THE tendency of modern Electric Lighting in Stoke Newington. to be to make large central generating stations, and hence the question that is at present being considered by many Local Authorities is whether they should manufacture the supply themselves or get it from other sources "in bulk," and then retail it through their own distributing mains. Colonel Crompton, in his report on the electric lighting of Stoke Newington, discusses this question at length. The Hackney Borough Council have offered to supply electricity to Stoke Newington at a price per unit less than that at which any London company has been able to produce it for themselves. The prices quoted by Hackney are 2s. 6d. per unit for a small supply, with rebates down to 2s. 4d. per unit for a large supply. The Hackney Council and their able engineer, Mr. Hammond, are to be congratulated on being in a position to make this offer. Colonel Crompton gives figures which prove that, so long as the output in Stoke Newington is less than a million units per annum, it would certainly be more profitable to buy their electricity from Hackney than to manufacture it for themselves. He points out that getting the supply in bulk not only leads to considerable economies in management expenses, but also greatly reduces the capital expenditure required. The Hackney Borough Council only propose a seven years' agreement, so if at the end of that time it should seem advisable, there is nothing to prevent the Stoke Newington authorities from laying down works for themselves. Colonel Crompton also discusses the question of the "free wiring" of workmen's houses and houses held on very short tenancies, to which class most of the houses in the district belong. In Hackney the Council have entered into an agreement with the National Electric Wiring Company, under which, if the consumer wishes it, the Wiring Company will provide and fix the wires and fittings for the electric light, the consumer paying the Council a rental charge of 5jd. per lamp per quarter in addition to the meter bill. Colonel Crompton, however, points out that if a litigious consumer refused to pay this rental it would be extremely difficult for the Council or the Wiring Company to force him to pay, as the wires remain the property of the Company.

A DEFECTIVE Railway System. A SINGULAR accident occurred on the Great Western Railway at Leamington early on Sunday morning. It was due, in the first instance, to the failure of the telegraphic communication, which rendered it impossible to work the traffic by the block system. Now, the rules of railway companies make very elaborate provision for the regulation of traffic during a temporary breakdown of this nature; and whether the rules were adhered to or not in this case, is a point for the Government Inspector to clear up. According to the reports of the accident, trains were permitted to enter a section "at stated intervals," and a train which had thus been

allowed to proceed towards Leamington, and had been brought to a standstill a short distance from the station, was run into by another train which had been subsequently passed into the same section. A great deal of damage was done, many waggons being completely wrecked. As they were "only" goods trains, and no personal injury ensued except to an unfortunate goods guard, the papers, of course, dismiss the occurrence in a few lines. Had a passenger train dashed into the wreckage, there would have been a different tale to tell, and it is a matter for congratulation that this did not happen. But the "time interval" system can hardly be regarded as a satisfactory one; there is a suggestion of uncertainty and insecurity about it which this occurrence goes to justify. Either the system or the officials were evidently at fault, and it is, to say the least, somewhat disquieting.

A BEGINNING has been made of the clearance of this site with the demolition of some premises on the east side of Beaufort-buildings. It is stated that the extensive alterations proposed to be effected by the Worcester Buildings Company conjointly with the Westminster City Council comprise the removal of Nos. 89-104, Strand, the closing of Herbert's-passage at the back, the widening of Beaufort-buildings, and the setting back of the building line so as to widen that portion of the Strand to 80 ft. Towards the cost of the last-named improvement the London County Council have agreed to contribute 50,000l. Amongst the premises thus marked for demolition is the large house, No. 96, Strand, at the corner east of Beaufort-buildings (a well known perfumer's shop), which was built in 1826 after J. B. Papworth's designs, and was occupied by Rudolph Ackermann. Papworth also built, in 1812, the large room at No. 101, Strand, for Ackermann, who had there revived the drawing school originally established by William Shipley, a co-founder of the Society of Arts. "Simpson's," Nos. 101-3, formerly Ries's Grand Divan, has replaced the old Fountain tavern, famed for its political club, which adjoined the premises of Charles Lilly, the perfumer and snuff-dealer, familiar to readers of Steele's papers in the *Tatler*. Lilly removed thence, after a fire, to the site of No. 96, where he kept Mr. Bickerstaff's Court of Honour. Beaufort-buildings marks the site of the town "inn" or mansion of the Bishops of Carlisle which at the Reformation was bestowed by Henry VIII. upon John Russell, first Earl of Bedford. Francis, the second earl, quitted it for a house he built on the north side of the Strand. The property then passed to Edward, second Marquis of Worcester, author of the "Century of Inventions" (1663) as tenant-in-tail. He let it for a while, at an annual rent of 500l., to Lord Clarendon, whose daughter was there married, in the night of September 3, 1660, to James, Duke of York. The third Marquis of Worcester, advanced Duke of Beaufort, let the ground for building purposes, reserving for himself at the south end the site of a small town house, which a fire consumed in 1695. Nos. 91-2, "Upton's Salisbury" tavern and dining-rooms, between Carting, formerly Dirty, lane and Beaufort-buildings, was rebuilt ten years ago after Mr. Edward Clark's designs.

The Prince of Wales's Theatre, Tottenham-st.

THE old playhouse in Tottenham-street, Tottenham Court-road, together with three freehold houses in Pitt-street, in the rear, was offered for sale at the Mart last week, but the property was withdrawn after a bid of 9,600*l.* The house was originally built in 1780 for musical entertainments for Francis Pasquali, and was enlarged, as the King's Concert Room, by Novosielski, who there gave his concerts of ancient music under the frequent patronage of George III. and Queen Charlotte. Having been styled in turn as the Amphitheatre (1808, for Saunders's equestrian troupe), the Tottenham-street, the Regency, the Royalty, and the West London (1823), and vulgarly known during some portion of its not always successful career as the "Dust Hole," it was leased as the Queen's in 1835 by Mrs. Nesbitt and her coadjutor, Mme. Celeste. Mme. Celeste (Mrs. Elliott) had there made her *début* before a London audience four years before; a programme of January, 1831, mentions the "act-drop" as painted and presented by Clarkson Stanfield. The name of the house was afterwards changed to that of the Fitzroy, and again to the Queen's. A change of fortune came, however, in 1865, when, under the management of Miss Marie Wilton (Lady Bancroft), the Prince of Wales's Theatre at once became one of the most favourite and fashionable theatres in London.

ORDINARY household metal wares are, as a rule, distinguished for dull insipidity, owing to the methods of their production and to the abrasive process, which removes from their surface all signs of life and feeling that tool-marks or interesting workmanship can give. Mr. Montague Fordham has just completed an order for metalwork for Government House, Capetown, which is remarkably free of the stamp of the machine. Nor are these productions copies of styles of a more or less remote period. They are the work of various craftsmen; two handsome beaten brass flower-bowls from Mr. Nelson Dawson's workshop; a pair of ecclesiastical-looking brass candlesticks by Mr. H. Wilson, simple, and certainly well designed; also a pair of copper candlesticks by Mr. Rathbone; coal-scuttles and scoops and incised brass flower stands by Mr. Nelson Dawson, the latter from designs by Miss Worthington, together with a number of large metal flower-bowls by the Birmingham Guild of Handicraft. We are used to seeing large quantities of old metalwork and furniture going to the Colonies, where such things are specially valued as the work of our forefathers; but it is encouraging to notice that modern handicraft is also in demand.

ADDITIONS TO BATHS, LEEDS.—A Russian bath, recently added by the Leeds Corporation Baths Committee to the baths at Union-street, was recently opened. The accommodation includes hot room, warm lavatories, shampooing-room, cooling-room, and dressing-boxes for fifty persons. The new arrangement occupies the space formerly taken up by the first-class swimming-bath. The temperature in the hot room ranges from 105 deg. to 110 deg. Fahr., and is obtained by injecting showers of steam. Mr. W. S. Braidwaite, of Leeds, is the architect.

CHURCH, PRESTON, BRIGHTON.—The foundation-stone of the new church of St. John the Evangelist, at Preston, Brighton, was laid by the Bishop of Chichester on the 16th inst. It is intended to accommodate nearly 500 people, and the estimated cost is 5,180*l.*, excluding seating, lighting, and heating. This church was one of the last designed by the late Sir A. Blomfield.

### THE SANITARY INSTITUTE.

THE Conference on Water Supply which was held during two days last week under the auspices of the Sanitary Institute may be considered to have been mainly occupied with the consideration of the control of the sources of water supply. Mr. J. Parry opened with a paper on "The Protection of Watersheds," and the number of Bills which had been passed to enable authorities to purchase catchment areas in order to prevent fouling of water was to find its way into reservoirs for domestic use; and his conclusion was that if water supplies are to be efficiently protected against risks of pollution which would be injurious to health, the entire area over which rain is collected must be in the hands of the authority responsible for the waterworks. His remark that "these drainage areas need not necessarily be left barren and uncultivated" seems to show that he recognised the existence of a difficulty for which he hardly suggested a remedy. Cultivation to any remunerative extent can hardly be carried on without involving pollution; and the difficulty of keeping large areas of land out of any use except as a cup to collect water seems likely to be an increasing one. Dr. Seaton, Medical Officer to the Surrey County Council, dealt with the protection of water against waste and against local contamination. The latter is a much simpler matter to deal with than the contamination of the source of supply, since in almost all cases he brought home to individuals, who can be compelled to abate or discontinue it. In regard to waste he described the steps taken by the Surrey County Council to resist encroachments on local resources in order to provide water for London, and also to adjust the claims of different localities within the county. This point, however, hardly comes under the head of "waste" so much as under that of misappropriation. Mr. Clayton Beadle, who followed with a third paper, went into the subject of underground pumping and its effect in depleting wells and streams which had been locally relied on for water supply or for mechanical power. He instanced the effect of the pumping by the Kent Water Co. on the neighbourhood of Orpington and Crayford, especially the drying up of the Cray and the consequent loss of power to the paper mills. Many of our readers will remember the strong complaints made by large manufacturers in Hertfordshire who found their underground water surreptitiously pumped away from them to supply London. This subject was much dwelt upon in the course of discussion which followed. Mr. Castle, of Garfield (Yorkshire), described the serious effects on the underground water of the sinking of a mine in a previously agricultural district, which drained wells on which the neighbourhood depended, while in the mine the water which they were wanting aboveground was actually being pumped to waste. Mr. Siddalls, from Tiverton, spoke also strongly in favour of the claims of rural districts, as against cities at a distance, to the water on their own land. In his district they said, "Dartmoor for Devon," and thought that local wants should be supplied before water was taken out of a district. The latter principle is quite right; but "Dartmoor for Devon," if acted upon at all beyond the limit of merely securing the necessary water for local use in the first instance, would represent a dog-in-the-manger policy. A wild district like Dartmoor seems appointed by Nature as a gathering-ground for a great water supply, the ground existing under circumstances which almost preclude any serious contamination.

The present position of the London water supply was touched upon by two speakers. Mr. Burgess, the Chairman of the Liverpool Water Committee, referring to the fact that in many villages and towns contamination of water went on to a great extent, said that where a considerable population lived on the banks of a river it could never be regarded as a satisfactory source of water supply, and that the position of London in this respect was not only a menace to the population of London, but was made an excuse or example for laxity in other places. The same line was taken by Mr. F. Verney, L.C.C., who spoke of the difficulties which the London County Council had to contend with in endeavouring to secure the proper efficiency and purity of the water supply. The filtration of the London water

was magnificent, but they ought not to have to depend on that for their health. There is, however, hardly any possible natural water supply which would not need filtration before use, so that argument must not be pushed too far. The speaker went on to suggest that the late Mr. Bateman's scheme for water from Wales was the right one and that no nearer source would be satisfactory, but Mr. Verney is probably mistaken in the belief that an adequate supply for London can be obtained entirely and solely from Wales. The question of London water supply was, however, after this speech ruled out by the Chairman (Professor Robinson) as involving matter of too controversial a nature.

Dr. H. R. Mill, in a paper on "Rainfall and Population in England and Wales in Relation to Water Supplies," maintained (what we have always maintained) that nature gives an ample supply of water for these islands for all possible needs, and that it is "not the water we use but the water we waste" that gives cause for anxiety. But Dr. Miller's notion of economising water consists, like that of almost all water engineers and water experts, in trying to make the users do with as little as possible, and in a rigid supervision of fittings. That is beginning at the wrong end, and putting the less before the greater. What escapes from bad fittings is a mere trifle compared with the enormous mass of rain-water which runs to waste every year through want of any systematic provision on a large scale for storing it. If that is undertaken properly, the question of the dribbles from fittings will be found to be a very secondary one, nor would there be any occasion to try to stint the use of water to householders. All water policies based on trying to reduce the amount of water used in households are thereby condemned at the outset. We do not use too much water but too little; what we ask from County Councils and water engineers is to get us more, not to try to restrict the use of what we have.

At the second meeting, on Thursday last week, Mr. W. Whitaker took the chair, and Professor Robinson, who had presided on the previous day, commenced the proceedings with a paper in which a kind of summary of the present position and recent progress of opinion in regard to the relation of rivers to water supply. We quote the following from the summary given in the *Times* report:—

"The author referred to the change of opinion which had taken place with regard to impounding reservoirs and the sedimentation of suspended matter brought down in flood-water. The Balfour Commission in 1892 expressed the opinion that flood-water was 'highly objectionable and undesirable,' whereas the recent report by Lord Llandafi's Commission stated that 'no restriction need be placed on taking flood-waters.' He thought the latter opinion would be acted upon with regard to the metropolis and would also furnish a solution of the problem of providing for the requirements of our towns, which even now is a pressing question in many places, and will be more acute as years go on. The Rivers Pollution Act of 1876 had not secured the general purification of our rivers, but something had been done in cases where special Parliamentary powers had been granted to authorities. He thought that in dealing with manufacturing effluents a certain amount of elasticity must be given in enforcing rules and standards of purity, and that cases must be carefully considered to avoid applying a rigid standard of purity under totally different circumstances. With regard to effluents from sewage outfalls, recent experience had enabled many of the difficulties to be solved, as the last few years had brought into shape remedies which were not previously available. He regarded the utilisation of bacteria in anaerobic or aerobic chambers as the solution of many existing troubles. The breaking up of organic matter by anaerobes enabled the resultant liquid to be utilised on land for agricultural purposes with greater advantage than in the crude state, and where sufficient or suitable land was not available the further treatment of the liquid in aerobic beds enabled any required standard of effluent to be attained. The application of sewage to land must be governed by sanitary, agricultural, and economic considerations. Each case should be considered on its merits, as it was seldom that two were alike."

It will be observed that the first portion of the remarks here summarised, in regard to utilisation and storing of the flood waters of rivers, is in direct opposition to the views for the most part laid down in the preceding day's discussion. The fact we take to be that the impounding of flood water from rivers is open to objection and constitutes a danger, which may however be reduced to very small proportions by adequate filtration; and that on the other hand, viz: admitting it to be a danger

and open to objection as regards the quality of water we want, it is not easy to see how we are to dispense with it when we come to consider the question of the quantity required. Mr. A. G. Leigh, in a paper on "The Control of Weirs and Dams on Streams in Relation to Water Supply," took up a subject which has an immediate connection with that of river pollution, for if a river be polluted, *a fortiori* a dam will be seeing that it forms a temporary block where all foreign matter in a stream, of a solid kind at least, is checked and collected. When dams are situated on streams the dry-weather flow of which consists almost entirely of manufacturers' and sewage effluents, one cannot be surprised that they become harbours of filth. They may, however, be turned to advantage in this sense, inasmuch as they afford at least an opportunity of intercepting and collecting matter which ought not to be in the river, and which it might be difficult to collect from the stream. If neglected, on the other hand, they only become an additional means for fouling the stream below them. What was required, Mr. Leigh said, was "a staff of river scavengers under the direction of the rivers authority, who would begin at the source of a stream and work downwards, removing all unnatural obstructions and abandoned weirs and dams, and flushing and cleansing out the stream."

The paper by Mr. H. W. Russell (Berkshire County Council) on the "Prevention of Pollution within the Thames Watershed," contained nothing new, and only stated over again the difficulties under which the Thames Conservancy find themselves in endeavouring to prevent pollution without acting oppressively towards small rural corporations or towards individual owners. He pointed out that it was a real grievance that small and poor communities should be heavily taxed for drainage schemes beyond their own requirements, "because they happen to be situated within the drainage area which supplies London with water." It is a grievance from the point of view of the small community, no doubt; but as long as we go on drinking Thames water, every possible check upon pollution must be rigidly enforced; one is sorry for the small community, but we are bound to consider the larger one first. The importance of this campaign against river pollution was opportunely enforced by the paper by Mr. Caink, the City Engineer of Worcester, with regard to the proved relation between typhoid and the state of the river at that city. Up to 1894 the river Severn, from which the water supply was derived, was polluted, and the annual rate of typhoid cases was 150 per 100,000 of population. In that year the filtration was improved, and the typhoid rate fell to 38. We must not pass without notice another significant and rather surprising fact brought forward by Mr. Caink, viz., that the typhoid statistics were lower in the towns supplied with filtered river water than in those supplied from artesian wells and from mountains. This fact, if authentic, certainly seems to tell against those who are inclined to be alarmists about the mere fact of taking drinking water from the Thames at all.

#### WATER SUPPLY FITTINGS EXHIBITION.

In connexion with the Conference, a well-arranged and interesting exhibition of fittings and materials more or less connected with this subject was opened during part of last week in St. Andrew's Hall, Newman-street.

A good many of the exhibits were of course well-known apparatus or materials. We had Polarite and Pasteur filters; the Maignen water-softening apparatus and the Desrueneaux water-softener and purifier; a large exhibit of the Sanitary Lead-lining Company's goods; illustrations of installations of the Septic Tank Syndicate; Messrs. Callender's bitumen sheeting for damp-courses and lining reservoirs ponds &c. At one stand were exhibited some of the apparatus used by the Sanitary Institute in their recent tests of extract ventilators and injectors.

Messrs. John Jones, Jennings, Doulton, Shanks, and Bolding, all exhibited samples of some of their best work, the general excellence of which is well known. Among things that are worth special mention is Messrs. Shanks's "aqua-jet" flushing cistern, which does away with all mechanical means for starting the siphon; a small pipe is carried about 18 in. down from the bottom of the cistern, opening into it just below the opening of the siphon; at

the foot of this pipe is a compressible rubber ball, looking something like the globe at the foot of a thermometer tube; the action of a small lever compresses the ball and sets up a jet upwards in the tube, which impinges on the orifice of the siphon and starts it. This does away with some part of the mechanism in the flushing cistern, and looks as if it ought to be a method of certainty of action, which, as we all know, is not always the case in siphon-flushing cisterns. They also show a lavatory basin with a siphonic waste, the object of which is to exercise a force to draw the water out in the case of a tap being left running, on the ground that even a much larger water-way than the supply tap will not prevent a basin overflowing, in consequence of the water entering at pressure from the main, and therefore faster than the escaping water. We have known this to be actually the case in a lavatory basin which had an apparently adequate overflow; but it is a simpler remedy to enlarge the relative area of the overflow-pipe than to insert this siphon waste, an awkward-looking object standing up at the back of the basin, which has of course to be specially shaped for it. The flushing cistern just mentioned should be less noisy than those that are more filled with mechanical gearing; but the "Sanitary Appliances Syndicate (Grundy's patents)" have gone a step further with a flushing cistern on a new principle, which really is "noiseless," and is the only one we have seen that properly merits the name. This cistern is empty until it is charged for immediate use by pressure on the seat; the water is then admitted to it by the turn of a two-way valve on the main, and rises in the cistern till stopped by a conical metal float or buoy which fits into a rubber seating in a circular opening in the top of the cistern and preventing the further escape of the air and consequently preventing the water from rising quite to the top of the cistern. The water discharges to the closet below simply by a direct down-pipe from the bottom of the cistern, with a perforated bell projected into the cistern which allows of an after-flush to keep the basin charged. As there is none of the drive which a siphon gives to the flush, it is obvious that the cistern must be at a certain height above the basin to get a sufficient head for a good flush; in most cases this could be done; at all events the cistern is practically "noiseless," a claim made in many other cases and not realised. Messrs. Doulton's exhibit showed admirably the beautiful working and fitting up of their "Claybury" self-closing non-convulsive valve, for hospital and asylum water fittings, and also their non-convulsive bath fittings, in which supply and waste are combined in one metal chamber placed outside the bath, on decorative brackets, so as to be always available for examination. Mr. Jennings had also a fine exhibit of somewhat similar appliances in the way of non-convulsive valves and taps, showing also admirable finish. Messrs. Bolding exhibited some very good specimens of their "Laydas" siphonic-action closets, which have the advantage also of a great depth of water in the pan, and also some very good taps with a seating of their special material, "Bolidite." They also exhibited a closet with a water-waste preventing valve on the service pipe, in lieu of the flushing cistern.

Among other things we may mention were Messrs. Townson & Mercer's fitted boxes of water analysis sets for the use of sanitary officials; Mr. George Kent's exhibit of water-meters; Greenway's sand-washing machine; Mr. Yardley's patent grooved and tongued pipe joint, which admits of a pipe being lifted for inspection or repair without disturbing the adjoining ones—this is ingeniously contrived, but we do not feel convinced of the joint being quite tight under pressure; Mr. Thomas Feather's bevelled ring for facilitating the junction of pipes at a slight angle, where a bend would not be necessary—this is an admirable contrivance and one wonders it has not been thought of before; the A. P. Smith Manufacturing Company's material for water service, especially their tapping machine, for making connexions to water mains under pressure; and Messrs. Tucker & Sons' fire and hard-pressed bricks for engineering purposes.

Both the exhibition and the catalogue were very well arranged.

#### THE ANNUAL DINNER.

The annual dinner of the Sanitary Institute took place on Thursday, the 17th inst., at the

Holborn Restaurant. Sir Francis Sharp Powell, Bart., M.P., presided, and among those present were Sir W. H. Broadbent, Sir William Church, the Mayor of Dover, the Mayor of West Ham, Mr. A. Winter Blyth, Dr. A. Newsholme, Dr. S. Cathcart, Dr. J. C. Thresh, Dr. H. R. Kenwood, Dr. Louis C. Parkes, Dr. A. W. Harris, Dr. G. Reid, Dr. C. Childs, Major R. H. Firth, Mr. T. Blashill, Mr. R. E. Middleton, Mr. T. W. Cutler, Mr. H. D. Searles-Wood, Mr. J. Osborne Smith, Mr. H. H. Collins, and Mr. E. White Wallis.

"The King" was proposed by the chairman, which was followed by "The Queen, the Duke and Duchess of Cornwall and York, and the other Members of the Royal Family," also submitted by Sir Francis Sharp Powell, M.P.

Mr. T. Blashill then proposed "The Municipal Corporations." He said there were many gentlemen gathered together on this occasion who were connected with municipal bodies, which, although not having the equality of State cast upon them, carried out the equally important duties of the preservation of the health and life of individuals of the community. It was not necessary to dilate upon the importance of those duties; this Institute, which was founded to help these corporations in every possible way, and was carrying out this intention thoroughly, was well aware of it. The assisting of municipal bodies was a very important part of the work of the Institute. It helped them largely by the holding annually of great congresses in different parts of the country, at which a very large number of delegates—some 1,200—from the corporations were sent to take part in the discussion of sanitary problems. The Institute also assisted them by holding examinations to test the merits and capacities of the persons who were candidates for positions under them. He desired to couple with the toast the Mayors of Dover and West Ham. Probably never before were these two municipalities coupled together. They were so widely different, the one so ancient, and the other so modern that little more than fifty years ago it was but a rural village. The corporations of this country, he concluded, were doing their duty, and they were alive to the necessity of sanitation, not altogether irrespective of cost, perhaps, but without undue regard to the amount of the rates.

The Mayor of Dover in responding mentioned that the corporation of which he was the head possessed its own waterworks, electric trams, and would soon have its own electric light. He considered that every corporation should be the proprietor of these undertakings, and it was certain that they would achieve a good deal more than at present if there was not quite so much red tapeism on the part of the Government and the Local Government Board. Whilst there should be some check upon corporations who might be inclined to extravagance, yet obstacles should not be placed in the way of schemes which were absolutely necessary for the good of boroughs.

The Mayor of West Ham also replied.

The Chairman, in proposing "The Duke of Cambridge (President) and the Sanitary Institute," said that for many years H.R.H. with characteristic kindness had occupied the chair at these annual dinners, but this being the year of mourning in Royal circle he had asked to be allowed to remain absent on this occasion. He (the Chairman) could not introduce the Sanitary Institute without in the first place expressing his deep regret in the loss they had sustained by the death of Mr. Rogers Field, whose presence on the Council was very frequent, and whose advice was always valuable, as his gifts were never ceasing. He had them in mind in his latest hour, as was shown by his liberal bequest of 5,000l. With regard to the Institute itself, it had become in one sense old—so many were the societies springing up around it—but although it was old in years it was constantly renewing its life. There never was a time when it was doing more excellent work. During the last year there were no less than seventy meetings, attended by 25,000 persons, and there had been more than 200 new applications for membership and association. They were proud of their past, they rejoiced in their present, and were determined that their future would surpass both. It was, indeed, a happy thought that drew together in one association those who were now gathered together under the auspices of the Sanitary Institute. There were those who were most eminent in the medical profession, those who were most skilled in engineering, and those

who were most acquainted with all the multifarious details of sanitary appliances. They all worked together in comradeship, without jealousy, and with one desire animating them all—how best to serve the great cause in which and for which they laboured. It was the great privilege of those who took part in their work, in a measure and to an extent, to at once guide public opinion and to exercise control over administration. There were some who sought to guide public opinion, who through their want of experience had become in the course of a few years wearisome pedants, and there were others who studied the practical side so much that they were constantly falling into errors from want of that scientific precision which was eminently necessary in order to carry out with good result any practical experiment. They guided public opinion and public opinion made laws, and laws which were made without public opinion had no validity. This was more especially applicable to laws affecting public health, which did and must affect every event in the daily life of the people. They were not content to possess knowledge, because knowledge locked up in their intellectual treasury was, for the present at least, vain and useless; but having gained that knowledge, they distributed it day by day by teaching the people to practise that which they so diligently and perseveringly brought to their notice. They had achieved a great deal. He had watched during many years the cause of public health both in Parliament and in the provinces, and he had seen how they had dispersed that terrible acquiescence in evil surroundings which paralysed all efforts and was fatal to progress. Whenever they went they found an increasing interest and a more marked readiness to co-operate with those sanitary reformers who desired to carry their healing message to the homes of the people. Whether one went into the crowded city or town, or into the village, there was to be found a readiness to learn and also a willingness to practise. There was one subject in their minds—that relating to the Parkes Museum, which he would refer to. He regarded this museum as not only of national, but of European, importance; its good effects were not confined to this country. There were some imitations of it in foreign lands; in Vienna there was a museum constituted on much the same principles, and he had reason to know that it had conferred great benefits upon Eastern Europe. They had the Parkes Museum as an inheritance, and were not content that it should remain in its present condition. They felt that the institution was not worthy of the name it bore or the object which it had to accomplish. He admired the courage of the active members of the Council of the Institute in moving to provide a place in London fitting to discharge the functions of that museum. The Council estimated the amount required as 25,000*l.*, and he hoped that sum would soon be placed in their hands by the generosity of an appreciative population. He desired to say, also, a few words with regard to the housing question. This problem had occupied their time during an important conference a few months ago. It had become a popular and almost a fashionable cry. He regarded this stage as most dangerous and one likely to lead to results of a disastrous character. He feared the demon of exaggeration. If they performed the achievement of travelling to any outside part of the country with eyes open upon the scenery, they would be impressed with the multitude of new houses which were springing up through every part of the most prolonged journey. He believed that the problem of the housing of the people was in many places now solved or about to be solved. In the Borough of Wigan—the town he represented—it was the opinion of the housing authorities that they had the solution of that problem entirely at their command. There had also been an enormous extension of dwellings for the people in Bradford owing to private enterprise. If they, in an hour of enthusiasm, built houses beyond the requirements—those houses necessarily involving a great expense—there would be a reaction which would be most harmful to their cause. There could be no doubt that in London, Liverpool, Manchester, and other such towns there was great reason for the movement, but he hoped that it would be made with discretion. With regard to the question of river pollution, they were making substantial progress, as in many other departments of their works, and he hoped the time

was not far distant when the working classes, who were really their masters in these things, will take action so as to preserve themselves from contamination by foul streams and to relieve themselves from the evil of smoke. When the working man was convinced that his family were injured by the pollution of the stream and of the air, it would not be long before an effectual remedy was supplied.

Dr. A. Wimper Blyth, in response, said the Institute had now been established for a quarter of a century, and he claimed that that was managed in the best way possible in the interests of the members and the community generally. Its council was composed of professional men most interested in hygiene—those men most adapted to further the aims of the Institute. Its members included not only medical officers of health, but well-known architects and famous engineers. They worked very hard indeed; during the last year, for instance, they had attended 125 meetings, which represented 700 individual attendances. There was nothing to gain personally in this work; it was all unselfish, self-denying labour. The examination of inspectors was a most important work because unless there were men properly qualified to carry out the details of this profession no sanitary advance was possible, but this was only a small part of the work of the Institute. Congresses were held from time to time attended by delegates from many large towns, and questions of vast importance were discussed. The conference on the housing of the working classes already referred to, was largely attended and certain very important conclusions were arrived at. They were not local in any sense or form but imperial in their influence. This assertion was not extravagant because they had already a branch in Australia, one in Canada, and negotiations were in progress for the formation of another in India. They wished to be world-wide because hygiene itself was a national and imperial matter. They had popularised it, but at the same time they had not neglected its technical aspect. With regard to their museum which was bequeathed by Dr. Parkes, the first professor of hygiene in this country, they wished to provide a better structure. It was visited by all the English speaking race, particularly by Americans; and it was very difficult to find. The building was not worthy of the British nation—if the museum was in Paris or some other Continental city, it would have a beautiful piece of architecture with a marble staircase and sculptured statues. They felt ashamed of the building and considered they should be housed in something more worthy of this great subject, which was so important to all the English speaking race. They knew very well that in warfare far more soldiers died from disease than at the hands of the enemy. In the present war more died from typhoid than from the sniping of the Boers, and that being so it was most important that a great institution which studied hygiene should be suitably housed and recognised by the nation. He was sorry to say that they had not yet received any funds from the Government, but they lived in hope. They had already made a commencement with regard to the building fund. If he had been asked to say the sum required for a proper building he would have put it at half-a-million, and some towns would spend more than that upon a building of a much less worthy and useful object than this. They were more modest, and put the cost at 75,000*l.* At the present time they had received subscriptions amounting to about 7,000*l.*, which included 15*l.* from the President of the Council and Vice-Presidents, 95*l.* from the members of the Council. No doubt they would receive considerable support from the provinces. The great towns which were doing such grand municipal work were indebted to this institute, because the principles that they had put in practice had been taught in theory for many years in the institute. Their various exhibits had been of great educational value, and chairmen and public health committees, medical officers, and sanitary inspectors could always find something new in their museum—something which would prove useful to them. A report of a committee, of which the late Mr. Rogers Field was the last member, had recently been published upon ventilation. Mr. Field had spent over 2,000*l.* and a good deal of the leisure of his life upon this committee, and the report was very valuable. Altogether, the institute was doing valuable work, and was worthy of support.

Dr. A. Newsholme proposed "The Guests," mentioning Sir Wm. Broadbent and Sir Wm. Church in particular. With regard to medical officers he said that Local Authorities should see that they obtained the best men by paying the best salary, and there should be some security of tenure. Sanitary science, he added, had attacked the water supply, the drainage question, &c., and now the house decorator must be made to keep the houses clean. This was a very important matter, as cleanliness in houses was a great factor in the prevention of disease.

Sir Wm. Church replied, and a toast to the Chairman concluded the proceedings.

#### ARCHITECTURAL ASSOCIATION DISCUSSION SECTION.

The first meeting of the Discussion Section of the Architectural Association for the session was held on Friday, the 18th inst., at 50, Great Marlborough-street, W., at 7.30 p.m.

Mr. R. H. Weymouth, the Chairman of the section, presided, and was supported by the secretaries, Messrs. J. H. Pearson and H. Gregory Collins.

Several questions having been asked by members and replied to, the Chairman called upon Mr. H. Gregory Collins to read his paper entitled "Stables and Stable Fittings," which we print in full on another page, and which was illustrated by drawings of various stables actually carried out in different parts of the world. The discussion was opened by Mr. G. H. Smith (who proposed a vote of thanks to Mr. Collins) and carried on by Mr. C. H. Brodie (who seconded the vote of thanks). Mr. Brodie pointed out the value of a paper of this kind, where so many facts had been gathered which were of the utmost value to the architect who had to design buildings of this sort. The following gentlemen also took part in the discussion:—Messrs. Watson, Geoffrey Lucas, Jacob, and Taylor.

The meeting was particularly fortunate in having Mr. Pye Smith, of the St. Pancras Ironwork Company, present, who was kind enough to come down and give them some valuable information on stable fittings which had been gathered over an experience of a quarter of a century. Mr. Smith heartily supported the vote of thanks, and said although Mr. Collins was a young man, the paper they had listened so attentively to that evening was a most exhaustive one, and showed that he had given great attention to the subject.

There were further good things in store when the Special Visitor of the evening—Mr. Arnold Mitchell—proceeded to sum up the discussion in a speech in which he gave the members the benefit of his experience in many works which he had recently carried out.

Mr. Mitchell emphasised the value of designing separate stables for the various classes of horses in first-class stables. A proper system of ventilation was most essential, and he agreed with the author of the paper that the open channel method of drainage was the right thing. Glazed wall tiles should not be used, but a dull green tile manufactured by Messrs. Powell was satisfactory. He advocated the use of double-hung sashes in stables with the deep bottom bead.

The Chairman included in the vote of thanks to the author the names of Mr. Pye Smith and Mr. Arnold Mitchell, also Mr. Burdett-Coutts, M.P., and Messrs. Musgrave & Co. for kindly lending drawings, which was passed unanimously.

Mr. Gregory Collins having replied, the meeting terminated, and it was announced that the next meeting would be held on November 8 next, when Mr. W. E. Davis will read paper on "The Finishing of a Dwelling-House," and Mr. Walter Millard has kindly promised to attend as Special Visitor.

THEATRE, NORTH SHIELDS.—The New Central Hall of Varieties, North Shields, has recently been opened. It has a frontage in Saville-street of 54 ft. On the ground floor are the exits to the theatre, a shop, and a buffet. On the first story is the theatre, which comprises a large hall with a tier over. The former is divided into pit and stalls, and the tier is divided into first and second circles. Accommodation is provided for about 1,000 people. The lighting throughout is electric, supplemented by gas, and the installation was carried out by the Northern Electric Engineering Co. Messrs. Hope & Maxwell, of North Shields, were the architects, and Mr. T. Robson, of the same town, the contractor.

A MODEL BUILDING TRADES' SCHOOL.

In a Report furnished to the British Government on the technical, agricultural, industrial, commercial, and art schools of Württemberg by Dr. Frederick Rose, his Majesty's Consul at Stuttgart, some interesting particulars are supplied respecting the Royal Building Trades' School, which is described as the most important institution in Württemberg for secondary technical education. Of the 23 similar schools in Germany, some of which are upon a much smaller scale, it is the most flourishing and important. This was evidently recognised by the authorities of the South Kensington Museum, who, after having inspected the school, invited its participation at the Health Exhibition held in London in 1884. At this Exhibition the school was awarded two diplomas, one for a series of scientific school work, and the other for the organisation of its curriculum. About seventy years ago there were in Württemberg no cheap facilities for the further education of skilled building workmen except the costly method of taking lessons from private teachers, foremen, or architects. This disadvantage was also keenly experienced by those who wished to devote themselves solely to technical professions or to become subaltern technical State officials, and who were consequently compelled to limit their studies or to visit technical schools in France or Austria-Hungary. For these reasons the Stuttgart Trades' School was founded in 1832, following the example of the technical education institutions which were founded in Germany at Karlsruhe (1825), Munich (1827), and Dresden (1828), and of the polytechnic schools founded in Austria-Hungary at Prague (1806) and Vienna (1815). In 1840 the trades' school was raised to the level of a polytechnic school, but, as in course of time it became evident that—owing to the peculiar conditions then prevailing—the curricula for primary and secondary technical education could not exist together in one institution, a new building trades' school was founded in 1845 for secondary technical education and entirely separated from the Polytechnic School, which was converted later into the Technical High School, and devoted exclusively to primary technical education.

For a period of twenty years, until 1864, the school was only opened in the winter months, as the majority of the pupils were engaged in practical building works during the summer months, and was for this reason generally known as the Winter Building Trades School. During this time the school had made such rapid progress, and proved itself of such great importance, that in 1865 summer classes were opened, the whole school placed under the immediate supervision of the Ministry of Education with the designation "Royal Building Trades School," and a special building erected at a total cost of 30,000l. In 1900 two new wings were added to the original building at a cost of 12,000l. The special aim of the school is the partially theoretical and thoroughly practical training of technical engineers, architects, surveyors, &c., including (a) Practical master builders (technical architects) of different degrees; (b) Subaltern building inspection officials for State, district, and municipal positions; (c) Hydraulic engineers for canal and dam construction, erection of mills, regulation of rivers, &c.; (d) Mechanical engineers, managers of mechanical workshops and factories, and foremen and draughtsmen; (e) Government surveyors and agricultural engineers (qualified surveyors who have attended further courses in irrigation and drainage).

The school is managed by a director and by a professorial committee, consisting of a limited number of the principal professors; this serves as an advisory board to the general professorial council (Konvent) which includes the whole of the teaching staff. This council decides, within certain limits, all important questions affecting the school, and is required to lay proposals before the Minister of Education regarding those matters which are not within its competence. The director of the school is appointed in permanence and not from year to year as at the technical high school. The organisation of the school is particular, and differs greatly from that of the technical high school and other technical schools, inasmuch as its curriculum provides facilities in the lower classes for the general and mathematical preliminary education necessary for the commencement of studies in the technical branches of the

upper classes. The school consists of three special departments for (a) architects; (b) engineers; (c) surveyors and agricultural engineers. These three departments rest upon a common foundation, which consists of one general and two mathematical preparatory classes. Classes with too many pupils are split up into parallel classes with exactly the same professors, subjects, and duration of teaching, as it is not considered advisable to allow, as a rule, more than thirty pupils in one class. The summer and winter terms contain 100 days each, and the remaining days are free. The longest holiday period is from the beginning of August until the latter half of October, the Easter and Christmas holidays being very short. This arrangement has been devised in order to enable the pupils of all classes to devote themselves to practical work during the summer holidays. Many of the poorer pupils earn enough during the summer holidays or summer term to keep them during the winter term. The professorial staff consists of twenty-five principal or ordinary professors, and nineteen extraordinary professors and assistants.

The general technical instruction afforded by the school is assisted and supplemented by:—  
1. Excursions for purposes of inspection of practical work to works, factories, buildings, and various places; duration of the same, two hours, half a day, or two to eight days. The expenses for travelling are defrayed by the school.  
2. Competition in the upper classes for prizes given for the best building designs; public exhibition of competitors' work.  
3. Annual public exhibition of all work done by pupils during the year.  
4. Permanent exhibition of the best work done by pupils of the school.  
5. School library, valued at 5,000l.  
6. Collections for instruction in architecture, mathematics, construction, mechanical and electrical engineering, chemistry, physics, surveying, freehand drawing, painting in water-colours and oil, models, &c., valued at 3,000l.

The number of pupils during last winter term was 823. During the summer term there were only 679, the diminution being caused by the large number of building pupils engaged in practical work during the summer, in addition to the holidays. The age of the pupils varies greatly. For instance, in the winter term there were 475 between the ages of 14 and 20, 259 between 20 and 25, 76 between 25 and 30, and 13 above 30. The lowest age was 14½; the highest, 34½; the average, 20. The large number of pupils between 20 and 25 is a very significant fact. As it may be safely assumed that a very large percentage of these pupils support themselves, their attendance shows what great value they attach to their further education. Of great interest also is an analysis of the occupations of the 823 pupils, as follows:—

Certificated master builders and aquatic engineers .....	16
Masons and stone masons .....	376
Carpenters .....	157
No handiwork .....	69
Mechanics and metal workers .....	147
Surveyors and agricultural engineers .....	54
Other occupations (joiners, sculptors, modellers, &c.) .....	27

It has already been mentioned that a special feature of the Royal Building Trades' School is the position of the various technical departments upon a common basis, consisting of one general preparatory and two mathematical preparatory classes. After pupils have passed through these they commence the study of their special technical branches in the upper technical classes. Intending pupils for all classes, preparatory and technical, must either show that they have already passed through school courses enabling them to participate fully in the subjects taught, or they are required to pass an entrance examination in order to prove their educational qualifications. Pupils for Class III. must be at least seventeen years old, for Class IV. at least eighteen, for Class V. at least nineteen, and for Class VI. at least twenty. Experience in practical work is not required for the general and mathematical preparatory classes, but is absolutely necessary, however, for further study in the upper classes in which the special technical instruction commences. The minimum limits of necessary practical work for commencement of studies in practical courses have been fixed as follows: Building department, one year; mechanical engineering, one and a half to two years; surveying, two years. By this means all the pupils of the technical departments, commencing with

Class III., are in possession of a sound general mathematical and practical education, with experience in drawing, before beginning their special studies in the technical departments. The total time necessary for the completion of studies is—without taking into account the periods of practical work—in the building and constructive engineering department (counting from preparatory classes), eight terms (four years); machine engineering, six terms; surveying (counting from Class I.), six terms. The fees are upon an extremely moderate scale, and amount to about 2l. per term, or 4l. per annum; they are partially or wholly dispensed with in the case of talented or industrious pupils who can produce officially-attested papers certifying to their indigent circumstances. There are also a number of small scholarships, of which his Majesty King William II. contributes twenty, and the Freemasons' Lodge three; they are each worth about 5l. per annum. The great majority of the pupils live in extremely moderate circumstances; the following estimate, which is the result of a number of careful inquiries, will give an approximate idea of the individual student's annual expenditure.

	£	s.	d.
Fees for two terms .....	4	10	0
Drawing materials, books, &c. ...	3	10	0
Combined bed and sitting room and board for two terms .....	27	10	0
Coals, light, and service .....	3	10	0
Miscellaneous .....	11	0	0
Total .....	50	0	0

During the summer holidays—about three months—they either reside with their parents or relations or earn salaries by practical building, engineering, or surveying work, or as draughtsmen. Pupils of the upper classes add to their incomes by giving lessons in mathematics and technical subjects to backward pupils of the lower classes. At the end of each term the best pupils of each class receive prizes worth from 15s. to 1l. 15s., the second best receive diplomas, and the third best honourable mentions. After passing through the full courses the final examinations for the following diplomas are held:—

1. State diploma for building and architecture.
2. State diploma for building and architecture.
3. Diploma for hydraulic engineering.
4. School diploma for mechanical engineering.
5. State diploma for surveying.
6. State diploma for surveying and agricultural engineering.

In the last financial year the total expenditure was 10,721l. and the income from fees 2,781l., the deficit of 7,940l. being covered by the State. Dr. Rose, after giving these and other details, affirms that of all the German schools for secondary education which are known to him from personal inspection and experience, the Stuttgart Building Trades' School undoubtedly occupies the first rank with regard to (1) preliminary mathematical, practical, and drawing education of the pupils; (2) excellence of the instruction in the upper classes in mathematics, constructive drawing, and practical technical instruction; (3) quality of the professorial staff which is, beyond dispute, one of the best of its kind at similar institutes in the German Empire; and (4) importance of the private and public positions held in Württemberg, Germany, and foreign countries by former pupils of the school.

THE LONDON COUNTY COUNCIL.

THE usual weekly meeting of this body was held at Spring-gardens on Tuesday, Mr. A. M. Torrance presiding.

Loans.—The following loans were granted to local bodies:—20,000l. to Shore-ditch Borough Council for purchase of land; 8,000l. and 7,360l. to Camberwell Borough Council for paving works; 20,000l. and 5,000l. to Hackney Borough Council for electric light installation and meters; 6,380l. to St. Pancras Borough Council for street lighting; 7,480l. and 2,810l. to Hampstead Borough Council for electric light installation and meters; 2,990l. to Kensington Borough Council for paving works; 200,000l. to London School Board for schools, &c.

London Fogs.—The General Purposes Committee reported that they had had under consideration a letter from the secretary of the Meteorological Office stating that it was proposed to hold an inquiry into the occurrence and distribution of fogs in the London district, and their relation to other atmospheric and

local conditions, and asking for the co-operation and assistance of the Council in the conduct of the inquiry. The Meteorological Council make the suggestion consequent on applications which have been received from the electric supply department of one of the Local Authorities and from some of the electric supply companies of London for special forecasts or warnings of the approach of fogs, and on account of the general importance of the subject to the inhabitants of London.

The mode of procedure suggested by the Meteorological Office was the initiation of a special inquiry during the winter months into the conditions associated with the development and distribution of fog in London and its vicinity; and for that purpose (1) to obtain records from properly selected positions in various parts of London; (2) to collate these records with the general atmospheric conditions at the time of the observations as shown by the information regularly furnished to the office; and (3) as far as possible to ascertain the character of the information requisite for anticipating the occurrence of fogs in particular localities. The Committee recommended the Council to concur in the suggestion that it should assist in the initiation of a special inquiry, on the understanding that all responsibility for the conduct of such investigation do rest with the Meteorological Office, and that, subject to the passing of the annual maintenance vote, the Council contribute in the next financial year a sum of 250*l.* for the investigation. This was adopted.

**Fire Alarm Posts.**—The Fire Brigade Committee reported that the provision of fire alarm posts of 5 ft. 6 in. instead of 4 ft. 6 in. had to some extent prevented the misuse of the apparatus, and the Council resolved to lease for ten years posts of the new pattern from the Post Office.

**Breaking up of Thoroughfares.**—The Highways Committee reported upon the result of the conference with the City Corporation on the question of breaking-up of London thoroughfares by companies and others, and now submitted the following recommendation:—

"That the Corporation of the City of London and the Councils of the respective Metropolitan Boroughs and of the City of Westminster be asked whether they will be prepared to support the London County Council in making a representation to his Majesty's Government as to the necessity for legislation to confer upon the Council, as the central authority for London, powers to make by-laws or regulations, and to enforce compliance therewith, as to the manner in which companies and others who have, for the purpose of executing works in connexion with their respective undertakings, statutory rights to break open the public thoroughfares, shall exercise such rights, and as to the time at which such works shall be commenced, and the period within which they shall be completed, and the surface of the roads re-instated."

This was agreed to.

**Photographs of Old London.**—The Historical Records and Buildings Committee reported that, through the kindness of Mr. Cohen, they recently obtained facilities for having photographs taken of certain paintings belonging to Mr. H. Bischoffsheim, of The Warren House, Stanmore. The pictures, which were recently on exhibition at the Whitechapel Art Gallery, are by well-known artists, and represent places of interest in London in the latter part of the eighteenth century. Mr. Bischoffsheim had now had the photographs enlarged and had generously presented a set to the Council. Their value is increased by the fact that only twelve copies of each picture were taken, the plates having then been sent to Mr. Bischoffsheim to be destroyed.

**Totterdown Fields Building Schemes.**—The Housing of the Working Classes Committee reported in reference to the vote of 74,093*l.* passed in July for the erection of 276 cottages at Totterdown Fields, Tooting. They invited tenders for the erection of three rows of cottages on Section A, and recommended the acceptance of that sent in by Messrs. C. B. Roberts & Co., amounting to 11,184*l.* This was adopted.

**Sewage Disposal.**—The Main Drainage Committee recommended that the estimate of 500*l.* in respect to the proposed alterations to the pumps at the North Woolwich Pumping Station be approved, and that the offer of Mr. John Cochrane to supply and fix the requisite new parts for 441*l.* be accepted. The Committee

explained that the quantity of sewage to be pumped was far in excess of what was anticipated when the engines and pumps were put down.

**Tramway Extensions, &c.**—The Highways Committee presented a report on the several improvements and widening of streets required in the Metropolis in connexion with tramway proposals. The cost reached the total of 1,093,652*l.*

## Illustrations.

### MUNICIPAL BUILDINGS, GLASGOW.

**T**HIS is a view of the late Mr. Young's celebrated building at Glasgow, taken from a new point of view, showing the elevation to John-street, looking towards George-square.

It is reproduced from a large and very fine washed monochrome drawing which was exhibited at the last Royal Academy.

### HOUSE AT CHISLEHURST.

THIS house, the drawing of which was in the last Royal Academy Exhibition, is designed by Mr. Ernest Newton, in his usual essentially home-like style.

The materials are red bricks and red tiles. The builders were Messrs. Willett, of London.

### SCULPTURE PANELS, PARES'S BANK, LEICESTER.

THESE two panels, which form part of the decoration of Pares's Bank, Leicester (Messrs. Everard & Pick, architects), illustrated in our issue of September 21, are 10 ft. by 5 ft. in dimension, and are executed in Portland stone.

In that entitled "Commerce," the central figure represents Commerce with her offspring, Peace and Enlightenment; to her left are figures suggesting the Hemispheres, east and west, bringing foodstuffs and raw materials; on her right are introduced British crafts and manufactures, to whom Commerce offers the horn of plenty.

The panel entitled "Agriculture" shows in the centre Agriculture crowned with wheat and accompanied by two children playing pastoral music; the other figures typify the corn harvest, sheep-raising, fruit-growing, and dairy-farming.

Mr. C. J. Allen, of University College, Liverpool, is the sculptor.

### STABLES AND STABLE FITTINGS.\*

THE question of the keep and management of horses is so intimately associated with the daily work of many of us that, although it is scarcely the professional side of the subject, I feel that I need offer no further apology in asking for an exchange of opinion on some points to which I have given my attention.

I shall endeavour in the few remarks I am going to make to speak only of those matters that will possess an interest for all of us who may be called upon to build stables, and here I may mention that I would take as a type the professional man's horse and stable, as it is more likely to come within our province to deal with our medical man before we have the good fortune to design stabling for a mansion or the buildings for a stud farm.

No one would, of course, buy a horse that he knew to be unsound, and I do not propose to enter into what constitutes unsoundness, but I would advise any one who thinks of purchasing a horse to get him examined by a veterinary surgeon whose opinion he can rely on, and tell him to give his especial attention to the horse's feet, for here, I believe, a source of evil is often overlooked, and no horse with faulty feet can stand much hard work on the roads.

I will now pass on to say a few words about the place where the horse is kept, and I propose to discuss the site and construction of the buildings by and by under the detailed headings of this paper, as these questions must be studied minutely by those who are fortunate

enough to build stables, and I want to insist upon the necessity of thorough and efficient ventilation and proper drainage in stables where it is expected to keep horses healthy.

The horse is possessed of very capacious lungs and active respiration, and is adapted by nature to live and thrive best in the open air; and it is in overcrowded, badly-ventilated stables, where sanitary rules are ignored, that horses are shortest lived.

I shall come to the question of ventilation in due course, after we have settled the planning and paving. The methods are numerous, and the circumstances of each case must be fully considered in adapting means to the end. I must point out that ventilation cannot be efficient unless a sufficient amount of space be allotted to each horse, and unless the inlets and outlets are kept patent and the pavement properly designed. It is no uncommon experience to go into a stable, even one that is managed by one who would consider himself much insulted if you ventured to suggest anything wrong, and find every door and window shut, the ventilators closed or choked with bundles of straw, and the keyhole and every crevice through which fresh air can enter carefully stopped up, whilst the atmosphere is so impregnated with ammonia and organic impurities that it makes one gasp for breath and brings tears to the eyes. The drains, too, will probably be found in such a condition that they are worse than useless, and whilst they fail to carry off effete material, are themselves a fruitful source of noxious gases and organic impurities. Unfortunately, the floors of many stables are made of such material that it is impossible to obtain a quick and thorough removal of urine, &c., which collects in little pits and crevices, and there decomposes and leaks into the subsoil, which in time becomes thoroughly saturated with all that is most baneful. You have only to see the cobble paving taken up from an old stable to become thoroughly conscious of this, and it will be enough to make you insist on having a floor which is impermeable, and which can be easily cleaned with water and a brush.

The temperature of the stable is another very important point. A hot stable is generally a foul one, whereas there is a great deal of truth in the old saying that "A cool stable makes a healthy horse."

It is especially necessary that a horse should not be kept in a hot stable, when he has often to leave it and stand about perhaps for hours on a cold night with scarcely any shelter or protection, when he will be much more liable to suffer harm if he has left a hot stable than a cool, well-ventilated one.

There can be no question, I think, that, whenever it is possible, horses should be kept in loose boxes rather than stalls. No matter if the box be not more than 10 ft. square, the horse will be able to rest better in it, to select the easiest position, to move about and be more comfortable and contented. He will be much less likely to acquire the bad habits of cribbing, kicking, &c.

Each horse in a stable should be allowed at least 1,200 cubic ft. of space, and there is no object in having the floor space larger than necessary, whilst the cost of bedding will be proportionately increased.

The War Office require 1,500 cubic ft. in cavalry stables, with more space for officers' stables, and loose boxes.

There is no doubt that straw looks best in a stable, and horses which lie on it are more easily kept clean than those whose coats get ingrained and stained with moss-litter; and although the latter is said to keep the stables purer, I believe that a stable which has good paving and efficient drainage and ventilation can be kept quite as healthy where straw is used.

A point that is too often forgotten is that the food of a horse should be carefully stored.

The position of the corn-chamber and hay-loft depends largely on the nature of the site, but the arrangement should be convenient for the cutting, bruising, and mixing of the fodder.

It is generally found most convenient to have a space on the stable floor, and even when such accommodation is provided on the upper floor, one often finds an empty stall or box utilised for this purpose.

A truss of new hay or straw occupies about 11 cubic ft. of space and a cubic capacity of 305 ft.—i.e., 8 ft. 3 in. by 8 ft. by 6 ft. in height will give a floor space of 66 ft., which will be sufficient to hold thirty-six trusses, or exactly one load of hay.

\* A paper read at a meeting of the members of the Architectural Association Discussion Section on Friday, October 18, 1901.

Computing the daily consumption per horse to be 16 lbs., this would provide storage for 135 days. Old hay weighs 50 lbs. and new hay 60 lbs. per truss, and the size varies between 3 ft. by 2 ft. by 1 ft. 3 in. for the former, and 3 ft. by 2 ft. 6 in. by 1 ft. 6 in. for the latter, or 7.5 cubic ft. and 11.25 cubic ft. respectively.

From about 8 to 10 lbs. of oats or mixed corn, according to the size and work required of the horse, per diem is considered sufficient.

Oats weigh from 38 to 40 lbs. per bushel, and a bin measuring 6 ft. by 6 ft. by 3 ft. in height will hold about eighty bushels.

#### Arrangement and Planning.

In selecting a site for country house stables on a large scale, and stud farms, the utmost care should be taken to place such buildings in a warm, dry, and well-sheltered situation; convenient to the residence, or in the case of a stud farm, to the groom's house and the home farm; and in the latter case a suitable position would be off a roadway leading to the farm buildings, with the groom's house on one side, if possible facing south. If you can take advantage of a wood or plantation to shelter your buildings from the north and east winds so much the better.

The buildings may take various forms of plan as circumstances may govern, but for all first-class stables on a large scale the quadrangular or an oblong form appears to be the best and most suitable; and by placing the back of your buildings to the north you secure the maximum amount of sunshine to your yard and boxes.

The administrative department, such as the coachman's residence, sleeping-room for grooms, harness and fodder rooms, should be in a central position and easily accessible from the stalls and loose boxes. Where there is plenty of room for the yard, as in the country, it will be easy to dispose your rooms to the best advantage as regards aspect; but in London, where you are cramped for room, great care is required in planning, but I have found cases of well-planned stables for a large number of horses in towns.

If possible it is better to do without rooms or lofts over stables, but where they are necessary the floors should be of concrete, for if the grooms' rooms are immediately over the horses, and with wooden floors, the noise is liable to be disturbing at night; and in the case of the hay-loft being over the stable the forage is likely to be contaminated.

The size of the ordinary stable, such as I have mentioned as suitable for the professional man, may be arrived at by the cubic measurement necessary for the number of horses it is to hold.

For the stalls a minimum width of 16 ft. 6 in. is sufficient for a stable with a single row of stalls, which gives 9 ft. 6 in. for the division and 7 ft. passage-way at the heels, 6 ft. 2 in. centre to centre of divisions and a height of 12 ft. to the ceiling. This provides a cubic space of 1,221 feet per horse.

In the case of stables with a double row of stalls, width of 29 ft. and a height of 12 ft. allows 1,073 cubic feet per horse.

If the lofts be open, 27 ft. is sufficient for the width of stable, with a height of 10 ft. 6 in. to the under side of tie-beam. This gives 1,200 cubic feet per horse.

A combination of stalls and loose-boxes under the same roof is the arrangement generally adopted.

For loose-boxes, 12 ft. by 12 ft. by 12 ft. high gives 1,728 cubic feet.

For sick-boxes, 14 ft. by 12 ft. by 12 ft., 2,016 cubic ft., and a minimum area of 14 ft. by 11 ft., or 121 feet superficial, should be given to each loose-box.

The War Office are more generous, and make their ordinary boxes 14 ft. by 13 ft., and sick-boxes fitted with "slings" 16 ft. by 13 ft. deep.

Boxes for hunters should be at least 12 ft. by 12 ft., and for mares foaling 15 ft. by 15 ft., or thereabouts.

I have not included racing stables, or such large buildings as omnibus and tramway stables, as each would require more time than that allotted for my paper.

In designing town stables it is always a difficult matter to obtain as much frontage as can be got in the country, and it is generally necessary to have the depth at right angles to the frontage, whereas in the country the length may be parallel to the frontage, thereby allowing more light and better means of ventilation.

#### Paving and Draining.

All paving should be water-tight, durable, and non-slippery, and these conditions are most nearly filled by the use of the adamantine clinker bedded on concrete, not less than 6 in. thick. Before the concrete is laid the utmost care should be taken to ensure that the surface of the ground is solid and levelled to the proper falls.

The adamantine clinkers are 6 in. by 1 1/2 in. by 2 1/2 in. deep, with chamfered edges, have a sandy surface and of a buff colour, which gives the floor a brighter appearance than when paved with vitrified bricks. The grooves in paviors are made semicircular, and those with the grooves crossing them diagonally, so that the brick may be laid transversely whilst the drainage will take a diagonal course towards the central channel.

In cavalry stables good cement concrete paving is found to answer most advantageously, but the stables should not be taken into use for three months after it has been laid, so as to give it ample time to set hard.

The floor of the stalls should have a fall of not more than 1/4 in. in 10 ft., and the passage at the back should have a slope of 1 in 40 to centre of channel. The stable floor should be 2 in. above the level of yard.

A greater fall than 1 1/2 in. in the length of the stall is not only unnecessary, but it puts a strain upon a horse and affects those which do not lie down to sleep. And I have frequently observed horses resort to all sorts of positions, sometimes right across the stall, in their endeavour to stand easily. Some owners of horses contend that the paving should be perfectly level, and for this purpose an iron gutter with a perforated top is designed with a slope in the bottom of 1 in. to 1 1/2 in. in the length of the stall.

Both stalls and loose boxes should be free from traps or gullies, and the channels should discharge into traps in the open.

The herring-bone pattern of paving, to my mind, gives the most pleasing effect for passages, yards, and coachhouses.

Stock bricks and granite cubes are sometimes used, but the former are too soft for prolonged wear, and the latter share the disadvantage with the vitrified bricks of becoming slippery with wear.

But no description of paving can supply a floor that will do without brushing and washing, and it is impossible to have a sweet and healthy stable unless the litter is removed once a day and the channels thoroughly washed down.

#### Ventilation.

It is always desirable to have plenty of light—say at least 9 ft. super of glass space per horse, and if possible to design your window openings at a sufficient height, not less than 7 ft. above the floors. They should be placed opposite each other, and made to open by being hinged at the bottom and falling inwards, so that through ventilation may be obtained and the windows opened or closed as the temperature of the stable may necessitate.

Hopper ventilators may be used for this purpose. It is quite an exploded notion that dark stables are conducive to putting on flesh; on the contrary, defective sight, causing shy and ill-health, are the result.

When it is not possible to obtain windows on either side, Sherrington ventilators should be used for the inlet of fresh air, and a course of air-bricks, about 1 ft. 6 in. above the floor, at the head of the stall, and for the extraction of foul air gratings should be fixed at or near the ceiling level, discharging into air ducts, and carried to the ridge level by a vertical shaft, which should have an extract ventilator at the apex. The gratings should have an inlet area of 54 square inches per horse, and the vertical shafts at least 18 square inches per horse.

A fanlight over the stable door is desirable, and answers far better than louvres, as it can be closed on cold winter nights, as a recuperative process is always going on by the natural pressure of the atmosphere through crevices and under the doors, thus causing the circulation of the gratings in the ceiling; but this is not always sufficient, and it is necessary to provide means of admitting fresh air as above described by means of ventilators and gratings.

The temperature of a stable should average between 50 deg. and 60 deg., and to a great extent the automatic action of the ventilators can be depended on, whilst a careful attention to the prevailing wind and the pressure of

the atmosphere by the opening and closing of doors and windows will result in an even and healthy temperature.

For loose boxes when the roof is open lanterns with fixed louvres may be used, and thus form an agreeable feature in the elevation.

#### Details and Fillings.

All sharp corners liable to injure the horses should be avoided, as well as all projections in the nature of mouldings internally. The external angles of masonry and the outside edges of door jambs, where the doors are not hung flush with the external face of the wall, in which case the inner edges should be rounded to a height of 8 ft., and in the case of brickwork this can be done by the use of bull-nosed bricks. These bricks can also be used for window-sills, where the openings are so low down as to make them dangerous to passing horses, by the use of the ordinary square projecting stone sill.

If the walls are plastered or rendered in cement, a washable distemper of an agreeable tint may be used. Where a matchboard dado of elm or other hard wood is preferred a border of tiles above has a good effect, but they should not be glazed, as I am of opinion that the glare of light on the shiny surface is neither good for man nor horse. A neat-struck and fair joint for brickwork and the wall whitewashed looks clean and is healthy. The custom of colouring brickwork is objectionable.

The entrance door should be in two heights, and hung to open outwards—unless made to slide—with a fanlight over for ventilation, and the opening should not be less than 8 ft. high, 4 ft. 6 in. in width.

The external doors to loose boxes should have an iron grille fitted to the upper half of opening fastened with a flush spring catch, and hung to fall outwards. The internal doors to loose boxes should be 3 ft. 8 in. wide, and hung to open outwards or to swing both ways, but should not be made to open inwards only, as a horse generally takes up his position directly inside the door, and thus prevents its being opened.

Horses are separated in the stable either by wooden divisions technically known as traversers, by bales, or by poles, the latter being chiefly used in cavalry stables.

The general plan adopted is that of a wooden division with an ornamental heel post and a wrought iron ventilating ramp on the top.

A sill with a groove is fixed at the bottom to receive the boarding or cleating as it is termed, 1 1/2 in. thick of well-seasoned oak, elm, teak, pitch pine, or red deal, fixed vertically into an intermediate iron rail which takes the under-side of the ramp.

Plain wooden divisions without the ramp should be 4 ft. 6 in. high at the heel post, and 7 ft. at the head. The heel post may be of iron or wood carried up to the ceiling and strongly fixed and bedded in concrete at the base.

Where an iron ramp is used, the intermediate rail should be fixed at a height of 4 ft. 3 in. from the floor, and the ramp should be about 6 in. at heel post, and 2 ft. 6 in. high at the head. The height of the middle rail being only 4 ft. 3 in. high brings the horses into close proximity, and it is necessary to have a close panel of wood lined with sheet-iron for a distance of 3 ft. 6 in. from the head.

Portable divisions, with clutch-boxes for fixing, are sometimes fixed with the advantage of converting two stalls into a box.

Safety bars are useful, as they prevent horses which have got loose at night from injuring themselves by over-feeding, and others by kicking.

The pillars of loose boxes and heel posts of divisions should be about 4 1/2 in. in diameter, with ornamental heads in brass or cast-iron, and the rings for pillar chains which are fixed on the front of the post or on either side, may be of brass or wrought-iron.

Loose-box partitions are similar to the stall divisions, and differ only in the top rail of the ramp being level instead of curved. The iron ventilating panels should be deeper in the front and door than in the partition. The pillars may be stiffened by the use of a wrought-iron bar in the form of an arch connecting the two. But the plainer the posts are made the better, and they should be firmly bedded in the concrete beneath the paving.

Wrought-iron work is preferable to cast-iron, but requires to be galvanised or frequently

painted, as all ironwork is largely affected by the salts of ammonia.

Brewers' and omnibus companies' stables are usually divided by means of bales. These are suspended at one end from poles, secured by cleats to the upper surface of the tie beams, running the whole length of the stable or from a hook in the ceiling. At the manger end each bale is attached by a wrought-iron link, and protected by sheet iron for a length of 3 ft.

They are made of elm or oak 2 in. thick and 1 1/2 in. deep. The upper bale is usually 8 ft. long, and suspended 2 ft. 1 1/2 in. above the floor to the underside, and the lower bale 4 ft. long, with a space of 3 1/2 in. between, and bolted together by 1/2 in. iron bolts.

The use of bales can only be tolerated on the score of economy of space, and they are frequently interspersed with divisions. They are soon worn out and become destroyed, and are dangerous, as horses get their legs over them when kicking, so that they should always be provided with safety hooks for the quick release of the horse.

For farm stables, &c., a plain manger of oak or elm, bound on the outer edge with sheet-iron, is the most economical, and may be considered the most suitable. They should be fixed at a height of 3 ft. 7 in., should be 12 in. deep, and can be fixed on brick corbels or manger posts, and should have iron bolts to secure them to the wall. These bolts should run through the manger, and so prevent the horse from throwing out his food with his nose.

These mangers, though fulfilling the requirements of strength and economy, are not suitable fittings for a first-class stable, and for this purpose there are a variety of designs manufactured in cast-iron, with rounded edges.

The generally accepted design is that with the corn-trough and hay-rack at the same level, and with the rack in this position the horse feeds comfortably, and without the hay-seeds falling into his eyes. Much attention has been given to mangers with the view of protecting the horse from injuring his head by getting it under its fittings, and for this purpose stout boarding or concrete is sometimes carried down to the floor, and a manger is manufactured with a guard of wrought-iron bars carried down to the floor level from the manger plate.

This arrangement also prevents the bedding being packed underneath the manger instead of being properly cleared out of the stall each day.

Corner fittings are usually fixed in the angles of loose boxes.

Halter-tying weight-boxes should be fixed beside the manger in the loose box and beneath the manger in the stalls.

Dressing rings of wrought-iron or brass should be fixed on either side of the stalls, and also on the walls externally.

Where the walls are not cemented or boarded, and the brickwork is left bare, it is necessary to provide kicking plates of elm or oak 1 1/2 in. thick, about 4 ft. high and 5 ft. long, from the end of the stall. In some cases mats are hung over the backs of the stalls to deaden the sound of kicking and prevent injury to the horses' heels.

The harness-room should be fitted with a stove, and a supply of hot water being often necessary it should have a back boiler, from which also a row of hot-water pipes may be taken to warm the coachhouse.

For keeping bits, curb chains, spurs, and ornaments, especially those of steel, it is necessary to provide a cupboard with a glazed front and lined with cloth. Their fitting should be placed over the fireplace or against an inner wall. A stout deal table, a saddle-horse, saddle-irer, and girth-stretcher should also be provided.

The following brackets may be of ornamental cast iron and firmly fixed to a wooden rail:—

*For Saddlery.*

- I. No. 1 ladies' saddle bracket.
- II. No. 1 gentleman's saddle bracket.
- III. No. 1 stirrup bracket.
- IV. No. 1 girth bracket.
- V. No. 2 bridle brackets.

*For Driving Harness.*

- VI. Single-harness pad bracket.
- VII. Double-harness pad bracket.
- VIII. Collar brackets.
- IX. Martingale and crupper bracket.
- X. Rein and crupper bracket.
- XI. Bridle brackets.
- XII. Harness brackets.

The coachhouse doors should be made to open outwards if hinged, and with Collings's hinges locking bar and stops. They may be made to slide on runners or the opening may be closed with a revolving iron shutter. Either of these arrangements is more convenient than a centre post.

A fanlight over the door may be sufficient for lighting purposes, but care should be taken to properly ventilate the coachhouse.

In some cases where extra accommodation is required it may be necessary to construct a basement, when the carriage may be lowered or raised by an elevator.

The corn should be stored in a wooden chamber, and in large stables a special granary is constructed, apart from the stable, with an air space beneath the floor, and bins constructed for the reception of the corn.

Galvanised iron bins of various sizes, with sloping lids, may be provided in small stables.

The Winchester bushel, which was formerly the standard for England and originally kept at Winchester, was measured by a law of King Edgar and observed throughout the kingdom. It contained 2,150.42 cubic inches. The imperial standard bushel now used contains 2,218.19 cubic inches. The proportion of the latter is about 32 to 33 of the Winchester measure.

Sliding doors are the most convenient for the hayloft, and it will be found the best method to suspend them from a wrought iron rail and secured by a locking bar.

A small hoist will be useful for lifting the sacks of grain or trusses of hay to the upper floor.

The water required for the various purposes may be obtained from a well; but in most cases it will be obtained from the company. A good-sized cistern should be provided.

Gas is most generally used for lighting, and care should be taken to fix the brackets or pendants high enough to be out of the way of the traffic, and with wire domes.

In conclusion I must say that I have purposely omitted any reference to the architectural treatment of the buildings, and may here remark that it is much better to design with taste and build with strength than to attempt the cheap and nasty.

Nothing causes so much displeasure and dissatisfaction as jerry-built work, which is continually requiring repairs, and is thus a constant source of annoyance and expense. So that if our stable is to prove a success it should be well planned, well built, thoroughly dry and wholesome, and properly drained, and efficiently lighted and ventilated.

#### ARCHITECTURAL SOCIETIES.

GLASGOW INSTITUTE OF ARCHITECTS.—The annual general meeting of this Institute was held on the 15th inst. Mr. John James Burnet, President, in the chair. The President, in moving the adoption of the annual report, said the year had not been without its share of responsibilities, but he believed the Institute was becoming more and more aware of the exact nature of its responsibility as one of Glasgow's corporate bodies, and was becoming recognised as capable to advise in its interests. It was with pleasure that he had to record the very kindly reception which had been given to the circular which was issued in the early part of the year soliciting from the members some financial support for the building fund of the college. That an institution offering educational facilities not only in the practice of architecture, but in all crafts—he would not say depending for their position on architecture, but largely depending for any artistic development of their practice on the profession—should not, in the constituent parts of its governing body, include architects seemed a gross error, but he believed that this was being recognised by those in authority, and that it might ere long be put right. In their relation with the tradesmen, or craftsmen as he preferred to call them, they had endeavoured to hold their position as neutrals; and though they had not given that prompt response to their request to consider with them a form of contract, it was primarily because it was felt that little should be done to interfere with the liberty of each man, either on the one side or the other, to enter into such a form of contract as might seem to him most suitable in the particular circumstances; and, above all, it was particularly necessary, in a large industrial and commer-

cial centre like Glasgow, to avoid anything that might be looked upon as purely parochial, and might militate against the freedom of tendering by those who were outside their boundaries. In skill their craftsmen had nothing to fear from outside competition, and they could best help them and their clients to a clear and concise contract by clear and concise drawings and descriptions of their designs. The Institute had again endeavoured by revising its suggestions for competitions to make them more useful to the public, and likely to result in able men submitting designs; but it had done so only as recognising the competitions as a seemingly necessary evil, and hoping that the public would ultimately recognise that it was not the best way to get "light and leading," and that the only ultimate competition, amongst those who were to be their advisers, was the competition amongst men in their daily work to earn their confidence, and not by a submission of their work which, from its very nature, if it was to be of any real use to them, could only be judged under expert advice. The Institute was convinced that architecture, in the true sense of the word, could only be good when it was the result of close personal consultation between the architect and his client, between whom the structure would grow consciously fit for its purpose and unconsciously artistically effective. One of the most interesting events of this year's work had been the position which the Institute felt itself obliged to take in reference to the reconstruction of one of Glasgow's most important public and charitable institutions. It was with very great regret that the Institute felt obliged to bring the result of the Royal Infirmary competition before the public of Glasgow, and seemingly to stand in antagonism to that body of gentlemen who so freely and generously gave so much of their time to the public service connected with the management of such institutions; but surely, if the Institute had any public duty whatever to perform, it was that of placing before the public any matter within its technical knowledge in which it felt they were being misled. No personal regard for such gentlemen should be permitted to influence its expression of opinion. In this instance the question was a very vital one, and one in which the public were entitled to the very best technical advice that could be obtained. What the Institute pleaded for, and asked the public to demand, was that such technical advice should be taken before they (the public) were led to support a scheme which, in its opinion, if carried out as at present proposed, could only lead to a very heavy first cost, enormous annual expenditure, and gross inefficiency for the purpose in view. The Council for the ensuing year was elected as follows:—Messrs. Alex. Petrie, John Jas. Burnet, James A. Morris, David Barclay, W. Forrest Salmon, A. N. Paterson, John Keppie, H. K. Bromhead, James Lindsay, N. Macwhannell, Campbell Douglas, T. M. Watson, J. M. Monro, Alex. McGibbon, A. Balfour, Jas. Miller, and John A. Campbell. Mr. John Keppie was elected a representative on the Joint House Committee.

#### TRIBUNAL OF APPEAL CASE:

##### THE LAYING-OUT OF NEW STREETS.

THE Tribunal and Appeal under the London Building Act, 1894, sat at the Surveyors' Institution on Monday to hear an appeal by Mr. A. Cameron Corbett, M.P., under Sections 9 and 10 of the Act, against the order of the London County Council, dated July 16, refusing to sanction the formation and laying-out of a new street for carriage traffic out of the west side of Torrion-road, Hither Green, on the St. Germans estate. The members of the Tribunal present were Messrs. J. W. Penfold (Chairman), A. H. Hudson, and A. Gruning. Mr. Cuningham Glen, barrister, appeared for the appellant, and Mr. Andrews, from the solicitors' department of the London County Council, for the respondents.

The case for the appellant was somewhat on the same lines as that advanced in the Forster appeal, heard a few weeks since by the Tribunal. The appellant is the owner of the St. Germans estate of nearly 300 acres, which has been developed within the past five years, and he now proposed to lay out the land at the western end of the estate for building purposes. The City Council objected because of the absence of direct communication between this and the Forster estate; but in the appeal Mr.

Glen pointed out that one end of the proposed road communicated with Torrion-road and the other with Killearn-road, which were both open for carriage traffic. There was thus, he contended, "direct communication."

Mr. Hudson's suggestion and the hearing of the appeal should be adjourned pending the preparation of a plan dealing with the estate as a whole, but after considerable discussion it was decided to go on with the case.

Mr. Andrews said this was a case in which the Council felt called upon to ask, on behalf of the future residents of the district, that the roads and streets should be laid out on a general plan, with due regard to the requirements of the whole rapidly-developing neighbourhood rather than isolated estates. They were taking their stand upon a high principle. The respondents' case was, he argued, covered by the judgment in *Woodham v. the London County Council*, in which case the Tribunal had decided that very similar formation of roads was not direct communication within the meaning of the Act, and on a special case being stated for the High Court that view was upheld. Therefore, it was for the convenience of both persons laying out estates and persons interested in the matter that there should be consistency in dealing with these things. The explanation of the Council having approved of a somewhat similar formation with regard to Killearn-road was that it was part of a large scheme, and if it had come before the Council as an isolated application it would not have been approved any more than the principle of the application now before the Tribunal would be approved. Mr. Andrews also cited the case of the Hendon Local Board *v. Pounce* to show that if the result of requiring direct communication was that the land could not be laid out for building purposes, that was no real answer to the objection.

In the result the Tribunal allowed the appeal, on the condition that a strip of land about 230 ft. long by 40 ft. wide, running eastward from the southern end of the proposed new road, should be reserved unbuild upon for future extensions of the road.

**APPLICATIONS UNDER THE LONDON BUILDING ACT.**

The undermentioned applications under the London Building Act were dealt with by the London County Council on Tuesday. Unless otherwise stated consent was given. The names of applicants, &c., appear in parentheses—

*Working Class Dwellings.*

**Lambeth, North.**—Three blocks of intended dwelling-houses, to be inhabited by persons of the working class, and proposed to be erected, not abutting upon a street, on a site between Gloucester-street and Burdett-street, Lambeth; and of two blocks of intended dwelling-houses, to be inhabited by persons of the working class, proposed to be erected on the north side of Burdett-street and south side of Gloucester-street respectively, with irregular open spaces at the rear, and the boundary fences of the site at less than the prescribed distance from the centres of Gloucester-street and Burdett-street (Mr. S. Bircham).

*Lines of Frontage and Projections.*

**Woolwich.**—Houses with projecting one-story shops and bay windows, on the eastern side of Woolwich-road and the south-eastern side of Greenvale-road, Eltham (Mr. G. F. Logsdall on behalf of Mr. A. Cameron Corbett, M.P.).

**Lambeth, North.**—The rebuilding of Nos. 1 to 38, inclusive, New Cut, Lambeth (Messrs. Clutton on behalf of the Ecclesiastical Commissioners).

**Strand.**—A stone canopy and balcony over the entrance to the Town Hall, Charing Cross-road (Mr. J. Murray on behalf of the Council of the City of Westminster).

**Dulwich.**—The erection of wood and tile pents over the entrances to fourteen semi-detached houses on the west side of Calton-road, Dulwich (Mr. J. H. Cooper).

**Dulwich.**—The erection of a one-story office building on the south side of Thurlof Park-road, Dulwich, next Dulwich railway station (Messrs. Marten & Carnaby).

**Hackney, South.**—One-story shops on part of the forecourts of Nos. 20 to 44 (even numbers only inclusive), Rushmore-road, Clapton (Messrs. Holbrook Brothers on behalf of Mr. Filman).

**Hampstead.**—Three four-story bay windows to a block of residential flats on the site of Nos. 6 and 7, The Mount, Hampstead (Mr. C. W. Matthews).

**Islington, South.**—One story addition with an iron and glass shelter in front of Nos. 399, 401 and 403, City-road, Islington, at the corner of Torrion-street, so far as relates to the construction of a lean-to-roof and skylight on part of the flat roof of such one-

story additions (Mr. D. Hay on behalf of the City and South London Railway Co.).

**Kensington, South.**—An extension of period within which the erection of an addition to No. 12, Summer-place, Kensington, to an advanced line in Old Brompton-road, was required to be commenced and completed.

**St. George, Hanover-square.**—An iron and glass conservatory at the first floor level at 41, Park-lane, Hyde Park (Messrs. Wetherill and Martin on behalf of Lady Meux).

**Kensington, South.**—A one-story addition to No. 67, Marlborough-road, Kensington, to abut upon Scarsdale-villas (Messrs. J. Surrey & Son on behalf of Mrs. M. Surrey).—Refused.

**Westminster.**—An addition in front of No. 9, Trevor-terrace, Knightsbridge (Mr. T. Shilton on behalf of Mrs. Lewis).—Refused.

*Width of Way.*

**Poplar.**—Two sheds at the West India Docks, Poplar, at less than the prescribed distance from the centre of Bridge-road (Mr. T. Hardy on behalf of the Managers of the London and India Docks Company).

*Space at Rear.*

**Dulwich.**—A modification of the provisions of the section with regard to open spaces about buildings, so far as relates to the proposed erection of a house on the south side of Lytcott-grove, East Dulwich, near Melbourne-grove, with an irregular open space at the rear (Messrs. Allen & Hoar on behalf of Mr. G. Branson).

**Whitechapel.**—A modification of the provisions of that section with regard to open spaces about buildings, so far as relates to the proposed erection of additions to No. 131, Commercial-street, Whitechapel, by reason of which additions the premises would have an irregular open space at the rear, and would extend above the diagonal line as directed by Section 41 of the Act to be drawn (Messrs. Still, Wheat, & Luker on behalf of Messrs. Noakes & Frosts' trustees).—Consent refused.

*Width of Way and Lines of Frontage.*

**Strand.**—A factory building on the east side of Martlett's-court, Drury-lane, Strand, at the corner of Crown-court (Mr. H. O. Ellis on behalf of Mr. L. Upcott Gill).

**Poplar.**—A two-story addition to the technical schools, East India Dock-road, Poplar, to abut upon Kerbey-street, with the external walls at less than the prescribed distance from the centre of Kerbey-street (Messrs. J. & S. F. Clarkson on behalf of the Governors of the George Green Schools).

**Brixton.**—A deviation from the plan approved by the Council on April 30 for the erection of a block of residential flats on the site of 400 and 402, Cold Harbour-lane, Brixton, so far as relates to an increase in the height of the proposed building (Mr. F. A. Powell).—Consent refused.

*Formation of Streets.*

**Lewisham.**—A new street for carriage traffic to lead from Blythe-hill, Catford, to Montem-road.—That the name Ravensbourne-road (in continuation) be approved for the new street.

**Lewisham.**—Streets for carriage traffic on the Crofton Park estate on the eastern side of Crofton Park-road, Brockley.—Consent refused.

**Woolwich.**—New streets for carriage traffic to lead from Samuel-street to Prospect-row, Woolwich (Mr. J. Bull).—Consent refused.

**Poplar.**—A new street for carriage traffic to lead from Chapel House-street to East Ferry-road, Poplar (Lady Margaret Charteris).—Consent refused, and as the land upon which the street is proposed to be formed is below Trinity high-water mark, the attention of the local authority, district surveyor, and applicant be called to the provisions of Part XI. of the London Building Act, 1894, with regard to the erection of dwelling-houses upon low-lying land.

**Wandswoth.**—A new street for carriage traffic to lead out of the west side of Gwendolen-avenue, Putney (Mr. J. T. Leander and Mr. S. Taylor).—Consent refused.

**Woolwich.**—A new street for carriage traffic to lead out of the west side of Swingate-lane, Plumstead (South Metropolitan Brick Co.).—Consent refused.

*Height of Buildings.*

**Strand.**—Building on the east side of Martlett's-court, Drury-lane, at the corner of Crown-court, to exceed in height the width of Martlett's-court (Mr. H. O. Ellis on behalf of M. L. Upcott Gill).

*Width of Way and Height of Building.*

**Rotherhithe.**—Factory building on the east side of Tower Bridge southern approach, Rotherhithe, with the external walls at less than the prescribed distance from the centre of Horselydown-lane, and to exceed in height the width of that street (Mr. L. A. Withall on behalf of the Army Clothing and Equipment Co., Limited).—Consent refused.

*Width of Way, Line of Frontage and Construction.*

**Kensington, South.**—A wooden door-frame and doors in front of No. 2, Cranley-mews, Kensington (Mr. A. M. Terrance on behalf of Mr. J. D. Hill).

**City of London.**—An enclosed iron and concrete ganeway across Bull's-head-passage, City, to connect Nos. 93 and 97, Wood-street (Mr. A. Conder).—Consent refused.

*Width of Way, Line of Frontage, and Deviation from Certified Plans.*

**St. George, Hanover-square.**—Certain deviations from the plans certified by the District Surveyor, under Sections 13 and 43 of the Act, so far as relates to the proposed rebuilding of No. 47, Hertford-street, Mayfair, at less than the prescribed distance from the centre of the street, with an irregular open space at rear, and with a projecting porch and an oriel window (Messrs. Hoare & Wheeler).—Consent refused.

*Dwelling Houses on Low-lying Land.*

**Woolwich.**—Six dwelling-houses on low-lying land on the south side of Abbey-grove, Abbey Wood.

The recommendation marked † is contrary to the view of the Local Authority.

**THE GROVE VALE DEPÔT.**

UNDER this title the Borough Council of Camberwell have just opened a large establishment which is intended as a depôt in which the work of the borough could be centralised and the stores and materials required carefully guarded and distributed; and its situation, in the middle of the borough, and in close proximity to the main road arteries, fits it to be the centre of municipal work and activity, and it will, it is hoped, be of the greatest assistance in the endeavour to conduct the work of the borough efficiently and economically. The Grove Vale Depôt is situated upon the north-east side of Grove Vale, almost opposite the East Dulwich station of the London, Brighton, and South Coast Railway.

The depôt premises are divided into three portions:—

(1) The main depôt; (2) a plot of land lying between the approach road and the railway embankment, which is used for the storage of materials for road-making and other purposes; and (3) two houses with stable for the outdoor superintendent of the district, and the foreman harness-maker, who is employed in the depôt.

The main depôt buildings have been erected from the designs of Mr. William Oxtoby, the Borough Engineer. The builder is Mr. H. L. Holloway, of Union Works, Church-street, Deptford, whose contract for the entire work, amounting to the sum of 28,195*l.*, was accepted by the last Vestry. The clerk of works, Mr. H. Castle, has supervised the execution of the work on behalf of the late Vestry and of the Borough Council.

The stabling consists of two blocks, 91 ft. 3 in. by 32 ft. each, and 12 ft. high. Each block contains stalls for nineteen horses and four loose boxes. The floors are laid with clambered adamantine clinkers, the walls lined with glazed bricks. The eight loose boxes are all 15 ft. 4 in. by 9 ft. 4 in., and each is provided with a separate doorway to the yard.

The stall and manger fittings have been furnished by Messrs. Musgrave & Co., of Belfast and London. In fitting up these stables, the health, safety, and comfort of the horses were the points to which particular attention was given. The stall divisions and loose box enclosures are very strongly made, being practically unbreakable. The heads of the divisions are fitted with solid iron panels to prevent the horses annoying one another while feeding, and the remaining part of the divisions is fitted with open panels to allow of free ventilation throughout each range of stabling. The halter tyings are noiseless, and are arranged in such a manner that when the animal is feeding or lying down there is practically no weight dragging at his head, the whole weight being taken off by means of an automatic stopper.

The cart sheds, one 100 ft. by 40 ft., and one 80 ft. by 48 ft., are fitted with pitch-pipe bumpers and also stand posts and valves for flushing purposes. There is room for eighty carts and vans. The floor is paved with asphalt and the walls lime-whited.

The fodder and corn store and machinery connected therewith take up a portion of one block, and is a four-story building. The whole of the walls are lime-whited. The machinery has been provided and fixed throughout by Messrs. Phillips & Son, of Reading. This includes a gas engine of 20 h.p., used for operations connected with the crushing of the corn, the cutting and sifting of chaff, and mixing of fodder; a bagger is used for the automatic filling of sacks, and a crushing mill for oats and beans, a grain elevator, an automatic mixer and weigher, a chaff sifter, and a chaff elevator.

The workshops and machinery block has in the centre thereof an elliptical archway, 30 ft. wide, formed to provide a cartway for the horses and vehicles. Upon the west side of the archway are four shops floored with granolithic, one for smiths' work, one for farriers', and two for wheelwrights'.

On the east side of archway are the gas meter room, containing also apparatus used for the high pressure gas incandescent system; the gas engine room, containing a Crossley's "Otto" gas engine, used for driving the machines in the machine shop hereinafter described. In this block also are the cement store and the machinery shop.

The whole of the machinery is kept on the ground floor, the advantages of which are sufficiently obvious. The front of the block is built of blue Staffordshire bricks, 4 ft. 6 in. high, and red glazed bricks above to first floor, beyond which stock brickwork is used, with blue Staffordshire brick arches. The whole of the shops are provided with incandescent lanterns and brackets, for use when artificial light is required.

Another block contains the general office, weigh bridge office, the weigh bridge, and the harness-making room. A large quantity of the new harness and all the repairs are executed upon the premises, and ultimately all the harness required will be made by the Council's workmen. On the first floor are the committee-room and lavatory.

All the lamps that are fixed in the yard and stables are fitted upon the patent high-pressure incandescent lighting system. The apparatus, as before mentioned, is situated in the gas-meter house, and occupies only about a square feet. It is entirely automatic, and to start the machine it is only necessary to light the burners. The machine stops working when the lights are extinguished. The depot is connected by telephone with the Town Hall, from which, by means of the switchboard, communication can be obtained with the trunk and metropolitan lines and also with all the other depots of the borough. The office and committee-room are also connected by telephone.

There are three fire hydrants in the yard, provided with sufficient hose to cover any portion of the premises. There is also a complete arrangement of electric fire-alarms in each building, which communicate underground with a central indicator in the cartway under the workshops.

It is intended that Grove Vale Depot shall be the centre of municipal work. It will contain the central stores, and no articles of any description will be received at any other depot or place in the borough without passing through the stores department at Grove Vale Depot.

The depot was formally opened on Monday, the 21st, by the Mayor, Councillor Matthew Wallace, Esq., J.P., &c. There were present several of the Mayors, Chairmen of the Works Committee, and officers of the various Metropolitan and surrounding boroughs, as well as the members of the Camberwell Borough Council.

## Correspondence.

### "LUX-CALOR" STOVES.

SIR,—In your last week's issue, in the notice with which you favour our new price-list of the "Lux-Calor" stoves, you take exception to our claim that these stoves do not in any way pollute the air of the building in which they are used.

The claim is, however, a perfectly just one if the stoves are fitted as we wish them to be, i.e., with a small tube attached to the exhaust at the bottom of the stove and led to the outside air. Then all the waste products—condensed water, carbon dioxide, &c.—pass away completely. If the stoves are not fitted in this way it is because the consumer will not incur the small extra expense.

RITCHIE & CO.

\* \* \* This provision for the removal of the combustion products is equivalent to the use of a flue, and we see no objection to the use of condensing stoves fitted in this manner in schoolrooms, provided that efficient ventilation is secured by other means. It is well to remember that the organic matter contained in animal respiration products is more dangerous to health than any constituent in the products of the complete combustion of gas, and one of the duties of a good open gas or coal fire is to assist in the removal of polluted air from an inhabited room by increasing the rate of flow of air up the chimney at the same time that it is emitting into the room a constant current of radiant heat. An electrical heater in an unventilated schoolroom would be subject to the same objection as a condensing stove fitted in the manner indicated by our correspondent. Both are harmless in themselves, but neither constitute ventilating agents.—Ed.

### GAS AND GAS FITTINGS.

#### 17.—GAS-ENGINES. GAS-HEATED INDUSTRIAL APPLIANCES.

**GAS-ENGINES.**—Gas-engines are now extensively used in all large towns for driving circular saws, lathes, drills, and all the tools to be found in carpenters', engineers', or smiths' workshops which are capable of being worked by mechanical power. For these purposes engines of low horse-power are used, while the larger engines are principally employed for driving dynamos for the generation of electricity.

The practical utility of the gas-engine may be said to date from the year 1876, when the Otto engine was introduced into this country, but for a long period after this date it was thought to be impossible to construct gas-engines of high horse power. Within the last ten years it has, however, been discovered that by improving the design of the cylinder liner, the piston, and the valves, so that they may all be efficiently water cooled, engines of almost any power may be constructed. Quite recently the American Westinghouse Company have constructed an engine of 1,500 B.H.P. (brake horse power) for use with the natural gas found in the United States, and it is believed that it will be possible to make them of fully double this power.

In this country the greatest number of engines are used with ordinary town (illuminating) gas, and are of low power. Many of the gas companies allow a considerable discount when a large quantity of gas is used in the day time for power purposes, and the small ground space occupied by gas-engines as compared with steam-engines is a factor of considerable importance in large towns. According to Mr. Bryan Donkin the number of gas-engines in use in the United Kingdom at the commencement of the year 1897 was 25,700, of which 4,600 were working in London, and the engines varied in size from half-man power to 100 h.p. Of these 50 per cent. were estimated to be below 5 nominal horse-power, and 25 per cent. between 5 and 10 h.p., the remaining 25 per cent. being larger sizes. A considerable increase has, however, occurred since 1897 both in the number of gas-engines employed and in their power. The use of cheap power gas, such as Mond gas, Dowson gas, or water gas, is rapidly extending, with the result that even large steam engines of several hundred horse-power are gradually being rejected in favour of engines driven by gas. Messrs. Brunner, Mond, & Co., for example, have gas engines of 500 and 650 h.p. respectively working in connexion with their electrolytic plant in Cheshire, and several municipal authorities are using gas-engines of over 100 h.p. for the generation of electric light.

The cost per brake horse power of running a gas-engine varies with the price of the gas, the heating power of the gas, the description of gas-engine employed, and the size of the engine; but the following table may serve to convey an approximate idea of the working cost of one of 10-h.p., taking town coal-gas at 3s., water-gas at 4d., and Mond gas at 3d. per 1,000 cubic feet:—

	Heating value of gas, B.T.U. per c. ft.	Gas consumed per h.p. per hour. C.ft.	Cost per h.p. per hour. Pence.
Town gas ...	624	20	0.72
Water gas ...	304	40	0.16
Mond gas ...	155	80	0.24

Water gas can be manufactured by the Dellwig process at a cost of about 3½d. per 1,000 cubic feet delivered in the gasholder. The water gas plant does not occupy much ground space, and where not less than 500,000 cubic feet are consumed per day the gas can be manufactured and consumed on the works, in lieu of town gas, with great economy; but water gas cannot be distributed over large areas at so low a cost as 3½d. or 4d. per 1,000 cubic feet.

Mond gas has only about one-half the heating value of water-gas, but can be manufactured at a cheaper rate. Parliament has recently sanctioned the formation of a company to undertake the supply of Mond gas, or other similar fuel gas, to a number of towns in Staffordshire at a maximum price of 3d. per thousand cubic feet to consumers taking not less than 16 million

cubic feet per annum, and 4d. per 1,000 cubic feet for those consuming less than this quantity. The company may refuse to supply any consumer requiring less than 4 million cubic feet per annum. Whether Mond gas is as suitable for distribution for power purposes as water-gas is a matter of dispute, but should the operations of the Mond Company prove a financial success there is little doubt that the use of steam as the motive power for stationary engines of less than 100 h.p. will soon be almost completely abandoned in this country.

**Steam versus Gas.**—Although, even with the best modern gas-engines, from 70 to 75 per cent. of the heat developed by combustion of the gas is lost, the proportion of heat wasted by the employment of steam-engines is yet greater. Bryan Donkin gives the following table of heat efficiencies, heat efficiency being the ratio of heat turned into work to the total heat received by the engine.

#### Percentage Proportion of Heat Converted into Work.

Agent Employed to Work Engine.	Engine of 100-h.p.	Engine of 50-h.p.	Engine of 10-h.p.
Steam ...	12.5	8.3	4.0
Lighting gas ...	25.5	23.1	21.2
Water gas ...	23.5	18.7	13.3
Dowson gas ...	23.5	18.7	13.3

The proportion of heat converted into work by a 100 h.p. gas-engine is therefore about double that converted by a steam-engine.

**Gas for Electric Lighting.**—Gas-engines of from 6-h.p. to 14-h.p. are extensively used for driving dynamos for private electric-lighting installations; while gas-engines of over 100-h.p. are used for municipal electric-lighting stations, a cheap fuel-gas being in the latter cases manufactured on the works. Gas-engines of high power driven by town gas are more costly than steam-engines, but when cheap power gas can be obtained as a fuel steam is the more expensive. Town gas as at present supplied is of too costly a quality for economical use as a fuel, and there is little doubt that in the immediate future the gas consumers in every part of the country will demand the supply of a cheaper lower grade gas which may be economically used in place of coal for fuel purposes, the heating power of the gas being carefully tested daily by official gas examiners.

In view of the fact that gas is in many cases the most suitable agent for generating electricity, it has been proposed that electricity shall in general practice be supplied from the same works as gas, and the gas companies of Walker and Wallend and of St. Albans have already obtained powers from Parliament which enable them to supply electricity in addition to gas.

**Gas Engines for Trams.**—Gas has been successfully applied for driving trams at Blackpool, Dessau, and elsewhere, the cost of traction being less with gas than with horses. The gas is compressed under a pressure of about 90 lb. per square inch in cylinders which are placed beneath the platforms of the cars, and a compressing station is provided at one end of the line to enable the cylinders to be recharged at the end of each journey.

**The Otto Cycle.**—The mechanism of gas-engines constructed by different firms varies considerably in design, but most of the engines at present in use work upon what is known as the "Otto" cycle. Each cycle is completed in two revolutions, during which only one impulse is given to the piston. The following are the four operations comprised in each complete cycle:—

- |                       |   |
|-----------------------|---|
| First revolution ...  | 1. The outstroke of the piston draws in air and gas.                        |
|                       | 2. The instroke compresses this charge.                                     |
| Second revolution ... | 3. The ignition is effected, causing explosion and expansion.               |
|                       | 4. The products of combustion are driven out by the instroke of the piston. |

In England the ignition of the explosive mixture of gas and air is usually effected by means of a Bunsen flame, but on the Continent an electric spark is commonly employed.

**Gas for Industrial Appliances.**—Gas is already employed as a fuel in a great number of industries, and when a supply of cheap gas

\* Dowson gas closely resembles Mond gas in composition and heating power.

Fig. 43—Heater for Soldering-irons.

Fig. 44.—Self-heating Soldering iron for Leaded Window Makers.

Fig. 45.—Glue-pot Stove.

is substituted for the existing costly supply, it will be yet more widely adopted. Mr. Thomas Fletcher, the pioneer in the work of adapting gas to industrial requirements, has already successfully introduced gas furnaces for enamelling, for hardening and tempering steel used for cycles, for glass-working, for gold-refining, and a host of other purposes. He has also adapted gas to many appliances of comparatively minor importance, such as blowpipes, soldering irons, and drying ovens. A vast number of ovens heated by gas for japanning work are now in operation in all parts of the country, and especially in the districts devoted to the manufacture of bicycles, the ease with which the temperature of these ovens can be adjusted to suit the description of varnish to be dried being a factor greatly in their favour. There is practically no limit to the use to which gas can be applied, but among the gas appliances already largely used in connexion with building may be mentioned gas-heated lacquering tables, blowpipes for brazing, heaters for soldering irons (fig. 43), self-heating soldering irons for leaded window makers (fig. 44), and glue-pot stoves (fig. 45), which can be made to maintain any number of glue-pots at the required temperature at very small cost.

**Gas for Lead Burning.**—It was at one time believed that the fusion of the edges of lead sheets in cisterns and acid chambers could only be performed by the aid of hydrogen, but it has since been found possible to perform the work equally well with coal-gas. The blow-pipe jet must be small, and a comparatively high pressure must be obtained with the aid of a small foot-blower. When coal-gas cannot be conducted by a pipe to the field of operations, cylinders containing compressed coal-gas may be employed.

OBITUARY.

MR. THOMAS LAWRENCE.—Last Monday week, October 14, the death took place, at the age of seventy-seven, of Mr. Thomas Lawrence, founder and senior partner of Messrs. Thomas Lawrence & Sons, of Bracknell. The firm were "general providers," but became known in the building world for their "T.L.B." rubber facing bricks, which are still produced in four or five large brickfields within a few miles of Bracknell. When the Berks County

Council was formed Mr. Lawrence was elected member for Warfield, a position which he retained till his retirement a few years ago, when his son, Mr. Arthur Lawrence, was elected in his stead.

GENERAL BUILDING NEWS.

**CORPORATION BATHS, BARTON HILL, BRISTOL.**—The baths about to be erected by the Corporation of Bristol in the Barton Hill district of that city are to be of red brick, with slate roof. The entrance lobby is to be on the men's side leading to the ticket office, and immediately in the interior of the building there are to be a number of commodious dressing-boxes, adjacent to which are the slipper, needle, and spray baths. These baths are also to be flanked at the other end with another series of dressing-boxes which divides the special baths from the ordinary baths. Of these there will be eighteen for men of the second-class order and six of the first-class character, a large waiting-room being adjacent. A spacious corridor will divide these single baths from the general swimming-bath and the women's department, which ranks at the end of the large swimming-bath. This bath, which is to be 60 ft. long and 30 ft. wide, is surrounded by dressing cubicles. There are ten baths for women, and in that department there is the drying-room, the wash-house, the boiler-house, and other offices. There are also waiting-rooms for female customers. Bangor slates are to be used for the divisions of the baths, and white glazed bricks are to be supplied by the Farnley Iron Company. The Lancashire type of boiler is to be adopted, suitable for a working pressure of 100 lbs., and tested to 200 lbs. per square inch by hydrostatic pressure. The boilers are two in number, and 22 ft. long by 6 ft. diameter. The architect is Mr. W. S. Skinner, of Bristol.

**READING-ROOM, BALCOMBE, SUSSEX.**—The foundation-stone of this building was laid by Lord Frederick Fitzroy on the 10th inst. When completed the building will be 50 ft. long, 23 ft. wide, and 16 ft. high, and it will be divided by a movable screen. There will be two entrances and a wide corridor, and the reading-room will be connected with the caretaker's house. Adjoining the room will be a small library, cloakroom, and lavatory. Heating will be by means of hot-water apparatus, the furnace to be in the basement. The architect is Mr. Gerald C. Horsley, of Gray's Inn-square, London; the contractor for the general work Mr. F. Pierce, of Balcombe; and the hot-water apparatus will be supplied by Messrs. Rosser & Russell, of London.

**RE-OPENING OF MARLETON CHURCH, NEWBURY.**—This ancient church after restoration and enlargement was re-opened on the 14th inst. The building

as enlarged consists of nave 45 ft. long, and a chancel 22 ft. long and 18 ft. wide. The old walls were underpinned to a depth of 4½ ft. with solid brickwork in cement and a damp-proof course inserted. A walled-up doorway of the Norman period on the north side has been opened out, the masonry repaired, and a massive oak door with characteristic ironwork now fills the opening. The old oak roof of the nave has been entirely stripped, the timbers strengthened and repaired, and covered with oak boarding. An unsightly modern stone turret at the west end has been removed, and a bold turret of framed oak with traceried openings, and roofed with oak shingles, has been added. The massive oak posts and timbers which support the turret form a bold feature within the nave. The new chancel is an extension of the church corresponding to the nave in width and height, the separation being marked by an arrangement of oak timber framing. The new chancel roof in general character is similar to the old roof of the nave, and continues in a line therewith, but of more substantial construction, and is enriched with mouldings and carvices to give an appearance of richness as compared with the simplicity of the nave roof timbers. The chancel stalls are of oak with carved poppy heads, and traceried panels. The chancel steps are of polished Devonshire marble, and the floors of glazed encaustic tiles of a special design. In the south wall of the chancel are sedilia and credence, so designed as to form an attractive architectural feature. On the east wall is a richly-carved reredos in fine grained stone with Devonshire marble panels and central cross. Above is a three-light traceried east window filled with stained glass, executed by Mr. C. E. Kempe. The subject is "the Nativity of Our Blessed Lord." The new vestry is on the north side of the church, and there is a heating-chamber beneath it. The seats of the nave are of oak, and wood block floors on cement concrete foundation have been laid where seats are placed. All other nave flooring is of small-sized geometrical tiles of one uniform colour. The church is warmed by hot water with radiators. The whole work has cost about 2,000l. The heating arrangements were executed by Messrs. Fox & Son, of Finsbury; the wrought-iron metal work by Messrs. Clew & Sons, of Stroud; the reredos by Mr. H. Frith, of Gloucester; and the building works have been carried out by Messrs. Groves & Sons, of Shipton-under-Wychwood, from the designs of Mr. Slingsby Stallwood, architect, of Reading.

**ADDITIONS TO SCHOOL BUILDINGS, YETHOLM, N.B.**—The reopening of these buildings, after considerable alterations and additions, took place on the 14th inst. Two large classrooms for juveniles have been built, each 25 ft. wide by 20 ft. and 23 ft. long respectively. The two existing classrooms have been improved in the heating, lighting, and ventilating arrangements. Cloakrooms for the girls, infants, and boys have been built, a female staffroom added, playbeds for protection in bad weather, &c. A large portion of the adjoining field has been rented so as to enlarge the playgrounds, and new boundary walls enclosing them have been built. A heating installation has been provided, as well as a new drainage system, and various other alterations have been carried out. There is accommodation for 200 pupils. The total cost of the works, furnishing, and incidental expenses will be about 2,500l. The contractors were:—Mason work, Messrs. John Bruce & Sons; joiner work, Mr. John Scott; plaster work, Mr. William Bryce, all of Kelso. Mr. John Scott, Innerleithen, carried out the plumber work; Mr. William Turnbull, Yetholm, the slater work; Messrs. W. Forsyth & Sons, Edinburgh, the painter work; and Messrs. Melkie & Philp, Edinburgh, the heating. The seating has been provided by the Bennett Furnishing Co., Glasgow; the classroom partitions by the North of England School Furnishing Co., Darlington. The architect is Mr. T. P. Marwick, of York-place, Edinburgh.

**OPENING OF NEW ARCADES, BIRMINGHAM.**—These new arcades, which, with contingent premises, are estimated to cost about 250,000l., were opened on the 18th inst. They connect the thoroughfares of Corporation-street, New-street, High-street, and Union-street, and they contain about 200 shops and offices, some of which are already occupied, and more of which are let. The main City Arcade commences in High-street, where it adjoins the Louvre, and continues to near the junction of Corporation-street and Union-street. A branch in course of construction will lead into it from New-street. The Midland Arcade runs from New-street to the City Arcade, which it joins about half-way between Corporation-street and High-street. The arcades, like most of the newer ones erected in Birmingham, are of terra-cotta, and the style of architecture is Renaissance. Within the arcades the predominant colour is green, the balustrades and pilasters of the shop fronts are ornamented with green faience, shaded in imitation of malachite. A subway underneath the thoroughfares facilitates the delivery of goods to the shops. Considerable extensions of the Louvre have been carried out in connexion with the scheme, and it is intended by another company to erect a block of shops and offices in New-street, between the Midland Arcade and the City Arcade branch. The

whole of the arcades are expected to be completed in about eight months' time, and the entire scheme about a year hence. Messrs. Newton & Cheate, of Birmingham, are the architects.—*Birmingham Gazette.*

**SANATORIUM, LIVERPOOL.**—On the 18th inst. the new sanatorium for consumptives, situated at one of the highest points in Delamere Forest, near Frodsham, was opened. The architects were Messrs. Willink & Thicknesse, of Liverpool.

**THEATRE, NEWCASTLE-ON-TYNE.**—A new theatre of varieties, designed by Messrs. Wilson & Long, architects, of King William-street, London, is about to be erected in Newcastle. The front of the building will be in Westgate-road, from which entrances are obtained to all parts of the house. The auditorium is divided into a ground floor with two tiers over. The entrance to the stalls, fauteuils, and dress circle is obtained from the apsidous entrance hall, which occupies the centre of the front. On each side of this are entrances to the pit and gallery respectively. At the rear of the pit, circle, and gallery respectively will be a spacious saloon, while throughout the building ample means of ingress and egress are provided. The building will be constructed on fire-resisting principles, and a fireproof curtain will divide the auditorium from the stage. The latter has a depth from the curtain line of 50 ft. The artists' dressing-rooms will be situated in a separate block of buildings entirely shut off from the other portions of the buildings.

**THE CORDWAINERS' HALL, CANNON-STREET.**—The Hall of the Cordwainers' Co., one of the most ancient of the City guilds—the Cordwainers being named from their trade in Cordovan leather, which was manufactured in Cordova in Spain—which is situated on the north side of Cannon-street, has during the last few months had extensive decorative works executed to it. The internal decorations of the large hall on the first floor, and the lower hall and court room on the ground floor, were originally executed in the Adam style, but beyond simple friezes, the walls and ceilings were left with plain surfaces. The Court has long felt that rooms of such good proportions required more decoration to complete them, and during the recent vacation they have had the lower hall and the court room ceilings decorated with Adam plaster work, and have had a series of oval medallions fixed to the walls, thus breaking up their bareness underneath the enriched frieze which already existed. An Adam dado has been fixed in enriched material round the two rooms, and the whole of the rooms have been decorated throughout in a rich buff color relieved and picked out with gold. Both the new ceilings have also been gilded in their enriched portions, and care has been taken that the rooms shall be effective not only in daylight but in artificial light, under which they are largely used. The ceilings have been supplied and fixed by Messrs. Jackson & Sons, of Rathbone-place, the painting and gilding works being executed by Messrs. Colls & Sons, of Coleman-street. The whole of the works were designed and have been carried out under the personal directions of Mr. Howard Chaffield Clarke, of Bishopsgate-street Within, the Co.'s Surveyor.

**NEW ROMAN CATHOLIC CHURCH, CASTLEBAR, IRELAND.**—This church has recently been dedicated by the Archbishop of Tuam. In regard to the interior decoration of the church, a principal feature is the stained glass windows by Mayer & Co., of Munich. First to be noticed is the five-light sanctuary window, nearly 30 ft. high, which is divided into three tiers of subjects, representing in the upper row the five Joyful Mysteries of the Rosary, in the centre row the Sorrowful Mysteries, and in the lower the Glorious Mysteries. This work has been presented by the Archbishop of Tuam. There are three-light side altar windows, representing the Apparition of the Sacred Heart to Blessed Margaret Mary and St. Dominic receiving the Rosary. In addition there are three nave windows of two lights each, illustrating the Wedding at Canaan, St. John Baptist de la Salle teaching, and the Raising of Jairus' Daughter. The Stations of the Cross were supplied also by Messrs. Mayer & Co. They are bold reliefs, almost full figures, in massive carved oak frames, over 6 ft. high and nearly 4 ft. wide. The gates in the Communion rail are of wrought brass, with battlements on the capping. One of the most effective ornaments in the church is the hanging lamp before the high altar. It is 8 ft. high and 3 ft. in diameter at the widest part. The top is formed of a very finely wrought Imperial crown, richly foliated, from which depend the chains, which are relieved with enamelled Gothic shields. From the corona, which is divided into six semi-circular panels and beaten in repoussé, project pedestals enriched with foliated caps, upon which are mounted six angels with extended wings. From the junction of the panels project six candle-holders carrying the chains. The lower portion of the lamp, which contains the glass for oil, is of circular form, and is worked of wrought trellis, with a crown and pedestal finely worked in repoussé. Beside lamps are also of brass. The lamps and gates were manufactured in the workshops of Kane and Gunning, of Dublin. The heating was by Messrs. Musgrave, of Belfast; Messrs. Ward and Partners, of Belfast, supplied some radiating lights, while Messrs. James Pearce & Sons, Dublin, supplied the three altars. Mr. J. F. Eberd did the woodblock floors throughout; T. and C. Martin the seats. The general con-

tractor was Mr. T. B. Healy, of Tralee. The contractor for organ gallery and carving was Mr. J. A. O'Connell, of Cork. Mr. William O'Connell, also of Cork, made the entrance screens and some of the seating. Mr. Andrew Cullen, of New Ross, the richly carved confessionals; Messrs. Kane and Gunning, of Dublin, supplied the elaborate solid wrought brass gates to the sanctuary and chapels, and a wrought brass corona for the chancel. Messrs. John Fagan & Sons, of Dublin, the wrought iron-work and lightning conductors. The tiling of the church and chapels is by Messrs. Craven, Dunne & Company. The tiling of the northern baptistry is by Mr. J. C. Edwards. The architect was Mr. Walter G. Doolin, of Dublin.

**NEW CHURCH, GLASGOW.**—The memorial stone of a church in Glasgow was recently laid by Mr. John Wilson, of Govan. The new building is situated at the corner of Dalrymple-road and Harvie-street, the principal entrance being from the former thoroughfare. Space has been left in the rear for hall and vestry accommodation. The total sittings provided for are 605, and the church is to be electrically lighted. Mr. J. C. McKellar, of Glasgow, is the architect.

**CHURCH SCHOOLS, WOLVERHAMPTON.**—These schools, now in progress, have been designed by Mr. Fred. T. Beck, architect, of Wolverhampton. Accommodation will be provided for the instruction of 310 girls and 350 boys. The girls will be located on the ground floor, and the boys on the first floor. A separate one-story building will provide accommodation for 190 infants. The principal rooms in the boys' and girls' schools will be 93 ft. long by 22 ft. wide, and will be divisible into three sections by means of glazed folding screens. There will also be classrooms, a teachers' room, hat and coat rooms, and lavatories for each department, the whole of these being under supervision from the main room. Both stores and caretaker's quarters are also provided. The chief infant school will be of the dimensions of 43 ft. by 24 ft., also divided by a glazed screen, while separate classrooms and rooms for instruction of brick, with red terra-cotta window sills, will be provided. The buildings will be constructed of brick, with red stone dressings. The roofs will be covered with Staffordshire tiles, and the rooms on the ground floor with wooden blocks, those on the first floor being boarded. All the departments and rooms will be heated by means of open fireplaces, assisted by hot-water apparatus. The staircases are to be of concrete. An emergency staircase is also to be constructed. The cost of the work is about 6,000l., and the schools are expected to be completed by next June. The builders are Messrs. H. Willcock & Co., of Wolverhampton.

**BUILDING WORKS, RADCLIFFE OBSERVATORY, OXFORD.**—At the Radcliffe Observatory during the year important works have been in progress. The great dome under which the new telescope is to stand has been finished, and the internal fittings of the new tower have been considerably advanced. The steel girders of the lifting-roof of 26 ft. in diameter have been mounted, the roller and rails to guide its motion have been placed in position, and the water main to supply the hydraulic power for raising and lowering the flood has been laid down. The telescope itself, which will be one of the finest photographic instruments in the world, is now practically finished in Sir Howard Grubb's works in Dublin, and the work of erecting it at Oxford will very shortly commence. Nor have the older buildings been neglected. For many months past a great scaffold has encircled the old tower built by Wyatt (1772-1795), rising to a height of about 100 ft. above the ground. The upper part of this tower, which is modelled upon the Tower of the Winds at Athens, is of a very ornamental character, and at the very top is decorated with huge figures representing the eight winds. Being built of Windrush and Bibury stone, however, a great many of the more boldly carved features had perished, especially the capitals of the handsome Corinthian columns by which the great windows are flanked. All these parts are being thoroughly restored. The work is being carried out by Messrs. Wyatt & Son, of this city. The architect is Mr. T. G. Jackson.

**NEW POLICE AND FIRE STATIONS, CAMBRIDGE.**—These buildings, erected on the site of the old police-station and spinning-house, were recently opened. The construction as a whole covers the requirements of a police-station and fire brigade-station, the latter being south of the former. The police-station has a pair of oak doors surmounted by a fine stone carving of the Borough Arms, the work of Mr. Frampton, sculptor. The entrance-hall has a grained ceiling and mosaic floor. On the right through an oak lobby are the inquiry office; the chargeroom adjoins, and communication is afforded by means of a hatchway. Both rooms are embellished with an oak dado to a height of 4 ft. A portion of the chargeroom is set apart for clerical purposes, and a window on one side commands the cell corridor running off to the rear of the building. Down the corridor are the cells, ten in number, six for males, three for females, and a reception-cell, fitted with a bath for medical treatment, the last-named being nearest the chargeroom. On the right are the lavatories. In the basement, under the cells, is a heating-room which warms them, and where constables may dry their

clothes or prepare refreshments. Here there is also accommodation for Morris tube practice, target and apparatus having been provided by the Chief Constable. The construction of the cell block are the quarters of the female warder and rooms for single constables. The former comprises kitchen, living-room, three bedrooms, and offices. Access is obtained by means of a door opening into the cell corridor. At the extreme end of the corridor is a mortuary in the door of which it is proposed to insert a small circular window, through which jurors may view the body without going inside the room. Here is also a room for holding inquests. Near the main entrance is a large staircase leading to the upper apartments, which is one of the principal features of the building. Like the lobby it is constructed of Bath stone, with stone balustrading, surmounted by a richly-carved newel, the foundation of a hammered brass standard electric light. The staircase is lighted by a fine circular bay window, whilst at the top of the landing is a second bay window of stained glass, facing the street, containing the arms of England, of the Borough, of the university, and of the various Cambridge Colleges. This work was executed by Messrs. Weyer, of Norwich. Opening on the landing, and approached by a handsome oak lobby, is a spacious Watch Committee-room, which is panelled with oak up to about 8 ft. or 9 ft. It possesses a massive chimney-piece, elaborately carved, and over which is a convex mirror. Above the panelling the walls are stone-faced, and there is a moulded plaster Renaissance ceiling. The floor is of oak, and the room is lighted by means of four pairs of windows. In connexion with the room there is a private office and lavatory of the same construction. The entrance hall communicates by a door at the back with a large covered-in courtyard, being flanked on one side by the cell block of the building, on the other by the police quarters, and at the rear by the Chief Constable's house. The courtyard is adapted for a drill yard, and is covered with a glass roof. On the left of this is a block containing on the ground floor the parade-room, and over it at one end the lecture-room and recreation-room; at the other end is a messroom. The new offices provided for the Chief Constable in connexion with the house occupy a portion of this part of the site reaching to Downing-place. The only other rooms in the police-station are the clerk's office, waiting-room, and general storeroom, on the right of the first-floor landing. The first two named are about 12 ft. square, and the storeroom extends over both rooms. At the south end of the site is the fire-station, access to which is obtained by means of a bold semi-circular arched doorway, fitted with folding doors. The fire station, which has a wood-block flooring is 30 ft. by 24 ft., and affords accommodation for a steam fire-engine and any equipment the town may require for its brigade. Upon entry, on the left is the watch room, in telephonic communication with all the call-posts in the town. Through the station is an open yard, to be used for cleaning and repairing purposes, and measuring some 50 ft. by 20 ft. It is paved with granite, and is provided with a hose hoist. At the rear of the yard is a muster room 20 ft. by 16 ft. and 12 ft. high. It has a wood-block floor, and is adorned by a wood dado about 4 ft. from the ground. This completes the ground floor, and the first and second stories contain the quarters of the foreman fireman. Both stations are furnished with electric light, electric bells, and telephones, the installation having been carried out by Messrs. Buxton, Grundy, & Barrett, Limited, of Cambridge. The architect of the buildings is Mr. John Morley, of Cambridge.

#### SANITARY AND ENGINEERING NEWS.

**MELTHAM SEWERAGE.**—A Local Government Board inquiry was recently held by Colonel A. E. Duffin, R.E., into an application of the Meltham Urban District Council for consent to deviate from the chemical purification scheme of sewage treatment for which a loan was sanctioned in 1899. It was stated by the Council's Solicitor, Mr. F. A. Reed, that the scheme previously sanctioned consisted of chemical precipitation followed by artificial filtration and subsequent land filtration, but the Council now desired to substitute in place of that the Polarite bacterial oxidation system, which would be more suitable for the requirements of the district than the scheme previously sanctioned, whilst the advantage to be obtained from it, in addition to greater efficiency, were that the use of chemicals would be dispensed with, the works would be automatic, and there would therefore be a considerable saving in labour. Mr. J. B. Abbey, of Messrs. Abbey & Son, of Huddersfield, the Engineers to the Council, produced the plans of the proposed works and described the system, which briefly consists in passing the sewage through a screening tank, and then into three detritus tanks, where the organic solids will become split up and disintegrated by the liquefying action of the bacteria present. From the detritus tank the sewage enters three anaerobic bacteria beds, the effluent from which will flow along aerating channels, and then be sprinkled by means of Candy-Caink automatic revolving sprinklers fed by automatic intermitters on to Polarite bacterial oxidation beds. These beds have a com-

lined area of 504 square yards with a working depth of 3 ft. 6 in., and will deal with 2,000,000 gallons of sewage per day. The advantage of delivering comparatively small quantities on the beds with short intervals of rest (which is accomplished by means of the Candy patent intermitters and automatic revolving sprinklers) is that a more complete aeration of the effluent as well as filter bed is obtained, and consequently a higher degree of purification, than by thoroughly deluging the beds and giving longer intervals of rest. Experience has also proved that better results are obtained by sprinkling than by either continuous distribution or ordinary contact beds. Mr. Candy, of the International Purification Syndicate, who was called to give evidence with regard to the Foliarite oxidation beds and the working of the patent intermitters and sprinklers, stated in reply to inquiries that there were no royalties in connection with the use of the system, which was being extensively adopted in various parts of the country as well as abroad. Dr. Wilson, Chief Inspector of the West Riding Rivers Board, was in attendance, and expressed the opinion that this was one of the most complete schemes he had seen submitted to the District Council, and that the work should be put in hand forthwith, the intercepting sewers having already been completed.

**PROGRESS OF THE BIRMINGHAM NEW WATERWORKS.**—The water committee of the Birmingham Corporation have recently made a report on the progress made in the Welsh Water scheme. Also, they state that in regard to the present supply the total consumption during the half-year, to September 30, shows a considerable increase over the corresponding period of 1900, having averaged 19.2 million gallons per week against 18.1 million gallons per week. The maximum day of this year showed a consumption of 24,297,000 gallons against 23,588,000 gallons last year. With the exception of a few days at the end of July, when there was shortage in some districts, the supply has been well maintained throughout the summer. The rainfall, although considerably below that of last year in total, has nevertheless been well distributed, there having been no prolonged drought throughout the summer. Turning to the Eilan Valley (Welsh) supply the committee give figures which show that the following purchases of land have been made:—Freeholds, 10,324 acres; common and exclusive rights, 24,587; mineral or mining rights, 5,879; manorial rights, 36,003. Good progress has been made during the summer with the works in the Eilan Valley, and on the various sections of the aqueduct, also at Frankley, and in connection with the laying of the distribution mains, but in the cases previously referred to, in which the work is behind time, the arrears have not yet been made up. The committee defer giving exact particulars as to progress until the reports to the end of the season have been received. By the Corporation Water Act of 1892 the time fixed for the completion of the works in the first instalment is ten years from the passing of the Act, which will expire on June 27, 1902. It will be impossible to complete all of the works by that date, and it will therefore be necessary to apply to Parliament for an extension of time. The Committee accordingly propose that the Corporation shall promote a Bill in the 1902 Session of Parliament to obtain such extension of time, together with a corresponding postponement of the sinking fund in respect of the capital raised under the 1892 Act. They further propose that advantage shall be taken of the occasion to obtain Parliamentary sanction to the abandonment of certain works found to be unnecessary, and the substitution of others to replace in certain cases, none of the variations proposed being in themselves important.

**NEW BRIDGE, NEAR EDINBURGH.**—The new "Shank" bridge on the main road from Newtonloan to the Shank at Armliston has now been completed. It has been erected on the site of an old bridge, and it was found by the engineers that the piers of the latter, which are very massive, could be repaired, and it was therefore decided only to take down the arches to the springing level, and to erect braced stools upon them for carrying the girders. These stools are about 28 ft. high, and are formed of four rectangular columns braced together and bolted to granite-bearing stones built into the piers, which have been thoroughly repaired. A bearing girder is fixed on the top of each stool, on which the longitudinal girders rest. The superstructure consists of two longitudinal plate girders, on the top of which thorough flooring is laid, and there is a lattice parapet on each side. Cement concrete is laid in and over this thorough flooring, and the roadway is formed of tar macadam, with tar paving on the footways. Cast-iron pilasters are placed over each pier, and castelled masonry pilasters on the abutments at either end of the bridge. The spans of the girders are about 47 ft., and the width of the bridge is 28 ft. between the parapets, divided into a roadway 20 ft. wide, with a footpath on one side 6 ft. wide and a cess of 2 ft. on the other side. The total length of the new bridge is about 320 ft., and the roadway is upwards of 60 ft. above the channel of the footway. Messrs. Girdley & Co., of Colinton, Motherwell, in conjunction with the engineers, Messrs. Crouch & Hogg, of Glasgow, were responsible for carrying through the work. The sub-contract for the removal of the old bridge and the

erection of the new masonry was placed with Mr. Stephen Hair, builder, Dalkeith, and the tar macadam and paving were done by Messrs. W. Walker & Sons, Leith and Ayr.

**STAINED GLASS AND DECORATION.**

**ST. ANDREW'S ROMAN CATHOLIC CHURCH, BRAEMAR, N.B.**—This church is about to be greatly improved and renovated. The work, which will take more than six months to execute, has already been begun, a number of stained windows having been inserted. The window at the end of the church, behind the altar, is a three lancet one. The centre light consists of Christ Crucified, with the Blessed Virgin and St. John, illustrating the text, "There stood by the Cross of Jesus his mother and the disciple whom Jesus loved." The light on the left is St. Andrew, the patron saint of the church. The figure is drawn from a photograph of the banner taken by the Scotch pilgrims to Lourdes in 1899. In the background to the right is a view of the Cathedral of Iona, and on the left St. Oran's Chapel. The light on the right represents St. Margaret, patroness of Scotland, and is taken from an altar piece in the Scots College, Rome, painted by a Polish artist. The saint is represented in prayer to the Holy Trinity. In the background is to be seen a view of the Battle of Alnwick, where were killed her husband, Malcolm Canmore, and her son. The two side windows in the sanctuary represent two Scotch saints—St. Columba and St. Ninian—and they are also from a painting in Rome by Seitz, an artist of the school of Overbeck. The whole of the work was executed by Mr. Louis Grosse, Bruges, Belgium, and of the firm of Louis Grosse, London. The emblems of Scotland—the thistle and crown—are delicately interwoven into the robes of the national saints. Other improvements are to be effected in the sanctuary, which is to have a new altar and surroundings, all of oak. The porch is to be laid with mosaic representing the figure of St. Andrew in the centre, and between that and the outer border the Scotch thistle will be depicted. The passages will be laid in coloured tiles.

**MEMORIAL WINDOW, ST. LUKE'S CHURCH, ISLINGTON.**—On the 18th inst. a stained glass memorial window was unveiled in this parish church. The window, which is in the south-east corner of the church, represents St. James, and underneath is a suitable inscription to the memory of the late rector of the parish. The work was executed by Messrs. Jones & Willis, of Great Russell-street, Bloomsbury.

**FOREIGN.**

**FRANCE.**—M. Edouard Lecerue has been elected President of the Société des Architectes de la Seine for the ensuing Session.—The new Hôtel de Ville at Tours, the work of M. Laloux, is nearly finished, and will be opened next year. It has cost nearly 3,000,000 fr. without counting the artistic decoration, which is to be done at the cost of the State. The principal façade fronts the Place du Palais de Justice. It is decorated with sculptured carvades by M. Sicard. The base of the campanile is adorned with two figures representing the Loire and the Cher, the work of M. Injalbert. Four figures by M. Cordonnier and M. Hughes, seated on the pediments of the gables, represent "Force," "Glory," "Science," and "Vigilance." Internally, the grand vestibule is decorated with four statues representing four celebrities of Touraine, viz., Cardinal Brissonnat, the painter Jean Fouquet, Marchal Boucicaut, and Paul Louis Courier. The Salle des Fêtes has two monumental chimney-pieces executed by M. Varenne, surmounted by two busts, by M. Injalbert and M. Loiseau Bailly, which represent "The Republic" and "Touraine." M. Schommar has been commissioned to paint the ceiling of this large room, and in the salle à manger will be placed eight compositions commissioned from two painters, MM. Eugène Lami and Corchon. A triplicity by M. Jean Paul Laurens will decorate the council-room, and the decoration of the committee rooms and the Mayor's parlour has been entrusted to M. Henri Martin. Considering all this exceptional talent engaged on the decoration of a building, designed under an architect of such remarkable acquirements as M. Laloux, it can be readily understood that the new town hall of Tours is no unimportant addition to modern French art. There are to be important public improvements carried out in the town of Constantine, at an expenditure of a million and a half of francs; including the completion of the Hôtel de Ville.

**INDIA.**—The railway from Calicut to Cannanore has been completed and will shortly be opened for traffic.—The water supply to Rangoon has been considerably augmented by the sinking of two tube wells, which yield freely.—The extension works on the Nilgiri railway from Coonoor to Ootacamund have been commenced.—Traffic has been much interrupted on a portion of the Burma Railway from Mandalay to Kunlon by the destruction of a bridge between Sedaw and Tanbo by floods.—In regard to the Northern Railway of Ceylon, we learn that the laying of rails has been carried for several miles

beyond Jaifna, and the ballasting has been done as far as Ianuville.—The Brush Co. are preparing to take over the Bombay tramway system and to convert it to electric traction.—The Viceroy contemplates placing a tablet or device, with a suitable inscription, on old houses in Calcutta which have historical associations.

**GERMANY.**—It is anticipated that the monuments to be erected to the memory of the late Emperor and Empress Frederick in front of the Braudenburg Gate will be unveiled next October. The Empress Frederick will be represented in her coronation robes, and with the crown on her head. Herr Fritz Gerth, the sculptor, is now, or has lately been, in Berlin in order to discuss the plans with Herr Inue, the Court Architect. The Emperor has decided that busts of Herr Eduard Zeller, the historian, and August Wilhelm von Hofmann, the eminent chemist, shall be placed at the foot of his mother's statue.—The Emperor Frederick's monument, by Herr Bruitt, is nearly finished. He is represented in the uniform of his consort, the Quirassiers. The pedestal of the statue will be adorned with busts of Professor Helmholtz and Field-Marshal Count Blumenthal.

**MISCELLANEOUS.**

**PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.**—Messrs. Howgate & Keith, architects and surveyors, have removed their offices from 70, Gower-street to 10, Sackville-street, Piccadilly, W.—Mr. J. R. Elliott, Civil Engineer, Nottingham, has removed to Barton Buildings, Parliament-street, Nottingham.

**WORKHOUSE EXTENSION, GRIMSBY.**—Messrs. Shortland ask us to mention that in the above-named building, described in our last issue, the wards are warmed and ventilated by means of their Manchester stoves.

**NO. 2, PALACE-GREEN, KENSINGTON.**—The Crown lease of this house, with some freehold garden ground at the back, will be offered for sale at auction in the course of next month. It stands on the west side, at the south end of the road, formerly Queen's-road, through Kensington Palace-gardens, and is the house, though somewhat altered since, in which Thackeray built for his own occupation. He, it is said, made a scheme for the general plan and design. Thackeray removed thither from No. 36, Onslow-square, South Kensington, in 1862, and there he died on Christmas Eve of the following year.

**ANCIENT TRADE REGULATIONS AT BEVERLEY.**—A report which has just been issued by the Historical Manuscripts Commission on the Manuscripts of the Corporation of Beverley contains many curious and informing extracts from the ordinances in force in the ancient Yorkshire town in the middle of the fifteenth century. Some of them concern individual trades. Here are a few specimens:—No carpenter or tiler (viz., "tilthacker, tilewaller, and plasterer"), who is not a regular apprentice who works with him, to employ a journeyman without the consent of the master of the works with whom he works, and the latter may employ any journeyman he pleases, and finish a job begun by one with another. Carpenters, tilers, and their servants, sawyers, paviours, and their servants and workmen, shall observe these hours:—From Easter to the Assumption (August 15) from 4 a.m. to 7 p.m., with an interval at 6 a.m. of quarter of an hour to drink; at 8 a.m. of one hour for breakfast; at 11 a.m. of one hour and a half to dine and sleep; at 3 p.m. half an hour to drink; otherwise they shall not be tardy, or absent from their work, on pain of 12d. to the community. From the Assumption to Easter they shall begin at daybreak, and leave off when the light falls. At this season they may have at 9 a.m. half an hour to drink or breakfast; 12 noon, one hour to eat; 3 p.m. quarter of an hour to drink. No carpenter, &c., shall refuse to work with any burghers who want him unless previously engaged on some other work; penalty, 6s. 8d. On account of the stink, fouling of the air, and destruction of fruit trees, none to make a kiln ("thorale") to bur, bricks ("tegiareum") in or nearer the said town than the kilns are now built; penalty, 10s.

**TIMBER EXPORTS FROM THE WHITE SEA.**—A report received by the Foreign Office from Sir Capel Wolsley, British Vice-Consul at Archangel, supplements in some respects the more elaborate review of the Russian timber trade sent recently by Mr. Consul Woodhouse from Riga, as already noticed in the Builder. Sir C. Wolsley states that the export of timber from all the ports of the White Sea amounted last year to 10,329,085 roubles (£1,008,200), being 2,000,000 roubles in excess of the previous year. The vast forests of the Province of Archangel are its most valuable commercial asset and the principal source of the prosperity of its ports. With occasional fluctuations, the development of the timber trade has been steady and rapid. Between 1862 and 1880 the export nearly doubled in the course of each decade. During the next ten years the increase was about 70 per cent. The export of 1900 was nearly twice that of 1891. Since 1898, which showed a slight decrease as compared with the previous year, the advance has been at the rate of about 200,000 standard dozens yearly, while the increase of value was about 1,400,000. In 1899 and over 210,000, in 1900,

the total amount of timber exported in that year being 1,200,000 standards, valued at 1,000,000. The exceptionally high prices obtained for sawn timber in 1890 still continued to prevail last year. The logs having been bought at moderate rates, large profits ensued for the saw-mill owners. A result of this access of prosperity was to cause some owners to start new mills and to bring competitors into the field. The new mills comprise two at Archangel, two at Kovda, one at Tumba, and one at Petchora district, and two small ventures inland near the line of the Moscow-Yaroslavl-Archangel Railway. Another effect of the two years' run of prosperity was to increase the price of logs. The Russian Government, to whom all the forests belong, only offer a limited number of trees for sale by auction each year. Last year, buyers, anticipating a continuation of the larger demand for sawn goods, strove to outbid each other in order to obtain the greatest number possible of the available trees, the result being that unprecedentedly high prices were paid. As the timber is generally allowed to lie two years in order to become seasoned, the result of this high rate of purchase will not be felt till 1902, when, unless the market improves, it appears inevitable that many owners will suffer loss.

**THE MERWARTH METALLIC GASKET.**—Gaskets, or joint rings for flanged pipes and unions, are sufficiently familiar to architects and engineers, and of late years the tendency has been towards the employment of metal as the most efficient and serviceable material. The "Merwarth" ring is of somewhat novel construction, consisting of a soft metal ring of  $\frac{1}{2}$ -in. diameter wire, outside which is soldered a concentric copper ring of  $\frac{1}{8}$ -in. diameter wire, and to the copper ring short pieces of thinner wire are attached which can be wound round the bolts for the purpose of holding the gasket in the proper position for making a joint. No doubt in very accurate work there is nothing better than a "metal-to-metal" joint, but in the case of ordinary pipes the flanges always present irregularities, even when machine-fabricated, and the use of some compressible yet durable material is always necessary. The device with which we are now concerned appears to be a good one for the inner ring of metal being ductile, is readily squeezed into all the irregularities of the flange surfaces, and thus forms a perfectly tight joint, preventing the leakage of liquid, vapour, or gas, and being reinforced by the outer ring of copper it is capable of resisting injury from expansion, contraction, and vibration. The gaskets are made up to 60 in. in diameter, and it is claimed for them that efficiency increases in direct proportion to the diameter. This is an unusual contention, and one of which we cannot yet speak from practical experience. Other clear advantages are that the rings do not deteriorate and can be used over and over again, whilst they can be removed and replaced in a minimum space of time.

**CENTRAL SCHOOL FOR THE BLIND IN LONDON.**—A scheme is under consideration for the establishment of a Central School for the Blind in London. Although provincial cities were the first to undertake the instruction of children thus afflicted, the Metropolis subsequently took the lead, and a comprehensive and systematic plan was prepared by the School Board. The blind children attend the schools, but receive special instruction, given by a superintendent and several teachers trained at the Royal Normal College for the Blind. The proposed central school is situated at Bolingbroke-grove, Wandsworth Common, and correspondence on the subject has been passing between the School Board and the Education Department. Some alterations are required on the premises, which are known as Linden Lodge, and when these are completed the Department has undertaken to grant a permanent certificate. —*Daily Telegraph.*

**NEW CHURCH FOR SOUTH KENSINGTON.**—The Ecclesiastical Commissioners have decreed the union of the two contiguous benefices of All Saints and Holy Trinity, Knightsbridge, and the demolition of the latter church, together with the vicarage adjoining. The united benefices will in future be served by the Church of All Saints, in Ennismore-gardens, which was erected some fifty years ago, and subsequently enlarged. The interior contains some decorative work by Owen Jones. In order that the spiritual needs of the district shall be fully supplied, it has been decided that a new church, together with a parsonage house, shall be built in Prince Consort-road, South Kensington, upon a site purchased from the Commissioners of the Great Exhibition. Mr. G. F. Bodley has been appointed to prepare the plans. —*Daily Graphic.*

**GIGGLESWICK SCHOOL CHAPEL.**—The Acme Wood Flooring Company ask us to mention that the wood-block flooring in the above-named chapel was laid by them, with the "Immovable-Acme" system of dovetailed blocks.

### RECENT PATENTS:

#### ABSTRACTS OF PATENTED INVENTIONS.

11,429.—AN ELECTRO-MAGNET FOR USE IN LIGHTING APPARATUS: *M. Vogelsang and F. Lindenstruth.*—An automatic switch and an electro-magnet are so combined that a strong current shall be firstly sent through the coil for starting the motion of the armature, after which the current will be weakened. An extension upon the core or

armature, which is surrounded with the coil will, concurrently with the attraction of the armature, move a switch lever in opposition to the action of a spring, and so effect the insertion of a resistance, which may be inserted either in series or parallel-wise to the coil.

11,438.—JOINING CASES FOR ELECTRICAL CONDUCTORS: *Siemens Bros. & Co., W. Diesthorst, and F. J. Budd.*—Two castings fitted together and secured with bolts and nuts constitute a casing for straight, T, or multiple joints. For the first-named the cable is gripped in the lower case or casting, and there are provided an air space for some low-melting-point insulating material, and channels for projections upon the upper casting. One of the channels takes a packing of strip lead, the other takes insulating material. The air holes and filling holes are to be closed with screws.

11,442.—PORTABLE BUILDINGS AND THEIR PARTS: *C. H. Rector.*—These structures, which are intended for use as hospitals and for military and other purposes, have foundation beams, rebated floor sections, wall and roof sections of composition board, and rafters and uprights of T or double-angle iron. Scarfed joints and interlocking lugs and slotted plates join sections of the beams together in line, the rafters being pivoted to triangular brace plates which are riveted to the uprights and are secured to the plates with slotted pins or bolts tightened and locked with slotted wedge plates sliding upon pins of the bolts; to the uprights and rafters are added lined lugs for engagement with the slotted side bars of the frames that support the wall and roof boards; sockets on the king posts at the gable ends carry the brace plates of the end roof trusses, and transport is facilitated by the jointing of the ridge bar. At the ridge are triangular brace plates riveted to the rafters upon one side of the roof, upon the other side they are joined to the rafters with pivots and slotted bolts; pivoted catches or levers passed through slots in the uprights and inserted into inclined wedging-slots in the sash stiles fasten the windows between the uprights. The specification provides for dividing the building into rooms by means of partition plates.

11,453.—KILNS, OVENS, DRYING-FLOORS, &c.: *J. T. Cope.*—A series of hot-air, furnace-gas, or steam-flues or ducts having triangular sections that present a set of furrows, ridges, or corrugations, constitutes an open drying-floor, or the floor of an oven or kiln. The flues may be made in lengths, whereof each is either in one piece or built up with tiles or plates, or they may be formed of some woven material upon ribs or frames. In one shape the tile is made of pierced tiles and is open at the base; clamps or shoes support its lower ends, and pierced filling-pieces lie in the furrow angles, the tiles interlocking at the ridge-tops.

11,510.—SIPHONICAL DISCHARGE: *E. Grube & H. C. M. Sanny.*—To a bell-siphon is attached the open-bottomed float of the supply-cock. When the pull-chain is pulled the float will be pressed downwards until the water overflows for the starting of the siphon. The inventors also contrive that the float shall act as a piston.

11,515.—A PARALLEL RULER: *D. T. Stokes.*—In the body of the ruler are openings in which is fit a shaft mounted with rollers, and a bevelled ruler (to which a combined folding square and protractor may be attached) runs upon the rollers, a spring catch controls the extent of the movement of the ruler between the ruled lines, and the catch is to be moved along a spindle into gear with one of a row of teeth or grooves upon a boss. For use with papers, &c., that have different widths, one roller, or both of them, can be adjusted upon the shaft by means of a spring click in the roller that will engage with scallops cut in the shaft. The rollers are made of side-plates drawn together with a screw-bolt upon their middle rubber portions.

11,525.—AN EXHAUST VENTILATING-SHAFT TOP: *J. R. Arnold.*—An open-ended draught-tube is placed within a passage which is fitted at 90 deg. to the up-take. The tube and the passage may be flared or may have one continued diameter, and the former will extend from one end of the passage to beyond the opening of the up-take. The draught-tube is lipped, and inside the passage is disposed transversely a raised ridge, groove, or ring for preventing the entrance of rain by the up-take. In another form the passage and tube are set upon a vertical spindle that they may be turned by the wind.

11,543.—DOMESTIC HEARTHES: *W. L. Dennis.*—The hearths consist of enamelled and embossed metallic plates secured on asbestos or other non-conducting pads; their corners are closely pierced in order that portions may be cut off them so as to fit the stove without injury to the enamel. The plate may be fashioned with extensions to be bent so as to make a combined hearth-plate and curb, or it may be fixed on to a fender or curb.

11,553.—LOCKS: *P. Stephens.*—Between the door and the lock is a recess for a plate on which slides another plate that closes the outside keyhole; the latter plate is maintained in its position by means of a bail which is pivoted on to the knob and abuts against the turned-up part of the covering-plate, and it may be caused to slide into its place, when the key is in the lock on the inside of the door, by means of a groove that is cut in its middle.

11,559.—PROCESS OF MOULDING BRICKS: *J. S. Pullen and W. H. Mann.*—A loose cutting ring or frame is fitted on to the feeding-hopper of the machine specified in No. 935 of 1899; its bevelled cutting edge will be pressed downwards against the mould or table by the pressure of the clay; close contact of the cutter against the table is brought about by its being forced down automatically as the underside is worn away.

11,594.—A HAND-TOOL FOR SETTING THE TEEPEE OR SAWS: *H. O. Kuller.*—Two jaws hold the saw which a gauge adjusts lengthwise; when the handles of one of the jaws are pressed together the jaw will be pressed against the saw, and then punches are forced against the opposite sides of the teeth. A pivoted lever, together with a curved lever, a link, a spring, and a third lever effect the working of the handles upon the jaw, and the pressure is extended to the punches which are joined to the opposite sides of a fulcrum. For sawing-in purposes a screw is drawn back for the insertion of the saw, and a file is operated within a recess.

11,600.—A LIFT VALVE: *G. O. H. Klopff and Klopff's Patents, Limited.*—For a cock or tap where-in the fluid pressure from below presses a ball-valve against a seating-ring, a ring which is fashioned in one piece with a sleeve keeps the seat in its position, and its turning is prevented by means of a side-lug that engages with a groove in the casing, in which it is held with a cap; water will escape through a channel and a port in the casing and the sleeve, and a rib in the bib or outlet obviates spraying. Confer also No. 8,386 of 1898 for the cock or tap device.

11,600-10.—PROTECTIVE CONTRIVANCES FOR USE WITH ELECTRICAL CIRCUITS AND SYSTEMS: *P. H. Thomsen.*—In order to prevent damage by excessive static potential, the inventor connects a lead of a system with lightning-arresters, which are set in series with earthed impedances; one shunting impedance, or more, can be used in each of the arresters, which consist of a series of spark-gaps variously unshunted, or shunted with impedances. No. 11,610 specifies a system of which the generator has impedances in the leads, condensers, and lightning-arresters that are bridged across the leads and connected to earth. For protecting the transformer from a rise in potential occasioned when the switches are opened are provided impedances and condensers bridged across the leads and connected to the transformer core. For a direct-current system it will be necessary to protect one side only with the impedance and arrester.

11,632.—A SEWAGE STRAINER OR SCREEN: *S. H. Adams.*—A flap is provided for a basket-shaped strainer or screen for the collection of the separated solid matters. The flap can be pulled upwards with chains so as to leave the solid matters in the basket, which also is to be lifted up for the removal of its contents, a screen being then lowered into the place of the basket.

11,638.—CHIMNEY-TOPS: *A. Z. Germalins.*—The inventor's object is to supply a chimney-top for use with furnaces in order to save fuel and consume smoke. Between the two parts (covered with a hood) which constitute the upper portion of the top, is a perforated ring-damper, which is worked with a lever and a chain; a set of small rotary fans are disposed around the upper part, a socket hangs from the lower part into the shaft beneath; the opening between the two portions is regulated with a sleeve to which a lever and a chain are attached. Confer also No. 315 of 1898.

11,660.—A METHOD OF SETTING-OUT CURVES: *H. Fischer.*—The instrument is devised for the setting-out of circular curves. It has a diametrical arm which carries slot-and-wire sights and is pivoted on to a graduated disc which has two fixed base-line sights. For setting-out a particular arc *a b*, one should firstly set out the diameter *a c* (of the circle) in both length and direction, then one should set up the instruments at the extremities *a* and *c*, with the base sights along *a c*, the diametrical arms being set to complementary angles; points along the curve *a b* will then be given by the intersection of the lines of sight.

11,798.—CONSTRUCTION OF BRICK AND OTHER KILNS, RETORT FURNACES, &c.: *E. Botlger.*—The arches are built up with hemispherical bricks at the two ends, segmental bricks at the vault, and recessed bricks, with it may be central key-stones at the crown.

11,823.—KILNS AND DRYING-FLOORS: *Meldrum Bros. and F. S. Orton.*—There are external furnaces in communication with flues beneath the floor, which latter should be constructed of removable slabs or tiles; two or more floors can be laid in series at different levels and be heated by one furnace or by separated furnaces. The invention concerns the manufacture of Parian cements, plaster of Paris, and barytes and china clay.

11,889.—A CONTRIVANCE FOR WORKING VALVES, COCKS, SWITCHES, &c.: *FROM A DISTANCE: L. Feldmann and L. Korach.*—A cylinder, which contains a spiral spring, is mounted upon the casing of the pipe, a link joins a bell-crank lever to the valve-handle, its axis being in engagement with one end of the spring; the free end of the lever will engage with a catch upon a pivoted lever supporting a plate. When the former lever is turned through 90 deg. the plate acts as the armature of electro-magnets that are connected to a battery circuit.

COMPETITIONS, CONTRACTS, AND PUBLIC APPOINTMENTS.

(For some Contracts, &c., still open, but not included in this list, see previous issues.)

COMPETITIONS.

Nature of Work.	By whom Required.	Premiums.	Application to be in
New Art School	Hull Corporation	100l., 60l., and 40l.	Jan. 31
New Buildings, and Laying-out and Fencing Field	Governors, Northampton School.	25 guineas to second	No date
Municipal Buildings	Stockport Corporation	Not stated	do.
New Public Library	Kingston-on-Thames Corporation	Not stated.	do.

CONTRACTS.

Nature of Work or Materials.	By whom Advertised.	Forms of Tender, &c., Supplied by	Designs to be delivered
Raising Boundary Wall at Cardiff Infirmary		E. Seward, Architect, Queen-street, Cardiff	Oct. 28
Road Metal (900 tons)	Pontypridd U.D.C.	E. Rees, Surveyor, Council Offices, Pontypridd	do.
Three Shops, North-parade, Bradford		S. Jackson & Son, Architects, Tanfield Chambers, Bradford	do.
53 Houses, Abercrombi, Wales	The Building Club	T. W. Millar, Architect, Mountain Ash	do.
Additions to Laundry at Workhouse, Fulwood	Freston Guardians	B. McE. Gray, Civil Engineer, Town Hall, Selby	do.
Building at Pumping Station, Whitworth-street West Street Works, Grange-avenue, &c.	Manchester Corporation	Waterworks Engineer, Town Hall, Manchester	do.
Additions to Hospital, North Prospect	Harrogate Corporation	Brough Engineer, Town Hall, Harrogate	do.

TO CORRESPONDENTS.

NOTE.—The responsibility of signed articles, letters, and papers read at meetings, rests, of course, with the authors. We cannot undertake to return rejected communications. Letters or communications (beyond mere news items) which have been duplicated for other journals are NOT DESIRED. We are compelled to decline pointing out books and giving addresses. Any commission to a contributor to write an article is given subject to the approval of the editor, when written, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance. All communications regarding literary and artistic matters should be addressed to THE EDITOR; those relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

TENDERS.

[Communications for insertion under this heading should be addressed to "The Editor," and must reach us not later than 10 a.m. on Thursdays. N.B.—We cannot publish tenders unless authenticated either by the architect or the building-owner; and we cannot publish announcements of tenders accepted unless the amount of the tender is given, nor any list in which the lowest tender is under £100, unless in some exceptional cases and for special reasons.]

\* Denotes accepted. † Denotes provisionally accepted.

ABERCARN.—For the erection of chapel, caretaker's house, &c., for the Urban District Council. Mr. George Stevens, Surveyor, Council Offices, Abercarn.— Ledbetter Bros., £2,650 J. Jenkins, £2,579 Davis Bros., Abercarn 2,648

### The Queen Victoria Memorial Designs.

HE designs for the Queen Victoria Memorial have been exhibited this week in a room in St. James's Palace. Of the selected design, by Mr. Aston Webb, we

have already expressed an opinion (see the *Builder* for August 3), and in the present issue we are enabled to give the plan and two perspective views; one looking along the Mall eastwards from Buckingham Palace, the other looking towards Buckingham Palace from the west end of the Mall.

On now having the opportunity, for the first time, of comparing the selected design with the others, we are decisively of the opinion that Mr. Webb has fairly won his position on the ground of the superiority of his plan. In a matter of this kind it is the plan, the mode of laying out the ground, that gives the key of the position. This is especially to be remarked in the manner in which the east end of the Mall is connected with Whitehall. It is at this point that all the other competitors have comparatively failed. They have nearly all got a weak junction of the Mall with Whitehall. The difficulty at this point arises from the fact that the Mall has to be brought into Whitehall at an oblique angle. Mr. Webb has hit upon the only means of getting over this inherent defect of the site, by inserting a circle at the junction—a feature which masks the irregularity of line of Pall Mall and Whitehall. Moreover, he has found out, what no other competitor seems to have discovered, that the central axis of the east Strand, produced, can be made to meet the central axis of the Mall at the centre point of his circular court. Thus the entrance to the Mall is made to centralise with the line of the Strand, instead of opening obliquely upon the line of Whitehall.

In the treatment of the semi-circular forecourt in front of Buckingham Palace one or two important alterations have been made in Mr. Webb's design since it was exhibited at the Foreign Office three or four months ago. The screen between Buckingham Palace court-yard and the semicircular court-yard is treated in a more monumental manner, being

transformed into an entirely masonic colonnade, in place of the iron grille and gates shown in the centre portion in the original design. This treatment gives a more homogeneous character to the screen in front of the palace, and also makes it more of a real and effective screen between the immediate courtyard of the Palace and the semicircular ornamental garden or parterre into which the public would have access. In the outer semicircular screen the pavilions on each side of the central entrance have been suppressed, and their place is taken by a lower screen wall with obelisks flanking the entrance; the object of the alteration being to clear the view of the actual monument as seen from the Mall, and leave it more open to the road. The flights of steps which, in the view we publish, are seen on the outer side of the quadrant, descending to the level of the walk by the St. James's Park lake, though retained in this drawing, are to be abandoned, as the architect considered (and we quite concur with him) that they broke the curve of the retaining wall in an undesirable manner, and were unnecessary in a practical sense, as the broad flight of steps opposite the end of Buckingham Palace-road give all the access necessary to the Park walks. As now intended, the curved retaining walls will rise directly out of the Park lake, and be reflected in its waters. Another point which is gained is that it is proposed to remove the lodge now standing at the south-west angle of the Park, and which is not central with anything, and to place there a small monument of some kind, with a parterre of shrubbery in front of it, past which there will be a direct vista along the Park water to the Horse Guards. The whole of this design, in fact, is calculated to secure centralised lines of vista; and that is one of its great merits—it is all laid out on a symmetrical system. The semicircular enclosure in front of the Palace-yard screen is laid out, as will be seen in the view, with a pavilion and a fountain half way along the quadrant, and a decorative arrangement of parterres internally, following out the design of the semicircular screen, and connected with it. A small portion of the Green Park is cut away by the screen, but as much as is taken away from the public in this way with one hand, is given back to them with the other, as they will be freely admitted to this decorative place within the semicircular screen.

In regard to the central monument by Mr. Brock, as to which we remarked in a former article that the architectural competitors seem to have been left to work up to a sculptural monument without having any notion of its design, it appears that there was a conference between the sculptor and the architects, in which the former described in a general way his intended design, and the proposed disposition of the sculpture, and gave the architects a base of 50 to 60 ft. to work to. But it was subsequently found that this base was quite insufficient, and the actual width of the base of the monument is over 100 ft. Mr. Webb has from the first assumed that a central exit from the Palace yard, against the back of the monument, would be out of the question, and has accordingly carried the screen of the Palace yard across the back of the monument, in a curve following the lines of its plan, and made two entrances, or rather an entrance and an exit, one on each side of it.

The general details of the design are of a quiet and unpretentious Classic type. The dignified effect of the whole arises from the *ensemble*, and from the admirable and consistent manner in which the whole is planned. One could not find a better example of the principle that plan is the basis of design.

No other competitor has achieved such an architectural connexion of the Mall with Whitehall as we see in Mr. Webb's plan. Both Mr. Jackson and Mr. Ernest George leave what we call a *delta* between Whitehall and the real commencement of their processional road. Mr. Jackson commences his processional road just west of the York column steps; which, failing a direct connexion with Whitehall, was perhaps the best and most obvious point to commence. He erects there a large and fine arch, of severely treated Classic style, crowned with a bronze group of fine outline, and with a bronze bas-relief inserted near the foot of the large plain masonry piers on each side. The design for the wrought-iron gates looks as if it would work out into something fine and sumptuous on full size scale. The central archway gives access to a central avenue 40 ft. wide, bordered by tolerably wide strips of lawn which are backed by trees, while along each side of the margin of the road are a series of statues at regular intervals, each on a pedestal at the back of a small semi-circular *exedra* cutting into the

grass lawn. All this would have a very good effect. We observe that the *Times* objects that one could never find enough good statues to fill up the scheme; but that is quite a mistake; it would be only a question of commissions and money. There is enough talent among the younger generation of English sculptors to supply any amount of good statues, if the Government would only give them the opportunity. In regard to the road, we may observe that every competitor has perceived that, as a matter of course, the axis of the road along the Mall must align with the centre of Buckingham Palace; which means that the existing trees must either be destroyed or moved, as we pointed out from the first.

Mr. Jackson's decorative forecourt at the end of the road, and in front of the Palace railing, is laid out in a most effective manner. It is a parallelogram flanked by a colonnade, which is returned at the east side to make an angle emphasised by a picturesquely designed pavilion on each side, with curved pediments and crowned by an obelisk finial, and seated bronze statues at the four angles. The bronze statues would perhaps, in this position, detach themselves a little too strongly from the stonework, and one is doubtful whether the effect would not be better, because more homogeneous, if the statues were of the same material as the rest of the pavilion. The side portions of the space within this screen, the width of which is defined by the return screen, are laid out in a most artistic manner as an ornamental parterre, the centre being accentuated by a large bronze fountain on the margin of each parterre, while two sub-centres, as we may call them, in each parterre are marked each by a group of white marble statuary on a large pedestal of the same material; the four groups symbolising respectively South Africa, Canada, India, and Australasia. A brilliantly executed water-colour drawing, somewhat too profusely peopled with nurse-maids, shows well the sparkling effect of the white statuary groups with the stone screen as a background. This design contains many fine suggestions, and the monumental arch forming the entrance to the road is perhaps the best example in the competition of this type of erection, owing to its mass and simplicity of outline.

Mr. Ernest George's design also shows many fine points in the architectural detail. Like Mr. Jackson, he leaves a *delta* between his monumental road and Whitehall. Considering that one point in regard to the scheme was the opening out of the Mall into Whitehall, it seems odd that three out of five of the competitors have left this junction of the two roadways practically to take care of itself. Having found our way from Whitehall through the *delta*, we come upon a graceful monumental arch with centre and side openings, much lower in proportion than one is accustomed to see a monumental arch, and therefore not so imposing as some of the others; but a very pleasing and harmonious composition. The road is treated very simply, with a row of trees on each side, which is "stopped" to the west of the Duke of York steps, and on either side of the opening to Marlborough Gate, by a pedestal placed longitudinally in line with the line of trees. Mr. George's ornamental court in front of Buckingham Palace is of longer proportion than the others, and

carried further eastward into the Mall; it is a parallelogram terminating eastward in a semi-circle. The monument is placed in the centre axis of this court, in a smaller parterre of its own, running lengthways and parallel with the outer screen of the court, and terminated at each end by a fountain with a circular basin. As the entrance to the court is central in the middle of the semi-circular screen, the traffic enters facing the monument and fountains, and then divides on each side of them, the north side leading to an opening into Constitution Hill, the south side to one into Buckingham Gate. Thus the traffic is taken *inside* the monumental court, and diverges close past the enclosure railing of the Palace itself, instead of being kept, as in the selected plan, entirely outside the monumental court and therefore further away from the Palace. This seems a decided mistake as to traffic planning, but there is plenty to admire in the architectural details of the design. The fountains at the back and front of the monument would have a fine effect. The semi-circular screen which bounds the court eastward is a double colonnade with domed pavilions at intervals. At the north and south sides of the court the screens are treated in a simple but exceedingly graceful manner. On the south side we have at intervals a group of four columns close together on the corners of a square, carrying entablatures and statues, and based on a projecting rusticated pier in the masonry below; on the north side we have similar groups of four columns, with a light iron railing between them, about two-thirds the height of the shaft. The effect of this, as shown in the geometrical elevation, is very refined; and the effect of the screen in the general view, with the masses of foliage outside it, is very good. In the interior of the court, it should be added, the parallelism of line east and west and is kept up and emphasised by a formal row of trees on each side of the monument site and parallel with it and with the outer screens.

Sir Thomas Drew, like the two last-named competitors, avoids attempting any special treatment of the junction of the Mall with Whitehall; he says that sufficient cannot be obtained by any triumphal arch brought forward "to the frontage of buildings in Charing Cross incongruous with it," but he is not content to leave a *delta*, and in this respect his design is more carefully considered than most of the others. He provides, as soon as we are clear of the street buildings, a forecourt of architectural dignity, 110 ft. wide and flanked by buildings of stately character, which is to form a kind of vestibule to the monumental arch and road, a transition between the common street and the State road. This is a fine idea, but the monumental gateway itself we cannot like; it seems to us quite out of proportion—too high for its width, and not fortunate in its sky line. The Mall is made to take one straight line from a point north of Drummond's Bank (so as to avoid the cost of buying that out), and as the trees of the Mall must be displaced in any case, not being central with the axis of the Palace, the line can just as well be turned a little as not. Sir Thomas Drew is the only one of the competitors who tries to insist on remodelling the front of the Palace. Others probably saw the desirability of this as fully as we did, but did not perhaps feel justified in

offering what they were not asked for. Sir Thomas Drew says in his report on the design:—

"The front of Buckingham Palace, built in 1842, cannot be said to be a work of fine architecture or a background of dignity for the great memorial. A memorial composition standing, say, 60 ft. high would not eclipse the Palace front, but would somewhat subordinate the central entrance as its leading feature. My proposition is to recast the façade architecturally without changing its fenestration or altering the internal arrangement. I would raise a pavilion block at each end, advanced from the building, which would give cast shadow to break the monotony of the elevation. The front I would remodel—accepting the present floor levels and window spacing—by applying a Corinthian order elevated on a rusticated or coursed basement, as an improvement of the present lowest story. I submit a detailed elevation for an architectural front."

With this we entirely agree; and we may add that the treatment of the Palace façade, considering that the author has felt bound to retain the windows as existing, is very successful and quite worth consideration, while it is not such as to entail any exorbitant outlay.

Dr. Rowand Anderson's design is, at the Buckingham Palace end, much slighter and more unpretending than any of the others; he seems to have assumed that the monument should dominate everything at this part, and that there should be no important architectural features to compete with it. Consequently we have only a balustraded semicircle as a plateau for the monument, with a smaller plateau at the re-entering angle at each side, containing ornamental fountains. In his Report on the design,\* he seems to assume that he was to make a design for the monument itself, which we take it is Mr. Brock's commission; the architects were only to furnish the frame for it, though it will no doubt be better if the architect who carries out the work assists the sculptor in the architectural details of the monument. Dr. Anderson's proposed treatment of the roadway, and of the decorative sculpture connected with it, is of considerable interest; we have not space to go into it fully, but the arrangement of the sculpture is intended to illustrate historically the title of the present sovereign to the throne. The statues of English sovereigns are arranged in historical order, and opposite Marlborough Gate is a special feature in the shape of a balustraded semicircle, laid out as a parterre, with an equestrian statue of Queen Elizabeth at the crown of the semicircle, and statues of great men of the Elizabethan period on subordinate pedestals in and at the extremities of the balustrade. This is a fine idea. At the commencement of the monumental road, where, like other competitors, the author makes no attempt at a definite architectural connexion with Charing Cross, there is an elaborate and graceful two-storied triumphal arch of Renaissance type, the upper arch containing an equestrian statue—in whose honour is not suggested. This arch is a very pleasing design in itself, but it is set in the middle of a space so that people can walk round on each side of it; a treatment which always looks rather unmeaning in the case of an arch which is intended as a gateway.

\* Sir T. Drew and Dr. Anderson each kindly sent us a copy of his Report. The other competitors' Reports on their designs we have not seen.

THE WORK OF THE LOCAL GOVERNMENT BOARD IN 1900.

**T**HE work of the Local Government Board is singularly characteristic of the English Constitution, for it has to do with the most diverse matters, and in most cases it is merely an addition to each Local Authority. It advises, condemns, and adjudicates, but the actual working machine is in some form or another the Local Authority, the County, the District, or the Parish Council, or the Guardians of the Poor. And it says much, on the whole, for the tact of English administrators that this "meddling" function, so to say, is discharged in such a manner that there is scarcely any friction between the Local Government Board and the many Local Authorities scattered from one end of England to the other. But with so varied and large a mass of work it is impossible for us to do more than note some portions of it.

At the present time one of the subjects uppermost in the public mind is that of taxation; it may be desirable, therefore, to touch on the subject in regard to local loans. For every loan to a Local Authority means sooner or later, additional taxation to the inhabitants of the locality. It will, we think, somewhat startle the ratepayer when he is told that during the year ending December, 1900, the Local Government Board has sanctioned loans to Town Councils and to Urban District Councils under the Public Health Acts which in the aggregate amount to nearly six and a half millions (6,304,217*l.*). But this expenditure represents, large as it is, an equally large advance in the public well-being, and shows that, in spite of the sanitary shortcomings which are still to be found, the country is making distinct progress towards a more satisfactory situation. The objects of the expenditure are not classified in the Report\* before us, but in all cases they tend to the material and intellectual benefit of the ratepayers, and the latter undoubtedly in exchange for the expenditure obtain substantial results. Street improvement appears to be the most important head; but sewerage is much in evidence, water supply, lighting, hospitals, fire-stations, public libraries and reading-rooms, public walks or pleasure grounds, are all subjects which are to be found in this table. And it is specially satisfactory that the expenditure should not be confined to purely utilitarian purposes, and that considerable sums should be spent on such work as public walks and pleasure grounds. Lancaster, for example, required 4,500*l.* for this purpose, Glamorgan 5,093*l.*, South Shields 2,000*l.*, and Stockport 6,881*l.* None of these places are tourist resorts; they are busy commercial towns; and the expenditure is not for the benefit of holiday-makers, as at Scarborough and Southend, but for those who are living lives of toil.

When we come to the question of artisans' dwellings, we do not find so large an expenditure by borrowing as might have been expected—the total is 608,512*l.* Burton-on-Trent was one of the largest borrowers, since this town required 33,000*l.*, a point which is of some interest, since there is an idea that the housing problem is a serious one only in a few large towns.

It is interesting to refer to the results of the Small Dwellings Acquisition Act, 1899, which was a pet scheme of Mr. Chamberlain, and which some Government supporters are in the habit of referring to as one of the great social reforms of the present Administration. At present the legislative mountain has produced an infinitesimal mouse, for only 1,830*l.* has been raised by loans for the purpose of this Act, an amount which, unless largely increased in subsequent years, shows that the Act is of no value at all.

In the foregoing remarks we have been concerned only with towns and urban districts. What has been done in the country villages? The amount of loans by Rural District Councils which has been sanctioned was 623,067*l.* To a certain extent it would appear that the term "Rural District Council" is not an accurate description of this Authority, since some of the districts—as, for instance, Merton, and Mitcham, and Pinner—have a good deal of the suburban character about them. The purely rural districts do not seem to have needed money. Most of the loans have been required for purposes of sewerage and sewage disposal, but occasionally highway and street improvements have been the objects on which money has been spent. Improvements in rural districts are less costly than in urban districts, and therefore we may probably be satisfied with the progress which is shown by the character of these statistics. If we add the amounts sanctioned both in the case of town and country we arrive at a total of over seven millions, nearly all of which represents money which has to be spent either in materials or labour, and a great deal of which goes into the pockets of artisans. Before leaving this subject we may conclude with the following figures: In the year 1874-75 the National Debt of the United Kingdom was, in round figures, 768,000,000*l.*, and the amount of total outstanding loans of Local Authorities was 92,000,000*l.*, which gives a percentage proportion of Local and National Debt of 12.07. In 1898-99 the National Debt had fallen to 627,000,000*l.*, while the Local Debt had increased to 276,000,000*l.*, and their proportion to 44.02—figures which we think justify the Local Government Board in not making borrowing by Local Authorities too easy.

One of the most important functions of the Local Government Board is its supervision of the poor law administration of the guardians. With this we are scarcely concerned, though one point should be noted, and that is the extension of cottage homes for pauper children. The planning of these homes to keep them as nearly as possible like private dwelling-houses would seem to give occasion for careful architectural thought, for it is essential that, whilst containing a reasonable number of children, they should at the same time be domestic in their character. One of these cottage "settlements" is thus described which belongs to the Rochdale Union. It consists "of a superintendent's house, a receiving home, eight homes holding twelve children each, and arranged in pairs, together with a home used temporarily as an infirmary." In the Blackburn Union these homes have been so planned that if for any reason it was desired to change their use, each home can, by very slight alterations, be converted into two

ordinary cottages. A larger extension of this system is extremely desirable.

As we said at the commencement of this review of the work of the Local Government Board, they have, so to say, to "condemn" Local Authorities for neglect of duty. On the whole, though individual inspectors have strongly criticised the inaction of various Authorities, it does not appear that the Board itself has done very much. A complaint, it seems, was made against the Urban District Council of Farnborough that it did not provide sufficient sewers, and after a local inquiry the Board found that the complaint was duly substantiated, and accordingly called on the Council "to take the question of the execution of a proper scheme of sewerage into immediate consideration," and they have since submitted a scheme. The same result has arisen from a complaint against the Rural District Council of Halesowen and also against the Town Council of Truro. We suspect, however, that if inhabitants and ratepayers would more generally make complaint of local shortcomings, whether in regard to sanitation or housing, more Local Authorities would be found to be in default. But, unfortunately, few persons are willing to take such individual responsibility, especially if it is to result in higher rates, for there are many who would rather run the risk of illness than take the certainty of an increased rate.

We note that the Board print in this report various circulars and also abstracts of recent statutes; one of these is the ancient Monuments Protection Act, 1900, which empowers County Councils to become the guardian of any historical monument situated in their county or in an adjacent county, or to contribute towards the cost of maintaining or managing such monument, which is defined as being "any structure, erection or monument of historic or architectural interest." We could have wished that a circular had been issued to every County Council drawing their attention to this statute. It was but a week or two ago that we published an appeal for funds to preserve a monument of undoubted architectural interest in the West of England. It is very desirable that this statute should be fully made known, and we can see no reason why, as the Local Government Board call attention to it in their report, they should not also do so by circular letter. Their powers and responsibilities are very extensive, and it may be that they draw the line at exercising any of the functions of a ministry of fine arts. We may in that case ask, Why was it thought desirable to refer to the Report to this statute at all?

NOTES.

Liverpool Cathedral.

To the surprise of every one, and certainly much to their own credit, the Liverpool Cathedral Committee, as will be seen from their advertisement in our present issue, have accepted the criticism of the architects as to their false position, and have withdrawn any requirement as to the copying of a particular historical style of architecture in the designs for the proposed cathedral. We say it is to their credit, for it is not every day that we meet with a committee in connexion with an architectural scheme who will have the candour and good sense to own that they have been proved

\* Thirtieth Annual Report of the Local Government Board, 1900-1901.

to be in the wrong, and to act accordingly; and we might name more than one public body in London, entrusted with important public works, which has been as unmistakably shown to be in the wrong, but has adhered to its mistake out of sheer obstinacy and a refusal to give way. We think also that the architectural profession owe their thanks to the *Times* for its able and cordial support in the controversy. We observe also that the Committee have undertaken unreservedly to employ professional advice in making their selection for the final competition. We think it would have been much better if, instead of asking for portfolios of specimen drawings, they had organised a regular sketch competition for this cathedral in the first instance; the sketch designs to be publicly exhibited, and from them a limited number to be selected for the final competition. We should then have some idea what each of the selected competitors meant to do with the actual site, which under the present arrangement may remain a mystery until the final designs are actually sent in. However, we must hope that under the present better auspices there may be a good result in the end. At all events, there can be no doubt that the controversy which has arisen on the subject has done a great deal of good; it has compelled many persons, probably, to think about the real meaning of architecture in a way they never thought before, and has excited a great deal of public interest in the cathedral scheme; so that on the whole we may think that the initial mistake was a fortunate one, which led to so useful a discussion of the subject.

**The Duke of Devonshire on Education.**

THE Duke of Devonshire's speech at Liverpool on Saturday last explains very clearly why so little progress has been made by the Government in organising secondary and technical education; it is because the head of the Education Department—the Duke of Devonshire—has not the necessary courage and constructive ability. He complains that the schemes and the suggestions of technical experts are not clear. Of course, educational experts differ as to details, but it is for the statesman to choose among these methods. The Duke also complains of apathy on the part of the people. If he refers to the more ignorant of the electorate he is right; but there is abundant desire among all thinking people to see education improved. It never can be a subject on which the ordinary elector will grow warm, and it is the business of a statesman to follow the lead clearly given to him by the more thoughtful portion of the community and to endeavour to carry measures through Parliament. Of course, if the chief of the Education Department is afraid to act, the educational obstructives will soon put an end to any measure which the Government may propose. That County Councils, District Councils, and other Local Authorities are jealous of each other and have conflicting claims difficult to reconcile is, we think, untrue. But no Local Authority with a sense of business desires to have the law in such a state that it raises disputes among different authorities. To carry out a thorough system of technical and secondary education requires, we fear, men at the head of the Education Department stronger, more enthusiastic, and more clear-sighted than its present chiefs.

**The London Building Act.**

NEITHER decisions of County Court Judges nor magistrates are binding as legal precedents, but they are useful indications of the manner of interpreting statutes. The recent judgment, therefore, of the magistrate at Marylebone should be noted, since he held that where a building which could be inhabited in separate rooms came within section 74 of the London Building Act, if in other respect as regards size, it was covered by the words of the section. To say that the words "separate set of chambers, offices, or rooms" did not include separate and single rooms, would obviously have been contrary to the whole object of the section, which clearly is to protect the inmates of these large modern buildings, whether the inhabitants dwell in flats or in single houses.

**Domestic Filters.**

In the *Times* of Saturday last Dr. Priestley, the Medical Officer of Health for the Borough of Lambeth, draws attention to the "need that exists for domestic filters and a strict standard in connexion therewith." He points out [that sand-filtration on a large scale does not always yield a pure water, and that, even if it does, the water may be subsequently contaminated in the mains and in storage tanks; hence the necessity for domestic filters. The well-known tests carried out at the conjoint laboratory of the Royal College of Physicians (London) and Surgeons (England) are briefly noticed, and interesting particulars are given of the surprising reduction of typhoid fever in the French army which followed the use of Pasteur (Chamberland) filters. Dr. Priestley considers these filters to be much superior to those made of infusorial earth, and to be, indeed, the only filters which are really satisfactory. There is little that is new in Dr. Priestley's letter, but its insertion in the columns of the *Times* may do something to dispel the ignorance which prevails as to this important subject. Filters are still sold in great numbers which are worse than useless for purifying water, and the public cannot be too often reminded of the dangers of such appliances. At the same time, where a Public Authority supplies water for domestic purposes, the consumers may reasonably claim that the water shall be sufficiently pure without recourse having to be had to private filtration.

**Ecclesiastical Dilapidations.**

THE season of diocesan conferences has now nearly concluded. It has been noticeable for the fact that in almost every one of these gatherings ecclesiastical dilapidation has formed a prominent subject of discussion. Unfortunately, however, no clear solution of the present difficulties has been universally agreed on. We have already pointed out that the businesslike way of dealing with dilapidations is to exact that there shall be periodical surveys of clerical buildings, so that they may never be allowed to fall into the bad condition which is now so common. At the present time when a clergyman is offered a living one of his first considerations is the state of the parsonage and the adjoining premises. Over and over again a living is declined because of the amount which must be spent in putting the parsonage into repair. In many cases the retiring vicar or rector or his representatives are quite unable to meet the demand on them. This state of

things can only be prevented by not allowing dilapidations to grow up, and this result will never be attained unless repairs even of a small kind are done at necessary, and it may be, frequent intervals. But business capacity is not characteristic of the clergy, and there is something pitiable and a little contemptible in observing the incapacity of the clergy to place the question of dilapidations on a reasonable footing.

**Proposed Memorial to Mr. James Brooks.**

THE Vicar of St. Faith's, Stoke Newington, writes that there is a feeling—with which we entirely sympathise—that some steps should be taken to erect a suitable memorial to the late Mr. James Brooks, especially in consideration of the work which he did in church architecture. With this idea, such a monument would fittingly be raised in some one of the churches for which he was architect, and the fact that Mr. Brooks was for twelve years churchwarden of St. Faith's renders it suitable that this church should be the one to contain his monument. It is true that Mr. Brooks was not the original architect of the church, which was designed by Burges (not "Burgess," as the Vicar's circular spells it); but he added largely to it, besides being connected with it in the manner already mentioned. Any one who wishes to subscribe to such a monument is invited to communicate with the Rev. C. H. V. Pixell, St. Faith's Vicarage, Stoke Newington. As to the form of the memorial various suggestions have been made—a chancel screen, a stained glass window, a screen between the church and chapel &c.; and the Vicar would be glad to have suggestions from any of Mr. Brooks's friends. We should say that the memorial ought certainly to be in architectural form—a screen or other such object rather than a window. With this suggestion we are glad to express our entire concurrence in the proposal. Monuments are erected to many who have far less claim to them than Mr. Brooks had.

**The Safety of Theatres.**

THE "Old Playgoers" Club met at the Criterion, London, on Wednesday evening last to debate upon "The L.C.C. and the Safety of Theatres." The discussion was opened by Mr. E. O. Sachs, who expressed the opinion that good planning in the arrangement of theatres is of more importance than the use of fireproof materials or the adoption of a system of surprise inspections. He considers that the new regulations issued by the L.C.C. may be taken as a model of what such regulations ought to be, but advocates an extension of the powers of the Council. He remarked that the vacillation in the policy and requirements of the Council has made that body unpopular with the managers of old theatres, and thinks that the managers would have less cause for complaint if the London County Council and its Committees would leave matters more in the hands of its permanent officials, and especially to the superintending architect, instead of allowing every succeeding election and every change in the composition of its Committees to exert an influence upon the policy of the Council. Mr. Sachs further suggests that the Local Authorities should be relieved of their responsibilities with regard to theatre construction, and that one central authority, such as the Home Office or some other Government

Department, should be charged with the superintendence of theatre construction throughout the whole of the United Kingdom. Several speakers pointed out that many provincial and foreign theatres possess better accommodation and more efficient arrangements for preventing the spread of fire than can be found in any London theatre. Most of the members of the club who took part in the discussion regarded the London County Council as the most suitable authority to have control over the construction of London theatres; but of eight theatre managers from whom replies to questions had been received, seven considered that the authority should be vested in the Lord Chamberlain, who already acts as censor of plays, rather than in the London County Council.

Architectural Association Conversazione.  
 THE annual conversazione of the Architectural Association was held on Friday evening last week at the rooms of the Institute of Painters in Water-colours—an excellent place for the purpose, as not only is there a large and fine suite of rooms, but the pictures on the walls—in this case the collection of the "International" Society—afford in themselves a very valuable addition to the entertainment. The visitors were received by the President and Mrs. Seth-Smith. The band of the Imperial Orchestra, in the East Gallery, played during the evening a selection of instrumental music, varied by the interpolation of songs by Miss Lilian Corner and Mr. Avalon Collard. In addition to the pictures on the walls, there were on view on screens the drawings by Mr. F. T. Green which obtained the Banister Fletcher Bursary; some water-colour sketches taken during the Association excursion to Cirencester by Mr. A. W. Hennings; architectural photographs by Mr. Wonnacott; some excellent work executed in the School of Design; and the design for a boys' school, by Mr. Drysdale, which obtained the Association Silver Medal. The large and commodious tea-room attached to the gallery enabled refreshments to be secured with more comfort and less crowding than on some other occasions. The attendance was large and the whole entertainment very successful.

The Fine Art Society.  
 At the Fine Art Society's Galleries is to be seen a collection of water-colour drawings by Mr. Alberto Pisa, exhibited under the title "The Cities of Central Italy." The artist, though for many years a resident in London, is a native of Ferrara, and has returned to his native land for the subjects of this collection of seventy-one drawings. The interest of the collection is perhaps architectural and topographical rather than artistic; that is to say, the drawings do not display any special power as examples of water-colour art, but they form an interesting series of illustrations of ancient architectural monuments of Italy, treated with a style which is sufficiently truthful in representation without becoming hard or realistic. Among the best are several of the illustrations from Perugia, especially "Roman Aqueduct, Perugia" (16), "Porta S. Susanna" (19), and the Arch of Augustus, in the same venerable city. Several illustrations of Siena Cathedral are

very good; also "The Duomo, Orvieto" (25), the "Marcella Fountain at Assisi" (40), the Brick and Marble Arcade in S. Maria Novella, Florence (42), the view of San Francesco, Assisi, and "The Back of the Church of Santa Maria Novella" (48), with its curious octagon brick columns with shields on the capitals. In the view of the "Piazza San Marco, Venice" (29), in which the lower portion of the campanile is seen, the long narrow pilasters are hardly sufficiently defined to give the impression of the structure. But architects should find much to interest them in the collection.

Messrs. Tooth & Sons' Gallery.  
 THE winter exhibition at Messrs. Tooth & Sons' Gallery in the Haymarket includes one of the finest works by M. Harpignies that we remember to have seen—"Château Gaillard" (29), a foreground of trees and foliage beyond which is a river and the old chateau, light in the sunshine. The building is not quite upright—even the greatest landscape painters do not seem to get over that little difficulty, but it is only a minor feature in the composition. The other central work on the walls is M. Bouguereau's "L'Élégie" (43), seen some two or three years ago on the Academy walls; a picture which represents the best of Bouguereau's art, full of the superficial beauty of colour and sentimentality, but totally devoid of feeling. Then there is M. Seignac, whose "Crainive" (4) is Bouguereau at second hand; equally sentimental and conventional, and not so fine in technique. A comparison with Millais' "Castaway," which hangs a few feet from this, affords a good example of the difference between first-class and second-class painting. Landscapes are the strong point of the collection. Oakes's "Fording the Tidal Creek" (5) is rather mannered in the foreground, but is a fine work as a whole. It is interesting to compare Mr. H. W. Davis's early and late style of work in "A Siesta" (1) and "East of the Sun" (70); the former, in spite of a little hardness, is a picture with more earnestness in it than the later and more sentimental picture. Among other things is a powerful brown landscape by M. Jacque (21); Mr. Crofts's spirited and real "Hougoumont" (41); a capital bit of Venice by M. Gallegos (44); one or two heads by M. Henner and another (a better one) by M. Dagnan-Bouveret; one specimen of Herr Israels (77); a fine landscape by M. Lhermitte (76), and various perfect pictures of dogs by Mr. Blinks. There are too many of Mr. Leader's tame conventional landscapes, but in the largest work, "Hills and Crags of North Wales" (63), he rises above his usual level.

Maclean's Gallery.  
 THE most noteworthy things in the exhibition at Mr. Maclean's Gallery in the Haymarket are a large landscape by M. Harpignies—"Early Autumn," which we seem to remember at one of the Paris Salon exhibitions, and the late J. C. Cazin's beautiful and poetical work "A French Homestead," a landscape of quite unusual power and originality in style and colour, and which is alone well worth a visit to the exhibition. M. Lhermitte's "Noonday Rest" is a good example of his broad and masterly style, and there is a fine landscape by Wimperis. Among less important works the small landscapes by M. Lamoriniere

are worth attention. The first room is occupied by a collection of etchings and slightly sketched crayon portraits of ladies by M. Helleu, who seems to be anxious to establish a *chicotele* here, as it is stated in the catalogue that he will visit London shortly to execute any commissions that may be received for portraits, so that this exhibition is evidently a kind of display of his faculty in feminine portraiture. Whether he will be able to render the style of the London lady as faithfully and characteristically as he portrays the Paris lady, or whether English ladies will not find themselves too much Frenchified in his portraiture, is perhaps a matter of question, for the resolution of which we must wait till some of these hoped-for London commissions have been executed.

The Goupil Gallery.  
 THE Goupil Gallery has changed hands, and is now to be under the direction of Mr. William S. Marchant, late manager to Messrs. Boussoad & Valadon; and the exhibition now on view is the first under the new management. It is not a very exciting one, unless for those who have a peculiar taste for what may be called the dark orsmudgy school in landscape. The names however are good enough, including Mauve, Israels (who shows us, under the title "The Bathing," the unwonted experiment of a nude figure), Maris, Corot, Bastien-Lepage, Harpignies, Troyon, &c. The Corots, however, are very small sketches, not of great value apart from the name. There is, however, a perfectly beautiful little Diaz, "The Forest Pool" (35), in his finest style; a fine work by Herr Israels, "Maternity," and two or three admirable pictures of winter effect by Mr. Fritz Thaulow. But on the whole a row of eminent names does not do away with the fact that most of them are attached to comparatively unimportant works. Bastien-Lepage's small but highly finished head of the present Sovereign, painted of course when he was Prince of Wales, is a remarkable work. But we shall hope to see better exhibitions than this in Mr. Marchant's gallery.

Socialist Art.  
 A CORRESPONDENT writes to us to know what the Editor of this journal meant, in his address to the Architectural Association School of Design published in our last issue, by his reference to the lamentations "of what may be called the Socialist school of critics" over the supposed death of architecture. The use of the word "Socialist" *en passant* was not intended with reference either favourable or the reverse, to any political or social theory of life, which was not the business of the address. It was merely used as characterising those who seem to think, as William Morris certainly professed to think, that architecture was an art emanating solely from the people; the work of associated craftsmen, in fact. That might very well be termed a Socialist view of art, as opposed to the view of an artistic conception as the work of an individual mind. The use of the word had no reference to any "platform" whatever.

THE GLASGOW EXHIBITION BUILDINGS.—A meeting of a special committee of the Corporation was held on the 23rd ult. to consider a proposal to retain permanently a portion of the exhibition buildings. There is a feeling that the Concert Hall and the Machinery Hall might be retained, and the committee decided to have a report prepared on these buildings.

## LETTER FROM PARIS.

The "Vieux Paris" Committee has asked for the rebuilding of the monument erected in 1802 on the Place Dauphine to the memory of General Desaix, which was demolished in 1875 when Alphand undertook to clear the place in front of the façade of the Cour d'Assises, which had just been completed from the designs of Duc. This monument, very dilapidated—a mediocre work by Percier—has been relegated to the storehouses of the Beaux-Arts, and its restoration, at a cost of 18,000 fr., would have made it a new monument of no historic interest. The financial argument has convinced the Committee, which has asked the Prefect of the Seine to arrange with the State to exchange the remains of the Desaix monument for the curious plans in relief which are preserved at the Invalides, and would be much more at their place in the Carnavalet Museum. Unfortunately, it is to be feared that these historic relics, especially the figure of the warrior with the Roman helmet who crowns the bust of the conqueror of Marengo, will not bear transport and will fall to pieces on the road.

For one monument disappeared how many others rise up on all hands against which the "Vieux Paris" Committee might well protest! While on the Champs Elysées, which the statumania has hitherto spared, they are erecting the monument of Alphonse Daudet, the garden of the Luxembourg continues to be encumbered with the effigies of authors and poets, some of whom little merit such an honour. Thus Ferdinand Fabre, author of some tolerable romances, who died recently, has already become a great man worthy of a marble statue. On a pedestal, designed by M. Pujol, a Languedoc peasant girl is seated at the foot of a column supporting the bust of the author (by M. Carqueste). It is sad to have to confess that Corneille and Racine are still forgotten.

The monument to Charles Garnier, who was a figure essentially Parisian, will not encroach upon any public garden. It will be placed in its right position adjoining the Opera House, which was his great work, and which will always be connected with his name. This monument is in progress, and will probably be placed in position next year, for the granite pedestal is to be sent from Scotland completely finished at the end of the present year; and M. Germain, the sculptor, has already modelled the ornaments for it, which will be cast by Messrs. Christofle, and M. Thomas has just completed the two accessory statues.

At the Luxembourg Museum M. Bénédite is preparing an exhibition of the works of Félix Buhot, the engraver. It is a good idea, for this artist left a number of drawings, engravings, and etchings which are little known and are of great merit. Among them are some beautiful Normandy landscapes, picturesque corners of Paris, and also some interesting views of London, including some drawings of the Houses of Parliament. Besides this exhibition the Curator of the Luxembourg is arranging in the gallery of foreign painters a selection of works by English and American artists.

The Union Centrale des Arts Decoratifs has at last officially taken possession of the Pavillon Marsan, and will be able next spring to open the first part of its new museum.

At the Trocadéro Museum the gallery of megalithic and prehistoric monuments has recently been opened, and in a few days the public will be admitted into the ethnographic gallery, consecrated to France and her colonies.

Puis de Chavannes has been dead for three years, and the mural paintings in the Pantheon after his cartoons are not yet finished. Cazin, who had been commissioned to finish them, has in his turn died, since when the cartoons have remained in the ateliers of the Louvre without any further decision being come to with regard to them. The selection of an artist to complete the work is no doubt a very difficult matter, but it is one which ought to be undertaken, and the Directeur des Beaux-Arts should inquire among the artists who were the constant assistants of the master, such as Alexandre Séon, the dreamy and mystical painter who was his favourite pupil, and whose works, recently collected in a private exhibition, impressed every one with their poetic charm as well as their purity of line.

As is well known, the painter Chenévard has instituted at the Ecole des Beaux-Arts some prizes of great value to be competed for, and

which in the eyes of the young artists are almost as important as the "Concours de Rome." The twenty-five pupils whom the jury selects to take part in the final competition receive each a subsidy of 2,000 fr., independently of the prizes awarded in the final competition. The prizes are awarded for painting, sculpture, medal work, copper-plate engraving, and architecture. In this last division are five candidates, MM. Coutan, Ferret, Janssely, Prévot, and Hubanié.

M. Detaille is executing for the Hôtel de Ville two large paintings for the Salle du Budget, the sketches for which he has just submitted for approval. The first of these represents a scene of volunteer enlistment under the First Republic. The scene is on the Pont Neuf, where the volunteers are being enrolled in the midst of popular acclamations; the picture forms a kind of restoration of this corner of old Paris, with the red brick houses of the Place Dauphine, the Henri IV, statue surrounded with scaffolding, the quays lined with the old houses which have now disappeared. The other painting shows the Barrière de la Villette, at the moment when the Imperial army brings to Paris the standards taken from the enemy, and is received in state by the municipal authorities. This decoration, which will certainly rank among the finest of M. Detaille's works, will be completed by a ceiling with an allegorical design, a kind of equestrian trophy symbolising France triumphing over her enemies; a design which will exhibit the genius of M. Detaille in a new light.

## CHELSEA, LITTLE CHELSEA, AND BROMPTON.

1801-1900.

No longer a "village of palaces" separated from the town by the Neat Gardens and the gently flowing West Bourne, Chelsea can now boast of three river bridges, a new parish church, a public free library, a polytechnic institute, barracks, a riverside embankment, and a theatre; it returns one member to Parliament and five to the School Board for London; we may epitomise its more modern history by saying that it is constituted a Metropolitan Borough under the London Government Act, 1899. Lysons records that in 1795 about 1,240 of the 1,350 houses in the parish were inhabited, the rest being for the greater part unfinished.

The earliest building project that comes within our theme consists of the laying out in 1800 of Chelsea Common, about 37 acres, for Whitehead's-grove (named after George III.'s builder), Waterloo-place, Marlborough-square, College and Blenheim terraces, and Leader, College, Francis, Oakham, and Keppel streets. Twelve years later a new burial ground was formed, and on October 12, 1820, was laid the first stone of the new parish church of St. Luke, built of Bath stone in the Late Gothic style, at a cost of about 30,000l., by James Savage, *obit* 1852, whose designs were chosen out of those of more than forty competitors. It has 2,000 sittings, is 187 ft. long, the stone roof is groined, and the pinnacled tower rises to 140 ft. On January 15, 1887, the late Metropolitan Board of Works agreed to contribute one-half of the net cost, being about 2,000l., of the conversion by the Vestry of the disused graveyard into a public recreation ground.

*Counter's Creek, Kensington Canal, Stanley Bridge, World's End, and Cremorne.*—On November 30, 1897, the London County Council resolved to expend 60,000l. upon the construction of a pumping station at Lot's-road, named after "the Lots" or allotment grounds, for dealing with the flow of the low-level and Counter's Creek sewers, and relieving them in times of heavy rains. Counter's, correctly Counter's, brook or creek, ran from its source at the "Red House" on the Harrow-road, a few yards west from St. John's Church, Kensal-green, along the eastern side of the West London Railway, with tributaries from ponds at Portobello Farm and Notting Hill Barn, joined the Eel Brook at the Swan, Walham-green, and flowed into the basin of the Kensington Canal, south-west of Edwardes-square, and so along the south-eastern side of Lot's-road into the Thames opposite Battersea parish church. Known also as the Stanford brook, it is depicted in Joseph Salway's plan and profile survey of the Kensington Turnpike Trust, completed in 1811, as crossed by Stanley Bridge carrying Bridge-street (now Fulham-

road) at an altitude of only 8 ft. 11 in. above high-water level. The Kensington Canal, opened in 1826, and closed in 1860 for an extension of the West London Railway, formed a boundary between Kensington and Fulham. Counter's Bridge has given place to Addison-road Bridge, between which and West Brompton station lay the great basin. Stanley Bridge is named after Stanley, or Stanley Grove, House, the home in 1815-22 of Sir William Richard Hamilton. In 1830 the National Society bought the house for their St. Mark's Training College, to which Flöre added a quadrangle in about 1850. On the left hand of one going westwards from the bridge that crosses the railway is the site of Sandford Manor House, a home of Nell Gwynne, which, having been converted into a cask manufactory, was taken for the Imperial Gas and Coke Company's works. World's End, a favourite place of entertainment *temp.* Charles II., appears to have been a precursor of Cremorne Gardens, originally Chelsea Farm, and owned by Sir Richard Lytton, *obit* 1774. The property then passed to Thomas, Viscount Cremorne, who died in 1813. Cremorne Gardens, situated between Battersea Bridge and Counter's Creek, were opened in 1843, and, after a not very reputable career, closed on October 5, 1877. Most of the ground was then taken by Mr. W. J. Bull, the orchid-grower and nurseryman, and having been sold in November, 1897, is now covered with streets. Sir Thomas More's epitaph in the (old) parish church no longer testifies to the dread in which he was held by heretics; in May, 1898, Cardinal Vaughan opened a church, the Convent of Adoration Reparatrice, erected on the reputed site of More's house in Beaufort-street, and gave it to the charge of a community of nuns that they might there pray day and night for the conversion of England to the Roman Catholic faith.

*Cheyne-walk and the Embankment.*—In Salway's Survey we see that Cheyne-walk then lay between the end of Robinson's-lane (Flood-street) and the engine-house opposite the (old) parish church, the present portion south-westwards to Battersea Bridge being named Lombard-street and Duke-street, with houses on both sides of the road, and one of them standing, within our own memory, across Lombard-street, two doors from Church-lane (Church-street). The road, having along the riverside a row of trees, wooden rails, and several sets of steps and "stairs" leading to the water, varied in altitude from 1 ft. 8 in. (south-west) to 4 ft. 9 in. (north-east) above high-water mark, and at high flood-tide presented a charming prospect. "Don Saltero's" is plotted as between the old Nos. 17 and 19; between Nos. 27 and 31 are the Bishop of Winchester's house and grounds; next to No. 35 is the Maggie tavern; the opening of Cheyne-row is between Nos. 44 and 45, and just opposite is the stone marking two miles from Buckingham Gate. Between the end of Lawrence-street and the churchyard wall stand the five houses of Prospect-place, on the site of the china factory. At the meeting of Lombard and Duke streets is Chelsea Ferry Stairs, nearly opposite the end of Danvers-street; beyond the bridge-foot are Lindsey-row and Davies-street, since incorporated with Cheyne-walk. Close to the former Bishop's Stairs is the present Oakley-street, of which the lower end has been opened out with a crescent (Pennethorne) as an approach to Albert Bridge. Alston, formerly Shrewsbury, House, built about 1540 and pulled down in 1813, at the remoter end of Cheyne-walk had been during a long period a residence of the Earls of Shrewsbury, and was devised by "Bess of Hardwick" to her younger son William, from whom it passed to Joseph Alston, created a baronet in 1682. The house, which was commonly, albeit erroneously, identified as Sir Thomas More's, was subsequently converted into a stained-paper factory. At the corner (south-west) of Lawrence-street is the Cheyne Hospital for Sick and Incurable Children (Mr. Beasley, architect, 1888), which occupies the site of the china manufactory which William Duesbury, agreeably with the covenants of his lease, demolished in 1784 when he removed to Derby. The ovens of his predecessor Nicholas Spremont were in the present Lawrence-street, and the warehouse in Justice-walk. Duesbury's showrooms were taken in 1786 for Echarde and Woodmason's stained and stamped paper manufactory, and afterwards by Harwood & Co. In 1791 Echarde's established at Blacklands House their factory of painted silk, varnished

cloths, &c., since Cooke & Hinchcliffe's stained-paper works. Nos. 7-11 [August 11, 1888\*] were rebuilt after Mr. F. Heming's plans and designs, upon the site of the great garden of Winchester House and of some old and historical houses, one of them being the Gothic House as altered and remodelled by the elder Pugin; the house [January 2, 1897; No. ix., "Sketches of London Street Architecture"] on the site of the old Magpie and Stump, formerly the Magpie, burned down in 1886, and Nos. 38-9 [January 19, 1901], their decorative frieze being by Mr. F. C. Varley, are by Mr. C. R. Ashbee. Mr. E. T. Hall is the architect of the Children's Home, in Millman's-street, for the St. George, Hanover-square, Guardians, built by Messrs. Foster & Dicksee, of Rugby, who contracted for 12,917., on the site of Nos. 35-7-9-41, Millman's-street, and Nos. 5-6-7, Eign-cottages.

The embankment of the Thames between the Royal Military Hospital and Millbank was carried out about fifty years ago. Under their Act of July, 1868, 31-2 Vic, cap. 135, the late Metropolitan Board of Works obtained powers for a continuation westwards to Battersea Bridge. The work, begun in July, 1871, and finished in May, 1874, was executed by W. Webster, contractor, at a net cost of 269,591., and forms a dam for the low-level sewer to Barking Creek. The south-western portion absorbed most of Lombard-street and Danvers-street, with Danvers and Old Ferry wharves. The new road from Cheyne-walk to Victoria Bridge, being rather more than three-quarters of a mile long and 70 ft. wide, passes along the verge of the Physic Garden and the Royal Hospital grounds, which until that time had formed the fore-shore of the Thames. It completes a riverside road which, with a break at Westminster, extends for four and a half miles from Battersea Bridge to Blackfriars Bridge. The London County Council's Bill of 1897 for lengthening the Embankment in a curve to the east ends of Cremorne and Lot's roads, at an estimated cost of 64,000., was strongly opposed, mainly upon aesthetic grounds, before a Select Committee of the House of Commons, who unanimously decided against the measure. In August, 1899, the London County Council agreed to contribute 4,400., being one-half of the net cost of widening Cheyne-walk between Beaufort and Millman's streets, as undertaken by the Vestry, whose scheme provided for setting forward the river wall so as to increase by 25 ft. the width of Cheyne-walk at the end of the Embankment, the additional width gradually decreasing to 6 ft. at Lee and Jerdein's Wharf.

**Queen's-road West and the Physic Garden.**—On March 3, 1900, the London County Council agreed to contribute one-half, or not more than 1,000., of the net cost of the widening to at least 40 ft. of Queen's-road West at the Physic or Botanic Garden as undertaken by the Vestry. The road has absorbed Paradise-row and Royal Hospital-row, and separates the hospital from the open space of Burton's Court so as to form a continuous thoroughfare from Pimlico-road, formerly Grosvenor-row, and Queen-street to Cheyne-walk. At its south-western end and near the site of the Swan riverside tavern is the Physic Garden, a freehold of three and a half acres originally leased to the Apothecaries' Company in 1693 by Lord Cheyne for a barge and boat-house, and conveyed to them by gift of Sir Hans Sloane by an indenture of February 28, 1721-2, for the cultivation of medicinal herbs and simples. In 1898 the Company applied to the Charity Commissioners for relief from their trusteeship of the garden, valued at 30,000., finding themselves unequal to the charge upon their exiguous resources. In December of that year the Charity Commissioners framed a scheme for the administration of the charity and its endowments, which yield about 950l. per annum, and established a committee of fifteen persons to maintain and equip the garden as a place of scientific instruction and research in systematic botany and vegetable physiology. The greenhouse and library were built in 1732 by Edward Oakley.

**Gordon House.**—In the Stableyard adjoining the Royal Hospital, south-west, stood the house inhabited by Sir Robert Walpole, who enlarged the property by purchasing some land from the Gough family. In 1808 the Government repurchased the property and built a large infirmary there after the designs of Sir John Soane, who, as Surveyor of the Hospital, had an offi-

\* Dates within square brackets relate to illustrations in the Builder.

The Old Chelsea Bun-Shop.

[From a print in *The Mirror* (1839).]

cial residence exactly opposite No. 4, Paradise-row (Queen's-road West). The greater portion of the remaining grounds had been leased in 1791 for a term of ninety-nine years by George III. to his Esquerry, General Gordon, who built the house. When the lease expired in March, 1890, the estate reverted to the Hospital Commissioners. In that year the Royal Military, and in 1891 the Royal Naval, Exhibitions were held in the grounds (three and a half acres) of Gordon House and in an adjoining plot of four acres. After the sale in December, 1891, of the materials of the two exhibitions, Gordon House became an infirmary of the Royal Hospital; the grounds were taken for the erection, 1895-8, of twenty-three houses, Chelsea Embankment-gardens, by Messrs. J. Allen & Sons, at a cost of 62,000., and a block of eighteen sets of flats, Chelsea Embankment-court, by Mr. H. Lovatt, at a cost of 41,000., from Mr. Delissa Joseph's plans and designs [February 5, 1898].

**Ranelagh.**—In its course from Knightsbridge to Grosvenor, also known as Bloody, Bridge on the east side of Sloane-square (formerly Blacklands), and thence to the river, the placid West Bourne entered the Thames at Ranelagh Stairs, close to where is now the disused Victoria steamboat pier. Upon its right bank stood until 1866 Ranelagh Gardens—watered with a canal from the stream—on the site of the present "Old Men's Ground" (next, south-east, to the pensioners' graveyard), which was added in that year to the Royal Hospital grounds. The "Old Men's Ground" lies along the south-west side of Chelsea Bridge-road, which separates it from the Guards' Barracks, behind which is the course of the West Bourne. A painting by Canaletto, and engraved by Parr in 1751, of the interior of the Rotunda was acquired for the National Collection in January, 1895. It is one of the three that he is known to have painted of the Rotunda. The picture is of intrinsic interest inasmuch as it delineates the original orchestra, octagonal on plan and supporting the flat roof, after its conversion into a fireplace; and the later orchestra, which, with the organ, by Byfield (1746), was built over one of the four entrances, 1769. William Jones, architect to the East India Company, designed the Rotunda for William Crispe and James Myonet; his adopted designs, with sections and a plan, engraved by F. M. La Cave, were published on June 30, 1742. The Rotunda, being somewhat similar in appearance to General Scott's Royal Albert Hall, had an exterior diameter of 185 ft., a rusticated arcade on the ground level carrying a gallery, and a truncated roof, apparently of slate, sloping to the clearstory. The pediments of the four entrances, after the Doric order, rose to the base of the top story. The interior diameter was 150 ft. Over the forty-eight open boxes—Walpole calls them "little ale-houses"—was a gallery, and above that the clearstory, lighted with sixty round-headed windows. The flat ceiling, coved at its edges,

was groined over each of the windows and the eight sides of the central orchestra, which rose in two stages. La Cave's later "Perspective View of the Amphitheatrical Building" to be erected at Chelsea, designed by Wm. Jones, archit., 1748, seems to be a design for altering or rebuilding the original structure, for it depicts the central orchestra as rising by a lantern and a cupola through a large round opening in the roof, and the roof as raised upon an added story. La Cave's later view shows Ranelagh House due north of the Rotunda, the "Great Bar," a covered way which joined the two, and, on the north-west, "boxes for gentlemen to smook in." The centre of the Rotunda lay 350 yards due north from the river-end of the broad walk which leads to the central front, facing south-east, of the Hospital. The gardens had belonged to the house which Richard, third Viscount and first Earl of Ranelagh, Paymaster-General to the Forces, designed and built for himself in 1690, having obtained from the Crown two leases of about 25 acres at a total rent of 45l. 11s. 6d. per annum, which eight years afterwards he exchanged for a grant in fee at an annual rent of 5l. James Hamilton's Survey of 1664, as corrected to 1717, plots the "Earl of Ranelagh's house and gardens." The house appears in the background of the view in our illustration of July 6 last, and its oak staircase is refitted in No. 51, Harley-street [Mr. F. M. Elgood, July 27, 1895]. An Act of 1730 vested the estate in trustees; in 1733 the house and grounds were sold in lots; two builders, Swift and Timbrell, bought most of the property for 3,200l., and leased their purchase to Lacy, patentee of Drury-lane Theatre, and Solomon Rietti, who intended to open the garden as a kind of winter Vauxhall. Myonet and Crispe revived the scheme, and on April 5, 1742, opened the Rotunda as a morning resort. In May the evening concerts began, with two ridottos weekly, a ticket costing one guinea. The building and disposition of the gardens (by Capon) cost 16,000l., writes Walpole to Mann in that year. Dr. Burney was organist in 1760. On June 29, 1794, Mozart, being then eight years old, played some of his own pieces upon the organ and the harpsichord for a charity. In May, 1767, the Catch Club gave their first entertainment, for which Arne composed the choral and instrumental music. Ranelagh attained its highest fame in the period 1775-85, under the patronage of Georgiana, Duchess of Devonshire and the Duchess of Ancaster, when the visitors used to arrive at mid-day and passed most of their time in walking round and round inside. Ranelagh was opened for the last time on July 8, 1803, and on September 30,

\* See also the large views by Rooker, after Canaletto, 1751; W. Newbould's perspective of the interior, 1751, in the Soane Museum, "A perspective view as intended to be finished," and "A geometrical section with the orchestra and orthogonal plan of the amphitheatrical building," and the view reproduced in the *Builder* of July 6 last.

1805, an order was made for pulling down all the buildings, the organ being removed to Tetbury Church, Gloucestershire. Until recent years some of the old lamp-irons still remained upon the trees. In 1854 were pulled down a large house, built over part of the site in the south-east corner, and Clarence House, for the laying out of the new road to Victoria Bridge. In Hamilton's plan, 1664-1717, which we illustrate, will be noticed the Creek (West Bourne), the Earl of Ranelagh's house and gardens, Stone-bridge, the stable-yard, College-cour, Chelsea-common, and several other places we mention.

**The Bridges.**—In 1881 the late Metropolitan Board of Works obtained powers to pull down Battersea Bridge, as being unsafe. The design of the wooden bridge, being very similar to that of old Putney Bridge [January 7, 1888], has been attributed to Cheselden, surgeon of the Royal Military Hospital; he, however, died in 1752. The bridge was built in 1771-2 to replace Chelsea Ferry, established *Temp.* James I., for John, first Earl Spencer, Lord of the Manor of Battersea and Wandsworth to which the ferry belonged, and fourteen other proprietors, who subscribed 1,700*l.* apiece, after the designs of Henry Holland (*obit.* 1806), at a cost of about 23,000*l.*, by Phillips, George III.'s carpenter. On May 24, 1879, Battersea and Albert Bridges were freed from toll at an outlay of 170,000*l.* In May, 1886, Messrs. Williams, Son, & Wallington ratified their contract for 143,000*l.* to build the new bridge, designed by Sir Joseph Bazalgette and Mr. E. Bazalgette, and opened on July 21, 1890; we illustrated and described a portion of the working drawings on July 26 of that year. Chelsea, or Victoria, Suspension Bridge, by Page, engineer to the Office of Works, was constructed in Edinburgh and built in 1836-7, at a cost of 80,000*l.* It was freed from toll, for 75,000*l.*, on May 24, 1879. The southern abutment marks the site, in Battersea Fields, laid out by the late Arthur Cates as Battersea Park, of the old Red House. Albert Bridge, opened on August 23, 1873, was taken over in or about 1881 by the late Metropolitan Board of Works, who replaced its steel-wire cables with solid steel links. Pennethorne made the approach from the northern bank, designing the pleasing feature of a spacious crescent at the end of Oakley-street. Messrs. Henderson & Fox built the Victoria railway bridge, since widened, for carrying the London and Brighton line to Victoria from the former terminus between Victoria-road and the Vauxhall and Southwark Waterworks.

**Queen's-road, Burton's Court, Franklin's-row, &c.**—Paradise-row, where many of the old houses yet survive, is now Queen's-road West; Queen's-road has been laid out through the Hospital grounds, and between the two hospital gates, so as to run in alignment with Paradise-row and Royal Hospital, since Jews'-row (now the south-western part of Pimlico-road). In Royal Hospital-row, along the side of the pensioners' burial-ground, and Paradise-row were as many as ten public-houses—mainly supported by the pensioners and their friends.\* Franklin's-row, depicted in Wilkie's painting of the pensioners reading the Waterloo gazette, and Garden-row, separated by Turk's-row, lay along the north-eastern side of the present open space named Burton's Court. Garden-row, formerly the hospital of the Royal Military Asylum, and Franklin's-row have lately disappeared, forming the sites of two blocks of residential flats, Burton-court, separated by Turk's-row—Mr. Paul Hoffmann. On the northern side of Turk's-row is St. Jude's Church, by Basevi, 1842. In 1887 the War Office, at an outlay of 800*l.*, converted the large open space of Burton's Court into a recreation ground for the Guards quartered in London. Burton's Court, about twelve acres between Queen's-road and St. Leonard's-terrace, was formerly known as Great, or College, Court, constituting, until the laying out of Queen's-road, the main approach to the Royal Hospital from the north-west. The trees in Royal-avenue, formerly White-stiles, beyond, support the tradition that Queen Anne intended to lay out an avenue of lime and chestnut trees through Burton's Court and the fields to Kensington Palace gates. Looking up the

\* In Paradise-row: the Fox and Hounds, Green Dragon, and George and Dragon. In Royal Hospital-row: the Royal Hospital (at the corner of Franklin's-row), General Howard, Snow Shoes, General Elliot, Recruiting Ser., Great, Mermaid, and Duke of York (by the corner of White Lion street).

avenue, one sees in the distance the tower of the Imperial Institute. The hospital buildings gave meaning and dignity to the garden, whose broad gravel-walk was a chosen resort of the pensioners; but they and the public alike are now excluded from a space that was bought in 1662 with public money, by a high-handed ordinance similar to that by which several acres of the once public grounds of the hospital grounds have been—in violation of an arrangement made in 1850—appropriated for the private enjoyment of the hospital governing staff. The adjacent Royal Military Asylum, renamed in October, 1892, the Duke of York's Royal Military School, was built in 1801-3, John Sanders being the architect.

Horwood's and Salway's surveys show two Chelsea Bun-houses, Nos. 7 and 10 on the north-western side of Grosvenor-row, and each with its colonnade over the footpath. Grosvenor-row (since Pimlico-road) extended from Royal Hospital-row to the south-western end of Ebury-street; on its south-eastern side, close to the left bank of the West Bourne, stood the Nell Gwynne tavern, opposite the Cheshire Cheese; at its north-eastern end was the watch-house. What is commonly described as the old "original Bun-house," whose renown had been established before the close of the seventeenth century, survived until the sale of its materials and "museum" on April 13, 1839; see the *Gentleman's Magazine* of May, and the wood-cut in the *Mirror* of April 6, of that year.

On July 23, 1891, the King laid the first stone of the South-West London Polytechnic Institute in Manresa-road—J. M. Brydon, *obit.* 1901 [March 21, 1891], the total estimated cost of the scheme amounting to 100,000*l.*, towards which several contributions were made by private individuals and public bodies, including the site, valued at 10,000*l.*, by Lord Cadogan, and a conditional grant of 50,000*l.* by the Charity Commissioners out of the City of London Parochial Charities Fund. To the building, which cost about 25,000*l.*, a new wing was recently added by Mr. F. G. Knight. The Public Library—J. M. Brydon [January 24, 1891], built by Messrs. Holloway Bros., and opened on January 21, 1891, stands on the site (Lord Cadogan's gift) of the studio of the late J. B. Phillip, sculptor. In the Queen Victoria Gallery—J. M. Brydon, added in commemoration of Queen Victoria's Diamond Jubilee, and opened on December 4, 1899, is a valuable collection formed by the Commissioners of Public Libraries of portraits and other memorials associated with bygone Chelsea. The Vestry Hall, built at a cost of about 15,000*l.* by Mr. Charles Wall, after J. M. Brydon's designs, upon a site given by Lord Cadogan, is illustrated, with sections and details, in our columns of May 2, 1885.

**Sloane-street, Hans-place, Cadogan-square, Sloane-square, and the Cadogan Estate.**—Sloane-street, Hans-place, and Upper and Lower Cadogan-place were laid out by Henry Holland along the eastern side of what appears as open ground as late as the time of Mogg's map of 1841. Holland built the Pavilion in Hans-place for his own occupation, and died there on June 17, 1806. Holy Trinity Church, Sloane-street, 1828-30, by James Savage, has been replaced with a notable and characteristic example of the inventive genius of J. D. Sedding—*obit.* April 7, 1891—built by Messrs. Higgs & Hill, and consecrated on May 13, 1890 (October 6, 1888; October 12, 1889 (day of nave arcade); January 4 and June 21, 1890.) Lord Cadogan, patron of the benefice, contributed 22,000*l.* towards the cost of the fabric begun, on the site of the former church, in 1888. The nave and chancel 60 ft. wide, extend to an unbroken length of 180 ft.; the south and north aisles are 12 ft. and 40 ft. wide respectively; an arcade of six lofty arches, spanning 30 ft., is carried by stone piers, 4 ft. 1/2 in diameter, and a range of pillars, of fine red brick, divides the north aisle, appropriated for daily services, into two sub-aisles. The cost of fully completing and decorating the edifice is computed at 72,000*l.* Some of the original houses in Sloane-street have been rebuilt—Nos. 27, 28, 29, 30, for instance, are by Mr. Frederick G. Knight; others have been re-fronted: of the latter we may cite No. 64, re-faced in Portland and blue Pennant stone, and No. 63, of which the stock-brick walls remain (a not unwelcome relief from the mania for red brick), Monk's Park stone having been used for the window dressings, and massed at the entrance and in top story—both by Mr. Fairfax B. Wade [January 29, 1898, and February 27, 1897;

Nos. xxiii. and x., "London Street Architecture"]. Some houses on the southern side of Pont-street, occupying the site of old "Prince's Ground" [November 27, 1886], are by Mr. E. T. Hall, who also planned and designed the houses in Cadogan-square and "The Mansions," Sloane-gardens, built by Messrs. Foster & Dicksee, and Messrs. Langdale, Hallett, & Co., which we illustrated on June 2, 1888, January 19, 1889, and (plan) January 26, 1901. St. Columba's Church of Scotland in Pont-street [March 29, 1884], built by Mr. E. Lawrence, is by Mr. J. MacVicar Anderson. In Cadogan-square Messrs. Ernest George & Peto were architects of two houses [May 15, 1886] built by Messrs. J. Simpson & Son for Colonel Thynne and Mr. T. A. De la Rue, the Gothic house is by G. E. Street (*obit.* 1881), and Lord Albemarle's, with others, are by William Young (*obit.* November 1, 1900), who also planned and designed Chelsea House, in Cadogan-place, for Lord Cadogan, with several mansions upon the Cadogan estate. In 1805-7 were built the Hans Town Assembly Rooms in Cadogan-place, by P. F. Robinson (1776-1858); the Racquet Court and most of "Prince's" were pulled down in 1886, and twelve years ago the club settled at Knightsbridge; St. Saviour's Church, Hans-place, is by George Basevi the younger, 1840. In this quarter several houses, including a row of eight in Hans-crescent, by Messrs. Read & Macdonald [March 20, 1897, No. xi., "London Street Architecture"], were built for the Belgrovan Land Company, who have made extensive improvements, pulling down "slums," widening streets, and building houses of good design. A corner house in Cadogan-gardens, a new thoroughfare, is by Mr. MacMurdo [October 7, 1899, No. xxiv. of our Series]; Farm House in Pont-street (1885) is by Mr. C. W. Stephens [August 7, 1897, No. xvi.]; Hans-crescent Hotel, opened in May, 1890, and since enlarged, is by Messrs. Read & Macdonald, the builders being Messrs. Stephens, Bastow, & Co. of Bristol. In Hans-road are two houses by Mr. C. F. A. Voysey, and No. 12, built in 1893 by the then firm of MacMurdo, Hornblower, & Walters [September 19 and August 29, 1896, Nos. iv. and v. of our Series]. The theatre, opened in the former chapel in Lower George-street, Sloane-square, on January 25, 1871, by the late Miss Litton, gave way in 1887 to extensive improvements on Lord Cadogan's estate, and was replaced with the Court Theatre designed by Mr. Walter Emden and Mr. W. R. Crewe, jointly, for Mrs. John Wood and Mr. Arthur Chudleigh, and opened on September 24, 1888. For rebuilding, with new streets, on the Cadogan estate, begun in 1886, were removed many thoroughfares, comprising George's-place, Lecle-street, Grove-place, Blackland's-street, Walker's Cottages, Blackland's-court, Moss-place, Lower Sloane-street, Chelsea Market, Little and Lower George-streets, Evans' Cottages, Union-place, Wood-buildings, and a part of King's-road. All that property, together with the Manor of Chelsea, became vested in Charles, second Baron Cadogan, on his marriage with Elizabeth, daughter and co-heir of Sir Hans Sloane. A group of twenty-eight mansions and seventy flats in Sloane-court [February 4, 1899] and the flats, Nos. 21 and 23, Cadogan-gardens, are by Messrs. Rolfe & Matthews; for another block of flats in Sloane-court—Mr. Paul Hoffmann, the tender of Messrs. J. Grover & Sons, for 18,178*l.* was accepted in February, 1898.

#### NOTABILIA.

**Churches.**—St. Simon Zelotes, Cadogan-square, 1853-9—Peacock. St. John, Ashburnham-road, 1876—Newman & Dilling. Christ Church, 1839, new chancel, organ chamber, and choir vestry—Mr. J. A. Reeve. Our Most Holy Redeemer, Upper Cheyne-row [October 12 and 19 and November 16, 1895]—Mr. E. Goldie. Holy Trinity, Sloane-street; east window—Sir Edward Burne-Jones; most of the metal work, the lectern, front panels of choir stalls, and statuettes of saints—Mr. F. W. Pomeroy; scheme of decoration, Lady Chapel—Mr. C. Whall, Mr. H. Wilson, and Mr. L. Davis. St. Luke (new) altar-piece—James Northcote, R.A.; the painting of "Time, Death, and Judgment" (a replica)—Mr. Watts, R.A.; windows—Mr. E. Frampton. St. Matthew, Oakley-square, 1856—J. Johnson; and memorial window to the late Rev. E. Phillips—Mr. E. Frampton. Park Chapel, originally built for French Protestant refugees, since enlarged, restored in 1880 by S. Bannister;

stained-glass windows—Gibbs & Steward; to be rebuilt.

Infirmiry, Chelsea Hospital, 1809—Sir John Soane. The Jenner (incorporated in July, 1861, as the British) Institute of Preventive Medicine, 1805-6—Mr. A. Waterhouse, R.A. The Clock House and the Old Swan House—Mr. R. Norman Shaw, R.A. River House, completed in 1879—Messrs. Bodley & Garner. Sir Florence Shelley's Theatre, west side of Tite-street (formerly Calthorpe-place), sold in October, 1896, and the site taken for Shelley-court. Victoria Hospital for Children, established in Tite-street in 1866; the out-patients' department and nurses' home, opened in July, 1866 [June 27, 1885, and July 3, 1886], built by Mr. Chas. Wall—Messrs. H. Saxon Snell & Son. Cheyne Court, 1861-2—Mr. F. Hemings. The White House, rebuilt; confer Thomas Girtin's water-colour view which Turner considered as excelling his own work. Memorial tablet in lead to Turner at No. 110, Cheyne-walk—Mr. Walter Crane. Chevnev-row (built in 1708), No. 21, bought for 1,750*l.*, as a memorial to Carlyle and his wife, marble bust—D. W. Stevenson, R.S.A.; statue in public garden—Sir J. E. Boehm. Memorial fountain to D. G. Rossetti in the public garden opposite Queen's House, No. 16, Cheyne-walk—Mr. J. P. Seddon; the quarter-length bronze figure, in alto-relievo—Ford Maxod Brown [April 17, 1886]. Bull-alley, renamed, 1845, Stamford-road. Princes-street, renamed Rawlings-street; Old Church House [February 5, 1890]; the Artists' Houses, studios—E. W. Godwin. Markham-square, site of Morris's nursery, formerly Box Farm; eight studios, Chelsea-reach—Mr. W. I. Chambers. Improvement and enlargement of the Chelsea Hospital for Women, 1899—Mr. Wm. Emerson. Extensive business premises for Mr. Peter Jones, King's-road, Sloane-square, and Symons-street—Messrs. Perry & Read [January 10, 1889]. Guinness Trust Buildings, 1893—Mr. M. E. Macartney. Additions to Whitelands Training College, 1890-1—Mr. C. Pemberton Leach. Chelsea Conservative Club, 193, King's-road, 1887-8—Messrs. Karlslake & Mortimer. Blocks of residential flats, east side of D'Oyley-street, 1898, and on site of Nos. 10-4, Sloane-terrace, 1890—Messrs. Bouchier & Galsworthy.

#### BROMPTON AND LITTLE CHELSEA.

An excellent map of London, published in 1836 for the Society for the Diffusion of Useful Knowledge, delineates a few scattered houses in Little Chelsea, Brompton, and Earl's Court. Those houses excepted, nearly all the land on the remoter side of Fulham-road as far as Knightsbridge, Kensington, and the Kensington Canal is open ground, consisting mainly of nursery and market gardens. Redcliffe-nursery has replaced Walnut Tree-walk; Roland, Cranley and Drayton gardens, with the Boltons, are built over Brompton Heath. Between Marlborough-road (formerly Blacklands-lane) and Hans-place are a long pond (Cadogan-square), the Wellington cricket-ground and extensive nursery gardens, now traversed by Pont and Walton streets. Horwood, 1794, shows all vacant ground beyond King's-road, with Blacklands (Sloane-square) and the Marlborough tavern and its cricket-ground. In 1819 he plots the beginning of some houses on Chelsea Common, which covered thirty-seven acres south of Blacklands-lane, together with Marlborough-square, College-street, and Keppel-street (Blacklands-lane) as then laid out. The Hermitage where lived Mme. Catalani, was pulled down in 1844 for Grove-place. In that same year, on July 11, the late Prince Consort laid the first stone of the Consumption Hospital (by Francis), built upon the site of Curtis's botanical garden, and enlarged about twenty years ago. Curtis was the author of "Flora Londinensis" and projector of the *Botanical Magazine*. A plan of his garden, in the space between Sloane-street and Cadogan-place, is in the *Gentleman's Magazine* of August, 1810. The new hospital buildings on the south side of Fulham-road were erected from the designs of T. H. Wyatt, *obit* 1880 [November 22, 1879]. Opposite Trafalgar-square is the block comprising the home for nurses, probationers, and servants, Mr. E. T. Hall [August 19, 1899]. Pelham-crescent, Sydney-place, Thurloe-square, Brompton (now Egerton) crescent, &c., were laid out by George Basevi the younger (*obit* October 10, 1845), after his appointment in 1829 as surveyor to Smith's Charitable estate and the adjoining Alexander estate. The Cancer Hospital,

founded in Cannon-row, Westminster, by Dr. Marsden in 1851, was removed to Hollywoood-road, Brompton, and thence to the buildings erected by Messrs. Lawrence at a cost of about 7,000*l.* from John Young & Son's plans and designs, Mr. D. Mocatta being honorary consulting architect [April 28, 1860]. Mr. Alexander Graham's additions are illustrated in our columns of September 26, 1885. We may here mention that No. 21, Alexander-square, built 1827-30, was the residence of George Godwin, *obit* January 27, 1888, during a considerable portion of the time he edited this journal. He was architect of Brompton Parochial Schools [January 4, 1845]; of St. Mary Church, with the sedilia, in the Boltons [October 19, 1850], enlarged in 1872 by Peacock; and, in conjunction with his brother, Henry Godwin, of Redcliffe-mansions [February 11, 1871], upon an estate laid out by Cubitt and McClymont in 1861-71.

In Fulham-road, at the corner of Church-street, is the burial-ground of the Westminster congregation of Jews, established there in 1816, and improved by the Metropolitan Public Gardens Association in 1898. Opposite stood, until 1848, the Queen's Elm turnpike, named, it is said, after an elm tree beneath which Queen Elizabeth took shelter from a shower when walking with Lord Burleigh, who lived at Brompton Hall. The parish records of 1586 cite "the Queen's tree at the end of the Duke's walk," and in 1687 the highway surveyors are amerced five pounds for not sufficiently mending the highway from the Queen's Elm to the bridge and from the Elm to Church-lane. The crossroads were subsequently called "Nine Elms" from some trees planted by one Bostocke around the older one. About a furlong distant are Elm Park-gardens, laid out over the site of Chelsea Park, plotted in Cross's map, 1836, which formed part of the Sand Hills, an unenclosed tract that belonged to Sir Thomas More. In 1625 the Lord Treasurer Cranfield, Earl of Middlesex, enclosed about 32 acres with a brick wall. Having belonged, in 1717, to the Marquis of Wharton, the park (see Hamilton's plan, in our sheet of illustrations), was leased for 122 years to, and planted with mulberry trees by, a company for rearing silkworms and manufacturing silk under a patent taken out by John Appleton in 1718. The scheme soon came to nought. The mansion (standing in 1869) was built for W. Broomfield, an eminent surgeon, and latterly belonged to Sir Henry Wright Wilson, Bart. Drayton-gardens, opposite Chelsea Park, has supplanted Thistle-grove, where lived John Burke, the genealogist, and J. P. Warde, the actor (*obit* 1840), whilst just beyond, at the corner of Park, formerly Lovers', walk, where began the village of Little Chelsea, the Goat in Boots public-house—whose sign Morland reputedly repainted—was rebuilt, together with three adjoining houses and shops, in 1888-9, Mr. T. H. Smith being the architect and Messrs. Turtle & Appleton the contractors [January 19, 1889]. Brompton Manor House, afterwards Manor Hall, where Mme. Vestris had her education, was standing sixty years ago on the north side of the road to Fulham, at the corner of the present Redcliffe-road. Having been occupied some thirty-five years since as St. Phillip's Orphanage, it has been rebuilt.

*The Oratory.*—In May, 1899, the Fathers of St. Philip Neri celebrated the first jubilee of their labours, which they had begun in two houses rented by Father Gordon, Father Faber (*obit* 1863), and others in King William-street, Strand, where they converted the back premises into a chapel, of which the site was afterwards taken for Toole's Theatre, that has lately been demolished for an extension of Charing Cross Hospital. Three or four years afterwards they migrated to Brompton, where, on the site of Blomell's House, along the west side of the avenue of lime trees leading to Holy Trinity Church (1826-9), Professor Donaldson, restored 1880 by Sir A. W. Blomfield, new buildings had been built for them by Scoles, and opened on March 22, 1851. In April, 1884, was opened the permanent Oratory Church, erected after the designs (selected in competition) of H. A. K. Gribble, *obit* March 26, 1895. The south front, begun in 1892, was finished, the two towers excepted, in 1895 by Mr. Shaw, clerk of the works for carrying out Gribble's original designs, which included a stone lantern as the crowning feature; but the outer dome, having a framework of steel, is by Mr. George Sherrin, the architect nominated, we gather,

by the donor of that portion of the fabric. The figure, 9 ft. high, of the Virgin above the central gable is by Mr. Collett.

In 1850 the St. George, Hanover-square, Union Guardians pulled down Shaftesbury House for their workhouse buildings. Mr. E. T. Hall was the architect of the new infirmary, for the enlargement of which was scheduled in February, 1898, some adjoining property in Fulham-road and Victoria-grove. The St. George, Hanover-square, Vestry had bought the property in 1787, from William Virtue, for an additional workhouse, the Act in that behalf declaring the house and grounds should be in St. George Parish so long as it served that purpose. The house, notable for its interior and charming old-fashioned garden (see the cuts in the "Art Union," 1848, and those by F. W. Fairholt in Croker's "Walk from London to Fulham," edit. 1890), was purchased by the third Earl of Shaftesbury, author of "Characteristics," in 1699 from the Bovey family, heirs of the widow of Sir James Smith, who, it is believed, built it in 1635; Brompton Cemetery, which formerly belonged to the West London and Westminster Cemetery Company, incorporated on June 12, 1840, was laid out between Honey-lane (field-road) and the Kensington Canal. The chapel and catacombs were designed by Benjamin Baud.

*Notabilia.*—West Brompton: The Church of the Sacred Hearts of Jesus and Mary, with the lady-altar, and the monastery for the Servite Fathers of St. Mary's Priory in Fulham-road—J. A. Hansom (*obit* April 29, 1882) and his son, Mr. J. S. Hansom [April 21, 1885]. Walton-street police station, 1894—Mr. R. Norman Shaw. Adrian-terrace and field-road, on site of Honey-lane; Redcliffe-gardens, on site of Walnut Tree-walk; Thistle-grove, on site of Brompton Heath. Buildings, south side of Park-walk, between Chapel-street and Winterton-place, 1898—J. T. Wimperis & Arber; block of flats, Park-walk—Mr. C. W. Stephens. St. Mark's College Chapel, windows in nave—Willes. The Oratory; white marble statue of Cardinal Newman, unveiled July 15, 1896, modelled by M. Chavalland, the memorial designed by Messrs. Bodley & Garner, executed by Messrs. Farmer & Brindley. The Grange (near Alexander-square), pulled down in 1842—built for himself by Michael Novosielski, who built also Michael's-place, 1786, pulled down in 1880 and partly rebuilt. Michael's grove, renamed Egerton-place; Brompton-crescent, renamed Egerton-crescent. London and Joint Stock Bank, Onslow-square—Mr. R. Creese Harrison. Basil-street (west side), at the corner of New-street, shops and flats, 1898—Mr. C. W. Stephens. Drayton-gardens, block of flats on site of No. 59—Mr. I. Norton. The Admiral Keppel, next, south, to which was Chelsea Pound, rebuilt 1850-7.

#### THE BRITISH SCHOOL AT ATHENS.

THE Annual Meeting of the British School at Athens, held at the Society of Antiquaries' room on the 24th ult., was well attended. Sir Richard Jebb occupied the chair; and Mr. Mayor, the acting Hon. Secretary, read the annual Report, from which we extract the following passages:—

"The work of the School, both on its teaching and on its exploring sides, has been energetically carried on during the past session under the newly-appointed director, Mr. Carr Bosanquet. The number of students in residence was five, as compared with six in the previous session. One of these, Mr. J. H. Marshall, scholar of King's College, Cambridge, had been already admitted for the session 1898-99, and came out now with the Prendergast Travelling Studentship; and a second, Mr. J. H. Hopkinson, scholar of University College, Oxford, had been already admitted for the session 1899-1900, and came out again for a second session as Craven Fellow of the University of Oxford. The three newly-admitted students were Mr. K. J. Frost, of Brasenose College, Oxford, who held the studentship offered by the Managing Committee to the University of Oxford; Mr. R. D. Wells, of Trinity College, Cambridge, who was appointed by the Committee to the Architectural Studentship on the recommendation of the President of the Royal Institute of British Architects; and Mr. J. H. Baker-Penoyre, of Keeble College, Oxford."

The new director, Mr. Bosanquet, reached Athens at the end of October and returned to England at the end of August, thus residing altogether ten months in Greece, of which about six months were spent at Athens and about four in Crete. Mr. Bosanquet has marked the beginning of his term of office by submitting to the Committee some valuable suggestions for the guidance of students at the School, which will, it is hoped, help to increase its usefulness as a teaching institution. These suggestions were printed in the last number of the "Annual," and are at the disposal of intending students on application to the Secretary.

Excavations were undertaken this year by the School at Prasos, situated on the central plateau of Crete, and at Petras on the coast a few miles to the north. The work was conducted by the director with the assistance of Mr. Marshall and Mr. Wells. Prasos was in historic times the chief centre of the Eteocretans, who represented the most primitive element in the population of ancient Crete, and it was therefore hoped that the excavations here might bring to light traces of civilisation of the Mycenaean epoch, together with inscriptions in the non-Hellenic and presumably Eteocretan language, of which one specimen had previously been found in this neighbourhood. The first hope was not fulfilled, for on the site of Prasos itself only one product of Mycenaean art was discovered, a gem found embedded in the mortar of a late Greek house, into which it must have been accidentally brought with the earth from some neighbouring tomb when the house was built. About a mile away, however, a large house of late Mycenaean work was discovered in a valley near a spring, and somewhat nearer the city were found two tombs of the same period, one a square chamber with a dromos, and the other a well-built beehive tomb. In the same neighbourhood a number of later tombs were opened, ranging from the Geometric period to the fourth century and containing a large quantity of vases of various periods.

Prasos itself appears from the remains discovered to have been an important place from the eighth or seventh century downwards. The most interesting objects were brought to light in a *temenos* on the top of a crag near the town. Here Mr. Bosanquet was fortunate enough to discover an inscription seventeen lines long in the non-Hellenic language referred to above and written in Greek characters of the fifth century B.C. In the same place were found a series of votive offerings in bronze and terra-cotta. The terra-cottas, which range from the sixth to the fourth century, reveal the existence of a vigorous native school of art, and include the upper part of a fine archaic statue of a young god, half life size, and a well-preserved head with fragments of the body of a couchant lion. The remains of three other sanctuaries were also investigated. On a saddle below the Aeropolis was discovered a large and solidly-constructed building of late Greek workmanship, with a front 75 ft. long, which may, it is suggested, have been an 'Andreion' of the kind in which the Cretan citizens met for common meals.

The excavations at Petras on the sea coast brought to light considerable quantities of pottery of the Mycenaean period. The site appears, however, to have been systematically turned over and terraced by its owners a few years ago, and it was therefore not thought worth while to undertake here work on a large scale. Accounts of the discoveries at Prasos and Petras will be published in the forthcoming number of the 'Annual.'

Supporters of the British School will be interested to hear of the work that has been done in the other parts of Crete during the past season by the Cretan Exploration Fund. At Knossos Mr. Arthur Evans, an associate of the School, assisted by two former students, Dr. Mackenzie and Mr. Fyfe, has continued the excavation of the great prehistoric palace which has been associated with the legends of Minos and the Labyrinth. The whole northern end of the palace and an extensive eastern quarter have been uncovered during the past year. Shortly before the close of the season a triple flight of stone stairs was brought to light, leading down from an upper corridor to a suite of halls, showing remains of colonnades and galleries. As it appears that the principal stairways were situated on this lower level, it is possible that the results of next season's work may surprise in interest even those which have already been obtained. Mr. Hogarth, the late director, has also been enabled by a grant from the Cretan Exploration Fund to explore an ancient site at Zakro, in the extreme east of the island. He has there laid bare a small Mycenaean town with well-preserved remains of the lower part of the houses and magazines, and has discovered some fine examples of early pottery and an interesting deposit of clay impressions of Mycenaean gems and signets, including 150 different types. Mr. Hogarth was assisted by Mr. Wells in mapping, and by Mr. Marshall in classifying pottery. Through the kindness of Mr. Evans and Mr. Hogarth accounts of these various discoveries will appear in the next number of the School's 'Annual.'

Three open meetings of the School were held in Athens during the past session, and were well attended. The Committee are glad to record, as a sign of the friendly relations existing between the School and its neighbours, that at one of these meetings a paper was read by Dr. Wilhelm, Secretary of the Austrian Institute at Athens, on an inscription formerly in Mr. Finley's house and now in the collection of the British School; while at another meeting a paper was read by a Greek scholar, M. Clon Stephanos, director of the Anthropological Museum in the Academy at Athens, on the ethnology of prehistoric Greece.

The repairs to the School building, which were stated in last year's Report to be urgent, were successfully carried out during the autumn of 1900 under the direction of Mr. Fyfe, who held the Architectural Studentship last year. The prin-

cipal matter requiring attention was the reconstruction of the roof, but the opportunity has been taken to carry out a number of minor improvements and repairs which have added greatly to the appearance as well as to the comfort and convenience of the School building. The precinct in which the School and hostel stand has also been much improved during the past year, by means of private subscriptions generously contributed by the director and a few other friends of the School. A new carriage road has been constructed giving access to the School from the street on the south; several bumed trees have been planted; and a terraced walk has been made along the upper northern end of the School grounds. It is proposed next year to complete the work by laying out the ground on the south-east side of the hostel.

The Committee point out with satisfaction that the cost of the very considerable repairs to the School, amounting to over £501, has been defrayed out of the revenue of the last two years, without any inroad upon the small invested capital of the School. This result has been obtained mainly by the special grants for the Prasos excavations made by the Society of Dilettanti (£50), and the Cretan Exploration Fund (£200), together with one of £40, from the Cambridge Prendergast Fund made to the director for the same purpose.

The monograph on St. Luke's Monastery at Stiris, on which Messrs. Schultz and Barnsley have so long been engaged, has now been published, and has been generally recognised as a most valuable contribution to the study of Byzantine architecture. Friends of the School are reminded that Mr. Schultz still has a good deal of material in his hands if funds could be provided for publication, while the Committee would gladly see other students to work in this important field if they were in a position to do so. Subscriptions to the Byzantine Architectural Fund for this purpose would be gladly received by the treasurer. There are still some copies on hand of the monograph on St. Luke's, which can be obtained on application to the publishers, Messrs. Macmillan & Co., or from any bookseller.

Considerable progress has been made with the scheme for establishing a British School at Rome, to which reference was made in the last Report. The director has written a full report on the recent excavations, which appeared in the *Times* of January 9, and has delivered a lecture, which will shortly be published, on the ancient Church of Santa Maria Antiqua. A monograph on the Roman Roads in the Campagna, by Mr. T. Asby, late Craven Fellow in the University of Oxford, and now a student at the school, is also nearly ready for publication. Additional funds are, however, urgently needed if the work of the school is to be properly developed. It should be remembered that the work of the school will not be confined to classical archaeology. It is intended to be a centre for all British students in Rome; and the provisional scheme, approved by the General Committee, provides that every period of the language and literature, antiquities, art, and history of Rome and Italy shall be considered as falling within its province.

In conclusion, the Committee think that they are entitled to say that the British School at Athens is every year fulfilling more successfully the objects for which it was founded. In the work of excavation it has, even with the scanty means which were at first at its disposal, done much—as much, it may confidently be said, in proportion to its funds, as has been done by any of the other schools in Athens; and, in view of the somewhat greater financial stability which it is now beginning to enjoy and the opportunities available for work both in Crete and elsewhere, it may be hoped that results as interesting as any of those secured in the past will be forthcoming in the next few years. On the side of education, too, the school has done most valuable service in providing a centre for classical students who wish to supplement their work at the Universities by one or two years' work in Greece, while it has also been of great assistance to British travellers in Greece generally. There is, however, one thing which the school still urgently needs, namely, some provision for advanced students of archaeology, by which their services might be secured to the school for a series of years. In this respect the British school is at present weaker than any of the foreign schools in Athens, all of which include on their staff either an assistant director or one or more such advanced students.

Sir R. Jebb, in moving the adoption of the Report, described the British School at Athens as being intended to furnish a permanent station from which explorations could be conducted, and also a kind of archaeological consulate for visitors to Greece. Referring to the archaeological work of the year, he mentioned especially Professor Furtwängler's discovery that the temple in Ægina was dedicated to a local goddess named Aphaia, soon after 400 B.C., on the site of a sixth-century Doric temple. He thought they wanted something in the nature of an archaeological fellowship in connexion with the School, tenable for a term of years, as an object to which a student might

look forward, and as helping to make a career for a man who had a special ability in archaeological investigation. This would render the institution more of the nature of an archaeological college; a character which the French School at Athens did to some extent possess.

Mr. Bosanquet made a statement as to the work of the school during the season, and announced that Mr. Marshall had been selected by the Government of India as Director-General of the Archaeological Survey of India.

On the motion of Mr. Penrose, seconded by Mr. F. E. Thompson, the following list of officers were elected for the ensuing year:—Committee: Professors Ernest Gardner, Percy Gardner, and Pelham, and Dr. Waldstein (re-elected); hon. treasurer: Mr. Walter Leake (re-elected); hon. secretary: Mr. W. Loring; Lord Lingen and Mr. F. Pollock as auditors (re-elected), and Mr. Edwin Waterhouse as an additional auditor.

#### ENGINEERING SOCIETIES.

THE INSTITUTION OF JUNIOR ENGINEERS.—The annual general meeting of this Institution was held at the Westminster Palace Hotel on October 25, the Chairman, Mr. Percival Marshall, presiding. After the usual preliminary business had been disposed of, the Council's Report on the work of the past year and accounts relating to that period were presented and adopted. The Report stated that there had been 103 elections, bringing up the total membership to 652. The names of Professor G. F. FitzGerald, F.R.S., hon. member of Dublin, Mr. Louis F. Awde, of London, and Mr. E. H. S. Cooper, of Rugby, members, had been removed by death. In addition to the seven monthly meetings, a meeting had been held under the title of "Engineering Question Night," when a number of different engineering questions were dealt with, this new feature in the programme proving very successful. The Institution premium had been awarded to Mr. Samuel Cutler, jun., for his paper on "Carburetted Water-Gas." The Council had accepted the offer of the sum of five guineas made by Mr. W. H. Northcott, hon. member, to be competed for by the members in the preparation of a paper on "The Mutual Relations of Employers and Employed," and the three adjudicators, consisting of Mr. Northcott himself, Mr. J. A. F. Aspinall, and Mr. Archibald Denny, had awarded the prize to Mr. William Powrie. Reference was made to the opening last June of the Institution offices at 39, Victoria-street, the rooms having been suitably furnished as library, reading and writing rooms, &c. There had been eleven visits to engineering works in London and the vicinity, and during the summer meeting at Plymouth the Government establishments at Devonport and a number of engineering and other works had been inspected. Acknowledgments of the courtesy met with on all these occasions were recorded in the Report. Reference was also made to the Engineering Congress at Glasgow, which the Institution had been invited to take part in, a number of the members being present. To the provincial technical societies an invitation had been addressed enabling any of the members who might be temporarily resident in London to attend the meetings of the Institution. The Council were co-operating with the German Society of Engineers in the compilation of a German-English-French technical dictionary. It was announced that the premier position in the Whitworth Scholarship Examinations for 1901 had been obtained by a member of the Institution, Mr. C. E. Hardy, of Plymouth. Allusion having been made to the appointment register, the utility of which was being much improved; to the library, which, now that the Institution had offices, would be considerably developed; and to the accounts, which showed that the finances were in a satisfactory condition, the Report concluded with some observations as to future arrangements, including the delivery of a Presidential Address by Sir John Jackson, F.R.S.E., to inaugurate the new session. The election of officers was announced as follows:—Chairman, Mr. P. Marshall; Vice-Chairman, Mr. Kenneth Gray; Hon. Librarian, Mr. L. H. Rugg; Members of Council, Messrs. S. Cutler, jun., Adam Hunter, C. J. McNaught, and H. C. Reid, in addition to those remaining in office; Secretary, Mr. W. T. Dunn.

THE LONDON BUILDING ACT, 1894 :  
THE TRIBUNAL OF APPEAL AND THE BUILDING LINE.

THE Tribunal of Appeal under the London Building Act, 1894, sat at the Surveyors' Institute, Westminster, on the 25th ult., to hear an appeal by Mr. C. W. Matthews against the certificate of the Superintending Architect of Metropolitan Buildings under Sections 22 and 29 of the Act, defining the general line of buildings on the western side of West Hill, Highgate, between Millfield-lane and Parliament Hill Fields in which he certifies the building in question to be situate. The members of the Tribunal sitting were Messrs. J. W. Penfold (chairman), A. H. Hudson, and A. Gruning.

Mr. Macaskie, barrister, appeared for the appellant, and Mr. Andrews, from the Solicitor's department of the London County Council, represented the superintending architect.

The appellant is the owner of the houses and premises, 1 to 5 (odd), West Hill, and of 1 to 4, Brookfield, and the two-story houses lying between 4 and 5, West Hill. The houses on West Hill and Brookfield have been erected within the last three years without any objection on the part of the County Council or any other authority. On October 16, 1900, a plan of buildings in four blocks—namely A to F—proposed to be erected by the appellant at West Hill, was submitted to the District Surveyor, and notice was at the same time given to him of the appellant's intention to commence building blocks A and B at once. The plan showed blocks A and B to be within the general line of building as defined by the superintending architect. This notice was forwarded by the District Surveyor the same day to the County Council, with a letter stating that he presumed that no question could be raised as to the general building line owing to the position of the existing buildings. Objection was taken to the proposal to lay out a new street as shown in the plan to connect blocks C, D, E, and F. No objection at all was raised as to the building line, nor as to erection of blocks A and B. On April 2 the appellant saw the Solicitor of the London County Council with reference to the proposed scheme for laying out a new street, but no question was raised as to the building line, and appellant, at his request, sent him a tracing of the proposed scheme, which was again placed before the Building Act Committee, and still no objection was taken to the building line.

The appellant, believing he was well within the building line, knowing that no objection had been taken as to the building line, but to the formation of the street only, and believing that no objection as to the building line would or could be taken, did, shortly after the date of giving notice of his intention so to do, begin building operations in respect of block A according to plans deposited on October 6 last, and had spent upward of 3,000l. to the date when he received the first intimation that it would be objected that block A was within the general building line. The appeal was, therefore, lodged on these grounds—First, that the superintending architect was wrong in defining the general building line as he did; secondly, that he was wrong in defining the general line for so much of the street as he did, it being contended that he should not have defined it so as to include or have regard to the buildings between block A and Millfield-lane, but that he should have defined it so as to include and have regard only to the buildings 1 to 4, West Hill, 1 to 4, Brookfield, the buildings marked X, and the sites and blocks A and B. Thirdly, it was urged that alternatively the superintending architect was wrong in not including or having regard to the houses on West Hill, lying to the north of Millfield-lane; and, fourthly, it was submitted that the application to the superintending architect to define the general line of buildings was made too late, having regard to the fact that the delay of the London County Council had led the appellant to expend large sums of money in the belief that the line was fixed as the appellant contended it to be.

Mr. Macaskie submitted that the superintending architect had put the general building line too far back. He proceeded to narrate the history of the case in so far as it related to the erection of the buildings already in existence.

Mr. Andrews, however, objected to the appellant going behind the superintending architect's certificate.

Mr. Macaskie insisted that the County Council, by their conduct, had objected too late.

Mr. Andrews urged that it was not too late for the superintending architect to be called in to give a certificate at that point. It had been clearly laid down that a certificate might be made after a building was up. He believed the appellant had been invited to make an application to the Council for permission to build in advance of the line. On the other hand, he contended that he was not bound to make such an application. If that was his (appellant's) view the Council could not help themselves.

Mr. Macaskie said he was instructed that no invitation was sent to the appellant. But even if it had been, that was no security that the owner would be allowed to build in advance.

Mr. Andrews again submitted that the point now before the Tribunal was whether the superintending architect's certificate was right. He cited the case of *Spackman v. Plumstead Board of Works*.

The Tribunal, having deliberated in private, declined to hear evidence on behalf of the appellant relating to the fourth ground of appeal, stating that the Tribunal could only deal with the appeal against the decision of the superintending architect's certificate.

Mr. Macaskie thereupon complained that the certificate was an extraordinary one, inasmuch as the superintending architect had drawn the building line more than 50 ft. from the highway, and behind existing buildings, which were set up without objection.

Mr. Andrews contended that the general building line as laid down was strictly in accordance with the Act and precedent, and after hearing evidence the Tribunal intimated that they would consider their judgment and communicate it to the parties in due course.

APPLICATIONS UNDER THE LONDON BUILDING ACT.

THE London County Council on Tuesday dealt with the following applications under the London Building Act, 1894. Unless otherwise stated consent was given on conditions. The names of applicants are given between parentheses:—

*Lines of Frontage and Projections.*

*Strand*.—Iron and glass shelter in Windmill-street, at the London Pavilion Music-hall, Piccadilly Circus (Messrs. Wilson & Long).

*Hampstead*.—Dwelling-house with two wood and brick porches, a verandah with wooden supports, and a projecting bay-window, on the east side of Finchley-road, Hampstead, at the corner of Platt's-lane (Messrs. Kidner & Berry).

*Hampstead*.—Wooden porch at the entrance to 78, Fitzjohn's-avenue, Hampstead (Messrs. Maple & Co.).

*Lewisham*.—Extension of the period within which the erection of houses with shops on the north side of Sydenham-road, Sydenham, between Silverdale-buildings and Mayow-road, was required to be completed (Messrs. I. Edmondson & Son).

*Islington, North*.—Iron and glass shelters at the Holloway Empire Palace, next Holloway-road and Manor-gardens, Islington (Mr. F. Matcham).—Consent refused.

*Hackney, North*.—Two-story building at the rear of No. 87, Reighton-road, Upper Clapton (Mr. H. Dyball).—Consent refused.

*Strand*.—The retention of a metal sign in front of the Windsor public-house, 427, Strand (Electrical and General Engineering Co.).—Consent refused.

*Width of Way and Lines of Frontage.*

*Hackney, Central*.—Iron and glass shelters at the Hackney Empire Palace, Mare-street, Hackney, in front of the portions of the building next The Grove (Mr. F. Matcham).

*Space at Rear.*

*Hampstead*.—Modification of the provisions of that Section with regard to open spaces about buildings, so far as relates to the proposed erection of two blocks of residential flats on a site on the west side of West End-lane, Hampstead, between Douglas Mansions and Carlton Mansions, with irregular open spaces at the rear (Messrs. Palgrave & Co.).—Consent refused.

*Means of Escape from the Top of High Buildings.*

*Westminster*.—On the fifth and sixth floors of a block of residential flats to be known as Stafford Mansions, and to be erected on the west side of Stafford-place, near its junction with Palace-street, Westminster, the upper surfaces of which floors will be above 60 ft. from the street level, for the persons dwelling, or employed therein.

*Formation of Street.*

*Greenwich*.—Formation or laying out of a new street for carriage traffic to lead out of Cedar-grove, Charlton (Mr. J. Ellis).—Consent refused.

*Alteration of Building.*

*Hampstead*.—The retention of a bedroom and boxroom constructed in the roof of No. 48, Belsize-park, Hampstead, of a less height than required by Section 70 of the Act, and by reason of the construction of which bedroom and boxroom the walls of the building are of less thickness than required by the first schedule of such Act (Mr. J. W. Stevens).—Consent refused.

The recommendation marked † is contrary to the views of the Local Authority.

THE LONDON COUNTY COUNCIL.

THE usual weekly meeting of this body was held at Spring-gardens on Tuesday, Mr. A. M. Torrance presiding.

*Loans*.—The following loans to public bodies were granted:—3,000l. to Brompton Borough Council for paving works; 6,700l. to Finsbury Borough Council for paving and sewer works; 2,545l. to Shoreditch Borough Council for paving works; 1,940l. to Woolwich Borough Council for various purposes; 2,900l. to Kensington Borough Council for paving works; 2,190l. to Poplar Borough Council for baths and washhouses; 22,365l. to Guardians of Stepney Union for erection of schools, &c.; and 5,970l. to Wandsworth Guardians for various purposes.

*Chief Engineer*.—The General Purposes Committee submitted a recommendation that the appointment of Sir Alexander Binnie be terminated from December 31, and that Mr. Maurice Fitzmaurice be appointed as from and including January 1, 1902, at a salary of 2,000l. a year. The Committee stated that the applications were thirty in number, and the sub-committee to whom they had referred the matter had had a personal interview with seven of the candidates. The sub-committee submitted three names to the Committee—Mr. Charles Elwin, general and Parliamentary assistant in the Engineer's Department of the Council; Mr. Maurice Fitzmaurice, chief engineer of the Assouan Nile reservoir (Egypt), and formerly resident engineer for the Council on the Blackwall Tunnel; and Mr. E. G. Mawbey, Engineer and Surveyor of the County of Leicester.

The recommendation of the Committee in favour of the appointment of Mr. Fitzmaurice was adopted.

*The Southwark Clearance Scheme*.—The Improvements Committee reported that in connexion with the Long-lane and Tabard-street improvement the Council had acquired from the Bridge House Estate Trustees a site in Leroy-street, Old Kent-road, and had prepared a draft scheme for the erection of dwellings for the accommodation of persons to be displaced by the improvement. They recommended that in the event hereafter of the Council approving the scheme that the expenditure of 1,443l. be charged to the account. This was adopted.

*SCHOOL BUILDINGS, WOLVERHAMPTON*.—These premises, which were recently opened, have been erected in Old Hall-street on a site containing 900 square yards. The accommodation, which occupies the whole of the ground floor, consists of a central hall, 28 ft. by 22 ft., with two classrooms, 22 ft. by 20 ft., to hold twenty in each room. Separate entrances are provided for boys and girls on either side of the building, with separate yards and out-offices, also separate hat and cloakrooms, lavatories, and bathrooms. A kitchen, scullery, and pantry are provided, also private room for head mistress. The several rooms are all fitted with open fireplaces in addition to hot-water apparatus. The first floor is to be used as a school for practical science, in connexion with the pupil teachers' centre on the opposite side of the street. The accommodation consists of a chemical laboratory, 40 ft. by 22 ft., to accommodate thirty students, also a lecture theatre 23 ft. by 22 ft. Lavatories for boys and girls are provided on the mezzanine floors. The hot-water apparatus was supplied and fixed by Messrs. Killick Cochrane, of Liverpool. The electric lighting has been fixed by the District Electric Lighting Co. The fittings and furniture have been supplied by Messrs. Fisher, Son, & Weaver, of West Bromwich, and Messrs. Speake & Son are the general contractors for the work. The total cost of the buildings and fittings has been about 4,000l. The whole was carried out under the designs of Mr. T. H. Fleeming, architect, of Wolverhampton.

The Queen Victoria Memorial: Plan of the

### Illustrations.

#### THE QUEEN VICTORIA MEMORIAL: SELECTED DESIGN.

**W**E give here the plan and two views of Mr. Aston Webb's design for the Queen Victoria Memorial, which has already been the subject of a descriptive article in our columns when it was first exhibited at the Foreign Office, and of which some further description, in regard to some modifications now made in it, will be found in the first article in the present issue.

The plan shows the ingenious connexion with Charing Cross by means of a circle, to which we have elsewhere referred. The actual entrance from Charing Cross will be by a decorated gateway without an arch.

The points opposite to the Duke of York steps and Marlborough Gate are emphasised, as will be observed, by the formation of an octagonal *place* at each point, with pedestals arranged for special sculpture subjects.

#### ILLUSTRATIONS OF OLD CHELSEA AND MILLBANK.

THESE illustrations, from some old maps and sketches in the Print-room of the British Museum, are published in connexion with the article on Old Chelsea on another page, and some of them are specially referred to there.

The bird's-eye view of Beaufort House does not directly come into the scope of the article referred to, but is of much interest in itself. The original "View of the House at Chelsey" is a fine print, on a large scale, engraved by Kip, after a drawing by Knyff, 1707. The house, which stood until 1740 where is now Beaufort-street, was, as some say, originally the "Great More House"—"my powre howse in Chelchit," of Sir Thomas More. Having been granted by Edward VI. to his Lord Treasurer, Sir William Paulet, first Marquis of Winchester, it passed by purchase to Gregory, Lord Dacre, whose widow devised it to Lord Burghley, whose son, the Earl of Salisbury, sold it to Henry Earl of Lincoln. In 1625 Charles I. bought the house, with its fifteen acres, from Sir Lionel Cranfield (Lord-Treasurer Middlesex) and gave it to the Duke of Buckingham. Whitelocke resided there during the time of the Commonwealth; the second Duke of Buckingham recovered possession at the Restoration and sold it in 1664 to John Godden. Then it belonged to George Digby, Earl of Bristol, who died there in 1677 leaving it to his widow, Anne, on whose behalf Evelyn effected its sale to Henry, first Duke of Beaufort. The Duke of Beaufort removed

thither in 1682 from his town house in the Strand (see our "Note" of October 26), and, as Evelyn also records, "made great alterations, but might have built a better house with the materials and cost he had been at." Henry, the third Duke, sold it, about 1738, for 2,500*l.*, to Sir Hans Sloane, who, four years afterwards, pulled the house down. Sloane, however, gave the gateway which Inigo Jones had built for Lord Middlesex to Lord Burlington, who set it up in his garden at Chiswick. Knyff's drawing shows the old houses in Duke and Lombard streets, by the waterside, to which we refer in our article, and Lindsay House, the iron gate of which we illustrated on November 28, 1891.

### Correspondence.

To the Editor of THE BUILDER.

#### SHOREDITCH TOWN HALL.

SIR,—Referring to your criticism of my arrangement of the cloakrooms and lavatories in this building in your issue of the 10th inst., it was not my intention to reply to same, as I considered the plan spoke for itself; but, as the chief officials at Shoreditch have signified their wish that I should do so, I venture to point out to you one or two facts which you have evidently overlooked or were unaware of. In the first place, both the ladies' and gentlemen's cloakrooms and lavatories are in the old building, and do not therefore form part of my new extension; they are old rooms altered and adapted as required.

There is a vestibule about 24 ft. wide, with a separate staircase up to large hall on each side. At the foot of each staircase is a door, that on left to ladies' cloakroom (from which their lavatory and crush cloakroom are approached), and that on right to gentlemen's cloakroom (from which their lavatory is approached). The other doors to the ladies' crush cloakroom and the gentlemen's lavatory are arranged so that these particular rooms may also serve other purposes—an arrangement adopted in most London town-halls.

The ladies' crush cloakroom will only be required to be used *as such* on very exceptional occasions; possibly twice or three times during the year, when the door you object to (which is an *existing* one) would be fastened. At other times this room will be used as an extra clerk's office by the Town Clerk (as might have been conjectured by the door leading from that official's department), when the door from vestibule will also be used. The door from only, when the cloakroom doors will be closed. In the evening, when the large hall is being used, the before-mentioned door would be closed, and the lavatory approached from cloakroom only.

I am sure you will admit after this explanation that your very severe remarks were at least un-

justified, and I should have thought that any expert would have seen and fully appreciated such an elementary but important point in a plan as the existence of alternative doors and the occasions on which the same would be in use or fastened. This would have at once disposed of your objections.

As your condemnation was so strong, I trust you will, in fairness to my clients and myself, find space for this letter in your next issue.

WILLIAM G. HUNT.

\*\* It is rather absurd for our correspondent to say that "the plan spoke for itself," as there was nothing in it to show which were old rooms and which were new, and no explanation as to the use made of the door of the ladies' crush cloakroom. On the face of it, and without explanation, the plan fully justified our observations; and we cannot but think that if the architect had been more fully alive to the importance of this point in planning he would not have allowed such a plan to be published without an explanation. The position of the cloak-room entrances is still, we think, open to criticism. The doors are too close to the foot of the stairs, and the plan represents the mistaken principle, which we have often protested against, that the entrances to ladies' and gentlemen's cloakrooms should be planned *symmetrically*, one answering to and facing the other. That is exactly what should not be done.—ED.

#### RE AMERICAN RED GUM.

SIR,—As use has been made of the name of one of our Committee, viz, Sir J. F. L. Rolleston, M.P., we wrote him on the subject, and he replies as follows—

"In reply to your letter, the impression you received as to the effect of our Report is altogether a mistaken one, as we expressed no opinion whatever as to the Red Gum Wood, and were not asked to do so."

J. MACCONNELL,  
Hon. Sec. The Westminster Rate-payers' Committee.

#### DEAL FLOORING.

SIR,—Will one of your readers kindly tell of a treatment of flooring of deal boards which will render it impervious to dirt, of a good colour, and readily cleaned?

D. J.

NEW CHURCH, AWSWORTH, NOTTS.—On the 10th ult. the foundation-stone of the new parish church which is being erected at Awsworth was laid. The edifice will be of red sand bricks, with facings of Coblench stone, and a roof of blue slates. The portion of the old church which has been left standing will be utilised as a temporary chancel, and the internal fittings of the new portion will be of pine. The cost is estimated at 2,000*l.* The architects for the work are Messrs. Naylor & Sale, of Iron-gate, Derby, and the contractors are Messrs. Walker & Slater, of Derby.

Mr. Aston Webb, A.R.A., Architect.

### The Student's Column.

#### GAS AND GAS FITTINGS.

18.—GAS LEAKAGES—EXPLOSIVE MIXTURES OF GAS AND AIR—DETECTION OF SMALL PROPORTIONS OF INFLAMMABLE GAS OR VAPOUR IN AIR—DETERMINATION OF THE HEATING POWER OF GAS.

**W**HEN a strong odour of gas is perceptible in the atmosphere of a room or building, all lights should be immediately extinguished, all windows should be opened, and unless the leakage of gas is occurring at some point where the cause of leakage is obvious, and where it can readily be stopped, as, for example, when a cock has been accidentally turned on, the gas should then be turned off at the meter.

After shutting off the gas at the meter, and when the odour of gas is no longer perceptible, an inspection should be made of all the pipes and cocks in the neighbourhood of the leakage, and if no defect can be detected the consumer should then seek the aid of the officers of the gas company, or send for an experienced gas-fitter.

Cheap brass pendants constructed of thin brazed tube, instead of thick drawn brass tube, should be avoided. They have a dangerous habit of splitting longitudinally. A long but hardly perceptible crack suddenly occurs in the tube and allows the gas to escape in large volume. Also the cheap ball-and-socket connections are frequently defective and allow gas to escape, particularly when the pendant becomes slightly tilted from the vertical position.

Explosions have sometimes been caused by the accumulation of gas in the space enclosed between the floorboards of a room and the ceiling of the room beneath. Gas confined in this space often fails to be detected until it is present in sufficient volume to form an explosive mixture, especially when the greater part of the floor is covered with carpet or linoleum; and when a naked light is taken near a crack between the boards, or a board is removed for examination of the pipes and a match is ignited to illuminate the space, a disastrous explosion occurs.

To ascertain whether any leakage is occurring in any part of a building, all the cocks to the burners should be closed, while the meter tap is left full on. Most meters have a dial situated above the ordinary recording indices which has a pointer which will make a complete revolution for every 2, 5, or 10 cubic feet (varying with the size of the meter) which pass through the meter. If a record be made of the position of this pointer when all the

burner cocks are closed, and if, during a period of fifteen minutes, it be found that the pointer remains quite stationary, the consumer may be satisfied that the fittings are gas-tight.

Explosions have occurred through two or more small gas jets being left burning in a room exposed to draught from a window. One of the jets has been extinguished by the draught, and sufficient gas has accumulated in the room, in spite of the open window, to form an explosive mixture, which has then been ignited by the jet not extinguished by the draught.

Leakages have occasionally occurred from sliding pendants provided with water seals, owing to neglect of the precaution to periodically add water to compensate for that lost by evaporation. This danger may be avoided by using glycerine, instead of water, in the water reservoir, as glycerine does not evaporate, and will, therefore, act as a permanent seal. If the use of glycerine be considered too costly, the rate of evaporation may be retarded by pouring a layer of lubricating or other suitable oil on the surface of the water until the layer is about  $\frac{1}{2}$  in. in depth.

*Explosive Mixtures of Gas and Air.*—The most important experiments which have been made to ascertain the proportions of air required to form explosive mixtures with different gases are those carried out by Dr. Frank Clowes, the present chemist to the London County Council, in 1895 and 1896. Some of the results of his investigation are shown in the following table, and it will be noticed that the explosive limits vary widely with different gases, the danger of the formation of an explosive mixture being, for example, greater with acetylene than with coal-gas:—

#### *Explosive Limits of Mixtures of Gas and Air.*

A mixture of—

Coal gas and air will not explode if it contain less than 5 per cent. or more than 15 per cent. of coal gas.

Water gas and air will not explode if it contain less than 5 per cent. or more than 55 per cent. of water gas.

Hydrogen and air will not explode if it contain less than 5 per cent. or more than 72 per cent. of hydrogen.

Carbon monoxide and air will not explode if it contain less than 13 per cent. or more than 75 per cent. of carbon monoxide.

Acetylene and air will not explode if it contain less than 3 per cent. or more than 82 per cent. of acetylene.

Methane (fire-damp) and air will not explode if it contain less than 5 per cent. or more than 15 per cent. of methane.

*Detection and Estimation of Small Quantities of Inflammable Gas or Vapour in Air.*—Coal-gas cannot always be detected by its odour.

By passing through a bed of gravel or other soil it may be deprived of its characteristic odour, and may accumulate in its odourless condition in an enclosed space in sufficient quantity to form an explosive mixture. It has been suggested that the mysterious explosions which have upon several occasions occurred in culverts containing electric lighting cables may have been due to leakages from neighbouring gas mains, the gas being deprived of its odour before reaching the culverts by passage through the interposing soil.

It has long been known to miners that when the atmosphere in a mine contains inflammable gas, but in too small a quantity to form an inflammable or explosive mixture, and a lighted candle is exposed in this atmosphere, a pale flame, or "cap," may be seen surmounting the candle flame.

When a Davy safety lamp is taken into an atmosphere of this description the presence of inflammable gas in the air is indicated by the presence of a pale flame filling the gauze chamber and eventually causing extinction of the lamp flame, or if the quantity of inflammable gas be insufficient to produce a mixture which burns within the gauze chamber it may yet be present in sufficient quantity to cause the oil flame to "spire" or become elongated and smoky. If the wick of the lamp be turned down until the oil flame has become almost non-luminous, the presence of as small a proportion as 3 per cent. of fire-damp in the atmosphere may be detected by the presence of a pale flame cap over the oil flame.

In 1881 MM. Mallard and Le Chatelier recognising that the employment of a luminous flame reduced to very small dimensions in the attempt to render it non-luminous is less useful for this test than a larger flame which is naturally non-luminous, proposed the use of a hydrogen flame in place of the oil flame. The process of generating hydrogen proposed was, however, too cumbersome for practical use, and trouble was experienced in regulating the size of the flame; and it was not until about the year 1890 when Dr. Clowes applied small cylinders of compressed hydrogen to this purpose that the hydrogen flame test became of practical utility. Dr. Clowes has invented a lamp consisting of a combination of the Davy safety lamp with a cylinder of compressed hydrogen. The cylinders had to be manufactured of sufficient strength and capacity to safely carry an ample supply of gas for testing purposes without materially affecting the weight or portability of the lamp. All difficulties have, however, been overcome, and the lamp is now extensively employed in coal mines.

By means of the hydrogen flame used in this lamp very small proportions of fire-damp or of

coal-gas can be detected and quantitatively estimated, the length of the flame-cap increasing with the proportion of inflammable gas present; while if the inflammable gas be present in dangerous quantity the flame is at once extinguished without igniting the explosive mixture in which it is exposed. The lamp may therefore be carried into an inflammable atmosphere without danger.

Disastrous explosions have occurred in the empty tanks of steamships used for the transport of petroleum owing to an explosive mixture

Fig. 46.—Apparatus for Detecting Inflammable Gas in Air.

Fig. 47.—Junker's Calorimeter.

Fig. 48.—Apparatus for Heating Power Test.

of air and petroleum vapour having been formed within the tank and ignited by red-hot rivets or by lights taken into the tanks by workmen employed on repairs. Dr. Boverton Redwood, co-operating with Dr. Clowes, has adapted the hydrogen flame test for testing the atmosphere of the tanks of petroleum steamships, and after a steamship has discharged its cargo of oil it is now obligatory that the tank atmosphere be tested before any person is allowed to enter the tank.

The testing apparatus devised by Dr. Redwood is shown in fig. 46.

The sample of air to be tested is collected under compression in a small metal cylinder by means of a pump. When being tested the air is led through a pipe to the base of the lamp, and flows around the hydrogen flame as it rises to the top of the lamp and escapes into the outer air. A series of wire baffles, through which the sample of air to be tested must pass, is provided in the lower part of the lamp, so that should the air sample be explosive the flame cannot flash back into the metal reservoir. The hydrogen supply for the lamp is obtained from a cylinder of the compressed gas of any convenient size. Behind the lamp is an upright metal rod with horizontal arms to support a black cloth, which is provided to enable the examiner to screen off external light and to observe the height of the non-luminous hydrogen flame, and (if the air

tested contain inflammable gas) the height of the flame-cap, through the glass front of the lamp.

The standard height to which the hydrogen flame should be adjusted is 0.4 in., and Dr. Redwood finds that a distinct cap is visible when the proportion of petroleum vapour amounts to one-ninth of the quantity which will make the mixture inflammable, or one-eighteenth of the quantity which renders it explosive, and considers that if the interior of the tank or other confined space be ventilated until a sample of the atmosphere within it is found to give no flame cap with this apparatus an ample margin of safety will be provided.

It has not yet been found possible to distinguish a flame-cap caused by the presence of fire-damp from a flame-cap caused by the presence of petroleum vapour. Further information relating to the detection and estimation of small quantities of inflammable gas or vapour in air may be obtained by reference to the Cantor lectures delivered by Dr. Clowes before the Society of Arts in 1894, and to the paper read by Mr. Boverton Redwood in the same year before the Institution of Civil Engineers, but from the brief outline which has been given of the method now commonly used for testing the atmosphere of coal mines and oil tanks it may be seen that the hydrogen flame cap test may be applied to any atmosphere suspected of containing inflammable

gas or vapour in dangerous quantity. Dr. Clowes states that with his lamp a visible flame-cap is obtained when as small a proportion as 0.1 per cent. of coal gas or of fire-damp is present in the atmosphere.

A number of instances will occur to the mind of the architect and engineer in which reliable information on this subject would be most valuable. Paints containing benzene or other light oils sometimes impregnate the atmosphere of the structures (such as the holds of ships) in which they are used with a dangerous proportion of inflammable vapour, and the lamp may also be used for testing the atmosphere of vaults, sewers, and subways.

*The Heating Power Test.*—Reference has already been made to the great difference in the relative heating values of coal gas, water gas, and Mond gas. The determination of the calorific power of a gas is an extremely simple process, and may be made with sufficient accuracy for all practical purposes in a very short time by means of Junker's calorimeter. The heat generated by combustion of the gas is transmitted to a current of water flowing at a constant rate, and observations are made of—

1. The quantity of gas burned.
2. The quantity of water heated.
3. The increase in the temperature of the water heated.

The calorimeter is shown in section in

fig. 47, and the complete apparatus required for testing is shown in fig. 48.

The gas to be tested is led through the meter to an atmospheric burner which forms part of the calorimeter. The gas is consumed at about the rate of 6 cubic feet per hour if coal-gas is being tested, but at a greater rate if the gas is fuel-gas of low heating power. The burner is surrounded by a vertical double-walled cylinder, and the hot products of combustion escape through a number of copper tubes passing down between the walls of the cylinder. The heated gases pass down through the tubes while the flowing water ascends outside the tubes. The tubes terminate in a common chamber in the bottom of the cylinder, and the uncondensable gases escape through the throttle at atmospheric temperature. The water flows through the calorimeter at a constant rate owing to the fact that the inlet device is provided with an overflow, and water is supplied to the instrument at a greater rate than it is allowed to flow through it.

The rate of flow is regulated until it is found that the temperature of the water flowing out of the calorimeter is between ten and twenty degrees C. higher than the temperature at the inlet. When the test is commenced the volume of water heated is carefully measured in a graduated cylinder of two litres capacity, and a reading of the gas meter is made. During the test readings of the thermometers at the inlet and outlet are made at short intervals and recorded.

The gross heating value of the gas in calories is found by the following equation:—

$$\frac{\text{Number of litres heated} \times \text{increase in temperature of water}}{\text{Cubic feet of gas consumed}}$$

The hydrogen contained in the gas is converted into water which condenses in the calorimeter, and gives up its latent heat to the circulating water. When gas is used as a fuel in practice the water formed escapes as steam and is not utilised. The latent heat is, therefore, usually deducted from the gross heating value, and the resultant figure is termed the "net" calorific value. The water condensed from the products of combustion is collected in a cubic centimetre measuring cylinder, and for every c.c. collected a deduction of 0.6 calorie is made. If 53 c.c. of condensed water were obtained from 2.0 cubic feet of gas, a deduction of 15.9 calories should be made from the gross heating value, thus:—

$$\frac{0.6 \times 53}{2} = 15.9 \text{ calories.}$$

The heating value of a gas is usually expressed in calories or British Thermal Units. A *calorie* is the amount of heat required to raise the temperature of one litre or one kilogramme of water one degree C, while a *British Thermal Unit* is the amount of heat required to raise 1 lb. of water one degree F. To convert calories into B.T.U. multiply the calories by 4 (or more correctly by 3.968).

#### GENERAL BUILDING NEWS.

**PARISH CHURCH, FVIE, ABERDEEN.**—Additions and alterations to this church have now been commenced. The whole area of the church is to be re-seated with pitch-pine seats. The interior of the chancel and the apse will be finished with an oak dado and finely-dressed Coronian granite throughout, with open oak beam work. A new chamber will be provided for the organ. The only part of the present church that will be taken down is the eastern gable between the galleries, and the latter will be connected by a dressed granite arch, spanning from the gallery to the ceiling. In front of the organ will be the choir. The walls of the eastern end of the apse will be filled with the three-light stained-glass window at present being manufactured by the Tiffany Company, New York. The two stained-glass figure windows at present in the church will occupy the north and south sides of the new apse. The floor of the chancel and apse will be 3 feet higher than the floor of the body of the church. The three or four steps leading up to it will be of white marble, and the whole of the chancel and apse flooring will also be of marble. Connected with the new chancel will be a new vestry and session-house. The present church was opened in 1809. The contractors as far as appointed are:—Mason work, Messrs Morgan & Co., Aberdeen; carpenter work, Messrs. McRobbie and Milne, Aberdeen; and slater work, Mr. Pirie, Fyvie. The architect is Mr. Marshall Mackenzie, of Aberdeen.

**ST. LUKE'S CHURCH, WOODSIDE, CROYDON.**—This church, after being partly rebuilt and enlarged, was reopened on the 15th ult., although the work is not quite finished in regard to a few details. The

rebuilt portion is 50½ ft. in width, and 52½ ft. in length. It is considerably more lofty than the old structure, which has been entirely replaced, or practically so, for at the north-west end there remains but a small fraction of the roof. The complete design provides for two more bays, with an end wall and porch, set off with turrets. A temporary entrance has been made there, and on the south side, opening to Spring-lane, there is a new door. The chancel, previously partly occupied by pews, is now clear. The roof is supported by transverse brick and stone arches, and these mark off the bays, which are arched between. There is accommodation for a congregation of about 500. The flooring is of wood block, with red tiles in the aisles. The windows, save for stained memorial glass which was part of the former edifice, are all of plain glass. With the completion of the building there will be a fine broad window at the west end. The artificial lighting is by incandescent gas, and this, with the heating by the radiator system, has been carried out by Messrs. Critall & Sons, of Noel-street, London.

The builders are Messrs. E. P. Bull & Co., of Croydon, and the architect is Mr. W. D. Caroe.  
**NEW FREEMASONS' HALL, OSWESTRY.**—On the 18th ult. the foundation-stone of the Freemasons' Hall, which is to be erected at the junction of Roft-street and Market-street, Oswestry, was laid. The building will consist of a hall 33 ft. by 22 ft. and a dining-room 23 ft. by 18 ft., which can be thrown into one hall when required, with retiring-rooms and other conveniences. On the first floor there will be a room, to be used for Masonic purposes only, 33 ft. by 23 ft., and a tyler's room 23 ft. by 18 ft. A caretaker's house will also be attached, containing five bedrooms, kitchen, bathroom, &c. The Roft-street front will be carried out in the Renaissance style, and the rest of the treatment will be Domestic Renaissance. The building will be faced with red brick and buff terra-cotta dressings. It will be warmed throughout by hot water, and fitted with the electric light. The cost is estimated at about 4,000. Messrs. Griffiths & Sons, of Ellesmere, are the contractors. The architect is Mr. W. H. Spaul, of Oswestry.

**RESTORATION OF WETWANG CHURCH, NEAR DRIFFIELD.**—On the 25th ult. the parish church of Wetwang, near Driffield, was reopened after being restored. An oak screen has been placed across the transept to form a chapel for weekly services, and the altar from the late chancel re-erected in it. The north aisle has been converted into a vestry, with oak screens, and the church is re-roofed. There is also an oak screen to the tower arch. The builders were Messrs. Thompson, of Peterborough, and Mr. Hodgson Fowler, of Durham, are the architect.

**HOSPITAL, HESWALL.**—The foundation-stone was laid on the 25th ult. by the President of the Local Government Board of a hospital which is being erected at Heswall for the treatment of tuberculosis cases by the joint Poor Law Unions of West Derby, Liverpool, and Toxteth Park. The site for the hospital is on the hillside at Heswall, and commanding extensive views of the estuary of the Dee and Wales, the total area of the land acquired being about fifteen acres. The buildings are to be erected with the main front facing due south, the outside facing carried out with Connaught Quay bricks, raised by red pressed Ruabon brick strings and arches. The administrative block will be placed in the centre and contain the various rooms necessary for the staff. Immediately in front of the first floor will be an open-air sun bath, divided, for both sexes. On either side of the administrative block will be two wings two stories high containing dormitories for ten-four patients, viz., twelve male and twelve female, divided on either side for two dormitories containing three patients each, and six dormitories for one patient in each. To every patient 1,000 cubic feet of air space will be allotted. All the windows will be made to open as casements, and all the rooms heated when necessary during the very inclement weather. Separate bath and lavatory accommodation will be provided on each floor for each sex, and separate staircases provided for the two sexes for ordinary use and in case of fire. The dining-hall is to be in the rear of the main building, connected by corridors with cross ventilation, and fitted complete with the usual kitchen and other offices. The water supply will be from the West Cheshire Waterworks. The total cost of land and buildings will be about 12,000. The contractor is Mr. Thomas Spencer, of Aintree, and the architect is Mr. Charles H. Lancaster.

**BUSINESS PREMISES, UNION TERRACE, ABERDEEN.**—On the 26th ult. the new buildings erected in Union-terrace, Aberdeen, for the Scottish Legal Life Assurance Society were formally inaugurated. The plan consists of two shops, with back saloons and cellars on the ground floor, and the first, second, and third floors are arranged as suites of offices, with accommodation for a caretaker in the attic floor. The entrance and vestibule doors are of mahogany, panelled and moulded, the vestibule door being glazed with bevelled plate-glass, and the fanlight of the outside door is filled in with a wrought-iron grill and shield, with raised brass letters "Scottish Legal Chambers." The stair from the ground to the first floor is of turn stone, with a dado of coloured glazed tiles. The staircase from the first floor to the attics is of an elliptic

form, with large windows filled with leaded glass, with the monogram of the company embossed on a shield. The front elevation of the building is faced with fine-axed Kemnay granite, except the piers of the shops and at the entrance doorways which are of polished Peterhead granite, with moulded capitals and bases of Kemnay granite. The elevation is divided into three boldly-designed bays, with mullioned oriels running up two stories, and surmounted with three large elliptic arches, and with moulded voussours and key-stones panelled on the face. These arches spring from double columns of clean-cut Kemnay stone, having moulded capitals and panelled and moulded bases. The third story is a flat surface, pierced with five semi-circular windows, with moulded rybats and key-stones divided from each other by three-quarter projecting circular columns, with moulded caps and bases. Above, there is the main cornice, formed with moulded dentil trusses and dentil blocks. Surmounting the main cornice is a moulded balustrade, and in the centre there is a pediment, with arched windows and terminated with a boldly-designed finial. The building is fitted up with the electric light. The following are the contractors:—Messrs. G. Fordyce & Co., masons; Leslie & Hay, carpenters; Sellar & Co., plasterers; Forbes Morrison, slater; John Campbell, plumber; George Donald & Sons, painters; George Bisset, ironwork; and the Aberdeen Electrical Engineering Co. The rates were supplied by Messrs. Marshall & Philip. Mr. George Sutherland, of Aberdeen, was the architect.

**VOLUNTEER HEADQUARTERS, GLASGOW.**—The new Volunteer headquarters building, situated at the south-east corner of Yorkhill drill-ground, with frontage to Gilbert-street, has now been completed. It is built of red brick faced with stone, and called the Aberdeen Electrical Engineering Co. The Volunteer Medical Staff Corps. Their entrance is from Gilbert-street, and comprises a drill-hall 70 ft. by 40 ft., store for ambulance waggons, armoury, sergeants' mess, &c. The drill-hall for the Volunteer battalion measures 142 ft. by 74 ft. Access is provided at both ends, the principal entrance being to the east. On the same level, towards Gilbert-street, and in direct communication with the drill-hall, are placed a large reading-room for the men, with buffet. Rooms for commissioned officers and adjutant occupy the remainder of the frontage. The officers' quarters are on the first floor, and include mess and billiard rooms, dressing-rooms, and lavatories, while on the attic story accommodation is provided for the sergeant-major, the resident official. Underneath the drill-hall, on the basement floor, a rifle-range has been formed. The building is heated by means of hot-water pipes on the low-pressure system, and is lighted throughout by electricity. Mr. Wm. H. M'Nab, of West George-street, Glasgow, is the architect.

**OPENING OF ST. SAVIOUR'S CHAPTER-HOUSE, SOUTHWARK.**—The Bishop of Rochester on the 28th ult. opened a Chapter-house for St. Saviour's, Southwark. The building which has been acquired for the purposes of the Chapter was originally the Chapel of St. Thomas the Martyr, which was founded in 1213. It is situated in St. Thomas' street, Southwark, in the neighbourhood of Guy's Hospital. Since the building has been taken over by St. Saviour's it has undergone several alterations, and has been thoroughly cleaned and redecorated. A feature of the house is a fine old oak gallery which runs round the northern and western walls. The tereos and communion-table, also of oak have been allowed to remain, and the old chapel have been broken up and utilised for the purpose of the electric light, and is amply furnished with new chairs. The architect was Mr. Arthur Bartlett, of Chancery-lane.

**RESTORATION OF LADY CHAPEL, ST. DAVID'S CATHEDRAL.**—This Lady Chapel, which has recently been reopened after restoration, was built by Bishop Martyn, whose tomb is in the north wall of the chapel, some time between 1299 and 1328. In style it is almost identical with the later Early English work adjoining it. The *Western Mail* states that in some respects it is not very dissimilar to the Lady Chapel at Llandaff, though differing greatly in proportion, that at Llandaff being tall and slender, with lofty windows, whereas that at St. David's partakes of the general character of breadth and lowness which distinguishes the whole cathedral. During several centuries the chapel was allowed to fall into disrepair, and its dilapidated condition, together with that of the two adjoining chapels, appeared all the more desolate by contrast with the remainder of the cathedral. The restoration just completed has been carried out in a conservative spirit. The ceiling of the Lady Chapel is a fine stone groined one, starting from the six old springers, the whole being supported by ribs, which were found to be sufficiently strong to carry out the vaulting. The ribs are of Douling stone. In the horizontal ribs, running due east and west, are five old bosses belonging to the previous vaulting, which collapsed about 130 years ago, and it was from the plan of these that the present vaulting was constructed. In the same rib are two new bosses containing the arms of the late bishop, Dr. Basil Jones, and of the present bishop, Dr. Owen. The intermediate ribs have

at the intersecting angles the arms of the three late deans—Lewellin, Allen, and Phillips. Bishop Martyn's tomb and the sedilia have now been restored, with as much of the old work left as possible. In the centre of the tracery work is a shield with the arms of Bishop Martyn and of the diocese. The altar base is a raised dais of two steps, inlaid with encaustic tiles, the altar itself being of carved oak, having four panels, with monograms in raised letters on shields, and carved buttresses. The east window is an example of the Decorated period, the other four windows being in the Perpendicular style. The ante-chapel, locally known as "The Seven Sisters' Chapel," is entered from the north and south aisles by two pairs of Early English arches, with moulded bases and capitals. Mr. J. Oldrid Scott was the architect.

#### MISCELLANEOUS.

**PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.**—Messrs. Pollard & Brand, builders, have removed from 10, Pelham-road to 32, Summerhill-road, South Tottenham, N.

**OLD SOUTHAMPTON.**—At the meeting of the Hampshire Field Club and Archaeological Society, held on the 17th ult. at Southampton, a number of buildings of historic interest were visited by the members. Amongst other places seen was the French Protestant Church, otherwise known as "God's House," or the Hospital of St. Julian. Here the President of the Society read a paper on the building. He stated that among the earliest settlements of Protestant refugees from Flanders and from France, having "churches" allotted to them, were those in London, Norwich, Canterbury, and Southampton; other congregations were formed at various periods at Sandwich, Rye, Winchelsea, Yarmouth, Colchester, Stamford, and Tipton, in the east of England; at Dartmouth, Plymouth, and Stonehouse in the south; and at Exeter, Barnstaple, and Bristol in the west. Of all the churches founded by the refugees none are more interesting than those of Southampton and Canterbury, which still survive. Of the records and registers remaining, the most ancient are those of Southampton, the first entries of which commence in the reign of Queen Elizabeth in 1567, and continue until the year 1797. The registers of the French Church at Southampton are now preserved at Somerset House. Although the first entries of the registers date from 1597, it is clear that this church of the refugees was first established by King Edward VI. The building itself originally formed the chapel of an ancient hospital dedicated to St. Julian, to the land already sold to the water company, and was subsequently walked to the West Gate, near West Quay (thirteenth century). This gave entrance to the town from the earliest quay constructed as a landing place for the medieval port. In the ancient room known as the Guard Room (fifteenth century) situated on the wall adjoining the West Gate the Rev. G. W. Minns read a paper on the building. He remarked that the history and purpose of this spacious upper chamber or solar cannot possibly be determined. It probably served as a guardroom, dormitory, or store in connexion with the neighbouring tower of the West Gate, from which it was entered by a door at the north end, the jambs of which may still be seen. It is proposed when opportunity occurs to restore this ancient approach. The building, as originally constructed, consisted of a stone basement, or plinth, the upper walls formed by studwork of oak, the interstices being filled with "wattle and daub," that is wattle or hurdle work over which clay was daubed, the face of the work being finished with rough cast or mortar. The architectural details of the chamber are of plain character, and indicate the date of the building to be of the fourteenth, or early in the fifteenth century. The roof, apparently of chestnut, is constructed with massive tie beams, king posts, purlins, and braces worked by the adze, the tenons secured by wooden pegs. The rafters have been extended to the rampart wall, but originally terminated on the outer wall of the chamber, the space between which and the parapet was open to the sky, and afforded an uninterrupted path for the military guard. He hoped that this interesting architectural feature would at some future time, in conjunction with the neighbouring West Gate, be more completely restored, after the manner of, and with the same purpose as, the West Gate at Winchester, which has been converted by the citizens into an attractive Municipal Museum. After leaving the ancient Guardroom the members spent much time in looking over the Tudor House in St. Michael's-square, which has recently been restored by Mr. W. F. G. Spranger, and the Medieval Hall, or Undercroft, in the old Simnel-street. After luncheon the party visited the Norman House, called in Duby's Hampshire "King John's Palace," and which contains the remains of a domestic building of the Norman period. The adjoining Norman arch was the next halting place; it was stated to have been one of the store houses of the old Norman Castle. Subsequently, the well-known Bargate was visited, after which the plans of Mr. R. M. Lucas for widening the side openings of the gate were inspected.

**NEW RIVER WATER SUPPLY.**—At the Surveyors' Institution, on the 23rd ult., Mr. Howard Martin, member of the council of the institution, sat as arbitrator in a dispute between the New River Company and the Provost and College of Dion, Mr. Freeman, K.C., with Mr. Arthur Shaw, appearing for the college, and Mr. Boyle, K.C., for the water company. In opening, Mr. Freeman said the company, under an Act passed in 1897, were empowered to carry out certain works to provide a further supply of water for London, the scheme necessitating the running of a pipe across the Wilds Estate of 760 acres at Hampstead, the property of the college. For the laying of that pipe the company proposed to acquire outright a strip of land across the estate amounting in all to two acres. The arbitrator was asked to decide what was the value of that land, and the amount of damage caused to the present owners by the severance. The estate would shortly be laid out for building purposes, and in counsel's opinion would rapidly develop in consequence of the facilities to be afforded by the extension of the Middlesex Tramways and the construction of an electric railway from Waterloo and Charing Cross. Five acres of the estate had been already sold at the price of 1,000l. per acre, and the college considered that the land to be acquired by the water company was worth 800l. per acre, with 10 per cent. for compulsory sale, and compensation was asked for damage by severance. In the present case it was not merely a matter of easement, but the company wanted the freehold of the ground through which they ran their pipe. Another matter which had to be considered was the difficulty that would arise when it was found necessary to construct sewers on the estate. The land so sloped that the drain would have to be carried across the line of the water-pipe, and by an undertaking entered into in March last, the college were bound not to build anything that would reach to within 4 ft. of the pipe above, and any sewer that was constructed was to be placed at such a depth as the engineer to the water company might reasonably require for the protection of the aqueduct. The company had said nothing as to the depth at which they were going to place their pipe, and it was, therefore, impossible to estimate the extra expenditure involved in running the sewer at whatever depth would be necessary to avoid the pipe. Counsel then called witnesses in support of his statement. They all agreed that the running of the pipe across the estate would necessitate the laying of the sewer at a low level, and consequently large extra expenditure. For the company Mr. Boyle said his witnesses estimated the value of the land at 200l. per acre. It was purely an agricultural district, and not likely to develop for building purposes for very many years. With regard to the land already sold, per acre, that had been purchased in order to enhance the value of adjoining land belonging to the purchasers. He considered that the pipes would not interfere with the drainage question at all, as it might be spread over different districts and not carried out in bulk as suggested by the college, and therefore the result of the acquisition of the land by the company would not mean any further expenditure. Expert evidence was taken with regard to the probability of development of the land for building, and on the question of drainage, and counsel afterwards addressed the arbitrator. Mr. Martin reserved his award.—Times.

**TRURO CATHEDRAL DAMAGE.**—The Truro Cathedral Building Committee on the 24th ult. reported to the Diocesan Conference that serious anxiety and painful disappointment had been caused by signs of fracture in eight of the Bath stone bases of the nave piers. Investigation showed that there was nothing to indicate anything amiss with the foundations of any settlement of the building, and the architect had reported that it was clearly a case of imperfect bedding. The Committee added that the cracked stones could be replaced, if necessary, by a very costly and possibly dangerous process, involving the underpinning of the arcades. But, before undertaking so serious an operation, they had decided, with the concurrence of the architect and contractor, to invite some thoroughly competent architectural expert to inspect the building and advise the Committee thereon.—Standard.

**CROMWELL STATUE, ST. IVES.**—On the 23rd ult. a statue of Oliver Cromwell, by Mr. F. W. Pomeroy, was unveiled at St. Ives. It is placed in the centre of the Market Hill, opposite the Free Church, and faces towards the station. The statue is in bronze, on a pedestal of Portland stone 8 ft. high. This is also the height of the figure, which represents Cromwell in the garb of a country gentleman of the period. He is wearing a sword, and under the left arm is a Bible. His right arm is pointing downwards. The pedestal rests on a granite base, and at the corners are four granite blocks, on which are placed gas standards of a design in accordance with the general character of the work. The stone bears the following inscription on the different sides: "Oliver Cromwell, 1599-1658; a townsman of St. Ives 1631 to 1636; erected by public subscription 1901; H. I. Hankin, Mayor; G. D. Day, Town Clerk."

**BUILDING ACTIVITY IN ABERDEEN.**—The Plans Committee of the Town Council has sanctioned the plans of the following buildings:—Two dwelling

houses on the west side of Bon-Accord-street, for Mr. Henry Duncan, granite merchant; dwelling-house on the north side of Fonthill-road, for Mr. John Brodie, fishcurer, per Messrs. Cameron and Sons, architects; dwelling-house on the south side of Albany-place, for Mr. B. G. Wilson, architect; fish-curing premises on the west side of North Esplanade, for the Scottish Co-operative Wholesale Society, per Mr. J. Davidson, Morrison-street, Glasgow.—Aberdeen Free Press.

**PUBLIC WORKS, EDINBURGH.**—The convener of the Streets and Buildings Committee of the Edinburgh Town Council has issued to the members of his Committee a report showing the extent of the works undertaken by the several departments under the Committee's direction, as well as a statement showing the actual expenditure of the Committee for 1900-1901, and the estimated expenditure for 1901-1902. The annual expenditure for the upkeep of macadamised streets approximates 14,000l., while in the case of causewayed streets it amounted to 15,000l. in the past year, and in the current year will cost over 18,000l. For new work and general repairs on the public footpaths of the city the expenditure involved is fully 10,000l. per annum. The large amount of work undertaken by the department in the making up and construction of new streets and footpaths (the cost of which is recovered from proprietors) may be measured by the expenditure on this account, amounting to about 12,000l. per annum. The expenditure for the upkeep and repair of sewers within the city amounts annually to between 6,000l. and 7,000l. This is exclusive of the charge for sinking fund and interest in respect of capital expenditure on new outlet sewers, such as that recently constructed in the Morningside district. In the current year a capital expenditure of 6,000l. for extension of general main sewers is estimated. The marked increase in the capital expenditure of the Committee for this year, as compared with last year (18,000l. compared with 5,600l.), is explained by such items as Bonnington Bridge, Portmado, and the improvements to the tramways to which the Council has been committed for some time. It is pointed out that the expenditure supervised by the Committee represents nearly one-fifth of the total annual expenditure of the city. With regard to the widening of Canonmills-road, it is stated that the negotiations regarding this improvement are now practically completed, and that the work will be immediately proceeded with. With regard to the Bonnington Bridge, arrangements have been made by the burgh of Leith and the Town Council for the erection of a widened and improved bridge. The National Telephone Company are now to proceed with the formation of the underground telephone way (at a cost of about 25,000l.), the estimates having been adjusted this week. Under the head of ordinary expenditure last year the actual amount was 71,871l. 10s. 10d., and the estimate for this year is 75,293l., while the actual capital expenditure last year was 5,031l. 17s. 11d., and the estimated expenditure this year is 18,190l., making a total estimate for this year of 93,483l., as against an actual expenditure last year of 77,503l. A report by the city road surveyor for the year ending May 15 last states that the total number of workmen then employed in his department was 206, and the wages paid during the year amounted to 3,561l. The total mileage of streets in the city is 63 miles. The work in hand at present, or in contemplation, includes:—(1) Formation of new approach avenue to Colinton Mains Hospital, for the Public Health Committee—estimated cost, 5,400l.; (2) formation of new roads at Quarryholes, Easter-road, on the lands of Trinity Hospital—estimated cost, 1,450l.; (3) rebuilding of Bonnington Bridge—estimated cost, about 8,000l.; (4) the opening up of about twenty-six miles of streets for the laying of underground pipes and conduits for the National Telephone Company, at an estimated cost of 26,000l. The cost of laying granolithic on foot-pavements in Portobello since May 15 last amounted to 1,329l. 8s. 7d.—Scottsman.

**CAPITAL AND LABOUR.**

**SOUTHPORT BUILDING TRADE.**—On Monday night an agreement was come to between the master joiners and men in Southport by which a farthing an hour was formally registered. Hitherto the pay has been 6d. per hour. On and after November 1 it will be 8½d. This will affect about 130 workmen, exclusive of those engaged on the Pier Pavilion.

**LEGAL.**

**BUILDING DISPUTE AT TORQUAY.**

IN the Chancery Division on the 25th ult. Mr. Justice Buckley had before him the case of the Torquay Hotel Co. v. Bell, on a motion by the plaintiff company for an *interim* injunction to restrain the defendant until the trial of the action or further order from erecting any building or addition to any existing building except in accordance with certain covenants and from opening any lights in any buildings within a distance of 15 ft. from the hotel.

Mr. Astbury, K.C., in support of the motion, said that the matter was rather a complicated one. The plaintiffs owned a large hotel at Torquay, which stood in a fine position and in very secluded grounds. The property was sold under covenants which restricted any adjoining owner as regarded building, and the defendant bought his property under an express covenant which provided that the hotel should not be interfered with, and by which he was to obtain the consent of one of two gentlemen to any building he might propose to erect. One of the covenants was that he was not to open any window overlooking the hotel grounds within 15 ft.

Mr. Henry Terrell, K.C., for the defendant, said that everything that the plaintiffs complained of, with the exception of one window, had been put right before the hearing was begun.

His Lordship remarked that the question then was merely one of costs.

After some discussion it was stated that the parties had come to terms. The defendant undertook not to use the flat roof of his building for drying clothes, and to put ground glass in the window complained of, and each party to pay their own costs of the action.

His Lordship accordingly made no order on the motion.

**WEST-END BUILDING DISPUTE:**

**ORDER TO COMMIT FOR CONTEMPT OF COURT.**

THE case of Bailey v. Lewis came before Mr. Justice Cozens-Hardy in the Chancery Division on the 24th ult., an action brought by the trustees of the Portland Estate against Mr. John Lewis, draper, of Oxford-street and Holles-street, to restrain a breach of covenant not to build other than private houses on land fronting Holles-street, where Mr. Lewis is extending his trade premises. On February 8 last, judgment was given, granting a mandatory injunction directing Mr. Lewis to pull down buildings already erected by him, and on August 2 the plaintiffs moved to commit Mr. Lewis for contempt of court in not complying with the injunction. His Lordship then directed the motion to stand over, but intimated that if the building was not pulled down by the end of the Long Vacation, an order for committal would be made as of course.

Mr. Vernon Smith, K.C., in support of the motion for committal, stated that practically nothing had been done to obey the mandatory order to pull down. He also informed his lordship that Mr. Lewis had placarded with posters the hoarding he had put up contrary to his rights.

Mr. Eve, K.C., for the defendant, said that no relief was sought on the ground of the posters, and so far as the motion before the Court was concerned, it was arranged on the last occasion that there was to be no discussion if the order had not been complied with, and his lordship stated that if this were not done, the writ of attachment would issue forthwith.

His Lordship: You are not in a position to resist the order.

Mr. Vernon Smith said, from the attitude the defendant had adopted, the plaintiffs feared that the order would never be observed unless one was appointed to do the work of pulling down.

His Lordship: We will try the effect of a few weeks in Holloway.

Mr. Eve stated that Mr. Lewis was the proprietor of a large business, and he asked to be allowed a week in which to make his arrangements. He would surrender in due course.

His Lordship: Mr. Lewis is not entitled to any indulgence. The order must take its usual course. The order to commit was accordingly made.

Mr. Wallace appeared with Mr. Vernon Smith in support of the motion, and Mr. Edward Ford, with Mr. Eve, for the defendant.

On the 26th ult., a motion was made on behalf of Mr. Lewis that the writ might not go for a week. Mr. Eve stating that his client had in no way intended disrespect to the court, and that he had satisfied the plaintiffs that he was taking prompt steps to carry out what the order directed. The

learned counsel further stated that the plaintiffs did not object to the application being acceded to.

Mr. Vernon Smith, on behalf of the plaintiffs, said this was so.

In the result his Lordship, as it appeared that the writ had already reached the hands of the Sheriff, allowed the plaintiffs to take from the Registrar a memorandum of instruction to the Sheriff not to proceed with the writ for a week. The learned Judge said that the application must be mentioned again to him on the next motion day, and Mr. Lewis must make an affidavit expressing his regret for the gross contempt he had committed, and showing that he had by then taken substantial steps towards the removal of the buildings complained of.

**THE CORPORATION OF WEST HARTLEPOOL AND BUILDING PLANS.**

THE case of the King v. the Mayor, &c., of West Hartlepool, *ex parte* Richardson, came before a Divisional Court of King's Bench composed of the Lord Chief Justice of England and Mr. Justice Ridley, on the 25th ult., on an application by Messrs. J. E. & H. W. Richardson for a prerogative writ of mandamus calling upon the Mayor and Corporation of West Hartlepool to approve of certain plans submitted to them for their approval.

It appeared that it was desired to erect a block of buildings in Stockton-street and Park-road, West Hartlepool, and on July 4 last Messrs. Richardson submitted plans of the buildings to be erected for the approval of the Corporation. The Corporation refused to give their sanction to the erection of the buildings according to the plans submitted, the reason of the refusal given by the Corporation being that buildings so erected would interfere with a public highway. Messrs. Richardson's case was that the street or way in question had never been dedicated to the public, nor used by the public, and was only used by the occupiers of certain cottages as a private way by the leave and licence of Messrs. Richardson. They further said that this street had never been repaired by the Corporation, nor had the Corporation ever called upon them to keep it in repair, and that the street and the cottages were in existence many years before the incorporation of the district with the Borough of West Hartlepool, and prior to the passing of the West Hartlepool Improvement Act, 1854. On behalf of the applicants it was now contended that since the existence of the highway alleged that since the existence of the Corporation exceeded their powers in refusing to approve of the plans for the building for the reasons given by them, and that the only question for them was whether the plans were in accordance with the by-laws as to the erection of new buildings.

At the conclusion of the arguments of Counsel the Lord Chief Justice, in giving judgment, said he did not think the *mandamus* ought to go. It could not be denied that the Corporation were the guardians of the highways of the borough, and that being so, he did not think that they ought to be compelled to approve of plans for new buildings which, in the honest opinion of that body, would interfere with a highway under their charge.

Mr. Justice Ridley concurred, and the application was accordingly dismissed, with costs.

Mr. C. A. Russell, K.C., and Mr. Naldrett appeared for the applicants, and Mr. Macmorran, K.C., and Mr. Pollard for the Corporation.

**ANCIENT LIGHTS:**

**IMPORTANT CASE IN THE COURT OF APPEAL.**

THE case of Warren and Others v. Brown came before the Court of Appeal, composed of the Lord Chief Justice and Lords Justices Vaughan Williams and Romer, on the 28th and 29th ults., on the appeal of the plaintiffs from the judgment of Mr. Justice Wright in the Queen's Bench Division on August 8, 1900. The case was reported in the issue of the *Builder* of August 11, 1900. The case raised a question of great importance in relation to ancient lights—namely, whether the right which is acquired by statutory prescription is a right to the continuance of substantially the whole quantity of light which has come to the windows during the twenty years, or is limited to a sufficient quantity of light for all ordinary purposes of inhabitation or business. The facts were these. The plaintiffs were the owners and the tenant of a building in the town of Leicester, and they claimed damages and an injunction in respect of the obstruction of the access of light to windows more than twenty years old. At the trial the claim was limited to two rooms, one on the ground floor and the other above the former, both facing to the south. For a length of about 17 ft. in front of these rooms the defendant had raised his building from a height of about 20 ft. 6 in. to about 26 ft., but had set it back about 2 ft. or 3 ft., so that the width of the street between the two buildings, which was about 17 ft., became about 19 ft. Four out of the five windows in each of the two rooms are opposite to that part of the defendant's building which has been mentioned. Mr. Justice Wright found, as a fact, that the defendant had not obstructed or diminished to any material extent, if at all, the light coming to the upper of the two rooms in question. As regarded however the four windows on the ground

floor, he found that the defendant had materially diminished the light which the plaintiffs enjoyed from those windows for twenty years past, but that abundant light remained for all ordinary purposes of inhabitation or business, and that the room in its then state was better lighted than the ground floor rooms in many of the principal streets. The plaintiff Baum (the tenant of the premises) had for less than twenty years carried on in the premises, and particularly in the ground floor in question, a manufacture of hosiery by means of machinery which required a very accurate adjustment and quality of light for the excellent quality of filaments to fine needles. Prior to this manufacture the manufacture of boots and shoes, which required good but not special or extraordinary light, was carried on in the premises. His Lordship held that the defendant had by the acts complained of so diminished the light that it was materially insufficient during some part of the day for the special requirements of Baum's industry, and he found that the plaintiffs' premises had throughout the twenty years before action been suitable for such a manufacture as that carried on by Baum. He thought that the light as it then existed would have been sufficient for any but the most recent kinds of machines. His Lordship decided that the plaintiffs had made out no case for a mandatory injunction or for damages, and gave judgment for the defendant with costs, but in case he should be held wrong in his law on the appeal he assessed the damages at 100l. for the tenant and 200l. for the reversioners. Hence the present appeal of the plaintiffs.

Mr. Hugo Young, K.C. (with him Mr. W. H. Stevenson), for the appellants, said that Mr. Justice Wright had held that, although there was a substantial diminution of light coming to the plaintiffs' premises, there was enough light left for ordinary purposes, and therefore the plaintiffs were not entitled to damages nor an injunction. His Lordship found as a fact that there was not enough light for the purpose for which Baum required it, but held that, inasmuch as the purpose for which he wanted it was a purpose which had not existed for twenty years, the plaintiffs could have no recompense. He (counsel) submitted that the moment he showed a substantial diminution of light, and a reasonable purpose, and one reasonably connected with the premises—he was not to be debarred from using that light and claiming that light, because he had not used it to the full extent for twenty years. Mr. Justice Wright had found that the trade for which the light was required was common in the town, and that these premises for over twenty years were adapted for such trade.

The Lord Chief Justice: For how long have you been carrying on the hosiery business?

Mr. Young: For some seventeen or eighteen years. The foundation for all claims of this kind is that there must be a substantial and material diminution of light, and that Mr. Justice Wright had found in the plaintiffs' favour. The learned counsel, continuing said that the effect of Mr. Justice Wright's judgment would be that all houses, notwithstanding how desirably situated at present with regard to light, were liable to be reduced to a common standard.

Lord Justice Romer: I thought that in questions of substantial interference with light you could not go into questions of particular use. If I have a very light house, a person could not justly interfere with it by saying, "I have left you enough light, and as good as nine out of ten houses in the street."

Mr. Young: No. Here we have got a house specially adapted for the present-day hosiery trade of Leicester, and our house has probably got a better light than others. But we have not carried on that trade for twenty years, and then when we begin that trade a man comes and reduces that light so that it is no better than the light of other places where the trade is carried on. Mr. Justice Wright's decision is that as we have been left enough light for ordinary purposes, although not enough for the hosiery business we have carried on for some years, we have no remedy. The learned counsel contended that the plaintiffs in law were entitled to succeed, and cited a great number of cases in support of his submission.

Mr. Stevenson having followed on the same side,

Mr. Warrington, K.C. (with him Mr. Neilson), in support of the judgment in the Court below, said that Mr. Justice Wright had found that no damage had accrued to the plaintiffs except in regard to the extra-ordinary light required for a new and intricate piece of machinery recently introduced by the tenant, and in respect of that he had assessed the damages at 100l. for the tenant and 200l. for the reversioners in case he was wrong in the view he took of the law that they were not entitled to compensation.

Lord Justice Romer said that the learned Judge had found that a substantial amount of light had been obstructed, and that the plaintiffs had suffered damage to the amount mentioned because the tenant could no longer carry on his business in the old way.

Mr. Warrington could not assent to that, his reading of the judgment being that Mr. Justice Wright assessed the damages with reference to the application of the light to new machinery. The light as it now existed would have been sufficient

for any but the most recent delicate machinery, and the lessor's grant must be limited to their lights as they existed at the time the agreement was entered into, or to such user as was then within the reasonable contemplation of the parties.

At the conclusion of the arguments their Lordships intimated that they would reserve judgment.

**ACTION AGAINST ARCHITECTS.**

The case of *Vaux & Son v. Wimpeys & Arber* came before the Court of Appeal, composed of the Master of the Rolls and Lords Justices Stirling and Mathew, on the 30th ult., on the appeal of the defendants from a judgment of Mr. Justice Grantham, sitting without a jury, in the King's Bench Division. The plaintiffs are engineers carrying on business in Sunderland, and the defendants are architects carrying on business in London. The plaintiffs brought the action to recover 238*l.* 7*s.* 8*d.* in respect of a portion of the heating apparatus of the New Palace Theatre at Blackburn, the defendants, it was alleged, having given the plaintiffs the order for the work. The matter arose out of a building contract by which a builder named Davidson contracted to build the theatre for 17,000*l.* By the contract the builder had to spend 350*l.* on the heating apparatus, and the order for this work was given to the plaintiffs. Subsequently the building owners having gone into liquidation, the defendants ordered from the plaintiffs extra heating apparatus, and it was in respect of this additional order that the present claim arose. Defendants pleaded that they were not liable as they were not the principals, but in the Court below Mr. Justice Grantham held that as Davidson was not responsible for an expenditure on heating of more than 350*l.*, and that inasmuch as the architects had given the orders in their own name without any qualification whatever, they were liable for the extra work performed by the plaintiffs. The defendants now appealed from this decision.

At the conclusion of the arguments of counsel, the Master of the Rolls, in giving judgment, said that the evidence in the case showed that the defendants had given the order to the plaintiffs in their own name, and that being so, they were liable to pay the bill to the plaintiffs.

The Lords Justices concurred, and the appeal was dismissed with costs.

Mr. Statham appeared for the appellants, and Mr. Montague Lush for the respondents.

**RECENT PATENTS:**

**ABSTRACTS OF PATENTED INVENTIONS.**

11,693.—**TOPS FOR VENTILATING SHAFTS:** *W. Cadman.*—A top for the up-cast shaft of a drain or sewer pipe, or some similar shaft, is fashioned in a conoidal or bulbous shape, perforated with holes in such a manner that the up-draught shall not be diminished. The particular form specified is devised in order to prevent birds from building nests in the shaft top.

11,694.—**A TOOL FOR BORING HOLES FOR POSTS:** *C. L. Tuttle.*—The auger has four sector-shaped plates which are secured to a crossbar at the lower end of its shaft which terminates beyond with a tapered feed-screw. The two plates that are attached to the underside of the crossbar are made with radial cutting edges turned downwards and cutting portions disposed vertically, they also have oblique setting-slots for their adjustment; the other two plates are hinged on to the upper side of the crossbar and their radial edges are turned upwards. There is an opening below the level of the cutters in the tubular shaft.

11,705.—**A FLOORING CRAMP:** *G. Kay.*—A plate and an adjustable pin grip the joist, the ears of the plate being joined with the pivot of the links which are joined with the pin—for which, however, a cam may be substituted; a lever which presses a plunger against the board is linked to the upper end of the first named link and is pivoted on to the plunger, which a pawl maintains in its position, the pawl being pivoted on to the plunger for engagement with teeth upon the upper ends of the links, or pivoted so as to engage with teeth upon the plunger.

11,907.—**BLOCKS FOR GAS, ELECTRICAL, AND SIMILAR FITTINGS:** *J. Bolton.*—The block, that can be fixed on an unplastered wall, is fashioned with countersunk holes for screws and with a hollowed back for waterproofed material, which is to be screwed in from the front; holes or a recess in the rear edge will take a pipe or casing or wires, and for metallic blocks a ring should be inserted over the gas or other fitting.

11,913.—**ATTACHMENTS FOR SCAFFOLDING:** *J. Fage and J. Hunt.*—A chain either passed through holes in a bar and secured with collars or pins, or fitted with bolts and nuts or screwed hooks, fastens the bar to the upright; another chain is passed around the latter which rests on the bars, and around the standard and braces. Hooks having right and left-hand screws are fitted on to the chain ends, and a cylindrical nut, between collars bolted to the bar, serves to tighten the chain, a rod or lever being applied in radial holes of the nut.

11,916.—**A PIPE-WRENCH:** *A. J. Savin.*—In the head of the handle are two lugs, through which are

inserted pins upon which the lower jaw and the upper hooked jaw are pivoted. Pivoted links connect the jaws, which under normal conditions are forced together by a spring that is held by the upper pin and bears against the upper jaw and a pin through the connecting link. The wear is taken by a tapered bar of cast-steel-section (which may be turned so as to give a fresh edge) affixed at the working end of the lower jaw.

11,983.—**APPARATUS FOR EXTINGUISHING FIRE:** *G. H. Downing.*—A perforated tube is secured within the main casing of the extinguisher by a neck at the top and a socket at the bottom. A screw-down cap holds the acid bottle in the top of the tube; in operation a weight falls to break the bottle when the case is inverted, the mixed liquids being thereupon discharged through the outlet.

11,987.—**AN ARTIFICIAL STONE:** *M. Corles.*—An admixture is made of gypsum, one part, peat rubble one part, tan one part, and water four parts. The moulded blocks are stated to be particularly adapted for dividing-walls or light partitions.

11,995.—**AN APPLIANCE FOR VENTILATORS:** *P. Sosulski.*—The inventor's object is to ensure that the door of the ventilator shall be quite shut. When the closing of the door around its pivot a roller is forced into a notch in the ring by means of a spring that is disposed so as to press upon the spindle of the roller. On the frame of the door is a plate that will sustain the ring centrally in its proper place.

12,038.—**A SELF-SHUTTING VALVE:** *A. E. F. Hanks.*—On to the inlet pipe is fitted a valve-casing of which the upper end provides a seating for the valve. Winged guides are fashioned upon the spindle, whereof the lower end works through a guide in the outlet fitted over the lower end of the casing. A claw upon the movable handle is set in engagement with a rim upon the casing, whilst its forked lower arms embrace the outlet, and will work against a rim at the upper end of the outlet. The outlet rises for the opening of the valve as the handle is forced downwards.

12,074.—**AN ELECTROMETRIC APPLIANCE:** *Siemens & Halske, A. G.*—In the case of an electrostatic volt-meter the inventors dispose the charged surfaces in such a manner that air will be compressed between them for damping their movement towards one another; they mount an aluminium body with wires upon an axle on which are a pointer and a balancing-weight, and which a spring will control and connect electrically. The other charged surface consists of a stationary curved box made of some insulating material thinly coated with metal, into which the aluminium body is attracted, and which it almost exactly fits.

12,106.—**A TROLLEY FOR CONTRACTORS' USE:** *P. G. Hossfeld.*—A two-wheeled trolley is devised for raising and transporting girders, baulks of timber, and so on. Rollers upon the crooked end of the handle are forced beneath the load; the other end of the handle or beam is pressed downwards, and the trolley is then pushed forward until the load rests upon the carrying-rollers. In another form the inventor provides arms, chains, and scissor-like levers which grip a beam or baulk of timber. The contrivance may be adapted to a four-wheeled wagon.

12,119.—**MEANS OF ATTACHING CIRCULAR SAWS:** *C. H. Clon.*—A disc or flange having a projection that will fit in the middle hole of the saw, is riveted on to the saw, which is then clamped on to its spindle. Bolts may be inserted through the collar of the spindle and through the flange, their heads being countersunk into the saw.

12,132.—**PROCESS OF MOULDING BRICKS:** *J. G. Lowood, W. J. Gardner, and J. W. Armstrong.*—A screw inside a hopper feeds the material to the moulds, and after their tops have been dusted by the dusting-boxes the bricks are pressed and marked with fixed stamps worked by cams, levers, and rams, provision being made for the reciprocation of the mould-slides and the movement of the shuttles or slides of the dusting-boxes. A cam upon the driving-shaft operates a set of levers which intermittently reciprocate the cross-head on which are mounted the claws that lift the mould-box from the pressed bricks. A slide that supplies fresh mould-plates to the empty mould-box then forces the moulded bricks up inclines on to a side table. A container for the mould-plates is disposed above the slide and two sets of pivoted supports or arms, having different lengths, liberate the mould-plates singly; each plate drops from the long arms on to the short arms and thence on to the carrier-slide which a cam and lever reciprocate. The arms are in pairs upon the opposite sides of cams which drive them apart so as to liberate the plates.

12,133.—**SAWS FOR STONE:** *J. Beckover.*—The saws consist of metal plates which are slotted so as to form the teeth; the outer slots are overlapped by the inner slots in order that they shall serve for teeth when the former set have been worn away; a clamp is employed for curving the teeth in turn towards opposite sides.

12,160.—**FILAMENTS FOR INCANDESCENT LAMPS:** *V. Thomas.*—These are composed of carbon or graphite and a refractory oxide, a mixture being made of nitro-cellulose, sixteen parts, dissolved in eighty-five parts of glacial acetic acid, with either 2 per cent. of thorium or beryllium acetate, or 1 per cent. each of thorium and aluminium acetates, or 3 per cent. of cerium acetate. The salts should be

added in aqueous solution, and nitrates may replace acetates.

12,182.—**PROCESS OF SLAKING LIME:** *W. Schultze.*—A certain quantity of water is sprinkled over the lime, which is laid upon a screen carried by rollers in the interior of a hopper, the lid is closed, and the screen is reciprocated; the powder which has dropped below is treated in a horizontal cylinder, of which the external jacket is heated by steam to 97 deg. C., and a conveyer, which is rotated in the lower half of the cylinder, agitates the lime and discharges it through a steam-beated pivoted outlet door. As soon as the cylinder is hot enough a catch is drawn for the admission of the charge through a non-conducting or steam-heated valve at the base of the hopper.

12,186.—**APPARATUS FOR USE WITH SEWAGE TANKS, FILTERS, &c.:** *S. H. Adams.*—For the automatic filling and emptying of the tank, the sewage is caused to flow from a tank through a pipe into a chamber and thence upon a filter by the operation of a siphon, which in some instances is placed within the tank. A siphon adjusted to the filter, and an air-bell inside a chamber and in communication with a pipe attached to the discharge siphon, will regulate the amount of the flow of the sewage, and the action of the latter is arrested as the chamber is filled by the auxiliary siphon, the air in the bell being impelled through the pipe into the other siphon. In a variant shape the inventor connects an air-bell to a lever which regulates a valve upon the discharge pipe of the tank.

12,258.—**MEANS OF ESCAPE FROM FIRE:** *F. M. Lepore.*—Around an overhead drum is passed an endless wire-rope ladder, of which the free end is allowed to hang through a window or other opening, the ladder being kept clear from the wall by guide pulleys. In use, the free end of the ladder is pulled downwards so as to unfasten the catch of the trap-door of the case in which the ladder is housed, and the speed of the descent can be controlled with a brake-rope and a brake strap.

**MEETINGS.**

**FRIDAY, NOVEMBER 1.**

*Architectural Association.*—Mr. A. Wood, M.A., F.S.A., on "Cambridge in Early and Medieval Times." 7.30 p.m.

*Institution of Junior Engineers.*—Presidential address by Sir John Jackson, F.R.S.E., Westminster Palace Hotel. 8 p.m.

*Institution of Mechanical Engineers.*—Adjourned discussion on the Second Gas Engine Research Report. 8 p.m.

**SATURDAY, NOVEMBER 2.**

*British Institute of Certified Carpenters.*—Adjourned discussion on Mr. Sweet's paper on "Modern Joinery." 6 p.m.

*Society of Engineers, Science, and Art.*—President Patrick Geddes, on "The Glasgow Exhibition: its Results and Lessons." Technical Institute, Small's Wynd, Dundee. 7 p.m.

**MONDAY, NOVEMBER 4.**

*Institute of Architects.*—President's Opening Address. 8 p.m.

*Society of Engineers.*—Mr. R. Gaskell, Hetherington, M.A., on "The Main Drainage of Ilford." 17, Victoria-street. 7.30 p.m.

*Liverpool Architectural Society.*—Mr. W. F. Irvine on "The Ancient Streets and Boundaries of Liverpool." 44, Castle-street, Liverpool. 6 p.m.

**TUESDAY, NOVEMBER 5.**

*Institution of Civil Engineers.*—President's Address, and presentation of medals and prizes. Great George-street. 8 p.m.

**WEDNESDAY, NOVEMBER 6.**

*Royal Archaeological Institute of Great Britain and Ireland.*—Mr. C. A. Bradford, F.S.A., "On a Vestige, Fiscal Window of Unusual Character at Milton Church." Mr. R. L. Holson on "Medieval Pottery found in England." 20, Hanover-square. 4 p.m.

*President Institution of Builders' Foremen and Clerks of Works.*—Ordinary meeting, 9, Conduit-street, W. 8 p.m.

**THURSDAY, NOVEMBER 7.**

*Carpenters' Hall.*—Mr. James Bartlett on "Setting O Work and By-laws." 7.30 p.m.

**FRIDAY, NOVEMBER 8.**

*Architectural Association, Discussion Section.*—Mr. W. E. Davis on "The Finishing of a Dwelling-house." 7.30 p.m.

*The Technical College Architectural Craftsmen's Society.*—Mr. Robert Stuart on "Soft Wood," and Mr. D. S. Pringle on "Hard Wood," 204, George-street, Glasgow. 8 p.m.

**SOME RECENT SALES OF PROPERTY:**

**ESTATE EXCHANGE REPORT.**

October 14.—By W. G. BURGESS (at Swanley Junction).	
Hextable, Kent.—The Nutley Nursery, 2 a. l. . . . .	£300
Dartford, Kent.—1 to 17, Orchard-st., ut. 75 yds of land, 1 . . . . .	850
Swanley Junction, Kent.—High-st., two plots of land, 1 . . . . .	360
Castle-rd., two plots of land, f. . . . .	150
1 to 16, Alexander-st., ut. 65 yds, 64. 35f. . . . .	490
1 to 24, Castle-rd., ut. 65 yds, 64. 60f. . . . .	680
1 to 14, Jessamine-st., ut. 87 yds, 64. 24f. . . . .	1,120
October 16.—By W. K. NICHOLAS & Co. (at Swanley).	
Braydon, Wilts.—Nine plots of building land, 3 a. 2 r. 10 p. f. . . . .	423

PRICES CURRENT OF MATERIALS.			
* * * Our aim in this list is to give, as far as possible, the average prices of materials, not necessarily the lowest. Quality and quantity obviously affect prices—a fact which should be remembered by those who make use of this information.

ESTIMATING AND QUANTITIES. CORRESPONDENCE CLASSES (carefully revised up-to-date) by an experienced LONDON SURVEYOR. Specially adapted to suit the requirements of Builders' Clerks, Foremen, Leading Hands, and others.

MUNICIPAL AND COUNTY ENGINEERS' EXAMINATION.—MR. RICHARD PARRY, by correspondence for this examination. The course of work may be taken to extend over six or twelve months according to previous knowledge.

R. J. EVERETT & SONS, LITHOGRAPHERS. Sole Proprietors of the Invention of the late Mr. R. J. EVERETT, so successfully worked by Sprague & Co., Ltd., and their predecessors, and known as THE INK-PHOTO PROCESS,

which stands unequalled for the effective reproduction of Wash Drawings, Pencil Sketches, Engravings, Estimates on application to the Works.—138, Devonshire-road, FOREST HILL, S.E.

THE BUILDER'S STUDENT'S SERIES

THESE Books, although intended primarily for the Student in Architecture, Engineering, Surveying, Sanitary Science, &c. will also be found of great practical value alike to the Professional man, the Contractor, and the Craftsman.

Direct from the Office, POST FREE, on receipt of remittance.

SANITARY FITTINGS AND PLEMBING. By G. LESTER SUTCLIFFE, A.R.I.B.A. M.S.I. &c. 212 Illustrations.

ROADS: Their Construction and Maintenance, with Special Reference to Road Material. By ALLAN EUSDEN, B.Sc. Lond. F.R.S. 46 Illustrations.

LAND SURVEYING AND LEVELLING. By ARTHUR WALMSLEY, M.I.C.E. F.S.I. F.R.C.S. Lond. Hon. Assoc. R.I.B.A. 140 Illustrations.

FIELD WORK AND INSTRUMENTS. By ARTHUR WALMSLEY, M.I.C.E. F.S.I. F.R.C.S. Lond. 61 Illustrations.

STRUCTURAL IRON AND STEEL. By W. N. TWYFLETTERS, M.I.C.E. 214 Illustrations.

STRESSES AND STRAINS: Their Calculation and that of their Residues. By FREDERIC HUGHES, F.R.S. 120 Illustrations.

SPECIFICATIONS FOR BUILDING WORKS. 3/6 and How to Write Them. Manual for Architects, Builders, and Surveyors. By FREDERIC HUGHES, F.R.S. 120 Illustrations.

QUANTITIES AND QUANTITY TAKING. By W. E. DAVIS. A reliable handbook for the Student, rare and simple, to cope being limited to the method of procedure in the production of a good bill of quantities.

2nd Edition. Revised and corrected by the Authors. CARPENTRY AND JOINERY: A Text-Book for Architects, Engineers, Surveyors, and Builders. By H. PHILLIPS FLETCHER, A.R.I.B.A. M.I.C.E. 124 Illustrations.

ARCHITECTURAL HYGIENE, or, Sanitary Science. By HANSTON FLETCHER, A.R.I.B.A. and PHILLIPS FLETCHER, A.R.I.B.A. M.I.C.E. 55 Illustrations.

R. I. B. A. SOCIETY OF ARCHITECTS. SURVEYORS' INSTITUTE, and CIVIL SERVICE TECHNICAL EXAMINATIONS. Preparation by correspondence or in residence. Private lessons. L. Street, Strand, W.C.

MUNICIPAL AND COUNTY ENGINEERS' EXAMINATION.—MR. RICHARD PARRY, by correspondence for this examination. The course of work may be taken to extend over six or twelve months according to previous knowledge.

BILLS OF QUANTITIES, &c.

LITHOGRAPHED CORRECTLY BY RETURN OF POST. LIBERAL DISCOUNT OFF USUAL PRICES. PLANS BEST STYLE.

ALLDAY, LIMITED. Shakespeare Press, Birmingham.

SURVEYORS' INSTITUTION EXAMINATIONS.

COMPLETE COURSES OF PREPARATION for these Examinations are given, either in class, by correspondence, or in office, by Mr. RICHARD PARRY, F.S.I. A.M.I.C.E. &c. Candidates show the prizes that have been obtained by Mr. PARRY'S pupils at the last seven Examinations:—

NOTE.—In 1895 the Crawley Prize was divided between two successful candidates, one of whom was prepared by Mr. PARRY. The above table shows the 42 prizes awarded at the last seven Examinations, 214 were obtained by candidates prepared by Mr. PARRY, and 191 by candidates not prepared by him.

For particulars of the Courses of Preparation, and for advice with respect to the Examinations, apply to Mr. RICHARD PARRY, F.S.I. A.M.I.C.E. 22, Victoria-street, Westminster. Telephone, 689 Westminster.

SANITARY INSTITUTE EXAMS.—Preparation for the Inspectors' Examination, by a system of correspondence needing no Text Books or Acts, by C. H. CLARKE, B.Sc. Lond.; Fellow Inst. San. Engineers; Honours Metallurgist in Chemistry; Member of the Society of Arts and of Societies Française d'Hygiène. See Clarke's Aids—Calculation of Cubic Space, &c. (New Edition), 1s. 6d.—Prospectus from 120, Strand-road, Strand, E.C.

SANITARY INSPECTORS' and PRACTICAL SANITARY SCIENCE EXAMS. of the SANITARY INSTITUTE. Complete Courses of Instruction by correspondence for Inspectors and Sanitary Engineers conducted by Gentlemen (Engineers, Surveyors, and Sanitary Inspectors), holding three Certificates from the Sanitary Institute, and Sanitary Inspectors, holding three Certificates from the Sanitary Institute. See Clarke's Aids—Calculation of Cubic Space, &c. (New Edition), 1s. 6d.—Prospectus from 120, Strand-road, Strand, E.C.

SANITARY INSTITUTE EXAMINATIONS.—A CERTIFICATED INSPECTOR and ASSOCIATE SANITARY INSTITUTE Preparation of Candidates for the Inspectors' Examination by Correspondence. No books required. Success guaranteed. MODEL SOLUTIONS Examination Questions for 1901.—List, prospectus, testimonials, &c. E. G. HOLMES, 27, High-street, Romford. (State Paper.)

R. I. B. A. EXAMS.—PREPARATION for the Inspectors' Examination, in three, six, nine, or twelve months' course, or ARCHITECTURE LIBRARY. Special three months' English course.—For full particulars apply to Messrs. HOGARTH & CO., 115, Gower-street, W.C. (close to the British Museum).

SANITARY INSPECTORS' EXAMINATIONS.—Successful POSTAL TUITION by Certified and Experienced Sanitary Inspectors, Plumbers, Mechanics, &c. Typewritten papers. Numerous sketches. Small fee. ASSOC. SAN. INST. No. 4, Duke-street, Adelphi, London.

AGENCY.—A firm in the Midlands doing a work of a high-class character in STAINED GLASS and LEAD GLAZING, in designs of appointment as AGENT in London, a firm or individual having a sound knowledge in all sanitary architects, &c.—Address, Box 218, Office of 'The Builder.'

SHARE OF OFFICES WANTED in City or Westminster by Quotative Surveyor for occasional attendance. Box 225, Office of 'The Builder.'

TO ARCHITECTS, ENGINEERS, and SURVEYORS.—Architect offers PART USE of his OFFICES in the Adelphi. Every convenience. Moderate terms.—Box 227, Office of 'The Builder.'

PARTNERSHIP REQUIRED by Architect. Preferred. Premium in a well-established practice. Provinces provided. Advertiser has had both London and Provincial experience in good offices.—Box 222, Office of 'The Builder.'

R. I. B. A. seeks ASSISTANTSHIP in practice. Has had good London training, foreign travel, and several years' private practice. Aged 31.—Box 224, Office of 'The Builder.'

WILLESDEN DISTRICT COUNCIL. APPOINTMENT OF CLERK FOR PUBLIC OFFICES. The Willesden District Council require the SERVICES of a Man and his Wife to act as CLERK and as the Public Office, Wyndham-road, Kilburn. They must be between 25 and 40 years of age, and without encumbrances.

Apartment, fuel, and lights will be provided, and the salary will be at the rate of 30s. per week. In addition to this amount the sum of 22s. per annum is allowed for servants in connection with the School House and the Board of Guardians.

Written applications, enclosing three copies of testimonials only, and addressed to the undersigned, to be submitted not later than FOUR P.M. on TUESDAY, 6th NOVEMBER, 1901.

O. LAUDE, Registrar to the Council. Public Office, Wyndham-road, Kilburn, N.W. October 23rd, 1901.

## Tunnelling.

**PUBLIC** attention has been directed more largely than ever during recent years to the subject of tunnelling, owing to the necessity experienced in all great cities of the world

for improved means of communication, sometimes from one part to another of a crowded centre, and at others from the busy centre to outlying districts. At one time work of this particular description was confined to the city of London, but it has now spread to Glasgow and to several cities on the Continent and in America. As the railway system may be properly regarded as the primary cause of the extensive tunnelling operations inaugurated during the last century, so it may be held responsible for more recent developments. Not content, as formerly, to burrow merely through level ground, hills, and mountains, the aim of the engineer now extends to the construction of deep-seated passages that make light of the obstacles hitherto presented by natural irregularities of the surface, buildings, rivers, estuaries, and seas. In the present day tunnelling is almost invariably executed for strictly utilitarian purposes, whereas in former times tunnels were fashionable as burial-places for persons of rank and position, who were able, without inconvenience, to expend the necessary thousands in constructive work, the currency being then represented by the lives of slaves. During the Middle Ages tunnels were generally formed for military objects, or for securing the safety of wealthy people in those uncomfortable times when the sword was more powerful than the pen. Of course, as we all know, the Romans distinguished themselves in the making of tunnels for useful purposes, and their methods were not greatly improved upon until the employment of explosive agents became general.

Few works have hitherto been published descriptive of modern practice in tunnelling,

and there is, therefore, ample justification for the treatise recently produced by Mr. Prelini and Mr. Hill, of New York.\* The other chief works on the subject are Drinker's "Tunnelling," published in New York some years ago, and Simm's and Clarke's "Practical Tunnelling," of which the fourth edition was issued in London some five years back. Both of these are masterly expositions of tunnelling work, although neither of them is entirely suitable for a beginner or for the busy man who wishes to acquire general information with a minimum expenditure of time. Mr. Prelini, the originating author of the present treatise, experiencing the want of a text-book of moderate size and price, proceeded to enlarge his own lecture notes, written for use at Manhattan College, and with the co-operation of Mr. Hill, editor of the *Engineering News*, to produce the volume now occupying our attention. In the course of an interesting and condensed review of the development of tunnel building the authors usefully mention the directions in which electricity is destined to be employed in future work. Electricity is undoubtedly one of the most convenient forms of power available to engineers of all classes, and we quite agree that its application to hauling, hoisting, excavating, drilling, and ventilating machinery is capable of considerable extension.

Before any survey of new territory can be satisfactorily commenced it is necessary to know exactly what has to be done, and in some cases a preliminary survey, or reconnaissance, is desirable so that the character and magnitude of the task may be more adequately realised. A similar operation may be conveniently applied as a preliminary to our examination of the ground covered by the treatise with which we are at present concerned. At the commencement, we find that the authors have duly recognised the importance of furnishing readers with sufficient preparatory information to aid the comprehension of the details and principles that

\* "Tunnelling." A Practical Treatise. By Charles Prelini, C.E., with Additions by Charles S. Hill, C.E. (London: Crosby Lockwood & Son; New York: D. Van Nostrand Co. 1901.)

follow. After the disposal of introductory matter, various methods of tunnelling are discussed in detail, and the book concludes with a series of four chapters on accidents, repairs, ventilation, and cost.

In the introduction a tunnel is defined as "an artificial gallery, passage, or roadway, beneath the ground, under the bed of a stream, or through a hill, or mountain." We are sorry to say of this definition—evidently taken from the "Century Dictionary"—that it is not strictly accurate in characterising any passage beneath the ground as a "tunnel." In the first place, the passage must be horizontal to justify the appellation, for, if vertical, it is termed by engineers a "shaft"; in the second place, the definition loses sight of the distinction between tunnelling proper and the cut-and-cover method, which produces a "covered way" rather than a "tunnel." It may, no doubt, be convenient to use the term conversationally in the sense suggested by the authors, but students should be taught to discriminate between different kinds of underground work. Again, the dictionary definition is not sufficiently comprehensive, for, whilst referring specifically to the case of a stream, it does not notice the possibility of forming a tunnel beneath any other body of water. These little deficiencies serve to show that general books of reference cannot always be safely followed by writers of purely technical works, in which the most precise terminology is invariably to be desired.

The first preliminary consideration placed before the reader is the choice between a tunnel and an open cut, and, to quote the words of the authors, "the answer to this question depends upon the comparative cost of construction and upon the relative commercial and structural advantages and disadvantages of the two methods." These factors are discussed briefly, but sufficiently to enable any one to apply them to the determination of any particular case. In general practice an open cut is seldom adopted for any great distance if a vertical depth of more than 60 ft. should be required, but this does not constitute an absolute rule, as the character of the ground must always be taken into account. We may

also add that the engineer should make it his study to avoid the necessity for tunnels as far as possible in any portion of a line of communication. Having once decided to build a tunnel, the engineer must ascertain the nature of the strata through which it will pass. For this purpose the diamond rock drill is recommended by the authors as affording most efficient aid. This appliance possesses the advantage of boring an annular hole, thus furnishing for examination a core which shows the character, position, and thickness of the different strata penetrated. A sufficient number of borings along the proposed course of the tunnel will frequently render unnecessary the adoption of other trial operations, but it is often quite impracticable to make such borings owing to the height of a mountain ridge or to other conditions. For the guidance of the engineer in such cases the study of geological characteristics is recommended by the authors. As a matter of fact, information of this nature is frequently more valuable than that obtainable from actual borings. A geological survey is especially useful for the settlement of preliminaries, and trial borings may afterwards be made to prove the accuracy or for the correction of theoretical deductions before tunnelling is commenced in earnest. The discussion of geological surveys in Chapter I. includes some very useful notes on the different rocks and soils encountered, on their merits and demerits from the point of view of a tunnel builder, and on the presence and pressure of water in such strata. Chapter II. deals with methods of setting out tunnels, and the forms and dimensions of their cross sections. For ranging and setting out the centre line, we are told that an ordinary theodolite is sufficient for all practical purposes. This does not seem good advice, as it is highly desirable that the instrument should be available for ranging one continuous line in two opposite directions from a station. In all other points the general practice is clearly and intelligibly set forth, yet without going into such minute details as belong more appropriately to a manual on surveying.

The forms and dimensions of cross-section are of much importance, and the form for adoption in any particular case must depend upon the pressures to be resisted; these being necessarily affected by the nature of the material penetrated by the tunnel. Mr. Prelini has here resisted a very obvious temptation to enter upon a mathematical demonstration, and has confined his remarks to a general explanation of the causes leading to the employment of the forms of cross-section in most frequent use; namely:—A section with arched roof and vertical side walls for hard rock; an elliptical section for softer materials; and a circular section for quicksands and mud. The elliptical form with an inverted arch at the floor is largely employed, the invert being intended to protect the side foundations from injury by horizontal pressure of the earth. In mentioning an important exception to the ordinary practice, the authors have evidently no thought of London in their minds when they say that in some of the underground city rapid-transit railways built of late years, a rectangular or box section is employed. Readers of the English edition will probably agree with us in thinking that the work would be a little more complete if the tubular form of section

were also mentioned in this connexion. Some comment as to the shape suitable for rock tunnels requiring no lining could also be included with advantage. For instance, in the case of igneous rock, a section of any form convenient for traffic can be employed, but the elliptical with a level floor is most usual. It is implied that a pointed arch is generally desirable in stratified rocks, and it might be added that a flat roof may be permissible if the rock formation is in thick layers with few natural joints. A necessary caution is given in the paragraph dealing with sectional dimensions, that the deformation of the lining masonry must be duly considered. Although the whole structure may not sink more than 3 or 4 in., yet allowance must be made for movement of the side walls towards each other, and for the settling of the roof arch. These matters are of considerable importance, and we are glad to see them mentioned.

The next six chapters continue in a general way the discussion of preparatory information. Thus, attention is devoted to excavating and hauling appliances, and to methods of excavating, timbering, and lining tunnels. Excavating machines are not treated in an entirely satisfactory manner in Chapter III., for no mention is there made of the various shields employed, in Europe and in America, for the driving of tunnels. One of the functions of a shield is clearly to perform a part of the excavating work, and some such appliances are provided with auxiliary apparatus for completing the excavation and for the removal of material. Under the circumstances it seems a little inappropriate to say that "the most recent attempts to use excavating machines in soft ground . . . must be classed as experiments rather than as examples of common practice." Rock drills receive more adequate notice, although the reader will not obtain full information as to details and methods of application until he has arrived at a further chapter on the subject, which for some reason is inserted in that section of the treatise dealing with methods of tunnelling. After considering the different forms of explosives and the manner in which they are employed, the authors pass on to discuss "General Methods of Excavation, Shafts, and the Classification of Tunnels." A good deal of necessary information on these subjects is given in very compact form, and the tabular classification at the conclusion of the chapter is well worthy of careful notice, as it serves to prevent confusion when different classes of tunnels are under subsequent treatment. One blemish that must be mentioned is the inclusion of "tunnels under or on a river bed" under the head of "submarine tunnels," and the exclusion therefrom of tunnels formed beneath the sea. The term "sub-aqueous" might appropriately be employed to cover all types of tunnels under water, and we believe it is to be found in American as well as in English dictionaries.

In opening the subject of "Timbering or Strutting Tunnels," attention is wisely directed to the great care necessary in respect of design and execution, as well as to the desirability of using timber of elastic nature so that warning of approaching collapse may be afforded. Hard woods somewhat resemble cast iron in resisting until the last moment, and in giving way suddenly under the breaking load; more-

over, they are of greater weight, and thus entail additions to the cost of labour and other expensive items that may be avoided by the employment of softer and lighter woods. A very complete description of the different modes of supporting headings and shafts in rock, and in loose materials, will be found in this chapter, and amongst the most interesting of the illustrations are those of the longitudinal and transverse poling board systems, and forms of strutting for treacherous materials. Some practical details as to the quantity and dimensions of timber required for the support of headings, tunnels, and shafts, ought to be of considerable service to the student. Timbering for the full section of a tunnel is briefly described, but the absence of diagrams somewhat detracts from the value of the letter-press. The concluding part of the chapter is occupied with references to iron strutting for tunnels and their auxiliary works. Perhaps the most interesting form of construction here mentioned is the sinking of shafts in soft ground by the aid of cast-iron segmental rings. The shaft is sunk in a manner similar to that adopted in brick-lined shafts where a "drum-curb" is employed for supporting the ring of brickwork. Instead of the drum-curb, a cast-iron ring is used having a cutting edge, and successive rings are added to form the permanent shaft lining as the work of sinking progresses. Only the briefest explanation is given by the authors of this extremely useful class of work, which is specially to be recommended in all cases where interference with underground springs might be detrimental to the foundations of buildings, and we may remark in passing that it has invariably been adopted in connexion with the low-level railways constructed during recent years in London. After the interpolation of two chapters relating to "Methods of Hauling in Tunnels" and "Types of Centres and Moulds," the discussion of internal supports is resumed, with special reference to the permanent lining of tunnels. This important subject is somewhat lightly dealt with, although the different methods are sufficiently described to impart a fair amount of general knowledge.

Chapter IX., on "Tunnels through Hard Rock," is largely occupied by a discussion of the machinery and appliances used for construction of tunnels in such strata. Recent experience fully justifies the remark that "the present high development of labour-saving machinery for excavating rock renders this material one of the safest and easiest to tunnel of any with which the engineer ordinarily has to deal." Machinery of the kind, however, requires considerable power, which has often to be transmitted to great distances, and has always to be applied to the tools with due regard to economy. At present the transmission of power is almost entirely effected by compressed air or hydraulic pressure, and it is to be hoped that electric power transmission may soon become generally available. Some further observations upon engineering plant are contained in Chapter XII., and it is by no means clear why the two descriptions should be separated. Possibly the authors may suppose the reader will not be able to grasp the information contained in the latter chapter until the intervening matter has been studied. As a matter of fact, however, there is nothing at all difficult of compre-

hension, and it is both inconvenient and confusing to have a subject split up and scattered about in different parts of a book in this manner. On the topic of excavation we find two methods are described of driving "the advanced drift or heading." It will be observed that the words "drift" and "heading" are used by the authors as synonymous terms, and yet a little later the following passage occurs:—"The Mont Cenis and Simplon tunnels are selected as examples of rock tunnels driven by a drift, and the St. Gothard and Busk (U.S.A.) tunnels as examples of rock tunnels driven by headings." As this book is ostensibly written for students, it is not unreasonable to suppose that some perplexity will result from this implied axiom, that things which are equal to the same thing are *not* equal to one another. We now look for some description of "excavation by headings," but find none, although later on, under the title of "excavation by drifts" the method is described without being anywhere clearly defined. Turning over some thirty pages, we accidentally encounter the heading "excavation by drifts," and here curiously enough is found a description of "excavation by headings." Finally, quite at the end of the section devoted to "Tunnels through Hard Rock," is found a paragraph where a "drift" is defined as an advance gallery opened along the floor of the tunnel, and a "heading" as a gallery coinciding with the upper part of the tunnel section. Definitions are always desirable at the outset, especially when distinctions are implied that are not universally recognised. Apart from these comments there is not much to find fault with in the chapters on "Tunnelling through Hard Rock." There is a good account of the Mont Cenis Tunnel, and a diagram clearly showing the sequence of excavation. A lengthy abstract from a paper read by Mr. Fox before the Institution of Civil Engineers on the Simplon tunnel, forms instructive reading, and the accompanying sketches add to its usefulness.

In Chapter XIII. the discussion on "Excavating Tunnels through Soft Ground" is commenced. This material includes many different grades, from stratified soft rock to the most unstable sands and clays, and the authors are justified in saying that if the easy and difficult materials be classed together the excavation of tunnels through soft ground is the most difficult task that confronts the engineer. Sometimes operations can be conducted with comparative facility, while at others uncertainties and obstacles occur which render the work more interesting to the engineer than to the contractor or others who may have to pay the bill. In the book before us, the Belgian, German, English, Austrian, Italian, and "quicksand" methods are grouped together in four consecutive chapters, permitting of ready comparison. The first five of these modes differ chiefly in the order in which the details of work are undertaken, in the number and dimensions of the headings, and in the forms of strutting employed. Quicksand methods naturally include tunnelling by the pneumatic shield, but no hint of this fact is vouchsafed by the authors beyond the statement that the shield system of tunnelling is, for the present, left out of consideration. If the reader institutes an industrious search he will ultimately find a full description of shield-driven tunnels under dry land in the

chapters headed "Submarine Tunnelling." The Belgian and German methods are carefully discussed, and their essential characteristics are clearly shown by the aid of diagrams. One great disadvantage in each instance is the fact that the invert is not built until the side walls have been finished, and there is consequently always a danger of distortion by reason of lateral earth pressure. Some notes upon accidents and repairs serve to emphasise the undesirable features of these modes of tunnelling. The German system is more logical than the Belgian, and having been adopted in connexion with the Baltimore Belt Line tunnel, it is the subject of rather extended notice. The most advantageous feature appears to be in the initial excavation of an annular gallery, in which the side walls and roof are built before the centre core is removed. Thus an excellent support is secured for the strutting and the roof centres. Apart from the inconvenience and expense caused by the narrowness of the spaces available for hauling, the German method is fruitful in mishaps, and the records of the Baltimore tunnel are conclusive on the point, as the following brief summary will show:—"The masonry lining flattened at the crown and bulged at the sides; there was sinking of the street surface varying from 1 in. to 18 in.; water and gas mains were damaged and in some instances had to be reconstructed; and at one point along the tunnel the surface settlement caused the collapse of an adjacent building. This comprehensive experience may serve as something more than a suggestion that the German mode of work is not likely to commend itself to municipal authorities in this country, especially in the vicinity of historic buildings.

In Chapter XV., the English method of tunnelling through soft ground is the subject of discussion. As stated in the treatise, the distinctive features of the system are the excavation of the full tunnel section at once, the use of longitudinal strutting, and the alternate execution of excavation and masonry work. It ought to have been added that the masonry is commenced in a common-sense way by the construction of the invert. The authors do not appear to favour the English method as a whole, though they admit that the mode of strutting has gained particular favour in America, and is commonly employed there "even when the mode of excavation is distinctly German or Belgian in other respects." We are told that the English method has gained unusual popularity in this country "owing to the general prevalence of comparatively firm chalks, clays, shales, and sandstones," and that in its entirety it "is confined in actual practice pretty closely to the country from which it receives its name." As there is no American method of tunnelling, it might be inferred from these comments that engineers in the United States prefer the Continental methods, whose defects are so clearly demonstrated in the treatise, were it not for the subsequent and somewhat contradictory statement that our own system "has been used in building the Hoosac, Musconetcong, Alleghany, Baltimore and Potomac, and other tunnels in America." Coming to details, we find the mode of procedure is fairly well explained, and due recognition is given of the fact that the method is applicable to "loose soils and very loose soils," as well as to the firm materials previously

suggested as the elements chiefly contributing to its popularity. The description of strutting is correct, so far as it extends; and if the arrangement of raking-props and polling-boards, as commonly used, were included, it would be fairly complete. Remembering that a fully-detailed and illustrated account of the Baltimore Belt tunnel was given, serving—perhaps unintentionally—as an awful example of the German method as practised in America, it might have been expected by the open-minded reader that some adequate notice would be included of a typical work constructed according to the English method. If American data were not available to the writers, plenty could have been obtained from British sources. One of the most successful examples is the railway tunnel under the Metropolitan Cattle Market, where the surface subsidence in open ground did not exceed  $3\frac{1}{2}$  in., and under buildings was only from 1 in. to  $1\frac{1}{2}$  in., several heavy buildings being undermined without the slightest injury. Such a record as this is certainly of interest to engineering students, whatever may be their nationality. When adverting to the Austrian method, the writers make the remark that whilst in some respects its principle is similar to the English, "the construction of the invert last exposes the side walls to the danger of being squeezed together, causing a rotation of the arch as in the Belgian method of tunnelling." In justice to Austrian engineers, it should here be observed that in treacherous soils the practice of building the invert first is usually followed. A chapter devoted to the special methods sometimes adopted in treacherous ground is well worthy of study. Of these the Italian system consists in excavating the bottom half of the section by means of successive drifts, after which the invert and a portion of the side walls are built. The space is then refilled, and the upper half of the section is excavated, when the remaining part of the side walls and the roof arch are built, and, lastly, the lower part of the tunnel is cleared of filling. Several serviceable diagrams and sketches are included to make clear the successive stages of the Italian mode, of which the chief disadvantage is excessive cost, practically limiting its employment to works of comparatively small section.

Quicksand tunnelling, as the authors remark, can be performed by modifications of other methods, the object being to drain away water from the tunnel and to hold back the particles of sand by means of timber lining. We have looked, but in vain, for any expression of opinion in this chapter that the process of draining away water from the subsoil should never be attempted in the vicinity of buildings. This is an undesirable omission from a work intended to instruct the rising generation. Here is the very place for a brief reference to the advantages afforded by the pneumatic-shield method. As a conclusion to the chapter, a short mention is made of the pilot method which was adopted in the uncompleted Hudson River tunnel. Compressed air was there used to keep back silt and water, and to prevent injury to the iron tube forming the pilot heading. Further details of this interesting work would be instructive to student readers.

Chapter XVII. on "Open-Cut Tunnels" is full of valuable matter, especially to those who are directly or indirectly concerned

with the essentially modern problem of traffic accommodation in cities. In the opening portion of the chapter, three methods of work are outlined, the single and parallel longitudinal, and transverse, trenches. Single cuts to the full width of the subway section are not suitable for municipal works, because they generally involve the entire interruption of traffic in the streets traversed. The parallel mode of excavation, as recently followed in the case of the Paris Metropolitan railway, permits one half of the roadway to be open for traffic during the continuance of operations; and the third method, as exemplified by the Boston Subway, does not necessarily interfere with traffic at all. Reference is also made to the forms of construction somewhat paradoxically termed in the treatise "Tunnels on the Surface." Work of this kind is no doubt occasionally necessary, especially abroad, and the authors are wise in mentioning it, although they might perhaps have found a more appropriate designation. The remainder of the chapter is occupied with an excellent discussion of tunnels under city streets, which will thoroughly repay careful perusal. It is highly probable that the low-level subway will not be the only type of underground passage to provide for the present and future requirements of the metropolis. Tunnels near the surface possess many advantages, and their construction beneath the chief thoroughfares would permit the establishment of readily-accessible electric tramways, besides enabling the authorities to deal with the troublesome question of gas, water, and other conduits. There is much valuable and essentially modern matter in the descriptions of the Boston Subway and the New York Rapid Transit Railway. Both of these important undertakings are fully considered and well illustrated in the treatise before our notice.

Chapter XVIII. resumes the interrupted subject of tunnelling proper, and is devoted to so-called "Submarine Tunnels." As a preliminary to such an undertaking, the authors properly emphasise the necessity for ascertaining the character of the material in which operations will be conducted. Investigations of the kind proposed cannot put the engineer in a position to do much more than to prophesy, more or less accurately, what will be the nature of the difficulties awaiting his attention, and it not infrequently happens that strata of soft or treacherous soil are encountered of which no indication has been afforded by preliminary investigation. The Milwaukee Water Supply tunnel and the East River Gas tunnel are cited as examples of "submarine" tunnels begun in firm soil, that passed into material of treacherous character after the work had proceeded for some distance. In the treatise the following classification of so-called submarine tunnels is adopted:—(1) Tunnels in rock, or very compact soils; (2) tunnels in loose soils; (3) tunnels on the river bed; (4) tunnels partly in firm soil, and partly in treacherous soil. In the first place, we must point out that the title of the chapter, apparently, compels the authors to omit the Central London Railway from mention, presumably because that work does not pass beneath a river, and, therefore, is not "submarine." Tunnels of Class 1, being driven by any ordinary method, require no special mention. Those of the second class may be driven by

shields, by the aid of compressed air, or by shields and compressed air together, whilst those placed in Class 4 hardly constitute a distinct type, and are to be dealt with as the variations of the material demand. The methods necessary for tunnels of Class 3 are distinctive, and involve the use of cofferdams or caissons, as may be most suitable for individual cases. The four chapters on "submarine" tunnelling are of considerable interest and value, and contain much admirably expressed information upon modern tunnelling practice, including details relative to the Severn tunnel, the East River tunnel, New York; the Van Buren-street tunnel, Chicago; and the Milwaukee tunnel. The fourth chapter of the series includes a well-written historical sketch of the shield system; diagrams of the shields employed in the construction of the Thames tunnel, and what is termed "London Tower" tunnel; as well as detailed drawings and descriptions of the more modern appliances adopted for the City and South London Railway, the St. Clair River tunnel, the Blackwall tunnel, the Clichy sewer, and of the roof shield for the Boston subway.

Of actual excavating processes there is now nothing more to be said, but the concluding chapters of the volume are quite as important as those by which they are preceded. The first deals with "Accidents and Repairs" in tunnels, during and after construction, a subject that is carefully and thoughtfully treated; the second, on "Relining Timber-lined Tunnels with Masonry" is equally deserving of commendation, though it is more applicable to the reconstruction of American railway tunnels than to work in this country. The fourth chapter is devoted to the vital questions of "Ventilation and Lighting," and might have been extended with advantage. The final chapter on "The Cost of Excavation and Time Required" is based entirely on American and Continental records. That there should be no British data on these points in a work courting the support of readers in this country seems to be a little unfortunate, because students are not afforded the means of making comparisons that would be useful in a particularly practical sense.

Regarding the work as a whole, it may be justly considered as a praiseworthy and successful effort to place on record in a readable style all the distinguishing characteristics of tunnelling methods practised in the present day. The treatment throughout is descriptive rather than mathematical, and those requiring general information on this highly important subject will find it presented in a thoroughly practical and intelligible form.

#### NOTES.

Municipal  
Trading.

THE address last week of the Hon. Horace Porter, the United States Commissioner in Cuba, to the London Chamber of Commerce, on the subject of municipal trading, was interesting as being the opinion of a disinterested observer of affairs in England. Mr. Porter is much struck with the apparent want of system which prevails in this country. He finds the London County Council with no authority over the water supply, but carrying on in part of the town the business of a tramway company. The same contradictions he notes everywhere, and more especially the curious fact that the

telephone system is to be partly in public and partly in private hands. In Mr. Porter's opinion private enterprise can do more for the public benefit than a municipality, and he would seem to desire to limit the work of municipalities almost entirely to the supply of water and light. But the value of private enterprise depends chiefly on the openings for competition, and the moment a private body obtains a monopoly there can be no doubt that it is likely to be less efficient than a municipality, since the latter can usually be stimulated by the ratepayers. No doubt the latter are often apathetic, but, on the whole, a municipality is more sensitive to public opinion than is a private corporation, and, moreover, is never in the tight place for funds in which a private trading company may find itself. But it is also true that there may be instances in which a municipality may be going beyond the proper mark in undertaking work or in pledging the ratepayers' money. There is, for example, no doubt whatever that the Corporation of Manchester ought never to have lent money to the Ship Canal Company.

THE extensive electric lighting works of the Hackney Borough Council, which were formally opened last week, are representative of the trend of modern electrical engineering. The pressure at which consumers are supplied for lighting purposes is the highest allowed by the Board of Trade, namely, 240 volts. The system is three-wire direct current, even although some of the feeding points at which the load is heaviest are over two miles from the central station. Consumers who desire motive power are supplied at 480 volts, which is the pressure between the two outer mains of the supply system. The benefits which accrue to consumers from this higher pressure are the cheap rates at which power is supplied, the charge being only 4d. per unit for lighting and 2d. per unit for motive power. Personally, we prefer electric lighting at 100 volts, as we consider that ordinary 100-volt lamps are much more efficient than 200-volt lamps. Again, electrical engineers are beginning to minimise the risks of shock. At a recent visit of inspection to the Portsmouth Electric Tramways Mr. Trotter, the electrical adviser to the Board of Trade, demonstrated by touching the trolley wire under a railway arch that the risks of shock were greatly exaggerated. These risks may be exaggerated, but considering the number of foolhardy people there are in the world, we think that this exaggeration does more good than harm. Demonstrations by electricians that under certain definite conditions it is safe to touch a live 500-volt or 20,000-volt wire teach nothing to experts, and only tend to mislead the public. Mr. Hammond has made the risk of serious shock at Hackney a very small one by using triple concentric mains similar to those used in Glasgow, and as the outer cylinder will naturally always be nearly at the same pressure as the earth, no pressure greater than 240 volts will be able to be got at by the public, who only use the lighting supply. A special feature of the Hackney scheme will be the utilisation of refuse for the generation of electrical energy. The refuse destructor, when finished, will consist of twelve furnace cells, capable of burning 160 tons of refuse per day. The refuse will be practically automatically

handled from the time of its arrival at the works until it is carted away as clinker. A powerful blast fan will enable it to be burned at a high temperature, and the hot products of combustion will be utilised for raising steam in three of the six water-tube boilers.

At the present day, when market gardening is becoming more and more an important business, the recent decision of Mr. Justice Cozens-Hardy in the case of *Mears v. Callender* is of considerable interest and importance. It raised, in the first place, the question whether a tenant could take away glasshouses erected by him for the purposes of his business and without the written consent of the landlord. The glass roof rested, in the case of one house, on concrete sides; in the case of the other houses wooden piles were driven into the ground, on the top of which sills were placed which supported the glass span roof. These roofs were nailed to the sills, which in their turn were nailed to the posts. "If," said the Judge, "erected for the mere purpose of pleasure and ornament and not for the purpose of a trade, they would not be removable," but he held that being erected for the purpose of trade they could be removed. It was unnecessary for the purposes of the case that the removability of ornamental conservatories should be considered, but it is, we think, doubtful if the law in this respect is as clear now as Mr. Justice Cozens-Hardy seemed to think. We can see no reason in principle why glasshouses lightly affixed to concrete or wooden foundations should not be as removable as tapestry fixed to a wall. The case in regard to these glasshouses for trade purposes up to the date of this last decision has not been altogether clear, but the Judge could hardly decide in any other way than he did, for, as he rightly said, "the whole tendency of the Courts in recent years has been to enlarge the rights of tenants in respect of fixtures," and we may add, in respect of domestic, as well as of trade, fixtures. It has, however, to be noted that tenants must still be careful in regard to this class of building, because sometimes, as in the present case, the lease may expressly exclude the action of the Agricultural Holdings Act, the thirty-fourth section of which enables the tenant to remove such things as glasshouses. Therefore, if this Act is expressly excluded, the tenant has only what is called his common law rights to rely upon, and it is only by virtue of these rights that he can remove glasshouses erected for the purposes of trade.

Church of St. Jean, Montmartre. THE new Church of St. Jean at Montmartre, which is being built to replace the old Church of St. Pierre, adjoining the immense basilica of the Sacré Cœur, has again got into difficulties with the administration, and the Prefet de Police has given orders to the architect to stop the work of construction at once and to proceed to demolish the building, which is now nearly completed. This church has already attracted considerable attention in architectural and building circles, first on account of the novel style of architecture which M. de Baudot, the well-known Diocesan Architect, has given to his design, and again by reason of the nature of its construction, entirely in armoured brick and cement called the Cottançin system.

The Prefet de Police requires the immediate demolition of the church under a penalty of 4*l.* per day of delay, simply because a proper demand for permission to construct was not made by either the architect or the vicar of the parish. The latter, considering that he had the right to build in spite of the Prefet, continued the work. It appears, however, that the Prefet is exceeding his rights, and that the vicar will win the day, for, according to the law relating to building rights, no demand for permission to construct a church on one's own property is necessary. The case is exciting great interest in Paris, for nearly 16,000*l.* of building work has already been done on the church.

The Westminster County Court, St. Martin's-lane. THE Commissioners of Works recently addressed the Mayor and Corporation of the City of Westminster with the object of learning which of the old Vestry buildings will no longer be required, and whether any of them can be rendered available as a new County Court for Westminster. The lease of the County Courthouse in St. Martin's-lane expired not long since. A proposal has been formulated for transferring the County Court business to the somewhat remote Town Hall in Caxton-street, Westminster, which the municipal authorities will vacate upon the completion of the alterations of St. Martin-in-the-Fields Vestry Hall, which are now being carried out, under the directions and superintendence of Mr. John Murray, for its conversion as the Hall of the City of Westminster. The County Court in St. Martin's-lane was established about fifty years ago to replace the Court of Requests, of which the business had been conducted in premises (formerly a Baptist chapel, and since demolished) that stood at the rear of the County Court-house. A new boundary will shortly be assigned to the limits of the jurisdiction of the County Court. They have hitherto extended to the wide area having the City boundary on the east, the Thames on the south and southeast, a winding line from Chelsea Bridge to the north end of the Serpentine on the west, and the high road from Bayswater to Holborn Bars on the north. That area is fairly co-terminous with the older confines, since reduced, of the parish of St. Margaret. The Hall in Caxton-street was built on the site of St. Ermin's-hill workhouse in 1881-3, from the designs, selected in competition, of Messrs. Lee & Smith.

Charing Cross Hospital and its Site. THIS institution, being at that time the eighth of its kind in London, was established for the two-fold purpose of a dispensary and a hospital by the exertions of Dr. B. Golding as an extension of the neighbouring charity founded in 1818. The present buildings were erected in 1831-3 after Decimus Burton's plans and designs as a part of the scheme of the Commissioners of Woods and Forests for the improvement of the western portion of the Strand, in pursuance of the Act 7 George IV., c. 77, Lord Lowther being Chief Commissioner, and W. C. Mylne acting as valuer on behalf of the Government. The principal front extends along all the western side of Agar-street, the return fronts along Chandos and King William streets continue the triangle, at the apex of which is the Ophthalmic Hospital established in 1816.

In 1870 some interior alterations, including the principal staircase, were carried out by James Thompson; and about that time the Governors acquired one or two houses in Chandos-street. In 1898 the Commissioners of Woods and Forests agreed, upon certain conditions, to sell to the Governors of the hospital for 16,114*l.* the freehold sites of Nos. 23-7, King William-street, of "Toole's" (formerly the Charing Cross) Theatre, and of Nos. 15-6, Chandos-street, to provide space for a new out-patients' department, with other needed improvements of the hospital buildings. The ground was finally cleared in the course of last year, and Mr. A. Saxon Snell, whose designs secured the first place in a limited competition, was appointed architect for the alterations and additions in respect of which a tender of Messrs. Holloway Bros. for 82,730*l.* has just been accepted. The Charing Cross Theatre had been built as the Polygraphic Hall in 1847-8 on the site of the residence and chapel of the Fathers of the London Oratory of St. Philip Neri, after the designs of James Thompson, whose son, John J. Thompson, rebuilt it for Mr. Toole in 1883. The theatre, which had latterly been the domicile of the revived Beefsteak Club, was pulled down five years ago.

St. Nicholas' Parish Church, Deptford. WE read that the fabric of the tower, from the level of the belfry floor upwards, of the church has been condemned as being in a dangerous condition. The structure suffered damage during a gale on October 17 last. The Early English tower, constructed of stone, formed in past times a conspicuous landmark for the shipping in the Thames. The church, situated between Deptford Green and the Stowage, was enlarged in 1630, and the nave, aisles, and chancel were rebuilt, of red brick, in 1697. A few years ago a fine piece of carving in oak, representing Ezekiel's Vision in the Valley of Dry Bones, and attributed to Grinling Gibbons, was removed from the chancel-house porch into the interior of the church. The organ, originally by Smith (1697), was rebuilt in 1868 by Hunter, and since repaired by Bevington. Amongst the monuments are those in memory of two of Evelyn's children, of Captain Fenton, who accompanied Frobisher on two voyages, and of several naval commanders who fought against the Dutch, French, and Spaniards at sea. The burial-ground, covering 1½ acre, which is detached, and has an entrance in Wellington-street (formerly Flagon-row), was laid out, at a cost of 300*l.*, by the Kyrle Society, and opened to the public on July 9, 1884.

Housing of the Working Classes. AT the annual meeting of the Workmen's National Housing Council in Clifford's Inn Hall, on November 4, Mr. Raymond Unwin delivered a lecture on "The Housing of the Working Classes." The lecture was well illustrated by lantern slides of plans of the numerous efforts of municipalities and others to meet the want, which were used by the lecturer chiefly as examples of what to avoid. He compared the existing system of laying out artisans' dwellings in streets with the plan of arranging them in quadrangles advocated by him. Mr. Unwin claims that by the latter arrangement the difficulty of aspect is got over, and living

rooms facing the back have a cheerful and healthy outlook, unlike the sunless outlook from the living rooms of many recently erected workmen's dwellings, and area within the quadrangle is more advantageously utilised as a recreation space, free from passing traffic. He urged the benefit of common rooms and common laundries at each of the four angles of the square as a satisfactory solution of modified co-operative living, which can only be successful by judicious limitation, the lack of which, to a great extent, is responsible for the failure of the Boundary-street common laundry scheme. Mr. Unwin showed several more or less successful plans of cottages on the quadrangle principle, with free backs unbroken by projections, which are always to be avoided where possible. His ideal schemes are more suitable for the country than the heart of London. The arrangement of rooms successfully meets the difficulties, but might have been more simple, and many of the sketches shown were scarcely models of good design. Some interesting slides of Port Sunlight and Mr. Cadbury's model dwellings were put on the screen. Several delegates from London municipal building committees were present and took part in the discussion.

In the monument to Sir Joseph Bazalgette, unveiled on Wednesday by the Chairman of the London County Council, Mr. Geo. Simonds, the sculptor, has followed the wise French fashion of making the monument a portrait bust in an architectural framework, instead of attempting a full-length figure in modern costume. The framework consists of pilasters and an entablature in white marble, let into one of the large and hitherto useless pylons of masonry which diversify the embankment; the bronze head being placed in the enclosed space, relieved against a deep hollow which makes a shadow behind it. The pilasters, as well as those of the podium, are carved with ornament partly symbolical; the cartouches on each side of the podium seem to want some emblem on them to give them a use and meaning. The only part of the work we do not like is the realistic outbreak of foliage beneath the bust. Realistic metal foliage is always disagreeable, and it is more so in this case because it is out of keeping with the conventional character of the carved marble foliage. But as a whole this is far superior in general conception and æsthetic treatment to the majority of the Thames Embankment monuments.

The Fine Art Society have on view a collection of cabinet pictures by Mr. Talbot Hughes, of somewhat uncertain interest. They are mostly single figures in the costume and with the interior surroundings of the eighteenth century, all well painted up to a certain point, but not possessing that special power and finish in execution which can render a mere figure and interior interesting for its own sake and as an example of fine execution; while a good many of them have no other kind of interest. Among the exceptions which have more marked character in conception and execution are "Changing Vases" (2), "The Fan Painter" (9), "Spoils of the Road" (13), and "The Dreamer"

(24), the latter a very pleasing study of a handsome young man in the beautiful dress costume of the period, leaning back in some rather happy imagination. "The Violinist" (27) does not know how to hold her violin, and is no virtuoso, though a pretty girl (with, however, an alarmingly thin waist). "Memory" and "Echo" (35, 37), in spite of their titles, are little more than costume studies with wax heads. "Virtue" (36), a study for a larger picture, promises something higher than most of the finished works in the collection. The usual puff preliminary, prefixed to the catalogue, is in this case carried to a pitch which is more likely to injure than to serve the subject of it.

The decorations at Victoria Station last week, put up in honour of the return of the Duke and Duchess of Cornwall, deserve a word of recognition; for though not attempting anything novel or original, they were well and tastefully done. The emphasising of the constructional girders of the roof, longitudinal and transverse, by a deep draping of a bunting in three strips of colour under each, was very effective, and showed the proper perception that temporary decoration in such a case should follow and be controlled by the lines of the construction. Outside of this portion was an arrangement of flags of various nations, drooped vertically, forming a kind of framework to the whole.

#### THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

The first meeting of the Royal Institute of British Architects for Session 1901-2 was held on Monday at No. 9, Conduit-street, the President, Mr. William Emerson, presiding.

##### Recently Deceased Members.

The minutes of the last meeting having been taken as read.

Mr. Alex. Graham, F.S.A., hon. secretary, said he regretted to announce the decease of several members since the last meeting, *i.e.*,

Mr. William Larnar Sugden, of Leek, who was elected a Fellow in 1892. He was a well-known architect in that neighbourhood, and was no doubt well known to many members of the Institute.

Mr. Robert Isaac Bennett, of the firm of Royle & Bennett, of Manchester. He erected a large number of edifices, and was an architect of very high repute.

Mr. Yeoville Thomason, of Birmingham, elected a Fellow in 1862. He was the architect of the Municipal Buildings and Art Gallery of Birmingham.

Mr. Herbert R. Lloyd, of Birmingham, elected an Associate in 1887. He was architect of the Technical Schools at Redditch; he restored St. Mary's Church at Cowes, in the Isle of Wight, and was a very prominent and active member of the Architectural Association of Birmingham.

Mr. John Mackland, elected an Associate in 1881 and a Fellow in 1892.

Mr. John Littlewood, of Manchester, well known as a member of the firm of Mangnall & Littlewood, who had erected a number of public buildings in Blackpool and other places.

Mr. James Brooks, a gentleman well known to all of them, whose decease called for something more than a passing comment. Mr. Brooks was elected a Fellow in 1866, and his loss was to be deplored for many reasons. He was not only a familiar figure in that room and a constant attendant at the meetings of the Council, of which he was a member for a long number of years, but he was more than that; he was one of the few survivors of the old school of Pugin. Mr. Brooks never swerved during his long career in the principles enunciated in that school, and he remained a disciple of Pugin, who was the exponent of

the great Gothic revival in this country fifty or sixty years ago. Mr. Brooks was an excellent church planner, the lines of his compositions were marked by simplicity, and there was one quality he possessed in a remarkable degree (and he mentioned it because it was a little opposed to the modern school of followers of Gothic work), *i.e.*, the quality of restraint, which was observable in most of his works. He (the speaker) therefore commended to the notice of the younger generation of architects the ecclesiastical work of James Brooks.

##### An Honour for the President.

Mr. Graham then announced that the President had been made an honorary member of the American Institute of Architects. The goodwill shown to them by their American brethren was, he felt sure, reciprocated by every member of the Institute, and he hoped the day was not far distant when it would be possible for the President to cross the Atlantic and attend one of the gatherings of the American Institute as the representative of the British Institute.

The announcement was warmly received, and the President briefly referred to it. He had, he said, crossed the Atlantic once, and he was not anxious to do so again. Still, he felt the honour which the American Institute had done him and the Royal Institute by electing him a member of their society, and he highly appreciated it. His feelings of sympathy with their American cousins in the dastardly assassination of President McKinley caused him to send a telegram to the American Institute sympathising with them in the loss the country had sustained, and he received a very kind reply from the President, and since then he had received notice of the appointment he had referred to. He would always have a very keen remembrance of the pleasant time he spent in America when he went over there as one of the judges in architecture at the Chicago Exhibition. It was a great pleasure to meet so many clever men—architects, sculptors, and literary men, and he would always recollect it with lively satisfaction. He thought the American school of architecture was doing excellent work; they were doing what certain members of the profession in England were urging the rising generation to do, and that was to let their imaginations have vent in solving the problems necessary for modern civilization; but they had a certain amount of restraint in all their work, and they were always studying the best examples of Classic and Gothic architecture. A large number of them had studied at the Ecole des Beaux-Arts in Paris and had returned to America, and were bringing up a class of men thoroughly grounded in ancient work, which was the best ground for training the imagination in working out modern problems.

##### Bequests to the Institute.

The President then said that a gentleman whose death was announced some time ago, and whose interest in the Institute was as great as any man's since the Institute was started—he referred to Mr. Arthur Cates, who took such a great interest in the educational movement, and who was quite the main mover in starting the examinations which it was now necessary for any gentleman to pass who wished to become an Associate of the Institute—had left the Institute under his will the sum of 1,500*l.* for the benefit of the Institute. While deeply deploring Mr. Cates' death, they must all feel grateful to him for remembering them in his will.

Mr. Graham said that, in continuation of what the President had announced, he had the pleasure to state that the Library had also benefited from Mr. Cates' thoughtfulness and kindness. Under his will Mr. Cates had bequeathed to the Institute 215 volumes from his library. The books were, more or less, well-bound, and the Literature Committee had come to the conclusion that, in cases where there were duplicates already in the library, the books presented by Mr. Cates, which were in such good condition, should be placed in the reference library, and the duplicates in their own library should be put in the loan library. They were all anxious that the loan library should be extended, so as to be useful not only to allied societies, but to all members of the Institute. They were hampered in their space, but that difficulty would be overcome in time, he hoped. They were much indebted to Mrs. Cates for her kindness, and for the manner in which she had

carried out the wishes of her husband. She had added to the bequest a number of prints, and had kindly presented one of Mr. Cates' bookcases. He desired to move that the best thanks of the Institute be forwarded to Mrs. Cates for her great kindness and consideration in carrying out the wishes of her deceased husband.

Mr. R. Phené Spiers, Chairman of the Literature Committee, seconded the motion. The collection was a large and valuable one. Mr. Cates was a great collector and a great reader, and the books he had presented were of the greatest possible interest.

#### The Glasgow Visit.

The vote of thanks having been heartily agreed to.

Mr. John Slater said that since the last meeting many of the members of the Institute had participated in one of those provincial meetings which were started some time ago and which enabled them to hold their annual dinner with one of the allied societies. Many gentlemen had had the privilege of going to Glasgow, where they were loyally entertained; and he thought the Institute would like to pass a vote of thanks to the various societies in Glasgow who entertained them so well. The Glasgow Institute, whose President, Mr. Burnet, they had with them that night, could not have done more than they did to make the visit to Glasgow a pleasant one. They entertained the members at a most *recherché* luncheon at the Exhibition, and the members of the Glasgow Institute were most anxious to put their services at the disposal of the visitors. Then the Glasgow Corporation gave them a most charming entertainment at the Town Hall, which all of them enjoyed to the full. The University invited them to visit that building, and they had a most interesting meeting there, and saw the buildings, and were delightfully entertained by Principal Story. To the Glasgow Arts Club a special vote of thanks should be accorded, for they gave the visitors a pleasing invitation to be free of their club, and did much to provide entertainment for them, and to the President of that club, Mr. Christie, they were extremely indebted for two most enjoyable evenings. The Imperial Union Club also made the visitors free of their rooms, and the Royal Scottish Society of Painters in Water Colours gave permission to look at the pictures in their galleries. It would take too long and it would be out of place to go into details as to the buildings of Glasgow, but the members who saw the Arts Club would feel that at any rate skill and originality were two great features of Glasgow architecture. He asked the meeting to pass a very hearty vote of thanks to the bodies he had mentioned for what they did in entertaining the Institute on the occasion of the visit to Glasgow.

The Chairman said the Glasgow Corporation most regally entertained them in the Municipal Buildings and provided musical entertainment and refreshments in several rooms, and altogether treated them most hospitably.

The votes of thanks were then heartily agreed to.

The Secretary, Mr. W. J. Locke, stated that on October 24 and 25 an examination qualifying for candidature as District Surveyor in London was held, and Mr. C. O. Nelson, of Chiswick, passed. He had been granted a certificate of competency to act as District Surveyor.

It was also announced that at the Institute examination held in Montreal last June (the first held in the Colonies) Mr. Andrew Sharp was successful in satisfying the examiners, and he has become qualified for Associateship of the Institute.

#### President's Address.

The President then delivered the following address—

Colleagues, Ladies, and Gentlemen,—I had occasion, in my two former addresses from this chair, to take a retrospective view in the one of the architecture of the past century, and in the second to consider what might be the state of our art during the coming century. This year I shall but glance at certain current points which seem to me either important or of interest.

First as to the increase of the numbers and influence of the Institute. Our numbers, I am happy to say, maintain a steady increase, and each year more candidates present themselves for examination than on previous occasions.

We have, in fact, some 1,700 actual members of the Royal Institute of British Architects—or over 3,000 members, counting those of societies in alliance with us. There are also some 1,500 probationers, and more than 400 students, which is some proof of the value set on the Institute examinations and the trend towards improvement in education of architects. I think this speaks very well for our increasing prosperity, so far as it can be told by figures. Unfortunately, though our numbers steadily increase, death has recently made dreadful inroads on our members, for since this time last year we have lost twenty-one Fellows and five Associates. It is sad to find that amongst this number have been some of the greatest and most honoured names. The roll includes Barry, Burnet, Brydon, Brooks, Cates, and Young; and many of the number were carried off while in the prime of manhood and busy in harness—two of them just as they had achieved the honour of being appointed to design and carry out two of our greatest public buildings. Truly we must feel that in the midst of life we are in death. Their loss we all deeply deplore.

That the influence of the Institute is growing and not waning is shown by the number of instances in which it continues to be appealed to on architectural questions by public and other bodies, both in the metropolis and provinces, and the number of congresses and other meetings to which we are asked to send representatives and invited to express our views. There can be no doubt that if the Institute would only let its voice be heard on important points in respect to architectural questions as they arise, whether they be metropolitan improvements or other important schemes, we should, and ought, gradually to become the guiding spirit in such matters.

While touching on this point of metropolitan improvements and large architectural questions, I suggested last year the advisability of some more organised system of control over design. Whether it were by a Ministry of Fine Arts, as proposed by me, or by a Royal Commission, as has been suggested since both by the President of the Royal Academy and Lord Wemyss, is of little matter so long as the responsibility were fixed. The discussions and very varied opinions expressed in the *Times* and other journals on such a question by writers qualified or unqualified to judge seems proof of the evident necessity for some such organisation. In America, at Washington, the same suggestion is being urged on the Government.

It has been stated that the widening of Piccadilly was only a part of a large improvement scheme for that particular approach to the City from Kensington, in which the taking down and rebuilding of Walsingham House would afford an opportunity for a move in that direction. Whether this is so I have no knowledge; but the question I would ask is, Why deal with only one small portion of London at a time? The whole question of the rebuilding of London, enormously difficult as it may be or the huge expense it may involve, ought now, without further delay, to be considered. Definite improvements and building lines should be laid down in all important directions, and all buildings pulled down and rebuilt or altered in the future should be obliged to conform to the scheme. It would mean increased expense to the ratepayers as each portion of ground was taken by the authorities for the widening or improvement of the thoroughfares; but it would be a gradual work, and, though slowly, London would at length be rebuilt on a properly considered plan, instead of an improvement here or a widening there being effected without relation to any well-considered inclusive scheme covering the whole problem.

And I would reiterate what I said last year as to the necessity for providing subways to avoid the constant taking up of the roads. I am glad to see that five parishes have raised an indignant protest against the ever-recurring interruption to traffic by street excavations, and that the attention of the London County Council has been drawn to the matter.

Since writing the above, I see that the Highways Committee of the London County Council will submit at the next meeting of the Council a report advocating the construction of a system of shallow underground tramways in London, with subways for pipes, wires, &c., on each side of the tramway subway, and that the experiment should be initiated in the new thoroughfare in course of construction between Holborn and the Strand. This is a step on a

most important matter quite in the right direction.

The consideration of the questions of the insanitary effect of large areas overcrowded by a dense population in flats, the shutting out of sun and air, arcades over footpaths, railway works in the metropolis, sites for workmen's dwellings, &c.—these are a few of the many questions entering into any scheme of improvement, as well as the embellishment of the metropolis by its public buildings, and they should be dealt with by the Ministry or Commission to which I have referred. If we do not wish future generations to hold us up to scorn and blame us for our culpable apathy, it is time that Parliament took some step in the direction indicated.

I must again this year refer to the question of competitions. A great deal has been written of late in some of the journals on the subject of Assessorships in Competitions, and evidently without knowledge of the truth of the matter or troubling to ascertain it. The suggestion has been that the blame of the dissatisfaction so constantly arising as to awards lies at the door of the President or Council of the Institute for not having exercised sufficient care in the selection of assessors. I have therefore had a list made of the competitions held since July, 1899, up to September last, with the assessors' names and the results—that is to say, as to whether there has been any expression of dissatisfaction in regard to their awards—and the following is what I find to be the case.

There have been during this period, as far as I can find out, ninety-seven competitions held in all parts of the country and metropolis. Out of this number there were seventy-three in which the authorities chose their own assessors, or, at any rate, did not apply to the Institute to name one. Out of these seventy-three the assessors' awards were set aside and dissatisfaction was expressed in twelve cases, or, practically, one in every six competitions. In the remaining twenty-four the President of the Royal Institute of British Architects, or the Council in a few instances, nominated the assessors, and in not a single instance was the award of these assessors set aside, nor can I find that any expression of dissatisfaction arose at their awards. There was only one case in these twenty-four where any unpleasantness at all arose, and that was solely on the part of one person out of sixty-two competitors for the same subject, because a certain alteration had been made in the conditions by the assessor, who was appointed a week or two after those conditions had been issued by the authorities. As it apparently made no difference to sixty-one out of sixty-two competitors, it could not have been of serious importance, and there was no dissatisfaction expressed at the assessor's award.

I think this proves how ready some even of our own members are to blame either the management or the officials of the Institute when they do not even know the facts about which they are writing or talking. A little more loyalty and real honest endeavour to serve the ends for which we are all supposed to be united and working would be more to the point, and assist materially the work of the Institute for the good of our art and the profession at large. And on this I must quote and adopt some words of Mr. Peabody's in his address to the American Institute: "We can only measure the amount of good the Institute has done by its output. Many a man who cares little for it benefits because others have cared. Many a man outside our numbers is more respected in his community, and has a more certain livelihood, because the Institute has proved itself a reasonable public body. Certainly through its influence the perils and hardships of competitions have been greatly mitigated. But all these are small and selfish ends. The real value of the Institute lies in its opportunities, in its openings for useful work and mutual high endeavour. Thanks to the wisdom of its founders, I think it has been a potent means of good. Thanks to them, it has none of the features of a selfish trade union. In a trade union a man's powers and skill are handicapped for the general good; but with us a member has entered into no engagement of any kind except that he will honourably practise his profession."

This examination of the result of the enormous number of competitions in a couple of years only is enough, I should think, to deter most men in the profession from taking part in them; but if not—and we choose to have it so

—we should bear in mind that in every competition the larger proportion of the competitors must naturally feel disappointed, as there can only be one winner; and if a man does not care to take this risk he should not compete. As I said last year, one can only endeavour to nominate the right man as assessor; but even he is hardly likely, however level-headed, careful, and just in his perceptions, he may be, to please every one. Anyhow, if the public continue to lay the burden of competition on the profession, and we prefer to bear this burden of enforced gambling, then at least let us be fair amongst ourselves, and insist that nothing shall upset the principle we have long ago laid down—that when a duly qualified assessor has been appointed, and has selected a particular design, the author of that design shall, unless there be some very special reason to the contrary, be employed to carry out the work. Otherwise we are simply playing into the hands of an unscrupulous public, prepared to take every advantage of our time, talents, and money. Even should the assessor happen to make an award that does not commend itself to all, it will certainly be better for the profession in the long run that the award be upheld than that each dissatisfied competitor should endeavour to upset it. Our only safeguard is loyalty to uphold this principle.

Our Congress last year gave rise to a most interesting discussion on bridge design, by the courtesy of the Civil Engineers at their institution. Whether it may bear fruit in the more intimate relations of the engineer and architect on the question of monumental bridges in the metropolis and provincial towns remains to be seen. The architectural effect of bridges must be the outcome of the construction at the inception of the design, and can scarcely be added as a dressing afterwards with advantage. It can, therefore, only be satisfactorily accomplished if engineers and architects would be willing to consult with each other at the commencement of any such scheme. Unless this be done, as the aim of the engineer is necessarily and properly, from his point of view, to construct in a purely scientific manner, usually omitting all that would add unnecessary weight or cost, the more such a purely engineering scheme is developed the more hopelessly ugly it usually becomes. The only way out of the difficulty appears to be for architects to study the subject of engineering for such schemes themselves, and, when opportunity offers, put forward their own views. Certainly, progress in the beauty of monumental bridge treatment may be made, if the designer will only remember at the outset that every idea in the design should be suggested by the construction, and that any ornamentation added for mere caprice certainly defeats its own object, if that object be the mere adding of unnecessary features as ornament to an already logical construction. Such friendly discussions as these between kindred professions cannot do otherwise than help in the appreciation of architecture as appertaining to engineering, and clinching the theory that architecture and engineering should go hand in hand as help-mates the one to the other.

In speaking last November, from this Chair, of the problems that the architecture of this century is likely to have to solve, I mentioned as one the planning of large churches to meet the needs of modern congregations, with a view to avoid the blocking of the central portions of churches in the mediæval manner of our Gothic cathedrals. I wish to-day to go a step farther on this point, though I do so with some diffidence, because any suggestion of alteration in our accustomed church or cathedral arrangements is looked on by many as almost heretical; but what I may say is with a view possibly to induce, at some later date, a discussion on the point I am going to raise—namely, that of bringing altars forward, nearer to the congregations than is possible with the present arrangement of deep chancels and choirs. Such a discussion might be very interesting and instructive from the architectural side of church arrangement, as well as in relation to the question of congregational worship in our larger churches.

In 1884 I wrote in one of the building journals some thoughts on church planning, the object of which was to show that the common fourteenth-century plan, with the crossing blocked by large piers and the enclosed choirs in the centre of the church, though well adapted for the mediæval and monastic times, is quite unsuited to modern worship in the nineteenth century. This view now seems

generally accepted; but further than this, the fervent spirit that has developed itself under the Church revival of late years renders it necessary that the large congregations should be able both to hear and see all parts of the services for full participation in them.

Beresford Hope, in his "Worship and Order" (written many years before his death, but still, I am assured, expressing his latest views, for he presented copies of this book to friends shortly before he died), says:

"I tell the man who wants to build a church, which shall be at once useful and beautiful, to forecast that church in his mind's eye, to forecast it at work—full of worshippers joining in the 'Te Deum,' upon their knees at the Holy Communion, of worshippers listening to the evening services. Let him guess, as he only can, by such a glance how every one can hear and every one can see. Let him notice where his light falls, and where it is darkness, and in particular let him make sure that the altar and its adjuncts stand well forward, and are not lost in the obscurity of some unlucky shadow. There is no reason, beyond the prejudice which such a novelty might excite, why at times one should not construct a circular or polygonal nave. The nave of the Temple Church is precedent enough, and the glorious design of St. Gerzon at Cologne would hold a goodly multitude. There are no more congregational naves anywhere than the octagon at Ely and the dome of St. Paul's."

All which means that what is wanted now, and much more now than when the above words were written, is a large open space for worshippers, with the altar brought well forward, and not buried in the depths of a lengthy chancel or choir, as in the case of the fourteenth-century English cathedrals, of which type the new one at Truro is a modern representative, and, however good in its architecture, is simply an anachronism.

Tradition and conservatism are well in their way, but should not go the length of hampering modern requirements with obsolete arrangements made for the benefit of colleges of monks, and not for the people. The desirability of a good open space for congregational purposes is now by most thoughtful minds generally conceded. The point I would suggest for reflection is the possibility and propriety of a further advance in increasing the facilities of large congregations for seeing and hearing, and participation in those parts of the services conducted at the altar, by an alteration in its position, which might, while being a step in advance towards meeting modern congregational wants, possibly also be found to be, in a measure, almost a return to early usage. In a modern cathedral, say, for argument's sake, the choir must contain stalls and seats for seventy to one hundred persons, with proper space for altar communicants and steps. The length would be at least 100 or 120 ft., and though this is considerably less than the depth of many mediæval churches, it, nevertheless, removes the east end of the sanctuary so far from the nearest members of the congregation that it becomes practically impossible for them, as a body, to see or hear the services conducted at the altar.

The question I ask is, conceded the open space in the centre of a large church, why should we not consider the advisability in the future of altering the arrangement of our choirs and placing the altar at the entrance to the choir instead of at the east end, with the clergy, choir, and bishop's throne behind the altar? To see if there is any reason in such a suggestion let us look back at some points in the history of church planning.

The seats for the clergy being situated behind the altar is a far older arrangement than the position assigned to them in the mediæval and monastic times. It existed at first in some of our own early cathedrals, as you all know—at Norwich and Canterbury, for instance, I believe I am right in stating that in the view of the Anglican party in the Church is that their rules, doctrines, and worship are intended to be in accordance with those of the earlier Church, and go back to the time before the Bishops of Rome established the Roman Church as the chief of all the churches, and arrogated to themselves the position of supreme head as Pope or Father. Now at this early period it is certain that the arrangements in the Christian churches provided for the altar being immediately in front of the congregation, and the seats for those who officiated at the various offices and at the altar being behind it. It is interesting to note how the earlier arrangements developed and were altered to meet the requirements of various times and peoples, and changes of thought.

Let us glance broadly at the various alterations that have occurred. In the early basilican arrangement, as in old St. Peter's

at Rome and St. Paul's without the walls at Rome, both in the ancient and lower, and the later or upper churches, and later also at St. Ambrosio at Milan, St. Maria Maggiore at Rome; also at Torcello and Parenzo, and in the Armenian Church of Pitzounda, in the Coptic churches, and, as before mentioned, in Canterbury and Norwich, and also at the little early church of Deerhurst, it was evidently thought desirable that no great distance should intervene between the congregation and the altar, and for this reason no doubt it was placed in front of the Bema, thus bringing it in close proximity to the worshippers. In those days the form of worship was comparatively simple, and the officiating clergy, who probably acted as cantores also, were seated behind the altar, their seats being ranged around the Bema, with the Bishop's throne in the centre, and the worshippers evidently took full part as well as the clergy in the ceremony of Divine worship.

These altars, it is true, faced the reverse way to ours, and the priest officiated standing behind the altar facing the people and the east. Now both priest and congregation in our churches usually face eastwards or towards Jerusalem, perhaps originated by Solomon's prayer at the dedication of the Temple, though other reasons are more usually given for the custom. Some few centuries later, when, in consequence of the holy mystery of the Divine Sacrifice being more prominently suggested in the church arrangements, indicated by the veiled altars, the ritual had extended and comprised more ceremonial, and more attention was paid to music, the addition of a chorus cantorum or choir was made, intervening between the altar and the congregation and jutting into the nave. The clergy still occupied the same position behind the altar during the missa and officium divinum, but subsequently those in holy orders, as well as the cantores, occupied the lower portion of the choir during the officium divinum, and those only actively engaged in the missa occupied the Bema.

One evident reason of the choir being thus brought forward into the nave between the altar and the congregation in the basilican churches, as in the upper church of San Clemente and others, seems likely to have been, that had the increased number of singers been placed, like the priests, behind the altar, it would have necessitated in such a plan the position of the altar being moved some bays down the church, towards the centre of the nave, by which arrangement many of the worshippers in the large aisles would have found themselves during the missa behind the altar and the officiating priest, instead of in front.

It seems to me there could have been no other logical reason for the departure from the first method of arrangement, which brought the altar in greater proximity to the congregation; and from this departure by gradual steps our mediæval choirs were evolved, resulting eventually in the abbey churches in the entire shutting off of the altar, clergy, brotherhoods, and choirs from the congregations by the elaborate screens even now remaining in many churches both here and abroad.

The more exalted ritual, with its greater suggestiveness of the importance of and reverence for the holy mysteries, aided by other Roman doctrines, seems to have led to the screening off of all those engaged in the service of the church from the congregations by the veiling of the altars, as in the Coptic and Eastern churches, by the iconostasis or solid screen which separated the altar from the choir, and also a further and more open screen which again separated the choir from the congregation. Instances of both these arrangements are found—of the first in the Church of Abu Sargah and the old Coptic churches of Egypt at old Cairo, in Russia and Armenia; and of the second in the upper church of San Clemente at Rome, and other early churches, and at Torcello; and possibly some such similar arrangement was adopted at old Canterbury and Norwich, and the little ancient church of Deerhurst.

Again, later on in mediæval times, when civilised but pagan Rome had fallen, and education for the masses had disappeared, the Church being the only light of the dark ages, and the Bishops of Rome had added worldly pomp and power to the spiritual character of their office, and claimed for themselves the title of Pope as head or Father of the Universal

Church, it was to be expected that the clergy and monastic orders should have conceived it necessary, considering the strong line of demarcation they had drawn between themselves, their elevated office, and the ignorant laity, to emphasise this point in their churches by altogether enclosing for themselves and occupying the central and best part of the churches and cathedrals. This was the natural evolution of the first enclosed choir in the Basilicas placed between the altar and the congregation, and completed by the separation of the clergy and monastic bodies from the laity. This arrangement is familiar to us all in the numerous cathedrals with the enclosed choir or pulpitum. By this plan the congregations were debarred from any prominent or general joining with the clergy in divine service or public worship, excepting in connexion with the mass or services held at the altar which it was then found necessary to place in the nave, outside the choir, or rood screen, as was the case at Lincoln and York. These altars were for the popular services. There was a great screen between the western piers of the central tower, the altar in the middle and doors on either side. A necessity for this altar for popular or congregational services is felt at the present time in some of our cathedrals, as at Norwich, in consequence of the enclosed choirs still remaining.

In the early mediæval times, that the congregations should unite with the clergy in public worship was, judging by the arrangements then existing, apparently considered of small moment. The people were to be impressed, or perhaps improved, from a spiritual point of view: but their worship was done for them, if I may so express it, by proxy, "as in the Jewish sacrificial rites, when the priests and Levites acted alone, but with this difference, that in this case the people could not even join in the prayers and praise, as did the Jews, for the reason that the divine offices were not in the vernacular." It was when, later on, education, both religious and secular, caused an expansion of thought and feeling in the popular mind that an alteration was felt to be necessary; and it was the recognition on the part of the clergy for the necessity of the participation of the congregations in the whole of the services that caused the introduction of these second prominent nave altars in such proximity to the people that all could easily see and hear, and, at last, the holding of the services in the language of the people, as an additional aid to their heartily joining in them.

This principle of two altars is sometimes considered not in accordance with the feeling of the English Church, which it has been said is one church, one altar; but it seems to have been the outcome, first, of the desire for the separation of the clergy and choir from the congregation, and, secondly, of the basilican churches having first arranged the choirs intervening between the altar and the congregation. If the basilican churches—which, after all, were first derived from courts of justice—had had, instead of the Bema, long chancels or choirs to accommodate a large number of cantores, like the late cathedrals, is it not possible that the same relative position of the altar near the congregation would have been maintained, and the chorus cantorum have been placed behind it with the clergy, instead of in front of it? The fact that later on the nave altar outside the choir were found necessary seems, to my mind, to argue that it would have been so.

In Spain in the fifteenth century the arrangement obtained of the *coro* or choir being placed in the nave and the altar in the eastern part of the church, with the congregation intervening between the altar and the choir. A modified form of this principle of arrangement is now to be seen at Westminster Abbey; and this plan was, no doubt, also the outcome of the feeling for the necessity of the altar being not too far distant from the congregation. There are also many instances now in Italy of the choir being behind the altar; but in some of these cases the public are brought too near the altar, which seems somewhat derogatory to reverence, as in Sta. Maria del Fiori, at Florence, where the high altar was placed under the dome, and the congregation entirely surrounds it. At Sta. Maria Maggiore the altar is still at the entrance of the Bema in the nave, and the choir and stalls for priests behind it on either side of a second altar at the end of the apse or Bema; and a somewhat similar arrangement exists in the semi-

Romanesque churches of Cologne and St. Gereon, thus bringing the altars in proximity to the congregations.

Does it not seem evident, from these variations at different times of the arrangements made to suit the feelings and education of the ages, that there can scarcely be said to be a hard-and-fast line drawn, or any grave law that would be broken if the present plan of accommodation of our tripartite arrangement of congregation, choir, and sacrum, were somewhat altered to meet modern requirements, however much, in some respects, our sentiment and conservative feeling make us averse to alterations?

The present arrangement, when we consider the late earnest Anglican movement, which claims to go back in its faith and ritual to the period previous to the absolute sway and domination of the Roman Church, seems in some respects to be wanting and illogical, where, as in our larger churches and cathedrals, large choirs and numbers of clergy have to be accommodated, causing, by this plan, the altar to be removed from the congregation, say from 80 ft. to 150 ft., and suggests the necessity for some revision in our plan which shall, as in the early times, bring the altar and the services conducted at it in closer proximity to the worshippers.

I quite feel that difficulties arise which are not easy to surmount in the suggestion of the principal altar being placed at the entrance to the choir, but I do not see that they are insurmountable. First, there must be the elevation of the choir above the nave, and then of the sacrum and altar above the choir; but with a wide choir, and a large open space in front, I do not see that this would be impossible any more than at Sta. Maria Maggiore in Rome, or at the Duomo in Florence.

Also there is the question of a great reared, but a canopied altar and a dossal of beautiful workmanship and precious and rare materials might be infinitely more satisfactory and in better taste than some of the large and elaborate altar-pieces of soft stone and inferior sculpture and workmanship that have been erected in many of our churches in late years. One objection, no doubt, that would be raised to such an arrangement would be, that by the present plan we are supposed by degrees to arrive at the holiest of all at the altar, which, therefore, is removed furthest from the vulgar; but the Roman Church has evidently not attached weight to this, and why should ours? A second altar might be placed at the extreme east end and used for smaller services, the bishop's throne and the choir and stalls remaining in the same relative position as at present. With the enormous congregations our churches are now attracting, width of nave and choir and spacious interiors are a necessity, and with these, were it found advisable, this arrangement could, I imagine, be made to suit our worship as easily as the Roman Church has, in numbers of instances, made it suit theirs.

As to its advisability in regard to sentiment and conservatism, no doubt many averse arguments could be raised; but, all the same, the question would still remain of the vital necessity for fervent worshippers being able to see and hear and join in all parts of Divine worship. The subject has been in my mind for a number of years, which must be my excuse for bringing it before you on this occasion, and, after all, it is as much an architectural question as an ecclesiastical one. At any rate, I am not the first to have proposed such a thing, and numbers besides myself are interested in the subject. I would commend the point for consideration to any of you who may be likely to have the chance of erecting a large church or cathedral suited to modern times.

Gentlemen, this is the last time I shall have the honour of addressing you on the first day of a new Session, and I can only conclude by once again saying how greatly I feel the honour you have conferred on me and the confidence you have reposed in me by again electing me as your President, and I assure you I shall continue, as I have ever endeavoured to the best of my ability, to do all I can to further the interests of our noble art, to extend the influence of this Institution, and to uphold in the highest sense, as far as I am able, the dignity of our profession. To these ends the Council are ever ready to give their unequalled aid, and I only ask you all to loyally join with us in our endeavours.

Mr. J. Macvicar Anderson, in moving a hearty

and cordial vote of thanks to the President for his able and interesting address, said it was pleasing to all loyal members of the Institute, as he took it they all were, to hear from the head of the Institute of its prosperity, both as to numbers and in regard to the influence which it exercised. Increased membership meant, of course, increased funds, and he referred to that in order to impress upon the Council again the advisability of allowing the surplus funds of the Institute to accumulate and not to be in a hurry to spend them. It was sad to know of the loss of well-known and valued members. In the case of Mr. Arthur Cates, no one knew better than he (the speaker) did what the Institute owed to him. Mr. Cates was not so much an architect as a surveyor, and yet he devoted his time, with indefatigable energy, to the interests of the Institute, and more particularly to the carrying out of the scheme of examinations, which had been so remarkably successful, and his memory might well be held in high regard by members of the Institute. It was sadly pathetic to think, too, that the two architects who, after much consideration, were nominated to carry out two great Government buildings had passed away, and it was pathetic, also, to know that a leading member of the profession had been laid aside for many months by serious illness. With the name of Alfred Waterhouse they had all been accustomed to associate an architect of great power and ability, and a prodigious worker of unbounded energy and activity. They could only hope that he would be spared for many years of usefulness, though it might not be of activity, and that in enforced retirement he might find that perfect rest and peace to which his active life so thoroughly entitled him. In regard to the widening of Piccadilly, the view he held was that it is too soon to enter upon such serious changes. It seemed a little unwise to begin by widening the widest part of Piccadilly so long as the narrowest part was allowed to remain narrow. There could be no doubt that in course of time underground communication in London would come more and more to the front, and he believed that, sooner or later, some such communication, similar to that on the north side of Hyde Park, would be constructed from the West End to the City. In saying that, he should add that he would oppose such communication being taken near the foundations of St. Paul's Cathedral; that was a scheme above all others to be avoided, but it did not seem to him that that feeling militated against this underground communication. If such a communication were made, and if the result were what the result of a similar communication had been on the north side of the Park, *i.e.*, to run the omnibuses off the road, then there would be ample room in Piccadilly for all other traffic. The best course seemed to be to wait, and not to go into extensive alterations which, as some thought, would ruin Piccadilly and which might be found to be ultimately unnecessary. As to the well-worn subject of competitions, many of the expressions of the President met with his entire approval. As to the "unscrupulous public," no doubt the public had become unscrupulous in the matter of competitions; but who was to blame for that? Not the public, but, in his opinion, the architectural profession, for no sooner was a competition announced than architects with great speed responded to the invitation to compete. He thought architects would better serve their own dignity and the welfare of the profession if they refrained from responding. He knew he was singular in that opinion, but he had never thought otherwise, and the older he grew the more he became confirmed in it. He was sure that the wisest thing for the profession to do in the matter was to have nothing to do with the burden the President had referred to, and if architects would refrain from so readily responding to invitations to compete the question of competitions would soon be solved. There was one competition which had occupied a great deal of attention lately, and that was the competition for the proposed cathedral at Liverpool. A great deal of nonsense had been written on the subject, and in his opinion the proper course for the Liverpool Committee to have followed was to have appointed the President of the Institute as the architect of the cathedral. Fifteen years since a competition was held and three eminent architects were asked to prepare designs. The late Mr. Ewan Christian was

appointed assessor (and no man had more sound judgment in such matters), and after much care he selected the design sent in by Mr. Emerson. It was true the site had been altered and the circumstances changed, but those were not sufficient reasons why the great labour and thought given to the matter by Mr. Emerson should be set aside. The President had devoted the greater part of his address to a subject which was of great importance, viz., the plan of modern churches. There could be no doubt that the mediæval plan of our modern churches and cathedrals were not suited to the worship of the present day, but at the same time the mediæval arrangement gave a wondrous charm and attraction to churches and cathedrals, and if that charm and attraction were to be lost by adopting a different arrangement, one would hesitate a long time before adopting it. It was a subject which had very properly been brought forward for the consideration of architects. As to the position of the altar, there could be no doubt what the origin of the idea was, for the Saviour dispensed the first communion on earth with his disciples all sitting at one table. Therefore, the idea of placing the altar at the most remote part of a long chancel, away altogether from the congregation, was certainly not confirmed by the primitive and original idea of communion.

Mr. G. H. Fellowes Prynne, in seconding the vote of thanks, said that when a President had to address an Institute like theirs three times, the difficulty was more than threefold. The two previous addresses were not only able, but more full of life and vigour, and were thoroughly practical, and yet elevating in their tone, and could be read with pleasure and profit. The present address was somewhat more limited in scope, although it dealt with matters equally practical. As to the losses the Institute had sustained by death, he felt that most of them must have felt the blank which the loss of many well-known men had caused. He thought it would be an excellent thing if the Council would consider the possibility of making arrangements for the exhibition in that room of works of deceased architects. It would not only keep green the memory of dear and departed friends and confreres, but would be of great value to members individually, and would help to popularise the meetings in that room. As to the subject of improvements in London, the rebuilding that the President suggested was, indeed, a large matter; to him (the speaker) it seemed almost hopeless. No sooner were our streets widened and buildings of ugliness were pulled down, than some fresh Goliaths were erected more hideous by their size or self-assertiveness than the former buildings. It seemed difficult to suggest any plan which would be satisfactory for the improvement of London. At the same time, as to the proposed Ministry of Fine Art, similar power had been granted in other countries, and certainly the improvement in art in the streets of those countries had been very great indeed, and a similar body, if truly representative of the art of the nation, might be of immense service both to the nation and the profession to which they belonged. As to competitions, he thought the Institute ought to be grateful to the President for having gone so fully into the matter as regards the assessors the Institute had named. He thought that would show members outside that the Council were thoroughly interested in getting absolutely fair play in competitions. He could not help referring to the great competition for the Liverpool Cathedral. He thought the President had a right to complain that he had been unjustly and unfairly treated, for the fine plan he sent in in the last competition was assessed as the best plan, and consequently the President ought to have been appointed on the present occasion. The lapse of time and the alteration of site seemed to him to make no difference, and the President ought to have been asked, at least, to send in a fresh scheme, even if the Committee would not bind themselves to accept it. Such an appointment would in no way have been regarded with jealousy or disapproval by architects generally, and it would have been welcomed by members as a compliment to the President and the Institute. In reference to the longest and possibly the most important part of the President's address, he should like to have gone into the subject in detail if it had been a paper on church planning.

The President, interrupting, said it was his idea that the matter would lead to discussion on a future occasion.

Mr. Prynne, continuing, said that the subject

was of great interest, and all who planned churches must feel that there was enormous scope for much improvement in planning; at the same time, everyone would recognise the great difficulties which existed in making radical changes in what were accepted as the principles of church planning, and although he most thoroughly endorsed the hope that our church plans might be in a sense more logical and, perhaps, more common-sense, he felt that the matter was full of controversy and side issues. Properly to build a church, the object must be something far higher, better, and nobler than that of merely seeing and hearing. We did not want our churches to become mere preaching houses or music-halls; something higher in their design was wanted. They must design in a devotional sense in their church architecture, so that every stone and the proportions would preach better sermons than the spoken discourse. The all-seeing and all-hearing idea should not be the main idea in church planning, though, of course, it should be incorporated in church planning.

Mr. Anderson then put the vote of thanks to the meeting, and it was heartily agreed to.

The President, in reply, said, as to Liverpool Cathedral, he was grateful to them for their expressions, but he thought that some of the remarks which had been made were too strong. The present committee who had the subject of the cathedral under consideration were not all the same gentlemen who formed the last committee, and no doubt some of them thought that architecture made great advances in the course of fourteen or fifteen years, and that by having a fresh competition they would get a better design. He would be delighted if, by dropping any claim he had, they got the finest cathedral. He had been disappointed in the matter, but long ago he felt that the cathedral was almost *in nubibus*, and he had not expected it to come up again in his lifetime. The meeting then terminated.

The next meeting will be held on the 18th inst., when Mr. K. Anning Bell will read a paper on "Mosaics."

#### THE ARCHITECTURAL ASSOCIATION

AN ordinary fortnightly meeting of this Association was held on Friday evening last week in the Meeting-room of the Royal Institute of British Architects, No. 9, Conduit-street, W. Mr. W. H. Seth-Smith, President, in the chair.

The minutes of the last meeting having been read and confirmed, the following gentlemen were elected members of the Association:—Messrs. A. C. M. Edwards, E. F. Knight, W. H. Hillyer, H. Bailey, J. H. Gott, A. G. Parker, H. L. Samson, B. B. Hooper, W. I. Parker, J. H. Belfrage, C. J. Calder, J. C. Corblet, J. H. Crabtree, J. J. Crowe, L. H. Harrington, A. J. Healey, D. S. Jennings, H. A. P. Pierce, L. Roberts, S. H. Stock, F. A. Stowell, T. J. Tatham, T. Thorne, G. F. Webb, A. B. Botterill, W. B. Sinclair, E. Chaplin, R. B. Curwen, M. E. D. Dixon, J. V. Gibberd, Norman Hall, C. R. G. Harrison, C. McJerron, H. Kemp, C. U. Kilner, D. M. O'Connor, A. E. S. Payne, P. Phipps, G. A. Potts, F. G. Russell, S. M. Spoor, E. G. Stevenson, R. W. Stuttle, W. J. Tomlinson, W. I. Travers, C. F. Ward, R. H. Willson, and B. H. Sutton.

Mr. R. S. Balfour, Hon. Secretary, proposed a vote of thanks to the Rotary Photographic Co. for the gift of some excellent photographs of ancient Rome. The motion having been agreed to.

The Chairman said that, owing to Mr. A. T. Bolton's appointment as Headmaster to the Day School, a vacancy had been caused on the General Committee of the Association, and in accordance with By-law 35 he gave notice that at the next ordinary meeting of the Association the Committee would nominate Mr. W. C. Waymouth, who, of the unsuccessful candidates, received the highest number of votes at the last election.

*Cambridge in Early and Mediæval Times.*

Mr. A. Wood, M.A., F.S.A., then read the following paper on "Cambridge in Early and Mediæval Times":—

Some three miles from Cambridge the Gogmagog Hills rise above the surrounding country. The name is supposed to be a corruption of Hog-Magog, from Hoog-Macht, or high strength. From them a good view may be obtained over the plateau upon which stands Cambridge. At this spot we are amid the

defences which the East Anglians raised or utilised against their encroaching neighbour Mercia. Across the Cam there is some elevated ground, and one catches a glimpse of the majestic minster of Ely. The hill to the north is the Castle Hill at Cambridge. Elsewhere one looks over land nearly as level as the sea which borders it to the east. We are here in the territory of the Iceni, which comprised what were afterwards Norfolk, Suffolk, and Cambridge. Middlesex and Essex belonged to the Trinobantes. Part of Cambridgeshire may be said to have hung on to Norfolk and Suffolk, and was defended on the west by the great Whittlesea Mere. The ground on which we are standing would have become a debatable land if it had not been strongly fortified on what may be called a trench-and-block-house system, the indications of which may be traced at the present day. The Great Dyke known as the Recken Dyke, the Devil's Dyke, St. Edmund's Dyke, extended over Newmarket Heath from Reche upon the Cam towards the woods of Essex. Water was the protection at one end, wood at the other. Parallel with the Great Dyke, at a distance of seven miles, was the Fleam Dyke. This began at Fen Ditton on the Cam below Barnwell, which is suburban to Cambridge, and ended at Balsham, to the south-east of the Gogmagog Hills. According to Dr. Mason, another dyke, starting about a mile south of Bourne Bridge, between Abington and Pampisford, trends towards Cambridge. This was probably for the protection of Worsted-street, a Saxon line of road which runs close beside the Gogmagog Hills.

Dyke means both ditch and mound. Scotchmen and North-country Englishmen still call a wall of whatever material a dyke. According to Palgrave, the name Rech or Recken Dyke does not come from the village of Reche, but means the Giant's Dyke, from a root found in Eastern and Western languages alike—as in the Latin *rex* and the Indian *rajah*, in the Anglo-Saxon *rean* and the common English *rich*, in the Castilian *ricos* and the Scottish *king-ric* for kingdom, and it may be added in the English *bishopric*. Still the village of Reche may have had the very same derivation. It is a poor, out-of-the-way place now, but tradition says that it was once a great city divided into four quarters, one of them inhabited by Jews.

Exning was the capital of Anna, King of the East Angles, with whom dwelt, until their departure into Kent, his daughters Ethelburga and Sexburga, and, until her marriage with her first husband Tonbert, Etheldreda, foundress of the Abbey of Ely.

Tonbert, one of the nobles at the Court of Anna, was an alderman, or, according to some, a prince of the Southern Girvii, one of the two peoples—the other being the Northern Girvii—that formed districts of the East Anglian kingdom. The Southern Girvii occupied the whole Isle of Ely.

On the summit of the Gogmagog Hills is a triple circular entrenchment enclosing about thirteen and a half acres, known as Vandlebury, which is, according to Gough, one of a chain of forts. The first is at Audley Ina in Essex, the second at Littlebury in the same county, the third at Chesterford to the south of Cambridgeshire, the fourth is Vandlebury, the fifth Granchester, the sixth Arbury, from which *castrum* or camp Chesterton, near Cambridge, derives its name; the seventh Belsars Hill, near Willingham, ten miles to the north-west of Cambridge. All are in sight of one another, and they reach from the woodland of Essex to the Fens, their line being crossed by several parallel ditches, both forming what I have called a trench-and-block-house system. The camps themselves were British or Roman, but they availed to defend the kingdom of the Uffingas or descendants of Uffa, the kings of East Anglia.

But it is time to leave the Gogmagog Hills, which Henry of Huntingdon calls "the pleasant hills of Balsham," and follow the Roman road, a portion of which is the Worsted-street of which I have spoken, to Cambridge. It may be well, however, to state here that the next fort to Vandlebury mentioned by Gough, that of Granchester, is a well-marked Roman encampment. Here there was evidently an extensive cemetery, as many ancient coffins are still to be seen built into the walls of the church and churchyard. Granchester appears to have been deserted at an early date in favour of Cambridge, with which it has often been confounded. We cannot doubt that it, and not

Cambridge, was the place to which Sexburga, sister of St. Etheldreda, foundress of Ely, sent for a coffin to enclose the remains of her sister. "The brethren whom she sent," says Bede, "took ship and came to a certain ruined town at no great distance [from Ely], which in the English tongue is called Grantacestr; there presently they found hard by the walls a white marble coffin, exquisitely wrought, with a lid of the same material." It seems safe to assume that this indicates the Roman cemetery at Granchester.

In the declaration of the laws of the Guild of St. Mary, Cambridge, written in Anglo-Saxon, and to which a very early date is attributed, Cambridge is written Granta-byrige, and not Granta-byrig, otherwise one might have thought that it really meant the town upon, as Granchester is the camp upon, the Granta. The mediæval name is therefore the Bridge upon the Granta.

Granta and Cam are quite dissimilar. Cam, which is familiar to us in the word *camber*, is found in Camboritum, the Roman name for Cambridge. Camboritum is explained as the ford at the bend, the sharp curve which the river makes below the Castle Hill at Cambridge. Camboritum was, however, properly the Castle of Cambridge, not the existing, although ancient, town. Rhedum (ford), the other constituent with Cam of the name, is found in Khedycina, the Latin name for Oxford. Ox represents such names for water as Esk, Usk, and Ouse, the last of which has been Latinised into Isis. It was only gradually and at a very late date that Cambridge supplanted the mediæval Grantabridge.

The outline of the Roman Camboritum can be readily and clearly traced. The western wall went from what is known as Mount Pleasant, and, enclosing the little Church of St. Peter and its churchyard, ran to a point near the old Norman Grange, known as the School of Pythagoras, where the southern side began, and crossed Magdalene-street by the south side of the Chesterton-road, the terrace in Magdalene College grounds forming part of the rampart. The eastern wall began a little beyond the college grounds and proceeded to Akeman-street, the Roman road, in the vicinity of the present Victoria-road.

The two roads that intersect at Camboritum are the Via Devana, running from Deva (Chester), from which it derives its name, to Camulocornum (Colchester). We have seen it as Worsted-street at the Gogmagog Hills. At Camboritum it is Magdalene-street; at Cambridge it has been Hills-road, Regent-street, St. Andrew's-street, Sidney-street, finally Bridge-street. All this confusion might be saved by calling it from its terminus—Castle-street, the name actually given it beyond Magdalene-street.

Akeman-street is the Saxon name for the Roman road which ran from Brancaster, in Norfolk, by Cirencester, to Akemancaster, the Saxon name for Bath. It seems that it must have coincided in part of its course with the Ikenild-street, which ran, also from Norfolk, by Camboritum to Old Satum, Exeter, and the extremity of Cornwall. It would also seem that the Via Devana ran at some point into the Watling-street, which ran from London to Chester. There was another Roman road that ran towards Ely, and yet another ran near Granchester towards Bedford.

At the extremity of the natural promontory enclosed by, though not as extensive as, the Roman camp stands the mote or mound specifically known as the Castle Hill, which gives the popular name of Castle End to this outlying north-western part of Cambridge. It is also known as the Burg or Borough. It is partly natural, partly artificial. It appears to have been formerly considerably larger than now. East Anglia contains fine examples of these mooted mounds. There are examples at Mifflam and Buckenham; the finest example is Castle Acre in Norfolk.

The Dances were at Cambridge in 874, and the mound is probably a Saxon work undertaken at that date as a means of defence against those invaders. In the representation of the taking of the Castle of Dinan in the Bayeux tapestry the conical mound is surmounted by a timber construction which two men are endeavouring to set on fire with torches, whilst others are climbing up by a steep bridge which crosses the moat and ascends towards a gateway. Many mounds or motes of this description kept their wooden walls down to the twelfth and thirteenth centuries.

William the Conqueror erected a castle at

Reche and another at Wisbeach. In 1069 he took up his residence in the Castle of Cambridge, whence he conducted his military operations against the Isle of Ely, where Hereward, the so-called last of the Saxons, maintained the struggle against him. William cleared away twenty-seven houses in constructing his castle at Cambridge, the previous one having been probably burnt along with the town by the Danes in 870 and 1070. The removal of houses was no doubt due to the construction of the base-court within the old Roman encampment, and not crossing the Via Devana. I need not pursue the not very eventful history of the Castle of Cambridge. The last remaining relic of the castle, the gateway, was pulled down almost in our own day to build the County Courts.

No less than three churches stood within the *castrum* of the old Roman camp: All Saints', by the Castle, subsequently removed and the parish united to St. Giles'; St. Giles' itself; and St. Peter's. All Saints' was the only church within the castle enclosure. This was the arrangement at Porchester in Hampshire, Oxford Castle, and elsewhere.

In the essay on "Fairy Superstitions," in the "Minstrelsy of the Scottish Border," Sir Walter Scott relates from Gervase of Tilbury a legend connecting the camp at Vandlebury on the Gogmagog Hills with the Castle of Cambridge. This legend is said to be as old as the twelfth century, and is a specimen of the tales that circulated around the winter hearth of a castle at that period. It has further a topical interest as showing that, whilst the castle at Cambridge was occupied, Vandlebury was deserted.

In the neighbourhood of the Castle of Cambridge, was, as we have seen, the so-called School of Pythagoras. This never was a school, and had nothing to do with Pythagoras. It appears to have been a farmhouse or grange of the twelfth or early part of the thirteenth century. The manor-houses of this period were usually in the form of a parallelogram, and of two stories in height. The lower story appears to have been invariably vaulted. There was no internal access from the lower to the upper story, the communication being by an external flight of steps such as we see at the King's School at Canterbury. In the upper story was at times the only fireplace in the building. Wealthy Jews appear to have been the first builders of stone houses in this country, as is seen in the Jews' house or houses at Lincoln and Moysey's Hall at Bury St. Edmunds. To the rooms above mentioned were frequently added a cellar on the lower and the solar on the upper floor. The kitchen appears to have been in a courtyard external to the mansion. The lower room of the "School of Pythagoras" is 60 ft. in length. The vault has disappeared, and there only remain two vaulting shafts. Light is admitted by an inserted fourteenth-century window of two lights. The windows on the first floor are fair examples of Transition work. This building was purchased by Walter de Merton, Bishop of Rochester, and bestowed by him upon his college in Oxford about 1270; hence the name occasionally given it of Merton Hall. It would almost seem as if he had at one time contemplated a collegiate foundation in Cambridge as well as in Oxford. It is a singular fact that Hugh de Balsham, Bishop of Ely, founder of Peterhouse in Cambridge, bestowed the advowson of the living of Gamlingay in Cambridgeshire upon Merton College, Oxford. It may be supposed that he did not at that time contemplate his own foundation of Peterhouse in Cambridge. The Oxford college thus derived a double benefit from what seems to have been a conflict of cross-purposes.

I have shown that there was a Roman road from Camboritum to Granchester. From Red Cross on the Via Devana a road ran westward, cutting the present Trumpington-road near Trumpington, and ran across the river, in which was a ford, to Granchester. There appears to have been a gradual concentration of population from the remoter parts of the area defined by the ancient road above mentioned towards the ford at the foot of the Castle Hill. This was the direction of traffic and commerce, and population followed it. This ford and the bridge that succeeded it must always have been of great importance as the only point at which goods and cattle could pass the river on their way from the eastern counties. It has been conjectured that the ancient Church of St. Benedict, remarkable for its Anglo-Saxon steeple, included throughout the

mediæval period in Cambridge itself and well within its boundaries, was originally the parish church of a distinct village, overtaken by the growing town.

It has been said that Cambridge was, commercially speaking, never a very flourishing place. This appears to me over-hastily said. At Oxford the colleges have fairly strangled the town, or rather city, which in the early history was a commercial capital, and which one finds mentioned with London and Bristol. Cambridge has lost its commercial, but has retained its agricultural, consequence.

In the history and constitution of its Guilds we may read the record of its early unfulfilled promise. Guilds are of very early origin, and the English are the earliest. The Guilds were lay bodies, and existed for lay purposes. In the case of the three Guilds in Cambridge given in the return (12 of Richard II.) one altogether excludes the clergy, another prescribes that they are to have no part in its management, whilst the third has a chaplain, but with the condition that if the funds run too low to maintain both a chaplain and the poor brethren, the chaplain shall be stopped.

Two Guilds—those of Corpus Christi and the Blessed Virgin—combined to found Corpus Christi College. The Guilds themselves united and bestowed much of their property in houses upon the college. This excited the people of Cambridge, who, in 1381, instigated by the Mayor and led by a certain James of Granchester, a local Wat Tyler, plundered and destroyed the house of a University official, the Esquire Bedell, whence they hurried to Corpus Christi, broke open the college gates, assaulted the master and fellows, and seized upon the college charters and plate. They next went to the house of the Chancellor of the University whom they constrained to subscribe two bonds, subjecting the University not to prosecute the town on account of these violent proceedings. The mob, after burning the University charters in the market-place, assailed Barnwell Priory and the Nunnery of St. Rhadegund, both of which had large possessions in the town, and the riot was only put down by the arrival of the Bishop of Norwich with an armed force. Dr. Keys relates in his history that after the burning of the University charters an old woman, Margaret Sterr, threw ashes—I suppose those of the charters—into the air, and shouted, "Thus let the learning of all scholars be confounded!" This amiable lady appears to have possessed an exuberance of civic life, and there is this to be said for her, that throughout the whole Middle Ages the colleges were thrusting themselves into and absorbing the most important region of the town, that adjoining the river, and were unpopular in consequence.

There were till lately several old houses in Cambridge, particularly in Bridge, Trinity-street, formerly the High-street, and the neighbourhood of the Petty Curry. The Jewry was in the parish of St. Sepulchre, and occupied a large part of All Saints' parish, including the site of St. John's College. The Synagogue and the house of Benjamin the Jew (afterwards converted into the Tolbooth) were not in the Jewry, but in the market-place, near the present Guildhall. Some have thought that the Jews did not live in the Jewry, but that is a mistake. As a matter of fact, they constructed numerous stone houses in and about the Jewry at a time when the majority of houses were constructed of wood. The presence of Jews in a town in such numbers as to have a special quarter assigned them is an evidence of its commercial importance.

I have referred to the Cambridge Guilds at an early date. At that time their ordinances were full and original. It is probably an evidence of the commercial decline of Cambridge that a very singular change took place in the fifteenth century. Nowhere else in England did, as in Cambridge, one Guild after another simply copy out the ordinances of an older Guild. Ordinances professing to be those of distinct Guilds, with more than forty years between them in the dates of their foundation, "are more identical in shape and words, so far as these could be used by separate bodies, than are the different versions of what are avowedly copies of the same by-laws."

The Cambridge charters have been published in the course of the present year under the editorship of Mr. F. W. Maifland and Miss Mary Bateson.

The churches of Cambridge would take a volume in themselves. To make the study of

them intelligent one has to make a circuit of several miles round Cambridge, and even further than that at individual points, to trace their similarity to other churches in the same district. Thus what I have seen described as the singular tracery and form of the windows at St. Michael's, Cambridge, proves not to be singular when compared with that at Over, some miles to the north-west of Cambridge, which appears to be by the same architect or band of workmen.

I shall omit all notice of the most remarkable church in Cambridge, St. Sepulchre's in the Jewry, as that is well known, and has been fully described as one of the round churches of England. I shall speak of those only which were connected with the colleges, and in doing so I shall take them in chronological order, as they existed in, and were part of, the town before the colleges were built.

The oldest church in Cambridge and the oldest building in the town is St. Benedict's, or St. Bennet's, Church. Its situation is slightly to the west of the site of the Austin Friars, and immediately adjacent to Corpus Christi College. The body of the church was restored by Mr. R. Brandon, and exhibits few traces of its remote antiquity. The tower, however, remains intact. It is of that version of Early Romanesque which we commonly call Saxon. It is in diminishing stages, not in one upright mass, as the tower of St. Michael's, Oxford. The material is rough masonry, the quoins being in "long-and-short" work. Of the three stages of which the tower is composed the lowest occupies nearly half of the entire height. The divisions are made by plain projecting string-courses. In the midst of each face of the belfry stage is a window divided by a central baluster standing in the midst of the thickness of the wall and supporting an abacus extending completely through the wall and bearing two semi-circular window-heads consisting of a single stone. There are smaller windows in each face set laterally to the larger ones, but on a higher level. The baluster shafts of the central windows are ornamented with a band of rudely-carved rings. The crowning member is a plain coping.

The tower of St. Bennet's communicates with the nave by a massive semi-circular arch having capitals adorned with roughly-carved representations of animals. Of the church contemporary with the tower only a few fragments remain built into the existing walls. The nave is of the thirteenth century. The original approach for the parishioners was by a porch, no longer existing, at the west end of the south aisle. The south aisle of the chancel is formed by a building that in mediæval times consisted of an upper and lower chapel, the former of which was used as a lecture-room. In the north wall was a window commanding a view of the parochial chancel. This building, deprived of many interesting features, is still connected with Corpus Christi College by a gallery supported by a four-centred archway.

The advowson of St. Bennet's was purchased by the founders of Corpus in 1350, and the Royal licence for the appropriation was obtained in 1352, but was not acted upon until a very late date. The college was in the parishes of St. Bennet and St. Botolph, one standing at one and the other at the other extremity of the site. The statutes of the college bound its members to attend service daily in one or other of the churches. A trace of the former connexion with the college is the monument in St. Bennet's of Richard de Billington, Master of Corpus in 1398, who died in 1432.

Much the finest example of First Pointed in Cambridge is what is now, and has been since the early part of the sixteenth century, the Chapel of Jesus College, formerly that of the Nunnery of St. Rhadegund. It was erected between the years 1150 and 1245, the north transept being the oldest portion of the existing building. It was originally in the form of a cross, with a tower in the centre, and had, in addition to the transepts, aisles on the north and south sides of the eastern limb, flanking it along half the extent of its walls and forming chapels, which opened into the chancel by two pier arches in each wall. Of peculiar beauty are the piscina and sedilia; the series of lancet windows, with blind arcading between them, in the chancel; and the roof-story gallery on the inner side of the tower walls. The piscina was thought so beautiful that it was copied in the parish church of Histon, to the north of Cambridge, and in the ancient Hospital of St. John, where St. John's College now

stands. The nave had seven piers on either side between it and the aisles. These piers were alternately cylindrical and octagonal. Upon this splendid fabric Bishop Alcock of Ely brought what was little else than ruin in transforming it into a college chapel. A considerable amount of his work has been undone in our own day, and there appears to be no reason beyond the expense that would be incurred to prevent the whole being brought back to its primitive condition.

The Cambridge example of the Second Pointed style is the fine Church of St. Mary-the-Less without Trumpington Gates, attributed to Alan of Walsingham, remarkable for its window tracery, and particularly for that of its east window, in which some see an approach to the Flamboyant character. The first church on this site was in the Norman style, and was known as St. Peter's without Trumpington Gates to distinguish it from St. Peter's by the Castle. The college was named St. Peter's from this church.

This church fell down about 1350. The actual Church of St. Mary was built as Merton Chapel or Church in Oxford to serve both for the college and the parish. It is a lofty body without aisles or any structural division between nave and chancel. The separation was effected by a screen. The length is roofed, and the width 27 ft. The church is divided into six bays, each of which, except the westernmost, is a double square in plan. It is lighted by lofty windows having between them deep buttresses. The tracery of the windows on the north side is all modern, with the exception of that in the easternmost window. In the eastern gable and in that on the south side are windows the tracery of which is exceptionally rich and flowing. The tracery is in the same style, and even from the same patterns, as that of the same date in Ely Cathedral. In the fourth bay are traces of chantries both on north and south, opening from the chapel by doorways and arches with rich complex foliage which formerly overhung monuments placed upon the line of the foundation of the wall. At the east end of the church is a vestry in two stories erected against the south wall of the easternmost bay, whilst against the next bay is an apartment or vestibule, entered from the south side of the choir. An ancient stone staircase leads from this vestibule to the gallery communicating with the college, so that the members of the community could use this as a private entrance. The floor of the vestry is raised upon a vault, which was used as an ossuary or charnel-house. The gallery connecting with the church is of the middle of the fifteenth century, at which date the choir was refitted. The new quadrangle of Peterhouse was built at the same time.

At St. Edward's Church the aisles to the north and south of the chancel belonged, that on the north to Trinity Hall, and that on the south to Clare College.

The south aisle of St. Michael's Church served anciently as the chapel of Michael House, one of the collegiate establishments on the site of Trinity College. The north aisle was the chapel of Gonville Hall. In this church was buried Hervey de Stanton, minister of Edward III. in 1337 and founder of Michael House.

St. Mary-the-Great is the University church. It has a lofty nave, with span aisles, and lighted by twenty windows in the clearstory.

One might be tempted to think on entering a college that the chapel was the most important building, the first built, and that all the other buildings had clustered round it. That is not the historical fact. The least ambitious part, the chambers, comes first. Originally chambers were lodgings in private houses, such as the accommodation—if such it can be called—for students in London or in the Scottish university towns. Next, larger or smaller bodies of students came to be entertained by a *host*, who furnished a common table, to the cost of which, however, each student contributed his own expenses. So we have *hostels* or inns. Some *hostels* were of sufficient importance to have parts of the parish churches appropriated to them. Then colleges came to build their own chapels, of which arrangement Pembroke is the earliest example in Cambridge. The chamber, the hall, the chapel—such was the progressive development. Eventually, with the exception of St. Mary's, the parish church ceased to enter into University life.

So also have monastic establishments. Dur-

ing the Middle Ages there were many monastic houses in Cambridge. The monks of Ely had one hostel, those of Croyland another, those of Norwich a third. Of the Friars, the Franciscans established themselves at Cambridge as early as 1224; in 1249 the Carmelites moved in from Gledeston to Newnham; in 1257 the Friars of the Order of Bethlehem settled in Trumpington-street; and in 1258 the Friars of Penitence settled in the parish of St. Mary-the-Great, whence they afterwards removed to the parish of St. Peter, where their buildings were eventually absorbed by Peterhouse. There were added to these at a rather later date (1273) the Friars of St. Mary, and two years afterwards the Dominicans. The Austin Canons had been for two centuries and a half established at Barnwell Priory, and the brethren of St. John's Hospital—also under the rule of St. Augustine—were established in 1135 by Henry Frost, a burgess of Cambridge.

Two Cambridge colleges, which fall without the mediæval period, Sidney-Sussex and Emmanuel, are built, the former on the site of the Franciscan or Grey Friars' house, Emmanuel on that of the Dominicans or Black Friars. The Carmelite house was situated between King's and Queen's Colleges; the Austin Friars near the site of the new museums; the White Friars of the Order of Bethlehem on the site of Addenbroke's Hospital.

The alleged history of the town and University of Cambridge in their early days is an impossible fable, and the account attributed to Peter of Blois, Archdeacon of Bath, is not history. Universities grew up from the episcopal and monastic schools. Something was wanted of wider range than their comparatively contracted teaching, and what became universities sprang up by the efforts of capable and enterprising teachers at suitable spots. Separate schools or colleges came in time to supplement the universities and to impart a more familiar and methodised instruction. This process was followed everywhere in Western Europe, except, indeed, in Scotland, where the students do not reside in colleges.

The word university is simply a mediæval law term for a corporation. When academical corporations were founded at Paris and Bologna they gradually absorbed into themselves the use of the word university, which had hitherto been common. The School of Bologna was called the University of Scholars, that of Paris the University of Masters, because in the one the students enrolled themselves into a corporation, and in the other the masters obtained for themselves corporate rights.

A college means properly a number of persons incorporated as colleagues for certain common purposes; the building is the house (*domus*), and hall (*aula*), and hostel (*hospitium*). The only buildings required by a university as such were a place to hold meetings and ceremonies, a library, lecture and examination rooms.

We know the appearance of the Cambridge schools in the middle of the fifteenth century. On the north side of the Quadrangle stood the Theology School, and on the west that of Canon Law, with the new library above it. To these on the south side were added the Schools of Philosophy and Civil Law. The whole building appears to have been completed in 1470 or 1471. The south building was entered by a *vicc* or turret staircase at the north-east corner, known as the schools' tower and as the schools' belfry from containing the schools' bell. It formed part of the east range containing the gateway—still preserved at Madingley near Cambridge—which was begun in 1470. The east building occupied the space between the staircase and the Theology School. The entrance gateway had above its archway shields bearing the arms of England supported by lions, and those of Archbishop Rotherham of York. On the side towards the Quadrangle were seen the arms of Edward IV. and of Richard III.

These schools were the outfit of the mediæval University of Cambridge. They were confined to a single building. The colleges, on the other hand, were numerous. Still, they had a common character, so that we say now of a building that it is or looks like a college.

It has been argued that the dispositions of a monastery were derived from those of a Roman villa, and in particular from those that partook both of the character of the town and country house, and this resemblance has been worked out in detail. The cloister, with its

pillars surrounding an open court having apartments opening from it, is, it has been argued, clearly derived from the peristyle common to the Roman town house and the country mansion, which was the part of the house reserved for private use. The outer court, with its stables, granaries, &c., corresponds with the *villa rustica* of the Roman country house. The *tablinum* becomes the chapter-house. The kitchen and refectory are in both cases situated on the outer side of the court. It is easy to press the analogy too far, but there is an evident truth in it.

So it may be said that there is between the general plan and disposition of a college an analogy with that of a monastery. The general enclosure within walls, the disposition into courts surrounded by buildings, the cloister, the refectory with its attendant kitchen and offices, the chapel (where it existed), the master's lodge corresponding to the dwelling of the abbot or prior, were similar to parts of the monastic structures or those occupied by the secular canons. The common dormitory, however, was a feature not reproduced, as the members of colleges slept in rooms or chambers, and were chamberers or chums. In Cambridge the chapel, the library, the master's lodge, and the great gateways of the later were wholly wanting in the earlier colleges. Even the disposition in a square or quadrangle was not at first attempted. The founder would purchase land and houses and accommodate them to the use of his college.

The colleges which fall within the mediæval period are fourteen in number.

1. St. Peter's, the earliest of the Cambridge colleges, was founded by Hugh de Balsham, Bishop of Ely, in 1284. He transferred to certain hostels on this site scholars whom he had previously placed in St. John's Hospital. He bequeathed funds which enabled his scholars to purchase land to the south of St. Peter's Church (now Little St. Mary's) and built upon it a handsome hall. The quadrangle was not begun until 1424. The buildings were then carried on continuously until about 1466. The north, west, and south sides were successively undertaken. The east side was still occupied by the original hostels.

2. Clare College was founded in 1326 by Dr. Richard Badew, Chancellor of the University, and was originally known as "University Hall." The college was founded anew by Elizabeth de Burgo, third sister and co-heiress of Gilbert de Clare, Earl of Gloucester and Hereford. This college does not appear to have been arranged upon the quadrangular plan until subsequently to the mediæval period. It is now wholly Renaissance, and the best specimen of that style in Cambridge.

3. Pembroke College is one of the four colleges founded in the middle of the reign of Edward III. It was founded by Mary de St. Pol, second wife of Aymer de Valence, Earl of Pembroke. The Earl died suddenly in France in 1374, when his widow became foundress of Denby Abbey, between Cambridge and Ely, and in Cambridge of a house of scholars with the name of the College or Hall of Valence-Mary, by way of jointly commemorating her husband and herself. The south side of the quadrangle was begun in the lifetime of the foundress, and the construction of the chapel—the first college chapel in Cambridge—was authorised by a Papal bull in 1355. The Countess had originally chosen another site for her college, and St. Botolph's Church was to have served as chapel. The very diminutive court at Pembroke is, with the exception of the building on the south side, of later date than 1351, when the site for it was obtained. Henry VI., in his charter, calls this "the most noble, renowned, and precious college, which, among all others in the University, was ever wonderfully resplendent."

4. Gonville Hall was originally erected on another site, and transferred to the present by William Bateman, Bishop of Norwich. The chapel, occupying part of the south side, was built in 1393; the chambers that complete that side and form the west side in 1441; the east side was not built until 1490. The chapel was built with its east end free, no buildings abutting upon it.

5. Trinity Hall has the peculiarity of an entrance court interposed between the quadrangle and the street, like the *cortia* of a monastery. The quadrangle is larger than in any previous college—175 ft. long and 80 ft. wide. The founder, Bishop Bateman, is believed to have built the hall and the range next the street. The rest of the west range and the

north range were added in 1374. The chapel is believed to have been built in the fifteenth century. Trinity Hall was a house of study for the Monastery of Ely prior to its conversion into a college for the study of civil law.

6. Corpus Christi College, built between 1352 and 1377, exhibits the first regularly-planned close quadrangle, as it has a hall range on the south, containing the hall, kitchen, and Master's lodge, and chambers upon the other three sides. The buildings are low and of equal height throughout. There was no chapel, but, as I have stated above, two parish churches, to either of which the students could resort.

7. The first stone of the old court of King's College was laid in 1441. The area was so cramped that the formation of a regular quadrangle could not be attempted. The first stone of the chapel for the enlarged foundation was laid in 1446. The design for the enlarged college was never executed, and the large southern quadrangle has sprung up in quite modern times. A closed quadrangle was contemplated, of which the chapel would have formed the north side; the west side would have been occupied by the library, the hall, and the Provost's lodge; the south and east sides by chambers. Westward of the chapel would have been a cloister, like Wykeham's at Winchester and New College, Oxford, with a lofty detached campanile.

King's College was founded by King Henry VI. in 1441 for a rector and twelve scholars. Two years later the King's plan was greatly extended and the endowment was made for a provost and seventy scholars. The college was not completed by either Henry VI., Edward IV., or Richard III., although both of the Yorkist kings contributed to this Lancastrian foundation, but by Henry VII.

8. Queen's College was founded by Margaret of Anjou, wife of King Henry VI., in 1448 for a president and four Fellows. The annual revenues amounted to 200*l.* a year, a sum of much greater purchasing value than now. The principal quadrangle was completely designed and finished in a few years. It is entered on the east side, which, as also the south, is occupied by chambers. The hall, kitchen, and buttery are on the west side, whilst the original chapel and the library were on the north.

The first stone of the chapel was laid for the Queen by Sir John Wenlock, who was afterwards slain at Tewkesbury, who caused to be engraved upon it (in Latin) the inscription, "The Lord will be a refuge to our Lady, Queen Margaret, and this stone for token," a prophecy ill-fulfilled by this event. The building of the college was interrupted by the Civil Wars; still the President, Andrew Duckett, was successful in obtaining for it the patronage of Elizabeth Wydeville, Queen of Edward IV. The number of Fellows was raised to nineteen, and as many as forty-five scholarships were founded. The endowments were much increased by Richard III. and other benefactors. Soon after the erection of the great quadrangle a large range of buildings was erected to the west, with, what is an exceptional feature for Cambridge, a cloister-walk on the ground floor. The arches are plain four-centred arches of brickwork, of three chamfered orders.

9. Catherine Hall was founded in 1473 by Robert Woodlock, Doctor of Divinity, Provost of King's College, and Chancellor of the University, who dedicated it to St. Catherine, and appointed a Master and two Fellows, and some Fellow-Commoners. The buildings formed a quadrangle. The hall, library, and Master's lodge were on the north side, and the chapel on the south, projecting eastward beyond the eastern range of chambers. This college was wholly rebuilt in the seventeenth and eighteenth centuries.

10. Jesus College was made into its present form from the pre-existing Nunnery of St. Rhadegund about 1495. The nunnery was endowed by Malcolm IV., King of Scotland, who was also Earl of Huntingdon. It was dissolved at the petition of John Alcock, Bishop of Ely and Lord Chancellor of England. Alcock's foundation was for a Master, six Fellows, and six scholars. I have already treated of the conventual church. The distinctive features of this college are the cloister surrounding the original quadrangle inherited from the nunnery, the entrance court, and the road leading to the entrance-gateway and running between the walls of the Master's and Fellows' garden. The cloistered quad-

rangle was universal in monasteries, but not to be found in colleges, except in their secondary courts. In ecclesiastical buildings the Vicars' Close at Wells presents a near analogy to the ordinary college quadrangle.

11. Christ's College was built on the site of a hostel called God's House, which had been originally settled near Clare College, and endowed in 1442 by William Bingham, Rector of St. John Zachary, London, but removed to this site to make room for the building of King's College. Margaret, Countess of Richmond and Derby, obtained a licence from her son, Henry VII., to complete the college, gave it a body of statutes, and lived to see the quadrangle completed.

The entrance gateway is to the west; on the opposite or eastern side are the master's lodge and the hall, having at its south end the butteries, and beyond them the kitchen, external to the quadrangle. The chapel occupies part of the north side, but extends beyond the eastern range of buildings. The remainder of the north side, the whole of the south side, and the greater part of the west are occupied by chambers. The library is on the first floor, on the west side, to the south of the gateway. The buildings have been much transformed externally, but the ancient structure remains.

Tradition says that Lady Margaret of Richmond was influenced by Bishop Fisher of Rochester in the interest she took in Christ's College. The exercise of that influence is much more certain in the foundation of St. John's. Dr. Fisher was Master of Michael House, in the immediate vicinity of the Hospital of St. John the Baptist. It had fallen into decay and disrepute about the time when Fisher became chaplain to Lady Margaret. She had endowed Christ's College with the Abbey of St. Mary of the Meadows at Creyke in Norfolk, and she now concurred with Fisher in his desire to devote the Hospital of St. John to educational purposes. Her death took place June 29, 1509, and the college was not begun until two years later. The building of the first court was carried on without interruption until its completion.

The college was opened by Bishop Fisher, July 29, 1516. One of the buildings of the hospital was altered into a chapel for the college, and formed such part of the north side of the quadrangle as was not occupied by the master's lodge. The lodge had an oriel resembling the bayed windows we find in the churches and chapels of the period. It gave the master a view of every part of the quadrangle. The west side comprised the hall, buttery, and kitchen. On the south was a range of chambers. On the east side was the library, with chambers beneath it. The second court is entered through the screens of the hall. There is nothing unusual in a passage open at both ends in this position. It was probably seen from the first that the college would extend in this direction. The entrance gateway is of the type of which that at Queen's is the first example. It is of red brick, with angle turrets, having stone quoins. There is an ogee canopy over the gate. The central shield, with the arms of England and France quarterly, is supported by the Beaufort antelopes. In the tympanum beneath is a rose. To the right (heraldically) is a large rose, to the left (heraldically) a portcullis. Both are crowned. Daisies, the special emblem of the Lady Margaret, are sown throughout the whole space beneath the string-course. The arms were formerly emblazoned in gold and colours, whilst the horns of the antelopes were gilt. Resting upon the finial of the ogee is a niche with a figure of St. John, beneath the usual Tudor canopy.

12. Of this noble gateway that at Trinity College may be considered a more homely version. There the entrances are double, one for carriages, the other for foot passengers. These have always reminded me of the tale of Sir Isaac Newton that he cut two holes in his door, a big one for the cat and a small one for the kitten.

13. Trinity College sprang up from a variety of hostels, of none of which are there now any but the most fragmentary remains. The history of this noble college itself falls without our period.

14. Magdalene College stands apart in more senses than one. It occupies the site of an ancient Benedictine establishment, dating from 1228. Different religious houses built different portions; Ely built one chamber, Walden a second, Ramsey a third. The general name of this composite fabric was the "Monks' Hostel." After the Dissolution the building was carried

on in succession by the Duke of Buckingham, Lord Audley of Walden, and the Duke of Norfolk. The buildings, with the exception of the Pepsian Library, were completed before the end of the sixteenth century. In the quadrangle of Magdalene is to be observed the corner staircase turret, a feature of Cambridge but not of Oxford colleges. The entrance gateway is unaccompanied by a tower. The hall, butteries, and kitchen occupy the east side, the hall being at the north end and the kitchen extending to the external south boundary of the buildings. On the north side is the chapel next the hall; the remainder was formerly occupied by the master's lodge. The south and west sides consist of chambers.

Magdalene College is at the foot of the Castle Hill of Cambridge, and I now end where I began, in Horace's phrase, "The close of a long journey and a long paper."

Mr. Butler Wilson, in proposing a vote of thanks to the lecturer for the trouble he had taken in preparing his paper, said that the subject of Cambridge was a very large one to deal with on one evening, and the ground which had been covered indicated that the lecturer had a very full knowledge of the subject, and he seemed to take it for granted that his audience knew something of Cambridge. The working out of the history of the collegiate buildings very quickly took them into antiquarianism, and perhaps, as a junior architectural association, consisting mainly of young students, they took more interest in that which was directly before them in daily practice. As a busy man, he found that however much he might be disposed to follow up the antiquarian subjects which presented themselves in the architectural world, he had to forego that pleasure, and the interest he took in buildings had to be focussed on that which might help him in his work. The colleges of Cambridge had all got histories; they had all been built to fulfil definite requirements, and in that there was a bond of sympathy between their builders and modern men.

Mr. Francis Hooper said he was glad to second the vote of thanks to Mr. Wood for his scholarly paper, and for showing his sketches of Cambridge buildings. It was true that the paper was more antiquarian than architectural, but there were few subjects that should be foreign to an architect, and, in a sense, the more antiquarian knowledge an architect possessed the better. It was interesting to learn how the University came to be established, also how much it was indebted to the Church for the educational work it undertook, and how the colleges, which began in a small way, had grown and had met the wants of the times. To what extent Cambridge University made the town, or the town the University, it would not be profitable to discuss. It was a happy fact—especially fortunate for architects seeking inspiration—that our two great Universities (Oxford and Cambridge) have been so little modernised. They were mediæval cities, and he believed that one could go to either place and throw one's self back into the life of the student of the sixteenth century, even the fifteenth century, when our national architecture was as virile as it ever had been. It was a matter, too, of great interest to recall the fact that the two universities, especially Cambridge, represented essentially a national architecture. He believed he was correct in saying that nothing could be found as a counterpart to the architecture of Cambridge in any part of the world; it was essentially characteristic of the scholastic and collegiate work of the fifteenth and sixteenth centuries. Many parts of the kingdom had been celebrated in times gone by for seats of learning. He had been much interested during a short visit to Ireland, to find what great importance had been attached, especially in the middle ages, to the University at Lismore. Lismore is shown in our maps as a comparatively insignificant town, but in the middle ages it was a seat of learning resorted to not only by Englishmen, but by people from all parts of Europe. Unfortunately there was now nothing left of that University, and we should appreciate adequately the Universities we still possess nearer home. Did the lecturer know of any educational establishments in Europe in any way on a par with our Universities at Oxford and Cambridge?

Mr. H. Cayley said he once heard a lecture on Cambridge of about this period by Mr. Clark, of Cambridge, who showed a most interesting map of the town before many of the

colleges were built, and from this it could be seen that at that time there were a number of churches and streets near the river. The river at that time was apparently the great highway of commerce, and no doubt the difficulties between town and gown were due to the manner in which the colleges encroached on the town. Mr. Clark showed how the colleges acquired some of their property. The beautiful open spaces which some of the colleges possessed were obtained by enclosing ground to which they had no right, and in the case of Trinity College the land was obtained by an exchange of land with the town, the college having no right to the property it was parting with.

The Chairman, in putting the vote of thanks to the meeting, said, as to the question of archaeological papers, they had arranged a very varied syllabus for the present session. Perhaps, as had been said, the most popular papers were those which were a little more to the point as regards actual study or practice; but he did not think any one would underrate the value and importance of antiquarian papers such as they had listened to that evening. Without a knowledge of the history of buildings, we lost half the interest and delight of going over them. When we knew this history, the buildings could teach us lessons in our actual work, and also the reasons why certain forms were invented. As to the guilds referred to by Mr. Wood, he presumed they were practical guilds. Really, the origin of Oxford and Cambridge was very much like the origin of the Association, which consisted of members who banded themselves together as a guild in order to help on the training in their particular art or craft. It was to be regretted that Cambridge was in such low water financially, and that such a magnificent university should be rather languishing and unable to do as much as they ought to do for education. It was to be hoped that something would be done to aid the university. Great changes were taking place in regard to education in this country, and it would be interesting to compare the new colleges which Mr. Aston Webb was to build at Birmingham with what was to be seen in our old universities—not only as to structure, which would give expression to our new wants, but as what those wants are. At Birmingham, amongst other things, there was, he understood, to be a chair of brewing, and when they thought of that, the question whether Greek should be a compulsory subject or not at Cambridge seemed rather an archaic one. With the vote of thanks he should like to couple the name of Mr. A. N. Papworth, that gentleman having pointed out the illustrations shown by Mr. Wood.

The vote of thanks having been agreed to, Mr. Wood, in reply, said in regard to his subject being archeological, so long as the Institute of Architects chose to examine in archeology, as they appeared to do more or less, it was certainly necessary that students should know a great deal about ancient buildings. He thought (though he did not wish them to take his guidance in practical matters affecting the examinations) that if they took a place like Oxford or Cambridge, or a cathedral town, and studied its edifices definitely and individually, making sketches and drawings of them, that would result in a better impression, a more definite idea, of architectural history than could be got by reading many books, or even by making many sketches of buildings widely separated. He had been very much struck with this idea in going over Cambridge, which he had known for long; and though he could not give the advice as an urgent recommendation, as he had not been in for the Institute examinations, he thought it might be practically useful. Another matter which had occurred to him was this: in Gilbert Scott's "History of Ecclesiastical Architecture in England," or in Rickman, everything was treated on an ecclesiastical basis, and he thought that our architecture had been treated too much in that way. Rickman's notes on castles were very disappointing, for all one seemed able to learn about them was that they were fortified places, whereas they were as valuable as churches. He (the speaker) thought that the plan of studying individual places would broaden our conception of Gothic architecture in the middle ages, and make that part of our studies more fertile. As to whether any other country could show such a large deposit of college buildings as England, he could not answer very positively, but he should say decidedly not. Colleges

were not so much places of residence in foreign places as in this country; the foreign universities and the colleges abroad were gathering-places where people came from different parts, and divided into countries. This was much the same in Scotland—at Aberdeen, for instance. As to the guilds, there were two classes: the craft-guilds, which some people thought were the origin of our trade unions (much the larger number were trade guilds) and the religious confraternities.

The meeting then terminated. The next meeting will be held on the 15th inst., when Mr. Max Clarke will read a paper on "The Sanitation of a Country House."

### COMPETITIONS.

**MANCHESTER FIRE STATION.**—On the 31st ult. the Watch Committee of the Manchester City Council awarded the premiums for competitive plans for the erection of the proposed new fire station. A large number of plans were submitted by competitors in different parts of the country. The premiums have been won as follows:—First premium, 300l., Messrs. Woodhouse & Willoughby and Mr. John Langham, of Manchester (joint plans); second premium, 200l., Mr. Geo. Watson, Edinburgh; third premium, 100l., Messrs. Magnall & Littlewood, Manchester. The new building is to be erected in London-road, on the triangular plot of land at the junction of Whitworth-street. It is estimated that the total cost, including land, will be over 100,000l.

**EXTENSION OF BRISTOL POLICE-COURT.**—New police-courts are to be built as part of the scheme of enlarging the petty sessional buildings in Bridewell-street, Bristol. The plans selected in competition for the extension were those sent in by Mr. Henry Williams.

**INFANT SCHOOL, &c., BERWICK.**—The Berwick School Board have selected the design submitted by Mr. J. Landell Nicholson and Mr. Fred E. Dotchin, as joint architects, of Newcastle, for their new infants' school, caretaker's house, playsheds, &c. It was an open competition, and altogether thirty-one sets of plans were submitted.

**TROWBRIDGE ISOLATION HOSPITAL.**—In the recent competition for the Trowbridge and District Joint Isolation Hospital, to be built at Trowbridge, Wilts, the designs of Mr. J. Hugh Goodman, architect and surveyor, of Reading, were selected for the first premium, and adopted by the committee for the erection of the hospital, in accordance with the recommendation of the professional assessor. There were over fifty designs submitted in the competition.

### Illustrations.

**VICTORIA MEMORIAL: DESIGN FOR TREATMENT OF BUCKINGHAM PALACE FRONT.**

**HIS** illustration is a greatly reduced copy—more reduced than we could have wished—of Sir Thomas Drew's drawing showing his proposal for remodelling the façade of Buckingham Palace, to which we have already referred in our last issue.

As our readers may remember, we have urged from the first that a part of the Victoria memorial scheme ought to consist of a new façade to Buckingham Palace, and that otherwise it would be a shabby and incongruous background to any memorial. Sir Thomas Drew has been of the same mind, and he here shows how he thinks it could be done, by bringing forward a wing at each end of the façade, so as to give shadow, and by introducing a columnar order between the windows, leaving the window openings as they are.

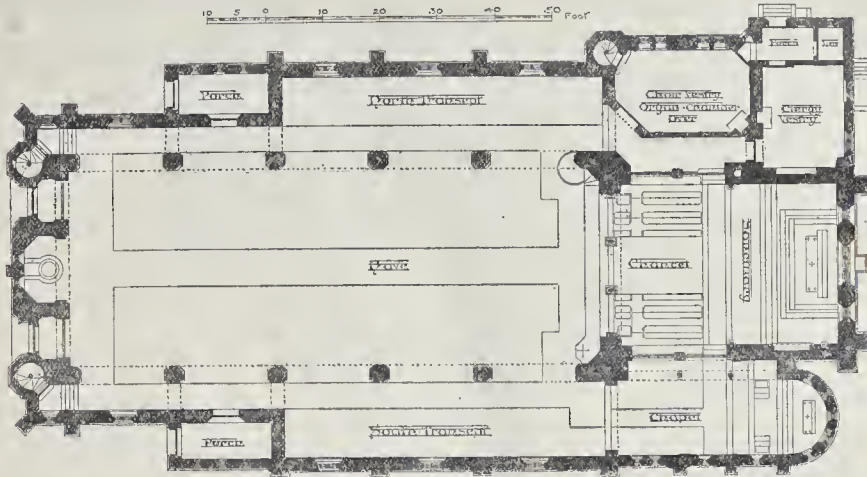

As treated here, the Palace front has a rich and dignified effect. Sir Thomas Drew estimates that the alteration might be carried out for about 100,000l. to 120,000l.

The drawing shows also the arrangement of the ground in front of the Palace, the placing of the Memorial, and the connexion of the central road with Constitution Hill and Buckingham Palace-road.

**CHRIST CHURCH, LOWER SYDENHAM.**

The illustrations show the interior view looking east, and the exterior view from the

Christ Church, Lower Sydenham. Plan.

west end of the above-named new church, the foundation-stone of which was laid on Saturday, November 2, by the Rev. Canon Ainger, Master of the Temple. The exterior view was exhibited in the Royal Academy this year.

The main object of the design has been to get a lofty and effective building that would accommodate about 850 adults at a very reasonable cost, and to trust to the general massing and proportion, rather than to detail, for effect.

The main form of the plan is a nave 93 ft. long by 34 ft. wide, divided into five bays of 18 ft. centres. Broad processional passages are placed on either side, leading into north and south transepts, that on the south side terminating into an apsidal-ended chapel, and that on the north side into the organ chamber.

The baptistry is situated at the west end of the nave and has a vaulted roof, and is flanked on either side by a porch, over the whole of which is formed a small western gallery, which extends the entire width of the nave, and to which access is gained by two turret staircases, one on either side. These turrets are carried up externally the whole height of the building, and form one of the principal features of the west end elevation.

The chancel is 41 ft. 6 in. long by 28 ft. wide, with an altar, raised nine steps from the nave floor level. Spacious clergy and choir vestries are placed on the north side, with heating chamber under. The chancel is divided from the nave by a chancel arch, rising to the entire height of the nave, being filled with a rich traceried stone constructional screen, which forms one of the principal features of the design.

The roof, which is carried at one level through the nave and chancel, is of barrel form, with the addition of a coved cornice for future decoration.

The materials used are red brick relieved with stone dressings. Messrs. Goddard & Sons, of Dorking, whose tender for the work is 13,590*l.*, are the builders, and the architect is Mr. Geo. H. Fellowes Prynn, of Westminster.

HOUSE, BOWDEN GREEN, PANGBOURNE.

The house is of red brick and red tiles—weathering dark upon the roofs. The work was carried out by Messrs. John Parnell & Son, of Rugby.

The joinery is all finished in white, except where of hard wood. The oak work in wall framings and ceilings is left in natural colour from the tool. In the floors it is waxed, but with a dull polish.

The lighting is by electricity, produced in the engine-house in the grounds. The voltage is a very low one and steam power has been found the most suitable.

Hot-water heating supplements the open fires, and a hot and cold water service is provided to the bedrooms.

Mr. Arnold Mitchell is the architect.

MAGAZINES AND REVIEWS.

The *Art Journal* has a frontispiece of considerable interest—an etching by Mr. A. H. Haig of Buckingham Palace from the garden. Neither the garden nor the palace are ever open to the public, consequently this is a view known to few, taken from a standpoint obtained by special permission. The garden elevation of the palace, it may be observed, is a good deal better in an architectural sense than the entrance front. The number is largely occupied by articles on paintings and decorative art in the Glasgow Exhibition; the pictures illustrated are all well known, but the illustrations of decorative and industrial art include some things of novel interest. "How Wallpapers are Printed—by a practical paper-stainer," is a technical subject of interest in an artistic as well as in a mechanical sense, for a precise knowledge of the process of printing is not without its influence on the design. A short article on "The Piano as a Piece of Furniture" says much that has been said before as to the necessity, and the possibility now, of getting something better in the way of design than the stock model; but the two examples from Messrs. Broadwood's are not fortunately selected. One of these is the upright with folding doors, which we have before pointed out are in the way when hanging open on each side of the player—no musical amateur who "meant business" would take that form of piano; and in the grand piano by Mr. Chas. Allom the supports have not the appearance of strength which they should for a heavy instrument which has to be pushed about on the floor. In the reaction from the clumsy and lumpy appearance of the trade pianoforte-legs, designers seem inclined to go to the other extreme of want of solidity.

The *Art Journal* devotes its special annual number to the life and works of the painter whose real name is B. W. Leader Williams, but who wisely dropped the too common surname and became known in the world of landscape-art as Leader. He is not a painter with whom we can profess to have very much sympathy, but it must be admitted that his work, most carefully executed on its own lines, has pleased a greater number of people than, probably, that of any other contemporary landscape painter; and after all, as Mendelssohn once said in apology for inserting a rather light piece of music into a programme—"The people have rights."

The *Artist* gives some excellent examples of M. Charpentier's small bas-reliefs, to accompany an article on his work. The illustrations of metal-work by M. Scheidecker (a French artist in spite of his name) are of more value as warnings than examples in design.

The *Magazine of Art* has also an article on a medallist artist, Hans Frei, a Swiss artist and a native of Basle. He is not a Charpentier, but there is a great deal of interest in his more quiet and what may be called more *bourgeois* work; the head and bust called "Lauretta"

has a great deal of character. It is observed that "his success lies in his strong originality and in his adaptation of mediæval style to modern technique," and the remark seems justified by the examples of his work given here. To architects an interesting article is the short one on the proposed new fish market at Venice, for which Signor Laurenti has made a design with an open loggia of pointed arches in the ground story, on columns without bases, the whole in fact borrowed from the suggestion of the Ducal Palace: old Venice revived. It is a question whether it will not appear too palpably a revival, a piece of modern-antique; but the effort seems to be prompted by a desire to do something in harmony with the ancient city.

The *Berliner Kunst*, of which the first number has reached us, appears to be a kind of supplement to the *Berliner Architektur-Welt*, intended to deal solely with furniture and industrial art; the present number being almost entirely occupied with illustrations of furniture, from which the English reader may form an estimate of the prevalent German taste in furniture. Some of the designs given are clever, but the mistake of them all is that they are too clever, too restless in style, and show a search after ingenuity and novelty rather than beauty. The grand piano figured on pp. 20 and 21 strikes us as hideous in design; the English new designs, if not always quite satisfactory in a structural sense, at all events show good taste and refinement. Among all the furniture illustrations the best thing is the chair by Keller & Reiner, of Berlin; its lines are simple and arise from a natural and unforced treatment of the construction. The *Berliner Architektur-Welt*, however, seems still to keep up its own industrial art section. In its latest number the most interesting architectural illustration is that of a curiously designed apartment house by Herr Paul Hobbe, in the Alt-Moabit; a house diversified with figures in low relief, fluting on the walls, &c., and with some varied and certainly very original treatment of some of the doorways, somewhat Egyptian in feeling; in that on p. 273, however, the cross-lintel looks a great deal too much like a block put in the rough to be carved subsequently. What is supposed to be the merit of the coloured scrawl by Herr Rieth which is given a page to itself, we cannot divine.

The *Architektonische Rundschau* is cosmopolitan apparently only as far as German work is concerned; that is, it illustrates work of the Germanic group of nations, but nothing English or French seems to be admitted. The illustrations are so well executed that it is vexatious to find them bestowed too often on designs which seem to have nothing to recommend them but eccentricity. The coloured print of the theatre at Meran, however, with its cream-white walls, red-tiled roofs, and details half Greek, half Roman, is a building of pleasing and suitable character; Herr Dillfer, of Munich, is the architect. A Vienna house

by Professor Wagner of that city, a comparatively flat front over-run for a great portion with a flowing floral and spiral ornament presumably in *graffito*, is a type of the strife after new treatment in street architecture. Herr Grissel's design for the entrance buildings to the new north cemetery at Munich, of which the central feature is a large square assembly-hall with an octagon cupola, the whole treated on very simple lines and with a good deal of sculpture decoration in low relief, is a pleasing conception, though perhaps a little too naive in its architectural treatment.

The *Quarterly Review*, among various interesting articles on subjects not within our province, has a valuable and instructive one on "Antique Gems," ostensibly a review of Professor Furtwängler's important work, but in reality a general essay on this fascinating subject. Those who wish to feel a new and more vivid interest in Greek gems should read this article and study the British Museum examples in the light of it. "The South Pole" is an article on a subject which, though not connected either with art or construction, may be mentioned here as one which ought to interest all Englishmen without distinction of profession; and those who wish to get an impression of the chivalrous barbarities of old French duelling may find a most interesting and amusing disquisition on the subject in the review of the new edition of Brantome.

The *Edinburgh Review* contains an article on the Glasgow School of Painting, which quite merits an article, but this one is written in what we call a very "provincial" spirit of criticism, the subject being treated entirely from the point of view of the Impressionist clique, as is obvious when we find that one question put in regard to the work of the Glasgow School is "how do they compare with their contemporaries of the South, like Mr. Rothenstein and Mr. Steer?" The best productions of the Glasgow School are quite beyond the productions of such artists as those named, and it is indeed almost an insult to Mr. Lavery to couple him with them. The writer is equally at sea as to what he calls the "lamentable degeneration of the modern Glasgow architects" as compared with "Greek Thompson"; a phrase which is really almost impertinent. Thompson was a man of genius, but a great deal of his work must be regarded as hopelessly *passé* now, and it is in any case not very well suited for the Scottish climate; and the fact is that Glasgow contains a larger proportion of architects who are really artistic and original designers than perhaps any other provincial city. The *Edinburgh Review* under its present management seems to have fallen sadly from the high standard of philosophic art-criticism which used to characterise it; it has descended to the level of the average art-critic.

*Filadelfia's Magazine* contains long articles with illustrations on electrical and other machinery at the Glasgow Exhibition, but it was sent too late for us to go into the contents further than their general mention.

In the *Century* Mr. Timothy Cole starts a new series of wood engravings of "Old Spanish Masters." The one here given, that of the three-quarter length portrait of Saint Elizabeth of Zurbaran, is a perfectly beautiful bit of wood-engraving, and makes Zurbaran's work look more attractive than it generally does in the painted originals. In the same issue is an article on one of the most interesting practical topics of the moment—"The dirigible balloon of M. Santos-Dumont." The article, by Mr. Sterling Heilig, is written with the knowledge and consent of the inventor, and gives a good account of the situation up to the present moment. We call the subject a practical one, because M. Santos-Dumont has, for the first time, succeeded in giving some promise of being able to make it so.

*Harper* contains an illustrated article on "Old St. Saviours, Southwark," by Mr. Charles E. Russell, who calls it in his sub-title "The Elizabethan Actors' Church." The illustrations are architectural, but the writing is merely in regard to the historic associations with the church, which, however, are interesting enough, and should, as the writer observes, be more familiar to Englishmen than they are. Not infrequently we find that Americans know more about our antiquities than we do ourselves. The rebuilding of the nave is alluded to. An article on "Athenian Conceptions of a Future Life," by Dr. Daniel Quinn, is an attempt to gather from Greek funeral monuments an idea as to the light in which

the Greeks regarded death and the probability of re-union after death. Little, however, can really be gained in this direction from sculptured monuments which are—perhaps purposely—so vague and passionless in expression.

Under "The Field of Art" *Scribner* prints a short double essay, by two writers, on the ideal arrangement of pictures in an exhibition such as the Paris Salon, so as to hang pictures in harmony with each other and with the rooms in which they are placed, instead of jumbling together pictures of all classes of subject and of art indiscriminately. What is said is mostly quite true, as an ideal; but it is an ideal practically impossible to carry out, unless the number of pictures were reduced by two-thirds, and the time and cost incident to hanging them multiplied by three. The reduction of the numbers would be an advantage to the public; but even then, under the circumstances in which an annual exhibition on a large scale is organised, the other recommendations could not practically be carried out. After all, there is such a thing as being too fastidious. People ought to be able to enjoy a really fine picture apart from its surroundings.

In the *Pall Mall Magazine* Mr. Francis Watt continues his article on "The Rebuilding of London," devoting his article to Newgate, of which there are a good many illustrations, as well as a head-piece showing Mr. Mountford's building which is to take its place. The writer, however, does not seem to be the least aware that Old Newgate is architecturally a remarkable building, or that it was designed by an eminent architect, whose name is of course (in the usual way in England) entirely omitted from the account.

The *Gentleman's Magazine* contains a short but suggestive article by Dr. E. W. Adams on "The Old Science and the New." The point of it is to show how some of the old scientific writers often just touched the confines of a modern discovery but failed quite to grasp it, or put away the idea as a fancy. There are two interesting quotations from Bacon ("Novum Organum") in one of which he states his idea of heat as "a mode of motion" in language which might almost pass for that of a modern writer; in another he remarks that a strange doubt sometimes assailed him, as to whether we see the images of the sun and the stars as they are at the moment, or was the impression received really that of an image of some time ago; in other words, did light take time to travel? He was on the very verge of a new truth, but dismisses the idea again. In the same number Mr. Elland Gore gives some account of Houzeau, an eminent Belgian astronomer of the nineteenth century, whose name is little known beyond the world of astronomers; and Mr. S. H. Ditchfield, F.S.A., contributes what will be more immediately interesting to some of our readers—an article on "Brass-rubbing," in which a good deal of information is compressed into a small space.

*International Notes*, a small monthly magazine, which gives short notes of artistic doings in different parts of the world, publishes also a good illustrated essay or lecture on Greek art by an architect, Mr. C. J. Tait, of Exeter; whose name, however, is mis-spelt "Tate."

*Knowledge* contains a paper on "The Sinking of Large Stones through the Action of Worms," by Mr. Charles Davison, well known as a special student and investigator of earth-quake. The present paper is based on some experiments and observations by Darwin and by his son, Mr. Horace Darwin, of which the results are given, with a diagram showing the method whereby provision was made to minutely measure the movements of a stone about 18 in. diameter and 2½ in. thick. The stone was found to be in a continual state of vertical oscillation; sometimes sinking further into the ground, at other times rising again, but we do not see that the movements were specially traced to the influence of worms; they appear to have been more the result of changes of weather. The subject, however, is of considerable interest in any case.

The *Leisure Hour* contains an article by the Rev. James Johnson on "Chained Books in English Churches and Cathedrals," chiefly notes on the present existing examples of this old custom, with illustrations of some of these chained libraries. In the same issue is the first instalment of a series of articles on our light-houses, under the title "The Coastwise Lights of England" (the expression is from a poem by Mr. Kipling), by Miss Gertrude Bacon, popular of course rather than scientific, but which may be of use in giving the general public some in-

formation about this most interesting class of structures, and drawing their attention to the subject.

The *Essex Review* (quarterly) continues the subject of the Dykes of the Thames, their history and present condition, and the work of Vermuyden, the Dutch engineer, in the seventeenth century. The Dutch engineers were brought over here as being experts in the art of keeping the sea off a flat country, and were regarded with a good deal of jealousy in the districts they dealt with in England. The number contains illustrations of old Walton-on-the-Naze Church, and of the quiet unpretending country house called Bradwell Hall, destroyed by fire in 1839.

*Macmillan* includes a short but strong article by Mr. Lewis F. Day on "The New Art," an idea which he truly says is as far from possibility of realisation as the Gothic revival. Regarded as the outlet of youthful restlessness, he thinks, its extravagance may pass; as the serious expression of mature art it lacks coherence, sober sense, and sanity:—

"The theory is, that Nature is enough, that an artist has only to look at her and she will guide him in the right path—but there is absolutely no shadow of a reason why Nature should point out the way of art. In relying wholly upon Nature the artist is no better advised than in trusting altogether to art. The New Art, indeed, cannot be said to breathe the spirit of Nature; but professed allegiance to Nature does not lead always to natural results. It has resulted before now in ornament more suggestive of railway signals than of any natural growth; it has resulted also in the New Art; at least, its votaries take shelter under the name of Nature. And, until now, it has hardly been denied that the artist, study Nature as he may and as he must, is bound to study the methods of art also, aye, and the works of artists before him; or, admirably as he may do, he will fall short of his possible achievement. The sincere artist seeks always the best, not the newest expression of his personality."

The *Church Builder*, the quarterly record of the Incorporated Church Building Society, gives illustrations and description of Mr. Caröe's Church of St. John, High Wycombe, and of the small mission church at Arlesley, near Hitchin, of which Mr. Ryan-Tenison is the architect. From Mr. Micklethwaite's amusing and trenchant "Occasional Notes on Church Furniture and Arrangement," dealing in this issue (Chapier 9) with the subject of "Cheap Churches," we quote the following, which is sadly too true:—

"As a rule, the only thing about the plan which the committee concern themselves much with is the number of the 'sittings,' and everything which does not contribute to that is cut down to the utmost. Then it comes to building. But to carry out substantially anything like what appears on the show drawings would cost a good deal more than the sum which may be spent. Some semblance to the drawings must, however, be kept, so the walls are made of the thinnest and the roofs the slightest which will pass muster with the several authorities whose sanction has to be obtained. The materials are of the poorest. The foundations are shallow, and such furniture as there is of the meanest. But there is a profusion of trumpery Bath stone trimmings, and perhaps a lean steeple besides.

When it is new and redolent of varnish the committee are satisfied. It all seems very smart in their eyes, and they think their money well spent. A few years of use show them its inconvenience, and a few more unpleasantly force upon their attention that superficial smartness is not a good wearing quality. The building begins to fail for lack of the substance which has been squeezed out of it to pay for the show. Large sums have to be spent on its repairs, and in half a century it may be quite worn out."

#### SANITARY INSPECTORS' ASSOCIATION.

The annual general meeting of this Association was held at the Carpenters' Hall, London Wall, on Saturday evening, Mr. W. Wilkinson, the new Chairman of the Council, presided, and in his inaugural address congratulated the members on the financial stability of the Association, the capital account showing assets of 3,359l. He thought the Association had entered upon its session's work with more promise than had ever before been the case, because from the highest to the lowest throughout the land there was more appreciation of sanitary work than had ever before been the case. The King had, almost in his first utterance after ascending the throne, sounded a note for the better housing of the poor. The Association represented those who had in their dull routine of work to carry out the drudgery of the sanitary administration, and they, in an

equal degree with others in a more exalted position, shared the desire that there should be a better and happier condition of life for everybody. The sanitary inspectors, along with many other sanitary administrators, voiced the desire that, inasmuch as public health was a national asset, the operations of all sanitary authorities should be controlled by a central body which would be supported from Imperial sources and have as its chief functions the protection of the nation's health. They further contended that, inasmuch as public health was a nation's wealth, that local administrative bodies should be allowed a sufficient period for the repayment of the cost of the work which was necessary to secure that good.

Sir J. Crichton Browne was elected President for the ensuing year, and the Chairman congratulated the members on securing one so eminent and learned for that position.

**STANDARD SECTIONS IN IRON AND STEEL STRUCTURE.**

THE following remarks on this important subject form a portion of the address given to the Institution of Civil Engineers on Tuesday last by their President, Mr. Charles Hawkesley. They are worth the consideration of architects as well as engineers.

Most British civil engineers have probably suffered inconvenience, and their clients not unlikely have sustained loss, owing to the absence in Great Britain of standard sections of iron and steel. For example, when designing a roof or a bridge, the engineer selects from the book of some well-known firm the sections of angle and tee iron best suited to his requirements, the contract for the work is let, and presently the contractor asks if he may be allowed to substitute another section for one of those selected, as that particular section is out of stock, and is either no longer rolled, or the quantity required is too small to induce the maker to put in the rolls to produce it. These difficulties have led to the adoption in Germany and America of standard sections of iron and steel with great advantage to the producer, the middleman (if any) and the buyer. The producer can cheapen the cost of production, because he can roll considerable quantities of any given section at one time, and place in stock any surplus. The middleman (if any) can buy in the cheapest market, and be sure to find an outlet for his purchases; the buyer can feel sure of obtaining the section that he requires from one firm or another with the least amount of delay, and at the least cost.

For some time past the Council of the Institution of Civil Engineers has realised the serious difficulties and disadvantages under which British manufacturers are placed by the lack in this country of some acknowledged standards. Our trade and interests are more far-reaching and world-wide than those of any other country, and this makes the question of standardisation more important, but at the same time more difficult. The Council of the Institution of Civil Engineers therefore approached the Institution of Mechanical Engineers, the Institution of Naval Architects, and the Iron and Steel Institute with a view to taking up this subject, and a strong and influential committee representing these four institutions was formed. The Committee decided in the first instance to call for evidence from all the various industries interested and affected as to whether they were favourable or not to the adoption of standards in the principal various rolled iron and steel sections used in building construction, railways, bridges, &c. The Committee sat for three days in June last, hearing evidence from all parts of the country and from those representing our colonies and dependencies, and the evidence as to the desirability of issuing standard sections and standard specifications was so unanimous, that the Council of this Institution decided to accept the Committee's recommendation and to proceed with the work forthwith. The work of the Committee has been divided into the four sections following:—

Section.	Chairman.
(1) Bridges and general construction .....	Sir Benjamin Baker.
(2) Railway rolling stock under frames .....	Sir Douglas Fox.
(3) Rails .....	Sir John Wolfe Barry.
(4) Ships .....	Mr. Arch. Denny, of Dumbarton.

These four Committees, on which the leading men of their several branches of industry

are associated, are now at work standardising the various sections used in their particular branches of industry.

The evidence before the Committee was interesting as showing the various methods in which the different countries carried out their work. For instance, in America, where the American Society of Civil Engineers has issued standard sections for rails and standard specifications, the rolling-mill makers will, in most cases, only roll to these sections. It transpired that from time to time various enquiries had been sent to America from this country for tenders for large quantities of rails and of other materials that were needed by companies in this country; but in nearly every case the reply was that 'unless you take our standards we regret we do not see our way to quote.' On the other hand, some instructive instances of the waste of time and money that occurs in this country for the want of standard sections were laid before the Committee. Many might be cited, but one instance must suffice. The case in point was a section incorporated in a bridge for one of our colonies. The average cost of the material was \$1.10s. per ton, but one of the sections specified was of such an odd size and the quantity of this size was so small that the section had to be made by a blacksmith at a cost of from 28l. to 30l. per ton. The multiplication of the number of sections is often quite unnecessary, and a striking case of the money that is lost or wasted in this way occurred a short while ago, where certain sections were specified in a bridge. When the contractor endeavoured to obtain these sections, and although they were contained in the price list issued by the makers, the makers themselves had none of the sections in stock, and could not give delivery. The contractor therefore worked out a girder of similar strength, incorporating therein sections which could be readily obtained, and the saving on this item alone was over 600l. Innumerable instances of this kind could be multiplied did the time at my disposal permit of it. It is therefore with a view to lessen the cost of and expedite the carrying out of the works designed by engineers, as well as to enable the British manufacturer to meet the keen competition which is now threatening even our home markets, that the Institution of Civil Engineers has taken in hand this important matter.

It may be interesting to quote what Germany and America have done in the direction of standardising rolled sections.

Germany has sixty-seven various standard sections and America has only forty-nine, whereas Great Britain has no standard sections, and uses over 170 different sections. The need of standards for rails in connexion with electrical traction is being particularly felt. It was recently shown that there were no less than seventy-one different sections of tram rails, many of the municipal engineers designing from their own sections, only slightly differing from those of their neighbours, but having just sufficient difference to cause considerable expense and trouble should their tramway system ever become connected to the neighbouring system. The tramway industry of this country is developing every day, and it is highly desirable that standards should be adopted before the industry begins to suffer more acutely from the want of them.

The American practice is to reduce the numbers of sections as much as possible; but this is, to my mind, travelling too far in the opposite direction. Care must be taken to provide a considerable variety of sections in the first instance, and to provide for adding to them from time to time as occasion may require.

The chief disadvantage of standardisation, it has been urged, is that a fixed set of sections tends to cramp originality of design, and this is not merely a groundless fear, for the American manufacturers have in many instances absolutely refused to roll anything outside their stock patterns. Such a course would, however, doubtless soon provide its own remedy, for if anything was to be gained by the adoption of a new design, a sufficiently high price would probably be offered by the buyer to induce some foreign manufacturer to execute the order if our own countrymen persisted in their refusal to do so.

I feel assured that the action of the Council in this matter will be hailed with satisfaction by the members of this Institution, and more especially by those of our professional brethren who are resident in India or our colonies, and

I hope the time is not far distant when the system of standardisation may be extended to other engineering requirements, as, for instance, to cast-iron pipes, always, however, bearing in mind that engineering designs must not be reduced to the level of the manufacturers' standards, but rather that the standards must be kept abreast of the requirements of the engineer."

**ENGINEERING SOCIETIES.**

**SOCIETY OF ENGINEERS.**—At a meeting of the Society of Engineers held at the Royal United Service Institution, Whitehall, on Monday evening last, Mr. Charles Mason, President, in the chair, a paper was read on "The Main Drainage of Ilford," by Mr. Roger Gaskell Hetherington. The author observed that the first drainage scheme was prepared by the late Mr. Brundell in 1882, when the population was only 7,500. The present scheme has been designed for a population of over 100,000 by Messrs. John Taylor, Sons, & Santo Crimp, and the old system has been incorporated with it. The drainage area is such that one portion of it only can be drained by gravitation. The various lines of sewers and their functions were described, and details of the construction of the main sewers were given. The general screening and pumping arrangements on the low-level sewers were also described. The outfall works, as first constructed, became in time inadequate, and they were greatly enlarged in 1898, and the present system of dealing with the sewage was then started. This method consists of treating the crude sewage with milk of lime and ferrous sulphate and then passing it through settling tanks. From the settling tanks the effluent is taken into coke breeze bacteria beds, and from thence to the river Roding, the sludge left in the tanks being pressed by sludge-pressing machinery. Owing to the works being required to deal with a considerably larger flow than that for which they were designed, the effluent has become unsatisfactory, and other modifications in the works are now being undertaken. The chief of these is the construction of an entirely new outfall to the river Thames. This effluent pipe will discharge into the Thames below the London Northern Outfall at Barking. As this outfall pipe, which is 2 ft. 6 in. in diameter, passes through a large tract of land lying below high-tide level, elaborate precautions have had to be taken to prevent tidal water being admitted to this low-lying land by any failure of the pipe. The scheme as a whole presents some interesting points as regards meeting the ever-recurring problem of treating the sewage of a district with a rapidly increasing population, without discarding the existing system, which was never designed for great enlargement.

**ARCHITECTURAL SOCIETIES.**

**EDINBURGH ARCHITECTURAL ASSOCIATION.**—The annual business meeting of this Association was held in the New Rooms, No. 117, George-street, on Wednesday evening, October 10th, Mr. Henry F. Kerr, President, in the chair. The reports of the Hon. Secretary, Hon. Treasurer, and the Conveners of the various Committees were submitted and approved. The resignation of Mr. Thomas Fairbairn, Hon. Secretary, was intimated on account of his health. Mr. Fairbairn has acted as Hon. Secretary of the Association for the long period of twenty years, and a very warm tribute was paid to him for the splendid service he had rendered the Association during his lengthy term of office, to which Mr. Fairbairn feelingly replied. The most interesting and important business was the formal amalgamation of the Edinburgh Architectural Association with the Edinburgh Architectural Society. The arrangements for the amalgamation were concluded some time ago, but this was the first joint meeting held. Mr. Henry F. Kerr was re-elected President for the coming session with the following other office-bearers:—Vice-Presidents, Mr. A. Hunter Crawford and Mr. A. Lorne Campbell; Hon. Secretaries, Mr. William M. Page and Mr. Colin B. Cowrie; Hon. Treasurer, Mr. John Johnston; Hon. Librarian, Mr. John Watson; Committee of Management, Messrs. James Bruce, W.S.; Thomas Ross, F.S.A. (Scot.); George Henderson, Hay Lamont, Alfred Greig, and A. F. Balfour Paul. The Amalgamated Association now comprises

Fellows, Members, and Associates. The Associates' section is to have a series of meetings and papers of its own, and has appointed the following office-bearers:—Chairman, Mr. J. Stuart Syme; Vice-Chairman, Mr. J. F. Matthew; Hon. Secretary, Mr. J. McIntyre; Committee, Messrs. J. Sidey, D. Davidson, Hay Lamont, J. Jerdan, B. S. Murphy, and J. A. Arnot. On Monday evening last the formal opening of the rooms took place, when the President and office-bearers held a reception, at which about 250 ladies and gentlemen attended. Sir George Reid, President of the Royal Scottish Academy, declared the rooms open, and Bailie W. S. Brown, as representing the city, and Professor Baldwin Brown, as representing the University, addressed the gathering.

**ARCHITECTURAL ASSOCIATION OF IRELAND.**—An Exhibition of Drawings, prepared by members of the Association, has recently been held in the rooms of the Royal Institute of the Architects of Ireland, by the kind permission of the President and Council of that body. The drawings consisted of the competitive works of members for the various prizes offered during the past session. Among these were nine large sheets of accurately-measured drawings of St. Patrick's Cathedral, Dublin, executed by Mr. T. A. Rockett, who has earned the prize—the Association Travelling Studentship—in competition for which they were prepared. Another set of measured drawings were shown of Mellifont Abbey, by Mr. A. C. Scott, of Drogheda. Seven sets of drawings were shown which had been prepared in competition for the prize offered by the Royal Institute of the Architects of Ireland for the best design for a Technical School. The prize was awarded to the drawings by Mr. Charles Powell. Three sketches of the Campanile in the Quadrangle at Trinity College were on view, one by Mr. L. O'Callaghan taking the Beckett Prize. The class drawings which were exhibited demonstrated the fact that real hard work is done by the members, and that the object for which the Architectural Association of Ireland was founded is being very well kept in view—that is, of providing a school wherein the younger members of the profession in Ireland may acquire knowledge of design and draughtsmanship.

#### THE LONDON COUNTY COUNCIL.

The ordinary weekly meeting of the London County Council was held on Tuesday, in the County Hall, Spring-gardens, Mr. A. M. Torrance, Chairman, presiding.

**Loans.**—On the recommendation of the Finance Committee, it was agreed to lend Poplar Borough Council 7,000*l.* for electric lighting; Woolwich Borough Council, 1,910*l.* for street improvement; Stepney Borough Council, 2,050*l.* for similar purposes; and Stepney Borough Council, 10,000*l.* for electric lighting.

**London Water Supply.**—The Water Committee recommended as follows:—

(a) That a Bill be promoted by the Council in the Session of 1902 for the purchase by the Council of the undertakings of the eight Metropolitan water companies, the Bill to be on similar lines to that of last Session.

(b) That it be referred to the Parliamentary Committee to prepare and submit to the Council the necessary Bill for carrying out the above recommendation; and also to prepare and submit the necessary Water (Finance) Bill.

After a long discussion the recommendations were agreed to.

**Improvement.**—It was agreed to contribute 1,487*l.* towards the cost of widening Harestreet, Woolwich, at Nos. 1 to 37.

**Tenders.**—The following recommendations of the Parks and Open Spaces Committee were agreed to:—

"That the gravel and hardcore required for the formation of the new cycle track at Parliament Hill be obtained from Mr. H. Barnaby, at a cost of 7*8*. 9*d.* a yard for gravel and 5*8*. a load for hardcore.

That the offer of Mr. H. Clarkson, to supply and cart to the Victoria Embankment the soil required for the tree-plant at 5*8*. a load, and for carting away the old soil at 5*8*. a load, be accepted."

The Bridges Committee recommended, and it was agreed:—

"That the supplemental estimate of 1,355*l.* submitted by the Finance Committee in respect of electrical lifts, fans, pumps, wiring, lamps, and fittings at Greenwich tunnel be approved; that the amended tender of Messrs. Easton & Co., amounting to 7,334*l.* 2*8*., be accepted."

The Highways Committee recommended, and it was agreed:—

"That, subject to the result of the usual inquiries proving satisfactory, the tenders of Messrs. Walter Scott, Ltd., be accepted, for the supply, (A) for the sum of 25,412*l.*, of the track-rails and fastenings; and, (B) for the sum of 25,334*l.*, of the slot-rails, conductor-tees, and fastenings required in connexion with the reconstruction, for electrical traction, of the London County Council Tramways, between (a) Westminster Bridge and Tooting, (b) Blackfriars-road and Kennington, and (c) Waterloo-road and St. George's-circus.

That Messrs. Walter Scott, Ltd., be allowed to sub-let to the Helicoid Lock-nut Co., of Acton, the supply of the bolts and nuts under contracts (A) and (B), and to another sub-contractor, to be approved by the Engineer (Mr. Kennedy), the supply of the tie-bars under contract (B), and also, under contract (A), to employ the Coghlan Steel Co., of Hunstet, to roll the fish-plates and other small work, for which Messrs. Scott will themselves manufacture the metal.

That, subject to the result of the usual inquiries proving satisfactory, the tender of Messrs. J. G. White & Co. be accepted for the execution, for the sum of 171,445*l.*, of the roadwork and plating required in connexion with the reconstruction, for electrical traction, of the London County Council Tramways between (a) Westminster Bridge and Tooting, (b) Blackfriars-road and Kennington, and (c) Waterloo-road and St. George's-circus.

That Messrs. J. G. White & Co. be allowed to sub-let to Messrs. W. Griffiths & Co. the roadwork, and to the Lorain Steel Co., of Ohio, U.S.A., the special work (namely, points and crossings)."

**Railways and Relieving.**—On the motion of Sir J. Dickson-Poynder, it was resolved:—"That, in the opinion of the Council, it is desirable that in all cases when railway companies seek powers from Parliament necessitating schemes for rehousing persons displaced, the companies should, in lieu of being bound to undertake the work themselves, pay to the Council the equivalent in money of the cost of carrying out such schemes, the execution of the work being left to the Council, to be dealt with in such manner as they may think best, and that the Railway Commissioners should be constituted by Parliament capable of determining the amount to be paid in each case; and that it be referred to the Parliamentary Committee to consider and report in what manner the matter can be brought to the notice of his Majesty's Government."

Other matters were disposed of, and the Council adjourned.

#### APPLICATIONS UNDER THE 1894 LONDON BUILDING ACT.

The London County Council on Tuesday dealt with the following applications under the London Building Act, 1894. Unless otherwise stated, consent was given on conditions. The names of applicants are given between parentheses:—

##### Lines of Frontage and Projections.

**Bermundsey.**—A building, to be used as a girls' school, on the north side of New Kent-road, Southwark, next Buckenham-square (Mr. W. C. Jones for the Governors of St. Saviour's and St. Olave's Foundation).—Consent.

**Clapham.**—A one-story shop commenced to be erected on the forecourt of No. 650, Wandsworth-road, Clapham, abutting upon Queen's-road (Mr. R. E. Smith for Mr. M. Jones).—Consent.

**Hampstead.**—A one-story bay window in front of a house in course of erection on the north side of Elsworth-road, Hampstead, to be known as "Shepherds' Well" (Mr. A. F. Faulkner for Mr. W. Willett).—Consent.

**Hampstead.**—The erection of a brick, wood, and tile porch to a house in course of erection on the north side of Elsworth-road, Hampstead, to be known as "The Warren" (Mr. A. F. Faulkner for Mr. W. Willett).—Consent.

**Hampstead.**—A one-story bay-window in front of a building in course of erection on the north side of Elsworth-road, Hampstead, to be known as "The Warren" (Mr. A. F. Faulkner for Mr. W. Willett).—Consent.

**Kensington, South.**—A stone hood over the entrance to No. 31, Kensington Gore, Kensington (Mr. A. O. Collard for Sir John Hutcheon).—Consent.

**Lewisham.**—Balconies over the entrances to fifteen houses to be erected on the west side of Lawrie Park-road, Sydenham (Mr. E. Tompkins).—Consent.

**Lewisham.**—A one-story shop on part of the forecourt of No. 262, Brockley-road, Lewisham (Mr. J. H. Waterworth for Mrs. M. A. C. Beacock).—Consent.

**St. George, Hanover-square.**—An iron and glass shelter at the entrance to No. 15, Wilton-road, Pimlico (Mr. C. Gerli).—Refused.

**Strand.**—An iron and glass shelter over the entrance to the Villa-Villa Restaurant, Nos. 37 and 38, Gerrard-street, Soho (Mr. R. H. Kerr for Mr. Tarvin).—Refused.

**Wandsworth.**—A wooden porch at the entrance to No. 1, Rodway-road, Roehampton (Mr. J. Harvey for Miss P. Higgins).—Refused.

**Westminster.**—A one-story shop in front of No. 133, Victoria-street, Westminster (Messrs. Bull & Esdaile for Messrs. Symons & Co., Ltd.).—Refused.

##### Width of Way.

**Wandsworth.**—Stable buildings at the Tooting Bee Asylum on the west side of Church-lane, Tooting (Messrs. A. & C. Harston for the Metropolitan Asylums Board).—Consent.

**St. Pancras, East.**—Two cottages at the rear of Nos. 18 and 20, Jeffrey-street, Kenish Town-road (Mr. T. B. Westacott).—Refused.

**Islington, West.**—A stable building at the rear of Nos. 42, 44, and 46, George's-road, Holloway, with the external walls at less than the prescribed distance from the centre of George-street-west (Mr. S. Allen).—Refused.

##### Lines of Frontage and Width of Way.

**Clapham.**—That the application of Mrs. R. S. Gray for an extension of the period within which the erection of eleven houses with bay-windows on the east side of Loats-road, and seven houses with bay-windows on the west side of Lyham-road, Clapham, was required to be commenced, be granted.—Agreed.

##### Width of Way and Space at Rear.

**Hackney, South.**—Three-story dwelling-houses and a boat-house on the south-west side of Middlesex-wharf, Lee Bridge-road, Hackney (Messrs. J. G. & H. G. Needham for Mr. T. Marvel).—Consent.

##### Lines of Frontage and Construction.

**Hammersmith.**—A coal transporter on the West Middlesex Waterworks Company's land on the north and south sides of Upper Mall, Hammersmith, and extending over such street (Mr. M. W. Hervey for the West Middlesex Waterworks Company).—Consent.

**Hampstead.**—The retention of a brick fodder store and a wood and brick tool-shed at Cranbrook-stables, Nutley-terrace, Hampstead (Messrs. White & Page for Mr. J. Duveen).—Refused.

##### Formation of Streets.

**Clapham.**—That an order be issued to Mr. C. G. St. John, sanctioning the formation or laying-out of a new street for carriage traffic, to lead from Navy-street to Voltaire-street, Clapham. That the name Army-street be approved for the new street.—Agreed.

**Poplar.**—That an order be issued to Mr. H. Hooper, refusing to sanction the formation or laying out of new streets for carriage traffic out of East Ferry-road, Millwall (for Lady Margaret Charteris).—Agreed.

##### Means of Escape from Top of High Buildings.

**Holborn.**—Means of escape in case of fire, proposed to be provided on the top story of the front portion of a building on the site of Nos. 120, 122 and 124, Southampton-row, Bloomsbury, for the persons dwelling or employed therein (Mr. P. E. Pilditch for Mr. A. E. Parker).—Refused.

##### Height of Buildings.

**City.**—A block of offices on the western side of Lloyds-avenue, Fenchurch-street, City (Messrs. Davis & Emmanuel for Lloyds-avenue Estate Co.).—Consent.

##### Deviations from Certified Plans.

**City.**—Deviations from the plans certified by the District Surveyor, under Section 43 of the Act, so far as relates to the proposed rebuilding of the Hoop and Grapes public-house, No. 14, Widgeate-street, City, and the erection of a warehouse building on the site of Nos. 2 and 3, Sands-row (Mr. W. M. Bratton for Mr. Evans).—Consent.

The recommendation, marked † is contrary to the views of the Local Authority.

**METROPOLITAN ASYLUMS BOARD.**—The fortnightly meeting of this Board was held on Saturday, Mr. Benson presiding. The Works Committee was authorised to obtain tenders upon a specification to be prepared by the Engineer to the Board for removing the wires from the conduits and rewiring the head office building where necessary on the surface. The tender of Messrs. Chas. P. Kinnell & Co., Ltd., of Southwark-street, was accepted in 70*l.* for carrying out certain additional beating works at Rochester House, in accordance with the plans and specifications prepared by the Engineer to the Board.

**PENNINGTON CHURCH, MANCHESTER.**—A three-light window and tracery in this church has been filled with painted glass. The subject chosen is "Faith, Hope, and Charity." The bases and canopies are treated in the Early Perpendicular style, and the tracery is filled with angels in adoration. The work has been carried out by Mr. H. A. Hyemers, of Chelsea.

## Correspondence.

To the Editor of THE BUILDER.

COMPENSATION FOR DISTURBANCE  
BY BUILDING OPERATIONS.

SIR.—A Municipal Corporation proceed, by contractors, to pull down buildings acquired under parliamentary powers for street improvement in an important thoroughfare. In so doing a tenant under lease in adjoining premises has suffered considerable inconvenience and loss by interruption of his business consequent upon accumulations of old materials, dust, noise, and other disturbances, which to some extent could have been avoided had the authorities taken the requisite precautions.

The exposure of and damage to the party wall has destroyed the comfort of some of the rooms, and fear as to its safety at one time caused the occupants to vacate the premises.

If any reader would state his experience or give reference to any records or reports showing what compensation a tenant or landlord may be entitled to for such disturbance, he would oblige an old reader and, no doubt, many others who may be liable to the same kind of injury. CITIZEN.

## GAS AND GAS FITTINGS.

19.—OFFICIAL GAS EXAMINERS AND THEIR WORK. HOW GAS IS TESTED FOR ILLUMINATING POWER AND PURITY.

OFFICIAL GAS EXAMINERS.—Competition in the supply of illuminating gas is no longer permitted in any part of the United Kingdom because the nuisance created by the incessant tearing up of the public roads by rival companies was found to be intolerable. The operations of one gas company in each district in addition to those of the water company, the electricity supply company, the telegraph authorities, the tramway and railway engineers, and the road repairers, already cause too frequent disorganisation of the traffic in many of the main thoroughfares. The country is therefore divided into districts, each of which is served with illuminating gas by only one company or local authority. Quite recently power has been given to the Mond Gas Co. to distribute cheap low grade gas for heating and power purposes in certain Staffordshire districts already supplied with illuminating gas, but this is a departure from the policy adopted by Parliament during the last half century.

The operations of each gas company are conducted under powers and conditions specified in certain Acts of Parliament, each company having its own special Act or Acts relating to the laying of pipes, the opening of streets, and the standard price, illuminating power, and purity of the gas to be supplied. Many of the smaller companies are controlled by the Gas Works Clause Act of 1871, which stipulates that a place for testing the gas, and the necessary apparatus, shall be provided and maintained by the gas company, and that the official gas examiner appointed by the Local Authority shall have access to such testing place within certain specified hours. Where no such gas examiner is appointed by the Local Authority, two Justices may, upon the application of not less than five consumers, appoint a competent and impartial examiner to test the illuminating power and purity of the gas. The standard illuminating power of the

gas supplied from small works in England is usually 14 or 15 candles, and the gas is required to be purified from sulphuretted hydrogen only.

In large towns a much more elaborate system of testing is commonly adopted, and a more rigorous purification of the gas is required. In London there are twenty testing stations well distributed over the area under the jurisdiction of the London County Council, in which the gas is tested every day for purity and illuminating power by examiners appointed by the Council. Within the City boundaries three additional testing stations are provided, in which the gas is similarly tested by examiners appointed by the Corporation of London. The County Council and the Corporation, moreover, each retain the services of an eminent chemist to act as superintending gas examiner and to advise on all matters relating to the public gas supply. The situation and number of the testing stations to be maintained by the gas companies, and the methods of testing to be adopted by the examiners, are prescribed by three gas referees appointed by the Board of Trade. A chief gas examiner who acts as arbitrator when a gas company appeals against the report of any of the gas examiners, and whose decision is final, is also appointed by the Board of Trade. The present chief gas examiner is Lord Rayleigh, F.R.S., and all of the gas referees are also Fellows of the Royal Society. The Act stipulates that one at least of the referees shall have "practical knowledge and experience in the manufacture and supply of gas," but owing no doubt to the able manner in which the scientific men have carried out the duties of the office no practical gas engineer has been appointed as a referee for many years.

At present the Acts of Parliament which control the operations of the metropolitan gas companies regulate only the pressure, the illuminating power, and the purity of the gas from sulphuretted hydrogen, other sulphur compounds, and ammonia; but in view of the increasing use of materials other than coal for the manufacture of gas, it appears probable that Parliament will presently be requested by the Local authorities, on behalf of the consumers, to fix a minimum standard for heating power, and a maximum standard for the proportion of carbon monoxide, and that the gas examiners will be called upon to include determinations of these in their daily tests. Already a Home Office Committee has recommended that wherever water-gas is mixed with coal-gas for public supply, a limit for carbon monoxide be fixed, and the London County Council has granted a sum of money for the purpose of making a series of estimations of the proportion of this poisonous constituent in the gas supplied in different parts of the metropolis.

In the Mond Gas Company's Act of 1901, which relates only to gas for heating and power purposes, standards have been fixed for heating value and for carbon monoxide, and provision has been made for the gas supplied to be tested by gas examiners appointed by the Local Authorities.

**Illuminating Power.**—It is beyond the scope of the present series of articles to discuss in detail the various methods of measuring the intensity of the light emitted from gas flames and other light sources. For detailed information reference should be made to Dibdin's "Practical Photometry," or Butterfield's "Chemistry of Gas Manufacture"; but a brief general outline may be given of the official methods of testing.

The illuminating power of gas in this country is expressed in "candles," a standard candle being the light emitted by a sperm candle (six to the pound) when consuming sperm at a rate of 120 grains per hour. The intensity of the light thrown upon an object by a light-emitting surface varies inversely as the square of the distance of the object from that light-emitting surface. Thus a flame which will throw a light of 16 candle-power upon an object 1 ft. distant, will throw a light of only 4 candle-power upon an object 2 ft. distant.

**The Bar Photometer.**—In the old method of gas testing (fig. 49) which is still employed in many districts, the measurement of light is made by burning two standard candles (A) at one end of a graduated horizontal bar (C) while the Argand burner (B), in which the gas is tested when burning at a rate of 5 cubic feet per hour, is fitted at the opposite end of the bar. The distance between the centre of the gas flame and the candle flames is exactly 60 in., and plumb lines are

fitted at each end of the bar to enable the photometrist to see that the flames are vertical and the correct distance apart. A greased paper disc, having a circular spot in the centre which is left ungreased, is fitted in the disc-holder (D), which is mounted on wheels and can be moved along the bar either towards the gas flame or towards the candles. The greased and ungreased portions of the disc have a different degree of translucency, and if the light thrown upon one side of the disc is more powerful than that thrown upon the opposite side, one side of the disc is at once seen to be illuminated to a greater or less degree than the other side. When the gas is being tested the disc is moved towards the candles or towards the gas flame until the disc is seen to be equally illuminated upon both sides, and it is then known that the disc is receiving an equal amount of light from the two candles as from the gas flame.

Attached to the disc-holder is a pointer which moves in front of the graduated scale on the bar as the disc is moved, and as the bar is graduated to indicate candles (thus obviating the necessity of measuring the relative distances of the gas flame and the candles from the disc) the candle-power of the gas flame may be obtained by observing the figure on the scale indicated by the pointer, and multiplying this figure by two, because two candles are used as the source of comparison. Thus, if the pointer be opposite the figure 8 when the disc is equally illuminated on both sides the illuminating power of the gas flame is 16 candles; or if opposite the figure 7, the illuminating power is 14 candles. As a standard candle is defined as a sperm candle burning sperm at a rate of 120 grains per hour, it is always necessary to ascertain the rate of sperm consumption during each test. This determination is made by employing a balance as the candle-holder (fig. 49), and by means of the standard stop-clock (F) observing the time taken by the two candles to lose exactly 40 gr. in weight. The time should be exactly ten minutes, and when the rate of sperm consumption is above or below the specified amount a correction must be made by calculation. The balance-governor (G) is provided to prevent any fluctuations in the rate of gas consumption during the test, and the King's gauge (H) is a sensitive pressure-gauge, which can be used to ascertain the pressure of the gas as it issues from the burner, or at the inlet or outlet of the meter. As the volume of gas varies with the temperature and pressure under which it is measured, it is usual to correct the volume of gas recorded by the meter to the standard temperature of 60 deg. Fahr. and standard pressure of 30 in. of mercury.

**The Table Photometer.**—Within the last five years the bar photometers at the London testing stations have been replaced by table photometers. In the table photometer devised and prescribed for use in the official testing stations by the Gas Referees candles have been replaced as a standard of light by A. G. Vernon Harcourt's Pentane Lamp (fig. 50).

Pentane is a highly-inflammable liquid obtained by distillation from American petroleum. The saturator (A) of the lamp is partly filled with liquid pentane, and is connected by indiarubber tube to the burner (B). When allowed free contact with air pentane rapidly vaporises, but the mixture of air and vapour being heavier than air, it sinks by its own gravity down the rubber tube and can be ignited at the burner. The rate of flow, and consequently the height of the flame, can be regulated by the cock S<sub>1</sub>, or by checking the ingress of air by the cock S<sub>2</sub>, or by lowering the damper (D).

The height of the flame is adjusted so that its tip is about half-way between the bottom of a mica window and a cross-bar provided at the back of the lamp. The metal chimney (C) is fixed at such a height above the steatite burner that it leaves a portion of the flame exposed, which emits a light of exactly ten candle-power. The portion of the flame not concealed by the metal chimney is partly surrounded by the metal shield (E), which does not, however, cut off any of the light from the exposed flame, which is thrown towards the photoped.

The table photometer used in the London testing-stations is shown in plan in fig. 51. Instead of burning the gas to be tested at a rate of 5 cubic ft. per hour, the flame of the Argand burner is adjusted until it emits a light of exactly sixteen candles; the rate of gas consumption required to obtain this intensity of

Fig. 49.—Ear Photometer with Standard Candles.

Fig. 50.—10-Candle Pentane Lamp.

Fig. 51.—Table Photometer with Pentane Standard Lamp as Used in London Testing Stations.

light is then recorded, and a calculation is made to ascertain the proportional intensity of light which would be obtained with a rate of consumption of exactly 5 cubic ft. per hour.

Instead of a greased disc being used to ascertain when the intensity of the light thrown by the gas flame and by the pentane flame upon a given spot is identical, a piece of white unglazed paper clamped in the photoped is used, and the gas flame is adjusted until the photoped paper is seen to be uniformly illuminated. The distances of the 10 c.p. lamp and the gas flame are so fixed that when the gas flame has an illuminating power of sixteen candles the intensity of the light thrown upon the photoped from the two sources shall be equal.

The photometer is used in a dark room, and suitable black screens are provided to prevent extraneous light interfering with the light thrown upon the photoped. Screen No. 1 (fig. 51) has orifices which allow the light from the burners to pass to the photoped without interference. The mirrors are provided merely to facilitate adjustment of the pentane flame and to throw light upon the gas-regulating tap.

**Pressure.**—The pressure under which the gas is supplied is ascertained by means of a water-gauge. From time to time tests are made in the street lanterns by the gas examiners, the burner and governor being removed and the pressure-gauge screwed in its place. One-tenth of an inch is deducted from the observed pressure in order to allow for the difference in height between the gas lamp and the gas main. The minimum pressure permitted in London between midnight and sunset is equal to a column of six-tenths of an inch of water, and between sunset and midnight to a 1-in. column of water.

**Sulphuretted Hydrogen.**—The gas is required to be completely purified from sulphuretted hydrogen, the company being liable to a heavy penalty for every day on which this impurity is detected in the gas distributed to consumers. The test for sulphuretted hydrogen consists in allowing 10 cubic ft. of gas to flow at a rate of about 0.6 cubic ft. per hour through an apparatus in which are suspended slips of white bibulous paper impregnated with acetate of lead. The presence of even a minute proportion of sulphuretted hydrogen in the gas causes a brown or black stain to appear on each of the slips.

**Sulphur Compounds other than Sulphuretted Hydrogen.**—In London the gas must not contain more than 17 gr. of sulphur per 100 cubic feet of gas between April 1 and September 30 in each year, nor more than 22 gr. in other months. To estimate the quantity of sulphur 10 cubic ft. of the gas to be tested are burned in a small Bunsen burner at a slow rate in an atmosphere impregnated with ammonia evolved from lumps of ammonium sesqui-carbonate. The products of combustion are led into a condensing-cylinder where the water vapour produced by combustion of the hydrogen and hydrocarbons in the gas is condensed, and the condensed water holds the sulphur compounds, which are oxidised during combustion, and which enter into combination with the ammonia, in solution. When 10 cubic ft. of gas have been consumed the gas is automatically shut off, and the quantity of sulphur in the condensed liquid is subsequently estimated by chemical analysis.

**Ammonia.**—The proportion of ammonia in the gas must not, in London, exceed 4 gr. per 100 cubic ft. of gas. The quantity of ammonia present is found by allowing 10 cubic ft. of the gas to pass at a slow rate through a glass cylinder containing glass beads, moistened with 50 septems of dilute sulphuric acid of a known strength. The acid combines with the ammonia present in the gas to form sulphate of ammonia, and by estimating the quantity of uncombined acid remaining in the cylinder after 10 cubic ft. of gas have passed through it, the quantity of acid neutralised by the ammonia, and consequently the quantity of ammonia present in the gas, is obtained.

More detailed information relating to the chemical examination of gas cannot be given in these columns, but the "Notification of the Gas Referees," containing the official instructions given to the London gas examiners with regard to the tests for illuminating power, purity, and pressure, may be obtained from Messrs. Eyre & Spottiswoode.

#### GENERAL BUILDING NEWS.

**NEW CHAPEL AT BLAIRS COLLEGE, ABERDEEN.**—The new chapel at St. Mary's College, Blair, which forms a section of the scheme of building extension which has been in progress there for several years, was opened on the 23rd ult. The chapel is not yet absolutely finished as a building, an addition yet to be made being a spire, the erection of which is to be proceeded with at once. The chapel is the gift of Mgr. James Lennon, Liverpool, and when completed will have cost close upon 12,000l. It is the design of Mr. Robert Curran, architect, Warrington, and is in the style of the middle period of Gothic architecture. Several features meet the eye of the worshipper inside the chapel; for instance, the richly-carved oak and pitch-pine woodwork, the stained-glass windows in the western gable behind the altar, and the altar. The altar, the work of Messrs. Pearse & Sons, Dublin, is specially worthy of notice. The front is of white Carrara marble, the outstanding feature of the main centre panel being a representation in high relief of Leonardo da Vinci's conception of "The Last Supper." The panels in the octagonal wall behind the altar will in course of time be filled in by a reredos. A set of Stations of the Cross in oak frames—fourteen pieces in all—is the work of Messrs. Mayers & Co., of Munich and London.

**STEEPLE, FOOT'S CRAY CHURCH, KENT.**—A new steeple has just been added to the parish church of Foot's Cray, Kent. The work of construction was entrusted to Messrs. Stebbings & Pannett, of Foot's Cray and Sidcup, and they have carried out the designs of Mr. Boucher, of the firm of Drake & Boucher, architects, Rochester. Advantage was also taken of the occasion to have the peal of five bells returned by Messrs. Gillett & Johnson, of Croydon, and rebung in the steeple.

**EMMANUEL CHURCH, NOTTINGHAM.**—The completion of Emmanuel Church, Woodborough-road, Nottingham, was commemorated on the 24th ult. by the new baptistry, clergy and choir vestries, which for some time past have been under construction, were dedicated. The additions are at the west end of the church, extending up to the western boundary of the site, and consist of a baptistry, 18 ft. by 23 ft.; a choir vestry, 15 ft. by 27 ft.; and a clergy vestry, 12 ft. by 13 ft. The baptistry gives accommodation for thirty-eight additional seats. The interior walls of this part and of the entrances are faced with red Bulwail bricks, with blue brick in patterns to correspond with the rest of the church interior. The dado consists of the evangelistic symbols and heads of the great apostles to the Jews and to the Gentiles, carried out in glass mosaic, arranged in panels. This dado has also been carried throughout the aisles and transepts of the church. The ornamental stencil work of the

baptistry ceiling has not yet been completed, but the exterior is carried out in a similar manner to the rest of the church, Coxcomb rock-faced stone being used for the walling, and Hollington stone for most of the carvings. The roof at the position of the baptistry are emphasised on the exterior by a metal cresting and foliated cross. Red tiles are used for roofing. The porch has timber gable work, and when completed will have two sculptured figures of apostles, one on each side, in niches. The works have been carried out from the designs and under the superintendence of Mr. Watson Fothergill by Messrs. Williamson & Co.—*Nottingham Guardian.*

**ST. COLUMBA CHURCH, GLASGOW.**—St. Columba Church, plans for which have just passed the Dean of Guild Court, is of considerable interest to the Highland community of Glasgow as being the only church in the city in connexion with the Church of Scotland in which the services are held in Gaelic. The new church is composed of nave and transepts, and accommodates close upon 1,100 sitters. There are galleries in the transepts, and a gallery at the end of the nave. The other accommodation includes a hall to accommodate 350, a smaller hall for 120, session-house, vestry, choir vestry, ladies' room, and kitchen. A church officer's house is also provided. The organ is divided, and placed in arched chambers on each side of the chancel, while the pulpit is placed on the one side of the nave, outside the chancel. A spire, rising to a height of 200 ft., forms a conspicuous feature, the spire having pinnacles and belfry stage for bell, and with niche and canopy in which is placed a statue of the patron saint, St. Columba. The architects are Messrs. William Tennant and Fred V. Barke, and the building will cost about 15,000l.

**CHURCH, CLEVELAND, YORKSHIRE.**—On the 30th ult. the Right Rev. F. R. Blunt, D.D., Bishop of Hull, consecrated a new church at Carlin How, in the parish of Brotton-in-Cleveland. The church, which contains seating accommodation for 340 worshippers, has cost between 2,000l. and 2,500l. The contract was carried out by Messrs. Cruddas & Sons, Guisborough. The church, which has been built from designs supplied by Messrs. Hicks & Charlewood, architects, Newcastle, is of red bricks, with terra-cotta facings. It has a single aisle running from the main entrance to the chancel, and is flanked on either side by bays, the arches leading to the transepts being supported on brick pillars. An organ-chamber and vestry have been constructed on the north side of the chancel.

**CHURCH OF ALL HALLOWS, EASTON, BRISTOL.**—The new Church of All Hallows, Easton (in connexion with All Saints', Bristol), was consecrated recently. The scheme provides for a building capable of accommodating 800 worshippers, but this has not yet been completed, the work accomplished including choir, sanctuary, north and south transepts, chapel, and three bays of the nave and aisles. The walls are faced externally and internally with red Pennant stone, Bath stone being used for the dressings, and an open timbered roof has been provided. The chief feature of the church is the apsidal termination of east end, which has an ambulatory around it. The choir and sanctuary are large and lofty, the apparent height being increased by the lofty arcades between the choir and the transepts. There is a fine altar, but the choir stalls have not yet been executed, and the pulpit is a temporary one. The contractors for the building are Messrs. R. Wilkins & Son, and the architects are Messrs. Crisp & Oatley, of Bristol.

**CENTRAL TECHNICAL SCHOOL, LIVERPOOL.**—The new Central Technical School and Museum, which was recently opened by the Duke of Devonshire, was designed by Mr. E. W. Mountford, of London, and the contractor for the buildings were Messrs. Joshua Henshaw & Sons, of Liverpool. The site comprises 2,900 square yards, and the height of the elevation to Byrom-street is 84 ft. The basement, ground floor, and first floor are occupied by the offices, lecture-halls, and classrooms of the technical school. The two upper floors are museum galleries, and the effect of this extension is to enlarge the museum to three times its former size. The chemical department of the technical school is, however, placed at the top of the buildings in a cross gallery specially designed for the purpose. It comprises a spacious laboratory. On the top of the building also is an observatory, fitted with an equatorial telescope and transit instruments for the use of the Nautical College. The building is constructed of Darley Dale sandstone. A concrete of finer and softer quality, is used for the bases and capitals of the pillars of the interior. This stone was quarried at Grantham, Lincolnshire. The steps and landing are of fine-grained Shepley flags, obtained near Huddersfield. The main entrance from Byrom-street conducts to a vestibule and hall, paved with white and grey marble, and decorated with pillars of Doric and Ionic style from Torquay. The key marble used for the panelling of the walls is from the Ashford Quarries, Derbyshire. Irish red marble, from Cork, has been used for the fireplace, above which is a sculptured panel of alabaster from Uttoxeter, the design being adapted from the armorial bearings of the Liverpool Corporation. The wood used for the lofty panels in the lecture-hall and throughout the building is Canadian white-wood. Oak has been used for the doors and panels in the hall and corridors, and pitch pine for the floorings. Messrs.

Paterson & Son carried out the structural woodwork. The woodwork fittings were executed by Messrs. Brown & Backhouse. The general and fibrous plaster-work was entrusted to Messrs. J. Turner & Son, and was carried out under the direction of Mr. Arthur Chute. In the entrance-hall and lecture-hall are reliefs by Mr. Pomeroy, of London, illustrating the development of shipbuilding and technical crafts. These were coloured by Mr. R. Anning Bell. The exterior sculptures are also by Mr. Pomeroy. These over the main entrance represent Art holding up a mirror to Nature, and Science veiled, holding a crucible. The groups in the pediments facing William Brown-street represent respectively Minerva (typifying the wisdom of the city) presiding over the education of the community, and Liverpool (a figure holding a globe and sceptre), supported by figures typical of its commerce and industries. Sculptured figures on the pediments of the arches represent Astronomy, Navigation, Geography, and Agriculture. The wrought-iron gates at the front entrance are by Messrs. Singers, of Frome; those at the entrance to the area in William Brown-street by the Bromsgrove Guild of Arts and Crafts; the iron railings and gates in Clayton-street by Vorrall, of Liverpool; and those in the archways leading to the interior courtyard by Messrs. Ramsden & Carr, of Battersea. The standards for the electric lamps on the balustrade at the Byrom-street entrance were modelled by Mr. Pomeroy, and cast in bronze by Messrs. Singers. The electrolites in the entrance-hall, as well as the firegrates in wrought-iron and brass in the vestibule and committee-room, are by Mr. Nelson Dawson, of London. The heating and ventilation of the building has been carried out on the Plenum system by Mr. W. Key, of Glasgow. The electric lighting and power equipment was carried out by the Corporation electric lighting department. The equipment of the mechanical and electrical engineering laboratories is by Messrs. Sloan & Lloyd Barnes. The building was illustrated in the *Builder* for August 8, 1896, and January 2, 1897.

**NEW ALTARS, PARISH CHURCH, CARNDONAGH, IRELAND.**—The church of the Sacred Heart, in Carnndonagh, has recently been supplied with three new altars. In the high altar, which stands 5 ft. above the ground-floor, the body is supported on double ebony pillars with central annulets and turned caps and bases. The centrepiece consists of three Romanesque arches, with walnut tablets of "I.H.S." inserted. The return ends of the altar have five Gothic arches, with Scotia mouldings around each. Underneath are five squares with chamfered mouldings at the bottom. On each end of the return stand two canopies, with Gothic arches, supporting a spire and having four urns, all with crocket facings, with the central one carried on top. At each side of the small canopy is a double reredos with four large buttresses of polished oak and six ebouised pillars between three Gothic arches, having carved crockets on top. In the centre is a tabernacle, with brass safe, having two ebouised columns in front, on which stands a canopy supported by four similar pillars of the same material, with polished carved annulets and caps. The top ends of an octagon spire supporting a large carved cross, with medallion under. The central canopy is 15 ft. high and extends to the ceiling. The body part of the altar of the Virgin is supported on four ebouised pillars, with caps, annulets, and bases of carved and polished oak. The central panel on this altar is composed of double-moulded quatrefoil, with carvings on walnut ground. The Sacred Heart altar is of polished oak, with ebouised pillars, caps, annulets, bases, &c., on which is a carved panel of the Heart. A statue stands on each of these two altars. On all the altars are carved brackets of polished oak, supported by ornamental caps for vases and small statues. A statue of carved wood also stands on each side of the high altar. The Communion rail round the altars has a length of 60 ft., and is formed of polished Romanesque arches, with moulded abaci, supported by turned caps, annulets, and bases of ebouised pillars, with chamfered bottoms, the rail being carved the whole way through. Over the arches are mouldings of ebony balls. The top is a 6-in. walnut capping, finely polished. The painting and panelling were carried out by Mr. McCloskey, of Londonderry. The altars were designed, executed, and erected by Mr. C. Bull, of Dublin, who was assisted in the work of erection by Mr. M. Doberty, of Carnndonagh.

**THEATRE, STOCKBRIDGE, EDINBURGH.**—The new theatre situated in St. Stephen's-street, Stockbridge, is practically finished, and will shortly be opened. Nearly the whole accommodation is on the ground floor, there being only one end gallery. The auditorium measures about 90 ft. by 76 ft., covered by an arched steel roof, and the floor space is subdivided into three divisions, pit, pit-stalls, and orchestra stalls, with promenades and boxes at each side. The stage, which measures about 55 ft. by 45 ft., has a proscenium opening 30 ft. in width, with the usual flies and grid constructed overhead. There are four entrances, and the building can be emptied of its audience in one and a half to two minutes. There is a large entrance hall measuring about 70 ft. by 25 ft., a number of dressing-rooms for actors and actresses, ladies' retiring-room, and other conveniences. It is lighted by electricity,

with gas in reserve, and is ventilated by large electrically-driven fans. The architect is Mr. P. Marwick, of Edinburgh.

### FOREIGN.

FRANCE.—A new post office is to be built at La Rochelle at a cost of 253,000 francs.—A committee has been formed for the erection at Dijon of a monument to Bossuet in some public situation (not yet decided on) in the town. M. Marfais, Moreau and M. Paul Gasq are to be the designers.—An important monument has been erected at Chartres, and was inaugurated on Sunday the 31st ult., to the memory of the soldiers of the Department of the Eure-et-Loire who fell in the Franco-German war. The monument, which stands at the entry to the Promenade des Charbonniers, consists of a triumphal arch between two pylons and is crowned by a *fronton* decorated with the armorial bearings of Chartres, Châteaudun, Dreux, and Nogent-le-Roi. Beneath the arch is a figure personifying the Republic, and waving a flag. On each side of the arch are two statues, an artillery-man on the right, a mobile on the left; in front of the arch is a circular basin supplied from two lion's heads sculptured on the pylons. The general design is the work of M. Nénot, and the sculptors are MM. Henri Allouard, Louisau-Bailly, and Boverie.—M. Chabas, the painter, has just completed the most important part of the decoration of the Mairie of Vincennes, which is still to be completed by two military subjects originally commissioned from M. Dupray, but now to be carried out by M. Arus.—The Municipal Council of Paris is occupied with the arrangement of the Victor Hugo Museum, which will occupy the house at 6, Place des Vosges, formerly inhabited by the poet. On the first floor will be placed pictures and engravings inspired by or relating to the works of Victor Hugo. On the second floor will be drawings, and also furniture, made by the poet himself; and on the third floor is to be a restoration of the room in which he died at Avenue d'Eylau.—A tapestry, after a cartoon by M. E. Toudouze, has just been placed in the Palais de Justice, at Rennes. It is about 20 ft. square, and represents the marriage of Anne of Brittany to Charles VIII., at the Château de Langeais, in 1491.—A monument to Duguesclin, by M. Frémiet, is shortly to be unveiled at Dinan. It consists of an equestrian statue.—The Municipal Council of Rennes has voted a sum of 300,000 fr. for a new museum of painting, the design for which will be the subject of a public competition.—An international art exhibition is to be held at Nice, from January to the end of March next year.—Mme. Gounod, the widow of the composer, has presented to the town of Marseilles the bust of the eminent composer executed by Carpeaux, which will be placed in the principal theatre.—The death is announced, at the age of sixty-six, of M. Dulac, architect, a former member of the Association Provinciale des Architectes.—The death is also announced, at the age of fifty-one, of M. Henri Degève, architect, and member of the Société Centrale. He was a pupil of Achille Huc, and gained the first premium in the competition for the Hôtel de Ville de Neulan. He had exhibited at the last Salon a remarkable design for a house to be built at Margival.

AUSTRALASIA.—The Council of the Royal Victorian Institute of Architects has decided that the age at which a candidate may submit himself for examination to qualify as an associate shall be changed from twenty-one to twenty years of age.—The death of Mr. R. Gordon Hyndman, a well-known Melbourne architect, is announced.—A new church erected at Cowwarr, Victoria, has recently been completed and opened.—The Crown Law offices in Sydney are about to be considerably enlarged, and the plans for the additions have already been adopted.—The Government has decided to carry out a number of improvements at Garden Island, Sydney Harbour, including buildings and harbour accommodation generally.—Competitive designs are about to be invited for a building to house the lending-library branch of the free library, now installed in the Victoria Markets, Sydney.

### MISCELLANEOUS.

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.—Mr. R. E. W. Berrington, civil engineer, of London and Wolverhampton, announces that his son, Mr. Ernest Berrington, has taken up residence in London as the manager of their London office at 28, Victoria-street, S.W.

COMMONS AND FOOTPATHS PRESERVATION SOCIETY.—A meeting of the Executive Committee of the Commons and Footpaths Preservation Society was held on Thursday the 31st ult., at 1, Great College-street, Westminster, under the presidency of the Right Hon. C. Shaw-Lefevre. It was reported that eminent legal advice had been obtained by the Society as to the recent enclosure of Stonehenge. It appeared that several clearly defined tracks leading to the monument had been obstructed by the erection of a barbed-wire fence, and the Society was advised that *prima facie* there was a strong case for the existence of public rights of way over these tracks. The Committee resolved to petition the

Local Authorities to protect the public rights involved, and letters from eminent archaeologists were read protesting against the enclosure of Stonehenge on the ground that the character of the monument had been entirely altered by the existence of a high barbed-wire fence in close proximity to the remains. It was further pointed out that the stones could be amply protected from injury, without enclosure, by means of the Ancient Monument Protection Acts. The solicitor stated that the obstruction to the footpath leading from Sewardstone to Epping Forest had now been removed by the Waltham Holy Cross Urban District Council at the instance of the Society. A mass of evidence has been obtained by the Committee and laid before Mr. Rawlinson, K.C., whose opinion was strongly in favour of the existence of a public path. As a result, the District Council had held a local inquiry and had resolved to cut the barbed-wire fence forming the obstruction. Much gratification was expressed at the action of the District Council, which has secured the preservation of one of the most beautiful means of access to Epping Forest. A further grant of *tol.* was made by the Committee to the expenses of an action to secure the preservation of a path at Wadborough, Worcester, and grants were confirmed with respect to commons cases at Lodsworth, Leagrave, and Okehampton. It was reported that counsel's opinion had now been received with reference to the quarrying away of cliff footpaths in the Isle of Portland. The Society were advised that the custom was illegal, and it was determined in the first instance to request the District Council to take immediate steps for the protection of the paths, some of which are rapidly disappearing. The secretary's General Report embraced particulars of nearly 150 cases which the Society is dealing at the present time. These included disputes respecting footpaths, commons, village greens, and roadside waste in thirty-five counties.

ARBITRATION CASE.—The award has been made in the arbitration proceedings of July and August last, between Messrs. A. Krauss & Son and the Corporation of Bristol, over the enlargement of the Lunatic asylum. Messrs. Krauss & Son claimed £3,734 on account of loss of profits, increased cost of labour, supervision and establishment charges, depreciation of plant, and loss of interest on capital, through alleged delay of the Corporation in delivering certain materials for the work. Mr. H. R. Withycombe, the arbitrator named in the contract, heard evidence for several days. Mr. James Inskip appeared for the claimants, and Mr. E. R. Vachell (instructed by Mr. W. H. Wise) for the respondents. The award is that the Corporation is to pay to the claimants a sum of £1,000, which they offered before arbitration, the claimants are to pay cost of the reference and the arbitration. The contract price was 36,927.—*Bristol Times.*

REEREDOS, ST. MARY'S, LEIGH WOODS, BRISTOL.—The reerodos at St. Mary's Church, Leigh Woods, to the memory of the late Mr. John Harvey, of Leigh Woods, has just been dedicated. The reerodos is of alabaster and gilt, with oak super-car, and near the latter is to be inscribed a plate bearing the inscription. In the reerodos there are nine panels, carved, each containing a sacred monogram or emblem of the Passion. The super-altar and paneling on each side of the altar are of fumigated oak. The architect is Mr. G. F. Bodley, A.R.A., and the sculptors were Messrs. Flint Brothers, of London; the church decorators and gilders employed on the work being Messrs. W. O. and C. Powell, of London.

GLASGOW BUILDING TRADES EXCHANGE.—The annual meeting of the Building Trades Exchange of the City and District of Glasgow, Ltd., was held on the 29th ult. in the Exchange, Gordon-street, Colonel Bennett presiding. The secretary (Mr. David Cook, writer) submitted the eighth annual report. It stated that the treasurer's accounts showed an income of 7011. 7s. 6d., and an expenditure of 6661. 10s. 5d. A further sum, however, had been earned, so that the total credit balance on the year should be 411. 17s. 4d. Of this balance the executive had devoted 31. to depreciation of furniture, and written 101. off the preliminary expenditure in connexion with the formation of the Exchange, leaving a balance of 311. 17s. 4d. to be carried to profit and loss account. The executive recommended a dividend of 4 per cent. on paid-up capital. During the year there had not been any work of particular moment to which the Exchange could devote its energies, with the exception of the scheme for the extension of the Glasgow and West of Scotland Technical College. Exchange members had contributed towards that scheme 2,0531., and there was a possibility that this sum might be considerably augmented. On the motion of the Chairman, seconded by Mr. Donald, the report was adopted. The vacancies on the Council were afterwards filled up, and Messrs. Paterson & Benzie, C.A., were reappointed auditors.

### CAPITAL AND LABOUR.

THE BUILDING TRADE.—The decline in the building trade of the country generally, which is attributed to the effect of the war and the continued high price of materials and labour, has caused several associations connected with the National Federation of Building Trade Employers to give

notices to the workmen for reductions of wages. At Birmingham the trade-union representatives of the carpenters and joiners, masons, bricklayers, plasterers, and labourers have each been notified of a reduction in wages, to come into operation next year.

### LEGAL.

#### THE WEST-END BUILDING DISPUTE.

The case of Bailey v. Lewis was again mentioned to Mr. Cozens-Hardy in the Chancery Division on the 1st inst., in which Mr. Lewis, the draper, had been committed for contempt of Court in not complying with an order of the Court to remove certain buildings in Holles-street, Cavendish-square, in breach of covenant with the ground landlord, the trustee of the Portland Estate. The case was reported in last week's issue of the *Builder*.

Mr. Eve, K.C., now put in an affidavit made by the defendant, expressing his regret for what had taken place, and adding that his reason for not complying at once with the order of the Court was that he was in the hope and expectation that satisfactory terms would be arranged which would avoid the necessity of carrying out the order. The learned counsel added that the plaintiff was willing to accept an undertaking from the defendant to put in plans and specifications which would possibly render the carrying out of the order needless.

Mr. Vernon Smith, K.C., on behalf of the plaintiff, agreed to this.

His Lordship, in accepting the apology in the terms of the affidavit, and ordering the plans to be lodged within a fortnight, again remarked that the defendant had committed an act of gross disobedience to the order of the Court.

#### THE LONDON BUILDING ACT, 1894:

##### TRIBUNAL OF APPEAL CASE.

The Tribunal of Appeal have made an Order in the Appeal made by Mr. C. W. Matthews, and heard on the 25th ult., against the certificate of the Superintending Architect of Metropolitan Buildings, dated September 17 last, under Sections 22 and 29 of the Act, defining the general line of buildings on the western side of West Hill, Highgate, between Millfield-lane and Parliament Hill Fields, in which street he further certifies the building in question to be a terrace. The Tribunal allow the appeal, and do decide and determine that the general line of buildings on the western side of West Hill, Highgate, between Millfield-lane and the south-eastern corner of No. 1, West Hill, is as defined on the plan annexed to their Order by a strong green line 7 and further, they make no order as to costs.

#### CASE UNDER THE 1894 BUILDING ACT.

AT Marylebone Police-court recently, Alfred Bush, builder, of 6D, Ridgmont-street, Gower-street, appeared to a summons, issued at the instance of Mr. Arthur Ashbridge, District Surveyor for Marylebone, for making, in the erection of a building at the corner of Paradise-street and Ashland-place, Marylebone, default to comply with a notice of irregularity under the Building Act. Mr. D. P. Andrews supported the summons on behalf of the London County Council, and Mr. W. Moyes, barrister, defended, representing the Portland Industrial Dwellings Company, the owners of the building in question. Mr. Andrews said that the building was a large one, and was intended for the occupation of persons of the industrial classes. It was agreed on both sides that, the building being over 125,000 cubic feet in extent, Section 68 of the London Building Act applied. It was provided by that section that in every public building, and in every other building of more than 125,000 ft. of cubic extent, which was constructed or adapted to be used as dwelling-houses for separate families, the floors of the lobbies, corridors, landings, and flights of stairs should be of fire-resisting material and carried by supports of a similar material. But it was also contended by the complainants that the building, being over twenty-five squares, or, in other words, covering more than 2,500 superficial feet, should conform with Section 74, Sub-section 3, which required that all the floors of the rooms, as well as those of the lobbies, &c., should be fireproof. Apart from that matter no exception was taken to the building. In all probability a paraffin lamp would be used in every one of the rooms in this building at night, and it was therefore of the highest importance that the floors should be fire-resisting. Mr. Moyes urged that Section 74, Sub-section 3, only aimed at large buildings like flats, containing three or four rooms, intended to be occupied by different persons, and with an outer door. The object of the company he represented was to solve the most acute problem of finding dwellings for the industrial classes in congested districts. Every one of the rooms in the building in question might be let off separately; at any rate, a weekly rent would be charged per room. They therefore thought it very oppressive and unreasonable to try and compel them to incur the great expense of making the floors of even the smallest rooms fireproof. As to the possibility of fire, he pointed out that in all probability gas, and

not lamps, would be used by the tenants. Mr. Plowden, in deciding the case, said that the whole question seemed to be what was a fair meaning to be placed on the words of the Act that in every building containing separate sets of chambers, offices, or rooms there should be fireproof floors. In his opinion "separate sets" had nothing whatever to do with offices or rooms, but referred simply to chambers. Every kind of room, office, or set of chambers which was inhabited at all should therefore have fireproof floors. Consequently he held that this building contained sets of chambers or rooms, or, even if not sets, they contained rooms which required fireproof floors. His order would be that the defendant should comply with both Section 74, Sub-Section 3, and Section 68 of the Act, and pay 5*l.* 8*s.* costs.

#### THE ARCHITECT AS ARBITRATOR.

ON the 4th inst. before the Court of Appeal (composed of the Master of the Rolls and Lords Justices Stirling and Mathew), the case of *W. Belcher and another (Trustee, &c.) v. The Roedean School Site and Buildings, Ltd.*, and another, was heard, on the appeal of the Roedean School Site and Buildings, Ltd., and of Mr. J. W. Simpson, an architect, from orders of Mr. Justice Lawrence in Chambers, dated August 8, 1901.

Mr. Ralph Neville, K.C., and Mr. Leigh Clare appeared as counsel for the appellants; and Mr. Reginald Bray, K.C., and Mr. Hudson for the respondents.

Mr. Neville said that the Roedean School Site and Buildings, Ltd., was a company established for the purpose of erecting the buildings of a well-known school at Brighton, and the respondents on the appeal were a gentleman named Belcher and also a Mr. Davis, the trustee in the bankruptcy of the contractors, Messrs. Peters, Peter, & Son, who had contracted to do some of the brickwork in the erection of the schools. The appeal was from a decision of Mr. Justice Lawrence, revoking the submission to the architect in the builder's contract. The learned judge revoked the submission altogether, and as he (counsel) understood the ground of the learned judge's decision, it was, to put it shortly, based on the fact that there was litigation pending between Mr. Belcher and the architect, and that the case came within the meaning of the decision of a Divisional Court in "*Daring Brothers v. Doulton & Co.*," that litigation pending between the architect and a party to the contract was sufficient ground for the revocation of the submission. In that case, however, the litigation which was pending was commenced by the architect himself against one of the parties to the contract; in the present case the litigation was commenced by one of the parties against the architect with the express view, as he (counsel) submitted, of putting an end to his acting as arbitrator under the contract.

Mr. Bray remarked that such a thing was never suggested to Mr. Justice Lawrence.

Mr. Neville: Well, I will only say this, that if this gentleman is successful in determining the submission to the architect by the proceedings he has instituted, there is a sure and simple method open to all parties in cases of this kind if they do not wish the arbitration to go on in the usual way. The learned counsel went on to state that the contract between the company and the contractors, Messrs. Peters, Peter, & Son, was entered into on February 25, 1897, the contract price being 43,589*l.* Mr. J. W. Simpson was the architect named in the contract. There was very little of the contract that he need call attention to. Clause 1 provided that the work should be completed to the satisfaction of the architect on or before September 1, 1898, with penalties of 10*l.* a day for delay. Clause 16 provided for the payment of the contract price by instalments upon the architect's certificates, 8 per cent. being payable until 4,500*l.* was in reserve, and after that for full payments on the certificates. Clause 20 made provision for the determination of the contract in certain circumstances, one of which was the bankruptcy of the contractors. Another clause gave the building owners power to determine the contract in case the work was not proceeded with to the satisfaction of the architect. Clause 26 was the arbitration clause, which provided that in the event of any dispute arising between the Company and the builders, they were to refer the same to the architect, whose decision should be conclusive and binding upon both the parties. When September 1, 1898, arrived, the buildings were very far from completion. It seemed that the builders were short of funds, and they obtained loans from different people on the credit of the contract.

Mr. Bray: This does not appear in any affidavit. Mr. Neville: It appears in the accounts then.

Mr. Bray said it was quite immaterial to the case.

Mr. Neville: I do not think we can get on without mentioning that there were persons who advanced money besides Mr. Belcher. The learned counsel continuing said that Mr. Belcher advanced money to the builders and got a charge on the contract in his favour. The first notice of any charge was in September, 1898, and again in January, 1899, there was notice of a charge. On January 2, 1899, the architect gave the contractors notice to proceed under the 20th clause of the contract, and on their

failure to proceed according to his satisfaction, the building owners on February 1, 1899, served notice to determine the contract under that clause. On the same day the contractors presented a petition in bankruptcy which was followed by a receiving order. Then the work was taken over in accordance with the terms of the contract by the building owners and completed under the inspection of the architect. On June 27, 1901, the architect issued his final certificate, which showed a balance due to the contractors of 350*l.* 18*s.* 5*d.* There was accounted for to the trustee in the bankruptcy of the company, in which they showed a claim for penalties for non-completion of the work in due time and damages for non-completion amounting to 1,250*l.* 7*s.* 5*d.* That amount was arrived at after deducting from the claim the amount due to the contractors under the final certificate of the architect, and a certain amount which had not been paid although certified for previously. These accounts were sent to the trustee in the bankruptcy of the contractors and also to the other persons from whom notices of charges had been received. The solicitors to the trustee refused to accept the certificate issued by Mr. Simpson on the ground that the contractors had a large claim against the company for improperly determining the contract. On July 6, 1901, the solicitors to the company wrote to the architect asking him to make an appointment as arbitrator under the contract, and the architect appointed July 23 for the first sitting. The trustee refused to acquiesce in the arbitration or to submit to the jurisdiction of Mr. Simpson as arbitrator. Mr. Belcher's solicitors also wrote to Mr. Simpson on July 19, 1901, stating their surprise that the balance due to the contractors under his certificate was only 350*l.* odd, and that their client had advanced large sums of money to the contractors on the faith of assurances given to him by Mr. Simpson as to the retention fund of 4,500*l.*, and so on. Subsequently Mr. Belcher commenced an action against Mr. Simpson for damages for misrepresentation and fraud, and he (Mr. Neville) submitted that this litigation was simply started to bring the case within the decision of *Daring Bros. v. Doulton & Co.*, and so put an end to the arbitration with Mr. Belcher did not like. A summons was afterwards taken out for an injunction to prevent the arbitration proceeding, and Mr. Justice Lawrence granted the injunction and revoked the submission to arbitration. The learned counsel argued that there was no ground for saying that Mr. Simpson was not a proper person to act as arbitrator under the contract, and that the action started by Mr. Belcher for which there was no justification was to bring the case within the decision of the Divisional Court before referred to. In the circumstances, he submitted that the orders of Mr. Justice Lawrence should be reversed.

Mr. Bray said that the action started by Mr. Belcher was a bona-fide one. Mr. Belcher was applied to by the contractors for money, and it was decided that he should provide the remainder of the money to finish the work. Mr. Belcher went with his solicitor to Mr. Simpson, and this gentleman assured him that the job was paying the contractors very well, and that he would be perfectly safe in advancing the contractors money for the rest of the job. The learned counsel said that the matter had been a most unfortunate one for Mr. Belcher, as he had advanced large sums of money to the contractors. He would be satisfied that any other qualified architect could act as arbitrator under the contract, but he submitted that Mr. Simpson, in the circumstances, was not the proper person to act as arbitrator. He suggested that as the amount said to be due to the Company was small, the arbitration should be ordered to stand over until the action against Mr. Simpson had been tried.

The Master of the Rolls in giving judgment said that in ordinary building contracts the architect was the person appointed to determine disputes between the parties. It was known that these disputes raised questions between the contractor and the architect. In many cases the architect as arbitrator had to determine when he had given say, a disputed order, whether he was right or wrong. The parties stipulated for not necessarily an unbiased arbitrator. That being so, what materials were there in the present case to suggest that there would be any bias in the arbitrator qualified to act as arbitrator under the contract in cases? Mr. Belcher, who was not a party to the contract at all, said that the architect had made representations to him which turned out to be so untrue that they must have been fraudulent at the time he made them. This was denied by the architect, and it was said on his behalf that there was nothing which could give any suggestion for fraud on his part. But it was said, however, that one of two parties who desired to avoid going to arbitration could, by making a most injurious charge against the arbitrator, at once stop his jurisdiction. His Lordship did not think that the Court ought to give effect to the objections given, because by opening the door to attempts to get rid of arbitration it would open the door to attempts to get rid of contracts. Mr. Bray had desired the Court to let the charge against the architect be decided by jury first and then come back to the question of arbitration. That, however, was not what the parties stipulated for. They

stipulated for the determination of their disputes by a named person. He thought that the architect should be reinstated in his position as arbitrator, and that the arbitration should proceed.

The Lords Justices concurred, and the appeal was accordingly allowed with costs.

#### CASE UNDER THE WORKMEN'S COMPENSATION ACT, 1897.

THE case of *Ayres v. Buckeridge* came before the Court of Appeal, composed of the Master of the Rolls and Lords Justices Stirling and Mathew, on the 6th inst., on the appeal of the defendant (the employer) from the decision of the County Court Judge at Brentford in an arbitration under the Workmen's Compensation Act, 1897, awarding the applicant, the widow of a labourer who sustained fatal injuries through an accident while in the course of his employment, 20*l.* 10*s.* compensation. It appeared that the deceased man was employed by the foreman of the defendant to assist in the demolition of a building at Ealing. At the time the man was at work in Whitechapel, and it was arranged, in order that the rate of wages should be remunerative to him, taking into account that he would have to travel to his work, that he should be employed for eleven hours a day for five days in the week and for five hours on Saturday, making altogether sixty hours a week, and that his pay should be 7*s.* 6*d.* an hour. The employment was not for any specified time, and the man was liable to be discharged at an hour's notice. The man was at work for four days, and on the fourth day met with the accident. He worked for eleven hours on each of the four days. The County Court Judge, in calculating the award of 20*l.* 10*s.*, did so on the basis that this was the amount which the man would have earned if he had been employed for sixty hours a week at the rate of 7*s.* 6*d.* an hour for a period of three years. The employer appealed, and on his behalf it was contended that the amount of compensation ought to be based on the amount of wages in fact received by the deceased man during the time that he was actually employed. The period of his actual employment was forty-four hours in the first week of the employment, and wages at 7*s.* 6*d.* an hour for forty-four hours amounted to 7*l.* 7*s.* 6*d.* On this basis it was contended that the award ought to be for 21*l.* 10*s.*

At the conclusion of the arguments of counsel, their Lordships held that the learned County Court Judge had dealt with the case in accordance with the law as laid down by the House of Lords in the case of "*Lyons v. Andrew Knowles & Sons*," and dismissed the appeal with costs.

Mr. Atterley Jones, K.C., and Mr. Kisch appeared for the appellant (the employer), and Mr. R. M. Bray, K.C., and Mr. W. M. Thompson for the respondent (the widow).

#### RECENT PATENTS:

##### ABSTRACTS OF PATENTED INVENTIONS.

12,307.—AN APPLIANCE FOR WATER-CLOSETS: *J. Baresford*.—The invention relates to a form of mechanism which works an inlet water-valve by means of the opening and closing of the seat-lid, on which is mounted a bracket, having a ball or roller at the bead. On the end of the valve-spindle is a double inclined lever, which the ball will act, whereby the valve will become quite opened. When the lid is half closed or half opened a spring in an air-chamber closes the valve, for which an air-cushion is provided. Rods and levers from the seat-lid will work the lid at the bottom of the pan.

12,317.—A FOUNDATION FOR FLOORING: *P. Tachard*.—A lower layer is made of an admixture of sawdust, thirty parts by weight, oxide of magnesium, thirty-five parts, and a solution of chloride of magnesium, four and a half parts, above that is spread a layer compounded of oxide of magnesium, asbestos, wood-meal, calc spar, chloride of magnesium solution, and some colouring matter in certain given parts; if only one homogeneous layer is employed the relative parts of the components are varied.

12,320.—WIRE FENCES: *W. Edenborn*.—The invention feeds the wires lengthwise through hollow spindles, and the stay-wires between rollers and cam-rollers having an intermittent motion, whilst pawls will prevent the wires from returning; between the spindles are spring-fitted grooves in discs which take the stay-wires, and as their lengths are cut off the discs are caused to rotate so as to bring the stay-wires and the adjacent strand-wires together, a sliding head that is worked with a cam carrier forks which cause the stay-wires to engage with the coiling-fingers which coil them about the spindles, and will straighten them. Confer also No. 8,343 of 1899.

12,331.—ELECTRICAL CONDUITS: *E. Schellbach*.—The outer casing of a sectional multiple conduit has its shell made of cement, &c., and has grooves or openings for taking the rods lengthwise; a lighter material is filled in the interior and is moulded with rounded openings. In another form the portion within consists of a casing having a movable top, and the tie-rods are fitted in the inner casing instead. The interior will serve for pipes laid upon piers.

insulating-partitions and for naked wires to be drawn through the partitions.

12,380.—A WORKMEN'S TIME-RECORDER: J. S. MacCoy.—For stamping it with the date and time, the card, when it has been dropped into a shoot, is held with a pivoted detent against the printing-wheels, whilst a cam and hand-lever mechanism works a lever at the end of a platen that strikes the card. At the same moment the platen drives a punch which removes a piece from the card, a cam is raised to clear a pivoted pallet upon a vertical shaft by an arm which, with the hand-lever, works upon another arm, so as to wind up a train-controlled spring, thereby the cam is returned over the pallet, and by turning the shaft disengages the detent to which it is linked. A band between two winding reels inks the type, the reels being driven in alternation by a shifting shaft having mitre-gearing at its end. The shaft is shifted by means of its two end levers beneath springs and a detaining latch which is tripped with a trigger.

12,392.—A CLAMP FOR CONDUCTORS AND FUSES: Callender's Cable and Construction Co. and J. C. A. Ward.—Two discs pressed together by a spring and an eccentric and mounted upon a pin, constitute the clamp; the spring is put under the lower disc, and above the other disc a forked eccentric is pivoted on a pin that works in a slot in the disc-pin; the disc pin may, otherwise, be fastened so that the eccentric can move between its legs.

12,418.—A ROAD SCARIFIER: W. Thackray and W. L. Thackray.—The two sides of the machine are joined with stays and mounted upon wheels; lateral bearing-bosses carry the shaft, and as the sides are constructed in parts they can be adjusted for their attachment to a traction-engine; double-ended prongs are keyed into levers upon a shaft, and the levers are linked to regulating-levers upon a shaft, whilst spring catches upon the former levers engage with recesses in segments upon the side plates; the steering-wheels can be carried by an axle which is fitted to an upright mounted in a bearing in the bridge-piece affixed to the sides.

12,436.—PROTECTION FROM FIRE: J. D. Gould.—The fire-alarm comprises a cable wherein a layer of some insulating material separates an outside conductor from an inside fusible conductor, wires connect the other ends of the conductors to the metallic ends of the reel, which takes the surplus cable, the ends being disposed in metallic connexion with the terminals of an electrical-bell circuit. When a fire breaks out near the cable, the inside conductor becomes fused, and as it makes its way through the insulating material effects contact with the outside conductor, so as to close the bell-circuit and raise an alarm.

12,446.—BRICKS FOR CEILINGS AND FLOORS: F. Albrecht.—The bricks are fashioned with interlocking corrugations or waved ribs and grooves arranged lengthwise. They may also be hollow, for reducing their weight and for deadening sound.

12,475.—TOPS FOR CHIMNEY AND VENTILATING SHAFTS: W. Mitchell.—As an improvement upon No. 19,266 of 1897, and in order to prevent the top from being blown quite round by the wind, the inventor devises a brake-block that will bang freely in a light wind, but will be actuated by a breeze. When three chimney-pots are fixed upon one stack the two outside pots are elbowed into the top which is secured to the pot between them.

12,498.—LADDERS FOR SCAFFOLDING: I. Szalay and J. Korom.—At the upper ends of the ladder ends are sockets for the feet of the sections next above them, for fastening the sections to one another parallel-wise are used screwed shackles and cross-braces that are to be bolted to one another as well as to the sides of the ladders.

12,501.—A STAGING FOR USE IN CLEANING AND PAINTING WINDOWS, &c.: I. Page.—The apparatus consists of a frame covered with wire-netting which stands upon the window-sill and is secured with adjustable screw coupling-nuts or turn-buckles to hooks inside the room, jointed links secure the hinged back of the frame, and to the back are hinged folding shutters which are also pivoted with catches on to the links.

12,513.—AN ARTIFICIAL STONE: Wachtel & Co.—The stone is made of coarse-grained and fine-grained sands in the ratio 2:1 mixed with lime, the former having been dried at a temperature of 100 deg. C. or higher, and made up with slaked lime to the consistency of a paste.

12,593.—DRAWING INSTRUMENTS: H. E. Ahlert.—A set-square for drawing regular polygonal figures has each of its corners cut to the angle of a regular polygon which is bisected with a line of holes, the radius of the circumscribing circle is determined by the means of the engagement of any hole with a fixed centre which has been struck on the paper, whilst the length of the side of the figure that corresponds with the given radius is obtained from the intersection of a line drawn from each hole to the edge of the set square; a detached and perforated strip is provided for drawing radii and circles.

12 605.—MEANS OF WARMING BUILDINGS: J. Russell.—The invention lies in the maintenance of the circulation of hot heating vapour or steam by making a vacuum in the return portion of the system, and preventing the passage of the steam or vapour into the return pipes, the water of condensation and the air in the condensed vapour being enabled to escape.

A float-valve or trap and a permanent by-pass for the air are placed in the outlet or condensed water-main of each radiator, heater, or coil, the by-pass serving as a spindle for a double-beat valve, and an opening in the tube between the valves leads into the passage that communicates with the outlet. Another kind of trap has one valve that is worked with a float having a pivoted arm through which is passed the tube upon which the valve is mounted.

12,048.—A METHOD OF FIXING FLOOR BOARDS: R. Endres.—For fastening the boards on to the joists and beams are devised nails that are pointed at both ends and can be driven slantwise to be out of sight, the adjoining board is driven up against the upper end of the nail which is turned down horizontally, a tool having a rounded recess for taking the nail-points is used for driving in the nails.

12,654.—A CIRCULAR-SAW GUARD: D. A. Murdoch and F. Murdoch.—The inventor contrives that the pressure of the wood as it is fed forward shall automatically raise the guard. A frame upon either side of the saw, and of which the openings are filled with "expanded metal," constitutes a shield whereof the rear end is joined by radius bars to an axis that rotates in bearings upon the horizontal arm of a standard. On the top of the shield is a wheel running upon the edge of a bracket secured to the arm. When the pressure of the wood lifts the shield, a counter-weight balances the weight of the shield and the radius-bars, and the latter (together with the wheel on the bracket) regulate the horizontal rising of the frame.

12,672-3.—MANUFACTURE OF GLASS: A. Voelker.—Worms from hoppers feed the raw materials to the electrical furnace, and heat from an arc between carbon electrodes fuses the materials; the molten glass is further heated in a clearing-tank for clearing away air-bubbles with an electrical current that is passed between electrodes through the tank, and the glass can be maintained at the desired heat by a current passed through the receiving-tank. (12,673.) Graphite, powdered charcoal, or other conducting substances are mixed with the ground raw materials, which are then melted with an electrical current that is passed through the admixture.

12,714-5.—TOPS FOR VENTILATING-SHAFTS: J. Linklater.—The inventor provides a long mouth-piece, shaped as a hood, and as wide as the down-take pipe, which has a wind-vane and ball-bearings that work in a ring. He also devises a semi-circular, or hemi-cylindrical, screen, which carries a directing-vane as an addition to the customary revolving fly, or slit-drum.

12,716.—A CONTRIVANCE FOR ELECTRICAL SWITCHES: W. B. Dale.—The contact is so arranged as to be always parallel to the plane of the contacts, and to thereby give a wide double break. In the case of a double-pole switch a cross-piece carries the contact-bars, and to its arms are pivoted two levers of which the other ends are pivoted to a bracket. For giving a quiet break a spring connects the bars, to one of which a handle is loosely connected.

MEETINGS.

FRIDAY, NOVEMBER 8.

Architectural Association Discussion Section.—Mr. W. E. Davis on "The Finishing of a Dwelling-house." 7:30 p.m. The Technical College Architectural Craftsmen's Society.—Mr. Robert Stuart on "Soft Wood," and Mr. D. S. Pringle on "Hard Wood," 204, George-street, Glasgow. 8 p.m.

MONDAY, NOVEMBER 11.

Surveyors' Institution.—Opening Address by the President, Sir John F. L. Rolleston, M.P. 8 p.m. Clerks of Works' Association, Carpenters' Hall.—Paper by Mr. J. T. Mickelthwait. 7:30 p.m. Bristol Society of Architects.—Mr. John Fisher on "The Work of Alfred Stevens," with illuminated illustrations. 8 p.m.

TUESDAY, NOVEMBER 12.

Institution of Civil Engineers.—Messrs. W. Kaye Parry, M.A., and W. E. Adeney, D.Sc., on "The Discharge of Sewage into a Tidal Estuary." 8 p.m.

WEDNESDAY, NOVEMBER 13.

Institute of Sanitary Engineers.—General Purposes and Finance Committee at 4 p.m. Council meeting at 7 p.m. Northern Architectural Association.—The President (Mr. Frank Caw) will deliver his Inaugural Address. 7:30 p.m.

THURSDAY, NOVEMBER 14.

Manchester Society of Architects.—Mr. Paul Waterhouse, M.A., on "Architecture Among the Modern Arts." 7 p.m. Sheffield Society of Architects and Surveyors.—Mr. C. F. Brindley on "Organ Cases and Organ Chambers." Institution of Electrical Engineers (Dublin Local Section).—Mr. P. S. Sheardown on "An Account of the German Tour of the I.E.E."

FRIDAY, NOVEMBER 15.

Architectural Association.—Mr. Max Clarke on "The Sanitation of a Country House." 7:30 p.m. Institution of Mechanical Engineers.—8 p.m.

SATURDAY, NOVEMBER 16.

Dundee Institute of Architecture.—Visit to St. Andrews.

SOME RECENT SALES OF PROPERTY:

ESTATE EXCHANGE REPORT.

Table listing property sales with columns for date, location, and price. Includes entries for Faverham & Co., Leamington Spa, Watford, Hammersmith, and various other locations.

CONTRACTIONS used in these lists.—F.g.r. for freehold ground-rent; l.g.r. for leasehold ground-rent; i.g.r. for improved ground-rent; p.g.r. for ground-rent; r. for rent; f. for freehold; c. for copyhold; l. for leasehold; e. for estimated rental; ut. for unexpired term; p.a. for per annum; yrs. for years; st. for street; rd. for road; sq. for square; pl. for place; ter. for terrace; cres. for crescent; yd. for yard.	

PRICES CURRENT OF MATERIALS.

\* \* \* Our aim in this list is to give, as far as possible, the average prices of materials, not necessarily the lowest. Quality and quantity obviously affect prices—a fact which should be remembered by those who make use of this information.

### Early Renaissance Architecture in England.

**A**MID the recurrent appearance of works in English Renaissance architecture it becomes rather difficult to distinguish between the object and scope of one work as compared with another; it seems at all events certain that English Renaissance architecture is at present regarded as an attractive subject both by architectural authors and architectural publishers. We have had Mr. Blomfield's work, "A History of Renaissance Architecture in England," followed by an abridged edition; Messrs. Belcher & Macartney's "Later Renaissance Architecture in England"; Mr. Gotch's "The Architecture of the Renaissance in England," a folio publication in which the illustrations formed the most important element; and now we have another work from the same author under the title, "Early Renaissance Architecture in England\*," a book in literary form, in which the illustrations, though numerous, are on a small scale and subordinate to the text, and the publication is of the nature of a historical handbook of the subject. In regard to Mr. Blomfield's book, the author of the present work defends himself from the charge of repeating the same subject by pointing out that, though Mr. Blomfield's work starts from the beginning of the sixteenth century, it does not dwell at length upon the earlier work, but is chiefly devoted to that of the seventeenth and eighteenth centuries. Mr. Gotch, in fact, in this book, classes Tudor and Elizabethan as "Renaissance," a classification to which, as a matter of definition, we decidedly object. If Tudor and Elizabethan work is called Renaissance, we are then called on to use the word Renaissance for completely different types of architecture, which have really very little in common. The fact is, we take it, that Renaissance is a popular word just now, and a better publishing name than Tudor or Elizabethan.

The first partial intrusions of Italian detail

\* "Early Renaissance Architecture in England: a historical and descriptive account of the Tudor, Elizabethan and Jacobean periods." By J. Alfred Gotch, F.S.A. London: B. T. Batsford, 1901.

and (apparently) of Italian workmanship into English architecture are no doubt of great interest, and Mr. Gotch has collected and illustrated a good many examples of them; but these flowerings of Italian ornament in details do not affect the architectural style as a whole; typical Elizabethan architecture, in spite of them, has still much more affinity with late Gothic than with genuine Renaissance; nor do the channelled terminations to the pendants in the Hampton Court roof make that anything other than a late Gothic roof. The gradual introduction of points of symmetry in the plan, not called for except for the sake of symmetry, is in reality a much more important indication of the invasion of the Renaissance spirit than is shown in mere ornamental detail. Mr. Gotch places on two contiguous pages two plans which illustrate this in rather a curious manner. In the plan of Compton Wynnyates a bay-window to the hall comes in close to one angle of the internal courtyard. In the plan of Sutton Place a bay-window to the hall, square on plan, comes in near one angle of the courtyard in the same way, but in this case it is duly balanced by a similar bay at the opposite angle, lighting however only a small and secondary apartment. The difference between the two buildings, according to Mr. Gotch's dates, is only four or five years (1520 to 1523-5); this is however rather a coincidence than an indication of a rapid chronological progress towards symmetry. Some of the details at Sutton are bad Italian in character, but the mouldings, as well as the general effect, are still late Gothic.

The development of plan in the Classic direction seems indeed to have been rather capricious; we have comparatively early plans which are very symmetrical, and later ones which are much more Mediaeval, such as that of Hengrave Hall (1538), where the bay-window of the hall is nearly central with one side of the courtyard but not quite, and the plan generally is quite unsymmetrical. What distinguishes it is the use of a central courtyard smaller in proportion to the rest of the plan than is the case with the older quadrangle plans, and with the unwonted and rather modern device of a corridor of communication round three sides of the court and lighted from it; all the rooms except the hall (which forms the fourth side of the court) getting their light through the exterior walls.

This provision of a communication corridor with a good light from a central area was

however an unusual refinement in regard to interior access to the rooms. The study of some of the plans in this volume is very interesting. The old quadrangle plan seems to have been the precursor of two forms of more compact plan in which there was still a reminiscence of the centre quadrangle. There is the plan with a central court for light, around which the rooms were grouped, and the plan with a central hall, top-lighted, around which also the rooms were grouped, but with, of course, no light except through the outer walls. Wollaton Hall (1580-88) is an example of the latter plan; and here nearly all the rooms open out of each other. Barlborough Hall, of about the same date, is built round a small court (fig. 1), now fitted with a modern staircase; this court does not seem to have been used for light, as far as the present plan shows; as it stands it is an intercommunication hall or lobby; but whether this was its original use, or whether the doors opening into it are modern, the author does not tell us. As will be seen, there was through communication all round the house, from room to room, in the naïve fashion of the day, without any use of the central space. The plan is a curious mixture of complete, almost classical, symmetry externally, with absolute lack of it internally. With all its exterior symmetry, however, the architecture is of late Gothic type, as may be surmised from the semi-octagon plan of the bays; these go right up, rising above the parapet and forming a species of towers; a treatment which, as Mr. Gotch truly remarks, "lends much distinction to an otherwise simple exterior." What was the reason for the extraordinary thickness of the interior walls as compared with the exterior ones there is nothing in either plan or view to explain. Chastleton, in Oxfordshire (fig. 2), dated 1603, shows the centre court pierced for windows, but nearly all the house consists of rooms opening out of each other, in a manner absolutely without plan or order, and as if the partition walls had been put up anyhow. In Bolsover Castle (fig. 3), dated 1613, we have again a plan of nearly complete symmetry outwardly, and with a great dignity in the arrangement of the forecourt; but here again all the symmetry is forgotten as soon as we get inside, and the plan becomes, one may say, more naïve than ever in the arrangement for intercommunication; but it should be a charming plan as regards internal effect, and those little surprises which do so much towards rendering a house interior interesting; and it

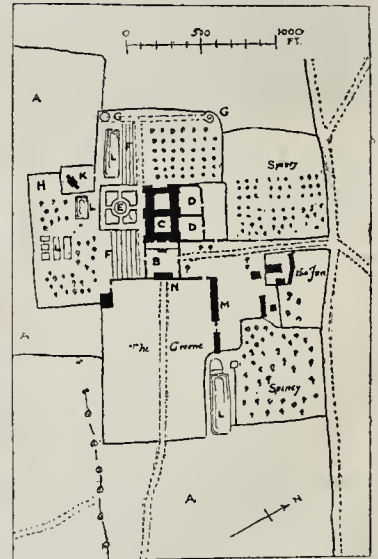

Fig. 4.—Holdenby House.

is worth notice that though there is no interior court, either for light or for passage, we still seem to have the reminiscence of the interior court in the shape of that small square of (apparently) solid wall left in the centre, of which the author gives no explanation, but which certainly requires one. As it stands in the plan, it looks as if they could not do without something in the centre to build round.

Mr. Gotch gives the block-plan of Holdenby House (fig. 4) as an example of the laying out of the ground around an Elizabethan house, though in this case it may be said that there is not much laying out at all. While the drive traversed the park it was left to wind as the undulations of the ground suggested, but within a quarter of a mile of the lodge (N on plan) it became a straight road through "the green" up to the

lodge, which stood on the axis of the house. "The house was built round two great courts, the first 128 ft. by 104 ft., the second 140 ft. by 110 ft. . . . The house covered nearly two acres, the basecourt (B) more than one acre; the green seventeen acres. In comparison with the house the village is a mere collection of outhouses, not so extensive as the range of stabling." This gives a good idea of the magnificent scale on which these Elizabethan houses of great people were planned, though it may be added that it has neither the magnificence nor the stateliness contemplated in Bacon's sketch of his imaginary house and Burdon's in the Essay "Of Building." The much smaller plan of Doddington Hall and its forecourt and garden (fig. 5) is a good example of stately and symmetrical laying out of the ground round a house, especially

in the combination of straight and circular drive from the gate-house.

In speaking of the general aspect of the Elizabethan houses, Mr. Gotch observes that their often picturesque and elaborate appearance is generally produced by very simple means. The picturesque effect of such houses as Haddon and Compton Wynyates is due to irregularity of plan; but in the Elizabethan house the design and plan (externally at all events) are regular and symmetrical, the picturesque springs from the manner of employing gables, windows, and chimneys. As the author says, there is "an exuberant vitality" about these houses, in spite of their occasional misuse of classic detail and insertion of unmeaning pilasters, which accords with the vitality of the literature of the period. There could be no better example of this than Burghley

Fig. 7.—Glass Panel from Moreton Old Hall.

House, the first impression of which, with its crowds of chimneys and turrets, is ineffaceable from the memory. The bay window, with as much of it pierced as was possible, is a feature which was perhaps made too much of. Mr. Gotch devotes some remarks and illustrations to this subject, and gives the palm to the great twin bays of Kirby Hall; but this habit of carrying the mullioned window all round the bay, leaving it to a great extent cut in two in the middle, is rather of the nature of a *tour de force* in building, and one feels that the mullions of the lower window in many cases have a greater weight to carry than they should have, for appearance at all events; besides the result that the room is over-lighted; a point specially criticised by Bacon, who complains that you find rooms where "you cannot tell where to be to come out of the sun." The front of Aston Hall, which Mr. Gotch shows on the same page as Kirby, is worse, for the windows are continued all along the wall between the bays, as well as all round them, making one continuous belt of window with only a very narrow pier at each angle of the building, so that the whole mass of the upper wall and parapet seem to stand in the air on stilts. That this should have remained in good preservation shows what careful and sound mason's work must have been done in setting up these windows, but it is really an effect much more suitable to a timber and plaster cottage

than to a stone mansion on a large scale, and it is not one by any means worth imitating, as some persons seem disposed to imitate it. One advantage of the mullion as an architectural feature is that continuity of this kind may be obtained by using wall mullions only between the windows, ranging with them—a much more solid and satisfactory method than cutting away a whole mass of wall from corner to corner of the building, and leaving one to wonder how it stands.

The subject of the decorative treatment of the interior of Elizabethan and Jacobean houses receives abundant illustration and comment in Mr. Gotch's book, and this part of the subject is worth careful consideration on account of the many suggestions it affords to the modern designer and decorator. We quite concur with the author in his admiration for the effect of the portion of panelling shown in his fig. 138 (p. 152), an upright panel perfectly plain in the stiles and in the lower portion of the panel, but with a design of carved dolphins formed in a rectangular sinking at the top of the panel. This placing of the ornament at one point only is very characteristic, and may be applied in various different ways. The important subjects, in a decorative sense, of fireplaces and ornamental ceilings are also largely illustrated. The artistic importance of the "strap-work" plaster ceiling has perhaps been somewhat exaggerated; a good many of these ceilings are very much alike; when

you have the *motif* of one you have that of all, with the exception of minor differences of detail; and in fact Mr. Gotch seems to think that the plasterers had stock designs from which they worked, though absolute repetitions of the same details are seldom found.

The "Long Gallery," to which the author draws special attention as one of the most characteristic features of Elizabethan and Jacobean houses, is one to which the modern architect of large mansions ought to give his attention. No finer feature, nor one which more repays the space bestowed on it, can be introduced into a house; and it may be planned, as in some Elizabethan houses it was, to serve not only as an apartment of State in itself, but as at the same time a means of communication and access to other rooms; and this is the use that it might be made to fulfil in a modern mansion. In a mansion of the highest class there should properly be no such thing as a mere corridor or "passage"; the conventional passage should be widened into a gallery, for more stately effect, while still fulfilling its practical use as a means of communication from room to room. And it is in such galleries more particularly that there is opportunity for the use of stained glass in decorative and heraldic inventions. The author gives a few useful notes as to where the best glass of the period may be found—some of it not very well known; and he gives some interesting specimens of ornamental glazing from Walter Gedde's "Booke of Sundry Draughtes," of which we have reproduced two (fig. 6) which are of rather unusual and ingenious character. It is worth notice that Gedde describes the designs as "principally serving for Glasiers," but also as "not impertinent for Plasterers and Gardiners," a phrase which shows how this taste for geometric devices ran through everything in the decorative art of the period. If a man could make an ingenious diaper pattern for window glazing, he might just as well carry out the same idea in plaster rib-work or in garden-beds. The glass panel from Moreton Old Hall (fig. 7), of which the publisher has kindly lent us the block, is a bold and effective piece of work of its kind, and illustrates the period when Dutch strap-work was in vogue, forming an ornamental border to the shield with the family device.

The book concludes with two interesting chapters; one on "Sixteenth-Century House-Planning as Illustrated by John Thorpe's Drawings," in which a great many of Thorpe's plans and quasi-perspective elevations are collected for study and comparison, including a most curious and clever plan based on a hexagon, with circular stair towers in the re-entering angles; and one on the much vexed question as to the "Architectural Designs of the Sixteenth Century." The author's conclusion is that while men like Thorpe provided plans and "up-rights," each trade employed on the building provided its own details and that this accounts for what is otherwise puzzling—the diversity of details in buildings supposed to have been the work of the same architect; and probably that is about the truth of it.

Mr. Gotch's book, which is full of information, forms an excellent companion to Mr. Blomfield's, the one being full where the other is more brief. The two together form a very complete history of English architecture from the sixteenth to the eighteenth centuries.

## NEW DECISIONS ON THE WORKMEN'S COMPENSATION ACT.

**T**HE Court of Appeal, as some of our readers may have noticed, early last week began to sit solely for the purpose of clearing off the arrears in the list of appeals arising out of the Workmen's Compensation; it has already given during this last sitting several important decisions which are likely to affect the bearing of this Act in the immediate future. Perhaps the two of most interest are those which have thrown further light on that curious part of the Act, the limitation of compensation in the case of workmen on buildings to edifices exceeding thirty feet in height. In *McGrath v. Neill*, the question arose from what point the measurement of the building was to commence. The building on which the accident occurred was of brick, and the height from the bottom of the footings, above the concrete foundations, to the top of the building was more than 30 ft.; but it was contended on behalf of the employers that the proper place from which to measure was the ground, and if this test was right then the building was not 30 ft. high. This view, however, the Court would not accept. The object of the limitation was, it was said, to exempt small and unimportant buildings on which small and poor builders were at work. But as a vast building had a great deal of its wall below the ground level, it was impossible, in the opinion of the Court, to limit the Act as was desired by the counsel for the employers. There was, apparently, some obscurity in the evidence as to the extent, if any, to which the footings were covered in. The Master of the Rolls could, he said, see no evidence that there was more than a flooring at the top of the footings. From this statement we assume that had the footings been covered in by solid earth the Court would in that case have considered the ground level the proper commencement of the measurement. The practical result, therefore, of this decision seems to be that measurement, which is in every case a question of fact, should begin from the top of the foundation if the portion from this level is uncovered. The same point arose again in *Knight v. Cubitt*, but here the building, instead of being new, was old, and was in course of demolition. The whole of it was admittedly under 30 ft. high at the time of the accident in question, except the party wall. Here again the decision of the Court was in favour of the workman, it being held that a substantial part of the building, namely, the party wall, was more than 30 ft. high. If ever a statute of the realm gave rise to legal conundrums it is the Workmen's Compensation Act, and every decision in it in regard to the height of buildings shows most clearly what gross injustice it is to allow this limitation to remain in force. Had it happened that there had been in the instance under notice been no party wall, it is obvious there would not have been any ground for the allowance of compensation; as it was the workman benefited by the fact that a bit, and a bit only, of the building of the requisite height was still in existence. It is equally obvious that, in the demolition of a building, a workman may be injured at two o'clock in the afternoon, when the building just exceeds 30 ft., and be entitled to compensation; at

half-past two the same thing may occur, but as by this time some rows of bricks have been knocked off the walls the injured man is not entitled to a farthing.

In the same case a point of no little importance in these days, when old buildings have to give place to new, was also decided. Messrs. Cubitt had entered into a contract to demolish and rebuild some premises, and for the former purpose they employed an independent contractor, a house-breaker. The workman was employed by the latter, and not by Messrs. Cubitt, and the point was whether or not they were liable for the injury to the workman. We confess that we should have thought the point was clear enough. The first contractor is liable for sub-contracts, says the Act, unless the work done by the sub-contractor is "merely ancillary or incidental to and is no part of, or process in, the trade or business carried on by such undertaker." Clearly, if a firm undertakes to demolish and rebuild a house, the demolition is a substantial part of the contract. Here, again, the Act is not altogether just, because the line between what is and what is not ancillary to the contract entered into may be extraordinarily narrow.

Some decisions on the mode of estimating the compensation due to workmen who have been injured must now be noted. They have considerable bearing on the case of irregular employment. In *Wbeale v. the Rhymney Iron Company* there was no regular contract of employment, but the man injured was engaged to work on a Wednesday, and continued to work every day, including Sunday, until the following Wednesday. The County Court judge took the average weekly earnings as being six times his daily pay, but it was urged by the employers that he should have taken half that sum, since the workman had not worked two full weeks, and therefore that the sum he had earned per day should be spread over two weeks. But the Court of Appeal agreed with the County Court judge; the man had worked for eight days, and therefore the rate per day was sufficient basis by which to arrive at the amount of compensation which, by the Schedule to the Act, in the case of a workman employed for less than three years was to be 156 times his average weekly earnings. In *Bartlett v. Sutton* the man who met with the accident had only worked for one day for the same employer. He was a casual labourer, and there was no evidence that he would have continued longer in the same engagement, though there was, perhaps, a possibility of it. In this case the Court took the single day as the basis of the average weekly wage in the employment of the same employer. This seems to be not altogether a fair average, because unquestionably most casual labourers would gain more in a week than a day's wage. But the Act is only an imperfect means of arriving at a standard of compensation—a rough and ready measure at the best, and if in such a case it is hard upon the workman, it might if more liberally construed be unjust in other cases to the employer.

This selection from the new decisions of the Court of Appeal includes those which are of most importance to the readers of this journal, and from them it will be obvious how desirable it had become that the appeals waiting for decision should be speedily dealt with by the Court.

## NOTES.

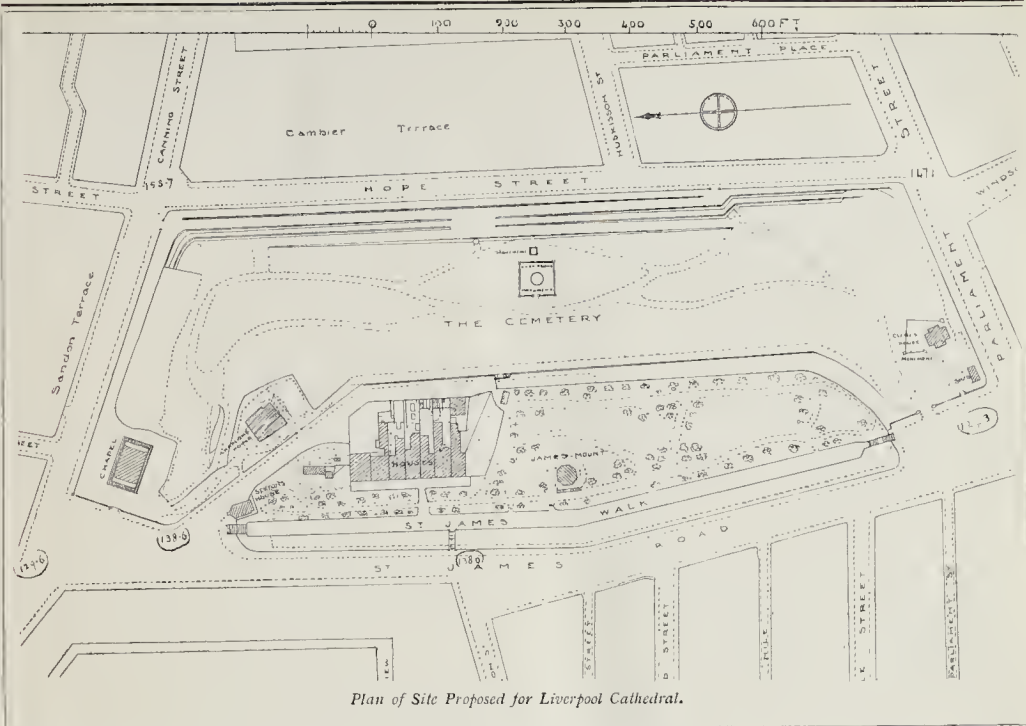

Liverpool  
Cathedral.

We give at the head of the next page a plan of what is called the St. James's Mount site proposed for the Liverpool Cathedral, though we may observe that there appears still to be no certain information as to what portion of this ground is really intended as the site of the Cathedral. From what has come out, informally, as to the ideas of the Committee, we may assume that the original proposal was to place the Cathedral on the portion of the ground which is called St. James's Mount, and which is here shown laid out as a garden. That site would have necessitated the placing the longer axis of the Cathedral north and south instead of east and west; and even then the width of the site is only just sufficient for the average measurement across the transepts of our English cathedrals. We do not regard the north and south alignment as a serious objection in itself, as, after all the east and west position has been only uniformly observed in England, and has not been a general rule in Christian churches elsewhere. If, however, the east and west alignment is desired, for the sake of uniformity with English practice, it is obvious that the choir must be built over ground which is now a cemetery, and monuments and graves must be disturbed to do this, which seems exceedingly undesirable. It may be added that the cemetery is formed at the bottom of an ancient quarry, and that there is a sheer drop of sixty or eighty feet, or thereabouts, between the level of the "Mount" and that of the cemetery. The plan serves to show how completely the site is devoid of any opportunity of central approach and vista; for a cathedral, in fact, it is what can only be called a hole-and-corner site. Mr. Myddelton Shallcross, a Liverpool architect who has already written forcibly on the subject, had an excellent letter in Tuesday's *Times* pointing out again the unsatisfactory nature of this site, and urging the Committee to take up what is called the London-road site, which has our strong approval and that of the Liverpool Architectural Society. This was followed however on Wednesday by a letter from Sir W. Forwood, as representing the Committee, stating that it was no use unsettling the minds of competitors by advocating another site, as the site had been definitely fixed at St. James's Mount and the levels were being taken. The fact of the levels having been taken, however, does not commit them to anything but the surveyor's fee, and we hope they will still reconsider their unwise decision, and abandon a site which, for the purpose of a large cathedral, may be said to have been condemned by the whole architectural profession.

Electrical  
Engineering in  
Germany.

In a paper read this week to the Dublin local section of the Institution of Electrical Engineers by Mr. P. S. Sheardown an instructive account is given of the official visit by many members of the Institution to Germany last summer. What seems to have impressed English electricians most was the absence of crowding in German engineering works. The rooms were spacious, lofty, excellently lighted, well ventilated, and kept scrupulously clean. Many of the companies provided "Kasinos" for their workmen, which contain reading-rooms, dining-

Plan of Site Proposed for Liverpool Cathedral.

rooms, bathrooms, &c., and where weekly lectures on scientific subjects were given by members of the staff and others. Another point which impressed the visitors was the almost entire absence of belts and shafting, the machines being nearly always driven by electric motors. This enables the lighting of the workshops to be done efficiently and economically by means of inverted arc lamps, the light being reflected from the ceiling into the room. Mr. Sheardown visited the high-speed electric railway which has been constructed between Berlin and Zossen for military purposes. He incidentally mentions that the electric motors make an alarming "purring" noise. Polyphase working seems to have made immense progress in Germany during the last five years. We think that this is mainly due to the very superior mathematical training given to the German electrician, which enables him to utilise the extraordinary adaptability of this system of working to all manner of practical problems. The visit to the Technical High School at Charlottenburg was most instructive. The complete and thoroughly up-to-date equipment of the school took English electricians by surprise. We are accustomed in this country to let students experiment with any antiquated dynamo, and to make measurements as best they can with old ammeters and voltmeters. It was a revelation to see students attaining an accuracy in their measurements which would more than satisfy practical requirements. Dr. Slaby, the principal of this school, has developed a system of wireless telegraphy which is rivaling the Marconi system, and Professor Josse, one of his colleagues, has shown that it is possible to get 30 per cent. more work from the "waste heat" of a steam engine by utilising it to work an auxiliary engine whose working substance is sulphur di-oxide.

UNDER this heading Mr. Blashill wrote a short letter to the *Times* last week commenting on the number of instances in which a death or deaths from fire occurred in the case of persons living over a shop filled with specially combustible materials. Mr. Blashill suggests that these minor cases of loss of life by fire, and the circumstances under which they occur, are not sufficiently considered, and that there ought to be legislation to the effect that the first floor of such houses should be compulsorily constructed so as to be so far fire-resisting as at least to give time for the fire-brigade to reach the spot before the fire had got so far as to render escape from the upper stories impossible. He adds "I should like to see any responsible person oppose an Act for bringing this about within five years." We quite agree with him.

An address on "The Thames: The Thames as its Tributaries, Banks, and Bridges," was delivered by Mr. Charles Welch on Thursday last week at the London Institution. The lecturer had little or nothing new to say, but, with the aid of excellent lantern views, he gave an interesting account of the river and the principal objects of interest associated with it, the survey actually extending from the source of the river to Gravesend. Perhaps the most interesting and useful part of the address was the description of the river as a grand highway in former times, and of the use the Court and Corporation made of it on occasions of public processions. He might have alluded to the possibility of the river being again used on such occasions, to say nothing of its more general use for purposes of every-day transit, for there appears to be no satisfactory reason why the Thames should not be used more

than it is as a highway; and at a time when so much attention is being given to the subject of transit in London, it seems extraordinary that something is not done to make better use of the river. Why should not the Lord Mayor's Show, for instance, proceed along the Thames from London Bridge to Westminster, returning by way of the Embankment? There is plenty of space on the Embankment for sightseers, while, if this suggestion were adopted, many of the streets in which traffic is stopped or disorganised on such occasions would not be affected.

In a "Note" on May 18 last Hogarth's House, we announced that a committee had been formed for raising a sum of about 1,500*l.* wherewith to rescue the house in Chiswick-lane from destruction, and to preserve it as a Hogarth Memorial and Museum. We observe that the property, which is copyhold and has about half an acre of garden, will be offered for sale at the Mart on November 25 current. We published an illustration of the house in our number of February 8, 1890. Hogarth bought it in or about 1750, and occupied it as a summer residence until his death on October 26, 1774, in Leicester-fields, leaving it to his widow, who demised it to her relative Mrs. Mary Lewis, who died in 1808; it then passed to some persons named in Mrs. Hogarth's will. The house was subsequently tenanted by Henry Cary, the translator of Dante. It was built in the earlier years of the eighteenth century of red stock brick, with rubbed brick dressings; on the first floor in the north and principal front is a bold wooden bay window, and it has a moulded wooden eaves-course. It is said that Hogarth planted the mulberry tree and that Garrick gave him the two leaden urns upon the gateposts. In 1890 the house—which had been not well cared for and let out in tenements—was taken by

the Typographic Etching Co. for the Hogarth Works. It is to be hoped that, even at the eleventh hour, some means may be found to purchase this interesting house and save it for the nation.

By direction of the late Sir John Millais' trustees, No. 2, Palace-gate, Kensington. Palace-gate will shortly be offered for sale at auction. The property has a frontage of about 80 ft. on the east side of the road, and occupies an area of about 7,400 ft. The house was built for Sir John Millais, P.R.A., on a plot of ground which he bought from Messrs. Cubitt & Co., who built it for him, after the plans and designs of P. C. Hardwick: it is illustrated in the *Builder* of June 10, 1876. The entrance hall measures 29 ft. by 26 ft.; on the first floor landing is a fountain by Sir Edgar Boehm, and on the first floor is the studio, 56 ft. by 49 ft., and 24 ft. high. The design is after the Italian style, carried out in red brick, with dressings of Portland stone.

On Thursday last week, at a sitting of the Consistory Court of London, Dr. Tristram, K.C., Chancellor of the Diocese, agreed to grant a faculty, after a novel kind, in respect of this church. The Rector and Churchwardens applied for powers enabling them to provide increased accommodation for the celebration of morning service for men who arrive at Broad-street and Liverpool-street stations by workmen's early trains, yet must wait an hour or longer before they can begin their work. During some while past about 200 women and girls have attended the early services in the church, which has sitting room for 184 persons, and a tent for men has been fitted up in the churchyard for congregations of about eighty men. The proposed building, which will cost about 1,000*l.*, is to be erected at the east end of, and will communicate with, the church. All Hallows was built in 1765-7, at a cost of 2,941*l.*, after the designs of George Dance the younger, and contains a monument, with bust, of John Patience, architect, and a copy of P. da Cortona's picture of Ananias restoring sight to Paul, which Sir N. Dance painted and presented as an altar-piece. Of the former church we published, on April 25, 1885, a view taken from the series of engravings published by R. West and W. H. Toms—the view being engraved by Toms after a drawing by R. West, 1736, together with Toms's account, which he manifestly copied *verbatim* from Hatton's "New View" of 1708. The present fabric was thoroughly renovated at a cost of about 1,700*l.* in 1897-8 by the late Sir Arthur Blomfield. In 1894-5 the Metropolitan Public Gardens Association laid out the churchyard that abuts against a piece of the old City wall which separates it from the gardens of some houses in New Broad-street; the Vestry, it is said, stands upon a bastion of the wall.

Messrs. Simpson & Sons, the well-known firm of decorators, have produced what they claim to be a permanent vitreous fresco decoration. The new material is an earthenware, upon which the fresco painting is made and fused in by a burning process. This vitreous earthenware is prepared in slabs about 8 in. square,  $\frac{3}{4}$  of an inch thick. The

surface is capable of various texture, the roughest surface being used for draperies and backgrounds, and smoother faced pieces are used for the flesh and more delicate draperies. The material is cut into shapes following as far as possible the lines of the design, as in the case of a leaded light window. The back of the material is roughed as a key for the cement, by which the whole is fixed in position, forming a concrete mass with the brickwork or other building material to which it is attached. Messrs. Simpson & Sons say that it is only half as costly as mosaic, and claim that it does not hold the dust and soot as mosaic does when used in this country. That is reasonable. The life of mosaic depends not merely on the material and design, but on the pieces being on varied planes and at different angles, which gives a rugged surface that will hold any amount of dirt. There is room for Messrs. Simpson's experiment, whether under the title of fresco or colour decoration. We imagine the process itself is more akin to the Della Robbia earthenware, without the glossy glaze, than to fresco painting, which mellows with age. With such a permanent material none but the most accomplished decorative artists should be allowed to perpetuate their work.

The New English Art Club.

THE exhibition of the New English Art Club includes among its eccentricities a few very interesting and powerful studies in style, in landscape especially. Mr. Muirhead's "The Water Mill" (100) has a touch of Constable about it; Professor Brown's "Woolhampton" (90) seems rather like a new application of the method of Diaz; Mr. W. H. Bell's "The Pond—Early Spring" (103) is a bright sketch full of light; Mr. Wilson Steer's "The Grove" (116) a good sketch of the effect of light through foliage; Mr. W. W. Russell's "Chepstow" (127) is a fine landscape in every sense; Mr. Sims has got a powerful effect of storm in the interrupted picnic (133), and Miss Alice Fanner shows her usual fine open-air effect in "Breezy Day on a Farm Datchett" (142). Mr. Orpen paints two interiors with the same not very beautiful young woman inhabiting them—"A Window in a London Street" (69) and "The Window Seat" (130); unfinished interiors, but treated with originality and effect. Architecture suffers badly at the hands of some of the members; Mr. Walter Sickert's "St. Jacques" (125) appears to be a building constructed of mud; in Mr. Bernard Sickert's "Groote Kerk, Dordrecht" (122), the tower is not upright; and Mr. Brabazon asks us to accept shapeless splashes of colour at all angles as buildings. In contrast to these Mr. MacColl's "Belfry and Watch-tower of Calais" (5) is a good little architectural picture; so is Mr. Fry's "Chantilly" (54). The best picture in the whole collection is perhaps Mr. Walter Osborne's "The Lustre Jug" (77), a sketchy interior with figures and bric-à-brac which shows great power in its way.

The Modern Gallery.

AT the Modern Gallery there is a collection of water-colour drawings by Mr. Herbert J. Finn, whose architectural pictures we have noticed before at this gallery; in this case the collection is diversified by a good many sketches and studies of landscape. From

an architect's point of view, as we have before suggested, Mr. Finn treats cathedrals too much in the spirit of a landscape-painter; their degree of surface decay is in many cases exaggerated for the sake of picturesque effect. This is the case in nearly all the studies of Lincoln Cathedral, the greater part of which is, in fact, in remarkably good preservation considering its age. The large view of "Durham Cathedral—Evening" (52) has not this defect, and is a very fine work both in colour and composition. "Durham Cathedral—Morning" (62) is a morning mist effect with the towers reduced to silhouettes; the effect is finely rendered, but the towers are too lofty in proportion, the centre one especially. The west front of Ely is shown with the south turret very much out of perpendicular, leaning away from the centre; we do not recollect any such marked settlement as is shown here, nor is there any indication of it in a photograph which we have before us; at all events we should think it is exaggerated. The west front of York Minster, again, is much cleaner and sharper in line, all except the lowest portion, than is here shown. This kind of picturesque treatment of buildings is probably the most pleasing to painters, but it does not satisfy architects. All the drawings from Winfield Manor, in making which the artist seems to have been in a more architectural mood, are satisfactory in this respect, and show a good and solid masonry texture; "The Crypt, Winfield" (51) is especially good. We were much interested in Mr. Finn's landscape sketches, which, though slight, and apparently done for the sake of a diversion from his architectural pictures, show so much feeling for colour and effect in landscape that we would suggest that he would do well to give more of his time and ability to this class of subject.

Society of British Artists.

THE exhibition of the Society of British Artists in Suffolk-street presents, as usual, a melancholy superfluity of artistic common-places; but there are a few works worth picking out from their surroundings. Among these is Mr. Foweraker's "Exeter Quay" (100), a fine work both in colour and composition. Among other pleasing landscapes are Mr. Walter Fowler's "Early Autumn" (8) and "On the Norfolk Marshes" (103), and various small landscapes by Mr. Val Davis (35), Mr. J. E. Jacobs (48), Mr. Westley Manning (45), Mr. A. E. Proctor (64), Mr. F. Spenlove-Spenlove (99 and 226), and Mr. Whitehead (118). Mr. Foottet's "Pont Neuf, Paris" (112), seen under a special effect of light, is clever, though looking rather like a stage effect than a genuine one. Mr. R. C. Bunny has aimed at something higher in his figure-picture under "L'Age d'Or" (67), there is a fine sense of colour in this, though it rather suggests an attempt to imitate Mr. G. F. Watts. The President (Sir Wyke Bayliss) exhibits, as usual, some highly-wrought interiors of cathedrals—"Malines" (81) and "Interior of the Duomo Pisa" (265), and there is also an able painting of the interior of "S. Sophia, Constantinople" (328), by Mr. Henderson, whose illustrations of S. Sophia in our pages will be remembered by some of our readers. The screen of small sketches by Mr. Lentestey is of considerable interest.

Messrs. Dowdeswells Gallery. At Messrs. Dowdeswells' Gallery in New Bond-street is to be seen, under the circumstances of artificial lighting apparently considered appropriate for religious pictures, M. Eugène Burnand's large painting, "Christ's Prayer after the Last Supper"—a fine and serious work which does not stand in need of any such adventitious aid to its effect. The scheme of colour is somewhat conventional, the artist having evidently aimed at keeping all the costumes and surroundings nearly colourless in order to concentrate the effect on the heads of Christ and the apostles; there is a white wall behind, its surface only broken by a shallow wall arcade, and the white tablecloth in front, the line of the table cutting level across the centre of the picture, the remains of the supper being all removed so as to leave no disturbing detail. The contrivance is a little too obvious and gives the scene the air of being rather symbolic than real; but perhaps this was the intention. The figure of Christ, facing the spectator in the centre, is treated with sculptural severity, the drapery falling in straight vertical lines; those of the eleven apostles (for this of course is after the disappearance of Judas) fall into more variety of line and pose, contrasting with the central figure. The apostles' heads are a series of very interesting studies, full of force and character; that of Christ is of the usually accepted type, and is solemn and spiritual in expression. Altogether this impresses one as a religious picture painted with sincerity and seriousness of aim; a picture better suited, it is true, to the church than to the picture-gallery; but is not that exactly the feeling which a painting of such a subject should suggest?

#### EGYPT EXPLORATION FUND:

##### GENERAL MEETING OF MEMBERS.

The fifteenth ordinary general meeting of the Council and members of the Egypt Exploration Fund was held at the Society of Antiquaries, Burlington House, on Thursday evening, 7th inst., Sir John Evans, the President, in the chair.

The Rev. R. A. Bullen proposed the re-election of the members of the Committee, the only change being the substitution of the name of Mr. Herbert Thompson for that of Sir Hermann Weber, M.D.

This was seconded by Mr. Sewell and adopted.

Mr. J. S. Cotton and the Rev. W. C. Winslow (Boston, U.S.A.) were re-elected hon. secretaries, and Messrs. H. A. Grueber, F.S.A., and F. C. Foster (Boston, U.S.A.) hon. treasurers.

The Hon. Treasurer then read his Report, which showed that the financial position of the Fund was much better than last year. It was mentioned in the first instance that the affiliated branch at New York had ceased to exist; but this loss was more than compensated by a new branch which had been established at Pittsburgh, and from which they had received large contributions. As to the Exploration Fund, the total disbursements had been 2,351*l.* 18*s.* 8*d.*, made up as follows—1. By the expedition account, 1,443*l.* 2*s.* 10*d.*, being the amount incurred on the work done at Abydos under Professor Petrie. 2. By publications they had spent 366*l.* 15*s.* 11*d.*, which included, besides the proportioned charges for the Archaeological and Annual Reports, the remaining outlay on "Denderah and the Royal Tombs," vol. i., and on the extra volume, "Diospolis Parva," by Professor Petrie, &c. 3. Various other items of expenditure which were stated. The total receipts over the same period had been 3,788*l.* 11*s.* 8*d.*, and they were able this year to carry over to their credit a balance of no less than 1,437*l.* 10*s.*, even after providing for the deficiency of 181*l.* 15*s.* 3*d.* of last year. In the archaeological survey the

total disbursements during 1900-1901 had been 523*l.* 8*s.* 5*d.*, and the receipts 723*l.* 0*s.* 4*d.* In the Græco-Roman branch the payments had amounted to 1,016*l.* 16*s.* 8*d.*, of which 459*l.* 19*s.* 4*d.* was devoted to the expedition account, which included the excavations conducted by Mr. Grenfell and Mr. Hunt at Rubbyat; and the receipts of the branch over the same period were 1,170*l.* 15*s.* 10*d.* Last year there was a considerable falling off in subscriptions, but this year they had recovered their position, for those in England showed a considerable advance, while those from America were more than doubled.

The President then read a short address. He commenced by referring to the losses the Fund had sustained by the death of Sir Greville Smyth, of Ashton Court, near Bristol, who was for many years a subscriber to the Exploration Fund; Mr. Arthur Cates, the well-known architect and architectural adviser to the Woods and Forests, who took a warm interest in the study of antiquity; and Mr. Joseph John Tylor, the eldest son of the late Mr. Alfred Tylor, F.G.S., who forty years ago was busily occupied with the discovery of flint implements fashioned by the hand of man in the gravels of the river Somme, near Amiens. Mr. Tylor's acquaintance with Egypt originated in a visit to that country in pursuit of health, but he soon became absorbed in the interest of carrying on excavations, and one of his principal aims was to obtain and preserve absolutely accurate reproductions of wall-paintings and hieroglyphic inscriptions on Egyptian monuments; and as a means towards this end he combined the use of photography with careful finishing by the hand and brush. It has been said of his series of the "Wall Drawings and Monuments of El Keb," published from 1895 to 1900, that they present as near an approach to absolute reproduction, even to the texture of the material represented, as has ever been attained. Referring to the scene of their operations during the past season, he observed that by the presence of re-used vases, and by the style of the sealings, Professor Petrie had succeeded in placing the tombs of the kings in a fairly trustworthy chronological sequence. The share of the spoil which was allowed to come to England was, in accordance with former precedents, exhibited during the month of July at University College, to the authorities of which they were much indebted, and also to the Museum authorities at Cairo for the equitable—if not, indeed, liberal—manner in which the produce of the excavations had been divided. Among the objects retained at Cairo were the four remarkable and artistic bracelets, of which coloured representations were given in the frontispiece to their volume. Their history was romantic. It would seem as if at a time when the tomb was anciently plundered the mummy of the queen of Zer or Teta, the second King of the First Dynasty, was broken in pieces, and a fragment of the forearm placed by one of the plunderers in a hole in the wall. For more than 1,000 years offerings were made at the Osiris shrine into which the tomb had been converted in the days of Amen-hetep III., and thousands of visitors must have passed within a few feet of the fragment, but without disturbing it. The Copts destroyed the shrine, and the *Mission Amélicaine* cleared the tomb, but still the arm lay untouched; but at last it came under the notice of Professor Flinders Petrie's workmen, and was brought to him, the bandages carefully removed and the bracelets brought to light. They were probably the earliest examples of female jewellery known, dating back as they seem to do to about 4,700 years before Christ. Among the objects exhibited in London might be mentioned the sceptre and the gold-capped marble vases of the seventh and last King of the Eleventh Dynasty, dating from about 4200 B.C. The sceptre was built up of pierced cylinders of card placed upon a central core of copper and had originally been at least 26 in. in length. A large stèle of Fer-ab-sen had gone to the British Museum and a curved bar of gold with the name of Aha to Chicago. The whole collection had now been divided mainly between the United Kingdom, including her Colonies and the United States of America, but portions had also been assigned to some European States, the principle of division adopted being that each country should, as far as possible, share *pro rata* in accordance with the amount that each had contributed to the Fund. In reference to Professor Petrie's work on "Diospolis Parva," he had one point of difference with the author

as to describing the period of which he treated as the "Prehistoric Period." He would rather term it the "Pre-dynastic," and thus limit it to Egypt and connect it with dynastic times. To regard a single cemetery in Egypt as representing half the prehistoric period, and to devote only three-tenths of the whole period to the days when metal was not known—for copper implements come in at the beginning of the series—seemed to him to be absolutely in disaccordance with what we knew of the neolithic period in other parts of the world, and to be entirely out of proportion even when regarded from the Egyptian point of view. The term "pre-dynastic" got rid of all those difficulties. Another publication of the Fund, which would now shortly appear, was "The Temple of Deir El Bahari," No. IV., which would comprise plates relating principally to the Temple of Hathor and the southern Hall of Offerings. The wall-paintings were of great interest, and the long religious texts subsequently incorporated into the Book of the Dead were worthy of notice, especially as Mr. Naville had offered a translation of one of them which somewhat differed from that of other authorities. The archaeological survey had during the past year produced two volumes, one of which, however, was only on the point of being issued. The first of these was *Plah-hetep*, Part II. The second was a detailed account of the Rock Tombs of Sheikh Said, prepared by Mr. M. de Garis Davies. The tombs, according to the list, were 102 in number, and belonged in the main to the ancient kingdom. The memoir was illustrated by thirty-four plates, and would be found full of archaeological information. With regard to the Græco-Roman branch, the Report was less satisfactory, though the volume of Fayoum papyri had for some time been in the hands of subscribers. The study of papyri required both time and daylight, and he feared that Messrs. Grenfell and Hunt had during the past year undertaken tasks for which these two necessities hardly sufficed. The examination and publication of Lord Amherst of Hackney's fine collection was a grave undertaking, and the editors were to be congratulated on the completion of their work. When, however, they undertook for Mrs. Hearst, of California, the editing of the Ptolemaic papyri, the time left at their disposal for the work of the Græco-Roman branch was fearfully curtailed, and but little could be done. It was hoped that an arrangement could be made by which a copy of this volume would be sent to each subscriber to the branch in lieu of the ordinary annual volume, or possibly of two; and if the papyri were of the character which he had heard assigned to them, he believed that they would have reason to be satisfied with the arrangement. Mr. Grenfell informed him that the papyri came from the cases of mummies of crocodiles, and that many of them were of extremely large size and well preserved. They all belonged to the period between B.C. 130 and 80, and were for the internal history of Egypt of great importance. The most remarkable, perhaps, constituted a series of forty-five decrees of Ptolemy Evergetes II. on a great variety of subjects. Official documents of all kinds were strongly represented, the source of a large proportion of the papyri having apparently been the bureau of the village scribe, who also kept the official archives of the place. Among literary fragments there were portions of two or three anthologies, including part of a chorus of a tragedy dealing with Iphigenia. A special feature of interest was that these documents formed a sort of pendant to the Petrie papyri, and carried on the history of the military colony in the Fayoum to its later developments. *Inter alia*, they went far to solve some of the most vexed questions with regard to Ptolemaic numismatics. The address concluded with a few remarks on the present position and hopeful future prospects of Egyptian archaeology.

The Hon. Secretary, Mr. J. S. Cotton, then read his Report, in which he observed that from an administrative point of view the chief feature of the past year had been the strengthening of their connexion with the United States. The two old affiliated branches of Philadelphia and Chicago were now both represented on the Committee by Americans—Major Cassatt, Military Attaché at the Embassy, and Mr. Louis Dyer, who was as well known at Oxford as at his original University of Harvard. From the Boston office they had received this year the equivalent of 10,000 dols., instead of 6,000 dols. last year. It must always be borne in mind that these liberal contributions from America

were frankly sent in view of a return in the form of antiquities and papyri for American museums and libraries. In accordance with their rule of following strictly the proportion of local contributions, the American share had been divided between five great museums—at New York, Boston, Philadelphia, Pittsburg, and Chicago.

Professor Petrie then read the following address:—

"This year we have the satisfaction of completing the most important historical work that had yet come into our hands. The continuous order of seventeen kings has been established, and the very foundations of Egyptian history have been settled in a manner which has hitherto seemed entirely beyond hope. The Royal cemetery of the tombs of the Kings at Thebes, belonging to the Eighteenth-Nineteenth Dynasties, and that of the pyramid-builders at Memphis of the Fourth-Sixth Dynasties, are the only series of Royal tombs yet known, and neither of those had added anything to the history, which was already fixed by other monuments. But the recovery of the Royal tombs of the earliest dynasties has given us not only another Royal cemetery, but has provided the only contemporary history of their time, and completely vindicated the historical character of the lists which had been preserved by later ages. The criticism of myths had told us that Mena, the founder of the Egyptian monarchy, was but a form of Manu, the lawgiver of India, and of Minos, the hero of Crete; and to hope for tangible monuments of his time was but seeing castles in cloudland. Now the long line of a dozen kings back to Mena is clear before us; we have seen and handled the gold, the crystal, the ivory, with his name and engravings, and even the kings who went before him are better known to us by actual objects than are half the Saxon kings of England. No such complete materialisation of history has been obtained at one stroke from any other country or age. And such a result was least to be expected from ground which had been pronounced exhausted, the last clearance of which unhappily had just been made before our work there. That previous clearance has not restored a single detail of the succession of the names, nor identified the historical position of a single king. It has only swept away the greater part of the materials, and left a chaos of destruction behind it. The whole of what we have covered by our work was from the overlooked residue which had escaped all the plunderers; that invisible margin was the total of what we had to use, and that a hundredth of all that had existed there, has sufficed to reconstruct the historic fabric. So difficult is it to really destroy history that we may now say that our methods—which will doubtless be improved—can resuscitate knowledge of a period of which the remains have been destroyed time after time by zeal and greed. By the use of a trained body of workmen, who had been taught in past years to notice and preserve the objects in their work, we recovered a far larger amount of material than we had hoped for. The splendid bracelets of gold and jewels, the gold bar of Mena, the gold sceptre, the gold-capped vases, were beyond all expectation; and the more instructive remains include about twenty engraved tablets and dozens of fragments, five Royal tombstones and 150 private tombstones, over 200 different scalings, nearly 100 inscriptions on stone vases, 800 stone vases restored, and many hundred of small objects of the greatest interest as illustrating the civilisation. Altogether, in the two volumes issued to you there are over 500 photographs, over 2,000 drawings, and nearly 2,000 marks, besides the full and detailed plans and sections of the whole of the tombs. None of this mass of material, which also has enabled us to restore the earliest dynasties, would ever have been known had we been content to leave the subject where the common routine of excavation had already abandoned it. You see before you on the largest scale an objection on the futility and destructiveness of a mode of work which was no worse than the greater part of what has been perpetrated in Egypt in the name of excavations during the last hundred years. Now there awaits us yet the great temple site of Abydos, the ground of the earliest temple, that of Osiris. It has been largely dug over for earth, and some monuments have been removed, but the lower levels of it are yet untouched. It seems that this was probably

the burial-place of the head of Osiris, the great relic which drew around it the burials of the historic times, and probably also was surrounded by those of the earliest dynasties, as one such grave has been found there by accident. The site is a very large one, about 500 ft. by 1,000 ft., or three times the size of the whole of Trafalgar-square and its roads, and it will have to be turned over 12 ft. deep. If we get a third of that, or as much as Trafalgar-square, turned over in the course of a season, that will be as much as one can expect, so that some three years will be occupied in undertaking this great site. It is in that ground that we may hope to find tombs of the earliest historic time, and carvings in stone and ivory of the primitive kings, like those from Hierakonopolis. Our treasurer must appeal to you to ensure that this most promising site of all Egypt is thoroughly and finally explored. It is now twenty-one years since I first began work in Egypt; Mariette then ruled, and this Fund was yet unborn. In those days the Pyramid of Khufu was our boundary of history; nothing whatever was known of the archaeology of Egypt as a comparative science, and no trace of Europe in Egypt was thought of, earlier than the Ptolemies. The situation now is completely different. The monumental history has been carried back to the very beginning of the written record, which has been entirely confirmed; and, beyond all that, the whole course of the prehistoric civilisation has been mapped out for perhaps 2,000 years more completely than has been done for such ages in any other land. The archaeology is better known than that of the most familiar countries; not a vase or a bead, not an ornament or a carving, but what falls into place with known examples, and can be closely dated. The connection with Europe has been led back to the beginning of Greek records, then to the Mycenaean times, next to the Twelfth Dynasty, and now even to the First Dynasty, and Egypt is the sounding line for the unmeasured abysses of European history. No such opening of new fields to the mind has come to pass since the days when the Renaissance scholars burst into the world of lost Classic authors; even the surprising unfolding of Assyria and Babylonia lacks the historic completion of the Egyptian record, and is still almost untouched in its archaeology and development. We cannot expect the next twenty-one years to be as potent as that which we have seen, for the great outlines are now laid down; but many a dim passage in the long course of the history yet awaits the light, and it will be the duty of the new century to fill in, as far as possible, the details of the picture which has been sketched in the last few years."

The Chairman expressed the thanks of the meeting to Professor Petrie for his very able and interesting address, and remarked that no one had done so much for England to unravel Egyptian history as he had. He congratulated the Professor on the great success he had achieved at Abydos. The work he was about to undertake would not be completed for three years, and he wished him success.

The vote having been accorded, Judge Baylis proposed a vote of thanks to the chairman, remarking that he was glad that the Fund realised what great services he was rendering to them by accepting the presidency.

Mr. D. Hogarth seconded, and expressed a hope that the explorations would be continued in the Delta of Egypt.

The Chairman, replying, remarked that the discoveries in Egypt were very important, and he was greatly interested in the movement. He was glad to find the finances in such a healthy condition, and he had no doubt that the result of the next few years' inquiry by Professor Petrie would yield valuable information.

This concluded the meeting.

#### GLASGOW ARCHITECTURAL CRAFTSMEN'S SOCIETY.

—The usual meeting of this Society was held on Friday evening, the 8th inst. Mr. James McKisack, President, in the chair. Papers were read by Messrs. Robt. Stuart and D. S. Pringle on Soft Woods and Hard Woods respectively. Each essayist described the growing timber and its conversion into various market forms, with descriptions of many of the trees of each respective class. Such points as the relative durability and prices of timbers, and the suitability and adaptation of these to various works, were discussed by the members, whose thanks were conveyed to the lecturers for their instructive and eminently practical papers.

#### THE ARCHITECTURAL ASSOCIATION DISCUSSION SECTION.

The second meeting of the present session of the Discussion Section of the Architectural Association was held at 56, Great Marlborough-street, W., on Friday, the 8th inst., at 7.30 p.m.

Mr. R. H. Weymouth was in the chair, supported by the hon. secs., Messrs. J. H. Pearson and H. Gregory Collins. There was a good attendance, and the book was signed by twenty-one members and ten visitors. Several questions were asked during question time and replied to by members.

The Chairman then called upon Mr. W. E. Davis to read a paper entitled "The Finishing of a Dwelling-House," which dealt, in a practical and interesting manner, with the many difficulties which beset the path of the architect, and which is printed nearly in full below.

The discussion was opened by Mr. H. P. Maule, who proposed a vote of thanks to the author, which was seconded by Mr. Lishman, and the discussion was carried on in a hearty manner by Messrs. Greenop, Geoffrey Lucas, J. H. Pearson, L. Hunt, Max Clarke, and the Chairman.

The Special Visitor, Mr. Walter J. Millard, was then asked by the Chairman to sum up the discussion which had resulted from such an excellent paper.

Mr. Millard said the subject had been treated in a very exhaustive manner. He quite agreed with all the remarks of the author that it was most important to give every attention to minor matters when planning the dwelling-house, and that it was necessary to show some forethought in matters of detail. We should combine the practical with the artistic, but, above all, he wished to impress upon the minds of the younger men the desirability of practising restraint in their work. It was essential that the cupboards and fittings should be designed by the architect, and that the client should be consulted in all matters.

A vote of thanks to Mr. Davis for his valuable and practical paper, and to Mr. Millard for so kindly attending as Special Visitor, also to Mr. Max Clarke and Mr. H. P. Maule, was passed with acclamation. Mr. Davis having replied, the meeting terminated. It was announced that the next meeting would be held on Friday, the 22nd inst., when Mr. G. H. Smith has promised to read a paper illustrated by lantern slides on "Canterbury Cathedral."

#### FINISHING A DWELLING-HOUSE.\*

THERE are two persons to whom a man shows a most commendable modesty as to his financial position; the opportunity in the one case recurs annually, and in the other not so frequently. The first individual is the Income-tax surveyor, the other his architect; but, while in the latter case he is so modest as to his means (sometimes this display of modesty commences as early as arranging for special fees), when he comes to his requirements he throws modesty and every other virtue to the winds. The result is, that instructions having been given for the preparation of the drawings, the client frequently calls during their preparation and suggests that he wants this, that, and the other; and that his wife wishes for something else; the architect unconsciously adding and adding, until the approximate estimate given at the commencement of negotiations would, upon a little consideration, look somewhat foolish. These approximate estimates are another source of trouble to the architect. He is generally expected to give an idea of the cost, "roughly, of course," says the client, at the same time making a very keen mental note of the amount, to be brought up later for the architect's discomfiture, when he, poor modest man, afraid of offending his patron, does not like to mention his (the patron's) liability for the extra cost. Of course I leave out of consideration those architects of whom I have heard, but with whom I have fortunately had few dealings, who purposely deceive their clients as to the probable cost of the work, hoping thus to commit them to something, and trusting to luck to get out of the hole they have got into by their dishonesty. These individuals are not worthy of our commiseration.

However, to return to the case under consideration. The drawings are prepared, and

\* A paper read at the Discussion Section of the Architectural Association, on the 8th inst., by Mr. W. E. Davis.

some "more" the specification, and if the architect is wise the quantities also—but not by the architect; as to this, I would refer you to the paper read here about twelve months ago by Mr. Buss. The tenders arrive and are opened; then follows the little speech that we know so well, "Thank you, gentlemen, for your tenders; they are all higher than I anticipated—in fact, considerably more than my client is prepared to spend." Later on comes the "cutting-down" stage, the detestable job hated by all. The architect is naturally anxious to get his job started, so that he sometimes lapses from that discretion that ought always to characterise an architect's actions. He is said to his credit that he sacrifices himself upon the altar of economy, the first item in the reduction bill being his last hope of salvation at the final settlement of accounts—the provision for contingencies. Then comes those items which he persuades himself should be considered as furnishing, viz., cupboards and shelving, plate-rack, hat and coat rails, and I have even known the kitchen dresser to go. Sometimes this is with the cognisance of the male half of the client, he suggesting that they have a number of old cupboards and shelves which they must use, &c., and so on. These remarks, I should explain, are in extension of the architect, lest it be considered that I am blaming him for lack of consideration of the requirements of the modern dwelling-house, when I know that he, of all men, is a creature of circumstance.

It being frequently the lot of the unfortunate surveyor to spend anything from days to weeks in a new house, during the early days of his occupation by the client and his family, for the purpose of dealing with that portion of his work known as E's and O's—more often than not there is a preponderance of the former—he generally gets a few candid opinions from the mistress of the house as to the shortcomings of the architect, with whom, for obvious reasons, he is anxious to keep upon the best of terms. It is, of course, the mistress of the house who claims—and rightly so—to be the supreme judge as to the household working of the establishment.

Sometimes the lady of the house raises various little points by putting conundrums, such as:—"How does Mr. So-and-so think we are going to clean the outside of those windows?" of which only one out of two or three lights are made to open, and that outward. It certainly is a puzzle, and the only way that suggests itself to the unfortunate individual addressed is a ladder; but being a wise man, he does not offer this suggestion, and, thinking of his friend the architect, meekly remarks that "It is a little awkward." "A little?" replies the lady with emphasis and scorn, and then turns away with an expression that leaves you in little doubt, that in her opinion, you are as bad as the architect. Now this is only a comparatively small matter, but a very important one to a good housekeeper, and should be avoided by the architect, if he is desirous of being able to visit his clients, without being continually reminded of his weak points. The only way that occurs to me to avoid the trouble, except the rather doubtful benefit of making his casements to open inwards, is to make the whole of the lights of his windows in three lights or less to open. Personally, I think the old-fashioned (or must it be considered by comparison new?) sash and frame preferable on all points, especially the very important one of ventilation. For myself—and I do not think I am singular in this respect—I like to have my bedroom window always open at the top; but when it has been my misfortune to sleep in a room lighted by casements, I have had in cold weather reluctantly to forego this luxury. In the summer, too, I have had more than once to get up to close the window on account of the rain entering; so that, taking all things into account, for bedrooms especially, there is nothing to compare with the sash window for usefulness. Please bear in mind that this was to be a practical paper, and not an artistic one.

Another trouble, and another little conversation—"When we came here there was not a single cupboard or shelf in the place." The victim's mind recurs to the Reduction Bill, Item 2, "Omission of Cupboards and Shelving," Item 1 being "Omission of Provision for Contingencies." Now he is in a dilemma. The surveyor, being generally a much married man himself, dares not repeat the remarks of the master of the house when arranging the

reductions. He therefore maintains a discreet silence; but at the same time, it is painful to him to hear his friend and patron, the architect, roundly abused, when he knows that this abuse is not merited. He therefore decides to advise him not to omit these items in the future, unless authorised by the mistress of the house, if he wishes to keep a friend in that direction.

While upon the question of cupboards, there is that vexed topic, the dust trap, *alias* cupboard top; being out of sight, it is generally out of mind also, and, therefore, is not always so well finished as it might be, and the cornice being frequently fixed with its top edge slightly above the level of the cupboard top, makes it almost impossible to keep clean. It has often occurred to me that cupboards, in bedrooms at least, being generally fixed in the recesses at the sides of the chimney breast, it would be better to take the bull by the horns, and arch over the recess, building up solid above; the little loss of air space being more than compensated for by the absence of the dust trap. Kitchen cupboards may run up to the ceiling, for, being in constant use, the objection to the upper tiers of shelves does not obtain, but I do not think that anything over 7 ft. or 8 ft. is advisable in bedrooms.

Do not have wide doors to cupboards; two narrow folding-doors cause much less obstruction in a room than one wide single one. This is again a comparatively small point, but has been impressed upon me more than once, especially where space is limited.

Akin to the last is the question of hat and coat space. Get this, if possible; a space where the master can keep those aids to comfort which he uses when he throws off the polished glory of the city for the freedom of his own garden. This should be off the hall, but not in such a conspicuous position that it is the first object met with upon entering the house. A recess can generally be formed under the stairs if there is no basement, by leaving part of the space open, instead of enclosing it all as a cupboard. This is, of course, in addition to the usual hat and coat arrangement, where the silver-knobbed umbrellas, and the shiny top hat can be displayed without disgracing the family. I ought perhaps, here to explain, that I have generally taken something considerably less than a mansion in my examples, where comfort, rather than display, is the chief factor.

The question of ventilation, I doubt not all will agree, is one of the utmost importance, which, however, I am afraid, is not appreciated, except—to use an Hibernianism—when it is absent. Where an attempt has been made to deal with it, it is often attended with so much discomfort by the clattering of mica flaps, that we find them, sooner or later, papered over. Where this is not done, they are always conspicuous to the sight, as well as the hearing, by the black patch on the ceiling and wall around, notwithstanding the maker's assertion that they are smoke-proof. Moreover, the requirements of Building Acts, by which ventilators in smoke-flues are to be kept at least 12 in. below the ceiling, rob them of a great deal of their efficiency. The slight extra brickwork required for a separate vent-flue from each room, when silk flap ventilators close to the ceiling can be used, is a good investment, and nothing in my experience works better than a louvred grating in each side of the stack, just below the pot. As an inlet, my old friend the sash window is again to the fore, especially when fitted with the deep sill bead. With this we get as near that grand thing, "ventilation without draught," as is possible. Of course, I am aware that there are numerous inlet ventilators that work well, but they are all very unsightly, notwithstanding the makers' ingenious attempts to make them appear like everything but what they are, besides being somewhat expensive.

At the risk of bringing forward obvious points, I will again repeat those oft-repeated suggestions. In planning sitting-rooms so arrange the door and fireplace that it is possible to enjoy one's own fireside without feeling an icy thrill every time the door is opened. Again, in planning bedrooms, arrange the windows so that there is a position in the room for the bed, without the sleeper directly facing the light. Apart from the discomfort to a person in health, one only needs to have kept his bed for a time during illness to appreciate this. I am aware that the arrangement is sometimes very difficult to carry out, but as clients often observe, "What do we employ an

architect for?" and it is by studying such points as these, that the architect makes or mars his work.

We have become so luxurious in these days that no house, however small, is considered complete without a serving hatch—a convenience, no doubt; but when, as is frequently the case, it is an opening from the kitchen leading directly into the dining-room, it is anything but an unalloyed blessing. Have a small lobby outside, if possible, but, in any event, have double shutters, both fastened from the dining-room side. In the first place, this reduces the annoyance from the smell of cooking, and in the second place prevents the passage of sound; and this in the case of a small house, where the dining has sometimes to answer as a sitting-room also, is important, as it is not always advisable that the conversation in the dining-room should be communicated to the kitchen, or, for that matter, vice versa.

We will now deal with one or two little matters connected with sanitation and water supply.

It has been my lot once or twice to stay at houses where everything has been right up to date—everything that it was possible to think of having been provided. One of these conveniences is a lavatory in every bedroom with hot and cold water laid on, with (and this is particularly appreciated by the maids) waste complete. It certainly is a convenience, but I have always taken care to see that the plug was in the waste before retiring, and I have grave doubts whether, convenient as it may be, a complete lavatory in a bedroom is desirable; that is, of course, as to the waste—the supplies there can be no question about. We all know the corroding properties of soap, how with the best arrangements the wastes are soon thickly coated. Those who paid a visit some years ago with the Architectural Association to the Ophthalmic Hospital, St. George's, will remember Professor McHardy's forcible, if not delicate, testimony as to its qualities. Now it seems to me that if the waste is left unplugged, this must have a deleterious effect upon the air of the room. I should like the opinion of members on this point, as, in fact, upon all the points I have raised.

As we are on the question of wastes, I would point out the necessity of keeping these large where soapy water is dealt with—2 in. at least. For one thing, it is much easier to run a cane down a 2-in. waste than a 1½-in., and I do not think the somewhat larger surface to coat need be considered, as with the large waste, the water passes through much quicker, which more than compensates for any anticipated trouble on that score.

It is comparatively useless to have a large waste pipe if the outlet from the basin is not of similar size; a 2-in. brass plug would, however, be a somewhat formidable thing if (and this does happen) it should be dropped into the basin; some makers supply them of india-rubber or vulcanite, which entirely overcomes this objection, and which work admirably.

The "plunger" bath waste is always, to my mind, unsatisfactory; and if any of you have taken one out, or have seen one taken out, you will, I am sure, agree with me. It is impossible to imagine in what a filthy state it can get in a very short time. How often do we find that the water in the bath lowers when the plunger is down; this, in the majority of cases, arises solely on account of the congealed soap. Nothing in my experience is so effective as the old-fashioned plug and chain—unsightly, no doubt; but I would repeat this is to be essentially a practical paper.

Do not on any account omit the safes under the baths, water-closets, and cisterns; have marble under the former if you can run to it; if not have lead. The cost will be more than saved when the first accident happens, and accidents will happen, as most of us know to our cost.

The subject of baths leads us on to that of water heaters. There is not the slightest doubt that a hot-water system is the best, but with the great improvements in gas cooking apparatus (in small houses at least) the gas cooker more often than not, does duty for the kitchen in summer. I am here speaking of houses not large enough to have a special furnace for the hot water. If, then, we are to have a hot bath in the summer, we have either to fall back upon the much-maligned "geyser," or have the kitchener started for this purpose only. My experience with these much-abused articles has been entirely in their favour. I suppose I have had half-a-dozen fixed at one time and the

other, and every one has been voted a 'great success by the users; in some cases even where there had been a very strong prejudice against them, owing to the newspaper reports of deaths arising from their use, but in every case as far as I could gather, an improper use. I have, however, never risked fixing one without a vent-pipe. This need not be a great eyesore; it can be of rectangular shape, but care should be taken that it is turned well up into the flue. The later patterns are much improved by the fact, that they are so made, that it is impossible to turn on the gas, without also turning on the water—in fact, they are turned on simultaneously, thus removing a large element of danger. I should like to hear the experience of the members upon this subject also, as the newspaper reports before referred to frequently prevent their adoption, when they would really be a great convenience to the small household.

While we are dealing with the bathroom, I would point out that the usefulness of that great convenience, the towel-airer (formed by a coil of the hot-water pipes), is much lessened by the almost universal practice of nickelpating. It was once pointed out to me by a sanitary engineer, but I was rather sceptical, so have tested it more than once, with the result that, in the same system, where the pipes were not plated they have been too hot to touch, whilst those which were so treated could be held without inconvenience. At first I thought that it might arise from the formation of the coil, but my subsequent unvaried experience proved that this was not the case.

As the slop-closet is a thing we cannot often go to the expense of in small houses, and is really not a necessity, try to run to a slop-top to your water-closets. It will save a good deal of slopping about, and the few shillings they cost will be well spent.

Another source of dissatisfaction is the lead-lined pantry-sink. After they have been in use for a little time, the bottoms will be found to have so buckled by the action of the alternately hot and cold water, as to make it impossible to keep them as clean as they should be. The remedy for this is to have them very much thicker than they usually are—12 lbs. at the least; and this is where I think the north country plumbers are so much to the front. I have measured a good deal of their work in the north country towns, and have found that generally it is of a much more substantial character than we are used to in the south. I have seen thick cast lead bottoms used, with a quadrantal internal angle of about a 13-in. radius, which seemed to me as perfect as we could expect a lead bottom to be. I have no doubt the glazed sink will be suggested as a way out of the difficulty, but there is a prejudice with housekeepers against these, owing to the smashing of crockery. Where they have been adopted a wood grid is sometimes placed in the bottom, and if this was kept out when not in use and properly cleaned, would meet this objection; but as a rule it is by no means kept as it should be, and moreover has a most awkward habit of floating on the top of the water. Taking everything into consideration, I am afraid we must stick to lead, with all its faults.

We are so patriotic, that we are inclined to think that oak answers every purpose where a hard wood is required. Now I have seen, and I have no doubt that you have, draining-boards made of this wood, warped and split in every direction. My experience is that there is nothing to compare with sycamore for this purpose, for besides looking clean, owing to its light colour (and this is a consideration), the grain is so much closer than oak, that it is more easily kept so.

When specifying the cistern, do not use the words "to be fixed where will be directed," the usual result that it is placed in a position practically inaccessible to everything but frost. I speak feelingly, as in my own case the cistern is placed in the roof, and the only access to it is through an opening in the wall of the bathroom, 1 ft. 5 in. wide and 1 ft. 11 in. high, the sill of which is 4 ft. off the floor. I was rather surprised to find that I could squeeze through an opening of these dimensions, but squeezing through is a small part of the trouble. Just inside, a valley crosses the opening, and about a foot farther in the exhaust from the hot-water service runs horizontally about 18 in. off the floor, so that it is a case of ducking under the valley, and over the steam pipe; at great risk to yourself in the one case, and to the steam pipe in the other. And, of course, the ceiling

joists are innocent of anything in the shape of boarding. With a little forethought this could have been entirely avoided; but although the example given is an extreme one, I have met with many others very little better. When in planning a house, the position of the cistern is considered at the outset, it will be found by no means difficult problem to arrange for easy access, and frequently off the level of the floor. This is important, as in the case of any of those little failures which will occur, notwithstanding all precautions, the trouble can frequently be stopped without waiting to send for a plumber or, in fact, any member of the male persuasion, which will be absolutely necessary in the case of the usual arrangement of a trap-door and break-neck ladder, which is seldom in position when wanted. Provide also a small quantity of rough flooring round the cistern, and from the entrance to the cistern space, or, what is better still, have the whole space floored. If you cannot go to the cost of boarding and felt throughout the whole of the roof, squance out a little for the cistern space, and on no account omit the cistern cover.

The question of frost brings one to troubles caused by the pipes bursting. A very effectual way to prevent this is to run the cold-water pipes near to the hot-water pipes (but not near enough, as I have seen them sometimes placed in an attempt to remedy the evil) to preclude the possibility of getting any really cold water when required.

Do not be sparing with your stop-cocks; a pound or two spent upon these will be one of the best investments you can make. If possible have one in every separate service; those in the services from the cisterns as close to it as possible, and in the branch services in the same relative positions to the main services. It is then easy to turn the water off from any part in the case of necessity of repair or of burst pipes, a convenience much appreciated by everybody concerned, frequently preventing damage to the house and furniture, besides facilitating repairs and the consequent saving of cost.

Another great convenience where there is a constant supply, is an arrangement whereby the cistern can be emptied, and yet a supply of water obtained off the main. This can be achieved by means of two stop-cocks with a draw-off between. I once had the particulars sent me of a combination fitting of the three in one, which struck me as being a practical solution of the difficulty. I should be glad to hear if any member has had an opportunity of seeing this in practical use.

As it is by no means an easy matter for the uninitiated to trace the water-pipes, or to see clearly to which service the stop-cocks belong, I would urge another little investment, which I have known to save endless trouble. Have all your stopcocks labelled. Small enamelled iron labels can be easily bought, or, failing this, parchment ones (as used for luggage) make a fair substitute, if the pipes are concealed in a casing. In the latter case have portions of the casing hinged over the stop-cocks.

If possible arrange for a draw-off on each floor; much labour and damage to carpets, &c., is saved by this; only take care that you have a large waste to the trough under, or the remedy is worse than the disease.

Try to arrange the water-closets, so that it is not obvious that a person is either going to, or returning from, this particular spot. There is a good deal of sarcasm expended over what is termed the mock-modesty of the English, but I for one should be very sorry to see the barrier entirely broken down. A very simple way out of the difficulty is to arrange for the bathroom with a lavatory in it to open from the same lobby, a short passage connecting this lobby with the main hall or landing. It, moreover, has the advantage of bringing the service pipes together. Do not consider that a water-closet on the first-floor is sufficient for any but the very smallest house. When those little social entertainments, which are so dear to every hospitable householder, are given, many painful and embarrassing situations will be saved by the little extravagance of an additional water-closet.

A really silent acting waste-preventer is, I suppose, not possible. There are, I know, so-called silent ones, but the silence comes too late, besides which the noisiest period of their working is unaffected.

In the hot water services take care to have the flow and return pipes of large size, not less than 1½ in., and do not be sparing in the length

of the flows and returns. Run them as near as possible to the points required, so that the lengths of single services are as short as possible. Nothing is more irritating than to have to draw off a large quantity of cold water before getting a supply of hot. Never omit the bib-cock for emptying the hot water system, nor the stop-cock in the cold water supply; but for safety have these with loose keys, so that they cannot be tampered with.

A small matter, but one which is so small as to be sometimes overlooked: if it is necessary to run any pipes in the thickness of the floors, see that the boards over are fixed with brass screws and cups, so that any portion of the pipes may be easily accessible without damaging the floor. We all know what the jobbing plumber or gasfitter is capable of when dealing with floors.

It is surprising how few staircases appear to have been thought out; not in the artistic sense, but the practical. It often seems to me that a certain space is portioned out for the stairs, and they have to be got in somehow. At least, that is how they often appear to me. Doubtless the staircase is a nuisance, but as it occurs in every house, an effort should be made to make the going as perfect as can be. Winders, we know, are a painful necessity frequently, but a good many years ago an old clerk of works gave me a rule which I have seen worked numerous times since with success; it may be generally known; if so, pray pardon the repetition—that is, to make the width of the winder at 18 in. from the newel end, the same width as the tread. The going will then be found continuous from flyers to winders and vice versa.

Now for the only item which in any way approaches the artistic, and my excuse must be the same as on that other historical occasion—it is only a little one. I have often felt how extremely unhappy the papering or other wall decoration finishes around an archway, the jambs and soffit being in cement and finished with a moulded edge. Sometimes papering the bead or moulding is tried, and a terrible both it is. Sometimes the paper is cut close up to the moulding, but this never looks satisfactory. A very simple method of overcoming the difficulty is to run a narrow fillet in the cement on the face of the wall for the paper to stop against. It need not be more than ½ in. projection and ½ in. wide; it therefore adds very little to the expense. It may be that this has been adopted more than I am aware of, but in my experience in not one out of ten instances has any attempt been made to get over the difficulty.

I suppose there is no limit to the subject I have chosen, but I think I have dealt with enough for one evening.

I believe I can claim to have kept the promises I made at the commencement. I have taken you all over the house from top to bottom, and in most of the corners. I have avoided being artistic except my last little lapse, for which I crave pardon; and I do not think I have mentioned many things that you are likely now to have heard for the first time. Perhaps, after all "Reminders" would have been a fairer title.

Believe me, I have not taken up this subject in a carping or cavilling spirit. All the points I have mentioned have been brought to my notice, and the majority of them by clients, some of whom, I must confess, were cavillers, and would grumble at anything. They seem to look upon the surveyor as a sort of whipping boy to the architect. Whether it is the architect's greater dignity protects him from the direct assault, I know not; but the probability is they look upon the surveyor prowling around in all the rooms and corners as a nuisance, especially as he is generally on the premises for a longer time at a stretch, when the house is in occupation, than the architect ever is, and they endeavour by this means to get even with him.

Nobody appreciates the artistic side of architecture more than your humble servant, but at the same time he must confess with sorrow, that the practical is often sacrificed to the artistic, or at least the decorative. If you have means for both, well and good, but do not forget that a house is primarily to *live in*. After looking to this, then do all you can to make it a thing of beauty. If you have not money for embellishment, then rely upon a chaste simplicity and good proportion, which are after all the true test of an architect's capabilities. I am speaking now to the artistic architect proper, the man who knows how to embellish

a building, not to the freak architect, the man who by every shilling he spends in embellishment makes his building more and more hopeless.

*Finally.*—Remember that it is the little things which add to the convenient working of the household that appeal to the lady portion of the client, long after the craze for those tricky little points of design have palled, and (this should be a whisper to any body but a professional one) I have heard that ladies have tongues; and you may rely upon it, that the lady who is satisfied with the internal domestic arrangements of her house, and has a pride in showing her lady friends around, is likely to do the architect more service in procuring him future clients, than the one who practically has to admit that the outside, after all, is the best side.

#### THE SURVEYORS' INSTITUTION:

##### PRESIDENT'S ADDRESS.

The opening meeting of session 1901-2 of this Institution was held on Monday evening at No. 12, Great George-street, Westminster, Sir John Rolleston, M.P., the President, in the chair.

The minutes of last meeting having been read and confirmed.

Mr. J. W. Penfold, hon. secretary, announced a large number of gifts to the library, including a very handsome bequest from the late Mr. Arthur Cates, consisting of 127 works, some of which were of considerable value. These and other books were left to Mrs. Cates with instructions that they were to be given subsequently to the Institution, the Institute of Architects, and others bodies, but Mrs. Cates had given the books at once, and in the circumstances he proposed that a special vote of thanks be given to her.

The vote of thanks having been cordially agreed to, as well as a vote of thanks to the other donors.

The President delivered his annual address, the greater part of which was devoted to an interesting but desponding review of the state of the agricultural industry of the country, and to a consideration of the Agricultural Rating Act of 1894. In his opinion, towns were sponging upon the country by the way people and industries removed, in order to avoid the heavier rates of the towns, to places where parochial expenses were paid in a preponderating proportion by the occupiers of the land. A still further invasion was contemplated by the provision of cheap transit, which was to transport the people of the town into the country to live. While not objecting in any way to this (indeed, he thought it desirable to relieve the overcrowded populations of the large cities), it was surely right that the farmer should be secured in some way against the expenses caused by these incursions, and the half-rates remitted on land were even an insufficient compensation for the inequality in rating to which he was subjected, and farms in the neighbourhood of dense populations had an especial claim for this remission. He could only hope that in the measure dealing with the general question which was promised the permanent relief of the taxation of agricultural land might occupy the most prominent and important place. Of all the products of land, the only one the value of which appears to be in the ascending scale is timber.

In the Midland counties he had been furnished with accounts of timber sales at which single oak trees had realised up to 100l., while other woods were commanding good prices, and poles and thinnings were readily sold. There was a reason for this. The great onslaught that had been made on the virgin forests of the world, from the time of the Phœnicians onwards, without artificial reforestation, must at length be appreciably felt. The increase of population and the advance of civilisation must also point to an increased use of timber of all kinds for works of construction, for articles of use and ornamentation, and for fuel. A rise in the value of home-grown timber seemed possible; in any case, a ready sale might be anticipated. With the decline in the value of cereals, it could hardly be doubted that a considerable portion of the land of this country (some of which was derelict, and some let at a very low rental) might be planted to advantage. Apart, too, from the planting on a large scale, and in champagne and not woodland countries, much timber might be secured by a careful conservation of such saplings as were the

weeds of the locality, and which might be found in abundance in every hedgerow. According to his experience, a hedgerow tree could not be planted to advantage, while the self-sown sapling would flourish. The hedgerow was mostly a ruthless destroyer of these, and he could only respectfully suggest to the young members of the profession who had the care of landed estates that a careful supervision of the hedgerows, in view of a future crop of timber, was desirable. An understanding with the tenant might easily be arrived at, and the denudation of the country-side which was so marked in some parts might be prevented, and a future crop of timber, affording shade, shelter, beauty, and profit, might be secured. The study of the science of forestry, for which special opportunities were afforded at that Institution, he would commend also to their careful attention.

The growth of population had its drawbacks as well as its advantages. One of these was the pollution of streams by sewage from dwellings and farmsteads, and it might well be suggested that impure water imbibed by cattle might have an injurious effect, not only upon the animals themselves, but also on human beings who consumed milk or meat. The representative councils of the counties were alive to this growing evil, but the expense of proper sewerage systems in rural parishes still favoured its continuance. With regard to the future treatment of sewage, he might say that there was no prospect of any cheaper processes being adopted than those in vogue, and that those who were intent upon dealing seriously with this question must make up their minds to the expenditure of money. The best, safest, and most efficient system known to-day was the preliminary treatment of sewage by one or other of the bacterial methods, with final purification of the effluent from the tanks or beds on land. In this case the bacterially clarified sewage was in a better condition for application to land than when applied in a crude state. It might, he thought, be taken for granted that the treatment of crude sewage on land was a system no longer in favour. The chemical treatment, too, except in some few cases where the sewage was highly charged with trade liquids, might be said to have been generally abandoned. The bacterial treatment had apparently made such progress that the sewage of any town might be dealt with even at no great distance from population, without final application to land should this not be available, but in his opinion the best system to-day was a combination of bacterial and land treatment.

Proceeding, the President said: The nationalisation of the land will never appeal to surveyors as an object worthy of accomplishment, but the nationalisation of water may commend itself more to their consideration. An ample supply of pure water is essential to the well-being of the people and to the trade of this country. While inroads are made on available supplies the quality is generally deteriorated as population and cultivation increases. The sources from which pure water, therefore, may be obtained get rarer. However ample in quantity, the water from inhabited areas appears to be undesirable. Water, however good, is defiled by population, and the pollution of water is productive of some of the most terrible diseases to which the human body is subject, as has been demonstrated recently in the borough of Maidstone. To the hills, therefore, it seems we must look for our great future supplies, but these great upland areas are getting scarce, at least in reasonable proximity to the great cities, and as these are becoming alive to the requirements of their people, something like a scramble arises for such as are suitable, and attempts are made to peg out claims and even to jump the claims of others in order to acquire these. But the need for pure water is as great in the country as in the town, in smaller places as in the great cities; but the expense of the supply is mainly prohibitive to the lesser community. It seems to me, therefore, that, subject to the claims of private owners to the collecting grounds, the water from the sky should be as free as the water of the sea, and that some scheme might in the future be adopted to secure these areas on behalf of the State, and that the cost and the carriage of the water might be the subject of national taxation, as without a generally good supply throughout the country the dangers of disease and death will approach proportionately nearer as population increases. Some

of our great cities, in order to secure the purity of water, are already purchasing these collecting grounds as well as the sites of the reservoirs, and this is a use to which land may most properly be applied. If no longer required to supply the people of this country with food, large areas may well be devoted to supplying them with water, the importation of which does not appear to have been at present suggested. If, however, the acquisition of large areas surrounding reservoirs becomes the fashion, there will be many more sources available than there are at present, inasmuch as the population and the cultivation on these areas can be dispensed with, and thus many sources now not available will be rendered suitable. . . .

The commercial prosperity of the country, the great amount of construction that is going on, has doubtless created an unusual demand for able bodied labourers such as the rural districts supply, and better pay and shorter hours have proved an attraction. In the matter of pay we can only regret that the farmer cannot compete with the wages paid by contractors and mine-owners. If he could, he would, in my opinion, keep the labourer on the land; but there is another drawback to certain kinds of rural labour, and that is continuous work for seven days of the week. Live stock must be cared for and cows must be milked on Sundays as well as on other days, so that I think it is not to be wondered at that there is a growing objection to work of this kind when the workman elsewhere is usually able to witness a football match on Saturday afternoon and to lie off on Sunday, probably with as much or more wages in his pocket. It seems hard to suggest a relief man for Sundays to the farmer or dairyman who can hardly make ends meet as it is, but it seems to me that to keep the labourer on the farm is a matter of money and money only. I am not a believer in the attractions of the town. Other things being equal, the country-bred man is usually averse to town life, and he is, as a rule, more comfortably housed in the country, especially where he has a garden to his cottage or an allotment, and if prosperity were to return to agriculture there would in my opinion be no difficulty in keeping the labourer on the land.

With regard to the housing in towns, I must remark on the general failure of municipal enterprise in that direction. No provision is ever made for the very poor. It is always the aristocracy of the working classes, those who are thoroughly able-bodied, earning good wages, and who can pay good rents, that are catered for. But it is those men who are born in a degree incapable or weak, the poor spinsters and widows who work in garrets, who receive no attention; and in my view, until municipalities provide for this class, who have the greater need, their efforts will still be attended with failure. If the public are to provide house accommodation for the poor, those who represent the public had better consider the construction of houses which can be let at a shilling a room the week, and which contain very few rooms. In my own experience where areas of this class of houses are taken down by railway companies or corporations, they are never replaced, but instead houses of six rooms at least are built, which do not rehouse the displaced population, who have to resort again to the overcrowded areas wherever they can be found, and which consequently become more crowded still. The very poor, who are always overlooked, have in my opinion the greater claim for consideration when house accommodation is provided at the public cost, and to provide for this class should in my opinion be the aim of the public bodies of this country. . . .

A matter of considerable difficulty and perplexity to surveyors is the law, or rather the absence of law, with regard to ancient lights, and I hope that the joint recommendations of our Institution and of the Royal Institute of British Architects, or something based on them, may before long blossom into an Act of Parliament. With the great amount of rebuilding and construction on a larger and more handsome scale that is now going on in our great towns, disputes as to lights are frequent and harassing. The instability of law founded on nothing more definite than varying, or apparently varying and conflicting, judgments in the Law Courts, is manifest. An excellent paper on this subject was read by one of our members at our meeting at Southampton last spring, and I observe the reference in it to a

Leicester case (Warren v. Brown), decided by Mr. Justice Wright in 1900, which even as I write is awaiting judgment by the Court of Appeal.\* Mr. Justice Wright expressed it as strange that the question should still be open to discussion as to whether the right of light that is acquired by statutory prescription is a right to a continuance of substantially the whole quantity of light which has come to the windows during the twenty years, or is limited to a sufficient quantity of light for all ordinary purposes. His lordship, who was both judge and jury in the case, obviously took the latter view, for after having found (1) that though there was no material obstruction or diminution of light to the upper windows of the factory, to the windows on the ground floor the defendant had materially diminished the light which the plaintiffs had enjoyed for those windows for the past twenty years, but that abundant light remained for all ordinary purposes of inhabitation or business; (2) that the inconvenience to which the tenant was subjected could be and to a great extent it had been, obviated by the removal of machines to the upper room, and in any case it could be remedied by some increased expenditure for gas; (3) that if the plaintiffs should be entitled to damages the amount should be 100l. for the tenant and 200l. for the owner, his lordship held that the plaintiff had no cause of action, and gave judgment for the defendant. With very great respect to this capable and learned judge, I venture to express the opinion that he has set the defendant a very formidable task to defend and uphold his judgment. The legal profession and our own will alike, no doubt, await with curiosity and anxiety, and will read with real interest the considered judgment of the Court of Appeal. If that Court speaks with more definiteness than it has ever done before as to the angle that should, as a general rule, be regarded as sufficiently protecting those who have acquired by statute easements of light, Mr. Justice Wright will, even if he should be overruled, have rendered valuable service to the building enterprise in our large commercial centres.

One subject which, as an inhabitant of this metropolis for the greater part of the year, seems to be of growing importance, is the great increase of street traffic, and well worthy of consideration are the various schemes put forward for its relief. The widening of streets on a large scale seems to be a project too ambitious to suit the pockets of the ratepayers, inasmuch as compensation for trade disturbance must amount to an enormous sum in addition to the cost of the land and buildings. Widening, however, is only one way of relieving traffic. It cannot be necessary that all the vehicular and pedestrian traffic should be conducted on one level. Streets or causeways may be deepened or heightened, and in my view certain schemes put forward by Sir Frederick Bramwell, Sir John Wolfe Barry, Mr. Emden, and others in this direction are most worthy of the consideration of the public. Again, the expansion of commerce and the general growth of population causes this increase of street traffic to be experienced in all our great cities, and the question of the material most suited to bear that traffic is a question of great interest to the whole country, and is likely to engage the attention of surveyors the world over.

Gentlemen, the present is the age of association. . . . From small beginnings our association has blossomed into one of the most important institutions of this country, representing vast and varied interests. When we consider that almost the whole of the land and buildings, the mines, the quarries, the forests, and very largely the interests of the great municipal and industrial corporations of the United Kingdom are represented by our Institution, we must, I think, conclude that the collective weight of the opinion of our members on matters affecting these interests must have due weight even in the Councils of the State. With the growth of our collective importance, therefore, our individual responsibilities must proportionately increase. With the advance in the position of our Institution, the status of those who comprise it must correspondingly advance, and they in turn will recognise that the interests of the Institution and the welfare of its members are under their care and in their keeping. . . .

Mr. A. Vernon proposed a hearty vote of thanks to the President for his address. Many

\* The decision of the Court of Appeal is reported on another page of our issue this week.—Ed.

of the subjects considered, the President had treated with impartiality. The only view to which he would take exception was the gloomy view the President entertained as to the agricultural prospects of the country. Throughout the whole world there were bitter complaints as to the agricultural industry, and in this country we were suffering as other countries were. He hoped that things had been better in recent years.

Mr. A. Buck seconded the vote of thanks. One subject of considerable importance which the President had dealt with was the migration of the rural population to the towns. One means of getting the population to stay on the land was to get the landlords to improve tenements, for it was the bad condition of the dwellings of farm labourers that drove the young men to the towns.

The vote of thanks being heartily agreed to, The President briefly replied.

The next meeting will be held on the 25th inst, when a paper will be read by Mr. Dudley Clarke on "Local Taxation."

### VICTORIA MEMORIAL COMPETITION.

WE give this week the general perspective view and the plan of Mr. T. G. Jackson's design for the Victoria Memorial, and the elevation of his triumphal entrance arch to the processional road. We give also the perspective view of Dr. Rowand Anderson's triumphal arch for the same situation in his scheme; a design which, as we have already observed, is much the best feature in his scheme, and its picturesque Renaissance treatment affords an interesting and effective contrast to the more Roman severity of Mr. Jackson's arch.

The following extracts from the Report submitted by Mr. Jackson with his design will best explain his views in regard to the treatment of the problem:—

"I have assumed that the Mall in any case be replanted on the lines shown in the official plan, but in other respects I have availed myself of the liberty allowed to the competitors to depart from the arrangement there laid down.

*The Square at the West end.*—At the west end of the Mall in front of the Palace I form a regular square or 'place' enclosed by colonnades, and partly occupied by gardens. It seems essential to the dignity of the scheme that this part should be laid on formal lines, having relation to the façade of the Palace and the straight avenue of the Mall beyond. I have also thought it important, so far as it can be done without inconvenience, to divert all public carriage traffic from this area. The cross road from north to south in front of the Palace must of course remain, but I make the two public carriage roads which run east and west to pass entirely outside of the colonnades which would screen the enclosed space from dust and noise, allow the monuments it contains to be enjoyed by the public without interruption, and so add materially to the quiet of the Palace itself.

It will be seen from my plan that this makes the line of road by Constitution Hill considerably more direct than at present, and provides a second carriage road on the other side.

The enclosed square is shut off from the Mall by a screen of piers, railings and gates, which excludes public wheel traffic, but gives foot passengers free access to the gardens and enclosure. Gates, however, at each end of the screen would be opened for carriages going to the Palace at receptions, and the Royal gate in the middle for the King when going in State to Westminster.

The Queen's monument would occupy the centre of the square, right and left of it I have placed a fountain of bronze in a basin of stone, and round it are groups of statuary representing the principal Colonies and Dependencies of the Empire. The area would be gay with flowers and shrubs in grass plots, and the colonnades would afford shelter and shade, and would be admirably suited for spectators at State processions, for whom the flat roof would also be available.

The back wall of the colonnades affords space for inscriptions and national memorials in sculptured relief to be added from time to time, for which there is at present no such place available in London.

The four pavilions at the angles would bear the Royal arms and cypher, and be adorned with bronze figures representing arts and industries.

The central part of the square is left open to afford space for carriages at State receptions.

*The Mall.*—The Mall, planted as proposed by the official plan to which I have adhered, forms three avenues. The two outer are public carriage roads, the middle one, besides a 10-ft. road in the middle, has a wide grass plot on each side, affording space

for the contemplated avenue of statues. The central avenue would be open to the public by day, but I propose to enclose it by railings, with gates to be locked at night for protection of the statues, a precaution which experience both at London and Berlin proves to be a necessity.

On State occasions the King would drive down this central avenue, but otherwise it would never be used by carriages.

*The Arch.*—At the east end is the great arches through which the Royal carriages would pass on State occasions. It seems better to place this at the entrance to the Mall proper than at the spot marked on the official plan. Eastwards of the spot where I have placed it, the Mall expands into several diverging thoroughfares, and its continuity is lost; and the arch would seem to lose its meaning unless it admitted specially and directly to the road leading to the Palace. The effect of it also in combination with the steps leading to the Duke of York's column would, I think, be very good. The exact position of the arch, however, is not material.

In its design I have aimed mainly at simplicity and dignity, avoiding ornament, except of the highest kind, and emphasising mass and proportion. In either of the positions suggested it will have to compete with the high buildings of Carlton House-terrace, and it must be on a grand scale or it will be dwarfed by its surroundings. The Marble arch, which is only 42 ft. 8 in. high, or the Wellington arch, which is 62 ft. high, would in this case look quite insignificant. I have made my archway 60 ft. high and 30 ft. wide, the height to the top of the cornice of the main order 70 ft., to the top of the attic 93 ft., and to the top of the sculpture which crowns it 120 ft. The area of the structure is 68 ft. by 34 ft., and besides the simple colonnade which carries the vault, the only positive ornamental details are a bronze frieze of life-size figures representing the Jubilee processions of 1887 and 1897.

*General Scheme.*—The whole scheme, beginning with a stately arch, continuing with avenues of trees and statues along the Mall, and reaching a climax in the colonnades and gardens of the new Palace square at the west end, would, I venture to hope, be a not unworthy expression of the nation's grateful remembrance of her Queen, and it would, I think, compare favourably with anything of the kind to be found in other European capitals.

In conclusion, it may be observed that the whole scheme is divisible into parts. The arch is quite distinct from the rest, and the statues in the Mall would, of course, be added one by one as occasion arose and means were found.

As no estimates were asked for, I have made the best design I could without considering expense, but I do not think any part of it is unduly costly. The most expensive feature would be the sculpture, of which, as I have said, the greater part can be carried out piecemeal.

The material I proposed generally for the masonry is hard Portland stone, which is not only the most durable and best able to resist this climate, but is also the most beautiful material for London use, bleaching, as it does, with exposure to a more than marble-like brilliancy."

We may add that while we considered Mr. Webb's design was rightly selected on account of its admirable and truly architectural plan, more especially in regard to the method of connexion with Charing Cross at the east end, we cannot but express the greatest admiration for Mr. Jackson's design, more especially his treatment of the ornamental place in front of the palace, which internally would have made a beautiful piece of work, although externally there is an architectural defect, to our eyes, in the fact that the rectangular lines of the screen contrast unpleasantly with the curved lines of the roadway, and this interferes with the architectural unity of the scheme.

### ROOD SCREEN, ST. DENYS', SLEAFORD.

THIS screen, which is one of the finest in Lincolnshire, is referred to by A. W. Pugin in his treatise on "Rood Screens," being particularised with eight others as amongst the most remarkable in England. Dr. Mansel Simpson, in his admirable and exhaustive paper on "Lincolnshire Rood Screens and Rood Lofts," read at the 1890 meeting of the Lincoln and Nottingham Architectural Society at Holbeach, repeatedly refers to it. "The splendid example at Sleaford I should feel inclined to date the close of the fourteenth century, about the same time as the stalls at Lincoln from the similarity of the tabernacle work, which is very evident on comparing the pulpitum at Lincoln with that at Sleaford. The stalls at Lincoln are dated at about 1380, which would suit the work at Sleaford very well, as there are traces of Perpendicular feeling in the transom, which is inclined at an angle of 45 deg. in the two outer bays." (Architectural Society's Report, 1890, p. 199)

It is, however, probable that the screen is a little later than this. The date of nave and chancel arch may be taken as Decorated at about 1380, and there are evident traces on the north jamb of the chancel arch of a previous screen of a different and flatter curve of groined canopy at a lower level; the plug holes for the woodwork still remain. This was destroyed by fire, the springing from north jamb of chancel arch and the respond of north arcade having been calcined to the sill of the clear-story windows. The level of the original screen was higher than its successor, as may be gathered from the insertion of stone in the old beam holes, and the fact, as shown, that there are two steps from the sill of the upper doors to staircase to the level of the "horthe wch remayneth."

From Peacock's "Church Furniture" we learn that the roof loft was taken down in 1566. "Itm: the rode lofte taken downe all save the lthm, wch remayneth standing, wch we cannot take doune, for yt is a waie frome one house to another, so yt we have noe passage but that waie to ytt," and probably then the paneling to the front was taken down and the groined canopy at the west removed. Still much remains that is very beautiful.

The drawing will explain itself. It is curious that although there are two staircases to the roof loft, a third was added some forty years after the nave was built, and contains two of the three windows engraved by Sharpe in his "Decorated Windows" (1849).

The screen was faithfully restored in 1833, and then the doors to the centre opening, which enclosed the chancel (as shown on a sketch in possession of Mr. E. Yerburgh, dated 1830), were removed.

It is regrettable that the lower doorways were then blocked by two monuments to Robert Carré (1590) on the north, and Sir Edward Carré and his wife (1680) on the south.

The screen is one only of the many objects of interest to the architect and ecclesiologist in this church, which is situated in a district singularly rich in church architecture.

H. K.

THE NEW GOVERNMENT OFFICES.

THE following short and trenchant leading article appeared in the *Times* of Tuesday:—

"Mr. Akers-Douglas is a bold man. He is not afraid, in spite of abundant warnings, to set himself in open opposition, not only to the educated public, but to the strongly expressed convictions and wishes of the architectural profession. He has obstinately adhered to the unfortunate policy upon which, after the lamented death of Mr. Brydon, the Office of Works embarked with regard to the new Public Offices at Westminster. It will be remembered that the late Mr. Brydon was appointed to design this important block of buildings, which are to occupy the magnificent site on the west side of Parliament-street, and that after making his plans and elevations the architect died. These plans and elevations were, of course, subject to revision; and, moreover, the detailed drawings were not made. Obviously, then, the proper course was for the Office of Works to call in the best available architect of a talent akin to Mr. Brydon's and to ask him to finish the details in the spirit of Brydon's work, and generally to bring the building to its completion in as close accord as possible with the original intention. But the Office of Works preferred a more domestic and possibly cheaper method. It has a staff of architectural clerks of its own; why not hand the job over to them? The intention so to do was announced; and immediately protests were made by Mr. Leonard Stokes (Mr. Brydon's executor), Professor Aitchison, and other architects, and by many other persons who urged that nothing should be done to jeopardise the success of what promised to be a really fine building. In this sense we have twice given expression to what we believe to be the absolutely unanimous opinion of competent and impartial people. In reply, the First Commissioner put out first an extremely feeble defence of his proceedings; and, secondly, an advertisement in the trade journals asking for builders' tenders. The time for these tenders to be sent in expires to-day. The unrepentant First Commissioner has had his way, and all that now remains for him is to accept one or other of the tenders, to proceed to carry out the clerk-completed version of Brydon's design, and to trust to the ignorance of his countrymen and to the chance

that the British voter will not detect the difference between work that is finished and work that is botched. Probably for the next big undertaking he will not think it worth while to employ an architect at all. Why should he? An office which can finish ought surely to be able to begin. Why trouble about professional opinion, the Royal Academy, the Institute of Architects, or any of "those who know"? We are only surprised that Mr. Akers-Douglas should have gone outside his office for the Queen Victoria Memorial. If he can carry out the Parliament-street block, why apply to any one else to reorganise the Mall or even to set up her Majesty's statue?"

ARCHAEOLOGICAL SOCIETIES.

ROYAL ARCHAEOLOGICAL INSTITUTE.—At the general meeting of this Institute on the 6th inst., Sir Henry H. Howarth, President, in the chair, Mr. C. A. Bradford read a paper on a Millom *Vesica Piscis* window of unusual character at Millom Church, Cumberland, which he illustrated with a number of photographs and drawings, in sketching the history of the term *vesica piscis* (fish-bladder), he pointed out the difficulty of discovering the relationship between the name itself and the thing signified by it, the latter indicating a regular geometrical figure of elegant and balanced form, the former a natural object of unsymmetrical and artistic appearance. The term was apparently first met with in the works of Albert Dürer, and introduced into the vocabulary of English antiquaries at the beginning of the nineteenth century, perhaps by Hawkins in 1813. The origin of the form itself was probably to be found in nature—in the leaves of the forest or the human eye. Translated from nature to art, it found a place in decorative art at a very early period, and spreading from the east to the west was soon employed everywhere—in Early Christian MSS., in paintings and frescoes, in painted glass, tiles, objects of devotion, and ecclesiastical vestments. Examples in sculpture were numerous in both England and France, in tympana of doorways, on capitals, on altar frontals and tombs. To-day there were at least three kinds of window to which the term "fish" was applied, namely, to that of the pointed-elliptical outline; to that filled with tracery of a peculiar character described by German archaeologists; and to that generally known as the spherical triangle. Mr. Rankin had pointed out the beauty and suitability of the *vesica piscis* form for gable windows in his description of the example at Dunblane Cathedral; and many instances of its occurrence, placed either vertically or horizontally, in England and Scotland were enumerated, notably that at Ashford Carbonell in Shropshire. The use of the *vesica piscis* as an elemental form in the development of Gothic window tracery had been carefully worked out by Freeman. The window at Millom was remarkable (1) for its large size, measuring to ft. 4 in. by 7 ft., and occupying the entire west end of the south aisle of the church; and (2) for its being filled with tracery. There was no documentary evidence of the fabric of the church, but the date of the window appeared to be about 1330, which would probably fix it as the work of Sir John Hudeleston, who obtained a licence from Edward III. for the fortification of the adjoining castle.—In the discussion that followed, Mr. C. R. Peers, Rev. T. Anden, Mr. E. Green, Mr. P. M. Johnston, and Judge Baylis took part. Mr. R. L. Hobson then contributed a paper on "Medieval Pottery found in England." After a few remarks on the quality of medieval pottery and the difficulty of arranging specimens in chronological order, Mr. Hobson went on to review the existing evidence of date, and to try and formulate the characteristics of the various periods. The constitution of the Abbey of Evesham (A.D. 1214) furnished the earliest reference to earthenware in contemporary writings. Manuscript illuminations were next considered, the most remarkable being a picture in the "Loutrel Psalter" (early fourteenth century) of a rustic breaking a pitcher over another rustic's head. This is the earliest instance in which pottery is clearly indicated in a medieval MS. Mr. Jewitt's verdict on the Burley Hill find was criticised to clear the way for the statement that no specimen found in this country has been proved to be of Norman date, though it is extremely probable that such specimens exist unrecognised. Lantern slides,

showing in all about fifty objects, were shown in two series—documentary pieces, ranging from the late twelfth to the sixteenth century, and a miscellaneous exhibition, including a number of ostrils, some fragments of so-called Cistercian ware, pieces illustrating the various forms and ornaments in use, and a number of vessels of grotesque shape.

BRITISH ARCHAEOLOGICAL ASSOCIATION.—The first meeting of the Session 1901-2 was held at 32, Sackville-street, Piccadilly, on November 6, Dr. W. de Gray Birch, V.P., in the chair. Mr. C. H. Compton exhibited two copies of Court Rolls of the Manor of Stoke Newington. One dated May 18, 13 George I, A.D. 1727, being an admission of Maria Lascells to a messuage, is in Latin, which ends *Fecitque fidelitatem* (and made fealty). The other is dated July 9, 1740, and is an admission of Mary Ingram to a moiety of certain hereditaments held of the same manor, is in English, and ends "but her fealty was respited." This is the usual form in copyhold admissions since that date. Mr. Compton also read a paper on "The President and Council of the North," an institution created in the twenty-eighth year of Henry VIII. for the government of the northern counties of England during and after the rebellions consequent upon the dissolution of the lesser monasteries. Some further relics from the crannog at Dumbuck were exhibited by the Rev. H. J. D. Asley and were commented upon by the chairman, Mr. Gould, and Mr. John Bruce, who mentioned that his excavations at Langbank, resulting in the discovery of a crannog upon the south side of the Clyde, as already reported, were suspended until the spring, but in due course a report of the operations and the results would be presented to the Glasgow Archaeological Society.

THE LONDON COUNTY COUNCIL.

THE ordinary weekly meeting of the London County Council was held on Tuesday, in the County Hall, Spring-gardens, Mr. A. M. Torrance, Chairman, presiding.

Loans.—On the recommendation of the Finance Committee, it was agreed to lend Chelsea Borough Council 13,500l. for purchase of artisans' dwellings; Bethnal Green Borough Council 9,700l. for baths and wash-houses; Camberwell Guardians 50,000l. for extension of infirmary; and Greenwich Guardians 6,000l. for fittings and fixtures for schools.

Acquisition of Southfields, Fulham.—The following recommendation of the Parks and Open Spaces Committee was agreed to after discussion:—

"That the estimate of 30,000l. submitted by the Finance Committee be approved; and that the Council do agree to contribute three-fourths of the cost of the proposed acquisition and laying-out by the Council of the Metropolitan Borough of Fulham of the land at Southfields, Fulham, about twenty-two acres in extent, for the purposes of a public open space, such contribution not to exceed 30,000l., and to be made upon the condition that the Council of the Metropolitan Borough of Fulham undertakes to maintain the ground as a public open space, and to complete the work of laying out within a period of two years from November 5, 1901. . . ."

Street Improvements.—The following recommendation of the Improvements Committee was also agreed to:—

"That, subject to the Councils of the Metropolitan Boroughs of Lambeth and Camberwell giving their consent to the proposed tramway from Camberwell-green to Lordship-lane near Crystal Palace-road, and agreeing to contribute between them one-third of the net cost of the necessary street widenings, and subject also to one-third of the net cost of the street widenings being charged to the account of the improvement, the remaining third being charged to the tramways account, which will also be charged with the whole cost of laying down and paving the tramway track, application be made to Parliament in the Session of 1902 for powers to widen Denmark-hill, Champion-park, Grove-lane, Dog Kennel-hill, Grove-vale, and Lordship-lane, in general accordance with the plan approved by the Improvements Committee on October 30, 1901."

Subways for Gas and other Pipes, and Tramways.—The Highways Committee recommended, and it was agreed:—

"That the Council do apply, in the next Session of Parliament, (1) for powers to make subways in streets for the reception of pipes, wires, and other things, where desirable, and for electrical traction and other purposes of locomotion; and (2) powers to construct a subway and to construct tramways therein for electrical traction from the Victoria-embankment, along Wellington-street, across the Strand, through the new street thence to Holborn,

under Holborn and Southampton-row, and to take such tramways, by an inclined plane, to the tramways terminus in Theobald's-road, or to the tramways authorised to be constructed in Rosebery-avenue, as may be considered most expedient."

**Tramways.**—On the recommendation of the same Committee, the following was agreed to:—

"That application be made in the next Session of Parliament for powers to enable the Council to construct tramways, for an underground conduit system of electrical traction, from the London County Council Tramways at Camberwell-green, via Denmark-hill, Champion-park, Grove-vale, and Lordship-lane, to a point near the intersection of that thoroughfare with Crystal Palace-road."

**Preservation of View from Richmond Hill.**—The Parks and Open Spaces Committee brought up a Report containing the following recommendation, which was agreed to:—

"That the estimate of £8,500, submitted by the Finance Committee be approved; and that, subject to Parliamentary authority being obtained to enable the several county and other councils to contribute towards the purchase, and to enable this Council to maintain the land, the Council do resolve to contribute a sum of 35,000, towards the cost of the acquisition of the Marble Hill estate as a public open space, such estate to be vested in, and remain under the control of, the Council in perpetuity. . . ."

**Bow Bridge Reconstruction.**—The Bridges Committee submitted a Report on this matter, containing the following paragraphs:—

"In 1895 our attention was first called to the necessity of the widening of Bow Bridge. The width of the roadway between the parapets is 40 ft. 6 in., which, generally speaking, is a fairly good width for a bridge, but having regard to the fact that it is on the line of an important thoroughfare between West Ham and London, and that a considerable portion of the carriage-way is occupied by a double line of tramway, it is insufficient for present requirements. . . . In considering this question we have borne in mind that Bow Bridge is a county bridge, and that it is of importance to the public generally. We have also considered it from a navigation point of view. With a view, therefore, of providing an iron bridge to meet the needs of traffic, with an improved headway, we instructed the Engineer in June, 1898, to prepare a design showing a total width of 58 ft. between the inner sides of the two outer girders, of which 2 ft. would be occupied by the centre girder, as in the case of Lea Bridge, two roadways, each 18 ft. 6 in. wide, and two footways, each 7 ft. 10 in. wide. The width of the span of this bridge would be the same as that of the existing bridge, the foundations of the latter being used for the new one; the headway at the centre of the span, however, would be 8 ft. 7 in. above Trinity high-water level, or 2 ft. more than the present maximum headway. This improved headway is practically maintained for the entire span, the level of the underside of the bridge at the abutments being only 4 in. below that at the centre of the span. The levels and gradients of the road surface of the approaches to the bridge would remain practically unaltered. The Engineer's estimate for the construction of such a bridge as is described above, including a sum of 3,450, for a temporary bridge and road which it would be necessary to construct in connexion therewith, was 17,000, in addition to which must be added the cost of acquiring property and the compensation which would have to be paid for the temporary use of land, namely, 4,000. . . . In December, 1900, the West Ham Corporation intimated that they were constructing a line on the south-east side of High-street, Stratford, for the purpose of making a 70-ft. road as far as Bow Bridge, and asked to be informed what would be the approximate additional cost for rebuilding the bridge 70 ft. wide instead of 58 ft.

Before replying to the West Ham Corporation it was necessary to make a careful comparison of the methods which would have to be adopted to accommodate traffic during the construction of a bridge either 58 ft. or 70 ft. in width. The conclusion we came to was that during the construction of a bridge 58 ft. wide the traffic would have to be provided for in the following manner—namely, the northern half of the existing granite bridge would have to be demolished, and the corresponding half of the iron bridge would then have to be erected. That during these operations one line of tram traffic and the general vehicular traffic passing from west to east would have to be accommodated by the construction of a temporary timber bridge with its approaches crossing the river Lea about 175 ft. south of the present bridge. That the other line of tram traffic and vehicular traffic passing from east to west would have to cross over the undemolished or southern half of the bridge, the pedestrian traffic being provided for by the erection of a temporary timber widening on the south side of the existing structure. During the construction of a bridge 70 ft. wide we found it would be possible to dispense with the temporary bridge and its approaches as in the formation of a 70-ft. bridge the tram and vehicular traffic would be adequately provided for without involving any

serious inconvenience or obstruction. Moreover, in the case of a 70-ft. bridge the southern portion of the existing granite structure would be first removed and the southern half of the iron bridge built, after which the whole of the traffic could be diverted on to the finished part while the formation of the northern half was in progress. The pedestrian traffic would, throughout the whole period of the rebuilding of the bridge, be accommodated by a temporary timber widening of the old bridge on its northern side. As the necessity for the construction of a temporary structure on the south side of the present bridge would thus, in the case of a 70-ft. bridge, not arise, a considerable saving would be effected. A still further reduction of the cost of a temporary bridge would be represented by the sum required for the purchase of the necessary property and for compensation to persons affected by the alterations; also for the maintenance, lighting, &c., of the temporary bridge for about three years. Taking into account the increase in the width of the bridge, also the additional margin of strength necessitated by the augmented dead and live loads, the Engineer estimates that the approximate cost of a bridge 70 ft. in width would be 19,000. Having regard to all the circumstances, we think it would be well that the scheme for the construction of an iron bridge 70 ft. in width should be adopted. . . . We recommend.—That the estimate of 21,000, submitted by the Finance Committee for the reconstruction of Bow Bridge be approved, and that the reconstruction be undertaken by the Council on condition that the Lea Conservancy Board contribute 5,000, towards the cost, namely, 19,000, of the actual construction of the bridge, and the West Ham Corporation one-half of the remainder, it being understood that the Council and the West Ham Corporation shall each bear the cost of acquiring the necessary property on its side of the river."

The recommendation was agreed to.

**Fire Station, Brixton.**—An estimate of 15,000, for a new fire station at Brixton was approved.

**Cubicles, Parker-street Lodging-House.**—It was also agreed to spend 500, on the construction of additional cubicles at Parker-street lodging-house.

**Housing at Wood Green.**—It was decided to spend 2,500, on the development of the White Hart-lane estate, Wood Green.

**Tenders.**—The Parks and Open Spaces Committee recommended, and it was agreed:—

"That the necessary materials for repairing the tar-paved playground at London-fields be obtained from Messrs. Constable & Co., Ltd., at the following prices:—Topping, 19s. 6d. per ton; dust, 10s. per ton; and spar, 70s. per ton. . . ."

**District Surveyor for North Battersea.**—The Building Act Committee reported as follows, the recommendation being agreed to:—

"The Council on November 10, 1896, consented to the appointment by Mr. H. J. Hansom, District Surveyor for North Battersea, of a deputy to act for a period of one year, the state of Mr. Hansom's health being such as to prevent him from carrying out his duties efficiently. This arrangement has been renewed from time to time, and the Council, on July 30, 1901, consented to Mr. H. J. Hansom appointing his son, Mr. R. D. Hansom, as his deputy for a period of six months from July 11, 1901, in consequence of the death of Mr. W. H. Woodward, who at that time was acting as deputy for the district. When recommending this appointment, we also stated that the whole question of the district surveyors' districts was under our consideration, and that we hoped to be in a position to report fully upon the matter shortly, including in our Report the arrangements to be made with regard to the position of Mr. H. J. Hansom and the permanent supervision of the district of North Battersea. With regard to the district surveyors' district generally, we have formulated our proposals, which will be submitted to the Council for approval in the course of this month. As regards the case of Mr. H. J. Hansom, we have come to the conclusion that the existing arrangement under which the district is supervised by a deputy should cease, and that Mr. Hansom should resign his office. Mr. Hansom has been duly informed of our decision, and we have now to report that he has tendered his resignation. We shall report the steps to be taken for filling the vacancy when submitting the Report as to the districts generally; in the meantime we have instructed the architect to make such arrangements as he considers necessary for the proper carrying out of the work in the district, as the appointment of Mr. R. D. Hansom as deputy will, of course, terminate on the acceptance of the resignation of Mr. H. J. Hansom. We recommend.—That the resignation of Mr. H. J. Hansom, District Surveyor for North Battersea, be accepted as from November 12, 1901."

**Tenders for Electric Tramways.**—On the recommendation of the Highways Committee, the following recommendations were agreed to:—

"(a) That, subject to the result of the usual inquiries proving satisfactory, the tenders of Messrs. Dick, Kerr, & Co., Ltd., be accepted for the supply,

(A) for the sum of 25,964, of the continuous-current plant, and (B) for the sum of 45,650, of the three-phase plant required for the electricity-generating stations to be erected at Greenwich, at the temporary station to be established near Loughborough Junction, and at sub-stations, in connexion with the reconstruction, for electrical traction, of the London County Council Tramways between (a) Westminster Bridge and Tooting, (b) Blackfriars-road and Kennington, and (c) Waterloo-road and St. George's-circus.

"That Messrs. Dick, Kerr, & Co., Ltd., be allowed to sublet (1) to the English Electric Manufacturing Co., Ltd., of Preston, the manufacture of the dynamos, generators, and other electric plant under both contracts; (2) to Messrs. Ferranti, Ltd., the manufacture of the large engines under both contracts; and (3) to Messrs. Belliss & Morcom, Ltd., the manufacture of the auxiliary engines under the contract (A) for the continuous-current plant."

The Council, having transacted other business, adjourned.

#### APPLICATIONS UNDER THE 1894 LONDON BUILDING ACT.

The London County Council on Tuesday dealt with the following applications under the London Building Act, 1894. Unless otherwise stated, consent was given on conditions. The names of applicants are given between parentheses:—

##### *Lines of Frontage.*

**Dulwich.**—A pair of semi-detached dwelling-houses commenced to be erected on the north-west side of that portion of Canonbie-road, Forest Hill, running from south-west to north-east (Mr. W. A. Lewis for Mrs. E. S. Evans).—Consent.

**Lewisham.**—A dwelling-house on the west side of Bromley-road, Lee, to abut upon Ronver-road (Mr. C. W. Horser).—Consent.

##### *Space at Rear.*

**Westminster.**—A modification of the provisions of Part V. of the Act as to the extension above the diagonal line directed by Section 41 of that Act to be drawn, so far as relates to the erection of portions of blocks E, F, and G of residential flats known as St. James's Court, Buckingham-gate, Westminster (Mr. C. J. C. Pawley for Mr. R. Rickard).—Consent.

##### *Width of Way and Lines of Frontage.*

**Hackney, North.**—Houses on the north-west and south-east sides of Portland-avenue, Clapton Common, with portions of the boundaries of the forecourts between the external walls of the buildings and the street at less than the prescribed distance from the centre of the street (Mr. C. Cheston for Lord Amherst of Hackney).—Consent.

##### *Width of Way and Working-Class Dwellings.*

**Rotherhithe.**—Two intended dwelling-houses, to be inhabited by persons of the working-class, and proposed to be erected as an addition to Vine-street buildings, on the east side of Vine-street, Tooley-street, Bermondsey (Mr. A. R. M. Gunn for the London Labourers' Dwellings Company, Limited).—Consent.

The recommendation marked † is contrary to the views of the Local Authority.

#### NEW BOARD SCHOOLS AND THEIR SITES, LONDON.

The School Board for London have just issued their annual schedule of the sites in respect of which they will seek to obtain a provisional order for the building of new, and the enlargement of existing, Board schools in London. The total number of scheduled sites is forty-one, but inasmuch as in each of four divisions two alternative sites have been chosen, the actual number of new sites to be taken amounts to thirty-seven. Taking a mean of the two areas for each pair of coupled sites we find that the thirty-seven sites cover an aggregate total area of 21 acres 20 poles (more or less), and are distributed amongst the following divisions:—Tower Hamlets—No. 537, Commercial-road East with garden ground, or Nos. 67-83 (odd), Bromley-street, with Nos. 62-80 (even), Portland-street, Stepney (1). Southwark—No. 46, Lamb-street; Nos. 205-7, Tabard-street, with Maniple place and two houses in Pardoners' street, Southwark; and No. 91, East-lane, Bermondsey (3). Marylebone—Nos. 32-8 (even), Haverstock-hill; Nos. 29-33 (odd), Cromer-street, St. Pancras; and Nos. 7 and 9, Well-walk, or the houses and gardens known as the Grove, Grove-lodge, Netley-cottage, and Terrace-lodge, in the Grove, Hampstead (3). West Lambeth—Vacant land in Sellin-court-road, Wandsworth; part of the garden of Elmwood house, Upper Tooting, or a plot of ground on the northern side of Elmfield-road, Balham; land, houses, &c., Nos. 24-6, Gaskell-street, adjoining the Larkhall-lane Board Schools, Wandsworth; a portion of the Putney Athletic Ground, between Hot-ham and Erpingham roads; two plots on the northern and south-western sides respectively of

Garratt-lane, Wandsworth; land near Burntwood-lane, Earlsfield; Linden Lodge and grounds, with an adjacent plot in Bolingbroke-grove; the St. John's Hill House School; Nos. 18-24 (even), Sleaford-street; No. 1, Freke-road, Wix's-lane, Battersea; and a site in Gipsy-road, adjoining the Salter's Hill Board School (12). East Lambeth—No. 12, Ann's-place, adjoining the George-street Board School, Camberwell (1). Hackney—Nos. 1-4, Rutland-road, with the vermish works, abutting on the Lauriston-road Board Schools; and the Mission Hall, Tottenham-square, with Nos. 68-70, Tottenham-road (2). Greenwich—Nos. 23-33 (odd), Blackheath-road; land on the southern side of Mayston-crescent, Glenister-road; No. 48, Rowland-grove, Sydenham Hill-road; and Nos. 182-4, Maxey-road, Plumstead (4). Chelsea—Land with houses, forecourts, &c., having frontages to Telford-road, Burnaby-street, and Lote-road; Nos. 91-5, Marlborough-road with Nos. 91-3-5, Keppel-street, Chelsea; a strip of land on the northern side of Beaufort, otherwise Sedlescombe-road, Fulham; Nos. 1-5, Middle-row, with their gardens, &c., and land in South-row, adjoining the Middle-row Board School, Kensington; and land on the eastern side of a proposed continuation northwards of Frithville-gardens, or lands adjoining the Ellerslie-road Board School premises, with a part of Occupation-road, Hammersmith (5). Finsbury—Nos. 38-0, Clerkenwell-close; No. 6, Barnsbury Park; Nos. 29-30 (odd), Hanley-road, with Nos. 26, 40-2-4-6, Grenville-road, and garden-ground in Grenville-road; Nos. 48-70 (even), Scholefield-road, with Nos. 43-5, Nicholay-road; Nos. 150-66 (even), Cloudestley-road; and No. 40, Romilly-road, abutting on the Ambler-road Board School, Islington (6). The Board recently resolved to commit to the care of the London County Council the rehousing of occupants who will thus be dispossessed of their tenancies.

**Correspondence.**

To the Editor of THE BUILDER.

**GRUNDY'S FLUSHING CISTERN.**

Sir,—In regard to your article on our exhibit at the Sanitary Conference, Water Fittings Exhibition, we desire to call your attention to the following points—

I. You state that "the apparatus is worked by the turning of a two-way valve." This is not so, as the valves are lifted, but first closing the outflow passage before opening the inlet valve, and vice versa, and thereby effectively preventing any waste.

II. The cistern, or flushing tank, standing empty until used is omitted. This we claim as one of its great advantages, being a sure protection from freezing.

III. "That the discharge lacks the drive of the syphon or other flushing tanks." We maintain that as good or better drive is given by the expanding of the compressed air within the automatically closing tank, given at the start of the flush, as is the case by the drive of the syphon. Having of late tested the flush, we find that two gallons can be discharged within three to six seconds according to pressure ranging from normal to 5 lbs. to the square inch.

D. GRUNDY, Manager, Sanitary Appliance Syndicate.

\*\* No. 1 is a mere question of accurate working. We saw no section of the valve. No. 2 is an important point in favour of the cistern, which we omitted to mention. In regard to No. 3 our opinion is not altered. No doubt there is an impetus given to the start of the flush by the expansion of the cushion of compressed air at the top of the cistern, but the depth of this can be but small, and after this cushion of air has resumed its normal condition, the rest of the discharge is by gravitation alone, and should require a good head to make an efficient flush. The cistern is an admirable one, and we recommend it strongly—only with this precaution—ED.

**GAS AND GAS FITTINGS.**

20.—THE RELATIONSHIP BETWEEN THE GAS VENDOR AND THE GAS CONSUMER. RECENT CONCESSIONS. HOW TO READ THE METER. HOW TO ASCERTAIN THE RATE OF CONSUMPTION OF ANY GAS-CONSUMING APPLIANCE.

**D**URING the last ten or fifteen years a remarkable change has in many districts occurred in the attitude of the gas manufacturer to the gas consumer.

Formerly a gas company considered its work satisfactorily completed when gas had been carried to the consumer's meter. If, after the gas had passed the meter, the consumer through ignorance consumed the gas in wasteful burners, it was not to the interest of the gas company to teach him how to obtain more light or heat with a smaller consumption of

gas. That was the opinion at one time commonly expressed by officers of gas companies.

With the passing of the nineteenth century, however, a radical change was witnessed in the business methods adopted by many gas companies and gas-producing Local Authorities. The gas vendor of the present day realises that it is to the interest of the shareholder as well as of the consumer to aid the consumer to obtain the highest possible efficiency in light, heat, or power, as the case may be, from every cubic foot of gas consumed. The introduction of leaky supply pipes and wasteful burners into a consumer's premises by an incompetent local ironmonger, whose opinion of the value of a burner is entirely dependent upon his rate of commission, is no longer viewed with equanimity by the gas manufacturer.

Managers of gas undertakings now vie with one another in devising new schemes for popularising the use of gas both for domestic and industrial purposes; but each company has its own rules as to the extent to which it will assist consumers in obtaining an efficient gas supply at small initial cost, and as to the class and variety of gas-consuming appliances which it will let out on hire or lend to consumers without charge. The following list of concessions which have already been granted by one or more companies or gas-producing Local Authorities shows that some gasworks managers have already recognised the necessity of adopting modern business methods, and will indicate to the consumer the kind of assistance he may hope to obtain from the gas vendor—

1. *Gas Supply Pipes.*—Many gas companies will provide and fix all gas pipes of any size and for any purpose at cost price, while a few will supply and fix the pipes free of charge. As most gas companies keep a large staff of competent fitters constantly employed upon this class of work, it is usually a good policy to have the fittings put in by the gas company's men.

2. *Flat Flame Burners for Lighting Purposes.*—In some cases these are supplied free of charge, and in others at cost price.

3. *Incandescent Gas Burners.*—These are in some cases supplied by the gas company at a lower price than that charged by shopkeepers, and in several cases the gas company undertake to maintain incandescent burners in good condition, and renew all mantles and chimneys whenever necessary at a nominal charge.

4. *Gas Fires, Stoves, and Cookers.*—These are let out on hire by most gas companies at a small charge. The rental for a fire for a dwelling-room of ordinary size is usually from 1s. 6d. to 2s. 6d. per quarter, and for a domestic cooker of moderate size from 2s. to 3s. per quarter. A few gas companies will lend these appliances to consumers without charge.

5. *Ring Burners.*—Small ring burners, suitable for boiling a kettle of water, are in many cases lent to consumers free of charge.

6. *Gas Engines.*—At High Wycombe these may be obtained on the hire-purchase system or on the continuous hire system. Few, if any, other gas companies have, however, yet undertaken to supply these on any terms whatever.

7. *Periodical Inspection of Fittings.*—Some companies now undertake without charge to keep and maintain all ordinary fittings in a clean and efficient condition. Inspection is made either upon receipt of request or by periodical visits. In most places the officers of the gas company will examine a consumer's fittings upon special request without charge.

All this "free-of-charge" business must, of course, be paid for eventually in the price paid for the gas, but by minimising the danger attendant upon the use of gas by periodical inspection of the fittings by competent officers of the gas company, by showing the consumer how to obtain the greatest efficiency from the gas with a minimum pollution of the atmosphere, and by assisting him to obtain appliances at low cost which he would otherwise reject, there is little doubt that real progress has been made since the time when the internal gas fittings of buildings were left to men who sometimes were incompetent fitters, and frequently were quite ignorant of the most elementary laws relating to the combustion of gas.

*Reading the Meter.*—The reading of the dials on an ordinary gas-meter is an extremely simple process; but many consumers neglect to watch the meter because the interpretation of the indications is thought to require special knowledge.

To ascertain the rate of consumption per day, per month, or per quarter, as the case may be, it is necessary to make a record of the position of the pointers on the dials at the commencement of the period and also at the end of the period, and to subtract one figure from the other. In fig. 52, for example, the positions of the pointers are shown at the commencement of a week at A, and their positions at the end of the week at B.

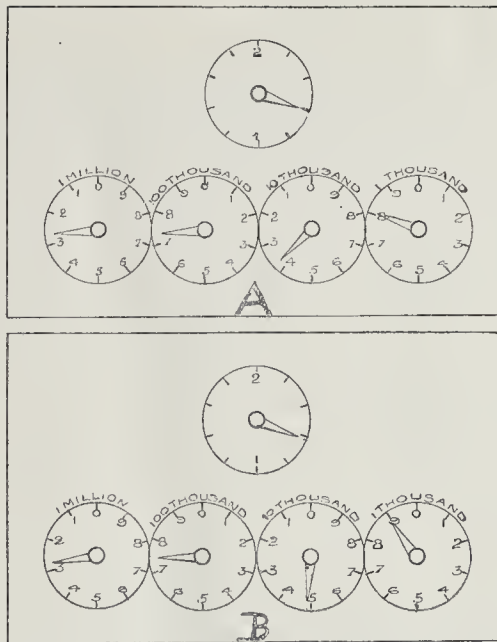

Fig. 52.—Index on Consumer's Meter, showing a consumption of 273,800 cubic feet at A, and of 274,000 cubic feet at B.

The dial with only two figures upon it which is seen above the four main dials is not taken into account when the meter is read by the gas inspector. The pointer of the dial will be the superscription "1 thousand" makes a complete revolution for every 1,000 cubic ft. which pass the meter, and as the dial is divided into ten equal parts, the pointer moves from one numeral to the next in succession during the passage of 100 cubic ft.

The pointer of the dial superscribed "10 thousand" makes a complete revolution for every 10,000 cubic ft. which pass the meter, and consequently the movement of the pointer from one numeral to the next indicates the passage of 1,000 cubic ft.

The pointer of the dial superscribed "100 thousand" makes a complete revolution for every 100,000 cubic feet which pass the meter, and consequently the movement of the pointer from one numeral to the next represents a consumption of 10,000 cubic feet.

The pointer of the dial superscribed "1 million" makes a complete revolution for every million cubic feet which pass the meter, and consequently the movement of the pointer on this dial from one numeral to the next indicates the passage of 100,000 cubic feet.

In fig. 52 the positions of the pointers when 273,800 cubic feet have passed the meter since the pointers were all at zero are shown at A, while the positions of the pointers, say, one week later are shown at B. The consumption indicated at B is 274,900. Therefore in one week 1,100 cubic feet (274,900-273,800) of gas have been consumed.

**Testing the Rate of Consumption of any Gas-consuming Appliance.**—The dial situated above the four main dials (fig. 52) on the meter affords a means of ascertaining the rate of consumption of any particular appliance and of the soundness of all the gas fittings within a building. The pointer of this dial makes one complete revolution for every two cubic feet of gas which pass the meter, and as there are ten equal subdivisions on the dial, the movement of the pointer from one subdivision to the next indicates the passage of a fifth part of one cubic foot of gas. Larger meters have a dial divided into cubic feet, and the pointer makes a complete revolution for every five or ten cubic feet of gas which pass the meter.

When all the burner cocks are shut off and the main cock on the meter outlet is turned full on the pointer on this dial will remain quite stationary if the pipes and fittings are gas-tight, but will change its position if a leakage of gas is occurring at any point.

Having ascertained that all the fittings are gas-tight by observing that the pointer remains quite stationary for a period of, say, fifteen minutes, the gas appliance to be tested should be put in action while all other burners are still kept shut off. The number of revolutions made in a fixed period, say ten minutes, should be noted, and the consumption per hour then calculated.

If in ten minutes the pointer makes one complete revolution the consumption per hour is 12 cubic ft.; and if it makes four and a half revolutions in this period the rate of consumption is 54 cubic ft. per hour. In this manner the rate of consumption of any burner or cooker or other appliance may readily be ascertained.

In addition to testing the rate of consumption of the different appliances in use it is a good practice to keep a record of the gas consumed from quarter to quarter, and if the consumption suddenly increases largely without apparent cause beyond the quantity consumed in the corresponding quarter of the previous year, to test the meter to be tested at one of the public meter-testing stations.

#### BOOKS RECEIVED.

EVERY MAN'S OWN LAWYER. By a Barrister. Thirty-ninth Edition. (Cr.-sbv Lockwood & Son.) PROGRESSIVE DESIGN FOR STUDENTS. By James Ward. 5s. (Chapman & Hall.)

REFUSE DESTROYER FOR NOTTINGHAM.—In reference to the application of the Nottingham City Council to the Local Government Board for sanction to borrow £1,000, for the erection of a refuse destructor at the Easteroff depot, London-road, Mr. M. K. North, Local Government Board Inspector, held an inquiry at the Guildhall Grand Jury-room, Nottingham, on the 6th inst. Mr. Harris, of the Town Clerk's Department, Mr. A. Brown, City Engineer, and Mr. F. B. Lewis, his assistant, represented the Corporation.

#### OBITUARY.

MR. E. W. FRY.—Mr. Edward Wickens Fry, well known in Dover as an architect and surveyor, has just passed away at his residence, St. Martin's terrace, at the age of sixty-five years. At one time he was in partnership with Mr. Whitley, and they jointly carried out several building undertakings, but for about thirty years he had devoted himself to his special professional pursuits as an architect and surveyor. He drew the plans for Messrs. Binfield Bros.' building in the Market-square, and for the new Waterloo House for Messrs. Hart & Co. He also, at a rather earlier date, designed and carried out the rebuilding of the counting-house, offices, and warehouses of Messrs. Dickeson & Co. He was for some time engaged in advising the Local Authorities at Deal and Walmer as to their drainage, and he carried out a good many alterations of premises at Sandwich. Mr. Fry had long been a member of the Kent Archaeological Society. His hobby was to collect rare books relating to his own profession as an architect, and he had got together one of the best collections of Kentish histories and works on the archaeology of the county of Kent to be found in any private library. During the agitation which preceded the carrying out of the large scheme of street widening in Dover he zealously worked for the scheme of widening the main thoroughfare, which ultimately proved successful, and when the old buildings on the south side of Biggin-street came down, many of the new elevations in that improved thoroughfare were from his designs. Mr. Fry commenced his public career as a member of the Town Council in the year 1881. Before his second term as a Councillor expired he was elected an Alderman, in November, 1886. He occupied a seat on the Aldermanic Bench for six years, and at the end of that term, in 1892, ceased to be a member of the Town Council. When the Kent County Council was constituted by the Act of 1888, he was selected as one of the Dover representatives, which post he continued to hold until the time of his death. He for many years was a director of the Dover District Permanent Benefit Building Society, and at the time of his death was Chairman of the society. Mr. Fry was President of the Dover Working Men's Institute from 1884 till 1887, and he gratuitously drew the plans for the enlargement of the Institute premises. He was up to the time of his death one of the trustees in whom the property of the Institute is vested. The funeral took place on the 8th inst. at Charlton Cemetery, when there were present at the graveside a large number of townsmen.—*Dover Express.*

#### GENERAL BUILDING NEWS.

UNITED FREE CHURCH, NEWLANDS, GLASGOW.—The foundation-stone has just been laid of the new United Free Church at Newlands, Langside. The site on which the new church is being erected is at the corner of Langside-road and Riverside-road. The church, which is cruciform in plan, having nave, transepts, and choir recess, is designed to accommodate 300. Part of the accommodation is provided in an end gallery, constructed over the main vestibule. The principal entrance is by a large porch at the south-east corner, the other two doors being intended for egress. From the porch access is obtained to the main vestibule, at the north end of which is the ladies' cloakroom. The main vestibule, closed in by swing-doors, is arranged as a general cloakroom. A cloakroom is also provided for the choir at the other end of the church, near the choir platform. Other accommodation provided is as follows:—A new vestry, large classroom for eighty, a kitchen for church purposes, and a house for the church officer. Recesses are formed at each side of the choir recess for a divided organ. The feature of the interior of the church will be the large aisle arches, with octagonal piers, all of freestone. Owing to the wide span of these arches and their consequent height, a clearstory is dispensed with, and the church lighted at the side walls by large traceried windows placed high above the floor. The aisles will be simply passages, no pews being placed behind the stone piers. All the windows and doors will show stone jambs inside. The roof timbers will all be exposed, showing an open timber hammer-beam roof. The windows are to be double glazed. The heating is to be by hot-water pipes and radiators. The exterior of the church is to be built of Giffnock stone, and the stone-work of the interior of Auchenheath stone. The work is being superintended by Mr. John Sim, inspector of works, and Mr. H. E. Clifford is the architect.

NEW CHAPEL, DONINGTON.—A new Primitive Methodist chapel has just been completed at Donington, Lincolnshire. The total cost, including the site and some buildings which are to be converted into schools, was 1,000. The chapel was built by Mr. Barnsdale, of Donington, Mr. W. Greenfield, of Boston, being the architect.

CHURCH, MOYNALVEY, IRELAND.—The new Church of the Nativity, Moynalvey, county Meath, will shortly be dedicated. The architect of the new church is Mr. W. A. Byrne, Dublin.

CHURCH, PETERSHAM.—Lady Sudley laid the corner-stone of a new church at Petersham Lodge on the 8th inst., to be erected at a cost of 10,000, with seating accommodation for 600. The building

is Romanesque in style, with a nave, two aisles, and a tower. The architect is Mr. John Killy.

REPAIRS TO CHURCH.—The Church of the Holy Rood, Packington, Leicestershire, was opened on October 22, after necessary repairs. A good specimen of Late, and rather Domestic, Perpendicular, it was thoroughly "restored" in the Georgian period, when the traceried windows and other decoration disappeared. Having again become dilapidated, it has now been repaired by the mending of stonework and roofs where absolutely necessary, and the area of nave and aisles has been reformed with plain red squares, and resetted. Some interesting discoveries were made of sepulchral slabs (sixteenth century), ancient flooring, and six magnificent bench ends, which were found, face downwards, in the mould under the seats. These are now once more bench ends in the nave, put back exactly as found, though some are rather decayed. The chancel is still untouched; it has a flat plaster ceiling cutting across the windows. The architects are Messrs. Frothero & Phillott, of Cheltenham; and the contractors Messrs. Collins & Godfrey, of Tewkesbury.

PLAISTOW HOSPITAL EXTENSION.—An extension of the Borough Fever Hospital at Plaistow was opened recently by the Mayor (Councillor A. Bishop, J.P.). The buildings occupy a site in Samsom-street and Credon-road, and have been erected by the direct employment of labour by the Works Department, the architect being Mr. E. T. Hall, of London.

The total provision for patients' beds is 170, and all buildings are built on a level above ground on arched open basements. The Isolation pavilion contains fifteen beds on two stories in various wards—four beds, two beds, and one bed—all communicating directly with the fresh air, so that each ward may be separately used without reference to its neighbour. In the open air, but under cover, are the staircases, the sanitary accommodation, bath-rooms, larders, bath-docks, &c. Close to the entrance to the ward is the admission room, where patients are received, examined, and bathed. They then are carried to the scarlet fever pavilions. The larger of the new pavilions contain thirty-one beds on two floors. There is no inside communication between the floors, the one being divided from the other by a concrete and steel floor with suspended ceilings. The pavilion contains two wards, each of fourteen beds, one two-bed ward and one one-bed ward, ante-room for the visitor, and two ward kitchens. From these staffrooms, observation windows enable a view to be obtained of all beds. There are on each floor, close to the staffrooms, a lavatory and water-closets for the use of the nurses, as well as a larder and linenroom. For the use of the patients there is a detached sanitary tower with a connecting bridge, having through currents of air. This contains, on each floor, two baths, two water-closets, four lavatory basins, and a nurses' sink-room. Each large ward is 83 ft. long by 26 ft. wide, and 13 ft. high. In the centre is a Faience stack containing two fireplaces, and around the smoke flues are grouped aspirating flues for taking off the vitiated air near the ceiling. All the smoke flues are swept from the open basement. In addition to the fires there are hot water radiators enclosed in cases into which cold fresh air is admitted at the bottom and passes over the radiators coming out at the top warmed to a temperature of about 60 deg. Under each of the fourteen beds there is an inlet ventilator for cold fresh air. The inlet of fresh air is regulated so as to change the whole volume of air in the ward three times in an hour. There are windows on both sides facing east and west as well as at the end. The floors are of oak, laid on concrete, and the walls are of concrete and varnished. All the internal angles are concave. There are external staircases throughout the hospital leading to the upper floors of the wards, and lifts for the service of the first floor with coals, food, &c., and there are iron fire-escape staircases from each upper floor. The hospital throughout is lighted by electricity, fitted with fire hydrants, electric fire alarms, and with telephones affording means of communication between every part night and day.

The Department (Mr. George Wise, Works Manager), has carried out the whole of the foundations and superstructure, the fire and sound proof floors and ceilings; the artificial stone dressings, pier caps, stairs and yard pavings; the plumbing, plastering, painting, and smith's work; the drainage and the sanitary arrangement. The specialists for electric wiring and lighting are Messrs. Young & Marton, Ltd., of Stratford; for boilers and steam piping, Messrs. Tinklers, Ltd., of Hyde; for heating and hot water supplies throughout the hospital, Messrs. Z. D. Berry & Sons, of Westminster; for laundry fittings, the Cherry Tree Machine Co., Ltd., of Blackburn; for kitchen fittings, Messrs. J. & F. May, of Houlborn; for fire mains and appliances, Messrs. Shand, Mason, & Co., of Blackfriars; for electric bells, fire alarms, and telephones, Messrs. Croston & Co., Ltd.; for gasfitting, the Val de Travers Asphalt Paving Co., Ltd., and Messrs. Pilkington & Co.; for disinfectors and destructor, Messrs. Manlove, Allott, & Co., Ltd., of Nottingham; for Bangor slating, Mr. J. J. Etridge, jun., of Bethnal Green; for lifts, Messrs. R. Waygood & Co., Ltd., of Borough, S.E.; for terra-cotta dressings, Messrs. J. Sitt & Sons, of Lambeth, and fireproof chimney stacks in the wards, Messrs. Doulton & Co., Ltd. The red brick facings have

been supplied by the Ibbotck Collieries, Ltd.; the stock bricks by Messrs. Wakeley Bros.; blue lias and scintelic by Messrs. C. Nelson & Co., Ltd.; glazed bricks throughout by the Farley Iron Co., Ltd.; Portland cement by Messrs. Martin, Earle, & Co., Ltd.; white glazed baths and lavatory basins by Messrs. Boulton & Co., Ltd.; white and brown glazed chimneys and gullies by Messrs. Broad & Co., Ltd.; drain-pipes by the Archer Sanitary Tube Co.; Palmer's patent flushing tanks by Messrs. J. Knowles & Co., Ltd.; glazed stoneware manholes by Messrs. J. Cliff & Sons, Ltd.; water-closets, water-cold apparatus, and slip-pipes by Messrs. Dent & Hellyer; patent hot and cold water taps by Messrs. B. Rhodes & Son; floor-springs for doors and the opening gear for fanlights and rooflights by Messrs. Smith & Turner; stoves and chimney-pieces by the Albion Iron Co. and Messrs. Yates, Heywood, & Co.; oak parquet floors by the Acme Wood Paving Co., Ltd.; rain-water gutters and pipes by Messrs. Macfarlane & Co., Ltd., and Messrs. McDowell, Steven, & Co., Ltd. The contract price is 98,000.

**HARROW SCHOOL CHAPEL.**—The Governors of the School have approved of the plans prepared by Mr. Aston Webb for a committee which has recently been appointed for erecting a memorial to the forty-eight old Harrovians who have died in the South African campaign. The memorial will take the shape of a prolongation, eastwards, of the north and south aisles of the School Chapel, at a cost of about 6,000. The chapel was built in 1857, after Sir G. G. Scott's designs; its stained glass forms a memorial to the twenty-five old Harrovians who fell in the Crimean war.

**VILLA RESIDENCE, KIRKCALDY.**—A villa residence, with stabling, coachman's house, &c., is being erected in Dysnart-road, Kirkcaldy, from the designs of Mr. David Forbes Smith, the following being the contractors for the work:—Masons, Messrs. Balfour Bros., Sincleartown; joiner, Mr. Matthew Wishart, Kirkcaldy; slaters, Messrs. Currie & Cant, Kirkcaldy; plumbers, Messrs. Blyth & Douglas, Sincleartown; and plasterer and tile worker, Mr. Henry Masterton, Sincleartown. This villa is the first to be erected on the land belonging to Mr. M. B. Nairn, just being opened up for building purposes. Mr. David Gilmour is contractor for the streets proposed to be made to the north and west of the site, and also for the laying-out of grounds, terraces, &c.

**LIBRARY, HULL.**—The new Central Library, which has been erected in Albion-street, Hull, at a cost of nearly 20,000, was opened on the 6th inst. by Lord Avebury. The building has been erected in the Renaissance style from the designs of Mr. J. S. Gibson, architect, London. The principal frontage is to Albion-street, and is executed in red brick from Leicestershire, and warm brown stone dressings and ornamental parts from Ancaster. The front consists of two stories, the lower one having square-headed windows surmounted by recessed arches, and the upper windows having balconies with wrought-iron balustrades, into the design of which has been wrought the City Arms. At the corner next the Church Institute, where the library buildings project some 12 ft. in front of the Institute, an octagonal tower has been carried up. The upper part of the tower is carried out in a series of breaks into a domed form, with detached columns below the dome. The building extends right through to Baker-street, where a frontage one story high has been carried out in a style to correspond with the main front. Above the main entrance is a shield, supported by figures of a boy and girl, containing the name of the library, while in the gable is a figure of "Literature" carved in relief. The front entrance gives access to a wide entrance hall containing the main stair, which is divided from the entrance hall by stone columns and arches, and the floor of this hall is laid with marble mosaic. On the left is the ladies' reading-room, 25 ft. long by 14 ft. 6 in. wide. Next to this room is the magazine-room, 26 ft. long by 26 ft. wide. On the right is the librarian's room, 24 ft. long by 15 ft. wide, which will probably also serve as a committee room. Adjoining this room is placed the lending library, 62 ft. long by 34 ft. wide, and 20 ft. high to the top of the open roof. The whole of the bookshelves behind the counter are of oak fitted with Tomks' patent adjustable fittings, while a book lift and private stair communicate with the reference department on the first floor. Telephones are also fitted between the chief rooms and the librarian's room. A wide corridor runs from the back of the hall to the Baker-street entrance, and off this corridor, near to Baker-street, is the newspaper reading-room. This room is 47 ft. long by 32 ft. wide and 20 ft. high. The walls of the entrance-hall and corridor and stairs have been covered with tiles. The reference library is on the first floor, at the top of the main stairs, and is a room extending the whole length of the Albion-street frontage. The dimensions are 72 ft. long by 30 ft. wide, and 21 ft. high to the top of the ceiling. The centre part of the room is to be used by readers, and tables have been provided to accommodate forty, the ends of the room being fitted up as a bookstore. The general contractors for the work are Messrs. Armitage & Hodgson, of Leeds; the furniture and fittings have been executed by the North of England School Furnishing Co., of Darlington, from the architect's designs; the

electric wiring, fittings, and telephones have been supplied by Mr. S. F. Wood, of Hull. The works have been supervised by Mr. W. H. Williams, clerk of works.

**HOMES FOR INEBRIATES, WHALLEY, LANCA-SHIRE.**—These homes are about to be erected on the Brockhall Estate, Whalley, for the treatment and care of inebriates committed by the various courts in the County Palatine. So far, plans have only been prepared by Mr. Littler, the County Architect, for the accommodation of females, the tender for which has just been let for the sum of 75,418. Primarily, the Lancashire Inebriates Acts Board scheme provides for the erection of two separate institutions for the reception and treatment of inebriates—one for males and the other for females—and that these buildings shall be at a distance of some 500 yards from each other. Each of the institutions will be provided with a reasonable area for recreation purposes, which can be subdivided for classification purposes if thought necessary, and the whole enclosed by an unclimbable iron railing. It is proposed to erect the establishment for the females almost in the centre of the property, and that for males about 500 yards north-east thereof on the high ground in the vicinity of the Brockhall Farm. The main frontage to all these buildings will have a south-west aspect. The plans show that accommodation has been provided for fifty males and 100 females, but the administrative blocks have been so designed as to admit of an increase in the number of inmates up to 100 males and 200 females. In respect to the provision made for females, the administrative block will be centrally situated, and will contain the necessary offices, visiting and committee-rooms, provision for the officers and staff, together with kitchens, &c., stores, and dining-room for 200. The living accommodation will be provided in six blocks of two semi-detached houses, situate three on the east and three on the west side of the administrative block, so that twelve distinct and separate dwellings will be available, which will give all the facilities required for classifying the inmates. Each house provides accommodation for eight inebriates, with a dayroom, attendants' room, scullery, boot-room, store, bathroom, and a separate bedroom for each inmate, and these houses will be approached from the administrative block by means of covered ways. The laundry, which will be used for the inmates and staff of both institutions, will be placed behind the administrative block for women, and in an adjoining building will be the steam boilers for heating the buildings, which will also supply the steam and hot water for the laundry and for the cooking apparatus in the women's institution. In regard to the accommodation for males, the scheme is similar to that proposed for the females, with a central administrative block and dining-room accommodation for about 100. It is anticipated that there will be three blocks of two semi-detached houses to accommodate forty-eight inmates to commence with, one of which can be used as a reception house. At the rear of this administrative block will be situate the electric generating plant for the lighting of the whole of the two institutions, and the boilers necessary for the purpose will supply the steam and hot water for heating and cooking in the men's institution.

**GOLF CLUB HOUSE, HOLLINWELL, NOTTS.**—The new club of the Notts Golf Club, situated at Hollinwell, has a view over the course towards Mosley Hills. The kitchen has been considered as the key of the plan, and is so situated as to serve direct the ladies' room, the dining-room, the gentlemen's club-room, and the dressing-room. The three first mentioned apartments are arranged along the front, and each has a door opening on to the verandah. A dressing-room is provided with lockers for nearly 200 members, and has at one end a radial drying closet for airing members' clothes, and also lavatory and shower-bath. Another lavatory is situated close to the main entrance, and accommodation is also provided for a steward, who will live upon the premises. The main building has been erected by Messrs. Gilbert & Son, builders, of East Kirby, whose contract was 2,160, and the plumbing and heating have been carried out by Messrs. Humphrey & Co., of Nottingham. Mr. A. Gaunt, of Bulwell, obtained the contract for lockers, &c., and the dressing-rooms, and Messrs. Dennett & Ingle, of Nottingham, have erected the professional shop and caddies' shelter. Mr. J. Harris and Miss H. G. Watkins have acted as joint architects for the whole of the work.

#### MISCELLANEOUS.

**PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.**—Schmidt's Supersting Co. have appointed Messrs. Wilcox Bros., 15, Norfolk-street, Sunderland, as their representative for Northumberland, Durham, and Yorkshire; and the Providence Engineering Works, Rhode Island, U.S.A., as their representatives for the United States.

**DESTRUCTOR WORKS, BIRMINGHAM.**—Mr. H. Percy Bulois, Local Government Board Inspector, held an inquiry at the Council House, Birmingham, on the 6th inst., into the City Council's application to borrow £31,000 for purposes of a refuse destructor, stabling, &c., at Rotton Wharf. Mr. E. O. Smith, town clerk (Mr. E. O. Smith) informed the inspector

that the Health Committee had for some time had under consideration the necessity for erecting additional furnaces for destroying refuse at the wharf in question. The two furnaces at present there were altogether inadequate to the work to be done, being capable of burning only about fifty tons per week of uncreased refuse. There was also a great need for stabling at the wharf. Evidence having been given, Mr. Bulois inspected the site of the proposed buildings.

**MEMORIAL CHURCH PLATE.**—The ladies of Natal, in conjunction with sympathisers in England, have decided to commemorate the memory of those who have fallen in defence of the colony during the present campaign in South Africa, by presenting to the Cathedral at Pietermaritzburg a set of altar vessels, comprising two chalices with patens, two burettes, and flagon, all richly jewelled with precious stones. The necessary funds having been fully subscribed, a design by the Rev. Ernest Geldart has been accepted. The work of execution has been entrusted to Messrs. Taylor and Clifton, of London.

**SOUTH KENSINGTON NATIONAL ART COMPETITION.**—In the list of these competitions a gold medal for architectural drawing was awarded to a student for a drawing which was a direct copy of Mr. Paul's drawing of Malvern Abbey Church in the New Year's number of the *Builder* for 1897. The attention of the authorities at South Kensington has been drawn to this, and we understand that they have withheld the gold medal.

**LINCOLN'S INN FIELDS.**—In the course of next week will be sold at auction, by order of the Commissioners of H.M. Office of Works, the materials and fittings of Nos. 30A, 30-1-2, Lincoln's Inn Fields, and No. 2 Serle-street, together with the Post Office premises at the corner. The site was taken lately for the proposed enlargement of the offices of the adjoining Land Registry in Lincoln's Inn Fields.

**APPOINTMENT OF SANITARY OFFICERS.**—The Local Government Board has sanctioned the appointment of the following sanitary inspectors, viz., Mr. C. M. Longden in Finsbury, Messrs. A. W. Stiles and H. Quantrell in Stepney, and Miss E. G. Gamble in Lambeth.

**DISCOVERY OF AN ANCIENT CAVE DWELLING IN NOTTINGHAM.**—An interesting antiquarian find has just been made while clearing the site of some old property on the south side of Hounds-gate, immediately opposite the lace factory of Messrs. Coopers & Lybrand. The workmen have come across an oblong rock chamber, measuring 8 yds. in length (from north to south), and about half as much in width. The height is about 7 ft. An idea was at first entertained that the place had been a chapel, but the geographical plan precludes that idea. In the centre is a finely-wrought pillar, oblong in plan, and conforming to the direction of the excavation. Unlike the vast majority of Nottingham rock excavations, this one exhibits detailed architectural features. The central pillar measures in diameter 4½ in. by 16 in. at the capital moulding, which latter is 7 in. in height, and is divided into three horizontal courses, each semi-circular in section. The south end, or front, of the pillar is wrought with three semi-circular pilasters, almost touching each other, and extending down to the floor level. At the height of about 5 ft. their continuity is interrupted by the projecting capitals moulding, above which they are continued as roof vaultings. The same style of groinings spring from the two sides of the column, and extend in splayed form across the roof. The latter, on either side of the pillar, presents a semi-circular elevation, and evidently indicates the Norman period of architecture. These side-roof mouldings are not continued down the sides of the pillar as in the front, however, and at the back, or north face, no mouldings appear either on column or roof. The projecting capital moulding alone is carried entirely round the four sides. The pillar is a little wider at the bottom than at the top. Though slightly damaged in places, on the whole the latter is in good preservation. At the opposite spring of the arches, or along the east and west sides of the apartment, and at the same level as the capital moulding, occurs a moulded projection or string-course, which, on the west side at least, yet retains a perfectly formed cable ornament, 3 in. in depth, which has suffered very little decay. This is not continued across the north end, while southward it terminates on either side, as though roughly broken off, two or three yards from the end of the excavation. The explanation appears to be that the latter has at some later date been enlarged in this direction. This view gains strength from the circumstance that the disposition of space is not symmetrical. The space between the arch springs on the west side is 5 ft. 2 in., and on the east side 5 ft. 4 in., or practically the same. Taking the opposite directions, however, while the distance between the pillar and the north end measures 7 ft. 3 in., that between the pillar and the south end measures 12 ft. 6 in. The present entrance is by a brick arched flight of steps at the south-west angle of the excavation, but the original entrance was possibly in the centre of the south end, for there a bricked-up space, large enough for a doorway, may be seen, and the rock on either side shows evidence of arrangements for barricading the same. Possibly this old entrance was reached by a pit or shaft, but such excavations may settle this detail. The chimney, affording proof of the former occupation of the place as a dwelling, is in the north-west

angle of the roof, and consists of a circular shaft like that of a well, about 2 ft. 6 in. in diameter. Its higher portion has been bricked around. The place has been utilised in modern times as a cellar, for not only is coal slacked to be seen about the floor, but such dates as 1823 have been scratched in several places. Mr. English, the contractor for the work now going on, informs us this interesting place will be buried again in about a fortnight's time.—*Nottingham Guardian*.

CENTRAL TECHNICAL SCHOOL, LIVERPOOL.—In reference to the account of this building in our last issue, Mr. J. R. Scates of Liverpool, asks us to mention that he acted as clerk of works during the progress of the building.

### CAPITAL AND LABOUR.

THE PENRYN QUARRY.—Since work was resumed at the Quarry on June 11, the number of men employed has steadily increased, especially during the last month, which showed an increase of forty, the increase during September having been twenty-seven. These included twenty-nine slate-makers and thirty-eight labourers and daymen. The production of slates has similarly increased very satisfactorily, in fact, the output last month was at the rate of 3,000 tons per annum.

THE STRIKE OF SLATERS AT HULL AND BRIDLINGTON.—This strike has come to an end, in the twelfth week of the struggle. In February last the operative slaters and tilters of Yorkshire approached their employers, and submitted a code of working rules for the county. Subsequently, joint conferences were held, and in July last an agreement was arrived at, and a new code of rules established and signed by the representatives of both parties. These rules came into force on August 1, and August 17 the Hull men took exception to them and came out on strike.

The Operatives' Amalgamation, true, it is stated, to their agreement with the employers, declined to support their Hull members, and refused them strike pay or travelling money. They also advertised for and drafted unionist workmen into the city to fill the places of the strikers. The Yorkshire employers drafted their senior apprentices into Hull, as also did other members of the National Association of Slate Merchants and Slaters, until a superabundance of labour obtained. The men then made overtures for a "conditional" surrender, but to no purpose. They eventually attended before their District Executive Council, signed the rules, agreed upon terms for repayment of the outpocket expenses occasioned by the dispute, and gave an undertaking to abide by the ruling of the District Committee in the future. Consequently the Hull employers have opened their yards, and taken on such of the men as they had vacancies for.

### LEGAL.

#### BUILDERS' LIABILITY UNDER THE WORKMEN'S COMPENSATION ACT, 1897.

THE case of Alice Knight v. William Cubitt & Co came before the Court of Appeal composed of the Master of the Rolls and Lords Justices Stirling and Mathew on the 7th inst., on the appeal of the defendants, the well-known firm of builders and contractors, from the award of the County Court Judge of Brompton under the Workmen's Compensation Act, 1897, the applicant being the widow of a man killed by an accident arising out of, and in the course of, his employment as a "house-breaker."

It seemed that Messrs. Cubitt & Co. entered into a contract with Messrs. Woolland to alter two houses known as Nos. 16 and 17, William-street, Knightsbridge, and under the contract No. 17 had to be demolished and rebuilt. A sub-contract was entered into by Cubitt & Co. with a house-breaker named Clements, the latter undertaking the demolition of the house. Knight was in the employment of Clements, and while engaged on the demolition of the building he was by an accident killed. The building was originally over 30 ft. in height, but at the time of the accident had been reduced to about 11 ft. in height. The party wall between Nos. 16 and 17, however, remained standing, and it exceeded 30 ft. in height. It was said that Cubitt & Co. habitually entered into contracts to demolish buildings and to rebuild them, but they never did the work of demolition themselves, always entering into a contract with a house-breaker to do this part of the work. The County Court Judge held that Cubitt & Co. were liable under the Act, and awarded the applicant 278l. compensation. From this decision Messrs. Cubitt & Co. now appealed.

Mr. Ruegg, K.C., and Mr. Minton-Senhouse appeared for the appellants; and Mr. Edmond Browne and Mr. Valentine Browne for the applicant (the widow).

Mr. Ruegg contended that as the work of demolition was merely ancillary to and formed no part of the trade or business carried on by Cubitt & Co., the case came within the exception in Section 4 of the Act. Messrs. Cubitt & Co. never demolished buildings, so that the demolition was no part of their trade or business. The learned counsel also contended that the employment of the deceased

man at the time of the accident was not on a building exceeding 30 ft. in height, the building then being about 11 ft. in height. It had been decided that the Act did not apply to employment on a building which was being constructed, but which at the time of the accident did not exceed 20 ft. in height, though when completed it would exceed 30 ft. in height (*Billings v. Holloway*). The same rule therefore applied to the demolition of a building. The learned counsel further contended that Messrs. Cubitt & Co. were not "undertakers" within Section 7, Sub-Section 3, of the Act.

Without calling upon counsel for the applicant, The Master of the Rolls, in giving judgment, said he was of opinion that the appeal must be dismissed. They had two, three, or four points discussed, but those that impressed themselves most on his lordship's memory were (1) that the term "undertaker" ought to be so construed as to exclude Messrs. Cubitt & Co. from liability in this case; (2) that the work to be done by Clements, the sub-contractor, who employed the injured man in the work he was doing, was ancillary to and not the main work that Messrs. Cubitt & Co. had undertaken; and (3) that the building on which the man was engaged in demolishing was not 30 ft. high at the time of the accident. He would deal with the points in the inverse order, the last argued first.

They had heard the finding of the learned County Court Judge that the building on which the man was engaged was over 30 ft. high at the time of the accident. That was a finding of fact, and all this Court has to do in dealing with it is to see whether there was any evidence on which the Judge could find that the building was over 30 ft. high at the time of the accident. What the man was engaged in doing was working on a building which was being demolished, and a substantial part of it, viz., the party wall, which was an essential part of the building when it existed as a building, was standing to a height of more than 30 ft. It appeared from the evidence that what the man was actually working on at the time of the accident was this party wall, and thus working on a substantial part of the building which remained and was not demolished and was more than 30 ft. high. His Lordship could not say that the learned Judge was not entitled to find that a substantial part of the building was more than 30 ft. high at the time of the accident. So much for that point. Then as to the "undertaker" point. It was said that Messrs. Cubitt & Co. were not "undertakers" at all because there was evidence that they did not usually themselves, by their own workmen, deal with the demolishing of buildings. But his answer to that was that it was, on the evidence, a part of their business to demolish. It might be that Messrs. Cubitt & Co. did not regard it as their special business, but they could not undertake to build without demolishing at all. Here they contracted to demolish certain buildings with a view to erect another building on the site, and they also contracted to alter or make alterations in the other building, which was not to be pulled down. In their contract they undertook both obligations, and that, from the evidence, was their usual practice. He thought that was evidence that Messrs. Cubitt & Co. were "undertakers" within the meaning of the Act. He construed the word "undertake" in this Act by reference to the Act itself. It might have a different meaning in other Acts of Parliament.

Lord Justice Stirling concurred. Lord Justice Mathew, who also concurred, said he had never been able to entertain any doubt that Messrs. Cubitts, as part of their business, undertook to demolish the house in question. It was, as he had said, a matter of convenience to the firm to make a sub-contract with a sub-contractor who employed persons called "housebreakers," as Cubitt & Co.'s workmen were usually employed to build, and they might not be as skilful in that particular work as those whose business it was to demolish. The only other point he need refer to was as to the height of the building. The Court had the finding of the County Court Judge on the subject, and his lordship should infer that he had more evidence before him than appeared on the note. A witness in the case had stated that at the time of the accident he was working at a big piece of the party wall, and that the deceased man was working a foot away from him. He thought there was abundant evidence on which the County Court Judge could find that the deceased man was employed in demolishing a building more than 30 ft. high at the time of the accident, and for those reasons he considered the appeal should be dismissed.

The appeal was accordingly dismissed with costs.

CASE UNDER THE PUBLIC HEALTH ACT.

THE case of the King v. Maude and Another came before a Divisional Court of King's Bench, composed of the Lord Chief Justice and Justices Darling and Channell on the 8th inst., in which Mr. Boswell appeared to show cause against a rule nisi for a *certiorari* to bring up and quash a conviction of the Guardians of the Hunslet Union for not complying with a certain by-law made under Section 157 of the Public Health Act, which required them to deposit the plans for a new

workhouse with the local Sanitary Authority. It appeared that the guardians were building the workhouse by the order of the Local Government Board, and it was contended that the by-law did not apply to such a case. The rule nisi had been obtained on the ground that the Board had no jurisdiction and that the service of the summons was not sufficient.

At the conclusion of the arguments their Lordships on the question of service thought that the rule should be made absolute, so that the proceedings could be commenced again *de novo*.

The rule was accordingly made absolute, but without costs.

Mr. Brooke Little appeared for the Guardians in support of the rule.

#### THE MEASUREMENT OF BUILDINGS UNDER THE WORKMEN'S COMPENSATION ACT.

THE case of McGrath v. Robert Neill & Sons came before the Court of Appeal, composed of the Master of the Rolls and Lords Justices Stirling and Mathew, on the 8th inst., on the appeal of the defendants (the employers) from the decision of the County Court Judge of Manchester under the Workmen's Compensation Act, 1897. The case raised the question as to the proper point at the bottom of the building to be measured from, so as to decide under Section 7, Sub-Section 1, of the Act whether the building at the time of the accident exceeded 30 ft. in height.

The applicant was a workman in the employment of the defendants, and was so injured in an accident which arose out of and in the course of his employment. The only question to be decided was whether the building on which the accident happened exceeded 30 ft. in height. The measurements taken and proved before the County Court Judge showed that from the bottom of the footings above the concrete foundations to the top of the building was 33 ft. 2½ in.; from the top of the footings to the top of the building, 31 ft. 2½ in.; from the basement floor to the top of the building, 20 ft. 10 in.; and from the level of the street to the top of the building, 20 ft. 8 in. Some evidence was given at the trial that at the time of the accident the footings were covered in. The County Court Judge thought that the standard of measurement to be taken was from the bottom of the footings, and as this measurement showed a height of more than 30 ft., he made an award in favour of the applicant. The employers now appealed, on whose behalf it was contended that the proper place to measure from was from the level of the ground where the foundations had been covered in.

Without calling upon counsel for the applicant (the respondent on the appeal), the Master of the Rolls, in giving judgment, said that in his opinion the proper measurement to be taken was a question of fact in each case, provided there was evidence to support the finding. The fact that part of a building was below the level of the ground did not prevent it being over 30 ft. in height. From the evidence it seemed that probably the footings were covered in, but his lordship could see no evidence that there was more than a flooring at the top of the footing. The presumption from the evidence was that the flooring at the time of the accident had not got beyond that stage. His lordship thought that the building should have been measured from the top of the footing, and as the building then exceeded 30 ft. in height the applicant was entitled to succeed.

The Lords Justice concurred, and the appeal was dismissed with costs.

Mr. Clavell Salter appeared as counsel for the appellant, and Mr. McCleary for the respondent on the appeal.

#### EMPLOYERS' LIABILITY ACT: ASSISTING IN WORK WITHOUT INSTRUCTIONS, AND THE CONSEQUENCES.

AT Brompton County Court, on Monday, before Judge Stonor and a jury, Albert Clark, a builder's labourer, Peasey-road, Fulham, S.W., brought an action under the Employers' Liability Act, 1880, against Mr. James Wendon, builder, 1, Danchurst-road, Fulham, claiming damages in respect of personal injuries sustained, owing, it was said, to negligence on the part of the defendant or his servants.

Mr. R. S. Nolan, counsel, appeared for the plaintiff, and Mr. J. W. Moyses, counsel, defended.

Counsel for the plaintiff explained that in May last the plaintiff was employed by the defendant as a builder's labourer on the Deauport House Estate, North End-road, S.W. On May 10 the man was assisting in digging a trench which had reached a depth of about 10½ ft., but had not been "timbered" or strutted, to prevent the sides falling in. The soil was soft and sandy, and, of course, was more likely to fall than a heavier soil. It appeared that before dinner time the foreman told the men working in the hole to timber the hole as soon as they came back at half-past one. It appeared also that there was a deficiency of timber on the job, and this accounted for the strutting not having previously been done.

As the plaintiff was assisting in the strutting, one side of the hole gave way, causing a large piece of timber to fall upon him. The man was thrown heavily upon his back, and the piece of timber injured a bone in the region of his left eye. The man was detained as an in-patient at the Queen's Jubilee Hospital for four days, and for four weeks he was incapacitated for work.

The plaintiff bore out his counsel's opening statement. He added that the hole was in treacherous soil of sand and stones. He did not hear the foreman say anything about the strutting, except that as soon as they came back from dinner two of them were to put in the timbering. He maintained that the strutting in such a hole should be put in before the hole exceeded 6 ft. in depth. There was plenty of timber on the job, but he did not know whether the foreman would let them use it. In work of the kind in question it was usual to employ men receiving extra payment for strutting the hole. There were no such extra-paid men to do the strutting at the time of the accident.

Cross-examined: It was true that the hole had a battering, making it narrower at the bottom than at the top, the object of which was to prevent the sides falling in. He denied that two of the other men were told by the foreman to do the strutting, and that he was directed to do nothing but the digging.

Walter Osborne, a builder's labourer, 87, Bayonne-road, Fulham, who was working in the hole at the time of the accident, stated that the foreman told him and another man, named Cattermole, to do the "timbering up." The foreman did not tell all the men in the hole to assist in that part of the work. With the exception of himself and Cattermole, the men were told to get on with the digging. There was plenty of timber about which could have been used for strutting up the hole.

The Judge: I do not think it is any use going on with this case. There must be a non-suit. The man might have been entitled to claim under the Workmen's Compensation Act, but if he had recovered compensation I should have given costs against him.

Mr. Moyes: I do not think he could have recovered under the Workmen's Compensation Act, because there was no building 20 ft. in height, nor steam and other mechanical power in question. I think the case is quite outside the Act. I do not now ask for costs.

#### CASE UNDER THE LONDON BUILDING ACT, 1894.

THE case of the King v. D'Eyncourt came before the Court of Appeal, composed of the Master of the Rolls, and Lords Justices Stirling and Mathew, on the 11th inst., upon arguments against a rule nisi which had been granted by this Court, calling upon Mr. D'Eyncourt, the Metropolitan police magistrate, to show cause why he should not state a case for the opinion of the Court.

It appeared that a Mr. Jas. Ellis had been convicted by the magistrate on a charge of having committed an offence under the London Building Act, 1894, viz., by erecting a building beyond the general line of buildings in a certain street. The magistrate made an order for the demolition of the building in question, and to state a case on the ground that no question of law was involved. The Divisional Court refused an application for a rule nisi and a writ of *mandamus* commanding the magistrate to state a case, but on a similar application made to the Court of Appeal the rule was granted.

Mr. Horace Avory, K.C. (with him Mr. R. Dalry, who appeared to show cause against the rule being made absolute, took the preliminary objection that as this was a criminal case or matter the Court of Appeal had no jurisdiction to hear it.

Mr. Freeman, K.C. (with him Mr. R. Cunningham Glen) argued that it was not a criminal case or matter within the meaning of Section 47 of the Judicature Act, 1873.

Their Lordships, however, held that it was clearly a criminal case or matter, and that they had no jurisdiction to entertain it, and discharged the rule accordingly, on the preliminary objection taken by Mr. Avory.

#### ANCIENT LIGHTS:

##### IMPORTANT DECISION OF THE COURT OF APPEAL.

IN the Court of Appeal, composed of the Lord Chief Justice and Lord Justices Vaughan-Williams and Romer, on the 13th inst., a considered judgment was delivered in the case of Warren and Others v. Brown, on the plaintiffs' appeal from the judgment of Mr. Justice Wright in the Queen's Bench Division on August 8, 1900. The case, which was reported in the issues of the *Builder* of August 11, 1900, and November 2 last, raised with regard to ancient lights the question whether the right which is acquired by statutory prescription is a right to the continuance of substantially the whole quantity of light which has come to the windows during the twenty years, or is limited to a sufficient quantity of light for all ordinary purposes of inhabiting or business.

The facts of the case are shortly as follows:—The plaintiffs are the owner and tenant of a house in Leicester, and they claimed damages and an

injunction in respect of the obstruction of the access of light to certain ancient windows in a room on the ground floor and another on the floor above, both rooms facing to the south. For a length of about 17 ft. in front of these rooms the defendant had raised his building from a height of about 20 ft. 6 in. to about 26 ft., but had set it back about 2 ft. or 3 ft., so that the width of the street between the two buildings, which was about 17 ft., became about 19 ft. Mr. Justice Wright found, as a fact, that the defendant had not obstructed or diminished to any material extent, if at all, the light coming to the upper of the two rooms in question. With regard, however, to the floor windows on the ground floor, he found that the defendant had materially diminished the light which the defendants enjoyed from the windows for twenty years past, but that abundant light remained for all ordinary purposes of inhabitation or business. The plaintiff Baum, who was the tenant of the premises, had for less than twenty years carried on in the premises, and particularly on the ground floor, a manufacture of hosiery by means of machinery which required a very exceptional quantity and quality of light for the adjustment of filaments to fine needles. Prior to this manufacture the manufacture of boots and shoes, which required good but not special or extraordinary light, was carried on in the premises. Mr. Justice Wright held that the defendant by his building had so diminished the light that it was materially insufficient during some part of the day for the special requirements of Baum's industry, and he found that the plaintiff's premises had throughout the twenty years before action been suitable for such a manufacture as that carried on by Baum. His Lordship decided that the plaintiffs had made out no case for a mandatory injunction or for damages, and gave judgment for the defendant with costs, but in case he should be held wrong in his law on appeal he assessed the damages at 100l. for the tenant and 200l. for the reversioners. Hence the present appeal of the plaintiffs.

The arguments on the appeal concluded on the 29th ult., when judgment was reserved.

Mr. Hugo Young, K.C., and Mr. W. H. Stevenson appeared for the appellants; and Mr. Warrington, K.C., and Mr. Nelson for the respondent.

Lord Justice Romer read the judgment of the Court, which was to the following effect:—In this case Mr. Justice Wright had found that certain of the plaintiffs' ancient lights had been substantially interfered with by the defendant's new building, and that they had thereby suffered substantial damage. On this finding one would have expected that judgment would have been entered for the plaintiffs, but the learned judge dismissed the action on the ground that notwithstanding the substantial diminution of the ancient light abundant light remained for all ordinary purposes of inhabitation or business. The learned judge appeared to think that in law there was a sort of standard in the matter of light, and that if a house was extremely well lighted the light could be diminished so long as it was as useful for habitation or business as the average run of houses in that locality. That was an erroneous view of the law. If ancient lights were interfered with substantially and damage ensued, the persons injured were entitled to relief, and it was impossible to hold that the statutory right was not interfered with, merely because the house still came up to some standard of light required for inhabitation or business. The plaintiffs were entitled to relief, and judgment must be entered in their favour for the amounts assessed. The defendants must pay the costs of the action and of the appeal.

#### THE LONDON COUNTY COUNCIL, AND FIRE-RESISTING STAIRCASES.

THE case of the Consolidated Properties Co. v. Chivers came before a Divisional Court of King's Bench, composed of Justices Riddle and Bigham, on the 13th inst., on an appeal by the company from a conviction obtained at the instance of the London County Council for non-compliance with a notice given under Section 17 of the Factories and Workshops Act, 1891, calling upon the company, which carries on business at 112, Queen Victoria-street, to provide a new staircase of fire-resisting materials to be constructed on the company's premises, connecting with all the floors and the roof. It appeared that the premises were being tenanted by the company, who were not using them for a factory; and in order to provide the new staircase it would be necessary to interfere with the ground floor, and this could not be done, as the company said they could not interfere with the tenants, and that therefore it was impossible for them to comply with the notice. On proceedings being instituted at the Mansion House against the company for not complying with the notice, the company proposed to give evidence of these facts, but the magistrate refused to hear it, and fined the company. An appeal was then lodged by way of special case to the Divisional Court, but their Lordships directed the matter to stand over till an arbitration had been held as to what was necessary to be done under the notice. The arbitrators made certain recommendations which the company said they were prepared to carry out, and the object of the present application was to quash the conviction on these terms.

On behalf of the London County Council it was urged that the proper order to be made on the special case was that the conviction should be affirmed and the appeal dismissed with costs.

In the result their Lordships allowed the appeal, and quashed the conviction, but without costs.

Mr. Bray, K.C., and Mr. Tudor, Howell appeared for the appellants; and Mr. Dumas for the respondent.

#### RECENT PATENTS:

##### ABSTRACTS OF PATENTED INVENTIONS.

12,762.—AN ELECTRICAL WATER HEATER: *A. E. Greville and A. W. Greville*.—The water is caused to flow on to a metal plate within the geyser and down the heated electrical conductors to another plate and so to the outlet, both plates being mounted upon insulating brackets, and suitable terminals being provided. The wires may be either hollow, or grooved, or tapered, &c., and also encased in order to obviate short circuiting.

12,783.—CONTRIVANCES FOR WATER-CLOSETS: *J. A. Fergusson*.—The inventor provides a raised foot-rest, and fashions the seat with a curve which is sloped downwards from the front.

12,797.—TAPE MEASURES: *J. J. Brunello*.—The tape is drawn out between rollers, and a spring pawl is disposed in engagement with a ratchet-wheel upon the reel-shaft. The tape can be freely pulled only by pressure upon a projecting stud.

12,803.—CEMENT, LIMESTONE, AND OTHER KILNS: *H. Schmidt*.—The material is fed from a rotary drying and preliminary heating tube into a chamber, and thence is passed into the burning-chamber, its quantity being regulated with a slide. There are openings for the supply of fuel and the introduction of tools, and flues which carry the products of combustion through a tube into the chimney.

12,810.—A ROAD-SCAVENGER: *W. H. Miller*.—The front of the machine, which is worked by hand, scrapes, and a brush mounted behind sweeps, the road. Curved arms, fitted with scales and passed through screw-clamps, adjust the brush, which is to be lifted or lowered in a frame that swings upon an axle, and is driven with gear from the main carrying wheel; the sweepings pass over an apron into one receiver, and the scrapings are thrown into another receiver. The former receiver has a loose front, and is attached to the scraper with a turn-buckle so that the two will rise together and, by means of a cord around a roller, will draw a scraper forwards for clearing the dustpan.

12,834.—WASHSTAND FITTINGS: *J. Wilson*.—The washstand is fitted with a basin which has an overflow and a plug for discharge to the waste-pipe. At the back is arranged a cistern having a lid and a discharge-pipe and cock. The cistern may be wholly concealed by the looking-glass, or one side of it may be placed behind the drawers. In another form it may be carried separately by a bracket on the wall.

12,846.—SAFETY LAMPS: *J. Glasnachers and C. Müller*.—The electrodes of a portable secondary-battery lamp consist of pierced leaden tubes which are filled with oxide paste, and are set in two metallic cases having screw covers lined with some non-conducting material. Tubes upon a glass cylinder around an incandescent lamp connect the cases. The cells are connected to the lamp and a switch, as well as to the charging-terminals, by wires that pass through the tubes and behind the linings.

12,864.—CONSTRUCTION OF PARTITIONS, WALLS, &c.: *J. F. Golding*.—Netted or expanded lathing is made up into sheets, which are fastened with staples on to temporary supports, and one side is coated with plaster, concrete, or cement. The supports are taken away when the coating has dried, and then the other side of the lathing is similarly coated. For adjusting the length of a pair of telescopic boards which press against the ceiling and floor, U-shaped guiding clips are affixed to the boards and clamped with wing nuts and screws, or a guiding clip having two loops takes a toggle-jointed support, being pivoted on to a loose bracket, which, if the joint is forced inwards, is tilted so as to grip one of the boards.

12,887.—A CREMATORY FURNACE: *S. W. Houghton and H. H. Fox*.—The retort is heated with liquid-fuel burners that are also fed with air and steam, whilst the resultant gases pass through a water-curtain into a chamber. There is an air space around the retort, and the furnace is constructed in the vault of a mortuary chapel which has a permanent grave, at the bottom of which is a trolley upon which the coffin is laid before the process of cremation.

12,913.—CONSTRUCTION OF GATES FOR VEINS: *W. B. Skotnicki and Count A. F. Ostrowski*.—A chain joins a sluice-gate to the end of a lever which is pivoted on to a framework secured to the piles, a float is fastened adjustably to the other end of the lever for regulating the position of the sluice-gate. If the gate should be suddenly raised, and to an excessive height, the inclined portion of a hook upon the gate will move a pole aside out of its retaining grooves, then a chain and counter-weight will lift the pole into engagement with the hook and so lift the gate into its proper place for floods. By another arrangement the gate can be attached directly to the end of the lever, and the float is in

that case fastened to the middle. Guides and a rod pivoted on to the framework limit the horizontal movement of the float, and it may be contrived that the fall of the counter-weight shall close a circuit and give a signal. The invention comprises a separate flood-gate of which the motion is restricted with stops and a chain.

12,925.—HEATERS AND RADIATORS FOR STOVES: E. Sauter.—These are devised for use with gas, hydrocarbon, or similar lamps or stoves about or above which the inventor places a series of water-tubes which are surrounded with a conical metallic funnel. The spiral tubes being connected to the heater, the radiator is filled from a vessel attached above it, and the products of combustion escape to a cowp upon the apex of the funnel. Other modifications are specified, by one of which a dome-shaped hood takes the place of the conical heating coil.

12,936.—PROCESS OF MOULDING TILES AND BRICKS: M. F. Solon and W. Teltoright.—An inclined block worked with a hand-wheel, an endless chain, a wheel-nut, and a screw lift and lower the bottom-plunger, which, after powdered marl or other cheap material has been filled into the mould, is lowered about one-sixteenth of an inch, when powdered clay is filled in above the marl, and the plunger is again lowered, a facing-glass being put over the clay. The stem of the lower plunger fits in a socket of an inclined block, and when tilted with a treadle and lever will eject the brick or tile. An upper plunger can be employed for pressing the clay in one single operation, or the force may be exerted after each layer has been put into the mould, of which the depth can be increased with perforated and superimposed plates. Confer also No. 2,035 of 1900.

12,938.—MECHANISM FOR LOCKS: F. Legge.—A boss upon the fall of the bolt works on a pin which is affixed in the casing, the arm of the bolt is worked by the arms of the follower, and above the bolt is a pin which carries the spring; behind the head of the bolt is a shield against dust.

12,944.—ELECTRICAL SWITCHES: H. F. Clayton, T. Bell, and S. S. Berry.—A boss of which the sides are flat and which is fitted upon the central pin carries the contact arms, the handle which embraces the arms is adjusted loosely upon the pin, and a quick break is effected by means of a pin that is regulated with a spring and slides within a recess in the base.

12,970.—PROCESS OF MOULDING BRICKS: R. T. Hughes.—Horizontal plungers that work through the open sides of the mould fashion indents or panels in the sides of the bricks, and in place of a slide for closing the mould the inventor adopts a cover mounted upon a vertical frame which has guides and is lifted and lowered with cams; a vertical rod that slides through a cross-bar on the frame carries the discharge-plunger, and with the lowering of the frame will lie upon the bed-plate, the mould being closed with the upper plunger. Confer also Nos. 6,230 of 1895, and 7,801 of 1899.

12,973.—AN ELECTRICAL INDICATOR: Siemens and Halske A.G.—For high pressures the inventors devise a metallic disc surrounded with a ring, the one being fixed and the other being mounted upon an axle, which is fitted also with a non-conducting pointer that traverses a scale, and is regulated by a spring. The ring and disc are oppositely electrified, the movable part being turned by the action of the charged air that streams from tangential directed points. For the spring may be substituted a weight, and for the pointed disc a notched flat ring, and condensers and impedance coils connected with the indicator will afford compensation for variation of frequency of alternating pressures.

12,990.—FLUSH-WATER APPARATUS: W. Franklin.—A pipe from the crown of the bell-siphon extends to a pneumatic push, the long leg is trapped in the casing, and an air-escape pipe and a ball-valve are fitted on to the crown of the siphon. A part of the frame will lie upon the bed-plate, when the push is worked, and when it is released the reduced pressure will cause the water to flow over the crown, and thereby set the siphon in operation.

13,020.—AN APPLIANCE FOR USE IN MOULDING BRICKS, &c.: F. Koepff.—The inventor seeks to furnish means of escape of surplus clay; he fashions the sides of the mould with bevelled meeting-edges, and with recesses for ornamental patterns. The plungers are similarly bevelled. Set-screws and adjusting-screws fasten the sides of the mould in the box or casing.

13,047.—A FIRE-ESCAPE: H. Behrens.—The upper end of a ladder which turns upon a pivot at its middle point is attached to a balcony with a self-acting hook when it is needed for use; at other times it is to be turned into a horizontal position along the front of the house.

13,052.—CONSTRUCTION OF WALLS, &c.: E. Priiss.—Hoop-iron bands stretched at right angles to one another constitute a framework of which the rolled ends are fastened to books or staples in the beams, posts, walls, and so on; slabs, bricks, or tiles laid with mortar, in which the bands are embedded, are filled into the spaces between the bands. The mode of construction extends to outer walls and double walls. For a partition or garden wall is erected a wooden frame, of which one side is faced with tiles or bricks bound together with hoop-iron strips.

13,064.—A FIRE OR SIMILAR ALARM: F. O. Schöppe.—The expansion of a spring as it becomes heated effects its contact with the point of a screw, so as to close the circuit of an electrical bell; an index-finger upon the screw is to be set to a number marked upon a dial that denotes the temperature at which the alarm should be sounded.

13,072.—AN APPLIANCE FOR STAGE SCENERY: F. G. Rossnay.—The inventor fashions the braces with hinged foot-irons that carry screws, of which the collars fit in recesses in the foot-irons; the angle of inclination of the braces may be changed at will and the screws will not be easily lost.

MEETINGS.

FRIDAY, NOVEMBER 15.

Architectural Association.—Mr. Max Clarke on "The Sanitation of a Country House," 7.30 p.m. Institution of Mechanical Engineers.—8 p.m.

SATURDAY, NOVEMBER 16.

Dundee Institute of Architecture.—Visit to St. Andrews.

MONDAY, NOVEMBER 18.

Royal Institute of British Architects.—Mr. R. Anning Bell on "Mosaics," with lantern slide illustrations, 8 p.m. Liverpool Architectural Society.—A collection of books on architectural subjects will be on view, 6 p.m.

TUESDAY, NOVEMBER 19.

Institution of Civil Engineers.—Further discussion on the paper by Messrs. W. Kaye PARRY, M.A., and W. E. ADENEY, D.Sc., on "The Discharge of Sewage into a Tidal Estuary;" and, time permitting, a paper to be presented for discussion, on "The Treatment of Trades' Waste Bacterially," by Mr. WILLIAM NAYLOR, 8 p.m.

WEDNESDAY, NOVEMBER 20.

Society of Arts.—Opening address of the 148th Session, by Sir WILLIAM HENRY PREECE, K.C.B., F.R.S., Chairman of the Council, 8 p.m. Builders' Foremen and Clerks of Works' Institution.—Ordinary meeting of the members, 8 p.m. St. Paul's Ecclesiological Society.—Mr. H. C. Richards, K.C., M.P., on "John Wesley in City Churches," 8 p.m.

THURSDAY, NOVEMBER 21.

Carpenters' Hall, London Wall.—Written examination on Sanitary Building Construction, 5 p.m.

FRIDAY, NOVEMBER 22.

Architectural Association Discussion Section.—Mr. G. H. SMITH on "Canterbury Cathedral," illustrated by lantern views, 7.30 p.m. Birmingham Architectural Association.—Mr. J. A. Gatch on "Architecture of the Eighteenth Century in England," 8 p.m. Glasgow Architectural Craftsmen's Society.—Mr. G. HERTONSON on "Foreign Competition in the Building Trades," 8 p.m.

SATURDAY, NOVEMBER 23.

Carpenters' Hall, London Wall.—Viva Voce Examination on Sanitary Building Construction, 12 noon. British Institute of Certified Carpenters.—Visit to the Vauxhall Bridge Works, 3 p.m.

TO CORRESPONDENTS.

S. S. (Amounts should have been stated). J. K.—W. D. (Below our limit).

NOTE.—The responsibility of signed articles, letters, and papers read at meetings, rests, of course, with the authors.

We cannot undertake to return rejected communications. Letters or communications (beyond mere news items) which have been duplicated for other journals are NOT DESIRED.

We are compelled to decline pointing out books and giving addresses. Any commission to a contributor to write an article is given subject to the approval of the editor, when written, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.

All communications regarding literary and artistic matters should be addressed to THE EDITOR; those relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

### Trade Arbitration at Home and Abroad.

THE ordinary daily journals are supposed to supply their readers with all the constantly occurring facts of our national life, so that they may know accurately the true course of events. But the want of proportion in journalistic presentment is often the cause of misunderstanding. If, for example, a strike of any importance occurs, it fills the news columns of the Press day after day, so that the public are impressed with the belief that labour disputes are long and bitter. Those cases in which differences between employers and workmen happen, and are quickly and amicably settled by conciliation or arbitration, are scarcely noticed. Differences of this kind there must always be, for bodies of men with adverse interests are no more likely to agree than are individuals in the same position. But though this fact is patent, it is not so obvious that there are many amicable settlements; if, however, we survey the trade world at home and abroad we shall find that masters and men, although they may differ, are constantly settling these differences by arbitration. If, for instance, we take the building trade, we find during the year 1900 that there were 146 disputes, affecting over sixteen thousand persons; of these forty-six were compromised, fifty ended in favour of the workpeople, and forty-seven in favour of the employers—figures which seem to show that the disputes were not unreasonable, since neither masters nor men had a preponderating gain by them. This is not surprising when it is borne in mind that, of the total number of disputes, no less than ninety-seven arose in regard to wages, a subject which it is as easy to differ over as the price of a house. All these figures are interesting and suggestive, but none are more so than those in regard to the amicable settlements of disputes. If we take all the disputes which have occurred throughout Great Britain we find that they number 648 for the year, of which 519 were settled either by arbitration, conciliation, or negotiation. "The great bulk," states the Board of Trade, "of the disputes of the year were ultimately

settled by negotiation between the parties directly concerned or their representatives. Thus of the total of 648 disputes three-fourths were so arranged, and these embraced 82 per cent. of all the persons concerned in the disputes of the year, as against 87 per cent. for the previous year.\* The difference is immaterial, the main fact being that a number of trade differences are settled in this manner. Some of these negotiations, of course, lasted for a long time, and if arbitration or conciliation had been employed, the end would, doubtless, have come earlier, for of the total number of disputes thirty-two were settled by this means. But it must not be supposed that these negotiations were ended after a long struggle, though it is equally certain that many of these differences would have been as satisfactorily and more quickly settled by arbitration.

If, however, we return to the question of disputes in the building trade, it is interesting to look a little more in detail into the twenty-four disputes which arose in the trade between July, 1899, and June, 1901. Of these sixteen were settled under the Act of Parliament. We find, for instance, that there was a dispute in May of the present year between the Amalgamated Society of Gasworkers, Brickmakers, and General Labourers and the Cheltenham Master Builders' Association, the former demanding an increase for all labourers from 5d. to 6d. per hour. Mr. A. A. Hudson was the arbitrator, and he refused the demands of the men. It is obvious that the moment a contest of this kind arises it should be settled by an impartial person. Nothing can be more absurd than an industrial battle, ruinous to all parties, about it. The same fate attended an attempt of the Staffordshire painters to obtain a rise of the standard wages from 7½d. to 8½d. In this case Mr. Blashill was arbitrator. The Board of Trade could not have made better selections of arbitrators, for Mr. Hudson has considerable judicial work as one of the Tribunal of Appeal under the London Building Act, and all our readers are familiar with Mr. Blashill's name. It also shows the value of the Conciliation Act of 1896 that both

sides in a dispute can now refer to the Board of Trade to appoint an architect. Private persons have their disputes settled by a judge, and trade bodies have now a tribunal to which they appeal at once. It is also to be noted that London, Liverpool, Bristol, Birmingham, Macclesfield, Halifax, Wakefield, and Dewsbury have each a District Board of Conciliation—a fact which shows that, however inevitable trade disputes may be, there is also growing up the means of settling them in an amicable manner.

These official arbitrations also fulfil another purpose: they can bring the parties together without a formal award—a still more satisfactory manner of terminating a dispute. Thus there was a dispute between the builders' labourers and the employers of Reading, and Mr. Hudson's good offices were again called in. But, he says in his report, "after some discussion I was able to bring the parties to terms, and I enclose a copy of the agreement which I drew up and they signed and exchanged. There was therefore no need for me to make an award." That agreement embodied an advance of wages of from 5d. to 5½d. per hour, but it is evident that all that was needed to end the dispute was a reasonable discussion of it, presided over by an impartial person who could keep it within bounds and prevent harsh or intemperate language. When, also, we look at the agreements made between employers and workmen, we find evidence of the same reasonable spirit. Thus in the agreement of April, 1899, made between the Master Builders' Association and the Carpenters' and Joiners' Societies of Wigan and District, Rules XIV. and XV. practically enact that disputes shall be settled by arbitration. If a change is desired in the rules, a deputation of five working joiners shall meet the same number of employers, and if they fail to come to an understanding, the matter shall be referred to the Board of Arbitration, which is to consist of a body of five working men and five employers. This board is that which primarily settles all disputes between the employers and workmen, and should they not agree, which, of course, is unlikely, then the question as to the change in the rules or the trade dispute is to be referred to an umpire or sole arbitrator to be agreed on, and in case of disagreement to be nominated by the

\* Report of the Chief Labour Commissioner on the Strikes and Locks out of 1900-1901.

Third Report of the Board of Trade of Proceedings under the Conciliation (Trade Disputes) Act, 1896-1901.

Second Abstract of Foreign Labour Statistics, Board of Trade Labour Department, 1901.

Board of Trade. It must be confessed that the step of having a board of arbitrators might well be dispensed with, and time would be saved by going at once to a single umpire. But we are not concerned now with the wording of rules, it is rather with the spirit which inspires them. And we are fairly entitled to say that while it is evident there must in the near future be many trade disputes, there is equal certainty that many will be settled by arbitration or conciliation.

If we turn to the Continent and to America, we shall find in both places inevitable trade disputes and fortunately also a growing tendency to the less brutal methods of concluding them. If we glance, for example, at Germany, where so much energy and vitality is visible in all forms of trade, we find that in the year 1896, the last for which statistics are as yet supplied, there were forty-four applications for the intervention of the Industrial Courts. In France, in 1889, there were 740 strikes, and of these 197 were settled by the operation of the law of 1892; in seventy-nine cases the parties, one side or the other, refused arbitration or official conciliation; and further, in forty-two cases disputes were settled by conciliation committees. If we cast our eyes across the Atlantic we find that in the State of Massachusetts in the year 1896 the latest to which the statistics are as yet available, there were 100 trade disputes recorded, of which thirty-nine were submitted to the State Board of Arbitration and Conciliation, and that of these, nineteen disputes were in the building trade. These figures are not very large, and are infinitesimal compared to the total figures for the whole of the United States, which one day we hope may be presented to the English public. But they are sufficient to indicate the direction of the wind, and together with those from France and Germany they show that there is among masters and workmen a considerable spirit of reasonableness, which one may fairly hope may become more marked the further we advance into the new century.

#### SEWAGE AND SEAWEED.

HE Clyde at Glasgow and the Liffey at Dublin have long had the unenviable notoriety of being the most evil-smelling river-mouths in the United Kingdom. The sea-approach to Belfast during the summer and early autumn is even worse, and it is not surprising that the Corporation of this flourishing city has found it necessary to attempt a mitigation of the nuisance. The problem at Belfast is peculiar in that the nuisance is not directly caused by the flow of sewage into the lough, but is due to the decomposition of vast quantities of a particular seaweed, the "sea-lettuce" (*Ulva latissima*), which flourishes in the upper reaches of the lough, and during high winds is washed ashore, forming banks 2 ft. or 3 ft. thick and miles in length, and there putrefies, the result being an intolerable stench. As the weed has some value as a manure, part of it is carted away for the use of farmers, but the quantity thus removed is very small in comparison with the amount cast up by the sea. At Holywood—about four miles from Belfast, on the south shores of the lough—

an attempt is made to remove it as quickly as it is deposited, but obviously this method would be very costly if applied to the whole of the foreshores over which the nuisance extends, and to prevent the extraordinary growth of the weed would undoubtedly be a better solution of the problem.

With this end in view, the Corporation instructed Dr. E. A. Letts, Professor of Chemistry in the Queen's College, Belfast, to prepare a Report on the proposed scheme of sewage purification, and its probable effects on the lough. This Report, which (somewhat curiously) is not dated, but which contains experiments on samples of sewage and effluents collected between January 6 and June 7 of this year, now lies before us. Dr. Letts shows (we think conclusively) that the occurrence of the sea-lettuce in large quantities in any locality is associated with the pollution of the sea water by sewage. The first ground for this opinion is the large proportion of nitrogen which the weed contains—more than 6 per cent. of the dry weight. The second is furnished by practical observation of the conditions under which it flourishes. In former times Belfast Lough was comparatively free from the sea-lettuce; it appears to have increased with the growth of the city. At the present day Strangford Lough, which is not far from Belfast Lough, but which differs from it in having no large town on its shores, is almost free from the weed. The case of Dublin Bay is particularly significant. The upper reaches are divided by the Pigeon-house wall (more than a mile and a half in length) into a northern and southern portion. The northern portion receives the sewage of the city and the sea-lettuce flourishes abundantly. The upper reaches of the southern portion are unpolluted and are free from the weed, but this is found again at Blackrock and Kingston on the south shore in the neighbourhood of their sewage outfall. Dr. Letts's third reason is based on actual experiment with the weed in samples of polluted sea water. He found that about 50 per cent. of the ammonia in the polluted water was absorbed by the weed in one hour, and nearly the whole of it in five hours.

This led naturally to another series of experiments. The purification of sewage effects a large reduction in the free ammonia, and thus reduces one kind of food which can be assimilated by the sea-lettuce. The question remained whether the albuminoid matters in the sewage effluent would, on dilution with sea water, change rapidly into ammonia or nitrates, both of which contribute to the growth of the weed. Experiments showed that the change was very slow, and Dr. Letts concludes that "their effect on the growth of the *Ulva latissima* may be disregarded." The purification of the sewage of Belfast may, therefore, reasonably be expected to remove some at least of the conditions which cause the sea-lettuce to flourish so abundantly.

The second half of the Report is said to deal with "the scheme of sewage purification proposed for Belfast." It really consists of an investigation of the degree of purification effected by four experimental contact-beds. The sewage is pumped into a storage reservoir, from which it is normally allowed to escape at the ebb tide. The contact-beds are fed from the storage reservoir, and are in two pairs, each pair consisting of an upper and lower bed. The sewage passes

through one upper and one lower bed in six and a half hours as follows:—Filling upper bed, three-quarters of an hour; upper bed resting full, two and a half hours; emptying upper and filling lower bed, three-quarters of an hour; lower bed resting full, two and a half hours. The beds are 3 ft. 6 in. deep, one upper and the two lower beds being filled with broken bricks, and the other upper bed with coke, all the pieces being about the size of a hen's egg. The purification effected is less than that obtained in the experiments at Leeds, and very much less than that obtained at Manchester by the open septic-tank and double contact, and Dr. Letts thinks it "worth while to try the effects of septic tank treatment on the sewage previous to that of the bacteria beds." Certainly, the more experiments that are made the more surely will the foundations of the science of sewage purification be laid. Further experiments with different materials in the contact-beds would also prove interesting. The two beds of broken bricks gave better results than the other pair, which consisted of one bed of coke and one of brick. The second bed might advantageously be formed with much smaller material.

In addition to the usual analyses Dr. Letts has ascertained the nature and quantities of the dissolved gases in the sewage and first and second effluents. This is almost a new departure, and gives promise of interesting results. During the process of purification a considerable proportion of nitrogen disappears. Dr. Letts considers that a good deal of this may escape into the air as free nitrogen, while another portion is absorbed by insects, worms, and plants. The bacteria-beds must be regarded therefore "more as dispersers of nitrogen than as mere converters of it into simpler compounds."

It is somewhat strange that in the preliminary section on "The Methods of Sewage Disposal" Dr. Letts does not draw attention to what may be termed "percolating filters." In these the sewage after partial purification passes downwards in thin films or drops, the filters never being filled with sewage as in the case of contact-beds. The result is more thorough aeration and a higher degree of purification. Of course, the necessity for a high degree of purification is not as great at Belfast as in inland towns.

Dr. Letts's Report is undoubtedly an interesting contribution to the subject of sewage disposal, and adds something to the common stock of knowledge. The part dealing with the relation between sewage and seaweed is more conclusive than that treating of the method of sewage disposal. The analyses of the sewage and effluents were vitiated by the entrance of sea water into the contact-beds or by other causes, the amount of chlorine in the effluents being generally greater than in the settled sewage; on the other hand, in a few cases the chlorine in the effluents was less than in the settled sewage; in only one instance was the original quantity maintained.

#### NOTES.

MR. LONG's speech on Monday, in which he referred to the question of the London water supply, indicates very clearly the policy of the Government on this subject. They will

London  
Water.

certainly introduce a Bill to constitute a public water authority for London and the immediately surrounding districts. Whether in a Session which is certain to be abnormal they will carry this measure through is quite another thing. This authority will have powers of rating, and the price to be paid to the companies will be assessed by what the President of the Local Government Board euphemistically calls a distinguished tribunal. Whether or not the public or the companies benefit by such arbitration, it is evident that there is a good thing in store for the lawyers. Mr. Long seems to think it is not altogether certain whether the House of Commons will accept the creation of an authority, not directly elected by the ratepayers, which shall have the power of levying money. Such a body would probably be just as economical as a directly elected body, but in these days it is doubtful if the theoretical objection to such a body will not be too strong. Representation and taxation are the watchwords of a democracy, and if the people are extravagant, that is their fault. However, time will show the public view on this point. At any rate, we now know the general scope of the promised measure. When it is introduced into Parliament the details will be given. It has also to be borne in mind that the Government have already on this subject tried and failed, and that was when they were in a much stronger position than they are to-day. We cannot, therefore, honestly expect much success in the coming Session.

UNDER the title of the "Crisis The Bricklaying in British Industry," the *Times* on Monday last published a striking article on the manners and customs of the bricklayer of to-day. The gist of this article was that the bricklayer at the present time lays about half the number of bricks that he used to do, so that the cost of labour is just about doubled. He does this in order to make work for a larger number; in other words, he is a Socialist at the expense of the public. His action prevents individual industry; it keeps every man at the same level of earning power. If a man tries to earn more by strength or sustained labour he is regarded as a blackleg by his unionist companions, and life is made disagreeable to him. These facts, which we have merely summarised, are set forth at length in the article above mentioned, and chapter and verse is given for them. They merely state, however, in a popular form what is already known to many of our readers, though the subject is treated in a definite manner. What remedy there is for this state of things it is impossible to say; for when men work in gangs at manual tasks the power of the majority to repress industry is very great, and as long as there is capital to draw on, the power of the workman to act as he is now doing continues. It is to a certain degree a question of supply and demand. In a poor country it would be impossible for the general public to bear the cost.

A Proposed American Building in London. THE daily papers have been publishing rather sensational statements in regard to a proposed immense block of building, of the American steel-frame and facing type, to be erected on the north side of the Strand, at a cost of two millions. This, as the state-

ments come from an American source, probably means dollars, though the newspapers give it as pounds sterling. The information in regard to the forward state of the scheme must be rather premature, at all events, since we found on inquiry that the architect's department of the London County Council knew nothing whatever of it, and such a building could certainly not be erected in London without a special application for suspension of by-laws as to height, &c.

Railway Charges. WE are so constantly being told of the superiority of American methods of railway working, that it is almost startling to read such remarks as the following, which were recently made by the president of a great trade convention in the United States: "In passenger transportation we are bemmed in with a lot of rules and regulations that seem unnecessary. In freight transportation matters are even worse. The many changes in classifications and tariffs have built up a system so complex, that it is almost necessary to educate a person specially to follow the many ins and outs of tariff sheets and freight matters generally." Clearly there is room for improvement elsewhere than in the old country. The rates and charges agitation of a few years back, the progress of which was closely followed in these columns, proved that we were in need of education on this question; and eventually resulted in the adoption of a uniform and intelligible classification. It is a matter for congratulation that we are not subjected to the sudden and arbitrary fluctuations of which American traders complain so strongly.

The Mond Gas Act. THE South Staffordshire Mond Gas (Power and Heating) Company's Act was issued by the printers on Monday last. This Act, as our readers will remember, confers upon the company power to supply gas for heating and power purposes to a number of towns in South Staffordshire and East Worcestershire at a maximum price of 3d. per 1,000 cubic feet to consumers requiring not less than 16,000,000 cubic feet per annum, and 4d. per 1,000 cubic feet to consumers requiring less than this quantity. Some of the most noteworthy provisions of the Act are—(1) the minimum heating value of the gas is fixed at 125 British thermal units per cubic foot; (2) the gas must never contain more than 14 per cent. of carbon monoxide; (3) the Act does not confer upon the company any monopoly or exclusive right to supply gas within the districts mentioned; and (4) if any consumer uses the gas for lighting purposes the company is to cut off his supply. This is the first occasion upon which standards for heating power and carbon monoxide have been introduced into any gas Act in this country, but as illuminating gas supplied by other companies is now very largely used for heating purposes, we trust that it will be made a precedent for future Acts. Mond gas contains about 50 per cent. of incombustible nitrogen, and we are of opinion that the supply of water-gas at double the price would be of greater utility to the community in general, for water-gas is wholly combustible and of twice the heating value of Mond gas. The multiplication of companies vested with power to open public

thoroughfares is to be deplored, but the supply of a cheap, smokeless fuel for both domestic and industrial purposes has become a matter of vital importance. When an existing gas company suggests a reduction in the illuminating power of the gas, with a proportionate reduction in the price, the company is at once suspected of endeavouring to snatch an advantage at the expense of the consumer, and probably no company other than one appearing as a thinly-disguised competitor would have received public support. A cheap mixture of coal-gas and water-gas, having a comparatively high heating value, eminently suitable for incandescent lighting, and capable (like methane) of being consumed without admixture with air before the point of ignition with either a non-luminous flame or a flame of feeble luminosity, would, we believe, best meet the requirements of present-day consumers, and would render it unnecessary to put down a second set of gas mains.

THE suggestion made by Mr. Testing Electrical Accessories. Wordingham to the Institution of Electrical Engineers, that it should undertake the work of testing electrical accessories and fittings, seems to us to be an excellent one. The increased pressures of supply now in general use make it imperative, both in the interests of consumers and manufacturers, that only certified articles should be used in electric circuits. We had occasion recently to test a small switch which controlled five 16 c.-p. lamps on a 240-volt circuit. When it was pushed smartly down it broke the circuit satisfactorily, but on breaking the circuit slowly the arc set up destroyed the switch. In our opinion this switch, which is of a fairly common type, ought never to have been put in the circuit. With 240 volts the fittings need to be of very much better material and much more carefully designed than when 100 or even 200 volts is the pressure employed. An ordinary 100-volt 5-ampere switch only breaks a 240-volt circuit when the arc set up has melted most of the metal inside the switch. Another point that has now to be considered in connexion with switches is the insulation resistance of the base of the switch. There may be nothing to choose apparently between two switches, and yet the insulation resistance of one may be so low that, if it is fixed in a cellar, for example, it will lower the resistance of the whole wiring so much that the supply company will refuse to connect the installation to its mains. The other switch may have an insulation resistance so high that it is practically impossible to measure it. If the Institution started a testing laboratory for electrical accessories, something similar, for example, to the meter-testing laboratory of the Board of Trade, then we are sure manufacturers would gladly avail themselves of the opportunity of enhancing the value of their wares by getting them officially approved. Architects would have more confidence in specifying electrical fittings for their clients if they knew that these fittings had been certified as suitable by an independent authority.

INCURSTATION ON St. Paul's Cathedral. IN the "Proceedings" of the Chemical Society issued on the 16th inst., there appears a note by Mr. E. G. Clayton "On an Incurstion from the Stone Gallery of St. Paul's Cathedral." Reference is made to an in-

crustation present on the balustrade of Portland stone erected around the Stone gallery which, upon analysis, was found to consist mainly of hydrated sulphate of lime. Mr. Clayton is apparently surprised at the result, and indulges in speculation as to how such a deposit came to be formed upon a stone consisting mainly of carbonate of lime. "After a careful consideration of all the circumstances, and especially the characteristic appearance of the incrustation, it is suggested that the presence of the main component is principally due to two centuries' solvent and weathering action of rain, charged with sulphurous and sulphuric acids derived from the gases and smoke of innumerable surrounding chimneys." Had Mr. Clayton consulted a paper communicated by Dr. Voelcker as long ago as the year 1864 to the Society of Arts, he would have discovered that the composition of this incrustation closely approximated to those of similar incrustations examined by Dr. Voelcker, who also showed that ordinary soot contains sulphate of ammonia, and that this sulphate of ammonia converts carbonate of lime into sulphate of lime, which in the presence of moisture "takes up water of crystallisation and thereby leads to exfoliation of the stone." The analysis is, nevertheless, an interesting addition to the scanty list of analyses of similar incrustations previously recorded.

A SITE in Leroy-street, Old Kent-road, has been acquired for the erection of dwellings to accommodate those members of the working classes who will be dispossessed by the improvements which are about to be carried out by the construction of a thoroughfare that will extend from the Borough High-street to the junction of Long-lane (formerly White-street) and Tabard (formerly Kent) street, passing around the north and east sides of St. George's Church. The new route, for which the London County Council voted 207,400l. four years ago, will pass through the churchyard that was opened as a public recreation ground on May 22, 1882, and over the site of part of the later Marshalsea Prison, which was built in 1811 on the site of the White Lion Inn that had been converted into a gaol in or about 1558. The new Marshalsea, overlooking the churchyard on its north side, served until 1849 as a prison for debtors, smugglers, and pirates. Of late years the male debtors' side—a block of eight houses, built back-to-back, four stories high, and containing seven rooms each—had been converted into a factory, approached from Angel-court, formerly Bridewell, or White Lion, alley; beyond was the "Tap" and turnkey's house, of which the second floor formed the female debtors' side; and beyond that the chapel and Admiralty Prison, latterly a registered lodging-house. No. 211, High-street covers the open forecourt of the gate-house; the rear part of the shop is the old "lock," and retains the four posts and cross beams, with their brackets, of the two prison gates. That is the Marshalsea of Dickens's novel; the name of "Little Dorrit" has been adopted for the children's playground, which is now being laid out on the sites of Falcon and Redcross courts on the opposite (west) side of the High-street. That highly insanitary area and haunt of the criminal classes comprises also Birdcage-alley, Maypole-alley,

Brent's-court, and Adam's-place, the removal of which Dr. Waldo, as Medical Officer for St. George-the-Martyr parish, advocated in a report he made to the Vestry in January, 1894. It is stated that whilst 800 persons are thus displaced, the death-rate of children under one year of age was 407 in every 1,000 born, as against 163, and that of mortality from zymotic diseases amounted to 4.1 per 1,000, as compared with 2.7, during the period 1892-5 in the whole of London.

In the list we published last week of new sites for schools scheduled by the School Board for London is one which calls for a passing notice. One of two "alternative" sites at Hampstead consists of Nns. 7 and 9, Well-walk, which were formerly the Assembly-rooms of Hampstead Spa, No. 5 being the "Long Room." Our readers will recall that the three houses were scheduled in November of last year by the Board, and that the proposal to pull them down was strongly opposed by residents in the neighbourhood and others. On that occasion the School Board, who were then about to conclude their triennial term of office, relinquished their project in so far as it concerned the houses we mention. Whilst the out-going Board could not make any pledge that would be binding upon their successors, some kind of understanding seems to have prevailed in the district that the new Board would not include that site in their present scheme. At a public meeting held in the Drill Hall on Tuesday night it was resolved to protest against the action of the Board and to address memorials to the various authorities concerned.

THE President of the Society of Designers, Mr. G. C. Haité, made some interesting remarks last Tuesday evening on "Design and Designers of the Victorian Epoch." Two or three hundred years is the limit of time that Mr. Haité will allow in the existence of designers or pattern-makers in this country; prior to the immigration of the Huguenots the crafts had not advanced beyond the primary conditions of weaving and dyeing. The Huguenots settled in certain parts of the country, notably the banks of the rivers Wandle and Cray, whose waters were peculiarly suitable from their chemical properties for dyeing and other manufacturing purposes. To these people, according to the lecturer, we owe all our handicrafts. Their descendants still continue the calling of their forefathers, in some instances every member of a family practising one or another of the arts. Mr. Haité divided design into three periods: the first that of the pattern-maker, the designer of simple dress materials and ornaments, who disappeared about the sixties of the last century, and whose work is still the delight of the collector; secondly, the period of the architectural designers, headed by Welby Pugin, Owen Jones, Burges, Eastlake, and Godwin; and thirdly, the present generation of decorative designers. In the early Victorian era, he said, it was the architects who pulled design out of the mud; decoration being a constructive art based on reasonable principles of fitness and proportion, no training so effectively taught the broad truths as an architect's. The proper relation of plain spaces to ornament and ornament

to mouldings was one of the most difficult lessons for the decorative designer to learn. Touching upon the subject of such universal requirements as wall-papers, chintzes, &c., the lecturer laid the blame for their bad style entirely on the middleman. The middleman rules the manufacturer by threatening to boycott his goods; dictates to the public as to what they ought to like; and practically creates the demand. We ourselves have more than once, at some large West End shop, been told that such a thing is no longer correct; we must have this or that hideous novelty. As a panacea Mr. Haité pleaded for academic recognition of designers. In some organised form of co-operation between manufacturers and designers the future of the handicrafts should lie; in that way it will be possible to know that what we buy is the expression of individual artists in their own line of handicraft.

SOME years ago we noticed the remarkable series of five pictures by Mr. E. A. Abbey illustrating "The Quest of the Holy Grail," painted as mural decorations for the Public Library at Boston, U.S.A., and which were exhibited at Conduit-street before being sent out to America. These five represented the first portion only of the series; ten others, which complete it, are now finished and have been on view at the Guildhall Galleries. The subjects are (6) Sir Galahad meeting the "loathly ladye" and her companions after his exit from the Castle of the Grail; (7) Galahad slaying the "Seven Knights of Darkness" in the "Castle of the Maidens;" (8) a monk giving him the keys of the castle; (9) his reception by the imprisoned maidens—this is the central and largest subject, on a canvas 19 ft. long by 8 ft. high; (10) Galahad quitting his wife Blanche-fleur, in order that he may continue the quest; (11) Galahad again at the Castle of the Grail, where he has now sought the information he should have sought before, and is enabled to heal Amfortas of his wound; (12) Galahad on a white charger, passing through the land amid the benedictions of the people; (13) Galahad in Solomon's ship making the voyage to Sarra, an angel with outspread wings in the prow; (14) the city of Sarra; (15) Galahad before the Golden Tree at Sarra, surrounded by a circle of angels, and seeing his last vision of the Grail. The Arthurian legend has been rather freely treated, actions which properly belong to different knights being concentrated in the person of Galahad, in order to give unity to the representation. The whole forms a remarkable series of modern mural paintings, and Boston is fortunate to have a public building decorated in such a manner; but we do not know whether these latter pictures altogether equal the first five, as far as our recollection of them goes. The most effective are the attack on the seven knights, whose armour is of a most weird and picturesque type, and the closing picture of the series, a piece of purely conventional decorative work, but in that sense admirable. Next to these perhaps is the picture of Galahad riding through the land on his white charger; and the small picture of the city of Sarra is a curious and characteristic vision of a mediæval city. In the ship picture one cannot but feel that Galahad may well be engaged in prayer if

Mr. Abbey's  
Boston Pictures.

he has to cross a stormy sea in so inadequate a craft; and in these as in the earlier series, the artist's conception of Galahad hardly rises to the occasion—there is still rather too much of the Broad Church curate about him. But as a whole the series is no doubt a remarkable production in decorative painting.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS:  
PICTORIAL MOSAIC.

An ordinary fortnightly meeting of the Royal Institute of British Architects was held on Monday evening at No. 9, Conduit-street, Regent-street, Mr. William Emerson, President, in the chair.

The minutes having been taken as read, Mr. Alex. Graham, hon. secretary, announced the decease of one of the oldest members of the Institute, *ie.*, Mr. Frederick William Porter, who was elected an Associate in 1850 and a Fellow in 1855. Mr. Porter practised largely in London, and was well known to many architects in London. A short memoir of his career would be published in the "Journal." He was sure that the members would wish that a letter of condolence be sent to the members of the family of Mr. Porter.

This having been agreed to, Mr. R. Anning Bell read a paper entitled, "Notes on the Practice of Pictorial Mosaic," of which the following is an abstract:—

Mosaic, the author said, was a method of artistic expression which had many advantages peculiar to itself, and which also had very definite limitations. It was obvious to anyone who had studied the work of the past that the realistic representation of natural effects, although it had been sometimes remarkably near success, was not the way to get the greatest beauty possible out of the material. The material proclaimed itself at the outset as being unsuitable for realistic effects for two reasons. The first and strongest was the uniformity of its surface which rendered it impossible to get that variety in the texture of the material which was the special reason why oil paint was so triumphantly superior to any other material in the rendering of the look of Nature; the second, the fact that it had to be applied in separate pieces with an interval, however small, between them. The tints could not shade off into each other with quite the subtlety of paint, and the interstices formed a lacework of ground colour and shadow which was the same all over the surface, and added to the monotony of the texture. The material, therefore, commanded a certain flatness as the effect to be aimed at, and, as a corollary to this, a certain archaism or stiffness in the design. This very flatness of effect imposed some restraint on the style of the design. It was not truly archaic, but was the fullest expression which the limits of the material permitted, and gave an artist plenty of elbow-room for his invention if he had any feeling for the method. For pictorial mosaic the subjects chosen must be such as are suitable to austere treatment. The play of facial expression or momentary gesture was out of court. The characters introduced could not be likenesses, or the occasion of their introduction a mere incident; the characters should be types, the incidents symbolic.

Discussing the practical questions of working and placing the mosaic, the author said that it should be some way from the eye, and a good deal higher up. Like many other good things, when you want it you want plenty of it; it is best of all when entirely covering a large space and unbroken by architectural mouldings. This applies more particularly to gold mosaic, which, when covering walls and domes, running round the arches, flashing into a glistening flake of light as it turns the corner, and covering every inch of space above the capitals of the columns, is much more satisfactory in effect than when used in juxtaposition with stout arch mouldings and pilasters. Small panels of mosaic, the author said, he did not like at all, even where they are merely filled with conventional foliage, though that is better than the clumsy look of small figures close beside the smooth and exact forms of the mouldings which frame them.

In interior work, gold mosaic—a treatment, that is, in which gold is largely employed—seems to be infinitely superior in effect to a treatment in colours only. For external work

the author considered the use of gold a mistake. First, from the practical side, owing to the construction of the tesserae, it was likely to be damaged by frost, as the film of glass which covered the gold-leaf was very easily flaked off should any water get into the interstices; and secondly, from the aesthetic side, there was no mystery of shadow to bring out its peculiar beauties; it glittered so strongly in sunshine as to destroy the effect of the design of which it formed part, and it was inclined to look rather garish even in ordinary daylight.

Treating of colour, the author advised a light scheme of colour as preferable to a deep one. The cooler colours are pleasanter than the warm ones when used in any quantity. Much orange is peculiarly unpleasant, and even reds should be sparingly employed, and rather as accents to strengthen other colours than in masses for their own sakes. Blues and greens tell well at a distance; they have a charming quality, will keep their colour very fairly, though one needs to use a much stronger blue than might be expected if it is to be at all rich in effect. It may be taken as a general rule that differences of any bright tints carry much further and tell much more strongly at a distance than similar differences in a lower key. In whites a very slight difference will have a very marked effect, and it will tell less close to the eye than some way off, whereas quite the opposite is true of strong colours, particularly of red. Difference of quality in the glass has also a marked effect on its carrying power.

As regards tesserae, very great differences of size are unadvisable in figure-work. A few large pieces among a large number of small pieces is unsatisfactory. If, however, large pieces are mainly used, a few small pieces here and there will rather enhance the effect. As an interesting example of this, Professor Beresford Pite's mosaic outside Pergami's Restaurant was cited. The effect is quite unlike what we are used to in mosaic, but the author would like to see more work done in this method. It has many advantages in a place like London. Dirt cannot easily settle on it, and when it does is easily washed off. It is permanent, and, as the pieces are so large, less labour is required than with ordinary mosaic. For outside work the author found that a scale larger than was generally seen in old work might be used with good effect. Should varying sizes of tesserae be used generally over the work, any place where they are kept of uniform size will infallibly attract the attention by its regularity; this would be seen in a pilaster forming part of the background of the panel at Horniman's Museum.

Careful study should be given to the size of the interstices. In background work they can be quite large if the colour is not wanted to be very pure, the dull tint of the putty toning down or saddening brighter colouring. In such parts as faces, hands, or other details to which particular attention should be attracted, they may be quite close together, so making a comparatively solid mass of colour, and giving emphasis to the part. In fact, it would be difficult to work a face without keeping the tesserae close, as the tone of the interspaces would destroy the quiet modelling, which is all that is necessary or advisable.

Remembering the limitations of the material, anything like truth of relative values or strength in the general effect of light and shade should not be attempted. Simplicity in modelling is desired. Variety of tone is obtainable by the relative strength of the colours used in different parts of the design. Realism of texture in draperies or other accessories should be avoided; trees, buildings, clouds, textiles, &c., should be felt to be rather symbols of those things than actual representations of them.

The author then treated of various matters and difficulties connected with the actual work of putting the mosaic upon the wall. His preference was for the method of doing the work *in situ*, a good result cannot possibly be obtained by other means. The modern Italian way, which the author described, is open to the obvious objection that you cannot see the progress of the work, and it is impossible to make alterations as you go on.

In translating the watercolour or pastel tints of the cartoons into coloured glass, a good deal of variety is possible, so that it is necessary to be always in touch with the workers to discuss with them which tint and quality of glass shall be used, and sometimes to vary from the cartoon when the work already finished may

suggest it. The setting of the mosaic is an essentially artistic craft; it is absurd of the designer-in-chief to say simply: "Here is my cartoon; take it and copy it exactly." It is impossible to copy it anything like exactly, and consequently complete co-operation between designer and craftsman or craftswoman—for it is one of the things that women do admirably—is absolutely necessary.

Though the most splendid, as it is the most permanent form of wall or ceiling adornment, mosaic is extremely arbitrary, and any attempt to stretch its limits is terribly punished. It will not easily put up with rivalry, and will not endure other methods of decoration in immediate juxtaposition. In interior work it quarrels with stained glass, and it destroys gilding, as may be seen in many a Roman church where the choir-arch and columns are gilt around an apse of mosaic. Outside, the mosaic must be made the dominant in the scheme of which it forms part. No colour can stand near it but in humble subordination, and its surface texture requires considerable art and discretion in the choice of neighbouring materials. Nobly used, it nobly repays; ignobly used, it does nothing but disgust.

Mr. George Frampton, A.R.A., in proposing a vote of thanks to Mr. Bell, said he felt that men like Mr. Bell, Sir William Richmond, Mr. Walter Crane, Mr. Spence, and other workers in this very beautiful art were really doing a great service to the art of the country and to architecture. In half a dozen men and women we in this country had the finest mosaic workers in the world. Titian and other men who worked in mosaic, utterly failed, and the reason why they did so was that they had no knowledge of architecture. He did not see how a man could be a decorator unless he had been through a course of architecture, or had some love or appreciation of that art. It seemed to him that architecture governed all the arts, or should do. He quite agreed with Mr. Bell that they should avoid strong black shadows, otherwise they produced a kind of hole in the wall. Few people really understood decoration; they had an idea that it was easy to turn out some kind of shape, and that they called decoration, but it was nothing of the kind; it was abomination in decoration. What was wanted in decoration was the mind of the man, his own individuality and his appreciation of the surroundings of his work, which Mr. Bell always gave. Another thing he would like to impress upon architects, because he had learnt it himself, was that they could never get a successful decoration from a firm. He had never known a firm give anything that was really excellent, for no one in the firm had any real interest in the work, and he did not see how they could. The one idea of the firm was to get a profit, and the work was given to a workman who, as a rule, had very little or no feeling for art, and so it passed from one to another, and the result was that the inferior thing was produced which spoiled the building, and even if the building was bad it was much better not to add anything which would make it worse. Mr. Bell was one of the few men who really understood what was required to make a beautiful surface without making what he called a hole in the wall.

Mr. Walter Crane, in seconding the vote of thanks, said there was one minor point on which Mr. Bell made an ingenious comparison between the network formed by the cement lines in tesserae and the textile lines which occurred in a half-tone process block. The textile line of a mosaic was a pleasing thing; one really delighted in it. It was in the nature of a built wall, a surface construction; and few things were more satisfactory than the simple joints of well-laid brickwork. In an irregular fashion one got that, too, in a mosaic, and that was a pleasing thing in itself. Mr. Bell made some suggestive remarks about a possible extended use of those joints, making them more open or narrower; and probably one might regard the putty or the joints, which were an essential part of the work, very much in the same way as one would regard the half-tone of the ground in painting; for instance, in working chalk on brown paper, one frequently left the paper in large interstices to speak for itself; it fell into the general scheme. So in mosaic, one might fairly regard the more or less brownish interstices as a kind of half-tone on which to impose colour. As regards the use of gold externally, most of them must have felt what Mr. Bell

expressed—that there was a certain glitter, a garishness, in it as used externally. That, he fancied, would largely disappear, perhaps, if it were not applied to a perfectly flat surface; but he was inclined to think that in no case did gold look well on a perfectly flat surface. A curved or concave surface was generally much finer, owing to the variation and gradation which the shadows gave, and also the half-light. Mr. Bell had spoken of the impossibility of reproducing a cartoon. He (the speaker), however, had made designs of mosaic long before the present method of working *in situ* upon the surface was revived with so much success. He remembered making some designs at the instance of Professor Aitchison for the Arab Hall in Lord Leighton's house, and those were executed, he believed, by the Murano Company. It was then necessary for the designer to make an exact cartoon, tessereating the whole of it, and marking all the joints in black, and he was very much astonished at the facility with which those designs were reproduced after the method Mr. Bell had described—viz., by laying down the work from the back. There was very little variation, the tesserae were given with the utmost exactitude, and the matching of the colours, allowing for difference in brilliance and translation of the dead colour from the finished colour of the cartoon, was simply extraordinary; even then he believed there was some method of giving a little push to the work when they turned it round, especially to get more variation of facet upon the background. It was only fair to say that those panels would bear examination as good workmanship, so far as exactitude and precision went.

Mr. C. Harrison Townsend said that with Mr. Bell's introductory remarks on the principles of mosaic no one could fail to agree, but he particularly felt the strength of Mr. Bell's argument on behalf of what he pleaded for under the somewhat unhappy name of "archaism." A certain formal, a certain conventional feeling which was given to the expression of the figure and of nature in mosaic work was, unhappily, apt to be classed by those who did not understand the conventions and limitations of the material as a wilful attempt to imitate the method of work of those who had preceded them. He thought that Mr. Bell had made it clear that that stiffness, that formality, and that conventionality did not proceed from an attempt to imitate. As in architecture, so in every kind of decorative design, to attempt to do other than what the conditions allowed was doomed to failure, but to allow oneself to be influenced by the material and to shape the design according to the limitations of that material was to show oneself an artist and a man who recognised the method in which he worked. To work in mosaic necessarily implied, if they were logical or had common sense, certain limitations which had to be recognised. A worker in mosaic did recognise and accept them, and did the best within these limitations, which, however, robbed him of any hope of dealing in atmospheric effect. The glory of the sunset and the romance of the moonlight, for instance, to him were symbols of sentiment—they were not imitations of sentiment. Trees in mosaic did not represent trees of Nature, with the glistening of the sun or the tender white of the moonlight: they were symbols of trees; but, working in mosaic, one was paid for sacrificing those artistic attributes, and the reward was that one worked in an imperishable material. Mosaic work could resist all but fire; it could resist water, London fog, and all the vicissitudes of climate, and still be unimpaired in its colour. It could hand down, as the Ravenna and Sicilian mosaics did, the colour scheme of the artist 1,000 years after he had perished—unchanged by time and undiminished in brilliancy. Mosaic work was the only artistic work that could be handed down as the artist did it, and that of course was a great privilege which was worth sacrificing something for. In reference to Mr. Bell's interesting remarks as to the technique of mosaic—the technique so far as the various cements were concerned—the decadence of mosaic work, curiously enough, coincided with the attainment of the one perfect cement. Up to about the year 1500 mosaic workers contented themselves with working in lime cement, and Muziano de Brescia was the first to use, in 1528, oil cement, which allowed them to obtain effects which were impossible with a quickly-setting cement. The new method allowed deliberation, and afforded

opportunities for alteration, whereas by the old method work had to be done quickly.

Mr. F. R. Spence said he thought the technical part of mosaic work might well be left to the man who had to carry out the work. That was a matter they need not worry much about. Now that there was a general and growing interest in the use of mosaic for decoration, its treatment should be approached in a practical and common-sense manner. In all schemes of decoration the great battle lay in the design, its suitability, and its application to the right spaces, so that, as in all decorative art, no man should embark in its practice unless he possessed the rare gift of design. Great discrimination should be exercised in the selection of the surfaces to be covered with mosaic. In every case such selection should be of spaces which had at all times shed upon them the toning and uniting qualities of light and shadow. All interiors possessed these conditions more or less. External, flat, shadowless spaces were not quite satisfactory in this respect. They were always in one of two conditions—either in bright or else in unreflected shadow. Granted that these panels or friezes might be good schemes of colour, yet they were shorn of the added charm of permanent variety and mystery. In the actual material the more brilliant and solid the colour the better. He used to be delighted to get the slabs of material which had delicate gradations of colour in each piece, but when they were cut up and fixed all these gradations were lost. If they were right in the first place with the surface to be covered—being under a fixed condition of varying light and shadow—this light and shadow would give naturally the effulgence of the colour scheme. Deep, almost crude tones become rich and mellow, not impoverished. His meaning might be made clearer by mentioning Titian's wonderful blue drapery, the shadows of which were a deep red. One should be liberal in one's areas of colour, and not fritter away by intersecting forms of ornament that in themselves were small in design. Drapery forms, fine in the designs of their lines and folds, were sufficient for the particular spaces they cover. Great spaces of blue or other colours in such forms as a dome, let its incurve be ever so crude, become harmonious from the natural shadows of its shape and the soft reflections of surrounding objects. The shadows and reflections were a broad and sweeping tone of softening unity. No mosaic, he thought, should be nearer the eye than 10 ft. Its function was to express the sentiment of colour, and not to usurp such attributes as need all the delicate and far-reaching craftsmanship capable of application to marble, metals, wood, &c. Some advocate that in the application of mosaic internally all mouldings and architectural features in any other materials should have no place. The vision of its success, however, had no place in his dreams. To him the juxtaposition of many and varied materials was inseparable from a really triumphant scheme of decoration. Jewels owed a large debt of gratitude to their setting. Figured subjects should be used where they suffer no distortion of their form. The treatment of figures on a dome, unless they formed shadows in perfect outline, were not, to his mind, satisfactory. Some asserted that figures should be drawn in simple lines without modelling. His experience led him to think that they should be modelled to a considerable extent, for when the mosaic was carried out its crudity came very far short of the modelling on the cartoon, yet it added a quality of colour much more interesting than flat spaces filled in between hard black outlines. He need hardly say that the design should be in unity with the architecture. It should not belittle its details, but rather add to the expression of its parts. His idea was that no decorator, in the treatment of a large figure-subject, could afford to drop certain simple architectural forms in the actual picture which were of the highest importance as details to bind together its composition. He did not mean that details of the enclosing architecture should be reproduced or carried into the picture, but only such simple details as would give it those rigid and geometrical lines which unite and save it from chaos. In mosaic they possessed a brilliant and permanent material for decoration, but, as in the making of a fine piece of architecture or any other work of art, they must come down to the bed-rock of creation—conception, design, call it what one

will; the all-important need is the man who can capture the beautiful, and has the practical sense to apply it rightly.

Mr. Bridge said that the putty need only be  $\frac{1}{2}$  in. thick, and the tesserae, when pushed in, displaced the putty and left about  $\frac{1}{2}$  in. behind. The general basis of the putty he had used was lime and boiled oil, but the lime should be old—some two or three years.

Mr. Brindley said he had been greatly interested in Mr. Bell's paper, but little had been said in reference to the fixing of the tesserae on the actual ground. All the good old Byzantine mosaics were, he believed, lime mosaics and not oil and putty, but probably they had albumen in them. Reference had been made to lime and powdered marble, but much of the lime and powdered marble that we read of in old times was marble not thoroughly burned through. Half of it would be lime and half of it marble which had become disintegrated, so that when it was put under the rollers it was crushed up. The marble that one saw at Parma and throughout Sicily (the marble-like covering on the rough stones) was pure lime, with nothing but albumen in it. With regard to the mosaics of the Byzantine period, his conviction was that they were nearly all applied on paper the same as was done in our modern way on a cartoon. In the case of the domes of St. Mark's, what practical man would put in tesserae by tesserae on a large surface like that, and what would it cost if it were done? He did not think it was worth the trouble at the height of St. Mark's dome, for the different sized tesserae were not seen, they were all practically of the same size, and the dome looked like a large copper burnished cauldron with enamelled figures on it. There was nothing to disturb the solidity of the dome. The more joints there were in mosaic the stronger he considered the work, but by the modern method he was convinced that the tesserae would come out.

Mr. W. Woodward said, as to embedding tesserae in cement, there were, he understood, two methods—one to embed the tesserae so as to produce a flat surface, and the other so as to produce a series of facets; and examples of the two methods could be seen in St. Paul's Cathedral. In the cupola of St. Paul's could be seen mosaic by Salvati, laid so as to produce a flat surface; and, in his opinion, the money spent on that particular form of mosaic had been to a large extent wasted, and a similar effect could have been produced at considerably less cost. If, however, they would look at the mosaic work of Sir William Richmond, they would see that, in order to produce certain effects, the tesserae had been placed anglewise, and the difference between the two methods was wonderful. One was lifeless and the other was perfectly brilliant, reflecting beautiful tints from the facets.

Mr. E. W. Hudson said, as an example of a mistaken attempt at a realistic representation in mosaic, he had thought of a portrait in the Brighton Museum of King George IV. Upon some 6 ft. of surface there were thousands of pieces of small tesserae, and at some distance from the work it was difficult to tell if from an oil painting, of which, no doubt, it was a copy. Every high light, middle tone, and shadow shown by the garments of the period had been attempted in the work, and it would probably be impossible to find a greater misapplication of ingenuity and perseverance and a greater waste of time and money.

Mr. Thomas Blashill said he supposed they were all agreed that the cost of the process described by Mr. Bell was such that there was not likely to be much of it done, and that in itself was a pity, for out of a large amount of work excellence was more likely to be obtained than by a limitation of work due to extreme cost. He therefore would like to ask a question as to a modified form of mosaic work. No doubt many of them had been to the Château of Chenonceaux in France. On the left of the entrance to that building there was a formal garden and there was a parapet about 3 ft. or 4 ft. high to a wall separating the garden from the river. The inner side of that wall was plastered, and in the plaster were set patterns in differently coloured stones. That did not, of course, complete with pure mosaic—with mosaic for the whole surface, and it was very coarse, but it seemed to have an interesting effect. He did not know if that kind of work was done to any large extent, or whether any one knew much about it, or

whether it could be usefully done here, but he was afraid it would not stand so well in this country as in France. Perhaps if a better kind of plaster could be invented, and a good deal of work could be done, something might come out of that as an alternative form of decoration for larger surfaces. He had had a certain amount of mosaic work carried out, and he knew something of the difficulties referred to that night. The flat surface treatment was, he supposed, best seen in the mosaic reproduction of great pictures in St. Peter's at Rome. The mosaics at Ravenna were remarkably coarse, and some of the pieces, which looked like mother-of-pearl at a distance, were merely dabs of white paint unless they had since been restored.

Colonel Lenox Prendergast said that Mr. Townsend had referred to a point which was of considerable importance to those who were likely to do much mosaic work. According to Mr. Townsend, at a particular period a different material was discovered in which to embed the tesserae, and it seemed to have affected design. One knew what would happen if this method of decoration was practised to any large extent; the artists would become, as unfortunately they had become in other matters, archaeologists, and hack they would go to Constantinople and St. Mark's. No one would disparage the great workers in Constantinople and Venice—at St. Sophia and St. Mark's. The former place was the headquarters of art, literature, and science of the time, as had been conclusively proved within recent years, and the work done there was splendid. Constantinople sent out the finest enamel, carving, materials for vestments, &c., that the world had then seen, but they reflected the work of the particular period in which the artists lived; and why should we go back and reproduce in our buildings merely what artists thought and did in those days? He did not think that should be done, and yet he was afraid it would be if Mr. Bell was to be followed. In one of the chapels of St. Mark's—the Chapel of St. Isidore—there was some very beautiful mosaic, which, however, would be condemned by Mr. Bell. What was at the bottom of the revival of mosaic work in this country was that it would wash, and that was the great recommendation of the method, and it was very desirable in this smoky atmosphere of ours to encourage the use of such a material, provided freedom of design was left untrammelled.

The Chairman said that with regard to Mr. Bell's statement that the expression which the limits of the material allowed should be our guide in designing mosaic, he thought this was a truism that we could not get away from. It was shown in the different effects of certain mosaics. Take, for instance, those at St. Peter's at Rome, which were copies in tesserae of certain old paintings, if he remembered rightly. If we compared them with the examples of mosaic at Santa Maria, Maggiore, or at St. Mark's, or at Pisa, the two things were entirely different. To any man of cultivated taste those at St. Peter's could not compare with the others. Notwithstanding what Colonel Prendergast said, he did not think they could avoid a certain amount of archaism from the material they proposed to use—indeed, the more archaic it was, the better the mosaic to his mind. With regard to gold mosaic, he agreed entirely with Mr. Bell that for external work it was not very satisfactory, whether on a plain or on a curved surface. Mosaics in the atmosphere of this country were apt to look garish, like very bright dresses on ladies on a foggy day. In India, where the sun was very bright, the colours of the mosaics were exceedingly harmonious—they were dull greens and blues and neutral tints and whites; although they were brilliant in general effect, there was nothing garish about them. As to leaving the tesserating of the design to the workmen, he could not think that that was right. The expression of the design depended greatly on the tesserating, and he did not think that a man could have his cartoon properly expressed by a workman who puts in the tesserae perhaps from his own idea; he had seen specimens of mosaic done in that way, and the tesserae had been higgledy-piggledy all over the surface. When he was in Burges' office (and, in fact, since, when he had had mosaic work to carry out on his own account) they used to draw out every single tessera, and show exactly where the joints were to come, and he was inclined to think that was the right way. The old mosaics were generally arranged methodically, in

order to get the archaic effect which Colonel Prendergast decried. The colour of the interstices was a very important thing in mosaics. His attention was drawn particularly to this some years ago when Street was doing the Guards' Chapel. The marble mosaics there were a little higher than level with the eye. First of all they were fixed in some material—he did not know what—and the interstices and joints showed a light colour. He was charmed with them the first time he saw them. They looked like frescoes, having that "sucked-in" appearance. The colour was beautifully soft and delicate, and sufficiently near the eye to be appreciated. Some little time afterwards he found that the little figures had all these little joints taken out; they had practically been painted over with dark paint, and to his mind the effect was entirely spoilt. He was in the Guards' Chapel a few Sundays ago, and he still thought they lacked colour compared with what they had the first time he saw them. There was not the slightest doubt that the greatest difference in effect could be obtained by thickness of colour in the joints of the tesserae. With regard to the size of the tesserae, personally he did not like the large pieces, though that, he supposed, was a matter of taste. There was a marked difference of effect between mosaic in large pieces and that in small tesserae. He did not mean minute tesserae like those in St. Peter's; but large pieces of mosaic always suggested to his mind the difference between *appliqué* work and embroidery. The one was a highly refined, finished piece of work, and the other seemed an easy-going, coarse method of getting over the difficulty.

The vote of thanks having been heartily agreed to,

Mr. Anning Bell, in responding, said Colonel Prendergast rather disputed his idea of the treatment proper to mosaics. Perhaps he had not sufficiently expressed his feeling that it was not archaism. He did not deduce what he thought was the proper treatment from the old work, but from the nature of the material itself. He did not think the work could be done in any other way to make it look well. A great deal of realism could be got, but in doing that the beauty of the material was sacrificed, and only a very poor painting resulted; whereas this glassy, stiff, formal material was a beautiful thing in itself. He did not clearly recall the chapel of St. Isidore, but that fact showed, he thought, that personally he was not very interested in it. He had seen a good deal of work of that kind, and very able work too; but, to tell the truth, he rather thought that it was playing the fool with mosaic to do that sort of thing. Mr. Spence rather disputed his idea that mosaic should dominate to the extent that he thought it should. Mr. Spence thought it went well with a lot of other materials. He (Mr. Bell) did not think so. In an apse in a church it looked well with other things all around, but it must be remembered that in most cases of old work the apse was generally the best thing in the church, and, as a rule, it had been knocked to smithereens and restored, so that it was rather hard to say that one had data to go upon in saying that. He himself felt that it was very much better where there was a great deal of it. Mr. Spence also said that outside mosaics should have variety and mystery. He did not quite see how that was to be got. It would be nice, but they would not get variety outside in a bright light. The other was the right treatment, because one got a whole treatment that looked harmonious with relation to the stone and things round it. As regards the point Mr. Brindley raised, that the old work was done on the flat, and then pressed face downwards, he did not think the point of taking so long to do affected those people particularly; they had a good many centuries to do the work in, and even when they did it quickly they employed many men. He had not, perhaps, sufficiently enforced his point when he spoke of the unpleasant effect of laying down mosaic because it was so flat. He meant from the front. They could not help getting a constant variety of plane by the natural touch of the finger in putting it down. He thought that was implied, and he never did anything else. He agreed about St. Paul's that the old mosaics were very poor mosaics and nasty-looking things; but Sir William Richmond's, although they were done in an excellent manner, were perhaps a little exaggerated and a little too lofty. He had got a little too glittering and shining an effect; and, if he might dare to

say such a thing, he thought the designs of Mr. Watts were not things for mosaics, they were rather florid for that kind of treatment. He was interested in hearing Mr. Townsend's account that the old mosaic was only invented in 1528, which was afterwards only commented upon when we were asked why we should stick to the earlier work. He did not think it was a question of having no medium. It was simply that the earlier work could not help being more limited, the materials being so limited that it was difficult to get outside them. When once they got a chance of doing clever things they did them. It was just the same in all other things. The history of all other art was, first of all, that a savage man must have a pretty strong impulse to want to do anything at all, except kill other people and get things to eat; he did not know much, and had to fumble about, and slowly he acquired the power to express his ideas. While it was difficult to express his ideas, he wanted to express them to the best extent, but it was so hard that he was pretty careful about the ideas that he expressed. But when he got easy with his material he wanted to do things that were clever in it, and to do things which were hard to do. And so every art almost rose and fell in that scale. He did not want to take the early mosaics (of which he approved) as being the only examples to follow, because they were of that period. He did not wish to say that the later ones must not be followed because they were later, but because he did not like them himself. He thought the later ones went wrong because they did not try to do what the mosaics did so well, and that the earlier ones kept within limits, partly because they did not know any worse. We should look at the stuff and see what it can do, and then do all we can with it, but we should not try to do more than we can do. It was interesting to hear Mr. Crane's remarks about the cartoons being reproduced in work that he had done. He agreed that it could be done, but all the same, in his opinion it was not a desirable method; and he felt he was rather at issue with the Chairman there, as he (the speaker) was of opinion that the workmen should be given some play along with the artist. Workmen differed so much in their power of carrying things out that one soon found out which of them could do the better work and which the easier work, and one could allot the work accordingly. And then there was a kind of variety got. Then there was one other point. Mosaic was not against realism, but he thought that it showed the advantage of not being able to get realism—that mosaic was one of the very few arts in which one was forced by the necessity of the material and the limitations of the material to a rather higher plane of thought, or at any rate into somewhat lofty subjects which could not be expressed by clever interesting execution. It meant the plain verities of simple facts: Time, the Judgment, Life—those things were best treated in something which could not remind one of other clever things in the same material. It had just got to be austere and definite—a sort of raw presentation only of the idea, without drapery or ornament to it. Mosaic did that, and so it was peculiarly useful for religious work.

The Chairman announced that the next meeting, on December 2, would be a business meeting, when the election of candidates for membership would take place, and the results of the November examinations would be made known.

Mr. Lacy W. Ridge has given notice that he will move a resolution to the effect that the Royal Institute of British Architects desires to thank the Local Government Board for the issue of model by-laws iv. (Rural Districts), but while doing so the Royal Institute would urge on the Board the desirability of preparing a model to enable Rural District Councils to regulate party walls as distinct from external walls.

Mr. H. W. Wills has given notice that he will move the following resolution: "That in the interests of the profession it would be advisable to have a list of Institute assessors drawn up from whom the President would nominate, and that this list be from time to time revised."

The meeting then terminated.

## THE ARCHITECTURAL ASSOCIATION.

An ordinary fortnightly meeting of this Association was held on Friday last week in the Meeting-room of the Royal Institute of British Architects, No. 9, Conduit-street, Regent-street, W., Mr. G. B. Carvill, Vice-President, occupying the chair in the unavoidable absence of the President, Mr. W. H. Seth-Smith.

The minutes were read and confirmed, and the following gentlemen were elected members, *i.e.*, Messrs. E. S. Barr, J. C. Bucknill, F. Bisset, W. J. Delbridge, J. H. Goodchild, C. L. Hampton, G. O. Howship, A. S. Jones, E. J. Kallenborn, E. G. Millar, D. W. Pollock, E. Pitt, H. Sandford, W. J. M. Thomasson, A. H. Whyte, and E. H. Walker.

The Chairman then nominated Mr. R. H. Weymouth to fill the vacancy caused in the Committee by the appointment of Mr. A. T. Bolton as head-master of the Day School. The election will take place at the next meeting.

*New Premises Fund.*

The Chairman said it was his pleasing duty to announce the following list of donations to the New Premises Fund, *i.e.*, Mr. I. Macvicar Anderson, 25*ol.*; the late Arthur Cates, 25*ol.*; Mr. Henry L. Florence, 25*ol.*; Mr. Arnold Mitchell, 20*ol.*; Mr. Aston Webb, A.R.A., 20*ol.*; Mr. E. A. Gruning, 10*ol.*; Messrs. Alfred Waterhouse, R.A., and Paul Waterhouse, 10*ol.*; Mr. A. Brunwell Thomas, 5*ol.*; Mr. William Emerson, 5*ol.*; Mr. T. M. Rickman, 5*ol.*; Mr. W. Howard Seth-Smith, 5*ol.*; the late William Young, 5*ol.*; Mr. J. A. Gotch, 3*ol.*; 10*s.*; Mr. Reginald T. Blomfield, 25*ol.*; Mr. G. H. Fellowes Brynne, 25*ol.*; Mr. A. E. Street, 21*ol.*; Mr. Ronald P. Jones, 10*ol.*; Mr. A. T. Bolton, 10*ol.*; Mr. Walter Emden, 5*ol.*; 5*s.*; Mr. W. L. Trant Brown, 5*ol.*; 5*s.*; Messrs. C. J. Blomfield and A. C. Blomfield, 5*ol.*; 5*s.*

*The Sanitation of a Country House.*

Mr. Max Clarke then read the following paper on "The Sanitation of a Country House":—

I have been wondering since the Committee of the Architectural Association asked me to read a paper on this subject whether they paid as great a compliment to the members as they did to me. That, I suppose, must be settled by each member for himself. As a rule, "sanitation" is looked upon as a matter to be got over with the least amount of trouble possible. When I say this you must bear in mind that I do not pose as a sanitarian; I simply look at this branch of the duties of an architect in the same light as I do any of the multifarious matters he is called upon to deal with for the usual 5 per cent.

Let me tell you how it came about that I was led to think seriously of the particular matter under consideration this evening. Many years ago I was walking through the streets of a provincial city with a friend; he had with him a clerk of works, who was engaged upon some of the buildings in course of erection, and had been upon others. Pointing to a pipe against a wall, this gentleman said, as well as I recollect, "The authorities are under the impression that is a ventilation-pipe, but I just stuck the end of it into the ground, and it looks all right and does no harm." This remark made a great impression upon me, as I could not help turning over in my mind, were the authorities at fault in asking for a ventilating-pipe or was the man at fault in so deceiving them. I always hope the architect knew nothing of the transaction, but he should have done so if he did his duty.

Now, gentlemen, let me for a moment substitute the word "hygiene" for "sanitation." The explanation in a dictionary of the word "sanitary" is "pertaining to, or designed to secure health," and of the word "hygiene" "the science which treats of the preservation of health." There does not seem such a difference between the two definitions that I might not substitute the latter for the former word. Now I must ask you to turn with me to the introduction to Parkes' "Hygiene"; the first paragraph is as follows:—"Hygiene is the art of preserving health—that is, of obtaining the most perfect action of body and mind during as long a period as is consistent with the laws of life. In other words, it aims at rendering growth more perfect, decay less rapid, life more vigorous, death more remote." This paragraph I consider the most admirable definition of "Hygiene." I should like to read to

you the whole of the introduction, but time will not permit, and I can only suggest that each member, at least each junior member present, and also those who may look over this paper in print, should carefully read over and consider the whole of this introduction to Parkes' "Hygiene."

Just fancy for the architect what the above paragraph means; that each one has it in his power to assist in such an endeavour, which, if carried out, would alter in a great measure the whole state of mankind, because that is what it really means, "the most perfect action of the body and mind." Is this not what we are all aiming at in various ways, or should we? Now, let me ask, how many of the architects in the United Kingdom have a copy of this particular work in their library? How many have given it the consideration it deserves, or deem it one of the main objects of their lives to further the objects it treats of? If I can only bring some of them, and particularly some of the rising generation, to realise that "The Art of Architecture" embraces such a duty to the whole of mankind, I shall have accomplished something. There are many different views as to what the duties of an architect are. They seem to me largely to turn on how much an architect should do or can do for 5 per cent. Lengthy articles have been written on his duties as an arbitrator and such like, but where does one read of his duties in rendering growth more perfect, decay less rapid, life more vigorous, and death more remote.

The other day the address of our President contained a paragraph to the following effect:—"It is a fault in our training that our pupils are not on the works enough, and that we do not specialise enough. Highly trained men, with a diploma from a guild or an institute or what not, ought really, if our building is to be of our best, to confine themselves to design and the supervision of building construction, and not to meddle with surveying, valuations and dilapidations, bills, &c., work which certainly does not savour of art."

Might he not have added to the list "sanitary engineering." It really is a most difficult matter, at least to my mind to decide what we should do ourselves and what leave to others; for my own part I see nothing wrong in employing another man to do that for me which I know he can do better than I could myself, the only difficulty to me is, who is to pay him? Personally I feel I should, if I undertook to do work for such and such a percentage, and if I were quite sure that my client got the advantage of the best information on the subject.

Now you may say, what has all this to do with the "Sanitation of a Country House" and my reply is this, that I look upon the title of the paper from the very broadest point of view, it not only concerns the drains and pipes, but it deals with almost the whole structure from foundations to roof-tree, and it is only by an architect having in view the benefit of the whole community at large, that he will have fulfilled his duty to mankind in general and his client in particular, not to speak of himself. It does not signify what the matter in hand may be, he is morally, if not legally, responsible for the result of his work, whether in fact it is a benefit to posterity or the reverse. I do not think this view of the case is brought home often enough to architects, and I take this opportunity of pressing it upon the younger members of the Association; for it is to those I am here to speak, the older ones I hope know as much about sanitation and hygiene as I do myself, whether these two items always get the consideration they deserve from men in practice is a question.

My friends say that I am very prone to deal in facts, when generalities would in their opinion answer, and my reply is that I think the more one gets to what some call "rock bottom" the better will our work be, whether it be as an art or profession, so I am going to give you a few instances of cases which have come before me. Some few years ago I had something to do with a building where the architect had, I presume, great confidence in his clerk of works and foreman; at any rate, they were given a plan of the drains; it was neither very good nor very bad, and the work was done. A short time afterwards, from various causes, the drains were overhauled, and it was found that there was one length of 9-in. pipe into which several 6-in. pipes were branched, and on the 9-in. pipe, between each

of the 6-in. branches, a 9-in. syphon trap was discovered, each trap being quite blocked up with soil; so far as I recollect there were five traps in a length of about 60 ft.

I heard of a case the other day, equally interesting, but from another point of view. A house in the country—fortunately I do not know either the neighbourhood or the architect—built not long ago, lately from some cause the drainage had to be examined, and was found to be defective. An architect was of course employed to put matters right, and his way of doing it was to write a letter to a builder instructing him to test the drains and put in new where he considered necessary, no supervision beyond a casual inspection being exercised over the country builder or what he "considered necessary."

I need hardly tell you my point is, that papers might be read here and elsewhere fill doomsday without any practical result, unless men take a different view of their responsibilities from those I have just quoted.

Having pointed out to you what I consider the responsibilities of an architect are in connexion with sanitation, it now remains to get an idea what are the sanitary requirements of any house, as I do not believe we should build any worse for the poor than we should for the rich, so far as sanitation goes.

We need not consider site, aspect, or prospect, as it seldom falls to the lot of an architect to decide on the first, and any man worthy of the name of architect would deal to the best of his ability with the two latter items, on which there is plenty of information to be had, and they are not matters which require supervision.

*Subsoil Drainage.*—The lie of the ground requires most careful consideration, and the drainage of the subsoil, if such is required, always bearing in mind that it is better to lay land drains so that they will convey water away from the house than towards it. I mention this, as I saw a scheme a little time ago arranged to convey all the subsoil water in a pipe under the centre of a house when it would have been quite possible to take it away at the sides of the house. Land drains or agricultural pipes are liable to get blocked up at times, which should be borne in mind when laying them. The general drainage I shall speak of later.

*Foundations and Concrete.*—The foundations should receive careful consideration even in the country, taking care in a clay district to carry them well down beyond the level which may be affected by droughts; if this were done we should not hear of so many cracked buildings and under-pinning jobs, which, though money-making for the architect, are not pleasant for the client.

In connexion with the foundations, let me remind you that Portland cement requires more examination and attention than it usually receives from architects. I find it very difficult to get it sufficiently air-slaked—or, in other words, it is, as a rule used when it is too fresh; it sets so rapidly that it is partly set before it is used in brickwork, drainwork, or concrete, and if knocked up again of course it is not the least use; it is also more likely to blow or expand when used fresh, accounting for the number of stone-ware pipe-collars fractured which are to be met with.

*Damp Courses Over Area of Buildings.*—Covering the area of buildings with Portland cement concrete, as required by many authorities, is for the purpose of keeping down ground damp, which, where there is no concrete or other damp-proof course, is liable to be drawn up in the building when the latter is heated, the damp or noxious gas sometimes coming from great distances where the earth is light or porous. In this way sewer gas may be brought into a building from defective sewers existing at a considerable distance. In order to prevent this, care should be taken that the cement is sound and slow-setting, and that the concrete is not porous; the aggregate not being too large, such for instance as brickbats, which one often sees in concrete. The surface should be well beaten down and smoothed over with a shovel so as to form an impervious face, even if the concrete is only to act as a damp-proof course, and not as a floor.

*Damp Courses.*—Damp courses in walls should receive great attention. The very old-fashioned clause to be found in specifications, "two courses of stout old slates bedded in cement," should, I suggest, be abolished, as it is most difficult to get stout slates, either old

or new, the usual type being so very thin that they break easily and are often damaged before the wall is built upon them. Asphalt often suffers from being laid upon the walls and then used as a gangway by the men on the works, or is otherwise damaged by moving materials upon the walls before the brickwork is continued up over the damp course. Whatever the material may be, it should be carefully protected until the superincumbent walls are built, then we may assume that we have done all that can be done to ensure a perfect layer of material to prevent damp rising. I do not give an opinion as to the best material to use, only care should be taken in its use. In connexion with damp courses and floors, I doubt if sufficient attention is paid to cases where there are wood floors with a space under, one side of a wall and tiles or mosaic with concrete under at the other side. Then some precaution is required to prevent the damp getting from the earth and concrete on the side of the wall to the flooring and timbers on the other side.

Numerous methods can be adopted, but they are usually conspicuous by their absence.

**Vertical Damp Courses.**—Vertical damp courses or dry areas are most important to rooms underground. I do not think there can be any doubt that where a wide area cannot be obtained, covering the external face of the walls with a double thickness of asphalt is the very best means of keeping out damp, the asphalt forming a horizontal damp course at the bottom and extending vertically above the level of the surrounding earth. My experience of hot compositions poured into a cavity in the wall is, that such care is necessary to prevent mortar droppings getting down, and to ensure the hot material getting down and adhering to that already in, I shall not risk it. The external application I can see and examine, the internal I have no means of knowing whether it is in as it should be or not.

Ventilation under floors should be attended to, sleeper walls being built open to allow of currents of air through the open spaces; one forgets at times that putting in an air brick to the space under one room and carrying up the brickwork close under the floor all round without any openings other than the one is not "ventilation," it is only leaving a hole. All holes made in walls should have a fall outwards to prevent wet being driven in.

Bedding wall or pole-plates in main walls at the ground level is a mistake, they should always be carried on corbels, piers, or independent walls. In connexion with this, I think hoop-iron, well tarred and sanded, is to be preferred to wood wall-plates.

**Walls.**—With regard to walls, what shall I say? That you should avoid, if possible, using 9-in. walls. It is not sanitary work, in my opinion, to build a house costing say, 2,000*l.*, all the outer walls being 9-in. brick; and particularly when the bricks are porous, as so many are nowadays, put together with poor mortar, and not even damped before laying. Of all the simple requirements in building, I do not think there is any single one I have so much difficulty in getting carried out as wetting the bricks well before they are laid; if this is not done the dry brick absorbs all the moisture out of the mortar so rapidly that the material is little better than dust or dry mud. Hollow walls require attention to see that the cavity extends below the level of the internal damp course; also that mortar is not allowed to drop down the cavity and rest on the wall, thus forming a means for the damp to pass from the exterior to the interior lining of the wall. The lead covering of lintels or arches over openings in hollow walls require attention to ensure the ends of the lead being wetted and turned so as to direct the moisture to the outer wall.

I have had some experience in building with granite, and I find it is a mistake to allow through or bond stones to extend to the inside face of the wall, as damp patches are usually found where the ends of these stones come. This is, of course, where neither brick lining or "strapping" (the Scotch term for battening and plaster) are used.

**Roofs.**—Some points in roofs require attention; one of the most important, to my mind, being in cases where eaves gutters rest on the tops of walls or on oversailing courses. It is a practical impossibility to make a cast-iron eaves gutter perfectly watertight, therefore short lengths of lead should be fixed on the top of the walls at each joint in the gutter to take the water which escapes from the joint away

beyond the face of the wall, not allowing it to percolate into the brick and stone, and so form a very unsanitary spot, as well as an eyesore on the inside. These pieces of lead should be wetted at two edges, and of the other two edges the back should be turned up and the front edge turned slightly down where beyond the outer face of the wall.

Down pipes are, as a rule, too large and too numerous in most buildings, where gulleys have to be fixed at the bottom of each stack, involving unnecessary drains and extra work clearing out, &c. The pipes should always be fixed so that they are clear of the walls in case of leakage.

I would suggest that "soakers," which are more usual in the north than in the south, are better in every way than either secret gutters or flashing, the cover flashing being less liable to damage than flashing laid on roof slates. Soakers also make a good finish to hips where the taste of the architect does not permit of hip tiles, slate, or lead coverings; the slates can be cut to a close joint down the angle. Slates of a greater width than the ordinary size should be used in these positions, so that no very narrow strips or small angle pieces are used, as these usually have only one nail or peg, and are very liable to get broken and fall off.

I think two courses of slating battens, the lower one vertical and the upper horizontal, is a good method of obtaining an air space in roof construction, and so rendering the interior less liable to be affected by changes of temperature. Felt should be clearly specified, and examined as to quality, the cheapest, which is often seen on work, is not a desirable article.

Silicate cotton or slag wool is a most admirable non-conductor, as well as being a sanitary material, to be used in almost all cases where hair felt is so often used, the latter being a happy hunting-ground for all sorts of vermin, whereas the slag wool is, to them, most objectionable; this applies to roof coverings, pugging in floors, "lagging" or covering pipes of all sorts, and all the other purposes a good non-conducting material is used for.

I need hardly refer to the fact that the common floor with wood joists, floor boards and ceiling plastered, is not a "sanitary" floor, but it will be some time yet before we can get a solid floor of any sort used in country houses even of the better class, so I need not go into the difficulties of any of the varieties, either as to cost or execution, but I may say with regard to partitions, that I think the stud partition, of "quartering" plastered both sides should be consigned to the past, porous and punice bricks, breeze concrete, perforated and solid plaster slabs and solid plaster on expanded metal are all so much superior that their use should be universal even in country houses. Building the tops of chimneys in cement and the insertion of proper damp courses in them should be a matter of common practice, but I fancy more attention is often paid to the problem how to get a chimney to draw, or not to smoke, without recourse to a chimney pot, than to whether the damp course has been properly put in.

The architect who has been called in once to try and cure a bad case of "dry rot" in a house wall, I imagine, need no reminder as to the necessity of making provision against such a misfortune arising in one of his own buildings, or one who has lived during a cold winter in a country house with no means of heating the hall or passages, he, I fancy, will bear in mind the necessity of heating arrangements, the nature of which we need not discuss. I would only say avoid any system which combines heating and a supply of hot water for domestic purposes, unless the former be of the most limited description.

**Windows.**—The height of rooms, the lighting of them by suitable windows, and if no fire-places are provided, some means for the air to escape, I shall not venture to use the word ventilate in connexion with this, even the cistern rooms should be well lighted; although the water is not the better of any light. The height of the windows with relation to the floor and ceiling requires attention, many of the building regulations having claims on the subject, and it is not a pleasant experience, when a picturesque window, or, mayhap, several of them, have been arranged in the roof, to receive a polite request from the authorities to alter so as to conform to by-law so and so.

High bottom beads or rails to double hung sashes as a simple inlet for air are not made use of as often as they should; they also form

a very excellent stop to prevent wet coming in at these points when heavy gales blow directly on windows, as is so often the case in exposed situations in the country.

A splayed notch on the outside of the bottom bead is an additional safeguard against water, but do not cut the notch upside down, as illustrated in a well-known work on specifications—evidently a slip, but still liable to be copied by the beginner.

I think we may now turn to the matters which are more usually known as sanitary. It is really to impress upon you how many sanitary items there are which require your personal attention and which you cannot hand over as a P.C. amount to your pet sanitary engineer. He, poor man, if he is a little above the average, may tear his hair when he finds water-closets, baths, lavatories, and sinks dotted about all over the plan, causing him the greatest difficulty in dealing with the arrangements, if (and bear in mind I say "if") you have not given the matter the consideration it requires from the first.

We shall presume all things are in order and the water-closets are grouped fairly well in one part of the building, as few outlying ones as possible, baths not over rooms where the flow of water from a quick waste will disturb the occupants of rooms below, also where, if leakages occur, as little damage as possible will be done.

All these things are in order, and we shall now consider the fittings and drains.

First of all, let me assure you that the more simple the fittings are the less future trouble your client will have, and that is a matter of some importance in outlying country districts. I spend a short time every year at a house where, if a plumber is required he has to be brought a distance of seventeen miles—about seven by rail and ten by coach. This is enough to make one careful that the taps do not require washers or the water-closets new sealings more often than is absolutely necessary.

Taking the important item of water-closets, I should advise in all cases a wash down or pedestal basin, and, in saying this, I know I lay myself open to criticism, but I have been through all the points of noise and flush and non-cleaning and comfort and habit and all the rest of it, and am still of the same opinion. As to the particular type I shall not say much. I think it should not be what is called "large area" water surface; I do not think the clearing of these is at all satisfactory, even with flushing cisterns of larger capacity than we are allowed to use in London as a rule.

I also think the basin you select should have the most simple joint to the soil-pipe that can be obtained, consistent with perfect water seal or air tightness, depending upon the position of the joint; in fact, I desire a perfect joint which any handy man can make, as the basin may be broken any day by careless use or accident. The back, of course, should be straight, and the flushing rim, if it is of that variety, should allow of a good body of water falling all round. Seats should always be of hardwood in two thicknesses, preventing the warping and cracking which seats made of one thickness are always liable to. The water-closet should be fixed so that the flushing cistern can be placed immediately over the inlet arm; the old-fashioned position back to a window is the worst for a water-closet worked with a W.W.P. or flushing cistern. The seat should either have rubber bosses fixed on the underside or iron bearers projecting from the wall, leaving the floor clear for sweeping; the hinges should be brass pivots and plates fixed to the edges of the seats at the side—not butt hinges, which are very usual. Every water-closet basin should be white; printed basins bid dirt.

One point in connexion with the W.W.P. which does not receive the attention it deserves, is the rate at which it fills. I put in specifications that it is to fill in a minute and a half, which means that with a low head of water a 3-in. ball valve must be used, and as this costs a little more than a 2-in. ball valve, it is not always used when it should be. As far as my experience goes a perfect flushing cistern has yet to be invented, so I shall not offer you any advice upon the sort to use except the fewer the working parts the better. The shell, if of cast-iron, should always be galvanised; wood lined with lead are best in some situations, both on account of quality in the water, and not so liable to damage from freezing. I think a chain or for the better qualities a brass rod, not in a slide, the best

form of pull, a stop cock on the water supply to each flushing cistern is an advantage when repairs are needed; the position of the arm for connecting the anti-siphon pipe is of some importance, and the method of connecting the pipe to the arm when the latter is of any stoneware type, is a difficulty sometimes not satisfactorily dealt with, therefore I am inclined towards a lead trap to which the anti-siphon pipe can be wiped, as the best way out of the difficulty. If a valve closet must be fixed, use a good one; cheap valve closets with flimsy parts and badly finished brass work require repairs frequently, and seldom repay for the small saving in the first outlay. A lead tray should always be fixed under these water-closets in case of leakage from the valve, with a weeping-pipe to the outer air having a copper flap at the end to prevent wind blowing up the pipe, and the same applies to the overflows from all cisterns and flushing-tanks. Care should be taken to make the wood fittings in connexion with these water-closets easily movable, and clear of plaster work and the like.

**Baths.**—I do not think I have any particular remarks to make as to baths. Whether porcelain, cast-iron, or copper be used, must always be a matter of individual taste; the first-named is always difficult to heat if a hot bath is required. Copper is the best in this respect, but a good one is always expensive, and requires stout cradling to prevent it being put out of shape.

The bath fittings should, in my opinion, be of ample size, so that the bath can be filled rapidly, and I lean towards valves or taps which are quite distinct, the hot supply from the cold, and the nose projecting well over the edge of the bath if not actually inside (which is a modern improvement), very useful in case the valve leaks at the stuffing box or union. Lead safes are useful where the baths are enclosed, but the best types of baths do not require enclosures, and with these lead safes are unsightly. A tile or mosaic floor being preferable, or perhaps a sunk marble slab if funds will permit.

The wastes from baths, sinks, and lavatories, should be ample in size to permit of quick discharge, and the outlets should be of sufficient area to properly fill the waste-pipe. The latter should, in my opinion, discharge into an open head outside, so that the traps may not be siphoned out. I think this a better method than having long continuous wastes fitted with anti-siphon pipes.

**Lavatories and Sinks.**—The number of lavatories and sinks from which we can select is so large that all tastes are catered for. Those having complicated fittings should always have lead safes under in case of leakage. Enclosures are to be avoided, as they become receptacles for dirt and objectionable things in general. Every fitting of this nature should have a proper overflow. I have had considerable trouble with sinks for hot water washing-up, in cases where glazed ware was unsuitable, and have tried wood lined with lead, zinc, and tinned copper, but they all proved practically useless in a very short time, in cases where there was much washing-up to be done with hot water; 2-in. teak put together with red lead, galvanised bolts and brass screws being the only form of sink suitable for this class of work; in this case I have had the waste plugs made hollow and of sufficient height to form an overflow. Care should be taken to have a proper grating in the waste washer, which can be removed but not too easily taken out, otherwise it is never in its place and pipes get blocked up. Angle strainers in sinks are a useful addition in this respect, if the domestics can only be induced to make use of them.

The vexed question of housemaid's sinks should be considered; what its use should be and to what extent they should be provided. Except in large houses I consider that a water-closet should be used for emptying the slop-pails into, but when a slop sink is required it should resemble a water-closet, not have a grating or anything of that nature to the outlet; the latter are only suitable for fixing under hot or cold draw-off taps, which should be provided in the housemaid's closet; the latter should be light and airy, not, as so many are, in some corner, deficient in everything except dirt and smell. If a real slop-sink is provided it must be fitted with a ventilated soil-pipe and anti-siphon-pipe, exactly as a water-closet would.

All sinks should have high backs or some other means of preventing the wall or enclosure from getting wet; slabs of marble, tiles,

rendering with Portland cement, all answer the same purpose. No space for water to trickle down should be left behind sinks of any description.

**Traps.**—Usually of drawn lead, should be fixed under all fittings; with brass cleaning screw, the latter having a square or oblong projection for unscrewing, not a couple of small holes, or an indentation requiring a special tool to unscrew it. A little time ago, I spent an hour with a plumber getting out a screw cap to a sink waste; if it had had a projection to fit a spanner, it could have been removed in one minute.

With regard to fittings generally, there seems to be a great laxity amongst men who do this class of work—both those who specify and those who execute—as to connexions between fittings and lead pipes; these should always be made with "unions and flynuts;" as a rule, the "union" portion is omitted, say, for instance, connecting a stop-cock; more often than not, both ends are simply "tinned" and the joints wiped; so that to get the cock off for repairs, the pipe must be cut in two places, and two new joints made when it is refixed. If proper unions were fitted in the first instance, they could be unscrewed, screwed up again without damage to pipes or fittings, or a useless expenditure of time. I shall only direct your attention to one other point in connexion with fittings, the word "self-cleansing," now in such common use. It would be well if all architects and, indeed, their clients also, would understand that this term does not mean that the particular fitting will keep itself clean, but that there are no corners, or angles, or the like, where dirt can accumulate. Baths, lavatories, sinks and water-closets particularly require "elbow-grease." The daily application of a closet-brush to water-closets would prevent such filthy traps as are on exhibition in too many houses of even the better class.

The supply of water to any house, country or otherwise, is a matter which should receive careful attention, but more particularly in the country. Very often the difficulties are increased by the supply being limited from various causes, such, for instance, as want of power to pump the water up to the required level. This is too large a matter to deal with to-night, beyond saying that the Canadian type of windmill, hot air, and petroleum engines, and also the hydraulic ram, all serve the purpose when natural gravitation is not available.

Pipes for water service should be considered, with regard to the nature of the water, particularly in some localities where both the water and the earth may cause deterioration of lead, the water thereby being contaminated occasionally. I show you a piece of lead pipe taken from a house near Bedford some time ago, the exterior eaten away by some action of the earth in which it was laid, some hundreds of yards had to be renewed in this case. I laid some lead pipes in the neighbourhood in trenches which were filled with sand and gravel, with which the pipes were surrounded to prevent damage from the above cause. Lead lined with tin, or iron lined with glass are very good, but are expensive, and the former require special joints. The storage of water is, of course, a debated point. Personally, I am for storage, as I consider it can be carried out with very little fear of contamination, and it saves many a trouble when there is a hitch in the supply. In a country house, a supply of water for drinking and cooking purposes can be stored in a glazed stoneware tank (if a slate or galvanised iron one is not considered good enough), either white or buff, which, with occasional cleaning, is about the most sanitary article which can be obtained. The general supply can be stored in a galvanised wrought-iron cistern, or cast-iron, or steel plate. If the size is large the wrought-iron should never be less than 4 in. in thickness; many are so thin as to be useless in a very short time. I have found it an advantage when a galvanised cistern is used to have it thoroughly cleaned out when all the connexions are made, and then to paint the inside twice with Portland cement, mixed with water to about the consistency of paint; this preserves the galvanising and covers many of the little projections left in the process.

I need hardly remind you that close-fitting covers to the cisterns are essential; that the cisterns should, if possible, not be placed where the water is liable to freeze in cold weather. Near a chimney is a good position, other matters being equal. Ease of access should be considered for cleaning out, and

safes under are always advisable in case of accidental overflow. The position of outlets deserves attention. They should always be in the side of the cisterns, so that dirt cannot get down the pipes, and if a supply is taken off for hot water, it should always be taken out of the cistern below the general cold water supply, otherwise there is danger of leaving the hot water system without water in times of scarcity. Stop-cocks, with unions and large wheel-heads, so as to be easily turned, are necessary. Wrapping the pipe with slag wool made upon canvas is desirable, and where casings are fixed they should be easily removable, not nominally so, as is so frequent. One further point with regard to cisterns. There are some on the market which are intended for use as a reserve only, the supply under ordinary circumstances coming direct from the service-pipe and not passing through the cistern. I am not in favour of this arrangement, as the water might be in the reserve for so long a period that its use might be undesirable. I think we may now turn to the soil pipes and drains, dealing with the former first. Naturally lead is the most suitable material, except in cases where large quantities of hot water alternating with cold have to be dealt with; under these circumstances cast iron is more desirable, as the lead is buckled and at times cracked by the alternate heating and cooling. The connexion of the foot of the soil pipe to the drain is often not carried out as it should be; if the soil pipe be 3½ in. in diameter, and there is no necessity for it being larger, the brass tail pieces usually sold have such a narrow flange that it will not bear on the collar of the pipe, but slips right down; a wide flange bearing all round on the stoneware socket should be specified and insisted upon; the tail piece should be lined with the lead pipe the whole length, the latter dressed over the flange all round, and the joint wiped round the top edge; the whole length of the tail piece should show above the ground level, and the joint to the drain be made with cement well flounced and trowelled hard.

A sufficient number of tacks should be put to lead soil-pipes, not less than every 5 ft., in pairs on both sides; bends should, of course, be avoided where possible; the soil-pipes should be carried up to a sufficient height to ensure the gases coming from them being taken away clear of windows and ventilators, but not up the side of chimneys finishing close to the chimney-pots, in which case there is a great probability that as the air from the drain comes up the ventilating-pipe it will go down the smoke flue, in many of which there is a down draught except during the time there is a fire actually in the stove. Guards of some sort should be fixed on the tops of soil-pipes to prevent birds building, leaves, &c., getting in. Branches into soil-pipes should be arranged so as to avoid joints being in the thickness of walls, and the connexions of water-closets to the branch pieces should be carefully attended to. So much has been written about drains and drain-pipes that I fear you will be weary of the subject. As a rule the drains are a simple matter, if one only could get perfect joints, and it is to improve these that so much attention is directed at the present time. Certain points should always have careful attention; for instance, where there are separate soil and rain-water drains the former should always be laid below the latter. If the rain-water be stored for use, the joints of the pipes conveying it should be most carefully made, as it is possible for water to get into the pipes from the surrounding earth, as well as to get out and the quality of that getting in may be very objectionable. One of the chief difficulties in laying drain pipes is to get a true alignment at the joints, so that each pipe may be quite concentric with those adjoining. With the ordinary joint this is a matter entirely depending on the skill of the individual who lays and joints the pipes. The cement exuding when the pipes are pushed up together is another difficulty; careful wiping out of the pipes at each joint being the only remedy for this most frequent defect. To obviate these difficulties some use gasket or hemp bound round the end of the spigot, to make the end of the pipe fit close and concentric; but I think the pipes with a ring of composition on the spigots and sockets and a cement joint outside is the best method of avoiding difficulties of this nature and taking a great responsibility off the man who actually lays the pipes. The con-

crete on which the drains are laid is a matter on which much difference of opinion exists. One of the latest text-books advises a bed of concrete about 6 in. thick, laid to a regular fall, on which the pipes are to be laid, the space under the body of the pipe then being packed up with concrete. I do not consider this a good plan. I suggest that a bed of concrete 6 in. or 8 in. thick be laid with indentations at regular intervals for the collars of the pipes, allowing room enough to make the joint. The whole length of the pipe bearing on the concrete render the lengths much less easily knocked out of position by accident. When each length is completed a benching at the side, up to about the middle of the pipe, is sufficient. Except to resist external damage, there is no object to be gained in surrounding pipes entirely with the ordinary concrete, which is of too porous a nature to keep in any sewer gas or air which may escape from defective pipes or joints. Of course if a pipe, surrounded with concrete, say 18 in. or 20 in. square, is to be looked upon as a beam, then it is superior to a pipe with benching up to its middle only; but I think we should always try and get a sufficiently good foundation for our drains to enable us to abandon the beam theory. It is, of course, necessary to protect pipes from shocks of heavy vehicles passing over them and such like. The concrete should be properly made with clean material, and where the earth falls in upon it when the pipes are being laid, i.e., the earth, should be carefully cleaned off the surface before the additional layer of concrete is put down, otherwise there will be two distinct layers not connected with each other.

I do not think I need trouble you with any remarks as to the size of drains, their inclination, whether they should be stoneware or cast-iron, these are more matters of office routine which can be decided to suit the circumstances of each particular case. If we turn to the construction of manholes or inspection chambers, a few remarks are necessary. If built of bricks I do not consider footings necessary to the walls; in ordinary earth, a slab of concrete extending to the external face of the wall is sufficient. I prefer rendering the interior with Portland cement, to the white glazed brick; the joints in the latter take away any benefit gained by the glazed surface of the brick. Some say that hot water damages the rendering, but as hot water does not often rise above the benching, I have not found the damage occur; the benching should be steeper than is usual, and of a convex section, so that the solids washed upon the inclined surface may slide into the central channel. The objection as to this form being inconvenient to stand upon and so on, need not be considered. Man-hole covers should always be galvanised, it is quite worth the extra cost. In the country where every manhole would be out of doors and not close to the house, the tight quality of a cover is not of so much importance as it is in towns. Turning to what is usually called the "air inlet," I think that unless it can be placed in an unfrequented position, it should always be carried at least 8 ft. high, without any mica flap or valve of any sort, these are a delusion, they get out of order so easily, and their use as at present in towns, will not continue very long. It is an accepted fact that there is an up current in most ventilated soil-pipes under ordinary circumstances, but where a water-closet on the soil-pipe is used, it reverses the current for the time and drives the air out at the first available outlet, which is usually the so-called "inlet." For this reason, particularly in towns, the inlet should be carried up above all windows and the like, but in the country, a pipe the same diameter as the drain taken up say 8 ft. with a bend and wire guard at the top to prevent leaves and so on getting in, is quite sufficient, perhaps more than sufficient some will say, and advocate a grating, say 18 in. square, close to the ground level. I need hardly remind you that overflows from rainwater tanks should not, under any circumstances, be connected to soil drains, nor do I think surface water drains should, even with traps fixed on the outlet, unless some length of open channel intervenes between the trap on the surface water drain and the connexion to the soil drain.

**Sewage Disposal.**—In many districts the disposal of the sewage of a country house is a great difficulty where there are no sewers in the neighbourhood and the pollution of streams is very properly objected to. In such cases it is perhaps desirable to consider the ad-

visability of having a separate system of drains to take the wastes from baths, lavatories, and fittings which do not take solid filth; with a tank, the contents of which can be used for watering gardens and the like, this would greatly reduce the amount of liquid to be dealt with. The sewage, or excremental filth portion, can then be dealt with by some of the forms of bacterial treatment, known by the various names of bacterial filters, septic tanks, and such like. From what I have read on the subject, it seems to me that the treatment should be a form in which the sewage is passed first through a closed tank, and then through filters exposed to the light. Time will not permit me to go into the various methods advocated. I would remark that I heard of the arrangement now known as the bacterial tank from a member of the Architectural Association a good many years ago, as Mouras' Automatic Scavenger, a description of which can be seen in the Proceedings Institute of Civil Engineers:—

Vol. 68, page 350, 1881-2;

Vol. 72, page 509, 1882-3;

Vol. 78, page 502, 1884.

From these notes I had a scavenger constructed in the latter part of 1893 at a private house I was then building, in the hope that it would render the sewage less offensive. This it has done most effectually, and although I cannot claim for it that the effluent is by any means clear, it is not offensive. The tank has never been touched during the last eight years, and the last time I examined the drains they were quite clear and no solid matter had passed out of the chamber, showing that the solids had been broken down as anticipated. Since then I have advocated its use at my lectures on sanitation, and I know other tanks have been installed from the advice I gave, so that no patent rights can be claimed for this portion of the arrangements which are now before the public. I show you a diagram of an arrangement enlarged from a sheet exhibited at the Sanitary Institute. The original sheet is prepared by the Worcestershire County Council for the assistance of those persons in that county who wish to make trial of such method of sewage treatment. The only difficulty is the great fall required from the inlet to the outlet, the total being 6 ft. 6 in.; various arrangements are illustrated on the original sheet, but I have only enlarged one, showing a liquefying tank and aerobic filters, suitable for a house of fifteen persons at twenty gallons per head, equal to 300 gallons per twenty-four hours. It has always seemed that some precautions should be taken against freezing in an installation of this nature. I have heard of one "Automatic Scavenger" (Mouras' name for the liquefying tank) being frozen up; it would be very inconvenient indeed if such should be the fate of some erected by our members; this is one of the points to be thought out.

I do not suppose any paper on the sanitation of a country house would be complete without some remarks on the dry system. A properly situated and arranged earth-closet is a most sanitary adjunct to a country house, no matter what class it may be intended for. Everything good in this world requires attention, and because the earth-closet requires, perhaps, a little more attention than people care to bestow upon it, it has got into bad repute. I speak now of outdoor—and shall we say isolated—earth-closets. If each country house was provided with an earth-closet constructed on the lines advocated by Dr. Poore, in his books, "Rural Hygiene" and "The Dwelling-House," I imagine some of the difficulties of sanitation would be got over, and some of the dangers from the want of it would never arise. I refer, of course, to the "dry catch" system, the principle of which is that the floor on which the excreta falls slopes towards the outside, allowing the urine to run into a receptacle filled with mould, and so the excreta is left dry, in which state objectionable gases are not generated. The usefulness of this arrangement depends, of course, upon regular attention—I do not say daily attention, as I intended to do at first, but regular. The difficulty is in getting people who will go just a little out of their usual course to obtain what will, no doubt, have beneficial results, the latter being to the people concerned not quite apparent. I can only commend to your attention the books of Dr. Poore, as you ought to know something of this method even if your clients cannot be brought to adopt the system advocated. I also suggest for your perusal an

article in *Country Life* in the number July 6, 1901, called "An Experiment in Sanitation," written by Dr. Poore, which deals in a most admirable manner with the storage of rain-water, and the disposal of slop-water and excreta, suitable for cottages.

Now, gentlemen, I have concluded, not because I have exhausted the subject, but because I was particularly asked not to make the paper too long, and also for the very good reason that I wish to leave time for a discussion, during which I hope that I amongst others may obtain some valuable information. I have tried to bring before you some points which are usually admitted as essential to the sanitation of a country or indeed, any house, but which I find require a great amount of supervision to ensure their being done properly, and as the very essence of sanitation is thoroughness in every small detail, I commend it to your most careful consideration, with the final remark that one of our objects should be to try and obtain "The most perfect action of body and mind during as long a period as is consistent with the laws of life; in other words, to render growth more perfect, decay less rapid, life more vigorous, death more remote."

The Chairman, in inviting discussion, said that Mr. Max Clarke might set his mind at rest; they had not wasted their time that evening.

Mr. Thomas Blashill said he desired to propose a very hearty vote of thanks to Mr. Max Clarke for a very valuable paper, which dealt very fully with many important matters. As to the difficulty of getting drains put in properly, he thought that workmen were getting more reliable than they used to be; perhaps because architects and builders were getting to know better what they wanted. He had felt disheartened at times to find that it was not sufficient to stand on the brink of a trench to see whether the workmen were carrying on the work properly. Once a very good builder said he would set some bricklayers to do the drains, as they would take more care. He with the builder watched the men lay a certain length of the drain, and while doing so he noticed that the "cement" being used was nothing but earth, for although the men had a bag of cement, they were using earth. In order to economise their master's material the testing of drains by the sanitary authority or by the architect would make such an attempt impossible. Mr. Clarke had mentioned certain difficulties in regard to basement-floors, or the lower floors of houses. He (the speaker) had not in the last twenty years put a wooden floor down as the lowest floor of a house with a space underneath; it was a great mistake to do anything of the kind. What should be done was to put coke breeze on ordinary concrete down and to nail the boards to that, and if this were done, ground air, rats, or things of that kind would be prevented from getting through. The boards should be treated with some of the three or four solutions which were on the market—Burnett's, for instance—but if that could not be done they could still nail the boards down without treatment. The boards should not be too thick, and if, or when, they wore out they could be replaced. As to dry-rot, he had seen it in the upper floors of houses, which floors had been pugged in the ordinary way, and where the boards had been nailed down too soon. Dry-rot was likely to attack in such circumstances, and if the rot could be discovered in time, it was a good and successful treatment to scrape the whole of the fungus off, and, with some Burnettising solution, thickened with whitening, cover the whole of the affected parts thick with it. In his experience that treatment, if adopted in time, was a cure. As to air-bricks, if they were relied on to ventilate a space under a floor, they were useless, for they always got stopped up; besides, they were useless if they were not stopped up. As to iron ventilating pipes for closet pipes, the usual result of using those pipes was that so much rust fell from them that the bottom was blocked up. He was strongly in favour of overhanging eaves. He had not done much in the way of hollow walls, but he had seen a great deal of such work where the damp came in under the flashings of the roof, against the outer wall, and he thought it was better to have solid walls. Overhanging eaves entirely stopped anything of the kind he had referred to happening. As to Mr. Clarke's remarks about the sewage disposal of a country house, he did not think the lecturer had

gone into the matter exhaustively. To put sewage into a pipe was not disposing of it; the difficulty began when they commenced to dispose of it. The Local Authorities would not allow it to be put into ditches which ran into cow ponds, and if it were put on grass where cows grazed, and the soil was not perfectly porous, the effect on the cows was disastrous after a time, as abortion was brought on. That might happen to two or three of the cows, but sometimes half or two-thirds of a herd were so affected. He was perfectly satisfied that in country cottages there should not be drains or sinks or anything of the sort. He was satisfied that every kind of slop produced in an ordinary country cottage with a garden could and should be disposed of in the old-fashioned way of putting it on the garden or giving it to the plants. Directly it was put into a tank or sink there was more or less trouble, but if they threw it on to the cultivated land it was done with. We ought to have more confidence in the purifying power of earth, and slops and excrement, if disposed of in this way, were never seen again. They should not put the stuff in pits, for the microbes which dealt with it were on the surface, and they would keep there if food was put there for them. The same with earth-closets; he had had great difficulty in getting them managed in a sensible way. The machinery of the closets did not work well sometimes when the closets were put down; people wanted to use ashes, instead of earth, and they might just as well use marbles. Ashes blotted up the moisture, but they did not deodorise. Dry earth was not suitable for earth closets, for it did not absorb the liquid as did a slightly damp earth taken in its natural state. The soil should not be buried deeply; all that should be done was just to cover the soil. As to the "automatic scavenger," a client, who had a large house very fully inhabited, told him that it acted splendidly, and he (the speaker) thought they would do well to give attention to it.

Mr. P. Gordon Smith, in seconding the vote of thanks, said a good deal had been said about Portland cement. They all knew the eccentricities of that material, and he had come to the conclusion that stoneware drains were not to be relied on, because the cement at the joints often split the joints of the pipes, and he had made up his mind to have nothing to do with stoneware pipes, but to substitute heavy cast-iron pipes with Angus Smith's solution on the inside. Such a pipe had many advantages over the stoneware, particularly in the fact of having one joint to three or four in the stoneware pipes. He was once concerned in the laying of some stoneware pipes; he saw the work being done and he knew it was performed in the best manner possible, and yet eight years after it had been completed nearly all the pipes leaked and had to be taken out and iron ones substituted. He had come to the conclusion that the iron pipe was the pipe of the future for all drain purposes. As to covering the area of the site of a building with concrete, that was an excellent plan if properly done. He knew the need of it, for he had seen a house in a Staffordshire village which was built above some disused coal mines. Some coal got ignited, and products of combustion arose from the earth and got into the house in cold weather when the ground outside was frozen and hard, and nearly killed all the family. Catching rain water was an important matter in villages where there was no water supply, but the collection was apt to be very objectionable if not properly done. It was a common practice to put gullies under rain-water pipes, whether they were wanted or not, and these gullies received all sorts of things besides rain water. Servants cleaning the house-step put slop-water into the nearest gully, and gullies were often used as urinals, and he had known of a case where serious results had followed from drinking water from a rain-water tank which had been receiving slop-water without anyone noticing it. Gullies ought not to be put where rain-water drains were connected with a tank; the down spouts should be connected directly with the rain-water drains. Copper baths were excellent things in their way, but he had had his notice directed to some copper baths in a hospital where the labour of keeping them clean was very great—almost prohibitive. If the baths were enamelled it was all right, provided the enamel did not come off in a few years. He had rather peculiar views about baths, for he thought they

were more or less luxuries. One did not require a bath necessarily to keep clean; that could be done with a tub and a couple of gallons of water; but it was nice, it was a luxury, to recline in a bath at full length; but where there were a number of people taking baths, it meant an enormous consumption of water, and appeared to be an extravagance. Spray baths, which were made in considerable numbers, were excellent things; comparatively little water was used, and the time occupied in using them was also an advantage. The hot-water supply to baths was another trouble, especially in private houses where two or three successive baths were wanted in the morning; there was great difficulty in getting hot water. As to cisterns, he thought it would be wise to bear in mind that they were more useful if they were in duplicate. If there were two cisterns, one could be cleaned out or repaired without interfering with the supply of water, and that was a great advantage. As to cesspools, he did not think they should be allowed anywhere, not even in the country. Sewage ought to be disposed of on the land or by sewers; cesspools were an absolute nuisance and ought to be prohibited.

Mr. E. O. Sachs said he would like to say a word or two arising out of Mr. Max Clarke's remarks as to the seriousness of the fact of the rising generation of architects growing up without a proper feeling of responsibility in these matters of sanitation. He (the speaker) was afraid that younger members of the profession were too liable to make use of those wonderful institutions called sanitary associations which, for two guineas, looked after these sanitary matters. Some architects of the rising generation shirked their responsibilities in these matters, and did not enjoy the sanitary side of architecture. It was most necessary that the young architect should take up the sanitary side of his work in a far more serious manner than he often did. It was also a matter of regret that it was so difficult to obtain from the ordinary country builder a sense of responsibility. The country builder performed his work in a most dilatory manner, and only recently he (the speaker) had had experience in Kent and Surrey where the builders had done their work in a most slovenly way. The architect, especially the London architect, could not watch everything that was being done, and many jobs did not justify the expense of a clerk of works, or of an assistant being constantly sent to supervise; and in such cases the builder was left to a great extent to his own devices, and it was unfortunate that, quite irrespective of any question of deductions for faulty workmanship, or any question of reconstruction, there was no legal punishment for bad work.

Mr. W. E. Hewitt, in supporting the vote of thanks, asked if the lecturer knew of a satisfactory method of turning bath and sink waste into the gully, giving 18 in. of open channel such as the local by-laws required? The most successful he knew of was the Albion clay slipper, which discharged underneath the grid and had 12 in. or so of open channel. He quite agreed with what had been said as to earth closets. Ladies as a rule objected to them because there was so much dust, but that was when ashes were used. There was a difficulty as to upstairs arrangements when earth closets were used, but that could be overcome by the use of commodes.

Mr. F. G. H. Hooper said that the rather obvious remedy for Mr. Sachs' difficulty as to scamped drainage work was to see the work before it was covered up.

Mr. E. Greenop said that in choosing a water-closet pan one had to be very careful that the arm provided for anti-siphonage was in such a position that the soil would not be washed up, and the more up-to-date sanitary authorities were condemning closets of good makers on this ground. He thought that labels should be put on all cocks, especially in a large house. One difficulty as to stoneware drain-pipes was the frequency of the joints; he had tried to get 3-ft. pipes instead of 2-ft. ones, but he found it was difficult to do so. Diameters of drain-pipes for ordinary houses were, in his opinion, always too large. He could confirm Mr. Clarke's views as to the inadequacy of the size of gully grids tested by observation in heavy storms. He had also put a filled gully in his house in London and in ordinary weather and without a fire the water had dried up in a fortnight.

The Chairman, in putting the vote of thanks to the meeting, said that Mr. Clarke might have

said a little more about septic tanks. Clients still seemed to regard the septic tank as if it were in its preliminary trial stage, and in one case he knew of ordinary cesspools had to be provided simply in order to get over a client's misgivings. He thought the suggestion as to duplicate cisterns was a very good one, and by having two flat cisterns they could be arranged quite close to the caves, and did not take up so much space. With regard to sinks in housemaids' closets, it was always a difficult matter to know what to do to provide a sink such as housemaids required, and he asked Mr. Clarke if he could give the members any further advice in this direction. The whole paper, in his opinion, went to show that an architect should not be dependent upon others in these matters, but should become more or less a sanitary expert. It was no good designing the house beautiful, or to devote time to fumigating the oak to perfection, if an error was made in the sanitation, and if the drains were to be badly arranged, it would be better had the house not been built.

The vote of thanks having been heartily agreed to,

Mr. Max Clarke, in the course of his reply, said he quite agreed with Mr. Blashill's remarks as to overhanging eaves. As to sewage, he put it into a pipe and then on to the land, and he found that the cows were not affected in the way Mr. Blashill had described. As to the automatic scavenger, he had put one in for the Church Body of Ireland when building a rectory for them. They were sceptical as to its utility, and he asked them to allow him to put it in at his own cost, as he had such faith in it. They agreed to that, and five years afterwards, the automatic scavenger having answered so well, he received a cheque for the work. If any one went to the septic tank manufacturers and asked for a sample of the effluent, the gentleman who had the matter in hand would pour out a portion of the effluent and drink it, and surely the Local Authorities would not object to such an effluent as that going into the ditches.

Mr. Blashill, interrupting, said his objection was as to the raw sewage being put upon the land. The septic tank or the scavenger was a cure.

Mr. Clarke, continuing, said Dr. Poore's book and paper were emphatic as to the disposal of excreta in the earth, but it was no use whatever to bury it 3 ft. deep; they might as well make a lot of little cesspits with it. The nearer the surface the excreta was put, the more effectual was the action of bacteria, which required air, and unless they got it the excreta would merely get into a state of sliminess. They might discuss drains, and the importance of making them good, until Doomsday. There was no building in the world that could not be made absolutely drain-tight if people would only start in the proper way. There was a notion that the only way to put down drains was to put in stoneware pipes or pipes which were correct when laid. The Science Committee of the Institute of Architects were, to some extent, instrumental in getting the County Council to adopt pipes with flange joints, and if iron pipes, coated with Angus Smith's solution, were used, there need be no difficulty about the drains. When people wish for an installation of hydraulic power or a steam engine the engineers never suggest that there may be a difficulty as to the supply on account of leaky joints, although one main may be under a pressure of 700 lbs. and the other 500 lbs. to the square inch; why then should there be any difficulty about drains which would last ninety or 100 years, and which it would be impossible to get any air through, even if the pipe were put under a pressure of 100 lbs. to the square inch. As to sinks, it was not an uncommon thing in better class houses for sinks to be used as urinals by the footmen and butlers; consequently, the fewer sinks there were the less would there be any of that sort of thing. As to bad workmanship, that could be dealt with by keeping back some of the money, and, if the work were not carried out satisfactorily, not to pay that money. As to making soil-pipes too large, he had a piece of lead pipe the bore of which was nearly stopped up by deposits. The by-laws of the L.C.C. gave a definite method for the anti-siphon pipe to be turned into the arm of the closet, i.e., that it should be turned into the arm in the direction of the flow. A teaspoonful of salt would prevent the evaporation of water from gullies, but people could not be got to attend to that detail.

If more care and cleanliness could be instilled into the ordinary housemaid, any sink would do, but as that could not be done, the only sink that was possible was one so arranged that it did not matter what was put down; it must be sufficiently large to take all sorts of things. In New York, when any sanitary work was contemplated, careful drawings had to be submitted to the authorities, and that was what would be required in this country before long. Every pipe and trap had to be shown, and the sooner that was required here the better.

The Chairman announced that the next meeting would be held on the 29th inst., when Mr. Arnold Mitchell would deliver an address on "Capitals," illustrated by lantern views. Mr. Mitchell had consented, at short notice, to take Mr. Bond's place that evening, as Mr. Bond, who was to have read a paper on the same subject, was unwell.

The meeting then terminated.

#### BUILDERS' BENEVOLENT INSTITUTION:

ANNUAL DINNER.

The fifty-fourth annual dinner of the Builders' Benevolent Institution took place at the Hall of the Worshipful Company of Carpenters, Throgmorton-avenue, E.C., on Thursday, the 14th inst. Mr. J. Carmichael (President of the Institution) occupied the chair, and amongst those present were Mr. G. H. Fellowes Brynne, F.R.I.B.A.; Mr. J. Howard Colls, Mr. D. Duff, Dr. R. R. Oram, Mr. W. B. Brown, Mr. K. D. Young, Mr. T. H. Brooke Hitching, C.C.; Mr. A. Ritchie, C.C.; Mr. W. Gilbee Scott, F.R.I.B.A.; Mr. E. Vanson, F.R.I.B.A.; Mr. H. N. Lancaster, A.R.I.B.A.; Mr. J. Gibson, A.R.I.B.A.; Mr. H. T. Hare, A.R.I.B.A.; Mr. J. Wigley, Mr. A. Masson, Mr. F. Farquharson, Mr. B. P. Ellis, Mr. A. E. Parker, Mr. B. D. Woodward, Mr. J. Scott Balfour, Mr. H. Holloway, Mr. R. J. Greenwood, Mr. H. H. Bartlett, Mr. J. Randall, and Mr. T. Rider. The company numbered altogether about 200.

After the usual loyal and patriotic toasts, the Chairman proposed the toast of the evening, "Success to the Builders' Benevolent Institution." He pointed out that the object of the charity was to relieve men who had been builders and in business for at least ten years, whose age must not be less than fifty-five, whose character would bear the strictest scrutiny, and who were now in poverty and want. He had often thought, had he been a Carnegie nothing would have given him greater pleasure than to search for and find out the thousands of poor but honest tradesmen scattered throughout the length and breadth of our land, so that he might help and assist them. He believed there was no more deserving class of men, and none who would more highly appreciate a little financial aid. The cause was a good one, and, whilst they were exceedingly grateful for all donations received, he wished to make a special appeal to all London builders to help this deserving charity by becoming regular annual subscribers. This was essentially a builders' charity, and ought to be supported by builders. Our merchants did nobly, but he regretted he could not say the same of some of our builders. The annual subscriptions had fallen off considerably this year, but he hoped they would make up the deficiency that night. The funds were administered with the greatest possible care, and at a minimum of cost. It might well be written over the doorway of the committee-room "No impostors need apply." In conclusion he asked the company to remember the words of his fellow countryman, Thomas Carlyle, "I pass through this world but once; therefore any good thing that I may do, or any kindness that I may show, let me do it now; let me not neglect it, as I shall not pass this way again."

The other toasts were, "The Worshipful Company of Carpenters," proposed by Mr. B. J. Greenwood, and responded to by Mr. John Wilson, J.P., the Worshipful Master of the Carpenters' Company; "The President," proposed by Mr. A. Ritchie, J.P., C.C., and responded to by the chairman; "The Architects and Surveyors," proposed by Mr. J. Howard Colls, and responded to by Mr. G. H. Fellowes Brynne, F.R.I.B.A., and Mr. W. Blumfield Brynne; and "The Vice-Presidents, Committee, and Stewards," proposed by Mr. Henry Holloway, and responded to by Mr. E. J. Lough.

During the evening the secretary, Major R. A. Bruton, read the list of subscriptions and donations, which amounted to 1,079l. 3s. The President's list showed a total of 948l. 17s. 6d., towards which the President himself contributed 105l.

#### COMPETITIONS.

MUNICIPAL BUILDINGS, WALTON-UPON-THAMES.—The first premiated design in the Competition for Municipal Buildings, &c., Walton-upon-Thames, is by Messrs. Mackintosh & Newnam, Birkbeck Bank Buildings, Holborn. The second premiated design is by Mr. Geo. Sedger, Great James-street, Bedford-row, and the third by Mr. Sidney Tatchell, Chevening-road, North Kensington, W.

POOR LAW HOSPITAL FOR EXETER.—At the weekly meeting of Exeter Board of Guardians on the 12th inst. the question of a new hospital was considered. Canon Hobson moved: "That architects be invited to provide plans for a new hospital for 150 beds at a cost not exceeding 80,000 per bed. That the hospital be built in sections as circumstances may require or permit, and that the first section, comprising administrative block, labour wards, isolation wards, and children's wards, be taken in hand as soon as arrangements can be made." Mr. Letheren seconded the resolution, which was carried. Mr. Munro gave notice that at the next meeting he should move to rescind the resolution.

#### ARCHITECTURAL SOCIETIES.

THE MANCHESTER SOCIETY OF ARCHITECTS.—At the monthly sessional papers meeting on the 14th inst. (Mr. Darbyshire presiding) there was an exhibition of students' drawings, and the following prizewinners were announced:—Design for a small plunge bath, Mr. Gerald Salamons. For the sketches in connexion with the summer visits—1st prize, Mr. Frank Osler; 2nd prize, Mr. Gerald Salamons. For measured drawings—1st prize, Mr. Claude Paterson; 2nd prize, Mr. Gerald Salamons. Afterwards Mr. Paul Waterhouse read a paper entitled "Architecture Among the Modern Arts." Mr. Waterhouse said he took it to be an axiom that the greatest periods of historic art had been those in which there was no consciousness of art; that, in fact, consciousness in art was a danger to its existence. He would during his paper inquire whether we were to look upon the modern practice of analysing the very nature of art as a necessary menace to our powers of art production. Our age was above all, he said, an age of expression, and in architecture especially the powers which made the critic were, he thought, allied to those which made the producer. In fact, the very mental exercises that enabled us in these days to define and detect that essence of art which was unnameable to our forefathers were not necessarily destructive of creative skill, but might be turned, at least so far as architecture was concerned, into the instrument of a riper, fuller, and more intellectual creation. After speaking of the simplicity which underlay Greek art, the beauty of some of the best specimens of Roman architecture, and the buildings of the Italian Renaissance, which last, he said, breathed the very essence of art, the speaker emphasised the fact that art as we understood the word was never talked about by their builders. In the great Gothic days the mason was a skilled craftsman, who was imbued with a simple pride in his work, which was to him an expression of pious faith and Christian belief; but the mason would have been quite unable to talk about his work. Until the present age art was cherished and beloved, but never talked of. We had, however, to-day the wish, and sometimes the ability, to express things which a former age would never have attempted to handle. Each preceding age had a style of architecture of its own. To-day an unconscious selection was exercised, but all noble work had its traditions in recognised styles, and was more or less the result of an academic choice. No architect to-day could consider himself equipped for his work without a sound knowledge of the elements in which he worked. So far from being choked, as some argued, by deeper insight, the architect must necessarily be a student. He attained the highest possible to him only when he could criticise his own work in the light of knowledge. Architecture was, so to speak, the application of taste to con-

struction, therefore only the man of wide knowledge could be trusted to vary or modify the old rules, since his power to judge depended upon his knowledge of the work of his predecessors. Architecture was creative and arose from the divine in a man. As its name implied, it was the queen of crafts; the architect was not an imitator, but a creator.

NORTHERN ARCHITECTURAL ASSOCIATION.—The opening meeting of the winter session of the Northern Architectural Association was held at 36, Northumberland-street, Newcastle, on the 13th inst. Mr. Frank Caws, F.R.I.B.A., presiding. Mr. Wm. Glover wrote resigning his position as a member of the Council of the Association, stating that the health of himself and wife was far from satisfactory, and that, therefore, he had decided to leave this district and to reside in the south. The President and Hon. Secretary (Mr. A. B. Plummer) expressed their regret at the severance. The President then delivered his inaugural address, in the course of which he said:—The nineteenth century will be distinguished by the future architectural historian as the most fickle century of all, in regard to the number, variety, and incompatibility of the styles and fashions of buildings which it has so restlessly and inconstantly first embraced and then spurned. During this fickle century the Battle of Styles has been fought to a finish, not of the "final issue," which never can be finished, but to a finish of the two contestants, the old Classic and the resurged Gothic, which entered both on the fray, and neither of which has survived. "As dead as Queen Anne" is an expression which has passed into a common by-word; yet it is remarkable that if there is any distinguishable survivor of the architectural fights of the great Victorian age it is the Queen Anne type, which still possesses much vitality, and seems to enjoy a fair prospect of extending its influence far into the twentieth century. Regarding the future of British architecture, we need not ask, "What will the end be?" For there will be and can be no end to the mutable fashions affected by restless humanity. Signs are not wanting that the rising generation of architects, to whom the twentieth century belongs, are coming to regard an intimate acquaintance with structural principles as a *sine qua non* of professional proficiency; for not merely statics, but also dynamics, are now included in the curriculum of the preliminary examinations which even novitiates must pass ere they can take rank merely as students of the Royal Institute of British Architects. The truly successful modern architect must of necessity be an artist, scientist, and commercialist, and whilst an excellent society man, all rolled into one. The popular measure of success is not supreme technical skill, is not even genius itself—that gift from the Highest to the highest—but is gold. This debasing influence reveals its presence amongst us by an increasing disposition to bribe clients to employ us, by offering our services at rates of remuneration below the rates fixed by usage, and by which every member of the Northern Architectural Association and of the Royal Institute of British Architects, to which it is affiliated, is bound, in honour and fairness to his professional brethren, to firmly adhere. To what extent these nefarious practices obtain amongst architects it is not easy for the clean-handed to discover, even if wishful to probe foul waters. Too many modern attempts at originality in architecture issue in mere oddities and vulgar sensationalism. Cruel contortions of gable copings and pediments, coupled with rustication carried to absurd excesses, are having a run just now. But the public taste, though strong enough to enjoy almost any architectural novelty, however vulgar, will become soon nauseated with such wretched fare. Nature's method of originality is worthy of our highest emulation. She knows how to be unfailingly interesting, and perpetually original, within the limitations of type. For example, in her reproductions of the human face divine she never makes two alike. Every human face possesses individuality, *i.e.*, originality. Yet the number and arrangement of the features are the same in all cases, the greatest differences of individuality being due to the smallest and most subtle variations. Nature's originalities are produced not by such horrible expedients as putting eyes in foreheads or by other monstrous transpositions of features, but by the most exquisite touches of ineffable art.

## Illustrations.

## VICTORIA MEMORIAL DESIGN.

**W**E give this week the plan of Mr. Ernest George's design for the Victoria Memorial, with the view of the ornamental *Place* near the palace, and a view of the triumphal arch at the east end of the processional road.

We have already commented fully on the design in our article of the 2nd inst., and the architect has no special remarks to offer.

In regard to the arch or rather gateway screen, while we think it a very charming composition, we may observe that it conveys more the idea of being an entrance to a park than a royal or national triumphal arch.

## HOUSE, BARNT GREEN, WORCESTER-SHIRE.

This house was designed to command the extensive views of the Avon and Severn valley from the Lickey Hills, the site falling rapidly towards the south. The materials proposed were Bromsgrove stone, rough-cast, old brick chimney shafts, and Colley Weston stone slates for the roofs, with oak finishings inside. Execution has been deferred for the time being.

The coloured drawing from which the illustration is reproduced was hung in the last Royal Academy Exhibition, and was prepared by Mr. C. E. Bateman, of the firm of Messrs. Bateman & Bateman, of Birmingham, the authors of the design.

## SOME EIGHTEENTH-CENTURY IRONWORK.

This sheet of drawings, by Mr. G. G. Poston, represents some typical examples of eighteenth century ironwork. Two of them are from St. Paul's Cathedral, but most of the others, as will be seen, are from less known and less central situations.

## DISTRICT SURVEYOR'S DISTRICTS.

At Tuesday's meeting of the London County Council the Building Act Committee brought up the following Report, the recommendations being agreed to:—

"We have had under consideration the question of adjusting the limits of the various district surveyors' districts under the London Building Act, 1894, in order to make those limits, as far as conveniently may be, co-terminous with the boundaries of the metropolitan boroughs constituted under or in pursuance of the London Government Act, 1890. Section 139 (1) (a) of the London Building Act, 1894, provides that the Council 'may alter the limits of the district of any district surveyor, or unite any two or more such districts, and place any such altered district under the supervision of any district surveyor, and do all such matters and things as are necessary for carrying into effect the power hereby given.' The various district surveyors interested have been consulted, and with the exceptions and reservations, and subject to the conditions hereinafter in the several recommendations contained, no objection is raised by those district surveyors to the adjustments of limits recommended. With a view to filling the existing vacancies caused by deaths and resignations, we propose to invite applications by advertisement. We recommend:—

(a) That the eastern limit of the district of Battersea, Central, be adjusted from Wix's-lane to Nine Elms so as to coincide with the boundary of the Borough of Battersea at that part.

(b) That the Western limit of the district of Battersea, North, be adjusted so as to coincide with the boundary of the Borough of Battersea at that part.

(c) That the western limit of the district of the southern division of Battersea and the detached portion of Clapham be adjusted so as to coincide with the boundary of the borough of Battersea at that part; that the southern and eastern limits between Trinity-road, Tooting, and the western end of Nightingale-lane be adjusted so as to coincide with the boundary of the Borough of Battersea at that part; and that the district be designated Battersea, South, and part of Wandsworth.

(d) That the western limit of the district of St. Mary Magdalen, Bermondsey, St. John, St. Olave, and St. Thomas, Southwark, be adjusted so as to coincide with the boundary of the Borough of Bermondsey, so far as such limit adjoins the district

of St. Saviour, St. George-the-Martyr (part), Christ-church, Southwark, and the Northern Division of Lambeth; that Mr. V. J. Grose, who is at present District Surveyor for St. Pancras (East), be transferred and appointed to the said district of Bermondsey, &c., upon condition that he shall not accept private practice within that district, but otherwise upon the terms of his present appointment, and that such transfer and appointment shall date from January 1, 1902.

(e) That the northern limit of the district of Bethnal Green East and South Bow be adjusted from Cambridge-road to Skew Bridge, Old Ford-road; that the district limit from Skew Bridge eastward be altered so as to coincide with the centre line of Old Ford-road to the existing limit of the district; and that the southern limit be adjusted from Cambridge-road to Bow-road so as to coincide with the boundary of the Borough of Stepney at that part.

(f) That the limits of the district of Bethnal Green West, westward of Cambridge-road, be adjusted so as to coincide with the boundary of the Borough of Bethnal Green, westward of such road, subject to the supervision by Mr. H. Lovegrove, district surveyor for Islington, South, Shoreditch, &c., of the erection of new buildings upon a site on the east side of Goldsmith's-row, bounded by Kay-street and Hackney-road.

(g) That the parish of St. Paul, Covent Garden, be transferred from the district of Holborn and East Strand to the district of Bloomsbury, St. Martin-in-the-Fields and Soho; that the northern limit of the said district of Bloomsbury, &c., be adjusted so as to coincide with the boundary of the Borough of Holborn at that part; that at the expiration of five years from January 1, 1902, that portion of the district in the Borough of St. Pancras be surrendered by the present district surveyor and added to the district of Holborn, &c., as proposed to be adjusted; that the limit from the south-eastern corner of Lincoln's-inn-fields to Kemble-street be adjusted so as to coincide with the boundary of the Borough of Holborn at that part, and that at the expiration of five years from January 1, 1902, the area on the south-east side of Kemble-street be surrendered by the present District Surveyor and be added to the district of Holborn and East Strand; and that the limit of the district from Kemble-street be defined by the centres of Drury-lane, part of the proposed new street to be formed by the Council, and the Strand to the existing limit of the district.

(h) That the western limit of the district of St. Leonard, Bromley, be adjusted so as to coincide with the boundary of the Borough of Poplar at that part.

(i) That the detached angular portion of the district of Newington, West, and part of Lambeth, situated on the north-east side of Camberwell New-road, westward of Camberwell Green, be transferred to the district of St. Giles, Camberwell; that the eastern limit of the district of St. Giles, Camberwell, from New Cross-road to the county boundary, be adjusted so as to coincide with the boundary of the Borough of Camberwell with the exception of an area eastward of Ivydale-road, forming part of the Haberdashers' Company's estate; that the north-western limit from Camberwell-road to Camberwell New-road be adjusted, so as to coincide with the boundary of the Borough of Camberwell at that part; and that the limit from that point be defined by the centre of Camberwell New-road to Camberwell Green, and thence by the old boundary of the parish of Camberwell to Dulwich-road, and thence by the centres of Norwood-road, Croxted-road, and Thurlow Park-road to the old boundary of the parish to the county boundary.

(j) That the limits of the district of Charlton, Lee, and Kidbrooke, be adjusted so as to coincide with the boundaries of those parishes as amended under the provisions of the London Government Act, 1890.

(k) That the western, northern, and eastern limits of the district of Chelsea, North, be adjusted so as to coincide with the boundary of the Borough of Chelsea at those parts.

(l) That the western and eastern limits of the districts of Chelsea, South, be adjusted so as to coincide with the boundary of the Borough of Chelsea at those parts.

(m) That the northern limit of the district of Clapham be adjusted so as to coincide with the boundary of the Borough of Wandsworth at that part.

(n) That the western limit of the district of St. James and St. John, Clerkenwell, and part of Islington, northward of St. Sepulchre Without, be adjusted so as to coincide with the boundary of the Borough of Finsbury at that part, and that the eastern limit of the said district be defined by the centre line of Goswell-road.

(o) That the vacant district of north-east Deptford be united with the district of south-east Deptford; that the district thus constituted be designated Deptford, East; that the northern and southern limits, and also the eastern limit southward of the parish yard at Deptford-creek, be adjusted so as to coincide with the boundary of the Borough of Deptford at such parts; that Mr. W. H. Lees, district surveyor for south-east Deptford, be appointed district surveyor for the district of Holborn and East Strand, upon condition that Mr. Lees resign his pre-

sent appointment as District Surveyor for South-East Deptford; that he do devote the whole of his time to the duties of his office, and do not during his continuance in office (except in the discharge of the duties thereof) carry on business as an architect, surveyor, or builder, or directly or indirectly as partner or otherwise, be interested in such business, and also upon the other conditions attaching to the appointment of District Surveyors; and that Mr. Lees' resignation and appointment as District Surveyor for the district of Holborn and East Strand, &c., do take effect as from January 1, 1902, and that, in the meantime, he be appointed in the stead of him for that district; and that advertisements be issued inviting applications for the appointment of District Surveyor for Deptford, East.

(p) That the northern and eastern limits of the district of Fulham, North, be adjusted so as to coincide with the boundary of the Borough of Fulham at those parts.

(q) That the eastern limit of the district of Fulham, South, be adjusted so as to coincide with the boundary of the Borough of Fulham at that part.

(r) That the western and southern limits of the district of Greenwich be adjusted from the parish yard at Deptford-creek to Pond-road, so as to coincide with the boundary of the Borough of Greenwich at that part.

(s) That the southern limit of the district of East Hackney, South and North Bow be adjusted from Cambridge-road to Skew Bridge, Old Ford-road, so as to coincide with the boundary of the Borough of Bethnal Green at that part, and that the district limit from Skew Bridge eastward be altered so as to coincide with the centre line of Old Ford-road to the existing limit of the district.

(t) That the western and southern limits of the district of Hackney, West, be adjusted so as to coincide with the boundary of the Borough of Hackney at those parts.

(u) That the eastern and southern limits of the district of Hammersmith be adjusted so as to coincide with the boundary of the Borough of Hammersmith.

(v) That the parish of St. Paul, Covent Garden, be transferred from the district of Holborn and East Strand to the district of Bloomsbury, St. Martin-in-the-Fields, and Soho; that at the expiration of five years from January 1, 1902, by the present district surveyor or Bloomsbury, &c., of the area in the north-east corner of his district which is in the Borough of St. Pancras, that portion of the Borough of St. Pancras southward of Euston-road, and eastward of Upper Woburn-road, and Tavistock-square, be added to the district of Holborn and East Strand; that the limit from the south-eastern corner of Lincoln's-inn-fields to Kemble-street be adjusted so as to coincide with the boundary of the Borough of Holborn at that part, and that at the expiration of five years from January 1, 1902, the area on the south-east side of Kemble-street be surrendered by the present district surveyor and be added to the district of Holborn and East Strand; that the limit from Kemble-street be defined by the centres of Drury-lane, part of the proposed new street to be formed by the Council, and the Strand to the existing limit of the district; that St. Sepulchre Without and the Charterhouse do remain part of the district of Holborn, &c., and that the eastern limit, northward of St. Sepulchre Without and the Charterhouse be adjusted so as to coincide with the boundary of the Borough of Holborn at that part; and that the district thus constituted be designated Holborn, East Strand, and part of St. Pancras.

(w) That the vacant district of Hampstead, West, be united with the district of East Hampstead, &c., that those portions of the latter district known as North St. Pancras and North-west Islington be surrendered by Mr. F. Hammond (the present district surveyor) and added to the district of East Islington; that the southern and eastern limits of Mr. Hammond's district thus constituted be adjusted so as to coincide with the boundary of the Borough of Hampstead, and be designated by the name of that borough; and that such alterations do take effect from January 1, 1902.

(x) That the district of Islington, East, be enlarged by the addition thereto of North-west Islington and North St. Pancras, and also by the addition of so much of the district of St. Pancras, East, as is situated eastward of Camden-street and Oakley-square, (north side) and northward of Euston-road; that the district thus constituted be designated Islington, North, and St. Pancras, East, and that such enlargement do take effect from January 1, 1902.

(y) That the limits of the district of Islington, South, Shoreditch, and Norton Folgate be adjusted so as to coincide with the boundaries of the Boroughs of Islington and Shoreditch, subject to the reversion of Norton Folgate by the present District Surveyor, Mr. H. Lovegrove, and to the supervision by him of the erection of buildings on a site on the east side of Goldsmith's-row, bounded by Kay-street and Hackney-road, and also on a site on the west side of City-road, southward of Baldwin-street.

(z) That the limits of the district of South-west Islington, St. Luke, Old-street, and the western part of Glasshouse Yard, be adjusted so far as they relate to the latter portion of the district, to coincide with

the boundary of the Borough of Finsbury eastward of the centre line of Goswell-road and St. Sepulchre, and the Charterhouse, subject to the supervision by Mr. H. Lovegrove, District Surveyor for Islington, South, &c., of the erection of buildings on a site on the west side of City-road, southward of Baldwin-street.

(bb) That the limits of the district of Kensington, North-west, be adjusted so as to coincide on the west with the boundary of the Borough of Kensington, and on the east, from Kensal-road to Kensington Gardens, with the boundary of the borough at that part.

(cc) That the south-eastern limit of the district of Kensington, South, be adjusted so as to coincide with the boundary of the Borough of Chelsea at that part.

(dd) That the districts of (1) Central Lambeth and part of Battersea; and (2) Battersea, be united and designated "Central Lambeth and North Battersea," and that advertisements be issued inviting applications for the appointment of district surveyor for such district.

(ee) That no change be made at present in the limits of the district of Lambeth, South, and part of Camberwell.

(ff) That the western and northern limits of the district of Lewisham be adjusted so as to coincide with the boundary of the Borough of Lewisham at those parts.

(gg) That the eastern limit of the district of St. Anne, Limehouse, St. John, Wapping, the Precinct of St. Katharine and the Hamlet of Ratcliffe, be adjusted so as to coincide with the boundary of the Borough of Stepney at that part.

(hh) That no change be at present made in the limits of the district of Lower New-road.

(ii) That the limit of the district of Mile End Old Town, northward of Whitechapel-road on the west, and of St. Paul's-road on the east, be adjusted so as to coincide with the boundary of the Borough of Stepney at that part.

(jj) That the southern limit of the district of Newington East, and part of St. George-the-Martyr, Southwark, be adjusted so as to coincide with the boundary of the Borough of Southwark at that part.

(kk) That the south-eastern limit of the district of Newington, West, and part of Lambeth from Camberwell-road to Camberwell New-road be adjusted so as to coincide with the boundaries of the Boroughs of Southwark and Lambeth at those parts, and that the detached angular portion of the district, situated on the north-east side of Camberwell New-road, westward of Camberwell-green, be transferred to the district of St. Giles, Camberwell.

(ll) That having regard to the fact that the London Building Acts, 1894 and 1898, and the by-laws, &c., made thereunder, are, under the provisions of the London Government Act, 1899, and the London (Penge) Order in Council, 1900, to continue and be in force in the district of Penge until such date as the Local Government Board by order may direct, no action be taken with regard to this district.

(mm) That the western limit of the district of Plumstead and Eltham, southward of Shooter's Hill-road, be adjusted so as to coincide with the boundary of the Borough of Woolwich at that part.

(nn) That the western limit of the district of All Saints, Poplar, be adjusted so as to coincide with the boundary of the Borough of Poplar at that part.

(oo) That no action be taken with regard to the district of Putney and Roehampton, as beyond the severance of the area recently known as Putney, detached, this district is unaffected by the provisions of the London Government Act, 1899.

(pp) That the limits of the district of Rotherhithe, Hatcham, and St. George-in-the-East, be adjusted so far as relates to the portions of such limits between Deptford Reach and Trundley's-road; between Nunhead Station and New Cross-road; and between Camberwell-road and Rotherhithe New-road, so as to coincide with the boundaries of the Boroughs of Deptford and Camberwell, at those parts.

(qq) That no change be at present made in the limits of the district of St. George, Hanover-square, North, but that upon the completion of the rebuilding of property, on the late detached portion of St. George, Hanover-square, on the north side of Bayswater-road, which has been included in the Borough of Paddington, that area be transferred to the district of Paddington, unless circumstances should arise which may render the earlier transfer of that area desirable.

(rr) That the western limit of the district of St. George, Hanover-square (Belgrave and Pimlico (Division)), be adjusted so as to coincide with the boundary of the City of Westminster at that part.

(ss) That the limits of the district of St. Marylebone be adjusted so as to coincide with the boundary of the Borough of St. Marylebone.

(tt) That the portion of the district of St. Pancras, East, westward of Camden-street and Oakley-square (north side), be transferred to St. Pancras, West; that the portion of the district southward of Euston-road be transferred to the district of Holborn and East Strand, subject to the adjustment of the limits adjoining the Borough of Finsbury, so as to coincide with the boundary of that borough, and also subject to the addition to the district of Bloomsbury, St. Martin-in-the-Fields, and Soho of

the area southward of Tavistock-place; that the remainder of the district be united with the district of Islington, East, as proposed to be enlarged; and that the district thus constituted be designated Islington, North and St. Pancras, East.

(uu) That the western and southern limits of the district of St. Pancras, West, be adjusted so as to coincide with the boundary of the Borough of St. Pancras at those parts; and that the eastern limit be extended by the addition to the district of the area westward of Camden-street and Oakley-square (north side) referred to in the foregoing recommendation.

(vv) That the eastern limit of the district of St. Saviour, St. George-the-Martyr (part), and Christchurch, Southwark, and the northern division of Lambeth, be adjusted so as to coincide with the boundary of the Borough of Southwark at that part.

(ww) That the areas recently known as South Hornsey, which have been added to the County of London under the provisions of the London Government Act, 1899, be added to the district of Stoke Newington, and that the limits of such district be adjusted so as to coincide with the boundary of the Borough of Stoke Newington.

(xx) That the eastern limit of the district of Streatham, East, and Brixton, be adjusted so as to coincide with a line drawn along the centres of Norwood-road, Croxted-road, and Tburlow Park-road, to the existing southern limit of the district.

(yy) That the limit of the district of Streatham, West, be adjusted from Trinity-road, Tooting, to the western end of Nightingale-lane, so as to coincide with the boundary of the Borough of Wandsworth at that part.

(zz) That the western limit of the district of Sydenham be adjusted so as to coincide with the centre line of Elliot-bank, and thence southward with the boundary of the Borough of Lewisham to the county boundary.

(aaa) That the area recently known as Mitcham (detached), which has been included in the County of London under the provisions of the London Government Act, 1899, be added to the district of Wandsworth, East, and Tooting Graveney; that the eastern limit of Wandsworth, East, be adjusted so as to coincide with the boundary of the Borough of Wandsworth at that part.

(bbb) That the eastern limit of the district of Wandsworth, West, so far as it adjoins the Borough of Battersea, be adjusted so as to coincide with the boundary line between the Boroughs of Wandsworth and Battersea at that part.

(ccc) That the northern limit of the district of St. Mary, Whitechapel, Christchurch, Spitalfields, the Hamlet of Mile End New Town, and the Tower Liberty, be adjusted so as to coincide with the boundary of the Borough of Stepney at that part.

(ddd) That, where alterations in the limits of districts are approved by the Council, the solicitor be instructed to take such steps as may be necessary to secure the carrying out of such alterations, which shall be subject to the conditions that any works in progress and any proceedings in progress relating to any dangerous or neglected structure, or any other building or structure in areas surrendered by a district surveyor shall, notwithstanding the transfer of those areas from his supervision, continue to be supervised by him until the completion of such works and proceedings, and that no district surveyor shall claim compensation for any diminution of income which may hereafter arise by reason of such adjustments of limits.

(eee) That unless otherwise specified, and subject to the exceptions, reservations, and conditions mentioned in any of the above recommendations, the transfer of district surveyors to other districts and the alterations of district limits do take effect on and after January 1, 1902, and be made in strict accordance with the conditions of the present appointments of the district surveyors concerned, and that the solicitor be instructed to take such steps as may be necessary with reference thereto."

#### COMPETITION FOR NEW MUNICIPAL BUILDINGS FOR THE URBAN DISTRICT COUNCIL OF WALTON-ON-THAMES.

This competition is one of those in which the winner is an easy first, with the remaining competitors far behind. Unfortunately, there is likely to be some heartburning over the result, as the authors of the first premiated design, Messrs. Macintosh & Newman, have transgressed one of the stipulations of the conditions, which enjoined that all drawings were to be executed in "black and white, or sepia and white." This injunction the successful competitors have apparently supposed to refer only to elevations, as they have coloured their plans, sections, and perspective. Although this technical breach of the conditions has occurred, the Urban District Council may be forgiven for considering that, after spending the ratepayers' money in promoting competition in order to obtain the best available design, they would not be doing justice to

their constituents by putting out of court for a trivial error a design which is far superior to any other submitted, whilst the unsuccessful competitors should accept their defeat with a good grace and the conviction that no amount of colouring in their own drawings, or the absence of it from those that have won the first premium, would bring their designs within measurable distance in point of merit of their successful rivals.

The site is at the corner of Hershams-road, to which it has a frontage of 104 ft., and Bowes-road, with a frontage of 177 ft. It is a regular trapezium, the width at the rear of Hershams-road being somewhat less than the frontage, and is amply sufficient for the buildings intended to be placed upon it. Indeed, the very amplitude of the site has led many of the competitors to ruin their chances by neglecting compactness of plan. The Hershams-road aspect of the site is a little south of west, and the Bowes-road frontage a little east of south.

The buildings required on the site are municipal offices for the Clerk, Surveyor, Collector, and Inspector, council chamber and committee-room, a small fire station, a residence for the Surveyor, and apartments for a caretaker. Space had also to be left for the future erection of a police-court.

The superiority of the first premiated design is manifested both in plan and elevation. The municipal offices face the Hershams-road, from which they are entered. Left of the entrance are attendant's room, with telephone, Collector's office, and Surveyor's office, and at the rear of same, separated by a corridor 6 ft. 6 in. wide, the Surveyor's drawing office and Inspector's room. On the right of the entrance is the Town Clerk's office, fronting Hershams-road, with his clerks' office at the rear and strong-room between. On the first floor the council chamber for twenty-one members is at the north end of the building, committee-room next, and two waiting-rooms. The plan of the municipal offices is compact and convenient, but the lighting of the Surveyor's drawing office might be improved by a slight alteration in the distribution of the windows, and surely with accommodation for fifty of the public in the council chamber besides the members, officials, and Press representatives, a separate stair would be a distinct advantage.

The fire station, with accommodation for engine and hose-cart, is placed next the municipal offices facing Bowes-road, and the clubroom for fire brigade, look-out, and stair therefor, form part of the main block, and enable the authors to provide the caretaker's apartments on the first floor, whilst the look-out tower gives the opportunity for an effective feature in the composition of the exterior.

The Surveyor's residence is at the east end of the Bowes-road frontage, leaving space for the police-court between it and the fire station, and the authors have proved the sufficiency of the space provided by drawing an admirable plan for the future building.

The elevations are well designed for erection in red brick and stone in a style based upon eighteenth-century English work, but sufficiently freely treated to stamp modernity upon the grouping and detail.

Save for the one transgression to which we have already referred, the drawings are carefully prepared and fully worked out in a businesslike fashion, united with an artistic ability in design that promises well for a satisfactory execution of the work if entrusted to the authors.

The second premiated design, by Mr. George Sedger, comprises in one main block facing Hershams-road the municipal offices and the Surveyor's residence, whilst the fire station is a distinct and isolated building at the east end of the site. The planning of Mr. Sedger's municipal offices is less compact than in the first premiated plan, and, though workable, is therefore more costly for the accommodation provided than is necessary.

In the fire station the clubroom is placed over the engine house and, being approached by a narrow circular stair, would necessitate sliding poles for anything like reasonable promptness in turning out. A hose tower is provided, a good feature if funds will allow, and a site for stables is suggested. The external treatment of the design is of too domestic a character and somewhat straggling in composition.

The third premiated design, by Mr. Sidney Tatchell, like the second, fails in reaching the compactness of the first design, and has besides some further weak points; thus the

Clerk's private office is separated from his public or inquiry office by a corridor, and is placed at the rear of the building with a north-easterly aspect, whilst the waiting-room is in an inconvenient position and has its doors arranged to jam each other in opening. Like the second design, Mr. Tatchell's scheme has the Surveyor's residence at the north end of the Hershaw-road frontage, thus making it part of the main block. The design is not illustrated by a perspective, and from the elevations is ultra-severe in treatment, with a probable intention of economy that would be more effectively attained by compact planning.

Some of the remaining designs have good points, but united to serious faults that justify their exclusion from the premiums, great as is the difference between the first and the two others.

"Red Circle" has an admirable plan for the municipal offices and council chamber, and a quiet, suitable, and scholarly elevation of eighteenth-century English character, but the fire station is very poorly planned and the Surveyor's residence too costly. If these adjuncts of the scheme had equalled the author's main building a higher position would certainly have been merited.

The author of "Apps Court" has made a strenuous effort to win, but is placed out of court by the rambling, extravagant nature of his plan.

"Vinces" has a suitable type of elevation and a plan better than many, but not equal to any of those premiated.

"Isis" is the motto of a painstaking author, whose misdirected energy has unfortunately resulted in a plan that is too complicated, involved, and wasteful, whilst the arrangement of the Surveyor's residence lacks a proper comprehension of domestic planning.

"Pan" sends clever elevations of *art nouveau* tendency, but the arrangement, or rather haphazard placing of plans of various floors of three different buildings on one sheet of paper, may be *chic*, but is not business, and business must be allied with art if competitions are to be won nowadays. An almost unintelligible jumble does not make for success. The plan of the municipal offices is in itself far too rambling and faulty to make a workable building.

"Lime" is another instance of a rambling plan and pretentious design that is neither suitable nor financially possible, in spite of a considerable manifestation of ability that errs on the side of over-exuberance.

#### THE LONDON COUNTY COUNCIL.

The usual weekly meeting of the London County Council was held on Tuesday, in the County Hall, Spring-gardens, Mr. A. M. Torrance, Chairman, presiding.

**Shop Blinds, Signs, &c., over Footways.**—Several petitions were presented against the proposed by-laws as to the height of shop-blinds, signs, and other structures overhanging the footways. The petitions were referred to the Building Act Committee.

**The Council's Bricklayers.**—On the report of the Finance Committee,

Captain Swinton asked the Chairman of the Committee whether he could give the Council any information as to the credibility of a statement concerning the laying of bricks which appeared in the *Times* of Monday, and which was to the effect that the London County Council limit was 330 bricks per day, or seventy per day fewer than the present recognised number for private London contractors.

Lord Welby: Some little time ago, when there was great activity in the building trade and a difficulty in obtaining that class of labour, it was thought that our bricklayers did not lay the number of bricks per day that would be considered fair, but lately the manager reported that the number had been increased. I cannot go beyond that at present. The attention of the Works Sub-Committee has been directed to the statements in the *Times*, and we are investigating them in order to consider how far they merit confirmation. Afterwards I hope to give my hon. friend a more specific answer.

Colonel Rotton: Do I understand that because there were fewer bricklayers available, those bricklayers laid fewer bricks?

Lord Welby: I am not responsible for the gloss which Colonel Rotton put upon my answer. I pointed out that when there was great competition for their services the brick-

layers whom we employed were rather slack in the way they performed their duties.

**Loans.**—On the recommendation of the Finance Committee, it was agreed to lend Greenwich Borough Council 3,030*l.* for paving works; Hammersmith Council 6,850*l.* for street improvements; Woolwich Borough Council 5,375*l.* for dust destructor, and 2,000*l.* for site of baths and wash-houses.

**Improvements and Rehousing.**—The Improvements Committee recommended the Council to approve of an arrangement for handing over to the Housing of the Working Classes Committee a rehousing site at Leroy-street, Old Kent-road, at a nominal price, in order to avoid a deficiency on the housing account. It appeared that there was a statutory obligation upon the Council to rehouse 291 persons who would be displaced by the Long-lane and Tabard-street (Southwark) improvement, and for that purpose the site in question had been acquired, and would accommodate 380 persons. The value of the land was 2,875*l.*, but the Housing Committee could only afford to allow 1,432*l.* for it, and the proposal was to make the balance of 1,443*l.* a charge upon the improvement account.

Mr. Beachcroft said this was a novel proposal, and it raised a very important question of principle. He doubted whether it was not setting aside the standing orders, and he moved to refer the report back.

Dr. Longstaff seconded the amendment.

Mr. H. Clarke observed that the trades unions had made it impossible to build houses at a profit.

Sir H. Bliss wondered by how much the cost of housing had been enhanced owing to the neglect of the British workman to give the Council a fair day's work for a fair day's wage.

After considerable debate the amendment was defeated, and the recommendation was adopted.

The Improvements Committee further recommend a similar arrangement in regard to a site at London-fields, Hackney, upon which it was proposed to rehouse 486 persons displaced by the Mare-street improvement. The value of this site was estimated at 1,250*l.*, but the Housing Committee, in complying with the requirements of the Home Office as to the buildings, were unable to allow anything for the land. It was proposed, therefore, to fix the value of the land for rehousing purposes at nil.

Some further discussion arose on this recommendation, which was then agreed to.

**Vaults under Footways.**—The Improvements Committee reported that, in connexion with the Holborn to the Strand improvement, they had had before them the question whether vaults should be constructed under the footway in the new street, in the Crescent-road, and on the north side of the Strand between Wellington-street and the Law Courts. The Metropolitan Board of Works constructed vaults under the footways when carrying out some street improvements, but the results were not financially satisfactory. There were, however, several reasons why vaults under the new footway on the north side of the Strand were highly desirable. They would provide a foundation upon which the footway could be laid, and the fact of having the subway for pipes close to the footway also made it more convenient to have the vaults constructed in the first instance, as the tops of the vaults could be used to support the crane, which would otherwise occupy a large portion of the carriage way of the Strand. The report added that the local authority would raise no objection to the construction of vaults projecting under the roadway to the extent of 12 ft. Excluding the frontage of certain establishments, the estimated cost was 3,500*l.*, for which the Council was recommended to pass a supplemental estimate, and the committee had reason to believe that the whole cost would be recovered from the lessees of sites on the north side of the Strand. The committee would advise in due course whether similar works should be undertaken in the new street and Crescent-road.

The report was adopted.

**The New Street.**—Mr. Davies, Chairman of the Improvements Committee, said that they had not yet decided what name for the new street to recommend, but the Council would have an opportunity of considering the matter.

**The Widening of Piccadilly.**—Mr. Davies

announced that his committee had conferred with the First Commissioner of Works as to the Piccadilly widening scheme, and had come to an understanding with the right hon. gentleman. The committee would meet that day, and would bring up to the Council on Tuesday next a definite proposal, with the view of securing the authority of the Council to commence the work at once.

**Erection of One-story Shops in Victoria-street, Westminster.**—The Building Act Committee brought up the following paragraph:—

"The Council on October 8, 1901, for the second time referred back for further consideration our recommendation on the application of Messrs. Z. King & Son on behalf of Mrs. M. Hiscox, Mr. J. T. Hiscox, and Mr. R. T. Raikes for the erection of one-story shops and an entrance porch in front of No. 125, Victoria-street, Westminster. We have again given the matter our careful consideration, with the result that the applicants have now submitted further amended plans, which include the houses Nos. 123, 125, and 127, and also Nos. 145 to 169 (odd numbers). By this proposal the shops are intended to be erected so that no portion other than the plinths to the pilasters will project in advance of the line of the projecting bay-windows, whilst the pilasters to the porches will project 14 in. in advance of this line. The effect will be that a strip of land 5 ft. 6 in. in width will be given up to the public way, except in front of the porches, where it will be 5 ft. 14 in. in width, and the shops will project 3 ft. from the present line of buildings. The recommendation, which was referred back, only provided for the giving up of a strip of land 4 ft. 9 in. in width in front of the shops and 4 ft. 3 in. in front of the porch, whilst the shops were to project a distance of 3 ft. 0 in. in front of the existing buildings. It will thus be seen that the present proposal is a more advantageous one, from the Council's point of view, than the proposal previously submitted, having regard to the increased width of the land to be given up to the public; and we think that the Council should favourably consider it. We recommend—1. That the Council, in the exercise of its powers under Sections 22 and 73 of the London Building Act, 1894, but in no way otherwise than under such sections, do consent to the erection of one-story shops and entrance porches in front of Nos. 123, 125, and 127, and Nos. 145 to 169 (odd numbers only, inclusive), Victoria-street, Westminster, to the lines shown on the plan, dated November 9, 1901, submitted with the application of Messrs. Z. King & Son on behalf of Mrs. M. Hiscox, Mr. J. T. Hiscox, and Mr. R. T. Raikes."

The recommendation, after some discussion, was agreed to.

**New County Hall.**—Replying to a question, Colonel Rotton said a Sites Committee had been appointed, but he was afraid he could hold out no hope of there being a settlement of the matter of a proper home for the Council for a long time.

The Rev. F. Williams asked if it was a fact that the Council paid 18,000*l.* a year in rent or buildings outside the County Hall.

Colonel Rotton said that was so. Within the last few years their staff had doubled.

On a recommendation to take further premises for the housing of the staff.

Mr. Pigott moved that the recommendation be referred back, and pointed out that it was time the question of a proper home for the Council was settled. The present state of affairs was unjust to the staff and unjust to London.

Captain Hemphill seconded the amendment, which, after discussion, was withdrawn, and the recommendation was agreed to.

**Fires in Oilshops.**—The Fire Brigade Committee called attention to the recent fatal fire at an oilshop in Judd-street, Brunswick-square. Three persons occupying rooms on the third floor were suffocated. The committee suggested that the Building Act Committee should consider the desirability of so amending the London Building Act as to provide for the fire-proof separation of oilshops from living and sleeping rooms, and for ready escape from such premises.

Mr. Gilbert, chairman of the committee, observed that most of the oilshops in London were nothing but death-traps in case of fire.

The report was adopted.

**Tenders.**—The tenders of Messrs. Ellis, Pollen, & Co., to execute for 111*l.* 10*s.* 102*l.* 11*s.* 113*l.*, and 73*l.* 17*s.* the wiring, and to supply the fittings for electric light installations at the West Hampstead, East Greenwich, and Perry-valle stations, and the Homerton sub-station respectively were accepted.

Having transacted other business, the Council adjourned.

APPLICATIONS UNDER THE 1894 LONDON BUILDING ACT.

THE London County Council on Tuesday dealt with the following applications under the London Building Act, 1894. Unless otherwise stated, consent was given on conditions. The names of applicants are given between parentheses:—

*Lines of Frontage and Projections.*

**Dulwich.**—A one-story bakehouse at No. 10, Alley-terrace, Park-road, Dulwich, to abut upon South-Crooked-road (Mr. F. C. Bockey for Mr. L. French).—Consent.

**Hackney, North.**—Two one-story shops on part of the forecourts of Nos. 91 and 91A, Upper Clapton-road, Hackney (Mr. W. H. White).—Consent.

**Hammersmith.**—That the application of Mr. W. G. R. Sprague for Mr. J. B. Mulholland for an extension of the period within which the erection of a theatre building on the north side of Hammersmith-road, Hammersmith, at the corner of Rowan-road, was required to be commenced, be granted.—Agreed.

**Levisham.**—Wood and tile pents to the entrances to fourteen houses on the west side of Homecroft-road, Sydenham (Mr. F. B. Colvill).—Consent.

**Levisham.**—Wood and tile pents over the entrances to four dwelling-houses on the south side of Stillness-road, Brockley-rise, Levisham (Mr. H. Lillywhite).—Consent.

**Strand.**—The retention of an iron and glass stall-board light and a parapet wall in front of No. 46, Great Marlborough-street, St. James's (Messrs. Dunn & Watson for Mr. C. H. Smith).—Consent.

**City.**—An iron and glass shelter at the entrance to the Saracen's Head Hotel, Snow-hill, City (Messrs. Wilkinson & Parker for Mr. F. Dredge).—Refused.

**Hampstead.**—A block of residential flats on the northern side of Finchley-road, Hampstead, at the corner of West Hampstead-avenue (Mr. J. Reynolds).—Refused.

**Hoxton.**—An iron and glass shelter at the London Music Hall, High-street, Shoreditch (Mr. F. Matcham for the London Music Hall Co., Ltd.).—Refused.

**Levisham.**—Houses in Brightside-road, Saravira-road, Eltham-road, Nightingale-grove, and Mallett-road, Hither Green, Levisham (Mr. G. Tolley for Mr. J. Laird).—Refused.

**Levisham.**—A one-story shop on the forecourt of No. 141, Rushey Green, Catford (Mr. J. Laird for Mr. F. Hardstone).—Refused.

**Marylebone West.**—Two projecting oriel windows at the rear of 30, Montagu-square, St. Marylebone, to abut upon Bryanston-mews East (Mr. G. R. Shaw).—Refused.

**Strand.**—A sign in front of the Lyric Theatre, Shaftesbury-avenue, St. James's (Mr. J. G. Buckle for Mr. T. B. Davis).—Refused.

**Strand.**—Two iron and glass shelters at the entrances to an extension of the Trocadero Restaurant, Shaftesbury-avenue, St. James's (Messrs. J. Lyons & Co., Ltd.).—Refused.

**Wandsworth.**—Buildings on the north-west side of Balham High-road, Balham, on the site of Russell House (Messrs. Bouchier, Burmester, & Galsworthy for Mr. J. W. Holdron).—Refused.

*Width of Way.*

**Southwark, West.**—Three warehouse buildings at Greenmore Wharf, Nos. 41, 43, and 44, Bankside, Southwark, with the external walls of such buildings at less than the prescribed distance from the centre of the street (Mr. W. A. Lewis for Messrs. Cranbourne & Cranbourne).—Consent.

**Hammersmith.**—The retention of boundary wall at less than the prescribed distance from the centre of Albert-road, Hammersmith (Mr. M. W. Hervey for the West Middlesex Waterworks Co.).—Consent.

**Rotherhithe.**—A store building on the east side of Dock-passage, Surrey Commercial Docks, Rotherhithe with the external walls at less than the prescribed distance from the centre of the street (Mr. J. S. Gaskell for the Surrey Commercial Dock Company).—Refused.

**Width of Way, Lines of Frontage, and Projection.**

**Marylebone, West.**—One-story addition in front of the coach-house at No. 9, Gloucester-mews West, St. Marylebone, with the external walls of such addition at less than the prescribed distance from the centre of the street (Messrs. W. Phillips & Son for Mr. H. E. Greenwell).—Consent.

**Hampstead.**—A motor-car house in the grounds of "Moreton," Holly-place, Hampstead (Mr. W. Woodward for Mr. T. E. Sidney).—Consent.

**City.**—An oriel window at the first, second, and third floor levels in front of Nos. 59 and 60, Old Bailey, City (Mr. R. Plumble for the Trustees of the United Kingdom Band of Hope Union).—Consent.

**Limehouse.**—A projecting turret to the Alexandra wing of the headquarters of the British and Foreign Sailors' Society, on the west side of Beccles-street, Commercial-road East, Limehouse (Messrs. Niven & Wigglesworth).—Refused.

**Clapham.**—One-story shops on the forecourts of Nos. 114, 116, 118, and 120, Clapham Park-road, Clapham, at the corner of Abbeville-road (Mr. H. G. Brace for Mrs. E. M. Jewell).—Refused.

**Marylebone, East.**—A church, with projecting porch and buttresses, on the west side of Glentworth-street, at the corner of Upper Park-place, St. Marylebone (Messrs. W. Bucknall & J. N. Comper for the Rev. G. F. Forbes).—Refused.

**St. Pancras, East.**—Iron and glass shelters at the entrances in Crownley-road and Wyham-place, to the Camden Theatre, High-street, Camden Town (Mr. W. G. R. Sprague for the Camden Theatre, Limited).—Refused.

*Space at Rear.*

**Chelsea.**—A modification of the provisions of Section 41 of the Act with regard to open spaces about buildings, so far as relates to the proposed erection of a block of residential flats on plots Nos. 1 to 4 Cheyne-walk, Chelsea, at the corner of Beaufort-street, with an irregular open space at the rear (Mr. J. Ross for the Town and Gown Association, Limited).—Consent.

*Width of Way, Lines of Frontage and Construction.*

**City.**—An iron and concrete gangway across Bull's Head-passage, City, to connect Nos. 93 and 97, Wood-street (Mr. A. Conder for Messrs. Dent, Allerott & Co.).—Consent.

**Hackney, Central.**—The retention of an iron shed at the rear of No. 358, Kingsland-road, Hackney, to abut upon Haggerston-road (Messrs. D. Gilson & Co.).—Refused.

*Width of Way and Space at Rear.*

**Woolwich.**—That the Council do make no order with respect to the application of Mr. H. Roe on behalf of Mr. W. Sutch, for consent to the erection of three houses on the west side of Barnfield-road, Plumstead.—Agreed.

*Formation of Streets.*

**Levisham.**—That an order be issued to Mr. W. B. Hill sanctioning the formation or laying out of two new streets for carriage traffic on the Grange estate, Sydenham-road, Levisham. That the name Sunnydene-street and Highclere-street be approved for the new streets.—Agreed.

**Bethnal Green, South-West.**—That the application of Messrs. Davis Brothers for an extension of the period within which the roadway of a new street for carriage traffic to lead from Bethnal Green-road to Old Bethnal Green-road, Bethnal Green, was required to be clearly defined throughout by posts and rails or so otherwise as the Council should permit, and be thrown open to the public as a highway, be granted.—Agreed.

*Means of Escape from Top of High Buildings.*

**Newington, West.**—Means of escape in case of fire, proposed to be provided in pursuance of Section 63 of the Act, on the top floor of an extension on the southern side of Rowton House, Newington Butts, Newington (the upper surface of which floor will be above 60 ft. from the street level), for the persons dwelling or employed therein (Mr. H. B. Measures for Rowton Houses, Limited).—Consent.

**St. George, Hanover-square.**—Means of escape in case of fire proposed to be provided in pursuance of Section 63 of the Act, on the top story of the southern portion of a block of residential flats on the west side of Harewood-place, St. George, Hanover-square (the upper surface of the floor of which story is above 60 ft. from the street level), for the persons dwelling or employed therein (Mr. P. Hoffman for Mr. H. Lovatt).—Consent.

*Buildings for the Supply of Electricity.*

**Hammersmith.**—An open shed at the electric lighting station, Fulham Palace-road, Hammersmith (Mr. H. Mair for the Council of the Metropolitan Borough of Hammersmith).—Consent.

**Norwood.**—The retention of a wooden cooling tower at the company's works, Bengeworth-road, Loughborough Junction (Messrs. Kincaid Waller, & Manville for the South London Electric Supply Corporation).—Refused.

**Lambeth, North.**—Two iron and glass structures to carry circular fans to be used for ventilating the engine-room at the generating station, 85, Commercial-road, Lambeth (Mr. W. B. Pinhey for the Charing Cross and Strand Electric Supply Corporation, Limited).—Refused.

*Cubic Extent.*

**Southwark, West.**—The erection on the east side of Dauling-street, Borough-road, Southwark, of a building to exceed in extent 250,000, but not 450,000 cubic feet, and to be used only for the purposes of the manufacture of printing machines (Messrs. R. Hoe & Co. for Mr. R. Hoe).—Consent.

*Cubic Extent and Construction of Building.*

**Poplar.**—The retention at Glengall-road, West Ferry-road, Poplar, of a shed which, together with the building to which it is attached, exceeds in extent 250,000 but not 450,000 cubic feet, and to be used only for the purposes of the manufacture of rope (Mr. R. C. Murray for Messrs. J. & E. Wright, Ltd.).—Refused.

The recommendations marked \* are contrary to the views of the Local Authorities.

THE STUDENT'S COLUMN.—Our Student's Column article ("Gas and Gas Fittings") is held over until next week.

Correspondence.

To the Editor of THE BUILDER.

ECCLESIASTICAL DILAPIDATIONS.

SIR.—With regard to your "Note" re "Ecclesiastical Dilapidations" in your issue of November 2, that there should be compulsory periodical surveys of clerical buildings—this matter was discussed in evidence before a Committee of the House of Commons "to inquire into the administration of the Dilapidations Act," in 1870; and it was found that the estimated cost to the clergy in fees alone for surveyor, diocesan officials, &c., would be 30,000 a year, if every benefice having buildings belonging to it were surveyed every five years. I suppose it was this report that prevented five-yearly compulsory surveys from being adopted; and in view of the fact that a large number of clergy keep their buildings in fair order without periodic surveys, it is certain, however, that there will soon be a change in the Dilapidation Act as at present administered, and the best method would seem to be for the Bishop to require each of his Rural Deans to report on the state of buildings in his Rural Deanery, so that in the case of buildings showing obvious neglect he could order a compulsory survey. This would be an encouragement to incumbents to keep their buildings in fair repair as by so doing they would avoid surveyors' fees. Mr. De Bock Porter's scheme of centring all administration of dilapidations in a large London office would be too drastic and open to obvious objections. The only serious hardship to be overcome is, that an incumbent at present is able to neglect his buildings, so that if he dies with no assets a large sum is chargeable to whoever succeeds to the living, as mentioned in your paragraph. GERALD COGSWELL, A.R.I.B.A.

A RIVERSIDE MEMORIAL CHAPEL.

SIR.—The reference in your last issue to the strange disuse of the Thames for displays and processions prompts me to ask—what others may have already asked, but if so, it has escaped my notice—between the Houses of Parliament and Lambeth Bridge would provide a fine site for the erection of a riverside memorial chapel? This would surely be a more suitable spot than the often proposed addition to the Abbey—often proposed, but as often condemned. With amply planned water-stairs and terraces, there should be opportunities here for impressive spectacles, and the approach by water of a stately funeral procession would fitly typify our British love for the sea. W. GANDY.

FINISHING A DWELING HOUSE.

SIR.—May we be allowed to say with what very considerable pleasure we have read the above interesting paper by Mr. Davis in your issue of the 16th. One point at least, however, seems to have been overlooked by its writer, which we think will appeal to all practical minds, viz., the lack of consideration given (generally speaking) by architects to the needed space that should be provided for the free and proper placing and use of inside and outside blinds. Many times it is found, after the completion of a most charming building, that the casements made to open inwards, with the transom fanlight and its perhaps necessary but most unsightly opening gear, prevent the use of any kind of rolling or venetian blind, so that the lady of the house has to in the end be satisfied with the new fangled collection of small pieces of cloth and strings called casement curtains, arising wholly from want of thought in anticipating the ordinary conditions of use of and necessity of inside blinds, especially in town houses. The trouble, however, becomes worse in houses when the casements and fanlights open outwards, and where outside blinds for sunny aspects are needed, for in such cases (especially when the window heads are made to run up close below an eaves gutter) it is often found impossible to fix a sun blind till the sashes have been relung, or at least rearranged. Please let this be a further plea for the lifting sash, not only on account of the nice adjustment of ventilation that is ensured by its use (and so feelingly put by the writer of the paper), but that either inside or outside blinds, and the customary curtains, may at all times be adapted and used.

We venture to address you at this length solely because we feel that blinds, though a small item as regards cost in "finishing a dwelling-house," form no small detail in assuring that comfort, quiet, and privacy that every owner of a house should receive the benefit of in return for his outlay. OLD READERS.

MANCHESTER FIRE STATION COMPETITION.

SIR.—After waiting over two months for the result of this competition to be announced, we

wrote to the Town Clerk of Manchester on the 6th inst. as follows:—

"DEAR SIR,—Will you kindly let us know when we may expect to hear the result of the Assessor's award in the Fire Station Competition, and also the name of the Assessor."

In your issue for the 6th inst. we noticed the result of the Watch Committee's decision, and again wrote the Town Clerk on the 9th inst.—

"Fire Station."

DEAR SIR,—In a further reference to our letter to you of the 6th inst., which remains unacknowledged by you, we notice a few meagre details of the result of the above competition in this week's issue of the *Builder*. We shall be glad to know whether the designs will be on view to the public or the competitors, and whether the competitors can obtain or see a copy of your professional advisor's report and be informed of the name of that gentleman."

This letter also remains unacknowledged up till now, and we are sending you this correspondence to show the cavalier manner in which the Manchester authorities are treating architects in this competition.

The letters could surely have received a formal acknowledgment, and competitors ought to be informed of the number of designs received, the assessor's name and his award, and whether the designs would be on view.

Two months also appears to be an unconscionable time to take to adjudicate on the designs received, and in the interests of architects who enter competitions, we think a protest should be made against this treatment, and a time limit be fixed in which the award would be made known, for when all information is so persistently withheld, as in the present instance, one cannot refrain from suspecting the bona-fides of the promoters.

S. B. RUSSELL and C. E. MALLOWS.

November 13.

### BOOKS RECEIVED.

A HISTORY OF ARCHITECTURE ON THE COMPARATIVE METHOD. By the late Professor Banister Fletcher and Banister F. Fletcher, A.R.I.B.A. Fourth edition; revised and enlarged. (B. T. Batsford.)

BRITISH SCULPTURE AND SCULPTORS OF TO DAY. By M. H. Spielmann (Cassel & Co.)

THE PAVEMENT ARTISTS OF SIENA. By R. H. Hobart Cust, M.A. (Geo. Bell & Sons)

### OBITUARY.

M. CHIEPIZ.—We greatly regret to announce the death of the eminent French architect M. Charles Chiepi, whose name, in conjunction with that of his collaborator M. Perrot, is so familiar to English architectural readers in connexion with their joint publications on ancient architecture. M. Chiepi was sixty-six years of age at the time of his death. He was a former pupil of Constant Dufeux and of Viollet-le-Duc. In 1872 he obtained the first premium in competition for the design for the war monument at Buzenval. He was well known both for his numerous publications and also for some excellent work in the restoration of ancient buildings. Among his works in modern architecture may be mentioned the national primary and technical schools at Armentières. M. Chiepi had been for twenty-seven years a member of the Société Centrale des Architectes Français.

MR. PORTER.—We regret to announce the death at his residence, Moyle Tower, Hythe, Kent, on November 17, in his eighty-first year, of Mr. Frederick William Porter, J.P., F.R.I.B.A., formerly of No. 16, Russell-square, London. Mr. Porter, who was District Surveyor for the Holborn and East Strand district, including St. Clement Danes, St. Mary-le-Strand, St. George-the-Martyr, St. Paul, Covent Garden, &c., became an Associate of the Royal Institute of British Architects in 1850, was elected a Fellow in 1855, and served for some while as a member of the Council. Of his more principal architectural works we may mention those following:—The Union Bank Chambers, Carey-street, W.C., the carving being by Mr. Kelsey (1866); the Union Bank of London, Charing Cross, at the corner of Spring-gardens, erected on the site of Farrance's noted confectionery shop and illustrated in the *Builder* of April 20, 1872; St. James-the-Apostle Church, Frensham-square, Packer-street, Islington, built by the Clothworkers' Company in 1873-5, for 500 seats, at a cost of about 10,000, to replace Lamb's Chapel, Monkwell-street, pulled down in 1875; the London and Westminster South Kensington branch bank, Brompton-road (the carving and sculpture by Mr. Kelsey), illustrated in the *Builder* of November 21, 1885; No. 16, Newman-street, W. (Messrs. F. W. Porter & Hill), 1892-3; the hall and gymnasium, presented by Mr. Howard Morley in memory of his father the late Mr. Samuel Morley, for the Young Women's Christian Association, at No. 20, George-street, Hanover-square, W. (Messrs. F. W. Porter & Son), 1897; and, as we understand, the church of St. Anne, in Thorburn-square, Bermondsey, with seating accommodation for 1,000 persons, consecrated on July 20, 1870. He was architect also of the Union Bank

of London branch office in Chancery-lane (1864-5), and, as we are informed, of that bank's chief offices in Princes-street, E.C.

### GENERAL BUILDING NEWS.

CHURCH, STIRCHLEY, BIRMINGHAM.—The new Church of the Ascension at Stirchley was dedicated recently. The building is a structure erected from the designs of Mr. W. Hale, the walls of which are of red brick, with outer dressings of terra-cotta. The internal piers, arches, and dressings are in selected Farleigh Down Bath stone, and accommodation is provided for 578 adults. The nave is 82 ft. long by 35 ft. wide, with north and south ambulatory aisles, each having five low arches from the nave. The chancel is 32 ft. 6 in. by 22 ft., and on the south side are the clergy and choir vestries, the latter of which is carried up as a tower, in which are the organ chamber, ringing loft, and belfry with provision for eight bells. At the western end of the nave, and connected with it by a triple-arcaded and traceried opening, is an apsidal-shaped baptistry. The chancel has a seven-light east window, and two lights on the north side and one on the south. The roof is waggon-shaped, and divided into panels.

CHURCH, WALSALL.—On the 2nd inst. the foundation-stone was laid of a new church which is to be erected at Palfrey, Walsall. The church is to take the place of an iron structure which has done duty as a mission church in connexion with Caldmore parish, and a new parish is to be formed. The contract has been undertaken by Mr. W. Hojn, of Birmingham, for 4,400l., the architects being Messrs. J. E. K. and J. P. Catts, of London.

CHURCH EXTENSION, GAINSBOROUGH.—At a meeting of the Enlargement Committee, in connexion with St. John's Church, Gainsborough, Mr. J. T. Micklethwaite, architect, of London, attended, and the alternative schemes for enlarging the church were discussed. It was eventually decided to lengthen the nave by three bays, and to construct temporary side aisles, the cost being estimated at over 2,000l.

MARLSTON CHURCH, BERKS.—This building has recently been enlarged. The church, as enlarged, now consists of a nave 45 ft. long and a chancel 22 ft. long inside, both of equal width of 18 ft. The old walls were underpinned to a depth of 5 ft. below the floor with solid brickwork in cement, and a damp-proof course was inserted to prevent dampness.

For the same purpose proper drainage has been put all round the church. The principal ancient feature of the church is a doorway on the north side, which has hitherto been blocked up. This has been opened out, the stonework repaired, and an oak door now fills the opening. The old oak roof of the nave has been stripped and overhauled without at all interfering with its ancient parts; the oak timbers have been strengthened and repaired, and the whole covered with oak boarding exposed on the inside. A modern stone turret at the west end has been removed, and a square turret of oak has been added. The new chancel is an extension of the church, corresponding to the nave in width and height, the separation between the two being marked within by an arrangement of oak timber framing. The chancel roof is of oak, and the general character is similar to the old roof of the nave. The chancel stalls are of oak, with poppy heads and carved traceried panels. The chancel steps are of polished Devonshire marble, and the floors are of encaustic tiles. On the south side of the chancel, within a window recess, there is a stone sedilla with credence. Against the east wall is a carved reredos of Corsham stone with marble panels, and in the centre panel is a marble cross. Above is a three-light traceried east window, which has been filled with stained glass executed by Mr. C. E. Kempe. It represents the "Nativity of our Lord," in the bottom of the central light being the figures of the Infant Child and Virgin Mother. Upon a scroll in the south light is the inscription. The vestry is on the north side, and there is a heating chamber beneath. The nave seats are of oak, and the floors, where seats occur, are of wood blocks on a concrete foundation; the other nave floors are paved with small red geometrical tiles. A new octagonal font has taken the place of a small bowl which formerly existed. The church is heated with hot-water radiators on the low-pressure system, supplied by Messrs. Fox & Son, of Finsbury; the reredos was executed by Mr. H. Frith, of Gloucester; the wrought metal work is by Messrs. Chew & Sons, of Stroud; and the building works were being carried out by Messrs. Alfred Groves & Sons, of Milton-under-Wychwood, all from the designs and under the supervision and direction of Mr. S. Slingsby Stallwood, F.S.A., of Reading.

CHURCH, JESMOND.—The foundation-stone of the new Church of St. Barnabas, in Goldspink-lane, Newcastle, was laid recently. The church is to be built of Byker stone. The whole of the roofs and internal wood fittings are to be of pitch pine. The walls will be plastered on the inside. The plan consists of nave and chancel, with narrow north and south aisles containing passage, clergy and choir vestries, and organ chamber and heating cellar below, with raised floor at the east end. The nave and chancel are lofty, and have apsidal ends, and include a clearstory of three-light windows. The north and south aisles are capable of future

extension. The total length of the church is 137 ft., and its present width 40 ft.; but its width when the aisles are extended would be 57 ft. A tower and spire, rising to a height of 160 ft., will be the principal feature when completed, but at present only the lower portion of the tower is to be built. There will be sitting accommodation for about 450, but the extension would provide another 350, making 700 altogether. The contractors for the work are Messrs. William & George Henry Scott, of Sunderland. Messrs. Hicks & Charlewood, of Newcastle-on-Tyne, are the architects.

PARISH CHURCH, FORTINGALL, PERTH.—The foundation-stone of the new parish church at Fortingall was laid by Lady Curry of Garth recently. The new church is being built on the site of the old church, but is thrown back 6 or 7 ft. in ground taken from the garden of the manse. The new building is practically the same size as the old one, and will have sitting accommodation for 200 worshippers. It will consist of nave and chancel. The walls will be in oak panelling to a height of 5 ft., and above this the stone will be exposed. The roof will be wholly in oak. The pulpit and seats will also be in oak. The architects are Messrs. Dunn & Watson, of London.

TYNECASTLE CHURCH, EDINBURGH.—A new church has been built close to the adjoining tenements of Gorgie-road, Edinburgh. The church has a frontage of 66 ft., and to secure better light for the portion of the interior darkened by the tenements, two entrances are provided, one near either extremity. The building consists of nave, 91 ft. by 29 ft., and aisles 6 ft. long, the total width being 51 ft. These divisions are indicated on the front by buttresses of varied size but the same projection, finishing at the top with pinnacles and carved finials. One larger than the rest is completed as a belfry. Vestibules and gallery staircases are provided in the entrances, and below the circular arch which carries the east staircase is a pendulum to the passage leading to the hall behind the church. The design is by Messrs. Hardy & Wight. The doorways have moulded piers, with engaged pillars and arches to correspond. The gallery at this end is lighted by a window 20 ft. by 10 ft. The interior has a ceiling boarded nearly to the ridge both in nave and aisles. The church is seated for 1,000, including choir and elders' seats. A Communion table and chairs in oak and a stone font have been gifted to the church, which will cost under 1,000l.—*Scotsman*.

ST. MICHAEL'S CHURCH, EDMONTON.—This new church, of which, together with the vicarage, Mr. Caröe is the architect, and of which the foundation-stones were laid on October 5 last, will provide sittings for a congregation of 730. The church has been established with a sum of 12,000l. allotted by the Ecclesiastical Commissioners out of the proceeds of the sale of the site and materials of the Church of St. Mary Bassishaw, in the City of London, and will replace the present mission church of St. Barnabas erected twenty years ago.

RESTORATION OF MOULTON CHURCH, NORFOLK.—After being closed for five months, the church of Moulton St. Mary was re-opened recently. The work of restoration has been carried out by Messrs. Hawes, of Norwich, under the direction of Mr. Arthur S. Hewitt, of Great Yarmouth, and includes a new open roof and flooring to the nave, with new benches instead of the old high pews, repairs to walls and windows, and the cleaning of the Jacobean pulpit and the Early English font. In the course of the work some interesting discoveries have been made, chief among which are a set of early mural paintings representing the "Works of Mercy," and a colossal painting of St. Christopher. A small brass epi- and inscription has also been discovered hidden under the floor.

SCHOOLS, ABERDEEN.—The Education Department has approved of the plans for the enlargement of the Central School into a high-grade public school and pupil teachers' institute, the enlargement taking the form of a new building facing Schoolhill and Belmont-street. The design is Renaissance in character. The frontage along Schoolhill will be about 160 ft., and along Belmont-street about 145 ft., and both will be similarly treated. The estimated cost of the building, exclusive of heating and furnishings, is 22,500l. The plans and designs of the building, and also of the heating, ventilating, and furnishings, have been prepared by Mr. J. A. O. Allan, the architect of the School Board.

BUILDING IN BRADFORD.—The Building Committee of the Bradford Corporation during the month of August 31st approved 145 plans out of 1,160 deposited. Included in the plans approved were 1,145 dwelling-houses, twenty-one houses and shops, twelve warehouses, four mills, sixteen workshops, two places of worship, twenty-five lock-up shops, fifty-four streets, and ninety-two back roads. Plans were also approved for five Board schools, two Poor Law relief stations, two tall chimneys, shafts, and the electricity generating station. There was more activity in the building trade than in the previous year, but less than in either 1898 or 1899.

KESTEVEN ASYLUM, RAUCEBY, LINCOLNSHIRE.—Advantage was taken of the practical completion of the new County Asylum at Rauceby to hold the quarterly meeting of the Kesteven County Council there on the 13th inst. The asylum, which stands in an estate of 115 acres—the actual buildings cover-

ing over seven acres—has cost 160,000l., and will accommodate 500 patients. The Kesteven authority formerly had a share in the County Asylum at Bridgebridge, near Lincoln, but owing to the increase in the number of patients, and the great difficulty in finding accommodation, it was deemed necessary to erect a separate asylum for Kesteven. The most modern ideas regarding the treatment of the insane have dictated the arrangement of the buildings, which were planned by Mr. G. T. Hine, of London, and have been erected by Messrs. Kirk, Knight, & Co., of Sleaford. The patients' blocks are placed in the brightest and most sunny aspects, and the quarters of the staff and officers are conveniently situated. The equipment of the premises is on a liberal, if not lavish, scale, the furniture alone costing 10,000l. A feature of the institution is a theatre capable of seating 700 spectators. Another interesting department of the institution is formed by the laundry block, in which modern machinery will be used, the power being supplied by an electric motor. There is also a bakery on similarly up-to-date lines. A chapel stands detached from the main buildings, and it comprises nave and aisles, north and south transepts, an organ-chamber and vestry. The buildings are of Leicestershire red bricks with Ancaster stone dressings, the roofs being of Vermont green slate. The patients' block bulk largely in the facade, but between them are the quarters of the head nurse and housekeeper and the assistant medical officer. The administrative block is between these on the south and the front entrance on the north, and to the east of this are the attendants' quarters, which look into a large court. On the west are the quarters for the nurses, with another large court in front. Adjoining are the laundry, drying-ground, and mortuary. Each block has two entrances from the main corridors which are 9 ft. wide, paved with wood, and with a golden-brown dado of glazed brick. The floors and ceilings are fireproof, being laid by the Stuart Granolithic Co., and the lavatories are the work of Messrs. Doulton & Co. For water-supply purposes there is a tower upwards of 100 ft. high. The hot and cold water mains, condensers, &c., are placed in a large subway running under the main corridors.

**—Yorkshire Post.**  
**NORWICH UNION LIFE OFFICE.**—The foundation-stone of this building has just been laid. The architects of the building, which was illustrated in the *Builder* for April 13, are Messrs. G. J. & F. W. Skipper, of Norwich.

**QUEEN'S EYOT, RIVER THAMES.**—Plans and designs have been prepared for the authorities of Eton College, by Mr. J. M. P. M. R.A., for a clubhouse on Queen's Eyot, an island situated a short distance below Monkey Island, between Bray and Boveney Locks. The level of the northern portion of the island has been raised, some trees have been planted, and the foundations of the new clubhouse have been begun, the total estimated cost being 3,000l., towards which 2,000l. is already subscribed. The Berkshire bank, near Boveney Lock, Queen's Eyot will henceforth serve as the resort and headquarters of the Eton Boat Club.

**THE UNIVERSITY LIBRARY, CAMBRIDGE.**—The University Library Syndicate have approved of the plans prepared by Mr. W. C. Marshall for roofing in the east court of the library buildings, at an estimated cost of about 6,500l.

**SALISBURY INFIRMARY.**—The Victoria Home for Nurses has just been opened. The Home is built of red brick with tiled roof, and the entrance for the nurses will be from the infirmary through a covered way. On entering the building a cloakroom will be found on the left, 19 ft. by 12 ft., fitted with lavatories, dressing-tables, and lockers. There are also a linen sorting-room and boxroom, which is lighted through the infirmary, and heated with hot water. On the right side of the corridor is the furnace-room with heating apparatus and hot-water supply, kitchen, and scullery for the use of the staff. The corridor leads into a hall, opening into which are sitting-rooms for the superintendent, head nurses and probationers. The superintendent's apartment is 18 ft. by 11 ft. 6 in., the nurses' 18 ft. by 15 ft., and the probationers' 28 ft. by 17 ft. On the first and second floors are forty-four bedrooms, varying in size from 18 ft. by 9 ft. 6 in. to 12 ft. by 8 ft. 6 in. The staircases are of stone, and provision is made for escape in case of fire by three iron ladders which are accessible from each floor. The upper floors are of Potter's patent fireproof construction. Telephonic and electric bell communication is established between the infirmary and the Home.

**DRILL HALL, HENDON.**—A new drill-hall has just been opened at Hendon. The buildings consist of an armory, an officers' mess, a sergeants' mess, recreation-room, a six-roomed house for the sergeant-instructor, and the drill hall, measuring 90 ft. by 45 ft., providing drilling accommodation for two squadrons. The cost of erection has been 25,400l. The buildings were erected from the designs of Messrs. Nowell, Parr, & Kates, architects, of Brentford.

**PRIVATE ASYLUM, DUNDEE.**—The new building which the Directors of the Dundee Royal Asylum

have erected at Westgreen is now almost completed. The building has been designed by Mr. T. S. Robertson, architect, Dundee, and has accommodation for about sixty patients. The style is Scottish Baronial, and in the erection of the building red stone from Ayrshire has been used in dressing, while local quarries have supplied the rubble. The centre part, containing the principal entrance, is of one story, and the wings to the front three stories, while to the back the wings are only two stories. The doorway is embellished with the Royal Arms, the Dundee Arms, and the Arms of Captain Clayhills Henderson, and is approached by a short balustraded staircase which leads from a wide terrace. The entrance hall will be used as a reception-room and also as a hailroom when occasion requires. The west wing is to be devoted to the male patients and the east wing to the females, and each is fitted up for its special purpose. Each wing has a large day-room. In the men's there will be billiard-tables and other means of recreation, while the women's is to be furnished more after the manner of a drawing-room. There is another and smaller dayroom in each wing. The bedrooms are upstairs, and there are lavatories and bathrooms attached to the various sections of the building. The dining-room is situated immediately behind the entrance-hall, and is a large room with timber ceiling lit with windows from both sides. The kitchen is immediately behind, and the scullery, pantry, and larder adjoin it. There is also the necessary accommodation for the matron and the servants. The building throughout is heated by steam and lit by electricity. The cost of the new asylum has been over 22,000l. The contractors were—Messrs. W. Mason, Mr. William Bennett, joiners; Messrs. D. P. How & Son, plasterer; Mr. David Brown; plasterer; Mr. James Lindsay; slater; Mr. A. Buttart, jun., glazier; Messrs. Lamsay & Scott; bells and blinds; Messrs. J. Pullar & Co.; heating, &c.; Messrs. G. H. Nicoll & Co.; firecocks and water pipes; Messrs. P. Nucator & Son; roads; Mr. Peter Gurrity; carving; Mr. James Brenner; painters; Messrs. Petrie & Greig; drains; Mr. Peter Bain; electric lighting; Messrs. J. M. Christie & Co.; clerk of works; Mr. James Robertson.

**DRILL HALL, BILSTON.**—This building was recently completed. It is situated at Mount Pleasant, and is partly built on the site of the old drill shed. The building consists of a large hall with officers' and sergeants' rooms in front, while leading out of the hall at the back are the armory, store room, kitchen and lavatories. Above the rooms in front, but with a separate entrance, are the quarters for the sergeant-instructor. The floor of the hall is composed of wood blocks, and the whole place has been wired for the electric light. Gas has also been temporarily laid on. The building is of red brick with stone facings, and the roof is of red tiles. Over the main door are carved the Royal Arms. Mr. H. T. Hare, of London, was the architect, and Mr. T. Threlkley, of Willenhall, has been the builder. The cost of the building will be 2,000l.

**TEMPLE OF MUSIC, WOLVERHAMPTON EXHIBITION.**—One of the principal buildings which will be erected on the site of the Wolverhampton Art and Industrial Exhibition is the concert-hall. It will have a raised floor, and accommodation is provided for an organ and a large number of performers. Within its walls some 2,000 people will be able to listen to the music. Messrs. Walker & Ramsay, of Glasgow, are the architects.

**CHANCEL SCREEN, ST. NICHOLAS CHURCH, BRISTOL.**—The new chancel screen which has been erected at St. Nicholas Church, Bristol, was dedicated recently by the Archdeacon of Bristol. The screen has a base of Bath stone, ornamented with six panels, each of which has a shield. Immediately opposite the centre aisle of the nave there are double gates of wrought iron embellished with Greek and Roman symbols. The top part of the screen is composed of wrought iron, worked with arcading, capped by a figured border. At the apex of the central arch is a cross, with the sacred monogram underneath. The decoration is being carried out by Messrs. Joseph Bell & Son, under the direction of the architect, Mr. W. V. Gough.

**TOWN HALL, ALTRINCHAM.**—Municipal Town Hall, erected at a cost of 200,000l., was opened on 4th inst. The town hall was built from the designs of Mr. Charles Hindle (Manchester and Eccles), in the Jacobean style.

**EXTENSION OF BIRMINGHAM HOMOEOPATHIC HOSPITAL.**—An extension of this building is nearing completion. Having decided to increase the accommodation, the work was placed in the hands of Messrs. Crouch & Butler, who made designs in keeping with the existing premises. Addition will be made to the ward accommodation, and the hospital, when the new wing is completed, will be able to provide beds for forty-two patients. But the extension applies principally to the administrative block, and here better provision is being made for the staff. The extensions, which will cost close upon 5,000l., include, in addition to a few extra wards, a board room and lady superintendent's office, considerable additions to the servants' hall and kitchen, improved accommodation in the way of bedrooms, sitting and dining rooms for the staff, and apartments for the lady superintendent.

**NEW BUILDINGS, LEEDS HOSPITAL FOR WOMEN**

**AND CHILDREN.**—The erection of the new Hospital for Women and Children in Leeds has been begun. According to the plans of Messrs. Chorley, Connon, & Chorley, the present building will be incorporated in the scheme. This has been rendered possible by the fact that for the present a maternity department is not included. Until sufficient funds are forthcoming to enable the Committee to rebuild the present structure it will be used for a children's ward, and for accommodation for the nurses and servants, as well as for the kitchen department. The new portion will comprise a hospital with accommodation for fifty beds, and an out-patient department.

**FIRE STATION, SALFORD.**—The Corporation of Salford recently determined to erect a new central fire station in Albion-place, the Crescent, to accommodate the men, horses, and appliances in comfort and convenience, and they applied to the Local Government Board to borrow 20,285l. for the purpose of erecting the new station. Colonel W. Langton Coke, M.P., M.C.E., held an inquiry on the 8th inst., at the Salford Town Hall, into the application. There were present Alderman Sbow, chairman of the Fire Brigade Committee; Mr. Corbett, Borough Engineer; Mr. H. Kirby, architect appointed to draw the plans; and others.

**WESLEYAN LECTURE-HALL, CHELTENHAM.**—A lecture-hall, with a seating capacity of 250 seats, and a church parlour in connexion therewith, have been added to the Wesleyan chapel and school, St. George's-street, Cheltenham. The building has been erected by Mr. Amos Wilson, of Cheltenham, from the plans of Mr. Arthur Geo. Dalzell, architect, of Halifax, and Mr. Thomas Malvern, surveyor, of Cheltenham, has superintended the work during the course of construction.

**GRAND OPERA HOUSE, YORK.**—A new theatre is being erected on the site of the old Corn Exchange, York. It will occupy when completed an area of upwards of 13,000 sq. ft., and will have frontages to Clifford-street, King-street, and Cumberland-street. The architect is Mr. John P. Briggs, of London. The building is being constructed mainly of red brick and terra-cotta. A complete plan for electric lighting is to be laid down. Mr. F. Sheppard, of York, is the contractor for the building, and Mr. S. King Sheldon is acting clerk of works.

#### SANITARY AND ENGINEERING NEWS.

**ELECTRIC LIGHTING WORKS, HECKMONDWIKE.**—These works are rapidly approaching completion. The station is situated in Bath-road, and is part of a building which is also being adapted for the purposes of public baths and fire station, and which extends into High-street. The *Batley Reporter* states that the original scheme provided for two water-tube boilers, made by Messrs. Stewart & Co., each capable of evaporating 4,000 lbs. of steam per hour, with a working pressure of 160 lbs. to the square inch, and also capable of working safely up to 200 lbs. In view of the extensions required for the purposes of the British Electric Tramway Co.'s scheme, the Town Council are also installing one of Messrs. Babcock & Wilcox's water-tube boilers, to work at the pressure above named, and with a capacity for evaporating 9,000 lbs. of steam per hour. This boiler has also a super-heater. The Green's economiser of ninety-six tubes fixed in the main flue will heat water up to 230 deg. before it goes into the boiler. Two boiler feed pumps have been fixed, each capable of supplying 1,500 gallons of water per hour, one being of the Blake Knowles' type, and driven by steam, and the other a three-throw pump by the same maker, driven by electric motor. Each boiler is fitted with an injector. The main steam piping is of lap-welded steel, and is supplied by the same makers as the boilers, whilst the valves are of the Hopkinson make. The two steam generators are each capable of developing 75 kilowatts, and they will run at 450 revolutions per minute, and are both capable of developing 25 per cent. overload without injury. The engines were made by Messrs. Reavel & Co., Ipswich. The generators, &c., are by Messrs. Fowler & Co., of Leeds, and work at from 460 to 500 volts. Storage batteries are capable of discharging at the rate of 160 amperes for three hours, and were made by the Tudor Accumulator Co. The main switchboard, with the usual instruments and switches, is by Mr. Bertram Thomas, of Manchester. An overhead travelling crane has been erected in the engine-room, for use when the larger engines are put into the works at some future time. About 5,000 yds. of underground mains have been laid in the principal thoroughfares of the town by Henley's Telegraph Works Co., London, who are also supplying existing gas lamps with the electric glow lights. Along the entire route of the electric cable these glow lamps will take the place of gas for public lighting, and ten "M.D." arc lamps by Messrs. Foote & Milne, London, are being placed in the centre of the town. These are enclosed arc lamps, and burn 150 hours without trimming. The station is being lit up by Mr. Fred Spivey, of Heckmondwike. The plant is capable of supplying 6,000 8-c.p. lamps, 3,000 of which have already been applied for. Mr. W. G. Hawtayne is the consulting engineer, and Mr. G. H. Carter the resident electrical engineer.

**ELECTRIC LIGHTING, KING'S LYNN.**—An addition

to the Corporation Electricity Works was inaugurated on the 23rd ult. The plant originally consisted of five gas engines, each driving a 40-kilowatt dynamo. These being found insufficient for the increasing demand for current, it was decided last year to add two high-speed steam engines, by Messrs Belliss & Morcom, coupled direct to the dynamos, by Messrs. Laurence, Scott, & Co., of Norwich, one of them of 120 and the other of 200 kilowatts. The smaller one was started in April last, and on the 23rd ult. the Mayor turned on steam to the larger one. The extensions are now complete with the exception of the second Lancashire boiler, which will be fixed shortly after Christmas. It was intended to run the steam plant in the ordinary course, keeping the gas engines as a reserve. The engineer is Mr. J. Palling, of King's Lynn.

**PROMENADE, BLACKPOOL.**—Colonel Durnford, an inspector of the Local Government Board, held an inquiry at Blackpool, on the 12th inst., into the Corporation's application to amend the Improvement Act of 1879, so as to allow the Promenade being widened 100 ft., at an increased cost of 40,000l. Mr. Fletcher opposed on behalf of William Eaves and others. The Town Clerk (Mr. T. Loftos) addressed the inspector for close upon an hour. Mr. J. S. Brodie, the Borough Surveyor, said he had had twenty-five years' experience in fighting the sea in some form or another. His previous experience had been at Liverpool and Whitehaven. He proceeded to say that the crowded state of the Promenade must convince any reasonable mind as to the necessity for its being widened. The existing form of bulking had been abandoned by almost all engineers, owing to its original cost, and its maintenance had been found to be excessive in the extreme. Blackpool had been an exception to the rule, for 52,000l. had been spent on repairing the present bulking. The face of the new bulking would be of basaltic stone, granite, and other hard rock. There would be a bull nose at the top extending 27 in. westward, and this, together with a spray of water from the top rail, would deal with drifting sand. Under the new roadway there would be a subway for all the electrical, &c., wires, so as to prevent the continual upheaval of the roads. The cost of a sloping bulking would be 60l. per lineal yard, and of the concave wall 30l. per lineal yard. The cost of maintaining the former would be three times that of the concave wall.—Mr. Sandyman, a Newcastle engineer, said he had considered the plans and the proposals of Mr. Brodie, and agreed entirely with them. The inquiry was adjourned.

**PROPOSED NEW WORKS, WALLASEY FERRIES.**—Colonel A. G. Durnford, R.E., an inspector of the Local Government Board, attended at the Public Offices, Church-street, Egrement, on the 15th inst., for the purpose of inquiring into an application of the Urban District Council of Wallasey for a Provisional Order to amend the Wallasey Improvement Act of 1872, to enable the Council to borrow (1) 5,000l. for the purpose of providing workshops in connexion with their ferries undertaking on land proposed to be leased from the Mersey Docks and Harbour Board; and (2) 11,000l. for general purposes of the ferries undertaking, being improvements and extensions at Seacombe Ferry.

### FOREIGN.

**FRANCE.**—M. Guillon, the President of the Tribunal of Commerce, has submitted to the Municipal Council of Paris a scheme for the transformation of the Champ de Mars, which includes retaining the two end portions of the Galerie des Machines, the centre being removed to allow of a view of Gabriel's facade of the Ecole Militaire.—A committee has been formed in Paris, with M. Gerôme as chairman, for the erection of a monument to the memory of the celebrated caricaturist Gavarni.—M. Dalou has been commissioned to execute a large allegorical bas-relief for the facade of the crematorium in Pere Lachaise cemetery.—The jury in the competition at Soissons for a public abattoir has awarded the first premium to M. Félix Piat, of Paris.—A new pavilion is being erected at the Paris Observatory for special observations to be made simultaneously at Paris and at Greenwich.—Parliament is occupied with a scheme for a new line of metropolitan railway from the Place du Palais Royal to the Place du Danube.—Madame Lardin de Musset, sister of Alfred de Musset, has offered to the city of Paris a statue of the poet, on condition that it should be erected on the Place du Théâtre Français.—The Government intend to rebuild the Imprimerie Nationale, which at present occupies an old historic house in the Rue Vieille du Temple, in the Grenelle district.—The Paris Municipality propose to re-erect, in one of the two squares adjoining the church of St. Germain des Prés, some curious arcades preserved at the demolition of a house in the Rue de l'Abbaye, and which formerly formed a portion of the chapter-house of the Abbey of St. Germain-des-Prés.—Several new Mairies in the suburbs of Paris are to be the object of important works in artistic decoration. Among them are those of Neuilly, Ivry-sur-Seine, and Choisy-le-Roi. The decoration is to consist of landscapes reproducing or suggesting views in the environs.

**UNITED STATES.**—The State of Michigan is about to replant with forest trees large tracts of sandy wastes whereon once grew what were thought some years ago to be inexhaustible forests of white pine. It is the belief of American experts in forestry that had these forests been treated with reasonable care thirty years ago, there would still be an immense annual yield of timber from these now barren wastes.—The report of the engineers, Messrs. E. Duryea, Jun., and Joseph Mayer, on the condition of Brooklyn Bridge shows that that structure is in danger, due to the continually increasing loads placed upon it since it was erected, and it appears, from the action of officials also, that the bridge is unsafe.—The directors of the St. Louis Exhibition of 1903 invite architects to submit before July 1, 1902, a list of such works as the latter desire to exhibit, including drawings, &c., of completed buildings, designs and projects for buildings, paintings, and mural decorations.

### MISCELLANEOUS.

**PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.**—The Electric Lighting Boards Company have removed their Sales Department to 9, Grosvenor-mansions, Westminster, which will be their principal depot, and to which all inquiries as to goods should be addressed.—Messrs. Heron & Bellairs, architects, have removed their offices from 27, Fitzroy-street, W., to 27, Sackville-street, Piccadilly, W.

**WEIGHTS AND MEASURES AND THE METRICAL SYSTEM.**—An Order in Council of May 10, 1898, legalised certain new denominations of metrical standards derived from the iridio-platinum linear standard metre and the iridio-platinum standard kilogram as deposited in the Standards Department of the Board of Trade at Old Palace-yard, which have since been included in the official standards for purposes of the Weights and Measures Act, 1878. An Order in Council of November 4 current fixes the scales to be paid to inspectors in respect of the verification and stamping of weights, measures, and weighing instruments of the metrical system. For measures of length—a metre and under, a double metre, and a dekametre, with their sub-divisions; of capacity—from 0.001 litre to a double dekalitre; and of cubical contents—from 1 cubical centimetre to 1,000 cubical centimetres, the scale of fees ranges from 1d. to 3d. The same scale is ordained for weights that range from 1 milligram to 20 kilograms, whilst the scale varies from 2d. to 10s. in the case of weighing instruments for from 0.5 kilogram and under to 10 tonnes, or 10,000 kilograms and above.

**BIRMINGHAM MASTER BUILDERS' ASSOCIATION.**—The annual meeting of the Birmingham Master Builders' Association was held on the 11th inst. at the Grand Hotel, Councillor F. G. Whittall presiding. In the report for the year the committee regretted that the falling off of trade referred to twelve months ago had become more marked, and much work that would probably not now be executed had been held back owing to the high prices of material and labour. The committee felt strongly that the present high rate of wages was no longer justified by the state of trade, and they had received from individual members many complaints as to the great inconvenience resulting from the present arrangement of several trades commencing and leaving off work at different hours. Consequently they have taken notice of the proposal for a general reduction of wages and for uniform hours of work. The committee felt they would be voicing the opinion of every member of the Association by expressing to the Chancellor of the Birmingham University their regret that Birmingham architects had been excluded from a competition for the University buildings. The balance-sheet showed that the receipts for the year were 187l., which, with the balance from last year, made a total of 368l. The various disbursements amounted to 151l., leaving a sum of 217l. to the credit of the Association. In proposing the adoption of the report, the Chairman referred to the state of the trade, which, he said, continued to be unsatisfactory. The large number of workmen that called upon them to obtain work showed that trade must be in a very bad state. It was because of the condition of the trade that the Committee, after careful and anxious thought, had deemed it advisable to give notice for a reduction of wages. It had not been done to cause differences or disagreements in the trade, but for the purpose of trying, if possible, to stimulate trade, which had suffered through the high price of material and labour. A great deal of work had been put aside until it could be done more cheaply, and they considered the reduction of wages would be in the best interests of the trade and the workmen. He hoped the operatives would accept the reduction. The Committee had taken some amount of trouble and effort to assist the funds of the Birmingham University, and therefore they keenly regretted that the architects of the city had no opportunity of competing for the designs of the new building. Mr. W. Sapote seconded the resolution, which was carried. Mr. Albert S. Smith was elected President for the ensuing year, and Mr. John Barnsley vice-president. Mr. G. Twigg was reappointed treasurer. Mr. E. J. Bigwood secretary, and Messrs. T. Johnson and J. S. Surman auditors. The Committee were also

elected. In order to strengthen financially the position of the Association, it was decided that, from the commencement of next year, the annual subscription should be 1s. for each 100l. of wages paid during the previous year. The retiring President, Councillor F. G. Whittall, was heartily thanked for his services during the year. In the evening the annual dinner was held at the Grand Hotel. The Lord Mayor (Alderman J. H. Lloyd) presided. The customary loyal toast having been honoured, Major Barnsley submitted "The City and Trade of Birmingham." The Lord Mayor replied to the toast. He spoke of the necessity of looking ahead to prepare for the requirements of the city, and said that it was the support of the citizens that helped a city like Birmingham to keep abreast of the times. With regard to jerry-building, he said that whatever might have been the case in the past they did not have jerry-building in Birmingham now. Some of the builders might think that the by-laws were hard and strict, but he knew they themselves were anxious that buildings should be put up properly and well. He hoped as time went on some of the slums would be cleared out, and the buildings of the town improved. Mr. C. F. Bateman, in proposing "Success to the Birmingham Builders' Association," expressed the hope that some members of the Association would secure the contracts for the new University buildings. The President (Mr. A. S. Smith) replied, and referred to the proposal to reduce the operatives' wages. The Association, he said, was not formed for the purpose of cutting down the men's wages, and they regretted that it was necessary to interfere with them. No one grudged the operative a good wage, but what they did resent was that restriction of output, that constant lessening of the amount of work which the unions encouraged. Other notices had been served upon the operatives having reference to certain unreasonable restrictions in trade rules which they were glad to have an opportunity of discussing, and they sincerely hoped all the matters would be amicably settled.—The other toasts were "The Architects and Surveyors," "The National Federation of Building Trade Employers," and "The Visitors."

**WAR MEMORIAL, BRISTOL.**—It is proposed to erect at Bristol a memorial to some of the soldiers who have fallen in South Africa. It has been arranged that the memorial shall be placed in College Green, on a site selected by the Dean and Chapter. The design has been prepared by Mr. Fred. W. Marks, architect, of London. The obelisk will consist of a bold shaft of Swedish red polished granite, with decorative fluting and ornamental design on the lower part of its sides. The base on which this shaft will rest is to be of polished green granite, and this in turn will stand on grey granite steps. Its site is to be surrounded by twelve grey granite posts, connected by heavy bronze chains. Upon the monument will be the following inscription:—"This obelisk is erected to the memory of Christian Victor, Prince of Schleswig-Holstein, and to the officers and men of Gloucestershire, Somersetshire, and Devonshire Regiments, who fell during the Boer War, 1899-1901, by Alfred Mosely, born in this city." The canopied bronze tablets on the four sides of the base will be noticeable parts of the design; and there will be smaller tablets containing the names of engagements in which soldiers from the three counties took part. The obelisk will be 41 ft. in height from ground level to the top.

**DANIEL OWEN MEMORIAL STATUE, MOLD, FLINTSHIRE.**—The statue erected in Mold to the late Daniel Owen, the Welsh novelist, was unveiled recently by Lord Kenyon. The statue is in bronze, and is erected upon a pedestal of Flintshire stone, stands in front of the County Hall. The figure is life-size. The statue is the work of Mr. Goscombe John, A.R.A.

**METROPOLITAN ASYLUMS BOARD.**—An ordinary meeting of the Managers of the Metropolitan Asylum District was held at the offices on the Embankment on Saturday last, Mr. R. M. Hensley, the Chairman, presiding. A letter was read from the Local Government Board formally approving the plans of the Southern Hospital; promising an order authorising an expenditure of 244,512l. on that hospital, and the borrowing of that sum; stating that the loan should be repaid as to 264,312l. in thirty years, and as to 20,000l. in fifteen years; and that Managers would be expected to adhere as nearly as possible to the estimated cost in carrying out the works. At the last meeting of the Board it was decided to complete forthwith the permanent hospital at Joyce Green by the erection of the remaining twelve blocks and the isolation block for patients, and the Works Committee were instructed to advise the Managers as to the course to be adopted for giving effect to that decision. It was now resolved, on the recommendation of the committee, that, subject to the sanction of the Local Government Board, the Managers should accept the offer of Messrs. Leslie & Co., Limited, the contractors for the erection of Joyce Green Hospital, to erect and complete the blocks and the isolation block for patients, and other works connected therewith at a schedule of prices based on their contract for the main portion of the hospital, in accordance with plans and specifications prepared by Messrs. A. & C. Harston, architects.

## LEGAL.

## ACCOUNTS INCURRED ON BUILDER'S BEHALF: LIABILITY OF CLIENT AND ARCHITECT.

At Brompton County-court, last Friday, before Judge Stonor, Mr. Frederick F. Scruby, English agent of the Lincrusta-Walton Company, Berners-street, W., brought an action against Mr. Thomas Chapman, proprietor of the Wheatheaf public-house, Goldhawk-road, Shepherd's Bush, W., claiming 23s. 10s. 0d. for Japanese wall-paper said to have been supplied to order.

Mr. A. W. Grosor, counsel, appeared for the plaintiff, and Mr. J. Oliver, counsel, defended.

Counsel for plaintiff explained that the claim had been remitted from the High Courts. It appeared that in January last the plaintiff received a call from a Mr. Richardson, architect, Shepherd's Bush, who said that he was acting as architect to Mr. Chapman, in connexion with certain works of reconstruction, &c., at the Wheatheaf, being carried out by a Mr. C. W. Knight, builder. Mr. Richardson spoke about certain expensive Japanese papers being supplied for the job, and when the plaintiff remarked that he was not acquainted with the builder, Knight, Mr. Richardson replied, "That is all right, you supply my client"—referring to the present defendant—"with the papers, and I, as the architect, will have moneys in hand before the final certificate is given, and I will see that you are paid." The plaintiff thereupon agreed, and Mr. Richardson selected certain patterns. About three days later Mr. Chapman came with his architect and saw other matters, and requested the plaintiff to send certain of the papers to the Wheatheaf as soon as the builder sent word as to the quantity required. Subsequently Mr. Knight, the builder, wrote the plaintiff as to the quantity, and goods to the amount of 80s. odd were then supplied, and used at the Wheatheaf. Of the account 35s. had been paid by a cheque drawn by the defendant. On May 11 the plaintiff was rung up on the telephone by Mr. Richardson, who said: "I want you to issue a writ against Knight, and if unsuccessful, then issue a friendly writ against Chapman, so that I may be able to show that I have paid for these goods." The learned counsel went on to describe this as "a very 'cute trick,'" for Knight was then on the verge of bankruptcy, and had the plaintiff sued him and failed to get the money, he could not afterwards have sued the present defendant. The plaintiff issued a writ against Knight, who, however, set out in an affidavit the relations existing between himself and Mr. Chapman, and the action was at once discontinued. Then the present proceedings were initiated.

The plaintiff bore out his counsel's opening statement.

Mr. Grosor: The architect was, of course, the principal agent.

The Judge: An architect would not necessarily have authority to pledge the principal's credit.

A duplicate of the document sent by Knight, giving particulars as to the quantity of goods required, was produced, when it was found that it began, "Please send me," &c. The receipt for the 35s. was also produced by Knight's name.

Mr. Oliver: The defendant, the builder referred to above, said that the plaintiff's action against him for the amount of the goods in question was discontinued as soon as it was known that he had become bankrupt. The goods in question were ordered by his foreman on his (witness's) behalf.

The Judge said it was useless for plaintiff's counsel to continue in face of the documents indicating that Mr. Knight had been bankrupt, and that the 35s. was paid on his behalf. No doubt, added his honour, the case was one of great hardship as regarded the plaintiff, but there was no liability on the part of Mr. Chapman, although there might be some on the part of Mr. Richardson. The documents relating to the case would have to be preserved. There would be judgment for the defendant with costs.

## WIDOW'S CLAIM UNDER THE WORKMEN'S COMPENSATION ACT, 1897.

The case of Sarah Bush v. G. E. Hawes came before the Court of Appeal composed of the Master of the Rolls and Lords-Justices Stirling and Mathew on the 14th inst., on the appeal of the applicant from a decision of the County Judge of Norwich, sitting as Arbitrator under the Workmen's Compensation Act, 1897. It appeared that the applicant was the widow of a labourer who was working at Lowestoft on October 2, 1900, met with an accident which resulted in his death, under the following circumstances. The deceased was in the employ of Messrs. Hadley & Sons, who were sub-contractors of the respondent Hawes, who was building a new fish-curing factory. The actual work on which the deceased was employed at the time of the accident was a boiler-house, the roof of which had not been completed. The boiler-house without the foundations was 28 ft. 4 in. high and with the foundations 30 ft. 4 in. high. To the boiler-house was attached a chimney-stack 100 ft. high. The deceased while engaged in guiding a rope by which the roofing was being hoisted to the top of the boiler-house, stepped back, and in doing so placed

his foot on a nail sticking out of a board, and afterwards died of lockjaw. His widow accordingly claimed compensation under the Act. The County-court judge, besides finding that the man did not meet with the accident in the course of his employment, held further that his widow was not entitled to compensation because the building on which he was engaged at the time of his accident was not 30 ft. high within the meaning of the Act. Hence the present appeal of the applicant, on whose behalf it was contended that the chimney-stack was a part of the building, which was therefore upwards of 30 ft. high. As to the other point, said the appellant's counsel, it was thought the other side would admit that the man met with his accident in the course of his employment. There was a cross-appeal by the respondent, who argued that the County Court Judge was wrong in holding that the work upon which the deceased was engaged was not ancillary to, but a part of, the business of the "undertaker" (respondent).

At the conclusion of the arguments of counsel, the Master of the Rolls said he was of opinion that the cross-appeal must be allowed. The claim was made by the widow of a workman who met with an accident while working as the servant of a sub-contractor who had undertaken to put an iron roofing on a building erected by the respondent, the "undertaker." In order that the applicant might succeed in such a case—assuming that it had been shown that the accident arose out of the man's employment, and that the building was 30 ft. high—she must bring herself within the proviso of Section 4 of the Act, which was to the effect that the "undertaker" was not liable if it could be shown that the work upon which the man was engaged was merely ancillary or incidental to, and not part of, the business of the "undertaker." If the work (roofing in this case) was not part of the trade and business of the respondent, and he had not undertaken to do it, then the applicant had no remedy against the respondent. The County Court Judge had found as a fact that this work of iron roofing was not part of the trade or business carried on by a builder, but he held that the section did not apply in this case because the respondent was in the habit of doing this kind of work. There was no evidence of that, and the learned Judge was wrong in so holding. This was a complete answer by the respondent to the claim of the applicant. It was not necessary, therefore, to deal with the other questions raised in the case, but he thought that but for this decision that the work was ancillary to the business of the respondent the applicant would be entitled to recover.

The Lords Justices concurred, and the appeal of the applicant was accordingly dismissed, and the cross-appeal of the respondent allowed.

Mr. W. M. Thompson appeared for the applicant, and Mr. F. Lowe for the respondent.

## CITY NUISANCE CASE.

THE case of Parish v. the Mayor, &c., of the City of London came before Mr. Justice Joyce in the Chancery Division on the 14th inst., an action by the plaintiff, the lessee of premises, No. 8, Church-row, Aldgate, for a mandatory injunction against the defendants to compel them to pull down an urinal which was erected so close to the plaintiff's premises as to constitute a serious nuisance and injury to his property. It appeared that Church-row is a *cul-de-sac*, the plaintiff's premises being situated on one side at the end of the court, which formed a public thoroughfare for foot passengers. The defendants erected the urinal complained of under powers conferred upon them by Section 104 of the London Sewers Act 1838, and placed it at the end of the court, close to the wall of the plaintiff's premises, the entrance to it being only 2 ft. from the plaintiff's only doorway. The plaintiff's case was that the urinal was a serious nuisance to him, and that in consequence of it he could not let his premises. The defendants' case was that they were acting in the *bona-fide* exercise of their powers, which enabled them to erect such places for the accommodation of the public, and that in consequence of their action the condition of the court was much improved.

In the result his lordship came to the conclusion that the defendants had no power to erect the urinal where they had done, and that it constituted a nuisance to the plaintiff. He therefore made a mandatory order upon the defendants to remove the urinal within six weeks, and directed them to pay the costs of the action.

Mr. Hughes, K.C., and Mr. Percy Wheeler were counsel for the plaintiff; and Mr. Badcock, K.C., and Mr. J. Henderson for the defendants.

## A BRICKLAYER'S LABOURER'S CLAIM UNDER THE WORKMEN'S COMPENSATION ACT, 1897.

THE case of Field v. Longden & Sons came before the Court of Appeal, composed of the Master of the Rolls and Lords Justices Stirling and Mathew, on the 15th inst., on the appeal of the defendants, Messrs. Longden & Sons, the employers, from the

award of the County Court Judge of Sheffield, under the Workmen's Compensation Act, 1897.

The applicant was a bricklayer's labourer, injured by an accident in the course of his employment on October 29, 1900. His average weekly earnings at the time of the accident were 30s. The employers commenced making weekly payments to the applicant of 15s. a fortnight after the accident, and this was continued till April 10, 1901. A few days subsequently the applicant's solicitor wrote to the defendants a letter with reference to the accident, and stating that his would be glad to hear of an offer of compensation, and that his letter was to be taken as a notice of injury and a claim for compensation. The defendants replied that they were paying the applicant the full weekly allowance, and that they were willing to continue the payments during his incapacity. After further correspondence, the applicant mentioned a lump sum which he was willing to accept, but this the defendants refused to pay. The defendants afterwards, as the result of a medical examination which they had made of the applicant, offered another lump sum to the applicant, but this the latter refused. On April 25 the applicant filed a request for arbitration, claiming 15s. a week during incapacity. At the hearing, the applicant gave evidence to the effect that there had been no agreement to settle either by lump sum or weekly payment, and although the defendants had never disputed liability, they had never admitted it. He contended that he was entitled to have an award in his favour. The defendants contended that there was no question to arbitrate upon, as the applicant had been regularly and fully paid by them since the accident. The county-court judge held that the applicant was entitled to an award, and made an order for a weekly payment of 15s. during incapacity. From this decision the defendants now appealed, on the ground that the county-court judge had no jurisdiction to make an award, first, because no question had arisen between the parties within the meaning of Section 1, Sub-section 3, of the Act; and, secondly, because if any question had arisen, it had been settled by agreement.

At the conclusion of the arguments of counsel their lordships held that no question ever did arise between the applicant and the defendants either as to the liability to pay compensation, or as to the amount of compensation, or as to the duration of compensation. There was, therefore, nothing to arbitrate upon. The appeal was accordingly allowed, and judgment entered for the defendants.

Mr. Manisty, K.C., and Mr. Wilherforce appeared for the appellants, and Mr. Danckwerts, K.C., and Mr. A. Sims for the applicant.

## CASE UNDER THE PUBLIC HEALTH (LONDON) ACT, 1891.

MR. JUSTICE JOYCE, in the Chancery Division, on the 10th inst., delivered a considered judgment in the case of the London and North-Western Railway Co. v. the Mayor, &c., of the City of Westminster, in the action brought by the plaintiffs for an injunction restraining the defendants from continuing to trespass upon premises of the plaintiff company at the corner of Parliament-street and Bridge-street, Westminster.

It appeared that a portion of the corner house abutting on Parliament-street was used by the plaintiffs as offices, and that the defendants had constructed underneath the middle of the street public conveniences, with approaches by means of subways, from either side of the street, the entrance to the subways being by means of staircases near to the edge of the pavement. The plaintiffs complained that the entrance and staircase to the extent of 2 ft. 0 in. was constructed, not in the roadway, but in the footway, and alleged that to this extent it constituted a trespass upon their property, as the Public Health (London) Act, 1891, only vested the soil of the roadway in the defendants, the soil of the footway being, by presumption of law, vested in the plaintiffs as owners of the adjoining property. The plaintiffs further said that the defendants had no power to make subways under the street.

The defendants justified their action under Section 14 of the Public Health (London) Act, 1891, which gave them power as the Sanitary Authority to provide public conveniences in places where they considered the same were required.

His lordship held, on the evidence, that the land or soil where the staircase was constructed as to 2 ft. 0 in. was the property of the plaintiffs, and, being part of the footway, not liable to be taken and used by the defendants under the Act of 1891 for the construction of the conveniences, and granted an injunction for the removal of that portion of the staircase. He thought that the order would do the plaintiffs no good, as the defendants could, if they chose, simply put the staircase 2 ft. 0 in. further into the roadway, so making it stand clear of the footway as it was before the works were commenced. His lordship declined to make an order (as asked for by the plaintiffs) compelling the defendants to restore the old line of the kerb or edge of the footway as it existed at the end of 1880, and stayed the operation of the injunction for six months, with liberty to apply for a further stay in the event of an appeal by the plaintiffs from his decision.

Judgment accordingly.  
Mr. Younger, K.C., and Mr. Montague Shearman appeared for the plaintiff company, and Mr. Hughes, K.C., and Mr. D. Pollock for the defendants.

RECENT PATENTS:

ABSTRACTS OF PATENTED INVENTIONS.

13,100.—FLUSHING APPARATUS: S. F. Ashell.—In order to prevent the freezing of the water a rod joins the closest-seat to a weighted lever at the end of a spindle upon which (in the valve-casing) is an arm; at the end of the arm are side-pins to which are pivoted rods that carry conical valves upon their ends. The flushing-pipe which leads to the basin, the service-pipe, and a draining-pipe that leads to the trap are joined to three nipples respectively, so that the flush will be started as one valve opens and another valve closes with the depression of the seat, but as the seat rises the one valve is closed to arrest the flush, and the other valve is opened for draining the flushing-pipe and the valve-casing.

13,116.—TACKLE FOR LIFTS, &c.: C. F. Kite.—A brake-box contains the driving-shaft, with a loose disc and a split brake-ring. In the disc and the pulley are recesses with which the two ends of a double crank respectively engage; a short shaft, having an elliptical section, joins the two cranks, and is passed between a fork upon the brake-ring, the disc being keyed loosely on to the driving-shaft. The pulley and disc will move slightly as regards one another when the power is removed, so as to partially rotate the short shaft in the fork, whereupon the brake-ring expands as it comes into play. In a system of adjustable pulleys for an alignment of the ropes of lift-cages the ropes are passed around pulleys, upon arms, of which the upper end rest against inclines upon the pulley-frame, and which are bolted in slots cut in the inclines.

13,129.—PROCESS OF MOLDING BRICKS: O. Fauger.—The moulding-box is divided into compartments with a set of plates upon its movable side, which is mounted on rollers running in channel-iron guide-rails, and is worked with links and a lever, and the bricks are perforated with core rods; the ends of the rods and plates fit into recesses cut in the opposite and fixed side of the box; vertical sliding-rods worked with a treadle carry a plate beneath the loose bottom plate. In a variant form the inventor devises hand-wheels, pinions, and racks for working the movable side and bottom, and the pawls that retain them in their places are maintained in engagement with the racks by means of springs; handles on the shafts which carry the pawls turn the springs out of action.

13,168-9.—CONCRETE PAVEMENT: F. Ward.—To a body of large-lugged stone that has been broken and tarred and screened is added similar stone of smaller gauge as a filling for the interstices; the compound is rolled to render it solid. For paths reduced gauges are used. 13,169.—The stone which is to be broken is passed from a kiln into a hopper and stone-crusher, whence an elevator lifts the fragments to a hopper, from which they are conveyed to screens disposed on different floors and to the sorting bins. The hot and dry broken stone is then thrown out on to a table in a uniformly heated hut, where it is mixed and tarred.

13,227.—A CONTRIVANCE FOR BAND-SAWS: F. Rech.—The inventor's object is to enable the bench of a band-sawing machine to be set at an angle so as to make bevel ends. He forms the bench of two parts that are hinged so that one can turn them upwards at any desired angle and then clamp them with set-screws and curved bars. The band-saw passes between the two flaps at their hinges.

13,248.—AIR OR WATER-TESTING PLUGS FOR DRAIN AND OTHER PIPES: F. S. Reekie.—In one shape the plug consists of a flexible disc whereof the diameter is larger than that of the pipe, two metal plates that support the disc about its middle, and a screwed handle. As the disc is drawn through the pipe it becomes compressed into the shape of a cup-leather.

13,251.—A FUEL ECONOMISER FOR STOVES AND GRATES: F. H. Wilkie.—Into each side of the fireplace is inserted a vertical grating which is secured to a back and to an angled-plate that will direct the heat into the apartment, a perforated metal plate upon the top of the contrivance will serve as a support for a kettle, pan, &c.

13,257.—MANUFACTURE OF VENEERS: M. Harross.—The veneer is made up of two parts, in each of which the two component veneers are disposed with their grains crossed. A compound veneer consists of a sheet of suitable material laid between two veneers. A hollow veneer is formed by enclosing veneer ribs between two compound veneer slabs. Casein cement should be used for the veneers, which are described as being available for covering vaults, columns, arches, and so on, as well as for making doors, furniture, piano-cases, &c.

13,274.—EXCAVATING MACHINES: T. Whitaker.—For steam navies which are employed for excavating narrow cuttings, a tank or platform carries the boiler, and has two studs that will slide in horizontal slots cut in the frame of the revolving table. There are holes in the side plates of the boiler that take bolts upon the lower ends of

pivoted links that are joined with rods to the frame of the crane. The body-wheel is made up of segments having teeth within, and affixed to a circular rim of H-section, of which the ends are fastened with flanged fish-plates bolted together. The plates can thus be separated for the replacement of a segment.

13,278.—CONSTRUCTION OF BUILDINGS IN CONCRETE: E. L. Ransome.—Walls and structures are moulded with chambers, cells, or shafts, and in the course of the work heated air, carbonic acid gas, or steam is forced into the spaces to harden the concrete, the draught being controlled by means of openings fitted with doors at intervals, and directed over the upper surface of fresh concrete by means of covers, moulding-boards and a cover. 13,279.—For strengthening the joints of concrete and similar structures, the inventor employs metallic coils that are embedded in the material so as to interlock with the layer next adjacent.

13,282.—BLOCKS FOR BUILDING PURPOSES: H. G. B. Brunckhorst.—The slabs or blocks are fashioned with horizontal and serrated grooves, into which liquid cement or mortar is filled through passages formed by grooves in the vertical edges of the blocks. Horizontal wires, joined by vertical wires crosswise that can be moved along the horizontal wires, support and strengthen the walls.

13,285.—A CONTRIVANCE FOR CLOSET SEATS: R. G. Howson.—The hinge-pin of the seat is inserted through a hole in a block, and the flushing-rod is made in one piece with the block. The invention extends to a similar contrivance as adapted for a cover of the seat.

13,287.—INTERCEPTING TANKS AND TRAPS FOR DRAINS AND SEWERS: E. Kirling.—A partition, having a grating for its top, divides the container into two portions; a sliding plate, worked with a hand-screw, controls the height of the weir. In some cases a second dividing plate is suspended from the cover. As the pressure rises the air will escape through the cracks at the top of the container.

13,210.—PORTABLE BUILDINGS: W. T. Chaffer.—Vertical bars which will slide in brackets bolted on to the structure carry its feet or wheels; a pivoted catch, which is kept in its place with a loosely-pivoted weight, is pressed by a stopping-pin on a sliding bar, within which will turn a vertical spindle, which carries the front wheel or castor; for lowering the structure on to the ground one lifts the weight off the catch, and lets it fall clear of the stopping-pin on the slide-bar.

13,357.—A SCREW SOCKET FOR ELECTRICAL INSULATORS AND SIMILAR OBJECTS: F. Monjau.—A socket, to be inserted into walls of stone or other materials, consists of a blank of sheet metal, which is folded at its middle and is pressed upon a screw passed through the middle hole, whereby screw threads are made in the sheet metal; the end lugs are then folded over one another, and the intermediate lugs are turned outward.

13,371.—FITTINGS FOR WINDOWS: A. G. Spencer.—The inventor fastens the glass frames with wooden strips in the frames and renders the joints watertight with corrugated or ribbed strips of india-rubber, which may have a backing of canvas, or the canvas may be fitted with beads of india-rubber. In another adaptation the edge of the glass is taken by a groove in the strip, and rubber beads are secured to the wooden rail. A moulded rubber ring, cut into four parts, furnishes quadrants for packing windows that have rounded corners.

13,390.—A PROP FOR USE WITH DRAWING-BOARDS: R. W. Skatczek.—A frame for the support and adjustment of a drawing-board is made of two portions—a main frame and an adjustable frame hinged together. At the ends of the main frame are teeth that will engage with a bar attached to two rods which are pivoted on to the movable frame, which has a ledge that retains the board in its place.

13,408.—A GOVERNOR FOR GAS SUPPLY: F. F. Child & R. F. White.—Upon a stationary plate is mounted a cylindrical valve which has triangular apertures in its sides and a closed top, and is joined to the gas inlet; around the valve is a sleeve which is connected to the top of the governor, and is dipped into a lubricant in an annular vessel which consists of a fixed sleeve; the governor may be shaped as a bell that dips into a liquid seal around its base-plate, or its top and bottom may be joined with a bellows, its interior being put into free communication with the outlet; the fixed sleeve will gradually shut the inlets as the top of the governor ascends, the openings will be similarly uncovered as the top descends.

13,417.—STONE-SAWING MACHINERY: F. Gay.—For sawing stone, in stone-cutting yards, a flexible cutter is passed around guiding pulleys upon a jointed or other frame disposed for cutting out hollow articles, the core being cut away with a wire which is led out over guide-rollers in a hole in the side; in another form the wire is led over rollers mounted upon magnets or electro-magnets, so that it may be kept in irregular paths, and for mouldings and so on templates are used for guiding the cutter. The invention comprises numerous other methods for working the wire, and describes various particular forms of wire, chain, and other flexible cutters as adapted for cutting columns, or hollow or irregularly shaped articles, as well as for quarrying, well-sinking, and tunnelling operations.

13,407.—ARTIFICIAL STONE: T. M. Thom.—Pure

lime, to which unburned limestone may be added, is slaked with water to the consistency of moulding-paste. The dried goods are put into a closed vessel that can resist an internal pressure of from 200 to 400 lbs. per square inch; carbonic acid gas is then admitted at a pressure beginning from about 30 lbs. and increasing gradually so as to keep the stone at a constant temperature of 90 Fahr. The stones are described as being also suitable, when polished, for use in lithography.

13,491.—BUILDING BLOCKS: G. E. Güssow.—The inventor seeks to provide building blocks for fire-resisting and non-conducting purposes and having a low specific gravity; they are composed of an admixture of clay, silicious sinter, magnesite or bauxite, and asbestos fibre, together with some organic substance, such as straw or peat-wood, finely divided; the moulded blocks are burned as ordinary bricks.

13,495.—AN APPLIANCE FOR WINDOWS: Perfection Window Hinge Co.—In order to facilitate the cleaning of window-sashes the inventors make inside and the parting beads in detachable portions, and arrange the sashes so that one can turn them inwards upon detachable hinges. Into the frame and sashes are screwed bushes having bayonet or keyhole slots, with which bayonet-lugs or pins that project from the shanks of hinge pins and sockets will engage; for detaching the sockets and pivots, they are turned until the lugs are opposite the keyhole slots in the bush-flanges.

MEETINGS.

FRIDAY, NOVEMBER 22.

Architectural Association Discussion Section.—Mr. G. H. Smith on "Canterbury Cathedral," illustrated by lantern views. 7.30 p.m.  
Birmingham Architectural Association.—Mr. J. A. Gough on "Architecture of the Eighteenth Century in England."  
Glasgow Architectural Craftsmen's Society.—Mr. G. Herberston on "Foreign Competition in the Building Trades." 8 p.m.

SATURDAY, NOVEMBER 23.

Carpenters' Hall, London Hall.—Viva Voce Examination in Sanitary Building Construction. 12 noon.  
British Institute of Certified Carpenters.—Visit to the Vauxhall Bridge Works. 3 p.m.

MONDAY, NOVEMBER 25.

Surveyors' Institution.—Mr. A. Dudley Clarke on "The Final Report of the Local Taxation Commission." 8 p.m.

TUESDAY, NOVEMBER 26.

Institution of Civil Engineers.—Mr. John A. F. Aspinall on "Train Resistance." 8 p.m.

WEDNESDAY, NOVEMBER 27.

Society of Arts.—Mr. J. Gordon Parker, Ph.D., on "Leather for Bookbinding." 8 p.m.  
City of London College Science Society.—Mr. E. R. Calhorne on "Narrow Gauge Light Railways of Heavy Traffic Capacity." 7.30 p.m.  
Northern Architectural Association.—Mr. H. S. Kerr on "Melrose Abbey," with lantern views. 7.30 p.m.

THURSDAY, NOVEMBER 28.

Institution of Electrical Engineers.—8 p.m.

FRIDAY, NOVEMBER 29.

Architectural Association.—Mr. Arnold Mitchell on "Capitals," with lantern views. 7.30 p.m.

SATURDAY, NOVEMBER 30.

Dundee Institute of Architecture.—Paper by Mr. W. M. Page, entitled "Notes on Art." 7 p.m.

**SURVEYORS' INSTITUTION EXAMINATIONS.**

COMPLETE COURSES OF PREPARATION for these Examinations are given, either in class, by correspondence, or in office, by Mr. RICHARD FARROW, F.S.I., A.M. Inst. C.E. &c. Candidates can arrange to commence study at any time. The following table shows the prizes that have been obtained by Mr. FARROW's pupils at the last seven Examinations:—

1st Prize	1895	1896	1897	1898	1899	1900	1901
2nd Prize	1896	1897	1898	1899	1900	1901	
3rd Prize	1895	1896	1897	1898	1899	1900	1901
4th Prize	1895	1896	1897	1898	1899	1900	1901
5th Prize	1895	1896	1897	1898	1899	1900	1901
6th Prize	1895	1896	1897	1898	1899	1900	1901
7th Prize	1895	1896	1897	1898	1899	1900	1901
8th Prize	1895	1896	1897	1898	1899	1900	1901
9th Prize	1895	1896	1897	1898	1899	1900	1901
10th Prize	1895	1896	1897	1898	1899	1900	1901

**NOTE**—In 1888 the Drawing Prize was divided between two bracketed winners, one of whom was prepared by Mr. FARROW. For particulars of the Courses of Work, or for any advice with respect to the Examinations, apply to Mr. RICHARD FARROW, F.S.I., A.M. Inst. C.E. &c., 22, Victoria-street, Westminster. Telephone, 658 Westminster.

**THE BUILDER'S STUDENT'S**

THESE Books, although intended primarily for the Student in Architecture, Engineering, Surveying, Sanitary Science, &c. will also be found of great practical value alike to the Professional man, the Contractor, and the Craftsman.  
 Direct from the Office, POST FREE, on receipt of remittance.

Just published.  
**SANITARY FITTINGS AND PLUMBING.** By G. LISTER SUTCLIFFE, A.R.I.B.A., M.S.I. &c. 212 Illustrations.

In this book an attempt has been made to enunciate the general principles now governing the design of sanitary work in buildings, and also to describe and illustrate the most important modern sanitary fittings and the plumber's work in connection with them.

Just published.  
**ROADS: Their Construction and Maintenance.** With Special Reference to Road Material. By ALLAN GREENWELL, A.M.I.C.E., F.G.S. &c. and J. V. ELSDEN, B.Sc. Lond., F.R.S.E., &c. 48 Illustrations.

Much space has been devoted to the consideration of the relative value of different kinds of road stone, in the belief that no one can become an efficient road engineer or surveyor unless he understands the nature and properties of the material at his disposal.

2nd Edition. Revised and corrected by the Authors.  
**CARPENTRY AND JOINERY: A Text-Book for Architects, Engineers, Surveyors, and Craftsmen.** By BANISTER F. FLETCHER, A.R.I.B.A., and H. PHILLIPS FLETCHER, A.R.I.B.A., A.M.I.C.E. 424 Illustrations.

Intended for those entering for the examination of the City and Guilds' Institute, the Carpenters' Company, and the Institute of Certified Carpenters, &c. Also for the examination in these subjects by the R.I.B.A. and the Surveyors' Institution, &c.

**ARCHITECTURAL HISTORY: or Sanitary Science as Applied to Buildings.** A Text-Book for Architects, Surveyors, Engineers, Medical Officers of Health, Sanitary Inspectors, and others. By BANISTER F. FLETCHER, A.R.I.B.A., and H. PHILLIPS FLETCHER, A.R.I.B.A., A.M.I.C.E. 305 Illustrations.

A concise and complete text-book, treating of all its branches, and intended to be of use to the student in any circumstances in Sanitary Science.

**LAND SURVEYING AND LEVELLING.** By ARTHUR WALMSLEY, M.I.C.E., F.S.I., F.R.C. Lond. 126 Illustrations.

A useful book for the student, containing the usual instruction given in a text-book on this subject, but valuable additions from the author's own experience, and an exhaustive chapter upon Parliamentary surveying.

**FIELD WORK AND INSTRUMENTS.** By ARTHUR WALMSLEY, M.I.C.E., F.S.I., F.R.C. Lond. 124 Illustrations.

Gives the Student a practical knowledge of the construction and handling of surveying instruments, and how to deal with their application to the field for setting out work.

**STRUCTURAL IRON AND STEEL.** A Text-Book for Architects, Engineers, Builders, and Science Students. By W. W. WILKINSON, M.I.M.E. 234 Illustrations.

In this elementary treatise the author has endeavoured to present in a regular sequence some of the more important details relative to iron and steel as applied to structural work.

**STRESSES AND STRAINS: Their Calculation and that of their Resistances.** By FREDERIC RICHARD FARROW, F.R.I.B.A. &c. 116 Illustrations.

A handbook for Students, particularly such as are preparing for the examinations of the R.I.B.A. and the Surveyors' Institution, and especially for those whose knowledge of mathematics is limited.

2nd Thousand.  
**SPECIFICATIONS FOR BUILDING WORKS.** and **How to Write Them.** A Manual for Architectural Students. By FREDERIC RICHARD FARROW, F.R.I.B.A.

Shows the student how he should write a specification, so that when he has learnt the method and general principles he may apply them to the particular exigencies of any building he may design.

2nd Thousand.  
**QUANTITIES AND QUANTITY TAKING.** By W. E. DAVIS.

A reliable handbook for the Student pure and simple. Its scope being limited to the method of procedure in the production of a good bill of quantities. The examples given, whilst intention ally simple, will be found to cover almost every phase of the subject.  
 London: DOUGLAS FOURDREINER, Office of "The Builder," Catherine-street, W.C.

**SANITARY INSPECTORS' EXAMINATIONS.**—A CERTIFICATED INSPECTOR AND ASSOCIATE SANITARY INSPECTOR prepares Candidates for the above Examinations by correspondence or in residence. Success guaranteed. MODEL SOLUTIONS, Illustrated. Examination Questions for 1901.—List, prospectus, testimonials, &c. R. G. HOLMES, No. 27, High-street, Bowdoin, Stoke Newington.

**SANITARY INSTITUTE EXAMS.**

Preparation for the Inspectors' Examination by a system of correspondence sending up Text Books or Acts, by G. CLARKE, Assoc. San. Inst.; Fellow Inst. San. Engineers; Honorary Medallist in Hygiene; Member of the Society of Arts and of Societe Francaise d'Hygiene. See Clarke's Aids—Calculation of Cubic Space, &c. Practical Drain Inspection, &c. Trade Notices, &c. Sanitary Law (New Edition), 1s. 6d.—Prospectus from 120, Thorold-road, Ilford, E.

**SANITARY INSPECTORS' and PRACTICAL SANITARY SCIENCE EXAMS.**

Complete Courses of Instruction by correspondence for these and similar exams, conducted by Gentlemen (Engineers, Surveyors, and Sanitary Inspectors), holding three Certificates from San. Inst. 1st Class Honorary Medallist in Hygiene, &c. Several hundred successful students for 1901. See prospectus, &c. Apply for Syllabus of subjects, testimonials, &c. to C.S.I. 28, Victoria-street, Westminster, S.W.

**MUNICIPAL and COUNTY ENGINEERS' EXAMINATION.**

—Mr. RICHARD FARROW, A.M.I.C.E., F.S.I., &c. 22, Victoria-street, Westminster, prepares pupils by correspondence for this examination. The course of work may be taken to extend over six or twelve months according to previous knowledge.

**R. I. B. A. EXAMS.—PREPARATION**

R. I. B. A. personally or by correspondence, in three, six, nine, or twelve months' courses. ARCHITECTURAL LENDING LIBRARY. Correspondence for 1901. See prospectus, &c. Apply to Messrs. HOWGATE & BOND, Associates R.I.B.A. 110, Gower-street, W.C. (close to the British Museum).

**SANITARY INSPECTORS' EXAMINATIONS.**

Successful POSTAL TUITION by Certificated Engineer (First-Class Honours Sanitary Plumbing, Mechanical, &c. Typewritten papers. Numerous sketches. Small fee. ASSOC. SAN. INST. No. 4, Duke-street, Adelphi, London.

**ESTIMATING and QUANTITIES.**

FOR FOUNDATION CLASSES. Pupils set up in detail by an experienced LONDON SURVEYOR. Specially adapted to suit the requirements of Builders' Clerks, Foremen, Leading Hands, and others.

For terms and full particulars, address CLARKE, Box 1, care of Willing's, 162, Piccadilly, W.

**TO ARCHITECTS and BUILDERS.**

5,000 wanted to develop New Process, patented and improved. Factory working abroad. Showing 30 per cent. profit.—For particulars apply to B. 415, at Shelley's, Grosvenor-street, E.C.

**AGENCY WANTED (Commission), any**

good article in the Building trade. Good shop and premises in West-end of London.—SHEPHERD, 32, Berkeley-street, Oxford-street, London, W.

**PARTNER—WANTED.** Practical

CONTRACTOR or otherwise with capital, in a two-branch Builder and Contractor's Business. Well established and connected. Splendid opening for extension. Strictly private. About 20 miles out of London.—Box 214, Office of "The Builder."

**CIVIL SERVICE COMMISSION.**

FORTHCOMING EXAMINATION. ASSISTANT EXAMINER in Civil Office of Works, &c. (23-30) NOVEMBER 29th. Technical training and qualifications necessary. The date specified is the latest at which applications can be received. They must be made on forms to be obtained, with particulars from the Secretary, Civil Service Commission London, S.W.

**CLERK OF WORKS WANTED, for the**

erection of Swimming Baths, Council Chamber, Offices, &c. for the Edmonton Urban District Council. Salary four to five guineas per week. Apply by letter to the Architect, W. GILLBERG SCOTT, Esq., F.R.I.B.A., 23, Bedford-row, London, W.C.

**METROPOLITAN BOROUGH OF WOOLWICH.**

BOROUGH ENGINEERS DEPARTMENT. DRAWING ASSISTANT. ACCOUNTS CLERK. The Council of the Metropolitan Borough of Woolwich REQUIRE the SERVICES of:—

1.—DRAINAGE ASSISTANT. Preference will be given to applicants having previous experience in this branch of a Municipal Office. Salary, 22s. 6d. per week. Age not to exceed 30.

2.—ACCOUNTS CLERK. Applicants must possess a thorough knowledge of accounts and have had previous experience in a Municipal Office. Age, between 21 and 30. Salary, 110s. per annum.

The persons appointed must give their whole time to the service of the Council, each appointment to be subject to the by-laws and regulations of the Council in force from time to time. Applications, in candidates' own handwriting, on forms to be obtained from Mr. FRANK SUMNER, Borough Engineer, Council Office, Macey-road, Plumstead, or sent together with copies of Woolwich, not later than three recent testimonials, to me at the Town Hall, Woolwich, not later than first post on FRIDAY, 29th NOVEMBER, 1901, in envelope endorsed "Assistant" or "Clerk," as the case may be.

By order, ARTHUR B. BRUCESON, Town Clerk. Town Hall, Woolwich, November 18th, 1901.

## Model By-laws for Rural Districts.

EARLY a generation after the passing of the Public Health Act (1875) the Local Government Board has awakened to the fact that there is a radical difference between Urban and Rural districts, and that by-laws which may be reasonably enforced in towns will be unduly onerous in the country. Rural District Councils have been aware of this, and with comparatively few exceptions have done without by-laws altogether rather than adopt the stringent clauses which the Local Government Board has hitherto considered necessary. In the recently-issued "Model by-laws as to new buildings and certain matters in connexion with buildings in rural districts," the Board shows a spirit of compromise which can scarcely fail to gain the sympathy of Rural Authorities.

The new model by-laws are "confined to matters affecting health," and do not, indeed, deal with matters of this kind in a harsh or exhaustive manner. They contain no clauses as to the stability of buildings, the prevention of fire, and the level, width, and construction of new streets, and do not even specify the height of rooms which are to be used for human habitation. In the main, the new series consists of a selection of clauses from the old model by-laws, but some idea of the simplification which has been effected will be gathered from the fact that the number of by-laws in the new series is only fifty-one, while in the old or urban series it is exactly 100.

By-law No. 1 contains interpretations of various terms such as "public building," "domestic building," &c., and, as far as it goes, is similar to the corresponding urban by-law.

No. 2 specifies the buildings which shall be exempt from the operation of the

by-laws, and contains nine clauses, eight of which tally with the urban exemptions. Three clauses of the urban by-law are, however, omitted, and a new clause is inserted which has the effect of excluding from the operation of the by-laws all buildings which are not public buildings, or buildings of the warehouse class, or dwelling-houses. Thus, to quote the words of the official memorandum accompanying the by-laws, "the erection of buildings for agricultural purposes, and out-buildings such as a plant house, orchard house, summer house, poultry house, tool house, &c., is wholly unrestricted, except that they should not encroach on the open space required to be provided for new domestic buildings." Pigsties and cowsheds, however, are not exempt unless they are detached from a dwelling-house. Stables are not mentioned, but we gather from the wording of the clause and of the memorandum that they are exempt whether attached to a dwelling-house or not.

Only three by-laws are devoted to "the structure of walls and foundations." The first (No. 3) specifies that the site of a "new domestic building" must be covered with asphalt or concrete "wherever the dampness of the site or the nature of the soil renders such a precaution necessary." The sentence within inverted commas does not appear in the corresponding urban by-law. No. 4 requires a damp-course to be laid beneath the level of the lowest floor (not "timbers," as in the older by-laws) in every wall of "a new public building or a new dwelling-house." The italicised words are new, and have the effect of excluding buildings of the warehouse class, the out-buildings of houses, &c., from the operation of the by-law. Two new clauses deal with the construction of walls of rooms below the level of the ground, and stipulate that such walls shall be impervious to moisture or double. If the latter method is adopted, there must be a cavity 2½ in. wide between the two parts of the wall and extending from the base to a height of 6 in. above the ground; the two parts

must be tied together with "suitable and sufficient ties" of iron, stoneware, &c., and must have damp-courses at the base and at the level of the top of the cavity. No. 5 completes the regulations as to the walls by specifying that parapets must be properly coped or otherwise protected to prevent dampness. Not a word is said as to the materials of which walls above ground must be built, and, consequently, wood, brick, stone, concrete, and other materials may be used; the thickness of the walls is also left to the discretion of the builder.

The clauses relating to the air-space in the front of buildings are much less onerous than the corresponding clauses of the old series. Between the fronts of domestic buildings on opposite sides of a street there must be a space at least 24 ft. wide; in the case of a building of this class "intended to front on a street laid out before the confirmation of these by-laws and of a less width than 24 ft.," the front of the building must be set back at least 12 ft. from the centre of the street. This is an equitable adjustment between the owners of the ground on opposite sides of the street. There is no obligation to increase the width of the roadway to 24 ft., but the space may be utilised as a garden or yard or for the erection of a portico, porch, step, &c., and may be enclosed by a gate, fence, or wall not more than 7 ft. high. The by-law relates only to domestic buildings; public buildings and buildings of the warehouse class do not fall within its scope.

The same remark applies to the next by-law (No. 7), which fixes the space in the rear of "a new domestic building" at not less than 150 square feet. The distance across this space "from every part of such building to the boundary of any lands or premises immediately opposite or adjoining the site of such building" must be in every part at least 15 ft.; but if the height of the building is 25 ft. the distance must be at least 20 ft.; and if the height is 35 ft. or more, the distance must be at least 25 ft. No building may be erected on this space except a water-closet, earth-closet or privy, and an

ashpit. Many Urban Authorities which have adopted the older model by-laws (containing almost identical provisions) have found it necessary to allow a coal-place also to be erected on this space, and we think that this permission ought to be explicitly granted in the new by-laws. A still greater objection may be taken to the clause as it now stands. In provincial towns and villages back streets or passages are almost invariably found, and have the great advantage of facilitating drainage as well as the removal of ashes and the contents of earth-closets and privies. In such places the adoption of the older model by-laws has at once led to friction between architects or builders and the authorities. The space required in the rear of an ordinary two-storied cottage, and "exclusively belonging to such building," must be at least 15 ft. wide; the back street between the two open spaces must be 36 ft. wide; and we thus get a total width of 66 ft. between the backs of opposite rows of cottages. Obviously, this is excessive, and authorities have almost invariably had the mortification of having to break their by-laws as soon as adopted. Generally a total width of 36 ft. between the backs of buildings has been adopted as the minimum, and of this a portion from 12 ft. to 15 ft. wide has been allotted to the back street midway between the buildings. Some provision of this kind might with advantage have been inserted in the new by-laws.

The ventilation of buildings is dealt with in By-laws 8 to 12, which agree very closely with Nos. 55 to 59 of the old series. The only important alteration is that the clauses relating to the sizes and openings of windows are now confined to new *domestic* buildings, and not, as in No. 57 of the earlier by-laws, to new buildings generally. The area of the aperture or air-shaft provided for the ventilation of a habitable room without fireplace has also been reduced from 100 to 50 sq. in.

Nos. 13 to 18 are concerned with the drainage of buildings, and provide for sub-soil drainage "wherever necessary," and for the mode of construction and ventilation of drains. Drains are to be laid in a bed of concrete "where necessary" only; the depth of drains under buildings is not now specified, but adequate means of access must be provided at both ends of such drains, the word "access" being now substituted for "ventilation." An intercepting trap must be placed in every sewage drain near the point of connexion with the "sewer or other means of discharge," and the drain must be ventilated by means of two openings—one at or near the surface of the ground, and the other at least 10 ft. above the ground—except as follows:—

1. No ventilation whatever is required for a drain not more than 20 ft. long if the drain does not serve a water-closet "within the building"; and
2. the opening for ventilation at or near the surface of the ground may be dispensed with if the drain is not more than 30 ft. long and does not serve a water-closet which has "internal communication with any building."

The waste-pipes from slop-sinks (No. 19) must be treated generally as soil-pipes, but the diameter of such waste-pipes is not specified. Soil-pipes may now be 3½ in. in diameter instead of 4 in. Waste-pipes from baths, kitchen-sinks, and lavatories must be trapped and must discharge over

channels leading to trapped gullies, but the length of such channels is now not stated. This is an advantage.

The provisions with regard to water-closets, earth-closets, and privies have been altered and improved. Earth-closets are now classed with privies, and not with water-closets, and may not be placed within a building. Windows are not required in water-closets which are not "within a building," but a sufficient opening for "lighting and ventilation" must be provided in each case. By a new by-law, the occupier of any premises is made responsible for the supply of a sufficient quantity of water for flushing the closet in his occupation.

In the earlier by-laws it was specified that privies must be at least 6 ft. from any habitable building. This distance is now increased to 10 ft., and must be adhered to in the case of earth-closets as well as privies. Earth-closets and privies (see Nos. 25 to 32) must be constructed alike, and may have either fixed or movable receptacles for filth. According to By-law 29, both earth-closets and privies must be provided with "suitable means or apparatus for the frequent and effectual application of dry earth or other deodorising substance, or of ashes, dust, or dry refuse," to any filth deposited in the receptacles. From these by-laws it would appear that there is now no distinction recognised between earth-closets and privies; but the explanatory memorandum shows that what is meant by an earth-closet is a closet in which dry earth (not ashes or other refuse) is used to cover the deposits. There can be no doubt whatever that earth-closets are seldom kept in proper condition; tenants are, as a rule, too careless to provide a supply of dry earth, and the closets become merely privies. Where, however, a Rural District Council is prepared to undertake the supply of dry earth, or can show that facilities for obtaining it exist, by-laws dealing with earth-closets apart from privies (on the lines of the older model by-laws) will be sanctioned by the Local Government Board. The only other alteration to which attention need be drawn is the increase of the size of a *fixed* receptacle for filth from 8 to 12 cubic feet.

The by-laws relating to ashpits (Nos. 33 to 38) differ from the urban model in only two important respects. They must be at least 10 ft. from a habitable building (an increase of 4 ft.), and may have a capacity of 20 cubic feet instead of 6. The latter alteration is designed to allow the accumulation of a month's refuse instead of the week's accumulation allowed for in the urban by-laws. Cesspools (Nos. 39 to 42) are regulated as before, with the exception of alternative methods of construction being provided for. By-law 43, dealing with the closing of buildings unfit for human habitation, is similar in all respects to the Urban By-law No. 90, and the remaining by-laws, which treat of the deposit of plans and sections, the giving of notices, the inspection and reconstruction of work, penalties, &c., are merely altered to exclude the laying-out and construction of streets, and the materials used in the erection of buildings, from the operation of the by-laws.

It will be gathered from this summary that the Local Government Board has gone a long way towards meeting the objections of Rural Authorities to the older model by-laws. Indeed, in the matter of the space

between the fronts of new domestic buildings, we think they have gone too far. A space only 24 ft. wide is too little, and the cost of building would be only very slightly increased if a width of 30 or 36 ft. were required. The additional space could be utilised for gardens, and, judging from the case of urban districts where the model by-laws have been adopted, we believe that the building owner would not have to pay a penny for the extra land, while the vendor would still be able to charge a price considerably in excess of its agricultural value.

That the erection of buildings in at least some parts of rural districts ought to be regulated, all sanitarians are agreed; and the new model by-laws are on the whole so reasonable, that many Rural District Councils which would have nothing to do with the old urban series will probably adopt them. It may be mentioned that by-laws may be made for a part of a rural district, but this part should be "very clearly defined by a well-recognised boundary-line." Of course, if a Council wishes to adopt more stringent by-laws for the whole or part of its district, there is nothing to prevent this being done; and as in many districts there are portions which are of a decidedly urban character, it will often be necessary to regulate the width of new streets and the materials to be used in the erection of buildings.

#### NOTES.

The City of London and Control of the Streets.

THE Corporation of the City of London will apply to Parliament in the course of next Session for leave to bring in a Bill that shall confer upon them new and further powers with respect to the breaking up of and interference with streets in the City of London and the Liberties. They seek also to obtain a more thorough control over the various persons—including the Postmaster-General—who have statutory or special powers of opening and breaking up the thoroughfares. The Bill will provide that not less than two months' notice, together with plans, sections, &c., shall be given before any work of that kind is begun; that a certain period shall elapse before such operations are renewed in the same street, and that the works shall be executed during such times of the day or night, or day and night, and in such order or sequence, as the Corporation may, under penalty, require. The Corporation desire further to make by-laws affecting the removal of house-refuse and its deposit by occupiers each morning in approved receptacles upon the pavement, and the demolition of buildings with its attendant dust, dirt, nuisance, and noise.

THE decision of the Court of Compensation Appeal in the case of Veazey v. Chattle puts a finishing

touch to the criticism on this statute. The question raised was really one of fact, which a sensible layman was just as capable of deciding as a trained lawyer, namely, whether a crawling-board was a scaffold. The Court decided that it was, for the reason that it was assumed that the Legislature could not have intended to do anything so foolish as exclude a workman from compensation simply because a crawling-board was not in common parlance a scaffold. This board, said the Master of the Rolls, fulfilled the

purpose of repair just as well as an actual scaffold. It was a kind of platform, and as the Court ought not to narrow down the statute more than was possible, the board should be regarded as scaffolding within the meaning of the Act. Whether this last decision will cause the Home Secretary to take in hand an amending Act we know not, but there can be no question that the recent course of decisions has shown more strongly than ever the urgent need of eliminating the unjust and tiresome exceptions in this Act, which are not only the cause of litigation, but often work the grossest injustice.

**THE South Metropolitan Gas Company** do not like the existing methods employed by the gas examiners of the London County Council for testing the quality of the Company's gas, and have given notice that they intend to introduce a Bill during the next Session of Parliament, to, among other things, abolish the present system of testing in favour of the testing arrangements prescribed by the Gasworks Clauses Act, 1871. Under the present system the gas examiners may test the gas for illuminating power at any hour of the day or night, but under the Gasworks Clauses Act the tests may only be conducted between certain hours in the evening. In the Gasworks Clauses Act no provision is made for testing the quantities of ammonia and of sulphur compounds, other than sulphuretted hydrogen, present in the gas; but under the existing arrangements the quantities of these impurities are estimated every day. If the gas is always of good quality, why object to the testing? Even if the testing necessitates the expenditure of a few thousand pounds per annum, this sum is insignificant in comparison with the sum which might be saved by the company, at the expense of the consumers, by systematically supplying gas of lower quality than it ought to be. The testing of a commodity does not necessarily indicate suspicion of the honesty of the vendor; it is a common-sense business precaution. The existing system of testing is prescribed by three gas referees, who are impartial experts of high scientific reputation appointed by the Board of Trade, and are quite competent to perform the duties they have undertaken. We have consistently advocated the supply of a cheap low-grade gas in preference to a costly high-grade gas, but whatever the quality of the gas it must be rigorously tested, and the most suitable reply which the consumers of South London can make to the present proposition of the gas company is to agitate for the addition of a calorific power test and a carbon monoxide test to the present series of tests prescribed by law.

**MR. LANGDON**, in his presidential address to the Institution of Electrical Engineers last week, stated several of the problems which have to be solved before electricity can displace steam in railway working. As Mr. Langdon is an electrician who has had unrivalled experience in railway working owing to the many years he has been associated with the Midland Railway, his address deserves careful study. He is convinced that sooner or later electricity will displace steam. He recommends railway companies to attack the problem

at once, and equip electrically a portion of their lines so as to find out experimentally the most suitable system. Failure to do this will probably lead to the construction of fast electric railways parallel to their lines with disastrous results. Although Manchester and Liverpool are connected by three lines of railway, yet the proposed electric line on a mono-rail system joining them has received Parliamentary sanction. The capital invested in electric railways is 1,300,000,000/., and the wholesale depreciation of such a vast sum would be a national calamity. The total weight of a modern steam locomotive and tender exceeds a hundred tons, and the tendency of the day is to make them larger and heavier, so that the speed of passenger trains and the load on goods trains may be increased. This involves a greater stress on the permanent way, and the impact on bridges and other structures over which the vehicles pass is often excessive. Two electric locomotives, or, better still in our opinion, a train made up of carriages each containing its own motors, would distribute the weight better, and would be welcomed by the engineer of the line. The reason Mr. Langdon gave for his preference of the electric locomotive was that the locomotive system would be equally suited for both goods and passenger traffic. In railway working a great loss is occasioned by the shunting of heavy goods trains going at the rate of twenty miles an hour to let the express trains pass. If we shortened the goods trains and ran them by electric locomotives at forty miles an hour, we could double the capacity of the line. Mr. Langdon stated that an overhead electrical service was inadmissible on main lines. He was probably thinking of a railway equipped with direct current where the great weight of the conductors required would make the expense of putting them overhead prohibitive. With three-phase high-tension currents we think two light overhead trolley wires might be most advantageously employed.

**WHEN** the Post Office proposed two years ago to start a telephone service in London, we welcomed the scheme, naturally thinking that the competition with the National Telephone Company would lower the rates and lead to a more efficient service. Two millions of the country's money has been sunk in the undertaking, and the Post Office was granted full powers to dig up the streets to lay their elaborate conduits. Considering that the National Telephone Company has to pay 10 per cent. of their gross receipts to the Government, and that it has to pay a dividend on a very inflated capital, it was not surprising that the public should have expected a substantial reduction of the rates. Apparently, however, the public derives no advantage at all from the new service. At present any one joining the Post Office system will have to wait longer at his telephone before he can get connected through to any of the company's subscribers than if he subscribed to the company. He will have to be connected to the company's exchange through the medium of the Post Office exchange, and he will gain nothing by this delay. It seems to us that it would have been far better for the nation to have purchased the National Telephone Company's undertaking on a reasonable valuation than turn the Post

Office into a branch establishment of the company, managed by officials who until a few months ago were on the staff of the Company. We hope that the agitation against the unreasonable tariff of the Post Office will lead to a lowering of the rates. The inhabitants of London put up very patiently during the last two years with the obstruction to traffic caused by the laying of the elaborate P.O. conduits. It seems hardly equitable that they should have to pay nearly a hundred per cent. more than the inhabitants of Glasgow do for their municipal service. The failure of the Post Office to compete with the Company has grievously disappointed the business people of London.

**Multiplex Telegraphy.** It is known to electricians that when we have an alternating and a direct current flowing in a wire each produces its own heating effect just as if the other were not there. For example, the heating of a wire carrying a current of 10 ampères direct and 10 ampères alternating is only half that produced by 20 ampères direct or 20 ampères alternating. To a certain extent direct and alternating currents in a wire seem to ignore one another's presence. This property of direct and alternating currents has recently been applied by M. Mercardier, Principal of the Polytechnic School at Paris, to perfecting a system of telegraphy. He is able to send numerous telephone messages along an ordinary telegraph wire without affecting in the slightest the working of the ordinary telegraph instruments. The principle of the system is not unlike the phonocone of Mr. Langdon Davies, but instead of a tuned reed M. Mercardier uses a telephone adjusted so that it only responds to a current of a certain frequency. A diaphragm, 4 in. in diameter, vibrates in front of an electromagnet which is excited by the current from the line. A small piece of carbon in the centre of the diaphragm and another piece at the extremity of a long vertical spring complete the microphonic contact required to work the receiver. It is found that the currents in the line do not interfere in the slightest degree with one another, each receiver vibrating only to its own current. The system has been tested between Paris and Bordeaux. Twelve operators sent messages simultaneously for several hours whilst at the same time the ordinary telegraph messages were being sent. It is extraordinary that a single wire can transmit so many messages simultaneously without interference, and M. Mercardier believes that the number of messages could easily be doubled.

**DR. WHEATON'S** Report to the Local Government Board on the sanitary circumstances of the Llandilofawr Rural District, Carmarthenshire, states that the dwellings are, as a rule, well-constructed of stone, but the downpipes discharge on the ground surface in the absence of drains to which they can be connected; many dwellings have been built without damp-courses; and from these causes and owing to the general absence of any impervious paving around houses, the foundations are soaked in moisture and the walls rendered damp. Water supply is pretty good (a public supply) at Upper Brynamman town; and the group of dwellings known as Cwmamman; but at Pwenty-

finnon the water supply is derived from a roadside watercourse, the water in which appears to be derived from the drainage of a field, and pig-sties and privies are now in course of erection within a few yards of the point at which the water appears to take its origin. At Ammanford there are a number of private wells in yards and in gardens, which are shallow, drystained with boulders, sunk in the loose drift, and exposed to risks of contamination by soakage of liquid from cesspools, and by filth washed into the ground during periods of rainfall, from privies, and from collections of manure and refuse which are frequently situate in proximity to them. There are no house drains in connexion with dwellings in the district. There are a few cesspools and catch-pits in Ammanford district, in which liquid refuse from the surface is collected; but they are never emptied, and the filth escapes by soaking away into the ground, thus endangering the purity of the water furnished by neighbouring wells. Privies are in general use, but in some parts of the district appear to be regarded as unnecessary, and are sometimes used as pigsties or store-places, and the ground around dwellings is often littered with excrement, the inhabitants being disinclined to make the exertion involved in going to a privy which may often be many yards distant from the dwelling-house, and disinclined also to make the necessary exertion required for emptying the privy and disposing of its contents. For the last reason privies are, wherever possible, set over water-courses so that the filth falls directly into the water; and in this manner many rivers and streams are polluted by fecal matter.

The University Library, Cambridge.

The Senate have "non-placeted" the proposal of the Library Syndicate to construct a building in the Schools Quadrangle. We understand that Mr. W. C. Marshall's plans and designs provide for a floor, level with the first floor of the existing rooms, resting upon iron columns set at a distance from the walls, clear from the buttresses, and so as to leave a passage-way around, the new floor being gained by a bridge, and being roofed in part with glass and iron. The quadrangle has suffered manifold changes since it was built at intervals on Nigel de Thornton's ground, and the gardens of the Crouched Hospital, Trinity Hall, and Corpus Christi College in the fifteenth century. The northern side (Divinity Schools) was finished in or soon after 1400; the western side (Canon Law School, since the Arts School, and library over it) was next begun, and completed fifty years afterwards; the southern side (Philosophy and Civil Law) was erected in 1458-70. Most of the tracery, wrought in soft stone, has disappeared from the windows. In 1659-60 is entered a charge "for cutting needless stone out of the windows to gain light" in the Divinity School. In 1583-4 the buildings had been underpinned, and in 1646-7 double rows of wooden columns had been placed under the floors of each of the schools. Thomas Rotherham, Archbishop of York, built in 1470-3 the Gothic eastern front, opposite Great St. Mary's Church, depicted in Loggan's bird's-eye view of about 1688. A Classical order replaced that front in 1754-5. Sir John Cotton bought the gateway for the courtyard at Madingley Hall, near Cambridge. Rotherham's statue, with those

of his co-benefactors to the library, was placed in the gatehouse of the Old Court of King's College which the late Mr. Pearson incorporated in his new library buildings (1888-9) erected on the west of the old quadrangle. In 1829 the University bought for 12,000*l.* the buildings and site of the Old Court, and six years afterwards cleared the ground (whilst leaving the unfinished gatehouse), having in mind to rebuild the entire quadrangle. In the result the north side of Cockerell's design was erected, 1837-40, along Senate House-passage, Cockerell's design having been preferred to those of Wilkins, and Rickman. In 1864-7 was added the southern wing, extending westwards, by Sir G. G. Scott, who also added a third story to the Old Common Library on the south side of the older quadrangle. In 1716-7 the Law Schools were fitted as a library and the Dome-room was built. The Divinity Schools, beneath the catalogue-room, were vacated in 1879 at the opening of the Selwyn Divinity School buildings designed by Mr. Basil Champneys, opposite St. John's College. Loggan depicts the Schools Tower, or Belfry, containing the staircase in the south-eastern corner of the quadrangle which was pulled down in 1732 on the opening of the Senate House, when the Regent House over the Divinity Schools was taken for housing King George I.'s gift of the 30,000 volumes which he had bought for 6,000*l.*—the library of Dr. Moore, Bishop of Ely.

#### COMPETITION FOR FIRE STATION AND POLICE COURTS, MANCHESTER.

It is somewhat surprising that only twenty-five sets of designs were submitted in this important competition, and of these one at least can only be regarded as a practical joke. The premiums offered were 300*l.*, 200*l.*, and 100*l.* (nearly 1 per cent. of the estimated cost of the buildings), and the Corporation undertook to employ a professional assessor "to assist them in determining the merit of the designs," and also stated that the designs would be submitted to a "quantity surveyor of repute," whose duty it would be to reject every design which would in his opinion cost more than 75,000*l.* The latter provision is a reflection on the decisions of some architectural assessors, who seem to think that a limit of cost is stated only to be exceeded, but is one which cannot fail to be appreciated by those competitors who honestly strive to prepare a design in accordance with the conditions. The work of competing architects was also simplified by the issue of plans of the four principal floors, drawn to a scale of 8 ft. to an inch, and showing the detailed arrangement of the several departments. The plans were complete as regards the fire-station, which is by far the most important part of the building, and also as regards the ground floor of the police and ambulance stations, but the branch bank, firemen's library, and policemen's quarters were only indicated in block, the details being left to the ingenuity of the competitors. Nearly all the competing architects have found these plans of the greatest service, although in no case has slavish copying been attempted; indeed, this was impossible, as the plans did not in every case tally with the amended schedule of accommodation. Broadly speaking, however, the competition, in consequence of the issue of these plans, resolved itself into a competition for the best external design accompanied with improvements in the details of the planning.

The site is in shape a trapezium, having the principal frontage (260 ft. long) towards London-road, a return frontage (284 ft. long) to Whitworth-street at right angles to the former, a rear frontage to Commerce-street (97 ft. 3 in. long) at right angles to Whitworth-street, and an oblique frontage on the fourth side (328 ft. 6 in. long) to Fairfield-street. All the angles were to be splayed, the length of the splays varying from 6 ft. to 15 ft. The area of the site is 5,632 square yards. The

buildings shown on the so-called "sketch plans" are about 36 ft. wide, and are arranged around the site so as to enclose a large yard or quadrangle for drill and other purposes. The principal entrance to this yard is shown in the centre of the London-road frontage, the space to the right being devoted to the gymnasium, and that to the left to the library and bank. The end of the gymnasium forms the extreme left of the Whitworth-street front, and is followed by the three loose boxes and the repairing shops. The police-station extends from these to the junction with Commerce-street. The ambulance-station is in the middle of the short front towards the latter street, and nearly the whole of the Fairfield-street front is devoted to the fire-engine house and rooms appertaining to it. The second officer's house is at the obtuse angle formed by Fairfield and Commerce streets, and the stairs to the chief officer's house are close to the bank at the London-road end of Fairfield-street.

The first premiated design (No. 23), by Messrs. Woodhouse & Willoughby and Mr. John Langham, of Manchester, follows this arrangement pretty closely. The principal alteration is in the location of the gymnasium, this being placed with the end to London-road and the side to Whitworth-street, instead of *vice versa*. This involves the removal of the repairing shops from the Whitworth-street to the London-road front. The police-station is in the position shown in the sketch plans, but the arrangement of the cells is altered so that each has an external wall in which a window is placed. This is decidedly an improvement. The stairs to the firemen's tenements and duty and recreation rooms are also designed with less wasted space on the landings. The tenements themselves, however, which are arranged on three floors over the fire-engine house, &c., are not improved; in the sketch plans the pantries are against the external walls and can therefore be lighted and ventilated, while in the accepted design they are in the middle of the building; the direct entrance from the balcony to the living-room is also less satisfactory in some respects than the passage arrangement suggested; and the central L-shaped hall or lobby in the middle of each tenement can scarcely fail to be dark and dirty. The policemen's tenements, which are not shown on the sketch plans, are more satisfactory; they are placed over the police-station, two on the first floor, three on the second, and one on the third, and are conveniently entered from the staircase landings and balconies. The remainder of the third floor over the police-station is given to the policemen's billiard-room and laundry, and the playground for policemen's children.

The library and bank are well planned, and the chief fire-brigade officer's house occupies the first and second floors over the latter. In order to provide a symmetrical front towards London-road a third story has been placed over the bank, &c., and allotted to bachelors' quarters. In the answers to competitors' questions it was distinctly stated that "no provision is to be made for single men."

The elevations are in the familiar type of English Renaissance, and each of the four has been carefully considered, which is more than can be said of many of the designs. The London-road front, which is the most important, has a slightly projecting central feature, containing the large arched entrance to the drill-yard, with an ungainly oriel over; columns and pilasters on pedestals run through the second and third stories, and the cornice is surmounted by a nearly semicircular pediment, above which is an equestrian group. There are four bays (with coupled columns in the second and third stories) on each side of the central feature, and beyond these are other projections (with rusticated quoins) rising one open story above the main cornice and terminated with semicircular domes. This group occupies the greater portion of the front, and has a rusticated ground story with wide, flat-arched windows; two windows are placed in the plain first story, over each ground-story window; above these, between each pair of pedestals supporting the coupled columns, there is a wide and low single window with semicircular arch; and in the third story the windows are again double and ornamented with the inevitable chesses and tea-chests. To the right and left of the main group are recessed portions with mansard roofs, the cornice being a story lower. These lower portions are terminated by octagonal turrets rising to a considerable height. So far the elevation is symmetrical, but beyond the

left-hand turret a portion over part of the bank is carried up to the central level, and crowned with an octagonal central cupola. The main cornice, except where the mansard roofs occur, is surmounted by a balustrade. The design bears evidence of careful consideration, but the pedestals supporting the coupled columns might with advantage be omitted; the second-floor windows are not of pleasing proportion; and the two gables enclosing semicircular lights (one in the centre of each curb roof) are quite out of character. The Whitworth-street frontage is more satisfactory. The grouping is quite different; at the middle and ends are portions with curb roofs, and between these are two higher and slightly projecting masses of six bays each, the end bays being brought forward and ornamented with columns and semicircular pediments. The ground story of the Fairfield-street frontage is very well designed, but the upper part is marred by the oval windows, nearly 8 ft. wide, and the projecting portions are over-windowed for satisfactory effect. The design as a whole is, however, well considered. Variety is given by the different massing of the four elevations, and the authors may be trusted to make improvements in detail during the preparation of the working drawings. Two bays are shown to a larger scale; the details are restrained and correct, but somewhat lacking in distinction.

The second premiated design (No. 25) is the work of Mr. George Watson, of Edinburgh, and, as regards the planning, follows the sketch plans still more closely than the accepted design. The prisoners' cells in the police-station are arranged (as in the sketch plans) in the middle of the building, with the corridors between them and the external walls, and are without direct light and air. The policemen's tenements are badly planned, being entered on two floors from narrow L-shaped corridors without windows; what these corridors will be like may be gathered from the fact that the long leg of each has a length of 90 ft., and the short leg 42 ft. Two of these tenements have the living-rooms and offices on the first floor, and the bedrooms on the second floor, the latter being approached by private flights of stairs.

On the first floor the doors of two tenements must be passed to reach the third. The elevations are simpler than those of the first premiated design. Some portions of the building are only three stories high, and the main cornice is carried round the whole building at the same level—that is to say, above the second-floor windows. This cornice has a plain frieze and no architrave. The detail is coarse, and there are some unhappy features, such as the heavy columns, 19 ft. high (rusticated in the lower parts), carried on orbels. The central feature of the London-road frontage is bald. The Whitworth-street frontage has for its central projecting feature an uninteresting mass of walling, with small windows to the stables on the ground floor, and slits to the hay and provender stores on the first and second floors; above is an attic story containing five wide arched windows and crowned with a pavilion roof and cupola. The apparent uniformity of height on either side of this attic story is deceptive, as the roof to the left is a curb roof, while that to the right is of ordinary pitch. The Fairfield-street front is more Dutch in character, and does not harmonise well with the London-road front.

The third premium has fallen to Messrs. Mangnall & Littlewoods, of Manchester. Their design (No. 10) follows the sketch-plans very closely. The tenements are slightly altered, the living-rooms being entered directly from the balconies, and the rooms being grouped around small dark lobbies in the middle, after the manner of the accepted design. A curious feature is that the first-floor tenements in Fairfield-street are *cut into*, the bedrooms and living-rooms of successive tenements having doorways between them; probably this is intended to show how a bedroom can be taken from one tenement and added to another, as circumstances may require. The planning has not been sufficiently considered in connexion with the elevations, with the result that the external grouping has a haphazard appearance, quite out of character with the Renaissance type of architecture adopted. This defect is most marked in the most important frontage, namely, that to London-road; the left-hand third of this front is a story lower than the remainder, and no attempt has been made to treat the whole as one dignified composition. The

Whitworth-street front is more satisfactory, although the different treatment of the police-station, with the floors at a lower level than the rest of the building, may be objected to. The authors have been most successful with the Fairfield-street elevation; this has a four-storied portion occupying about three-fourths of the length, but not quite in the middle of the front; the end portions are a story lower. The central part has high-pitched gables at the middle and ends, the former being flanked by wide bays of small projection carried up an additional story and crowned with lofty octagonal roofs and cupolas. The upper portion of the hose-tower is picturesquely designed. Indeed, the detail generally is good, but the design is marred by unsatisfactory grouping.

After proceeding so far in his task, the first thought of the reviewer is that the remaining designs must be either commonplace or costly to have been passed over in favour of the three premiated designs, and this thought is in the main corroborated by inspection. Very few indeed of the twenty-two rejected designs are of striking architectural merit, and these have probably been rejected on account of the cost, as estimated by the quantity-surveyor, being in excess of the limit imposed. Design No. 1 is decidedly original both in plan and elevation. The gymnasium is placed in the middle of the London-road front, with the library and bank to the right, and the electrician's room and offices to the left. The engine and ambulance houses open into Fairfield-street, and the yard entrance is in the middle of the Whitworth-street front with the hose tower by the side of it. The chief officer's house is much too large, the drawing and dining rooms are 29 ft. by 20 ft., with bay windows in addition, and seven bedrooms, two bathrooms, three water-closets, sitting-room, box-room, kitchen, &c., are also provided. Thirty-five complete tenements are provided for the firemen, and seven for the police, in addition to officers' quarters. The instructions asked for accommodation for thirty-five firemen and six policemen, and certainly seemed to indicate that complete tenements must be provided for all; the accepted design contains only twenty complete tenements for firemen. The elevations of design No. 1 are well conceived and admirably drawn. The three principal elevations are symmetrical with the exception of a tower at the left-hand corner of the London-road front, and show a dignified treatment, rusticated masonry being largely used and well-designed, carving being introduced in broad masses. This is a good design, but the author cubes it out to 1,717,365 ft., an amount considerably in excess of the first premiated design. The price allowed for the latter is 1s. a cubic ft., and for the former, 10s. 6d.

No. 3 is an attractive set of drawings, but the engines are placed in Whitworth-street, and the drill engine-room is separated from the gymnasium. The author has thoroughly grasped the problem of the elevations, and has obtained a symmetrical and dignified front to London-road; a concave recess is planned, in the middle in which the archway (two stories high) leading to the yard is placed. The ground story is rusticated with segmental arches to the windows; massive columns run through the next two stories, and the main cornice is surmounted throughout the greater part by a mansard roof. The central tower is, however, weak, and the order adopted is not well proportioned. The fronts to Fairfield-street and Whitworth-street are more thoroughly Georgian in character, and of considerable interest.

The elevations of No. 8 are very elaborate and costly, but without freshness, and somewhat feebly drawn.

No. 10 shows a knowledge of Mr. Aston Webb's design for the Birmingham Law Courts, but "the little more and how much it is, and the little less and what worlds away."

The Fairfield-street elevation of No. 11 is the most successful of the four; the treatment is simple and generally refined.

Design No. 12 can only be regarded as a joke, and we trust that the Corporation will show their sense of its unfitness by withholding the two guineas which the author paid for the conditions of the competition.

The acute angle between London-road and Fairfield-street is cleverly planned in No. 14, but the elevations are rather heavy and costly.

No. 16 is shown in a set of wash drawings, which as far as draughtsmanship is concerned

are decidedly the best submitted; no attempt has been made at symmetry, but the design is interesting throughout. The chimneys brought to the front of the buildings are, however, a mistake; they are diamond-shaped in plan, measuring about 7 ft. by 5 ft., and rising 24 ft. above the main cornice and about 10 ft. above the top of the parapet. The design is effective but costly. The cubical contents are about 2,500,000 ft.

No. 18 has the gymnasium in the middle of the London-road front, and the yard entrance in Whitworth-street. The tenements are ingeniously altered from the sketch plans, but the bathrooms entered from the balconies would not be appreciated. The elevations are of a pleasing character, and neatly drawn.

It cannot be said that the designs as a whole reach a high level. A commendable feature is that the authors' reports are appended to the drawings, but the authors' names are not given.

#### CONTINENTAL OPINION AND PRACTICE IN REGARD TO CEMENT TESTING.

THE third Congress of the International Association for Testing Materials was held in the Hall of the Royal University of Technical Sciences at Budapest, from September 9 to September 14. At this Congress a number of papers by representatives from different countries were read in regard to cement and cement testing. The following *resumé* of the contents of some of these has been forwarded to us from Budapest, and may be of interest as showing the state of opinion and practice on the Continent:—

In Germany especially the increase in the manufacture of cement has been enormous, and from the latest statistics it is to be feared that foreign cements, chiefly of German and Belgian origin, are supplanting the products of English manufacturers, even in England. During the first nine months of this year the imports of cement into Great Britain amounted to 156,760 tons against 79,439 tons for the corresponding period of 1900. The import of foreign cement into London has increased during the nine months by 244 per cent., although the neighbourhood of London abounds in the necessary raw materials. This seems to indicate that the English cement industry is not in a state of progress, and that English manufacturers must seek cheaper methods of production and possibly, at the same time, endeavour to produce better material.

The only paper presented in English, and the one which deserves the first consideration, as it directly affects a large number of English manufacturers, was one on "The Constancy of Volume of Cements," by Mr. Bertram Blount, of London, Cement Chemist and Expert to the English Admiralty and to several Colonial Governments. The author described a form of hot test for Portland cement which in its qualitative form has been long applied to cement to be used in the construction of harbours and other public works. It is proposed to adopt the test in its quantitative form as follows:—A bar of neat cement is exposed to the influence of water at 45 deg. C., and the expansion observed by means of the Bauschinger apparatus. A good cement should remain absolutely free from cracks and expand not more than 2 per cent., attaining constancy of volume in seven days. Experiments with sixty-eight specimens of cement, produced by five leading English manufacturers, gave satisfactory results in twenty-nine cases.

Commenting upon this paper, Professor Tetmajer, of Zurich, President of the International Association, and the best known authority on the Continent, observed that a hot test for cement was already adopted by the Swiss Federal Government, and of 127 specimens tested in his laboratory, which had fulfilled the requirements of the usual mechanical tests, only three failed under the hot test.

Mr. Blount's paper was eventually referred to a sub-committee of the International Association.

It should be mentioned that the opinions expressed in the papers read by experts of different nationalities indicate that a form of hot-water test will be included in the specifications for Portland cement to be discussed at the next Congress, especially in the case of cement required in the construction of harbours and in other heavy work.

Professor H. Le Chatelier (Paris), in a paper on "Simplified Rapid Tests for Cements," discusses four methods which may be used for the acceptance, but should not be taken to warrant the rejection, of cement. The fineness of the cement can be tested by the sieves with 900 and 4,900 meshes to the square cm. The nature of the particles, which are so fine as to form a dust, is determined by observing the quantity of water required to produce a paste of a certain consistency. The time of setting can be readily ascertained by means of Vica's needle or simply by pressure with the thumb. The setting is ended when no impression is left on the surface of the cement by the needle or the thumb. For determining the constancy of volume, a hot-water test may be employed. If placed in water at 100 deg. C., lime ceases to expand after three hours and magnesia after six hours. Cement manufacturers complain, apparently with justice, that the hot-water test is too severe, and that a cement which has stood the cold-water test for twenty-eight days is good, whatever may be the result of the hot-water test. The author of the paper has already shown that irregular strains in cement disappear in the course of time, and it is easily possible that cements which, under the influence of heat when setting begins, disclose a certain quantity of free lime may prove suitable in practice. Hence this test cannot be used for the rejection of cement, but in case the cement stands the test it may safely be accepted. The test consists in exposing specimens prepared from normal paste to the action of water at 100 deg. C. after the paste has been allowed to set for twenty-four hours. The expansion produced is measured either by employing Le Chatelier's needle forms or by Klebe's needle process, or by noting the external change of form in the specimens. The maximum expansion should lie between 1 and 2 per cent. Every well-conducted Portland cement factory can supply products which will satisfy this test. With regard to the mechanical tests for ascertaining the strength of resistance to tensile and to compression forces, only one need be carried out, since they give practically corresponding results. As cement is only used with sand, it is sufficient to test a mortar consisting of one part by weight of cement and three parts by weight of sand. The sand employed is prepared by mixing three kinds of sand of different grain. In the case of Portland cement, slag cements, and quick-setting cements the test may be concluded after eight days, since these cements have in that time attained their maximum strength. The practice of using stamped specimens arose from the desire of the manufacturers to point to a greater strength of resistance in their products, but is in reality without advantage. Either the tearing test or the bend test may be employed, but the latter is accepted as being the simpler. Bars of section, 20 by 20 mm., are placed on supports 100 mm. apart and bent seven days after the process of setting is complete.

Mons. M. Mercier (Paris) compared the results of tension tests with bricks of the usual 8 shape and of bend tests with prisms, using three kinds of sand in preparing the specimens, and showed that the percentage average deviation calculated on the average of the results of six tests for each series, is smaller for prisms than for the bricks both for cement paste and cement mortars. The ratio of the resistance to tension and to bending is 1.10 for pure pastes of lime and of cement, and shows a tendency to increase when the specimens with the lapse of time become more solid. For mortars of lime and of cement the ratio is 1.7, and there is no tendency to increase in the case of tests of long duration.

Mons. L. Deval (Paris) described experiments proving that the presence of calcium sulphate occasions in hydraulic mortars an increase of volume which can exceed 100 per cent., the increase being due to the combination of the calcium sulphate with the tricalcium aluminate of the cement. Calcium sulphate has no action on a cement which contains no aluminium or which does not contain enough calcium for the aluminium to form a tri-calcium aluminate. Those cements most exposed to injury under the influence of calcium sulphate are aluminium cements of feeble hydraulic powers, such as Portland cements. He determined for the compound produced in the expansion the formula  $Al_2O_3 \cdot 3CaO_3(SO_3 \cdot CaO)$ .

A paper on "The Present State of Cement

Testing in Germany" was read by Professor Max Gary, Chief of the Building Materials Department in the Royal Mechanical and Technical Testing Institute at Charlottenburg, Berlin. To this paper were appended a number of proposals which gave rise to a lengthy discussion, ending with the adoption of a motion by Professor H. M. Howe (New York), who proposed the appointment of an International Commission to collect, so far as possible before the next Congress to be held in St. Petersburg in 1903, material for establishing normal tests and specifications for Portland cement which may be used in international commerce. The following is a brief outline of Professor Gary's paper:—

The tests for Portland cement as at present employed in Germany are based on "The Revised Rules for the Uniform Supplying and Testing of Portland Cement," published in 1887 by the Association of German Portland Cement Manufacturers. The Prussian Ministers for Commerce and Industry and for Public Works issued ordinances to their departments enjoining the observance of these Rules, and shortly afterwards the same Rules were accepted by all the States of the German Empire. In recent years some changes have been made, and a complete revision of the Norms is in contemplation. In 1882 the practice was begun of mixing finely-ground furnace slags with Portland cement, and consequently, in a preface to the Rules of 1887, Portland cement is defined as the product obtained by pulverising the shrunken mass resulting from the burning of an intimate mixture of substances containing lime and clay as essential constituents. Members of the Association are pledged not to bring into the market any other product than the above under the name of Portland cement. No foreign bodies may be added, either during or after the process of burning, except small additions to the extent of 2 per cent. required for regulating the time of setting. Members must submit their products to tests applied at the discretion of the governing Committee, and infringement of the regulation is followed by expulsion from the Association. Recently a number of new factories have been established, chiefly in connection with iron-works, which employ slag in the preparation of Portland cement. This slag it is important to detect, but unfortunately the methods proposed for this purpose are not readily applicable without special arrangements.

As the Rules are applicable only in the case of pure Portland cement produced in accordance with the above definition, a preliminary investigation must be undertaken to ascertain if impurities are present. If the raw materials are not properly chosen, defects arise principally from the presence of lime, magnesia, and gypsum. In good Portland cement there should be from 58 to 67 per cent. of lime and not more than 67 per cent., not more than 3 per cent. magnesia, and not more than 2 per cent. gypsum. The quantity of these three substances present can only be estimated by means of chemical analysis. As additions to Portland cement are employed, colouring matters, clay, sand, ashes, ground limestone, ground slate, hydraulic lime, trass, and silicates of lime, such as slag. These substances, with the exception of slag, are qualitatively detected without difficulty by determining the specific gravity, the rate of loss of heat, the action under the influence of diluted acids, &c. A reliable method of detecting admixtures of slag has hitherto been wanting.

For pure Portland cement Fresenius established the following limits:—

(a) A specific gravity of at least 3.125, and in any case not less than 3.1.

(b) A degree of alkaline strength such that a water solution containing .5 grammes of cement neutralises 4—6.25 c.c.m.  $\frac{1}{10}$  normal acid.

(c) An absorption of 18.8—21.67 c.c.m. of normal acid by 1 gramme of cement powder under direct treatment and in any case not materially less than this.

(d) An action in  $KMnO_4$  solution (1.589 g. of  $KMnO_4$  in one litre of water) so that 1 gramme of cement reduces from 0.79 to 2.8 milligrammes of potassium permanganate, and in any case very little more than this.

With the same  $KMnO_4$  solution Fresenius found that under a similar treatment 44.34—74.67 milligrammes of potassium permanganate were required for different kinds of slag powders, the difference arising from the fact that in Portland cement iron is present almost exclusively in the form of ferric oxide, whereas in slugs it is present only as ferrous oxide.

It has, however, quite recently become known that cements which have been burned in a revolving furnace or in the reducing flame likewise require the use of a considerable quantity of  $KMnO_4$ , although they do not contain slags. Therefore the  $KMnO_4$  test has no decisive value for proving the presence of high-furnace slags, and can only be used as a preliminary test.

In testing for slags the cement is treated with  $KMnO_4$ , according to the method of Fresenius. If less than 3 milligrammes are required for 1 gramme of cement, the cement cannot be suspected of containing slag; if more than 3 milligrammes  $KMnO_4$  must be used for 1 gramme of cement, then the cement can be:—

1. Cement from a revolving furnace (cement burnt in the reducing flame).
2. Cement mixed with high-furnace slag.
- (a) Made out of raw materials with pieces of slag added.
- (b) With slag added after the process of burning.
3. Cement to which slag has been added to form an intimate mixture before burning.

The cement is passed into a mixture of methyl-iodide and purified turpentine oil, possessing at 15 deg. C. a specific gravity of 3.01.

The light parts which swim in the fluid can be:—

- |                                      |     |      |
|--------------------------------------|-----|------|
| (a) Coal of average specific gravity | ... | 1.30 |
| (b) Gypsum                           | "   | 2.33 |
| (c) Coal slack                       | "   | 2.75 |
| (d) Furnace slag                     | "   | 2.94 |

With suitable fluids these different constituents can be separated.

The heavy parts which sink in the fluid of specific gravity 3.01 can be:—

- |  |        |
|--|--------|
| (e) Cement of specific gravity                               | 3.035. |
| (f) Iron from the furnace slag and different iron compounds. |        |

The Prussian Rules have fixed no definite limits for the weight of the cement required to occupy a unit of space. They only aim at fixing the gross and net weight of the casks of cement usually found in commerce. The weight of such a cask of cement should be 180 kilogrammes gross and 170 kilogrammes net, and for half a cask 90 kilogrammes gross and 83 kilogrammes net; 180 kilogrammes gross correspond to 400 English pounds. The size of the casks is not prescribed. It has, however, become usual to determine the space occupied by the cement both in a loose condition and when well shaken down. Unfortunately, a uniform method for determining this does not exist. The form of vessel used in measuring is not fixed, although this is important, especially if the cement is in loose condition. Professor Gary recommends a litre measure of about 124 mm. diameter. For filling the measure a funnel with a sieve fixed in the lower orifice should be used.

Portland Cement may be of such a nature that it does not set in less than two hours, and is then described as slow-setting. Quick-setting cement sets in less than two hours. To ascertain the time of setting, pure slow-setting cement is stirred three minutes and quick-setting cement one minute in water until it forms a stiff paste. This is put on a glass plate to form a cake about 1.5 thick in the middle, but becoming thinner towards the edges. The degree of fluidity required for producing this cake shall be such that the paste, placed on the glass plate by means of a spatula, first begins to run towards the edges after the glass plate has been several times shaken, for which purpose, in most cases, 27 to 30 per cent. water suffices. As soon as the cake is hardened to such a degree that it resists a light pressure with the finger-nail, the cement must be regarded as set. For determining more accurately the time of setting and for fixing the moment when setting begins, a normal needle is employed, which weighs 300 gr. and has a cross-section normal to the axis of 1 square millimetre. Then a metal ring 4 cm. in height, and with a diameter of 8 cm., is placed on a glass plate filled with the cement paste of the above-mentioned fluidity, and placed under the needle. The moment in which the normal needle can no longer completely penetrate the cake of cement is to be taken as the beginning of setting. The time which elapses until the normal needle leaves behind on the hardened cake no visible impression is the time of setting.

This process possesses so many defects, that the Association of German Portland Cement Manufacturers, in common with the Testing

Institutes of Charlottenburg and Stuttgart, are engaged in seeking for a more reliable method.

The decisive test for constancy of volume is as follows:—A cake of pure cement is placed on a glass plate, and then after the lapse of twenty-four hours, or after the process of setting is complete, put under water. If during the process of hardening under water deformations or cracks appear on the edges of the cake, this indicates "working" of the cement. This is, as a rule, already visible on the third day of observation, and at all events an observation extending over twenty-eight days is sufficient. The objection to this test is that it requires too much time for the "working" cement to be recognised, and it is rarely possible to wait long enough to allow of a decisive result being obtained before using the cement. Hence the necessity of a more rapid method of determining the constancy of volume. The different hot tests proposed by Michaelis, Heintzel, Tetmajer, Maclay, Deval, Erdmenger, &c., are not decisive because they frequently characterise cements of inconstant volume as constant, and lead to cements perfectly suitable for building purposes being suspected of not possessing constancy of volume. These tests cannot be used for rejecting cement, but are advantageously employed for roughly testing products in the factory, for cements which must possess a special degree of constancy for particular purposes (vessels for hot substances, fine cement articles, large structures lying exposed to the air, &c.), and for testing cement which contains magnesia. Bauschinger's apparatus as improved by Martens is employed for measuring the expansion, and occasionally Kiehl's method, in which is used a measuring-rod inserted between two needles fixed at a certain distance apart while the cement is still soft.

With regard to fineness, the Prussian Rules prescribe that Portland cement shall be so finely ground, that if tested with a sieve of 900 meshes to the square centimetre, and such that the thickness of a wire shall be equal to half the space between two consecutive wires, there shall remain on the sieve at most a residue of 10 per cent. The degree of fineness required by this regulation is inadequate in the present state of the German Portland cement trade. The tests carried out at the Charlottenburg Institute show that most German cements leave a very small percentage of residue on the sieve of 900 meshes per square centimetre, and cements which leave more than 20 per cent. residue on a sieve of 5,000 meshes to the square centimetre are very rare. For such a degree of fineness it is impossible to obtain sieves of identical uniformity of structure. Moreover, it appears from recent researches that the finest ground cements, if kept lying in stock, undergo a further refinement to an extent altogether indeterminate by means of sieves, but which is apparent from the change in the weight of powder in a loose condition required to occupy a unit of space. It will be necessary to give up this sieve method, and have recourse to the wet method or to sifting with wind.

The binding force of Portland cement is determined by testing a mortar consisting of three parts by weight of a normal sand and one part by weight of cement. The test is carried out after a uniform method by applying tensile and compression forces with the same apparatus to bodies of similar shape and the same sectional area. Professor Gary proposes to discard the minimum limits of solidity hitherto accepted, or furnish them with a new mark by which the cementing limit between cement and sand would be expressed in such a manner that it could be seen which cement attains a certain solidity with the highest proportion of sand. The normal sand employed is procured by taking pure quartz sand and passing it through a sieve of 120 meshes per square centimetre, the thickness of the wire in the sieves being .32 mm. The normal sand is taken from the Hammorthal pits in Freienwald.

The Prussian Rules prescribed that the cement and sand should be mixed with 10 per cent. of water, but with cements so finely ground as is now usual in Germany, 10 per cent. water is almost always too much. It is necessary to ascertain the quantity of water which can most advantageously be employed in mixing the cement. To obtain uniformity in mixing, the Steinbrüch-Schmelzer apparatus is employed. The mortar is worked up with 8 per cent. and 10 per cent. of water in moulds provided with grooves, and it can be seen

which quantity is more suitable from the circumstance that with the proper quantity of water cement paste should begin to flow in the grooves after 90-100 blows. The quantity of water thus ascertained is used in preparing the specimens for the resistance test. For hammering the specimens intended for the tension and compression tests, Böhme's apparatus, carrying a hammer of 2 kilos, is used, and every specimen is subjected to 150 blows. These hammers are tested in the Charlottenburg Institute to ensure uniformity. With regard to the form of specimens tested, those subject to the tension test have a section of 3 square cm. at the surface of rupture, and the compression test is carried out with cubes, of which each side contains 50 square cms.

The Prussian Rules advise the compression test as the standard test for resistance, as mortars in practice are usually subjected to compressive forces. It has, however, become customary to judge Portland cements exclusively by the tension test, as this can be more conveniently carried out. The effect is that German cement factories, for the most part, guarantee a fixed degree of resistance to tension in the (1 by 3) mortar, and a high resistance to tension is sought for regardless of durability. The Association of German Portland Cement Manufacturers has this year decided to give the compression test the first place, as this test gives more reliable results than the tension test. Professor Martens has shown that the probable error varies in tension experiments, on an average, between  $\pm 3$  per cent. and  $\pm 5$  per cent., and in compression experiments the error varies only from  $\pm 1$  per cent. and  $\pm 3$  per cent. The decisive test is carried out after twenty-eight days, although there is usually a preliminary test after seven days. A specimen made with three parts by weight of normal sand and one part by weight of cement should, after hardening for twenty-eight days—one day in the air and twenty-seven days in the water—have a minimum resistance to tension of 16 kilos per square cm., and a resistance to compression of at least 160 kilos per square cm. These figures are higher than those of all other countries, but still too low for the present state of the German cement industry, which owes its prosperity to the careful observance of the Rules and the perfecting of the methods of testing.

It may here be mentioned that, on the invitation of the Russian Minister it was decided to hold the next Congress of the Association at St. Petersburg in September, 1903.

Among the 1,748 members of the Association are 418 Russians, 363 Germans, 232 Austrians and Hungarians, 166 Americans, 97 Frenchmen, and 87 Englishmen.

#### THE SURVEYORS' INSTITUTE.

An ordinary fortnightly meeting of this Institute was held on Monday at 12, Great George-street, Westminster, Sir J. Rolleston, President, in the chair.

The minutes of last meeting having been read and confirmed, and Mr. J. W. Penfold, hon. secretary, having read a list of donations to the library and library fund.

Mr. A. Dudley Clarke read a paper on "The Final Report of the Local Taxation Committee." The terms of reference to the Commission were: "To inquire into the present system under which taxation is raised for local purposes, and report whether all kinds of real and personal property contribute equitably to such taxation; and, if not, what alterations in the law are desirable to secure that result." The Commission sat for the first time on March 11, 1897, and its work resulted in the examination of 162 witnesses and the publication of eight volumes of evidence and memoranda, in addition to three Reports. The further Reports, dealing with Scotland and Ireland, have not yet been issued. There has not been unanimity of opinion amongst the members of the Commission, but there has been substantial accord on several important issues. The Report of the Majority (Lord Balfour of Burleigh being the Chairman) is signed by twelve out of the fifteen members of the Commission, but there are reservations on the part of some of them to some portions of the Report. Those of the Chairman bring him nearly into line with the views of the Minority Report. There is also a separate Report on Urban Rating and Sites Values, and a Report by Judge O'Connor, who dissented from all his colleagues.

The author dealt with the Reports in a

long and able paper, but the subject does not come sufficiently within our province to be noticed at greater length in our pages. A hearty vote of thanks was accorded to the author on the motion of Mr. Sabin, seconded by Mr. G. S. Mathews, and the discussion was adjourned until January 27. The next meeting will be held on December 9, when a paper will be read by Professor Somerville on "Artificial Manures."

#### THE INSTITUTE OF BUILDERS.

MR. WOODMAN HILL gave a lecture (illustrated) entitled, "Submarine Construction by Diving and other Compressed Air Methods: Cylinder Sinking and Tunneling under Compressed Air," in the Drawing-room of St. James's Hall, Piccadilly, on Wednesday, the 20th inst.

There was a large attendance of the members of the Institute of Builders, their friends, and representatives of the various branches of the architectural, engineering, and surveying professions. Mr. Charles Wall, President, occupied the chair.

The following is an outline of the lecture:— After briefly tracing the development of diving from the days of Aristotle to the time of the open-helmet dress, first constructed in 1830, in the employment of which the lecturer subsequently had actual personal experience, he minutely described and illustrated the modern appliances used for diving, the various circumstances under which diving operations are undertaken, and gave valuable information as to the depths at which they are practically possible, and the type of men suitable for this class of work. He also referred to the attempts made to use artificial light under water, to the expedients used for establishing efficient communication between the diver and the surface, and to the great improvements made in this respect after the introduction and perfection of electrical appliances, improvements which would have been impossible without them. A complete modern diving-dress, and helmet fitted with a telephone apparatus, and also a relic of former days in the shape of an original open helmet made by Deane, were to be seen in the lecture-room. The advantages and disadvantages of bell work were then discussed and compared with the work of the individual diver, illustrations of actual works accomplished by both systems being given and explained; these were notably the building of the foundations for the Spithead Forts, the constructions of the foundations for the circular heads of the defensive harbour at Portland now in progress, and a typical example of a sea wall of concrete blocks founded on concrete in bays.

Works constructed of concrete blocks weighing thirty to forty tons apiece, and the positions in which they are necessarily and successfully employed, were next dealt with, and the respective merits of staging with steam winches and of Titan travellers compared; illustrations being given of the staging, travellers, and bells employed in the construction of the various piers and breakwaters at Folkestone and Dover, and of a Titan traveller employed on a Russian breakwater, and the Titan setting the last block of the detached Mole at Gibraltar.

The chapter dealing with this branch of submarine work was concluded by referring to the construction of piers and breakwaters in the open sea by means of concrete in mass deposited in casings or large bags, almost all examples of which have proved unsatisfactory, Mr. Hill giving it as his opinion that, to construct submarine foundations in mass concrete successfully, would require it to contain so large a proportion of cement that the work would be as expensive as building with concrete blocks in which the ordinary proportions of materials were used, and always more risky to execute.

Reference was then made to the rectification and deepening of the channel at the entrance to the Hamoaze at Devonport, which was entrusted to, and has been executed by, the speaker's firm, and which necessitated the removal of portions of shoals, covering in the aggregate an area of more than 30 acres, the depths of which varied from a few inches to 20 ft., and which consisted almost entirely of limestone and shillet rock. The drilling barges, boring appliances (used in a bell worked with compressed air), and dredgers, which were specially designed and constructed for the

GREEN PARK

Proposal for a Road Parallel to Piccadilly.

—H. L. Florence, Architect—

work, were illustrated, but only very briefly described as not coming within the scope of a paper on construction.

What may be described as land works requiring the employment of compressed air, on account of more or less percolation of water through the strata to be dealt with, were then briefly entered into, and the methods of cylinder sinking by the compressed air process, and the employment of these methods in dock work and continuous quay-wall work abroad were explained and illustrated; the instances mentioned were the construction of the foundations of the harbour of La Pallice at La Rochelle in France, the wharf walls in the Garonne at Bordeaux, and also dock work on a large scale at Genoa; the author expressed his opinion that foreign engineers were much in advance of English ones in the employment of these methods.

Reference was then made to the dock works at Keyham, where a portion of the main outer sea-wall is being built upon concrete columns sunk to the depth necessary to secure a solid foundation by novel and interesting methods. The lecturer concluded his paper by speaking generally but briefly of what he described as horizontal cylinder driving or tunnelling by compressed air methods, as found necessary in the gravelly and sandy portions of the City and South London Railway, the Waterloo and City Railway, the Tower Subway, and also in connexion with the completed Blackwall Tunnel, which he described as the finest work of the kind in existence.

The President thanked Mr. Woodman Hill for his able and interesting lecture, and a cordial vote of thanks, moved by Mr. T. F. Rider, seconded by Mr. John Greenwood, was passed to him.

#### COMPETITIONS.

**DISPENSARY, LEEDS.**—The designs of Messrs. Bedford & Kitson, architects, of Leeds, have been accepted for the new public dispensary for Leeds, to be erected in Hartley Hill, North-street. The present building is to be demolished in connexion with street improvements.

**PAVILION, LLANDRINDOD WELLS.**—In the competition for pavilion, laying out recreation-ground, &c., Llandrindod Wells, the first premiated design was by Messrs. R. Wellings Thomas & W. Alec Millward, Llandrindod Wells. The second premiated design was by Mr. J. H. Williams, Worcester; and the third by Mr. E. P. Morris, Llandrindod Wells.

**BUILDERS' CLERKS' BENEVOLENT INSTITUTION.**—At a special general meeting on the 26th inst., Mrs. Sarah Gough was elected to a full pension of a widow, 2*l.* per annum. Mr. Wm. Seymour was also elected to the builders' clerks' pension of 30*l.* per annum.

**CORNWALL COUNTY ASYLUM EXTENSION.**—At Cornwall County Asylum, on the 21st inst., Major C. E. Norton, R.E., held an inquiry on behalf of the Local Government Board into the application of Cornwall County Council for an extension of their borrowing powers and for permission to borrow 105,000*l.* for the extension of the asylum. Mr. Coward, Clerk to the County Council, explained that for the extension of the asylum 105,000*l.* would be required. The tender of Messrs. Pethick Bros. was for 87,973*l.*, the cost of furnishing was estimated at 8,000*l.*, and drainage 20,000*l.* Treadwell informed the inspector that the stone to be used was local stone, and Mr. Coward observed that the period of the loan would be as long as possible. There was no opposition.

#### PROPOSAL FOR A NEW ROAD PARALLEL TO PICCADILLY.

THE accompanying plan has been prepared to show an alternative scheme to the official proposal already before the public in regard to the relief of the congested traffic in Piccadilly. The inadequacy of the method suggested to widen Piccadilly by taking a strip of the Green Park up to Walsingham House has been pointed out in most of the organs of the Press, and the practical result of this scheme would be to create a worse block than at present exists where the narrow part at Berkeley and Arlington streets commences.

As a means of obviating this difficulty it is proposed to continue the line of Jermyn-street and Bennett-street by a road parallel to Piccadilly, through the Green Park, to a junction with Constitution Hill at the Wellington Arch.

Only one house in Arlington-street would have to be acquired to open out this route; the public underground conveniences, recently constructed at great cost, facing Devonshire House would not be interfered with; the new road, being generally at a lower level than Piccadilly, would not seriously diminish the attractiveness of the Park; comparatively few trees would have to be removed; and the present Piccadilly pavement, trees, and railings would be unaltered.

This duplicate line of transit east and west could not fail to attract the carriage and cab traffic, thus greatly relieving the overcrowding from Hyde Park Corner to Piccadilly Circus, and although this road would, like Constitution Hill, be closed at night, no inconvenience would result therefrom, as the congestion only exists in the daytime.

An additional relief would be afforded by the entrance to the new road through gates facing Hamilton-place.

It is to be hoped that the authorities may yet give further consideration to this matter before deciding upon carrying their present plan into execution.

H. L. FLORENCE.

#### ARCHITECTURAL SOCIETIES.

**EDINBURGH ARCHITECTURAL ASSOCIATION.**—New rooms have been acquired for this Association. They are situated at No. 117, George-street, on the first floor, and consist of two large apartments. The room to the back forms the meeting-room for lectures, while the front room is the reading-room. The rooms have been improved, electric light introduced, and completely redecorated. It is intended that the front room will be used as a sort of clubroom where members may consult the books in library and the professional journals. Stationery is also provided for use. Smoking will also be allowed in this room.—At the last meeting of the Committee of Management it was resolved to present a testimonial to Mr. Thomas Fairbairn in recognition of his long service as Honorary Secretary to the Association, and to invite subscriptions for the same. Subscriptions to be payable to Mr. John Johnston, C.A., Hon. Treasurer, 28, Dundas-street.—The Council have had under discussion the designs for the new buildings, proposed to be erected at the Castle, and recently exhibited in the City Chambers. After having inspected the plans, the site and the probable effect from various points of view, and having fully considered the question, they resolved as follows:—"The Council desires to express its sense of the courtesy of

the War Office in giving the citizens an opportunity of seeing and discussing what is proposed to be erected on a site so unique in position as Edinburgh Castle. The Council feels most strongly that a site of its commanding position demands the most careful and skilful consideration, and although it is evident that no little attention has been directed to the preparation of the designs, the Council observes with great regret that from any point of view the outline of the great mass of the Castle and its buildings will be disfigured; and, further, that the general designs do not commend themselves as being in harmony with the better work on the Castle Rock. The Council trusts that, as this question is one of very great and permanent importance, nothing will be done without further serious consideration."

**LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.**—The first meeting of the winter session of the Leeds and Yorkshire Architectural Society took place on the 21st inst. at the Queen's Hotel, Leeds. Mr. Butler Wilson, President, occupied the chair. During the evening the prizes were distributed to the successful students. For the best measured drawing work the prize was given to Mr. S. R. Day, of Skipton. To Mr. J. Hinchcliffe, formerly assistant with Mr. Bowman in Leeds, and now of Chorley, in Lancashire, four prizes, making a total of eleven guineas, were presented. One was for the design of a village church, another for the construction of a village church roof, a third for the best essay on ancient ecclesiastical architecture in Leeds, and a fourth for sketching. A letter was read from Mr. George Corson presenting to the Society the portrait of himself which had been given to him by the members of the Society. Mr. Corson was the Society's first president when it was founded twenty-five years ago, and it is partly in commemoration of that fact that the painting, which is by Mr. H. Willson, was subscribed for. The gift was gratefully accepted. The President, in his inaugural address, said the Council of the Society had suggested that, in the event of the Leeds Queen Victoria Memorial Committee deciding to place the proposed memento in Victoria-square, the area of the square should be increased, and that an architectural laying out of the square should form an inseparable part of the scheme. A resolution to this effect had been forwarded to the Lord Mayor, and there was every reason to hope that it would receive consideration. To students he would say that in these days of accumulation of material things the great requisite for success was enthusiasm. The means of education to-day opened out a path by which students might follow in the footsteps of the authors of the greatest architectural achievements. The Royal Institute of British Architects, with which the Leeds and Yorkshire Society was allied, had over 1,740 members, and there could be no better foundation for an architect's education than the working for the qualifying examination of the Royal Institute. Dealing with the progress and outlook of the profession, Mr. Wilson observed that any man who left this country twenty, or even ten, years ago was amazed on his return at the changes that had taken place in our towns and cities. There had been a vast increase of population and education, and, it followed, a greater amount of accommodation had been required for intelligent persons, so our great towns and cities had turned in their sleep, and were now in the process of rehabilitation.

Already the principal streets of our cities were overcrowded and almost impassable, and the necessity for subways was suggested on all hands. "In this wholesale reconstruction," the President proceeded, "we see the danger of uncontrolled action, and we, as being principally concerned in the responsibility, will have to take strong measures in dealing with the danger. Our cities are of themselves undergoing great transformations—they are in closest touch with each other by railway, and also in many cases electric traction is establishing the greatest intimacy between them and their neighbouring villages. Most of the reconstruction seems to have been carried out without plan or system, or any consideration for the ultimate development. No thought is given for providing great arteries of communication from centres to outlying districts; architectural treatment is uncontrolled; owners and builders seem to have had carte blanche for ugliness. I would suggest that these conditions ought to be effectively dealt with, and that schemes be prepared for the probable and ultimate development of our cities and towns consequent on their rebuilding, proper sites for future public buildings being carefully selected; that provision be made for subways; and that the insanitary areas be cleared in accordance with such schemes; so that the whole may be homogeneous as well as conglomerate." The formation of County Councils in place of rural and urban authorities was resulting in the erection of public institutions, county halls, hospitals, and asylums. These designs were often inadvisably obtained by competition, perhaps a clumsy and costly means of obtaining the best results, and certainly very costly so far as the profession of architecture was concerned, for the conditions of competition were usually unfair and unreasonable, and even in the event of an architect winning a competition, it did not always follow that the execution of the work was entrusted to him. The subject was, he was glad to say, receiving very serious attention.—Mr. H. Perkin proposed a vote of thanks to Mr. Wilson for his instructive address. Mr. W. H. Thorp, in seconding, said that within a few weeks the Society would reach the twenty-fifth anniversary of its foundation. The presence of so many young members of the profession that evening augured well for the Society's future. The President having acknowledged the compliment, the remainder of the evening was devoted to a smoking concert.

**MANCHESTER SOCIETY OF ARCHITECTS.**—At the Queen's Hotel, Manchester, a few days ago, the annual dinner of the Manchester Society of Architects (Incorporated) was held. Mr. Alfred Darbyshire, the President of the Society, presided. The President, in proposing the toast of "The Royal Institute of British Architects," spoke of its numerical growth. He could not help referring to the fact that some fourteen or fifteen years ago the designs of Mr. Emerson, the President of the British Institute of Architects, were chosen in the competition for a cathedral at Liverpool as being the best. The organisers of the Liverpool Cathedral scheme had now decided to build it on another site, and it was one of the most regrettable incidents which had occurred in their profession that Mr. Emerson had decided not to compete again.—Mr. Emerson, in replying, said that, in connexion with this matter of the Liverpool Cathedral, he had been surprised to see a statement that it was to be sincerely hoped that the genius of the country would produce a building in a new style. He could not help thinking that such remarks were calculated to do an enormous amount of harm and cause a deterioration in architectural progression. No doubt there was a very considerable striving after originality at the present time, but, unless one could show that it was better to diverge from known principles and known proportions, it was better to stick to the old lines.—Mr. E. Salomons, who proposed the toast of "The Corporation of Manchester," said that the Improvement Committee was not an originating committee. It never seemed to have a grand scheme in hand. It was always widening Cross-street by 6 ft., or Market-street by 2 or 3 yds.; but never, in his fifty years' experience of Manchester life, had he seen any really grand scheme put forward in Manchester. He had been abroad a great deal and seen what they had done there in the setting up of boulevards, particularly in the case of Brussels, where a grand boulevard had been made 250 ft. wide, with two rows of trees on each side of it. Of course, in Manchester

they could not grow trees, but he had never seen such an idea put forward in regard to Manchester; they had never had any suggestion of that kind; nothing but merely the widening of streets. He hoped that under the régime of the present Lord Mayor of Manchester they would see some such scheme for the development of Manchester which they had never seen before. He had also been informed that it was proposed by the Manchester Corporation to appoint a city architect, and not merely a city surveyor or engineer. They had felt the want of it for many years, and he believed it was on the  *tapis*  that such a man would be appointed. He trusted that, under the guidance of their Lord Mayor, the right man might be chosen.—The Lord Mayor, in replying, said he had to fall foul of the proposer of the toast, because he differed  *in toto*  as regarded the appointment of an architect by the Corporation. He believed that it was better that, in the matter of architecture, competition should be open to all the architects of the city. He could not but think that it would be a loss to the community that there should be just one stamp put upon the buildings of Manchester. He went along with the members of the Society that there should be a wider view taken of what a great Corporation should do in the direction of matters pertaining to the architectural profession. They did not live in heroic times, and the Corporation was very largely governed by questions of rates, and however brilliant their fancy might be, they found that fancy very effectually curbed by the position in which the rates stood. At the same time, he believed that such a great community as Manchester might do great things for art, and he had some hopes that the time would come when the pursuit of the beautiful would not be dissociated from, but rather regarded as a handmaid to, the struggle for material comforts. Mr. Percy S. Worthington proposed the toast of "The Victoria University and Owens College," to which Mr. A. Hopkinson, Principal of Owens College, replied. The other toasts included "The Manchester Society of Architects," proposed by Professor Tont, and responded to by the President; "Our Hon. Legal Adviser," proposed by Mr. J. B. Gas and responded to by Mr. W. Goldthorpe; and "The Hon. Secretary," proposed by Mr. John Ely, and replied to by Mr. Paul Ogden.

#### ARCHÆOLOGICAL SOCIETIES.

**BRITISH ARCHÆOLOGICAL ASSOCIATION.**—The second meeting of the Session was held on the 20th inst., Dr. W. de Gray Birch in the chair. At the Council meeting previously, Dr. Birch was unanimously elected hon. treasurer of the Association, in succession to Mr. Charles Lynam resigned. The Rev. R. I. Woodhouse exhibited an iron crucible weighing 6 lbs. 10 oz. bearing evidences of a hinge at one time existing, which was found at Merstham, in Surrey, not a great distance from the neighbourhood of the Sussex Ironworks, at which it had probably been made. He also exhibited a clay or terra-cotta money-box considered by Mr. Gould and others to be of early seventeenth century date. Miss Dobson brought for exhibition some brass and bronze coins, the finest being a brass of Lucilla, daughter of Marcus Aurelius, 147 A.D.; others were of Probus, Tetricus, and Galienus. Mr. Patrick, hon. secretary, made an exhibition on behalf of Mr. Chas. Lynam, and read some notes he had prepared in description of a fine series of photographs of the recent excavations and discoveries at Arbor Low, in Derbyshire. Mr. Andrew Oliver exhibited some curiosities from Russia, including a brass "icon" in three compartments, a brass figure of St. Michael with an inscription in Greek at the back, and a plaque of mother-of-pearl engraved with the "Nailing to the Cross." Mr. Thomas Fisher exhibited a large stone (porphyry) recently unearthed in Threadneedle-street, at a depth of 20 ft. below the surface, and Mr. Garside a photograph of a very fine celt in excellent condition, found at Rowarth, in Lancashire, and another of a so-called "Druid's Chair" from near Stockport. Mr. W. J. Andrew exhibited through the Rev. H. J. D. Astley a fine cinerary urn still containing cremated ashes, the urn bearing the inscription: "L. MVNIVS PPRISCVS ALLAE PRISCAE FILIVS ARTEMAE-NEPOS," which was found in the garden of Justinian, and was probably originally in a columbarium.—The paper of the evening was by Dr.

Plowright, of King's Lynn, and was read in his absence by Mr. Astley. The paper dealt exhaustively with the "Archæology of Woad" from the earliest times down to the beginning of the nineteenth century. It was well illustrated by drawings and photos of woad mills and implements connected with its manufacture, both in this and other European countries, and references to the chief books upon the subject were given. The earliest references to woad as the source of a blue dye colour occur in the classics, the most familiar being that of Caesar in his Commentaries. Pomponius Mela and Pliny also mention it. At the opening of a barrow at Slenc, near Hartington, some years ago a considerable quantity of woad-indigo was found in lumps and in powder—the sepulture probably being that of a dyer. Frequent reference is made in ancient documents to the sale of woad, or "wad," as it was then called, and still is by the woad grower of the fenslands of East Anglia. There is a roll preserved in the records of the borough of King's Lynn, dated 1243, setting forth the dues payable upon various commodities in which "woad" or "wad" is included. There is one locality in England where woad is still regularly cultivated for dyeing purposes, viz., the fenland districts of Cambridgeshire and Lincolnshire. An interesting discussion followed the paper, in which Mr. Forster, Mr. Gould, Mr. C. J. Williams, and others took part, the Chairman remarking that woad was at first called *Glastum* or *Glast*, *Glastonbury*—or with the Saxons, *Glastingbury*—having a reference to it; and at *Bridgewater*, in Somersetshire, there used to be a large trade carried on in woad.

#### THE LONDON COUNTY COUNCIL.

The usual weekly meeting of the London County Council was held on Tuesday, in the County Hall, Spring-gardens, Mr. A. M. Torrance, Chairman, presiding.

**Loans.**—On the recommendation of the Finance Committee, it was agreed to lend Islington Borough Council 5,811l. for electric light installation; Kensington Royal Borough Council 4,750l. for street improvement; and the Guardians of Poplar Union 4,775l. for the erection of officers' quarters at the workhouse.

**The Council's Bricklayers.**—Captain Swinton asked if Lord Welby had any further information to give the Council on the subject of the amount of work done by the bricklayers in the Council's employ.

Lord Welby, Chairman of the Finance Committee, said he would remind the Council that it was first stated there had been a considerable diminution in the work done, especially by the bricklayers, of late years. Last week he stated that the Works Sub-Committee had made inquiries on the subject, and up to a certain point they came to the conclusion that, so far as the evidence before them went, there had of recent years been a diminution in the amount of work done by the bricklayers, but that recently there had been an improvement. The Committee had continued its inquiries, and the result confirmed the general impression. But the circumstances varied considerably in the various cases before them, and it was impossible for them at the present moment to state in any specific form what the production had been, and what had been the increase of late. They were pursuing their inquiries, and would bring a Report up. There was one point he must notice. It had been stated that the laying of 330 bricks per day was considered a fair day's work for a bricklayer by the Council. He need hardly say that the Committee had never given encouragement of any sort or kind to such a limit as that. It was the desire of the Council to be a model employer, and that the wages given should be in accordance with the wages given by the best of employers. But if they gave good pay there must be some reciprocity, and a good rate of pay must be rewarded by a good rate of work, and to secure that they would give unwavering support to the Works Manager.

Captain Swinton asked if, in reporting, the Committee would go into the matter of other branches of labour besides bricklaying.

Lord Welby promised to take that question into consideration.

**Inventions by Officials.**—Considerable discussion took place on a Report of the General Purposes Committee dealing with an amendment of the Standing Orders relating to inventions by officials of the Council. The recom-

mentations of the Committee in effect prohibited any official or servant of the Council in future taking out a patent for any invention which is in any way connected with his official duties. Further, for any invention not connected with his official duties, an officer must obtain the consent of the Council before taking further steps other than taking a provisional patent.

Mr. Beachcroft moved an amendment to the effect that the Standing Order remains as at present, except that certain words be omitted.

The amendment was carried.

**Working-class Dwellings.**—A detailed return was made by the Housing of the Working Classes Committee, showing the receipts and expenditure in respect of all working-class dwellings and lodging-houses erected or owned by the Council for the year ending March 31, 1901. The dwellings mentioned in the account comprised 2,041 tenements, 305 cottages, and 321 cubicles, providing accommodation for 12,196 persons. During the year accommodation was provided for 2,608 persons, while since the closing of the account reported upon additional accommodation has been provided for 1,908. The gross income for the year was 44,226l. 12s. 3d., and of this 47.06 per cent. was required for outgoings, a slightly smaller percentage than in the previous year.

The report was adopted.

**Tenders.**—The following recommendation of the Parks and Open Spaces Committee was agreed to:—

"That the offer of Messrs. Flavell & Churchill (187l. 10s.) to supply certain piping, damper gearing, &c., to replace worn-out portions of machinery, &c., at the Battersea Park pumping station, and the offer of Messrs. C. Yates & Co. (133l.) to supply new boiler seating, engine foundations, &c., be accepted."

The Highways Committee recommended, and it was agreed,

"That Messrs. J. G. White & Co. be allowed to sub-let to the Anderson Foundry Co. the manufacture of the cast-iron yokes and road-boxes and of the other cast-iron work specified in the contract for the roadwork and platelaying in connexion with the reconstruction, for electrical traction, of the London County Council Tramways between (a) Westminster Bridge and Tooting, (b) Blackfriars-road and Kennington, and (c) Waterloo-road and St. George's-circus."

**Appointment.**—Mr. C. A. Daubney was appointed as a surveyor in the Architects' Department, on the recommendation of the Establishments Committee.

**Post Office Telephone Charges.**—The Highways Committee presented a report, and recommended that a copy of it should be sent to the Postmaster-General, "with an expression of the regret of the Council that the scheme of the Post Office telephone system for London does not establish real and effective competition, as recommended in the report of the Select Committee of the House of Commons of 1893, and does not secure to the public the advantages which they have been led to expect."

Mr. Benn, Chairman of the Committee, said he brought up the report with great regret. The Council had devoted ten years to endeavouring to secure for London an efficient telephone service at moderate charges, but they had been betrayed. The arrangements to be made by the Post Office were known to the National Telephone Company last September, and had the effect of forcing up their stocks to 360,000l. increased value; so that those who were "in the know" made a lot of money. Even now the Council would be happy to take over the Post Office telephone plant, and to supply London at provincial rates.

The debate was adjourned.

**Piccadilly Widening.**—The Improvements Committee reported the result of a conference with the First Commissioner of Works as to the proposed widening of Piccadilly from Hyde Park Corner to Walsingham House, and presented a modified scheme, extending only to that portion of the thoroughfare between Hyde Park Corner and Down-street. They proposed to cancel the Council's vote of 30,000l. for the complete scheme and to substitute an estimate of 13,536l.

After some remarks by Mr. Low, Mr. Campbell, and Mr. Davies (Chairman of the Committee), the modified scheme was adopted by the Council.

The Council adjourned at seven o'clock.

## Books.

**Brunelleschi.** By LEADER SCOTT. (Great Masters in Painting and Sculpture.) London: George Bell & Sons. 1901.

WE are glad to notice any book that deals appreciatively with the life and work of a great man. In the textbook before us Leader Scott pays tribute to an architect of the very first rank—Filippo Brunelleschi. We know of no buildings more dominated by the individuality of genius than the churches of San Lorenzo and Santo Spirito. In these Brunelleschi established the form and detail now identified as the Italian Renaissance, although in their calm dignity and grace they are less Italian than distinctly Florentine. The capture of his popularity, however, has doubtless been set by the dome which he reared upon Arnolfo's unfinished cathedral. The story of the dome is here written down for us with much interesting circumstance. The story of how Filippo took to his bed and left Ghiberti, his incompetent partner, to work out his own undoing, loses none of its relish by re-statement. The struggles and differences between the architect, the opera, and the guilds are also retold. Whether the *Maestri di Pietra*, or Guild of Master Masons, was ever so responsible a body as we are invited to consider it, is open to question. The author hints darkly at co-operative building and the mysteries of Freemasonry. We see no reason, however, to attribute to the many what it is within the powers of one to accomplish. It is at least gratifying to note that Brunelleschi undeniably showed himself the master of the *Maestri* in this instance. The chapter referring to these events is entitled, "The Great Dome." It is, indeed, a great dome, but not so great a one as the author supposes. It has not a span of 200 ft. in diameter as stated. It is barely 140 ft. A mistake like this is a serious one, which might have been easily avoided.

The affectionate relationship existing between Brunelleschi and Donatello will always add a charm to the biography of either; and it was a fitting tie between the two men who moulded, in one case the architecture and in the other the sculpture, of the fifteenth century in Italy. The book is well illustrated.

**The Art of Building a Home: A Collection of Lectures and Illustrations.** By BARRY PARKER and RAYMOND UNWIN. London: Longmans, Green, & Co. 1901.

THE authors have in a series of essays or lectures endeavoured to cope with the unmeaningness of design and useless ostentation that characterise so many of our dwelling-houses. They have done so with a sincerity of purpose that we cannot but commend. If the essays have faults, they are the faults of enthusiasm. Yet we cannot help thinking that they would have been improved by a little more elasticity and a little less seriousness.

There is a reasonable halting place between the materialism of Mr. Whistler's famous "Ten o'clock" and the opposite extreme. Why, for instance, when discussing the relation of a house to its surroundings, should the authors tell us that "in the country certainly the low house is more successful, more in harmony with the scenery; perhaps because it is suggestive more of man's dependence upon nature, less of his defiance of her powers." The first portion of the sentence is obviously open to considerable extension and modification. A house which happily groups itself beneath the shelter of trees might appear insignificant when standing open on a plain; and although another, when perched upon a hilltop, might with propriety be unassuming in its sky lines, we have nevertheless seen a bolder treatment quite as successful. It is not an easy matter, we know, to develop statements within the limits imposed by a short essay, and a writer should therefore be the more careful as to the statements to which he commits himself. As for the reason given in support of the opinion we have quoted, we will only say that it had been much better left out.

It is reasonably insisted that a house, to be in any sense perfect, must be built to suit the habits and needs of those who inhabit it. We sometimes think, indeed, that the very whims and oddities of the occupier would have greater justification for expression than the whims and

oddities of the architect, who has but a twelve months' acquaintance with his building. But since a house is built to last presumably for ninety-nine years, and will probably change hands more than once in that period, and since it cannot be all things to all men, it must become a glaring inconsistency if a certain moderation be not observed in the first place. Therefore, although originality in an architect is exceedingly desirable, good sense and moderation are equally so.

In the numerous illustrations with which the book is provided, there is ample evidence of originality on the part of the designer. Whether all the suggestions there shown, or referred to in the text, are to be desired is perhaps open to question. Although our authors, for instance, may have a preference for "the rich variety of colour and tone of light and shade of the naked brickwork" for interior walls, other folk may possibly find it most inconvenient for more practical reasons. It will hold the dust, it must soon become soiled and remain soiled, while a barked knuckle would be the least important injury that it could inflict. The edges of books, of furniture, would all suffer. We were about to add picture frames also, but pictures of any kind, we are told, look only less absurd on the walls of your house than they do upon the walls of an exhibition. Carpets are a further abomination. By such whims as these, the authors, as it seems to us, defeat their own ends. That a convenient and commodious living room should take the place of the three tiny "reception" rooms generally provided in the small house is reasonable enough. But we like, nevertheless, to see our favourite prints upon the walls, and enjoy the sense of warmth and colour, and we may also add, quiet, which is lent by a carpet covering partially, at least, an expanse of oak floor. It is truly observed that the size of a room bears no relation to its cosiness. It is a quality conferred upon it by those who live in it. Yet the limitations imposed by the writers of this book will make it a more difficult matter than heretofore. There are one or two other points, we notice, which are likely to interfere with the comfort of the best of rooms. We question, for instance, whether a dog-grate could be satisfactorily put into so large a fireplace opening as in plate 16. Such grates require a great deal of humouring or they will smoke. We have also observed that exposed ceiling joists, with the ceiling contained between them, will buckle and crack the plaster, unless some binder takes the place of bridging, which is necessarily omitted.

However, the book offers so many suggestions to an intending home builder, that he must be content to take his risk with some of them.

**Building Construction.** By CHARLES F. MITCHELL, assisted by GEORGE A. MITCHELL. Third edition, thoroughly revised and much enlarged. London: B. T. Batsford, 1901.

THIS useful work, the third edition of which has just been published, has been further enlarged by a good deal of new matter and many new illustrations. The increase both in the number of illustrations and in their size is indeed the most prominent feature of the new edition. Several double-page plates have been added, among which, one, giving working-drawings of a large hammer-beam roof (of the Westminster Hall type), deserves special notice, as it ought to be of much interest and value to students. Even in this plate, however, objection must be taken to some of the detail, as being either badly placed or inharmonious—in short, as failing in the elementary grammar of design; but how such lame and tawdry "ornament" as some of that shown, for instance, in fig. 402, should be chosen to set before beginners for imitation, surpasses our comprehension. It is only fair to the authors of this work to say that they appear to aim at, and on the whole have been successful in maintaining, a somewhat higher standard of taste in their examples than is found in the other manuals of "Building Construction." As compared with those specimens of the very worst type of engineer's detail which the well-known "Notes on Building Construction" have rendered too familiar to many generations of students, with sad results on the vernacular building of the country, Messrs. Mitchell's drawings are, indeed, much to be commended. But they have need of improvement still in this respect; for to scatter broadcast as patterns—with the certain prospect of their repetition in thousands of

suburban houses—such abominably proportioned windows (no weaker word can describe them) as those of the "picturesque" cottage on p. 297 is, from an educational point of view, a serious fault.

With the same object, the sound instruction of youth, in view, and also in their own interests for the sake of a wider circulation, the authors may pardon the suggestion that they would do well, when next revising their work, to engage (besides an architect to prune and proportion their designs) some one conversant with common literary English, to correct and sometimes rewrite their letterpress. For it is a pity, indeed, that a work on which not only so much labour has been bestowed, but which is also so really good and valuable in many ways, should be marred by clumsy and faulty writing. Take the following passage, for example:—

"Fresco painting is a system of mural decoration in which pictures are painted on the finished surfaces of walls, with water-colours, which incorporates with the same."

This drawback must always prevent the work from gaining the high position as a text-book which it might otherwise take, for though the material is well worth making into a book, a real book it can hardly be called so long as it contains so much "specification" or "surveyor's English." There are many depths of bad English, but perhaps none so repellent and so painful to read as this particular jargon. In the preface to the present edition thanks are given to several persons for assistance in revision, and to one in particular "for his careful reading of the proofs." Seeing that the reader whose services are thus acknowledged is a member of a distinguished university, we can only suppose that he was restricted to testing the accuracy of the mathematical calculations (a most important point in itself), and that English grammar and spelling were not in his brief.

Among the new features of the work which should be mentioned are, as stated in the preface, that "advantage has been taken of American experience in iron and steel manufacture and in construction, and of Scotch practice in modern stonework," and that "many of the more important and pertinent by-laws of the Local Government Board and London County Council are included." Also that "in most trades a typical specification, approved by some important public body, has been inserted." The chapters that have been most largely added to are those on materials, foundations, vaulting, dome and bridge construction, roof coverings, wood roofs, joinery, and sanitation.

The work seems now to have reached its limit of thickness with respect to convenience, and if further additions have to be made, the authors should look to the abandoning of useless matter; for instance, there could be no loss in omitting such things as the two rather unpractical fire-resisting floors which take up the best part of pp. 387-8, one being an invention of Viollet-le-Duc, never probably used in this country, and the other a quite obsolete system, employing joists of cast-iron. We trust that in the next edition, whenever it may be called for, the authors will not be content with additions and slight corrections only; but that they will instead make searching amendments throughout the work, so as to bring it up to that higher level of merit to which, with such a good solid substructure as it already possesses, it might with comparative ease attain.

*First Stage Building Construction.* By BRVSSON CUNNINGHAM, B.E., A.M.I.C.E. (The Organising Science Series), London: W. B. Clive.

AN examination cram-book of the barest and duller type this little volume appears to be from first to last. There is nothing whatsoever original about it, and when the held is already so much better occupied, it is cause for wonder why such an unnecessary publication should be produced. It gives the impression of someone without the slightest interest in building having "got-up" to order a number of old South Kensington Examination papers, and then compiled a key to them. These papers are themselves responsible, of course, for the many useless and ridiculous things which the young student of building is expected to be acquainted with, as well as for the omission of several very elementary and quite essential matters which he is oddly

supposed to have nothing to do with. But even when writing with such standards in view, an author with any enthusiasm for his subject would contrive to bring in a little reasoning and suggestion of better things into his text, together with something better than the hackneyed drawings which have done duty in so many previous manuals. But there is no trace in this work of any attempt or even desire to lift the student's view a hair's-breadth out of the Board of Education rut; it is merely a collection of routine statements, throughout which the word "is" refers to things solely as they appear in the examination syllabus, not as they either are or ought to be in reality. According to his lights, the author has performed his duty faithfully, accurately, and to the letter, but we should be sorry to recommend the work to architectural students as being likely to lead them in the right way.

*Primer of Geometry, Comprising the Subject Matter of Euclid I-IV. Treated by the Methods of Pure Geometry.* By H. W. CROOME SMITH, B.A. London: Macmillan & Co., Ltd. 1901.

FOR many years past the feeling has been more or less prevalent that the accepted versions of Euclid do not constitute entirely satisfactory aids in the teaching of geometry. Many of the defects and difficulties that puzzled students of a bygone generation have been eliminated from various modern textbooks, but much that is illogical and inconclusive still remains, even in some amended treatises. Mr. Croome Smith believes the time has come for the presentation of "a reconstruction of the subject which it is claimed is much more than a mere revision of Euclid's system, while it in no way strains those principles which mathematicians are agreed in recognising as axiomatic." In attempting a reconstruction, the author tries to avoid the points in which the system of Euclid is at fault. For example, in Book I, he teaches the theory of parallel and inclined lines and rectilinear figures without making use as Euclid does, of the circle, with whose properties the student is not supposed to be acquainted. No one will question the argument that it is doubtful logic "to make use of the circle in the early stages, and subsequently to use the properties thus demonstrated of lines, angles, &c., in demonstrating the properties of the circle." Teaching on such lines is distinctly cyclical, like that in many spelling books where the meanings of words are concealed by correlative definitions. Again, the author is correct in characterising as illogical the assumption that recognition of a theorem can be dependent on any particular method of carrying out a construction. The consequences of supposing the theorem to be dependent upon the problem are that theory becomes involved and circuitous, and that inconvenient methods for the solution of problems are encouraged.

Mr. Croome Smith defers problematic construction until theoretical principles have been discussed in logical order in his Books I. to III. The student, therefore, reasons with representative points and lines, and his mental exercise is untrammelled by practical considerations. Finally, when the book of problems is reached, he will find the methods to be fairly in agreement with those adopted in actual practice. In the three first books of the primer the whole theory of Euclid I-IV. is included, all theorems of similar character being brought together as far as possible, and generally converse theorems are included as one proposition. This treatment is useful, conducing both to logical consistency and to brevity. The latter quality is further aided by the employment of simple, precise, and intelligible definitions in substitution for the less direct phraseology sanctioned by long use. In his definition of a straight line, the author includes the idea of direction, thus suggesting a sight along the line to find whether it is "one which lies evenly between the two extreme points." The innovation appears to be good, and more likely to aid the conception of a straight line than the device sometimes proposed of applying a flat ruler to a line drawn on paper. The idea of motion is advantageously introduced into definitions of the angle and the circle. According to the author an angle is to be measured by "the amount of revolution of a straight line when turned about the vertex in the plane of the lines from the

one to the other." Thus, a right angle involves one quarter of a revolution, an angle of two right angles is formed by one half of a revolution, and an angle of four right angles results from a complete revolution. Inasmuch as the straight line that revolves must be terminated by a geometrical point, we get at once the conception of the circle from the definition of the angle of four right angles. Further, the idea of revolution in connexion with an angle leads to the consideration of an angle which is greater than one of two right angles. Architects, engineers, and surveyors—the latter especially—do not regard an angle as a dead corner formed by two set lines, but as the outcome of motion. This being so, the author is strictly logical in asking why writers should pretend to exclude the idea of revolution from elementary geometry. The term "structure," as used by the author, seems conveniently to denote any combination of lines and angles, or anything constructed, and the term "magnitude" is only employed by him in its abstract sense. "Duplicate" is a term chosen to designate such structures as are equal in all respects. Everybody knows what it means, and it is effectively applied to the proof of certain theorems in the present primer. Many beginners have racked their brains over such expressions as "parallelograms about the diagonal of a parallelogram" and "the complements of the parallelograms about the diagonal." In such geometrical figures there is nothing difficult; the only thing in the way of comprehension is the luxuriant language in which their definition has been hidden. The method of treatment followed in the four books is distinctly original, and it will be found an interesting study to compare the demonstrations of the author with those contained in any standard version of Euclid's Elements. From what we have already said, it will be understood that the arrangement of the propositions is by no means identical with that of Euclid, and we notice that in many cases two or even three propositions are included in one demonstration. If the present attempt at reconstruction should be favourably received, the author promises to extend the scope of his primer. That the book will serve a most useful purpose in further suggesting the need for reform, we do not for a moment doubt, but the work of altering established methods of teaching is a stupendous task, which the most sanguine can hardly hope to accomplish within the limits of a lifetime.

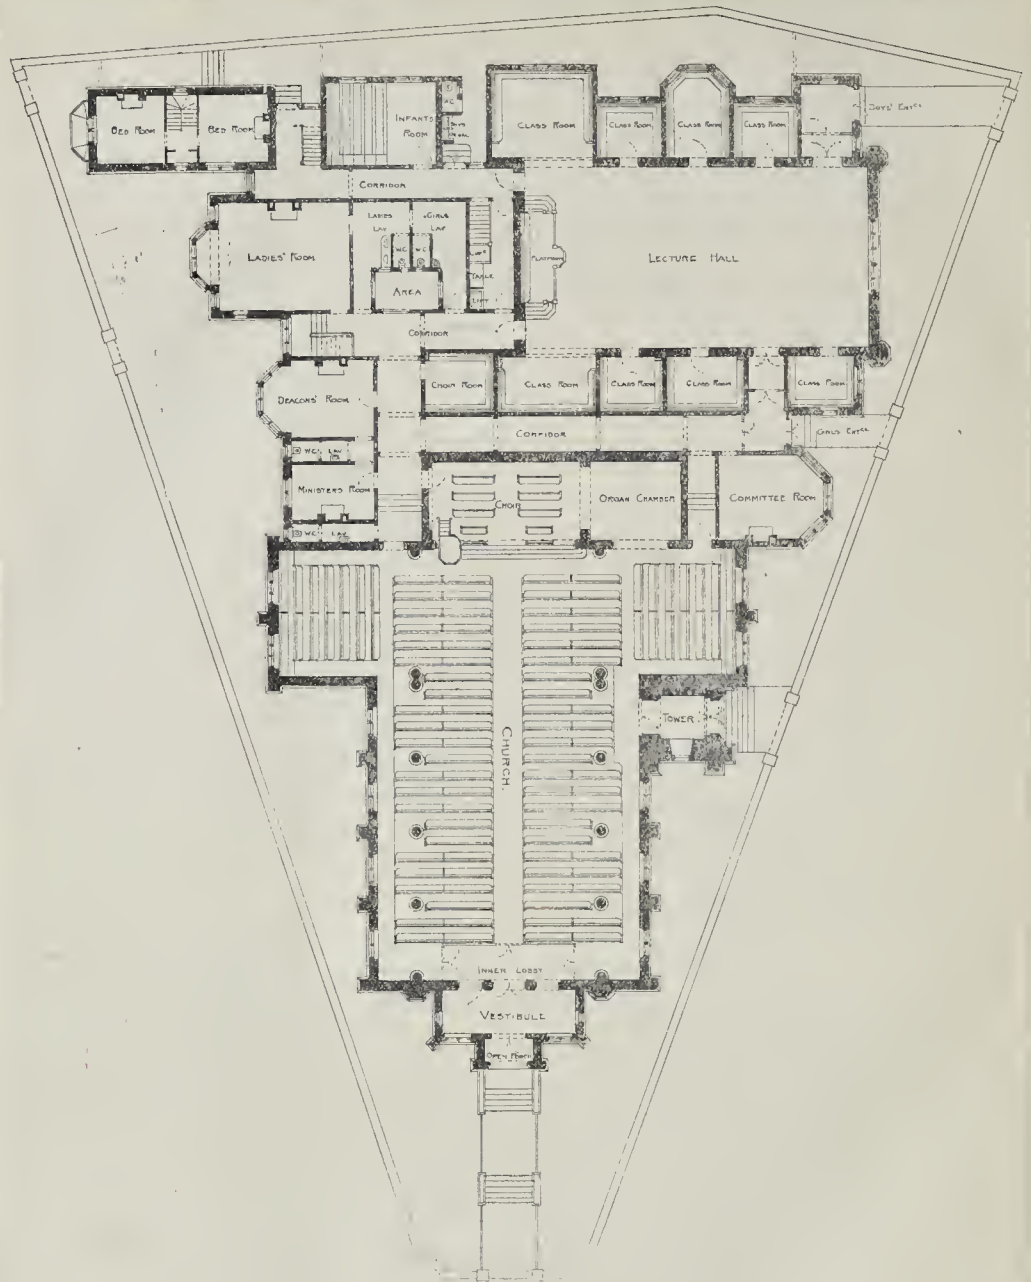

*Modelling: A Guide for Teachers and Students.*

By ED. LANTERI, Professor of Sculpture at the Royal College of Art, South Kensington; with a Preface by OSNLOW FORD, R.A. London: Chapman & Hall, 1902.

IT would seem almost superfluous to praise a guide to modelling by Professor Lanteri. In this work the student may follow the whole process through a series of remarkable photographs from the construction of the armature to the finished state of the figure or bust. The building up of the muscles and prominences, with the added vigor of the thumb marks left upon the clay, is presented in the various stages of progress, the student being thus led forward step by step. Plate 14, which shows the first stage in modelling a mouth, is a typical example of the method employed throughout the book. "Leave your work in such a state that it will interest you when you take it up to-morrow" was the wise advice once given us. Undue haste in the endeavour to obtain a finished effect will take all the life out of the clay. Professor Lanteri shows us how interesting the phases or stages may be made, while he makes it evident that there is but one way of achieving the desired end. He insists that a knowledge of anatomical form must in the first place be mastered, and the reason of these forms, or the student will become involved in those "unreasoning alterations" which are always tried when this branch of instruction has been neglected.

There must be few who will not recognise the truth of this criticism, or be unable to recall the tedium of those "unreasoning alterations" by which they have endeavoured to rectify some short cut to proficiency.

STATION HOTEL, NOTTINGHAM.—The Victoria Station Hotel at Nottingham has just been completed. The new hotel is situated in the heart of the city, immediately adjacent to the Great Central Railway. The architect was Colonel Edis.

*Congregational Church and Schools, Leeds. Plan.*

### Illustrations.

#### CENTRAL HALL FOR NEW CITY OF LONDON SESSIONS HOUSE.

**I**N our issue for June 30, 1900, we gave the elevations and plans of Mr. Mountford's competition design for the new Sessions House, together with an interior view of the central hall as then intended.

The present illustration, from a drawing

which was exhibited at the last Royal Academy, shows the central hall design as remodelled and in our opinion very much improved. The dome is now a circular one on pendentives, in place of an octagonal one carried on squinch arches over a square plan. The first design was more novel and unusual, but this has much more breadth and unity.

The central dome is 37 ft. square on plan and 66 ft. high above the floor, the main cornice being 41 ft. above the floor. On each side of the central dome are lower ones 27 ft.

square on plan, the three making a hall 104 ft. long, from which the four courts are all directly entered. The floor and lower portion of the walls will be of marble.

#### CONGREGATIONAL CHURCH AND SCHOOLS, WOODHOUSE-LANE, LEEDS.

THE church, which is now in course of erection on a site in the centre of a residential population, together with the school and classrooms which were opened last month, will

form a complete and compact block of buildings well adapted for the purpose intended. The ground covers 2,700 square yards, and is situated at the junction of two wide thoroughfares, slightly rising. All the rooms are on the same floor, except part of caretaker's house and kitchen, &c.

The church has been planned with wide nave and narrow aisles, transepts, chancel, and organ-chamber. It is 95 ft. long, 48 ft. wide, and 82 ft. across transepts, and is capable of seating 760 adults. At the junction of the streets an open porch with inner vestibule is placed, over which is a seven-light traceried window terminating in a gable with angle turrets. At the junction of the nave and transept next Woodhouse-lane is placed another entrance, over which the tower and spire rises to the height of 130 ft. At the end of the chancel another seven-light traceried memorial window is placed, to be filled with stained glass.

The school or lecture-hall is connected with the church by two wide corridors, and is 64 ft. long, 34 ft. wide, and 26 ft. high, well lighted by a five-light window at the front and clearestory windows at sides; with eight classrooms at sides (those near the rostrum can be thrown open to the schoolroom when required). A ladies' parlour, 30 ft. by 24 ft., is conveniently placed with all necessary conveniences. Pastor's, deacons', and choir vestries, and infants' room are also provided.

The buildings are erected of pitch-faced wallstones and fine sandstone dressings, all outer walls lined with brick, all internal wood-work of pitch pine unvarnished, the roofs covered with the best dark Westmorland slates, all windows filled in with leaded lights, and the whole building lighted by electricity. The cost of the building, exclusive of land and fees, &c., is 14,800l., and the principal contractors are Messrs. C. Myers & Sons, masons, and Messrs. H. Atkinson & Sons, joiners, both of Leeds, and the whole is from the design and carried out under the superintendence of Mr. G. F. Danby, architect, of Leeds.

RESIDENCES NEAR LONDON.

The three houses illustrated have recently been erected on the Kelsey Manor Estate, Beckenham, Kent, and in the rear or west side overlook the charming park and lake.

The general contractors were Messrs. Syme & Duncan and Messrs. Popeland & Son, of Beckenham. The architects were Messrs. Thomas Archer and Francis Hooper, of London.

CATESBY HOUSE STABLES, NEAR DAVENTRY, NORTHANTS.

These stables were erected for Mr. Henry A. Attenborough in the centre of a very favourite hunting country, and so arranged that, in case of need, the coach-houses could be converted into additional loose-boxes.

Ample space is provided for washing both horses and carriages under cover. A separate room is built for drying saddles and horse-clothing apart from the harness. There is a smithy next the loose-boxes, an isolated box in case of sickness, and an estate carpenter's shop over one of the coach-houses. The head groom's rooms are over the harness-rooms, &c., and the turret contains large storage tanks.

The buildings are in close proximity to the site of Catesby Abbey, and the water supply is obtained by force-pumps from the fishponds which were formerly part of that establishment.

The general contractors were Messrs. G. & H. Bywaters & Sons, of King-street Regent-street, W. The architects were Messrs. Thomas Archer and Francis Hooper, of London.

A DECORATIVE PAGE.

This piece of work illustrates two pages of an illuminated copy of the old French romance "Aucassin and Nicolette," which Mr. Cowlishaw is writing out and decorating in this form with a view to its being subsequently bound by Mr. Colden Sanderson.

The romance was probably composed about the beginning of the thirteenth century. Nothing is known of the author, but the book is one held in much respect by students of old literature. The single manuscript known to exist is preserved in the Bibliothèque Nationale at Paris.

The musical notation in the verse sections is a transposition from the notation in the edition of MM. Moland and d'Hericourt, and known as that of Franco of Cologne, who probably lived about 1250.

The version here given is translated from the old French by Mr. F. W. Bourdillon, from whose notes this information is given.

SOME EXAMPLES OF METALWORK.

The articles shown in this plate are designed by Mrs. Starkie Gardner, who is giving special attention to the class of furniture illustrated here, with a view of introducing articles of this kind combining artistic design with moderate price.

The locks, finger-plates, and handles are executed in brass, pewter, copper, or iron, all hand hammered. The brass rim lock is intended specially to go with oak doors. The pendant for a billiard-room was a special commission carried out to order.

The style of Mrs. Gardner's work, as will be seen, is picturesque and artistic, while avoiding the eccentricity into which recent designers have sometimes run in their search after novelty in work of this class.

APPLICATIONS UNDER THE 1894 LONDON BUILDING ACT.

The London County Council on Tuesday dealt with the following applications under the London Building Act, 1894. Unless otherwise stated, consent was given on conditions. The names of applicants are given between parentheses:—

Lines of Frontage and Projections.

*Brixton*.—A chapel, with hutresses, at St. Gabriel's Training College, Cormont-road, Camberwell (Mr. P. A. Robson for the Rev. Canon C. E. Brooke).—Consent.

*Westminster*.—A porch at the entrance to Members' mansions, No. 36, Victoria-street, Westminster (Messrs. Ardron & Dawson for Mr. J. Browne Martin).—Consent.

*Hackney, South*.—The retention of two projecting entrance staircases at the schools on the north side of Cassland-road, Hackney (Mr. T. J. Bailey for the School Board for London).—Consent.

Width of Way.

*Whitechapel*.—The retention of a building used as a urinal on the south side of Corbet's-court, Little Pearl-street, Whitechapel, with the external walls of such building at less than the prescribed distance from the centre of Corbet's-court (Mr. J. Tickle for Mr. E. Bell).—Consent.

Means of Escape from Top of High Buildings.

*Westminster*.—Means of escape in case of fire proposed to be provided in pursuance of Section 63 of the Act on the seventh, eighth, ninth, and tenth stories of the easternmost portion (described as Block A) of the residential flats with shops on the ground floor, known as Park-mansions and situated on the south side of High-road, Knightsbridge, between Erompton-road and Knightsbridge-green (Mr. G. D. Martin for Messrs. A. Kellott & Sons, Ltd.).—Consent.

*Westminster*.—Means of escape in case of fire proposed to be provided in pursuance of Section 63 of the Act on the eighth and ninth stories of Blocks A, B, and C of St. James's-court, Buckingham-gate, Westminster (Mr. A. Blackford for Mrs. Leeds).—Consent.

The recommendation marked † is contrary to the views of the Local Authority.

BOOKS RECEIVED.

MANCHESTER: THE CATHEDRAL AND SEE. By the Rev. Thomas Perkins, M.A. (Geo. Bell & Sons.)

MEDIEVAL LONDON. By W. Benham, F.S.A., and Charles Welch, F.S.A. (Seeley & Co.)

VILLAGE CLUB, BLAGDON, SOMERSETSHIRE.—On the 23rd inst. the Right Hon. Lewis Fry formally opened the clubhouse which Sir W. H. Wills has provided for the village of Blagdon at a cost of upwards of 2,000l. The club is situated in the centre of the village. It is a domestic Gothic structure, with half-timber work above the ground floor. The building is two stories in height, and is built of native stone. On the ground floor are the reading-room and library, the former being 30 ft. by 18 ft., and 12 ft. high, whilst the latter is 20 ft. by 18 ft., and of the same height. A staircase leads from the hall to the upper rooms, which are of the same dimensions as the lower, one being intended for the billiard-room, the other the games-room. The architect is Mr. Frank W. Wills, of Bristol. Messrs. J. & C. Clark, of Rickford, were the builders.

Correspondence.

To the Editor of THE BUILDER.

THE "CA' CANNY" (GO-EASY) QUESTION.

SIR.—In reference to the *Times* article and your comment thereon, permit me to say, that having been in the building trade (boy and man) for forty years, as apprentice, journeyman, foreman, clerk of works, and manager, I have come to the conclusion that many, if not most, of the charges against the men are utterly void of foundation. Masters are frequently prejudiced by interested persons in authority, who shield their own neglect and deficiencies behind the men. The incompetence, most rife in the building trade, lies not in the labour so much as in the supervision. Incompetent foremen; incompetent estimators, or, as they now style themselves, surveyors; clerical routine, instead of practical execution; a smattering of technical knowledge instead of experience; these are the evils of the building trade, and coupled with trading on borrowed capital, or working the jobs on the strength of the "draws," constitute the real crisis. How many real builders are there, either in town or country, to-day?

Then, again, the "too old at fifty" business is another curse. Personally, I am a better man now as regards ability and power to carry out works than ever; but I am obliged to work at "half-cock" because masters and public bodies look askance, and in effect say, "grey hairs are upon you," a biblical reference with which all employers are doubtless familiar. Investigate by all means, but begin at the right end. I hold no brief for trades unionism. I am not, and never was, a member of any trade combination; but I flatter myself that, allowing for the increase in the rate of wages, without either huffing or dancing attendance on the clerk of works at the bar of a public-house, I can get work done as cheaply now as twenty years ago. I say work, because the 1,000 or 1,200 bricks referred to were practically tumbled in from a barrow.

As I read the signs of the twentieth century, it appears that the day of the "big contractors" is gone. The day of the specialist has come. Except for the use of scaffolding and hoisting machinery, is there any job which could not be worked by a manager for the architect and client as effectively as a manager or foreman now does it for a builder? With a reliable man, and a depot for the hiring of scaffolding, &c., and the working of stone by stone firms and joinery by joinery firms, the real practical builder could be on the works; the staff regulated by the size of the job. The architect would then be in touch with his work without the intermediary either of a capitalist or a clerk of the works. Perhaps, as John Bright said of politics, so of building—the time may come when an honest man may engage in it; until then, perhaps, I shall only be "one of the young men who dream dreams."

ONE FROM THE BENCH.

\*\* There may be a good deal of truth in our correspondent's letter, but it does not touch the main point of the discussion—are men compelled or persuaded to do far less work in a day than they could do and used to do, at the orders of and in the interests of the trade-unions?—ED.

ROOD SCREEN, ST. DENYS', SLEAFORD.

SIR.—In your issue of November 16 appeared a plate of the above screen, and on the top was the following lettering: "Drawn by Mr. Herbert Kirk, Diocesan Surveyor, Sleaford."

I beg to point out that the drawing was executed solely by me, and that the words referred to should never have been inserted. Mr. Wilfrid Bond assisted me to measure it, but beyond that it was my work entirely. C. H. LANFEAR.

\*\* The words were inserted by us to complete the title in the usual way by giving the draughtsman's name. We received the drawing from Mr. Kirk, and certainly were under the impression that it was his own. Perhaps Mr. Kirk can throw some light on the matter.—ED.

PRESERVATION OF OLD BENCH ENDS.

SIR.—At Packington Church, in Leicestershire, some very interesting fifteenth century bench-ends have been brought to light. They had been buried in damp mould; and one or two of them are in a condition that makes them like hardish putty. Can you or any of your readers suggest any treatment which would harden and preserve them without destroying their present beautiful colour and surface? HENRY PROTHRO.

PROPOSED THEATRE, MANCHESTER.—It is stated that proposals are on foot for the erection of a new theatre in Manchester. The site suggested is the rectangular piece of ground lying between the Refuge Insurance Buildings, in Oxford-street, and the Manchester South Junction and Atrincham Railway line. The name of Mr. Alfred Darbyshire is mentioned as the architect.

## The Student's Column.

### GAS AND GAS FITTINGS.

21.—THE PROPERTIES AND MANUFACTURE OF CALCIUM CARBIDE.

**P**ROPERTIES OF CALCIUM CARBIDE.—Calcium carbide is a dense solid compound of calcium and carbon. Its chemical formula is  $\text{CaC}_2$ , which indicates that it consists, when pure, of 62.5 per cent. by weight of calcium combined with 37.5 per cent. of carbon. It is neither explosive nor inflammable, and may be strongly heated in an open fire or in a gas flame without undergoing any change. When exposed to the atmosphere, calcium carbide, like a lump of quicklime, slowly changes into a bulky powder. This change of condition is due to the water vapour in the air. The hydrogen of the water vapour enters into chemical union with the carbon of the carbide to form the inflammable gas acetylene, which continues to escape into the air so long as any undecomposed carbide remains exposed to its influence; at the same time the oxygen of the water vapour combines with the calcium of the carbide to form calcium oxide, or quicklime, which in turn combines with a further quantity of atmospheric water vapour to form calcium hydrate or slaked lime.

When liquid water is poured upon calcium carbide, or the carbide is dropped into water, the same reactions occur as when the carbide is exposed to the atmosphere, but they take place at such a rapid rate that the decomposing carbide becomes more or less strongly heated, and acetylene gas is evolved in a brisk stream.

Absolutely pure calcium carbide will yield 5.82 cubic feet of acetylene per pound of carbide decomposed, but with commercial carbide of good quality the average yield of acetylene does not exceed 5 cubic feet per pound, and with inferior carbide or with generators of an inferior type the yield often falls considerably below this volume.

Moissan has shown that pure calcium carbide is white and transparent, but the carbide of commerce is neither pure, transparent, nor white. Commercial calcium carbide is usually either a dense agglomeration of opaque iridescent crystals, or a compact semi-crystalline mass of bluish-grey or grey-black colour. It has a semi-metallic appearance and resembles granite in hardness. Its density is 2.22. The difference in the physical condition of different samples of commercial carbide is caused by variations in its rate of cooling from the fused state in which it is formed in the furnace, and also by variations in the nature and quantity of the impurities present. Comparatively large crystals are formed when the carbide cools slowly, and small crystals when it cools rapidly. The colours are mainly due to the presence of iron as an impurity in the raw materials employed. Black particles of carbon which have not united with calcium to form carbide are also frequently present. No reliable indication regarding the purity of carbide is afforded either by its colour or by the size of its crystals.

**The Electric Arc**—If a wire through which a strong electric current is passing be severed, and the severed ends remain within a short distance of one another, the current will leap across the space by which they are separated, and its passage will be accompanied with the evolution of light. If a rod or pencil of carbon be attached to each of the ends formed by severing the wire, and the tips of the two pencils be brought in contact and then drawn a short distance apart a dazzling light will be at once emitted. The evolution of light is due partly to the ends of the carbon pencils becoming incandescent, partly to the electric arc which is produced as the electric current leaps from one carbon pencil to the other, and partly to small particles of carbon which flow with the current from one pencil towards the other, and which become heated to incandescence in the arc. The end of the positive carbon emits a more brilliant light than the end of the negative carbon, and after a short period it becomes slightly flattened and has a small hollow or "crater" formed in it. It is from this crater that the whitest and most intense light is emitted.

The appearance of the electric arc and carbon pencils is shown in fig. 53, which is reproduced from a photograph for the use of which the writer is indebted to Professor Vivian B. Lewes, and it will be seen that

while the positive pole becomes flattened, the negative pole becomes more pointed.

When the ends of the carbons are too close together a hissing noise is produced, and if they are a little too far apart a roaring noise is

Fig. 53.—The Electric Arc.

emitted and the evolution of light is apt to suddenly cease, owing to the failure of the current to effect a junction between the two carbons. When the carbons are a suitable distance apart the combustion of the carbons

Fig. 54.—Electric Furnace for Producing Calcium Carbide.

and the passage of the current should proceed silently, and be accompanied by the evolution of a brilliant and steady light. The value of the electric arc for the manufacture of calcium carbide is, however, not due to the evolution of

light nor to any influence peculiar to electricity, but merely to the fact that the temperature of the arc is much higher than that obtainable by any other known means.

**Electric Furnaces**—The temperature of the electric arc has been found by experiment to be 3,500 deg. C., and by enclosing it in a chamber having infusible non-conducting walls the useful appliance known as an electric furnace is constructed. Electric furnaces have been employed for scientific research work for a long period, but it is only within the last quarter of a century that they have become of great industrial value. Lewes divides electric furnaces into two classes:—

1. Those in which the substance to be heated is placed in the path of the electric arc, or is made to form one or both poles for the formation of the arc, and

2. Those in which the heat is generated by offering resistance to the flow of current, as when a piece of thin platinum wire is heated to incandescence by making it the link between two copper wires of greater diameter through which the current is passing.

For the manufacture of calcium carbide on a large scale, furnaces of the arc type are always employed. It would serve no useful purpose to describe each of the numerous designs for electric furnaces which have been patented for the manufacture of carbide, and a brief description of one of the arc furnaces (fig. 54) recently invented by W. S. Horry, of Niagara, must serve as a type of carbide furnaces in general, but further information relating to calcium carbide and the various furnaces which have been employed for its manufacture can be obtained by reference to Professor Lewes' exhaustive treatise on acetylene.

In the Horry furnace (fig. 54) the carbon pencils are placed in parallel vertical position, and are buried in the mixture of lime and carbon to be converted into calcium carbide. When the arc is produced between the lower ends of the two pencils the mixture in the neighbourhood of the arc fuses and is converted into a pool of liquid carbide. A portion of the superimposed mixture then falls into the liquid carbide, which spreads laterally until it passes beyond the field of reduction and solidifies. That portion of the solid mixture which has fallen into the molten carbide is acted upon by the electric arc, and is itself speedily converted into molten carbide. In this manner the mixture in the lower part of the furnace is gradually converted into carbide. In order to bring the upper layers of mixture into the field of the arc, mechanism is provided whereby the furnace may be moved vertically downwards, so that the carbon pencils, which remain in a fixed position, may occupy a higher position in the furnace.

The chemical name for quicklime is calcium oxide, and when a mixture of ground coke and lime is subjected to the heat of the electric arc the carbon contained in the coke and the calcium contained in the lime enter into chemical combination to form calcium carbide, thus:—

The foregoing chemical equation shows that, theoretically, 56 parts by weight of quicklime will combine with 36 parts of carbon to produce 64 parts of calcium carbide and 28 parts of carbon monoxide. The carbon monoxide is a poisonous, inflammable gas, which burns at the mouth of the furnace, or may be utilised to assist in maintaining the high temperature of the furnace. In practice the lime and the carbon employed are never pure, and it is necessary to ascertain the proportion of the impurities present in them by chemical analysis, and to make allowance for them when calculating the relative proportions of lime and coke to be employed in the mixture to be converted into calcium carbide.

There are two forms of carbide on the market, known respectively as "ingot" carbide and "run" carbide.

**Ingot Carbide**—When powdered lime and coke, mixed in the correct proportions for carbide manufacture, are heaped around the carbon poles in an electric furnace, that part of the mixture which is in closest proximity to the electric arc fuses and becomes converted into calcium carbide, but the outer portion of the mixture is not heated to a sufficiently high temperature for conversion into carbide. When the electric current is cut off and the material within the furnace is allowed to cool, the whole of it is found to have become conglomerated

into one compact mass or "ingot," consisting of a core of high-quality calcium carbide with a crust which contains less and less carbide as its distance from the core increases.

The entire ingot as it leaves the furnace contains about two-thirds of its weight of commercially pure calcium carbide, while the remaining one-third consists of "crust" and contains a large proportion of lime and carbon which have escaped conversion into calcium carbide. When the ingot is broken into small lumps for distribution to consumers the worst portions of the "crust" are picked out, but a considerable amount of material, consisting partly of carbide and partly of useless lime and carbon mixture, is blended with the purer carbide. Occasionally a sample of carbide, consisting mainly of "crust" and yielding only about one-half of the normal quantity of acetylene, is found on the market.

**Run Carbide.**—If an excess of lime is added to the carbon and lime mixture to be converted into carbide, the additional lime acts as a flux, and renders it possible to convert the whole mixture into a molten mass, which may be run out of the furnace into suitable moulds. When producing ingot carbide the temperature of the furnace becomes so high that the furnace lining is rapidly destroyed, and it is found that by using an excess of lime and producing run carbide the destruction of the furnace lining is less rapid. Run carbide is more uniform in composition than ingot carbide, but as it contains an excess of lime it will not yield so large a volume of acetylene as the best selected ingot carbide. When, however, the crust obtained with ingot carbide is mixed with the core of the ingot the mixture may be of less value than run carbide. Every consumer who uses carbide in considerable quantity should provide himself with some means of ascertaining the volume of acetylene evolved from a definite weight of the carbide supplied to him, and should insist that the price of the carbide be regulated by its quality.

**Protective Coverings for Carbide.**—Many attempts have been made to protect carbide from the influence of atmospheric water vapour without interfering with its utility for the production of acetylene by contact with liquid water. The carbide has been soaked in glucose, which was intended to provide a coat which would be impervious to the atmosphere, but which would dissolve as soon as the carbide was immersed in water. The carbide has also been treated with liquid petroleum, paraffin-wax, tallow, and other substances of a like nature, the object in some cases being merely to retard the rate of evolution of the gas when the carbide was brought in contact with water. In other cases the carbide has been sealed in metal cartridges to be dropped into the water and then perforated with a suitable pointed tool.

The steeping of carbide in glucose, oil, or wax does not protect it efficiently from the action of atmospheric water vapour, for if a sample of carbide so treated be exposed to the air for a week, it will be found to be more or less completely decomposed. The sealing of the carbide in metal cartridges is not convenient when the gas has to be generated in comparatively large quantities, and the preservation of the raw carbide in stout metal drums with air-tight lids remains the best and safest method of storage.

#### OBITUARY.

MR. F. WILD.—The death is announced of Mr. Fred Wild, architect, of Bradford, which occurred at his residence, Farcliffe Place. The deceased, who was a native of Halifax, came to Bradford with his father in early youth, and was articled to Mr. Samuel Jackson, J.P. Among the local buildings of which he has been the architect is the Bradford Conditioning House, in course of erection; the East Ward Conservative Club; and the caretaker's lodge at Chellow Heights. Mr. Wild was a bachelor, and was forty-nine years of age.

THE CENTRAL LONDON RAILWAY (NEW LINES).—The company have prepared a Bill for powers to construct a line which will in effect complete the circle, or rather oval, of their present railway and enable them to run the trains continuously. The new line from Shepherd's Bush is planned to take a route to Old Broad-street by way of Kensington, Knightsbridge, Piccadilly, the Strand, Ludgate-hill, Queen Victoria-street, and Leadenhall-street, with two subways—one from Surrey-street, Strand, to Victoria Embankment, the other from Bennet's-hill to Paul's Stairs by the riverside.

#### GENERAL BUILDING NEWS.

ST. OSWALD'S, METHLEY, LEEDS.—This church was reopened on October 26, after the partial completion of very extensive repairs. The whole building, constructed of Oulton stone, has suffered so much from weather, smoke, and perhaps chemicals, that most of the old surface had perished entirely, in many places to a depth of 7 in. or 8 in. The parapets had mouldered away, the buttresses in some cases had separated from the walls, and the spire was dangerous. To a great extent the church has now been repaired with hard Derbyshire stone, the spire was taken down and rebuilt, the tower made good, and the surface of the walling on the south side attended to, an open drain being formed all round the building. Inside, the church has many features of interest, including one very fine window of fifteenth-century glass, and a good screen of the same date. Foundations of a Saxon building were discovered across the west bay of the nave, part of the north wall being supported on them. Plain floors of red square and black and white marble have been laid down, new oak choir-stalls erected, and the old seats refixed. Two arches open into the temporary organ-chamber. The seventeenth-century pulpit and font-canopy are repaired, and the lectern (of German design) cleaned from varnish. A figure of St. Oswald which was over the south porch door has been brought into the church as it was perishing; also two effigies, which stood in the north porch, have been once more made recumbent in openings prepared for them in the walls, strips of copper recording their "translation" in the following words:—

RECTORIS IGNOTI EFFIGIEM SUCCESSOR HIC  
PONI CURAVIT. MDCCCCL.

SERVUM TUUM NOBIS IGNOTUM DOMINE CUSTODI.

The lower part of the walls, disencumbered of thick modern plastering, displayed in places some interesting paintings, but most of the original surface had been hacked away. The Jacobean altar is kept in use, surmounted by a large red marble slab. Much remains to be done, especially on the north side, before the church is once more weatherproof. The architects are Messrs. Prothero & Phillott, of Cheltenham, and the builders Messrs. Collins & Godfrey, of Tewkesbury.

CHURCH, IFRACOMBE.—A new church is to be built at Ifracombe on the site of the present St. Peter's. Mr. G. H. Fellowes Prynne, of London, is the architect.

PRESBYTERIAN CHURCH, STANLEY, DURHAM.—The foundation-stones of a new Presbyterian church at Stanley, county Durham, have just been laid. The buildings are being erected from the design and under the superintendence of Messrs. Badenoch & Bruce, architects, Newcastle-on-Tyne, and comprise a church to seat 350, hall seated for 250, with vestry, class, and session-rooms. The walls are of local stone, with hammer-dressed facings, and having chiselled dressings. The site is on the brow of the hill to the east of Stanley, and on the north side of the main road from Shield-row. The church is planned with wide nave and no aisles, and has vestibule porch at entrance, with tower and spire. The hall and classrooms are at the east end, and the hall gable abuts on the main road, with the porch at one side giving access to same, and answering as an exit from the church. The timber work throughout will be of pitch pine, stained, and the floors will be in wood blocks laid on concrete. The contractors are: Wm. Johnson, White-le-head, mason; John Anderson, joiner and slater; Matthew Charlton, plumber; Richard Frankland, Blackhill, plasterer; Adam Robertson & Sons, painters and glaziers; and heating, Messrs. Emley & Sons, Ltd., all of Newcastle, except the mason and plasterer.

CHAPEL, PANBRIDE, FORFARSHIRE.—St. Bride's Chapel was opened on the 12th inst. The chapel accommodates 402 persons, and is situated at the intersection of Cartlegie-road and Maule-street. It consists of a nave and side aisle with raised chancel at the east end, from which an organ-chamber is divided by an arch. At the west end there is a font recess, with dressed stonework and tiled walls and floor. The roof is of open timber work, and the aisle is divided from the nave by wooden pillars and trussed timbering. The architects were Messrs. James MacLaren & Sons, Dundee, whose design was chosen in competition.

STORES, YORK.—A branch of the York Equitable Industrial Society, Limited, has just been opened at the corner of Vyner-street and Haxby-road. Mr. Beck was the architect.

FACTORY, BRISTOL.—A new factory for Messrs. Pearson, Huggins, & Co. has just been built on a corner site at the junction of Minver-street and Catwrest East-street. The area of the floor space available is slightly over an acre, and at least 1,000 workers will be employed. In the basement is a fireproof storeroom, which is lighted by Luxfer prism windows. There is a lift from this store to the other floors. The ground, first, and second floors will be used for the making, finishing, and packing of the army, railway, police, and tramway clothing. The other premises are lighted by electricity and warmed by hot water, the apparatus for the latter being supplied by Skinner & Co. The contractor for the general work is Mr. Longden, of Eastville, and the architects are Messrs. La Trobe & Weston.

BUSINESS PREMISES, ABERDEEN.—Work in connexion with the suite of new offices at Broadford Works, Aberdeen, for Messrs. Richards, Ltd., is now nearing completion. The new building, which is 112 ft. in length, is erected on the site of the old offices, which were found to be insanitary and unsuitable for the business. Plans for the new premises were prepared by Mr. R. G. Wilson, architect, Aberdeen. The accommodation consists of a manager's and board room (in which the meetings of the directors will be held), an assistant manager's office, a counting-house (13 ft. in length by 30 ft. in breadth, occupying a central position), a room for the typists, and a large office, with gatekeeper's premises, waiting-rooms, and lavatories. There are three built safes in connexion with the different departments of the work, and also a large safe on the basement floor underneath the counting-house running throughout the building gives access to the various rooms.

NEW BUILDINGS, EDINBURGH CASTLE.—The finished drawings of the new buildings which are to be erected in Edinburgh Castle are now on view to the public in one of the committee-rooms of the City Chambers. They have been prepared at the War Office under Major Hemming, R.E., and are in the style of the Castellated or Scottish Baronial style of architecture, providing officers' mess-room accommodation and quarters for seventeen officers and their servants. The new structure, which is 122 ft. long and 100 ft. deep, is for the most part two stories in height, but the fall in the ground at the north side is utilised for the kitchen, cellars, offices, and servants' quarters, and that part of the building is thereby increased to four stories. The site is on the old Mills Mount, to the immediate east of the recently-erected military hospital, and the barracks now occupying the site will be demolished to make way for the new quarters, the design of which is in harmony with the architectural features of the existing building. On entering the Castle, the new building will be to the right, after passing the Argyle battery. The first floor, which is entered through a vestibule and hall—in which there is a recess for the band—will contain the principal apartments, including mess-room, ante-room, billiard-room, and the usual mess offices, which communicate with the kitchen by a separate staircase and lift. On the north side of the entrance are suites of rooms for two field officers, one on the ground floor and the other on the upper flat, with separate entrances, and the rest of the building is devoted to bedroom accommodation. In front of the mess there is a terrace, with a stone parapet, and on the north side a spacious flat over the billiard-room commands a view of Princes-street and the Fife coast. The contracts have not yet been let, but it is understood that they will be placed with local firms, and the probable cost is estimated at about 20,000l.

NEW LIBRARY FOR LEWISHAM.—On the 23rd inst., Mr. T. W. Williams, Mayor of Lewisham, opened to the public a new central public library, which has been erected in the High-street, Lewisham, close to the parish church, at a cost of nearly 8,000l. The building is in the Renaissance style, and is built of red brick, with terra-cotta dressings, from the designs of Mr. A. R. Hennell. The builders were Messrs. Black & Son, of Forest Hill. In the hall is a bronze tablet to the memory of Alfred the Great.

WORKHOUSE, WORMWOOD SCRUBBS.—An ordinary fortnightly meeting of Hammersmith Board of Guardians was held on the 20th inst., at the Guardians' offices, Fulham Palace-road, when it was stated that the Building Committee had considered the Board's reference of the question of the formal appointment of Messrs. Giles, Gough, & Trollope as architects in connexion with the erection of the new workhouse and infirmary at Wormwood Scrubbs. Having had an interview with representatives of the firm, the Committee recommended that Messrs. Giles, Gough, & Trollope be appointed as the architects. To this the Board agreed.

NEW FIRE-STATION, BARNESLEY, YORKSHIRE.—An inquiry was held at the Town Hall, Barnsley, on the 21st inst., by Mr. A. G. Malet, M.I.C.E., an Inspector of the Local Government Board, on a proposal of the Town Council to borrow 1,800l. for a new fire-station and firemen's houses, and 408l. for the improvement of the road at Shaw-Lane. The Borough Surveyor, Mr. J. H. Taylor, explained what was proposed.

#### SANITARY AND ENGINEERING NEWS.

ELECTRIC LIFTS FOR GREENWICH FOOTWAY TUNNEL.—There will be two electric lifts, one at each end of the tunnel, each of which will be capable of carrying about seventy passengers at a speed of 180 ft. per minute. The lifts will travel about 44 ft. and 50 ft. respectively. In order to reduce the current required, the cage and half its load will be balanced by a cast-iron weight. The cages will be of strong construction, having steel suspension frames with the lower parts filled with panelling of contrasted woods. The upper half will be finished with ornamental ironwork. Each cage will be fitted with automatic safety gear arranged to stop the car if the speed exceeds a fixed limit. The cages (and balance weights) will

run on steel rails milled to gauge to ensure easy running. Each car will be suspended by eight flexible steel wire ropes, the ultimate strength of all the ropes being twenty times the maximum load that they have to carry. The driving gears will be made to Björnstad's patents and fixed overhead, so that only three pulleys are required for each. The motors actuate the driving pulleys through worm gear. The worms will be of mild steel gearing with phosphor bronze wheels with machine-cut teeth and enclosed in oil baths. The controlling gears are constructed under Björnstad's patents, all the switches required for starting and stopping the motors being actuated by powerful magnets, which are controlled by the attendant in the cage through a small switch. Messrs. Easton & Co. are the engineers.

**THE MANCHESTER WATER SUPPLY.**—The Manchester Waterworks Committee met on the 21st inst., and decided to remove all restrictions upon the water supply under their control. The effect of recent heavy rains has been, not indeed to fill the reservoirs at Longendale, but so far to fill them as to make the question of a water famine rather remote. The Committee, having dealt with the question of the immediate supply of water, next turned their attention to the question of the laying of the second pipe from Thirlmere, and it was decided that tenders for laying the first section, namely, that between Prestwich and Hoghton, near Blackburn, be advertised for. There will be fourteen miles of cast-iron pipes 44 in. in diameter, and ten miles of similar pipes 40 in. in diameter, with three-quarters of a mile of steel pipes to be used in carrying the line over bridges. The use of steel pipes for this purpose is at present purely experimental, and they are therefore to be placed in such a position as shall be easily accessible. The Committee have not at present absolute faith in this, fearing that the steel pipes will be more liable to corrosion than pipes made of cast-iron. It is for this reason that steel pipes are only to be brought into requisition to such a limited extent.—*Manchester Guardian.*

### FOREIGN.

**FRANCE.**—A historical exhibition of wood-engraving is to be held at the Ecole des Beaux-Arts during this winter. It is to include examples of French and foreign wood-engraving from the commencement of the art to the end of the nineteenth century.—An exhibition of the ceramic work of M. Lachenal is open at the George Petit Gallery, Paris. It includes a great deal of fine work in stone, ware, faience, and enamel. The "Alliance Provinciale des Industries d'Art" has decided on the formation, at Nancy, of a school of theoretic and practical instruction in applied art, to include wood-carving, metal-work, textile art, ceramic art, and other artistic industries.—M. Ch. Gozier, architect, of Rheims, has been elected President, for 1902-3, of the Société des Architectes de la Marne; and M. Ekave has been elected President of the Société at Nantes, for the same period.—The decorative panels executed by M. Cheret for the Hôtel de Ville of Paris, and which represent Pantomime, Dancing, Comedy and Music, are about to be placed in position. They will be framed in white wood borders picked out with gold. The scheme of decoration will be completed by four smaller panels over the doorways, consisting of figures of children and various symbolic attributes.—The death is announced, at the age of sixty, of M. Paul Emile Sautai, painter, and pupil of Jules Lefebvre and of Robert Fleury. He was a painter of landscape and genre pictures many of which have found places in provincial art museums, and in the Luxembourg are his two pictures "Interior de l'Eglise de Lavardin," and "Souvenir de Rome." He had received medals in various successive Salons.

### MISCELLANEOUS.

**PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.**—Mr. C. J. Innocent, architect, of Sheffield, has taken into partnership his son, Mr. Charles Frederick Innocent, who is an Associate of the Institute of British Architects.—Messrs. Mansell & Mansell, architects (Birmingham), have removed from Imperial Chambers, Colmore-row, to No. 47, Temple-row, Birmingham.—Mr. Joseph Berry, architect (Huddersfield), has removed his offices to 3, Market-place, Huddersfield.—Messrs. Denny, Mott, & Dickson (London) have been appointed sole agents in Great Britain for compo-board.

**GLASGOW ARCHITECTURAL CRAFTSMEN'S SOCIETY.**—The usual fortnightly meeting of this Society was held on Friday, the 22nd inst., Mr. James McKissack in the chair, when a paper entitled "Foreign Competition in the Building Trades" was read by Mr. Geo. Herbertson, measurer. He held that the restriction put by the combined action of workmen on the importation of foreign-made joinery finishes and the like was contrary to the spirit of free trade, which is the policy of this country. He suggested that for rolled steel beams and Portland cement a certain standard should be specified, and let the material come from where it might. He deprecated the proposed boycotting by slate quarry masters in their attempt

to keep out foreign slates. A discussion followed. On Saturday, the 23rd inst., the members of the Society visited the lodging for men known as "Whitehouse," situated at Springburn. The promoters, a syndicate under the name of "The St. Mungo Boarding House Company," are to be congratulated on their very effective solution of the problem of providing home comforts for the working classes in an establishment, palatial in its construction, and such as to promote the health and happiness of its inmates, at a cost which must be considered to be extremely reasonable. The idea of the management is not so much to cater for the single-night lodgers as to provide for permanent or weekly boarders. For the modest sum of 13s. 6d. per week a working man has his breakfast, dinner, tea, and supper served in a dining-room, large, airy, and well lit, on tables laid with spotless tablecloths, and waited on by civil attendants. His evenings, if he be of a literary turn, he can spend profitably in the library. The building reflect credit on the architect, Mr. Whiteley, of Glasgow, treated as they are in an artistic fashion combined with strict economy in their design. The walls are constructed of brick, rough-cast cement on face, with red-tinted cement as dressings. The floors are fire-proof, and the buildings are lighted throughout by electric light. Steam is employed in the cooking arrangements, and the laundry work and cleaning is accomplished by the most improved machinery.

**THE CARPENTERS' COMPANY'S EXAMINATIONS.**—This Company held their annual examination in sanitary building construction at their Hall during last week. The Board of Examiners included Professors T. Roger Smith and H. Robinson; Mr. John Willson, the Master of the Company; Mr. Slater, Vice-President of the Institute of Architects; Mr. Seth-Smith, President of the Architectural Association; Dr. Wynter Blyth, Medical Officer of Health of Marylebone; Mr. Chas. Wall, President of the Institute of Builders; Mr. Bartlett, of King's College; and Mr. S. Green, President of the Clerks of Works Association. The following is a list of successful candidates arranged in order of merit: F. Hartnoll, special prize of books (as he already holds the Company's silver medal); H. Barsby and H. German (equal), silver medals; G. H. Lovegrove, E. W. F. Martin, and A. Norton (equal), bronze medals; H. Walker, H. Bolton, J. Sandham, C. W. Woodhouse, A. B. Harvey, E. A. Crane, G. J. Boog, J. Lawrence, and W. M. Cooper, certificates.

**APPOINTMENT OF SANITARY OFFICER.**—The Local Government Board has sanctioned the appointment of Mr. H. E. Cox as a sanitary inspector in Stoke Newington.

**SCHOOL OF ART WOOD-CARVING.**—The School of Art Wood-carving, Imperial Institute, South Kensington, has been reopened after the usual vacation, and we are requested to state that some of the free studentships, maintained by means of funds granted to the school by the Technical Education Board of the London County Council and by the Drapers' Company, are vacant. The evening class is, for the present, closed, but to meet the requirements of those professionally engaged during the week, a special Saturday afternoon class is held. Forms of application for the free studentships and any further particulars relating to the school may be obtained from the manager.

**INCORPORATED CHURCH-BUILDING SOCIETY.**—This Society held its usual monthly meeting (the first of the present session) on Thursday, Nov. 21, at the Society's House, 7, Dean's-yard, Westminster, S.W., the Rev. Canon C. F. Norman in the chair. Grants of money were made in aid of the following objects, viz.:—Building a new church at Stoughton, Emmanuel, near Guildford, 50l. for the first portion, and towards enlarging or otherwise improving the accommodation in the churches at East Bridgford, St. Peter, near Nottingham, 25l.; Hednesford, St. Peter, near Stafford, 70l.; Ickham, St. John the Evangelist, near Dover, 25l.; Manningtree, St. Michael and All Angels, Essex, 25l.; Tebury, St. Mary, Gloucester, 20l. in lieu of former grant of 10l.; West Dereham, St. Andrew, Norfolk, 25l.; Weston-super-Mare, St. Saviour, Somerset, 60l.; and Worlington, St. Saviour, Suffolk, 50l. Grants were also made for special Missions and Buildings Fund towards building Mission churches at Eastcombe, near Stroud, Gloucester, 15l.; New Catton, St. Luke, Norwich, 30l.; Newton, near Burton, Pembroke, 20l.; and Steelworks, near Ebbw Vale, Monmouth, 20l. The following grants were also paid for works completed:—Roath, St. Martin, Cardiff, 1000l.; Grove, St. James, Wantage, Berks, 50l.; Woolmer Green, St. Michael and All Angels, Welwyn, Herts, 80l.; Little Bowden, St. Nicholas, Northampton, 35l.; Great Saughall, All Saints, Chester, 50l.; Heysham, St. John, Lancaster, 150l.; Worlington, All Saints, Suff-1k, 15l.; Greenhead, St. Cuthbert, Carlisle, 30l.; Croydon, St. Augustine, Surrey, 150l.; Stow Longa, St. Boniph, near St. Neots, Hunts, 25l.; Comp. Dundee, St. Andrew, Somerset, 25l.; Helton-le-Hole, St. Nicholas, Durham, 200l.; South Shields, St. John the Baptist, Grantham, Lincs, 25l.; Sidcup, St. John the Evangelist, Kent, 100l.; T'bxated, St. John the Baptist, Essex, 20l.; Pontardulais, St. Michael and All Angels, Glamorgan, 110l.; Witley Rocks, St. John, Stoke-on-Trent, 20l.; Latchford, St. Hilda, Warrington, 15l.; Leyton, St. Luke, Essex, 20l.; Willesden, St. John the Baptist, Middlesex, 50l.

Dundraw Mission Church, Bromfield, Cumberland, 15l.; Cotteridge Mission Church, near Birmingham, 50l.; St. Leonards, St. Faith, London, 35l.; Chapel St. Leonard, St. Leonard, Alford, Leicesters, 15l.; Starchley-street, The Ascension, near Birmingham, 200l.; Noman's Heath, St. Mary the Virgin, Tamworth, Staffs, 10l.; and Wendebury, St. Giles', Oxon, 20l. on account of a grant of 25l. In addition to this the sum of 466l. was paid towards the repairs of twenty-seven churches.

**ELECTRIC LIGHT POWER STATION, NEEPSFEND, SHEFFIELD.**—Mr. A. A. G. Mallet, A.M.Inst.C.E., Inspector under the Local Government Board, sat at Sheffield Town Hall on the 10th inst. to inquire into the subject-matter of the application of the Sheffield City Council for sanction to borrow 500,000l. for purposes of the electric lighting undertaking. Mr. S. E. Fedden is the electric light engineer.

### CAPITAL AND LABOUR.

**MILL-SAWYERS AND WOOD-CUTTING MACHINISTS' RULES.**—The following are the new working rules which have been agreed upon between the representatives of the London Master Builders' Association and the Amalgamated Society of Mill-Sawyers and Wood-cutting Machinists:—1. That the working hours in summer shall be fifty per week for forty weeks. That during twelve weeks of winter, commencing on the second Monday in November, the working hours shall be for the first three weeks and the last three weeks forty-seven hours per week, and during the six middle weeks forty-four hours per week. *Summer* (for forty weeks)—First five days of each week, 6.30 a.m. to 8 a.m., 8.30 a.m. to 12 noon, 1 p.m. to 5 p.m. Saturdays, 6.30 a.m. to 8 a.m., 8.30 a.m. to 12 noon (equal to fifty hours per week). *Winter* (for twelve weeks)—For three weeks commencing the second Monday in November: First five days of each week, 7 a.m. to 8 a.m., 8.30 a.m. to 12 noon, 1 p.m. to 5 p.m.; Saturdays, 7 a.m. to 8 a.m., 8.30 a.m. to 12 noon (equal to forty-seven hours per week). For the next six weeks: First five days of each week, 8 a.m. to 12 noon, 1 p.m. to 5 p.m.; Saturdays, 8 a.m. to 12 noon (equal to forty-four hours per week). For the following three weeks: First five days of each week, 7 a.m. to 8 a.m., 8.30 a.m. to 12 noon, 1 p.m. to 5 p.m.; Saturdays, 7 a.m. to 8 a.m., 8.30 a.m. to 12 noon (equal to forty-seven hours per week).

2. That overtime, when worked at the request of employers, but not otherwise, shall be paid at the following rates, namely:—from leaving-off time until 6 p.m., ordinary rate; from 6 p.m. to 10 p.m., time and a quarter; after 10 p.m., double time. On Saturday the pay for overtime, from noon to 4 p.m., shall be time and a half; after 4 p.m., and Sunday, double time. Christmas Day shall be paid for the same as Sunday. 3. That one hour's notice be given or one hour's time be given by either side, on determining an engagement.—4. That payment of wages shall commence at noon, or as soon thereafter as practicable, on Saturday.—5. That wages earned after leaving-off time on Friday, and Saturday only, shall be kept in band as back time.—6. That the term "London District" shall mean twelve miles radius from Charing Cross.—7. Conciliation Rule.—(a) For the adjustment of all disputes and to avoid stoppage of work, it is agreed that in the event of any arising between an employer or upon the works of an employer and any of his workmen from any cause whatever, notice shall be given by the association or society of the complaining party to the association or party representing the other side, and the subject matter of dispute shall thereupon be referred to the Board of Conciliation, who shall be summoned within seven days, and, if practicable, shall give their decision within the next six working days, proceeding in the following manner: (b) For all purposes of the foregoing rules the Board of Conciliation shall consist of three members nominated by the employers and three by the workmen. Each party shall send to the other within one week from the date of signing these rules, and within one week from January 1 in each year, the names of six persons from whom three shall be selected to act as their representatives on the Board of Conciliation for the current year ending December 31, and in the event of the death or resignation of any member, either party shall appoint another member within one week, notice being given thereof. The number of representatives of the employers and of the workmen on the Conciliation Board shall always be equal and shall be so maintained during the sitting. (c) The Board of Conciliation so constituted, if unable to agree, shall make application to the Board of Trade under the "Conciliation Act, 1896," or apply for the appointment of a person to act as a conciliator. The Board of Conciliation shall have power to decide all questions arising between the employer and the workmen, including any questions between one trade and another as regards demarcation of labour or other matters, provided that for the decision of any question involving claims or rights of other sections of the building trades a joint Conciliation Board shall be constituted of the three representatives nominated by each trade involved and by a similar number of representatives of the employers, so that members on the Joint Conciliation Board may be specially represented on such Board, and so that the numbers of representatives

of the employers and the workmen on such Joint Conciliation Board shall be equal and be so maintained during the sitting. (d) A Joint Conciliation Board shall have the like powers as a Conciliation Board, and be regulated in the same manner. (e) The Conciliation Board, or a Joint Conciliation Board, shall have power to make such rules and regulations for the transaction of business as they may approve. (f) In the event of an application being made to the Board of Trade, or a person being appointed as conciliator, the decision of such person or the Conciliation Board shall be final and binding on both parties. 8. That six months' notice on either side shall terminate the foregoing rules. (It is understood that the six months' notice shall not expire during the winter weeks.) Throughout the rules "employer" means a member of the London Master Builders' Association, and "workman" means a member of the Amalgamated Society of Mill-Sawyers and Wood-Cutting Machinists.

## LEGAL.

## A BUILDER'S APPEAL UNDER THE WORKMEN'S COMPENSATION ACT, 1897.

THE case of *Veazey v. Chattle* came before the Court of Appeal, composed of the Master of the Rolls and Lords Justices Stirling and Mathew, on the 23rd inst., on the appeal of the defendant (the employer) from an award of the County Court Judge of Derby, who had made an award in favour of the applicant under the Workmen's Compensation Act, 1897.

In this case the applicant was in the employ of the defendant, a builder, and met with an accident whilst doing some repairs to the roof of a house. It seemed that the applicant and another workman erected a ladder against the side of the building, and took what was called a "crawling-board" up the ladder for the purpose of doing the repairs. This board consisted of a plank 20 ft. in length and 10 in. wide and it had nailed screws across it ridges of wood for the purpose of giving foothold to the man who was working on it, and at one end of the plank, on the underneath side, was another ridge for the purpose of hooking it over the ridge of the roof. The two men placed this plank on the roof, but it was not in any way attached to the ladder. The applicant went up the board for the purpose of lifting the end of it over the ridge of the roof, the other man standing on the ladder and holding the board to keep it steady. Before the applicant had done what he intended doing the board slipped and the applicant fell and was injured. The County Court Judge found that the applicant was employed on, or in, or about a building which exceeded 30 ft. in height, and which was being repaired by means of a scaffolding within the meaning of the Act (Section 7), and awarded the applicant compensation. From this decision the employer now appealed, on the ground that the County Court Judge was wrong in holding that the ladder and "crawling-board" constituted a scaffolding within the meaning of the Act.

At the conclusion of the arguments of counsel, the Master of the Rolls, in giving judgment, said the meaning of the Act (Section 7) was the case of *Hoddnott v. Newton, Chambers, & Co.*, was clear authority for saying that that which would not ordinarily be called scaffolding might be scaffolding within the meaning of the Act. Was it possible to say as a matter of law that this arrangement could not be a scaffolding within the meaning of the Act? It seemed to his Lordship that it fulfilled the purpose for which it was used—viz., the repair of a building—as well as did the trestles and boards in the cases cited during the arguments. It was a platform which was used by a workman in order that he might get on with his work. It was a special contrivance such as was usually adopted for the purpose of allowing a workman to work safely in a position at a considerable height from the ground, and it afforded a means of supporting him for doing his work in the same way as the trestles and boards which had been held to be scaffolding. It seemed to his Lordship quite clear from the decisions of the House of Lords that a ladder might be scaffolding within the meaning of the Act. He thought that the arrangement in this case answered to the description of scaffolding, and that the County Court Judge had come to a proper conclusion on the matter, and that the appeal ought to be dismissed.

Lord Justice Mathew concurred. Lord Justice Stirling, however, dissented. The question to be determined was whether the structure which was used in this case could in the language of Lord Brampton in the case of *Hoddnott v. Newton, Chambers, & Co.* be called scaffolding, or in the language of Lord Lindley, could fairly be called a scaffolding. To his mind it could not. It seemed to him to be a form of ladder, and when the accident happened the board had not been put in position. In his opinion, the combination could not either fairly or properly be called a scaffolding. He therefore thought that the appeal ought to be allowed.

By a majority of the Court, therefore, the appeal was dismissed, and the decision of the County Court Judge affirmed.

Mr. Rugg, K.C., and Mr. Cranston appeared

for the appellant (the employer), and Mr. Chester Jones for the applicant (the respondent on the appeal).

## IMPORTANT CASE UNDER THE PUBLIC HEALTH ACT, 1875.

THE actions of Wigham, Richardson, & Co., Ltd., v. the Walker-on-Tyne Urban District Council and of the District Council against Wigham, Richardson, & Co. came before Mr. Justice Farwell in the Chancery Division on the 26th and 27th insts.

Mr. Cripps, K.C., Mr. Macmorran, K.C., and Mr. Gatey were counsel for the company; and Mr. Robson, K.C., and Mr. R. J. Parker for the Urban District Council. The case of the Council was given priority to by the Court.

Mr. Robson, in opening his case, said that his clients were the Urban District Council of Walker, in the county of Northumberland, and the defendants were manufacturers and engineers at Walker; and this action was brought under Section 26 of the Public Health Act, 1875, which enacted that any person who in any urban district without the written consent of the Urban Authority causes any building to be erected over any sewer of the Urban authority, or causes any vault, arch, or cellar to be newly built or constructed under the carriage-way of any street shall forfeit to the Urban Authority 5*l.*, and, also, for every day after written notice has been given on behalf of the Urban Authority; and the Urban Authority may cause any building, vault, arch, or cellar constructed in contravention of this section to be altered, pulled down, or otherwise dealt with as they might think fit, and might recover the expenses of so doing. This was what the defendant company objected to, but the Council maintained that the company, having erected a vault, arch, or cellar, the Council were entitled to pull it down or dispose of it as they thought fit. The Council were also the public electric lighting authority. In April last it was reported to Mr. Laycock, the Council's Surveyor, that the defendants were building, without the consent of the Council, a tunnel under Fisher-street. The defendants' works were on both sides of that street, and they wanted the two sides connected for the purposes of their works. The Council were responsible not only for the sewers which they might hereafter lay down, but also for the electric lighting if they might wish to lay it down; and they did not wish a tunnel of 12 ft. high put down in this street which might interfere with their own operations hereafter. Notwithstanding that, the defendants persisted in continuing to construct this subway, and while the construction was going on subsidence of the roadway began to take place, and one of the water pipes was sprung, leaked, and the water began to wear away the soil from under the gas pipes. The Council said that this must not go on; and they claimed the right under the Statute to deal with the matter as they thought fit. But the plaintiffs went on with the work to carry their electric mains from one side to the other. Wigham, Richardson, & Co. were large shareholders in the Gas Co., who had powers to supply electrical energy outside this area. Within this area the legislature had given the Council powers to supply electrical energy, but Wigham, Richardson, & Co. took their electrical energy from the Gas Co. at present, and desired to have it extended to the other side of the street—both sides being within the Council's district. The Council submitted that although they could not prevent Wigham, Richardson, & Co. laying this tunnel under their own premises, they could prevent them constructing it under the public thoroughfare. The defendants had filled up the tunnel to some extent, and said that there was no longer a vault or tunnel under the street. But they had not removed the structure. On the contrary, they had left it more dangerous than ever, by filling up the space above the wires with ballast instead of concrete or material homogeneous with the surrounding soil or rock. The Council's Surveyor advised them that in consequence there would be a continuation of the subsidence, and that the Council would be unable to lay drains down this street.

Mr. Thos. Wm. Laycock, Surveyor to the Urban District Council, gave a description of the character of the tunnel or arch.

Mr. Cripps, for the company, said that after all they only wanted to get at the point of law. The Urban Council seemed to fear that they would lose for electric supply purposes the business of Wigham, Richardson, & Co., whose works gave employment to over 3,000 persons. For those works the company wanted to get the polyphase system, and to do that they had to go under the highway; but, having had their attention drawn to the matter, they destroyed the arch, leaving the pipes or wires to pass through the concrete casing. All the District Council were entitled to under the statute was to get rid of the arch, but not to remove the electric wires. Yet they had proposed to dig down and cut those electric wires under the guise of filling up this arch; and against that Wigham, Richardson, & Co. got an interim injunction, as they had no right to cut this electrical connexion. While the company had been wrong in constructing an archway, and had admitted that they were still entitled to restrain the District Council from taking up those mains, pipes, and electrical wires, which was now the only mode of connection.

After further argument, his Lordship, in giving judgment, said that the view he took of this case was that it turned on a question of fact, viz., whether the pipes in question were a structure or situated in any structure which the District Council were entitled to remove under Section 26 of the Public Health Act. The first action was by the Local Authority claiming a declaration in accordance with that section, and to that there was no defence at all, because nobody disputed that the Local Authority had that particular statutory right. But the company admitted that they brought a cross action to restrain the Local Authority from interfering with the pipes. The company were lessees of forty-four years unexpired of the land on both sides of Fisher-street. The subsoil of the street, therefore, at the *locus in quo* belonged to them. Wigham & Co., being owners on both sides of the street, were minded to take their electric cables from their property on one side to their property on the other. Had Wigham & Co., being owners, simply drilled a hole through the subsoil, and thrust a pipe through from one side to the other, there could have been no interference by the Local Authority. But they had built a tunnel with an arched roof and sides and floor of concrete. Such a structure required the written consent of the Urban Authority before it was built, and as it was not so obtained the Urban Authority had the right to have that structure removed. Having made that tunnel the company changed its plans, and instead of laying their pipes in the interior of that tunnel they cut away the centre of the concrete floor down to the clay and laid their pipes on the clay; and on the top of them the concrete was filled in again to the height of the original flooring. The Local Authority wanted to cut those wires on the ground that they were part of the floor of the arch, vault, or cellar, that they were entitled to remove the floor, and, inasmuch as these pipes were in or under the floor, they were entitled to remove the pipes also. In his Lordship's judgment the place where the pipes were now laid was no part of the floor of the vault as built, and no part of a vault, arch, or cellar under the statute. The District Council succeeded in their claim for a declaration of their rights under the Section, and Wigham & Co. would have to pay the costs of that action. In the cross action, Wigham & Co. succeeded, and there would be an injunction to restrain the District Council from cutting, disturbing, or damaging the pipes or mains, the Council to pay the costs of that action.

## RECENT PATENTS:

## ABSTRACTS OF PATENTED INVENTIONS.

13,544.—CEILINGS AND FLOORS: E. L. Ransome.—After a plastic or concrete ceiling has been moulded in place upon false work, the flooring is finished; short legs serve to sustain the core-boxes, which, until the cement has become set, are braced in position; then, when the boxes have been taken away, the floor is laid either over temporary frames or over permanent centres. For the metal coils (see No. 13,279 of 1900), which may join the parts as they are moulded in turn, the inventor substitutes hard porous earthenware or concrete blocks, laid over the webs and related to support the centres.

13,503.—A PRESSURE REGULATOR FOR GAS: F. Achermann.—A regulator for gas burners comprises a cylindrical case containing a cup fitted with a conical needle, as the gas raises the cup the needle tends to reduce in extent the gas-passage into the burner above, the cup being weighted to suit the normal pressure; a base-plate forced downwards with a helical spring may replace the cup.

13,591.—WINDING MACHINERY FOR LIFTING PURPOSES: F. Eastmead and A. C. Moffatt.—A lever that moves against a spring displaces lengthwise a shaft which carries a winding drum having conical ends. On the shaft runs loosely the driving wheel, which is prevented from moving sideways with a flange and a clip. On one side of the frame is affixed a brake-cup, and a brake-cup is fashioned on the pulley; when the spring comes into play, the drum is moved to engage with the brake, but when it is displaced towards the right-hand it will become engaged for winding with the pulley.

13,596.—SPIRIT AND OTHER LEVELS: F. A. Brownell.—Flanges are fashioned upon the outside and inside of the casing, which also has an internal screwed collar for pressing the container up against the cover. A small opening, to be closed with a screw, serves for the pouring in of the fluid.

13,602.—DECORATION OF CEILINGS, WALLS, AND SIMILAR SURFACES: H. Schudt.—Layers of quickly drying plastic material, wherein wire, string, shot, or other filling has been embedded, are brushed on the flat surface with long-haired brushes; the plastic material is compounded of glue, melted resin, and a paste of chalk and water, to which, when cool, are added oil and colouring-matter, and it may be, lime, wax, or shellac. The process is described as being available for imitation leading on glass with coloured transfers, as an imitation of stained glass.

13,603.—FOLDING GATES AND GUARDS: J. Fudd.—Gates and guards for shop-fronts, windows, &c., have uprights that are joined together with lattice-work in the form of lazy-tongs, and consist of two

bars joined with pierced spacing-blocks which provide guides for the pins of lazy-tongs joints above and below. The amount of opening of the framework is regulated with pins or stop-blocks upon the end uprights, between which the lattice-bars are pivoted at the middle.

13,614.—A SOLDER FOR ALUMINIUM. H. Lange.—After the surfaces have been cleaned with a file they are coated with zinc as they are being heated, an alloy containing about one part of aluminium and two and a half parts of zinc is then spread over them and the surfaces, pressed together, are heated until the alloy is melted.

13,673.—A CONTRIVANCE FOR WINDOW-SASHES: W. Cummings.—For the turning inwards of sliding sashes a part of the inside head is hinged, the parting is made detachable, and hinge eyes or sockets are either secured to the sashes for engagement with pivotted eyes, or fitted over pivots upon the frame. Bevelled pin-and-socket plates and a turn-buckle in engagement with a slotted plate on the head, fasten the parting-head, whilst a thumb-screw in a fixed threaded socket or nut secures the inside head.

For a lower-sash hinge is devised a T-shaped plate, upon the sash, having a lug and socket that will interlock with a flap which is pivotted on to the frame, and pivots upon the pulley-stile engage with socket-plates on the upper sash. A recess in the sash-stile contains a hook or button around which the sash-cord is looped, a fixed hook holds the detached cord when one turns the sash inwards.

13,691.—AN APPLIANCE FOR USE WITH DRAWING-SCALES: E. L. Sykes.—The inventor seeks to dispense with the use of compass dividers by fitting the drawing-scale with a movable pointer and a pointer fixed at one end of the scale.

13,703.—FLUSHING APPARATUS: R. Chantry & H. C. Milbank.—Two tubes constitute a bell-siphon having its walls hollowed, a third tube is joined to the inner one of the two tubes, and is dipped into a stand-pipe. The third tube is also connected to a pipe at the base which leads into a cylinder containing a weighted piston; if the piston, as it falls, causes the water to flow over the crown of the siphon whereby the flush is set in operation.

13,730.—CONTRIVANCE FOR HOISTING AND LOWERING PURPOSES: R. Watson & C. E. Stevenson.—A trolley, which carries the load, runs upon a rail which is to be raised upon a middle guide secured with brackets to the side of a building, when it has been lifted high enough the rail will form a connection between fixed rails, on to which one can run the trolley; a spring-stop serves to prevent the trolley from running off too soon, and the winding-up of the rail too far is prevented with a lug that engages with the underside of the rail.

13,730.—AN APPLIANCE FOR DOORS, GATES, CASEMENTS, &c.: D. Davis.—A combined stop and holder consists of a curved metal plate, having its ends turned upwards, which is pivoted eccentrically and has an extension-piece for the control of its movement, the extension having a curved slot through which a pin is inserted. The edge of the door, as it is being opened, meets the end of the curved metal plate, and so turns the extension-piece into place for keeping the door opened between the ends of the plate.

13,750.—TILES FOR BUILDERS' USE: F. Furness.—Tiles for interlocking are fashioned with bevels so that they shall overlap with those next adjacent. They are bolted on to floors, walls, ceilings, and other surfaces, the bolts being fastened with screws and flanges, but for rubber tiles the bolt-heads are put into under-cut recesses. For the tiles see also No. 20,248 of 1894.

13,755.—FLUSHING APPARATUS: W. Muller.—Between a flange and lugs upon the bell is mounted a loose plate. As the bell rises the water will flow to beneath the plate through openings that are made in the bell between the lugs and the flange. The flush is started by the flowing of water over the crown of the siphon together with the fall of the loose plate.

13,793.—CONSTRUCTION OF CONCRETE WALLS, &c.: E. L. Ransome.—For adjusting mould boards or panels to the plumb-line are employed screws that will press against wedge-shaped or rebated braces, the panels, or cleats upon the boards, tie-bolts being passed through the boards and braces. Between the upper edges of the boards are inserted struts or distance-pieces, and on the outer sides of the adjacent boards are fitted turn-buttons that are pivoted to the boards.

13,796.—MEANS OF REGULATING WATER SUPPLY: S. M. Rutnagar.—For regulating the quantity of water delivered for flushing and other household or similar purposes, and for preventing waste, the inventor devises a screw-down or plug-valve, which is either closed automatically with a tippler or opened and shut with a handle. An outlet from the container communicates with a vessel fitted with an ordinary exit branch, and another that feeds water to the tippler, of which, when the valve is open, a weighted part will lie against a stop. The valve, when left opened, will become automatically closed after a certain known quantity of water has been supplied. For a spring push-valve an eccentric disc for working the push is mounted upon the spindle.

13,805.—INSULATORS, &c., FOR ELECTRICAL CONDUCTORS: G. Wright and C. Aalborg.—The supports and insulators are more particularly in-

tended for telephone switch-boards. They are made with central openings and annular recesses and projections, so that one can apply them to a bolt. When two insulators are put side by side lateral grooves maintain the conductors in their places and bosses upon the brackets fit into the insulators beneath.

13,817.—A CALCULATING MACHINE: J. Verneuchen.—The instrument is intended for the processes of multiplication, division, squaring, and calculating by means of logarithms. Two discs and two operating counters, which are carried by screw-threaded or lengthwise-adjustable spindles, are thus set in engagement with friction discs mounted upon other spindles, the latter spindles being worked either separately or together with a clutch and handle. The former spindles may be stationary, their discs constituting nuts that are joined to the counting mechanism. Further counters are joined to the other discs for making logarithmical calculations. Various modifications of the invention are specified.

13,839.—FILAMENTS FOR INCANDESCENT ELECTRICAL LAMPS: E. M. Drake and Nestor Electrical Light, Limited.—The filaments are fashioned with a flat, oval, rectangular, star, or pinion section, so that their surfaces shall be large in ratio to their sectional areas; they are composed of a paste of some refractory substance, and are hardened by being passed through an electrical arc.

13,866.—MANUFACTURE OF BLOCKS, &c., OF ARTIFICIAL STONE: S. G. H. Crockett.—The moulded blocks are hardened with steam pressure. A piston-rod or shaft, which can be lifted and lowered with a hydraulic cylinder, carries shelves or platforms upon which the blocks are laid. When the shelves have been loaded they are raised into a bell, on to the flange of which the lowest platform or shelf is bolted. After the articles have been hardened by steam admitted into the bell, the piston is lowered for a re-loading of the shelves.

13,868.—A BASE OR SUPPORT FOR POSTS, POLES, &c.: L. K. Forsyth.—A support for fencing-posts, telegraph, telephone, and electrical conductors, and so on, consists of horizontal blocks of concrete, stone, &c., which are tied with bolt-rods to an upright block fitted with flat or angle-iron binding-strips and staying-rods, the post being fastened with bolts to the strips—the strips may be replaced with a tanged metal socket at the top of the upright block.

13,910.—PROCESS OF MOLDING BRICKS AND TILES: T. C. Fawcett, Ltd., and J. W. Bottomley.—For making bricks and tiles having recesses. The plungers are provided with loose frames which springs press outwards, the slotted sides of the frames slide upon screws or stop-pins in the plunger; for a screw press is contrived a friction driving-mechanism which can be automatically thrown out of working, as the pressing-plunger rises to the top of its stroke, by means of a friction disc which is recessed at its middle, a clutch and a forked lever worked by hand in one direction at the beginning of the pressing action move a shaft lengthwise from one position to another, friction-discs are mounted upon the shaft, and the movement is continued by a balanced lever which impinges against a stopping-piece when the plunger has completed its stroke downwards.

13,937.—A VENTILATOR AND DOWN- DRAUGHT PREVENTER: H. Brown.—A set of inclined plates is disposed over the top of the fire so that their lower edges shall lie upon a crossbar and their upper ends upon rods that are held in slots in the outer casing of which the top consists of additional inclined plates; the lower plates divert products of combustion through side-spaces to outlets and thence to the flue, the down-draught being directed by all the plates through inner spaces to those outlets. For chimney-tops, the openings in the casing communicate with the outer air, and are turned away from the direction of the wind.

13,942.—SPIGOT-AND-SOCKET JOINTING AND PIPE-COUPLING: W. Vandermann.—A coupling-piece for waste, sewer, and other pipes is made of two portions which are screwed together internally and are then packed. The inventor claims that the device will facilitate repairing and plumbing operations.

13,947.—MANTLE HOLDERS FOR INCANDESCENT LAMPS: G. Birch.—The mantle holder is detachable, and supplies an incombustible socket for the mantle-rod whilst allowing air to flow to the lower edge of the mantle. It has a ferrule that fits over the head of the burner; a pierced flange which serves as a guard for the lower edge of the mantle; and a mantle-rod socket, with its lugs fastened either between lugs upon the ferrule and a lower ring, or between lugs on the ferrule and lugs upon a ring placed above.

MEETINGS.

FRIDAY, NOVEMBER 20. Architectural Association.—Mr. Arnold Mitchell on "Capitals," with lantern views. 7-30 p.m.

SATURDAY, NOVEMBER 30. Dundee Institute of Architecture.—Paper by Mr. W. M. Page, entitled "Notes on Art." 7 p.m.

MONDAY, DECEMBER 2. Royal Institute of British Architects.—Business meeting.—1 To announce the results of the November

examinations. 2. Election of candidates for membership. 3. Mr. Lucy W. Ridge to move.—That the Royal Institute of British Architects desires to thank the Local Government Board for the issue of "Model By-Laws, IV. (Rural Districts)." While doing so the Royal Institute would urge on the Board the desirability of preparing a model to enable Rural District Councils to regulate party-walls as distinct from external walls, a matter for which the Urban Model By-Laws, to which the Board refer them, are not available. The Institute ground this on the belief that the existence of properly constructed party-walls has proved an efficient barrier to the spread of fire, and that it is undesirable that such protection should be withdrawn in places where it has already existed. Mr. Herber J. Wells to move.—That in the interests of the profession it would be advisable to have a list of "Institute Assessors" drawn up, from which the President would nominate, and that this list be from year to year revised. 8 p.m.

London Institution.—Mr. A. W. Clayden, M.A., on "Photographic Study of Clouds," illustrated. 5 p.m. Society of Engineers.—Mr. H. Alfred Roehling, C.E., on "The Sewage Question during the last Century." 7-30 p.m.

Liverpool Architectural Society.—Mr. C. E. Bateman on "Castle Bromwich Church," illustrated with limelight views. 6 p.m. TUESDAY, DECEMBER 3.

Institution of Civil Engineers.—Paper to be further discussed, "Train Resistance," by Mr. John A. F. Aspinall, M.Inst.C.E. 8 p.m.

WEDNESDAY, DECEMBER 4.

Royal Archaeological Institute.—Mr. Alfred C. Fryer, Ph.D., F.S.A., on "Fons with Representations of the Seven Sacraments." 4 p.m.

British Archaeological Association.—Mr. A. R. Goddard, B.A., on "The Underground Strong-Room at Richborough, Kent." 8 p.m.

Society of Arts.—Mr. H. Stone on "The Identification of Wood and its Application to Scientific and Commercial Purposes." 8 p.m.

Builders' Foremen and Clerks of Works' Institution.—Ordinary meeting of the members. 8 p.m.

Edinburgh Architectural Association.—(Associates' Paper). Mr. J. Edin on "The Applied Art of To-Day and Yesterday." 8 p.m.

FRIDAY, DECEMBER 6.

Architectural Association.—Discussion Section.—Mr. S. G. H. Crockett on "The Statistics of Dilapidations." 7-30 p.m.

Institution of Junior Engineers. (Westminster Palace Hotel).—Paper on "Street Railway Construction for Electric Traction," by Mr. F. S. Pilling. 8 p.m.

Institution of Civil Engineers. (Students' Meeting).—Mr. R. W. Brewer on "Gas-Engine Construction." 8 p.m.

Birmingham Architectural Association.—Mr. H. H. Statham on "The Architectural Treatment of Bridges." 8 p.m.

Glasgow Architectural Craftsmen's Society.—Mr. C. Ernest Monro on "Hotel Planning and Construction." 8 p.m.

SATURDAY, DECEMBER 7.

British Association of Waterworks Engineers.—Winter meeting of the Association, to be held at the Geological Society's Rooms, Burlington House, London.

1. Ballots for the Council and Officers for 1902-3, and for new members and Associates. 2. Discussion on Mr. Ingham's paper, entitled "The Design, Construction, and Cost of Open and Covered Service Reservoirs." 3. Paper, entitled "French Practice in the Manufacture of Cast-Iron Pipes," by Mr. A. G. Cloke. 4. Paper, entitled "English Practice in the Manufacture of Cast-Iron Pipes," by Mr. S. H. Terry, M.Inst.C.E. 5. An abstract, entitled "American Practice in the Manufacture of Cast-Iron Pipes" (from the Engineer), will be taken as read. 6. Discussion on the three papers above mentioned. 10.30 a.m.

British Institute of Certified Carpenters.—Annual general meeting, Carpenters' Hall. 6 p.m.

College of London.—Associates' Meeting (White-street, Moorfields, E.C.)—Visit to the works of the Baker-street and Waterloo Railway, by permission of the contractors, Messrs. Perry & Co.

SOME RECENT SALES OF PROPERTY: ESTATE EXCHANGE REPORT.

Table listing property sales with columns for location, description, and price. Includes entries for Battersea, Norwich, Brundall, Hastings, Stokenham, Brighton, Southwark, Manor Farm, Dagenham, and building land.

COMPETITIONS, CONTRACTS, AND PUBLIC APPOINTMENTS.

(For some Contracts, &c., still open, but not included in this List, see previous issues.)

Refer also to "TOO LATE" column, page xxi.

SURVEYORS' INSTITUTION EXAMINATIONS.

COMPLETE COURSES OF PREPARATION for these Examinations are given, either in class, by correspondence, or in office, by Mr. RICHARD FAREY, F.S.I., A.M.I.C.E., &c. Candidates can arrange to commence study at any time, the following table shows the prizes that have been obtained by Mr. FAREY'S pupils at the last seven Examinations.

Table with columns for Examination Prize, 1895, 1896, 1897, 1898, 1899, and 1901. Rows include Special Prize, Driver Prize, Penfold Silver Medal, Penfold Gold Medal, and Greater Prize.

NOTE.—In 1898 the Greater Prize was divided between two bracketed winners, one of whom was prepared by Mr. FAREY. The above table shows that of the 42 prizes awarded at the last seven Examinations, 24 were obtained by candidates prepared by Mr. FAREY, and 16 by candidates not prepared by him.

For particulars of the Courses of Work, or for any advice with respect to the Examinations, apply to Mr. RICHARD FAREY, F.S.I., A.M.I.C.E., 22, Victoria-street, Westminster. Telephone, 680 Westminster.

SANITARY INSPECTORS' EXAMINATIONS.—A CERTIFICATED INSPECTOR and ASSOCIATE SANITARY INSPECTOR prepares Candidates for the above Examination by Correspondence. No books required. Success guaranteed. MODEL SOLUTIONS, illustrated to Examination Questions for 1901.—Last prospectus, set in London & E. G. HOLMES, No. 27, High-street, Bedford. (State Paper.)

BILLS OF QUANTITIES, &c. LITHOGRAPHED CORRECTLY BY RETURN OF POST. A LIBERAL DISCOUNT OFF USUAL PRICES. PLANS BEST STYLE.

ALLDAY, LIMITED. Shakespeare Press, Birmingham. R. J. EVERETT & SONS, LITHOGRAPHERS.

Sole Proprietors of the invention of the late Mr. R. J. EVERETT, so successfully worked by Sprague & Co., Ltd., and their predecessors, and known as THE INK-PHOTO PROCESS, which stands unequalled for the effective reproduction of Wash Drawings, Pencil Sketches, Engravings, Estimates on application to the Works—138, Devonshire-road, Forest HILL, S.E.

"THE BUILDER" STUDENT'S SERIES.

THESE Books, intended primarily for Students in Architecture, Engineering, Surveying, Sanitary Science, &c., will be found of great practical use in the Offices of PROFESSIONAL MEN and CONTRACTORS, to whom also they are recommended as suitable for

CHRISTMAS PRESENTS to their ASSISTANTS, PUPILS, CRAFTSMEN, and APPRENTICES.

Direct from the Office POST FREE, on receipt of remittance.

Just published. SANITARY FITTINGS and PLEINING. By G. LESTER SUTCLIFFE, A.E.I.B.A., M.S.L. Ed. 212 Illustrations.

In this book an attempt has been made to condense the general principles now governing the design of sanitary work in buildings, and also to describe and illustrate the most important modern sanitary fittings and the plumber's work in connection with them.

LAND SURVEYING and LEVELLING. By ARTHUR WALMSLEY, M.I.C.E., F.S.I., F.R.C.S. (London). 140 Illustrations.

A useful book for a student, containing not only the usual instructions given in a text-book on this subject, but valuable additions from the author's own experience, and an exhaustive chapter upon Parliamentary surveying.

STRESSES and STRAINS: Their Calculation and that of their REINFORCEMENT. By FREDERIC RICHARD FAREY, F.R.I.B.A., 55 Illustrations.

A handbook for students, especially such as are preparing for the examinations of the R.I.B.A., and arranged and intended especially for those whose knowledge of mathematics is limited.

STRUCTURAL IRON and STEEL. A Text-Book for Architects, Engineers, Builders, and Science Students. By W. N. TWELVELOCK, M.I.M.E. 234 Illustrations.

In this elementary treatise the author has endeavoured to present in a regular sequence some of the most important details relative to iron and steel as applied to structural work.

2nd Edition. Revised and corrected by the Authors. CARPENTRY AND JOINERY: A Text-Book for Architects, Engineers, Surveyors, and Builders. By BANISTER F. FLETCHER, A.E.I.B.A., and PHILLIPS FLETCHER, A.R.I.B.A., A.M.I.C.E. 342 Illustrations.

Intended for those entering for the examination of the City and Guilds Institute, the Carpenters' Company, and the Institute of Certified Carpenters, &c. Also for the examination in these subjects by the R.I.B.A. and the Surveyors' Institution, &c.

London: DOUGLAS FOURDRINER, Office of "The Builder," Catherine-street, W.C.

Just published. ROADS: Their Construction and Maintenance. By ALLAN BLOOMER, B.Sc. (London), F.G.S., 48 Illustrations.

Much space has been devoted to the consideration of the relative value of different kinds of road stone, in the belief that no one can become a proficient road engineer or superior unless he understands the nature and properties of the material at his disposal.

FIELD WORK and INSTRUMENTS. By ARTHUR WALMSLEY, M.I.C.E., F.S.I., F.R.C.S. (London). 104 Illustrations.

Gives the student a practical knowledge of the construction and handling of surveying instruments, and how to deal with their application in the field for setting out.

2nd Thousand. SPECIFICATIONS FOR BUILDING WORK, and How to Write Them. A Manual for Architectural Students. By FREDERIC RICHARD FAREY, F.R.I.B.A.

Shows the student how he should write a specification, so that which he has learnt the method and general principles he may apply them to the particular exigencies of any building he may design.

2nd Thousand. QUANTITIES and QUANTITY TAKING. By A. W. BAYNE. A reliable handbook for the student pure and simple, its scope being limited to the method of procedure in the production of a good bill of quantities. The examples given, whilst intentionally simple, will be found to cover almost every phase of the subject.

ARCHITECTURAL HYGIENE: or Sanitary Architecture. A Text-Book for Architects, Surveyors, Engineers, and Medical Officers of Health. Sanitary Inspector, and Students. By BANISTER F. FLETCHER, A.R.I.B.A., A.M.I.C.E., and D. PHILLIPS FLETCHER, A.R.I.B.A., A.M.I.C.E. 305 Illustrations.

A complete text-book, treating the subject in all its branches, and intended to be of use to those entering for any examination in Sanitary Science.

ARCHITECT is desirous of meeting with neighbours of Chamberlaine & Partners Agency, by letter, to H. H. care of Messrs. R. F. White & Son, General Advertising Agents, No. 33, Fleet Street, E.C.

OFFICE.—An Architect wishes to SHARE Architect's or other OFFICE near Strand or Chancery. Address, J. I. care of Messrs. R. F. White & Son, General Advertising Agents, 33, Fleet-street, E.C.

ARCHITECT in Gray's Inn is desirous of meeting with a qualified Surveyor, Engineer, or Architect, to share the office, or the exclusive use of one office. Every convenient, good light, quiet, and well furnished. Rent moderate.—Apply to Messrs. Chamberlaine & Partners, 33, Fleet-street, E.C.

FOR SALE.—HALF-SHARE in sound established STEAM JOINERY WORKS. An exceptional opportunity exists for purchase of above. Large and influential connection. Good profits.—Write for full particulars to Box 262, Office of "The Builder," 33, Fleet-street, E.C.

CANADA.—PARTNER REQUIRED by a practical Contractor in established business, to assume charge of office. 1900.—Write, PARTNER, care of Oonid's Advertising Office, 24, New Oxford-street, W.C.

PARTNER of Gentleman with good connection capital wanted to join a well-established Builder and Contractor, and to develop an estate here for building near London. An exceptional opportunity. Splendid offer. Sound investment, and clear prospect of good returns. Strict confidence.—Box 267, Office of "The Builder."

CHINA, Japan, India, Australasia. America.—Exceptional opportunity for Manufacturer to INTRODUCE his GOODS through. Gentlemen going round the world undertake to sell, wholesale only, and export agents in the principal towns of these countries.—SEGG, 20, Regent-st. London.

THE undersigned Company wants to form connections with a firm of good standing willing to take up on their own account the SALE of our patent dyeing and dyeing-preparations "PINK," which is highly recommended by the highest German authorities, amongst others the Royal Prussian War Office.—Please address DEUTSCHE YEBEIKES-GESSELLSCHAFT "PINK," Nuremberg, Bavaria.

SANITARY INSTITUTE EXAMS.—Preparation for the Inspector's Examination by a system of correspondence leading to Text Books or Acts, by C. H. CLARKE, Assoc. San. Inst., Fellow Inst. San. Engineers; Honorary Medallist in Hygiene; Member of the Society of Arts and of Societe Francaise Hygiene. See Clarke's Aids—Calculation of Cubic Space, &c.; Practical Drain Inspection, &c.; Trade Nuisances, &c.; Sanitary Law (New Edition), 1s. 6d.—Prospectus from 120, Thorold-road, Ilford, E.

SANITARY INSPECTORS' and PRACTICERS' EXAMINATIONS.—MEMBER OF THE SANITARY INSTITUTE. Complete Courses of Instruction by correspondence for these and similar exams, conducted by Gentleman (Engineer, Surveyor, and Sanitary Inspector), holding first certificates from San. Inst., 1st Class Honours Medallist in Hygiene, &c. Several hundred successful students for 1901 and 1902 EXAMS, just commencing. Apply for Syllabus of subjects, testimonials, to S.I.S.I. 28, Tottenham-street, Westminster, S.W.

R.I.B.A. SOCIETY OF ARCHITECTS. SURVEYORS' INSTITUTE, and CIVIL SERVICE TECHNICAL EXAMINATIONS. Preparation by correspondence or in residence. Private Lessons and Tutoring. 60, MIDDLETON & GARDEN, 19, Craven-street, Strand, W.C.

MUNICIPAL and COUNTY ENGINEERS' EXAMINATION.—Mr. RICHARD FAREY, A.M.I.C.E., F.S.I., &c., 22, Victoria-street, Westminster, prepares pupils by correspondence for this examination. The course of work may be taken either over six or twelve months according to previous knowledge.

R. I. B. A. EXAMS.—PREPARATION personally or by correspondence in three, six, nine, or twelve months' courses. ARCHITECTURAL LEARNING LIBRARY. Special three months' finishing course.—For full particulars apply to Messrs. HOGWATE & BOND, Association R.I.B.A. 115, Gower-street, W.C. (close to the British Museum).

SANITARY INSPECTORS' EXAMINATIONS.—Successful POSTAL TUITION by Certificated Engineer (First Class Honours Sanitary Plumbing, Mechanics, &c.) Typewritten papers. Numerous sketches. Small fee. ASSOC. SAN. INST. No. 4, Duke-street, Adelphi, London.

so much on Nicolette, his sweet friend, that he fell so hard upon a stone, that his shoulder flew out of place. He felt that he was much hurt, but he beset himself as well as he could and tied his horse up with his other hand to a thorn, and turned over on his side, so that he came all on his back into the bower. And he looked through a chink in the bower, and saw the stars in the sky; and he saw one there brighter than the rest, and he began to say:

Now it is sung:

Little star, see thee plain,  
That the moon draws to her train!  
Nicolette is with thee there,  
By love, of the golden hair.

God, methinks, wants her in heaven, to become the lamp of even.  
How so greatly my fall might be,  
Would that I were there with thee!  
I closely would hiss and cling!  
There I son to crowned king,  
Thou shouldst well become me yet,

Sweet Nicolette!  
How they speak and they relate and they tell.  
When Nicolette heard Buccassin she came to him, for she was not far off.  
He came into the bower, and threw her arms round his neck, and hissed him and caressed him.  
Fair sweet friend, well be you met!

### Ancient Theatres in Crete.

HE Italian archaeological expedition to Crete has recently made some important discoveries at Phaistos, near Gortyna (or Gortyna), where what is supposed to be one of the oldest Greek theatres has been discovered. Apropos of this fact it may be of interest to publish some curious old documents of the sixteenth century describing the condition of many of the greater Roman monuments in Crete as they existed at that period, when the Venetians held sway in the island, and possibly carried on an extensive destruction of such things for the sake of transporting the old materials to Venice and elsewhere.

These documents, from which the following extracts have been made, consist of some old letters and a bundle of original plans, preserved amongst the MSS. of the Ambrosiana at Milan. It is possible they are not the true originals; the custom of collecting MSS. seems long to have survived the use of printing, especially in matters of merely local or special interest, but in any case they are of contemporary character. A large collection of Greek inscriptions is bound up with these documents, and they may possibly have been already printed, but the architectural portion has certainly never before been published. The original drawings were made to fit pieces of paper of a uniform size; in our translation they have been all reduced to one uniform scale of the "foot" of Vicenza, *i.e.*, the old Venetian foot which was in the sixteenth century somewhat larger than the modern English measure (3 Venetian feet = 1 metre). The plans, although measured with care, are evidently somewhat sketchy and the work of an amateur. In translating the extracts from the letters the Italian place-names have been retained

in their spelling of the period. There are several evidences of what seem to be mistakes on the part of a copyist.

The collection is entitled "Drawings of Theatres and Temples sent from the island of Candia by Honorius Belli to his uncle, Valerius Barbarano of Vicenza." The author would appear to have been a medical doctor, perhaps in charge of a hospital at Gortina, to which he refers in the first letter. He is also known as a corresponding member of the College of Medicine of Vicenza. His leisure time seems to have been given to the study of antiquities with all the enthusiasm of that Renaissance age, and he seems to have been a good deal engaged in stealing the Roman works of art from Crete, in the customary way in which Venetians stole from all parts of the Levant in those days.

#### Letter I.

"Magnifico Signor Zio Ossime.—I send you three plans of theatres from the many which I have made drawings of during my pilgrimage through all this kingdom. That of Gierapetra was richly adorned with two orders of columns of the whitest marble, five quarters (?) in thickness, and of the Ionic order, with very beautiful capitals and cornices.

Many of the statues from this theatre I sent to Venice, but others of stucco, which were entire when I was dismantling the front, were reduced to powder in course of removal. The columns are nearly all spoilt by the action of fire. Many of the spectators' seats, two Vicenza feet in width, are still entire. The columns of the portico behind the proscenium at Gierapetra are of the same sort as the two columns at Venice. There are such quantities of columns at Gierapetra and Gortina as to stupefy the beholder.

The small theatre at Gortina was of the Doric order, the columns being of white and black marble (*sic*) incrustured with different coloured marbles (!). The great theatre had a most ornamental proscenium with most beautiful marble columns 16 ft. high and one foot and a half, and one inch (*oncia*) thick, of the Ionic order and the whitest marble. There are no traces of any portico behind the proscenium, and what is particularly remarkable is that immediately behind the proscenium passes the river Leteo which is covered over for a distance of about two hundred paces, and over it are built the hospitals and many other houses. This tunnel is built of very large stones without mortar, and the work is still in an intact

condition. I have walked along its whole length, having been told there were many inscriptions cut upon it, but I saw nothing of the kind. The bed of the river is much filled with ruins, and it is much altered from its original course. You must understand that in making these plans I have used the greatest diligence as I had plenty of time and opportunity for the purpose. Now I will not write more but recommend myself, &c. From Canea the 24th day of April (old style), 1586.—*Vostro nepole, Honorio de Belli.*"

Two notes are written in a different hand between the letters:—

"In the smaller theatre of Gortina, the measurements are a little less than the original; in the Great theatre they are a little larger than they should be. The lines which show the stepped seats must be made parallel.

In the smaller theatre of Gierapetra, the stepped seats in the original are prolonged beyond the half circle by an extra pilaster. Any one wishing to correct this must place the pilasters in such a way—providing not more than sixteen for the purpose—at an equal distance from each other, and lengthening the plan accordingly."

#### Letter II.

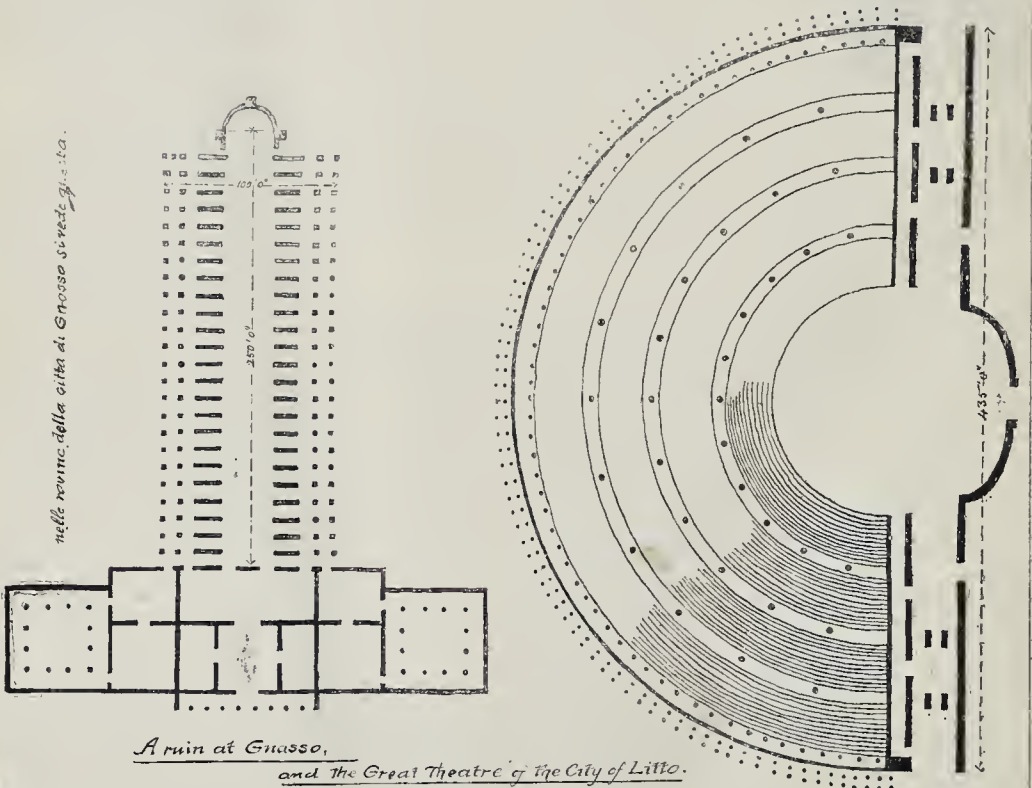

"Magnifico Signor Zio Ossime.—I send you the plans of three more theatres and of a temple of the city of Litto. There is some obscurity as to the prosceniums of the theatres on account of their much ruined state, which prevents one's seeing how they were originally arranged. The stepped platforms (for the spectators) were cut in the slope of the hill, which consists of a soft tufa easily quarried. This tufa is also used for covering houses and for making terraces to resist the rain.

This Great Theatre of Litto is the largest ever constructed in the kingdom of Candia. It had three ranges of copper vases contrived for the purpose of increasing the sounds, and nearly all the cells where these were placed may still be seen. The city of Litto was built on a hill with several summits, and had a very small amount of level space, but everywhere one ascended or descended. Altogether the site is the most unusual and worst ever seen, notwithstanding it had buildings of great importance, and I found there many beautiful statues which you can now have the opportunity of seeing in the house of my illustrious Patrono. I also found there a great many epitaphs which you have already seen, from which it is clear (as Polibius describes) that the inhabitants of Gnosso and Gortina ruined this city. At the same time it would appear that in the times of Trajan, Hadrian, and the Matidie (*sic*) this city was in a flourishing condition, and distant from the

northern sea about twelve or fourteen miles, on the borders of which sea was another city called Cheronesso, now Chirossonisso. This latter was the harbour for the ships belonging to Litto, and between one and the other was a fine, well-made road, crossing hills and valleys without difficulty. There is also a stupendous aqueduct which conducts water from a copious spring four or five miles above Litto, at a place in the mountains of Sasati, which are very high. This aqueduct leads the water, first to Litto, then to Chirossonisso, across the hills and valleys with so many turns and over such high arches as to stupefy the beholder, for its length is really about thirty miles. This aqueduct is still standing almost intact, for it is built with such solidity that in my opinion vestiges of it will remain to eternity.

The city of Cheronisso was but small—I think not more than two miles in circuit—whilst Litto was four. But, although it was a small city, it possessed an amphitheatre of no great size, which I now send you, and many great and fine buildings. It had also a port (now silted up) capable of containing thirty galleys, and, according to Strabo, here was the temple of Brittomart, of which there are still some vestiges visible.

Another theatre is the great one at Gierapetra, which also was cut out of the rocky side of the mountain. It also had an arrangement of copper vases, as may be seen by the cells which remain in an intact condition. The natives of those parts, who know nothing about theatres or cells, call them ovens, and the fables they have concocted about these ruins are enough to make Melancholy laugh. The proscenium of this theatre was adorned with columns, cornices, &c., of white marble mixed with a kind of red stone resembling the Veronese, but everything is ruined and broken. The order was Ionic, like nearly all the buildings of this kingdom. For a long time the Corinthian order did not reach that perfection which has been discovered and made use of by Palladio.

The plan of a temple which I send you is of that in the city of Lebena, the port for Gortina; a distance of twenty miles separates the two cities. Lebena is about twelve miles from Limenos and Lassea, cities visited by St. Paul when on his way to Rome, according to St. Luke's account in the Acts of the Apostles.

Lassea still retains its name, although it is quite ruined, and the nearest inhabitants are four or five miles off in a monastery of Caloyers called Pesonesso, a most beautiful place. These Caloyers have more than 2,000 ducats of income, and

Two Theatres of the City of Gortina. (A, C) A Theatre at Cheronesso. (B.)

are most kind and courteous, and have the finest wine in the world.

The city of Lebena is now called Leada, and is entirely ruined: only a few mud houses remain. The port is quite ruined and become open sea-beach, where there is a place that they use for making signals in smoke or fire whenever the corsairs are discovered off the coast. Now, returning to the temple, it was built on a hill and had many columns of that sort of stone of which the two columns in the Piazza of Venice are made. Many of these columns are in existence, but all are ruined by fire. I think this temple must have been dedicated to Esculapius, because in a panel there I have seen a very great serpent sculptured, and because Pausanias mentions in his description of the territory of Corinth, a temple in Labene, a city of Candia, which was made as a copy of that which existed in Cirene.

The drawings which I now send you have been made in a hurry, and the ink and paper have tried me beyond measure (*mi hanno assasinato*), but those in my book are much better. Recommending myself to your good graces, I beg you to salute *Madonna* in my name and in that of *Madonna Bianca*. From Canea—October 11 (old style), 1585.—*Di V. S. nepote come figliuolo*.

*Honorio de Belli.*

In studying this series of sketches of old Romano-Greek theatres some subjects of interest seem to suggest themselves. In the first place, there seems a connexion between its being sent home in 1586 and the creation of that fantastic model of an "Olympic" theatre built by Palladio in Vicenza in the closing years of the sixteenth century, and completed after his death in 1584. This curious old model of a Greek theatre is a striking instance of that ardent longing which seems to have filled Palladio and his contemporaries to produce the absolutely exact copies of the buildings wherein their beloved models of classic times moved and had their being. At the present day such an attempt to reproduce a Greek or Roman theatre would hardly be made without some imitation of the proportions of an original example. The model at Vicenza looks ridiculous on account of its small size. The absurd perspective backgrounds appearing through the openings of the proscenium may belong to a later period than Palladio. The school of architecture which Palladio so materially assisted in originating must be credited with much greater success in designing churches in imitation of pagan temples than in reproducing a classic theatre. At the same time this little theatre of Vicenza is perhaps the prototype of the theatre of modern days, and as an evidence of its practicability, it is still occasionally used in the daytime—a wise regulation of the authorities prohibiting any lighting up of the building, for fear its worm-eaten old

*In the City of Lebena.*

*In the City of Lampo*

0 50 100 200  
Feet [*Piedi di Vicenza*]

timbers should share the fate of many a theatre since the days of Palladio. It is probably the oldest surviving attempt to restore the *mise-en-scene* of the classic drama, and if these drawings of Cretan antiquities were made in reference to its completion—as would seem very probable—they derive some interest from that fact. The building of the theatre in Vicenza was at the expense of an "Accademia," or literary-artistic society of the city, and no doubt the local interest in the matter would be very keen, and Uncle Valerio Barbarano was probably one of the interested parties.

The plans of the theatres in Crete are shown without the usual divisions of spectators' seats into *cunei*, but this is perhaps merely a careless omission. A much more important peculiarity about the drawings is the very unique way in which the *præcinctiones* are shown as occupied by concentric rows of columns. Such an arrangement of course suggests the "covered theatre" of antiquity, of the construction of which we seem to know very little. The *Odeion*, or covered theatre of the Romans, used for musical performances, seems to have been a common adjunct to a Roman provincial town during the Empire. The best-preserved example is perhaps the theatre of Herodes Atticus, built at Athens in A. D. 161. It is said that charred remains of timber and brickwork, supposed to have

been used in the construction of the permanent covering, were found here in 1848, when the ruins of the Acropolis were undergoing exploration. At the present day there are certainly no traces of such a roof, nor do there appear to be any remains of columns on the *præcinctio* in the position shown on the Cretan plans. The whole question of how an *Odeion* was roofed over remains a puzzle, unless these examples of such buildings in Crete, which were, of course, in a more perfect condition 400 years ago, may throw some light upon the subject. It may be suggested, however, that if the roof was carried on the columns as shown in De Belli's sketches, the lowest row near the proscenium must have been phenomenally high, and perhaps slender, or the back seats of the auditorium would have had but a poor view of the stage, especially in the case of the great theatre of Litta. The covered theatre of the Romans was evidently a great stride in such arrangements from the simple Greek theatre excavated in the hill-side, exposed to a great extent to the sun and rain, and almost unusable at certain seasons.

In his first letter De Belli speaks of the columns at Hierapetra (Hierapetra) as being all spoilt with the action of fire. This intimation of the aspect of the ruins in 1586 would accord with the idea of the concentric rows of columns having at one time supported a roof. Palladio, when designing the Vicenza theatre, would probably have derived his information at second hand. He seems never to have travelled beyond Rome (where he had hopes of succeeding Buonarrotti at St. Peter's), and consequently he did not see the great theatres of Sicily, which would doubtless have inspired him with a grand idea for such a building. He very probably had access to such information as could be gleaned from the collections of Antonio and Francesco San Gallo (now in the Barberini Coll. Rome) which contain sketches made in Athens and elsewhere in Greece. But during the sixteenth century very little was known about Greek antiquities, and not until after the brilliant expedition of Morosini in 1685 was any effort made to publish works illustrating the monuments of ancient Greece, such as the folios of Fanelli and Coronelli about the close of the seventeenth century.

The mediæval idea of a "stage" seems never to have developed into more than a mere staging. The modern conception of a theatre, with its proscenium and accessories, may perhaps be attributed to the sixteenth century efforts to resuscitate the classic drama after a lapse of more than a thousand years.

#### UNDERGROUND TRAMWAYS.

**T**HE ever-increasing congestion of street traffic in the central parts of London is already recognised as a problem for which it is most urgent that some satisfactory solution should be found. During recent years the steady increase of traffic has been most noticeable, the results being an intolerable nuisance and loss to those having business premises along many thoroughfares, and much inconvenience and loss of time to the travelling public. This normal condition is much aggravated by the frequent tearing up of street surfaces and the dilatory manner in which work is done before they are restored. It would be im-

possible for the most imaginative comic paper to exaggerate the utterly absurd methods of the privileged disturbers of London thoroughfares, whose operations add so largely to the difficulties of street locomotion. Even leaving their deprecations quite out of the question, it appears to be the fact that the money value of the time now lost owing to congestion of traffic amounts to many millions of pounds annually. According to a recently published estimate by Sir John Wolfe Barry, the loss at four only of the busy centres in London, namely, Cheapside, the Strand, Piccadilly, and the Oxford-street corner of Tottenham Court-road, may be reckoned at no less than 2,154,000*l.* per annum. It will, therefore, readily be seen that if other well-known centres were considered in a similar manner, the total loss must mount up to an appalling sum. Figures such as these may not be before all those who join in condemning the traffic facilities of the metropolis, but that they are more or less familiar to many of the public authorities supposed to be responsible for the proper government of metropolitan boroughs cannot be doubted.

The fact is, however, that none of the authorities in question have power to do anything to ameliorate the hard lot of the population. No single body could do any material good without the consent of others, whilst the formulation of a complete and really satisfactory scheme can only proceed from a central board armed with ample Parliamentary powers to carry into effect whatever might be devised for the good of the community. In other cities and towns such bodies actually exist and do their work in a practical and businesslike way. For examples we may take the Corporations of Glasgow and Liverpool, with the admirable tramway systems of those cities, and the Rapid-Transit Commissions of Boston and New York, with which are associated still more desirable methods of dealing with street traffic. For means of locomotion, London is at present almost entirely dependent upon the money-making instincts of commercial companies and private individuals, each playing his own game and only concerned in benefiting the public so far as that contingency may appear to be likely to pay. The streets have hitherto been practically at the disposal of any one desiring to use them, and any one has been perfectly free to introduce whatever inconvenient or unsuitable class of horse-drawn conveyance might be chosen for trade in locomotion. The only means of transit upon which restrictions have been placed are those of improved character, such as tramways and mechanically-driven carriages. Some improvement is now evident with regard to the two last-mentioned systems of locomotion, but much remains to be done before the position can be regarded as satisfactory.

One of the most hopeful signs is the remarkable and praiseworthy interest taken by the London County Council in the question now under discussion. People are not wanting who unhesitatingly condemn the ownership of tramway systems by municipal bodies generally, and by the London County Council in particular; but the true point for consideration is whether we can hope for reforms of really comprehensive character from any other quarter. It is possible that

after some years of deliberation a Royal Commission might recommend to the Imperial Parliament the creation of a Rapid-Transit Commission, but it is equally probable that such a commission would never be appointed, or only appointed after the lapse of several years. Further, the County Council is already empowered to deal with various details that are directly and indirectly connected with such work as would fall within the scope of any transit commission. For these reasons we think the Council may properly be entrusted with the reorganisation of street traffic, and with the provision of additional means of communication, although not to the exclusion of companies who may be working upon other lines. Thus the salvation of the metropolis need not depend solely upon the London County Council, nor upon the various companies interested in the construction of deep-level railways. As the aim of the Council is to deal exclusively with lines upon or near the surface, no obstacles need exist against the unlimited extension of tubular railways. There might, and naturally would, be competition, but that there will be plenty of passengers for lines at both levels no one can for a moment doubt.

Since acquiring the tramway systems now under their control, the London County Council has been troubled by the fact that the City Corporation and the West End authorities seem determined to resist any attempt to introduce tramways within their territories. As Parliament similarly refuses to permit the passage of tramways over Westminster Bridge, and as many streets would require expensive alterations even if way-leave were obtainable, the difficulties in the way of making adequate connexion between the northern and southern tramway systems appear to be almost insuperable, except by the aid of shallow subways into which the surface cars could dive on approaching prohibited areas. This solution was first suggested at a meeting of the Council on June 13, 1901, when it was decided that the Highways Committee should investigate and report upon the practicability of constructing a shallow underground electric tramway from Westminster, *via* Parliament-street, Strand, Fleet-street, and Cheapside, to the Bank, thence under Moorgate-street to Finsbury-pavement, on a principle similar to that adopted in Budapest, and Boston U.S.A., provision being made beside the tram-lines for subways to contain gas and water mains, electric light mains, telephone wires, and other conduits. Since that time the Central London Railway has been opened and has proved how great are the possibilities of an efficient and rapid underground railway in London. The Paris, Budapest, and Boston systems have been similarly successful, and the great undertaking in New York, to which a further reference is made in this issue, has been well advanced toward completion. In the meantime the Council has not been idle; the subject has several times been before the Highways Committee, and the Tramways Manager and the Electrical Engineer to the Council have recently returned from the United States, where it was their duty to inquire into the latest developments of electrical traction generally, and particularly to study the construction and working of the subways in Boston and New York. In their Report, now made

public, we find attention is devoted entirely to the description of the subways mentioned, leaving electrical matters to be dealt with in a separate Report. So far as Boston is concerned, it may be useful to remark that the conditions of traffic before the subway came into operation were extremely unsatisfactory. In Tremont-street especially the stream of cars seems to have constituted a nuisance as unmitigated as that due to the endless line of omnibuses to be found in London. To quote from an old Report of the Commissioners of Boston, the surface cars "moved in an almost unbroken procession with a slowness which was vexatious, aggravated by stops of uncertain duration. The rate of progression was often not more than two miles per hour." Then the American mind promptly grasped the situation, and a Rapid-Transit Commission was formed to deal with the whole question of city communications, of which the new subway formed merely a part. The total length of subway authorised was about five miles of single track, part being for four lines, and part for two lines. At Boylston-street an incline admits cars to the subway, which, passing beneath the edge of Boston Common to Tremont-street, is joined by a branch coming from Pleasant-street, where another incline leads to the surface. From the junction the subway continues to the Tremont-street side of the Common to Park-street, the centre of the system, where there is a loop terminus. From Park-street the subway is carried under Tremont-street to Scollay-square, and by branches under Hanover-street and Cornhill to a junction under Washington-street, continuing thence to Haymarket-square, and immediately afterwards rising to the surface. With the exception of short lengths, the whole of the excavation was performed by the cut-and-cover method, continued day and night and also on Sundays, the car tracks being undisturbed and the surface of the streets left free for traffic during the daytime.

Such, briefly, is the history and character of this undertaking, which has proved so inestimable a boon to the city of Boston, and of which the Park-street station is said to possess a traffic equal to the largest amongst other stations in the world. An interesting account is also given in the Report of the New York subway works, intended to provide facilities for traffic in a city where natural difficulties are far greater than those presented in London, and where the streets are in a particularly congested condition. A very unsatisfactory detail noticed in each case is the absence of proper accommodation for the pipes and other conduits, a point to which attention has previously been directed in our columns. On the other hand, great care has been taken to secure efficient ventilation, a matter that does not appear to be understood by the eminent engineers to whom London is indebted for the low-level lines constructed of late years. Generally it may be said that their visit to the United States has convinced the reporters of the entire practicability of shallow tramways for the needs of London, an opinion in which we quite concur. Many passengers are timid, and object to bury themselves 70 ft. or 80 ft. below the surface, or to be carried up and down by lifts. Others think of the time spent on the lift journey and in waiting a minute or two for a

train. People of these classes would certainly prefer simply to descend a few steps, and to board one of a stream of single cars, instead of travelling under present conditions; and this alternative method possesses other incidental advantages. For instance, single cars carry away passengers as soon as they arrive on the platform, and deliver them to the street again at a steady rate, instead of discharging crowds amidst noxious fumes every few minutes, as in the case of our tubular railways. Again, the shallow tramway system would enable the Council to deal suitably with the great and pressing question of underground conduits the treatment of which would be facilitated very greatly.

That many difficulties and much opposition will have to be encountered we do not for an instant doubt. That is the fate of every single thing likely to be productive of good, notably in conservative-minded London. The treatment of vested rights in premises with basements projecting beneath the footway may be attended with difficulty, and objections on the score of vibration will probably arise. These and other points are quite capable of proper adjustment, and it is to be hoped that the evident desire of the Council may shortly find expression in the formulation of a definite scheme for the inauguration of the new means of communication foreshadowed in the Report.

#### NOTES.

**The New Government Offices.** We publish in another column the correspondence which has passed between the Council of the Institute of Architects and the Office of Works in regard to the carrying out of the late Mr. Brydon's building. It appears that the excuse now put forward by the Office of Works for not appointing an eminent architect to carry out Mr. Brydon's design is that they have been unable to find any eminent architect who would be willing to carry out the work without putting his own individuality into it; and the Office of Works are so tender of Mr. Brydon's reputation that they cannot bear to expose his design to the risk of being thus tampered with. The argument, which in any case could only be received with laughter, is knocked down under them by Mr. Leonard Stokes's letter in Thursday's *Times*, in which he points out that Mr. Brydon's drawings are so incomplete that in any case there must be some fresh individuality imported into the building, and his friends had hoped that it would have been the individuality of some eminent architect and not that of the Office of Works. It pleases the Office of Works now to assert that their official architect is an eminent architect, but unfortunately we have his Post Office buildings in evidence on this head, and it is perfectly certain that his appointment would never have satisfied poor Mr. Brydon. But the feelings of an eminent architect—more especially when he is dead and out of the way—are of no consequence in the estimation of the Office of Works.

**The Housing Question.** THE conference held this week at the Westminster Palace Hotel on housing in town and country will, we hope, have some practical results, chiefly by being the beginning of

further legislation. [It is admitted] by men of all political parties that the houses of the dwellers in rural districts are, in many places insufficient in numbers, and it is certain that the only way to remedy this defect is by giving greater power to the Local Government Board to order the building of dwellings if the supply is found on inquiry to be insufficient. This was in substance one of the resolutions which were carried at the conference, and it forms the basis for a further piece of short, and it may be hoped effective, legislation. At the present time the Local Authorities in the rural districts do not recognise the pressing need for more and better dwellings, and it has been the national policy for many years that when Local Authorities do not recognise the duties imposed on them by the Legislature in sanitary matters, the central government should have powers of compulsion direct and indirect. This is obviously the only policy which promises any effective results in regard to the housing question in rural districts.

**Stockport Workhouse Infirmary Competition.** (ON Monday last the Stockport Guardians indulged in a discussion which is not pleasant reading. In March last sixteen designs submitted in the competition for the infirmary were exhibited, and a brief review of these designs was given in our columns. The first premium was awarded to Messrs. Giles, Gough, & Trollope, presumably on the advice of the assessor, Mr. Thomas Worthington. In the conditions of the competition there were two clauses relating to the cost of the buildings, and in view of recent developments, the exact wording of these clauses is interesting. One of them runs as follows:—"The Guardians are of opinion that the designs should provide the requisite accommodation at a cost not exceeding 130*l.* per bed for the buildings, including boundary wall, boilers, machinery, fixtures, and fittings." The other clause states that "designs shall be excluded from the competition . . . if the assessor should determine that the probable cost of carrying out the works will materially exceed the outlay estimated by the competitor." These clauses, it will be seen, did not impose a definite limit to the cost; the Guardians merely expressed an opinion that 130*l.* per bed would suffice, and only contemplated the exclusion of designs the "probable" cost of which might "materially" exceed their authors' estimates. The assessor named in the conditions was clearly intended to be the sole arbiter as to the interpretation of these indefinite clauses, and the very fact that the premiums were awarded shows that he did not think that the probable cost of the accepted designs would materially exceed the estimates. The Guardians clearly do not think that it is even yet too late to discuss the question of cost, and some of them go the length of construing the "opinion" expressed in the conditions as a definite stipulation. At the meeting on Monday the Workhouse Committee recommended that the sixteen sets of plans received in the competition should be submitted to another assessor, namely Mr. P. Gordon Smith. A letter from Mr. Smith was read in which, after stating that his fee would be 150 guineas, he declared that "the limit of

130*l.* per bed was so low that he doubted whether they could erect a hospital for 322 beds and administration for 500 patients at that price."\* An amendment was moved by one of the Guardians that the plans keeping within the 130*l.* limit, "with the addition of those of Mr. Ward, of Birmingham," be reconsidered by the Board. This was lost by the casting vote of the Chairman. "Amendment after amendment was moved, but no headway could be made, and eventually Mr. Clarke gave notice of motion that the whole of the plans should be superseded by those of Mr. Ward, of Birmingham." There seems to be considerable danger of injustice being done, not only to the authors of the premiated designs, but to most of the other competitors.

**The Sewage Question.** ON Monday evening a paper entitled "The Sewage Question During the Last Century" was read by Mr. H. Alfred Roechling, C.E., before the Society of Engineers. The author, following some other writers, distinguishes land treatment as "natural," and the second method as "artificial," but the distinction can scarcely be regarded as accurate. The processes of purification in both cases are natural; the means employed are largely artificial. If crude sewage is turned in large volumes on to unprepared land, a nuisance will inevitably be created. The surface of the land must be carefully prepared, the soil must in many cases be lightened, drains must be laid, special crops must be grown, the flow of sewage regulated, and the most careful management exercised. A sewage farm is to all intents and purposes as artificial as the means adopted in the so-called bacterial treatment, but in both cases natural processes are relied upon for effecting purification. Mr. Roechling appears to us to be somewhat biased in favour of land treatment. The difficulties connected with it are scarcely mentioned, and nothing is said as to the enormous areas of land which would be required for the purification of the sewage of some of our largest inland towns, such as Manchester and Leeds, although this difficulty has proved an almost insuperable objection to the adoption of land treatment. Mr. Roechling quotes Dr. Houston's report on the London experiments to the effect that "the effluents from the bacterial beds cannot be reasonably assumed to be more safe in their possible relation to disease than raw sewage slightly diluted;" and speaking of the possibility of diseases being spread by germs passing through the soil into the effluent drains of a sewage farm and thence into streams, Mr. Roechling says: "There is . . . no case on record where such a thing has actually occurred." Perhaps not, but, on the other hand, is there any case on record where the effluent from well-managed tanks and filters has caused the spread of disease? The fact is that the bacterial character of effluents from sewage farms has not been examined to anything like the same extent as the effluents from filters. Mr. Roechling does not quote a single bacterial test of an effluent from an English sewage farm, but in a paper written in 1896 he confessed that "there are a few sewage farms in existence on which the sewage is not

\* We quote from the *Manchester Evening Chronicle*.

*purified.* This statement is as true to-day as when it was written, and if the sewage is not purified the effluent is impure, whether there is any case of resultant disease on record or not. With Mr. Roehling's observations on the importance of careful and intelligent management of sewage-purification works we heartily agree, and there is wisdom in his suggestion that some "means of educating our future sewage-disposal managers" ought to be found.

THE paper by Dr. Drysdale describing an instrument for testing the magnetic qualities of an iron forging or casting, which was read to the Institution of Electrical Engineers last week, directs attention to a problem of great importance to electricians. In designing dynamos, assumptions have to be made as to the magnetic qualities of the iron employed, and it is well known to electricians that these qualities are very variable. Two samples taken from castings made from the same steel have been found to differ by as much as 50 per cent. Hence, if exactly similar machines were made from these castings, the output of the one would be 50 per cent. greater than the output of the other. Dr. Drysdale uses a drill of a special form which makes a circular hole of about half an inch in diameter and half an inch deep in the casting, and leaves a circular pin of about a tenth of an inch in diameter in the centre of the hole. By means of a special plug this iron pin can be magnetised and its magnetic qualities determined in the ordinary manner. Dr. Glazebrook criticised the method and pointed out that it only determined the qualities of the surface of the casting. Professor Perry suggested an easy test to settle the question whether the instrument determined the real magnetic qualities of the iron. Mr. Mordey pointed out that the effect of the drill on the iron pin may alter its physical properties. He said that he had noticed that in those electric meters which are controlled by an aluminium disc rotating between permanent magnets there was often a variation in the speed for different positions in the spindle, which was most probably due to slight differences in the physical properties of the apparently homogeneous metal disc. Dr. Drysdale, in his reply, stated that his instrument would enable manufacturers to test and accept or reject castings or forgings immediately on delivery, and would thus enable machines to be designed with far greater certainty. In our opinion, the instrument may be useful for giving rough comparative tests, but it will certainly not supersede the accurate ring methods of Rowland and Ewing.

THE bridge at Bow, which is to be replaced with one constructed of iron and 70 ft. wide, was built of granite in 1839-40, and is 40½ ft. wide between the parapets. The original bridge across the River Lea at Bow was built "arched like unto a bow," in the reign of Henry I., by his Queen, Matilda of Scotland, as one of her probably politic benefactions to the citizens of London. Leland records that she had "got well washed in the stream," and, therefore, provided the means for diverting and carrying the main road from Aldgate eastwards

across the river and marshes to Stratford, and so into Essex, in lieu of the dangerous passage at Old Ford, a short distance upstream, near the outlet of Hackney brook, which marks the route of the more ancient track into Essex. Matilda also, by one account, caused another bridge to be made across the Channelsea Cut, where is now Stratford Bridge Railway Station, and constructed between the two bridges at Bow and Stratford a causeway, the High-street of Bow, which at this day crosses the Three Mills streams by the two intermediate Pack's Hole and St. Michael's bridges. For maintaining the two bridges and the causeway she bestowed the manor and Wiggen mill upon the Abbess of Barking Abbey.

WE hear that it is now proposed to rebuild the complete fabric of the Parish Church of St. Mary, instead of carrying out the extensive repairs which, in view of the unsatisfactory condition of the structure, had been considered to be necessary. The church, which stands upon the site of the former one, was begun in August, 1751, and consecrated on May 26, 1754, having been erected after the plans and designs of Launcelot Dowbiggin. Its dimensions are 108 ft. in length by 60 ft. in width; it is constructed of brick, with quoins, cornices, and dressings of Portland stone; the stone steeple, with the vane, rises to 164 ft. For the repairs executed in 1787 a curious scaffolding of wickerwork, having a staircase within, was built up around the tower and spire, for 201., by Bird, a basket-maker of St. Albans. Of that scaffolding there exist contemporary views, one being drawn and engraved by M. Skinner, of Islington.

WE are exceedingly glad to be able to report that Hogarth's House at Chiswick, instead of being sold as builders' material, was purchased for 1,500l. at the auction last week by Colonel Shipway, a resident at Chiswick, with the view of permanently preserving it as a historic relic. Views of the house will be found in the *Builder* for February 8, 1890, and June 22, 1901, the latter from a sketch by Mr. R. W. Paul.

ON Wednesday, at the Society of Arts, Mr. Herbert Stone gave a lecture on a subject which he has evidently made his own, the study of the structure and formation of wood as seen in thin sections examined microscopically. The lecture was unfortunately not by any means audible to all the audience, and a good deal of the information intended to be conveyed in it was consequently lost; but the series of lantern slides of magnified sections of various woods were beautifully got up, and of the greatest value and interest in themselves, apart from the lecture.

ON November 30 Mr. Walter Gandy, of Messrs. Doulton, delivered a lecture on "Decorative Ceramics" to the Builders' Foremen's Association at the Memorial Hall, E.C. Mr. Gandy prefaced his lecture by a brief outline of the history of ceramics from the earliest pottery of Egypt and Babylonia on to the Persian period, and laid stress on the great influence of Holland in the develop-

ment of salt glaze so evident in the ceramic ware of to-day. The baking difficulties are the most serious troubles of the potter in preparing material for architectural use, and the lecturer emphasised the necessity of the most carefully detailed full sizes being supplied by the architect, these being enlarged to a given scale by the potter's draughtsmen to allow for shrinkage. The varying shrinkages of different clays must be also considered, and as colour is dependent on these, any alteration in the colour scheme at the last hour is often productive of great expense and delay. The difficulty of retaining certain colours—especially bright red—when baking at a high temperature precludes that freedom of colour handling which exists in paper designing. Mr. Gandy rightly maintained that to be successful the colours must be simple and few, and the success of ceramic decoration depends on the simplicity of the general colour scheme. Messrs. Doulton showed an example of their stoneware polychrome, a very highly polished ware for external use, the effect of which is doubtful, judging from the sample, which was very badly chosen. A painted tile, of vitreous fescue shown was extremely interesting, in so far as all the quality of the painting was retained and burned on to the tile, which, however, was only suitable for internal use.

JAPANESE Art. AN exhibition and sale of Japanese ivory carving, embroideries, and screens was held during the week at Willis' Rooms, St. James's. We should like to see a representative collection of Japanese art in London—some such exhibition as the superb collection that was to be seen at the Paris Exhibition last year. To our mind Japan was easily first in the modern art section of that exhibition, not from the poor representation of other countries, but from the vitality and fire, apart from exquisite workmanship, that distinguished their work. The present small exhibition at St. James's exhibited notable work, specially among the ivory carvings. The statuette of Kwannon by the late Ono Hakujitsu is a most remarkable ivory carving standing 2 ft. 2 in. high, with elaborate trappings. It is a wonder that art survives so much painstaking detail—it occupied the artist three years of his life—but you have to look no further than the goddess's face to be attracted to the work. A pair of pigeons and young by Mitsukazé is a fine piece of carving, as is also a kneeling lion by Ishikawa Komei, now artist to the Emperor of Japan. The embroidery was characteristic—composition, colour, and workmanship the most usual combination—but, of course, the exhibits were fewer and less remarkable than those at Paris last year.

THE winter exhibition of the Society of Painters in Water-Colours. Colours is one of the best we have ever seen. When these winter exhibitions were first established they were professedly for "sketches and studies"; and while this limitation was soon overlooked by a good many members, who contributed finished drawings, the liberty to be represented by sketches still remains, and enables some members to give us interesting examples of their work in this lighter and broader manner. Nothing of

the kind could be better in its way than Mr. Thorne Waite's landscape under the title "A Rapid Sketch" (107), and equally good in the same way is his study called "An English Homestead" (61). Mr. Albert Goodwin's devotion to his art is attested by no less than thirteen beautiful studies, chiefly of city scenery or buildings, pre-eminent among which are the view of Milan Cathedral in twilight, with the pinnacles just touched by the last rays of the sun (41), and his grand composition on a small scale, "Sunset from the Makalton Hills, Cairo" (236). Mr. Herbert Marshall seems a good deal possessed by Mr. Goodwin's spirit; at all events, whether intentionally or not, his present treatment of city scenery, in some of his smaller works, bears a curious resemblance to Mr. Goodwin's effects. Mr. Cuthbert Rigby is well represented, and Mr. Colin B. Philip exhibits a fine bold example of his power in treating hill scenery, in "High Crag, Buttermere" (172). Mr. Charles Davidson's "Clouds" (128), in a very different way, is a fine and unusual landscape showing a broken cloudy sky above a stretch of moorland. Among other landscapes that may be especially mentioned are Mrs. Allingham's "Berkshire Cottages" (247); Mr. Thorne Waite's "Cornfield in the West of England" (213), a large work with a very fine distance; Mr. Allan's "Return of the Fishing Fleet" (96); Mr. Waterlow's "Across the Meadows to Christ Church" (144); and Miss Butler's "The Four-Horse Thrasher" (184) not so much a landscape as a farm scene, but an admirable little picture. Among works rather out of the usual line of the exhibition and of special interest for their artistic qualities are Miss Barton's interior with a figure of a small child, under the title "A Cold Day" (141), a thing which is just a composition and nothing more, but full of artistic quality; Mr. Anning Bell's rather curious work "The Bathers" (92), in which the nude figure looks strangely flabby and woebegone, but which as a whole is a remarkable piece of colour and composition; and a very highly finished little interior and figure, with a quotation from Herrick for title (88), by Mr. Walter West, a name we do not remember here before, but whose work will certainly be looked for in future exhibitions. Mr. Lionel Smythe's study of "A Boulogne Fisher Girl" (75) is a bright piece of work, and Mr. Edwin Alexander's "Chameleon" (73) a very clever realistic study. Architectural subjects are rather largely represented; besides a number by Mr. Goodwin and Mr. Marshall, already referred to ("Chartres" is the best of Mr. Marshall's), we have a large and fine drawing of the "Castle of Jean Dunois at Chateaudun" (193) by Mr. T. M. Rooke, who also sends an excellent study of sculpture, as yet unrestored on the north porch of Chartres Cathedral; Mr. S. J. Hodson gives us the "Tower of S. Ouen, Rouen" (49: the facts without the poetry of the architecture); Mr. Reginald Barratt "The Courtyard at Cordova" and "The Interior of the Mosque" in the same city (54, 55), which we may regard as professedly architectural drawings rather than studies in water-colour, but they are excellent of their kind; Mr. Robert Little has a very good drawing of the interior side of the gateway in the quadrangle at St. John's, Oxford (146); Mr. Allan gives us the "Clock Tower, Auxerre" (198) but his "spotty" manner does not lend itself too

well to architectural subjects; and the numerous subjects by the veteran artist Mr. Callow (the oldest member we believe of the club), if a little old-fashioned in manner, are in precision and drawing as good as ever, and take back our associations not unpleasingly to the taste of a former generation of artists of whom he is one of the few survivors.

#### LETTER FROM PARIS.

THE official lunch offered annually by the President of the French Republic to the winners of the Prix de Rome was given this year at the Elysée in honour of MM. Jacquot DeFrance, Bouchard, Hulot, and Caplet. The Minister of Public Instruction and Fine Arts, the director of the Ecole Française à Rome (M. Guillaume), and the director of the Ecole des Beaux-Arts (M. Paul Dubois), and M. Bonnat were present at the lunch.

The question of the ornamental entrances to the stations of the new Metropolitan Railway has been the cause of a little scandal in official circles. It will be remembered that as a result of a competition between sixty architects the Municipal Council selected M. Hector Guimard as the architect for all the future stations, and M. Guimard, who is a fervent advocate of a modern style of art, has up to the present designed all the existing stations in a manner which has given entire satisfaction to the Council, although to some tastes the style of these erections is rather too modern and gaudy. The Railway Company has been endeavouring to obtain the adoption of the designs of an official architect for the future stations, but the Municipal Council has firmly decided that no other than M. Guimard shall design the stations, not only because they wish to respect their former decision, but because it is desirable that the aspect of the stations should be the same for all the lines of the railway.

The competition for the abattoirs of Soissons has been won by M. Felix Plat, architect at Paris.

The subversive ideas of M. Tony Garnier, a pupil at the Villa Medici, who, it will be remembered, sent home for exhibition at the Ecole des Beaux-Arts, a few months ago, designs and ideas which were much too modern for the spirit of the school teaching, resulting in the exclusion of his drawings, have already found favour in some circles, and a meeting, presided over by MM. Alfred Bruneau and Frantz Jourdain, was held a few days ago to protest against the classical spirit of the official teaching of art in France. The meeting was a very noisy one, and ended in much tumult; but M. Jourdain was able to relate the Tony Garnier incident, and to declare that M. Garnier was to be praised for his endeavour to free himself from the influence of the Ecole, "a backward school, hostile to all new manifestations of art."

The commission appointed to consider the question of forming district schools of architecture is now busily working under the direction of M. Henry Roujon, Directeur des Beaux-Arts.

The monument erected to the memory of the school teachers and villagers shot down by the Prussians in 1870 was recently inaugurated at Soissons by M. Legues, Minister of Fine Arts. The architectural portion of the work is due to M. Guilbert, the young architect of the chapel in the Rue Jean Goujon. The figure subjects are the work of M. Hiolin, well known also for his sculpture in the above chapel. The cost of the monument was estimated at about 2,500*l.*, but as the public subscriptions did not by any means reach this amount, the architect, sculptor, and builder, by giving up their fees and a portion of the cost of their work, managed to complete the monument with the help of the money already subscribed.

The Municipal Council is discussing the question of lighting the gardens of the Tuileries by electricity, and keeping them open to the public until eleven at night.

The Mayor of the district of Grenelle has sent in a petition from the inhabitants of his quarter requesting public powers to choose the quarter of Grenelle as the site of the reconstruction of the Imprimerie Nationale, in preference to the quarter of Montsouris.

The Place de l'Opéra will very shortly suffer a certain change in its present aspect. The Equitable Insurance Company of the United States proposes to acquire the buildings and

ground situated on the angle of the Boulevard des Capucines and the Rue de la Paix for the purpose of erecting an immense building destined as offices for the company. The present buildings will be demolished as soon as the lease expires; in the meantime a competition amongst architects will be opened for plans and designs for the proposed new buildings. According to custom at Paris, the ground floor of the new buildings should—especially at such a frequented corner—be devoted to shops, cafés, or restaurants, but it appears that the company has decided that such establishments would take from the dignity of business offices, and that the ground floor shall consist of offices alone. It is strange that this angle of the Place de l'Opéra is one which has undergone more frequent changes than any other site in Paris.

The competition for the new schools at Ivry has been carried off by M. Pierre Despeyroux, architect, of Paris.

The question of the Cirque des Champs Elysées seems never ending. It has now been decided to accept the terms of the lease proposed by M. Leoncavello, but it is understood that if the sums exacted as a guarantee are not paid within the week following the notification of the lease, the Municipal Council will immediately proceed to pull down the building.

It has been decided to abolish the greater portion of the old Marché du Temple. A public sale by auction will be shortly made of the 2½ acres of ground and buildings at a starting price of 130,000*l.*

The Municipal Council has voted a credit of 500*l.* for the completion of the Crematorium at Pere la Chaise.

An interesting example of modern art, the work of M. Hector Guimard, the architect of the Castel Berenger, and called the "Temple of Classic and Religious Art," has just been inaugurated in the Rue Saint Didier. This large hall, which has been planned to meet the requirements of 200 musicians and an auditory of about 1,200, is designed in the style of modern art dear to M. Guimard. The lower portions of the building are constructed of stone and cement materials, with carefully planned passages for exit in case of panic. The interior of the roof is formed entirely of mahogany trusses rising from the ground floor, and supporting at the same time as decorating the roof, which is lit up by a very large number of tastefully arranged electric lamps, screened and coloured to throw a rather effective light towards the lower portion of the hall. The first-floor gallery, which surrounds the interior of the hall, is most effectively designed. The aspect of the whole is something quite new in the way of public halls.

The scheme prepared by M. Girault for the heating of the Petit Palais by means of a system of steam at low pressure at a cost of 4,300*l.* has been adopted by the Municipal Council. M. Thomas, the architect of the Grand Palais, is about to light the building completely by electricity.

At the Ecole des Beaux-Arts the jury has awarded medals to the pupils of the first class for designs for a "timber ceiling for the large hall of a sixteenth century chateau," and to the pupils of the second class for plans and designs for "dwellings for the servants of a national palace."

An International Exhibition will be held at Lille from May to September next. The architectural portion is entrusted to M. Hannotin, architect, of Lille.

The forthcoming meeting of the Société des Amis des Monuments Parisiens will deal with the following matters: the extreme slowness of the work of placing Paris in a fit state again after the late Exposition; the question of safeguarding the Parisian gardens menaced by the new fiscal law of taxation proposed to be levied on unbuilt property; the new buildings of the Place de la Bourse; the ruins of the Cirque de Champs Elysées; and the necessity of lighting the Champs Elysées and the Tuileries.

The third line of the Metropolitan Railway is commenced. This will be a transverse line, and will cross Paris from Courcelles to Montmartre. There will be fourteen stations, and the line will pass under the canal of Saint Martin at a depth of about 20 ft., protected by an arch 4 ft. thick.

M. Carré, Architect to the Minister of Foreign Affairs, has left for Peking with a view of reconstructing an entirely new plan the French Legation, which was destroyed during the siege.

The Société des Amis des Monuments Parisiens are endeavouring to obtain the free entrance of the public to visit the interior of that interesting monument of the eighteenth century, the Ecole Militaire, by Gabriel. The members of the Société were enabled to visit the building a few days ago and admire the five magnificent rooms on the first floor, beautifully decorated in the Transition style of Louis XV.-XVI. The Salle des Maréchaux is especially to be admired with its marvellous bronze chimney-piece and the four military pictures by Le Paon. The chapel on the ground floor, surrounded by columns of the Corinthian order, recalls the style of the best portions of the Palais de Versailles.

The Commission Parlementaire d'Hygiène invites the Minister of Commerce to prepare without delay an official set of by-laws concerning the replacing of the use of white lead in painting and similar work by another product less harmful. In the meantime, M. Baudin, Minister of Public Works, has forbidden the use of white lead in all work done for the State.

M. Bouvard has informed the Commission du Vieux Paris that he hopes to restore to the town of Paris the equestrian statue, the work of Pradel, which once surmounted the façade of the Cirque d'Été of the Champs Elysées. If the old building is demolished, the statue will be placed in the garden to be formed on its site.

The Commission du Vieux Paris hopes to succeed in obtaining the preservation of the famous Hotel de Rohan, menaced with destruction. The secretary of the same Commission has just discovered in the Rue de Montreuil vestiges of one of the last "folies" or country houses which the rich bankers of past times built for their mistresses. This pavilion, called the "folie" of General Tison, still contains a number of very fine painted ceilings and interesting panelling. One of the ceilings, valuable as an artistic piece of work, is also interesting as documentary evidence, for it was here that Reveillon, one of the inventors of wall-papers, installed his studio and workshop in 1787, and his artists drew much of their inspiration for their designs from the ceiling above their heads.

Amongst the new municipal taxes destined to replace the octroi taxes taken off wines and other products is one which is received by much disfavour on all sides, and that is the tax proposed to be levied on gardens and other unimproved property. On one side the landholders are unwilling to pay taxes on vacant ground or even pleasure gardens which are unproductive of money interest; on another side the art societies complain that this law will have the effect of doing away with many private gardens and open spaces which, although unproductive to their owners, are nevertheless most advantageous to the general aspect of Paris; and on the side of sanitation others contest that the present building laws allow houseowners too much liberty as regards the minimum dimensions of courtyards and open spaces obligatory between and behind dwelling-houses, and that the proposed law will force householders to seek the very minimum of open space in future buildings, and even encroach on garden ground which might otherwise be left untouched. That on the contrary, all encouragement should be given to property holders to leave as much open space as possible around their houses; that new rules should enforce the leaving of larger courtyards in buildings to ensure a better access of air and light to dwellings; and that special advantages should be allowed to property holders who are willing to leave a large proportion of vacant ground around their buildings for making into permanent gardens. The Commission des Amis des Monuments are taking up the matter very strongly, for such a law would fall very heavily on private houses and museums at present surrounded by much vacant ground—ground which is formed into gardens for the enhancement of the buildings, many of which are of public interest.

The Caserne des Celestins, near the Boulevard Henri IV., is about to be demolished as soon as the new barracks now being erected opposite by M. Jacques Hermant, architect, are completed. The Commission du Vieux Paris is busy over the question of saving from destruction the numerous decorative portions of the old building. A ceiling by Bon Boullogne which decorates the large staircase, erected in the seventeenth century, will be preserved, as well as a decorative pediment,

built early in the reign of Louis XV., and some valuable painted consoles, and will be set up in the Musée Carnavalet.

The arrangements for the next Salon are the subject of much discussion among the members of the Société des Artistes Français. The committee of ninety, which comprehends the three sections of Painting, Sculpture, and Engraving, has two proposals before it. One, which proposes to give special favour to all artists who have received decorations and medals, has been at once repudiated, and the existing regulation which limits to 1,600 the number of pictures to be accepted by the Jury of Painting will be maintained. But the critics of the Société observe, not without reason, that with this limitation of number, the artists *hors concours*, and who have a right to two pictures each, could by themselves overpass the maximum limit of numbers. The Société includes also the artists "Médailles" and "Mentionnés," whose works cannot be refused. These conditions would leave no room whatever for the other members, who are organising meetings to consider and defend their interests, and talk of having another exhibition of "dissidents," for which however they can find no locality. The question is a difficult one, and the majority of the artists not yet become celebrated complain bitterly of the large phalanx of dignitaries of art who block their way. The Société Nationale des Beaux-Arts (New Salon) ignores these contests, and the committee of organisation presided over by M. Carouss-Durand—a more pacific character than M. Bongoreau—will adhere to its old rule of allowing each member of the Société to exhibit six works, grouped together.

We have to record the death, at the age of seventy-three, of M. Rouyer the architect, author of the fine Mairie of the tenth arrondissement, which has been illustrated in the *Builder*. M. Eugène Rouyer was a pupil of Ballard, and an artist of great ability, who in the celebrated competition for the Hôtel de Ville was classed next after the successful competitors MM. Ballu and Depertthes, and to whom Paris owes a good many important buildings. M. Rouyer was a Chevalier of the Legion of Honour.

We have also to record the death, at the age of seventy-four, of M. Isidore Bonheur, sculptor, and brother of Rosa Bonheur. He was the pupil of his father Raymond Bonheur, and obtained medals in the Exhibitions of 1865, 1869, and 1889. He was the author of numerous large and vigorous works in animal sculpture; among which may be mentioned the two lions for the front of the Palais de Justice.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A BUSINESS meeting of this Institute was held on Monday at No. 9, Conduit-street, Regent-street, W.

The minutes of last meeting having been taken as read, the results were read of the November examinations. The following are the results:—

A Preliminary examination, qualifying for Probationership R.I.B.A., was held simultaneously in London and the provincial centres indicated below on the 5th and 6th ult. One hundred and eighty-eight candidates were admitted, and thirty-seven were exempted from sitting. The remaining 151 were examined, with the following results:—

	Passed.	Relegated.	Total Examined.
London.....	59	15	74
Birmingham..	8	3	11
Bristol.....	7	3	10
Exeter.....	3	4	7
Leeds.....	20	6	26
Manchester... 17	6	23	
	114	37	151

The following are the names of the successful candidates, together with those exempted, making a total of 151 newly registered probationers:—

W. L. Allen, Regent's Park, N.W.; F. L. Atwell, Plumstead, S.E.; H. J. Axten, Crouch End, N.; C. H. Barlow, Widnes; J. J. Beck, Doncaster; A. L. Belcher, Brixton, S.W.; W. T. Benslyn, Oldbury, near Birmingham; H. E. Berntson-Benjamin, Windsor; A. Bolton, Bingley; A. Boulton, Dundee, N.B.; T. Brameld, Hull; J. E. G. Burroughs, Bristol; H. Carnelley, Barnsley, Yorks; W. Carver, London; E. S. Charlton, Tunbridge Wells;

H. G. Cherry, St. Albans; C. Chippendale, Harrogate; H. H. Christie, London; W. T. Clark, Birmingham; W. T. Clarke, Liverpool; R. H. Cochrane, Dublin; J. Cocker, Timperley; G. S. Cockrill, Great Yarmouth; H. R. Collins, Exeter; A. S. Constable, Stockfield-on-Tyne; W. H. H. Cooke, Stroud; A. Cooper, Rickmansworth; F. C. B. Dabbs, London; G. F. B. Daniell, London; J. S. B. Davidson, Aberdeen; A. H. Davis, London; F. M. Dean, London; D. W. Dickburn, Leytonstone, N.E.; A. H. Douglas, Maida Vale, W.; A. H. Douglass, Morpeth; G. B. Dransfield, Barnsley; W. T. Duncan, Rochdale; A. Dunn, Birmingham; E. S. Edmonds, Stamford; A. H. Edwards, Leicester; A. C. M. Edwards, Rickmansworth; E. S. England, Blackpool; W. L. Etherington-Smith, Putney, S.W.; E. W. C. Faulker, Freshfield, near Liverpool; W. G. Fearn, Clacton-on-Sea; H. Fielding, Accrington; A. H. Fitz-roy, Lincoln; F. B. Foster, Leamington; H. J. Fox, Stamford-hill, N.; D. S. Gardner, Weston-super-Mare; J. H. Goodchild, Crouch End, N.; B. R. Gribbon, Leeds; A. H. Gully, Bedford; R. W. Gunson, Manchester; B. G. Gwyther, Egham, Surrey; G. Hanson, Bradford; F. H. Healey, Bradford; J. H. Higgs, Leicester; J. H. Hill, Liverpool; J. R. Hobson, New Eltham; J. N. Horsfield, Jun., Kingston-upon-Thames; W. H. Huckvale, Tring; A. H. Kirk, Pall Mall, W.; F. R. Jolliffe, Penarth, Glam.; B. W. Jones, Bexhill; G. H. Jones Cardiff; Leon de Barr Kelsey, South Kensington, W.; A. W. Kenyon, Sheffield; A. S. Killby, Highbury; C. U. Kliner, Bayswater, W.; S. J. Lampshire, Devonport; A. A. Langham, Wimbledon, S.W.; H. Langman, Southampton, Lancs; H. B. Laycock, Manchester; H. G. Lay, Wellingborough; T. Linton, Leith; J. H. Lowry, Liverpool; P. J. Mafey, Southampton; E. H. N. Major, London; H. W. Markwick, Devonport; R. H. Mason, Birkenhead; F. J. Matthews, Clapton, N.E.; M. G. St. J. Maule, Huntingdon; F. C. Mears, Edinburgh; E. H. Mills, Shrewsbury; H. G. H. Mills, Southsea; A. M. Millwood, Barnes, Surrey; E. Mines, Rochdale; S. W. Mobbs, Lowestoft; E. Morley, Bradford; P. W. Mulready, Brondesbury, N.W.; F. T. Negus, Woburn, Beds.; W. H. Nevell, St. Albans, Herts; G. E. H. Newbold, Gainsborough; J. Norquoy, Manchester; D. M. O'Connor, Southall; S. S. Parkinson, Gravesend; G. Pemberton, Edgbaston, Birmingham; G. E. Peto, Bath; G. E. Phillips, Cambridge; A. P. H. Pierce, London; A. E. Poley, Hampton Hill, Middlesex; W. D. Quirk, London; N. L. Read, Leicester; A. G. E. Rehbeck, Frome, Somerset; H. J. Roberts, Portmadoc; R. G. Roberts, Doncaster; A. H. Robinson, Birmingham; B. Royce, Leicester; W. P. Rylatt, Hull; H. Shackleton, Keighley; W. H. Shute, Newport; E. H. Smith, Leicester; J. W. Smith, South Hampstead, N.W.; J. C. Smythe, Plymouth; R. G. Stevens, Bromley; J. D. Stevenson, Redhill; R. Stockton, Stockport; R. Stokes, Sunderland; H. S. Stowell, Croydon; F. M. Stratton, Salisbury; L. W. Taylor, Newcastle-on-Tyne; C. E. Tebbs, Upper Tooting, S.W.; F. W. Tempest, Sutton-in-Ashfield; E. E. Temple, Upper Norwood, S.E.; C. Beckett R. Terrell, Tonbridge; R. A. Thomas, Gosport; M. Thompson, Doncaster; G. M. Trench, East Dulwich, S.E.; J. R. Truelove, Sheffield; R. F. Tucker, Upper Teddington; J. T. Turner, Wanstead, Essex; H. G. Turner, South Croydon; M. J. Vadsley, Hull; P. F. Warren, Norwich; A. J. Watson, Newcastle-on-Tyne; B. Watson, North Shields; R. F. Wheatly, Bromley, Kent; H. E. White, Birmingham; R. W. White, Kenilworth, N.W.; A. H. Whyte, Kensington, W.; T. S. Wilcockson, Chesterfield; L. Wilkinson, New Southgate, N.; H. A. Willatt, Nottingham; E. J. Williams, Leicester; J. R. Willis, Derby; R. H. Willson, Kingston-on-Thames; J. D. Winder, Wandsworth Common, S.W.; A. T. With, Anerley, S.E.; W. O. Wright, Morecambe; J. A. Yells, East Dulwich, S.E.

The Intermediate Examination, qualifying for Studentship R.I.B.A., was held simultaneously in London, Bristol, Leeds, and Manchester, on the 5th, 6th, 7th, and 8th ult., with the following result:—

	Number Examined.	Passed.	Relegated.
London.....	52	29	23
Bristol.....	9	5	4
Leeds.....	7	3	4
Manchester..	11	8	3
	79	45	34

The following are the names of the passed candidates given in order of merit as placed by the Board of Examiners:—

A. Scott, Glasgow; C. M. Crickmer, Regent's Park, N.W.; H. W. Asman, Bradford; W. F. C. Holden, Cambridge; C. H. Brightiff, Southampton; W. J. Freeman, Halifax; A. Gilpin, Bristol; E. L. Hampshire, London; V. C. Cook, Wolverhampton; D. Anderson, Hampstead; J. E. Mundell, Litton, Poole, Dorset; C. B. Cleveland, Cambridge; B. D. Tracey, Camden-road, N.W.; J. H. Taylor, Battersea; J. Wilcock, Bradford; C. P. Moss, Crouch Hill, N.; H. Slater, Preston; K. D. S. Robinson, Westminster, S.W.; C. H. Heaton, Wigan; H. R. Crabb, Exeter; W. B. Colthurst, Taunton; A. R. Crisford, Eastbourne; P. A. Horrocks, Bolton; E. M. Ellis, London; P. R. Strong, Balham, S.W.; F. Sykes, Manchester; F. G. Brooker, Peckham Rye, S.E.; W. T. Curtis, West Dulwich, S.E.; S. H. Rainforth, Lincoln; J. W. Jarvis, Birmingham; H. W. Stone, Taunton; J. T. W. Brooke, Bowdon, Cheshire; R. W. A. J. Cosway, Wandsworth; E. Harding, Brixton Hill, S.W.; F. F. Hobson, Belfast; E. R. Kennedy, Belfast; S. Maddock, Frodsham, Cheshire; L. Morris, New Brompton, Kent; B. S. Murphy, Edinburgh; W. R. Osborne, Swindon; F. I. M. Owen, Liverpool; S. H. Penlington, Sunderland; E. R. Sladen, Bourne End, Bucks; J. B. Smith, Bedford; C. J. Thompson, London.

The Final and Special Examinations, qualifying for candidature as Associate R.I.B.A., were held in London alone on the 15th to the 22nd ult. Sixty-two candidates were examined, and the following thirty-seven passed, the others being relegated to their studies:—

C. T. Adshede, Stockport; S. W. Bensted, Wandsworth Common, S.W.; E. G. Besant, Cambridge; A. E. Biggs, Felixstowe; A. B. Botterill, Streatham, S.W.; C. A. Broadhead, Nottingham; H. Busbridge, Plumstead, S.E.; R. S. Cockrill, Great Yarmouth; H. L. E. M. De Colleville, Brighton; W. J. Devlin, Adelphi, W.C.; W. E. Dobson, West Hampstead; W. W. Ellison, Erith, Kent; J. Ewing, Regent's Park, N.W.; E. L. Gaunt, Ilkley, Yorks; A. E. Gibbins, Islington, N.; F. R. B. Haward, Marylebone, W.; R. E. Hemingway, Nottingham; A. E. Hughes, Regent-street, W.; A. T. Hussell, Ilfracombe; E. W. Lees, London; E. B. Norris, Birmingham; L. R. Oakes, West Kensington, W.; H. F. Ponton, London; W. B. Rees, Cardiff; C. H. Reilly, London; F. G. Richardson, Tufnell Park, N.; E. G. Rodway, Weston-super-Mare; G. L. T. Sharp, Barnes, S.W.; W. Slater, Nottingham; F. D. Smith, London; T. M. Smith, Tollington Park, N.; W. S. Tucker, Newmarket; A. H. Verstage, London; J. A. Moore, Derby; E. L. Wratten, Croydon.

The following shows the number of failures in each subject of the Final:—

I. Design .....	23
II. Mouldings, &c. ....	18
III. Materials .....	11
IV. Sanitation .....	13
V. Specifications .....	1
VI. Construction: Foundations, Walls, &c. ....	11
VII. Construction: Iron and Steel, &c. ....	10

**The Ashfiled Prize.**—On the recommendation of the Board of Examiners the Council have decided to award this Prize to Mr. Charles Thomas Adshede [Probationer 1894, Student 1897], he having most highly distinguished himself in the Final Examinations held during the current year.

**Special Prize.**—On the recommendation of the Board of Examiners the Council have decided to award a Prize of Books of the value of 10l. to Mr. F. Dare Clapham, in recognition of the merit displayed by him in his work at the Special Examination held last June. Mr. Clapham obtained the highest number of marks ever awarded at the Final and Special Examinations.

The following candidates for membership were then elected:—

As *Followers*—Messrs. B. E. Baily, Nottingham; John Begg, Consulting Architect to the Government of Bombay, of Bombay; John Cash, Oxford-street, W.; H. E. Farmer, Walsall; Henri Favarger, of Cairo, Egypt, and London; J. H. W. Hickton, Walsall; F. E. Masey, Capetown; M. B. Price, Pietermaritzburg, Natal.

As *Associates*—Messrs. T. W. Aldwinckle, London; H. Allberry, Dublin; J. P. Bishop,

London; C. H. E. Bridgen, London; H. Cayley, M.A. Cantab., London; F. D. Clapham, Eltham, Kent; W. B. Dawson, Westminster; H. D. Day, Godalming; W. M. Dean, Strand, W.C.; L. G. Detmar, Sutton; T. N. Dinwiddie, London; L. W. Ensor, Sheffield; K. Gammell, Strand, W.C.; J. C. Gregory, London; C. L. Hall, Blackburn; J. P. Hall, Kensington, W.; S. J. Halse, Canterbury; G. R. C. Harding, Lincoln; A. Holstead, Alnwick; E. V. King, South Shields; A. G. R. Mackenzie, London; E. G. Page, London; A. Pickup, Blackpool; L. E. Pryke, London; E. J. Pullar, London; A. H. Roe, Forest Gate, E.; R. B. Rowell, Colchester; C. Stretton, Leicester; J. G. Walker, London; R. C. Winch, Ipswich.

As *Hon. Corresponding Members*—Senor Don Enrique Mariá Repulles Y Vargas, President of the Central Society of Spanish Architects, of Calle de San Agustín 3, Madrid; Senor Don M. Alberto de Palacio, Madrid.

Mr. Lacy W. Ridge then moved the following motion, which was agreed to:—

"That the Royal Institute of British Architects desires to thank the Local Government Board for the issue of 'Model By-laws, IV. (Rural Districts)'. While doing so the Royal Institute would urge on the Board the desirability of preparing a model to enable Rural District Councils to regulate party-walls as distinct from external walls, a matter for which the Urban Model By-laws, to which the Board refer them, are not available. The Institute grounds this on the belief that the existence of properly constructed party-walls has proved an efficient barrier to the spread of fire, and that it is undesirable that such protection should be withdrawn in places where it has already existed."

The following motion by Mr. H. D. Searles-Wood was also carried:—

"That this Institute urges the Local Government Board to promote a Bill in Parliament to embody those sections of the London Building Act, 1894, which apply to ownership and the mode of dealing with party-walls, and make them apply to the United Kingdom."

A motion by Mr. Herbert W. Wills:—  
"That, in the interests of the profession, it would be advisable to have a list of Institute Assessors' drawn up, from whom the President would nominate, and that this list be from year to year revised," was withdrawn.

#### THE ARCHITECTURAL ASSOCIATION.

An ordinary fortnightly meeting of this Association was held on Friday evening last week in the Meeting-room of the Royal Institute of British Architects, No. 9, Conduit-street, Regent-street, W., Mr. W. H. Seth-Smith, President, in the chair.

The minutes having been read and confirmed, Messrs. E. G. Dawson, D. N. Paddon, and A. Pomeroy were elected members of the Association.

Mr. K. H. Weymouth was then elected to fill the vacancy on the Committee caused by the appointment of Mr. A. T. Bolton to the position of Master of the Day School.

Mr. R. S. Balfour announced the following donations, viz., "A History of Architecture on the Comparative Method," by the late Professor Banister Fletcher and Banister F. Fletcher; and twelve photographs of cathedrals, presented by Messrs. Bolas.

#### The New Premises Fund.

A vote of thanks having been accorded to the donors,

The Chairman said he was glad to be able to announce the following additions to the New Premises Fund:—The Architectural Association, 1,000l.; Messrs. Basil Champneys, 50l.; H. T. Hare, 50l.; E. W. Mountford, 50l.; Ernest George & Yeates, 50l.; John Belcher, A.R.A., 25l.; Beresford Pite, 20l.; E. Guy Dawber, 12l. 12s.; R. S. Balfour, 10l. 10s.; E. M. Gibbs, 10l.; Francis Hooper, 10l.; H. D. Searles-Wood, 10l.; A. Parull, 6l. 6s.; W. A. Forsyth, 5l. 5s.; A. H. Hart, 5l. 5s.; H. P. G. Matile, 5l. 5s.; C. B. Bone, 3l. 3s.; J. H. Squire, 3l. 3s.; F. D. Clapham, 2l. 2s.; W. H. Rafines, 2l. 2s.; G. L. S. Sharp, 2l. 2s.; H. Teather, 1l. 1s.; E. F. Reynolds, 1l. 1s.; A. O. Collard, 1l. 1s.; P. J. Turner, 1l. 1s.; and Stanley Towse, 1l. 1s. Mr. Belcher's donation was accompanied by a promise that as soon as the matter was well in

hand he would be glad still further to assist them, and said the Chairman, no doubt there were others who would do the same. He (the Chairman) wished that there had been more guinea donations, for he had more hope in a large number of small donations than in a small number of large ones. Small contributions would show that the scheme was being supported by the general body of members, and that, of course, was what was wanted, for the Committee desired to know that the members were thoroughly in sympathy with the movement. It was not a matter of ambition—i.e., that they were trying to get a fine building; it was simply a matter of absolute necessity. The lease of the present premises had about two and a half years to run, and the Association must be prepared to give notice and go into new premises at the end of that time, or take the present premises for another seven years, and if they had to take the second alternative the work of the Association would be seriously handicapped. He hoped that the members would do all they could to augment the fund, and that they would remember that it was much easier to get the first 5,000l. than the additional 15,000l. required. Therefore, although they had every reason to be greatly encouraged by what had already been done, they could not but regard the future with some concern. The Committee counted on the enthusiasm of the members in the matter, and they felt they had it, but he hoped that as many of them as possible would show their hearty support in a practical way by collecting, if they were not in a position to give, something towards the fund. The smallest sum would be welcome, or promises of help—for the money was not necessarily needed at once, though the more they could get together at once the more they would receive in the way of interest. They might begin to build in 1903; but in any case they had a great deal to do between then and now.

#### Capitals, &c.

The Chairman said that Mr. Arnold Mitchell had very kindly undertaken, at short notice, to deliver an address that evening on "Capitals," in place of Mr. Bond, who, unfortunately, was too unwell to keep his engagement, and had been compelled to go to the seaside that day. He (the Chairman) had sent a letter to Mr. Bond expressing their sympathy with him in his illness.

Mr. Arnold Mitchell then delivered an able lecture on "Capitals," or, rather, on the Triforia of English Cathedrals, Tympana, Sculptures, and Capitals, illustrated by a large number of lantern views. As the light was extinguished during the lecture in order to show the views, it was impossible to report Mr. Mitchell's remarks in full, but the following notes will give a general idea of the character and scope of the address. He said he addressed his remarks chiefly to the younger members of the Association, who, perhaps, up to the present had not given much thought to some of the detail and points of interest of the old buildings about which he was going to speak. From the pictorial point of view, was there anything more beautiful than some of our old buildings—than the cloisters at Salisbury, for instance, with the beauty of colour which the photograph could not show? And if these old buildings possessed interest from the pictorial point of view, how much more interest was there in the detail—in such work, for instance, as Bishop Bridport's tomb at Salisbury? Had we not in our English churches detail which equalled or surpassed in interest and beauty any foreign work? It seemed to him that the study of detail was really the most interesting study in mediæval buildings. Take a view of part of the interior of Lincoln Cathedral—the triforium. The triforium in these old mediæval buildings was part of the design which received great thought, and he would like to put before him a short series of views of triforia showing how the design grew and developed. The chief interest in these questions was to see how the builders began from the simplest and most elementary forms, and then gradually worked out those magnificent designs which were produced from the thirteenth to the fifteenth century. In the study of architecture we must realise that no composition was the sudden inspiration of the builders who produced it, but that it was the gradual outcome of what had gone before. Consequently, it was very interesting to trace out the process which

gradually led up to those perfect examples of the Middle Ages.

One of the simplest and earliest of these triforia designs was to be found in Winchester Cathedral. Here could be seen the very beginnings of the Norman period, when the work was crude, elementary, and simple, and when the builders had all to learn and so little upon which to go. They began with the most simple and elementary forms—as, for instance, in the plain ring of stones in the outer and inner arches of the triforium. Even in the tympana there was the same simple use of the stones (for the builders had also to learn how to work and dress the material they used), the crude workmanship, and the wide mortar joints. At Chichester, a few years later, a great improvement was noticeable. In the outer arches of the triforium there was a plain moulding on the stones; and in a simple manner, but so as to produce an impressive effect, the rings of small stones of which the arch consisted were built up and recessed one behind the other. In examining Norman detail and ornament they would see in what an extraordinary way the builders made it tell with the minimum of labour. In the earliest examples, where they dispensed with mouldings altogether, it was remarkable what an amount of effect the builders got merely by recessing those rings of stone one behind the other, and so getting a great architectural effect of light and shade under the recessed rings of stone. The builders in these first examples of architectural history were built with an enormous waste of material, simply because they had not learnt what the materials would do for them. It was only in later years that they learnt the advantages of worked stone and dressed beds of masonry. There were thirteenth-century buildings as high as Norman buildings with not one half of the masonry in them, simply because the builders had learnt how to use with advantage the material they were employing. In the tympana of the triforium at Chichester the builders had produced an effect of enrichment in the diaper use of the stones with absolutely no expenditure of skilled labour, but by the simple arrangement of the stones—by taking a square stone and turning it up on edge. Instead of the expenditure of labour, they expended their brains and got this effective result.

In a little later example, at Peterborough, there was the same treatment of the arches of the triforium, and in the tympana there were the diaper patterns, but on the lower edge there was an idea of relief work—an incised ornamental treatment, which was a distinct advance.

Then at Rochester there was a further advance—the same treatment really, but further elaborated. The tympana were enriched by the diaper pattern again, but on each stone there was cut a little low incised ornament which, multiplied throughout the design, gave a very original effect; and yet how simply was each stone treated!

In a later period, at Lincoln, there was a still further advance in the piercing of the tympana spaces instead of working on the surface—a new principle by which a strong, black depth of shadow was got in the tympana spaces. What great possibilities were open to the old builders when this idea was hit upon!

In other examples could be seen a widening and an elaboration by mouldings of the openings in the tympana until the whole space was taken up by these piercings. At Ely, for instance, could be seen how the idea was elaborated, and in such examples refinements were got similar to what could be found in Greek work.

A most beautiful triforium was the eastern extension of the choir of Lincoln Cathedral, where the openings in the tympana occupied the whole of the space, and we got a perfect example of triforium treatment. Perhaps the most beautiful of all was the wonderful triforium at Westminster Abbey, with the refinement of design of the base mouldings of the central shafts set out so as to be seen from below level with the mouldings of the columns of the triforium arch.

As to the sculptures in these mediæval buildings, there was always a purpose behind them. It was particularly important to notice that in these early sculpture works the story was told by means of pictorial representation, quite regardless of true proportions. In the representation of the screen, of Noah and the Ark, he supposed, although there was no pro-

portion, yet how well the story was told! The heads of the figures were large and altogether out of proportion to the figures, and yet the facial expression was obtained, and that was the object the builders had in view.

In the Priests' Door at Ely was another distortion of the human body, but the other way about, *i.e.*, the bodies were out of proportion to the heads; if the figures were to stand up they would look ridiculously tall. There was great difficulty in filling the spaces over these doorways with figures, and if we tried to do the work ourselves we felt greater respect for the old builders, and still more when we realised how they were hampered by the material that they had to use. Not only was the space difficult to fill, but there were the coarse materials and the consequent wide joints to be managed, but these old builders managed to get the vertical lines of their compositions, and the wings, for instance, of their subjects, to correspond with the vertical lines of the joints of the stone.

As an illustration of a later period, he would mention the beautiful arcading round the Chapter House of Salisbury Cathedral, which showed the same perfect type of sculpture work of the kind. One of the interesting points was the series of human heads which formed the stops to the label of the mouldings. The fertility of design was wonderful, and he could not think that the builders in producing work showing such fertility of invention and about which, in the treatment of each individual head, there was so much variety, had any ideal representation of the human form as their object as the men in Greek times had. In the heads on the arcading at Salisbury Chapter House, so different in type and expression one from the other, one saw the representations of men of the day who actually posed as models for the occasion—the actual men engaged on the building, most likely.

The sculpture above were representations of Adam and Eve, with the same want of proportion between the figures and trees, &c., which he had already referred to. Another example, also from the Chapter House at Salisbury, was even of greater interest, *i.e.*, a representation of the building of the Tower of Babel, in which there was the same lack of proportion. The tower was a thirteenth-century example of a tower, and no attempt was made to go back to Biblical times for the illustration—the builders just depicted the things around them. Work of that kind threw a valuable sidelight on the methods of doing things in those days. For instance, there was the representation of a man carrying a stone on his head; did that not suggest that stones, &c., were raised on to the buildings by manual labour instead of by mechanical means? Then there was a form of ladder to be seen which no doubt represented the kind of ladder used at the time. We might fairly conjecture, he thought, that in that they saw the kind of ladder used at the time the sculptures were done.

As to capitals, he wanted to show the development which had taken place in them. What he had to say would be obvious to most of his hearers, but there might be some who had not given sufficient thought to these fine old mediæval buildings, which, the more they were studied, the more would be found in them. He would go back to the beginning of things—to Anglo-Saxon times. In the little church at Wittering a square block of stone, with no architectural enrichment at all, was used as the capital. He supposed the idea of church capitals originated in a feeling that the juxtaposition of two diverse forms of structure—*i.e.*, the pier and the arch—must be marked in some way, and the capital was adopted as a dividing line. It was particularly interesting to notice how the builders worked out the design for their capitals. A capital was a feature above the eye of the spectator, and any improvement would obviously take place from the point of view of being seen; where the arch springs, the builders wanted to emphasise the springing line; hence the abacus.

At Sompting Church was to be seen the roughest, rudest type of sculpture-work in the capitals, but there was a smoother, more rounded effect, instead of the square, sharp overhang of the last example.

An example from Peterborough, with the abacus projecting, was a more perfect example, and it showed a far better dividing line than in the previous examples. Zig-zag ornament, to which he would draw their attention, was the most interesting of all Norman enrichments, but the actual ornament was exceedingly

simple. The more we studied the Old Norman buildings the more we wonder at the effect their ornament produced, and yet how little labour they put into it! and that was one of the highest of achievements.

From Rochester Cathedral they had an elaborate system of scollop form of ornamentation, but unfortunately some of it had been restored away since the photograph he showed had been taken.

A capital from Steyning Church showed the introduction of a new principle in the concave form of capital instead of the convex, in which the attempt of the builders was seen to adapt the design so that it might be best seen from below. More room for effect from this point of view was obtained by this concave form of capital, for it afforded splendid opportunities for sculpture work. The leaves of the foliage in these thirteenth-century capitals stood out from behind in a wonderful way, and this concave treatment was an enormous improvement, from an architectural point of view, upon the convex treatment. There were 2,000 of these beautiful capitals at Lincoln, and not one was like its neighbour! He did not know of anything which so indicated the resource of the builders as the foliage of these capitals, which was absolutely tossed about in the design. The stalks were stiff, but not the leaves. A beautiful example of a capital was that from the little porch of Skelton Church in Yorkshire.

Mr. Arnold Mitchell then showed several views of Norman doorways, in which sculptures were shown. It was wonderful, he said, to what an extraordinary length moulding work could go, giving a maximum architectural effect. A beautiful doorway was that from Lincoln, and some of the most beautiful sculptured doorways were of this period. At Ilfley we saw a moulded doorway, with carved beakheads (an explanation of which he would like to have), and in that we had the beginning of sculpture work before we got to the figure stage. In the Priors' door at Ely Cathedral, through which people did not generally go, though it was well worth while doing so, we had a beautiful example of the elaboration of sculpture work on doorways, of which the Norman builders were capable; and at Barfreston was another beautiful doorway. One constantly came across a rich Norman doorway in a building of a different date, and no doubt that was due to the fact that when buildings were altered and enlarged, the doorway was more often retained or incorporated in a new design, than other parts of the original building. At Barfreston we saw the object of these sculptures; people at the time the work was done were incapable of reading or writing, and so the sculpture subjects were introduced for the purpose of speaking forcibly to them.

He desired to direct their attention to the little church of Copford, near Colchester, for if they were to pass that little building without entering it, they would lose a great deal. Not many years ago the church had some interesting frescoes on its nave walls, but the rest of the interior was whitewashed. At the recent restoration the whitewash was carefully removed from the chancel, with the result that there was revealed quite the most finished and beautiful example of colour decoration in a church in the whole country, which, only a few years ago, no one knew existed. In some places the whitewash was something like one-eighth of an inch in thickness. We were so accustomed to see in our churches bare masonry, that we were apt to be amazed to find in a building like the little church at Copford colour decoration so fine. The restoration work had been most carefully carried out, and the frescoes had been slightly strengthened and repaired. The result showed how carefully restoration work should be carried out, and also that they as architects would be well repaid for their care if they got results such as those to be seen at Copford.

The Chairman said one never tired of going into the matters Mr. Mitchell had dealt with, but when a man had mastered his subject as Mr. Mitchell had, and when he had also had considerable experience as a lecturer, it was a real pleasure to hear such an address as they had heard that evening—an address which was not only so interesting, but was of practical importance too. He cordially agreed with Mr. Mitchell's remark as to cost being saved by the application of brains in work, and if architects would only impress the public, and particularly their clients with the belief that they used

their brains in their work in order to save the pocket of the client, instead of throwing as much detail of a costly nature into their work as they could, they would bring much more credit to the profession, enjoy their work much more and increase their clientele at the same time. As to the refinements in the works referred to by Mr. Mitchell, there was no doubt, as Mr. Reginald Blomfield pointed out in his book on the Renaissance, men like Wren learnt to do their work so much by observation on the spot—by observing the effect of each feature as it was built up, very often varying it from time to time as the result of those observations. Those architects were not paper architects. He recently asked an architect for a donation on behalf of the work of the Association, but unsuccessfully, the architect whom he asked remarking: "I do not agree with paper architecture, and I don't want to encourage paper architects." His, the speaker's, reply was: "Neither do we; we try to make our architectural student a practical architect." In listening to Mr. Mitchell's address, his opinion as to the importance of studying Gothic had been confirmed. In looking at the drawings of Gothic work submitted by students in the Institute examinations, he had been very much struck by the atrocious character of many of them. The sheets of testimonies of study for the Institute examinations were, as a rule, as bad as they could be, and when the candidates were asked why they had chosen such villainous examples when there were such beautiful examples to select from, they usually replied that there was no encouragement in the schools—no examples, no models. The London candidates had not that excuse, for there was the Architectural Museum, and also South Kensington, where there were beautiful examples which students could measure. It was just this: Gothic was out of fashion. We must take care that we did not sacrifice the individuality of our English architecture; we should do so if we dropped the study of Gothic as students of architecture. We found in Gothic what we did not get in Classic, *i.e.*, the freedom which was at the bottom of our English character and which was translated in stone in our English architecture at every period. We needed that spirit of freedom which the study of Gothic could give us, and which resulted in that infinite variety which Mr. Mitchell had mentioned. He was not able to agree with those who argued that in the design of mediæval buildings there was no architect or master mind conceiving the whole, and that it was left to individual workmen, working in some sort of concert, to produce these beautiful works. The more he thought the matter out the less he was inclined to agree with that theory. On the contrary, to him it was absolutely proved that there was a master mind concerned in the erection of those great buildings, though he believed that the individual workman had great liberty in the design of the detail he carried out. In his opinion, the modern architect could obtain much the same happy result if he would only give craftsmen under him more freedom of the same kind.

Mr. Alex. Wood, M.A., in proposing a vote of thanks to Mr. Mitchell, said he had listened with the greatest pleasure to Mr. Mitchell's address, and he had seen with equal pleasure the beautiful lantern views. He did not agree with Mr. Mitchell's remarks in regard to the rather curious floriated carving in the tympana at Rochester Cathedral. It did not appear to be truly Norman work. The sculptures appeared to be a sort of copy, and were not genuine. It was difficult also to see how the eastern part of the crypt at York was genuine Norman work. There was considerable study of Norman work in the fifteenth century, and it looked as though the builders had familiarised themselves with it, and either toiled the old work or did the real thing. The porch at Skelton had been shown as a splendid example of a village church porch, but the tradition of the neighbourhood was that it was done by the masons employed on the transept at York. If they studied Christian's book carefully, they would find that Skelton was not considered a fair example of a village church, *i.e.*, a genuine growth of the village mind, but was rather an importation from a large town. He was glad that attention had been called to the church at Copford, in Essex; it was really a Byzantine church, and had evidently had a string of domes, which were broken up in the early centuries, and turned into an Early

English building. The painted work seemed to have a strong Byzantine character about it.

Mr. C. H. Brodie seconded the vote of thanks to Mr. Mitchell for a delightful lecture.

Mr. H. P. G. Maule supported the vote of thanks. He agreed that they could not study Gothic work too much, for even if they did not design in Gothic, they could not get too much of the spirit of the Gothic builders into them. We could not do better than try and get the spirit in which they worked in those days and the joy they put into their work. With regard to the beak heads on the doorways, to which Mr. Mitchell drew attention, he did not know if there was anything in it, but it had occurred to him that in country districts one often saw coats, and crows, and cats nailed up on barn doors, and after a time nothing was left but the skeleton. In the case of the crow, the part in such circumstances that was most prominent was the beak, and it was just conceivable that in past days some one may have seen this beak nailed upon a door and may have taken a hint from that.

The vote of thanks having been heartily agreed to,

Mr. Mitchell, in reply, said that every one of the photographic views shown that evening belonged to the Association, and had been presented to the Association a year or two ago, and he had used them so that they might get adequately noticed, for they were really splendid photographs, and he did not think that they had been so far properly valued. As to Mr. Maule's point about the beak heads, it had occurred to him while Mr. Maule was speaking that perhaps they were grotesque beasts put round the doorway to frighten away evil spirits; and when it was known what superstitious notions the people had in those days, the suggestion he had made might seem to have something in it. It used to be the fashion in olden days to have, at the time of baptisms, the south and north doors open, the idea being that the spirit of the natural man should leave by the north door and the holy spirit enter and take possession by the other. There might be something in the suggestion; at all events, the beak heads were seldom on the south door. He desired to say another word or two as to the photographs he had shown, and which, as he had said, were the Association property. Owing to the totally inadequate arrangements for properly showing the views upon the screen the views had not been done justice to, and he thought that the Association in their own interests should see that something was done in the matter.

The Chairman said it was true, as Mr. Mitchell said, that the photographs belonged to the Association, but it was entirely due to Mr. Mitchell that they did so. The photographs were presented by Mr. Gardner, thanks to Mr. Mitchell. He quite agreed with Mr. Mitchell's remarks about the screen. It was time they approached the Institute and asked them to join the Association, not only in improving the method of lighting the lantern (for they were always running risks with the bottles of gas), but also in getting a better screen.

The Chairman announced that the next meeting will be held on December 13, when Mr. J. E. Forbes will read some notes descriptive of his Travelling Studentship tour.

The meeting then terminated.

#### THE ARCHITECTURAL ASSOCIATION DISCUSSION SECTION.

The third meeting of the present session of the Discussion Section of the Architectural Association was held at 56, Great Marlborough-street, W., on Friday, November 22, Mr. R. H. Weymouth in the chair.

The paper announced to be read by Mr. Vivian H. King being unavoidably postponed till next February, Mr. George H. Smith, Vice-chairman, kindly took his place, and at a few days' notice prepared a paper on "Canterbury Cathedral," which was illustrated by plans showing its development from Early Saxon times down to the present building, Mr. F. G. Osborne Smith lending his services to show with the A.A. lantern a fine selection of views of the cathedral specially prepared by Messrs. Bolas & Co.

Commencing with the traditions of an old Roman church, the landing of Augustine in 597, and early Saxon times—following a supposed restoration of that early church by Professor Willis—Mr. Smith traced the gradual growth of the present structure, especially calling

attention to Archbishop Lanfranc's work in 1070 and Prior Ernulf's in 1093, and the glorious Choir of Conrade destroyed later by fire. In 1170 took place the tragic martyrdom of Thomas à Becket, followed later by his canonisation and the great pilgrimages to Canterbury of mediæval times. William of Sens and his successor in 1189, William the Englishman, and their great additions to the Cathedral, for the most part still remaining, and all the additions and destructions up to modern times, were alluded to, the slides shown at the close of the lecture greatly enhancing its value.

The Chairman proposed a hearty vote of thanks to Mr. Smith and Mr. Osborne Smith, alluding to the wonderful vistas obtained by the flights of steps in the Cathedral. Mr. Taylor seconded, and Mr. Wonnacott supported it, Mr. Wonnacott remarking how studying the vaulting of the Cathedral is most instructive, and, incidentally, how few members were aware of the fine set of slides the Camera Club had of Canterbury. The discussion was continued by Mr. Jacobs, Mr. Dudley Forsyth, and Mr. Barwell. The vote of thanks being carried with acclamation, Mr. Smith replied and the meeting was ended.

The next meeting was announced for Friday, December 6, at 7.30, when Mr. Sydney Perks is to read a paper on "The Ethics of Dilapidations," Mr. Douglas Mathews hoping also to attend as Special Visitor.

#### COMPETITIONS.

HAWICK NEW LIBRARY.—At a private meeting of Hawick Town Council, on the 29th ult., the plans for the Carnegie Library were considered, and it was resolved to recommend the public meeting of the Council to accept the plan signed "Teviot," by Mr. Scott, of Messrs. Scott & Campbell, architects, Queen-street, Edinburgh.

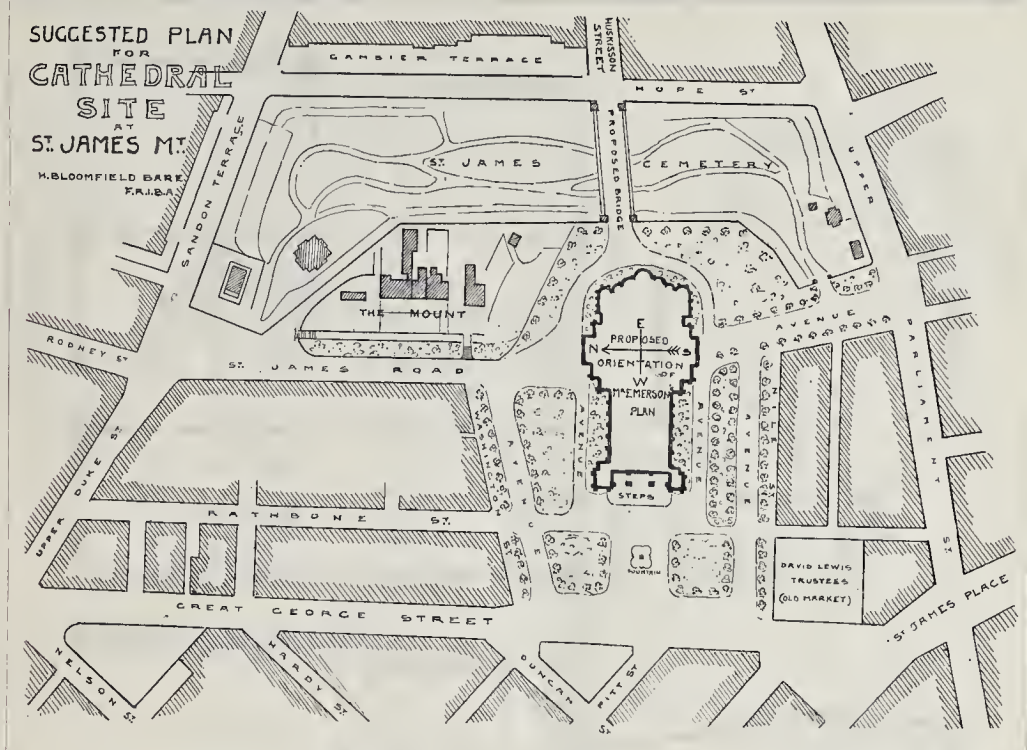

#### ARCHITECTURAL SOCIETIES.

EDINBURGH ARCHITECTURAL ASSOCIATION.—A meeting of the Edinburgh Architectural Association was held on the 28th ult. in the rooms, No. 117, George-street, Mr. Henry P. Kerr, president, in the chair. Mr. Louis A. Barnier, B.A., delivered a lecture on "The Old Monuments of Provence." The lecture opened with some remarks on the history of the country, and showed how the influence of Greek and Roman civilisation began earlier and finished later than in the rest of the Gaul, and therefore left a stronger mark on the people, who have ever since preserved an individuality, and have been, so to speak, a nation apart from the rest of the French. Some of the monuments, Roman theatres, amphitheatres, temples, mausoleums, &c., in the following towns were specially mentioned:—Orange, Avignon, Tarascon, and Beaucaire, Arles, Aignes, Mortis, Carcassone, and Nîmes. These buildings were also illustrated with a set of limelight views. At the conclusion of the lecture, Mr. Hunter Crawford proposed a hearty vote of thanks to Mr. Barnier for his lecture, which was duly accorded.

#### ENGINEERING SOCIETIES.

SOCIETY OF ENGINEERS.—At a meeting of the Society of Engineers, held at the Royal United Service Institution, Whitehall, on the 2nd inst., Mr. C. Mason, President, in the chair, a paper was read on "The Sewage Question during the Last Century" by Mr. H. Alfred Roehling, C.E., F.G.S. After some preliminary remarks relating to his subject, the author gave a short history of the theory and practice of sewage purification during last century. Concerning its theory, he remarked that from the position of pure instinct, it had advanced through various stages, until at last Pasteur and others had given it that form it now generally took, *viz.*, that in sewage purification, mechanical, chemical, and biological agencies played an important part, and that the decomposition of the organic matter was in the main a biochemical process. Dealing with the practice of sewage purification, the author observed that the only known method of sewage treatment at the dawn of the last century was irrigation on land. He then pointed out how, years afterwards, chemistry had tried to make a lucrative business out of it; how Commission after Commission, and, in fact, every authoritative

inquiry, had expressed an unmistakable verdict in favour of land treatment; and how, in consequence of this mass of accumulated evidence, the Local Government Board had been compelled to insist on land treatment of the raw sewage or effluent in any scheme of sewage disposal for which its sanction had been asked. But the author observed that even the best of land could not do its work for ever if it was not well looked after; and so it happened that through gross neglect and ignorance, the apparent failures created a strong feeling against land treatment, and finally led to the appointment of a new Royal Commission. This new Commission had just issued its interim report, in which it had re-established land in its position as the first and only natural method of sewage treatment, and had termed all the biological or bacterial methods "artificial," some of which would be admissible without land. The author next referred to the natural self-purification of sewage, or to the self-purification of sewage in the only natural medium, land, and considered in detail the self-purifying powers of land, mentioning amongst other things that besides its retentive and absorbing properties it possessed also the power to decolorize, to deodorise, and to retain and render harmless such poisons as strychnine, nicotine, &c. The self-purifying process, he said, might be likened to a process of digestion, and when the digestive powers of land had been overtaxed, sickness was the only natural result. After describing the work of bacteria in the soil and some products of their activity, the author stated that experience and experiment had proved that the chances of pathogenic germs doing further harm on sewage farms were exceedingly remote. No soil, with the exception of peat—owing to its great amount of moisture—was probably entirely useless, and a loamy sand subsoil had, in many instances, proved very effective. The depth of soil necessary for purification depended on local conditions, such as the character and thickness of the top soil (humus), the nature of cultivation of same, the character of the subsoil, especially its facilities for retaining and exchanging air quickly, the surface slopes of the land, and the level of the subsoil water (thickness of the zone of evaporation, and of the passage and capillary zones). Dealing

next with the artificial self-purification of sewage or the self-purification of sewage in artificial media, the author remarked that, apart from the sludge difficulty (which had been reduced, but not altogether removed), these artificial methods had given very fair and encouraging results concerning the chemical purity of the effluent. But whilst warning his hearers not to expect that these theoretical results would be reached in practical working, and incidentally mentioning two cases of failure of works of this kind, he drew attention to the bacterial impurity of the effluent, which was little better in this respect than raw sewage. The Legislature, however, could not contemplate without the gravest concern the wholesale admission of pathogenic germs into the streams, as an action might lie against a Sanitary Authority for causing an outbreak of typhoid fever lower down the stream. After stating that the excessive quantities of manurial elements in the effluents from artificial self-purification works might engender such a luxuriant vegetation in the streams as to obstruct the natural flow of water and to completely cover the whole bed, the author stated that the objections raised led, in the natural order of things, to the supplementing of the artificial methods by the only natural one—land—when all reasonable requirements would be satisfied. It might likewise prove advantageous to partially treat the sewage by an artificial method before using it on the land. No system, however, would prove successful unless the present method of supervision of sewage-disposal plant was radically altered and the education of future managers systematically taken in hand.

**THE INSTITUTION OF CIVIL ENGINEERS.**—At the ordinary meeting on the 3rd inst., Mr. Charles Hawksley, President, in the chair, it was reported that eighty-two candidates had been admitted as students. The monthly ballot resulted in the election of one member, viz.:—C. E. Allan (Belfast), forty-three associate members, and six associates.

**THE SANITARY INSTITUTE.**—The Secretary informs us that it has been decided not to hold the sessional meeting of the Sanitary Institute on December 11, as given in the calendar in the Supplement to the "Journal."

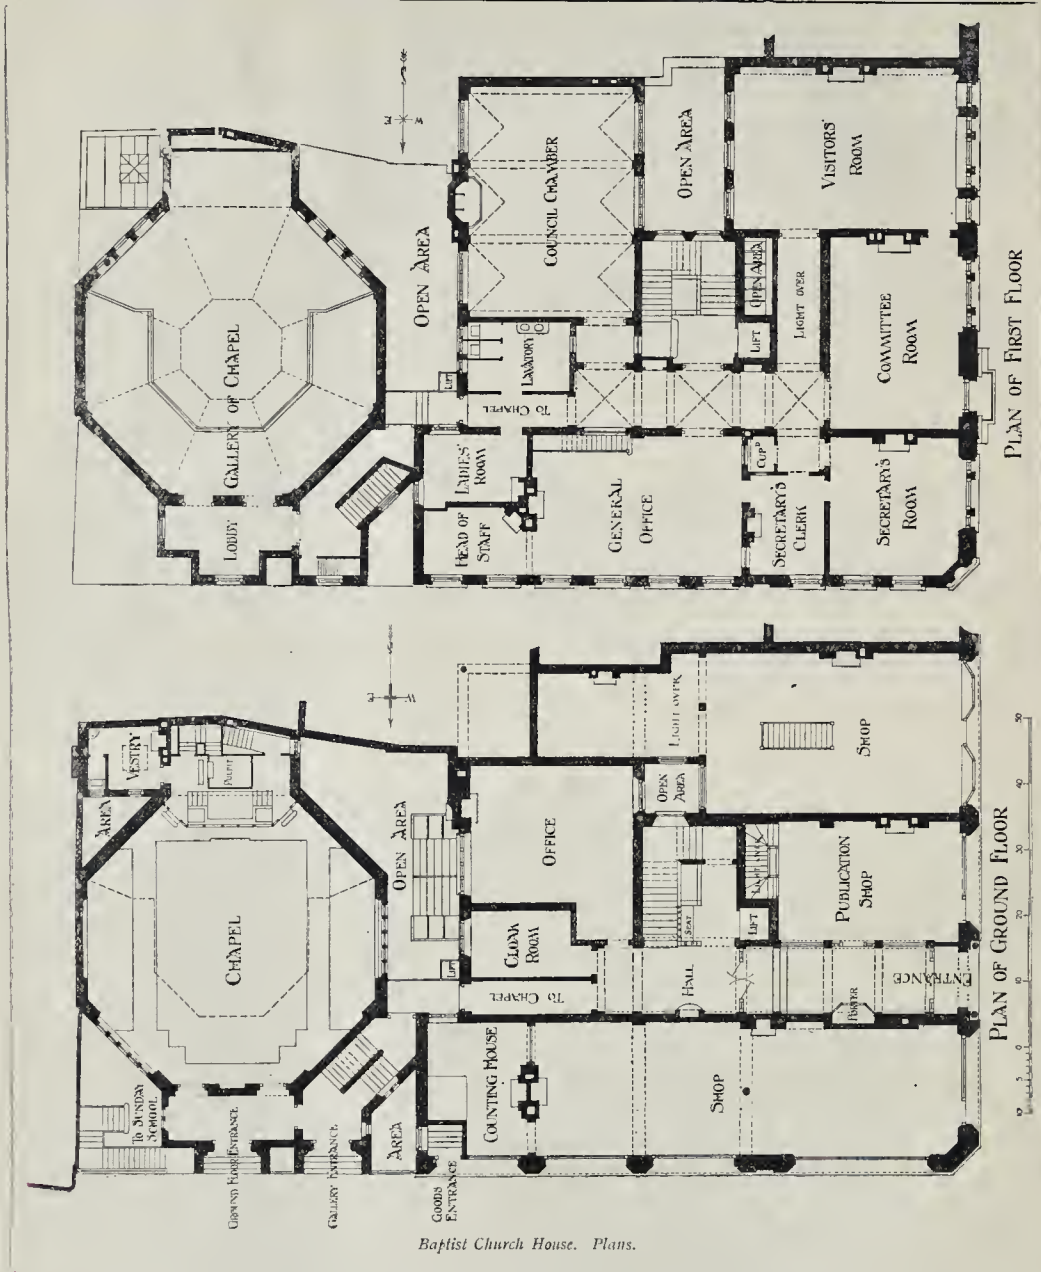

**SUGGESTED MODIFICATION OF THE LIVERPOOL CATHEDRAL SITE.**

THE accompanying plan was made by a Liverpool architect, Mr. Blomfield Bare, as an extension and improvement on the site proposed by the Committee for the Liverpool Cathedral. The plan of the Committee's site we gave on page 431 *ante*, though we were not informed at that time as to what portion of the site they propose for the Cathedral. We have since learned that (as we supposed) it is confined to the long narrow portion called St. James's Mount, now laid out as a garden, and that the Cathedral is not to trench on the cemetery. That would of course mean that the Cathedral must be aligned north and south.

Mr. Bare suggests acquiring more land to the west of St. James's Mount, and placing the cathedral as shown on his plan. This is undoubtedly an improvement, but it would be costly, and it would still leave the cathedral in an out-of-the-way position and facing a poor collection of second-class streets; and Great George-street, which would run past it, though a wide street, is not an important thoroughfare. There is also a great fall of the ground westward, which would necessitate, we should think, a more extensive flight of steps than is indicated in Mr. Bare's plan.

Though we publish the plan as a clever attempt at a new solution of the problem, we are as far as ever from approving of this situation for the cathedral; and we believe that, in spite of the declaration of the committee that they will abide by their intention, they will be met by such a systematic opposition to it in Liverpool as will probably compel them to give way.

**POST OFFICE, COLWYN BAY.**—New post office buildings have been designed by Messrs. Booth, Chadwick, & Porter for Colwyn Bay, the cost being estimated at 4,000l. The plans have been approved by the Postmaster-General and the Treasury. On the ground floor will be a large public office, the Chief Clerk's room, messengers' room, and sorting-rooms; the first floor will contain the Postmaster's office; and the second floor the telephone and telegraph instrument rooms. It is a four-story building, and will consist in the main of huff bricks and terra-cotta dressings.

Baptist Church House. Plans.

**Illustrations.**

**THE BAPTIST CHURCH HOUSE.**

**T**HIS building is being erected in the widened part of Southampton-row which forms the beginning of the new street from Holborn to the Strand, and it is the first building to be started in the street.

It forms the headquarters of the Baptist Union, and on the ground floor there is a large shop for the publication department of the Union. The site was partly occupied by the old Kingsgate-street Chapel, and a new chapel is being built to take the place of that building.

It was at first proposed to build a library over the chapel, and the octagonal form shown on the plan was adopted to get over difficulties of lighting. Some arbitrary divisions of the site that had to be adhered to made any regularity of treatment in the street front

difficult, and therefore I have tried to group the various features so as to get balance and composition without too much regard for symmetry or classical conventions.

A small first contract was carried out by Messrs. G. S. S. Williams & Son, and the main building is now being built by Messrs. Higgs & Hill.

ARTHUR KEEN.

**SELECTED DESIGN FOR NEW MANCHESTER FIRE-STATION.**

We give this week the two principal plans, and two elevations and two sections, of the design by Messrs. Woodhouse & Willoughby to which the first premium has been awarded in this important competition.

We commented on the design at considerable length in our last issue, and it hardly requires any further explanation.

The object of the architects has been to

combine symmetrical arrangement with a thoroughly municipal character, and to group the departments so as to give priority to the more important ones.

As many advantages are attained by planning the firemen's tenements to London-road in one continuous block similar to those in Fairfield-street, they have placed the gymnasium longitudinally parallel to Whitworth-street rather than to London-road (as shown on the sketch plan); and by a further minor re-adjustment of these tenements thirty-four complete sets are obtained in one scheme, of a larger and more uniform size as compared with the thirty-two sets shown in the sketch plan.

The buildings are to be warmed by heated air on the "plenum" system. The heating of the police-station is calculated so as to give a complete change of air in the cells every ten minutes.

The architects' estimate of cost is 74,930*l*.

DESIGNS FOR JEWELLERY AND UTENSILS

ALL the work here illustrated is from designs by Mr. C. R. Ashbee, with the exception of the tankard, No. 8, which was designed by Mr. J. Witham and executed by Mr. A. Cameron.

No. 1 is a gold chain and pendant, with silver links set with pearls, designed and executed by Mr. Ashbee. The pendant is the figure of an angel cast in silver, with gold wings, under a canopy of blue enamel, and large pearl drops at the bottom.

No. 2 is a muff chain in oxidised silver with pearl facings; it was executed by Mr. J. McQueen.

No. 3 is a gold necklace, executed by Mr. C. Mason and Mr. A. Cameron. It is set with turquoise and emeralds, as also the pendant. No. 4 is an oxidised silver vase with enamelled lid mounted with a cluster of red cornelians; executed by Mr. C. Fawcett and Mr. A. Cameron.

No. 5 is a copper-gilt chalice set with carbuncles, executed by Mr. W. Hardman and Mr. A. Schonwerk.

No. 6 is an electric-light fitting in pewter and iron, made by Mr. W. A. White.

No. 7 is a copper-gilt jug, made by Mr. J. Bailey and Mr. A. Schonwerk, and No. 8 a copper-gilt biscuit-box.

All the work was done, we believe, at the Guild of Handicraft in Essex House, Mile End-road, under the direction of Mr. Ashbee.

THE NEW GOVERNMENT OFFICES.

THE following correspondence has taken place between the Institute of Architects and the Office of Works, in reference to the carrying out of the late Mr. Brydon's design for the new Government offices in Great George-street:—

"Royal Institute of British Architects,  
9, Conduit-street, Hanover-square,  
London, W.,  
November 8, 1901.

To the Right Hon. A. Akers-Douglas, M.P., First Commissioner of Works and Public Buildings, Storey's-gate, S.W.

SIR,—The Council of the Royal Institute of British Architects have taken the opportunity of their first meeting of the Session to pass a unanimous resolution that representations be respectfully addressed to His Majesty's Government with regard to the present proposal to execute the new Government buildings in Parliament-street from the late J. M. Brydon's designs without the aid of a specially-appointed architect of repute.

The Council, with the warm support of the Presidents of all the architectural societies in the United Kingdom in alliance with the Royal Institute, whose names are appended as signatories to this letter, venture to express the earnest hope that even at this eleventh hour an architect in sympathy with Mr. Brydon's artistic ideals may be appointed to superintend the erection of this vast building, which, if not very carefully detailed in the spirit in which it was designed, will lose much of the grace with which Mr. Brydon, had he lived, would have clothed it. They would also, with all deference, point out that it is only during the execution of his building that the architect himself arrives at the true development of his original conception, so that, for the successful execution of work of this important character, the inventive genius of a sympathetic colleague of the original designer is essential.

The Council of the Royal Institute of British Architects earnestly and respectfully urge the above considerations upon the attention of His Majesty's Government.

We have the honour to be, Sir, your most obedient servants,

WILLIAM EMERSON, President Royal Institute of British Architects.

THOMAS DREW, Kt., President Royal Hibernia Academy (Member of Council R.I.B.A.).

GEORGE C. ASHLIN, President Royal Institute of the Architects of Ireland.

F. MARSHALL, President Sheffield Society of Architects and Surveyors.

S. PERKINS PICK, President Leicester and Leicestershire Society of Architects.

ALFRED DARBYSBIRE, President Manchester Society of Architects.

JOHN JAMES BURNETT, President of the Glasgow Institute of Architects.

FRANK CAWS, President of the Northern Architectural Association.

FRANK W. WILKS, President Bristol Society of Architects.

ARTHUR MARSHALL, President Nottingham Architectural Society.

F. M. SIMPSON, President Liverpool Architectural Society.

W. H. BIDLAKE, President Birmingham Architectural Association.

BUTLER WILSON, President Leeds and Yorkshire Architectural Society.

H. G. LUFF, President Devon and Exeter Architectural Society.

JAMES P. BRUCE, President Dundee Institute of Architecture, Science, and Art.

C. H. CHANNON, President York Architectural Society.

EDWIN CORBETT, President Cardiff, South Wales, and Monmouthshire Architects' Society.

ARTHUR CLYNE, President Aberdeen Society of Architects."

"H.M. Office of Works,  
Westminster, S.W.,  
November 28, 1901.

SIR,—I am directed by the First Commissioner of His Majesty's Works, &c., to acknowledge the receipt of your letter of the 8th inst., together with a resolution signed by the President of the Royal Institute of British Architects and others; and to say that Mr. Akers-Douglas quite appreciates the point of view of those who would prefer some other method of carrying out Mr. Brydon's work than that upon which he has decided.

It was, however, after careful examination, during which none of the considerations now urged were overlooked, that the decision to carry out the designs by the agency of Mr. Henry Tanner, F.R.I.B.A., the principal architect of this Department, was arrived at.

I may say frankly that among architects of high repute the First Commissioner failed, after some confidential inquiry, to discover any one sufficiently in sympathy with Mr. Brydon's artistic ideals to subordinate his own inventive genius to that of the original designer.

It appeared to Mr. Akers-Douglas due to the memory of Mr. Brydon that his work should remain intact, and that the designs which he left should be carried out with as little variation as possible. The question as to whether these drawings are in a sufficiently complete state to enable this to be done is one upon which the First Commissioner is aware opinions differ; but he has confidence in the judgment of his technical advisers, and he will be ready to exhibit these drawings to Parliament should his action, as a Minister of the crown, be hereafter questioned.—I am, Sir, your obedient servant,  
H. M. ESHER.

The Secretary, Royal Institute of British Architects,  
9, Conduit-street, W."

INSTITUTE OF SANITARY ENGINEERS.  
ANNUAL DINNER.

THE annual dinner of the Institute of Sanitary Engineers was held at the Holborn Restaurant on Wednesday evening. Dr. J. B. Wilkinson, Medical Officer of Health for the County-Borough of Oldham, presided, and amongst those present were Dr. J. C. Thresh (president-elect), Mr. W. J. Wells, Mr. H. M. Dove, C.E., Messrs. N. W. Hoskins, C. E., Butcher, T. W. Deadman, F. W. Mason, and Arthur E. Ashby (secretary).

After the loyal toast had been honoured, Mr. A. Baker proposed "The Navy and Army."

Lieut.-Col. W. R. Smith, V.D., acknowledged the toast, and said that circumstances which had recently occurred made him very interested in the prosperity of the Institute. He was, as they knew, connected with the Royal Institute of Public Health, which was housed under the same roof as the Sanitary Engineers. He knew they had had some anxiety lately, but he hoped, after the consolidation which had taken place between them, that they would go forward and achieve a very great measure of success, and that in every possible way they would do for themselves and the country what was so much needed. So far as his Institute was concerned, it would always be delighted to help and co-operate with the Sanitary Engineers.

Mr. G. P. Reveirs, Chairman of the Sanitary Publishing Company, submitted the toast of the evening, "The Institute of Sanitary Engineers." In spite of what was said about America and Germany being ahead of us, there was one science in which we excelled—that was the science of sanitation. No doubt, we had become a little spoilt by prosperity, but he considered that if we dealt with the question in a practical way we should get abreast of our international rivals as time sped on. In the past, he regretted to say, the voices of labourers in the work of sanitary science had been like those of the prophets—in the wilderness. To-day, however, a large proportion of the inhabitants of this country were friendly to them, a certain proportion were interested in their work, and a minority were hostile. But even the latter were gradually coming to their side. Their

greatest difficulty was ignorance; the next, vested interest. In fact, sanitary engineers were engaged in the greatest crusade of our time. Sanitation was the handmaid of religion—a fact that was only just beginning to be realised. Another science that had always gone with theirs was that of medicine. Referring to the problems that confronted them, he spoke of the housing of the working classes, and urged that membership of that Institute should be a guarantee that the advice or the work put in by members would be of the very best. He trusted this would be borne in mind, and that increased attention would be given to the Institute. Unfortunately, through the death of their late secretary (Mr. Kemsley) they had not been able to hold some meetings as in previous years, but he hoped that in the years to come their meetings would be better attended, that they would have more of them, and that the papers would be more distinct and of growing value.

The Chairman, in responding, said the Institute was born in the closing decade of the last century, and he trusted it would be fed on food upon which it would thrive. He agreed that the housing of the working classes was one of the great problems that confronted them. True, we were very much better now in the matter of housing than in those years long past, when, according to an eminent public health servant, people were considered well off so long as there was only one family in each corner, but when a new family came to the middle of the room there was some difficulty. Such things as that were, happily, now of the past. Sewage disposal was another problem facing them, and he regarded the Institute as of the highest value in giving them facilities to bring forward their difficulties and failures for criticism.

Dr. Thresh proposed "The Chairman and Members of Council," and Messrs. W. J. Wells (Chairman), F. J. Rayner, and E. R. Palmer responded.

"The Visitors" was given by Mr. H. M. Dove, and acknowledged by Mr. A. Baker, solicitor to the Institute.

THE LONDON COUNTY COUNCIL.

THE usual weekly meeting of the London County Council was held on Tuesday, in the County Hall, Spring-gardens, Mr. A. M. Torrance, Chairman, presiding.

Loans.—On the recommendation of the Finance Committee it was decided to lend Poplar Borough Council 3,680l. for sewer and channelling works and 3,100l. for street lighting purposes; Fulham Borough Council 3,550l. for underground conveniences; and Guardians of Wandsworth and Clapham Union 13,460l. for erection of schools.

Telephones.—The Post Office Telephone scheme was discussed at considerable length, on a recommendation of the Highways Committee that regret should be expressed that it did not secure to the public the advantages they had been led to expect. The recommendation was agreed to, with an addition that the Postmaster General be asked to receive a deputation on the subject.

A Limehouse Housing Scheme.—The Housing of the Working Classes Committee submitted sketch plans of a housing scheme which the Stepney Borough Council had undertaken to carry out at Queen Catherine-court, Limehouse. The County Council had undertaken to contribute half the net cost, not exceeding 3,200l., and the plans were for a block of five-story balcony dwellings, to accommodate 130 persons in eleven tenements of two rooms, and fourteen tenements of three rooms.

The Council approved the plans.

Gas Testing.—A report of the Public Control Committee drew attention to the refusal of the South Metropolitan Gas Co. to comply with the notification of the Gas Referees relating to the cleaning out of the service pipes at certain testing places, the result being that no tests could be made. It was recommended.—That the Board of Trade be urged to deal at once with the matter of the refusal of the South Metropolitan Gas Co. to comply with the notification of the Metropolitan Gas Referees with regard to the cleaning out of the service pipes at gas testing-places.

The recommendation was agreed to.  
Isolation Hospital, Colney Hatch Asylum.—It is proposed to erect an isolation hospital at this asylum. It is intended to provide accommodation for three male and three female patients

and the necessary staff. The dormitory has been arranged for two beds, each having a space of 2,000 cubic feet, the single rooms having a similar capacity. The building is being connected with the late chaplain's house by a corridor open at the sides and roofed over, the day rooms, nurses' room, lavatory, kitchen and scullery accommodation being provided by utilising the latter building. The cost of this hospital is estimated to be the same as the amount originally voted, viz., 2,000*l.* The new plans have now been approved by the Home Secretary, and the Asylums Committee recommended that the Council do sanction the alteration of the plans of the isolation hospital at Colney Hatch Asylum to enable accommodation to be provided for three male and three female patients with the necessary staff, instead of four female patients as originally contemplated.

The recommendation was agreed to.  
*Theatres, &c.*—Approval was given, on certain conditions, to the carrying out of the following works:—

Alterations to the back portion of the St. John's Schools, Peel-grove, Bethnal Green (Mr. A. Cox for Mr. D. Keymer).

Alterations, Balham Music Hall (Mr. Cronk).  
Arrangements of seating in men's first-class swimming-bath at the Battersea Public Baths, Nine Elms, when such bath is converted into a concert-hall (Mr. W. M. Wilkins, for Battersea Borough Council).

Arrangements for the electric lighting of the Battersea Public Baths, Nine Elms (Mr. H. R. Forbes Mackay for the Battersea Borough Council).

Fire-resisting screen to the proscenium opening at the Britannia Theatre, Hoxton, and the ventilation of the stage, &c. (Mr. B. C. Brew for Messrs. W. S. & A. L. Crawford).

A re-arrangement of the artists' entrance and the provision of new external doors to the scenery entrance to the stage, and of a new pair of swing doors to the stalls entrance at the Empress Theatre of Varieties, Brixton (Messrs. Wilson & Long).

A small pass door at the Hackney Empire, between the upper circle saloon and the gallery staircase (Mr. F. Matcham for Mr. Oswald Stoll).

Alterations to the lavatory accommodation at the Murphy Memorial Hall, Gurney-street, New Kent-road (Mr. A. S. Taylor).

An alteration in the position of an iron door between the o.p. side of the stage and the stairs leading to the basement of the Oxford Music-hall (Messrs. Wilson & Long).

*District Surveyors' Districts*—*District of Paddington*.—The Building Act Committee reported as follows, the recommendation being agreed to:—

"Our report on the district surveyors' districts under the London Building Act, 1894, submitted to the Council on November 10, 1901,\* contained a recommendation with respect to the district of Paddington which we instructed our chairman to withdraw, as we considered it desirable to have some additional information on the subject. Upon further consideration, we have decided to make no alteration in the terms of the recommendation. We recommend—That Mr. F. R. Meeson, District Surveyor for East Hackney, North, be transferred and appointed to the vacant district of Paddington upon the conditions now in force regulating the appointments of new district surveyors; that the western limit of the district of Paddington, from Kensal-road to Kensington-gardens, be adjusted so as to coincide with the boundary of the Borough of Paddington at that part; that such transfer and appointment do take effect from January 1, 1902; and that advertisements be issued inviting applications for the appointment of District Surveyor for East Hackney, North."

*Tribunal of Appeal*—*Corbett v. London County Council*.—The same Committee reported as follows, the recommendation being agreed to:—

"The Council on July 16, 1901, refused to sanction the formation of a new street out of the west side of Torrion-road on the St. German's Estate, Hither Green, Lewisham. Mr. A. Cameron Corbett, M.P., on whose behalf the application had been submitted, appealed to the Tribunal of Appeal, and the appeal was allowed, subject to the reservation of a strip of land running from the south-west corner of the new road for a future extension to a proposed road on the estate. A form of agreement, to be entered into between the Council and Mr. Corbett in accordance with the order of the Tribunal is being prepared, and we ask authority to have the seal of the Council affixed to the agreement in the event of such sealing being necessary. We recommend—That the seal of the Council be affixed to

the agreement to be entered into between the Council and Mr. A. Cameron Corbett, M.P., in accordance with the order of the Tribunal of Appeal in the case of the formation of a new road out of the west side of Torrion-road on the St. German's Estate, Hither Green, Lewisham, in the event of such sealing necessary."

*St. Dunstan's, Stepney*.—The Historical Records and Buildings Committee reported as follows:—

"The Council is probably aware that on October 13, 1901, St. Dunstan's Church, Stepney, one of the most historic buildings in the East End, was partially destroyed by fire. The church, which has, however, been much altered, dates from the year 1486, and it is said (though the statement admits of some doubt) that the site was occupied by a church from early Saxon times. The Clerk of the Council has, by our instructions, prepared a report as to the extent of the damage, and we think the following particulars will be of interest to the Council. The principal damage done to the main body of the church consists in the destruction of the old vestry, the roof of the chancel, and the greater portion of the roof of the centre of the nave. The side aisles are very little injured, the south aisle being almost untouched. The interesting old monuments and wall-paints, including the monument to Sir Henry Colet, Mayor in 1495, and father of Dean Colet, the founder of St. Paul's School, and the well-known 'Fish and Ring' monument to Dame Rebecca Berry, have almost entirely escaped the effects of the fire, and the seats and the stone arches are undamaged. Even more important is the fact that the parish registers, which, with the fine seventeenth-century communion plate, were in an iron cupboard in the destroyed vestry, were saved. These parish registers date back to 1568, and are amongst the most interesting parochial records in London. Unfortunately, the organ, the front of which was one of the finest examples of Grinling Gibbons' carvings, was totally destroyed. A fine stained glass window and a modern vestry were also destroyed, but neither of these were of any particular historical interest. We understand that in restoring the church every effort will be made to preserve as much as possible of the old building, and to restore the destroyed portions in their original form; and we have asked to be informed of the plans of restoration when a definite decision has been arrived at with reference thereto."

*Housing*.—The Housing of the Working Classes Committee reported as follows:—

"Mulready-buildings and the second block of the dwellings known as Reynolds-buildings, Millbank Estate, are now ready for occupation. It will be remembered that the completion of Reynolds-buildings has been delayed by the making good of the damage done by fire to the upper portion of the buildings. Accommodation is provided in this block of Reynolds-buildings for 190 persons in 19 tenements of two rooms and 19 tenements of 3 rooms, and, in addition, an estate office and a 4-room tenement are provided for the use of the superintendent of the estate. Mulready-buildings provide accommodation for 230 persons in 20 tenements of 2 rooms and 25 tenements of 3 rooms."

The Council, having transacted other business, adjourned.

## THE TRIBUNAL OF APPEAL.

The Tribunal of Appeal under the London Building Act, 1894, sat at the Surveyors' Institution, Great George-street, S.W., on the 29th ult., to hear an appeal by Mr. A. G. H. Brown, under Section 13 of the Act, against the determination of the London County Council, dated October 24, refusing their consent to a deviation from the plans approved by the Council on April 30 for the erection of a block of residential flats on the site of 400 and 402, Coldharbour-lane, Brixton, so far as it related to an increase in the height of the proposed building as shown on the plans dated September 7 and 12, 1901, submitted with the application of Mr. F. A. Cowell.

The members of the Tribunal present were Messrs. J. W. Penfold (Chairman), A. H. Hudson, and E. Gruning.

Mr. McIntyre, barrister, represented the appellant, and Mr. Andrews, from the Solicitors' Department of the London County Council, appeared for the respondents.

Before the facts of the case were entered into, Mr. Andrews offered the preliminary objection that the appellant had not given the section and sub-section of the Act under which the appeal was brought. This, he contended, was necessary under the rules governing the procedure of the Tribunal, rules which had been approved by the Lord Chancellor.

After some argument, the Chairman said the Tribunal upheld the objection that the notice

of appeal was, in consequence of the omission, bad. Inasmuch as they had no authority to allow a departure from the rules, their jurisdiction was ousted. They allowed the respondents ten guineas costs.

## APPLICATIONS UNDER THE 1894 LONDON BUILDING ACT.

THE London County Council on Tuesday dealt with the following applications under the London Building Act, 1894. Unless otherwise stated, consent was given on conditions. The names of applicants are given between parentheses:—

### Lines of Frontage and Projections.

*Westminster*.—A hood over the entrance to No. 34, Queen Anne's-gate, Westminster (Mr. A. M. Poynter for Mr. C. S. Goldmann).—Consent.  
*Greenwich*.—That the application of Mr. J. Mills for an extension of the period within which the rebuilding of the Baptist Church, Shooter's Hill-road, Blackheath, was required to be commenced, be granted.—Agreed.

*Hackney, North*.—That the application of Mr. G. H. Paine on behalf of Mr. C. C. Paine, for an extension of the period within which the erection of eight houses, with bay windows, on the east side of Upper Clapton-road, Hackney, between Nos. 174 and Moresby-road, was required to be commenced, be granted.—Agreed.

*Hammersmith*.—The retention of a three-story addition at the rear of No. 138, Goldhawk-road, Shepherd's Bush, abutting upon St. Stephen's-avenue (Mr. A. W. Osborn).—Consent.

*Hampstead*.—Wood and tile pent roofs over the entrances to five houses in course of erection on the north-east side of Fordwych-road, Hampstead (Mr. J. P. Birch for Messrs. Bridge & Neal).—Consent.

*Lewisham*.—The retention of a dwelling-house on the northern side of Farley-road, Catford, eastward of Laleham-road (Mr. C. Farley).—Consent.

*Lewisham*.—Wood and slate pent roofs over the entrances to two houses on the north side of Tredown-road and two houses between Nos. 28 and 34, Burghill-road, Sydenham (Mr. G. Tolley for Mr. W. Cooper).—Consent.

*Lewisham*.—Wood and slate pent roofs over the entrance doorways of four houses on the south-east side of Brockley-road, Lewisham, northward of Stillness-road (Messrs. Thomas & Son).—Consent.

*Marylebone, East*.—A stone balcony over the arched hood of the entrance doorway to No. 101, Harley-street, St. Marylebone (Mr. W. H. White for Mr. A. F. Voelcker).—Consent.

*St. George, Hamover-square*.—A warehouse building on the site of Nos. 109 to 203, Buckingham Palace-road, Piccadilly (Mr. W. A. Large for Messrs. Humphreys, Limited).—Consent.

*St. Pancras, South*.—The retention of a wooden fascia and cornice fixed round the base of a projecting oriel window on the north-western angle of No. 28, Rathbone-place, Oxford-street (Mr. P. D. Jar for Mr. J. Brehm).—Consent.

*Strand*.—A stone canopy and balcony over the entrance to the Town Hall, Charing Cross-road (Mr. J. Murray for the Council of the City of Westminster).—Consent.

*Wandsworth*.—Two three-story houses, with shops on the ground floor, on the site of No. 279, Balham High-road (Mr. H. E. Roastier for Mr. H. W. Nightingale).—Consent.

*Battersea*.—A parcels office, milk depot, and covered cab yard at Clapham Junction Railway Station on the northern side of St. John's Hill, Battersea (Mr. S. Bircham for the London and South-Western Railway Co.).—Refused.

*Clapham*.—The retention of a brick wall and the erection of an addition at the rear of No. 89, New-road, Wandsworth-road, Battersea, abutting upon Mundella-road (Mr. H. Griffin for Mr. J. H. Burr).—Refused.

*Hackney, North*.—A block of residential flats with on-story shops in front, on the north-east side of Manor-road, Stoke Newington (Messrs. Gordon & Gunton for Mr. F. Matthews).—Refused.

*Kensington, South*.—A one-story addition at the rear of No. 67, Marloes-road, Kensington, to abut upon Scarsdale-villas (Messrs. J. Surrey & Son for Mrs. M. Surrey).—Refused.

*Norwood*.—A porch at the entrance to a bank building on the south-east side of Elmwood-street, Norwood-road, Norwood (Messrs. W. G. Bartlett & Son for the London and County Banking Co., Ltd.).—Refused.

### Width of Way.

*Chelsea*.—A brick boundary wall in front of stable buildings on the site of Nos. 27 and 30, Church-street, Chelsea (Mr. R. T. Kingham for the London General Omnibus Co., Ltd.).—Consent.

*Hampstead*.—Three four-story bay windows to a block of residential flats on the site of Nos. 6 and 7, The Mount, Hampstead (Mr. C. W. Matthews).—Consent.

*St. Pancras, East*.—A three-story dwelling-house at the rear of Nos. 18 and 20, Jettreya-street, Kentish Town-road (Mr. T. B. Westcott).—Consent.

*Greenwich*.—A one-story addition at the Thames Engineering Works, Greenwich, with the external

\* See our issue for November 23.—Ed.

walls of such addition at less than the prescribed distance from the centre of John Penn-street (Mr. G. S. Young for the Thames Ironworks, Ship-building, and Engineering Co., Ltd.).—Refused.

**Westminster.**—A mansard roof, to form an additional story to Nos. 32 and 34, Great Peter-street, Westminster, at the corner of St. Ann's-lane (Messrs. Wake & Co. for Messrs. Wilson & Pilcher, Ltd.).—Refused.

*Space at Rear.*

**Holborn.**—A modification of the provisions of Section 47 of the Act with regard to open spaces about buildings and extension above the diagonal line, so far as relates to the proposed erection of a hotel building on a site on the north side of Great Russell-street, at the corner of Bloomsbury-street, with an irregular open space at the rear (Mr. G. Waymouth for Messrs. Howard & Co.).—Consent.

*Lines of Frontage and Width of Way.*

**Hackney, Central.**—A one-story addition to a building in the garden of No. 97, Lansdowne-road, Hackney (Mr. A. Cook).—Refused.

**Strand.**—A building on the site of Nos. 19 and 20, Bateman-street, Soho (Mr. H. A. Woodington for Mr. B. Lynch).—Refused.

*Width of Way and Space at Rear.*

**Hammersmith.**—Deviation from the plans approved for the erection of two blocks of flats on the site of Nos. 54, 54A, 56, 58, and 60, Queen-street, Hammersmith, so far as relates to an alteration to the front enclosure of the third floor of such flats (Mr. J. Butters for Mr. C. W. Carpenter).—Consent.

*Projection and Construction.*

**Holborn.**—A gangway across Onslow-street, Holborn, to connect No. 87, Farringdon-road with a building on the west side of Onslow-street (Messrs. Lander, Bedells, & Crompton for Messrs. Falk, Stadelmann, & Co.).—Consent.

*Formation of Streets.*

**Hackney, North.**—That an order be issued to Messrs. Lamb, Son, & France, sanctioning the formation or laying out of a new street for carriage traffic to lead from Mount Pleasant-lane to Comberton-road, Hackney, and in connexion therewith the widening of Mount Pleasant-lane and Comberton-road (Mr. W. W. Hayworth). That the name Alcester-crescent be approved for the new street.—Agreed.

**Hampstead.**—That an order be issued to Messrs. Tuckett & Son sanctioning the formation or laying out of new streets for carriage traffic on the Powell-Cotton estate, on the north side of Westbere-road and north-west side of Minster-road, Hampstead (Mr. P. H. G. Powell-Cotton).—Agreed.

**Strand.**—That an order be issued to Mr. A. Young sanctioning the formation or laying out of a new street for carriage traffic to lead from Kemble-street to Drury-lane, Strand (for the Improvements Committee of the Council).—Agreed.

*Means of Escape from Top of High Buildings.*

**Strand.**—Means of escape in case of fire proposed to be provided, in pursuance of Section 93 of the Act, on the sixth floor of a building erected on the site of No. 19, Charing Cross-road and No. 28, Leicester-square, and known as Gloucester House (Mr. J. P. Crosby).—Consent.

**Kensington, South.**—Means of escape in case of fire proposed to be provided, in pursuance of Section 93 of the Act, on the eighth and ninth stories of a block of residential flats known as Block No. 1, Iverna-court, and situate on the west side of Wright's-lane and south side of Iverna-gardens, Kensington (Mr. R. Clarke for Messrs. J. Howard & Co.).—Refused.

*Cubical Extent.*

**Hackney, North.**—A factory building, on the west side of Tyssen-street, Dalston-lane, Hackney, with one division, to exceed in extent 250,000 but not 450,000 cubic feet, and to be used only for the purposes of a cabinet and joinery works (Mr. E. O. Sachs for the Shannon, Ltd.).—Refused.

*The recommendations marked \* are contrary to the views of the Local Authorities.*

BOOKS RECEIVED.

BOOK OF TABLES OF CUBIC CONTENTS OF DEALS, BATTENS, &c. By Thomas Valder. (Longmans, Green, & Co.)

FREEHAND DRAWING OF FOLIAGE, &c. By John Carroll. (Burns & Oates.)

ALL SAINTS' MISSION, PENTONVILLE.—Lady Jeune, on the 30th ult., laid the foundation-stone of the new Mission Church of All Saints, Pentonville, N. The dimensions of the church are 38 ft. by 45 ft., and seating accommodation will be provided for 250 persons. Below the church is a gymnasium, with the same floor space and 15 ft. high. The building has been designed by Mr. R. A. Briggs, and is being constructed by Messrs. Campbell, Smith, & Sons in red brick with Bath stone dressings. Its cost will be 4,500.

Correspondence.

To the Editor of THE BUILDER.

THE DIRECT EMPLOYMENT OF LABOUR.

SIR,—In his concluding paragraph your correspondent of last week, "One from the Bench," seizes an idea that has been a good deal discussed of late, and of which much more may be heard. His views on the execution of works without the intervention of a contractor are very natural from the workman's point of view and deserve attention.

By the force of circumstances the contractor is fast becoming less of a manufacturer of the different items of a building, and more of a purchaser and constructor. In like manner, the workman in the building trades becomes less of an artificer and more exclusively a fixer. In the five and twenty pages that, like husk and shell, enclose the kernel of your journal, in volumes of advertisements inches thick, by pestering travellers and pursuing catalogues, one is shown how to acquire ready-made the different items of a building so as to dispense more and more easily with the regular mechanic. There are good old trades the necessity for which has practically gone, not only as regards the operation of building, but even in the workshop, and the process does not stop. The contractor may, if he likes, have his yard and workshops, his dead stock and live stock, his machinery and the clerical staff of a large manufacturing establishment; and, as a rule, he probably will keep up this system more or less. But it is no more necessary than it is for a joiner to have the old-fashioned box of tools. And if this is unnecessary for the contractor, it is unnecessary for the private building-owner.

Thus the temptation to dispense with the contractor and to carry out the work by direct labour under a foreman or clerk of works, directed by the architect or engineer, increases, and the sources of economy seem many. There is the saving of the contractor's profit, of his heavy payments for interest, and of the sums which he must put down on account of the stringency of the conditions of contract. The owner with money in hand can buy as well as—indeed, I have been told, better—than the contractor who takes even the shortest credit; he can insure against every insurable risk, and he may not unreasonably hope to come out of the business better than he would do if it had been done by contract.

But people do not, as a rule, enter into contracts to save money, but to avoid risk, and the risks against which it is impossible to insure are many and heavy. If drawings, specifications, quantities, and contract are all right, as they should be, the owner knows at the outset what the building will cost him; but when he is his own builder he can be sure of nothing until he has got in the last bill, nor even then, for he will still have to make good all defects. A rich man or company or corporation may be advised to take the risks of such business, but the ordinary man, who has probably scraped together with difficulty the money first supposed to be sufficient for his building, and may count on borrowing enough to make up for the increase in the estimate which usually declares itself, cannot prudently be advised to go into building on his own account, even though he may go to specialists for nearly everything that he requires. There is still a great and uncertain item for labour, the risk of strikes, the risk of miscalculations, and of dishonesty even, though your correspondent seems to think that honesty and reliability can be ensured with a stroke of the pen.

Upon the whole, I think the contractor, whether big or little, will be with us for some time longer, and it would be well for all parties concerned with building to make the best of the system by fair dealing and reasonable demands.

THOS. BLASHILL.

BRICKLAYERS NOW AND THEN.

SIR.—At regular intervals, and in the entire absence of the all-absorbing sea-serpent story, the journalist of the day must dish up something that has a promise to "catch on for a while" at any rate. And, apparently, a shot at the British mechanic through the bricklayer, in this instance, gives the essentials of such a promise. It has served the purpose before, and very likely will again. These fables die hard. The sting of these fables lies in the

covert sneer, that is scarcely hidden below the surface, and which, in a few words, implies that a bricklayer now dare not lay as many bricks as he could if allowed, and that because his mates will not allow him.

With your permission, Sir, I shall try to give an impartial answer. I have been in the building trade thirty-seven years, as an apprentice, carpenter, shop foreman of joiners, general foreman, and clerk of works, and here is my answer in brief. Bricklayers do not lay so many bricks now as formerly, and that mainly because they do lay them well. On any decent job to-day the sectional bond as well as the face work has to be properly carried out, all the joints have to be properly flushed up; in short, a good proportion of conscience is introduced into the wall along with the bricks and mortar. I have no hesitation in saying that all this was extremely rare so late as fifteen and twenty years ago. Then very seldom was sectional bond thought of, and the work was not as a rule flushed up or grouted. Now this is the rule. Again, Sir, just look at the class of work that is demanded of bricklayers now, compared with what was demanded then. Architects now are not satisfied with the plain expressionless monotone surfaces, unrelieved by any projecting feature, horizontal or perpendicular, that did duty then. If an occasional look-out was kept for a rectangular bole for a door and another for a window—after that it was plain sailing for muscle, because brain had done its duty. Under those conditions a bricklayer could, and did, lay twice—yes, often three times—as many as he can lay now. And why? One instance may suffice. I am at present in charge of a job where no less than eight different kinds of bricks are used, with Bath stone dressings at frequent intervals. The surface of the walls is often broken by projecting bands and by recesses and piers, thus involving a great deal of plumb rule work. Under the above circumstances any tyro can see that a bricklayer now cannot lay as many bricks as he could then. Then, perhaps, he worked hard on the above class of work now he can only be busy. He has to use his brains more now, and his great want is—more brains still.

In answer to your P.S. to the letter of an old bench hand, I for one have never known of a case in which an organised attempt was made to restrict the output of work by a set of bricklayers against any individual or set of individual bricklayers. So far as my observations go, I have never suspected an attempt at coercion in the above direction. Bricklayers are human. There are worthless fellows among them, but the latter do not rule the mass; they only sneak their way about until they are found out.

MONDAMIN.

"THE CA' CANNY (GO-EASY) QUESTION."

SIR,—I have read nearly all the letters and articles that have appeared in the daily Press and in the Builder about the alleged slowness or laziness of bricklayers, and it surprises me to find that certain persons are beginning to discover a few facts that other men have known all their lives.

My experience has been acquired during nearly thirty years' occupation as foreman and as clerk of the works in eighteen different counties of England and Wales, and the result of notes made and observations recorded is that brickwork costs for labour almost precisely the same number of hours in all localities. During the past six or seven years I have had charge of some rather large jobs that have swallowed up from three to four millions of bricks per annum, taking one year with another, and these jobs were located so as to form roughly an equilateral triangle with sides about ninety miles long. The builders and the architects were in each case different, and the men and the foremen were in each case also different. The work, however, was somewhat similar. The walls were thick, and straight and long; the bulk were 14 in., faced outside with red bricks, and there were a rather large number of glazed bricks used internally as facings. The proportions were, roughly stated, as follows—37 1/2 per cent stocks, 30 per cent red facings, 12 1/2 per cent glazed facings, and none of the work was pointed as it was built, but all joints were well raked out and swept off clean.

The outcome of my observations and notes was that, taking each of the before-mentioned jobs and dividing the number of bricks of all kinds used by the merchants' invoices by the number of trowels, I have an average of 400 bricks per day per bricklayer. There was not 5 per cent difference between either of the jobs in the quantity of bricks laid per day.

In my opinion, based on many years' close observation and many confidential chats with bricklayers of all sorts, the right way to estimate the cost of the labour to a rod of reduced brickwork is to allow one bricklayer at local rate of wages as the net prime cost of brickwork in public buildings such as hospitals and asylums. That rate of price would include internal and external work, facings of ordinary and glazed bricks, but not the pointing. Of course, if the estimator puts down a fancy price for laying facing bricks, then my calculation of eleven full days for a bricklayer must be reduced.

As regards the evil influence of the trade-unions, I must candidly say I think that is all "moonshine." I have talked to lots of bricklayers, both society and non-society, and I have never heard a word to lead me to suppose anything of the kind exists.

In conclusion, I would like to say that to bring out an average of 400 bricks laid per day right through a big job, the heavy footings must be laid with great rapidity and each man must then account for over a thousand per day. In bricklaying, as in many other things, circumstances alter cases.

PROVINCIAL.

### The Student's Column.

#### GAS AND GAS-FITTINGS.

##### 22.—THE PROPERTIES AND GENERATION OF ACETYLENE.

**THE PROPERTIES OF ACETYLENE.**  
—Pure acetylene is a colourless gas possessing a sweet ethereal odour. Commercial acetylene possesses a stronger and more offensive odour owing to the presence of gaseous impurities. The chemical formula for acetylene is  $C_2H_2$ , which indicates that it consists of 92.3 per cent. by weight of carbon combined with 7.7 per cent. of hydrogen. It is soluble in water to a considerable extent, eleven volumes of gas being dissolved by ten volumes of water at ordinary atmospheric temperature and pressure. The gas is much less soluble in water which has been saturated with common salt, but strongly saline solutions are found to exert a corroding influence on the metal vessels commonly used for the generation or storage of acetylene. Acetylene is much heavier than coal gas, but somewhat lighter than air. The approximate specific gravities of acetylene and other gases extensively used for lighting or heating purposes are shown in the following table:—

Hydrogen.....	0.07
Coal gas.....	0.42
Plain water gas.....	0.54
Natural gas, U.S.A.....	0.56
Carburetted water gas (26 c.p.).....	0.62
Mond gas (Power gas).....	0.79
Acetylene.....	0.91
Air.....	1.00

Acetylene gas can be converted into a colourless, transparent liquid under normal atmospheric pressure by cooling it to  $-82$  deg. C., or into a solid white crystalline mass by cooling it to  $-85$  deg. C. The gas may be liquefied at a higher temperature if also subjected to high pressure. Acetylene is feebly poisonous, but it is less poisonous than ordinary coal gas.

**Acetylene an Endothermic Compound.**—Some compounds absorb heat during their formation, and evolve that heat when they subsequently undergo decomposition. Such compounds are termed endothermic, and acetylene belongs to this class. Other compounds evolve heat when they are formed and absorb heat when they are decomposed, and are termed exothermic. The endothermic character of acetylene is a factor which must be taken into consideration when considering its explosive value for engine driving, or its flame temperature, since to the heat of combustion of its component hydrogen and carbon is added the heat absorbed during its formation.

**Detonation of Acetylene.**—Acetylene without admixture with air can be decomposed with explosive violence by firing in it a detonator such as mercuric fulminate, but unless the acetylene is under higher pressure than ordinary atmospheric pressure the explosion is extremely local, and is comparatively harmless, as the greater portion of the acetylene remains unaffected by the detonation. The products of the decomposition by detonation are amorphous carbon and gaseous hydrogen. This amorphous carbon or "acetylene black" is now manufactured on a large scale by compressing the acetylene under a pressure of two atmospheres and exploding it by means of an electric wire or spark, air being carefully excluded. The carbon thus produced is said to form a remarkably high-grade pigment.

**Explosibility of Acetylene Mixed with Air.**—Any mixture of acetylene and air containing from 3 to 82 per cent. of acetylene will explode when ignited. The most violent explosion is produced when the proportion of acetylene amounts to from 8 to 10 per cent. by volume of the mixture. In the presence of air acetylene can be ignited at a temperature of 896 deg.

Fahr., which is considerably lower than the igniting point of coal-gas.

**Illuminating Power of Acetylene.**—Under the most favourable conditions acetylene will give a flame of 48 c.p. when burning at the rate of 1 cubic foot per hour, but this result is seldom or never attained in practice. A good commercial burner consuming commercial acetylene at a rate of 1 cubic foot per hour will give a light of about 32 c.p. The relative illuminating values of acetylene and coal-gas per cubic foot of gas consumed per hour under good working conditions may be stated as follows:—

Acetylene.....	Per cubic foot of gas per hour. 32 candles.
Coal-gas, flat flames.....	2½ "
" incandescent mantle.....	20 "

Acetylene is so rich in carbon that no burner has yet been devised which will consume it at a rate of 5 cubic feet per hour without producing either a smoking flame or a flame of comparatively feeble luminosity. In practice it is found necessary to employ burners incapable of passing more than 1 cubic foot of gas under ordinary pressures, and a large number of burners which consume only ½ or ¾ of a cubic foot per hour are in use.

The relative sizes of a coal-gas flame and an acetylene flame of equal illuminating power are shown in fig. 55.

(a)

(b)

Fig. 55.—a=16-Candle Coal-Gas Flame, consuming 6½ c. ft. of gas per hour.  
b=16-Candle Acetylene Flame, consuming ½ c. ft. of gas per hour.

The photograph shows a 16-candle coal-gas flame (a) obtained from a No. 6 flat-flame burner when consuming 6½ cubic ft. of gas per hour under a pressure of 1 in., while the acetylene flame (b), which is photographed on exactly the same scale, was obtained from a Naphey burner passing ½ cubic ft. of acetylene per hour under a pressure of 3 in. The best results with these burners were obtained with coal-gas under a pressure of 1 in., and with acetylene under a pressure of 3 in., the difference in pressure being necessitated by the difference in the specific gravities and carbon contents of the two varieties of gas.

**Heating Power of Acetylene.**—The heating value of acetylene is much greater than that of any other gas commonly used for domestic or industrial purposes. The following table shows the relative heating values per cubic foot of each of the principal commercial varieties of gas:—

Acetylene.....	Calories. 379
Natural Gas, U.S.A.....	225
Coal-gas.....	156
Hydrogen.....	82
Water-gas (plain).....	76
Mond gas (power gas).....	39

Acetylene is therefore far superior, volume for volume, to coal-gas for engine driving or heating purposes, but its cost is in most cases prohibitive.

When used for illumination, however, acetylene does not evolve more heat than coal-gas consumed in flat flame burners because a much smaller volume of gas is required to produce a light of given intensity. From the following table given by Lewes it will be seen that the heat emitted by the acetylene flame closely approximates to that emitted by an incandescent coal-gas light of the same intensity, but is much less than that emitted by luminous coal-gas flames.

##### Ratio of Heat Emitted to Yield a Light of 64 Candles.

Incandescent coal-gas light.....	100
Acetylene.....	115
London Argands.....	571
Flat flame burners.....	914

**Combustion Products.**—When pure acetylene is consumed in suitable burners the only products of combustion are carbon dioxide and water vapour, the same compounds as those which form the main proportion of the combustion products of coal-gas. Professor Lewes has calculated the extent to which the atmosphere of a room is prejudicially affected by acetylene coal-gas, and oil lamps respectively, and has drawn up the results in the following table:—

##### Comparative Hygienic Effect of Illuminants per Unit of Light.

	Carbonic Acid Evolved.	Moisture Evolved.	Oxygen Removed from Air.	Heat Produced.
Acetylene.....	100	100	100	100
Coal-gas, flat flame.....	480	1,470	530	795
Coal-gas, mantle.....	45	230	62	37
Petroleum, large lamp.....	595	760	498	245

**Actinic Value of Acetylene Flames.**—The light emitted by acetylene flames more nearly approaches that of sunlight in the relative proportions of rays of different wave length than any other light produced by artificial means, and is even richer than sunlight in those blue and violet rays of the spectrum which are most active in effecting chemical change in those bodies which are sensitive to light. Acetylene is therefore exceedingly useful for photographic work, and Walmsley finds its relative value as compared with other forms of light for acting upon sensitive photographic plates to be as follows:—

Direct sunlight.....	Seconds. 1
Acetylene, 1 c. ft. burner.....	3
Diffused daylight, reflected from mirror.....	12
Incandescent mantle.....	24
Coal gas.....	24
Oil gas.....	240
Oil lamp.....	240

**The Generation of Acetylene.**—Several methods of producing acetylene are known, but the only process of commercial importance is that which consists in effecting contact between calcium carbide and water. The following chemical equation represents the reaction which takes place:—

and signifies that sixty-four parts by weight of calcium carbide will react with thirty-six parts of water to form twenty-six parts of acetylene and seventy-four parts of slaked lime. Theoretically, therefore, 1 lb. of carbide requires rather less than half a pint of water for complete decomposition, but in practice at least one pint of water should be allowed for every lb. of carbide, as a considerable quantity of water is vapourised as steam and carried forward with the gas.

**Cool Generation Necessary.**—The chemical reaction which occurs when calcium carbide comes in contact with water is accompanied by the evolution of heat, and it is a matter of great importance that the heat should not be allowed to accumulate in the decomposing carbide, but should be conducted from its neighbourhood as speedily as possible. When a small fragment of carbide is dropped into a vessel filled with water, the carbide rapidly decomposes, but the heat evolved is so quickly distributed through the large bulk of water that the temperature of the water is not perceptibly increased. If, however, water is allowed to fall in a fine continuous spray over a

large mass of carbide, the decomposing carbide becomes strongly heated, polymerisation of the acetylene occurs, and benzene and tarry compounds are produced.

The slaked lime which is obtained as a residue when all the carbide has been decomposed should be white or grey. If it is of a yellow colour, or contains soot or tarry matter, it is evident that the carbide has been decomposed under unfavourable conditions.

In some generators carbide can always be decomposed without materially increasing the temperature of the decomposing mass, while in others both the carbide and the generator become strongly heated. Sometimes a water-jacket is placed around the generator to keep the generator cool, but this may in many cases be regarded as an attempt to remedy an unnecessary defect in the method adopted for decomposing the carbide.

Cool generation is the object desired, and if this be attained it is not a matter of great importance whether the acetylene be generated (1) by dropping carbide into water, (2) by allowing water to rise to carbide, or (3) allowing water to fall upon carbide. When carbide is dropped into a large volume of water under suitable conditions, cool generation is effected provided that the live carbide is not allowed to become buried in a bed of lime sludge at the bottom of the generator, but a considerable quantity of gas is lost owing to the solubility of acetylene in water. When either the second or third method of decomposition is adopted, it is necessary to be able to control the rate of decomposition to ensure that overheating shall not occur. As a general rule, generators in which water "drips" or is sprayed over carbide should be avoided because it is in such generators that overheating most commonly occurs.

Careful and intelligent operators can decompose carbide by any of the three processes with satisfactory results, but ignorant or careless operators may obtain very unsatisfactory results with the same methods of decomposition and the same apparatus.

**The Cost of Acetylene.**—The cost of acetylene as compared with coal-gas depends upon local conditions, but for domestic lighting the writer would not recommend the substitution of an acetylene installation for coal gas supplied from a local gasworks when coal-gas can be obtained for 5s. per 1,000 cubic feet or less although well aware that acetylene is commonly regarded as equivalent to coal-gas at about 3s. to 3s. 6d. per 1,000 cubic feet. In the illuminant the field for acetylene as an illuminant is limited under existing prices to the lighting of country houses, churches, or villages in districts not provided with a satisfactory public gas supply, and to portable appliances for various purposes.

GENERAL BUILDING NEWS.

**METHODIST CHURCH, YORK.**—The stone-laying ceremony of a Primitive Methodist Church in Monk-gate, York, took place recently. The church will occupy a site adjoining the York Home for Nurses, Monkgate. There will be seatings for 400 on the ground floor and 375 in the gallery, making a total of 775. The church will be entered by two doorways opening into a vestibule, and the gallery will be approached by two flights of stairs in the angle towers, one of which terminates in a spire rising to a height of 75 ft. from the ground. The gallery will have circular ends. The Sunday-school premises will be in the rear, and on the ground floor will contain a lecture-room and infants' room, each accommodating 100 persons. The assembly-hall is on the first floor and will accommodate 400 scholars. There will be ten classrooms of different sizes and also ministers' and choir's vestries. Ample kitchen and lavatory provision is arranged. The front will be faced with Ruabon bricks, the dressings being of Morley stone. The total cost, exclusive of the land, will be about 6,000l. Mr. George Mansfield, of York, is the builder, and Mr. F. W. Dixon, of Manchester, is architect.

**RESTORATION OF EDLINGHAM CHURCH, NORTH-UMBERLAND.**—The restoration of this interesting Early Norman architecture having been completed, the opening service was held recently. The alterations and additions include a new roof, an improved system of drainage, a new pulpit, a new lectern, new doors, and new windows, although it should be mentioned that on account of the great historic interest attached to the building, and because every stone is beautifully age-stained as well, it was decided to allow each window opening to remain unaltered, so as to preserve as far as possible the historic memories associated with the church. The floor which was raised 120 years ago above the bases of the fine Norman pillars has been lowered to its

original level. The nave has been roofed and ceiled with pine, as enough was not forthcoming, unfortunately, to admit of oak being repeated. The new seating accommodation, however, is of oak. The cost of the restoration is estimated at over 1,000l. Mr. A. B. Plummer, diocesan surveyor, Newcastle, was the architect for the nave and tower; Messrs. Graddon & Son, Durham, the contractors; Mr. Caröe, London, the architect for the chancel, representing the Ecclesiastical Commissioners, who are responsible for that part of the scheme, and who have executed that portion at their own expense. Mr. Percy Appleby, Newcastle, was responsible for much of the carving in connexion with the scheme. —*Alnwick Gazette.*

**WESLEYAN CHURCH, WEST BRIDGFORD, NOTTINGHAM.**—A new Wesleyan church was opened at West Bridgford on the 21st ult. The building is situated at the junction of Lady Bay-road with Trent Boulevard. The building which is intended for a Sunday school until the church proper can be erected, is 58 ft. in length by 31 ft. in width, and has seating accommodation for 300 persons. At the rear is a large room measuring 30 ft. by 17 ft., and two smaller rooms, 17 ft. by 17 ft. and 17 ft. by 22 ft. respectively, to serve as vestries and classrooms. On the south side are the heating-chamber, kitchen, &c. The front of the church, facing the Boulevard, is faced with Coxenhatch stone; the walls are of red brick. The porch is 19 ft. high by 8 ft. The interior fittings are of Columbian pine, stained and varnished. The heating has been carried out on the low-pressure hot-water system, and the lighting is by gasoliers. The contract for building the church, which was placed in the hands of Mr. T. E. Ebdow, has amounted to over 2,000l. Mr. A. E. Lambert was the architect.

**CHURCH, PENLEY, ELLESMERE.**—The Bishop of Lichfield recently dedicated the new Church of St. Mary Magdalene at Penley. The new church has been designed by Mr. Hodgson Fowler, of Durham, at a cost of 2,500l. It consists of nave and chancel of local red stone, with a roof of red Ruabon tiles; the chancel fittings are of oak.

**MEMORIAL CHAPEL, LEICESTER.**—The new Robert Hall Memorial Chapel, Narborough-road, Leicester, has just been opened. The building stands at the junction of the Narborough and Upper roads. The corner of the two roads is emphasised by a tower which rises from the ground some 70 ft., and is surmounted by a lead-covered octagonal spire. The main entrances to the chapel and school are in the Narborough-road (north-east end of the building); the vestry, deacons' and minister's entrance being in the Upper-road. In plan the building is almost a parallelogram, with shallow transepts on either side. The rostrum are placed at the north-west end, with the baptistry underneath the upper one, which is sunk below the chapel floor. It is entered from either side of the chapel, and exit is given into the adjoining corridor, which gives access to the various vestries. The floor of the chapel is formed of pitch-pine wood blocks, and has a slope towards the rostrum. The seating is in pitch-pine, and will accommodate 850 persons. The floor of the lower rostrum is about 2 ft. 3 in. above the chapel floor, and is surrounded with a mahogany hand-rail, supported on wrought-iron brackets. The upper rostrum, which overhangs the baptistry, is approached from the lower one, and is executed in pitch-pine, with selected pitch-pine panels. At the rear of the rostrum an elliptical chancel arch rises and separates the choir stalls from the chapel. All the electric light fittings are of brass. The roof is one span of 48 ft., and is executed in Oregon pine. The chapel and the whole of the building are heated on the hot-water low-pressure system. The windows and a large number of the upper panels of the doors are filled with stained glass; and all the corridors and lobby floors are finished with Venetian marble mosaic. A ladies' vestry is provided at the north-west end; also ministers' and deacons' vestries. The school, which adjoins, contains a lecture hall. At each end of the hall galleries are constructed to be used for several classes. The roof is an open timber one in Oregon pine. A large infants' classroom is placed near the school entrance (south-east end). The men's classroom, which is approached by a separate entrance, is placed at the rear on the first floor, and has an area of 500 sq. ft. The building is carried out in the Early Tudor style. The iron casements were supplied by Messrs. Hope & Sons, Birmingham; the electric light fittings by the Birmingham Guild of Handicraft; the heating work was carried out by Messrs. Ashwell & Nesbit, Leicester; the stained glass by Mr. Walter J. Pearce, Manchester; the mosaic work by Messrs. Diaspeter & Co., London; and the folding partitions by Messrs. Pease & Norquoy, Manchester. Mr. Walter Brand, of Leicester, is the architect, and Messrs. J. E. Johnson & Sons the builders.

**NEW PHYSICAL LABORATORY, ROYAL BELFAST ACADEMICAL INSTITUTION.**—A new physical laboratory has just been completed at the Royal Belfast Academical Institution. Among the principal changes is the conversion of the house which was, until June last, occupied by Dr. Sheldon into new classrooms. The new physical laboratory, which formerly was the ground floor of Dr. Sheldon's house, has been fitted up with all the most modern requirements and fittings. The floor is laid with oak wood blocks on a solid concrete foundation, the

whole of which is insulated from the walls, as is also the special stone table. Adjoining the laboratory is the lecture-hall. A raised platform has been constructed in this room, so that every pupil has an unobstructed view of the demonstration-table. The contractors were Messrs. M'Laughlin & Harvey, and the architects Messrs. Blackwood & Jury.

**ENLARGEMENT OF KENDRY HOSPITAL, BARNSELEY.**—Ald. Wilkinson, J.P., Chairman of the Sanitary Committee of Barnsley Town Council, laid the foundation-stone on the 28th ult. of an extension of the Kendry Hospital for infectious diseases. The enlargement will be erected at a cost of 7,541l., from designs of Mr. J. H. Taylor, Borough Surveyor, and will contain twenty-eight beds, making the total accommodation of the hospital seventy beds.

**MEMORIAL CROSS, CORNWOOD, DEVON.**—A granite cross has been erected at Cornwood in memory of the late Lord Blackford. It is octagonal in plan, the base being formed of three steps, and the shaft tapering towards the cross. The total height is about 15 ft. Around the top step is an inscription in which Lord Blackford's services to his country for twenty-five years in the Colonial Office are referred to. The cross has been erected from the design of Messrs. Hine & Odgers, architects, Plymouth.

**NEW PARISH HALL, PLYMOUTH.**—The new parish hall of St. Simon's, Plymouth, has been opened by the Bishop of Exeter. Affording accommodation for about 500, it has a single-span roof with barrel ceiling, having moulded ribs, the monotonous Portland stucco of the neighbourhood being abandoned for brick and Bath stone, while the tints of the interior are governed by the green-stained woodwork. Mr. Ambrose Andrews, of Harbottle Road, of Exeter.

**WORKHOUSE INFIRMARY, SUNDERLAND.**—This building has been erected on ground adjacent to the local workhouse. It will, when finished, have cost about 40,000l., the architects being Messrs. W. and T. R. Milburn. The new infirmary, which is designed to accommodate 200 patients, really consists of four departments—an administrative block, a pavilion for male inmates, a pavilion for females, and a maternity hospital. Externally the buildings are of brick, faced with Sherburn House bricks. The lighting is by electricity, derived from the Corporation power stations; and the heating is accomplished by means of the American Radiator Company's system. The buildings are fireproof; and fire-escape staircases have been constructed on the outside of all the premises. The contractors who have carried out the work are Messrs. D. & J. Ranken, of Sunderland. Mr. A. J. Wilkins has acted as clerk of the works.

**EMPIRE THEATRE, HACKNEY.**—A new theatre of varieties has been erected at Hackney, in Mare-street. The new theatre is fitted with the electric light, has a sliding roof 7 1/2 ft. above the floor, and is decorated in gold, buff, and white. The architect of the building is Mr. F. Matcham; the builders are Messrs. F. and H. F. Higgins; and the work of construction has been carried out under the superintendance of Mr. J. F. Revell.

**BARRACKS, SALISBURY PLAIN.**—Mr. H. Lovatt, of Wolverhampton and London, has obtained the contract for building the barracks decided some time ago to be placed on Salisbury Plain. The contract amounts to over 1,000,000l., and the buildings are to contain quarters for eight battalions of infantry. A village is to be built by the contractor to accommodate the large number of men required for the works, and a railway has been constructed by the War Department from Ludgershall to Tidworth, which will be permanent.

FOREIGN.

**UNITED STATES.**—The conditions regulating the competition for the soldiers' monument in Philadelphia seem to be satisfactory to American architects, except that the premiums are considered inadequate, only 3,000 dols. having been appropriated to pay five prizes in a competition for a structure to cost nearly 500,000 dols. The award is to be entrusted to a jury of architects and sculptors selected by the Insitute.—The Commission appointed by Congress to prepare a plan for the improvement of the city of Washington has arranged for the preparation of two models, one showing the city in its present condition, and the other representing the scheme which the Commission advises, both of which are to be placed in the Corcoran Art Gallery for public inspection and criticism.

—The death is announced of Mr. Adolph Robert Kraus, a well-known sculptor, of Boston. He was in receipt of a pension from the German Government for conspicuous merit as an artist. One of his principal works in America is the Massacre Monument on Boston Common.—A valuable deposit of marble has been discovered near Fort Bowie, Arizona. Its main ledge is about 1,000 ft. in width, and is about three miles in length. The stone is of various colours, but the striking features of the discovery are a vein of pure white marble about 75 ft. in width, and a long ledge of intensely black stone. Much of the white marble is stated to be as good in quality as the Italian, and superior to that so extensively raised in Vermont.

## MISCELLANEOUS.

**PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.**  
—Mr. W. B. G. Bennett, who has been for twenty-six years Borough Engineer of Southampton, is resigning his appointment in order to take up private practice, in partnership with his son, at Midland Bank Chambers, Southampton. — Mr. S. Inskip Ladd, architect, of 7, Doughty-street, Mecklenburgh-square, has opened a branch office in Market-place, Huntingdon.

**OPEN SPACES AND OLD HOUSES.**—The Corporation of Burnley have agreed to purchase, for 17,500*l.*, the Towneley Hall estate from Lady O'Hagan, widow of the first Lord O'Hagan, Lord Chancellor of Ireland. Lady O'Hagan inherited the property from her father, Colonel Towneley, in whose family it has continued by direct descent from a very remote period. Charles Towneley formed the collections of marbles, terra-cottas, bronzes, gems, &c., bought for the nation in 1808-10.—Mr. H. H. Raphael, who bought the Gidea Hall estate, Romford, four years ago, has offered to the Urban Council 14 acres of land, together with a lake extending over 6 acres, out of the park, for dedication to the public. The estate, which covers a total area of 500 acres, is one of those in Essex with which the Liberator Building Society was at one time connected, and was withdrawn from sale at auction on July 7, 1897, after a bid of 36,000*l.* The hall, standing near the road to Brentwood, was built in or about 1720 by Sir John Eyles, Bart., on the site of the manor-house which Sir Thomas Cooke, under a licence from the Crown to build a fortified residence, began in 1467, and his grandson, Sir Anthony Cooke, completed. Thomas was elected Lord Mayor in 1562. Anthony was tutor to Edward VI., and father of the learned daughters whose classical attainments Dr. Walter Haddon eulogised in an address to Cambridge University. A view of the house was inserted in Le Serre's account of Marie de Medici's progress from Harwich to London; she stayed there a day and a night, Charles I. escorting her from Chelmsford. The bridge of three elliptical arches at Gidea Hall is ascribed to James Wyatt. Efforts are being made to secure 22 acres at Southfields, Fulham, to be vested in the Borough of Fulham; 15 acres of land at Deptford for 50,000*l.*; and 16 acres at Southfields, Wandsworth, for 24,000*l.*, and negotiations are in progress for the opening of the churchyards of St. Giles', Camberwell; All Saints' and St. Matthias, Poplar; and of Granville-square, Clerkenwell.—A Bill will be introduced next Session for vesting (1) Petersham Common, Petersham Meadows, and contiguous lands in the Richmond Corporation; (2) Ham Common in the Urban District Council of Ham; and (3) lands on the riverside between Nightingale-lane and Richmond Ferry and Half-mile Tree Point, near Kingston, in the Surrey County Council and other local Public Authorities, so as to secure the preservation of the view from Richmond Hill and the prevention of building on those areas. The measure provides for a free conveyance of the ground by Lord Dysart and the trustees of the will of his predecessor in title, and for the extinction of lammias and other rights of common over part of Ham Fields, with compensation to Lord Dysart and the trustees in respect of similar rights, and the sale or exchange of other portions of the Ham Lammas Lands. The Bill complements the project for purchasing the Marble Hill estate, 663 acres, on the opposite side of the river, for 72,000*l.*, to be contributed by the Middlesex (12,000*l.*), London (30,000*l.*), and Surrey (10,000*l.*) County Councils, the Corporations of London (5,000*l.*) and Richmond (5,000*l.*), and the Councils of Twickenham (3,000*l.*) and Hammer-smith (1,000*l.*). Marble Hill has frontages of 2,100 ft. to the river, and 1,750 ft. to the Orleans and Richmond roads. It is said that Lords Burlington and Pembroke designed the house for Henrietta Howard, elevated Countess of Suffolk by George II., who gave 12,000*l.* towards the cost of it; it was since tenanted by another Royal favourite, Mrs. Fitzherbert. Cobbett's "Memorials of Twickenham" relates that Pope planned the gardens, and Dean Swift stocked the cellar. The house forms an interesting specimen of the stately "villa" of its day. Prominence was given to the first floor, the ground and second floors having a comparatively low altitude. Mahogany wood was extensively used in the interior, the staircase and some of the room floors also being made of it. The property was offered for sale at the Mart in August, 1888, and withdrawn after a bidding of 52,000*l.*

**SHALLOW UNDERGROUND TRAMWAYS.**—The London County Council have issued a Report on shallow underground tramways, which contains a joint Report by the Tramways Manager and the Electrical Engineer of the Council on the construction and working of the Boston, U.S.A. subway, and on the rapid transit subway now under construction in New York, and an addendum by Mr. J. Allen Baker, Vice-Chairman of the Highways Committee. The Report is illustrated with maps and reproductions of photographs of existing shallow underground tramways similar to that which it is proposed to construct from Southampton-row to the Thames Embankment.

**REFUSE DESTROYERS, BRADFORD.**—An inquiry has just been held at the Bradford Town Hall by Lieutenant-Colonel A. C. Smith, R.E., one of the

inspectors of the Local Government Board, into the application of the Bradford Corporation to borrow a sum of 93,000*l.*, to provide for the erection of refuse destructors at Greengates, Fairweather Green, Low Moor, Tong, and Southfield-lane, and for additions and new works at the present Sunbridge-road and Hammerton-street destructors, respectively. The Town Clerk (Mr. C. Stevens) conducted the case for the corporation, and was accompanied by the City Surveyor (Mr. J. H. Cox), the City Architect (Mr. Edwards), the Medical Officer of Health (Dr. W. A. Evans), and the Cleansing Superintendent (Mr. J. McTaggart), and others. The only opposition offered was with respect to the Low Moor and Fairweather Green schemes.

**THE CHURCH CRAFTS LEAGUE.**—The second annual meeting of the League was held on Thursday, November 28, at London House, 52, St. James's-square, the Bishop of Rochester in the chair. The adoption of the annual report was moved by the Bishop of Rochester, who referred at length to the encouraging manner in which the League had gone forward during the past year. The membership had been doubled, both amongst the artists and the ordinary members, and the work done through the League had increased proportionately. The application received for advice during the year had numbered ninety-one, and in every case this had been given free of all cost to the inquirer. Work had already been placed in twenty-six churches, while a large number of schemes were in progress, and would come into next year's statistics. Meetings of the League had been held at Oxford (through the kindness of Dr. Biggs) and at Mr. Stirling Lee's studio at Chelsea, and the results of these gatherings had been so satisfactory that it had been decided to arrange another series during the coming winter. The Committee had also taken in hand the compilation of a book of simple designs for churchyard monuments, with suggestions for the use of clergy as to the protection of churchyards from disfigurement, and it was hoped that this might help considerably towards a much-needed reform. Mr. T. Stirling Lee seconded the adoption of the report, and referred to the wide area over which the work done by the artist members had been spread, extending as it did to the Colonies. Mr. Dyer Edwards proposed, and Mr. Henry Holiday seconded, that the Bishop of Rochester be re-elected President, and this was agreed to unanimously. The election of three ordinary and three artist members of the Committee to fill the places of those retiring under the Rules of the League was then proceeded with, and resulted in the Canon Rhodes Bristol, Dr. F. D. Drewitt, Mr. J. T. Micklethwait, and Mr. R. Anning Bell, Mr. T. Stirling Lee, Mr. C. O. Skilbeck being elected, while Mr. T. Dyer Edwards was elected treasurer for the ensuing year. An election of artist members followed, the successful candidates being Mr. Robert Marchant (architect), Mr. Robert Hilton (metal-worker), Mr. Jasper Brett (glassworker), Mr. Hilyard Swinsted (painter), and Mr. John D. Seddon (architect). At the conclusion of the business, discussion took place on the future work of the League, in which Canon Armitage Robinson, Mr. J. E. Dowson, Rev. Percy Dearmer, and others took part.

**INSTITUTE OF BRITISH DECORATORS.**—In connexion with the Northern Branch of the Institute of British Decorators a lecture was given at Sheffield, on the 28th ult., by Mr. G. C. Haité, on the subject "Decoration and Decorators, a survey of the past and present." Mr. Haité, referring with 40 domestic aspects of decoration, alluded to it as the art which surrounds us during the most impressionable period of our lives—the days and hours of childhood—and which beautifies the surroundings of the greater part of our lives. Its influence for good or bad was much stronger than was generally imagined, and, in his opinion, every nursery should be decorated in such a manner as would tend to educate and elevate the infant mind. Until quite recently, decoration had been a luxury only obtainable by the rich. Since the introduction of wall-paper, however, it had become accessible to the people, and he thought that there was no longer an excuse for anyone who desired to have an artistically decorated home failing to get it. Decoration was at its lowest ebb, perhaps, at the beginning of the last century, but after the great Exhibition of 1851 a change became manifest. Decoration was no longer, however, what it ought to be. Some exponents of what is called fine art assert that there are as laws no general principles to govern art expressions, but this was wrong. The great principle which applies to all art expression, as it does to life itself, was "fitness." Let the expression of art be of our own time and our own faith, accepting, and content only with the best to be had, and rendering it capable of bearing the tests of logical reasoning. Exceptional opportunities for the decoration of public buildings and palaces were few. In a humble way, however, in domestic decoration, problems occurred that called for all the judgment, experience, and originality likely to be at the decorator's command. Substitutes for hand work were now supplied most plentifully, and in the right choice and use of these materials the decorator of to-day had great scope for the display of individuality and skill. It was no longer weighing against the use of these materials, for they were an evidence of the times, and many of them of great excellence. In fact, the manu-

facturer had outstripped the decorator. He had supplied media, artistic in form and colour, at a price possible for all; and it was for the decorator to apply these with skill, taste, and judgment. Some people contended that decoration was decadent, but if such were the case it was because of the commercialism imported into its practice by the huge combinations of decoration with other trades. In conclusion, he urged that decorative art was a necessity in the progress of civilisation, and should therefore be educational; that manufactured goods were not essentially antagonistic to the art of the decorator; that it was desirable that the art of the decorator should be kept apart from other trades instead of being undertaken by linendrapers and furnishing firms. He submitted as a scheme to them that the decorators of the country should appoint a council through this Institute, to organise an exhibition of decorated rooms in London, to be kept open for three months, and that afterwards it might be sent to the larger provincial centres. He thought such an exhibition would go far to abolish what he designated as the "Tottenham Court-road" school.

**ELECTRICAL RAILWAYS, LONDON AND THE SUBURBS.**—Amongst the numerous projects for which powers will be sought in the course of the ensuing Session of Parliament we may cite the following schemes for electrical railways:—From Cannon-street Terminus to Southwark Bridge-road, Kennington, St. John's Hill, Wandsworth, and Hartfield-road, Wimbledon; Hammersmith to Barnes, and West Strand to the Bexley, Green, and Hyde Park Corner, with subways at Charing Cross and Hyde Park Corner; Edgware Station to Finchley-road, Hendon, and Holly Bush Hill, Hampstead; Cannon-street and Queen-street to Rye-lane, Peckham, and the Penge entrance to the Crystal Palace; Shepherd's Bush and Hammersmith to Barnes, Knightsbridge, Charing Cross, Clapton Junction, and Marble Arch; Peckham Rye Common to Greenwich-street and Barking-road; Plaistow, and Camberwell New-road to Nelson-street, Greenwich.

**PROPOSED IMPROVEMENTS IN MANCHESTER.**—A Bill has been prepared to authorise the incorporation of a company for acquiring a site that lies on the west side of Corporation-street and extends southwards to Market-street, between Cannon and New Brown streets, for erecting new buildings on that area, and for making new streets—one from the junction of Corporation and Cannon streets to the junction of Market and New Brown streets, the other from the junction of Cannon and New Brown streets to the junction of Corporation and Market streets, which will furnish more direct lines of communication from the Manchester Exchange and Victoria Station to Shudehill Market. The contemplated City Circle underground railway, to be worked with electrical power, which will have its chief station at the corner of Tod-street and Long Millgate, near Victoria Station and the Cathedral schools, with a generating station on the west side of the Corporation hydraulic power works, by the Rochdale Canal.

**MANCHESTER HOUSING SCHEME AT BLACKLEY.**—The Housing Sub-Committee of the Sanitary Committee of the Manchester City Council, after inquiry with the City Surveyor, have decided upon new plans for the model cottages to be built at Blackley for submission to the Council and to the Local Government Board. In a great degree the plans approved follow the lines adopted in the building of model cottages at Leek, in Staffordshire, and have several improvements as compared with the original design. The chief additions are a bathroom and a bedroom, the former room being placed on the ground floor immediately behind the kitchen fireplace. Access to it is obtained from the scullery, from which it can at pleasure be cut off when in use by folding doors. The bathroom is to be made available for washing purposes generally. The third bedroom is to be in the centre of the building, the floor being 3 ft. 6 in. higher than that of the other bedrooms. So far as the cost is concerned, the alteration in the original scheme for the erection of 205 cottages will involve an additional outlay of 7,000*l.*, and application to borrow this sum will have to be made to the Local Government Board if the plans are adopted by the City Council.—*Manchester Guardian.*

**SCARBOROUGH MASTER BUILDERS' ASSOCIATION.**—The annual meeting of the Scarborough Master Builders' Association was held at the Albemarle Hotel, on the 30th ult., Mr. A. W. Sinclair (President) occupying the chair, report and balance-sheet presented by Mr. R. H. Carr, were considered very satisfactory and were adopted. The officers for the ensuing year were re-elected as follows:—President, Mr. A. W. Sinclair; Vice-president, Mr. T. B. Jowsey; auditors, Mr. W. Malton and Mr. W. Tindall; secretary, Mr. R. H. Carr. Messrs. A. W. Sinclair, Moore, R. H. Carr, and Councillor Bland were elected the four delegates to represent the association upon the National Federation of Building Trade Employers of Great Britain and Ireland at the two half-yearly meetings.

**SUNDERLAND AND DISTRICT BUILDING TRADES ASSOCIATION.**—The annual meeting of the Sunderland and District Building Trades' Association was held on the 28th ult. in the Grand Hotel, Sunderland. In the annual report, which was read by

Mr. W. H. Hope, the secretary, it was stated that there was one great question looming on the builders' horizon, as it did on the horizon of employers generally, and that was the great evil which was sapping the entire business relations of employers and employed. This referred to the action of the operators in the way they worked in the different branches of the trade. The effect of the limitation of the amount of work to be done by a workman kept up the cost and militated against the letting of contracts, and, further, was handicapping this country enormously in its struggle to maintain its commercial supremacy. Mr. J. B. Stott was elected President, in the place of Mr. J. W. White, who retired.

**NATIONAL REGISTRATION OF PLUMBERS.**—The first of a series of papers for the winter session arranged by the District Council for Cardiff, South Wales and Monmouthshire, in connexion with the Worshipful Company of Plumbers, was delivered by the President for the year, Mr. W. H. Dashwood Caple, architect, at the Technical Schools, Cardiff, on Tuesday, the 26th ult., when there was a representative attendance of the master plumbers and operatives in the district. The subject of the President's paper was "Plumbing Notes," and it embraced the various branches of the work of the craft. At the conclusion of the paper there followed an interesting and instructive discussion. The other arrangements for the Session are as follows:—December 17, "The Plumber's Craft and the Registration Movement," by Mr. E. B. Sawyer; January 27, "Sanitation of our Homes," by Mr. E. J. Manders; February 18, "Roof Water and how to deal with it," by Mr. C. R. Williams; March 18, "Cardiff Water Supply," by Mr. W. H. Allen; April 15, a paper by Mr. Edwin Seward; May 20, "Some Defects in our Local Sanitary System from a Plumber's point of view," by Mr. E. J. Sawyer. The meetings will be held on Tuesday evenings at eight o'clock in the Technical Schools, Dalmuir-Place, Cardiff.

**APPOINTMENT, WALTHAMSTOW.**—At the last ordinary meeting of the Walthamstow School Board, held on the 22nd ult., Mr. H. Prosser, the Board's Surveyor, was appointed Architect and Surveyor to the Board at a commencing salary of 250*l.* per annum.

**A HERALDIC CALENDAR.**—An exceptionally well-designed and printed calendar for the coming year has reached us from Messrs. Archibald Constable & Co. with the title of "St. George's Calendar." Its chief feature is some very boldly drawn heraldry. It is in book form, with shields charged with the Cross of St. George, and the three lions passant of England on the cover. Opposite each month is a coat of arms with helmet mantling crest printed in colours, including, among others, the arms of Howard, Courtenay Hastings, Berkeley, Scrope, and Clifford. The last named is particularly effective. The calendar is published at the very moderate price of 1*s.* net.

**FIRE TESTS WITH DOORS.**—The British Fire Prevention Committee again undertook a series of investigations at their Bywater testing station on Wednesday, Mr. Edwin O. Sachs, chairman of the executive, presided, and among the principal visitors were Sir Joseph Renalds, Bart. (late Lord Mayor), Sir James Weeks Schlumper (late Mayor of Richmond), Major Fox (London Salvage Corps), Captain Dyson (Windsor), and a number of representatives from the London County Council, the Local Authorities and principal fire insurance companies. The test was conducted with doors with doors, firstly, with two double deal doors and two double oak doors; secondly, with a single "Jarrah" wood door and a single "Karri" wood door, the thickness of the doors in each case being 2 in. The double oak doors appeared to have very considerable fire-resistance compared to the deal double doors, the test in each case extending to one and three-quarter hours. The "Karri" and "Jarrah" wood doors were, unfortunately, badly constructed by the makers, and although the wood itself showed considerable resistance during a test of one hour, the fire appeared to get through where the joints had not been satisfactorily made. The full official reports will shortly appear in the usual way. It might be noted that the testing operations were somewhat hampered by the fog, all the photographs and records having to be taken by flashlight.

**SEWER VENTILATION.**—We have received from Mr. Joseph Aird, of Great Bridge, Staffordshire, a description of his tubular sewer-ventilating standard. The standard has a cast-iron base with an arm for connecting to the sewer branch, and the upper part is formed of wrought-iron or mild steel tubes, which can be built up to any reasonable height. The tops of the standards are fitted with cowls or wire guards. Mr. Aird claims that these standards can be utilised for the dual purpose of sewer ventilators and telegraph or telephone poles. Certainly any invention which reduces the number of poles or shafts in our streets is worthy of consideration. As a sewer ventilator, Mr. Aird's standard has advantages over cast-iron, as it can be carried up to a greater height and need not be as heavy.

**WINDOW, NEWTON TRACEY CHURCH, NORTH DEVON.**—A new stained-glass window was unveiled on Advent Sunday at St. Thomas a Becket's church, Newton Tracey, near Barnstaple. The window, consisting of three lights, illustrates the

parable of the "Pharisee and Publican," and is dedicated to the memory of T. H. E. H. Dimond Hogg, who was a warden of the parish for twenty-one years. The work is from the studio of Mr. Gilbert P. Gammon, of London.

### CAPITAL AND LABOUR.

**THE PENRHYN QUARRY.**—Since work was resumed at the quarry on June 11 the number of men employed has steadily increased. During the last three quarry months 103 employes have been admitted—namely, during September, twenty-seven; October, forty; and November, thirty-six. Notwithstanding the short hours it is now possible to work the production of slates continues very satisfactory, and it is expected that this month will show an output at the rate of 35,000 tons per annum. The district is still unfortunately in a very disturbed state. The usual weekly mass meeting of some of those on strike was held on Saturday evening.

**SLATE TRADE.**—Price-lists for 1902 have just been issued by the Dinorwe, Penrhyn, and Festiniog Quarries, and the Carnarvon ones will be out in a day or two. Prices show an upward tendency, but not sufficient to encourage foreign competition, especially with the rise in American slates, caused, no doubt, by better home demand. The Mineral Statistics for 1900 showed a considerable falling in tonnage value of Welsh slates.

### LEGAL.

#### MARYLEBONE BUILDING DISPUTE.

The case of *White v. Harrow*—*Harrow v. the Marylebone District Property Co.*, came before Mr. Justice Joyce in the Chancery Division on the 20th ult. on a motion by the applicant *White* for a stay of proceedings of the action *Harrow* had commenced against the *Marylebone District Property Company, Limited*.

It appeared that *White* was the lessee of No. 24, High-street, Marylebone, from the trustees of the *Howard de Walden estate* for a term of about thirty years unexpired. By a deed dated August 3, 1899, *White* under-leased the house for a term of twenty-one years to *Harrow*, together with all easements and appurtenances belonging to the premises. The lease contained a covenant that the lessee would not "object to any works to adjoining premises which might be sanctioned by or on behalf of the lessor or the superior landlord." The lease also contained the usual covenant for quiet enjoyment of the premises. It seemed that the *Company*, having acquired an interest in property adjoining No. 24, High-street, which formed part of the same estate, proposed to erect thereon some buildings which *Harrow* said would obstruct his light, and brought an action against the *Company* to restrain the *Company* from obstructing his light. These proposed buildings had been approved by the surveyor of the *Howard de Walden estate*. Mr. *White*, who was also interested in the *Company*, then took the present proceedings to restrain *Harrow* from prosecuting his action on the ground that it constituted a breach of the above-mentioned covenant.

At the conclusion of the arguments of Counsel, his Lordship came to the conclusion that the covenant in question prevented the lessee from raising objection to any building works on adjoining premises which might have been so sanctioned, and accordingly stayed the proceedings taken by *Harrow* against the *Company*.

Mr. *Hughes, K.C.*, and Mr. *Wace* appeared for the applicant, and Mr. *Younger, K.C.*, and Mr. *E. Ford* for the respondent.

#### ACTION BY FOREMAN CARPENTER FOR DAMAGES AND PERSONAL INJURIES.

The case of *Simons v. the Birkbeck Building Society* came before the Court of Appeal, composed of the Master of the Rolls and Lords Justices *Stirling* and *Matthew*, on the 2nd and 3rd insts., on the application of the defendants for judgment or new trial on appeal from verdict and judgment entered at the trial before Mr. Justice *Darling* and a common jury in the King's Bench Division on June 11 last. The case was reported in the *Builder* of June 15, 1901.

The facts were shortly as follows: The plaintiff, a foreman carpenter, brought the action to recover damages from the defendants for personal injuries sustained through the alleged negligence of the defendants in the following circumstances: The plaintiff, prior to the accident, had earned some 5*s.* a week. Having saved some money and being desirous of buying a house, and not having a sufficient sum laid by he borrowed some money from the *Birkbeck Building Society*. The loan was repaid in monthly payments, the plaintiff's wife being in the habit of taking the money to the Society. On August 13, 1900, however, the plaintiff took the money to the bank himself, and never having been there before, and on asking the porter where he should go, understood him to say "Third floor o' the lift." The plaintiff looked round and seeing

the entrance to the lift walked towards it. There was no light, and the plaintiff instead of walking into the lift fell down the shaft, a distance of about 15 ft., sustaining severe injuries, for which he claimed damages. For the defendants it was contended that the lift-door was only open some 8 in., or 10 in., at most, and that the plaintiff in opening it further had been guilty of contributory negligence. In the result the jury awarded the plaintiff 150*l.* damages, and judgment was entered accordingly. Hence the present application of the defendants, who asked for judgment or a new trial on the grounds that the verdict was against the weight of evidence and that the learned judge had misdirected the jury.

In the result their Lordships allowed the appeal, holding that there was no evidence of negligence on the part of the defendants, and entered judgment for them with costs.

### RECENT PATENTS:

#### ABSTRACTS OF PATENTED INVENTIONS.

13,365.—A MACHINE FOR ROAD-MAKING AND KINDRED USES: *J. Behmer*.—By substituting a chisel-shaped tool for the hammer, and employing an anvil, the motor-driven machine for ramming paving material will serve also for working or splitting stone. An eccentric and a rod upon the shaft, which is driven with a belt from the motor-driven shaft, work the hammer; provision is made for angular or linear adjustments with a hand-wheel lever, and other mechanism. Rollers upon rails enable the framing to be swung round the shaft on the carriage; the force-carriage can take a rocking movement and be turned about for steering purposes; and worm-gearing will rotate in either direction the shaft on which are mounted the drums around which the steering chains are wound.

14,015.—A DOOR-CLOSING CONTRIVANCE: *G. F. Newman*.—The inner end of the closing-spring is hooked on to a sleeve that is joined at its upper end to a ratchet-wheel, whilst the outer end of the spring is hooked on to a groove within the casing. As the wheel rotates it moves—by means of a pawl that is pivoted upon the arm—a jointed door-closing arm. For checking purposes, two face-cams upon the axis reciprocate a piston with the turning of the axis. A spring valve allows the oil in the cylinder to freely flow through a spring-valve in one direction, but its return is prevented by means of a spring-controlled valve.

14,028.—AN APPARATUS FOR WINDOWS: *J. W. Cotter*.—The spindles of toothed wheels carry coils of springs which balance the sashes, the wheels being in gear with racks upon the sash stiles. The springs are discarded in the case of small sashes, which can be fastened at any height desired with springs that engage with the toothed wheels or spring-pins that engage with the racks.

14,063.—A COMBINED FUSE AND SWITCH: *C. C. Pillingier and A. Vandani*.—A switch arm for use upon distributing-boards is made of some insulating material, and its contacts are disposed for engagement with the terminals, the fuse having a support fitted with plugs that will bridge the contacts. In another form the switch arm carries the fuse wire directly which is fastened with screws.

14,069.—A LIGHTNING CONDUCTOR: *A. G. Electricitätswerke vorm. O. L. Kummer & Co.*—The diverging spark gaps of the conductor are fitted, near the spark-originating position, with cases of para-magnetic material having a horseshoe-shaped section, which may be carried upwards to some extent.

14,083.—MOULDING MACHINERY FOR BRICKS, TILES, &c.: *W. Wilkinson*.—The driving shaft and the eccentric shaft of the press are in one and the same vertical plane, the latter being worked with a pinion and a spur-wheel; a geared pinion turns a pug-mill shaft, which is set at a level lower than that of the driving-shaft; across the pug-mill shaft is another shaft which carries gearing that rotates intermittently a moulding cylinder in front of the pug-mill; the rebated foundation block of the press is bolted between rebated side frames.

14,097.—URINALS: *J. Shanks*.—The inventor uses one slab, or more, for building up the back of the urinal, of which the stalls are separated with pillars which are made wider at the back, and so as to afford enough space in front of the slab for cleansing and flushing purposes. Capping blocks may be adapted to join the pillars to the back.

14,114.—REMOVAL OF PAINT, &c.: *A. Klee*.—For removing varnishes, paints, and so on the inventor devises an emulsion which is compounded of linseed oil, soda, Venetian turpentine, water, and spirits of wine.

14,152.—A COMBINED DRY CLOSET AND DRY-STEAM FURNACE: *F. P. Smith*.—These are made in a portable form and are intended for use in camps, &c. Above a grate is a convexed plate on to which the refuse is passed through an opening, receptacles for the ashes are rocked upon cross-shafts so as to cast their contents into the grate from which they are conveyed between triangular bars to a receptacle at the base, a flue is connected to the upper portion of the furnace, and over it the furnace is joined to a lower flue by a pipe that leads into the main chimney; when the damper is

shut the supply of air is drawn through the seats and the fuel, the lower fire carries away the heated gases so as to heat the plate upon which the soil has accumulated.

14,202.—A DUST BIN: H. Smith.—The bin has a sloping bottom-plate and a hinged lid, the bottom constitutes a shoot for the discharge of its contents when the bin is turned upon the pivot which supports it upon a casing that is fixed in the wall, the turning of the bin is regulated with a fastening and a stop-piece.

14,208.—AN APPLIANCE FOR WINDOWS: J. M. Chambers and W. T. Christian.—The inventors seek to prevent sashes from rattling; to the frame and sashes they attach pins on which are fitted perforated straps joined together with elastic rings; in one adaptation a buckle of one strap takes the tongue of the other, whereby the tension of the ring is limited in its extent; in another form the loose end of one strap is inserted through the ring and a buckle.

14,210.—TILES AND FACING-PLATES FOR WALLS, &c.: F. Beer.—That they may be better take cement or plaster the glass facing-plates and tiles are roughened with an admixture of silicate of sodium or potassium 1 part, and dry pulverised carbonate of lime 2 parts. When that is dry a backing of plaster or cement is applied, the plaster being wetted with formic aldehyde or alum to render it insoluble, infusible, and non-putrescible, or gauged or mixed with water that contains gelatine.

14,243.—VALVES OF VARIOUS KINDS: S. E. Alley.—The piston of a reducing-valve that has an inverted conical valve joined to a piston of greater area is provided with a flexible diaphragm fastened with a screwed washer on to the casing enclosed with a pierced cover. A screwed spindle will serve to make the valve available for a stop-valve, or that object can be effected by the employment of a headed stud which is screwed into the end of the spindle so as to work within a recess in the valve. In another form a washer and a flanged ring retain the diaphragm between them.

14,253.—AN ATTACHMENT FOR DOOR KNOBS AND HANDLES: J. E. Cope.—One end of a squared spindle is screwed for taking a loose knob, and another knob is affixed to its other end; a squared hole in the loose knob takes a squared collar that will slide upon the spindle, which has an ordinary rose at one end, and at the other end a rose formed of two hinged parts kept in place with screws. For adjustment, one passes the spindle through the door, threads upon it the rose, the collar, and the loose knob, and then fixes them all in position by inserting the hinged rose, when the spindle has been forced forwards for engaging the collar and the loose knob; a metallic mounting fastened in the knob is screwed into engagement with the spindle, when the knobs are of wood, china, or glass.

14,278.—MANUFACTURE OF PORTLAND CEMENT: H. Passow.—The materials are melted down and granulated as oxygen, air, or gases charged with oxygen are passed through them. A cement produced by grinding blast-furnace clinker similarly treated may be added to ordinary Portland cement. The slag, &c., may be treated with air in an apparatus after the Bessemer-converter kind.

14,289.—A TUMBLER-SWITCH: A. W. B. Pearson.—In order that the contact-lever when in the "off" position shall rise to an almost horizontal direction it is fashioned in a short length and the operating lever is curved accordingly; for ensuring a quick break a pawl is set in engagement with the lever, and will so remain until the movement of the handle is nearly finished.

14,295.—LOCKS FOR DOORS: J. M. Burgoy.—A follower which is worked by handles upon a spindle, and an especially shaped spring work the latch-lock for a pair of folding-doors, a lever worked by a key outside and by a stud inside controls the lock-bolt that may be shot either behind the latch-bolt or into a notch so that by keeping it drawn back the doors may serve as swing-doors. The stud also will put the lock-bolt into a midway position to lock the latch-bolt and the key will not draw it back, teeth upon a flange on the lever will engage with teeth upon the edge of the bolt by the action of a spring, whereby the lock-bolt will be held in that position. In another form a key is used on either side to turn the bolt, and when the bolt has been put into the intermediate position any one upon the opposite side is prevented from dislodging the key from the keyhole, since his attempt to turn it will be frustrated by a spring which is affixed to the bolt and engages with a notch cut in the lever.

14,317.—A FASTENING FOR WINDOW SASHES: W. Brady.—A bevelling latch-bolt to be shot with a spring into engagement with the catch operates in the casing upon the meeting-rail of the lower sash, and when it has been so shot is made fast with a bar that falls behind a shoulder upon the bolt. For releasing the fastener one pulls the handle, thereby the lever will raise the bar and the bolt can be moved back; as the bolt is drawn away, a small bolt upon the top of the lever becomes forced forwards and rests upon the casing, then one holds up the bar until the closing of the window forces the latch-bolt back. In order that one's two hands may be free for lifting the sash, the latch-bolt is first drawn back, and then a plate that is binged on

to a pivoted plate is thrust between the catch and the end of the bolt.

14,330.—BURNERS FOR BLOW-PIPES: J. H. Letcher.—Gas and air are supplied through a fixed plug, upon which rotates a sleeve which carries a radial set of blowpipe-burner tubes, and as each burner tube is turned into position for work, the gas and air are turned on automatically through ports made in the plug and the sleeve. A middle tube in the plug, and a passage (which also feeds a pilot flame) and ports convey the gases to the outside burner tube, as the air flows up the hollow of the plug and through a port into the inside tube. Another arrangement of the ports provides for the shutting-off, either wholly or partially, of the gas before the air-blast is acted upon by the turning-sleeve.

14,341.—A COWL OR TOP FOR VENTILATING PIPES, CHIMNEYS, &c.: G. McCaul.—The top or cowl is fashioned with a hollow conical drum having ducts of which the flared ends will take the wind and so set up a draught, whilst rain is kept out with a conical hood resting upon legs.

14,365.—BRICKS: J. Borgar.—The inventor devised a brick which the face is fashioned with a rib or flange, his object being to dispense with pointing and to render the mortar invisible from without.

14,373.—AN ELECTRICAL CUT-OUT.—H. O. Farrell.—The fuse-wires attached to removable bridges are disposed upon the fuse-boards, and the contact surfaces are placed at right angles with the plane of the bridge-pieces; in one arrangement the bridge that carries the fuse is E-shaped, the middle projection being placed between the contacts; in another form L-shaped contacts are fitted against a dividing-bridge made upon the base; the fuse is laid in a groove and spring-contacts are set upon the upper bridge.

MEETINGS.

FRIDAY, DECEMBER 6.

Architectural Association Discussion Section.—Mr. S. Perkin on "The Ethics of Dilapidations," 3.30 p.m. Institution of Junior Engineers. (Westminster Palace Hotel).—Paper on "Street Railway Construction for Electric Traction," by Mr. F. S. Pilling, 8 p.m.

Institution of Civil Engineers (Students Meeting).—Mr. R. W. A. Brewer on "Gas-Engine Construction," 8 p.m.

Birmingham Architectural Association.—Mr. H. H. Statham on "The Architectural Treatment of Bridges." Glasgow Architectural Craftsmen's Society.—Mr. C. Ernest Monro on "Hotel Planning and Construction," 8 p.m.

SATURDAY, DECEMBER 7.

British Association of Waterworks Engineers.—Winter meeting of the Association, to be held at the Geological Society's Rooms, Burlington House, London. Ballots for the Council and Officers for 1902-3, and for new members and Associates. 2. Discussion on Mr. Ingham's paper, entitled "The Design, Construction, and Cost of Open and Covered Service Reservoirs." 3. Paper, entitled "French Practice in the Manufacture of Cast-Iron Pipes," by Mr. A. G. Clouke. 4. Paper, entitled "English Practice in the Manufacture of Cast-Iron Pipes," by Mr. S. H. Terry, M.Inst.C.E. 5. An abstract, entitled "American Practice in the Manufacture of Cast-Iron Pipes" (from the Engineer), will be taken as read. 6. Discussion on the three papers above mentioned, 10 a.m.

British Institute of Certified Carpenters.—Annual general meeting, Carpenters' Hall, 6 p.m. City of London College Science Society. (White-street, Moorfields, E.C.4.)—Lect. on the works of Baker-street and Waterloo Railway, by permission of the contractors, Messrs. Perry & Co.

MONDAY, DECEMBER 9.

London Institution.—Mr. Francis Bond on "Medieval Monks and Monasteries," illustrated. 5 p.m. Surveyors' Institution.—Professor W. Somerville on "Artificial Manures," 8 p.m.

Institution of Electrical Engineers.—Annual dinner, Clerks of Works Association, Carpenters' Hall.—Monthly meeting. Paper by Mr. T. Stirling, Jan. 8 p.m.

Bristol Society of Architects.—Mr. Harold Smith on "Paris, Past and Present," with line-drawing illustrations. 8 p.m.

TUESDAY, DECEMBER 10.

Institution of Civil Engineers.—(1) Further discussion, on Mr. J. A. F. Aspinall's paper on "Train Resistance." (2) Mr. E. B. Dunk on "Motive Power from Blast Furnace Gases," 8 p.m.

Cardiff, South Wales, and Monmouthshire Architects' Society.—Paper by Mr. J. Coates Carter, 8 p.m. Institution of Electrical Engineers (Glasgow Section, 207, Bath street).—Lect. by Mr. W. Murray Morrison on "Aluminium: Notes on its Production, Properties, and Use," 8 p.m.

WEDNESDAY, DECEMBER 11.

Society of Arts.—Professor Ernest Wilson, M.Inst.E.E., on "Aluminium," 8 p.m. Institution of Civil Engineers.—Students' visit to Messrs. Maple & Co.'s New Electricity-driven Cabinet Factory in Highgate-road. 3 p.m.

Northern Architectural Association.—Mr. J. M. Carr on "Terra Cotta, &c.," with lantern illustrations and models, 7.30 p.m.

Institution of Electrical Engineers (Birmingham Local Section).—Dr. W. E. Sumner will read short papers, "On the Power Factor of Alternate Current Circuits," and "On the Workshop Testing of Dynamos and Motors," 7.50 p.m.

St. Paul's Ecclesiastical Society.—Paper by Mr. Leopold G. Wickham Legg, B.A., entitled "Suggestions for the Reconstruction of the Coronation Ceremonies," illustrated by line-drawing views of the Regalia, the Royal Processions, and Westminster Abbey and Hall. 8 p.m.

THURSDAY, DECEMBER 12.

Manchester Society of Architects.—Mr. Halsey Ricardo on "The Revival of Gothic Architecture," illustrated by lantern slides.

Sheffield Society of Architects and Surveyors.—Mr. A. Jeffery on "Stained Glass."

Leeds and Yorkshire Architectural Society.—Rev. H. A. Hall, M.A., on "Some Village Churches of North Devon," 7.30 p.m.

Institution of Electrical Engineers (Great George-street, Westminster, S.W.).—1. Conclusion of discussion on "The Physical Properties of Certain Aluminium Alloys and Some Notes on Aluminium Conductors," by Professor E. Wilson, and 2. Some Principles Underlying the Profitable Sale of Electricity," by Mr. Arthur Wright, 8 p.m.

FRIDAY, DECEMBER 13.

Architectural Association.—"Travelling Students Notes," by Mr. J. E. Forbes, 7.30 p.m.

SATURDAY, DECEMBER 14.

Institution of Junior Engineers.—Visit to the Crodon Combined Electric Light and Traction Works, 3.15 p.m.

Dundee Institute of Architecture.—Visit to Arbroath and Hospitalfield.

SOME RECENT SALES OF PROPERTY

ESTATE EXCHANGE REPORT.

November 20.—By DRIVER, JONAS, & CO. (at Usk).

Table listing property sales including Raglan, Tregare, Penrhos, Duke's Gorse, Llantilio-Crossenny, Tregare, Common Farm, Treacile Farm, Enclosures of land, Cwmcarvan, Mitchell Troy, Redfern Farm, Freehold house, Various cottages, Penallt, and others with prices.

November 21.—By FULLER, MOON, & FULLER (at Sydenham).

Sydenham.—2 and 3, Holmstead-st., with stabling, yard, &c., f. 1,730

Adams-rill-rd., plot of building land, f. 200

November 22.—By MESSRS. SPELMAN (at Norwich).

Norwich.—54, Calvert-st., f. 100

73 and 75, Gladstone-st., f. 268

November 23.—By T. C. COX.

Wetherfield, Essex.—Freehold brewery premises, with 16 teen tied houses and various cottages, f. 17,000

By ELLIOTT, SON, & BOYTON.

Hanwell.—Lower Boston-rd., Floral Villa, f. 1,450

also two plots of land in rear, tot. 3 yrs. f. 142

By L. C. COWLEY & CO.

Chiswick.—Hogarth-lane, Hogarth House, area 2 a. c. 1,500

Hammersmith.—3, Farwood, f. 420

Shepherd's Bush.—1, also 2, f. 450

ut. 66 yrs., g.r. 4l. 450

Askew-rd., a piece of freehold land 300

November 26.—By BELTON & SONS.

Hanley, Staffs.—The Grand Hotel, f. and c. 18,000

estimated rental; u.t. for unstreep term; p.a. for per annum; yrs. for years; st. for street; rd. for road; sq. for square; pl. for place; ter. for terrace; cres. for crescent; yd. for yard.

PRICES CURRENT OF MATERIALS.

\* \* \* Our aim in this list is to give, as far as possible, the average prices of materials, not necessarily the lowest. Quality and quantity obviously affect prices—a fact which should be remembered by those who make use of this information.

BENTHAIL WORKS, JACKFIELD, SHROPSHIRE.

## TILES

PLAIN AND ORNAMENTAL,  
for WALLS, HEARTHES, FLOORS,  
EMBOSSED, GLAZED,  
PRINTED, PAINTED,  
MOSAIC & ENCAUSTIC.

MAJOLICA

MOSAIC & C.

WHOLESALE AGENTS: MESSRS. W. F. SIMPSON & SONS, 87 & 89, ST. MARTIN'S LANE, LONDON W.C.

## PLATEWALL PARTITIONS

Now used in all the most important buildings. Also by H.M. Board of Works and London County Council and specified by the leading architects.

These Platemwall Partitions being smooth faced **no plastering** is required.

For further particulars apply

The LONDON FIREPROOF PLATE WALL COMPANY, Limited,  
60, WATLING STREET, LONDON, E.C.

Telephone No. 6050 Bank.

Telegrams "Gypsoplast London."

Absolutely Fireproof and Soundproof. No limit to size. Rapidly erected. Great saving in time and space. Rough-faced plates also supplied for tiling, &c.

Thickness, 2 1/2", 3 1/2", and 4". Size 20" x 26", and 17" x 22".

Prices from 5/6 to 9/6 per yard super fixed and finished complete for distemperring, papering, or painting.

## WILLESDEN PAPER.

Water-proof—Rot-proof—Insect-proof.

2-Ply for Underlining Slates, Tiles, Iron Buildings, with or without Boards.

1-Ply for Laying on Joists under Floor Boards to Deaden Sound, &c.

Lists and views of large contracts where Willesden Paper has been used, and Catalogues and Samples Post Free.

WILLESDEN PAPER & CANVAS WORKS, WILLESDEN JUNG, LONDON, N.W.

## DENNETT FIREPROOF FLOORS, &c.

CONSTRUCTIVE IRONWORK OF ALL DESCRIPTIONS.

DESIGNS AND ESTIMATES SUPPLIED TO ARCHITECTS.

FIREPROOF ENCASEMENT OF IRONWORK, CONCRETE STAIRS, PAVING, &c.

Apply to DENNETT & INGLE, No. 24, QUEEN ANNE'S GATE (late 5, WHITEHALL), LONDON, S.W.

SPECIAL ADVANTAGES TO PRIVATE INSURERS.  
**THE IMPERIAL Insurance Company, Limited. FIRE.** (Est. 1833, 1, Old Broad-st., E.C. and 22 Pall Mall, S.W.)  
 Subscribed Capital, £200,000. Paid-up, £90,000. Total Funds, over £1,500,000.—R. COZENS SMITH, General Manager.

**PHENIX ASSURANCE CO., Ltd.**  
**PHENIX FIRE OFFICE,**  
 19, LOMBARD STREET,  
 AND  
 87, CHARING CROSS, LONDON.

LOWEST CURRENT RATES.  
 LIBERAL AND PROMPT SETTLEMENTS.  
 ASSURED FREE OF ALL LIABILITY.  
 ELECTRIC LIGHTING RULES SUPPLIED.

**BUSINESSES WANTED & FOR SALE.**

**BRICKWORKS,** known as Laindon Brick-works, Hereford, to LET or SOLD as a going concern. The works adjoin Launce station, L.L. & S.R. and have a siding to main line. There is about 76 acres of land. The plant and machinery is all modern and consists of a 25-h.p. compound condensing under-type engine and boiler, by Marshall & Sons, Galphorthorpe; a 10-h.p. portable engine and boiler, by Hornsby's; brick-making machine, by Alexander & Sons; pug mill, crushing mill, pug mill for hand-made bricks, a Clayton pipe-machine, 1,800 yds. tramway, 60 artificial cars, 12 clay wagons, 24 brick trolleys, barrows, mantles, tables, wheeling plates, &c.; drying building, 129 ft. by 29 ft. Blackman's system of hot air; stock houses, four Scotch kilns, one Crystal Palace kiln, with down draught. The whole or part (FREEHOLD) TO BE SOLD or LET.—Apply to Mr. H. GOODWIN, 48, Old Kent-road, London, S.E.

**BUILDER and DECORATOR'S BUSINESS FOR DISPOSAL** in a high-class neighbourhood. Thoroughly genuine, good connexion, and unrivalled stock, good will, and plant about 600.—See 242, Office of "The Builder."

**TO BE SOLD,** in the County of Bedfordshire, a **BUILDER'S BUSINESS,** with house and premises, where a good trade is done, and can be increased by a competent man of business. Cause of disposal ill health.—Apply to **STEAKES,** Wycombe House, Bedford.

Refer also to "Too Late" column, page xxi.

**THIS DAY, Crown No. 232** pages, with 118 Illustrations. 2s. cloth.  
**THE ART OF BUILDING.** By E. DOBSON. Fifteenth Edition. Revised to date by J. P. ALLEN, Lecturer on Building Construction, Durham College of Science, London. CROSBY LOCKWOOD & SON, Stationers' Hall-court, F.R.

**TO BOOKBUYERS and Librarians of Free Libraries.**—The DECEMBER CATALOGUE of valuable Second-hand Works and New Remainders, offered at prices greatly reduced, is now ready, and will be sent upon application to W. H. SMITH & SONS, Library Department, 159, Strand, London, W.C.

Praised by **TEN Trade Papers.**  
**TELLS COST** at a Glance of All Sizes of Timber and Stone at any Price per Standard or per Cube Foot.  
**PRICE, POST FREE, 2/9 P.O. Preferred.**  
 Over 6,000 Copies Sold.

**J. H. KERNER GREENWOOD, (B. DEPT.) 4, MARKET PLACE, KING'S LYNN.**

**SURVEYORS' INSTITUTION EXAMINATIONS.**

COMPLETE COURSES OF PREPARATION for these Examinations are given, either in class, by correspondence, or in office, by Mr. RICHARD PARRY, F.R.I.C., A.M.I.C.E., &c. Candidates can arrange to commence study at any time. The following table shows the prizes that have been obtained by Mr. PARRY'S pupils at the last seven Examinations:

Sanitation Prize	1895	1896	1897	1898	1899	1901
Special Prize	—	—	1897	1898	1899	1901
Driver Prize	1895	1896	—	1898	1899	1900
Canfield Silver Medal	1895	1896	—	1898	1899	1900
Fenfold Gold Medal	—	—	—	1899	1900	—
Crawley Prize	—	—	—	1898	—	1901

NOTE.—In 1898 the Crawley Prize was divided between two bracketed winners, one of whom was prepared by Mr. PARRY. The above table shows that of the 42 prizes awarded at the last seven Examinations, 291 were obtained by candidates prepared by Mr. PARRY, and 161 by candidates not prepared by him. For particulars of the Courses of Work, or for any advice with respect to the Examinations, apply to Mr. RICHARD PARRY, F.R.I.C., A.M.I.C.E., 24, Victoria-street, Westminster. Telephone, 620 Westminster.

**SANITARY INSPECTORS' EXAMINATIONS.**—A CERTIFICATED INSPECTOR AND ASSOCIATE SANITARY INSPECTOR prepares Candidates for above Examination by Correspondence. No books required. Success guaranteed. MODEL SOLUTIONS, illustrated, to Examination Questions for 1901.—List prospectus, testimonials, &c. R. G. HOLMES, No. 27, High-street, Eomford. (State Paper).

**SANITARY INSTITUTE EXAMS.**—Preparation for the Inspectors' Examination by a system of correspondence using no Text Books or Acts, by C. H. CLARKE, Assoc. San. Insp., Fellow Inst. Enginrs., Honorary Medals in Hygiene; Member of the Society of Arts and of Societe Francaise d'Hygiene. See Clarke's Aids—Calculation of Cubic Spaces, &c.; Technical Drain Inspection, &c.; Trade Notices, &c. Sanitary Law (New Edition), is 6d.—Prospectus from 120, Thorold-road, Ilford, E.

**SANITARY INSPECTORS' and PRACTICAL SANITARY SCIENCE EXAMS. of THE SANITARY INSTITUTE.** Complete Courses of Instruction by correspondence for these and similar exams conducted by Gentlemen (Engineers, Surveyors, and Sanitary Inspectors) holding Licenses from San. Inst. 1st Class Honorary Medals in Hygiene, &c. Several hundred successes. Classes for 1901 and 1902 E.K.A.M. Just commencing.—Apply for Syllabus of subjects, testimonials, &c. to C.R.I., 26, Victoria-street, Westminster, S.W.

**R.I.B.A. SOCIETY of ARCHITECTS.** SURVEYORS' INSTITUTION, and CIVIL SERVICE TECHNICAL EXAMINATIONS. Preparation by correspondence or in residence. Private lessons. Streeting, &c.—MIDDLETON & GARDEN, 19, Cross-street, Strand, W.C.

**BILLS OF QUANTITIES, &c.**  
 LITHOGRAPHED CORRECTLY BY RETURN OF POST. A LIBERAL DISCOUNT OFF USUAL PRICES. PLANS BEST STYLE.  
**ALLDAY, LIMITED.**  
 Shakespeare Press, Birmingham.

**R. J. EVERETT & SONS, LITHOGRAPHERS.**

Sole Proprietors of the invention of the late Mr. R. J. EVERETT, so successfully worked by Sprague & Co., Ltd., and their predecessors, and known as  
**THE INK-PHOTO PROCESS,**  
 which stands unequalled for the effective reproduction of Wash Drawings, Pencil Sketches, Engravings, Silver Prints, &c.  
 Estimates on application to the Works—138, Devonshire-road, FOREST HILL, S.E.

**"THE BUILDER" STUDENT'S SERIES.**

THESE Books, intended primarily for Students in Architecture, Engineering, Surveying, Sanitary Science, &c., will be found of great practical use in the offices of PROFESSIONAL MEN and CONTRACTORS, to whom also they are recommended as suitable for

**CHRISTMAS PRESENTS**

to their ASSISTANTS, PUPILS, CLERKS, CRAFTSMEN, and APPRENTICES.  
 Direct from the Office POST FREE on receipt of remittance.

Just published,  
**SANITARY FITTINGS and PLUMBING.** By G. LATER SUTCLIFFE, A.R.I.B.A., M.S.I. &c. 212 Illustrations.

In this book an attempt has been made to enunciate the general principles now governing the design of sanitary work in buildings, and also to describe and illustrate the most important modern sanitary fittings and the plumber's work in connection with them.

**LAND SURVEYING and LEVELLING.** By ARTHUR WALMSLEY, M.I.C.E., F.R.I., F.R.A.S., &c. 160 Illustrations.

A useful book for a Student, containing not only the usual instructions given in a text-book on this subject, but valuable additions from the author's own experience, and an extensive chapter upon Parliamentary surveying.

**STRESSES and STRAINS: Their Calculation and Distribution in Structures.** By FREDERIC RICHARD FARKOW, F.R.I.B.A. 95 Illustrations. A handbook for students, particularly such as are preparing for the examinations of the R.I.B.A. and arranged and intended especially for those whose knowledge of mathematics is limited.

**STRUCTURAL IRON and STEEL.** A Text-Book for Architects, Engineers, Builders, and Science Students. By W. S. TWELVEBERRY, M.I.M.E. 224 Illustrations.

In this elementary treatise the author has endeavoured to present in a logical sequence an account of the mechanical properties of iron and steel as applied to structural work.

2nd Edition. Revised and corrected by the Authors.  
**CARPENTRY and JOINERY: A Text-Book for Architects, Engineers, Surveyors, and Craftsmen.** By BANISTER F. FLETCHER, A.R.I.B.A., and H. PHILLIPS FLETCHER, A.R.I.B.A., A.M.I.C.E. 24 Illustrations. Intended for those entering for the examination of the City and Guilds' Institute, the Carpenters' Company, and the Institute of Certified Carpenters, &c. Also for the examination in these subjects by the R.I.B.A. and the Surveyors' Institution, &c.

London: DOUGLAS FOURDRINER, Office of "The Builder," Catherine-street, W.C.  
**MUNICIPAL and COUNTY ENGINEERS' EXAMINATION.**—Mr. RICHARD PARRY, A.M.I.C.E., F.R.I.C., &c., 24, Victoria-street, Westminster, prepares pupils by correspondence for this examination. The course of work may be taken to extend over six or twelve months according to previous knowledge.

**R. I. B. A. EXAMS.—PREPARATION** personally or by correspondence, in three, six, nine, or twelve months' courses. ARCHITECTURAL DRAWING LIBRARY. Special three months' finishing courses.—For full particulars apply to Messrs. HOWGATE & BOND, Associates R.I.B.A. 115, Gower-street, W.C. (close to the British Museum).

**SANITARY INSPECTORS' EXAMINATIONS.**—Successful POSTAL TUITION by Certified Engineer (First-Class Honorary Sanitary Inspector, Mechanical, &c.) Typewritten papers. Numerous sketches. Small fee. ASSOC. SAN. INST., No. 4, Duke-street, Adelphi, London.

**ARCHITECT** is desirous of meeting with another to SHAKE with him good OFFICES in the neighbourhood of Chancery-lane—For terms apply, by letter, to H. H. care of Messrs. E. P. White & Son, General Advertising Agents, No. 73, Fleet-street, E.C.

**OFFICE.**—An Architect wishes to SHAKE Architect's or other OFFICE near Strand or Chancery-lane.—Address, 11, care of Messrs. E. P. White & Son, General Advertising Agents, 73, Fleet-street, E.C.

**OFFICE.**—Established Consulting Engineer wishes to SHAKE Architects or other furnished or unfurnished OFFICES (with or without clerical assistance), where interest would be paid.—Near Fleet-street preferred; or would take gentleman to share advertiser's office. Highest references given and required.—See 227, Office of "The Builder."

**ENTIRE MANAGEMENT** of a Building Estate Wanted by a practical Builder, or will undertake all labour (piece-work). Can find plan if necessary.—Box 235, Office of "The Builder."

Just published,  
**ROADS: Their Construction and Maintenance.** By ALLAN GREENWELL, A.M.I.C.E., F.R.S., &c. and J. V. ELSLEY, F.S.L.E., F.S.S., &c. 48 Illustrations.

Much space has been devoted to the consideration of the relative value of different kinds of stones. In the belief that no one can be an efficient road engineer or surveyor unless he understands the nature and properties of the material at his disposal.

**FIELD WORK and INSTRUMENTS.** By ARTHUR WALMSLEY, M.I.C.E., F.R.I., F.R.A.S., &c. 224 Illustrations.

Gives the student a practical knowledge of the construction and handling of surveying instruments, and how to deal with their application in the field for setting out work.

2nd Thousand.  
**SPECIFICATIONS for BUILDING WORKS.** 3/6 and How to Write Them. A Manual for Architects, Surveyors, and Students. By FREDERIC RICHARD FARKOW, F.R.I.B.A. Shows the Student how he should write a specification, or that when he has learnt the method and general principles he may apply them to the particular exigencies of any building he may design.

2nd Thousand.  
**QUANTITIES and QUANTITY TAKING.** By W. E. DAVIS. 3/6 A reliable handbook for the Student, pupil and ampler, its scope being limited to the method of procedure in the production of a good bill of quantities. The examples given, whilst intentionally simple, will be found to cover almost every phase of the subject.

**ARCHITECTURAL HYGIENE: or, Sanitary Science as Applied to Buildings.** A Text-Book for Architects, Surveyors, Engineers, Medical Officers of Health, Sanitary Inspectors, and Students. By BANISTER F. FLETCHER, A.R.I.B.A., and H. PHILLIPS FLETCHER, A.R.I.B.A., A.M.I.C.E. A complete, up-to-date, text-book, treating the subject in all its branches, and intended to be of use to those entering for any examination in Sanitary Science.

**THE LONDON COUNTY COUNCIL require the SERVICES of a JUNIOR BUILDING SURVEYOR,** who must have had experience in a Builder's Office, and in the supervision of repairs. The appointment will be temporary at wages of 21. per week. Apply, by letter only, to "The Housing Manager," 8, Warwick-street, S.W.

**METROPOLITAN BOROUGH OF FULHAM.** ASSISTANT SURVEYOR. The Council invite APPLICATIONS for the office of ASSISTANT BROUGH SURVEYOR. The salary will be 300L. per annum, rising by annual increments of 50L. to 250L.

Applicants must not be less than 25 nor more than 35 years of age, and the person appointed will be required to devote the whole of his time to the duties assigned him. No superannuation or other allowance made. (Serving members of the Council is strictly prohibited.) Applications, stating age, with copies of not more than three recent testimonials, endorsed "Assistant Surveyor," must reach the undersigned on or before TUESDAY, DECEMBER 10th.

By order, E. M. PRESCOTT, Town Clerk.

Town Clerk's Office, Town Hall, Fulham, S.W.

**WILMSDEN DISTRICT COUNCIL.** APPOINTMENT of THREE CLERKS of WORKS. The WilmSDen District Council desire to receive APPLICATIONS for the APPOINTMENT of CLERKS of WORKS for the supervision of the following works, viz.— (1) Erection of buildings and chimney shaft, Electricity Work (main station). (2) Erection of buildings, Electricity Works (sub-station and offices) &c. to 250L. The salary will be the rate of 4s. per week for each appointment. Applications, stating age, and if previously engaged upon similar work, together with copies only of three recent testimonials, endorsed "Clerk of Works," must reach the undersigned on or before TUESDAY, DECEMBER 10th, 1901.

By order, O. CLAUDE ROBSON, Engineer to the Council. Public Offices, Dyse-road, Kilburn, N.W. November 27th, 1901.

### Students' Designs at the Royal Academy.

THE annual exhibition of the designs made in competition for the prizes offered by the Royal Academy is an event of considerable interest, for it is from this exhibition mainly

that we can learn what is the tendency of Academical teaching in art, and what prospect there is of the arising of any new men of genius to fill ultimately the place of those who are gone.

Something depends, in such a competition, on the choice of subjects made by the Academy for their students to work on. Subjects for treatment in sculpture and painting are in one sense innumerable, but it is not so easy to select a number which will offer a stimulating interest to the student; a difficulty obviously felt at the Ecole des Beaux-Arts as well as at the Academy. "France Giving Algeria Artesian Wells," which the French students had to work on one year, for instance, was hardly a subject calculated to evolve an interesting picture; and the Royal Academy has not always been more happy. This year however, the Council, or whoever selects the subjects, may be congratulated on having been more successful than usual. In architecture, "A Town Hall for One of the New London Borough Councils" is not only an excellent subject in itself, but one which is calculated to interest the students in an actual architectural requirement of the moment. "Boadicea Exhorting her Troops," and "The Expulsion of Adam and Eve from Paradise," are subjects well worn in painting, but not often treated in sculpture. "Saul and the Witch of Endor" offers considerable opportunities for expression and effect to the painter, and "One of the Bridges over the Thames in London" we should have thought an ideal subject for the Turner gold medal, though we must admit that it does not seem to have inspired the competitors very much. For the Creswick prize it is always

difficult to define a subject; what is wanted is simply a good landscape, and that is a vague want difficult to define. "Cumulus Clouds over a Fen Country" serves, however, to indicate the main character of a landscape, so as to keep the competitors in a certain path and render comparison easier. But the best stroke in the way of selection of subjects is that for the decorative painting for a public building—"The Maske of Cupid" from the "Faërie Queene" (Book III., canto 12), the wondrous procession which Britomart sees file through the hall, the personifications of vices and passions, and Cupid riding on a lion among them; a subject certainly to stimulate the imagination, and giving every opportunity too for fine and effective colouring. It is not surprising that so suggestive a subject should have brought out a larger and better competition than usual.

In these pages we must take the architecture first, though architecture has never been the most flourishing of the arts at the Academy, partly because a good deal of the best youthful talent goes to compete for the Institute of Architects' prizes. We have some doubt whether the gold medal for architectural design has been rightly awarded. Mr. Hugh Webb's perspective view is probably mainly what has gained him the medal; it is a sensible and well-balanced Renaissance design of thoroughly municipal character; there is some originality in the treatment of the cupola, and the sculpture figures are well put in. The sectional design of the large hall is not very interesting, and the plan is faulty in principle as well as in some of its details. A principal entrance and vestibule should never lead up to the *side* of the principal apartment; there is an anticlimax in such an arrangement; and the cloakrooms are absurd—two small square rooms facing each other, quite inadequate in size and with no lavatories attached. No hall for public gatherings could be satisfactory, or workable at all, with no better provision for the convenience of the audience than this; planning of this kind is merely evading an important practical point. On the other hand, the corridors are well lighted, and the official

lavatories well isolated; but we cannot call this a plan to give a medal to, and we fear plan is not considered at the Academy as much as it ought to be on these occasions.

The two next best designs also make the entrance to the large hall at the side, but No. 197 is a fine plan on the ground floor, and the hall and staircase dignified, but all the entering audience are led to one door only, for the door at the end would be practically only an exit. The design is somewhat too busy and pretentious, but it is effective; the treatment of the end cupolas shows French influence. No. 199 is a very clever and original design, and we are almost disposed to think that it merited the medal. In the exterior there is a fine and effective contrast of masses of masonry with sculptural decoration; the low block in front in the centre is perhaps a little too plain and unadorned, but the whole is original; the large hall is effectively designed, and the cloakrooms are far better planned than in the medal design. The other designs are crude attempts which need not occupy us.

The 25% Upper School prize for "A Set of Architectural Designs" (not quite an accurate description, for here, as in other cases, there is only one design shown by several drawings) has been won by Mr. F. Winton Newman with a design for a pulpit to be executed in marble. This is in a style of detail of the latest fashion, somewhat too thin and rigid in line and proportion, but it has the merit of being exceedingly well suited for marble, and the decorative details are well sketched in. No. 209, a design for the same object, has also merit, and No. 208, a design for a riverside warehouse, is good, though perhaps a little weak in character for a warehouse. How are the subjects for this prize chosen? Two competitors have, as we noticed, sent in designs for the same object, the others for objects widely different. It would seem better to have a selected subject; it is difficult to compare things so diverse as a cathedral pulpit and a riverside warehouse; they have no common denominator, so to speak.

The 10% prize in the Lower School has been well merited by Mr. T. G. Davidson for a "Design for a Country House" with a

very clever and unusual plan, consisting of a centre block chiefly occupied by entrance hall and dining-room, with wings projecting forward on each side in a kind of horn shape, enclosing the forecourt between them. It would perhaps not altogether do to have one of the drawing-room windows looking across the court at the kitchen offices; but nevertheless the plan is a very clever one; the small side windows opening immediately on the kitchen range are a good feature (kitchen ranges are often deficient in lighting), and the planning of the dining-room, with its two doors and its semicircular bays at the opposite ends, is very effective. The treatment of the exterior is quiet and rather deficient in character as compared with the plan.

Although as we think, plan is not generally sufficiently considered in the architectural awards, the Royal Academy has during the last few years recognised the importance of plan in another way, by offering a 10*l.* prize for a plan of a building. There is only one competitor this year (the subject is evidently not an attractive one), Mr. L. U. Grace, who has made a plan of a Casino and Grounds—*i.e.*, a building with dining rooms and a theatre, with a large formal garden laid out around it. The plan would be a very effective one; the entrance especially is finely conceived; but to have the entrance facing north and both the dining-rooms facing full south is a fatal error, notwithstanding the verandah or colonnade in front of the windows. Aspect is an important point in planning, and those dining-rooms would be very hot in summer. Something larger in the way of a drawing-room seems to be required than the small salon opening out of the end of one of the dining-rooms. Though a fine plan in the effective sense, it is not a very practical one, and the question of aspect seems to have been overlooked, as it often is by the Academy architectural students, though we are assured that it is duly brought before them by their instructors.

The silver medal for architectural drawing has been awarded to Mr. Palmer for a very good set of measured drawings of the Trinity House, and the silver medal for perspective drawing (for architects only) to Mr. A. C. Bussom for a drawing of Lord Burlington's villa at Chiswick. He has also submitted a tinted perspective drawing of the front and central vista of the Temple of Theseus, as a study in sciography. The very useful medal for perspective drawing in outline open to painters and sculptors only has this year, we are glad to see, attracted three competitors; it would have been well if there had been more, for that many painters have never properly learned to handle a building in perspective is a point of which one has evidence in almost every picture exhibition. This prize is in this case taken by a lady, Miss Ada Fuller, who we have no doubt will find the knowledge gained in this competition useful to her in future.

There can be no question that the prize work in sculpture composition—the Boadicea subject before referred to—is far away the best of those sent in; it is by Mr. S. N. Babb, who has treated the subject with great dramatic vigour and at the same time entirely with the proper limits of bas-relief sculpture. The relief is in a rather flat monumental manner, perhaps a little influenced by Donatello, though not so

obviously so as in the case of No. 176; who, however, has captured nothing of Donatello but his habit of undercutting low relief figures. No. 177 shows sculpturesque feeling, but is hardly sufficiently worked out. In the competition for a sculpture design (or rather sketch) in the round, "The Expulsion of Adam and Eve," it is noticeable that the first and second prizes have gone to almost the only two competitors who have contented themselves with the human element and omitted the expelling angel. That angel has evidently been a great temptation to most of the competitors, and has led them into sensationalism. The author of the first prize group, Mr. Chrisfield, has shown the two figures walking side by side, their heads bowed, with a consentaneous movement which seems to combine the two into one design with a common *motif*; nothing could be simpler, but its simplicity is its success; it is an admirable design, and we should like to see it worked out life size.

The prize for the cartoon of a draped figure has been taken by a lady student, Miss Gregory, whose figure, in a long black cloak the folds of which are carefully studied, seems to fulfil best the title of the subject—"A Mourner;" but there is a great deal of merit also in the classically draped figure by No. 89; the competition as a whole is a good one. Coming now to the highly interesting mural picture competition, there can be no doubt that the best painting is that by Mr. Eastman to which the prize has been awarded; the colour scheme is fine as a whole, and every figure has been carefully studied. Yet we are not sure whether the second prize design, by Mr. W. E. G. Solomon, does not come nearer to the right way of treating the subject, in the very fact that the figures are less highly-finished, less realistic, more abstract. Spenser, it is true, describes his figures very fully; but after all, they are allegorical personages, and in allegory a degree of detail which can be expressed in words without destroying the poetic element is apt to become too realistic when expressed in painting. One or two of the competitors have fallen into this snare completely, and their pictures only suggest a drawing-room masquerade; there is no glamour about them; and Mr. Eastman's design is just on the verge of the same defect. It merits the prize for its fine and conscientious execution, but we do not know whether Mr. Solomon's is not the more poetic type of treatment, and there is a fine tumult of colour in it too. Mr. Eastman has made a good point in composition by representing his Cupid not riding astride of the lion, as the others have done (and we may add, as Spenser obviously intended), but reclined along the animal's back, and with one of his wings forming a sweeping line above the group; this is a fine element of design, and adds very much to the effect and movement of the whole composition. Among the best of the other designs are those numbered 96 and 99.

The competitors for the "Design in Monochrome for a Figure Picture" (subject, "The Sacrifice of Manoh") are as usual very numerous, and the greater number of them pretty equal in merit and not very remarkable in conception. The one to which the prize has been awarded was not one of the most striking at first sight, but it is certainly the best composed in the relations of the angel and the two other figures; and composition

is the main object of this competition. The Historical Painting competition seems (as usual) to support the view that painting of this class is the most difficult of all the arts; it is rarely that, in the students' competition in this class of work, we come upon any work which can be regarded as a satisfactory picture in itself; it is only the best out of so many attempts. Mr. Murray's picture is exceedingly stoney and melodramatic in colour and treatment, but his witch is good; Mr. Appleyard gets a *proxime accessit* for a painting in which he has represented the witch under the exceedingly improbable semblance of a young and nearly nude woman, whose figure shows good treatment, but the picture as a conception of the scene in the Old Testament is absurd. Mr. Osmond Pittman may be congratulated on having obtained both the landscape prizes, the Turner and the Creswick, and both we think deservedly—certainly at all events as regards the Turner medal. He has selected Putney Bridge as his subject, choosing low water for the sake of the shore and the craft lying on it; as a whole it is a very good landscape, though the bridge is sadly maltreated; of course in a landscape one does not expect a bridge to be architecturally made out, but something more of its real character might be given than Mr. Pittman has given, and of its real colour too, for it is a bridge which, on every occasion that we have seen, always looks *white* in the scene, not the colour it is shown here. In the Creswick competition Mr. Pittman's is unquestionably the most finished work, but it does not exactly meet the terms of the subject, "Cumulus Clouds over a Fen Country"; it is not a fen country. The picture numbered 25 has more power of pictorial effect and is more in keeping with the terms of the competition, but it must be admitted that it is somewhat crude in execution. In neither the Turner nor the Creswick competition was the general average of work good; and it seldom is.

The address which was delivered by the President at the distribution of the prizes was full of wise and thoughtful criticism, especially directed against the present craze for originality (or what is thought to be such) at all costs. Sir E. Poynter specially warned the students against the idea that originality could be produced by throwing aside all the best traditions of art. To adopt the pattern of design or colour or the startling methods of execution of some eccentric painter in vogue, showed no whit more originality than to follow in the steps of the great men of the past. "Such aping of eccentricity might be good for the comic journals, but for serious art never. . . . Let them get at the heart of their theme, and they would find that they had been original without knowing it:" a sentence which we are glad to see was received with much applause. We earnestly hope the art-students of the Royal Academy will act upon this teaching.

#### NOTES.

THE case of the Attorney-General *v.* Steward & Co., which reached the last stage of litigation in the House of Lords last week, makes one despair of business men, for on the one side was the Admiralty, on the other a limited company, the owners of the Portland quarries, two contracting

Contracts with the Government.

parties who, one would have supposed, would have been able to make arrangements in plain language. The Admiralty sent out tenders for stone in such quantities and at such times as may be required by the Admiralty. The company tendered to supply the stone—approximate amount "about two million tons"—and the Admiralty accepted the tender for the supply "of about two million tons or such quantity as may be required." Before the two million tons was taken the Admiralty gave notice that they needed no more, having given up the work to a contractor. The Court below the House of Lords gave judgment for Steward & Co.; the latter tribunal have reversed these findings, and have held that the contract was not for a specific quantity. The truth is that no two men will construe loose language of the kind alike; each will look at it differently. But the whole of this expensive litigation would have been avoided had the contracting parties said in clear terms what the contract was. No doubt the Admiralty officials merely meant that two millions was the limit required, not necessarily the amount to be taken. Steward & Co. equally genuinely imagined that they had made a contract to supply a definite amount of material. To the ordinary mind it must be confessed the contractors' view seems the most reasonable, but the moral of the affair is that parties to such a contract as this ought to have made their meaning clear in the first instance, and it says little for the business capacity either of the Admiralty or the contractors that they did not put the terms of the contract into less ambiguous language.

**Electrical Traction, Underground Railway.** THE arbitrator's award in the dispute between the Metropolitan and the Metropolitan District railway companies, in regard to the system to be employed for electrical traction, has been given in favour of the "continuous" or "direct" current system advocated by the Metropolitan District Company. We regret the decision, as it will probably delay the application of electrical power to working long-distance railways. As Professor Ewing pointed out, the cost of the copper required by the direct-current system to work a long-distance railway would be absolutely prohibitive. The Ganz scheme for working the Underground Railway was a most attractive one. Circle trains, composed of six cars, the first and last of which were motor-cars, were to give a two and a half minutes' service on the circle, and other trains were to change steam for electric motor-cars outside the circle. The primary motors were to take current at 3,000 volts from two overhead trolley wires on the three-phase system, the rails forming the third conductor. The safety devices that were described by the able engineers of the Ganz Company were excellently designed, and so far as safety from shock is concerned, the advantage, in our opinion, lay with the poly-phase system. The motors were to be used as brakes, as they are in the Valtellina line in Italy, where 30 per cent. of the energy expended in braking is recovered, as the motors act as dynamos during the process. By the ingenious method of working the polyphase motors "in cascade" various speeds could be obtained without the use of the complicated "series-parallel" controller which is necessary with direct currents. The speed at which the

trains would run would enable them to get round the circle in fifty minutes, the maximum speed being twenty-five miles an hour. The weak point in the direct-current system is the necessity of using polyphase currents at the start, and then transforming down by means of rotary converters, introducing an immediate loss of 8 per cent. of the power generated. No one questions that the Underground Railway can be worked by direct currents, but if this system is adopted we shall be surprised if the question of the electrolytic corrosion of gas and water pipes does not demand attention in the immediate future.

**The New York Subway.** COMMENDABLE progress continues to be made towards the completion of the New York Rapid-Transit Subway. This important and difficult work was commenced about February, 1900, and the contract stipulates that it must be finished in August, 1904. Amongst the incidental difficulties of construction there are some of particularly troublesome character. Starting at the busiest centre of traffic in the city, the subway runs for no inconsiderable part of its twenty-mile course beneath many important thoroughfares, in close proximity to the surface. As an essential feature is that street traffic may not be interrupted, it was necessary, before starting the work of actual excavation, to construct a complex system of falsework for supporting the roadways and electric tram-lines, as well as to provide suitably for the network of gas, water, electric, and other conduits. Bearing these things in mind, it would be by no means surprising if the present state of work were to foreshadow a deferred date for completion. To find, on the contrary, that the contractors are several months ahead of their time is as satisfactory as it is unusual. The quantity of earth excavated amounts to 300,000 cubic yards out of the estimated total of 1,700,000 cubic yards; 366,000 cubic yards of rock have been removed out of the total of 1,300,000 cubic yards; and 9,700,000 dols. out of 35,000,000 dols. total had been expended up to November 1 of this year. A site for the power house has already been selected of sufficient area to provide, not only for the extensive plant at present ordered, but for considerable additions that may be required for future development of the subway system. Even at the start the power station will be larger than the 70,000 h.p. plant of the Metropolitan Street Railway, and even larger than the 100,000 h.p. power station of the Manhattan Elevated Railway. Contracts have recently been settled for the boilers, engines, and electric generators, and it is anticipated that the whole undertaking will be in operation in the early months of the year 1904.

**Bridge Painting.** VISITORS to Scotland frequently notice the difference of tint between one part and another of the Forth Bridge, but only those who take the trouble to inquire into the matter know the exact cause of the phenomenon. The fact is that since its completion the bridge has been continually in the hands of the painters, who commenced work at the southern end, and on finally reaching the northern extremity, at the expiration of about three years, once more resumed operations at the original starting point with the same goal in view.

Three such laborious and snail-like journeys have been performed, and the fourth is at present in progress. The Resident Engineer has instituted a complete system of ladders, cradles, and platforms for the painters to work from, motive power being provided by a number of steam hoists and winches. Ladders are attached to the larger struts and ties, and permanent elevators are installed for furnishing access to the loftier parts of the structure. The under side of the roadway is reached from platforms suspended on wire cables stretched at each side of the bridge, and the platforms are drawn along the wires from point to point. Paint is mixed in houses built near the elevators, so that it may be distributed conveniently for use. The satisfactory manner in which the work has been performed is evidenced by the fact that not the slightest sign of deterioration has yet been discovered. Under the present system every detail of the structure is bound to be painted, whether it appears to want it or not. Thus, there is no risk that any out-of-the-way parts can be forgotten, as would certainly be the case if a piecemeal system of work were adopted. There is a weird contrast between modern and ancient bridges. The most magnificent of modern steel structures, the Forth Bridge can only endure by the aid of paint. Stone bridges last for ages without such adventitious aids, as, for example, the bridge built by Trajan at Alcantara, 650 ft. long and 140 ft. above the river, which still survives after braving the elements for 1,800 years.

**The New Delaware Breakwater.** A GREAT engineering achievement is the new breakwater in Delaware Bay, now on the point of completion. This important undertaking affords material for a most striking comparison between old and new methods of construction. The old breakwater, about one mile in length, occupied seventy years in building, and contains about 1,231,587 tons of stone, of which the greatest quantity deposited in any one year was 32,000 tons. Its total cost was 2,807,000 dols., and the accommodation was limited to a comparatively small and shallow harbour, now used by nothing larger than coasting and fishing vessels. The new breakwater, one mile and a half long, was designed in 1892, and has already been practically finished. It contains 1,464,410 tons of stone, laid at the average rate of 32,000 tons per month, the maximum monthly rate being 62,719 tons, and the maximum yearly rate 450,000 tons. Its total cost will not exceed about 2,239,334 dols., and the area of the harbour is 789 acres, of which 552 acres have a minimum low-water depth of 30 ft., and 237 acres a similar depth of 24 ft. In point of time the saving has been very remarkable, especially if we assume that methods of work on the older structure were periodically improved: in material the saving has been nearly 400,000 tons at the original rate per mile, and much more if we take into account the greater depth of the new structure; whilst from a financial point of view the saving is no less than 1,971,166 dols. The reduction of time and cost is due to the employment of powerful machinery both at the quarries and the breakwater, and also to the improved method of construction which has so largely reduced the amount of stone

required. The method in question consists in adopting for the submerged portion of the breakwater a cross-section determined by the action of the sea itself, instead of a much flatter slope, such as was previously believed to be essential. Whilst giving every credit to the engineer responsible for using this form of design, we do not quite concur with the American Press as to its novelty, for the principle is well known to our own marine engineers, who have for many years recognised the desirability of designing their structures in harmony with the working of waves and tides.

**The Profitable Sale of Electricity.** WE hope that the lengthy paper read on Thursday by Mr. Arthur Wright (the Electrical Engineer to the Brighton Corporation) to the Institution of Electrical Engineers will enable electricians to fix upon some standard system of charging consumers for electric light. The prevalence of hazy ideas on the subject is shown by the great diversity of systems in use. Some companies begin by having as many as seven or eight bases for making out their consumers' accounts, which entails great clerical labour, and soon leads to general dissatisfaction. Others, as Mr. Wright says, discourage the use of lamps, and thereby the employment of their own capital, during the time most people require light, by quoting a high evening rate and a low day rate. The cost of supplying electrical energy divides itself into two classes—the cost of getting ready to supply energy, and the cost of continuing to supply energy. Methods of separating the two costs were given, and stress was laid on the importance of only considering the annual costs. In Mr. Wright's opinion, the reason why the present electricity consumers are not so profitable in proportion as ordinary gas consumers is due to the imperfect systems of tariff in vogue, to the practice of only running distributing mains in wealthy neighbourhoods, and to the great initial cost of wiring. He points out that supplying the middle-class districts is the most profitable, as the number of users is so much greater per square mile. The tariff he favours is the maximum demand system in use at Brighton, and it certainly seems to us to be the most equitable one. The opposition to a high initial rate only comes from the unprofitable consumer.

**Baker-street Station.** THE Metropolitan Railway are taking in hand the enlargement of Baker-street Station none too soon. For it is intended to apply to Parliament in the approaching Session for powers by Bill to take the necessary property. It has long been little short of a scandal that a terminal station should have no vehicular outlet but the open street, and that passers-by and passing traffic should be inconvenienced by the railway traffic. The enlargement of the terminal station will, it is to be hoped, improve the circle station, which is altogether too small for its traffic. We are glad to note a considerable improvement in the lighting of some of the stations on the District line, and we are confident that lighter stations would attract traffic, for no one, if he can possibly avoid it, will descend into dark and positively dangerous underground stations.

**The Church of St. Bartholomew, Little Moorfields.** THE Ecclesiastical Commissioners announce that the freehold site and the fabric of the church will shortly be offered for sale at the Auction Mart. The site has frontages to Tenter-street, Moor-lane, and New Union-street, and extends over an area of about 6,300 superficial feet. The benefice is now united with that of St. Giles, Cripplegate Without, and a new church to be dedicated to St. Bartholomew will be erected with the proceeds of the sale. On October 5 last we gave an account of the reinstatement in St. Giles's Church of some of the interior fittings at St. Bartholomew's, which was built by Professor Cockerell, who used much of the materials—comprising the tower, with its singular top-stage—and fittings of Wren's church of St. Bartholomew-by-the-Exchange, pulled down in 1840 for a widening of Threadneedle-street at the building of Tite's Royal Exchange.

**Mr. Weedon's Landscapes.** THE Fine Art Society has on view a collection of water-colour drawings by Mr. A. W. Weedon, of more than average excellence. Mr. Weedon is one of the water-colour artists of the old broad school of handling, and in his best work there is much affinity between his style and that of the late Mr. Wimperis; see "Waste Ground near Lymington" (16), for instance, with its grand clouds floating over a barren moor. Among others of the same type of excellence are "Fittleworth Common" (9), an exceptionally fine little landscape both in composition and in the treatment of the sky; "On the Dunes, Holland" (3); "Coast Road, Bosham Creek" (13); "Peat-bog, Poolewe" (50); and "The Borders of the New Forest" (62). The largest work, which fills the centre space at the end of the room, is "Launching the Boat" (35)—an expanse of flat shore and a great space of windy sky; the boat and figures surrounding it form an incident concentrated at one point in the scene, so as to produce what may be called a strong accent in a scene where all else is sky and shore, in a very fine and effective manner. Other types of subject are well treated; "Richmond Park" (34) is a fine tree picture; there is a fine view of Salisbury (48) from the same point as Turner's "Liber Studiorum" sketch, with the same long low hill in the background; and "Martello Towers near Eastbourne" (55), a work unlike the others, is a beautiful bit of bright sunshine effect. The whole collection is the work of a conscientious and genuine water-colour artist.

**Decorative Paintings for a Church.** THE pictures of Mr. Frederick Shields, now on view at Messrs. Dowdeswell's gallery, painted for the chapel of the Ascension in Hyde Park-place, can only be strictly called decorative in regard to the four single figures of Faith, Hope, Love, and Patience; the larger subjects, in regard to style, are easel pictures, though intended no doubt, in a sense, to constitute church decoration. We cannot say that they are very striking either in conception or colour (so far as the latter quality can be judged of in the artificial light under which they are exhibited); that representing "The Cleansing of the Temple" is very weak, the figure of Christ being totally without energy of ex-

pression or action. In "The Lesson of Forgiveness" there are higher qualities of expression. The four single figures are treated symbolically, and combined with symbolical attributes; these require a certain degree of explanation in the catalogue, which is a weakness in a work of art; the only symbolism fit for painting is that of which the meaning is obvious without literary explanation. The finest and most effective of these figures is "Faith"; but the whole give rather the impression of being painted for their moral significance than for artistic impressiveness. It may be argued that this is the right aim for church paintings, and we do not say that it is not so; only works painted in this spirit must be estimated from the religious and not from the artistic point of view.

**Mr. F. C. PENROSE and Sir J. Norman Lockyer** have been engaged during the past summer in taking observations at Stonehenge, more particularly with the object of ascertaining the date of the erection of the stones, and of investigating the actual or supposed orientation of the remains. We gather that in the result they are inclined to consider that the stones were set up about seventeen hundred years before the Christian era, upon the prior assumption that the structure constituted a solar temple.

#### MAGAZINES AND REVIEWS.

THE *Architectural Record* contains a very interesting and significant article by Mr. Montgomery Schuyler on "Monumental Engineering." The article is partly suggested by the results of a recent competition for a bridge across the Potomac from Washington to Arlington. It constitutes an exceedingly thoughtful criticism on the aesthetic treatment of bridges. The "accepted design," by Mr. Burr (engineer) and Mr. Casey (architect), is somewhat like the Vauxhall Bridge, in so far as the actual construction is a steel-braced one, and the facing a masonry arch with rusticated voussoirs—of better proportions, however, than the Vauxhall design. The competition, says the writer of the article, should have value in bringing about an increasing attention to the appearance of bridges, and in forcing engineers to consider the artistic element in design. "This competition shows us that eminent engineers may be entirely helpless when the element of design is introduced. It is not beyond hope that the looks of municipal bridges may come to be regarded as of as much importance as the looks of other municipal erections, and even that railways will come to consider the appearance of their bridges as well as of their stations. For these works the engineers cannot resort to the architects, but must rely on themselves. When this happy state of things comes about, the question of the artistic training of engineers will settle itself by resolving itself into a question of supply and demand. And then it will be no longer possible for a professed vandal to remain an eminent engineer." It is gratifying thus to find that the movement which is taking place in England in favour of the artistic designing of bridges has its counterpart on the other side of the Atlantic.

The *Berliner Architekturwelt* contains an article on "The Berlin High-level Bridge from an artistic point of view" ("als Kunstwerk"), but the illustrations given show more of eccentricity than art. The new building for the Berlin Handselgesellschaft, by Herr Alfred Messel, is a fine and dignified piece of architecture of the Classic school, with some touches of originality.

In the *Art Journal* Mr. Claude Phillips continues his critical essay on the contents of the Wallace collection, dealing in this number chiefly with the works of Pragonard and Greuze. A short article on the Castle of Neuschwanstein, by Mrs. James Douglas, with illustrations by her husband, introduces us to

a Bavarian castle of singularly romantic beauty of design and position. Under the title "An Artist in Floral Design," Mr. Lewis F. Day introduces us to the work of Mr. Lindsay P. Butterfield, whose designs for tapestry and cretonne, illustrated here, are excellent examples of the application of foliage forms to conventional design.

The *Magazine of Art* contains an article on the later work and studies of Adolf von Menzel, who appears to have taken largely to pencil work in his latter days. Miss Helen Zimmern contributes a short article on the "Trend of Modern Italian Art," which, from her account, appears to be rather largely influenced by northern art, not excepting what is called the "Glasgow School"—not, apparently, with very happy results. An imaginary conversation on "Impressionism: Con. and Pro," is worth reading; and there is an article on the work of "A German Artist in Metal," Herr Albert Reimann, the illustrations of whose work show a great deal of piquant fancy and invention.

The *Artist* includes an article on "The Influence of the Pre-Raphaelites in France"—an influence which we should imagine to be purely imaginary; one on "Auguste Rodin," in the usual spirit of adulation which is fashionable at present; and one on "Two Bohemian Painters," F. Jennewein and E. Holarck. These painters, judging by the illustrations of their works that are given, are possessed of no little power, though they illustrate the present-day tendency to the worship of ugliness and morbidity in art. What is the meaning or charm of the two ridiculous little chromolithographs of houses at Samer (near Boulogne) we fail to comprehend.

Under "The Field of Art" Mr. Russell Sturgis contributes to *Scribner* an article on "Art Societies and Societies of Artists," and the special good they may do or should aim at doing. An article on American portraiture of children, by Mr. Harrison S. Morris, shows in its illustrations some very charming examples of the treatment of children in art. "A Miniature," by Margaret Kendall, showing a little child in his shirt wading in a stream, with a hedge as a background, is something quite original, and there are other very good examples among the illustrations.

The *Century* has an article by Mr. C. Dexter Allen on "The Appeal of the Book-Plate, Antiquarian and Artistic." The illustrations are of course all from American book-plates, of which the best are two by Mr. E. D. French, who appears to be considered the leading American designer in this class of work. That of the New York Yacht Club Library shows a decorative treatment of the stern of a seventeenth-century ship, with decorative water and the name of the club on a panel; the mistake of the design is that you see an anchor and a distant view of the sea through the centre stern window, so that the ship is reduced to a skeleton frame, though a mast and sail are seen above this vacuum. A certain probability should pervade even conventional decorative design. The other we refer to is that of the Grollier Club. In the same artist's design for the Union League Club the decorative detail is admirable, but the perspective view of the interior of the club in the centre of the plate seems out of place. A book-plate should be symbolical, not realistic. The author of the article notes that originally all book-plates were heraldic, and that "the question of the use of the family coat of arms vexes the American very seriously;" not however, as we should have expected, because Republican America despises such vanities (at least it is not so stated), but because of the difficulty of acquiring certainty about the "right to arms," or of getting the "coat" well drawn when this initial difficulty has been got over. "Heraldry is too exact a science to admit of liberties, and it is no small achievement to draw the coat of arms with absolute correctness, and yet with artistic feeling." This is quite true, but one is surprised to read the sentence in an American magazine. The same issue contains some rather striking and effective chromolithograph illustrations to Milton's "L'Allegro," by Mr. Maxfield Parrish.

*Harper* contains an important article by Dr. Waldstein, "New Light on the Parthenon Sculptures." This seems to be substantially the paper which he read before the Hellenic Society last year, in which he drew attention to the photographs of two statues purchased almost accidentally in Rome in 1892 (they are said to have been merely "thrown in" along

with other articles supposed to be more important), and now in the Dresden Sculpture Museum, one of which is so like the general attitude of the Parthenon Kephissos figure, as as to leave no doubt of its having been a copy of it. The other is a complete half-draped female figure, which corresponds in many of its lines with draped female figures at the Parthenon of which only portions remain, and which Dr. Waldstein therefore takes, with great probability, as being a copy of a figure by Phidias of which we have lost the complete original. The same number contains a most interesting article on Rosa Bonheur, by M. Jules Claretie, and one on Snow Crystals, by Mr. Wilson Bentley, accompanied by illustrations of forms of the most beautiful and elaborate symmetry from actual snow crystals, suggesting a new field for the student of decoration.

The *Pall Mall Magazine* contains an article on "London Bridge" as it is and as it will be, by Mr. Hugh B. Philpott, with illustrations by Mr. Hedley Filton. The author has the sense to perceive that we may be paying too high a price for any convenience which the widening of the bridge may bring us: "the 100,000*l.* is a trifle to the city of London; but we have to pay a heavier price in the permanent disfigurement of one of the few great monumental structures our city possesses." That is what many other people will probably discover—after the mischief is done.

The *Engineering Magazine* contains an article by Mr. A. Lazenby on "Advanced Methods in a British Engineering Workshop," the "workshop" being the Victoria works of Messrs. Willans & Robinson. Among the advanced methods it is mentioned that the firm have for a long time been in the habit of standardising their principal productions, and making all corresponding parts of the same size interchangeable. In order to ensure this, the different parts are invariably made in quantities, and an elaborate system of gauges and templates is maintained and a special department forming part of the machine shop is set aside for their manufacture and storage. The following statement as to the relations of the firm with their employees is of interest at the present moment:—

"In dealing with their workmen the company have adopted the premium system so far as is possible. Every standard part has a certain 'reference rate' as a basis of payment, and if the workman produces it more cheaply the difference is divided in equal proportions between himself and the company. Certain regulations are in force for preventing the arbitrary cutting down of rates and so depriving the workman of his reward for increased skill, and the arrangement has been found to work satisfactorily to both sides. In the great engineers' strike of 1899 not a single man left the company's employment, and the only trouble experienced was from the difficulty of obtaining raw material. Most of the members of the staff received a contingent salary, dependent upon the general profits, in addition to the fixed stipend."

*Feilden's Magazine* has an article by Mr. J. H. Dales on "high-speed" engines; not locomotives, but stationary engines working at high speed, and their advantages in economy and safety. The subject is a very interesting one to all who have an interest in machinery at all, and is to be continued. There is also an article on "The Design and Construction of Groynes" by Mr. R. G. Allanson-Winn. The most important point in the paper is the author's advocacy of slanting groynes, rather than groynes at right angles to the sea line; and his reasons for the recommendation, and his experience as to the action of slanting groynes, should be considered.

The *Gentleman's Magazine* contains an interesting historical and archaeological article on "The Three Towers of Grasse," by Mr. F. G. Dunlop-Wallace-Goodbody (we reproduce conscientiously both the hyphens), and in the same number is a paper on "Jewelry (sic) and Gems" by Miss Emily Hill, which contains some information and also some sensible remarks on the aesthetic side of the subject.

In *Knowledge* Mr. W. F. Denning's article on "The Real Paths of Fireballs and Shooting Stars" may assist ordinary observers of these beautiful phenomena to form a clearer conception of the actual scientifically ascertained facts in regard to their flight and distance.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.—Mr. Arthur Evans, for reasons of health, been obliged to postpone his paper on "The Palace of Knossos in Crete," the general meeting of the Institute fixed for Monday, December 16, will not take place.

#### THE ARCHITECTURAL ASSOCIATION DISCUSSION SECTION.

The third meeting of the Discussion Section was held at 56, Great Marlborough-street, W., on the 6th inst., Mr. R. H. Weymouth presiding. The minutes of the last meeting were read and confirmed. During question time several questions were asked and answered by the members.

The Chairman then called upon Mr. Sydney Perks to read a paper entitled "The Ethics of Dilapidations." The discussion was commenced by Mr. Geo. H. Smith, who proposed a vote of thanks to Mr. Perks for his interesting paper, in which the somewhat dry subject of dilapidations had been exhaustively treated. The vote of thanks was seconded by Mr. Trent Brown, who advocated the preparation of a schedule of dilapidations at the commencement of tenancy.

The following gentlemen joined in the discussion, which was of a most instructive nature, viz.,—Messrs. Nicholson, F. G. Buss, C. H. Brodie, W. B. Hopkins, and Louis Jacob.

Mr. Douglass Mathews, who had kindly consented to be present as Special Visitor, then proceeded to sum up the discussion in a practical manner by giving the members the benefit of his experience.

The vote of thanks was carried with acclamation. Mr. Perks having replied, the meeting terminated.

It was announced that the next meeting would be held on Friday, December 20, when Mr. Howard Humphreys will read a paper on "Cement and Cement Testing."

#### ENGINEERING SOCIETIES.

THE INSTITUTION OF JUNIOR ENGINEERS.—There was a crowded attendance at the meeting of this Institution on December 6th, held at the Westminster Palace Hotel, the Chairman (Mr. Percival Marshall) presiding, the paper read being on "Street Railway Construction for Electric Traction," by Mr. F. S. Pilling (member), of Devonport. In introducing the subject, the author pointed out how necessary it was in laying out a tramway scheme to keep well in mind the object of such an undertaking, viz., to attract the largest possible number of passengers. Unless the engineer were familiar with the working of the system from the traffic-manager's point of view, there would ultimately be failure somewhere, preventing the lines from being worked at their full earning capacity. Reference was made to the arrangement of termini as affecting the car mileage, and to the mistake often committed of constructing double junctions between main and branch lines with no provision on the main line at the junction for transferring a car from one line to the other, with the result that when the cars were being distributed in the morning and were returning in the evening, they frequently had a profitless run of perhaps 300 or 400 yards to the nearest cross-over in order to be transferred to the right line outwards or inwards. The objections to constant radius curves were dwelt upon, and the writer showed that the application of railway practice to permanent-way construction for tramways on public highways was a mistake. In considering the construction of the track the difficulty was to make and maintain it in an absolutely rigid condition. The weakness arose in the jointing of the rails, the most satisfactory type of which at present, to meet British requirements, was the girder with a weight of not less than 90 lbs. per yard. Considerations affecting the design of rail section for electric traction purposes were then entered into, and the chemical composition touched upon. In treating the question of rail-joints, and to show the necessity of perfect rigidity in them, the author theoretically investigated the problem of a loaded car meeting with obstruction through an imperfect joint, proving that the defacing force of the blow upon the joint would be equal to that given by a steam hammer, the head of which weighed 4,000 lbs., falling at a velocity of practically 3 ft. per second at the moment of impact. Sole plates were not to be commended. The adoption of a deeper rail section with a very much wider sole than is usually employed, together with the use of deep-ribbed fish-plates secured by means of six pairs of bolts, would probably be found advantageous, the bolts taking the form of copper rivets of large area, compressed into holes

Fig. 2.

MUCH WENLOCK PRIORY, SALOP.

IN the cloister court of the ruined Cluniac monastery at Much Wenlock are the foundations of a building which, when perfect, seems to have been a fountain well and lavatory (fig. 1). It consists of a circular centre 11 ft. in diameter, the sides about 2 ft. 4 in. in height, enclosed at a distance of 4 ft. 6 in. by a wall 2 ft. 2 in. thick, octagonal in shape, with the bases of pierce buttresses and vaulting shafts at the angles. The west side of the octagon coincides with the inner wall of the west alley of the cloister, from which it was evidently approached. The outer octagonal wall exists only for a height of about a couple of feet above the ground line, but from various details now placed on the walls, each side appears to have had an arcade of two bays supported in the centre by the coupled columns, of which a perfect example still exists in the garden near the cloister. A base showing a group of five columns may have formed the central shaft of the west entrance from the cloister.

The face of the circular well or fountain consists chiefly of slabs of stone, 2 ft. 4 in. in height and about 4 in. in thickness, and rubble walling of more recent date. On the east and north sides are two sculptured panels, one with

Fig. 3.—Ornament (reversed) from a Rock Dwelling Illustrated in Mrs. Bishop's Book, "The Yangtze Valley and Beyond."

two saints under a Norman arcade, and the other apparently of slightly later date, with a representation of what appears to be Christ walking on the water. The space between the lower boat and the bottom of the panel is occupied by fishes. Arranged on the walls of the well are several fragments of the lower trough or basin; there are remains of more than one of these. In one example, the outside is covered with elaborate carving of a conventional type (fig. 2), and the inside is arched. Most of these details are here illustrated, and also a ground plan given of the foundations and walls remaining. A ground plan of the abbey (made by Mr. T. L. Worthington) was given in the Builder, May 23, 1885, and the position of the well is shown, although the line of the west walk of the cloister is omitted. Its position, however, is easily shown by the doorways in the north and south walls of the cloister, from the church and frater respectively.

Within a few days of making the drawings

of the well at Much Wenlock, I happened to see Mrs. Bishop's book entitled "The Yangtze Valley and Beyond" (John Murray, 1899). On page 468 a stone frieze from a rock dwelling on the banks of the Min River is described and illustrated, the conventional ornament on it (fig. 3) being identical with that on some of the fragments of the well at Wenlock. The carved stones at Wenlock have all the appearance of having formed part of the building on which they are now placed, and I have so far been unable to get any evidence that they have been brought from abroad.

If the work at Wenlock originally belonged to the well, the exact similarity of pattern is remarkable.

In the carved frieze shown in Mrs. Bishop's book the pattern is the reverse of that at Wenlock. In the tracing here given it has been inverted so that the comparison between the two can be more easily made.

ROLAND W. PAUL.

THE LONDON COUNTY COUNCIL.

THE usual weekly meeting of the London County Council was held on Tuesday in the County Hall, Spring-gardens, Mr. A. M. Torrance, Chairman, presiding.

Strike at Horton Asylum.—Mr. Beachcroft asked the Chairman of the Finance Committee if he had anything to report with reference to the strike which took place at Horton Asylum about three weeks ago, and which caused a number of bricklayers, labourers, and others to be without employment.

Lord Welby said the Works Sub-Committee had received a deputation that day, and had had a full conversation as to the disagreement between the bricklayers and tilers. He hoped the matter would soon be settled.

Overhanging Structures.—Several petitions were presented against the proposed by-laws as to height and weight of shop blinds, lamps, &c., overhanging the footways, and at a later stage of the sitting Mr. Goddard Clarke, Chairman of the Building Act Committee, stated, in reply to Mr. Pomeroy, that the proposed by-laws had been circulated in draft for the observations of Local Authorities, but would not be presented to the Council for discussion until next year. Meanwhile, he might say that the public need not fear any such drastic proposals as had been rumoured.

Loans.—On the recommendation of the Finance Committee it was agreed to lend Battersea Borough Council 10,000l. for electric light installation and 3,815l. for street improvements; the Hackney Borough Council, 35,800l. for electric light installation and dust destructor; the Kensington Borough Council, 14,400l. for street improvement; the Lewisham Borough Council, 1,325l. for laying out an open space; the St. Pancras Borough Council, 18,210l. for electric light installation and meters; the Shoreditch Borough Council, 5,300l. for the erection of lodging-houses; the Westminster City Council, 24,000l. for alterations to the Town Hall; the Mile End Old Town Guardians, 1,575l. for paving works at workhouse; and the Wandsworth and Clapham Guardians, 1,270l. for alterations at the workhouse.

Improvements.—The Improvements Committee recommended, and after discussion it was agreed—(a) That the estimate of 2,614l. submitted by the Finance Committee be approved, and that a contribution be made on the usual conditions of two-thirds of the net cost of the widening of King's-road, Chelsea, at Nos. 157 to 165, Nos. 204 to 230, and Nos. 303 to 341, proposed to be undertaken by the Council of the Metropolitan Borough of Chelsea. (b) That the estimate of 428l. submitted by the Finance Committee be approved, and that a contribution be made on the usual conditions of one-half of the net cost of the widening of Beaufort-street to 50 ft. proposed to be undertaken by the Council of the Metropolitan Borough of Chelsea. It was also agreed that the estimate of 7,550l. submitted by the Finance Committee be approved, and that a contribution be made on the usual conditions of one-half of the net cost of widening Brompton-road between Brompton-square and No. 186, Brompton-road, proposed to be undertaken by the Council of the Metropolitan Borough of Kensington.

Tramways.—The Parliamentary Committee recommended, and it was agreed, that the London County Council (Tramways and Improvements) Bill be approved, that the seal of the Council be affixed to a petition for leave to

closed with the announcement of the visit on Saturday afternoon, December 14, to the Croydon Corporation Combined Electric Light and Traction Works.

SOCIETY OF ENGINEERS.—The forty-eighth annual general meeting of the Society of Engineers was held on December 9, at the offices of the Society, 17, Victoria-street, Westminster. The chair was occupied by Mr. Charles Mason, President. The following gentlemen were duly elected by ballot as the Council and officers for 1902, viz.:—As President, Mr. Percy Griffith; as Vice-Presidents, Messrs. James Patten Barber, David Butler, and Nicholas James West; as ordinary members of Council, Messrs. Joseph Bernays, G. A. Pryce Cuxson, George A. Goodwin, W. H. Holtum, R. St. George Moore, Henry Shirley-Price, Joseph W. Wilson, and Maurice Wilson; as hon. secretary and treasurer, Mr. George Burt; as hon. auditor, Mr. Samuel Wood, F.C.A.

NORTHAMPTON INSTITUTE, CLERKENWELL.—On Friday, the 6th inst., the Marquis of Northampton presented the prizes and certificates awarded to students at the Northampton Institute (City Polytechnic, St. John-street-road, Clerkenwell) during the last session. In his address to the students the Marquis said that in these days of keen foreign competition the provision of a higher standard of technical education was absolutely necessary, and it was the duty of those to whom such opportunities were afforded to make the utmost use of them. They should remember that the true object of education was not merely self-advancement, but the general welfare of the nation, and if it were true that foreigners were ahead of us in the matter of technical education, he was heartily glad the fact was being emphasised, for it would stimulate our efforts to maintain and improve our position.—During the evening the workshops and classrooms of the Institute were open to visitors to view the exhibits and witness demonstrations of the students' ability. In the artistic crafts' department were shown some specimens of decorative metal work for architectural and general purposes. These were executed by instructors and students, and comprised chandeliers, lamps, electroliers, screens, and general fittings of good design and finish. An exhibition of building materials contained examples of plasterers' work and brick arches of varied style at different stages of construction, and a demonstration showed that the work is done with care and accuracy. The permanent exhibits are very interesting, and include a large number of models illustrating the principal styles of architecture, some delicately carved panels and ornaments of French and Flemish origin, and several plaster casts of lock plates belonging to the fifteenth century.

PARISH HALL, COALBROOKDALE, SHROPSHIRE.—This hall has just been completed by the contractor, Mr. T. Pace, of Shrewsbury. Due regard in designing has been paid to its wooded hill surroundings, the materials employed being Ruabon bricks with Grimshill stone dressings and red Lightmoor tiles. The main hall has a semi-octagonal roof with carved and tracered trusses. Mr. Harbottle Reed, of Exeter, is the architect.

bring in the Bill, and that the Bill and petition be deposited pursuant to the Standing Orders of Parliament, with such necessary alterations (if any) in the Bill as the Parliamentary Committee may consider desirable.

The Council seek power to construct the following tramways:—

Seven Sisters-road (existing lines), via Amhurst Park, to Upper Clapton-road (existing lines).

Chelsea Bridge (north end), via Grosvenor-road, to a point near Lambeth Bridge.

Hampstead-road, across Euston-road and along Tottenham Court-road, to a point near Oxford-street.

Edgware-road (from a point near the Marble Arch), to the County boundary at Cricklewood.

Hammersmith Broadway, via Queen's-street, Fulham Palace-road, High-street, Fulham, and Putney Bridge to the Lower Richmond-road.

Along the Victoria Embankment from a point near Westminster Bridge to a point near Blackfriars Bridge.

Along Elgin-avenue, from Maida-vale to Harrow-road.

Clapham Common, south side (existing tramways), via Clapham Common, Battersea-rise, Wandsworth Common, north side, East-hill, and West-hill, to the County boundary in Kingston-road.

Depford (existing tramways), via Blackheath road and hill, Shooter's Hill-road, to the Herbert Hospital, and from thence via Woolwich Common-road, the road to the west of St. George's (garrison) Church into New-road, and Thomas-street and Green's End to Beresford-square, Woolwich, and returning along New-road and Mill-lane to a point in Woolwich Common-road near Nightingale-place. New Cross-road to High-street, Lewisham.

Siratham High-street via Siratham High-road, to the County boundary at Norbury.

Camberwell-green via Denmark Hill, Champion Park, Grove-vale and Lordship-lane, to a point near the intersection of that thoroughfare with Crystal Palace-road.

Trafalgar-road, Greenwich, via Blackheath-lane, to a point near the southern approach to the Blackwall Tunnel.

Herbert Hospital, via Wellhall-lane, to Eltham.

The Bill also seeks powers to run necessary omnibus services, and also to widen various thoroughfares.

The Highways Committee recommended, and it was agreed:—

"That the underground system of electrical traction, submitted by the Highways Committee, be approved for use on the London County Council Tramways between—(a) Kennington-road, at its junction with Westminster Bridge-road, and St. George's Circus; (b) the Elephant and Castle via New and Old Kent-roads, and New Cross-gate; (c) the Elephant and Castle and St. George's Church, Borough, and thence to the junction of New and Old Kent-roads; (d) the Elephant and Castle, via Walworth-road and Camberwell-road, and New Cross-gate; (e) Camberwell Green and the terminus near Vauxhall Bridge; and (f) Kennington Park-road and Brixton-road."

**The Underground Tramways Scheme.**—The Parliamentary Committee also brought up a draft, which they recommended the Council to adopt, of the London County Council (Subways and Tramways) Bill, which proposes the construction of a shallow underground tramway from the Victoria Embankment to Holborn.

The Council approved the Bill.

**View from Richmond-hill.**—The London County Council (General Powers) Bill combines a large variety of subjects, including the purchase of three properties for addition to public parks, the Marble-hill scheme for the preservation of the view from Richmond-hill, and common lodging-houses.

Lt. Col. Monkswell, Chairman of the Parks Committee, stated that the option of purchase by the Council of the Marble-hill estate had been extended to June 30, 1902.

The Bill was approved.

**The Electric Supply Bill.**—This measure deals with the purchase of electric supply undertakings by Local Authorities, and proposes also to give the County Council power to supply electricity in bulk to Borough Councils desiring it.

The Council approved the Bill.

**The Water Purchase Bill.**—The Parliamentary Committee submitted a resolution for a Bill for the purchase by the Council of the undertakings of the eight metropolitan water companies, on similar lines to the rejected projects of previous sessions.

The Council adopted the recommendation of the Committee to proceed with the Bill.

**Rules for Theatres Licensed by the Council.**—The Theatres and Music Halls Committee submitted a revised code of rules and regulations or theatre license by the Council. The fol-

lowing are the rules which principally affect our readers:—

5. All doors and barriers must open outwards.

6. All gangways, passages, and staircases must be kept entirely free from chairs or any other obstructions, whether permanent or temporary.

7. All exit and other doors or openings used by the public for the purposes of exit must be indicated by notices clearly painted to the satisfaction of the Council in 7-in. letters. Such notices must be painted over such doors or openings at a height of at least 6 ft. 9 in. above the floor. The words "No Exit" must be clearly painted to the satisfaction of the Council in 7-in. letters at least 6 ft. 9 in. above the floor, over all doors or openings, which are in sight of the audience, but which do not lead to exits.

8. All doors used for purposes of exit must, if fastened during the time the public are in the building, be secured during such time by automatic bolts only, of a pattern and position to be approved by the Council, and the management must allow the public to leave by all exit doors.

9. All curtains covering doors or in passages must be hung so as not to trail on the ground.

10. An ample water supply, with hose and pipes, shall be available to all parts of the house, where possible on the high-pressure main.

11. All fixed and ordinary gas burners on or about the stage must be furnished with efficient guards; movable and occasional lights must be, where possible, protected in the same manner, and put under charge of persons responsible for lighting, watching, and extinguishing them.

12. All gas pipes must be made of iron or brass.

13. An additional means of lighting for use in the event of the principal system being extinguished must be provided in the auditorium, corridors, passages, exits, and staircases, and if oil or candle lamps are used for this purpose they must be of a pattern to be approved by the Council, properly secured to an unflammable base out of reach of the public. Such lamps must be kept alight during the whole time the public are in the premises, and no mineral oil must be used in them.

14. The rows and lines of lights and gas burners in the wings must commence 4 ft. at least from the level of the stage, and be protected by fixed iron wire guards.

15. Blankets or rugs, and buckets filled with water must be always kept on the stage and in the flies, scene docks and immediate passages approaching the dressing-rooms, ready for instant use, and attention must be directed to them by placards legibly printed or painted and fixed immediately above them. Some person must be held responsible by the management for keeping the blankets or rugs and fire appliances ready for immediate use.

16. Hatchets, hooks, ladders, and other appliances for taking down hanging scenery in case of fire, where such scenery is in use, must be always kept in readiness for immediate use.

17. Information of any outbreak of fire, however slight, must be at once communicated to the Metropolitan Fire Brigade.

18. The corridors must not be used as cloak-rooms, and no pegs for hanging hats and cloaks shall be allowed therein.

19. No decoration, or construction for the purpose of decoration must be employed in dressing-rooms which does not adhere without any cavities to the surface of the wall.

20. All open fireplaces or stoves must be protected by strong fixed iron wire guards and fenders, part of which may be made to open for all necessary purposes.

21. All gas burners within reach of the audience must be protected by glass or wire globes.

22. All gas taps within reach of the public must be made secret.

23. The fire-resisting screen fitted in the proscenium opening must be worked daily in the presence of the audience so as to ensure the arrangements being in proper order.

27. All bangings, curtains, and draperies must be rendered non-inflammable.

30. No structural alteration must be made in the theatre without the sanction of the Council. Plans and particulars of such proposed alterations must be sent to the Clerk of the Council.

31. The manager is held solely and entirely responsible for the carrying out of the above regulations, for the management of the theatre before and behind the curtain, and for the safety of the public and the employees in the event of fire or panic.

33. The following notice to the public shall be printed on the programme of the performance or legibly exhibited in every part of the theatre:—

In accordance with the requirements of the London County Council—

(1) The public may leave the theatre at the end of the performance by all exit doors.

(2) The fireproof screen to the proscenium opening is lowered at least once during every performance to ensure its being in proper working order.

The Report was adopted, with an additional rule, taken from the Lord Chamberlain's regulations, as to the counterweighting of drop scenes and the testing of the apparatus.

**The Proposed American Building in the Strand.**—Mr. Hubbard, Chairman of the Corporate Property Committee, stated, in reply to Mr. R. Williams, that the offer of the American syndicate to lease a large portion of the proposed crescent site in the Strand had been referred to the valuer and the solicitor.

**Tender.**—It was agreed to expend 261l. on repairing portions of the wood paving of the carriage-way of Westminster Bridge.

**Historical Interest in London.**—The Historical Records and Buildings Committee brought up the following Report:—

"Many houses in London are of considerable interest owing to the fact that they have been associated with historical events or distinguished individuals, and, in our opinion, one of the most important matters in which the Council, under the powers of the two Acts of Parliament authorising such work, can with advantage take action, is to arrange for some suitable indication being given of the associations connected with such houses. As a matter of fact, the Society of Arts has for some time past been engaged in work in this direction, and has affixed memorial tablets on thirty-four houses which have been the residences of celebrated men and women. We take this opportunity of expressing our appreciation of the public-spirited action of the Society in the matter, and we think that, if carried out systematically, a very valuable work could in time be accomplished all over London. Unfortunately the Society are not able to give that attention to the work which is desirable, and they have intimated to us that they would very gladly see the work performed by the Council. We have accordingly been in communication with the Society on this latter point, and have now received a letter, in which they express their readiness to place at the Council's disposal whatever information they have collected on the subject, and to afford the Council in the future any assistance in their power. In these circumstances we have no hesitation in recommending the Council to take over the work. In the event of the Council agreeing with our recommendation, we do not propose to incur any expenditure in connexion with the work during the present financial year, but the necessary provision will of course be made in next year's estimates, and we would observe that this would not extend beyond a sum necessary to purchase the required number of wall plates. We recommend—That, subject to the passing of the annual maintenance estimates for 1902-3, the work of indicating houses of historical interest in London be undertaken by the Council, and that it be referred to the Historical Records and Buildings Committee to make the necessary arrangements for the execution of the work."

**Shops and Dwellings, Shoreditch.**—The Housing Committee recommended, and it was agreed:—

"That the sketch plans submitted by the Council of the Metropolitan Borough of Shoreditch of the shops, with dwellings over, proposed to be erected on plots 6, 8, and 10 of the area cleared under the Moira-place and Bumber's-place scheme, be approved, subject (a) to the details of planning as to the water-closets and sculleries, and as to the size of the bedrooms being amended to the satisfaction of the Council's architect, and (b) to any necessary approval under the London Building Acts being subsequently obtained."

The Council adjourned shortly after seven o'clock.

#### ARCHITECTURAL SOCIETIES.

**LIVERPOOL ARCHITECTURAL SOCIETY.**—The members of the Liverpool Architectural Society met at the Law Library, Castle-street, on the 2nd inst., when Mr. C. E. Bateman delivered an address on "Castle Bromwich Church." He dealt in detail with the construction of the church and its chief architectural features, his remarks being illustrated by lantern slides and plans.

**YORK ARCHITECTURAL SOCIETY.**—The members of the York Architectural Society held their annual dinner in the White Swan Hotel, Pavement, recently. Mr. C. H. Channon, F.R.I.B.A., member of the Council of the Royal Institute, presided. The loyal toasts having been honoured, Mr. A. B. Burleigh proposed "The Archbishop of York, the Clergy, and Ministers of all Denominations," the Clergy, and Ministers of all Denominations.

There was, he said, a bond of union between architects and the Church, and there was, or should be, mutual good feeling existing between them. The holy men of yore were architects. Our ministers, our abbays, which, he was sorry to say, were now in ruins, were the work of those men. They were not only architects, but were builders too; they knew how to erect as well as to design. In speaking of the Dean, he said he had a great work in hand—the restoration of York Minster. That building had withstood the ravages of time. Others had

gone to decay, like St. Mary's Abbey, Rievaulx, and Fountains, but York Minster stood to-day the same as when it was completed. Unfortunately, decay was shown in the exterior, and in Mr. Bodley they had one of the ablest men engaged in its restoration; he was not only an architect, but he was an artist. The Dean should have the support of every man in Yorkshire in the great work he had undertaken to restore the Minster.—The Rev. G. H. Hewison responded, and expressed the belief that as fine buildings could be built in the present day as in the Middle Ages if we only had the money to spend on the work of erection.—Mr. A. Pollard proposed "The Royal Institute of British Architects and Allied Societies." Though the parent society was not an educational society, he expressed the hope that the day was not far distant before it would be able to see its way to helping the members to gain a thorough grounding in their profession.—Mr. W. J. Locke, secretary of the Institute, in responding, said that the President and Mr. Alexander Graham, honorary secretary of the Institute, regretted very much their inability to be present. He went on to say that the Royal Institute thoroughly recognised the great aid which the allied societies had given to the Institute. He had heard, and he supposed all present had heard, rumours and complaints perhaps that the Institute existed chiefly for London men and did not pay sufficient attention to the interests of provincial men. He did not think that was the case; they regarded it as a matter of great importance that they should gain the co-operation of their brethren in the provinces. The question of professional status was a very burning one. He supposed that it was the same in York as in other provincial centres. The one cry was, "Our professional position is not recognised by the public." Those at the headquarters of the Royal Institute thoroughly appreciated the fact, and would do all they could to remedy it. One remedy proposed was a matter of vital importance, and that was registration. It was looked on as the panacea for all disabilities under which architects suffered. The Institute had been accused in many quarters of standing in the way of the great principle of registration, but as long as any registration is put forward in which sixty years of strenuous work and diplomas of the Institute were not recognised as the basis, as it were, of the closure to the profession, the Institute would not act. He said that whilst so many qualified members of the profession in England did not join the Royal Institute it would not be in a position to come before Parliament with a cry for registration. He urged the necessity of as many qualified members of the profession as possible coming into the ranks of the Institute. Their professional status needed strengthening and the public needed education in architecture, not only on the artistic side, but on the professional side. Every day brought forward some curious instance of the public ignorance in this respect. It seemed the absolute duty of the profession and the societies which they represented to do all they possibly could to raise the status of the profession.—Mr. Butler Wilson also replied, and spoke of the enormous amount of work which was done at the Royal Institute. He contended that the Institute showed a willingness to help in every way the formation of allied societies, and if those societies took advantage of what was offered to them by the Institute he felt certain that their membership would increase, and the importance of the Royal Institute would increase also. He spoke on the matter of competitions, and expressed himself in favour of the present mode of the President of the Institute appointing assessors. In arranging competitions, it was exceedingly important that the public should be educated to understand that in competitions fair play must be given all round. The Rev. H. Mayall proposed "The York Architectural Society," which was replied to by the President. "Prosperity to the City of York" was proposed by Mr. H. Perkin, and replied to by Alderman Purnell, and this concluded the toast list.

**ARCHITECTURAL AND ARCHEOLOGICAL SOCIETY, NORTHAMPTON AND OLDHAM.**—The fifty-sixth annual meeting of the Architectural and Archeological Society for the Archdeacons of Northampton and Oldham was held at the Society's rooms, Sheep-street, Northampton, on Monday morning. Previous to the meeting a committee meeting was held, when new mem-

bers were elected and books presented to the Society were acknowledged. At the annual meeting the chair was taken by the Rev. A. W. Pulney, and Mr. Wentworth Vernon was elected vice-president in the place of Sir Charles Isham resigned. The committee was re-elected with the addition of the Rev. F. Churchill, and the hon. secs., Mr. C. A. Markham and the Rev. A. K. Pavey, were also re-elected. Mr. J. A. Golch then read a paper on "Renaissance Architecture in Northamptonshire." Mr. Golch said that to many people the word "renaissance" conveyed different meanings, but he desired that it should indicate that period of architecture which was in effect the transition from the Gothic to the Classic. So far as Northamptonshire was concerned, the Italian forms did not seem to have obtained a very great footing except in the matter of tombs. The first example of this work was a piece of panelling and chimney-piece at Deene Hall; and Italian forms affected to a more or less extent church architecture, but they had not very many examples in the county of churches affected by the earlier work of Italian ornaments. Mr. Golch showed photographs and plans of houses of this period, which included Dingley Hall, Holdenby House, Kirby Hall, Apethorpe House, Canons Ashby Hall, Burleigh House, and other well-known examples in the county.

#### ARCHITECTURAL ASSOCIATION OF IRELAND.

—At an ordinary general meeting of this Association, held at 20, Lincoln-place, Dublin, on Tuesday evening, December 3, Mr. G. F. Sheridan in the chair, two short papers were read. The first, by Mr. E. Bradbury (one of the Honorary Secretaries), dealt with Northamptonshire as a field for sketching and study for architects, and in it the lecturer described briefly, and in some cases illustrated by sketches, a large number of churches and old houses in the villages and towns of Northamptonshire. In proposing a vote of thanks to the lecturer, Mr. F. G. Hells suggested that it might be possible to arrange that a party made up of members of the Association should, during the ensuing summer, visit some of the places described, a proposal which met with considerable approval. Mr. T. E. Hindman also gave a short lecture on "Architectural Odds and Ends," in which he described a few strange experiences he had had whilst on sketching trips, and also some interesting, but very little known, facts in connexion with matters of an architectural nature.

#### BIRMINGHAM ARCHITECTURAL ASSOCIATION.

—At the meeting on December 6, the President, Mr. W. H. Bidlake, in the chair, Mr. H. H. Statham read a paper on the "Architectural Treatment of Bridges." He said the question was quite a recent one, for in the Medieval period bridges were only regarded as utilitarian structures and not built to be picturesque, though we might think them picturesque now; and in the modern period bridges till recently were considered almost entirely as practical engineer's work, and in some respects rightly, since foundations in deep water were out of the scope of an architect's experience and education. Recently it had begun to be perceived that bridges in large cities might have an important effect on city architecture, and engineers had got an idea that bridges should be "handsome," but their attempts in the way of design had been exceedingly unfortunate. The question, therefore, had now arisen, whether in England, as in France, architects ought not to be commissioned to take part in the design of such structures. Bridges might be classed under three heads; those entirely of masonry; those of masonry piers and steel spans; and those of steel entirely. The latter were best treated as pure construction, with no attempt at ornament; the structural lines giving the interest to them. Bridges entirely of masonry were among the most fascinating of structures, and had so much of the element of architectural effect in them that even if left quite plain they could not be fine objects. In a city, however, it was not only legitimate but desirable to treat a monumental bridge so as to connect the architecture on the two banks, carrying the architectural effect across the river. And in such bridges it appeared to him that the superstructure was really more architectural than engineering work; and that instead of an engineer being commissioned to build a bridge with an architect to assist him in the architectural details, it might be more rightly put that an architect should be commissioned to build it, with an engineer to lay the founda-

tions. If an architect could not build a large arch, what was the good of him? The treatment of masonry bridges might be considered under the heads of the pier, the arch, the spandrels, and the horizontal or nearly horizontal lines of cornice and parapet. The pier was generally brought out beyond the line of the arch-plane, both for real and apparent solidity; and this projection should be treated as what it really was—a buttress, not as a place for columns or pilasters, especially not such absurd over-grown stumpy columns as they had seen in Blackfriars Bridge and other recent engineering works. The lower portion of the pier, subjected to the stress of the water, should rightly be treated differently from the upper portion, as it had a special function. In a tidal river it should be formed on both faces as a cut-water, but in a stream only the up-stream face should take that form; a certain rounding off on the down-stream side was desirable, but not to make both sides the same, which was like designing the stem and stern of a ship on the same lines. As to the form of the arch, a semi-circular arch, though it looked very well, was impossible in these days, as it did not allow a sufficiently wide waterway. They had the choice of the elliptical or the segmental arch. The former was the finest in appearance, and had the advantage that it gave a higher headway near the piers, and sprung from them tangentially, whereas a wide and shallow segmental arch made a harsh angle with the pier, and had the appearance of being jammed between the piers instead of springing from them. An elliptical arch would be somewhat flatter in the crown than a segmental arch of the same span and rise, and hence required more careful construction. The system of building the soffit of the arch in a series of parallel ribs, often used in mediæval bridges, added an appearance of power to a moderate sized bridge, but in a bridge on the largest scale perhaps it was not so fine as the sweep of the flat unbroken soffit. The treatment of the spandrels of the arches would depend a little on the treatment of the arch. If, as in London Bridge, the rustication of the vousoirs was on the same plane with that of the spandrel masonry, the latter was best left quite plain. If, on the other hand, the vousoirs were strongly accentuated so as to leave a well-defined spandrel, then the spandrel might be a field for decorative treatment, either by the introduction of a medallion or an escutcheon in the centre, or, in the case of a comparatively small bridge, by filling up the space with bas-relief sculpture. On a bridge of the largest size this would hardly do, as the sculpture would have to be on too large a scale, and moreover filling up so large a space with ornamental treatment would destroy the severe and monumental character proper to a great bridge. There was at all events one thing *not* to do with the spandrel—not to fill it up with a panel following the bounding lines of the space. To do that was at once to destroy its masonic character and reduce it to a piece of joinery. In regard to the cornice and parapet lines, if the roadway of a large bridge could be kept perfectly level, as in Waterloo Bridge, then a massive cornice could be used, which would break round the projections of the piers; but where, as in most cases, the roadway had to be a raking line, a heavy cornice should be avoided—it was a feature too rigid for such a position; there should in that case be only a small cornice or corbel-table; and the raking lines of this and of the balustrade should not be carried round the piers, but should stop against them. To mitre the raking cornice and parapet round the piers was a common mistake, and was an illogical and unworkmanlike proceeding; the piers were vertical abutments, and any lines or string-courses on them should be truly horizontal; they should interrupt the rake of the balustrade and not partake of it. A number of lantern slides of various bridges were shown in illustration of the various points mentioned in the paper.

**CHURCH, MARGATE.**—The Archbishop of Canterbury consecrated recently the new district Church of St. Augustine of Canterbury at Margate. The church, which has been built from the designs of Mr. Dalby Reeve, of Margate, has been erected at a present cost of 5,000l. It is of brick, with Bath stone dressings, and consists of nave and aisles, to which it is intended to add an apical canopy at a further cost of 2,000l.

## ARCHÆOLOGICAL SOCIETIES.

ROYAL ARCHÆOLOGICAL INSTITUTE.—At the general meeting on Wednesday, December 4, Mr. Emanuel Green in the chair, Mr. Alfred C. Fryer read a paper on "Fonfs with Representations of the Seven Sacraments," and exhibited ninety-one lantern slides in illustration of his paper. There are twenty-nine fonfs known upon which sculpture representing the seven sacraments have been carved. Sixteen are in Norfolk, eleven in Suffolk, one in Kent, and one in Somerset. The sacrament of Baptism is usually portrayed by the priest immersing a nude infant in an octagonal font, and he is accompanied by acolytes holding the open book of the ritual and the casket of holy oils. The bishop is generally depicted in these fifteenth century fonfs vested in his long rochet and mozetta or tippet when giving Confirmation. In every instance infants are being presented to the bishop and the child is held by the godfather or godmother according as it is a boy or a girl. In the panel representing the Holy Eucharist the sculptor has usually depicted the moment when the priest, standing before the altar, is elevating the chalice or the sacred Host. Candlesticks are found upon four of the altars, and acolytes holding tall flaming torches are depicted on five of the sculptures. At Woodbridge and Great Glenham the priest is communicating a man and a woman who hold a house-cloth before them, while at Farningham the priest is genuflecting after the consecration. The sacrament of Penance is depicted by a priest seated in a chair shaming a kneeling penitent, and is frequently accompanied by an angel with wings spread widely over both priest and penitent. The evil spirit with horned head and dragon wings is departing crestfallen and confounded. When the plaster was removed from the font at Gresham, in Norfolk, the evil spirit is said to have represented so dreadful an appearance that his figure was chipped away, and now only the outline remains. The sacrament of Extreme Unction is administered by a priest who is represented dipping his thumb in the holy oil and anointing the dying person. The sculpture at Gresham shows a circular object placed on the bed, which is doubtless the dish on which four lumps of cotton-wool are placed in the form of a cross, with which the priest wiped the places he had anointed. Holy Orders is portrayed by either the ordination of a priest or deacon. The bishop is generally vested in alb, tunic, dalmatic, chasuble, and mitre, and, holding his pastoral staff in his left hand, he lays his right hand on the head of the kneeling candidate. If a sub-deacon is being ordained a deacon he is vested in a dalmatic, but if a deacon is being raised to the priesthood he is robed in a chasuble. Several ecclesiastics accompany the bishop; one holds the open book of the ritual, another the casket of holy oil, while another is doubtless the archdeacon, whose duty it was to present the candidate or ordination. At Nettlecombe, in Somerset, while the bishop is ordaining a candidate, a barber, dressed in a short tunic, hose, boots, and round hat, is shaving a tonsure on the head of a figure seated on a low bench. The sacrament of Holy Matrimony is usually depicted at that crucial point in the ceremony when the priest is joining the hands of the couple and blessing them. At Brooke we find a woman standing behind the bride holding in her arm a red veil, probably intended for the pall which was held over the newly-married pair from the Sanctus in the celebration of the Holy Eucharist until the conclusion of the nuptial benediction after the Paternoster. At Woodbridge the bridegroom is depicted as placing the ring on the thumb, forefinger, middle finger, and finally leaving it on the third finger of the bride, while the acolyte has partially closed the book, because the priest would say the words for the bridegroom to repeat in English. The eighth panel in these octagonal fonfs is devoted to various subjects: the Crucifixion, Baptism of our Lord, the Last Judgment, the Assumption of the Virgin, &c. These fonfs having representations of the seven sacraments upon them were made about the middle of the fifteenth century. The one at East Dereham was carved in A.D. 1498, and the church accounts state that it cost 12*l.* 13*s.* 9*d.*; but the one at Walsoken was a gift to that church in A.D. 1341. The women are represented in horned head-dresses on many of the fonfs, showing that they were made about the period of Edward IV. The

bridegroom in the panel for Matrimony at Badingham has a round turban cap of the date of about 1485, and at Great Glenham and Woodbridge the women appear in the butterfly headgear, so that these fonfs may be dated about A.D. 1485. The Rev. H. Bedford Pim made some interesting remarks in the discussion on this paper.

BRITISH ARCHÆOLOGICAL ASSOCIATION.—The third meeting of the session was held on Wednesday, December 4, Dr. W. de Gray Birch, Hon. Treasurer, in the chair. A paper was read by Mr. A. R. Goddard upon "The Underground Strong-Room at Richborough," which was well illustrated by carefully drawn plans and conjectural sections of its possible construction. Notwithstanding the numerous explorations that have been made in the *Castrum Rutupiae*, and all the theories suggested by antiquaries as to the reason for and the meaning and purpose of the vast work of masonry near the centre of the *Castrum*, discovered by Mr. Boys in 1792, it still preserves its secret intact; at once the hope and the despair of all who are interested in the Roman chapters of our national history. The recent explorations of Mr. Garstang have fixed the position of the missing wall of the *Castrum* to seaward, and have determined the area enclosed to have been about six acres; and near the middle of this enclosure is situated the remarkable vast platform of concrete, 145 ft. by 104 ft. and 5 ft. in thickness, with its super-imposed cross strips, the broader strips 47 ft. long by 22 ft. wide, about in a line with the Decuman Gate of the station, and the longer strip 87 ft., but only 7 ft. 6 in. wide at right angles to it. The thickness of these strips is 4 ft. 6 in., and they end abruptly, each at an equal distance of about 20 ft. from the edge of the platform. In 1822 the researches of Mr. Gieg revealed the fact that beneath this vast platform there existed a massive building, which he probed to a depth of 21 ft. from the underside of the platform, when water stopped his sinking further. This building is set far back from the outer edges of the platform to an extent of 10 ft. on the north and south sides and 12 ft. on the east and west sides, and thus it escaped the observation of Mr. Boys. In 1813 Mr. Rolfe excavated a passage, some 5 ft. in height and 3 ft. in width, round two sides and partly round the third side of this block, using the overhanging platform as a ceiling, and Mr. Dowker and the Rev. R. Drake in 1865 completed the passage and formed the underground gallery by which the four external sides of the building can now be explored. Mr. Goddard himself remeasured the block last October, and found it to be 126 ft. by 81 ft. What was the purpose of this singular building? Is it solid or is it hollow? No sign of any opening has as yet been discovered. Probing holes, with great labour, have been made in the walls to a depth of 20 ft. at various periods, but none have succeeded in penetrating any sealed enclosure, and the mystery remains unsolved. The platform is entirely covered with a rough coat of mortar 6 in. thick, thus effectually hiding any probable access from the top to any concealed chamber, and this mortar seems to have been intended to receive a marble pavement, as a small portion, *in situ*, was met with by Mr. Garstang. Mr. Goddard exhibited an enlarged drawing of the *Castrum* at Gamzigrad, from Kanitz's "Servia," which has much in common with the station at Richborough, and possesses a massive sub-structure nearly in the same relative position, very solid and conspicuous and still unexcavated. Having reviewed the various theories which have from time to time been set forth by antiquaries as to the purpose of this strange work, Mr. Goddard suggested two other possibilities of its use from the very necessities of the case; first, that it may have been for the storage of water for the use of the garrison and the fleets—a great piscina or reservoir, in fact, and he submitted a conjectural plan and section showing how the water could have been stored in various vaulted chambers, communicating with one another, similar to those at Fornos on the Adriatic, and near Baia, and similar to such a piscina connected with one of the aqueducts near Rome, of which he showed a section. The second possibility is that it may have been the strong room of the station, its *Ararium Rutupiae* was a very important centre, as the great point of connexion with Gaul. Some kind of strong room must have been needed for the bullion or moneys awaiting transport, and there is evidence also of a

mint having been established at Rutupiae. An interesting discussion took place, in which the chairman, Mr. Mill-Stephenson, Mr. Gould, Mr. Compton, and others, took part.

## THE ROYAL ACADEMY PRIZE LIST.

The following is the list of Royal Academy prize-winners in the Students' Competitions for this year:—

Historical Painting (Saul and the Witch of Endor)—1. Samuel, xviii. 7-14—Gold medal and travelling studentship (20*l.*), George Murray; *provincie accessit*, Fred. Appleyard.

Landscape Painting (One of the Bridges over the Thames in London).—Turner Gold Medal and Scholarship (50*l.*), Osmond Pittman.

Landscape Painting (Cumulous Clouds over a Fen Country).—Creswick Prize (30*l.*), Osmond Pittman.

Painting of a Figure from the Life (open to male students only).—Silver Medal—1st, Frank Samuel Eastman; 2nd, Jas. P. Sidney Streetfield.

Painting of a head from the life.—Silver medal, 1st, Gertrude Lindsay; 2nd, Frederick Dallas Barnes.

Painting of a draped figure (open to female students only).—Silver medal, 1st, Lizzie Hands; 2nd, Annie Margaret Page.

Cartoon of a draped figure (A Mourner).—Silver medal and prize (25*l.*), Elsie Gregory.

Design in monochrome for a figure picture (The Sacrifice of Manah—Judges xiii. 19-20).—Armitage Prizes—1st (30*l.*) and bronze medal, Ernest Board; 2nd (10*l.*), Alfred William Sangster.

Design for the decoration of a portion of a public building, (the Maske of Cupid—Spenser's *Païre Quene's* book iii., canto 12, v. to xxvi.).—Prize (20*l.*), Frank Samuel Eastman; *provincie accessit*, William Ewart Gladstone Solomon.

Set of six drawings of a figure from the life (open to male students only).—1st prize (50*l.*) and silver medal, Walter Ernest Webster; 2nd (25*l.*), William George Simmonds; 3rd (15*l.*), Jas. P. Sidney Streetfield; 4th (10*l.*), Frederick George Swaish. (Mr. Streetfield and Mr. Swaish were disqualified owing to having received a superior prize in the same competition before).

Drawing of a head from the life.—Silver medal—1st, Walter Percy Day; 2nd, John Hodgson Lobley.

Drawing of a statue or a group.—Silver medal—1st, John Hodgson Lobley; 2nd, Arthur Bentley Connor.

Perspective drawing in outline (open to painters and sculptors only).—(The Entrance-hall of the Royal Academy).—Silver medal, Ada Gladys Fuller.

Composition in sculpture (Baudicca urging the Britons to avenge her outraged daughters).—Gold medal and travelling studentship (200*l.*), Stanley Nicholson Babb.

Model of a design (The Expulsion of Adam and Eve from Paradise).—1st (30*l.*), Frederic Charles Christfield; 2nd (10*l.*), Frank Ransom.

Set of four models from the life (open to male students only).—1st (50*l.*) and silver medal, Alexander James Leslie; 2nd (20*l.*), Arthur Charles White.

Design for a medal (In Commemoration of the Death of Queen Victoria, with a head of the Queen on the obverse).—Silver medal, George Gilbert Walker.

Model of a bust from the life (open to female students only).—No competition.

Model of a statue or group.—Silver medal—1st, Louis Richard Garbe; 2nd, Elsbeth C. P. Rommel.

Designs in architecture (A town hall for one of the new London Borough Councils).—Gold medal and travelling studentship (200*l.*), Bernard Hugh Webb.

Set of architectural drawings (The Trinity House).—Silver medal—1st, Charles Thomas Palmer; 2nd, Percy Ion Elton.

Set of architectural designs (Upper school).—Prize (25*l.*), Francis Winton Newman.

Set of drawings of an architectural design (Lower school).—Prize (10*l.*), Thomas Gerard Davidson.

Plan of a building (A casino and pleasure grounds on the borders of a lake).—Prize (10*l.*), Lionel Uperton Grace.

Original composition in ornament.—No competition.

Perspective drawing in outline (open to architects only) [Lord Burlington's villa at Chiswick (published in Kent)].—Silver medal, Alfred Charles Bossom.

The Landseer scholarships in painting and sculpture, of 40*l.* a year each, tenable for two years, have been awarded—in painting, to Frank Samuel Eastman, Alfred William Sangster, and Frederick Dallas Barnes (extra); in sculpture, to Charles James Pembworth and Frank Ransom.

THE ART UNION OF LONDON.—The Art Union have produced for their presentation plate this year an etching by Mr. W. L. Wyllie of his large picture of the naval funeral procession of the late Queen, which was exhibited at the last Royal Academy. The etching is a fine reproduction of the picture, though, like all the Art Union's plates, it is of an unnecessary and inconvenient size.

### APPLICATIONS UNDER THE 1894 LONDON BUILDING ACT.

The London County Council on Tuesday dealt with the following applications under the London Building Act, 1894. Unless otherwise stated, consent was given on conditions. The names of applicants are given between parentheses:—

#### Lines of Frontage and Projections.

**Norwood** †—Three houses, with shops on the ground floor, on the west side of Knight's Hill-road, Norwood, at the corner of St. Julian's Farm-road (Mr. H. Blackburn).—Consent.

**Hampstead**.—A timber-framed porch to a house in course of erection on the south-west side of Kidderpore-avenue, Hampstead (Mr. W. A. Burr for Mr. G. Estcourt).—Consent.

**Deptford**.—A one-story addition in front of a factory building at Crown Wharf, Grove-street, Deptford (Mr. A. G. Scott for Messrs. A. G. Scott & Co., Ltd.).—Refused.

#### Width of Way.

**Norwood**.—A one-story coachhouse and stable on the west side of Knight's Hill-mews, West Norwood (Mr. F. G. Baxendale for Mr. Agate).—Consent.

#### Formation of Streets.

**Levisham**.—That an order be issued to Mr. A. W. Osborn, sanctioning the formation or laying out of two new streets for carriage traffic in continuation of Staplehurst-road, and Fernbrook-road, Manor Park, Lee (for Messrs. Johnson & Aldridge).—Agreed.

**Levisham**.—A deviation from the plan sanctioned for the formation of new streets for carriage traffic out of Laleham-road, Catford, on the site of the Catford sports ground, so far as relates to the position of the street to be named Englehart-road, in continuation (Messrs. H. and G. Taylor).—Consent.

**St. Pancras, North**.—A deviation from the plan sanctioned for the formation of a new street for carriage traffic to lead from Highgate-road to Gordon House-road, St. Pancras, so far as relates to the position of the northern portion of such street (Messrs. Boehmer & Gibbs for Mr. A. W. Armstrong).—Consent.

#### Formation of Street, Space at Rear, and Height of Buildings.

**Hampstead**.—That an order be issued to Messrs. Palgrave & Co., sanctioning the formation or laying-out of a carriage-drive on the west side of West End-lane, Hampstead, and the erection on one side of such drive of four blocks of residential flats to exceed in height the width of such drive and with irregular open spaces at the rear of two of the blocks (Messrs. H. Reeves & Co.).—Consent.

The recommendation marked † is contrary to the views of the Local Authority.

## Correspondence.

To the Editor of THE BUILDER.

### "QUESTIONS" IN COMPETITIONS.

Sir,—Will you kindly favour us with space to draw attention to a matter which deserves the serious consideration of the profession generally, and particularly of those members of it whose practice includes competitive work. The conduct of competitions has often formed the subject of comment in your columns, but we do not remember that the point we have in mind has been discussed.

We refer to the opportunity frequently given to competitors to question the promoters upon points not made clear in the conditions issued. So long as questions are confined to this, the legitimate object of the arrangement, perhaps no harm is done, and there is probably no better way of clearing up doubts and ambiguities due to the loose way in which the conditions are frequently drawn up.

But the matter does not end there. In more than one instance recently the opportunity has been taken advantage of by some (whom the nature of the questions asked clearly shows to have been quite incapable of dealing with the design in question at all) to obtain advice upon the disposition of the plan, character of the elevations, and other points upon which each competitor should be left to exercise his discretion. The advantage to which the experience of capable architects entitles them is thus extended to all competitors alike, and ceases to be an advantage.

One competition now in process of being carried out furnishes a case in point. In answer to the promoter's invitation one hundred and thirty-seven questions were submitted for the decision of the assessor. Advice and information were solicited upon every conceivable problem presented by the design, and with the utmost courtesy and impartiality the assessor placed his experienced opinion at the disposal of all alike, in fact rendered it almost unnecessary for competitors to think for themselves at all.

We may, in passing, say that so well were the

conditions drawn up in this case, that we ourselves did not find it necessary to ask a single question; and the sole point on which our plans were affected by the replies to queries involved a definite and distinct breach of the original conditions.

The net result of this convenient arrangement has in this instance been the waste of nearly two months out of the period allowed for completion, and the complete rearrangement of the plans of some who were quite content to adhere to the original conditions.

We hold the opinion very strongly that assessors should either not invite questions at all, or should confine themselves strictly to elucidating points upon which the wording of the conditions admits of more than one interpretation.

We should be glad to hear the opinions of others upon the subject.

We enclose our name, but, as interested parties, prefer for the present to remain **INCÓGNITO**.

\*.\* We quite agree with our correspondent in his general position. An assessor ought to decline to admit frivolous and unnecessary questions, or such as argue professional ignorance on the part of the questioner. Questions should, in short, be confined to the object of understanding fully the requirements of the promoters of the competition.—ED.

### "THE DIRECT EMPLOYMENT OF LABOUR."

SIR,—In view of the immense increase in cost of all building operations during the last few years, it is not to be wondered at that people are casting about in their minds as to the best means of reducing it; nor that the possibility of doing work "without the intervention of a contractor," as the L.C.C. loves to phrase it, should be one of the more plausible advocated.

It is not surprising that "One from the Bench" should be found among these. The British workman dearly loves a "soft" job, and, as a rule, there is no softer billet than one under a County Council, in some Government establishment, or with some rich brewery or landed proprietor. As recent illustrations of this I can call to mind from my own observations the spectacle of five men working a steam-hammer, four of them with pipes in their mouths; five men with a ganger using strenuous efforts to haul an empty 10-gallon oil-drum out of a dock; twenty-seven men in a fitting shop, only two of whom were making any pretence at doing anything; a timber shed erected by a brewer the labour alone on which cost 3s. per cubic foot; a piece of boundary wall built by a gas company which cost for labour only 10s. per rod, &c.

I am, however, a little surprised to find Mr. Blashill seemingly advocating the same theory. One would have thought he would have had more insight into the practical aspect of the matter. Some time ago, you will remember, there was a great outcry against the "middleman," who was supposed to interpose between the manufacturer and the consumer, and pocket the whole of the profits. Seeing, however, that he fulfilled the not altogether useless purpose of taking goods from places where they were not wanted and placing them where they were, he has been permitted to survive, and I have no doubt the contractor will, as Mr. Blashill puts it, be in evidence for some little time to come, if only because he possesses the one thing absolutely essential to the successful carrying-out of an enterprise—experience.

It seems very remarkable to me, who have been in the business since my school days, and still find constant occasion to deplore my lack of experience and foresight, how lightly this is esteemed by architects, journalists, county councillors, and others. They seem to argue thus: You have a building to put up; all that is necessary is to engage a foreman or clerk of works, give him carte-blanche as to plant, materials, and money, and the building will find itself erected. And so it will, but at what cost? I am convinced, and act upon the conviction in my own business, that there is no getting away from the fact that work of whatever description is most economically and efficiently performed by those whose lives and energies have been systematically devoted to the particular description of work required to be done, and that any departure from this rule is most unlikely to result in saving.

When the L.C.C. Works Department was started, the Radical journals informed their confiding readers that a saving of 25 per cent. was the least that would be effected. Their tone nowadays is rather apologetic than otherwise. As a matter of fact, I suppose an contractor who clears a net 5 per cent. on the balance of his good and bad jobs is well satisfied. I have seen it stated that the profits of the late Mr. Brassey averaged no more than 3½ per cent., and surely the services rendered by a contractor, the advantages derived from his experience, and discernment in the selection, organisation, and management of men; provision of ample and suitable plant; foresight; knowledge of prices and value of labour, are well worthy this moderate remuneration. The building owner or his architect, lacking this experience, are as little fitted to carry out a building operation of any size as an amateur yachtman—however clever a navigator—to command the Channel Fleet.

Nor does it follow that one result of dispensing with the contractor will be more satisfactory work. I have noticed that architects are less stern in dealing with the building owner than with builders. I know of one building erected with bricks no builder would have been permitted to use. This, of course, was in opposition to the wishes of the architect, but shows that they—the architects—do not feel themselves so freighted in dealing with the one as the other. Per contra, on the same job, the very best joiners' deals were being used as scaffolding.

No, Sir, the remedy is rather to be looked for in the direction indicated by the writer of the articles in the *Times*, which, I am glad to see, are causing some amount of stir. I fancy the object of your correspondents "Mondamin" and "Provincial" is rather to confuse the issue. No builder would complain if he got an "average" of 400 bricks per day, including labour. The complaint is that this number is not approached in common work, by which, as I take it, your correspondents know well enough, is meant work without face in walls 14 in. thick and upwards. My own experience is that when the job is situated in a district where the Union is non-existent practically twice the amount of work is actually done as in towns where the Union is powerful. **WM. F. WALLIS.**

Maidstone.

SIR,—Referring to the letter of Mr. Thos. Blashill appearing in your last issue on the above subject, there are a few points upon which I venture to think contractors as a body would like to be enlightened, *viz.*—

1. "The contractor may, if he likes, have his yard and workshops, his dead stock and live stock, his machinery and the clerical staff of a large manufacturing establishment; he probably will keep up this system more or less. But it is no more necessary than it is for a joiner to have the old-fashioned box of tools."

2. "There is the saving of the contractor's profit, of his heavy payments for interest."

3. "The owner with money in hand can buy as well as—indeed, I have been told, better than—the contractor who takes even the shortest credit."

4. "He may not unreasonably hope to come out of the business better than he would do if it had been done by contract."

Now, with regard to paragraph 1. I venture to suggest that without his machinery, workshops, &c., the poor contractor would very soon find his business on the decline, and it does not follow that because advertisements for "ready-made joinery, &c." appear in great variety the various workmen would be content to "simply fix it on the building." I know of cases where a contractor has tried the experiment with disastrous results; the workmen and their leaders are not fond of "imported goods," as they are pleased to call them. Have there not been many cases of friction between contractors and employees over "worked York stone" being sent into London for the London mason to "fix only?"

Again, I maintain that at no time has there been greater necessity for an efficient (owing to the ever-increasing difficulties the contractor has to contend with) and large clerical staff in his office than the present.

2. I challenge this statement; it is the old story, but proofs are wanting. There may have been individual cases of saving, but, on the whole, facts point to the contrary being the case.

3. Is there not some misunderstanding here? Surely a merchant is unlikely to supply "casual buyer" at lower prices than a "regular one."

4. My opinion is that that were one told this by a friend and tried the experiment of "direct employment," the result of experience so gained would mean that "coolness might possibly exist between them ever after."

With the greater part of the latter two paragraphs in Mr. Blashill's letter a good many will no doubt agree; still it does occur to me, "Do not people enter into contracts to save money?" If such is not the case, why obtain so many tenders? Is not the main idea generally of so much competition to obtain the lowest possible figure?

GEORGE H. CHAPPELL.

### BOOKS RECEIVED.

THE ROCK TOMBS OF SHEIK SAID (Archæological Survey of Egypt). By N. de G. Davies. (Kegan Paul & Co.)

THE ART OF BUILDING (Weale's Series). By Edward Dobson. Fifteenth edition. Revised by T. P. Allen. (Crosby Lockwood & Son.)

THE LAW RELATING TO FACTORIES AND WORKSHOPS. By William Bowstead. (Sweet & Maxwell.)

MANCHESTER FIRE STATION COMPETITION.—In the plates of the First Premiated design for the above, published in our last issue, the architects' names should have been given as "Messrs. Woodhouse & Willoughby and John Langham," instead of "Messrs. Woodhouse & Willoughby" only.

## Illustrations.

### DESIGN FOR A MEMORIAL TO BRITISH HEROES.

**T**HIS design was the outcome of a suggestion made a few months ago by a daily paper that the nation should subscribe and erect a memorial to our soldiers lost in the war. A Classic design was submitted by me to the Editor, but, owing doubtless to the death of the late Queen, and other matters probably, the scheme is still in abeyance.

This, my second design, consists of a very lofty tower and spire, with a great hall on the ground floor, 100 ft. square, surrounded by smaller chapels, vestibules and ante-chambers, &c. The central tower stands upon the walls of the great hall, and contains a continuous spiral of steps, arranged in flights of six or seven risers, low and broad, with a landing 15 ft. square to each flight. On (and in) the walls all round would be built the monuments and tablets to the memory of our great and worthy dead—scientific, artistic, literary, musical, and naval and military heroes.

The stairway would be supported on each side by an arcade of marble columns and arches, and would be clear of the walls about 3 ft., which space would be arched over at convenient corners for constructional purposes. There would be left in the centre a space of about 50 ft. square, tapering up with the batter of the walls. In a large chamber at the top of the tower, about 250 ft. from the ground, would hang a peal of bells, with one large one for tolling. Outside galleries and corridors would be arranged at the base of the spire, among the pinnacles.

In the chapels below, of which there are eight, burial and memorial services would be held when required. A large organ would be built in the central hall, where the public would be admitted. They could also ascend into the spire, by lifts and staircases, to the topmost stone, which is 550 ft. from the ground. This stone would be hollowed to sufficient capacity to hold four or five persons, with windows or openings all round, from which a magnificent view could be obtained.

The site is, of course, a matter for consideration. I have had in my mind the square enclosed grass plots on the north side of Westminster Abbey; but as good or better might be found in one of the parks. Of the cost it is very difficult, if not impossible, to speak. Many smaller schemes might be added to the interior, which would increase the amount. For instance, a record-room could be arranged beneath the hall. Sacred concerts might be held in the hall, with a little modification of the plan; and rooms for public use, museums, libraries, &c., might be added, if thought fit. Fountains for display and drinking would be arranged outside, and small trees, shrubs, and seats laid out where the architectural features of the building would allow.

E. B. LAMB.

### MANCHESTER FIRE STATION COMPETITION.

#### SECOND PRIZES DESIGN.

WE give this week the elevations and the two principal plans of the design by Mr. George Watson, of Edinburgh, which received the second premium in the competition for the new Fire Station at Manchester.

We commented at some length on the design in the review of the competition in our issue of November 30, to which we may refer our readers.

### SKETCHES FOR HOUSE INTERIORS.

THESE sketches for interiors are by Messrs. Parker and Unwin, whose book on "The Art of Building a House" was recently noticed in our columns.

The sketches were made partly to try the effect of a room before finally completing the plan of the house; and the architects suggest that such a method may often be very usefully employed in order to realise better the effect which the plan of a room will have. In some cases their plans have been modified as the result of such sketches. This seems a good suggestion, worth consideration in working out the design of a house.

Fig. 56.—Non-Automatic Water-to-Carbide Generator.

### COMPETITIONS.

**CAMBERWELL PUBLIC BATHS.**—These baths are to be erected in Old Kent-road, and will comprise two swimming-baths, 130 warm baths, a Turkish bath, and a public wash-house with fifty compartments. The competition was open to the profession generally, Mr. A. Saxon Snell being appointed as assessor. Fifty-two designs were received early in October. The assessor's award (which has been adopted by the Council) is as follows, viz.:—First premium, No. 18, Mr. Harding Payne; second premium, No. 7, Messrs. S. B. Russell and C. E. Mallows; third premium, No. 32, Mr. Dighton Pearson. Mr. Harding Payne has been appointed architect to the building, which is estimated to cost 50,000*l.* The whole of the designs will be on exhibition at the Camberwell Public Baths, Church-street, Camberwell Green, S.E., up to and including Wednesday next.

## The Student's Column.

### GAS AND GAS-FITTINGS.

#### 23.—SOME ACETYLENE GENERATORS.

**A**CETYLENE generators may be divided into two classes:—

1. Non-automatic generators;
2. Automatic generators.

In the first class a gas-holder is provided of sufficient capacity to contain all the gas which can be evolved from the largest charge of carbide which can be placed in the generator; whilst in the second class the rate of generation is dependent upon the rate of consumption, the gas-holder is not usually of sufficient capacity to contain all the gas generated from a charge of carbide, and the supply of water to the carbide, or carbide to water, is automatically stopped when the gas is generated at a more rapid rate than that at which it is being consumed.

During the last six years several hundred forms of apparatus for generating acetylene by the action of water upon carbide, or carbide upon water, have been patented. Of these only a small proportion are now on the market, but the number of survivors is nevertheless too large to admit of a description of each in these columns. A description of four of the different forms of generators in general use at the present time must suffice to illustrate the general principles of generator construction. Of these the first two are non-automatic, and the last two are automatic generators. In some

forms of generator the carbide has to be used in a granulated condition, but as granulated carbide seldom yields so large a volume of acetylene as lump carbide, owing to the loss of gas which occurs when the carbide is crushed and stored, these generators are not, as a rule, economical.

The advantages of non-automatic generators over those of the automatic description are greater simplicity and safety, but they have the disadvantages of being more costly owing to the necessity of providing a gasholder of comparatively large capacity, and of occupying a larger area of ground. When cost is not a primary consideration, non-automatic generators are, in the opinion of the writer, preferable to those of automatic form; but it is an indisputable fact that many automatic generators of a simple description are in operation in many parts of the country and are giving complete satisfaction to their owners.

When selecting a generator, attention should be given to the following points:—

- i. Excessive heating should not occur during the decomposition of the carbide. The lime sludge left after decomposition should not contain yellow compounds, tarry matter, or soot.
- ii. The air space in the generating chamber should be as small as possible, in order to prevent the formation of an explosive mixture of acetylene and air when gas is first generated after recharging.
- iii. No undecomposed carbide should be found in the generator when it is cleaned out.
- iv. All parts of the apparatus should be well constructed in strong and durable material. Generators constructed with old salmon tins by amateur mechanics are liable to lead to disaster. Brass pipes or apparatus should be avoided, but stopcocks of brass may be used.
- v. Not less than 4½ cubic feet of gas should be obtained from every pound of good commercial carbide placed in the generator.
- vi. The gas pressure within the generator should at no time exceed 12 in. of water.

**Non-Automatic Generators.**—The generating apparatus known as "The Ideal" (fig. 56) may be regarded as a type of the simplest and safest class of generators. It is non-automatic, since the admission of water to the carbide is regulated by the manual operation of a cock, and the generator is connected to a gasholder of sufficient capacity to contain all the gas which can be generated from a maximum charge of carbide.

Water from the tank (A) is admitted to the generator (B), in which is situated a perforated basket (C) partially filled with carbide. The basket is introduced into or removed from the

Fig. 57.—Battery of Generators with Condenser for Connection to a Gas-holder of 4,000 Cubic Feet Capacity.

Fig. 58.—Non-Automatic Carbide-to-Water Generator.

generator by taking off the cover, which is held in position by a screw and cross-piece as shown in the illustration. The water slowly rises within the generator, and soon comes in contact with the lower portion of the carbide. Acetylene gas is immediately generated, and passes through a condensing coil (E), from which condensed water is from time to time drawn off. From the condenser the gas passes into the gas-holder (F), or may be passed first through a purifier and then into the gas-holder. When the carbide basket is completely flooded with water, and gas ceases to be evolved, the water-supply cock and the cock (D) between the condenser and the generator are closed, the sludge in the generator is removed by opening the lever cock at the base, the carbide basket is removed and its contents discharged, and the apparatus is then ready to be re-charged.

The water-tank is only slightly raised above the generator, and the gas outlet pipe from the generator is carried up higher than the top of the tank, so that it is impossible for the water to flow over into the condenser. The pipe which admits water into the generator is of very small bore, so that water cannot flow into

the generator very rapidly, and in the event of any obstruction occurring in the outlet pipe from the generator the pressure of the gas within the generator drives back the water from the carbide before the pressure has become considerable.

The illustration (fig. 56) shows a plant intended to supply sixteen acetylene flames, each consuming  $\frac{1}{2}$  cubic foot per hour, for a period of five hours without refilling the holder.

When the quantity of acetylene to be manufactured is large, a number of these small generators are connected in the form of a battery to one large gasholder (fig. 57).

This is preferable to making one large generator to contain all the carbide to be decomposed, because in decomposing a large bulk of carbide in this manner the heat accumulated within the generator during the period of decomposition is apt to be excessive. The generators are sometimes provided with water-jackets, but this is quite unnecessary, since no harm is done if the temperature of the generator does not rise above that which the hand can bear without discomfort, and there is no difficulty in decomposing the whole of the

carbide without exceeding this temperature if the flow of water to the carbide is stopped when necessary. The battery of generators shown in fig. 57 is connected to a suitable condenser, and is adapted to fill a holder of 4,000 cubic feet capacity.

Another form of non-automatic generator is that manufactured by the British Pure Acetylene Gas Syndicate (fig. 58). This apparatus also has the merit of extreme simplicity. The carbide is placed in an iron pot (A) having a lid with a central perforation. This is plunged through a tank (B), which is open to the air, into a water chamber (C) which is closed (by C<sub>1</sub>) from the open air. The water slowly enters the carbide pot through the perforation, and the gas generated bubbles up through the water, and passes through a washer (D), and from thence passes through a pipe (E) to a gas-holder. When employing an apparatus of this type, a certain proportion of acetylene is lost owing to its solubility in water, and the water soon emits a disagreeable odour owing to the solubility of sulphuretted hydrogen, ammonia, and other impurities in the water. The foulness of the water is not, however, a matter of importance when the generator is situated at some distance from the dwelling supplied with acetylene, and the fact that the water removes a considerable proportion of the impurities from the gas is some compensation for the loss of acetylene which occurs.

*Automatic Generators.*—In Strode's "Simplicity" generator (fig. 59), which is manufactured for installations not exceeding twenty lights, water rises to carbide, the supply of water to the carbide being automatically controlled by the rise and fall of the bell of the gasholder. In the illustration, A is the gas-holder tank, B is a tapered gas bell, C the lip for filling the tank with water, D a cylinder for holding the carbide container, E the carbide container attached to D by a bayonet joint, F are trays in which the carbide is placed, G is the gas outlet pipe, H the lid for introducing or removing the carbide container, and J is a trap for condensed water.

Each tray is half filled with carbide and placed in the generator. When the generator cover has been closed, the gasholder tank is slowly filled with water until sufficient gas has been generated to cause the gas bell to rise about 6 in. More water is then added until the water level mark is reached. The apparatus will then work without attention,

Fig. 59.—Automatic Water-to-Carbide Generator.

in consequence lowered, and water ceases to flow into the generating chamber; while if the consumption is more rapid than the generation the bell descends, and, owing to its tapered form causes the displacement of a comparatively large volume of water which flows over into the generating chamber and increases the rate of decomposition of the carbide.

Strode's "Perfect" (fig. 60) generator is another form of automatic generator, but in this case the carbide is dropped into a large volume of water, instead of water being allowed to rise around the carbide. The carbide container (C) is situated above a revolving cone having a spiral chamber into which the carbide falls by its own gravity. The cone is actuated by a water-wheel (D) which discharges carbide into a wire-gauze chamber or strainer (F), which is immersed in the water contained in the generator-tank.

When water is discharged into one of the pockets of the water-wheel until the pocket is filled, the wheel turns a quarter revolution. The discharge of water into the pocket is regulated by the rise and fall of a tapered gasholder bell (M), the walls of which displace the water in the gasholder-tank when the bell descends, and causes it to overflow and be discharged upon the wheel. The water employed to actuate the wheel falls subsequently into the generator-tank (I), which is provided with a suitable overflow.

In order to maintain the necessary quantity of water in the gasholder tank, a water regulating tank fitted with double ball-valves and an overflow, and connected with the water main, is provided. A box-shaped cover (B) slips over the carbide container and water-wheel, and dips some distance into the water, thus forming a gas-tight seal. The container can be charged with carbide by removing the cap (A), water is conveyed from the gasholder tank and discharged over the wheel through the pipe (G), the gas produced passes from the generator to the gasholder through the pipe H.

Fig. 60.—Automatic Carbide-to-Water Generator.

until the whole of the carbide has been decomposed, because when the gas is generated at a faster rate than it is consumed the bell rises and the water level in the tank is while K is the pipe employed for filling the generator tank with water, and L the pipe which conducts the acetylene from the gasholder to the burners,

**Location of Generators.**—Acetylene generators should never be fitted in the basement or any other part of a dwelling, for the operation of cleaning and recharging is always accompanied by the evolution of a disagreeable odour, which is so penetrating that it soon becomes disseminated through the whole building. The generator should be situated in a detached building, and should never be exposed to the action of frost, as the freezing of the water in the gasholder tank or supply cistern would put the apparatus out of action. The carbide may be stored in the generator house on platforms or shelves raised above the floor level, so that if a bucket of water is accidentally upset the water cannot come in contact with the vessels in which the carbide is stored. The generator should be charged in daylight, and no flames should be allowed in the generator house.

The waste sludge should never be passed directly into a sewer, but should be discharged into an open intercepting pit, so that the evolution of gas from any portion of the carbide which may have escaped decomposition in the generator cannot result in the formation of an explosive mixture in a confined space.

#### OBITUARY.

**MR. INNOCENT.**—We regret to announce the death on November 30, at his residence, No. 18, Wellesley-road, of Mr. Charles John Innocent, of No. 23, High-street, Sheffield, in his sixty-third year. Mr. Innocent became an Associate of the Royal Institute of British Architects in 1865; he was elected Fellow in 1880, and for some period was member of the Council. He was a Fellow of the Surveyors' Institution, and had served as President of the Sheffield Society of Architects and Surveyors. He formerly practised in co-partnership with Mr. Thomas Brown, who had been his brother-pupil in the offices of Messrs. Hatfield, Son, & Garland, successors to the late firm of Weightman, Hatfield, & Goldie—both of Sheffield. Together with his former partner, Mr. Innocent found and made his opportunity in the passing of W. E. Forster's Elementary Education Act of 1870; they were the architects of a large number of public elementary schools in Sheffield and around, and in 1874 they published a volume, "Illustrations of Public Elementary Schools," containing drawings of schools designed by them. Amongst Mr. Innocent's architectural works we may instance the following:—Sunday schools, with other buildings, at Carbrook, Sheffield (1887); superintendent's house, offices, probationary home, cottage homes, and children's hospital upon the Goddard Hall estate, at Crabtree, for the Union Guardians, Sheffield (1803-4); alterations and enlargement of the Gleadless-road Schools, Heeley, with a new girls' department and separate cookery and manual instruction departments—opened on February 6, 1889—for the Sheffield School Board; additions and improvements, with two large assembly-rooms for the young men's and young women's institutes, classroom, infants' school-room with gallery, &c., at St. John-street Methodist Church, Sheffield (1807); a Methodist church at the corner of Fulwood-road and Nether Green-road, Rannoor, begun in October of last year; and a Methodist church and schools at Nether Green, for the Sheffield New Connexion. In August, 1894, Mr. Innocent was awarded the second premium for his plans and designs, out of fourteen sets submitted, for the Tinsley Park-road Board Schools. Only a few days before his death he had taken his son, Mr. C. Francis Innocent, into partnership. We may add that Mr. Innocent had been from an early period an enthusiastic member of the local auxiliary forces, and more than forty years ago, with some of his fellow-students at the Sheffield School of Art, took an active share in the establishment of the Engineer Volunteer Corps.

#### GENERAL BUILDING NEWS.

**EMMANUEL CHURCH, SPARKBROOK, BIRMINGHAM.**—The growth of population in Christ Church parish, Sparkbrook, has necessitated the erection of a chapel of ease the corner of Walford and Golden Hillcock roads, on a site presented by the trustees of the Birmingham Churches Fund, and on the 23rd ult. the edifice, which is named Emmanuel Church, was consecrated. The church, which is in the Decorated style, has been built by Messrs. Mottatt & Son, of Camp Hill, in accordance with plans prepared by Mr. W. Hawley Lloyd, architect, of Bennett's Hill, but the whole of the original scheme has not yet been carried out. The site is of sufficient extent to allow of the erection at a future time of other parochial buildings. The church is a brick erection, with stone dressings, and has a bell turret for the accommodation of three bells, and is surrounded by a minaret of stone. When completed the church will accommodate over 700 worshippers, but the present building, which consists of chancel, organ-chamber, vestry, chancel aisle, and two bays, the latter with tracery win-

dows, will seat about 450 persons. The present cost is about 5,000. At the east end there is a traieed window.

**WESLEYAN CHAPEL AND SCHOOLS, WORCESTER.**—A new Wesleyan chapel is being erected in Pump-street, Worcester. At the rear, on property acquired for the purpose, schools will be placed. The school buildings will include an assembly-room and five classrooms, vestries, and a lady's parlour. Beyond will be a yard for the boys and girls. The total outlay is estimated at 8,000. The architect is Mr. Jameson Green, of Liverpool, and the contractors, Messrs. Hopkins & Son, of Birmingham.

**REPAIRS, &c., ST. JOHN'S CHURCH, WOODBRIDGE.**—St. John's Church, at Woodbridge, was reopened recently upon the completion of a scheme of internal improvement. With the exception of the gallery, the whole interior has been resented. The new benches are in teak. The floor is laid with pitch-pine blocks, resting on cement concrete. The floor of the porch is tiled. Two cast-iron columns which supported the front of the organ have been removed, and an oak arching substituted, the heads of the bays being filled in with carved and cusped tracery. The stone pulpit has been lowered about 18 in., while the former small stone shafts and red stone are replaced with others of polished Connecticut green marble. New leaded lights have been inserted in all the windows; the gas is now laid on—the church having been hitherto lighted by oil lamps—and the burners are on wrought-iron and polished brass standards and brackets; and an entrance to the vestry through the north end of the east wall, instead of from the apse, as before. The walls are distempered, and the apse is painted and decorated. The central window above the Holy Table contains the figure of a saint in stained glass. The architects were Messrs. Brown & Burgess, of Ipswich. The work at the church was executed by the following firms:—The benches and all joiners' work by Mr. W. T. Smith, of Woodbridge; the concrete, tile floor, and bricklayers' work by Mr. Barrell, of Woodbridge; gas and alterations to pulpit, Mr. Watts, of Colchester; gas and decorative work, Messrs. Alfred Stearn & Son, of Ipswich; new windows in nave, Mr. H. J. Salisbury, of Brompton-road, London; gas standards, Messrs. Jones & Willis, London; carving on bench-ends, &c., by Mr. P. Groom, of Ipswich.

**CONGREGATIONAL CHURCH, MATLOCK.**—At Farley, a suburb of Matlock, on the 30th ult., the foundation-stone was laid of a Congregational church. The contract has been let to Mr. T. Needham, and there is to be provision made, not only for a church, but also for a schoolroom in the basement. Mr. A. E. Falding is the architect.

**NEW CENTRAL POLICE-STATION, HULL.**—At the Hull Town Hall, on the 3rd inst., an inquiry was held by Mr. E. A. Sandford Fawcett, A.M. Inst. C.E. (Local Government Board Inspector), into the application by the Hull Corporation to borrow 30,000*l.* for the provision of a new central police-station, and 5,430*l.* for the erection of stables, &c., at the Scarborough-street depot. There was no opposition to the application. Mr. Hirst, the City Architect, gave evidence to the effect that the plans had been approved by the Home Office. He described the building, and said the walls would be of brick, with stone dressings. The drainage would be to the main sewer street. The Local Government Board Inspector then dealt with the application for the Scarborough-street stables. The Town Clerk stated that what were required were stables, wagon shed, and foreman's residence. The site on which the buildings were to be erected belonged to the Corporation, having been purchased for a refuse-destroyer. The Corporation had taken up the collection of dry dust, and it became necessary for them to purchase horses and carts, and, fortunately, they had sufficient area for the stables. Originally 10,402 square yards of land were bought for the destroyer. Mr. Hirst said that there would be accommodation for forty-seven horses.

**Y.M.C.A. BUILDINGS, LEICESTER.**—The formal opening of the new buildings of the Leicester Young Men's Christian Association took place on the 1st inst. The buildings, which stand on a site on the London-road, have been erected at a cost of about 55,000*l.* from the plans of Messrs. Draper, Walters, & Co., and Mr. A. E. Sawday. The main entrance is from the London-road. The entrance hall gives access to the principal staircase and the cycle-rooms through the area. On the first floor are newspaper-room, library, recreation-room, and refreshment-room, together with committee-room, President's parlour, and offices for the secretary and clerks. These are approached from the main corridor or from the lounge hall at the head of the staircase. Lavatory and cloakroom accommodation are also provided on this floor. The clubrooms, which face the London-road, are arranged *en suite*, so that they may be used for receptions and large meetings of various kinds. The second floor has a large room to hold about 200, which can be used for lectures, classes, or for other meetings. There is a retiring-room in connexion with the above, having a separate approach from the hall. Two classrooms, capable of seating seventy and fifty respectively, are placed so that they may be used in connexion with the large meeting-room. The remainder of this floor is occupied by the residential parlour and five sitting or bedrooms for the use of

members. The third floor contains seventeen bedrooms for residential members in connexion with which bath and lavatory accommodation is provided. The administrative offices are placed on the second floor in the side portion facing East-street. These consist of a large kitchen, connected with the refreshment-room by service chairs and up and down dinner-lift, scullery, larder, &c., with parlours and bedrooms for the caretaker and servants. The Association hall, capable of seating about 750 people, is approached from the London-road and East-street, and made to be used either in connexion with the Y.M.C.A. or let for independent meetings. Two retiring and cloak rooms are arranged in connexion with the hall, and a small kitchen is arranged for the service of teas and light refreshments. In the basement there is a gymnasium 60 ft. by 45 ft., with dressing-rooms, &c., fitted up with shower and plunge baths. The principal rooms are heated by radiators supplied with hot water, but in addition to these open fireplaces are provided.

**TOWN HALL, LIFORD.**—This building, which is situate in the High-road, with a return frontage to Oakfield-road, has just been opened. At the opening ceremony Mr. B. Woolford, the architect, said the principle of the plan was the arrangement of the building into two sections, the business section and the Town Hall section, so that although one building, one section, when in use, would not clash with the other, when in use at the same time. For that reason two main entrances had been provided, one giving access to the Council offices, and the other to the Town Hall. The site had a frontage to the High-road of 115 ft., and to the Oakfield-road of 105 ft. The building, when complete, will have two symmetrical fronts, the Oakfield-road front being at present incomplete. The elevations are of Bath stone, with copper domes. The height of the parapet is 43 ft., and at the highest point the building is 86 ft. In the office portion, on the ground floor rooms are provided for rate collectors, surveyor, accountant, sanitary inspector, medical officer, road foreman and clerk of the works, who work in connexion with the surveyor and sanitary inspector. There are also two fireproof strong-rooms. On the floor above, approached by a stone staircase, are arranged the Council chamber, a room 40 ft. by 30 ft., two committee-rooms, a chairman's parlour, an ante-room, and a suite of offices for the Clerk of the Council. These rooms, and those on the ground floor, are all connected by means of speaking tubes. There is a secondary staircase at the rear of the Council chamber, for the use of the public attending the Council meetings, approached from the Oakfield-road, and communicating with the ground floor. There is a suite of rooms for the caretaker on the top floor, and a basement with heating chambers, &c., under a portion of the back part of the building. In the Town Hall portion there is a hall 50 ft. by 75 ft., with a platform 33 ft. by 18 ft.; two retiring rooms on the same level, and three large rooms under. There is also a gallery 35 ft. by 22 ft. The main entrance is under this gallery, and has a cloakroom on either side. The seating accommodation is estimated at about 1,000. The platform has been raised some 5 ft. Four pairs of double doors at each end, and an extra set in the middle of the room have been provided, and all doors have special panic bolts. Special automatic fire alarms have been fitted up all over the building. The builders are Messrs. G. Sharpe, and the clerk of the works Mr. J. W. Thurlow.

#### FOREIGN.

**FRANCE.**—The Prefect of Police at Paris, M. Lépine, recently organised a competition among the makers of toys for Christmas and New Year's presents, with the view of encouraging them to endeavour to put more artistic style into such articles than is usually found. There has been an exhibition of the work of the competitors in the large hall of the Tribunal of Commerce, and many of the things shown are both ingenious and pretty. Some very eminent artists have even been induced to make designs; there is a monkey modelled by M. Frémiet; French and Russian soldiers by M. Detaille; a "Marchande de jouets" by M. Gérôme; figures of skaters by M. Coutan; and a "Japonaise" by M. Felix Regamy.—The Municipal Council of Paris are continuing the work on the underground railway, and a scheme for a new line is before Parliament. This will detach itself from the Vincennes line at the Palais Royal, and will follow the line of Avenue de l'Opéra, and of Rue Halévy, Rue Lafayette, Rue Chabrol, and Rue Strasbourg, and will pass under the Buttes Chaumont and terminate at the Place du Danube in the NINTH Arrondissement. The first cost will be nearly 10 million francs. The Rue de Rennes, which now ends at the Place St. Germain de Paris, is to be prolonged to the Seine, at a cost of 22 million francs. This will necessitate also the building of a new bridge over the Seine.—M. Moyaux has been elected President of the Société Centrale des Architectes Français for 1901-2.—The Prefect of the Seine has made it an order to the mayors of districts in the Department of the Seine that they are not to allow any monument of a historic or artistic character to be destroyed before the "Vieux

Paris" Committee has been consulted in regard to it.—M. Carrière is just completing four large decorative pictures intended for the Mairie of the NINTH Arrondissement, the subjects being "Marriage," "Birth," "The Family," and "The Return from Labour."—The Société Modernes Beaux-Arts has opened, at the Georges Petit gallery, an interesting exhibition including works by M. Victor Prouvé, by the Flemish painter M. Villbert, and by MM. Millou and Rouault, two remarkably clever pupils of Gustave Moreau; also some sea pieces by M. Détray and views of Paris by M. Houbron.—At Aubervilliers, on the 22nd, is to be opened a large new Salle des Fêtes, built from the designs of MM. Joanny Bernard and Robert.—The jury in the competition opened by the Municipality of Ivry for new school buildings, has awarded the first premium to M. Despeyroux, the second to M. Emile Robert, and the third to MM. Marchi and Letrosne.—The Municipality of Royau is about to open a competition for a Casino and a Salle des Fêtes on the beach at Pontillac.—The annual fine art exhibition at Angers has just been opened.—The Municipality of Lyons intends to establish an underground railway system in that city.—M. Morvan, architect, St. Briens, has been commissioned to build a new Hotel de Ville at Loudac (Gôtes du Nord).—A competition is to be opened for the rebuilding of the museum at Nîmes.—Important restoration works are to be commenced at the old twelfth-century chateau of Laval.—A well-known amateur, the late M. Lutz, has left to the Louvre a curious picture by Boilly representing a gathering of artists at the studio of Isabey.

**INDIA.**—Plans and estimates have been prepared by the Military Works Department for a water-supply scheme for Neemuch.—New barracks and hospitals are about to be erected at Quetta, the Secretary of State having sanctioned the expenditure necessary.—The tenders submitted for building the new Municipal offices, Calcutta, vary so widely that, in order "to institute a fair comparison between them, it has been found desirable to adopt a schedule of quantities, and apply the working rates in the case of each tender to ascertain the cost.—The "paying patients" building of the Presidency General Hospital, Calcutta, is intended to be commenced during the present season.—The Southern India Railway Company propose to erect a large station in the Hindu style of architecture at Egmore terminus.

#### MISCELLANEOUS.

**NO. 16, MAIDA VALE, W.**—Mr. Alfred Gilbert, R.A. is about to dispose of his leasehold interest in the house, No. 16, Maida-vale, with the attached studio and workshops, which he designed and fitted for his own occupation. The property for sale includes the adjoining house, and covers a total area of nearly one acre, with a frontage to the main road.

**THE STRAND IMPROVEMENT.**—On the 6th inst., at the Guildhall, Westminster, Mr. John Troubeck, sitting as High Bailiff, and a special jury had before them the case of "F. and E. J. Hazeldine (trustees of Little, deceased) v. the London County Council" in being a claim for compensation for the compulsory acquisition of the freehold premises No. 7, Windsor-court, Strand, required for the purpose of the new Strand to Holborn avenue. Mr. Edward Boyle, K.C., and Mr. W. C. Ryde were counsel for the claimants; and Mr. Freeman, K.C., represented the London County Council. Mr. Boyle said that the house, which had been let out in tenements, had a frontage to Windsor-court of 28 ft., and the property had been let for 65*l.* per annum. By expending about 100*l.*, however, his client could have increased its value as workshops to 100*l.* a year, and, inasmuch as the court was private property, he contended that cellars could have been constructed to produce at least 20*l.* per annum. His expert witnesses had capitalised those two sums at twenty years' purchase, which, with the 10 per cent. allowed for compulsory sale and after making the usual deductions, would yield 2,550*l.*, which was the amount he asked the jury to award. Mr. Douglas Young, F.S.I., and Mr. W. A. Ball, of Pall Mall East, gave evidence in support of Mr. Boyle's statement. Mr. J. F. Field, ex-President of the Auctioneers' Institution, gave evidence to a similar effect. Mr. Freeman submitted posterous one, and that a little over 100*l.* would amply compensate the claimants. Mr. James Green, of Chancery-lane, gave evidence in support of these figures. The jury awarded the claimants 1,320*l.*, including everything.

**GLASGOW ARCHITECTURAL CRAFTSMEN'S SOCIETY.**—On the 6th inst. a paper was read by Mr. C. Ernest Monto, Vice-President, entitled "Hotel Planning and Construction." The question of site, aspect and prospect was discussed, and following this the position on plan and the general treating of the various public rooms, was illustrated. Among these the coffee-room was important, and should possibly have bay windows, ceiling of good height, say 14 ft., the floor of parquetry, and musicians' gallery provided if desired. The lounge should be situated conveniently to the coffee-room, and designed in a sumptuous if not luxurious manner. The drawing-room also should be of easy access from the coffee-room and have a good outlook. The lecturer recommended the use of double sashes

to these rooms, as also to the reading and writing rooms, to ensure the exclusion of outside sounds. The matter of prospect was also to be considered regarding the bedrooms, as good outlook is desirable to these. The various other rooms, including kitchen, servery, and offices, with the sanitary treatment necessary, were each in turn treated, and the lecture was illustrated by means of plans of several of these buildings erected in Scotland.

**NORTHAMPTON CHURCH EXTENSION SOCIETY.**—The Restoration Committee of the Church Extension Society for the Archdeacons of Northampton and Oldham met at the Society's rooms in Sheep-street, Northampton, on Monday morning, the Rev. A. W. Pulteney presiding, and an application was received asking for assistance in the restoration of Chipping Warden Church, and it was decided to make a grant of 25l. for this purpose.

**APPOINTMENT OF SANITARY OFFICER.**—The Local Government Board has sanctioned the appointment of Mr. W. Tedham as a sanitary inspector in the Metropolitan Borough of Woolwich.

**RECORD BUILDING WORK.**—All records in building have been broken in New York. The entire steel framework of a fifteen-story office building has just been erected at 68, William-street. The work was accomplished in twenty-five days. On November 6 the old building occupying the site was removed and the ground cleared. A huge steel skeleton was then erected, and is now ready for the stone and brick work. The building will be fully completed in six weeks from Dec. 6, and the owners then expect to have all the offices filled with tenants.—*Daily Mail.*

**NEW REREDOS, WOODFORD BRIDGE.**—At St. Paul's Church, Woodford Bridge, on Saturday, November 30, the Bishop of St. Alban's dedicated the reredos which has been erected by public subscription as a memorial to the Rev. C. B. Waller, the late vicar. The reredos is of alabaster, and has six *opus sectile* panels, in which are figures of St. Matthew, St. Mark, St. Luke, St. John, St. Peter, and St. Paul. The reredos, and also a credence table which has been erected, were executed by Messrs. Butcher & Axtell. Messrs. J. Powell & Sons, of Whitefriars, were responsible for the *opus sectile* panels. The whole of the work was carried out under the supervision of the architects of the church, Messrs. William G. Bartlett & Son, of London.

#### CAPITAL AND LABOUR.

**MASONS' STRIKE AT PAISLEY.**—After extending over five months the strike of Paisley operative masons has come to an end. It was on July 7 that the strike commenced. The masters had proposed to fix the wages at 9d. per hour, being the same rate as Glasgow. This the Paisley men refused, insisting on a continuance of 9½d., and they then struck work. The men have now accepted the masters' terms.

#### LEGAL.

##### BUILDING BY-LAWS, BLACKPOOL.

At Blackpool on the 1st inst. William Johnson was summoned for an offence against the building by-laws. The case had been adjourned for the Corporation to prove that the defendant was the owner of the premises, which, it was alleged, he had purchased from a builder named Hardman. The premises extended over the building lines.

Mr. Callis, who represented the defendant, admitted he was the owner of the property, but as the offence was committed before he purchased, he could not be held liable. If it were so, nobody would dare buy property in Blackpool for fear of the Corporation coming down upon them for an offence committed by the previous owner. The man who had committed the offence was Hardman, who was now in South Africa, and had the Corporation been able to get at him they would have done so.

Mr. Stevens, the deputy Town Clerk, replied that if what Mr. Callis said was right the whole thing would be a farce, and it would be possible for two men to act in collusion and defeat the aims of the Corporation.

After a lengthy retirement the Bench decided that the offence was committed by Hardman, and the defendant not being liable, the case would be dismissed. Upon the application of Mr. Stevens, the Bench agreed to state a case.—*Lancashire Daily Post.*

##### ACTION BY AN ARCHITECT.

The case of Thompson v. Tolhurst came before Mr. Justice Laurance and a special jury in the King's Bench Division on the 5th inst. It was an action by the plaintiff, an architect, to recover commission alleged to be due to him by the defendant, a solicitor.

It appeared that the plaintiff carried on business as an architect, surveyor, and land agent at South-end, and the defendant was the proprietor of the Warrior-square estate at that place. The son of the defendant, Mr. Bernard Tolhurst, asked the plaintiff to introduce lessees or purchasers, intimating that

the usual rate of remuneration would be paid. The plaintiff's case was that it was agreed that he should have a fixed remuneration of 2½ per cent. for introducing a purchaser, and as to leases, it was left to the usual terms, which were one year's rent. The plaintiff disposed of a plot to a Mr. Burdett, and the Hotel Victoria, which the plaintiff was architect, was built on it, and he was paid commission at 2½ per cent. in January, 1899. The plaintiff then prepared plans for an hotel for another plot and endeavoured to find a purchaser, and ultimately, through Mr. Greenhalgh, introduced a Mr. Hayward, who agreed to take a lease for 99 years at 2,000l. a year ground rent on the terms of erecting an hotel according to plans which the plaintiff had prepared. Mr. Hayward appointed the plaintiff his architect and the Hotel Metropole was built on the site. The plaintiff received something under 3,000l. as architect's fees for his five years' work. When the plaintiff asked for his commission, as he had to pay a share to Mr. Greenhalgh, the defendant's son said that the appointment as architect was the only remuneration to which he was entitled. A sum of 300,000l. had been spent on the building, and the bank which had financed Mr. Hayward had gone into possession. Mr. Hayward had become bankrupt and cannot now be found.

The defence was that the arrangement came to was that the plaintiff was only to be paid for being architect of the building and was not to have any commission, and that, in accordance with this arrangement, the defendant and his son stipulated with Mr. Hayward that the plaintiff was to be appointed architect. As to the commission on the plot sold to Mr. Burdett, the defendant's case was that he was not liable for it, but paid it in case people should say he had behaved shabbily.

Evidence on behalf of the plaintiff was called to prove the custom that on the taking of land on a building lease at a ground rent, the estate agent introducing the person who took the lease was entitled to a commission equal to one year's ground rent, but that where the ground rent was a large sum, as in the present case, there was generally a special arrangement.

The jury awarded the plaintiff 1,300l. and judgment was entered accordingly.

Mr. Duke, K.C., and Mr. Arthur Powell appeared for the plaintiff; and Mr. Bray, K.C., and Mr. George Wallace for the defendant.

#### RECENT PATENTS:

##### ABSTRACTS OF PATENTED INVENTIONS.

14,420.—**METERS (ELECTRICITY):** A. Wright.—A non-return pointer held so as to be movable against a spring by means of fluid frictional connection with the rotating spindle of a supply meter (see No. 17,704, of 1898) constitutes a maximum demand indicator. An axle, regulated with a spiral spring, carries a pointer over a graduated scale, and has a ratchet wheel that engages with a fixed spring-pressed pawl. Unless the pawl is drawn out by the hand it can turn only forwards. To the meter spindle is affixed a cup that holds glycerine or other liquid in which vanes upon the axle turn, and the spindle is geared to a registering-train. For liquid friction air can be substituted by making the vanes of the cup and axle so large that they will pass near to one another.

14,437.—**AN ATTACHMENT FOR T-SQUARES:** H. W. Roberts.—A handle is fitted on to the blade of the T-square, and may also be joined with a cord to a block that is secured to the drawing-board, and has a recess that will fit across the blade; the block, when detached from the T-square, can be used with the cord for setting out ellipses.

14,446.—**VALVES FOR FLUSHING AND OTHER PURPOSES:** R. C. Grundy, T. R. Grundy, and D. Grundy.—The supply pipe is joined to a two-way valve, and has a conical check-valve—the former being formed of an inlet valve which a spring retains upon its seat and has on its spindle a piston that works in an air chamber. The spindle of the outlet valve is joined loosely to the spindle of the inlet valve, which will be drawn on to its seat when the other valve has been opened; the spindle of the outlet valve reaches downwards to the tilting seat of the closet. As the seat is depressed the outlet valve will become shut and the inlet valve will open so as to allow water to flow into the container, which will be discharged through the outlet valve as the seat rises.

14,476.—**A WINDOW-FASTENER:** H. C. Crouch.—A spring presses a bolt into engagement with the groove of the sash-frame; the bolt is enclosed in a casing upon the lower sash, and can be withdrawn with a lever, the key of which is controlled with a spring, and, being passed through the casing, will fit any one of a set of holes in the upper sash; a projection from the adjustable head of the key will engage with holes in a plate fastened to the sash; in the one position the key can freely engage with the sash, and in the others it is retained out of engagement.

14,483.—**AN APPLIANCE FOR USE IN DRAWING, SKETCHING, &c.:** H. Sheaf.—Two graduated scales are pivoted on to another graduated scale at the centre which is the origin of a series of radiating lines marked, as on a protractor, upon the base scale. The extensions of the two other scales

beyond that centre of the pivot are marked with central lines, by which one may read the angles between the scales.

14,486.—**HOT-WATER APPARATUS:** T. Müller and R. Thomas.—The radiator, devised for purposes of a steam-heating system, has a sheet-metal casing fitted with a perforated false bottom, a water-outlet, a steam-inlet, a safety-valve, and a steam whistle. The heat derived from the steam is stored up in fragments of burned clay, kaolin, &c., in the upper portion of the cage which when the steam has been periodically admitted and cut off will radiate the heat.

14,496.—**A GUARD FOR CIRCULAR SAWS AND OTHER WOOD-WORKING MACHINES:** A. Cook.—A roller that will bear against the surface of the wood is carried by a pair of spring arms upon an adjustable frame that can be lifted and lowered, a channel-shaped hood is arranged above the arms and is pierced, in its part above the roller, to allow one to see the cutters—all being placed upon a hinged bracket. For circular saws a spring lever is raised, when required, from the saw-table with a handle so that a roller upon the lever will rest upon the wood as it is being sawn.

14,503.—**FIRE-BRICKS AND BLOCKS:** B. Talbot.—The inventor seeks to obviate the cracking or breaking of acid or basic blocks and bricks in furnaces, gas-retorts, and so on. He soaks them in hydro-carbons, coal-tar, heavy oils, resin, for instance, heated to 100 deg. F. The resin or a hydro-carbon that is solid at ordinary temperatures is melted and used separately, or is added to the tar.

14,550.—**FLUSHING APPARATUS:** H. L. Doulton.—The long leg of a ball-siphon is trapped, and from the air-space in the crown of the siphon an air-pipe extends to a vessel wherein, under normal conditions, it is trapped; a lower vessel is connected with a pipe to the latrine outlet siphon, and contains a float which regulates a valve that communicates from one vessel to the other. As the latrine is filled the overflow passes to the lower vessel, whereupon the float rises to open the valve, to empty the upper vessel, and to untrap the end of the air-pipe. The consequent flush draws air away from the crown of the siphon outlet of the latrine, and so starts the discharge. In one of other modifications the starting of the siphon is effected by the lifting up of a bell which covers the end of the air-pipe.

14,526.—**AN APPLIANCE FOR SLIDING DOORS:** SASHES, &c.: A. E. Alden.—The doors and sashes are hung from ball-bearings. In the case of windows of sliding doors, each of them is fitted with a casting grooved for the balls, and with a screw, a portion of which closes the end of the groove, the balls working upon a ledge; thus the door, which is free at the base, is held up.

14,547.—**CONTRIVANCE FOR USE IN JOINERY WORK, &c.:** H. O. Howorth and F. V. Robinson.—The apparatus is devised for marking out the places for tenons, mortises, and so on, in the making of window sashes, doors, door frames, and similar joinery work. A cross-head is reciprocated vertically above a bed which is affixed to the table, being worked with a treadle framing that is joined by rods to the sleeves that slide upon fixed uprights and support the cross-head; the bed and cross-head carry the adjustable marking cutters, whilst an adjustable gauge-plate and stopping-piece control the position of the woodwork; in a modified form the cross-head and bed can be caused to approach one another horizontally, the gauge-plate being set in a horizontal plane.

14,550.—**INSULATION OF ELECTRICAL CONDUCTORS:** A. Tesla.—The conductors are surrounded with water or some aqueous solution, which is frozen with currents of cold gas, such as carbonic acid, hydrogen, or ammonia. In the case of solid conductors laid in a trough a tube for the cooling gas is also laid down, though it needs not to be used as a conductor. For transformers the coils may be mounted in absorbent media, the cooling gas being taken by the primary in tube shape.

14,620.—**MEANS OF DISINFECTING CLOSET AND SIMILAR BASINS:** F. Lettice.—A receptacle consists of three compartments into one of which the flush is, in part, diverted, and out of which it flows into another compartment that contains liquid disinfectant, some of which is thus forced through a tube into the third compartment, and so to the basin; an overflow pipe of adjustable height, and made of a tube that slides within another, serves as a regulator fitted between two of the divisions of the container.

14,621.—**A LIFT VALVE:** W. Woodland.—A cone-shaped body is screwed into the enlarged lower end of the hollow spindle, and fits on to a conical seating. The spindle is suitably packed within, and a screwed rod is provided for pressing the packing.

14,628.—**A STAGE FOR USE IN HOUSE-Painting, WINDOW-CLEANING, &c.:** T. H. Strater and T. Alder.—Brackets that carry a seat, or stand, are fixed upon the window-sill with clamps, studs, and screws, and hooked pivoted tie-bars carry uprights, which are pivoted to the brackets. The back of the frame, which can be folded up, is hinged at the middle, and also to the seat, and can be extended with hooked bars. The accidental disengagement of the hooks from the studs is prevented with pivoted tumblers. There are slotted guide-bars for the clamps, which are worked with screws mounted

TO CORRESPONDENTS.

J. S. M.—S. S. (Assumptions should have stated).  
 NOTE.—The responsibility of signed articles, letters, and papers read at meetings, rests, of course, with the authors.  
 We cannot undertake to return rejected communications.  
 Letters or communications (beyond mere news items) which have been duplicated for other journals are NOT DESIRED.  
 We are compelled to decline pointing out books and giving addresses.  
 Any communication to write an article is given subject to the approval of the Editor, when written, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.  
 All communications regarding literary and artistic matters should be addressed to THE EDITOR; those relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

TENDERS.

[Communications for insertion under this heading should be addressed to "The Editor," and must reach us not later than 10 a.m. on Thursday, N.B.—We cannot publish tenders unless authenticated either by the architect or the building-owner; and we cannot publish announcements of tenders accepted unless the amount of the tender is given, nor any list in which the lowest tender is under £100, unless in some exceptional cases and for special reasons.]

LONDON.—For the supply of gravel for parks for the London County Council:—

Large table with multiple columns listing gravel suppliers and their prices for various parks and locations in London, including Battersea Park, Chelsea Embankment, Brockwell Park, Clapham Common, Kennington Park, Myatt's Fields, Wandsworth Common, Dulwich Park, Ladywell Recreation Ground, Manor House Gardens, Peckham Rye Park, Telegraph Hill, Plumko Garden, Hampstead Heath, &c., Ravenscourt Park, Waterlow Park, Bethnal Green Gardens, Clissold Park, Highbury Fields, Mill Fields, Meath Gardens, Victoria Park, and Churchyards in the N.E. District.

[On the recommendation of the Parks and Open Spaces Committee of the Council it was agreed, "That, subject to the usual inquiries, the tender of the Crayford Sand and Gravel Pits Co. to supply gravel to the places south of the Thames at the prices set out in the above table, the tenders of Messrs. Boyer & Sons and Messrs. J. Weston & Sons as regards Plumko Garden and Ravenscourt Park respectively, and the tender of Mr. J. E. Clark as regards Waterlow Park, Bethnal Green Gardens, Clissold Park, Highbury Fields, Mill Fields, Meath Gardens, Victoria Park, and the various churchyards in the north-east district be accepted." Inasmuch as the price quoted in the lowest tender for the supply of gravel at Hampstead Heath is rather high, the Committee propose to invite prices afresh for the supply of gravel to this place.]

[See also next page.]

LONDON SCHOOL BOARD TENDERS. At the last meeting of the London School Board, the Works Committee submitted the following lists of tenders. Mr. T. J. Bailey is the Board's Architect:—

 COMPLETE COURSES OF PREPARATION for these Examinations  
 are given, either in class, by correspondence, or in office, by  
 Mr. RICHARD FARBY, F.R.I.A., A.M.I.C.E., &c. Candidates  
 can arrange to commence study at any time. The following table  
 shows the prizes that have been obtained by Mr. FARBY'S  
 pupils at the last seven Examinations:

Institution Prize	1895	1896	1897	1898	1899	1900	1901
Special Prize	—	1897	1898	1899	—	1900	1901
Driver Prize	—	1895	1896	—	1898	1899	1900
Penfold Silver Medal	—	1895	1896	—	1893	1898	1900
Penfold Gold Medal	—	—	—	—	1899	1900	—
Crawley Prize	—	—	—	—	—	—	1901

NOTE.—In 1895 the Crawley Prize was divided between two  
 bracketed winners, one of whom was prepared by Mr. FARBY.  
 The above table shows that of the 42 prizes awarded at the last  
 seven Examinations 24 were obtained by candidates prepared by  
 Mr. FARBY, and 18 by candidates not prepared by him.

For particulars of Work or any other subjects prepared by  
 Mr. FARBY, and list of candidates not prepared by him,  
 with respect to the Examinations, apply to Mr. RICHARD FARBY,  
 F.R.I.A., M.I.C.E., 24, Victoria-street, Westminster. Telephone, 680  
 Westminster.

**R.I.A.S. SOCIETY OF ARCHITECTS,**

R. SURVEYORS' INSTITUTION, and CIVIL ENGINEERS' TECH-  
 NICAL EXAMINATIONS. Preparation by correspondence or in  
 residence. Private Examinations in Streets, Land Surveying, &c.—  
 MIDDLETON & GARDEN, 19, Craven-street, Strand, W.C.

**BILLS OF QUANTITIES, &c.**

LITHOGRAPHED CORRECTLY BY RETURN OF POST. A  
 LIBERAL DISCOUNT OFF USUAL PRICES.  
 PLANS BEST STYLE.

**ALLDAY, LIMITED.**  
 Shakespeare Press, Birmingham.

**R. J. EVERETT & SONS, LITHOGRAPHERS.**

Sole Proprietors of the invention of the late Mr. R. J. EVERETT, so successfully worked by  
 Spragge & Co., Ltd., and their predecessors, and known as  
**THE INK-PHOTO PROCESS,**

which stands unequalled for the effective reproduction of Wash Drawings, Pencil Sketches, Engravings,  
 Silver Prints, &c.  
 Estimates on application to the Works—138, Devonshire-road, FOREST HILL, S.E.

**"THE BUILDER" STUDENT'S SERIES.**

THESE Books, intended primarily for Students in Architecture, Engineering,  
 Surveying, Sanitary Science, &c., will be found of great practical use in  
 the offices of PROFESSIONAL MEN and CONTRACTORS, to whom also they are  
 recommended as suitable for

**CHRISTMAS PRESENTS**

to their ASSISTANTS, PUPILS, CLERKS, CRAFTSMEN, and APPRENTICES.  
 Direct from the Office POST FREE on receipt of remittance.

Just published.  
**SANITARY FITTINGS AND PLUMBING.** By  
 G. LISTER STURGEON, A.B.R.A., M.S.L. &c.  
 212 Illustrations.

In this book an attempt has been made to enunciate the general  
 principles now governing the design of sanitary work in buildings,  
 and also to describe and illustrate the most important modern  
 sanitary fittings and the plumber's work in connexion with them.

Just published.  
**ROADS: Their Construction and Maintenance.**  
 with Special Reference to Road Material. By ALICIA  
 GREENWELL, A.M.I.C.E., F.G.S. &c. and J. V.  
 ELSDEN, B.S.-Lond., F.G.S. 48 Illustrations.

Such space has been devoted to the consideration of the relative  
 value of different kinds of road stone, in the belief that no one can  
 become an efficient road engineer or surveyor unless he understands  
 the nature and properties of the material at his disposal.

**LAND SURVEYING AND LEVELLING.** By  
 ARTHUR WALMSLEY, M.I.C.E., F.S.I., F.R.C.S.Lond.  
 Hon. Assoc. R.I.A.S. 149 Illustrations.

A useful book for a Student, containing not only the usual instruction  
 given in a text-book on this subject, but valuable additions from  
 the author's own experience, and an exhaustive chapter upon Partia-  
 limentary surveying.

**FIELD WORK AND INSTRUMENTS.** By  
 ARTHUR WALMSLEY, M.I.C.E., F.S.I., F.R.C.S.Lond.  
 Hon. Assoc. R.I.A.S. 234 Illustrations.

Gives the Student a practical knowledge of the construction and  
 handling of surveying instruments, and how to deal with their  
 application to the field for setting out work.

**STRESSES AND STRAINS: Their Calculation**  
 and Chart of their Reactions, by  
 Formulas and Graphic Methods. By  
 FREDERIC RICHARD FARROW, F.R.I.A.S. 95 Illustrations.

A handbook for Students, particularly such as are preparing for  
 the examinations of the R.I.A.S., and arranged and intended especially  
 for those whose knowledge of mathematics is limited.

**SPECIFICATIONS FOR BUILDING WORKS.**  
 and How to Write Them. A Manual for  
 ARCHITECTURAL STUDENTS. By FREDERIC RICHARD  
 FARROW, F.R.I.A.S.

Shows the Student how he should write a specification, so that  
 when he has learnt the method and general principles he may apply  
 them to the particular exigencies of any building he may design.

**STRUCTURAL IRON AND STEEL.** A Text-Book  
 for Architects, Engineers, Builders, and Science  
 Students. By W. N. TWELVEEYES, M.I.M.E. 234  
 Illustrations.

In this elementary treatise the author has endeavored to present  
 in a regular sequence some of the most important details relative to  
 iron and steel as applied to structural work.

**QUANTITIES AND QUANTITY TAKING.** By  
 W. E. DAVIS.

A reliable handbook for the Student pure and simple,  
 its scope being limited to the method of procedure in the production  
 of bills of quantities. The examples given, which are unusually  
 simple, will be found to cover almost every phase of the subject.

**CARPENTRY AND JOINERY: A Text-Book for**  
 Architects, Engineers, Surveyors, and  
 Craftsmen. By BANISTER F. FLETCHER,  
 A.R.I.A.S., and H. PHILLIPS FLETCHER, A.R.I.A.S., A.M.I.C.E.  
 421 Illustrations.

Intended for those entering for the examination of the City and  
 Guilds' Institute for Carpenters' Company, and also for students of  
 Certified Carpenters, &c. Also for the examination in these subjects  
 by the R.I.A.S. and the Surveyors' Institution, &c.

**ARCHITECTURAL HYGIENE; or, Sanitary**  
 Science as Applied to Buildings.  
 A Text-Book for Architects, Surveyors, Engineers  
 Medical Officers of Health, Sanitary Inspectors, and Householders. By  
 BANISTER FLETCHER, A.R.I.A.S., and H. PHILLIPS  
 FLETCHER, A.R.I.A.S., A.M.I.C.E. 300 Illustrations.

A complete and readable text-book, treating the subject in all its  
 branches, and intended to be of use to those entering for any ex-  
 amination in Sanitary Science.

London: DOUGLAS FOURDRINER, Office of "The Builder," Catherine-street, W.C.

**"The ARCHITECT'S DIARY," for 1902,**  
 Specially prepared for the use of Architects, Surveyors, and Engineers.

These publications contain not only the usual Diary, ruled and printed to a particular form, specially adapted for professional use, but, in addition, an index, a Note Book, a Rent and Insurance Register, a Cash Book, and a Ledger, with all the usual diary information, and much special matter referring to the various Architects and Engineers' Associations; a digest of all the Acts passed last Session; contain also Cases decided in the Superior Courts of Justice during the Legal year, from November, 1900, to August, 1901, of interest to the Profession; Regulations of the London County Council under the orders of the Council applying to Music, Dancing, Theatre, and other Licences; Complete list of Metropolitan Surveyors and Districts, with Official and Private Addresses; Alphabetical Index to the Practical Statutes, Stamp Duties, &c.; the whole forming in One Volume a complete set of Books for the year. The Editions are:—

- No. 12.—One Page to a day; size, 8 1/2 in. by 5 in. cloth gilt, 4s. 6d. paper 5s.
- No. 13.—Two Pages "With Patent Lock and Key, 3s. extra.

**"The BUILDER'S DIARY," for 1902,**  
 Specially prepared for the use of Builders and Contractors.

No. 11.—Two days to a page, ruled and printed to a special pattern. Also contains Bill Register, Note Book, Rent, Insurance, and Mortgage Register, Cash Book, Ledger, and 139 pages of Tables, of great value to all engaged in the Building Trades. In all, 460 pages, size, 8 1/2 in. by 5 in. bound, whole cloth, gilt, indexed and paged end of Diary

PRICE 4s. 6d.

"The novel and valuable feature of these Diaries is that each volume forms in itself a complete set of books for the year.—Builder."  
 "For use in the office of architects and builders they are better fitted than any diaries with which we are acquainted.—Architect."  
 "Messrs. Hudson & Kearns' Diaries need no recommendation save a trial.—District Architect."  
 "We have used them ourselves throughout the year with much satisfaction, and are glad now to draw attention to the new batch sent us.—Building News."  
 "These Diaries published by Messrs. Hudson & Kearns are quite unrivalled for convenience and comprehensiveness.—Building World."  
 "These Diaries may be said to have introduced the Diaries for the professions for which they are issued.—Illustrated Carpenter and Builder."

Sole Publishers:—HUDSON & KEARNS, 83, Southwark Street, London.

**SANITARY INSPECTORS' EXAMINA-**

TIONS.—A CERTIFICATED INSPECTOR AND ASSOCIATE  
 SANITARY INSPECTOR prepares Candidates for the above  
 Examination by Correspondence. No books required. Success  
 guaranteed. MODEL SOLUTIONS, Illustrations to Examination  
 Questions for 1901.—List, prospectus, testimonials, &c. G. G. HOLMES,  
 No. 27, High-street, Bedford.

**SANITARY INSTITUTE EXAMS.—**

Preparation for the Inspectors' Examination by a system of  
 correspondence teaching. Text-Book or Course, by G. H. CLARKE, R.I.A.S.,  
 Assoc. San. Inst.; Fellow Inst. San. Engineers; Honourable Metallurgist  
 (Copper), Member of the Society of Arts and of Societies Francaise  
 d'Hygiene. See Clarke's Aids—Calculation of Cubic Space, In.;

### The Liverpool Cathedral Question.

As mentioned in our issue of December 7, when giving Mr. Bare's plan for a rearrangement of the proposed cathedral site at Liverpool (page 511 *ante*), that we had

reason to believe that there would be a more systematic opposition to the scheme of the Cathedral Committee than they could well afford to overlook. Since then we have received from the "Liverpool Cathedral Petition Committee" a pamphlet containing their views, and a collection of opinions extracted from various papers and periodicals, in opposition to the Cathedral Committee's proposals, and accompanied by a letter in which they specify the line of action which they intend to take, and their reasons for it. With the pamphlet is bound up a plan of a portion of the city of Liverpool, of which a reduced copy will be found on the next page (fig. 1), and which is intended to show the specially advantageous position of what is called the Monument-place site, the one favoured by the Petition Committee.

The name which is assumed by this committee indicates the line of action which they intend to take if it should become necessary. A Bill in Parliament will be required to authorise the Cathedral Committee to take the St. James's Mount site for the proposed cathedral, and the opposition committee has been formed with the intention, if persuasion and public opinion fail to produce any effect, to petition Parliament against the Bill. The position which the Petition Committee take may be best set forth in their own words:—

"The Petition Committee are not antagonistic towards the erection of a cathedral in Liverpool if it is to be placed upon a suitable site and to be of a worthy character; but they will, as far as they are able to do so, strenuously oppose the foisting upon the nation of a poverty-stricken new cathedral, a site even for which the promoters of the scheme allege they cannot afford to purchase at a comparatively few pounds per yard.

If it be true, as alleged, that there cannot be a cathedral at all unless upon a practically free site, its cheapness due to the deprivation of the citizens of Liverpool of one of the few public recreation-grounds and open spaces which still remain within the heart of the city, then, in the name of the true religion of the nation, the Petition Committee protest against such holding up of the nation to international scorn; and they say "in that case, better no cathedral."

Some of the expressions used in the above quotation may be thought rather exaggerated; but with the closing words we are entirely in agreement. The Cathedral Committee do not understand their business, and have gone into the matter in a wrong-headed and totally ignorant manner from the first. They commenced by entirely ignoring the architect whose design was practically selected in the first competition, and who had every right to expect that he would be the first person consulted in any revival of the scheme for a cathedral for Liverpool. By asking for designs in a special style, and that style the Gothic, they showed themselves entirely out of touch with modern thought and principle in architecture, as well as oblivious of the fact that the requirements of modern worship are in some very important points quite different from those which a mediæval cathedral was built to serve; and on this point of demanding a special style they have been compelled formally at least to give way, though we fear that they are not less determined to select a mediæval design when the time comes, or to select as final competitors those architects who are obviously mediæval in their architectural faith and tendency. They have persisted, in the face of unmistakable expressions of public opinion, in selecting a site which affords no proper view of or approach to the cathedral, and where it would be out of the way of public notice and convenient access—a site, in fact, in which a first-class building, if obtained, would be entirely thrown away; and all this on the miserable ground of economy; as if there could be any use in the world in attempting to build a cheap cathedral. We hear, from private sources, that the Cathedral Committee calculate, after having obtained their cheap site, on erecting the building for 350,000*l.* If they think that

anything worthy of the name of a first-class cathedral can be carried out for that sum they are woefully mistaken—not a penny under the half-million will do it. And is Liverpool, one of the largest and most important cities in the kingdom, to be put off with a second-class cathedral? We do not think that public subscriptions will be forthcoming, on any large scale, in support of such a *fiasco* as this would be. The question does not concern Liverpool only; it concerns the whole country, and more especially all those who are interested in modern English architecture. The manner in which this proposed cathedral is carried out, in regard to scale, style, and design, will have a very important bearing on the advance of modern architecture in this country, and more especially, of course, on church architecture, which at present is by no means in a satisfactory condition.

Turning to the plan which we have reproduced, we may point out the peculiar advantages of position which the Monument-place site affords. It is very near the largest and most central railway station, the London and North-Western terminus at Lime-street; the one by which nearly all visitors from the capital would arrive; for the Midland Railway route from London to Liverpool, though a picturesque, is a roundabout one, and takes considerably longer to travel over. The principal road eastward out of Liverpool, with a tramway route, runs past the north side of the site. The cathedral could be built there with the usual orientation, its entrance front facing west and the choir to the east, while on the site proposed by the Cathedral Committee it is admitted that the building would have to be built with its longer axis north and south; and though, as we have before said, this point is not of the first importance, it has a sentimental value to a good many people, and it would certainly seem a pity that the cathedral should form the one exception among English cathedrals to the east and west position. But the architectural advantages of the Monument-place site (if indeed that of aspect may not be counted among them) are even more important. As will be seen from the plan, the main route

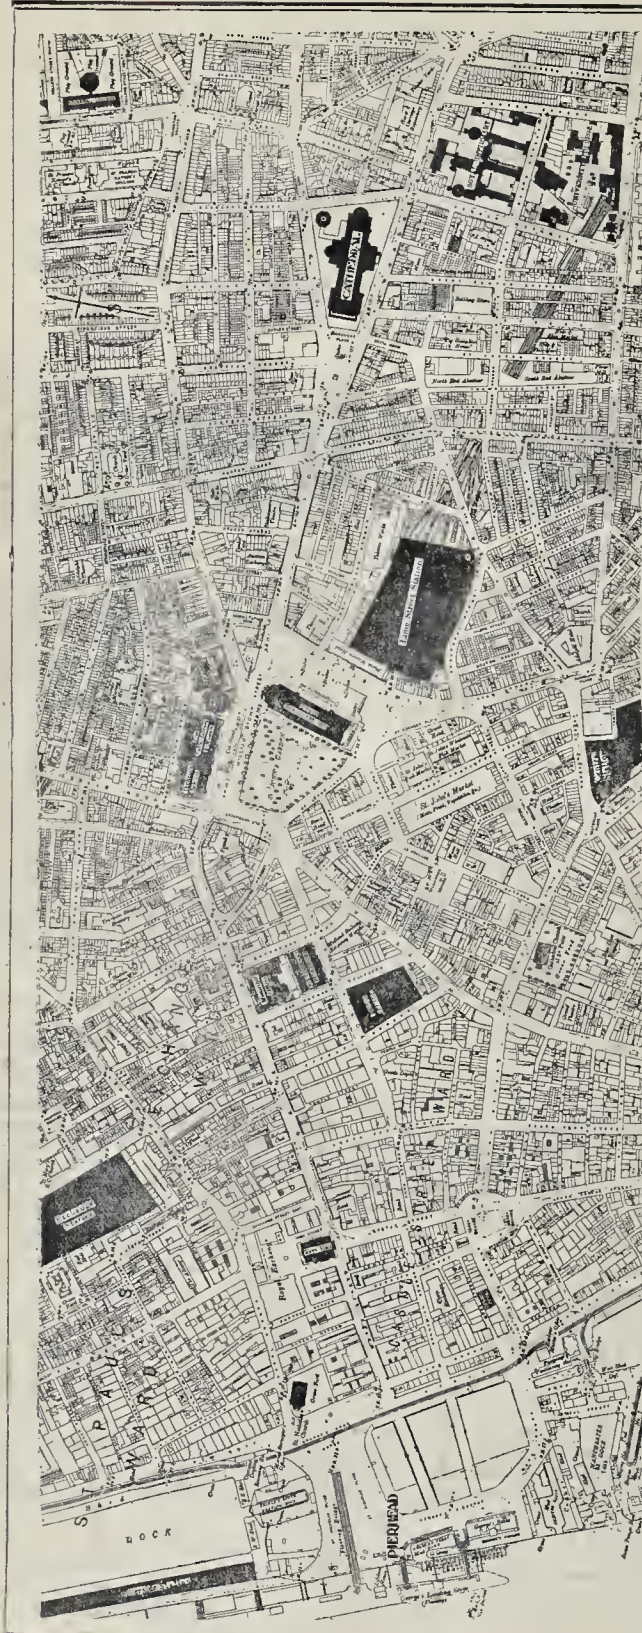

Fig. 1.

from the landing stage at the river would lead directly up to the cathedral, and leads past the Town Hall, the Municipal Offices, St. George's Hall and the group of the Art Gallery and Public Library; so that the cathedral would in this sense be placed in relation with the other principal architectural monuments of the city, and it would be visible from the point between St. George's Hall and the Library group, which may be called the architectural centre of the city, and would have in front of it a wide street leading right up, centrally, to its main façade. The monument, of course (if retained), would have to be moved so as to be on the axis of the cathedral: it is not shown so on this plan.

The St. James's Mount site does not come into this map; it is situated considerably more to the south, and those who know Liverpool will remember that it is not on any important line of route, nor would the cathedral be grouped or connected with any other of the leading buildings of the city. The plan of the site and its approaches, which we also reproduce from the Petition Committee's pamphlet (fig. 2), shows only too plainly how completely unsuited is the site for any architectural effect for a large cathedral. There is no road leading up to it; not point from which an effective distant prospect of it can be obtained, and its west side (what is ritually the south side) faces a collection of poor and narrow streets. As far as architectural effect is concerned there could not be a worse site for an important building, and it is in an out-of-the-way neighbourhood. To build a new cathedral in that situation in Liverpool would be the same kind of thing as if we were to build a new one in London in an out-of-the-way square in Dayswater. The distance from the most important centres is not so great, of course as that would be—distances are so much greater in London; but that supposition conveys about the nature of the site in relation to the more prominent and frequented portions of Liverpool. This should be understood, because subscriptions will no doubt be sought for from the country generally as well as from the Liverpool neighbourhood, and it is no use subscribing towards what, though a cheap cathedral, will for that very reason be a costly mistake.

It may be useful here to reprint the petition to Parliament which the Petition Committee propose to present should all other means of persuasion and argument fail in inducing the Cathedral Committee to change its course. It is as follows:—

*"Objections to the Present Scheme for a Cathedral in Liverpool.*

The following are some of the objections to the present scheme for a cathedral in Liverpool, viz.:—

1. That the site selected, known as St. James' Mount, is—

- NOT CENTRAL;
- NOT READILY ACCESSIBLE;
- NOT COMMANDINGLY PROMINENT;
- WITHOUT VISTAS.

2. That the site selected is a public garden and recreation ground.

That it is an open space.

3. That the ratepayers of Liverpool would be practically contributing to the cost of the cathedral were St. James' Mount site granted at the price suggested.

4. That there is available a site, known as Monument-place site, which possesses none of the above

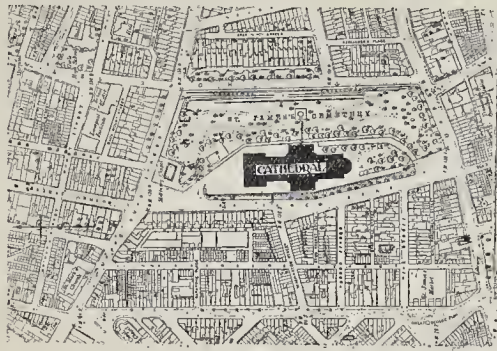

Fig. 2.

objections, and is, in fact, the site originally selected by the Cathedral Sites Committee.

5. That Monument-place site is central, is readily accessible by road, rail, or tram from every part of the Diocese of Liverpool, and is near to the principal railway stations, and within easy distance of the Landing Stage.

6. That Monument-place site is commandingly situated, physically; abuts upon the London-road, which is the main thoroughfare in and out of Liverpool, and is passed daily by thousands of people in following their ordinary vocations.

7. That there is a vista extending for nearly half a mile, which would be terminated by the west end of the Cathedral, were Monument-place site adopted; and the Cathedral would form the crowning feature of lines of streets, over a mile in length, commencing at the landing stage and riverside station, and passing the following public buildings, viz. —

- Town Hall;
- Municipal Offices;
- Government Buildings;
- New General Post Office;
- Magistrates' Courts and Police Offices;
- Technical Schools;
- Brown's Museum;
- Free Library;
- Picton Reading-room;
- Walker Art Gallery;
- St. George's Hall;
- Queen Victoria's, Wellington's, and other monuments.

Whilst in close contiguity with the site are:—

- The Royal Infirmary;
- The Liverpool College;
- The University College.

8. That the methods adopted by the Cathedral Committee for obtaining a design for the Cathedral are unlikely to result in the best design being obtained, and consequently the money of the subscribers would not be expended to the best advantage."

The Petition Committee have sufficient funds in hand to enable them to lodge a petition, but they will not do so unless they feel assured of the support of the country generally, by having guaranteed to them sufficient funds to conduct an exhaustive and effective enquiry, if necessary, into the whole case; they have no wish to oppose the Cathedral Committee except with a view of ensuring that the cathedral to be erected in Liverpool shall be a noble structure, and placed upon the best site. They would therefore be glad to have the views of subscribers, of architects, and of the general public, on the whole subject, and the line of action which they are proposing to take in reference to it. We shall be very glad to find room in our columns for any correspondence on the subject from those qualified to deal with it.

NOTES.

Wireless Telegraphy.

We see no reason to doubt the statement made this week that Mr. Marconi has succeeded in sending signals through space from Cornwall to Newfoundland. We know that messages have been sent hundreds of miles over the sea by very ordinary apparatus, and hence it is not incredible that the very powerful apparatus used by Marconi should have sent signals thousands of miles. The Hertzian waves following the contour of the ocean must lose very little by absorption. The experience gained in South Africa showed how rapidly the waves were absorbed when passing over dry soil, and hence this kind of telegraphy will probably be mainly used for over-sea working. What is still wanted, however, is a proper system of tuning. Marconi's system of tuning is only partially successful; his receiving instruments successfully disentangle two messages sent simultaneously from two separate sending instruments, but both messages are received on any other instruments between the two stations. What is wanted is a system of perfect tuning, so that the message sent out by a particular instrument will be read by a particular receiver and by that receiver only. We are aware that several electricians are experimenting in this direction, but most of them seem to do their tuning by trial and error. It seems to us that a better way would be actually to measure the capacity to earth, and the inductance of the receiving and sending apparatus respectively. Then if the product of these two quantities is the same the instruments are in tune, no matter how they differ in other respects. Unfortunately very few practical men know how to measure or to calculate either capacity or inductance, although methods of doing both are fully described in Dr. Fleming's recent "Cantor Lectures on Wireless Telegraphy."

The S.C.A.P.A. Society. The Society for Checking the Abuses of Public Advertising held a special meeting on Monday last, to receive the formal resignation of their former President, Mr. Alfred Waterhouse, rendered necessary by his ill-health. The Society in great measure owes its existence to Mr. Waterhouse, who as President spared no pains to assist its objects both by his influence and advice, and by cordial and punctual collaboration at

its meetings; and a letter of gratitude and sympathy with him was read and passed, and the hon. secretary requested to communicate it to him. In his place Dr. Longstaff has been elected President, and a better choice could hardly have been made. Dr. Longstaff has been a member of the Society from the first, and is greatly interested in its objects; and his businesslike character, as well as his important position in the London County Council, will probably enable him to render valuable assistance to the cause. The Society has already accomplished more than could have been expected during the comparatively short time that it has been in existence, considering the great phalanx of prejudice and of commercial interests against which it has had to contend; and by being the indirect means of leading the Dover Corporation to obtain an Act for regulating advertisements and sky signs, it has established a precedent which other municipalities may well be invited to follow. The subject is of special importance just at the time when so much is about to be done in London in laying out and building new streets. If we are to expend money in improving and adding to our street architecture, let us at least provide that it shall not be spoiled and vulgarised by the hand of the advertiser.

Projected Improvements in Paris.

It is proposed to extend the already lengthened perspective of the Avenue des Champs Elysées, which stretches from the Tuileries to the "rond-point" of Courbevoie (where stands Ernest Barrias' monument "De la Défense"), by a great avenue from the latter point to the Seine, between Bezons and Nanterre—that is to say, to the extreme boundary of the Department. On the right bank of the river the lugubrious St. Lazare prison, of unhappy memory, is to give place to a new square to be formed on its site. These are the principal operations comprised in a large scheme for new works recently submitted to the Conseil-Général of the Seine, and which will involve an expenditure of 180 million francs.

Aluminium Alloys.

THE paper on the physical properties of certain aluminium alloys recently read by Professor E. Wilson, of King's College, to the Institution of Electrical Engineers contains many data which will prove of the greatest use to electricians. The purest commercial aluminium contains traces of iron and silicon, so that practically the metal is always used in its alloyed state. Pure aluminium is bulky for bulk less than one-third the weight of copper, its co-efficient of expansion by heat is 50 per cent. greater and the resistance it offers to an electric current is 60 per cent. greater. A copper wire a square inch in section will break down when it supports a weight of 64,000 lbs., but 28,000 lbs. will break an aluminium wire of the same section. Professor Wilson has made exhaustive tests on twenty-four samples of aluminium wire, each of which has been alloyed with 1 or 2 per cent. of various metals. When alloyed with 2 per cent. of copper the breaking load is increased to 40,000 lbs., and the electric conductivity is increased 20 per cent. Hence it seems to us that for electrical purposes an aluminium alloy containing about 2 per cent. of copper would be very much more useful than pure alu-

minium. On increasing the percentage of the copper in the alloy very little is gained in either tensile strength or conductivity. An alloy containing 13 per cent. of nickel and 1 per cent. of copper gave a breaking load of 46,000 lbs., which was the highest figure obtained. Its conductivity, however, was low. Professor Wilson's experiments prove that for use as overhead conductors whether for telegraphic or power purposes, several of the alloys he describes are superior to copper. Although the arts of soldering and welding aluminium are now well known, yet the construction of mechanical joints has been so perfected that there are power transmission lines in America nearly a hundred miles long where only mechanical joints are used. For equivalent conductivity aluminium is slightly cheaper than copper; still, as the world's output of the former is only about 2 per cent. that of the latter, fluctuations in the price of aluminium will not have much effect on the price of copper.

THE wholesale destruction of telegraph connexion by the recent storm emphasises in a very complete way the need for the gradual abolition of overhead wires on trunk lines, for the stoppage of telegraphic communication is positively for the time a national trouble. It is obvious that the more numerous wires become the heavier is the load which the poles have to bear when, as in the recent storm, the wires become covered with moist snow, which presently freezes, causing a heavy and compact mass to extend from pole to pole. There is really no difficulty about underground wires in rural districts and along railroads, but we suppose it will require another storm or two before the necessity of the abolition of overhead wires becomes clearly apparent to the Postmaster-General. We hope that in the ensuing Session attention will be called to this important subject.

WE may commend to the notice of architects who patronise competitions the invitation of the Chorlton and Manchester Joint Asylum Competition. The Chorlton and Manchester Joint Asylum Committee to architects, now appearing in our advertisement columns, to submit designs for a proposed new set of "colony" buildings to be erected on a site of some 165 acres of land at Langho, near Blackburn, to receive the imbeciles, idiots, and epileptics—sane and insane—now in the workhouses of those two Poor Law districts. The scheme, which is to comprise accommodation for some 700 or 800 patients, has some points about it that are quite novel in this country, at least so far as number of patients and diseases is concerned. The arrangement of the accommodation is to be in a series of "homes," each holding from 25 to 50 or 60 patients, the "homes" being grouped in "villages" for the respective classes instead of a range of large buildings on the usual asylum plan. There is but little information to be gathered as to the working of this new system from existing institutions for the classes of patients in question in this country; but the system has been in operation for some years in Germany and also in the United States, and it is described, with more or less detail, in "The Care and Treatment of Epileptics," 1900, and "The Insane in Foreign Coun-

tries," 1889, by William P. Letchworth, LL.D.,\* and is briefly referred to in Mr. Gordon Smith's recently published book on Poor Law buildings. The Joint Committee have prepared a creditable set of conditions and instructions to competitors; they offer three prizes—200l., 150l., and 100l.—for the best three designs; they promise the work to the author of the best design (provided he is able to satisfy them as to his ability, fitness, and experience); and they have engaged Mr. Gordon Smith to advise with them in the selection of a design. The plans are to be drawn to one-sixteenth scale, to be delivered in portfolios—not on straining frames—and no perspective views are to be sent in. Four months are allowed for the preparation of designs, and altogether the competition appears to deserve success.

IN the course of next February the Gas Light and Coke Company will offer for sale at the Auction Mart, Tokenhouse-yard, their property, being for the greater portion freehold, by the riverside at Pimlico. The gasworks, with offices, workmen's dwellings, weigh-bridge, &c., cover an area of 4 acres, having a wharf frontage of 320 ft. to the Thames and a tunnel underneath Grosvenor-road. The buildings stand between Bessborough-place and Pulford-street, on the north-eastern side of St. George's-square. The gasworks were originally established there about seventy-five years ago on the two banks of the Tyburn, near Vauxhall Bridge. In an excellent map surveyed and drawn by W. B. Clarke, the architect, and published in 1836, the "gasworks" and "gas factory" are plotted as lying on the northern and southern banks, respectively, of the Tyburn stream, just above its outfall into the river at Thames Bank Wharf, in (old) Millbank, since renamed Grosvenor-road. The stream at that point ran by the Sluice-house, and the King's Scholars' Pond from which the sewer afterwards took its name.

AN old timber-built tenement in King's-court, Great Suffolk-street, will shortly be demolished. It stands opposite the site of the Bredwell that was built *circa* 1773 upon Hangman's Acre, where is now the junction of Friar and Hill streets. The house was taken just 100 years ago by a congregant who had separated themselves from the Baptist community in Union, formerly Duke-street. A tradition is current that Bunyan sometimes preached in the meeting-house in King's-court, as well as in that belonging to his friend Dr. Thomas Barlow, in Zoar-street, Slutswell (since Gravel-lane), in the course of his frequent visits to London.

AT Willis's Rooms, St. James's Mr. Ando has had on view a fine collection of Japanese cloisonné enamels, mostly his own work. The most interesting piece was a small model of a mandarin duck by Ando, a masterpiece of enamel colour. In the same case was a cloisonné silver vase decorated by a group of gold fishes in water, beautifully drawn in transparent tints. A pair of vases of "wireless cloisonné" showed a charming composition of a winter view with crows and snow-covered bamboos in cold

greys. The many other examples by the same artist illustrate his skill in obtaining delicacy and depth in all his colours rather than success in their use in design, and we wish for that conventionality and subtlety of composition which is so characteristic of the best Japanese art. The gradation of tone, the clever use of copper and silver backgrounds, and the pure transparency of the enamel necessary to give these their full value are proof of his mastery of the materials used. The use of wireless cloisonné, and its combination with wired and embossed details, are shown in many examples with varied success. There is a tendency to break away from the best traditions of the art, an influence which cannot fail to bring its quota of failures when exercised by an artist of such versatility. When Mr. Ando has felt the limit of his palette, we hope to see his work again. A pair of large vases by Gonda, decorated with autumn shrubs and birds, all wired on a black background, are splendid pieces, drawn and coloured with marvellous lightness. An incense burner by Honda, of conventional design and restrained tints, shows a true feeling in colour. In some of the other examples by Honda we also miss that spontaneity of balance which is wanting in some of Ando's compositions. Than Japanese there is no art more sensitive to the unfitness of outside influence, and it will be a dark day in its history when it allows an overstraining after the popular and the new to break through and spoil its purity, reaping only that benefit which is won by the cupidity of commercialism.

A CORRESPONDENT writes to us that we have done an injustice to Mr. Pittman, the winner of the Turner gold medal at the Royal Academy, by describing his picture as representing Putney Bridge and its neighbourhood, and accusing him of not having done justice to the bridge, as his scene really represented new Battersea Bridge. This we find is correct, but the mistake would not have been made if the bridge had been more correctly represented in the picture. The composition, with a suspension bridge in the distance and a stumpy church tower on the left, we took to be a view up the river, with Hammersmith Bridge in the distance and Putney Church on the left; it appears it is a view down the river, with Chelsea Suspension Bridge in the distance and Chelsea Church tower on the left. But the point is that Battersea Bridge is a bridge with stone piers and steel spans, and there was no indication of this in the picture; the bridge seemed all of one material, whatever it was; and that is exactly what we complained of; landscape painters treat a thing like a bridge without giving any indication of its structural character. Turner himself, no doubt, would have done the same; but that does not make it right. A more curious thing, from our point of view, is that an artist who had, by the terms of the competition, a choice of any of the Thames bridges as the central object of the composition, instead of selecting one of the really fine stone bridges, should have chosen such a piece of tawdry sham structure as Battersea Bridge, a thing which is a horror to every architect. This is no disparagement to Mr. Pittman's picture as a whole; it is a fine work with much future promise; it is the bridge alone that we

\*Putnam's Sons, New York and London.

object to. A bridge, if introduced into a landscape, should at least appear to have some structural character, and not be treated as if it were cut out of a piece of cheese.

#### THE ETHICS OF DILAPIDATIONS.\*

The cause of dilapidations is the improper use or improper care of premises. Now a man usually takes a house or a shop or a factory on lease to use the building for the purpose it was built for, or for which it has become adapted.

When I see some schedules I think, had the tenants known what was in store for them they would have hardly dared to inhabit the premises. Now when a man hires an article under the ordinary conditions he has a right to the reasonable use of it for the purpose that caused him to hire it. I believe if a man hires a horse for hunting, the purpose is known, and should the horse be killed the hirer is not liable for the cost. Again, if I hire a bicycle I do not expect when I return it to the shop that the man will go carefully all over the frame to see if there is the slightest chip of the paint and then to demand the cost of re-enamelling the whole machine; neither do I when I return it expect to have the cost of cleaning it added to the hire, even though the day has turned out wet and the cycle is covered with mud. If I puncture or break anything, certainly I pay.

Why should not a man have the same rights when using a building as he has when using a bicycle? In other words, has he a right to ordinary wear and tear? What is the meaning of "fair wear and tear"? If ever a phrase was invented to trouble surveyors, that is the one. I tried hard to find some origin or derivation of wear and tear, but could not do so, finally I wrote to the editor of "Notes and Queries" and explained that "wear and tear" was constantly used with reference to substances that one could not, from the nature of them, "tear," e.g. stone paving, and could he help us to find out how the expression had become general. The reply I received was this:—"A proverbial locution such as this ceases naturally in time to be confined to its first signification, and becomes a synonym for use."

I am afraid that does not help us very much. I looked up some law authorities with little result. A law dictionary defines wear and tear as "the waste of a substance by use," a good definition, but not touching the accepted meaning of the words taken singly. Woodfall is silent on the subject, so is Macer; Banister Fletcher refers to machinery.

The only case I can find on the subject is *Scates v. Laurence* (2 F. & F., 286). There was no express covenant to paint in certain years, the tenant had well and sufficiently to repair, uphold, sustain, paint, glaze, cleanse, scour, and keep and leave the premises in such repair, reasonable wear and tear excepted. It was held that if the tenant had repaired within a reasonable time before leaving, he was only bound, in addition to the repair of actual dilapidations, to clean the old paint, &c., and not to repaint.

Surveyors differ as much as possible, one man will contend that the phrase, "fair wear and tear excepted," will, like Charity, cover the multitude of sins his client may commit, and another surveyor will say the words mean just nothing at all, and they might as well be omitted.

What is a "fair tear"? One, of course, thinks of wall papers in connexion with tearing, and I know of no fair tear unless it be a nail hole for hanging pictures, which a tenant has a perfect right to make.

For "it is a monstrous thing to say that because a person puts nails into the walls of a house he must take them out and fill up the holes, or commit a breach of the covenants of a repairing lease" (*Ferry v. Chotner*, 9 T.L.R., 488).

But surely every tenant should have a right to the ordinary wear and tear of the premises leased to him, no matter what the covenants may be, special or general.

And whether we admit this principle or not, we certainly accept the idea, because if a floor or paving is only worn we do not ask for a renewal. But in making surveys we should

not accept this matter of renewal as an invariable rule. We ought to be governed far more than we are by the locality and character of the premises, and to consider carefully the purpose they are used for, and more particularly if they are used in accordance with the intention of the parties at the time of the demise. We are too fond of taking rules for survey from some one else, the pupil works according to his master's ideas, too often formed and set, he starts practice and uses the same rules, never thinking out the subject for himself. Or, perhaps, he hears that some authority, a well-known surveyor, has a certain rule, and he at once adopts it, and is glad to do so, and always quotes his authority, "Mr. So-and-So does, and so do I. What is good enough for him is good enough for me," &c. I refer to such rules as asking for a window to be reglazed if cracked across from opposite sides, but to pass it if the crack is across a corner. Or, again, to condemn a chimney-stack or wall if it is so many inches out of the upright in so many feet, or to always ask for reglazing if the premises have been grained previously, and entirely without reference to the covenants.

All these matters and many others should not be governed by a universal rule, but should be thought out with reference to the age, locality, and character of the property, but having, of course, due regard to the covenants.

Let me give two instances. Take the case of a house built and let when new and perfect as a school or factory. In the course of a few years the sills of the entrance doors will be worn away, we will say some inches, and form that inverted-arch appearance we often see. Although there is no actual breakage, that wearing away has been done by the proper use of the building for the purpose for which it was let and is no dilapidation. But if a house in the West-end, also newly constructed, is let for domestic purposes, and the sills become worn almost away, in consequence of the house being used for meetings, business, or charitable purposes, for which it was not leased, I contend that a surveyor would be justified in considering the sills in the latter case to be dilapidations, although not broken, and even though they be far less worn away than the sills at the school which he should pass.

A better instance is, perhaps, a staircase in a school or a factory; the treads would naturally become very much worn, the building being used, and properly so, for business purposes, and the wear is a perfectly right one, but if a house in Grosvenor-square had a staircase with treads even less worn, I think a surveyor would be entitled to consider the defect a dilapidation, because in the latter case it is usual to cover the stairs with carpets and so avoid almost any wear, the treads at the end of the term should be in practically as good a condition as at the commencement.

This brings me to another accepted tradition, if a tread is worn away at the edge the rule is to ask for a new nosing. The surveyor writes, "Renew nosings to treads" in almost any building, but although that may be a good remedy for a defect in business premises it is not a proper remedy for high-class residential property. A nosing to a tread never fits properly; where it joins the tread, it may be the same thickness near the strings; but in the middle, where the tread becomes worn, there is a difference in the thickness, and there is a sharp edge for about a foot or more in the length. This is felt when walking on the staircase, and when carpets are laid down, in a very short time they get worn along this line, and the money that should have been expended in properly repairing the staircase is thrown upon the cost of renewing the stair-carpets, and the outlay increased considerably. Again, the joint always shows at the side, whether the margins are painted or not, and is unsightly. I contend that a new tread in good property should be asked for. But even if much more worn in business premises, that even a nosing cannot be claimed.

With regard to this damage to business premises when legitimately using them, I had an instance not long ago at a factory for binding books. The building was let for that purpose; it was an old building in the City, and never had been and never could be used except as a warehouse or factory; there were benches all along the walls, and when the paper was held in the hands of the workers for binding, the glue had dropped on the floor.

Each floor was marked from end to end with a ridge of glue some inches high. I had this glue carefully cleared away, and to remove it properly, it had to be chipped off the floor with a chisel. The result was the floor showed the chisel marks and was uneven and stained but nowhere worn through or broken. I acted for the lessee, and contended that, as a warehouse or factory floor, it was in a good condition. The surveyor for the lessor asked for a new floor to be laid along the part in question. There could be no dispute that an incoming tenant might not take the building as it was, because of these stains and marks. In a private house his demand would have been a proper one, but in this case I consider it was not.

I have a case of dilapidations going to the Courts shortly in which I act for the lessor. It is a factory, and had I estimated on the above lines, my estimate would be three or four times the amount it is, and I should not like to face cross-examination.

These remarks also refer to the class of work that one may pass. It is wrong to expect the best paint or other work in inferior property, and to refuse to pass it unless it is up to a high standard (*Proudfoot v. Harl*).

In this paper please do not think I hold a brief for the tenant; but there seems to be a general tendency at the Courts to deal lightly with a lessee, and surveyors are following this inclination at a distance. I want to draw attention to a few matters quite impartially.

One rule seems to be adopted by the profession with regard to casement windows when the wood sill and the lower ends of the frame and mullions have become rotten. I think the recognised custom is to ask for a new sill, and to cut off the rotten parts of frame and splice them and make good to the sill. What is the result? You have a nasty splayed joint showing through the paintwork on each side. If a frame has become defective from want of paint that the lessee should have applied, surely he ought to renew the whole article and not patch it. This applies also to sash frames and frames of external doors. But this is not always done. We as a profession allow this patching, and I suggest we should not do so. We should not do so in other cases. If my coat is torn by a stranger I want the cost of a new coat. I cannot agree to his suggestion that it is only a little tear, and his tailor will stitch a bit in the middle of the back, and it will not show much. Neither will the patched window last as long as a proper whole although old one. This is not a case that should vary with locality, it is a defect in the structure arising from neglect, and should be properly remedied. At the same time, if the rot occurs where it cannot be avoided, as in posts to field gates, then a repair should be passed. Rotten casements and sashes are sometimes passed if repaired by angle irons securing the work which has become dilapidated and worthless. This should not be allowed any more than we should allow zinc or lead to be nailed over a rotten sill.

The surveyor's lot is often a difficult one. For many weeks past I have been employed surveying property that has been neglected for very many years—it is not a case of lessor and lessee, but somewhat similar—and it is extremely difficult to decide in cases of very bad structures when to allow for repairs and when to estimate for entirely rebuilding.

Now one very serious, because expensive, part of our work deals with repairs to brickwork and the question of rebuilding. The portion of premises usually under observation in making a survey are:—

1. Parapets out of the upright.
2. Chimney-stacks out of the upright.
3. Bulged walls.

Day after day surveyors go to buildings, note a leaning over of the parapet or chimney stacks, and without a moment's hesitation note down the item and ask for rebuilding. It is their rule, they never think about it; why they should do it, here it is, a fact out of the upright, and the note is made, "Take down so many feet, &c."

Now let us look a little into this. If the building is a new one I think we can agree that these defects are caused by the bad construction of the property, and if old it is only carrying the argument a little farther to see that had the building been constructed in a stronger manner the defect could not have occurred at the date of the survey. I assume that he tenant has pointed the wall, that is all in the ordinary way he could do to repair brickwork, and if a parapet is

\* A paper by Mr. Sydney Perks, read before the Architectural Association's Discussion Section on the 6th in 1901.

too thin no amount of pointing will keep it upright. I believe the usual cause of parapets leaning over either towards the house or away from it is the thrust in consequence of the construction of the roof. If the parapet is well built in at the ends it will lean inwards; we often see a long length of parapet wall 9 in. thick with a heavy stone coping upon it. So in most cases, and in fact in almost any case, the result of the defect is in no way due to the neglect of the tenant; he has not gone and shoved over the wall or the chimney stack, and caused the necessity of rebuilding. Surely the reason is the defective construction and age of the building, it is the natural result of time. If the parapet had been thicker it would not have needed rebuilding. To stand properly, all parapet walls in long lengths should be at least 14 in. thick, but they rarely are. I contend that when a structure or any part of it needs renewing, the cost should fall on the owner, if the tenant has not caused the damage or allowed it to take place.

I know it is argued that a tenant not only agrees "to repair," but he also covenants to "support, uphold, and maintain," and this rebuilding is necessary to fulfil those covenants, which it is contended, must mean something. My plea is that unless the defect can be shown to be the result of the tenant's neglect, that he should not be asked to rebuild any portions of the property badly, or not sufficiently strongly constructed to last his term. With regard to this I will ask you to kindly note the wording of the judgment in the case of "Lister & Lane," which I shall presently quote.

The same principle applies to bulged walls; they are rarely the result of neglect, nearly always of age or bad construction and the wearing of the building. It may be that the tenant has overloaded the floors or done something to cause the bulge, and if so he should be liable, but if liable he should not be simply asked to tie in the walls with iron rods, he ought to make good his damage by cutting out and properly rebuilding.

I referred just now to a new house where the walls become out of plumb, and contend that there should be no difference between a comparatively new and badly-built house, and an old and better built house. The end must come some day; a time will arrive when each must cease to exist; and as all men do not live to the same age, so all buildings do not last for the same period, and a house badly built and ten years old may be nearer to its end than one well-built and 100 years old, so I think we must not consider age as the same number of years in every case.

But although what I have said may be simply argument and the opinion of a surveyor, we get a step farther when we go to the law reports. There is one great case on the subject, and that is "Lister and another v. Lane and another" (T.L.R., C: A., vol. ix., p. 503).

The following extracts are taken from the Times law reports.

"Where there is a general covenant to repair, the age and general condition of the house at the commencement of the tenancy are to be taken into consideration in determining whether the covenant has been broken."

The Master of the Rolls said: "If a person took a house which was such a house and of such a kind that by its own inherent quality it would in course of time fall into a particular state, that would not amount to a breach of covenant to repair the house, however large the covenant might be," &c.

In this case the covenant was to "sufficiently and substantially repair and keep in repair, uphold, sustain, and maintain." Certainly a strong undertaking. The case was doubtless a very bad one, the building was condemned as a dangerous structure, but I think we surveyors should consider it in less important cases. Please also note that such covenants must be construed according to the intention of the parties at the time it was entered into, also that the tenant was asked to underpin the property, and "such work did not come within the covenant to repair."

I have recently had a case of a house—part of one of the old Inns of Court, a building almost historically old, and so decrepit that it was beyond alteration, and was pulled down at the end of my client's term; the walls were bulged and tied in several places, but the surveyor of the freeholder asked me to take down and rebuild all bulged portions, some of the ties were in, I am certain, for very many years before the lease was granted, the wall was fairly well pointed and no improper thrust

was exercised, for the rooms had been empty for years. I think the demand was most improper. I tried to get the matter referred to any surveyor appointed by the Royal Institute of British Architects, but my suggestion was refused.

In *Gutteridge v. Munyard* (1 Moo. & R. 334) C. J. Tindal stated: "Wherever an old building is demised and the lessee enters into a covenant to repair, it is not meant that the old building is to be restored in a renewed form at the end of the term, or of greater value than it was at the commencement. What the natural operation of time flowing on effects, and all that the elements bring about in diminishing the value, constitutes a loss, which, so far as it results from time and nature, falls upon the landlord; but the tenant is to take care that the tenement does not suffer more than the operation of time and nature would effect; he is bound by reasonable application of labour to keep the house as nearly as possible in the same condition as when it was demised. If it appear that he has made that application, and laid out money from time to time upon the premises, it would not perhaps be fair to judge him very vigorously by the report of a surveyor who is sent upon the premises for the very purpose of finding fault."

This case was previous to *Lister v. Lane*, and Woodfall's paragraph on this subject is as follows:—

"Where a lessee covenants to keep old premises in repair, he is not liable for such dilapidations as result from the natural operations of time and the elements, and with a view to determine the relative sufficiency of repair the jury may consider whether the house was new or old at the time of the demise, and what was its *then* state of repair and condition generally, not in detail. These principles are carried to their full extent by the Court of Appeal in *Lister v. Lane*. There the covenant was to 'repair, uphold, sustain, and maintain' a house in Lambeth more than 100 years old built on a timber platform resting on a boggy soil, with the result that a wall bulged and the foundation sank so that rebuilding became necessary. It was held that the tenant was not liable, inasmuch as the dilapidations were due to the inherent defect of the house."

I also note that in Woodfall's reference to *Proudfoot v. Hart* he states: "In every case the age of the premises, and also their class and general condition, must be taken into consideration in order to measure the extent of repairs to be done."

Please also note that in *Proudfoot v. Hart* not only is the age of the property insisted on, but also the character, which does not mean locality, because locality is also mentioned, and both are defined. I think character means something apart from the distinction between a cottage and a palace, and we are not stretching a point if we say this also refers to the difference between a jerry built house and a well built house. This, I think, is also clearly indicated by the case of *Gutteridge v. Munyard*.

There is the idea with many surveyors that if a man takes a badly built house on a lease with strong repairing covenants he is a fool and must pay for his folly. The man is a fool, but I do not think he should suffer for what he has done in ignorance, and I think the cases I have given also indicate that principle. The severity of a schedule should vary according to the class of property surveyed.

I spoke just now of our accepting other surveyors' rules and adapting them without thought; but another and, perhaps, worse fault is that we read the results of cases and never read the decisions—we are content with a few lines or extracts in a text book.

There has been a tendency among surveyors to smile at some of the decisions in the courts because some trifling slip is made by the judges with reference to practical details. I wonder if the leading surveyors know as much about law as the leading lawyers know about surveying, and doubt it very much.

If we want to grasp the meaning of a case we must read the whole judgments and, when carried to the Court of Appeal, we must follow the reasoning from court to court, and if there be any here who have not done so I hope you will, if only in a few instances—it will not take long—look up "Crawford v. Newton," "*Proudfoot v. Hart*," and "*Lister v. Lane*." All went to the Court of Appeal.

*Proudfoot v. Hart* is most important, and deals with the likely requirements of a reason-

ably minded person, but touches on many things. It refers to *Belcher v. Mackintosh* and tells us tenable repair, good repair, and habitable repair all have a similar meaning.

It refers to *Payne v. Haine* and tells us not to expect repairs to be equally well done in all localities, and touches on the age and class of properties and to the "purpose for which they are used," it also refers to *Muntz v. Goring*, stating the tenant must fulfil the covenant according to the nature of the premises, &c.

When surveyors complain that the legal decisions are difficult to apply, and grumble at them as vague and inexact, I think they want a little too much. The more general the wording is the better, and that is where the skill of the surveyor (which is a very different thing to the knowledge of a builder's estimating clerk) comes in. We must have the knowledge to estimate, but we must also have a certain amount of law knowledge and power to decide how to properly apply it. For it is hard, very hard, to conscientiously say what should be done under certain covenants, we find that out when acting as arbitrators. When we act for the lessor, the rule is, when in doubt "claim it," and if acting for a lessee, the reverse. But only if there is any doubt.

I say "when in doubt," for there should not be many points we cannot decide, and to me nothing stamps a surveyor and shows his ignorance so much as badly-prepared schedules of dilapidations. We find them worded in exactly the same way as specifications for repairs, which is wrong; and the surveyor claims quite irrespective of the covenants, which you doubt if he has ever seen, anything that occurs to him as he goes over the house is jotted down, his only anxiety seems to be the risk of omitting anything that the lessor might like to have done to improve his property.

In conclusion, a few words about surveyors and arbitrators. If difficulties occur where acting for lessee or lessor, I have shown just now what to do, but those difficulties must be met and decided when we act as arbitrators. As a rule I find that when surveyors refer to me there is usually some great difference in the interpretation of the lease. It is not a question of prices, but of principle, e.g., one surveyor will claim for entire painting, the other surveyor will say none is necessary under the covenants, and so on. I had a case recently where one surveyor's estimate was six or seven times as much as the other. Each estimate was correct according to the view taken of the meaning of the covenants. In cases like these do not be weak, do not go on that jury system of splitting the difference, if you can help it, and please do not make each party pay his own costs unless in special cases. This question of "costs" is doing us harm. More than one solicitor has said to me, "I will not refer anything to a surveyor, he is sure to go wrong over the costs." Another solicitor said a short time ago, "I will never refer a dispute to a surveyor unless he is bound to make the costs follow the event." Only a few months ago I was in a case of a disputed builder's account. I suggested at once to refer it to a surveyor. My client's solicitor told me he did not like the idea, he had no faith in references to surveyors; and the solicitor for the other side flatly refused. The result was it was referred to a barrister. I imagine from his remarks he had no knowledge whatever of technical details.

Dilapidation surveys are not absolutely necessary, and if the lessor employs a surveyor to make a schedule he should be prepared to pay his fee. This employment of a surveyor is different to party-wall cases; then the adjoining owner *must* appoint a surveyor if there is a difference. It is compulsory by Act of Parliament, and it is only just that his neighbour, who makes this employment a necessity, should pay for it; but in dilapidation matters there is no such necessity.

Consequently I was surprised recently to be asked for my client, the lessee, to pay the fees of the lessor's surveyor "as usual." "As usual" I believe the practice is not to do so. I know, of course, that under certain conditions named in "the Conveyancing and Law of Property Act, 1892," the lessee has to pay, but the instance I had was the usual one at the termination of a lease.

I am ashamed to say that some surveyors do not act fairly for the lessor when you want to settle on behalf of the lessee before the end of the term. You see them about six months

or more before that time with a view to a settlement, and failing that you leave plenty of time to do the work. You are met in a courteous manner; no schedule has been served, but you are assured that a survey will be made as soon as possible. Nothing is done, and time goes on, the object being to keep delaying the matter so as to make a money payment compulsory; depriving the tenant of his option to do the work, and also with a view to claim rent for the time the work would take to carry out. You may have met such a surveyor, and you may be a sharp man, but he is a sharper, and you must be on your guard.

I sincerely trust I have been able to mention a few matters you may think worthy of discussion, and I look forward to hearing your views.

#### THE ARCHITECTURAL ASSOCIATION.

The usual fortnightly meeting of the Architectural Association was held on Friday evening last week, in the Meeting-room of the Royal Institute of British Architects, No. 9, Conduit-street, Regent-street, W. In the unavoidable absence of the President, Mr. W. H. Seth-Smith, Mr. R. S. Balfour, hon. secretary, was voted to the chair.

The minutes were read and confirmed, and Mr. E. Cooper was elected a member of the Association.

The Chairman announced that a meeting of the Discussion Section would be held on Friday, the 20th inst., when Mr. H. Howard Humphreys would read a paper on "The Manufacture, Testing and Uses of Portland Cement."

#### New Premises Fund.

The Chairman also announced that the following additional donations had been made to the New Premises Fund, viz.: Mr. A. W. Soames, M.P., 25l.; the Hon. A. McGarel Hogg, 5l.; and Messrs. John Slater, 26l. 5s.; E. T. Hall, 20l.; E. T. Batsford, 10l. 10s.; W. A. Pile, 10l. 10s.; the executors of the late T. Satchell, 10l. 10s.; H. A. Satchell, 10l. 10s.; Captain W. B. Marling, 10l.; G. C. Ashlin, 5l. 5s.; H. B. Creswell, 5l. 5s.; W. Woodward, 5l. 5s.; R. H. Weymouth, 3l. 3s.; H. Cayley, 2l. 10s.; H. Lovegrove, 2l. 2s.; Cole A. Adams, 1l. 1s.; E. A. Agutter, 1l. 1s.; and S. J. Tatchell, 1l. 1s. The total amount received or promised exceeds 3,000l.

#### Travelling Students' Notes.

The Chairman then called on Mr. J. D. Tate to read, in the absence of the author, the Travelling Students' Notes for 1901, by Mr. J. E. Forbes. It was stated that Mr. Forbes, who devoted his tour to a study of Oxford buildings, had been unavoidably detained in Birmingham.

The writer of the paper, in an introductory paragraph, said he was aware that he was out of order in treating the subject in an historical rather than an architectural manner, but his reason for doing so was that, in his opinion, in order thoroughly to appreciate the architecture of Oxford one must first acquire the atmosphere of the place—its legends, origin, and early history. Of architectural Oxford so much was familiar to all, and so much had been written and said, that it would be quite unnecessary for him to repeat facts that were so well known to all interested in architecture.

The paper opened with an account of the legend of St. Frideswyde, and the opinion was expressed that round the ring up in all likelihood, both the town and the schools, developed by gradual successes to a general resort for students. The author then referred to the "chest," the earliest form of corporate property possessed by the University for the relief of poor scholars. They continued to exist and multiply until the end of the fifteenth century, when they had reached the number of twenty-four. Each chest was in charge of two guardians, and was 8 ft. to 10 ft. long and half as wide, and all the chests contained volumes and valuables deposited as pledges by those who had borrowed from them. Reference having been made to the libraries, the author dealt with mediæval college life; the Presbyterians and Independents, who began to appear in the seventeenth century; college life in the eighteenth century (including an account of the coffee houses of the period); a reference to some of those who were to become notable men of England; a description of Shelley's rooms; some remarks on "sport-

ing the oak," and a few remarks as to the differences in college life in old and new Oxford.

Mr. E. W. M. Wonnacott then showed more than fifty very fine lantern slides of Oxford buildings and views.

Mr. N. F. Barwell proposed, and Mr. H. J. Leverton seconded, a vote of thanks to Mr. Forbes for his paper, and to Mr. Tate for reading it.

The Chairman said that Mr. Forbes was the A.A. Travelling Student for 1901, and he was aware that the Committee were not in sympathy with the line he had taken in regard to the preparation of his paper. Mr. Forbes was invited by the Committee to read a paper giving an account of his tour, and he told the Committee that he expected in doing so to provoke some criticism by the comparatively unorthodox character of his paper. In occupying the chair that evening, and in asking them to accord Mr. Forbes a vote of thanks, he did not wish to do more than express his personal feeling of regret that Mr. Forbes had not taken them more into his confidence in regard to his impressions while on tour and as to the character of his studies. Mr. Forbes said that so much was known about the architecture of Oxford that it was quite unnecessary for him to repeat facts already well known. He (the Chairman) entirely disagreed with that view. Mr. Forbes confessed in that either that he was unobtrusive, and that he had not received any impression from his tour (a conclusion which they could not accept), or that he was so modest that he felt he was unworthy to record anything about the work he did while away. He thought they would agree that Mr. Forbes had mistaken his audience in the matter, and that they would have been more interested in his personal records and achievements during the last summer than in what he had written. What one student could tell another was of considerable interest, and the exchange of ideas between students could never be tiresome to any one. He had listened to the paper with much interest, but not from a practical point of view.

The vote of thanks was then agreed to, and the meeting terminated.

The next meeting will be held on January 3, when Mr. J. A. Gotch will read a paper on "The Development of Domestic Architecture from the Twelfth to the Eighteenth Century," with lantern views.

#### POST OFFICE LONDON DIRECTORY.

The Post Office London Directory for the ensuing year—the 103rd annual issue of the work—has just been published. No new features have been introduced in the Directory, and, as we have previously remarked, it is not obvious to us that anything could be done to improve it. It has been corrected down to the latest possible date in the careful manner that has characterised previous issues. It now contains 3,356 pp., which is an increase of thirty-five pages over the edition of 1901. The publishers are Kelly's Directories, Ltd., 182-184, High Holborn.

#### THE LONDON COUNTY COUNCIL.

The usual weekly meeting of the London County Council was held on Tuesday in the County Hall, Spring-gardens, Mr. A. M. Torrance, Chairman, presiding.

**Loans.**—On the recommendation of the Finance Committee, it was agreed to lend St. Pancras Borough Council 5,510l. for sewers and paving works, and 6,310l. for electric light installation; Westminster City Council 22,000l. for purchase of land; Woolwich Borough Council 700l. for site for a library; Guardians of Greenwich Union 5,600l. for purchase of property; Kensington and Chelsea School District Managers 550l. for enlargement of lodge; and West London School District Managers 2,500l. for provision of a boiler, &c., at schools.

**Bricklayers' Work.**—Lord Welby, Chairman of the Finance Committee, in reply to a question, said the Works Sub-Committee had collected a good deal of information as to the amount of work done by the bricklayers in the Council's employ, but it had been impossible to go through it and report before the recess.

**Strike at Horton Asylum.**—Lord Welby also stated that he had received a letter from the Council of the Operative Bricklayers' Society, stating that, if the Council would open the works at Horton at once to the workmen, the strike would be ended.

**The Works Department.**—The Finance Committee submitted a statement showing the estimated and actual cost of works completed by the Works Department during the half-year ended September 30. The whole of the works completed during the half year were included in the statement, but the Committee stated that the total gave no indication of the turnover of the Department during that period, because some of the expenditure on the works occurred previous to the half-year in question, while, on the other hand, a large part of the expenditure during the six months was upon works still unfinished. The approximate expenditure on estimated works for the half-year was 147,000l. The statement dealt with twenty-one works, the final estimate of which was 105,620l. 16s. 2d. The actual cost was 118,162l. 5s., showing a balance of cost above final estimate of 14,541l. 8s. 10d. In thirteen works there was a saving on the final estimate amounting in all to 2,434l. 17s. 2d. In the other eight works there was a loss on the final estimate, the greatest being in the case of the North Woolwich drainage works, for which the final estimate was 47,683l. 17s. 6d., and the actual cost 64,398l. 1s. 2d. A further statement was presented showing the results of all works executed by the Works Department since its creation in November, 1892. With regard to estimated works, the grand total of the final estimate was 1,260,020l. 13s. 4d., and the actual cost 1,338,937l. 9s. 10d., showing the balance of cost above estimate to be 78,847l. 16s. 6d. With respect to jobbing works since April 1, 1895, works of the schedule value of 192,025l. 13s. 2d. have been executed at an actual cost of 189,876l. 12s. 7d., leaving a balance of cost below schedule value of 11,149l. 0s. 7d.

Lord Welby asked that the Report should be postponed till after the recess, and this was agreed to.

At a later stage of the sitting, a report of the Housing of the Working Classes Committee on a proposed lodging-house at Deptford was considered. The Committee recommended "that the working drawings, specification, bills of quantities, and estimate of 51,500l. submitted by the Finance Committee in respect of the lodging-house to be erected on the Mill-lane area, Deptford, be approved; that the work of erecting the house be carried out by the Council without the intervention of a contractor; and that the working drawings, specification, bills of quantities and architect's estimate of 47,750l. be referred to the manager of works for that purpose."

To this Sir John Dickson-Poynder moved to omit all words after "approved," and the following substituted: "That the work of erecting the house be done under contract, and that tenders be invited for the execution of the work."

The Committee, in their report, stated that—

"In pursuance of instructions the architect prepared a plan of a men's lodging-house on the lines of those already erected by Lord Rowton. The area is triangular in shape, and the plan showed that a building of this kind could be erected on the deeper portion of the area, and that the building would provide accommodation for 670 persons. The shallower portion of the area would still be left, and upon this we were advised that cottage dwellings could be built. Without committing the Council to the erection of such a house on the Mill-lane area we obtained the approval of the Local Government Board to this plan, but before bringing the question of the kind of dwellings to be erected again before the Council, we thought it well to ascertain how far a lodging-house of the character mentioned would be likely to be beneficial and successful if erected on the site. We accordingly communicated through our then chairman (Sir John Dickson-Poynder) with Lord Rowton and Sir Richard Farrant, and they generously intimated their willingness to place their unique knowledge and experience at our service. After having discussed with them very fully the question of the erection of such a house, we were convinced that the site was an exceedingly suitable one for the erection of a men's lodging-house similar in character to those known as the Rowton houses. Both Lord Rowton and Sir Richard Farrant emphatically stated that the most economical number to provide for was 800 lodgers, and that in order to make the house a success it was essential that it should contain all the comforts and improvements which are the characteristics of a Rowton house, whilst the architect informed us that these could only be provided by making a charge of 6d. per bed per night.

As this is the first lodging-house on these lines that the Council has attempted, no doubt a somewhat detailed description of the plans of the house will be useful. Accommodation is provided for 804 lodgers, as

compared with 800 and 805 in the Newington Butts and Hammersmith Rowton houses respectively. The entrance and principal rooms on the ground floor are arranged as follows:—The entrance is central, and gives access to the dining-room on the right and to the smoking and reading rooms on the left. The office commands the entrance for lodgers and for the staff, and is arranged close to the superintendent's quarters. The dining-room is planned with a long hot-plate chamber in the centre, with lodgers' sculleries. It is well lighted from side and roof. The hot-plate chamber is ventilated by two fans driven by electricity, and this arrangement helps the ventilation of the dining-room. Immediately adjoining the dining-room is the lodgers' crockery-room. The shop for sale of hot and cold viands is placed in a convenient position with a direct service thereto, and with easy communication to the kitchen in the rear. The smoking-room is arranged on the Mill-lane frontage. It is well lighted and has good cross ventilation. The reading-room is approached from two of the main corridors. It is of a suitable shape and it is well lighted by side and top lights. This room also will have cross ventilation. . . . With regard to the sleeping accommodation, two principal staircases leading to the dormitories, and one emergency staircase, are provided. It will therefore be practically impossible for all egress from the house to be blocked in the event of fire. Each cubicle is 4 ft. 10½ in. wide and 7 ft. 4½ in. long (internal dimensions), and is provided with a window, so that ample means of through ventilation are secured. Two cubicles on each floor will be occupied by the resident male staff. The dormitory corridors are 4 ft. 6 in. wide, and four water-closets and two sinks for night use are provided on each of the five dormitory floors. The lodgers' promenade is provided over the reading room and part of the dining-room, and is approached by means of the south-west staircase. Throughout the preparation of the plans we have had the advantage of the advice and assistance of Lord Rowton, whose courtesy and kindness in the matter we wish to heartily acknowledge. The architect's estimate of the cost of the building as above described is as follows:—Cost of building (including clearance of site, trial holes, superstructure and foundations, special works, electric lighting, provisional amounts, &c.), 49,287l. 15s.; architect's expenses, quantity surveyors' and other fees, supervision, provision for articles to be bought direct and incidentals, 2,212l. 5s.; making a total of 51,500l. We have referred the drawings, specification, quantities and architect's estimate of the cost of building (37,750l.) to the manager of works for examination and report, and he has informed us that he is prepared to undertake the work of erecting the house at this amount. In these circumstances we propose that the work should be done by the manager of works."

Sir J. Dickson-Poynder, M.P., said he was greatly disappointed that it was proposed to hand this work over to the department. There was no doubt the Council were running some risk in the erection of such a building, and he felt that in giving it over to the Works Department they were dooming it to failure, or at least running a very great risk of it being a failure. No fair-minded man in the Council could say that the Works Department had been a success, or that it warranted them in allowing such a work to be carried out by direct labour. He asked them to throw off insincerity and affectation, and admit this fact. There was no doubt that the reason of the non-success of the direct labour policy was that trades union restrictions, always excessive, became absolutely extreme in connexion with a body like the London County Council. Trades unions could be kept in check by contractors; but the Council pandered to them, and, consequently, it was impossible that the Department should be a success. Lord Rosebery told them the County Council was just emerging from unpopularity; but he (the speaker) felt that if they continued the policy of direct labour they would again decline into extreme unpopularity.

Mr. A. T. Williams seconded the amendment as a business man with a practical training. He declared that the methods of those responsible for the Works Department were enough to make a business man's flesh creep.

Mr. Campbell supported the amendment, and remarked that, considering the amount written off the land, it was absurd to talk of the house being built on a self-supporting basis.

Dr. Collins said the mover and seconder of the amendment had indulged in a diatribe against the direct employment of labour, but that was not the question before them that day. Coming to the question as to whether this building should be erected by the Works Department, he saw nothing unreasonable in the recommendation of the Committee. In view of the figures of the present management

of the Works Department, he saw no reason why that Department should not carry out the work. He was not an out-and-out opponent of contractors, but he believed it best to have both contractors and direct employment, so that they could have an opportunity of stepping in if there was reason to suspect collusion amongst the contractors.

Colonel Rolton asked the Chairman of the Committee whether he believed the lodgings could be let at 6d. a night if the work was carried out by the Works Department, and, secondly, whether it could be carried out as expeditiously by the Department as by a contractor.

Mr. Howell J. Williams said that Sir J. Dickson-Poynder had been unfortunate in his selection of a case. The Rowton House Company did not employ contractors, but had adopted a system of direct employment of labour; why, then, should not the Council do the same? Two years ago the department was kept without work, and now that enormous capital had been sunk in it, it was absurd to think of putting a check upon it now that it was in full swing. This was a work in which there was much repetition work, and it was one which the Department would be well able to carry out. Still, the Department was not on a satisfactory basis. The Council imagined that it employed its own labour, but it did so only in a sense. They found the capital, but the work was hindered by hostile influences. What private owner who wanted to build a mansion would allow one or two clerks of works to hinder the successful carrying out of the work? The cause of the want of success of the Works Department was the hostility of clerks of works to the Council doing its own work.

Mr. H. P. Harris said he would admit that the Council had a mandate to have a Works Department, but he took it also that the Council had a mandate to have an efficient and economical Department. In the case of work for the Main Drainage Committee, if a loss was made it only fell on the unfortunate ratepayer, but the consequences were more serious to the Housing Committee, which had to make its accounts balance. It was time a protest was made, for they had these facts before them. Of the works carried out by contractors for the Housing Committee they had been done for 15,000l. below the architect's final estimate. On the other hand, the Works Department, in the work they had carried out for the Committee, had exceeded the measured value by 25,000l. If he thought the Works Department would be inquired into he was prepared to call a truce, but unless that was done they must go on protesting.

Mr. Fletcher expressed the opinion that the only way in which this lodging-house could be made a success was by allowing it to be built by contractors.

Mr. Burns, M.P., denied the truth of the charge that workmen limited their output when employed by Municipal Authorities. Direct employment of labour under the Council had given the ratepayers better work, and the men better wages and safer conditions of labour. The Works Department was founded on the delinquencies of the contractors and not at the demand of the trades unions. With fair criticism and honest clerks of works, the results of the operations of the Department would be better in the future than they had been in the past. The Department had been crippled by enemies within and without. If the men scarpred their work the remedy was to dismiss them.

Mr. W. Peel, M.P., said he was glad to see that a change had come over the opinions of the labour bench as to the Works Department, and as to the evils and sins of contractors. Apparently, Mr. Burns was now persuaded that the Department was not as efficient as it might be.

For the last three or four years the Progressives had said the Works Department must be reorganised, but they had not made the slightest attempt to improve it. Yet when complaints were made they met criticism with the same old answer, that they would reorganise the Department, which they desired to do on although losses were made. It almost seemed as if the policy of the Progressives was to hound the Works Department instead of the working-classes.

Mr. White said there was a great deal of truth in the published assertions as to restriction of the labour output. The Main Drainage Committee, in asking for a large excess vote, said:—"It would appear that the excess is principally due to the large expenditure on

labour, and we understand that all the men engaged on the work, with one exception, were discharged for not doing their duty to the Council."

Mr. Waterlow, Chairman of the Housing Committee, pointed out that there was at present far more work in the hands of the contractors than there was in the hands of the Department. As to the proposal now under discussion, if the recommendation were agreed to the Department would be able to start work at least two months before a contractor if the work were put out to contract, and he saw no reason why the Department should not do the work expeditiously and so as to make it pay. He should vote for the Committee's recommendation on the distinct understanding that the Department was to be improved, and that very shortly.

Mr. Crooks said he and his party had sympathy with labour, but not with loafing.

The Council divided, and the amendment was defeated by 84 votes to 28. A further amendment, requiring a fuller report from the committee on the financial bearings of the scheme, was negatived by a show of hands. The committee's recommendation was then adopted.

*Houses of Historical Interest.*—The report of the Historical Records and Buildings Committee relating to the indication of houses of historical interest in London, which we printed in our last issue, was discussed.

Mr. Beachcroft moved the following amendment:—"That the recommendation be referred back to the Committee for further consideration, the Council being of the opinion that the undertaking of work of this kind should be avoided as far as possible, as tending to discourage the efforts of societies and associations now working voluntarily in the public interest." He thought, unless they had a Committee of Taste, it would be very difficult to carry the Committee's proposal out.

Mr. H. Lawson seconded the amendment on the ground that there was no reason why the Council should go about and seek fresh obligations.

After some further discussion the Council divided, and the amendment was defeated by 54 votes to 46. The recommendation was then agreed to.

*The Government and the Fire Brigade.*—The Council adopted a recommendation by the Finance Committee to protest against the proposed action of the Treasury in regard to stopping the annual subvention of 10,000l. in aid of the Metropolitan Fire Brigade, and to point out that the inspection of fire appliances in many Government buildings was gratuitously performed by officers of the board.

*South Metropolitan Gas Burners.* Mr. Organ asked the Chairman of the Public Control Committee to state what steps the South Metropolitan Gas Co. had taken to supply and fix, free of charge, burners suitable in all respects for the consumption of gas of the illuminating power prescribed in their Act of last year.

Mr. W. C. Johnson replied that the company obtained power to reduce the illuminating power of their gas from sixteen candles to fourteen candles, on condition that they supplied and fixed, free to consumers, burners suitable for burning the gas of lower power. The company had given notice to consumers that they would supply such burners to any consumer who asked them to do so, but many consumers had not applied. It was important that the public should know that the old burners were not suitable for the gas now supplied by the company, and that consumers would save money and obtain better light by obtaining the new burners from the company. Some of the burners which had been issued by the company were governor burners, and were very satisfactory, but the company also issued other burners which were not so suitable or satisfactory when the gas is burnt at a high pressure, and consumers should, therefore, ask for governor burners in every case.

*The Control of the Erection of Wooden Structures.*—Mr. Goddard Clarke, Chairman of the Building Act Committee, stated, in reply to questions, that the decision of the Divisional Court in the test case brought by the Westminster City Council against the London County Council placed the obligation for the safety of wooden structures upon the Borough Councils, but that the County Council still controlled the erection of iron structures.

*Technical Institutes.*—The Technical Education Board reported as follows:—

"The Governors of the Hackney Institute have

accepted a tender for the erection of the first block of buildings in connexion with the technical institute for Central Hackney at Hackney Downs, on a site, part of which was transferred to the Governors by the Charitable Commissioners, and part taken over from the North-East London Institute. The designs, which were prepared by Mr. Arthur W. Cooksey, were selected from a limited competition by Mr. Thomas Blashill, late Superintending Architect of the Council, who acted as assessor. The first block of buildings will provide a physical laboratory with electrical testing-room, mechanical laboratory, chemical laboratory, balance-room, preparation-room, lecture theatre, drawing-office, and six classrooms, in addition to a boiler-room and other facilities. The block forms about one-quarter of a complete scheme of buildings for which plans have been prepared and which will completely cover the site.

The contract drawings for the Poplar Technical Institute are complete, and are about to be submitted to the Quantity Surveyor. It is estimated that about five weeks will be required for taking out the quantities, so that we expect that the estimate for submission to the Works Department will be available at the end of January.

The contract drawings for the new Brixton Technical Institute have been completed, the specification is now being prepared, and the drawings and specification will be sent to the Quantity Surveyor before the end of the present month. It may be anticipated that the estimate for submission to the Works Department will be available about the third week in January.

**The Criterion Theatre.**—The Theatres and Music Halls Committee reported that they had for some time past given careful consideration to the question of the structural condition of the Criterion Theatre, Piccadilly, and its suitability as a place of entertainment from the point of view of the public safety. The building was originally intended for use as a small concert-hall, and only after the entire carcass was erected was it decided to convert the premises into a theatre:—

"In 1899, in accordance with our practice of making a thorough survey of the older places of public entertainment, a complete inspection of the theatre was made by the Council's officers, and as the result we considered certain suggestions for improving the premises. The architect and chief officer of the Fire Brigade, however, when these proposed alterations were before us, reported that the site of the theatre was such as to render it quite unsuitable for use as a place of public entertainment, and in the circumstances we saw no alternative but to acquaint the Lord Chamberlain with this opinion. . . . We did not see our way when asked by the Lord Chamberlain for an opinion on the theatre to ignore the important question of the site, and we, therefore, informed his lordship on February 21, 1901, that, subject to the disability inherent in the site, the lessee appeared to be ready to make almost every possible arrangement to promote the safety of the public. In reply the Lord Chamberlain stated that he would be glad to understand whether the Council withdrew its letter of October 18, 1900, which would have practically made it necessary for him not to renew the licence in future for the theatre. After again considering the whole of the circumstances of the case we informed his lordship that we regretted our inability to withdraw the letter referred to, but that we had communicated to Mr. Wyndham the fact that we should be prepared to consider any plans or scheme which, in his opinion, would make the building safe in the event of a fire. We were subsequently informed on October 1, 1901, that the Lord Chamberlain had granted a full licence for the theatre upon Mr. Wyndham giving an undertaking to comply with the Council's suggestions in a manner to be agreed upon on further discussion with the Council (forthwith, and a fire-resisting curtain to be fitted to the proscenium opening without delay." Since that date proposals have been submitted by Mr. Verity on behalf of Mr. Wyndham for improving the theatre, and both these gentlemen appeared before us at our meeting on the 4th inst., and undertook to carry out all the alterations which were suggested in October, 1900, as the result of the examination of the theatre made by the Council's officers. For this purpose property will be purchased on the Jermyn-street side of the theatre which will enable exits to be provided sufficient to give ample and direct egress to the street. It was pointed out to us that it was very important the Lord Chamberlain and Mr. Wyndham should know our opinion of the theatre when these alterations have been carried out. . . . We recommend that the course taken in regard to the Criterion Theatre be approved, and that the Lord Chamberlain be informed, taking into consideration the small holding comprised in the theatre, the Council is of opinion that, when the proposed alterations and additions are completed, the theatre will be reasonably safe for the public."

The recommendation was agreed to.

**Theatres, &c.**—The following applications were agreed to on conditions: Boating Exhibition, London Exhibitions Buildings (Mr. A. O.

Collard); arrangements for the New Gaiety Theatre, which it is intended to erect at the junction of the Strand with the west spur of the proposed new road from Holborn (Messrs. E. Runtz & Co.); alterations to the basement exit at the south-east angle of the St. Peter's Institute, Buckingham Palace-road (Messrs. Chambers & Son).

**Fire Stations.**—The following recommendations of the Fire Brigade Committee were agreed to:—

"That the estimate of 3,600*l.* submitted by the Finance Committee be approved; that an expenditure of 3,350*l.* be authorised for enlarging the Stoke Newington station; that the work be executed by the Council without the intervention of a contractor; and that the drawings, quantities, specification, and estimate be referred to the manager of works for that purpose.

"That the estimate of 810*l.* submitted by the Finance Committee be approved; that an expenditure of 795*l.* be authorised for the provision of a ladder shed and additional stabling at the Fulham station; that the work be executed by the Council without the intervention of a contractor; and that the drawings, quantities, specification, and estimate be referred to the manager of works for that purpose."

**Objects of Archaeological Interest.**—The Historical Records and Buildings Committee reported as follows:—

"Our attention having been called to the fact that objects of archaeological interest frequently come to light in the course of dredging operations in the Thames, it appeared to us most desirable that such objects should be preserved to London; and we accordingly communicated with the Thames Conservancy, asking them to afford facilities to the Council for obtaining such articles with a view to their preservation. We have now to report that we have received a letter in reply from them, stating that any such objects which are discovered are preserved at the offices of the Thames Conservancy, where they may be inspected. Considering the great number of objects recovered from the Thames which have found their way into private ownership, we feel sure that the Council will be glad to know of the action of the Thames Conservancy, and we accordingly report the fact for its information."

**Housing: Reid's Brewery Estate.**—The Housing of the Working Classes Committee reported as follows, the recommendations being agreed to:—

"On December 10, 1901, the Council referred to us tenders for the superstructure of block C, Reid's Brewery estate. The tenders have been based on the understanding that the superstructure of blocks A and B shall also be carried out by the successful tenderer at the same schedule of prices as that for block C. The tenders received were as follows:—

	Amount of Tender for Block C.
Messrs. Hobbs Bros .....	£9,942
Mr. R. M. Hughes (Birmingham) ..	10,012
Mr. H. L. Holloway .....	10,026
Messrs. Holloway Bros. ....	10,090
Messrs. Martin, Wells, & Co. ....	10,093
Messrs. McCormick & Sons .....	10,247
Mr. B. E. Nightingale .....	10,436
Messrs. Stimpson & Co. ....	10,733
Messrs. E. Lawrence & Sons .....	10,866
Messrs. Spencer, Sainsbury & Co. ....	11,078
Mr. Samuel Redhouse .....	11,162
Messrs. Treasure & Son .....	11,198
Architect's estimate .....	10,382

The result of the tendering for the three blocks A, B, and C appears satisfactory, since the amounts of several tenders are well below the amount of the Architect's estimate. We are unable to recommend the acceptance of the lowest tender (that of Messrs. Hobbs Bros.) or of the next (that of Mr. R. M. Hughes). We think the Council will be well advised to accept the tender of Mr. H. L. Holloway. With regard to blocks D, E, and F, we have received a report from the manager of works to the effect that he is prepared to undertake the work of erecting the superstructure of block D at the amount of the architect's estimate, and also to build the superstructure of blocks E and F at the same schedule of prices. We are therefore of opinion that the work should be entrusted to the manager of works. We recommend:—(a) That the tender of Mr. H. L. Holloway, amounting to 10,026*l.* for the erection of the superstructure of block C, Reid's Brewery estate, and for the erection of the superstructure of blocks A and B, at the same schedule of prices, be accepted.

(b) That the work of erecting the superstructure of blocks D, E, and F, Reid's Brewery estate, be carried out by the Council without the intervention of a contractor, and that the working drawings, specification, bills of quantities (submitted to the Council on December 10, 1901), and architect's estimate of 10,382*l.* in respect of the superstructure of block D, be referred to the manager of works for that purpose, on the understanding that the erection of the superstructure of blocks E and F shall be undertaken at the same schedule of prices."

**Improvements.**—The following recommendations of the Improvements Committee were agreed to:—

"That the estimate of 1,500*l.* submitted by the Finance Committee be approved, and that subject to the Council of the Metropolitan Borough of Islington arranging with the New River Company for the necessary alterations in the position of the culvert under the footway in Essex-road, and subject to the borough council undertaking at its own cost the necessary paving and other works, the offer of the owners of the Tufnell-Canonbury Estate to give up for 1,500*l.* the land required for widening Essex-road between Cross-street and Halton Cross-street be accepted by the County Council. That the estimate of 341*l.* submitted by the Finance Committee be approved, and that a contribution be made on the usual conditions of one-half of the net cost of widening Herbert-road and rounding the north-eastern corner of Herbert-road at its junction with Plumstead Common-road, proposed to be undertaken by the Council of the Metropolitan Borough of Woolwich, such contribution not to exceed 341*l.*

"That, in connexion with the Old-street and Goswell-road improvement, the action of the Improvements Committee be approved in substituting wood paving for granite sets for the widened portion of the carriage-way between the kerb and the tram line.

"That, in connexion with the Tower Bridge southern approach improvement, the plot of land now approached road and Grange-road, Bermondsey, be allotted to the Council of the Metropolitan Borough of Bermondsey, with a view to the construction of underground conveniences."

**The View from Richmond Hill.**—A number of recommendations came up from the Parks Committee respecting the renewal of the option for the purchase of the Marble Hill Estate, as was explained by Lord Monkswell at last week's meeting of the Council.

Lord Monkswell said that with regard to the clause discussed at last week's meeting of the Council regarding boats and landing-stages, the Executive Committee did not feel it was an important one, and therefore it might be considered *defunct*—for this year, at any rate. The report was agreed to.

The Council adjourned at eight o'clock for the Christmas recess, and will not meet again until January 21.

ARCHITECTURAL SOCIETIES.

**SHEFFIELD SOCIETY OF ARCHITECTS AND SURVEYORS.**—The usual monthly meeting of the Sheffield Society of Architects and Surveyors was held at the Society's Rooms, Leopold-street, on the 11th inst., Mr. T. Winder in the chair. Much regret was expressed on the death of Mr. C. J. Innocent, a past President of the Society, and a vote of condolence and sympathy with his widow and family was passed. —Mr. A. Jeffery, artist in stained glass, then delivered a lecture on "Stained Glass." He commenced by giving a slight history of stained glass. The old masters taught us many lessons, and much could be learned from them. We should try and embrace all the good qualities of the old men, ignore their shortcomings, and try to improve on what has been done before us. After the sixteenth century stained glass died out, and did not again revive until the nineteenth century. Mr. Jeffery went on to explain that a window should be part of a building, a mode of letting light into a building, and should not be treated as a picture or wall decoration. If a man attempted a picture he spoiled his material as glass, and made a very bad picture. English glass was superior to foreign, both in material and workmanship. The most important point in a window was permanency, and only the most permanent of colours should be used, at whatever cost. Speaking of domestic glass, he did not think the modern style was a passing fancy, but had come to stop; but, like all other transitions in art, at the outset it seemed to have been let loose, and we seemed to be seeking after something we could not quite grasp. It would ultimately settle down and find its own level. He was eagerly looking forward to the time when there would not be so much commercialism in connexion with artistic crafts. He hoped architects in the near future would come more in contact with the craftsman, and by their joint ideas be enabled to raise the standard of work higher than it is. By so doing he thought there would be a bright prospect for stained glass in the future. The lecture was illustrated by drawings and examples of stained glass. On

the motion of Mr. C. Hadfield, seconded by Mr. J. Smith, and supported by Messrs. W. J. Hale and H. L. Paterson, a vote of thanks was accorded the lecturer.

**NORTHERN ARCHITECTURAL ASSOCIATION.**—A meeting of the Northern Architectural Association was held on the 11th inst., at the offices of the Association, 36, Northumberland-street, Newcastle. Mr. J. Miller Carr delivered a lecture on "Terra Cotta: constructional faience and ceramic mural decoration." The lecturer at the outset referred to the ancient history regarding terra cotta, and then to the modern use of the material. In doing so, he remarked that it was a fact that building materials have an increasing value from a decorative point of view exactly in proportion to the richness and variety of their colour. Speaking of colour in connexion with terra cotta, they must say that ten years ago they were in the full tide of uniformity in architects' specifications. A few years later a close approximate uniformity was attained with the same material, and after some eight years the feeling for true art advanced in the country by leaps and bounds. The saddest thought he had to-day about colour in terra cotta buildings was that they did not really know what value and beauty they might have if only they would let Nature have her own way. One of the principles he laid down was that the true methods of use of any material should be such as were suited to its nature and properties. A successful use of faience involved a true understanding of terra cotta as its foundation. They must consider the materials suitable for exteriors of buildings in this country. In his opinion it was a mistake, for many practical reasons, to attempt to carry out glazed treatments for the internal parts of buildings at the same time that the general structure of the exterior was proceeding. The question arose: was it not possible to depart with advantage from some of the traditional forms of treatment for interiors? He next directed their attention to the various examples of ceramic mural decoration on the screen, and pointed out the characteristics of each example.—After the lecture, the ex-President of the Association (Mr. W. Glover) was presented with an illuminated address and a silver ink-stand on his leaving the district for the South after seventeen years' membership.

#### APPLICATIONS UNDER THE 1894 LONDON BUILDING ACT.

The London County Council on Tuesday dealt with the following applications under the London Building Act, 1894. Unless otherwise stated, consent was given on conditions. The names of applicants are given between parentheses:—

##### Lines of Frontage and Projections.

**Strand.**—The retention of an iron and glass shelter at the front entrances to the Century Theatre, Strand (Messrs. E. Kuntz & Co. for Mr. G. Edwardes).—Consent.

**Clapham.**—Wood and tile porches at the entrances, and wooden brackets to the overhanging portions of the roofs of the gables, of two semi-detached houses on the east side of Rodenhurst-road, Clapham Park (Mr. H. J. Capell for Mr. A. E. Peacock).—Consent.

**Clapham.**—Six houses, with one-story shops in front, on the site of Nos. 95, 97, and 99, High-street, Clapham (Mr. W. Theobalds for Mr. H. F. Harrington).—Consent.

**Deptford.**—Retention of a wood and glass covered way and a greenhouse at the side of No. 39, Lewisham High-road, New Cross, abutting upon Park-road (Mr. E. Crosse for Mr. H. Bisley).—Consent.

**Fulham.**—Deviation from the plans approved for the erection of a two-story addition on the northern side of No. 4, Filmer-road, Fulham, so far as relates to the construction of a window, with shop fascia over, in substitution for two windows at the ground-floor level (Mr. A. R. Bulley for Mrs. J. Davis).—Consent.

**Hackney, North.**—A three-story building, with a shop on the ground floor, on the site of No. 80, Stoke Newington-road, Stoke Newington (Mr. H. W. Bannan for Mr. W. Pearson).—Consent.

**Hackney, North.**—A building at the rear of No. 168, Albion-road, Stoke Newington, to abut upon Broughton-road (Mr. C. F. Parsons for Mrs. E. Parsons).—Consent.

**Kensington, South.**—A brick and stone porch at the entrance to No. 11, St. Alban's-road, Kensington (Mr. C. E. Sayer for Mr. F. Sanders).—Consent.

**Lewisham.**—A one-story shop on part of the forecourt of No. 144, Rushey-green, Catford (Mr. J. Laird for Mr. E. Hardstone).—Consent.

**Lewisham.**—Wood and tile pents over the entrances to twelve houses on the south side of

Stillness-road, Lewisham, between Crofton Park-road and Brockley-rise (Mr. J. S. R. Richardson).—Consent.

**Lewisham.**—The retention of a wooden oriel window at the basement-floor level in front of No. 22, Sydenham-park, Lewisham (Mrs. M. Hart).—Consent.

**Lewisham.**—A one-story shop on part of the forecourt of No. 64, Rushey-green, Catford (Mr. A. W. Osborn for Mr. W. Hatch).—Consent.

**Strand.**—Two iron and glass shelters at the entrances to an extension of the Trocadero Restaurant, Shaftesbury-avenue, St. James's (Messrs. J. Lyons & Co., Ltd.).—Consent.

**Strand.**—An iron and glass shelter in front of the London Pavilion Music-hall, Piccadilly-circus (Messrs. Wylson & Long for the London Pavilion, Ltd.).—Consent.

**Wandsworth.**—A dwelling-house on the south side of Ormerley-road, Balham, to abut upon Laitwood-road (Mr. W. E. Johnson for Mr. G. E. Treves).—Consent.

**Chelsea.**—Retention of a wood and glass roof over a portion of the area of No. 18, Tedworth-square, Chelsea (Messrs. H. Gibbons & Sons for Mr. M. Vradham).—Refused.

**Clapham.**—A two-story house on the north side of Poynder's-road, Clapham Park, at the corner of Rodenhurst-road (Messrs. R. Price & Son for Mr. S. H. Poulton).—Refused.

**Fulham.**—Residential flats, with projecting shop fronts, on the site of Nos. 104, 106, and 108, High-street, Fulham (Mr. C. H. Brodie for the Eagle Investment Co.).—Refused.

**Greenwich.**—A one-story shop in front, and a one-story workshop at the rear, of No. 12, Old Dover-road, Blackheath, at the corner of Doraberg-road (Mr. A. Roberts for Mr. G. Hall).—Refused.

**Hammersmith.**—Four houses, with shops, on the west side of Askew-road, Shepherd's Bush, at the corner of Gayford-road (Mr. H. Blackburn for Mr. R. Percy).—Refused.

**Hampstead.**—Three houses, with bay windows, on the east side of Finchley-road, and six houses, with bay windows, on the north side of Platt's-lane, Hampstead (Mr. G. W. Hart).—Refused.

**Wandsworth.**—A one-story shop in front of No. 15, High-street, Putney (Mr. J. C. Radford for Mr. E. W. Taylor).—Refused.

**Woolwich.**—Two houses, one on the north side and one on the south side of Tuam-road, Woolwich, to abut upon Ennis-road (Mr. J. O. Cook for Mr. H. W. Grant).—Refused.

##### Width of Way.

**Lewisham.**—The retention of the forecourt fence in front of Nos. 1, 2, and 3, Laurel-villas, at less than the prescribed distance from the centre of Laurel-grove, Acacia-road, Sydenham (Mr. T. H. Wood).—Consent.

**Finsbury, East.**—Warehouse buildings on the north side of Great Arthur-street, and south side of Bayer-street, Golden-lane, with the external walls of such buildings at less than the prescribed distance from the centre of Bayer-street (Messrs. N. S. Joseph, Son, & Smith for Mr. S. H. Beddington).—Consent.

**Greenwich.**—No order with respect to the application of Mr. J. Hollick for consent to the erection of a stable building on the south side of Morden Wharf-road, Blackwall-lane, Greenwich.—Agreed.

**Brixton.**—Stable buildings on the south side of Baker-street, Brixton, at less than the prescribed distance from the centre of the street (Mr. J. J. Freeland for Mr. G. Bentley).—Refused.

##### Width of Way and Projections.

**Bermondsey.**—Deviation from the plans sanctioned for the erection of a building, with bay windows, to be inhabited by persons of the working class, on the east side of the Tower Bridge southern approach, Bermondsey, to abut also upon Longwalk, Abbey-street, and New-road (Messrs. Humphreys-Davies & Co. for the South-Eastern Railway Company).—Agreed.

**Marylebone, East.**—A church, with projecting porch, buttresses, and plinth, on the west side of Glentworth-street, at the corner of Upper Park-place, St. Marylebone (Messrs. W. Bucknall and J. N. Comper for the Rev. G. F. Forbes).—Consent.

##### Space at Rear.

**Woolwich.**—No order with respect to the application of Mr. A. E. Parnell, on behalf of Mr. A. Chapman, for consent to an increase in height of the back additions to No. 2, High-street, Plumstead.—Agreed.

**Lewisham.**—A modification of the provisions of Section 41 of the Act with regard to open spaces about buildings, so far as relates to the proposed erection of a coach-house at the rear of Nos. 1 and 2, The Parade, Sydenham-road, Sydenham (Mr. G. Tolley for Mr. F. A. Norden).—Refused.

##### Width of Way, Line of Frontage, and Space at Rear.

**Lewisham.**—A detached house on the east side of Brockley-rise, Brockley, northward of Stillness-road, with the external walls of such house at less than the prescribed distance from the centre of a public footpath to an advanced line of frontage in Brockley-rise, and with an irregular open space at the rear (Mr. J. W. Webb).—Refused.

##### Line of Frontage and Construction.

**Bow and Bromley.**—The retention of a wooden shed addition to a saw-mill and joiner's shop at Tredegar Works on the south-west side of Ordell-road, Bow, and to the retention of an iron and concrete timber-drying stage at such premises in advance of the general line of buildings in Ordell-road (Messrs. Perry & Co.).—Refused.

##### Formation of Streets.

**Norwood.**—That an order be issued to Mr. R. Pippettsanctioning the formation or laying out of a new street for carriage traffic to lead from Auckland-hill, West Norwood, to St. Gotthard's-road, and in connexion therewith the widening of Auckland-hill and St. Gotthard's-road (for Mr. J. G. Pilcher). That the name St. Bernard's-road be approved for the new street.—Consent.

**Wandsworth.**—That an order be issued to Mr. J. M. Jones, sanctioning the formation or laying out of a new street for carriage traffic to lead from Wimbledon Park-road, Southfields, to Replingham-road, and in connexion therewith the widening of a portion of Wimbledon Park-road and Merton-road (for the Lands Development Syndicate). That the name Pirbright-road be approved for the new street.—Consent.

**Woolwich.**—That an order be issued to Messrs. Farebrother, Ellis, & Co., sanctioning the formation or laying out of a new street for carriage traffic out of Woolwich-road, Woolwich, in continuation of Yately-street (for the Trustees of the Bowater estate). That the name Yately-street (in continuation) be approved for the new street.—Consent.

**Lewisham.**—That an order be issued to Mr. J. W. Webb refusing to sanction the formation or laying out of streets for carriage traffic, 40 ft. wide, on part of the Crofton Park estate on the eastern side of Crofton Park-road, Brockley.—Agreed.

**Wandsworth.**—A deviation from the plan approved by the Metropolitan Board of Works for the formation of new streets out of Strea-ham-hill, Streatham, to be named Everton-road, Normanhurst-road, Roseheath-road, Daysbrook-road, and Wavertree-road (Mr. F. N. Kemp for Mrs. Wyatt-Coffey); for consent to the formation of the western portion of Normanhurst-road of a less width than 40 ft., and to the erection of houses.—Refused.

##### Means of Escape from Top of High Buildings.

**Kensington, South.**—A modification of the means of escape in case of fire, proposed to be provided in pursuance of Section 63 of the Act, on the eighth and ninth stories of a block of residential flats known as Block No. 1, Iverna-court, and situate on the west side of Wright's-lane and south side of Iverna-gardens, Kensington, for the persons dwelling or employed therein (Mr. R. Clarke for Messrs. J. Howard & Co.).—Refused.

The recommendations marked † are contrary to the views of the Local Authorities.

#### TRADE CATALOGUES.

THE Kern Burner Company have sent us an illustrated catalogue of their Clamond gas-heating radiators, which form a new description of gas fire, and were noticed in the *Builder* recently. It is claimed that these fires emit a greater total heat and a larger proportion of radiant heat per unit of gas consumed than any other gas fire on the market. The burner is constructed on the same principle as the Kern burner for incandescent lighting, a thorough mixing of the air admitted through the side holes in the Bunsen tube being effected with the gas before the mixture reaches the point of ignition. The effect of employing a more intimate mixture of gas and air is, no doubt, to shorten the flame but to increase its temperature, and as the flame is utilised for heating a number of perforated clay tubes, it is quite conceivable that a larger proportion of radiant heat is obtained than in the older forms of gas fire. It is improbable that the total heat obtained is greater than that yielded by some forms of condensing stoves, but radiant heat is much preferable to convected heat for heating dwelling-rooms, and we have no hesitation in recommending the Clamond radiator to the consideration of our readers.

The Simplex Steel Conduit Co., Ltd., of 20, Bucklersbury, London, have sent us supplementary pamphlets to their current price-list. This company makes a speciality of conduit wiring for the electric light, and these supplementary sheets give particulars of some important additions and improvements to their system. We note that they now supply enamelled screwed steel piping with the longitudinal seam unbrazed, at a price nearly 40 per cent. cheaper than the same material with the seam brazed. It was formerly found impracticable to screw unbrazed conduit, but by a novel die which they have invented this

can now be done simply and effectively. These conduits would be suitable for wiring for the electric light in breweries, engine-rooms, &c., as they would be able to withstand rough usage and can easily be made watertight.

Mr. Samuel Cabot (Boston, U.S.A.) sends us some specimens of his numerous creosote stains for wooden shingle, used more largely in America than in this country, as a covering to house walls. It is claimed that these stains wear as well as the best paints, and are softer and better in colour, leaving the grain of the wood showing, while they preserve the wood from decay or insects. As far as appearance goes the specimens sent to us bear out the claim made for them. He sends us also a book containing some prettily executed views of houses in chromo-lithograph, illustrating the effect of some of the colours when seen *en masse* as the colour element of a building.

We have also, by the same patentee, Cabot's sheathing and deafening "quilt," a material for the lining of walls and roofs for warmth and for deadening sound. It is a double thickness of a brown paper sewn together in sheets and containing between the two layers of paper a filling of cured eel-grass (*Zosteria marina*), with long flat fibres crossing each other at every angle, and forming a soft cushion of innumerable dead-air spaces. It is not inflammable except as to the paper, and it is stated that the material is repellent to moths and vermin. It seems a material worth attention. The B. & S. Folding Gate Co. are the agents for it in London.

Mr. Robert Adams sends us the new edition of his complete catalogue of building specialities, which includes an immense variety of articles such as fanlight openers and adjusters for various models of sash; gate and door fittings and spring hinges; reversible sashes and various contrivances for safe window-cleaning; casement and window fastenings sliding; rolled steel and bronze casements; iron window frames; gun-metal handles and door furniture of various types, &c.

Messrs. Charles Carr, of Smethwick, send us their supplementary list, containing particulars of their steam valves and steam fittings in copper and brass.

Messrs. Ewart & Son, Ltd., of 346-350, Euston-road, send us their new catalogue of geysers and other water-heating apparatus. Besides their well-known "Lightning" geyser, which is now made in seven sizes, illustrations and descriptions are given of the "Acme," "Californ," "Auto-Lighting," and other geysers. The "Californ" is, perhaps, the most important of the new types. The geyser itself may be fixed in any convenient place in the basement or elsewhere, and a single pipe is led from it with branches to the bath and other fittings at which a supply of hot water is required. The opening of any hot-water tap raises the gas in the "Californ," and a supply of hot water can (it is said) be "instantly obtained at any temperature (up to 200 deg. Fahr.) in any quantity." We presume that the water in the pipe between the geyser and the tap must be drawn off before hot water will issue from the tap. The water is delivered at the same pressure as the main service, (but not exceeding 100 lbs. per sq. in.), and taps can, therefore, be fixed above as well as below the geyser. In this and some other geysers (including the "Lightning") the products of combustion do not come in contact with the water. This is a great advantage, which is not obtained in the "Champion" and "Surprise" geysers. In the "Fuel" geyser the heat is obtained from coal or wood, and in the "Success" oil is the heating agent. Some general hints are given on geyser ventilation, and appliances are shown for reducing the risk of down-draughts, but more might with advantage have been said on this subject, as great annoyance is often caused by down-draughts in the flue-pipe leading from a geyser. In windy weather sudden gusts of air may pass down the pipe and blow the gas flames through the openings till the whole geyser is a sheet of flame. In cold, still weather there may be a steady down-draught in the pipe with the same result, but in this case the current can easily be reversed by closing the door of the bathroom and opening the window. Among the other apparatus illustrated in the catalogue are towel-warmers, urns, boilers, and copper and iron baths. The catalogue cannot fail to be of service to architects and plumbers.

Messrs. Winsor & Co., Ltd., send us their

new catalogue of sanitary appliances. Many of the drainage goods of this firm are already well known, and need not be described in detail. An important feature of this new catalogue is the section on "Iron Drainage," which contains illustrations of iron pipes, bends, junctions, traps, sewers, and inspection covers. The "Imperial Chambers" are well worth notice. These are really the floors of inspection chambers, each being in one piece of cast-iron. It is said that patterns for 300 different chambers are kept in stock, ranging in size from 1 ft. 6 in. by 1 ft. 6 in. to 1 ft. 6 in. by 6 ft. The main channels are 4 in., 5 in., or 6 in. wide, and as many as seven branches on each side can be provided in the largest chamber. Iron raising pieces can be supplied to take the place of brick walls. The iron is coated with Angus Smith's solution. Various kinds of manhole covers (both air-tight and perforated for ventilation) are illustrated in the catalogue, as well as grease and other gullies, flush-tanks, drain-plugs, sinks, lavatories, and water-closets. It is an interesting and useful catalogue.

From Mr. John Jones, of Chelsea, we have received an illustrated catalogue of "Improved Sanitary Goods and Specialities." The first illustration represents an intercepting chamber with pipes instead of the usual channels; all the fittings are of cast-iron, including the intercepting trap (fitted with a ventilation arm), the clearing arm and junction, and the main pipe which is fitted with a double-seal inspection cover. Cast-iron channels and junctions for junction chambers are shown, and various cast-iron traps, bends, manhole-covers, &c. Stone-ware traps and channels are also shown. The sanitary fittings illustrated include baths, lavatories, sinks, urinals, and water-closets, but these do not call for special mention. The last section of the catalogue is devoted to drain-testing and drain-clearing appliances. Among the drain-testing appliances we notice two expanding screw stoppers with indicators attached for registering the amount of leakage under the hydraulic test.

The Stanhope Water Engineering Co., Ltd., of 20, Bucklersbury, London, send us a pamphlet of twelve pages containing illustrations and descriptions of the "Stanhope" water softeners, purifiers, and heaters. The water softeners and purifiers are designed for softening water in large quantities for steam boilers, laundries, town supplies, and trade processes. Softening is effected by a solution of lime or carbonate of soda, or both, according to the nature of the ingredients causing hardness in the water. The mechanism is simple and ingenious, the supply of the softening solutions being automatically regulated by the amount of water drawn from the tank containing softened water. The combined softener and heater for the feed-water of boilers is on similar lines, but means are provided for heating water by exhaust steam. The "Stanhope" softeners are already in operation at many places in the Metropolis, and will prove of great value in reducing incrustation in boilers and pipes, in saving soap in laundries, and in other ways.

"Notes on Non-Conductors of Heat" is the title of an illustrated pamphlet received from Messrs. Fred. Jones & Co., of Perrin-street, Kentish Town, the well-known manufacturers of silicate cotton or slag wool. A brief account of the process of manufacture is given, and this is followed by records of experiments showing the valuable non-conducting qualities of the material as applied to steam pipes, hot-water pipes, and refrigerating chambers.

The leaflet for December sent out by the General Electric Co. describes several very interesting inventions. The "Batten" patent rectifier is a cheap apparatus which will enable householders supplied with alternating current to obtain direct current for charging accumulators, working induction coils, &c. It consists practically of a polarised relay the tongue of which moves synchronously with the alternating current, and thus sends unidirectional current into two branched paths. By its means we can get two circuits, each carrying what is practically 6 amperes of direct current at a pressure of 25 volts. Each of these circuits would do excellently for charging the accumulators used for motor-cars and for carriage lighting. There has been a demand for an apparatus of this sort, and this is the first practical solution of the problem we have come across. The General Electric Co. are also making accumulators for use in connexion with engines, motor-cars, and launches where petrol is used for the motive power. One of these will

enable an 8-h.p. motor-car to run about 1,000 miles on one charge. Another novelty the company advertises is an automatic cut-out with equivalent resistance for arc-lamps, which is very neatly designed.

Messrs. J. Sagar & Co., of Halifax, send us sheet lists of their improved tenoning machine and power mortising and boring machine. The first of these, notwithstanding its name, was designed specially for those users who have not sufficient work to justify the adoption of a machine for tenoning alone, and it is available for making tenons of different kinds, for cross-cutting, and grooving. The second machine is designed for mortising and boring either hard or soft woods, and as the boring-bit is in a line with the mortising chisel the timber can be placed under either at one setting. Both the machines are of good design, and are evidently of substantial construction.

## Illustrations.

### DESIGN FOR TAPESTRY HANGINGS FOR A MUSIC-ROOM.

THE design is by Miss Mabel B. Keighley, of the Plymouth School of Art, and gained for its author a gold medal in the South Kensington "national" art competition.

In explanation of the design, Miss Keighley writes that it is intended to suggest the employment of music in a marriage hymn. The panels on the left plate in our illustration would, in execution, go one on each side of the centre panel shown in the right-hand plate. The centre figures in this latter represent the bride and bridegroom; the child on the step, "Love" or "Hymen"; the musicians and the angels in the side panels, terrestrial and celestial beings joining in the hymn of praise.

The embroidery is upon hand-woven linen from the Windermere Spinning Industry, of a deep grey tone; the stitches are worked upon a frame, in Harris flax threads in reds, blues, greens, yellow, orange, black, and white, with gold and silver thread; but all subdued in tone by the grey of the background.

The whole of the design, including the embroidered specimen, has been purchased by the Board of Education.

### ROYAL VICTORIA HOSPITAL, BELFAST

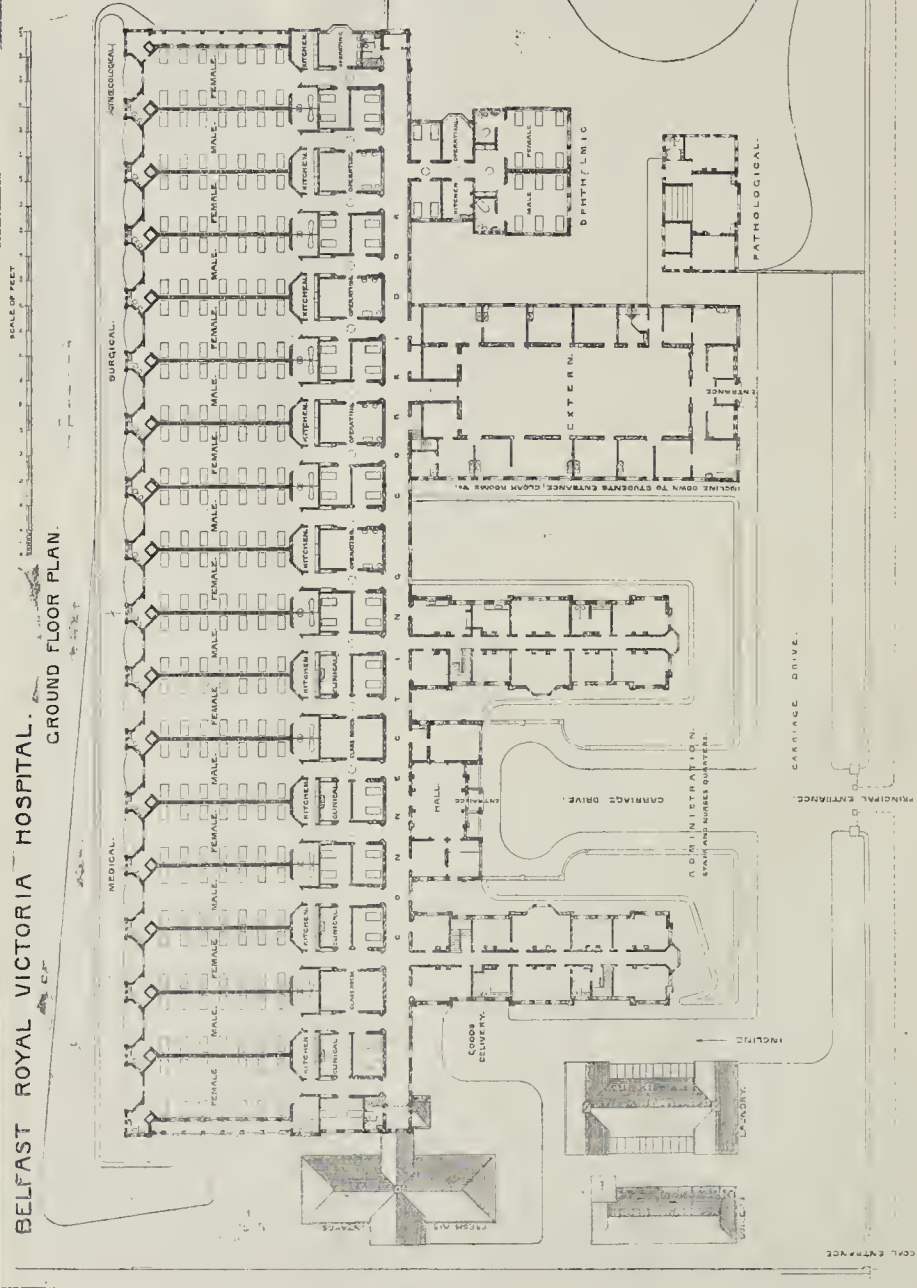

THIS hospital, of which we give two views and a plan, is designed by Messrs. Henman & Cooper, of Birmingham, and is planned on the lines suggested by Mr. Henman in a letter in our issue of August 8, 1895, in which he advocated the treatment of hospitals and infirmaries as "health manufactories," and went on to urge the desirability of their being planned with special regard to their admitting of perfection of work accomplished with ease and despatch, against which he considered the "pavilion" system militated, necessitating, as it undoubtedly does, the traversing by the traffic of the building of long distances both vertically and horizontally, in corridors, staircases, and lifts. He then proceeded to suggest the placing of the wards, all on one story, side by side, and lighting them principally by continuous lantern lights, an arrangement rendered possible, of course, only by a development to the full of "Plenum" ventilation. In 1898 Mr. Henman was commissioned to prepare a design on those lines by the Committee of the Belfast Royal Victoria Hospital. The scheme went through various stages of development, which we need not detail, all tending, however, towards the fullest utilisation of the possibilities of Plenum ventilation; and, finally, working drawings were prepared, in conjunction with his partner, Mr. Thomas Cooper, and a tender accepted from Messrs. McLaughlin & Harvey, builders, of Belfast and Dublin, for the erection of the buildings.

The following is the architects' further description of the building—

"The plan will show very clearly what compactness of arrangement this new departure in hospital construction admits of. We have here seventeen wards on one floor and side by side, four physicians and four surgeons having each his own pair of wards—male and female—while the seventeenth is specially reserved for gynaecological cases. Each pair of wards on the medical side has a kitchen, a doctor's room, two bathrooms, and two wards of two beds each, while each group of four wards has its classroom.

On the surgical side each pair of wards has a

kitchen, two bathrooms, and two wards of two beds each, as before, and also has a large operating-room. The gynaecological ward at the extreme western end of the group has its own operating-room, kitchen, bathroom, and two-bed ward.

Each main ward is separately approached by its own branch corridor, on either side of which are placed the above-mentioned subsidiary rooms, with stores for linen and patients' clothes.

Every main ward has its axis running north and south, and is lighted at its southern end by large windows with French casements opening into a roomy balcony looking over the hospital gardens, and flanked by the sanitary turrets attached to the wards. These main wards are all of one size, 58 ft. by 24 ft., containing fourteen beds each, and are all additionally lighted on both sides by continuous and nearly vertical lantern lights. Fresh warm air is admitted at a height of 7 ft. above the floor between each pair of beds, and the vitiated air finds exit at the floor level below every bed and is conveyed thence to the outlet ventilator in the roof of the sanitary turret. The air of the ward being constantly under slight pressure will naturally flow outwards, and therefore disconnecting lobbs to the sanitary turrets have been dispensed with.

All the accommodation we have been describing lies to the south of the principal corridor, running east and west, while north of it lie the administrative buildings, the out-patients' or extern department, and the ophthalmic block.

The administrative buildings consist of a low central block containing the entrance-hall with other rooms, and of two four-story wings housing the medical staff, the dispensary department, the matron, nurses, and servants. In the basement the kitchen, porters, and stores are provided for, with rooms for noisy patients.

The extern department comprises a large waiting-hall, top-lighted like the wards, with its attendant consultation and other rooms ranged round it on all sides, and is entered at the northern end, and communicates with the main corridor at its southern end, by which communication in-patients will enter the building. Below it are rooms for students—male and female—attached to the hospital.

It may here be mentioned that in this hospital medical teaching is a feature of its administration, for which purpose the classrooms previously mentioned are provided.

The ophthalmic building receives sixteen patients in two wards of six beds each and two of two beds, and has its own operating-room, kitchen, &c.

Sixty wards for six and infectious wards for four patients are arranged in two detached buildings, each with its own kitchen, nurses' room, and all necessary adjuncts, and in a third detached building are the mortuary and post-mortem theatre and pathological rooms.

The total hospital accommodation thus provides for 300 patients' beds, while the resident staff includes eight medical and surgical officers, seventy-six nurses, and thirty-two male and female attendants and servants.

In the engineering arrangements the architects have had the valuable assistance of Mr. Henry Len, the consulting engineer, and in this department it is hoped to show a very decided advance on what has been hitherto accomplished, in the way of simplification of the appliances and a lessening of the cost of their efficient maintenance.

By the use of the exhaust steam from the engines for the heating of the hot-water supply of the building, a large deduction may reasonably be made from the cost attributable to the employment of mechanical means for ventilation.

The air-intake buildings lie at the east end of the main corridor, below which runs the great air duct of the hospital, 30 ft. by 9 ft., in sectional area at the intake end. This main air duct in its course westward gradually diminishes in height as it gives off supplies to the several branch ducts, this diminution of height following a rise in the natural level of the ground from east to west. Engines and air propellers are provided in duplicate, each of sufficient power to supply the minimum amount of air required by the whole hospital, thus allowing for all the contingencies of cleaning, rest, and repair of machinery. Without the opening of any windows a change of air seven times an hour in winter and ten times in summer, has been allowed for the whole cubic capacity of the building, exclusive of the administrative block, which, being of a residential character is provided with fireplace, heating, and ventilation in the ordinary way, supplemented by hot-water heating.

The boiler house and steam laundry buildings are at the north-east end of the site. A destructor and disinfecting apparatus are also provided.

Externally the hospital has been advisedly treated with great simplicity in red sand stock brick with dressings of Giffnock stone, the Committee having made a very strong point of concentrating the expenditure upon completeness and thorough efficiency of internal arrangement and fittings.

The total cost of the buildings will not exceed the sum of 300l. per bed, a particularly low figure for so completely appointed a hospital.

Associated with the work should be mentioned the names of the quantity surveyor, Mr. W. H. Stephens, of Donegall-square North, Belfast, and of Mr. G. A. Flower, clerk of the works.

### THE QUEEN VICTORIA MEMORIAL: A SUGGESTION.

MR. W. H. LYNN, of Belfast, has sent us the plan here published, as a suggestion for a further development of Mr. Aston Webb's plan for the Queen Victoria memorial. The following is Mr. Lynn's description of his intention in the plan:—

"Mr. Aston Webb's bird's-eye view of his design looking towards Buckingham Palace, published with your issue of November 2, suggested the possibility of continuing the curved lines of the colonnades backward to form a circular enclosure to the Memorial site, and of connecting them with the Palace, to associate the latter more distinctly with the general design. I send you the outcome of a rough trial plan aiming at this.

In points of detail Mr. Webb's design was followed as far as possible; but in the effort to include the whole within the limits of his plan, some variations were unavoidable; for instance, the setting back of the front colonnade from the surrounding road line—the sufficient space this would leave for ornamental treatment, between the colonnades and the footway, would perhaps be no disadvantage.

The circular form of enclosure necessitated an advance of the Memorial eastward; also a change in the form of the Palace forecourt. By the former, the line of traffic passing north and south, in front of the Memorial, would be removed so much further from the Palace. In the latter the forecourt is enclosed at the sides by the arches screens connecting the colonnades with the Palace block; and in front by the curved lines of the railing and entrance gates—the latter rather in advance of Mr. Webb's enclosure, and on good driving lines, to and from the Palace. The forecourt would thus seem to be rendered more private, while the triple archways or screens form stately entrances to the court from the side approaches.

I indicate solid backs to the colonnades forming wings to the Palace, with a view to imparting solidity of effect to them as wings, and as forming a background to the Memorial and the circular court. On the outside the walls could be relieved by engaged columns, and niches with statuary. The larger pedestals on the line of the inner circle suggest equestrian statues.

If the western half only were carried into execution, it would present a by no means incomplete appearance."

### COMPETITIONS.

**SCHOOLS, CHADDERTON.**—In a competition for Stanley-road schools, Chadderton, the assessor, Mr. A. N. Bromley, Prudential-buildings, Nottingham, has placed first the design of Mr. Charles T. Taylor, A.R.I.B.A., Oldham. The second premiated design is by Messrs. Winder & Taylor, Oldham; the third by Mr. Richard Holt, Liverpool; and the fourth by Messrs. Cheers & Smith and J. & H. Aspinall (joint), Blackburn.

**EXTENSION OF WIMBLEDON PUBLIC LIBRARY.**—In the limited competition held recently for the extension of the Wimbledon Public Library, the design submitted by Mr. R. J. Thomson, A.R.I.B.A., of Hill-road, Wimbledon, has been accepted for the work, which is to cost 2,500l.

### METROPOLITAN ASYLUMS BOARD.

The usual meeting of this Board was held at the Boardroom, Victoria Embankment, on Saturday.

**The Joyce Green Hospital.**—In view of the near approach of the Christmas holidays, the Works Committee reported that they had replied to a Local Government Board communication in which that Authority stated that it would be necessary for plans and a complete estimate of the cost of certain works to be submitted for their approval. The Committee had replied that the Local Government Board were already in possession of the plans, but that a copy of the working drawings forming the basis of the contract would, when completed, be forwarded. The Board approved of the action of the Committee.

**Accommodation at South Wharf.**—The same Committee reported that at an extraordinary meeting of the Managers, approval was given to plans prepared by Messrs. T. W. Aldwinckle & Sons, architects, for the erection of receiving-rooms, isolation ward, and male staff quarters

at South Wharf, Rotherhithe, and for the erection of a detention shelter at North Wharf, Blackwall, and directed that when the approval of the Local Government Board had been received, the plans should be referred to the Committee with instructions to take such action as might appear to them to be requisite to secure the completion of the buildings at the earliest possible date. In view of the urgency of the matter, the architects were instructed to submit to them a tender from the contractors for the permanent buildings now in course of erection at South Wharf for the erection of the proposed additional buildings. In this tender, amounting to 5,930l., which was before them at their meeting, Messrs. Waller Lawrence & Son, the contractors, guaranteed to complete the buildings within eight weeks from the date of the order to commence, subject to a reduction from the contract sum of 100l. per week for every clear week after the period during which the said buildings should remain unfinished. The recommendation of the Committee in favour of the acceptance of the tender was adopted. Subsequently, the Committee mentioned that the Local Government Board had already approved the plans (with some minor alterations), and it being imperative, in view of the inadequacy of accommodation for patients at both the South and North Wharves, that the buildings should be erected without further delay, they (the Committee) had directed the architects to instruct the builders to proceed with the works forthwith. The Committee had also, at the request of the Ambulance Committee, authorised the provision in a temporary building at South Wharf of eight additional cubicles for the male staff.

### BOOKS RECEIVED.

CENTRIFUGAL PUMPS, TURBINES, AND WATER MOTORS. By Charles H. Jones, M.A. Third edition, revised. (John Heywood.)

### Correspondence.

To the Editor of THE BUILDER.

#### "THE DIRECT EMPLOYMENT OF LABOUR."

SIR,—To find myself suspected of advocating this system is so refreshing that I am tempted to pursue the matter a step further. It would be false modesty to disclaim the amount of insight into the practical aspect of direct employment with which Mr. Wallis would credit me—I am writing of that which I have viewed from all sides.

Mr. Chappell has not caught my argument. The savings I enumerated are such as may naturally occur to the owner who thinks of dispensing with the contractor; whether he will actually secure them depends on good management and good luck. The ordinary building owner willingly pays more money to a contractor than he may be advised that the building would cost by direct employment, because he cannot afford to run the uninsurable risks. The owner who can afford it will take his chance. I will not here go into the question of trade discounts which was touched upon in my recent paper at the Surveyors' Institution, but those who supply building materials and accessories are of the same flesh and blood as other manufacturers and merchants. Show them gold, and I have enough evidence that if one will not do business on the lowest terms that he can afford, another will. The owner whose money is ready must save the interest which the contractor has to pay while he is waiting for the owner's cheque. If he gets a bright and honest manager who is properly supervised by the architect or surveyor, he will also save the contractor's profit, or some of it. As to friction between employers and employees, let your correspondent not despond for the private owner. His class already pays in the shape of enhanced tenders for all the disputes between contractors and workmen, and they have to sit down helpless during strikes. One of my friends had such troubles as Mr. Chappell prognosticates. They might have ruined a contractor, for every job he had got would have been struck, and his establishment charges would have gone on piling up. But this man just paid everybody off and locked the gate till workmen turned up. There was no expense and but little delay.

In dealing with the question of direct employment, I would keep clear of labour questions, and if my opinion is of any value, I may say that while contractors manage their business with intelligence, they are not likely to be swept away by the rival system. If I were in want of a new house, I should invite a limited number of tenders and accept the lowest.

THOS. BLASHILL.

#### ANCIENT THEATRES IN CRETE.

SIR.—The article on Cretan theatres in the *Builder* of December 7 very much interested me, as, in being architect on the Knossos Excavations, I have come across some of the places mentioned by your correspondent. A few up-to-date particulars may be of interest.

Fragments of the ruined building at "Gnosso" exist to this day, and it is indicated as a probable Roman basilica on the General Survey plan of the site of Knossos, published in the Annual of the British School of Athens for 1899-1900.

Near it, lying across the present main road, are distinct traces of a Roman amphitheatre, and, more interesting still, an important Roman mosaic is known to exist quite close to the basilica. This, it is hoped, will be investigated when the Cretan Exploration Fund has money enough to completely explore the Knossos site outside the palace. Other fragments, which may be Roman, exist in the vicinity, but it is difficult to date them accurately now. In the case of the basilica, we have evidence of a definite plan on a large scale, the fragments of walls and piers being some 5 ft. above the ground in places, and composed of a rough rubble of stones and mortar, which has stood the wear of time through the excellence of the cementing material.

In turning to another site mentioned, that of Lyttos, it may be noted that modern archaeologists fully bear out the reflection of De Belli's on the perplexing nature of the ground. Only one fragment of the vast aqueduct which he mentions appears to exist to-day, and is in the actual vicinity of the site of Lyttos. The note about the water having been carried from the mountains of "Sasali" is interesting, and at once suggests the outlet among caverns, which descends into the bowels of the earth at the end of the Plain of Lasithi, about 1,500 ft. above Lyttos. This plain is in the heart of the Lasithi Mountains, the third highest range in Crete, and the outlet above mentioned goes into the earth and reappears in some springs which are beside the present devious mule track, uphill from Lyttos to Lasithi. Lasithi is one of the most fascinating parts of Crete, and is described by Mr. D. G. Hogarth in the account of his exploration of the Dicketan Cave, published in the *Monthly Review* at the end of last year. The site of Lyttos, which is one of the concessions of the British, has yet to be explored.

Chersonesos (I give the modern spelling), which is mentioned in connexion with Lyttos, is also unexplored, but it does not offer many promising indications. A piece of Roman mosaic exists above ground almost on the rocks by the seashore.

But by far the most interesting Greek and Roman site in Crete is Gortyna. The disposition of the temple here is quite intact, showing a hall with the bases of a double row of columns, an atrium, and some paving leading to a statue pedestal in front. Professor Halberth, the Italian archaeologist, is at present working on the great inscription of the Laws of Gortyna, the finest archaic Greek inscription known; it is chiefly written round the inside of what must have been a circular building some 100 ft. in diameter.

The parts that have been already disclosed show beautiful Greek masonry about 6 ft. high.

D. T. FYEE,

Architect to Cretan Exploration Fund at Knossos.

SIR.—The plans of ancient theatres in Crete published in the *Builder* of the 7th inst. with letters describing the buildings as they existed in the sixteenth century, reopen more than one question that has baffled the archaeologists of many generations. It will be remembered that some of these plans show what appears to be concentric rows of columns occupying the *proscenium*, for the purpose, it has been assumed, of supporting a roof.

The largest of these theatres, which is 435 ft in diameter, has three such rows, and the "columns" are arranged on lines converging to the centre of the orchestra. Thus the intercolumniations are made to vary from about 40 ft. in the back row to

some 20 ft. in the front; this disparity is rather against the roof theory, unless we accept a velarium, and it seems to have been determined by reasons other than constructional. As mentioned in your article, coverings or roofs were provided for music theatres for the purpose of retaining the sound; but for theatres where perfect lighting and an uninterrupted view of the stage were essential, other methods were sometimes adopted to improve the acoustic properties. In this connexion it will be remembered that Vitruvius has a chapter on the Vases used in the Theatre, and as the probability of his account has been doubted by one of his English translators, it is satisfactory to have the evidence which is contained in the letters you have published.

According to Vitruvius, bronze vases were sometimes arranged amongst the seats, in musical order, in cavities prepared for the purpose, but so as not to touch the wall in any part, and opposite to the cells openings were left in the beds of the lower seats. We cannot tell exactly where these cavities were placed, but Vitruvius goes on to explain what should be their general arrangement; at the same time he is careful to mention that he knows of no instance of their use in Rome, but such may be seen in some of the provinces of Italy and many in the Grecian States. If the theatre is of moderate size, thirteen cavities must be ranged round at half its height and at equal distances apart; but if it is on a larger scale the height is to be divided into four parts, so that three ranges of cavities may be provided, the bottom range to have thirteen, the middle twelve, and the top thirteen. The following extracts bearing on this point are taken from the letters: "The Great Theatre of Lito is the largest ever constructed in the Kingdom of Candia. It had three ranges of copper vases contrived for the purpose of increasing the sounds, and nearly all the cells where these were placed may still be seen." Again: "The Great Theatre at Gierapetra also had an arrangement of copper vases, as may be seen by the cells which remain in an intact condition."

A reference to the plans that accompany these letters will show that the ranges of supposed "columns" agree exactly with the ranges of cells as above described, and in one instance the number of the columns is the same as that given by Vitruvius for the vases. In the other cases the discrepancy in the numbers is so slight that it may be accounted for by the carelessness that led to the omission of the *cunei* on the plans, or possibly the Vitruvian rules may not always have been strictly adhered to. It seems to be a question, then, whether we have not on these plans of Cretan theatres some evidence rather of the acoustic arrangements described by Vitruvius than of a permanent roof.

JOHN A. MARSHALL.

#### THE BRICKLAYING TRADE.

SIR.—My attention was arrested by the straightforward query you appended to the letter of "One from the Bench," viz.—"Are men compelled or persuaded to do far less work in a day than they could do and used to do, at the *orders of and in the interests of the trades-unions* to this query as it stands cannot, I opine, be given by any individual. This seems to have been realised by your several correspondents, for I notice that, with one exception, no attempt has been made at reply. One can, however, be possessed of an opinion, and I personally have in the whole of my experience, which has been varied indeed, never heard of a bricklayer receiving such orders, and, further, I believe to the best of my belief that such orders have ever emanated from any trade union office; this is more strongly because the mere idea appears to me absurd.

An authoritative answer to this query as it stands cannot, I opine, be given by any individual. This seems to have been realised by your several correspondents, for I notice that, with one exception, no attempt has been made at reply. One can, however, be possessed of an opinion, and I personally have in the whole of my experience, which has been varied indeed, never heard of a bricklayer receiving such orders, and, further, I believe to the best of my belief that such orders have ever emanated from any trade union office; this is more strongly because the mere idea appears to me absurd.

If, however, we eliminate from the query the words I have taken the liberty to italicise, and substitute the word "themselves" for "the trades-unions," we have left a query to which every one actually associated with the trade can immediately answer, yes.

Thus far every shade of employer and employee are in agreement, but when we seek the cause of the reduced output, we find the former prone to put the blame on the trades-unions, whereas employees generally give entirely different reasons.

Before proceeding, perhaps I may be permitted to explain my own position.—1. I do not lay bricks nor have I any direct interest in the amount of work done. 2. I know very little about trades-unions. 3. I seldom read a newspaper, and never the *Times* for a reason I need not here state. I have read no correspondence on this matter excepting what has appeared in your paper.

Now, Sir, "that bricklayers lay less bricks in a day than they used to do"—say, ten years ago—there can be no doubt. And that there is great difference of opinion as to the cause of this is not to be wondered at when we realise that this question is to the financier and the average employer a simple factor in a complicated sum, but it is the governing factor of the very life of the operative. In my opinion, trades-unionism has certainly played an important part in the change under consideration, not by any such silly process as ordering its members to do less work, but rather by bringing the men more closely into touch with each other, and creating a feeling of goodwill in the place of personal dis-

trust and antagonism that at one time existed; by focussing their energies upon certain definite projects with one end in view—to better their position. And I would ask who is he that, having worked along the line during the winter of 1891 and 1892—that following the carpenters' strike—will now come forward and say that some improvement was not absolutely necessary?

At that time the treatment men received at the hands of some foremen—whose action, I protest, the employers condone as such as good owners would scruple to apply to animals. Hundreds of bricklayers were walking about the streets of London looking for work they could not obtain. A demand—to expire in May, I believe—had been given for an increased wage, and the employers, intoxicated with their triumph over the carpenters, strained every nerve to prevent the O.B.S. preparing for the prospective struggle.

One method by which several employers sought to intimidate the men was to regularly discharge numbers of men at all hours of the day. On the job upon which I myself was working I have known men stopped at breakfast-time, noon, and evening—not by ones and twos, but by twenties—for no apparent reason whatever, unless it be the following given by an intelligent (*sic*) foreman, "Show them who they are."

Sir, can one wonder that these men, once they realised that they had the power to practically control the amount of work done, should exercise such power, and, remembering the sweetness of revenge, would they not have been more than human had they never abused it?

But enough of this that is known to all directly interested. One's time will be better employed in seeking a remedy for the evil present. Let us realise that mechanics of to-day know their power far too well to be easily intimidated or forced aside from their object by any acts of recrimination rendered practicable by the ever-varying fortune of supply and demand. Let employers of men accept the fact that salvation is to be found in better management and better organisation—not of a clique, but of their own business.

Confining my remarks to that part of the subject of management that I am acquainted with—the foremanship of bricklayers—the day of the bully is gone, and in his place is required a master workman possessing no mean degree of tact, the ability to discriminate and weed out from his gang the lazy and the incompetent, to be quick in discerning the most effective way to get from any man the maximum amount of work under prevailing conditions. Such an one will see that his men always are properly supplied with material in the most convenient form of bricklayers; that the amount of work apportioned to each man is such as to prevent any unnecessary waste of time; and, above all, he will set the example of taking pains with his work. Nothing demoralises a gang of men more than having to alter work done.

The foreman I have sketched is born, not made. Fortunately, plenty exist, if contractors and their managers had only the powers of discrimination necessary to pick them out. This is done in some cases, and the fortunate and, indeed, meritorious contractor grows rich whilst his confederates grumble their way to the bankruptcy court.

BRICKLAYER.

\*.\* We never supposed that written orders or rules for shortening output of work were issued by trades-unions; but are there no unwritten ones? At all events, our correspondent "gives away" the working men in his admission that their "goodwill" for each other leads them to concur in mutual arrangements for doing as little as possible.—ED.

LOYD'S AVENUE, FENCHURCH-STREET.—On Monday last Lloyd's Register of British and Foreign Shipping moved into the new premises built for that Society at the corner of Lloyd's Avenue and Fenchurch-street, by Messrs. John Mowlem & Co. as the general contractors, after Mr. T. E. Colcott's plans and designs—illustrated, with a plan of the ground floor, in our number of August 31 of the current year. For a block of offices on the western side of the Avenue to be erected for Lloyd's Avenue Estate Co. designs have been prepared by Messrs. Davis & Emsman.

BIRMINGHAM SCHOOL BOARD ARCHITECTURAL WORK.—At the forthcoming meeting of the Birmingham School Board the Sites and Buildings Committee will recommend that three months' notice be given to Messrs. Martin & Martin, architects and surveyors, to terminate their engagement, all work which they have now in hand for the Board to be completed by them on the existing terms; that the Board advertise for an architect to be the architect to the Board for new works, at a rate of remuneration of 7s. 6d. per secolar of accommodation, plus 1 per cent. for taking out and furnishing quantities, the engagement to be for three years with a clause for determining the same at three months' notice on either side at any time; that the Board advertise for a land surveyor at a commission of 1 per cent. on the purchase money; and that the Board advertise for a superintendent of buildings for alterations and repairs, at a salary of 250l. per annum, to devote all his time to the duties and to the work in the Board's offices, all necessary office furniture, stationery, &c., being provided by the Board.—*Birmingham Post*.

The Student's Column.

GAS AND GAS-FITTINGS.

24.—THE PURIFICATION AND COMBUSTION OF ACETYLENE.

**THE IMPURITIES IN COMMERCIAL ACETYLENE.**—Commercial calcium carbide usually contains small quantities of calcium phosphide, calcium and magnesium nitrides, and aluminium sulphide. These compounds are decomposed under the conditions which exist in acetylene generators by reaction with water, and cause the acetylene to become contaminated with certain objectionable gaseous impurities. Phosphuretted hydrogen is evolved during the decomposition of the calcium phosphide, ammonia during the decomposition of the nitrides, and sulphuretted hydrogen during the decomposition of the aluminium sulphide. In addition to these gaseous impurities, the acetylene gas as it flows from the generator also contains more or less water and finely divided lime mechanically suspended in it, and it is a matter of importance that these should be removed by passing the gas through a condensing coil before the gas is allowed to pass into the gas-holder.

**Liquid Drawn from the Condenser.**—A considerable proportion of the water present in the acetylene as it leaves the generator may be removed by passing the gas through a condenser, and the condensed liquid which is from time to time withdrawn is found to contain a considerable quantity of other impurities. A sample of liquid drawn from the condenser of an acetylene generator has been found by Professor Lewes to contain the following substances:—

	Grams per Litre.
Lime .....	16.28
Sulphur .....	6.92
Phosphorus .....	4.01
Iron and Alumina .....	0.19
Ammonia .....	7.14

It is evident, therefore, that by simply passing the gas through a condensing coil it may be purified to a certain extent, and for outdoor illumination it is not necessary to subject the acetylene to further purification, but for indoor use it should be more completely purified.

**Frank's Acid Cuprous Chloride as a Purifier.**—For the more complete removal of the ammonia, sulphuretted hydrogen, and phosphuretted hydrogen, many systems have been proposed, but few are of any value for domestic use. Frank's purifier, consisting of a solution of cuprous chloride in hydrochloric acid has proved one of the most successful. The siliceous porous earth known as kieselguhr may be impregnated with this solution, since it is not attacked by the acid solution, and simply acts as an absorbent. It is found that the solid material thus prepared is less objectionable to handle than the liquid. The ammonia in the gas is neutralised by the acid and is converted into ammonium chloride, the sulphuretted hydrogen is decomposed and produces a black precipitate of copper sulphide, and the phosphuretted hydrogen is partly absorbed and partly precipitated as copper phosphide.

**Ulmann's Chronic Acid as a Purifier.**—Another good purifying agent is the solution of chronic acid acidulated with sulphuric acid proposed by Ulmann. This liquid also removes ammonia, sulphuretted hydrogen, and phosphuretted hydrogen from the acetylene.

**Bleaching Powder as a Purifier.**—Bleaching powder may also be used for the removal of sulphuretted hydrogen and phosphuretted hydrogen, but the ammonia must first be removed by other means, because it may possibly react with the hypochlorite of lime to form an explosive chloride of nitrogen. The hypochlorite of lime in the bleaching powder oxidises the phosphuretted hydrogen and the sulphuretted hydrogen, and produces phosphate of lime and sulphate of lime respectively. To remove any traces of chlorine which may be carried forward from the bleaching powder, the gas after leaving a purifier containing bleaching powder should be passed through a vessel containing slaked lime. To render the bleaching powder more porous, Wolff mixes with it a small proportion of lead chromate, and the mixture then appears as a powder of a uniform yellow colour. Thorn and Hoddle employ a mixture of bleaching powder and oxide of iron.

It has been a common practice to mix saw-

dust with the bleaching powder to expose a larger surface of the powder to the action of the gas, but Ahrens has shown that under certain conditions reaction may take place between the sawdust and the bleaching powder and be accompanied by the evolution of heat. Sawdust should therefore be discarded in favour of kieselguhr, powdered coke, lead chromate, or other substance unaffected by the bleaching powder. Professor Lewes considers that every precaution should be used when adopting bleaching powder as a purifying agent, because many cases of spontaneous ignition and explosion have occurred when air has been admitted to bleaching powder purifiers which have been in use for some time, and because it has long been known that free chlorine may cause the explosion of a mixture of air and acetylene.

**White "Haze" Produced by Combustion of Acetylene.**—When acetylene has been burning for a considerable period in a room not efficiently ventilated, a white haze is sometimes apparent in the atmosphere. This haze is only formed when the acetylene has not been purified from phosphuretted hydrogen, and is due to the formation of phosphorus pentoxide, which has a remarkable affinity for water vapour, with which it forms phosphoric acid. An extremely small proportion of phosphuretted hydrogen will give rise to the white haze, and it is imperative that this impurity should be removed before the acetylene is consumed in confined spaces.

The formation of the haze may often be prevented by simply passing the gas through a condenser, then through a washer, and finally through a dehydrating material such as quicklime; but it is always safer to pass the gas through one of the purifying agents previously mentioned.

**Combustion of Acetylene.**—For complete combustion one volume of acetylene requires 12.5 volumes of air, whereas one volume of coal-gas requires only about 5.3 volumes of air. To enable the acetylene flame to meet with sufficient air for its complete combustion, it is necessary to supply the gas to the burner under higher pressure than that employed for coal-gas luminous flames, and to use burners having smaller orifices than those provided for coal-gas. To produce a luminous flat flame with coal-gas, a gas pressure of about 2 in. is, as a rule, most suitable, but for acetylene the best results are usually attained when the gas issues from the burner under a pressure of about 3 in.

**Bray Burners for Acetylene.**—Bray burners for acetylene resemble Bray coal-gas burners in outward appearance, but have extremely small orifices. They give a good result for a time, but gradually become choked with a carbonaceous deposit. They can, however, be bought retail for 2d. each, and many acetylene consumers employ these burners, and discard them when they begin to yield a smoky flame, in preference to buying more costly burners which remain serviceable for a longer period.

**The "Naphy" Burner.**—The tendency of acetylene to burn with a smoky flame and to leave a carbonaceous deposit in the burner orifices greatly detracted from the practical utility of the gas when it was first adopted for domestic lighting. To overcome this trouble Buller and others devised burners having air passages formed in the burner tip. A burner of this type is that known as the "Naphy" burner. It consists of a metal tube having two arms, which near their extremities are bent towards one another at right angles. The end of each arm is fitted with a steatite or lava tip having side holes for the admission of air and a central passage for the exit of both gas and air. When the jets issuing from the two burner tips are ignited, the two flames impinge upon one another and produce a flat flame. Owing to the provision of the air holes, the flames do not quite touch the tips of the burner but burn just above them, and consequently the burner tips are not so speedily blocked with carbon as those of the Bray union-jet type. In these burners the air does not mix with the gas in sufficient volume to materially reduce its illuminating power, but merely forms an envelope around the issuing gas and protects it from contact with the heated burner tips.

**The "Shaffer" Burner.**—When the Naphy burner had been in use for some time it was found that the metal arms sometimes became warped, with the result that the two jets were displaced from their proper relative positions, and the flame became distorted and had a

tendency to smoke. This trouble was, however, soon overcome by constructing the arms of the same rigid material as the burner's tips.

Fig. 61.—"Shaffer" Acetylene Burner.

Shaffer's burner (fig. 61) is a good example of burners of this type.

A host of burners of both the Naphey and the Shaffer type are on the market, but it does not come within the scope of the present series of articles to attempt to discriminate between them, or to discuss the various claims for priority of discovery.

**The "Phos" Burner.**—A number of burners fitted with mechanical devices for removing the carbon deposits as soon as they are formed have been patented, but the only one which calls for mention is the "Phos" burner (fig. 62). The construction of the burner will

Fig. 62.—"Phos" Acetylene Burner.

readily be understood by reference to the illustration. The deposit is removed by screwing up the button (A), which pushes the wire (B) through the burner tip (C). The arms of the burner are made of soft metal, which can be twisted into their proper position with the fingers if they become warped and cause distortion of the flame.

**Importance of Uniform Pressure.**—The gas pressure most suitable for the combustion of acetylene varies with different types of burner, but a pressure equal to about 3 in. of water is the pressure required for many of the burners in use at the present time. It should be remembered that every burner requires to be supplied with gas under a certain definite pressure, and that any departure from that point, whatever it may be, must result in a reduction in the illuminating efficiency obtained from the acetylene.

**Incandescent Mantles with Acetylene.**—From time to time acetylene burners of the Bunsen type have been constructed with the intention of using them in conjunction with incandescent mantles, but although a higher lighting efficiency may be obtained from the mantles with acetylene than with coal-gas, the former gas is at present too costly and too difficult to use in atmospheric burners to be suitable for incandescent lighting.

**Cooking and Heating Appliances.**—Acetylene can be used with specially constructed burners for cooking and heating purposes in the same manner as coal-gas, but it is more costly, and it is more difficult to construct satisfactory atmospheric burners for acetylene than for coal-gas, owing to the larger proportion of carbon contained in the acetylene and its wider range of explosibility. Acetylene has, however, been successfully adapted to ring burners for the boiling of water, and the troubles attendant upon its use as a heating agent for other appliances will no doubt be overcome after further experience. Luminous flames can be employed for heating and cooking in the same manner as luminous coal-gas flames, but have a greater tendency to emit free carbon.

25.—PIPES AND FITTINGS FOR ACETYLENE INSTALLATIONS—SOME PORTABLE ACETYLENE APPLIANCES.

**PIPES AND FITTINGS.**—All buildings in which acetylene is used should be quite free from any odour of the gas, and where an odour is present it is due to the

use of defective pipes or fittings. No composite pipe should be employed, but all pipes should be iron barrel of the best quality, and should be connected together without the use of packing or paint. White lead mixed with oil, and other substances of a like nature commonly employed when connecting pipes for coal-gas distribution, should not be used, because they are attacked by the acetylene, and their cementing power is soon destroyed. The threads may be dusted with finely-ground plumbago, but the pipes should be sufficiently well made and threaded to enable gas-tight joints to be made without the aid of any cementing material. The brackets and pendants should be constructed of stout metal, preferably iron. Fittings of the best quality which have been used for coal-gas may be employed for acetylene if they are thoroughly overhauled and refitted by a competent fitter but cheap brass fittings of brazed tube must be rejected. When the work of connecting all the parts of an installation has been completed, the installation should be tested until found to be perfectly air-tight or gas-tight under a pressure of 20 in. of water. Before attempting to ignite the gas at any of the burners, the gasholder should be filled with acetylene, and a rubber tube should be attached to the gas-bracket or pendant most distant from the gasholder. The free end of the rubber tube should then be passed through a window into the open air, and acetylene from the holder should be allowed to pass through it until all the air in the pipes and fittings has been replaced by acetylene. The freedom of the acetylene issuing from the mouth of the rubber tube from contamination with air may be ascertained by passing the gas into an inverted test-tube. If the test-tube, after being filled with gas, is removed from the neighbourhood of the rubber tube, and the gas within it is ignited, it will burn quietly if free from air, but will ignite with a sharp explosion if air be present in dangerous quantity.

Acetylene should not be stored in the gasholder for more than forty-eight hours before it is required for consumption, because, owing to the fact that the gas is soluble in water, and that water saturated with acetylene and in contact with the atmosphere slowly yields up its acetylene to the atmosphere, an appreciable loss in volume occurs. This loss increases with the pressure under which it is stored, but the gas must nevertheless always be stored under slight pressure, because it is better to lose a certain proportion of the gas than to run that risk of permitting any air to enter the holder, which would exist if the gas were stored under a slight vacuum. The acetylene should by preference be generated and stored in the gasholder only a few hours before it is required for combustion.

**Portable Appliances.**—The high illuminating power of the acetylene flame, even when the gas is being consumed at the rate of only  $\frac{1}{2}$  cubic foot per hour, renders this illuminant very valuable for all kinds of portable lamps. For the temporary lighting of building and engineering works, for searchlights and signalling, for carriage and hand-lamps, for the lighting of camps, and for isolated lamps in village streets or public or private grounds, acetylene is admirably adapted. For portable lamps automatic generators have always to be used, and the carbide has usually to be broken into pieces of very small dimensions. The yield of available gas per pound of carbide consumed is not, therefore, so large as that obtained with stationary non-automatic generators. Portable acetylene generators can be constructed to meet almost every conceivable requirement, and the ease and safety with which carbide can be transported, and acetylene generated by simple contact of the carbide with water, renders acetylene much preferable to oil as an illuminant for outdoor use. A number of acetylene table-lamps for indoor use have also been devised, but none are altogether satisfactory,

and the garlic-like odour of impure acetylene is generally more or less noticeable in rooms in which they are employed. Even if they do not emit an odour when in use, the operation of cleaning and recharging the generator cannot be performed without creating a nuisance. The cleaning may, of course, be performed in the open air outside the house, but only an acetylene enthusiast will use a lamp requiring such treatment throughout the cold winter months.

**Street Lamps.**—Street lamps may be lighted with acetylene generated at a central station and conveyed through small gas mains to the lamps in the same manner as coal-gas; but where isolated lamps in villages or carriage drives have to be provided, a small portable generator may be attached to the upper part of the lamp column as shown in fig. 63, or may be located in a lock-up chamber in the base of the column as shown in fig. 64.

**Lamps for Cars or Omnibuses.**—A large number of cars and omnibuses are now lighted by acetylene, the "Phos" Company alone having undertaken to fit 2,000 of the London omnibuses with acetylene lamps in place of the oil lamps formerly employed by January 1 next. One of the "Phos" lamps used for this purpose is shown in perspective in fig. 65, and the lower portion of the lamp in which the acetylene is generated is shown in section in fig. 66. The lamp is fixed on the right hand front of the car, and shows a light ahead at the same time that a comparatively brilliant light is thrown into the car. The carbide container is situated in the lower part of the lamp. The lid of the container is of wire gauze or perforated metal, and the base consists of a metal plate which is pressed upwards by a spring. The object of the spring is to press the upper layer of carbide against the perforated lid, and to thus ensure uniform and continuous decomposition. The water reservoir is situated above the carbide container, and is fitted with an adjustable

value from which water drips upon the perforated lid of the carbide container and comes in contact with the carbide.

All the different forms of "Phos" lamps are constructed upon this principle, although slight modifications in constructive details are made to render each lamp suitable for the particular purpose for which it is intended.

**Lamps for Building Works.**—Hand lamps consisting of lanterns connected to portable acetylene generators are made in all sizes and designs. A form of lamp suitable for use on building and engineering works is shown in fig. 67.

**Cyclic Lamps.**—Patents have been obtained for a great number of acetylene cycle lamps, many of which closely resemble one another in all essential details; but few, if any, of the lamps are altogether satisfactory. In some the carbide has to be used in the form of cartridges, and it is often difficult to obtain these at the moment when they are required. In others the water is admitted to the carbide through a porous medium such as felt or cotton wick, and this soon becomes choked with lime. Others are provided with a carbide container of insufficient capacity, and the lamp goes out before the evening's journey is completed. Many of the lamps cannot be used without the generation of an offensive odour, and in many the gas continues to be generated for a long period after the lamp has been extinguished. In spite, however, of all these disadvantages, and of the fact that acetylene is more costly than oil, acetylene cycle lamps remain very popular, and are in demand in every part of the country.

**Signal and Searchlights.**—The brilliancy and penetrating power of the acetylene flame, and the ease and freedom from danger with which calcium carbide, as compared with oil, may be transported, renders it extremely valuable for military purposes, and it may also be used with advantage as a searchlight when the more powerful electric arc light is not available. It has been proposed that acetylene searchlights should be used by fire brigades to enable the men to see more clearly through the steam and smoke in which the burning structure is frequently enveloped, and generators mounted on wheels, like those often used by contractors, have already been constructed for this purpose. The acetylene signal and searchlights constructed by different firms of generator makers are usually supplied with acetylene from flexible pipes connected to small generators which work upon the same principle as those provided for domestic lighting. A projector to be used with acetylene for searchlight purposes, which is supplied by the "Bon-Accord" Company, and which is intended especially for use on ships, but is adapted for use in other situations, is shown in fig. 68.

Fig. 68.—Projector for Use with Acetylene.

**UNITARIAN CHAPEL, MERTHYR.**—The foundations of the new Unitarian chapel now in course of erection in Thomas-street, Merthyr, were laid recently. The new sanctuary, which is of late Gothic design and is to be constructed of brick with Bath stone dressings, provides accommodation for about 150 worshippers, and there is a school-room underneath, the total cost of the building, including the site, being about 2,000l. The architect is Mr. E. A. Johnson. The contract for the erection was first taken by Mr. John Jones, Glynneath, and upon his death it was transferred to Mr. Edward Lumley, who is at present carrying it out.

**FOOD SCREEN, ST. PAUL'S, KNIGHTSBRIDGE.**—The food screen at St. Paul's, Knightsbridge, which was erected years ago from the design of Mr. G. F. Bodley, is to be decorated with a series of painted panels by Mr. N. H. J. Westlake.

GENERAL BUILDING NEWS.

**ST. ANDREW'S-STREET BAPTIST CHURCH, CAMBRIDGE.**—The design of Messrs. George Baines and R. Palmer Baines has been accepted for this new church, &c. The building is to be faced with whole white flints, the dressings, tracery, &c., being of red Mansfield stone. A square tower forms a feature of the design. The joinery is to be of oak. The seating accommodation is for about 950 persons, and the estimated cost is 6,200l.

**YATTON CHURCH TOWER.**—The tower of Yatton Church, one of the landmarks of Somerset, was rededicated by the Lord Bishop of Bath and Wells recently. Some time ago the tower and some of the parapets were found to be in an unsafe state, and parishioners were divided on the question of repair or rebuilding, those in favour of the former doing all in their power to secure the retention of the old work, with which were bound up so many old associations. Various meetings were held and the Society of Antiquaries, reporting that the tower could be repaired and made as efficient as if rebuilt. Mr. Edwin Buckle (diocesan architect), on the other hand, reported strongly in favour of rebuilding, and this latter course was at length adopted, and the work has been carried out by Messrs. Merrick & Son, of Glastonbury, who have preserved as much of the original stone as possible, and the tower again stands out in its stunted form.—*Western Press.*

**BAPTIST CHURCH, WYCOMBE.**—A site for a new Baptist church has been secured at the junction of Oakridge and Jubilee-roads. At present effort is concentrated on the first part of the project—the erection of schools and classrooms, to accommodate about 250 persons. The design is by Mr. T. Thurlow, architect, High Wycombe.

**CONGREGATIONAL CHURCH, SOUTH CLIFF, LOWESTOFT.**—The tender submitted by Mr. John Ashby, Lowestoft, has been accepted for this church, and building operations have been commenced. The contract amounts to 1,698l. Architects' estimate amounted to 2,000l. The architects are Messrs. George Baines & R. Palmer Baines, Clement's Inn, Strand.

**FIRE BRIGADE STATION, CARDIFF.**—Plans for the new fire station, with living quarters for thirteen officers and firemen with families, and for eleven single members of the brigade, were submitted on the 11th inst. to the Cardiff Watch Committee by Mr. Harpur, Borough Engineer. The buildings are to be erected at the corner of Quay-street and Westgate-street. The cost is estimated at 13,000l. The plans were adopted.

**RECONSTRUCTION OF THE THEATRE ROYAL, NEWCASTLE-ON-TYNE.**—It is announced that the reconstructed Theatre Royal will be opened on Boxing-night. The old theatre was shut, as it were, between shops. The area of the new building has been considerably enlarged, several shops, both in Market-street and Shakespeare-street, being taken for the purpose. The portico, which has dominated Grey-street for over sixty years, has not been interfered with. Beneath this, as before, is the main entrance to the theatre, and from the street inwards great improvements have been made. A stone screen has been built up there, in strong relief against the darker background. The screen is surmounted by two sculptured figures. Here are the entrances to the dress circle and the upper circle, and the emergency exits from the pit and gallery. The vestibule is spacious; it is approached by a lobby, whose walls are lined with rose marble. The entrance-hall has Pavanazza marble plasters and columns, and there is a marble staircase leading from the hall to the dress circle. There is a polished mahogany dado on the walls of the hall and staircase, the frieze and the ceiling being decorated in fibrous plaster. A retiring saloon is provided, the floor being paved with white marble. The pit and gallery entrances are in Shakespeare-street. Here, too, are the exits from the upper circle and the stalls, as well as the stage-doors and the entrances to the dressing-rooms. All the exit doors are fitted with patent panic bolts, and open outwards. The ways to the different parts of the house are so arranged, the descents particularly, as to prevent the possibility of a crowd accumulating at any given spot. The dressing-rooms are ventilated on the plenum system. Each room is fitted with hot and cold water. The house is divided, as it was before, into pit and stalls, dress circle and upper circle, boxes, amphitheatre, and gallery. All these are built of fireproof material, the floors being concrete, and there is not a hanging part to be seen anywhere, all the overhanging parts being carried on cantilever girders. The proscenium front is of alabaster and fibrous plaster. The stage is divided from the front of the house by a fireproof curtain. The auditorium will seat 2,500 people. The theatre will be lighted by electricity, and there is an installation of four thousand lights, operated from a switchboard on the stage. The architect of the new building is Mr. Frank Matcham, of London, and the general contractors have been Messrs. J. Parkinson & Sons, Blackpool, Lancashire. The clerk of works has been Mr. C. Greenman. Messrs. Vaughan & Dymond, of Newcastle, have supplied the ironwork; the marble work has been provided by Messrs. J. Tweddle & Co., Newcastle; and the system of ventilation has been put in by Messrs. Stott &

Co., Oldham; and the ornamental work in front of the circles and boxes has been supplied by Messrs. De Jong, London; and the electric installation has been put in by the Alliance Electrical Company, Manchester. The hydrants have been provided by Messrs. Oldroyd & Co., Leeds, and the stage portions of the work by Mr. J. N. Lyons, London, represented by Mr. Mather.

**LEEDS SCHOOL OF ART.**—Sir James Kitson, M.P., laid the foundation stone of the new school of art in Leeds on the 11th inst. The building will accommodate twice as many pupils as the old school, which, as a Government school of design, was established in 1846. Last year six silver medals and seven bronze medals were won by the students, and the number of successes in design was such as to place the school third in the provinces. The number of individual students was 575. Last year the committee decided to invite competitive designs for a new building, the cost not to exceed 10,000l. The design by Messrs. Bedford and Kitson, of Leeds, was selected, on the recommendation of the adjudicator, Mr. W. H. Bidlake, M.A., of Birmingham. The new building will have frontages in Vernon-street, Percival-street, and Cookridge-street. In character the building will be quite plain, but on the west elevation, facing Cookridge-street, provision will be made for a panel, which will be filled in by the students in glass mosaic. In the basement provision will be made for classes in the applied arts, including plaster work, repoussé, enamel, marble and stone carving, wood carving and cabinet work, pottery, painting and decorating, lithography, and bookbinding. On the ground floor there will be a light and shade class-room, a model and freehand class-room, and a lecture-room capable of seating 100 students. The first floor will afford accommodation for a painting class-room, an architectural class-room, a design-room and library, and an elementary modelling-room. On the second floor there will be the life room, antique room, life modelling-room, master's room, and a conservatory for plants to be used in the school.

**FIRE STATION, LONDON.**—Mr. J. D. Gilbert, Chairman of the Fire Brigade Committee of the London County Council, laid the foundation stone of the new fire station in Euston-road on the 14th inst. The land cost 7,700l., and the contract for building was 14,377l. The builders are Messrs. Simpson & Co., and the architect was Mr. W. E. Riley, of the London County Council. The station will be in Portland stone and red brick. There is ample provision for the third officers' quarters, quarters for station officer, seven married men, coachman, and single men, with large recreation room. Stabling will be erected for six horses, and the engine-room will be 39 ft. by 33 ft., with space for a horse escape, steam-engine, and hose-cart.

**LEEDS TOWN HALL ALTERATIONS: PROPOSED NEW ASSIZE ACCOMMODATION.**—At a meeting of the City Buildings Sub-committee on the 10th inst., Mr. Jonathan Peate, the chairman, recommended, as the result of a conference with the City Engineer, the provision of entirely new rooms leading off the corridor of the Town Hall, on which the Grand Jury room opens. The suggestion is to knock down a portion of the blank wall and to roof over the leaded flat as was done when tearooms were added to the Lord Mayor's suite of apartments on the other side of the building. Another point considered was the contemplated rearrangement of the Chief Constable's and the Town Hall Superintendent's offices.

**ALTERATIONS TO WOLVERHAMPTON TOWN HALL.**—The General Purposes Committee of the Wolverhampton Town Council have issued a report with regard to the proposed alterations and additions to the Town Hall buildings. Seven tenders were received, and the Council is recommended to accept that of Messrs. H. Wilcock & Co., of Wolverhampton, amounting to 14,550l., and request them to tender for the panelling of the council-chamber and the Mayor's reception-room, and the erection of a gallery in the council-chamber. It is also recommended that the Public Works Committee be asked to make proper arrangements for the sittings of the Council in the Sessions Court, for the removal of the pictures in the Council-chamber, and also to make other provision for the carrying on of the business of the Corporation while the alterations to the Town Hall are in progress, and that tenders be invited for the necessary furniture for the Council-chamber and the new and altered offices, and that the special committee, who have charge of extensions to the Town Hall, be authorised to accept such tender as they may think proper.

**NOTTS SANATORIUM FOR CONSUMPTIVES, NEAR MANFIELD.**—The construction of the Nottingham and Notts Sanatorium for Consumptives upon the site on Ratchar Hill, near Mansfield, is rapidly approaching completion. The frontage of the sanatorium faces south-south-east, towards Blidworth. The general plan of the building is a small central block, with wings east and west of it, the overall measurement being 174 ft. by 66 ft. The building is constructed throughout of wood, with brick foundations and corrugated iron roof, and is designed to accommodate about twenty patients, though provision will only be made at the outset for fourteen, together with a matron, one nurse, and two or three servants. In the central part of the building are located the apartments of the matron, nursing, and domestic staff, the private wards, isolation ward,

bathrooms, and lavatories. The kitchens and other domestic offices are also placed between the wings. The walls of all the rooms in this part of the sanatorium are of Carolina pine match-boarded of double thickness, with layers of felt and air-space between. In the wards compo-boarding has been used for the walls with a view to securing a smooth, washable surface. The two main wards are each 40 ft. by 22 ft., and measure 11 ft. 6 in. from floor to ceiling, providing accommodation, respectively, for six or seven patients of either sex. The sanatorium is lighted throughout by means of electricity, generated in a small electric lighting station on the north side of the building. With the exception of the matron's and nurses' sitting-rooms, the sanatorium is heated throughout by low-pressure hot-water radiators, the boiler-room being in the basement of the central building, and the roofs are fitted with Boyle's air-pump ventilators, surmounted with ornamental turrets. A feature of the sanatorium is the series of verandahs. These run the whole length of the wings on both the north and south sides, the dimensions of each being 67 ft. by 9 ft. They are roofed with glass, but are open at the front and ends, save for a boarded palisading about 3 ft. high. The accommodation of the sanatorium can be increased to a capacity for twenty-six patients by utilising a large attic in the central building, with very slight structural alteration, as a ward. The buildings have been constructed in accordance with designs provided by the Portable Buildings Co., of Manchester and Fleetwood, under the direction of their representative, Mr. Robinson, the superintending architect being Mr. Robert Evans, Jun., of Nottingham. The contract for the construction of the foundation, brickwork, and roadmaking has been carried out by Mr. C. Vallance, of Mansfield; the heating apparatus, baths, and ironmongery have been fitted by Messrs. T. Danks & Co., Nottingham; and the electric light fittings and generating plant have been put in by Mr. W. J. Furse, Nottingham.—*Nottingham Guardian*.

**NEW BUILDINGS, ST. PETER'S HOSPITAL, BRISTOL.**—A new boardroom has been opened at St. Peter's Hospital, for the use of the guardians of the Bristol Union. In the course of last year it was decided to erect new buildings at the west end portion of St. Peter's, without interfering with the ancient frontage of the hospital. The architect, Mr. W. S. Skinner, was directed to make no alterations involving the destruction of any part of the building of any antiquarian or architectural interest, and when his plans were submitted it was seen that the retention of the front elevation was secured, and also the existing courtyard and all the rest of the interior which was of any antiquarian interest. At the same time the plans showed a new boardroom of suitable dimensions, and other much-needed accommodation for the guardians, for the stairs, and for the port applying for relief. The nature of this new accommodation on the three floors is as follows:—First floor (same level as existing board-room and clerk's offices), board-room, 40 ft. by 30 ft., with entrance lobby, 23 ft. 6 in. by 8 ft., and long corridor down side; guardians' private room, chairman's room, ladies' cloak-room, gentlemen's cloak-room (and inner room and lavatories also). Ground floor (entrance level), two offices, and one large office, 21 ft. 6 in. by 21 ft. 6 in. (about to be divided into three). Basement (yard level), large waiting-hall or pay-station, 46 ft. 6 in. by 21 ft. 6 in., with two offices for relieving officers, and lavatories and stairs to ground floor. The new board room is lined throughout to a height of 15 ft. in Austrian oak, designed in the Jacobean style, but of a somewhat later date than the woodwork of the old board room. The frieze and pilasters are carved, and no two panels of the former are of the same design. The ceiling is coved, ribbed, panelled, and enriched in plaster, and has a central lantern light. Electric light is given from six electrolites, each of five lights. The seating accommodation is for sixty-four persons, in addition to which there are five seats on the dais for the chairman, vice-chairman, clerk, &c. Messrs. Stephens, Bastow, & Co., Ltd., of Bristol, were the builders. The cost of the work has been about 7,000l.

**DUNDEE BUILDING TRADE.**—The state of the building trade in Dundee at the present time is not particularly bright, and those in a position to know give as the cause that the city is overbuilt, and that material is still at too high a figure. The valuation roll shows at present something like 2,000 empty houses. During recent months building work has consisted almost entirely of tenements and small buildings, and, with the exception of the prospect of district libraries, there is no contract of importance in view. Builders are looking to the tramway extensions developing feuing. Already, by the opening up of the outlying districts of the city, many small cottages and villas have been built, notably in the Maryfield district, and now that the cars penetrate to Balguy on the one hand and Ferry-road on the other, additional dwellings may be expected to spring up. The laying down of tramways gives rise also to the probability of new streets being formed, and if these should happily result, the building and allied trades may take a turn for the better.—*Dundee Advertiser*.

## FOREIGN.

**FRANCE.**—A monument to Mgr. d'Hulst has been inaugurated in the chapel of the Catholic church in Rue Vaugirard. The bust is by Chaplain, and is placed in a niche decorated with a framework of mosaic designed by M. Daumet.—The ultimate use of the Palais on the Champs Elysees seems still undecided, in spite of the resolution which had consigned it to the Municipality of Paris as an Art-Museum, but which has not been formally ratified. Meantime the work for the efficient warming of the building is being carried on, at the respectable cost of 108,000 francs; and a great deal more is to be spent on interior decoration.—M. Ferrary, sculptor, has been appointed professor of modelling at the Ecole des Beaux-Arts, in place of the late M. Massoule.—A committee has been formed to erect in the Parc Monceau a monument to Palleron, the brilliant author "Le Monde ou l'on s'ennuie."—A splendid tapestry executed at the Gobelins, after the "Danse des Nymphes" of Coppel, is to be placed as a decoration in the large Conseil of State gallery at the Palais Royal.—M. Paul Dubois has just completed a fine equestrian statue of the Republic, generally known as "L'Esperance," proposed to close the quadrant galleries of the Trocadero at Paris, in order to enlarge the sculpture gallery, which has become insufficient for its requirements.—The Victor Hugo monument, by M. Barrias, is to be unveiled in the Place Victor Hugo on February 26, the anniversary of the poet's birth.—The painter Weerts has just completed a large picture, 30 metres long by 5 in height, for the gallery of the fourth convent of the Sorbonne. It represents a Fair at St. Denis in the XVth century.—The engineer of the Department of l'Ain has been commissioned to construct a bridge over the Saône at Feans, at a cost of 300,000 francs.—On Friday last the Chamber of Deputies passed, without discussion, the new law which gives to architects and to decorative sculptors a copyright in their works on the same basis as artistic and literary copyright, generally.—The Municipal Council of Paris has decided to demolish the Ecole Speciale de l'Architecture, the present building of which is to be soon demolished, is to be rebuilt on the line of the Boulevard Raspail, on a site near the Mont-Parnasse cemetery.—The Conseil-General of the Seine has voted for the reconstruction of the two suspension bridges of the Ile Saint-Denis, at a cost of about 2,000,000 fr.—There is to be an International exhibition of arts and industries at Lille next year, from May to September. It will be installed on the space at Lille called the Champ de Mars, and is to be on a large scale, occupying an area of 150,000 square metres.—M. Albert Bessard has been appointed president of the "Objets d'Art" section of the new Salon, in place of the late M. Cazin.—Important artistic work is shortly to be carried out in the Department of the Seine for the decoration of the Hotel-de-ville of l'Ivry-sur-Seine and that of Neuilly, and also for the decoration of the Mairies of Choisy-le-Roi, Clichy, and Thiais.

## MISCELLANEOUS.

**THE CHRISTMAS HOLIDAYS.**—Next week the *Builder* will be published on Tuesday, the 24th inst., and to ensure attention all communications for the editor must reach our office by Monday morning, the 23rd.

**LEICESTER MASTER BUILDERS' ASSOCIATION.**—The annual dinner of the Leicester Master Builders' Association took place on the 11th inst., Mr. Edwin Fox presiding. The Chairman having proposed the loyal toasts, Mr. H. J. Grace proposed "Success to the National Federation of Building Trades Employers, and of the Midland Centre." He was, he said, one of those who believed in workmen's unions; he thought they might be made to do a great deal of good. He would not say they might not do harm, but if they did so, it was not the fault of the union, but of those who did not use their power or control over the men in the way that it ought to be used. He had heard it said sometimes that these workmen's unions tyrannised. That might be so, but that was the fault of the officers of the union. He did not think it was the fault of the men, for he had always found the men agreeable to meet their employers in a conciliatory spirit. The men had been organised in the past better than the masters. It remained for the masters to organise and hold well together, and by so doing he was sure they would avoid any serious disputes.—Mr. Arthur Chambers, President of the Midland Centre, responded. He said it was true that they had only been reorganised for a short time, but it was twenty-one years since the National Association of Master Builders came into existence. During the last twelve months they had altered the name from the Master Builders' Association to the National Building Trades Employers' Federation, which covered rather a larger ground than the former title. It was felt that the Association, representing one of the most important trades in the country, should not only embrace one section of the trade, but that it should embody the whole of them. It was very necessary in times of any difficulty that all the combined trades should put their shoulders to the wheel and work together,

rather than they should act as units, and simply have to stand upon the strength of their own federation. He quite recognised the fact that the men had as much right to organise as the masters, and he thought that the only way to bring matters in dispute to a satisfactory settlement was for both sides to meet on an equal footing, and discuss the matter in all its bearings. The National Federation was not an aggressive body, but was formed simply to protect the interests of the building trade.—Mr. A. S. Smith (President of the Birmingham Association) proposed "The Leicester Master Builders' Association." The present system of trades unionism was one which encouraged the worthless, and which compelled the worthy to do as little work as possible for their money. It behoved the builders to stand shoulder to shoulder, and resist to the uttermost this system, which was becoming a very real peril to the trade and commerce of their land.—Mr. Edwin Fox, President of the Leicester Association, responded. He said that he was happy to say that they had now no dispute whatever with their operatives. They had one at the beginning of the year in regard to the demarcation of work at the Halford-street market. Sir William Markby, the arbitrator, laid it down that a builder had a right to say whether a navvy should mix concrete or not, and it was the first time he had known a builder allowed to decide anything except paying wages on Saturday. Afterwards the masters and men had a conference with regard to other points, and he was glad to say that they came to an amicable conclusion. There were some of the best men in the world among the labouring classes—diamonds in the rough. The fault, he thought, was that although the working classes were taught to read and write, they were not taught to think. In reference to the "go easy" principle of only laying so many bricks per day, the speaker said he thought it was their duty to do away with it once for all. They could do it if they were all united, and were determined to get a fair day's work for a fair day's pay. There was not a bricklayer or a union in the country which could say them nay. Then Mr. Wellington proposed "The Architects and Surveyors" and Mr. Poyner responded. Mr. Brown (Derby) proposed "The Town and Trade of Leicester," and Mr. O. Wright responded. The last toast was "The Visitors," proposed by Mr. D. Garrett, and responded to by Mr. Smith (Nuneaton).

**LONDON MARKETS.**—In August last the London County Council withdrew their Bill, which had been passed by the House of Commons, for the acquisition of Spitalfields Market. At their meeting on December 12, the Court of Common Council of the City of London ratified their agreement to purchase the freehold and leasehold interests in the market and its site, for 176,750l., from the vendors. The market, it is stated, had been let to Mr. Robert Horner upon an eighty-four years' lease from 1832 at a rent of 5,000l. per annum. The Court also resolved to offer facilities to a party of Russian agriculturists, who have arrived in London for inspecting the Central Meat and Provisions Markets at Smithfield, and the Cattle Market at Islington.

**LEICESTER-SQUARE.**—We read that the premises lately vacated by the Dental Hospital, on the southern side of the square, have been acquired at a cost of about 28,000l., which includes the freehold, by the National Society for the Prevention of Cruelty to Children, who still need a sum of 18,000l. to enable them to establish their chief offices there unencumbered by liabilities.

**SALE OF BOOKS ON ARCHITECTURAL SUBJECTS.**—The sale of rare books and manuscripts at the rooms of Messrs. Sotheby, Wilkinson, & Hodge, Wellington-street, Strand, on December 11 and 12, included a number of works on architecture. The following prices were realised:—"The Arts Connected with Architecture in Central Italy," by J. B. Waring, 1858, 2l.; "Memorials of English Medieval Churches, with an Introductory Essay on Ancient Ecclesiastical Architecture," by Charles Wickes, 1857, 7s. 6d.; "Architectural and Other Designs, Studies of Trees, &c.," by James Thompson, architect, thirty-eight original drawings, 10s.; John Stow's "Survey of London," enlarged by Anthony Munday and Henry Dyson, 1633, 1l. 10s.; "Architectural Sketches from the Continent," 100 plates, by R. N. Shaw, architect, 1858, 6s.; Serons d'Agincourt's "History of Art, by its Monuments," translated, 1842, and "Ancient Wood and Iron Work in Cambridge," by Redfern and Clark, 1886, 10s.; "The Decorations of the Garden Pavilion in the Grounds of Buckingham Palace," by L. Gruner, 1846, 5s.; "Architectural Antiquities of Normandy," by J. S. Cotman, with historical and descriptive notes by Dawson Turner, 1822, 19s.; "Remarks on the Domestic Architecture of France (Charles V. to Louis XVI.)," by Henry Clutton, architect, 1853, 6s.; "Ancient Architecture of England," by John Carter, enlarged, with notes, &c., by John Britton, 1837, 17s.; *The Builder*, Vols. XLVI. to LXXVII, 1881-99, 4l. 4s.; "Sculptured Stones of Scotland," edited by John Stuart (Spalding Club), numerous finely-executed plates, Aberdeen, 1856-67, 10l.; "British Archaic Sculpturings of Cups, Circles, &c., upon Stones and Rocks," by Sir J. Y. Simpson, Edinburgh, 1867; and Dean Stubbs's "Historical Memoirs of Ely Cathedral," 1897, 8s.; A. V. Pugin's "Contracts," 1 Parallel, 1841, 10s.; "Principles of Painted or Christian Architecture," 1841, Apology

for the Revival of Christian Architecture in England," 1843, and "Chancel Screens and Roof Lofts," 1851, all bound in one volume, 1l. 7s. 6d.; "Ancient and Modern Architecture," by J. Galliaubaud, 1844-6, 16s.; "Examples of Ancient Domestic Architecture," by F. E. Dolman and J. B. Jobbins, 1858-63, 2l. 7s.; "Collectanea Archaeologica: Communications made to the British Archaeological Association," two volumes, 1862, 1l. 9s.; "Historical and Descriptive Accounts of the Theatres of London," by E. W. Brayley, with plates by D. Havell, 1826, 1l. 18s.; "Detached Essays and Illustrations, published by the Architectural Publication Society, 1848-52," and "Dictionary of Architecture," complete, eight volumes in five, 9l. 10s.; "Sculptured Monuments in Iona and the West Highlands," by James Drummond, Edinburgh, 1881, 2l. 4s.; "Westminster Abbey: Its History, Antiquities, and Monuments," by R. Ackermann, 1812, 3l. 3s.; "Dictionnaire Raisonné de l'Architecture Française du XI au XVI. Siècles," by Viollet-le-Duc, 10 vols., 1858-68, 11l. 5s.; "Edeik and Marble in the Middle Ages; Notes of a Tour in the North of Italy," by G. E. Street, 1855, 8s.; "The Ecclesiastical Architecture of Ireland, anterior to the Anglo-Norman Invasion, comprising an Essay on the Origin and Uses of the Round Towers of Ireland," by George Petrie, 1845, 1l. 7s.; "Remarks on Church Architecture," by J. L. Petit, 2 vols., 1841, "Dictionary of the Fine Arts," by J. Elmes, 1826, and "Canons on the Elgin Marbles," 1816, 17s.; "The Ecclesiastical Architecture of Scotland, from the Earliest Christian Times to the Seventeenth Century," by D. Macgibbon and T. Ross, Edinburgh, 1866, 3l. 9s.; "The Dolmens of Ireland: their Distribution, Structural Characteristics, and Affinities in Other Countries," by W. C. Borlase, 3 vols., with 4 maps and 800 illustrations, 1867, 2l. 2s.

**EDINBURGH AND LEITH MASTER BUILDERS' ASSOCIATION.**—The annual dinner of the Edinburgh and Leith Master Builders' Association was held on the 14th inst. in the Royal British Hotel, Edinburgh. About 120 gentlemen were present and Mr. Robert Lamb (president) occupied the chair. After the toast of "The King, Queen, and Royal Family" had been duly honoured, Mr. Lowmie gave "The Imperial Forces," and Bailie Cameron replied. The Chairman proposed "The Lord Provost, Magistrates, and Town Councils of Edinburgh and Leith." Lord Provost Mackie, in replying for the Leith Corporation, alluded to the friendly relations that existed between the two Corporations. Bailie Telfer replied on behalf of the Edinburgh Corporation. The toast of "The Edinburgh and Leith Master Builders' Association" was proposed by Mr. McArthur, who spoke of the good work the Association had done. He alluded to the proposal for a national federation of employers' associations and trades-unions to cement between employers and employed the feeling of common interest; and stated that if such a proposal could be carried through, he believed it would be one of the best things that could be accomplished. Councillor Forrest replied, and expressed himself in favour of national union. He was opposed to Town Councils, County Councils, and School Boards doing their own work. The Scottish Building Trades Federation was given by Mr. Thomas Lamb, and Mr. Alexander Drysdale replied. Other toasts followed.

**ARCHÆOLOGICAL DISCOVERY.**—While workmen were engaged near Falkirk, they came upon what will probably prove one of the most interesting relics of the Roman occupation of the Stirling district. It is a large stone about 19 in. broad, 10 in. thick, over 4 ft. high, and weighing probably half-a-ton. It is beautifully sculptured in high relief; the ornamentation is divided into two panels, the larger one being at the top. These panels are separated by a band about 1½ in. broad, which also is carried round both panels, meeting in an angle at the top of the stone. Under the angle is a beautiful shell-like device, delicately executed. The upper panel is completely filled by a horse and rider, the latter carrying a sword triumphantly aloft. He is arrayed in full armour, and bears a shield. The lower panel represents a naked man, a wild Celt, presumably, in a fallen condition, his shield and weapon lying beside him. The profile is perfect, and the stone is in a complete state of preservation. It was found buried about 5 ft. below the surface of the ground, and it seems as if it had been so placed almost immediately after it had been sculptured. It is certainly a very fine specimen of the Roman sculptor's art, and its history will be closely investigated. Mention the relic has been taken possession of by Mr. Gair, Procurator Fiscal, on behalf of the Crown authorities.—*Standard.*

**BRITISH FIRE PREVENTION COMMITTEE.**—The executive of the British Fire Prevention Committee have arranged to test in January next a large timber floor by Millar's Karri and Jarrah Wood Co., which is to show the fire resistance of these Australian hardwoods compared with iron and concrete—a subject of the utmost interest to the great dock companies. The attendance of several distinguished foreign experts is anticipated. There will also be some door tests in Karri and Jarrah wood. We understand that among other tests to be expected early next year are tests by the Electric Timber Seasoning Co. with treated wood; and by the British Uralite Co. with fire-resisting slabs.

CAPITAL AND LABOUR.

**DISPUTE BETWEEN JOINERS AND SHIPWRIGHTS, BARROW-IN-FURNESS.**—In compliance with the request of the arbitrators appointed by the joint Secretaries of the Master Builders' Association and the Joiners' Society, Barrow-in-Furness, Mr. James W. Little agreed to act as umpire to consider whether Messrs. Gradwell & Co. should employ shipwrights and handymen, or joiners, to do the work connected with the repairs to the wharf at Ramsden Dock. The arbitrators appointed by both parties to the dispute came to the unanimous decision that the joiners had failed to make out a case for their exclusive employment on the work under consideration. There was, however, a slight difference of opinion in the wording of the award, as drawn up by the respective arbitrators, and consequently it becomes necessary for the umpire to give the final decision, which was as follows, viz.:—That, in accordance with local custom and precedent, and the general practice in other parts of the country where similar work has been performed, Messrs. Gradwell & Co., Limited, are at liberty to employ shipwrights and handymen and joiners to do the work connected with the repairs to the wharf at Ramsden Dock, and that the work does not devolve exclusively on the joiners.

**CO-OPERATIVE BUILDING AND JOINERY WORKS.**—The December report of the Amalgamated Society of Carpenters and Joiners contains the announcement that the great majority of the 68,000 members have voted in favour of the establishment of co-operative building and joinery works. When this proposal was first mooted it received, it is stated, but scant support, but the educational influences of recent events—not the least of which are the charges put forward that the organised workers in the building trades are the principal offenders in "go easy" methods—has had its effect. The report also contains the statement that the carpenters and joiners have joined the Labour Representation Committee, and are prepared to aid in every legitimate manner the securing of the direct representation of wage-earners not only in Parliament, but also on all public bodies.

LEGAL.

DISPUTE BETWEEN THE CORPORATION OF WESTMINSTER AND THE LONDON COUNTY COUNCIL.

The case of the Mayor, &c., of Westminster v. the London County Council came before a Divisional Court of King's Bench, composed of the Lord Chief Justice and Justices Darling and Channell on the 16th inst., upon a special case stated raising the question whether the County Council or the Corporation of Westminster was the proper authority to lay down conditions for construction, and to sanction the construction of wooden structures for the accommodation of spectators at public functions taking place within the area of the City of Westminster. The question arose originally out of the structures erected to accommodate spectators at the funeral of the late Queen, and the opening of Parliament by His Majesty the King on February 14; but the question also applied to the forthcoming opening of Parliament and the Coronation procession in June next. The City of Westminster claimed that, under the London Government Act of 1839, the administration of this matter within their area was handed over to them, inasmuch as the structures were wooden structures within Section 83 of the London Building Act, 1894. This section of the Act, the powers under which formerly vested in the County Council, were specifically handed over to the Corporation of Westminster, applied to the erection of special and temporary buildings and wooden structures, and provided that no person should set up any wooden structure except hoardings enclosing vacant land, exceeding 12 ft. in height, without having first obtained for that purpose a licence, which must contain conditions as to the nature of the structure, the time for which it was to be permitted to continue, and the place at which it was to be erected. The County Council contended, on the other hand, that the structures in question did not come under that Section, but under Sections 82 and 83, which also applied to temporary buildings, &c. The case found that the structures now in question, and which were erected in February last, were constructed of wood, except the nails and some of the other fastenings of the cloth or other hangings placed upon them, and that they were of a temporary character. The case also stated that questions having arisen between the two public bodies as to which was the proper authority to act under the London Building Act, the Court was asked to say which was the body (1) to control, approve, or license the structures referred to, and (2) to take proceedings against the persons who had without license permission or approval erected them. The County Council was also asked to say further whether such structures were or were not subject to the supervision or inspection of the District Surveyor under the Act.

Mr. Manisty, K.C., and Mr. Craies appeared for the Corporation of Westminster; and Mr. Horace

Avory, K.C., and Mr. Daldy represented the County Council.

Mr. Manisty argued that upon the proper construction of the Acts his clients had had the power of dealing with these structures transferred to them. Mr. Avory said the only desire of the two bodies was to obtain a decision in order that they might exercise their duties under the different sections and avoid a conflict of jurisdiction. He suggested that the only way to reconcile these sections and make them work harmoniously was to hold that Section 84 of the Building Act applied to structures like bicycle and other sheds which were put up at the back or front of a house, which were not temporary in the sense of being put up and taken down in a week or so, but which were to last for several years.

In the result, the Lord Chief Justice in giving judgment said it was quite impossible to deal with every case that might arise. The question here had reference to a number of structures made wholly, except in regard to the nails, of wood, and he wished to guard himself against being misunderstood as laying down any rule which might govern some special case, which might give rise to other considerations. In his opinion, the broad question of whether the County Council or the Corporation was the proper Authority to lay down conditions and to sanction the construction of wooden structures which might have to be erected on the occasion of public functions in the City of Westminster, should be decided in favour of the Corporation of the City of Westminster. The Court did not propose to answer the third question as to the supervision of the District Surveyor, as to do so would, they thought, lead to difficulties. The Court, however, thought that the Corporation of Westminster was the Authority which had the right to exercise the powers of Section 84 of the Building Act.

The other judges concurred.

A WOLVERHAMPTON ARCHITECT AND HIS FEES.

At the Wolverhampton County-court a few days ago before Judge H. Roberts, Mr. Charles Henry Martin, architect, of Wolverhampton, sued Mr. George Head, a publican, of Horseley Fields, for the sum of 47l. 18s., as his commission for the preparation of plans, specifications, &c., for the erection of a house.

Mr. T. Dalloz was the solicitor for the plaintiff, and Mr. Tildesley appeared for the defendant.

The evidence of the plaintiff was to the effect that on May 26 the defendant called upon him and stated that he wanted him to prepare plans for the erection of a villa-residence. Nothing was said at the interview as to what the house was to cost, and the plaintiff, with the assistance of his son, set to work and prepared the plans. These were submitted to and approved by the defendant, and by his instructions the specifications were prepared, estimates of quantities got out, and tenders invited.

The lowest tender sent in was 687l. 10s. This, the defendant said, was more than he wished to expend, and he desired that the plans should be reduced so as to bring the cost of the house within 300l. This was done by excluding several items in the plans. Tenders were again invited, and one was sent in for 417l. 10s. The defendant said he would not go beyond 350l. Other alterations were made in the plans to reduce the cost, but ultimately the defendant declined to proceed with the plans prepared by the plaintiff, and had his house erected by another builder. In September the plaintiff had an interview with the defendant, and it was suggested that he should receive 20s. as remuneration. He refused. In the account sent in he charged 2½ per cent. on the lost building for the preparing of the plans, 2½ per cent. for getting out the quantities for the builders, 8l. 10s. for altering the original plans, and 1l. 15s. for sketch copy for the District Council. The house not having been built from his plans, he deducted ¼ per cent.

In cross-examination plaintiff denied that he told defendant that his charge would only amount to 2½ per cent. on the total cost of the building.

Mr. F. T. Beck, architect, said he had carefully examined the plans and specifications prepared by the plaintiff. He considered the charges fair and reasonable, and such as were the recognised charges in the profession.

The defence was that the plaintiff exceeded his instructions by drawing out plans of a more elaborate character than was intended.

Defendant, on being put into the box, denied that any plans were shown him until the first batch of tenders arrived.

After further evidence his Honour awarded judgment in favour of the plaintiff for the sum of 40l. 10s., at the same time expressing the opinion that the statement made by the defendant that he was never shown any plans until after the tenders were sent in was not accurate.

RECENT PATENTS:

**ABSTRACTS OF PATENTED INVENTIONS.**  
14,774.—A DOOR-CHECK: Russell & Erwin Manufacturing Co.—The check, which is particularly intended for swing doors, has a piston-rod, at the end of which is a plate having a V-shaped groove for

the pin of a crank upon a rod which is joined to the frame of the door. When the door is being opened the crank draws out the piston, which will in turn retard the motion of the door when it is being closed. One end of the rod that joins the door and the crank shaft has a stud that moves in a slotted plate beneath the woodwork above the door, and the other end of the rod is clamped on to the shaft.

14,778.—AN ARTIFICIAL COMPOUND FOR BRICKS, STONE, &c.: A. H. Crozier and A. E. Thomine.—The bricks, tiles, cornices, mouldings, and other objects are fashioned under pressure of a compound of slaked lime, sand, loam, or clay, or it may be of clay and lime only, and for the sand may be used blast-furnace or similar slag. The moulded articles are exposed to steam at a high pressure in a closed vessel.

14,781.—AN APPLIANCE FOR INCANDESCENT GAS-BURNERS: W. Kraeche.—In order that the self-igniter may not be damaged by the flame and be readily removed, the pellet is mounted centrally on a detachable fitting, which has a peg for the socket in the head of the burner, and arms that carry the mantle-rod socket and a perforated plate.

14,822.—APPARATUS FOR EXCAVATION PURPOSES: W. Taylor and W. S. Hubbard (Taylor & Hubbard).—Side-frames join the bucket to pins upon two levers, the levers being rigidly secured to a shaft carried by bearings in plates upon the jib, and between them is fastened a third lever, which a girder connects to the arm of a pivoted quadrant in gear with a worm. Of the gear-wheels that serve for the working of the worm from the crank-shaft of the engine, the last bevel-wheel is geared to two bevel-wheels loose upon the shaft, whereof either can be fastened to the shaft with a double-sliding friction one. A friction-cone helps to control the position of the bucket in respect of the soil.

14,827.—A VICE: C. Rauhe.—One leg or both legs are pivoted on to a bar which has an extension that can be fastened upon a table. The legs have jaws and are adjusted with a screw; they have also fittings that will serve for pressing, shearing, punching, and similar operations. The distance between the legs can be varied by joining one of them adj. justably to the bar.

14,847.—CONSTRUCTION OF ROOFS, WALLS, FLOORS, &c.: F. H. Turner.—Blocks of terra-cotta or fire-clay are fashioned with flat recessed, flanged bottoms, convex tops, partitions, and side-ribs to be laid upon the girder flanges. There are openings between the ribs through which fine concrete may be filled in, and until concrete has been run in the terra-cotta tubes are held in position with distance-blocks of iron, wood, or fire-clay. The girders may have triple flanges. Ribs may be attached to the webs below the neutral axis or central line.

14,938.—PROCESS OF MOULDING BLOCKS, TILES, &c.: F. Wernicke.—A sharpened box having a sieve bottom feeds the material into the mould, where it is stirred with the wires of a frame hung upon a rod, excess of material being fed to the edges or elsewhere for blocks with thick edges, &c., by means of the spacing of the wires. After the mould has been filled the bottom of the box is closed by the lowering of the wires between those of the sieve. In another form of grating the mould can be directly filled.

14,940.—AN ATTACHMENT FOR HATCHETS: G. M. Fenell.—The handle, the head, and the blade are formed of sheet metal and are brazed or rivetted together, and the blade may be caused to abut against the end of the head, which may be made in one piece with the blade; the upper end of the handle is shaped so as to constitute a wedged part of the tool.

14,976.—AN ANTI-CORROSION PREPARATION: F. J. Robinson.—In order to prevent the prevention and removal of corrosion and incrustation is made of an admixture of eucalyptus leaves, creosote, and chloride of ammonia, for use in liquid or pulverised form in the parts of—eucalyptus leaves, 330 lbs.; creosote, 1 c. z.; and chloride of ammonia, 130 lbs., mixed with water, 1,100 gals.

15,001.—AN ELECTRICITY CURRENT METER: A. Honig.—The axle of a continuous current am-meter or volt-meter carries a pointer and a ring-shaped permanent magnet, at one side of which is a small air gap in which are set fixed circuit conductors in order that the magnet-poles shall move across them with the turning of the axle; a portion of a wire coil wound in a former having a flat part in the gap constitutes the conductors. For large current an am-meter has a conducting-strip (in place of a coil) of which the part near the axle is turned into a vertical plane; the interposition of an insulator provides for the shifting of the strip by the main conductor, and any scale required can be produced by a variation of the thickness of the coil or conducting-strip in the air-gap. The former of a portable instrument wherein a pressure-measuring coil is wound will conduct the current that is to be computed, or a current-supporting strip can be adopted for the pressure coil.

15,012.—A LIFT VALVE: W. R. Skinner and A. Oatley.—The valve is adapted for high-pressure service and for steam and water service. An enlarged cone is fashioned at the upper end of the valve-spindle with a seat in the casing upon which it is forced with nuts upon the spindle, a recess in the cone takes the squared end of the lower and screwed portion of the spindle, and a hand-wheel works the valve; a cone-shaped seat in the casing fits against a corresponding ring upon the removable section, which a ferrule that is screwed into a nut carrying the ring in the casing maintains in its proper position. For a small valve an internally-screwed portion of the casing will take the ferrule.

15,021.—ELECTRODES FOR ARC LAMPS: I. Alexandroff.—To save the expenditure of energy with the employment of pure carbons the inventor makes a compound of carbon and oxides or salts of magnesium, zinc, aluminium, silver, copper, cerium, thorium, zirconium, calcium, yttrium, or other suitable metals, and mixes a paste of asphaltum dissolved in turpentine, finely pulverised coke, sixty-three parts; graphite, thirty parts; lamplack, seven parts; and magnesia, one part; which he presses into rods that are rendered dense enough by alternately baking them and moistening them with a solution of sugar.

15,035.—MANUFACTURE OF BRICKS: F. Thompson.—The material consists of about two parts of clay dust mixed in a dry state with three parts of riddled sawdust; it is then wetted in a pug-mill. The dried bricks are slowly burned in a kiln until the sawdust has been consumed. The inventor claims that the articles are fire and sound proof, and available for being nailed or plastered, for partitions and party-walls, and for a substitute for timber in building construction.

15,057.—A SHED FOR PURPOSES OF SAFETY: G. A. Mahsen.—The sheds, which are devised for use in the manufacture or storage of explosive substances, are built above cellars that have inclined floors and double walls, and are divided into vaulted compartments. In order to lessen damage that may be caused by an explosion, the cellars are charged with water, ashes, infusorial earth, or other suitable materials.

15,074.—A TOOL FOR USE IN SUBMARINE OPERATIONS: B. H. Coffey.—Rocks under water are broken by the fall of a weighted chisel through an air-chamber. Spuds and anchors hold the floating stage in which is an opening for the air-chamber that is moved about its vertical axis by means of a separated engine. The air-chamber is open at its base and closed at its top, and is fitted with guides for the heavy weight to which the chisel is keyed. A rod connects the weight to a cross-head that slides in vertical guides upon the derrick, and is lifted or lowered with a chain and drum worked from the engine. The ends of pivoted arms extending from the chamber may be hooked on to the cross-head for the lowering or lifting of the chamber when the fixing-clamp has been opened. In a variant form there are projections from the top of the weight which will engage with jaws upon a spring-regulated catch joined to the rod. A wedge automatically liberates the catch, whereby the weighted chisel will freely fall as the catch rises to the top of the air-chamber.

15,095.—ELECTRICAL CURRENT METERS: J. Wright and Reason Manufacturing Co.—In order to obtain powerful action, a demand indicator, worked with electro-magnetism, has a large amount of iron in its composition, whilst the residual magnetism may for practical purposes be neglected. In one form of the meter the coil that conveys the current has two iron coils (one of which is fixed) having end arms; the other coil is turned upon its axis by magnetic repulsion between the arms and a fast and loose pointer which traverses a scale, the latter pointer being moved by a projection from the other one and resting at the point of highest deflection. The motion of the movable core may be retarded with a vane dipped into glycerine, and a separate maximum pointer may be discarded for the engagement of a ratchet-wheel mounted upon the movable core with a pawl which will obviate the reversal of motion. Cont. also No. 18,271 of 1897.

15,123.—APPLIANCES FOR ARC-LAMPS: Nettletons, Ltd., and W. E. Symons.—The top plate of a solenoid lamp carries a differentially-wound solenoid together with iron tubes at the sides which support an insulated and lower carbon-holder; an iron core of which the iron arms are guided by the side-tubes sustains the upper carbon-holder, whilst interposed copper gauze or iron tubes, case with brass or copper will prevent an actual contact. A flexible conductor establishes connexion with the upper carbon-holder.

15,132.—A WRENCH FOR WORKMEN'S USE: W. King.—In order that the disc shall not be turned backwards whilst a loose nut is being screwed up the inventor fashions the disc of a ratchet wrench with an extension upon each side of the head and with milled heads; the disc is either pressed upon by hand or pressed against the work.

15,136.—APPLIANCES FOR HOISTS AND ELEVATORS: G. H. Hill.—A motor which is affixed to the cage works an electrically-driven hoist or elevator, being geared with drums that wind and unwind the lifting ropes, which pass to the upper end of the well. In a modified shape there are weights which counterbalance the weight of the cage and portion of its load, and drums upon the shafts serve for the winding and unwinding of ropes that are attached to the bottom of the well.

15,186.—DOMESTIC WATER-SUPPLY: M. M. Brophy.—A single nozzle is made to supply both hot and cold water, the hot water being provided by admitting steam into the cold water. In order to prevent the parts adjacent to the nozzle from becoming hot, the inventor contrives that steam shall pass to the water-heater and water into the

encompassing vessel, and fits rods (formed of two parts with overlapping ends clamped together) and cocks for regulating the flow of the steam and the water; a large pipe joins the containing-vessel to the nozzle, which is a T-shaped chamber into which the rods are inserted. The rods are fastened to crank-pins upon discs within the chamber, and of the handles that turn them one is caused to overlap the other, whereby the water-cock will be opened together with the steam-cock. Cont. also Nos. 12,105 of 1899 and 15,187 and 21,647 of 1900.

MEETINGS.

FRIDAY, DECEMBER 20.  
Architectural Association Discussion Section.—Mr. Howard Humphreys on "The Manufacture, Testing, and Uses of Portland Cement." 7.30 p.m.  
Institution of Mechanical Engineers.—Mr. W. Campbell, B.Sc., on "The Microscopical Examination of the Alloys of Copper and Tin." 8 p.m.  
Institution of Civil Engineers (Students' Meeting).—Mr. M. Morgan on "Transmission Dynamometer." 8 p.m.  
Glasgow Architectural Craftsmen's Society.—"Tiles: (a) Mr. W. G. Peddie on "Wall and Floor Tiles." (b) Mr. J. M. Kin on "Substitutes for Tiles." 8 p.m.

WEDNESDAY, JANUARY 1.  
Builders' Foremen and Clerks of Works' Institution.—Ordinary meeting of the members. 8 p.m.

FRIDAY, JANUARY 3.  
Architectural Association.—Mr. J. A. Gotch on "The Development of Domestic Architecture from the Twelfth to the Eighteenth Century," illustrated by lantern views. 7.30 p.m.

SOME RECENT SALES OF PROPERTY: ESTATE EXCHANGE REPORT.

Table listing property sales with columns for date, location, and price. Includes entries for December 6, 12, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, and January 1, 1902. Locations include various farms, fields, and residential plots in London and surrounding areas.

The samples and schedules of prices submitted by the various contractors have been carefully examined by the Architect, who is of opinion that the system adopted by Messrs. Norton & Gregory, would be suitable for the Board's work. The Committee accordingly recommend that the tenders of these two firms should be accepted, in order that there may be no delay in carrying out the work required.

### An Imperial Lecture on Art.

**V**HETHER we like or do not like the Emperor of Germany, it must be admitted that he is the most dramatically interesting Sovereign who has sat on a European throne since the days of Napoleon. He is full of surprises; in the words of Falstaff, "one knows not where to have him." He is ready to set all the world right about everything, and his latest appearance has been as a lecturer on modern sculpture and its tendencies and temptations, on the occasion of his inviting to dinner all the sculptors who have been employed on the Avenue of Victory at Berlin. And to a considerable extent, at all events, Imperial lecture justified itself. It contained some very wise remarks, which are worth the attention of artists.

That the Emperor should have thought that the Avenue of Victory would be the astonishment of foreign visitors, and that German sculpture had shown itself to be equal to the sculpture of the Renaissance, is of course only what one must expect. That is the natural attitude of the Teuton mind. The Emperor would no doubt have fully sympathised with the gentleman who tried to stop Heine from speaking at a patriotic meeting, with the caution—"At this German meeting must the German German speak." So far we fear we cannot go with the Emperor. Whether an actual visit to the "Avenue of Victory" would convert us it would be rash to speculate, but our present impression of German sculpture is that it is marked by a certain rude and trenchant vigour combined with a lamentable want of refinement; and that as to any comparison with Renaissance art, Michelangelo's Medici tomb figures are by themselves worth more than all the united artistic genius of modern Germany could produce. But nevertheless it is a fine thing to see that Germany believes in her sculptors, as England—officially at least—does not. When one of the competitors for the Queen Victoria Memorial proposed to line his processional road from end to end with

groups of sculpture, the leading journal asked, with a slight suspicion of a sneer, where we were to find the sculptors to produce all these works. The fact is that we are much better provided with sculptors for such a task than we have any reason to believe that Germany is. English sculpture has never been in so flourishing and hopeful a condition, artistically considered, as it is at this moment. Mr. Spielmann has just brought out a critical and illustrative book on contemporary English sculpture\* which, in its numerous illustrations, affords a very good panoramic view of the recent productions of English sculpture; and no one, we think, can turn over its pages without being struck by the variety, originality, and refinement, of most of the work there represented. But these sculptors get little or no encouragement or employment from our Government. Herein the Emperor of Germany has set our rulers an example which they might well take to heart. He went, he said, on the principle that there should be direct relation between the artists and him who gave the commissions, without the intervention of the machinery of juries and committees. What the German artists thought of this we do not, of course, know. It is commonly supposed that in the multitude of counsellors there is safety, and to dispense with them was a somewhat daring, and would in this country probably be thought a too autocratic mode of procedure. But the Emperor seems to have done exactly the right thing. He gave the idea of what he wanted; with the assistance and advice of Herr Begas, and his own personal knowledge acquired from visits to a good many studios, he selected the artists; but having done so, he left each of them free to treat his own special subject in his own way, recognising that "every work of art implies some particle of the individual character of the artist." As a principle of procedure we do not see that he could possibly have done better; and though such personal management of such a matter on the part of the Sovereign would hardly be possible in our more constitutional country, nevertheless one cannot but feel that the spectacle of the Sovereign of a great country personally interesting himself in the production of a series of works of art

for the adornment of his capital, selecting the artists and gathering them round him to have a talk about it when the work was completed, is in itself a wholesome and refreshing one, and does not in the least call for the sneering tone with which it has been commented on by some English journalists. The Emperor knows and cares more about art than they do, at all events.

The remarks which the Emperor made about modern art, after a reference to the opening of the collection of antique art at the Pergamon Museum, are particularly wise and well-timed. Sculpture, he said, still remained for the most part free from the influence of certain modern tendencies and movements; he evidently referred to the tendency to sensationalism which has so much beset modern painting—to the representation of ugliness rather than of beauty, in the search for novelty; and he urged his hearers to keep it so. Art that ignored the laws and limits of aesthetic beauty, so remarkably illustrated in the antique sculpture to which he had been referring, was no longer art; "it is a manufacture, it is an industry, which art must never become." Of no art is this more true than of sculpture, which is essentially an ideal, not a realistic art. French sculpture, though at its best it is still at the head of all, has been painfully invaded by this base of sensationalism and realism, which, if not checked, will go far to ruin the art in France. Modern English sculpture, with all its variety and originality, has hitherto kept clear of this deteriorating influence; it is to be hoped that it will continue to do so; but in painting we are unfortunately not without too many examples of the kind of art which, as the Emperor says, "descends into the gutter" for its inspirations. Artists who follow this path, he thinks, whatever their talents, are on the wrong track. "If art, as is often the case nowadays, does nothing but depict misery in a guise even more hideous than the reality, it is sinning against the German people. . . . The art which descends to advertisement is no longer art, though it be extolled a hundred and a thousand times. The feeling for what is ugly or beautiful\* is in every man, be he

\* "British Sculpture and Sculptors of To-day," by M. H. Spielmann. London: Cassell & Co. 1901.

\* We quote from the *Times* correspondent's report but probably what the Emperor really said (or at all events meant to say) was, the perception of the difference between the ugly and the beautiful.

ever so humble; and I need you all for the further cultivation of this sense among the people; and for having performed a piece of this kind of work in the Avenue of Victory I give you most especial thanks." Whether the Avenue of Victory sculptures are all that the Emperor takes them to be is a matter about which there may be differences of opinion; but at all events these are noble words to be addressed by a Sovereign to his artist subjects.

#### PUBLIC HEALTH AND HOUSING.

Our issue of February 16 of this year we gave a brief synopsis of the history of the Housing Question in London, based on the special Report prepared by the London County Council, and expressed the conviction that the problem could only be effectually met by the combined efforts of public bodies and private enterprise; neither is alone sufficient to the task; and therefore that municipal authorities should not endeavour to crush out private enterprise. The question as to who should do it, however, though it is the first step in the matter, is after all, hardly so important as the question how it should be done; and on this head the suggestions of an able medical man\* who has made the hygiene of the dwelling a special study, are worthy of careful consideration.

The sub-title to Dr. Sykes's book evidently refers to the change which has gradually been developing from the house to the "flat" system. A "house" may indeed be let to different families on different floors, but the essential difference between a house and a flat is that in the former the sanitary conveniences are mostly all in the basement, in the "flat" they are provided, or may and should be provided, on the same floor with each dwelling. There are those who maintain that "flat" houses should have the latrines grouped on upper or lower floors, or even out of the building. We have always held that for reasons of privacy and order each habitation in a flat should contain within itself the necessary provision for everything in the household life except the washing of clothes, which is a business of only weekly occurrence. As Dr. Sykes puts it—

"What chance has a respectable family of observing the decencies of life in a house where there are one or two dissolute families, where the domestic and sanitary conveniences are all used entirely in common, and the members of the respectable family, even the youngest, are continually traversing the house to and fro? If domestic and sanitary conveniences are provided on each floor, those living on that floor can at least cultivate their own good habits in their own way. What is wanted is to procure for families as much privacy as can be obtained, and to reduce the common usage to the smallest proportions possible."

In regard to considerations of order and decency this is obvious enough, but Dr. Sykes adds another argument the force of which is not so generally realised. In the case of families (and there are numbers of such cases) living on the top floors of houses some 40 ft. high, where the water-taps, sinks, water-closets and dust-bins are situated at the ground floor or basement,

Dr. Sykes points out that it is usually assumed that twenty times more energy is expended in walking up stairs a certain height than in walking the same distance on the level:—

"Therefore walking to the top of a four-story house is equivalent to walking about 800 ft. upon the level, and, say a cottage measures 15 ft. frontage, this is equivalent to walking past a row of over fifty-three cottages to reach the common sanitary conveniences above mentioned. What would be the opinion of a medical officer of health or of the Local Government Board if provision were as inadequately made even in a rural district? Yet this is the condition that prevails over a large part of London."

The case could hardly be more strongly or practically put. If it be said that in the cheapest class of tenements economy of structure demands the concentration of the water-closets, it may be replied that concentration can be made, to a certain extent, vertically as well as horizontally, and that water-closets, sinks, &c., may be combined in a tower or projection running through all stories and serving two tenements on each floor, with separate access. This is the method specially recommended by Dr. Sykes in the case of the structural adaptation of "floor" houses into "flats," but it might very well be applied to new houses built as flats.

To come back to the primary objects of Dr. Sykes's book, let us see what light he throws, from the medical point of view, on the question of the hygienic effect of the increasing tendency, among upper classes as well as lower classes, to live in flats rather than in separate houses. The fact that rate of mortality increases, in the main, with density of inhabitation per square area, has long been admitted; Dr. Sykes puts it that in consequence of the altered conditions arising from the increased use of dwellings in flats, we have now rather to consider density of inhabitation per cubic space. This may be a simpler way of dealing with statistics for the purpose of practical application, but we do not see that it really makes much difference. If there are twenty people in a four-story house where there used to be ten people in a two-story house of the same area the density per square area is doubled, and we do not see that the fact of their being piled one above another vertically materially modifies the case, for their relation to the amount of sun and air available around them (which is one of the most important factors in the matter of hygiene) is practically much the same. It seems to us, in fact, rather important to keep in view this aspect of the problem, because on it hangs the necessity (which we cannot for a moment doubt) of demanding that increased height in building should be accompanied by wider spacing between buildings. This is exactly one of the things which estate-owners or their agents in London cannot be made to see, and which the law ought to compel them to see, whether they will or no. In Bloomsbury, for instance, which according to statistics has figured as about the healthiest part of London, a considerable number of sites have recently been cleared of the old houses and rebuilt upon with houses in flats nearly or quite twice as high as the old houses, on the same amount of land. It is ridiculous to suppose that this can go on without affecting the health statistics of the district; and

legislation ought to put a check upon it. It does not appear, moreover, from Dr. Sykes's statement, that there are at present any extensive statistics available in regard to rate of mortality in relation to density of cubic space inhabitation, at all events in London. Some statistics in regard to the proportion of the death-rate to the number of rooms in dwellings—which may be taken to represent approximately the relative size of the dwellings—are very significant. Dr. Sykes gives a table from Glasgow of the comparative death-rate in dwellings of "one and two rooms," "three and four rooms," and "five rooms and upwards"; the figures are respectively 27.74, 19.45, and 11.23. We have only space to give the totals; the table is classified for various diseases, but in some special forms of disease the difference is even more startling; in the case, for instance, of "nervous diseases and diseases of nutrition of children," the respective death-rates are 4.80, 2.35, 0.91. Here of course comes in the element of want of adequate separation, and the use of the same room for living and sleeping. It is a better hygienic condition to inhabit two small rooms than one large one on the same floor area. In dealing with statistics of persons per room, the author considers as "overcrowded" all dwellings in which the number of inhabitants is more than double the number of rooms. The following table gives the results in this respect for six of the capital cities of Europe:—

City and date.	Population.	Over-crowded population.	Percentage over-crowded.	Mortality of whole city.
London (1891)...	4,211,743	830,182	20 per cent.	21.4
Paris (1891)...	2,424,795	331,976	14 "	21.6
Berlin (1885)...	1,315,337	363,960	28 "	24.6
Vienna (1895)...	1,364,548	287,000	21 "	24.6
Budapest (1891)	463,759	348,609	74 "	28.0
St. Petersburg (1890).....	956,226	442,593	46 "	28.4

Table showing relation of mortality to overcrowding of persons per room, in six capitals of Europe.

It is stated that the comparative results as between Budapest and Paris are not so different as appears at first sight, because in the Budapest returns only the actually inhabited rooms are taken, excluding lobbies and other apartments not permanently inhabited, whereas in the Paris returns all apartments within a tenement are included; therefore the proportion of overcrowding in Budapest may be exaggerated and that of Paris under the mark. This will not however entirely account for the much lower proportion of death-rate to overcrowding in London than in Paris, which may be fairly set down to the generally better sanitary state of London, owing to the sanitary reform and legislation of the last half-century.

In his chapter on the "Effects upon Health of Certain Kinds of Dwelling-Houses and Dwellings" Dr. Sykes disposes effectually of the attempts which have been made to delend back-to-back houses, showing that according to careful statistics as to comparative mortality in the same town, back-to-back houses have a mortality per 1,000, for all diseases, one-third higher than that for through houses. This seems unanswerable, and yet there are town authorities who will persist in defending, or excusing, this method of building, on grounds of so-called economy. Dwellings over stables are another class of habitations of which the mortality statistics in

\* "Public Health and Housing: the Influence of the Dwelling upon Health in Relation to the Changing Style of Habitation." By John F. J. Sykes, M.D. London: E. S. King & Co. 1901.

London, especially for infants, are very high. The mortality in these dwellings for infants under one year of age is, for all diseases, nearly double the general mortality at the same age for London; and for bronchitis and pneumonia it is more than double. Although we do not in any case favour or defend dwellings over stables, we do not see any necessity for such a death-rate as this if they were properly constructed, with solid impervious floors between the stable and the dwelling, and efficient through ventilation. In many cases, however (as those Londoners will know who happen to live in terraces looking on to the back of a "mews"), the houses are, in regard to through ventilation, in the same condition as back-to-back houses, the back wall being unpierced with windows, probably to prevent the depreciation of the better-class house property by having stable-dwelling windows overlooking their backs or their gardens; and in the case of the older buildings the floors between stable and dwelling are only boarded. This latter defect can easily be remedied now by concrete floors, but the question of the back windows is a difficulty that can hardly be got over, for there can be no doubt that their existence would amount to a serious depreciation of any terrace-house property on which they faced. The moral is that such dwellings should be discontinued, and the existing ones disestablished as soon as may be. The present London Building Act compels the interposition of the concrete floor in any new building of the kind, but it does not provide for through ventilation, since, as long as there is only one room in the width of the building, the required windows may all open towards the stable-yard. In a mews on a large scale, where there is room for an inclined plane to be worked in, the problem might perhaps be better met by building the stables in two stories and grouping the dwellings separately from them, since it is probable that a certain number of dwellings on the spot are practically a necessity.

In regard to such large blocks of artisans' dwellings as the Peabody buildings and others of similar type, statistics show that the general death-rate is lower in these than the average of London; but that on the other hand the death-rate for disease propagated by direct infection is higher; which is exactly what we should have expected. In regard, however, to the death-rate for all causes, Dr. Sykes is of opinion that the statistics for these buildings can hardly be taken as normal, inasmuch as they are occupied by what is really a selected population living under special conditions, and for this and other reasons any comparison between the statistics as to the houses demolished on an insanitary area, and the new buildings erected on the site, would be of little value.

On the other hand, some most important comparisons are made in regard to the health effect of different systems of focal removal: comparisons which, we are not surprised to find, are entirely in favour of the water-closet system—the only system, in our opinion, fitted for a civilised city. The advocates of the nasty system, as we do not scruple to call it, of pail-closets, should take to heart the statistics quoted by the author from the Report of Dr. Boobbyer, the Medical Officer of Health for Nottingham,

in regard to the distribution of typhoid fever in Nottingham during ten years (1887 to 1896), in houses with different types of closets. This investigation showed that in midden-privy houses the proportional annual incidence was one case for every 37 houses; in pail-closet houses, one in 120; in water-closet houses one in 558: figures which require no comment. He found also—which is easily comprehensible—that the disease was much more liable to recur after it had arisen in the privy and pail-closet houses than in the water-closet houses:—

"Of the eleven third consecutive cases that occurred in single houses, three were in privy houses, eight in pail-closet houses, none in water-closet houses. Of the four fourth consecutive cases in single houses, all were in pail-closet houses. He pointed out that the closet-pail is essentially only a small portable privy above ground, and is capable of polluting the air, the soil, and the surroundings almost as much as the privy, especially by spilling and leakage in scavenging."

Dr. Sykes's chapters in regard to the arrangement of houses in streets contain nothing new, except that he draws attention usefully to the bad features of arrangements (illustrated by block plans) whereby the angle houses become back-to-back houses. In regard to blocks built in straight lines he also draws attention to the fact that "wherever there is a central wall or partition separating the front rooms from the back rooms," there is the type of the back-to-back dwelling. He means, we presume, wherever there is no direct opening between these front and back rooms, but only outer openings to them, separately from a staircase. The common staircase, too, unless to some extent permanently open to the air, is a means not of ventilation, of communicating to one dwelling the air that has been breathed in another. Staircase windows ensure light, but not ventilation. In many cases they are never opened.

The author's remarks about the treatment of the ground adjoining houses are important and worth quoting:—

"With regard to the surface of the open spaces immediately contiguous to dwelling-houses, the soil in towns always becomes polluted and prejudicial to health. There are two ways in which it can be effectually dealt with: the one is by cultivation as a garden, the other is by impervious paving, so levelled and drained as to be readily cleansed. As a temporary expedient, the surface may be gravelled and rolled, but this is not of permanent benefit. Many small gardens in towns are merely barren wastes, and in deciding whether it is a garden or a yard, the test is whether it is regularly cultivated with grass or permanently paved. It should be definitely provided that such spaces should be regularly cultivated or permanently paved, instead of leaving it to vague by-laws that are difficult, if not impossible, to interpret."

If we ask what, amid all the useful suggestions as to details, is the general recommendation Dr. Sykes has to make to the housing problem, considering it in the light of providing sufficient and healthy dwellings for those who require them, it seems, though nowhere very clearly or consecutively stated, to amount to this:—That it is of no use to think that those who are turned out of insanitary property which has to be pulled down, can be provided for by the erection of buildings in far suburbs and the provision of increased and cheaper means of transport. They will not all transport their chattels to a distance; they want to be near their old neighbourhood and near their work. Nevertheless, he holds

that demolition of insanitary and overcrowded property must always have a 'good effect. Its effect is "not only to destroy the houses, but also to disperse the worse elements among the better elements of the population;" in other words, to dilute the evil. On the other hand, a large number, not perhaps of the worst, are by the demolition driven into sublet houses unsuited to the use to which they are put. But these might be altered and adapted to their new usage at no very great expense; and in the effort to do this, to make the best of the houses available by altering and adapting them, Dr. Sykes thinks the greatest hope of regeneration lies. It is not what is called a heroic remedy; that it is so very simple and matter-of-fact is perhaps its best claim to attention.

#### NOTES.

Home and  
Colonial Stores  
20. Colls.

In this appeal case in regard to right of light, which is reported in our legal column, it

appears that the defendant has suffered from an unexpected and very hard measure on the part of the Appeal Court. In the first action, which was to restrain the defendant, a well-known builder, from erecting a building which it was contended would obstruct the ancient lights of the defendants, it appears that the principal claim was in respect of a large ground-floor window lighting an office where a number of clerks worked; but though these windows were of large size, it appears that the upper portion of them was filled 20 in. deep with stained glass, and the lower portion covered with horse-hair blinds, so that it would not seem that the demand for light was so very great after all. Mr. Justice Joyce, before whom the case was heard, found for the defendant, on the ground that there was no substantial injury to the plaintiffs' light. Plaintiffs gave notice of appeal; and meantime the defendant—it may be said, rather imprudently—went on with his building. The Court of Appeal has reversed the judgment, on grounds which appear in the report, and has ordered the defendant to pull down his building. This is where we consider the hardship occurs. The defendant took the risk of the reversal of judgment, but he probably never contemplated having to remove the building. Claims of this kind, as we have frequently pointed out, can be settled by compensation; and it has appeared that judges were rather disposed to take this view. The moral of the case is perhaps, that it is more prudent not to proceed with a building when there is an appeal pending; but to compel the defendant to pull it down seems to be an unnecessarily harsh procedure in the case of a damage to light which was at all events disputable, and savours rather more of law than justice.

Crystal Palace  
Gas Exhibition.

THE International Gas Exhibition which is now being held at the Crystal Palace cannot

be regarded as worthy of the industry which it is supposed to represent, and many of the best-known firms of burner-makers and gas-stove manufacturers have no exhibits. In spite, however, of the limited scale of the exhibition, one or two novelties are shown which well merit attention. The Lucas incandescent intensive gaslight is exhibited for the first time in this country. This

lamp has met with great success in Berlin, and emits a white light of such brilliancy, that it is exceedingly conspicuous, although exhibited in close proximity to high-power incandescent gas lamps of the well-known type. The Lucas lamp is supplied with gas under ordinary pressure, and it is stated that with a consumption of 17 cubic feet of gas per hour a 700-c.p. light is obtained. One of the essential features of the lamp is its chimney, which is about 3 ft. in length, and creates a strong upward current of air around the mantle and flame. Another exhibit which calls for special mention is the inverted incandescent gas lamp. In this lamp the burner is situated above the mantle, and has a cone of white porcelain to act as a radiator and reflector. The mantle is inverted and suspended from the burner, so that when properly shaded, the lamp closely resembles an incandescent electric lamp. It is claimed that this burner gives a light of from forty to fifty candle-power with a gas consumption of 3.4 cubic feet per hour, and although it is therefore less efficient than burners of the usual form, it is considered that this disadvantage is more than counterbalanced by the freedom from shadow and more pleasing appearance of the new lamp. It remains to be proved whether the mantles are as durable when applied to inverted burners as when used on burners of ordinary construction. Other noteworthy exhibits are the new Clamond gas radiators and the Welsbach self-intensifying lamps. A few stalls are devoted to acetylene appliances, but as these exhibits are not shown in action they are not of great interest. The exhibition will close on the 11th proximo.

THE learned paper on the "Applications of Elastic Solids to Metrology," by Dr. Chree, the Superintendent of Kew Observatory, which appears in the *Philosophical Magazine* for this month, is a most valuable contribution to our scientific knowledge. The object of the paper is to exemplify the bearing of elasticity on physical measurements, and the author's unique knowledge of the mathematical theory of elasticity has enabled him to give a complete and systematic treatment of the subject. We are apt to regard a solid as something whose volume alters only with temperature. When, however, we make very accurate physical measurements it has to be remembered that bodies are elastic, and not rigid. Dr. Chree proves that the changes in the volume of the international standard kilogramme made of platinum iridium are appreciable owing to variations in the height of the barometer, and hence a standard pressure ought to be assigned at which a kilogramme has its normal volume. Hence, with the accuracy of measurement they are trying to attain at the National Physical Laboratory, they have to recognise that platinum is an elastic solid whose volume alters with the atmospheric pressure. The author, from the theory of elastic solids, deduces the difference in the volume of a glass tube when it holds mercury and when it holds water, and proves that this difference is very appreciable. Perhaps the most important of his results are those showing how standards of length alter owing to the fact that the bars on which they

are marked are not absolutely rigid. Most modern standards of length are supported on two symmetrical rollers, as the bars have to be surrounded by liquid so as to promote uniformity of temperature, and hence the flexure of the bar has to be considered. Dr. Chree proves that the reaction of the supports possesses as yet only theoretical interest, but that the effect of barometric pressure has to be considered. At Kew the standard yard is the distance between the centres of two gold plugs let into a bar so that they lie flush with the upper surface. Dr. Chree gives the mathematical solution of the problem of finding the distances of the supports from the ends of the bar so that the distance between the plugs shall be unaffected by stretching.

#### Copper-Tin Alloys.

AN important communication on the "Microscopical Examination of the Alloys of Copper and Tin" was made to the Institution of Mechanical Engineers on the 20th inst. by Mr. William Campbell, B.Sc., of Columbia University, New York. The work which led up to the writing of the paper was carried out in the metallurgical laboratory of the Royal School of Mines, and is supplementary to the Reports of the Alloys Research Committee. A number of experiments were detailed, with a view to explain the complete freezing-point curve of the copper-tin alloys published in the fourth Report of that committee; they also throw much light on the change of structure in those alloys due to casting. Perhaps the most interesting and original part of the communication consists in the description of the micro-structure of the alloys. Mr. Campbell finds that when the alloys which contain between 0 and 1 per cent. of copper are cast, the tin crystallises out as grains very much smaller than those of the slowly cooled alloys. The proportion which the grains bear to the eutectic is greatly increased by casting, and this seems to point to the fact that in cooling quickly the grains of tin retain some copper. On the other hand, no crystals can be seen in the 1 per cent. alloy when cast, whereas when it is slowly cooled in the furnace they are present. This last principle is not, we may remark, a new discovery, for it has for years been known, in connexion with the cooling of igneous rocks, that de-vitrification, accompanied very frequently by the development of phenocrysts, takes place on slow cooling, whereas the same magma may become vitreous when rapidly cooled. The author states that when from 1 to 8 per cent. of copper is present casting produces a fine network of bright crystallites; the 20 per cent. alloy is composed of bright rod-like crystals which, under a magnification of some 300 diameters, are seen to be composed of two constituents, and the rods increase in size as the copper is increased to 40 per cent. With 41 per cent. of copper the crystals change in character, and become more or less fibrous in appearance. The surface structure of the alloys containing between 80 and 100 per cent. of copper is often very fine, and generally consists of numbers of distinct skeleton crystals which stand out prominently above the surface. The conclusion arrived at is that the result of casting is in all cases to make the structure comparatively minute. These researches by Mr. Campbell mark a distinct advance in metal-

lurgical science, and they have considerable bearing on the subject of bronze-casting in general.

In 1709 Sir John Cass, Alderman of Portsoken Ward, made a will vesting in trustees some lands adjoining his house in Gover-street, South Hackney, together with a capital sum of 1,000*l.*, for the establishment and maintenance of an advanced or higher grade school at Hackney, and a charity school in his native parish of Aldgate. In 1718 he prepared another will that increased the yearly subsidy in favour of the Aldgate school. He did not live, however, to completely execute the later will, for whilst signing the second sheet he died with the pen in his hand. Considerable litigation ensued, and several years elapsed before Lord Chancellor Hardwicke gave judgment in favour of the former will; the Court of Chancery ordered that the income, 493*l.* per annum, of the trust should be expended upon the schools in Aldgate, the funds not being sufficient for the school at Hackney as well. In 1833-4 the Charity Commissioners formulated a scheme for the allocation of the funds of the endowment, which had so increased in value as to yield a yearly income of 6,500*l.*, which, it is computed, will ultimately reach nearly 30,000*l.* as the leases expire. The scheme apportioned a capital sum of 5,000*l.* and a sum of 500*l.* per annum for educational purposes in Hackney out of the surplus endowments at a future time as the property enhances in value, and continued the Cass's School, for 220 boys and girls, with their board and clothing, in Aldgate. The Commissioners further provided for the establishment in Aldgate of a Technical Day School and Institute in Jewry-street, Aldgate, for which Mr. Arthur W. Cooksey's designs and plans were accepted in a competition limited to five architects, Professor Aitchison acting as assessor, in conjunction with Sir Philip Magnus and Dr. Garnett of the Technical Education Board (see the view, section, and plans illustrated in the *Builder* of July 23 1898). In September last Mr. Blashill, as assessor, awarded the first premium in a limited competition to Mr. Cooksey in respect of his plans and designs for the North-East London Polytechnic buildings to be erected near Hackney Downs Railway Station, as part of the Cass foundation. In October a tender for 10,826*l.* was accepted from Messrs. Chessum & Sons, of Bow, contractors, for the new works.

#### Leeds and Yorkshire Architectural Society.

THE Leeds and Yorkshire Architectural Society, which appears to be making new progress under its present energetic President, Mr. Butler Wilson, has followed the example of the Architectural Association and of some of the leading provincial societies in issuing an annual "Book," to be called "The Green Book," containing information as to the proceedings of the Society, its classes and meetings, its finances, &c. From the first issue of the "Green Book," which we have just received, we learn that the Council report a slight increase in the membership of the Society, which now numbers 119 members, as against 111 at the same date last year. The Report expresses regret that the competition for the Society's prizes was less than might be wished; it hopes there will be a better record in this

respect in the future. The prizes offered are a silver medal and five guineas, offered by the President for measured drawings of any ecclesiastical or domestic building erected anterior to 1800 A.D.; the Society's prize of three guineas for the best design for a lodge and entrance gates; the Society's prize of three guineas for the best constructional drawing of a roof for a gymnasium or swimming-bath; and a prize of two guineas for the best essay on "Modern Street Façades in Leeds," illustrated with sketches as far as possible. That ought to be an attractive subject, and Leeds affords plenty of good examples.

At the London Institution on Antiquities of *Susa*, a lecture on the "Recent Discoveries at *Susa*" was delivered by Mr. W. St. Chad Boscawen. In Mr. Boscawen's brief summary of the progress of exploration on both banks of the Tigris, he referred to the excellent work of the French explorers, and dealt chiefly with the discoveries of M. De Morgan. The illustrations put on the screen consisted mainly of inscriptions, and as explained and translated by Mr. Boscawen prove the existence of an advanced civilisation much further back than any Babylonian records. In pre-historic times the stone written title-deeds of land grants, and the accounts of miscellaneous traders, show the existence of a perfect system of land survey and valuation and accurate bookkeeping. That certain parts of Elam were laid out in vast wheat-growing areas he claims abundant evidence. The lecturer drew an ingenious, though somewhat unconvincing, analogy from the remains of pottery evidently cast in a basket mould, and concluded that the art of basket-making was prior to that of the potter, and traced the subsequent surface decoration of pottery from this source. Architecturally, the most interesting slide was one of a rough pointed arch, discovered under a lease dated at 4000 B.C. A slide of a fragment of sculpture in low relief, dated 3800 B.C., representing the attack of the Elamites led by their king up the precipitous slopes of their enemies' position, is a piece of marvellously powerful pictorial sculpture.

#### THE ARCHITECTURAL ASSOCIATION DISCUSSION SECTION:

##### THE HISTORY, MANUFACTURE, TESTING, AND USES OF PORTLAND CEMENT.

The fifth meeting of the session of the Discussion Section of the Architectural Association was held at 56, Great Marlborough-street, W., on the 20th inst., when a paper, prepared by Mr. H. Howard Humphreys, M.Inst.M.E. (unavoidably absent), was read by Mr. E. Stone Spencer, M.Sc., on "The History, Manufacture, Testing, and Uses of Portland Cement." The chair was occupied by Mr. R. H. Weymouth.

The Chairman said he would like to say how very much Mr. Humphreys regretted that he was unable to be present that night. About ten days ago he was called away on a business engagement to Spain, and he felt he was not justified in putting off an important business engagement and had, therefore, asked their friend, Mr. Stone Spencer, to take his place. Mr. Spencer had known Mr. Humphreys for many years, and some part of his time worked under him. He was sure they would be glad to have Mr. Spencer with them, when he told them he had made a long journey from Liverpool on purpose to read the paper.

Mr. Spencer then read the following paper:—The subject upon which I have the honour of addressing you to-night is one which, although at first sight it appears to be essentially dry, is in reality teeming with interest. Several

years ago, when I first began to take special interest in Portland cement, the manager of a large works on the Thames made a remark which I, at the time, thought somewhat extravagant. He said, in effect, that in undertaking the study of this substance, I was embarking upon a study for a lifetime; after a good many years of research, I have, however, come to the conclusion that the remark was entirely justifiable. Cements all seem to possess an individuality which is marked to a far greater extent than is that of any other building material; different samples of this substance which only present what are apparently minute chemical and physical differences, will still act in ways which are often entirely contradictory.

The deep debt which we owe to Portland cement is hardly recognised as widely as it should be. Its invention alone rendered possible many of the extraordinary architectural, and more especially engineering, feats of the past century, and, when properly prepared, its durability far exceeds that of many bricks and building stones. Its present excellence is the outcome of years of patient scientific investigation, and although the names of its inventors and perfectors (who laboured principally during the first half of the nineteenth century) are forgotten, or at best but dimly remembered, the result of their work has revolutionised and assisted design to as great—or, perhaps, greater—an extent than has the introduction of mild steel for constructional purposes.

*History.*—Generations of constructionists, even before the time of Vitruvius, the celebrated architect for Augustus, had noted with dissatisfaction the difficulty of carrying out hydraulic works, owing to the lack of cementitious material which would set hard under water. Vitruvius himself says that after having laid the cofferdams for bridge foundations, "they kept the same empty for a period of not less than two months, in order to allow the masonry to harden."<sup>1</sup> We must not infer from this, however, that the Romans did not know something of the composition of hydraulic limes, for such a theory would be entirely contrary to fact; it has been found, for instance, upon examination of many of their mortars, that they recognised the advantages to be obtained by the mixture in their mortars of a certain amount of powdered brick or tile dust or a volcanic substance known as puzzolana. On the other hand, I do not think that we have much to learn from the Romans with respect to the composition of mortars. Vitcat said that there was a belief throughout France that the Romans possessed a secret for the fabrication, and I have frequently heard remarks which have shown that a similar idea exists in this country. Analyses, however, of various ancient mortars prove that they possessed a variable composition, which would hardly be the case had a general specification (evolved from a special knowledge) been worked to.

Pliny at a later date (lib. 36) ruthlessly destroys the theory of general excellence of Roman mortars, for he says:—"The greatest cause of the ruins of the town was due to the fact that the cements were fraudulently composed of lime lacking in adhesiveness."<sup>2</sup> Evidently the building inspectors of Rome had troubles, and it is certain that whatever crimes may be urged against the genus jerry builder, it cannot be said that the race is of mushroom growth, although in this behalf we may even go back to an earlier period, as it is fairly evident from Biblical records that the labours of Joshua and his compatriots were considerably lightened in the case of the collapse of the walls of Jericho, by the circumstances and evidence existing that these structures had been erected by the progenitors of the gentlemen so much in evidence in the suburbs of London.

Throughout the Middle Ages the search for some more durable binding material continued; hydraulic limes were used, and to some extent understood, but the economic difficulties of transit prevented their general adoption, and it was not until the latter half of the eighteenth and the first decade of the nineteenth centuries that real progress was made. As usual, it was a case of necessity proving to be the mother of invention. Smeaton's research work, whilst he was building the Eddystone lighthouse, convinced him that the theories of the ancients were incorrect, and that lime

<sup>1</sup> Relinquantur pila ne minus quam duos menses sit siccata.

<sup>2</sup> Ratum urbis ea maxima causa quod furto calcis ferrumine suo cements componitur.

burnt from hard stone did not of necessity give the hardest mortar. He noted also the important fact that many impure limes, which contained a fair amount of clay made an excellent hydraulic cement. Prior to his day it had not been generally recognised that it was an advantage to calcine clay and lime together, and so benefit from the partial chemical combination effected. Smeaton, however, did not turn his knowledge to financial account, and it remained for James Parker,\* of Christ Church, in the county of Surrey, to invent and patent a cement in 1796, to which some years afterwards he applied the unfortunate misnomer of "Roman," giving rise to the theory that this material was originally prepared by the invaders of Britain. The deposits from which Roman cement was made varied widely in their composition, the resultant cements differing considerably. After the lapse of a few years Parker began to prepare his material from pebbles found on the Isle of Sheppey, Whitstable, and Harwich. At the same time the name was altered to "Parker's Cement," which was the immediate precursor of the material now so well known.

In the year 1813, Joseph Aspdin, a Leeds bricklayer, succeeded in manufacturing cement from limestone which had been reduced to puddle or powder and clay. He patented this in 1824, and called the substance "Portland Cement," because of its fancied resemblance to Portland stone.† In the year 1825, Aspdin established a manufactory at Wakefield for his cement, and in 1828 Sir Marc Isambard Brunel and his son, Mr. Isambard Kingdom Brunel, are said to have used this material on the Thames Tunnel. Aspdin's cement, after it had been fired, was only in a semi-burnt condition, proper vitrification had not taken place, or if it had taken place, those portions of clinker which approximated to blackness were thrown aside and considered inert, whereas in reality the best material was rejected.

It was, I think, General Pasley who, at a later date, discovered first the value of burning lime and clay to a point of incipient vitrification. James Frost, builder, of Finchley, should also be mentioned as one of the pioneers of the industry, as he in 1825 established himself in cement works at Swanscombe, the site, I believe, being the same as that now used by Messrs. Bazley White & Co. In the year 1830, General Pasley, then Inspector to the Royal Engineers School, at Chatham, independently produced a fair hydraulic cement from the Medway clay and chalk, and he appears to have continued his researches for some time. He mentions, in the second edition of his book on the subject (1847), that there were three manufacturers of artificial cements in England who turned out satisfactory materials—Messrs. J. B. White, Swanscombe, Kent (who had taken over Frost's works at that date); Messrs. Evans & Nicholson, of Manchester, who were manufacturing what they called a patent lihic cement; and Richard Greaves, of Stratford-on-Avon, who was preparing blue lias cement. It is fairly certain, however, that General Pasley underestimated the number of manufacturers, Aspdin's Wakefield factory being amongst those omitted.

In the year 1843, Messrs. Grissel & Peto, contractors for the Houses of Parliament, conducted a series of comparative tests between Roman and Portland cements, consisting of

\* Parker's patent provided for the preparation of cement from septaria or nodules present in clay. See Appendix for analysis.

† Aspdin's specification, No. 5,022, is dated October 21, 1824, and is for "An Improvement in the Modes of Producing Artificial Stone," which invention he thus describes:—"My method of making a cement or artificial stone for stuccoing buildings, water works, cisterns, or any other purpose to which it may be applicable (and which I call Portland cement), is as follows:—I take a specific quantity of limestone, such as that generally used for making or repairing roads, after it is reduced to a puddle or powder; but if I cannot procure a sufficient quantity of the above from the roads, I obtain the limestone itself, and I cause the puddle or powder, or the limestone, as the case may be, to be calcined. I then take a specific quantity of argillaceous earth or clay and mix them with water to a state approaching impalpability, either by manual or (if) labour or machinery. After this proceeding, I put the above mixture into a slip pan for evaporation, either by the heat of the sun or by submitting it to the action of fire or steam conveyed in flues or pipes under or near the pan, until the water is entirely evaporated. Then I break the said mixture into suitable lumps and calcine them in a furnace similar to a limekiln till the carbonic acid is entirely expelled. The mixture so calcined is to be ground, beat, or rolled to a fine powder, and is then in a fit state for making cement or artificial stone. This powder is to be mixed with a sufficient quantity of water to bring it into the consistency of mortar, and thus applied to the purposes wanted."—Redgrave's "Calcareous Cements."

The breaking weights borne by brick beams and cantilevers. Their letter to the manufacturers states that they were satisfied that a mortar composed of sand in the proportion of three parts to one of Portland cement was more than double the strength of the Roman mortar, although the latter had only one part of sand. Messrs. Grissel & Peto's experiments advertised the material, and as they used it extensively on the numberless and extensive works of an architectural and engineering nature upon which they were engaged, the demand steadily rose. In the years of the railway mania, 1846-50, prices ran up for all hydraulic cements, so much so, in fact, that Sir Robert Peel, fearing exhaustion of septaria, proposed putting a tax upon it; but Mr. Aspdin interviewed Sir Robert, assuring him that even if the supply of the Harwich stones failed (from which the Roman cement was manufactured), there was a better material on the market, and one which was inexhaustible.

Experiments as to the crushing weights which could be borne by the two rival materials were conducted at Messrs. Bramah's works in 1848, and reported in the *Builder* of September 30 of that year, the results showing most conclusively the superiority of Portland cement.

In the year of the Great Exhibition (1851), experiments for tensile strength were made at that building, and this is the more interesting because it was here that briquettes first appeared. In 1859 the main drainage of London was about to be carried out, and the Board of Works were fortunate in selecting as their engineer Mr. John Grant, M.Inst.C.E., who was the first to take testing in hand in a systematic and scientific manner. His researches were brought before the Institution of Civil Engineers, and attracted so much notice that Roman cement soon became little more than a memory. The discussion on Mr. Grant's various papers not only had the effect of further popularising Portland cement, but immensely improved its manufacture, owing to the free interchange of thought between engineers and manufacturers.

**Manufacture.**—Present-day Portland cements vary considerably from those prepared under Aspdin's specification, which neither provided for a definite proportion between the limestone and argillaceous matter, nor for the burning of the mechanical mixture to a condition in which true chemical combination had taken place. It is in the careful observance of these two points, however, that one of the principal secrets of excellence in our present cements is found.

There are three principal methods of manufacture, viz. :—

1. Wet process.
2. Semi-dry or Goreham process.
3. Dry process.
4. Rotary process.

1. In the wet process, which is in vogue at some of the Thames and Medway works, chalk and clay are mixed together in definite proportions in a wash-mill, and with an excess of water. The mill consists of a round pit in which there are horizontal revolving arms fitted with vertical "tyes" or teeth by which the chalk and the clay are broken up and their particles reduced to a fine state of division. The resultant mixture called slip or slurry is then elevated to settling reservoirs, where the supernatant water is drawn off, or to drying chambers on top of the kilns, where waste gases from the flues absorb the excess of water. When the slip has been partially dried, it is chopped out in rough blocks, laid in kilns with layers of coke, the latter material being in the proportion of 8 or 9 cwt. to every ton of clinker produced.\* The amount of fire required depends very largely, of course, on the quantity of moisture retained in the slip when kilned. There are almost numberless, and most ingenious, varieties of kilns, having for their object the utilisation of as great a proportion as possible of the waste gases from the burning clinker.

The changes effected in the kilns are various, but the main alteration is due to the liberation of the carbonic dioxide from the lime by the intense heat. The lime, deprived of this gas is in such a condition that it will readily enter into chemical combination with silica and alumina of the clay, forming silicates

and aluminates of lime; it is upon the correct formation of these chemical compounds that the subsequent success of a cement depends. When the kiln charge has been burnt through, it is drawn, and (in the better class works) the unburnt portions of the slip are picked out by hand for recalcination. The properly formed clinker, which is almost black, but not glassy in appearance, is taken away to crushers, where it is reduced in size prior to being passed through the grinding mills. As in the case of the kilns, there is a very great variety in the design of these mills, but the mechanical details hardly appear to come within the scope of this paper. The final grinding of the cement should reduce the clinker to an exceedingly fine, almost impalpable flour, as other things being equal the commercial value of a cement will be in inverse proportion to the size of its grain. This point, however, I will elaborate later on. After leaving the mill the finished cement passes along a shoot or trough to the store, where it lies more or less exposed to the air until it is bagged up for delivery.

2. The Goreham or Semi-Dry Process is one in which only about one-quarter of the water required in the wet process is used in the wash-mill, but the mixture is further incorporated by passing the resultant slip between horizontal millstones or edge-runners. In my opinion, this system is vastly superior to the wet process, as (taking one point only) the heat required to develop power to work the millstones is nothing like so great as that required to reduce the excessive moisture in the slip prepared by the wet process. The subsequent grinding, &c., of the cement is practically the same as that already described under heading 1.

3. The Dry Process is used in some parts of Wales and in Warwickshire, where the interstratified limestone and shales of lias formation supply the materials for making cement. The raw materials are mixed in proportions varying according to their chemical composition; they are then crushed, ground to powder, mixed with water, and passed through a pair of wet stones, which incorporate the mixture as in the case of the Goreham process. They are then dried, loaded into kilns, burnt, and ground.

4. The Rotary Process of preparing cement<sup>†</sup> is not yet at work in this country, although it is largely used in the United States. In the first three processes described there are at least two serious drawbacks, due to waste of heat and to imperfect burning. The rotary process of manufacture was invented in this country by Mr. F. Ransome, and carried a stage further towards perfection by Mr. Wilfred Stokes. A difficulty, however, was met with which at the time seemed insurmountable, but the ingenuity of the Americans has overcome the obstacle, and now the process is a commercial success. Perfected machinery is being put in at the Swanscombe Works of Messrs. Bazley White & Co. The process consists in burning the slip in a slightly-inclined revolving cylinder, the feed being at the far end from the burner, which is supplied with injected coal-dust as fuel. The material slowly finds its way down the cylinder, and, at a distance of approximately 10 ft. from the burner, the sintering begins. When the clinker drops from the first cylinder it is said to be thoroughly vitrified, and entirely uniform in quality. The clinker then goes to a second inclined cylinder, where it heats the air passing to the coal-dust burner. After leaving the second cylinder the clinker passes through crushing rolls, which are sprayed with water, and which reduces the coarser lumps before the material passes into the third cylinder, where it is further cooled and pulverised prior to dropping into the trucks which take it to the grinding-mill. It is stated that the damping in the rolls has a beneficial effect upon the resultant cement, and that the material prepared by this process requires little subsequent sinteration. The cost of production is said to be approximately three-fourths of that of the cheapest process in vogue on the River Thames and Medway, and the output is very largely increased. The experiment will be watched in this country with great interest, but one may reasonably expect it will be a success, as Americans do not, in an ordinary way, take up a method of manufacture which will not give a good return on their initial expenditure.

**Testing.**—Amongst the materials of construction, cement occupies an unique position, as it arrives in the raw state—that is to say, it is unfit to go through the various processes of testing without further individual preparation, which is bound to introduce the personal equation to a greater or less extent. Moreover, there is a very wide divergence of opinion as to what the "further preparation" should consist of. In the early days of cement manufacture the tests were of a very rough and ready character. General Pasley's experiments were eminently practical, for he cemented bricks together and ascertained the tractive force required to draw them apart. Messrs. Grissel & Peto's tests, together with those of Messrs. Bramah and the ones made at the Great Exhibition in 1851, have already been mentioned. With the exception of Bramah's, they were all more or less crude, and it seems to have been left to Mr. Grant to make a further series of trials in 1866. One of these experiments was carried out with the object of ascertaining what the effect of shape of moulds was upon the tensile strength of briquettes. Mr. Grant tried ten different shaped moulds, and, after an interval of thirty days, he discovered that briquettes made from the same samples of cement, and under the same conditions, varied in the tensile stress they bore between 512 lbs. and 328 lbs. on the square inch, or in the proportion of 1 to 0.64, a result somewhat startling and quite sufficient to induce an attempt to obtain uniformity in the pattern of moulds. Makers of testing machines were soon in hot competition, and it was but natural that they introduced, not only what they considered improvements in machines, but improvements in the form of moulds. Comparison of tensile tests made by different experts in different shaped moulds became practically an impossibility on this ground alone. But the trouble in connexion with neat cement tests did not end with difference in the shape of moulds, and, in considering this point, it is necessary to have a clear conception of what are the real objects of cement testing. Amplifying Professor Unwin's conditions, I consider it essential (1) that a cement shall harden with reasonable rapidity under water; (2) that it shall remain constant in volume, except so far as unavoidable atmospheric changes cause expansion and contraction; and (3) that it shall develop considerable powers both of adhesion and cohesion. It is the duty of the expert to forecast the future condition of the cement he is testing. No. 1 does not require any very great experience to ascertain, but Nos. 2 and 3 present problems of considerable difficulty. The general tendency during the last twenty years has been in the direction of reducing the period of time allowed for the making of cement tests. This unfortunate hurry to make haste, coupled with the fact that architects and engineers have contemporaneously insisted on higher tensile results over the seven days' period, has caused considerable trouble, as it has often led makers to over-line their cement, that is to say, to use this substance considerably in excess of that required to enter into proper chemical combination with the silica and alumina of the clay. By this means they have been able to procure a much higher seven days' breaking stress, but at the expense of the subsequent constancy of volume of the cement. I do not think that some users of cement have yet quite grasped how essential "constancy of volume" is, otherwise I am sure that far less stress would be laid upon tensile strength in specifications, and more attention would be given to the production of a material which would neither expand nor contract with the lapse of time. The seven days' tensile test (although it is a point which a large number of architects and engineers consider more than any other in an expert's report) is absolutely no guide by itself as to the future behaviour of a cement in work. This is true, even on the assumption that all experts made their tests in the same kinds of moulds under the same conditions of heat and cold, with equal proportions of water, and with the same degree of pressure in making the briquette. But the unreliability of this test is further increased by the fact that there is no general agreement upon public works (or amongst experts) as to the methods to be employed in manipulating the cement for tensile test. It is the easiest thing in the world for two different men to get a tensile result on a good cement varying anywhere between the limits of 350 lbs. and 600 lbs. per square inch in seven days. In a recent

\* One ton of clinker roughly = 1½ tons of dry raw materials, which will be in the approximate ratio of 1½ tons of chalk to ½ ton of clay.

† Described in detail by Messrs. Stanger and Elouint in a paper read before the Institution of Civil Engineers recently.

number of the *Contract Journal* I gave the following list of causes for divergent results:—

- I.—*Due to Different Types of Machines and Moulds.*
  - A. The form and hanging of clips in which the briquette is held.
  - B. The distance of the point of application of the strain with reference to the minimum section of the stress.
  - C. The shape of briquette.
    - 11.—*Due to the Cement itself.*
  - D. The age of the cement after grinding.
  - E. The fineness.
- 111.—*Due to the Operator and Testing-room.*
  - F. Amount of water used.
  - G. The temperature of water used for mixing and immersion.
  - H. The method of filling moulds.
    - 1. The rate of mixing and trowelling.
    - 2. The rate at which stress is applied to the briquette.

I have experimented upon the whole of these points, and have ascertained the variations as stated; but Mr. R. W. Leslie, of the American Society of Civil Engineers, goes much further than I do, as he says that there are no less than thirty-six causes having a distinct and definite influence upon the tensile strength. My modest list, however, will perhaps convince you that if you go to one expert, and he tells you that the sample of cement you have submitted to him only bears a stress of 350 lbs., and you then go to another expert who makes the breaking weight 500 lbs., you will have no common basis for forming a definite opinion as to the value of the cement, unless you also know precisely the conditions under which each expert carried out his experiments. I say, and say deliberately, that architects and engineers who trust to a seven days' tensile test alone, whether the briquettes are made by themselves or by experts, are living in a fool's paradise. To be able to place reliance on this test it should extend over a far longer period, and over such a period that, in the majority of cases, considerable inconvenience would be caused by delay in work. I give in the appendix the results of some experiments which I have made from very excellent cement supplied by Messrs. I. C. Johnson, of Greenhithe. The result of these tests shows that at the end of a period of seven days—

- 1. Briquettes made with hot—that is, unacrated—cement gave a considerably higher result than when the cement had been weathered and was in condition for use.
- 2. That the effect of ramming the cement into the moulds increased the tensile strength by 136 lbs. on the square inch over that obtained by making the briquettes by thumb pressure only, which latter, I always maintain, is the correct method of making same.
- 3. That the flour of cement (*i.e.*, the most valuable portion) having been passed through a 30,000 mesh to the square inch sieve, and separated from the more coarsely ground particles, gave 145 lbs less tensile strength than did the unsifted cement.
- 4. That the large section briquettes—that is, 1½ in. by 1½ in. (2½ sq. in.)—did not attain nearly the same strength per square inch in seven days as did the 1 square inch sections.

The most startling and paradoxical of these results is that which shows that fineness of grinding reduces the neat tensile strength, whereas it immensely increases its covering capacity and adhesion to sand or other aggregate. If one were to judge by tensile test alone, it would be quite possible, and even probable, that a material high in cementitious value would be rejected in favour of one which contained possibly 6 cwt. per ton of improperly ground clinker, which has little, if any, more value than so much sand.

You will, I feel sure, forgive me if I have laboured this point somewhat, but several years of experience have taught me to place little, if any, reliance upon the neat short-time test. In conversation with the manager of one of the oldest and best works on the Thames recently, I found that he had come to precisely the same opinion as myself. If I appear to you to be playing the rôle of iconoclast, I feel that there is abundant reason for assuming this character. Far be it from me to say that the neat tensile test has no value. It has, if the time given by the architects and engineers is lengthened to one, two, or three months, but this is generally impossible in an age of feverish activity, and therefore we must look to other tests to ensure our obtaining a mate-

rial which shall be safe. These tests are—

- I.—*Physical.*
  - A. Constancy of volume.
  - B. Fineness of grinding.
  - C. Degree of aëration.
  - D. Specific gravity.

Dealing first, then, with constancy of volume, I hold that tests made with the object of discovering whether a cement has, concealed within itself, elements sufficient for its own subsequent disintegration are the most important that can be performed. You are all familiar with the "blowing" of cement work, and this is the way in which *inconstancy* of volume generally shows itself. There are a number of causes, some of which I need not trouble you with, but the one which occurs most frequently is due to an excess of free or loosely-combined lime in a cement. The fact that cements should be cooled by being brought into contact with air prior to use is widely known; the free or loosely-combined particles of lime which are present in every cement (however good) are slaked by this means, and their expansion takes place by the absorption of moisture from the air in very much the same way that ordinary lime is slaked by the addition of water. If a cement is slightly under-burnt and finely ground, the process of aëration is comparatively easy, but when a sample is hard-burnt and coarsely ground, the process is much more difficult, as the air will not reach the lime which is concealed, and which reposes in a metamorphic condition in the interior of the coarsely-ground particles. Obviously, then, the best way to provide against subsequent expansion is to have the substance ground as finely as possible, so that the air may play upon and hydrate the whole of the molecules. I have myself seen some remarkable instances of self-contained disruptive forces in a cement, destroying the stability of an entire structure. One instance occurs to me where a large railway viaduct, carrying four lines of way, and costing approximately 30,000*l.*, was badly damaged by the use of a cement which contained free lime, and which, after having been tested by the ordinary orthodox seven days' tensile test, had been passed as satisfactory.

In the case of concrete floors, the dangers are exceedingly great, as the floors are often practically monoliths without any room for expansion. I had some time since to report upon the disturbance of a building which, when erected, measured 16 ft. between walls. It had a concrete floor, which expanded and pushed the walls out 3 in. The invention of a clever little contrivance by the chief assistant of my Association (Mr. Harold Claxton) has enabled me to give you in the appendix one or two measurements as to the expansion of a hot, though excellent, material. All cements before use should be carefully shot into thin layers, turned over, and should not be put into work until the heat developed after mixing with 20 per cent. of its weight of water does not exceed 6 deg. in one hour. The whole of the tests carried out in the laboratory of the Association I represent are made under these conditions, and I am in thorough agreement with the system.

In regard to specific gravity, in many of the older specifications (and, unfortunately, in some of those still used), one finds that weight per "striked bushel" is retained; this is generally given at "not less than 112 lbs." Sometimes it is added that a cement shall be filled into the bushel measure from hopper spout 18 in. above the cement; but upon consideration it will, I think, be quite obvious that even under the last-named and best condition, a striked bushel is an exceedingly vague and thoroughly unscientific term. "Specific gravity" is fortunately rapidly taking the place of "weight per bushel" as a check upon burning, &c., and it is probably the best measure that we can have of density of the material; but if two tests for specific gravity are made upon the same cement which has undergone different periods of aëration, the results will not compare. Freshly-ground clinker will show a specific gravity of about 3.175, whereas after the hydration of the lime has been effected, and the cement is ready for use, I have frequently found that not more than 3.06 to 3.08 is obtainable. In comparing, therefore, the reports of two experts upon the same sample, it is also essential in this test to know the conditions as to heat when the experiments were carried out.

II. *Chemical.*—The chemical portion a

report will not by itself prove to be a sufficient guide as to the quality of the substance, but taken in conjunction with the physical tests it is almost invaluable, as it not only gives a check upon the physical report, but it renders possible the explanation of many points which otherwise would be difficult to interpret. It materially assists in detecting adulterations, and, if properly done, is a good guide as to the probabilities of a cement attaining great tensile strength with a lapse of time. The chief points to be looked for in the analysis are:—

- 1. Proportions of soluble silica and alumina to lime.
- 2. Proportion of magnesia.
- 3. Proportion of sulphuric acid.

As I have stated before, it is upon the proper chemical combination of silica and alumina with lime that the success of a Portland cement depends.

In an article in the *Builder* of October 5, 1901, I said that

"Dr. Spencer Newberry, after a considerable number of experiments, found that the limits of the molecules of lime to those of the soluble silica in the clay is as 3 to 1, and in the same way the proportion of lime to alumina should not exceed 2 to 1. Substituting atomic weight for these proportions, this will represent in weight 2.8 parts of lime to combine with 1 part of silica and 1½ of lime to combine with 1 part of alumina. Supposing that these proportions are departed from to an appreciable extent, it will then be seen that the best compounds, namely, a tri-silicate and bi-aluminate, will not be obtained, as there will either be a surplus of imperfectly combined lime present in the cement, or silica and alumina will be in excess."

Magnesia is hardly ever present to a harmful extent in Thames or Medway cements, but it occasionally appears to bulk large in the material made in the Midlands. Its action is subtle, and the last word has by no means yet been said upon its effects. It is generally thought, however—and there is, I think, good ground for this belief—that if present in proportions exceeding 3 per cent., magnesia may cause expansion after the lapse of a considerable time. I myself put the safe proportion at a considerably lower figure than 3 per cent.

The sulphur compounds are principally derived from coke. Sulphur compounds used for the purposes of burning the slip, and the amounts obtained from this source are not likely to have any very serious effects. Of late years, owing to the demand for finer grinding and the consequent necessity for otherwise giving a cement greater time to weather, it has been the custom to add small amounts of sulphate of lime, or as it is more generally known, gypsum, to the fresh cement; curiously enough, this compound has the property of somewhat retarding the setting. I have carried out several experiments, but have not yet arrived at a definite conclusion with regard to the ultimate effects of the sulphate. In the meantime, however, when asked for an opinion I invariably advise the exclusion of gypsum, as I consider that the same results can be obtained if a little extra time and care be given to aëration, and this latter course is, at least, absolutely safe. I have found that 2 per cent. of gypsum will certainly not be a sufficient quantity to so retard the setting of the finely-ground cements as to do away with all necessity for subsequent aëration. I have further found that upon supplementing the work of the gypsum by spreading out the cement and aërating it, the effect of the gypsum, as a retarding influence, rapidly disappears. You may ask now what course I should suggest in testing a cement over a period of seven days. First and foremost, I place great confidence in the Michaelis boiling test, which requires a mixture of neat cement to be made up with about 20 per cent. of water, set in damp air for twenty-four hours, and immersed in cold water raised to a boiling heat, and maintained at that temperature for three hours. I am fully aware that this test is severe, but for important works I do not think it is at all too stringent, and I have never once known a case of failure in work where a pat had passed through the boiling ordeal without signs of radial cracking. If a cement is slightly coarse, this boiling test will find out and expand any free or loosely-combined lime which may exist within the larger particles, and I do not, therefore, think that anything short of this will suffice. Cements with low tensile strengths will not stand this test, and will frequently boil away entirely. The fineness of grinding should, I think, always be ascertained, but I

consider that fineness on sieves having fewer than 5,600 divisions to a square inch can very well be omitted. I do not believe that the portions of a cement which are retained on a 14,400 mesh sieve are of any great cementitious value, and the only reason which leads me to recommend the retention of the 5,600 sifting is so that if the rejected particles upon this sieve are very large in size, the severity of the Michaelis test may be increased in order thoroughly to penetrate the larger pieces of clinker. With reference to the tensile test, I should much prefer to substitute for the neat test a test upon standard sand. I have already explained that *adhesion and cohesion are not interchangeable terms*, and that the mere fact that a cement has a high neat tensile strength is not sufficient to prove that it will develop a great power of adhesion to foreign substances; but it is the power of adhesion that one really wants to test. It may be urged, on the other hand, that in testing with standard, or Leighton Buzzard sand, one is not obtaining a measure of the strength of one's mortar if such standard sand is not used upon the actual work for which the tests are made. This is undoubtedly true, but the neat test does not give any advantages in this direction, and by employing the sand test the possibility of rejecting a finely-ground material with a low neat strength in favour of a coarser cement would be eliminated. I give in the appendix a type specification which I hope may be of some service to members of this Association. It is, of course, prepared for high-class work only, on the assumption that architects are drawing their specifications with the main object of providing thoroughly durable work for their clients.

#### The Using of Portland Cement.

Under the heading of "Testing," I have laid great stress upon the necessity for properly aerating this material, but I think I should here add a word of caution with reference to exposing cements for too long periods prior to use. If there is any feeling of hard knobs in a bin of cement, the same should be carefully screened out, as so much moisture has then been absorbed from the air that chemical action has commenced, and this when once started prevents the nodules (even though reduced to powder) from setting a second time. Under some circumstances, notably in carrying out tide work, it is necessary to use a fairly rapidly setting cement. In putting in pier foundations some years ago, I succeeded in obtaining quick setting by other and, I think, safer means. The whole of the cement was first thoroughly aerated, and a small quantity of furnace ash was mixed in with the stone aggregate; the whole of the concrete was then mixed with fresh water through which a steam hose had played for a few minutes. The surface of the concrete was subsequently protected by ordinary sacking weighted down with iron joists or rails. By these means I was able to obtain a thoroughly sound, homogeneous, and quick-setting concrete; but there are circumstances where it is impossible to carry out this method, and consequently moderately quick-setting cements must be used in order to prevent the washing away of the concrete surfaces. In tide work fresh water should always be used for mixing in preference to salt, as, although salt water does not affect the strength of the material in the long run, it materially retards the immediate setting. For ordinary work in foundations or where hydraulic properties are essential, a slow setting cement gives the best ultimate results.

**Aggregates.**—First, for concrete. The most suitable aggregates for concrete are (A) hard broken stone mixed with sufficient clean, sharp sand to completely fill the voids (roughly about 40 per cent. of the total volume), or mixtures of broken stone, thoroughly vitrified furnace clinker and sand; (B) gravel with sand and hard broken bricks; (C) gravel and sand.

The advantages of broken stone over rounded material must be fairly obvious. Broken stone is generally clean, having jagged fractures forming an excellent key for the cement, and the volume of the interstices to be filled with sand and small stones is less than in the case with gravel. The addition of furnace clinker adds considerable toughness, providing it is thoroughly burnt and free from small dust. Granite is sometimes used, but more frequently various kinds of hard limestone. I always consider that the finest specimen of concrete that I have ever seen was made from the Klamia

blue stone and estuary sand of the river Hawkesbury, in New South Wales. This concrete was used for the piers of the bridge spanning the river at Peat's Ferry. These piers below high water line were practically monoliths, the smallest of them measuring approximately 100 ft. in height, whilst the deepest was 160 ft. The concrete set so hard that it was practically impenetrable, and no sign of weathering has, to the best of my belief, ever occurred. Round stone, that has been water-worn, is not a good material, especially where the concrete has to bear transverse strains. If gravel *must* be used, I always consider that it is a great advantage to use hard broken brick (preferably well-burnt stocks or broken bricks) in conjunction with the gravel, as a certain amount of cohesion is thereby added to the mass which would otherwise be entirely lacking. Burnt ballast concrete is to my mind the worst of any; it is impossible to obtain a thoroughly vitrified class of ballast until the cores of the ballast heaps are reached. The outsides are entirely unsuitable for use in damp positions, as the baked clay is readily acted upon by the moisture, and gradually returns once more to its original condition. In making concrete too much attention cannot be given to the careful mixing of the cement and aggregates. I think that the fewest possible number of times of turning is four—that is to say, the material should be incorporated, twice dried and twice wet, the water being added through the rose of a water-can, so that the cement may not be washed off the stone; no water should, in my opinion, be added on the fourth turning. There has been much discussion as to the advantage or otherwise of dropping concrete into foundation pits from a considerable height. I am entirely opposed to this course, as I have noticed again and again that in course of falling the lighter and finer particles are left behind owing to greater proportionate atmospheric resistance, and the larger stone descends through the partially-set substrata disturbing chemical action and forcing the lighter portions to the top, causing lines of weakness. I do not think such concrete is ever thoroughly homogeneous. What is true of dropping concrete into deep foundation pits in the dry is even more true in the case of placing the material in water, as the evil of buoying up the lighter particles is accentuated in the case of passage through liquids, and I remember that in constructing the foundations for the bridge I have before mentioned we lowered every yard of concrete in an automatic opening hopper. Ramming has, to some extent, the same action as dumping from a height, and is by no means an unmixed blessing, although it is claimed by some that it is absolutely essential if a concrete is to be made water-tight. I demur entirely to this view, as I believe that by the careful proportioning of the materials a water-tight concrete can be obtained without ramming.

Coming to the question of cement mortars, the same general principle which obtains in the case of concretes applies here also; that is to say, the cleaner and more angular the aggregate, the better will be the resultant compo. Sand should not have the whole of its particles of one size; there should be a small percentage of the finer granulations so that the volume of the interstices may be thoroughly filled. Remarkably good results can be obtained from hard furnace clinker ground in a mortar-mill by itself, and subsequently mixed with the cement. One of the great practical difficulties which is met with upon public works is getting bricklayers or concretors to mix materials in small quantities just sufficient for immediate use. If large volumes are mixed at one time they can only be prevented from setting by the addition of excessive quantities of water, and this will have a most harmful effect upon the cement work for all time, as proper crystallisation will never take place. If small quantities are used and mixed with just enough water to make them plastic and workable, a first-class compo is obtained. It should be remembered that chemical action begins with a cement as soon as water is added, and I am not of opinion that this action is delayed by the addition of sand or other aggregate. It follows, therefore, that cement concrete or mortar which has partially set should be thrown upon one side. There are two other points which require care; these are the protection of cement work from frost, and from sun and wind when initial setting is in progress. I believe that as bad

effects are caused by the sun as by frost; the latter expands the materials, and so disintegrates them, and the former robs the mixture of the water requisite for crystallisation. Work carried out under conditions of extreme cold should be protected by sacking, and the water used should be warm; or if the work is in the nature of paving, an inch of sand spread over the surface will effectually prevent any but excessive frosts from disturbing the concrete. In the case of heat, it is a great advantage to keep the face of work watered and to cover it up with damp sacking. A further danger exists in using bricks which effloresce to a considerable extent, as a film of dust is formed on the beds which prevents thorough adhesion. I know of at least one disastrous failure due to this cause.

The use of concrete in connexion with expanded metal or with iron or steel rods has, I believe, a great future before it, as the additional strength obtained by the introduction of the metal is vastly in excess of what mere theory would lead us to expect. In Germany and France and in the United States this class of work is frequently met with, but up to the present time no very large amount has been carried out in this somewhat conservative country. It is bound to come, however, and, considering the condition of what is generally called the "skilled" labour market, it will be well if some substance (which it is possible to make by unskilled labour) can be substituted for brickwork, as we may then hear that bricklayers are once more pleased to lay more than 400 or 500 bricks per diem. There may be a drawback, however, in using this armoured concrete, for unless the iron or steel rods, joists, &c., are thoroughly protected, they will rust with great rapidity, and not only will their own strength rapidly disappear, but in addition to this the expansion of the metal in process of oxidation will cause disruptive forces to be set up in the heart of the work. I recently examined a concrete and rolled iron joist roof, the whole of which was protected by cement rendering; portions of the rendering had perished, but even in places where the concrete was absolutely watertight, the joists had rusted to such an extent in eight years, that upon calculation I found that the flanges were exactly half of their original scantling, and, to make matters worse, the oxidation was most marked upon the flanges and not upon the web, where the waste could have occurred with fewest bad results. I am certain that unless proper protection is given to the steel parts of many of the buildings which are now being erected, there will be trouble in the near future, owing to the causes which I have mentioned. Personal experience has led me to the conclusion that the best coating material which can be used on iron or steel is a mixture similar to Dr. Angus Smith's solution, but containing pitch and a certain amount of sand. This mixture, if applied hot, forms a tough, intensely adhesive skin which will stand a reasonable amount of knocking about. Joists look better painted, but I hardly think that appearances should be studied in matters of this kind.

In conclusion, I would draw your attention to a few results obtained by colouring samples of cement with a small percentage of lamp-black, red oxide, and ultramarine, as you may at some time find it advantageous to incorporate colouring matter with the cement. Should you, however, decide to apply paint to cement work, I believe that one of the best preliminary preparations is a solution of 1 part of good sulphuric acid in 100 parts of water freely applied to the surface of the work after the same has thoroughly set.

I must apologise for the abnormal length of this paper. The only excuse that I can offer is that the subject is one of intense interest to me and of immense and growing importance to those who are engaged upon constructional works. I trust, therefore, that I have not wearied you, and that you may not feel like the old Scotch lady who was seen hurrying away somewhat early from church, and who, on being asked whether the clergyman had finished his sermon, replied, "He's done lang syne, but he winna' stop!"

#### Appendix I.

Analyses of Septaria used for making Parker's or Roman cement. Authority, R.E. Lectures, Chatham:—

Silicic Acid .....	12.0

Expansion of New Cement. — A first-class cement, mixed with 20 per cent. water, expanded on mixing  $\frac{1}{2}$  in. per 100 in. in one day and  $\frac{3}{4}$  in. per 100 in. in seven days, or at the rate of 1 in. in 33 ft. 4 in.

Appendix II.

EXPERIMENTS SHOWING UNRELIABILITY OF SHORT TIME TENSILE TESTS ALONE.

The effect of making briquettes with hot cement—	
	Average ultimate tensile stress in lbs. per square inch after 7 days.
Briquettes made with cement of maximum rise of temperature of 14 deg. Fahr. ....	473
Briquettes made with same cement cooled to 6 deg. Fahr. ....	449
The effect of ramming cement in moulds—	
Briquettes made by ramming cement in moulds .....	580
Briquettes made by pressing cement into moulds with thumbs in usual way adopted by Cement Users' Testing Association .....	450
The effect of fineness of grinding—	
Briquettes made with un sifted cement (residue on 14,400 mesh = 1.84 per cent.) .....	449
Briquettes made with same cement after it was passed through 36,000 mesh sieve .....	394
Briquettes made with residues left on 14,400 sieve .....	50
The effect of various sectional areas—	
	Per 7 days.
Briquettes of $\frac{1}{4}$ square inches cross section .....	300
Briquettes of 1 square inch cross section .....	448

Appendix III.

SAND TESTS.

For these experiments the sands used were passed through a 20-mesh sieve and retained on a

30 mesh. Ten per cent of water. Sand to cement as 2 to 1:—

Sand from Newbury .....	4302	Ultimate tensile stress after two months. lbs. per sq. in.
Sand from Nuneaton .....	265	Unwashed. Washed.
Sea sand .....	307	320
Furnace clinker .....	320	308
Standard Sand .....	297	325
Granite dust from Rugby ...	361	261
Granite dust from Nuneaton	350	356
		351

Effect of partial setting of cement mortar prior to use. Briquettes made with cement, and standard sand and cement, as 2 to 1:—

Mixed one hour before putting into moulds .....	83	Ultimate tensile stress after two months.
Put into moulds at once .....	230	lbs. per sq. in.

The effect of colouring matters. Briquettes made with cement and standard sand as 2 to 1:—

	Ultimate tensile stress after two months. lbs. per sq. in.
Coloured with 5 per cent. ultra-marine .....	3945
Coloured with 75 per cent. oxide of iron .....	325
Coloured with 4 per cent. lamp black .....	2805
Uncoloured cement mortar .....	276

Appendix IV.

TYPE SPECIFICATION FOR IMPORTANT WORKS.

Fineness of Grinding.—The cement shall be prepared from thoroughly burnt clinker only, without any admixture of under-burnt portions or other substances. Not more than 5 per cent. residue shall remain on a sieve of 5,600 meshes, and 12 per cent. on a sieve of 14,400 meshes to the square inch.

Specific Gravity.—The cement when freshly burnt shall have a specific gravity of not less than 3.15 or 3.08 when weathered to 6 deg.

Chemical Analysis.—A sample shall not contain more than 12 per cent. magnesia, 14 per cent. sulphuric acid, 1 per cent. carbonic acid, or 1 per cent. insoluble residue, and shall not contain more than 62 per cent. nor less than 58 per cent. of lime.

Tensile Tests.—Test blocks of not less than 1 sq. in. cross section shall be made with 20 per cent. of water after the cement has been weathered, and the mixture shall be placed in a mould without ramming and kept one day in a moist atmosphere of a temperature not less than 50 deg. Fahr., and shall afterwards be placed in water of temperature not less than 55 deg. Fahr.

Some of the blocks shall be made of neat cement, and some of 1 part cement with 3 parts by weight of standard dry sand; the latter shall have 10 per cent. of water only. The neat cement blocks shall bear a stress per square inch of 400 lbs. after seven days, 500 lbs. after fourteen days, and 600 lbs. after twenty-eight days.

The cement and sand blocks shall bear a stress per square inch of 100 lbs. after seven days, 150 lbs. after fourteen days, 200 lbs. after twenty-eight days.

Slabs or cakes shall be made with 20 per cent. of water and shall be kept in air for twenty-four hours; afterwards they shall be immersed in cold water and raised to boiling heat, and maintained at this temperature for three hours. No signs of warping, checking, or radial cracking shall show on them.

A pat made with 20 per cent. water shall not take less than three hours to harden, and not more than seven hours.

All cement shall show a uniform growth of strength.

Adhesive Test.—A pat of cement 3 in. diameter and  $\frac{1}{2}$  in. thick shall, after the expiration of seven days, adhere firmly to the natural surface of a Welsh slate; the slate to be soaked in water prior to the application of the cement and to be kept moist during the interval.

Heating.—A sample of the cement shall be made into a paste, and if the rise of temperature be more than 6 deg. Fahr. during an hour after mixing the cement shall not be considered ready for use nor for testing.

Expansion.—The cement shall be shot on to a perfectly dry floor in a watertight shed near the site of the works and to a depth not greater than 1 ft.; it shall be permitted to remain as long as the architect shall direct, and shall be turned over from time to time as the architect shall direct.

The Chairman said he was sure they were very grateful to Mr. Spencer for reading the paper. They would have noted he hinted that experiments had been specially made for the meeting, and if Mr. Humphreys had been there they would no doubt have heard that for the last three months he had been making experiments so as to bring his paper as much as possible up to date. He thought they might

take it that they had really got the latest information on the subject from one who was undoubtedly an expert.

Mr. Max Clarke said the first thing they had to do was to thank Mr. Humphreys for taking such an immense amount of trouble with his paper, and they also had to thank Mr. Spencer for reading it in the absence of Mr. Humphreys. He (the speaker) would only say that they had, he supposed, selected him to the martyrdom of opening that discussion just for the same reason that cement had taken it upon itself in the last two years or so to make a martyr of him. For about that period he had been building some very extensive buildings of one kind and another. He commenced by acquiring a cement-testing machine, and he made some experiments, and when he produced the result of those experiments to the cement manufacturers they laughed at him, and they said, "You should go to some proper man." So he (Mr. Max Clarke) went to a proper man, and he got a report in due course. But what appeared to him to be the great difficulty as regarded the work was that he was provided with cement which set, so his expert said, in five minutes. That had been going on for about three years, in which time he had sent tons away; altogether, he should say, he had sent 350 tons of cement away absolutely, in barges containing 60 or 80 tons per barge. He had got rid of it because it was totally impossible for the bricklayer who set his 500 or 600 bricks a day to use it quick enough; it would not be set. He was told by their expert and, of course, by Mr. Humphreys that he was to expose it to the air and to aerate it, but he thought they ought, if possible, to acquire some practical details, and he would suggest that when they were drawing a specification, not only should they put in it that they were to obtain the cement aerated, but also a stipulation that if it did not come in aerated the builder or contractor might take upon himself the aerating. He had 80 tons of cement come in to him last week, and he had a report one day this week, and for the first time he had compelled the builder to turn it out because it set in less than five minutes. He had the manufacturer up at his office, and he said, "It is a great pity you have not some of that cement here now." He (the speaker) replied, "Yes, I have; here is the other half of that which I sent to the expert." It was produced, and the manufacturer set to work, and they had a pat of cement tested and that pat took about one hour and three-quarters to set. After he went away they had a little private experiment of their own in the office, adding a less proportion of water but still sufficient, and their cement had set hard a long time before that which was made up by the manufacturer. Those were the sort of difficulties they had got to contend with. He would have been pleased to have heard something about the aggregate which Mr. Humphreys would propose for floors. Of course, that was one of the great difficulties that any one who built largely in the factory way or anything in the public building way had to contend with. It had been more impressed upon him lately by seeing at a meeting the other day drawings of a large school building, and on the top there was a large playground with a brick parapet 7 ft. high. The brick parapet was cracked in many directions very considerably, and from the level of the first floor to the level of these playgrounds the walls were pushed outwards about  $7\frac{1}{2}$  in., and in some portions of the school horizontal cracks had developed immediately under the concrete floor or roof. That might have been explained, perhaps, if it had occurred immediately after, or somewhat immediately after, the place was built; but the cracks did not develop in the building either vertically or horizontally until more than a year after the school was finished. One or two items in the paper struck him as being, perhaps, the reason which would account for that peculiarity but it was not a pleasant thing to know that a year after one had left a building, and received his commission, and gone away perfectly happy, that something might happen which might make things very unpleasant. He noticed that Mr. Humphreys recommended a mortar mill, but two or three sentences further on they were told not to mix up the cement in large quantities. There were two things about the mortar mill, and one was that it was the very worst invention that was ever produced for any man that wanted to do good work, because all sorts of things could go into it, and they were concealed in a very

rapid manner; the second objection was that you could not manufacture properly a very small quantity of mortar in a mortar mill, and, therefore, it was very objectionable from that point of view. Therefore, if they took his advice they would not use a mortar mill in making mortar in which cement was used. There were two or three points upon which he did not seem to be quite clear, and first he would like to know whether he heard aright that cement was not delayed in setting by adding sand. It might be said that it was a difficult question for them to talk about, and that it was one for the experts; but he looked at the matter from a different point of view. He wanted the best material which would stick his bricks together, and he certainly thought that when he added mortar to the cement he made it set slower. Another point he did not feel certain about was as to joists rusting when they were completely surrounded with Portland cement. He himself had taken iron joists which had been in concrete floors for more than ten years—and not only had he seen them taken out, but he had seen them put in—and they were just as good the day they were taken out as the day they were put in; there was not one single particle of rust on them. He had always been under the impression that it was rather a disadvantage than otherwise to paint joists if they were to be completely embedded in concrete, but, of course, one had to see that they were completely embedded. Then he would like some information about the use of coke breeze. He had the unfortunate privilege of being one of the members who had got to do with the British Fire Prevention Committee, and they had definitely made up their minds that coke breeze concrete was the sort of concrete that would last in a fire better than any other. Some people said there were two sorts of coke breeze concrete—one was called pan breeze, and the other was called ordinary coke breeze. If anybody could give him any information as to the values of these two different sorts of coke breeze he would be obliged. In some cases sawdust was used to cover a concrete floor, and, of course, it was much cheaper to use sawdust than sand. In conclusion, Mr. Max Clarke said he felt sure they would heartily support the vote of thanks he had the pleasure of proposing.

Mr. George Smith, in seconding the vote of thanks, said that before one got up to discuss the paper one wanted some time to study it quietly, but there were one or two points which struck him on which he would rather like some information. One was the point raised by Mr. Max Clark about coke breeze. He knew himself from experience that there were two kinds of coke breeze—or rather coke breeze and clinker breeze, which was usually passed off as equal to coke breeze. However, one was worth 1s. a load compared with coke breeze at 4s. or 5s. He did not think from the fire-prevention point of view clinker breeze was a safe material to use. He would like to hear from Mr. Spencer or Mr. Butler some idea of what would be a good proportion of cement and coke breeze for a floor. As regarded the question of steel joists rusting, to which Mr. Max Clarke had referred, he should say that if they adopted the usual limit of encasing their steel joists with 2 in. of concrete all round there would not be much danger of rusting. He recollected about some ten years ago a friend of his constructed a very large paper mill, in which a large quantity of iron joists and concrete were used, and almost as soon as it was finished there was a large crack right down the building, which they discovered was due to expansion of the concrete, and about that time he saw it stated in one of the professional journals that the rate of expansion was something like  $\frac{1}{8}$  in. in 96 in., or something like that. He would like to know whether there was any reliable amount of expansion to be allowed for. Of course, in the floor to which he had referred, the usual deal fillets had not been provided—it was rather before they were thought of. With regard to the question of testing cement, he thought that to a very great extent for ordinary buildings they did not require cement to undergo such a severe test as was generally specified. Certainly if they specified for tests at all he thought they ought to make certain that the tests were carried out. The usual practice seemed to be to adopt a test and then not to carry it out. That, he did not think, was fair play to either the builder or the employer. What he would like to have

some information about was as to what was a fair test for ordinary building cement as distinct from engineering cement. Of course he quite recognised that for engineering they wanted the very best cement, but for building purposes he did not see that they needed such a very strong cement. He remembered that some years ago he had to test samples from each eight tons which were delivered. It was regularly passed, but one lot was condemned, and of course the manufacturer was very much upset about it. He came down and put some of the cement in a mould and the cement stood the test, but the amount of pressure which he put into his pat was very different to that which was applied in the others. After that it was discovered that the machine used had been out of gear for some time, and consequently the whole thing was an absolute failure. They wanted to make sure that if a cement was going to be tested, it was tested by a standard measure. There were so many machines about that he thought the tests ought to specify the machines to be used for them. He would say in conclusion that in his opinion the specific gravity test was the best they could possibly have, provided they had the requisite equality of time between the different samples.

Mr. H. Claxton at this point explained a number of photographs bearing on matters put forward by Mr. Humphreys.

Mr. H. Cartwright Reid said that cement of course was one of the most interesting subjects to an engineer, and he had listened to the paper that night with a good deal of pleasure. It did them all good to go back over what might be somewhat familiar ground, and it did them good to hear the latest on any subject, and they had had both that evening. There were, however, so many points in the paper he would like to say a word about that he hardly knew where to begin. He was one of the engineers of the Admiralty and they were continually day by day dealing with cement. They tested every load of cement they used, and it frequently happened that their rejections were by no means small, and it often happened that they were told when a rejection took place that if they had only known it was an Admiralty specification the cement would have come all right. That contained a moral, viz., that if they did not test they did not get what they specified. One of the speakers said he did not quite see that architects required a very high quality of cement, and he supposed that with the ordinary mortars for sticking bricks together there was no point in having such very good cement. Lime mortars had answered the purpose, and they saw that in many of their most prominent buildings lime mortars had answered all the purposes of the architect. He did not know whether it was the practice in London amongst contractors to specify cement mortars, and to what extent; but for ordinary mortar it did not appear to him that architects gained very much by the use of cement. But in concrete, of course, they must use good quality cement, and when they were cutting floors down to the smallest dimensions so as to reduce the thickness, they must have the best quality cement. They had heard a good deal of very interesting matter as to the way tests might be manipulated, and he had had a good deal of experience, and had tested for thousands of tons of cement, or supervised such tests. He had often had the manufacturers' representatives, who had told them all sorts of things they wished done in order to bring about a proper result. One gentleman, from a large firm in the Medway, said he always liked to test his cement by the German method, and wished to have it encased in a glass case and at a uniform temperature, with so much moisture, and put on blotting paper. Well, as the cement which they were going to use was not to be put on blotting paper it did not appear to them that the test was going to be of very much good. One point not alluded to in the paper was that they ought always to have an average of samples. That was done by the Admiralty, and they found they never had two alike, but the average gave them an idea. To take one particular sample and test it was not very satisfactory. Then they had heard a good deal about the expansion of concrete and the expansion of cement. He had an example of that which rather took him back on one occasion. They were building the wall of a reservoir at Chatham 250 ft. long, about 16 ft. high, and 7 ft. thick at the bottom. It was built in the very hot summer about three years ago, when they had a sudden change from hot

to cold weather, and the wall broke into segments at points about 30 ft. apart. They were very much perturbed and wondered if the foundations had given way, but it was noticed that on a very cold morning the cracks were a measurable quantity, and when the sun came out in the heat of the day they practically disappeared. They did not meet much guidance there to suggest a remedy, and when the temperature was low they filled the cracks in. They had also heard that night of the evils of the mortar-mill, and there was no doubt that a mortar-mill was not an unmixed blessing, and an example of that came to his knowledge which was of rather an amusing nature, in connexion with one of the Admiralty stations a good many miles from London. When they took a lease from the Chinese Government of Wei-hai-Wei there was a pier which had been built by some railway contractors some years before, and it was a pier of concrete piles surrounded by a wall, and on the top was a concrete floor which had been a good deal damaged during the Chinese and Japanese war. The Admiralty had the pleasure of putting the pier right, but in the interval between the war, the Chinese, being short of cement, took up the floor and ground it up to make fresh cement, as they could not get any other.

Mr. H. H. Statham said there were one or two points he would like elucidated. The writer of the paper had said there were three methods of manufacturing cement, and then he proceeded to mention four. He would like to know whether the rotary method was combined with one of the others. Another point sent a shudder through him. They had been told by every writer on cement that there was nothing like fine grinding, and that the more it was ground the more powerful it was. In the paper, however, they heard that finely-ground under certain circumstances was less effective than the coarse ground. He had been looking at the specimens, and one was marked "Cement of bad colour." He had looked at it with great interest, but in the first place he could not see any difference in colour between that and another one not condemned with that phrase. He did not think the difference was very marked. They would like to know what was the meaning of cement with "bad colour"—what bad quality it implied, and how they were to distinguish between cement of good colour and bad colour. There was a much larger point which had often exercised his mind, and that was as to the combination of iron and concrete. How far really did the iron and concrete act together? It seemed to him a very doubtful thing. When they put an iron joist into concrete, did they really act together in resisting forces?

A Member remarked that one thing occurred to him, which was the importance of seeing that the cement was not used hot and had been aërated. The manufacturers made it, and, of course, were anxious to get rid of it, and it went to the builders and merchants. They did not want to store it, for, of course, it meant money to them, and as soon as they had made it they wanted to get rid of it. That was an important thing for them to watch, and it was more important, perhaps, than the actual tensile strength. Some years ago Mr. Earl read a paper there on the manufacture of Portland cement, and it was mentioned then about not using cement when it was hot, and it impressed him very much, and it came in very useful to him because at that time he had to re-stucco a church, and it was most important that the cement work should not come cracking off very soon afterwards. Fortunately, he came to the discussion there and got the information from Mr. Fajja and sent samples to him for testing, with the result that it was all right. He mentioned that because he felt that the use of fresh cement was the greatest danger they were likely to run into. He had listened with great interest to the paper, and was sorry Mr. Humphreys was not there himself, and he supported very heartily the vote of thanks.

Mr. L. Jacobs observed that Leighton Buzzard sand had been mentioned. He would like to know if anything had been ascertained about that, as a builder had told him there was a great deal of iron in Leighton Buzzard sand. Would that have any detrimental effect on Portland cement?

Mr. Arthur Harston said that he was glad to hear Mr. Humphrey advocated the necessity of different finenesses of sand. They wanted variations in the grains which cement would fill up. He quite agreed that from the architect's point of view, strength was no

necessarily the most important factor in cement. The absence of expansion and contraction seemed to him from their point of view much more important. He did not mean to say strength was unimportant, but he did not think it was desirable to have an exceedingly strong cement if it would conduce to a greater liability of expansion and contraction, and that is why he agreed with previous speakers that strength was not only the only thing to be considered by architects in judging their cement. He, like Mr. Statham, was somewhat surprised to hear the lecturer say that fineness reduced the tensile strength. He was in hopes that the new process which was to win with the cement so as to give them all flour and no residue, was to give them a better cement, and that a cement free of residue would be less liable to expansion. He was in hopes that they would have got rid of the residue altogether, but now his hopes were somewhat shattered. Of course, an architect dealt with cement as only one of the many materials he used, and he could not test everything. Cement came in in cartloads, and one would be all right and the next all wrong. They would not specify it to be ground extra fine in the way that people whose living depended upon it would specify. He was told that paviors always paid extra price for it and they had it stored and seasoned in the cement works, and that this special cement when it was sent out had a little blue ribbon tied round the mouth of the bags. They had got into the habit of calling it the blue ribbon cement. Referring to an article in the *Builder* of October 75, he would like to know whether there was any information whether gypsum was being used more largely. He believed it had been said that the addition of gypsum was a comparatively recent innovation in the manufacture of cement—at all events within the last few years. There were alterations also taking place, one saw from the *Builder*, in the manufacture of gas, and he would like to know whether the altered gas process increased the sulphur in the residual coke, and whether it altered the coke so as to affect a coke-breeze when used in the aggregate—whether more or less sulphur was in the coke, and if so, whether it had a prejudicial effect when used as an aggregate. With regard to expansion he might say that when care was taken in the aeration of the cement they had had no serious difficulties, but he had heard lately of several cases of expansion. The splits, as far as he came across them, were not very serious, but still if a building split into various sections, no matter how small, it was not a nice thing, and it was very peculiar that those fractures had occurred in buildings in which coke breeze floors had been laid. Certainly they were rather long floors—120 ft. long—and they had been laid in all seasons and in all normal temperatures. The expansions, however, took place from six to eighteen months afterwards. It might have been considered that the expansion really took place earlier, but in this case it was not so, because the inside cement was put on a considerable time afterwards, and the inside cement had been painted and varnished and no cracks were observable until some time after that. So that it was evident, as far as his experience was concerned, it was some new kind of expansion he had not met with before. In a conversation with Mr. Spencer that evening and also from the remarks of several of the gentlemen who had joined in the discussion, he found that his experience was not unique. But in these cases, he should imagine, the cement was either unusually defective or had not been properly aërated. He would like to know whether the concrete expansion depended at all on the aggregates. For instance, would ballast concrete or coke breeze concrete be more liable to expansion? He himself thought that coke breeze concrete was not so liable to expansion, or that if it did it might expand in the vertical position, whereas ballast concrete would go the other way—that is, expand in the direction of length and not of thickness. He did not know how far that affected the question of breeze always containing sulphur. He had a case in which a hot-water pipe was laid in a pipe filled with coke breeze, and it rotted away in a very short time, and the explanation given was that there was sulphur in the coke breeze. Whether that caused the expansion in that particular case he did not know, but there was always sulphur in the breeze, and it appeared to him if sulphur lime compounds affected the cement to any great degree, then the sulphur in the breeze and the

lime in the cement might be reasonably suspected of interacting on each other. In a publication which had been before them some time it was stated that pan breeze should be strictly prohibited, but an eminent architect who had had the conduct of many large buildings specified pan breeze and a certain amount of coke breeze. Ordinary breeze was that which fell through in the gas companies' works. But pan breeze was that coke which they used over again as fuel under their retorts, so that it got burnt again. Whether that affected it he really did not know, but the two authorities he had referred to quite differed as to which was the best. He was told on inquiry of a gas engineer that pan breeze was much cheaper, and that was why builders preferred to use it, he supposed. It contained little particles of iron from the furnace bars, and he should imagine it contained a good deal of ash. Then again, the stuff which was called clinker breeze was got from furnaces. He thought that was the worst of the three, as it contained a good deal of impurities—iron and so on. With regard to aëration, a builder told him some time ago that a builder would be a fool who did not aërate cement, because if they took the hot cement and aërated it they could make much more of it; but when the builder came to do the work, he (the speaker) found that he had considerable objection to aërating it. The question had been raised about the use of the mortar mill. As to iron joists rusting, it was quite a new experience to him. He had seen iron joists taken out all right, but personally he did not like them painted. With regard to that point sometimes pins were put in to give a hold and sometimes square rods were used and twisted—in fact anything to prevent the iron from slipping. It was a curious thing with regard to the addition of gypsum to cement, that it delayed the setting of the cement, and that was a thing he did not know before the paper was written. If the cement was going to be good, he did not know what good was done by delaying the setting, and if it was going to set in five minutes they should not use it at all, and he did not think the addition of gypsum was any good in that case. There was one question he would like to ask. They had heard of the slaking of lime as it was done by the Romans. They used to put it in a pit for three years, and he would like to know what kind of lime that was. If they in England nowadays were to slake lime for three years in a pit, and it happened to be only a very slightly hydraulic lime—the stone lime used in London—what little hydraulic properties it had would go.

Mr. J. G. Walker remarked that it had been said that Portland cement should not be used hot, and should be turned over four times; but it had not been said what intervals should elapse before each turn-over. He might say that in drawing up a specification the other day they were not allowed to use Leighton Buzzard sand in the concrete, and a builder who came in said he knew from experience that Leighton Buzzard sand would not set under water. He said it was all right where the air had a certain amount of effect upon it, but it would not set under water.

Mr. D. Butler Butler (Special Visitor) said that there were so many points in the paper that he would hardly have time to deal with them all. One speaker had referred to four processes of cement manufacture, but he, Mr. Humphreys, was wrong in tabulating the rotary process as a fourth process. The rotary process simply referred to the calcining of the cement and nothing else. There was the amalgamation of the raw material, the chemical combination of the raw material into certain chemical constituents by heat, and the grinding of the clinker after it had been burned to a powder. So, really, the rotary process was hardly a process at all, and was only a third of the process. Then Mr. Humphreys made the statement "When the kiln charge has been burnt through it is drawn, and in the better class of works the unburnt portions of the slip are picked out by hand for recalcination." It was rather unfair to refer to that "better class of works," because from his experience he knew that nine-tenths of the works had a boy specially told off to pick out the unburnt portions. With regard to the point raised by a speaker as to the effect of the fine grinding of cement, he thought the speaker scarcely understood Mr. Humphreys' point when he said that fine grinding deteriorated the value of cement, because it was the reverse. Fine grinding might perhaps

make a cement give a lower tensile strength when gauged neat, but when it was used with sand the fine grinding gave a much greater covering power, and therefore greatly increased its value. There was another point finely grinding the cement they also obviated the blowing or expansion, because the blowing or expansion was generally due to particles of free or uncombined lime contained within the unground particles of clinker, which was subsequently affected by water in the concrete. It had been proved by experience that if fine ground the tendency to blow was largely obviated. With regard to the specification on the tests Mr. Humphreys advocated, he divided them into three. These were all very well, but he did not think they were of any value unless they also had some idea of the strength of the cement. He was at issue with Mr. Humphreys as to the cooling of cement. He says, "A sample of cement shall be made into a paste, and if the rise in temperature be more than 6 deg. Fahr. during an hour after mixing, the cement shall not be considered ready for use nor for testing." He submitted that the evolution of heat during setting was entirely due to chemical action, and did not depend on the lime. The heat depended on the setting qualities of the cement, and nothing else, and, therefore, he did not understand the reference to 6 deg. Mr. Humphreys headed his specification for "important works," and he took it that the specification was a good deal too laboured for the ordinary small building work. It would cost too much, and it would be scarcely worth carrying out for small work, but for an important engineering work it was, of course, necessary. Mr. Humphreys spoke very highly of Johnson's cement. He knew that firm produced very good cement, but it was rather a peculiar thing that in the specification he alluded to 1 per cent. of insoluble residue, while in the analysis he gave to Messrs. Johnson there was 24 per cent. He did not attach any importance to that. Insoluble residue was supposed to indicate the amount of burning to which that cement had been subjected, but after all it was negligible. With regard to tensile tests, Mr. Humphreys said in the specification that test blocks of not less than 1 sq. in. cross section shall be made with 20 per cent. of water, but he could not agree with any hard-and-fast line being laid down as to the amount of water to be used in gauging cements. Some required 24 or 25, and some 18 per cent. It was purely a matter of the requirements of the particular cement under examination. Then Mr. Humphreys said a pat made with 20 per cent. of water shall not take less than three hours to harden, and not more than seven hours. Did that mean three hours before the final setting? He supposed Mr. Humphreys took the final setting. Then they came to the heating business again, and as he said before, that entirely depended on the setting properties of the cement. Coming to tests, and as to the best tests of architects' general work, he would like to refer to his late chief, Mr. Fajia. One of his dicta was that for ordinary work if the cement was sound—that was to say, had shown no expansion or contraction—and well ground, in nine cases out of ten it was good enough for all constructive purposes. That was a broad specification, but he gave it as enough for most cases of architectural work. Of course, in addition to that, they might have the ordinary tensile strength test, but the soundness was the chief thing. It stood to reason that if the cement was unsound, it was no good showing strength, and that was a point he always tried to impress. Here, again, he disagreed with Mr. Humphreys, for he thought his test of soundness was too severe. For ordinary purposes he thought the Fajia test quite good enough, which was a pat allowed to set in a moist atmosphere for seven hours and then plunged in boiling water and remain for fourteen hours. He had always found that reliable, both from a manufacturer's and user's point of view. He had had a good many years' experience as a maker of cement, and knew something about it. He thought that Mr. Humphreys' test should be used in a negative sense only. He meant that if the cement stood the boiling they could be quite sure they were safe; but not to say because it would not stand the boiling it was not safe. The point had been raised of the iron and concrete, and he understood that the cohesion of cement concrete to iron was equal to 550 lbs. per square inch. He could not say that he agreed with painting

the joists, for it seemed to him that would destroy the cohesion. The reference to hot cements was somewhat of a misnomer. They could not call it hot, but he could describe it as a cement not fit to use. As to special storing and grinding for paving purposes, of course, if those who made a speciality of paving liked to pay the manufacturers a special price for fine grinding and special storing they might do so, but they could hardly expect the manufacturer in the ordinary way to grind cement extraordinarily fine and store it for nothing. The finer it was ground the more it cost.

Mr. Harston said his point was that the men brought the cement tied with blue ribbon and it was considered that was special for paving.

Mr. Max Clarke said in the previous specification it was left very vague.

Mr. Butler said a good deal of controversy had raged round the use of gypsum making cement slower setting. They all knew that gypsum had been accepted on the Continent for many years past within 2 per cent, but he was at one with Mr. Humphreys when he said he did not think the matter had been sufficiently threshed out yet to admit the use of gypsum without question. As to aeration increasing the bulk of cement, particulars were brought forward a few years ago at a meeting of the Institution of Civil Engineers that the effect of thoroughly aërating cement increased the bulk by 6 per cent, and it was also stated that the added bulk thus obtained paid for the cost of turning. As to Mr. Max Clarke's criticism of the experts, he thought he was very hard upon them. He knew it took experience to be able to test cement, and he had had twenty years of it himself, and it was only to be expected that a man who was always at it, as his assistants were, were able to do it better than those who did it once in a month. It was merely a question of manipulating the tools properly. The object of testing cement was, he took it, to know what it would do under the best conditions, for by taking the best conditions they got a criterion, and on the works they could not expect to approach these conditions.

Mr. Spencer, in acknowledging the vote of thanks, said that with regard to Mr. Butler's criticism he had seen his statement as to the cooling before, and had never quite understood it. Did Mr. Butler mean that aëration lessened the quick-setting properties.

Mr. Butler: Certainly.

Mr. Spencer said Mr. Butler admitted apparently that there was lime in the cement in a state of activity with regard to water, and it was known that water-slaked lime would cause a rise in temperature.

Mr. Butler said it might be in a slight degree due to the free lime, but it was so slight as to be negligible.

Mr. Spencer said that Mr. Humphreys' point was that, whether due to quick setting or lime, the cement should be properly aërated if it did not rise 6 deg. when treated with water.

Mr. Butler: Then I say that if it only showed 2 deg. it might be thoroughly unsound.

Mr. Spencer said Mr. Humphreys did not say that he merely showed that they should not treat it as unsound because it was fresh from the mill. If they found it unsound before cooling it to that extent, they would be sure they would not improve it by aërating.

Mr. Butler: The chances are that by aërating it you would make it sound.

Mr. Spencer said that was so, and Mr. Humphreys wished to give it every chance. He would not consider the cement fit to put in the work before aëration. Several members asked a question as to what Mr. Humphreys thought the best aggregate for floors, and he believed he advocated furnace clinker. He did not know the proportion.

Mr. Claxton answered a question as to furnace clinker, and said the clinker they used was refuse-destroyer clinker.

Mr. Spencer added that Mr. Humphreys did not wish to put forward Messrs. Johnson's cement any more than any other.

The meeting then terminated.

UNITARIAN CHURCH, BIRKENHEAD.—The old Unitarian Church at Charing-cross, Birkenhead, having been pulled down, it became necessary to find a new building. This is now being built in Bessborough-road, Oxton, where a school building has already been erected. The church is from the plans of Mr. J. J. Tabbot, Liverpool, and will consist of nave, transepts, and chancel, with a gallery over a large waiting hall at the entrance end of the building.

## Illustrations.

### STUDIES FOR A MADONNA AND CHILD.

THESE illustrations are reproduced from two studies made by Mr. Westlake for a life-size painting of the Madonna executed as a commission from the Marquis of Bute, for the church at Old Cannock built for him from Burges's designs.

The Madonna is represented in this case as the "Mater humillima," and the representation is purposely carried out in the style of a good many ancient paintings of the same class. The colours are limited to brown and blue, the lights being assisted by gold hatching. In the study, as well as in the finished painting, the ground is gold, but it was impossible to represent this in lithograph, unless by a strong yellow, which has not a satisfactory effect; and the ground has therefore been kept dark, as the best means of making the figure stand out from it in somewhat the same decisive manner in which it would stand out from gold.

Mr. Westlake thought it would be of interest to place the study from life, specially made for the picture, alongside of the finished study. The process of translating, as it were, an Italian woman and child into a Madonna, is exactly that which we come across in comparing Raphael's figure studies with his Madonnas, except that in his more naturalistic school the difference between the original model and the picture is much less than in this case, where the finished study is purposely treated in a conventional and ecclesiastical manner.

The young Italian woman (now dead) who furnished the model was well known to various London artists under the name of Maddalena Fiorda; she came from Picinisco near Monte Cassino, a neighbourhood noted for the pure Italian type of beauty among its inhabitants, who are called "Greeks" by the other Italians.

Both studies have been exhibited at the Royal Academy.

### THE PALACE OF CHARLES V. AT GRANADA.

#### LA GIRALDA AT SEVILLE.

"SYMBOL of himself and Spain, great in conception and impotent in conclusion," is Ford's characteristic description of the Palace of Charles V. at Granada. The apparent completeness of the elevation, elaborately worked even to its sculptured details, hardly prepares the visitor for the mere abandoned shell that a closer inspection of the structure reveals. Devoid of either floors or roof, the massive masonry walls remain standing after nearly 400 years in an astonishing state of preservation, and little imagination is required to reconstitute the original design.

To assert that this building has suffered unjustly from proximity to the Alhambra is to record a simple fact, for it is even amusing to observe how visitors, intent on the novelties of Moorish art, have no eyes for a palace design which would be their centre of attraction in any other city in Spain.

Of the middle period of the Renaissance, this Palace is on the whole the finest specimen of the style in Spain, for though the early period of fresh and fanciful design had passed, the grandiose but dull formalism of Herrera and his followers had hardly begun to sterilise the Renaissance art of Spain. We are, in fact, in the presence of the work of an immediate follower of Bramante and Raphael.

The Palace was begun by Charles V. in 1526 as a Royal residence, in the lately conquered Moorish kingdom, and within the fortified hill of the Alhambra, immediately adjacent to the Moorish Court.

The architect was Pedro Machuca, who had studied in Italy among the band of brilliant pupils who gathered round and associated with Raphael. In the fashion of the day Machuca appears to have been a painter as well as an architect, and on coming to Granada in 1524 is said to have worked on Retablos for churches. He directed the Palace works for twenty-four years, dying in 1550. His son, then twenty-five years old, carried it on up to 1568, when the rebellion of the oppressed Moors caused the abandonment of the undertaking. This son died in 1572, and the expulsion of the Moors in 1610 caused the final ruin of the province.

The great masonry walls are well executed in a fine golden coloured stone, described by Ford as a "creamy pudding stone called Almedrado, from the quarries of El Turro." The centres of the two facades are of coloured marbles, white, green, black, and red. This colouring is managed with great skill, and without the dissonance of effect that the mingling of sandstone and marble might suggest.

The sculpture by Berruguete is very cleverly and finely executed. It is anatomical in character, after the influence of Michael Angelo's work. The bas-reliefs have figures, three-quarter turned to the spectator, exhibiting the play of muscles involved in such intricate positions. Some of the work is in much lower relief, as in the dies of the pedestals of the order. Some groups of boys riding on dolphins are put in with considerable effect of life and motion, but the more elaborate sprandril figures are somewhat tame and stiff.

The circular court inside promised to be a fine feature, with its free standing columns and grand unbroken sweep of entablature, but only the lower order is properly completed; the upper, very low in relative proportion, is perhaps not according to the original intention.

There is a key plan of the palace in Ferguson (vol. iii.), and a somewhat more sympathetic criticism of the design than is usual with him, when dealing with Renaissance work.

The *Giralda at Seville*, so called from the vane which turns ("gira"), is happily described by Ford in his well-known "Handbook to Spain," as "a rich fluted belfry, elegant and attractive beyond description." Here Renaissance work so follows on Moorish that the whole tower is commonly regarded by visitors as one design. A close inspection will show the student that more of the Moorish core still remains in the upper part than his first impression will anticipate. The designer has triumphed over the shackles of the older work, and so capped the tower as to appropriate the old as the base of the new.

It is difficult, however, to say much for the detail of the Renaissance stages. It is one of those rare instances where the proportion and outline of the whole command success, in spite of the most grotesque detail. The flowers and their pots are of bronze, and the inlay shown in the pilasters, &c., is of ordinary Spanish glazed tiles, apparently black, but changing to the deep blue of the sky, in the strong sunlight of the south. The brickwork is pale red, and the stone slightly yellow with the same blue inlay in parts. The colour combination would be an utter failure in every probability in any northern climate, just as it would be a great experiment to undertake to revise the detail of the tower without the loss of its exceptional grace of outline. The reproduction of the tower at the last Paris Exhibition, in the Spanish quarter, completely failed to give the effect of the original.

The Moorish shaft is given in Ferguson as 185 ft. high by 45 ft. square, and it is suggested that it was built to commemorate the victory of Alarcos gained by the Moorish King Yusuf in 1150. Ford, however, gives 1105 as the date. The Renaissance addition was made in 1568 by Ferdinando Ruiz.

It will be noticed that the tower has no steps up but a vaulted inclined way winding round an inner shaft. The hanging of the bells, as shown, is the characteristic Spanish method, its picturesque effect is helped by the piled up headstock, required to counterbalance the bell which is pulled down by a short cord until it keeps turning round and round head over heels. The ringers pass round behind the bells by the passage between the outer and inner walls. For the largest bell the clapper is thrown by a cord against the side of the bell without the bell being swung.

The complete inscription is "Nomen Dei Fortissima Turris—Proverbs xviii. 10"—one word on each face. The upper stages of the tower as drawn were carefully measured up to the bronze turning figure on top, which is about 14 ft. high and is said to weigh 2,800 lbs. This was quite inaccessible, as there was no scaffolding available. The figure is of Faith carrying the labarum or standard of Constantine. It was cast by Bartolomé Morel in 1568.

All necessary permission and free access to the tower were granted with much courtesy by the Spanish clergy.

These drawings were made by the author during his Soane Medallion Tour in 1893.

A. T. BOLTON.

REREDOS, ST. KATHARINE'S CHAPEL, QUEEN-SQUARE.

We have not received any information from the architect, Mr. John Medland, in regard to this design for a reredos. From the treatment of the drawing, it is apparently a work in carved wood, and is richly decorated with canopy work and figure subjects.

ST. LUKE'S CHURCH, MAIDSTONE.

This design was submitted to the promoters in conformation with instructions to provide a church in which all present at a service could see the preacher, and in which the choir were to occupy an inconspicuous position in one of the transepts. It was abandoned in favour of the usual three-aisled church, in deference to the views of the late Archbishop of Canterbury. W. H. SETH-SMITH.

"GILLINGROVE," KENDAL : AND CURATE'S RESIDENCE, STANMORE.

The first-named house of these two is situated at the top of some high land overlooking the grey old town of Kendal and at the head of the Gilling grove, which, during flood time, pours a torrent of brown water down the steep, declivity to the River Keat.

At the time it was built it formed the first attempt to introduce into the sombre town a little bit of colour and irregular skyline, and so far has this succeeded that visitors to the district find in it a pleasing relief to the surrounding uniform and square-built limestone buildings.

Mr. John F. Curwen, the architect, designed it to have a lower story of dressed limestone, the upper portion to be covered with red hanging tiles, red Ruabon chimney-stacks, and the whole covered with a steep roof of brown tiles. It was entirely built by local builders at a cost of 2,005*l.* 14*s.* 6*d.*

The Curate's Residence at Stanmore, Harrow, was designed by the same architect at the same time, in red bricks and brown tiles, and carried out at the comparatively small cost of 1,500*l.*; Messrs. George Kirby & Sons being the contractors.

CAMBERWELL BATHS COMPETITION.

This competition, the drawings of which have been on view at the present baths, has attracted fifty-two competitors, and the general character is above the average and includes some very excellent work.

It is somewhat bewildering to examine individually such a collection, as the requirements and restrictions which the limited site affords do not give scope for much variation in general. Two great swimming baths had to be provided, 130 slippers, thirty-two douches, Turkish baths, a complete parochial wash-house, and the necessary administration, all of which had to be dovetailed into the site, which is situate in the Old Kent-road, the long side of the site being to Marlborough-road.

The planning of a great bathing establishment must necessarily be subjective to a full knowledge of the working and administration of the same. The great extent of these swimming baths and their non-use for bathing during the winter has brought in a new element in their utilisation for entertainments. In so doing they are brought within the province of the theatre regulations of the London County Council.

These two elements have, therefore, to be assimilated in the production of a successful plan in compliance with the letter of the law in the matter of egress and exit, and the many conflicting details which are inseparable from the bathing requirements.

It is, then, not to be wondered at that there is so much similarity in the plans. The assessor's task has therefore not been an easy one, and the only way to arrive at a just result is the course which no doubt has resulted in the selection of No. 18, Mr. E. Harding Payne, who receives the first premium, 150*l.*, for all the designs this one seems to contain the greatest number of good points, without being what we should term the best all-round design, but in its selection we entirely concur. Some minor points of detail it may be desirable to improve without affecting the general principles, and a very excellent plan will result.

The two swimming baths are placed side by

side the long way of the site, parted from Marlborough-road by a narrow corridor, the utility of which is not quite clear; the second-class bath would probably have to be closed while the other is in use for entertainments. Provision has been made for artists' rooms, and separate access thereto. The slipper baths are placed partly upon the ground and upper floors; the lighting to the latter might be improved. The galleries seem rather narrow, 2 ft. for seat and passing being too small. The same applies to the gangways and staircases, which require extra width.

A very excellently arranged Turkish bath is provided in the basement, while the wash-houses are disposed at the rear of the site.

The elevations are inferior in quality to the plan; they are red brick with stone dressings. As we have before remarked, this design seems to embody most of the essential points necessary to such an institution.

The second premium is awarded to No. 7, Messrs. Russell & Mallovs, who show an excellent all-round set with many good points. The first-class baths are on Marlborough-road, and a good and original idea is secured by utilising the second-class bath for a crush-room, supper-room, and cloakrooms. This consideration has, however, resulted in the second-class bath having been sunk to below the level of the sewer, so that it would have to be emptied by a centrifugal pump. This, no doubt, has been considered an obstacle, notwithstanding the fact that it could be emptied quicker than by running the water away. The elevations are strongly executed in Renaissance, a tower being a prominent feature, but the detail is rather overweighed for a building of this character, the lower part being out of scale with the upper. The plan, excellent though it is, falls behind the selected design in good and necessary points.

The third premium is awarded to No. 32, Mr. H. Dighton Pearson. This plan is not unlike the first noticed; and the access to the artists' rooms is not fully considered, and though it is full of admirable working points, it lacks the compact qualities of the first premiated design. The latter is somewhat deficient in practical and technical information, while Mr. Pearson's sections show minute study of the requirements; the elevations are also more satisfactory than those placed first.

After inspecting the majority of the designs, a large number of which are evidently by architects who have had practical experience of the construction of public baths, a return to the selected design demonstrates that it is evident that its combination of good points has gained the award.

No. 9 shows a capital set of drawings, but placing the men's slipper baths at the rear, partly over the public wash-house, is not the best arrangement. The elevations were among the best in the exhibition; the style is latter-day Renaissance, but the general character of the design is hardly expressive of baths.

No. 34 has, at first sight, rather a straggling look, the second-class bath being at the rear on a diagonal line, bisecting the site into first and second class. The vexatious gallery question is cleverly solved by omitting it over the dressing-boxes, which are kept distinct on the east side, the space under the galleries being utilised for cloakrooms and stores, thus improving the character of the entertainment hall.

The elevations are red brick and terra-cotta, and are of a suitable and interesting character. No. 27 is an interesting and characteristic design, beautifully drawn, the elevations being simple, elegant, and refined, and evidence more knowledge than is displayed in the plan. No. 20, on the other hand, is uninteresting and commonplace in regard to external adornment, but the plan shows much practical knowledge. The two great baths are placed *en echelon*, with good direct exits and supervision, one particular feature being the placing of the men's second-class slipper baths around the gallery of the second-class bath.

No. 48 is a strongly executed set, not without character in the elevations, which are loaded and heavy. No. 11 has a remarkable similarity to No. 34; in this design the dressing-box question is again tackled, the boxes being placed below the galleries in bays. The whole set had much good suggestion. No. 4 has simple and dignified expression in the elevations. No. 6 is one of the few designs which attempt a definite idea, the second-class bath being placed upon Marlborough-road, and is made a crush-room to the entertainment hall or first-class

bath. No. 37 arranges his swimming baths by placing them at right angles to one another; but the plan becomes involved. No. 40 has points not unlike No. 6; the slipper baths being placed to the front and back of the site is not the best arrangement for supervision.

INCRUSTATION ON ST. PAUL'S CATHEDRAL.

In a recent "Note" in the *Builder* reference was made to the paper read by Mr. E. G. Clayton before the London Chemical Society on the subject of incrustations taken from the Portland stone balustrade round the base of the dome of St. Paul's Cathedral. Some further consideration of the subject may be of interest.

This balustrade is surmounted by a heavy coping stone of the same material; much of the surface is greatly "weathered," and is coated by a stratum of a grey or black substance which in some places (especially on the under side of the coping stone) attains a thickness of  $\frac{3}{4}$  in. This material, which is brittle and detachable with a knife, has a very rough and irregular surface, is stalagmite in character, and though differing in colour, in other respects resembles very closely some boiler deposits, and is easily reduced to a fine grey powder.

Analysis of the Incrustation.

Water (lost at 100 deg. C.)	206
Water (lost at 150 deg. C.)	22.48
Organic matter	1.10
Lime	26.44
Magnesia	.27
Ferrous oxide	1.31
Sulphuric acid (combined)	34.93
Phosphoric acid	1.02
Carbonic acid	none
Chlorine	trace
Silica, sand, &c.	10.39
(including combined silicic acid, SiO <sub>2</sub> )	2.33
	100.00

From the above results the substance is evidently composed chiefly of hydrated sulphate of lime associated with some siliceous matter and minute particles of carbon in the form of soot. The solvent action exerted by rain charged with sulphurous and sulphuric acid derived from the gases and smoke of innumerable chimneys of the surrounding buildings, has after the lapse of two centuries transformed the original carbonate of lime of the Portland stone into sulphate of lime, which in a more or less soluble condition has been carried by water action and gradually deposited as calcareous tufa or stalagmite on the underside of the coping-stone.

The practical conclusion to be drawn from this research is very obvious, namely, that buildings in large cities, and especially in manufacturing towns, should not be constructed of limestone, which is readily decomposed by the acids existing in the smoke due to the use of coal largely impregnated with sulphur.

Granite and hard sandstone appear much better adapted for city buildings, but stone of a calcareous character was doubtless originally employed on account of its being more readily and therefore more economically worked into suitable shape by the stone cutter.

JOHN HUGHES.

COMPETITIONS.

HOSPITAL, BEXHILL.—In the competition for an isolation hospital, Bexhill, the design placed first was that sent in by Mr. Francis D. Smith, Parliament Mansions, Victoria-street, Westminster, and the second premiated design was by Mr. J. H. Cossar, Borrowwash, Derby. The selected design was sent in by Mr. T. S. Inglis, Savernake-road, South Hampstead.

LAYING OUT GROUNDS AT BEXHILL.—In this competition the first premiated design was that sent in by Mr. J. W. Webb, of Bexhill, and the second was by Mr. J. Cheal & Sons, Crawley, Sussex.

COLEFORD SEWERAGE AND WATER SUPPLY.—The Coleford Urban District Council have adopted schemes of water supply and sewerage for that town prepared by Mr. Harry W. Taylor, of Newcastle-lyne and Birmingham. The water will be obtained from a deep boring in the old red sandstone; the sewage will gravitate to the outfall and be disposed of bacterially. The estimated cost is 10,000*l.*

## ARCHÆOLOGICAL SOCIETIES.

**SOCIETY OF ANTIQUARIES.**—At the last meeting of this Society, Mr. W. Gowland read a paper on the recent work at Stonehenge. He said that he had had the honour of being chosen as the representative of the Society during the carrying out of the recent works at Stonehenge in raising the leaning stone to an upright position, and in examining the excavations made for this purpose. This work was effected by enclosing the stone in a cradle, and hoisting it up by winch power. When erect, the base was bedded in concrete, and the work, he believed, would be of lasting character. The various stages were illustrated by lantern-slides thrown on the screen. The excavations had been carefully mapped, and it would be possible to fix the locality where any of the objects were taken. The earth had been carefully sifted so that the tiniest fragment could not escape observation. Beneath the surface layer was rubble, overlying the chalk in which the stone was bedded. Mixed with the soil and rubble were lumps of sarsen, chips of diabase, hornstone representing the "bluestone" uprights, and flints rudely chipped or shaped into hammers, probably used in dressing the stones. The sarsen uprights and cross-pieces showed signs of tooling, and a slab was exhibited side by side with a piece recently worked with one of the flint tools to show the tooling could be done with these implements. Large stone mauls were also found, probably employed for rough dressing the stones. A few bones and teeth of no interest were met with, and a pick made from a deer's antler. The only traces of metal were a copper-stained stone and a Roman coin. The stone tools and implements were of a rude type, quite different from what we usually associate with Neolithic times, but this might, perhaps, be accounted for by the somewhat rude purpose to which they were put. The transport and erection of the stones, Mr. Gowland said, offered no difficulties that might not have been overcome by the Neolithic men, and by means of lantern slides he showed how heavy stones were moved by man-power in Japan, and referred to Poynter's picture of the transport of a monolith in Ancient Egypt. He would fix the date of Stonehenge near the later part of the Neolithic period, and this would probably carry us back to 1800 or 2000 B.C. Its purpose was that of a sun-temple, and its analogue might be seen in an antique engraving exhibited on the wall. This he had brought from Japan. It represented the worship of the rising sun, a trilithon, an altar, and upright stones forming a line between that and the worshippers. These megalithic monuments were not copied by one people from another, but were the outcome of development on similar lines. Sir Norman Lockyer make some remarks on the astronomical view of the question, and the resemblance of the banks at Stonehenge to the stone avenue at Carnac, and the Sphinx avenues in the Egyptian temples. He thought it probable that Stonehenge might have served a religious purpose, but they should not unduly labour the point that such structures were connected with any kind of sun-worship, though the inner circle at Stonehenge resembled the Naos of the sun-temples. One of the chief necessities of early man was the measurement of time, and that these structures might be made to subserv. The astronomical results of the work done at Stonehenge in the determination of the temple axis gave a date of 1080 B.C., with a minus variation of about 200 years.

**CRYSTAL PALACE ENGINEERING SCHOOL.**—The "Wilson" premium for the best paper read before the Crystal Palace Engineering Society during the present session has been awarded by the Council to Mr. S. J. N. Carrington for his paper on "The Widening of the Brighton Line between Balham and Croydon." Other papers read during the term were "The Eastbourne Pier Improvement Works," by Mr. J. M. Atlee; "Trade Unionism," by Mr. F. H. H. Williamson; and "Modern Electricity," by Mr. E. A. A. Parsons. The premium was presented to Mr. Carrington by Colonel Raban, R.E., Director of Works to the Admiralty, on the occasion of the eighty-seventh distribution of certificates at the above school on December 20.

**LIVERPOOL ARCHITECTURAL SOCIETY.**—The second members' meeting of this Society was held on the 16th inst. in the Law Library, Castle-street. Mr. C. J. Anderson presided. Mr. C. Brien read a paper on "Wood Staining and Veneering," illustrated with specimens of woods and stains. Mr. James Cook afterwards exhibited a series of lantern slides of French cathedrals.

## The Student's Column.

## GAS AND GAS-FITTINGS.

26.—BRITISH LAWS AND REGULATIONS RELATING TO ACETYLENE AND CALCIUM CARBIDE—FIRE INSURANCE.

**W**HEN calcium carbide was first placed upon the markets as an article of commerce very little was known by the general public concerning its nature and properties, and a number of acetylene generators were constructed which were a source of danger to those to whom they were sold. Fatal accidents, moreover, occurred in America and on the Continent, owing to the attempt to use acetylene compressed and liquefied in metal cylinders under high pressures, and it was not until acetylene in this condition had been proved to be an extremely dangerous explosive that the use of compressed or liquefied acetylene was abandoned. The British Government speedily recognised the desirability of safeguarding the public by introducing reasonable regulations as to the conditions under which carbide and acetylene may be used, and public confidence in the new illuminant has been restored by the fact that, since these regulations have been enforced, acetylene has been extensively used in this country under a great variety of conditions with very few serious accidents.

Acetylene has now been used for a sufficiently long period, and in sufficiently large quantities, to prove that it may be safely used by the general public for all ordinary illuminating purposes, provided that the conditions under which it is used do not violate any of the legal enactments, of which brief digests are given in the present chapter, and that such reasonable precautions are taken as are set forth in the printed Regulations issued by the Public Control Department of the London County Council for use within the area under the jurisdiction of that Council.

## The Storage and Transport of Carbide.

**Calcium Carbide placed under the Petroleum Acts.**—By an Order in Council, dated February 26, 1897, calcium carbide is brought under the Petroleum Acts, 1871 to 1881, with the deletion of certain clauses which relate only to petroleum and similar liquids, and with the following additions:—

The label on a vessel containing calcium carbide must bear in conspicuous characters the words:—

"Carbide of Calcium."

"Dangerous if not kept dry."

"The contents of this package are liable, if brought into contact with water, to give off a highly inflammable gas."

Also every package or vessel must bear upon it:—

(a) The name and address of the consignee or owner, if the package is to be kept.

(b) The name and address of the sender, if the vessel is to be sent or conveyed.

(c) The name and address of the vendor, if the vessel is to be sold or exposed for sale.

**Licence Required.**—Under the Petroleum Acts it becomes unlawful for any person to keep any quantity of calcium carbide, whether for sale or for use, without a licence from the Local Authority. By an Order in Council, dated July 7, 1897, a quantity of calcium carbide not exceeding 5 lbs. is permitted to be kept without a licence on any premises, provided that it is kept in "separate, substantial, hermetically closed metal vessels containing not more than 1 lb."

Where calcium carbide is to be stored in greater quantities than 5 lbs. in 1-lb. tins, a licence, granted for a sum not exceeding 5s. per annum, must be obtained from the Local Authority, and must be renewed every year. The conditions to be attached to such licence rest entirely with the Local Authority, and may vary in different districts, but usually only such reasonable conditions as are required to afford protection in the use and storage of the carbide are written upon the licence. In most districts the issue of carbide licences is made from the office of the surveyor to the Borough or District Council, but in the area controlled by the London County Council the licences are issued from the Public Control Department of the Council after inspection of the premises and of the vessels in which the carbide is to be stored, and the apparatus in which it is to be decomposed, by one of the Council's inspectors.

## Acetylene.

**Liquid or Compressed Acetylene Prohibited.**—By an Order in Council, dated November 26, 1897, acetylene is declared to be an explosive when in a liquefied condition, or when subjected to a pressure exceeding 100 in. of water, and in such condition acetylene is "prohibited from being manufactured, imported, kept, conveyed, or sold."

**Exception.**—"If it be shown to the satisfaction of the Secretary of State that acetylene declared to be an explosive by this Order when in admixture with any substance, or in any form or condition, is not possessed of explosive properties, the Secretary of State may by an Order exempt such acetylene from being deemed to be an explosive within the said Act."

**Compressed Mixtures of Acetylene and Oil-Gas.**—By an order of the Secretary of State, dated March 28, 1898, it is ordered that a mixture of acetylene and oil-gas not containing more than 20 per cent. by volume of acetylene, and not subjected to a greater pressure than 150 lbs. to the sq. inch, shall not be deemed an explosive within the meaning of the Act, provided that the acetylene and oil-gas be mixed together before the gases are compressed.

## Acetylene compressed into Porous Substances.

Certain substances have the property of absorbing a large proportion of acetylene when the gas is passed into them under pressure, and of evolving the acetylene in a continuous stream when the pressure is relieved or the temperature of the substance is raised. The substance containing this absorbed acetylene does not possess the explosive character of liquefied or highly-compressed acetylene. The liquid known as acetone is capable of absorbing 300 times its own volume of acetylene when the gas is passed into it under a pressure of 180 lbs. per square inch. An Order of the Secretary of State (No. 6), dated April 10, 1901, declares that acetylene, when compressed into porous substances, with or without acetone, shall not be deemed to be an explosive within the meaning of the Act, provided that the porous substances to be used shall be similar in every respect to samples deposited at the Home Office, that the pressure does not exceed 150 lbs. to the square inch, and that certain other conditions set forth in the Order are not violated.

**Acetylene Mixed with Air Prohibited.**—By an Order in Council, dated May 15, 1900, it is ordered that acetylene in admixture with air or oxygen shall be prohibited from being manufactured, imported, kept, or sold. Nothing in this order applies to mixtures produced by admitting air into the burner, or to air unavoidably admitted into the generator when recharging.

## Conditions of Licence from Local Authority.

Local authorities may attach any conditions which they consider necessary to the carbide licences issued in the districts over which they have control, but the printed regulations issued by the London County Council may with advantage be used as a model by other local authorities, and the following extracts therefrom include all the essential conditions.

**London County Council.**—In addition to the regulations as to the labelling of vessels containing carbide to which reference has already been made, the London County Council grant licences within the County of London upon the following conditions:—

1. Application to the Council for a licence to keep carbide of calcium at any place in the County of London (except the City of London) must be made upon the form provided for the purpose, which can be obtained by application in writing, addressed to the Chief Officer, Public Control Department of the London County Council, 6, Waterloo-place, S.W.

2. Every application must be accompanied by a fee of 5s. in money, or, if sent through the post, by cheque or postal order for that amount payable to the order of the London County Council. The fee will be returned to the applicant if the licence be not granted.

3. Every application must state—

(a) The quantity of carbide which the applicant desires to keep;

(b) The proposed place and method of storage;

(c) If the carbide is only to be kept in closed vessels, or if it is to be used in the manufacture of acetylene gas.

4. Carbide of calcium should be kept in strong metal vessels, and—

(a) Such vessels should be constructed and closed as to prevent the admission of water or atmospheric moisture.

(b) Such vessels should only be opened for the time necessary for the removal of any required quantity of carbide, or for the refilling of the vessels.

(c) No vessel should have a greater capacity than 3,696 cubic inches (equal to a cylindrical vessel 14 in. in diameter and 24 in. in depth).

(d) Every vessel of a greater capacity than 2 lb. should be provided with a lock or be placed in a locked receptacle, so as to prevent unauthorised persons gaining access to the contents.

(e) Copper should not be used in the construction of vessels for containing carbide.

5. Vessels containing carbide of calcium should not be kept inside dwelling-houses, but preferably in dry and well-ventilated out-buildings.

6. Small quantities of carbide for sale or immediate use will, however, be allowed in shops, dwellings, or workshops, upon licensed premises, if the arrangements are satisfactory.

7. The Council proposes only to grant licences to keep carbide of calcium which is pure (in a commercial sense), i.e., which contains no impurities liable to generate phosphuretted or silicuretted hydrogen so as to render the gas evolved liable to ignite spontaneously.

8. Where carbide of calcium is kept for the manufacture of acetylene gas, it is desirable that such of the following precautions for ensuring safety as are applicable to the circumstances, should be adopted:—

(a) Every apparatus for generating and storing acetylene gas should be placed in an outbuilding. (This does not apply to portable apparatus holding a charge of less than 2 lbs. of carbide.)

(b) Such building should be situated as far as may be practicable from inhabited buildings, and should be well ventilated.

(c) No fire or artificial light as would ignite inflammable gas should be taken into or near the building or place where a gasmaking apparatus is situate.

9. Every apparatus (including generator and gas holder) used for acetylene gas should as far as practicable be constructed and used so as to provide against the special risk, i.e.:—

(a) Copper should not be used in any part of the apparatus;

(b) The various parts should be of adequate strength;

(c) Escape of gas from the apparatus should be carefully guarded against;

(d) Satisfactory provision should be made against dangerous development of heat;

(e) Satisfactory provision should be made against undue pressure by the employment of an adequate safety valve connected with a pipe discharging into the open air, and a suitable pressure gauge should be attached to the apparatus;

(f) Provision should be made for the residue of the carbide being mixed with at least ten times its bulk of water on being removed from the apparatus;

(g) No person should have charge of an apparatus until he has been properly instructed in its management.

10. Licences are granted for keeping carbide of calcium for periods not exceeding one year, and prior to expiration application must be made for their renewal. Notice of the expiration, and a form of application for renewal, is sent to each licensee at the proper time.

With reference to the foregoing regulations it may be mentioned that under certain conditions, which seldom exist in practice, copper may be attacked by acetylene, and a highly explosive compound, known as copper acetylide, formed. Danger from overheating or excessive pressure only exists when generators of faulty design or construction are employed.

Danger of spontaneous ignition of the acetylene through the presence of impurities in the carbide does not exist at the present time, because the quantities of phosphuretted hydrogen and silicuretted hydrogen evolved from the carbide now manufactured are much below the danger limits.

The following is a copy of the "application

form" for a carbide licence issued by the London County Council:—

LONDON COUNTY COUNCIL.

PUBLIC CONTROL DEPARTMENT.

PETROLEUM ACTS, 1871 TO 1881,

And Orders in Council dated February 26, 1897, and July 7, 1897.

.....Reg. No.

Application to the London County Council for a Licence to keep Carbide of Calcium.

This application should be fully filled up in accordance with the following instructions, and forwarded to the Chief Officer of the Public Control Department, London County Council, 6, Waterloo-place, S.W., with a P.O. or cheque for 5s., payable to order of the London County Council and crossed. This fee will be retained if the licence be granted, or returned to the applicant if the licence be refused.

State Christian name and Surname of the applicant.

If a firm, the names of each member in full. If a company, the name of the company and its secretary.

State situation of the premises for which the licence is required.

State quantity desired. If the quantity is 10 cwts. or more, a plan must accompany this application, showing the proposed place and method of storage, and the buildings within 50 ft. of such place. The plan must be to the scale of 1/4 in. to 1 ft.

State if the carbide will be kept and sold unopened in the vessels in which it is received, and, if not, what will be done with it.

State in what vessels the carbide will be kept, capacity of vessels, how closed against moisture, and of what material constructed.

State (a) in what part of the premises the carbide is to be kept; (b) the construction of the store; (c) if the store is used for other purposes, and, if so, what.

State if the carbide is to be used for the manufacture of acetylene gas, and if so, state—

(a) The make and capacity of the generator.

(b) Particulars as to the building in which it will be placed, if detached from other buildings, and if used for other purposes.

(c) How you propose to dispose of the residue.

(d) If the machine will be in the sole charge of a person properly instructed in its management.

Signature of Applicant

Trade or Profession

Postal Address

Date 1901

Corporation of London.—The conditions upon which the Corporation of London grant licences for the storage of carbide are very similar to those of the London County Council. The carbide has to be kept in metal vessels approved by the City Surveyor, and the place of storage, which must not be an inhabited house, has also to be approved by the City Surveyor.

Fire Insurance.—Fire Insurance Companies do not, as a rule, charge any extra premium on

buildings in which acetylene is used, provided that the generator is located outside the building; but notice should be given to the Insurance Company when the installation is introduced, and the insurance policy should be endorsed by the company to the effect that the use of the apparatus for the generation and combustion of acetylene is permitted. Some companies issue a printed list of rules for buildings in which acetylene is generated or carbide is stored, and for buildings in which acetylene is consumed; but these are usually merely repetitions of some of the London County Council licence regulations which have already been enumerated.

GENERAL BUILDING NEWS.

REOPENING OF HACCONNY CHURCH.—The Bishop of Lincoln reopened the Parish Church of Hacconny, South Lincolnshire, on the 14th inst. The Earl of Ancaster, who is lord of the manor, undertook certain sections of the work, including the restoration of the chancel and side chapel, the tower, and the provision of seats for the chancel. The other portions of the work have been effected by public subscription. The whole of the work has been carried out to designs by Mr. C. A. Bassett-Smith, the architect, Messrs. Halliday, of Stamford, being the contractors.

HOLY TRINITY CHURCH, PRINCE CONSORT ROAD, S.W.—On December 12 the Dean of Westminster laid the corner-stone of this new church, upon a site in Prince Consort-road which has been acquired from the Commissioners for the Exhibition of 1881. Towards the total cost, exceeding 25,000l., are apportioned the proceeds of the sale of the site and materials of the church of Holy Trinity, Knightsbridge, erected in 1860-1, after the designs of R. Brandon and H. M. Eytton, and illustrated in the *Builder* of April 21, 1866. The church, designed by Mr. G. F. Bodley, A.R.A., will have a capacity for about 800 persons. The buildings comprise a morning chapel, vestry, a parish-room, and a vicar's house. The style, we learn, will be English Gothic, after the manner and character of a town church in the fourteenth century, with a wide nave and chancel aisles. A new parish of Holy Trinity will be constituted, the benefice of the present Holy Trinity church having been united with that of All Saints' church in Emswiler-gardens.

MONKIE PARISH CHURCH, FORFAR.—Monkrie Parish Church has just been reopened after being restored. The interior of the building has been practically reconstructed, the internal fittings, gallery, and woodwork entirely cleared out, and substantial wood flooring put in. In place of the gallery stretching round the east, north, and west sides of the structure, one main gallery has been erected at the west end of the church, while the pulpit has been removed from its original position adjoining the south wall to the east side. The old windows set in the north wall are converted into lancet windows, and the whole have been glazed with lead light. Over the pulpit in the east gable a new three-light window has been formed. All the fittings have been renewed in pitch pine. The operations were conducted under the supervision of the architect, Mr. James H. Langlands, Dundee. The contractors were:—For mason work, Mr. Charles Dick, Monkiet; joinery, Messrs. A. Bruce & Son, Dundee; plaster work, Mr. John D.ign, Forfar; slater work, Mr. Alexander Hogg, Carnoustie; heating and plumbing work, Messrs. A. L. Peacock & Co., Dundee; painter work, Messrs. P & A. Davie, Dundee.

WESLEYAN CHAPEL, MARLOW.—A new chapel was opened for the Wesleyan community at Marlow recently. The new chapel has been erected by Mr. Y. J. Lovell, builder, of Marlow, from designs prepared by Mr. R. Wellcome, architect, of Marlow. Externally, the edifice is constructed after the Renaissance style, and red bricks have been used with Bath stone dressings. The interior is approached by a semi-circular porch. The floor of the porch is paved with mosaic. On one side of the central gable a staircase has been erected, which leads to a gallery situated at the southern end of the building. Internally the chapel is 31 ft. 6 in. in width by 51 ft. in length, and accommodation has been provided for 300 persons.

COUNTY SCHOOL, MILFORD.—On the 4th inst. new County School buildings were opened at Milford. The schools, which have been erected at a cost exceeding 2,000l., consist of a stone building relieved by Bath stone. They will provide accommodation for 100 students, and there is an assembly hall, classrooms, kitchen for cookery classes, with the usual classrooms, &c. The floors are all wood block. Adjoining the buildings are two playgrounds, divided for boys and girls. The architects were Mr. Walter J. Wood, of London, and Mr. J. B. Gaskell, of Milford Haven, and the contractors Messrs. George Cole & Sons, of Milford Haven.

NATIONAL SCHOOLS, STOCKPORT.—New National day and Sunday schools have been erected at Spring Gardens, Churchgate, Stockport. The site of the present schools and the buildings at Wellington-road South, directly opp site the Stockport Infirmary, have been acquired by the Corporation with a view to the erection of a town hall and

municipal buildings. The new schools will cost about 8,000l. The buildings occupy an elevated site; there are separate departments for boys, girls, and infants, and an assembly-room, the accommodation being for 600 day scholars. Messrs. Stott & Sons, Manchester, are the architects, and Mr. Josiah Briggs, Stockport, builder.

**POST OFFICE, SWANSEA.**—The new Swansea Post Office has been erected on the site of the old Mackworth Hotel, in Wind-street, Swansea, and runs back to the Strand behind. The facade in Wind-street is stone, relieved by carvings and granite pillars. The parapet is surmounted by four stone figures, emblematic of the four countries of Great Britain, Wales and England being central and prominent. There is an ornamental tower above. There is to be a porch over the main entrance. The side elevation in Green Dragon-lane is built of bricks, and there is a separate entrance for the female staff and the public having business with the principals of the various departments. The rear of the building is faced with buff bricks and stone dressings. The entrance for the mailcars and mail staffs is from the Strand. The mails will be driven in and unloaded under the shelter of a glass roof, on to a platform level with the sorting office. Entering the building from the main doorway, the public business room is on the right-hand side of the vestibule, and is furnished with the customary clerks' counters and tables for the public. To the left of the vestibule are the respective private offices of the postmaster and chief clerk. The sorting-room is 132 ft. by 36 ft. On the first floor are rooms for the engineer, and a telephone-room. Opening out of the instrument-room are the superintendent's room, lavatories, &c. On the second floor there are the female clerks' retiring-room, lavatories, a dining-room for the benefit of the staff generally, and a kitchen. On the top floor are a gymnasium, a recreation or music-room, and a messengers' waiting-room. The contract for the erection of the new building was originally given to Messrs. David Jenkins & Co. but the work has been finished by the Government's clerk of works.

**NEW BUILDINGS IN ABERDEEN.**—The Plans Committee of Aberdeen Town Council report having sanctioned the following plans—Additions in connexion with the Royal Lunatic Asylum, Berryden-road, per Mr. George Taylor, clerk of works; two dwelling-houses and shop on the west side of King-street at its junction with School-road, for Mr. John Adams, per Mr. William Ruxton, architect; alterations in connexion with premises on the west side of Commerce-street, for Messrs Brown & Robb, per Messrs Brown & Watt, architects; alterations in connexion with shop front at No. 83, Union-street, for Salmon & Gluckstein, Ltd.; alterations in connexion with shop front at No. 96, Union-street, for Miss Walker, Forsyth Hotel, per Messrs. Brown & Watt, architects; alterations and additions in connexion with bakery on south side of Queen-street, for Mr. Thomas Mitchell, baker, per Mr. R. G. Wilson, architect; fish-curing premises on the west side of North Esplanade, for the Scottish Co-operative Wholesale Society, Ltd. per Mr. James Davidson, architect, Glasgow. The Committee had also before them plans of two dwelling-houses on the east side of Sunnyside-road, for Mr. Charles Aden and Mr. William Petrie, per Mr. James Brown, builder; dwelling-house on the north side of Bedford-place, for Mr. Joseph Shirras, builder; two dwelling-houses on the west side of Forest-avenue, for Mr. Lewis, per Mr. William Smith, architect; two dwelling-houses on the west side of Hlenheim-place, for Mr. Alexander Robson, engineer, and Mr. George Robson, manager, Ceylon, per Mr. John Milne, architect. The Committee approved of these respective plans.

**RESTORATION OF BRECHIN CATHEDRAL.**—The restoration of Brechin Cathedral may now be regarded as an accomplished fact. The object of the recent scheme was "while conserving what still exists of the ancient fabric, to bring back by a judicious restoration as much as possible of its pristine beauty." When the plaster ceiling was taken away it was found that the clerestory remained uninjured. Stone coffins were disclosed, and there were found the foundations of what had evidently formed a Norman building on the site of the present cathedral. The chancel had suffered least from the ruthless destruction of time and Vandal. It was a very beautiful and delicate piece of work of Early English pattern, and the fragment that remained has enabled the architects to continue the design through the restored part. The chancel is a thirteenth century one, coeval, of course, with the building of the cathedral. The composition of the windows is repeated; the roof is of oak, embellished with carvings; and the stone used is the same as that of the original construction. A porch dignifies the principal entrance on the north side. Doors for egress are provided, one from the new north aisle and one from the south transept, in addition to the great western door, which has been left intact. As there was little left to guide the architect in the restoration of the aisles, this involved a fresh design. The outside walls have been brought down to their proper height and roofed over, and the entire result brings into fine relief the famous round tower. Mr. Campbell contributed the expense of the organ case, made of Karri pine; a native of Brechin filled all the windows of the

choir with stained glass, and in the chancel there are fourteen memorial windows. Other windows include one erected by public subscription to the memory of the late Rev. John A. Clark; another by the family of Shilvers Will, of Ardovie. The Communion table, made of fine oak, with Gothic carving, was the gift of the Women's Guild of the congregation. So was the pulpit of oak, with cusps and canopied niches and figures. It stands at the south end of the chancel. On the north respond is a large Corennic granite font, the gift of the Rev. William Duke, of St. Vigean. The architects were Messrs. John Honeyman, R.S.A., and Keppie.—*Dundee Courier.*

**WESLEYAN SUNDAY SCHOOLS, ILFORD.**—The memorial stones were recently laid of the new Sunday school and church premises in course of erection at the rear of the Wesleyan Church, High-road, Ilford. The building, which is to cost about 3,000l., will have accommodation for 550 adults, and will consist of a classroom, 50 ft. by 40 ft., and an infants' class room, 17 ft. by 20 ft. There will be a church parlour and other rooms on the first floor. The building is of bricks, with bath stone dressings, and will be about 30 ft. high. The interior will be lighted by gas, and heated with Grundy's patent hot air system. The architects are Messrs. Gordon & Guntton, and the builders Messrs. E. A. Rourke & Co.

**FACTORY, BRISTOL.**—A new boot factory is being built to the order of Messrs Parsons & Co., boot and shoe manufacturers, at Gerrish-avenue, a part of the Whitehall Estate, St. George. The new factory, when complete, will be 200 ft. by 120 ft., and the basement story will cover an area of 115 ft. by 60 ft. The premises, when complete, will be lighted with the electric light, and the heating of the factory will be by hot-water (low pressure). The flooring will be of granolithic, and the latest type of machinery will be erected in the new factory. The architect is Mr. John Mackay, of Kingswood, and the builder is Mr. Fred. Brown, of Easton.

**COUNTY COUNCIL OFFICES, DUBLIN.**—The building known for several years as the National Club in Rutland-square, having been acquired by the Dublin County Council, has been remodelled for the use of the County Council. The building has been remodelled by Messrs. J. & W. Good, builders, Dublin, according to plans prepared by Mr. W. Colton, C.E., County Surveyor. The painting has been done by Messrs. W. Martin, Son, & Co., and the panelling of the walls and the parquet flooring by Messrs. Goodall & Co., of Manchester. The Council chamber, committee-room, and secretary's office are furnished in Austrian oak.

**GYMNASIUM AND INSTITUTE, CARLETON, STIRLING.**—A new building for the Camelion Institute has been erected in Union-road. The accommodation comprises gymnasium, dressing-room, bathrooms, reading and committee rooms, recreation or billiard room, stores, caretaker's house, &c. The gymnasium is about 50 ft. long by 30 ft. wide, is lighted from the front by four windows, and also by four roof-lights. It may also be used as a concert hall when required, a temporary platform being fitted up at one end. The dressing-room opens off at the west end of the gymnasium, but has a separate entrance from the side street on the north. A set of lockers is arranged along one wall for the use of the members. At the south end are two bathrooms. The reading and committee rooms are on the north side of the gymnasium, and have communication with the gymnasium. The billiard-room is on the west side of the Union-road is built with Ballochmyle red stone and the other portions with red bricks, and the architects are Messrs. Robert Keith & Son, Dundee, and the contractors as follows:—Mr. R. Dalziel, mason; Messrs. Gilchrist & Packman, joiners; Mr. John Smith, plumber; Mr. James Millar, plasterer and slater—all of Falkirk; Messrs. G. H. Nicoll & Co. Dundee, heating engineers; and Messrs. Coulsland & Mackay, Glasgow, ventilating engineers.

**ORANGE HALL, BALLYMACARRET, BELFAST.**—This building, which will be four stories in height, is nearing completion. On the ground floor there will be four shops—two on each side of the main entrance corridor. At the end of the corridor, stairs on both sides will rise to the landing place on the first floor, from which access will be had to two lodge-rooms 50 by 20 ft., and in case of necessity these two rooms can be thrown into one by the withdrawal of a folding door. It is estimated that this room will then give accommodation for meeting purposes to about 500 persons. The second floor will be similarly arranged, and on the third floor there will be several lodge-rooms, store-room, &c. The design, plans, and specifications were prepared by Mr. Cooper, architect (now of Dublin), and estimates for the erection of the building having been completed, the contract was secured by Mr. K. G. Walker at 3,000l. The work is now under the immediate superintendence of Mr. Henry Seaver, architect, Belfast.

**NEW BUILDINGS IN ABERDEEN.**—At a meeting of the Plans Committee of the Aberdeen Town Council on the 12th inst., fourteen sets of plans, including thirteen new dwelling-houses, were submitted. The only item of a public nature was a plan for additions to Rosemount Public School, comprising increased classroom accommodation, rooms for cookery, and manual instruction, &c., at

a cost of 7,000l. The total amount involved in the plans submitted to the meeting was about 20,000l.

**ST. ANDREW'S CHURCH IMPROVEMENTS, BRAMMAR.**—In pursuance of the improvements going on in St. Andrew's Church, Braemar, the vesting of the church has been laid in most of the details of the floor is a full length figure of St. Andrew, the patron saint of Scotland and of the church, with his distinctive cross, and holding in his hand the book of the gospels. The border of the design is made up of the thistle of Scotland and leaves. The original idea of the design was supplied by Canon Paul, the pastor of the church, and was wrought up by Messrs. Minton, Hollins, & Co., Stoke-upon-Trent, who executed the whole work. The work of laying the floor was entrusted to Messrs. Rodger & Baxter, of Aberdeen.—*Aberdeen Journal.*

## SANITARY AND ENGINEERING NEWS.

**DRAINAGE SCHEME FOR WALSALL.**—On the 3rd inst., at Walsall Guildhall, Colonel W. R. Slacke held an inquiry on behalf of the Local Government Board into an application by the Town Council for sanction to a loan of 1,800l. for surface drainage works. The Town Clerk (Mr. I. R. Cooper) explained that it had been found that the sewers in the borough were not large enough to carry off the water which ran into them whenever there was a storm, and this had led to flooding in some of the lower parts of the town, which had occasioned great inconvenience. There were also difficulties in the way of dealing with it at the sewage farm. A scheme for laying a complete system of surface water throughout the borough had been prepared by the Borough Surveyor, the town being divided into fifteen districts. The estimated cost of the whole scheme was upwards of 23,000l., but the Council decided to carry out the work in instalments.—The Borough Surveyor (Mr. R. H. Middleton) having given details of the work to be carried out, the inquiry terminated.

**ABERDEEN HARBOUR WORKS.**—A new entrance to the Upper Dock has been constructed at Aberdeen, and the old Regent Bridge, over the tidal harbour at the foot of Marischal-street, which, with the growth of trade and the development of the Upper Dock, not only had become unsuitable for shipping, but inadequate for the pedestrian and vehicular traffic, is being reconstructed. The new bridge will be built entirely of steel, and will be able to carry two locomotives, with trains, vehicles, and a crowd of people. The new passage, which it spans will be 67 ft. wide, or 20 ft. wider than the passage opened for traffic on the 11th inst., which is only part of the new entrance; but the position has been shifted considerably south of the old passage in order to lead shipping more into the centre of the Upper Dock, and give protection to the vessels lying at the quays. The new bridge has abutments or piers of masonry founded on cylinders, on which it rests, and the south abutment is permanently completed and forms the south boundary of the new passage. The north abutment will be constructed within the cofferdam, which at present forms the north boundary of the new passage. As the Commissioners decided that the cross traffic should be carried on with the least possible interruption during the reconstruction, a temporary bridge had to be provided, and, seeing that the shipping to the new entrance, it was necessary to provide an opening in the temporary bridge in line with the new entrance to let the shipping through. This has been accomplished by a bascule bridge, which is a light structure built entirely of steel. It has two leaves, which open in a vertical plane by revolving on axles or pivots carried in bearings on pilework. The width of the bridge is 14 ft. over all, made up of a carriage-way 8 ft. wide and two pavements about 3 ft. wide. At the opening of the bascule bridge on the 11th inst., there were present Captain Crombie, harbour master; Mr. R. Gordon Nicol, C.E., harbour engineer; Mr. A. Simpson, assistant engineer, and others.

**LONGTOWN WATER SUPPLY.**—Having got the sanction of the Local Government Board to a scheme devised by Mr. John Little, of Carlisle, for the supply of the two parishes of Arthure (including Longtown) and Kirkandrews-on-Esk, at an estimated cost of 17,000l., the District Council have decided to enter into a contract with Messrs. Drummond & Sons, Dumfries, for the work to be carried out at a cost of 10,317l. 13s. 6d. There were sixteen tenders considered by the Council.

## MISCELLANEOUS.

**PROFESSIONAL AND BUSINESS.**—Messrs Davis & Emanuel, architects, of 2, Finsbury-circus, have taken into partnership, as from the 1st January next, Mr. H. C. Smart, who has been in their office for fifteen years. The title of the firm will remain unaltered.—Mr. Charles E. Hawkins, who has served thirty-two years on the Government Geological Survey, has now retired, and intends to devote his whole time to private practice as a consulting geologist.

**SPRAGUE'S POCKET DIARIES.**—We have received from Messrs. Sprague & Co. their Pocket Diary and

Architects and Surveyor's Memorandum Book for 1902. On the usefulness of this small diary, and the tables of statistics bound with it, we have often spoken. They send us also a general pocket diary and memorandum book in another form, the pocket-form being tolerably large, leather-bound, or letter-case, with the diary inserted in one of the pockets.

SALE OF A LIBRARY.—Messrs. Sotheby, Wilkinson, & Hodge, held their last book sale of the season at their rooms in Wellington-street, Strand, on December 17, 18, and 19, when the catalogue included several hundred volumes from the library of the Royal Archaeological Institute. The following were some of the prices realised:—"Monumental Effigies of Great Britain," by W. A. Stothard, 1817, 2l. 16s.; "The Principles of Gothic Ecclesiastical Architecture," by M. H. Bloxham, three volumes, 1882, 13s.; "Medieval Military Architecture of England," by G. T. Clark, two volumes, 1884, 14s.; "Glossary of Terms used in Architecture," by J. H. Parker, 1850, 2l.; "On the Styles of Architecture in England from the Conquest to the Reformation," by T. Rickman, 1841, 1l. 13s.; "Some Account of Domestic Architecture in England," by T. H. Stone, 1851-3, 2l. 12s.; "Miscellaneous Tracts Relating to Antiquity," published by the Society of Antiquaries, 1770-1900, 16l.; "The Decorative Arts, Ecclesiastical and Civil, of the Middle Ages," by H. Shaw, coloured plates and illustrations, 1851, 1l. 6s.; "Horns, Feralis, or Studies in the Archeology of the Northern Nations," by J. M. Kemble, edited by Latham and Franks, numerous plates, 1863, 1l. 16s.; "The Monumental Effigies, Ancient Stone and Lead-coffins, Tiles, &c., in the Temple Church," two volumes, plates, 1813-5, 6s.; "Incised Markings on Stone, found in Northumberland, Argyleshire, and other places by the direction of the Duke of Northumberland," by Rev. J. C. Br. 1846, 9s.

THE INCORPORATED CHURCH BUILDING SOCIETY.—This Society held its usual monthly meeting on Thursday the 10th inst. at the Society's house, 7, Dean's-yard, Westminster Abbey, S.W., the Rev. Canon C. F. Norman in the chair. Grants of money were made in aid of the following objects, viz.:—Building new churches at Pockthorpe, Cumberland, near Norwich, 15l.; St. Marylebone, St. Cyril's, Middlesex, 250l.; and Sandway, St. John the Evangelist, near Northwich, Chester, 65l.; and towards enlarging or otherwise improving the accommodation in the churches at Ashton, St. John the Evangelist, near Chudleigh, Devon, 25l.; Milford Haven, St. Catherine, Pembroke, 60l.; St. Columb Major, St. Columba, Cornwall, 35l.; Wembury, St. Michael, Devon, 15l.; and Radley, St. James, near Abingdon, Oxford, 30l.; in lieu of former grant of 20l. Grants were also made from the special Mission Buildings Fund towards building Mission Churches at Preston, St. Matthias, near Brighton, 20l.; and West Bromwich, the Good Shepherd, Staffordshire, 25l. The following grants were also paid for works completed:—Forest Gate, St. Edmund, Essex, 150l. on account of a grant of 250l.; Cardiff, St. Helen, 200l.; Hvo. All Hallows, near Rochester, 20l.; Eastcombe Mission Church, near Stroud, Gloucester, 15l.; Churwell Mission Church, near Dewsbury, 25l.; Cowper Quay Mission Church, near Blyth, Northumberland, 20l.; and Steelworks Mission Church, near Ebbw Vale, Monmouth, 20l. In addition to this the sum of 257l. was paid towards the repairs of twelve churches from the funds of the Society.

THE ELEVATIONS OF BUILDINGS AT BELFAST.—A deputation waited upon the Belfast County Council recently in order to state their objections to the clause making it compulsory that drawings showing the elevations of buildings overlooking any street in which it is proposed to erect or alter any building, as well as the height, character, and design of the proposed building and of any adjoining buildings should be supplied to the City Surveyor. The clause states that any person aggrieved by a decision of the surveyor may appeal to the Recorder of the city, whose decision shall be final. The deputation consisted of the following:—Messrs. W. J. Gilliland, W. J. Fennell, W. B. Fennell, N. Fitzsimons, A. T. Jackson, J. St. J. Phillips, and W. B. Blackwood. Mr. Gilliland said he represented the Ulster Society of Architects, and through them the proposition on in Belfast. The proposed clause was objected to, and the alterations made had not improved matters, but rather the reverse. The City Surveyor was constituted the censor for Belfast in architectural matters, a position which they as architects thought no City Surveyor should occupy. There should be by-laws to assist him in forming his opinion. It might often be very difficult to supply the particulars demanded in regard to neighbouring buildings, the owners of which might be at daggers drawn with the person erecting the new building. The appeal to the Recorder was an illusory form of appeal, being simply an appeal from an opinion, and all arguments would simply leave the matter where it was originally. He hoped they were all working to improve the architectural character of the streets of Belfast, and they again tendered their assistance publicly to the Corporation to help them in framing a clause having this object in view; but they objected to the possibility of an architect's design being vetoed on the mere opinion of the City Surveyor. Mr. W. J. Fennell said they had made a wise regulation as to

the thickness of the walls of the buildings in the city, and they ought to have a similar clause as to the height of buildings in ratio to the width of the streets. They objected to the City Surveyor saying, "Thus far and no further," although they did not object to Mr. Gilliland's taking a general view of the clause. The Lord Mayor asked if the deputation had prepared a clause in substitution for the one they objected to. Mr. Gilliland answered in the negative. The Lord Mayor said in case of appeal, the Recorder would hear the evidence and act upon it. The deputation then retired.

ARCHITECTURAL SHAMS.—Mr. E. R. Taylor, head master of the Birmingham School of Art, distributed the prizes at Brightlemston School, Birkenhead Park, Southport, on the 14th inst. In his address Mr. Taylor spoke of the value of drawing as a part of education. They learned to draw because it was a help to other studies, and another reason was that they might help to lessen the ugliness of to-day. Until about a century ago, he said, all things made by man, from buildings to articles for kitchen use, had in them some element of beauty and fitness, and generally so much of rightness and beauty that the former could not be pulled down without protest, and the latter were gathered into museums. Looking at the two extremes of each, they must admit there were distinct lines of demarcation between beauty and ugliness. In architecture the manor houses and cottages on the Cotswolds, or the half-timber work of Cheshire and Warwickshire, were things of beauty, and in contrast to most of the modern mansions and workmen's cottages. If they admitted that beauty and ugliness were not convertible terms, it was worth while to inquire into the cause of so much of the present-day ugliness. If they looked at Turkey, India, and Japan they would find that good work continued to be produced in these countries until recently. The work, however, was now contaminated by modern European influences, the same influences which had made our work in this country bad. Japan was the most recent and lamentable instance. It had hurried to adopt western ideas of life, and its exhibit at the Glasgow Exhibition was the most melancholy sight there. One cause of this present-day ugliness was the attempt to revive old styles. The notion then we could bring to life dead styles was a mistake of the study of history, and yet it still prevailed. Another cause of bad work was the love of shams—not toleration only, but a real love of shams. When he began work in Birmingham, students and others on showing him their work generally reached the climax of praise by stating it was like something it was not. As an instance of this he cited the treatment of a rubble wall which had a beauty of its own with its irregular mortar joints, which gave a texture to secure which in other things great expense was often incurred. This was spoiled by ruling straight mortar joints at all angles to make it less like rubble work. A final cause affecting all the others was the judgment by money value. This tainted all their work. In closing, he advised them in their pursuit of beauty to study simple and right construction, to study old work to see how it grew, to love nature, the source of all that was beautiful, and to live simply.

FLORENTINE INDUSTRIES.—In a special report recently made to the Foreign Office by Mr. Percy Chapman, British Consul-General, on the industries of the province of Florence, it is stated that the Florentine mosaic (hard stones) industry, quite a specialty, once an important world-wide industry, is now greatly affected by the competition of inferior mosaics of softer stones, as well as by fashion. The important Government works for hard stone-giving employment to twenty-one men, are, however, still in existence. It is calculated that this industry gives employment to 150 hands, including some children under fifteen years. The working of ornamental stones, and especially of Carrara marble and serpentine (*verde di Prato*) holds a considerable place among the industries of the province. The working of marble and alabaster into statues and statuettes of an industrial type likewise occupies a considerable number of workmen, partly working at their masters' studios and partly at their own homes. The approximate number of workmen can be given as 135. The industry of mosaics, is almost exclusively supported by British and American demand. Of stone quarries there are 202 in actual work in the province, of which four are serpentine (*verde di Prato*), five calcareous stone (*alberese*), two grindstone (*enfolide or granitone*), five hierrospite stone, three calcareous tuff, 170 "arenaria" (hard grey stone for olive presses), eleven building stone (*pietra forte*), and two majolica earth. The serpentine (*verde di Prato*) serves for architectural and ornamental purposes. These quarries, situated at Monferatto, near Prato, have been worked from a very early date. In 1305 they were taken on lease by the Opera del Duomo to employ the stone in ornamental works on the Cathedral. At present they are in the hands of two private persons, and their output valued at 1,000l. per annum) is almost entirely used in Florence, partly for repairs to the Cathedral and other churches of the city, and partly in making statuettes, bowls, vases, and other ornamental objects. With regard to the calcareous stone (*alberese*), some is cut into flags for street paving, and the remainder is employed in masonry in its

original state, or else reduced into chippings and utilised in the metalling of roads. The average output of these quarries may be calculated at about 3,200l. per annum. The tuff is utilised as a very common building stone, the greater part being reduced into gravel. The arenaria stones, including the varieties of "macigno" and "pietra forte," enjoys an excellent reputation as a first class architectural and building stone; the largest output is obtained at Fiesole, Carmignano, Lastra a Signa, and Galluzzo. The Fiesole quarries alone give an approximate annual output of 10,000l. The total number of quarries is 1,300. This stone is frequently used outside Tuscany and even exported abroad.

ARBITRATION CASE.—Mr. G. F. Deacon, C.E. the arbitrator appointed to determine the dispute between Messrs. Holme & King and the Merthyr Urban District Council in connexion with the construction of the new reservoir at Upper Neundd, has issued his award. Messrs. Holme & King in 1875 contracted with the Council to do certain work at the new reservoir, the contract upon a schedule of prices being estimated to amount to about 77,000l. They were to quarry the stone and deliver it on the works, and to supply the cement and lime necessary for making the concrete in which the masonry was to be set, the setting of the masonry to be done by men employed on behalf of the Council. The contract was to have been concluded in three years, but there were difficulties in the way of completion within the stipulated term, and the period was extended. The work still lagged, and from time to time the contractors sent in continuously increasing claims to the Council for damages for delay, caused, as they alleged, by their men being kept idle and unable to go on with their work, consequent upon the Council's men not carrying out expeditiously their portion of the undertaking. Eventually the position became so strained that in June last the contractors were relieved of their contract. Messrs. Holme & King then brought up their claim to no less than 37,000l. The Council declined to pay, and so the matter under the contract was referred to Mr. Deacon, the consulting engineer, who took evidence in London. The proceedings extended over a month, Mr. Joseph Shaw, K.C., appearing for the Council, and Mr. Leyton, Liverpool, for the contractors. The amount of the award is 2,030l., each side to pay their own costs.—*Western Mail.*

STRAND IMPROVEMENT AWARD.—On the 19th inst. Mr. John Troutbeck, High Bailiff for Westminster, and a special jury sat at the Surveyors' Institution, Westminster, to assess the amount of compensation to be paid by the London County Council to Mr. W. H. Collingridge of Aldersgate street City, for the freehold premises, 17 and 18, Wych-street, Strand, compulsorily acquired for the purposes of the Strand improvement scheme. The jury awarded the claimant 11,084l., including everything. The High Bailiff decided that the claimant had not lodged full particulars of his claim within a reasonable time, so as to allow the Council to make him a proper offer, contrary to Section 10 of the Act. The effect of this was that the claimant pays all his own costs and half the cost of the inquiry.

NEWCASTLE BUILDING TRADE ASSOCIATION.—The annual dinner of the Newcastle, Gateshead, and Tyne District Building Trade Employers' Association was held on the 18th inst. at the County Hotel, Newcastle. The chair was occupied by Mr. Walter Lowry, and the President, Mr. Alex. Pringle. After the loyal toasts, Mr. W. T. Weir proposed the "Mayors and Corporations of Newcastle and Gateshead." The Mayor of Newcastle, in responding, said careful observers must notice that a great transformation was taking place in Newcastle. If the Corporation was encouraged by having the confidence of the ratepayers, Newcastle ere long would be opened out in various directions. Its heart would be extended and its suburbs developed. The main thoroughfares in the heart of the city were too narrow and too few. They required duplicating. He hoped that before long not only would Grey-street be carried up to the Hay Marker, but that they should have a great thoroughfare uniting the vast population of Heaton with that of Arthur's Hill. He hoped the Corporation would have sufficient intelligence to secure Singleton House property as a future home for the municipal buildings. If the purchase was delayed, instead of costing 120,000l. or 140,000l., it might cost them twenty years hence 300,000l. Referring to the electric tramways, he said they were putting the cars on the rails as soon as the manufacturers could deliver them. In six months probably they would be fully equipped and have two or two and a half minutes' service in the principal thoroughfares. The Mayor of Gateshead also responded. Alderman D. Ranken, Sunderland (President of the Northern Counties Federation), proposed the "Newcastle, Gateshead, and Tyne District Branch of the Northern Counties Federation of Building Trade Employers." He spoke of the unity displayed in Newcastle by members of the building trade, when they held out for nine months against what they believed to be the unfair and unjust demands of the workmen. There were still some firms outside the Building Association whom he thought should throw in their lot with the Federation. He also suggested the advan-

bility of getting the foremen to join the employers' society. So long as the foremen remained members of the men's society they would not, as employers, secure the full measure of assistance in carrying out their work which they ought to have. He alluded to the recent articles in the *Times* newspaper and other publications as to the limitation of work on the part of the men. He trusted one effect of the exposure would be that in future the men would do a fair day's work for a fair day's wage. The President (Mr. Walter Lowry), who responded, was received with musical honours. He spoke of the very large number of bankruptcies which there had been in the building trade throughout the past year. There were two reasons why they occupied this unfortunate position. The first reason was that people entered the building trade with too little capital, and the second reason was that they did not know the proper prices to put down to cover the work they had to do. Referring to the subject of the restriction of output, as mentioned by Alderman Ranken, he said the doctrine that if three men did the work of two it would make employment for another man was a foolish argument, which could only rebound on the heads of those who made it. They had seen the fruit during the year of one of the most disastrous strikes known in the building trade for a long time. It was an extraordinary thing that a body of men should have the power to dislocate the whole trade throughout the North of England for nine months. He hoped the time was not far distant when some other method would be established for settling disputes. He felt hopeful that in the future conciliation would play an important part, and he instanced the success of the Conciliation Act in New Zealand.

**SOUTH WALES BUILDING TRADES FEDERATION.**—A meeting of this Federation was held at the Master Builders' rooms, 10, Dynevor-place, Swansea, the President, Mr. W. Thomas (Cardiff) presiding. Letters were read with reference to the Foremen's Association. It was resolved that the secretaries of the various associations affiliated should be written to for a complete return of their members, together with the amount of wages paid by each member during the last twelve months, this return to be sent in by the last week of January or the first week of February. In accordance with the resolution passed at the previous meeting held at Cardiff, the Swansea delegates submitted the draft of the new rules which this Association had drawn up, and intended offering to the Plasterers' Society in May next. After a long discussion they were eventually approved, of subject to a few alterations, and certain power was given to the Swansea Association for dealing with same. It was resolved to adopt the crest submitted by the National Association, and that each association affiliated with this Federation be advised to obtain one. Resolved that the next meeting be held at Newport about the first week of March, date to be arranged by the President and secretary.

## LEGAL.

## BRADFORD ARCHITECT'S CLAIM.

At the West Riding Assizes, Leeds Town Hall, on the 18th inst., before Mr. Justice Ridley, an action was brought by Mr. Wilson Bailey, architect, of Bradford and Keighley, to recover 171l. 3s. from Mr. James Longton, schoolmaster, of Keighley, for services rendered. The defendant had paid 87l. 1s. 11d. to the plaintiff, and brought into court a further sum of 81. 4s. 6d., which sums, he contended, were sufficient to satisfy the claim. Mr. Scott Fox, K.C., and Mr. Vaughan appeared for the plaintiff; and Mr. E. Tindal Atkinson, K.C., and Mr. Compton defended.

In opening the case, Mr. Vaughan said that the claim was for services rendered in respect of the preparation of plans, the getting out of quantities, and the obtaining of tenders for certain houses which the defendant contemplated building in Highfield-lane, Keighley. The defendant's intention at first was to build seven houses on the back portion of the land. The plaintiff prepared plans for these, and then the defendant said he would build five houses on the front portion. The defendant instructed the plaintiff to put all the sculleries on the left-hand side of the houses, and then he had the sculleries of the first and third houses reversed, which necessitated fresh plans. The plaintiff then obtained tenders from builders for the erection of these houses. Later the defendant decided to have fresh plans prepared with the sculleries inside the houses. The defendant continued to change his mind, and finally decided not to build. The defendant set up in defence an agreement in writing, dated January 7, 1898, alleging that in this the plaintiff estimated the cost of the buildings at 2,250l. 10s., that when the tenders were obtained he amounted to 2,206l., and that by reason of that the act services became wholly worthless. The defendant further said that the plaintiff did not prepare a second set nor obtain further tenders, or if he did the cost was 3,100l., which was far more than the estimate.

Mr. Compton intimated that liability was not denied, the sole question being as to the amount which the plaintiff was entitled to.

Mr. W. J. Morley, architect, Bradford, said that

he considered the plaintiff's charges for the work were low. The Institute's charges would have been about 300l. Mr. Sugden, architect, Keighley, said that his charges for the same work would have been over 200l.

Called on behalf of the defendant, Mr. John Connon, architect, Leeds, declared that a fair remuneration for the work done would be about 95l.; and Mr. Charles France, architect, Bradford, said that he thought the amount the defendant had paid into court, 92l. 6s. 5d., was reasonable remuneration.

The defendant said that in 1887 Mr. Bailey had built for him a number of houses on the Highfield-lane plot. He intended building other houses on the same plot in 1898, and entered into an agreement with Mr. Bailey for the preparation of plans at 5 per cent. on the cost of the houses. He had every wish to pay the plaintiff fairly for the work he had done.

His Lordship found for the plaintiff for the amount claimed, holding that there was no agreement in regard to the cost of the houses.—*Yorkshire Post*.

## ALLEGATIONS AGAINST BIRMINGHAM ARCHITECTS.

At the Birmingham Assizes last week, before Mr. Justice Kennedy and a special jury, the case of *Forbes and Charles v. Lloyd* was concluded. Mr. Hugo Young, K.C., and Mr. McCarty appeared for the plaintiffs; and Mr. A. T. Lawrence, K.C., and Mr. Stubbs for the defendant. The plaintiffs Charles was a builder, and Forbes and the defendant were architects, and the action was brought to recover damages for libel. The statement of claim alleged that before the month of May, 1900, the plaintiffs prepared ground plans for the erection of an arcade and theatre upon the site of the Theatre Royal, and a description of the plans was published in the *Daily Argus* on October 4, 1901. On October 8 the defendant, in a letter to Mr. F. S. Bolton, falsely and maliciously wrote and published of the plaintiffs, *inter alia*, the words following:—"Your architect and builder have practically appropriated in its entirety my scheme." And on October 15 the defendant wrote to the editor of the *Birmingham Daily Mail*, and caused to be published in the issue of that paper of that date a letter repeating the accusation in different terms. The defence was simply a denial of the matters alleged. It appeared that some time before the defendant prepared plans and submitted them to certain gentlemen who were endeavouring to form a syndicate to acquire the site in question, which, however, was ultimately secured by Mr. Bolton, who employed the plaintiffs as builder and architect, and they prepared ground plans and published them as stated. Before their publication the defendant saw the plaintiff Charles, and tried to get plaintiffs to purchase his plans for 100s., and to have him appointed as architect, but they did not fall in with these proposals. The defendant, in his evidence, reasserted his belief that the plaintiffs had appropriated his ideas. He was also allowed to give evidence in mitigation of damages as to the alleged close resemblance of the two plans. The plaintiffs denied on oath that they had seen the defendant's plan at all before they prepared their own. The jury found for the plaintiffs; damages, 50l. to Charles and 25l. to Forbes.

## LAVATORY ACCOMMODATION.

At Lambeth Police-court, on the 10th inst., the South-Eastern and Chatham Railway Company were summoned, at the instance of Mr. J. S. Pointon, a sanitary inspector in the service of the Camberwell Borough Council, to answer the complaint that there was an insufficiency of lavatory accommodation at their station at Nunhead, Mr. G. W. Marsden, solicitor to the council, supported the summons on their behalf, and said the proceedings were instituted under Section 27 of the Public Health (London) Act. Nunhead Junction was a station at which a very large traffic was done. There were 1,000 season-ticket holders, and in addition the station staff and a number of coal porters working at the adjacent coal siding had to be accommodated. The council were of opinion that the lavatory accommodation provided was insufficient, and they had been in communication with the company, who had, however, absolutely refused to provide any further accommodation. He submitted that the station was a "building or house" within the meaning of the section. Mr. Alexander Glen, who appeared for the company, said the main question that arose in this case was whether the provisions of the statute in question applied to a railway station which was erected under the powers of a special Act of Parliament. Inspector Pointon and Dr. Stevens, Medical Officer of Health for Camberwell, having given evidence in support of the summons, Mr. Glen pointed out that the notice served by the Council was in general terms and did not say what accommodation was necessary. Mr. Francis: Do you want this case to go off upon a technicality or are you prepared to do anything? Mr. Glen said he took the point that the notice was not sufficient, and he also took the more important point that the station was built in pursuance of the special Acts of the railway company,

and that the Act under which these proceedings were taken did not apply. Mr. Francis.—In other words, you say I have no jurisdiction in this matter. Mr. Glen.—In the first place, that the Local Authority have no jurisdiction, and that, therefore, it follows that they have no power to enforce compliance with their requirements in this court. In the course of some further discussion, Mr. Glen mentioned that the company contemplated rebuilding the station, and, consequently, did not want to go to any large expense in regard to the present structure. Eventually the further hearing of the case was adjourned for a fortnight, with a view to an arrangement between the Council and the company.—*Times*.

## ANCIENT LIGHT DISPUTE IN FINSHURY

## MANDATORY INJUNCTION AGAINST A BUILDER.

The case of the Home and Colonial Stores v. Colls came before the Court of Appeal, composed of Lords Justices Vaughan Williams, Romer, and Cozens-Hardy, on the 20th inst. for judgment on the appeal of the plaintiffs from an order of Mr. Justice Joyce in the Chancery Division on December 19, 1900. The case was fully reported in the *Builder* of December 8 and 20, 1900.

The facts were shortly these:—The plaintiffs are an incorporated company having a number of shops in different parts of the country, and brought the present action to restrain the defendant from erecting a proposed building so as to obstruct the plaintiffs' ancient lights. The premises in question were the head offices of the plaintiffs, situate in Worship-street, City. The plaintiffs' building was situated at the corner of Paul-street and Worship-street, but the only part concerned in the action was the Worship-street frontage. The plaintiffs were lessees of the premises from the Ecclesiastical Commissioners. The defendant was a builder, and also lessee of premises which he was erecting on the opposite side of the road, which was about 41 ft. wide. The premises which formerly stood on the site were 10 ft. high, and the defendant had proposed to erect a building to a height of 42 ft., which the plaintiffs said would obstruct their lights. The main question to be decided was as to the apprehended injury to the light coming to the windows on the ground floor of the plaintiffs' premises, the portion of the ground floor opposite the defendant's premises being used as an office. It consisted of a large room 11 ft. 10 in. high and of unusual depth, the back wall being covered with 30 ft. from the Worship-street front, and it had no window nor source of natural light at the back. This room, which was used by clerks in the plaintiffs' employ, was fitted with electric light, and the result of the evidence given at the trial was that it was the custom to use the electric light in the back part of the room on most days. The windows on the ground floor were of large size, the uppermost part of each window being filled with coloured glass to a depth of 20 in. from the top, and there were wire blinds fixed at the bottom of each window. At the trial a great amount of expert evidence was given, and it was practically admitted by the plaintiffs' witnesses that the defendant's building might be raised to a height of 25 ft. from the ground without any material injury to the plaintiffs. Mr. Justice Joyce was of opinion that there was no evidence to show that any extraordinary amount of light from the Worship-street windows had been enjoyed for anything like the twenty years, and that the proposed new building of the defendant would not affect the selling or letting value of the plaintiffs' premises. He said that if erected to the proposed height of 42 ft. no part of the defendant's building would be high enough to reach any line drawn at an angle of 45 deg. to the horizon from any point in the base or sill of either of the windows in question belonging to the plaintiffs. But he thought the defendant's building would for its width of 30 ft. directly south of these windows cut off a portion of the sky area then visible from within the plaintiffs' office, and would, he thought, to some extent necessitate the more frequent use of artificial light in the front part of the office. Apart from any question with respect to the back part of the plaintiffs' premises and to the extraordinary amount of light from the windows in the absence of illumination by artificial light, the plaintiffs' premises would still, in his lordship's opinion, after the erection of the defendant's building be well and sufficiently lighted for all ordinary purposes of occupancy as a place of business. In his lordship's opinion, the plaintiffs' premises were unusually well lighted. If, however, as the plaintiffs contended, they were always entitled to the full amount of light they then enjoyed, they would have a good cause of action, although it might be doubted whether the diminution of light to their building by the defendant's proposed building would entitle them to an injunction. The learned Judge came to the conclusion that he must follow the decision of Mr. Justice Wright in the case of *Warren and others v. Brown* (reversed on appeal on the 13th ult. This leading case was reported in the *Builder* of August 11, 1900, and November 16, 1901) and dismissed the action with costs. Hence the present appeal of the plaintiffs.

Immediately after his Lordship's judgment, the plaintiffs gave notice of appeal, whereupon the

defendant proceeded with the completion of his building.

The arguments on the appeal were heard on December 2 and 3, when their lordships reserved judgment.

Mr. Hughes, K.C., and Mr. W. E. Vernon appear for the appellants, and Mr. Bray, K.C., and Mr. O. L. High Clerk for the respondents.

Lord Justice Cozens-Hardy read the judgment of the Court, which was to the following effect:—The appeal, he said, raised a question as to the nature and amount of evidence required to entitle a plaintiff to relief by way of injunction for the protection of ancient lights. The action was tried before Mr. Justice Joyce in December, 1900. That view of the law was accepted by the defendant's counsel in the cross-examination of the plaintiff's witnesses and in the examination of the defendant's witnesses, and as the Court read the judgment was adopted by Mr. Justice Joyce. Mr. Justice Wright's decision had recently been reversed by that Court, and the true rule of law with reference to the interference with ancient lights had been authoritatively laid down thus:—"Ancient lights are interfered with substantially, and real damage thereby ensues to tenant or owner, then that tenant or owner is entitled to relief." In this sentence "substantial" did not indicate any particular percentage. In the case of *Back v. Stacey* it was laid down that, in order to give a right of action and sustain the issue, there must be a substantial privation of light, sufficient to render the occupation of the house uncomfortable, and to prevent the plaintiff from carrying on his accustomed business (that of a grocer) on the premises as beneficially as he had formerly done.

Continuing, his lordship said that without substantial interference there was no right of action, and, in addition, in order to obtain an injunction the plaintiff must establish substantial injury, suffered or threatened. There was no standard or fixed amount of light to which alone a plaintiff was entitled. He must be inconvenienced or frustrated. He must recognise the necessity of give and take matters of this nature. But there might be real damage to the owner or occupier of a building used for particular purposes, or reasonably adapted for particular purposes, although there would be no real damage if the building were not used or reasonably adapted for such purposes. The application of these principles was far easier when the building which was complained of was erected and damages only were claimed, but they had to be applied when the plaintiff came for an injunction before the building had been erected. It was the duty of the Court to arrive at the best conclusion it could upon the effect which the proposed building, if erected, would produce, and if the Court was satisfied that in that event the plaintiff was entitled, as a matter of law, to an injunction to prevent the defendant from interfering with his ancient light, or in other words to restrain the defendant from committing a wrongful act. The difficulty of applying the rule in a *quia timet* action might well induce the Court to scan the plaintiff's evidence with severity, especially where an angle of 45 deg. was left. It was settled, however, by the law, that a man might always build up to an angle of 45 deg., but, in judging of the probable effect of a proposed building the Court might not unreasonably regard the fact that an angle of 45 deg. would be left as *prima facie* evidence that there would be no substantial interference, and might require this presumption to be rebutted by satisfactory evidence. That seemed to be the result of the authorities. It remained to apply those general principles to the present case. His lordship then referred to the evidence, and said with regard to the large clerks' room on the ground floor it was impossible to hold that the plaintiffs would not suffer "real damage" if they had to consume and pay for more electric light than hitherto. As this Court read the judgment of Mr. Justice Joyce it was a finding in favour of the plaintiffs that real damage would result, though light enough would be left for ordinary purposes of occupancy as a place of business, and there was no finding that the interference was not substantial. In the opinion of the Court, on the balance of evidence, substantial interference and "real damage" would result; and the proper judgment would have been to grant an injunction in the settled form known as the *Yates v. Jack* form. But immediately after the action was dismissed with costs the plaintiffs gave notice of their intention to appeal. Notwithstanding this the defendant had proceeded with and completed the erection of his building. Under those circumstances there was only one course open to this Court, and that was to reverse the judgment of Mr. Justice Joyce and grant a mandatory injunction requiring the defendant to pull down anything erected in breach of the terms of the injunction and to pay the costs in that Court and in the Court below.

Lord Justice Vaughan Williams said that he wished to add for himself that, so far as the rule of 45 deg. was concerned, he doubted very much whether that rule, as the law was now settled, could be regarded even as a rough measure of the right of the owner or occupier of ancient lights.

Their lordships, on the application of Mr. Bray, suspended the operation of the injunction for a certain time to enable the defendant to lodge an appeal to the House of Lords.

#### A LEEDS FIRM'S COPYRIGHT CATALOGUE.

In the Chancery Division on the 20th inst., before Mr. Justice Joyce, the Farnley Iron Co., Ltd., were granted an injunction restraining Messrs. Warrington & Son, of Berry Hill Works, Brook-street, Stoke-on-Trent, from printing and publishing any catalogues, &c., containing any plates or illustrations, or tabulated lists of bricks copied from or being a colourable imitation of those in the plaintiffs' book called "Farnley Price List—Glazed Brick Section."

Mr. Manby, for the defendants, said his clients had undoubtedly copied the catalogue unwittingly, and they submitted to the injunction.

#### RECENT PATENTS:

##### ABSTRACTS OF PATENTED INVENTIONS.

15,187.—A LIFT-VALVE FOR BATH AND LAVATORY SERVICE: *M. M. Brophy*.—The projecting flange of the casing has a screwed cap and inclined edges, projections from the valve which slides in the cap fit with the inclined edges, and also engage with slots in the top disc, which is forced away from the valve with a coiled spring; the valve is opened or closed with the turning of the handle, which causes the projections from the valve to slide upon the inclined edges.

15,236.—AN APPLIANCE FOR TELEGRAPH AND OTHER POSTS: *L. K. Forsythe*.—Concrete bases for posts are fashioned with cross-sections and with ties, set lengthwise, of flat or angle section, upon their faces or angles at the bottom. The ties, which are bolted in position, may be joined underneath. The post is fastened in its footing with clamping-rings or with cross-tie bolts.

15,239.—A CLIP-AND-SLEEVE JOINT: *L. W. Bates*.—A flexible connexion has a protecting sleeve composed of coils in the form of wire fabric, whose axes lie in planes that are perpendicular to the axis of the sleeve, which is secured to the connexion with bolts and straps, a strip of leather being interposed. A similar fastening is used for attaching the pipe ends to the connexion.

15,297.—A CONTRIVANCE FOR USE WITH BALL-AND-FLOAT VALVES: *A. Hill*.—The inventor's object is to help the action of the float as it rises and closes the valve. He causes the valve-spindle to project above the casing, and loads it with weights, which will expedite the closing of the valve, and can be altered in their amount with a variation in the pressure.

15,322.—ADJUSTMENT OF SKY-LIGHTS: *A. Minnie*.—Ventilation is obtained, and rain and snow are excluded, by means of a set of louvres or Venetian laths, within which the skylight is placed. The frame of the louvres rests, under normal conditions, upon the projecting frame, and is pivoted upon the axis of the skylight, which, together with the louvre-frame, can be turned clear of the window-frame. A stay-rod serves for adjusting the opening of the skylight within the louvre-frame.

15,328.—A FIRE-EXTINGUISHER: *A. C. Badger*.—Vertical wires, having projecting feet, carry the acid-bottle. They are encompassed with a ring, and are bent against the shoulders of the bottle. The stopper—which will fall out when the bottle is inverted—has a guide made of wires that hangs from a ring screwed on to the edge of a disc, which is screwed on to a plug beneath the capping, whereby one can adjust the height of the outer cage, in order that it may bear against the shoulder of the bottle. In another form the carrying wires are not bent inwards against the bottle.

15,344.—A SEPARATOR FOR CEMENT, &c.: *W. F. Gorham*.—For purposes of testing, the glass container, which has a small metallic cone at its base, is pressed against an india-rubber ring, whilst compressed air is forced into it from the serrated end of a tube down a branch of which the fine particles are carried, and so to the expansion chamber. The specification extends to apparatus upon a somewhat larger scale, in which the receiver is set at an inclination from the feed to the tail-end, and is fitted with helical feed and discharge arrangements.

15,349.—A GUARD FOR WOOD SAWING AND PLANING MACHINES: *E. L. Dutton*.—A curved steel blade or riving knife, which covers the back of a circular saw, and a front guard of aluminium or other metal, are pivoted to a pin upon an adjustable arm. A link, which is clamped to one end of a lever attached to the pin, will adjust the guard to the cut, and a screw in the other end of the lever will adjust the knife. In the case of a hand-feed planing machine, a guard mounted upon a pivoted arm that is pressed against the fence with a spring covers the cutters, and the guard is forced aside by the work in passing over the cutters.

15,352.—BRICKS, BLOCKS, SLABS, &c., FOR BUILDERS' USE: *T. Rouse*.—These are fashioned with a central body, core, or part of lime-concrete faced with cement-concrete; the former material being composed of unslaked lime mixed with sand, gravel, pulverised stone, clinkers, slag, and so on, and steam in a closed mixer; and the latter material of Portland or other cement mixed with sand, broken granite, &c., and wetted with steam or water. The articles are pressed in moulds and subjected to steam or vapour at 212 deg. Fahr., to ensure a union between the two materials and to render the lime-concrete weatherproof.

15,388.—CONCRETE FLOORS: *M. Koenen*.—The ribs are laid upon wooden beams that are sustained in part with suspension of the rods, and repose upon the lower flanges of the girders. The ceiling is secured to the beams which will sustain the temporary arching centres.

15,390.—A CONTRIVANCE FOR DOMESTIC FIRE-PLACES AND HEARTHES: *B. A. Lillie*.—For utilising waste heat a casting which has a covering of glazed tiles is inserted under the bars of the grate, underneath the bars at the back is fitted a triangular fire-brick, and sloped cross-strips of metal which are disposed immediately under the bars serve to turn the waste heat into the hollow hearth.

15,395.—HOT-WATER APPARATUS FOR SWIMMING-BATHS, VATS, &c.: *F. Stoll*.—Pipes join a cylinder to the bath or tank, opposite to one of them is the water-supply pipe, and between the steam-pipe and the base of the cylinder is a pipe, fitted with a valve and fixed in such a manner that when the steam-valve and the water-pipe are closed the body of water will circulate and become re-heated by an auxiliary supply of steam.

15,416.—IMPROVEMENTS FOR CRANES: *H. A. L. Barry*.—As an improvement of the invention No. 20,606, of 1899, the hoisting-rope is secured to a link, which is hung from a lever having at its free end a pawl on the axle of a spring-drum, on which is wound a rope attached to the fall-block. Beneath that lever is provided another pivoted lever, of which the other end carries a weighted pawl that will engage with a spur-wheel upon the axle of one of the carriage wheels. Side-links join the pulley of the fall-block to the book—both being free to move in a slot in the fall-block to which is pivoted a lever which is also pivoted to an extension of one of the links. Whilst the carriage is at rest the spring in the drum is overpowered by the weight of the fall-block so that the plunger will be sustained as lifted, but in lowering, together with a retrograde movement of the carriage, the weighted pawl will lift the first-named lever through the second-named lever so as to free the first-named pawl for its engagement with a wheel and to stop the paying-out of the rope together with the fall of the fall-block. The inventor further contrives that the plunger shall be moved downwards in relation to the book for engagement with a trigger-lever and dumping of the bucket, and that, in a variant form, the tripping-plunger shall be automatically worked with a cam upon the pulley-axle of the fall-block after the load has been raised, carried to the point of discharge, and lowered.

15,432.—MANUFACTURE OF PORTLAND CEMENT: *A. Gomb*.—The inventor substitutes, besides bitum for the customary shale or clay, in order that the materials may be fused without the employment of less than 60 per cent. of lime. He also uses baryta as carbonate or silicate, &c., for the lime, in part, and for making the cement recommends sandstone, or sand, chalk, or limestone, with the residue derived from extracting copper from burned pyrites known as purple ore, and, it may be, clay, to be wetted and fashioned into small lumps; the melted product is granulated in water, drained, dried with the waste heat from the furnace, and then ground. For the furnace, which should have an oxidising flame, confer No. 11,301 of 1900.

15,446.—CONCRETE WALLS AND PARTITIONS: *G. L. Mouchel*.—Metal bars are embedded in the concrete, so as to afford resistance against thrusting and shearing. The outer walls of a site are built up of slabs, which are inserted between grooved pillars of concrete or of iron, and have their upper and lower edges tongued and grooved, metal rods being used for strengthening purposes. During the progress of the work concrete beams are moulded between the pillars over the slabs, from time to time, and grout is run into the joints. Other adaptations are specified.

15,453.—FIREPROOF FLOORING: *L. Pitsch*.—For constructing fireproof floors are devised slabs or blocks, having recesses in them, which are to be laid upon girders and ribbed joists, and to be embedded in concrete or cement.

15,501.—BURNERS FOR BLOW-PIPES: *T. Fletcher, A. Nell, and Flecker, Russell, & Co.*—The Dunsen burners are intended for use in small "blast furnaces," more particularly those that serve for experimental purposes and are equipped with crucibles; for a protection of the gauze from the heat of the furnace after the blast has been turned off the gauze-plate is fitted with a guard-cap or cover.

15,521.—A CONTRIVANCE FOR THEODOLITES: *H. D. Hoskold*.—To enable one to take observations down a shaft by turning the telescope into a vertical position, the vertical axis of the theodolite is made hollow, and in order that the telescope shall clear the plate (the length of the standards not having

COMPETITIONS, CONTRACTS, AND PUBLIC APPOINTMENTS.

(For some Contracts, &c., still open, but not included in this List, see previous issues.)

COMPETITIONS.

Table with 4 columns: Nature of Work, By whom Required, Premiums, Designs to be delivered. Includes 'New Club House' by Royal Norfolk & Suffolk Yacht C.

CONTRACTS.

Table with 4 columns: Nature of Work or Materials, By whom Advertised, Forms of Tender, &c., Supplied by, Tenders to be delivered. Lists various construction projects like Granite Road Metal, Sewers, etc.

PUBLIC APPOINTMENTS.

Table with 4 columns: Nature of Appointment, By whom Advertised, Salary, Application to be in. Includes 'Clerk of the Works' at Warwick Guardians.

Those marked with an asterisk (\*) are advertised in this Number. Competitions, p. iv. Contracts, pp. tr. vi. viii. & x. Public Appointments, pp. xvii.

been increased) it is caused to slide in a sleeve that is fitted with stopping-pieces.

15,522.—BAR-FENCING: T. W. Palmer.—For enclosing one to adjust vertical bar-fencing upon inclined ground, the horizontal rail, which should have a channel-section, is fastened near the ground to uprights. The ends of the vertical bars are then passed through holes in the upper flange of the rail and so to the lower flange. The bars have shoulders which take the upper rail (having a U-section) that is passed over them. For each panel, or space between two standards, a bar is passed through a hole in the upper rail, and its lower and threaded end is also passed through the upper flange of the horizontal rail.

15,558.—A BRACKET OR STAGE FOR USE WITH LADDERS: L. Troppmann.—The hooks of the two slotted pierced bars are adapted for engagement with the ladder-rounds, and, being joined to one another with a screw and wing-nut, are clamped on to the side of the ladder, so that they will form a support for a platform or staging. The apparatus can be used to prevent a workman, or his tools, &c., from falling off a ladder that is laid upon a roof.

15,561.—A TRAP FOR GULLEYS: W. Oates.—On the side of the gully is fashioned a small chamber, and an opening communicates from one to the other. At the top of the chamber is an outlet which a sliding plate, that is in engagement with sloped grooves, keeps separated from the inlet, and which is coned from both sides, so that the discharge pipe may be adjusted anglewise, and also may be grooved for cementing purposes.

15,568.—VENTILATION OF WALLS: H. F. Einfeldt.—To keep the walls dry and prevent the spreading of dry rot or fungus, they are built with hollowed bricks that are laid so that their openings shall constitute continuous ventilation-shafts and air-flues. The bricks are made in different shapes; some have middle stiffening-ribs, and others are fashioned in an angular form for gable-ends.

15,632.—TOPS FOR CHIMNEYS AND VENTILATION SHAFTS: O. H. Champagne & J. B. Tanguay.—The

central spindle supports a top that rotates around the up-take, and at the same time drives a fan which is attached to a sleeve within the up-take. The speed-gearing, provided with ball-bearings, comprises a pinion upon the sleeve of the fan, with intermediate pinions upon pins in a stationary basin, and a ring-wheel around the spindle.

MEETINGS.

FRIDAY, JANUARY 3.

Architectural Association.—Mr. J. A. Gotch on "The Development of Domestic Architecture from the Twelfth to the Eighteenth Century," illustrated by lantern views. 7.30 p.m.

TO CORRESPONDENTS.

NOTE.—The responsibility of signed articles, letters, and papers read at meetings, rests, of course, with the authors.  
We cannot undertake to return rejected communications.

Letters or communications (beyond mere news items) which have been duplicated for other journals are NOT DESIRED.

We are compelled to decline pointing out books and giving addresses.

Any communication to a contributor to write an article is given subject to the approval of the article, when written, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.

All communications regarding literary and artistic matters should be addressed to THE EDITOR; those relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

TENDERS.

[Communications for insertion under this heading should be addressed to "The Editor," and must reach us not later than 10 a.m. on Thursdays. N.B.—We cannot publish tenders unless authenticated either by the architect or the building-owner; and we cannot publish announcements of tenders accepted unless the amount of the tender as given, nor any list in which the lowest tender is under £100, unless in some exceptional cases and for special reasons.]

\* Denotes accepted. † Denotes provisionally accepted.

 street, W.C. (close to the British Museum).

BY HER MAJESTY'S ROYAL LETTERS PATENT  
 ESTABLISHED A.D. 1774

**AUSTIN'S NEW IMPERIAL PATENT**

**SUPERFINE FLAX LINE.**  
 The above article is now being manufactured and sold in large  
 quantities for Greenhouse Shades, Public-house Shutters, and other  
 heavy work. The manufacturers would recommend it for its strength,  
 and the large amount of work in it, consequent upon its peculiar  
 manufacture.  
 AUSTIN'S IMPERIAL PATENT FLAX SHADE and BLIND  
 LINES (two Prize Medals awarded). The Manufacturers of the  
 above article particularly wish to draw the attention of the Trade to  
 their Imperial Patent Flax Shade Lines, of which they are now making  
 six qualities, all of which they can strongly recommend, as they have  
 given unqualified satisfaction to the Trade for now over 100 years, and  
 the proprietors continue to give their personal attention to the  
 manufacture of these goods.  
 They also invite the particular attention of the Trade to their  
 IMPERIAL PATENT BLIND LINES, which are very superior to  
 anything yet offered.  
 They can be obtained of all Rope-makers, Ironmongers, Merchants,  
 Factors, and Wholesale Houses, in Town or Country.  
 N.B.—Please note that all our Goods as advertised above are labelled  
 either D. 14 or outside with the Trade Mark the "Anchor".

**BILLS OF QUANTITIES, &c.**  
 LITHOGRAPHED CORRECTLY BY RETURN OF POST. A  
 LIBERAL DISCOUNT OFF USUAL PRICES.  
 PLANS BEST STYLE.  
**ALLDAY, LIMITED.**  
 Shakespeare Press, Birmingham.

**R. J. EVERETT & SONS, LITHOGRAPHERS.**

Sole Proprietors of the invention of the late Mr. R. J. EVERETT, so successfully worked by  
 Sprague & Co., Ltd., and their predecessors, and known as  
**THE INK-PHOTO PROCESS,**  
 which stands unequalled for the effective reproduction of Wash Drawings, Pencil Sketches, Engravings,  
 Silver Prints, &c.  
 Estimates on application to the Works:—138, Devonshire-road, FOREST HILL, S.E.

**"THE BUILDER" STUDENT'S SERIES.**

 Surveying, Sanitary Science, &c., will be found of great practical use in  
 the offices of PROFESSIONAL MEN and CONTRACTORS, to whom also they are  
 recommended as suitable for

**CHRISTMAS PRESENTS**

to their ASSISTANTS, PUPILS, CLERKS, CRAFTSMEN, and APPRENTICES.

Direct from the Office POST FREE on receipt of remittance.

*Just published.*  
**SANITARY FITTINGS AND PLUMBING.** By  
 G. LISTER SUTCLIFFE, A.R.I.B.A., M.S.E. &c.  
 5/- 212 Illustrations.  
 In this book an attempt has been made to enunciate the general  
 principles now governing the design of sanitary work in buildings,  
 and also to describe and illustrate the most important modern  
 sanitary fittings and the plumber's work in connection with them.

*Just published.*  
**ROADS: Their Construction and Maintenance,**  
 with Special Reference to Road Material. By ALLAN  
 GREENSWELL, A.M.I.C.E., F.R.S. &c. and J. V.  
 FLEWEN, B.Sc. (Lond.), F.G.S. 4s. Illustrations.  
 Much space has been devoted to the consideration of the relative  
 value of different kinds of road stone, in the belief that to one can  
 become an efficient road engineer or surveyor unless he understands  
 the nature and properties of the material at his disposal.

**LAND SURVEYING AND LEVELLING.** By  
 ARTHUR WALMSLEY, M.I.C.E., E.S.I., F.R.C.S. (Lond.).  
 7/6 140 Illustrations.  
 A useful book for a Student, containing not only the usual instruction  
 given in a text-book on this subject, but valuable additions from  
 the author's own experience, and an exhaustive chapter upon Parlia-  
 mentary surveying.

**FIELD WORK AND INSTRUMENTS.** By  
 ARTHUR WALMSLEY, M.I.C.E., F.S.I., F.R.C.S. (Lond.).  
 6/- 224 Illustrations.  
 Gives the Student a practical knowledge of the construction and  
 handling of surveying instruments, and how to deal with their  
 application in the field for setting out work.

**STRESSES AND STRAINS: Their Calculation**  
**and Use of their Results.** By  
 FREDERIC RICHARD FARROW, F.R.I.B.A., 10 Illustrations.  
 A handbook for students, particularly such as are preparing for  
 the examinations of the R.I.B.A. and arranged and intended especially  
 for those whose knowledge of mathematics is limited.

*2nd Thousand.*  
**SPECIFICATIONS FOR BUILDING WORKS,**  
**3/6 and How to Write Them.** A Manual for  
 Architectural Students. By FREDERIC RICHARD  
 FARROW, F.R.I.B.A.  
 Shows the Student how he should write a specification, so that  
 whether he uses the method and general principles he may apply  
 them to the particular exigencies of any building he may design.

**STRUCTURAL IRON AND STEEL.** A Text-Book  
 for Architects, Engineers, Builders, and Science  
 Students. By W. N. TWELVETREE, M.I.M.E. 24s.  
 42 Illustrations.  
 In this elementary treatise the author has endeavored to present  
 in a regular sequence some of the more important details relative to  
 iron and steel as applied to structural work.

*2nd Thousand.*  
**QUANTITIES AND QUANTITY TAKING.** By  
 3/6 A reliable handbook for the Student pure and simple  
 whose scope being limited to the method of procedure in the production  
 of a bill of quantities. The examples given, which are not only  
 practically ample, will be found to cover almost every phase of the subject.

*2nd Edition. Revised and corrected by the Authors.*  
**CARPENTRY AND JOINERY: A Text-Book for**  
**Architects, Engineers, Surveyors, and**  
**5/- Craftsmen.** By BANISTER F. FLETCHER,  
 A.R.I.B.A. and H. PHILLIPS FLETCHER, A.R.I.B.A., A.M.I.C.E., &c.  
 42 Illustrations.  
 Intended for those entering for the examination of the City and  
 Guilds' Institute, the Carpenters' Company, and the Institute of  
 Certified Carpenters, &c. Also for the examination in these subjects  
 by the R.I.B.A. and the Surveyors' Institution, &c.

**ARCHITECTURAL HYGIENE; or, Sanitary**  
**Securities as Applied to Buildings.**  
 5/- A Text-Book for Architects, Surveyors, Engineers  
 Medical Officers of Health, Sanitary Inspectors, and Students. By  
 BANISTER F. FLETCHER, A.R.I.B.A., and H. PHILLIPS  
 FLETCHER, A.R.I.B.A., A.M.I.C.E. 303 Illustrations.  
 A concise and complete text-book treating the subject in all its  
 branches, and intended to be of use to those entering for any ex-  
 amination in Sanitary Science.

London: DOUGLAS FOURDRINER, Office of "The Builder," Catherine-street, W.C.

 No. 13.—Two Pages  
 5s. 6d. " 6s.  
 With Patent Lock and Key, 3s. extra.

**The "BUILDER'S DIARY," for 1902,**  
 Specially prepared for the use of Builders and Contractors.

No. 11.—Two days to a page, ruled and printed to a special pattern.  
 Also contains Bill-Book, Note Book, Rent, Insurance, and Mortgage Register, Cash Book, Ledger, and 130 pages of Tables, of great value  
 to all engaged in the Building Trade. In all, 400 pages, 10 1/2 in. by 8 in. bound, whole cloth, gilt. Indexed and pag'd to end of Diary  
 PRICE 4s. 6d.  
 "The novel and valuable feature of these Diaries is that each volume forms in itself a complete set of books for the year."—Builder.  
 "For use in the office of architects and builders they are better fitted than any which we are acquainted with."—Architect.  
 "Messrs. Hudson & Kearns' Diaries need no recommendation save a trial."—British Architect.  
 "We have used them ourselves throughout the year with much satisfaction, and are glad now to draw attention to the new batch sent  
 us."—Building News.  
 "The Diaries published by Messrs. Hudson & Kearns are quite unrivalled for convenience and comprehensiveness."—Building World.  
 "These Diaries may be said to have become the Diaries for the professions for which they are issued."—Illustrated Carpenter and  
 Builder.  
 Sole Publishers:—HUDSON & KEARNS 83, Southwark Street, London.
