been ignored except in the few cases where private generosity has come forward to reduce the calamity. To-day all are agreed that the state of affairs calls for serious general remedies. Some suggest that matters might be considerably improved by an efficient official inspection (and consequent improvement) of the accommodation which already exists; some claim a reform in the building laws with a reduction of the rates and taxes levied upon buildings with small dwellings, whereby such enterprises would hold out the temptation of fair investments; others, again, want a more systematic development of the means of communication, whereby land outside the towns could be usefully acquired for the building of cheap dwellings. One suggestion which enjoys particular favour invites the Town Committees to acquire extended areas, which are to be let to building societies on long leases, with the proviso that the buildings to be created are to supply the much-needed dwellings. This suggestion has become possible only since the introduction of the new Civil Code, which has legalised (since 1900) long leases. Another suggestion goes a step further. The town communities, after acquiring the extended areas, are themselves to build the dwellings, for which reasonable rents would then be assured, as the community need make no profit, and only charge interest on cost and outlay by way of rent. This course, however, though it appears attractive at first sight, would undoubtedly meet with difficulties in municipal administration, and is open to the objection that the community thereby enters into competition with the certain owners who pay house taxes, &c. The want of dwellings has, for a number of years, been more particularly felt at Frankfort, where the average annual increase of the population has amounted to about 6,500. Owing to local reasons, it has so far been an absolute impossibility to build the necessary additional accommodation. In the beginning of 1900 the whole community of Frankfort (i.e., Greater Frankfort) covered an area of 8,014 hectares, out of which only 730 hectares were available for building purposes, and these were so split up and divided, and so unfortunately situated, that they were useless as building sites, and the mapping out of new streets was impossible. A Bill, therefore, was laid before the Prussian Diet, and will shortly have the force of law, which for the first time applies to sites in a township the idea of "pooling" which is common in rural districts, where great distances between properties owned by the same person would materially interfere with a cheap working of the soil. All properties in a district are thrown together, and each proprietor receives one continuous block of land, which, after careful calculation, represents the value of the divided old ones he held. By the Bill referred to, "Lex Adickes," so named after the Mayor of Frankfort, the sites are to be "pooled"; the streets are to be drawn out first, and the remainder is to be divided among the former proprietors of the various parts, with—in some cases which call for special compensation—a sum of money added. The measure has been so framed that although in the first instance it is only to apply to Frankfort, its application may be extended to any other town in Prussia if the working of the scheme is found to be practicable.

COMPETITIONS.

CEMETERY CHAPEL, BEXHILL.—The following is the result of the competition for a Cemetery Chapel, Bexhill:—1st premiated design, Mr. W. H. Allon, Bexhill; 2nd premiated design, Messrs. Crickmay & Heath, London; and 3rd premiated design, Mr. F. W. Richardson, London.

The Student's Column.

GAS AND GAS FITTINGS.

8.—CONSUMER'S METER AND SERVICE PIPES.

CONSUMER'S METER. — The consumer's meter may be of either the "wet" or "dry" description, but the "dry" meter is now almost universally employed. Fig. 13 shows a wet meter in section, and fig. 14 a dry meter. The wet meter is constructed on the same principle as the station meter previously described.

The dry meter has a case of tinned iron divided into compartments by a central partition, and two or more movable diaphragms having flexible leather sides. The gas enters and leaves the compartments alternately through suitable slide valves. The pressure of the gas on the surfaces of the diaphragms causes alternate inflation and collapse of the bellows-like chambers, and, consequently, alternate variations in the area of the inner and outer compartments, and the movements of the diaphragms bring into operation the lever and cranks which actuate the wheelwork of the indicators.

Meters are classed according to the number of "lights" which they are intended to supply, each "light" being supposed to consume 6 cubic feet of gas per hour. Thus a 10-light meter should be provided when the consumption is likely to approach 60 cubic feet per hour, and a 50-light meter when a supply of 300 cubic feet per hour is required. This nominal capacity of the meter does not represent the largest quantity of gas which can be passed through the meter under ordinary pressures, but the meter should not be required to perform more than its nominal duty. The *prepayment meter*, also called the *coin meter* or the *slot meter*, is an ordinary meter having attached to it a box with a slot in it. When a penny, or any other coin for which the meter is provided, is dropped through the slot a certain quantity of gas is allowed to pass to the burners, and when the pennyworth of gas is nearly consumed, the volume of gas passing gradually diminishes until the flow altogether ceases unless another penny is dropped through the slot. The price charged for the gas is greater than when bought by means of an ordinary meter, because the extra cost of the meter has to be considered. About 25 cubic feet of gas are commonly allowed for one penny, but the quantity varies in different districts.

The prepayment meter first came into use about ten years ago, but it at once became very popular, especially in cottages and workmen's tenements, and there are now about 800,000 of them in use in the United Kingdom alone.

A meter is termed "slow" when it registers less than the actual volume of gas passed through it, and "fast" when the recorded consumption is larger than the amount actually passed through it. A meter which registers correctly at a low pressure would register "slow" if the gas were measured under a higher pressure. By the "Sale of Gas Act" of 1859 a meter is passed as correct when it registers not more than 2 per cent. fast or 3 per cent. slow, the slow registration being in favour of the consumer.

In most large towns one or more meter testing offices are provided and maintained by the Local Authority, which also employs competent and impartial inspectors to test any meter which may be sent to the office for the low fees quoted in the Sale of Gas Act.

The following circular, issued from the Guildhall, London, will serve as an example of the facilities commonly afforded to gas consumers for verifying the registration of gas-meters. The privilege of having a meter, or any number of meters, tested at this low rate of charge is not confined to the inhabitants of the City of London, but is open to every one. The circular runs thus:—

"The attention of the inhabitants of the City is called to the facilities for testing gas-meters:—

1. The Testing Office provided by the Corporation is situate at the City Green-yard, Lower Whitecross-street. Office hours 9 to 5.

II. A gas consumer desiring to have his meter tested should first give twenty-four hours' notice thereof to the gas company. If at the expiration of that time the company have not taken the necessary steps to examine and test such meter, the consumer may do so, the party in the wrong paying certain charges.

III. The charge for testing a 2, 3, or 5-light meter is sixpence, and for larger meters as follows:—

Dry Meters.		Wet Meters.	
Lights.	s. d.	Lights.	s. d.
10	1 0	10	1 0
20	1 0	20	1 0
30	1 0	30	2 0
50	2 0	50	2 0
60	2 0	60	3 0
80	3 0	80	4 0
100	3 0	100	5 0
150	5 0	150	8 0
200	7 0	200	10 0

IV. Three days are by the Act allowed for testing, but as a rule a meter can be received back the same day.

V. The consumer can, under special circumstances, have his meter tested on his own premises, but extra cost is thereby incurred.

VI. Any further information may be obtained by applying personally at the Testing Office, Lower Whitecross-street."

Similar testing offices are maintained by the London County Council; one being situated in

Westminster, a second in Clerkenwell, a third in Shoreditch, and a fourth in Southwark; and so many meters are sent to these places by gas-consumers and meter-makers that, notwithstanding the low fees charged, the meter-testing offices are found to yield a considerable revenue.

In cases where the suspected meter cannot conveniently be removed, the meter inspector may send a standard meter, known to register correctly, to be coupled to the suspected meter. A quantity of gas is then allowed to pass through the two meters in succession, and if the volume registered by the meters is not identical, the registration of the suspected meter is known to be incorrect. This method of testing, however, entails greater expense than when the meter is sent to the testing office.

When appliances which require a large volume of gas, such as gas fires or cookers, are introduced into a building already supplied with gas, the size of the meter in use must be considered. It frequently happens that a meter which has been fixed to supply "ten lights" or ten burners, each consuming 6 cubic feet of gas per hour, is also called upon to pass the gas required for a ring burner and several gas fires. The result is that the supply of gas throughout the whole building becomes unsatisfactory, the gas-flames assume a miserable appearance, the heating appliances emit very little heat, and complaints are made that the gas supplied by the manufacturer is of very poor quality. The advantage gained by the provision of large and well-laid main service and service pipes may be altogether lost through the use of a meter of insufficient delivering capacity.

The following table shows the nominal delivering capacity of meters of various sizes and the diameter of their inlet and outlet pipes:—

Dry Meters.		
Meter.	Diameter of inlet and outlet.	Delivering capacity per hour.
Number of lights.	Inches.	Cubic feet.
2	1/2	12
3	3/4	18
5	1	30
10	1 1/4	60
15	1 1/2	90
20	1 3/4	120
30	2	180
40	2 1/4	240
50	2 1/2	300
60	2 3/4	360
80	3	480
100	3 1/2	600
120	4	720
150	4 1/2	900
200	5	1,200
250	5 1/2	1,500
300	6	1,800
400	7	2,400
500	8	3,000
600	9	3,600
800	10	4,800
1,000	12	6,000

Wet Meters.		
Meter.	Diameter of inlet and outlet.	Delivering capacity per hour.
Number of lights.	Inches.	Cubic feet.
2	1/2	12
3	3/4	18
5	1	30
10	1 1/4	60
15	1 1/2	90
20	1 3/4	120
30	2	180
50	2 1/2	300
60	2 3/4	360
80	3	480
100	3 1/2	600
150	4	900

Position of Meter.—The meter should be fitted in a place where it will never be exposed to a freezing temperature nor to the direct rays of the sun. Gas when subjected to low temperatures usually deteriorates in illuminating power, and when the meter or service pipe is cooler

Fig. 13.—A Wet Meter in Section.

Fig. 14.—A Dry Meter.

than the main service pipe, water is liable to be deposited from the gas and to collect in the pipes and cause "jumping" of the gas flames.

In a dry meter the leather of the diaphragms is liable to stiffen and cease to work properly when the meter is subjected to a freezing temperature, while the freezing of the water in a wet meter would at once put the meter out of action.

Gas expands when heated, and contracts when cooled. A thousand cubic feet of gas measured at standard temperature (60 deg. Fahr.) will be registered as more than a thousand cubic feet if the temperature of the meter exceeds 60 deg. Fahr., and less than a thousand cubic feet if the temperature be below 60 deg. Fahr. It would, therefore, be foolish for a consumer to allow his meter to be fixed in a place where the temperature was maintained at, say, 80 deg. Fahr. As a rule, a cellar is the best place in which to place the meter, for in such places the temperature is usually neither very high nor very low, and is

more uniform than elsewhere. The meter should be so situated that it can readily be examined at any time, and should be fitted with its base in a level position.

**Service Pipes.**—The pipes which convey the gas from the meter to the point of ignition should be of wrought iron. Composition pipe is often used for small services, but is more liable to damage. Gas pipes should never be buried in plaster, for all pipes should be fitted in such position that they can be examined at any time without undue inconvenience. Gas leakages have repeatedly been caused by nails for picture hanging being driven into composition pipes buried in plastered walls.

Where possible the pipes should be run in suitable recesses in the wall, or along the face of the wall, and if regarded as unsightly may be covered with removable casings of wood or any other material. Pipes fitted under the floor boards should be laid with a view to periodical inspection, and not as though they were to remain in position for all time, and

the floor boards over the pipes should be screwed, not nailed. Care should be taken that the bore of every iron tube is examined before being laid down, as occasionally these pipes have internal contractions or blisters which greatly reduce their delivering capacities. Mr. Grafton mentions a case in which a very poor supply of gas was discharged from a service one inch in diameter, and after much trouble it was discovered that the failure of the supply was due solely to the fact that one length of pipe had been used in which the bore was constricted for several inches to about  $\frac{3}{8}$  of an inch.

All gas pipes should be laid with a fall or inclination, and be provided with siphon-cocks at convenient points, so that any liquid which may be deposited in the pipes may readily be withdrawn.

The following are the sizes of pipe commonly recommended for supplying a number of burners:—

Internal diameter of Pipe.	Length of Pipe.	Greatest number of burners at 3 cubic feet each per hour.
Inches.	Feet.	
$\frac{3}{8}$	20	3
$\frac{1}{2}$	30	6
$\frac{5}{8}$	40	12
$\frac{3}{4}$	50	20
1	70	35
1 $\frac{1}{4}$	100	60
1 $\frac{1}{2}$	150	100
2	200	200

The greater the length the greater the diameter of pipe required to deliver a given volume of gas.

Iron pipes are measured by internal diameter; lead, copper, compo, and brass pipes by outside diameter.

BOOKS RECEIVED.

DULVERTON AND THE DISTRICT: HOMELAND HANDBOOKS, No. 12. By F. J. Snell, M.A. (Dulverton: E. Bayley, London: The St. Bride Press, Limited, 24, Bride-street, E.C.)

THE SOCIETY OF LANDED ESTATE AGENTS.—This society has been inaugurated, and its principal objects are: (1) To promote and protect the interests of the profession. (2) To advise by mutual conference on all matters of practice relating to the management of landed estates. (3) To disseminate information by means of publications, correspondence, &c. (4) To watch legislation on matters affecting the interests of agriculture and land generally, and (5) to provide a centre in London for members. A Provisional Council has been appointed, and the secretary (*pro tem.*) is Mr. William Broomhall, 10, Coekspur-street, Pall Mall, S.W. Membership is restricted to landed estate agents, their pupils and assistants.

## Illustrations.

## NEW CHURCH, STIRLING.

**T**HIS church, for the Free Church of Scotland, has recently been built from the designs of Mr. J. J. Stevenson. Mr. Stevenson being out of town, we are unable to give other information than that conveyed by the drawing.

## "HELNESTOWE," ABINGDON.

This house stands on the site of the nunnery of Helnestowe, a mediæval foundation, from which it takes its name. At the time of the alterations the ground was occupied by a malt-house and cottages with sheds abutting upon the river. The sheds were taken down and the malt-house and cottages were gutted; the excellent timber roof of these last forming a feature in what is now the hall. Various pieces of old work were brought to light, including some oak panelling—re-used in the hall—and the traceried head of a fourteenth-century window, which has been completed and now helps to light the drawing-room.

The old buildings supplied much of the required material. The owner was his own builder, engaging and superintending local workmen, with very frequent visits from the architect. This arrangement has answered admirably, and the work has been extremely well done. HARRY REDFERN.

## "BRYN HAFOD," KETTERING.

This house is situated on a hill on the west side of Kettering overlooking the town.

A Leicestershire pressed brick has been used for the facing, with Ketton stone dressings; the roofs are tiled, and the house is lighted throughout by electric light, which is obtained from a private installation.

The contractor was Mr. George Henson, of Wellingborough, the lead lights and casements are by Mr. George Wragge, of Manchester, and the ceilings by Messrs. Shuffrey & Co., of London.

Messrs. Gotch & Saunders, of Kettering, are the architects.

## HOUSE AT PINNER.

This house is now in course of erection in the Avenue, Royston Park Estate, Pinner, for Mr. J. H. Shankland. The lower story is of red brick, with arches and quoins of red rubbers; the upper part is finished in white rough cast, and the roof is covered with red Broseley tiles.

Messrs. G. & J. Waterman, of Watford, are the contractors. A. N. PRENTICE.

## WEST HAM CLUB AND RESTAURANT.

The following extract from the company's prospectus will describe the purpose of this building, which is the first of a series intended to be erected in the district:—

"The company has been formed for the purpose of establishing and conducting in the County Borough of West Ham (and elsewhere should it be so determined) club houses and restaurants, and of providing therein refreshments, sleeping accommodation, amusements, and recreation for the industrial classes. There is nothing of the kind in West Ham. A long-felt need exists for large, well-ventilated, healthy, and attractive rooms, in which dinners and light refreshments can be served at popular prices. Such rooms should be patronised largely by those employed in the numerous factories and works in the immediate locality. West Ham is very inadequately provided with hotel accommodation, and constantly men have to return to the City at night who would remain in Stratford were suitable bedrooms available. There is great need for popular, well-lighted rooms, in which men can meet and read the latest news and discuss the events of the day, as well as for rooms in which billiards, chess, draughts, &c., can be played without the surroundings of the public house. It is proposed to encourage athletic clubs, friendly and other societies, to make the establishment their headquarters, and thus ensure a volume of trade and extend the popularity of the house."

The work is being carried out by Messrs. T. H. Kingerlee & Sons, of Oxford, at a cost of about 12,000*l.*, from the design and under

the superintendence of Mr. S. B. Russell, of Gray's Inn-square, W.C.

## Books.

*Notes on the Life of Thomas Rickman, F.S.A.* Collected by his son, T. M. RICKMAN, F.S.A. London: G. J. W. Pitman. 1901.

**T**HIS is a small volume, not exactly a biography, but a simple statement of facts connected with the life and work of Rickman, deduced from his letters and diaries. The main object seems to have been to put on record memoranda which might otherwise be forgotten.

The name of Rickman ought to be always held in honour among English architects and students of architecture, and we are indebted to his son for giving us this brief record of his life, which, though not of any literary pretensions, contains a great deal of matter of interest.

Rickman lived in Liverpool from 1807 to 1821, and it was in that town that his taste for architecture was first developed. It appears from the notes that some churches in Liverpool which have been now and again attributed to Rickman were in reality only modified under his influence. The parish church of St. Luke (the one which it was recently proposed to pull down to make a site for the Liverpool cathedral) has been ascribed to him, but the only mention of it here seems to show that it was designed by Foster, of Liverpool, and that Rickman, having been shown the drawings, observed that "though beautiful, they were not entirely correct," and suggested some improvements. He may, however, have had more to do with it afterwards. Among his memoranda at this time is an entry recording his having gone to see Fawcett's Foundry illuminated by gas lights, "which are indeed very brilliant, and promise apparently extensive usefulness." This was in 1809.

During this period Rickman took every opportunity of visiting old buildings and drawing them as carefully as possible. "He sketched in pencil in his note-books, and made Indian ink drawings from his sketches." He records in 1811 making the acquaintance at Doncaster of Blore, "a very intelligent clever man" who showed him many fine sketches he had made, "and gave me some intelligence with respect to some Saxon buildings, which is different from what I have heard of." For "Saxon" we may no doubt read "Norman."

The buildings carried out by Rickman were very numerous, and many are mentioned in the memoir. As a kind of appendix Mr. T. M. Rickman gives a descriptive analysis of the successive editions of his father's great work "An Attempt to Discriminate the Styles of English Architecture," and of the variations and additions made in them.

*The Art and Craft of Garden-making.* By THOMAS H. MAWSON. Second edition, revised and enlarged. London: B. T. Batsford. 1901.

WE may congratulate Mr. Mawson and his publisher on the fact that a second edition of his charming and at the same time practical work on garden-making has so soon been called for. It is not often that a somewhat costly book of this kind reaches a second edition in the short space of six months.

Mr. Mawson's preface to the second edition, in which he to some extent reviews his reviewers, and comments on the great variety and incompatibility of the recommendations that he has received, is good reading, and he makes an important point, at the close, in commenting on the fact that "one style of house, which might grace the flat half-timbered districts of Cheshire and Shropshire, is propagated everywhere," and one cut-and-dried garden plan is applied alike in the country and in the suburbs, regardless of both house and site. This is the fact; fashion influences the style of both houses and gardens far too much, regardless of circumstances; and on this account the author may well be excused for, as he says, falling back upon first principles.

*Archæological Survey of Egypt.* Ninth Memoir: The Mastaba of Plahetep and Akhetep at Saqqûrah. Part II. By N. de G. DAVIES. London: Kegan Paul & Co. and B. Quaritch. 1901.

THIS number of the publications of the Archæo-

logical Survey of Egypt is almost entirely occupied with drawings of the sculptures of Akhetep; but the illustrations include also a plan and section of the Mastaba, and one or two photographs of portions of the partially excavated masonry. Both from want of time and also because of the peculiar behaviour of the drifted sand of the desert, which acts almost like a fluid, it was considered useless to attempt a thorough excavation of the Mastaba; the corners were cleared, and it was assumed that the walls ran straight between these points.

This Mastaba, which is now one of the sights of Saqqûrah, lies close to the west slope of the eminence on which the Step Pyramid stands. The description of the structure, and the masonry is of considerable interest. The vices of building seem, after all, to be as ancient as anything else in connexion with the art; the recess above the lintel of the doorway appeared to be built of very large blocks, but they were found to be only thin facing stones, backed by rubble. The interior of the hall is in a state of great ruin. The heavy stone roof was carried on roughly-hewn architraves, ten to eleven feet in length, "which crossed the room in three spans by the aid of four pillars." This is not very clearly put; a reference to the plan shows that there were two of these architraves or stone beams running the long way of the apartment, each partly resting on two squared columns. The total length of the hall is figured as 27 ft. 5 in., the width is a little over 20 ft. The hall is built of white stone, but the surface of the walls and pillars is rough; the pillars merely have the angles chamfered.

*The Egypt Exploration Fund. Diospolis Parva.* By W. M. FLINDERS PETRIE (special extra publication). *The Royal Tombs of the Earliest Dynasties.* Part II. By W. M. FLINDERS PETRIE. London: Kegan Paul & Co. and B. Quaritch. 1901.

THE principal object of the first-named of these books is to illustrate the sequence of historic periods by examples of the pottery characteristic of each period. There are an immense collection of illustrations of pottery with the supposed dates or approximate dates appended to them; also of a considerable number of pre-historic flints and ivory combs, &c. The stone vases from Abadiyeh are interesting from the refinement of curved line shown on some of them. Some of the archaic decorated pottery is of interest in respect of the forms and means of decoration used. We have also illustrations of alabaster vases, copper mirrors, and copper weapons and tools, the latter ranging from the sixth to the eighteenth dynasty. The volume is full of information valuable to students of Early Egyptian history.

The second volume named in the heading is the continuation of the one previously published on the Royal tombs of Abydos. This volume is entirely occupied with the description and illustration of the multifarious objects found in these tombs. The objects illustrated, including a great many of the "sealings" of various kings, are more of historical than artistic interest: the vases of quartz crystal and of porphyry and syenite for their finely designed outlines. The plans of the various tombs are given, with the numerous rows of subsidiary chambers which surround or accompany the principal chamber. The illustrations to the volume are the result of an immense amount of patient and learned labour.

*The Management of Engineering Workshops.* A course of six lectures by ARTHUR H. BARKER, Wh.Sc., B.A., B.Sc. The Institution of Junior Engineers, Westminster. 1901.

EVERY one who is interested, directly or indirectly, in any industrial establishment will be quite prepared to admit the necessity for a carefully-designed system of work. So far as the experience of competent judges extends, German and American manufacturers are at present at an advantage as compared with the same class in this country. No doubt many of our old-established works have recently been thoroughly reorganised, and numerous new works have been built and equipped on the most approved lines, but in the great majority of our commercial establishments there is considerable room for improvement in respect of systematisation. Some excellent modern treatises on this vital matter are already before the public, but in our opinion none of them are likely to prove of greater value than the

volume now issued by the Institution of Junior Engineers. The lecturer shows practical knowledge of his subject and a clear perception of the difficulties attending the realisation of theories involved therein. One especially useful feature in connexion with the series now published is to be found in the discussion reported at the conclusion of each lecture. Those taking part in comments upon the views of the author were evidently qualified to speak from personal experience, and their remarks tend to throw light on various important and controversial points. It must, of course, be understood that no treatise or course of instruction can possibly apply to all the requirements of any individual workshop. Every manager must work out his own salvation, but he will be able to derive many valuable hints and to instruct himself upon the general conditions for observance by a perusal of the volume to which this notice refers.

*Surveying and Levelling Instruments.* By WILLIAM FORD STANLEY. Third Edition. London: E. & F. N. Spon. 1901.

In the present edition of Mr. Stanley's useful treatise, various suggestions from surveyors and civil engineers are incorporated, and those chapters dealing with constructional details have been revised to accord with modern methods of manufacture. In the last-mentioned respect there are noticeable advances. For instance, the perfection of modern machinery renders it possible to form many parts of surveying instruments from the solid instead of attaching together sundry separate parts. Thus accuracy, strength, and lightness are more readily secured, and the quality of lightness is further aided by the use of aluminium alloys. The general scope and arrangement of the treatise are the same as in former editions which have received attention in our columns, but many new instruments are now described for the first time. Amongst such may be specially mentioned the author's new model theodolite with mechanical tribrach stage, his special transit theodolite for railway work, and a gradometer patented by him providing means of extending and fixing a scale of gradients by an open reading upon a divided helix. As may be naturally expected, the instruments designed by the author, or made by his firm from the designs of various engineers, receive more ample notice than those produced by other makers, but it should be observed that Mr. Stanley is always ready to speak in approving terms of any developments having real value. His book omits mention of some instruments and methods of work favoured by engineers whose experience has been largely gained in India and the colonies, but as an intelligent record of the appliances in more general use it possesses a distinct value.

*Hydraulic and other Tables for Purposes of Sewerage and Water-Supply.* By THOMAS HENNELL, M.Inst.C.E. Second Edition. London: E. & F. N. Spon. 1901.

MANY engineers adopt the practice of calculating tables to suit their own requirements, and some of them are induced to make these public, believing that other engineers may find such data useful. As the previous edition of the work to which we now refer made its appearance some eighteen years ago, it is to be feared that a great many other engineers have been relying upon their own tables, or have preferred to employ direct calculations, or again, that they may have possessed themselves of some other of the numerous works of the same kind available. Yet Mr. Hennell's book contains much useful information in a very handy form. The tables relating to the flow of water in various conduits are calculated by Eytelwein's formula, an equation that labours under the drawback of giving results too high for small pipes and too low for larger pipes and channels. Some of the tables, therefore, require qualification by percentages suggested by the author in an explanatory chapter, and we are not sure that this is a convenient arrangement because there is some risk of the necessary corrections being overlooked. Some useful tables relating to rainfall and water analysis have been thoroughly revised and brought up to date, and a table, which ought to be of value to those requiring approximate information, is one showing the dimensions of reservoirs, filter-

beds, main pipes, and machinery, for the supply of given populations.

*Die Englische Baukunst der Gegenwart.* Von HERMANN MUTHESIUS. Lieferung I. Leipzig und Berlin: Cosmos, Verlag für Kunst und Wissenschaft.

THE author of this work, as many of our readers are probably aware, is the architectural attaché to the German Embassy in London. This is the first volume of a work in which he is undertaking the task of illustrating modern English architecture for the German public. The book, in large folio form, consists of German text interspersed with a number of plans and sketches, and a collection of finely executed plates of English buildings.

Among the buildings selected for special illustration are Mr. Norman Shaw's well-known insurance offices at the corner of St. James's-street; Mr. Mountford's Northampton Institute; the Imperial Institute; and, among smaller buildings, a house by Mr. Norman Shaw in Queen's-gate, and Messrs. Bechstein's front in Wigmore-street. The publication, if continued on the same lines, seems likely to give a fair and comprehensive representation of contemporary English architecture. It will give German architects who do not know this country an idea of a modern architecture less eccentric and startling than their own, but not with less variety, and (we humbly hope) in a good deal better and purer taste.

Correspondence.

To the Editor of THE BUILDER.

GALVANISED ROOFS.

SIR,—Can any of your readers advise as to the best method of treating a galvanised roof to prevent rust? Is paint any good? If the colour could be white (for coolness), so much the better.

JOHN CLARK, LTD.

VERANDAHS.

SIR,—In your issue of August 10 you speak of verandahs being "objectionable and now seldom seen." Permit me to say that in Bournemouth, where the fresh air treatment of consumptives is much practised, verandahs are coming greatly into use. Unfortunately they are often not wide enough to sit comfortably in.

C. F. M.

OBITUARY.

MR. HUTTON.—We regret to learn that Mr. James Hutton, of Dundee, has been accidentally drowned whilst bathing. He was a member of the Dundee Institute of Architecture. He prepared the plans and designs for St. John's Free Church, Dundee.

GENERAL BUILDING NEWS.

WESLEYAN CHURCH, ROWLANDS GILL, DURHAM.—The foundation-stones of a new Wesleyan church, to be erected at St. Andrew's-road, Rowlands Gill, were laid on the 5th inst. The structure, which is estimated to cost about 2,600l., will provide accommodation for between four and five hundred persons. It is to be a stone building, and will include a couple of vestries and one classroom, together with a caretaker's house at the south side. Messrs. Turner Erosa, Gateshead, are the contractors, the architect being Mr. F. R. N. Haswell, of North Shields.

NEW CHURCH, LOSSIEMOUTH.—St. Gerardine Church, erected in connexion with the Established Church of Drainie, was opened recently by Professor Cooper, Glasgow. The church is on the Coulard Hill, and has been built from plans by Mr. Burnett, architect, Glasgow. Accommodation is provided for over 500 worshippers, and the total cost is about 4,000l.

PRIMITIVE METHODIST CHURCH, GNOSALL, STAFFORDSHIRE.—The foundation and memorial stones of a new Primitive Methodist church at Gnosall were laid recently. Messrs. Hickton & Farmer, of Walsall, are the architects. The new church will be in the Renaissance style, and will be built of Ruabon dressed bricks and Monk's Park stone. The front façade will be flanked with octagonal turrets, with stone dressings. Sitting accommodation will be provided for about 150 worshippers; the seats being of pitch-pine. A schoolroom will be erected at the rear of the church, and it will be so built as to be utilised as part of the church on special occasions. The contract for the new building has been given to Mr. Whittingham, of Newport.

ST. MATTHEW'S CHURCH, DUNDEE.—The alterations upon and additions to St. Matthew's Parish

Church in Ferry-road have now been so far completed that the church has been opened for public worship. The cost of the improvements, including the new organ, will amount to upwards of 1,000l. Messrs. Johnston & Baxter were the architects for the renovations, and the contractors for the various departments of the work were:—Mason, R. Sheach, jun.; joiners, Charles Smith & Son; painters, P. & A. Davie; plumber, David Brown; plasterer, Alexander M'Ritchie; slater, David Hutchison.

CHURCH, DUNMORE, WATERFORD.—Dunmore East Church, Diocese of Waterford, was reopened recently, after being closed nearly four months for restoration and rebuilding of the roof on the nave. The architect was Mr. Fogarty, and the builder, Mr. G. Nolan, of Waterford.

CHURCH, CASHEL, CONNEMARA.—The Church of St. James, Cashel, Connemara, was recently dedicated. The building, the architect of which was Mr. T. J. Hamilton, of Galway, is capable of accommodating some 500 people. The High Altar is composed of marble and coloured Irish marble, with inlays of rich colouring. The bottom base is moulded, the centre panel under the altar table being carved in bold relief, the chalice, surrounded by vine and grapes, standing out conspicuously, with adoring angels on either side. It was designed by Mr. C. J. Taylor, C.E., architect, Dublin, the sculpture work being executed by Messrs. B. J. Taylor & Sons, Dublin.

WESLEYAN CHAPEL, ALLENHEADS, NORTHUMBRIA.—The new Wesleyan chapel and school erected on a site, presented by Mr. W. C. B. Beaumont, M.P., at Ropchlaugh, Allenheads, was opened recently. It has seating accommodation for 250. The architect was Mr. John Kidley, of Allenheads, and the contractors were:—Mason work, Mr. John Glendinning, Allendale Town; joiner's, painter's, and glazing work, Mr. George Race, Eastgate, Weardal; slating, Mr. John Hewitson, Newcastle; and hot-water heating, Messrs. Dinning & Cooke, Newcastle.

CATHOLIC CHURCH, WARRINGTON.—On the 11th inst. the foundation-stone of a new Roman Catholic church in St. Mary-street, Latchford, Warrington, was laid by the Bishop of Shrewsbury. The architect is Mr. Robert Curran, and the builder is Mr. Peter M'Lachlan, of Birkenhead. The new church will be capable of accommodating 600 persons, and will be of Transitional Gothic design, built of Yorkshire stone, with red stone dressings. The length of the interior will be 124 ft., and the width 48 ft., while the height of the clearstory will be 45 ft. The total height of the tower and spire will be 130 ft. The principal entrance will be from St. Mary-street, and there will be one from Clifton-street. There will be a nave and two aisles, with six granite columns on each side of the nave, resting upon a Yorkshire stone base, a large sanctuary, with altar, &c., two side chapels, and vestries, &c. Entrance from the presbytery will be obtained through the cloister leading into the vestries. There will be an organ gallery and choir accommodation over the main entrance. The cost will be 6,000l.

RESTORATION OF THE LADY CHAPEL, ST. DAVID'S CATHEDRAL.—The restoration of the Lady Chapel, together with the ante-chapel, at the east end of St. David's Cathedral is now practically completed. The work, which has cost over 2,500l., has been carried out by Mr. William Thomas, of Hay-on-Wythe, according to the plans of the architect, Mr. J. Oldrid Scott, of London. During the progress of the work an ancient carving was discovered in the floor. It has been placed in Bishop Vaughan's chapel, with a number of ancient crosses. On the exterior, and above the window at the east end of the Lady Chapel, is a statue of the Virgin and Child, by Mr. Bridgeman, of Lichfield.

NEW CHURCH, ABERDEEN.—The new United Free Church at Ruthrieston, Aberdeen, is nearly completed, and will be opened on the 4th prox. The buildings, which are of grey granite, front Broomhill-road and Station-road. There is a tower, with angle buttresses and spire, rising above the main edifice. In a transept gable is a richly-traceried five-light window. The ceiling of the church is entirely of pitch-pine, and is Gothic in form, with moulded principals at intervals and moulded ribs intervening. The whole of the windows are filled in with leadwork and tinted glass. The present church (behind the new church), when vacated, will be used as a hall for the congregation. The church is seated for 550, and the estimated cost was 3,600l. Messrs. Brown & Watt, Aberdeen, are the architects, and the contractors were:—Mason, Wm. Murray; carpenter, Jas. Farquhar; slater, Alex. Law; plasterers, A. Ross & Son; plumber, James T. Ross; and painters, John Mason & Son—all of Aberdeen.

CHAPEL, ETCINGHAM, SUSSEX.—Plans of a new Wesleyan church for Ectingham have been prepared by Mr. A. R. B. Smith, and the contract of Messrs. Ellis & Son has been accepted. The plans provide for a structure with a frontage to the road and with accommodation for 150 worshippers.

CHURCH, SWINTON, YORKS.—On the 15th inst. the Archbishop of York consecrated a new mission church which has been erected at what is known as the Bidge end of Swinton. The new building is Early English in style, and is not yet completed. The finished portion consists of chancel and part of the nave, providing seating accommodation for about 200 persons. Underneath the chancel there

is a parish-room, which will seat about seventy or eighty people. Local stone has been used in the construction of the building, and the roof is of pitch-pine and open timber. The cost is about 2,500. When the scheme has been completely carried out it is expected that accommodation will be found for about 450 persons. The architect is Mr. J. D. Webster, of Sheffield, and the work has been carried out under the superintendence of Mr. J. Douglas Webster. The contractors are Messrs. Geo. Longden & Son, of Sheffield, whose acting foreman has been Mr. James Basseby.

**SCHOOLS, SOUTH SHIELDS.**—On the 12th inst. the new school buildings which have been erected by the South Shields School Board in Mortimer-road were opened by Mr. W. S. Robson, K.C., M.P. The school has been designed as a mixed school for seniors and juniors, and will accommodate 1,160 children in eight classrooms, and a central hall on the ground floor for juniors, and eight classrooms and a central hall on the first floor for seniors; and on the second floor there are a gymnasium, joiner's shop, and a cookery classroom. There are four cloak-rooms, two on each floor for boys and girls respectively, the head master's and mistress's rooms being on the mezzanine floor between the cloakrooms, and entered from a private corridor leading from the main staircase. The school has been built of brick, and faced with Lowry's Penwash bricks, with red Carlisle stone dressings. Internally the school is plastered, with the exception of the dados and the whole of the staircases, which are faced with brown salt-glazed bricks. The whole of the work has been carried out from the designs and under the superintendence of Mr. J. Wardle Donald, of South Shields, who also designed the infants' school. Mr. I. R. Todd was the clerk of works.

**CATHOLIC SCHOOL, ABERDEEN.**—The new elementary Roman Catholic School, Summer-street, Aberdeen, was opened on the 13th inst. There are four classrooms, each 26 ft. in length by 25 ft. broad, and 14 ft. high, capable of accommodating 60 pupils, or 240 in all. Besides these rooms there is a gymnasium on the ground floor, 52 ft. by 26 ft. 6 in. The school is built to accommodate 207 children. Mr. R. G. Wilson, Aberdeen, was architect, and the contractors were: Mason, W. Farquharson, carpenter; J. Henderson, slater; G. Davidson; plasterer; Jas. Simpson; plumbers; Thom & Strachan; painters; J. Garvie & Sons; heating apparatus; Robert Tindal, all of Aberdeen.

**NEW SCHOOL NEAR ABERDEEN.**—The new school provided for Raemore by Banchory School Board has been finished. The building, which is of red granite from Hill of Fare, contains eighty school places, and cost upwards of 1,000. The architects are Messrs. Brown & Watt, Aberdeen.

**BOARD SCHOOL, MILLBRIDGE, YORKSHIRE.**—The formal opening of the new Upper Board school, erected by the Liversedge School Board at Millbridge, took place recently. The school, which has been erected in a new road opposite the Heckmond-wike Gas Company's offices, has been built to the plans and designs of Mr. A. E. Rhodes, Heckmond-wike. The ground-floor contains a central hall, six classrooms, lecture-hall, and chemical laboratory, with teachers' room and lavatories at the entrance. In the basement there are covered playgrounds at each side of the school, with a kitchen for cookery, and a joiner's shop. The contractors have been as follows:—Masonry, G. Horstall & Sons, Liversedge; joiners, Milnes Bros., Heckmond-wike; slater, J. Roberts, Cleckheaton; plasterers, Parkinson Brothers, Heckmond-wike; plumbers, glaziers, and hot-water fitters, E. Walker & Co., Heckmond-wike; painter, Fred Akers, Hightown; ventilators, E. Bedford & Co., Halifax; blacksmith, J. Hirst, Hightown; wood flooring, Nightingale & Co., Grimby; concreting and asphalt, J. Roberts, Batley.

**CATHOLIC BLIND SCHOOL, WEST DERBY, NEAR LIVERPOOL.**—New blind schools have been erected on the Rice House Estate at New Tree-lane, West Derby, by the Liverpool Catholic Blind Asylum. The new schools provide for children of school age from the hitherto overcrowded institution in Brunswick-road. The building accommodates between sixty and seventy children, but the kitchen department is of sufficient size to provide for double that number. Being intended for the blind, the aim has been to avoid staircases as much as possible, so the building extends over a considerable plot of land, a large portion being only a narrow high-way. The building is of ordinary bricks, relieved by red brickwork and stone. The inside joinery is of yellow pine, stained green and varnished. The main corridors have tiled floors and tiled dados. The main entrance, approached by a broad drive, is placed in the centre of the principal building, and gives access to an entrance hall and central staircase, and, running right and left, to the main corridor, which is the chief feature of the building. On the left of the main entrance are two reception-rooms, clothes-room, sisters' rooms, kitchens, laundry, and children's dining-room, half of which is at present used as a temporary chapel. On the right are the children's dayrooms and schoolroom. The upper floor provides four dormitories, each for sixteen children, lavatories, bathrooms, and bedrooms, and a small infirmary for six beds. Storage room is supplied in an attic floor in the roof. Messrs. Sinnott, Sinnott, & Powell, of Liverpool,

were the architects, and Mr. Michael Fogarty, of Liverpool, the contractor.

**SCHOOLS, WHITEHAVEN.**—A voluntary school, built at the expense of Miss Crostbwaite on a site given by the Earl of Lonsdale, was opened at Whitehaven last week by the Lord Bishop of Carlisle. The cost has been about 5,500. The architects were Messrs. Oliver & Dodgson, of Carlisle and Leeds.

**NEW ART GALLERY, NEWCASTLE-ON-TYNE.**—The foundation-stone has just been laid of the new Art Gallery, which Mr. Alexander Laing is to have erected in Higham-place, Newcastle. The site has been provided by the Newcastle Corporation, whilst Mr. Laing will, on completion of the structure—which is estimated to cost 20,000—hand it over to the municipality. The site adjoins the Free Library. Messrs. Cockett & Burns are the architects. The building will be two stories in height, forming on plan a hollow square, the ground floor consisting of large entrance and sculpture hall, and three art or museum galleries, extending through behind the public library, and lighted from the central court, the upper floor being entirely taken up with top-lighted art galleries, four in number, varying in size about 65 ft. by 27 ft. by 27 ft. high to the top of the arched ceiling. The main façade is to Higham-place; the corner formed with the Free Library at the south-east angle is occupied by a tower 25 ft. square and 112 ft. high, which contains the grand staircase. The staircase is reached from the sculpture hall, the main entrance to which is about the centre of the Higham-place front. The whole of the floors throughout are constructed of concrete—in the case of the upper floors, combined with expanded metal on steel joists. The surface of the floor to the entrance hall is of tessellated marble pavement, and that of the galleries polished oak blocks. At the north end of the building are provided reading-rooms, private staircase, and picture hoist. The design externally, carried out in polished ashlar, is Renaissance in style, the ground floor forming a rusticated plinth the same height as that of the Free Library, and upon which are detached Ionic columns projecting out on either flank, and carrying the entablature with semicircular arched pediment, under which are sculptured niches. The general height is about equal to that of the library. The main entrance is 8 ft. wide, flanked by double detached Doric columns, with pedimented entablature, and with sculptured figures on either side. Over the arch of the doorway is formed a niche with moulded architrave and twisted shafts on either side. The tower has a deep band of sculpture on the exposed faces immediately under the lantern, the latter being octagonal on plan, and supporting a stone dome about 20 ft. diameter. The system of heating and ventilation is the plenum.—*Newcastle Leader.*

**NURSES' HOME, SCARBOROUGH HOSPITAL.**—A new Nurses' Home has been built in connexion with the Scarborough Hospital. The building has been erected on the site of an old house in Aiburrough-street, which communicated with the open space at the back of the hospital. It has direct communication with the hospital, and consists of a sitting or recreation room on the ground floor, a small service pantry, twelve bedrooms, two bathrooms, lavatories, &c. The home is built of red brick. The principal contractors for the work have been Councilor Bladon, Mr. Abraham Moore, and the whole has been carried out under the supervision of Mr. Frank A. Tugwell, architect. The total cost of the work exceeds 2,000.

**NORFOLK AND NORWICH SAVINGS BANK.**—New premises have been erected in Red Lion-street for the Norfolk and Norwich Savings Bank. The general contractors for the work have been Messrs. Seales Brox, the masonry has been carried out by Mr. J. G. Bush, and the carving executed by Mr. Minns, of Norwich. The marble-work has been done by the Art Pavements and Decorations, Limited, London. The heating apparatus, fire-places, &c., have been supplied by Messrs. Barnard, Bishop, & Barnards, Norwich; the electric lighting, wiring, and fittings by Messrs. Pank & Son, Norwich; and the electroliters in the banking hall by Messrs. Neaby, Evans, & Co., London. The architects were Messrs. G. J. & F. W. Skipper, whose designs were selected in a competition limited to the architects of the city and county.

**BUILDING IN MOORFIELDS.**—We understand that Mr. G. D. Martin has been appointed architect of the buildings that are about to be erected upon the vacant site in St. Martin's-lane, with the demolition of the Roman Catholic Church of St. Mary, Moorfields, and the adjoining presbytery, clergy-house, and school premises.

**NEW THEATRE, ST. MARTIN'S-LANE.**—Mr. W. G. R. Sprague has been entrusted with the preparation of the plans and designs of a theatre, having a capacity of 1,040 persons, to be erected upon the vacant site in St. Martin's-lane, with fringes on the south and west sides in St. Martin's-court.

**Y.M.C.A. BUILDINGS, ST. HELENS.**—In a limited competition for plans for the erection of the new Young Men's Christian Association buildings for St. Helens, those of Messrs. Briggs & Wolstenholme, of Liverpool and Blackpool, have been accepted. The buildings will be erected on the plot of ground which adjoins the gymnasium, facing North-road. The principal feature of the ground floor will be the main entrance, which will be 16 ft. wide, and

two shops on the Duke-street side, and five others facing North-road. Through the main vestibule will be an entrance hall, through which entry will be obtained to the present gymnasium. On the first floor there will be first reached an open reception hall, leading to the various rooms. On the left an entrance will be made to the gymnasium gallery, next the secretary's office and private room. A reading-room will look out on the corner of Duke-street, while immediately over the entrance will be a library and parlour for writing purposes. On the right, extending to the end, a lecture hall, which may be divided into three by folding doors, is planned. On the second floor there is to be a lecture-room the same size as the present assembly-room, together with other smaller rooms for caretakers, &c.

**COTTAGE HOMES, ONGAR, ESSEX.**—New cottage homes, to accommodate 300 children, are to be erected at Ongar for the Hackney Board of Guardians. Mr. W. A. Finch has been instructed to prepare drawings for the homes.

**COUNCIL CHAMBER, NEWPORT.**—The foundation-stone of the permanent council chamber and offices of the Monmouthshire County Council was laid recently by the Chairman of the Council, Alderman Edwin Grove, at the buildings in course of erection at Pentonville, Newport. The new building is being erected from the designs of Mr. W. Tanner, the County Surveyor, by Messrs. D. Richards, Limited, builders, Newport, whose contract price is 8,700.

**THE VICTORIA WING, BLACKBURN AND EAST LANCASHIRE INFIRMARY.**—It was decided in April, 1897, that Blackburn's permanent memorial of the late Queen's Diamond Jubilee should be an additional wing to the infirmary to be known as the Victoria wing, and should include a modern operating theatre. The plans of Messrs. Simpson & Duckworth, architects, Blackburn, were accepted for the extension, and the foundation-stone was laid on June 22 in that year. All that was at that time definitely decided was that the extension should be in harmony with the south wing, so as to give a symmetrical appearance to the whole. The completion of the Victoria wing has balanced the front, there being now two blocks upon each side of the central block, which contains the main entrance hall. The accommodation provided in the basement includes a pathological laboratory, dark room, and room for the use of the Röntgen rays, heating apparatus—chamber, linen and grocery stores, and room for the extra stores of clothing and for use as a sewing-room. All these rooms are well lighted, and the walls are finished with white glazed and red pressed bricks. The floors are finished either in marble terrazzo or with teak and maple wood blocks. On the ground floor is the boardroom (to be used also as the secretary's office) facing the front, measuring 20 ft. 6 in. by 20 ft. 8 in. Across the corridor are the private quarters of the resident medical staff. The floors, excepting in the main corridor, are finished with teak blocks. On the first floor is provided a sick ward to the front, 26 ft. 6 in. by 20 ft. 6 in., and across the corridor a suite of rooms for operations. The heating is by means of radiators upon the low pressure system, the hot water being supplied from calorifiers heated by steam. Each set of rooms is worked upon a separate system of circulating pipes, and each room is separately controlled by valves. A general temperature of 85 deg. Fahr. has been arranged to be maintained in the operating theatre, and a temperature of 75 deg. in the anaesthetic room, a normal temperature being required only in the rest of the building. Provision for ventilation is made by inlets to the radiators, the incoming air being passed through filter screens having a spray of water passing constantly over them when in use. The vitiated air is extracted by means of an electric fan with connecting tubes and flues from the several rooms. Further ventilation is provided by means of opening casements and hopper ventilators in the window frames. The additional accommodation provided in the Victoria wing is seven beds. When, however, the quarters vacated by the resident doctors have been converted into a ward, and the old operating-room turned into another ward, the entire accommodation will be for about 120 as against 102 at the present time. The principal contractor for the work has been Mr. W. J. Woolf Cronshaw, of Blackburn, and the several sub-contractors were:—Messrs. T. Higson & Sons, joiners' work; Mr. John Dean, slater's work; Mr. V. H. Law, plumbing and glazing; Mr. W. H. Ainsworth, plastering; and Messrs. H. Pickup & Son, painter's work. The special contract work has been executed by:—Messrs. Minton, H. Illins & Co., Stoke-upon-Trent, wall-tiling; Mr. J. F. Ebner, London, wood block flooring; Messrs. J. & H. Pateson, Manchester, carving and marble terrazzo flooring; Mr. George Wright, Manchester, wrought-steel window casements; Mr. Jas. Gibbon, locks and door furniture, &c.; and Messrs. Morrison, Ingram, & Co., sanitary fittings. The scheme for the heating and ventilation has been carried out by Messrs. Dargue, Griffiths, & Co., Liverpool; and the installation for the electric lighting has been undertaken by Messrs. G. H. Woods, & Co., of Blackburn, from the specification of the consulting electrical engineers, Messrs. Lester, Taylor, Kelly, & Hide, of Liverpool. The whole of the work has been

carried out under the superintendence of Messrs. Simpson & Duckworth. The operating theatre occupies the east end of the wing on the first floor. It measures 26 ft. 6 in. by 23 ft. Off it is a sterilising room, 12 ft. 6 in. by 9 ft. 7 in.; an anaesthetic room, 10 ft. by 13 ft. 6 in.; and the suite is completed with a small ward, 10 ft. 3 in. by 14 ft. 6 in. for gynaecological cases, and the usual laterine accommodation.

**SCHOOL INFIRMARY, DENSTONE COLLEGE, STAFFORDSHIRE.**—The Duchess of Sutherland recently laid the foundation stone of a new school infirmary in connexion with Denstone College. The object of the infirmary is to cope with the first outbreak of infectious diseases among the boys of the school. The staff will be placed in a position to deal with minor outbreaks of two or three orders of infectious disease. The portion of the infirmary now to be erected is a four-bed ward and a one-bed ward. The completed scheme provides for an isolation block for ten patients. It will be built of red bricks, with stone dressings, and tiled roofs. The architects are Messrs. R. Scrivener & Sons, and the builder Mr. Thomas Godwin, Hanley.

**MISSION HALL, NORTH SHIELDS.**—The foundation-stone of a new mission hall in Northumberland-street, North Shields, in connexion with Tyne-outh Congregational Church, was laid recently. The buildings will comprise a mission hall, children's school, vestry, class-rooms, &c. The school will accommodate over 200 children. The work will be carried out by Mr. Thomas Robson, builder, of Tyne-outh, from plans by Messrs. Thomas A. Page & Son, architects, South Shields.

**SANITARY AND ENGINEERING NEWS.**

**PUBLIC IMPROVEMENTS IN BIRMINGHAM.**—According to the *Birmingham Post*, considerable progress is being made with the various public improvements which have been undertaken by the Public Works Committee of the Corporation. The principal scheme is the reconstruction of the sewers, a project which was commenced about two and a half years ago, and will occupy the attention of the authorities and the Finance Committee, who have charge of the public purse, for some years to come ere it can be said to be within measurable distance of completion. At the outset the city was divided into five districts, and operations were commenced in Edgbaston and Harborne, a district which, in respect to its sewerage, was the worst in Birmingham. In the reconstruction of the sewers in the locality, which embraces practically the whole of the Edgbaston Parliamentary division, it became necessary to lay down about sixty-four miles of new foul-water pipes, and in addition many miles of storm-water pipes. The total cost of this portion of the scheme was estimated at 155,000l. in round figures, and it was believed that the work would be finished in about four or five years. This estimate in regard to time and money, it is expected, will be well within the mark. Nearly two-thirds of the work has already been accomplished, and if the same progress is maintained another twelve months or so ought to see the beginning of the end, so far as this particular district is concerned. Some of the worst neighbourhoods have been finished, and at the present time the work is proceeding in Edgbaston Park-road, Hermitage-road, Westbourne-road, Norfolk-road, Harborne-road, Calthorpe-road, and some of the adjoining thoroughfares. A good deal of the work is in the hands of contractors, but by far the most important part of the scheme is being carried out departmentally. The weather is responsible for the progress made, but it is believed that the culverting in the roads named will be completed within the next two months, and then other thoroughfares will be closed to traffic. As soon as the district is re-sewered the next worst of the five districts will be taken in hand, and so the work will be continued until the whole of the city has been provided with new sewers, which it is anticipated will be sufficient for all practical requirements for about half a century. Another important matter which is engaging the attention of the Public Works Committee is the construction of the Rea main sewer at Salfley. It runs from Montague-street alongside the river Rea through the land of the Midland Railway Company and the Gas Department to beyond Netchells Recreation Ground, a 6-ft. culvert being used between Montague-street and Salfley viaduct, and a 7-ft. culvert from that point to the terminus. The Sewer Department is also very busy in other parts of the city, not only in respect to the renewal of pipes, but in the inspection and superintendence of the sewerage in those districts where the building trade is especially active just now. Street and road improvements are in progress on every side of the city. Those people who are acquainted with Fritchett's-lane, which runs from Edgbaston Park-road to Somerset-road, will know what a narrow awkward thoroughfare it is. It is an important link, which to all intents and purposes connects the Bristol-road with Harborne, and all who use it will rejoice to learn that it is now to be straightened and broadened and made something like what a public road should be. In the central

parts of the city attention is turned to Summer-lane, where between Snow Hill and Hospital-street the macadam is being replaced by granite on a concrete foundation. The upper part of Broad-street has recently been relaid with wood, and the London and North-Western Railway Company are improving the bridge in Navigation-street which carries the thoroughfare over the railway from Hill-street to Hinfold-street. The wood floor on the top of the girders is in course of restoration, and when that is finished the Road Department of the Corporation will, at the expense of the company, complete the work by laying down on a concrete foundation a new granite pavement.

**TREURO SEWERAGE AND SEWAGE DISPOSAL.**—The City Council at their meeting on the 13th inst. adopted the recommendation of the Sanitary Committee that the services of Messrs. Beesley, Son, & Nichols, of Westminster, be retained as engineers for the preparation of a scheme for the interception and disposal of the sewage of the city.

**EXTENSION AND MAINTENANCE OF LIVERPOOL DOCKS.**—The annual Report by Mr. Anthony G. Lyster, Engineer to the Mersey Docks and Harbour Board, on the general state and progress of the dock works at Liverpool shows that large works have been carried out during the year, and that several extensions are still in progress. Reference is made to the completion of the new tobacco warehouses at Stanley Dock, which has fourteen floors, with an aggregate area of 36 acres, and is capable of storing 60,000 hogsheads. Some figures are given in the Report regarding the dredging work done at the bar and in the channels leading therefrom to Liverpool. The quantity of sand removed during the year amounted to nearly 9,000,000 tons, the result being that the condition of the bar and the channels has been fairly maintained. In conclusion, the Report states that the amount of work carried out under the control of the Engineer's department has been exceptionally large during the year. The wages bill has at times been within a few pounds of 11,500l. per week, and the number of men employed has been upwards of 7,800 at one time. These figures, it is pointed out, are exclusive of payments to contractors, and do not include the men employed by them. The total expenditure in the Engineer's department for the year has been 1,230,049l.

**LEEDS WATER SUPPLY.**—The available water in the Leeds Corporation reservoirs has now been reduced to a quantity equivalent to 484 days supply. At the corresponding period last year there was enough to last 78 days. It is stated that the recent rainfall has not benefited the reservoirs in the slightest degree. The position was discussed at a meeting of the Waterworks Committee on the 16th inst., and steps were taken for increasing the supply and diminishing the consumption.

**FOREIGN.**

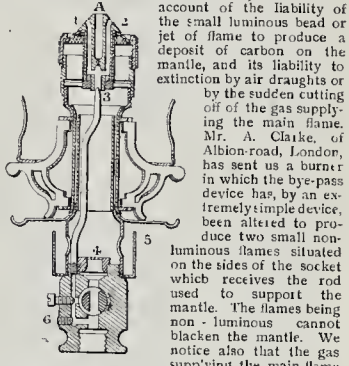

**FRANCE.**—M. Scellier de Gisors, the official architect to the Luxembourg, is occupied with the restoration of the chapel of the palace, a beautiful interior which has for a long time been used as a storehouse for things not wanted. An exhibition of pictures of English, Spanish, and Italian painters is also to be organized at the Luxembourg. A new Hotel de Ville has been built at La Ferté Macé (Orne), as the result of an architectural competition, in which the design by MM. Kepfer and Lepigneux, of Paris, was selected. The Société des Arts et de la Manche has opened its fifth annual exhibition at Cherbourg. A fine chimney-piece by M. Felix Charpentier, the model of which figured in this year's Salon, has been erected in the Salle des Fêtes of the Town Hall at Avignon. Two bronze figures, symbolising Wine and Cider, support the entablature, which is surmounted by a group of Bacchantes carved in stone. —M. Ulmann, architect, has been commissioned to carry out the large buildings for the Institut des Sourds-Muets for the Department of the Seine. —A palace for the Military Commandant is shortly to be commenced at Tunis, at a cost of 2,300,000 fr.—M. Louis Chapelle, a well-known contractor for public works at Paris has been killed in an accident to an automobile car at Comenelle-sur-Risle, near Rouen. He had taken a large part in the construction of the buildings for the Paris Exhibition of last year.

**AUSTRALIA.**—A large railway station is about to be erected at Port Pirie, South Australia. —A Roman Catholic church is being erected in Merigum, Victoria. —Mr. James Henderson, architect, of Newcastle, New South Wales, has been commissioned by Messrs. Fred. Asp, Limited, to prepare plans for a large bond and bulb warehouse, to be erected in Burwood-street, Newcastle. —The Government has decided to have statues executed of Sir Henry Parkes, James Spire Farnell, Daniel Henry Denieby, Dr. Lang, and Sir James Martin, and they are to be placed in niches on the exterior of the Lands Office, Sydney. They will be of sandstone. —The Parramatta Hospital for the Insane is to be considerably enlarged. —A church is to be erected at Thoon, Victoria, for the Church of England congregation. —A large hotel is being built at the corner of Gipp-street and George-street, Sydney, on the site of the old Larkin Hotel.

**MISCELLANEOUS.**

**PAINTING CONTRACT AT FULHAM.**—At the meeting of the Fulham Board of Guardians on Thursday last week, the General Purposes Committee reported that they had considered the following tenders for painting and cleaning works at the infirmary and offices:—Joseph Halse, Fulham, 1,645l.; W. J. Renshaw, Putney, 1,497l.; J. Bendon, Hammersmith, 1,050l.; Vigor & Co., Poplar, 800l.; J. J. Richards, Brixton, 792l.; G. McArthur, Fulham, 700l.; E. Mills, Westcombe Park, 743l. They recommended the acceptance of the tender of Mr. McArthur, lowest but one. Mr. Rule drew attention to the discrepancy in the tenders, and said the Committee ought to have employed a quantity surveyor before inviting tenders. It would have been more business-like, and would have cost only about 25l. Surely one man was not going to do for 743l. the same work that another wanted 1,600l. for! The Chairman (Rev. P. S. G. Probert) said the Committee had the architect before them, and went into the matter as fully as they could. Mr. Westwood said the architect told the Committee that the estimate of 1,600l. was altogether beyond the mark, and that although Mr. McArthur would have to cut it fine, at the same time he thought it possible for him to do the work for the money. Mr. Peter Lawson desired to know why the lowest tender should not be accepted, saying that Mr. Mills had carried out work satisfactorily in the past. The Chairman replied that the Committee, in its wisdom, thought that for a matter of 17l. the tender should not be taken from a local man. Ultimately the Committee's recommendation, to accept Mr. McArthur's tender, was adopted. It was further resolved that a clerk of works be appointed at a salary of three guineas a week, and that the architect be requested to select a qualified man for the post. Afterwards it was stated by the architect that the Clerks of Works' Association had informed him that four guineas a week was the minimum salary that could be accepted by a qualified clerk of works. It was decided to empower the architect to agree to the larger salary if necessary.

**NON-LUMINOUS BY-PASS FLAME FOR INCANDESCENT BURNERS.**—Hitherto incandescent burners fitted with a bye-pass for kindling the main gas jet have been objectionable on account of the liability of the small luminous bead or jet of flame to produce a deposit of carbon on the mantle, and its liability to extinction by air draughts or by the sudden cutting off of the gas supplying the main flame.

Mr. A. Clarke, of Albion-road, London, has sent us a burner in which the bye-pass device has, by an extremely simple device, been altered to produce two small non-luminous flames situated on the sides of the socket which receives the rod used to support the mantle. The flames being non-luminous cannot blacken the mantle. We notice also that the gas supplying the main flame may be alternately turned on and off suddenly, repeatedly, and in quick succession without extinguishing the bye-pass flames, and that the latter are less readily extinguished by draughts than the single luminous flame usually employed.

**THE ROMAN VILLA AT BRISTLINGTON, BRISTOL.**—The further investigations carried on at the site of the Roman villa have resulted in the discovery of a large number of interesting Roman relics. In addition to human remains, &c., the well has also, we are informed, yielded an abundance of objects of considerable interest, among them being a series of seven metal vessels of great rarity, with handles beautifully marked. A quantity of Roman pottery, including a pretty little pitcher in a perfect state of preservation, is likely to be admired. Near the bottom of the well were found some remains of wooden buckets, with portions of iron handles attached; also part of a comb cut in wood, with fine teeth on one side and coarse on the other. Some of the articles in bronze included a very nicely worked spoon, also a pin and fibula. The whole of these finds has been handed over to the Museum.—*Bristol Times.*

**IMPROVEMENTS IN HOXTON.**—The Shoreditch Borough Council have lately opened new premises in Branch-place, Hoxton, of which the lower portion constitutes an addition to their electrical lighting works, whilst the upper part of the house will form a "shelter" for temporary occupation by poor families in whose own homes infectious disease has broken out, and who are therefore disposed of for a term during the disinfection of their rooms.

**SWEDISH GRANITE AND TIMBER.**—In the Gothenburg district quarrying is reported (officially) to be now carried on on a very large scale. The granite industry of Lysekil and the immediate vicinity thereof chiefly comprises the production of paving-

stone, of which considerable quantities are shipped to the United Kingdom and the Continent. Granite for building and other purposes is obtained at the quarries farther north, bordering the Norwegian frontier. The granite is said to have found a good market of recent years in the United Kingdom. The exports of last year included 63,021, worth from Strömstad, 3,157, from Uddevalla, 7551, from Marstrand, 14,510, from Warberg, 28,000, from Halmstad, and 57,121, from Carlscrona. The year was most satisfactory to those engaged in the timber trade. Both redwood and whitewood, particularly in large dimensions, were easily disposed of at advancing prices, whereas battens and small dimensions met with less demand, and the prices of these could consequently not be fully maintained. The prospects of the timber trade are stated to be at present very good, and sawmill owners and shippers consequently look forward to another prosperous season. Last year's exports included from Gothenburg 55,410 standards of deals, battens, and boards, 1,382 standards of other wood goods, joinery to the value of 276,305*l.*, laths to the value of 119,440*l.*, and turnery goods to the value of 25,771*l.*; from Uddevalla 12,023 standards of wood, and joinery to the value of 25,978*l.*; from Warberg 7,100 standards of wood; from Halmstad 45,000 standards; from Helsingborg 11,596 standards; and from Carlscrona 13,450 standards.

**SCHOOL BUILDINGS.**—The Board of Education has issued the following rules as to the building of Higher Elementary Schools:—"1. Article 110 (6) of the Code limits the numbers of a Higher Elementary school to about 300. For such a school ten classrooms will generally be required, since every class should have its own classroom. Of the ten classrooms at least four should be suitable for a class of forty scholars. 2. (a) A classroom for forty scholars should have an area of about 620 square feet; a classroom for thirty scholars should have an area of about 480 square feet. (b) All classrooms must be furnished with single desks; the desks should be 2 ft. long, arranged in pairs with intervals of 2 in. and gangways of 2 ft. 3. Every Higher Elementary school should be provided with suitable laboratories. (a) The laboratory accommodation must be sufficient to provide at one time for the largest class in the school. (b) There should generally be one laboratory for chemistry and one for physics. (c) A laboratory should afford 30 square feet of floor space for each scholar; the minimum size will, therefore, be 600 square feet, but it is, as a rule, desirable that the laboratory should be somewhat larger. If, however, the laboratory accommodates more than twenty-five scholars, a second teacher would be required. (d) Laboratories must be fitted with suitable tables, which must be well lighted; they should be properly supplied with gas and water. For chemical laboratories, sinks, cupboards, and the necessary fume closets must be provided. (e) A small balance room may be provided if desired. 4. (a) In addition to the classrooms and laboratories, it is desirable that a Higher Elementary school should include at least one lecture-room, which should be fitted with (1) demonstration table furnished with gas and water supply and a sink, and (2) a fume closet. A lecture-room should have an area of about 750 square feet. (b) A small preparation room, fitted with bench sink, cupboards, and shelves, and proper supply of gas, should be provided in a convenient position for the lecture-room. 5. A drawing classroom for the more advanced drawing is desirable. It should provide 30 square feet of floor space for each scholar; the best size will be a room with an area of 750 square feet. If suitably lighted the hall would answer for this purpose. 6. Other special rooms for cookery, laundry work, and manual instruction should be provided in accordance with the Rules in Schedule VII. of the Code. 7. A Higher Elementary School may be planned with a central hall, but no class (other than drawing) can be recognised in such a hall. Good dimensions for such a hall would be 50 ft. by 25 ft. As an alternative the hall might be adapted for use as a gymnasium when occasion requires. Such a gymnasium for a school of 300 children should have a floor space of 1,800 square feet. The gymnasium should not be adjacent to the laboratories."—*Standard*.

**HOUSING QUESTION, LIVERPOOL.**—Colonel W. R. Slacke, R.E., an Inspector of the Local Government Board, held an inquiry in the Town-hall, Liverpool, into the application of the City Council to the Local Government Board for sanction to borrow 42,500*l.* for the erection of dwellings for persons of the working classes. Mr. Cripps, assistant solicitor to the Corporation, at the outset explained that the application was to borrow 42,500*l.* to provide for the erection of 251 dwellings, which would accommodate 1,079 persons. The site was that known as the Adlington-street area, and was bounded by Adlington-street, Henry Edward-street, Lace-street, and Bispham-street. The Corporation had on a former occasion given a pledge to erect houses to accommodate a large proportion of the people who had been, or would be, dispossessed owing to the demolition of insanitary property. In respect of this pledge, they had built, were building, or were about to build, 33 houses, estimated to accommodate 1,648 persons. The Corporation had also in prospect, in fact they had acquired, sites for building workmen's dwellings, and would shortly be in a position to submit

further plans for houses capable of accommodating about 1,200 persons. By this application they intended to make provision for the rehousing of 80 per cent. of the dispossessed tenants on the particular area. They were providing for ten four-roomed dwellings, 113 three-roomed dwellings, sixty two-roomed dwellings, and forty-eight one-roomed dwellings. The one-roomed houses were very useful, and a large number of people would be in the workhouse or receiving parish aid if such one-roomed dwellings were not provided. Regarding the repayment of the money they desired to borrow, Mr. Cripps said the Housing Committee hoped the Local Government Board would see their way to extend the period to six years. The buildings were erected and looked after by the Corporation, and were estimated to have at least 120 years' life. In regard to land, they thought they ought to be allowed 100 years within which to repay loans. Mr. F. T. Turton, deputy surveyor, gave details of the scheme connected with the present application. Subsequently the inspector visited the area in question.

**NORFOLK MARKET HALL, SHEFFIELD.**—The Finance Committee of the Sheffield City Corporation are advertising for plans from local architects for the structural improvement of the Norfolk Market Hall, the principal of the markets of which the Municipal Authority has control. The object is to improve the letting value of the property, and improvements to be effected include the better natural lighting of the interior (possibly by the provision of more windows), the development of the shop accommodation both interior and exterior (by the removal of the existing stalls and appliances, or otherwise), and the provision of more adequate factory accommodation in such position as to be available for those using the market and the public outside. Competing architects are to be at liberty to show in their plans a gallery carried around the interior of the hall at the first-floor level, to give the public access to an upper story of shops, if such an arrangement is considered commercially practicable. The estimated cost of these improvements is not to exceed 15,000*l.*

**THE GOUPEL GALLERY.**—Messrs. Boussoud Valdon & Co. have disposed of their London galleries to their late manager, Mr. William S. Marchant, and have further granted to his firm, Messrs. William Marchant & Co., the sole right to describe themselves as Messrs. Boussoud Valdon & Co.'s agents in the United Kingdom.

**SALES OF PROPERTY.**—Messrs. Protheroe & Morris will sell by auction on the 24th inst. on the estate, seventy freehold sites, comprising a further portion of the East Pentire Building Estate, Newquay, Cornwall. The estate, overlooking the Fialral Beach and the Gannel, faces the Atlantic Ocean, is about 100 ft. above sea level, and within one mile of Newquay Station on the Great Western Railway. The lots to be offered are suitable for the erection of detached residences, shops, and bungalows, together with an hotel site.—Mr. E. A. Jephcott, of Alcester, will sell by auction at Swan Hotel, Alcester, on the 28th inst., the old Presbyterian Meeting House, Alcester, which was erected in 1723. Also the old panelled oak, &c., therein (estimated from 3,500 to 4,000 superficial feet).

**THE DEVONIAN CLUB.**—The Committee of the Devonian Club, on the 20th inst., elected its honorary secretary Mr. C. H. Brodie, A.R.I.B.A., in succession to Mr. George Wreford, C.C., the founder and honorary secretary from the commencement in 1891. Architects and their assistants who hail from the western shire are invited to communicate with Mr. Brodie at the club, Adelphi Hotel, W.C.

## CAPITAL AND LABOUR.

**DUNDEE BUILDING TRADE.**—An important agreement, affording a promise of industrial harmony in Dundee building trade, has been entered into between the masters and operative masons of the city. This section of the building trade has within recent times suffered from strikes and petty disputes involving a good deal of friction between employers and employees. The agreement referred to—the terms of which have now been accepted by both parties—provides that for a year, that is to say as from June last, no reduction will be made in wages. Having regard to the present position and prospects of the trade, this provision has proved specially acceptable, and the operative masons' interests of the masters are safeguarded by a clause which will have the effect of prohibiting the calling out of men from the jobs of employers whose policy and actions do not coincide with the views of the Union officials. Probably the most important feature of the agreement is a proviso for the appointment of an arbiter mutually chosen, whose decision in all matters of dispute will be binding on the signatories to the agreement.—*Dundee Advertiser*.

## RECENT PATENTS.

### ABSTRACTS OF PATENTED INVENTIONS.

7,077.—**DREDGING APPARATUS:** F. Hoffmann.—Two shafts with intermediate bevel-wheels drive a dredging-wheel at the mouth of a suction-pipe; pipes, or that portion of the mouth of the suction-

pipe which the ground covers, will regulate the ratio of the amounts of dredged material and water. If a turbine is adjusted at the mouth of the suction-pipe, that ratio will be regulated with a curved slide worked by a rod and covering a portion of the turbine wheel; the ratio is indicated by pressure upon an air-bubble manometer within the upper arm of the suction-pipe, which for dredging in different depths can be made after the telescopic kind.

7,092.—**A GOVERNOR FOR WATER-WHEELS:** E. F. Cassel.—Springs compress together two discs which form the wheel, and each spring carries a bucket against which a jet is directed, unequal and adjustable weights affixed to frames constitute a differential governor mounted upon brackets, when the speed becomes too high the discs are forced asunder by the arms of the governor and the jet then escapes between the separated buckets; one set of buckets may be discarded, or loaded arms pivoted on to one of the discs may be employed instead of the weights. By another arrangement the buckets are divided, and a pivoted loaded arm is attached to the underside of each half-bucket, whereby as the speed becomes excessive the halves open asunder through the centrifugal force exerted.

7,316.—**A DAM OR DYKE FOR WATER:** G. Serravallo.—In order to control a sudden increase of water flowing down a torrent, a dam or dyke is constructed across the narrow portion of the valley, and its lower part (which is built up of mixed earth and straw) is strengthened with a casing of iron bars and wire trellis-work that surrounds a block of gravel and stones. The collected water is suffered to flow away through channels cut in the dam, and along the hillside additional overflow canals are supplied.

7,337.—**MEANS OF HEATING WATER:** F. Hatcher.—A gas-geyser has an outside cylindrical wall and an inside conical roughened or corrugated wall, which constitute an annular water receiver to which an outlet is fitted. The heater is joined to the inlet, and by tubes, to the discharging-ring, by which means the discharged water is directed against the inside casing.

7,338.—**INCANDESCENT LAMP:** E. Schallies and F. W. Harmer.—A parallel rod of carbon or some other conductive substance serves for a preliminary heating of a magnesia or similar refractory incandescence rod, and after the magnesia rod has become heated the supply of current to the heater will be cut off by the thermal expansion either of a coiled strip having a contact-arm or of a magnesia rod which actuates a contact-spring mounted upon an insulating support and a metal strip.

7,366.—**A CONTRIVANCE FOR WINDOWS:** H. Pieper.—The inventor's object is to maintain a uniform temperature within the room and to prevent moisture from becoming condensed or frozen upon the window. Double panes are employed for the glazing, and openings or channels extend from the panes between the panes to the air outside, the entrance of dust through the openings is obstructed with wire strips.

7,369.—**SPIGOT AND SOCKET AND SLEEVE JOINTS:** Ritter von R. S. Traunfels.—In order to dispense with asbestos or similar packing materials in the case of pipes that may be subjected to a high temperature, copper or other metal cones are deposited, for a sleeve-joint, upon the pipes with an electrical current, and nuts are set in engagement with the screw-threaded double conical sleeve; for another mode of jointing, and in substitution of the conical sleeve, a thin layer of copper is deposited upon the pipes, and conical sleeves are heated and the drawing having a contact-surface of the case of spigot-and-socket joint, one conical piece of iron is made, one of the pipe-ends being screw-threaded.

7,401.—**A VENTILATOR:** F. J. Rawlings and W. R. Rawlings.—The apparatus comprises a middle frame which is to be built into the wall, a gauze or other screen over a louvred grating, and an inside frame containing a counter-weighted valve which may be shut with a pull-cord and is fitted with stops and a huffer-pad.

7,403.—**A FASTENING FOR DOORS, WINDOWS, &c.:** A. Graham.—For a sliding window a pivoted piece, on which is a pierced projection, is carried by a plate which is affixed to one of the frames. To the other frame is affixed a plate, from the under side of which project lugs or pieces wherein a spring-controlled bolt works for engagement with the pierced projection. The bolt is to be drawn back with a pin that slides in a slot in the latter plate, whereupon the lug is freed, and one can lift the pivoted piece for the separation of the frames.

7,406.—**WORKING OF STONE:** F. Trler.—Upon the slide of a reciprocating machine having rolling cutters are disposed auxiliary cutters which are oppositely inclined to the main cutters. Trunnions carry the holders of the finishing tools that may be worked with a stop-rod for a reversal of the skew with the end of the stroke, and in order to start the rolling of the cutters they are laid against elastic adjustable rails; collars and pins hold the shank of the holder in any one of four positions in order that the holder may be worked upon a rest having a level-adjustment. For giving the skew the holder is caused to rock between stops. Various other adaptations and features of the machinery are specified.

7,433.—**A BALL AND SOCKET JOINT:** H. Hirst and F. H. Collings.—An adjustable support for a

**"The Builder" Student's Series**

Books sent from the Office, POST FREE, on receipt of remittance.

**7/6 LAND SURVEYING AND LEVELLING.** By ARTHUR T. WALMSLEY, M.I.C.E. P.S.I. F.E.C. LOND. Hon. Assoc. R.I.B.A. With 140 illustrations.

A useful book for a Student, containing not only the usual instruction given in a Text-book on this subject, but valuable additions from the author's own experience, and an exhaustive chapter upon Parliamentary surveying.

**6/- FIELD WORK AND INSTRUMENTS.** By ARTHUR T. WALMSLEY, M.I.C.E. P.S.I. F.E.C. LOND. Hon. Assoc. R.I.B.A. With 24 illustrations.

Gives the student a practical knowledge of the construction and handling of surveying instruments, and how to deal with the application of the field for setting out work.

**7/- STRUCTURAL IRON AND STEEL.** By W. N. TWELVEBEE, M.I.M.E.

In this elementary Treatise, the author has endeavored to present in a regular sequence some of the more important details relative to iron and steel as applied to structural work.

**5/- STRESSES AND STRAINS; THEIR CALCULATION AND THAT OF THEIR RESISTANCE.** By FREDERIC RICHARD FARROW, F.R.I.B.A. With 30 illustrations.

A Handbook for Students, particularly those preparing for the examinations of the R.I.B.A. and arranged and intended especially for those whose knowledge of the matter is limited.

**3/6 SPECIFICATIONS FOR BUILDING WORKS, AND HOW TO WRITE THEM.** A Manual for Architectural Students. By FREDERIC RICHARD FARROW, F.R.I.B.A.

Shows the Student how he should write a specification, so that when he has learnt the method and general principles, he may apply them to the particular exigencies of any building he may design.

**3/6 QUANTITIES AND QUANTITY TAKING.** By W. E. DAVIS. (2nd Thousand.)

A reliable Handbook for the Student pure and simple, its scope being limited to the method of procedure in the production of good Bill of Quantities. The examples given, whilst intentionally simple, will be found to cover almost every phase of the subject.

**5/- CARPENTRY AND JOINERY:** A Text-book for Architects, Engineers, Surveyors, and Craftsmen. By BANISTER F. FLETCHER, A.R.I.B.A. and H. PHILLIPS FLETCHER, A.R.I.B.A., M.I.C.E. With 40 illustrations.

Intended for those entering for the examination of the City and Guilds Institute, the Carpenters' Company, and the Institute of Certified Carpenters, &c. Also for the examination in these subjects by the B.I.B.A. and the Surveyors' Institution, &c.

**5/- ARCHITECTURAL HYGIENE;** or SANITARY SCIENCE AS APPLIED TO BUILDINGS. By BANISTER F. FLETCHER, A.R.I.B.A. and H. PHILLIPS FLETCHER, A.R.I.B.A., M.I.C.E. With 30 illustrations.

A concise and complete Text-book, treating the subject in all its branches, and intended to be of use to those entering for an examination in Sanitary Science.

London: OUGLAS FROUDRINER, "Builder" Office, Catherine Street, W.C.

**SURVEYORS' INSTITUTION EXAMINATIONS.**

COMPLETE COURSE OF PREPARATION for these Examinations are given, either in class, by correspondence, or in office, by Mr. RICHARD FARROW, F.R.I.B.A., M.I.C.E. &c. The SIX and EIGHTY MONTHS COURSES will commence on the 10th of SEPTEMBER next. The following table shows the prizes that have been obtained by Mr. FARROW'S pupils at the last seven Examinations:—

Institution Prize ..	1855	1856	1857	1858	1859	—	1901
Special Prize .. ..	—	—	—	1897	1898	1899	—
Driver Prize .. ..	—	1855	1856	—	1888	1890	1900
Penfold Silver Medal ..	—	1895	1896	—	1898	1899	1900
Penfold Gold Medal ..	—	—	—	1858	1859	1900	1901

NOTE.—In 1856 the Oravver Prize was divided between two bracketed winners, one of whom was prepared by Mr. FARROW.

The above table shows that of the 43 prizes awarded at the last seven Examinations, 254 were obtained by candidates prepared by Mr. FARROW, and 164 by candidates not prepared by him.

For particulars of the Courses of Work, &c. in any advice with respect to the Examinations, apply to Mr. RICHARD FARROW, F.R.I.B.A., M.I.C.E. 52, Victoria-street, Westminster. Telephone 56, Westminster.

### The English Renaissance.

HE monumental work on the architecture of the English Renaissance,\* on which Mr. Belcher and Mr. Macartney have been at work for some time, and the first numbers of which have already been noticed in our pages,† has now appeared in complete form in two large and handsome folio volumes. We are still of opinion that the title of the book is a misnomer, and is confusing our architectural nomenclature. The period selected commences with the work of Inigo Jones, and that, in our view, was the commencement of Renaissance architecture in England. The sub-title runs "Domestic Buildings erected subsequent to the Elizabethan Period." "Domestic buildings" is not a strictly accurate definition, as the works illustrated include Greenwich Hospital, Trinity College Library, Abingdon Town Hall, and other buildings which are certainly not domestic. That is a minor matter: but the special reference to "Elizabethan" implies that the authors consider Elizabethan as Renaissance architecture, and the work commencing from Inigo Jones as "later Renaissance." Now we entirely decline to regard Elizabethan as "Renaissance" architecture. It is Elizabethan, and it represents a phase of architecture peculiar to this country, which is not to be found elsewhere and which is much better distinguished by the term hitherto conventionally assigned to it. Elizabethan architecture is a picturesque possession of our own; it is not only peculiar to England, but it arose out of circumstances peculiar to England. The Perpendicular Gothic which immediately preceded it is also an indigenous phase of architecture, represented by nothing on the Conti-

ent. Elizabethan architecture is the result of the reminiscence of that phase combined with the echoes of the Italian Renaissance movement which, in consequence of the insular position of this country and the slow travel of artistic influences with us in those days, reached us at first only in a piecemeal manner, and affected details without affecting the English style of architecture as a whole. Hence this reposeful, rich, picturesque *mélange* of late Gothic and patchwork Renaissance detail which we have learned to call Elizabethan, and which is an essentially distinct thing from Renaissance.

For the distinction is not one of words only; it concerns the whole architectural treatment of a building—the whole conception of architecture as an art. Renaissance architecture means the forms and principles of Classic, and especially of Roman architecture, which followed in Italy the revival of classical learning. And, apart from the mere revival and imitation of the Classic orders, which is its outward and visible sign, it means the conception and treatment of a building as a uniform whole, dominated by one paramount idea which has its basis in the plan, and which rules the whole design. Now Elizabethan architecture never rose to that intellectual height. Its plans are for the most part naïve, and deficient in unity of conception. The real power of Renaissance architecture lay in this, that it grasped the conception of a building as one whole and symmetrical idea. We neither forget nor underrate all that modern architectural criticism has had to say in regard to the deadening and academic effect of the Classic revival and its adherence to precedents of antique detail; of its unsuitability to our climate; of its want of life and variety in comparison with mediæval detail. In all that criticism there is much truth. But the great thing which the Renaissance revival brought with it was this power of unity of architectural conception. Italy brought it to the modern world; and a century or so later Inigo Jones brought it to England. We never had it before him. His plan of Whitehall Palace was a kind of architectural conception of which there is no previous example on our shores. He was the leader of the English Renaissance.

Therefore, the title of the book before us should have been "Renaissance Architecture in England." What would be properly called our "later Renaissance" would be the Georgian architecture—also peculiar to this country, and which represents the decadence of the Italian Renaissance—dry, stiff, and formal; destitute of the large manner and dignity of the Renaissance in its pristine vigour, though it still retains some of the Renaissance characteristics of unity and comprehensiveness of design.

An illustrative book of English Renaissance architecture, in the true signification of the word, would to our thinking be more instructive if the examples were arranged in chronological order. No attempt has been made at this in Messrs. Belcher and Macartney's book. The dates of nearly all the examples illustrated are known and are given; but the sequence of the illustrations has no reference whatever to date. This we cannot help also regarding as a defect in the book, though it is one very characteristic of the present day. In this as in other cases, to produce a collection of fine illustrations seems to be the principal aim, without taking any trouble to arrange them in such an order as to be historically illustrative. It would have been so exceedingly easy to do this, being merely a question of arranging or numbering the plates according to the sequence of date, that one can only suppose that the authors considered it of no consequence; a conclusion in which we cannot agree. One object of such a collection should be to illustrate the development and decadence of a style; not merely to bind together a series of illustrations without method or system.

These are the defects of what is nevertheless a very fine architectural publication, containing a collection of examples illustrating almost all the types of English Renaissance architecture, from the palace to the street house. In their Introduction, the authors do not omit to recognise the quality of unity of design which we have alluded to as one of the most special characteristics of Renaissance architecture. Among its developments, they observe, "there is the bringing to maturity the well-balanced design; a complete project, with every part rightly ad-

\* "Later Renaissance Architecture in England; a Series of Examples of the Domestic Buildings erected subsequent to the Elizabethan Period." Edited, with introductory and descriptive text, by John Belcher, A.R.A., and Mervyn E. Macartney. London: B. T. Batsford; 1901.

† See *Builder* of July 25, 1898.

justed and with carefully considered outline. It was this striving after unity, which may be said then to have reached its most complete development; indeed, it went beyond the mansion and extended to its environment." There could not be a finer example of this feeling in architectural design, which includes the placing and grouping of the buildings as well as their detailed architectural treatment, than is to be found in Wren's working out to its completeness of the plan of Greenwich Hospital, which forms the first illustration in the book. The wide spacing of the two front blocks, leaving the rear blocks partly visible behind them, and the introduction of the domes at the inner angles of the latter, so as to bring them into full view from the front quadrangle, combine to form one of the stateliest of plans; and although a dome seems naturally and generally a central feature, we are reminded here how it may be effectively used at an angle of a block of building. In fact, without following any precedent, Wren placed his principal features here exactly where they would be most effective in relation to the whole scheme. Take away the outstanding front blocks, and the domes might seem to be weakly placed—one might think that they ought rather to be in the centre of the entrance façades. Taken in connexion with the whole plan, they are exactly where they ought to be, forming prominent objects as seen from the great front court, and standing as a stately commencement or portal to the narrower avenue between the two rear blocks. While referring to the plan, however, we cannot but comment upon the difference between this and some other recent architectural publications, in the matter of plans, as compared with the practice of earlier architectural illustrators. Campbell in the "Vitruvius Britannicus" gives all the plans on the same scale as the elevations. Here, as well as in Mr. Gotch's recent publication, we have no plans except small-scale blocks in the text; and the principal illustrations are not elevations but photographic views. We have no quarrel with these latter; by their means the reader is given a vivid idea of the actual look and character of buildings which he may never have seen; but we should certainly think it more complete if they were accompanied by plans to a large scale. The lack of these is another indication of the spirit of architectural illustration in the present day; it is all concerned with the picturesque effect of a building, not with illustrating its working out. We see the same at the Royal Academy, where architects are content to send, if any plan, merely a diminutive one in a corner of the drawing, and perhaps would not be accepted if they attempted anything else; whereas in France the plans are exhibited to the same scale as the elevations; and it would be the same in a French architectural publication. In this respect we have fallen below the level of Campbell and Kent; in a modern publication it seems to be sufficient if there is a plan just large enough to form a key to the general meaning of the photographic view—a plan, too, dissociated from the view and relegated to a back place in the explanatory text. That is certainly not an ideal system of architectural illustration; but it is what appears to suit the present demands.

In studying the illustrations of the build-

ings of a past age, we should endeavour to criticise them as we would criticise modern work, not to adopt an attitude of indiscriminate admiration. In this respect the remarks on the various examples are in a right spirit; the authors do not scruple to point out what they consider the defects and shortcomings of some of the buildings illustrated. The criticism on "The Great House, Burford"—the incongruity of effect of the vases planted on the top of the battlements, and the indiscriminate manner in which a pediment is got in, to break the line, without any constructional basis, is quite to the point. In fact Burford, as they remark, "is an example of the overlapping of Early and Late Renaissance work," or (as we should prefer to put it) of Elizabethan and Renaissance work; the general design is Gothic in feeling, but the newly arrived vase terminals of the Renaissance have been perched on it. We cannot agree with the comparative criticism as to Wilton House and Houghton. The authors say that "the Houghton front lacks the quiet dignity of Wilton, where more restraint is exercised in every part." Restraint may be carried too far, and we confess that we think Wilton rather over-rated; the name of Inigo Jones has cast a glamour over it. Its simplicity is pleasing no doubt, as well as the contrast afforded by the one bit of sculptural decoration introduced in the centre, but the end pavilions are very deficient in dignity. We have reproduced the view of Houghton (see plate), and we do not understand the meaning of the want of "restraint" complained of. With the exception of the cupolas, it can hardly be more simple, and it has a palatial dignity which is wanting in Wilton. The house, we are told, was designed by Campbell in 1723, but carried out by Ripley, who substituted the domes for the originally designed attic at each end. He certainly thereby made an improvement, and the whole effect is that of one of the most dignified mansions in England, and one which shows, too, what may be done in Renaissance architecture by the mere treatment of wall, windows, and cornice, without the decorative use of an order of columns or pilasters. Again, somewhat too much is surely made of Groombridge. It is a mean-looking brick house, with its high-pitched roofs and plain overhanging eaves; and the columned portico, so far from giving it the dignity it lacks, seems out of keeping with the rest of the elevation. Nor can we concur in the admiration expressed for the ceiling decorations of the drawing-room, said to be the one room of sumptuous character which the house possesses. The great ragged mass of realistic plaster fruit and flowers, running round the central oval compartment, has no redeeming quality but its boldness; it is bad ornament, with no principle of design in it at all, and entirely destitute of refinement. It has had imitators, however, in recent work. If people will imitate old Renaissance detail, let them at least imitate its beauties, not its faults. As an example of a far superior type of English Renaissance detail we have reproduced the plate of details of the Winchester School Hall, by Wren. We do not by any means agree that Wren always used "swags" and that kind of ornament well; there is no doubt, for instance, that a great deal of the exterior carved ornament of St. Paul's, in the way of floral festoons, is coarse

and poor, as Ruskin has justly remarked; and good or bad, there is always the question whether it is really Wren's design, or only that of his carvers working out their own will in their own way. But in the case of the Winchester Hall there is no doubt that the disposition of the swags, forming a kind of frieze ornament, is Wren's own, and is very effective; and there is a severity of line about them, as shown in the detail drawing, which is very creditable to the carver, and far superior to the exuberant vegetation of the Groombridge ceiling. The treatment of the door and windows, for plain and simple work, can hardly be surpassed in dignity and refinement.

The employment of the order as a decoration, however we may theoretically condemn it, cannot be dissociated in the mind from the highest achievements of Renaissance architecture. For a building in this style of the largest and most imposing class, the use of the columnar order is really the condition of the greatest dignity of effect, as many of the illustrations in this book do practically testify. It may be misused, as it certainly is at Stoneleigh, where the majority of the treatment consists of windows and window dressings only, but where each angle of the building is formed by a great square fluted column or angle pilaster, running nearly the whole height of the building, with an Ionic capital. A modern architectural student who did this in a prize competition design would be condemned at once, both by his teachers and by most of his fellow students; it is absolutely bad; and yet one cannot exactly regret its existence in this instance; it is an interesting curiosity, and a variety from the general use of the order, and it gives a certain individuality to the building; only let not the young architect go and do likewise. On the other hand, in the plainer forms of domestic architecture, there are many examples in this book showing how much of dignity, and how much of the true and best characteristics of Renaissance architecture, may be realised without the introduction of the order. Houghton, already referred to, is an example on a large scale; an admirable example on a smaller scale in a less ambitious building, is that of Tyttenhanger. We entirely concur with the authors in their admiration for this house, which is an ideal specimen of architectural good taste and refinement displayed in a simple and severe manner and almost without the use of ornament. Another example is Inigo Jones's Raynham Hall, with its fine free design in the scroll gables; the authors call attention to one charming little detail in this, viz., the termination of the scrolls, just under the horizontal cornice, with a diminutive Ionic cap; a playful incident which in itself shows the original mind of the designer, and which seems to give the scroll the effect of supporting or, as the authors put it, "lifting" the gable. There is a good deal of general resemblance between the style of Raynham and that of a less well-known example, Swately Hall, in which the treatment of the gables is very similar, though the house as a whole has not the fine simplicity of Raynham. No architect's name is connected with it. In reference to Raynham, we may draw attention to the singularly delicate and graceful treatment of the doorway, shown in a separate plate to a larger scale, and especially the carved ornament over the door, which has a cha-

acter of its own, different from that of the usual Renaissance carved ornament.

Out of the ordinary type of Renaissance ornament is also the carving in the semi-circular lunette over a door in Ashburnham House (Plate 20)—so much so that one is surprised to find no comment on it in the text. Though the detail of the leafage is Classic, in its general effect it reminds one of mediæval work.

Among the plans given in the text there is perhaps none of greater interest than that of Fenton House, Hampstead, originally known as the Clock House, probably from a clock which once occupied the circle in the blank window-space over the entrance. The architectural character is of the simplest—a brick house with plain flat-arched windows. The plan in its outer lines is a simple square, but the way in which it is divided up shows the hand of a genuine architect. A recessed porch with two columns is obtained in the centre of the entrance front, and the internal space on either side of this is turned into a closet on one side and an alcove on the other, opening respectively out of boudoir and study, which are lighted from the side. A similar contrivance is repeated with the back rooms, the closets or alcoves both in front and back going behind the freplaces, which are thus kept away from the outer walls and from the influence of cold conducting to bad draught. This little plan is quite a study in its way. In the matter of chimneys the authors draw attention in another place to the manner in which architectural effect is combined with practical advantage in the massive treatment of the chimneys at Coleshill (Berkshire); "the size of the stack has no doubt insured (*sic*)\* the warmth of the flues, so that no pots are required to make them 'draw' well." As a whole, Coleshill is a very fine house, another of the examples of Renaissance dignity obtained without the use of the order; in its general effect it may be compared with Houghton, though on a smaller scale and wanting the accentuation of the angles. The back entrance gateway, with its busts in circular niches, is singularly fine and dignified in effect, and unlike any other gateway of the kind that we can recall.

We do not altogether share the authors' admiration for the Radcliffe observatory. It is true that it is original and that its originality grows naturally out of the requirements of the plan, but on the whole it is rather a clumsily managed pile. The use of terracotta plaques as ornaments on the walls is a hint which might have received more attention. Bowood, Wilts, though the architecture taken in detail is not remarkable, is a fine example of the architectural grouping of house and garden in one design, and is well illustrated in this sense. We give a reproduction of the plate showing the mural fountain in the garden, not because there is anything of particular value in the architectural detail, but because the whole makes so fine a picture.

In spite of some mistakes which we have noticed, as to the view of Renaissance architecture implied in the title, and as to the small part which is given to plans in

the illustrations, this is one of the most remarkable and fascinating works in architectural illustration which has appeared in our time. As before observed, the fine photographic illustrations from the actual buildings have all the effect of bringing them before us; and the number of examples of bold, fine, and monumental work thus brought before the eyes has a quite inspiring effect as we turn the pages. The work will probably not be without a considerable influence on the younger generation of architects. It should be added that in every respect of paper, printing, and general make-up and execution, the book is worthy of its great subject.

A Sundial from Wrest.

NOTES.

In a letter to the *Times* of Tuesday last, Dr. C. Johnstone Stoney, brother of Dr. Bindon B. Stoney, the well-known engineer, suggests that the subsidence which has been going on more or less since St. Paul's Cathedral was built is chiefly due to the removal and rearrangement of material by water travelling laterally through the lower layer of sand and over the surface of the London clay. It is undoubtedly the fact, as Dr. Stoney states, that underground water always exercises a solvent action on the mineral constituents of the material encountered, and is also to some extent responsible for the rearrangement of gravel, and the washing away of clay. He might have added that fine particles of sand are often carried away by the underground flow of water, an effect amply evidenced when pumping is practised in sandy soil. Dr. Stoney points out that any subsidence, attributable to causes such as those mentioned, must obviously be variable, as water generally chooses special paths in making its way from one place to another. The remedy which he proposes is to prevent any water from having access to the layer of sand immediately above the London clay by an intercepting sewer, probably best placed to the north and east of the cathedral, and by stopping the downward percolation of surface water to the same sand layer. Assuming this treatment were adopted it would be necessary to fence off a large area by sheet-piling as a first precautionary measure, and then to form a huge retaining wall or dam in addition to the drain. These works might possibly be conducted by closing St. Paul's Church-yard, but it is not improbable that

operations would have to be extended into two or three adjacent streets. In either case the direct cost and the indirect loss to the community would be very great, and the further work of rendering waterproof the whole of the ground about the Cathedral would prove to be an equally expensive undertaking. Perhaps the proposed remedy might be effectual, but on this point we do not feel at all certain. One result that would inevitably follow would be the complete draining away towards the south of water now contained in the interstices of the sand layer. This process might possibly be attended by some further settlement, although it may be reasonably held that the pebbles or grains of sand ought to be self-sustaining in a dry state. In any case, we think the course of treatment foreshadowed by Dr. Stoney is hardly practicable in the centre of so busy and closely built a city as London. A much more feasible and satisfactory scheme is to underpin the foundations of the cathedral, as suggested a week or two ago by Mr. Reilly. As the London clay is to be found at a depth of about 35 ft. from the surface, there would be no difficulty in providing the foundations of St. Paul's with means of support such as would be unaffected by hostile influences, whether of natural or artificial origin.

St. Bride's Church, Fleet-street.

A CLEARANCE which has been made for the re-building of St. Bride's-avenue on the south side of Fleet-street, affords for the while a good view of the church. Some alarm has been taken at the construction of some scaffolding around the upper portion of the steeple. We are enabled to state that a "steeple-jack" was lately employed to make an inspection of the fabric, and consequently upon his report it was deemed advisable to construct a staging for an examination to be made by Mr. R. Cuninghame Murray, architect to the vicar and churchwardens, of the third stage (counted from the tower) of the steeple. Mr. Murray has not yet drawn up his report. The custodians of the church, however, are apprehensive about the condition of the stonework of the third stage. Its eight arches, open to the weather, are tied within by iron clamps that pass through the stonework at the angles of the octagon; it is feared that the accumulation of rust from the corrosion of the iron bars is gradually tending to loosen the joints and to leave the stones slightly apart. Wren began the re-building of the church in 1680; the tower and steeple as originally built by him, in 1701-3, rose to a total height of 234 ft.; on June 18, 1764, it was struck by lightning and so greatly damaged that it was found necessary to take down and reconstruct 85 ft. of the masonry. In repairing the injury (at a cost of 3,000*l.*) Sir William Staines lowered the spire by 3 ft. In 1803 the steeple was again struck by lightning. In the storm of Friday, July 15, 1887, it narrowly escaped destruction by a memorable stroke of lightning which however expended its force beneath the stone paving at the base of the tower. The fastenings of the conductor, which had become worn and insecure, were then repaired, and in 1888 the outer stonework of the tower and steeple was repointed and reinstated. The opening of St. Bride's-avenue into Fleet-street was designed by J. B. Papworth, at a cost of about

\* "Ensured" is the correct expression in modern English, though "insured" was formerly used in the same sense. There are some other slips of language; it is odd that few architectural books are without them.

10,000, in place of Bride-passage, a narrow alley which was consumed by the fire in Fleet-street on November 14, 1824. See the woodcut in Hone's "Every Day Book," vol. i., cols. 87-8.

**Innerpeffrey Castle, Perthshire.** WE hear that Colonel Hay is about to carry out a restoration of Innerpeffrey Castle, after designs prepared by Mr. Georgé T. Ewing, of Muthill. The castle, situated on the north bank of the river Earn, and about four miles distant from Crieff, was built by the Honourable James Drummond, created Lord Maderty, a few years before his death in 1623. The castle, L-shaped on plan, with a square tower, which contains a newel staircase from the ground to the top story within the re-entering angle, presents an interesting example of a period when Scottish lords began to build their castles as much for peaceful occupation as for purposes of refuge and defence. Nevertheless, at Innerpeffrey some features of the older military architecture were adopted—for instance, the outer wall, the narrow loop-holed openings on the ground floor, and the shot-holes from the kitchen that cover the door. In the vaulted ground floor are the storerooms; larder, cellars, and kitchen, with, it would seem, a secret stair from one of the cellars to the hall. The principal floor contains the hall, measuring 32 ft. by 20 ft. and lighted on three sides, a private room with garde-robe, and a bedroom beyond. The rooms on the floor above are similarly disposed, but each of them is entered from the staircase, of which the steps are carried up to the attics above; the gables are crow-stepped. The neighbouring chapel, lately reinstated, formed during many generations the chief burial place of the house of Drummond.

**The British Museum.** IN the annual statement presented to the House of Commons respecting the affairs of the British Museum it is notified that, in the Department of MSS., the purchase of the third portion of the Buckler collection of architectural drawings completes a transaction which secures for the department an unequalled series of sketches of buildings and architectural details from all parts of England and Wales, made by three generations of the Buckler family (especially by John Chessell Buckler) during the past century. As a record of the state of the ancient buildings of this country at the period named these drawings, which fill nearly 100 volumes, are of special value to the national collection. Mention is also made of the acquisition, in the Department of Prints and Drawings, of 113 drawings and three sketch-books of topography and costume, executed in pencil and water colours by George Scharf, sen., illustrating chiefly London houses, shops, and street musicians, the rebuilding of the British Museum, and military uniforms; also forty-five drawings, mainly views of old buildings in Westminster, by Sir George Scharf, by whom they were bequeathed to the Museum.

**Donington Park, Leicestershire.** THIS ancient property of the Rawdon family, extending over 5,090 acres, will shortly be offered for sale by auction. The estate, which yields a rent-roll of about 8,500l. per annum, comprises a park of some 400 acres, bounded by the Trent, famous for its

beautiful scenery, its herds of red and fallow deer, and its fine old oak trees. The south front of the mansion was constructed of stone quarried upon the estate. The east wing forms the chapel, measuring 58 ft. by 20 ft. On an eminence near the village of Castle Donington, in the extreme north-western corner of the county, are the remains of a castle that had been built, upon the site of a former one, by Henry de Lacy, Earl of Lincoln, who died in 1310, and was again rebuilt by George (Hastings), fourth Earl of Huntingdon, who in 1595 had bought it from Robert, Earl of Essex. In 1795 Francis, second Earl of Moira and first Marquis of Hastings, enlarged the residential portion of the house, which had been the home of his ancestress, Selina, Countess of Huntingdon, celebrated for her association with the Methodists, whose daughter, Lady Elizabeth Hastings, brought Donington, together with the Baronies of Hastings, Hungerford, &c., in marriage to John (Rawdon), first Earl of Moira. In some cottages on the estate are vestiges of the hospital founded by John de Lacy (who died, 1179, in Palestine), Constable of Chester, for a master and thirteen brethren and sisters, which he dedicated to St. John the Evangelist.

**Electric Wiring Rules.** THE paper on wiring rules by Mr. F. Broadbent, which has just been published in the *Journal of the Institution of Electrical Engineers*, severely criticises many of the codes of rules issued by supply companies and fire offices. It would undoubtedly save a great deal of needless trouble if the code of rules issued by the Institution of Electrical Engineers was universally accepted. In our opinion, this code is far from perfect, but it has the merit of being brief and treating only of important points. Many of the fire office rules magnify unimportant details, and their recommendations sometimes even increase the fire risk. For example, some of the rules say that motor-starting resistances must be fixed on stone or brick walls, and one even goes so far as to insist that they must be placed "outside of the building." Mr. Broadbent points out the absurdity of this rule by instancing a printing establishment employing a hundred motors. If the resistances were fixed outside we should require at least 2,000 connecting wires, and the fire risk would be most decidedly increased. Again, many corporations make very stringent regulations about the maximum permissible starting current of a motor, but none apparently make any objection to the current being switched off at any instant, although the blink in neighbouring glow lamps caused by a sudden rise of pressure must considerably shorten the life of the lamps. Companies fine consumers by means of their maximum demand indicators for taking too much current for a short period, and they prove to every one's satisfaction that this is an equitable arrangement. It seems to us that companies ought to be fined whenever their pressure of supply rises too high, as this spoils the lamps in the circuit. It is unfair that the fines should all be at the expense of the consumer.

**Sanitary State of Leicester and District.** DR. S. MONCKTON COPEMAN, in a recent Report to the Local Government Board on the general sanitary circumstances and adminis-

tration of the Alcester, Warwickshire, Rural District, mentions that water-closets, except in Alcester, are almost unknown throughout the district, the methods of excrement disposal comprising the use of pails, to which, in some instances, dry earth or ashes are supposed to be added, and ash-pit privies. At Alcester, Studley, and Bidford, the removal of ashes and of excremental and other refuse is carried out by scavengers under contract with the District Council. The following are Dr. Copeman's conclusions in this connexion:—

"It would be well that the Rural District Council should as soon as possible make arrangements for the periodical removal of excremental and other refuse in all the larger villages. Probably also increased efficiency in the manner in which the work is carried out would be attained if the Council took the matter entirely into their own hands, instead of farming it out to contractors. But in any case, where scavenging is carried out, they should insist on collection at sufficiently frequent intervals, and so prevent any accumulation of refuse in the neighbourhood of houses."

The Report supplies evidence as to overcrowding in several of the villages, and in regard to Alcester itself we may quote the following remarks, which, we fear, are applicable to many other towns and villages in the country:—

"At Alcester, the building of new houses is almost at a standstill. In one block of buildings in Gas House-lane, most appropriately known as the Rookery, I found that overcrowding existed to a very serious extent. In support of this statement it may be mentioned that on making inquiries at several adjoining cottages on the Gas House-lane side of the block, I learnt from the inhabitants that the bedrooms, of which each cottage possesses two, having a total air capacity of only about 1,000 cubic feet, had to afford at night sleeping accommodation for the number of persons noted below:—1. Husband and wife, with nine children varying in age from sixteen years to three months. 2. Husband and wife, with five children varying in age from twelve years to one year. 3. Husband and wife with six children varying in age from twelve years to two years."

**The Duke of Westminster Memorial, Westminster Abbey.** WORKMEN are now engaged in removing the stained glass from the great rose window in the south transept of Westminster Abbey. This glass, known as the marigold glass, dates from 1847, and has always in our opinion very much detracted from the view from the north transept, overpowering with the brilliancy of its colours the setting which it was intended to adorn. It is to be replaced by the new Duke of Westminster memorial, a scheme that includes all the glass in the south wall of the south transept. The design for the new glass is in the hands of Mr. G. F. Bodley, A.R.A., and we understand that Messrs. Burlison & Grylls, who are doing the work, will have it completed before the Coronation. The centre of the rose is to be filled by a figure of Christ, while the radiating lights will be occupied by angels and the Virtues, Old Testament and pre-Christian characters. We cannot speak of modern stained glass with unguarded enthusiasm, but the position that this memorial is to occupy ought to be a sufficient guarantee that the best that is possible will be done.

**The New Government Offices.** WE are very glad to see that the *Times*, in a leading article in its issue of Monday last, has spoken out strongly on the subject of the Office of Works carrying out Mr. Brydon's building without an architect. The article

comes rather late in the day, but now that it has appeared, it is everything that we could wish. The whole case is put very strongly, and on quite the right grounds; and we can hardly doubt that such an article in the *Times* will have its effect on public opinion.

#### MACHINERY AT THE GLASGOW EXHIBITION.

WHILST there are several buildings of comparatively small size in the Glasgow Exhibition devoted to mechanical appliances of different kinds, the bulk of the exhibits coming within this class are collected together in the Machinery Hall. This building, therefore, forms a natural starting point for visitors who are interested in engineering work. The Hall is 500 ft. long by about 300 ft. wide, comprising five bays, and with its annexes covering an area of about five acres. The roof of the central bay has a span of 108 ft. and a height of 54 ft.; it is supported on steel latticed columns spaced 8 ft. apart and disposed in pairs on either side of each principal. Arched girders extend from one end of the building to the other, having a span of 41 ft. 6 in., corresponding with the longitudinal spacing of the supporting columns. Cantilevers are built around each pair of columns for the support of the 16 ft. wide gallery running round the Hall at a height of 12 ft. above the floor level, and of double lines of shafting for actuating machinery. As the site of the building exhibited a rise in one direction, excavation was necessary in order to provide a level floor space, and retaining walls were required along two sides to prevent injury to adjoining roadways. The foundations of these walls were sunk through mud and silt to a solid bottom in order to avoid damage to adjacent property and to ensure the stability of the structure. At one end of the main building is the dynamo-house, about 100 ft. square, and communicating with this is the boiler-house, 204 ft. long by 70 ft. wide. The floor of the latter is sunk to a convenient depth so that visitors can command a good view of the steam generators and auxiliary appliances from a gallery on a level with the floor of the main building. For the purpose of driving the machinery intended to be operated in the Exhibition it was estimated that about 5,000 horse-power would be required, and the supply of motive force is furnished by the aid of several types of steam boiler.

Messrs. Penman & Co., of Glasgow, have four Lancashire boilers in operation, each 30 ft. long by 8 ft. diameter, working at a pressure of 120 lbs. per square inch. These boilers furnish steam to such exhibitors as require a moderate pressure, and the service-pipes (equalling a total length of over 1,000 ft.) are of wrought iron or mild steel with cast-iron connexions, the pipes being laid in timber-lined channels below the flooring. The whole of the controlling valves, steam separators, steam traps, and expansion joints were lent by the Glenfield Company, of Kilmarnock. A main flue situated behind the four boilers serves to collect the products of combustion, which pass through a Green's Economiser of 192 tubes, thus heating to a temperature of from 550 deg. to 700 deg. Fahr., the water employed for feeding the boilers. A small independent engine is situated on the top of the Economiser for driving the mechanical scrapers designed to remove soot as fast as it is deposited on the surface of the tubes. By the employment of such an apparatus it is well known that a very considerable saving of fuel may be effected without impairing chimney draught, but unfortunately many public bodies are still to be found who permit financial considerations to exclude the advantage in question from the buildings under their control. Beyond the Economiser is an induced-draught plant, installed by the Sturtevant Engineering Company, comprising a direct-driven fan built in brickwork at one side of the main flue, and connected therewith by suitable suction and discharge ducts. The fan is driven at a speed of about 450 revolutions per minute, its effect being to materially increase the volume of air passing through the boiler furnaces. By the aid of this arrangement cheap forms of fuel may be employed, and the cost of chimney shafts will be materially reduced. Next to the Lancashire boilers mentioned above is one of Messrs. Davey, Paxman, & Co.'s Economic

boilers, 14 ft. 6 in. long by 8 ft. 9 in. diameter working at a pressure of 160 lbs. per square inch. This type of boiler has return fire-tubes above the furnace, and after passing through these the hot gases are led along each side and under the bottom of the boiler before entering the back flue. At one side of the boiler is a Paxman superheater having dampers which are operated from the front, and a Green's Economiser is installed in connexion with the main flue. Water-tube boilers of three types are also used for the generation of steam at 160 lbs. per square inch. There are two Stirling water-tube boilers, made by the Stirling Boiler Company, of Edinburgh. In these the tubes are nearly vertical, and arranged so that the hot gases are compelled to pass along different banks of tubes, and finally to emerge at the point where the feed-water enters. In this way the temperature of the gases is reduced to a minimum before entering the flue. One of the Stirling boilers is fired by coal, the supply being controlled by a Vicars' mechanical stoker, and the other is fired by gas furnished by a Duff's patent Gas-Producer, made by Messrs W. F. Mason & Co., of Manchester. Adjoining the last-mentioned boilers are two Babcock & Wilcox water-tube boilers, capable of providing steam for about 2,000 indicated horse-power. Each of the boilers is fitted with one of the same firm's superheaters, imparting from 100 deg. to 120 deg. Fahr. superheat to the steam, and also with the Babcock & Wilcox chain grate stoker actuated by eccentrics on a shaft attached to the front of the steam-drums. A Babcock & Wilcox marine type steam-boiler is also shown, this being equal to about 1,000 indicated horse-power.

It should here be remarked that the necessity for erecting a large and expensive brick chimney has been avoided by the expedient of establishing separate wrought-iron shafts for the different groups of boilers. The Lancashire boilers have a wrought-iron chimney 80 ft. high by 6 ft. internal diameter, resting upon a cast-iron bedplate built in segments upon a brick foundation; the Stirling and the Babcock boilers are each in communication with a wrought-iron shaft 80 ft. high by 4 ft. internal diameter; and the Babcock marine type boiler has a 3 ft. diameter flue connected up to the nearest chimney. All the chimneys and their bases are suitably protected by firebrick linings. Coal is brought directly into the boiler-house by means of a siding in connexion with the system of the Caledonian Railway Company, each truck passing over an automatic weighbridge, built by Messrs. W. & T. Avery, which records the gross weight inwards and the weight of the empty truck outwards. The handling of fuel is assisted by a conveyor laid down by the New Conveyor Company, of Smethwick. In the boiler-house, and in an adjoining apartment—known as the feed-heater and pump-room—there is a very fair selection of auxiliary appliances having for their object the attainment of economy by utilising waste heat from boiler fires, and exhaust steam from the engines. Of these aids the economisers have already been mentioned, and the others are of the class of apparatus described as "feed water heaters." The well-known firm Messrs. Joseph Wright & Co., of Tipton, exhibit two of their Excelsior non-pressure heaters, which, in addition to heating the water, filter it and separate particles of oil contained therein; there are also two of the Berryman pressure type heaters. A set of Worthington vertical direct-acting pumps is devoted to the service of the heaters mentioned, the pumps having a combined duty of 35,000 lbs. of water per hour against a pressure of 160 lbs. per square inch. Two varieties of Royle's feed water heaters are to be seen in the feed-heater and pump-room; class A being intended for ordinary use, and class B for dealing with water containing a large proportion of dissolved mineral matter. Heaters of the first class are served by compound vertical duplex pumps by Messrs. Carruthers & Co., capable of delivering 35,000 lbs. of water against a pressure of 160 lbs. per square inch; the other heaters are served by a set of Weir's vertical direct-acting feed pumps. The whole of the pipe connexions are duplicated, thus reducing very materially the risk of any interruption of the water supply to the steam-boilers. This portion of the boiler department is well worthy of careful examination.

Motive power for the use of exhibitors is furnished (1) by electric current, (2) by steam engines, and (3) by compressed air. Taking

these in order, we come first to the electricity generating station to be found at the south-west end of the Machinery Hall. Two of Messrs. Willans & Robinson's vertical triple-expansion central-valve engines naturally attract the attention of the visitor, the examples on view being the pair of engines designed for the new electric light station at St. Andrew's Cross, Glasgow. One motor is connected with a Crompton dynamo, and the other with a generator of the Schuckert type; in each case the armature of the dynamo takes the place of a fly-wheel, this arrangement being rendered possible by the uniformity of motion afforded by the three cranks. The power developed by each engine under normal conditions is 1,200 indicated horse-power, or 1,500 indicated horse-power in cases of emergency. An excellent coupled compound electric-traction engine is exhibited by Messrs. Davey, Paxman, & Co., of Colchester, this machine being attached to an E.C.C. dynamo by the Electric Construction Company, Limited, of Wolverhampton. Another coupled compound engine of the horizontal type is shown by Messrs. Robey & Co., of Lincoln, this engine developing 500 indicated horse-power, and acting in conjunction with a Mavor & Coulson dynamo. Two high-speed vertical compound engines and dynamos combined are also exhibited by the same firm, one of the dynamos being by Messrs. Scott & Mountain, of Newcastle. A well-designed high-speed vertical engine of the enclosed type is contributed by Messrs. Ruston, Proctor, & Co., of Lincoln, and the well-known Belliss engine is to be seen working in association with a 200 kilowatt dynamo by Messrs. Bruce Peebles & Co., Edinburgh. Other electric steam plants are included in this part of the Machinery Hall: a 125 h.p. vertical engine by Messrs. Sisson & Co., attached to a Clarke-Chapman dynamo; an Alley & MacLellan three-crank compound vertical engine of 300 horse-power coupled to a 6-pole dynamo; and a Browett-Lindley vertical engine of 200 horse-power, working conjointly with a generator shown by the Edison-Swan Electric Company. Altogether there are twelve sets of generators giving a total output of about 4,175 electrical horse-power, and although none of the plants can be said to be of more than the most moderate dimensions, yet they are sufficiently indicative of the fact that British engineers are alive to the importance of providing for the rapidly increasing application of electricity in the present day.

Steam is furnished to the engines by a ring main with suitable branches; stop valves are placed so that any section of the piping can be cut out in the event of mishap; and there is ample provision of separators and steam traps for removing water of condensation from the service pipes. All the separators and valves in this department have been furnished by the Glenfield Company, and the steam traps by Messrs. Royles, of Manchester. The exhaust pipes from the engines are of various diameters ranging from 5 in. to 36 in., they are arranged to furnish steam to the feed water heaters at a temperature of about 250 deg. Fahr., pressure being equalised by means of a 30-in. steam sluice valve, and they have three outlets to the atmosphere. Before dismissing the electrical plant from consideration it may be remarked that five of the dynamos afford current at from 500 to 530 volts at the terminals, and seven at from 250 to 295 volts, the range in the voltage being intended to cover losses in transmission to the different points of distribution in the Exhibition area. The main switchboard is 31 ft. 9 in. long by 7 ft. high, and contains 15 panels furnished with the usual apparatus and instruments. There are also seven distributing stations, of which two are in the Machinery Hall, one in the Grand Avenue, and three in the Industrial Hall, these stations being devoted to the control of all the arc and incandescent lighting. The arc lamp is employed in the main buildings for general lighting, ten lamps being run in series on a 500-volt system, and in the other buildings the same class of lamp is used, five in series on a 250-volt system. In addition to the above mentioned, there is a large number of incandescent lamps of various powers, including a complete system of pilot lighting, arranged so that all the principal passages can be lighted direct from the Corporation supply. All the main cables, branch main cables, and sub-main cables were supplied by the British Insulated Wire Company, of Prescot, and the arc circuit cables for the main buildings by Messrs. Frankenburg & Salford. More than 120

motors, ranging in power from  $\frac{1}{2}$  h.p. to 150 h.p., for driving machinery are to be found in the Machinery and the Industrial Halls.

One of the lines of shafting in the Machinery Hall is driven by a steam engine of 100 h.p., by Mr. John Cochrane, of Barrhead, and the other by a 100 h.p. electric motor, by Messrs. Bruce Peebles & Co., of Edinburgh. Both lines of shafting, together with all the necessary auxiliaries, were furnished by the firm of Messrs. Watson, Laidlaw, & Co., of Glasgow.

Compressed air is chiefly used for the operation of machine tools, the only exceptions we noticed being for the purpose of demonstrating the working of a locomotive engine by Messrs. Neilson, Reid, & Co., Glasgow, and of one or two full-size working models of gas meters. A very complete installation of air-compressing plant is exhibited by Messrs. Macdonald & Son, Glasgow and Newcastle, agents for the Ingersoll-Sergeant Company. The same firm is responsible for a varied display both inside and outside the main buildings of the Ingersoll-Sergeant and the New Tait Howard Pneumatic Tool appliances. Exhibitors requiring compressed air are supplied from the Ingersoll-Sergeant plant, which includes a compound steam-driven compressor having a capacity of about 1,200 cubic feet of free air per minute, compressed to 100 lb. pressure; a steam-driven piston inlet type compressor with a capacity of 400 cubic feet per minute; and a belt-driven compressor with a capacity of 300 cubic feet per minute. Another compressor is situated in a pavilion in the Exhibition grounds, this machine being driven by electricity, and having a capacity of 210 cubic feet per minute.

Up to the present point it has been possible to preserve to some extent a consecutive treatment of the machinery noticed, but a similar course is very difficult of application to general exhibits, partly because they are more or less distributed over the Machinery Hall and in outside pavilions, and partly for the reason that most engineering firms are manufacturers and exhibitors of different classes of apparatus. As far as practicable, however, the attempt will be made to classify our comments. Steam and electric traction come within a department of engineering which is only incidentally of interest to our professional readers, but we cannot entirely pass by without remark the admirable examples of locomotive engines occupying a prominent position in the Machinery Hall. One of the new types of passenger engines now being introduced upon the South-Eastern and Chatham Railways, is shown by Messrs. Sharp, Stewart, & Co., of Glasgow, and near this is one of the Midland standard type of passenger engine, exhibited, as before mentioned, by Messrs. Neilson, Reid, & Co. A noteworthy example of locomotive construction is an express passenger engine of the London and South-Western Railway type, shown by Messrs. Dubs & Co., of the Glasgow Locomotive Works. Electric traction, which is destined to afford much scope for the exercise of architectural skill in the vicinity of large cities, besides contributing to the well-being of the workers and dwellers therein, is well exemplified by the combined exhibit of Messrs. Dick, Kerr, & Co., the English Electric Manufacturing Company, and the Electric Railway and Tramway Carriage Works. At this stand are shown two standard types of completely equipped electric cars, a 500-kilowatt traction generator, a complete traction switchboard, and a series of traction motors and controllers. The four-wheel double-decked car is a very handsome vehicle, and the bogie combination is a single-decked vehicle of a kind not previously introduced into Great Britain, but presenting advantages which ought to commend themselves to tramway managers. The work of the three companies mentioned is specially interesting for the reason that they are making a determined effort to meet the demand for traction machinery in Great Britain with appliances of British manufacture throughout, and to compete more effectively with American and Continental engineers for colonial and foreign trade. Electric traction is also exemplified by the British Schuckert Electric Company, whose pavilion and adjoining space in the Exhibition grounds will repay a visit. We have already adverted to the generators made by this firm, whose manufactures extend to varied branches of electrical work, including dynamos, motors, transformers, switching and controlling apparatus, meters, ammeters, voltmeters, arc lamps, searchlight projectors, and electric supply stations. On the dome of the

Grand Hall is a search-light projector erected by the Schuckert Company, having a parabolic mirror rather more than 78 in. in diameter. This is the largest light of the kind hitherto built; the equipment is regulated by two electric motors, and the working current is taken from the Corporation supply.

We have before referred to the principal engines used for the operation of generators, but some of the others are equally worthy of notice. Four small engines are shown by Messrs. Alexander Shanks & Co., of Arbroath. One of these is running daily, and drives a two-pole continuous current dynamo. The engine is of the vertical compound open type, giving 22 h.p. with steam at 100 lbs. per square inch. The second engine is also vertical, of the enclosed compound type, with forced lubrication, giving 75 h.p. with steam at 160 lbs. per square inch. The other two engines represent the vertical and horizontal single cylinder types made by this firm, who deserve every credit for the excellent design and finish of the machines shown. Besides the three-crank engine previously mentioned, Messrs. Alley & MacLellan exhibit two others, the smaller one of 50 h.p., with two pairs of cylinders disposed in the vertical tandem style. A varied collection of machinery is provided by Messrs. Clarke, Chapman, & Co., of Gateshead, amongst them being a small electric lighting set and a number of mechanical and electrical appliances, chiefly suitable for steamships. An extremely ingenious tool we noticed was a portable electric drill attached to a clamp, and driven from the motor by a flexible shaft. Messrs. Duncan Stewart & Co., of Glasgow, show an internal combustion engine of entirely novel design, in which pulverised coal is employed as fuel. Unfortunately, this interesting motor was not exhibited in working order, and the visitors had therefore no opportunity of judging for themselves as to the merits of the most recent attempt to develop the power latent in coal without the wasteful intervention of a separate furnace, water, and steam pipes. An air compressor on the same stand is driven by a vertical inverted compound engine with Meyer cut-off valves and using steam at any pressure up to 150 lbs. Heudech's "Heavy Oil" motor is another engine shown by Messrs. D. Stewart & Co., specially designed for the propulsion of waggons and other vehicles used for the transportation of heavy merchandise. Ordinary paraffin oil is used as the source of power, and the engine will develop 20 h.p. on a consumption of one pint of paraffin per horse power per hour. An arrangement of electrically driven Weston type centrifugal machines, and an electrically driven Stewart's carbonic anhydride refrigerator are shown at the same stand.

One of the most important exhibits in the Machinery Hall is that of Messrs. Mather & Platt, of Salford. This is divided into four distinct classes, the first comprising bleaching apparatus of different kinds; the second relating to filters and the purification of sewage, to which we directed attention in a previous article, and in this class there is also a working model explanatory of the Archbutt-Deeley water-softening apparatus, which has been very successfully used for the treatment of public water supplies, and of water to be applied in various industrial operations. The third section comprises engines and electrical apparatus. Two compound open-type vertical engines may be seen, each giving a multipolar generator, the larger plant having a capacity of 135 kilowatts, and the smaller of 70 kilowatts; there is also a small high-speed engine and dynamo of unique design for an output of 200 volts, 115 amperes, equaling 23 kilowatts as normal working load. Messrs. Mather & Platt's patent high-lift centrifugal pumps are shown in two sizes; the first, capable of discharging 210 gallons per minute against a head of 70 ft., is driven by an electric motor having an output of 13 h.p. when running at 1,400 revolutions per minute, and the second, capable of discharging 1,250 gallons per minute against a head of 95 ft., is direct-coupled to a multipolar motor having an output of 50 h.p. when running at 700 revolutions per minute. Both these sets are admirable examples of design and workmanship. Another pump is of the three-throw variable stroke type, capable of delivering 2,500 gallons per hour against a pressure of 180 lbs., and the special feature of this machine is that the motor runs at a constant speed, the delivery of water being regulated entirely by

varying the stroke of the plungers. By this arrangement the waste of power occurring when resistance is inserted in the main circuit for varying the speed of the motor is altogether avoided. A large generator is exhibited as an example of eight now in course of construction for the Salford Corporation tramways and light-g. This generator is of striking and massive design, weighing fully 50 tons, which is double that of any similar appliance in the Exhibition. Several electric motors from 4 h.p. to 40 h.p. are shown on the same stand, an engine-driven turbine pump of very compact design, a self-contained portable electric drill, in which the spindle is direct gear driven from the motor shaft and an "Aspinally" electric conveyor, which is practically an electric locomotive and crane combined. The fourth section of Messrs. Mather & Platt's exhibit is chiefly devoted to fire appliances. Of these the Grinnell automatic sprinkler is well known to our readers, and so also are some of the other appliances in the section. Messrs. Mather & Platt's armoured self-closing fire-doors are certainly constructed on common-sense principles, and deserve the success to which they have attained. Messrs. D. Bruce Peebles & Co., of Edinburgh, are a comparatively new firm, whose works are equipped, we are happy to say, with equally modern machine tools and labour-saving appliances for the manufacture of electrical apparatus. In addition to the motor and dynamo mentioned in the early part of these notes, a considerable amount of their other electrical machinery is on view. All the exhibits of this firm combine symmetrical design with good workmanship, and a visit to their stand will be by no means a waste of time. The General Electric Company and Messrs. Verity have each a good assortment of standard fittings, lamps, switches, switchboards, and kindred appliances; and the Sturtevant Engineering Company show samples of the Cutler-Hammer automatic motor starting and controlling rheostat, an appliance which is much in favour with electrical engineers.

Pumping machinery is a prominent feature of the Glasgow Exhibition, and one of the most important exhibits is that of Messrs. Tangyes. An excellent example of pumping plant for dock work is the principal object on the stand of this firm. It has been built for use at the Hebburn Graving Dock, and comprises two centrifugal pumps and two direct coupled engines, the total capacity being a delivery of three-quarters of a million cubic feet of water per hour against a head of 35 ft. Each pump is 6 ft. diameter, the suction and delivery pipes being 3 ft. 9 in. internal diameter. A smaller set of pumps intended for drainage work is worth inspection, as also is a very well made working model of the pumping engines now being built for the Hastings Corporation Waterworks. In that installation there will be two sets of pumps, including two well pumps and triple ram pumps in the engine-room, driven by two triple expansion vertical engines. The well pumps are to be capable of lifting 90,000 gallons of water per hour from a depth of about 250 ft., and of discharging this quantity through a mechanical filter working at 10 lbs. per square inch. The engine-room pumps will deliver 80,000 gallons of water per hour through rather more than 5½ miles of 16-in. main with a total rise of 515 ft. One of the Tangeye gas engines is shown on the stand, but this does not call for any special remark.

An exhibit that constitutes quite a distinctive feature in the Machinery Hall is that of the well-known firm of Messrs. G. & J. Weir, of Glasgow. Something more has been attempted in this case than the mere collection of a number of utilitarian appliances. Those who are acquainted with the productions to which we refer are aware of their mechanical excellence, but every visitor to the Exhibition now has ample opportunity of appreciating the artistic taste evidenced in the arrangement of the display made by this firm. The main exhibit is situated at the level of the gallery in the Hall, and on the floor level is a concrete reservoir 40 ft. long. From this water is drawn by two Weir pumps and discharged into a lead-lined tank 8 ft. above the reservoir water level. This tank is arranged so that the water continuously flows over the front edge into the reservoir beneath, thus forming a cascade 40 ft. wide, which at night is illumined by coloured electric lights. Many of the

pumps and other appliances exhibited, both at work and at rest, are intended for marine use, but several of them are of general interest. Amongst the latter we may cite a standard tandem compound feed pump for electric light station duty, various sizes of standard differential type pumps, and of standard boiler feed pumps. The Pulsometer Engineering Company, of London, present for examination a very excellent display of their varied manufactures. Naturally the "Pulsometer" steam pump itself occupies a prominent position, and this ingenious appliance is represented by a series ranging in capacity from the smallest, with a capacity of 900 gallons per hour, to one with a duty of 52,000 gallons in the same time. Readily set to work in almost any situation, easily shifted, and almost universal in its applications, the "Pulsometer" has fully justified its claim to recognition by engineers, architects, builders, contractors, and all who have occasion to lift water from one place to another. The horizontal "Deane" and vertical "Deane" sinking pumps are also handy and serviceable machines. A "Torrent" filter, of the so-called "mechanical" type, finds a place on the same stand, and is undoubtedly a valuable adjunct to industrial establishments of different kinds, as by its employment river or other impure water may be rendered clear and fit for use in manufacturing processes or for feeding steam boilers. Apparatus for the purification of water for use in land and marine boilers is to be seen in various stands. For instance, Messrs. Raitton & Campbell exhibit their "corrugated and ringed" feed-water filters, which have been largely adopted in electric-light stations, and interesting exhibits of a similar character are made by Mr. James Davie, of Glasgow, and the Harris Patent Feed Water Filters, of Greenock, the latter firm also showing the Harris-Anderson automatic water softener. Morrison's feed water heater, cleaner, and air-extractor, made by Messrs. Richardson, Westgarth, & Co., of Hartlepool, is another appliance of interest. Zscheck's water-cooling tower, for which Messrs. Doherty & Donat, of Manchester, are the sole licensees, includes an ingenious arrangement of patent hurdles with "dripping noses," and has been adopted in thirty-five electric light stations in different parts of the world. Messrs. John Turnbull, Junr., & Sons, of Glasgow, have a stand on which their "Hercules" turbine is shown, this machine being recognised as one of the most satisfactory water motors for electrical and other industrial purposes. Messrs. Lancaster & Tonge, of Manchester, have a good show of their specialities, including the Lancaster trap, which is probably the most reliable and satisfactory steam trap of its class. Raw-hide pintoes are shown by Messrs. George Angus & Co., of Newcastle, together with specimens of leather belting. Raw-hide gearing is perfectly noiseless in action, and is therefore very suitable for employment in buildings where the working of lift or other machinery ordinarily constitutes an annoyance to the inmates. Architects as well as engineers may frequently make use of flexible steam tubing such as that exhibited by the United Flexible Metallic Tubing Company, of London. Apart from the Exhibition buildings themselves there are not many stands devoted to structural work, but the small pavilion erected in the Machinery Hall by Pease's Tubular Construction Company, of Darlington, should on no account be overlooked. The form of construction involved enables the ironwork to be put together without skilled labour, without perforations in the metal sheets. Cambered pultrins bring the sheets into firm contact with tubular rafters, and the lap between the sheets is absolutely close. Pease's patent steel floor troughs are also recommended to attention. This form of flooring is very readily laid, and the hollows can be filled with concrete or ashes, or they may be automatically filled with water in the event of fire breaking out. As might be expected, Messrs. Walter Macfarlane & Co., of Glasgow, are very much in evidence, and their trophy in the Machinery Hall is worth a visit.

Messrs. P. & W. Maclellan, of Glasgow, show, in the Machinery Avenue, a full-size model of Turner's tubular fire-resisting floor; and some samples of floor troughing, as used in the Concert Hall, are exhibited by Messrs. Alexander Findlay & Co., of Motherwell. The same material was adopted, it may be remarked in passing, in the roof of the Great Central Railway Station, London. There are

several fine displays of constructional iron and steel in the Machinery Hall, amongst them being those of Messrs. A. J. Stewart & Menzies, Glasgow; David Colville & Sons, Motherwell; the Steel Company of Scotland; the Glengarnock Iron and Steel Company; the British Griffin Chilled Iron and Steel Company, of Barrow; and the British Hydraulic Foundry Company. At the stand of the last-named are shown several rings of different diameters illustrative of the linings for tubular railway and other tunnels. Stone-breaking plant is represented by Messrs. Robert Broadbent & Son, of Stalybridge, whose machines are furnished with manganese steel jaws and a new draw-back motion. A fair selection of brick-making machinery is placed on view by Mr. Thomas C. Fawcett, of Leeds, but attracts comparatively little attention owing to the fact that it is not shown in operation.

We now come to appliances for elevating and conveying, foremost among which are those of the New Conveyor Company, of Birmingham, intended for industrial undertakings. The Crompton atmospheric ash-hoist may be seen at work in the boiler department of the Exhibition where it is used for lifting and discharging all the ashes from the furnaces. This hoist is noiseless in action, and although hitherto chiefly adopted in marine work, it might be advantageously applied to land boilers. Messrs. Pickering, of Stockton-on-Tees, show examples of their well-known elevators for buildings; and Messrs. A. & P. Steven have a very complete installation of lifts at work, including hydraulic and electric elevators for passengers and goods. Messrs. Henry Pooley & Son exhibit automatic weighbridges of different kinds, as well as an assortment of scales of various descriptions. The Bundy time recorder and the Rochester Time Recording Company, of London, should be specially interesting to builders and contractors. Messrs. Watson, Laidlaw, & Co., of Glasgow, are makers of sugar machinery of several kinds, but they are best known in connexion with the "Weston" centrifugals and hydro-extractors, of which different types are to be seen on their stand. The water-driven type of hydro-extractor was specially designed for public institutions, and has been extensively adopted by the Glasgow Corporation in baths and other municipal buildings. Messrs. Thomas Bradford & Co., of Manchester, and Messrs. D. & J. Tullis, of Glasgow, each exhibit steam laundry machinery in considerable variety. Amongst refrigerating and ice-making plant we noticed two interesting installations in operation, by Messrs. J. and E. Hall, of Dartford, and Messrs. L. Sterne & Co., of Glasgow, representing the rival "carbonic" and "ammonia" processes.

Heating and ventilating apparatus is for the greater part contained in a separate pavilion at the end of Machinery Avenue, but there are several kindred exhibits in the Machinery Hall. Messrs. James Stott & Co., of Oldham, have examples of air propellers, ventilating appliances, and gas governors; the Sun Fan Co., of Bradford, whose speciality is ventilating and drying, show an "unbreakable" fan driven by belt, and one of the same kind direct driven by an enclosed electric motor; the James Keith and Blackman Co., of London, exhibit a Keith's python hot water boiler of exceptionally large dimensions, a 72-in. Blackman electric fan, and a large belt-driven fan; the Sturtevant Engineering Company and James Gibb & Son are also exhibitors of ventilating fans and kindred apparatus. Thwaites Brothers, of Bradford, show several types of the well-known Root's blower, of which they were the original licensees in this country. Machines of the kind are largely used in connexion with forges and foundry cupolas, and are illustrated at the Exhibition by a blower driven direct by a compound tandem engine, a belt-driven and a motor-driven blower. Other examples of the firm's work are two centrifugal pumping-engines, both of them in operation. Hot-water boilers, radiators, &c., are exhibited by several firms. Amongst those are the American Radiator Company, of London, and Messrs. Richard Crittal & Co., of London. Wood-working machinery has not received much attention at the Exhibition, although there are two fairly complete collections, one by Messrs. John McDowell & Sons, of Johnstone, and the other by Messrs. Kirchner & Co., of London. Cook's patent guards for wood-

working machinery, shown by Messrs. William Cook & Sons, of Glasgow and Sheffield, are very practical and efficient appliances. The types shown are intended for circular saws, moulding machines, and planing machines. Engineer's machine tools are present in great variety—in fact, all the leading British makers, as well as most of the importers of American tools, are in evidence either in the Machinery Hall or in outside pavilions. Probably the most interesting of such exhibits are those relating to the use of compressed air for boring, drilling, chiseling, and riveting. Most of the tools adapted for these purposes are to be seen in actual operation, demonstrating very effectively the superiority of modern methods in aid of structural and other work. Several small buildings in the Machinery Avenue are devoted to acetylene apparatus, and artificial lighting is further exemplified by the high-pressure system of incandescent gas lighting. It is claimed by the exhibitors, the Water Motor and Automatic Liquid Elevator Company, of London, that by this method ten times the amount of light can be obtained from gas that would be produced in the ordinary way. Two of the company's compressors, capable of supplying 12,000 cubic feet of gas per hour are employed to furnish the pressure necessary for the high-pressure installation in the grounds of the Glasgow Exhibition. The results obtained are certainly remarkable, and there ought to be a considerable future for the system.

In closing our remarks upon machinery at the Glasgow Exhibition, we may say that although many well-known firms are noticeably absent, there is nevertheless a very fair representation of the engineering industries of the United Kingdom. Scotland is naturally well to the front so far as the number of exhibitors is concerned, whilst in point of excellence both England and Scotland show conclusively that the reputation earned by our country in the past is still being worthily maintained.

#### AN OLD BUILDERS' GUIDE.

MANY years before Gwilt gladdened the heart and lightened the labour of architectural students, there were efforts made by other lexicographers to bring the technical terms used by architects and builders into a consecutive list; that is to say, long before the publication of Gwilt's "Encyclopædia of Architecture," with its good glossary, a certain Richard Neve was in the field with a smaller volume wherein he set down, alphabetically, all the technical words he could include between an abacus and a zopissa, extending his explanations of some of them in an encyclopedical fashion. This work was eventually enlarged and corrected, and a third edition of it appeared in 1736. As it has become a custom among some of our contemporaries to take down old books from the shelves in their libraries and descant upon their contents, a glance at the information collected in this one may not come amiss or be considered out of the way. A plan and elevation of the Earl of Burlington's house at Chiswick were chosen for a frontispiece; and the title-page sets forth that it was "The City and Country Purchaser's and Builder's Dictionary, or the Complete Builder's Guide," and contained "an explanation of all the terms of art used by workmen, as also what is necessary to be known in the art of building, as well by gentlemen as artificers of every denomination." Further on it claims to be "very useful to gentlemen, to workmasters and workmen, in the making of bargains, contracts, or computations relating to any part of a building;" and that it was originally written and compiled by Richard Neve, Philomath. It was printed for six booksellers, who doubtless shared the risk of the venture. The first edition must have met with a good sale, for before the third was undertaken two rival volumes made their appearance that had incorporated a great part of Mr. Neve's observations and experiences, to the great indignation of the six booksellers mentioned, whose names were Sprint, Brown, Osborn, Birt, Linton, and Wilde, some of which are familiar to us through other associations.

Mr. Richard Neve refers to a previous author, Mr. Sebastian Le Clerc, as an authority for the range of subjects necessary for any one to study to "procure him a genius, an accuracy and a good taste," as well as to the authors of older times, such as Pliny, Vitruvius, and Palladio. He mentions several persons then living by name, who gave him their experi-

ence as to prices and methods, either in their works or in correspondence or conversation, and thus we learn something of the identity of individuals who have now long passed away, and into whose labours we may be said to have entered. For instance, he mentions the ingenious surveyor, Mr. R. Hooke, who caused water to be thrown over each course of brickwork in the building of the College of Physicians in Warwick-lane. A Mr. Wing gave him the current prices of materials in Rutlandshire, which differed very much from those furnished him by Mr. Leybourne, of London. A Mr. Switzer was his authority for Wiltshire facts. He mentions a method of surveying practised by Mr. Ventres Mandays, and experiments by Dr. Halley (levelling by means of the barometer) and Dr. Derham. Mr. Miller, of Chelsea, the author of a gardeners' dictionary, is often quoted for his opinion concerning trees and timber. If there should be any descendants of these worthies at the present day, they may be glad to hear of the consideration in which they were held. It was only thirteen years before that Sir Christopher Wren was buried in St. Paul's Cathedral, with the proud word *circumspice* on his tombstone in the crypt. It was just about the time that Johnson and Garrick resolved to try their fortunes in London, and twenty years before the publication of Johnson's own dictionary. Pope and Swift were still living, and Horace Walpole had not then begun his Parliamentary career, nor inaugurated the revival of Gothic architecture at Strawberry Hill. An Act of Parliament had been passed not very long before that required all water from the tops of houses, balconies, and pent-houses to be conveyed by "party pipes" into channels under a penalty of 10*l.* for non-compliance.

As we turn over the pages, to which time has given an incomparable tint, we come to many quaint expressions. For example, in one place our author tells us that light is God's eldest daughter, and in another that it is better to be too little for a day (in planning a house) than too big for a year, and easier to borrow a brace of chambers of your neighbours for a night than a bag of money for a twelvemonth. He tells us that a weather-cock was often called a beggar-man in those days, and writes of the sky as the cope of Heaven. In building he says—"Let not the front of your house look asquint on a stranger, but accost him right at the entrance." And concerning timber and trees, he says it is worth every builder's while to get Spenser's lines about trees to heart, and gives them in full. A gnomon was called a cock of the dial.

It is, however, to more practical items in his experience that we would call attention. He tells us that one Rubbie, a mason in Kootham, in Kent, had offered to teach a thatcher, for a small matter, how to thatch a roof so that no mouse or rat could get into it, but that the thatcher, thinking the secret would be of no use to him, declined to purchase it. The Rootham mason assured him he knew a thatcher who had 4*d.* a square yard more than the usual price for doing it in this particular manner. But still the thatcher declined the offer. "This," says Neve, simply, "is a thing worth inquiring after." Wages, of course, were on a different scale from those of the present day. He makes out various bills for the instruction of his readers, and from these we glean that a bricklayer and his labourer would lay about a thousand bricks in a day, but if very efficient as many as twelve or thirteen hundred. For a day's work for himself, or the master, he puts down 3*s.*, for the man 2*s.* 6*d.*, and for the labourer 1*s.* 8*d.*

The price of the bricks differed, too. Mr. Wing reported they were only 12*s.* per thousand at the kiln in Rutlandshire; and Mr. Leybourne never knew them to be cheaper than 9*s.* nor dearer than 18*s.* in London. In Sussex and Kent Mr. Neve knew them to be sold for 16*s.* a thousand, though at some places, where they lay them two or three miles distant, they were 20*s.* The price of making the bricks is thus told—"In the country their usual price is 5*d.* per thousand for the moulder, the bearer-off hath 4*d.*, and he that tempers the earth ready for use hath 4*d.* per thousand, and he that digs it hath 6*d.* per thousand. For making the earth ready (after it is digged, the digging not being reckoned into the making), moulding, bearing-off, &c., and burning, their usual price is 5*s.* per thousand." In the city there was a division of work into tiling, walling, chimney-

work, and paving; but in the country a bricklayer was generally a mason and a plasterer, too. Materials in some items are altogether changed from those in use in 1729. Wooden pipes for the conveyance of water were then the alternative of the expense of leaden ones. The best kind were made of oak and cost 20*s.* a yard, or half the price of lead; but, says Mr. Neve, "iron pipes are now growing into vogue." Pipes made of alder were the cheapest of all; they were bored for about 10*d.* or 12*d.* per yard, but being necessarily small, were not strong enough to bear much force, and were consequently only available for gentle streams or small springs and short distances. The pump-makers about London, he says, made use of fir for pipes; but elm was stronger, and it might be cut down, hewed, or bored from 8*d.* to 20*d.* a yard, "5*d.* or 6*d.* a yard boring being a sufficient allowance." He also mentions square pipes made of elm plank as resulting in less waste in cutting. He says nothing about the divining-rod as a means of discovering water, but recommends the following proceeding in searching for springs—"If you lie down on the ground, in places where you would seek for them, before the sun rises, and having placed your chin as close as you can, till it is, as it were, propped by the earth, so that the adjacent country may be plainly seen (the reason of this posture is, that by this position the light will not wander any higher than it ought); if you keep your chin unmoved, it will give a certain definition, and true level of the parts where you are plac'd, and in those places where you see vapours gathering themselves together and rising up into the air, there you may dig; for this sign never happens in a dry place." Further on he remarks that there is not a more certain sign of water in the world than when the alder tree grows naturally in a place. But we pause to consider the water-seeker of those days taking off his three-cornered hat, and smart with his rufles, buckles, wig or queue, getting himself into the position indicated above.

Our author relates there was an attempt to introduce saw-mills driven by wind and water, as in Holland and other places abroad, but Parliament interposed for the sake of the families that would have been impoverished by the loss of the hand labour. "By this means," says our author, "an useful improvement is not only lost to the kingdom, but foreigners are thereby enabled to underwork and undersell us in all sorts of building materials that require the saw. Much better would it have been, as we humbly presume to think, if the Parliament, at the expense of the public, provided for the poor families some other way that would have yielded them equivalent maintenance for life, and suffer'd the public to reap the advantage of the improvement; and every builder might have been tax'd what he would have sav'd by the mill-sawing, towards their provision. And as no more than a small limited number should have been brought up to the business for the future, this charge would have soon been over." The price of sawing up oak varied from 2*s.* 8*d.* to 3*s.* 6*d.* per 100 superficial feet. The sawing of ash and beech was rather more, in some places touching 4*s.* per 100ft. An experienced sawyer told him they sometimes cut ship-planks for 10*s.* the load. The lowest rate in Sussex was 6*s.* the load, but as they built at Tunbridge Wells it was 7*s.* 6*d.* or 8*s.*

Of glass, our author describes ten kinds; Crown, made at Ratcliff and Lambeth; French; German, two sorts, white and green; Dutch; Newcastle; Staffordshire; Bristol, looking-glass; Jealous, or wrinkled, so that one cannot distinctly see what is done on the other side of it; and Woolwich glass. The Ratcliff Crown glass was 9*d.* per ft., and when wrought in lead and set up 1*s.* 6*d.* The Lambeth variety was 8*d.* in squares and 1*s.* 4*d.* when wrought and set up in windows. Mr. Leybourne gave his experience that the price of Newcastle glass was uncertain, because when coal was plentiful it was cheap, and when coal was scarce it became dearer. A London glazier, however, stated that the most common price of it was 34*s.* per case. Woolwich glass, by reason of some discouragement, ceased to be made.

The prevalence of diamond panes is indicated in the association of lead with the glass in many of the computations given. "For taking down quarry-glass and soldering it anew, and banding and setting up again, the

usual price is 1½*d.* per foot; but if it be in churches where they say they have usually more banding, &c., their price is 2*d.* per foot. They have also 2*d.* per foot for taking down, scouring, soldering, banding, and setting up again the old-fashion'd work, which is composed of pieces of glass of different sizes and figures."

Some of the definitions in their simplicity remind us of that famous chapter on snakes in Ireland. The word dial, for instance, is said to represent what is so well known as to need no description. Some, again, tell of considerable confusion. Thus, a confessional is described as "a place in churches, under the main altar, where anciently the bones of deceased martyrs and confessors were deposited;" and a steeple is said to be "a well-known pile built at the west end of a church to hold the bells, &c." It is called a spire when it ends in a sharp point, and a tower when otherwise. But there is a prescience of possibilities here and there that have since come to pass. Neve had a thought, he tells us, that something might be done in the way of making mantel-pieces, mouldings, and architraves, door and window frames of similar materials out of which bricks were made. "If men of this profession," he goes on, "would set their minds to contrive some good composition of earth, and a way to manage it well in moulding, burning, &c. But, the more is the pity, men of this profession too generally partake of the materials they work upon." Probably, if he saw the use now made of terra-cotta he would be less disdainful of the characteristics of brick-burners. A touch, too, here and there, tells of innovations then making their way. More than once he refers to the new custom of placing closets in rooms. Painted wainscot he speaks of as now so much used. He dwells, too, on the importance of a healthy situation for a house, quoting Dr. Fuller, a prebend of Sarum, who put it forcibly that air being a dish one feeds on every minute, it had need be salubrious. We may gather that cisterns were considered to be well-placed in cellars; and that for a basin or reservoir the clay should be first well wrought with the hands and then trodden in with the naked feet. In connexion with the ornamental rose, he tells of that custom among the ancients of placing a rose on the ceiling of rooms where they met for companionship, to intimate that all restraint might be laid aside with the certainty that nothing said there would be repeated elsewhere, and remarks, somewhat cynically, "we all know people who ought to meet under the influence of the symbol."

There is but little difference observable in the spelling of most of the words used in technicalities. The screen is now the screen, of course, just as the spaw is now the spa. Stuck has lengthened out to stucco nowadays. Speaking of statues, Neve says:—"Several statues are made in stuck. These figures are for the ornament of ceilings, frieses, and cornices. As to the making of figures, the first thing is to form the soul of plaster," and when this psychological feat is performed, then the soul is covered with stuck, for which the workman had proper tools. A contemporary tone may be noticed in the mention of the ingenious Mr. Allen (people were often ingenious in those days), who lived in Bath, and owned the quarries there. Neve says he was justly esteemed an honour to the Bath, but he should say the less of him and his quarries because they are so well known to the politest part of the kingdom, "who have now two inducements for going to Bath; the first, the wonderful and salutiferous waters that have justly renowned that place for so many ages; and the other, the surprising effects of this gentleman's extraordinary genius which appear in the works and inventions we have mentioned (for lifting and conveying stone), and others that are still every year rising under his direction, to engage the admiration of the curious."

And as we close the embrown'd volume to put it back in its place, and give a glance to its still glossy chestnut-hued cover, we think of the beaux and belles of Bath before Miss Austen set them down in black and white, or Beau Brummel ordered the rules and regulations of the assemblies; and still more of the thatchers, bricklayers, and ill-paid brick-makers, masons, plasterers, smiths, carpenters, glaziers, slaters (Neve makes no mention of Welsh slates, though he notices a difference recorded by the barometer between the top and base of Snowdon, and says slates were

chiefly used for summer-houses and banqueting-houses in gardens as being light and lasting, the tiler (he calls them "tilers"), who helped to make up the more workaday world so long ago; and most of all, perhaps, of the self-styled Philomath, the lexicographical Neve, and his friends Wing, Leybourne, Switzer, and Miller. The last-named, by-the-by, is still quoted in the fashionable books on gardening of the present day. Linnaeus styled him the Prince of Gardeners. The Chelsea Gardeners were in his care from 1722 to 1771. S. W.

**WELSH CALVINISTIC METHODIST CHAPEL.**

THIS chapel was erected last year for the congregation of Welsh Methodists at Mile End. The front towards the Mile End-road occupies the site of three old houses. The central opening gives access to the ground floor of the chapel; the two side openings to staircases leading to the galleries. The chapel itself is lit by a large octagonal lantern light in the roof. It provides accommodation for about 400 people. At the back is a large vestry, with lavatories, &c. and a large yard at present unbuilt upon, but on which it is proposed at some time to erect schoolrooms and classrooms. The contractors for the building

work generally were Messrs. Falkner & Sons, Ossory-road, Old Kent-road, S.E.; the terra cotta was supplied by the Burmantofts Company; the steel work was carried out by Messrs. Fawcett & Co.; and the heating apparatus was provided by Messrs. Haden & Sons. The work was carried out from the plans and under the superintendence of the architects, Messrs. Young & Hall, Southampton-street, Bloomsbury, W.C.

APPOINTMENT.—Mr. Reginald Brown has been appointed Surveyor and Engineer to the Southall-Norwood Urban District Council. He was selected from over 100 applicants. Mr. Brown was for two and a half years Chief Surveyor, Stoke Newington; six years Chief Assistant-Surveyor, Ealing; and about two years Assistant-Surveyor, Erentford.

MESSES. DOULTON & CO., LIMITED.—The King has granted permission to Messrs. Doulton & Co., Limited, to use the title "Royal" in describing their potteries and manufactures.

THE ARCHITECTURAL ASSOCIATION :  
FIFTH SUMMER VISIT.

A VISIT of the Architectural Association took place on the 24th inst. to Cambridge, the main object of the visit being to see Mr. H. T. Hare's new Presbyterian College. On arriving in the town, the party immediately proceeded by way of Trinity College to the building, which is situated in Madingley-road and was erected two years ago. Mr. H. T. Hare kindly accompanied the members, who were received at the building by Mr. William Saint, the contractor, and Mr. Smieton, the Bursar. At 1 o'clock the members were hospitably entertained by Mr. Saint in the large dining-hall, by permission of the college authorities, and afterwards, under the guidance of Mr. Hare and Mr. Saint, inspected the building. It has been erected for the Presbyterian Church of England, and is called "Westminster College." At present, accommodation is provided for only twenty-six graduates, but Mr. Hare has arranged for future extension and also for a chapel. For the time being, part of the library is used for this purpose.

The main buildings consist of Principal's house, dining-hall, with kitchen and offices, suites of rooms for students, and a large common-room. The library and combination-room are on the first floor. In the grounds are two houses for professors. The garden and terrace were designed by the architect and the main entrance has now some stone gate-piers and high wrought-iron gates. A full description, with plans and elevations, appeared in our issue of May 15, 1897, so that a detailed account is not necessary.

Before leaving, the members were entertained to tea by the Bursar. Then the party walked along the "Backs" to the Trinity Library, and then Kings College Chapel was visited. A move was then made to Pembroke, to see the library, and also the new work by George Gilbert Scott. From there the members went to the New Geological Museum, which, by the courtesy of the architect, Mr. T. G. Jackson, R.A., was open for their inspection. This building was illustrated in our issue of May 12, 1900, but only part is being proceeded with at present; when finished it will have frontages to three streets. It is being erected as a memorial to the late Professor Sidgwick, a statue of whom, by Mr. Onslow Ford, R.A., will be placed in the building. The roof is not yet on, so that internally there was not much of interest to see. Mr. Robert Edwards, the clerk of the works, conducted the members over and explained the various points of interest. Externally, it is of brick with stone dressings. The bricks are from the Crawley district of Sussex. The contractor is Mr. W. Sindall, of Cambridge.

The party then visited Peterhouse and looked at the windows in the chapel, the one over the altar being a copy of Rubens' famous picture of the Crucifixion which is at Antwerp. The side windows are filled with glass from Munich, depicting various Biblical incidents. More interesting, perhaps, to the members were the very fine windows in the hall and combination-room, some of them designed by Sir E. Burne-Jones, and all executed by the late Mr. William Morris, who also is responsible for the decoration and carpets in these rooms. As there was still time, visits were made to Emmanuel and Queen's, and the party then left for London. The members much appreciated Mr. Hare's kindness in personally showing them not only his own work, but the various colleges visited. The arrangements of the visit were made by Messrs. W. H. Raffles and F. D. Clapham.

#### LLOYDS REGISTRY OF SHIPPING.

**H**IS building has been erected for Lloyds Register of British and Foreign Shipping. It is situated in, and forms a feature of, Fenchurch-street, and the new street named Lloyds-avenue.

The whole of the two elevations is faced with Portland stone, the sculptured work being from the designs of Mr. G. Frampton, A.R.A., and the ornamental carving by Mr. J. E. Taylerson.

The boardroom is 47 ft. by 28 ft., and has an elliptical ceiling carried by marble columns, between which is inlaid mahogany panelling. The ceiling is being decorated by Mr. Gerald

Moira; over the principal fireplace is a large marble sculptured panel by Mr. H. A. Pegram.

The staircase and entrance-hall are lined with Devonshire marbles. The staircase has on the first floor a bronze and ivory frieze, designed and executed by Mr. F. Lynn Jenkins—one panel of this frieze occupied a prominent position in this year's Royal Academy Exhibition.

The Committee-room is panelled in English oak, and the library in African mahogany with inlaid ornament.

The marble work has been executed by Messrs. Burke & Co. and Messrs. Jenkins & Sons, of Torquay, and the ornamental plastering by Messrs. Jackson & Sons. The general contractors for the building were Messrs. John Mowlem & Co., and the whole has been carried out from the designs and under the superintendence of the architect, Mr. T. E. Colcutt.

#### "THE ENGLISH RENAISSANCE."

THE illustrations of Houghton, Norfolk; mural fountain, Boswood, Wilts; and details of Great Hall, Winchester School, are from Messrs. Belcher & Macartney's "Later English Renaissance" and are referred to in a review of that work on another page.

#### CUPOLA, QUEEN'S COLLEGE, OXFORD, AND OLD HOUSE, LUDLOW.

THE cupola to Queen's College, Oxford, is

the central one to the outer quad, while the old house, Ludlow, is a typical example of woodwork in that part of the county.

EDWIN FORBES.

#### BRISTOL AND GLOUCESTERSHIRE ARCHAEOLOGICAL SOCIETY.

HAVING in their summer meeting last year visited the southern part of the county of Gloucester, and made an incursion into Wilts, the members of the Bristol and Gloucestershire Archaeological Society made their headquarters this year in the eastern portion of their own county, and in their excursions took in a district of Worcestershire. The Bristol contingent and those from the upper part of the county united at Ashchurch on the 20th inst., and were then conveyed to that most interesting town, Evesham. The name is derived from Evesham, "the dwelling on the level by a river's side," but traditionally from Eves, a swincherd, whose marvellous narration led to the foundation of the abbey in 701. He saw, so he related to Egwyn, Bishop of Worcester, the vision of a lady, whose glory darkened the sun, and her beauty above that of women, with two female attendants. The bishop went in search of the apparition and found the lady in a wood, decked with a cross of gold and in robes whiter than the lily and more fragrant than the rose. King Ethelred, when he heard of the vision, gave a site, Egwyn built St. Mary's Minster, and became the first abbot. At the

battle of Evesham in 1265 the abbey was desecrated by the massacre of the fugitives who fled for refuge to it. The tourist of to-day is enabled to see a singularly beautiful gate tower and two churches standing in the same cemetery, and rising from a gentle elevation sloping to the meadows which skirt the banks of the Avon. The churches of St. Lawrence and All Saints were both erected by the inmates of the abbey for the inhabitants of the town. As to the Benedictine mitred abbey of St. Mary the Virgin, the church stood immediately south of All Saints and south-east of St. Lawrence, so that the north-west angle of the nave of the abbey church was in a line with the south-east angle of the south aisle of St. Lawrence Church. Numerous fragments, richly carved and gill, have been found on the site.

The party first entered the church of All Saints, being received by the Rev. J. H. Walker, the vicar. Mr. H. A. Prothero described some of the features of the church. Of the two churches All Saints' is the larger and more architecturally varied. It consists of a west porch, west tower, nave, aisles, transepts, Lichfield chapel, chancel, and vestries. Outside, the most unusual feature is the very rich sixteenth century west porch, with entrances north and south, a fine moulded west window, and very high open parapet. The church, about 130 ft. long by 73 ft. at its widest part, has an early arch opening into it from the porch, on the north side of which is a stoup. The nave of four wide bays is divided from the aisles by a continuous arcade to the south, and three arches with a break and a transeptal arch on the north; above which is a low clearstory with quatrefoil windows, and the whole is covered by a tie-beam roof. The great feature of the interior is Abbot Lichfield's Chantry Chapel of Our Lady of St. Ecgwyn. The very gorgeous roof of fan tracery is worked in two circles, two semi-circles, and four quarter-circles. The pendant, a very rich one, is in an unusual place at the side against the wall. A design of roses surrounds the shield and monogram of Clement Lichfield. The old altar and reredos have disappeared, also the old glass; otherwise the chapel is uninjured. In the church are hung up lists of the abbots from St. Ecgwyn to Lichfield and his nominal successor, also of the vicars of the two parishes from 1535 to 1647, and of the united parish from 1662 to the present time.

St. Lawrence Church, though showing some traces of earlier work, is, in the main, a simple sixteenth century church, built straight off as one now sees it. Its history appears to be that it was entirely rebuilt by Abbot Lichfield, and perhaps barely finished when the abbey was seized.

When the party had spent an hour in Evesham they entered their vehicles and were driven to Wickhamford, where they were received at the church by the Rev. W. H. Price, having passed the Grange, a fine half-timbered mansion restored by Lord Sandys. The church of Wickhamford consists of a nave, chancel, and western tower. The "three-decker," the screen, the western gallery (the front of which remains), the seats, and the royal escutcheon are all of seventeenth century date. The carvings of the Virgin and Holy Child on the pulpit are very unusual and very interesting, considering the date. An inscription says that the church was restored and beautified by Lord Sandys, of Ombersley Court, in 1841, and it is stated that the pews and gallery were brought from a church in London by Lord Sandys. On the north side of the chancel is a double alabaster monument, supported by five pillars and two pilasters, on the two slabs of which lie respectively the effigies of Sir Edmund and Lady Sandys and Edwin Sandys and his wife, Penelope. On the front of the tomb are the kneeling figures of the sons and daughters, and above are the figures of Faith, Hope, Charity, and Time, and various coats of arms on shields or lozenges. On the north side of the sanctuary is a flat stone to the memory of Penelope Washington, bearing the family arms, supposed to be the original of the stars and stripes on the flag of the United States.

Chipping Campden was the next place in the route. The town derived its first name from *Ceapan*, to buy, and, like Chipping Sodbury and Chipping Norton, was a market town of some importance, and a trading centre for Cotteswold and Welsh wool. It had a charter from Henry III. and James I., and grants of fairs, &c., from the early lords of the manor. The Corporation was abolished in 1883. Baptist

Hicks built Campden House at Kensington in 1612, and commenced the construction of a splendid mansion at Campden in the following year. In 1620 he was created Lord Hicks of Ilmington, and in 1628 Viscount Campden. He died in 1629, and was succeeded as lord of the manor and Viscount Campden by his son-in-law, Sir Edward Noel, who died at Oxford in 1642. During the Civil War, Campden House was occupied in turn by the Puritans and Royalists, and in 1645 it was destroyed by Sir Henry Bard, who had held it for the King.

There was a meeting at the Town Hall, and the Rev. T. Carrington, the vicar, was voted into the chair. He said he hoped the Society would have pleasant memories of their quaint old town, and vacated the chair in favour of Alderman Fox. The annual report was read by the Rev. Canon Bazeley, and stated that there were at present 385 annual members, eighty-two life members, and three honorary members on the Society's list, giving a total of 470 members, as against 409 in July, 1900. The income of the Society for the year ending December, 1900, including a balance of 416l. 11s. 3d., was 664l. 12s. 6d., and the expenditure for the same period was 238l. 4s. 9d., leaving a balance at the Society's bankers of 426l. 7s. 9d. on December 31, 1900. From that balance, however, should be deducted the cost of the Society's "Transactions" for 1900, the first part of which had been issued to the members, and the second part would be in their hands in October. Volume xxiv., part 1, for 1901, would, it was hoped, be issued before the end of the year. Besides the balance of 426l. 7s. 9d. the Society had a funded capital of 632l. 3s. 10d. The investigations which were commenced on the site of the Cistercian Abbey of St. Mary Hayles in 1899 were continued in 1900, and the abbey church was carefully excavated under the superintendence of Mr. St. Clair Baddeley and the general secretary. The excavation had been temporarily suspended owing to the sale of the Taddington estate, but it was hoped that they would be recommenced next year. The Council had gladly adopted the suggestion of the Congress of Archaeological Societies that a list of the monumental effigies in Bristol and Gloucestershire should be compiled under the direction of that Society. The Committee nominated the re-election of the President of the Council, the Vice-Presidents, and the other officers.

Mr. T. Sherwood Smith moved the re-election of the following gentlemen as members of the council, viz., the Rev. J. M. Hall, Canon Ellacombe, Mr. G. S. Blakeway, Mr. H. Medland, and Mr. C. H. Dancy.

Mr. Scars seconded the resolution, which was adopted.

On the motion of Bishop Brownlow, thanks were tendered to Alderman Fox for his services as President during the past year.

Alderman Fox, in acknowledging the compliment, expressed the great aid he had received from Canon Bazeley. He then said that he desired to introduce to them his successor, the Earl of Gainsborough.

The Earl of Gainsborough then presided. He adverted to the changes which had taken place in the town, and spoke of it as a centre to which wool was brought from the Cotswolds. He was afraid places of that size in agricultural districts had not any chance of getting beyond their present prosperity.

The Vicar received the party at the church and gave some information as to the building. The Church of Campden is said to be dedicated to St. James. It would seem that this, or an earlier church, was dedicated to St. Mary the Virgin. It consists of a nave with north and south aisles which are continued eastwards, and a clearstory, a western tower, and a chancel with north chapel, now used as a vestry. Below the north side is a crypt. The nave has five bays on either side with lofty columns. The south chapel of the chancel has been used as a burial-place of the Hicks and Noel families, and contains four life-sized effigies and two busts. The chancel roof is said to have been the gift of Sir Baptist Hicks, who also was the donor of the Jacobean pulpit and the brass eagle. It was he who built Campden House at the beginning of the seventeenth century, and probably must be assigned to him the rebuilding of the porch, the caps of the turret staircases leading to the roofs at the north-west and south-west corners of the nave, and perhaps also the battlements and pinnacles of the nave. There is a quaintly-carved niche over the

fifteenth-century doorway of the porch, which must be an insertion. In the middle of the south chapel on an altar tomb recline the superb alabaster effigies of Sir Baptist Hicks, Viscount Campden and his wife, Elizabeth, arrayed in mantles, ruffs and coronets. He died in 1629, and his widow erected this monument to his memory. On the south side of the chapel are the marble effigies of Sir Edward Noel, Viscount Campden, and Julianna, his wife, one of the daughters and co-heiresses of Sir Baptist Hicks. They died respectively in 1642 and 1644. They are represented as standing in a cupboard or tomb, enveloped in shrouds.

Old Campden House, adjoining the church, was also visited by the archeologists. At night a conversation was held at the Town Hall, and papers were read.

On the 21st inst. the members proceeded in carriages to Ebrington. The village of Ebrington, with its quaint houses, was seen to signal advantage, and the party lost no time in inspecting the picturesque features which presented themselves. The Rev. W. Barclay read particulars respecting the church. It is stated that the name Ebrington is derived from the patron saint, St. Eadburgha. The place appears to have been the scene of a battle, as in a field not far from the vicarage, human skeletons, shields, and spear-heads of Saxon manufacture have been found. The church consists of a nave with south chapel, chancel, and western tower. The north wall of the nave has been rebuilt. The south window of the chancel and the east window of the south chapel contain some painted glass, given by Sir William Keyt, representing the life of Joseph, also the arms of Keyt of Coventry, &c. On the north side of the altar the effigy of Sir John Fortescue, Lord Chancellor in the time of Henry VI., lies on a handsome fifteenth century tomb, with a tablet erected to his memory by Robert Fortescue in 1677, and repaired in 1705 by Matthew, Lord Fortescue. On the south wall are the busts of Sir John Keyt, who died in 1662, and his wife Margaret, daughter and heir of William Taylor, of Brixworth, who died in 1660. The chancel arch is Perpendicular. Two pointed arches lead into the south chapel, which has an open timber roof. The doorway of the rood loft remains. The Late Perpendicular tower of two stages is embattled; it has four pinnacles, and a staircase in the south-east angle.

Hidcote House, about two miles from Campden, was the next halting place, permission to examine the mansion being readily extended by Major Wright. When his auditors were assembled on the green sward in front of the house, Canon Bazeley read some notes on the structure by Mr. E. Guy Dawber. The writer said Hidcote House stood on high ground and was a picturesque example of the seventeenth century architecture. It was built entirely of stone in the not uncommon "L" shape. The plan was entirely self-contained, there being no porch or bay window, or other projection. The house was dated 1663. The interior, as well as the exterior, was examined by the party, though much of the inside fittings is modern.

After leaving Hidcote the party were conveyed to Quinton, where the Rev. W. Bazeley gave some particulars in regard to the church. Quinton, which appears in the Domesday Survey as Quenintune, in the hundred of Ceolflede, was held in 1086 by Hugh de Grentmaisonil, of Lisieux in Normandy, one of the companions of the Conqueror. Hugh died in 1093, leaving a son, Robert. In the reign of Stephen, Robert Marmion, Lord of Tamworth, in Warwickshire, gave the church of Quinton to the nuns of Polesworth, and they held it till their convent was dissolved. The arches of the south arcade have capitals with scalloped edges and truncated cone mouldings, and short round piers cut square on the south side, but hollowed out with a square set off on the north side. This arcade is no doubt part of the original Norman church. The north arcade, with its pointed arches and small circular moulded caps, is Transitional Norman, and was probably added after the nuns of Polesworth obtained the church. The chancel is Early English, with characteristic moulding below the windows continued along the east wall. There are two deeply-splayed hooded windows, and one beautiful fifteenth century window on the north side. The windows on the south side are of the fourteenth-century

style. The east window was walled up until the recent restoration. There is an Early English aumbry on the north side of the altar, and a bracket for a piscina of the same style on the south side. The tower has a single light window. The belfry windows are long, each of them having two lights and a transom. The parapet is embattled, and at each angle there is a crocketed pinnacle. The late fifteenth century ribbed spire has some ogee-headed windows, and near the top a band of Tudor flowers. The aisles and clearstory have no battlements. The east gable of the nave has a bell niche. The effigy of Sir William Clopton lies on an altar tomb under the south arcade. The brass effigy of Joan, Lady Clopton, lies on an altar tomb in the Radbrook Chapel. The figure is within an arched canopy.

The party then proceeded to Mickleton, and having inspected the church, they repaired to Long Marston, and then left for Chipping Campden via Burnt Norton.

At the conversation held in the Town Hall there was a good attendance, and papers were read. The Earl of Gainsborough presided. A paper had been prepared by Mr. E. Guy Dawber on the "Domestic Architecture of Campden," but as he was unable to be present Canon Bazeley read it. The writer stated that Campden was almost unique amongst the many interesting towns of the Cotswolds, and within its small limits contained some beautiful examples of domestic architecture. It lay in the heart of the stone district, that material being used to the exclusion, almost, of all others, and they found there the genuine Cotswold common-sense stone building brought almost to perfection. Apart from the picturesqueness of the long street with the somewhat unusual arrangement of groups of isolated buildings, and the strong and sturdy character of its architecture, it was singular in presenting a group of buildings, designed evidently by one hand and erected within a few years of each other. Thus possessing all the charm and variety of the local work, they were stamped with a scholarly feeling and grasp of design and composition that imparted an air of distinction, apart from the other buildings of the town.

Mr. F. B. Osborne read a paper on the local grammar school, and Mr. Kennedy Skipton read a paper on "Sports in Gloucestershire."

Mr. W. St. Clair Baddley referred to the monuments at Miserden Church to Sir William and Lady Sandys. He said the sculptor was an Englishman, Nicholas Stone, and the work was not Italian, as often stated.

On the 22nd inst. the members entered upon the final day of their gathering. A concluding meeting was held at the Town Hall, when a vote of thanks was accorded to the Earl of Gainsborough as President, on the motion of Mr. C. Bowly, seconded by Mr. J. Baker, and a vote of thanks was passed to Canon Bazeley, the General Secretary.

The first stopping place after the vehicles had been entered was Buckland, and to reach it the party journeyed past Campden House and the tithe barn, which were duly admired, Broadway was glanced at, and the view from the Tower, said to comprehend fourteen counties on a clear day, was to some extent taken in, though the mist which prevailed prevented the full extent being surveyed. When Buckland was reached the rectory was first viewed. The rectory house contains an ancient hall with some good fifteenth-century glass and carving. As in one of the windows appears the rebus of William Grafton, "a graft rising from a tun," the building of the hall, &c., may be attributed to this rector. Canon Bazeley described some of the interesting articles in the hall, and then a move was made to the church. The structure, dedicated to St. Michael, consists of a nave with north and south aisles, and a north porch, a chancel, and a square embattled tower at the west end. The three bays of the south arcade of the nave, and the two eastern bays of the north arcade, are late Early English or thirteenth century. They have plain chamfered arches with clustered semi-detached shafts and moulded bell-shaped caps. The responds of the two easternmost bays of the north arcade have each a single detached shaft. The chancel arch, the east and west windows of the north aisles, and a piscina in the south aisle, all belong to the thirteenth century church. At the east end of the nave on the apex of the gable is the cote which formerly contained the sanctus bell. The bell itself has been removed

into the belfry, and is now known as the Ting Tang. Considerable changes took place in the fifteenth century. A clearstory was added to the nave, and the upper part of the tower and the western bay of the north arcade were built. The chancel was rebuilt, and the perpendicular windows were inserted in the north and south walls of the nave. A low-pitched roof, as may be seen by the drip courses on the east wall of the tower, was substituted for the thirteenth-century roof. Some of the oak seats are relics of this second restoration; so also are the font and a richly-carved tomb on the north side of the tower. Canon Bazeley referred to the old plaster having been stripped from the walls. He said that architects were too fond of stripping off the plaster, which was often beautifully ornamented, and leaving the bare stone. They should be made to replace what was removed at their joint expense. Churches ought to be restored to something of their ancient state.

He explained the subjects in the ancient east window, saying that the glass was evidently of the time of Edward IV. It represented three of the seven sacraments—"Confirmation, Marriage, and Extreme Unction." There is a holy water stoup at the north door. In the nineteenth century restoration the plaster was ruthlessly stripped from the walls, and many interesting frescoes were irreparably destroyed.

Driving back to Broadway, the party were specially interested in the Grange. The fourteenth-century building, which is locally known as "The Priory," was originally a Grange of the Abbey of Pershore. When the Society visited it in 1884 it was found to be in a deplorable state of dilapidation, but it has been greatly improved by the present owner, Mr. F. D. Miller, and is now used by him as a studio. The Church of St. Eadburg was inspected. It is cruciform, comprising a nave, with narrow north and south aisles, a central tower, with external staircase at the north-east angle, north and south transepts, and a chancel. The north and south arcades of the nave are Transitional Norman, having each three bays with pointed arches, capitals with truncated cone mouldings and circular bases. Half the arches have square edges, the others are chamfered. The roof of the nave dates from the fifteenth century, and is somewhat higher than the pointed roof which preceded it. There are traces of thirteenth and fourteenth century work in the transepts and chancel. Most of the windows were inserted in the fifteenth century. The font is Early English. There is an escutcheon of Charles I., and a Jacobean pulpit with sounding-board, and another of fifteenth century work. A pillar almsbox is of an unusual form and very ancient.

Mr. Edgar Flower invited the Society to his residence, Middle Hill, situated on an eminence, and approached by a steep carriage drive. Middle Hill was built by Mr. William Taylor, Recorder of Evesham, in 1726, and was enlarged in 1776. It was for some time the abode of Sir Thomas Phillips, who filled it with his collection of manuscripts and printed works. It has been greatly improved by Mr. Edgar Flower, its present owner, who heartily welcomed his guests. They remained until the exigencies of railway travelling compelled them to seek their vehicles, and they were driven to Evesham, where the party separated, highly gratified with their three days' excursions.—The above has been abstracted from the interesting report which appeared in the *Western Press*.

#### BOOKS RECEIVED.

HINTS AND SUGGESTIONS AS TO THE PLANNING OF POOR LAW BUILDINGS. By Percival Gordon Smith, F.R.I.B.A. (Knight & Co.)

CONSTRUCTION OF ROADS AND STREETS. By H. Law and D. K. Clark. Sixth edition, with additional chapters by A. J. Wallis-Taylor. (Crosby Lockwood & Son.)

NEW OUTFALL SEWER AT ABERDEEN.—The Aberdeen Town Council has just accepted the tender of Mr. Peter Tawse, contractor, Aberdeen, to construct the portion of the main outfall sewer from Point Law under the new channel of the River Dee and thence to the sea at Girdleness, for the sum of £4,019/8s. 3d. Large iron pipes, 7 ft. diameter, will be used for carrying the sewer under the river, and on the Torry side of the navigation channel there will be a considerable amount of tunnelling through rock and deep excavations. The plans and specifications are by Mr. W. Dyack, M.Inst.C.E., Borough Surveyor, Aberdeen.

## The Student's Column.

### GAS AND GAS FITTINGS.

0.—GAS PRESSURE AND GAS GOVERNORS, PRESSURE AND CONSUMPTION GAUGES.

WHEN gas is required for the purpose of producing an illuminating flame it should be supplied at the point of ignition under very low pressure (say 0.6 in. of water), but when required for incandescent burners, or other burners in which air is admitted to produce a non-luminous flame, the gas should be supplied to the point at which it is injected into the mixing tube of the burner under a higher pressure (say 1½ in.). It is commonly stated that "atmospheric" gas fires are most efficient when supplied with gas under a pressure of about ½ in., but although this may be true when coal-gas is used in nicely adjusted gas fires having clean burners and tested under favourable conditions in a room free from draughts, it is a statement which is likely to mislead the ordinary consumer.

In practice the burners are seldom perfectly clean, but are more or less covered with dust deposited from the atmosphere or dropped upon them from the overhead fireclay or asbestos fuel; consequently the gas ceases to issue in sufficient volume, becomes mixed with too large a volume of air, and "flashes back" when ignited, or burns with a short, noisy, green flame. Non-luminous flames, produced by admitting air before the point of ignition, have also a greater tendency to "flash back" under the influence of air draughts, caused by opening windows or doors, when the gas is supplied under a pressure of less than 1 in. than with gas under a higher pressure. Also the common practice of mixing carburetted water-gas with the coal-gas, and thereby increasing the specific gravity of the gas, necessitates the use of gas under a higher pressure than ½ in. The main disadvantage attendant on the use of gas under high pressure is the hissing noise produced in the burner.

*Initial or House Gas Governors.*—The pressure of the gas as it leaves the consumer's meter varies considerably during every twenty-four hours in most districts, and to prevent it exceeding a certain limit at the points of ignition a governor is often affixed on the service-pipe close to the outlet of the meter. The object of the governor is to prevent wasteful consumption of gas, and to maintain a uniform pressure at the burners irrespective of the changes in the pressure under which the gas is supplied to the meter. When the pressure of the gas entering the meter is too low, or the meter itself is too small, governors are quite useless.

Governors should always be fitted in a level position, and in places where they can readily be inspected. By turning a screw or manipulating small weights the governors can be so adjusted that the pressure at the outlet will be maintained at any desired point lower than the pressure at the inlet. It is usual to recommend that the pressure be reduced to 7 in. when the usual number of lights are in use, but if incandescent burners or other appliances fitted with "atmospheric" burners are to be supplied in addition to burners for luminous flames, it is better to allow a pressure of 1½ in. at the governor outlet, and for the luminous flames to use governor burners, or Bray burners fitted with the "economisers" to be described in the next chapter.

The governor usually consists of a small chamber through which the gas flows, the inlet being partially closed by a small cone which automatically rises and reduces the size of the inlet orifice when the pressure increases, and which descends as the pressure decreases and thereby increases the size of the orifice through which gas can pass. In some governors the upper part of the chamber consists of a flexible leather diaphragm, which expands in an upward direction when the pressure increases and draws up the conical or semi-spherical plug which is connected to the diaphragm by a central spindle, and which controls the gas inlet orifice. The gas pressure required to raise the diaphragm and top plate is regulated by removable weights, or by turning a screw which regulates a spring pressing upon the flexible diaphragm. To obtain greater regularity of action the governor sometimes consists of two of these expansible chambers arranged side by side, and forms what is termed a "double dry governor."

In Peebles's "mercurial" governor a small gas bell floats in a cup containing mercury, the

Fig. 15.—Peebles's Mercurial House Governor.

rise of the bell when the pressure increases causing a reduction in the size of the inlet orifice, and the gas pressure required to raise the bell being dependent upon the weight placed upon it.

One of these governors is sometimes attached to every appliance which consumes a large volume of gas, such as a fire or stove, as in such cases the saving effected by carefully governing the supply may be considerable.

**Governor Burners.**—Instead of, or in addition to, placing an initial governor at the outlet of the meter, the burners used may each be provided with a small governor, situated either in the body of the burner or immediately beneath it.

In Peebles needle burner (fig. 16) the chamber beneath the steatite burner tip contains a perforated conical float of white metal, and as the gas pressure increases the float rises and reduces the size of the orifice through which the gas escapes to the burner tip. The needle is an upright central metal rod which passes up inside the float and prevents it becoming tilted out of its proper position. The greater the pressure the smaller becomes the outlet orifice, while a decrease of pressure is accompanied by a descent of the float and consequent enlargement of the outlet orifice.

Fig. 16.—Peebles's Needle Governor Burner.

A great variety of burner governors are manufactured, but most of them depend upon the movements of a float which automatically reduces the size of the gas inlet or outlet orifice as the gas pressure increases, and enlarges it as the pressure decreases. They are mostly effective while maintained in good working order, but all require occasional inspection, as the accumulation of a little dirt within them, or the corrosion of the metal, is liable to put them out of action. Sometimes in float governors the float becomes jammed against the sides of the chamber containing it, and needs to be released by tapping the burner, or by unscrewing the base of the chamber and shaking it free.

**Pressure Increases with the Elevation.**—The specific gravity of coal-gas being much lower than that of air, the gas pressure increases as the height of the service-pipe above ground level increases, and decreases when the pipe is carried in a downward direction. A gasworks is usually situated on the lowest level in the district to be supplied, because a higher pressure is required to distribute gas downhill than uphill. The pressure on the top floor of a building is greater than in the basement, if no governor be employed. The increase in pressure is equal to about  $\frac{1}{2}$  in. of water for every 10 ft. of elevation, and in lofty buildings a governor may with advantage be provided on the service-pipe at every elevation of 30 ft.

**Pressure Gauges.**—The simplest pressure gauge is a glass U-tube filled to about half its height with water, one end of the tube being open to the air and the other open to the air until connected to the gas supply-pipe. When both ends of the tube are open to the atmosphere the column of water is at the same height in both limbs; but when one limb is connected to the gas supply the pressure of the gas causes the water level to be depressed in one limb and to rise in the other. The height of the water level in the one limb above

that in the other limb is measured in inches, and represents the pressure of the gas in inches of water. For convenience the water in the tube may be tinted with cochineal or soluble indigo, a scale graduated in tenths of an inch may be attached to the tube, and a stopcock and nipple may be fitted to the end of each limb; but these additions merely render the apparatus more convenient to use, and do not affect the accuracy of the readings.

**Mercury Gauges.**—For pressures higher than the maximum of 4 in. or 5 in. under which coal-gas is usually supplied, the U tube may be charged with mercury instead of water, mercury being 13.4 times the weight of water. Mercury gauges are sold having a scale on which the figures represent the pressure in inches of water, and the necessity of multiplying the readings by 13.4 in order to convert them into inches of water is thereby obviated.

**High-pressure Gauges.**—For measuring pressures of many pounds to the square inch spring gauges in a circular metal case, similar to those used for steam boilers, are employed.

**Service-pipe Cleaners.**—Service pipes and main-service pipes exposed to low temperatures sometimes become blocked with naphthalene or other matter deposited from the gas. To remove the obstruction the pipe is usually "blown out" with the aid of a force pump known as a "service cleanser," the removal being sometimes facilitated by introducing into the pipe a solvent, such as benzol, naphtha, or petroleum.

**Consumption and Pressure Indicator.**—Indicators are manufactured which show at a glance the approximate hourly rate of gas consumption of any ordinary gas-burner, and which may also be used as pressure-gauges. The consumption readings of the indicator vary with the specific gravity of the gas, and consequently an indicator adjusted to give correct readings with rich Scotch gas would not indicate correctly the consumption of burners tested with London coal-gas. The indicator must be adjusted by the manufacturer to suit the quality of the gas supplied in the district in which the indicator is to be used.

To ascertain the rate of consumption of any burner the indicator is attached to the gas supply, and the burner is screwed into the top of the indicator. The gas entering the bottom of the indicator, passes through a glass tube, within which is a floating disc which rises to a height dependent upon the rate of flow of gas to the burner. On one side of the metal case containing the glass tube is a scale of cubic feet per hour, the consumption of the burner under examination being indicated by the position of the floating disc, which rises until opposite that figure on the scale which indicates the consumption. As the height to which the disc is raised is dependent upon the specific gravity of the gas, it follows that the instrument registers inaccurately when used with gases of widely different specific gravity, but for obtaining an approximate estimation of the consumption of different burners in districts supplied with gas of uniform specific gravity the apparatus is very useful.

Fig. 17.—Consumption and Pressure Indicator.

To use the instrument as a pressure gauge a cap provided with the instrument is screwed on the top in place of a burner, and reference is made to another scale engraved on the opposite side of the metal case. The float rises as before, and the point at which the disc remains at a constant height indicates on the scale the pressure in inches of water of the gas under

examination. Variations in the specific gravity of the gas do not affect the accuracy of the pressure indications.

**Testing the Gas Fittings.**—Gas services and fittings to be used with gas under ordinary pressures of less than 4 in. of water should always be tested under a pressure of 10 in. or 12 in. before being approved as gas-tight. A force pump and mercury or water-pressure gauge with connecting pieces form the whole of the apparatus required for testing; gas or air being forced into the pipes until the required pressure is obtained, and observation being made as to whether the pressure remains constant for a long period or gradually decreases. A leak-detector of this description is made by Harrison & Sheard, and quite recently a detector known as the "Wizard," in which benzoline is provided to render the air inflammable, and thus facilitate detection of the point of leakage, has been introduced by Falk, Stadelmann & Co.

[By a printer's error the sectional drawing of a dry meter (fig. 14), shown in the preceding chapter, was inverted.]

## Correspondence.

To the Editor of THE BUILDER.

### THE LATE MR. BRYDON'S GOVERNMENT OFFICES.

SIR,—It is strange that no one has suggested that for the superintendence of the above the Government should employ the late Mr. Brydon's gifted assistant, Mr. Arthur Hannaford, who was his intimate friend and *only* helper for a considerable time, and his right-hand man for years. Mr. Hannaford prepared details for most of his chief's works, including those in Bath; and I know that Mr. Brydon was most anxious to have his assistance again (he had left to go for health and study to Italy) when designing the Government Offices. It seems impossible to name a more suitable or better qualified man, as, considering the advanced state of the drawings at the time of Mr. Brydon's death, it would be easier for Mr. Hannaford to sympathetically work out the ideas of his dead friend and teacher than for other architects, who, if really "eminent," can less easily adapt themselves to another man's lines of work.

Whether Mr. Hannaford is available, however, I do not know.

\*\* We gladly publish the letter of "Z." who has no personal interest of any kind in the matter; but we are still of opinion that one of the most eminent architects of the day should be appointed to carry out the building, both in respect to the memory of Mr. Brydon, and as the best guarantee for the worthy execution of the work. Such an architect, if appointed, might no doubt do well to avail himself, if possible, of the assistance of the gentleman named by our correspondent.—ED.

### ARCHITECTURAL COURTS AT THE CRYSTAL PALACE.

SIR,—I do not know if your attention has been drawn to the present condition of the architectural courts of the Crystal Palace. After a lapse of some years, visiting Sydenham expressly to enjoy their beauties, I found my recollection had not done justice either to their extent or to the care with which they had been arranged. In some respects, the collection of casts surpasses that at South Kensington. The Medicean Dukes are not solitary, but supported by the allegorical recumbent figures; the Pistoian frieze is in one continuous length and at its proper height (although incorrectly coloured). There are no large models at Kensington of the Acropolis, the Pantheon, or St. Peter's, Rome, nor casts of English medieval remains so varied as at Sydenham. But in what manner are these reproductions of the world's greatest art treasures displayed?

The principal Egyptian Court is now occupied by cooking-stoves, and its vistas destroyed by painted canvas backgrounds and imaginary battlefields, which at night produces a truly Egyptian darkness in the colonnades behind, duly appreciated by young people of both sexes. The Greek Court is appropriated to wounded and dying soldiers in khaki. The Roman Court has been execrably repainted, and is crowded with various casts of a period, 1,500 years later than one would expect, and a series of models of modern battles, in glass cases. The Court of the Alhambra is evidently considered a "draw," for it has been properly redecorated and is free from intrusive objects. Truly the plants are not specially characteristic of Spain, neither does the untempered arc light which essentially renders invisible the beautiful dome of the Abencerrages recall the sunny clime of the Peninsula. The tile paving is worn plain, and the water plashes no longer in the fountain. However, some effort is made here to save appearances, and we

cross the nave hopefully to the Byzantine Court opposite.

Here, however, birds are in possession, and the large aviaries render many of the casts unapproachable. The Medieval Court is in somewhat better order, although the French and German vestibules contain displaced casts of other periods and nationalities to the confusion of the student. The Renaissance Court is at present occupied by an exhibit of armour and military costume, the partial cause of the overcrowding of casts elsewhere.

That Queen Elizabeth is practically screened from view renders the fact that she is buried beneath cardboard boxes and old newspapers less noticeable. She has been exiled from her own Elizabethan vestibule as this is required for a club, which is also in complete occupation of the spacious Italian Court beyond, so that these portions are no longer accessible to general visitors.

We are frequently reminded of the difficulty the Palace Company have in keeping the building open without loss, and giving them the credit of knowing their own business best, one can but feel that the space the courts occupy can, in their opinion, be more remuneratively employed. Certainly at present the courts only provoke sadness to that section of the public who really care about them, while those who do not care about them would not mind their removal. Therefore one would suggest that, falling their acquisition by Government (which is scarcely to be looked for after Lord Salisbury's recent speech on State encouragement of art), some enterprising city like Glasgow, Liverpool, Manchester, or Birmingham, should make an offer for their acquisition, and thus form a nucleus of a great architectural museum.

F. HERBERT MANSFORD.

### OBITUARY.

MR. C. ABBEY.—Mr. Charles Abbey, architectural sculptor, died at his residence at Rosemont-road, Richmond Hill, upon the 21st inst., aged sixty-five. Mr. Abbey was greatly esteemed by all who knew him. For some years he was in partnership with Mr. Charles W. Harrison in Dublin.

### GENERAL BUILDING NEWS.

CONGREGATIONAL CHURCH, LEEDS.—The foundation-stone has been laid of the new Congregational Church in Woodhouse-lane, Leeds, which will take the place of the East Parade Chapel that was purchased by an insurance company for 31,000l. The new church, having a capacity for about 1,000 persons, is planned and designed by Mr. C. F. Farby, and will cost about 25,000l. It is proposed to insert a stained-glass window in memory of three former ministers, Dr. Cuder, Dr. Reynolds, and the Reverend John Ely.

CHURCH, BALLYCOTTON, EAST CORK, IRELAND.—The new Church of Our Lady Star of the Sea, recently built at Ballycotton, has just been dedicated. The style of the church is Romanesque. The dimensions are, roughly speaking, 100 ft. by 20 ft.; height of ridge of nave 70 ft., and 19 ft. of bell turret 70 ft. The nave is 25 ft. wide, and the aisles 12 ft. 6 in. each. The nave is separated from aisles on each side by arcades of five bays carried on columns of polished Aberdeen granite, with caps and bases of Portland stone. Above the bays of the nave there are on each side six clearstory cinquefoil windows, beneath which runs a string course internally of Portland stone. Between the chancel and nave there is a chancel arch springing from polished granite columns with Portland stone caps and corbels. There are two short transepts, gable roofed, which contain the altars, and the chancel portion of the aisles is separated from the body of the aisles on each side by arches. A winding turret stair of limestone leads to an organ gallery, which stretches across western end of nave, and beneath which there is a porch. The glass in this porch and in all the windows of the church is cathedral glass, and was supplied from the Youghal Art Works of Mr. Watson. For each of the six clearstory windows at each side there are two aisle windows, except in the spaces required for sacristy and porches. Behind each side altar there are two windows, and behind the high altar three. At the western end the nave is lighted by three windows, above which is a rose window. There is also a light at the western end of each aisle over the confessionals. The confessionals are of pitch pine, and made by Mr. Murray, of Youghal. The nave is filled with pitch pine benches made according to the architect's design by Mr. T. O'Brien, of Cloyne. The floor is of pine on breeze concrete, the porches and central passages being tiled. There is also encaustic tiling along the whole width of the sanctuary, all the tiling being the work of Mr. Nicholas Sisk, of Cork. The high altar of marbles and mosaics is by Mr. E. Sharpe, of Dublin. The walls lined with Youghal brick, are externally of Little Island limestone in pitch-faced ashlar masonry, set and pointed in cement. The architect is Mr. G. C. Ashlin, of Dublin, and the contractor is Mr. Jerh. J. Coffey, of Middleton.

SCHOOL, GIGGLESWICK, YORKSHIRE.—On October 4 the new chapel which Mr. Walter Morrison has presented to the Giggleswick Grammar School will be formally inaugurated. Externally the build-

ing is constructed of red and white stones, the dome, which is octagonal in plan on its exterior and nearly semicircular in section, being covered with copper. There is a small lantern with a cupola over the eye of the dome. In the interior marble, mosaic, carved wood, and stained glass have been plentifully used. The interior of the dome is covered with mosaic. Around the summit of the dome light from the lantern, are figures of winged saints with golden halos. On the lower part of the dome are a series of angelic figures with uplifted wings, most of them bearing musical instruments. At the crossing of the transepts are four large figures of the Evangelists. The floor of the church beneath the dome is arranged as choir stalls, and is paved for the most part with black and white marble. Immediately beneath the centre of the dome is a disc of Italian Breccia, and around this are arranged in a circular design a pavement of verde antique and other marbles, including specimens of grey and green marbles from Ireland, Italy, and Greece. The northern transept is occupied with an organ loft, and in the south transept is a small gallery. The transepts and nave have wagon-headed vaults, the former being stencilled with decorative designs. Most of the boys of the school will occupy seats in the nave, and at the west end are stalls for the masters. The nave aisles are very narrow, and will serve only as passages. They open into the church by three round-headed arches, with decorated capitals. The fronts of the organ and of the galleries and the stalls are designed, in harmony with the rest of the building, in the Tudor Gothic. The ends of the seats to be occupied by the boys have also elaborate carved borders, in which the foliage of many of the local plants is reproduced. The whole of the woodwork is of cedar. In convenient niches are to be placed statues of the late Queen Victoria and of King Edward VII., commissions for their execution having been placed with Mr. George Frantzen, A.R.A. The transepts are nearly all filled with stained glass. The east window is scriptural, the principal subjects being the Sermon on the Mount and the Ascension. The west window is circular in shape. It shows the sun, moon, and stars, the earth, with the Tree of Knowledge in its centre, and the waters under the earth. Beside the Tree of Knowledge stand Adam and Eve, and around them are representative figures of most of the principal groups of animals. The lion, tiger, rhinoceros, hippopotamus, reindeer, ox, sheep, kangaroo, crocodile, many birds, including the flamingo, and many fishes are depicted. In the nave windows are the full-length portraits of some of the great figures of our history. Alcuin, William of Wykeham, and Arnold of Brescia represent the monastic life. King Edmund, the saint and martyr, Sir Thomas More, and Bishop Latimer are taken as representing the non-monastic religious life. Wycliffe, Bunyan, and Wesley are the typical Puritans. Columbus, Henry Martyn, and Livingstone represent the noble band of missionaries. King Alfred, Sir Phillip Sidney, and General Gordon are the fine types of English military life at its best, and Cadmon, Milton, and Keats represent the English literature. A fine organ has been built in the church by Messrs. Henry Willis & Sons, of London. The stained-glass windows are all by Messrs. Burlison & Grylls, of London. The mosaic work is by Messrs. Powell & Son, of London. Mr. George Murray is the artist engaged in the decoration of the church; and the works have been carried out under the supervision of Mr. R. Evans as clerk of works. Mr. T. G. Jackson, R.A., is the architect.—*Burdock Observer*.

SCHOOL, PERTH.—The new Central District School, Perth, occupies the site of the old Middle Church Parish School in the Meal Vennal. Owing to the peculiar shape of the ground, it was found desirable to have all the classrooms facing one direction, in order to get the full benefit of the open space for light and air, and it was found necessary to construct the new school three stories in height. On the ground floor of the new school are three infant classrooms, each seated for seventy-two pupils; one spare classroom for forty pupils, to be used as a demonstration cookery classroom; a central hall, which rises the full height of the three stories; a bathroom, cloakrooms for infants and girls, female teachers' retiring-rooms, boys' and girls' entrances, and six staircases at either side. On the first floor are four classrooms for Standards I., II., and III., each seated for sixty pupils; a combined workshop and practical cookery classroom for eighteen pupils, boys' cloakroom, and headmaster's private and retiring-rooms. The second floor contains three classrooms for Standards IV., V., and VI., each seated for sixty pupils. The walls of the central hall, staircases, and corridors have a dado of cream-coloured tiles, and the classrooms have yellow pine dados to a height of about 4 ft. The architect is Mr. G. P. K. Young. The following are the principal contractors:—Masons, Messrs. Fraser & Morton; joiners, Messrs. James Hay & Voughal brick; plumbing work and heating, Messrs. Frew, Watson, & Co.; plasterer, Mr. A. M'Ritchie, Dundee; slaters, Messrs. James Buchan & Son; glazier, Mr. C. Alexander; electric lighting, Messrs. Frew, Watson, & Co.; clerk of works, Mr. Robert Smith.

MUNICIPAL TECHNICAL COLLEGE, SUNDERLAND.—The foundation-stone of this building, which is situated in Green-terrace, near Bishopwearmouth

Parish Church, was laid about a couple of years ago, and the formal opening of the completed edifice is to be performed on September 13. Designs for the new building were accepted in competition from Messrs. Potts, Son & Hennings, architects, of London, and the building contract was secured by a local man, Mr. J. White, whose original tender was 681, which, with the addition of various extras, will closely approach 18,000l. The building is English Renaissance in style, of red brick, with buff-coloured terra-cotta. The most conspicuous feature of the building is the corner block, which has been carried up as a square dwarf tower, topped by a miniature dome. In the basement, in addition to the physical laboratory, the heating apparatus, &c., provision has been made for working machinery, testing machines, and workshops fitted with all the requisite mechanical appliances. Chief among the various rooms on the ground floor is the examination and lecture hall, which measures 70 ft. by 30 ft.; while the leading divisions on the first floor are the chemical laboratory, which is 70 ft. long, 30 ft. wide, and 20 ft. high, and the chemistry-lecture theatre, these rooms having respectively accommodated eighty-four and sixty students. On the second floor and in the tower are rooms for astronomical study.

CO-OPERATIVE STORES, BIRTLEY, DURHAM.—The foundation-stones of the new co-operative stores, at Durham-road, Birtley, have just been laid. The buildings are to be erected for the Birtley Co-operative Society by Mr. John Jopling, of Birtley, from designs prepared by Messrs. Liddle and Browne, Newcastle-upon-Tyne. The site is in the centre of the village, and occupies a position facing the Durham-road. The front of the building is to be of Rubicon red facing brick with stone facings, and it will have a frontage of 265 ft., and a depth of 133 ft. There will be eight shops on the ground floor, and on the first floor a large hall to seat 900 people. Provision will also be made for club and committee rooms, with secretary's and cashier's offices, &c. The whole is to be lighted by electricity, and plant will be laid down for that purpose. The total cost of the new premises is estimated at 20,000l.

ADDITION TO THE NATIONAL GALLERY, DUBLIN.—The work of building an addition to the National Gallery in Leinster Lawn, which was commenced in January, 1900, is fast drawing to a close. The building is an oblong structure, with a frontage facing Leinster Lawn of 54 ft., and a depth towards Kildare-street of 220 ft., and consists of basement, ground and first floors. The design is the work of Sir Thomas N. Deane & Son, the front being Italian Renaissance in style. The entrance is through a portico into a hall on the ground floor, off which will be the approaches to the basement and first floors. The basement is wholly occupied by store-rooms and the boiler-room, from which the entire building will be heated on the radiating principle. The ground floor, which will be the main gallery of the new building, contains, besides lavatories and other necessary arrangements, seven rooms, each room being about 30 ft. square and lighted from the north and south sides by fourteen side windows, 10 ft. by 14 ft. These rooms will contain the bulk of the gallery exhibits. The first floor will also contain seven public rooms besides the directors' apartments. The floor will be lit from the roof by lantern lights nearly 22 ft. square. The contractors are Messrs. Meade & Son. The building is fireproof throughout, the flooring being of steel joists and breeze concrete, and being finished on the ground floor in teak parquet, and on the first floor in Kiga oak and pitch pine. The roof is finished with iron and pitch pine. The roof elevation and part of the side railings. The front elevation and part of the side railings are in Portland stone and Ballyknocken granite from Osborne's quarries. The remaining stonework is Co. Dublin calp from Messrs. Meade's own quarries. The window dressings are of Athy stone brick. The Portland stonework was executed in Messrs. Meade's shop under the personal supervision of Mr. John Brophy. The stonework throughout has been carried out in Messrs. Meade's premises under the supervision of Mr. Joseph Clarke. The carving is being executed by Messrs. Harrison & Sons. The total cost of the building will be about 30,000l.—*Irish Independent*.

NAPSBURY LUNATIC ASYLUM.—On the 20th inst. at the Guildhall, Broad Sanctuary, Westminster, Mr. E. A. Sandford Foxcett, A.M., Lord Clerk of the Board, appointed by the Local Government Board, held an inquiry respecting the application of the Middlesex County Council to that authority for power to raise by loan the sum of 250,000l. for the purposes of the new lunatic asylum which they propose to erect at Napsbury, St. Albans, Herts. The County Council was represented by its architect, Mr. Rowland Plumbe, and the Deputy Clerk, Mr. W. J. Austin. The site has been already purchased at a cost of about 50,000l., and the foundations for the main building are nearly completed. The new asylum, which is much needed to relieve the pressure upon similar institutions in Greater London, will be constructed to accommodate a total of 1,150 inmates.

CONVALESCENT HOME, SANDGATE.—On the 17th inst. the Alfred Bevan Memorial Convalescent Home for Men, Women, and Children, was opened at Sandgate. The institution, which was formerly known as the Beach Rocks Hospital, has been rearranged as an auxiliary to the Morley House Seaside Convalescent Home for Working Men, Dover, and is intended to perpetuate the memory of the late Sir Alfred Henry

Bevan. Mr. G. D. Stevenson was the honorary architect.

**ART SCHOOL, FALMOUTH.**—The foundation-stone of the new school of art, in Manor Drive, Falmouth, which is to be a memorial of Miss Anna Maria Fox, was laid on the 19th inst. The architect is Mr. O. Caldwell, of Penzance.

**ALTERATIONS AND IMPROVEMENTS, PRINCE'S THEATRE, MANCHESTER.**—The Prince's Theatre has been altered and improved. Mr. J. Blain was the contractor for the structural alterations and the contract for the decoration and upholstery has been carried out by Messrs. J. Binns & Sons, of Halifax. The structural and decorative work has been executed from the drawings prepared by the architects, Messrs. Darbyshire & Smith, and carried out under their personal superintendence.

**NEW PUBLIC BATHS, WEST HAM.**—It is announced that the Town Council of West Ham have resolved to build a swimming-bath, having a water area of 100 ft. by 35 ft., together with a Turkish bath, slipper-baths, and waiting-rooms. Provision will be made for using the swimming-bath, during the winter months, as a hall or gymnasium, and for the accommodation of 1,000 persons in the gallery and the additional floor-space which can be obtained by folding the dressing-boxes against the walls.

**DRURY-LANE THEATRE.**—During some weeks past extensive alterations and improvements of the interior of the auditorium have been in progress—the structural works being carried out by Messrs. Patman & Fotheringham, under the directions and superintendence of Mr. Philip E. Pilditch, who also has designed a scheme for the new upholstery (by A. R. Dean, Limited) and decoration. The improvements comprise a reconstruction of the stalls and the grand and first circles, the steel work for which is by Messrs. Drew-Bear, Perks, & Co., together with the removal of some of the boxes on the stall-floor, the widening of some of the aisles, a new exit-door in Russell-street, a fresh system of ventilation throughout the whole of the building, and a re-installation of the electric light supply in two services, either one of which will be available, in case of accident, for replacing the other, so that in such an event a recourse to gas will not be necessary.

**CATHOLIC SCHOOL, ABERDEEN.**—On the 15th inst. the new Roman Catholic School in Summer-street was opened. The school takes the place of the former Convent School in Huntly-street, which has become inadequate for the purpose. The new school was designed by Mr. R. G. Wilson, architect. Including the site, it has cost altogether over 5,000l., and provides accommodation for 267 pupils.

**PUBLIC BATHS, CORK.**—New public baths have been erected at Cork. There are two baths, each 75 ft. long by 30 ft. broad. The floor is an inclined plane, thus securing at one end a maximum depth of 6 ft. 6 in., and at the other the minimum depth of 3 ft. 6 in. The baths are approached at each corner by wooden stairs, and the bottom and sides are lined with white glazed brick, with two lines of coloured brick along the centre. Each bath is provided with fifty-eight dressing-boxes, and eight douche baths are attached to each swimming apartment. The main apartments will be lighted by two arc lamps, and the dressing-baths and other portions of the premises will be lighted with incandescent lights. There is a glazed roof. The dressing-boxes are made portable, so that in the winter-time, if it were found unnecessary to use both baths for swimming purposes, the boxes could be taken down, and the tank temporarily floored over and used as a gymnasium or for other public purposes. Attached to the bath premises is a steam laundry. The buildings are approached from Eglinton-street, there being two separate doors, one for each bath, with a central ticket office from which control of both baths can be obtained. The baths were erected under the superintendence of the City Engineer (Mr. H. A. Cutler).

**SANITARY AND ENGINEERING NEWS.**

**LINLITHGOW DRAINAGE SCHEME.**—The work of opening the pipe track in connexion with the new drainage scheme for the burgh of Linlithgow has commenced. The contractors are Messrs. Blair & White, Glasgow, whose offer for executing the work amounts to 5,761l. 18s. 11. The Council have now asked Messrs. Warren & Stuart, the engineers, to have the specifications for the septic tank works submitted without delay.

**ABERDEEN HARBOUR IMPROVEMENTS.**—In connexion with the work at present going on of the single-swinging bridge (with double line of rails) in line with Marischal-street, and between Victoria place and Upper Docks, Aberdeen, the Harbour Commissioners are now to construct a temporary bascule bridge—64 ft. apart between pivots or axles, 14 ft. in width, being two footways 3 ft. wide each and a carriage-way of 8 ft.—of strong steel, able to carry a six-ton lorry and a crowd of people. The work will be carried out by Messrs. Abernethy & Co., Ferry Hill Foundry, Aberdeen, and it is intended that the bascule bridge be utilised by being shifted to other parts of the dock when required. The plans are by Mr. R. G. Nicol, Harbour Engineer.

**STOCKPORT AND ITS WATER SUPPLY.**—The growth of the burgh of Stockport and of the residential and manufacturing districts surrounding it

convinced the Corporation of the necessity of extending their water supply, and they have prepared a scheme which, when carried out in its entirety, will relieve the district of anxiety in the matter of ample provision for many years to come. The new gathering ground is provided by the great district of Kinder Scout. The scheme received the sanction of Parliament in the past session. It provides for the construction of three reservoirs at Kinder, in the parish of Hayfield. The reservoir to be first constructed will be made by an embankment across the river Kinder. The storage capacity thus provided will be equal to 624,000,000 gallons, and will give a daily supply of 2,000,000 gallons. The reservoir to be made as a second instalment of the work will be formed by the making of an embankment across the river Sett. Here a total capacity of 310,000,000 gallons will be created, with a daily supply of 1,500,000 gallons. As a third instalment a reservoir will be formed at Hollingworth Clough, with a capacity of 60,000,000 gallons, allowing for supply purposes 750,000 gallons per day. Adequate arrangements are made for the supply of compensation water. The total gathering ground is 4,560 acres. At the foot of the Kinder reservoir filter beds will be constructed, and from thence ample provision will be made for supplying the area included in the Stockport district. The engineer of the scheme is Mr. James Mansergh. The construction of the first of the three reservoirs will be commenced in the early spring. A period of ten years is fixed in the Act of Parliament for the completion of this portion of the works, but it is expected that it will be finished in seven or eight years. The Corporation obtained powers under the Act to borrow 750,000l. for works and 64,000l. for the purchase of lands, drainage, &c., in connexion with their scheme. The cost of the first reservoir, with the necessary mains, filters, service reservoirs, &c., is estimated at 350,000l.—*Manchester Guardian.*

**PUMPING PLANT, EUSA DRAINAGE STATION, EGYPT.**—We are informed that Messrs. Eas on & Co, Limited, of Westminster, have secured the order for the pumping plant for the Eusa Drainage Station. The plant in question consists of six Lancashire boilers, two economisers, four vertical compound condensing engines direct coupled to four large centrifugal pumps, with all necessary steam and exhaust pipes, feed pump and feed-pipes, &c., and is designed to raise 6,500,000 gallons of water per hour against a head of about 15 ft.

**SEWAGE SCHEME, WINDERMERE.**—The Urban District Council have instructed Messrs. Beesley Son & Nichols, Civil Engineers, of Westminster, to prepare a scheme for the sewerage and sewage disposal of the town.

**FOREIGN.**

**FRANCE.**—The brick and iron church of St. Michel at Batignolles (Paris) is to be pulled down and replaced by a new church on a great scale.—M. Rochet, the architect to the Académie de Médecine, has received instructions to erect a crematorium in connexion with the Ecole Pratique de Médecine, Rue Racine. The special object is to dispose of bodies which have been the subject of post-mortem dissections, which have hitherto been interred at Père-la-Chaise.—The fine monument to Mlle. Clairon, by M. Ganquière, illustrated some time since in the *Builder*, has just been finally erected at Condé-sur-l'Escaut.—M. Sandler, the architect who directs the art-work at the Sèvres manufactory, has been superintending the design and execution of a tower in porcelain, nearly 150 ft. in height, which is to be erected at Saint-Cloud, on the site of the former erection known as the "Lantern of Diogenes," which was destroyed by the Germans in the war. The site forms the highest point of the Saint-Cloud park.—The Public Works Department is about to construct a bridge over the Garonne at Bordeaux, opposite the Place Ribellien, in the form of a suspended travelling car.—A new Lycée is to be built at Paris, as an annex to the Lycée Buffon in the Boulevard Pasteur.—A committee has been formed at Paris to erect a monument to the celebrated furniture artist Boulle, whose name is permanently associated with a well-known type of French furniture of the seventeenth century. The design of the monument is entrusted to M. E. Jacques, sculptor, and it will be erected at the angle of the Faubourg St. Antoine and the Rue de Valenciennes.—M. Gabriel Ruprecht-Robert, architect-in-chief to the Commission des Monuments Historiques, is carrying out some researches and excavations on the summit of Puy-de-Dôme, among the ruins of a Roman building commonly known as the "Temple of Mercury." He has already brought to light a number of interesting relics, including a fine Corinthian capital in good preservation, and various specimens of pottery and coins of the Roman period.—A new basin is to be formed at the port of Boulogne, at an estimated cost of six million francs.

**THE ARCHITECTURAL ASSOCIATION.**—The prize of a silver medal and ten guineas, offered for the best monograph of Sir John Vanbrugh, with suitable plans and photographs, has been awarded to Mr. Gilbert H. Lovegrove, son of Mr. Henry Lovegrove, District Surveyor of Shore-ditch

**CAPITAL AND LABOUR.**

**STATE OF THE BRADFORD BUILDING TRADE DISPUTE.**—The dispute in the Bradford building trades has now extended over sixteen weeks, and the prospects of any settlement appear to be as remote as they were when matters were brought to a crisis on May 1. Both employers and workmen are as firm in their attitude as ever, and to this extent the position of affairs may be said to remain unchanged, but in another aspect the situation can scarcely be described as so acute as it was in the earlier stages of the difficulty, from the point of view of either side. For some time past there has been a steady importation of non-society labour, until now, so far from building operations in the city being practically at a standstill, as was the case for some months, workmen officially stated to number two or three hundreds are engaged on several of the largest building undertakings. These include the Cartwright Memorial Hall, the Green-lane Board School, the electricity extension works, and the new Conditioning House. Mr. W. A. Forshaw, who has charge of the new labour bureau, reported that day by day a satisfactory number of applications are received, and that the new workmen are started as soon as their credentials are verified. He hazarded the opinion that, if the present rate of applications is continued, the places of the trade unionists will have been entirely filled up in the course of another month or so. It was also stated that there is a steady supply of masons, and that at present, more joiners are forthcoming than the agency can provide with immediate employment. Mr. Forshaw declared that, in spite of the criticisms of the unionists, the quality of the work done by the non-society men is quite satisfactory. On the other hand there is a corresponding anxiety among the two trade societies mainly affected by the dispute in drafting their members to other districts. On May 1 the number of carpenters and joiners thrown out of employment was about 400, and the policy pursued has reduced the number on the books to 200. Similarly, as to the masons, the number on the books of the Bradford branch has diminished from about 500 to just over 300. It is stated that there is considerable activity in the building trade generally, and that in the great majority of cases the men have no difficulty in obtaining as much as 10s. an hour, which, of course, is a penny an hour higher than the rate of wages upon which issue has been joined in Bradford. Some indignation has been aroused in the union by an assertion that its members are receiving a larger weekly allowance than their wages would ordinarily average in the course of a year. The allowance at the commencement of the dispute was 14s. 1; afterwards it was increased to 15s., and now so much support is forthcoming from other branches in sympathy with the Bradford men that the pay has been increased to 24s. a week, beyond which it is not likely to advance, however large the funds at disposal.—*Bradford Observer.*

**MISCELLANEOUS.**

**PROPOSED ENLARGEMENT OF PADDINGTON TOWN HALL.**—The Paddington Borough Council is considering a scheme for enlarging the present Town Hall at Paddington Green at an estimated cost of 20,000l. The scheme is being opposed on the ground that the building is not suitable for extension purposes and that a new building should be erected, even though it cost 50,000l. or 60,000l.

**LEEDS MASTER BUILDERS' ASSOCIATION.**—The annual meeting of the Leeds Master Builders' Association elected Mr. John Pickard president for the ensuing year. Other appointments were made as follows: Vice-president, Mr. G. Wilson; secretary, Mr. W. C. Ellisdon; committee, Messrs. J. T. Wright, W. H. Dawes, W. Airey, C. Myers, W. Simpkins, W. Oakes, and G. W. Nettleton.

**THE ORDNANCE SURVEY.**—During the twelve months ending with March 31 of this year the progressive work of the Ordnance Survey has been hindered through the absence of one-third of the officers upon the establishment who were withdrawn for active service in South Africa. In the course of the period under review the authorities published maps covering 4,950 square miles—an aggregate so far of 23,255 square miles—of their revision of the cadastral survey of all the counties of England and Wales, on the 1:2,500 scale, which was completed about twenty years ago. In the new series of 1-in. outline maps, of which the issue was begun in 1893, a fresh classification has been adopted for both public and private roads. In the first class are placed those which lead from one town to another and have a minimum width of a 14-ft. metalled roadway. The second class includes other metalled roads in a good state of repair and available for fast-wheeled traffic at all seasons, from and to villages, towns, and so on; all other metalled roads fit for wheeled traffic are assigned to the third class, whilst the fourth class includes unmetalled roads only. A coloured issue is made of these 1-in. maps for a large part of the South of England, mounted on canvas, and either flat or folded in a cover, for a charge of 1s. per sheet, measuring 18 in. by 12 in. The colours adopted are burnt sienna for metalled roads, brown for hill shading, red for contours, and blue for

water. Of the reduction, to a scale of four miles to the inch, based upon the 1-in. survey thus revised, the Department have now published sheets representing 31,515 square miles of England and Wales. They have just completed the publication of the 1:2,500 maps of the cultivated parts of Scotland, having during the last twenty years made and issued the surveys for the counties of Edinburgh, Haddington, Kirkcaldy, Wigtown, Fife, and Kinross, and the Lewis. The one-inch outline maps of that country are revised and finished. Ireland is not re-surveyed, by an increased staff, on the 1:2,500 scale. The field revision and drawing are concluded for the new one-inch maps, and the whole country has been surveyed for the publication (which is now completed) of maps to a scale of 6 inches to one mile. The departmental publications, indexes, maps, &c. can now be obtained at most provincial post-offices, but it does not appear that the public have largely availed themselves of that medium of purchase.

**CARRARA MARBLE INDUSTRY.**—An official report published by the Italian Ministry of Agriculture, Industry, and Commerce shows the number of working quarries in the districts of Carrara, Massa, and Versilia to be 538, the number of quarries and workmen employed being 10,215. The year's output was 94,832 tons of sawn marble and 14,085 tons of worked marble, of the aggregate value of £421,301. The United Kingdom takes about 20 per cent. of the marble exported, France 14 per cent., Germany 11 per cent., and the United States 27 per cent. The actual quantity shipped to England was 10,653 tons of block, 19,765 tons of sawn, and 7,398 tons of "otherwise worked."

**CHERBOURG STONE.**—Writing from Cherbourg, Mr. Loftus, the British Consul, remarks:—"There are several firms engaged in stone-quarrying here, all of whom appear to be doing well, and showing an ever-increasing business. The stone derived from the Cherbourg quarries is principally adopted for use as road metal; the stone is broken by hand, and is shipped mostly in British vessels to ports in the south of England, such as Peole, Shoreham, Southampton, Newhaven, Dover, Ramsgate, Margate, Herne Bay, Rochester, Stroud, and the Thames. The stone shipped to these ports is termed screened, the stone being broken into pieces ranging from 1½ to 2½ in. in size. A slight misconception of terms should here be noticed, namely, that what is usually termed granite in England is here (Cherbourg) known under the name of quartzite, and it differs from the granite proper as found in the neighbourhood of Fermanville and Dielette in being much softer. A somewhat cheaper kind of stone is shipped to Llanely and Bridgwater. The main trade is, however, in screened stone, and this export has shown a large increase during the last few years. The Cherbourg Quartzite Company, Limited, shipped 34,000 tons, the Kent Road Maintenance Company 55,483 tons, and other firms about 2,885 tons."

### LEGAL.

#### A BUILDING DISPUTE SETTLED.

The case of Savory v. Revill came before Mr. Justice Joyce, sitting as Vacation Judge in the Chancery Division, on Wednesday last.

Counsel stated that this was a motion to restrain the building of a wall. The case was in his lordship's list on the 21st inst., and stood over in order to allow the architects on both sides to meet and arrange terms. Those gentlemen had met and had been successful in coming to terms, and it was therefore desired to take an order in the terms of the minutes.

His Lordship: Signed by the junior counsel? The learned counsel stated that the minutes had been signed by the solicitors for the parties in pencil. The other side were not now represented by counsel.

His Lordship said the other side must be represented by counsel to enable him to consent to the order as asked. He could not accept mutual undertakings, as these were, signed by the solicitors. On the learned counsel producing a consent brief, signed by counsel on both sides, to the registrar the order could go.

The learned counsel stated that this would be done.

#### BUILDING DISPUTE AT NEWCASTLE.

The case of Reid v. Sanderson came before Mr. Justice Joyce, sitting as Vacation Judge in the Chancery Division, on Wednesday last, on a motion by the plaintiff for an interim injunction to restrain the defendant from erecting a certain building at Newcastle which would interfere with plaintiff's ancient lights.

Mr. Bramwell Davis, K.C., stated that the parties had been able to arrange matters. The property in question had been sold, and it had been arranged that the action should be discontinued, the plaintiff undertaking to bring no subsequent actions against the defendant, each party to pay their own costs. That settled the matter in dispute completely.

Mr. Alexander, K.C., who also appeared on the

motion, said he consented to the arrangement mentioned by his learned friend.

Order accordingly.

#### BUILDING DISPUTE IN THE CITY.

The case of Writford v. Patrick came before Mr. Justice Joyce, sitting as Vacation Judge in the Chancery Division, on Wednesday, on a motion by the plaintiff for an interim injunction to restrain the defendant from building so as to obstruct the plaintiff's ancient lights.

Mr. Maugham for the plaintiff said that last week his lordship gave him leave to serve the defendant with the notice of motion and the writ, but it had been impossible to serve the notice of motion and the writ, and he had therefore to move *ex parte* for the injunction. He thought the truth was that the defendant, knowing that the action had been commenced against him, had made it difficult to serve him. The *locus in quo* was in Wood-street, Cheapside. The defendant himself was the building owner, and was himself a builder. He had a place of business in London, and he was also by his agents carrying on the building in question in the City of London. The writ and the notice of motion had been taken several times to his business address in the Westminster Bridge-road and to the place where the work was being carried on. The persons in charge of both places knew the defendant's present address, which was in the country, but declined to give it.

His Lordship, having looked at the plans, asked how long the building had been going on.

Mr. Maugham stated that the defendant started building last February, and ever since the plaintiff had been anxious to see the plans. The idea of the defendant undoubtedly was that if he could get the building up before he was stopped, the Court would not order him to pull it down. He (counsel) had several affidavits in support of the motion. Mr. Adams, architect and surveyor, had made an affidavit that the defendant's building would interfere to a highly objectionable degree with the plaintiff's ancient lights.

His Lordship: What do you ask for?

Mr. Maugham said he asked that the defendant should be restrained from interfering with the plaintiff's ancient lights until the trial.

His Lordship, after consulting with the Registrar, said he would give the learned counsel an order for substituted service of the writ and notice of motion on the manager or any clerk of the defendant by leaving copies at his place of business with the manager or a clerk there, or by leaving them with the foreman, architect, or any person in authority at the building in question. If this were done, and a copy of the writ and notice of motion were also sent by registered letter to the defendant at his place of business and the building, the learned counsel could take an *ex parte* order in the terms of the notice of motion, but subject to the defendant having the right to get it discharged on his showing that it ought not to have been made. The plaintiff would, of course, give the usual undertaking in damages.

Order accordingly.

### RECENT PATENTS.

#### ABSTRACTS OF PATENTED INVENTIONS.

7,690.—A DRILL-BRACE: P. C. Carstensen.—In order that the feed-screw shall not be turned too far out of its nut, it is fitted with a shell of which the flange is notched, and is to be passed over lugs upon the nut as the drill is put together. Thus three or four threads will remain in the nut by impact against the projections concurrently with the feed of the drill.

7,695.—A WALL-PLUG FOR ELECTRICAL PURPOSES: S. S. Galsworthy.—The solid porcelain or similar base of the plug is pierced with pin-holes and a cap is screwed on to it. Nuts secure the square-headed pins. A grip for the wire is supplied by grooves and projections upon the base of the plug, which may have either a lug that fits into the socket, or a recess that will engage with a projection thereon.

7,715.—A WOOD-SAWING MACHINE: E. Pollard and Pollard & Metcalfe.—A compounded vertical and horizontal movement is given by the mounting of the saw upon a slide which a pivoted lever worked with a cam-groove upon a cam-disc will move vertically so as to feed the saw forwards and backwards. Another cam-groove upon the opposite side of the cam-disc works a swinging frame or lever that hangs from a pin, and to which a slide from the saw-shaft is pivoted, whereby the saw receives a horizontal movement equal to that of the lath or other material which a roller and a flat piece, carried by angle-levers, press against the table. Confer also No. 11,549 of 1898.

7,731.—AN ARTIFICIAL GRANITE: W. F. M. Blöcher.—An admixture is made of suitable coloured crushed marble chips and Portland cement moulded under pressure in a moist state. The block is immersed for some while in water, is allowed to become hard, and may then be rubbed and polished.

7,750.—A CONTRIVANCE FOR ROOFING PURPOSES: W. R. Pryke and W. Palmer.—So that their

front edges may be lifted up, and that at the same time their backs may be kept away from the wall, the eaves-gutters are fashioned with flanges or projections upon their sides.

7,762.—A CHIMNEY-TOP: H. John.—The chimney-top is made up of a short pipe of which the square section at the foot-joint is merged into a round section at the top, and which is fastened on to the brickwork with four interior footplates. The footplates are loosely joined together with angle-pieces having bores with bored holes and teeth; upon each plate is also fashioned a cross-rib for a similar rib in the lining of mortar. The pipe carries a rotatory hood within which is a frictionless collar that fits the thickened base of the pivot-pin of the hood. The steep forms of the hood and its vane are devised for their being easily packed within the pipes, and for their being employed upon chimneys in close proximity with one another. In the case of fallboys an extension of the pipe in which spring ears have been cut is substituted for the footplates.

7,765.—A SIZE: P. Grosfils.—The size is intended for use in the preparation of water-colours or distemper, or in painting wall-papers, and in sizing surfaces, it is composed of common starch that has been dissolved in diluted nitric acid; it will then constitute a liquid glue which, it is stated, will remain for a long time in a liquid condition.

7,766.—AN APPLIANCE FOR USE WITH CAGE-LIFTS: F. F. Caution.—The inventor seeks to furnish means of arresting the cage automatically at the ends of its travel. In those cases a projection from the hydraulic cylinder of the piston-rod will engage with either one of two pivoted Y-shaped levers which are joined crosswise with rods whose lengths can be suitably adjusted. To one of the Y-levers a throttle-valve is joined by means of a rod. The valve can be closed by the action of the projecting lug, which rocks the one Y-lever towards the right, and so turns the other Y-lever in the contrary direction.

7,806.—ADJUSTMENT OF WINDOW SASHES: J. W. Cropper.—The sashes are attached with sliding bolts to sliding stiles upon one side of the frame, and are hinged on to rebated sliding stiles upon the other side of the frame; the bolts are shot back into sockets in the pulley stile, the sliding stiles being thus kept in their places. When one turns the sashes upon their hinges, and for the turning of the upper sash into the room, the lower sash will enter a recess made in the window-head, which has a ventilation space opening into the air outside. Slaps of mica or other material being fitted upon the middle board, which is perforated.

7,815.—APPLIANCES FOR WINDOWS: R. R. Thom and S. McCall.—The lower sash is caused to slide in the frame and turn inwards upon lower pivots, whilst the upper sash is pivoted at the bottom rail within the frame, the sash-cords are secured to the rebated or grooved edges of the lower sash and are thence passed around guide-pulleys or through eyes upon the frame and the upper sash, which can be sustained in any position desired by means of the friction between the cords and the hooks or pulleys. For fastening the sash in a partially-opened position there are sliding bolts within the meeting-rail of the lower sash that will engage with grooves cut in the upper portion of the frame and can be shot into holes in the frame. Provision is made for a removal of the upper sash from the frame by means of pivots upon it, which will slide along transverse grooves in the pulley-stiles and so into vertical grooves cut in the sash.

7,834.—DRAIN-PIPE SOCKETS: R. Stanley and R. H. Smith.—For making the socketed ends of drain-pipes and similar plastic goods, the inventors contrive that the two halves of the socket-die of the pipe-making machine shall exert great pressure upon the material. In one form the two halves of the die (into which are screwed hard-metal tips) are set to slide upon parallel guides; the spaces between their ends are filled with wedges which, together with the die-halves, are operated at one and the same time with crank and link gearing, the pressure being exerted by means of blocks which are joined to a four-sided frame that is worked with a screw mechanism. In another shape the half-dies are caused to slide upon metal guides, and their lugs join them to levers that are worked with a hand-wheel, for which, however, other power may be substituted. At the ends of the shaft are right and left handed threads, and hollow blocks, having their inner surfaces rounded, are mounted upon the shaft.

7,833.—TRAVELLING CRANES: F. W. Tannett-Walker.—A carriage, on rails, having a horizontal pulley and a crab, also on rails, traverses the traveller. A rope from the carriage passes around pulleys to the crab, then around the fall-block, and so to the crab again, and thence to a fixed point upon the traveller, whereby the lifting-hook will be lifted and dropped with the movement of the carriage. For working the carriage apart from the position of the traveller, another rope is passed from the fixed hydraulic cylinders round a pulley upon the traveller and so around pulleys upon the carriage and traveller to a fixed point. In a modified form of the apparatus the ends of cross-shafts have pulleys which run upon rails, and pulleys upon the cross-shafts carry the hauling-ropes for the traveller. Each of the shafts is disposed in the bight of the

CONTRACTS AND PUBLIC APPOINTMENTS.

(For some Contracts, &c., still open, but not included in this List, see previous issues.)

CONTRACTS.

Table with 4 columns: Nature of Work or Materials, By whom Required, Forms of Tender, &c., Supplied by, and Tenders to be delivered. Lists various construction projects and their respective contractors and completion dates.

PUBLIC APPOINTMENTS.

Table with 4 columns: Nature of Appointment, By whom Advertised, Salary, and Application to be in. Lists public service positions such as Assistant Examiner in Patent Office and Clerk of Works.

Table listing prices for Fine Elastic Copal Varnish, Best Elastic Copal Varnish, Best Hard Copal Varnish, and Best Japan Gold Size.

TO CORRESPONDENTS.

Notice to correspondents regarding the responsibility of signed articles, letters, and papers read at meetings.

TENDERS.

Notice regarding tenders for communications for insertion under this heading, including details for Aberdeen and Aston Abbotts.

ASTON ABBOTTS (Bucks).—For the erection of a pair of cottages for Mr. Edward Hart.

AXMINSTER.—Lower Westwater farm buildings, for Mr. J. Dominett.

AXMINSTER.—Middle Westwater residence, for Dr. Dunstan, of London.

AYLESBURY.—For the erection of a detached residence in the Wendover-road, for Mr. J. Kingham.

BRILL.—For additions to the National Schools at Oakley, for the Brill School Managers.

CHEARSLEY (Bucks).—For additions to house at Chearsley, for Mr. F. T. Higgins Bernard.

CROYDON.—Two shop premises at corner of Tamworth-place, Church-street, Croydon.

CROYDON.—Four cottages, Newark-road. Mr. A. Broad, architect, 22, George-street, Croydon.

GREENOCK.—For the extension of the engine-room at electricity station, Hunter-street, for the Police Board.

HARROGATE.—For the erection of a police convalescent home, Messrs. Chorley, Cannon, & Chorley, architects, 15, Park-row, Leeds.

HEREFORD.—For the erection of six cottages at Asylum, Burghill, for the Visitors. Mr. A. Dryland, County Surveyor, Shire Hall, Hereford.

LONDON.—For alterations and additions at No. 22, Great Titchfield-street, W., for Mr. William Matthews.

LONDON.—For alterations at No. 66, Berners-street, W., Messrs. H. Fuller Clark & Percy A. Boulting, architects.

LONDON.—For re-pointing, painting, and general repairs to 101 and 102, Chalton-street, for Messrs. Conroy Bros.

LONDON.—For office fittings, &c., at 10, Cousin-lane, Cannon-street, E.C., for the Ceylon, India, and China Tea Association.

LONDON.—For painting, whitewashing, and repairs, &c., at the workhouse and infirmary, Fulham Palace-road, Hammersmith, W., for the Guardians of the Poor of Fulham Parish.

LONDON.—For alterations and additions to the workhouse, Fulham Palace-road, Hammersmith, W., for the Guardians of the Poor of Fulham parish.

LONDON.—For the erection of cottage homes for the aged poor, at Tooting Home, Church-lane, Tooting, for Wandsworth and Clapham Guardians.

NEWTON ABBOT.—For the erection and completion of isolation hospital for the joint committee, Mr. Wm. Rowell, architect, Newton Abbot.

NORTON (Yorkshire).—For the erection of semi-detached villas, Langton-road, for Mr. T. Lofthouse.

NORTON (Yorkshire).—For the erection of a detached house, St. Peter's-street and Langton-road. Mr. H. Ascoug Chapman, architect, Leeds and Scarborough.

ORPINGTON (Kent).—For additions and alterations to a private residence at Orpington, Mr. St. Pierre Harris, architect, 8, Ironmonger-lane, E.C., and Orpington.

[See also next page.]

### The "Colonne Soriano," St. Mark's, Venice.

LOSE against the southern flank of St. Mark's church, just where the great fifteenth century gateway of the Ducal Palace leads to the "Giant's Staircase," within the courtyard stand two singular-looking square monolithic piers of hard limestone, each covered on three sides with elaborate oriental carving—carving unlike any to be elsewhere found in Venice—reminding one of Persian tiles or Eastern carpets, and yet with a certain special character of its own which distinguishes it from the genuine Byzantine and Classical fragments of sculpture built up in the walls of the adjoining basilica. These two columns have, in addition to their flowery Eastern carving, two very curious circular panels on each of their outer sides or fronts, filled in with singularly puzzling monograms which have hitherto remained unexplained. The chronicles and old guide books of Venice are almost silent as to their history. Sansorina in his "Citta Nobilissima" (1570), for instance, merely describes them as the Syrian columns brought from Acre by the Crusaders, and having inscriptions in the "Syrian language." All that we can discover about them is that they were transported from Acre to Venice in the middle of the thirteenth century, at the time of the great double victory won by the Venetians over the Genoese in the waters of Tyre and Acre; and we may, perhaps, conclude that their presence on the Piazzetta has some reference to this event, but there is no historical evidence to prove such to have been the case. On the contrary, they may have been brought over merely as ballast to some returning empty galley, in the way in which so many of the artistic treasures robbed from the Levantine sites were procured for the decoration of the Patria. The two columns seem to have been set up in the Piazzetta

with the intention of forming an important arched entrance to the baptistry of the basilica. To the ancient capitals an abacus of ordinary Venetian type of carving was added to receive whatever superstructure may have been originally intended—something, perhaps, resembling the curious elongations of the great west front of the basilica. But whatever was the intention of the builders in the thirteenth century, no trace of any such design now remains, owing to the manner in which the outside of St. Mark's has been rebuilt and restored time after time. The large crosses in flat relief on the lower portions of the columns seem to belong to their thirteenth century adaptation by the Venetians. On the inside of the columns are rebates or grooves for the gates or doors, but no trace of hinges remains. We must, therefore, conclude that such gates or doors were designed to work on pivots at top and bottom in the oriental manner.

The interest attaching to these columns is not so much in their present position, or their adoption by the thirteenth century Venetians as part of the external decorations of St. Mark's, as in their origin and the associations with a little-known type of art which they represent. We know that they were brought over from Acre in the middle of the thirteenth century, but what position they may have occupied in that famous city it is now quite impossible to determine. They are monoliths on so large a scale, that one is tempted to conceive them the decorations of an important city gate, more especially if the interpretations of the monogram inscriptions should prove correct.

Acre, the scene of so many thrilling and important episodes all through the two centuries of the Latin Kingdom's existence, has in modern days shrunk to about one-third of its former extent. In the early Middle Ages it was certainly the most important political and commercial centre of that wonderful borderland between European civilisation and Eastern tyranny, if not barbarism, constituted by the Latin principalities of the Levant, which in modern language would perhaps be dignified by the title of a "buffer-state." Absolutely nothing of any importance remains in

modern Acre of so remote a date as the thirteenth century, and therefore it is perhaps almost useless to speculate upon the original position occupied by these columns at that time. Acre was divided up into "bici" or quarters belonging to the various nations and races constituting its citizens, and it would appear from such mediæval plans of the city as we possess that the Venetian quarter of the city was intimately associated with the port. If the columns of the Piazzetta once formed, as they seem to have done, an ancient gate of Ptolemaic Akka, we may perhaps be allowed to imagine it the port or water-gate of the city, which would afterwards come within the more immediate control of the Venetians. But such a supposition entirely depends upon the interpretation of the monogram inscriptions in the four circular panels on their fronts. The identification of these inscriptions with any known Levantine alphabet is due to one of the professors in the American College at Beirut, who suggests that they are in the Nabatean or earliest Cufic of the period beginning with the Christian Era. This gentleman ingeniously reads inscription No. 1 as a monogram of the name of Acre in its more primitive form of Akka or Aco, by taking the diamond-shaped letter or symbol in the centre of the monogram as the initial vowel, then the K or Arabic Kaf on the right, and the terminal vowel on the left resembling a Greek E reversed to form the complete word. This theory, is not, however, completely conclusive, and demands verification by a specialist in Cufic, who would also perhaps be able to read inscription No. 2.

However these inscriptions may be translated or the alphabets to which they belong may be identified, these two columns represent a type of art in their sculpture which has received but little study, and they are probably the only examples to be found in Europe on so large a scale. The sculpture (see plate in this issue) is precisely that of all the curious monuments which are neither distinctively Roman, Greek, or mediæval, in that long tract of country stretching between the Gulf of Akaba and the Upper Euphrates

The Syrian Columns, Venice.

In other words, they represent "Semitic" art in as far as such a thing can be said to exist. The Holy Land of Palestine, Syria, and the Sinaitic and trans-Jordanic regions have always been occupied to some extent by Semitic nations, although, owing to an inherent nomadic character, the race has often dwindled under the intrusive influence of European colonisation in Roman and mediæval times. The ancient Jews, during their five hundred years' occupation of the country, seem not to have created one solitary surviving monument which can with any certainty be attributed to them; and their congeners, the Arabs of more modern times, cannot be credited with any artistic inventiveness or genius. The Saracenic splendours of Cairo owe their origin to Coptic workmen (see the researches of M. Gayet, the French archaeologist), and the decorative details of Damascus are but a mingling of Persian and Byzantine elements. Between the remote history of the ancient Jews, with their absolute deficiency in artistic expression, and that of the modern Arabs, intervenes an interesting period during which a genuinely Arab race or tribe, the Nabatean, was induced to abandon the nomad life, and under the influence of Romano-Greek civilisation, to develop the remarkable "style" of art of the monuments of Petra. This chapter of history is usually dated from about the third century B.C. until the crushing of this almost independent nationality by the Emperor Trajan in A.D. 105, when its capital Petra was abandoned. The strange and imposing creations of these rock-hewing Semites,

which remind one more of the Renaissance vagaries of Dresden or the Jesuit style of the sixteenth century than of any contemporary Classic work, from which they are nevertheless copied, naturally ceased with the national life; but the style continued to survive to some extent long after, independently of the Byzantine and Persian influences fated to supersede it. The supposed Jewish synagogues of very uncertain date, whose ruins are scattered over central Syria, exhibit sculpture which belongs to this primitive Semitic attempt to erect buildings and monuments of an architectural character in rivalry with the flourishing cities of the Decapolis and the Roman Empire. All through the history of the Semitic world the same peculiarity of development presents itself. The Arab and Jew are incapable of invention, but their copies and adaptations of the arts of Aryan nations are always tinged with a certain special character.

In the case of the Jew, almost all efforts at artistic display betray the taste for what is second-hand, which is simply proverbial of the race. The Arab, actuated by a greater desire for luxury than the Jew, adopts the decorations of civilised life, but applies them in a way which adds to their richness of effect regardless of propriety in application, and sometimes produces a result almost equivalent in originality. In the later days of the Middle Ages the Arabs of the Holy Land and Egypt received a remarkable impetus from the Gothic style of the twelfth and thirteenth centuries imported by the Crusaders. The luxurious homes of the Frankish lords of Kerale, Acca,

or Edessa were designed by their European owners, but the building and furnishing of them seem to have been the work of native hands, and this interpretation of European inventions by the uninventive Asiatic, to meet the demands of a different climate and mode of life and an extravagant luxury, produced the "Saracenic" style of the twelfth to sixteenth centuries. Since that period very little European influence has been brought to bear on the Levant in a way which would give any artistic development, and, as a consequence, the motifs for decoration and architecture left behind by the last Crusaders still survive, and the modern traveller is astonished to see a degenerate pointed arch style adopted as a rule for modern houses and mosques, which frequently look as if they might have been built in the thirteenth instead of the nineteenth century.

In a precisely similar way the Arab and other Semitic races of the Levant carried on the traditions of the Romano-Greek styles, which they had first learnt to copy in the palmy days of Petra, long after the decay of the Roman Empire, and until the great revolution of 1099 introduced a total change of ideas. The monuments of the Holy Land may consequently be divided into two very clearly-defined sections by this date of 1099. After that date everything with any artistic pretensions is in the Gothic style of early mediæval Europe; before that date the traditions of Rome and Greece seem paramount, and the distinctively characteristic Byzantine style of Justinian's reign is exceedingly rare. Of the few Byzantine buildings remaining in the Holy Land, the most important are the substructures and Golden Gate of the Haram enclosure at Jerusalem. The two columns of the Venetian Piazzetta illustrate some of the peculiarities of the "Semitic" style. It will be noticed that the ornament is spread over the surface of the columns in a way peculiar to Saracenic art, without reference to any constructive meaning or appropriateness. The capitals are clearly enough copied from classical types, but instead of the Byzantine adaptation of classical detail, with its constructive meaning in volute and moulding, this more Eastern example is merely a network of ornamental detail and decoration. The ornament is the usual vineleaf pattern, so common in Semitic buildings, rock-cut tombs, and synagogues in the Levant. The vine as a decorative element in architecture is as characteristic of the Holy Land as the acanthus is of Rome or the honeysuckle of ancient Greece. The early Christians seem to have introduced it into Italy and Byzantium with their religion of Semitic origin. Another peculiarly common Eastern feature is the design in the side panels of clumsily-shaped vases holding flowers; in the present case the vases are almost indistinguishable from the floral ornaments. These clumsy attempts to represent one of the simplest objects suited to decoration sufficiently exemplify the helpless incapacity of the Semite to carry on artistic expression beyond the simplest forms of conventional ornament. Mohammed and Moses are both credited with a desire to prevent their disciples from studying the source of all truly progressive and fine art—the representation of living forms; but perhaps their objections to such art study may have arisen partly from a prudent consideration that it is

no use doing anything in art unless you can do it well. Certainly the Semitic races have never displayed any qualifications for the higher branches of art, and the most admired of Saracenic monuments are more remarkable for an infinite multiplicity of minute details—insignificant and uninteresting in themselves—than for any æsthetic quality.

### CAN WE DATE OUR SAXON CHURCHES?—I.

By PROFESSOR BALDWIN BROWN.

 HE question of the distinction between Saxon work as a whole and Norman leads to the further problem of a chronology within the pre-Conquest period. This covers some 450 years, and within it it would be natural to expect considerable architectural changes. It is the purpose of these two papers, supplementary to those which have recently appeared in the *Builder*, to ask the question, What criteria exist for fixing the relative dates of the fairly numerous monuments which fall within the general limits of the period? With regard to some of these there is already practical certainty. For reasons which it would be tedious to discuss, all authorities seem at present agreed in assigning a date in the seventh century to the early foundations below Gundulph's work at Rochester, to Lyminge (the small apsidal church), St. Pancras Canterbury, Reculver, and Brixworth, and the crypts at Ripon and Hexham. Parts of St. Martin, Canterbury, may be even earlier; while, of northern examples, Escomb, Monkwearmouth, and Jarrow would be by most people included in any early list.

On the other side, there are not a few churches that are clearly of a very late date in the period. Kirkdale, Yorks, and Deerhurst Chapel are attested as such by inscriptions, and advanced Romanesque features, such as angle shafts and roll mouldings, in other examples bring them well forward in the eleventh century. In the case, however, of by far the largest number of Anglo-Saxon\* remains there are no generally accepted signs of date, and opinions as to their respective epochs have been little better than guesswork. The ubiquitous Wilfrid has been credited at one time or another with a good proportion of our pre-Conquest churches, and the seventh or eighth century has been made responsible for work like the tower at Monkwearmouth, which probably belongs to the eleventh. Records of church building occur throughout the Anglo-Saxon period. After the first great missionary age was over, we read of events like the rebuilding in the eighth century of the church at York, with its thirty altars, that must, one would think, have given an impetus to church extension all over the North. Subsequent to this came the Danish desolation, but even after the inroads had begun we hear of local activity in church architecture on the part of bishops such as Swithun of Winchester, who died in 862 A.D. The close of the next century witnessed a widely-diffused revival encouraged by King Edgar and carried out under Dunstan, Ethelwold, and Oswald. Canute, at the beginning of the eleventh century, built and rebuilt numerous churches and monasteries, and in

the middle years of it one of the laws ascribed to Edward the Confessor refers to the fact that there were then three or four times as many churches as in the early days, in terms which seem to imply that church building was a feature of the age just prior to the Conquest.

We can obtain a convenient division of the time from the conversion of Ethelbert to the Norman Conquest by making an early period end with the first inroad of the Danes and the ravage of Northumbria, a middle period cover the epoch of the Danish wars, and a late one begin with the reign of Edgar. These three periods would correspond roughly to the years 600-800, 800-950, 950-1066. Are there, we have to ask, any criteria by which we can distinguish the work of these periods; and further, if the "late" buildings, which in the nature of things will be most numerous, can be separated as a whole from the rest, are we able to subdivide these, say, into the Edgar group, the Canute group, and that associated with Edward the Confessor?

The possible criteria are those of general appearance and proportions, of plan and of details. It is obviously useless to argue that a building is of particularly early date because it appears rude and primitive in workmanship or is small in scale. If we did this we should have, conversely, to put elaborate or workmanlike structures, or those of large size, correspondingly late. But Wilfrid's crypts and the porch at Monkwearmouth are well wrought and cunningly enriched, while Brixworth is one of the largest churches of the period that we possess. The value of the criterion of the proportions of ground-plans may be judged from the evidence presented in the *Builder* of October 6, 1900, where it seemed to be indicated that very long and narrow proportions were an early sign, but that fabrics of quite other relative dimensions might be of equally remote a date. Height of walls should not be an early indication, for the peculiarity does not occur in the two classes of structures that may have influenced our early work—that is, in Irish oratories or in the basilican churches of Roman tradition. It may have been due to the desire to get the windows high up out of the way of the prowling spoiler, and this would locate the feature in the time of the Danish inroads or the Middle-Saxon period.

The criterion of plan as distinct from proportions is of more value as an indication of relative dates.

It is noteworthy here that in some of the very earliest structures we find already modifications of the simple Irish or Roman scheme that affect both interior arrangement and external form. Brixworth has a clear rectangular space marked off, possibly for monastic use, between nave and apse, and the early group in Kent show something of the same arrangement. The side chapel and the western porch of entrance appear at St. Pancras, and these seem the beginnings of what is again a specially Anglo-Saxon peculiarity—the gradual development from such elements of the cruciform plan and the western tower. If the transept grows out of the side chapel, we may infer the comparative dates of pseudo-cruciform churches by the stage at which the evolution is shown. Though no argument can be drawn merely from the fact of the presence or absence of a tower—for towers existed in Christian architecture as early as Anglo-

Saxon churches—yet the western tower carries with it, as we shall see, an important chronological indication. Though it may not be possible to ascribe to any of our western towers a really early date, there may be differences of period among them that would be worth investigation. Brixworth and Deerhurst have an early aspect, and the latter has detail that seems the most Carolingian thing in Anglo-Saxon work.

This mention of detail brings us to the last and, in a sense, most important class of our available criteria. As a matter of practice, inferences based on the apparent place of a monument in an assumed scheme of development, though they have their place and value in architectural discussion, are seldom so cogent as the more direct witness of some definite feature or piece of detail, and in what follows attention will be mainly concentrated on evidence of this character.

The buildings above enumerated as by general consent in the first flight in respect to date are distinguished by the absence of certain features which are common in Anglo-Saxon churches generally. We do not find in them long-and-short quoins, double windows with mid-wall shafts, double-splayed lights, pilaster-strips, strip-work surrounding openings, nor, it may be added, internally splayed loops of a tall narrow form. In any discussion of the relative date of these features, there is, of course, a danger of arguing in a ring, and trying to prove X early by the absence from it of Y, and Y late because it does not appear in X. We are fortunately not left in this vicious circle, for several of the features in question appear on the continent in dateable surroundings, and this suggests a *terminus post quem* for their use in our own country.

The part of the continent where most of them are to be found is Germany. Hitherto there has been a tendency in discussions on this subject to turn to Italy for prototypes, but as a fact there is no need to bring Italy into the argument at all. We can find what we want in the way of prototypes much nearer home. The form of Wilfrid's crypts has been connected with that of the *cubicula* of the Roman Catacombs, but the truth is that such barrel-vaulted chambers are common enough in Gaul and Germany, where we find them of various ages, from the early examples, probably of the sixth century, that have been lately excavated in the cemetery of St. Matthias at Trier. The double belfry-openings belong originally to Italy, but Italy gave them to Germany where they are familiar features in a vast number of the Romanesque churches, and it is from German and not Italian sources that our pre-Conquest builders borrowed them. The Anglo-Saxon bell-tower, as a whole, has been claimed as Italian, but though Italy is the land of towers and produced them of most kinds and at all epochs of Christian architecture but the earliest, yet our particular form of tower, the single one joined to the church at the western end, is distinctly not Italian, but German. There are special features connected with Anglo-Saxon western towers, notably their growth in some cases from a western porch, which give them a place apart, but we can hardly dissociate the appearance of the feature in our later pre-Conquest architecture from its prevalence in the neighbouring lands of the lower Rhine and

\* As these papers contain references to the architecture of Saxony under the term "Saxon," the expression "Anglo-Saxon" will be used to denote the examples in our own country.

Fig. 1.—Mid-Wall Shaft and Corbel Cap in the West Front of Trier, Germany. Middle of the Eleventh Century.

Westphalia. It was from there and not from Italy that we were influenced in the large employment we made of the form. German, at any rate, is the half-round stair turret attached to the western tower, though abroad we generally find a pair of such turrets at the two sides of the tower instead of one in the front, as is the case at Brixworth, Brigstock, and our other examples.

Neither in Germany nor, to the writer's knowledge, elsewhere, do we find our elaborately-turned baluster-shafts, our long-and-short quoining, our strip-work round openings, and these must be regarded in the meantime as showing in our old English builders an original treatment of details which matches their special arrangements in planning and distribution. On the other hand, the mid-wall work, the double-splayed windows, and the upright pilaster strips appear in Early German Romanesque in much the same form as among ourselves. The only difference in the first case is that the through-stone, which is commonly with us a flat chamfered slab, is in Germany very often a moulded corbel cap that may either be used alone above its shaft, or may surmount a normal cap, plain or enriched, of the cubical type familiar in our Lincolnshire bell-towers. The small double-splayed lights have at times the central opening cut, like ours, in a mid-wall slab. The likeness between the German *Lisenen* and the Anglo-Saxon pilaster strips is generally acknowledged.

Any one familiar with the details of Anglo-Saxon buildings who explores, say, the west front of the Cathedral at Trier, of the first half of the eleventh century, from which is

taken fig. 1, will be readily convinced that Germany is likely to furnish the most instructive parallels to our native work of the pre-Conquest period. When we reflect on the political and ecclesiastical connexions between the Carolingian realm and England, these affinities in architectural forms will not surprise us. If their existence is admitted, and we can discover when the features in question came into use in Germany, we shall find a valuable aid to the chronology of Anglo-Saxon buildings. To assume such borrowing is not derogatory to our native builders. Whatever we may have accomplished in the earlier period in the seventh century, there is no question that the Minster of Charles the Great at Aachen represents, both in construction and details, an architectural achievement that the England of the ninth and tenth centuries certainly could not match, and the Minster gave an impulse to building in Western Germany that carried the art rapidly forward. In the Carolingian epoch, and in that of the Saxon Emperors which followed it, as in the Gothic period two centuries later, England was receptive rather than herself a centre of architectural influence.

#### NOTES.

The New Government Offices. The admirable article in the *Times* on this subject, noticed in our last issue, has been followed in Tuesday's issue by a communication "From a correspondent," obviously officially inspired, and which may be taken as a characteristic expression of English official obstinacy and Philistinism. It is now

denied that the proposal to have Mr. Brydon's building carried out by the Office of Works originated in any idea of economy far from that, Mr. Akers-Douglas was only actuated by consideration for the comfort of those who would have to occupy the building. Then why did he say nothing about this motive when the question was asked in Parliament, and why did he pointedly assert, on the same occasion, that "a considerable saving would be effected"? The obvious fact is that the argument on account of economy has been discredited, and must therefore be abandoned. Sir John Taylor, we are told, is "an eminent architect," and carried out the front of the Record Office in Chancery-lane, "one of the most beautiful buildings in London." The apologist of the Office of Works could hardly have done worse for its cause than to let out that they consider that piece of cast-iron commonplace beautiful architecture; and in justice to Sir John Taylor—one of the most modest and amiable of men, who has the goodwill of all who know him—we do not believe he has ever claimed to be an eminent architect in the sense in which those words are generally understood. Mr. Tanner, we are told by this official spokesman, is not so well known, but no more was Sir J. Taylor when the Record Office was entrusted to him, yet "The choice is amply justified by the result;" and so we are told it will be with Mr. Tanner, whom unfortunately we know chiefly as the architect (by repute) of the various Post Office buildings. The summary effect of the whole communication is that the Office of Works is a Department as self-satisfied as it is ignorant; that the First Commissioner of Works has got the matter in his hands and means to keep it, apparently from sheer obstinacy and a refusal to give way to the opinions and advice of those who really know what architectural design implies.

LORD WEMYSS, who, in spite of his curious faith that the making of models of buildings would infallibly revive the art of architecture, and who is really to be praised for his perseverance and enthusiasm in the cause, has called attention in trenchant language to an absurdity which we have frequently commented on—that of placing the national public buildings of the country under the charge of an official who is appointed solely for political reasons. It is perhaps rather hard on the present First Commissioner of Works to make a scapegoat of him; for although, as Lord Wemyss says, he was never heard of as an architectural authority before his appointment to his present office, this criticism would apply equally to most of his predecessors, and he has at all events shown more disposition to take competent advice on the subject than some of them, and not done the active mischief which has been brought about by other First Commissioners who were as ignorant but more self-confident. It is the system itself that is absurd. Lord Wemyss intends, on the re-assembling of Parliament, to move for the appointment of a permanent Royal Commission to whom all designs for public buildings, monuments, or "plans for the mutilation of our parks," should be submitted and, if approved, be exhibited in model for public criticism before they are carried out. Whether either the models or the public criticism will help the cause much

may be a question; but it is quite certain, at all events, that architecture has nothing to do with politics, and that questions of public architecture ought to be settled by a permanent tribunal or department of persons appointed for their knowledge of the subject, and not by officials appointed only on political grounds, and to be superseded at every change of Government.

ONE of the practical objections to regularity in large schemes of street architecture is very much in evidence at this time of year. Take, for instance, the work of the Adam Brothers in the Adelphi, or Regent-street, and the houses round Regent's Park, the work of John Nash, or any of the great formal blocks of street houses in the Bayswater-road. The landlord or lessee of every alternate house or so is having the exterior of his own particular frontage painted in the colour of his fancy; from the coping to the iron railings in the basement every feature is divided in fair proportions by the conscientious house decorator; thus reducing formal street architecture to an absurdity. Many of these streets are built in stone, but paint is used all the same as the best means of preserving it from the impurities of the atmosphere. The Quadrant of Regent-street was a striking architectural conception, and the sweeping horizontal lines produce a fine effect even since the basis of the design was swept away. There is no doubt that the arbitrary restrictions imposed upon street architecture allow small chance for any great improvement on the existing state of things. When there is no recognised local building material the chance of harmonious treatment of the streets is very remote. Individual liberty and enterprise is too much respected to suffer such restrictions as the Parisians experienced under Napoleon III. and his Prefect, Baron Haussmann. Under that autocrat Paris gained a certain dignity and completeness that few other cities can boast of; at the loss, it is true, of much that was historically important. Such as is the London Building Act, clauses of which cripple legitimate opportunities in design, in our opinion the Act should recognise the shifting character of a town population and make such provisions as would protect existing formal street architecture from the incongruities which render it absurd, and are a cause of discouragement to new schemes of centralisation and improvement such as are needed in these days when the population of cities increases so rapidly.

THE streets of London are never free from the excavations and repairs that follow so quickly upon each other, but during August and September most of the principal thoroughfares are given over to the Authorities. Whitehall, the Strand, Piccadilly, the Marylebone-road, and the High-street, Kensington, are only some of the roads that are "up" and more or less impassable. Roads built of whatever material wear out, and need to be relaid, and no time is better suited for doing this than during August and September; but what we hope some day to see is a system in doing these renovations. "The Authorities," whoever they are—and it is very hard to ascertain—are content with the patchwork system of 100 yards of

wood block paving here, and 200 yards of asphalt there, and setting the steam-roller to work over the way, with the result that such a thoroughfare as that from the Bank to the Uxbridge-road consists of samples of every kind of road-making. There ought to be one responsible head to introduce an intelligible system carried out with as little inconvenience to the public as is compatible with large schemes. We remember during the Architectural Congress last year more than one speaker calling attention to the historic use of the river as a thoroughfare. Some day it will be recognised that the river can bear a more considerable part in passenger traffic than it now does. If there were a well-organised, speedy, and comfortable service of electric boats, it would be a matter of pleasure as well as of health to use the river instead of the "Tube" or the "Underground."

THE annual Report of the Labour Department of the Board of Trade for the year 1900, which has just been published, is of more than usual interest; for it chronicles the fact that "the year 1900 was the culminating point of the upward movement of wages which began in 1896," and that the general level of wages stood higher at the end of 1900 than in any other year for which statistics exist. In other words, in the last year of the nineteenth century the artisan was in a more flourishing condition than at any other time in the history of this country. But the same Report also states the fact that from the end of 1900 wages began to decrease, and this downward movement is certain, there can be little doubt, to continue for some time to come. As regards the hours of labour, it is interesting to note that one of the most important changes was that in the cabinet trade, there being a reduction of two and a half hours per week, affecting 8,000 cabinet-makers in London. In the building trades there were 9,111 people affected, and a reduction of 8,016 hours for a full week, which represented an average reduction in hours per week of 0.88. Thus, together with an increase in wages, there was a reduction in the hours of labour, all tending to show how much the condition of the working classes has been improved in the century which is now at an end. We wish we could say that the wages had increased and the hours of labour decreased among indoor workers such as clerks and others.

THE Committee which was appointed by the London Chamber of Commerce to consider what modifications were desirable in the Board of Trade Rules regarding high-pressure electrical mains have now sent a series of suggestions for altering existing rules to the Board of Trade. The Committee is thoroughly representative of commercial electrical engineering, and so it is naturally anxious that the industry should be hampered by as few restrictions as possible. In the first place, it is suggested that pressures up to 20,000 volts at least should be sanctioned, and they make a strong plea for the use of overhead wires for the transmission of energy, pointing out that overhead work at very high pressures has been in use in America and the Continent for the last ten years, and that great industries have sprung up in consequence

which have no counterpart in this country. They also say that they are "strongly of opinion that permission to use overhead wires outside crowded city areas is vital to the commercial success of power schemes over large districts." We were rather surprised to read this, seeing that many members of the Committee are directors of "power schemes over large districts" which have recently begun working. It seems to us rather rash to start large commercial undertakings which can only be successful if the present Board of Trade Rules are altered. We are well aware that power is being distributed in America at voltages above 20,000, but we doubt whether any of these undertakings is really successful, and whether their engineers have guarded against all contingencies. For example, the use of aluminium wires has been attended with indifferent results, their frequent breakages making the service very uncertain. The raising of the pressure of supply of the Niagara Falls Company this year from 11,000 to 22,000 volts has been attended with several untoward incidents. The first thunderstorm earthed the line, and so the traction and lighting systems of Buffalo, where the Pan-American Exhibition was being held, were shut down for nearly an hour. Again, the engineers calculated that a break of 4 ft. 6 in. would be sufficient for the high-tension switches, and so they were all made with this sized break. The break, however, is found insufficient, as the switches arc across, the flames sometimes rising to the ceiling. They are now all being replaced with switches having a 6-ft. break. Further West the engineers frankly confess their inability to guard against all contingencies, and so the transformers are mounted on four-wheeled trucks, which can be run out into the open air the moment they catch fire. Some modifications of our Board of Trade Rules are desirable, but we think that this Committee is asking too much.

IN our "Note" of last week (page 188, ante) we adverted to the removal, now in progress, of the modern stained glass from the great rose window in the south transept of Westminster Abbey. We may here mention that the stonework of the window was renewed in 1814 by Thomas Gayfer, the younger, as master mason to the Abbey Church, under the directions of Benjamin Dean Wyatt, who in the previous year had succeeded his father, James Wyatt, as surveyor to the Abbey. In 1847 Thomas Ward and J. H. Nixon inserted the brilliantly-coloured "marigold glass." As the scheme stands at present the three two-light windows and the six lancets beneath will be filled with figures of Fathers of the church, together with coats-of-arms in the cinquefoils, and (in the lancets) of SS. Alban, David, Patrick, Ninian, Aidan, and Augustine of Canterbury, and also with certain historical and local heraldical devices.

WE gather that this notable house is threatened with destruction, in order to provide for a widening of the Corso, for the completion of the monument in memory of King Victor Emmanuel II. The house, which was distinguished with a commemorative tablet about forty years ago, was occupied by Michelangelo during the last twenty years of

Formal Street Architecture.

Michelangelo's House in Rome.

his life, when, declining the invitations of Duke Cosmo to return to Florence, he preferred to abide in Rome that he might continue the building of St. Peter's, to which he was appointed architect in 1547, and his work in the Vatican Palace. During the interval we mention he completed, in 1550, the monument of Pope Julius II., designed the model (1558) for the dome of St. Peter's, and composed his sonnets in honour of Vittoria Colonna.

WE hear that the freehold site of Stratheden House, Knights-bridge, latterly the residence of Mr. Mitchell Henry, has been lately purchased for about 85,000*l.* The house, which has been recently demolished, was occupied by Lord Campbell, who there wrote his "Lives of the Lord Chancellors of England," and "Lives of the Chief Justices." He died there, suddenly, in 1861. The ground covers an area of about 4,400 square yards, having a frontage of 128 ft. 6 in. to the main Kensington-road, with a return frontage of 306 ft. 6 in. to Rutland-gardens. In March, 1899, had been accepted the designs of Mr. W. I. Chambers for a block of residential flats, each consisting of fourteen large rooms, with balconies, and having a spacious entrance hall, which it was proposed to build on the site; but the property was withdrawn from sale at auction in June last year after a bid of 89,000*l.*

The Latest  
Competition  
Dodge.

AN advertisement recently appeared in our columns to the effect that young architects who were experienced in street architecture were invited to enter into a competition, the conditions of which could be ascertained from the advertiser. The real object of the advertisement is disclosed in the following reply, lithographed copies of which have been sent to us by several indignant "young architects" who had answered the advertisement. We omit name and address—

"DEAR SIR,—In reply to yours, a competition is advertised by the Corporation, limited to architects practising in this town.

It is our intention of joining (sic) in the competition, but pressure of work prevents us from dealing with the matter as we should like; therefore we are inviting young architects or others, who have had experience in street buildings, to send in plans, the successful competitor to be appointed joint architect with us.

If you care to enter into this competition we will forward you full particulars, with block plan, on receipt of 1*l.* rs., which will be returned on receipt of bona-fide plans."

We can hardly imagine a more impertinent and insulting proposal to make to architects of ability than to invite them to sell their talents to a man who is evidently conscious that he would have no chance in the competition himself, but who is to pose as a "local architect" by sending in their designs from his office. We must regret that such an advertisement should have found its way into our columns, but there was, of course, nothing on the face of it to indicate its real nature and object.

**BATHS AT OLDHAM.**—The new baths which have been erected by the Oldham Corporation at Robin Hill, off Rochdale-road, were opened on the 20th ult. The total cost is a little under 10,000*l.* The baths include thirty-six private or slipper baths, with separate entrances and corridors for females and males, and a swimming bath, 75 ft. long by 27 ft. wide, 6 ft. 6 in. in depth, sloping to 3 ft. 6 in. at the other end. The work has been carried out by Mr. Emanuel Whittaker, of Oldham, from the designs of Mr. C. T. Taylor, of Oldham.

#### LETTER FROM PARIS.

THE competition for the Grand Prix de Rome in Architecture, for which the subject was "An American Academy of Arts and Science at Paris to be constructed on a portion of the ground left vacant by the demolished fortifications," was decided as follows—The Grand Prix de Rome was awarded to M. Hulot, pupil of M. Marcel Lambert; the 1st Second Prix to M. Prevot, pupil of MM. Guadet and Paulin; and a mention to M. Barrias, pupil of M. Pascal, in the place of the 2nd Second Prix, which the jury decided not to award this year.

The historical Château of Saint-Germain is now being restored so completely and in such a manner that those who know the château will hardly recognise the building when the work is terminated. Under the pretext of restoring and completing the whole building in the style of Francis I., all the portion constructed since that epoch, principally by Mansart, has been demolished and the old foundations filled in; a new tower in exact counterpart to those existing on the façade facing the Seine will take the place of the old portion, thus entirely changing the aspect of the château on the façade facing the square.

As already mentioned in our columns, the art director of the Manufacture Nationale de Sèvres has in hand ready for execution the designs and details for the porcelain tower which is to be erected on the plateau of Saint Cloud. The tower will be 150 ft. in height and will consist of a polygonal base which will be decorated on each face by the work of one or another of the best known Parisian sculptors, supporting a circular tower decorated with elegant columns, the whole to be constructed of ceramic ware with an outer covering of porcelain. An iron staircase in the interior will lead to the summit of the tower, crowned by a shapely dome surmounted by a decorative finial and surrounded by figures of animals. The whole of the work will be executed by the manufactory of Sèvres: the general tone will be mother-of-pearl, heightened here and there by glints of topaz, turquoise, and coral.

A small proportion only of the exhibitors at the 1900 Exhibition have received the medals awarded to them, medals engraved by M. Châlain, and of which there are about 60,000. As each medal will have to pass through the Mint a second time to receive the name, &c., of the exhibitor, and as only about one-tenth of the medals have been struck up to this time, exhibitors must have patience for some months to come.

The Institut has awarded the Prix Léon Faucher, of the value of 120*l.*, to M. Flour de Saint-Genis, late Conservateur des Hypothèques, for his work entitled "The Present Situation and the Future Outlook of Large and Small Landed and Other Property in France." The Académie des Beaux-Arts has awarded the Prix Bailly, value 60*l.*, destined to recompense the architect of an important and interesting work, to M. Malgras Delmas, architect, of Saint-Quentin, for his Palais de Fervaques in that town. The Prix Bordin, value 120*l.*, for which the subject of competition was "Characterise the talents of the French painters who helped to make illustrious the first half of the nineteenth century," is awarded to M. Eugène Guillon, Paris.

The work of enlarging the Palais de la Bourse at Paris is now well in hand under the direction of M. Cavet, Architect to the city of Paris.

A sum of 4,000*l.* has been voted for the continuation of the restoration of the church of St. Eustache, near the Halles at Paris.

The Minister of Public Instruction and of Fine Arts has just appointed M. Emile Bertone, late Prix de Rome, on an archaeological mission in Greece and Turkey.

A new museum, destined to contain exhibits of the best of the various works sent in by the students of the Ecole des Beaux-Arts for the school competitions and the Prix de Rome, is being prepared by M. Louis Bernier, architect, in the premises of the old and once well-known official studio André of the Ecole, vacant since 1892.

It is proposed to construct a new bridge over the Seine between the Pont des Arts and the Pont Neuf, almost in front of the Louvre, where the prolongation of the Rue de Rennes will join the river.

The Municipal Council has granted the credits necessary for the isolation and restoration of the old Collège de Médecine, called the Hôtel Colbert, an interesting building com-

posed of two portions of very pure work of the fifteenth and eighteenth centuries. The owner of the old Hôtel des Evêques de Sens has offered to pass over the building to the Municipality for the sum of 60,000*l.*; it is to be hoped that this offer will be accepted, for it will save from destruction the most curious and interesting specimen of mediæval architecture existing at Paris, next to that of the Hôtel de Clugny.

The question of the Cirque des Champs Elysées is at last decided, and a contract has been signed with M. Leoncavallo by which the Municipality hands over the ground to this gentleman for the purpose of constructing thereon an international theatre of opera.

It has been decided that the ventilation of the tunnels of the new Metropolitan Railway leaves much to be desired, and the question of ventilation by means of openings through the vaulting into the streets, and the covering and decoration of these openings, is much discussed.

The work of arranging and decorating various new rooms at the Louvre Museum is constantly in hand. One of the latest rooms, now nearly completed, is that close to the last of the rooms for the exhibition of engravings and drawings. This room is destined to receive the magnificent and valuable collection of ecclesiastical gold and silversmiths' work of the middle ages, given to the museum by the late Baron Adolphe de Rothschild, and valued at several millions of francs. The donor added to his gift the sum of 10,000*l.* for the purpose of preparing a room worthy of the collection, and a portion of this money has been spent on a magnificent ceiling in Venetian style and some very rich wainscoting for the walls of this small room.

The fourth exhibition of decorative panels, sketches, studies and water colours executed by the artists of the Manufacture Nationale des Gobelins, is now being held at the manufactory. Several tapestries by M. Emile Maloïsel, "The Herd," "The Shepherd," and "Morning Mist," are worthy of attention amongst the exhibits. A portrait by M. Lallemand, and several original etchings on holland by M. Damazy, are much admired.

The celebrated laurel-crowned bust of Victor Hugo, one of the finest of the works of David d'Angers, has just been presented to the Institut de France by the family of the poet. This bust was executed by David d'Angers in 1842, after reading the "Rhine" of Victor Hugo and as a token of his great admiration for the poet. The original clay model of this bust may be seen amongst the works of David at the museum at Angers; a plaster cast was given by David himself to his friend Victor Pavie, and still exists; the third and last repetition of the work is that in bronze to be seen in the museum at Besançon, the birth-place of Victor Hugo.

The memory of the celebrated artist workman, André Charles Boullé, who was born at Paris in 1642, and whose personal talent in the work of enriched furniture, bronze, copper, ivory, and other materials has made his name famous, will be perpetuated by a monument to be erected in the Faubourg Saint-Antoine, the centre of the furniture workshops at Paris. The design has been entrusted to a young sculptor, M. Edouard Jacques, and the work will represent a workman in his ordinary working clothes, his tools placed on the ground near him, in the act of raising a young boy who is lifting his cap in respect towards the bust of Boullé. Louis XIV., who was a great admirer of Boullé, gave him a special mark of his favour in allowing him to take up his quarters in the buildings of the Louvre as cabinet-maker, architect, and engraver of the Royal seals to the King.

The monument to the celebrated landscape painter, Louis François, was inaugurated on August 18 at Plombières-les-Bains. The work is due to M. E. Peynot, sculptor, and MM. Godefroy and Carvat, architects. A well-designed and lofty pedestal, placed in the centre of a hemicycle of Vosges granite, carries the bust of François; on the front of the pedestal is a draped figure of a young woman holding a branch of oak towards the master; at her feet a figure representing the rustic Muse, decorated with garlands of wild roses, plays the pipe of Pan.

The work of partially restoring and rearranging the Palais of the Luxembourg is rapidly going on under the care of the architect, M. Scellier de Gisors. A large scaffolding at present masks the Pavillon de l'Horloge on

the chief façade of the building, for the purpose of placing in position the four ancient allegorical statues modelled by Pradier, but which, being executed in soft stone, did not withstand the ravages of the weather, and have now been sculptured anew in hard stone by M. Crauk.

A fine piece of work for an epergne or table ornament has just been completed at the manufactory of Sèvres by M. Raoul Larche, and consists of a central piece entitled "The Year," represented by the figure of a young woman clothed in long drapery, held up and surrounded by a number of figures of children, representing the "Days." The four angles of the piece consist of figures representing the "Seasons" and "Months." Another piece of work now being completed at Sèvres is the set of panels for the decoration of the refreshment-room of the Palais Bourbon. The panels are formed of about fifty squares, and are entitled the Four Seasons; Spring and Summer being designed by M. Alfred Boucher, Winter and Autumn by M. Constant Roux.

#### AUCH.

We imagine that there must be few interiors more simply beautiful, and that convey a more lasting impression of delight to the mind, than does the cathedral at Auch, which, in contrast with the hurry and bustle of the streets outside, seems to breathe nothing but a calm peace; but as these lines are written for the benefit and encouragement of the student, we must, instead of indulging in rhapsodies, confine our efforts to a description of the main points most likely to interest and instruct him. These are (a) the severe and simple treatment of what, as a rule, has the fault of *abandon* and ultra-elaboration—his Late Flamboyant work; (b) the gorgeous colouring and quaint mannerisms of its late painted glass; and (c) the wonderful beauty and excellence of its plan, as well as the splendour and variety of detail of every part of its stalls and subella, second only, if at all, to those of Amiens and Ulm, but equal to either in completeness of scheme and entire freedom from mutilation—an unusual condition, which must be taken to heart. Easily reached by railway from Toulouse, and commanding lovely views of the Pyrenees, it is a city of amply sufficient attraction to the general tourist, but to the antiquary and the art-lover it should approve itself as a far more attractive and delightful hunting ground than, thus far, it seems to have become. The great Revolution has undoubtedly left sad marks behind, yet one must take comfort to find so little damage done during that unhappy epoch. A singular lesson of the ways of the later masons may be learned on the south side of the cathedral, where, as at the west front of Rouen, work built up for the carver to work out his imagination upon still remains *en bloc*. The old escutcheons of dead and gone families have been ruthlessly torn from their moorings, and history suffers in consequence, but the building is rather a gainer, from the fact that their places have been filled up with plaques of beautiful specimens of Pyrenean marbles.

Auch is the principal town in the Department of Gers, having some 14,000 inhabitants, and there are many old houses of interest still remaining in its streets to the north of the cathedral, which, with the city, is placed on a high platform sloping away to the west, and from which long flights of steps lead to the sandy plain below to the east of the building. The great Antoine Mègret, Baron d'Etigny, who died all too young, and whose works abound at Bagnères de Luchon and other places in the adjoining country, as a great promoter of tree-culture, laid out the Cours d'Etigny here, from which, in clear weather, there is a fine view of a considerable part of the Pyrenean range. There is a poor statue here raised to his memory, very inferior as a portrait, and still more so as a work of art, to that at Luchon. As the capital of the Auzoi, and in later times of the Comté d'Armagnac, the city has much historical interest, and, commercially, by the brandy of Armagnac (preferred by many to that of Cognac), which is produced hereabouts and forms a great article of trade. The place may also be visited well from Pau, eighty-nine miles off by rail, but the route via Toulouse is much shorter, and to the student of old glass is instructive as forming a good example by way of com-

parison, both places abounding in good work. This railway passes through Gimont-Cahuzac, probably the cradle of an old Gascon family, now to be found in England—Cusac or Cahuzac (?), the affix "ac" being very common hereabouts. There is not much to attract on the journey, to which the slowly-flowing, muddy, and shallow stream of the Gers contributes little or nothing, so that, when reached, the charm of the place is all the more refreshing. "La métropole de la troisième Aquitaine fut invariablement soumise à Saint Pierre de Rome." It is the seat of an archbishopric, no less than eleven of the occupants of which have received the honours of the Cardinalate, and of whom the 88th, François Guillaume, Cardinal de Clermont-Lodève, invited Arnaud de Moles to undertake the eighteen large windows in the Chevet. Dominique de Vic, the 66th, supplied the three rose windows at north, south, and west; the 97th, Henri II. de Lamothé-Houdancourt, built the western towers; and the 90th, Augustin de Maupeou, founded the Hospital of Auch. The classic west front, with two towers of the Corinthian Order and a large western porch or narthex, has a peculiarly Italian air about it. There is a charming sense of spaciousness about the interior, the arches of which have no capitals to receive their mouldings, but these, bolder than usual in similar work, pay out gracefully upon the filleted drums of the piers. The bases are elaborate, somewhat high from the floor-line, and with interesting interpenetrations. The triforia, three-centred in form, with plain, straight mullions and no traceries, have elegant open screens for protecting their gangways, with carved fronts of apparently somewhat later date. The vaulting is quadripartite, with circular bosses, and was finally completed in the time of Louis XIII., the western towers forty-five years later. The tracery to the windows is peculiar, very free in line, and in general composition most graceful, recalling some of those at Notre Dame de Brou, at Bourg, but evidently the work of an original genius who scorned to be a copyist.

The crypts and tombs are well worthy of careful study. The bells are hung in the north, but the *bourdon* only in the south tower. The stained glass, 1507-13, is the work of a Saxon artist, one Arnaud de Moles, and there are several windows of this unique series reproduced in Mr. Westlake's admirable book on the subject, but no publication can give the wonder of its colour effect. He says:—"A tradition that his eyes were put out that he might not repeat his glorious work elsewhere is, fortunately, without any historical evidence or probability, for, as we have seen, there are works of his elsewhere in the neighbourhood, viz., at Fleurance and at the Abbey of Simorre." These windows occur in the eastern chapels, of which are the following:—Du Purgatoire, de Saint-Cœur de Marie, de Notre Dame de Pitié, de Saint-Anne, de Sainte-Catherine, du Saint-Sacrament, de Saint-Louis, de la Compassion, de l'Ascension, de Notre Dame d'Auch, which before 1860 had been dedicated to the Holy Spirit. The subjects, very rich in colour and varied in composition, include apostles, prophets, bishops, sibyls, &c., and abound in grisaille work, arabesques, heraldries, legends, &c. There is a quaint humour about the whole work which, compared with that of the same date in the country, is very naive and refreshing.

The stalls, 113 in number (1520-46), constructed throughout in the "kindest" of oak, and elaborately detailed in every part, represent, by large single figures taken from Jewish, Christian, and Pagan sources, a wide field of history. There are no less than fifty life-size figures, to say nothing of subsidiary subjects. The whole work has been marvellously preserved by constant rubbing, apparently with oil, and their present appearance is well and truthfully described by Viollet-le-Duc as having all the effect of being wrought in *cornelian*, so delicate and transparent do they appear. The gangways are wisely placed so as to flank the arch-piers. There is a lofty screen to west of the stalls, with choir, organ, and rood over it, the stalls forming a part of it below. The design of this organ is in harmony with the screen itself, and there is yet another large and very fine organ at the west end of nave, evidently of the same age as the western towers. Much of the rood is apparently modern, but in good taste, with six large angels holding trumpets below it. One very

excellent point in the arrangement of the stalls is brought out by the agreeable break, octagonal on plan, round the piers, which prevents, in a natural way, the long straight line usually found in canopies over stalls; every portion of which here has received a full measure of attention and care, both as regards utility and beauty. The pose and the draperies of the figure sculpture, the treatment of traceries, pinnacles, crockets, finials, and grotesques, misericordes and elbows, can hardly be surpassed. They are certainly the best preserved stalls in France; that of the Archbishop is on the south side of the screen doors. To sum up the whole, the one word *thoughtfulness* seems to do so exactly, and neither the whole nor the parts seem to escape it.

The first bishop of Auch was Citére (A.D. 313); the first archbishop and fifty-fourth bishop was Bernard (A.D. 946). Four times demolished and renewed, the church was refounded in 1486 (*temp.* Charles VIII.), and finally completed (*temp.* Louis XIV.) save for a few modern details comparatively unimportant.

The height of the interior is 87 ft. English, and the length of the interior 102 m. 86, inclusive of the west porch, and the width 34 m. 95. There are twenty-one chapels—ten of them to the west of the crossing, and eleven at the chevet. The nave has five bays and the choir four bays, the whole terminating in a five-sided apse; the easternmost bays of the choir are much narrower than the three bays to the west of it. The building was consecrated February 12, 1548, under the name of "Nativity of the B.V.M."

There are no sham flowers, trumpery fittings, or tawdry images here to disturb the beauty of the delightfully delicate brown stone of which it is built. Truly a rare condition of things. In conclusion, let me advise the student to choose a cool month for visiting this interesting old city, or even to repeat my own experience of July heat and a plague of flies rather than omit to see it altogether.

E. SWINNFEN HARRIS, F.R.I.B.A.

#### THE ARCHITECTURAL ASSOCIATION.

In the printed curricula of the Architectural Association for 1901-1902 some further particulars are given of the arrangements made for the starting of the new day classes. The fee for the full course is 12 guineas per term, or 35 guineas per annum; or, for the lectures only, 2 guineas per term, or 5 guineas per annum, for either the history or construction course. After payment of the fees for the first year's course, students will be eligible for election as ordinary members of the Architectural Association without payment of the usual entrance fee of 2 guineas, and as ordinary members they would be eligible to compete for the prizes and studentships.

The following subjects are included in the curriculum:—*First year's course.*—*The studio:* The use of instruments and scales. Free-hand drawing. Elementary perspective. Orders of Classic architecture. Elements of the various styles of architecture. Principles of mechanics. Elementary construction. Sketching and measuring details and portions of existing buildings. History of architecture, thirty-six lectures (illustrated by visits to buildings and museums.) Elementary construction and materials, thirty-six lectures (illustrated by visits to workshops and buildings in progress).

Work in the studio will be carried on daily, varied by visits to buildings, galleries, and works in progress as will be arranged from time to time. The lectures will be delivered by the master on two afternoons in the week. There will be seventy-two lectures, thirty-six on the history of architecture and thirty-six on elementary construction and materials. Twelve on each subject in the term.

The general idea of the lectures on the history of architecture is as follows:—

*1st term.* Early history of architecture in Egypt, Greece, and Italy.

*2nd term.* Continuation of the subject, with development of Byzantine from Roman work to Romanesque and the commencement of Gothic.

*3rd term.* Outline of mediæval and Renaissance architecture, with a sketch of the subsequent history of the art up to the present time.

The scheme of the lectures on elementary construction and materials is as follows:—

*1st term.* Elementary course on foundations, brickwork, and masonry.

2nd term. Outline of timber and metal construction.

3rd term. Some account of roof coverings, plumbing, plastering, joinery, and finishing.

Every student will be expected to take up a course of reading under the direction of the master, and will be required to refer to works on each subject concurrently with the lectures on the same, and for this purpose the studio library will be available. The master will direct students as to their vacation studies, and a due proportion of outdoor work will be expected of all during the summer. The character of the instruction will be of a strictly preparatory nature, adapted to pupils proposing to be articled and enter the office of an architect. The aim of the master will be to direct the student's studies towards the knowledge of all that is accepted as the best in ancient and modern architecture.

Second year's course.—Continuation of the subjects forming the first year's course. Advanced perspective and sciography. Descriptive and applied geometry and graphic statics. Principles of architectural design.

In reference to the evening school, the work will be carried on by practically the same lecturers and instructors who assisted last year.

As to the general meetings of the Association, the opening address by the President, Mr. W. H. Seth-Smith, and the distribution of prizes will take place on the 11th prox., and the conversation will be held at the Royal Institute of Painters in Water Colours, Ficcaddilly, on the 25th prox. The following is the programme for the succeeding meetings:—

November 1, Mr. A. Wood, M.A., F.S.A., on "Cambridge in Early and Mediaeval Times;" November 15, Mr. Max Clarke on "The Sanitation of a Country House;" November 29, Mr. Francis Bond, M.A., on "Capitals;" December 13, Mr. J. E. Forbes on "Travelling Students' Notes;" January 3, Mr. J. A. Gotch on "The Development of Domestic Architecture from the Twelfth to the Eighteenth Century;" January 17, Mr. T. C. Cunningham on "Architectural and Constructional Engineering;" January 30, Mr. C. Harrison Townsend on "Originality in Architectural Design;" February 14, Miss Ethel Charles on "A Plea for Women Practising Architecture;" March 7, Mr. J. Miller on "The Glasgow Exhibition;" March 21, Mr. W. H. Lever on "The Dwellings Erected at Port Sunlight and Thornton Hough;" April 11, Mr. W. D. Caröe on "The Preservation of Ancient Buildings;" April 25, Mr. E. A. Gruning on "Arbitrations;" and May 9, papers by Mr. Owen Fleming on "Artisans' Dwellings from the Municipal Point of View" and Mr. Louis Ambler on "Artisans' Dwellings from the Private Point of View."

#### THE SANITARY INSPECTORS' ASSOCIATION.

##### AUTUMN CONFERENCE AND MEETING.

The proceedings in connexion with the autumn meeting and conference of the Sanitary Inspectors' Association opened on Thursday last week at Carpenters' Hall, E.C. At a general meeting, Archdeacon Sinclair was elected an honorary member.

Sir Hugh Gilzean Reid, the President of the Association, occupied the chair at the Conference which followed. In his opening remarks he expressed satisfaction that the objects of the Association, to raise the standard of efficiency of its members and to afford all reasonable protection to their interests, had been justified. He referred particularly to the value of the Bill drafted for securing to Medical Officers of Health and Sanitary Inspectors full security in their respective positions and adequate retiring allowances. When this measure passed—as he was sure it would—stability to their occupation would be assured. He also regarded the proposal to appoint a Minister of Health as an excellent one, and, although we were rather slow in moving in this country, he did not think much delay would occur before such a reform as this were introduced.

Sir Alexander Binnie, C.E., Chief Engineer to the London County Council, followed with a description of the London main drainage system. He remarked that some idea of the difficulty of draining London may be gathered from the fact that out of 121 square miles within the county at least 10 per cent., or 12 square miles, are situated below the high-water level of the Thames. Having described the features and course taken by the main

sewers, and pointed out that up to 1888 the sewage of the metropolis was discharged into the Thames at Barking and Crossness, Sir Alexander mentioned that it was on the advice of his predecessor in office, Sir Joseph Bazalgette, that a series of precipitation works at the two outfalls were commenced. The principle adopted in these works is, he continued, "that of a chemical precipitation, four to five grains of lime and one grain of sulphate of iron per gallon being added to the crude sewage. It is then admitted into precipitation channels, from which the effluent water passes into the river. The sludge so deposited, after a further period of sedimentation, is pumped into ships and deposited in the sea twenty miles below the Nore. These works as originally designed were estimated to deal with 150 million gallons of crude sewage a day and 3,000 tons of sludge per day. The total quantity of sewage now dealt with is about 132 million gallons a day at Barking and 98 million gallons a day at Crossness, a total of over 230 million gallons. The quantity of sludge sent to sea is over two million tons per annum, containing a little less than 10 per cent. of solid matter. There are six ships of 1,800 tons gross and 1,000 tons net capacity engaged in this work, and in the year 1900 their aggregate number of voyages totalled a distance of 236,000 miles. The capital cost of works of precipitation only, including ships, was 1,079,000l., and the annual cost of working is about 101,000l.

The river, which previous to 1890 was exceedingly foul in the neighbourhood of the outfalls, with large masses of black floating matter, is now comparatively free from all noticeable pollution. Within the last twenty years, however, principally owing to the valuable series of experiments carried out at Massachusetts, in the United States, we have been brought face to face with the fact that the elimination of dead effete matter is largely, if not entirely, due to the action of various microbe organisms. These organisms, acting for a longer or shorter period, appear to be able to reduce dead organic matter into an inert and harmless condition. I have studied the question very carefully for the past eleven or twelve years, and the conclusions at which I have arrived may be briefly summed up as follows:—That, as far as possible, all solid and floating matter should be removed from the sewage by mechanical means; for, although undoubtedly these solid and suspended matters would ultimately be destroyed by the micro-organisms, yet the time required would be too long to admit of its application in ordinary cases. Second, that as far as possible, such minute suspended matter still remaining in the sewage should be reduced by the aid of those organisms with which we are well acquainted, from the solid to the fluid state. This, to my mind, is the first step and the first lesson which we have clearly learned from our investigations into this wonderfully interesting subject. The effluent sewage containing, then, a large proportion of dissolved organic matter is in a condition to be further treated either by intermittent filtration in what are called contact beds, or by some other means being brought into contact with those organisms which have the mysterious power of reducing these dissolved organic substances, which, if left to themselves, would putrefy and be the cause of offensive smells, if not of dangerous consequences. In the case of intermittent filtration and contact beds considerable difficulty arises from the presence in the effluent, along with the dissolved organic matter, of certain mineral substances in a minute state of subdivision, derived, no doubt, from the washing of the streets. These latter substances, of course, cannot be acted upon by any species of bacteria; consequently, in course of time, they tend to clog up the filter-beds themselves. But intermittent filtration and contact beds is not the only mode of treating the sewage effluent which has been deprived of its grosser and more palpable organic matters. It is a well-known fact that if the sewage effluent be poured into a sufficiently large volume of otherwise comparatively pure water, the dissolved organic matter contained in it disappears with remarkable rapidity; in other words, the contact bed, instead of being composed of coke or other solid matter, is formed of water, in which the mysterious process of the reduction of the dissolved solids is carried on. . . ."

In the discussion which followed, Mr. Grigg, the Chairman of the Council, said the immin-

sity of the problem of the sewage disposal of London awed those who heard Sir Alexander Binnie's figures.

Mr. Addiscott (Plymouth) inquired whether there was not a great manurial value in the sludge, which would render it profitable for disposal to farmers?

Mr. Humphreys (Reigate) asked how London stood with regard to trade refuse being allowed to pass into the sewers?

Mr. Lindley (Batley) mentioned that in his town they had come to the conclusion that bacterial filtration was the best plan.

Mr. McMahon (Torquay) explained that at Torquay the sewage was carried into the English Channel by an intercepting sewer, 100 ft. below the sea level.

Mr. Young (Battersea) declared that a great many of the present difficulties might be remedied by increasing the size of the flushing tanks from two to three gallons in residences. He ventured to think that this might be done if the water supply were municipalised.

Sir Alexander Binnie, replying to questions, said it was true that there was originally a manurial value in the sludge, but after treatment it did not seem to have any attractions for farmers. In fact, at one time the latter, rather than pay for the sludge, required the Public Authority to pay them 1s. a ton for removal. Oil refineries seriously interfered with the sewers by the quantity of refuse they discharged into them.

Mr. W. H. Grigg then read a paper prepared by Professor Frank Clowes, Chemical Adviser to the London County Council, on "The General and Experimental Treatment of the Sewage of the Metropolis at the Outfalls of the London County Council." For many years (he stated) the London County Council had conducted experiments upon a small portion of their sewage flow, with the object of ascertaining to what extent the quality of the sewage effluent discharged into the river could be improved by substituting bacterial treatment for treatment by chemical sedimentation. The effluent from chemical sedimentation contains much dissolved impurity, which rapidly undergoes offensive changes at summer heat, and which deprives the river water of much of its dissolved oxygen. It may be stated generally that the effluent resulting from the bacterial treatment of the screened sewage successively in a septic tank and in intermittently fed coke-beds is entirely free from this objection. The Professor then described the result of experimental bacterial treatment in coke-beds, mentioning that raw sewage, which had been deprived of its larger particles by screening it through coarse gratings, lost practically the whole of its suspended matter by remaining in such a coke bacteria-bed for two or three hours. It appeared that the suspended particles of fecal matter underwent liquefaction by the bacteria, and did not collect upon the surface of the coke. The sand and grit and finer mud, arising mainly from the wear of road surfaces, however, were deposited upon the coke surfaces, and gradually reduced the capacity of the coke-bed. Hair, fibrous matter, and woody fibre, derived from the wear of wooden street pavements, and particles of chaff and straw, mainly derived from the dejecta of horses employed in the street traffic, were also deposited upon the coke surfaces and gradually choked the coke-bed. These substances, which consisted mainly of cellulose, were apparently only acted upon by bacteria with extreme slowness under these conditions. They arrived, however, in a water-logged condition, and rapidly settled down from the sewage if its rate of flow was reduced.

The total number of bacteria underwent some reduction in the coke-beds, but the different kinds of bacteria which were present in the sewage were still represented in the effluents. The introduction of such a sewage effluent into the Lower Thames appears (continued Professor Clowes) to be unobjectionable. The river water at this part is uniformly muddy; it is always brackish and frequently salt to taste, owing to the presence of tidal sea water. It is, therefore, not capable of being used for drinking purposes, and the introduction of bacteria could not lead to danger arising from the river water being drunk. The effluent will certainly cause no deposit upon the river-bed, and will ordinarily tend to render the muddy river water more clear by mixing with it. No offensive smell can be emitted by the effluent as it is discharged, and the bacteria which it contains slowly and inoffensively remove the remaining

dissolved organic matter from the effluent after it has been introduced into the river. The effluent will be suitable for the maintenance in the river of healthy fish-life.

Recent experiments have shown that if the roughly-screened sewage is made to pass with continuous flow through a settling tank, with constant surface level, and the flow is so regulated that a unit of sewage takes about five hours to pass through the tank, a fairly clear effluent suitable for coke-bed treatment is obtained. Under these conditions about 25 per cent. of the sediment or "sludge" in the settling tank disappears by bacterial action.

Sir James Crichton Browne then read a paper dealing with tuberculosis, and urged that the disease should be made compulsorily notifiable. He recognised that a great deal of good was already being done by a system of voluntary notification in some towns. Much depended upon the conscientious performance of their duty by sanitary inspectors to secure cleanly and sanitary milkshops and cowsheds which, he pointed out, could by neglect be made the source of much disease. The learned gentleman also dealt with Dr. Koch's views on the disputed point as to the contagion following bovine tuberculosis, and concluded by appealing to sanitary inspectors to use their best endeavours to rid the land of the worst scourge of humanity.

After a short discussion, a resolution was, on the motion of the President, adopted calling upon the Government to appoint a commission to inquire into the question of the contagiousness of bovine tuberculosis.

Mr. E. Tidman, the hon. secretary, mentioned that he had undertaken to read a paper analysing and criticising the new by-laws of the London County Council dealing with house drainage. He had been unable, through pressure of other work, to complete his paper, but he indicated in a general way the defects which he detected in the by-laws.

A paper, prepared by Mr. Prim, late resident engineer of the Houses of Parliament, was brought up by Mr. Tidman. Mr. Prim dealt exhaustively with the system employed for ventilating, heating, cooling, draining, and lighting the legislative chambers. He pointed out that the total length of the building is 940 ft.; its principal front, that facing the river, being 880 ft. in length, 680 ft. of which forms the terrace. The enclosed area upon which it stands—viz., exclusive of Old Palace-yard, but including Westminster Hall—occupies 7½ acres. The debating-chamber of the House of Peers has a floor area of 4,050 ft., while that of the House of Commons has only 3,060 ft.

The total number of persons occupying the chamber during the division which took place after the debate on the second reading of the Government of Ireland Bill, in 1886, was 903, and as the total capacity of the chamber is 165,000 cubic feet, only 182 cubic feet was on that occasion apportioned to each individual; but as really one million and a quarter cubic feet of air was passed through the chamber per hour, thereby changing the air every 8½ minutes, the supply of air per individual was, at that rate, of 1,326 cubic feet per hour, or 22 cubic feet per minute. The minimum temperature of the chamber was 63 degrees, and the maximum 67 degrees during a sitting of nine hours' duration, while the out-door temperature ranged from 65 degrees at the commencement of the sitting to 59 degrees at the rising of the House. When, however, the out-of-doors temperature is high then an increased temperature is maintained indoors, whereby a chill consequent on the sudden fall in temperature of some 20 deg. or 25 deg. on entering the building may be avoided. During protracted sittings the temperature of the air is gradually raised as morning approaches, want of rest and fatigue causing a slower circulation, and consequently chilliness. Those parties forming the relief parties, and who have had a night's rest, a bath, a breakfast, and possibly a short walk, on arriving at the House at 8 a.m., do not generally approve of the then temperature, but they are not entitled to the same consideration as those who have struggled through a long night, rendered more tiresome by frequent and, on such occasions, almost useless divisions.

The volume of air supplied to the Debating Chamber is regulated according to the number of persons present, the minimum quantity being 25 cubic feet per minute for each individual, but on occasions of exceptional crowding and excitement as much as 30,000 cubic feet of air per minute have

been passed through the chamber, or not less than 33 cubic feet per head, assuming a full attendance. The principal source from whence the air supply is drawn is from the river front of the building, where, from thirty-five openings, air ducts are distributed for the service of the libraries, committee-rooms, Commons refreshment and smoking rooms, several offices, and the Debating Chamber of the House of Commons. The air for the Debating Chamber is drawn by the action of a fan along a gallery, where, on passing through jets of water converted into fine spray or mist, mechanical impurities, such as soot or dust, are washed out; in hot weather, in addition to the cooling effects of these sprays, the air is also brought into contact with large blocks of ice, and is then drawn through a fan or propeller, the speed of which is regulated according to the external temperature, as well as the number of persons occupying the chamber. This fan is driven by means of an endless rope from a steam engine, which is placed at a distance so as to avoid both noise and smell, the not unusual accompaniments of an engine. After leaving the fan, the air which is now being propelled passes through a screen of large area; this screen, which is composed of scrim or canvas of a light, open, and fluffy texture, arrests the further progress of any dust or smut that may have escaped the washing process. The air in its onward course next arrives at the filter, when, should the weather be foggy, the air-ways used in clear weather are closed, and the whole of the incoming air, the presence of which is increased by accelerating the speed of the propeller, is forced successively through two layers of cotton wool, each layer having a thickness of 3 in. and an area of 1,000 superficial feet. Having passed through this filtering medium during thick weather, and around it when no fog exists, the air ascends through gratings in the roof of the vault and enters the warming chamber overhead.

The warming is effected by means of steam conveyed through small pipes upon which zinc plates are soldered, and are called batteries. The principle of the battery enables a large quantity of air to be raised in temperature to a moderate degree, while the promptitude with which the heat may be checked whenever a sudden influx of members takes place, either on the call of a division or on the rising of a popular speaker, renders the apparatus superior to any other system. Following the onward course of the incoming air, after receiving the necessary amount of warmth, it ascends into the equalising chamber, where heated currents arising direct from the batteries become absorbed by the general body of the air, which assumes an equable temperature throughout before entering the Debating Chamber overhead, into which it passes.

The floor of the chamber is composed of perforated cast-iron plates, covered with an open-meshed matting of whipcord; there are also numerous openings in the walls and fittings round the chamber. In order to avoid any chilling effect from the upward movement of the incoming air about the Members' feet, that portion of the floor immediately in front of the benches is composed of wood covered by rugs. The area of opening in the floor, and panels around the Chamber, is so large that no perceptible draught is felt. Special inlets for air are provided for the galleries all round the Chamber. The vitiated air is extracted through the ceiling, which is composed of a number of ornamental panels slightly raised above their framings so as to permit the outgoing air to pass freely away. Sixty-four of the panels in the centre of the ceiling are of glass, through which the light from an equal number of gas-burners overhead illuminates the chamber. The extraction-flues from these burners alone act as powerful ventilators, but in addition to these are two ventilating up-cast shafts, the principal one being in the Clock Tower, at the base of which a fire is maintained day and night throughout the year.

The ventilation of the House of Peers is effected entirely on the extraction system, by which the air from two adjacent courtyards is drawn through water sprays, canvas screens, and steam-heating batteries, as already described, after which the air ascends through an open perforated floor, covered with a hair cloth carpet, into the Debating Chamber, passes from thence through the ornamental framework of the ceiling, and is extracted by furnaces placed at the base of up-cast shafts, the principal one forming one of the angle turrets of the Victoria Tower.

The ventilation of the Commons dining-rooms, the serving-room, the kitchen, the principal smoking-room, and the bathroom is effected by fans or air propellers driven electrically.

The heating medium is steam, which is supplied from four boilers, each 28 ft. in length by 7 ft. in diameter, and having two furnaces. The cooling of the air is effected both by placing blocks of ice in the "intake," or gallery, through which the air is drawn, or by fine sprays of cold water, which, playing upon canvas screens, presents a large surface of cooling medium to the passing air, tending not only to cool, but also to cleanse and moisten it.

Dealing with the drainage system, Mr. Prim pointed out that the whole of the sewage, together with the drainage from the roofs and courtyards, which, on a rainfall of one-tenth of an inch, represents nearly 20,000 gallons, or 88 tons, gravitates through iron pipes into three reservoirs, called "ejectors," having a combined capacity of 1,200 gallons. As these "ejectors" become full in their turn, a pressure of air, generally of about 12 lbs. on the square inch, forces the sewage into the metropolitan sewer. The air employed for this purpose is supplied from compressors actuated by steam-engines placed at a considerable distance from these ejectors.

As to lighting, at present the number of electric lamps in use within the building is, he said, equivalent to upwards of 5,000 of 8 candle-power; but before the completion of the installation a further 3,000 lamps will be required. The signal light on the Clock Tower is illuminated by gas, and is one of Wigham's patent apparatus, similar in design to those used by the Board of Irish Lights for light-house illumination.

At the conclusion of the reading of papers the usual votes of thanks were passed.

#### COMPETITIONS.

ADDITIONS AND ALTERATIONS TO WORK-HOUSE, HEREFORD.—The two twenty-five guinea premiums in the competition for the additions and alterations to this workhouse, which additions include new infirmary buildings and administration block, have been awarded to Mr. E. H. Lingen Barker, of Hereford, and Messrs. Wells & Anderson, of Swansea, both of whom have London offices. The other competitors were Mr. S. H. Eachus, of Wolverhampton, Mr. Arthur Marshall, of Nottingham, and Mr. R. I. McBeate, of Manchester.

#### BOOKS RECEIVED.

RIPON, THE CATHEDRAL AND SEE. By Cecil Hallett, B.A. (London: George Bell & Sons.)

SHELTER AND DISINFECTING STATION, HACKNEY.—From the Report by Dr. J. King Warry, M.D., on the sanitary condition of the Hackney district, we learn that in the month of July, 1900, the Local Government Board was asked by the local authority of Hackney to give their consent to a loan being raised for the erection of a shelter, a new disinfecting station, and a caretaker's lodge. A local inquiry was held at the Hackney Town Hall, and the consent of the Board was given. The shelter consists of four entirely separated and furnished tenements of two rooms, with water-closet and bathroom to each. The disinfecting station is of good size, and the chamber receiving the infected goods is completely cut off from the chamber receiving the disinfected articles. It is provided with two Allott & Paton's improved Washington Lyons high-pressure steam disinfectors. In connection with the non-infected chamber is a small laundry, fitted with a washing-machine, a hydro (both to be worked by means of an electric motor), trough, &c., and an ironing-room fitted with electric heated irons; also a drying-room. It was thought desirable to include in this block shelter for the vans used in the transport of articles to and from the station, and a two-stalled stable and loose box for the horses employed. It is intended to provide the disinfecting station with steam from the boilers of the dust destructor; but to provide against the contingency of a failure on the part of the destructor, an upright boiler has been provided in connexion with the disinfecting apparatus. The opportunity was also seized to erect bathroom accommodation and apparatus for the cleaning of persons and their clothes infested with vermin. This accommodation consists of a bathroom for males and one for females, properly furnished with apparatus for the disinfection of the infested clothing. The architects are Messrs. Gordon & Gunton, Finsbury House, E.C.

### Illustrations.

#### BEDALES SCHOOL, PETERSFIELD.

**T**HIS is a large private school, built for Mr. J. H. Badley, the headmaster, at Sleep, near Petersfield. The illustration shows a view from the south-west. The south or main front is centred on the end of the Great Hall, with its stone mullioned window and large gable. To the eastward of the hall is the private wing containing the headmaster's house; to the westward the school-rooms, returning with a west wing, set at right angles to the front, to enclose a quadrangle, the northern side of which is further enclosed by the workshops, with studio and bookbinding over, and the five courts, and the eastern by the central block containing servants' offices and bedrooms, the matron's room, storerooms, sick dormitories, and bathrooms, &c.

The basement of the school buildings, in the west wing, contains the heating chamber, a drying-room for clothes, boot rooms, &c. On the ground floor are, in the south building, the headmaster's study, music and class rooms, the masters' common room, bathrooms, and lavatories, and chemical and physical laboratories; the corridor connecting these and forming two sides of the glass roofed quadrangle, is an open cloister with a quadripartite vaulted ceiling.

On the first floor of the school buildings are the remaining class and music rooms, and the library, in the north-west angle. The corridor is an open arched loggia looking out upon the quadrangle.

On the second floor are the dormitories, the bathrooms, and the masters' bedrooms.

There are two more dormitories and one masters' room over the hall.

The buildings are of local red brick; the walls, where the brick is exposed, being built with cavities, and being elsewhere coated with fine rough-cast stucco. The roofs are covered with local red tiles. The great aim has been to admit as much light and air as possible.

The builders are Messrs. Holloway Bros., of London; the architect Mr. E. P. Warren.

The school is lighted by electricity, for which special plant is provided; and the water supply is obtained by an electrical pump.

#### "MUNSTEAD WOOD."

This house was built for Miss Jekyll by Mr. Thomas Underwood, of Dunsfold, Godalming, from the designs and under the directions of Mr. E. L. Lutyens.

The walls are built of local stone, the roofs covered with tiles, and the principal timbers, window frames, &c., are of English oak.

#### "TIGBOURNE COURT."

This building was erected for Mr. Edgar Horne. It is of local stone, with small cast bricks for mullions, &c. The roofs are covered with tiles.

The house is on a limited site, and is built on the road side, so as to give the maximum of garden ground on the south and east sides.

The architect is Mr. E. L. Lutyens; the builder, Mr. Maxey, of Reading; and the plumbing was carried out by Mr. Allen, of Eastbourne.

#### THE PALAZZA UGUCCIONI.

The Palazzo Uguccioni is situated in the Piazza della Signoria, Florence, and is an excellent example of Florid Renaissance architecture. It was designed in the sixteenth century by Mariotto di Zanobi Folli.

D. MCKAY STODDART.

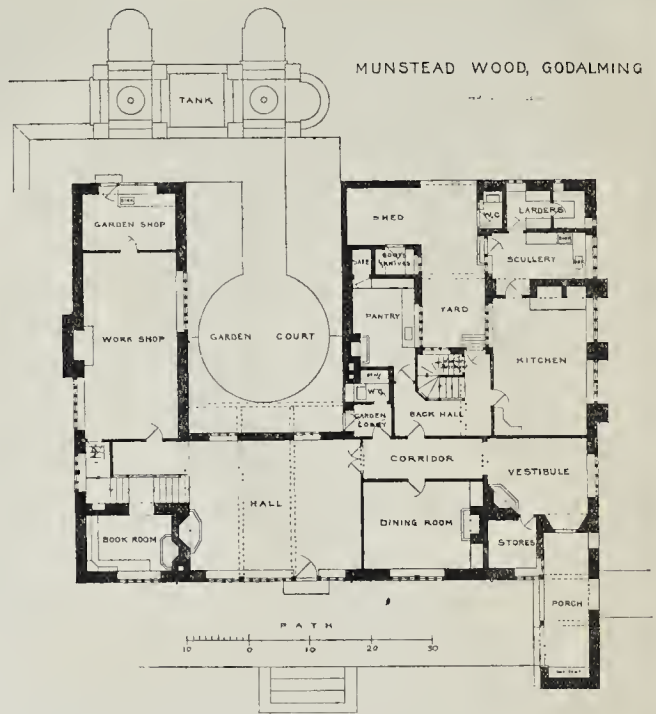

#### COLUMN, ST. MARK'S, VENICE.

This is one of the two short square pilasters, with Greek monograms, at St. Mark's, in the Piazzetta. They are referred to in our leading article this week.

The cap is from the entrance-hall, at atrio, of St. Mark's. The drawings are by Mr. D. McKay Stoddart.

#### FORMBY GOLF CLUB HOUSE.

This design was submitted in a recent competition, limited to Liverpool architects, by Mr. James Strong. The view represents a plain treatment in cement pebble-dash, having a red brick base and tiled roof. The drawing was exhibited at the Royal Academy this year.

#### TIGBOURNE COURT, WITLEY

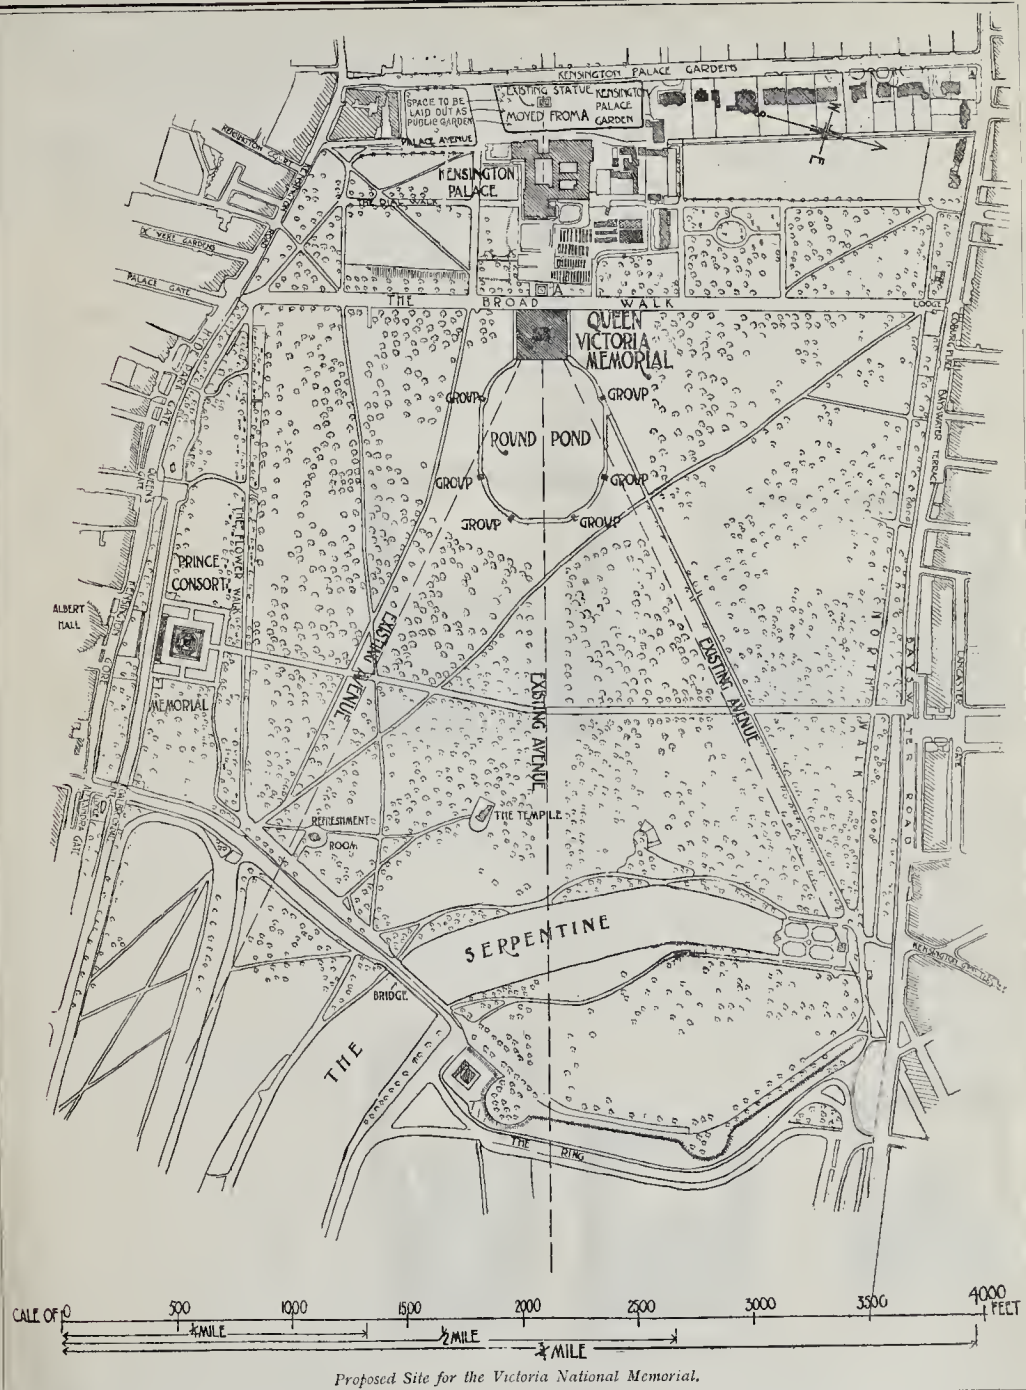

#### THE PLYMOUTH ARMS, ST. FAGANS, GLAMORGANSHIRE.

The Plymouth Arms is an old village hostelry near the entrance to the picturesque grounds of St. Fagan's Castle, the Glamorgan-shire residence of the Right Hon. Lord Windsor, to whose family the inn has belonged for many years.

The alterations were carried out some time ago by Mr. Edwin Seward, and in adapting the older house and adding to it,

Lord Windsor used the opportunity to apply to it certain ideas as affecting public-house management, which have caused this work to be regarded with much interest, not alone within the immediate locality. It has been referred to as an instance of the "Gothenburg system" of utilising a licence, but although it is in many respects a model public-house properly supplying all the requisites of a place of refreshment under good management, its speciality relies rather on the principle which has recently been put into more general appli-

Proposed Site for the Victoria National Memorial.

cation by Lord Grey and his colleagues, in accordance with which the persons who conduct the business have no interest or advantage in the sale or intoxicants of any description. The planning arrangements are dependent on this, and the place altogether will always be interesting as one of the first instances in this country of an inn arranged to meet the requirements of a village public-house attractively, and with specialities as to construction and management which ensure that the business carried on is of a good class, usefully serving the neighbourhood, as distinct from providing the abnormal "facilities" which so often distinguish the public-house.

**Correspondence.**

To the Editor of THE BUILDER.

**THE SITE FOR THE VICTORIA NATIONAL MEMORIAL.**

SIR,—I have been urged, even at the eleventh hour, to bring under your notice an alternative site for the Victoria Memorial—on the elevated plateau in front of Kensington Palace—which about a month ago I ventured to suggest to an important member of the Memorial Committee. The accompanying

plan, reduced from the Ordnance Sheet, shows the site in question. With its converging avenues, fine sheet of water, open space, and endless ornamental possibility—without the sacrifice of a single tree or altering in any way the present character of Kensington Gardens—this site is of unequalled importance and beauty. Further, its special fitness for the memorial to our late Queen rests on her having been born at Kensington Palace—where her toys are still preserved—while it was there she was told of her succession to the Throne. No such associations gather round Buckingham Palace. I am therefore not without hope that you may be induced to give the subscribers

and the general public, as is just and right, an opportunity of judging as to the relative fitness of suggested sites for the National Memorial to our great Queen.  
 Gosford, Longquidry,  
 August 22, 1901.

WEMYSS,

**The Student's Column.**

**GAS AND GAS FITTINGS.  
 10.—LUMINOUS FLAT FLAMES.**

Obtain the highest lighting efficiency from a luminous flame the pressure under which the gas escapes at the point of ignition must be very low. The luminosity of the flame is due to the presence of minute particles of solid carbon liberated by the decomposition of certain hydrocarbons under the influence of heat. The greater the temperature to which the carbon particles are heated the greater is the intensity of the light emitted.

When gas issues under high pressure from the burner, less light is emitted from the flame than when the gas is burned under low pres-

sure, because rapid currents of air are induced in the neighbourhood of the flame, which consequently becomes cooled and over aerated, and becomes less highly charged with the solid carbon particles.

The gas should issue from the burner in such a manner that the flame is capable of supplying itself with that proportion of air required to effect complete combustion of the gas without cooling the flame by undue dilution. If the flame is of such shape or dimensions that it cannot attract to itself sufficient air to completely oxidise all the carbon particles liberated, the flame becomes smoky and emits less light than when the gas is consumed under favourable conditions. A poor quality gas requires less air than a rich gas, and the apertures in a burner to consume the former

the majority of gas consumers use Bray burners without a governor of any description, the sole regulation of the gas consumption being that produced by turning the gas cock until the flame appears to be emitting the maximum quantity of light.  
*Bray Burners with Economisers.*—The gas "economiser" is merely a small expansion chamber of brass, fitted internally with a muslin screen and terminating at top with a slit burner. These economisers slip over the ordinary Bray burner, and have the effect of materially increasing the illuminating power of the flame without affecting the rate of gas

Fig. 18.—Batswing Burner and Flame.

Fig. 21.—Slit Union Burner and Flame.

should be larger than those in a burner for rich gas. A pressure of 0.5 in. at the inlet of the burner is sufficient in most cases.  
 Flat flame burners may be divided into three classes:—(1) Batswing, (2) union-jet or fishtail, (3) slit union burners.  
 The burner lip should always be made of some material which is not a conductor of heat, the materials most extensively used being steatite and enamel.  
*Batswing Burners.*—The batswing burner (fig. 18) yields a flame having a shape somewhat resembling that of a bat's wing. It is especially adapted for rich gas, such as that obtained from canal coal, of from eighteen to thirty candle power.

Fig. 19.—Union Jet or Fishtail Burner and Flame.

Fig. 20.—Bray Burner with and without Economiser.

The richer the gas the more narrow must be

consumption. They are particularly effective when used in places not provided with governors, and supplied with gas under the usual pressure of 1 1/2 to 2 1/2 in. Bray's "Codac" economisers may be bought retail for a 10s. each, or 7d. per dozen, and although like all slit burners they gradually become blocked with carbonaceous deposit, their price is so small that they may be replaced by new ones every two or three months without appreciably affecting the annual cost of maintenance of a lighting installation. The Bray burners most extensively used are Nos. 4 and 5, consuming 8 and 10 cubic feet per hour respectively under the ordinary gas pressure. These may with advantage be replaced with No. 2 burners capped with No. 7 Codac economisers. When the

economisers are discarded for new ones, it is not necessary also to renew the No. 2 burners. Bray's adjustable burners are constructed on similar lines, but the upper portion of the burner is made to screw on to the lower portion instead of to slip over it.  
 The following tables show the lighting power and rate of gas consumption obtained with a No. 2 and No. 3 Bray burner (patent enamel regulator) when tested under different gas pressures with and without the economiser, the gas cock in every case being turned fully open without regard to the appearance of the flame. The quality of the gas tested in a standard Argand burner was 15 1/2 candles per 5 cubic feet per hour rate:—

Fig. 10.—Union Jet or Fishtail Burner and Flame. A photograph showing a burner with a flame that has a distinct notch or 'jet' at the top, resembling a fish's tail.

Fig. 20.—Bray Burner with and without Economiser. A photograph showing two burners side-by-side, illustrating the difference in flame size and shape when an economiser is used.

No. 2 Bray Burner without Economiser.

The relative sizes of the flames obtained with a No. 2 Bray burner, with and without the No. 7 Economiser respectively, are shown in fig. 20. The rate of consumption under a pressure of 1.75 in. was 5.6 cubic ft. in each case, and the illuminating values were 1.4 and 16.6 candles respectively.  
 It will be observed that the lower the pressure the better the result when no economiser was used, but that when the burner was capped with the economiser the results improved as the pressure increased. The gas issuing from the economiser is under less pressure than when it issues from the orifices of the burner below it, and in every case the economiser increased the light efficiency of the gas. The light efficiency obtained when the Bray burners were used without an economiser would probably have been higher had the flow of gas to the burners been adjusted by turning the gas-cock until the flame appeared to be giving the maximum amount of light. Professor Lewes gives the following table of comparative duties of flat flame burners of different sizes tested with 16-candle gas, but the pressure of the gas is not stated, and the flames were probably always adjusted by turning the gas-cock until the brightest flame was obtained.

Flat flame burner (without Economiser) ..... No 0 ... 0.50  
 Ditto ..... 1 ... 0.85  
 Ditto ..... 2 ... 1.22  
 Ditto ..... 3 ... 1.63

Slit Union Burners.—The slit union burner is a combination of the union-jet and batswing burner. It somewhat resembles the batswing burner in appearance, but has a recessed top, and produces a flame wider at the base than the batswing, and less ragged at its upper edges. These burners are often employed for street lamps.  
*Sugg's "Winsor" Burner* is a flat flame burner, provided at the bottom of the burner chamber with a screw regulator, by means of which the gas consumption can be reduced to suit the gas pressure. Every variation in pressure necessitates a readjustment of the regulator, and these burners are therefore intended to be used where a governor is placed at the outlet of the meter.  
*Sugg's "Christiana" Burner* is another flat flame burner provided with a self-acting governor with a screw on top of the gas

Flat flame burner (without Economiser)	No	Candles per cubic foot per hour.

chamber to regulate the consumption to any desired point.

**Iron Burners.**—Flat-flame burners constructed of iron are still used for flames exposed to the open air, as for stalls and the outside fronts of shops. They will stand rough usage from rain and wind better than the finer grade steatite or enamel burners, but the yield of light from them per unit of gas consumed is very low, and they also have the disadvantage of being liable to become blocked by rust.

[The diagrams of gas flames in this chapter, though not, of course, the actual size, are correct in their relative proportions.]

### TRADES UNION CONGRESS.

THE annual meeting of the Trades Union Congress was opened in the Albert Hall, Swansea, on the 2nd inst., Mr. C. W. Bowerman presiding. The Congress having been welcomed by the Mayor and others, Mr. S. Woods, Secretary, presented the Report of the Parliamentary Committee, which stated that since the last Congress several questions relating to the Workmen's Compensation Act had been before the Law Courts, and decisions in the Appeal Court had been challenged by the trade unions, taken to the House of Lords, and in every case reversed in the interests of the workers. It must be obvious to every one who had watched the proceedings of Parliament that it was useless to expect any active measures of industrial reform from the House of Commons, because, composed as it was at present, it was plain that any measure having for its object the improvement of the condition of the working classes, the strengthening of trade-union principles, or attacking existing monopolies was blocked by the dilatory proceeding of the House of Commons, and the taking away of the opportunities of private Members by the Government, thus making it difficult to pass any progressive measure of labour reform. This was proved by the experience in successive Sessions with the Miners' Eight Hours Bill, and the Committee were of opinion that till these initial difficulties to legislation were removed, trade unions and the working classes of the country would always be hampered in their desire for progressive labour legislation. The one case that put every other in the trade-union movement in the shade was the remarkable decision of the House of Lords in the Taff Vale picketing appeal. During the last twenty years large sums of money had been spent by trade unions with the object of keeping intact and safeguarding trade union funds; especially had this been the case in connexion with some of the larger trades, because it was contended by all trade-union leaders that the real object and intention of the Trade Union Act was to give the fullest protection to these funds. . . . This judgment was so far-reaching in its effect on the trade-union position and action that the Parliamentary Committee lost no time in placing the matter in the hands of their advising counsel, who had given the following opinion:—"The position of trade unions created by the judgment in the Taff Vale case is very serious. In my opinion, the funds of unregistered unions were equally liable with unions for damages caused by the illegal acts of persons acting as agents for and on behalf of those bodies. The seriousness of the judgment is because of the position of the law relating to picketing as laid down in the case of Lyons v. Wilkins. Under the judgment there it will be exceedingly difficult to conduct a strike with any degree of success without doing illegal acts. The consequence of these acts, as done in the words of Lord Macnaghten, by persons who from their position might be taken fairly to represent that body, will be to render the funds of the society liable for the damage occasioned by such illegal acts. So that the first step to be taken, in my opinion, should be that the first case where an injunction is sought to restrain persons from picketing should be taken to the House of Lords under the authority of Congress or such persons as it would authorise, so as to prevent possibility of anything happening similar to that in the case of Lyons v. Wilkins. I am also of opinion that the various unions should amend their rules so as to prevent as far as possible action being taken against unions now that they are sueable in their collective capacity. The last point referred to me for opinion is as to whether or not the unions under the judgment have obtained any benefit in the matter of being able to sue employers. I think there is a great advantage of being able to sue, say, a vindictive employer, who might try to break up or otherwise injure a union for his own benefit. If it can be shown that employers did such an act I should say that a good cause of action lay with the union against such an employer."

Mr. Bowerman delivered his inaugural address as President on Tuesday. The Congress afterwards proceeded to the consideration of the Parliamentary Committee's report.

Mr. Pete Curran (London) moved:—"That this Congress expresses its strong admiration at the courage and behaviour of the Bethesda quarrymen during their long and arduous struggle to free themselves from the trammels of serfdom and to establish the principle of combination, and further emphatically condemns those in authority who are responsible for the drafting of the military and police forces into that district, there being absolutely no ground for such unwarrantable action."

Mr. Brace (Monmouthshire Miners) seconded the resolution.

Mr. Moyses (London) moved an addition to the resolution recommending the societies represented at the Congress to contribute a sufficient regular income to the quarrymen so as to enable them to carry their struggle to a successful issue.

Mr. Sexton (Liverpool) seconded the addition, and the resolution, with the addition, was unanimously agreed to.

Mr. Steadman (London) moved that the standing orders should be suspended so that the Parliamentary Committee's recommendations on the Taff Vale case should be considered. These were that the Congress take a test case to the House of Lords to settle how far picketing may be carried out without infringing the law and rendering the funds of the societies liable for damages. The Committee further advised the establishment of a fund for the purpose of carrying this out, and also that each society should amend its rules to secure protection against some of the consequences of the House of Lords judgment in the Taff Vale case.

Mr. E. Browne, standing counsel to the Congress, explained the legal situation created by the decision of the House of Lords, and advised the delegates to agree to the recommendations of the Parliamentary Committee.

Mr. Galbraith (London) moved, and Mr. B. Turner (Bathley) seconded, the resolution recommended by the Parliamentary Committee.

Mr. Baker (Stockton-on-Tees) moved as an addition "and urge each society to use their best endeavours to bring about such alteration in the law as will meet with the approval of this Congress."

Mr. R. Bell, M.P. (Secretary of the Railway Servants' Society), said they had no doubt all been startled by the announcement in the papers that an action for £20,000 had been entered against his society. He could not go fully into the subject, as the case was *sub judice*. The present position was that there had been an argument before the Master of the Rolls with regard to the venue of the trial. The railway company wanted it in London, and the Railway Servants' Society wanted it in Glamorgan-shire. The Master of the Rolls had reserved his decision until after the Long Vacation. In his (Mr. Bell's) opinion, it was hopeless for the unions ever to get back the *status quo* that existed before the decision of the House of Lords. What they must do, however, was to secure an amendment of the Trades Union Act so as to protect all funds for a benevolent purpose.

Mr. Sexton (Liverpool) said that no man could have expected any other decision than that given by the House of Lords if he looked at the matter from an equitable point of view.

The president announced that the Parliamentary Committee were quite willing to accept the proposed addition.

The discussion was continued on Wednesday, when recommendations of the Parliamentary Committee were agreed to.

Resolutions were agreed to advocating the amendment of the Factory and Workshops Act in the following particulars:—By the appointment of inspectors in building trades; by the prohibition of women and young girls working overtime; and by raising the working age limit for children to fifteen.

A motion by Mr. B. Tillet in favour of the establishment of compulsory arbitration was defeated.

### OBITUARY.

MR. BENNETT.—We regret to announce the death, on August 21, of Mr. Robert Isaac Bennett, of No. 17, Copper-street, Manchester, partner of the firm of Messrs. Royle & Bennett, of that city. Mr. Bennett was elected a Fellow of the Royal Institute of British Architects in 1888, of which he was also President during a long period of the Manchester Society of Architects. The firm of Messrs. Royle & Bennett planned and designed many schools and other buildings for the Manchester School Board, amongst them being the Moston-lane Board Schools, the offices at Deansgate, and the Higher Grade Schools at Cheetham. They also designed the blocks of warehouses and shops at the corner of Mount-street and Lloyd-street, and carried out the recent improvements of the approach into Albert-square, Manchester. He and his partner, Mr. A. Royle, had been employed in an adjudicatory capacity in respect of several important competitions—including those for the Constabulary Offices at Warrington, the Heaton Norris District Council public offices; the Accrington-road, Blackburn, Board Schools; and, a few months ago, the St. Matthias Schools, for the Salford School Board.

MR. C. DORMAN.—We regret to record the death of Mr. Charles Dorman, senior member of the firm

of Messrs. Dorman & Son, architects and surveyors, Abington-street, Northampton, which took place at his residence early on Sunday morning. Mr. Dorman, who came to Northampton from Uppingham, started business in Northampton in 1882, and in 1897 he took his son into partnership with him. Prominent buildings, especially in Northampton, have been built from his designs. Mr. Dorman was sixty-three years of age, and leaves a widow with five daughters and one son—Mr. C. H. Dorman—who will carry on the business.

### GENERAL BUILDING NEWS.

CONGREGATIONAL CHURCH, SWINTON.—On the 29th ult. a new Congregational church, erected at a cost of about £2,000, was formally opened at Swinton. The architects were Messrs. Hemson & Paterson, of Sheffield, who let the contract was let to Mr. Miles N. Brown, of Mexboro'. The building is faced with Mexboro' "rocky" stone. The windows are of leaded coloured glass by Messrs. Jeffrey & Foster, of Sheffield. The accommodation is for 500 persons, including a gallery at one end of the building.

CONGREGATIONAL CHURCH, BLACKPOOL.—A new Congregational chapel has just been opened in Warley-road, North Shore, Blackpool. This chapel has cost £5,000, and the land another £1,000. It was built by the Mayor, Alderman T. H. Smith, from the designs of Messrs. Anderson, Symond, & Crawford, architects, of Edinburgh.

THE HIPPODROME, BRIGHTON.—A large building has been erected in Middle-street, Brighton, on the site of the late Ice Skating Rink, from the plans of Mr. F. Matcham, of London. The work has been carried out by Messrs. Griffith & Co., London.

COLLEGE OF DOMESTIC SCIENCE, LIVERPOOL.—A building has been erected on a site at the junction of Seel-street and Colquhitt-street, Liverpool, for the School of Cookery. The entire scheme—land, buildings, furnishings, &c.—will cost upwards of £10,000. The new college, which has been built from designs prepared by Messrs. Pain and Charles Blease, architects, Liverpool, will include all the different departments now carried on in separate buildings.

THE "CENTURY" THEATRE.—The old Adelphi Theatre in the Strand has been remodelled and renamed. The stage of the old "Adelphi" is left practically intact, but the auditorium, approaches, &c., have been rearranged, and included in the new structure is an adjoining property on the western side, enabling the architects to provide a more spacious crushroom, with managerial offices in addition, besides giving an opportunity for revising the approaches to the stalls. A subway now leads from the main entrance and crushroom to both prompt and O.P. sides of this part of the house. Centrally situate in the crushroom is the main staircase leading to the foyer and dress circle, with its lounge and saloon, together with the ante-rooms. The Adam style of decoration has been the keynote of the architectural treatment. Considerable improvement has been effected in the auditorium. The private boxes are on the stalls and dress circle level only, eight in all. On the upper circle, in lieu of boxes, the seats have been continued around to the proscenium opening in the walls. There are upwards of 200 seats. The pit is one of the largest in London; it has a refreshment saloon and emergency exits. The prevailing scheme of decoration is ivory white, yellow, old gold, and electric blue, developed in silk, velvet, and mural coverings in the old days, and has been unusually large in the erection of dressing-rooms on the stage-level for the use of the principal artists. In all there are twenty-four dressing-rooms. The heating is on the low-pressure system. There is a complete installation of electric light, with gas as a stand-by. Westward the elevation has been extended in keeping with the old façade, and a new glazed shelter has been provided over the principal approaches. The whole of the scheme for the reconstruction of the theatre has been prepared by Messrs. Ernest Runtz & Co., architects, of Walbrook, E.C.

and the details of the plastic decoration, and the decorations themselves, have been designed by Mr. Frank Kirk who was the contractor. The Florentine frieze over the proscenium was executed by Mr. Charles Duchel. Messrs. Maple & Co. were entrusted with the following:—Electric other firms engaged are the following:—Electric installations, Vaughan & Brown; heating, &c., Vaughan & Brown; fireproof curtains and hydrants, Merryweather & Sons; act drop, Charles Hemsley; stained glass, Prest & Co.; sanitary arrangements, Barton. The whole of the decorative scheme has been carried out by Mr. Edward Bell, Castle-road, Kentish Town. The proscenium opening is 30 ft. by 31 ft.; the stage is 64 ft. wide and 87 ft. deep, by 31 ft.; the distance between fly-frames extending back to Maiden-lane; the height of flies from stage 28 ft. 6 in.; the distance between fly-frames 46 ft.; the auditorium is 56 ft. wide and 77 ft. deep from curtain line; there are over 200 stalls, 170 dress circle seats, 250 upper circle seats, and the gallery and pit are very large; the crush room is 33 ft. long by 20 ft. wide, and the foyer 44 ft. 6 in. long by 18 ft. wide, with deep columniated recesses at either end.

THE OLD HOLBORN WORKHOUSE.—The old workhouse, near the western end of Clerkenwell

road, at the junction with Rosebery-avenue, is about to be pulled down. The site will be occupied by a block of casual wards in Little Gray's Inn-lane, which the Guardians of the Holborn Union are about to erect, after plans and designs prepared by Messrs. Smith & Coggin. The present building is one of the last of its kind that has remained in London.

**THE ST. HELEN'S TOWN HALL-SQUARE.**—The work of re-arranging the property in front of the St. Helen's Town Hall, and clearing a space of about 4,000 square yards, in order to form an open space in front of the Town Hall and Gamble Institute, is it is stated, being pushed on rapidly. Messrs. Briggs & Wolstenholme, the architects, have arranged a line of buildings in harmony with the building in which the free library and technical schools are housed. Immediately the disturbed parties are settled in their new premises, Mr. Joseph Ellison, the builder, who is carrying out the work, will have the new space cleared and the square finished as rapidly as possible.

**THE BUILDING TRADE IN SHEFFIELD.**—It is a matter of common knowledge that during 1890 and 1900 there was abnormal activity in the building trade of Sheffield, all parts of the city, and principally, of course, the suburbs, being affected. As a matter of fact, 2,016 new houses within the city boundaries were certified as fit for occupation during the former year, whilst during the succeeding twelve months the total rose to 2,797. An opinion seems now to prevail that a slump in the local building trade is inevitable at no distant date. The facts supporting such a contention are difficult to find. It is perfectly true that (as already stated) the number of houses erected in recent years has largely increased, but the real question to be considered is whether more houses have been built than were required to meet the demands of a growing population. On this point nothing could be more significant or conclusive than one fact: The percentage of losses on the district rate in consequence of houses being unoccupied was lower during the twelve months ended March 25 last than for any similar period during the last ten years. That the supply of housing accommodation has not exceeded the demand is further proved by the readiness with which owners of newly-completed houses are able to find occupiers. In most districts of the city at the present time there is such a demand that builders and owners have considerable difficulty in keeping their property free of tenants till it is properly inspected and certified as fit for occupation, whilst any one known to have houses to let is besieged by applicants.—*Sheffield Independent.*

### SANITARY AND ENGINEERING NEWS.

**DOCK, BURNTISLAND, FIFE-SHIRE.**—The new deep water dock at Burntisland was opened on the 23rd ult. Its area is about 12 acres, which is twice the dimensions of the old basin; it is fitted with three hoists, each of which is expected to load about 400 tons an hour. The south wall of the dock is pitched, and from the slope a timber jetty is brought forward, on which the third hoist has been erected. Unlike the old dock, which is equal sided, the new basin is oblong in shape, extending to 1,270 ft. in length by 554 ft. broad at the widest part. Much of the reclaimed ground extending east from the dock quays to the Lammerlaw has not yet been levelled. It will afford storage room for waggons of coal waiting shipment. Temporary means of lighting the dock will be employed pending the installation of the electric light, which has been decided on as the illuminant. The engineers of the new dock were Messrs. P. W. Meek, Urquhart, and R. Henderson, and the contractors Sir John Jackson (Limited), with Messrs. H. C. Wynne Edwards and A. Whiteley local managers. Sir William Armstrong & Co., of Newcastle, have supplied the dock gates, hoists, and hydraulic machinery.

**SEWERAGE DISPOSAL, BALDON, YORKS.**—The Urban District Council of Baldon has accepted the tender of Mr. Wm. Brigg, of Frizinghall, Bradford, at 1,900*l.* for works of sewerage and sewage disposal, for the districts of Baldon Wood Bottom, Baldon Green, Lower Holme, and Low Hill, and the works are to be proceeded with immediately. The engineers to the scheme are Messrs. Beesley, Son & Nichols, Westminster.

### MISCELLANEOUS.

**PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.**—The Pulsometer Engineering Company, Limited, have removed their works and offices from Nine Elms, S.W., to Nine Elms Ironworks, Reading, Berks. All communications should now be addressed to Reading, though the company are retaining their offices and showroom at Queen Victoria-street, E.C.

**VOLUNTEERS' HEADQUARTERS.**—It is announced that the War Office authorities have approved of a site in Whitecross-place, Shore-ditch, for the erection thereon of new headquarters for the 3rd London Rifle Volunteers.

**LONDON BRIDGE.**—The Royal Assent having been given to the measure introduced last session by the Corporation of London, the work of widening the

bridge will, we gather, be soon proceeded with. The plans and designs have been prepared by Mr. Andrew Murray, the City Surveyor, in conjunction with Mr. Cruttwell, Resident Engineer of the Tower Bridge. They provide for a widening of the structure from 53 ft. to 65 ft., the additional width—nearly 6 ft.—of each footpath being supported by granite corbels or shoulder-pieces, which will be bolted on to the main fabric of the bridge with steel work. A balustrade will replace the present stone wall on either side, and it is calculated that the increased weight to be laid upon the foundations will not exceed 67 lbs. to the square foot. It is estimated that the cost will amount to about 100,000*l.*

**THE GLASGOW SCHOOL OF ART.**—We have received the Prospectus and Prize Scheme of this school for session 1901-1902, the autumn term of which commenced on September 5. The work of the school is divided into four departments: (1) Drawing and Painting; (2) Architecture; (3) Modelling; (4) Design and Decoration. Courses of studies are arranged in groups for each of these departments. These courses are for the training of students as painters of landscape and figure, architects, modellers, sculptors, designers, and decorative artists, art masters and masters. Architect students learn the elements of construction; the nature of materials and the mechanics of architecture; draw from the cast; study the historical development of architecture in Europe; acquire a knowledge of the principles and growth of ornament; measure and sketch buildings and receive instruction in architectural design. Concurrently with this, they study drawing and modelling from the antique and life, and attend the lectures on ornamental design; anatomy and proportion and figure design and decoration. They are specially prepared for the examinations of the Royal Institute of British Architects. There is a museum of casts, containing examples of figure and ornament from the Classic, the Gothic, the Renaissance, and later styles. A large addition of casts—figure and ornament—was made last session. The casts are arranged under the heads of the various historic styles. Where possible, photographs are being added, showing the ornament or figure in its place in the building. The school reference library contains over 1,400 volumes of works on architecture, the graphic and the decorative arts, and applied arts, together with portfolios of prints, drawings, and photographs. A collection of lantern slides for lecture purposes is being formed, and embraces an historical series of each of the following architectural styles:—(1) Greek, (2) Roman, (3) English Gothic, (4) Italian Renaissance, (5) French Renaissance, (6) English domestic work, (7) Scottish work. The reading-room is always open, and is free to all students of the school. A school museum of applied art, as a feature in the school building. A set of workshops fitted with the necessary appliances for dealing with designs in the material has been specially built. These fittings include kilns, mufles, stoves, and other appliances, so that students may carry their works to a completion. The subjects dealt with are stained glass, decoration of interiors, needlework, bookbinding, ceramic decoration, enamels, block cutting, mosaics, sgraffito, gesso, lithographic design, posters, &c., metal work, wood carving, stone carving, furniture. The headmaster of the school is Mr. Francis H. Newbery. In the architectural section Mr. Alex. M'Gibbon, A.R.I.B.A., is the director, and he and the following gentlemen are the instructors: Messrs. W. R. Watson, James Smith, and John Dunlop. The architectural classes have also the advantage of architect visitors.

**THE NORTHAMPTON INSTITUTE, CLERKENWELL.**—At the Northampton Institute (City Polytechnic), St. John-street-road, E.C., the arrangements have been completed for the educational course for the season 1901-1902. The aim of the Northampton Institute is to provide classes in Technological and Trade Subjects and to this end attention is paid first to the immediate requirements of Clerkenwell. The educational courses fall into two distinct sections. The Engineering Day Courses for students who are willing to give the whole of their time for one, two, or more years to a thorough and systematic training in one of the branches of engineering dealt with, and the Evening Courses and Classes, which are provided for the needs of those who, on account of being engaged during the day, or for any other cause, are unable to devote the whole of their time to attendance at day courses. In the Artistic Crafts Department the subjects undertaken are those which will be serviceable to jewellers, gold and silversmiths, diamond mounters, engravers, chasers, decorative metal workers, modellers, and workers in plaster; wood, stone, and marble carvers; painters and decorators; sign writers, marblers, and grainers. In addition to the ordinary drawing and design classes held every evening, special courses have been arranged for those engaged in the gold and silversmiths, jewellery, decorative metal work, electric light fitting, building, and wood working trades. In each of these sections workshops are provided, fully equipped for carrying out practical work in the various branches of the trades, and open every evening to enable students to practise. In all classes students receive instruction in the design as well as in the practical work of their trades; short courses of lectures deal-

ing with the artistic and technical characteristics of the various subjects will be given during the Session. The courses arranged for those engaged in the building trades are in conjunction with the lecture and practical classes in the Mechanical Engineering Department. These courses will deal with the architectural and decorative branches of the subjects and the artistic treatment of stone, wood, plaster, and similar materials used in the construction of buildings. A collection of casts, books, and photographs of examples of architectural ornament has been made, and will be further added to from time to time. It includes examples of ornament of all periods. Actual specimens of artistic handicraft productions will also be procured to illustrate special characteristics of work, and historical periods and styles. The following are the sections under which the various classes are held:—mechanical engineering and metal trades; artistic crafts; electrical engineering and applied physics; technical chemistry; biological; miscellaneous trades; and domestic economy and women's trades. Judging from the book of "announcements" which has been sent us, very thorough work is being done at this institution.

**THE DISMISSAL OF THE SURVEYOR OF FULHAM.**—A meeting called to protest against the dismissal of the Surveyor of Fulham (Mr. Chas. Botterill) by the Borough Council was held at Fulham Town Hall on Tuesday night. Councillor McArthur moved a resolution protesting against the arbitrary and unjust action of the small majority of the members of the Council in dismissing, without reason, Mr. Botterill, A.M. Inst. C.E., after sixteen years' faithful service, placing on record their appreciation of his business abilities and courteous manner in the discharge of his duties, in the initiation and completion of the many important improvements made from time to time in the borough, and assuring him of the fact that he still retained the confidence of the general body of ratepayers. Mr. Stuart Barker seconded the resolution, and Councillors Cooney and Scriven having spoken, the resolution was put to the meeting and declared by the Chairman to be carried by the majority of the ratepayers present.

### RECENT PATENTS:

#### ABSTRACTS OF PATENTED INVENTIONS.

**8,230.**—ENERGY AND QUANTITY METERS (ELECTRIC). *Siemens and Halske, A. G.*—The conductor of an induction motor and the travels between laminated iron cores that are wound with coils that convey alternating currents in different phases and with closed circuits. In the inner cylindrical core are recesses rendered adjustable with an arm in engagement with screws in order that they may be placed near opposite poles of the core, so as to compensate for errors due to friction or other causes, without affecting the fields of one pair of poles. Round holes near the edge of the core may replace the recesses, and the main or a proportional current may be carried by the coils on the poles.

**8,247.**—ATTACHMENT OF HANDLES AND KNOBS: *H. W. Grove.*—The neck of the knob is pierced with holes or slots for a staple that will engage with a slot cut in the spindle when the knob has been put in its place, the ends of the staple being taken by grooves in the neck of the knob; in another form a split collar is used instead of a staple and holes are made through the knob and spindle.

**8,265.**—CONSUMPTION OF SMOKE: *C. H. Bryant, A. C. Kessler, F. M. Mitchell, and G. T. Augsburg.*—The invention is intended to deflect the gases downwards into the furnace where they may consume the smoke after they have been caused to circulate in the shape of a hollow tube as they flow upwards; within the chimney is placed a metal cylinder of which the two spiral guides are tapered downwards, and above it is a canopy divided into convoluted partitions which are shallow around their circumferences and deep around their centres, the vanes being produced down the shaft or cylinder to a short distance from the furnace.

**8,275.**—A SANITARY APPLIANCE: *H. Martin.*—Around the top of a commode is fashioned a trough to be filled with water for which a hanging flange forms a trap; the flange of the cover will dip into the water between it and the side of the container, and whenever the latter is inverted the seal may be perfected from a reservoir underneath.

**8,289-90.**—ELECTRIC CONDUCTORS: *G. E. Hev-Ding.*—For covering insulated or bare conductors they are passed, together with two strips of the insulating material, between grooved rollers of which the flanges are set so as to join together, without severing, the strips (the outside edges excepted) of the material. The rollers may have cutting edges that will divide the cables during the process of covering. **8,290.**—In the case of multiple conductors the rollers will separate and re-cover them, and a spacing-piece is placed between the conductors, a ridge being fashioned upon the upper roller which will make a groove into which nails or other fastenings can be inserted.

**8,300.**—MANUFACTURE OF GLASS: *H. E. Kniesel.*—For the manufacture of glass containing calcium phosphate, so as to be opaque and coloured, the fluxes employed in the melting of insoluble carbonate consist of barium or bismuth compounds, namely, carbonate, chlorate, hydrate, nitrate, sulphate, or oxide.

8,376.—ROTARY ROCK DRILLS: W. George.—A twisted bar, having an I-section, constitutes the drill, and at its cutting-end are left thickened edges by the removal of a portion of the web. For driving purposes may be employed either a hand-crank with bevel gearing, or a motor, mounted upon the frame to which a crutch and a handle are attached.

8,304.—A CONTRIVANCE FOR STARTING SIPHONS: T. G. Rhodes and R. Gault.—A piston having a middle rod is fitted within a piston-starting cylinder, an opening for the admission of the fluid being formed by the cutting-away of a part of the screwed cap. The piston can be removed, without disturbance of the cap, by means of a slot which is cut in the latter.

8,409.—MAKING OF CEMENTS, &c.: G. Warren.—The slurry for plaster of Paris, cement, and so on, is cast in moulds having movable partitions, and of which the contents are dried upon a drying-floor or upon the roof of the kiln, after which the goods are taken out of the moulds and fired in the kiln. In order to reduce the space above the bricks, the arches of the kiln are flattened. An injecting-apparatus for liquid fuel may be advantageously used with the kiln, for which confer No. 6,067 and 24,040 of 1894.

8,410.—APPARATUS FOR WEIRS: C. Fohr.—The inventor furnishes means of directing to an overflow weir all materials that might clog a sluice or channel, of two pairs of parallel and horizontal bars carried upon piles, one pair is disposed at the bottom and the other pair over the level of the water, and an intermediate pair of bars may be used upon occasion. Angle-iron brackets are fastened within the bars, and upon them are arranged, in the shape of a Venetian blind, a series of flat vertical bars. By another arrangement logs, on to which the vertical bars are pivoted, are substituted for the brackets, by which means a relative displacement of the parallel bars horizontally will cause the vertical bars to turn about their axes.

8,410.—A FRAME FOR USE BY ARTISTS: F. W. Schüller.—The frame, to be used for painting upon canvas, is made (by preference) of aluminium, a cord is passed around the rollers of the frame, and also around loose rollers to which hooks are fastened, the hooks being secured in crevices made in the canvas. A winding-roller, fitted with a handle, serves for the tightening of the cord.

8,433.—MATERIALS FOR USE IN INCANDESCENT LAMPS: F. Dannert.—For making a homogeneous conductive lighting body the inventor moulds and heats a plastic paste of succrate of lime or some other chemical compound, which when carbonised will produce definite parts of carbon and a metallic oxide, whilst the ratio of resistant carbon can be reduced by adding to the material a concentrated solution of some inorganic metallic salt.

8,481.—SLABS FOR FLOORING PURPOSES: F. Woss.—Subsidiary draining-grooves are fashioned in the slabs, and are set to run into main diagonal channels which are laid with a slight incline.

8,518.—SOLDERING ALUMINIUM GOODS: J. Noel.—For metal goods that have been firstly tinned are used an ordinary solder and a copper bit, with a flux, for tinning, composed of stearic acid 5 parts, resin 2 parts, and oleic acid 1 part; or else stearic acid 3 parts, and resin 1 part. For soldering purposes should be used stearic acid 1 part, and oleic acid 10 parts. The two fluxes are stated to be available for both purposes.

8,548.—PIPE AND TAP COUPLINGS: G. Rydill.—The socket for a tap or pipe outlet is fitted with induramber packing and a strainer. A nut which is screwed into the socket, and which packs the opening around the pipe, takes the nozzle. By another arrangement, a screwed cap may replace the nut, or the socket may be screwed on the outlet of a plug-cock.

8,609.—A HOLDER FOR USE IN SHARPENING TOOLS: L. Louvades.—The holder, in which chisels, plane-irons, &c., can be clamped, has handles and an arm, of which the roller will run the tool upon the bench so as to maintain a uniform degree of inclination of the blade to the oil-stone.

8,633.—TILES FOR ROOFS: G. Kistner.—Under the lower edges of the tiles are fashioned ribs that will fit into recesses cut in the upper faces of the tiles next adjacent, and there are deeper ribs that will bear against the upper edges. The tiles, which are to be jointed with cement, have hanging ribs, leathers, and interlocking ribs, and raised ornamentations.

8,637.—FASTENINGS FOR WINDOW-SASHES, ELEVATOR-DOORS, &c.: H. G. Carleton.—A pivoted hook or catch is pressed forward with a spring into engagement with a rack upon the sliding sash, which may thus be fastened at various positions. A cam-surface presses the catch back on to a magnet when the sash is closed. When the circuit is completed the magnet has sufficient strength to hold the catch back against the action of a spring, whereupon one can open the window, and when one tries to open the window when the circuit is broken, an alarm circuit will be closed through the drawing of the catch upwards by the rack-teeth, which causes a pin to touch a spring.

8,652.—A VENTILATOR FOR LARGE BUILDINGS: C. F. Sevari and H. G. Walton.—Air outlets are turned in or near the roof so as to leave the spars untouched, and the openings are provided with shutters which consist of swinging flaps having

hooked supports at their upper ends, so that they will become closed through their own weight; the shutters, however, may be closed by other means, such as rods fastened obliquely to rods that can be moved lengthwise, or bell-crank levers and rock-shafts.

8,659.—APPARATUS FOR CLEANING FLUES, TUBES, &c.: W. H. Ingersoll.—A jet of steam is forced into the flue and so sets up a current of air within it; the egg-shaped head or nozzle of the steam-pipe will serve for scraping the interior of the flue. In another form of the cleaner its conical head is placed within an air-chamber formed by a sleeve upon a disc which engages with the head whereby air will be discharged around the flue and will mix with the middle jet of steam. Confer also No. 1,358 of 1900.

8,667.—APPLIANCE FOR USE IN EXTINGUISHERS: E. F. Steck.—The invention concerns the mounting of the acid bottle in an extinguisher. A metallic casing for the bottle is pivoted with two pins on to the cap of the receiver, which can therefore be turned backwards after it has been removed for the filling of the bottle. The falling out of the bottle upon an inversion of the extinguisher is prevented by the hanging forwards of one of the hangers of the bottles, whilst the turning of the case upon the pivots, when inverted, is prevented by the friction of the end of the other hanger. The stopper of the bottle will fall out, and so allow the acid and alkaline solution to become mixed, when the extinguisher is inverted.

8,679.—A GUARD FOR CLOSET SEATS: L. Spelthens.—A sheet of paper is drawn over the opening of the seat from a pair of rollers behind it by means of spur-gearing which is driven by a pawl and a pivoted arm, grooved for the working of a pin upon the side of the lid of the seat, which is binged. The used paper is gathered around a roller and a cutting edge fitted underneath the lid cuts out a suitably-sized piece of paper whenever the lid is turned downwards.

8,680.—A SAFETY VALVE FOR HYDRAULIC CRANES AND SIMILAR MACHINES: H. Berry.—In order that the rams shall not return with an accidental falling of the pressure in the mains, the inventor joins the spindle of the valve in the supply-passage to a ram that works in a chamber placed in communication with the main; a reduction of the pressure will effect the closing of the valve by the pressure through the supply-passage from the principal cylinders and that of a spring which is set within an extension from the valve, and is rendered adjustable by means of a screw which is passed through a removable capping; the valve in the supply-passage may be opened for the exhausting of the water or other fluid by a supplementary valve, which is joined on to the main at a point beyond the main valves, so as to regulate the amount of supply to the chamber which contains the ram already mentioned.

MEETINGS.

SATURDAY, SEPTEMBER 7.

Sanitary Institute (Demonstrations for Sanitary Officers).—Inspection at Morden Hall Dairy Farm, Morden, Surrey. 3 p.m.

MONDAY, SEPTEMBER 9.

Clerks of Works Association (Carpenters' Hall, London Wall).—Monthly meeting. 7.30. Sanitary Institute (Lectures for Sanitary Officers).—Mr. W. Marriott, F.R.Met.Soc., on "Meteorology." 7 p.m.

WEDNESDAY, SEPTEMBER 11.

Institute of Sanitary Engineers.—Examination and Literary Committee at 3.0 p.m. General Purposes and Finance Committee at 4.0 p.m. Opening Sessional Meeting at 7.0 p.m. Sanitary Institute (Lectures for Sanitary Officers).—Dr. J. Priestley, M.D., on "Sanitary Law." I. 7 p.m.

FRIDAY, SEPTEMBER 13.

Sanitary Institute (Lectures for Sanitary Officers).—Dr. J. Priestley, M.D., on "Sanitary Law." II. 7 p.m.

SATURDAY, SEPTEMBER 14.

Sanitary Institute (Demonstrations for Sanitary Officers).—Inspection at Southwark and Vauxhall Waterworks, Hampton. 3 p.m.

SOME RECENT SALES OF PROPERTY:

ESTATE EXCHANGE REPORT.

Contractions used in these lists.—F.g.r. for freehold ground-rent; l.g.r. for leasehold ground-rent; i.g.r. for improved ground-rent; g.r. for ground-rent; r. for rent; f. for freehold; c. for copyhold; l. for leasehold; c.r. for estimated rental; ut. for unexpired term; p.a. for per annum; yrs. for years; st. for street; rd. for road; sq. for square; pl. for place; ter. for terrace; cres. for crescent; yd. for yard.

PRICES CURRENT OF MATERIALS.

\* \* Our aim in this list is to give, as far as possible, the average prices of materials, not necessarily the lowest. Quality and quantity obviously affect prices—a fact which should be remembered by those who make use of this information.

Table with columns: Material Name, Price per 1,000 or per yard, etc. Includes items like Hard Stocks, Rough Stocks, Facing Stocks, Shippers, Flettons, Red Wire Cuts, Best Fareham Red, Best Red pressed, Rubson Facing, Best Blue Pressed, Staffordshire, Do., Bullnose, Best Stourbridge, Fire Bricks, Glazed Bricks, Best White and Ivory Glazed, Stretchers, Headers, Quoins, Billnose, and Flats, Double Stretchers, Double Headers, One Side and two Ends, Two Sides and one End, Splays, Chamfered, Squints, Best Dipped Salt Glazed Stretchers and Headers, Quoins, Billnose, and Flats, Double Stretchers, Double Headers, One Side and two Ends, Two Sides and one End, Splays, Chamfered, Squints, Seconds Quality White and Dipped Salt Glazed.

Thames and Pit Sand 7 3 per yard, delivered. Thames Ballast 6 0 " " Best Portland Cement 34 6 per ton, delivered. Best Ground Blue Lias Lime. 25 6 " " Note.—The cement or lime is exclusive of the ordinary charge for sacks. Grey Stone Lime 125 6d. per yard, delivered. Stourbridge Fire-clay in sacks, 28s. od. per ton at 11y. dp. [See also page 221.]

**MITCHELL'S**  
 Celebrated Text-Books on  
**BUILDING CONSTRUCTION.**

FOURTH EDITION. 26th Thousand. Revised and Greatly Enlarged.  
**FIRST STAGE, OR ELEMENTARY COURSE.** A Text-Book on the Principles and Practice of Construction, specially adapted for Students in Science and Technical Schools.  
 360 pp. of Text, with nearly 500 Illustrations, fully dimensioned, the majority specially re-drawn for this edition.  
 Crown 8vo. cloth, price 5s. 6d. net. 5s. 6d. post-free.

"The book is a model of clearness and compression, well written and admirably illustrated, and ought to be in the hands of every student of building construction."—*The Builder*.  
 "It seems to have most of the advantages of Vols. 1. and 2. of Winton's 'Building Construction,' with the additional ones of cheapness and conciseness, and appears to be admirably practical."—*Mr. J. T. Hurst, Author of the 'Surveyor's Handbook.'*

**READY THIS DAY.** THIRD EDITION, thoroughly Revised and Greatly Enlarged. 12th Thousand.  
**ADVANCED AND HONOURS COURSES.** For the use of Students preparing for the Examinations of the Board of Education, the Royal Institute of British Architects, the Surveyors' Institution, the City Guilds, &c., &c.

620 pp. of Text, with 500 Illustrations, fully dimensioned, many being full-page.  
 Crown 8vo. cloth, price 5s. 6d. net. 5s. 6d. post-free.

This edition has been specially prepared for the forthcoming session, and contains a large amount of additional information and illustrations.

"Mr. Mitchell's two books form unquestionably the best guide to all the mechanical part of architecture which any student can obtain at the present moment. In fact, so far as it is possible for any one to compile a satisfactory treatise on building construction, Mr. Mitchell has performed the task as well as it can be performed."—*The Builder*.

**B. T. BATSFORD, 94, HIGH HOLBORN, LONDON.**

Just Published, 400 pages, crown 8vo. 6s. cloth.  
**THE CONSTRUCTION OF ROADS AND STREETS.** By H. LAW and D. K. CLARK, Sixth Edition. Revised, with additional Chapters by A. J. WALLIS-TAYLOR, M. Inst. C.E. With about 100 Illustrations.  
 London: CROSBY LOCKWOOD & SON, Stationers' Hall-court, E.C.

**TO BOOKBUNDERS and Librarians of Free Libraries.**—THE SEPTEMBER CATALOGUES of valuable Second-hand Works and the Examination, offered at prices greatly reduced, are now ready, and will be sent Post Free upon application to **W. L. SMITH & SON, Library Department, 136, Strand, London, W.C.**

**WANTED,**  
 A Copy of

**KING'S COLLEGE, LONDON**  
 (UNIVERSITY OF LONDON).  
**ENGINEERING, AND APPLIED SCIENCE DIVISION OF THE FACULTY OF SCIENCE.**  
 SESSION 1901-2 COMMENCES THURSDAY, OCTOBER 3rd.

MECHANICAL ENGINEERING—David S. Casper, M.A. M. Inst. C.E. & M. I. M. S.  
 CIVIL ENGINEERING—Henry Robinson, M. Inst. C.E.  
 ELECTRICAL ENGINEERING—E. Wilson, M.I.E.E.  
 NATURAL PHILOSOPHY—W. D. Adams, M.A. D. Sc. F.R.S.  
 ARCHITECTURE—R. Eiley Smith, A.R.B.A.  
 CHEMISTRY—J. M. Thomson, F.R.S., F.I.C.  
 MATHEMATICS—W. H. H. Endon, M.A.  
 METALLURGY—A. K. Huntington, A.R.S.M. M.I.M.E.  
 GEOLOGY and MINERALOGY—H. G. Searby, F.R.S.  
 RESIDENCE OF STUDENTS.—There are a few rooms vacant in the College.

**EVENING CLASSES**  
 are held for Civil, Mechanical, and Electrical Engineering, Workshop Practice, Architecture and Building Construction, Drawing, Metallurgy, Wood Carving, Mathematics, Physics, and all Science subjects.

**ADVANCED EVENING and SATURDAY MORNING CLASSES.**  
 In conjunction with the Technical Education Board of London County Council will be held in  
 EVENING — Civil Engineering, Mechanical Engineering, Electrical Engineering, Building, Architecture.  
 SATURDAY MORNING — Mathematics, Physics, Physiology.  
 For Prospectuses and all information apply to the  
 SECRETARY,  
 King's College, Strand, W.C.

**BILLS OF QUANTITIES, &c.**  
 LITHOGRAPHED CORRECTLY BY RETURN OF POST.  
 LIBERAL DISCOUNT OFF USUAL PRICES.  
 PLANS BEST STYLE.  
**ALLDAY, LIMITED**  
 Shakespeare Press, Birmingham.

**IMPORTANT TO BUILDERS.**

Specialy Liberal Terms are granted to Builders, giving a complete indemnity against liability under The Workman's Compensation Act, 1897, The Employers' Liability Act, 1880, and the Common Law. Rates will be quoted on receipt of full particulars by the

**ROYAL EXCHANGE ASSURANCE**

INCORPORATED A.D. 1720.  
 Head Office: ROYAL EXCHANGE, LONDON, E.C.  
 Funds in Hand exceed £4,600,000. Claims paid exceed £40,000,000.

**FIRE.**  
 INSURANCES ARE GRANTED AGAINST LOSS OR DAMAGE BY FIRE on Property of almost every description at moderate rates.  
 LOSSES OCCASIONED BY LIGHTNING will be paid whether the property be set on fire or not.  
 Properties insured during course of construction at low rates.

**LIFE.**  
 EVERY DESCRIPTION OF LIFE ASSURANCE IS TRANSACTED.  
 ABSOLUTE SECURITY. LARGE BONUSES. MODERATE PREMIUMS.  
**PERSONAL ACCIDENTS, BURGLARY, EMPLOYER'S LIABILITY INSURANCES GRANTED.**  
 Bonuses on Accident Policies allowed to Life Policy-holders and Total Abstainers.  
 Apply for full Prospectuses to W. N. WHYMPER, Secretary.

**"The Builder" Student's Series**

Books sent from the Office, POST FREE, on receipt of remittance.

**7/6 LAND SURVEYING and LEVELLING.** By ARTHUR T. WALMSLEY, M.I.C.E. F.R.I. F.R.O.L. Hon. Assoc. R.I.E.A. With 140 Illustrations.  
 A useful book for a Student, containing not only the usual instruction given in a Text-Book on this subject, but valuable additions from the author's own experience, and an exhaustive chapter upon Parliamentary surveying.

**6/- FIELD WORK and INSTRUMENTS.** By ARTHUR T. WALMSLEY, M.I.C.E. F.R.I. F.R.O.L. Hon. Assoc. R.I.E.A. With 24 Illustrations.  
 Gives the Student a practical knowledge of the construction and handling of surveying instruments, and how to deal with the application in the field for setting out work.

**7/- STRUCTURAL IRON and STEEL.** By W. N. TWELVETREES, M.I.M.E.  
 In this elementary Treatise, the author has endeavored to present in a regular sequence some of the more important details relative to iron and steel as applied to structural work.

**5/- STRESSES and STRAINS; THEIR CALCULATION and THAT OF THEIR RESISTANCES, FORMULAE and GRAPHIC METHODS.**  
 A Handbook for Students, particularly those preparing for the examinations of the R.I.E.A. and arranged and intended especially for those whose knowledge of mathematics is limited.

**3/6 SPECIFICATIONS for BUILDING WORKS, and HOW TO WRITE THEM.** A Manual by FREDERICK RICHARD FARROW, F.R.I.E.A. Architectural Students.  
 Shows the Student how he should write a specification, so that when he has learnt the method and general principles, he may apply them to the particular exigencies of any building he may design.

**3/6 QUANTITIES and QUANTITY TAKING.** By W. R. DAVIS. (2nd Thousand).  
 A reliable Handbook for the Student pure and simple, it accords with the method of procedure in the production of a good Bill of Quantities. The examples given, whilst intentionally simple, will be found to cover almost every phase of the subject.

**5/- CARPENTRY and JOINERY:** A Text-book for Architects, Engineers, Surveyors, and Craftsmen by BANISTER F. FLETCHER, A.R.I.E.A. A.M.I.C.R. With 404 Illustrations. 2nd Edition. Revised and corrected by the Author.  
 Intended for those entering for the examination of the City and Guilds' Institute, the Carpenters' Company, and the Institute of Certified Carpenters, &c. Also for the examination in these subjects by the R.I.E.A. and the Surveyors' Institution, &c.

**5/- ARCHITECTURAL HYGIENE,** or SANITARY SCIENCE AS APPLIED TO BUILDINGS. By BANISTER F. FLETCHER, A.R.I.E.A. A.M.I.C.R. and R. FLETCHER, A.R.I.E.A. and A.M.I.C.R. With 305 Illustrations.  
 A concise and complete Text-book, treating the subject in all its branches, and intended to be of use to those entering for an examination in Sanitary Science.

London: DOUGLAS FOURDRINER, "Builder" Office, Catherine Street, W.C.

**UNIVERSITY COLLEGE, LONDON.**  
**ENGINEERING AND ARCHITECTURAL DEPARTMENT.**  
 Assisted by Technical Education Board of London County Council and by the Carpenters' Company.

The COURSES OF INSTRUCTION in Mechanical, Civil, Municipal, and Electrical Engineering and Architecture COMMENCE on OCTOBER 3rd. They are arranged to cover periods of two and three years.

Particulars of the Courses, of Entrance Scholarships, of the Matriculation Examination, and of the Fees, may be obtained from the Secretary.  
 PROFESSORS:  
 MECHANICAL ENGINEERING—J. D. Cornack, B.Sc. M.I.E.E.  
 ELECTRICAL ENGINEERING—A. Fleming, D.Sc. F.R.S.  
 ARCHITECTURE—R. Eiley Smith, F.R.S.  
 MUNICIPAL ENGINEERING—Oskar Chwastick, M.I.C.E. C.M.G.  
 CIVIL ENGINEERING—L. F. Vernon Harcourt, M.I.C.E.  
 PHYSICS—H. L. Callendar, F.R.S.  
 CHEMISTRY—W. Ramsay, F.R.S.  
 APPLIED MATHEMATICS—L. Pearson, F.R.S.  
 ECONOMIC GEOLOGY—E. J. Garwood, M.A.  
 MATHEMATICS—M. J. M. Hill, F.R.S.

The new Wing of the College, opened by H.R.H. the Duke of Cambridge in May, 1900, contains spacious Mechanical and Electrical Engineering Laboratories, Workshops, Drawing Office, Museum, and Lecture Theatres.  
 The Laboratories are fitted with all the best appliances for Practical Work and for Research Work of the most advanced character.  
 T. GREGORY FOSTER, Ph.D.  
 Secretary

**KING'S COLLEGE, LONDON.**  
**TRAINING FOR SANITARY INSPECTORS.**  
 THE COURSE OF SYSTEMATIC INSTRUCTION in Building Construction, the General Duties of Sanitary Inspectors, and Chemistry and Physics in relation to Sanitary Science, will commence 21st TRAVELER St.

Apply to the SECRETARY, King's College.

**BATTERSEA POLYTECHNIC.**  
 NEW DAY TECHNICAL COURSES for Students preparing for Architectural and Sanitary work. Municipal Engineering, 3rd Year, &c. Session commences SEPTEMBER 18th.  
 For special prospectus apply to the Secretary.

**BATTERSEA POLYTECHNIC.**  
 Principal and Head of Building Trade Department: SIR H. WELLS, W.B.S.A. M. Inst. C.E. M. Inst. M.E. NEW PROFESSIONAL DAY COURSES in ARCHITECTURE, ENGINEERING, and CONSTRUCTIONAL WORK.  
 Instruction in Science and Art Subjects and in Workshop Practice Building Construction and Architectural Drawing, Estimation, Quantity and Sanitary Science.  
 Preparation for preliminary R.I.E.A. examinations.  
 Fees, &c. per term. Session opens September 18th.  
 Other Day Courses for Mechanical, Electrical and Chemical Engineers, and Evening Classes in Engineering, Building, and technical subjects.  
 For particulars, see Day Classes Prospectus, price 1d., post free.

### The Vaulting of the Crypt of Glasgow Cathedral.

THE many beautiful examples of thirteenth century work which survive to us in England and Scotland none is more successful in design, more original in plan and elevation, and more beset with archaeological difficulties than the double choir of Glasgow Cathedral. In his new book Mr. Watson\* has gone far, if not finally to dispel ancient illusions and misconceptions, at any rate to provide copious material for a full elucidation of the growth and uprearing of this remarkable work. He has provided seventy-eight illustrations, some of them measured drawings, some photographs, others coloured plans, by the aid of which it is possible to test the theories proposed by himself and others. His own theory, first propounded in 1886, has not yet made converts of other experts. Messrs. MacGibbon and Ross, in the third edition of their work on the "Ecclesiastical Architecture of Scotland," withdraw the modified approval which they had expressed in previous editions. Mr. Thomas Ross, in the third Rhind lecture, delivered in 1900, says, "Probably the original plan of the crypt is the plan we see to-day." Mr. John Honeyman, in the "Book of Glasgow Cathedral," retains his opinion that in the crypt we have the original design. All this is naturally very disheartening to the author of a theory. Nevertheless, we think that it hardly justifies Mr. Watson in asserting that "a change of design in the middle compartment of the crypt is not within the range of intelligent controversy." This is perilously close to bad language; and it is unnecessary, for Mr. Watson has a strong case. It may be stated as follows:

\* "The Double Choir of Glasgow Cathedral; a Study of Rib-vaulting." By T. L. Watson, F.R.I.B.A. Glasgow: James Hedderwick & Sons. 1907.

the building of the present cathedral, as is only too often the case, is conflicting and misleading. Bishop Jocelin is recorded to have built a choir or a part of a choir between 1175 and 1179; and to him the whole of the present choir used to be ascribed. This is manifestly impossible. From him the credit was transferred to Bishop Bodington, who ruled from 1233 to 1258. Now Mr. Watson, with much likelihood, ascribes the earlier part of the work to Bishop Walter, who ruled just when the great Gothic building period was at its zenith, from 1208 to 1232. His guidance lies in the analysis of the plan of the vaults, the curvature and mouldings of the ribs, and the construction of the springers. From a consideration of these he arrives at the conclusion that the work was done in five instalments, with, possibly, short intervals between them, between the years 1220 and 1270 or thereabouts. To the first period belongs the south-western compartment of the crypt. Here the ribs are pointed in section; and in order to bring them all to the same height the diagonals are segmental, while the transverse arches remain semicircular. To the second period belong the north and south aisles of the crypt. Here the diagonals are semicircular; the other arches of the vault are pointed. To the third period belong the north, south, and eastern aisles, and the eastern chapels of the choir above. The mouldings of the ribs here are of later character; and ridge-ribs, both longitudinal and transverse, are introduced. To the fourth period belongs the famous and intricate vault of the middle compartment of the crypt. Here the mouldings of many of the ribs are again later in type, and the ribs are interwoven into geometrical patterns by the addition of liernes. The fifth period includes the stair vaults in the crypt, which have tiercerons or intermediate ribs, and late angular mouldings. To these must be added much of the vaulting in the eastern chapels and aisle of the crypt, as the same late mouldings occur there.

Two objections present themselves to the above order of operations. First, why was

the middle of the crypt left open, and not vaulted, till the choir above was finished? Second, why were the eastern aisle and chapels of the crypt left to be vaulted last of all? The answers of the author are interesting. As to the first, he tells us that the clearstory of the choir was built from inside, and that it contains stones many of which are nearly half a ton in weight. These were raised, not by a crane, but by a screw-jack. Obviously, if the crypt had been already vaulted, its slight vault would have collapsed at once under the weight of the screw-jack and the blocks of stone. Secondly, all these blocks had to be wheeled in to their places on the floor of the crypt just beneath the screw-jack. The builders, therefore, had to leave an opening somewhere in the walls of the crypt. That they left an opening for a long time in the east wall of the crypt is plain from the fact not only that the vaulting hereabouts is late, but that the middle piers of some of the two-light windows have later mouldings than the jambs, and, therefore, were not built till much later than the latter, so as to leave passage for the carts.

As to the peculiar vault of the middle crypt, it has no doubt its rationale, if we could find it. Probably it is partly due to constructional reasons, partly to considerations of ritual. In the first place, its plan is conditioned by the fact that the middle crypt has three arches to the west but only two to the east; these two conditions have to be brought into harmony. Secondly, it was necessary to glorify one part of the crypt where was to stand the famous shrine of St. Kentigern, and another part where was to be placed the altar of the Virgin Mary (owing to the fall of the ground there could be no projecting Lady Chapel in the upper choir). To the west, therefore, but nearly central in the crypt, in a small square compartment, surrounded by four pillars, was placed the shrine. And to the east and west of it two large compartments were vaulted, after the manner of Lincoln Morning Chapel, with a central stalk; while in front and to the west of the altar of the Virgin, that there might be no obstruction,

Glasgow Crypt. East.

another large compartment was vaulted, like the Lincoln Consistory or Southwell Chapter House, *without* a central pier. Hence the exceedingly bewildering plan of this crypt.

Mr. Watson's hypothesis is coherent and well argued. How far his evidence is trustworthy could only be ascertained by a detailed examination *in situ*. It will be little to the credit of the Scottish architects if they fail to test rigorously the mass of detail which is now laid before them. For ourselves, it must be said that Mr. Watson's treatment appears now and then not to be rigorously critical. It is altogether unscientific to appeal to French Gothic as a guide to English chronology (p. 105). The two Gothics, English and French, went on in the main independently and at a different pace. Moreover, in England itself, as Mr. Prior has well shown in his "Gothic Art in England," there was not one school of Early English Gothic, but several. Mr. Watson must make up his mind whether Glasgow is to be correlated with the Canterbury and Chichester Gothic or with that of Wells and

Cwm Hir, or with Lincoln, or with Yorkshire Cisterciau. He **must** not appeal to them all at random. Moreover, he has an objectionable way of turning his probabilities a few pages later into certainties, *e.g.*, "The church of Jocelin must have been pulled down by Walter," p. 20, becomes on p. 22, "We have seen that Jocelin began by pulling down the unfinished church of Jocelin." What he ought to have said is, "We hazarded the conjecture," and a very unlikely conjecture it is. For he tells us that the portion of the church carried out either wholly or in part by Jocelin between 1175 and 1179 was a choir with vaulted crypt, and probably also with vaulted aisles. We should want a great deal of evidence, of which Mr. Watson adduces next to none, to induce us to believe that such a great mass of recent work was pulled down only twenty years later; builders, at any rate in England, were practical men, nor were their employers millionaires. On several minor points the book gives us pause. Viollet-le-Duc is quoted as saying that all the great cathedrals of central France were com-

menced between 1180 and 1240. It is well known that Notre Dame, Paris, was commenced in 1162, and Sens nearly twenty years earlier. The ridge-rib is said (p. 72) not to be found in our earlier vaults; it occurs in Ripon transept (c. 1170). Nor is it likely that the tierceron or intermediate rib was introduced because some additional support was needed for the ridge-rib in the larger vaults (p. 90); rather it was introduced to facilitate filling in, especially by panels. We are told that the stair-vaults with tiercerons and abbreviated ridge-ribs could not have been produced earlier than 1270; both forms of rib occur in the vault of Lincoln nave. Nor is there any reason to assume that the foliated capital shown in fig. 11 is of later date than its twelfth century base; simple trefoil capitals of this character occur sporadically throughout England and Wales in the last twenty years of the twelfth century—*e.g.*, in Chichester presbytery, St. Anne's, Lewes, Llandaf, Cwm Hir.

Nevertheless, the book is a most valuable

Glasgow Crypt. Site of the Shrine of St. Kentigern.

74

contribution to architectural literature, and especially to the history of Gothic vaulting in Great Britain. But it is plain that, in any final attempt to settle the disputable chronologies of Glasgow choir, attention must not be fixed on the vaulting alone. Plan, bay design, piers, capitals, bases, indeed every architectural member, will have to be studied; and from a synthesis of the whole a conclusive determination may be arrived at.\*

#### CAN WE DATE OUR SAXON CHURCHES?—II.

BY PROFESSOR BALDWIN BROWN.

**I**N the last paper attention was called to the importance of Anglo-Saxon art of the connexion of England with the Carolingian Empire. England gave in learning and religion what she received back again in another form in architecture. The term "Carolingian" is, geographically speaking, a very wide one, for the Empire of Charles the Great extended from Spain to the Danube and the Elbe. This vast region, however, fell naturally into two halves, the earlier Neustria and Austrasia, prefiguring the later France and Germany. The English came in contact with both west and east, for Alcuin was settled at Tours and planted in its school his own Northumbrian learning, while Willebrord and Boniface wrought the conversion of Frisia and Central Germany. Willebrord and Boniface were accompanied and followed by such a large number of Anglo-Saxon ecclesiastics, like Pirmin the founder of Reichenau, and Lul who succeeded Boniface in the See of Mainz, that it was specially with the regions beyond the Rhine that our countrymen became connected, and our architectural forms in consequence take

after those of the east rather than of the west.

Putting aside the crypt or chapel at St. Gervais above Rouen as being still essentially Roman, we may divide the early mediæval monuments of the Frankish empire into two groups. One is marked by the Gallo-Roman *petit-appareil*, sometimes with lines of brick (Basse Euvre, Beauvais; Vieux-Pont-au-Auge), and especially by an elaborate mosaic-like treatment of facing-stones (St. Christophe, Suèvres; Cravant; St. Jean, Poitiers). These kinds of work are almost entirely confined to the western regions, the only two examples eastward being the so-called Clara-Thurm at Cologne, and the entrance gatehouse to the cloister of Lorsch, near Worms. The careful monograph on the latter, by R. Adamy, has recently thrown a welcome light on the origin of this notable little monument. It is of earlier date by some thirty years than Charles the Great's minster at Aachen, and was built under the rule of a brother of Chrodogang, Bishop of Metz, and with the help of monks transferred to Lorsch from a convent near Metz, from the neighbourhood of which part of the material was conveyed. It is therefore not a local architectural product, but really belongs to the region west of the Rhine. It thus falls into line with the other mosaic-faced structures already referred to, for which the name "Merovingian" has been with some reason suggested. In any case, the architectural tradition known as "Carolingian" does not begin with Lorsch, which is exceptional, but with the minster at Aachen of about the year 800.

From this time onwards there are differences growing more and more marked as time advances, between the Romanesque of the western and eastern provinces. The Frankish architecture of the west gives birth in the fulness of time to the Norman sty'e,

This preserves the old facing technique with *petit-appareil* and decorative herring-bone work and *opus reticulatum*, whereas we could hardly find an example of these east of the Rhine. Normandy employs the buttress, while this feature, after Aachen which has it at the corners of the Octagon, does not appear in early German Romanesque, its place being taken by the decorative pilaster, or *Lisenc*. Germany employs the double-splayed window, while the Normans confine themselves to the internally-splayed form. In Germany the column is in frequent use in nave arcades, while in Normandy we find almost exclusively the pier. The characteristic early Norman cap is a rude Ionic; the cubical cap is just as characteristic of the eastern province. The mid-wall work universal in Germany is modified in Normandy by recessing. Finally, in the composition of western ends, though the twin-towered scheme is equally characteristic of west and east, yet Germany alternates with this the single western tower not found in the western province, and derived by some from the tower-shaped frontal of the minster at Aachen.

Turning from the west to the east, we find that the monuments which represent the eastern tradition are as a rule dateable, and form a continuous series from Aachen onwards. The so-called Eginhard-Basilica at Michelstadt in the Odenwald, begun in 827 A.D., though only partially preserved, is especially valuable. A little later we have the fine churches of Saxony, of which Gertrude, of the tenth century, is the earliest and most interesting; and from this date onwards to the culmination of German Romanesque in the twelfth century examples are too numerous to mention. It is suggested here that Anglo-Saxon architecture in all but its earliest forms has strong affinities with this early Romanesque of the eastern parts of the Frankish realm, and is out of all

\* A plan of the crypt appeared in the *Bilder* on July 1, 1893.

historical relation to the Romanesque of the west as displayed in Normandy.

Upon this basis we can understand why it is that, whenever definite details are forthcoming, it is comparatively easy to tell late Anglo-Saxon work from Norman, and why the character of our architecture was so decisively changed at the Conquest. We can understand, too, how, in spite of this change, there are features in our English Norman that do not appear in the Duchy, such features representing to some small extent (for the west greatly predominates) a fusion of the styles of the two provinces. With these questions we are not now concerned, and it remains to draw out some of the consequences for Anglo-Saxon chronology of what has just been put forward. We will deal in turn with *Lisenen*, with the various forms of window-openings, and with mid-wall work, including the caps of dividing shafts.

I. *The Lisenen*.—These appear as we have seen at Lorsch, about 770 A.D., but have here the distinctly Classical form of short fluted pilasters with debased but somewhat elaborate Ionic caps. They do not appear at Aachen or Michelstadt or at Eginhard's other basilica at Seligenstadt, but we find them again, and still with Classical bases and caps, on the lower stages of the west front of St. Castor, Coblenz, dating from the end of the ninth century. A little later, at the west end of Gernrode of about 960 A.D., the *lisenen* are losing the character of Classical pilasters and becoming long upright strips either ending under a flat string-course or joined at the top by an arcading of small arches. On the north-west tower of Gernrode these arches are straight-sided, on the other round-headed, and where they spring from the pilasters these last have imposts with a hollow chamfer. Later on the *lisenen* are often quite plain, but are generally joined by the round-arched arcade, and in this shape, no longer suggesting antique pilasters, they are established features of German Romanesque in the eleventh and twelfth centuries. Occasionally, however, the Classical caps and bases still appear, as at the east end of Mainz and the west end of Trier, both of the eleventh century. At the latter some of the carved caps are of Corinthian design.

Assuming that architectural influence of Germany on England which the connexion of the two countries renders probable, we can use the chronology thus gained for our own purposes. Many English examples of stripwork exhibit, not indeed classically shaped caps and bases, but rude blocks which are meant to do duty for such, and many others plain strips, with sometimes an indication of the arcading. We cannot suppose that our builders borrowed directly from Lorsch or other eighth-century examples a feature that was not taken up in the far more important Carolingian buildings of a generation later. It is reasonable to suppose that the borrowing would take place when the particular feature had become established in the region whence the influence proceeded, and we are directed in this way to the tenth century as the earliest date to which we can ascribe any of our buildings that show this feature, and this will practically mean the time of Edgar and Dunstan. A comparison between the stripwork on the north-west tower at Gernrode with that on the tower at Earls Barton will be instructive (see fig. 2). In both cases the pilaster caps

Fig. 2.—A. Pilaster Strip, Arcading and String-course on the North-West Tower at Gernrode. B. Pilaster Strip and String-course at Earls Barton.

and the string-course have a hollow chamfer. Such correspondence may seem a trifling matter, but trifles of the kind are often of considerable value in the settlement of architectural chronology. It may be pointed out that the peculiarly Anglo-Saxon plan of carrying a flat strip as a sort of frame round an opening is a refinement on the use of the upright pilaster. Any chronological inference which applies to the latter will be equally available for the "stripwork round openings."

II. *Windows*.—The double-splayed light in the form in which we are familiar

Fig. 3.—Double-splayed Light in the West Front of Trier.

with it, where the central aperture is comparatively narrow, is common enough in Early German Romanesque, but it would be hard to say where it first makes its appearance. The lower stage of the Rotunda at Fulda, of 820 A.D., possesses it, and if Adler is right the east end of the interesting little church of Niederzell, in Reichenau, has still earlier specimens. On the other hand, and this fact is of no little importance, there is nothing of the kind at Michelstadt. This basilica of about 827 A.D. possesses its original nave lights. They are of both the round-headed

and the circular form, and are all internally splayed and furnished on the outside with a rebate for a shutter. The windows at Aachen, save some slits in the western flanking towers, are of the large-apertured Early Christian type. In the north flanking turret of the west front of St. Pantaleon, Cologne, there is an example from about 980 A.D. In the north wall of Bishop Meinwerk's Bartholomaeus Kapelle at Paderborn of the early eleventh century is an original blocked double-splayed light, while in the west front of Trier, of about the middle of the century, they appear abundantly in a common Anglo-Saxon form (see fig. 3). Here again, the absence of the feature at Michelstadt seems to show that the doubled-splayed was not as early as the single-splayed window, and would lead us to date at least as late as the tenth century any example in our own country.

The shape of aperture in the ordinary internally-splayed windows with round heads is a matter to notice. In England, taking the Anglo-Saxon and Norman periods together, the apertures vary from those of comparatively broad proportions to narrow slits. Norman windows are sometimes very narrow. The smallest in the vaulted chancel at Darenth, Kent, measure 8 in. in width of aperture by a height of 2 ft. 10. In late Norman work they are much broader. The accepted early Anglo-Saxon churches which have internally-splayed lights—Monkwearmouth, west front; Jarrow, south side of present chancel; and Escomb—have them of broad proportions, and these appear also in the west wall of the nave of St. Martin, Canterbury, the technique of which suggests an early date. The aperture at Monkwearmouth was about 1 ft. 8 in. by 2 ft. 10 in. of height. This agrees with the German evidence, for the Michelstadt windows and those in the sister basilica at Seligenstadt are of broad proportions. It is true that tall narrow loops give light to the turret stairs in the west front at Aachen, but the imitation of arrow-slits in towers of defence is here the probable motive. On the whole, we should probably be right to regard narrow, internally-splayed lights in Pre-Conquest churches as decidedly late indications.

Fig. 4.—A. Corbel Cap at Trier. a. Base of Shaft. B. Corbel Cap at Sompting. b. Front View of Top of Cap. c. Grating that Fills in the Window Opening.

III. *Belfry and other Openings Divided by Mid-Wall Shafts.*—In connexion with this feature it is of special moment to test the theory of German influence, for what has been termed for brevity "mid-wall work" makes its appearance in Italy much earlier than beside the Rhine. If the pre-Conquest builders may have borrowed this directly from Italy there are no chronological data to be obtained from it. There is nothing, however in which the derivation from Germany seems more sure, for in the first place we find the feature in the vast majority of cases in the single western tower, the connexion of which with that region can hardly be doubted, and in the second there is a correspondence in details that is still more convincing. At Sompting, in the tower which carries a German "helm," we find in the south-west opening of the belfry stage a corbel cap that strikingly resembles a very common German form. The example from Trier, a sketch of which was given in fig. 1, p. 208 *ante*, is drawn to scale for comparison with the Sompting cap in fig. 4. The only difference is that the roll under the abacus is narrower in front view than the abacus. The base of the shaft at Trier is also quite familiar. Furthermore many of the cubical caps employed in our bell-towers of the Lincolnshire type can be matched pretty exactly in the numerous Romanesque towers in Germany. One of our most curious shapes, that in the western belfry opening at Glentworth, occurs at Gelnhäusen and at Gernrode. The Scartho cap illustrated in the *Builder* of August 6, 1898, p. 118, fig. 8, is found, with the leaves rather more freely treated, in the oldest part of Werden a. d. Ruhr; the east cap at Glentworth, *ibid.*, fig. 7, at Quedlinburg, &c.

The history of German "mid-wall work" is somewhat as follows. The Minster at Aachen introduced the large opening subdivided by columns after a fashion known in Roman times. The smaller aperture divided by a single shaft occurs in some subsidiary buildings thereto attached, and we find it again in the western part of the Minster at Essen, of the middle of the tenth century. It then becomes very common, especially in belfries, and in the matter of chronology may be regarded as in line with the *Lisieux* and the double-splayed window. It would not be safe to date any example of it in this

country earlier than the epoch which seems to be indicated by the other evidence already passed in review. No building, in other words, that exhibits any of these three features can be safely placed earlier than the third period, opening with the reign of King Edgar, who, we are specially informed, "rebuilt and endowed churches."

Regarding now from this point of view the 170 Anglo-Saxon churches in the list published last autumn in the *Builder*, we find that the double-splayed window and the pilaster-strip or strip-work round openings would exclude about fifty examples from any early period, and forty more would be rejected by the appearance or previous existence in them of the double openings with mid-wall shafts, so that in the evidence of these three criteria about ninety churches would be pronounced not earlier than the time of Edgar. There are about a score of others that without these special marks have indications of comparatively late date in the possession (or traces) of western towers, in advanced doorways or chancel arches, or in developed cruciform plans in which the side chapels have grown into complete transepts, as at St. Mary, Dover Castle.

This process of elimination leaves us with about sixty examples for which the above criteria are not available. Of these eleven constitute the acknowledged early list recorded at the opening of this paper, and nothing has transpired in the course of this survey to throw doubt on the received ascription. The only dubious feature is the great height of the nave walls at Monkwearmouth. The dozen might be rounded off by the inclusion, on the ground of its technique, of Stone-by-Faversham, though the late Mr. J. T. Irvine thought it a later fragment. Of the remaining half-hundred examples about a score present long-and-short work in quoins as clear indications of pre-Conquest date. These may be middle or late Saxon, but hardly early, for this quoining does not make its appearance on any of the first group.

Lastly, there is an interesting residuum of a couple of dozen examples, some mere fragments, about which there are no distinctive marks of either middle or late date, and which may, conceivably, therefore, go back to the earliest period. The principal of these are the following: St. Mildred at

Canterbury, Stoke d'Abernon, Avebury, Somerford Keynes, St. Michael at St. Albans, Oxford Cathedral, Wroxeter, Heysham Church, Heysham Chapel, Bardsey porch, Sockburn, Hart, and Corbridge. St. Mildred has the big stones at the quoins, which as being in many cases Roman may have been used at an early date. It is a large building, but Brixworth in the seventh century was larger, and Canterbury is a place where ambitious efforts might be looked for. At Stoke d'Abernon the south wall of the nave, 2 ft. 7 in. thick, and part of the adjoining chancel wall claim attention. The technique is flint rubble, irregularly disposed in which are blocks of free stone, and on one of these is a projecting boss with the lines of a Saxon-looking sundial. This seems *in situ*, and its position over an old south door is normal. There are near it also the marks of an old flat-headed light like the one at Wroxeter. Nothing at Avebury seems incompatible with considerable antiquity, for the traces of long-and-short in the quoins are slight, and if, at St. Michael's, St. Albans, we assume the nave arcades to have been cut through pre-existing walls, these walls, with their internally-splayed lights, may be early. Oxford there is not space to discuss. The north wall of the present church at Wroxeter may be early Anglo-Saxon, for the square-headed opening can be paralleled at Escomb. Somerford Keynes should be taken in connexion with Heysham Chapel. The construction of the jambs of both doorways resembles that of the west door of the porch at Monkwearmouth and the chancel arch at Escomb, and the cable ornament on the head of the Wiltshire example may be of any date. The old north door of Heysham Parish Church is also of the same early form, but it must be admitted, on the other hand, that the jamb construction in question occurs also in later monuments, such as Earls Barton. Bardsey porch, if it existed before the tower, may be quite early, as it has the plan of Monkwearmouth and Corbridge, very thin walls and an internally-splayed light. Sockburn-on-Tees bears, in technique though not in proportions of plan, a resemblance to Escomb, and may be of the same generation. Hart, Durham, by the discovery of turned baluster-shafts like those at Monkwearmouth and Jarro, seems to be linked with these acknowledged early examples. Finally, Corbridge, in virtue of its porch and Roman arch of entrance to the church, which has internally splayed windows, has a good claim to its place in the same rank accorded to it by northern antiquaries.

The intention of the foregoing remarks has been to call attention to some of the points that have to be considered in any attempt to form a chronology of Anglo-Saxon architecture. It makes no pretence to be more than a contribution to the work, in which so many are engaged, of building up some substantial knowledge of the earliest phase of English architecture. The list of examples offered recently is certainly far from an exhaustive one, and there may exist many buildings in the country that have as good a claim to a place on the early roll as these now noticed. Such a claim would, however, be barred by the appearance of any of the definite features that point to a more advanced epoch. There is no space here for any further attempt to distinguish subdivisions in the last and most

prolific period of the three adopted, or to suggest special criteria by which to identify works of the central or Danish period. We learn of St. Swithun, in the early part of this period, that he "gave great attention to the construction of churches in those places that were without them, as well as to the restoration of those that were ruined and broken down," and it is natural to seek for evidence of his activity in some existing monument. His diocese of Winchester included only Hampshire and Surrey, and had he gone over his borders he would have got into trouble with his brethren of Sherborne and Selsey. Of the Anglo-Saxon churches on the list in Hants and Surrey, Boarhunt, Corhampton, Headbourne Worthey, Hinton Ampner, Little Sombourne, Braemore, Guildford, Godalming, Stoke d'Abernon, all but the last two have pilaster strips, and on the evidence relied on in these papers cannot be of his time; still less, of course, of the time of Willfrid. Godalming has been so much altered that a criticism is difficult, and at Stoke d'Abernon we have only a bit of walling without definite architectural features, though this may possibly be of his date. On the other hand, Somerford Keynes and Avebury, in the Sherborne diocese, have just the character that might fit them for this epoch. Avebury, in fact, with its suggestion of long-and-short and its single-played lights, would suit the Swithun period to a nicety, but it is unfortunately out of his beat.

## NOTES.

**Trade-Unions and the Taff Vale Case.** THE now celebrated Taff Vale case was, of course, the subject of discussion at the Trades Union Congress last week, and the fact that the House of Lords by their decision in that judgment have made trade-unions legally liable for the acts of their agents rendered necessary a consideration of the new position of these bodies. It was decided to take a test case to the House of Lords to ascertain how far picketing may be carried on without rendering the funds of a trade-union liable for damages. It seems, however, to have been overlooked that these questions of damages do not depend on pure questions of law. That which actually damages an employer is the strike, the cessation of work. But it is perfectly lawful for workmen to enter into combinations and to strike, and it is easy to think of a very flagrant case of picketing which may be unlawful, but which may at the same time be a legal wrong without carrying with it, under the circumstances, any right to damages; for an act of picketing would not be such as would carry with it damages unless some substantial loss could be proved to have flowed from it. We are inclined, indeed, to think that the Taff Vale case will have little effect on the funds of unions, because the very fact that an injunction may be obtained against a union in respect of the acts of its agents will have the effect of enabling employers to protect themselves before serious injury has accrued to them. So-called test cases are usually unsatisfactory and are frequently misleading, because when a real struggle arises the facts may be different, perhaps only slightly, but sufficient to render a decision in a previous "test" case inapplicable. We believe that trade-unions would be well advised merely to watch the action of

employers and to keep a careful eye on this branch of law, the development of which in favour of employers is probably more difficult than they think.

Welbeck Abbey.

WE learn that the Duke of Portland will employ Messrs. Trollope & Co. for the rebuilding of the "Oxford" wing at Welbeck Abbey, rendered necessary by the disastrous fire in October last year. The "Oxford" wing was built by the Countess of Oxford (who also restored the ancient Gothic Hall in 1751) after the marriage of her only daughter and heir, Lady Margaret Harley, to William, second Duke of Portland. It is also stated that the new works will comprise the pulling down of the "tan gallop," a long arcade roofed with glass, of which the stones will be utilised for the reconstruction of the "Oxford" wing, and the site will be planted with an avenue of trees. The "tan gallop," with its east and west pavilions, is nearly 1,300 ft. long, and contains upwards of 64,000 ft. superficial of glass. It was erected for exercising the horses during the winter and on rainy days. The property derives its name from the abbey which was founded in King Stephen's day for Premonstratensian Canons of the Cistercian order by Thomas le Flemangh. At the Dissolution, when the revenues were computed as of the value of 298*l.* per annum, Henry VIII gave a grant of the abbey to Richard Whalley, a wealthy clothier, who sold it to Sir Edward Osborne, of London, citizen and clothworker. From Osborne it passed, through some intermediate hands, to Sir Charles Cavendish, father of William, first Duke of Newcastle, who, in 1623, built the great riding house at Welbeck, which the late Duke of Portland altered and enlarged for a picture-gallery and chapel.

Tintern Abbey.

IT is satisfactory to know that Tintern Abbey has now been transferred by the Duke of Beaufort to a public trust, for, unless a private owner is very public-spirited and wealthy, historical or architectural monuments are less well cared for by private individuals than by some public or semi-public body. The surroundings of Tintern Abbey are not altogether satisfactory, and if, as we understand, some of the adjacent buildings are to be removed, it will be a distinct gain. The whole Abbey should also be carefully surveyed, not with a view to its restoration, but with the object of preventing further decay. Ivy is a picturesque addition to a ruin, but when allowed to grow in masses it has a bad habit of loosening mortar. A ruin so beautiful in itself and its surroundings as Tintern demands the most careful guardianship. It should never be forgotten that it is a ruin, but it should equally be borne in mind that it should be preserved as far as possible from further decay. Every information should also be given to the self-guiding visitor by hand cards, and the loquacious and parrot-like human guide should be prevented from troubling those who do not demand his services.

London Roadways.

IN a city like London, where the traffic is of so varied a character and where control is vested in a number of independent municipalities, it is not at all surprising that different methods of paving should be

adopted. In many comparatively quiet thoroughfares macadam is still perpetuated in spite of its manifest disadvantages; in other streets and roads over which heavy traffic passes, granite setts remain in evidence; but in the principal highways asphalt and wood paving are predominant. Yet none of the paving systems in use can be said to fulfil all the essential conditions. These are necessarily of conflicting nature, for any material that is hard and uoyielding, like granite, is resonant, and readily becomes smooth and slippery; another such as asphalt, that is compressible and has a fine surface affords practically no foothold in bad weather and becomes depressed in softer parts or flaked in harder parts; another again, such as wood, which is quiet and safe for animals, wears out quickly and is non-sanitary. Putting ordinary roadmaking materials into one category we find all the required characteristics, but the trouble is to combine them in any one form of material. Successful results reported from American and Continental cities cannot be obtained in London whose traffic is unapproached by that of any other place in the world. Moreover it must be remembered that the London omnibus carrying a very heavy load on extremely narrow wheels plays sad havoc with, and places a very unfair strain upon, any type of roadway. No doubt the enforcement of regulations by which the width of wheel tyres should be made proportionate to the maximum load, would vastly facilitate the work of municipal engineers, although such a policy would by no means constitute a solution of the problem presented. One step in this direction is recorded by Mr. Livingstone in a recent letter to the *Times*. Mr. Livingstone, who has had considerable experience of paving operations, directs attention to the "sanitary block" paving. Each block consists of Lake Trinidad bitumen mixed with small fragments of hard stone, the process of manufacture being performed at a temperature of 300 deg. Fahr., and the block is formed under a pressure of 125 tons. So far as our experience of this material extends, it undoubtedly combines most of the advantages possessed by asphalt and wood. It is non-absorbent, gives a good foothold in all weathers, and shows signs of considerable durability. On the latter point it should be said that the only sample subject to really heavy traffic, including omnibuses, has not been laid for a sufficient time to afford reliable data. The example in Carlos-place, which has been in use for four years without repair, shows no sign of wear, and the surface is fully equal to that of the adjoining wood pavement laid only two years ago in Mount-street. The effect of traffic seems to be that the blocks are slightly compressed and spread laterally, thus closing up the joints and making the surface even smoother than at first. Possibly the sanitary block system may not be of sufficient durability to stand exceptionally heavy traffic. That remains to be proved, but in the meantime it appears to be clear that the material is quite suitable for many roadways where neither wood nor asphalt is entirely free from disadvantage.

Australian Hard Woods.

A RECENT number of the "Bulletin of Miscellaneous Information," which is issued at irregular intervals from the Royal Botanic

Gardens, Kew, contains a Report of a good deal of interest by the late Mr. Ednie Brown, Conservator of Forests, on the Australian hard woods Jarrah and Karri, which are of much value for all kinds of out-of-door work. Of the Jarrah wood Mr. Brown states that—he is speaking of wood which had already been in use for sixty years—"it seems capable of standing wear and tear for another 100 years." Water seems to have no effect upon it. Of the Karri wood the Report says:—"For bridge planking, shafts, spokes, felloes, and large planking of any sort, flooring, general waggon work, beams, it is unequalled in this colony." The whole Report should, therefore, be carefully studied by those who are interested professionally in matters having to do with the construction of buildings, for it is open to doubt whether sufficient attention has been paid in this country to the Australian hard woods, and at the present time, when we hear so much of trade within the bounds of the Empire, it is desirable to use this feeling for the spread in the mother country of really sound commercial products.

Safety of the Brooklyn Bridge. PUBLIC opinion in New York has been much agitated lately by a comparatively small, but still sufficiently significant, mishap to the Brooklyn Suspension Bridge, and the alarm felt has been somewhat naturally increased by the fact that another failure occurred two or three years ago. When the bridge was opened for traffic in May, 1883, it afforded five passage-ways between the opposite sides of the East River: one footway, two cable-car tracks, and two carriage-ways. Since then two tracks for trolley-cars have been added, and there can be no reasonable doubt whatever that the structure has been loaded fully up to, and possibly beyond, the safe limit. Under such circumstances it is hardly fair to throw blame upon the original designers, although, in the light of more recent engineering experience, we may be able to see where some details of construction might be improved. Examples of bridge building such as the Newcastle High-level and the Menai Tubular bridges have neither developed faults nor signs of weakness under greatly-increased loads, but this happy circumstance may be traced in no small measure to the ample margin of strength which has always been allowed by British engineers. On the other side of the Atlantic the tendency has been, and still is, to regard the factor of safety with a certain amount of suspicion, as a thing that may conduce to waste of material if not carefully watched. The effect of this policy, as applied to bridge construction, is obviously to place a strict limit on any increase of load or variation of stress, but no such consideration appears to have entered the minds of those responsible for the safety of the Brooklyn bridge. It was bad enough to add nearly 50 per cent. to the original load, but it was much worse to admit to the additional roadways trolley-cars capable of powerful dynamical effect, and no one need be in the slightest degree surprised to hear of repeated failures. The first warning was given by the buckling of the stiffening trusses of the floor system, and the second by the breaking of nine suspenders by which the roadway is hung from the main cables. At the centre of the main span the trusses have

slip joints, permitting a maximum longitudinal movement of about 7 in., and the cables also move, but in a vertical direction. Therefore the lower ends of the suspension rods move backward and forward as temperature varies. At the points of connexion, trunnion blocks are provided to which the rods are secured. Owing to inefficient action of the trunnions, largely due to want of proper supervision, a heavy bending strain has been brought upon the suspension rods, the strain being first in one direction and then in the other. Unfortunately these reverse strains were greatest at the centre of the span where the rods were shortest, and consequently possessed the minimum degree of flexibility, and the mischief was aggravated by the rusting of the screwed ends. The most extraordinary feature revealed in connexion with the present mishap is the inadequate nature of the supervision exercised by the responsible officials, and it is clear that in future a thorough system of inspection must be continually maintained. Some modification of structural details is also required to guard against the recurrence of failure. The main trusses should be made continuous across the centre of the span, and expansion joints might be formed at a short distance from each tower. Then no necessity would exist for hinged joints, as the great length and flexibility of the suspension rods would prevent the existence of injurious strains at the points of connexion.

#### High Speed Railways.

THE paper read last week at the International Engineering Congress at Glasgow by Mr. Lasche on high speed railways is a very important one. He describes fully the experiments on high speed electric cars which are being carried out at great expense by the Allgemeine Electricitäts-Gesellschaft of Berlin. The details given are of great practical value to engineers. For example, liquid starting resistances have been found feasible, and this device will get over many difficulties. In the experimental line at the Berlin works the pressure used is 12,000 volts, but Mr. Lasche contemplates a pressure of 40,000 or 50,000 volts on the three-phase system. The speed for which the car has been constructed is 200 kilometres (124 miles) per hour. If this high speed is to be used on railways it will be absolutely necessary to have a separate track with lines in both directions for the express trains. The present system of signalling will also need altering, and crossings and switches will have to be abandoned. In the discussion Sir William Preece praised the way experiments were made in Germany, and complained that in England large sums of money were spent in trying to prevent experiments being made at all. He instanced the proposed electrical mono-rail between Liverpool and Manchester, and the costly opposition the promoters experienced in getting their Bill through Parliament. In our opinion, however, there would not have been so much opposition if the promoters could have referred to successful experiments. Professor Silvanus Thompson was of opinion that the conversion of railways from steam to electricity was the most important field of research for electricians at the present time. He deprecated the spending of a great deal of money in useless experiments

like the one recently made at Earl's Court. He hoped that English manufacturers would equip practical research departments on the same lines as those in which the author had conducted his experiments. Professor Carhart mentioned that an entirely novel single-phase high-pressure system was shortly to be tried in Michigan, U.S.A. In this system, when the train pulled up, the motors would not be stopped, and hence the load on the line could be kept fairly constant.

MESSRS. POWELL & SONS have Stained Glass, just completed a stained glass window which is on view at the Whitefriars Glass Works; besides its artistic treatment, the interest of this window lies in the fact that it is a German order and is going to the German church of Immanuelskirche, Frankfurt. The glass is of the mosaic treatment, similar to that done by Messrs. Powell & Sons at St. Paul's for Sir Wm. Richmond. This treatment was specially chosen by the donor in contradistinction to the Modern German style. The window will probably be regarded rather as a curiosity in Germany, but we hope it may draw favourable attention to a more rational treatment of glass decoration in that country. The scattered way that stained glass is nowadays introduced into churches makes it a difficult form of modern decoration to accept seriously. Sometimes the poetic completeness of the old Gothic churches is realised, but we fear they are too often disturbed by unsuitable innovations. In the case of a modern church the mosaic treatment has several advantages: one is the peculiar opalescent and jewel-like effect which is obtained and makes it suitable for concentrated decoration; it is also displayed to the best advantage among simple surroundings. We do not know whether its immense weight is likely to render it less durable from the "creeping" of the lead; for this reason, at any rate, it is probably undesirable for large windows such as those of the fourteenth or fifteenth centuries.

#### Stirling.

WHEN so many tourists are returning from holidays in the Highlands it is not untimely to suggest that those who are concerned with architecture should not pass Stirling by unvisited. This there is certainly a tendency to do, and it is not perhaps surprising, since it lies so closely on the border line of the Highlands that tourists are inclined to leave this town on one side and make either for Edinburgh or some Lowland place. The situation of the castle is remarkable, but what is more noticeable architecturally is the influence of French art. The house popularly called Argyle's Lodging, but once the home of Sir William Alexander, the poet, who was created Earl of Stirling in 1632, might have been transferred bodily from the banks of the Loire. The remains of the mansion known as Mars Work is as ornate as anything in Touraine, whilst the palace itself is distinctly reminiscent of France. No place more strikingly marks the connexion between Scotland and France before the Union, and there is something remarkable in seeing architecture which is so suitable to and so characteristic of the sunny climate of France straggling, so to speak, for existence in the uncongenial and stern atmosphere of Scotland. The Grey-

friars' Church equally shows traces of the same influence, so that a student who will spend a morning in Stirling will find matter for interesting and suggestive study.

#### THE RUSSIAN PAVILIONS AT THE GLASGOW EXHIBITION.

APART from the forestry exhibits, the portions of the Russian section which will prove of most interest to our readers are the buildings themselves. These are six in number, but two of them—devoted to flour and cereals—are very small, and need not be further referred to. The other four buildings are large wooden structures, built in the national style, garishly coloured, but undoubtedly picturesque, although to English eyes somewhat bizarre. They were all designed by Schechtel, a Moscow architect, and are worth careful study.

The building devoted to agriculture is perhaps the most important, and consists of a lofty nave about 11 yards wide, and two aisles, each about 7 yards wide, with large windows in the aisles and clearstory. The principal entrance is in the centre of one side, and two other entrances are provided in the extreme bays on the same side. The walls are painted—chiefly in pale green and salmon—and the shingles are coloured Indian red to imitate tiles. The forestry building consists of a lofty hall about 60 ft. wide with high-pitched roof having half-hipped gables, and has a verandah along one side, with a square tower rising from the end bay. The tower has a simple pyramidal roof, and forms (on the ground floor) a vestibule between the projecting porch and hall. The walls are painted light-brown and buff, and the shingles blue. The building devoted to mining industries is still more like a church, and has a nave and one aisle and an octagonal tower and spire masking the front end of the aisle; the shingles here are green. The most characteristic building of all is that devoted to miscellaneous exhibits. It is an ecclesiastical-looking structure on what is known as the central type of plan, and has an octagonal tower over the central area with tiers of sharply-pointed gables and a lofty octagonal spire. The picturesqueness is increased by various annexes. The walls are salmon colour, and the shingles reddish brown.

It is not likely that the architectural details will be imitated in this country, but the construction of the roofs may serve as instructive types. That over the Agricultural Pavilion is roughly shown in figs. 1 and 2, which have been redrawn from rough sketches, and not from accurate measurements. The span of the nave is about 11 yds., and that of each aisle about 7 yds. The supporting posts measure 10 in. by 10 in., and are about 20 ft. apart. As shown in fig. 2, intermediate trusses are supported on cross timbers and struts midway between the posts. The dimensions of the various timbers forming the trusses are only approximate. The truss is of the hammer-beam type, each hammer-beam being composed of two pieces (about 9 in. by 2 in.) bolted to the foot of the principal rafter and to the sides of the raking strut. The common rafters are fixed horizontally, purlins being thus rendered unnecessary.

The roof over the Forestry Pavilion (figs. 3 and 4) is more peculiar, being a combination of the hammer-beam and scissor-beam types. The span is about 20 yds., and the framing is approximately as shown in the drawings. The main trusses (fig. 3) are about 17 ft. apart, and the intermediate trusses (fig. 4) are placed midway between them. The intermediate trusses are of the scissor-beam type, with a collar at one-third of the height. The main trusses are similar, but with long raking struts carried up from the posts to the ends of the collars. The raking struts are braced to the rafters and posts by two pairs of pieces measuring about 6 in. by 2 in. Iron straps are bolted to the timbers at the ends of the collars, and at the intersections of the scissor-beams on the king-post. At every other intersection, a single bolt is fixed. Each scissor-beam is composed of two pieces, about 9 in. by 2 in., one on each side of the main timbers.

The Forestry Pavilion contains by far the most interesting exhibits. They are all, or nearly all, supplied by the Imperial Appanages Ministry of Russia. These Appanages, by the way, were originally State lands, which were

Construction of Roofs of Two Russian Pavilions, Glasgow Exhibition.

set apart in 1797 by the Emperor Paul I. (who evidently knew what he was about) for the members of the Imperial family, other than the Emperor and his eldest son. The annual revenues have not always been spent, and the surpluses have been devoted to the development of the estates, and also to the purchase of new estates, so that at the present time the Appanages are very valuable properties, producing minerals, timber, vines, and cereals in great abundance. Some idea of their extent may be gathered from the fact that the area of the forests of the Appanages exceeds 150,000,000 acres. About two-thirds of this area is now under management. Regulations are made in order to preserve the forests from depletion. Each portion of a forest passes through a cycle of growth, cutting, and replanting, the duration of the cycle being regulated by the rate of growth in that particular district and other factors; thus, the "minima revolutions" for pine intended for the market is 160 years in the northern districts and 120 years in the southern. The cycles for firewood trees are much shorter, varying from about thirty to eighty years, according to the locality and the kind of tree.

Most of the timber is sold standing, the average price per deciatine (2.7 acres) being 94 roubles (9l. 16s. 6d.) in 1885, 99 roubles

10 copecks (10l. 5s. 6d.) in 1895, and no less than 134 roubles (13l. 10s. 6d.) in prosperous 1899. The net income from the forests was about 1,610,000 roubles in 1885, 1,900,000 in 1895, and 4,060,000 in 1898. Only about 10 per cent. of the annual production of the forests is converted in the saw-mills belonging to the Appanages, but the proportion is steadily increasing, as new saw-mills are being erected. At Archangel there is a saw-mill for the northern forests of Velsk; the forests of Vologda supply a saw-mill on the Kovja, a river of the Marie basin, whence the converted stuff passes to St. Petersburg or (for foreign markets) to the port of Kronstadt; the logs from the Nijni-Novgorod forests are floated down the Volga to the mill at Kaptarski; and another mill at Stralia serves the forest of Svislotchkaia. There is now a fifth mill at Astrakhan for converting the timber required in the Transcasian districts. The mills at Archangel and on the Kovja are of more interest to English readers; of the output of that at Archangel from 1891 to 1898 inclusive, 70.7 per cent. was exported to England, the remainder going to Holland, France, Spain, Belgium, and Germany. Of the "pine and silver fir" (i.e., red or yellow deal or fir, and white deal or spruce) exported from the mill on the Kovja, during the period 1897-9, about

60 per cent. was shipped to England, and about 27 per cent. to Germany.

A comparison of the woods grown in the different forests can be made by examining the 231 specimens collected in the two stands marked No. 7. The specimens are numbered, but unfortunately they are not placed in consecutive order, and it is, therefore, a difficult matter to find any particular number. The specimens are all 10½ in. long, but of various widths and thicknesses, and are polished on one side only. Fifteen different Appanages and Imperial estates are represented, ranging from Velsk and Volozda in the north to the forests adjoining the Black and Caspian Seas in the south. The soft woods, which are, of course, chiefly from the central and northern forests, include "common pine" (*Pinus sylvestris*), "silver fir" (*Picea excelsa*), "Siberian spruce fir" (*Abies sibirica*), and "Siberian larch" (*Larix sibirica*). Among the hard woods are oak, birches, alders, poplars, elms, sycamore and maples, willows, ash, linden, rowan-tree, palm-tree, apple and pear-tree, chestnut, hornbeam, box, hazel, fig-tree, walnut, holly, yew, almond-tree, and others. The student will find it interesting to compare the different varieties of the same species, as well as the different species.

Another series of exhibits (Nos. 8 to 53) is restricted to the timbers most commonly found in the forests, and important from the commercial point of view. The specimens in this series are about a yard long, and are cut from the lower parts of trees which have arrived at the age for exploitation. They are shaped as shown in fig. 5, one half of the face being polished, and include nearly all the common softwoods and hardwoods. In a third series (Nos. 54 to 66), confined to oak, aspen, and softwoods, the specimens are discs, a few inches thick, cut from the lower parts of tree trunks of large diameter; these specimens are "skied," and cannot be properly seen. Among the other exhibits are planks of various kinds of timber, oak stavewood, models of log rafts, &c.

At Stand No. 109, which is not mentioned in the catalogue, are some fine unarked logs of oak, pine, silver fir, and larch, about five yards long and 2 ft. in diameter, but some of the most interesting exhibits are the three series on the "defects and technical vices" of timber, as exemplified in the Velsk forests. The first series is numbered 159 (1 to 43), and deals only with common pine; the second series (No. 159, 45 to 73) is confined to silver fir; and the third (No. 159, 74 to 79) to larch. Thirty-four different names of defects are recognised in the sorting of timber at Velsk, but these may be classified in ten groups:—(1) Knotty wood, (2) rot, (3) curvatures, (4) rot at the foot, (5) clefts, (6) sunstroke, (7) recovered wounds, (8) soft wood, (9) irregularity of the structure, and deformity, (10) dead timber. As the specimens are not placed in consecutive order, it is difficult to follow them according to the catalogue, but the time taken in examining them will be well spent.

We have not by any means exhausted the exhibits in the Forestry Pavilion, but sufficient has been said to show that they are of great interest, not only to the timber-merchant and builder, but also to the architect.

In the other pavilions there is little which calls for notice. The exhibits in what we may call the miscellaneous pavilion consist of furs, carpets, trinkets, &c., and some inlaid cabinets and screens, which are, perhaps, more useful than beautiful, but this is not saying a great deal. In the agricultural pavilion the most interesting exhibits are the photographs of the ruins in the vast Imperial domain of Mourghab in Asia, and the relief map of the domain showing the system of irrigation. The pavilion devoted to mining industries contains twenty cases of minerals lent by the Mining Institute of St. Petersburg, some geological maps, and a large stand of building and ornamental stones, including polished granites of various colours, besides minor exhibits.

Undoubtedly the forestry pavilion is of most interest to our readers, and we recommend a study of the materials collected within its walls.

TRADES UNION CONGRESS.

The fifth sitting of the Trades Union Congress was held on the 6th inst. in the Albert Hall, Swansea. Alderman C. W. Bowerman (London) presiding.

Mr. Fisher (Cardiff Coal Trimmers) moved a resolution re-endorsing the necessity for the extension of the principle of the Workmen's Compensation Act to all trades and occupations, abolition of the fourteen days' qualifying period, and that the basis of claim be fixed on the average wage per hour as representing a week's earnings, instead of the average week as at present; that appeals to the House of Lords be allowed against decisions of the Scotch Courts, that all workpeople be brought within the operation of the Act, that compensation be paid for all injuries sustained in the course of employment, that the 30ft. limit as regards buildings, &c., be deleted from the Act, and also that the fourteen days' limit as regards liability be abolished, and that compensation be paid as from the date of the injury; that schedule 11 be amended, so that where total or partial incapacity for work results from the injury, a weekly payment shall be made during incapacity of not less than 50 per cent. of the recognised rate of wage of the trade or calling to which the injured person may belong, but in no case shall the compensation paid fall below 10s. per week for persons over eighteen years of age, young persons under the age of eighteen injured in the course of their employment to have their compensation fixed on prospective earnings; in no case shall a person who is in receipt of compensation be compelled to undertake any work other than that in which he was engaged when he met with the injury; also that the subsection as to serious and wilful misconduct of that workman be deleted, and emphatically protesting against the attempt now being made by the House of Lords to abolish the right of appeal to that body in cases of workmen's compensation in England. He said there were many limitations and restrictions to compensation paid under the Act which required to be swept away.

Mr. Marlin (Liverpool Carpenters), who seconded the motion, dwelt upon the importance of the elimination of the 30-ft. limit to the workmen engaged in the building trade.

Mr. J. Holmes (Leicester Hosiery Federation) thought it inequitable to ask for the elimination of the serious and wilful misconduct clause. Supposing a man met with an accident when drunk, was the employer to pay him compensation?

Mr. John Ward (London Navvies) was surprised that workmen should have tacitly agreed to the 50 per cent. limitation of their claim for compensation for injury. It was a principle new to British law, and he hoped they would insist upon receiving compensation to the full amount of damage sustained.

Mr Edmund Browne (Standing Counsel to the Parliamentary Committee) said he had drafted a Bill to amend the Workmen's Compensation Act, which included the majority of the points in the resolution. The Bill abolished the fourteen days' limit, and the average wage per hour was also met.

Mr. Ward's point was not in the Bill, but the Parliamentary Committee had no objection to altering the amount of compensation from 50 per cent. to the full wages. Casual labourers were now included, but the House of Lords had not yet decided how the wages were to be assessed. If a man had worked for however short a length of time his average weekly earnings could be very easily computed. It was one of the most extraordinary things in this most extraordinary Act that it entirely left out the right of appeal to Scotland. They had heard a lot about the House of Lords, but he was bound to say, so far as decisions under the Workmen's Compensation Act were concerned, they had been absolutely right, while the Court of Appeal had been absolutely wrong with reference to the clause asking the courts to estimate the prospective earnings of young persons who were permanently injured. He was of opinion that they ought to be reasonable in their demand. It was a very serious thing to ask any one to estimate what a young person of eighteen would be earning at twenty-five. With respect to the serious and wilful misconduct clause he felt Mr. Holmes was about the only person in the Congress who would leave it in the Bill. It was not so much a matter of suicide or of getting drunk, but if they once allowed an employer to raise the point of wilful and serious misconduct he would raise it as a defence in every action.

Mr. O'Grady (London Upholsterers) wished to know whether his amendment asking that the Compensation Act should be amended to cover all accidents sustained and sickness contracted through ill-ventilated and insanitary workshops, or arising from working at dangerous trades, was included in the draft Bill.

Mr. Browne stated that provision was made and compensation for illness arising from employment.

The resolution was carried. Mr. W. Brace (Monmouth Miners) moved a resolu-

tion in favour of the amendment of the Miners Act by enforcing an eight-hour day for boy labour and colliery winners, and for securing improved working conditions in the mine. He said that in asking for the restriction of boy labour in mines to eight hours per day they were asking for a reform that Parliament ought to grant.

Mr. Carter (Castleford Colliery Enginemen) seconded the resolution, which was carried.

Mr. T. Smith (West Ham Gasworkers) moved a resolution in favour of a general eight-hour working day.

Mr. Honney (Fulham Shop Assistants) seconded the resolution, which was carried.

Mr. Albert Stanley (Cannock Chase Miners) proposed "That the Parliamentary Committee render all assistance possible to the Miners' Federation in pressing forward the Miners' Eight Hours Bill." Mr. Walsh (Yorkshire Miners) seconded the resolution, which was carried.

The concluding sitting of the Congress was held on the 7th inst. Mr. Bowerman presided.

Mr. W. C. Steadman moved:—"That as the housing problem demands drastic solution, we, the organised workers, call upon the Government to amend parts one and eleven of the 1890 Act Amendment Bill, to make provision for dealing with the owners of unhealthy houses, to extend the time for repayment of loans to 100 years, and the establishment of fair rent courts. Further, that this congress thoroughly endorses the principles contained in the Bill promoted by the Workmen's National Housing Council, and introduced into Parliament by Dr. Macnamara, and demands of the Legislature that no time be lost in dealing with overcrowding and excessive rents. The congress further instructs the Parliamentary Committee to press the Government for facilities and support for the passing of this Bill in the next session of Parliament; and to take steps with a view to the amalgamation and concentration of labour forces on the housing question, not only for the purposes of legislation, but so that in any district where a slum or house famine exists the local authority shall take the necessary steps to provide proper accommodation at the cost of construction and maintenance." A good many people imagined that the whole of the 1890 Act was practically a Housing of the Working Classes Act. But parts one and two of the Act did not apply so much to housing schemes as to clearance schemes. In his experience of clearance schemes, it was impossible to rehouse on the site the same number of people as had been displaced. Municipalities put in force clauses 1 and 2 of the Act to clear away a slum district, but, unfortunately, under the present law they found it a very costly operation. In all clearance schemes they had got to compensate the owners of the property to the fullest extent unless they could prove to the Local Government Board that the area they were going to clear was an unhealthy one, when the owners of the property did not come within the Land Clauses Act. Apart from that one exception, it cost to put the Act into operation 80 per cent. more than it otherwise would do in adopting Clauses 1 and 2 of the Act.

As the law gave municipalities power to prosecute a butcher or a fishmonger if he sold food unfit for human consumption, he contended that the same law should apply to the owner of slum property, and instead of compensating the slum-owner he should be prosecuted. The only land that was vacant to-day was agricultural land, and they could purchase that land for agricultural purposes for a very nominal amount. The County Council of Sussex purchased some land for 11. per acre, but when they wanted land on which to build a lunatic asylum they had to pay 1001. per acre. He maintained that before they could solve in a practical manner the housing problem they had got to tackle the land question, and if the owner was going to demand more than agricultural value for his land when required for housing schemes, then he ought to be taxed now on the amount which he intended to ask as the value of the land.

Mr. Walsh (London Tinplate Workers), who seconded the motion, said that for the first time they were asking a Parliamentary Committee to take this matter up with a view of securing local action for improving the housing of the working classes. The resolution was carried unanimously.

Mr. E. C. Gibbs (London House Decorators) moved, "This congress, having in mind the importance of cheap transit as a means towards the solution of the housing problem, instructs the Parliamentary Committee to urge upon the Board of Trade the necessity of bringing pressure to bear upon the railway companies to strictly comply with the Cheap Trains Act, 1883, by issuing cheap tickets to all classes of workmen, and further to take such steps as may be necessary to cause all railway companies to issue third-class season tickets at the correspondingly cheap rates at which they now issue first and second class season tickets."

Mr. Cheeseman (London Fawcett Association) seconded the motion, which was agreed to.

CHURCH FOR LEA AND HOLLOWAY, SHEFFIELD.—It is proposed to erect a new church for the newly-created parish of Dethick, Lea, and Holloway. The architect is Mr. Percy H. Currey, of Derby, and the contractor, who has started work, is Mr. J. W. Wildgoose, of Matlock.

Cottages, Walton-on-Thames.

### Illustrations.

#### "GLEBELANDS," WOKINGHAM.

**T**HIS house, the illustration of which appeared in the Royal Academy Exhibition this year, is red and white. Messrs. Bottrill & Son, of Reading, were the builders; Messrs. Longden did the heating, &c.; Messrs. Wenham & Waters did the glazing and casements and the cast leadwork generally. Mr. Ernest Newton was the architect.

#### GRIMSTON COURT, YORK.

THIS house is in course of erection for Mr. J. J. Hunt on a fine site in the centre of his estate about three miles east of York. The site was laid out and planted some years ago for a smaller house, which somewhat restricted the arrangement of the present one.

The house will have fine views over the Plain of York, the Yorkshire Wolds, and the Vale of Derwent.

It is being built of 2-in. red Leicestershire bricks and Ketton stone, with oak for timbering. The works also include lodges, stables, electric light station, &c.

Mr. Anelay, of York and Doncaster, is the builder, and Mr. W. H. Brierley is the architect.

The drawing was in this year's Academy.

#### RUSSIAN PAVILIONS, GLASGOW EXHIBITION.

THE Wood Industries Pavilion and the Mining Pavilion which we illustrate are two of the Russian pavilions at the Glasgow Exhibition. An article on the Russian pavilions at the Exhibition will be found on another page of this issue.

#### ROADSIDE COTTAGES, WALTON-ON-THAMES.

THESE cottages are built very simply of local material, and quietly finished in every particular. Messrs. Niven & Wigglesworth are the architects.

#### DESIGN FOR A BILLIARD-ROOM.

THIS design is sufficiently explained by the drawing and the plan illustrated. It is the work of Mr. W. J. Tapper, architect.

#### COMPETITIONS.

**INFANT SCHOOL, ST. ALBANS.**—The local competition at St. Albans for the new infants' school at Garden Fields has resulted in the work being given to Messrs. Smece & Mence. Mr. S. Doddimeade Edmunds received the only premium awarded.

**THERMAL WATER PUMP, BUXTON.**—The first premiated design in the competition for thermal water pump, Buxton, was that by Mr. Gustave Agate, Pendleton, Manchester. The second premiated design was by Mr. C. Swain, Buxton, and the third by Messrs. Warren & Cargill, Matlock Bridge.

#### MUNICIPAL ENGINEERS AT GLASGOW.

THE Municipal Engineering Section, Section VII. of the International Congress of Engineering, was opened in the Engineering Lecture Theatre at the University, Glasgow, on Tuesday morning last week. The section was arranged by the Incorporated Association of Municipal and County Engineers, and the President (Mr. E. G. Mawbey, C.E., of Leicester) occupied the chair. There was a large and representative gathering of members of the Association present from all parts of the kingdom.

The President, in his inaugural address, said,—As representatives of that branch of engineering practice which is, perhaps, more closely identified than any other with the health of the people of the United Kingdom and our Colonies, it is fitting that we municipal engineers should take a duly prominent part in this International Congress, at what is possibly the greatest exhibition ever held away from London in the British Isles.

And I may here remark that it would have been difficult, if not impossible, to have selected a more suitable site for a great exhibition, and particularly for a congress of

civil and sanitary engineers, than this city, which is the commercial capital of Scotland, the Manchester and Liverpool of the North, a seat of profound learning and a veritable hive of industry. Indeed, comprehensive as are the scope and character of the exhibition, it is doubtful whether it can convey more vividly and strikingly an adequate idea of the indomitable energy, pluck, skill, and enterprise of the British race than is conveyed by the great manufacturing works of Glasgow itself and the world-famed ship-building establishments and other gigantic centres of production on the Clyde; for a mere enumeration of the vast and varied industries so successfully carried on in this city and its environs would occupy much more time than I can devote to my brief address.

You will, however, I am sure, pardon me for alluding to one typical instance of the enterprise of the citizens of Glasgow. I feel that I must take this opportunity of congratulating the Civic Fathers of the city, who have been pioneers of British municipal tramways, upon the inception and completion of one of the most important tramway undertakings in the United Kingdom, and in these congratulations must be specially included Mr. Young, the eminent tramways general manager, and Mr. Clark, the able engineer. Even those of us who live at a remote distance from this city have watched with the keenest interest the progress of the undertaking, and if our admiration had not been voluntary it would have been compelled by the splendid way in which really phenomenal difficulties have been overcome as they have arisen. The principal characteristic of the scheme may be said to be that it is so thoroughly up-to-date in every particular, and it is evident that neither pains nor money have been spared to ensure complete success. The equipment of the Pinkston Power Station is especially interesting and instructive, for the plant includes both British and American engines of the highest types produced in their respective countries, and an unique opportunity is here afforded of judging of their relative merits when working under precisely identical conditions. I would strongly advise our members to take the fullest advantage of the facilities afforded for obtaining every possible information as to this grand undertaking and the admirable system of working and management.

#### Sewage Treatment.

Lieut.-Col. A. S. Jones, V.C., A.M. Inst. C.E., then read a paper on "Sewage Treatment." After a careful review of the numerous experiments in sewage treatment during the past thirty years, the author said it was almost a truism to say that in the matter of sewage disposal each locality required special plans and treatment, and he only pretended to put forward a few general conclusions. 1. In works of sewerage, limit and regulate as far as possible the volume of sewage by excluding sub-soil and clean surface water. 2. Interpose a narrow, deep catch pit or grit chamber at some convenient spot for taking clean heavy matter out of sewer, and then an iron screen (8 in. opening between bars) before the sewer discharges into the deepest part of tank large enough to hold two or more hours' flow. 3. The tank outlet should be over a level weir 1 in. below level of invert of sewer mouth, and as long as convenient; the floor of tank should slope up to this weir from deepest part under inlet of sewer. 4. Such a tank will be quite inoffensive for fifteen or twenty days, and be then nearly full of sludge, to be run off, if level permits, or pumped out. Or it can be left to act as a "septic tank" for six months or more, if it is desired to encourage anaerobic action, with its advantage of less sludge and drawback in offensive smell. 5. There is no practical difference, as regards the subsequent aerobic process, between the tank effluents resulting from the clean and the dirty alternative modes of working the depositing tank described in the last conclusion (4).

6. The essential point in the aerobic process, whether in land or "contact-bed," is sufficient aeration (excess, as by blowing, has no result commensurate with cost of its introduction), and it can be attained by intermittence of sewage and rest, or by continuous passage of sewage through a contact-bed kept always just moist in all its atoms by rain-like dropping on the surface so carefully adjusted as to moisten all parts, and not to form a water seal in any part of the bed. Intermittence is easily arranged on any scale of working, and continuous filtra-

tion, on the contrary, is difficult even for a few thousand gallons a day. 7. A low estimate for the construction of contact-bed may be taken as 5,000<sup>l</sup> per acre, but 131 acres of land may often be purchased for that sum (at 38l. per acre), and we know that area of land, at Aldershot, to have dealt with about 1,000,000 gallons of sewage a day for nearly forty years, and to be more efficient than ever, while Mr. Dibdin's formula, "one acre of contact-bed to 1,000,000 gallons a day," has been cut down by most of his disciples to 500,000 or 250,000 gallons, and we have yet to learn what the fate of such bed will be ten years hence. The heavy first outlay of capital for land purchase often deters Councils from a frehold investment which must be of great value to a future generation, and leads them into hand-to-mouth expedients which will leave little or no asset when the sewage problem has at last to be faced in real earnest. Since the paper was written the interim Report of Lord Idlesleigh's Royal Commission had been published, and he could not send it to press without adding an expression of his satisfaction with the conclusions set forth by that authority. Land therein evidently held its position as the only natural process, and all other modes of sewage treatment were conveniently classified together as "the artificial processes." They were assured that the latter were in the experimental stage, and were promised a continuance of the careful examination commenced three years ago of the problems involved "which are so many and varied that only investigation and, we may add, experience of a prolonged and varied character will suffice to solve them."

Mr. K. F. Campbell, M.Inst.C.E., Huddersfield, contributed a paper on "Researches into the System of Sewage Purification at Huddersfield by Bacterial and other Methods." The staple trade of Huddersfield is woollen, the waste from which contains fat, soaps, dyes, and a variety of chemicals used chiefly in the dyeing and finishing of the goods, resulting in a highly-coloured soapy liquid. The dry-weather flow of sewage contains 30 per cent. of trade waste, of which but a very small proportion is derived from other than the woollen industries. For a number of years a portion of the sewage was purified by means of chemical precipitation and subsequent filtration through beds composed to a great extent of sand. These, however, rapidly became clogged, and although elaborate provision was made for the cleansing of the filtering material by upward washing, it became impossible thoroughly to do so unless removed from the beds, and as this would have been of frequent occurrence the process was abandoned, the cost of working being already prohibitive. Attention was then directed to the more modern systems of sewage purification, and experiments have since been conducted with three methods, which are as follows:—1. The treatment of the raw sewage in contact-beds. 2. The purification of the effluent produced by chemical treatment in contact-beds. 3. The treatment of the sewage in an open septic tank and contact-beds. The following table shows the loss of capacity of various beds at Huddersfield, and also the period they had been in operation:—

	Initial Capacity (gallons)	Latest Capacity (gallons)	Loss of Capacity (per cent.)	Period (weeks)
Rough contact-bed, treating crude sewage . . . . .	19,000	4,800	75	76
No. 7 bed, treating chemically-treated sewage . . . . .	19,230	11,425	41	110
No. 10 bed, ditto . . . . .	19,940	9,793	51	142
No. 12 bed, ditto . . . . .	19,300	8,829	54	137
No. 13 bed, ditto . . . . .	19,972	11,425	37	68
Rough contact-bed, treating septic effluent . . . . .	3,990	2,030	49	34

After the above observations were taken the rough contact-bed treating septic effluent was allowed to rest one month, during which its capacity increased to 2,560 gallons (56 per cent. of original); after five days' working and the tenth filling the capacity decreased to 2,230 gallons (45 per cent. of original); and after a fortnight to 2,130 gallons (47 per cent. of the original capacity). The author, after three years' careful investigation of the subject, has arrived at the following conclusions:—1. That by no process can the formation of sludge be obviated. 2. When the

crude sewage is treated in contact-beds the rapid accumulation of matter in the beds renders the process impracticable. 3. That by the use of a small quantity of lime and coppers, followed by contact-bed treatment, a satisfactory effluent can be produced. 4. That the contact-beds used for the purification of the effluent after chemical precipitation will not retain their capacity indefinitely, and that in the course of a number of years it will be reduced to such an extent as to render necessary the washing or riddling of the material. 5. That by the open septic process about 40 per cent. of the sludge is destroyed. 6. The septic effluent is not as amenable to subsequent contact-bed treatment as the effluent from chemical precipitation. 7. The capacity of the beds treating the septic effluent decreases more rapidly than that of the beds treating the effluent after chemical precipitation owing to the excessive amount of suspended matter in the septic effluent. 8. The septic effluent after double contact is frequently unsatisfactory. The results obtained tended to show that the sewage problem is one which, even to-day, requires further investigation on the part of the engineer and chemist before the hidden mysteries in connexion with it are properly solved and accepted in practice.

Mr. Fowler, London, moved a vote of thanks to the authors of the papers, and said the delicate process of bacteriological treatment must really come to nothing if they had not an efficient manager to carry out properly the engineer's design. He suggested that the filtering material in the coarse contact-beds should be of bricks, finished off with clinkers and cinders; and he was in favour of a periodical cleaning of the filtering material.

Mr. Midgley Taylor, Westminster, who seconded, predicted that any experimental works put up for bacterial treatment of sewage would be a failure unless they dealt with the whole of the area, thus rendering it possible to obtain a true sample of the sewage to be treated. The question of cleaning bacterial beds had been closely gone into by him, and he calculated that it cost something between 200l. and 300l. per annum per acre to keep a bacterial contact-bed in order. This annual expense was very much lost sight of by engineers recommending authorities to put in bacterial installations.

Mr. A. J. Martin, Exeter, said the results which Colonel Jones had obtained with land treatment at Wrexham and Aldershot entitled his opinions on the subject to a great deal of respect, and the results which Mr. Mawbey had obtained at Leicester also showed what could be done with land treatment. Possibly the weakest point in connexion with land treatment was that it laid itself open more than any other system to being tampered with in the supposed interest of the rates. Colonel Jones had slightly misrepresented Mr. Cameron's septic tank system. The great object of the septic tank was to exclude the atmosphere and to preserve an equable temperature in the lower layers of the tank.

Mr. J. Price, Birmingham, said the detritus tank was an absolute necessity of the septic system in Birmingham. Colonel Jones was consistent in having always advocated the land, and he thought he was right. Fortunately, at Birmingham they had been able to get a sufficient area of land up to the present to deal with their sewage, but the next twenty years might force them either to go to a larger area or to bacterial treatment.

Mr. S. Platt, Rochdale, admitted that sludge could not be entirely removed, but it could be to a very great extent reduced. He had been experimentally dealing with 200,000 gallons per day, and the sludge was 2 ft. deep in the tanks after two years' working, a quantity which would be obtained in a week's work by the ordinary precipitation process.

Mr. T. Stewart, Cape Town, who claimed to be the first to introduce the bacterial treatment in South Africa, gave some particulars of the working there.

Mr. Corbett, Salford, said that in beds fitted with sprinklers and used practically continuously for five years he had found no deterioration whatever. They had no difficulty with sludge. They disposed of it at 8d. per ton, sending it to sea by way of the Ship Canal.

The vote of thanks having been agreed to, The President said it was too late to discuss the question of bacterial treatment versus land. They had proved beyond doubt that they could satisfactorily deal with the sewage of manufacturing towns, as well as domestic sewage,

by bacterial treatment. But his own idea was that where they had excellent land available, and plenty of it, at reasonable cost the time had not come to disregard such an opportunity and go in recklessly for bacterial treatment. If they had job land at their doors the proper thing was to make the best use of it, and supplement it by bacterial methods where land in sufficient quantity could not be obtained.

*Water Supply Works for Birmingham.*

The sitting was resumed on the 4th inst. under the presidency of Mr. E. G. Mawbey, C.E., when Mr. Mansergh, C.E., President of the Institution of Civil Engineers, delivered a lecture on the works which are now in progress in the Elan Valley for supplying water to the city of Birmingham. Having explained that the present daily water needs of Birmingham were 18 or 19 million gallons, which in the present dry season rose to 24 million gallons a day, Mr. Mansergh said the source of the new supply was the river Elan, a tributary of the Wye. The distance from the lowest reservoir to the centre of Birmingham was eighty miles, divided pretty equally between tunnel, cut and cover, on the one hand, and iron and steel pipes crossing valleys. Mr. Mansergh then showed by means of lantern slides the position of Birmingham and the Elan watershed, Manchester and Thirlmere, Liverpool and Vyrnwy, and the scheme which Sir Alexander Binnie has suggested for London. The mean rainfall on the watershed was 68 in., rising to 94 in. in years of heavy rainfall and falling to 44 in. in times of drought. The reservoir at Caban Coch, with the submerged dam, was then shown on the screen, Mr. Mansergh stating that from this reservoir they expected to get 27 million gallons of water a day and to send down the stream a further 27 million gallons as compensation water. Mr. Mansergh next showed by slides the means by which the flood water was dealt with during construction, and followed this with an interesting description of the village built to accommodate the workmen. It contains about 1,200 people, with schools, recreation-hall, wash-houses, and hospitals. One of the hospitals was intended for infectious diseases, but was not used much on account of the precautions to keep out smallpox and typhoid. There was also a doss-house, in which all men who came on tramp had to go for a week. They were put in quarantine, in fact, under the supervision of the doctor. They had also to have a bath, and were given a clean nightshirt. This had proved most useful in keeping the village free from infectious disease. The canteen-keeper had no interest in the sale of beer, and the Corporation was able to make 1,500l. a year, which was being spent for the benefit of the men employed upon the works.

Mr. Harpur, Cardiff, moved a hearty vote of thanks to Mr. Mansergh for his lecture. He did so with great pleasure as a frequent visitor to the works, and one who had considerable knowledge of the district. He considered the works to be the finest of the kind which up to the present had been attempted.

Mr. W. Weaver, Kensington, seconded the vote of thanks, which was accorded with acclamation.

*Municipal Sanitation.*

Mr. W. Weaver, Kensington, then read a paper on "Municipal Sanitation." He said, included in the duties of a municipal authority, those appertaining to sanitation ranked as most important, inasmuch as upon their efficient discharge the health and comfort of the community to a very large extent depended. House drainage, as far as consistent with efficiency, should be made as simple as possible. Complication necessitated extra expense, and this, with other details of sanitary administration, meant extra rent. It could not be disputed that sanitary inspection had been an active factor in bringing about the present difficulty of making house-room too expensive for the poor. Water, and like air, was a necessity of life, and both should be pure, free, and unstinted. The two latter qualifications might be unattainable, but there should be no question as to the purity, and only by municipal ownership could there be any future chance for a free and unstinted water supply. Most of the provincial towns own their respective water supplies, but in London, where the supply, pure and efficient, was in the hands of private enterprise, many inconveniences were inflicted upon

\* Such beds at Salford and Birmingham cost 10,000l. and upwards per acre.

the consumers, arising to a large extent from the somewhat absolute statutory powers conferred upon the companies, and the manner in which those powers were exercised. Quite recently, at enormous trouble and expense, the Metropolitan authorities had to make a determined stand (fortunately with success) against the water companies, who were submitting for State approval by-laws dealing with water supply and fittings. Although the London County Council, innocently or otherwise, had interpreted the storm of indignation thus aroused with regard to the fittings as having been directed against the supply, it could not be gainsaid that whatever arguments (and they were many) might be urged in favour of the Metropolitan water companies, it remained a sound principle that a vital public necessity such as water should not be left to the supply and control of private enterprise for purposes of profit. With reference to sanitary administration, one of the great difficulties arose from inability to enforce cleanly and sanitary habits on the occupiers. Some slight remedial effort in this direction had been made within the past two years by the passing of the Verminous Persons Act, but the practical application of the measure was extremely limited owing to its inherent

Subject to wise use, the power to acquire land generally would be a great boon, if conferred on Local Authorities, instead of being, as at present, restricted to special Acts for special purposes. If each municipality owned the site of its town and its environs, the enhancement of the value of the latter by the work and prosperity of the former would form a valuable corporation asset in reduction of rates, and corporation land stock would form a popular and profitable investment for the savings of the inhabitants, encouraging local energy and habits of thrift. Main paved streets should be thoroughly washed at night and the solids prevented from passing into the sewers, unless the latter were large with a good flow to outlet independent of pumping. Machine brooms should thoroughly sweep the surface whilst saturated, leaving the refuse in ridges about 2 ft. from kerbs. Such refuse after draining should be heaped and picked up in the early morning. By following this system of cleansing, the surface water flushed the sewers during their minimum flow, and only comparatively solid refuse had to be carted away—an economical consideration. The prompt and regular removal and sanitary disposal of towns' refuse was an imperative necessity.

Mr. Macdonald, Glasgow, also contributed a paper on the disposal of sewage.

Mr. Midgley Taylor, Westminster, moved a vote of thanks to the authors of the paper.

Mr. George Chatterton, Westminster, seconded. The vote of thanks was accorded unanimously and briefly acknowledged.

The meeting then adjourned.

#### APPLICATIONS UNDER THE 1894 BUILDING ACT.

At the meeting of the Building Act Committee of the London County Council, held on the 20th ult., the proceedings were governed by the clause in the Order of Reference which empowers the Committee at certain seasons to act on behalf of the Council in relation to matters included in the Order of Reference. Those applications to which consent has been given are granted on certain conditions. Names of applicants are given in brackets. Buildings are new erections unless otherwise stated:—

##### Lines of Frontage and Projections.

**Fulham.**—That the application of Messrs. Flew & Co. for an extension of the period within which the erection of one-story shops on part of the forecourts of Nos. 83, 85, and 87, North-end-road, and No. 1, Beaumont-crescent, Fulham, and the erection of a block of flats with one-story shops in front, on a site between No. 83, North-end-road and Beaumont-mansions were required to be completed, be granted.—Agreed.

**Bermundsey.**—That the application of Mr. A. Murray for an extension of the period within which the erection of buildings on the site of Nos. 73 to 101 (odd numbers only), inclusive, Old Kent-road, Southwark, was required to be completed, be granted.—Agreed.

**Clapham.**—Buildings on the south side of Clapham Park-road, Clapham, to abut upon Park Hill (the Council of the Metropolitan Borough of Wandsworth)—Consent.

**Clapham.**—A school building on the site of Nos. 62 and 63, Clapham Common South-side (Mr. J. O. Smith for the Girls' Public Day School Company, Limited)—Consent.

**Deptford.**—The retention of a newspaper stall and book stands in front of No. 151, New Cross-road, Deptford (Mr. J. H. Waterworth for Mr. F. Hulbert)—Consent.

**Finsbury, Central.**—That the application of Mr. T. H. Watson on behalf of Capt. F. T. Penton, for an extension of the periods within which the rebuilding of Nos. 2 to 5, inclusive, White Lion-street, Pentonville, was required to be commenced and completed, be granted.—Agreed.

**Hammersmith.**—Three houses in the north-west side of Dalling-road and four houses on the north side of Wellesley-avenue, Hammersmith (Mr. G. Trotman for Mr. W. Hyde)—Consent.

**Hampstead.**—Bray windows to twelve houses on the south side and eight houses on the north side of Holycroft-avenue, Hampstead (Mr. W. J. King)—Consent.

**Kennington.**—A one-story addition at the rear of No. 71, The Grove, Harleyford-road, Vauxhall (Mr. W. Head)—Consent.

**Lewisham.**—That the application of Mr. E. C. Christmas for an extension of the period within which the erection of houses, with bay windows and shops, on the site of Nos. 49 and 51, Dartmouth-road, Forest-hill, was required to be completed, be granted.—Agreed.

**Lewisham.**—Three one-story shops on the north side of Stanstead-road, Forest-hill, westward of No. 129 (Mr. R. E. Crossland for Mr. E. Paul)—Consent.

**Lewisham.**—The retention of the dwelling-houses numbered 355, 357, 359, and 347, with one-story shops in front, on the east side of Brockley-road, Lewisham (Mr. E. Tompkins for Mr. G. Lawrence)—Consent.

**Lewisham.**—Wood and tile pents over the entrances to a pair of semi-detached houses on the north side of Micheldever-road, i.e., westward of No. 8 (Mr. J. S. Blunt for Mr. W. Marsden)—Consent.

**Peckham.**—Four houses, with one-story shops, on the site of Nos. 104, 106, and 108, Rye-lane, Peckham (Mr. T. Wilkins for Mr. W. Wilson)—Consent.

**Woolwich.**—The retention of an addition to a coachhouse and stabling at the rear of No. 23, High-street, Plumstead, abutting on Reidhaven-road (Mr. H. O. Thomas for Mr. J. J. Messent)—Consent.

**Haggerston.**—Iron and steel balconies at the first, second, and third floor levels in front of the new wing to the North-Eastern Hospital, on the north side of Hackney-road, Bethnal Green (Messrs. Marshall & Vickers for the Committee of Management of the North-Eastern Hospital)—Consent.

**Strand.**—Two iron and glass shelters at the entrances to an extension of the Trocadero Restaurant, Shaftesbury-avenue, Piccadilly-circus (Mr. G. W. Booth for Messrs. J. Lyons & Co., Limited)—Refused.

**Greenwich.**—One-story shop fronts to thirteen proposed houses on the north side of Woolwich-road, Greenwich, between Nos. 461 and 491 (Mr. T. N. Dinwiddie for Mr. T. Dinwiddie)—Refused.

**Hackney, South.**—The retention of a one-story shop front to No. 121, Daubney-road, Hackney (Messrs. Lamb, Son, & Prance for Mr. G. T. Poole)—Refused.

**Islington, North.**—A one-story addition on the north side of No. 122, Dartmouth Park Hill, Islington, to abut upon Langdon-road (Mr. R. Midworth for Mr. F. Bryen)—Refused.

**Kennington, South.**—A one-story addition at the rear of No. 67, Marlow-road, Kennington, to abut upon Scarsdale Villas (Messrs. J. Surrey & Son for Mrs. M. Surrey)—Refused.

**Kennington, South.**—A two-story building on the south side of No. 7, Cathcart-road, Kennington (Messrs. Law & Allen for Mrs. E. Ward)—Refused.

**Marylebone, West.**—A one-story porch on the north side of No. 55, Montagu-square, to abut upon Montagu-place (Mr. F. W. Foster)—Refused.

**Norwood.**—A school building and additions to the clergy-house at the rear of Corpus Christi Church, Brixton-road, Brixton, to abut upon Horsford-road and Treat-road (Mr. J. F. Bentley for the Right Rev. F. Bourne)—Refused.

**St. George, Hanover-square.**—An addition to the one-story shop in front of No. 225, Regent-street, St. George, Hanover-square (Messrs. H. G. Lancaster & Co., for the Orchestral Company)—Refused.

**St. George, Hanover-square.**—An iron and glass verandah at the first floor level in front of No. 9, Queen-street, Mayfair (Messrs. Spillman & Co.)—Refused.

**Strand.**—A projecting lamp and iron sign in front of Nos. 7 and 8, Rupert-street, St. James's (Mr. C. Manzie)—Refused.

**Woolwich.**—A one-story addition at the rear of No. 8A, High-street, Plumstead, to abut upon Mineral-street (Mr. A. L. Guy, for Messrs. Pearkis, Gunston & Tee, Ltd.)—Refused.

##### Width of Way.

**Bermundsey.**—A one-story shop addition to No. 2, Millstream-road, Dockhead, Bermundsey (Mr. J. A. Stayner)—Consent.

**Deptford.**—That the application of Messrs.

Douglas Young & Co., for an extension of the periods within which the erection of three two-story houses with shops on the east side of Watergate-street, Deptford, at the corner of Trevithick-street, was required to be commenced and completed, be granted.—Agreed.

**Fulham.**—The retention of an addition to a laundry building on the south side of Garden-row, Fulham-road, with the forecourt fence at less than the prescribed distance from the centre of that street (Mr. A. Howard for Mr. A. Chubb)—Consent.

**Hackney, South.**—The rebuilding of Nos. 50, 58, and 62, High-street, and No. 1, Bridge-street, Homerton, at less than the prescribed distance from the centre of Bridge-street (Mr. J. Hamilton for Mr. W. E. Stevens)—Consent.

**Hampstead.**—Two one-story additions to the George public-house, No. 210, Haverstock-hill, Hampstead, with the boundary fence at less than the prescribed distance from the centre of the roadway leading from Haverstock Hill to the North-Western Fever Hospital (Mr. D. W. Crawford for Messrs. V. Younger & Co., Limited)—Consent.

**Lambeth, North.**—An additional story on the one-story addition at the side of No. 10, Juxon-street, Lambeth-walk, Lambeth (Mr. F. A. Powell for Mr. A. Wyatt)—Consent.

**Peckham.**—A laundry building and a house at the rear of Nos. 887, 888, and 885, Old Kent-road, Peckham, with the forecourt boundary at less than the prescribed distance from the centre of Wagner-street (Mr. E. Crosse for Mr. F. Cole)—Consent.

**Rotherhithe.**—A church and a clergy-house on the south side of Paradise-street, Rotherhithe (Mr. F. W. Taskar for the Rev. Canon St. John)—Consent.

**Whitechapel.**—A building and a boundary-fence at less than the prescribed distance from the centre of Nine-court, Whitechapel-road, Whitechapel (Mr. J. R. Smith for Mr. A. W. Brown)—Consent.

**Whitechapel.**—A slaughter-house, boiler-house, and chimney-shaft on the south side of Wintthrop-street, Whitechapel, westward of Nelson-court, with the boundary-fence at less than the prescribed distance from the centre of the street (Mr. A. Roe for Messrs. Harrison, Barber, & Co., Limited)—Consent.

**Deptford.**—Two houses at the rear of Nos. 45, 47, and 49, Kender-street, New Cross, and the rebuilding of two houses on the east side of Kender-street, southward of No. 49, at less than the prescribed distance from the centre of a passage-way leading to Esther-cottages (Mr. J. H. Waterworth for Mr. W. Falkner)—Refused.

##### Space at Rear.

**Islington, North.**—A modification of the provisions of Section 41 with regard to open space about buildings, so far as relates to the proposed erection of an addition to No. 6, Ebury-street, junction-road, Islington, with an irregular open space at the rear (Mr. J. D. Hunter for Mr. F. Cousins)—Consent.

**St. George, Hanover-square.**—A further deviation from the plans approved on July 31, 1899, under Section 41 (1) (vi.) of the Act, for the erection of a block of residential flats on the site of No. 25, Hanover-square, at the corner of George-street, St. George, Hanover-square, with an irregular open space at the rear, so far as relates to the erection of an addition at the ground floor level at the rear of the premises (Messrs. C. Bell, Withers, & Meredith for Mr. G. H. Schofield)—Consent.

##### Width of Way, Lines of Frontage, and Projections.

**Westminster.**—An iron and glass shelter at the Westminster Fire Brigade Station, Francis-street, Howick-place, Westminster (Mr. O. Fleming for the Fire Brigade Committee of the Council)—Consent.

**Holborn.**—An iron and glass hood over the entrance to the Theobald's Temperance Hotel, No. 5, Harpur-street, Theobald's-road, Holborn (Mr. J. A. Trefeller for Mrs. M. P. Anderson)—Refused.

**Kennington, South.**—An addition to consist of a projecting wooden frame and doorway in front of No. 2, Cranley-mews, South Kennington (Mr. M. King for Mr. J. D. Hill)—Refused.

**Woolwich.**—Five houses on the north-west side of Red Lion-lane, Shooter's Hill, Woolwich (Mr. A. E. Farnell for Mr. J. Stanford)—Refused.

**City.**—An oriel window at the first, second, third, fourth, and fifth floor levels of the Saracens Head Hotel, Snow Hill, City, to abut on King-street (Messrs. Wilkinson & Parker for Mr. F. Dreage)—Refused.

##### Width of Way and Space at Rear.

**Woolwich.**—Three houses on the west side of Barnhill-road, Plumstead, at the corner of a roadway leading from Barnhill-road to Princes-road (Mr. H. Roe for Mr. W. Sutch)—Consent.

##### Lines of Frontage and Construction.

**Hackney, South.**—An iron and glass covered way in front of Nos. 8 and 10, Southwold-road, Hackney, to connect the basement entrances of those premises (Mr. J. Hamilton for the executors of the late Mr. C. Butters)—Consent.

**Islington, North.**—A wood and glass photographic show-case on the forecourt of No. 18, Junction-road, Islington (Mr. J. D. Hunter for Mr. F. Kotch)—Refused.

**Line of Frontage, Width of Way, and Construction.**

**Holborn.**—A temporary wood and iron motor-car shed on the forecourt of No. 20, Red Lion-square, Holborn (Mr. M. Dukas).—Refused.

**Line of Frontage and Space at Rear.**

**St. Pancras, West.**—A deviation from the plans approved on October 9, 1900, under Sections 22 and 41 of the Act, for the erection of six buildings on the north-east side of a proposed diversion of Mornington-road and two buildings on the south side of Mornington-place, St. Pancras, so far as relates to the open space at the rear of such buildings (Mr. A. Whitelaw for London and North-Western Railway Company).—Consent.

**Width of Way, Line of Frontage, and Construction.**

**Southwark, West.**—An open iron and concrete gangway across Pontynool-place, Blackfriars-road, Southwark (Messrs. J. Hoare & Son for Messrs. J. Pascall, Limited).—Consent.

**Formation of Streets.**

**Hammersmith.**—That an order be issued to Messrs. Clutton sanctioning the formation or laying out of a new street for carriage traffic to lead from Emlyn-road to Hartswood-road, Stamford Brook, road, Hammersmith (for the Ecclesiastical Commissioners). That the name Palgrave-street be approved for the new street.—Consent.

**Wandsworth.**—A deviation from the plans sanctioned on February 19, 1901, for the formation or laying out of new streets for carriage traffic upon the Totterdown Fields estate, Upper Tooting-road, Wandsworth, so far as relates to an alteration in the position of roads A, C, and D on such plans (Mr. J. Briggs for the Housing Committee of the Council).—Consent.

**Woolwich.**—A deviation from the plans sanctioned on October 10, 1899, for the formation or laying out of new streets for carriage traffic upon the Eltham Park estate, High-street, Eltham, so far as relates to an alteration in the position of the road to be named Glenlea-road (Messrs. Logsdail & Beale for Mr. A. Cameron Corbett, M.P.).—Consent.

**Greenwich.**—That an order be issued to Mr. A. Roberts refusing to sanction the formation or laying out of new streets for carriage traffic out of the north side of Woolwich-road, Greenwich, westward of Lombard-road (for Mr. E. T. Fyfe).—Agreed.

**Hampstead.**—That an order be issued to Messrs. Tuckett & Son refusing to sanction the formation or laying out of new streets for carriage traffic on the Powell-Cotton estate on the north side of Westbere-road and north-west side of Minster-road, Hampstead (for Mr. P. H. G. Powell-Cotton).—Agreed.

**Lewisham.**—That an order be issued to Mr. E. W. Evans refusing to sanction the formation or laying out of new streets for carriage traffic on the Grange estate, on the north side of Sydenham-road, near its junction with Elderton-road.—Agreed.

**Lewisham.**—That an order be issued to Mr. G. Tolley refusing to sanction the formation or laying out of a new street for carriage traffic in continuation of Oaksford-avenue, Wells-road, Sydenham.—(for Mr. A. Covell).—Agreed.

**Wandsworth.**—That an order be issued to Mr. J. C. Radford refusing to sanction the formation or laying out of two new streets for carriage traffic out of the east side of Putney Park-lane, Putney (for Mr. J. T. Leader and Mr. S. Taylor).—Agreed.

**Wandsworth.**—That an order be issued to Mr. W. Kivett-Carnac refusing to sanction the formation or laying out of new streets for carriage traffic to lead out of Gwendolen-avenue and Howard's-lane, Putney (for Mr. J. T. Leader).—Agreed.

**Means of Escape from Top of High Buildings.**

**Southwark, West.**—Means of escape in case of fire, proposed to be provided in pursuance of Section 63 of the Act, on the topmost story of a warehouse proposed to be erected at Wallongo Wharf, Upper Ground-street, Blackfriars (Mr. E. R. Hewitt for Messrs. Vestey Bros.).—Consent.

**Westminster.**—Means of escape in case of fire, proposed to be provided in pursuance of Section 63 of the Act, on the sixth and seventh floors of St. James's-court, James-street, Westminster (Mr. A. Blackford).—Refused.

**Separation of Buildings.**

**Bermondsey.**—The retention on the ground floor of an opening in the party wall between Nos. 215, 217 and 219, Borough High-street, Borough, without making the buildings in conformity with Sections 74 (c) and 77 of the Act (Mr. T. W. Willis for Mr. F. H. Barker).—Consent.

**Cubical Extent and Construction of Building.**

**Whitechapel and Bethnal Green, South-West.**—The erection on the east side of Brady-street, Mile End, Whitechapel, between Thomas-passage and Bath-street, and extending back to Foster-street, of a beer store in two divisions, each division to exceed in extent 250,000, but not 450,000 cubic feet, and the erection of a east-washing shed at such premises (Messrs. W. Bradford & Sons for Messrs. Mann, Crossman, & Paulin).—Consent.

**Buildings for the Supply of Electricity.**

**Marlybone, East.**—A chimney shaft and the permanent brick walls of a portion of a proposed electrically generating station on the east side of Grove-road, St. John's Wood, between the Regent's Canal and Lodge-place (Mr. C. S. Peach for the Central Electric Supply Company, Limited).—Consent.

**Alteration to Building.**

**Dulwich.**—A lumber-room in the roof of No. 10, Stradella-road, Herne-hill, without the walls of the building being thickened so as to make such walls comply with the first schedule of the said Act (Mr. A. T. Shorey).—Consent.

**GAS AND GAS FITTINGS.**

**II.—ARGAND, REGENERATIVE, AND VENTILATING BURNERS. THE ALBO-CARBON LIGHT.**

**ARGAND BURNERS.**—The Argand gas-burner is a modification of the Argand burner for oil-lamps invented by Argand about a hundred years ago, and many of the earliest Argand gas-burners were, in fact, merely Argand oil-burners altered to gas-burners. A perforated top was fitted in the position previously occupied by the wick, and the gas was admitted through the oil-inlet. Those primitive burners have, however, long been superseded by improved forms invented by Mr. William Sugg.

Fig. 22.—Sugg's London Argand.

The City of London Gas Act of 1868 stipulated that "The gas referees shall prescribe the burner for testing the illuminating power of the gas, and it shall be such as shall be the most suitable for obtaining from the gas the greatest amount of light, and shall be practicable for use by the consumer." This proviso still remains in force, and the burner selected

by the referees is "Sugg's London Argand No. 1." The Argand burners commonly used by gas consumers differ slightly in their dimensions from the standard Argand, but a description of this burner will serve to illustrate the principles upon which all Argand burners are constructed.

Sugg's London Argand No. 1 is shown in sectional elevation in fig 22. The burner consists of an annular hollow stearite ring (D) pierced with twenty-four holes for the passage of the gas, and connected with a metal body having three small supply tubes (A) and terminating in the socket which is screwed upon the gas service pipe. Above the supply tubes is a gallery (B) which carries a glass chimney 6 in. in height and 1½ in. in internal diameter (E). Around the stearite ring within the glass chimney is a metal cone which deflects the upward current of air upon the outer surface of the flame. Another supply of air flows to the flame through the central passage enclosed by the stearite ring, and thus is produced a hollow cylindrical flame supplied with air upon both its internal and external surfaces. Argand burners give the greatest light efficiency when supplied with gas under a pressure of less than 0.5 of an inch, and the dimensions of the chimney and burner orifices must be varied in accordance with the quality of the gas to be consumed. The holes in a burner for gas of low illuminating power must be larger than those made for a richer gas. The London Argand was intended to be used with 16-candle coal gas consumed at a rate of 5 cubic feet per hour, but the highest efficiency is always obtained by adjusting the gas cock to give a flame 3 in. in height. Argand burners are very sensitive to variations of gas pressure, and should therefore always be provided with a governor. The light efficiency obtained by the use of an Argand burner is usually appreciably higher than that obtained by the use of flat flame burners, but the necessity of using a glass chimney with each burner considerably detracts from its practical utility; and the heat emitted from the Argand flame and chimney also tends to make this form of burner unpopular.

It is sometimes argued that as the incandescent gas-light is now "practicable for use by the consumer," and gives six or seven times more light per unit of gas consumed than the Argand, the gas referees in selecting the burner "most suitable for obtaining from the gas the greatest amount of light" should select some form of incandescent burner. When the Act was passed the incandescent system of lighting was not in vogue, and the referees are undoubtedly acting in accordance with the intention of the Act in prescribing the Argand burner for testing purposes, but when comparing the relative cost of lighting by different illuminants London gas must now be accredited with an illuminating power of at least 20 candles per cubic foot instead of the 3.2 candles per cubic foot obtained with the use of the Argand burner.

**Regenerative Burners.**—The higher the temperature of an illuminating flame the greater is the intensity of the light emitted. Instead of allowing the gas to be consumed by admixture with air supplied to the flame at normal atmospheric temperatures, the air may be previously heated by the heat of the waste combustion products escaping from the flame, and by its radiant heat. By thus heating the air before allowing it to come in contact with the flame, the temperature of the flame may be raised, and its illuminating power thereby increased. Burners constructed to utilise the waste heat in this manner are termed "regenerative burners," and it is found that the light emitted from high-class burners of this description, such as those of Wenham or Siemens, is about three times greater per unit of gas consumed than that emitted from ordinary Argand or flat flames.

The simplest forms of regenerative burner are those constructed on the principle employed by Dr. Frankland in 1853, and by the Rev. W. R. Bowditch in 1854. They enclosed an Argand burner with two glass cylinders, one inside the other, and fitted a plate beneath the burner and outer cylinder so that the air admitted to the flame had to pass down between the two chimneys, and in its passage became strongly heated. Modern modifications of this burner have recently been placed on the market under such names as "the non-mantle incandescent gas-burner," the "mantleless gas-burner," and the like.

Fig. 23.—Regenerative Argand Burner.

These regenerative Argand burners (fig. 23) do not approach the large Wenham or Siemens type of burner in efficiency, but if well constructed give appreciably higher results than the ordinary Argands. The advantage gained in increased illuminating power is not, however, sufficiently great to compensate for the cost of the frequent renewals of the inner chimney, which is soon destroyed by the high temperature to which it is subjected, or for the inconvenience of having to periodically clean the two chimneys.

Regenerative lamps of the Wenham or Siemens type (fig. 24) also owe their increased lighting efficiency to the heating of the air supplied to the flame. The air is made to pass through a number of flues or passages heated by the products of combustion escaping from the flame. The burners are placed at a considerable height above the floor, and most of the light emitted from them is thrown in a downward direction. They are usually provided with flues to carry away the waste combustion products, after they have been deprived of as much heat as is practicable.

The regenerative lamp is often made to assist in the ventilation of a room (fig. 24). A perforated metal case is placed around the upper part of the lamp, and has its upper end sunk into the space between the ceiling and the overhead floor. The waste products of combustion passing from the lamp into the flue create an updraught, and increase the rate of flow of air through the room. The flue is carried in a horizontal direction between the ceiling and the floor overhead into a brick chimney, or into the open air. It is usually constructed of sheet iron, and must be carefully encased in non-conducting fireproof material.

Different persons have different notions as to what constitutes effective lighting, but Professor Lewes, in the Cantor Lectures delivered in 1897, refers to some experiments made in that year by Major Scott Moncrieff on the suitability of various burners for illuminating the interior of barracks and buildings of a similar character, and the deductions made by Major Scott Moncrieff from the results of his experiments may serve as a guide in estimating the amount of illumination required in other circumstances.

The barrack-room in which the experiments

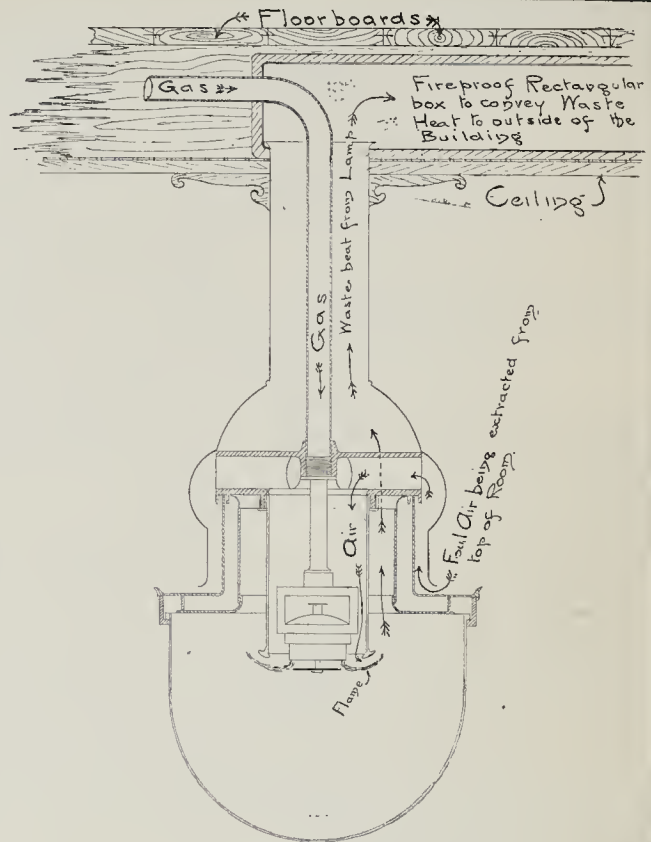

Fig. 24.—Regenerative Lamp used for Ventilating Purposes.

were conducted was 40 ft. long by 20 ft. wide, and the source of light was fixed 8 ft. above the floor. The illumination on a horizontal plane 2 ft. above the floor was then determined by means of a specially-constructed photometer. The height of 2 ft. was selected as representing the lowest level at which it would be necessary to be able to read printed matter.

The following table shows the practical results yielded by the different burners:—

*Illumination of a Barrack-room, 40 ft. by 20 ft., at a height of 2 ft. above the floor.*

Description of burner.	Total gas consumption per hour, cubic feet.	Illumination
Two Bray burners.....	16	Whole room insufficiently lighted, nowhere possible to read small print 6 ft. below gaslamp.
Two flat-flame burners fitted with caps....	11'4	About one-quarter the working space illuminated.
Two Scott-Thorpe reflex lights.....	18	Eight-tenths of working level efficiently lighted.
Two Sugg's workshop lights.....	16	About one-quarter the working space efficiently lighted.
Siemens' regenerative	11	Whole room well illuminated.
Diemel regenerative..	9	Two-thirds working space efficiently lighted.
Two Schulte lamps..	10	Practically whole working space illuminated.
Welsbach incandescent, with glazed conical reflector....	4'3	Whole room brilliantly lighted.

The following conclusions were drawn from the results of the investigation:—

1. The present illumination of the barrack-rooms by means of No. 5 Bray burners is wasteful of gas and inefficient as regards illumination.

2. The Bray burner may be retained if used with caps and grouped as in the "Scott-Thorpe" arrangement. This may in some cases be extravagant in gas, but the illumination is good and the arrangement is not easily damaged, and ventilation is assisted.

3. For reading-rooms, sergeants' messes, officers' messes, and other accessory buildings, the incandescent light is the best illuminant.

4. For places where the light source is some height above the floor, as in gymnasias, lecture-halls, and churches, regenerative lamps give very satisfactory results.

*Burners for Illuminating and Ventilating.*—

The initial cost of ventilating regenerative lamps of good quality is somewhat heavy, and lamps of this description have the disadvantage of requiring occasional cleaning by a skilled workman. For simultaneously lighting and ventilating large halls and theatres gas lamps of the "sun" or "sunlight" class are still extensively used. Strode's sunlight (fig. 25) may be regarded as a typical example of lamps of this kind. It consists of a number of flat-flame burners horizontally inclined and arranged in rings near the mouth of a ventilating shaft. The illuminating value per unit of gas consumed obtained from these burners is rather low owing to the cooling effect of the upward current of air, and the distance of the flame above the floor, but the general lighting effect is good, and where economy is not of the first importance they are often preferred to more economical burners. They are very simple in construction, and any of the burners which may become unfit for use may readily be replaced by new ones at very small cost.

*Ventilating by Gas Flames.*—When gas is

required solely for ventilating purposes, it is immaterial whether a luminous or a non-luminous "atmospheric" flame be employed. Chemical laboratories, for example, are sometimes ventilated by shafts in which gas burners are provided to produce a strong upward current, and in such cases luminous and non-luminous flames are of equal value. Mr. Thomas Fletcher found that with a vertical flue 6 in. in diameter and 12 ft. in height a gas flame had the ventilating values indicated in the following table:—

Gas consumed Cubic feet.	Speed of air per minute.	Total air cubic foot per hour.	Air exhausted cubic foot per hour.	Temperature at outlet Normal 59° F.
1	205	2,460	2,460	82° F.
2	245	2,940	1,470	92° F.
4	325	3,900	975	110° F.
8	415	4,980	622	137° F.

The most economical speed of air current for a flue of these dimensions is, therefore, that of 200 ft. per minute, obtained by consuming gas at the rate of one cubic foot per hour. Mr. Fletcher concluded from his experiments that for each circular foot of section in a ventilating flue the consumption of gas should not be allowed to exceed 5 cubic feet per hour.

**The Albo-Carbon Light.**—Albo-carbon is recrystallised naphthalene, one of the distillates obtained from coal tar. It is solid at atmospheric temperatures, but melts when heated to 174 deg. Fahr., a temperature considerably below the boiling point of water. In the albo-carbon lighting system the naphthalene is melted by the waste heat of the gas flame, and is used for enriching the gas as it passes to the burner. Lumps of albo-carbon are placed in a spherical metal reservoir fitted with a gas-tight screw cap. The gas enters the reservoir and passes through it to the burner. The flame raises the temperature of a copper conductor, which is located a short distance above it, and connected to the reservoir in such a manner that heat is rapidly conducted from the copper to the reservoir. In a few minutes the temperature of the reservoir rises above the melting point of the albo-carbon, and the gas flowing through the reservoir mixes with the naphthalene vapour, and its illuminating power is thereby increased. The burners used are flat flame burners with very small orifices, such as are used for consuming oil gas, and accord-

economic than that obtained from flat coal-gas flames, but the trouble of periodically refilling the reservoir often prohibits its adoption, and of late years it has been largely superseded by the incandescent gas light.

GENERAL BUILDING NEWS.

**WESLEYAN CHURCH, WESTERTHOPE, NEAR NEWCASTLE.**—On the 7th inst. the foundation stone was laid of a new Wesleyan church for Westerthope. The buildings will be of stone, and the cost is estimated at about 500l. The large hall will accommodate some 500 persons, and the smaller one about 120. The architects are Messrs. Marshall & Tweedy, and the contractor Mr. W. J. Jamieson.

**SCHOOL, ANSTRUTHER, N.B.**—A new school has been erected by the Anstruther School Board at the west end of Melville-terrace. The school was designed by Messrs. Williamson & Inglis, architects, Kirkcaldy and Edinburgh, and provides accommodation for 320 pupils. The classrooms are planned so that by means of sliding screens a large room is provided. The building has two entrances, and a corridor 10 ft. wide running from end to end. From it the five classrooms enter, three being used by senior pupils and two by infants. The cost has been upwards of 3,500l.

**BRITISH SCHOOLS, ILFRACOMBE.**—The British Schools, situated in Fore-street, Ilfracombe, having become too small to accommodate the number of scholars attending, the trustees acquired the "Hermitage," with its house and grounds with entrances from High-street and Wilder-road, at a total cost of 3,108l. The building was then altered according to the plans of Mr. Allen Hussell. At present the old school will be used for infants, only the elder boys and girls being educated at the "Hermitage." The contractor is Mr. W. Smyth.

**MASONIC HALL, OKEHAMPTON.**—A new masonic temple was dedicated at Okehampton, a few days ago. The new building is of stone, in the Renaissance style, with slated roof. Externally, the structure is plastered, with brick dressings, while the roof is surmounted by an ornamental turret. The accommodation comprises robing and retiring rooms, a lodge-room, 36 ft. by 22 ft., with a height of 18 ft., a lavatory, and the necessary offices. The entrance lobbies and corridors have tile floors, and all are provided with swing doors. The lodge-room has an open roof. The contractor was Mr. Slesman, of Okehampton, who executed the work in accordance with the designs of Mr. J. A. Lucas, F.S.I., Exeter.

**CHILDREN'S HOMES, HUDDERSFIELD.**—Children's homes have been erected at Outlane by the Huddersfield Board of Guardians. There are two homes in the block, the rooms being arranged on exactly similar lines. The building is of local stone, the following is a list of the contractors:—Mason and slater, Mr. J. Hellawell; joiner, Mr. M. Hirst; concreter, Mr. John Cooke; plasterer, Mr. T. R. Crowther; plumber, Messrs. Milnes & Garside; ironmonger, Messrs. T. Heaps & Co.; painter, Mr. A. Wood. Mr. J. W. Cocking, architect, Huddersfield, prepared the designs, and the work has been carried out within his estimate of 2,000l.

**LABOURERS' DWELLINGS FOR NEWCASTLE.**—Mr. M. K. North, A.M.I.C.E., one of the inspectors of the Local Government Board, sat in the Council Chamber of the Town Hall, Newcastle, on the 3rd inst., to conduct an inquiry into an application made by the City Council to the Local Government Board that sanction should be given to a scheme for the erection of dwellings for the labouring classes. The Town Clerk (Mr. Hill Motum) was present, as well as the Surveyor (Mr. Liddle). The Town Clerk said that in carrying out certain of the street works authorised by their Newcastle-on-Tyne Tramways and Improvement Act of 1899, the Corporation, in acquiring property for that purpose, would acquire a number of houses occupied by the labouring classes, within the meaning of Section 114 of the Newcastle Improvement Act of 1892, which was incorporated with the Act of 1899, and now sought the approval of the Local Government Board to a scheme for providing accommodation or dwellings for the labouring class displaced, or for such number of them as under Section 114, they were bound to provide for. The Corporation submitted a scheme for building two blocks of dwellings, one on the site in Albion-row and another on the site in Walker-road. These two blocks of buildings would comprise seventy-two separate dwellings—that was to say, on the Albion-row site the accommodation would be six separate dwellings of three rooms each; and upon the Walker-road site sixteen separate dwellings of one room each, twenty-three separate dwellings of two rooms each, and twelve separate dwellings of three rooms each. They proposed that these houses should afford the most modern accommodation for such class of houses. In the separate dwellings of one room each, there would be a large room, 15 ft. in length, 12 ft. 9 in. in width, and 9 ft. in height, with a screened bed recess, a sink recess, a pantry, a separate water-closet, and a separate coal-bunker. In the dwellings of two rooms each there would be a large living-room, 15 ft. in length, 12 ft. 6 in. in width, and 9 ft. in height, with a bed recess, a sink recess, and a pantry, and with a separate bedroom 14 ft. in length, 12 ft. 9 in. in width

and 9 ft. in height; also with a separate water-closet and coal-bunker. The houses of three rooms each would have a kitchen, 15 ft. in length, 12 ft. 9 in. in width, and 9 ft. in height, with a bed recess, sink recess, and pantry, two separate bedrooms, one 14 ft. in length, 12 ft. 6 in. in width, and 9 ft. in height, and the other 12 ft. in length, 14 ft. 6 in. in width, and 9 ft. in height. There would also be to each a separate water-closet and coal bunker. Each of these separate dwellings would have the use of a washhouse, and an ash-shoot from each floor to an ash-box on the ground floor. Each room in each dwelling would have a fireplace, and be adequately ventilated. The dwellings would be three stories high. The Surveyor (Mr. Liddle) explained the plans to the Inspector.

**CARDINAL NEWMAN MEMORIAL CHURCH, EDBURSTON.**—According to the *Birmingham Post*, plans for a memorial church to Cardinal Newman have been prepared by Mr. E. Doran Webb, F.S.A.

**SYNAGOGUE, FINSBURY PARK.**—The Finsbury Park Synagogue, which was consecrated by the Chief Rabbi on the 8th inst., is situated in Princess-road, Finsbury Park. The building provides accommodation on the ground floor for 100 gentlemen and in the galleries for 134 ladies, 334 in all, and is constructed to meet the growing needs of the small congregation, which has been established for many years in temporary premises in Portland-road. The building is provided with two stone staircases, a complete installation of heating on the American plan, and ample cloakroom accommodation for both ladies and gentlemen. The exterior is executed in red brickwork, relieved with stone dressings. The principal entrances to the ground floor are on the main facade in Princess-road, the secondary entrances and the entrances to the galleries being at the rear of the site. The building has been constructed by Messrs. Whitehead & Co., Limited, from the designs of Mr. Delissa Joseph.

**CATTLE MARKET, BODMIN.**—A new market was opened on the 2nd inst. at West Heath, Bodmin. The work has been carried out by Mr. E. Harris, contractor, Bodmin, and the cost has been about 2,000l., exclusive of site. The work has been performed under the direction of Mr. E. J. Oliver, Borough Surveyor, who designed the whole of the premises.

**PUBLIC HALL, HATFIELD, YORKSHIRE.**—On the 5th inst. the foundation-stone of a new public hall, to be called the Victoria Hall, was laid at Hatfield. The new building will be 48 ft. by 24 ft., with ante and dressing-rooms, and other rooms for storage, &c. The architect is Mr. Thomas Moat, of Hatfield, and the contractors Messrs. J. D. Gables & R. Hartop, of Hatfield.

**TEMPERANCE HALL, HUDDERSFIELD.**—The new Temperance Hall fronting the south side of Princess-street, erected for Huddersfield Temperance Society, was opened recently. The building is in the Italian Renaissance style, and has been erected, at a cost of about 5,000l., from designs and plans prepared by Mr. B. Stocks, architect, Huddersfield. The front is faced with extra hammer-dressed wallstones with aslar dressings, and the back, in Page-street, with hammer-dressed wallstones and aslar dressings. The bottom floor is intended to be used as a temperance club, and the remaining two floors provide rooms for meetings and offices for the executive work of the Huddersfield Temperance Society, &c. The work has been carried out by the following Huddersfield contractors:—Messrs. John Radcliffe & Sons, masons' work; Messrs. Wood Bros., joiners' work; Messrs. Milnes & Garside, plumbers' work; Mr. T. D. Tunnacliffe, slaters' work; Mr. W. E. Jowitt, plasterers' work; Mr. Allen Jackson, painters' work; Messrs. Henry Brook & Co., Limited, ironfounders' work; Mr. John Cooke, concreters' work; Messrs. Tomlinson & Milan, Limited, hot-water engineers' work; and Messrs. T. A. Armitage & Co., electrical engineers' work.

**TOWN HALL EXTENSION AT SHOREDITCH.**—On the 9th inst. the Mayoress of Shoreditch (Mrs. Kershaw) laid the foundation-stone of a new wing which is being added to Shoreditch Town Hall. The extension is on similar lines to the old building and will afford extra accommodation for all departments. The architect is Mr. W. C. Hunt, and Messrs. Kilby & Gayford have the building contract, which amounts to 2,853l.

**FLATS, RUTLAND GATE.**—The foundations are now being put in for the four blocks of flats which are to be built upon the site of Stratheden House, Rutland Gate. Mr. Delissa Joseph is the architect.

**SYNAGOGUE, HAMPTSTEAD.**—The Hampstead Synagogue, which was consecrated by the Chief Rabbi, after enlargement, on September 8, was originally built nine years ago from Mr. Delissa Joseph's plans. The enlargement has been effected by removing the east wall of the synagogue and extending the building eastward to the limit of the site. The choir, which was originally at the rear of the Ark, is now in the gallery above the Ark. The original number of sittings in the building was 560 on the ground floor and 300 in the gallery; the additional seats provided by the enlargement are eighty-four on the ground floor and sixty-two in the gallery, giving a total seating capacity for 814 souls. Although the present two staircases in Dennington Park road are in excess of the needs of the London Building Act, the opportunity has been taken, in

Fig. 25.—Shodde's Sunlight Ventilating Burner.

ing to Butterfield, a light of 25 candles is obtained with a gas consumption of 4½ cubic feet per hour, and a consumption of 0.02 lb. of albo-carbon per hour. One albo-carbon reservoir may serve to supply a number of burners arranged in a cluster around it. A bright, steady flame is usually obtained, but the flame is more liable to smoke than the ordinary coal-gas flame, and more rapidly blackens the ceiling above it. The albo-carbon light is more

effecting the extension of the building, to provide two supplementary staircases at the east end, one of which leads directly into West End-lane. The design of the original structure has been maintained in the extension, and the opportunity has been taken of redecorating the entire building in pure white. The contract has been carried out by Mr. Henry Lovatt, from the designs and under the superintendence of Mr. Delissa Joseph.

### FOREIGN.

FRANCE.—Forty-eight young architects have entered into the preliminary competition for the Chaudesaigues Prize, the subject being "A triumphal arch in honour of a foreign Sovereign." The jury have selected twelve of these to enter into the final competition.—The new Sorbonne is now completed, with the exception of some of the interior artistic decoration, which is being actively carried on. M. André Brouillet has been commissioned to paint the panels of the Vice-Rector's reception-room, and it is proposed to commission M. Pollet to execute a series of "passages historiques" in the Salle de la Faculté. It is expected that the formal opening of the new buildings, several times postponed, will now take place at the end of the present year.—The modern Gothic fountain in the Square de l'Archevêché, to the east of Notre Dame, Paris, is in process of repair and restoration. It was erected in 1843 from the designs of the architect Parfait Merleux.—At the Hôtel des Chambres Syndicales du Bâtiment, in Rue de Lutce, Paris, an exhibition has been opened of the designs sent in for the tenth competition instituted by the "Société Nationale des Architectes." The subject is "A Hospital for Temporary Aid to the Injured."—The Government will shortly commence the works necessary for the construction of a masonry bridge at Valence, to replace the suspension bridge which at present crosses the Rhone opposite that town. The cost is estimated at 1,165,000 francs.—The death is announced, at the age of 72, of M. Emile Basly, member of the Société Centrale des Architectes. He was a pupil of Garnaud, and had obtained, at the time of the 1900 exhibition, the medal offered for the author of the best works in domestic architecture.

### MISCELLANEOUS.

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.—Mr. Henry Rose, architect, has removed to Holy Road-street, Chard, from 3, Staple-inn, London.—Mr. J. W. Start, F.S.I., architect and surveyor, High-street, Colchester, and New Broad-street, E.C., has taken Mr. Reginald Rowell, A.R.I.B.A., into partnership. The firm will in future be known as Start & Rowell.

NEW ELECTRIC STATION, ABERDEEN.—The tender of Messrs. G. Donald & Sons, painters, Aberdeen, has been accepted (690l.), and also that of Messrs. Sellar & Co., Aberdeen (1,298l.) for subway.

EXPORTS OF TIMBER FROM DANTZIG.—An official return shows that the quantities of wood exported from Dantzig during the past five years have been as follows:—In 1896, 234,095 tons; in 1897, 272,604 tons; in 1898, 265,756 tons; in 1899, 308,640 tons; in 1900, 252,342 tons. The year 1900, it is stated authoritatively, was in many ways very profitable for the Dantzig timber trade. The general prosperity prevailing in commercial circles all over the world had a beneficial influence on sales, more especially in the spring, and prices ranged between satisfactory limits. Oak sleepers were an exception, and they were practically unsaleable at Dantzig, as the German State railways now use pine and fir. Other descriptions of oak were also sold with difficulty and at a loss. The several sawmills were fully occupied, but were adversely affected by the more rapid rise in price of the raw material as compared with the sawn wood. In some cases deals and planks were sold for less than the timber cost from which they were cut. Prices for round timber fell towards the end of the year, and only the best qualities were saleable at lower rates. The export trade was, on the whole, carried on during the year under favourable circumstances. There were either floated down the River Vistula or reached Dantzig by railway the following timber goods:—In 1898, 665,055 cubic metres, value 1,010,073l.; in 1899, 717,100 cubic metres, value 1,005,000l.; in 1900, 439,159 cubic metres, value 637,830l.

GREAT FIRE IN THE CITY.—Shortly before three o'clock on Saturday last week one of the City constables discovered smoke to be issuing in dense volumes from the premises of Messrs. W. H. Lascelles & Co., cabinet makers, &c., of 121, Bunhill-row. He at once raised an alarm, and by three o'clock number was gradually augmented until a quarter past three, when no fewer than thirty had been turned out and had got connected with the hydrants. Messrs. Lascelles' works stand in the centre of a group of factories and buildings. The group forms a block, having frontages in Chiswell-street, Whitecross-street, Errol-street, and Lamb's-buildings. Adjoining the works is a timber yard belonging to Messrs. Wm. Oliver & Sons. Backing on to these are the stores of Whitbread & Co.'s brewery, and

surrounding the whole are shops, dwelling-houses, a Board school, a mission hall, the headquarters of the London Rifle Brigade, and the depot of the Globe Parcel Express Company. It was not until about five o'clock that the fire was under control. Nearly the whole of Messrs. Lascelles' buildings and contents have been destroyed. The front stage and contents in Bunhill-row belonged to Messrs. Oliver & Sons are mostly saved, but three-fourths of the firm's stock was completely destroyed, and the damage done by burning, cutting away, heat and water to the surrounding places belonging to Messrs. Whitbread & Co., and Le Grand & Sutcliff, artesian well engineers, was considerable. The fire did not damage the interior of the premises of Messrs. W. Walker & Sons, wholesale cabinet makers, Bunhill-row, but the exterior was damaged in several respects. Their stock is intact, and work and machinery are going on as usual. Messrs. Lascelles & Co. have secured the premises recently occupied by Messrs. W. Scrivener & Co., which, with their own premises at Stratford, will, we are asked to state, enable them to continue their joinery business without any delay. Communications are still to be addressed to their old address, 121, Bunhill-row, London, E.C., as the offices have not been seriously injured. Messrs. Oliver & Sons have asked us to state that they will, owing to their stocks of timber elsewhere, be able to continue their business as usual, and all letters and orders should be addressed to their head office, 120, Bunhill-row.

AUCH.—The artist of the glass, described in our article on Auch last week as a Saxon, was a Gascon; and the words printed "choir, organ," should be "choir-organ."

MUNICIPAL TECHNICAL INSTITUTE, WEST HAM.—The day and evening classes at the Municipal Technical Institute, Romford-road, Stratford, E., will commence on the 21st inst. Classes have been formed in physics, electrical engineering, civil and electrical engineering, art, building, &c. The lecturer in building construction is Mr. Edward Willis, A.M. Inst.C.E., F.S.I., M.San.Institute; the lecturer in technical drawing is Mr. J. H. Fry, F.S.I.; and the lecturer in quantity surveying is Mr. W. E. Trent, F.S.I. The instruction given is of a thoroughly practical character.

REMOVAL OF HOUSE REFUSE FROM FLATS.—The following interesting observations appear in Dr. J. King Warry's Report on the Sanitary Condition of the Hackney District for the year 1900:—During the last few years a gradual change has been creeping over the social life of Londoners. The "home" occupied by one family has given place to the "flat," a unit of a group of families as closely lodged together as the ingenuity of architect and builder can bring them. The closer aggregation of these families demands, therefore, more vigilance in keeping their surroundings free from harmful influences; but the structural arrangement of the block has introduced certain difficulties in safe-guarding their health. The particular difficulty I have met with in Hackney is connected with the disposal of the house refuse in connexion with these buildings. The blocks of flats in this district contain from two to five floors. The arrangements for the deposit of the house refuse until removed by the Local Authority differ. (a) In a few blocks portable dustbins are provided for each tenement to hold the waste refuse, which is kept either on the landing near the door of the tenement or inside the scullery. (b) In others a shoot is formed in the walls of the blocks, with doors opening into the passages at the level of each floor, to receive the house refuse from the tenements at that level. At the foot of the shoot is a chamber near the doors of the tenements on the ground floor. Into this the refuse falls and remains until removed by the local dustman. (c) Another arrangement, worse than the last, is somewhat similar with the exception that the opening to the shoot is in each kitchen. In some the openings are closed by a simple wooden shutter sliding in grooves, in others an iron drum, one-third of which is open, is arranged horizontally, and is worked by a lever. When the lever is depressed the drum is ready to receive the refuse, and by elevating the lever the drum revolves, throws the dust into the shoot, and is then supposed to cut off all effluvia from the shoot; but, as a matter of fact, on testing it is found they are not air-tight, and it can easily be demonstrated in all that the shoot ventilates into the living-room. The common chamber, or dustbin to each shoot, is usually in these cases at the rear of the block, where it is emptied once a week. It is obvious that neither of these arrangements is satisfactory. In the first case, the presence of foul-smelling dustbins close to the doors of living-rooms and in passages alive with children is clearly bad. The same remark applies to the arrangement of shoots with doors opening on the landing. Practically the shoots are ventilated into the passages, and this is especially the fact when the chamber receiving the dust from the shoot is at the foot of the staircase. It is almost unnecessary to state that these chambers are very offensive at times. But the most objectionable are those shoots with shutters or other openings into the living rooms. The tenants complain that an evil smell proceeds from them even when closed; that dust is forced into the room when the shoot is used by tenants on the upper floor; that when used by themselves the dust is blown back into the room, and it is conse-

quently extremely difficult to keep the room clean. It would not have been difficult when these blocks were designed to have devised some means by which these difficulties could have been avoided, but now it would involve much labour and expense to make any satisfactory alterations. It is an axiom of sanitation that house refuse should be removed from the neighbourhood of occupied dwellings at the earliest possible date, and if this is true of the house with its attached open space or garden, how much more so is it true of a block accommodating some of them several hundreds of persons? It is contrary to all sound principles of sanitation that garbage should be kept at the doors or under the stairs of occupied houses, or that dust shoots should ventilate into the passages or living-rooms of the same. Even if a daily collection were established it would not remove the objections to the above. The shoots must be abandoned, but our difficulty is to find a place free from objection for the portable bin. It must either be kept in one of the rooms of the tenement itself, or on the staircase or outside at the back of the block. The last is so inconvenient to tenants that they will not adopt it, and of the two former expedients it is difficult to say which is the less objectionable. My object in discussing this is to show how easily such difficulties could be avoided if architects were to give a little of the thought expended on decorations to the convenience and sanitation of dwellings. I am also not without hope that the London County Council will endeavour to obtain such alterations in the Building Acts as will effectually remedy the above condition of things.

BUILDING CONSTRUCTION CLASSES, HIGH SCHOOL OF GLASGOW.—The building construction classes at this school have just been opened. An additional feature of the classes this session is that students will have the opportunity of studying workshop practice in Kent-road School as a branch department of the High School, the two classes working in conjunction with one another. The architectural lecturer in the theoretical department is Mr. D. Bennett Johnson. The practical workshop department is for the use only of students attending the theoretical department.

WATER SUPPLY WORKS, WESTBURY, WILTS.—New waterworks were opened at Westbury on the 4th inst. The cost of construction has been about 13,000l., and the scheme was prepared by Mr. W. H. Stanley, C.E., of Trowbridge. The pumping station is situated on the Bratton-road, about a mile from the town. It is a red brick building, with Bath stone dressings, and contains a storeroom and repairing shed.

BATTERSEA POLYTECHNIC.—The prospectus of the day and evening schools and classes at the Battersea Polytechnic gives a good idea of the thorough character of the work carried on at this institution and of the provision which has been made for the technical, scientific, and general education of the inhabitants of Battersea, Clapham, Wandsworth, and neighbouring districts. The principal work of the Polytechnic is the provision of evening classes for both sexes in all subjects of technology, pure and applied science, art, commerce, domestic economy, and music; but it also provides a technical day school, a science day school for boys and girls, a training school of domestic economy, a domestic economy school for girls, a day school of art, and special day courses in science and technical subjects. During the last session, 250 evening classes in more than 100 different subjects were attended by over 3,100 individual students, while 520 students were in regular attendance at the day schools and classes. The institute is provided with workshops for engineers, smiths, carpenters and joiners, pattern-makers, plumbers, bricklayers, masons, plasterers, and painters and house decorators, and with laboratories for engineering and mechanics, electrical engineering, physics, chemistry, and natural science, and with an art school, photographic rooms, &c. and with ordinary lecture and class rooms, refreshment-rooms, and a great hall. The successes in day and evening classes for the session 1899-1900 included:—Whitworth Exhibition, three Intermediate County Scholarships, two-sixth Evening County Medal Exhibitions, and Scholarships, thirty-seven Medals and Prizes, three Domestic Economy Training School Scholarships; total value of scholarships, exhibitions, and prizes, 1,227l. The principal is Mr. Sidney H. Wells, A.M. Inst.C.E.

CLOCKS FOR TRAMWAY DEPOSITS.—The London United Tramway Company have placed an order with Messrs. J. W. Benson, Limited, of Ludgate Hill, for three large clocks for the depots at Acton, Hanwell, and Hounslow, the first having a large illuminated dial.

### CAPITAL AND LABOUR.

CARPENTERS' DISPUTE AT BARRY.—Various carpenters, who came out on strike in May, 1900, for an advance in wages from 8d. to 9d. per hour, have now declared the dispute at an end, and claim that the majority of employers in the district pay the advanced rate. The local Master Builders' Association, on the other hand, have refused as a body to recognise the advance, and have since that time employed non-unionists at 8d. per hour.

LEGAL.

ARBITRATION CASE.

MR. GODFREY PINKERTON has now published his award in the matter of the arbitration between Mr. John Thomas Hockley, of Grantham, builder (trading as R. Hockley & Son), and the Trustees winding up his estate, Messrs. John Simpson (Grantham) and J. T. Medcalf (London), against Henry Metcalf and Thomas R. Greig, trading in co-partnership as architects in London. The dispute arose on a contract entered into by Hockley with Metcalf & Greig to build some large flats known as "Irema Mansions," South Kensington, London, for the sum of 25,762. Hockley did a large amount of work on the contract, but, in consequence of the failure on the part of Metcalf & Greig to keep up their payments, he stopped work and ended the contract. Over and above the amount paid by Metcalf & Greig prior to the stoppage of the works, Hockley claimed there was due, for work actually executed, a large sum of money. It was also claimed that Metcalf & Greig had been guilty of a breach of contract, and that Hockley was justified in putting an end to the same and was entitled to damages from Metcalf & Greig for loss of plant, &c., and of profit on the contract. On the other hand, Metcalf & Greig contended that Hockley had been fully paid for all the work he had done, that he was not justified in stopping the work, and that he had committed a breach of contract, and they claimed over 6,000l. damages for their loss in consequence. The arbitrator decided and adjudged—(1), that the sum of 2,052.18.9d. was due from Metcalf & Greig in respect of the work executed by Hockley, the value of which he fixed at 17,160.18.9d.; (2), that Metcalf & Greig should pay the sum of 760l. for loss incurred by Hockley upon plant and material supplied on the contract; (3), that there was nothing due from Hockley to Metcalf & Greig in respect of damages claimed by them; (4), that Metcalf & Greig should pay the costs of, and incidental to, the reference, and the costs of the award, as between party and party; (5), the arbitrator also decided that there had been a breach of contract on the part of Metcalf & Greig, and that Hockley was entitled to the sum of 1,183l. for loss of profit on the contract, the total sum under which Hockley would have been entitled to be paid, had he completed it, amounting to 20,000l. As regards the last item of the award, the arbitrator reserved a point of law, which is to be submitted in the form of a special case stated by the arbitrator to the High Court, as to whether, on the facts stated therein, Hockley is entitled to be paid the sum representing the loss of profit, or any part of such sum; and the costs of the special case to be left to the Court. The first part of the award will be enforceable forthwith, but the special case will have to be argued after the Long Vacation, as soon as it can be brought on.

Mr. Theodore Norton, Grantham, was the solicitor acting for Hockley and his Trustees and Messrs. Morris & Richards, London, were solicitors for Metcalf & Greig—*Grantham Journal*.

RECENT PATENTS:

ABSTRACTS OF PATENTED INVENTIONS.

- 8,731.—A CAN FOR USE BY PAINTERS AND OTHERS: E. G. Hill.—A can for use by painters, French polishers, and other workmen is provided with an interior slip which secures the brush and wire for the removal of surplus liquid from the brush.
- 8,780.—PREVENTION OF SPARKING: E. Eugene Brown.—In order to provide a fixed line of commutation and thereby to prevent sparking the inventor makes slots in the field poles in directions at a right angle to, as well as parallel to, the lines of force; for a motor in which the direction of rotation is to be reversed both portions of the divided pole are slotted, and for a dynamo he makes one of the right-angled slots in the back portion of the pole; the slots at a right angle to the lines of force may be cut upon the outer sides of the pole.
- 8,791.—A METHOD OF ROOFING: W. P. Whitmore.—To the outer edges of sheets made of tarred roofing-paper or felt are applied plain untarred strips of fabric, and the upper and lower edges of a covering strip respectively are fastened to one overhanging roofing-sheet and to a layer of cemented or asphalted gravel upon the other roofing sheet, both of which sheets are secured with nails, &c., which the covering-strips protect. The strips are overlaid on their outer sides with asphalted and gravel, the next adjacent joint being made in the same manner.
- 8,792.—COLUMNS FOR BUILDING PURPOSES: G. F. Fall and W. P. Maynard.—The columns consist of grooved interlocking blocks, which are cemented or glued together so as to form a half column, the halves being then glued together and joined with interior tie-blocks having dove-tail tongues that fit into grooves cut in the blocks.
- 8,796.—A CIRCULAR SAW FOR CUTTING PAVING-BLOCKS: F. Barr.—The multiple circular saw is intended for cross-cutting battens into pavement blocks; the saws are mounted at the distances required upon a spindle, which is journaled in a

- sliding frame that is reciprocated by means of a crank upon the main shaft; as the batten is forced a drive on to the pivoted bench, which can be turned down for the removal of the blocks which have been cut, a cam upon the main shaft works the bench by means of rods and a bell-crank.
- 8,807.—A CONTRIVANCE FOR USE WITH CRANES: F. Schofield and B. Johnson.—The inventors' object is to furnish means of rendering an ordinary travelling crane available for driving piles; they fasten the monkey-frame with stays to the rotating frame, which, in one form, may be mounted upon a detached trolley; for the employment of several monkeys at one and the same time they pivot the customary weighted tripping-levers on to a cross-bar, which is hung upon the lifting-chain and is provided with a guide mounted in the frame.
- 8,814.—RETAINING WALLS FOR TEMPORARY PURPOSES: F. Hennequin.—The retaining-walls are devised for occasional use upon quays, wharves, and similar platforms, they consist of sets of portable cement blocks which are fashioned with a base, a front, and hutchings, and are strengthened with bars of iron: confer also Nos. 10,203, 39,143, and 39,144 of 1897.
- 8,818.—SLATE MANTELPieces AND THEIR PARTS: W. J. Lewis.—A detached plinth is fastened in a recess made in the jamb or pier, with bolts inserted through holes in the jamb and into screw-threaded holes in blocks that are leaded in the plinth, the plinth thus specified will be adaptable for a jamb or pier, having side-strips which are fastened with angle-plates and screws inserted in leaded-in blocks. For joining the strips the edges of one of them are pierced for a plate with a threaded hole, a bolt or a wood-screw is passed through the other strip into the screwed hole.
- 8,820.—MANUFACTURE OF WHITE LEAD: E. R. Blundstone.—A strongly alkaline solution is made by dissolving litharge in lactic acid or lead lactate, which will remain in solution ready to be used again. Then, by the employment of carbonic acid, the white lead is precipitated from the solution until it has become neutralised.
- 8,822.—MECHANISM FOR USE IN GRINDING TOOLS: C. E. Boys.—A double guide is devised for grinding a tool against one of two wheels, the tool being held against a bar which may be set at any angle to a piece which will slide in a groove in a plate in order that the tool may be carried across the face of the wheel. The plate, upon the inclined face of which the tool is held, is caused to slide parallel to the axis of the wheel by a projection that engages with a support which has arms that embrace the wheels, and is adjusted vertically with screws, the inclinations of the four faces of the plate to the horizontal correspond with the angle which is necessary for the clearance of the tool. The two wheels serve for rough and fine grinding respectively, and the angles of the faces are modified in accordance therewith.
- 8,831.—CONSTRUCTION OF COFFER-DAMS, CAISONS, BREAKWATERS, PIERS, WELLS AND TIT LINGS, &c.: G. L. Mouchel.—The blocks or sections consist of concrete moulded around a framework of metal. In the case of a cylindrical foundation cylinder, each of the three sections is made by moulding a thin shell of concrete around the frame in such a manner that the upper concave end of one shell shall fit the lower convex end of the next adjoining shell with a layer of grout filled in between them, the end flanges are bolted together, spaces being left in the framework free from concrete, then the flanges and shell are completed by embedding metal loops, which join the bare portions of the framework together with those portions of the framework in more concrete. For rectangular blocks for a quay wall, each block rises to the height of the wall and its two parts are grouted together and strengthened with beams of concrete and a framing of metal, adjoining blocks being fastened together with bars, and concrete being filled into the intervening spaces.
- 8,849.—AN APPLIANCE FOR WINDOWS: H. T. Thurman and F. Smith.—The flange and the rounded body of a pulley frame (held in its place with screws at the sides or at the top and bottom corners) are arranged so as to engage with a rectangular slot in the pulley stile, and in the latter is also cut a rounded recess having a diameter larger than the width of the pulley stile, a face-plate of metal is affixed with pegs at the sides or corners to the flange of the pulley frame.
- 8,868.—MECHANISM FOR USE WITH LIFTS: D. Corcoran.—Upon a frame which is fastened to the cage are pulleys that serve to keep endless chains in engagement with racks upon the lift-guides, and the chains, passing beneath guide-pulleys, are placed in engagement with worms upon the shaft of the rope-pulley which is engaged by a bight of the driving-rope that is extended throughout the well; the cage will rise or fall, respectively, with the driving in the one or the other direction of the rope-pulley. In a variant form the racks are secured to opposite sides of the same guide.
- 8,871.—MANUFACTURE OF PRISM GLASS: M. F. Faen.—For making glass with prismatic ridges a sheet of glass is cemented in a ribbed and heavy frame of metal which is laid on the table of a planing machine, and adjusting screws fasten a set of tools having ridged faces in another frame. The glass is moved to and fro underneath the tools for making the grooves, whilst moistened emery is

- applied to its surface, and polishing powder is used upon rollers laid end to end, or upon a single grooved leather roller.
- 8,888.—AN INSTRUMENT FOR DRAWING AND MEASURING ANGLES: P. Jacolin.—The instrument, which can be combined with a slide-rule, comprises a double blade to one end of which is pivoted a blade that can be folded within it, and is marked with a protractor and a tangent-line. At the end of the double blade, which is cut away so as to expose the protractor, are reading-marks, and graduations are set out upon the blades.
- 8,899.—MEANS OF MEASURING RELATIVE ANGULAR DISPLACEMENTS: F. J. Guel.—The single-reading apparatus is intended for the measurement of relative angular displacements, and may be combined with the ordinary optical means for taking observations by double reflection; the two mirrors are carried upon rods, which turn and slide in sleeves, and upon clamps.
- 8,934.—A SMOKE-CONSUMING APPLIANCE: R. H. Burns.—A ring-pipe, or similar chamber, provided with hanging funnels or tubes having pierced ends and sides, serves for the admission of air, or some other medium which will assist combustion, so as to mingle with the products of combustion in the hood or uptake of a vertical boiler. The funnels, which should be mounted upon ball-joints, have deflectors disposed underneath them.
- 8,941.—A FASTENING FOR WINDOW-SASHES: D. Stewart.—The meeting edges of the sashes are covered with a plate which is secured, in preference, to the lower sash and has a recess which may be formed by folding over the plate; to the other sash is pivoted a bolt which, when one wishes to fasten the window, is to be turned round into engagement with the recessed plate of which the overlapping part will prevent the bolt from being moved from outside the window. The sashes can be drawn to one another, and their rattling obviated, through the engagement of an inclined slot in the plate with a lug upon the bolt as the bolt is turned round.
- 8,946.—A CONTRIVANCE FOR VENTILATION: F. S. Wright.—The inventor seeks to furnish means of evaporating nitrogen from liquid air, and utilising the remainder that has been evaporated so as to oxygenate the atmosphere of hospital wards, auditoria, and similar apartments. He fashions a container at the bottom of a vessel, into which liquid air is caused to flow. The lower part of the vessel is hermetically sealed around the container, and is composed of and covered with materials that will not readily conduct heat, such as lead, wool, glass, and so on, or glazed tiles having hollowed or porous interiors into which liquid air or its gases will percolate. Some good heat-conducting substance constitutes the upper portion of the vessel, in order that the nitrogen shall first evaporate as the liquid air flows from and over the bottom of the container. When the nitrogen has been drawn away, the oxygen that is left will flow through pipes into the space which is to be ventilated, and it may be heated as it flows through a metallic portion of the flexible pipe. A stand, having racks and a rod, and a pivoted back and bottom (in the shape of a chair), serves to support and tilt the vessel whilst the apparatus is doing its work.
- 8,994.—APPARATUS FOR WARMING BUILDINGS: T. Whitwell.—The inventor's object is to retain and utilise the water arising from condensation in hot-water circulating apparatus; a pipe conveys steam to the coil in the heater, and to the pipe or coil outlet is joined a steam pipe which another pipe through a non-return valve joins to the water space of the heater; the cistern has a pipe for the overflow (which may be returned into the steam boiler), and is connected to the cold end of the circulating pipes by means of a pipe that is U-shaped at the end and is fitted with a controlling valve.
- 9,003.—A LIFT VALVE: A. Nixon.—For a screw-down tap or valve is devised an especially packed valve disc, within which is placed a cone-shaped plug or packing formed of an admixture of antimony sulphide and asbestos, ground up with rubber dough, and moulded into the shape desired. The compound is described as being suitable for other kinds of valves.

MEETINGS.

SATURDAY, SEPTEMBER 14.

Sanitary Institute (Demonstrations for Sanitary Officers).—Inspection at Southwark and Vauxhall Waterworks, Hampton. 3 p.m.

MONDAY, SEPTEMBER 16.

Sanitary Institute (Lectures for Sanitary Officers).—Dr. Priestley, B.A., on "Sanitary Law." 11. 7 p.m.

WEDNESDAY, SEPTEMBER 18.

Sanitary Institute (Lectures for Sanitary Officers).—Dr. J. Priestley, B.A., on "Duties of a Sanitary Inspector: Outdoor." 7 p.m.  
Builders' Foremen and Clerks of Works' Institution.—Ordinary meeting of the members. 8 p.m.

FRIDAY, SEPTEMBER 20.

Sanitary Institute (Lectures for Sanitary Officers).—Dr. J. Priestley, B.A., on "Duties of a Sanitary Inspector: Indoor." 7 p.m.

SATURDAY, SEPTEMBER 21.

Sanitary Institute (Demonstrations for Sanitary Officers).—Inspection at Wimbledon Sewage Works. 3 p.m.

CONTRACTS AND PUBLIC APPOINTMENTS.

(For some Contracts, &c., still open, but not included in this List, see previous issues.)

Table with 4 columns: Nature of Work or Materials, By whom Required, Forms of Tender, &c., Supplied by, and Tenders to be delivered. Contains numerous entries for construction and engineering projects.

PUBLIC APPOINTMENTS.

Table with 4 columns: Nature of Appointment, By whom Advertised, Salary, and Application to be in. Lists various public service roles and their associated details.

Those marked with an asterisk (\*) are advertised in this Number. Competitions, p. — Contracts, pp. iv, vi, viii, x & xxiv. Public Appointments, pp. xxi & xxiv.

SOME RECENT SALES OF PROPERTY:

Table listing estate exchange reports with columns for date, location, and price. Includes entries for Peldon, Penrith, and Hamsrest, Kent.

Table listing property sales with columns for location, date, and price. Includes entries for Clapham, Dover, Penmonville, and Halesworth.

Contracts used in these lists.—P.R. for freehold ground-rent; l.g.r. for leasehold ground-rent; i.g.r. for improved ground-rent; g.r. for ground-rent; r. for rent; f. for freehold; c. for copyhold; l. for leasehold; e.r. for estate-rental; t. for term; p.a. for per annum; yrs. for years; st. for street; rd. for road; sq. for square; pl. for place; ter. for terrace; cres. for crescent; yd. for yard.

PRICES CURRENT OF MATERIALS.

\* Our aim in this list is to give, as far as possible, the average prices of materials, not necessarily the lowest. Quality and quantity obviously affect prices—a fact which should be remembered by those who make use of this information.

Table listing prices for Bricks, Hard Stocks, Facing Stocks, Shippers, Flettons, Red Wire Cents, Best Farnham Red, Best Red pressed, Ruabon Facing, Best Blue Pressed, Staffordshire, Do., Bullnose, Best Stourbridge, Fire Bricks, Glazed Bricks, Best White and Ivory Glazed, Stretchers, Headers, Quoins, Pillars, and Flats, Double Stretchers, Double Headers, One Side and two Ends, Two Sides and one End, Splays, Chamfered, Squints, Best Dipped Salt Glazed Stretchers and Headers, Quoins, Pillars, and Flats, Double Stretchers, Double Headers, One Side and two Ends, Two Sides and one End, Splays, Chamfered, Squints, Seconds Quality White and Dipped Salt Glazed, Thames and Plat Sand, Thames Ballast, Best Portland Cement, Best Ground Blue Lias Lime, N.B.—The cement of lime is exclusive of the ordinary charge for sacks, Grey Stone Lime, Stourbridge Fire-clay in sacks, per ton at rly. dep't.

Table listing prices for Stone, Ancaster in blocks, Bath, Farnleigh Down Bath, Beer in blocks, Grinshell, Brown Portland in blocks, Dawley Dale in blocks, Red Gorsehill, Red Mansfield, Hard York in blocks, Hard York 6 in. sawn both sides landings, 10 steels, 6 in. sawn both sides landings, 2 7/8 per ft. super. at rly. dep't., 6 in. Rubbed Ditto, 3 in. sawn both sides, slabs (random sizes), 2 in. self-faced Ditto, Hopton Wood (Hard Bed) in blocks, 2 3/4 per ft. cube, deld. rly. dep't., 6 in. sawn both sides landings, 2 7/8 per ft. super. deld. rly. dep't., 3 in. do., 1 2 1/2 per ft. super. deld. rly. dep't.

Table listing prices for Slates, 10 in. best blue Bangor, 11 5/8 per 1000 of 1200 at rly. dep't., best seconds, 10 15/8, 16x8 best blue Portman, 2 5/8, 20x10 best blue Portman, 10 18/8, 16x8 best blue Portmadoc, 6 0, 20x10 best Eureka, 11 6/8, fading green, 11 5/8, 16x8 Permanent green, 10 0, 16x8, 11 5/8, 11 5/8.

Table listing prices for Tiles, Best plain red roofing tiles, 5 s. d. per 1,000 at rly. dep't., Hip and valley tiles, 3 7/8 per doz., Best Broseley tiles, 4 8/8 per 1,000, Hip and valley tiles, 4 0 per doz., Best Ruabon Red, brown or bridled Do. (Edwards), 57 6 per 1,000, Do. ornamental Do., 60 0, Hip tiles, 4 0 per doz., Valley tiles, 3 9, Best Red or Mottled Staffordshire Do. (Peakes), 50 9 per 1,000, Hip tiles, 4 1 per doz., Valley tiles, 3 8.

Table listing prices for Wood, Deals: best 3 in. by 11 in. and 4 in. by 9 in. and 11 in., 14 10 0, 16 10 0, 18 10 0, Batts: best 2 1/2 in. by 7 in. and 3 in. by 7 in. and 8 in., 11 0, 12 0 0, Batts: 1/2 in. by 6 and 3 by 6, 10 0, less than 7 in. and 8 in., Deals seconds, 1 0, 0 less than best, Batts: seconds, 1 0, 0, 2 in. by 4 in. and 2 in. by 6 in., 9 0, 10 10 0, 2 in. by 4 1/2 in. and 2 in. by 5 in., 9 0, 10 0 0.

PRICES CURRENT (Continued).

TO CORRESPONDENTS.

NOTE.—The responsibility of signed articles, letters, and papers read at meetings, rests, of course, with the authors. We cannot undertake to return rejected communications. Letters or communications (beyond mere news items) which have been duplicated for other journals are NOT DESIRED. We are compelled to decline pointing out books and giving addresses. Any communication to a contributor to write an article is given subject to the approval of the article, when written, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance. All communications regarding literary and artistic matters should be addressed to THE EDITOR; those relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

TENDERS.

[Communications for insertion under this heading should be addressed to "The Editor," and must reach us not later than 10 a.m. on Thursdays. N.B.—We cannot publish tenders unless authenticated either by the architect or the building owner; and we cannot publish announcements of tenders accepted unless the amount of the tender is given, nor any list in which the lowest tender is under £500, unless in some exceptional cases and for special reasons.] \* Denotes accepted. † Denotes provisionally accepted. AYLESBURY.—For rebuilding the Railway Tavern, Aylesbury. Mr. Guest Luckett, architect, Aylesbury. Senior & Clarke, £63. [Lowest of three tenders received.] See also next page.

HENDON.—For fully making-up Borthwick-road, Ravenshurst-avenue, and Cricklewood-lane widening for Urban District Council of Hendon. Mr. S. Slater Grimley, Engineer:—

### Sanitary Engineering.

Our issue of December 31, 1898, we reviewed at length the first edition of Colonel Moore's great work on "Sanitary Engineering," and now, less than three years later, the second edition\* lies before us. This is not a mere reprint with minor alterations, but claims to have been "brought thoroughly up to date, so as to maintain the position it has gained as the standard work on sanitary engineering." The first edition formed a bulky volume; the second is still bulkier, containing 791 pages (an increase of 170), 360 illustrations in the text (an increase of 326), and ninety-two "large folding plates" (an increase of twenty-two). The principal additions to the text are in the chapters relating to sewage-purification and refuse-disposal, and in the hydraulic tables, but numerous additions have also been made in other chapters, particularly in those dealing with sewer-ventilation and sanitary apparatus.

In the preface to the new edition Colonel Moore states that "every endeavour has been made to profit by the hints and suggestions which have been received from a variety of sources," and we are glad to find that our own criticisms, almost without exception, have been of service. In the space of a single article it was, of course, impossible to draw attention to every erroneous or disputable statement in such a large work, and we regret to find that many such statements have been carried forward into the new edition, and unfortunately much of the new matter contains similar blemishes. The fact is that Colonel Moore relies too little

on his own judgment and too much on that of persons financially interested in the fittings or processes which they recommend. The result is that some of the chapters are very much like merchants' catalogues, the advantages of an apparatus being greatly exaggerated and the defects as carefully concealed as those of a would-be young old maid. These praises are not always sung within inverted commas, and they go forth to the world, therefore, as Colonel Moore's own deliberate judgment. This is unfortunate for Colonel Moore. There are several examples in chaps. ix. and x. We select one from the former chapter, p. 395. It is a description of a wash-down water-closet, illustrated in plate xxv, but which we will not particularise. The description begins:—"The manufacturers state that this is the only closet the basin of which [can\*] be removed from the lead pedestal and trap, so that the plumber has full play to make a plumbing or wiped joint, and thereby doing away with the risky method of soldering a piece of lead pipe to the earthenware trap." Here we have the manufacturers' statement (grammar and all) which the reader will take for what it is worth, but there is nothing to show that the remaining eleven paragraphs (occupying twenty-four lines) are not Colonel Moore's own words. Without search we should not like to offer an opinion as to the correctness of the opening statement at the time it was written, although no doubt the manufacturers believed it to be true; but the statement is certainly not correct to-day, as closets with pottery basins and lead traps or half-traps are now made by a number of manufacturers of sanitary fittings. Two such closets with half-traps of lead are illustrated by Colonel Moore on the same plate, and the "Hygienic" closet, which is also illustrated on plate xxv, has been made for about twenty years with a complete trap of iron (as shown) or of lead; the latter form has apparently been forgotten by Colonel Moore, although it is on almost identical lines with that under notice, and is recommended by the inventor for identical

reasons. Why, then, does Colonel Moore repeat without qualification the statement which we have quoted? Some of the remaining paragraphs—for all of which Colonel Moore is responsible, as there are no inverted commas—are also highly coloured. We need refer to one only:—"There is also a large surface of water in the basin and a deep water seal in the trap." The illustration is, with the exception of the base of the pedestal, a geometrical section, and is apparently printed from the manufacturers' block. No scale is given, but we may assume that the total height of the fitting is 17 in. or 18 in., and with this as our scale we find the "large surface of water in the basin" to be a circle 3½ in. in diameter, and the "deep water seal in the trap" to be ½ in.!! Perhaps the drawing is incorrect, but if this is so, it lies between Colonel Moore and the manufacturers.

This, although a flagrant instance of the indiscriminate copying to which we have taken exception, is only one of many examples in the book, and the new edition is more full of them than the first. Thus, the special drain-pipes of a certain firm were praised in the first edition, but one paragraph was ushered in with the sentence—"The manufacturers state," and the seven special praises came after the words—"The following advantages are claimed for them." In the new edition the description is even more glowing, and has been amplified to twice the original length; but no space could be found for the two principal sentences we have just quoted; and, as if this was not enough, a paragraph has been added which is of such a nature that we quote it in full, with the exception of the proper names:—"Messrs. . . . manufacture also every description of salt-glazed sanitary ware, in which the far-famed . . . clays alone are used, thus ensuring only the highest class of impervious product. They make a speciality of 'tested pipes' and of various forms of patent joints, . . . &c." We venture to style this "the puff direct."

Chap. vii., on "Ventilation," has been in part re-written, and has been extended from thirty-four to forty-seven pages. Much of the new matter consists of quotations,

\* "Sanitary Engineering: A Practical Treatise on the Collection, Removal, and Final Disposal of Sewage, the Design and Construction of Works of Drainage and Sewerage, and the Disposal of House Refuse and Sewage Sludge, with numerous Hydraulic Tables, Formulae, and Memoranda, &c." By Colonel E. C. S. Moore, R.E., M.San.I., author of "Sanitary Engineering Notes," &c., formerly Instructor in Estimating and Construction at the School of Military Engineering, Chatham. Second edition, revised and enlarged. London: B. T. Batsford, 1901.

\* This word is accidentally omitted in the text.

most of which are from the writings of authorities who have no axes of their own to grind, but others are of a less distinguished character. In the first edition there was a reasonable account of an apparatus for extracting and destroying "sewer gas" by means of heat. This reappears in the second edition, but fifteen pages further on a new quotation of two and a half pages begins, the author having the same name as the inventor of the apparatus just mentioned, and arriving at the conclusion that "the most perfect method of extraction is displacement by heat, when the extraction and destruction of the foul gases can be done at one and the same time." What Colonel Moore thinks of the special methods and apparatus which he mentions we are not able to discover; he is apparently content to let the student arrive at an independent conclusion. This is scarcely the part of a guide, philosopher, and friend, such as the author of a large and important work like this ought to be. Not content, however, with leaving to the student the initial difficulty of deciding between the opinions of the various authorities quoted, Colonel Moore has unfortunately rendered the decision more difficult by conflicting statements of his own. On p. 324 we read that sewer-ventilating shafts "not less than 6 in. in diameter are recommended to be led from the manholes, or shafts [*sic*], to the gables of adjoining buildings, or to ventilating lamp-posts." This paragraph and the figure illustrating it are copied exactly from the first edition. As the author does not state by whom this recommendation is given, and as the passage is not in inverted commas, we naturally conclude that the arrangement has his own approval, but in the *new* edition we read on the next page—"Air shafts connected directly with the public sewer should never be fixed against any dwelling-house or building, nor within at least 20 ft. of any window or chimney." On the page facing this definite dictum is the illustration referred to, showing an exit drain "for foul air," carried from the crown of an egg-shaped sewer to the foot of a ventilation-shaft fixed to the gable-end of a building (apparently a house), and within about 4 ft. of a window. In both editions we are told that "inlets and outlets must, therefore, be considered as possibly acting alternately in any capacity, depending on the amount of friction set up at various times by the flow of sewage." The reason given is quite erroneous, and is now contradicted by a new paragraph on the same page (325), from which we learn that "the power of ventilating-shafts depends entirely on the difference of the pressure of the atmosphere at the outlet and inlet of the shaft, from which a deduction must be made for the loss caused by friction; this varies with the size of the shaft and the nature of the inner surface." In the former statement the "friction set up . . . by the flow of sewage" is given as the controlling factor, while in the latter the power of extraction "depends entirely" on atmospheric pressure, modified to a slight extent by the friction of the air in the ventilation shaft itself. Colonel Moore's new statement as to the commanding influence of atmospheric pressure is, however, as erroneous as the old one about the friction of the sewage; the tests made by Mr. Horton, to which we referred him, and

which he now quotes *in extenso*, ought to have enlightened him, "I have not noticed," says Mr. Horton (p. 349), "that the variation of atmospheric pressure makes any difference." We have not by any means exhausted the contradictions in the new matter inserted in this chapter, but we have said enough to show that the author is not yet sure of his ground. The reader will do well to study the quotations, but he had better leave the author's conflicting theories and the formulæ on p. 326 severely alone.

On the details of sanitary plumbing the author is almost as contradictory as he is on sewer ventilation. With reference to cast iron soil-pipes, it is said on p. 302 that they "should be at least 4 in. in diameter to obviate the risk of becoming choked," while on p. 304, in the paragraph entitled "Soil-pipes, Size of —," we read that "a 3-in. pipe is sufficient for this purpose [*i.e.*, for keeping them "clean and wholesome" even where several water-closets discharge into it (fig. 176)." The figure shows six closets served by one soil-pipe. Waste-pipes are inadequately treated; on p. 307 we have the illuminating paragraph: "Waste-pipes. — Waste-pipes from small sinks and baths are often made of light lead piping, six pounds per foot run." The ventilation of waste-pipes is dismissed in twelve lines, commencing on p. 335. In one of the chapters on apparatus, we are told (p. 437) that "a trap of the class shown in fig. 250 or 251, p. 363, should be fixed immediately below the sink"; one of these is a Mason's trap, and the other the old pattern D-trap. This is clearly a slip in reference, and quite pardonable in the case of a large work like this. On p. 439 it is said that a pantry sink ought to be fitted with a trap "selected from those illustrated in fig. 312 or 313, p. 382." One of these is a w.c. trap with a 4½ in. inlet. Pantry sinks, we are told on page 438, "should not be less than 15 or 16 in. deep." Modern wastes and overflows for sinks are conspicuous by their absence.

The sections on baths and lavatories are almost equally inadequate and unsatisfactory. Copper baths, it is said, "are the most durable and retain heat better." This is very loosely expressed. On the next page (441) the author states that "all bath-wastes should discharge . . . into an open channel leading to a self-cleansing drain-trap, such as are represented in figs. 289-293, pp. 374, 375." Of the two traps thus recommended, one is a deep silt-trap with perforated bucket, and is therefore not even intended to be self-cleansing. The size of lavatory wastes is dismissed in two lines, which are almost as enigmatical as sybilline leaves—"the waste-pipe from a lavatory basin should be large enough to admit of rapid discharge, and it is usually from 1 in. to 1½ in. in diameter." We are also told (p. 446) that a certain lavatory basin, the waste-pipe of which is (according to the drawing) not more than 1½ in. in diameter, "forms an efficient drain flusher." Perhaps Colonel Moore can explain how it comes to pass that a 4-in. drain is efficiently flushed by the discharge of 2 or 3 gallons of water through a 1½-in. pipe, and how he reconciles this statement with the table on p. 449, where we are told that it is "generally considered necessary" to provide a chamber holding 30 or 40 gallons for the efficient flushing of a 4-in. drain. This table, by the way, is of very little use, as the

length of the drain is not taken into consideration. No practical man would dream of fixing flushing chambers of the capacities stated in the table in connexion with short drains. In giving Mr. Adams's method of calculating the volume of water required for flushing sewers (p. 453), Colonel Moore includes the length of the sewer as one of the factors to be considered, although, with as little regard for grammar as the monks of Rheims, he says, "there is little actual data bearing upon sewer flushing available."

House drainage is, on the whole, more satisfactorily treated, but even here there are several inconsistencies and lapses from perfection. We read (p. 309) "drains should never be laid under buildings," and then we are told that where such drains are absolutely necessary they should be of cast iron. "Never" is a word not easily qualified; it would be better to use the Gilbertian phrase, "well, hardly ever." The author proceeds to say that cast-iron drain-pipes should be "coated inside and outside with Dr. Angus Smith's composition," forgetting that he has previously stated that the glass enamel now applied to iron pipes "is impervious to the action of sewer-gas, and renders the pipe as smooth as if it were made of glass." The connexion of the soil-pipe with the drain in plate xix. is made within the thickness of the wall, although there is an inspection-chamber outside the building within 2 ft. of the pipe; the correct method would be to carry the soil-pipe into this chamber. In plate xvii. two 4-in. "foul-air extracting shafts" of equal height are carried up from drains leading to one inspection-chamber; a plan ought to have been given showing the position of the two shafts in relation to the chamber. Two more quotations, and we have done with this part of the subject, although we have not by any means exhausted our black list:—"It is sometimes necessary, when the natural action is insufficient to induce an upward current of air in the ventilating-pipe, to employ a cowl." This is from p. 331. On p. 325 we read "inlets and outlets must therefore be considered as possibly acting alternately in any capacity." In other words, the natural action in every ventilating-pipe must be considered as sometimes insufficient to induce an upward current. Must every ventilating-pipe, therefore, be provided with a cowl? Fig. 210 and plates xvii. and xix. answer no. What, then, must be done? Shall we be wrong in concluding that every ventilating-pipe must be fitted with an anemometer, and day-and-night watchmen set to observe it, with definite instructions that, when "the natural action is insufficient to induce an upward current of air," the watchman on duty shall climb to the top of the pipe and place a cowl on it?

Probably it will be of service to Colonel Moore if we point out a few of the minor errors which we have discovered in the new edition. In the first edition (p. 24) and in the second edition (p. 33), we read that "in 1873 M. Liernur introduced his somewhat complicated vacuum system for the transmission and collection of sewage." In the new edition this system is described on pages 43-5, and we are told that "Liernur's Improved Pneumatic System" was introduced in 1868, and first employed at Amsterdam in 1871. The reference on p. 215 should be to p. 56, not 47. It

is a mistake to say (p. 239) that to make drain-pipes 3 ft. long "is only practicable for the larger diameters"; even 4-in. pipes are now made 3 ft. long "ex socket." Whether stoneware pipes more than 18 in. in diameter may be used for sewers, depends upon the strength of the pipes and other circumstances; such pipes have been satisfactorily used up to 3 ft. in diameter. We have already drawn attention to Colonel Moore's method of writing on water-closets, and need only quote his statement (copied from the first edition) that "wash-out closets. . . are in great demand" to show that the revision is not by any means as thorough as it ought to have been.

Let us now turn to sewage disposal. In the first edition there was one chapter on this subject, occupying 107 pages. In the new edition two chapters, with an aggregate of 163 pages, are devoted to it, namely, chaps. xiv. and xv., the latter dealing entirely with bacteriology. This chapter contains 105 pages, or, strictly speaking, 104½—very nearly twice as many as the subject occupied in the first edition. If from these 104½ pages we deduct the six pages of illustrations (none of them original), we have a residue of 98½ pages of text, of which about 83½ are admitted to be either quotations from existing works or written by persons other than Colonel Moore. The remaining fifteen pages are almost entirely occupied by condensed accounts of experiments and apparatus; the first page only appears to contain strictly original matter by the author of the book, and this is a summary of the defects of treating sewage on land and by chemicals. The first quotation consists of a paper read by Sir Douglas Galton before the Sanitary Institute in December, 1895, together with the discussion thereon, and extends from p. 574 to p. 593. Thirteen pages are occupied by Colonel Waring's description of bacteriology and his apparatus, and tests in connexion therewith. We need not particularise the remaining quotations. Some of them are written by patentees or other persons interested in the processes and apparatus described. We merely state this as a fact, without any reflection on the value of their contributions. But, we ask, how are we to review or criticise a chapter like this? The so-called author of the book is scarcely in evidence from the beginning of the chapter to the end. All we can do is to criticise his method of book-making. Surely it was within his powers to have written a succinct account of the processes involved, and then to have gone on to describe the different kinds of apparatus, instead of letting different writers repeat *ad nauseam* the very elements of the subject. The chapter might thus have been reduced nearly one-half, and would have formed a consistent whole, instead of being, as it now is, a heterogeneous collection of extracts from trade circulars and the author's commonplace book.

We regretfully come to the conclusion, therefore, that the second edition of this large book has not gained in value as much as it has gained in bulk. Like the first edition, it contains a vast amount of extremely useful information, but there is too much book-making about it and too little authorship. We do not wish to leave a wrong impression, and it is with pleasure that we draw attention to the voluminous labour-saving tables, which are such an

important feature of the work; to the numerous illustrations and descriptions of sanitary apparatus, from household fittings and drains to sewers, sewage-disposal works, and refuse-destroyers; and to the convenient collection, within one volume, of the opinions of so many sanitarians, distinguished and otherwise.

NOTES.

IN Tuesday's *Times* Mr. Leonard Stokes, who is one of the late Mr. Brydon's executors, returned to the charge in regard to the proposed carrying out of the Government Offices by the Office of Works, in an admirable and forcible letter, in which he replied to the absurd statements made in the communication to the *Times* "From a Correspondent," to which reference has already been made in our columns. We are glad to be able to add that his letter was enforced by another excellent and sensible leading article in the *Times* of the same date, putting the case as well and as strongly as it could possibly be put. As the writer says, if Sir John Taylor is an eminent architect competent to carry out a great piece of architecture of this kind, why was he not originally named and included among the list of architects whose names were first suggested for the work? The Government never proposed him then; they wrote to the Institute of Architects to recommend a list of names for the War and Government Offices. We have no desire to say a word against Sir John Taylor, who as a Government official (and a very able one in a practical sense) is bound to carry out the orders of his official chief. The *Times* goes on to remark that if we desired to have an Office of Works to design great buildings we should of course put at its head and into the ranks of its officials the most eminent architectural talent of the day:—

"To such a department we might perhaps safely entrust the expression of the national taste in architecture. To the Office of Works, as at present constituted, we can entrust nothing of the kind. Its whole conception of a public building appears to be that of a builder, not of an architect. It is not even actuated, we are assured, by a zeal, laudable in itself though deplorable in the particular application, for public economy. It proposes to take a course not less costly than that which commends itself universally to professional and enlightened opinion, and to take it, so far as we can see, out of sheer lack of artistic perception. For this is really all that the argument of its apologist comes to. If you can only get a distinguished architect to make a pretty drawing and leave a few unfinished sketches, all the rest can be done by a draughtsman, a couple of departmental officials, and a competent builder. We can only say that no great public building ever was, or ever can be, produced in this way."

It is encouraging to find such a line as this taken by the leading journal. For many years the *Times* seemed to be under a kind of hereditary disposition to scout architecture and architects, and little was admitted into its columns on such subjects beyond the Philistine amenities of Lord Grimthorpe. We may congratulate our great contemporary on having at last taken up a line in regard to public architecture which will earn for it the gratitude and sympathy of all artists.

It would have been more satisfactory if Sir John Gorst, as President of the Educational Section of the British Association, had last

week in his address endeavoured to give some scientific and statistical view of English education rather than deliver a mere desultory essay. No one perceives more keenly than the Vice-President of the Council the weak places in our system of national education, and no one seems to take more pleasure in pointing them out, at the same time abstaining from giving us remedies. Perhaps the most important point of the address was the clear manner in which Sir John Gorst stated what cannot be too often repeated, that it is useless to hope for good results from technical and secondary schools until elementary education is thoroughly sound. "Classes and schools spring up like mushrooms, which profess to give instruction in the lacking branch of applied science to scholars who have no elementary knowledge of the particular science, and whose general capacities have never been sufficiently developed. Science cannot be taught to those who cannot read, nor commerce to those who cannot write." These and more like them were the statements of the Minister of Education. Practical men would say that if such is the opinion of this official he should enthusiastically and strenuously labour to improve the elementary education of England. But, unfortunately, Sir John Gorst regards it rather from the point of view of the philosopher than of the administrator.

Subways for Underground Pipes.

PLAINTIVE suggestions are made from time to time that the system of subways inaugurated in the City some years ago should be extended to all parts of the metropolis, but no one expects any practical result from such appeals. The number of companies privileged to interrupt traffic by tearing up streets is steadily on the increase, and corporations of this kind seem to grow more fastidious year by year. At one time any old roadway served to gratify their destructive instincts, but in the present day nothing less than a newly-laid pavement will suffice. It is perhaps not to be expected that the welfare of the community should influence the operations of a public company, although consideration for the pockets of shareholders might be looked for. If gas, water, electric and other mains could be laid, altered, or repaired during the renovation of a road surface, some saving would certainly be effected. The fascination exercised by the pastime of road-wrecking must be as powerful as it is mysterious, otherwise pecuniary advantage would never be relinquished for the empty pleasure of spoiling smoothly-paved streets by digging out and filling in trenches, the traces of which frequently remain more or less permanently in the form of irregularities and projections above the normal surface level. Much as the public may desire to see the establishment of subways, nothing can be done without legislation, for the streets have been given up by Parliament to numerous companies who are duly authorised to break them up and to play havoc with traffic at will. A similar problem now confronts the municipal authorities of New York City, where various conduits are buried in any sort of fashion beneath the streets. Referring to this important question, the *Scientific American* says: "It is a pitiful commentary upon our supposed twentieth century development that these mains should be buried beneath the streets

in altogether haphazard fashion." The rapid transit tunnel would have included provision for water, gas, and other mains in roomy galleries had not opposition been offered by the sewer, gas, and water departments, who raised objections that are characterised by our contemporary as being of a trifling nature. At present, therefore, the pipes are merely suspended from falsework during the construction of the tunnel, and after a section is completed, the soil is filled in around the pipes, leaving them in the usual undesirable state, which requires disturbance of the roadway whenever repairs or other attention is needed. So we find the *vis inertiae* of vested interests is already a factor to be reckoned with even in New York, where people affect surprise at the slow growth of municipal reforms in London. The fact is that in all great cities there is urgent need for a constantly progressive policy, and this will only be seriously considered when the authorities find the public to be emphatic as to the necessity for its adoption.

The New Redheugh Bridge, Newcastle-on-Tyne. THE old Redheugh Bridge between Newcastle and Gateshead, erected in 1871, has recently been replaced by a new structure built from the designs of Messrs. Sandeman & Moncrieff, MM.Inst., C.E., of Newcastle, and the work involved a most interesting and probably unprecedented engineering feat, deserving more than passing notice. The old bridge was of the suspension type, having masonry approaches, one at Newcastle 216 ft. long, and the other at Gateshead, 132 ft. long. There were three river piers and four spans, two of 168 ft. and two of 232 ft., the total length of the bridge and approaches being 1,187 ft. For various reasons it was found necessary to build the new bridge on the old site, and this task was successfully accomplished without stopping foot traffic for a single day, and without interrupting vehicular traffic until the work was nearly completed. The foundations of the new river piers each included four cylinders, two being disposed on either side of each old foundation; the river piers were built up outside the old piers and braced together as far as possible. During the conduct of this work, the approach arches at each end were centred and taken down simultaneously, the roadways having been previously shored up. The masonry of the piers and abutments was then built up as to half the width to the required level, and half the width of the new girders, superstructure, and roadway were finished, the other half being afterwards dealt with in a similar manner. Then the main girders of the river spans were built out as cantilevers from the new pier heads, the projecting ends of the two longer girders were joined at the centres of the spans, and the two shorter girders were built out entirely as cantilevers, reaching from the outer river piers to the masonry approach piers. But the girders were not erected in their final position, as the centre line of each was 4 ft. 6 in. away from the centre line of the river piers, and they were slightly higher than the proper level. This mode of procedure was rendered possible by the large cross girders joining the pairs of columns forming the river piers. When the four spans had been practically finished, the entire structure of the old bridge was taken down, all hitherto

uncompleted bracing was put in, and the main girders—weighing about 1,600 tons—were moved over horizontally by means of hydraulic jacks. This operation was commenced early on the morning of May 6 last, and so carefully had all the details been thought out that the work of shifting the girders only occupied a few hours. The spans were then adjusted to a uniform gradient and line, and the fixed and roller bearings were inserted. Afterwards the flooring, roadway, and footpaths were finished, and the new gas and water mains, which had been temporarily uncoupled, were joined up. The new Redheugh bridge is of unpretentious design, but it has the merit of looking exactly what it is—a steel-girder bridge; and further, the skilful manner in which all the details of construction have been designed and executed reflect the greatest possible credit upon the engineers and upon Sir W. Arrol & Co., the contractors.

A New Department in Gas Manufacture. THE Gas Section of the International Engineering Congress held last week at Glasgow was presided over by Mr. George Livesey. In his address Mr. Livesey pointed out that "consumers now have it in their power to get out of 5 cubic feet of gas per hour anything from five to 150 candles from ordinary coal-gas, whether it be nominally ten, fifteen, or twenty so-called candle-power," and exclaimed, "What a useless absurdity does this make of all illuminating power tests!" We quite agree that, owing to the introduction of the incandescent gas light and the extensive use of gas for heating, the so-called illuminating power has become a matter of secondary importance as compared with heating power; but until Parliament has fixed a standard calorific value to take the place of the present illuminating power standard we think it would be inimical to the interests of gas consumers to allow the illuminating power tests to be abandoned. Professor Vivian B. Lewes read a paper on "The Utilisation of Water-Gas in the Destructive Distillation of Coal," in which he described a new method of gas manufacture by which low-grade gas of high calorific value can be made more cheaply than has hitherto been possible. The coal is heated in retorts in the usual manner; but while carbonisation is being carried on a rapid stream of non-luminous water-gas is passed through the retorts in order to push the coal-gas out of the zone of heat before its richest illuminating hydro-carbons have been decomposed into products of less value. By adding 40 per cent. of water-gas (costing 3½d. per 1,000 cubic feet) in this manner, a mixture is obtained which has a heating value about 15 per cent. lower than ordinary coal-gas of good quality, and an illuminating power about one and a half candles lower. The ordinary consumer would probably not detect any difference between this mixture and ordinary coal-gas. In view of the excessive cost of the gas supplied by the Gas Light and Coke Company on the north side of the Thames, it is to be hoped that this company will lose no time in obtaining Parliamentary sanction for a reduction of the standard illuminating power, and by adopting this new process make a substantial reduction in the price charged to consumers. The economy effected by the new process has been found by working on a fairly large

scale to be 2s. 1d. per ton of coal carbonised and as the quantity of coal used by the London gas companies amounts to four million tons per annum, the economy effected in London alone would exceed 400,000l. year.

In a paper read before the American Society of Heating and Ventilating Engineers Professor R. C. Carpenter directs attention to a curious effect due to the accidental presence of superheated steam in some radiators tested by him in the spring of 1901. The radiators were placed on a platform about 2 ft. above the floor, so the vessels might be employed for receiving the water of condensation. Steam was furnished from a high-pressure main, having passed through a separator to remove free water, and thence through a reducing valve for the regulation of pressure. Temperatures were taken of the outside air and at several places in the compartment where the tests were conducted, the temperature of steam condensed and of the radiator surfaces being also recorded and the water of condensation was carefully weighed after being cooled. It appears that the process of reducing the pressure caused wire drawing of the steam, thus liberating a considerable amount of energy which was expended in superheating the steam and, contrary to expectation, the result was clearly to reduce the quantity of heat transmitted by the radiators. Expressing heat transmission in British thermal units per hour, per square foot of surface, per degree difference of temperature the following effects were ascertained: With one radiator using saturated steam at 2 lbs. pressure, the heat transmission was 1'48 when using steam at the same pressure, but with 36 deg. superheat, the transmission only reached 1'16. With the other radiator corresponding loss of efficiency, from 1'83 to 1'41, took place. Similar experiments were made with steam at 5 lbs. and 10 lbs. pressure, with varying degrees of superheat, and in every instance decrease of heat transmission followed the increase of superheat. It is therefore, manifest that superheated steam is a very undesirable medium for warming purposes, probably for the reason that in this state the vapour of water has the properties of a perfect gas, and parts with its heat less rapidly than when it is in the ordinary state of saturated condition.

The annual Report of the Buckinghamshire County Surveyor, Mr. R. J. Thomas, on the highways of the county of Bucks is of more than local importance. Mr. Thomas has a high reputation as a road administrator, and the Report which he issues enables an opinion to be formed of the progress of English highways. For the county of Bucks is of a varied character, and highways of every kind are to be found in it. From the chart showing the cost per mile of the Bucks main roads for the twelve months ending March in each year since 1886, we obtain a clear idea of the results of recent legislation. In 1887, 1888, and 1889 the roads were under parish management, and the cost for each of these years was 65l., 67l., and 62l. respectively. In 1891, the second year of the administration by the County Council, the cost had fallen to 53l. There came a period of exceptional expenditure on

materials, so that in 1893 the cost was 75 $\frac{1}{2}$  per mile. It then fell rapidly, so that in 1896 it was only 52 $\frac{1}{2}$ , and has since kept almost this level, though in 1901 it rose to 53 $\frac{1}{2}$ . It is thus clear that an exceptional expenditure on highways, so as to place them in a thoroughly sound condition, is far more economical in the long run than a niggardly policy; and it is also clear that the main roads of Buckinghamshire are now kept in a better condition and at a less cost than under the less intelligent and amateur management of parish surveyors. The practical moral to be deduced from this Report is that the County Council should be the sole highway authority for every county.

RESTORATION work of some importance is now in progress at Oxford, both at Christchurch and at Merton. At the latter the front of the north transept of the chapel is undergoing repair, being as far as can be ascertained, refaced. At Christchurch two pinnacles are being added to the east end of the cathedral, at present wooden patterns being erected at which, of course, plenty of adverse criticism is directed. The east side of the well-known Tom bell-tower is also being restored. The work at Christchurch is under the advice of Mr. Bodley, and at the cost of two members of the college. It is satisfactory to note this generosity, for of late the pious benefactor has not been much in evidence at the Universities, and his assistance is needed as much now as in former days. Of course there are some who would prefer that ancient buildings should remain untouched, but in regard to many the time must inevitably arrive when work must be done upon them if they are to be preserved for future generations. Nothing is, indeed, more striking at Oxford to-day than the decayed state of much of the stonework, many of the details of the sculptures and carving being quite obliterated by time.

We notice that house-breakers are at work upon the demolition of No. 43, Gerrard-street, Soho, which it seems had fallen into decay. The only part standing when we last saw it was the basement, and above it "the ground-room, next the street," in which, as Pope records, Dryden "used most commonly to write." The house is that to which Dryden removed from Long Acre in 1686, and where he wrote "The Hind and the Panther," his first Ode for St. Cecilia's Day, "Alexander's Feast," the version of Virgil, the "Fables," and several dramas including "King Arthur" and "Don Sebastian." At that time the back windows of the house gave a view of the gardens of Leicester House. Dryden died at No. 43, Gerrard-street, on May 1, 1700. A collection of extracts made some years ago from the rate-books of St. Anne, Soho, shows that Dryden when living there was rated at the sum of 11s. 3d., and that his widow, Lady Elizabeth Dryden (whose name, by the way, is entered as "Madam Dryden") continued to occupy the house, being rated at 12s. The street had been built in or about 1680 upon some land which had formed the military exercise and artillery ground of Henry, Prince of Wales, and afterwards became the property of Charles Gerard, Earl of Macclesfield. The street

was a fashionable quarter at one time. In a period of thirty years reckoned from 1691 were rated (with other notable persons) the Earl of Manchester (1693), "Earle Maxfield" and Lord Wharton (1700), Lord Mohun (1706), General Holmes and Colonel Brett (1711), Lord Howe, the Countess of Suffolk, the Duke of Norfolk, Lord Kerr, and the Earl of Scarbrough (1711); and Lady Maynard (1721). Lord Macclesfield's house, on the south side, was consumed by fire on August 10, 1887.

THE ninth exhibition of the Photographic Salon, which professes to illustrate photography as a fine art, is open at the Dudley Gallery. The means by which this is done in many cases seems to be either to make a faulty photograph, out of focus and blurred, or to work up the photograph until it ceases to be properly speaking a photograph, and becomes something else. Thus Mr. Moss's "Tidal River" and Mr. Bourgeois's "The Clyde, Glasgow" appear to be worked on afterwards; the lights on the water in the latter have all the appearance of being put on by hand. Mr. Hinton's "Recessional" has the appearance of a mezzotint; what process it has gone through we do not understand, but a pure photograph in the ordinary sense it is not. Dr. Henneberg's "Fishing Boat" and others seem to have been made up in a somewhat similar manner; Mr. Davison's "Lucerne" is apparently out of focus and all misty and uncertain. Then we have photographs that look as if they were made on canvas, and others that seem to be made on blotting-paper. But these contrivances to make a photograph look like brush-work only serve to remind one how much better and more interesting brush-work is. Some photographs of sprays of flowers would be very useful as studies for artists; in themselves they have not the value of a drawing; the only one which has some claim to be a work of art is perhaps Mrs. Cadby's "Snowdrops," on account of the care which has been taken in combining the delicate white flowers with the delicate greyish background. Mr. Keighley's "The White Sail," in which a drooping sail of a boat aground is backed by the curved wall of the pier, is a good piece of composition; and in composition there is something to be done in photography; the photographer may choose a better or worse point of view, or he may group or pose a figure well or ill. In this respect, however, the natural man is more recalcitrant in real life than he is in the hands of the painter, and it is rarely that we find a photographic group or figure as well posed as a painter will do it, who can to some extent create the pose he wants. And on the whole we prefer good photographs which are simply photographs to those which try to be something else. There is Mr. Craig Annan's really fine portrait of Professor Young, for instance, and Mr. Hollyer's of Captain Hutton; most satisfactory examples of photographic portraiture. An open air study by D. Spitzer, of a powerful naked man carrying a stone up a hill (we wonder it is not called "Sisyphus"), is a good piece of work. As we have before complained, architecture, the class of subject best of all suited to photography, is nearly ignored. Mr. H. H. Hopkins, however, shows a clear little photograph of "Varenna," Mr. F. H. Evans

a little miniature interior of Bourges," Height and Light," which is very successful; and Mr. H. W. Bennett an interior, "In an Old Church," which we take to be St. Albans.

NOTES ON THE BRITISH ASSOCIATION MEETING.

PROFESSOR RÜCKER'S inaugural address, more concentrated as to subject and more popularly comprehensible than some Presidential addresses on these occasions, afforded an admirable summary of what may be called the greatest step in recent times towards a true conception of the mechanism of matter—that matter which is the constituent of the universe and the substratum of life. Most of what he said as to the atomic theory of matter, or what he called in one passage of the address the "course-grained character of matter,"\* should by this time be familiar to all who, even without claiming to be physical scientists themselves, have kept an intelligent eye on the progress of scientific conception and reasoning. For it is by reasoning rather than observation that the atomic theory has been established, as it may now be said to be; at all events, as Dr. Rücker put it, "the atomic theory must hold the field until another can be found which is not inferior as an explanation of the fundamental difficulties as to the constitution of matter." For that is the only test we can have of the truth of a theory which deals with conjectured atoms invisible to sight: does it offer the best-known explanation of the phenomena that are visible? In this light, the atomic theory seems justified at every turn. It meets us as the rational explanation of the interpenetration of gases and fluids, by an analysis of the same order as that which has apparently solved the question of the mechanical stability—even possibility—of Saturn's rings. No telescope has brought us near enough to Saturn's rings, or probably ever will, to enable us to form any judgment from the appearance of their surface as to their constitution; but analysis has shown that their constitution and stability are explicable on the theory that they are composed of small particles with independent motion; and, so far, on no other theory. These are not "atoms," of course; they may be comparatively large particles; but the process of reasoning applied to them is the same; it is the atomic theory on a magnified scale. Late as this discovery is, comparatively speaking, it may already pass as a scientific commonplace. One or two illustrations not so familiar were cited in the course of the address. The most striking of these is the experiment of Sir W. Roberts-Austen, who placed pieces of gold and lead in contact at a temperature of 18 deg. C. "After four years the gold had travelled into the lead to such an extent that not only were the two metals united, but, on analysis, appreciable quantities of the gold were detected even at a distance of more than 5 millimetres from the common surface. . . . Whether it is or is not possible to devise any other intelligible account of the cause of such phenomena, it is certain that a simple and adequate explanation is found in the hypothesis that matter consists of discrete parts in a state of motion, which can penetrate into the spaces between the corresponding parts of surrounding bodies." A very little thought will show that any theory which regards the lead and the gold as close and compact substances entirely united is absolutely at variance with this ascertained fact of interpenetration. The deductions from one such observed fact are wide-reaching, and must affect our whole conception as to matter. Where we are brought up is when we attempt to step from the conception of inanimate matter to that of life. "Perhaps," observed the President, "the chief objection which can be brought against physical theories is that they deal only with the inanimate side of Nature, and largely ignore the phenomena of life." But is not the step here referred to the eternally impassable one—the "Thus far shalt thou go and no farther" addressed to the human intellect. As to the mechanics of

\* Those who were present at the remarkable Friday evening lecture given at the Royal Institution a good many years ago by Lord Kelvin (then Sir W. Thomson), may remember his illustration of the atomic structure and movement in matter by means of a number of ivory balls hung on a level and at equal distances by long threads from the ceiling, and which all entered into movement from an impulse given to one of them.

matter we may look to continually increase our range of observation and knowledge, but the mystery of *life* will still remain the Sphinx whose riddle none may hope to read.

Considerations as to the constitution and mechanics of matter will hardly, it is true, affect architects practically in dealing with construction; but they serve to give us a clearer idea of the nature of the material universe which is our basis of life, and therefore they should be of interest to all thinking persons, of whatsoever profession. In our notes on the remainder of the proceedings, we must confine ourselves to the papers on subjects of more direct interest to our readers. In the Geographical Section the President of the section, Dr. H. R. Mill, took for his subject "Research in Geographical Science," in the course of which he thus defined the principles of geography:—

"The science of geography was, of course, based on the mathematical properties of a rotating sphere; but if they defined geography as the exact and organised knowledge of the distribution of phenomena on the surface of the earth, they saw the force of Kant's classification, which subordinated mathematical to physical geography. The vertical relief of the earth's crust showed them the grand and fundamental contrast between the oceanic hollow and the continental ridges; and the hydrosphere was so guided by gravitation as to fill the hollow and rise upon the slopes of the ridges to a height depending on its volume, thus introducing the great superficial separation into land and sea. The movements of the water of the ocean were guided in every particular by the relief of the sea-bed and the configuration of the coast lines. Even the distribution of the atmosphere over the earth's surface was affected by the relief of the crust, the direction and force of the winds being largely dominated by the form of the land over which they blew. The different physical constitution of land, water, and air, especially the great difference between the specific heat and conductivity or diathermancy of the three, caused changes in the distribution of the sun's heat, and as a result the simple climatic zones and rhythmic seasons of the mathematical sphere were distorted out of all their primitive simplicity. The whole irregular distribution of rainfall and aridity, of permanent, seasonal, and variable winds, of sea climate and land climate, was the resultant of the guiding action of land forms on the air and water currents, disturbed in that way from their primitive theoretical circulation. So far, they saw that the surface forms of the earth, themselves largely the result of the action of climatic forces, and constantly undergoing change in a definite direction, controlled the two great systems of fluid circulation. Those in turn controlled the distribution of plants and animals, in conjunction with the direct action of surface relief, the natural regions and climatic belts dictating the distribution of living creatures. A more complicated state of things was found when the combined physical and biological environment was studied in its incidence on the distribution of the human race, the areas of human settlement, and the lines of human communications. The complication arose partly from the fact that each of the successive earlier environments acted both independently and collectively; but the difficulty was in greater degree due to the circumstance that man alone amongst animals was capable of reacting on his environment and deliberately modifying the conditions which controlled him. It seemed to him that the glory of geography as a science, the fascination of geography as a study, and the value of geography in practical affairs were all due to the recognition of that unifying influence of surface relief in controlling, though in the higher developments rather by suggestion than dictation, the incidence of every mobile distribution on the earth's surface."

Following out this idea, geographical study might be classified into geomorphology, dealing with the forms of the solid crust of the earth; oceanography, dealing with the masses of water on the globe; and climatology, dealing with the effects of solar energy in the air. Considering the subject of geography and the State, he believed that geography would be found to afford an important clue to the solution of every problem affecting the mutual relations of land and people, enlightening the course of history, anticipating the trend of political movements, and indicating the direction of sound industrial and commercial development. Unfortunately, it would be easy to enumerate misconceptions of history, blunders in boundary settlements, errors in foreign policy, useless and wasteful wars, mistakes in legislation, failures in commercial enterprise, and lost opportunities in every sphere, which were due

to the neglect of such a theoretical geography. Surely it was to the laws defining the interaction of nature and man that they should turn for guidance in such affairs, rather than to the dull old British doctrine of "muddling through."

In connexion with this subject Dr. Mill complained of the serious omission in the Ordnance Survey, that the extension of the survey to the lake-beds should have been forbidden on the score of expense, and spoke with satisfaction of the prospect of this totally indefensible omission being made up for by a survey of the lake-beds which was proposed to be carried out as a private enterprise by Sir John Murray and Mr. Laurence Pullar. At the conclusion of his address Dr. Mill warned his hearers that this country was not in a satisfactory state in regard to geographical work. The best work of some of our cartographers in Edinburgh and London need fear no comparison; but in the main it could not be denied that Germany led the world in map-making. It would be interesting to know how many pennies in the income-tax would have been saved had we been possessed, in the present war, of fuller and better maps of the country, resulting from a survey of South Africa carried out as an Imperial duty when Cape Colony was settled. The survey would not have prevented the war, but it would have shortened it by some months. Meteorological surveys would also become of increasing national importance in view of the probability that wind and water would be more used in future in industrial enterprises, and the Government ought to place our great national industries, in this respect, on a basis of scientific knowledge.

At a further meeting of the section Mr. Chisholm read a paper on "Geographical Conditions Affecting British Trade," in the course of which he alluded to the great advantages which those countries would have, in the near future, which possessed the greatest natural opportunities for the development and use of water power; Switzerland, Norway, Italy, Canada, and the United States being in this respect all more advantageously circumstanced than Great Britain. Italy, in particular, which since the opening of the Suez Canal held a very favourable commercial situation, was developing the resources of water power largely, and might thus be able to develop a great trade based on her own resources. In answer to a question as to the effect on England of a successful completion of the Panama Canal, Mr. Chisholm thought it would tend more to the advantage of the eastern seaboard of the United States than of this country, but he would not say that Great Britain would not benefit at all by the carrying out of such a work. At a further meeting of the Section Professor Smith read an interesting paper on the botanical survey of Scotland. The 1-in. maps of the Ordnance Survey had been used for the full work, the 6-in. maps for smaller areas. One object was to mark the different associations of plants, and the dominant species in each area. On the sea-level the maritime or littoral association. Then came the cultivated land, which was rather difficult to deal with, being too much under the influence of man. It was divided into two classes, a better class on which wheat was grown, and the poorer class where wheat did not enter into the rotation. The vegetation on the arable land was marked, and the woodlands were also recorded—oak, pine, and on Scotch maps larch. The heather moorlands were recorded by a different colour, and the grasses again by another. Above the 2,000-ft. line the heather gave out, and the blueberry association became dominant. Above the 3,000-ft. line was the Alpine plateau, on which it was difficult to say what was the dominant species.

In the course of the discussion, the President pointed out that by the study of plants which resisted erosion and the movement of sand dunes the Emperor Napoleon hit upon the idea of binding together a part of the coast of France with the result that had had enormous practical value. Some years ago, too, a British General, when visiting a newly-erected fortress on the coast, asked the officer in command why the mound was so bare. He was told that grass had been tried upon it but would not grow. He replied, "Sow no more grass, but go along the coast and find out what plants are growing there naturally. Get them and plant them." This certainly suggests a very practical application of the knowledge of geographical distribution of vegetation.

On the subject of the Lakes of the British Isles a special conference was held at a later period of the meeting, a joint conference of the Geological, Zoological, and Geographical sections, at the close of which a resolution was passed expressing the gratification of the conference that the work of this amateur survey would be carried on under the direction of Sir John Murray, and also their sense of the munificence of Mr. Pullar, who it is understood is providing the funds for the work.

The address of Colonel Crompton, President of the Mechanical Science Section, was occupied with three main subjects—high-speed railways, traffic in streets, and foreign competition. He considered that in future high-speed railways would be worked by electrical power, and that there would be a great development of such railways over the long distances presented by American travel. In England there were only a few journeys long enough to make saving of time by high speed a very essential element, and the topographical question would put English engineers at a disadvantage, since the number and mileage of such railways would be far greater on the Continent and in America than in England. We do not see the force of the argument; if high-speed railways can be made safe and are not injurious to health (on both which points we have our doubts), people in England will alike demand them in spite of the comparatively short distances. But the question arose, he said, whether rapid transit between two towns might not best be effected by high-speed motor cars running on special roads constructed for the purpose. This is an idea worth consideration, but it is to be hoped separate roads would be provided for going and returning, otherwise, in spite of steering, there would be likely to be some fearful accidents.

In regard to street traffic Colonel Crompton laid stress on the difficulties created by the mingling of slow and quick (or what should be quick) traffic, and by the constant neglect of the rule to keep to the left of the roadway except when moving out to pass another vehicle. This is very well on paper, but there is little possibility of adhering to such a rule in crowded streets. "A great deal might be done," he suggested, "by arranging that during certain hours much of the slower moving traffic should be shunted into alternative routes, so as to be kept by itself. Motor cars could safely travel at sixteen miles an hour, and therefore need only take half the time and occupy only half the street surface that an omnibus did when travelling at eight miles per hour. Such high speeds as these, which were desirable and perfectly safe for motor cars, could not, however, be obtained unless some regulations were made as to the use of the roadways by foot passengers;" and it was also suggested that towns situated on our main through roads should provide alternative routes so that through travellers could, if they desired, avoid the crowded streets of the town. But how many through travellers are there in the streets of our large towns? Vehicles coming to a large town have almost invariably that town as their immediate object; the through traffic would not be important enough to justify a special route. On the whole, one can hardly consider the address a very logical one, or adding much to the subject. In regard to foreign competition, Colonel Crompton emphasised the fact, which has been more than once referred to in our columns, that "the chief difference between the manufacturer of America and the manufacturer at home was that, whether it be steam-engines, tools, agricultural machinery, or electrical machinery, the American invariably manufactured goods in large quantities to standard patterns. In America work was far more specialised than here, so that a manufacturer as a rule provided himself with a complete outfit of machinery to turn out large numbers of one article. In America it seemed to be understood by the purchaser that it was a distinct advantage to every one concerned, both manufacturer and purchaser, that the purchaser should to some extent give way and modify his requirements so as to conform with the standard patterns. On other matters it was quite possible for manufacturers here to combine, so as to obtain some standardisation of parts. Many years ago Sir Joseph Whitworth impressed on the world the importance in mechanical engineering of extreme accuracy, and of securing the accurate fit and interchangeability of parts by standard gauges. But in spite of his idea being so widely known and

\* The direct quotations are from the *Times* report, except the paper on lightning conductors by Mr. Killingworth Hedges, which is from a report specially furnished to us.

taught, how seldom had it been acted upon to the extent that it should be!"

It is this practice of manufacturing standard and interchangeable parts that enabled an American firm, not long since, to supply a Government order which English firms declared themselves unable to cope with in the allotted time. Such a system is not, of course, so satisfactory to an engineer, who likes to design structural details after his own mind; but it is a very important factor in the race against time, which is becoming so pressing an element in modern work.

At a subsequent meeting of the Mechanical Science Section Mr. Hele-Shaw read a paper on "Resistance of Road Vehicles to Traction," a subject which he has made his own, and on which he has been carrying out a series of special experiments. Mr. Norman Macdonald, of Edinburgh, read an important paper on railway rolling stock. He summed up, on the question of locomotives, in favour of the compound as against the simple engine, and expressed his surprise (as he well might) at the fact that only one railway in England regularly used compound engines. We suspect the fact is that one great railway company will not, out of jealousy or a fear to appear to be learning from its rival, adopt a principle which has been started by the locomotive designer of another great railway. Instead of that, they endeavour to show that it is all a mistake, and that the supposed advantage of the compound engine is imaginary; a conclusion with which facts and statistics are at variance. Mr. Macdonald next emphasised the importance of the boiler, and even recommended moderate-sized driving wheels in order to get in a larger boiler; a question, we take it, between speed and "staying power" in the engine. We were behind other nations in our locomotive boiler pressures, which showed an average of 180 lbs. pressure with occasional excursions to 200 lbs.; while in the United States pressures of 210 lbs. to 215 lbs. were the ordinary ones, and the best engines ran to 225 lbs. and 230 lbs., and it was expected that before long 250 lbs. and even higher pressures would become common. He also pointed out that at the Paris Exhibition the British locomotives were almost the only ones which did not show some form of equalising or compensating levers for the purpose of automatically distributing shocks over the various springs and axles. Mr. Macdonald seemed to suggest that our system of carrying rails in chairs tended to multiply shocks, and therefore the more required such precaution against their effects. He does not appear however to have stated what system of rail-laying he recommended as free from the supposed defects of our own. At the same meeting Lord Rosse read a paper on the rather novel subject "An Arrester for Intercepting Leaves in the Intake of a Water Supply."—

"The apparatus consisted of a cylinder of wire gauze, 4 ft. in diameter and 4 ft. 6 in. in height, set in an opening in a vertical diaphragm extending across the supply drain and revolving twice in a minute or so round a vertical axis. The current flowed through the gauze cylinder in a horizontal direction. The leaves carried down with the current adhered to the cylinder under pressure of the stream, and were carried round till they reached the diaphragm. The latter on one side was double, with an intervening space of some 10 in., which was connected with the tail-race. When the cylinder had made a sufficient part of a revolution for the current, relatively to the gauze, to be reversed, the leaves were detached and carried by a portion of the water towards the tail-race. Four or five per cent. of the supply was ample for conveying the leaves; probably much less would suffice. A very few leaves got past and on to the screen, but so few that they gave no trouble."

At the meeting of the same section on the 17th it was stated that it had been usual to devote the Monday to electrical engineering papers, but on this occasion none were forthcoming; an exceedingly surprising announcement considering the exceptionally active position of electrical engineering at the present moment. As the nearest approach to an electrical subject, Mr. Killingworth Hedges read a paper on "The Protection of Buildings from Lightning," of which we are able to give the following résumé:—

"The last time this subject was brought before this Association was at the Bath meeting in 1888, when a joint discussion of Sections A and G was held; but there has been

no official report as to the effect of lightning stroke upon buildings protected by conductors since the Lightning Rod Conference of 1882. Interest in the subject has been again revived, first, by the Electro-Technische Verein of Berlin, who have this year published a set of rules; and, secondly, by the establishment in this country of the Lightning Research Committee, organised jointly by the Royal Institute of British Architects and the Surveyors' Institution.

The author compares Continental and American practice, and gives an account of his rearrangement of the system used at St. Paul's Cathedral, where the conductors, erected as recently as 1872, were found to be totally inefficient, both as regards the conductivity of the joints and the resistance of the earth connexions. In the plan recommended, both for this installation and for the more recent one at Westminster Abbey, the number of ordinary conductors from air to earth has been greatly increased, and, besides these, horizontal cables are run on the ridges of the roofs and in other prominent positions so as to encircle the building, being interconnected to the vertical conductors wherever they cross one another. The horizontal cables are furnished at intervals with aigrettes, or spikes, which are invisible from the ground level, and are designed to give many points of discharge. At the same time they, in conjunction with the cables, would receive any side flash which might occur should any portion of the building receive a direct stroke of lightning.

The unreliability of soldered joints for conductors, whether of cable or tape, has led the author to design a special joint box, which can be applied for uniting any portion of the system together in such a manner as to give great mechanical strength as well as good electrical contact; at the same time any box can have points inserted so as to form an aigrette in any desired position.

Owing to the difficulty of sinking an earth plate of sufficient area, on account of old foundations, a special form of tubular earth has been designed which takes up little space and has the advantage that if a suitable moist ground is not obtainable the desired low electrical resistance is attained by leading a tube in connexion with the rain-water pipes, so that a portion of the rainfall is diverted to the tubular earth.

The author alludes to the immense amount of damage to property annually occurring which might be prevented if efficient conductors were installed. He mentions that instead of every church having its lightning conductor not ten per cent. are so provided; and in the case of other public buildings the percentage is not much larger, the reason in the case of the former class of buildings being that a vicar wishing to safeguard his church has usually to pay the cost out of his own pocket.

Architects, as a rule, treat the question of lightning conductors in a very brief manner, and in their specifications seldom say anything as to the way in which they are to be run, or the necessity for good joints and good earth connexions."

We may have space for some further notes next week on some of the subjects discussed in other sections.

#### HYDE ABBEY AND KING ALFRED'S MILLENNARY.

THE Millenary of King Alfred is an all-absorbing topic of the week. The City of Winchester, already interesting to the eye, is proving itself interesting to the mind as well, and the Cathedral, the West Gate, the City Cross, and other architectural treasures of the place are, for once, out-vied by the humbler scanty remains of Hyde Abbey and the Tudor-arched gateway in King Alfred-place, just beyond the north walls.

Appropriately enough, on the first day of the four devoted to the local festivities in honour of the great king, the Mayor's guests went in worldly pilgrimage to the shrine of their saint, Hyde Abbey, the site of King Alfred's interment, where, a month or two ago, some portions of the foundations of the apse of the abbey church were unearthed.

This church was the one to which the monks removed in 1110 from New Minster, which was so close to the Cathedral, or Old Minster—and to the abbey founded by Alfred's Queen

hard by, as to interfere with each other's services by bell-ringing, &c. The properties of the Abbey of New Minster were regranted to Hyde with some further additions of land and privileges.

New Minster was dedicated in 903 to the Blessed Trinity, Our Lady, and St. Peter by King Edward the Elder, son of Alfred, and consecrated by Archbishop Plegmund. Edward transferred the remains of his father and mother to the new church on its completion, and placed secular Canons in the Abbey. After a tenancy of sixty years or so, the disorders within the monastery were stopped by the Ecclesiastical and Civil Authorities combined, and the Canons who would not take the monk's habit were dismissed and monks brought from Abingdon to replace them. For about a century little is chronicled about the Abbey, but Alwy, brother of Earl Godwin, who succeeded to the Abbacy in the latter half of Edward the Confessor's reign, took part with Harold, his nephew, with twelve monks and twenty soldiers against the Conqueror, and was killed. William I. then seized the Abbey Estates, and kept the Abbacy for two years before allowing an Abbot to be chosen, and alienated their narrow enclosure.

Relenting after two years, the King elected Wulfric, and gave back part of the Abbey and other possessions in exchange for some he still kept.

During the whole of Rufus' reign New Minster was in the hands of Passlebere, the king's agent. A temporary end of the monks' troubles came at the accession of Henry I., when a regular abbot was chosen from the cathedral—Hugh, renowned for piety and monastic discipline. It was in this reign the removal to Hyde took place. Hyde Abbey had been erected for the monks by Giffard, Bishop of Winchester, at the instance of the King, and the buildings were on a sumptuous scale. One of the privileges extended to Hyde was enjoyed by the monks when at New Minster, viz. the possession with the monks of the cathedral to St. James's Church above the castle. St. Peter was chosen patron of Hyde, though it was sometimes known as St. Grimbaldus and sometimes as St. Barnabas.

In 1140, *temp.* Stephen and Maud, the Abbey was burnt down, and the Great Cross given to New Minster by Canute robbed of its gold and silver by Henri de Blois, which was melted in the burning Abbey. He is supposed to have been the incendiary. The damage done to the Abbey amounted to 4,862l. 13s. 4d. of the money of the time. The monks instituted Canonical process against him, and Bernard, Abbot of Clereval, helped them in their appeal, which was so powerful, that in 1151 the Bishop had to go to Rome to clear himself. He reconsecrated the cross ten years later, after having carefully restored it.

The church and abbey were rebuilt with great magnificence in Henry II.'s reign, and it soon became one of the most distinguished houses of the kingdom, the Abbot being one of the twenty-five summoned to the Upper House. The bell-tower was destroyed by fire in 1445, with its peal of eight bells.

The last Abbot was John Sulcot, who came from Holm, Norfolk. He was instrumental in getting his University (Cambridge) to comply with the King's divorce, and was consequently promoted, April 19, 1539, to Bangor Cathedral, and allowed to hold Hyde *in commendam*. For his "good services" in promptly giving up the Abbey in 1538, and getting twenty-one of his monks to join him, he was further "preferred," in 1539, to Salisbury, which See he governed for eighteen years. He was buried in that Cathedral.

The value of Hyde Abbey at the Dissolution is given as 865l. 18s. 0½d. (Dugdale), and 865l. 18s. 6½d. (Speed); and the site was granted, 37 Henry VIII., to Richard Bethell, who promptly pulled down the buildings. Leland, writing after Wriothesley had held it for a term of years, said it existed no longer. In Camden's time the remains were still fairly extensive.

King Alfred's remains were undisturbed till 1788, when the Corporation of Winchester required a site for a prison, which was erected on part of the space occupied by the Abbey Church, and capitals of columns and other ornaments were dug up all over the city, especially here. The prison was demolished in 1830.

The Registers were important, notably the Liber de Hyda. The seal of the Abbey is nearly perfect.

The site is included in the 35 acres of land just recently acquired by the Winchester Corporation as used for a recreation ground, and the gateway is likewise now the property of that city, through the generosity of Mr. Barrow Simonds.

It is impossible, of course, in the above short notice, to more than slightly allude to some of the salient points of interest in the history of Hyde Abbey; but it will serve its purpose if it arouses some public interest in the Abbey of a less local nature. J. A. R.

#### HOUSE AT MILLHOUSE.

This house, to be built for Mr. Geo. Hoyland, will be finely situated for moor views. Local stone will be used, with brick inside stone, slates, and rock stone dressings. Mr. C. O. Nelson, of London, is the architect.

#### MAGAZINES AND REVIEWS.\*

The *Art Journal* contains the continuation of an essay by Mr. Claude Phillips on the Wallace collection, dealing in this number with the Watteau pictures, and constituting an admirable critical essay on the art of Watteau, so often misunderstood and regarded as frivolous though graceful in its human element. As Mr. Phillips fully recognises and eloquently points out, Watteau's scenes are really full of human passion, but it is passion restrained in expression by the social manners of that outwardly conventional period, when "the modish Cupid of the day" not less effectually "shrilled his finsel shaft." The exquisite picture entitled "La Fontaine" fully merits, not only in originality and grace of composition, but in real feeling, all that Mr. Phillips says of it. Mr. Montbard continues his effective pen-and-pencil sketches of the capital of Morocco. A notice of Mr. S. J. Hodson's art is given by Mr. Lewis Lusk, under the title "A Painter of Romantic Cities," with various illustrations from his pictures; a subject certainly interesting to us, though we cannot help feeling that Mr. Hodson, whose architectural pictures are very complete and correct, somewhat fails to convey the element suggested by the title of the article, and is accurate rather than romantic. An article on "Scenes of the Chase Applied to Decoration," by Miss Beatrice L. Thompson, deals with a very interesting subject. One point with the author is that sporting subjects were treated as of much more artistic importance by the ancients than by the moderns; as she says, there are plenty of hunting pictures on the walls of our annual exhibitions, but none of them

are of any permanent importance in art. She seems rather inclined to dismiss Landseer in the same category; but that would be a mistake. Landseer's stag pictures were not decorative, certainly, because in England in his day no one thought much about decorative art; but they are very fine and powerful works, and will not be forgotten. Fox-hunting certainly has not had its Landseer, or its decorative painter either; but does it, after all, present much attraction for a great painter? And one reason for the prevalence of hunting scenes in antique art is that life was less complex then, and painting dealt with line and movement rather than with emotional expression. It is well, however, that the possibility of doing something more important in art with modern sporting subjects should be suggested.

The *Magazine of Art* devotes an article, written by Mr. B. Kendall, to that fine French painter of idealised figure subjects, M. Raphaël Collin, whose genius and style are judged by the critic both with sympathy and discrimination. M. Collin is not a powerful painter, and can hardly be called a great one; but no painter of the day, perhaps, has been more refined, and has shown more variety, grace, or poetic feeling, in his treatment of the figure as a medium of decorative effect and of ideal suggestion. In the latter respect the two panels in the Opéra Comique illustrating "La Chanson Légère" and "L'Ode," of which small illustrations are given, are very happily characteristic of his way of embodying a poetic ideal in a figure. His larger and much more important picture, "L'Inspiration," which we noticed at the time of its appearance at the Salon, would have been worth a separate plate; the small scale illustration only gives a very inadequate idea of it. We have, however, two large-size reproductions from figure studies by the artist. The remainder of the number is largely occupied with reviews of this year's exhibitions—the Salon, the Académie, and the Guildhall. In reference to landscape at the Académie, is a remark with which we entirely sympathise. The writer (Mr. Spielmann) observes that the British school of landscape, at least as illustrated at the Royal Academy, "has resisted the incursion of the tendency to regard Nature as a mere material for the solution of light and colour problems. The theories of *Impressionistes*, *Poinillistes*, &c., Mr. Spielmann remarks, are interesting and to be encouraged, but commonly stop short of what ought to be the ultimate aim of a complete work of art. A scrap of landscape, without arrangement or charm of selection or composition, is frequently taken as an excuse for showing how well—perhaps how unprecedentedly well, the painter can suggest blinding sunlight and mysterious shadow. This may be good sunlight painting,

but it is not landscape painting; a caution which is very much needed. There is a short article with some illustrations on "Wood-carving of Mr. J. Phillips," a carver of talent and originality who is to a great extent working with architects in carving ornamental detail. Mr. Phillips appears to be going back to Nature in the endeavour after originality—a course which is tempting but dangerous, when we have to do with architectural carving. In the altar frontal for instance, which forms one of the illustrations, the symmetrical ornament in the panels is very good, but the naturalistic ornament on the uprights is far too ragged, both in itself and in relation to the panels. Every great style of decoration has refused this kind of irregular work; it is a variety no doubt, but it is beside the true end of architectural decoration.

In the *Berlin Architektur-Welt* the leading subject is the "Neues Romanisches Haus," an immense building for shops and dwellings, and including a café, of which Herr F. Schwetien is the architect, but which in its general style might almost be taken to be the work of Richardson. It is, of course, as its name implies, based on the same style on which Richardson founded his architecture; there is, however, a coarseness and showiness about some of the details which we do not find in the American architect's work. It is, however, a powerful and interesting building, the plan of which shows clever treatment of a very irregularly-shaped site. Among the other illustrations in the number are some pretty interiors of dressing-rooms by Carl Müller & Co., a Berlin firm of decorators, which have less than usual of the restlessness of the "Art Nouveau" about them. A double-page illustration of the ceiling of an entertainment-room, painted in a brilliant though somewhat rampant style by Herr Max Koch, is another of the special features of the September issue.

Parts 7 and 8 of vol. viii. of the *Architectural Review* (Boston) contain much interesting matter in both illustrations and text. In Part 7 we have an article with illustrations on "A House of the Transitional Period," which in American architectural history means, apparently, the modern Academic Classic architecture which succeeded the old Colonial period, and preceded the later architectural developments of the United States. The house in question, called "The Old Bennett House," New Bedford, is certainly a remarkable one; a centre block with a pediment and a hexastyle Ionic portico, with detached wings, set back and connected by low buildings to the centre block and decorated with each with a tetrastyle portico on a smaller scale. The writer of the article (Mr. Wheeler Dow) observes—"I should not recommend to a client his exploiting an

\* Unavoidably postponed from last week.

act replica of the Pennell House, but what a superb suggestion it supplies for modern development!" a sentiment in which we entirely concur. Many of these old symmetrical Classic houses, however unsuitable for precise reproduction as modern dwellings, afford noble types on which to work afresh. It is a pity that a plan of it was not given, for, in the way of modern adaptation, that is of course the root of the matter. The building of the North American Trust Company, at Havana (Messrs. York & Sawyer), is based on a triangular plan with the outer angle rounded off into a nearly half-circle—a very suggestive form of plan of which the most has not been made; the treatment of the rounded portion is weak and wanting in character, and large circular-arched windows on a circular plan are not desirable features. "The Problem of the Storefront," by Mr. R. Coolidge, is an interesting article with a number of illustrations of various executed commercial buildings, none of them however, to our thinking, of very good architectural quality. Mr. Coolidge bestows much praise on Mr. Stephen Codman's latest commercial structure, the Pelham building at Boston, which he calls "the last word in design for a building whose greatest need is light." Steel columns encased in splayed mullions of granite carry the floors, and these mullions of granite carrying run up the outer part of the front in vertical lines, the whole space between them being window and the edges of the floors; but the proportions are far too thin for mullions which appear to the eye to be of granite; moreover, they give the impression of a much smaller scale than the actual one. In Part 8 "Office Interiors," (i.e. the writing on plans), by Mr. Chouteau Brown, deals with a minor subject which will interest many English architects, to bestow a good deal of thought and consideration on lettering; a matter not unworthy special attention. Some of the alphabets of capitals are very good, but we hardly sympathise with the rather mechanical system of decorative letters which is illustrated, in which the bow-pen takes a larger part than the free hand. The sheets of details of the Massachusetts Horticultural Society's building (Messrs. Wheelwright & Haven) are valuable and interesting; but Messrs. Maginnis, Walsh, & Sullivan's St. Mary's Church, Taunton (Mass.) is a very weak piece of modern quasi-classic.

The *Artist* contains an illustrated article on the work of a very remarkable Russian artist, Ischa Schneider, some of whose designs we have seen before, but whose work is little known in this country. Schneider is a very able draughtsman of the figure (almost always a male figure, not the female), which, however, he uses almost entirely as the symbol of artistically conceived ideas. Some of his conceptions are very striking and original. Every one interested either in the approaching ceremony of the Coronation or in the preservation of Westminster Abbey from injury and danger to its fabric, should read Mr. Somers Clarke's article in the *Nineteenth Century* on Westminster Abbey and the Coronation. It is to a great extent historical, and gives some very appalling information as to the way in which the Abbey has been knocked about and abused on former occasions in the course of the erection of vast masses of staging. And, as Mr. Clarke observes, these vast temporary erections actually do away with much of the possible grandeur of the scene. The Abbey itself makes the finest of surroundings for the great ceremonial, and the Abbey has been, to an increasing extent on each successive occasion, despoiled of its beauty in almost wanton manner. Mr. Clarke has his own suggestions, which he might, however, have explained in more detail. The most prominent feature in them is the proposal for the erection of a great temporary vestibule or hall outside of the west front of the Abbey, which would enable 2,000 persons to see the procession without risk of injury to the building. We do not quite gather what his proposals are for the interior. But we hope his protest against the dangerous and unsightly lining up of mountains of timber scaffolding and seating within the building will receive attention in official quarters.

The *Contemporary Review*, which is generally addicted to grave subjects of a political and moral cast, has launched out into two papers on artistic questions, placed together, evidently having some connexion in idea. The

first is by the able and thoughtful lady who writes under the name of "Vernon Lee," but who in this paper hardly shows her usual intellectual discernment. It is entitled "Art and Usefulness;" and as soon as we see the title we know what to expect. It is the old pet heresy of Ruskin and of other critics of his school dressed up afresh—that art is only craftsmanship; that "furniture and utensils; things which exist because we require them, which we know because we employ them, these are the type of all great works of art," "Vernon Lee" indeed does seem to admit some sort of difficulty in putting craft in the same category as works of imagination:—

"I call Art whatever kind of process, intellectual and technical, creates, incidentally or purposely, visible or audible forms, and creates them under the regulation of this æsthetic instinct. Art, therefore, is art whenever any object or any action, or any arrangement, besides being such as to serve a practical purpose or express an emotion or transfer a thought, is such also as to afford the *sui generis* satisfaction which we denote by the adjective: beautiful. But, asks the reader, if every human activity resulting in visible or audible form is to be considered, at least potentially, as art; what becomes of *craft* as distinguished from *craft*, or rather what is the difference between what we all mean by art and what we all mean by *craft*?"

To this objection, perfectly justified by the facts of our own day, I would answer quite simply: There is no necessary or essential distinction between what we call *art* and what we call *craft*. It is a pure accident, and in all probability a temporary one, which has momentarily separated the two in the last hundred years. Throughout the previous part of the world's history art and craft have been one and the same, at the utmost distinguishable only from a different point of view; *craft* from the practical side, *art* from the contemplative."

So that there is no essential difference, but only an accidental one, between a picture and a wheelbarrow, and things "to serve a practical purpose or express an emotion" are things in the same category. "The sonnet or the serenade are useful to the romantic lover in the same manner that carriage-horses and fine clothes are useful to the man who woos more practically-minded ladies." One is loth to speak disrespectfully of such a writer as "Vernon Lee," but we must say that greater nonsense is more hopeless confusing of things essentially distinct, we never read. And then Vernon Lee endeavours to insinuate that the contemplation of art apart from any end of utility is something frivolous, and that our consciences feel it to be so:—

"If we examine into our own feelings, we shall find that even for the most art-loving of us the hours spent in galleries of pictures and statues, or listening to music at concerts, are largely stolen from our real life of real interests and real pleasures; that there enters into them a great proportion of effort and boredom; at the very best that we do not enjoy (nor expect to enjoy) them at all in the same degree as a dinner in good company, or a walk in bright, bracing weather, let alone, of course, fishing, or hunting, or digging and weeding our little garden" (!)

If that is the way the writer feels in regard to the enjoyment of a fine picture exhibition or a great symphony, we can only say that we are very sorry for her; but she may be assured that there are persons who enjoy these things in a different spirit, and with no feeling of "boredom." All this kind of talk is the result of the modern rage for trying to explain all our pleasure in art, and all the meaning of art; whereas the highest art is not explainable either in itself or in its influence on us; and as soon as we try to explain we mar it. The succeeding article in the *Contemporary* is by an American lady, Miss (or Mrs.) Ada Cone, and is entitled "The Art Problem in the United States." To some extent we are in sympathy with this article, for it is in part an attack on the American worship of French art, and the idea that America can be made artistic by assimilating the school and the methods of French art. She says, and we think truly—

"The adoption of this course in America is a threatened disaster. For, on the one hand, the characteristics of this art are such that the nation which borrows them necessarily puts a clog on the development of its natural æsthetic expression; and, on the other hand, if we look at the conditions of American life, it appears evident that a people in these conditions which takes European fine art to be a suitable channel for its own expression is a people which has mistaken its way."

This is quite true; we have long regretted, and some thoughtful Americans have regretted,

this tendency to make a French art in America, instead of endeavouring to create an American art. But a little further on we find that Ada Cone is attacking French art, and in fact all that is called fine art, in itself, and is in the same condemnation with Vernon Lee:—

"And what is modern fine art? A work divorced from utility as its first condition, and, therefore, separated from the people. A representation of life, of history, of dogma, isolated in a frame, or otherwise detached from its surroundings, an intellectual idea clothed by art laws, in which the intellectual tends to prime the æsthetic, which itself is reduced to a question of processes scarcely appreciated outside the profession except by critics specially trained. This art necessitates an artificial method of instruction. It is learned; however interesting, it is a dead language."

It is perfectly true that fine art demands an intellectual training to understand it; "the people," so far as we take that to mean the mass of the untrained or little trained intellects, do not understand it—and never will, until (if ever that time comes) the present level of education of the best instructed classes is that of the people generally. But to pour contempt on art because it is so intellectual a pleasure that intellectual training is required to enter into it, is about the oddest paradox we have heard of. Some of the author's remarks on French industrial art are, however, true enough, and we may also thank her for a spirited attack on Rodin-worship, and on the collection of curiosities and indecencies which were to be seen in his special pavilion at the 1900 Exhibition.

Under "The Field of Art" in *Scribner's Magazine*, Mr. F. Crowninshield considers the subject of architectural decoration in the form of "a mural painter's letter to his pupils." What he is driving at is not very clear, but apparently he is trying to hold the scales between archaeology and invention in decoration; and his conclusion is that "there are plenty of new things to be done on guaranteed lines, plenty of new inspirations to be cajoled from Nature if she be humoured and studied. The expressions of them must be very largely in terms of the past, modified to meet new thought and feeling." That is a reasonable position. We cannot make all art over again, with the idea of being original; but there is much more scope for originality within academic lines than is generally realised, because people are so often content to be academic merely, instead of striving to put a new spirit into the academic framework. As to "Art Nouveau" Mr. Crowninshield speaks out bravely:—

"There never has been, nor ever will be an art nouveau in the sense that its disciples would have us believe, unless there is to be a *Man Nouveau*. Human taste is essentially the result of aggregated experience, and the old man must be taken into account. There may indeed be novelty, but not necessarily art. Follow the course of art down the perspective of years from its infancy to the present day, and you will never find a 'new art' at any specified moment. It is a gradual evolution. If at times a new art has seemed to burst suddenly into being, it is only because the missing links have been undetected. Archaeology has taught us this much, and let us be grateful. The geniuses added their grain of personality to accumulated knowledge, not a great deal, but enough to give interest and the personal note, the *sine qua non* of all great things; but none of them ever dreamed of throwing off the past and starting *ab initio*. Yet this is just what the clamour for new things would do. They exact too much. They throw off too much. If they knew more, if they retained more, they would give more. Nor do they seem to have any sense of the humorous. To the uninitiated this lack of humour is less obvious in their decorative design where the figure is eliminated. But where there are figures, how ludicrous they often are! Lanky, malarious, grotesque; affected even to absurdity! And their decorative forms are ludicrous, too. On the table before me there lies an amusing reproduction of a restless interior, the latest expression perhaps of Art Nouveau. On its wall a stringy scheme swirls from vainscot to ceiling in fatuous lines. Liberated telegraph wires, snarled and swayed by the storm, seem to be the fundamental motive of another decorative scheme."

This is really refreshing reading.

In the *Century* we have a description and illustrations of a New York institution which we have not before heard of—viz.: "Mid-air dining clubs." This is one use apparently to which the modern high buildings of New York are put, to provide dining-rooms and restaurants high up in mid-air—

"Above the smoke and stir of this dim spot  
Which men call earth—"

dining-clubs reached by swift express "elevators" which in a few moments convey the tired business man from the street to a station in the fresh air and with a wide prospect. A good many illustrations of views from these aerial dining-rooms are given. There is something both seductive and not unpractical in the idea, when you have the high buildings; whether it is worth while to crowd a city with them for this purpose is another question. A short article introduces us to an American landscape painter, W. L. Picknell, now dead, with whose name and works most English people are probably unacquainted. Like most American painters of any note in recent times, he studied and painted for some years in France, and the one illustration given of his work, "The Road to Concarneau," has (as far as we can judge of it in black and white) the style of the best French school of landscape art.

*Harper* contains an article by Mr. Arthur Symons on "Prague," with illustrations by Mr. Louis Hitchcock. Mr. Symons's powerful faculty of literary expression enables him to give an effective summary of the historic and picturesque interest of Prague, though there is no special architectural perception displayed in it. The small sketch of the Castle of Karlstein is the most interesting of the illustrations. The same number contains a popular but authoritative article on "Cathode Rays," by Dr. J. J. Thompson.

In the *Pall Mall Magazine* Mr. Hugh B. Philipott has indulged in a speculative or prophetic article on "The London of Ten Years Hence." It is an attempt to describe the impression which will be produced in a walk through London from Westminster to St. Paul's, when the Roman Catholic Cathedral, the new Government Offices and War Office, the Strand improvement and new street, the new courts on the site of Newgate, &c., are all completed. The number also contains an article on Israel and his art, by Professor Liebermann. We learn from it that the great Dutch painter began his career in great poverty and earned a bare existence by portrait painting. He lived at that time in the Jews' quarter at Amsterdam. It was not until the age of forty that he developed the type of execution and of subject which has made him famous; until then he painted, as Professor Liebermann puts it, "like any one else." The general estimate of his genius in the article is just and well expressed. It is worth note that Israel considered himself very deficient in technique; a remark of his is quoted to the effect that "no painter except Millet has been less able to draw and paint than I, and yet made such good pictures." There is, indeed, some similarity between him and Millet intellectually, though not, of course, in style and execution.

*Feilden's Magazine* contains an account, written by Mr. Lewis Longfield, C.E., of "Argentina," the industrial development of the Argentine Republic, which appears to be progressive by leaps and bounds. Mr. Maxwell's papers on "The Town Refuse Problem" are continued, with sections and illustrations of several types of refuse destructor. He sums up with the conclusion that "from experience gained at steam-raising destructor plants it may be accepted that, in suitably designed stations, town refuse may be relied upon to generate high-pressure steam for the generation of electric energy or other uses, that refuse has a fairly definite calorific and commercial value for this purpose, and that its treatment by fire under the conditions dealt with is not only the most sanitary, but also the most economical and perfect method of disposal of the refuse of towns."

The *Engineering Magazine* is largely occupied with the subject of the installation of exhibitions, having an article on "Engineering at the Glasgow Exhibition," on "Mechanical and Electrical Features of the Pan-American Exhibition" (the Buffalo Exhibition), and on "The Engineering Organisation of a Great Exposition." This last article is a summary of the engineering arrangements of the Paris Exhibition of 1900, and is of considerable interest both as a record, and as a guide and suggestion as to what is necessary in future undertakings on a similar great scale.

A copy of the *Engineering Times*, a journal with which we were not previously acquainted, has been sent to us, containing an article on the "National Industrial Association," the object of which is to federate existing employers' and trade-union organisations, "with the main object of promoting a feeling of

common interest between masters and men." It is pointed out that there is at present no association in existence which represents both employers and employed; it is desired to make the Association in question a means of doing this, and of convincing both sides that their interests are identical. That is of course just what is wanted to put an end to strikes and lock-outs; many efforts have been made to that end with only partial and temporary success. If the National Industrial Association can achieve this end it will have done a great work.

In the *Revue Générale* M. Louis Humblet has an interesting critical article under the title "Plume et Pinceau," an attempt to discriminate between the powers of pen and pencil in conveying ideas to the mind. It is a kind of disquisition which perhaps does not lead to very much, for there are so many different points of view from which writing and drawing may be compared; but considerations of this kind at all events serve to stimulate thought in regard to the objects and limits of art.

In the *Cornhill* a very pleasantly written article on "A Byway in the Cotswolds" will put the reader on the trace of a good many interesting old farmhouses and other buildings, which may be missed by the traveller without such hints.

In the *Gentleman's Magazine* Mr. Eric R. Buckley brings together a good deal of curious information in regard to "The Staging of Plays 300 Years Ago."

In *Knowledge* the Rev. J. Bacon's article on "The Capricious Hearing of Certain Sounds at Long Range," evidently based on long and rather special experience and observation, is of interest in regard to the effect of locality on the hearing of fog-signals made by bells or other sound-producers.

## Illustrations.

### NEW LABORATORIES, NETLEY HOSPITAL.

THE illustration shows a piece of the facade of the new Pathological Institute building, with red brick and Portland stone to match the existing hospital.

We hope to publish the complete plans and general description of the Institute in a future number. The illustration is here given as an example of a very characteristic adaptation of the elements of Classic architecture to a plain piece of building for practical purposes.

The original drawing—which, we may observe, is an exceptionally excellent example of monochrome brush-work—was exhibited at the last Royal Academy.

### PARÉ'S BANK, LEICESTER.

THIS building is now in course of erection for Messrs. Paré's Leicestershire Banking Company as their head offices, and occupies the site of the old buildings.

The new bank is faced externally with Portland stone, the base being of unpolished grey Aberdeen granite. The external sculpture is the work of Mr. Chas. J. Allen, of Liverpool. The banking hall has a domed ceiling of steel construction covered with expanded metal to receive the plastering, the modelled decoration of which has been executed by Mr. G. P. Bankart. The lower portion of the internal walls is lined with unpolished mahogany panelling. The whole of the fittings are polished mahogany. The floors are partly oak and partly marble; the latter work and other marble decorations have been executed by Messrs. Farmer & Brindley. The lead glazing is by Mr. George Wragge. The electroliers and some of the ironwork are the work of the Bromsgrove Guild of Applied Art. Some of the electric standards, name-plates, and other bronze work are by Messrs. Collins & Co., of Leicester.

The contractors for the general building work are Messrs. J. C. Kellett & Son, and the architects Messrs. J. B. Everard & S. Perkins Pick. The total expenditure will amount to nearly 40,000l. The drawing was exhibited in this year's Academy.

### COTTAGES.

GLAZENWOOD COTTAGE, Guildford, was built for Mr. A. C. Curtis. It is a brick and rough-cast cottage with a slate roof. Mr. Billimore, Guildford, was the builder.

The two gardeners' cottages at Dorking were built for Mr. G. P. Gooch. The walls are 9-in. hollow walls, cement-washed, and white-washed. The roof is of local tiles. The builders are Messrs. Pledge Bros., Dorking.

The proposed gardeners' cottage at Lichfield for Mr. F. H. Lloyd, is explained by the plan; the two wings are attached as overflow bachelor quarters from the house, served from the cottage, yet separate from it.

The Artist's Cottage, Bickley, was designed for a site adjacent to a house of similar character, with rough-cast brick walls, red brick base, red roof, and black paint. It has not been carried out as yet.

Mr. W. Curtis Green and Mr. Arch. C. Dickie are the architects of all the cottages illustrated.

### EXAMPLES OF ESSEX BRICKWORK:

#### FEERING PARISH CHURCH.

THIS is one of many examples to be met with in the county showing brickwork at its best. The county of Essex is peculiarly a brick district, the soil being eminently suitable for the making of bricks, more particularly those of the richest red colour. The bricks are small, not much over 2 in. in thickness, and the joints are wide, owing, no doubt, to the roughness of the hand-process of making; the joints are seldom less than 3/4 in. thick, and often more.

The diapering is produced by precisely similar bricks—all headers, but those headers selected which have been fired to a greater extent than the bricks generally. The extra firing produces a rich blue-grey; and with age the tone of the mixed red and blue is delightful.

ARNOLD MITCHELL.

### MUNICIPAL ENGINEERS' CONFERENCE AT GLASGOW.

THE sitting of the Municipal Engineers' Section of the Engineering Congress was concluded at Glasgow on Thursday, September 5, Mr. E. G. Mawbey, C.E., Leicester, presiding.

Mr. J. More, jun., C.E., F.R.S.E., read a paper on "Recent Tramway Practice," which called forth considerable discussion.

Mr. A. H. Campbell, Engineer and Surveyor to the East Ham Council, read a paper on the problem of the housing of the labouring classes, with special reference to suburban districts. He said the district of East Ham growing at the rate of 7,000 persons per annum, and those chiefly of the working classes, afforded probably as good a field as could be found for experience in the problem. The limit of wages which he had in mind in the provision his Council were making was a maximum of 30s. per week. In the provinces no doubt, this rate would be considerably lower. For the housing of this class the scheme adopted by the East Ham Council was to provide four and five roomed houses, containing 470 superficial feet and 520 superficial feet (available room space) on ground and first floors respectively, at a rental of 5s. 9d. and 6s. 3d. per week (inclusive of all rates, taxes, water, and outgoings). With this idea the scheme was matured, and received official Government approval, providing for the erection of fully 540 separate houses, which, with land charges, formation of roads, and contingencies, made up a total of 120,000l. The workman's ideal house should have entrance and exit independent of any other house. To this extent only need it be self-contained, any should have the following accommodation:—

(1) A kitchen containing at least 144 superficial feet, net; (2) scullery, with small range, copper and bath, 90 superficial feet; (3) parlour, usable as a bedroom, 125 superficial feet; and (4) bedroom, 90 superficial feet; total, 435 superficial feet, together with arrangements for coal-water-closet, clothes closets, and larder, a suitably positioned. A house giving the above accommodation should be provided in the London suburbs at an inclusive rental of from 6s. to 6s. 6d. per week, and in the provinces where building costs, rates, and taxes are lower at a correspondingly lower rental. It might no doubt, be desirable to add one or even two bedrooms to the schedule, but the problem before Local Authorities, and given them by the Legislature to carry out, was not the creation of municipal villadoms with their six and seven roomed houses, but the erection of plain, substantial cottages for the respectable lower.

wage-earning classes, and at rents within their very restricted means. Hence his plea against the ambitious tendency of municipal bodies to compete in accommodation for show with the houses provided by private persons for quite another and better-off class than was ever intended by the framers of the various schemes. A well-defined municipal policy would bring about a better understanding between Public Authorities and private persons whose capital was embarked in house property. In cases known to him in the suburbs of London there were being provided by Local Authorities houses 8s. 6d., 9s. 6d., 10s., and up to 12s. per week of rental. Schemes like that betrayed ignorance, or at least misconception, of their statutory duty.

The President expressed the fear that in many cases the tenants would take lodgers, and the houses be occupied by two or three families. It was just a question whether it was not more advisable to provide two-roomed tenements at a less cost—say about 1s. 6d. a room per week.

Mr. J. Lobley, Hanley, who moved a vote of thanks to Mr. Campbell, said the problem was largely one for London. There was no doubt in providing this class of dwelling Mr. Campbell was doing something not provided by private enterprise, and he took that to be the point from which this question should be regarded by the Authorities. The difficulty in Midland towns was that the public wanted a 7s. house for a 3s. 6d. rent.

Mr. Cooper, Wimbledon, said the bedroom accommodation in Mr. Campbell's plan was not sufficient for a family.

Mr. Munse, Belfast, asserted that houses could be provided at much less cost in Ireland, and that owners of small house property could make 10 per cent. profit on their outlay.

The vote of thanks was accorded.

Mr. Campbell, in reply, said that they had found the demand was for two-bedroomed houses and not one, however small the bedrooms might be. His Authority would not recognise the taking of one penny from the rates.

Mr. F. W. Mager, Walsall, contributed a paper on "Coal-mining Subsidences in relation to Sewerage Works," which in the absence of the author was taken as read.

The Conference closed with a vote of thanks to Mr. Mawbey for presiding.

### COMPETITIONS.

INFANTS SCHOOL, HALIFAX.—In the recent competition for Infant School, Halifax, the 1st premiated design was that sent in by Messrs. C. F. L. Horsfall & Son, Halifax.

### ENGINEERING SOCIETIES.

THE INSTITUTION OF JUNIOR ENGINEERS.—The summer meeting of this Institution took place at the Three Towns, Devonshire, last month (August 12 to 17). By permission of the Lords Commissioners of the Admiralty, Devonport Dockyard was first inspected. The workshops were visited and H.M.S. *Queen* (battleship) and *Encounter* (third-class cruiser) were seen in course of building. In the afternoon, by special steamer, the party had a rough passage from Plymouth, outside the breakwater, to view the rivers Yealm and Kitley. On the following morning, a steamer kindly provided by Sir John Jackson took the members from the Promenade Pier to H.M.S. gunnery-ship *Cambridge*, and thence to the torpedo-school ship *Defiance*. In the afternoon, the party visited the Keyham Dockyard Extension Works, a scheme so gigantic that it will involve the expenditure of over four millions sterling. When completed, in about four or five years' time, the port will be provided with ten docks and five basins, including a tidal basin of 353 acres area—1,550 ft. long, 1,000 ft. wide, and 55 ft. deep, communicating with the Hamoaze by a caisson. The Royal Naval Engineering College was visited first on the morning of the next day, under the guidance of members of the Institution in residence at the college. Proceeding afterwards into the Keyham Steam Yard, the nature of the practical training which the students undergo was pointed out, in the section specially set apart for their instruction. The other divisions of the factory were shown, the Dockyard was visited and a number of various vessels of war therein were seen. In

the afternoon some of the members went by brake in very unpropitious weather to Lea Moor to view the China Clay Works belonging to Messrs. Martin Brothers, while others took advantage of an invitation received from the agents to go aboard the famous Atlantic liner *Deutschland* on her call at Plymouth. Under the guidance of the superintendent, Mr. W. A. Moore, the Royal William Victualling Yard was visited on the Thursday morning, special attention being paid to the engineering features. The rebuilding work at the Royal Naval Hospital was afterwards inspected. The afternoon and evening were devoted to a steamer excursion on the river Tamar. Arrived at Cothel, the historic house of the Earl of Mount-Edgcumbe was, by his kindness, opened for the members' inspection. Embarking again, the steamer completed the run to Weir Head and returned down stream to Marwellham. On nearing the Three Towns on the passage back, the powerful searchlights from the vessels in the harbour and from various points on land were observed in operation. The Royal Albert Bridge, Saltash, was visited on Friday morning, Mr. Elms acting as guide on behalf of the Divisional Engineer of the Great Western Railway, Mr. T. H. Gibbons. A thorough examination of the renewal work of the lower girders which was going on was made, and the party ascended into the tube, remaining there during the passage of a train across the bridge, so that they might experience its effect. The degree of vibration of the tube was almost imperceptible, a condition due, it was stated, to the satisfactory character of the girder-strengthening work already referred to. In the afternoon the members were entertained by the Mayor of Plymouth, Mr. J. D. Bellamy, to a garden party in Beaumont Park, the use of which for the purpose had been granted by the Corporation. The magistrates, aldermen, councillors, and other local friends were invited, and all the arrangements made for the pleasure of the guests were much appreciated. The summer dinner of the Institution was held in the evening at the new Hotel Continental, a number of Government officials and other gentlemen of the neighbourhood being invited. An incident of the evening was the presentation of an oak stationery cabinet to Mr. F. S. Pilling in token of the members' gratitude for his assiduous services as honorary local secretary of the meeting, a well-deserved compliment. On Saturday the Plymouth Gas Works were visited under the guidance of the manager, Mr. P. S. Hoyte, and the waterworks at Burrator were also inspected. A number of other engineering works were open during the week to the visit of the members, who were received with the greatest cordiality wherever they went.

### Books.

*Classic Architecture: A Series of Ten Plates Illustrating Typical Examples of the Grecian and Roman Orders.* By CHARLES F. MITCHELL and GEO. A. MITCHELL. London: B. T. Batsford. 1901.

THESE plates have been drawn by the authors, who are lecturers on architecture to the Polytechnic School of Architecture, for the use of students preparing for the examinations of the Board of Education, or intending to become students of the Royal Academy and of the Institute of Architects.

Only one typical example is given of each order, which perhaps is sufficient for the purposes of a student; and though the plates are neither so numerous nor so refined in execution as in Normand or Mauch, they are on a larger page, and give the whole columnar height in each order, instead of giving only the capital and base of the column, according to the older received and orthodox method. The student thus gets his eye inured to the proportional appearance of the whole order. Two plates of Greek and Roman ornament are added. The book is a very good publication for its purpose, though we had thought that Mr. Spiers's selection of plates of the Orders had supplied what was wanted for those who could not possess themselves of the larger collections of Normand or Mauch. As that, however, was issued (if we remember right) by the same publisher, we presume he believes there is room for the new publication without injuring the old one.

*Euclid's Elements of Geometry.* Books I-IV, VI, and XI. Edited for the Use of Schools. By CHARLES SMITH, M.A., and SOPHIE BRYANT, D.Sc. London: Macmillan & Co., Limited. 1901.

"EUCLID" has been a source of worry to schoolboys for more reasons than one during past generations. Teachers of a former day were prone to require their pupils to repeat word for word the demonstrations as expressed in some standard translation of Euclid's Elements. It was, therefore, only natural that many pupils should come to regard the task as one for the memory rather than for the reasoning powers. The teacher apparently found it easier to criticise parrot-like repetition with the convenient aid of a text-book than to encourage thought, and he seldom or never put before his students new theorems for proof, or problems for solution, in their own language. No wonder then that the elements of geometry were thought by the average schoolboy to be dry and useless. In the work now before us we are pleased to find that the language of Simson, Pott, and Todhunter, is by no means scrupulously followed. Moreover, Euclid's own proofs are discarded in cases where they are incomplete or obscure. Instances of such treatment will be found in I. 22 and 24, II. 9 and 10, and III. 26-29. With regard to the four last-mentioned propositions, relating to the properties of circles, it may be said that proof is afforded by superposition, a method which is instructive and has the advantage that each proposition can be proved independently of the others. Again, Euclid's own proofs are given in certain cases, instead of alternatives as suggested by some editors, because the former are justly considered to be easier of comprehension. The definitions and axioms are clearly explained where necessary by interlined remarks, some useful notes and exercises are printed at the end of each book, and symbols for words are adopted in the text as far as possible in order to facilitate appreciation of the different steps of reasoning. This edition of Euclid's Elements will undoubtedly be of much help to the beginner, and should do something to popularise what is really an interesting as well as a useful science.

*By-Laws as to House Drainage and Sanitary Fillings made by the London County Council.* Annotated by GERARD J. G. JENSEN and Another. London: The Sanitary Publishing Company. 1901.

THE new "Drainage By-Laws" of the London County Council did not receive the approval of the Local Government Board until June 14, and Mr. Jensen's preface is dated July. No time, therefore, has been lost in issuing this book. Three sets of by-laws are considered:

(1) By-laws prepared under the Public Health (London) Act, 1891, Section 16 (2), relating to the removal and carriage of fecal or noxious matter, the closing of cesspools, &c. (2) By-laws prepared under Section 39 (1) of the same Act, with respect to water-closets, earth-closets, privies, ashpits, cesspools, and receptacles for dung; and (3) The new "Drainage By-Laws," prepared under the Metropolis Management Act, 1855, Section 202, for regulating "the pipes, drains, and other means of communicating with sewers, and the traps and apparatus connected therewith."

The method of procedure adopted by the authors is to append notes to each by-law. In many cases the notes are simply a re-statement, in different words, of the provisions of the by-law. In others, however, they are explanatory and describe various ways of complying with the by-law, illustrations being added for the purpose of further elucidation. We cannot endorse all the interpretations which the authors have given. Thus, the new drainage by-laws state that every drain (other than a subsoil drain) must be so "constructed as to be water-tight and to be capable of resisting a pressure of at least 2 ft. head of water." With reference to this the authors write—"As, owing to the wording of the clause, it would appear at first sight that the by-law requires drains to be tested by water, it may be well to point out that the pressure to be withstood, and not the means by which drains are to be tested, is prescribed; hence, not only the hydraulic but also the pneumatic test may be employed." There can be little doubt that the intention of the authors of the

by-law was to make the water test the official method of testing, otherwise they would surely have stated the test—pressure in pounds per square inch, and not as "head of water," and would have stated clearly that the drains must be tested by the person who laid them. Perhaps, however, Mr. Jensen's mysterious collaborator, whose name, we are told, "it has been necessary to omit from publication for the present," possesses a knowledge of the intentions of the Council which is denied to the outside architect and builder. Objections might also be raised to some of the author's recommendations, as, for example, the wash-down closet in fig. 7, with the outlet joint at the floor level; but taken as a whole, the notes are distinctly useful, and architects and builders will find it a great convenience to have the three sets of by-laws in one handy volume. A map of the administrative county of London, showing the Metropolitan boroughs, is given as a frontispiece, but as very few streets are shown, the map is of little use in fixing the various boundaries.

*List of the Streets and Places in the Administrative County of London.* Compiled by the Superintending Architect of the L.C.C. London: P. S. King & Son.

THIS is a tolerably large quarto volume giving in tabular form a complete list of the street names within the county of London, the names which formerly existed and have been abolished being given in italics. The list is, of course, alphabetically arranged, and the pages are ruled for columns as follows: "Name—Locality—Postal District—Parish—City or Metropolitan Borough—County Electoral and Parliamentary Division—Ordinance map sheet (5 in. to a mile)—Year of approval—Date of order—Number of plan—Names abolished—Remarks." It will readily be seen for how many purposes such a list as this will be useful.

Mr. G. L. Gomme, the Clerk to the London County Council, writes a short preface, pointing out the historical interest in many cases of old street names, and implying (as we should have expected) that the London County Council is anxious to avoid altering or tampering with these whenever it can be avoided. Some of our London street names go back many centuries for their origin, and are the last existing witnesses to events or circumstances long forgotten, or at least only known to close students of antiquity. In regard to the new names, Mr. Gomme's remarks indicate that these are being treated in a commendable spirit. A new name, as he observes, should not be a duplication of an existing name; it should in some way indicate associations with the place; it should not suggest false history or false associations. We entirely agree also in the feeling that there is a great deal of interest in names carefully chosen, as compared with what Mr. Gomme rightly calls "the soul-less American custom" of numbering the streets instead of naming them. One is pleased to find that the London County Council interfered to preserve the name of "Ducksfoot Lane," in the City which it was proposed to incorporate as part of Laurence Pountney Hill. We should have been as sorry to lose "Ducksfoot-Lane" in London as "Naughty Boys' Street" ("Rue des Mauvais Garçons") in Paris.

A very fertile source of interesting names for new streets is to be found in calling them by the names of distinguished men; a method which has been much more constantly pursued in Paris than in London; in fact, in France to have a street of the capital named after you is now almost an honour calculated on by any one who has done anything remarkable. One objection may be that in most cases it only represents general and not local associations. Still it is a source of street-naming which deserves more attention than it has received in London.

*Canadian Trade Index.* Toronto: Canadian Manufacturers' Association, 1901.

THIS is the title of a publication which has been prepared by the Secretary of the Canadian Manufacturers' Association, Toronto, for the use of British, French, and Spanish importers. The "Index" contains the names of some 800 leading manufacturers of Canada, who have formed themselves into a voluntary association for the purpose of advancing the trading interests of the country. It also contains a brief sketch of the leading export manufactures of

Canada. Then follows an alphabetical list of the members of the Association, together with a limited list of the articles made by them. The third part contains an alphabetical list of the articles produced by the various members, under which appear the names of the manufacturers of each. The names of the articles are given in English, French, and Spanish.

*Superficial Ready Reckoner for Boards, Deals, Battens, &c.* By ROBERT HALL, Builders' Surveyor. London: E. & F. N. Spon. 1s.

THIS is a series of tables of the superficial contents in feet, inches, and parts, of Boards, Deals, Battens, &c., from 1 to 50 ft. in length and from ½ in. to 3 ft. in width. There is nothing but the tables, which it is stated have been carefully compiled, and are presumably correct. They are likely to be very useful to those who are concerned in dealing in wood on a basis of superficial measurement.

#### GAS AND GAS FITTINGS.

##### 12.—INCANDESCENT GAS LIGHTING.

**ENERGY LOST IN GENERATING LIGHT.**—In all artificial methods of generating light, other than phosphorescent light, more energy is expended in producing heat than in producing light. The large proportion of energy so wasted is indicated in the following table given by Professor Lewes in the Cantor Lectures in 1899:—

Percentage of energy transformed into:	Heat.	Light.
Candles .....	98	2
Oil lamps .....	98	2
Coal-gas:—		
Flat flame and argand.....	98	2
Regenerative .....	93	6
Incandescent .....	88	12
Electric light:—		
Geissler tubes.....	97	3
Arc .....	90	10
Incandescent .....	95	5
Magnesium light .....	85	15
Sunlight .....	70	30
Glow worms, fireflies, and luminous beetles .....	1	99

*Welsbach System of Lighting.*—The foregoing table shows that a marked advance over all the earlier methods of generating light from gas has been made by the discovery of the Welsbach system of lighting. This system consists in heating to brilliant incandescence certain substances in a finely divided condition by means of a non-luminous gas flame. The luminosity of an ordinary luminous flame is due to the presence within it of solid carbon particles heated to incandescence; hence the luminous flame is an incandescent gas-light. The phrase "incandescent gas-light" is, however, usually applied only to light produced by heating by means of a non-luminous gas flame a body which when so heated emits light without simultaneously undergoing permanent chemical change.

The non-luminous flame may be produced by mixing air before the point of ignition with gas containing illuminating hydrocarbons, such as coal-gas; or may be produced by gas free from illuminating hydrocarbons, such as water-gas, which burns in the atmosphere with a non-luminous flame, and which consequently does not require admixture with air before ignition at the burner.

*Early Forms of Incandescent Light.*—The earliest form of incandescent gaslight was that known as the "limelight" introduced by

Drummond in 1826, the lime being heated to incandescence by the intensely hot oxyhydrogen blowpipe flame. In later years cylinders of magnesia and of zirconia were substituted for the lime, but large masses of material, such as are used for limelight purposes, cannot be economically heated to the temperature required to render them incandescent.

After Drummond's discovery attempts were made from time to time to use lime and other earthy oxides in more attenuated form for generating light, and metallic mantles of platinum, or platinum alloyed with other metals, were repeatedly tried, but never proved a commercial success.

*Welsbach Patents.*—The practical success of the incandescent gas-lighting system is due to Dr. Auer von Welsbach, who, after prolonged investigation, at length succeeded in manufacturing a mantle of commercial value.

In 1855 Welsbach obtained a patent for making mantles by saturating cotton fabric with certain metallic salts, the cotton being subsequently ignited and a skeleton of metallic oxides retaining the meshwork form of the cotton fabric produced. After ignition of the cotton the mantle is exceedingly fragile, and it was of little commercial value until (in 1887) a process was found which enabled the mantles to be handled and transported without damage. This process consisted in dipping the mantle into a solution of collodion, and then allowing the mantle to become dry. The collodion formed an elastic varnish over the mantle which protected it during transport, and which could readily be burnt off the mantle when the latter had been placed in the position in which it was to be used.

In 1886, Welsbach obtained another patent in which he claimed the use of thoria, used alone or mixed with other earthy oxides.

The mantles sold prior to the year 1891 gave a light of about six candles per cubic foot of gas consumed per hour, and it was believed that this light was emitted by pure thoria. About the year 1891, however, it was discovered that a mantle of pure thoria emitted very little light, but that a mantle consisting of 99 per cent. thoria and 1 per cent. ceria gave the remarkably high efficiency of about 17 candles per cubic foot of gas consumed per hour.

The efficiency of the early thoria mantles is now known to have been due to the presence of a very small proportion of ceria, which existed as an impurity in the commercial thoria used in manufacturing the mantles, and in 1893 Mr. Moeller, of the Welsbach Company, obtained a patent for a mantle consisting of thoria mixed with ceria or certain other rare earthy oxides, in quantities not exceeding 1 or 2 per cent.

*Excitants.*—A great number of substances have been used for the manufacture of mantles, but it is now recognised that an efficient mantle cannot be made of any pure oxide, and that a small proportion of some other oxide, sometimes termed an "excitant," must also be present. Nearly all the mantles at present in use consist of 99 per cent. of thoria with about 1 per cent. of ceria to act as an excitant.

*Theory of Luminosity.*—A mantle consisting of about 1 per cent. ceria and 99 per cent. thoria yields the greatest amount of light on an incandescent burner. If the proportion of ceria be materially increased or decreased the light-emitting power of the mantle becomes greatly diminished. Mantles of pure thoria or of pure ceria emit very little light. The nature of the action of the ceria upon the thoria is unknown. Many ingenious theories have been advanced to account for it, but none are entirely satisfactory. Mr. Swinton has proved that the generation of light does not occur if the mantle be heated in a vacuum tube, and it may therefore be assumed that one of the constituents of the atmosphere, probably the oxygen, exerts an important influence upon one or both constituents of the mantle when the thoria and ceria are mixed or combined in the required proportions. Dr. Bunte has suggested that the generation of light is due to intense local temperature produced on the surface of the mantle by combination of the hydrogen of the gas with atmospheric oxygen, brought about by the catalytic action of the ceria. He found by experiment that in the absence of ceria, chemical combination between hydrogen and oxygen, mixed in the proportion of 2 to 1, did not occur below a temperature of 1,200 deg. Fahr., whereas in the presence of ceria the combination took place at a temperature of 600 deg. Fahr. Thoria was found to have no

(a) Cotton Hood for Incandescent Mantle Manufacture. (b) Mantle Produced after Burning off the Cotton.

Fig. 26.

Fig. 27.—De Lery Burner and Tassels.

Fig. 28.—Fahnehjelm Comb for Incandescent-Lighting.

influence upon the temperature of which chemical action occurred.

So far as is known, ceria will not act so efficiently as an excitant upon any material other than thoria, and although other materials may be used as excitants for thoria, none are so efficient as ceria.

Many cases are known in which two dissimilar substances will not enter into chemical combination unless a third body be present, which, however, itself undergoes no permanent chemical change, and the influence exerted by this third body is spoken of as "catalytic action." The cause of catalytic action is not yet known, and the use of the term by modern chemists is akin to the fatuous explanation of the action of the common pump given by ancient philosophers when they said that "Nature abhors a vacuum."

**Pink "Sunlight" Mantles.**—Oxide of cerium than those of thorium and cerium have the power, when mixed in certain combinations, of emitting light when used in the form of mantles for gas flames. The pink "Sunlight" mantle, which emits a golden-yellow light, consists of the oxides of aluminium and chromium; zirconia may also be added, but merely acts as a neutral constituent without affecting the lighting efficiency of the mantle. Mantles of pure alumina or of pure chromic oxide have little or no light-emitting power, but when the two oxides are combined in certain proportions the mantle of mixed oxides gives a light efficiency of about eleven candles per cubic foot of gas consumed per hour. The chromium, however, appears to gradually volatilise under the high temperature of the flame, and in the course of a few weeks the light emitted by the mantle diminishes materially.

**Manufacture of Mantles.**—To manufacture a mantle for incandescent gas lighting, a network hood (fig. 26a) of cotton or other vegetable fibre is soaked in a strong solution of the nitrates of thoria and ceria mixed in the correct proportions. The mantle is then passed through a small wringer, dried, stretched into suitable shape on a wooden or glass mould, and then, with the aid of a gas flame, the cotton is ignited. The hood while burning shrinks considerably (fig. 26b), and a fragile mantle of oxides in the desired shape is obtained; the conversion of the nitrates into oxides is usually completed by heating the mantle over a blast flame, which also has the effect of strengthening the mantle. Finally, the mantle is trimmed into shape and "collodionised."

The object of dipping the mantle into a solution of collodion, or some substance of a similar flexible nature, is to render it less liable to breakage when handled and during transport; and as soon as the mantle is placed upon the burner and a flame applied to it, the collodion burns away and leaves the fragile network of oxides.

**Collodion Mantles.**—Instead of making mantles by soaking cotton fabrics in solutions of the salts, they are now extensively manufactured by mixing the salts into a paste with collodion solution, then squeezing the paste into threads through capillary tubes under pressure, and finally weaving the dried thread into a network hood similar in shape to that made from cotton fabric.

When the collodion is burnt off, the network of oxides forming the mantle may be distinguished from the mantle made by the use of a cotton hood by examination under the microscope. The threads from the collodion mantles appear like loose bundles of rods,

while the threads from mantles made with cotton, after the cotton has been burnt off, have a fluted and more compact appearance.

**Shape of Incandescent Mantle.**—In this country mantles of the Welsbach shape are at present universally used, but in America the De Lery tassels arranged in a circle around a rose burner (fig. 27) are being extensively used. These tassels are, we believe, similar in composition to the Welsbach mantles, although they do not give so great an illuminating power per unit of gas consumed, but their effect is more pleasing to the eye, owing to the absence of the irritating glare common to mantles of the Welsbach shape.

Attempts have also been made to adapt incandescing bodies to non-luminous flat flames. Fahnehjelm, of Stockholm, introduced (in 1885) a comb consisting of a number of thin magnesia rods, set in a fireclay back, having an iron frame. This comb (fig. 28) was suspended over the non-luminous flame. If water-gas were used the gas was consumed in a small Bray burner, but the comb was never very successful, owing to the volatility of the magnesia.

The "fringe" or "plume" subsequently invented by De Mare was a somewhat similar device, but was more successful, owing to its being composed of non-volatile rare earths having a greater light emissivity. The use of these rare earths, however, was in this country held to be an infringement of a Welsbach patent.

**Value of Different Gases for Incandescent Lighting.**—It is often stated that the value of gas for incandescent lighting is directly proportionate to its calorific power, and Mr. Foulis has published the following figures, which appear to support that statement, since the calorific value of plain coal-gas increases with the illuminating power:—

Illuminating Power. Flat flame, corrected to 5 cubic feet per hour. Candles.	Illuminating Power. Incandescent burner, cor- rected to 5 cubic feet per hour. Candles.
23.1 .....	117.3
17.9 .....	90.3
16.2 .....	87.9
14.6 .....	84.4
13.5 .....	81.9

Dr. Bunte and Dr. Strache have, on the other hand, shown that as high an efficiency for incandescent lighting may be obtained from gases of much lower calorific value, as from coal-gas. Dr. Bunte experimented with coal-gas alone and then with coal-gas mixed with certain other gases, and found that the addition of 20 per cent. of water-gas to the coal-gas does not diminish its efficiency for incandescent lighting, although it materially reduces its illuminating power for flat flame lighting, and also its calorific value. The following are some of the results obtained by Dr. Bunte:—

	Slit burner. 51 cubic feet per hour.	Welsbach incandescent burner. 3.53 cubic feet per hour.
	Hefner candles.	Hefner candles.
Coal-gas .....	15.0	70.0
Coal-gas, with 20 per cent. water-gas ...	3.1	73.5
Coal-gas, with 20 per cent. carbon monoxide .....	2.8	59.5
Coal-gas, with 20 per cent. hydrogen ...	7.3	70.0
Coal-gas, with 20 per cent. marsh-gas ...	12.5	61.6
Coal-gas, with 25 per cent. ethylene .....	4.0	95.2
Coal-gas, carburetted with benzol .....	25.0	75.6

The Hefner-Alteneck amyl-acetate lamp is extensively used in Germany as a standard of light, and a Hefner candle is equivalent to 0.877 of an English standard candle.

Dr. Strache has devised a number of incandescent burners for consuming plain water-gas possessing about one-half the calorific value of coal-gas. The water-gas flame being non-luminous, it is not necessary to mix air with the gas before the point of ignition, and Dr. Strache finds that the plain water-gas is quite as efficient for incandescent lighting as coal-gas. In fact, it will be seen from the following figures published by him that he claims a considerably

higher efficiency for water-gas than for coal-gas:—

Incandescent light.	Consumption per 1,000 candle hours.		Heat developed per 1,000 candle hours.	
	Cubic feet.	Calories.	Cubic feet.	Calories.
Water-gas....	52.4	3,710	24.6	1,730
Coal-gas.....	84.5	11,970	103.1	7,410

Dr. Strache claims for incandescent lighting with plain water-gas that a very white light of great brilliancy is obtained, and that, compared with incandescent lighting with coal-gas, it has the advantage of emitting less heat per unit of light, that less atmospheric oxygen is consumed and less carbon dioxide produced, and that as air is not mixed with the gas before the point of ignition, the flame can never "flash back." Also that, owing to the absence of hydrocarbons in the gas, the flame never smokes, and carbon is never deposited upon the mantle.

It is evident, therefore, that the value of gas for incandescent lighting as used at the present time is not solely dependent upon its calorific power, but that the flame temperature per unit of area must also be taken into consideration. Water-gas when consumed in an argand burner at the rate of 5 cubic feet per hour gives a flame 1 in. in height, whereas coal-gas consumed at the same rate gives a flame from 2 1/2 to 3 in. in height. Hence a given area of water-gas flame may be of a higher temperature than a similar area of coal-gas flame, although the total heat of the coal-gas flame per unit of gas consumed is twice as great as that of the water-gas flame.

Possibly a method may presently be discovered of causing the coal-gas to burn with a shorter flame (as it does in high-pressure systems), and a higher value for incandescent lighting be obtained from it.

In a paper read at the recent Engineering Congress at Glasgow Professor Lewes ascribed the high lighting efficiency of water-gas to the fact that it does not require admixture with air before the point of ignition, that the inner cone of flame formed in coal-gas burners is therefore absent, and that consequently there is "little or no difference in the temperature of the outer zones of the flames in which the mantle is heated." It is possible that this may be the correct explanation, but extensive experimental investigation is yet required into the relationship between light and heat in the Welsbach system of lighting.

#### OBITUARY.

MR. LLOYD.—We regret to announce the death, at Redditch, through misadventure, on the 12th instant, of Mr. Herbert R. Lloyd, of Birmingham and Redditch, architect and surveyor, aged thirty-nine years. Mr. Lloyd was a well-known man, and was highly respected. Of his more recent professional works we may mention the restoration, as completed in August, 1898, of St. Mary's Church, at Cowes, in the Isle of Wight; the new Technical Schools at Redditch, comprising carpenters' and smiths' shops, a lecture theatre, and (in the top room) a museum gallery, which were opened in October of last year; and a church and Sunday school for the United Methodists, at Mount Pleasant, Redditch, opened just two months ago. Mr. Lloyd and Mr. Henry T. Hare, as joint architects, prepared the plans and designs for the new Isolation Hospital at Hill Top, Bromsgrove, for the Bromsgrove, Droitwich, and Redditch Joint Boards, in respect of which a contract-tender of 10,080l. by Messrs. J. & A. Brazier, of Bromsgrove, was accepted in December last.

#### GENERAL BUILDING NEWS.

MEMORIAL CHURCH, LLANDUDNO.—On the 14th inst. the Bishop of St. Asaph consecrated St. Paul's Church, better known as the Duke of Clarence Memorial Church, at Craigydon, Llandudno. Sitings are provided for 950 worshippers. The style is Early English, and the building consists of a nave, 64 ft. long by 28 ft. wide, with north and south arcades, and entrances towards the west and south, a chancel 37 ft. long and 23 ft. high, with an aisle or chapel on one side, and vestries and organ chamber on the other. The tower and spire will stand at the south-west angle of the nave. The church is built of local limestone, with dressings of Bromsgrove stone. The architect of the church was Mr. Oldrid Scott.

CHURCH, CROOKESMOOR, SHEFFIELD.—The scheme for the formation of the new parochial district of St. Nathaniel, Crookesmoor, is now complete, and the foundation-stone of the parish church will be laid on October 7. The site of the church is in Roebuck-road. When complete the building will seat a congregation of 700; but the funds do not permit the signing of the contract at present for the completion of the church, and consequently the nave is to be built first. Without the chancel, there will be seating accommodation for a congregation of 380. The front of the building will be in Roebuck-road, and there will also be an entrance from Chatwin-street. The plans have been prepared by Mr. Joseph Norton, of Sheffield, and the total cost of building the church will be about 7,000l.

RESTORATION OF LLANDENNY CHURCH.—The Bishop of Llandaff recently reopened the restored parish church of Llandenny, near Usk. The diocesan surveyor, Mr. G. E. Halliday, of Cardiff, was the architect of the restoration, and Mr. Ballinger, of Dingestow, was the contractor. The interior facing of the church has practically been entirely renewed, the plaster stripped and the walls pointed, whilst the lower part has been largely restored. During the work an ancient window in the north wall was discovered. This had been hidden from view by a medieval buttress. The architect says the window is one of the very few remaining fragments of British pre-Norman church architecture preserved in the Principality. The opening is only 3 in. wide, and from the wide inner splay it seems to have been used for decorative purposes. The fragments in very good preservation. A new pulpit has been erected by the parishioners in memory of Queen Victoria. The old lych gate, one of four early examples remaining in the diocese, has been restored.—*South Wales Daily News.*

CONGREGATIONAL CHURCH, NEW CROSS, LONDON.

Lewisham High-road Congregational Church has been renovated and decorated throughout, and the electric light installed. The stonework of the spire has been repointed in cement and treated with a solution of "Fluax," and a new lighting conductor has been fixed by Messrs. E. Beresford & Co., Ludgate Circus, E.C. The repairs and decoration have been carried out by Messrs. J. O. Collingwood & Co., Brockley, S.E.; the electric light installation by Messrs. Braby and Tomlinson, Hart-street, Bloomsbury. The electric fittings were made by Messrs. Evered & Co., Dursley-lane, W.C. The whole have been carried out from the designs and under the superintendence of Messrs. Geo. Baines and Reginald Palmer Haines, architects, Clements'-inn, Strand, W.C., at a total cost of about 1,300l.

WESLEYAN CHAPEL, COYTRAHEN, GLAMORGANSHIRE.—The foundation-stones were laid recently of the new chapel which is being erected by the Wesleyans at Coytrahen. The contractor is Mr. Jenkin Mathews, and the architects Messrs. E. W. Burnett & Sons.

CHAPEL, BARRY ISLAND.—A new chapel, erected on a spot adjacent to the post-office on Barry Island, in connexion with the Wesleyan denomination, was opened recently. Mr. D. Morgan was the builder, and Mr. G. A. Birkenhead the architect.

WISHART MEMORIAL CHURCH, DUNDEE.—This building has just been erected in King-street, Dundee. There are two entrances from King-street, each of which leads directly into the nave of the church, while the entrance under the square tower also leads to the gallery and the halls below. The stone dressings of the front elevation are of red Dumfriesshire stone, while the infilling is from Burgumlihead, Forfarshire. The plan is arranged in one large nave and side aisle and transept, and gallery next King-street. The choir and organ galleries are placed in one end of the transept, while the pulpit and platform are erected on the south wall in an apsidal recess, which is lighted by windows on each side. Traceried windows placed in the nave and transept run up into the roof above the wall head to secure better light. A subsidiary staircase from a side street leads to the vestry and choir gallery, minister's vestry, caretaker's room, and also the balls in the basement. The tradesmen for the various works have been—Mason, R. Laing, Dundee; joiner, Thomas C. Stocks, Dundee; plumber, J. Crighton & Sons, Dundee; slater, William Brand & Son, Arbroath; plasterer, Michael Lawless, Dundee; glazier, Lindsay & Scott, Dundee; painter, J. Nicholson, Dundee; blacksmith, William Young, Newport; iron and steel, Nicoll & Son, Dundee; heating engineer, A. L. Peacock & Co., Dundee; stained glass, William Melkie & Son, Glasgow; carving, James Bremner, Dundee. The buildings have been erected from plans by and under the superintendence of Mr. T. Martin Caddon, Dundee.

HOLY TRINITY CHURCH, KENSINGTON.—It is stated that Messrs. Stephens, Easton, & Co. Limited, of Bristol, have been entrusted with the erection of the new Church of Holy Trinity, Kensington, London, S.W., from designs of Mr. George F. Bodley, A.R.A. The church will cost upwards of 30,000l.

CHURCH, WALTON, LANCASHIRE.—The foundation-stone of a new Congregational school church, to be erected in Rice-lane, Walton, was laid on the 14th inst. The structure, when completed, will accommodate 350 people, and will cost 3,500l. The architects are Messrs. Brigg & Wolstenholme, and the builder Mr. William Mather.

CHURCH, ROATH, GLAMORGANSHIRE.—A new church for the Roath district of Cardiff was opened on the 14th inst. by the Lord Bishop of Llandaff. It is dedicated to St. Martin, and is situated in Albany-road, off Castle-road. The plans were prepared by Mr. F. R. Kempson, of Cardiff. The plan of the church is a nave of four wide bays flanked by a narrow processional aisle on the north side, and a wide southern aisle. The entire width of the nave with its aisles is 71 ft. There is a porch at the north-west side; the wide south aisle terminates at the west end in a baptistry and internal porch. The chancel consists of two open bays and an enclosed bay forming the sanctuary. It is 43 ft. in length, and of the same width as the nave, from which it is now separated by the base of the future roof-screen. On the north side of the chancel is a chapel 42 ft. in length and 15 ft. wide. On the south side of the chancel lies a passage giving access to the choir vestry and sacristy. Above the sacristy an organ gallery has been built, opening through a stone screen to the south aisle of the nave, and on its north side to the chancel. The building is of red brick with stone facings, the roof being of grey slate. The pulpit and font are of warm red stone.

CHAPEL, EAGLESCLIFFE, YORKSHIRE.—The foundation-stone has just been laid at Eaglescliffe of a new Primitive Methodist chapel and school. The building stands at the junction of Witham-avenue. The chapel will be 50 ft. by 30 ft., and the Sunday-school will occupy a space of 30 ft. by 20 ft. The school will be divided from the chapel by an ornamental glazed partition, which can be set aside when it becomes necessary to provide for a larger congregation. The cost, including the land, will amount to 2,200l., and the chapel will have seating accommodation for 250 people. Messrs. Henry Doughty & Sons, of Yarm, are the builders, and Mr. T. W. T. Richardson, of Stockton, is the architect, under whose supervision the work is being carried out.

BANK, LEEDS.—The stone building which the London City and Midland Bank, Limited, have erected at the junction of North-street and Meadow-road, Leeds, was opened for business on the 9th inst. Mr. W. Bakewell was the architect.

SMALL-POX HOSPITAL, ELSWICK, LANCASHIRE.—A Board of Trade inquiry has just been held into the application of the Eyde, Preston, and Garstang Joint Small-pox Hospital Committee to the County Council to borrow the sum of 18,000l. for the erection at Elswick of a small-pox hospital. Accommodation will be provided for thirty-two patients. Mr. Edward C. H. Maidman, of Edinburgh, is the architect. His plans were accepted in open competition.

PROPOSED NEW THEATRE FOR ABERDEEN.—Plans of the proposed new theatre for Robert Arthur's Theatre Co., Ltd., at Rosemount-viaduct, between U. F. South Church and Schoolhill station of Great North of Scotland Railway Co., have just been approved of generally by Aberdeen Town Council. These plans have been prepared by Mr. Frank Matcham, architect, London, and have been lodged by Messrs. Brown and Watt, architects, Aberdeen. The building, in the Italian Renaissance style, will be of light grey granite. The frontage to the viaduct is 115 ft., and the estimated cost is upwards of 20,000l.

MUNICIPAL OFFICES FOR LOUGHBOROUGH.—The alterations and additions which have been proceeding for some time at the Town Hall, Loughborough, are nearing completion. The Corn Exchange has been improved and enlarged by a new stage, the old platform having been removed, and dressing-rooms, storerooms, kitchen, and other conveniences provided. The place will accommodate 120 additional persons, the capacity being now 750. Corridors run down each side of the hall, connecting at both front and rear of the exchange, and there are seven exits, all the doors opening outwards. On the right of the entrance hall the old Council-chamber has been renovated, and will henceforth be known as the lecture-hall. With regard more particularly to the banking company next door to the Town Hall, and upon this what is termed the north corridor has been built, with access from the one side to the Exchange, and on the other to the office of the Borough Accountant, to a cloakroom and lavatory, a clerks' office, and a committee-room, 30 ft. by 15 ft. Coming to the south corridor, which is situated parallel with Town-hall passage outside, is the Victoria-room, leading likewise to the balcony in the Corn Exchange, and taking the place of an old erection of wood. There is an alcove, or small gallery, in the Council Chamber. The whole of the building work, estimated to cost 6,000l., has been carried out by Messrs. Wm. Moss & Sons, Loughborough; the heating (hot-water apparatus) for the entire place has been entrusted to Messinger & Co., and Messrs. Gascoyne & Son, of Nottingham, did the glazier's work. The plans for the alterations

and enlargements were prepared by the Borough Surveyor, Mr. A. E. Walker.

**ISLE OF WIGHT, FORFAR**—An infectious diseases hospital has been built at Whitehills, Forfar, for the Dundee and Forfar Districts of the Forfar County Council. The buildings consist of a large administrative block, on the east side of which is placed the isolation block, having two wards of one bed each, with nurses' room, bathroom, &c., and to the west of the administrative block is the discharge block, with undressing and dressing rooms, bathroom, and stores for patients' clothes. Along the high ground to the south-east of the administrative block is placed the scarlet fever block, having two wards of eight beds each, and two wards of one bed each for acute cases. The nurses' rooms and pantries are placed between the wards; while the baths are placed in annexes at the end of each ward, connected with the main buildings by through ventilated passages. South-west of the administrative block are placed the typhoid and diphtheria blocks, having two wards of two beds each, with nurses' rooms and other conveniences. The offices are placed at the south end of the ground, out of sight of the other wards, and consist of mortuary, ambulance sheds, tool-house, wash-house and ironing-room, disinfectant and boiler-house, coal stores, and other conveniences. The blocks have been placed on the highest ridges of the ground, about 60 feet apart, and the intervening ground made up to an even surface between Granolithic footpaths lead from the nurses' entrance in the administrative block to all the other blocks. Telephones connect the various wards with the administrative block. The whole ground is enclosed by a stone wall. The contractors for the various works are as follows:—Messrs. James Cargill & Co., builders, Forfar; Messrs. Alexander Hay & Co., joiners, Forfar; Messrs. William Brand & Sons, slaters, Arbroath; Mr. D. Brown, plumber, Dundee; Mr. D. Masterton, plasterer, Forfar; Mr. J. H. Douglas, glazier, Montrose; Messrs. Thomas Bradford & Co., laundry engineers, Manchester; Messrs. A. Westwood & Son, bells and telephones, Dundee; gas main, Messrs. William Mitchell & Son, Dundee; water supply, Messrs. William Mitchell & Son, Dundee; drainage, Messrs. J. Gray & Sons, Newtyle; locks and furniture, Messrs. Eddie & Kinmonth, Forfar; painter work, Messrs. Doig & M'Phee, Forfar; boundary walls, Mr. James McLean, Forfar; laying out of grounds, Mr. P. Girrity, Dundee; ventilation, Messrs. R. Boyle & Sons, Limited, Glasgow; gates, Messrs. G. H. Nicoll & Co., Dundee; gates, Mr. A. McCall, Dundee; furniture and furnishings, Messrs. Thomas Justice & Sons, Limited, Dundee. The clerk of works being the late Mr. D. Kidd, Mr. Drummond has acted as clerk of works since Mr. Kidd's death. The whole works have been carried out from plans and under the superintendence of the architect, Mr. T. Martin Crippon, Dundee.

**PUBLIC OFFICES, SELSTON, NOTTINGHAMSHIRE**.—Public offices are being erected at Selston for the Parish Council. The architect is Mr. F. Ball, of Nottingham, and the builders are Messrs. Minkley Bros., of Underwood.

**THE NATIONAL PHYSICAL LABORATORY**.—Good progress is being made with the works for the enlargement and alteration of the house in Bushey Park for purposes of the new National Physical Laboratory, which it is anticipated will be ready for occupation before the end of the year. The basement and ground floor of the old house will be reserved for physical investigations of a delicate kind. A room measuring 80 ft. by 50 ft., and lighted from the north with a waving-shed roof, has been constructed for engineering work, with a drawing-office and an engine-house close by. Two general laboratories will be fitted up in the main building, which has a substantially constructed central block, about 70 ft. square on plan, upon a vaulted basement containing several rooms, of which the floor has been thickly overlaid with concrete. The outer and inner walls are very thick, and all the conditions are favourable for the prosecution of steady work in even temperatures. A mercury column is being erected for measuring up to 200 lbs. to the square inch; and for minimising vibration, a 60 kilowatt Parsons' turbine will be employed to distribute electrical power to the various laboratories. A compressor, a dividing-engine, and some high-class measuring apparatus have been presented to the laboratory by Sir Andrew Noble. The first work to be undertaken will be the photo-micrographical examination of steel rails, with the testing of the elastic properties of alloys.

#### SANITARY AND ENGINEERING NEWS.

**STAINES SEWAGE SCHEME**.—A Local Government Board Inquiry was held on the 3rd inst. by Mr. F. H. Tulloch, M.Inst.C.E., into an application of the Staines Urban District Council for a loan for the construction of sewage filters, which, on the recommendation of the General Caret, past Engineer-in-Chief of the Local Government Board, are to contain Polarite, on the same principle as the Polarite filters at the Chorley Corporation Sewage Works. The filters at Chorley were laid down about seven years ago, and are stated to produce an effluent so high a degree of purity that the Local Government

Board have waived their usual stipulation as to the effluent from them passing over land. At Staines, although the works have been most carefully supervised and ample tank accommodation provided, yet the unsuitable nature of the land has given rise to numerous complaints caused by offensive emanations due to secondary decomposition of the tank effluent when on the land; hence it has been found necessary to resort to artificial filtration through powerfully active oxidising beds. There was no opposition to the scheme, and the chairman, at the conclusion of the inquiry, pointed out to the inspector the urgent need of the loan, and the expediency of carrying out the improvements forthwith in order to avoid further complaints. We are informed by the International Purification Syndicate of Westminster, the proprietors of Polarite, that by improved arrangements whereby the sewage is distributed on to the beds by means of automatic revolving sprinklers (Candy-Calk patent), labour on the filters is now reduced to practically nothing.

**BRADFORD ELECTRICITY EXTENSION**.—The memorial stones have just been laid at Bradford of a new generating station in connexion with the electricity supply works. The buildings—which are to be situated in Valley-road, and to face the Midland Railway on ground adjacent to the second generating station erected by the Corporation—were commenced early in the year, and should have been very shortly ready to receive the plant, but owing to the dispute in the building trades the work has been very much delayed, and it will be impossible now to instal the plant and get into working order before the summer of next year. In order, however, to deal with the increased demand for electricity, arrangements have been made to instal two engines of 300 h.p. each in an extension of the present engine-house. As to provision for further extension, the buildings are so designed that they may be duplicated by adding another engine-house at the back of the boiler-house, the boiler-house itself being so arranged that the boiler horse-power installed can be doubled to deal with the engines in this second engine-room. The front of the new works will be built in ornamental stone-work, and will constitute one side of the new engine-room. The engine-room will run parallel to the roadway, and behind it will be the boiler-house. At the north end of the building will be an economiser house, feed water storage tanks, and ash bunkers. The interior of the engine-room will be built with glazed bricks of an ornamental design. The portion that is being built at present will be capable of accommodating three engines, having a total horse-power of 6,000. The electric generators will each have a capacity of 1,000 kilowatts. Surface condensing plant will be installed to be used in conjunction with these engines, and will be operated in connection with the cooling tower that is now being erected over the reservoir. An electrically-driven 50-ton overhead crane will be installed in the engine-room for the purpose of erecting or repairing any parts of the plant. The engine-room, when built, will be capable of containing five units of plant, having a total capacity of 10,000 horse-power, and the second engine-room at the back of the boiler-house will be of the same capacity. It is intended to instal six boilers, having a total capacity of 4,800 horse-power. The gases from these will pass into a main flue, which will conduct them through an economiser and into the chimney. The chimney will be built of brick, in circular form, with an internal diameter of 13 ft. It is to be 200 ft. high. A large coal store has been arranged over the centre part of the boiler-house. The city electrical engineer is Mr. R. Chatterck, and Mr. S. T. Dalton, Mr. W. Jones, Mr. E. S. Saunders, Mr. assistant engineers; Mr. W. A. Atkinson is clerk of the works; Mr. R. Mawson and Mr. R. Hudson are the architects, and Messrs. Obank the contractors.

**LICHFIELD SEWERAGE**.—The Lichfield City Council, after interviewing three engineers, have appointed Mr. J. R. Elliott, C.E., of Nottingham, to prepare plans and report upon the city sewerage.

#### FOREIGN.

**FRANCE**.—A large tapestry is just being completed at the Gobelins, which is to decorate one of the rooms in the Bibliothèque Nationale. It is after a cartoon by M. Ehrmann, and symbolises the French Renaissance, and includes portrait figures of all the great artists of that period, while the background shows representations of the most celebrated châteaux. The tapestry will complete the series of which the other four tapestries represent "Antiquity," "The Middle Ages," "Writing," and "Printing."—M. Louis Dumoulin has received a State commission to paint a large picture representing the arrival of the Imperial train at one of the stations, either Dunkerque, Reims, or Compiègne.—At the Sèvres factory a room has been devoted to a historic collection of pieces of ceramic ware dating from the first manufacture at Vincennes, under Louis XIV., as well as specimens of the First and Second Empire periods, and works that figured in the Exhibitions of 1859 and 1900.—The Public Works Department has approved of the design for a viaduct at Fades, on the line

from Saint-Elvi to Pauniat. This viaduct, which is to cross the deep valley of the Sioule, will be 370 metres in length, and 132 metres in height above the valley level.—The pupils of the Ecole des Beaux-Arts have addressed a memorial to M. Paul Dubois, the eminent sculptor who directs the establishment, petitioning that, during the work of alteration and repair in various parts of the building, the clay sketches, drawings, and paintings executed during a long time past by the competitors for the Prix de Rome, should not be injured or destroyed. These works constitute in fact a highly interesting collection, many of them signed by names which have since become famous. Mention may be specially made of an equestrian figure executed by Regnault when a pupil in the school.—The occasion of the visit of the Czar is to be taken to inaugurate the new Hotel de Ville of Dunkerque, designed by M. Louis Cordonnier of Lille; a fine building in the style of the Flemish Renaissance.—The jury in the competition for a circus theatre at Troyes have awarded the first premium to M. Henri Schmidt, the second to M. André Bérard, the third to M. Emile Robert, and the fourth to M. Bruno-Pelissier—all of Paris.

#### MISCELLANEOUS.

**PUBLIC IMPROVEMENTS, FULHAM**.—The Fulham Board of Guardians have passed resolutions consenting (1) To the provision of increased boiler accommodation, the erection of a chimney at the workhouse, and to the execution of works and the provision of machinery and apparatus for the purpose of lighting by electricity the workhouse, infirmary, and board offices of the parish, in accordance with plans to which the Local Government Board have affixed their seal, subject, nevertheless, to such modifications as the Local Government Board might direct. (2) To the expenditure for the above purposes of a sum not exceeding £1,111. (3) To the borrowing of such an amount or such part as might be necessary.

**A NEW THEATRE, HAMMERSMITH**.—It is stated that, with the concurrence of the Charity Commissioners, a site has been taken for the building of a theatre at the corner of Rowan-road and the main road, Hammersmith, upon land which belongs to the trustees of a charitable endowment.

**PUBLIC HEALTH (LONDON) ACT, 1891; PROPOSED AMENDMENT**.—From the Report of Dr. J. King Warry, M.D., on the Sanitary Condition of the Hackney District for the year 1900, we make the following extracts:—My experience of the last few years shows that there is need for some amendment of the Public Health Act, which will enable Local Authorities to deal more promptly with recalcitrant owners of property in respect to the cleansing of rooms, especially those occupied by the working and lower classes. To the credit of the majority of property owners most of the cleansing is done on the service of a notice by the Local Authority; but there is a certain class of owners who will not do such work unless by a magistrate's order. At present, in order to obtain a magistrate's order to cleanse the walls and ceilings of an occupied room, it is necessary to take it as a general nuisance under Section 2 of the Public Health (London) Act as a nuisance, or dangerous, or injurious to health. It is extremely difficult to prove that a dirty ceiling or wall is dangerous or injurious to health in any special sense. Certainly cleanliness of dwelling, as well as person, is essential to good health, and when they are so dirty that they give rise to a stuffy or unwholesome smell, they tend to lower the vitality of the inmates. But the Local Authority should have the power of dealing with this before it reaches the condition to injuriously affect the health of the occupants in a similar way to that in which factories, or workshops, or bakehouses are periodically cleansed. The law is adequate to deal with the cleansing of these. Tenements, houses registered under the by-laws for houses let in lodgings are also required to be cleansed thoroughly once a year by the landlord. Now this provision of annual cleansing should be applied to every house occupied by the working classes; if not, these houses ought to be at least put on as high a sanitary level as workshops under the Public Health Act (London), 1901, that is that the cleansing of any room should be compulsory on the certificate of a Medical Officer of Health. If this amendment of the law could be effected, the work of the Local Authority in dealing with dirty rooms would be much simplified and made more effectual.

**ALL SAINTS' CHURCH, DALSTON**.—The fire that broke out a few days ago caused serious injury to the fabric and equipment of the church. The official report sets forth that one-third of the ground floor and the gallery, with their contents, are severely damaged by fire; 90 ft. of roofing are damaged by fire and cutting away, and the rest of the building and its contents are damaged by heat, smoke, water, and breakage. The church was begun after Hardwick's designs and consecrated on July 4, 1856; the stiles were built and galleries were added afterwards by Mr. Knightley, so as to increase the capacity of the church to that for 1,500 persons. The organ was by Willis, 1857.

**STREET IMPROVEMENT, HULL**.—The scheme of street improvement which the Right Hon. Walter

Long, President of the Local Government Board, will formally inaugurate in the middle of next month is the greatest and most important undertaken by the Hull Corporation. To reach Prospect-street from Monument Bridge people had to travel round by way of Waterworks-street and Chariot-street. Through the centre of the block of property facing Monument Bridge a fine road 80 ft. in width has been driven and an uninterrupted vista from the bridge to Beverley road corner, nearly a mile in length, now meets the eye. Not a few old streets, containing old, worthless, insanitary property, have been completely demolished and their names taken off the street nomenclature of the city. The sites of the new street, so soon to be known as King Edward-street, have realised large prices, several about 50l. per square yard, as the thoroughfare will undoubtedly take front rank in the business avenues of Hull. Another improvement which will be commenced in 1902 is the demolition of the junction-street and St. John-street block of buildings, and the formation of a great central square, measuring 272 ft. from north to south, and 210 ft. from east to west. This open square will be in the heart of the city, and a little over an acre in extent. The scheme also provides for the erection of thirty-four shops of varying frontages, and the provision of a public hall, with retiring-rooms, together with three large reception halls. The expenditure upon land and buildings in connexion with this improvement is estimated at 62,000l. The present gross rental of the property, which belongs to the Corporation, is 4,861l. After the improvement is completed, it is estimated that the Corporation coffers will be enriched by an additional annual sum of 3,872l.—*Leeds Mercury.*

**THE LAND REGISTRY.**—The annual returns prepared at the Land Registry, Lincoln's-inn-fields, cover the twelve months ended with March 31 last. The report sets forth that, whilst no registrations have been effected under the Small Holdings Act of 1892, there were 10,885 separate titles on the register at the close of last year under the Land Transfer Act of 1875, and the Land Registry Act of 1881; the total number of transactions registered during the year 1900 was 19,678, and their value (where ascertainable) was 24,401,753l. The fees received during the period of twelve months in the Land Registry amounted to 53,802l., the salaries and expenses to 38,303l.; the salaries and expenses in respect of the working of the Land Transfer Acts of 1875 and 1887 amounted to about 22,800l., and the receipts from fees under those Acts to 37,600l. In the year 1900 were registered on first registration the titles to 2,585 freehold estates, valued at an aggregate of 7,181,051l.; on December 31 last there were 2,820 separate titles on the register, and the total number of separate titles that had been removed from the 1862 register on that date (otherwise than by transfer to the 1875 register) was 270, representing about 86 acres out of a total area of 40,117 acres, valued at 5,316,477l.

**FULHAM WORKHOUSE TO BE LIGHTED BY ELECTRICITY.**—The Local Government Board has sanctioned the scheme of the Fulham Guardians for engineering works at the infirmary, and for lighting by electricity the offices, workhouse, and infirmary. At the last meeting of the Guardians it was decided to instruct Mr. Melhurst (the engineer) to prepare the necessary specification of works, plans and forms of tender, the estimate being 10,223l. Mr. W. R. Sayer said that the expenditure would result in a saving to the ratepayers, and that it would be cheaper for the Guardians to make their own current than to take it from the Borough Council.

**THE SANITARY INSTITUTE.**—A donation of 100l. has been promised by the Leeds Fireclay Company to the fund for the new Building and Endowment Fund of the Parkes Museum.

**GREENCOAT TECHNICAL CLASSES, CAMBERWELL.**—The technical and art classes, held at the Greencoat School, Camberwell Green, S.E., will resume work for the winter session on Monday, September 23. These classes are in affiliation with the Technical Education Board of the London County Council, the City and Guilds Institute, and the Board of Education. Of late their usefulness has been considerably increased by the help of the Technical Education Board's grants in aid of equipment. By this means a valuable collection of models and apparatus has been provided for the use of students engaged in the building trade.

**WINDOW, ST. PETER'S CHURCH, STAINES.**—A large seven-light stained-glass east window and a small three-light side window have recently been placed in St. Peter's Church, Staines. They are from the designs and cartoons of Mr. E. Fellowes Pryne, brother of the architect of the church, Mr. George Fellowes Pryne, and have been carried out by Mr. James Jennings. The subject of the large window is the "Church Triumphant," and of the small one "The Nativity and Adoration of the Magi and Shepherds."

#### CAPITAL AND LABOUR.

**BUILDING TRADE DISPUTE AT BATH.**—About one hundred masons and bricklayers employed by Messrs. Jacob Long & Sons, of Bath, have left work, refusing to labour with five men who have incurred penalties under the Operative Masons and Bricklayers' Union which they refuse to pay. The

men required that they should either pay up or that Messrs. Long should discharge them, and they also demanded that the employers should agree henceforth to employ only society men. The employers, of course, refused, and called upon the assistance of the Master Builders' Association, who at a recent meeting passed the following resolution:—"That the members of this Association condemn the coercive action of the executive of the Operative Masons and Bricklayers' Union in compelling their members to strike on account of the employment by Messrs. Jacob Long & Sons of non-union men, and consider such action as an unjustifiable breach of the working rules mutually agreed upon on June 13, 1901, and that unless the strikers return to work by 9 a.m. on Friday next, September 13, and comply with the same working rules, the members of this Association will reluctantly look out the union masons and bricklayers in their employment, and take such steps as they may be advised to retain the right as hitherto to employ union and non-union men without distinction." The resolution was communicated to the men. There are about 400 masons and bricklayers in Bath, and something like 1,500 or 1,600 men are engaged in the whole building trade, which would be at a standstill in the event of a strike.—The meeting on advice from the headquarters of the trade union, have returned to work.

**THE BUILDING TRADE DISPUTE IN BRADFORD.**—It may now be taken for granted that the dispute in the Bradford building trade, which commenced nearly five months ago, has passed beyond the probability of any other settlement than that resulting from the gradual introduction of non-union labour into the places previously filled by union labour in Bradford, and the removal of unionists to other towns where no quarrel of the kind is in an active state. Masters and union men alike decline to "budge" from the positions which they have taken up, and neither party has now any desire for intervention. The employers state that they are rapidly filling up all vacancies with non-union workmen, are quite satisfied with the quality of the new men, and do not intend to have relationships with the trades unions concerned at any future time. The labour bureau which has been conducted by Mr. W. A. Forshaw for some weeks past in the interests of the Building Trade Federation is intended to be a permanent institution for the registering of individual workmen. Application for joiners' places now have to be received, waiters are plentiful, banker hands and general labourers are coming forward freely, and masons (though not yet numerous enough to satisfy all requirements) have presented themselves in sufficient numbers to justify the hope that in a couple of weeks or so there will be no remaining vacancies. The slight deficiency of masons, of course, hinders the work of other departments in which the workmen follow on in the ordinary course of building, but, by an interchange of men, the employers are keeping the work which is of actual importance going on well. It is expected, for instance, that the work in connexion with the Cartwright Memorial Hall will be in full swing in the course of another week. The foregoing represents the employers' view of the position, and the representatives of the displaced trades union workers would not seriously traverse this statement except in two or three respects. The trades union officials hold that the imported non-union labour is inefficient and unsatisfactory, and, though it may triumph for a time, will be beaten out again in the long run. Their opinion is that the employers are acting with the support, and really in the interests, of the National Federation of Master Builders, whose habit it is to select what they regard as a weak labour centre from the trades union point of view, and make some sacrifice in order to turn out the union labour for a time. The unionists appear to look upon the resultant displacement with perfect equanimity, as a matter in relation to which time will work out its revenges. The Amalgamated Society of Carpenters and Joiners has 67,000 members, of whom only 1,200 are out of work by reason of strikes and lockouts throughout the country. The society, having large accumulated funds, can continue paying displaced members for an indefinite period, and has, in fact, increased the rate of remuneration to these men recently. The masons are similarly well provided for, having a powerful society with ample funds at its back, enabling them to snap their fingers at any action which the employers may take. The labourers also have their own society, which keeps them in fairly comfortable condition. All the union men prefer to transfer their homes to some other city or town rather than give way to the masters' demands, because in their opinion compliance with these requirements here would encourage the National Federation to open the attack elsewhere.—*Bradford Observer.*

#### LEGAL.

##### CASE UNDER THE 1864 BUILDING ACT.

MR. CHARLES ANSELL, builder, of Chicheley-street, York-road, was summoned recently at North London Police-court by Mr. Payne, District Sur-

veyor for East Hackney, for that in doing certain work at the Brunswick Arms public-house, Hackney, he acted contrary to the London Building Act of 1864. Mr. Wootton, barrister, defended. Mr. Payne's case was that the defendant had placed a new flap to the cellar of the public-house without giving him notice as District Surveyor and had used in the construction deal instead of some hard and incombustible material.—Mr. d'Encourt said a cellar flap could not be made of anything but wood. The Act of Parliament, moreover, gave them no ground to go upon, and the summons would be dismissed, with 3l. 5s. costs.

##### ANCIENT LIGHT DISPUTE AT WAKEFIELD.

The case of Archers, Limited, v. Elvey, came before the Lord Chief Justice of England sitting as Vacation Judge on the 18th inst. on a motion by the plaintiffs for an interim injunction to restrain the defendant from building so as to interfere with the plaintiffs' ancient lights.

Counsel in support of the application stated that the plaintiffs' property was a lodge on the Plumpton House Estate, Wakefield, and by a wall which the defendant was erecting the light coming to the windows of the lodge, which was now used as an office, would be materially affected.

His lordship stated that he had read the affidavits filed, and asked Mr. Compton, the learned counsel appearing for the defendant, if his client would give an undertaking to pull down at the trial if the judge held that the plaintiffs were right?

Mr. Compton said he could not do so, because there were reasons why his lordship should not interfere at this stage of the case. If there was any interference with the plaintiffs' light it was of the most trivial character.

The plaintiffs' counsel stated that the injunction was claimed on two points: firstly, that the lights were ancient; and, secondly, that even if they were not, the defendant could not block them, because he conveyed the property in question to the plaintiffs with the then existing unobstructed lights, and he was now derogating from his part by building on his own land and obstructing the light.

In the result his lordship directed that the defendant must be restrained from building further until the trial, and granted an interim injunction in those terms. He also directed that the trial should be expedited, and that the costs of the application should be costs in the cause.

#### RECENT PATENTS:

##### ABSTRACTS OF PATENTED INVENTIONS.

9,047.—A ROAD-SWEEPING MACHINE AND ELEVATOR: *W. H. Melvin and A. Mann.*—The mud and other refuse is swept into a trough at the top of an inclined plate by means of a rotating brush upon a frame carried by side-wheels upon an axle and a front-wheel upon a swivelling front carriage. The refuse is conveyed by a screw that turns in the trough into a receiver whence a screw lifts it up to a swivelling spout for discharge; chain-gearing from a side wheel of the frame drives the brush and the conveying-screw in the trough, and a chain and bevel gearing drives the screw which raises the mud out of the trough; in another form bearings adjusted with screws carry the brush and the shaft. The receiver or casing is fitted with a manhole, and scrapers upon chains upon sprocket-wheels convey the mud up the inclined plate of which the lower portion slides upon the upper portion which a spring forces against the road.

9,113.—A WOOD-MORTISING MACHINE: *J. Thomson.*—A crank-handle and a train of gearing move a sprocket-wheel which drives the pitch-chain to which the cutters are affixed. A screw feeds forwards a sliding frame which carries the chain. The cutters are set so as to project in turn from opposite sides of the chain and are adjusted with a slot and a screwed pin. For increasing the length of the cut mortise, one separates guide-rollers that sustain the forward end of the chain, and forces apart, with a wedge, the hinged arms upon the ends of which the guide-rollers are mounted.

9,120.—CONSTRUCTION OF FLOORS: *J. C. Pilton and L. E. Mosher.*—Perforated metal sheets, that may be wrapped around anchoring rods at their edges are employed for strengthening the concrete, or similar, blocks, and wedge-shaped supporting blocks made of concrete layers applied to sheets of fire-proof fabric are fitted between metal beams or guides, the plastic layers being folded around perforated strips or cores of sheet-metal. The blocks can then be pressed into the required shapes, and their shoulders will hold up the flooring and ceiling blocks. Bent wires may be used for suspending the ceiling, and a skeleton of metal rods and strips will serve to strengthen the blocks.

9,128.—DREDGING APPARATUS: *A. F. Smulders.*—A rotary pump raises the soil and lowers the end of a pipe on to which a stop-off valve is fitted, and by means of a reversing valve the soil will be discharged through a pipe on to the bank or through another pipe into the barge. The barge is emptied by the closing of a valve and the reversal of the reversing valve and of an auxiliary valve.

9,131.—PIPE MOULDING: C. F. Kielberg.—A tube, upon which is mounted a screw, slides upon a rotating or fixed core. When the screw is at its lowest position the cement is poured into the mould cylinder where it may be compressed by screwing the tube upwards through it. By this invention the movable core and compression screw specified in No. 14,353 of 1886 are dispensed with.

9,130.—A PACKING FOR JOINTS: C. H. Meszarth and F. Conlin.—A packing for pipe-joints and similar objects consists of two wire rings (for which washers can be substituted upon occasion), of which the inner one is made of a soft metal, and the outer one of some harder metal; there are strips—of lead wound around a pair of bolts—for facilitating the centering of the packing.

9,115.—APPLIANCES FOR PILE-DRIVING AND DEEP-BORING MACHINERY: C. L. S. Isler and H. F. Broadhurst.—Cams and gearing from the shaft drive a lever, to which the rope around the head-pulley is passed; a screw and a split feeding-nut feed out the rope, ratchet gear and a hand-lever near the pivot of the lever serving to drive the screw, whilst an adjustable block varies the leverage.

9,220.—ELECTRICAL TESTS AND RESISTANCES: Williams & Robinson and G. L. Adlenbrooke.—For testing polyphase or single alternating-current meters, transformers, and generators, &c., are devised loads formed of non-inductive resistances and variable inductances connected parallel wise. A variable inductance is composed of strip or wire coiled through laminated iron frames which are disposed in radial arrangement about a common non-magnetic centre, and adjustable air-spaces in the circuits are formed by causing the ends or outer sides of the frames to be moved separately by means of slit holders and screws; in another variety two nuts which are linked to the outer sides of the frames are mounted upon a middle rotatable right-and-left-handed screw whereby an adjustment at one end and the same time will be effected on one rectangular iron frame having one of its sides adjustable may be substituted.

9,275.—PROCESS OF HARDENING LIME OR ARTIFICIAL SANDSTONE: P. Prior.—For hardening the raw building material the inventor mixes it with alkalis or their salts—say, potassium carbonate or sodium carbonate—and then exposes the compound to superheated steam under high pressure, or he first volatilises the alkali and mingles it with the superheated steam, or causes the steam to pass over alkali laid in pierced pans within the hardening vessel.

9,280.—FIXING OF FENCING-WIRE: F. Webb.—A wire-straining appliance has arms hinged together and upon them are mounted pivoted clamps, of which the ends are serrated to a curve which is eccentric as regards the pivots. When the clamps are turned the wires become gripped between the serrations on the ends of the clamps, and serrations upon the hinged arms, which are worked with a nut and screw or a screwjack; hooked and hotted clips fasten the looped ends of the wires.

9,342.—A SPRING HINGE FOR DOORS: A. L. Slump and F. Brucker.—A plate fastens a socket to the door-frame, and to the outer end of the socket is secured one end of the spring—its other end being set so as to bear against a sliding plate which is to be drawn out with one of two pins attached to a socket upon the double swing-door when the door is quite opened one of the pins will pass into a rebate in the outer end of the door-frame socket, and so keep the door in that position.

9,354.—MATERIALS FOR BRAZING: A. Vogt.—After the objects have been coated with a protecting composition, and (as to their surfaces which are to be joined) a solution of water-glass and borax, they are heated and then put into the molten brazing material. For the composition an admixture is made of carbon, hydrated oxide of iron, with powdered asbestos and stearite, and (if needed) an aluminium oxide, together with beer glue solution, or some such binding agent.

9,301.—A STAFF FOR LEVELLING PURPOSES: G. Hilscher.—In order to simplify the process of "correcting" when the staff has been observed through the telescope the inventor provides a staff which is marked with two sets of graduations, either way, from a zero line, and having behind it a graduated foot that will slide adjustably within staples. In correcting for the height of the telescope and for its angle of elevation when one seeks to ascertain the difference of level between two objects, the staff should be raised upon its foot until its zero is horizontal with the height of the telescope.

9,422-3.—MEANS OF EXTINGUISHING FIRE: H. B. Feßger.—For extinguishing fire with refrigerated gases the inventor causes some non-combustion-supporting gas to be drawn by a fan from a receiver into the refrigerating chamber, and thence into the closed apartment where the fire is. For cooling the chamber a charge of sulphurous dioxide, or ammonia, under pressure in a receiver is caused to flow through a pipe-coil into the chamber where it will mingle with the gas.

9,460.—ELECTRICAL ENERGY METERS: A. Peloux. In the case of an induction motor meter for single alternating currents and having a conducting disc

or cylinder driven with a shunt magnet and main current coils displaced anglewise on opposite sides of the cylinder, the inventor contrives to minimise the retardation arising from eddy currents due to the increase of the main current coils when the main current is large. He either provides additional compensatory driving force by means of a second winding upon an electro-magnet, which a main current transformer supplies with current, or provides for keeping constant the total magnetical flow through the cylinder or disc. For the latter purpose he causes a rotating disc to be driven by the interaction of an electro-magnet in a highly inductive shunt circuit and displaced coils, which are in non-inductive shunt circuits that contain the secondaries of two main current transformers. Other variant forms of the invention are specified.

9,481.—FITTINGS FOR MATHEMATICAL DRAWING INSTRUMENTS: A. J. Thornton.—For a firm attachment of a needle-point it is held by its extreme end only in a hole in the split socket at the end of the compass-leg, which is made of tempered steel; through a nut carried by a screw is passed the upper part of the needle, which will become secured when a milled nut is turned so as to draw the other nut into a recess cut in the leg.

9,487.—BEARINGS FOR PLUG-COCKS: F. Glover and Royles, Limited.—The invention relates more particularly to plug-cocks used under high pressure; a gland, embodying an auxiliary gland, holds the plug in its casing, and the plug bears against packing-rings; between the plug and the additional gland is inserted a ball-bearing formed of balls (or rollers) and rings; the bearing may be arranged at one or both of the ends of the plug.

9,402.—ELECTRICAL COUPLING AND DISTRIBUTION: W. M. Douglas.—Three pieces of metal, fitted with binding-screws, are used with a ceiling-rod or some similar connection, for a two-wire supply. Loops of the supply wires are connected with the first and second metal pieces, whilst the first and third pieces are connected with the lamp. Wires that connect the second and third pieces with a switch serve to complete the circuit. Insulating partitions keep the three pieces separated from one another. The couplings are specified as being available for connecting lamps upon two different circuits, and so on, and as rendering unnecessary the making of joints and long loops in the wires.

9,404.—PILE DRIVING, STAMPING, AND SIMILAR MACHINERY: E. S. Brett.—The inventor's object is to increase the travel of the head with the same extent of the oscillation of the driving-shaft. In the case of a pile-driver he mounts the piston of a rotary engine upon a driving-shaft of which the arms support a pulley which takes a bite of the rope, and when the arms are oscillated in one direction the head will be raised twice the distance which is moved by that pulley; the travel may be still further extended by using a pair of pulley blocks instead of only one. The inner end of the rope is passed over a pulley mounted above the piston and thence to a rope barrel having a pawl and ratchet-wheel for adjustment of the position of the head. Center also No. 2,924 of 1890.

9,512.—TREATMENT OF SEWAGE, &c.: E. W. Ives.—A pipe conveys the sewage or foul water from a screening-chamber into a mixing-channel, beyond which is the settling-tank. The screening-cage has bars which break up some of the solids. Two pipes (which are joined to a short pipe upon which is mounted a set of distributing-arms) convey the sewage, &c., from the mixing-channel into the tank, of which the lower portion, cone-shaped, constitutes a sump for the sludge, into which water or air may be forced. Filtering-bodies receive the liquid portion of the sewage.

MEETINGS.

FRIDAY, SEPTEMBER 20.

Sanitary Institute (Lectures for Sanitary Officers).—Dr. J. Priestley, B.A., on "Duties of a Sanitary Inspector." Indoor: 7 p.m.

SATURDAY, SEPTEMBER 21.

Sanitary Institute (Demonstrations for Sanitary Officers).—Inspection at Wimbledon Sewage Works. 3 p.m.

Northern Architectural Association.—Excursion meeting. Members to assemble at the south end of Sunderland Central Station, at 3.5 p.m., upon the arrival of the 2.32 p.m. train from Newcastle.

TUESDAY, SEPTEMBER 24.

Sanitary Institute (Lectures for Sanitary Officers).—Dr. J. Priestley, B.A., on "Duties of a Sanitary Inspector: Offensive Trades and Trade Nuisances, &c." 7 p.m.

WEDNESDAY, SEPTEMBER 25.

Builders' Foremen and Clerks of Works' Institution.—Quarterly meeting of the directors. 8 p.m.

SATURDAY, SEPTEMBER 28.

Sanitary Institute (Demonstrations for Sanitary Officers).—Inspection of the Richmond Main Sewerage Pumping Station and Purification Works, Kew Gardens. 3 p.m.

SOME RECENT SALES OF PROPERTY: ESTATE EXCHANGE REPORT.

September 3.—By Messrs. KEMSLEY (at Birmingham). Shrewley, Warwick.—Pinley Hill Farm, 86 a. 3 r. 31 p., f. .... 7,000

By PERKINS & SONS (at Romsey). Itchingham, Hants.—Wilkins Farm, 130 a. f. and 6 a. .... 1,500 Put Farm, 114 a. f. and 7 a. .... 1,070

**TO CORRESPONDENTS.**

NOTE.—The responsibility of signed articles, letters, and papers read at meetings, rests, of course, with the authors.  
We cannot undertake to return rejected communications.  
Letters or communications (beyond mere news items) which have been duplicated for other journals are NOT DESIRED.  
We are compelled to decline pointing out books and giving addresses.  
Any communication to a contributor to write an article is given subject to the approval of the article, when written, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.  
All communications regarding literary and artistic matters should be addressed to THE EDITOR; those relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

**TENDERS.**

[Communications for insertion under this heading should be addressed to "The Editor," and must reach us not later than 10 a.m. on Thursday, N.B.—We cannot publish tenders unless authenticated either by the architect or the building-owner; and we cannot publish announcements of tenders accepted unless the amount of the tender is given, nor any list in which the lowest tender is under £50, unless in some exceptional cases and for special reasons.]

\* Denotes accepted. † Denotes provisionally accepted.

### The Canals of Canada.

GLANCE at the map of North America will show that the region of the great lakes is singularly fitted for a system of canals. At their head and furthest from the ocean we have to realise the inland sea of Lake Superior, 601 ft. above the sea level, covering 32,000 square miles, as stormy as, and perhaps more difficult of navigation than, many so-called seas, the gathering basin, if the expression may be used, of a region rich in the supply of wood and of minerals, the working of which, in Canadian soil at least, is but in an early period of development; and of the wheat-growing areas of the North-West. In this or in any other of the great lakes there is nothing to prevent their navigation by vessels of the largest tonnage, though from December to April navigation is rendered impossible by ice. Thus the tendency of the shipowners of the lakes is to increase the size of their vessels.

If the map be again noted it will also be seen that there is a very slight separation between Lake Superior and Lake Huron, which is 581 ft. above sea level, so that, except for a short and single obstacle, these two lakes and Lake Michigan, also 581 ft. above sea level, are one for the purpose of navigation. This obstacle is the rapids at Sault Ste. Marie, partly American, partly Canadian territory. Years ago they proved a trouble to the Indians and Hudson's Bay traders, and there is still preserved on the premises of the Lake Superior Company a small and primitive lock on one of the side streams, with a rise of 9 ft., which, together with some portage, enabled the early explorers and traders to raise their canoes from Lake Huron to Lake Superior.

The first communication between the two lakes—for the so-called St. Mary's River, the channel of which, varying in width, winds picturesquely for some fifty miles to the broader waters of Huron, is but a part of the lake—was completed by the State of Michigan in 1855. This, the first artificial link in the navigation of the great lakes,

was a canal 1,800 yards long, 100 ft. wide, and 12 ft. deep, with two locks, each 350 ft. in length. This was succeeded by another lock, also on the American side, the canal being lengthened and deepened. This work, which was finished in 1879, provided a lock 515 ft. long, 80 ft. wide, and 39 ft. 6 in. deep. This, the Weitzel Lock, was found insufficient, and in 1897 there was opened another and larger lock known as the Poe Lock, 800 ft. between the gates and 100 ft. in breadth. On the Canadian side a canal and lock, the latter 800 ft. long and 60 ft. in breadth, were constructed by the Government and opened for traffic in 1895. Like the American locks, this is free of toll. The Falls of St. Mary still dash in curling foam from Superior to Huron as they did when, on an early summer day in 1671, Lussou, standing among a little knot of Frenchmen in the middle of a crowd of Indians collected from the vast forest around the lakes, with picturesque symbols took possession of these regions for the Crown of France. But on either side there now passes to and fro through these great gates one of the largest

ship traffics in the world. The bellow of the steam signal, the splashing of the screw constantly are heard where, even fifty years ago, the Indian's fishing-canoe was almost the only boat in these waters.

The perpetual stream of traffic increases year by year. The lake steamers are growing in size, and some are now built to carry 7,000 tons deadweight on a draught of 19 ft. The so-called "whale-back" craft, shaped like a cigar with a kind of forecastle and poop which some years ago came into vogue, are now giving way to vessels worked by their own steam, low in the waist with a high-raised forecastle and poop topped by a species of deckhouse. Practically all the traffic of the lakes passes through the locks of Sault Ste. Marie, and then expands, so to speak, some going down Lake Michigan to United States ports only, some to the American ports on Huron and Erie and Ontario, notably Cleveland and Buffalo among these, and some to Canadian destinations. The vast extent of this traffic, scarcely realised in this country, is best exemplified by the following official figures:—

Comparative statement of Lake Commerce through United States and Canadian canals at Sault Ste. Marie, Michigan, and Ontario for the seasons of 1899 and 1900.

 Average value per ton of freight for season of 1899, 11'14 dols.

The canal which at present is of the first importance in connexion with the eastward-bound through traffic is the Welland Canal, which passes by Niagara and connects Lakes Huron and Ontario, and is the second artificial link in the navigation of the Lakes. The third and succeeding links are the canals between the Bay of the Thousand Isles, where the St. Lawrence leaves Lake Ontario and Montreal, consisting of the Williamsburg Canals, namely, Gallops, Rapide Plat, and Farrans Point, respectively eight, four, and one mile in length; the Cornwall Canal, eleven miles; the Soulange, 13½ miles; and lastly, close to Montreal, the Lachine Canal, 8½ miles long with five locks, and a total lift of 45 ft. The Welland Canal is of importance not only to Canada, but also in less degree to the United States, since Buffalo, on Lake Erie, is the port and centre of transportation for the lake trade to the United States. The Welland Canal is twenty-seven miles long with twenty-five locks, and a depth of 14 ft.; indeed, the com-

pletion of the works on the Soulange Canal, on the northern bank of the St. Lawrence above Montreal, gives a uniform depth of 14 ft. on the through canal system of Canada. To attain this end large sums have been expended by the Government, and vessels capable of carrying cargoes up to 3,000 tons will be able to pass through from any port of Lake Superior to Montreal. On the other hand, the increasing class of vessels of deeper draught, which are now so much in favour and so profitable, will not be able to ply through to Montreal, and with the present satisfactory freight rates it is certain that more and more of these vessels will be built.

There are those who think also that with a canal system capable of accommodating vessels of greater draught a communication might be established between the lakes and Europe. Large, however, as are many of the steamers now plying on the lakes, they would require to be different in build for ocean traffic, with a higher freeboard and stronger construction. Severe as are the

storms and high as the seas can run on these lakes, the rolling swells of the Atlantic are unknown, and the traffic in the summer only. But even with a 14-ft. channel some ocean steamers could trade between Europe and the lakes and carry a considerable cargo.\* How substantial is the increase in cost through the present necessity of transshipment is well shown by the following figures, which, though not recent, are clear as examples:—

\* Statement made by the Railroad and Warehouse Commission, showing market value of No. 1 Northern wheat at Duluth on September 4, 1899, as compared with actual sale of 8,000 bushels Duluth No. 1 Northern wheat on same day at Liverpool for delivery in London, c.i.f. (cost, freight, and insurance):—

	Cents.
September 4, Duluth quotation for No. 1 Northern .....	68'00
Duluth elevator and inspection charges.....	0'85
Lake freight and insurance, Duluth to Buffalo .....	4'70
Elevator charge and commission at Buffalo Canal freight, Buffalo to New York .....	2'50
Elevator charged, &c., in New York, viz. demurrage, towing, transferring, and trimming .....	2'00
Ocean freight and insurance, New York to London.....	7'20
Shrinkage in weight, Duluth to London.....	0'50
Cost in London, c.i.f. ....	86'83
September 4, sold in Liverpool for London delivery, 1,000 quarters (8,000 bushels) Duluth No. 1 Northern wheat at 28s. 1½d. per quarter (480 lbs.), or 8½c. per bushel (say).....	84'38
Difference .....	02'45

Showing that on that day the market in London was about 2½c. lower than that of Duluth."

A point which will be at once noted in the above statement is that the lake and canal freights are higher than the ocean freights—the freight from Duluth to New York is 7'28

\* During the winter 1900-7 the Lake Superior Company despatched four steamers with cargoes of ore from Lake Superior to the Bristol Channel.

*Sault-St.-Marie : Lock in Process of Filling.*

*Sault-St.-Marie : Below the Lock Gates.*

against 7<sup>20</sup> from New York to London. The reason, no doubt, is that on the lakes the tonnage and the seasons are limited; on the Atlantic there are plenty of ships, and the traffic continues from year's end to year's end.

But when the canal system of Canada is under consideration it needs only a glance at the map to show that for the through traffic between Superior and Montreal, or

one may say from Port Arthur in the west to Montreal in the east, a distance of 1,274 miles—Montreal representing the point of departure for the ocean—there are routes which might be shorter than those now existing. One of these is the Trent Canal system—to connect the eastern end of Georgian Bay with Lake Ontario—a scheme which, valuable in conception, appears to be wholly inadequate as it is being carried out.

Progress in the work is slow, and even when completed the size of the canal will be such that it will be quite useless except for small traffic. There is also the proposed, but still wholly indefinite, scheme to make a connexion between Georgian Bay and Ottawa by way of French River, Lake Nipissing, and the Ottawa River, and which was recommended in the report of a Special Committee of the Canadian Senate in 1898.

It would at Ottawa join the Rideau Canal which runs from Kingston on Lake Ontario to Ottawa, a distance of 126 miles, with forty-nine locks, and a rise of 282 ft. to the summit. Each of these schemes would shorten the distance from Montreal to Superior by a very considerable mileage. The importance of this, when the fact is remembered that the navigation of the lakes is not open for more than about seven months of the year, cannot be overrated; a day on the lakes is much more valuable than in purely ocean traffic. To those who are unacquainted with the already immense trade on the lakes the importance of the canals of Canada is naturally impossible of appreciation. But it must be clearly borne in mind that it will continue to increase. Canada has large undeveloped mineral resources; the North-West is a great field of agricultural produce. The gravitation of population to the United States instead of Canada is now less marked, and as labour becomes more obtainable in the Dominion so will development proceed, and with it there will be more traffic to be handled. Thus the importance of the canal system of Canada will be constantly increasing. From a British point of view, the value of an outlet for the wheat-growing districts of Canada through Imperial territory to a point whence grain can be shipped to the United Kingdom can hardly be overrated. In time of war, with the Atlantic patrolled by powerful cruisers, the wheat-fields of the wide regions to the west of Lake Superior would be the true granaries of England. The canals of Canada are thus essential, not only as a link for commercial purposes, but also for the well-being of the mother country. Their development and perfection are more worthy of attention than fantastic plans for national granaries in the British Islands. Duplication of routes, rapidity of locking, the prevention of accidents by widening and deepening of canals and channels, are essential so as to prevent any interruption of traffic between the North-West of Canada and the ocean, because in the Canadian wheatfields there exists a certain and vast supply of grain for Great Britain in time of war so long as communication is adequate and uninterrupted in Canada, and the passage across the Atlantic is efficiently safeguarded.

#### THE NEW "DRAINAGE BY-LAWS" OF THE LONDON COUNTY COUNCIL.

IT is somewhat strange that, although the power of making by-laws "for regulating the dimensions, form, and mode of construction . . . of the pipes, drains, and other means of communicating with sewers" was conferred on the Metropolitan Board of Works by the Metropolitan Local Management Act of 1855, neither the Metropolitan Board of Works nor its successor, the London County Council, has exercised its power directly until this year. Indirectly through the Vestries the power has been exercised, but the result has been much less satisfactory than if the central authority had undertaken the work. The by-laws of different districts varied in many important details. In one district no house-drain must be more than 6 in. in diameter; in another, the

be at least 6 in. One vestry required branch-drains from water-closets to be 6 in. in diameter; another authority was wisely satisfied with 4-in. branch-drains. The gradient of drains was variously specified: in one case, 1 in 80; in another, 1 in 60; in a third, 1 in 40 for 6-in. pipes and 1 in 30 for 4-in. pipes; and in a fourth, "half-inch in each pipe," the length of the pipe not being stated. These are merely a few out of the many instances which might be given to show the confusion which has resulted from the devolution of its power by the central authority, and there cannot be two opinions as to the advantage of one uniform code of by-laws applicable to the whole of London County. Whether the by-laws which have recently been adopted by the County Council are satisfactory in themselves, remains to be seen.

The older by-laws made by the County Council under the Public Health (London) Act, 1891, to regulate the construction of water-closets, &c., remain in force, with the exception of the last clause of No. 3, which dealt with the ventilation of water-closet traps, and the whole of No. 4, which contained the regulations respecting soil-pipes. These have been repealed in favour of the altered requirements in the new Drainage By-laws. The alterations will be more particularly referred to hereafter.

*By-law 1* deals with subsoil drainage. No objection can be made to the method of construction specified, except to the vagueness of the clause which requires the pipes to be "properly laid to a suitable fall." It is worth noting, however, that subsoil drainage is not enforced by the by-law—"A person who shall erect a new building and<sup>o</sup> shall cause the subsoil of the site of such building to be drained by means of a drain communicating with any sewer," shall construct the subsoil-drains in the manner specified, but there does not appear to be any obligation on the part of a building-owner to drain the subsoil. Probably each municipal authority in the metropolis will sooner or later insist on such drainage being carried out wherever, in the opinion of the Borough Surveyor, it is necessary.

*By-law 2* specifies that drains for conveying surface-water must be constructed in the same manner as sewage drains, and that every inlet to such drains must be "a properly-trapped gully."

*By-law 3* requires every rainwater pipe or channel conveying roof-water to a sewer "to discharge in the open air over a properly trapped gully, or into such gully above the level of the water in the trap thereof." Rainwater pipes or channels must not be constructed to receive "any solid or liquid matter from any water-closet, urinal, slop or other sink or lavatory." Baths are not mentioned, and the waste water from these may therefore be conveyed into rainwater pipes or channels if desired. The reason for this exception is doubtless that bath water is, as a rule, less foul than the discharges from the fittings mentioned, but, after all, there is usually very little difference between bath water and lavatory water, and both are often less foul than rainwater draining from sooty and bird-polluted roofs. If bath-wastes may be connected with rainwater pipes, there seems to be little reason for prohibiting the connexion of lavatory wastes. On the other

hand, it ought not to be forgotten that in small houses the bath is sometimes used as a washtub, and as a lavatory basin is generally fixed in close proximity the two wastes may conveniently be connected to one main pipe.

*By-law 4* deals with drains and consists of fifteen clauses. The stipulations in this by-law, unless otherwise stated, refer to all drains except those for the drainage of the subsoil. The pipes must be "of glazed stoneware or of cast-iron or of other equally suitable material," and must not pass under any building except "where any other mode of construction may be impracticable." Drains must be "of adequate size," the diameter of sewage-drains to be "not less than 4 in.," the size of drains from rainwater pipes and surface-gullies is not clearly stated, but apparently 3-in. pipes will be allowed.

Every drain must be laid on a bed of concrete "not less than 6 in. thick, and projecting on each side of the drain to an extent at least equal to the external diameter of the drain." The width of the concrete must therefore be at least 12 in. for 3-in. stoneware pipes, 15 $\frac{1}{2}$  in. for 4-in., 18 $\frac{1}{2}$  in. for 5-in., 21 $\frac{1}{2}$  in. for 6-in., and 31 $\frac{1}{2}$  in. for 9-in.; the width will be slightly less for iron pipes—namely, 10 $\frac{1}{2}$  in. for 3-in. pipes, 14 $\frac{1}{2}$  in. for 4-in., 17 $\frac{1}{2}$  in. for 5-in., and 20 $\frac{1}{2}$  in. for 6-in. This stipulation applies to all underground iron drains, and to stoneware drains not under buildings. In the case of stoneware drains under buildings, the pipes must be "completely embedded in and covered with good and solid concrete at least 6 in. thick all round;" the beds required for 3-in. and 4-in. pipes must therefore be 16 in. and 17 $\frac{1}{2}$  in. wide respectively. Stoneware drains not under buildings must be surrounded with concrete to the full width of the beds and to at least half the depth of the pipes. This stipulation appears at first sight to apply also to iron drains, but a later clause of the same by-law shows that this is not intended, as it specifies that an iron drain passing under a building must be "laid on a bed of good concrete in accordance with the requirements of this by-law relating to drains which do not pass under a building." Not a word is here said as to embedding the drain in concrete to half its depth, and if this is not required for drains under buildings, it cannot be considered necessary for external drains. The concrete must be composed of one part of "good Portland cement," two parts of "clean sand," and six parts of "clean gravel, hard brick broken small, or other suitable ballast." Jerry-builders will be pleased to note that the clause does not permit them to use concrete of better quality, or compel them to break the gravel, however coarse it may be.

Cast-iron drain-pipes may have flange-joints "securely bolted together with some suitable insertion," or socket-joints "made with molten lead properly caulked." The sockets must not be less than 2 $\frac{1}{2}$  in. deep, and 3 $\frac{1}{2}$  in. in diameter for 3-in. pipes, 4 $\frac{1}{2}$  in. for 4-in., 5 $\frac{1}{2}$  in. for 5-in., and 6 $\frac{1}{2}$  in. for 6-in. The weights of cast-iron drain-pipes per 9 ft. length (including flanges or sockets and beaded spigots) must be 110 lbs. for 3-in. pipes, 160 lbs. for 4-in., 190 lbs. for 5-in., and 230 lbs. for 6 in. Such pipes may be fixed above ground in buildings, if "carried at least at each joint on adequate piers or

\* The italics here and throughout this article are ours.

other sufficient supports, constructed of iron, stone, brick, or cement concrete."

Stoneware drain-pipes must have "socket joints properly put together with cement or other equally suitable material." The kind of cement—whether Portland, Roman, Arabian, Keene's or other—is not stated, but doubtless Portland cement is intended. Admixture with sand is apparently prohibited, but surely this is a mistake. The thickness of the stoneware, and the diameter and depth of the sockets are specified for the different sizes of pipes.

Every drain must be "laid with a suitable fall," but we are not informed what fall is considered suitable. Apparently this detail is left for the consideration of the various Borough Councils, on account of the different depths of the sewers in different parts of the metropolis. "Whenever practicable . . . adequate means of access" must be provided at each end of a drain passing "beneath" a building; this is doubtless intended to apply also to an iron drain carried on supports within a building. Drains passing "beneath a wall" must be protected from injury (which might be caused by the settlement of the wall) "by means of an arch, flagstone, or iron support, which shall not bear on the drain."

Every inlet to a drain, except those provided for ventilation, must have "an efficient trap . . . capable of maintaining a sufficient water-seal," but bell-traps, dip-traps, and D-traps are prohibited.

Every drain, except a subsoil drain, must be "so constructed as to be water-tight, and to be capable of resisting a pressure of at least 2 ft. head of water." This clause is a most important one, and has already been interpreted in different ways. It does not appear to us to be intended to throw upon the builder or building owner the onus of applying the water-test, but merely to give the municipal officers power to apply it if they desire to do so. If the intention had been to render the water-test obligatory on the builder, the wording would surely have been on the lines of the other clauses in the by-laws, and would have read as follows:—"And shall cause such drain to be tested with a pressure of at least 2 ft. head of water."

By-law 5 specifies that every drain must be trapped at a point "as near as may be practicable" to its junction with the sewer. "Adequate means of access to such trap" must be provided. This may take the form of "a separate manhole or other separate means of access." The meaning intended to be conveyed by the use of the word "separate" is not obvious. It surely cannot mean that the manhole may not also be used as an inspection-chamber for the drains or as a junction-chamber for branch drains.

By-law 6 requires manholes and other means of access to be "water-tight up to the level of the adjoining ground-surface or roadway," and to be fitted with suitable covers, those within buildings to be airtight.

By-law 7 prohibits right-angled junctions (both vertical and horizontal) in drains.

By-law 8 deals with the ventilation of drains, and specifies three methods which may be adopted, namely, (1) a low-level inlet near the intercepting trap, and an outlet pipe or shaft "as far distant as may be practicable," (2) a low-level inlet near the

head of the drain, and an outlet shaft "as near as may be practicable to the trap," and (3) two "suitable vertical pipes or shafts" carried up "to such heights and in such positions that when either acts as an inlet the other may be a safe outlet for foul air." Each opening is to be fitted with a grating, the apertures in which must not be less than the sectional area of the pipe or shaft. Bends must not be formed in any ventilating pipe or shaft, "except where unavoidable." Soil-pipes and waste-pipes from slop-sinks may be used as ventilating-pipes for drains not more than 4 in. in diameter, if the pipes are not less than 3½ in. in diameter, and are otherwise satisfactory "as to the position, height and mode of construction"; special ventilating-pipes must, however, be not less than 4 in. in diameter, and must be constructed in all other respects as soil-pipes.

By-law 9 prohibits drain-inlets within buildings, except from water-closets, slop-sinks, and urinals.

By-law 10 specifies that every waste-pipe from a lavatory and sink (other than slop-sinks) must be trapped immediately beneath the fitting by "an efficient siphon-trap," the traps and pipes to be of "lead, iron, or stoneware." Neither the diameters nor weights are stated. Copper, brass, and white metal are not mentioned, but surely this is an oversight. Bell-traps, dip-traps, and D-traps are expressly prohibited, and every siphon-trap must have "adequate means for inspection and cleansing," and be ventilated into the external air whenever this is "necessary to preserve the seal of such trap." Baths are not included in the foregoing provisions, and the waste-pipes may, apparently, be of any material and untrapped.

"Every" waste-pipe, however, must discharge in the open air over or into a trapped gully or over a channel leading to such a gully.

By-law 11 contains some of the new regulations regarding soil-pipes. The absolute prohibition of internal soil-pipes in new buildings is now withdrawn, but such pipes must be of drawn lead (not cast-iron), and will only be allowed when it is not "practicable" to fix the pipe outside. No alteration has been made in the weights of lead and iron soil-pipes, but the minimum thickness of iron is now specified, namely, 3 in. for 3½ in. and 4-in. pipes, and ½ in. for 5-in. and 6-in. pipes. This alteration has probably been made so that irregular castings can be rejected. Iron pipes may have flange joints "securely bolted together with some suitable insertion," or socket joints "made with molten lead properly caulked." Internal lead soil-pipes must have "proper wiped plumbers' joints"; the joints for external lead soil-pipes are not specified. The waste-pipes from slop-sinks may be connected to soil-pipes, but rainwater pipes and the wastes from other sinks and baths must not be so connected. There is no prohibition in this clause against the connexion of lavatory waste-pipes to soil-pipes, but this is doubtless an oversight. The trapping of a soil-pipe at the foot is still expressly prohibited, but the unnecessary provision about carrying the soil-pipe above the highest point of the roof, and 3 ft. above any window within 20 ft. of the open end of the pipe, has been omitted.

By-laws 12 to 16 deal with the joints from lead to iron, stoneware to lead, lead to

stoneware, iron to stoneware, and stoneware to iron. In the old by-laws only three of these joints were specified, namely, lead to iron, stoneware to lead, and stoneware to iron; in these cases the same type is specified in the new by-laws as in the old. The lead to stoneware joint may be made by means of "a flanged thimble of copper, brass, or other suitable alloy" connected to the lead pipe by "a wiped or overcast metallic joint," the flanged end of the thimble to be inserted into the stoneware socket and the joint made with Portland cement. The iron to stoneware joint may be made by placing the beaded spigot of the iron into the stoneware socket, and filling the annular space with Portland cement. In every case, however, alternative methods may be adopted if "equally suitable and efficient." This may lead to different methods being practised in different boroughs, but has the advantage of allowing new inventions to be adopted. An important innovation is that, whereas in the old by-laws the specified joints were only applicable to connexions with soil-pipes, they are now enforced for connexions with soil-pipes, ventilating-pipes, and waste-pipes.

By-law 17 takes the place of the last clause of the old By-law 3, and specifies that, where two or more water-closets are connected to one soil-pipe, the trap of each must be "ventilated into the open air at a point as high as the top of the soil-pipe, or into the soil-pipe above the highest water-closet." The ventilating-pipe must have an internal diameter of not less than 2 in., and must be connected to the trap in the manner specified in the old by-law. The new matter states that trap ventilating-pipes must be of drawn lead if fixed inside the building, or of drawn lead or cast-iron if fixed outside the building. The weights of the pipes are stated in addition to other details.

By-law 18 deals with slop-sinks and urinals, the two kinds of fittings being treated exactly alike. Every fitting must have "an efficient siphon trap," which must be ventilated where necessary after the manner prescribed for a water-closet trap. It is not clearly stated that, if a water-closet and slop-sink are connected to one soil-pipe, the traps of the two fittings must be ventilated, although trap ventilation is then more necessary than in the case of two water-closets. The waste-pipes from slop-sinks and urinals must be constructed as soil-pipes, but the internal diameter may be 3 in. instead of 3½ in. The weights must be as follows:—Lead, 60 lbs. per 10 ft. length; cast iron, 40 lbs. per 6 ft. length. The provision of a 3-in. waste-pipe for a single urinal is both extravagant and insanitary; how can it possibly be kept clean by the one-gallon flush commonly allowed?

By-law 19 throws upon the owner of a building the duty of maintaining "in a proper state of repair all pipes, drains, and other means of communicating with sewers, and the traps and apparatus connected therewith."

By-law 20 prescribes the penalties for offences "against any of the foregoing by-laws."

By-law 21 specifies that "these by-laws shall, as far as practicable, apply to any person who shall construct or reconstruct any pipe or drain or other means of communi-

cating with sewers, or any trap or apparatus connected therewith, *so far as he shall effect any such works* in any building erected before the confirmation of these by-laws, as if the same were being constructed in a building newly erected." A certain amount of latitude is allowed by the phrase "so far as practicable," and no fault need be found with this; the words "so far as he shall effect any such works" appear to have been inserted for the purpose of narrowing the scope of the by-law, but their exact meaning is not by any means clear. If, for example, a person wishes to ventilate the traps of two water-closets served by one soil-pipe, does the by-law compel him to reconstruct the soil-pipe, or does it merely compel him to construct the trap-ventilation pipes in the specified manner? We believe that the by-law involves only the latter and not the former, but the final interpretation will probably have to be given in the law-courts.

*By-law 22* defines the word "person" to include "any body of persons, whether corporate or unincorporate," and *By-law 23* declares that the by-laws "shall not extend to the City of London."

It is obvious from this cursory review of the by-laws that they are not by any means perfect. There are sins of omission and of commission, and the meaning is not everywhere clear. Some of the requirements are unnecessarily onerous, but in the main the by-laws are a fair compromise between jerry-work and extravagance. In some cases the provisions are less stringent than those in the former by-laws, and an amount of latitude is allowed which cannot in the end fail to be advantageous, although at first it may lead to friction.

#### NOTES.

The Liverpool Cathedral.

It is evident that there is to be a new competition for the Liverpool Cathedral, which we think is rather unjustly throwing over Mr. Emerson, whose design was practically selected in the former competition. It is true that a new design must in any case be made, the selected site being entirely different in its nature and surroundings from the originally proposed one. This however is no doubt a question on which there may be difference of opinion; the new committee is not in any direct way bound by the action of the old one. But what we do regret to see is the foolish mischievous resolution that "the style of the new cathedral should be Gothic." Here is the ecclesiological prejudice in church architecture in full blow again; a great chance for the production of a grand and original piece of modern church architecture is deliberately thrown away, and we shall have another specimen of imitation mediævalism. Not only is the Gothic style unsuitable for a modern cathedral; the fatuity resides in demanding a special "style" at all. Architects should be invited to design a cathedral, simply, and be left to consult their own genius as to its treatment. A committee who could make a formal demand for a "Gothic" cathedral must be entirely behind the age in their ideas, and entirely ignorant of the spirit and tendency of the best modern thought in architecture. By making such a demand they have practically thrown away a great opportunity.

The Lightning Conductors at Westminster Abbey.

MR. KILLINGWORTH HEDGES is to be congratulated on the system of lightning conductors which now protect Westminster Abbey. In protecting a building of national importance, it is very difficult to decide how far we should cover it with a network of wires. Mr. Hedges seems to have fixed upon a happy mean; there are sufficient conductors to make the main buildings of the Abbey almost absolutely safe, and yet they are very unobtrusive. He uses  $\frac{3}{8}$  in. seven-strand copper cables, which are carried horizontally along the apex of the roof of the nave and transepts and also over Henry VII.'s Chapel. The towers, lantern, and other higher parts are protected by similar conductors, which are joined on to the main cables. Along the horizontal conductors are fixed thirty four-point aigrettes, fastened to the cables by substantial joint boxes, which are filled up with solder, and ought therefore to last as long as the cable. The pinnacles all round the roof are each protected by  $\frac{1}{2}$  in. solid copper wire, and so it will be seen that the system is fairly elaborate. We are glad that there are no absurd tall spear points sticking up all over the roof; in our opinion Mr. Hedges' arrangements are quite as efficient. We do not quite understand why Mr. Hedges keeps the vertical conductors 6 in. from the walls by means of special holdfasts. Surely there is nothing inside the building to which the lightning might possibly side flash. The earthing arrangements are very complete, a small pipe being laid from the nearest rain-water pipe to the coke surrounding the earth plate. The conductor will, therefore, nearly always show a very low earth resistance. Whilst we admit the importance of periodically testing the earth resistance of lightning conductors, we are not prepared to insist on the necessity of a very low earth resistance. We had occasion recently to test the earth resistance of four lightning conductors which varied from one-tenth of an ohm to 160 ohms. Thinking that possibly the high resistance of one of them was due to a break in the cable, we had it dug up. It was found that there was no earthplate at all, simply a few bricks and a little blackish earth, which probably was once a few pieces of coke. Yet this lightning conductor, which was a copper rope half an inch in diameter, had protected a very lofty chimney shaft for over twenty years.

The Proposed Draining of the Zuyder Zee.

THE withdrawal is announced from The Hague, by the newly-formed Dutch Cabinet, of the Bill for the draining of the Zuyder Zee. The Bill had been introduced in the Second Chamber of the States-General by Mr. Lely, Minister for the Waterstaat. Mr. Lely's scheme contemplated the enclosure and the gradual reclamation in part of the Zuyder Zee. He proposed to begin the work with a dam—having sluices opening into the North Sea—from Piaam, in Friesland, to Wieringen, in North Holland. He intended then to reclaim two areas of dry land, or polders: the one, the Wieringen Polder, to extend over a total area of 21,700 hectares, including 18,700 hectares of fertile land; and the other, the Hoorn Polder, to extend over a total area of 31,520 hectares, including 27,820 hectares of fertile land. The two polders would lie between Medemblik and

Wieringen, and Marken and Hoorn, respectively. It was estimated that the works would be accomplished in eighteen years hence at a computed cost of 95,000,000 florins, or 7,916,667*l.* The two polders we mention are plotted on the west side of the Zuyder Zee and represent but a portion of its aggregate extent.

Rural Drainage.

THE correspondence on subject of rural drainage which has been going on for some weeks in the *Times* reveals an unsatisfactory state of things. The extracts, however, from the Reports of the Inspectors of the Local Government Board, which we have published year by year, might well have prepared our readers for this. But it is useless to discuss emendations in the Public Health Act. What is chiefly needed is that the existing law should be strictly enforced, and more especially that the water supply should be kept free from contamination. Parish Councils have power over the water supply of villages, but, speaking generally, they have taken no steps whatever to safeguard the purity of the water of English villages. If every cottage had an earth closet there would be no sanitary difficulties, and even if other systems were properly managed sanitary matters in the English villages would be greatly improved. The local Inspectors are averse to minut supervision, and as a rule, unless the attention is called to some nuisance by a individual or by the outbreak of some disease, they take no steps to keep openers up to the mark. In the rural district in sanitary matters the door is being constantly locked after the horse is stolen. Polluted water supply causes an attack of diphtheria, the local Inspector pronounces well to be polluted, and an order is made for it to be closed. If such well had been inspected and closed at an early period in the course of a systematic survey of the district, there would have been no outbreak of disease. Common sense and care are the chief needs of English rural drainage. The rural population is decreasing, so that there is not the need for new systems of drainage which are necessitated by the growth of urban districts.

New York Central Railroad Tunnel.

A REPORT has now been made by a grand jury appointed to consider the case of the two-mile tunnel through which the New York Central Railroad approaches its terminal station. The jury recommended that the wall dividing the two outer tunnels from the centre tunnel be removed; that passenger-coaches be protected from the sun when not in use; and that some other motive power than steam locomotives be used through the tunnel. We know something of unpleasant conditions in railway tunnels in this country, thanks to the existence of the Metropolitan and Metropolitan District Railway Companies; but even these awful examples serve but inadequately to convey a true idea of the discomfort experienced by passengers in the more trying climate of New York. In other respects public feeling with regard to the Central tunnel in that city very much resembles the ordinary state of opinion in London as to similar conduits. There is, we learn, an "outburst of indignation against a railroad company of which the public has been such a liberal patron,"

the company is accused of showing not slightest indication of any solicitude for comfort of the travelling public. No effort seems to be made to store the carriages in sheds where they could be kept moderately cool, ventilation of the tunnel is conspicuously absent, and the officials, expending unlimited time and thought upon the problem, regret to find that all alternative methods of traction present insuperable difficulties. Up to the present time the Central Railroad enjoyed something very like a monopoly so far as a certain portion of the traffic is concerned, but the completion of the Rapid Transit tunnel, the construction of the Hudson River bridge, and the introduction of competing roads into Manhattan Island, will no doubt materially affect the condition. Then the offending company will readily discover—as our own sinning cometh did—that electric traction is not merely a philosophical abstraction. Railway companies very frequently resist all reforms that are not dictated by diminishing expenses. This has certainly been the case with our own Metropolitan companies, and the public is now rejoicing to think that the stinging influences of adversity have not been exercised altogether in vain. But our friends in New York have not yet the same reason for self-congratulation.

**THE** paper read by Professor Jamieson to the Electrical Section of the Engineering Conference at Glasgow on the dangers arising from trolley wires was a most instructive one. Recent accidents prove that, so long as telephone, telegraph, and electric wires are permitted to pass over the trolley wire, no matter how complicated the system of guard wires adopted may be, there is always the risk of a broken wire making contact between a person or animal and the trolley wire. It seems, therefore, that all message or lighting wires must be placed underground. Doing this would once dispense with the necessity of guard wires, which are in themselves a source of danger and frequently cause a breakdown of the system by earthing the trolley wire. Sometimes the current carried by the broken guard wire is not sufficient to disrupt the system, and so the hanging wire becomes white hot. Professor Jamieson makes the useful suggestion that an earthing switch ought to be placed on every car, so that in the event of a wire falling over the trolley the driver could, by turning this switch, at once cause the magnetic cut-out of the feeder of that section of the live wire to act, and hence the pressure would be cut off. We understand that this device has been successfully tried at Leeds. It seems to be much the safest and simplest method of procedure in an emergency. We have no doubt whatever in india-rubber gloves which are so much in evidence in the rules of the Electric Light and Power Act, for protection and lighting stations. We have tested several of these gloves at pressures easily obtainable in the laboratory, and none of the English-made gloves survived the test. The mechanical strength of the gloves so far as we were able to test was very deficient, they could easily be perforated or torn mechanically. Hence, we wonder at the confidence that electricians have in them. Earthing the trolley-wire by means of a switch, however, would be a perfectly safe operation, and it seems to us

that on a dark night this is the only thing that even the most skilful electrician could do without running grave risks.

**THE** paper which Dr. Leybold, of Hamburg, read at the Glasgow International Engineering Congress, on the "Destruction of Gas-Pipes by means of Electricity," treats of a subject of the greatest importance at the present time. In this country electric traction on the overhead system is being rapidly extended in all directions, and it is well known that large leakage currents from the rails often come back to the station by the gas and water mains. We have very little practical knowledge as to the amount of damage which is being done by these currents, and hence a paper on this point full of practical data will be welcomed by both electrical and gas engineers. An escape of gas in a street of Hamburg was traced to holes eaten away in a wrought-iron gas-pipe which crossed the street at right angles to the tram rails. When the pipe was taken out it was found that there was a hole eaten away directly underneath each of the four tram rails, and nearly all the pipes in the street were similarly damaged. These holes were obviously due to electrolysis. In the cast-iron water-pipes which were laid deeper down no corrosion was detected. The tramway authorities at Hamburg had been in the habit in winter-time of melting the snow on the rails with salt or with waste nitrate of soda. When the ground was soft it got saturated with a saline solution, and any pipes embedded in it got rapidly corroded by electrolysis. To protect some 1-in. gas-pipes they were covered in canvas soaked in boiled tar. On removing the lengths of the pipes, however, and unwrapping the covering, it was found that they were corroded, the corrosion taking a spiral form coinciding with the wrapping of the canvas. The author stated that it was highly probable that leakage electric currents in private houses sometimes destroyed pipes embedded in the walls. A clear example of this had recently come to his notice. Knowing as we do the large leakage currents taking place from some of the mains of direct current supply systems, it is of the greatest importance to watch for signs of electrolytic action. In the subsequent discussion Mr. Gisbert Kapp, the eminent German electrician, stated that the Board of Trade "seven volt" rule for preventing damage being done by leakage currents was altogether inadequate. There is no scientific reason for selecting seven volts as the maximum permissible pressure between the rails and the water-pipes. At Hamburg the electricians have reduced the maximum pressure of the rails to much less than this.

**THE** Borough Council have agreed to effect an absolute transfer to the Southwark Borough Council of all their interest in the market and its profits. But inasmuch as St. Saviour's parish derives from the market rents a sum of 5,000*l.*, which is applied in relief of the parochial rates, the trustees are of opinion that the Borough Council should fully compensate the parishioners for the loss which they will suffer through the transfer. The Borough Market, for fruit and vegetables, is one of the oldest in London.

It represents a street traffic that was carried on in very early times on London Bridge. After a clearance that had been made in 1290 of the stalls in the roadway of the bridge the business of the market was removed to within the precincts of (old) St. Thomas's Hospital, also to St. Margaret's Church-gate, and subsequently to the main street, there known as "Long Southwark," between the church and the end of the bridge. The Local Authorities suppressed the traffic under powers of an Act they had obtained in 1756; but it was revived by a later enactment in the "Triangle," the former site of Grimes Croft, which William, second Earl Warren, had bestowed upon the monks of Rochester Cathedral, and of Rochester House pulled down in 1604. For some new market buildings, designed by Henry and E. Rose (1851), was demolished the St. Saviour's Grammar School as rebuilt, after the fire of May, 1676, on the site of the prior's house next, south, to St. Mary Overie's. In 1885 plans were prepared by Mr. McIntyre North for a further enlargement of the market by taking in additional ground between Borough High-street and Messrs. Barclay & Perkins's brewery in Park-street, at a cost of about 65,000*l.* Six years ago Mr. A. T. Walmisley was appointed engineer for the construction of a new roof and other works, and Messrs. H. Jarvis & Son made plans for some new covered stands and the flower market.

**A** PETITION addressed to the London County Council is being prepared by owners and occupiers in St. John's Wood against a contemplated interference with the residential amenities of that quarter of the town. It appears that Lord Howard de Walden, as possessor of what until lately had been the Duke of Portland's estate, is carrying out some extensive alterations and rebuilding in the Portland Town district, to extend over an area of about twenty acres. For rehousing the dispossessed tenants the managers of the estate seek to acquire a site (recently cleared) on the west side of Grove End-road, St. John's Wood. The petitioners represent that the building of model dwellings on that site will seriously affect their enjoyment of a locality which already within the last few years has suffered much through encroachments upon its garden spaces. Moreover, Lord Howard de Walden proposes, as part of his scheme for improving the Portland Town area, to advance the building-line on the front gardens in Park-road to a distance ranging from 10 ft. to 26 ft. The effect of that encroachment upon the roadway which passes along the north-western limits of Regent's Park may be best estimated from what our readers have witnessed during some while past in Euston and Marylebone roads, where what was originally designed to be a broad avenue or boulevard in the former New-road has been gradually destroyed by the erection of buildings upon the forecourts and similar front spaces.

**THE** STRAND IMPROVEMENT.—Mr. Daniel Watney has published his award arising out of the claim brought by Mr. Davison, silversmith and pawnbroker, against the London County Council for compensation in respect of Nos. 264 and 318, Strand, which were compulsorily acquired for the purpose of the Strand improvement. The experts' valuations on both sides ranged from 8,103*l.* to 27,876*l.* Mr. Watney's award is 16,317*l.*

FURTHER NOTES ON THE BRITISH ASSOCIATION MEETING.

"EDUCATION" has been the subject of a newly-created section of the Association, concerning which it is not quite clear how it comes properly under the category of subjects of an Association professedly formed for "the advancement of science." It rather reminds one of the class of subjects which used to be taken up by the now extinct Social Science Association. Professor Armstrong, who read a paper on "The Future Work of the Section," seemed to tacitly admit that there was no such thing, at present, as a science of education, as he said that "it would be the function of the section gradually to shape a science of education." The superiority of German to English education lay, he said, in the thoroughness with which the work in schools was done, and in the fact that the Germans had made research the corner-stone of their educational system; in other words, that the Germans give more place to science in their educational system than we do; but that is not to say that they have made a science of education, and we fail to see how there can be any such science in the proper and usually accepted meaning of the term. The field which the British Association has to endeavour to cover at its annual meetings, in regard to the subjects which are properly and by universal consent classified as science, is already so immense that it seems unwise to further extend and complicate its programmes by the inclusion of subjects which can only by a stretch of language be said to be scientific. The proper object of the British Association is the study of nature and natural law. We observe also that in the course of the discussion which followed Professor Armstrong's paper all the remarks turned on the methods of teaching science and the inadequate position which science occupied in our educational system. Much of that is perfectly true; only that is not the science of education, but education in science. If there is to be a science of education, it must be concerned with education generally, not education in science alone. In brief, we think the section is a mistake, and that it is wasting some of the power of the British Association by taking on a subject not strictly within its borders.

The subject of the teaching of mathematics occupied more usefully part of the time of the mathematical sub-section of section A. Professor Perry started the discussion in a paper the main point of which was to consider the true use of mathematics as a part of general education. It was uselessness, he said, which must determine what subjects ought to be taught to children and in what ways.

"The obvious forms of usefulness in the study of mathematics were:—(1) In producing the higher emotions and giving mental pleasure hitherto neglected in teaching almost all boys. (2) In brain development (2) in mere mathematical study, (3) in the aid given by mathematical weapons in the study of physical science, hitherto neglected in teaching almost all boys. (3) In passing examinations—the only form that had not been neglected; the only form really recognised by teachers. (4) In giving men mental tools as easy to use as their legs or arms; enabling them to go on with their education (development of their souls and brains) throughout their lives, utilising for that purpose all their experience. That was exactly analogous with the power to educate oneself through fondness for reading. (5) Perhaps included in (4); in teaching a man the importance of thinking out things for himself and so delivering him from the present dreadful yoke of authority, and so convincing him that whether he obeyed or commanded others he was one of the highest of beings. (6) In making men in any profession of applied science feel that they know the principles on which it was founded and according to which it was being developed. (7) In giving to acute philosophical minds a logical counsel of perfection altogether charming and satisfying, and so preventing their attempting to develop any philosophical subject from the purely abstract point of view, because the absurdity of such an attempt had become obvious."

He objected to the teaching of elementary mathematics as if all boys were going to be pure mathematicians. He would teach mathematics in quite a different way to different students. In short, the Professor evidently leans towards the use of practical applied mathematics in schools, up to a certain point and for the majority of students. "Mathematics was a powerful weapon with which to unlock the mysteries of nature. If a man" (the average man, we presume) "knew how to use the weapon that was enough. Let him leave to others, the men who delighted in that, the

forging of the weapon, the complete study of it." This is only a fresh expression of a feeling which is becoming increasingly prominent at present. There are engineers who hold that, in regard to their studies, mathematics should be gone into just as far as the study bears on the practical problems of their profession, and be taught in direct relationship to, even to some extent by means of, those practical problems. The further discussion naturally introduced the subject of Euclid, who is being somewhat shaken in his seat in connexion with modern education. But we are not sure that some of the arguments used do not cut both ways. Professor Forsyth complained of Professor Perry making usefulness the sole test of the value of a study; subjects progressed not on the line of direct usefulness. Major MacMahon, the President of Section A, followed in the same strain, observing that Professor Perry seemed to look upon every boy as if he were to be an engineer. If they were asked to give up Euclid they must have something to take the place of Euclid, and no substitute for it had been found. "Euclid," he observed (and we entirely agree with him) "was mainly an instrument for the cultivation of the mind, and only secondarily a means of impressing geometrical facts upon students." But he thought it should be taught in connexion with geometrical drawing. Professor Miall, who said he was not a mathematician, but could discuss the subject from the point of view of human nature, thought that if the intellectual needs of the people had been considered in the past, such a book as Euclid's elements would never have been put into the hands of schoolboys. "It was contrary to human nature to put a highly developed technical and artificial system of geometry, complete in all its forms, before a school-boy and expect him to understand it. The method adopted in teaching should be that by which intellectual activity could produce its own results. It should be exploratory. It should begin with the concrete and put questions on observed facts. Thus was obtained a constructive geometry which every one built up for himself." And as to the question what was to be put in the place of Euclid, it might be observed that in Continental countries they had no Euclid, and had erected nothing in its place. Professor Minchin, following, thought that no satisfactory progress would be made in the teaching of mathematics in this country until Euclid was given up. The stumbling-blocks were the headmasters of the public schools, who would have Euclid. Those who taught mathematics had not yet realised the enormous value of graphical methods.

The point of the whole discussion is really whether mathematics is to be regarded as a mental training or as a means to a practical end. Surely the former is the higher view, and the one most consistent with the broadest interpretation of the word "education." The headmasters of public schools, who came in for Professor Minchin's sneer, are not concerned in teaching boys to be engineers, but in giving them a general education. In this sense the study of Euclid is a fine source of mental training; and we can testify that there are schoolboys, not specially brilliant ones either, who really enjoy the study of Euclid. Sir John Gorst, who occupied the chair and summed up the discussion, charged on the "practical usefulness" side, but appears to us to have unconsciously advanced what was really an argument on the other side. He said he had attempted to teach mathematics to Maori boys and men in New Zealand; he proceeded on the embryo Sonnenschein system, and found that the Maoris learned the practical arithmetic useful to them in active life faster than boys or men in this country would generally learn it, but when he attempted to teach them geometry after the Euclid fashion, it was an absolute failure; not one of them could grasp or understand the simplest proposition of Euclid. Naturally so. These Maoris were, if not savages, only just emerging from the state of savage life; and it is the characteristic of the savage mind as distinguished from the civilised, that it can only take in what presents itself as a concrete and practical object. Are we to reduce the system of teaching in our schools to the level of what can be taken in by the barbarian mind? The object of teaching the Maoris, and the only object, evidently, which they could understand, was to give them what is called useful knowledge. The object of general education for a cultured people is not merely "useful knowledge," but

the development and training of the intellectual powers as an end in itself; and in that respect we think Euclid will still maintain his place. The general tone of the discussion of the subject at the Association we should call sadly utilitarian, and recommending a view of education which tends to narrow rather than to develop the intellect.

The Geology and Chemistry Sections were not for the most part occupied on any subjects having a bearing on those in which our readers are concerned. In the Chemistry Section a paper was read by Mr. Bellby on "The Minute Structure of Metals," but we have seen no report of it beyond the title. In the Geology Section Dr. R. Logan Jack read a paper on "Artesian Water Supply in Queensland." The western area of Queensland, like other portions of the Australian continent, offers a vast area of land fit in itself for cultivation, but deficient in rainfall and in surface water.

"\* In 1881 he suspected that the cretaceous rocks of the Western Downs afforded conditions favourable for the discovery of artesian water, and in 1888 he, as Government geologist, with Mr. J. B. Henderson, hydraulic engineer, made a study of the area, and an experimental bore was put down which proved a success. From Mr. Henderson's annual report for 1899-1900 it appeared that up to June, 1900, 185 miles of boring had been made in search of artesian water in the district, and a large proportion of the bores had been successful; although the artesian water did not fully compensate for the lack of rain, still the bores had already produced an important change in the conditions of life in the interior. The greater part of the western interior of Queensland was composed of soft strata of lower cretaceous age, consisting of clay-shales, limestones, and sandstones. Along the eastern margin of the cretaceous area there was a porous sandstone of great thickness, the Blythe date Braystone, and owing to a low dip the outcrop of this permeable stratum occupied a belt from five to twenty-five miles wide; but the Braystone finally disappeared beneath the argillaceous and calcareous upper members of the series forming the surface of the downs to the west. Several rivers disappeared while crossing the outcrop of the Braystone, and the water must be carried in it beneath the clay-shales of the downs. Dr. Jack gave an estimate of the water which should penetrate the Braystone, and suggested the probability that much of it finds an outlet into the sea in the great Australian Bight and the Gulf of Carpentaria. He further observed that artesian water basins were, in fact, broken basins the break giving rise to leakage either on land beneath the sea. In places, therefore, the water rose in a bore, but did not reach the surface owing to the site of the bore being higher than the level of pressure. This was termed 'sub-artesian water' and illustrations were given of both artesian and sub-artesian water in the district in question."

In the Mathematical and Physical Science Section Dr. Glazebrook read a paper on the new National Physical Laboratory in course of erection at Bushy, of which he is superintendent, and about which we gave some particulars in our last issue. He exhibited the plans of the building, and gave the following description of its construction and arrangement:—

"The main building consisted of a substantial central block about 70 ft. square, standing on vaulted basement. At each corner there was a large wing practically single-storied; the rooms there were being fitted up for various special purposes. In the central building itself would be the general laboratories. There would be a large lecture hall, arranged as an apparatus-room, a library. The basement contained six rooms of a size; the floor had been covered with a thick layer of concrete. The walls were very thick, so that the air was extremely steady, and the temperature conditions all favourable for steady work. In addition there were other smaller rooms on the basement; two of these were entirely surrounded by thick interior walls, and arrangements would be fitted to maintain a steady temperature throughout the year. At the back was another wing containing a number of rooms suited for special researches, there a lift had been fitted, and also a mere column having a height of about 50 ft. For more delicate physical work the ground floor basement of the old house afforded ample accommodation. For the engineering work a room, 80 ft. by 50 ft., had been built, lighted from the north by a weaving shed roof. It was divided longitudinally into two bays by a series of rolled steel pillars. One bay would contain a light travelling crane along the other rail, and a line of hoisting machinery and for experimental purposes. Adding this laboratory was a drawing office, while the engine-house and boiler-rooms were close at hand. Power, obtained from a 60-kilowatt Parsons turbine, would be distributed electrically to various

\* We quote, as before, from the résumé published in *Times*.

parts of the laboratories; this form of engine was chosen for the express purpose of avoiding vibration as far as possible. The necessary tools were on order and in course of installation. The work which the committee hoped to attack in the first instance was that which had already been under the consideration of the Alloys Research Committee of the Mechanical Engineers. Apparatus for the photo-micrographic examination of steel rails was being set up, and machines for testing the elastic properties of alloys were in course of construction. Pressure gauges and steam indicators would also be tested. The height of the building would not allow the mercury column, now being erected, to measure more than 200 lbs. to the square inch, but apparatus was being constructed for pressures in excess of that amount. Considerable attention was to be given to high temperature thermometry, the testing of platinum thermometers, and the measurement of electrical quantities. Before the end of the year the committee hoped the laboratory would be fully and usefully occupied."

In the Physical Section a report was presented by Professor Everett on the subject of the rate of increase of temperature at distances below the surface in various localities. The results stated are somewhat surprising in regard to the variability of the rate of increase of temperature. Mr. Alfred C. Lane, the Michigan State Geologist, in the absence of more precise information, estimated the mean annual temperature for the district in question at 38.6 deg., and the mean temperature at the depth of no variation at 40 deg. Fahr. If we took this latter as the temperature at 50 ft. and compared it with the temperature 84 deg. at 4,450 ft. (the admitted temperature at that depth), we had an increase of 44 deg. Fahr. in 4,400 ft., or 1 deg. in 100 ft. Mr. Lane's estimate for the Calumet district, where these mines were situated, was 1 deg. Fahr. in 107 ft., and he stated that a gradient was indicated of between 1 deg. in 100 ft. and 1 deg. in 115 ft. No authorities were cited for the conductivities which Mr. Lane assigned to the rocks, and fuller information on this point was desirable; but in view of the fact that the variation in the British Isles from 1 deg. in 34 ft. to 1 deg. in 92 ft. had been characterised as a surprising divergence of extremes from the mean, it was well to emphasise the connexion between gradient and conductivity. At a deep boring in Upper Silesia, the deepest in the world, the highest temperature at a depth of 1,959 metres was about 157 deg. Fahr., and the average increase 1 deg. Fahr. in 62 ft.

The crack-brained persons who, like the Sultan in *Don Juan*, deny that the world is round, because it appears flat to their senses,\* might find some interest in the account communicated by Mr. Yule Oldham to the Geographical Section of his and Dr. Wallace's photographic object-lesson in regard to the earth's curvature. They selected for the demonstration a straight six-mile stretch of the Bedford River, between Welney and Denver, where there was a bridge at each end and an uninterrupted length of river between. The height of the parapet of one bridge from the water level was measured, and a mark at the same height set up on the other bridge, and an intermediate mark on a pole, at the same height above water level, at a distance of three miles from each bridge. A telescope was then directed along the line of sight from the parapet on one bridge to the mark on the other, and the intermediate pole mark was seen about 6 ft. above the line of sight. The result, obtained by means of telephotography, was shown on the screen. Sane persons do not of course need such a proof; but considering how completely such a stretch of river would impress the eye as level, there is an almost dramatic effectiveness in having its curvature illustrated in this manner. And if this should meet the eye of the surveyor who once wrote to us to ask "whether the line of sight of a telescope was a straight line in space, or a line following the curvature of the earth,"† it may also serve to clear his mind and that of any others whose wits are similarly befogged.

In the Anthropology Section Mr. J. L. Myres, Mr. Hogarth, and Mr. Arthur Evans described the recent archaeological discoveries in Crete; but with these our readers are already well acquainted.

In the Economic Science and Statistics Section the subject of the housing of the poor and

working classes was the subject of an animated discussion. It is difficult to see exactly how this subject, any more than education, comes properly under the head of "Science," but one need not quarrel about nomenclature if any assistance is given towards clearing up such a problem. The subject was started by a paper by Mr. A. L. Bowley on Glasgow wages in the nineteenth century, of which we have seen no report. Professor Smart opened the discussion by some remarks full of common sense, but only embodying the opinion at which, we imagine, all thoughtful persons who have studied the subject have arrived, viz., that it was dangerous and inimical to private enterprise if a municipality undertook housing on unremunerative terms; that the question ought to be made clear whether it was the poor or the working classes who were to be housed; and if the former, it should be recognised as a form of poor relief. And if the working classes were to be housed on any terms short of being remunerative, it was an indirect subsidy, and the deficiency was borne by the ratepayers. He also suggested that where local bodies took action in regard to housing their accounts should be open to inspection. Mr. Peter Fyfe, a sanitary inspector, and presumably taking up the cause of the Glasgow Corporation, said he did not think the housing of the poor necessarily involved loss. Defining the poor as those who earned not more than 25s. a week (which is perhaps putting it rather high), he thought they could not be housed without municipal help. There should in the case of loans be a differentiation of the sinking fund from the interest of capital. The sinking fund ought not to be paid for by the rents—for land was not depreciated by time. The rent ought to be only interest and allowance for depreciation of the buildings. Buildings under good by-laws would last 100 years. In his opinion, the sinking fund might be allowed to be repaid in 100 years instead of forty or fifty years. Mr. McBain thought the Improvement Trustees of Glasgow had by no means solved the problem; they had lost a large sum, and no proper account had been taken of the heavy cost of repairs; and if the rents were to be such as Mr. Fyfe proposed, the sanitary requirements of municipalities made it impossible for private persons to build houses for the poor. This is a complaint that has often been repeated, and the necessity for demanding solid and sanitary building no doubt adds to the *crux* of the problem; but it is not the less a necessity for all that. Mr. McBain went on to assert that these cheap houses at small rents were constantly occupied by people who could afford better rents, and who spent the surplus in drink. The Lord Provost declared that the Corporation never built to lose; they had been obliged, however, to go further out of the town; and he admitted that they had not yet tackled the problem of the lowest class. No special decision or resolution on the subject seems to have been arrived at.

In the midst of these sober practical questions, concerned with the life of man and the study of natural phenomena on this planet, Lord Kelvin made on the Tuesday a kind of meteoric appearance in a brilliant address soaring into the region of speculative and cosmical science, the ostensible subject being "The absolute amount of gravitational matter in any large volume of interstellar space." Here we come again on the question of the structure of the Universe—the greatest of all structural questions. Lord Kelvin's address was, we understand spoken, not read, nor did he furnish any written *résumé* for the Press; and as he habitually speaks with a characteristic rapidity of transition from one point to another, we question whether the published reports quite correctly represent on all points, what he said or meant to say. He does not seem to have kept very directly to the nominal subject of the paper. This seems to have been touched, and almost immediately abandoned, at the commencement only of the address, Lord Kelvin drawing a distinction between "matter" simple and "gravitational matter," instancing the presence of ether as a proof of the existence of matter outside the limits of gravitational influence. Considering that ether has hardly advanced to more than the condition of an assumption, one can hardly regard this in the light of "proof," but we can accept the reasoning that if there is ether it must be imponderable, on the ground that if it extended to all space it could not be subject to gravitation, because

in that case its condition would not be stable. After all, "ether" seems to be little more than a new name given to what used to be called "space," in order to save us from the necessity of trying hopelessly to imagine absolute vacuum. But Lord Kelvin said that he had no wish to discuss ether and its peculiarities ("peculiarities" is certainly good of a substance of which we are only postulating the mere existence), but he was rather concerned to show that our universe, meaning thereby (as indeed we should naturally conclude) not the solar system, but the wider space from which the light of the most distant star could reach our telescopes, "was a small affair." The old sin of speaking disrespectfully of the Equator was nothing to this; but Lord Kelvin means that it is within the grasp of thought and of mathematical expression. The space or sphere (assuming it to be spherical, which was not necessary) which he would consider could be expressed very easily in mathematical language, and he would express it by  $309 \times 10^6$ , a number which would express the number of kilometres in the radius. This distance was selected because a star situate on the boundary of such a sphere would have a parallax of a thousandth of a second, "or the distance of the sun from the earth would subtend an angle of that amount at that distance." Surely Lord Kelvin must have said, not the distance of the sun from the earth, but the diameter of the earth's orbit. We do not take parallax angles from the sun, as we cannot get there; the received base for the parallax angle of a distant star is the diameter of the earth's orbit—in other words, observations at intervals of six months, affording the longest base practicable to mortals. What follows we quote in the words of the *Times* report, with the exception of correcting an obvious mistake therein of "metres" for "kilometres":—

"If the radial force were equal over the whole spherical surface its amount could be expressed as a small but definite fraction of terrestrial gravity, and that every body on or near that surface would experience an acceleration towards the centre, which in the ordinary notation of kilometres per second, per second would be expressed by 137, divided by 10 raised to the power of 13. The velocity acquired per year would be the millionth part of 432 kilometres. In five million years the velocity acquired would be 22 kilometres a second, if the body started from rest at the spherical surface, and the space traversed would be about one-twentieth of the imagined radius. In 25,000,000 years the velocity would be 108 kilometres per second, and the distance covered, expressed in kilometres, would be 425 multiplied by ten to the power of 15, or more than the radius of the sphere, which showed that the rate of acceleration could not remain approximately constant for 25,000,000 years. If the system were started at this remote distance of time, the stars would have had the opportunity of acquiring velocities either more or less than the critical velocity of 108 kilometres, here given, and this velocity agreed with the measured velocity in the cases of stars like  $\alpha$  Centauri and  $\delta$  Cygni, and was not greatly different from the velocities in the line of sight determined by the spectroscope."

This is a curious and almost startling concurrence of observed phenomena with the result of abstract reasoning; unless indeed Lord Kelvin consciously or unconsciously marshalled his mathematical argument up to the known rate of movement revealed by the spectroscope. Then followed the consideration of the probable distance of stars from each other. He was more inclined to assume the existence of 1,000 million such bodies in the assumed space than Professor Young's 100 millions, but nine-tenths of them might be dark bodies, or dark to us (for a reason which appears at the close of the address). If the stars (this postulated number, we presume) were arranged exactly in cubical order, the six nearest neighbours to any sun would have a parallax of  $\frac{1}{10^6}$ " ; this distance expressed in kilometres would be about  $50 \times 10^3$ ". Here we do return again to the nominal subject of the lecture, and Lord Kelvin proceeded to illustrate the question by increasing the possible number of suns and decreasing their size, till, if they were reduced to one centimetre in diameter, the proportion of space occupied to diameter that vacant would be as 27 to 1,000; but we question whether these reported figures can be correct; the proportion of matter to vacancy seems much too large in comparison with the initial statement as to the distances separating the original suns; but we have not had time to attempt following out and checking the figures arrived at. The centimetre suns were

\* We had a correspondent who used annually to send us letters and supposed demonstrations on this point, praying for their insertion in our columns. His decease alone put an end to his pertinacity.

† A fact.

then reduced to the size of molecules, and a consideration followed as to the extent of free path each of these could have without coming in contact with a neighbour; a matter of mathematical analysis. The figure reported seems enormous—10,000 million kilometres, and we can hardly think it can be correct. The question has of course an important bearing on the nebular hypothesis, a point which was evidently discussed by Lord Kelvin, but not reported. Finally he came to the consideration of the effect of the appreciable time required by light to traverse space. There was irrefragable evidence to prove that the life of our sun as a luminary was but a moderate number of million years—he would put it at fifty million. "The time taken by light to travel from the outlying stars of our sphere would be about 3½ million times the life of such a star"; and this in a universe which Lord Kelvin calls "but a small affair." We conjecture there is some mistake in that "million." The light from the nearest fixed stars is estimated, if we remember right, to take twenty years to reach us. To give the furthest such an unimaginable time for light-travel seems disproportionate, unless the universe—"our universe," as Lord Kelvin calls it—is to be regarded as practically infinite, an idea which he discountenanced at the outset. Did he not say "3½ times" the life of the star? That would give us an allowance of about 162 million years for the light travel of the outlying stars. It seems a sufficient conception for a universe which is "but a small affair." The result even in this case is that all the existing stars would never be seen together; for them all to blaze on us at once they would have to be set alight at earlier and earlier periods as we progress outward from the centre to circumference; the earth, for the purpose of this argument, being the centre.

Such calculations and such times and distances, though expressible in figures, are hardly within the grasp of mental realisation. Nevertheless, such speculations serve to lift us above the common and prosaic realities of life; and perhaps it is not the least wonderful part of the subject, that beings who are materially confined to this almost infinitesimal point in the vast ocean of matter, should have the capacity to deal in

"These thoughts that wander through eternity."

At all events, Lord Kelvin's brilliant address was the most remarkable feature of the Glasgow meeting. One cannot but be amused however at the naive manner in which Dr. Schuster, who seconded the vote of thanks to Lord Kelvin, asked "What was the state of the universe at creation? Were the atoms spread out uniformly or scattered in groups?" It would seem from this that Dr. Schuster has a mind able to conceive the nature of "creation" and the existence of a prior nothingness or nonentity before creation. If so, his brain must be intrinsically superior to that of ordinary man. We may use such words as "creation," but neither the idea of that or of previous non-existence of time or space are thinkable by the human mind.

### Illustrations.

#### TERRACE GARDENS, FOOT'S CRAY PLACE, SIDCUP.

THIS illustration forms part of the second edition of Mr. Mawson's "Art and Craft of Garden Making," which was reviewed in our issue of August 24, wherein is a full description of the house, site, and surroundings pictured in the above illustration.

With the intent of redeeming the gardens from the state of partial neglect into which they had fallen through unoccupation, Mr. Waring, the owner, called in the assistance of Mr. Mawson, who, together with his colleague, Mr. Dan Gibson, after due calculation of the rise and fall of the land, prepared a complete scheme which can be carried out partially or wholly, as deemed desirable, a portion of the work being now in progress. The illustration shows the suggested terracing to the immediate front of the house, the central steps of which lead down to a characteristic beech avenue to the lake.

The idea, as will be gathered, has been to give this house a stately setting in harmony with its architectural style.

#### "STEEP-HILL," JERSEY.

THIS house occupies the site of an old one; it is set in a typical Jersey garden. The whole of the exterior is rough cast; the roofs are covered with deep red hand-made tiles. The porch is of rough grey granite, with cast lead gutter and semi-dome. Inside, the drawing-room, hall, and library are panelled, the former with deal painted and the latter with oak. The staircase is also of oak.

The plaster ceilings of hall, drawing-room, and library are the work of Mr. Bankart.

The general building and all the joiners' work were contracted for by Mr. Crill, of Jersey.

Mr. Reginald Lloyd, architect, of Jersey, supervised the whole of the work on the spot. The plan and design are by Mr. Ernest Newton. The drawing was exhibited at the last Royal Academy.

#### DESIGN FOR A MEMORIAL BRIDGE.

THIS sketch is the embodiment of a passing idea, and does not claim to represent a worked-out scheme. The following facts, however, gave rise to it:—

An additional bridge is needed across the Thames between Waterloo and Blackfriars, east of Somerset House, and could be well placed to connect with the eastern spur of the new Holborn to Strand thoroughfare.

This bridge should be much wider than other London bridges, with aisles for slow traffic.

No finer sight, for sight-seeing purposes, could be procured in London now than the centre of the river, at a point around which the great Embankment radiates, flanked by the groups of Somerset House and St. Paul's. A grand memorial arch planted midstream astride the bridge would connect tide and road, and perhaps be an architectural embodiment of the fact that the British Empire is firm rooted in maritime power.

BERESFORD PITE.

#### LEICESTERSHIRE SOCIETY OF ARCHITECTS.

THE following is the address given to the members of the Leicestershire Society of Architects, on the 14th inst., by the President, Mr. S. Perkins Pick. We omit a few introductory words referring to matters of local interest:—

It has occurred to me that this would be an opportune time to say a few words chiefly to the younger members of that body who have taken up architecture as a study and pursuit in life.

All those who take a keen interest in the arts must necessarily be students always; the subject itself is inexhaustible, and the variety of it boundless; it may further be said that the pleasure derived from a knowledge sufficient for the appreciation of fine work, whether displayed in a building, a picture, a piece of furniture, silver, glass, or any other object, is indeed very great. Even this alone ought to be some compensation for the energy and exertion which it is necessary to show in order to obtain sufficient knowledge to reap this advantage; but then there is also that serious responsibility which comes to architectural students a little later on in life of spending other people's money upon work which may be altogether unworthy. The thought of this ought also to make each one of us determined to leave no stone unturned which may lead to better results. To do good work a great amount of care, thought, knowledge, and ability is requisite, and the importance of architectural students acquiring a proper knowledge of the grammar of their calling cannot be overrated. Those who trust to Providence and chance and spend their studentship days listlessly will in days to come have a poor chance of success. Many of our clients—and it is a pleasure to add that they are an increasing number—have a good knowledge and excellent taste in architectural matters. In not a few instances their judgment on buildings, furniture, and decoration is undoubtedly better, and is therefore preferable to that of quite a large proportion of architects who are practising the profession for a livelihood. This ought not to be. Architects should give their art a first place, and their chief aim should be thorough efficiency in this before all things. One hears of, and even knows of, architects who are really geniuses in matters outside their professional calling—men who are extremely clever in quite a variety of

ways other than their own, by which is meant other than those which the brass plate at their office door indicates as the mode by which they expect to earn their livelihood. There are instances in which it almost amounts to obtaining money under false pretences, so little does the work of such men justify their existence as architects. But pray do not misunderstand me. We must all have a high opinion of the genius who is capable of doing many things well. We know that there are men who are extremely versatile, and who can do many wonderful works of great variety. It is not to these that reference is made, but to those who make specialities of many other matters rather than their own calling. In other words, there is a strong feeling and desire on the part of all right-thinking persons that men should first be geniuses at their own work, and that other accomplishments should be of secondary importance. Possibly more need not be said to those who have selected architecture as a pursuit in life about the advisability of making architecture and the allied arts their first consideration, beyond this, namely, that the number among the public who have a good knowledge of architecture is rapidly increasing, and it is absolutely necessary, if we as architects are to retain our position as advisers in the matter of architecture, that we should obtain sufficient knowledge and good taste to justify our existence as such.

To obtain this knowledge is really a huge problem, and the earlier we realise this the better for those who venture hereafter to place their confidence in us, and, indeed, the better for ourselves also. To you as students it should be pointed out that the grammar of your work must be acquired very largely in the beginning of your career as pupils; indeed, if the elements are not learnt at this period, it is doubtful if they ever can be attained in after life. Take, for instance, such a subject as the bonding of brickwork; it never is, and cannot be, properly taught in an architect's office, neither can all the practical methods of plumbers', carpenters', stonemasons', or iron-founders' joints, and a thousand and one other technicalities. Then, again, how can the ordinary pupil obtain a proper knowledge of the history of architecture, or of ornament in the ordinary routine of an architect's office? What can he learn there of light and shade, advanced drawing, and more particularly of modelling, and the crafts generally? It doubtless is well known to every one of you that knowledge and accomplishments of this character are not, and cannot be, acquired in an ordinary architect's office. There must, therefore, be found some other solution of the difficulty, and what have we better, or more suitable, at any rate, at the present time in this country than our schools of art.

To those architects who take pupils it should be pointed out that they have a duty devolving upon them of a serious nature which is not always properly realised. In a great number of cases the pupil is admitted by the payment of a premium; he is allowed the free run of the office, but beyond this no particular instruction is given, or special care taken, or facilities offered, by which he may attain a proper knowledge of architecture and building. He is, as a matter of fact, generally left to his own resources, and it amounts to a chance whether the pupil fails or succeeds. All this is much too casual. Would it not be desirable and wise to make it a condition that architects' pupils during their articles should spend, say, not less than two days, as well as three evenings, a week in some such institution as this School of Art, and could not more facilities be given for sketching and measuring old work and for study of building works in actual progress? If the student is one whose heart and soul are in his work, and he is imbued with a craving for the knowledge and love of fine work, it matters not so much whether any curriculum is provided for him or not; in fact, there are cases where the so-called natural bent of the industrious student—that rare genius one sometimes hears about—has been rather harmed than helped by it, but even these very rare young men must have facilities for study, and where are they likely to find better materials, at any rate in the provinces, than in a school such as this? Think, too, of the advantages of meeting other students for an interchange of opinions—how one's net ideas get shot at and hard hit by the competing genius who possibly does not accept the ideas of his

brother student, and who probably may have quite opposite dreams and fancies of his own of realising an architectural Utopia in some dim and distant future; and, again, what a grand thing it is to make endeavors to lay that "ghost" which appears and disappears with almost the regularity of the moon, viz., "a new style of architecture!"

Let us pause and ventilate our views on this subject, which is always a fascinating one for us. Speaking broadly, with reference to this matter, it may be said (and in my opinion it is so) that there is a great deal too much striving after this phantom of a new style of architecture. It is a delightful thing to have dreams of all this, but there is nothing more dangerous than to endeavor to realise them in solid material. It is not intended to convey by this that you should not aim at originality, but that you should first know and realise the true principles upon which good work has been done in the past, and the altered conditions necessary in a building of to-day. Generally you will find that modern requirements have so altered that by the time you have provided the accommodation required, and got your materials together, there are quite enough new elements in the problem to make it impossible to reproduce any style of old work. And while upon this subject of originality it may be as well to point out that the most original work now being erected is that carried out by the speculative builder and the mediocre architect. Men like Mr. Norman Shaw, and Mr. T. F. Bentley, and Mr. John Belcher, although among the best architects now living, are not anything like so original in their buildings as are the ordinary clap-net architect and speculative builder whose work is so generally prevalent. Does it not occur to you that leading architects of the type mentioned are possibly among those who have a greater knowledge of precedent, have drawn and made a study of old work to a greater extent than most other practising architects? There does not appear in their work any great effort to be particularly original; indeed, it is generally the omission of this which makes their buildings so scholarly and suitable. There is no attempt on the part of such men as these at that drastic measure one sometimes hears of, namely, the smashing up of the styles; but, unfortunately, one too often sees specimens of that by men of smaller attainments; and there can be no discord in music made more trying to the nerves of a fine ear than are the results of some of the attempts at architecture made by these smashers up of the styles. It is quite as essential that a building should be in key and tune, so far as style goes, as it is for the various instruments in an orchestra, that is to say, if there is to be any resultant pleasure to those who have an eye for colour or an appreciation for good composition and form. There is nothing more dangerous to architecture than this craving after something entirely original and new, and we are suffering almost as much from the unrest caused by it as from the lack of education to which reference has already been made. Some short time ago, when discussing the question of harmony in architectural design, a friend retaliated that he disagreed with me entirely, and pointed out that in the finest pieces of music discords were often introduced with great effect. My answer to that is, that these discords could only be used by the musical genius, and, as a matter of fact, it is believed are chiefly used by them to give additional value to the harmony which precedes or follows the discord. A similar discord may be, and often is, introduced by the architectural genius, but here again it is done to give some additional value to the surrounding work.

The argument is this, that music consisting entirely of discords cannot give pleasure to a sane and educated musician. Neither can a building consisting of numberless features out of harmony with each other satisfy the eye of an accomplished architect. The whole question may be summed up by stating that a genius may do daring things and be successful, where the mediocre person will ignominiously fail.

The moral which should therefore be pointed out is "Do not attempt to be too clever." The result of all these attempts at so much originality generally ends in but a poor mediocrity or something worse which ordinarily goes by the name of ugliness.

Well, now to return to the main subject

which it is my chief anxiety to lay stress upon, namely, the education of our students in architecture. This is probably one of the most important matters that we can possibly discuss. Some learned men have suggested that it is the public who need education in building and architecture, and not those who practise it as a profession; but my view is that it is the architect who needs looking after, for whatever may be the knowledge, and love, or desire on the part of the public for really fine work, it cannot be of much avail unless architects have the necessarily superior knowledge to satisfy the yearnings of those who wish for something better than what generally prevails. And besides, one's own experience of those of the public who practise amateur architecture is that they never know, and in fact cannot know, sufficient of the subject to justify them in directly giving instructions in building operations. It has been already pointed out that many of the public have a very keen appreciation for good work; the erection of a building is, however, much too complicated a business for any amateurs to ever gain a sufficient knowledge to justify them in being their own architect. Some of us have been told by a client as a preliminary when further building operations have been contemplated to his premises, that for certain buildings which are often pointed to with evident satisfaction, "I was my own architect for that." Well, gentlemen, it is perhaps needless to tell you that this information is generally needless, for the work usually proclaims that lack of knowledge which is the hall-mark of the amateur. On one occasion a client made use of this expression to me, and the quality of the work was surprisingly good. It was rather difficult to understand, but the secret came out when I asked the amateur architect who made the drawings: "Oh," said he, "Mr. So-and-So did that, but they simply embrace my own ideas." Possibly that may have been perfectly true, but nevertheless that amateur architect would not have had so good a result without the assistance of Mr. So-and-So, who must have very cleverly put those so-called "own ideas" in such a form that the builder was enabled to erect a very satisfactory piece of work. It occurred to me that this gentleman, who prided himself in being so clever when acting as his own architect, was very lucky to have found such an excellent ghost to do the actual work; particularly so when it is realised how scarce and difficult it is to find the genuine article.

It is no pleasure to speak to you in a disparaging manner, but it is advisable, especially on an occasion like this, to be candid and honest when speaking on a subject which is of the greatest importance to all of us. The regret with which it is said does not alter the fact, namely, that a very large proportion of architects' assistants cannot even draw decently, much less design a passable moulding or a creditable cottage. Surely there is something wrong in this. What good result can be achieved by such men in work like architecture, if they are incapable of even properly putting any ideas they may have in a sufficiently intelligible form for a tradesman or craftsman to be able to execute the work therefrom? As an opposite illustration, let me call your attention to those, the minority of students, who are capable draughtsmen; does it not occur to you that they are also the most capable designers as well? And is it not within your own knowledge that these men are those who have been enthusiastic workers in our Academy schools, Architectural Association classes, and our schools of art? It does not appear to me necessary to labour this matter, because it must be so well known to you. Therefore, why are there comparatively so few students from architects' offices in Leicester who attend here to improve their knowledge, and to gain that facility, power, and judgment which are so imperative for their work? Is it that students have recently received so much conflicting advice from various enthusiasts, one insisting that they must be first and foremost men of science, another that they must be artists pure and simple, and still another that they must be craftsmen and not draughtsmen; all this resulting in students giving up the whole thing in dismay at the multitude of advisers and the disparity of advice offered by them? Or is the reason to be found in that lack of interest and earnestness which are so absolutely essential before good work of any kind can be achieved? It is rather to be feared that the latter is more likely to be the correct interpretation of the reason why all

architectural students do not accept opportunities which are not only offered, but really pressed upon them in these days. Perhaps it ought to be pointed out—and, indeed, it is a pleasure to do so—that we in Leicester are not worse off than the profession in other towns and cities of a similar size.

Indeed, we are assured that the proportion of promising and industrious men is probably larger in our own town than in many other towns, so that the foregoing remarks may be considered as superfluous and possibly unjust. One is quite aware that we have a minority of young and rising men who have acquitted themselves admirably, and who doubtless will in the future do work of a highly creditable nature, and will help to make the Leicester of the future a more interesting city than the town of Leicester to-day. You will probably forgive me for mentioning as an instance the name of our friend Mr. Shirley Harrison, whose power as a designer and draughtsman is very great, and who a very short time ago came out the Ashpitel Prizeman, being the first man of his year at the Associate Examination of the Royal Institute of British Architects. And as another instance, it is a pleasure to mention the name of Mr. Albert Herbert, whose all-round knowledge and refined tastes are quite exceptional; he also distinguished himself at the same examination on a previous occasion by gaining the "Arthur Cates Prize."

There are others among us who have shown improving powers, and some who, Mr. Fletcher assures me, have unquestionable faculties which only need application on the part of the students to make real and rapid progress. But a regret remains, and that is the small proportion of the total number of architectural students who show that rare power and perception to which reference has just been made.

Probably some of you may say that all these exceptional students belong to that select class known as "the heaven-born genius," and indeed it may be admitted that they have some special brain faculties, but you may be quite assured that the most precious gift they possess is the aptitude for intelligent industry, which, properly applied, creates a love of fine work; and when once a student has arrived at the stage of having an appreciation of good work, it is fairly safe to conclude that he will in the future do creditable work himself. No man is actually born with a knowledge of architecture, painting, sculpture, or craftsmanship of any kind. And no man achieves success in any such work without a long and constant intelligent application.

Those students who either cannot, or will not, make the effort to attain a proper knowledge of their work by the necessary sacrifices which the process entails, should give up the idea of being architects or artists; and the sooner the better, not only for themselves, but for the rest of the world.

#### EXHIBITIONS AND SCHOLARSHIPS IN ART.

THE Board of Education have awarded Royal Exhibitions and Scholarships to the following teachers, students, &c.:

*Royal Exhibitions.*—Helen M. Pike, art student, Edinburgh; Arthur W. Pope, art student, Nottingham; Horace Wooller, art teacher, Brighton; Walter S. George, architect's assistant, Ashton-under-Lyne; Charles H. Eroughton, art student, West Bromwich; Richard R. Gauden, art teacher, Weymouth; James A. Stevenson, art student, Chester; Nathaniel Sparks, art student, Bristol; Frank Marlow, art student, Leicester; and James P. Samuel, lithographic artist, Aberdeen.

*Local Scholarships.*—Arthur E. Fowkes, art student, Leicester; Harold A. Rigby, art teacher, Preston; Harry C. Hall, art student, Sheffield; John B. Piercy, art student, Chester; Jessie Kilpin, art student, Leeds; Mary G. Tutin, art student, Nottingham; Frank Gatter, art teacher, London; Peter Mitchell, art teacher, Galashiels; Joseph N. Sanders, art student, Birmingham; Mabel Thatcher, art student, Bristol; Charles Haworth, art student, Liverpool; Ernest Collins, art student, West Bromwich; Ethel Cliff, art student, Leeds; William G. Spooner, art student, West Bromwich; John B. Godson, art student, Leeds; James I. Grant, art student, Aberdeen; Frederick N. Smith, art pupil teacher, Bridgewater; Ethel K. Pitt, art student, Bristol; Albert H. Greenfield, art teacher, Brighton; and Ellen Hill, art student, Bradford.

A Royal Exhibition is tenable for three years, and entitles the holder to free admission to the Royal College of Art, London, or the Metropolitan School of Art, Dublin, for the session of

about forty-two weeks each year, and during that time to a maintenance allowance of 25s. a week and third-class railway fare for one journey to and fro, each session, between the home of the exhibitor and London or Dublin. The Royal Exhibitions are held on the condition that the exhibitor regularly attends the course of instruction laid down for him, complies with the rules laid down for his guidance, and makes satisfactory progress. The allowance may be withheld or reduced in the case of a student who fails to attend as prescribed.

A Local Scholarship is tenable for three years, with a maintenance allowance of 20s. a year, at any School of Art under the Board which is open at least three days and five nights a week, and which will remit the fees for instruction of the holder. The scholar must attend a School of Art during at least forty weeks in the year for thirty hours each week, of which eighteen hours at least must be in day. The scholarship commences on the date at which the school where the scholarship is tenable re-opens after the summer vacation in each year. The maintenance allowance is paid quarterly, on the receipt of a certificate from the Master and Secretary of the School of Art that the scholar has attended regularly and pursued his studies satisfactorily.

### COMPETITIONS.

MARKET HALL, LLANRWST.—A competition for a new market hall, &c., at Llanrwst, in North Wales, has just been decided. The successful design is for a building of Penmaenmawr granite, relieved with Yorkshire stone dressings, and was sent in by Mr. E. Grubb, of South Shore, Blackpool, to whom has been awarded the premium of 20l. There were twenty competitors.

### RUSSIAN TIMBER TRADE.

THE question of the partial exhaustion of the timber supply is briefly and lightly touched upon in Mr. Consul Woodhouse's Report to the British Foreign Office on the trade and commerce of the Riga district. He remarks that one broad fact as regards the wood trade of the world in general is ever before us. It takes from sixty to seventy years to grow an average convertible tree, and two minutes to hew it down. Thus each year the supply of timber is diminished, the forest fringe recedes further and further from the ways and means of transport; each year the expense of working out the forests is increased by the extra distance the logs have to be carried. Then, owing to the nature and manipulation of the trade, consumption and supply cannot keep pace with each other; one is continually catching up the other, and the consequences are rises and depressions. But in the opinion of all who know anything about timber, and have studied the great question of supply, there must be a steady increase in the price of every description of wood goods, and each flood-wave of rising prices will attain a higher level than its predecessor. Even now (observes Mr. Woodhouse), at this moment of greatest depression and stagnation, prices are at a level which a few years ago would have been regarded as high. As far as the Riga sawing trade is concerned, the forests which furnish the timber are now so far away from the rivers which carry the logs that Riga cannot be supplied unless prices are fairly high. If 70 per cent. of the cost price of a log in Riga consists of the expenses incurred in bringing it down from the forests, it is clear that a reduction can only be made on the remaining 30 per cent. By these remarks the British Consul does not, he assures his readers, intend to imply that the supply of timber is reaching its end. There is still plenty of timber, but it is becoming comparatively so inaccessible that in many parts it can only be worked out when prices rule high. Higher prices will always render accessible for supply those forests which were not considered worth while to work at low rates. It is much the same, in fact, as with coal and the working of deeper levels. Reviewing the operations of last year and the first half of this year, Mr. Woodhouse recalls that the spring of 1900 opened with abnormally high prices for sawn timber, both red and white. Unfortunately, however, for the Riga sawmills, they possessed in the aggregate only about 35 per cent. of their usual first open water stocks. As soon as the fresh rafts arrived the buying of logs was very keen, and astonishingly high prices were paid for the raw material, and early in the season every sawmill was hard at work cutting night and day in order to take advantage of the high prices ruling abroad for sawn goods. A rapid rise of freights, however, came as an unpleasant surprise to many who had sold goods ahead *c.i.t.*, and a rate of 40s. was paid by sellers who had calculated on

chartering at 25s. This great rise in freights checked the flow of business. Riga shippers being afraid to go on selling *c.i.t.* and the extra rate of freight, added to the already abnormally-high *f.o.b.* prices of sawn goods, made buyers hold back from purchasing. By September the consumption abroad also seemed to fall off, and, although freights had begun to get easier, it became more and more difficult to sell goods except at a reduction in prices all round. Riga sawmill owners, having by this time bought heavily of logs at high prices, were disinclined to accept lower figures. They imagined that the slackening of prices was only temporary, and that it would be better to hold over their goods until the spring; but in this they made a mistake. In January of the present year they might have sold a large proportion of their stocks at a reduction of only about 10s. per standard on the spring prices of 1900, but they all held stolidly back. Unfortunately, the sellers of other wood-producing countries followed the same policy. They all had large stocks, and thus by their waiting they brought about a rout along the whole line. Consumption, instead of improving, became slacker, and meanwhile buyers had discovered that stocks abroad were heavier than they had been led to suppose. As spring came on and the time for shipping drew near, the mill-owners of all countries began to feel restless, for, contrary to their experience of previous years, they had sold nothing; they therefore began to approach the buyers. These, however, soon understood the position. They were being offered goods from all sides, and they either held back or offered much lower prices. Those of the sellers who accepted proved to be the luckier ones, for as spring advanced each sale was at a progressively lower rate, while the buyers, who had bought first, thinking they were doing well in getting their goods so much cheaper, soon found themselves at a disadvantage with their competitors who had waited. The consequence of all this is that prices have tumbled all round, and yet there is no large buying, for, seeing prices continually dropping, buyers have grown nervous; there seems to be "no bottom," and now they are only buying from hand to mouth. The position in Riga is that there are unusually large unsold stocks for this time of the year,\* and all who are able are still holding out, as they cannot bring themselves to face the loss which the selling-off at present low prices would entail. At least 90 per cent. of the mills are standing, most of which will probably remain idle until the autumn, as, by not adding to their stocks, they hope to dispose of what they have at better figures and stop the rout. The actual stock of sawn goods in Riga this last spring was barely an average one, and may be put down at 90,000 standards, against the usual 110,000 to 120,000 standards. In Sweden and other wood-growing countries, however, stocks were heavier. This year there will probably not be more than 10,000 to 17,000 log rafts floated down to Riga, against 21,000 to 22,000 logs last year, a decrease of 25 per cent. or thereabouts.

The exports of wood of all kinds from Riga during the year 1900 amounted to 46,550,000 cubic feet, value 1,500,000*l.*, as against, in 1899, 46,700,000 cubic feet, value 1,748,870*l.*

## Correspondence.

To the Editor of THE BUILDER.

### THE DOUBLE CHOIR OF GLASGOW CATHEDRAL.

SIR,—The interest and importance of the subject may excuse a few notes on the valuable review of my book, "The Double Choir of Glasgow Cathedral," in your number of the 14th inst. It is, I think, something more than "a very unlikely conjecture" that the church of Jocelin at Glasgow, so far as it had been carried out, was pulled down by Walter. We know that this church was under construction between 1180 and 1199, and that accordingly a large part of the existing structure has been attributed hitherto to the twelfth century. Your reviewer accepts, however, my ascription of this work to Bishop Walter (1208-1232) as having "much likelihood." But if the work is of the thirteenth century, how are we to account for the disappearance of Jocelin's building, with the exception of a few fragments that have been built into the walls of Walter's chapel, and what other conclusion can we come to than that the unfinished work of Jocelin was pulled down by Walter? The fact also that Walter should have used some of the worked stones of Jocelin's church in adjoining the temporary altar and shrine of Kentigern, if so much is admitted, is further evidence that the earlier building had to give place to the later. There are not wanting instances of unfinished and even of completed works of the eleventh and twelfth centuries that were pulled down soon after their erection to make way for larger structures in the newer style then in course of development. Willis states that Lanfranc's choir at Canterbury was pulled down

twenty years after its completion ("Canterbury Cathedral," p. 63). Viollet-le-Duc mentions that in France, at the beginning of the epoch of great cathedrals, the portions first constructed were sometimes pulled down to make way for still more magnificent projects ("Dictionnaire de l'Architecture," vol. ii. p. 284). Mr. E. S. Prior, at p. 70 of his recently published work, informs us that "the fabrics of most of the eleventh and twelfth century presbyteries have perished." The existing buildings, I think, demonstrate that in many cases the earlier work must have perished at the hands of the builders of the twelfth and thirteenth centuries! If it is the case that the unfinished choir of Jocelin was pulled down by Walter, it may be accepted, I think, as an incident in some measure characteristic of this particular period.

In quoting Viollet-le-Duc, to the effect that "all the great cathedrals of central France were begun, and to a large extent carried out, between the years 1180 and 1230," I have perhaps somewhat distorted his meaning. By way of amendment I cite the passage referred to in his own words: "La période pendant laquelle les grandes cathédrales eussent dû être conçues et élevées, celle pendant laquelle leur existence est pour ainsi dire un besoin impérieux, l'expression d'un désir national irrésistible, est comprise entre les années 1180 et 1230" ("Dictionnaire de l'Architecture," vol. ii. p. 284). It is, of course, true that some of the extended cathedrals were founded before 1180, but the great wave of enthusiasm for cathedral building in central France is limited, according to Viollet-le-Duc, to sixty years.

The statement that the ridge-rib is never found in the earlier vaults may require some qualification, but the case of Ripon transept is in some measure covered by the reference on p. 43 to occasional instances "of partial anticipation of a still undeveloped tract." The ridge at Ripon is scarcely entitled to be called a rib; it is rather a slender ridge moulding, decorative in purpose and quite unlike the constructionally evolved ridge-rib of the thirteenth century. Such as it is, it is of great interest, but it does not touch an argument founded on the introduction of the ridge-rib into the vaulting system.

The suggestion that the tierceron was introduced to support the ridge-rib, as well as to help to carry the infilling, is not mine, but is given by Viollet-le-Duc ("Dictionnaire de l'Architecture," vol. iv. p. 117). In view of the number of dislocated ridge-ribs that we find, it is, I think, well founded.

The particular type of vault that I refer to as having been introduced about 1270 is the one with abbreviated ridge-ribs in both directions, while the nave vault at Lincoln has, I think, a continuous ridge in one direction. Probably I have not been sufficiently explicit on this point. It may be added that the dates in connexion with the development of vaulting are in some degree tentative. I know of no authoritative guide on the subject, and certainly make no claim to lay them down from my own knowledge or observation.

I agree with your reviewer that the carving of the capital of Jocelin's pillar (fig. 11) might be of the twelfth century, and have said so in the footnote on p. 33. I think, however, that it is more probably of the early part of the thirteenth century. So far as my observation goes, this type of carving is usually associated with mouldings of a later character and a capital of different form from the one in question. I shall hope for further assistance in determining the interesting point whether this capital, apparently of the twelfth century, owes its carving to the date of its re-erection in the early part of the thirteenth century or whether it was originally carved as we see it.

I have not stated that the materials of the clear-story were raised by a screw-jack. All that I know is that the larger stones were grappled by a "lewis," similar in principle to those in use to-day, and that they were then raised vertically by means of a mechanical appliance of some kind—probably of the windlass and pulley species. The screw-jack is figured as being the most powerful engine for raising loads that was known to the builders of the thirteenth century.

I have made no attempt to treat the cathedral exhaustively, or to correlate its architecture with any particular school of English Gothic. "Plan, base design, piers, capitals, bases" are referred to incidentally, but my main purpose has been to show that in the vaulting we have a master-key which opens up to us much of the history and chronology of the building. It reveals the successive changes of plan of the middle vault; it affords some insight into the mind of the designer at each stage, and enables us to follow the steps by which the result as we now see it has been attained. I join in the hope that my work may be tested by the careful examination of others, and its deficiencies by this means amended. D. L. WATSON.

BRICKLAYING AND BRICKCUTTING. By H. W. Richards. (Longmans, Green, & Co.)

REPORT OF THE CHIEF LABOUR CORRESPONDENT ON STRIKES AND LOCK-OUTS OF 1900 (Eyre & Spottiswoode, 10s.6d.)

\* Mr. Woodhouse's Report is undated, but it reached the Foreign Office in London on August 16, 1901.

The Student's Column.

GAS AND GAS FITTINGS.

13.—INCANDESCENT GAS BURNERS.

**B**URNERS WITH CHIMNEYS.—In this country all public gas supplies consist of illuminating gas, and in order to produce a non-luminous flame which will not deposit soot upon the mantles, the gas is consumed in "atmospheric" burners of the Bunsen type. The gas under pressure is made to issue in one or more fine jets in an upward direction into a vertical tube having holes formed in its sides near the base. The gas in its uprush draws air also into the tube through the side holes, and a mixture of air and gas flows to the head of the burner, and when ignited burns with a non-luminous flame. The efficiency of the flame so obtained depends upon the proportion of gas to air in the mixture, and the completeness of the mixing operation.

In the earlier forms of Welsbach burners the proportion of air drawn into the tube was not sufficient to produce a non-luminous flame of the required shape unless a chimney were used with the burner to create an updraft, and thus bring a strong current of air in contact with the surface of the mantle and flame. When the glass chimney supplied with burners of this description (fig. 29) is removed from the burner, the gas cannot obtain sufficient air for complete combustion until it has escaped through the network of the mantle, and a large proportion of the heat which should be utilised in bringing the mantle to an incandescent condition is lost.

The proportion of air required for combustion of the gas varies with the richness of the gas in illuminating hydrocarbons, and consequently the length of the glass chimney should be varied in accordance with the quality of the gas to be consumed. An 8-in. chimney is of sufficient length for use with London 16-candle gas, while for 14-candle gas a 6-in. chimney would be suitable, but with the 20-candle to 26-candle gas supplied in some parts of the North of England and Scotland a 10-in. or 12-in. chimney is required.

**Effect of Dust or Dirt on the Burners.**—In the course of a few weeks a considerable quantity of dust from the mantle, or from other sources, accumulates on the wire gauze of the burner, and on the gas nozzle near the air holes. The presence of this dust often reduces the light emitted by the mantle by fully 50 per cent. To remove the dust, lift the head of the burner off the Bunsen tube without removing the mantle from the head. Blow gently up the tube of the part removed in order to blow the dust off the gauze, and then unscrew the Bunsen tube from the nozzle from which the gas issues and remove the dust from the nozzle also. Then replace the parts in their original positions and relight the burner. Whenever a new mantle has to be placed on the burner, the latter should first be freed from dust.

**Deposition of Soot upon Mantles.**—The deposition of patches of soot upon incandescent mantles is caused by imperfect combustion of the gas. Imperfect combustion is usually due to the burner being in a dirty condition, and consequently producing a flame having more or less luminosity. Even a very feebly luminous flame will speedily produce a deposit of carbon upon the mantle. By-pass burners in which a small luminous flame is used to ignite the main flame without

necessitating the use of a match are often rejected on account of their liability to blacken the mantles and to be extinguished by draughts. The small by-pass flame is often of sufficient size to come in contact with the mantle and to leave a black patch upon it. When burners without governors are used it is often impossible to avoid altogether this blackening, because the by-pass must pass sufficient gas to prevent the flame being extinguished when the pressure falls to its lowest point, and even when adjusted to the smallest dimensions under the lowest pressure the flame becomes sufficiently elongated when the pressure increases to its maximum point to come in contact with the mantle and blacken it. A useful by-pass device which gives two small non-luminous flames situated on the sides of the socket which receives the rod used to support the mantle, and which are not easily extinguished, has recently been invented by Mr. A. Clarke. It is a marked improvement upon burners having a luminous by-pass jet, but has not yet come into general use.

**Chimneyless Incandescent Burners.**—In 1898 the Welsbach Company placed upon the market a new burner for incandescent gas lighting which did not require a glass chimney. This burner is known as the "Welsbach-Kern" burner, and has attained great popularity. Bandspeht had introduced a chimneyless burner a few years earlier, which was largely used for public lighting, but was not so serviceable for domestic lighting as are the small sizes of the Kern burner. The use of burners without chimneys is made possible by effecting a thorough mixing of the gas and air in the most efficient proportions before the mixture reaches the point of ignition. The light efficiency per unit of gas consumed obtained from the mantles

until the noise is no longer observable; but in practice this procedure is always found to produce an immediate diminution in the intensity of the light emitted. The average consumer will always adjust his burner to give the maximum amount of light, without regard to the gas consumption.

The effect of slightly increasing or decreasing the proportion of air to gas in the mixture issuing from the burner is shown in the following table published by Professor Lewes, who made a series of experiments with a chimneyless burner. The gas supply was maintained at a constant rate under a pressure of 1½ in., and the air supply was regulated as required. The gas used for the experiments was 16-candle London gas:—

Condition of Flame.	Rate of flow.		Ratio.		Candle-power per cubic ft. of gas.	Temperature of mantle & in. above burner-head.
	Gas, c. ft.	Air, c. ft.	Gas.	Air.		
Under aerated...	4.5	10.0	1	2.2	14.4	1885 C.
Best aerated...	4.5	12.75	1	2.75	20.0	1918 C.
Over aerated...	4.5	15.95	1	3.4	17.7	1905 C.

It was found by experiment that 1 volume of the gas required 5½ volumes of air for complete combustion, and it is therefore evident that the best results are obtained with 16-candle gas when half the total quantity of air required for combustion is mixed with the gas before the point of ignition to produce the inner zone of flame, while the second half enters into combination after ignition of the gas and produces the outer zone of flame in which the mantle is suspended.

**High-pressure Burners.**—By increasing the pressure of the gas supplied to the burner and increasing the consumption, it is found that a higher illuminating value per unit of gas consumed can be obtained than with low-pressure gas, and for street lighting with lamps of high candle-power high-pressure burners are being extensively adopted. Most of the high-power burners can be used without chimneys, but require a glass guard to protect the mantle from wind and the gaslighter's torch.

**The Welsbach-Kern High-pressure Burner.**—This burner closely resembles the Kern burner used with gas under ordinary pressures, and can readily be taken to pieces for cleaning (fig. 30). The burner is intended to be used with gas supplied under a pressure of 8 in. to 10 in., and is said to give a light of 30 to 35 candles per cubic foot of gas consumed per hour, as compared with a light of 20 to 25 candles per cubic foot obtained with the ordinary Kern burners. With a consumption of 10 cubic feet of gas per hour the high-pressure Kern burner is said to yield a light of 350 candle power.

At present gas is commonly supplied under

Fig. 29.—Welsbach "C" Burner, with Chimney.

Fig. 30.—Welsbach-Kern High-pressure Burner.

a. Burner complete. b. Burner with mantle removed. c. The detachable parts of the burner; viz., outer cone, Bunsen tube, and inner cone.

when these Kern burners are used is found to be considerably greater than that obtained from the older forms of chimney burners; but owing to the hissing noise emitted by the chimneyless burners many consumers still prefer the less noisy chimney burners. It is stated that the production of a hissing noise is an indication that an excessive volume of gas is being consumed, and that the gas cock should be adjusted

a pressure of less than 3 in., and for high-pressure systems it is necessary to use compressing apparatus to raise the pressure to 10 in. or 12 in. When calculating the cost of a high-pressure system of lighting the cost of the compressing apparatus must be included.

There is, however, no reason why the gas companies should not be called upon to increase the pressure of the public supply to

to in., since with the aid of inexpensive governors the consumer can readily reduce the pressure to any desired point; and it has been repeatedly demonstrated that by the use of suitable mains and fittings gas can be distributed under this comparatively high pressure without undue loss by leakage.

**The Self-intensifying Kern Burner.**—The Welsbach Company claim that results almost equal to those obtained with high-pressure gas can be obtained with gas under low pressure when consumed in the Self-intensifying Kern burner. This burner (fig. 31) is intended for use in the lighting of streets or industrial works. It is a Kern burner so modified that with the comparatively large gas consumption of 10 cubic feet per hour the head of the burner is sufficiently small to fit into a No. 4 high-pressure Kern mantle, a slight alteration being

Fig. 31.—Self-intensifying Kern Burner, with "Shadowless" lantern.

made in the internal construction of the burner head. In the upper part of the lantern in which the burner is placed is a metal chimney from the lower end of which is suspended a glass chimney. The glass chimney surrounds the mantle, and the so-called "self-intensification" is due to the draught produced by the elongated chimney thus formed. It is claimed that a light of 300 candles is obtained with a consumption of about 10 cubic feet of gas per hour.

**Compressing Apparatus.**—To raise the pressure of the gas supplied to the burner to the 10 or 12 in. required for high-pressure gas lighting many devices have been adopted. In the Scott-Snell lamp the waste heat from the burner is employed to actuate a novel compressing apparatus which is located a short distance above the mantle; and in other systems, motors actuated by water supplied from the street mains are used. In the latter case the cost of the water must be taken into consideration when estimating the cost of the light, and it is usually found with all high-pressure systems that the mantles have a shorter life than when used with gas supplied under low pressure.

**Anti-vibration Devices.**—When incandescent gas lights were first used for street lighting it was found that the number of mantles broken by vibration and shock caused by the passage of heavy vehicles over the roads was so great as to almost prohibit their employment in the main thoroughfares. A number of anti-vibration devices were, however, soon invented and

placed on the market, and some of these are now extensively used. They are mostly of simple construction and depend upon the interposition of some description of spring between the burner and the gas supply pipe to which it is attached. Those which depend upon the elasticity of india-rubber should be avoided, since this material perishes with comparative rapidity, and is affected by changes in the temperature of the atmosphere.

**Advantage of Incandescent Lights over Luminous Flames.**—The principal objections to the use of gas are:—(1) The heat generated is out of proportion to the light obtained; (2) The flames are usually more or less smoky, especially in draughty situations, and quickly blacken the walls and ceilings; and (3) The withdrawal of oxygen from the air and the formation of carbon dioxide by combustion of the gas is prejudicial to health. The luminous flames most commonly used are flat flames or argand flames, burning not less than 5 cubic feet per hour, and having an illuminating power of about fifteen candles. When these are substituted for incandescent burners, it is usual to introduce a burner giving a light of sixty candles for a gas consumption of 3.5 cubic feet per hour for every 15-candle flame previously in use. Consequently, a better light is obtained, the gas consumption is reduced 30 per cent., less heat is generated, and, owing to the use of a non-luminous flame as well as to the reduction in the temperature of the air and products of combustion rising from the burner, the ceilings are less rapidly blackened.

On the other hand, the mantles for which the high retail charge of 7½d. is at present made in this country require renewing periodically, and in some households are a constant source of trouble.

Until mantles less fragile than those at present manufactured are introduced the incandescent system cannot be regarded as altogether satisfactory, but great progress has been made since 1886, when Welsbach's earliest mantles were placed on the market, and there is every reason to believe that other improvements equally important may be made within the present decade.

**Avoid Powerful Lights of Small Area.**—The use of intense lights of small area should be avoided as much as possible in all systems of lighting. A 60-candle power light emitted from an area of 1 in. is more irritating to the eyes, and less serviceable for illuminating purposes, than a light of the same total intensity emitted from an area of, say, 6 in. Two No. 1 Welsbach-Kern burners fitted in suitable positions with good diffusive shades will effectively illuminate a dwelling-room of ordinary size (say, 22×15×10 ft.), although each burner consumes only 1.5 cubic feet of gas per hour, and has an illuminating power of probably only twenty-five candles; whereas a single burner having an illuminating power of seventy candles, and used without a shade, will be found to brilliantly illuminate one portion of the room while another part is left in comparative darkness. The fact that the two small burners have a total illuminating power of only 50 candles for a consumption of 3 cubic feet, while the larger burner gives a light of 70 candles with the same rate of gas consumption, does not necessarily prove that it is better to use the single burner instead of the two small burners. The electric arc light has a high illuminating power, but no one would select it for the illumination of dwelling-rooms, since it possesses in a marked degree the feature which it is most desirable to avoid,—i.e., it emits an intense light from a very small light-emitting surface.

#### GENERAL BUILDING NEWS.

**PRIMITIVE METHODIST CHURCH, CHESTER-LE-STREET.**—The foundation-stone of the new Primitive Methodist Church has just been laid at Chester-le-Street. The new church has been designed by Mr. J. W. Taylor, architect, of Newcastle, and will be built by Messrs. Davison & Bolam, contractors.

**UNITED METHODIST FREE CHURCH AND SCHOOLS, FENTIMAN-ROAD, SOUTH LAMBETH, S.W.**—The opening ceremony of these buildings took place recently. The buildings, which have been erected on a prominent corner site, are designed in Perpendicular Gothic, freely treated. The facings are of red bricks and the dressings of Bath stone. The roofs are covered with green slates. The church, school, and church-parlour gables all face Fentiman-road; the school, however, is set back to give prominence to the church. A square tower, containing angle entrance and staircase to the small end gallery,

forms a prominent feature at the corner of the block; this is terminated by a small lead-dressed spirelet and vane. An octagonal narthex is a feature in front, and this contains the two main entrance-doors to the church. The church consists of nave, transepts, and apse, with side organ-chamber opening by arches into both apse and church. Accommodation for the choir is provided in the apse. A traceried and carved stone pulpit and dwarf screen on either side extending across the apse are the gift of a member of the church. A large platform, furnished with carved and traceried oak communion table and chairs, is placed in front of the pulpit and is surrounded by an oak handrail supported by carved oak newels and wrought-iron and copper standards. The seating is circular on plan. The apse arch is moulded Bath stone, supported by shafts with carved caps. The transept arches are carried on dwarf Irish green marble columns with stone caps and corbel bases. The accommodation of the church is for about 650 persons. A large schoolroom (which is arranged to be divided off into a number of classrooms), with gallery around, with wrought-iron grille in front, is provided, also church-parlour, vestry, ladies' working-room, library, infants' room, kitchen, with lavatories, &c. The whole block is lighted by electricity, the fittings being of wrought-iron and copper work. Low-pressure hot water has been adopted as a means of heating the buildings. The cost of the entire block is about 7,000*l.*, and has been carried out by Mr. J. O. Richardson, Peckham, S.E., from the designs and under the superintendence of Messrs. George Baines & R. P. Baines, architects, Clement's-inn, Strand, W.C.

**CHURCH, PERTH.**—A new church has been erected on the site of the old one by the congregation of St. Paul's United Free Church. In the front elevation the principal feature is the end gable of the church, with two four-light windows with cusped and panelled heads in the lower stage, and a large five-light window with traceried head and deeply-moulded joints lighting the gallery. The gable flanks are enriched with panelling, and the apex has an arched cusped panels with a central niche, over which a floriated cross forms the terminal feature. To the left of the main gable is a projecting stone porch, with wide moulded arches forming the principal entrance, and to the right another doorway serves as exit from the gallery. The ladies' room and session-room form a two-story block to the left of the main entrance. The side elevations are simply treated with two tiers of triplet windows, the upper ones having trefoil cusped heads under an arch. Internally the church is divided into nave and side aisles by moulded columns and arches of wide span. The nave ceiling is semi-octagonal in form, divided into bays by arched timber ribs. Over the side aisles the main couplers are also shown and filled with ornamental timber cusping. The church is planned with side and end galleries, but the side galleries are narrow and recessed at the columns. The total number of sittings provided will be 800, and the estimated cost is within 4,000*l.* The architect is Mr. John B. Wilson, Glasgow, and the works have been carried out under his instructions by the following contractors:—Mason, Mr. A. Beveridge; joiner, Mr. William M'Quibban; slater, Mr. D. M'Lauchlan; plumber, Mr. James M'Leish; plasterer, Mr. John Peebles; glazier, Mr. C. Alexander; electrical appliances, Mr. M'Leish; and Mr. Thomas L. Kay is clerk of works.

**WESLEYAN CHURCH, TOTNES.**—A new Methodist church and school were opened in Fore-street, Totnes, on the 10th inst. The building is of limestone, with Portland stone facings, and is entered over a flight of granite steps. In the south-east corner there is a tower with a short turret. New schoolrooms have also been built on the site, and were opened about a year since. The aisles are paved with wood blocks, and the seats are made of pitch-pine. The windows consist of stained glass. Messrs. Reeve, Son, & Full were the contractors, and Messrs. Bridgman, of Paignton and Torquay, were the architects. The cost of the building, including the purchase of the site, is about 3,000*l.*

**UNITED METHODIST FREE CHURCH, WESTCLIFF-ON-SEA.**—The foundation-stone of this building was laid on the 21st inst. The church is Late Perpendicular Gothic in style, freely treated, and is faced with red bricks externally, the dressings and tracery being of white Costessey work. The roof is covered with green slates. The main gable is flanked on the one side by a dwarf octagonal turret and on the other by a bold square tower, the latter terminating in a spirelet. The church is designed for future deep double transepts, but these are at present only to be erected to a depth of a few feet. A large school and classrooms are provided for in the future. The present portion is being erected by Messrs. Battley, Sons, & Holmes, Old Kent-road, S.E., and the cost amounts to 2,150*l.* The architects, whose designs were accepted in a recent competition, are Messrs. George Baines & R. P. Baines, Clement's-inn, Strand, W.C.

**BAPTIST CHURCH, LEWIN-ROAD, STREATHAM, S.E.**—The tender of 3,037*l.*, submitted by Messrs. W. Johnson & Co., Wandsworth, has been accepted for the erection of this building. A square tower and spire above form a feature of the front elevation. The building is faced with red bricks, and the dressings are of white Costessey work.

The roof is to be covered with green slates. The architects, whose designs were selected in a competition held some years ago, are Messrs. Geo. Baines & R. P. Baines, Clements-inn, Strand, W.C.

**CHURCH, NEWTON, OYSTERMOUTH.**—The foundation-stone of the proposed new Church of St. Peter, at Newton, Oystermouth, was laid recently. The proposed church is eventually to seat 600 persons, and provision is now being made for 400. The total cost will be about 6,000l. Mr. Bruce-Vaughan is the architect, and Mr. Howells, Cardiff, the contractor.

**PROPOSED ENLARGEMENT OF FISHPONDS CHURCH, BRISTOL.**—It is proposed to enlarge the parish church of Fishponds. The enlargement, if carried out, will provide additional seats for 271 persons, at a cost of 1,700l. Plans have been prepared by Mr. E. H. Lingens Barker, architect.

**BOARD SCHOOLS, GLOUCESTER.**—The new Hatherley-road Board School, intended for the Lower Barton-street district, was opened on the 16th inst. The schools have been erected by Messrs. J. Gurney & Sons, of Gloucester, under designs and under the superintendence of Mr. Alfred J. Dunn, on a plot of land about 2½ acres in extent, at a total cost, including playgrounds, playsheds, fence walls, caretaker's house, &c., of 11,548l. 10s., the accommodation being for 993 children.

**INFANT SCHOOL, FRASERBURGH, ABERDEEN.**—A new infant school, erected by the Fraserburgh School Board, to accommodate 600 scholars, was opened on the 18th inst. by Lord Saltoun. The school is designed by Mr. A. Marshall Mackenzie, A.R.S.A., Aberdeen, and is estimated to cost about 6,000l. when completed. The school is built on a site over two acres in extent, at the west end of the hall at the corner of Victoria-street and Winton-street. It is a one-story school, the buildings being about 140 ft. in length and 70 ft. deep. The design provides ten classrooms, a hall, teachers' rooms, and cloakrooms for the children. The central part of the building is the hall, 85 ft. long by 21 ft. wide, while to the rear are built out, close together, six of the classrooms, each under a separate roof. Four of these rooms, each 21 ft. by 25 ft., extend the same length as the hall, the other two at either end are larger rooms, 21 ft. by 25 ft., and the structure of them is brought forward by wing blocks which provide other four classrooms, one at either end, in line with the hall, 21 ft. by 25 ft. and 21 ft. by 21 ft., and the other two in front, 20 ft. by 25 ft. and 16 ft. 6 in. by 20 ft. The space between these two latter, which project several feet outwards, and which form the entrance to the school, is utilised for the cloakrooms and teachers' retiring-rooms. The school is built of a light grey-coloured stone from the Peathill Quarry, near New Pittisligo, the front and east side being of dressed masonry, and the back and west side of ashlar work. The flooring and wall linings are of pitch-pine, the inside doors and all finishings of American yellow pine, and the structural work of Swedish redwood. The classrooms afford accommodation for from fifty to sixty scholars each, who will be on raised galleries. Each of the classrooms is provided with a fireplace and ventilated on the Boyle system of ventilation. There is extensive playground accommodation, at the north end of which is a stretch of shelter sheds, with latrine conveniences built of enamelled brick. The contractors for the work are:—Mason, Mr. William Davidson, New Pittisligo; carpenter, Messrs. Brebner & Jenkins, Fraserburgh; plumber, James Reid, Fraserburgh; slaters, Messrs. Alexander Wiseman, Fraserburgh; painter, Messrs. Mitchell & Mitchell, Aberdeen.

**FREE LIBRARY, GRANGETOWN, CARDIFF.**—A few months since the first of the sectional lending libraries of Cardiff was opened in new buildings in Splottland. The second one was declared open at Grangetown a few days ago, and the third is fast approaching completion at Roath. The new library at Grangetown is situated on the junction of Clive-street and Redhaver-street. The architect was Mr. E. M. Bruce-Vaughan, whose design was selected in an open competition. The building is of red brick with stone facings. The contractors were Messrs. D. Thomas & Son, and Mr. Tom Taylor was clerk of the works.

**COTTAGE HOSPITAL, EBBW VALE.**—A cottage hospital for accident cases has been erected at Ebbw Vale, at a cost of over 2,000l. The architects were Messrs. Lansdowne & Greggs, Newport. Messrs. S. T. Davies & Sons, Ebbw Vale, being the contractors. The building is situated near Hillside House. The ground floor contains the matron's suite of rooms, entrance hall, receiving room, and operating theatre. The floor is mosaic, and the walls of adamant cement. The second floor contains a main ward with five beds and a cot, No. 3 Ward with four beds for more serious cases, and a special ward with one bed. There is also a day room for convalescents, opening out by means of French windows to a large verandah. The second floor also contains a bathroom, kitchen, lavatories, &c.

**ASYLUM, KINGSSEAT, ABERDEEN.**—The foundation-stone has just been laid of the hospital at Kingsseat, forming part of the asylum buildings for the Aberdeen City District Lunacy Board. The extent of ground set apart for the asylum buildings, including cricket and recreation grounds, is about 40 acres. The plans were entrusted to Mr. A. Marshall Mac-

kenzie, A.R.S.A., architect, Aberdeen. The ground is laid out in three sections. In the first place, what may be termed the general section consists of the administration building, kitchen, and stores, laundry, steward's house, hall, medical superintendent's house, conservatory, gardener's and engineer's lodges, &c. Then the second section is that devoted to industrial work. It consists of what are termed colony villas, two for male patients, accommodating respectively forty-two and thirty-two persons each; and two villas for female patients on an exactly similar plan and with similar accommodation. The female colony is placed on the east of the administration block, and the male to the west of these buildings, while at a convenient point between the two villas for male patients are the workshops, where those who are physically fit will be employed in occupations suited to their skill and capacity. On the other hand, the villas for the female patients have been erected not far from the laundry, where, as well as in the kitchen, a number of the patients who are capable will be employed in useful occupations. The villas are comfortable buildings of two stories. On the ground floor of the villas for females there are a kitchen, dining-room, dayrooms, bathroom, with stores, &c. The first floor is entirely devoted to dormitories, with two or three rooms for special uses. The same arrangement applies to the villas for male patients, which are each under the charge of a married caretaker, who has two rooms allotted to his use. Coming to the medical section, the principal building is the hospital, which is of two floors, but a second story is planned to be erected over the part of the hospital devoted to administration purposes. On the ground floor, on one side, are three large dormitories and a dayroom for female patients, and exactly similar accommodation on the opposite side of the block for male patients, and there are single rooms off the dormitories attached to all the wards, which will be used for special cases. An isolation ward will also form part of the plan, with accommodation for about four male and four female patients in each. The centre building of the block consists of medical superintendent's rooms, waiting-rooms, and admission-rooms. On the upper floor is accommodation for nurses and doctors during the day, consisting of parlour or sitting-room, bathrooms, &c. The dormitories are ventilated on the Plenum system. On either side of the hospital there are observation villas, one for male and the other for female patients, who are provided to the number of thirty-five in each building. On the lower floor of each are dayrooms, dining-rooms, kitchen, and other accommodation, and on the floor above are dormitories and single rooms. In addition to all the accommodation described there are four closed villas, two for male and two for female patients, who require, from the nature of their cases, special treatment and supervision. For the females the villas accommodate respectively thirty-five and twenty-seven patients each, and the villas for males are substantially the same. The recreation hall, which occupies a prominent position on a circular piece of ground near the centre of the asylum area, is intended to give accommodation for 400 persons. For the nurses of the institution special provision is made in what may be termed the nurses' home, fitted up with comfortable bedrooms. Among the buildings on which substantial progress has been made is the power house, laundry, and kitchen administration block. For the hospital the whole of the excavations are finished. The upper floor is now being prepared rapidly under the superintendence of Mr. Alex. Souter. Roughly speaking, the cost of the property, including the water rights and the whole of the buildings, amounts to over 70,000l. The contractors and the amount of the contracts are:—Mason work, Mr. Edgar Gauld, 26,083l.; carpenters, Messrs. Hendry & Keith, 10,526l.; slaters, Messrs. Adams & Co., 2,521l.; water, Messrs. Dalziel & Sons, 3,784l.; ironwork, Messrs. Grant & Co., 1,511l.; plumber, Mr. A. B. Robertson, 6,748l. The plaster-work has not yet been contracted for.—*Aberdeen Journal*.

**HOSPITAL EXTENSION, SALFORD.**—The Mayor of Salford opened on the 18th inst. two new pavilions which have been erected at a cost of 20,000l. as an extension of Ladywell Sanatorium. Built from the design of Mr. Henry Lord, the two pavilions are provided with eighty beds. The chambers, apart from the wards, include a "sun room" and a retiring hall.

**ARTISANS' DWELLINGS, BRIDE'S ALLEY AREA, DUBLIN.**—The work of constructing suitable residences for the artisan classes in this long-neglected quarter of old Dublin is proceeding with truly satisfactory rapidity under the personal supervision of the City Architect, Mr. C. J. MacCarthy. At present the first section of dwellings, comprising nine separate blocks, and containing in all seventy-two tenements, is rapidly approaching completion. The contract for this section of the work is upwards of 17,000l. The second section of the building operations is also well advanced, the walls being 15 ft. over the ground. This section comprises eleven blocks, containing sixty-six separate tenements or flats, several of these being intended for the use of the better class of artisans. Some of them will be three-roomed, and will, it is expected, readily let at 3s. to 6s. per week, while others will be two-roomed, with a probable rent of 3s. 6d. to 4s. 6d. per week; but all, whether

two- or three-roomed, will be self-contained. The cost of this section will be about 15,000l. or 32,000l. for both. Mr. James Donovan, of Harcourt-street, is the contractor for both sections. When all is completed and the 138 tenements fully occupied, accommodation will be available for some 700 persons, allowing five to each family, and the Bride's-alley area will have undergone a wonderful change from its former dreadful condition. The third and concluding section in the same area has not yet been begun, but will be commenced in due time.—*Irish Times*.

**TECHNICAL DEPARTMENT, MECHANICS' INSTITUTE, PUDSEY.**—The new technical department of the Pudsey Mechanics' Institute has just been opened. Mr. Herbert Hodgson, of Pudsey, is the architect. The eight classrooms, two on each floor, which form the principal block of the new building, have a turreted gable facing Waver Green, where there is a separate entrance. All the windows in the staircases and landings are stained. The classrooms themselves are inter-communicating on each floor. All the heating is done by low-pressure hot water. The two large classrooms in the basement will be used as workshops, and the old tearoom on this floor has been enlarged so as to be available for use as two classrooms. Altogether, this and the extension generally will provide accommodation for 600 students over and above those for whom room is found in the older premises. Lavatories and cloakrooms are provided on each floor.

**COTTAGE HOMES, CULCHETH, LANCASHIRE.**—On the 10th inst. the chairman of the Salford Board of Guardians laid the foundation stone of cottage homes which the Board is proceeding to construct at Culcheth for children. Various sites in Lancashire and Cheshire were visited within a radius of twelve miles. Twiss Green, near Culcheth was eventually decided upon, and 45 acres of land were purchased for 4,500l. The Board appointed Mr. H. Lord as their architect, and his plans were finally adopted. The provision made comprises eleven semi-detached houses, accommodating twelve children each, with rooms for the foster mother. There are also two single houses accommodating twelve each, and making the total accommodation 388. There will be an infants' school and a mixed school to accommodate 300 boys, girls, and infants, while the hospital will accommodate sixteen children and the requisite staff. The administrative block includes workshops, bakery, laundry, bandroom, and swimming baths, and an electric light installation. A superintendent's house is provided. The estimated cost of the work, including building and furnishing is 53,711l. There will be playgrounds, and the elder boys will be taught various trades and the girls instructed in sewing and housework.

**WORKMEN'S DWELLINGS, BRISTOL.**—From the annual Report of the City Engineer's department of the Bristol Corporation we learn that workmen's dwellings are being erected, in accordance with the requirements of the Local Government Board, for the purpose of rehousing those persons whose dwellings have been pulled down under various schemes of street improvement. Four sites have been selected, all in densely-populated districts, and sixty dwellings are in course of erection. The dwellings are divided into two classes—a first-class house contains a living-room, 14 ft. by 13 ft. 10 in. by 8 ft. 6 in.; two bedrooms, average size respectively, 14 ft. by 8 ft. by 8 ft. 6 in., and 9 ft. 3 in. by 9 ft. 6 in.; wash-house, 8 ft. by 4 ft. 6 in. by 8 ft. 6 in. Maximum number of persons, five. The second-class houses contain living-rooms, 14 ft. by 13 ft. by 8 ft. 6 in.; bedrooms, 12 ft. by 9 ft. 6 in. by 8 ft. 6 in.; wash-house, 8 ft. by 4 ft. 6 in. by 8 ft. 6 in. Maximum number of persons, three. The following are the sites upon which the various dwellings are being erected—viz., Chapel-street, St. Philip's, fourteen first-class, ten second-class; Bragg's-lane, St. Jude's, six first-class, four second-class; Mill-pond-street, Baptist Mills, sixteen first-class, four second-class; Mina-road, two first-class, four second-class. The buildings are of red brick, and the roofs are covered with double Roman tiles. The tenements are built in pairs, one situated on the ground floor, and the other on the first floor. Those on the ground floor are approached direct from the street, but those on the first floor from an iron verandah, 3 ft. wide, which runs the whole length of the building, and is reached from the street by a wide, open fireproof staircase. The living-rooms are well lighted, and provided with an open kitchen grate with oven. Each bedroom has a fireplace fitted with a mantel register grate. In the wash-house are a boiler and small coal cupboard. The floors are of cement concrete, floated up to a smooth face. The dwellings on the ground floor have a back as well as a front entrance, but those above can only be approached from the verandah before referred to. At the back of each block of tenements is a spacious yard laid with tar paving, and is available for the use of all persons occupying the dwellings. Galvanized-iron ash-bins are provided for general use. The drainage of the buildings has received special attention, and each pair of tenements has an intercepting chamber between it and the main drain. The drains are ventilated throughout.

**COLLEGE, SCARBOROUGH.**—The new college at Scarborough, which has been erected on the Waponaess Estate, South Cliff, has just been

opened. The buildings include a schoolroom 54 ft. by 24 ft., six classrooms, reading-room, dining-hall to seat 120 boys, covered playground, and cycle-house, dark-room for photographers, four large dormitories, ten small bedrooms, sick-rooms, lecture-hall for science teaching, preparation room, and large chemical and physical laboratories. The total cost of the building apart from the furniture has been about 13,000l. The architects are Messrs. Hall, Cooper, & Davis, of Scarborough and London, and the contractors are as follows:—Mr. W. Overton, brick, stone, and plaster work; Mr. G. Scales, carpentry and joiner work; Messrs. Appley & Brogden, ironwork; Mr. G. F. Wells, plumbing work; Mr. Joseph Hargreaves, tiles; Mr. Thomas Fidler, painting; Mr. H. C. Febr, London, sculptor work; Messrs. Emley & Sons, Newcastle, heating and ventilating; Messrs. C. White & Co., London, school furnishing; Mr. T. B. Jowsey, entrance gates; Mr. W. Malton, roadways; whilst the grounds are being laid out by Mr. L. Thompson, of Scarborough. The building was described and illustrated in our issue for August 10.

**TECHNICAL SCHOOL, NEW BRIGHTON, CHESHIRE.**—On the 21st inst. the new technical school, New Brighton, was formally opened. The school has been erected at a cost of 5,400l. upon a site at the corner of Field-road and Rawson-street, Upper Brighton, and has been designed by the District Engineer and Surveyor (Mr. W. H. Travers), and erected by Mr. John Gourley, contractor, of Liscard and Liverpool. It is built of Ruabon brick with Storeton stone dressings. An external feature is an octagonal tower containing a teachers' room on each floor. The building is two stories in height, the main entrance being in Field-road. The ground floor comprises vestibule, inner hall, classroom, to be used temporarily as a reading-room, cooking and laundry classroom, with pantry and stores, workshop, cloakroom, and lavatory; while the second floor includes two classrooms and a science lecture-room. The heating and ventilation have been carried out by Messrs. Dargue, Griffiths, & Co., Liverpool. The electric light installation is the work of Messrs. Brewer & Brant, Hoylake. The floors generally are of fireproof construction, finished chiefly with wood-block paving.

**ESSEX CHURCH, THE MALL, KENSINGTON.**—This church, which some fourteen years ago took the place of the old Essex-street Chapel, Essex-street, Strand, under a scheme approved of by the Charity Commissioners, has during the summer vacation had extensive repairs. The timber of the church has been cleaned and varnished, and the whole of the internal brick and stone work throughout the interior thoroughly brushed down and cleaned, including the Bath stone and alabaster reredos. The old gas-fittings have been removed, and the church has been lighted by electricity. In the assembly hall and schoolroom underneath the church the electric light has also been installed, and a new heating apparatus has been fitted to heat this part of the building independently of the church. The cost of the various works has amounted to upwards of 450l. The work has been carried out under the direction of Mr. H. Chaffield Clark, the architect of the church, the building works being executed by Messrs. Campbell, Smith, & Co., the new heating apparatus by Messrs. Edwards & Son, and the electric light installation by Mr. Herbert Nash.

**LADY BAY MISSION CHURCH.**—The new portion of this church has just been dedicated. The Lady Bay Mission was established about three years ago, as an adjunct to the parish church of West Bridgford. A temporary iron church, with seating accommodation for 70 persons, was erected, but its capacity was soon considerably outgrown, and the erection of a more commodious building was decided upon. The first portion of this has been completed, and will be used in conjunction with the western portion of the iron structure for the present. The extension consists of a nave and small chancel, 56 ft. in length and 28 ft. wide, giving, with the old building, a total length of about 80 ft., and affording accommodation for 550 persons. The building is of red brick, with stone facings. The nave has an open roof, with semi-circular pitch-pine principals, and the chancel arch is of red sand brick. The extension has cost between 400l. and 500l., and is from the plans of Mr. W. R. Gleave, of Nottingham, the builders being Messrs. V. H. & J. Simons. As funds permit and requirements dictate, it is intended to carry the building westwards to a frontage upon Pierpoint-road. The final part of the more pretentious architectural appearance upon a site in the vicinity, and the building now partially completed will be eventually used as a church hall and Sunday school.

#### SANITARY AND ENGINEERING NEWS.

**BRIDGE, MONQUHITTER, ABERDEEN.**—On the 14th inst. the new bridge just completed over the Turiff Burn at Mill of Pott was opened for traffic. The new bridge is of one span. Mr. Ferguson, Kyrie, carried out the mason work; the iron-work was entrusted to Messrs. Abernethy & Co.,

Aberdeen; while Messrs. James Duncan & Son, architects, Turiff, were inspectors of works.

**PADSTOW DRAINAGE.**—On the 10th inst. a Local Government Board inquiry was held at Padstow by Colonel A. G. Durnford into the scheme to provide a water supply to the town. It is proposed to adopt a source at a distance of about four and a half miles, where springs will be collected and conducted to a receiving chamber, and thence to a service reservoir at an ample elevation above the town. The inspector visited the source with the Engineer, Mr. Gordon W. Harris, and carefully investigated the means to be adopted to avoid pollution.

#### STAINED GLASS AND DECORATION.

**ST. STEPHEN'S CHURCH, AVENUE-ROAD.**—This church has been in process of decoration. The chancel is treated in colour and gold; on the upper part of the east wall are angels with censers in adoration of the Agnus Dei; on each side of the window under canopies with a mosaic background are the figures of St. Stephen and St. Andrew. The reredos (yet to be finished) will be rich in gold ornament, and the Four Evangelists painted in gold with gesso backgrounds. The side walls are diapered, supported by arcades with emblems of the Passion in gold, and a dado in reds, green, vellum, and gold. The nave walls are diapered, with borders to the wall plate and window headings; the spandrels are filled with ornament in salmon, red, and green, with various devices in white on red grounds. Round the base of the nave walls is the text, "Now have I chosen and sanctified this House that My Name may be there for ever, and Mine eyes and Mine heart shall be there perpetually." The work has been designed and carried out by Messrs. H. G. Bartlett & Co., of Brixton.

#### FOREIGN.

**FRANCE.**—There is some talk of the Municipal Council of Paris acquiring the Hôtel de Sens, with the view of making an annexe to the Historical Museum of the city. —The Mairie of the NINTH arrondissement of Paris is to be enlarged. —The jury in the competition opened by the Municipality of Lous-le-Saunier for the rebuilding of the theatre in that town, recently destroyed by fire, has awarded the first premium to MM. Georges and Tony Ferret, architects, of Bourg, and the second to M. Jules Pelleitier, of Lous-le-Saunier. The third premium was not awarded. —The fine bronze group by M. Fremet, of St. George, and the gable shortly proposed to substitute new steel girders for the existing weak 10 ft. to 25 ft. spans on the South Indian Railway. —The Koppil Bridge on the Assam-Bengal railway is now completed. It consists of three 100-ft. span girders and eighteen 60-ft. span girders. —A considerable addition is being made to the Bengal-Nagpur railway by the construction of a branch line from Ramkanal, chiefly for the conveyance of minerals. —We learn that the total cost of the Public Works Department in restoring buildings in Assam damaged or destroyed by the great earthquake of 1897 amounts to Rs. 41,12,000 up to the end of 1899-1900. This does not include the cost of extensive repairs to roads and bridges in certain districts. —The proposed railway line in Kashmir, to run from Jammu to Srinagar, will traverse the Larul and Banhal passes. The top of the latter pass is 9,321 ft. above sea level, and will be pierced by a tunnel about 5,670 ft. in length. —The combined military secretariat and foreign offices in Calcutta, designed by Mr. Banks Gwyther, are to be erected on the Belate bungalow site, taking in some adjacent grounds. The design shows a central main carriage entrance, which is treated as a Classical portico feature surmounted by a pediment. —Additions are about to be made to the Medical College and Eden Hospitals in Calcutta, to accommodate the nursing staff. —A new building has been commenced at the Presidency General Hospital, Calcutta, to accommodate certain kinds of infectious cases.

#### MISCELLANEOUS.

**PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.**—Messrs. Lansell & Harrison, architects, have removed their offices from 38, Bow-lane to 65 and 66, Basinghall-street, E.C. —Messrs. Doulton & Co. have opened new showrooms at 30A, Paradise-street, Birmingham, for the display of sanitary fittings, fireplaces, wall panels, &c.

**ELECTRIC LIGHTING, WORKSOP.**—About two years ago the Urban District Council of Worksop obtained the provisional order for providing electric light, and in October of last year commenced to build a generating station at their depot on Canal-road. This has been completed under the direction of Mr. A. B. Mountain, M.I.E.E., of Huddersfield, the consulting engineer, and the plant was a few

days ago opened. The buildings consist of a boiler-house, to accommodate four Lancashire boilers, of which two have been fixed at present, raising steam up to 105° 600 h.p.; engine room for two 100-kilowatt plants, and three 150 ditto, with the necessary condensing plants, pumps, boosting plants, and switch-boards. The plant at present fixed is sufficient to generate electricity for 11,600 lamps of 8 c.p., and there are also accumulators provided.

**DISCOVERIES AT RABY CASTLE.**—Lord Barnard is now restoring and renovating the chapel at Raby Castle, and during the work of clearing the walls of a layer of plaster some interesting discoveries were made. The chapel is the oldest portion of the castle, dating from the middle of the fourteenth century; and at the west end was disclosed a six-light window of that period, about 14 ft. wide and 8 ft. high, walled up with solid masonry about 2 ft. thick. This was completely removed, with the almost perfect sills. Head, jambs, mullions, and tracery are now to be seen. This was evidently originally an open screen, or unglazed window, opening from the end of the chapel into the "Baron's Hall," the side of which abuts on it, and was, no doubt, for the purpose of enabling persons in the hall, or general living-room, to participate in the services which, prior to the Reformation, took place at the altar opposite. On the south side was found a fourteenth-century doorway and a beautiful three-light window of water—probably, fifteenth century—work. This, too, seems to have been an unglazed window or screen between the chapel and a small chamber or pew. Another discovery is the ancient fourteenth-century aumbry, which has been found nearly perfect in the east wall, to the south of the altar.—*Standard.*

**PROPOSED ABATTOIRS, ST. IVES.**—The Corporation of St. Ives having applied to the Local Government Board for sanction to borrow 2,000l. for the provision of public slaughter-houses near the road between Nanjivey and the Stennack, an inquiry was held in the Town Hall on the 19th inst. by Colonel A. G. Durnford, R.E. The Borough Surveyor (Mr. J. Grenfell) produced plans of the proposed buildings, and in reply to the Town Clerk stated that the nearest dwelling-house to the site proposed was 33 yards distant, and that was the property of the Corporation, who were prepared to pull it down if there was any objection to it. The walls of the proposed buildings would be 2 ft. thick, and the floors of cement concrete.

**NEW THOROUGHFARE TO TOWER BRIDGE.**—A portion of the new roadway, from the Tower Bridge to Artillery-street, skirting the churchyard of St. John the Evangelist, Southwark, has been open for eighteen months, and now a new section has been opened—between the railway and the Bermondsey New-road. From Artillery-street the road passes under the ornamental arch of the South-Eastern and Chatham Railway Company's widened line, and is perfectly straight from the Tower Bridge to the Church of St. Mary Magdalene, Bermondsey, where, in order to avoid passing through the churchyard, it sweeps in a grand crescent into the Bermondsey New-road. A third section is nearly complete. The pavement throughout, on both sides (some 12 ft. wide), will be bordered by trees—a few already have been planted.

**STONEHENGE.**—The great leaning monolith at Stonehenge has been raised into a perpendicular position. The stone was encased in a cradle of strong timber to prevent it from cracking, and strong ropes were carried to two powerful winches, by means of which the raising was effected. The monolith was shored up on every side with timber, and every precaution was taken to guard against an accident of any kind. Now the stone is raised it presents quite an imposing appearance. It stands 21 ft. above the ground, its total length being about 20 ft. 6 in., and its estimated weight more than 30 tons. The excavations necessary for putting in a bed of concrete on the north-west side of the stone will now be proceeded with in the most careful manner, and it is believed that some important discoveries will be made near the famous altar stone.—*Standard.*

**RUSSIAN THEATRE SAFETY COMMISSION IN LONDON.**—Count Suzor, the President of the Russian Theatre Safety Commission, is now on a visit to London inquiring into the effect of our regulations in regard to the protection of theatres from fire. He has made an inspection of the British Fire Prevention Committee's new testing station, with a view of creating similar facilities for research at St. Petersburg, under a scheme mooted in connexion with the terrible fire losses which have occurred in Russia during recent years.

**NATIONAL PHYSICAL LABORATORY, BUSHEY.**—We are asked to mention that the floors in this building, briefly described in our last issue, are being laid with patent pitch-pine woodblock flooring from the Cement, Concrete, Asphalt and Wood Paving Works, Farnworth.

#### LEGAL.

##### EMPLOYERS' LIABILITY ACT.

**LABOURER'S FALL DOWN A HOLE.—**QUESTION AS TO CONTRIBUTORY NEGLIGENCE.

At Marylebone County Court on Monday, before Judge Stonor and a jury, William Thomas Smith, a

bricklayer's labourer, 10, Charles-street, Queen's-road, Notting-hill, brought an action under the Employers' Liability Act, against Messrs. Fabbock & Wilcox, Limited, contractors, &c., 30, Farringdon-street, E.C., claiming damages in respect of personal injuries sustained, owing, it was said—to negligence for which the defendants were responsible.

Mr. John O'Connor, counsel, appeared for the plaintiff, and Mr. Addington Willis, counsel, for the defendants.

Plaintiff's counsel explained that on January 28 last his client was in the employment of the defendants, working at the Notting Hill Electric Lighting Company's depot at Wood-lane, Shepherd's Bush. In order to get some castings and fittings fixed as soon as possible the plaintiff, with a few other men employed by the defendants, was working overtime. At about a quarter to twelve at night the defendants' foreman fitter, Logan, told the plaintiff to go to the tool-house, about 100 yards away, and fetch a spanner.

In answer to the judge, the learned counsel explained that the defendants were doing the work in question under a contract with the Electric Lighting Company.

Continuing, Mr. O'Connor said it appeared that between the boiler-house, where the men were working, and the tool-house, there was a hole some 15 ft. deep, in which a coal elevator was to be erected. No lights were about, and as the plaintiff was on his way to the tool-house he fell down the hole, seriously injuring both wrists and hurting his back and face.

The plaintiff bore out his counsel's opening statement, and in cross-examination admitted that when he continued to go to the tool-house he did not go back and ask for a lamp, although he knew that there were two on the job. He had several times prior to the accident seen the hole down which he fell.

Other evidence having been given, John Logan, an engineer's fitter in the employ of the defendants, said that he had charge of the job in question. He admitted giving the order to the plaintiff to go to the tool-house and fetch a spanner, but said he was not aware that the spot near the hole was in complete darkness. He had spoken to one of the Electric Lighting Company's officials about having the electric lights turned on all night, and understood the official to consent.

The judge: You can't say exactly what answer he gave?—Witness: No, I only took it by his muttering that he agreed with what I said. There was no definite answer that I can recall.

Continuing, the witness stated that at six, and also at seven o'clock, on the night in question, the electric lights were on. Afterwards he was working in a furnace and could not see that they had been turned off.

The judge put questions as follow to the jury—1. Do you believe that the witness Logan had the conversation with the Electric Lighting Company's engineer, and understood that the electric lights would be kept in during the time the men were working? 2. Do you think that the witness Logan was justified in thinking that the lights were still in when he gave the order to the plaintiff to fetch the tool? 3. Do you think that the plaintiff was guilty of contributory negligence in knowingly and willingly running the risk in question?

The jury answered the questions in the plaintiff's favour, assessing the damages at 75l. 5s.

His Honour gave judgment accordingly, with costs.

Counsel for the defendants asked for liberty to bring a new trial on the ground that the jury's answer in the negative to the third question was against the weight of evidence.

His Honour intimated that application for a new trial would have to be made in the usual way.

RECENT PATENTS:

ABSTRACTS OF PATENTED INVENTIONS.

9,535.—A COMBINED LEVEL AND STRAIGHT-EDGE. *A. Thom.*—A removable double spirit-level for plumbing and levelling purposes is mounted upon a graduated straight-edge, and for inclined work is provided a pivotted strip to be clamped with wing-nuts and a graduated slot at any small angle required. For fastening the spirit-level may be used either a stud and keyhole arrangement or a tapering dovetailed groove to correspond with a feather upon the straight-edge.

9,574.—BEAMS AND GIRDERS: *G. Stockfish.*—For carrying the ends of the joists extended flanges are fashioned upon angle, channel, T or I-section beams and girders, and transverse webs are added for strengthening purposes.

9,601.—FIRE-PROOF CONSTRUCTION: *W. Seefels and O. Soldan.*—Metal lathing or light open metal-work, fixed between standards, girders, &c., and overlaid with cement, plaster, or concrete, constitute the material for building hollow fireproof floors, ceilings, walls, and so on; in the case of an arch a skeleton frame is made up with curved and straight laths or strips, and for a hollow wall or partition the skeleton frame is made of U-shaped strips and cross strips, together with cross-shaped or double T-shaped standards, with bolts, rivets, and clips; for stairs, some strips, set lengthwise, are joined

with triangular strips, and in the concrete at the front of each step is embedded a channel-iron bar to be filled in with lead or other suitable material; at either side is a channel-iron girder and an angle-iron girder for carrying the framework.

9,620.—TRAPS FOR LAVATINES: *B. G. Smith.*—The inventor seeks to avoid the necessity for soldering by making the trap and overflow-pipe constitute one piece of casting, a socket is provided for the fixing of the overflow outlet, and the basin outlet is screwed on to the trap.

9,626.—FASTENINGS FOR WINDOWS: *J. H. Edwards.*—To one sash is secured a casing to which is pivotted a tumbler recessed for engagement with a lug upon a plate affixed to the other sash. On the tumbler are projections which engage respectively with a weight that slides in the casing and a projection from the plate. For opening the window one lifts the weight on to a rest in the casing where it is freed by the tumbler. For closing the window the weight is lifted by means of the engagement of two projections, and when the tumbler has thus assumed the "locking" position it cannot be worked since the weight has fallen behind it. A modified adaptation provides for lifting the weight and turning it into a horizontal position when one wishes to open the window.

9,633.—STOVE-PIPE FITTINGS: *G. Pickhardt.*—The pipe of a portable stove is inserted into an annular space that consists of a hollow metal cylinder fixed to the wall and a conical tube at the inner end of the cylinder, the free end of the stove-pipe being secured in its place with springs or other means.

9,645.—APPARATUS FOR USE WITH LIFTS: *J. Fletcher.*—By this apparatus bolts are shot beneath the bottom of the cage when the well-door is opened; a shaft having pinions at its ends that engage with sliding rack bolts carries a wheel set so as to engage with a worm upon a shaft above, a pinion upon the upper shaft is in gear with a rack upon the bottom edge of the sliding door; the bolts therefore are shot into the well and supply a support for the cage with the opening of the door; the inventor contrives also that bevel gearing shall impart the movement of the door to the rack bolts.

9,654.—CONDUITS FOR ELECTRICAL CONDUCTORS: *J. Hamblet and I. Parbes.*—Clay forced into a mould fashioned a triangular socket, and clay pressed through a die fashions the body of the conduit. A die or core that fits the interior of the socket is fitted on to a table that will rise and fall, and cores or plugs for making the passages are bolted on to the bridge-pieces, as the table and socket fall the mould, which falls with them, touches the heads of some supporting bolts. The die has rounded recesses for making the rounded ends of the partitions, and as the socket is being moulded air can escape through holes in the die. The contrivance is described as being applicable for making conduits with two, four, or more passages.

9,671.—APPARATUS FOR USE IN DEEP-BORING: *A. Raby.*—The inventor contrives that the rocking-lever may be shifted so as to obviate the need for removal of the frame when percussive tools are to be replaced with diamond drills. He makes guides (on the frames) of a pair of open rails or of a frame whereof one side is hinged, or of a single rail with which forked pieces upon the lever will engage. Projections from the lever can be engaged with or liberated from the guides by the action of rack and screw-and-worm gearing.

9,725.—BRICKLAYING AND WALL BUILDING: *E. H. Wright.*—Recesses in the bricks above take ribs on the bricks next below, and there are grooves at the corners of the bricks for vertical keys; a wall may be built of bricks having double interlocking ribs and grooves secured with double dovetailed keys, and portable temporary structures may be built without the use of cement or mortar; in the case of hollow walls there are recesses in the inner vertical edges of the bricks that will fit with spacing keys which join interlocking bricks together.

9,727.—A COMBINED REGISTER AND HOOK FOR USE WITH CRANES: *C. H. P. Michel.*—A spring-controlled disc is pivotted between the two side plates of the hook, and over it is a register or counter from which hangs a rocking lever having a forked end for engagement with a pin on the side of the disc; as a load ascends the sling will engage with a recess in the disc, so that it becomes closed and locked through the engagement between a spring bolt and a stop, and when the bolt has been freed with a key the disc is turned again into the open position, and so enables the counter or register to do its work.

9,730.—APPLIANCE FOR ELECTRICAL SWITCHES: *F. S. Worsley and F. J. Green.*—For a double-pole switch there are arms that project from an insulating boss turning upon a fixed spindle and that carry U-shaped contact pieces. Two pins which turn the boss engage with teeth of a sleeve turning upon a bolt which is attached to the spindle. In a slot in the boss will slide a locking cross-bar which is in the sleeve, being pressed up by a spring into a groove in the cover of the sleeve. The bar is to be pressed downwards with a key inserted into the cover, so that one can turn the cover and the switch contacts together.

9,746.—AN ELECTRICITY METER: *A. Wright and Reison Manufacturing Company.*—In a mercury voltimeter the electrodes of mercury are disposed outside two porous diaphragms, the electrolyte

being between them, and thus form two containers for the mercury; for purposes of registering may be utilised the overflow of the mercury cathode from a porous pot into a measuring-tube, the anode being kept at a rather higher level with mercury admitted from a feeding-tube; for the two containers can be substituted paraffin or similar bags attached to vertical measuring-tubes wherein the cathode mercury will rise and the anode mercury will fall. Confer also Nos. 2,222, 5,040, and 5,593 of 1900.

9,762.—A COMPOSITION FOR USE IN BRAZING: *H. Garner.*—A protective composition for use in bending, brazing, and kindred operations consists of borax and boric acid mixed with water or any other suitable liquid—the admixture is to be applied as a coating which can be wiped off afterwards, and it is claimed to be available as a flux in brazing.

9,779.—A WINDOW-SASH FASTENER: *N. W. Spaulding.*—A curved spur that projects from a plate on one sash is to be engaged with a slotted arm which is pivotted to a plate upon the other sash, when the arm is lifted for separating the sashes a lug upon the slotted arm will engage with the spur-plate, the movement of the arm is restricted with a stop and it will fall down so as to engage with the spur through impact of the spur-plate and the lug as one shuts the window.

9,808.—CONSTRUCTION OF PARTS OF BUILDINGS: *L. de Vallière.*—For girders, beams, bresssumers, ceilings, floors, and so on the inventor devises a material composed of concrete in which are embedded rounded tension rods made of iron, together with flattened helical coils of wire of which the sides have an inclination of 45 deg., more or less, to the rods.

9,813.—APPARATUS FOR VENTILATION: *J. W. Thomas.*—A valve that opens vertically is so disposed within a turret provided with louvres, and above the roof-crest that when it is shut its upper flange fits around the seating, for lifting and lowering purposes is provided a cord having at its end a stirrup that will engage with an automatically fixing-hook which is held in its place (when the stirrup is hooked) through the engagement of the rear end of the hook with a rack; a scale—adjusted in accordance with the temperature of the outer air—serves for determining the extent of the necessary opening of the valve, and a flap or windmill appliance is placed over an opening outwards in order to indicate any variation between the relative air-pressures, inside and outside, which the ventilator should be adjusted to remedy.

9,907.—STONE-DRESSING MACHINERY: *T. Stigitz.*—The threaded portion of the spindle that works through a ratchet wheel retained in one direction with a pawl turns the tool round at its return stroke, whilst a crank-and-slot movement, driven with bevel-gearing from a flexible shaft, imparts the reciprocatory motion; a saddle, which traverses the cross-head, carries the tool-holder, and screws will vertically adjust the cross-head upon the frame, which is moved upon the rails by means of screws—by another arrangement the stone itself is moved.

MEETINGS.

SATURDAY, SEPTEMBER 28.

Sanitary Institute (Demonstrations for Sanitary Officers).—Inspection at the Richmond Main Sewerage Pumping Station and Purification Works, Kew Gardens, 3 p.m.

TUESDAY, OCTOBER 1.

Sanitary Institute (Lectures for Sanitary Officers).—Dr. H. R. Kenwood on "Water; Composition, Pollution, and Purification," 9 p.m.

WEDNESDAY, OCTOBER 2.

Builders' Foremen and Clerks of Works' Institution.—Ordinary meeting of the members, 8 p.m.

Sanitary Institute (Lectures and Demonstrations for Sanitary Officers).—(1) Inspection at Lambeth Disinfecting Station, Wandless-road, Loughborough Junction, 3 p.m., (2) Dr. H. R. Kenwood on "Elementary Statistics," 7 p.m.

THURSDAY, FRIDAY, and SATURDAY, OCTOBER 3, 4, and 5.

Royal Institute of British Architects.—Visit to Glasgow and Annual Dinner. The programme as at present arranged is as follows:—Thursday, October 3, Annual Dinner. Friday, October 4: (1) Lunch in the Exhibition grounds, given by the Glasgow Institute to the Royal Institute visitors. (2) Visit to the Glasgow University (tea). (3) Conversazione given in honour of the Royal Institute by the Corporation of Glasgow. Saturday, October 5: Visits to Exhibition, &c.

FRIDAY, OCTOBER 4.

Sanitary Institute (Lectures for Sanitary Officers).—Mr. J. Wright Clarke on "Details of Plumbers' Work," 7 p.m.

SATURDAY, OCTOBER 5.

British Institute of Certified Carpenters.—Monthly meeting. Mr. W. T. Sweett on "Modern Joinery," 6 p.m.

Sanitary Institute (Demonstrations for Sanitary Officers).—Inspection at the Sewage and Destructor Works, Ealing, 2.15 p.m.

Northern Architectural Association.—Visit to Newcastle Breweries' premises, Haymarket, and Electric Power Station, Newcastle.

CONTRACTS AND PUBLIC APPOINTMENTS.

(For some Contracts, &c., still open, but not included in this List, see previous issues.)

Nature of Work or Materials.	By whom Required.	Forms of Tender, &c., Supplied by	Tenders to be delivered
*Broken Granite	Brentford U.D.C.	Nowell Parr, Clifden House, Boston-road, Brentford	Oct. 1
Sewers, &c.	Bradford-on-Avon U.D.C.	S. Howson, Surveyor, Town Hall, Bradford-on-Avon	do.
Sewerage Works, Bridge and Granville-streets	Dover Town Council	H. E. Stilgoe, Civil Engineer, Town Hall, Dover	do.
House, Cambourne, Cornwall	Mr. J. F. Pearce	J. F. Pearce, Cambourne	do.
Electric Lighting Works	Poplar Borough Council	L. Potts, Council Offices, High-street, Poplar, E.	do.
Wheels and Axles, Switches, &c.	Aldershot U.D.C.	Director General, India Office, Whitehall, S.W.	do.
Granite (2,500 tons)	Lexden & Winstree Guardians	N. F. Dennis, Civil Engineer, Aldershot	do.
Laundry, Stanway, Essex	Great Yarmouth Town Council	G. H. Page, Architect, Trinity Chambers, Colchester	do.
Wood and Granite Paving Blocks and Setts	do.	J. W. Cockrill, Civil Engineer, Town Hall, Great Yarmouth	do.
Chapel, &c., Calster	Plymouth School Board	H. J. Snell, Architect, 11, The Crescent, Plymouth	do.
Schools, Salthay-road	Windsor Royal Gaslight Company	J. H. Strange, 2, Victoria-street, Windsor	do.
Workshops, &c.	New Britannia Pier Co., Yarmouth	J. H. Strange, 2, Victoria-street, Windsor	do.
*Pavilion on New Pier	Swindon Corporation	Mayho & Haley, Amberley House, Norfolk-street, Strand, W.C.	do.
Electricity Buildings	Littlehampton U.D.C.	Lacey & Co., Engineers, 2, Queen Anne's-gate, Westminster	Oct. 2
Pumping Machinery, &c., Warming, Sussex	Bosmere & Claydon Guardians	H. Howard, Engineer, Town Offices, Littlehampton	do.
Drainage Works at Workhouse, Barham, Suffolk	Entfield U.D.C.	H. Miller, 16, Museum-street, Ipswich	do.
Sinking Well, Hadley-road	Entfield U.D.C.	R. Collins, Surveyor, Court House, Entfield	do.
Electric Cables	Rochdale Corporation	C. C. Atkinson, Borough Engineer, Town Hall, Rochdale	do.
Boundary Walls, &c., Uphill Manor	Weston-super-Mare School Board	H. F. Price, Architect, School Board Offices, Weston-super-Mare	do.
Paving Works, Locking-road	do.	do.	do.
Additions to Workhouse, Barnhill	Glasgow Parish Council	MacWhannel & Rogerson, Archts., 59, West Regent-st., Glasgow	do.
Fire Station and Cottage, Newton-road	Rushden (Northants) U.D.C.	W. B. Madin, Civil Engineer, Vestry Hall, Rushden	do.
*Construction of Sewer	Wimbledon U.D.C.	Engineer, Council Offices, Broadway, Wimbledon	Oct. 3
Steel Girders, Albion-street	Salford Corporation	N. W. Woodworth, Engineer, Town Hall, Salford	do.
Road Improvement Works, Bank-street	Castleford U.D.C.	Mr. Green, Surveyor, Castleford	do.
Laying Main (2 1/2 miles) Meerbrook Slough	Ikeston Town Council	G. & F. W. Hodson, Engineer, Town Hall, Ikeston	do.
Cement, Seven Pipes, &c.	Bray (Ireland) U.D.C.	F. MacDonnell, Town Hall, Bray	do.
Steel Girder Bridge, Blackmill, near Bridgend	Ogmore U.D.C.	H. D. Williams, Civil Engineer, Blackmill, nr. Bridgend, S. Wales	do.
Coastguard Buildings, Bexhill	Admiralty	Coastguard Station, Bexhill	Oct. 4
Walls, &c., at Cemetery	Carrickfergus U.D.C.	W. D. R. Taggart, Civil Engineer, 17A, Donegal-street, Belfast	do.
Additions to Police Station, Thornaby	Yorksire County Council	County Surveyor, County Offices, Crownhill, York	do.
Sewers, &c.	Bideford Corporation	C. E. Bruzes, Civil Engineer, 1, Victoria-st., Westminster, S.W.	do.
Stables, Cart Shed, Stores, &c.	Camberwell Council	Borough Engineer, Town Hall, Camberwell	Oct. 7
Water Supply Works, Killea	Londonderry Town Council	J. J. S. Barnhill, Civil Engineer, 1A, Strand, Londonderry	do.
Granite Road Metal, Cradley Heath, Staffs.	Quarry Bank U.D.C.	A. Homfray, Council Offices, Cradley Heath, Staffs.	do.
Mortuary Buildings, Chapel, &c., Stockport	Chease U.D.C.	G. H. Brady, Architect, 18, Little Underbank, Stockport	do.
Lighting of School	Iford School Board	C. J. Dawson, 7, Bank-buildings, Iford	do.
Roadmaking and Paving Works	Wilkeson District Council	O. Claude Robson, Dyne-road, Kilmour, N.W.	do.
*Granite Setts	Edmonton U.D.C.	G. Eeles Eschus, Town Hall, Lower Edmonton	Oct. 8
Superstructure of Electric Lighting Station, Greenhill	Oldham Corporation	A. Andrew, Corporation Offices, Oldham	do.
Additions to Workhouse, Selly Oak	King's Norton Guardians	Mansell & Mansell, Surveyors, Colmore Row, Birmingham	do.
*New Generating Station at Greenhill	Oldham Corp. Electricity Dept.	A. Andrew, Gas and Water Offices, Oldham	do.
Lodge, &c., Longbridge-road	Barking (Essex) U.D.C.	C. F. Dawson, Surveyor, Public Offices, Barking	Oct. 9
*Heating St. James' Church, Wood Green	The Committee	McKenzie, 85B, Hatton-garden, E.C.	Oct. 10
Erection of School	Farningham School Board	G. H. Taft, Architect, Dartford, Kent	Oct. 12
Town Hall	Cheltenham Corporation	Waller & Son, Architects, 17, College-green, Gloucester	do.
New Visiting Rooms	Wilts County Asylum	County Surveyor, County Offices, Crowbridge	do.
*Additions, &c., to Workhouse	Berkhamstead U.D.C.	C. H. Hew, Architect, Berkhamstead	do.
*Firemen's Cottages, &c.	Beckenham U.D.C.	J. A. Angell, Surveyor, Beckenham	Oct. 14
*Broken Granite	Hanwell U.D.C.	Council Offices, Hanwell, W.	do.
Cattle Market, &c.	Braintree (Essex) U.D.C.	F. Whitmore, Architect, Chelmsford	do.
*School Buildings, near Exon	St. Olave's Union	A. H. Newman, Architect, 31, Rooley-street, S.E.	Oct. 15
*Heating and Ventilating, Youghal Lunatic Asylum	Cork District Lunatic Asylum	H. A. Cutler, Municipal Buildings, Cork	Oct. 17
Town Hall	Cheltenham Corporation	Town Clerk, Municipal Offices, Cheltenham	Oct. 21
House, Shop, &c., Micklegate, Pontefract	Mr. Blackburn	Garstide & Pennington, Architects, Roper-gate, Pontefract	Oct. 30
Business Premises, Market Place, Pontefract	do.	Tennant & Bagley, Architects, Pontefract	No date
Wesleyan Chapel & School, Worsborough Dale, Yorks	Cowes (Isle of Wight) U.D.C.	G. Moxon, Architect, 28, Church-street, Barnsey	do.
Cast-iron Pipes	do.	W. Halliday, 40, High-street, Cowes, Isle of Wight	do.
Heating of School	Iford School Board	C. J. Dawson, 7, Bank-buildings, Iford	do.

PUBLIC APPOINTMENTS.

Nature of Appointment.	By whom Advertised.	Salary.	Application to be in
*Assistant Clerk of Works	County Borough of Salford	32 per week	Sept. 30
*Clerk of Works	Derby Corporation	Not stated	Oct. 1
Engineer and Surveyor	By CASTLETON & GIBBONS (at Carlisle)	250L per annum	do.
*Clerk of Works	Taylstock U.D.C.	Not stated	do.
*General Manager	Walsall Corporation	46 4s per week	Oct. 5
*Storekeeper	Camberwell Council	20L per annum	Oct. 7
	do.	150L per annum	do.

Those marked with an asterisk (\*) are advertised in this Number. Competitions, p. 22. Contracts, pp. 1v, vi, viii, x, & xlv. Public Appointments, pp. xli & xlv.

SOME RECENT SALES OF PROPERTY:

ESTATE EXCHANGE REPORT.	By whom Advertised.	Price	Remarks
September 12.—By G. B. HILLIARD & SON (at Chelmsford).	By KING & CHAZEMORE.	£1,150	Three freehold meadows, 26 a, (including fishing rights)

TO CORRESPONDENTS.

NOTE.—The responsibility of signed articles, letters, and papers read at meetings, rests, of course, with the authors.

We cannot undertake to return rejected communications.

Letters or communications (beyond mere news items) which have been duplicated for other journals are NOT DESIRED.

We are compelled to decline pointing on books and giving addresses.

Any commission to a contributor to write an article is given subject to the approval of the article, when written, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.

All communications regarding literary and artistic matters should be addressed to THE EDITOR; those relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

TENDERS.

[Communications for insertion under this heading should be addressed to "The Editor," and must reach us not later than 10 a.m. on Thursdays. N.B.—We cannot publish tenders unless authenticated either by the architect or the building-owner; and we cannot publish announcements of tenders accepted unless the amount of the tender is given, nor any list in which the lowest tender is under £100, unless in some exceptional cases and for special reasons.]

\* Denotes accepted. † Denotes provisionally accepted.

## Trees and Shrubs in Towns.

THE protest against the proposal to widen Piccadilly was noticeable, among other points, for the regard which was expressed by many persons for the preservation of the trees on the south side of Piccadilly. These particular trees are of no great individual importance, and the affection, one may almost say, with which many of the public regard them appears somewhat exaggerated in view of the neglect and indifference in regard to trees and shrubs in many parts of the Metropolis and in many towns and urban districts all over England. For if the Piccadilly trees are well worthy of preservation—as we believe they are—why do not the public interest themselves more in urging on Local Authorities to increase the number and to show greater care of trees which are already in existence? That there should be this feeling for the Piccadilly trees is not surprising when we remember how country-loving a person the average Englishman is, and how much he prizes a day out of town. But that fact only increases the surprise that more is not done towards beautifying towns by trees, shrubs, and flowers. For undoubtedly nothing does more to increase the charm of cities than the bringing into them as much of the country as is possible, as much of the colour and variety of Nature as is compatible with the artificiality of a town. Yet when we look round London, or indeed any other English town, it is impossible not to be struck with the lost opportunities. We congratulate ourselves on Kensington Gardens and on our parks, sometimes on our squares, but nevertheless there is a conspicuous want of system in the enlargement of Nature in towns. What is done is done too often spasmodically, or is the result rather of individual effort than of corporate determination. Thus it is understood that Sir J. Wolfe Barry has induced the Westminster Town Council to consider the desirability of planting trees in Whitehall and Parliament-street. Here we have probably the

result of individual effort in regard to a particular thoroughfare. But, by way of example, let us suppose Parliament-street and Whitehall planted with trees. At the top of this thoroughfare we arrive at Trafalgar-square, which long ago might have been made infinitely more attractive by systematic planting of trees; room for beds of shrubs and of flowers might also have been found, bringing colour and beauty into a singularly bare space. Let us follow our walk, and we come to Waterloo-place, the portion of which between the Guards' Memorial and the Duke of York's Column might long ago have been a mass of greenery—an offshoot, as it were, of the Mall and of St. James's Park. Portland-place, again—we take only some of the most obvious instances—stands a perpetual reminder of the neglect which is apparent in London of the opportunities of beautifying it systematically, of making the most of the opportunities which occur. What is needed is not irregular individual effort, but a combined and continuous determination by Local Authorities to make the most of such spaces as are capable of supporting the growth either of trees, flowers, or shrubs. A tree once planted will take care of itself. Artificial lopping of limbs such as has disfigured the planes on the Embankment is greatly to be deprecated. In regard to these particular trees, we would urge on the Authorities the necessity during the coming winter of completing the thinning of these trees by the removal of every other tree, as has been done at the west end of the Embankment. The dwarfed intermediate trees overpowered by their fellows ought never to have been planted at all, and ought to be removed as soon as possible.

But, apart from trees, a great deal more might be done with shrubs, which need less space than timber trees. In this respect, almost every square in London is an example of lost opportunities. Perhaps the most glaring example is St. James's-square, which is surrounded with a dense and ugly thicket of lilac, which never flowers, and which hides the picturesque timber and green sward in the centre. It is high time, indeed, that St. James's-square was handed over to the Local Authority for public use. It has ceased almost entirely to be a residential square; but if these bushes were removed and it were made a public place, it

would be used as an agreeable lounge by many from the whole district around, and it could be made bright with flowers, as parts of St. James's Park now are. Indeed, if we examine the London squares, nothing is more noticeable than the want of colour. Of course, brilliant flowers will not flourish under spreading trees, but there are plenty of openings and spaces which a skillful gardener would utilise. But, taking them as a whole, nothing whatever is done. It would be easy to find places in every square in London where a tub of agapanthus could be placed in the summer, the striking blue flowers of which are in bloom from July to September, and which needs only to be removed to an outhouse or cellar in the winter. We give this as one instance only, but any one acquainted with flowers and shrubs can find in every square in London lost opportunities, more especially in regard to coloured shrubs. Where are the purple Prunus Pissardi, the most hardy of shrubs, the variegated maples, the various species of berberis, the golden yew, and others of equal beauty, to be seen in London?

So far as squares are concerned, this neglect of opportunities is quite remarkable, for many of the householders who have an actual interest in the square gardens are lovers of flowers, and sometimes possess country houses. Yet they are satisfied to allow the square gardens to be treated with neglect in an age when booksellers' shops are filled with works on gardens and on flowers, and when every publisher has one or more works on this subject on his list. Why some of these good people who are constantly giving us their experiences of Surrey gardens, or a year's work here or there, do not endeavour to improve the appearance of London horticulturally is really astonishing. There is the dreary courtyard of Burlington House; the centre might quite well have a small fountain filled with lilies, and around it a little plot of green with some well-tended shrubs and bright flowers. Instances multiply themselves on every hand. London can architecturally never hope to compete with cities such as Paris or Berlin, but, retaining those particular characteristics which give it a unique character it might become even more beautiful if the authorities and inhabitants to their minds not only to utilise the space which is available for the growing of flowers, and shrubs, but to

not only with care, but also with intelligence. Every Local Authority, as well as the Office of Works, might have an advisory committee of specialists to suggest and to report not only on desirable horticultural improvements, but on the management of existing trees, shrubs, and flowers. Some disappointment in homes there must be with trees and shrubs, since the atmosphere of the Metropolis is certainly injurious to many plants. But we have only to look at Kensington Gardens, St. James's Park, and Regent's Park to see what is possible of accomplishment, for on a smaller scale everything that is carried out in those places is possible in any London square. And even in these parks the horticulturist is constantly struck with opportunities not seized and with the absence of new shrubs. But when he leaves them he is generally thankful that the cultivation of trees, and flowers, and shrubs is as satisfactory in these places as it is, when he perceives the complete absence of colour in many parts of London, where summer and winter are alike unmarked by the beauty of plant life.

#### THE ARCHITECTURAL TREATMENT OF BRIDGES.

By THE EDITOR.

HE illustrations in this issue of the *Builder* are all of bridge designs—two by architects and one by an engineer; and have been purposely combined in one issue in order to afford an opportunity for a few words in regard to the treatment of bridges from an architectural point of view; in other words, the degree and the manner in which, after the purely structural requirements have been worked out, a bridge may be further regarded and treated as a work of art, susceptible of architectural effect and embellishment.

The subject has been brought prominently into notice recently, firstly by the peculiarly unfortunate æsthetic mistakes which were made in the case of the Tower Bridge, and which have converted what might have been a grand and effective structure into a piece of architectural gimcrack; secondly, by the controversy which arose in regard to the exceedingly awkward and ill-conceived architectural design proposed by the Engineer of the London County Council for the granite facing of Vauxhall Bridge; thirdly, and in a much more agreeable and satisfactory manner, by the admirable paper read by Mr. J. Husband before the Institution of Civil Engineers, in March of this year, on "The *Æsthetic Treatment of Bridge Structures*," a paper which, though one may not agree in detail with all the views expressed in it, can only be regarded as an honour to the author of it and to the Institution of which he is an Associate member, and which has certainly tended to definitely advance the study of the subject. Moreover, the association of a good many architects, kindly invited by the Institution, in the discussion of the paper, has we may hope done something to break down the wall of partition or misunderstanding between engineers and architects, and to convince the former that architects really have something to say on the subject, and some right to a *locus standi* in connexion with it; and it is probable that

we shall not again hear indignant complaints from engineers that the proposal to associate an architect with them in the design of a large bridge is of the nature of an insult to them. Indeed, it would seem that even the stubborn hearts of the Loudon County Council have been somewhat melted within them on this point; for while they have persistently refused to call in the aid of an architect in the treatment of Vauxhall Bridge, on the futile and illogical ground aforesaid, that it would hurt the feelings of their engineer (a consideration which they apparently put before the proper carrying out of a great public work), it seems to be pretty well understood that on the next occasion of the kind the assistance of an architect will be sought—at all events where it is intended to develop a bridge beyond the phase of bare constructional requirements, in which case alone the work gets out of the proper province of the engineer.

The question, however, where does engineering end and architecture begin, in the case of a bridge—and the correlated question, where is the line of demarcation between the province of the engineer and the architect, is not such a very easy one to settle; it seems indeed to call for a kind of æsthetic application, if one may so say, of differential calculus. The words "architectural effect or embellishment," a few lines above, were not used without purpose. There may be architectural effect without any embellishment; effect arising solely out of line and mass, and in which decoration has little or no place; such effect as we see in London Bridge for instance, and in some of the plainer and sterner examples of Norman and Transitional architecture. In the case of a built bridge of stone or granite, this effect may be arrived at without going beyond the best structural requirement; in other words, without going out of the engineer's province. The best lines of structure, in such a case, will often produce also the best effect. As soon as the element of embellishment or decoration comes in, however, we are purely in the architect's province. An engineer's education does nothing for him in training the eye and taste in architectural decoration; his faculty of design, in the artistic sense, has never been cultivated, and the probability is that he appropriates stock features out of architectural books, treats them clumsily and misapplies them so as to be absurd and unmeaning. On the other hand, if we go back to the early stages of the structure—the preparation of the foundations in deep water, it is equally certain that here we are on ground which is peculiarly the engineer's, and for which the usual education and experience of the architect have not prepared him. We may say, then, that there are three stages in bridge building on a large scale and in a sumptuous manner: the preparation of the foundations and the inner structure of the piers, which is purely engineering work; the decorative embellishment, which is purely architectural work; and an intermediate stage which, according to circumstances, might be handled either by engineer or architect, but which (we may add) will be in general the better for the collaboration of the two.

The case of the Vauxhall Bridge affords an apt illustration of this latter point. In this case the wide flat segmental arch, starting abruptly from the piers and as if

jammed between them, has anything but a good effect. But we are told that these lines are almost absolutely settled by practical conditions. The piers were, by the requirements of the Thames Conservancy, to have so much waterway between them; the crown of the arch was to give so much headway above the water level: on the other hand, by the requirements of the shore authority (the County Council) the gradient of the roadway was limited to a certain minimum of rise. Obviously under such conditions there is very little margin left to the constructor, and it is not surprising that a steel bridge was at first proposed as the only solution. There was a considerable public feeling, however, in favour of a granite bridge; but no engineer, or architect either, would have recommended the erection of an arched masonry bridge of so great a span on such flat lines. Then came the *via media* of a concrete arch, so-called, which is really rather a couple of huge cantilevers than an arch; which can be safely constructed on the lines required by the authorities, and which could be faced with granite so as to give the effect of a monumental bridge of that material. This was apparently quite satisfactory to the County Council's engineer; but from an architect's point of view the result is this, that an apparently granite arched bridge is designed on lines which would not be employed if it were really of that construction, and of which consequently the effect is unsatisfactory to the eye. And here comes in the point at which the presence and influence of an architect in this intermediate stage would have been of value. In the first place, an architectural coadjutor would never have passed or permitted such clumsy and vulgar details as were shown in the engineer's design (whether or how far they are to be modified in accordance with the criticisms that have been passed on them I know not); in the second place, he would certainly have put the question whether these lines and proportions of construction proposed were really so necessary and inevitable as was pretended. Engineers wanting to build ugly things are so fond of professing that whether you like it or not, they cannot help it; that the proportions are fixed by circumstances or authority; and so on. An architectural adviser could and probably would have put the question—is it really necessary to have so wide a span between the piers, spoiling the proportions of the bridge by so flat an arch? Is not this extreme width a somewhat imaginary necessity, and is it not worth while to give up something of space for the sake of a finer structure? An argument of that kind, strongly pressed, might perhaps have been met by a relaxation of the conditions which are supposed to have been so imperative, and by an admission that something must be conceded on both sides; but there was no one to do it. Did such a case occur in France, the architect commissioned along with the engineer would almost certainly have put that argument; and what is more, *he would have been listened to*. In France such considerations have weight. In England it is a fixed idea, in regard to engineering structures, that the practical considerations are everything, and that no argument in regard to architectural appearance is of any consequence at all.

Thus it comes about that we are having a bridge erected which, while on the face of it it is to appear as a masonry structure, is not

structurally such, and is designed on lines which, on so large a scale, are unsuitable and insecure-looking for such an apparent structure. Regarded as such, it is too flat in its lines and too weak in its crown. No treatment could really make it satisfactory. What is suggested in the design published in this issue is such a treatment as would minimise the appearance of weight in the masonry, and give the greatest possible apparent depth in the crown. The manner in which this has been arrived at is pointed out more in detail in the explanatory article under the head of "Illustrations," and need not be recapitulated here. What is important to note, however, is that if the system of concrete linged arches, or cantilevers, with a granite facing, is to be accepted as a favoured form of bridge-building in the future, it is necessary that a treatment of facing granite should be adopted suitable and expressive of the circumstances, and totally distinct from that which is suitable when the bridge is really a monumental and homogenous structure of stone or granite. In the latter case, the more powerful and massive the face design is the better, as in the fine examples of London Bridge and Waterloo Bridge. In the former case, a lighter and perfectly different treatment is required, to express the true function of a facing which is a *revêtement* and not an essential element of the construction.

It would be worth while, perhaps, to take into consideration the possibility of a satisfactory surface treatment of the concrete itself, without any masonry facing; and let a concrete bridge, if that construction be decided upon, appear frankly as such, with a cement treatment on the face of it. Such a bridge could never have the imposing appearance of a masonry bridge, and it is not likely it would ever be adopted except where circumstances of site or a rigid necessity for economy demanded it; but there would be a certain merit in frankly accepting the concrete bridge and making the best of it.

Coming back to solid granite or masonry bridges, however, which after all are likely to keep the field more or less (for they certainly make the finest and most monumental class of bridge structures), the points which seem most to require attention are the face of the main piers, and the spandrels of the arches. There has been a great prevalence of the use of columnar orders on the face of the piers, in the shape of engaged columns or pilasters. This is really a misuse of such a feature, as Mr. Husband did not fail to point out in his paper. There has been a feeling that something must be done at that point in the way of architectural or decorative treatment, and the column has been seized upon, as it has in many more purely architectural structures, because *something* is wanted, and that is a historic feature which comes readiest to hand. Rennie avoided it in London Bridge, but adopted it in Waterloo Bridge; and it must be admitted that there is something very fine in those great, plain, severe columns which stand in couples on the Waterloo piers. Architectural logic, however, must rule, that they are out of place there, even more than on the screen wall of a building. The pier has to have the effect of lateral strength; there is nothing of any consequence to support above

it; and a feature which expresses resistance to vertical weight is out of place. What we want is something of the suggestion of a buttressing mass; not applied to the face of the pier, but resulting from the shape and design of the pier itself. This is what is attempted, in a new form, in the study published in this issue.

Then, in a bridge on a large scale, the spandrels of the arch offer a considerable space which may or may not be specially treated. Panelling, as noted by Mr. Husband, has been resorted to, but it is a weak expedient, and suggestive of a structure other than masonic. In a bridge of a severe type, perhaps nothing is better than to leave the lines of the masonry, more or less emphasised by rustication. If it is desired to fill in or diversify this blank space, it would seem that here we may rightly apply something of the nature of a surface decoration; either a bas-relief where the bridge is a comparatively small one, or a heraldic device, or a bust in a medallion. It depends to some extent on the amount of decorative treatment admitted in other portions of the bridge, whether we should leave the spandrels as plain masonry, or relieve the space with a decorative feature. In the case of the design published in this issue, where the voussoir lines (for a reason noted under the head of "Illustrations") are carried up to the corbel-table under the balustrade, the longer lines in the haunches of the arch are too insistent and require something to break them; hence the heraldic escutcheons and wreaths, aesthetically of the nature of an applied ornament, but of course in reality carved out of projections left in the solid stone. In this case the spandrel, in the usual sense, has disappeared; the facing is, so to speak, all voussoir, and the decoration does not follow but breaks their lines. So it would be also in the case of a bridge with spandrels of masonry in horizontal or nearly horizontal courses, above a strongly marked system of voussoirs.

Then there is the question of a cornice. Here again we should recognise a distinction between the solid and veritable masonry bridge, and the bridge which is a concrete structure with a mere facing of masonry. In this latter case a heavy cornice of great projection is out of place; it is emphasising too much and placing too much weight on what is only a decorative facing. But in a solid masonry bridge a powerful cornice is a fine source of effect; only, in introducing it, we must remember that we are not dealing, as in an ordinary building, with a true horizontal line; unless in such a case as Waterloo Bridge, where the approach is artificially built up (on the south side) in order to leave the bridge its unbroken horizontal line. This produces a grand effect as far as the bridge itself is concerned, but it was hardly justifiable to deliberately construct a heavy gradient approach in order to obtain the effect, and it is not a process likely to be repeated. Where the bank level is not very high, and a certain minimum of headway is required above the water level, a bridge will always have to assume a certain degree of slope and curvature of line on either side of the crown. In that case the cornice becomes a raking cornice, and it is essential that it should be stopped by the piers, not made to break round them, because such a break cannot be properly constructed; either

the cornice must rake round the vertical feature (whatever it is) of the pier, which has the worst possible effect, or it must stop on the further side and begin again at a slightly lower level; an arrangement which cannot be worked at all. That was one of the worst faults of detail in the engineer's original design for Vauxhall Bridge, published in our plates a year or two ago; the large cornice was supposed to be carried in a continuous line round a great circular column on the pier, and resumed on the other side. Such an arrangement could only be worked by "fudging" the mouldings.

One of the besetting sins in the treatment of bridges is to entertain the idea of harmonising them with the environment by adopting some kind of feature belonging to another age; as in the case of the Tower Bridge, which was "Gothicked" (after a fashion), from an absurd idea that this was necessary in order to harmonise it with the neighbourhood of the Tower. It is to be feared that the right lesson in this respect is still unlearned, for one has heard threats that the new Lambeth Bridge is to be made Gothic, to "harmonise" with the Houses of Parliament. Hamerton pointed out the fallacy of this idea in the case of the Conway tubular bridge, where the towers were battlemented in consequence of the proximity of Conway Castle; and Mr. Husband, in replying to the discussion which followed his paper, rather defended this on the ground that there were circumstances in which bridges might be required to be fortified. Very well; in that case fortify them in a modern manner, by a revolving turret or an earth bastion with a disappearing gun; but do not suggest, in a modern bridge approach, a mode of fortification which is centuries out of date. Tricks of this kind only spoil a design. Mr. Husband rightly praised the general design of the Grinethal bridge, which formed one of the illustrations to his paper; but that bridge, a very fine and picturesque example of modern steel structure, is spoiled by its absurd castellated towers at each end, which look as if they had come out of a toy box of bricks.

In the case of steel bridges attempts at ornamentation have hitherto almost always been bad, and are moreover little required if the lines of the structure itself are good. If they are, it will be a gratification to the eye; if they are not, gilding and rosettes and ornamental rivet heads, and such gauds, will only make it worse. Good lines of structure in steel work, candidly shown, can never be offensive to the taste, and render the structure an object of interest at all events to those who understand construction. Nearly all the valid objections that architects and artists often make to the works of engineers' steel structures arise not on account of the structure, but on account of the ill-judged attempts to make it what is called "ornamental." In this respect the small bridge at Breamore, designed by the County Surveyor of Hampshire, and illustrated in this issue, is a very good example of the sensible and unaffected treatment of a work of this kind. The work is perfectly plain; the only bit of what may be called ornamental treatment in it, the scroll terminations to the stiffeners, gives them some additional strength and is a natural and suitable way of treating the extremities of a piece of steel in this position. The brick piers are quite unadorned

and merely serve their constructive purpose. But there is nothing here that is in bad taste; it is a perfectly satisfactory piece of work, and a good example, though on a small scale, of the right spirit in which to treat steel bridge structures.

#### NOTES.

WITHIN the last few years the increasing application of machinery and engineering appliances in buildings of all kinds—to say nothing of structural steelwork—has added considerably to the responsibilities of the architect. Sooner or later serious attention must, undoubtedly, be devoted to this matter, for it cannot be said that its present position is at all satisfactory. On every hand we find that private houses, blocks of flats, office buildings, warehouses and public institutions of various kinds are being erected and equipped, under the direction of architects, with electrical and mechanical appliances and machinery, the design and installation of which properly demands years of training and practical experience. Very few architects claim the possession of these qualifications, yet it is rare to find any who decline to undertake such work. Sometimes a consulting engineer is called in to advise the architect privately, but, as a general rule, the manufacturing or contracting engineer has the privilege of furnishing technical information, not only without payment, but without any assurance that he will secure the work in question. It would be unreasonable to blame architects for this state of things, as we believe clients to be entirely at fault. They expect the architect to be a sort of universal expert, and are not willing to run the risk of paying for co-operative advice and superintendence. A similar condition has already evidenced itself in the United States, and has been under consideration by the American Institute of Architects. In a report made by that body, after a conference with a Committee of the American Society of Heating and Ventilating Engineers, and engineers interested in various specialties, the recommendation was made that the scheduled charges of the Institute should be so amended that the minimum fee of the architect for those parts of the work involving electrical, mechanical, and sanitary engineering, heating and ventilation, should be 10 per cent. of the cost, and that the architect should select engineering experts who should render their services under his supervision. An arrangement of this kind appears to provide reasonably for the interests and the co-operation of both professions, and the advisability of similar action might well be considered by our own Institute in conjunction with the leading engineering institutions.

THE thirty-fifth annual convention of the American Institute was announced to be opened this week at Buffalo, New York State, on the 3rd, 4th, and 5th inst. The Reports of a number of Standing Committees form a large portion of the business. Friday was to be entirely occupied by a series of papers in reference to the Pan-American and other Exhibitions (or "Expositions," as the Americans prefer to call them, we suppose because "exposition" is the French word), with

the object of considering the best manner of arranging and designing such exhibitions, and providing for lighting, decorative effect, &c. In the main the subjects discussed seem hardly to be of the usual interest from the higher architectural point of view.

It is sometimes noticeable that St. Séverin, Paris, while the French give much thought to the propriety of new buildings, they are not always so careful as they might be to make the most of ancient buildings. It is satisfactory, therefore, to note the clearance of the miserable houses which have obscured the east end of the Church of St. Séverin in Paris. Already a space at the south corner is cleared, and it is interesting to see how at some period—not, perhaps, so very remote—domestic buildings of the most common kind and apparently of the most temporary description have been fastened against the church, shutting out the windows and the whole of the east end. It is very much to be desired in the interests of architecture that a clearance should be made of the domestic buildings which are to be found attached to cathedrals and churches in many of the French provincial towns, for it has to be borne in mind that they are constantly a source of danger by fire. However, we may be thankful when a clearance takes place as in the case of St. Séverin. Not that the space around should be so large as to give churches the appearance of mere monuments, for it is far more suggestive to find buildings in the position in which their builders intended they should be. But houses built against the church windows are obviously a pure barbarity.

THE creation of a voluntary association in Birmingham, under the name of the "Sanitary Aid Committee," appears to be in many ways more important to the country generally than to Birmingham, which has always had a foremost place in active municipal life. This committee appears to have as its object to act as a kind of independent aid to the regular sanitary authority, and to enlighten the community in regard to sanitary matters. Persons of common aims, working together, can do much more than by individual action, and if in other districts a few persons interested in the improvement of sanitation were to combine they could effect much. There is, in the first place, the necessity of calling the attention of sanitary authorities to the performance of their duties. There are various associations in existence for the protection of commons and rights of way. Where one of these bodies finds an assumed right of way interrupted it brings the matter before the proper authority, and any number of public rights have been thus preserved. The same kind of action in regard to sanitary matters both in towns and in rural districts might have equally valuable results. Good work could also be accomplished by the spread of information, the giving of lectures in schools and in clubs. Altogether we hope that in other places besides Birmingham Sanitary Aid Committees will be established.

A RECENT Report of the Rivers Committee of the Manchester Corporation was discussed at the meeting of the Council last week. The discussion is interesting as showing what

use is already being made of the last Report on sewage-purification issued by the London County Council. About two months ago we pointed out the unsatisfactory nature of the processes and apparatus adopted in these tests, and our view was confirmed a week later by Mr. Scott-Moncrieff, but one of the Manchester Councillors has evidently accepted the conclusions of this Report as entirely applicable to any and every process of bacterial purification, and quoted them in proof of his statement that "to attempt to treat sewage by the bacteriological system without the use of chemicals would be an absolute failure." Dr. Dreyfus, the vice-chairman of the Committee, characterised the statement as "false," but, at the request of the Lord Mayor, withdrew this unparliamentary adjective and substituted the words "most inaccurate." Of course, no one goes so far as to say that bacteriolysis effects an absolute purification of sewage in the short time which can be allowed in the treatment of sewage, but even such a statement would be less erroneous than a wholesale condemnation of the process.

Petrified Oak in Russia.

A CORRESPONDENT sends us an interesting account of some remarkable deposits of petrified wood existing in one of the rivers of South Russia. The deposit consists of a quantity of calcined oak lying in the bed of the river in layers three or four deep, and extending over an area of some 150 miles. A main feature—which, indeed, constitutes the chief value of this specific hardwood—is its variety of colours. No fewer than twelve shades in pink, blue, yellow, and that known as American walnut have been found. This peculiar formation would seem to have been caused by the variegated character of the soil at the bottom of the river. How long Nature has taken to achieve this feat is a question to be solved by geologists. Some six years back a Russian timber merchant purchased a twelve years' lease of the deposits and determined to exploit them. During the six years of his tenancy, already expired, he has nearly doubled the sum of his original outlay, and this with only very primitive methods of exploitation, viz., manual labour with boat-hooks. The excavated timber is in logs of from 42 ft. to 200 ft. in length by 15 in. to 20 in. in diameter, and each log is of one uniform shade throughout. The transit to St. Petersburg or Riga from the locality of the deposit is comparatively cheap, via Russia's main waterway, the river Volga, and the present leaseholder estimates the deposit as being still capable of yielding from 150,000 to 200,000 good, sound logs of an average length of 70 ft. In the face of the present controversy on the relative values of American timber compared with Australian hardwoods for certain purposes, it would be interesting to know the opinion of the trade upon this Russian deposit of hardwood. It would be still more interesting, from a geological standpoint, to discover whether similar deposits have been known to exist in other parts of the world. That the hardwood may be turned to practical use is evident from the experience of the above-mentioned trader.

The Capetown Cathedral.

IN a recent issue *South Africa* publishes the ground plan of the intended cathedral at Capetown (the foundation-stone of which was

laid in August by the Duke of Cornwall, and gives some particulars but not the name of the architect. From the plan, the building is evidently intended to be Gothic in character. On the south side of the plan there is a cloister court, not however against the south wall of the nave, but (as at Chichester) abutting against nave and choir walls, and enclosing the front of the south transept as one side of the cloister garth. The modern uses of the cathedral are indicated in the titles of the rooms opening out of the cloister, which consist of classrooms, cloakrooms, lavatories and offices. All this appears to us quite in accordance with the principle of rendering the cathedral of practical use for its neighbourhood, though we suppose some ecclesiologists will be shocked at what they will consider a kind of profaning of the sacred precinct. The chapter-house, rectangular in form, opens at the east end of the south cloister walk. It is intended, if possible, to use entirely stone found in the colony, in the erection of the building. Table Mountain sandstone is proposed for the exterior; and for the interior, stone from Stormberg, Steenpan, or Bulawayo, the last-named being said to be the best stone in the colony.

We understand that Mr. G. F.

Bodley has been appointed architect of the new church which, together with a parsonage house, is about to be built in Prince Consort-road, South Kensington, upon a site (in the parish of St. Stephen) which the Commissioners for the Exhibition of 1851 offered for sale. To the cost of the new church will be applied the proceeds of the sale of the site and materials of Holy Trinity Church, Park-side, Knightsbridge, built in 1860-1 by Messrs. Dove Brothers, at a cost of 3,250*l.*, from the designs of R. Brandon and H. M. Eyton, and illustrated in the *Builder* of April 21, 1860. A scheme recently made by the Ecclesiastical Commissioners provides for a union of the two contiguous benefices of All Saints' and Holy Trinity, Knightsbridge, and for the demolition of the church of the latter vicarage. The Commissioners ordain that the united benefice shall be served by All Saints' Church, which was erected fifty years ago (and subsequently enlarged) in Ennismore Gardens from the designs of Lewis Vulliamy. The interior was decorated by Owen Jones.

No. 19, Old Jewry.

A FEW days ago the National Debt Commissioners removed their offices to Finsbury Pavement House from No. 19, Old Jewry, and the demolition of their former premises in Old Jewry is now in progress for a rebuilding by Messrs. W. Cubitt & Co. The house was designed by Soane in 1818-9, for purposes of the National Debt Redemption and Life Annuities business, and completed the block for which Soane had designed in 1803-10 the five houses known as New Bank-buildings\* in Prince's-street, which he widened and straightened, taking some of the recovered ground for his enlargement of the Bank of England. In the Soane Museum is preserved a set of plans signed by him, and

entitled "The Five Houses in Prince's-street called 'New Bank Buildings,' erected 1807-10 upon ground recently bought by the Bank of England." The ground was acquired from the Grocers' Company, who received 20,000*l.* as compensation. In the same collection are some sets of varying designs for the complementary premises—No. 19, Old Jewry. On the ground floor of the National Debt Offices was a large open chamber, lighted by a drum and cupola carried upon four arches, which Soane designates as the "cenotaph and place for paying English and Irish Tontines," and especially designed for Westmacott's seated statue of William Pitt, a gift of the Bank Directorate to the National Debt Commissioners: a wooden model of the "cenotaph" is in the Soane Museum. The plans we mention show the sites of the Grocers' (old) Hall and garden; and of the old Meeting House, Meeting House (formerly Windmill) court, and almshouses in Old Jewry. No. 19 and the open space in the rear occupy the site of the almshouses, the Meeting House, and three other messuages, which together constituted the Morys trust property as sold for 10,000*l.* to the Governors and Company of the Bank of England by the Armourers' Company. Soane also designed (1811) Thellussons' banking-house in Meeting House-court. The almshouses, now quite forgotten, had been founded there with a bequest in 1551 to the Armourers and Braziers from Dame Elizabeth Morys of all her lands and tenements in St. Olave, Jewry, parish under charitable trusts. Mr. A. C. Blomfield's designs for the rebuilding of Bank-buildings were at the Royal Academy Exhibition of the current year.

WE observe that the printed prospectus of lectures on architecture and construction at University College contains the announcement of a course of lectures on the architecture of the "Renaissance." It is not a misprint, for it recurs six times in the paragraph. Of course it is generally understood that University College is an institution for instruction in science rather than in literature; but still we should have hoped that some one connected with the issue of the prospectuses would have been aware that there is no accent over the first syllable of "Renaissance." Such mistakes do not look well in the printed circulars of an important teaching body.

SOME PRIMARY CAUSES OF EXPANSION AND CONTRACTION IN PORTLAND CEMENT CONCRETES AND MORTARS.

By H. HOWARD HUMPHREYS, A.M. INST. C.E.

THE extraordinary "boom" which set in some five or six years ago in the building trades, for which the buoyant commercial condition consequent upon prolonged peace amongst the great manufacturing nations of Europe was chiefly, though not entirely, responsible, has had a curious, and to some extent a paradoxical, effect on the general use of Portland cement. The cause of the boom in this country was doubtless materially assisted by the fact that several large engineering and building works had started about the same time, and an artificial scarcity of cement was created, with the usual result that the price of the material was very shortly inversely as the supply. Then appeared the paradox; for as soon as the fact had been carefully advertised that manufacturers could not cope with the demands made upon their works by consumers, many engineers and architects who had hitherto taken little notice of cement began to attribute

an excellence to it, as a constructional material, to which they had previously been blind, and to specify it where they had formerly used either hydraulic or common lime. An internal boom, due to what may be called secondary excitation, therefore occurred, and this at the present time is largely responsible for the fact that the storage sheds of the best manufacturers show but little stock.

Deplorable as are some of the transient fashions of the building trades, in this particular instance the supersession of the feebly hydraulic limes by Portland cement makes wholly for good, as it assists constructional men in arriving at the goals of stability and durability. Unfortunately, however, cement is a highly complex and apparently capricious material, which sometimes develops disintegration where cohesion was reasonably expected, and disgusts those who would have been its best friends were it more constant in its attachment. This is especially so in the matter of its volume, which certainly should be permanent, except so far as regards expansion and contraction due to atmospheric causes, and which it is extremely difficult, if not impossible, to entirely neutralise. It is obvious that if concrete or mortar expands after taking its initial set it will cause movement and distortion, destroying the homogeneity of the structure upon which it has been used, or, in the case of floors, pushing the main walls of the building out and causing endless damage to cross walls, and disturbance and secondary stresses in floor girders. What, then, are the causes which lead to such troublesome results? They may be classified under two heads:—

- 1st. Disruptive stresses due to internal movement in the cement.
  - 2nd. Disintegrating atmospheric conditions.
- Heading No. 1 can be split up, and the responsibility for the elimination of the expansions and contractions can be divided between the manufacturer and user thus:—
- A.—Causes of Internal Expansions and Contractions over which the Manufacturer has Primary Control.
    1. Due to unscientific proportioning of raw materials leading to either over-liming or over-claying.
    2. Insufficient burning, resulting in the presence of loosely combined caustic lime in the cement.
    3. Excessive quantities of chemical impurities, as magnesia and sulphuric acid.
    4. The presence of artificial impurities, such as slag and gypsum.
    5. Bad milling, resulting in a partially pulverised clinker.
  - B.—Internal and External Causes over which the User has Control.
    6. The use of new and unacrated cement.
    7. The use of mortars, principally for purposes of rendering, which contain too high a proportion of cement.

It will now be useful to examine each of these causes in detail, and to see how far they bear on the phenomena of expansion and contraction.

1. *The Unscientific Proportioning of Raw Materials, Resulting in Over-Liming or Over-Claying.*—It must be remembered that Portland cement is a chemical compound formed from the calcination of a mechanical mixture of some kind of lime and clay. In order to get the best results so far as rapid hardening and permanence of volume are concerned, the lime must be in such a proportion to the clay that it can enter into complete combination with the silica and alumina of which the latter mainly consists. Dr. Spencer Newberry found experimentally that the limit of the molecules of lime to those of the soluble silica in the clay is as 3 to 1, and in the same way the proportion of lime to alumina should not exceed 2 to 1. From the atomic weights we find that these proportions will represent in weight 2.8 parts of lime to combine with 1 part of silica, and 1.1 of lime to combine with 1 part of alumina. Supposing that these proportions are departed from to an appreciable extent, it will then be seen that the best compounds, viz., tri-silicate and di-aluminate, will not be obtained, as there will either be a surplus of imperfectly combined lime present in the cement, or the alumina will be in excess; in either of these events an alteration of volume is almost certain to occur, especially if the slurry has been over-limed and the clinker highly fired, for lime burnt at a high temperature slakes more slowly than that which has been subjected to moderate heat, and consequently signs of expansion from the hydration of the q<sup>o</sup> (often concealed in the coarser ground cement) do not occur so

\* Not to be confused with (old) Bank-buildings, built after Sir Robert Taylor's designs and pulled down in 1843, which stood at the west end of Threadneedle-street, south side.

months after the concrete has set. It is essential that a constant check shall be kept on the proportioning not only of the lime to the clay by means of the calcimeter, but also to the character of the clay itself, to determine mainly the relative proportions of silica and alumina present in it, in order that the lime may be added according to a sliding scale.

At the present time the tendency with many users of cement is to raise the tensile requirements for the week's test. This frequently results in manufacturers over-liming. Subsequent expansion (due to the causes above mentioned) disturbs the initial cohesion, with the natural result that very frequently the stress borne at twenty-eight days is actually 30 per cent. lower than that carried in a week.

2. *Insufficient Burning.*—The comparative expensiveness of coke during the last few years has tended towards too great an economy of fuel, thus leaving a considerable quantity of "pinks" or under-burnt clinker in the kiln. In this material the lime is not properly combined with the other constituents, and the consequence is that there is also present in it a considerable amount of lime which is a source of danger, but not of so great a danger as is the lime of a hard-burnt and over-limed cement, for the cements which are imperfectly calcined are naturally easier to grind, and consequently the loosely combined lime, being better exposed, will frequently pass through the whole of the dangerous stages of expansion if it has been exposed to the air for a short time on the floor of a cooling shed. Considerable danger, however, exists where a very under-burnt material is used, as shrinkage almost invariably occurs in the work.

It is, however, fairly easy to detect the under-burnt cement, as when fresh from the kiln it has a low specific gravity and a brownish colour, instead of the hard grey tint which is generally an indication of a proper degree of calcination. In cases where doubt exists it is useful as a test to mix a sample of cement with about 25 per cent. of water, pressing the mixture into a test tube with a small cylindrical rammer, the effect of which is to bring the lighter—i.e., the under-burnt particles—to the top of the tube, where they form a layer sometimes  $\frac{1}{2}$  in. deep on a total depth of about 4 in. This top stratum sets with great rapidity, and in the course of two or three days shows a ring of a comparatively light chocolate colour. Such cements are not necessarily dangerous, but they most certainly require a considerable degree of aeration prior to being used upon works.

3. *Excessive Quantities of Chemical Impurities, such as Magnesia and Sulphur Compounds.* (A) *Magnesia.*—In practically every Portland cement this oxide exists in greater or less proportion. The cements manufactured on the banks of the rivers Thames and Medway show a considerably smaller amount than those made from the shales and limestones of the Warwickshire district. Until fairly recently engineers and chemists differed very considerably in their opinions as to the action of magnesia. The researches of Dr. Spencer Newberry, of Cornell University, have, however, thrown considerable light upon the action of this ingredient, and in the very able paper which he read before the New York section of the Society of Chemical Industry in 1897 he concludes with the following paragraph:—

"Magnesia, though possessing marked hydraulic properties when ignited alone, yields no hydraulic products when heated with silica, alumina, or clay, and probably plays no part in the formation of the cement. It is incapable of replacing lime in cement mixtures, the composition of which should be calculated on the basis of the lime only without regard to the magnesia present."

Herr Dykerhoff presented an exhaustive report to the German Association of Manufacturers, which tended to prove that the presence of over 4 per cent. of magnesia resulted in a weakening of the cement. He showed that the action of the magnesia was expansive, and took a considerably longer time to develop disintegration than does free or loosely combined lime.

Professor Le Chatelier has also experimented upon this somewhat complex question, and he mixed 5 per cent. of magnesia with a sample of ordinary Portland cement of good quality. The swelling did not commence for six months in the case of the cold paste, but in water at boiling temperature expansion began in six hours and ended in forty hours. In this connection it is interesting to note that the magnesia, when coarsely ground, produces expansion,

but when in the form of an impalpable powder, the swelling produced is not nearly so marked.

Whilst it is difficult to make an absolute pronouncement upon the effect of magnesia, yet it is evident from the result of experiments that it is desirable to have the least possible amount of this ingredient present in a cement, as with average grinding its tendency is towards expansion, though this takes place after a lapse of considerable time, and the effect of aeration is of no avail in reducing the dangerous properties of magnesia.

(B) *Sulphur Compounds.*—One of the most dangerous and common compounds of sulphur which can exist in Portland cement is that known as sulphate of lime. The presence of this compound is shown in the analysis by a large sulphuric anhydride figure. Like magnesia, there is bound to be a certain amount of sulphur present (derived largely from the fuel) in every cement, but if the percentage exceeds two parts it is probable that some expansion will take place. 0.59 of sulphuric anhydride will represent about 1 per cent. of calcium sulphate, and this being a readily oxidisable compound, causes considerable expansion. Personal experiments with cement to which definite proportions of sulphate of lime had been added up to a maximum of 4 per cent. have proved that it is unadvisable to either add this material or to accept a cement which contains a higher sulphuric anhydride figure than indicated above. The writer's firm, in reporting some years ago on two samples of cement made from clays which lay close together, and which, to every outward appearance, were identical (but which when mixed with the same proportion of lime gave widely different strengths in the finished cement), found upon analysis that the one clay contained but a small amount of sulphate of lime, whereas in the second case nearly 7 per cent. was present, due to sulphate in nodular form. Mr. D. B. Butler quotes a similar experience in his recent work on Portland cement; and M. Durand-Claye, who was called upon to examine mortar from a sea-wall which had failed, discovered that the sea had had the effect of washing out the sulphate of lime from the work.

The call for finer grinding of cement, together with the heavy demands made upon manufacturers for quick delivery during the last few years, have resulted in the mixing of small percentages of sulphate of lime (gypsum) with cements, the object being to retard the tendency which very finely ground cement has to set with inconvenient rapidity. It would be far preferable in the best interests of work to adhere to the older method of aeration which has been practised for many years past, as it is absolutely safe, and, providing the material is a good one, no anxiety need be felt as to the subsequent expansive action of the cement in work.

4. *The Presence of Artificial Impurities.*—Some manufacturers (although fortunately they are in the minority) use considerable quantities of two adulterants, viz., slag and Kentish rag. The former material, when ground up without any chemical preparation and incorporated with the cement, is undoubtedly an element of considerable danger, as it is very variable in its chemical composition, contains a considerable amount of sulphur, and, in addition to this, it is a dilutant which detracts very considerably from the strength of the cement when mixed with sand or gravel, so that it is both dangerous and constitutes a direct robbery so far as the user is concerned. Kentish rag, which is a sandy limestone, has no dangerous effect so far as expansion is concerned, but it is a distinct dilutant.

5. *Bad Milling.*—One of the most expensive items in the preparation of cement is the grinding of the clinker, and it is somewhat natural that manufacturers should not pay the attention to the fineness of their material which they would doubtless do if it were less costly. From the user's point of view a double advantage is to be obtained by the purchase of cement containing as much impalpable powder as possible, as its covering capacity is considerably greater when in this condition, and, further, the source of danger due to particles of free and loosely-combined lime in the coarser pieces of clinker is eliminated. The old specifications allowing a residue of 10 per cent. of a 250 mesh are rapidly becoming obsolete, and it is somewhat startling, but nevertheless true, that from 6 cwt. to 8 cwt. per ton of cement supplied under the old specifications was useless for a cementitious purpose.

Some experiments made by the writer with an ordinary builders' cement a short time since revealed in a remarkable way the hidden dangers due to coarse grinding. The sample in question had stood the tensile test admirably, but it was coarse; and upon application of the Michaelis boiling test the pats cracked in all directions, and over the surface of them there were a number of eruptions like miniature volcanoes. This expansion in the work might not have occurred for some months, or possibly years, but it most certainly would have occurred at some time; and as the cement was to be used for floors, and therefore in a confined lateral space, the defects which would have developed might have been exceedingly serious.

The American Society of Civil Engineers recently appointed a Committee for the consideration of the proper manipulation of tests of cement, and whilst the economical side of fine grinding is rather outside the scope of this article, it is interesting to note that in the Committee's Report of the reply to Question 9, which dealt with the size of mesh which should be used for sifting, Professor J. B. Johnson says, with reference to the 14,400 sieve, that there is no significance to be attached to results from coarser sieves, so far as cementation value is concerned. Mr. A. E. Carey stated in the Royal Engineers' Institute Papers, vol. 21, that "every particle of cement which will not pass through a 32,257 mesh sieve is of little or no use in making concrete." Whilst this statement appears to be distinctly startling, it is gradually becoming accepted, and many of the German manufacturers are grinding to a very fine flour. A sample recently tested by the writer's firm showed a residue of only 3.2 per cent. on the 14,400 sieve. At least one important cement works in this country has under consideration the question of separating the flour of cement from the coarser particles and re-grinding the latter.

#### *Internal and External Causes over which the User has Direct Control.*

6. *The Use of New and Un-aerated Cement.*—This side of the question has already been dealt with in a fragmentary manner, but although it has been recognised from the time when Portland cement first came into popular use that it should be weathered, the writer ventures to think that even now engineers and architects do not pay sufficient attention to the necessity for shooting and carefully turning the cement prior to using the concrete. It is practically impossible for manufacturers to find adequate storage room for cooling cement, and the only alternative is for the purchaser to obtain this material well in advance of the time when he requires to use it. Case after case has come to the writer's knowledge where a cement, perfectly satisfactory in its chemical and physical attributes, has been the cause of trouble from the fact that the user of it had not exercised proper care in aerating prior to mixing the concrete. The writer's firm was recently called in to report upon the failure of a small building, and the measurements show conclusively the tremendous expansive force which is developed by the presence of lime in unweathered cement. The building when originally erected measured 16 ft. from wall to wall. A few months afterwards, when the hot cement had expanded, the measurement at floor level was 16 ft. 3 in., and the walls were bulged to an alarming extent. Much of this trouble could probably have been saved by the spreading of the cement.

Mr. Carey in the paper which has already been quoted from, says:—

"I recollect in one instance seeing the floor of a large warehouse, the walls of which were well built of 18-in. brickwork with heavy iron cross ties, cracked and in serrated ridges from end to end. This result was due to the use of an underburnt cement in the concrete."

The effect of underburning, as mentioned before, can (unless it is excessive) be almost entirely neutralised by weathering.

7. *The Use of Mortars for Rendering which Contain too High Proportion of Cement.*—It is a well-known fact that neat Portland cement exposed to air diminishes slightly in volume. Should the material be placed in draughts or in sunshine the tendency of the shrinkage is to increase, that is to say, under normal conditions a neat cement will inevitably show slight hair cracks, especially if the face of the work is allowed to dry with any speed. As rendering is commonly used for the purpose of making

brickwork impermeable to water, it is very necessary that these cracks shall not exist, and the best way to avoid them is by the use of about one part of absolutely clean sharp sand in combination with the cement. A further cause of unsatisfactory neat rendering is due to the inability of a bricklayer to lay the face coat with sufficient rapidity, and he is therefore constantly tempted to what he calls "knock up" the partially-set cement a second time.

*Disintegrating Atmospheric Conditions.*—It is, of course, quite impossible to entirely neutralise the disruptive action set up by extremes of temperature, but it has been shown over and over again that concrete made of first-class materials is very little acted upon by fire or frost. Nevertheless, repeated expansions and contractions must in time tell upon this material, and have the effect of weakening it. If care is taken to shield the concrete from frost until it is thoroughly set in the winter, and to keep the surface continually moist in the summer, extremely good results can be obtained, but this second precaution is frequently disregarded altogether, and the result is that the water which is necessary for the process of crystallisation is evaporated by the action of the sun or air, and the mortar or concrete consequently loses enormously in its tensile strength. Extensive experiments on this question were made at the McGill University a few years since, and in the report the following paragraph appears:—

"Attention has been drawn to the poor results obtained by the same tests (*viz.*, on 6 to 1 concrete) by reason of long exposure to dry air. This shows up a very important point, *viz.*, the necessity for covering up carefully all concrete and cement works exposed for any length of time to dry air and sun. The bad effects of these agents is plainly demonstrated, and it is doubtful whether much strength will ultimately be recovered."

The writer's own experience makes him quite certain that the action of the sun is as destructive upon the tensile and adhesive properties of rendering as the action of frost; and in the construction of a heavy section of retaining wall some years since this fact was brought out in a remarkable way. A portion of the wall in question faced south, whilst another section faced nearly due west. The latter portion was rendered during the cold weather, and the former during the summer. The western portion was covered in the ordinary way, whilst the wall that faced south had no special protection given to it, and the rendering showed exceedingly bad signs of failure within a very short time of the construction of the work. The quality of the sand and the cement was precisely similar in each case, and equal care had been taken as far as workmanship was concerned.

LETTER FROM PARIS.

THE Académie des Beaux-Arts has awarded the Prix Chaudesaigues of a value of 50*l.*, comprising two years' study in Italy, to M. Moisant, pupil of M. Moyaux. First and second mentions were awarded to M. Hebrard, pupil of MM. Ginain and Scellier de Gisors, and M. Bouffroy, pupil of M. Moyaux. The subject of the competition was "A Triumphant Arch raised in honour of a Foreign Sovereign." During the vacation at the Ecole des Beaux-Arts a considerable amount of work has been done in rearranging the various studios, and the old Ateliers André have been transformed into a museum for the exhibition of the various work done by competitors for the past scholarships at the Ecole. It was intended to put into a thorough state of cleanliness and repair the large number of cubicles in which the competitors are shut during the Prix de Rome competitions, but the walls are so covered with cartoons and sketches by old students since become masters of French art that it was decided not to touch any of these portions. A series of new "loges" are now being arranged in a simple but rather dainty manner for the use of the recently admitted female students.

The Manufacture Nationale de Sèvres has just been enriched by the addition of a new room on the first floor for exhibiting specimens of the various work of the manufactory since its foundation under the reign of Louis XV. This room contains five large showcases, in the first of which are exhibited specimens of the first models executed in the styles of Louis XV. and XVI.; the second contains work done during the Empire and the Restoration; the

third shows examples of the style of the Second Empire and the first productions of ceramic ware with applied ornaments. The other two are reserved for specimens of the more recent work which was exhibited at the late Exhibition.

The subject of the annual competition made under the auspices of the Société Nationale des Architectes was "An Almshouse for Victims of Labour Accidents," the cost of which, ground not included, was to be 14,000*l.* The first prize was awarded to M. Clabaut, and second and third prizes to MM. Parenty and Paulet respectively. An additional prize, given by the Minister of Public Instruction, was awarded to M. Clabaut.

M. Georges Cain, the curator of the Musée Carnavalet, is preparing in one of the rooms of this museum, on the Place des Vosges, the installation of the Victor Hugo Museum. Amongst the many interesting souvenirs of the great poet will be the curious collection of wood panels sculptured by Victor Hugo when living at Jersey, and painted by him in bright colours, somewhat in the spirit of Japanese art. These panels—of which there are a very large number—covered the walls of the poet's study at Jersey, and will now be arranged in wall panelling around the walls of the new room at Carnavalet.

The new Hotel de Ville of Dunkirk, inaugurated very recently by the President of the French Republic, is a very interesting example of the work of M. Cordonnier, of Lille, an architect whose work, in the spirit of the old Flemish style, is well known in the North of France and in Flanders. The building is of red brick, heightened by portions of white stone around the bays, and surmounted by a central clock tower of simple but elegant design and 250 ft. high. A fine staircase placed in the centre of the building leads to large and airy rooms on the first floor; on the landing is a stained-glass window representing Jean Bart returning from one of his seafaring adventures. M. Cordonnier carried off the first premium in the competition for the Bourse of Amsterdam; he took a grand medal at the Salon of 1892, and a grand prix at the exhibition of 1900.

The Statistics Department of the Prefecture of the Seine has just completed its report on the profits realised by the city of Paris in connexion with the 1900 Exhibition. According to this report, the Municipality has realised a profit of 160,000*l.*, to which must be added the value of the newly-acquired property of the Champ de Mars and the Petit Palais, handed over to the town by the State. The extra business transacted by the inhabitants of Paris during the Exhibition is stated to have amounted to 18,000,000*l.* All the smaller buildings of the Champ de Mars have now been demolished, but nothing has yet been decided as to the ultimate destiny of the Galerie des Machines, the Palais d'Electricité, and the Château d'Eau. The authorities have entirely failed to meet with purchasers for the large iron buildings on either side of the Champ de Mars; the public competition offers gave no result; and it is probable that the authorities will now deal direct with those contractors whose private offers are thought worth considering.

The beautiful Fontaine de Sèvres, a piece of work by M. Sandier, which was exhibited in the grounds of the Champs Elysées and was wilfully damaged by mischievous persons, will be completely remade with certain modifications, and will probably go to adorn the garden of the Palais du Luxembourg.

The interesting old Palais de Justice of Nantes, built during the fifteenth century and menaced with destruction on account of its ruinous state, which has become a danger to the immediate neighbourhood, has at length, thanks to the steps taken by the archaeological committee of the district, been classed as one of the Monuments Historiques, and will therefore be taken into hand for repairs. The architect of the Département has been instructed to prepare designs for a new Palais de Justice, and the old building having now been purchased by the Municipality of Nantes for the sum of 1,600*l.*, will be carefully restored and be used for the purpose of municipal offices and the housing of the large municipal library.

The town of Marseilles announces its intention to demolish and reconstruct the important old quarters of the town situated behind the Bourse, and has invited architects and contractors to enter into competition and to tender for the work, which has been

estimated to cost about two and a-half million pounds. No offers have, however, been received, first by reason of certain onerous terms in the conditions, and also in consequence of the rather bad reputation the town has amongst architects and contractors, from whom it has from time to time, by means of promises which it is said were never kept, obtained designs and schemes which have never been put into hand, or have been carried out partially without any profit or return to the initiators.

The Municipality of Paris has decided to embellish and render more attractive the crematoria buildings in the cemetery of Pere Lachaise. It is proposed to hide the ugly chimney stack by means of a large dome, and the building will be decorated in such a fashion as to render the whole aspect a little less dismal.

A syndicate of Clermont-Ferrand and L'Auvergne, under the auspices of the Touring Club, has opened a competition amongst architects for the best plans and designs for a modern hotel arranged, designed, constructed, and installed according to the best and latest precepts of hygiene and sanitation. The jury, presided over by M. Gustave Rives, architect to the Touring Club, is composed of the President of the Société Nationale des Architectes, M. Fernoux; M. François Roux, architect; two architects and two "maîtres d'hôtel" belonging to the district, elected by the syndicate, and two members of the syndicate. Money premiums and medals will be awarded to the authors of the chosen designs. M. Constant Orsat, delegate of the Touring Club of France at Lyons, has obtained from the municipality of St. Gervais-les-Bains, the concession of a large piece of ground in a most admirable position for the purpose of erecting a modern hotel, to be called "Hôtel du Touring Club," and a syndicate for this purpose is being formed.

The date for the inauguration of the new Sorbonne, of which the architect is M. Nénot, and which, including the immense library building to contain 900,000 volumes, has taken twelve years to complete, has not yet been decided. The 700th anniversary of the founder of the Sorbonne, Robert de Sorbon, falls on October 9, but this date, although interesting as one appropriate for the inauguration, has for certain reasons not been adopted.

M. Sortais, architect, Grand Prix de Rome, Chief Inspector under M. Bouvard at the Exhibition of 1900, has been appointed Second Inspector of Civic Buildings for the reconstruction of the Palace of the Cour des Comptes.

The house-owners who refused to comply with the terms of the recent law concerning the application of the "tout à l'égout" drainage to their houses, and were summoned by the City of Paris to immediately put into hand the necessary work, have lost their case in the Courts of Law, and have been condemned to pay nominal damages to the City, and to proceed at once to execute the sanitation work comprised in the terms of the law.

As regards their defence, that the City itself had not fulfilled its duties to householders by completing the promised municipal work of sewage disposal, the judges considered that this question had nothing to do with the defendants, these latter having first to fulfil their duties with regard to the terms of the law, and then if they desired they could on their side attack the Municipality for the non-execution of its promises.

Owing to the present diplomatic difficulties between France and Turkey, M. Emile Bertone, architect, Prix de Rome, who had been entrusted with an archaeological mission in Turkey, specially in view of researches at the ruins of Palmyra, has been informed officially that the mission will be changed for one in Germany and Denmark.

As the Commission des Monuments Historiques has found the credit annually voted for the restoration and maintenance of public historical buildings quite insufficient for its requirements, this credit will next year be increased by 12,000*l.*, bringing the amount to 57,000*l.*, an amount which will still be very moderate considering that the Commission has to deal with no less than 2,570 buildings.

NEW HOTEL, HALIFAX.—Plans for a new hotel to be built at the west end of Halifax, prepared by Mr. Lister Coates, architect, of that town, have been approved by the magistrates, to replace one to be removed for street improvements. The works are to be put in hand as early as possible.

### THE BATTERSEA ELECTRICITY SUPPLY WORKS.

LAST Saturday the Central Electric Generating Station of the Battersea Borough Council was formally opened by Mr. Torrance, the Chairman of the London County Council. The large engine-room was crowded with guests, and the speeches, especially one made by Mr. John Burns, M.P., in praise of municipal enterprise, were enthusiastically applauded. Battersea Vestry obtained a provisional order five years ago, so they cannot be accused of undue haste in acting on it. They have wisely made plenty of room for future extensions. Although the plant installed has a capacity of only 1,500 h.-p., yet the buildings will accommodate plant of about 7,000 h.-p., and provision can be easily made for double this amount on the extensive site which has been acquired. One of the most striking features of the building is the octagonal chimney 220 ft. high, which is very substantially built. It measures 25 ft. 6 in. by 25 ft. 6 in. at the base and at the top 13 ft. 6 in. by 13 ft. 6 in. We were very favourably impressed with the appearance of the engine-room. Its height to the top of the roof is 55 ft. 6 in., and the girders for the travelling crane are 34 ft. above the floor. The walls are faced with white bricks embellished by blue and brown glazed tiles, and hence the light in the room is excellent and cleanliness can be easily maintained.

In the boiler-house are four Babcock & Wilcox water-tube boilers, which are fired by mechanical chain grate stokers, two to each boiler. The upper portion of the band, which is formed of cast-iron links, travels slowly from the front to the back of the grate, carrying with it a layer of small coal, which is fed on to it by a hopper in front of the boiler. The thickness of the layer and the speed of the band can easily be regulated by the fireman. The products of combustion on their way to the chimney pass round the 256 tubes of a Green's economiser, through which the feed-water for the boilers is passed. The water entering the boiler is thus raised almost to the same temperature as the water in it, and this leads to a considerable economy in fuel consumption.

The engines are Willans & Robinson triple expansion type, and are directly coupled to multipolar dynamos made by Messrs. Mather & Platt. The dynamos have carbon brushes, and are excellent examples of the best English workmanship. The switchboard is placed on an elevated platform at one end of the room, and there are several novel points in its design. The main dynamo and battery switches are fixed at the back of the main board, and are worked by rods attached to levers placed in front of the board. The voltage of the dynamos is regulated by handwheels placed in front of the switchboard, one turn of the hand wheel moving the rheostat slider over one contact.

The system adopted for the supply of electric energy is the continuous-current three-wire system, the pressure of supply being 230 volts, so that there is a pressure of 460 volts between the outers. The area supplied is fan-shaped, the station which is on the river being at the centre of the fan. The farthest point supplied is 2½ miles distant from the station. The distributing mains are laid on the solid system—that is, the three cables are placed side by side in a cast-iron trough and melted bitumen poured over them; they are then enclosed by a tile covering.

Two batteries of accumulators are used which will enable the steam plant to be shut down at times of light load, and they also assist in maintaining the balance of the three-wire system. There is a very large arc lamp load, 240 street lamps having been erected. Each of these lamps takes ten amperes, and they are connected ten in series between the outers. The lamps are supported on ornamental cast-iron pillars, generally from a bracket from the top of the pillar. The design of this pillar was specially prepared some years ago by the School of Art in Edinburgh, and it has since been used in Westminster, Carlisle, and several other places.

The consulting engineers are Messrs. Kennedy and Jenkin, and the design of the station is very similar to several others recently designed by them. The only drawback to the service from the consumer's point of view, is, in our opinion, the pressure of 230 volts. This is practically the highest pressure allowed by the Board of Trade in this country. We would recommend the Battersea Borough Council to get a batch of 230-volt lamps and another batch of

ordinary 100-volt lamps tested for life and efficiency. It will be interesting to see how much the inefficiency of the consumer's lamps discounts the benefit he receives from a low meter bill. Electricians are apt to forget that it is light and not electric energy that a consumer wants.

### HOUSES AT MALINES AND BRUGES

THESE two views of characteristic bits of street architecture, the one from Malines, the other from Bruges, are from pen sketches by Mr. E. Stanley Mitton, architect, of Birmingham.

### THE ECCLESIASTICAL ART EXHIBITION, BRIGHTON.

THE art exhibition held in connexion with the Church Congress this week at Brighton does not represent ecclesiastical art in this country at its best. If it did represent the best life in church art and handicraft we should feel that "ecclesiastical" and "art" were words henceforward not to be used in conjunction. The exhibits are shop exhibits, feeble copies of old workmanship of an age differing in ideals and in methods from those of the present. We think the Congress has been ill-advised in the title of the present exhibition. It savours more of the bazaar. Art is outside, or will not show herself. Though unrepresented, there are happily a fair number of individual workers

ADDITIONS TO COTTAGE HOSPITAL, LYTHAM, LANCs.—On the 21st ult. there was opened a memorial ward which has been built at the Cottage Hospital, Lytham, by public subscription as a memorial to the late Dr. Luke Fisher, who for nearly thirty years was hon. medical superintendent for that institution, and hon. secretary. The new ward is in keeping with the older part of the building, and is connected with it by a glazed corridor with tiled floor. The accommodation is for five beds. It is cross-ventilated by windows on either side, and fresh air is also admitted under each bed by a special arrangement. The floor is of polished oak, the walls are finished in Keene's cement and painted, and all corners are rounded off so as to prevent accumulation of dust. The architects were Messrs. Heywood & Harrison, of Accrington and Lytham, and the contractors were Messrs. J. E. & B. Myerscough, of Lytham.

HOUSE AT BRUGES

ASSOCIATION OF MUNICIPAL AND COUNTY ENGINEERS.

A HOME counties district meeting of the members of the Association of Municipal and County Engineers was held at Southend on Saturday, September 28. In connexion with the meeting most of the members attending paid a visit on the previous day to the works of Messrs. Millar's Karri and Jarrah Forests, Limited, at Purfleet. The party travelled to Purfleet by special train, and on arrival at the works were entertained to luncheon by the firm, Mr. C. Temperley presiding. After luncheon an inspection was made of the works, which were situated on the north bank of the Thames at Purfleet, and comprise an area of 42 acres laid out in bays, each connected by a railway siding, enabling the travelling cranes to reach each stack of timber. The sawmills are equipped with Temperley's patent cross-cut saws, driven by electric power, and turning out blocks at the rate of 6,000 per hour. The Australian wood is delivered direct on to the works from steamer discharged at a Karri-bull pier, 300 ft. in length by 50 ft. in breadth. After a complete inspection of the works the journey was resumed to Southend.

The business meeting was held in the Council Chamber at Southend, on Saturday morning. Mr. E. G. Mawbey, C.E., Leicester, President, occupied the chair, and was supported by Messrs. W. Nisbet Blair, St. Pancras; Howard Smith, Westminster, T. H. Nabbicom, Bristol; A. E. Collins, Norwich; E. J. Silcock, Leeds; I. Shone, Westminster; T. Cole, Westminster (secretary); C. Jones, Ealing; A. D. Greatorex, West Bromwich; C. C. Smith, Sutton; Hayward, Sudbury; W. Harpur, Cardiff; Walker, Croydon; Pierce, Twickenham; E. P. Hooley, Nottingham, and others.

The Mayor (Mr. J. Francis), who was attended by numerous members of the Council, formally received and welcomed the Association to Southend. He said, although not so large a town as many represented at the meeting, Southend gave evidence that it had carried out works of interest, not only to themselves, but to the general community.

The President, in acknowledgment, said he had never been to Southend before, but it was an agreeable surprise to him to find so pleasant a seaside resort so near to London. He had been struck by the evidence of the great amount of public spirit which existed there. The splendidly complete system of electric traction promoted by the Corporation had been carried out entirely by the Corporation officials. They had also a very excellent sea-water scheme for watering the streets and flushing the sewers. Then, in respect to sewer ventilation, he understood they had shut up all the surface-grids and put up shafts, and that since this had been done they had got rid of all complaint.

On the proposition of Mr. A. D. Greatorex, West Bromwich, Mr. R. J. Thomas, County Surveyor of Buckinghamshire, was re-elected honorary secretary for the Home Counties district.

Mr. A. Fidler, A.M.Inst.C.E., Borough Engineer, then read a paper on the Municipal Works of Southend-on-Sea. He said the population at the last census was 28,793, and the rateable value 200,000. In a decade the population and rateable value had more than doubled, a rate of increase that could only be regarded as sensational. Southend undoubtedly owed its prosperity to its proximity to London. The population was largely residential, numbers of the residents being engaged in business in London, and going to and from there every day. During the season the floating population reached a high figure, very frequently 80,000. The building by-laws in force were based on the model by-laws of the Local Government Board. Three building inspectors were engaged in supervising the erection of new buildings. The drains were all laid on concrete, with water-tight joints and disconnected from the sewers. They were all water tested before being covered up, and finally smoke tested prior to the granting of the certificate for habitation, which must be obtained before occupation of each house. A record book was kept which showed the history of each house inspected. The majority of the houses built were of an annual rental of 35l. to 40l. Recently some very ambitious buildings had been added to the town, large hotels, amongst them the unfinished Hotel Metropole, said to cost 300,000l., and the Kursaal, said to cost 200,000l. The Public Streets Works Act, 1892, had been adopted. As soon as any new road

devoted to ecclesiastical art. Stimulated by the work left by such men as Sedding and the younger Gilbert Scott, they are working upon reasonable lines that admit of scholarly research and originality. The shop article, however, at present represents the taste of the majority of the clergy and laity, a different state of things from when the Church led the way, when art was hid in the Church and sought for in the Church by the laity. That age is represented at the present exhibition by a loan collection of some rare and valuable objects. A fine early thirteenth-century enamelled chalice or reliquary, representing the martyrdom of St. Thomas of Canterbury, a work of great excellence; several plain, but beautifully proportioned, chalices of the seventeenth century; some pierced silver Byzantine work; a later sixteenth-century pair of silver maces. These are some of the most interesting of the gold and silver smith's art. Of many interesting books, a Latin version of the Four Gospels written in Anglo-Saxon characters, not less than 1,000 years old, is most interesting; apparently it was bequeathed to the See of Hereford by Bishop Athelstan, who

died in 1055. It is in a fine state of preservation. Also the original charter of Cuthwulf, Bishop of Hereford; a grant made with consent of Berthwulf, King of Mercia, A.D. 840, besides several fine MSS. lent by the Dean and Chapter of Hereford and by private individuals. The finest embroideries are two examples of Italian work of the seventeenth century, two cope-hoods, one representing Our Lady presenting the rosary to St. Dominic, the other, St. Francis of Assisi, receiving the Stigmata. There are some interesting copies of mural paintings from Sussex churches, the originals being of great interest, representing the oldest and most complete mural paintings remaining in England. Noticeable, also, is a very fine collection of monumental brass rubbings lent by Mr. Henry E. Franks.

WESLEYAN CHAPEL, COTGRAVE, NOTTINGHAM. — Memorial-stones of a new Wesleyan chapel, at Cotgrave, were laid on the 26th ult. The building is to be in the late-Gothic style, and is from the designs of Mr. A. E. Lambert, of Nottingham. It is to seat about 220 persons, and is estimated to cost 1,250l.

or 'street' was sufficiently built upon, which very quickly followed its laying out, steps were taken to make it up in accordance with this Act. The value of work executed in this department averaged 10,000l. per annum. Prior to 1897 the main drainage outfall system was of a very primitive character. Sewage was discharged at many points and at all stages of the tide. The natural result was a foul foreshore with its attendant evils.

The present outfall system was designed and carried out by Mr. Mansergh, President Institution of Civil Engineers, in 1897. The works consist of two systems, viz.:—(1) The Eastern Valley system; (2) The Western Valley system. In each a high level intercepting sewer discharged into a storage tank. There was also in each a low-level area from which the sewage was lifted to the storage tank. Each storage tank communicated with the main outfall which discharged into a channel just covered at L. W. O. S. T., about one mile from the shore, and about 600 yards east of the pier. The sewage is discharged only on a falling tide, i.e., at high water to within two hours of low water. The outfall was 27 in. in diameter, laid at a ruling gradient of one in 1,500, and was capable of discharging on an average 900 cubic feet per minute. Complete records were kept of the daily working and inspection of the foreshore, and it had been demonstrated that if the proper conditions were observed there was no deposit of sewage whatever on the foreshore; it was completely carried away to sea.

The capacity of the Eastern Valley storage tank was 540,000 gallons.

The tank was covered and was constructed similar to an ordinary covered storage water reservoir. The normal daily dry weather flow into the tank averaged 400,000 gallons. The scheme was designed to deal with a population of 40,000 people with an estimated dry weather flow of 800,000 gallons per day. The present population was rapidly approaching that figure, and in view of the expected requirements he had already received instructions to report on the whole question, so that provision might be made in time and prospective requirements be anticipated. Up to two years ago the ventilation of sewers depended upon surface gratings. Reporting on the subject in 1898 he recommended that a ventilating shaft or column should be fixed opposite every manhole and the manhole cover sealed. The recommendations were adopted, and a loan for 3,500l. obtained by sanction from the Local Government Board. Where possible ventilating shafts (glass lined internally) 6 in. by 4 in. internal dimension, were fixed against the sides of the houses and in the highest parts. Where permission to fix these could not be obtained columns were erected on the footpath, 6 in. internal diameter and 30 ft. in height. In the days of surface gratings complaints of foul smells from the sewers were constant. Now they were never received. Southend enjoyed the reputation of possessing the longest pier in the country. The estuary of the Thames was very flat, and low water mark was about one mile from the shores. From the designs of the late Mr. Brunlees the present pier was built in 1890, and cost 87,000l. The pier was extended in 1896-7 by 170 yards by Mr. Brunlees, jun., and Sir J. W. Barry. There was now at the pier head about 30 ft. of water at L. W. O. S. T. enabling very large steamers to land and embark passengers. The current from the pier tramway and electric lighting way generated on the pier premises, but it was intended to obtain power from the central electricity generating station and abolish the present station. The pier undertaking had altogether cost 103,000l., and since its completion had contributed over 15,000l. to the rates. The net profit for the year ended March last was 3,622l. In 1897 the Corporation had conveyed to them about 20 acres of low-lying land in Southchurch for the purposes of a recreation ground. Amongst the conditions attached to the gift were the construction of a lake for the drainage of the remainder of the estate and a conduit to convey surplus water to the sea. He had prepared plans for laying out the land, and of the works proposed there had been carried out fencing, cricket pitches, planting, lake, conduit overflow and valve chambers, and groyne, at a cost of about 5,000l. In 1899 he reported on the question of the utilisation of sea water for street watering and sanitary purposes; the scheme was adopted and the works carried out

at a cost of 10,000l. One of the most important schemes carried out by the Corporation was the light railways scheme. The estimated cost of the whole scheme was 80,000l.

The existing provision in the shape of marine parades and esplanades was inadequate to accommodate the large masses of people so frequently assembled there. The question of carrying out improvements in this direction had frequently been discussed, and many schemes prepared and submitted for adoption. No scheme for the central portion had yet been adopted. The author prepared a scheme in 1899 providing for a continuous parade and sea wall from the front opposite the Halfway House on the east to Chalkwell Hall on the west, a distance of four miles. The estimated cost was 300,000l. Generally the scheme was for a roadway of a width of 70 ft. with a sea wall, but the central portion was to be specially treated. About forty-five acres of the foreshore was to be reclaimed. The reclaimed area to be utilised for lakes, baths, pleasure-grounds, &c. Shops to be built on the north side, and a marine drive on the south side. It was estimated that the receipts from this scheme would have left a profit after paying all charges on loans, maintenance, &c. Against this, if the work was only confined to road-widening, an annual charge would be made on the rates until the loan was paid off. Quite recently, however, schemes had been adopted for the construction of about one mile of 70 ft. wide road and sea-wall on the western end of the pier. The first portion, about 650 yards long, the Corporation executed at their own cost. The estimated cost was 19,000l. The second portion, about 1,100 yards, was being done by arrangement with the Chalkwell Hall Syndicate, who were contributing payments amounting altogether to 8,000l. towards the cost, which was estimated to be 21,500l. In 1898 the Council invited designs for a block of buildings, to contain a Town Hall and public-houses, technical school, free library, and police-station. The designs of Mr. H. T. Hare were accepted, the estimated cost being 40,000l. It was decided first to proceed with the technical school portion only, and the foundation-stone had just been laid by Lord Avebury. This portion would cost altogether 19,000l., towards which the County Council contributed 5,000l. The Corporation owned a considerable portion of the cliffs to the west of the pier, which were laid out and planted and formed a very valuable and appreciated resort for the visitors in the season. In addition, the Corporation had just negotiated the purchase of Chalkwell Hall and grounds (about 23 acres) for a public park at the price of 16,750l.

Mr. T. H. Yabbicom, Bristol, in moving a vote of thanks to Mr. Fidler, said the paper showed that Southend had a very energetic Corporation, anxious to do everything they could for that rising community. Mr. Fidler had referred to the adoption of the Public Works Act of 1873. He (Mr. Yabbicom) thought the weak point of that Act was giving the Justices, who were not experts in road-making, a sort of veto over the wishes and decisions of a committee or council who had devoted a very large amount of time to the subject.

Mr. W. Harpur, Cardiff, who seconded, remarked that there was great difficulty in knowing in what condition wood paving should be laid down. He had been laying down a large quantity of wood paving, and his experience had been the reverse of Mr. Fidler's. The Jarrah, which had been in stock, instead of expanding, had contracted, leaving a joint of 1 in., which they had had to fill up. Now the question was, What was going to arise when they had the wet weather during the winter? Would they have the experience of Mr. Fidler, that expansion pushes the blocks out? He was having a large quantity of that rightly or wrongly condemned red gum, and he would be able to get experience of it. He believed there was nothing like getting one's own experience instead of taking what was in the newspapers.

Mr. G. E. Collins, Norwich, Mr. E. J. Silcock, Leeds, Mr. Howard Smith, Westminster, and others supported the vote of thanks, which was passed unanimously.

The Mayor (Councillor J. Francis) entertained the members to luncheon at the Kursaal, and the afternoon was devoted to inspecting the electric generating station, storeyard, and tramway works.

## Books.

*Land Surveying: Its Theory and Practice.*  
By SAMUEL SKRIMSHAW, F.S.I. London: Frank P. Wilson, *Estates Gazette* Office, 1901.

**L**ARGELY owing to the wise action of the Surveyors' Institution and, we may add, of the Auctioneers' Institute, the necessity for adequate training is now thoroughly recognised as an essential by all who intend to become professional surveyors. In writing the book now before us the author evidently intended to furnish in a convenient form the information most needed by candidates for professional certificates, and to provide a serviceable book of reference for busy practical men. A cursory glance through its pages at once indicates that the general arrangement is well suited to the latter purpose. There are numerous diagrams and other illustrations, which often save pages of wordy explanations; every chapter is subdivided into numbered paragraphs for internal reference, and the subject matter is clearly indicated by a full table of contents and an adequate index. To what extent the other objects of the work have been realised is a point that requires more critical examination.

Neglecting the customary historical sketch, the author begins with a concise statement of the purposes for which a land survey may be made, of the different kinds of surveys, and of the surveys required by the Surveyors' Institution examination. A somewhat lengthy, but necessary, dissertation follows upon the instruments used in land surveying and incidental work. In this section of the volume a useful preliminary feature is a schedule where instruments are grouped according to the purpose for which they are employed. The following extract is given to explain our meaning more fully, and to serve as an example of the method adopted more or less throughout the treatise:—

### "8. Schedule of Implements and Instruments.

Purpose for which used.	Instruments.
The measurement of land.	Chain arrows and drop arrows.
	Offset staff.
	Steel bands and linen tapes.
	Pedometer.
	Passometer.
	Perambulator or viameter."

Another useful feature is to be found in the description and enumeration of the parts common to different instruments, and thus a good deal of needless repetition is avoided. It seems rather a mistake to select for illustration the least satisfactory form of adjusting device for instruments supported on tripods. The old-fashioned four-screw adjustment has the great disadvantage that a sensitive bubble cannot easily be levelled up by its aid so as to remain in the centre of the rim. This difficulty is owing to straining of the screws when moved in or out to any considerable extent, and we certainly think a few words of caution should be included in future editions for the guidance of beginners. In describing levels the author favours the dumpy type, as being more handy than the Y for general use. This preference is easy to understand in a country like our own, where instruments can be sent at any time to the makers for adjustments that cannot be performed by the operator, but in the colonies and some foreign countries it is desirable that the mode of construction should be such as to permit testing and adjusting to be carried out by the surveyor or engineer. The improved forms of levels introduced with the object of complying with this condition are not noticed by the author. We are pleased to observe that in his illustrations of levelling instruments Mr. Skrimshaw indicates the tribrach stand instead of the time-hallowed adjustment above mentioned. A still better arrangement is the ball-levelling joint, permitting the level to be set 15 deg. to the inclination of the tripod independently of the screw adjustment. The form of levelling-staff illustrated, and said to be "most generally preferred," is one specially devised by Mr. Stanley for his point index. It is true that this is fairly popular, although, to be strictly accurate, the form of reading originally devised by the late Thomas Sopwith is still more used than any other. As an instrument likely to remain in favour with land surveyors in Great Britain, the theodolite is more amply treated than some of the other appliances

described. It is somewhat difficult to explain on paper owing to the complicated nature of its refinements. By first describing and illustrating a rudimentary instrument, the author succeeds in imparting a very clear notion of the leading features of the theodolite, and the reader is thus prepared for the complete description that follows of its details, purposes, adjustments, and uses in practice. The box sextant is mentioned at some length in the same chapter, and deservedly so, for on fairly level ground this is a valuable and sufficiently accurate instrument for taking both horizontal and vertical angles. The remaining chapters in this portion of the book relate principally to drawing instruments, and present no features calling for special comment.

Chap. xii. serves as a sort of introduction to the technical discussion of surveying which occupies nearly all the remainder of the treatise. It contains a concise series of technical definitions, statements of the main purposes for which a survey may be made and of the order to be followed, a general outline of the principles of triangulation, and a set of plates reproduced from a field book. By the adoption of this course the ground is cleared very considerably, and the student is prepared to enter upon his work with a sufficient amount of preliminary information. In treating of the measurement of land by chaining, the author describes the ordinary mode of procedure and indicates the steps necessary when obstructions are encountered. Several examples illustrated by diagrams are set forth in so clear and practical a way, that the beginner should have little difficulty in making himself tolerably proficient after a little practice in the field. Much more time must be spent in field work before he can be competent to carry out a complete chain survey, although such an operation may seem to be quite a simple affair as shown by plans and explanations on paper. In suggesting the methods to be adopted, the author employs the tabular form of statement, and then proceeds to give the details of an imaginary survey. Although the example is described as a chain survey, it should be noted that all angles formed by the principal lines are to be read by the theodolite, the use of which was indicated in a previous chapter.

After the field book has been completed, a good deal of work remains to be done in the office. Accordingly the author is led into the writing of several chapters dealing with plotting, the computation of areas, the methods of laying out land, and the apportionment of lands. In entering upon the principles and practice of levelling, Mr. Skrimshaw adopts his system of defining in brief paragraphs the various technical terms applicable in that branch of work. Then follow some general observations upon the art of levelling, expressed in language so simple that the beginner might be excused if he imagined there could be little more to learn. Whilst this would, of course, be an entirely mistaken idea, it is the fact that what remains to be learnt is much more readily appreciated because the reader is better able to grasp the meaning of his mentor, by reason of the preliminary knowledge imparted. Although the treatment of this part of the subject is by no means exhaustive, it appears to be sufficient for enabling candidates to qualify themselves for the examinations specially in the view of the author. Traverse surveying is treated in the succeeding chapter, and here we touch the fringe of the more scientific methods adopted in engineering practice. As a combination of linear and angular measurements, traversing is particularly applicable to boundary surveys, to the survey of roads and rivers, and especially to cases where the measurement of lines across the land would be impracticable. The examples presented by the author refer more especially to the closed traverse, in which operations are completed at the original point of departure, but as the surveyor must frequently have occasion to deal with long, narrow, and winding tracts of country, some detailed instructions as to the mode of procedure in such cases could be usefully incorporated in the treatise. We notice it is said that "traversing may be performed by (a) the theodolite, (b) the prismatic compass," and this remark appears to be insufficiently qualified by the caution that the former should always be used when great accuracy is required. As a matter of fact, the compass is naturally delicate and liable to get out of order, and other demerits render its use in surveying undesirable, except for filling in details after the theodolite. Methods of set-

ting out curves form the basis of the next chapter, the most generally accepted form—that of the circular arc—being alone considered. Two methods are explained—one by offsets and the other by angles—or, as the author describes them, "with the chain" and "with the theodolite." If the former mode of work could be followed with absolute accuracy, the final offset would cut the corresponding tangent as desired. Such a result seldom occurs in practice, except by accident; consequently, at tedious succession of trials becomes necessary until errors have been sufficiently eliminated. The angular method is far more elegant, and is the only one by which circular curves can be set out expeditiously and correctly. Sometimes a curve joining two lines may be partly inaccessible, or the points of junction may be so, and then special treatment is necessary. Confinements of the kind have not been anticipated in the volume before us, and we think that examples suitable for these and other conditions should be included for the complete guidance of the student. Chapters on logarithms and the solution of triangles conclude the treatise. Of course, neither of these subjects necessarily belong to a work on surveying, as they may be studied by the aid of separate text-books. The object of the author has been to equip his student readers with the requisite information for following out all the other teaching conveyed, and the two chapters are well adapted for this purpose. An appendix contains various useful tables, miscellaneous information, and a sample set of examination papers as issued by the Surveyors' Institution.

Although Mr. Skrimshaw's work cannot be described as a profound or complete exposition of the whole subject, yet it possesses a distinct value of its own, and should be of considerable service to those desiring to acquire sound and reliable knowledge of ordinary surveying operations.

*Ripon: The Cathedral and See.* By CECIL HALLETT, B.A. London: George Bell & Sons. 1901.

MR. HALLETT has produced a conscientious little book on the minster church of Ripon. No claim is made to originality of treatment or of views, but his indebtedness to almost all previous writers on the great church, from Canon Fowler down to some modern guide-books, which he had better have eschewed, is fully acknowledged. Indeed, if Mr. Hallett had more opinions of his own, or tried to arrive at some conclusions on puzzles, the book would have been clearer and more readable. As it is, those who know the church fairly well cannot help being rather confused by the diversity of statements put forth, whilst those who visit it for the first time with this book in their hands will, on several points, be left quite to their own judgment as to dates and probabilities. For instance, although Mr. Micklethwaite's conjectural plan and explanation of the crypt are given, other theories and views are woven into the letterpress after such an embarrassing fashion that it is not only impossible to realise what are Mr. Hallett's own ideas, but what all the different statements as to square ends and ape ends, Roman or ultra-Roman, mean. We strongly advise Mr. Hallett to read and study the late Mr. G. G. Scott's masterly treatise on the "History of English Gothic Art," and he will then have clearer ideas of his own on the subject, and consequently be able to impart them to others. As to the old stone pulpit in the north transept, the short paragraph and note about it merely suggest a variety of theories as to date and original position. The fifty-three illustrations are mostly from photographs by Mr. Watson, of Ripon, and come out excellently. We are specially glad to see the clean picture of the twelfth-century vaulting of the north transept aisle. The picture of the exquisite fifteenth-century carving of the quire stalls is another good one; but is not the photograph of the reconstructed angle of the great tower somewhat out of focus?

The history of the church, apart from its description, which occupies the first thirty-seven pages of the book, is well told after a concise fashion. It adds much to the value of the book that a plate is given of the striking and in some ways beautiful west front of Early Perpendicular date, unfortunately cleared away in the 1862-70 restoration. The descriptive part of the book fails in lack of explanation of the extent of the various Victorian alterations. The high altar was then removed to the

easternmost arch, thus destroying the old processional path.

*Llandaff Church Plate.* By GEORGE ELY HALLIDAY, F.R.I.B.A. London: Bemrose & Sons.

THIS is a remarkably good and clearly-compiled book on the church plate of the diocese of Llandaff, that is of the counties of Glamorgan and Monmouth. Mr. Halliday is much to be commended in having refrained from giving a long general introduction on the question of old church plate in general, and of English in particular. This has been already done far too often by the compilers of lists for other counties. Mr. Halliday's diligence in searching out and describing the church plate of all the parishes in these two counties—many of them in out of the way districts—has been rewarded by bringing to light many interesting examples. There is only one piece of pre-Reformation plate left in the diocese, and that is the paten now in use at Llanmaes, Glamorgan, which has not previously been chronicled or illustrated. The hall-marks undoubtedly point to 1495 as the date; in the centre is the vericle, or face of our Lord. The diocese possesses about seventy-five examples of chalices of the Elizabethan period, many of them with their paten-covers still remaining. Some of them are of unusually good design; the best of those with the ordinary foliated strap work pattern is that at St. Michael's Church, Risca, Monmouth. It bears the date 1573 on the paten-cover. At St. Mary's, Monmouth, is a grand piece, hall-marked 1501, which is quite unique as a chalice. The cover takes a spiral form and is richly embossed; it is much like a standing cup (1598) belonging to the Armourers' Company. Mr. Halliday seems to doubt it having originally been a secular cup because of the shape of the bowl; but it is quite impossible that a church cup at such a date could have been designed with a cover of this kind. There are several most interesting Commonwealth specimens, as well as some double-handed porringer-shaped cups of later date and similar origin, and also a few with the heraldic bearings of their donors. Nor has Mr. Halliday forgotten to take note of the old pewter still scattered about in the rural districts of the diocese.

Among other useful though rather painful results of putting on record such a catalogue as this is the exposure that is made of the poverty-stricken character of much of the "plate" (2) now in use in the diocese. It is distinctly discreditable to the diocese that upwards of twenty churches, and several of them in towns, only use Sheffield or other kinds of plated silver. In one parish, that of Tonyrefail, the only vessels are of pewter. In two other cases they are of "white metal." At Cwmcarn, Monmouth, it is said that "the vessels belonging to this church are of glass;" whilst at Bettws St. David, in the same county, the vessels are "a chalice, paten, and flagon, brass, tinned inside."

The illustrations supplied by Mr. Halliday are numerous and excellent of their kind, whilst the typography and arrangement do credit to the publishers.

*A Theoretical and Practical Treatise on Oblique Bridges in Stone and Brick.* By FRANCIS CAMPIN, C.E. London: The Publishers of the *Railway Engineer*.

THE little book suffering from this formidable title is an interesting chapter on the subject of oblique bridges, but it has neither the form nor the method of a treatise, in the ordinary acceptance of the term. After a few general observations upon the conditions necessary for stability in masonry and brick structures, the author proceeds to show the method of preparing the drawings from which to build a skew arch. The demonstration occupies about thirty-four pages, or nearly three-fourths of the whole essay, and is based entirely upon one example taken from actual practice, in which the section of the arch on a line at right angles to the axis forms a segment of a circle. Such a section necessitates the use of skew backs shaped so as to fill the triangular spaces resulting from the oblique intersection of the bed-joints with the line of springing. The author does not mention the fact that this treatment is unnecessary if an arch springs vertically from the abutments in such a way that none of the bed-joints intersect the line of springing. We notice he implies that the bed-joints should be

spirals winding around the axis of the arch. This is correct so far as practice is concerned, although it must be remembered that spiral joints are merely adopted as an approximation, because joints of the correct form are difficult of execution. No mention whatever is made of the ribbed skew-arch, a method of construction usually followed in the United States, and sometimes adopted in this country. It certainly ought to receive notice in a work professing to be a treatise. With the exception of six lines referring to brick arches, the whole of the book is devoted to stone bridges. An improvement would be effected if the various steps to be taken in the preparation of the drawings were arranged in consecutively-numbered paragraphs, and it might also be convenient if practical hints on constructional details, templates, and gauges were separated from the demonstration of theoretical principles.

*Practical Mathematics for Beginners.* By FRANK CASTLE, M.I.M.E. London: Macmillan & Co., Limited, 1901.

LIKE a previous work by the same author, termed "Elementary Practical Mathematics," for the volume under our notice is intended for the assistance of students attending classes where the syllabus of Practical Mathematics issued by the Board of Education forms the basis of the lessons. The plan of the book is admittedly due to the inspiration of Professor Perry, who, it is well known, seeks to place the teaching of mathematics on a practical basis. His views were put forward at the recent meeting of the British Association, and met with a good deal of support from those present, although allowance had to be made for the unmathematically humorous terms in which they were expressed. The particular mode of teaching mathematics advocated is rapidly growing in popularity, but, as Mr. Castle admits, the subject is in a tentative stage. This condition probably accounts for the recent revision of the syllabus by the responsible authorities, and incidentally for Mr. Castle's present book, which might very well have been described as a revised edition of his former work. Judging by the preface, the "tentative stage" appears to exist also for the author. In his former treatise it was said that the inability of students to profit by technical instruction given in polytechnics is largely due to insufficient preliminary training in mathematics. Now we are told that engineers and artisans can be given a mathematical training through the agency of their daily work, and preliminary training upon academic lines is said to be unsuitable for the practical man. We are rather afraid that the author has been taking some of Professor Perry's hyperbolic language in too literal a sense, for to suggest that engineers and artisans can be conveniently trained through the agency of calculations made in the course of work is about as reasonable as to propose that authors should learn spelling and grammar by the aid of the books they write. Of course, every one who is wise will continue to learn as long as he lives, but the value of preliminary training must not be depreciated. In the body of his useful and carefully considered work, Mr. Castle provides adequately for those in want of this preliminary training, thus affording another proof of the adage that "example is better than precept."

### DESIGN FOR THE ARCHITECTURAL TREATMENT OF VAUXHALL BRIDGE.

**I**N a paper a year or two ago at the Institute of Architects on "The Architectural Treatment of Engineering Structures," the question of the treatment of Vauxhall Bridge, which was then attracting so much attention from architects, was touched upon, and I appended to the paper a small elevation and section, of very simple and plain character, merely showing the principle of treatment by which, accepting the engineer's arch-lines and parapet line as conditions imposed, the bad effect of the very thin crown of the arch might be minimised by the reduction of the cornice to a corbel-table, and carrying the voussour lines right up to this over the whole surface of the arch masonry. In the

same small drawing a buttress form of treatment, different from that which has been usually employed in large bridges, was suggested.

It has been a matter of some interest to me to try what could be done with this skeleton idea, when worked out into a more complete and architectural form, and I endeavoured to do this, though somewhat hurriedly, in the geometrical drawing published in this issue, and which was prepared and exhibited at the last Royal Academy exhibition. The perspective view which is also published in this issue was made subsequently in order to try the effect of the design in perspective.

As far as Vauxhall Bridge is concerned, at the stage at which the work has presumably now arrived, the interest of the design may be regarded as of purely theoretical or academical character; a fact, however, which removes one objection to its publication. As an attempt to deal with the problem from a new point of view, it may not be without interest to architects; and if any engineers condescend to look at it, it may also serve, at all events, as an explanatory diagram to make clear some points which it is not very easy, in general, to get engineers to enter into.

It must be remembered that this is a design for facing with granite a concrete bridge, and the object of the treatment of the voussours is partly to suggest this idea. In the original design of the County Council engineer a great point was made of having a large cornice (very badly profiled) and a very heavy course of rusticated voussours, with the idea of imparting "power" to the design, as if this rusticated arch were the main element in the stability of the arch. Instead of this, the stability of the arch really resided in the concrete construction behind the granite, and the rusticated voussours were not only a sham expression of the structure, but really an unnecessary weight added to it. A further resthetic result of the large cornice and the large voussour course was that, owing to the narrow limits left between the crown of the arch and the road line, the cornice and the voussours were crushed up together at the crown in a most clumsy manner, the voussours shorn of nearly all their depth and apparent stability and reduced to mere squares of masonry, and the appearance of the crown of the arch hopelessly weakened. In fact, a worse piece of design in masonry has seldom been seen. It is to be hoped that in execution, at all events, there is to be some improvement on this.

The idea in the treatment of the arch face in my design was this: by reducing the cornice to a corbel-table of moderate proportions a greater height and a better proportion is left for the centre voussours. By carrying out the voussour treatment throughout, and by slightly recessing each alternate voussour and treating it in a decorative manner by fluting it, the idea of its being a flat *renflement* and not an important constructional arch is conveyed, or is meant to be; and the alternate thinner and thicker proportions of these voussour courses show, on the soffit of the arch, as an effective margin to the concrete surface, and as toothed into the concrete in a manner that suggests the coherence of the whole structure. The voussour facings might perhaps very well have been thinner than they are shown in the drawings. Heraldic escutcheons surrounded by wreaths are introduced as an appropriate and effective manner of relieving the wide surface at the haunches of the arch.

The treatment of the pier would be as applicable to a purely masonry bridge as to a concrete structure faced with masonry. It represents the face of the pier treated as in my opinion it always should be treated, as a kind of buttress, not as a feature designed to support vertical weight, as it almost always is treated. Indeed, this is the only design for a bridge on a large scale that I have ever seen, in which this buttress principle has been adopted or suggested. Although the decorative details are classic in type, the treatment of the centre projection carrying the lamp-standards, and breaking out as a projection from the lower face of the buttress, is really suggested by Gothic rather than Classic associations.

Some people seem to have an idea that it is a rigid rule to have the lamp-standards over the centre of the arch, and when my first sketch of the idea was published in the *Institute Journal*, some wisacre was good enough to tell me in print with an air of authority, that I had got the lamp-standards "in the wrong place." If he had known anything about the subject he would

have known that, as far as Thames bridges are concerned, the authority as to the right or wrong place for the lamp-standards in a practical sense, is the Thames Conservancy, whom I consulted in the matter, and who sent me a long letter going into the whole subject, the broad conclusion of which was that there were precedents on the Thames bridges for both positions; that they were rather uncertain at present which was really preferable, but that their opinion on the whole was in favour of having the lamp-standards over the pier rather than over the arch. In an architectural sense there can be no doubt that the best position for the lamp-standards is over the pier, where they can form the culminating point of an architectural base or pedestal. In the present case this is emphatically so, because the weak point of the bridge, on the engineering lines, is the want of depth at the crown of the arch, and the position of a large lamp-standard there would appear to emphasise this defect by adding weight just where the structure looks weakest.

Another point in the design to which I may draw attention for a practical reason, is the nature of the crown moulding or finish to the rusticated cut-water pier, which is formed by a series of recessed filets, so as to avoid any projection under which any part of a boat might be caught, with a rising tide. This is not an imaginary danger.

It may be added that the tone-block reproduction of the perspective does not quite truly represent the actual values of light and dark; foreground cutwater buttress should be a good deal darker under the arch; and on the other hand the shadow of the central projection of the buttress, for some reason, has come out much too black. Tone-block reproduction is a rather capricious process, and one never quite knows how it will deal with lights and darks in a drawing.

H. H. S.

### DESIGN FOR BRIDGE OVER THE WEY, AT GUILDFORD.

WE must regret that this sheet of drawings does not represent a bridge that has been or is to be carried out, as the Guildford Corporation eventually determined, it appears, to erect an iron bridge. The design however is of considerable interest as an example of an architect's treatment of a small bridge in a country town, and shows also that in such cases it is possible to find an architect who can dispense with the assistance of the engineer, as the author's business-like structural details indicate. The treatment of the lines of the parapet is very graceful, and the balustrade and other details show a departure from ordinary precedent. The following is Mr. Ricardo's note on the design—

"The bridge at the foot of the High-street at Guildford was partially destroyed the winter of 1890-1891 by some stacks of timber drifting loose owing to a violent and sudden flood, and getting jammed in one of the two effective archways. As the waters rose the timber prised up the arch from underneath—a very unexpected form of accident. The bridge originally was a mediæval five-arched stone structure, built to supplement the ford, but in time the encroachments of the town absorbed two of its arches. About one hundred years ago, owing to the increase of traffic, the bridge was nearly doubled in width by brick arches springing from the abutments and sterlings on one side. A further increase of width was obtained subsequently by carrying the footway on iron cantilevers.

The proposals before the Town Council were three:—

1. To retain as much of the existing structure as possible, and to bridge over the gap with a masonry arch, using the existing abutments.
2. To make a new bridge in concrete faced with brickwork on fresh piers and new abutments, and so increase the waterway; and
3. To make an iron structure, going from bank to bank, and giving a waterway clear of all obstruction.

This last scheme is what has been eventually adopted by the Town Council.

In the scheme illustrated the difficulties that had to be met with were those of height, and that the axis of the bridge was not perpendicular to the axis of the stream. It was required that the roadway of the new bridge should not rise so steeply as that on the old bridge, whilst the height above the waterline should be increased for the accommo-

Breamore Bridge. Mr. W. J. Taylor, Engineer.

dation of barges laden with hay, timber, &c. The skewness of the piers was proposed to be masked by carrying the footway on arches perpendicular to the main axis of the bridge, starting from corbels on small abutments rising from the cutwaters, the spandrels to be filled in with local (Bargate) stone, the balustrade and parapet to be made of Purbeck, the bricks to be thin red paviers well fused by hard burning. The main mass of the structure to be of Portland cement concrete.

The builder's estimate for removing the damaged structure and erecting the new one as shown, exclusive only of metalling the roadway, was 5,300*l*.

HALSEY RICARDO."

**BREAMORE BRIDGE, HAMPSHIRE.**

THIS "county bridge" is situated in the west of Hants, about eight miles south of Salisbury, and carries the district road from Breamore to Woodgreen across the River Avon. The new bridge, just erected by the County Council, replaces an old wooden structure which has spanned the river at this point since the year 1846, up to which date passage was obtained by a ford only.

The new bridge consists of two spans of 41 ft. 5½ in. each, with a clear width of roadway of 16 ft. The girders are of the lattice type, and built of English steel; the roadway is carried on corrugated steel sections, spanning from girder to girder and rivetted to their lower flanges. These sections are covered with tar concrete, on which the ordinary road metalling is laid.

The pier and abutments are of red brickwork and concrete with Swanage stone templates and dressings.

The bridge is calculated to carry the heavy traffic of the present day with the usual margin of safety.

It will be noted that the girders, forming an arc of a circle from abutment to abutment with a 9 in. rise in the centre, are fixed clear of all masonry and brickwork so that all parts may be as far as possible easy of access for painting and inspection, and the lines of construction show themselves and preserve the simplicity of the work. The outside members of the stiffeners are scrolled and looped up over the top flanges of the girders.

Separate tenders were invited for the steel superstructure, and the girders were made by the Thames Ironworks and Shipbuilding Company, who, notwithstanding the additional

trouble involved by some parts of this small work varying from the usual practice, took the greatest pains to faithfully interpret the drawings. The substructure was satisfactorily carried out by Mr. F. Osman, of Southampton, and the foundations being in shingly gravel gave some trouble.

The bridge was designed by Mr. W. J. Taylor, the County Surveyor of Hants.

**TRADE CATALOGUES.**

MESSRS. JAMES TRUSCOTT & SON, of London, send us a copy of "The Engineering Price List," which is said to be "the recognised medium for shippers and export merchants." It is difficult to know why the volume should be called a "price list," inasmuch as, with the exception of the index, it consists entirely of advertisements, very few of which include prices. Although the book does not appeal particularly to the bulk of our readers, it may well be useful to firms desirous of ascertaining suitable sources of supply for various classes of machinery and engineering materials.

We have received from Messrs. Barford & Perkins, engineers, Peterborough, a copy of their catalogue of "steam cooking, heating, and laundry appliances." The cooking section contains illustrations of boiling pans, vegetable steamers, ovens, boilers, and other apparatus required in the kitchen departments of large buildings. A statement of the fittings required for various numbers of persons will be of service. The laundry section contains illustrations and descriptions of Washington Lyon's well-known steam disinfecting apparatus, in addition to laundry and washhouse machinery and fittings. The catalogue might with advantage have been extended. The descriptions are too meagre to be of much service, and the sizes of the different apparatus are, with few exceptions, left to the reader's imagination. No doubt fuller information can be obtained "on application." A list of important works fitted up by the firm is given in the catalogue, together with a number of testimonials.

The Bon-Accord Acetylene Gas Company, of Aberdeen, send us their new catalogue of appliances for generating and utilising acetylene. The price of a generator, with purifier and all the generator adjuncts, is quoted at 15*l*. for one of sufficient size to supply ten 25 candle-power lights for nine hours, 50*l*. for one to supply sixty lights, and 130*l*. for one to supply 160 lights. The company state that they have fitted a large number of steamships with acety-

lene installations, and that the generators have been found to work satisfactorily in all weathers. For harbour and railway works, and for contractor's work in general, portable lamps of high candle-power and convenient form are manufactured. The calcium carbide required for the generation of acetylene must not be stored in larger quantities than 5 lbs. (in separate 1 lb. tins) without a licence from the Local Authorities; but the company undertake to procure the necessary licence for their customers when required, the cost of which is 5*s*. per annum.

Messrs. J. H. Sankey & Son send us their new general illustrated catalogue, which comprises three sections—sanitary goods, bricks and tiles, and fireclay goods. Their stoneware pipes have been tested at Kirkcaldy's, and it is stated that the 4 in. 6 in. and 9 in. sizes have stood an average test of 4,000 lbs. The catalogue of course includes all kinds of pipe junctions and bends, and they note a novelty in connexion with this class of work, in the shape of an interceptor with a spirit-level attached, to ensure level seating. There are some good sections of pedestal closet, though the one called the "Trent" we cannot recommend in consequence of the shallowness of the standing water in the basin. The porcelain enamelled fireclay lavatory range is an excellent article of its class. The catalogue includes enamelled and salt-glazed bricks, fire-bricks, &c., as well as their "Purimachos" fire-cement, which is stated to be capable of withstanding a greater heat than that necessary for the fusion of iron. A very large number of stock sizes of fire-bricks and tiles are kept in stock. The firm should, however, get some better designs for their "red finials," garden vases, &c.

The General Iron Foundry Company send us a large illustrated price-list of their ranges, stoves, mantel registers; iron, wood, and marble mantels; steam cooking apparatus; baths, lavatories, and closets; sanitary castings; soil and rain-water castings; general castings, and stable fittings and hot-water goods. The catalogue illustrates a great variety of ranges, large-size, cottage, portable, and ship ranges, and a set of directions for the best fixing of ranges. Of the large variety of grates illustrated, many are over-ornamented, and though we cannot afford space to particularise them here, the firm may be assured that, in a general way, it will be the plainer ones and not the ornate ones that will please the best architects and the best class of customers. Most of the iron mantels, too, are behind the day in point of design, and the firm would find

t worth their while to go to one of the artistic architects who have given attention to design of this class, and get a superior class of designs from them. All the practical work in the catalogue seems to be very good.

The Crittall Manufacturing Company (Manor Works, Baintree) send us a handsomely got-up folio catalogue of iron casements, sashes, doors, gearing &c. They illustrate their casements in a most practical manner, by numerous full-size sections of the working parts, which show what good provision is made for rain-tight qualities. There are full technical illustrations, also, of the Crittall "Safety" casement, capable of being reversed for cleaning. The malleable iron handles and casement stays show variety and very good character of design. The catalogue includes elevation drawings of sashes for various purposes, sash gearing, sliding doors, wrought-iron roofing, &c. It is a useful and practical catalogue, well illustrated and in the right way—for use rather than show.

Messrs. George Anderson & Co. (Carnoustie, Dundee) send us, through their London agents, Messrs. M. Powis Bale & Co., a short illustrated list of their stone-working machinery and contractors' plant. These include their patent diamond saw, with diamond cutters electrically welded into the blade, for sawing sandstone, limestone, marble, &c.; also a swing frame saw, a rotary disc polishing machine, a planing and moulding machine; a circular rubbing bed for polishing stone, marble and granite; a stone channelling machine for quarrying; and derrick cranes and aerial ropeways.

### Correspondence.

To the Editor of THE BUILDER.

#### PRODUCTS OF GAS BURNING.

SIR,—Your able contributor, in the thirteenth section of his series of articles entitled "Gas and Gas Fittings," states, at p. 275, that one of the objections to the use of gas is "(3) . . . the formation of carbon dioxide" (carbonic acid gas=C.O<sub>2</sub>). Now, the Bunsen or atmospheric burner, in which air is mixed with the gas before combustion, and which gives a blue flame with much heat and but little light, produces mostly, not carbon dioxide, but the more deadly poisonous carbon monoxide.

As the incandescent burner is primarily an atmospheric burner, and gives off the deadlier monoxide before the mantle is placed in position, I would be thankful to be informed distinctly and authoritatively whether the incandescence produced by the mantle has the effect of transforming the product of combustion from mainly carbon monoxide to mainly the comparatively less harmful carbon dioxide. If that is so, the result is not more prejudicial to health than the use of ordinary flat-flame and argand burners. Am I right in so assuming? A. H.

\* \* \* When the gas is burning under normal conditions the Bunsen or atmospheric burner does not produce carbon monoxide in the ultimate products of combustion. Carbon monoxide being a combustible gas, any volume of this product of incomplete combustion which may be formed within the flame is oxidised into the comparatively harmless carbon dioxide before it can escape from the outer zone of flame. The products of combustion evolved from an incandescent burner are not affected by the presence or absence of the mantle. A false alarm was raised in 1894 by M. Gréhan, who contributed to the *Comptes rendus de l'Académie des Sciences* the results of some experiments which he believed proved that a minute proportion of carbon monoxide was present in the product of combustion from incandescent burners. In a subsequent note contributed in the same year to the same journal he admitted, however, after experimenting upon a dog, that the use of the incandescent burner is not attended with any danger of poisoning by carbon monoxide. In view of the importance of the subject an investigation was subsequently made by the *Lancet* Sanitary and Analytical Commission, with the result that the commission reported (January, 1896) that no trace of carbon monoxide could be discovered in the combustion products from incandescent gas burners.

THE WRITER OF THE ARTICLES.

#### LONDON STREETS.

SIR,—The metal bins for the reception of gravel, sand, and the like, placed in the streets for roughing the roads when slippery, "have come to stay," but they are as ugly as they are useful. In these days of art applied to objects of daily use there is nothing to prevent these receptacles being made by a series of ornamental iron castings, like good old firebacks, and bolted together in segments, so that any size and shape could be produced to suit the

position. I expect by the new improved American moulding machines now in use the cost would be found less than the present ugly ones.

As regards the roughing material, fine gravel is generally used. This is the hardest and toughest part of quartz flints, the remains after ages of wear. When crushed these produce the most powerful abrasive, which not only cuts away the roads, but the horses' shoes and feet. A somewhat softer material would probably answer better, such as granite and syenite chippings, or mountain limestone. W. BRINDLEY.

\* \* \* As to the first part of Mr. Brindley's letter, we confess that we do not see any particular suitability in surface decoration for gravel-bins, and should regard the proposal to make them "ornamental" with some anxiety. The best art in such a case is to give them the best form for their practical use.—Ed.

#### GAS AND GAS FITTINGS.

14.—SHADES, CHIMNEYS, REFLECTORS, AND GUARDS.

#### LAT-FLAME SHADES AND GLOBES.

—Shades are usually placed around gas-flames to produce greater diffusion of the light, to prevent the irritation caused by exposure of the eyes to direct rays of light from the naked flames, and to give a more pleasing appearance to the apartment illuminated.

All shades (the term "diffusers" would be preferable) offer a certain obstruction to the passage of light, but the proportion of light obstructed varies according to the shape of the shade and the material of which it is constructed.

Mr. W. King found that when No. 3 fish-tail burners were employed, globes of different descriptions obstructed the passage of light in the proportions shown in the following table:—

	Loss of Light.
Clear glass globe	10.57 per cent.
Ground " "	29.48 " "
Smooth opal " "	52.83 " "
Ground " "	55.85 " "
Ground opal with painted figures	73.98 " "

The obstruction exerted by glasses of different descriptions and thicknesses is shown in the following table of results obtained by Mr. F. H. Storer, and published in *Silliman's American Journal of Science and Arts*. He placed sheets of the various glasses at a distance of 3 ft. from the Argand burner (with ordinary chimney) in which the gas was consumed, and determined the loss of light in each case:—

Description of Glass.	Thickness of Glass.	Loss of Light.
Thick English plate	3/4 in.	6.15 p.c.
Crystal plate	1/2 "	8.61 "
English crown	3/8 "	13.08 "
Double English window glass	1/2 "	9.39 "
Double German	1/2 "	13.00 "
Single German	1/2 "	4.27 "
Double German ground	1/2 "	62.34 "
Single German	1/2 "	65.75 "
Berkshire (Mass.)	1/2 "	62.74 "
Berkshire enamelled*	1/2 "	51.23 "
Orange coloured window glass	1/2 "	34.48 "
Purple ditto	1/2 "	85.11 "
Ruby ditto	1/2 "	89.62 "
Green ditto	1/2 "	81.91 "
A porcelain transparency	1/2 "	97.68 "

\* Ground only on portions of its surface.

Mr. Storer thought that the percentage of light obstructed remained the same whatever

the distance between the illuminant and the glass screen; but in the year 1881, the late Mr. Hartley contributed a series of papers on "Observations on Glass as an Obstructor and Reflector of Artificial Light," to the *Journal of Gas Lighting*, in which he gave the results of a long series of experiments he had conducted with both Argand and flat flames to ascertain the influence of different kinds of globes upon the light obtained in a horizontal and in a downward direction, and he found that the greater the distance between the flame and the glass, the greater was the proportion of light obstructed. Hartley's papers are worthy of careful study by manufacturers of gas shades, and the general conclusions he drew from the results of his experiments, and enumerated in the following order, may serve as a useful guide in the selection of shades for different purposes:—

#### Horizontal Lighting: Sheet Glass.

1. That ordinary sheet glass, apart from thickness, varies in its obstructive power to the passage of light. That the percentage loss increases with the distance of the glass from the flame, and increases also as the light grows stronger.
2. That ground sheet glass, apart from thickness, also varies in obstructive power. That the percentage loss increases with the distance of the glass from the flame, and decreases as the light grows stronger. That the percentage loss depends on which side, clear or ground, is presented to the flame.
3. That with flashed opal the losses follow the same law as ground glass for distance from, and for power of light.
4. That with clear glass as an obstructor of light in front of the flame, and clear glass behind the flame as a reflector of light, the reflected light reduces the loss to a degree dependent on the distance of each glass from the flame.

#### Globes.

5. That a clear glass globe obstructs light from an Argand flame, but increases the sensible light from a flat flame.
6. That globes of ground glass obstruct less light than sheets of ground glass: That the percentage loss diminishes as the light grows stronger; and is, for an average light, from 18 to 20 per cent.
7. That opal globes obstruct an amount of light equal to 33 to 65 per cent.

#### Overhead Lighting.

8. That the amount of light yielded by a flame in an angular direction is much less than it yields in a horizontal direction.
9. That glass globes with elevated or overhead Argand flames reduce the power of the light—clear globes, about 3 per cent.; ground globes, about 21 per cent.; and albatrine globes, about 23 per cent.
10. That glass globes with flat-flame burners, at a certain elevation and within a certain radius, increase the power of the light—clear globes, about 6 per cent.; ground globes, about 9 per cent.; albatrine globes, about 23 per cent.; and German opal globes, about 21 per cent.
11. That reflectors greatly increase the power of the light, within a radius dependent on the shape and size of the reflector; the range in the experiments being from 52 to 92 per cent.
12. That screens at the base of an Argand flame cause a reduction in the power of the light, whatever be the size and form of the reflector.

It is especially noteworthy that when the shades are used on overhead burners, as is usual in practice, the loss of light occasioned by their employment is not nearly so great as that indicated by the early experiments of King and Storer, who measured only the light obstructed in a horizontal direction.

The shape of the shades is a matter of considerable importance. Globes with narrow openings at top and bottom were at one time almost universally used, but are now recognised as the worst form of shades for flat flames that could be devised. The contracted openings cause the globe to act as a chimney, the heated air and products of combustion escaping through the small opening at the top of the globe cause a strong draught of cold air to be drawn through the narrow opening at the bottom and brought in contact with the flame, with the result that the flame is constantly

flickering, and, owing to the cooling action of the current of air, emits less light.

In some cases the shade is made with a more open top, while the narrow opening at the bottom is retained. Such shades are less objectionable than those with a narrow top, but still cause flickering of the flame, and are not so good as those with an opening 4 in. or

Fig. 32.—Flat-flame Shades of Bad Shape. Two 5 in. in diameter at both top and bottom. Two of the old forms of shade are shown in fig. 32, while more modern shapes, with large

Fig. 33.—Flat-flame Shades of Good Shape.\* openings at top and bottom, are shown in fig. 33.

**Holophane Shades.**—A new type of shade, designed by Psaronidati and Blondel, has been placed on the market under the name of the "Holophane" globe or shade. (Fig. 34.)

Fig. 34.—Holophane Shade.

The globe is made of clear glass, and the exterior side of the shade has horizontal prismatic lines running round it, while the interior has vertical prismatic lines. The horizontal prisms are moulded to deflect downwards some of the light which would otherwise be thrown against the ceiling, and thus more light is obtained in a downward direction when a holophane shade is used than when the flame or mantle is employed in a naked condition. The presence of the vertical prisms causes the light to be more evenly distributed over the shade than it would be if the horizontal prisms only were present. Professor Leves has published the following table of results which he obtained with holophane and other shades placed over a Welsbach ordinary burner with chimney. The figures represent the average gain or loss of light due to the use of the shades when the objects to be illuminated are situated (as in ordinary use) at angles varying between the horizontal and 45 deg. below it:—

Percentage Gain or Loss of Light Due to the Use of Various Shades with a Welsbach Mantle.	
Shade.	
Holophane—Tulip shape	Gain of 12.3 p.c.
" Conical shape	" 13.1 "
" Conical " pink	" 11 "
White opal globe	Loss of 7.5 "
Ground glass globe	" 12.4 "
Frosted glass—Tulip shape	" 11.2 "
Frosted glass—Pink	" 23.2 "
Pink opal globe	" 34.1 "

\* The expression "good shape" refers, of course, only to the practical suitability of the shape.

The Holophane globes do not, of course, possess the power of generating light, but merely deflect downwards upon the table and floor some of the light which would otherwise be thrown in an upward direction. They are manufactured in all shapes and sizes, and are equally suitable for use with coal gas and acetylene flames, or for incandescent gas lights.

**"Jena" Bulbs for Incandescent Gas Lights.**—Instead of using an ordinary cylindrical chimney with the Welsbach "C" or "York" burners, the chimney known as the "Jena" incandescent gas bulb, introduced into this country by Messrs. Falk, Stadelmann, & Co., may be employed. This bulb (fig. 35) has a number of holes around its lower circumference, which should be on a level with the top of the burner when the bulb is placed in position. Two or three holes are also made in the upper part of the bulb for the escape of the products of combustion. A small brass cone is slipped over the burner head and forms a base-plate for the bulb, so that no current of air can flow upwards to the flame. The air required for combustion (other than that drawn into the Bunsen tube of the burner in the usual manner) flows to the flame in a lateral direction, through the side holes. The bulbs are manufactured at Jena of a glass capable of withstanding great heat and sudden changes of temperature without injury.

It is usually found that an appreciable increase in the intensity of the light emitted by the mantle is obtained by adopting this device, and the mantle is protected from draughts and dust to a greater extent than when chimneys of ordinary shape are used. Glass screens are manufactured in a variety of patterns to surround the lower part of the bulb, and the bulb has then a very pleasing appearance. These "Jena" bulbs are not, of course, intended to be used with the chimneyless burners.

**Chimneys.**—Chimneys are required with Argand burners and with certain descriptions of incandescent burners, because the flames from these burners would otherwise be of long, irregular shape and would be too unsteady for lighting purposes. The gas issuing from the burner-head under low pressure does not induce sufficient air to flow towards it to cause oxidation to proceed with the required speed, and the flame becomes elongated owing to the greater distance it has to travel before meeting with the volume of air necessary for complete combustion. Immediately a chimney is placed upon the burner an upward current of air comes in contact with the flame, and causes combustion to take place more readily, with the result that the flame becomes shorter and more rigid. The proportion of light obstructed by glass chimneys varies with their thickness and colour. It is impossible to ascertain the proportion obstructed by a chimney of the best quality, because the burner cannot be used without a chimney of some description, but an approximate estimate can be obtained by reference to the experiments of Hartley and Storer previously mentioned. Chimneys made of glass rods have the advantage of causing better diffusion of the light than plain glass chimneys, but this is counterbalanced by their greater liability to break and the greater difficulty experienced in cleaning them.

Mica chimneys are extensively used for incandescent burners, and have the advantage of being practically unbreakable, but they obstruct a considerable proportion of the light. Chimneys made of mica of inferior quality are liable to become ragged and unsightly and to obstruct fully 25 per cent. of the light from the mantle or flame, but a chimney of good quality will remain in good condition for an indefinite period, and should not obstruct more than 15 per cent. of the light.

**Reflectors.**—The object of reflectors is to obstruct the passage of light thrown in those

directions in which it is not required, and to send it into the field to be illuminated. Mirrors and polished metals are excellent reflectors but bad diffusers of light, and are not agreeable for indoor illumination, although most valuable when the light has to be concentrated into one strong beam, as in searchlights.

Reflectors made of opal or thin porcelain have a much more pleasing effect for indoor use, and may increase the light thrown in any particular direction by fully 60 per cent. The angles of inclination of the sides of reflectors were at one time very frequently made too acute, a portion of the light from one side of the reflector being thrown upon the opposite side, instead of upon the object to be illuminated, but the advantage gained by inclining the sides at more obtuse angles is now generally recognised.

The most agreeable form of light is that obtained entirely from diffused reflected light, both the sources of light and the reflectors being entirely concealed from sight. This method of lighting is extravagant, but where the ceiling is white and the walls are covered with paint or paper of a light tint the cost need not be prohibitive.

**Guards for Naked Flames.**—In many cases where naked flames are in use the risk of fire may be materially reduced by the employment of wire guards (fig. 36). When the flames are

Fig. 35.—Jena Bulb.

Fig. 36.—Guards for Naked Flames. a. Without top-plate. b. With top-plate.

less than 3 ft. from the ceiling the wire guards should be provided with covers of sheet metal.

QUEENSLAND FOREST TREES.

THE following information in regard to Queensland forest trees is forwarded to us from the office of the *North Queensland Herald*, and we give it on the authority of that journal, as it may be of interest to some of our readers:—

Amongst the hardwoods, where strength and durability are required, those known as Ironbark take first rank. Of these there are several kinds, the best being obtained from *Eucalyptus siderophloia*, of which there are two kinds of wood, one red and the other a brownish-grey, both excellent timbers, though the red is the favourite; *E. crebra*, or the Narrow-leaved Ironbark, which has a greyish wood, very strong and durable; and the Palmer River Ironbark, better known by the lemon-like fragrance of its leaves, from which it received its local name, than as a timber. The wood of this last, though very hard and of a rich red colour, is usually small and pippy. The trees known as Stringybarks supply excellent timber for sawing and splitting; the kinds cut under this name are usually *Eucalyptus acuminoides* and *E. eugenoides*. Nearly resembling these in bark are the trees sometimes called Turpentine (*E. microcorys*), a very hard, strong, durable timber; *E. Baileyana* and *E. resinifera*, two excellent timbers with a fibrous bark, from which circumstance they are at times known as Stringybarks. The timber generally known as Gum is furnished by those Eucalypts which annually shed their barks,

as the Blue Gum (*E. leucocornis*), the Poplar Gum (*E. platyphylla*), the Grey Gum (*E. saligna*), the Spotted Gum (*E. maculata*), the Woollybutt (*E. botryoides*), and the Moreton Bay Ash (*E. tessellata*). The bark of the last two is persistent at the base. There are also several others called Gum-trees, but those noticed furnish the best timber. The so-called Box is a name under which several trees supplying good, useful timber are known, as Poplar Box (*E. populifolia*), Gum-topped Box (*E. hemiphysa*), Thozet's Box (*E. Ravensteinii*), and also the Brisbane Box (*Tristania confertifolia*).

Two trees are designated Bloodwood. The Common Bloodwood (*E. corymbosa*) is only adapted for using whole, as it often contains cavities in the wood so full of gum as to render it useless for sawing; it is, however, the favourite timber, on account of its durable nature, for house-stumps, piles for bridges, and other works where it can be used uncut. The White Bloodwood (*E. trachyphylla*) is very similar, but the wood is of a lighter colour, and not quite so durable.

The hardwood of the Johnstone River is furnished by a species of *Bachostia*, *B. Bancroftii*. This is a very tall, erect tree, and so far as is yet known, the wood is both durable and strong, does not crack or warp, and is easy to work. The Broad-leaved or Paper-barked Tea-tree (*Melaleuca leucadendron*) the Mahogany—Tom Russell's Mahogany as it is sometimes called—(*Cycasporus tenuifolius*), and the Swamp Mahogonies (*Encalyptus robusta* and *Tristaniaruvicola*) are timbers of a high quality, though the last-mentioned is useless except under water, when it is extremely durable.

The hardest wood, however, of Australia is that of *Erythrophloeum Labouchei*, a tree met with in North Queensland, from the Endeavour River to Normanby. The wood of this tree is a rich red in colour, and takes a high polish.

The softwoods in use are the Bunya (*Aracaria Bidwillii*); Moreton Bay or Hoop Pine (*Aracaria Cunninghamii*); Dundathu Pine (*Agathis-Dammara-robusta*); the She-pine (*Podocarpus elata*); and several of the *Callitris* under the name of Cypress Pine.

For cabinet and ornamental purposes the following are in high request:—Red Cedar (*Cedrela Toona*)—the Mountain Cedar of the English market; Yellow-wood (*Flindersia Obliquata*), and others of this genus, especially *F. australis*; Silky Oak (*Grevillea robusta*); Deep Yellow-wood (*Rhus rhodantha*); Tulip-wood (*Harporhiza pendula*); and Beech (*Guelinia Leichardtii*), a tree attaining a great size. The wood of this last is in great request for verandah flooring and deck planking.

Other woods suitable for cabinet work are:—*Eucarpus Bancroftii*, a tree with a firm, light-sparked heartwood, and a quantity of very hard, prettily-marked wood, though perhaps its true value will be in its proving a substitute for the American *Lignum vite* in the manufacture of blocks, pulleys, &c., than as a cabinet wood; several of the *Evodias*, all having a white, pliable wood; the Satinwood (*Zanthoxylum brachyacanthum*), one of the most beautiful Yellow-woods known; *Gelera Mulleri*, a common tree in most Queensland scrubs, having a large quantity of beautifully-marked dark heart; *Siphonodon australe*, another scrub tree whose wood is nearly white, very much resembling ivory when polished; the Beartree (*Castanospermum australe*), growing a heartwood somewhat resembling Walnut, but apt to warp in seasoning; the Queensland Ebony (*Banhiina Hookeri*), a rich-coloured hardwood, very suitable for veneering; the Scrub Sandalwood (*Eucarpus lalijohnii*); the Australian Olive (*Olea paniculata*); and many species of *Acacins* commonly called Myalls or Watties, and remarkable for their rose-like fragrance.

Handsome woods are produced by the "Dead-fern" (*Albizia basaltica*), *A. canescens*, *Archidendron Vaillanti*, several of the genera *Terminalia*, *Maba*, *Grevillea*, *Hakea*, *Xylolobium*, *Stenocarpus*, and *Banksia*; the timber of the last five being known as Beech-wood; the Silky Oak; the Cull-country Gutta-percha (*Excavaria parvifolia*) is very prettily marked and conspicuous for its beauty; and the Threedy-barked Oak (*Casuarina inophloia*).

#### GENERAL BUILDING NEWS.

**ADDITIONS TO TRAINING COLLEGE, LINCOLN.**—The additions to this college were recently opened. The old buildings have been considerably improved, and a new dining hall, a new classroom, four governors' rooms, and forty-six dormitories have been erected, accommodation now being provided for 104 students (83 resident and 21 day) compared with fifty-six a short time ago. The work has been carried out by Messrs. Wright & Son from designs of Mr. H. H. Dunn, architect, of Lincoln.

**HOSPITAL, WESTERN BANK, SHEFFIELD.**—The rebuilding of the administrative block and out-patients' department of the Children's Hospital, Western Bank, has been commenced. The new building will be considerably larger than the houses occupied. The erection will face Western Bank and Clarkson-street. It will be of three stories. Entering from Clarkson-street, there will be a waiting-hall, 34 ft. by 23 ft., two surgeons' rooms, two examination-rooms, a dental room, a small operating theatre, and other rooms belonging to the out-patients' department. A room is pro-

vided for at once isolating infectious cases that may present themselves in the waiting-room. The house surgeon will have his rooms on the ground floor, where will also be the surgeons' sitting-room, nurses' rooms, kitchens, &c., and the first floor will be occupied by the bedrooms of the nursing staff and servants. The work of building is expected to be finished in about twelve months, and the cost is estimated at 9,000l. The architects are Messrs. J. D. Webster and J. D. Webster, jun., of St. James-street, Sheffield.

**METHODIST SCHOOL BUILDING, KEIGHLEY.**—Memorial-stones of this school were recently laid on the site adjoining West-lane chapel. The new building is for the greater part of one story. The central hall, 53 ft. by 25 ft., will accommodate 300 persons, and a gallery at one end will seat another 100. Ranged round the central hall are eleven classrooms, and there are an infants' room, 25 ft. by 16 ft., and a lecture-room, 40 ft. by 20 ft. There is also a library, 19 ft. by 11 ft., between the two front entrances, and a kitchen, 16 ft. by 13 ft., on the ground floor at the back. At one side the building will be run up to another level to provide two additional classrooms, each measuring 20 ft. by 12 ft. 6 in. Eventually the appearance of the edifice will be plain, in keeping with the chapel on the right. The cost of the building, excluding the site, but including the furnishing, will be about 2,500l. Messrs. Moore & Crabtree, of Keighley, are the architects, and the contractors are as follow:—Mason's work, Mr. Michael Sunderland; joiner's work, Mr. S. Foster; slater's work, Mr. W. Thornton; tinsley; plumber's work, Mr. Wm. Bottomley; plasterer's work, Mr. John Greenwood; crosshills; painter's work, Mr. Frank Petty; heating apparatus (hot water on the high-pressure system), Mr. R. Rundle, Idle.

**PARISH CHURCH, HOVE, BRIGHTON.**—The new parish church at Hove was opened by the Archdeacon of Lewes on the 28th ult. It has been built of Sussex sandstone, and with stone from the quarries of Sir Weetman Pearson, M.P. The seating accommodation is for about 1,300, the building being 100 ft. long and nearly 80 ft. broad. The nave, including the transept, is 68 ft. long and 35 ft. wide, and is divided into six bays. The two western bays, opening respectively into the baptistry and the base of the tower, are marked by lofty and richly-moulded arches springing from clustered piers attached to the north and south walls. The next four bays open into the north and south aisles, and are each 16 ft. wide. The arcades consist of clustered piers, 17 ft. high, from which spring lofty pointed arches. Above these is the clearstory. The architect was the late Mr. Pearson.

**SCHOOL BUILDINGS, ST. ANTHONY'S, NEWCASTLE-ON-TYNE.**—On the 27th ult. the foundation-stone of a new infants' school was laid at St. Anthony's, Newcastle. The site is near the church, and the building will comprise a schoolroom, 73 ft. long and 55 ft. wide, with a folding screen and classrooms. It has other accessories, such as a cooking-room, &c. There will be a large playground about 100 yards in extent. Some 200 children will be accommodated. The architect is Mr. James Wightman Douglas, of Alnwick, and the builder Mr. W. S. Anderson, of Hunter's-road, Newcastle.

**CHAPEL AND SCHOOL, HIGH WYCOMBE.**—The foundation-stone of this school was laid on the 28th ult. The site of the new buildings is at the junction of Oakridge and Jubilee roads, with direct and near access from the main road to Oxford. The plans show that the schoolroom will be after the Late Gothic style of architecture. The building is to be of red brickwork with stone dressings, and the schoolroom will be 53 ft. 6 in. by 28 ft., accommodation being provided for 250 persons. There is also to be a classroom, 21 ft. by 13 ft.; a lobby and cloakroom facilities will be arranged, together with a scullery at the rear. The contract for the erection of the schoolroom is estimated at 1,377l. 8s., which includes the cost of erecting the boundary walls round the site. The architect is Mr. T. Thurlow, of High Wycombe, and Mr. J. T. Harris, of the same town, is the contractor.

**ADDITIONS TO MANSION, NEAR PITLOCHRY, N.B.**—Extensive alterations and improvements are being made to the mansion house at Dunfallandy, near Pitlochry, for Mr. D. Stewart Ferguson. The contractors are:—Mason, Mr. Charles Robertson, Pitlochry; joiner, Mr. A. B. Kennedy, Pitlochry; plumber, Mr. Buchanan, Dundee; plasterer, Mr. John Veitch, Pitlochry; slaters, Messrs. Campbell & Storrer, Pitlochry. Mr. A. G. Laskie, of Glasgow, is the architect.

**NEW BUILDINGS, ASCOT RACECOURSE.**—Work in connexion with the new buildings on Ascot racecourse has been commenced. The *Windsor Chronicle* remarks that the Royal stand will be situated between those of the Jockey Club and the Master of the Horse and the Lord Chamberlain, its position being similar to that which the old building occupied. The erection will be 70 ft. in length and 40 ft. high. Panelled balconies projecting from the front will overlook the course, and the verandahs above are to be covered with copper. The lawn will be reached by two curved staircases leading down from the principal tier, and sheltered by a canopy, also roofed with copper. The brick wall

at the rear will be somewhat in the Queen Anne style, and will be provided with an ornamented iron portico, where the Royal or other visitors will alight from or enter their carriages. The Jockey Club stand will be placed next the Subscribers' private stand, which latter, as well as the clock-tower and grand stand, remain as they were. It is to be 50 ft. 9 in. in length and 34 ft. high, and will have a light iron roof for an awning and verandahs facing the Heath. Dressing-rooms and other apartments will be provided in the building, and there will be separate entrances for members and visitors. The third stand, which will be reserved for the Master of the Horse, the Lord Chamberlain, and others, is the largest of the group. It will be erected on the west of the Royal stand, and here Major Clements and the clerks will have offices. Staircases will lead to the Press stand, and accommodation will be provided for owners and jockeys. There will be several uncheon-rooms and lifts. The buildings which will be constructed chiefly of iron and wood, will not be in line with the grand stand, as hitherto, but will be brought forward to an angle, so that the occupants might get a better view of the races as the horses come up to the judges' box. This will necessitate the course being altered, and instead of running in a straight direction to the Grand Hotel, it will be brought to a gentle curve. An effort will also be made to reduce the uphill gradient by the winning-post. In order to get the work completed by next June a staff of 500 or 600 men will be employed, and a large number have already been engaged. The men will work night and day, and to enable this to be done the electric light will be installed. The architect is Mr. C. W. Stevens, and the contractors are Messrs. Allen & Sons, of Kilburn.

**ST. MARTIN'S CHURCH, ROATH.**—This new church has recently been opened by the Bishop of Llandaff. It is of red brick, with stone dressings. The designs were by Mr. F. R. Kempton, of Cardiff. He was required to accommodate for 1,000 persons the sons; the site, which is short and broad, made this a difficult matter. It has been done by means of a broad nave and chancel under one continuous roof, with a wide aisle at the south side; on the north side is a narrow nave aisle and a slightly wider chancel aisle, which forms a side chapel. The chancel is raised above the nave, and will eventually be divided from it by a balustrade stone roof-screen.

**RECTORY, ST. MARY MAGDALENE'S CHURCH, DUNDEE.**—The new rectory, church, halls, and symposium erected in connexion with the church of St. Mary Magdalene, Dundee, were opened on the 20th ult. The rectory occupies the front of the building facing Well-road. It is four stories in height, with large public rooms, the upper floors being occupied by the studies of the clergy, bedrooms, &c. The large hall is entered by two spacious staircases from Well-road, leading to a vestibule which extends the full width of the building. From the staircases two flights of stone stairs lead to the galleries. The entrances are all fireproof. The hall is 72 ft. long by 50 ft. wide, with a platform at the west end 19 ft. broad, and is capable of seating 1,300 persons. The roof is of partially open timber. Galleries run round the four sides, but it is intended at a future date to place an organ in the west gallery above the platform. On the west wall is placed a large shield bearing the arms of the diocese with mitre on top. The columns supporting the galleries are relieved with small shields bearing heraldic devices illustrating the different sees of the dioceses of Scotland. The walls are also decorated at suitable points with oil paintings, as is likewise the vestibule, but owing to the spacious character of the walls there is ample room for more pictures than are yet available. A separate stair leads to the platform at the north-west corner of the hall, and is continued up to the galleries. At the south-west corner an outside stone stair, affording means of egress from the gallery, has been built for emergency purposes. There are thus four separate means of public exit from the hall. Lavatories and retiring-rooms for both sexes are provided both at the platform and at the main entrance. Underneath the organ hall is a lesser one, capable of seating about 300 persons, and which will prove of great utility for small meetings. A special feature of the building is the gymnasium. This is 50 ft. long by 18 ft. wide, and 17 ft. in height. Entrance to the gymnasium is gained at the north side of the building. In common with the halls and rectory, it is lined throughout with pine, lit by electricity, heated by the low-pressure hot-water system, and ventilated by what is known as the natural system of ventilation. The total cost of the building, including the purchase of the site, has been about 3,000l. The designer was the late Rev. Edward Sugden, who was for some time Rector of the Church at Coupar Angus. His designs have been carried out in the office of Mr. Robert Blackadder, of Dundee, under the supervision of Mr. David Allan. All the contractors were local firms, namely:—Masons, James Fowrie & Son; joiners, D. P. How & Son; plasterer, A. McRitchie; painters, Pirie & Croom; slater, Laburn & Son; ironwork, Beath & Keay; plumber, David Brown; electric lighting, heating, grates, &c., G. H. Nicoll & Co. Mr. Robert Low was clerk of works.

**SANITARY AND ENGINEERING NEWS.**

**BARROW-IN-FURNESS WATER SUPPLY.**—The Barrow Corporation Water Bill has now received the Royal Assent. The scheme is one for taking a supply from the river Udd at a point about four miles from the Middle Bridge. The area of the watershed above the proposed intake is about 12,000 acres, and is situated on the lower alluvial formation. It is very mountainous, the altitudes ranging from 250 ft. to 2,625 ft. above the level of the sea. The average rainfall is 90 in. per annum. The scheme includes the raising of the level of Senthwaite Tarn by the construction of a masonry dam, so as to enable the Corporation to keep in reserve a quantity of water equal to 450 million gallons for giving compensation to the river in times of drought. The pipe line from the intake works to Barrow will be 17½ miles in length. The water is of fine quality, and is suitable for domestic consumption and trade purposes. The Borough Engineer, Mr. W. H. Fox, is the engineer for the scheme.

**WATER-TOWER, WIVENHOE.**—On the 24th ult. the foundation-stone of this water-tower was laid. The general water scheme comprises a bore-hole, which has been made in chalk to a depth of 130 ft. It yields 9,000 gallons per hour, and the water has been pronounced by Dr. Thresh, the county analyst, to be excellent. The boring is situated in the lower level of the town, near Queen-street, and the water is to be pumped direct to the water-tower in course of erection on the higher part of the town at the Cross. The tower, 55 ft. high, will be surmounted by a tank which will hold 50,000 gallons. Services are to be laid all over the district. A bore-hole was first tried near the water-tower, but the water proved to be too saline for domestic purposes. The total cost of the scheme will be 6,500 l. The contractor is Mr. H. Shardlow, and Messrs. Sands & Walker, of Nottingham, are the engineers.

**WATERWORKS, WISHAW, N.B.**—On the 16th ult. the new waterworks, which have been constructed for the borough at a cost of upwards of 100,000 l., were formally opened at Peden, in the parish of Crawford. The water, which is of excellent quality, is drawn from three burns—the Potrail, Potrenick, and Peden—rising in the Lowthers, on the borders of Dumfriesshire, and pipes have been laid capable of delivering 2,220,000 gallons per day. Mr. W. R. Copland, of Glasgow, was the engineer.

**ELECTRIC LIGHTING, LONDON.**—The electric lighting station erected by the Longton Corporation was opened on the 23rd ult. The site is included in the gasworks premises, and the cost of putting down the plant, &c., has amounted to about 21,000 l. The generating plant, which has been installed by the Electric Construction Company, Wolverhampton, consists of two E. C. Bellis generators of a normal capacity of 145 kilowatts each, with provision for a third in the existing station. The steam required for the works is provided by two boilers of 1,000 horse-power. The accumulators are of the chloride type. The normal discharge rate of the battery is 40 kilowatts for a ten-hour period, but in case of emergency the battery could be discharged at the rate of 200 kilowatts for one hour. The works have been designed and carried out by Mr. W. Langford, the Corporation gas manager and electrical engineer.

**STAINED GLASS AND DECORATION.**

**WINDOWS, BRECHIN CATHEDRAL.**—Several valuable stained-glass windows have recently been presented to the restoration committee of Brechin Cathedral, and they are described as follows in the *Dundee Advertiser*. In the restored chancel fourteen stained-glass windows have been put in, five on each side and four in the big east window. The subjects on the north side of the chancel represent the five principal scenes in our Lord's life before the commencement of His public ministry. Those on the south side depict the five principal scenes of that ministry. In the north division of the east window there is a figure of Christ as Prophet, in the centre division the figure of Christ as Priest, and in the south division the figure of Christ as King. The first window on the south side of the chancel represents the Nativity—in the top the angels appearing to the shepherds, in the centre the manger at Bethlehem, and at the foot the three wise men coming to worship. The subject of the second window on the same side is the flight into Egypt—at the top an angel appearing to warn Joseph and Mary, in the centre the massacre of the Innocents, and at the foot Joseph and Mary with Jesus on their way to Egypt. In the next window is depicted at the top the presentation of our Lord as a babe at the Temple, in the centre our Lord amongst the doctors, at the foot our Lord in the carpenter's shop. The subject of the next window is the Baptism—in the top there is a representation of John the Baptist baptising our Lord, in the centre a figure of Christ alone, and underneath the figure of John the Baptist pointing him out to some of his disciples, and saying, "Behold the Lamb of God that taketh away the sin of the world." The Temptation forms the subject of the next window—in the top our Lord is seen in the wilderness amongst wild beasts, in the centre He is on the top of a

high mountain looking down upon the three great Kingdoms of the then known world—Babylon, Rome, and Egypt—and at the bottom Christ with the angels ministering to Him. In the first window on the north side of the chancel there is a picture of the Transfiguration, and underneath the demoniac boy being healed. The second window on that side deals with the scene in Gethsemane—on the top Christ is seen praying with the angel ministering to Him, in the centre the three disciples asleep, and at the foot Judas kissing Him. The Crucifixion—a figure of Christ upon the cross, with His mother and the Magdalen—is the subject of the next window. The succeeding one deals with the Resurrection—at the top an angel at the empty tomb, in the centre Christ and Mary in the garden, and at the foot Christ with His disciples at Emmaus. The Ascension is the subject of the next window—in the upper part a figure of our Lord ascending, in the lower part the figure of an angel saying to the disciples, "This same Jesus shall come in like manner as ye have seen him go." The rose window at the east end bears "Agnus Dei." These windows are all the gift of an anonymous donor. They have been executed by Mr. Henry Holiday, of London, while the scheme was prepared by the Rev. A. D. Tait Hutchison, of the Cathedral. In addition to these, two fine stained-glass windows have also been presented to the church. One at the east end of the north aisle represents Isaiah and John the Baptist. The other window, which has been placed at the east end of the south aisle, portrays the figures of St. Peter and St. John. These windows were executed by Messrs. Stephen Adam & Sons, Glasgow, after a design by Mr. William Gauld, of Glasgow.

**WINDOW, ST. PETER'S CHURCH, SHEFFIELD.**—On the 20th ult. a window erected in the baptistry at St. Peter's Church, Abbeydale, Sheffield, in memory of the late Mr. William Turner, was unveiled. It is by Messrs. Jones & Willis, of Birmingham, from the design of Mr. Joseph Norton, architect, of Birmingham. The subjects dealt with in the three lights are Christ blessing the children, the Presentation of the infant Saviour in the Temple, and the youthful Samuel. Below is a suitable inscription.

**FOREIGN.**

**FRANCE.**—M. Denys Puech, the sculptor, has, by the aid of photographs only, modelled a fine bust of the czar, which is to be sent as a gift to the Empress of Russia from the French President. The jury in the competition opened for a new church at Domfront, has awarded the first premium to M. Jardel, of Suresnes; the second to MM. Berger & Maistrasse, of Paris; and the third to M. Pignard. Sixty-seven architects have competed for the rebuilding of the Church of St. Germain, at Mers-les-Ornes. The first premium has been awarded to M. Forget; the second to MM. Berger & Maistrasse; the third to M. Brasséon. The estimated cost of the work is 700,000 fr.

**MISCELLANEOUS.**

**ROMAN REMAINS IN HAYLING ISLAND, HANTS.**—With Roman settlements in Hampshire, Sussex, and the Isle of Wight, it is not strange that tradition should have come down to us of the existence of Roman remains in Hayling Island, and fixed the site at a spot which the excavations of Mr. Talfourd Ely have shown to be correct. In the north part of the island, a little to the west of North Hayling Church, is the Townell Field, part of a larger area at one time held in allotments, and here from time to time coins have been turned up by the plough. In this field there was a slight elevation, manifestly artificial, and, when examined carefully, it was easy to trace, by the different colour of the crops, the outline of the foundations below, just as at Silchester, the *insule*, or blocks, may be detected by the same criterion of a less fertile yield over the stonework. In 1807 Mr. Talfourd Ely commenced operations, which have been carried on year by year since that time. Though he has been rewarded by no very valuable finds in the way of curiosities or museum specimens, he has had the good fortune to establish the fact that here stood a very early Roman building of large size, the foundations of the outer walls being, in round figures, 150 ft. by 170 ft. As the work progressed, it became evident that here was more than a villa in the sense of a country residence. The outer walls seem to have enclosed not only the house but outbuildings, such as sheds or barns. The living-rooms were indicated by the presence of painted wall plaster, roof tiles, and light and dark tesserae, though nothing was found that could in any way compare with the fine pavements unearthed at Brading, Silchester, and many other places. This is probably due to the early date of the work, which is approximately fixed at the end of the first century of our era. A bronze coin of Domitian was found during the work. Later coins have also been met with, but early coins seem proportionately commoner here than in most villas. Year by year the excavations have gone on and thrown more light on the character of the building, which will no doubt be described fully by Mr. Talfourd Ely when the work is finished. Last year a chamber was uncovered, the floor of

which was of small flints covered with trampled clay, set with tesserae so thickly that more than eighty were picked out from the space of a square yard. The building must have been warmed by hypocausts, for remains of the furnace and flue-tiles were found. A fine specimen of Romano-British work in the shape of a circular bronze brooch was discovered. The groundwork is blue enamel, still brilliant, with a central raised circle, surrounded by smaller ones, each with a depressed setting for a stone. This year a corridor 50 ft. long, another about 30 ft., and a room 15 ft. by 20 ft. were uncovered, so that it is safe to conclude that the house itself was of considerable size. An interesting discovery consisted of a number of fragments of terra-cotta, with deep fittings. Mr. Ely believes that the pieces are to be accounted for by the building having been burned down. The terra-cotta probably served as a dado, or wall lining, as many of the pieces have a projection at the back apparently for fastening to the wall. The other remains include nails, a Roman key, a razor blade or knife, black Romano-British pottery, and a few pieces of red Samian ware. No human remains were met with; the bones belonged chiefly to domestic animals, and there was more than the usual quantity of boars' tusks, some of large size.—*Standard*.

**BRITISH FIRE PREVENTION COMMITTEE.**—A silver portrait medal accorded by her Majesty, the German Empress, in connexion with the Berlin Fire Congress of June last, has been presented to the executive of the British Fire Prevention Committee, as a mark of appreciation for the services rendered by that body in the demonstration of scientific and economic aspects of fire protection. It will be remembered that a deputation of the committee comprising Mr. Edwin O. Sachs (chairman), Mr. Ellis Marsland, Mr. F. R. Farrow, and Mr. C. E. Goad, accompanied by the secretary and engineer, visited Berlin in the summer, and that an important exhibit of technical models and photographs was lent to the German Authorities for the exhibition held in connexion with the congress.

**ALTERATIONS, ST. GILES' CHURCH, CRIPPLEGATE.**—Upon the union of the benefice of St. Bartholomew, Moor-lane, with that of St. Giles, Cripplegate, it was decided to remove to the latter edifice a number of historic appointments which formed an interesting feature of the first-named church. Though itself a comparatively modern edifice, St. Bartholomew's, Moor-lane, contained not a few valuable relics which were recovered from the church of St. Bartholomew-by-the-Exchange at the time of the Great Fire. The original church was rebuilt near the Bank in 1438, destroyed by the historic conflagration, and replaced by Wren. Then, the historian informs us, "the materials of the old church were sold by auction in 1841 for 437 l. 15s. the south wall and a chapel being reserved to be built into the San Fire Office, as was also some of the carved masonry, the old pulpit, the organ, and other woodwork, which were preserved in a copy of the old tower and church erected in 1849-50 by Professor C. R. Cockerell, R.A., in Moor-lane." When it was decided that the Moor-lane edifice should at last disappear for ever, the authorities of Cripplegate obtained a faculty authorising the removal of the several interesting relics to St. Giles'. For some months past the work of re-erection has been in progress by Messrs. W. H. Lascelles & Co., of Bunhill-row, under the direction of Mr. F. W. Jackson, the clerk of works, and now it is nearly complete. The result of the improvement has been to provide an ante-chapel at St. Giles', to the north of the chancel. Here the reredos from Moor-lane has been placed. It is composed of carved wood, attributed to Gibbons, and contains two coloured panels representing Moses and Aaron. The communion-table is of elegantly-figured marble. On the wall, to the north of the reredos, has been fixed another specimen of carving, in which are apertures for two panels. The reading-desk has also been removed. The tiled floor of this former chancel has been relaid, and the partition rails have been made from the choir stalls in use at St. Bartholomew's. The removal has been carefully carried out, and the result is to add in no small degree to the beauty of Cripplegate's parish church. When "the four shoppees" disappear, the Great Fire commemorative window is also to be fitted up at St. Giles'. Apropos of the improvements, it is interesting to note that the same firm have had in hand the re-erection of a house adjoining the church. In order to establish a sound foundation it was necessary to burrow some 27 ft. below the chancel of St. Giles'. This necessitated the temporary removal of a large number of coffins, and, judging from the spot at which the remains of Milton are believed to rest, it is not improbable that the body of the poet was among those thus disturbed. It is significant that the whole of the coffins bore inscriptions, with one exception, and that in this instance the body was enclosed in two shells. The remains have since been restored to their original positions.—*City Press*.

**STREET STATUES, HULL.**—The *Yorkshire Post* states that at a special meeting of the Hull Corporation City Improvement Committee, held at the Town Hall on the 25th ult., the Mayor approached the members as to their willingness to take another statue out of the Town Hall for the purpose of decorating the new streets. Already the statue of

William de la Pole, the first Mayor of the town, has been placed at the junction of Jameson-street and King Edward-street. Now, the Mayor suggests that another stone should adorn the open space at the junction of Jameson-street and Saville-street, and he mentioned that of Andrew Marvell, a marble effigy sculptured by Mr. Keyworth, and presented to the Corporation in 1867. The Committee were unanimous that the suggestion should be carried out.

**A NEW GARDENING PAPER.**—*Garden Life* is the title of a new paper of which the first issue has been sent to us, and which is described in its heading as "a practical journal for amateur gardeners." Judging from the contents of the first issue, it seems likely to be of use to those for whom it is intended. "My Suburban Garden: How it has been made Beautiful," is an article the title and subject of which appeal to many who have a small garden and wish to make the most of it.

## LEGAL.

## BUILDING HOUSES—A CURIOUS CASE.

At the City of London Court on the 23th ult, before Mr. G. Pitt-Lewis, K.C., Deputy Judge, the assignee of Mr. William Purkis, timber merchant, sued Messrs. Nicholson & Son, 105, Cheapside, for £81.7s. for timber supplied. Mr. Abinger, plaintiff's counsel, said that the defendants had been building sixteen houses in Brook-road, Walthamstow, and the timber sued for was used. The defendants entered first of all into a contract with one Palmont, sen., who was unable to carry out the contract. In the month of January they entered into a contract with Palmont's son. He had no capital, and an agreement was entered into by which they undertook to pay him the sum of 1,600*l.* for the completion of the houses. As the young man had neither capital nor plant it was obvious that he could not carry out the agreement without being financed. Palmont, jun., was paid weekly wages for carrying out the work as the foreman bricklayer for the defendants. The plaintiff's case was that the timber now sued for was ordered by Palmont, jun., on the authority of the defendants. Other goods had been supplied to the houses, and had been paid for by the defendants, who now, however, refused to pay the timber bill. All the prices of the timber and other goods ordered for the buildings were submitted for the approval of the defendants before the orders were given. That showed that the agreement, which had been prepared in solemn form, was really bogus. Evidence was given by the plaintiff and Palmont of the goods having been supplied and used. Palmont, jun., said that nobody had paid for the goods. The defendant's case was that Palmont, jun., agreed to finish the houses for 1,600*l.* The orders for the timber now sued for were given by Palmont, and not by the defendants. There was no truth in Palmont's story that he had been paid weekly wages, and that he was acting as the servant of the defendants. He had received 1,800*l.* in all for carrying out the contract. It was true that the defendants had guaranteed some of the orders which Palmont gave, but in all those cases they had paid the accounts themselves. No such guarantee was given in the plaintiff's case, and no liability was resting upon the defendants. The Deputy Judge delivered judgment at great length, and said that the case was one of considerable importance, not only because of the amount in dispute, but because of the principles involved. The defendants' case was that the work performed by Palmont had been done under a contract, and that, as that was the case, the timber must be paid for by him. The Deputy Judge said he could not hold that there was a contract at all. It was true that an agreement had been prepared in solemn form, and that it was sent to Palmont for approval by the solicitors, who were the brothers to the defendants. He did not think that Palmont had the ability to understand the matter at all. In his view, Palmont was not an independent contractor, and the relationship between the defendants and him was that of master and servant. That being the case, judgment must be entered for the plaintiff for the amount claimed.—*City Press.*

## ALLEGED INTERFERENCE WITH A PARTY WALL.

The case of Sadler v. Fairclough came before the Lord Chief Justice of England, sitting as Vacation Judge, on the 2nd inst., on a motion by the plaintiff for an interim injunction to restrain the defendant from interfering with a party wall.

Upon the case being called on, counsel for the plaintiff in support of the motion asked that the case might stand over for a fortnight, as there was a prospect of the parties being able to come to terms.

His Lordship: You had better take three weeks. The learned counsel stated that nobody now appeared for the defendant, but he had given an undertaking that if the case stood over for a fortnight he would not, in the meantime, further interfere with the party-wall in question.

His Lordship: Very well. I will agree to the case standing over then.

## BUILDING DISPUTE SETTLED.

The case of Goldsworth v. Masters & Richards came before the Lord Chief Justice of England, sitting as a Vacation Judge, on the 2nd inst., on a motion by the plaintiff for an interim injunction to restrain the defendants from building until the trial so as to interfere with the plaintiff's ancient rights.

Mr. P. Chitty said that the defendants were willing to treat the motion as the trial of the action, and submit to a perpetual injunction. Order accordingly.

## RECENT PATENTS:

## ABSTRACTS OF PATENTED INVENTIONS.

10,680.—A FIRE-PROOFING COMPOSITION: *Huelsberg & Co.*—A composition for rendering wood, fabrics, paper and other substances fireproof consists of the double salts of ammonia and magnesia, or ammonia, and iron, zinc, and so on. It is heated to a temperature of about 70 deg. C. before it is pumped into the impregnating vessel within which it is to be maintained at 98 deg. C. For wooden articles, boric acid is added to the mixture.

10,615.—VENTILATING AND COGNATE APPLICATIONS: *T. Wallon and F. H. Wallon.*—The air in weaving-sheds is humidified with steam from untreated water with an apparatus that causes steam circulating through pipes to heat water in a cylinder; the steam is drawn away from domes that it may mingle with the air which is forced through pipes, and is then conveyed to the spaces under treatment. For purposes of ventilation the steam supply should be cut off. An injector which supplies the feed-water from a tank is started or stopped by the descent or ascent of a float that acts upon a valve arranged in the steam-supply pipe.

10,030.—AN ENAMEL FOR FICITILE WARE: *G. Appiani.*—An enamel, which is free from tin, consists of an admixture of calcined sand, about 20 parts; minium or litharge, 18 parts; kaolin, 20 parts; common salt, 4 parts; soda, polish, or other alkalies, 3 parts; and quartz or calcined marble, 28 parts.

10,114.—A CIRCULAR SAW GUARD: *F. E. K. Long.*—By this invention the wood which is to be sawn works the saw-guard automatically. The top of the saw is covered with two semicircular plates affixed to a slide which will be raised with a cord from the end of a lever against which the wood is forced forwards, the guide of the slide being pivoted to a radial bar adjusted about the pillar; a spring lifts the lever, so as to draw the sliding bolt backwards, as soon as the rear end of the wood has passed beyond the end of a lever pivoted beneath the bench, whereupon a curved guard will ascend and cover the saw behind the wood. The guard may upon occasion be worked by hand.

10,108.—CHIMNEY-TOPS AND THEIR FITTINGS: *E. Milburn.*—For a chimney-top is devised a slotted drum, set vertically, around which are bung louvered upon heights that project from a wire frame, which is disposed around the drum beneath the cover which carries the vanes; a middle bearing upon brackets carries the spindle that reaches up to the top of the up-take; the pointed end of the spindle rests upon a step in an oil-bath, and the spindle is further supported with a series of loose wide rings, each of which consists of a pair of discs having a vulcanite disc between them. The rings being also kept apart from one another with loose tube sections.

10,180.—BLOCKS FOR BUILDING PURPOSES: *F. C. Sellars.*—Hollow blocks for walls and floors are fashioned with interlocking ribs and recesses, and with other recesses that will take horizontal T-iron bars to be tied and clamped together; for stiffening purposes tubes or battens are passed vertically through the blocks; for quoins and buttress or bonding blocks, recesses fashioned transversely in the ribs will take the similar edges of the blocks next adjoining. The blocks consist of cement or lime mixed with ground refuse-destroyer clinker, and will serve for tiles when they have been cut across lengthwise. Numerous forms and adaptations of the blocks are specified.

10,161.—A JUNCTION PIECE FOR GAS PIPES AND BURNERS: *T. Doerlag.*—A capsule and tube having indiarubber attachments, constitute a connection-piece that can be fitted on to a split-burner by drawing the rubber over the burner; in the case of a Bunsen burner a rubber ring is used for closing the air-holes when the indiarubber piece has been adjusted in its position.

10,218.—MOULDING OF BRICKS, PIPES, TILES, &c.: *H. Collier, E. Vieille, and A. Maiese.*—Concave, flanged, and eccentric screw-blades, that are bolted in pairs on to plates secured to hubs of a squared shaft, press the clay from the mixing cylinder through a grating and a die-plate or mouth-piece, stones, nails, and other hard substances being pressed into boxes provided with doors. The shooks produced by those extraneous substances are reduced by means of knives or arms upon the cylinder and the shaft which will receive a small vertical motion. A fixed arm prevents the blades from carrying the clay around, and one of the arms carries a scraper or rake which is pressed against the cylinder. In order to impart a slight rocking

movement to the steel screw-blades, each of them is bolted on to a plate with two bolts, whereof one is inserted through a slot and the other through a round hole in the blade. For hollowed goods, a cross-bar in the die-plate carries a support on to which a core or mandrel is bolted; as it is expelled from the die the plastic body is held up with an arm upon the front of the core, whilst a travelling band, divided into lengths, takes the column as it emerges from the die.

10,244.—VENTILATING APPARATUS: *F. H. Robinson.*—The inventor seeks to minimise the disadvantages attaching to cast air-grate ventilators wherein the moulding and casting limit the extent to which the inclined cross-bars will overlap one another. He fashions the cross-bars separately from the frame and then sets them in their places; in one form of the contrivance he affixes them on to extended cheeks upon the frame; in another he disposes the cross-bars upon the cheeks and secures them with a rod which has projections that will bear upon the bars and is fastened with a nut.

10,251.—A LIFTING-JACK: *F. C. Cellin.*—The forked end and the other end of a girder are, in each instance, sustained by means of a cross-head worked upon a screw in standards, the load to be moved rests upon one or more of the girders; spur-wheels, a shaft, a worm-wheel, and a worm upon a hand-driven cross-shaft, communicate motion to the main middle shaft. It is arranged that the worm upon the cross-shaft can be disengaged, whereby one may apply a crank directly to the upper end of the shaft and so lower the cross-head rapidly.

10,266.—A WATER-SUPPLY TAP: *F. Shanks and R. Burnside.*—The tap is intended for use as a flushing-valve for water-closets, a ball-and-float valve, and a measuring valve for tanks and cisterns. It comprises a valve which slides within a chamber that is joined to the inlet with a passage, and to which a conical facing is affixed. Upon the valve is a seat for a disc-valve mounted upon the spindle; pressure upon the top of the valve keeps it shut under normal conditions, but when one forces the spindle upwards water will escape through, the disc-valve being opened, thereupon the valve is raised by means of a shoulder upon the spindle, a plug-valve serves to control the amount of water supplied to the chamber; a float-lever may be used for the working of the spindle, and the valve can be utilised for supplying measured quantities of water to a cistern, or for flushing purposes.

10,275.—AN APPARATUS FOR KILNS: *G. Horn.*—Cold air is admitted into kilns after the annular kind through a main pipe and branch pipes having regulating-flaps, a cone-pulley driving the ventilator.

10,597.—MEANS OF PRESERVING WOODEN PAVEMENT-BLOCKS, SLEEPERS, &c.: *A. Beyer.*—After the blocks have been subjected to a temperature of 212 deg. in closed receivers during from one to five hours, the temperature is increased to from 250 deg. to 500 deg., and an air pressure varying from 100 lbs. to 200 lbs. per square inch is exerted; then is employed a preservative mixture (heated to 300 deg. at a highest pressure of 400 lbs. per square inch) of creosote, oil, resin, and formaldehyde. As the blocks are subjected to become cool under a lessening pressure they are treated with resinate of lime and turpentine. The invention comprises apparatus for the processes specified, including a furnace for melting the resin, tanks, pumps, air-compressors, &c.

10,340.—FLOATING BATHS: *F. C. Dodd.*—The structure comprises a frame built with girders and having air-tight removable tanks beneath, a platform or deck, which is provided with a transverse bottom, composed of planks interspaced, which can be lifted and lowered.

10,361-3.—APPLIANCES FOR ELECTRICAL LAMPS: *F. A. Halford.*—Two conductors formed of fine copper wire wrapped in an asbestos braiding and a penetrable asbestos or cotton material, constitute the cable. A shoulder or head, against which the fingers may be pressed as one puts the lamp into its holder, is fashioned upon the cap of the lamp, and the sharp edge of the cap enters the support and thereby prevents the accidental flow of water to the connecting-spikes. Pieces for connecting lamps to ceiling-strips have pins or arms that make contact with the conductors, and may either be rigid and be turned round in recesses to bear against the contacts, or be laid in grooves in a strip, the lamps being held in position by spring arms that bear against the conductors. Confer also No. 18,414 of 1899 for the special lamps cited.

10,370.—MANUFACTURE OF WHITE LEAD: *F. F. Corbett.*—Finely-divided lead or lead oxide is dissolved within an air-tight receiver by the application of acetaldehyde, alcohol, or alcohol and water. The carbonate or white lead is precipitated under pressure and agitation by the introduction of liquid carbonic acid or carbonic acid gas.

10,381.—AN APPLIANCE FOR SKETCHERS' USE: *H. Trice.*—The lower portion of the sketching-box has a hinged lid, a hole for the brushes, and a thumb-hole, whilst its upper surface (together with a sliding lid) serves for a palette; thin wooden panels are secured with pivoted clips in grooves cut in the lid.

10,384.—A POTTER'S LATHE: *A. Richard and G. de Franceschi.*—The lathe is devised for making a bowl having a figured polygonal rim, a smooth polygonal body, and a rounded base. The base is

is apened with a profile tool mounted upon a vertical axis, on which the main jolley lever is pivoted. The profile tool for the body of the tile is mounted upon another lever, which is pivoted to a vertical pin of the jolley lever, and as a vertical rod that engages with the cam-groove of a ring upon the table or wheel. A spring draws the two levers together in a horizontal guiding-fork. In a bent portion of the second lever is loosely mounted a third lever, which is provided with a profile tool which fastens the corrugated or beaded pattern and is pressed by a flat spring attached to the second lever. Round, elliptical, and polygonal articles may be made by using two, three, or more levers and suitable profile tools.

10,490.—METHOD OF MOULDING BRICKS: H. Uvander.—The plastic material is pressed forwards from the bottom of the pan into an ordinary cylinder machine by a pug mill, the opening in the mixing pan being regulated with slides having bolted hot holes, whilst all surplus clay in the mill will rise through ports in the mouthpiece and casing and drop over the edge into the mixing-pan.

MEETINGS.

THURSDAY, FRIDAY, AND SATURDAY, OCTOBER 3, 4, AND 5.  
 Royal Institute of British Architects.—Visit to Glasgow and Annual Dinner. The programme as presently arranged is as follows:—Thursday, October 3, Annual Dinner. NOTE.—The responsibility of signed articles, letters, and papers read at meetings, rests, of course, with the authors.

We are compelled to decline pointing out books and giving addresses. Any commission to a contributor to write an article is given subject to the approval of the Editor, when written, by the Editor, who retains the right to reject it if massive

All communications regarding literary and artistic matters should be addressed to THE EDITOR; those relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

TENDERS.

[Communications for insertion under this heading should be addressed to "The Editor," and must reach us not later than 10 a.m. on Thursdays. N.B.—We cannot publish tenders unless authenticated either by the architect or the building-owner; and we cannot publish announcements of tenders accepted unless the amount of the tender is given, not any list in which the lowest tender is under £100, unless in some exceptional cases and for special reasons.]

**7/6 LAND SURVEYING AND LEVELLING.** By ARTHUR T. WALMSLEY, M.I.C.E. F.S.I. F.R.C.Lond. Hon. Assoc. R.I.B.A. With 140 Illustrations.  
 A useful book for a Student, containing not only the usual instruction given in a Text-book on this subject, but valuable additions from the author's own experience, and an exhaustive chapter upon Parliamentary surveying.

**6/- FIELD WORK AND INSTRUMENTS.** By ARTHUR T. WALMSLEY, M.I.C.E. F.S.I. F.R.C.Lond. Hon. Assoc. R.I.B.A. With 254 Illustrations.  
 Gives the Student a practical knowledge of the construction and handling of surveying instruments, and how to deal with their application in the field for setting out work.

**7/- STRUCTURAL IRON AND STEEL.** By W. N. TWELVETREES, M.I.M.E. With 234 Illustrations.  
 In this elementary Treatise, the author has endeavoured to present in a regular sequence some of the more important details relative to iron and steel as applied to structural work.

**5/- STRESSES AND STRAINS; THEIR CALCULATION AND THAT OF THEIR RESISTANCES, BY FORMULÆ AND GRAPHIC METHODS.** By FREDERIC RICHARD FARROW, F.R.I.B.A.  
 A Handbook for Students, particularly those preparing for the examinations of the I.B.A. and arranged and intended especially for those whose knowledge of mathematics is limited.

**3/6 SPECIFICATIONS FOR BUILDING WORKS, AND HOW TO WRITE THEM.** A Manual for Architectural Students. By FREDERIC RICHARD FARROW, F.R.I.B.A.  
 Shows the Student how he should write a specification, and how the method and general principles, he may apply to the particular exigencies of any building he may design.

**3/6 QUANTITIES AND QUANTITY TAKING.** By W. E. DAVIS. (2nd Thousand.)  
 A reliable Handbook for the Student pure and simple, its scope being limited to the method of procedure in the production of a good Bill of Quantities. The examples given, whilst intentionally simple, will be found to cover almost every phase of the subject.

**5/- CARPENTRY AND JOINERY.** A Text-book for Architects, Engineers, Surveyors, and Craftsmen. By H. PHILIPS FLETCHER, A.R.I.B.A. A.M.I.C.E. With 294 Illustrations. 2nd Edition. Revised and corrected by the Authors.  
 Intended for those students for the examinations of the City and Guilds Institute, the Carpenters' Company, and the Institute of Certified Carpenters, &c. Also for the examination in these subjects by the R.I.B.A. and the Surveyors' Institution, &c.

**5/- ARCHITECTURAL HYGIENE; OR SANITARY SCIENCE AS APPLIED TO BUILDINGS.** By BANISTER F. FLETCHER, A.R.I.B.A. AND H. PHILIPS FLETCHER, A.R.I.B.A. A.M.I.C.E. With 305 Illustrations.  
 A concise and complete Text-book, treating the subject in all its branches, and intended to be of use to those entering for any examination in Sanitary Science.

London: DOUGLAS FOURDRINER, "Builder" Office, Catherine Street, W.C.

**ELEMENTARY NOTIONS IN ARCHITECTURE.**  
 This work will be found very useful to Architects and their Assistant. It contains over 80 diagrams and figures, some of which occupy a full page. It deals very fully on various kinds of Architecture, and will be found a suitable text for reference.  
 Published: CITY OF LONDON BOOK DEPOT, White St., Moorfields, London, E.C.

**BIRKBECK INSTITUTION.**  
 BREMEN-BUILDINGS, E.C.  
 SURVEYING DEPARTMENT, AUTUMN TERM, 1901.  
 Professor—HERNRY BISHFIELD, F.S.I.  
 LAND SURVEYING: Lectures on the subject of SURVEYING, 2nd and 3rd years.  
 and LEVELLING: Field Work on Saturdays, 2nd—4—30 p.m.  
 QUANTITY SURVEYING—Lectures on Tuesday, 5—8 p.m.  
 Commencing OCTOBER 1st and OCTOBER 1st respectively.  
 Classes in all branches of Selects, Languages, Art, &c.  
 Syllabus on application to the Secretary.

**WORSHIPFUL COMPANY OF CARPENTERS.**  
 Lectures on Sanitary Building Construction.  
 In connection with an EXAMINATION to be held at CARPENTERS' HALL on NOVEMBER 15th and 17th, will be delivered as follows—

DATE, 1901.	LECTURER.	SUBJECT AND SYLLABUS.
Thursdays, Oct. 10th	KEITH DOWNE, F.R.I.B.A.	Building in its Relation to Health. Soils, Foundations, The Use of Lime, &c. Intentional and accidental to Health, Heat, Moisture, Structure, Plastering, &c. Sanitary Architecture.
Oct. 17th	MARK H. JUDGE, Esq., F.R.I.B.A.	Design: Material; Building; Workmanship and Sanitary Appliances.
Oct. 24th	A. WYNTER BLYTH, Esq., Medical Officer of Health for St. Mary Islebone.	The Advantages and Disadvantages of various Sanitary Appliances used in Buildings and Warming Buildings. Principles of Ventilation and the Use of Water in Buildings. The Springs, Pipes, Taps, &c. of Water in Buildings. Hot Water Circulation; Radiators, University College, London.
Oct. 31st	Prof. T. ROBEY SMITH, F.R.I.B.A.	Setting Out Work and By-Laws.
Nov. 7th	JAMES BARLETT, Esq., F.R.I.B.A.	Principles of Calculating Areas, Estimation of the Interpretation of Tenders, King's College, London. Drawings to Scale; Methods of Drawing out Work, Checking Levels. Knowledge of the Acts of Parliament relating to Building. The Model By-Laws issued by the Local Government Board, and how they relate to the subject of the Examination.

These Lectures are primarily intended for Candidates for the present or future Examinations, and are illustrated by table-pieces models, large diagrams, photographs, and specimens of materials.  
 Lectures commence at 7.30 p.m.  
 ENTRY FORMS for the EXAMINATION, TICKETS for the LECTURES, and ALL PARTICULARS can be had of W. PRIBSTON, Esq., Carpenter's Hall, London Wall.

**SOUTH-WESTERN POLYTECHNIC, MANBERS ROAD, CHELSEA, S.W.**  
 (Close to Sloane-square and South Kensington Station.)  
 UNIVERSITY EXTENSION LECTURES.  
 A COURSE OF 25 LECTURES ON "ARCHITECTURE," specially considering the merits of the different styles and the suggestions they afford for design, will be given by BANISTER FLETCHER, A.R.I.B.A.  
 Lectures on Architecture at King's College, London.  
 The Lectures will be followed by Sketching Classes from the Lecturer's Diagrams.  
 The First Lecture is on MONDAY, OCTOBER 7th, at SEVEN p.m. For the Course, 10s.  
 For Syllabus, apply to the SECRETARY. A detailed Syllabus (price 3d.) can also be obtained.

**SURVEYORS' INSTITUTION EXAMINATIONS.**  
 COMPLETE COURSES OF PREPARATION for these Examinations are given, either in class, by correspondence, or in office, by Mr. RICHARD PARRY, R.I.B.A. Hon. Sec. R.I.B.A. Candidates are encouraged to commence study at any time. The following table shows the prices that have been obtained by Mr. PARRY'S Special Prices:—  
 1897 1898 1899 1900 1901  
 Driver Prize .. .. . 1898 1899 1900 1901  
 Penfold Silver Medal 1898 1899 .. . 1898 1899 1900 1901  
 Penfold Gold Medal .. .. . 1899 1900 —  
 Crozier Prize .. .. . 1898 —  
 NOTE—In 1898 the Crozier Prize was divided between two bracketed winners, one of whom was prepared by Mr. PARRY.  
 The above table shows that the 42 prizes awarded at the last year's examination, 263 were obtained by candidates prepared by Mr. PARRY, and 169 by candidates not prepared by him.  
 For particulars of the Courses of Work, or for any advice with reference to the Examination, apply to Mr. RICHARD PARRY, F.R.I.B.A. M.I.C.E. 82, Victoria-street, Westminster. Telephone 659 Westminster.

**SANITARY INSITUITE EXAMS.—**  
 Preparation for the Inspector's Examination by a system of correspondence, see Text Books, or by C. H. CLARKE, Inspector, Member of the Societe des Societes Francaise d'Hygiene. See Clarke's Aids—Calculation of Cubic Space, &c.; Practical Drain Inspection, 6s.; Trade Notices, 6s.; Sanitary Law (New Edition), 1s. 6d.—Prospectus from 130, Thornhill-road, E.C. 4.

**SANITARY INSPECTORS' and PRACTICAL SANITARY SCIENCE EXAMS. of the SANITARY INSTITUTE.** Complete Courses of Instruction by correspondence for these and similar exams conducted by Gentlemen, Engineers, Surveyors and Sanitary Inspectors, holding three Certificates from Sanitary Inspectors' Institute, in Hygiene, &c., several hundred successful. Classes for 1901 and 1902 EXAMS, just commencing. Apply for Syllabus of subjects, testimonials, &c. to C.S.I. 28, Victoria-street, Westminster, S.W.

**MUNICIPAL and COUNTY ENGINEERS' EXAMINATION.**—Mr. RICHARD PARRY, A.M.I.C.E. F.S.I. &c., 82, Victoria-street, Westminster, prepares pupils by correspondence for this examination. The course of work may be taken over a period of six or twelve months according to previous knowledge. At the examination of last October more than one-half of the successful candidates were prepared by Mr. Parry.

**R. I. B. A. EXAMS.—PREPARATION** personally or by correspondence, in three, six, nine, or twelve months' course. ARCHITECTURAL LENDING LIBRARY. Special three months' finishing courses.—For full particulars apply to Messrs. HOWGATE & BOND, Associates R.I.B.A. 115, Government-street, W.C. close to the British Museum.

**SANITARY INSPECTORS' EXAMINATIONS.** Successful POSTAL TUITION by Certified Instructor. First Class Honorary Sanitary Fitting, Mechanics, &c. Type-written papers. Numerous sketches. Small fee.  
 ASSOC. SAN. INST. No. 4, Duke-street, Adelphi, London.

**WANTED, PRIVATE TUITION (evening)** by two pupils in SANITARY ENGINEERING, BUILDING CONSTRUCTION, and ESTIMATING at own office, or weekly at home, in evening class within easy distance of Holborn or Victoria-street, S.W.  
 Address, stating evenings, hours, and terms, to H. 50, Ebury-street, S.W.

**PATENT FOR SALE.** Great labour-saving method for AUTOMATIC TRANSPORTATION of Bricks, Mortar, Earth, Coal, or other material, already proving highly successful abroad.—Address, E. C. Davey & Co. Advertising Agents, 23, Finsbury-lane, Cornhill.

### A Ramble through South-Western France.

PERHAPS the most noticeable difference between the extreme south of France and the centre or north is that a larger number of old public buildings and churches remain in an unrestored state than might be expected at the beginning of the twentieth century. The borders of the Mediterranean are still comparatively pastoral and agricultural; whilst the northern districts, crowded with industries and a manufacturing population, are in every sense changed. In the north and centre of France the ancient churches, buildings which must always represent a desire on the part of a people to perpetuate its own memory in monumental form for future ages, have evidently disappeared to a remarkable extent. In purely rural districts the old parish church still lingers in the centre of each village. As a rule it is a perfectly uninteresting building, its outside walls probably "restored" during the past half century by the government department charged with this business, its interior "decorated" in the coarse and vulgar style of imitated mediævalism for which the school of Viollet-le-Duc is perhaps responsible, and every trace of ancient furniture and decoration completely removed, and replaced with the cheap gaudy trappings associated with the Roman Catholic religion on the Continent.

France has suffered from two very thorough destructions of ancient art and architecture. At the Renaissance and during the period of the religious wars the old churches were probably to a very great extent gutted of all that they possessed of mediæval furniture. But this havoc was more than completed by the atrocities of the various revolutions the country has suffered from during the past hundred years, which have always been animated by the curious desire to destroy everything ancient, or which could suggest a historical past. As a consequence, a

strange sense of the unaccountable comes over one on finding as exceptions to a rule a few old tombs and monuments of various ages in out of the way corners of some of these old churches, when everything else has been sacrificed to revolutionary rage. These old monuments are usually of very little interest in themselves—naturally all that bore an important historical character had the least chance of surviving—they merely serve to accentuate the bareness of the old whitewashed interiors, and remind one of what an enormous amount of monumental art has been destroyed. The Government engineers found but little to "restore" during the "Gothic revival" of the past century except the bare walls and vaults of these old churches; all the tombs and altars and other ecclesiastical works of art of the former centuries had practically disappeared, and probably more than half the ecclesiastical buildings of France were in ruins, or being pulled down for other purposes during the early years of the nineteenth century. In the far south of France the natural indolence of the people, perhaps, tended to preserve the old buildings, and they have merely been converted as they stand into stores and workshops. In Avignon, for example, although the horrors of the Great Revolution broke out here with extraordinary violence, the city at first sight appears to be still provided with its ancient public buildings; but the defaced churches, with their broken statues and ornaments, are mostly converted to secular purposes. The curious palace-fortress of the mediæval Popes remains in a singular state of preservation—indeed, it is quite one of the best preserved unrestored buildings in the whole of France. Its simple massive walls, perhaps always devoid of armorial or decorative features, appear not to have excited the animosity of the revolutionists, who merely converted the place into a huge prison for the unfortunate "aristocrats" of the district. Since those days of horror it has served as the local barracks, for which purpose it is likely to remain in use for many years to come. Lately a project has been started to turn it into a provincial museum, but the means are not forthcoming. Two little frescoed

chapels in one of the towers, supposed to have been painted by the Florentine Simone Memmi, remain in a wonderful state of preservation, the whitewash having been cleared off without any restoration of the old paintings.

Almost adjoining the palace is the curious little cathedral, a building of Romanesque period, with singular additions of much later times, well preserved and quite unrestored; and in this church are the monuments of two mediæval Popes, that of Benet XIII., still standing in its chantry, and in a remarkably perfect condition, but no doubt considerably patched up during the past century. The other monument, that of John XXII., is merely in fragments, and its original location is not clear; at least, the chantry in which it once stood no longer exists. This latter monument, to judge from the fragments which remain, was most extraordinarily like an ordinary canopied tomb of the English fifteenth century style, with a canopy of three divisions terminating in spires carried over a recumbent figure of the Pope. Traces of very charming coloured decorations of the Italian Cinquecento remain over the western entrance of this church.

Avignon is certainly the loveliest of all the old French cities; it is situated in the most beautiful part of the Republic, and its artistic remains are amongst the most interesting to be found in France. The view from the upper part of the city over the windings of the Rhone towards Villeneuveles-Avignon is quite unparalleled in its peculiar character and charm, and it has the remarkable interest of looking almost untouched since the Middle Ages. The great château of Villeneuve, with its frowning battlements and round towers, and the mediæval town clustering round it, is seen at such a distance, that any trace of modern building which may exist is invisible. The ruined bridge with its tiny chapel on a pier, so well known from pictures, which once connected Villeneuve and the city of the Popes, gives almost an unreal effect to the exquisite landscape. No sign of modern life appears, no railway or factory chimney comes within view to mar the peculiar beauty of the scene. Even the modern bridge which

replaces the famous old one happens to have been constructed out of sight.

But, alas! this exquisite old city of so many historical memories is to be devoted ere long to a considerable amount of "progressive" vandalism. It would seem that the ancient walls of the city which still survive in a remarkable manner are to be removed. The *Journal des Débats*, &c, in a recent number draws attention to the threatened destruction in the following words:—"Le Ministre et la Commission des Monuments Historiques ont montré une scandaleuse faiblesse en abandonnant aux caprices de la municipalité un monument, dont du reste ils n'ont pas le droit de disposer."

Should this beautiful old palace-fortress of the mediæval Popes ever be "restored," some of the grandest and largest Gothic vaulted halls in existence will come to light. The great hall of the Consistory, now divided in its height by a wooden floor, is a splendid apartment divided by a row of columns into two aisles of immense length and width, but in its present condition its proportions are quite invisible. Its vaultings are still decorated with paintings of the early Italian school.

Carcassonne is a very interesting place for the antiquary to visit. The old city, standing on a height and containing 600 inhabitants, is separated from the comparatively modern town and railway station by a river spanned by a mediæval bridge. Seen from the railway, the old city has almost a theatrical effect, reminding one of some reproduction of "Old Paris," or "old" anywhere else, at an international exhibition; and this impression is not very much lessened by a nearer approach to the ancient site. The walls of various dates surrounding the city, with the château at one corner, remain, at least as far as their plan is concerned, in a remarkable state of preservation. These ancient walls have for some years back been declared a national monument illustrating the mediæval history of France; but the very thorough "restoration" to which all their upper parts have been subjected must rather detract from their actual historical value. As a monumental picture of a mediæval city, due to the munificence of the French Government, Carcassonne is a very remarkable place and well worth a visit.

The fortifications of Carcassonne are of the crossbow period, and consist of a main curtain with towers of various form crowned by slated roofs (these latter are probably all modern). The base of this curtain is protected by another lower wall, with low round bastions in front of each of the towers of the main curtain. The château of the fifteenth century is an irregular enclosure surrounded by a higher curtain and round towers. It is a system of fortification without a moat, which the site on a hilltop and a southern climate necessitated. Within the tower there are very few ancient houses remaining, and only one church—the former cathedral, a building with a highly picturesque interior on a plan of the usual mediæval Italian type, the hammer-headed or tan cross. The poor commonplace cottage buildings of the town are probably much the same as must have existed in the Middle Ages, and consequently they do not detract from the unity of effect which has been aimed at in the modern restoration. Seen from a distance no modern buildings appear above the city wall.

This singular effort to "restore" a mediæval town is, of course, due to the influence of Viollet-le-Duc and his school. As a monumental illustration of the famous "Dictionnaire," it is of special interest to a student of mediæval antiquities, and the French Government is to be lauded for such a munificent gift to the artistic world as is constituted by this most learned restoration. For it is a distinctly learned, careful, and reverent restoration, and the buildings which form the monument remain unoccupied for any modern use, and so there is a certain interest attaching to the work, although to many visitors that special charm of an unrestored mediæval town, with its evidences of gradual change and development into comparatively modern usage, may be absent.

The least satisfactory detail in the restoration is the very much renewed church. This might surely have been left in such condition as the revolutionists may have determined at the end of the eighteenth century. But the building has been very completely "restored," and even a number of ecclesiastical tombs provided, with the deplorable reproductions of mediæval sculpture which the modern Frenchman considers good enough for a church. As a building this church has a remarkably picturesque interior; the transepts have an eastern aisle provided with shallow chapels, but the furniture is merely the ordinary modern Roman Catholic sort. A pompous inscription records the completion of this work in 1898.

The lower town of Carcassonne also appears to be of mediæval foundation, but it has at one time been surrounded by an ordinary earthwork with bastions of the seventeenth century type. Hardly any mediæval buildings remain in this lower town, except two very large churches, probably built by the two great Orders of the Middle Ages. Both these churches are of the same Italian plan with three eastern apses within the width of a very spacious nave, and a great tower at the west end. As is the case with most French churches, the interiors are completely devoid of furniture and monuments older than the beginning of the present century, and such fragments of antiquity as may have escaped the Revolution have been removed by would-be "restorers," who have decorated the unfortunate buildings with poor imitations of Viollet-le-Duc's peculiar mural decorations.

The enormous span of the nave vaults in some of these southern French churches astonishes the northern visitor. These two churches at Carcassonne are good examples of the ordinary style (fifteenth century). Many of the comparatively small towns or villages also possess churches of the same type, with naves of over 50 ft. in width. The means of supporting the thrust of these enormous vaults is obtained by building the walls as a series of small chapels on each side of the nave; the side walls of the chapels constitute enormous buttresses capable of carrying almost anything.

Albi is a wonderful old southern city, hard to arrive at and still more difficult to leave conveniently; it lies off the main railway lines, and retains that delightful air of the old "cathedral city" with which we are familiar in England. Its stupendous cathedral is its only monument of importance. A picturesque little palace of the archbishop stands in an adjoining enclosure and, combining with the

mediæval surroundings, forms a charming picture of provincial France.

The cathedral of Albi is probably the largest example of the wide single-span vaults peculiar to the south of France. This stupendous construction is supported in the usual way on a series of enormous internal buttresses which form side chapels on each side of the nave. The choir of the church is formed by an enclosing wall of the most elaborate flamboyant stone tracery which entirely surrounds it, allowing of a passage or ambulatory between the choir and the external walls of the church. The interior seems to have been somewhat spared at the Revolution, and the fine large figures of saints, which very much resemble the series in Henry VII.'s chapel, Westminster, still occupy nearly all the niches. Two features about this church are of special interest to a student—its particularly imposing and beautiful proportions, due chiefly to its simplicity of plan and completeness in every respect, and secondly to its very original decorations. These decorations consist of elaborate painting over the entire internal surface of the building in the early Renaissance style, and with the utmost variety of colour and detail. Each division of the great vault is treated differently, and, of course, the small lateral chapels have each a separate design. These decorations, which must have become very decayed at the beginning of the nineteenth century, were restored at that time by local workmen, who painted them over in oil colour, following the original design with few exceptions. The total effect is rich and very interesting.

Marseilles is a grimy, squalid, deplorable-looking city, with hardly a redeeming feature from the architect's point of view. Its modern quarters resemble Paris in their vulgar pretentious architecture of a style which, after a few years of exposure to a smoke-laden atmosphere, assumes a particularly depressing and gloomy effect. The huge masses of ponderous stone carving framing the innumerable windows of a modern French boulevard or street are peculiarly meaningless and uninteresting. The monotonous character, the vulgar display, the want of individuality, and also the want of scale in these buildings, produce as depressing an effect on the mind as some suburban district of London. In the case of Marseilles the unsatisfactory characteristics of the city are heightened by a detestable climate and the consequences of a dirty smoke-laden atmosphere. More even than in Paris the sordid commercial spirit of modern days is manifested by the universal method of constructing the houses with their pretentious carved stone fronts apparently reposing on the plate-glass windows of cafés and shops. Hardly a house in Marseilles possesses a ground-floor which is not a shop. In fact, Marseilles, though it is considered the second place in importance in France, is a very second-rate city. It is as squalid as Naples used to be, but without the beautiful atmosphere of Italy to redeem its ugliness. Its unswept streets, encumbered with the eternal French café chairs and tables and the obtrusive display of low-class stores, give a detestable impression to the visitor anxious to get away from such a disagreeable sort of place.

As in the case of all French cities of modern days, the architecture of the public buildings, as well as the new houses in the

boulevards, has evidently been "made in Paris." Architecture of such a kind is not sufficiently interesting to call for criticism; every local characteristic is eliminated, and the huge *maisons de rapport* may be better studied in their native Paris, where their peculiar developments are carried out on a more impressive scale.

The only noticeable modern monument of any artistic importance in Marseilles is the Cathedral, a huge building at the side of the port, chiefly built during the reign of Napoleon III., whose name is inscribed within it under the title of "Prases Reipublice." It is imposing on account of its size and singular position, almost overhanging the great port and quite detached from the city. It is in that peculiarly uninteresting round arched style so much affected by the modern French church; its details have the appearance of being machine work, and its decorations are painfully unconventional. Completed so lately as 1886, this building looks quite old in consequence of the blackening effect produced by the neighbouring port. It has all the uninteresting character of a great monument completed and finished in every part "by contract." Nothing suggests any private or individual interest in any part of the building. No monuments or private chapels disturb the uniformity of this model Government cathedral. It has been built by Government architects at Government expense; and it remains a gloomy, unsympathetic monument of the State religion of the country.

ON SOME UNFINISHED PICTURES.

"INTERNATIONAL" is a rather large term to apply to an exhibition in which a few foreign artists—mostly not of the highest rank—exhibit along with a number of English ones, many of whom also are not very much known to fame. "International Society of Sculptors, Painters, and Gravers" it is called ("engravers" is evidently a vulgar word); but the internationality seems to be rather in abeyance, for even some of the few foreign works are apparently lent by owners, and not sent directly by the artists. Moreover, this International Society apparently cannot spell the name of the greatest French landscape-painter, for two small landscapes lent by Mr. J. S. Forbes, which seem to be early works by M. Harpignies, appear as by "Harpigny." At all events "Beaulieu" (112) shows exactly M. Harpignies' peculiar method of outlining the stems of trees with a streak of dark colour, and it is odd if there is a painter with a name so similar employing so similar a method.

Nevertheless, the exhibition at the Piccadilly Galleries is of interest, not only because it contains a good many clever and striking pictures, but because it serves to illustrate a certain tendency in modern painting—landscape-painting especially—to regard the subject of the picture not as a matter of interest in itself, but merely as an opportunity for showing the handling of an effect of light, or of mist, or of colour, which is regarded as the end in itself, the development of the nominal subject of the picture being a secondary matter. In some cases this is carried to a perfectly absurd extreme, as in Mr. Studd's "Hampton Court" (27) the object of

which is evidently the contrast of colour and line between the masses of trees and the building, but in which the trees are mere formless blotches of pigment, which it is ridiculous to ask us to accept as trees; and there are other examples just as bad. Works of this kind may be very useful to the artist as rapid memoranda of effects made on the spot; but to exhibit them as works of art is playing on the credulity of the spectator. So, again, M. Neven-du-Mont's "Lily—a Portrait" (63), is a good rapid pastel study for a portrait, but much more a work for the studio than for the picture gallery.

There are other things in the exhibition which, as examples of a broad and free treatment of Nature without finish of detail, are of considerable power and interest, and serve to remind one of Muller's remark to Constable as to the finishing of a picture being the spoiling of it. Mr. Priestman's "The Lock" for instance (77), is a fine study of effect of trees and water, and one might very well accept the idea that to carry it further might be to spoil it. But then, in this and other cases, is not the artist really shirking a difficulty, either in regard to executive power or to labour? It is surely a much easier task to produce a broad effect which shall please the eye and mind, and suggest a good deal more than is actually made out, than to carry the picture out to a more complete stage without losing the appearance of breadth and freedom. That is just wherein the highest difficulty lies, and the artist eludes it. The curious feature in connexion with the whole matter is that these painters of unfinished pictures would persuade the public, and have persuaded some of the coterie of art critics, that there is an æsthetic superiority implied in the mere fact of leaving a picture at this stage; that this is the higher art; that an unfinished picture stands *ipso facto* on a higher level than a finished one. It is only on this supposition that one can explain a great deal of really clever work which is to be seen in such an exhibition as this. There is even in the catalogue a long quotation of mystical satire from Mr. Whistler in regard to the abject folly of finishing portraits or figure paintings (for that is what it seems to amount to), dramatically illustrated by his own ghost of a figure of Phryne. Whether the artist himself really believes in such a painting of the nude figure as this, or whether he is merely amusing himself by playing on the credulity of his public, is a conundrum we do not undertake to solve.

Taking this, however, as a collection of for the most part unfinished pictures, there are in it a good many works of power and interest as such; among the landscape studies especially. Mr. Paterson's "Blacknest Tarn" (2) is a good study of the landscape under the light of the rising moon; the moon is cracked on the face and not quite spherical, though evidently meant for a full moon, but the effect of light is there. Mr. Reid-Murray's sketch of "Autumn Landscape" (65) has merit of the same kind—a mere sketch, but true in light and colour; Mr. Priestman's "Uplands" (89) also; his "Bend of the River" (87), on the other hand, is a mere smudge. Landscape composition (if there is still such a thing) is well illustrated in Mr. Grosvenor Thomas's "Evening" (103). There is poetic feeling

in Mr. Withers's sketch of "Evening on the Forth" (119); character and interest in Mr. Dekkert's "Low Tide at St. Monau's" (120), with the craft aground in the wind; and Herr Petersen's "Marine" shows a certain individuality in colour and general treatment of the sea, without overstepping the limits of Nature; as much cannot be said of his "Hochsee" (254), which is a mere stage sea under artificial lighting. James Maris's "Amsterdam" (107), lent by Mr. Forbes, is a really fine work, but is only a loan, not an artist's exhibit. Fissarro's "Le Carrousel" on a winter morning (242) is a real piece of Paris winter effect; and there is another admirable winter picture in Herr Buysse's "Wondelgen Church" (273), seen at the end of an avenue with snow on the ground; a kind of modern Hobbema as to composition. An interesting and suggestive picture too is M. de Sidaner's "La Statue" (238), a little *place* in some French country town, seen in warm mellow sunshine, the "statue" in the middle forming a central object with its back to the spectator, so that we may fancy it what we will. Some of the contributors, however, seem to have a special spite against architectural subjects; one of them shows a front of Amiens Cathedral (209) in what is called "water-colour," but may be rather called a scabble in dirt, and the same may be said of "Vieilles maisons au bord de l'eau" (28), by another foreign contributor—a smudge out of which it is indeed difficult to make anything.

Such a sketch as Mr. Crawhall's "Barnet Fair" (23), a momentary effect, as one may say, of sunlight and horses, forms one of the best apologies for the system of unfinished pictures, representing as it does an effect which was worth record but hardly perhaps worth a picture in the completer sense. So also Mr. David Gauld's "Ayrshire Calves" (55: is there a particular character, by the way, in Ayrshire calves as distinguished from others?) shows an excellent study of animal form and movement, though the texture is left to the imagination. Among figure subjects which come within the prevalent temper and tendency of the exhibition Mr. Chase's life-size of a woman and child, "His First Portrait" (21), cannot however be classed among unfinished pictures; it is painted in a broad style and somewhat dingy in colour, but is a complete and expressive work. Mr. Lavery's beautiful half-length portrait of a lady (48) is complete in every sense, and a picture which seems quite out of place amid its surroundings; in two other works he seems to have relapsed into the prevalent habit of the place and sent large scale portraits which are in a very crude stage of execution. M. Renoir's picture called "The Promenade" (93) is a curious example of the tendency referred to above, to regard a subject not for itself but only as a means of exhibiting the study of a particular effect. The figures are a man and woman representing the most uninteresting and vulgar type of French middle-class life; as far as they are concerned the picture is absolutely ugly and commonplace; but it is painted, and hung, for the sake of the representation of the effect of broken sunlight, through foliage, on the woman's white dress. This is cleverly done, but was it worth while to paint a picture of this kind for the mere sake of the effect? One is curious to know, too, for reasons of another kind, what a life-

size portrait by Boldini is doing here; a kind of picture and a kind of artist that we should have thought would have been repudiated with both hands by the Committee of an exhibition of the professed aims of this one; a picture which represents the most commonplace *chic* of sleight-of-hand painting. The exhibition can boast of a fine picture by Israels (101); but that is a loan, and not an artist's exhibit.

The works in sculpture are only small bronzes for the most part—not numerous nor very important; but M. Troubetzkoy's small group called "Mother and Child" is full of force and character, and we may also draw attention to Mr. Fisher's fine bit of enamel design on copper, "How Beautiful upon the Mountains," &c., classed in the catalogue with the West Gallery exhibits, but really in the Central Gallery. This at any rate is finished, and is a beautiful bit of work of its kind. And among the unfinished pictures there is much to admire, in others besides those we have named. It would be interesting to have an exhibition of them in their finished stage next year.

#### NOTES.

The late  
Mr. Brooks.

MR. JAMES BROOKS, whose death is recorded in our obituary column, together with a list of some of his executed works, filled a more important place in modern English architecture than the general public seem quite to recognise, judging from the meagre notices of him which have appeared in the daily papers. Commencing his architectural career at the time when the movement for church building was in full activity, and being employed largely as a church architect, instead of following the line of mere imitation mediæval architecture, he struck out a path of his own, and exactly in a direction in which a new ideal for the modern church was very much needed. He was professedly and by predilection a Gothic church architect; but he treated Gothic in a manner of his own. He perceived that the principle of mediæval architecture could be as well illustrated in brick as in stone, and that it was possible to carry out large churches for the masses at a reasonable cost, not by being content with thin walls and bad carving, but by employing plain materials in a substantial and monumental construction, and depending for effect on composition and mass rather than on ornament. On these lines he succeeded in producing churches, for town sites especially, which were dignified and solid edifices with no suspicion of modern-mediæval gimcrack about them. He obviously gave a great deal of study to the designing of the lines of his buttresses and gables and other features which are sometimes treated in a perfunctory manner; and the evidence of the study was unmistakable in his buildings. Plain as they often were, they were never commonplace, and gave the impression that every line had been carefully considered. His design for Liverpool Cathedral, based on a fine plan, and with a great deal of power and picturesqueness in the architectural treatment, was a remarkable conception, over which also he spent immense care and thought, studying and drawing many parts of it to a larger scale than required in the competition draw-

ings, in order to work it out more thoroughly. He was an architect possessed both of genius and of the faculty of painstaking and conscientious study.

The Glasgow  
Visit of the  
R.I.B.A.

THE meeting in Glasgow last week of the Royal Institute of British Architects left nothing to be desired except, perhaps, better weather. Although some well known architects were absent, the meeting was representative both of the profession and the Institute, and the heartiness of the welcome of the Institute by the local architects says much for the good understanding existing between the allied societies and the parent body. On the occasion of such a successful exhibition as that which is now being held in Glasgow, the visit was sure to be specially interesting and profitable, but success was assured when the Corporation and the Glasgow Institute were united in the endeavour to give the visitors a hearty welcome. A fitting conclusion of the visit was the brilliant reception by the Corporation in the municipal buildings, when the members had an excellent opportunity of inspecting Mr. Young's building. Altogether, the visit must rank as the most successful of the kind which the Institute has held away from London.

The Liverpool  
Cathedral  
Scheme.

A LIVERPOOL architect, Mr. Shallcross, writes an admirable letter in the *Times* attacking the action of the Liverpool Cathedral Committee in regard to what, as he truly says, is a matter of national and not of merely local interest. He directs his criticism especially against the mistake on which we have already commented, of demanding a cathedral "in the Gothic style"; a double mistake, since not only is the idea of demanding a style of the past an absurdity in itself, but the mediæval type of cathedral is not suited either to the requirements or the sentiment of modern worship. In fact, the Cathedral Committee appears to consist of fossil ecclesiologists who are totally unaware of all that has been going on in the modern architectural mind during the last quarter of a century. They make no undertaking, either, to employ professional advice or assistance in judging of the drawings sent in to them. They may be pretty well assured that no architect of the highest class will respond to such an invitation.

The National  
Trust.

THE society which is now becoming well known as "The National Trust"—for places of beauty; &c., being understood (we may suggest, *en passant*, that the society, whose offices are at 1, Great College-street, Westminster, should adopt the popular name if only to propitiate journalists)—highly congratulates itself on the excellent piece of work it has done by obtaining for the public in perpetuity a large tract of land on Derwentwater. No one can move about the United Kingdom without seeing what a wide and useful field there is for the operations of this society. We look forward to work being done by it no less valuable and national than that of the Commons Preservation Society. There are many open spaces and many interesting buildings which will be lost to future generations unless they are taken charge of by this society. Perhaps the most

striking example is the Thames, which every year is losing something of its charm by the erection of houses along its banks—the goose being rapidly killed for the sake of the golden egg, since every villa that is built by the side of the river takes away from its beauty. Unquestionably the time has come when this society would be undertaking national work if it set out to obtain for open space as much land as it can obtain along the banks of the Thames. We believe that were a special fund opened for the purpose it would be widely supported, and there is so much land in the market on the Thames that there would be no difficulty in commencing operations at once. On the architect and the architectural student this society certainly has great claims, since it is likely to hold for posterity many important buildings which, not being as world-famous as English cathedrals, are liable to be lost unless placed in the hands of a society whose object is primarily not to restore but to preserve.

A LETTER published in the *Labour Disputes*, *Times* this week from Mr. Thomas Case, the well-known

Oxford tutor, called attention to various interesting points in regard to labour disputes. Mr. Case appears to think that the right of combination has given too great power to working men, but it is now purely academic to complain of this fact, for combination is the most remarkable feature of recent trade movement among all classes. Trusts and co-operative societies are striking examples. When, however, Mr. Case says that workmen "have a legal right, which is less defensible (than the right to combine), to combine to picket in crowds, with a view to information about another's business," he undoubtedly points to a weak spot in the present state of the law. Theoretically, it may be perfectly harmless for several hundred workmen to surround a factory, and inform non-union men of the mistake it is to go on working in that building. Practically this amiable and benevolent object becomes a severe threat, and where one man is getting information a dozen are using threats. And as long as the law stands as it does this must happen, for it is powerless to prevent verbal and also indirect intimidation by the mere presence of masses of hostile men. Workmen should have the fullest right to strike and to combine, but the moment a strike is declared it should be made illegal for workmen on strike to loiter near a building owned by capitalists against whom the strike is directed. Absolute freedom for every one should be the aim of the law, and any form of picketing is a blow at individual freedom.

The Workmen's  
Compensation  
Act.

THE decisions of county-court judges are, of course, not binding as legal precedents, but from time to time, they deserve consideration, as in the case of that recently-given at Southwark. The long and short of the case was that the hands of a workman, by continued working at a particular process, became sore and then diseased, and it was contended that he had suffered from "a personal injury by accident." It is clear that the workman was not injured by what is popularly and generally known as an accident, and the Judge so held. But obviously the case raises questions of some importance, since it

ls—as happened to this workman—quite conceivable that a man may be injured just as seriously gradually as suddenly. In such circumstances why is he not to be compensated? It may be said that he enters into the work knowing what risks he runs. But in a sense every workman knows that in most trades he is liable to accidents. One can imagine a painter, for example, being seriously injured in his health. These cases are rare, but that is no reason why they should be left outside the Act, and it would appear desirable that, in cases of injury to health by the use of certain processes, the workman should be entitled to compensation when a real chain of causation between the sickness and the process can be clearly proved.

**Architectural Association of Ireland.**  
 THE Annual Report of the Architectural Association of Ireland, together with the prospectus of meetings and classes for the coming session, shows that the Association is in earnest in its endeavour to promote and facilitate architectural study. The Association has still to make its way, and we presume it has not received as yet all the support it may have the right to hope for, but the tone of the Report is encouraging. The Association is offering a studentship of 10*l.* (open to members under thirty) for the best measured drawing of a building in Ireland erected before 1820; a good list of suggested buildings being added. The Institute of Architects of Ireland offers a prize of the same amount to members of the Architectural Association for a design for Public Baths and Wash-houses for a town in Ireland with a population of 20,000; Mr. Doolin offers a prize of four guineas for the best-filled sketch-book; and Mr. W. F. Beckett one of two guineas for the best sketch of the Custom House, Dublin. Classes for architectural history, design, and building construction are to be held twice a week during the session. "Every effort is being put forward to make these classes of real and lasting benefit to the students." Their success must largely depend on the students themselves, and it is to be hoped that they will do their best to take advantage of the opportunities of improvement offered to them.

**A.A. Discussion Section.**  
 THE programme of subjects to be considered in the Discussion Section of the Architectural Association during the coming session is a very good one, and appeals to a variety of interests. It includes, among other subjects, "Stables and Stable Fittings," the subject to be started by Mr. H. Gregory Collins; "Design in Furniture," by Mr. Vivian H. King; "The Manufacture, Testing, and Uses of Portland Cement," by Mr. H. Howard Humphreys, the author of the useful and practical communication published in our last issue; "The Work and Influence of Augustus Welby Pugin," by Mr. P. W. Mulready; "Stained Glass," by Mr. Dudley Forsyth; and "The Organ, its Proper Position and Architectural Treatment," by Mr. F. C. Eden. The only question in our mind is whether some of these subjects might not have been still more advantageously considered at the larger general meetings of the Association. The distinction between the two, of course, is that the larger meetings are for the reading of a pretty full paper on

a given subject, the discussion being secondary; whereas at the Discussion Section discussion is the main object, and the papers ought to be short, and calculated to make suggestions and start discussion rather than to exhaust the subject. Writers of papers for the Discussion Section will be wise to bear this in mind, and keep their communications brief and comprehensive; otherwise the Discussion Section may lose its proper function and become too much like a repetition of or rival to the general meetings.

**Higher Elementary Schools.**  
 THE Board of Education has recently issued "rules as to building" higher elementary schools. By Article 110 (6) of the Code the number of scholars in a school of this kind is limited to about 300. For a school of the maximum size the new rules require ten classrooms, of which at least four must be suitable for classes of forty scholars. A classroom for forty scholars must have an area of about 620 square feet, and one for thirty scholars about 480 square feet. These areas are considerably in excess of the requirements for elementary schools. The desks must be single, 2 ft. long, and arranged in pairs with intervals of 2 in., and gangways of 2 ft. Laboratory accommodation must be provided, generally one for chemistry and one for physics; 30 square feet of floor space must be allowed for each scholar, the minimum size of each room being 600 square feet. Proper fittings must be provided, and a balance-room may also be included. A lecture-room with an area of 750 square feet is said to be desirable, together with a small preparation room. A drawing-classroom for "the more advanced drawing" should contain 30 square feet of floor-space for each scholar, the best size being a room with 750 square feet. If the building is planned with a central hall, and if this is properly lighted, it may be used for the drawing class, good dimensions for such a hall being 50 ft. by 25 ft. As an alternative, the hall may be used as a gymnasium, an area of 1,800 square feet being required for a school of 300 children. The gymnasium should not be adjacent to the laboratories. Special rooms for cookery, laundry work, and manual instruction should be provided in accordance with the rules in Schedule vii. of the Code. It is to be hoped that the issue of these rules betokens a desire on the part of the Board of Education to encourage the erection of higher elementary schools, but in the present unsettled state of local educational authorities it is doubtful whether much progress will be made in the immediate future.

**St. George's Church, Botolph-lane, E.C.**  
 AN Order in Council has been made for ratifying a scheme of the Ecclesiastical Commissioners for effecting a union of the two rectories of St. Mary-at-Hill with St. Andrew Hubbard and St. George, Botolph-lane, with St. Botolph, Billingsgate. The scheme provides for the constitution of one consolidated benefice, with the Church of St. Mary-at-Hill as the parish church, and for the demolition of the church of St. George, Botolph-lane. The latter church, which has been closed for some five or six years past, was built in 1672-4, at a cost of 4,510*l.*, from Wren's designs. It is built of stone, and has a plain exterior, but it presents some pleasing

features characteristic of Wren's London churches—a tower that rises directly from the ground, and a solid unbroken basement story which gives a stability of appearance to the entire structure. The tower, 16 ft. square at the base, rises by three stages to a total height of about 85 ft.; it has a cornice and a dead-pannelled parapet, with angle piers which carry vase-shaped pinnacles. In the interior two Corinthian columns, widely spaced, on each side, divide the aisles from the nave. The roofs of the aisles are flat; the nave roof is arched in sections. There is a reredos of oak with a Corinthian order. The church, which was repaired in 1836, and again in 1884, measures 54 ft. by 36 ft., and is 36 ft. high. The rectory passed from Bermondsey Abbey to the crown at the Dissolution. Since the Great Fire the parish has been united with that of St. Botolph, Billingsgate. The Commissioners further provide for the removal to St. Mary-at-Hill church of the font, communion-table, sacramental plate, organ, carved woodwork, and other fittings, now in the church of St. George; but if any of those fittings are not needed for St. Mary's they will be transferred to a new church, which, with a parsonage house, it is proposed to build in or near London with the proceeds of the sale of the site and materials of the church of St. George. The provision for transferring the organ to St. Mary-at-Hill seems indeed absurd on the face of it, as that church possesses already an unusually large and fine organ with a fine carved case.

**The Grammar School, Monmouth.**  
 PLANS have been prepared by Mr. Henry Stock, architect to the Haberdashers' Company, for new school buildings at Monmouth. In 1614 William Jones—who made other large benefactions to the Company—gave a sum of 9,000*l.* to the Haberdashers for the endowment of a preacher, a free school, and almshouses for twenty aged poor in Monmouth. The Company expended 3,400*l.* in the purchase of a site and the erection of the several buildings, including houses for the schoolmasters and preacher, or lecturer, and bought an estate of 349 acres at Hatcham, New Cross, to furnish an income for the charity. A scheme was made by the Court of Chancery in July, 1854, for regulating the amounts of various payments to the beneficiaries under the trust. In an official return made twenty years ago the annual income of the endowment is given as 4,507*l.* 7*s.* 5*d.*, of which amount, it seems, a yearly sum of 3,207*l.* 7*s.* 5*d.* was appropriated to the school, and one of 1,000*l.* to the almshouses and almshouses. The Haberdashers' Company rebuilt the almshouses, in 1842, at a cost of 7,000*l.*

**Pictures by the late W. Stott.**  
 WE do not know that it was much of a kindness to the late Mr. William Stott—"of Oldham" (as he chose to call himself), to have got together a collection of his pictures for exhibition. He was an artist who had genius, very much marred by eccentricity and (apparently) imperfect training. It was only in such recent works as "The Awakening of the Rose" and "Autumn," both which are here, that he seemed at last to have hit on a settled path in art which would have been worth pursuing. The "Rose" is a remarkable picture, both in colour and conception; and the portrait of a man in a seaman's dress

is a good piece of effective and straightforward portrait painting. Most of the other works (in the Water-Colour Society's gallery) we prefer, on the principle "de mortuis nil nisi bonum," to pass over. The preface to the catalogue, written by a popular novelist who appears to have been a friend of the painter, is one of the most absurd pieces of extravagant adulation we have ever seen even in catalogue prefaces. The unfortunate painter might well have said, "Save me from my friends."

#### THE ROYAL INSTITUTE OF BRITISH ARCHITECTS :

##### ANNUAL DINNER AND VISIT TO GLASGOW.

The annual dinner of the Royal Institute of British Architects was held in Glasgow on Thursday last week, at Windsor Hotel, St. Vincent-street, many architects from London and the provinces being present. The chair was occupied by the President of the Institute, Mr. William Emerson, and among other gentlemen present were Principal Story, D.D., Sir James Marwick, LL.D., Town Clerk of Glasgow; Sir Thomas Drew, P.R.H.A., Bailie Cleland, the senior magistrate; Dean of Guild (Mr. Robert Gourlay), Professor George Adam Smith, D.D., Mr. Alexander Cross, M.P., Mr. John Wilson, M.P.; Mr. John Belcher, A.R.A., Mr. Thomas E. Colcutt, and Mr. John Slater, Vice-Presidents of the Institute; the Deacon-Convenor (Mr. James Macfarlane), Mr. C. H. Dick, President of Glasgow Chamber of Commerce; Dr. James Finlayson, President of the Faculty of Physicians and Surgeons; Mr. W. R. Copland, Chairman of Glasgow Technical College; Mr. James Fleming, President of Glasgow School of Art; Mr. C. H. Channon, President of York Society; Mr. J. E. Christie, President of Glasgow Art Club; Mr. C. E. Whitelaw, President of Glasgow Architects Association; Bailies J. King, Shearer, Sorley, Maclay, and W. F. Anderson; Mr. J. J. Burnel, A.R.S.A., President of the Glasgow Institute; Mr. J. M. Taylor, LL.D., Dean of the Faculty of Procurators; Professor Gourlay, Mr. Ernest George, Mr. William Fawcett, F.S.A., Mr. F. H. Newbery, Mr. Henry F. Kerr, President of the Edinburgh Architectural Association; Mr. John Muirhead, President of the Institute of Measurers; Mr. Alfred Darbyshire, F.S.A., President of the Manchester Society; Dr. Donald Mackintosh, Mr. Thomas Mason, Mr. S. Perkins Pick, President, Leicester Society; Mr. Frank Caves, President, Northern Association; Mr. Arthur Clyne, President, Aberdeen Society; Mr. W. J. Locke, secretary of the Institute; and Mr. C. J. MacLean, secretary, Glasgow Institute. The croupiers were Mr. Leonard Stokes, Mr. E. W. Mountford, Mr. Alexander Graham, F.S.A., hon. secretary of the Institute; Mr. Edwin T. Hall, Mr. P. Gordon Smith, and Mr. Henry T. Hare. Among other gentlemen present were Messrs. E. Boardman, H. D. Searles Wood, A. B. Plummer, H. G. Ibberson, Clyde Young, A. Hessel Tilman, R. S. Balfour, W. A. Pite, E. J. Milner Allen, T. W. Cutler, G. Guthrie, R.S.A., J. H. Pentland, R.H.A., W. Flockhart, J. D. Grace, Hippolyte J. Blanc, R.S.A., J. J. Stevenson, F.S.A., John Honeyman, R.S.A., C. Harston, A. Cullen, W. Forrest Salmon, W. Henman, G. D. Oliver, Geo. Frampton, A.R.A., J. Kieppie, J. Douglass Mathews, Campbell Douglas, J. Ely, Aie. McGibbon, W. Kerr, T. Martin Cappon, W. Tait Conner, J. Lochhead, D. R. Niven, Wm. Leper, W. Reynolds-Stephens, H. K. Bromhead, J. C. Nicol, and J. Salmon, the company numbering nearly 200.

After dinner, the Chairman read letters of apology for absence from Lord Rosebery, Sir James King, Sir John N. Cuthbertson, Sir Francis Powell, Mr. Aston Webb, Dr. Rowand Anderson, and others. He also stated that the Imperial Union Club of Glasgow had made the members of the Institute honorary members of the Club during the period of their meeting in Glasgow. He was sure they would join in passing a vote of thanks to the Club for their kindness. This having been heartily agreed to,

The Chairman proposed the toast of "The King." He said that for the first time in the history of the Institute the first toast of the evening had to undergo a change. The King, shortly after the death of Queen Victoria, at

the request of the Institute, very graciously consented to become their patron, and also promised to continue the presentation of their annual gold medal. For this they were greatly indebted to his Majesty, for there was no art that tells in history of the greatness or the aspirations of a country better than the work of architects. Architecture could be greatly influenced by royalty, by the interest which a monarch took in their art, and the King had always shown considerable interest in the arts of the country. He believed the art of architecture, the mother of all the arts, would be greatly influenced during the reign of King Edward.

The toast having been honoured, as was also that of "Queen Alexandra, the Duke and Duchess of Cornwall and York, and the other members of the Royal Family," (which was likewise given from the chair),

Mr. John Belcher, A.R.A., gave the toast of "The Houses of Parliament." Educational matters and scientific questions were not, he said, neglected by the Houses of Parliament, but the consideration of the art of architecture was apt to be regarded by Parliament as not so much a necessity as a luxury, which an economical Government did its best to avoid. What was to be learnt from Glasgow as to that?

The answer to that was: the Exhibition buildings, which had conducted so much to the financial success of the Exhibition. There were also the municipal and other public buildings of Glasgow; in fact, this great city, given over to work and commercial interests, had not forgotten art, for it was clever enough to know that art paid, as well as gave pleasure. Another pleasing effect which one observed in Glasgow was that the people loved their work and took a pride in it, and this it was which art enabled them to give expression to in their buildings, and it was this feeling in Glasgow which they wanted the Houses of Parliament to have. As was well known, new public offices were about to be put up upon magnificent sites, and it seemed to be the opportunity of the century to beautify the very centre of Imperial government, and to express by the buildings something of the dignity and importance of the matters carried on there. In deference to public opinion, he believed, two able architects were selected to make designs for the buildings, but, as every one deplored, those gentlemen did not live to carry out their designs. The carrying out of the designs would have been the most important part of the work, and he was convinced that the great experience and knowledge of Mr. Brydon and Mr. Young would have enabled them to carry out their work with great success. It was now proposed to put the matter into the hands of the Office of Works! Now, in going to war Parliament would appoint the best generals they could to carry it out, and should one be recalled or killed, his place would be immediately taken by another general. That he believed was the procedure in other Departments. Then why not in the case of public buildings? How many great architects were employed before St. Peter's at Rome was completed? If the history of a nation were read in fine architecture, then these buildings would represent to posterity the indifference and apathy of all concerned. He did not wish to find fault entirely with Parliament in this matter, for Parliament only represented the general apathy. In proposing the toast, and in coupling with it the name of Mr. Alexander Cross, he expressed the hope that that gentleman would use his influence to see what could be done to get Parliament to treat the art of architecture with greater respect and consideration.

Mr. Cross, M.P., in the course of his reply, said, in regard to the duties of Parliament towards the architecture of the country, he believed that Parliament had to some extent risen to the occasion. Nowadays we did not destroy our old monuments, and we did not make our old castles and other old buildings quarries for material for building farmhouses; and he thought the same spirit would enable them to rise to the occasion in the erection of public buildings. As to the two public buildings in question, although it had been announced as the intention of the Government to entrust the carrying out of the detail of one of those buildings to the Office of Works, the other building, the War Office, was entrusted to the son of the deceased architect, and in his (the speaker's) opinion no better appoint-

ment could have been made. As to the other building, should there be any occasion for raising the question of a better arrangement being made for carrying out Mr. Brydon's design than the one proposed by the Government, he did not think that any considerations of economy would be likely to interfere with the realisation of a better arrangement. He had been much struck at the improvement in the architecture of London; and in contrasting the buildings erected twenty-five years ago with those erected now, especially in some of the suburbs, he had been much impressed by the enormous development which had taken place. He had visited foreign cities and many parts of Europe, and he doubted whether in any other city they would see finer modern examples of the art of architecture than were to be seen in the new parts of London.

Mr. John Slater, B.A., then proposed the toast of "The Corporation of Glasgow." The history of the country, so far as regards its peaceful reform and progress at home, was written in the archives of the municipalities of the kingdom. In early days, for security of trading, people banded themselves together in associations which were called trade guilds, and these soon developed into the famous communities of merchants' guilds, gaining enormous power. It was a most interesting story how the trade guilds, as opposed to the more select merchant guilds, gradually acquired powers of their own and then merged with the merchant guilds, and so became the nucleus of the municipalities. The development went on the same lines all over the country, retarded here and accelerated there by local causes, but in all cases the result had been very much the same, whether the head of the community was the Lord Mayor of London or the Lord Provost of Glasgow. There could be no doubt that the fine organisation which was controlled by the Glasgow Corporation was the result of small accretions and extensions from time to time and that the corporation was doing now for that great city much the same sort of thing that was done 800 years ago when market tolls and that sort of thing were regulated. In the south of England the efforts of various municipalities to obtain increased powers had been viewed with some disfavour, especially when they had gone into trading affairs, such as gas, tramways, &c., but he could not but think that it was to the interests of the community that the corporation should control such monopolies because, if properly managed, they must result in profit, and it was far better that the profit should be shared by the whole of the citizens than go into the pockets of private shareholders. He thought that even Glasgow might go further. They looked after the physical health of the people; why not look after their mental and moral health? They had municipal bands; why not municipal theatres, public-houses, and even music-halls? The cost of crime, pauperism, and drunkenness was considerable, and when this cost was increased by the wretched surroundings in which numbers of people of such a city were compelled to live, he thought that, from the money point of view, it would be well to take in hand the amusements and recreations of the people. He thought that some city like Glasgow might take in hand this work. Glasgow had made enormous advance in greatness and in many other ways, but size was not everything, and it was to be hoped that the Corporation would take in hand the beautifying of the city and the brightening of the lives of its inhabitants.

Bailie Cleland, in response, referred to the absence on the high seas of the Lord Provost, who, but for his departure on a well-earned holiday, would have been present. It was always gratifying to the Corporation to know that their efforts in the interests of the city and their labours to promote the well-being of the citizens were appreciated and valued by those outside of the civic arena. It was to him, and he was sure he spoke for the other members of the Town Council, peculiarly pleasing to be assured of the good opinion which the Royal Institute of British Architects entertained of the Municipality of Glasgow. Their approbation, he took it, was not based on sentimental grounds, nor was it prompted by considerations of courtesy merely. He believed that in their hearty reception of the toast they deliberately wished to give expression to their sense of the important work which, in a variety of directions, the Corporation was endeavouring to perform. None of the important bodies which had visited Glasgow

this year, and whom the Corporation had been delighted to honour, was in a better position to judge of the value or otherwise of the various ramifications of civic enterprise than the Institute of Architects. The Corporation, in almost every one of its Departments, was indebted to the architectural profession, for to it they must look for adequately housing the hundred and one interests which the Town Council controls. Much of the success which had attended the operations of the Corporation, and a great amount of the commendation which it had received from the strangers who had from time to time been within its gates, for the manner in which it had faced the various municipal problems, must be attributed to the enlightened manner in which their own staff of capable architects, as well as those talented professional men outside, whose assistance they had been fortunate in securing, had interpreted the requirements of the City, by designing not only handsome and ornate edifices, but also structures which combine with their external perfections commodious and appropriate internal equipment for the purposes for which they have been erected. He invited the members of the Institute of Architects during their meeting in Glasgow to inspect the various buildings in which the Departments of the Corporation are housed, not to speak of the tenements of dwelling-houses which had been erected for the working-classes under the auspices of the City Improvement Trust, the policy of which had been largely controlled by the present Lord Provost, who had lived to see his efforts crowned with the most gratifying success. The tenements which the Corporation have thus erected were intended to supply the working-classes, at a moderate rent, with houses in which they will be able to live with their families under conditions of greater comfort and happiness than was possible in former days. He thought no architect could address himself to a nobler task than that of designing houses for the artisan classes of such a character as to secure at once a pleasing elevation to our public streets and a fit habitation which would more nearly interpret the proverbial phrase that "Every man's house is his castle," than had yet been possible. The idea had often occurred to him when viewing the long vistas of our public streets that greater variety might be introduced and a larger amount of genius displayed in the designing of ordinary street architecture, so as to do away with those continuous lines of tenement of almost geometrical formation, each one like its neighbour, which our present system presents in monotonous regularity. He knew that the answer to this statement would be that it had not been possible for architects to effect any great improvement in the direction he had indicated, as they were restricted by the requirements of their clients, whose desire often was to obviate unnecessary cost in construction, while securing all needful accommodation and facilities. Builders might argue that, from an æsthetic and sentimental point of view, such designing might present a more artistic exterior, but that that had nothing to do with utility. Be that as it may, and whether we were all severe utilitarians or not, he could not allow the opportunity to pass without appealing to the gentlemen in whose hands the architectural reputation of the country rests, to endeavour to break away from the hard and fast rules which apparently obtain in the matter of the domestic architecture of large towns.

Ex-Ballie Shearer, in proposing the Royal Institute of British Architects and Allied Societies, traced the progress of the Institute since its foundation in 1834, and dwelt upon its objects. What greater boon could be given to a city than healthy homes? And what could make life in a city sweeter and brighter than the embellishment of that city by artistic buildings and beautiful parks? Although Glasgow was a city of toilers, they could point to beautiful spots in their midst, and to buildings worthy of a visit even from the Royal Institute of British Architects. Architects had taught them that light, airy, and sanitary dwellings for the poorest should be always associated with beauty of line and harmony of colour, and that grace, dignity, and beauty should always be associated with our public buildings; and that teaching they would strive to carry out. With the toast he coupled the names of the President of the Royal Institute of British Architects and the President of the Glasgow Institute of Architects.

The Chairman, in responding for the Royal Institute, said it was the first time in the annals of the Institute that their annual dinner had been held in Glasgow. He would like to impress upon them this point, *i.e.*, that the Institute is not the Royal Institute of English Architects, but the Royal Institute of British Architects. It took in the whole of the British Empire—England, Scotland, Ireland, and Wales, the Colonies, and India. In all these there were societies in alliance with the Institute. Their numbers, including the allied Societies, amount to nearly 3,000. The Charter was granted by King William IV. in 1837, which year was also the first of Queen Victoria's reign, who graciously became their patron. In 1887, in order to bring the powers of the Institute more into line with the work it aspired to accomplish, and to render the fact of membership to a certain extent a test of proficiency, the supplemental Charter of the fiftieth Victoria, conferring among other privileges power to hold examinations and issue certificates or diplomas, was granted, the document receiving the Royal sign Manual on March 28, 1887. Since then large numbers of candidates had each year presented themselves for examination. When they got a body of men like this spread all over the Empire with one object in view, there ought to be no doubt of the success of their aims, and he did not think there could be any doubt as to the eventual success of those aims, which were the advancement of their art, and the elevation of the profession of architecture. When at a great city like Glasgow, in a country the birthplace and home of so many eminent and shining lights in the history of culture, and art and science, men were brought together from all directions as a means of promoting good feeling amongst the members of a great profession, and to extend its influence, there certainly should be good fruit borne. It was a peculiar pleasure to him to hold the first Royal Institute of British Architects' dinner of the new century in Glasgow with their allied society, for the people of Scotland had always taken a prominent part in the advancement of the arts and a leading position in things appertaining to culture—Edinburgh had been dubbed our modern Athens. In literature, the mention of only one or two names such as Burns, for instance, with his tenderness and genius for descriptive power, passion, and love of Nature; or Professor Wilson, in the exuberant humour and force displayed in the "Noctes Ambrosianæ"; or Scott's, whose works had charmed them all, and did so much for the revival of Gothic architecture; and the deep influence over all thinkers of the works of Thomas Carlyle, claim for Scotland a place in the first rank of letters. In painting, such names as Sir David Wilkie or Sir Henry Raeburn and David Roberts, a name ever dear to architects, claim also for Scotland a foremost place in the rank of great painters. And in architecture, names like the brothers Adam, Fergusson, and the Mylne family, who for twelve generations had been designing and carrying out important works, were sufficient also to place Scotland in the first rank of architectural art. Of late years, the experience of their Institute, if it told them anything, pointed to great progress in the work of their students in architecture, which promised well for the future of their art in this new century, and Scotland was well to the fore here. Many of their best medals and prizes had been carried off by the young architectural students of Scotland during late years, and the young Englishmen and Irishmen would have to look to their laurels. The Royal Institute of British Architects knew no partiality; progress in the art of architecture was what it wanted, and all honour was given to whom honour was due. Glasgow itself and their allied society had done much for architecture of late years. The art galleries and municipal buildings, as well as many other works, proved its desire to foster an art in a manner worthy of the great Empire of which it formed a part, and the Exhibition buildings showed a restraint and excellence in this class of design which he had only seen equalled or surpassed by the World's Fair at Chicago, where there was no rococo extravagance of detail, but a fine monumental effect, grand and imposing—a city of palaces; and it was a pity the buildings were only temporary. At Chicago they had, however, the advantage of unlimited means; and a consensus of taste of a large committee, formed of architects, artists, and sculp-

tors, not only Americans, but also from the pick of Europe, ruled the schemes. He felt sure that the high objects and interests for which the Institute was formed and obtained its charter—namely, the advancement of the art of architecture and the dignity of the profession—would be worthily upheld and maintained by the Glasgow society. From the work of architects would be derived the impression that future generations would have of our national greatness or meanness, our high or our low aspirations, rather than from all our wars, or even from all our other arts. It was, therefore, no mean task they found themselves engaged in at the beginning of this century in the striving to carry out the views of those who were the founders of this great Institute of British Architects. Let them pull well and honestly together, and their influence must increase yearly and should, before long, obtain for them some proper legal recognition as a great profession on whose lines that would materially advance the ends they had in view. If advancement of the art of architecture was the principal of these ends, then the voice of this Institute and its allied societies should give no uncertain sound on all important public projects where architecture was concerned. In the extension, improvements, and rebuilding of our great Metropolis and of the large provincial centres, and also in great Government and other public buildings, surely it was the consensus of the architects' opinions which should be the guide and should carry the greatest weight. We saw much discussion in papers and journals by artists, engineers, and Parliamentary Members, County Councilmen, and others on questions of public improvements and the erection of public buildings, but how often had any of these individuals the proper qualifications to lay down the law on such subjects? It should be the consensus of opinion of an Institute like theirs, with its allied societies, that should carry the most weight if they would only, in a public-spirited manner, let themselves be heard on such matters. But if they expected their influence as a body of professional men or as an Institute to have weight they must all be true to themselves and consistent in their conduct. He mentioned this because there seemed a spirit abroad that the rush for employment caused sometimes, either under the temptation of personal interests or the chance of some great architectural prize, actions or words subversive of the very principles of professional conduct which they had themselves laid down. Such action must quickly cause the influence of an Institute like theirs to wane, nor would their word or opinion on momentous public questions of policy in regard to their art receive much respect from the public or those in authority if it be found that their utterances were inconsistent or intended to serve selfish interests. Any influence their profession might be able to exercise, and the history of its late years showed it had considerable, must be above suspicion and apart from party or personal ends. Let them do nothing to weaken their position, and endeavour to act amongst themselves as they wished the public to act by them.

Mr. J. J. Burnet, in the course of a brief reply, said the Glasgow Institute had watched with intense interest the endeavours they had been making to increase the public appreciation of architecture in the Metropolis, and had recognised with no little pride the eagerness with which the counsels of the Institute had been sought, not only by the Government, but by the various municipal and other authorities throughout the country; and while in some few cases the advice of the Institute might not have met with the unanimous approval of the profession which one would have desired, he did not think that great weight need be attached to such criticism. In their art they learnt to wait for the verdict of future generations, who alone were able to judge how far the men whom the Institute might have placed in important positions had warranted the choice and done honour to the profession to which they belonged. The Glasgow Institute, as a corporate body, as well as individually, were endeavouring quietly to meet the various responsibilities of our time, and he ventured to believe that the presence with them that night of so many of Glasgow's eminent citizens, and the reception given to the toast on this the first visit of the Institute to Glasgow, might be looked upon as some proof that the city was steadily growing in its appreciation of architecture. They could not

hope that in a large commercial and industrial centre like Glasgow the art of architecture would be generally understood and appreciated, but they knew that amongst those responsible for the various municipal and private schemes there was a growing conviction that such schemes would remain monuments, not only of commercial and industrial enterprise, but would be looked upon as indicating their state of culture at the time, and the need then felt that the material surroundings should be in sympathy with the deeper needs and loftier aspirations, and they looked forward with confidence to the growth of this feeling, eager to render themselves more competent to give it expression.

The remaining toast was "The Guests," which was humorously proposed by Mr. Campbell Douglas and acknowledged by Mr. John Wilson, M.P., who referred to Glasgow Cathedral as a building which not only answered the purpose for which it was designed, but owed its beauty, not to meretricious ornament, but to its form.

The company then dispersed after singing "Auld Lang Syne," after which some of the party proceeded to the Imperial Union Club.

On the following day, on the invitation of the President and Council of the Glasgow Institute of Architects, a large party of ladies and gentlemen partook of luncheon in the Grosvenor Restaurant in the Exhibition grounds.

After luncheon the Chairman, Mr. J. J. Burnet, President of the Glasgow Institute of Architects, proposed the toast of "The King," and briefly but cordially welcomed the guests.

Mr. Emerson said that after the very hearty welcome the Glasgow Institute had extended to the Royal Institute they could not separate without toasting the President and members of the Glasgow Institute. In any profession like members practised the distance at which members practised from one another caused them to know very little of each other, and in the different localities in which they practised there were differences in views on certain public questions affecting architecture, and there were also different modes of working in most organisations. But such meetings as they were having in Glasgow tended very much to enlarge their minds by an exchange of views and by a realisation of the differences of opinion which existed. Moreover, there was rather a tendency to think slightly of people one did not see or know, but such meetings did away with these ideas. He had learnt a good deal during his visit to Glasgow, and he was sure others from the south had done so.

The toast having been heartily received, Mr. Burnet, in response, expressed regret that the visit to Glasgow had not been arranged for a longer period.

Mr. W. F. Salmon suitably proposed "The Ladies," Sir Thomas Deane responding.

The proceedings then terminated. In the afternoon a large party of architects, ladies, and friends visited the University on the invitation of Principal Story and the Senate of the University. The guests inspected most of the principal rooms in the building, including the Hunterian museum and the library, where tea was provided.

In the evening a reception was given by the Corporation of Glasgow. The guests promenaded the salons and corridors of the Municipal Buildings, and at 8.30 there was an adjournment to the banquetting-hall, where Bailie Cleland, in the absence of the Lord Provost, occupied the chair. The Chairman, after welcoming the members and friends of the Institute, remarked that Glasgow as a city had no reason to be ashamed of the examples of architectural skill which her thoroughfares presented, and he could safely say that in the city members would find many most interesting examples of both ancient and modern architecture. He felt that the influence of such meetings as those of the Institute of British Architects and of the other important organisations which had preceded it was of no ephemeral character, but rather of far-reaching and lasting importance on the life of the community in whose midst they were held.

Mr. Emerson expressed the thanks of the Royal Institute of British Architects to the City and Corporation of Glasgow for their kindness to the members of the Institute during their visit to Glasgow. Glasgow had done a good deal in furtherance of the art of architecture, and no one could go about the city without

learning something from the great public buildings which had been erected. He had been particularly impressed by a visit to the enormous power station for the electrical supply to the tramway system, where some of the engines had fly-wheels weighing 120 tons. Similar sensations could be caused by works of architecture, and probably no greater sensation could be caused than by a visit to a great cathedral. No one who went through the Glasgow Exhibition art galleries or saw the buildings of the city could fail to realise that the city took pains to encourage the erection of works which should be architecturally pleasing and interesting, and add to the lustre of the British Empire.

Mr. Burnet briefly addressed the audience, remarking that no corporate body of the citizens of Glasgow was more anxious to be of service to the city than the Glasgow Institute of Architects.

An excellent programme of music was gone through during the evening by Herr Iff's orchestra and the Corporation band, while vocal music was given by the Glasgow Glee Party. A very enjoyable evening was spent by the large party present.

#### MAGAZINES AND REVIEWS.

The *Art Journal* has an illustrated article on "The Minor Sculptures of the Certosa of Pavia," that building of multifarious detail and never-ending interest. The article is by Professor Melani—a translation we presume; he gives some information as to the names of artists presumably connected with the work, though we feel rather sceptical as to the authenticity of these ascriptions. Among the details illustrated are the carving on one of the choir stalls, a bronze candelabrum of great richness and beauty, and the carving of the capitals and entablature of the principal doorway. An article of more exceptional interest is that by Mr. Arthur Tomson on some of the less-known pictures of Millet. They are illustrated from photographs which came into the writer's possession through a friend who had picked them up somewhere in Paris. They belong to the early period of Millet's art, when he painted chiefly nude and classic subjects, and will be a revelation to those who know him only by pictures of the class of the "Angelus" and the "Sower." One or two pictures by Millet of this period have found their way into London exhibitions, and have been noted in our columns; but none so remarkable as those that are here illustrated. About two of these, "Les Baigneurs" and "Le Sommeil de Venus," there is a power reminding one of Michelangelo. It may be as well for the world that Millet in his later period adopted peasant life as his subject, for otherwise we should have missed the most remarkable illustration of that class of life in painting; but we are disposed to think that he was really a greater artist in these very different works of his earlier period. Ought not some effort to be made to collect and exhibit these earlier works of Millet's? It would be an exhibition of rare interest, and would revolutionise popular opinion in regard to this remarkable artist.

The *Magazine of Art* contains an article on a very interesting subject, "Idealism in Contemporary French Painting," by M. Camille Maclair; probably a translation. He regards what he calls Idealism (the nature of which is best illustrated by the examples from M. René Ménard and others) as a distinct movement in French painting, which has succeeded to Impressionism. Henri Martin, to whom he does not quite do justice, was one of its earliest apostles. We quite agree as to the spiritual beauty of the compositions of M. Ménard, which form the bulk of the illustrations. The essay is to be continued in another issue. The "Decoration of Upright Pianos" is treated by Mr. Aymer Vallance, whose criticism on the subject is good and suggestive. We quite agree with him as to the first illustration which he gives having nothing of the appearance of a piano; it might be a sideboard. Bechstein's piano for the North German Lloyd Company is, on the other hand, too rooco and the other more classically-lined examples are somewhat too square-cut; no example of those given is what we shall call an ideal design. Mr. Ogilvey's piano with folding doors, for Messrs. Broadwood, is excellent in style, but the doors standing open on each side of the player are a nuisance. Mr. Vallance's suggestion at the

close, as to acknowledging more, in the shape of the case, the vertical arrangement of the strings, merits consideration. We must protest against ornament being applied to the keys themselves. Mr. Vallance recognises, indeed, that they ought to appear as a general contrast of black and white, but he proposes that the upper surface of the keys may be enriched with "delicate filagree ornament." That is entirely out of place, and distracting to the player. The glory of the keys lies in what is done with them, not in their appearance; and they should be left perfectly plain.

The *Artist* contains an article on "Ancient Peruvian Pottery," with some curious examples from a private collection about shortly to be dispersed—that of Sir Spenser St. John, formerly the English representative in Peru. "Garden Sculpture especially in reference to the Fountain," by Mr. P. G. Konody, is a good subject in itself, but seems introduced here only to illustrate the work of one artist, or rather of two who work together, and the designs are somewhat eccentric and not very pleasing in line. A charming frontispiece to the number is formed by a study of a head in red by Mr. Greiffenhagen, whose pictures form the subject of an article.

The *Berliner Architektur-Welt* contains illustrations of a fine piece of school architecture by Herr Hoffmann, the "Parish School" (equivalent we presume to our "Board School") in the Dunckerstrasse. It is, however, a building of greater size and more formal treatment than a London Board School building. Externally it is a brick building with thin stone courses at intervals, which are made lineable with the heads, sills, and transoms of the windows, thus binding the whole together. The interiors, though not ornate, are treated with some view to effect, especially in the use of decorative ceilings with flat ornament of somewhat Elizabethan character. The plan is extremely simple; a long parallelogram with the administrative entrance and offices in a centre block, and large hall over, the wings right and left symmetrically arranged for boys on one side and girls on the other, with their entrances at the ends. The whole seems an admirable building for its purpose. A good deal of space is devoted to competition designs for churches and other buildings at Grunewald. The square or nearly square plan seems rather in favour for the churches; very much diversified externally, however, by a collection of gables and other features. The designs are of what in this country would be thought a very weak Gothic type.

The *Architectural Review* (Boston), Vol. VIII., No. 9, contains an article by a Mr. Edward R. Smith, Reference Librarian in the Avery Architectural Library, Columbia University, on "Architectural Periodicals;" an article which shows a good deal of ignorance and the usual determination to write up everything French. He has even the assurance to say that the illustrations in English journals "are disappointing to one accustomed to the superb plates of the great German and French journals." Perhaps he will state what French architectural journal it is the illustrations in which are equal to those of the best English journals? The *Revue Générale*, we admit, was superior to any English journal in this respect, but it has been extinct for twelve years, and it was a monthly publication—not even that in fact, for it published just when convenient; and the writer of the notice referred to must be very ignorant if he does not know that illustrations to a monthly paper are got up and printed under conditions quite different from those by which weekly publications are governed, and much more advantageous, and that any comparison between them is entirely misleading. This is the case also with the German publications; those that are referred to as having such fine illustrations are monthlies, not weeklies. If there is a single weekly architectural publication in Germany with illustrations comparable to those of the English architectural journals, we shall be glad to hear of it. We have never come across any such, and we think Mr. Smith will be puzzled to find one; and that our readers who know the French journals will be amused to read that *La Construction Moderne* is an architectural paper superior to the English ones.

The *Antiquary* contains an article, by the Rev. E. Maule Cole, on "Norman Features in Wold Churches, East Riding, Yorkshire," meaning the churches of the Chalk Wolds of the East Riding—little known, the author says, even to Yorkshiremen. In 1070 the whole of

this district was devastated by order of the Conqueror, and the existing churches would have been then destroyed or so much injured as to require rebuilding when the manors were eventually portioned out among Normans. The object of the first devastation is not mentioned—perhaps is not known. But the circumstances, as far as known, explain the existence of a good deal of Norman work in the churches of the district, which are mentioned and described. The article will open to some architectural tourists a new corner of interest in England. The same number contains the concluding portion of an article by Mr. W. H. Jewitt on the interesting subject of "Winged Beings" and their delineation in art.

In the *Engineering Magazine* Mr. Longmuir's article on "Opportunities for Bettering the Work of the Foundry" should have the attention of foundry managers. He speaks strongly on the want of system in foundry work, and the content with which inferior plant is content, especially in the matter of moulding machines.

A moulding machine is installed, but not operated. The preliminary expense of this machine was met with pleasure, but the necessary accessories were fitted up on the cheap system. Moulding boxes were good enough without fitting plates would answer quite well without any expensive machining up, and therefore the handy-man of the establishment prepared both the boxes and plates. This machine now stands in 'icy isolation,' a superb monument to the folly of the cheap system. The arrangement of the foundry is in keeping with the tools—no mechanical appliances of any kind, and every ounce of metal, every lift, is carried or performed manually. Boxes are stacked anywhere, and generally in the most inconvenient places. Foundry supplies are equally inaccessible, and the moulders spend no inconsiderable time in searching for material. . . . The method of working is equally haphazard; the moulds are slovenly made, put down in any corner that strikes the man's fancy; hence all classes of work are indescribably mixed, and the appearance of the floor just before casting time is one of bewildering confusion.

The example quoted is not that of a foundry suffering from want of capital, nor yet that of an establishment making no profit, and many similar instances may be found amongst the jobbing foundries. If profits are made under these squalid conditions—and they undoubtedly are—then a most magnificent opportunity lies already at hand to increase these profits manifold.

The author proceeds to specify what should be the improvements made in order to realise this possible result. There is also an article on "The Rapid-Transit Problem in London," by Mr. F. J. Sprague, an American engineer of special experience in city railway working; so that we here have a criticism of the London system (if it can be called a system) from a foreign expert. Mr. Sprague is strong in condemnation of the useless weight and inconvenience of the heavy locomotives used on the Central London Railway, and advocates for our adoption what he calls the "multiple-unit" train.

"This is a method of train operation and control by means of which cars are equipped with motors and motor-controllers individual to these cars, so that they may be united with any number of other cars similarly equipped, or with any number which have no motors, into a train of any length, and operated from as many points as desired through a controlling line common to all cars. The number of the cars, their sequence, and their end-to-end relation are preferably matters of indifference. The character and capacity of the equipment is dependent upon the schedule required; it varies from every car, where the highest schedule is required, down to two cars in a train. Every motor car is a unit, and any combination of motor cars and trail cars may also be considered a unit, which can be operated from either end, and can be joined with other units.

Such a system readily lends itself to every condition of congested service. The similarity of equipment ensures flexibility of train operation, and provides a motive power proportioned to the requirements. Locomotive switching operations are abolished, trains can be reversed at any cross-over, and traffic concentrated on any section of a road."

The adoption of some such system, if electrically-worked Metropolitan railways are further developed, seems almost a foregone conclusion.

In *Felden's Magazine* the article on alternating-current motors by Professor A. Hay is an extremely instructive one. He describes clearly the difference between synchronous and non-synchronous motors both for single phase and polyphase currents. Students will feel

obliged to Professor Hay for clearing away the many difficulties in this somewhat abstruse branch of practical electrical theory. We cannot do better than recommend his article for their diligent perusal.

In the *Contemporary* "Vernon Lee" gives the second and concluding portion of her essay on "Art and Usefulness." Apart from what we have already spoken of as the central heresy of the writer's position, which confounds the intellectual suggestions and the intellectual enjoyment of art with mere usefulness, there is much more in this second part of the essay that we are able to sympathise and agree with than in the first part. The author seems indeed rather disposed to go back on her former position by admitting that "art cannot be enjoyed with initiation and training," but she holds that wherever art has existed spontaneously, it has brought with it that initiation and training. "The initiation and training, the habit of understanding given qualities of form, the discrimination and preference thereof, have come, I maintain, as a result of practical utility." As far as decorative and industrial art are concerned this may be true; but where is the utilitarian basis of the ceiling of the Sistine Chapel, or of Titian's "Bacchus and Ariadne?" Was that wonderful picture-poem, at the time it was painted, any better understood by the uneducated of that day than it is by the uneducated of this day? The author is trying to push her theory to cover phases of art which it will not cover. In other parts of the essay we come on true and important reflections in regard to art. One of these is in regard to the "fragmentary, superficial attention" which, according to Vernon Lee, most of us give to a work of art; "and giving this little, we find that art gives us little, perhaps nothing, in return." Vernon Lee is rather too sceptical as to the real attention which lovers of art in this country do give to it, and the real enjoyment they derive from it; but it is true that such lovers of art are in a very small minority among us, and that this careless and superficial attention is the characteristic of the average modern English mind towards art. One reason that the French are a more artistic nation than we are is that they do consider art as something worth thinking about and discussing seriously, as if it were a thing of national importance; while by the English public mind it is regarded only as a kind of toy. Later on she endeavours to suggest the remedy for "this mal-adjustment by which art is divorced from life, and life from art." The better distribution of wealth, or of "work and idleness," will put an end to the exploitation of individuals in great gangs; "the workman will be able once more to see and shape what he is making."

In place, we presume is meant, of mechanically making a part of it only. It is perfectly true that the condition of labour hinted at in the prevalence of machine-made articles and machine-like labour, is one of the great hindrances in the way of industrial and decorative art; though unhappily we see little hope at present of any improvement in this respect. But this does not affect the fine or intellectual arts. A picture is still painted by one man and is the work of one brain; symphonies are written by one composer and are the offspring of one mind which sees and shapes the whole work; poems are not as yet produced by machinery. That consideration suggests the fallacy running through the whole article—the same fallacy which pervaded the teaching of William Morris—that art is the same thing as craftsmanship. In a healthy state of life all craftsmanship should be art; but all art is not craftsmanship. The "Fine Arts" still maintain their right to stand on a higher intellectual level.

The same number contains a thoughtful article by Professor Rawson on "The Nation, Apprentice, and Polytechnic." The main object of it is to show how tentative and partial are our efforts at technical education, and how limited is the use made of it, in comparison with that which is to be found in many Continental nations; and he urges that a higher objective should be given to technical education; not the mere learning of a craft, but the acquirement of general technical knowledge for its own sake, and as an important factor in the education of the mind. The article is worth serious attention.

The *Nineteenth Century* contains an able and most important article by Sir Herbert Maxwell on "The Sad Plight of British Forestry," a subject of national importance. Sir Herbert

Maxwell goes very fully into the demonstration of our neglect of a great source of national wealth in not sufficiently attending to the cultivation of forest trees; and argues that much ground now devoted only to purposes of sport would be far more profitably occupied, to the nation in the end and to the private owner in the first instance, if allotted to the culture of forest trees. We have not space to follow out here the arguments and statistics given, but we consider it to be perhaps the most important of any published this month, and one which ought to receive serious attention.

The *Century* contains an article by Mrs. Pennell on "Italy's Garden of Eden," which serves as a string on which to thread a host of small line sketches—some of them so small as almost to be called thumbnail sketches—by Mrs. Pennell. It is a typical "popular" article, and one cannot say that either the pen or pencil portion of it is of any particular value. Mr. J. Mead Howells contributes an article on "A French Government School from the Inside"—an art "atelier" to wit; an article which, from the descriptions it gives of French student manners, and the treatment of newcomers in a studio, leaves one in doubt whether French art-students are more of lunatics or more of blackguards—at least unless Mr. Howells's description of them is very highly coloured.

*Harper* contains an article by Professor Flinders Petrie on "The Royal Tombs at Abydos," a short account of his recent discoveries, which has the additional interest of some illustrations of various articles of artistic character found in the tombs, including what the Professor calls "the oldest group of jewellery known in the world." The perfection of the soldering in the very ancient goldwork is commented on. "In no case can the joint be detected with a magnifier, either by colour or excess." The abundance of vases cut in hard stones is also remarkable. Some 500 different forms have been made out from the fragments remaining, and the materials include rock-crystal, obsidian, diorite, gneiss, syenite, granite, slate, marbles of different colours, &c. The importance of the discoveries, in the opinion of Professor Petrie, is that they give us the turning-point of Egyptian art, which till the time of King Zer was archaic and tentative, but during his reign of probably fifty-seven years became crystallised into the forms the character of which varied little for more than 4,000 years later. The same number contains some examples of new illustrations to "Alice in Wonderland," by Mr. Peter Newell, who expresses the highest appreciation of Tenniel's illustrations, but craves leave to try his own reading. His figures of Alice do not quite satisfy us—perhaps they are based on the American rather than on the English child; but in every other respect his illustrations are masterly in humour and in power of drawing.

*Scribner* devotes "The Field of Art" to a consideration of M. Bartholome's great sculptural work, the "Monument aux Morts," signed with the initials of Mr. Russell Sturgis, who, writing with great sympathy and admiration for the French sculptor's work, makes it the occasion to consider the question whether sculpture can rightly abandon the character of quietness and immobility. We hardly see that the question is specially raised by M. Bartholome's alto-relief groups, which, though poignant in emotional expression, cannot be called violent or strained in action. The question of realism in the rendering of age and youth in the various contrasted figures, also touched upon, is undoubtedly suggested by this work; and it may perhaps be admitted that this realism is carried so far as to be rather a disturbing element in the work from a purely artistic point of view. It may be argued, however, that in such a work placed in such a position (in the centre of a cemetery) the moral or human element has more claim to prominence than in other cases. We admit, however, that to our mind the great beauty and impressiveness of the work lies in those two central figures entering the door of the tomb—a group which both in conception and design is one of the finest and most impressive things in modern art; and those are perfectly sculptural in style.

The *Pall Mall Magazine* contains an article by Mr. Marillier on the life and work of Lord Kelvin, with a portrait in which he is represented holding some of those molecular models to which we recently referred in a footnote to our *résumé* of the British Association meeting.

The article is an exceedingly good and interesting account of some of Lord Kelvin's most prominent scientific inventions and what may be called his comical ideas and suggestions. It includes also a good anecdote; how Professor Joule came into the laboratory when Lord Kelvin was experimenting for the construction of his sounding apparatus. Joule, seeing large coils of pianoforte wire, and being told they were for sounding, asked absently "What note?" "O, the deep C," was the reply.

The *Idler* contains a short article on "What We Know About Mars," by Mr. E. S. Holden, formerly director of the Lick Observatory—a very salutary kind of article to have in a popular magazine, since it puts in a plain and comprehensible way a little of the real truth as to appearances on Mars, and the possibility (at our present telescopic distance) of drawing any positive inference from those appearances. It will be a disappointing article to the sentimentalists who think we have got so much information about "canals" in Mars and probable inhabitants of the planet, but it may tend to clear their heads a little.

In the *Revue Générale* M. Humbert concludes his spirited and thoughtful essay on "Plume et Pinceau," the comparison between the powers of verbal description and artistic representation. The interest of the article is rather in the direction of literary than of artistic criticism, but it should interest artists nevertheless.

The *Home Counties Magazine*, which has reached its third year, continues to be both a useful and interesting collection of information in regard to the history and objects of interest of the neighbourhood around London. In the present issue the "Notes on Church Plate" deals at some length with the subject of beak-staves in the churches of the City and neighbourhood. Of the City examples a series of fifteen photographs are given, of which the most interesting in the matter of design is that of St. James, Garlickhythe, the head formed by an open ring which encircles the scallop shell of St. James, and is surmounted by a small figure of the saint. Among the other illustrations are a reproduction of an old woodcut of Pope's house at Binfield, and a view of the old Market Place, Brentford, which serves to explain the ill-odour in which Brentford was held in ancient times, as "a town of mud"; it certainly looks a pigstye of a place in the illustration.

We have reviewed also the *Gentleman's Magazine, Knowledge, and Climate*.

#### LIVERPOOL ARCHITECTURAL SOCIETY: THE CATHEDRAL SCHEME.

At the opening meeting of the session of the Liverpool Architectural Society on Monday last, the President, Professor Simpson, devoted the principal portion of his opening address to a criticism of the scheme for the proposed new cathedral for Liverpool. He commenced by referring to the decision of the Liverpool Cathedral Committee that the style of the new cathedral should be Gothic, and after tracing the history of the Gothic revival in England, he remarked that in the large workshops there was no longer the enthusiasm for Gothic work which prevailed twenty years ago, and which made the Gothic revival more real than many supposed. Of the men whose genius carried the revival to its height few survived, and to these might be added some of the younger men who had remained true to their masters' traditions, but without the slightest exaggeration it might be said that the greater number of architects now practising in England were seeking development in other directions than Gothic. What was Gothic? Unfortunately mediæval detail was still regarded by some, especially by those interested in but not practising architecture, as constituting the Gothic style. But this was the wrong way of looking at it. Construction, not detail, made a style. If the committee were willing to depart from the recognised forms of ornamentation, which hitherto had been more or less obligatory, and allow the architect who designed, and the other artists who assisted a free hand in plan, ordinance, and detail, then it was possible that a building could be produced suitable to modern requirements, and yet Gothic in the true sense of the word. But if, on the other hand, by Gothic the conventional was meant; if the term was to be narrowed to mean a

reminiscence of mediæval buildings; if the plan, mouldings, carvings, and accessories were such as would conform to the standard of the amateur, whether ecclesiastical or lay, who took no interest in living architecture, but who found satisfaction in examining the work of the past, then there was every danger that the finest opportunity which had occurred since the time of Sir Christopher Wren was going to be thrown away. If the term Gothic was used in its narrow sense limitations would be placed on architects which workers in no other art would tolerate for a minute. Why they should always be the sufferers he failed to understand. They were daily told that other arts were advancing while theirs was standing still. He did not believe that. The advance in architecture was as great, if not greater, than that in any other art, but restrictions such as that proposed to be inflicted rendered advance doubly difficult. If the Emperor Justinian had commanded the architect of the new Santa Sophia to construct it in the Greek or in the Norman style the world would have been the poorer by one of its finest buildings. But the Emperor had too much good sense; he allowed the architect fair play and a free hand, and that was all they asked from the Liverpool Cathedral Committee at the beginning of this new century. If there was ever to be a new departure now was surely the time. Architecture more than any other art in existence suffered from a glorious past. What should be a source of strength to them was converted into a source of weakness. Nobody admired the old Gothic buildings more than he did. There was not a cathedral in England he had not visited, and he had seen most of the best on the Continent, but that did not make him regard their style as the one most suitable for a modern cathedral.

His objection was not so much to the decision that the style was to be Gothic as to the dictation that the style was to be anything at all. The citizens of Liverpool acted otherwise seventy years ago. If Elmes had been told he had to design in the Gothic style they would not have had in St. George's Hall one of the most remarkable buildings in the world. He would be told that that building was different; that it was not ecclesiastical. No more were the Houses of Parliament, built at exactly the same time; and yet that did not prevent the committee from issuing instructions to architects that the style of the building was to be Elizabethan or Gothic. Had they advanced nothing in seventy years? Was the method observed in London in the first year of Victoria's reign to form a precedent to be followed in Liverpool in the first year of Edward VII.? There was some excuse seventy years ago. The tide of the Gothic revival was flowing strongly, and men were full of enthusiasm for the new movement, but the tide had turned now, the old enthusiasm was dead, and a new movement on totally different lines had taken its place. It was unfair to ignore this fact. Cathedrals were not built every day. Another such opportunity might not occur throughout the century, and the narrowing of the instructions to architects would cut out many men accustomed to deal with big architectural problems, but whose sympathy with Gothic was but slight, because to them the style was inappropriate to the requirements of the day, and incapable of further development beyond the point reached 300 years ago. To turn to another point. Against the style dictated there were certain local objections. Liverpool had fine architectural traditions, but they were not Gothic. Its public buildings and many of the fine blocks of city offices erected before the middle of the last century were all Classic. So were the best recent buildings in the town. A Byzantine or Romanesque cathedral would harmonise with these surroundings because both styles were founded on Classic work. The site undoubtedly lent itself more to the squarer Classic or Byzantine than to the longer, thinner Gothic. He was not, however, protesting so much against the inclusion of the Gothic, although he regarded it as unsuitable, as the exclusion of the other styles. That the style should be left open was one of the points the Architectural Society emphasised in the meeting held between the Cathedral Committee and a deputation from the Council of the Society. They intimated to the committee their disapproval of a limited competition on the ground that, outside the very

few really well-known church architects, it could not be said that there were many who possessed special claims to be regarded as experts in cathedral planning and design. Many men had recently built excellent churches, but a man who built a decent church might not be capable of dealing with the much bigger problem of a cathedral. Provided the committee did not wish to appoint direct one of the well-known men as architect, the Society suggested a competition open to all English architects, and that proper assessors should be appointed. They further suggested that at least six months be allowed for the preliminary competition, and twelve months for the final. None of these suggestions had found favour; in fact, he understood the committee had decided to dispense with assessors altogether, and make their own selections from portfolios and drawings submitted. If this were true it was opposed to the method under which all important competitions were now decided. Practical considerations were ignored by the restriction as to the style of the cathedral, and the only result would be to fetter the architect and all whom he called to assist him. This was to be the first cathedral of the new century. Was it to be merely the coping-stone of the style of the last century, or was it to be the foundation of the new? Here was a chance for an epoch-making building, for a second Santa Sophia, a second Amiens Cathedral. Was this chance going to be thrown away? The committee, he was sure, were animated by the same desire as all of them to see a building worthy of the city and worthy of the opportunity. But with all deference they were going the wrong way to obtain it. It was no offence to them to say that, not being architects, they were out of touch with the architectural movement of the day. They were clinging to a departing style.

In an unrestricted competition it was possible that the best style sent in might be Gothic; if so, build it; but the decision of the committee prevented any attempt being made to show what was possible on other lines. The cathedral might take a quarter of a century to build, and at the end of that time if dry-as-dust design was now chosen, and the present architectural movement continued to grow as rapidly as it had done in the last ten or twelve years, it was probable that the first cathedral of the twentieth century, when finished, would be as obsolete in style as an old East Indian was now.

In the course of the discussion which followed, Mr. W. E. Willink said that it would have been very much better if the Society had never been invited to give their opinion at all, for it had been ignored, but the committee were under the delusion that they were meeting their views. A very large number of architects of repute, probably four-fifths, would be excluded from competing, because if they did compete they would be working in a style with which they were not well acquainted. The non-appointment of a professional assessor would ruin the competition, and the committee would find they had acted foolishly. That the committee excluded everything except what they crudely called Gothic was a calamity. In proposing a vote of thanks to Professor Simpson for his address, Mr. Willink added that it had been delivered on a melancholy occasion, for a great opportunity had been lost. Another member observed that it ought to be publicly known that the architects of Liverpool were practically unanimous in condemning the action of the Cathedral Committee.

#### METROPOLITAN ASYLUMS BOARD.

The ordinary meeting of this Board was held at the Board's offices, Victoria Embankment, on Saturday, Mr. Hensley presiding.

The Works Grant Committee, reporting with regard to Joyce Green Hospital, recommended the acceptance of the tender of Messrs. Moorwood, Sons, & Co., Limited, of Sleaford, in 1,688*l.*, for fitting up the kitchen department in accordance with the plans and specifications prepared by the architects, Messrs. A. & C. Harston. The recommendation was adopted. The other tenders were:—J. & F. May, London, 1,877*l.*; Wenham & Waters, Croydon, 2,009*l.*; Benham & Sons, London, 2,067*l.*; W. Summerscales, Keighley, 2,145*l.*; Clements, Jeakes, & Co., London, 2,200*l.*; and R. & A. Main, London, 2,612*l.*

On the recommendation of the same Com-

mittee instructions were given to Messrs Harston to proceed at once with the preparation of the land set apart for a cemetery at the Joyce Green Hospital, and with the fencing, formation of paths, and approach roads in connexion therewith.

THE LONDON COUNTY COUNCIL.

The first meeting of the London County Council after the summer recess was held on Tuesday in the County Hall, Spring-gardens, Mr. A. M. Torrance, Chairman, presiding.

**Loans.**—On the recommendation of the Finance Committee it was agreed to lend Battersea Borough Council 2,745*l.* for alterations to the Town Hall; the St. Pancras Borough Council 5,500*l.* for street improvements; the Wandsworth Borough Council 500*l.* for the purchase of dust vans; the Woolwich Borough Council 3,300*l.* for the purchase of land; the Islington Borough Council 3,241*l.* for contribution to street improvement; the Paddington Borough Council 15,000*l.* for paving works; the Hampstead Borough Council 9,525*l.* for electric lighting purposes, 19,525*l.* for electric light installation and meters, and 9,620*l.* for electric light purposes; the Kensington Borough Council 19,020*l.* for wood paving works; the Shoreditch Borough Council 2,040*l.* for provision of shelter; the Stepney Borough Council 10,000*l.* for electric light purposes; the Woolwich Borough Council 600*l.* for completion of underground conveniences; the Holborn Guardians 9,000*l.* for the erection of casual wards; the St. George-in-the-East Guardians 40,000*l.* for reconstruction of workhouse and erection of nurses' home; the Wandsworth and Clapham Guardians 1,010*l.* for additions to the infirmary; and the Woolwich Guardians 23,040*l.* for purchase of land and erection of cottage homes.

**The Chairman's Annual Address.**—The Chairman then delivered his annual address, in the course of which he said that the whole staff at the central offices now numbered 803, and there was a crying need for new offices. More than half the staff was housed away from the chief building, and in some cases in premises which were quite unfit to be used as offices. There was great loss of power owing to lack of proper concentration of departments. The present rents amounted to 15,400*l.*, as compared with 4,950*l.* in 1889. The present position demanded change, in the interest of health and efficient working, and as the need was urgent the remedy should be speedily undertaken. The cost would be large, but the time was already overdue when the largest municipal staff in the world should carry on its work in elevating surroundings.—During the year four important improvements were completed, including that of Highgate Archway, and considerable progress was made with the twenty-five schemes in course of execution. Of those, the most important, of course, were the Holborn to Strand scheme and the Westminster improvement. Some of the improvements now being undertaken were in districts rich in historical associations. Wherever possible, buildings of historical interest were preserved, but when it was absolutely necessary to demolish them, the greatest care was taken to preserve the most interesting portions. Moreover, during the work of excavation, vigilance was exercised to secure and preserve any objects of archaeological interest which might be brought to the surface, a reward being offered to the finders thereof. In this work of preserving objects of interest the Improvements Committee have had considerable assistance from the Historical Records and Buildings Committee. The total gross expenditure of the Council in respect of the county improvements already sanctioned and now in hand, or about to be undertaken, was estimated at 11,065,207*l.*, while the net expenditure, after deducting recoupment, was estimated at 5,202,042*l.* The serious question, with all that was projected outlay, was that of ways and means, as a marked increase in the rate must have a damaging effect on the Council's future. It seemed only reasonable that those who benefited by these improvements should make substantial contribution.—One of their most valuable acquisitions was that of the Archbishop's Park, Lambeth. The work of laying out had been commenced, and would be completed at a cost of 4,800*l.* Three entrances were to be formed, and the Ecclesiastical Commissioners had granted the Council, free of

cost, the use for ninety-nine years of the necessary access. In 1889 the parks and open spaces numbered forty and cost 52,000*l.* for maintenance. Now there were ninety-two, and the cost was 113,210*l.* The acreage had increased in the same period from 2,656 to 3,833.—The Highways Committee had vast schemes in progress and under consideration. It aimed at revolution; it would not rest content until every district in London was properly served with tramways. It was convinced that horse traction was doomed, that electricity must be the future power, and that the conduit system must be adopted. He would give one illustration, of a personal character, showing how the individual was served who wished to travel in London. Returning last Saturday week from the ceremony of opening the new electric generating station at Lombard-road, Battersea, the following appeared to be the quickest route—a car from the station a certain distance, another to Chelsea Bridge, a 'bus to Victoria Station, train to Mansion House, 'bus to Broad-street, train to Mildmay Park, and then car to Highbury, or seven conveyances to go about nine miles. The working-men of London were handicapped by such a monstrous want of system more severely than in any other city. Surely that state of things needed alteration.

—The Building Act Committee had held thirty-six meetings. During the year under review 7,389 new buildings were examined, for which fees amounting to nearly 21,000*l.* were received, being the greatest amount in fees received in one year since 1881; 2,966 cases of dangerous structures were dealt with, and 680 summonses were issued in consequence of the failure of owners to comply with the requirements of the Council. It had been necessary to take legal proceedings in a large number of cases, either to obtain authoritative decisions or to enforce compliance with the law. The London Government Act, 1899, considerably affected the old areas of the Local Authorities, and steps are being taken to render the areas of the districts of the District Surveyors as far as possible co-terminous with the boundaries of the metropolitan boroughs. In connexion with the naming of streets, 160 subsidiary and other names were abolished, and the numbers of 4,349 houses rearranged; ninety-nine names for new streets were approved, and 104 streets were ordered to be renamed and renumbered.

The Chairman was thanked for his address. **Buildings in Victoria-street.**—The Building Act Committee recommended that the Council, in the exercise of its powers under Section 22 of the London Building Act, 1894, but in no way otherwise than under such Section, do consent to the erection of one-story shops and an entrance porch in front of No. 125, Victoria-street, Westminster, to the line shown on the plan (signed by the Chairman of the Building Act Committee, and dated July 13, 1901), submitted with the further application of Messrs. Z. King & Son on behalf of Mrs. M. Hiscox, Mr. J. T. Hiscox, and Mr. R. T. Raikes. The recommendation was referred back for further consideration and report.

**Tramways.**—The Highways Committee recommended as follows:—

"That the Highways Committee be authorised to conduct the negotiations, and the arbitration (if any), with reference to the purchase by the Council from the South London Tramways Company, of the tramways, works, and undertaking authorised by the South London Tramways (Extensions) Act, 1880.

"That the Highways Committee be authorised to conduct the negotiations, and the arbitration (if any), with reference to the purchase by the Council, from the Woolwich and South-East London Tramways Company, of the tramways works and undertaking authorised by the Woolwich and Plumstead Tramways Order, 1882, and the Woolwich and South-East London Tramways Order, 1881, as confirmed by the Tramways Orders Confirmation (No. 2) Act, 1880, and the Tramways Orders Confirmation (No. 1) Act, 1881, respectively."

The recommendations were agreed to.

**Breaking-up Roads.**—Mr. John Burns, M.P., asked the Chairman of the Committee, Mr. Benn, whether he was prepared to take steps to prevent the breaking-up of roads by all sorts of companies. He also wanted to know whether the Committee would take steps to require that all these companies should do this work at the same time so that one breaking-up would do.

Mr. Benn explained that the London County Council was unfortunately deprived of its rights over the roads by the Borough Councils Act of 1869. All his Committee could do was

to make representations to the Local Authorities.

**Housing.**—The Housing of the Working Classes Committee reported as follows:—

"On July 30, 1901, the Council voted a sum of 8,745*l.* for the erection of the first block of dwellings to be built on the Swan-lane site, Rotherhithe, and authorised us to invite tenders for the erection of the dwellings. At the same time the Council authorised our Chairman to open the tenders when received, and to accept the lowest satisfactory tender. The following tenders were accordingly received and opened by our Chairman—

	£	s.	d.	Alternative price with comb-graining of internal woodwork.
Messrs. Holloway Bros.	8,051	...	8,122	
Mr. B. E. Nightingale...	8,222	...	8,277	
Mr. R. L. Tonge .....	8,280	...	8,323	
Messrs. Martin, Wells, & Co. ....	8,310	...	8,424	
Messrs. Spencer, Santo, & Co. ....	8,400	...	8,480	
Mr. H. M. Patriek.....	8,400	...	8,574	
Messrs. Herbert Bros.	8,773	...	8,864	
Messrs. Tod & Newman	8,913	...	8,968	
Messrs. Sabey & Son ...	9,418	...	9,530	
Messrs. D. Gibb & Co. ...	9,745	...	9,821	
Messrs. J. Smith & Sons, Limited .....	10,954	...	11,108	
Messrs. Hobbs Bros. ...	12,085	...	12,258	

The architect's estimate for the dwellings (including comb-graining of internal woodwork) amounted to 8,145*l.* Acting, therefore, on the authority referred to above, our Chairman accepted the tender of Messrs. Holloway Bros. of 8,122*l.* The contract was sealed on September 11, 1901, and the work is now in hand.

The following tenders were received and opened by the Council on July 30, 1901, for the construction of the first part of the roads and sewers on Section A of the Tottenham-fields estate:—

	£	s.	d.
Mr. F. J. Coxhead .....	7,500	0	0
Mr. George Wilson .....	7,525	11	7
Messrs. C. W. Killingback & Co.	7,791	5	4
Messrs. Lawrence & Thacker .....	7,932	15	9
Mr. Samuel Redhouse .....	8,118	0	0
Messrs. John Mowlem & Co. ....	8,658	14	7
Mr. Stephen Kavanagh .....	8,749	5	7
Messrs. William Neave & Son ...	9,722	11	7
Messrs. E. Rogers & Co. ....	9,866	19	4
Messrs. Meston & Hale .....	12,045	19	1
Mr. James Dickson .....	13,793	6	4

On July 30, 1901, the Council sanctioned an expenditure of 7,725*l.* to cover the cost of the work, and of this sum 7,275*l.* represented the amount which could be spent on the contract itself. On the same date the Council authorised our Chairman to accept the lowest satisfactory tender within the amount sanctioned. The lowest tender received exceeded this amount by 94*l.*, and, acting on the authority referred to above, our Chairman reduced the amount of the provisional sum of 500*l.* for contingencies included in the tender of Mr. Coxhead by the Council. The result of inquiries as to Mr. Coxhead's position and competence to carry out the work having proved satisfactory, our Chairman then accepted his tender for the revised amount of 7,200*l.* The work was at once put in hand, and is now well on the way to completion."

The Council, having transacted other business, adjourned.

ENGINEERING SOCIETIES.

**SOCIETY OF ENGINEERS.**—At a meeting held at the Royal United Service Institution on Monday evening, the 7th inst., Mr. Charles Mason, President, in the chair, a paper was read on "Preliminary Investigations for Water Supply," by Mr. Sydney A. Hollis. The author first pointed out the difficulties which were encountered by engineers in tropical and sub-tropical countries in the gaugings of rainfall and rivers. Some statistics of remarkable and erratic rainfalls in the Cape Peninsula were given. The author then gave a detailed account of the gaugings carried out by him at Steenbras River, Cape Colony. He stated that the gaugings were taken with a view to the ultimate formation of a large storage reservoir by means of a dam across the mouth of the valley, the object being to obtain a supply of water for some of the suburbs of Cape Town. A large gauge weir was erected measuring 60 ft. across, and it was found that the flow of water in the river fluctuated between half a million gallons and 300 million gallons in the twenty-four hours. A description was given of the river gauges constructed to measure the flow of water in winter and summer, with particulars of the number and position of the rain and evapora-

tion gauges. A paper was also read on "Irrigation Works in South Africa," by Mr. J. Freebairn Stow. The author first referred to the Report of the Royal Commission on the settlement of time-expired soldiers and others in South Africa on the conclusion of the war, and pointed out that the Commissioners were strongly impressed with the value of irrigation works being undertaken in order to convert the vast area of dry veldt into an agricultural site, capable of providing produce for intending settlers. The author then drew attention to the persistent attempts made in 1886 by the late Mr. H. S. Orpen, at that time Surveyor-General of Griqualand West, to induce the Government of the day to take up the subject of irrigation works. The author then described the first scheme of irrigation ever attempted in South Africa on a large scale, and referred to the failure which attended the project. He then gave an account of the scheme prepared by Mr. Litchfield for irrigating the veldt in the vicinity of Douglas, and described the ingenious and somewhat rough-and-ready means adopted for the construction of the masonry dam across the Vaal River, and the engineering difficulties encountered. The use of explosives in the blasting operations, necessitated by heavy rock cuttings, and the methods adopted for crossing the valleys and running the canal round the kopjes, were described, and the difficulty of ensuring a safe passage across or under the irrigation canal for storm-water from off the numerous kopjes was also discussed. The manner in which the last sections of the masonry dam were built in was described, and the author gave examples of the way in which engineering work in a rough country was carried on, and how plant and material were transported where railways were unknown. In conclusion, he referred to the favourable attitude of the Government of Cape Colony in respect of irrigation works.

Illustrations.

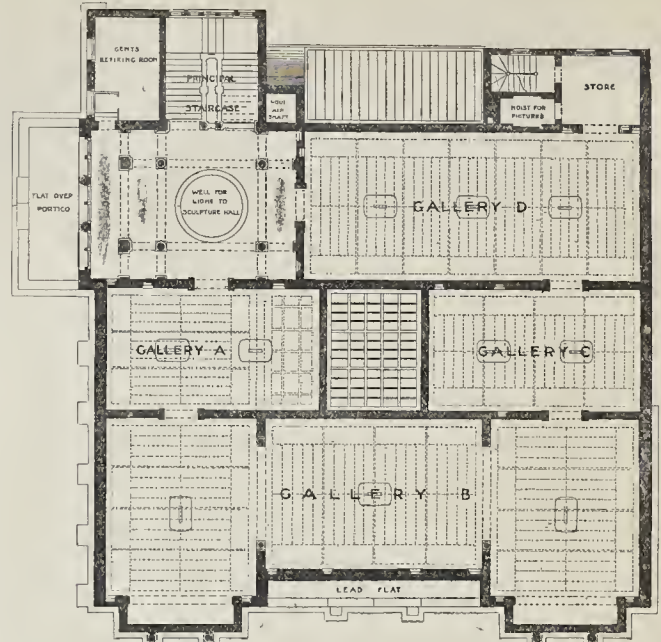

BURY ART GALLERY AND PUBLIC LIBRARY.

THIS building is situated at the corner of Moss-lane and Silver-street, and has a frontage to Moss-lane of 110 ft. and to Silver-street of 105 ft.

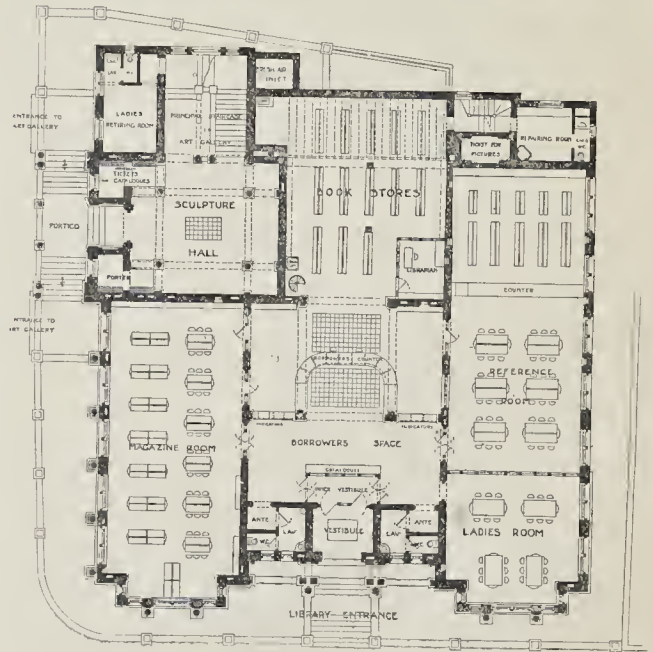

The structure comprises three complete stories—basement, ground, and first floors—with a sub-basement under the rear for the heating and ventilating plant. The first floor is entirely devoted to art, and is entered from a sculpture hall on the ground floor by a spacious stone staircase. There are five galleries arranged in sequence, the sizes varying from 27 ft. by 33 ft. to 27 ft. by 61 ft. Provision is made for ladies' and gentlemen's cloak-rooms, lavatories, &c., and at the back of the building there are rooms for repairing, &c. A large hoist connects the loading way with all the floors.

The ground floor has been devoted to library purposes, and will be entered by a vestibule 12 ft. wide. This vestibule opens direct into the borrowers' space, which is 40 ft. wide. To the right of the borrowers' space swing doors open into the ladies' and reference rooms, and to the left admission to the magazine and reading-rooms is gained in a similar manner. Separate conveniences are provided on each side of the entrance, and are entered from the borrowers' space through ante-rooms. A librarian's room and a large book store are arranged in conjunction with the borrowers' space. The basement is chiefly devoted to stores under the library, and connected therewith by a spiral staircase is a large book store. At the rear of the building a loading way for receiving books, pictures, &c., hoist, and packing-room are provided on this floor. The remainder is occupied by store-rooms for packing-cases, &c.

The main elevations are faced with boasted ashlar obtained from the Higher Stancliffe Quarries, Darley Dale, Derbyshire, the remaining elevations being faced with Edwards' Ruabon best selected red bricks. The joiner's work generally is Kauri pine stained. The gallery floors are laid with oak parquetry, the library with oak blocks, and the reading-rooms with pitch-pine blocks. The vestibules and halls have mosaic floors, and the steps, landings, &c., for the staircases are blue Shepley with Bath stone balusters and handrail.

FIRST FLOOR PLAN.

GROUND PLAN.

Bury Municipal Art Gallery. Plans.

The building is heated and ventilated on the "Plenum" system, is of fireproof construction throughout, and is lighted by electricity. Messrs. Thompson & Brierley, of Bury, have carried out the general contract, their tender being 21,250/. The clerk of works was Mr. G. E. Smirk, of Bury.

The following special tradesmen have also been employed on the work:—Messrs. Sutcliffe & Co., Manchester—heating and ven-

tilating; The Banks Fireproof Construction Syndicate, London—fireproof construction; Mr. J. F. Ebner, London—art gallery floors; Messrs. C. W. Williams & Co., Manchester—mosaic; Mr. J. J. Millson, Manchester—carving and sculpture work; Messrs. W. J. Pearce & Co., Manchester—leaded lights; Messrs. Heywood & Co., Huddersfield—patent glazing; Messrs. Marley Bros., Birmingham—fire extinguishing apparatus; Messrs. Hardman,

The Bar-Gate, Southampton, as it would appear after the Alterations proposed in Mr. Lucas's Scheme.

Powell, & Co., Birmingham—wrought-iron gates; Mr. Burgoine, Bury—hoist; Mr. George Wragge, Salford—protection rails, brackets, &c.; and Messrs. Singer & Co., Frome—electric light fittings.

The furniture and fittings have been executed in Dantzic oak by Messrs. Goodall, Lamb, & Heighway, Manchester, and the building has been painted and decorated by Mr. George Smith, of Bury.

The whole of the work, including the fittings, has been designed and supervised by the architects, Messrs. Woodhouse & Willoughby, of Manchester.

**HOUSE, ASCOT HEATH.**

This house, which is being erected on the north side of the heath, is constructed of two kinds of local brick, the quins, &c., being red and the filling-in of a "grey" colour, and the roof is covered with tiles. Mr. Wm. Watson, of Ascot, is the builder, his contract being about 3,000l., and the architect is Mr. Leonard Stokes, of Westminster.

**SCHEME FOR DEALING WITH THE BAR-GATE, SOUTHAMPTON.**

As many of our readers will probably have heard, there has been a foolish agitation going on at Southampton in favour of doing away with the old Bar-Gate, one of the most interesting ancient monuments in Southampton, on the usual plea of public improvement. A Southampton architect, Mr. Lucas, has drawn up the scheme illustrated in our plate (from a drawing exhibited at the last Royal Academy) for altering the roadways so that the obstruction to traffic may be removed without injuring the structure.

Mr. Lucas's aim is to preserve permanently the original function of the building as the town's chief gateway, while, nevertheless, increasing the traffic facilities of the street. It is proposed to do this by widening the two side passages for the use of carriage traffic, and by forming two new passages for pedestrians under the adjoining business premises. The side passages, made towards the end of the eighteenth century, have no historical value whatever, and the enlargement of their southern entrances would be a distinct gain to that face of the Bar-Gate, as, by being the same height and only about two-thirds the width, they clash with the central opening, making it appear

stunted while they look stilted. Their arches, too, are of a different type to the older one, and they are awkwardly out of centre with the windows over.

The alteration on the north side is so slight that many people have with good excuse taken the sketch which we print in the text to represent the gate as they know it. We understand that if other considerations readily permitted, Mr. Lucas would have preferred to design the northern entrances of the carriage-ways somewhat farther to the east and west so as to clear the two turrets and allow of building up under them from the ground. It is doubtful, however, whether the arrangement shown is not more picturesque though less constructional; and it is certain that the carving of the passages would be a great inconvenience.

The scheme only involves one complete rebuilding, that of the public-house at the north-west corner, the other premises affected having their lower stories set back and the upper ones carried on columns. The covered walks thus formed would be a boon to those who have shopping to do in wet weather. These walks are on the plans called "piazzas," for want, possibly, of an English name that would be as suitable and concise. A piazza, however, is not necessarily a covered place; but there are also objections to the words "colonnade" and "penthouse."

The plan shows the extreme narrowness of the street independent of the Bar-Gate, so that even from a wholly utilitarian point of view its removal would be absurd. Mr. Lucas's plan trebles the effective width of the road, and divides the wheeled traffic into two streams, one going up and one down. It increases also the wayleave for pedestrians, and provides better access to the large hall over the gateway, now used as the Guildhall, by a new doorway and a partly new flight of steps at the east end, and by an entirely new staircase at the west.

**"PRIX DE ROME" DESIGNS.**

We give on one plate reproductions of the works in architecture, painting, and sculpture which gained the "Prix de Rome" at the last competition for it at the Ecole des Beaux-Arts, Paris.

The subject for the prize in architecture, gained by M. Jean Hulot, was "An Establishment for Artistic, Literary, and Scientific Studies, founded at Paris by the United States of

America." Except in the presence of the eagle as an acroterion to the dome, there is nothing specially to connect the design with the United States, unless we take the view that as American architects have closely imitated French methods, the more French, and the more "Ecole des Beaux-Arts," the design appears, the more American it is. The smaller elevation is apparently intended to show the proposed site and grouping.

The subject for the prize in painting, gained by M. Jacques Defrance, is "Christ Healing the Sick at Evening before the Gate of a Town."

The subject for the sculpture prize, awarded to M. Bouchard, is "Edipus and his daughter Antigone driven from Thebes."

The winning of the Prix de Rome, as our readers are probably aware, entitles the young artist to four years' sojourn and study in Rome, at the expense of the State.

**THE TRIBUNAL OF APPEAL:**

**THE LAYING OUT OF NEW STREETS.**

THE Tribunal of Appeal under the London Building Act, 1894, met at the Surveyors' Institution, Great George-street, Westminster, on 27th ult., to hear an appeal by Mr. Walter H. Dawson as agent for and on behalf of Mr. Henry W. Forster, M.P., against the order of the London County Council refusing to sanction the formation or laying out of new streets for carriage traffic on part of the Forster Estate, on the east side of Bromley-road, Catford, at the corner of Sangley-lane. The members of the Tribunal present were Messrs. J. W. Penfold (chairman), A. H. Hudson, and E. A. Gruning.

The appellant's case was conducted by Mr. Guy Lushington, barrister; while Mr. J. W. Andrews, from the Solicitor's department of the London County Council, appeared in opposition to the appeal.

Mr. Lushington said the appeal was brought under Sections 9 and 19 of the Act, the Council having refused to pass plans for the creation of new streets on an estate which was now in process of development. Their ground for this refusal was set down as due to the proposed road not communicating conveniently with existing streets. The Council had the right to use their discretion in this matter, subject, of course, to an appeal to that Tribunal; hence, he had all the more confidence in ap-

pearing before them. The real reason of the Council's refusal was, he contended, due to the fact that the four projected streets did not, according to the view of the County Council, communicate with the streets of the adjoining estate, which was being developed by Mr. Cameron Corbett, M.P. The Tribunal had, he submitted, to be guided by the law, and not by the opinion of a man or a body of men. As a matter of fact, the streets proposed to be laid out by the appellant would communicate with two existing streets, and he argued that it was not the duty of the public authority to cast its eyes around an increasing neighbourhood to see whether the plans would suit the circumstances of an adjoining estate not developed. The law, on the contrary, provided only that proposed new streets should communicate in a reasonable manner with other streets already in existence, and not with adjoining estates. The Lewisham Borough Council had signified that it considered the scheme unobjectionable.

Mr. Dawson, agent to the appellant, gave evidence in support of the appeal.

Mr. Andrews, for the respondents, mentioned that there was already before the Council an application in connexion with the roads of the adjoining Corbett Estate, and in the course it had taken the Council was acting bona-fide in the interest of the public. Indeed, it was the intention of Parliament to cast upon the Council the responsibility of watching the interests not of individual owners, but of the public as a whole, and to insist that a man should not lay out his estate without regard to the public convenience. In this case it was the opinion of the advisers of the Council that the proposed roads did not offer ready means of access into Bromley-road, and that, having regard to the certainty that roads would shortly be constructed on the adjoining Corbett Estate, the proposed streets should be planned in such a manner that they would readily communicate with the others. His contention was that there should be a well-considered scheme, designed in the public interest, for the development of the estate, having regard to the development which was to proceed on the adjoining estate. In this connexion he mentioned the possibility of an appeal coming before the Tribunal from the owner of the adjoining estate, and he suggested an adjournment of the present appeal until that had been dealt with.

The only witness called for the respondents was an assistant in the Superintendent Architect's department of the London County Council. He pointed out that the chief road sketched in the appellant's plans was not direct, and that if the application were sanctioned there could be no direct means of access between the Foster and the Corbett Estates. This would be very inconvenient for future residents, particularly in regard to access to the two nearest stations—Hither Green and Bellingham.

Mr. Andrews contended that this alone was a great consideration.

Mr. Hudson: But the Council has no right to put on the screw at the expense of an individual owner.

Mr. Andrews: The Council considers the claims of rich and poor alike; it represents London as a whole.

The Chairman said the Tribunal was unanimously of opinion that the appeal should be allowed, but they added a stipulation that the proposed roads should be constructed within three years.

Some discussion ensued on the question of costs.

Mr. Andrews contended that it would be scarcely just to condemn the Council for a decision arrived at bona-fide as a part of its duty to the public.

Mr. Lushington argued that a principle was involved, and that the appellant was entitled to be reimbursed the costs to which he had been put in upholding it.

Negotiations between Mr. Lushington and Mr. Andrews with a view to an agreed sum having proved abortive, the Tribunal certified for 25*s.* costs.

#### REEREDS, ST. MICHAEL'S CHURCH, EDINBURGH.

A Reeredos has recently been erected in the Lady Chapel of St. Michael's Church, Hill-square, Edinburgh. When complete the niches will contain groups of figures. The carving was carried out from designs by Mr. Hamilton More Nisbett, architect, by Mr. John Gibson, Haymarket; and the painting and colour decoration were done by Messrs. G. & H. Potts, Edinburgh. The cost of the erection was 145*l.*

#### APPLICATIONS UNDER THE 1894 BUILDING ACT.

At the meeting of the London County Council on Tuesday the following applications under the 1894 Building Act were considered. Those applications to which consent has been given are granted on certain conditions. Names of applicants are given in brackets. Buildings are new erections unless otherwise stated:—

##### Means of Escape in Case of Fire.

**Holborn.**—Means of escape in case of fire proposed to be provided on the fifth and sixth floors of the Kingsley Hotel, Hart-street, Bloomsbury (the upper surfaces of which floors are above 60 ft. from the street level) for the persons dwelling or employed therein (Mr. C. F. Doll for Mr. J. Truslove).—Consent.

##### Lines of Frontage and Projections.

**Wandsworth.**—Five shops, with a screen wall and storerooms over, on the south side of Lower Richmond-road, Putney, westward of Martyr's Waterman's School (Mr. F. A. Powell for Mr. A. C. Ballard).—Consent.

**Bethnal Green, North-East.**—One-story shops on the forecourts of Nos. 32 and 34, Teesdale-street, Hackney-road, Bethnal Green (Mr. C. A. Legg for Mr. J. Mendes).—Consent.

**Brixton.**—A building, to be used as a furniture depository, on the south side of Brighton-terrace, Brixton-road, Brixton, on the site of Musley House (Mr. J. W. Chapman for the Bon Marché, Limited).—Consent.

**Hackney, North.**—Houses, with bay windows, on the east side of Mount Pleasant-lane, Upper Clapton, between Baker's-hill and No. 121, Mount Pleasant-lane (Mr. G. R. Woodruff).—Consent.

**Hackney, South.**—A two-story building on the east side of Durrington-road, Clapton, to abut upon Ashenden-road (Mr. H. M. Wakley for Mr. R. H. Barnes).—Consent.

**Hammersmith.**—Two projecting buttresses and two projecting doorways at the People's Hall, on the west side of Lattimer-road, Hammersmith, northward of Olaf-street (Messrs. Fleetwood, Son, & Everden for Mr. W. H. Winterbotham).—Consent.

**Greenwich.**—One-story shops in front of thirteen proposed houses on the north side of Woolwich-road, Greenwich, between Nos. 461 and 491 (Mr. T. N. Dinwiddy for Mr. T. Dinwiddy).—Consent.

**Kensington, South.**—That the application of Mr. W. G. Hunt for an extension of the period within which the erection of buildings on the east side of Addison-road, Kensington, at the corner of Oakwood-court, was required to be completed, be granted.—Agreed.

**Lewisham.**—That the application of Mr. J. W. Brooker for an extension of the period within which the erection of six houses on the east side of Brockley Rise, Lewisham, at the corner of Brockley Park, was required to be commenced, be granted.—Agreed.

**Lewisham.**—A wood, iron, and slate porch at the entrance to No. 50, Longton-grove, Sydenham (Mr. J. M. Stewart for Messrs. Stone, Simpson, & Mason).—Consent.

**Lewisham.**—Retention of two, and the erection of eleven, dwelling-houses on the south side of Brownhill-road, Catford (Mr. H. G. Rodda for Mr. Durrant).—Consent.

**Marylebone, West.**—Porch on the north side of No. 33, Montagu-square, St. Marylebone, to abut upon Montagu-place (Mr. F. W. Foster).—Consent.

**Pekham.**—One-story shops on part of the forecourts of Nos. 136, 138, and 140, Kimberley-road, Nunhead (Mr. J. W. Watkin).—Consent.

**Wandsworth.**—A two-story addition in front of No. 35, Jew's-row, Wandsworth (Mr. A. E. Nightingale for Mr. E. H. Bartle).—Consent.

**Woolwich.**—An open wooden porch in front of No. 32, West Chislehurst Park, Etham (Mr. G. Hubbard).—Consent.

**Woolwich.**—One-story shops on part of the forecourts of Nos. 43, 44, and 45, Plumstead-road, Woolwich (Messrs. Church, Quick, & Whineport for Mr. P. J. Gibbons, Mr. H. A. Back, Mr. W. A. Peckett, and Mr. B. H. de Bartodano).—Consent.

**Holborn.**—An iron and glass enclosure over the sunk area in front of No. 27, Red Lion-square, Holborn (Messrs. Lunder, Bedells, & Crompton for Mr. E. Marshall).—Refused.

**Marylebone, East.**—Buildings on the west side of Albert-road, Regent's Park, at the corner of High-street, on the site of Portland-terrace (Mr. F. J. Stevenson for Lord Howard de Walden).—Refused.

**Westminster.**—Three three-story bay windows and two porches to two blocks of residential flats, proposed to be erected on the south-west side of Emery Hill-street, Westminster, northward of Coburg-grove (Mr. E. J. Stubbs for Messrs. J. Allen & Sons, Limited).—Refused.

**St. George, Hanover-square.**—A warehouse building on the site of Nos. 109 to 203, Buckingham Palace-road, Pimlico (Mr. W. A. Large for Messrs. Humphreys, Limited).—Refused.

**St. George-in-the-East.**—The retention of a wooden bay window or shopfront in front of No. 542, Commercial-road, St. George-in-the-East (Dr. W. J. Harding).—Refused.

**St. Pancras, East.**—Buildings on the site of Nos. 152 to 170, Euston-road, St. Pancras (Mr. M. C. Meaby for the Hearts of Oak Benefit Society).—Refused.

152 to 170, Euston-road, St. Pancras (Mr. M. C. Meaby for the Hearts of Oak Benefit Society).—Refused.

**Strand.**—A projecting wood and iron sign in front of No. 38, Old Compton-street, Soho (Mr. H. Fritch).—Refused.

**Strand.**—The retention of a projecting illuminated sign in front of the Lyric Theatre, Shaftesbury-avenue, St. James's (Mr. J. G. Buckle for Mr. T. B. Davis).—Refused.

**Wandsworth.**—An estate office on the south side of Replingham-road, Southfields, at the corner of Wimbledon Park-road (Mr. D. Matthews).—Refused.

**Woolwich.**—The re-building to an increased height of the back additions of No. 2, High-street, Plumstead, to abut upon Griffin-road (Mr. C. Kitley for Mr. A. Chapman).—Refused.

##### Width of Way.

**Westminster.**—Two one-story office buildings on the east side of Palmer-street, York-street, Westminster, northward of the Metropolitan District Railway, with the external walls of such buildings at less than the prescribed distance from the centre of Palmer-street (Messrs. Barlow & Roberts).—Consent.

**Fulham.**—A one-story building to be used as a billiard-room at the rear of the Three Kings public-house, North End-road, Fulham, with the external walls of such building at less than the prescribed distance from the centre of Conan-street (Messrs. Richardson & White for Mr. R. Wash).—Consent.

**Kennington.**—A building to be used as a staircase, at Cumberland Works, Wigton-place, Milverton-street, Kennington, with the external walls of such buildings at less than the prescribed distance from the centre of Wigton-place (Mr. A. Farnacott for Messrs. F. & W. Judge).—Consent.

**Hammersmith.**—A block of flats on the west side of Queen-street, Hammersmith, at the corner of Sussex-place (Mr. H. G. Brace for Mr. E. Messier).—Refused.

##### Width of Way and Lines of Frontage.

**Finsbury, Central.**—An iron and glass porch at the entrance to St. Philip's Vicarage, Holford-square, Pentonville (the Rev. T. C. Eldson).—Consent.

**Hackney, North.**—A block of dwellings on the north side of Stamford-terrace, Stamford Hill, Hackney (Mr. C. G. Smith for Messrs. Michell, Goodman, Young, & Co., Limited).—Consent.

**Lewisham.**—Five houses, with bay-windows, on the south-east side of Dartmouth-road, Forest Hill (Mr. R. C. Murray for Mr. W. A. Owston).—Refused.

##### Lines of Frontage and Space at Rear.

**Strand.**—Certain deviations from the plan certified by the District Surveyor, under Section 43 of the Act, so far as relates to the proposed rebuilding of No. 55, St. James's-street, Piccadilly, at the corner of Bennett-street (Messrs. Newman & Newman for the American Dental Institute).—Refused.

**Wandsworth.**—A dwelling-house on the south side of Ormerley-road, Balham, to abut upon Laitwood-road (Mr. W. E. Johnson for Mr. G. E. Treves).—Refused.

##### Lines of Frontage and Construction.

**Lewisham.**—The retention of a wood and glass showcase on the forecourt of No. 31, Brownhill-road, Catford (Messrs. A. T. and E. J. Bateman).—Refused.

**Deptford.**—Two houses at the rear of 45, 47, and 49, Kender-street, New Cross, and the rebuilding of two houses on the east side of Kender-street, southward of No. 49, with the external walls of the houses at less than the prescribed distance from the centre of a passage-way leading to Esther-cottages (Mr. J. H. Waterworth for Mr. W. Falkner).—Refused.

**Westminster (detached).**—A building, to be used as a church, on the north side of Prince Consort-road, South Kensington, with the external walls of such building at less than the prescribed distance from the centre of Jays-mews (Mr. G. F. Bodley for the Rev. H. B. Coward).—Refused.

##### Space at Rear.

**Hackney, South.**—Two-story workshop building at the rear of George House, Gainsborough-road, Hackney Wick, with an irregular open space at the rear (Mr. H. Gaye for Miss G. M. Bevan).—Consent.

**Holborn.**—A block of residential flats on the site of Nos. 47, 48, and 49, Hunter-street, and No. 9, Handel-street, Brunswick-square, St. Pancras (Mr. J. Davis for Messrs. Brown Brothers).—Refused.

##### Formation of Streets.

**Lewisham.**—That an order be issued to Mr. G. F. Logsdail refusing to sanction the formation or laying out of new streets for carriage traffic on the St. German's estate, Hither Green, to lead out of Torrillon-road and Killcarran-road (for Mr. A. Cameron Corbett, M.P.).—Agreed.

**Wandsworth.**—That an order be issued to Mr. J. M. Jones refusing to sanction the formation or laying out of a new street for carriage traffic to lead out of the east side of Wimbledon Park-road, Wandsworth, northward of Replingham-road (for the Lands Development Syndicate).—Agreed.

**Buildings for the Supply of Electricity.**

**Bermondsey.**—A deviation from the plans approved for the erection of a generating station and works on the west side of Neckinger, Spa-road, Bermondsey, so far as relates to an alteration in the height of the battery-room and the erection of an additional story on the one-story men's room and lavatory to the southward of the battery-room (Messrs. Kincaid, Waller, & Manville, for the Council of the Metropolitan Borough of Bermondsey).—Consent.

**Height of Buildings.**

**Islington, West.**—That the application of Mr. F. Matcham for an extension of the periods within which the erection of a theatre building on the south side of Holloway-road, Islington, to exceed in height the width of a proposed new street to lead from Holloway-road to Writers-road was required to be commenced and completed, be granted.—Agreed.

**Dwelling-houses on Low-lying Land.**

**Woolwich.**—That the solicitor do prepare a licence under Section 122 of the London Building Act, 1894, to Messrs J. & C. E. Pearson, for the erection of a public-house with a cellar beneath, on low-lying land at the corner of Bostall-lane and Abbey-wood-road (Mr. J. O. Cook).—Agreed.

The recommendations marked \* are contrary to the views of the Local Authorities.

**GIGGLESWICK SCHOOL CHAPEL.**

THE new chapel at Giggleswick School in Yorkshire, built from the designs of Mr. T. G. Jackson, R.A., the exterior of which was illustrated in our issue of September 10, 1898, was opened last week, when there was a large gathering of visitors to a special service and a lunch afterwards, followed by an organ recital in the chapel in the afternoon.

The chapel stands in an isolated position on the crown of a hill, and by the wish of the donor, Mr. Morrison, the principal feature in it was to be a dome, though the architect has partially assimilated this feature to the Gothic style of the remainder of the building, by designing the dome as an octagon on plan, which of course removes it from the category of domes in a constructional sense, though the architectural impression, in a distant view at all events, is retained.

We take the following information in regard to the building from the illustrated booklet which was issued in connexion with the occasion. The walls of the chapel are fitted into the naked rock which comes to the surface of the hill, the inclined planes of the stratification forming fine lines in the configuration of the site. Advantage has been taken of these in placing the chapel and forming the approaches, so that the natural and artificial lines should compose harmoniously and help one another.

It was the wish of the donor that the building should be finished and furnished in every respect from the beginning, leaving no room for subsequent intrusion of possibly unsympathetic work; and thus the chapel affords a rare instance of a building in which every detail, not only of construction but of decoration and furniture, has been completed at once, and designed by the same hand or under the same direction.

The dome is constructed on a novel method, with interlocking blocks of terra-cotta, invented and made by Mr. Pulham, with a backing of concrete. With these blocks and some additional contrivance it was found possible to build the dome without centering.

The outside of the dome is of timber covered with copper; the four main roofs are laid with cast lead; and the aisles and antechapel are covered with green Ellerwater slates.

The walls are of millstone grit, quarried on the spot, faced externally with yellow Idle sandstone up to the plinth, and above it with Mr. H. R. Simpson's red Lazonby stone, intermixed with bands and chequers of sandstone and black limestone from Mr. Delany's quarry at Horton. The wrought masonry outside, including the window traceries, is of Messrs. Obank's Lees-moor sandstone. The interior dressings are of Ancaster Oolite, from Messrs. Lindley's quarries, banded with red Egremont sandstone, supplied by Mr. James Smith. The mortar in the foundations is made with Portland cement, and above with Messrs. Nelson's selenitic lime, which is also used for the plastering.

Advantage is taken of the fall of the ground to form a vestry under the east end, which communicates with the chapel above by a stair in one of the turrets.

The dome and four pendentives are lined with glass mosaic on an arrangement and scheme of colour devised by the architect, the cartoons being drawn by Mr. George Murray, a student and medallist of the Royal Academy, and executed by Messrs. Powell, of Whitefriars. Their foreman, Mr. Gregory, and the workmen under him, had previously carried out the mosaic decoration for Sir W. B. Richmond's designs at St. Paul's Cathedral. A semi-dome model showing the design was exhibited in the architectural room at the last Royal Academy, when we drew attention to it. We presume the archaic character of the design satisfies the architect and the donor; we should have preferred to see something a little more modern in spirit as the decoration of a chapel for a modern school. The mosaic, like that of St. Paul's, was worked from the face and *in situ*. Round the base of the dome in letters of mosaic is the text:—

MEMENTO CREATORIS TVI IN DIEBUS IUVEN-  
TVTIS TVAE ANTEQVAM VENIAT TEMPVS  
AFFLICTIOMIS.

This scheme of decoration is continued beyond the limits of the mosaic by "sgraffito" in the four vaults which support the drum of the dome, and in the nave ceiling. In each of these vaults the design consists of a circle in the crown of the arch bearing a sacred monogram, and scrolls of vines and grapes, with labels regularly spaced and bearing the following texts:—

In the eastern arch—

EGO SVM RESVRRCTIO ET VITA QVI  
CREDIT IN ME ETIAM SI MORTVVS FVERIT  
VIVET

ET OMNIS QVI VIVIT ET CREDIT IN ME  
NON MORIETVR IN AETERNVM

In the southern arch—

EGO SVM VIA ET VERITAS ET VITA  
NEMO VENIT AD PATEREM NISI PER ME

I I I S

NON RELINQVAM VOS ORPHANOS VENIAM  
AD VOS QVIA EGO VIVO ET VOS VIVETIS

In the western arch—

EGO SVM VITIS VERA ET PATER MEVS  
AGRICOLA EST MANETE IN ME ET EGO IN  
VOBIS

I I I S

EGO SVM VITIS VOS PALMITES QVI MANET  
IN ME ET EGO IN EO HIC PERT MVLTVM  
FRVCTVM.

In the northern arch (over the organ)—

BENEDIC ANIMA MEA DOMINO ET OMNIA  
QVAE INTRA ME SVNT NOMINI SANCTO  
EIVS

A Ω

IVBILATE DEO OMNIS TERRA SERVITE  
DOMINO IN LAETITIA

Sgraffito is also employed on the walls of the antechapel in a diaper pattern, with this text over the entrance to the nave—

INTROITE PORTAS EIVS IN CONFESSIOE  
ATRIA EIVS IN HVMNIS

The sgraffito was cut and worked by two young Oxonians, pupils of the architect, Mr. William H. Nicholls, of Hertford College, and Mr. Douglas Stewart, of Oriel.

The great window of the south transept refers to Giggleswick School and its benefactors and *alumni*. In the middle light is Edward VI. copied from an illumination in the charter given by him to the school, and below him is the figure of James Carr of Stackhouse, who founded the school in 1512, holding a model of the first building in his hand. In the other lights are Mr. Walter Morrison, holding a model of the new chapel of which he is the donor, Archdeacon Shute, Archdeacon Paley who was a boy here, and the Rev. George Style, the present head master. The figures in the window were drawn by Sir James Linton.

The six clearstory windows bear figures of Christian worthies of various ages, kinds, and denominations, also were designed by Sir James Linton.

North Side. South Side.

| Wykeham.     | Cudmon.          |
| Arnold.      | Tennyson.        |

Below them a band of sgraffito round the nave bears texts from the chapter commonly read in colleges on their Founder's day.

In niches over the west door inside the chapel are two figures in bronze by Mr. George Frampton, A.R.A., representing King Edward VI., who gave the school its charter, and Queen Victoria, whose "Diamond Jubilee" the chapel was built to commemorate.

The whole of the furniture is of cedar, imported by Mr. Morrison direct from the province of Tucuman in the Argentine Republic.

The boys' seats occupy the nave right and left of a wide central passage, and at the west end are eight stalls under canopies for the head-master and others. These western stalls have carved and pierced standards to the canopies, containing figures of the Four Evangelists writing their Gospels, and attended by their emblems. The figures were modelled by Mr. Carter, and are treated in a broad, simple manner suitable to the material. In the canopies above are pendants modelled by Mr. Carter, with six figures of prophets—Moses, Elias, Esaias, Jeremias, Ezekiel, Daniel.

The foliage of the capitals of the nave arcades is taken from plants common in the locality; a method which adds a certain local interest to the carving, but which, as in the case of the Oxford Museum, is rather apt to lead to too much realism in architectural detail.

The whole of the carving in wood and stone was undertaken by Messrs. Farmer & Brindley. The lectern is of bronze, and was made from the architect's designs by Messrs. Hart, Peard, & Co., of Drury-lane, London.

The pavement is of black and white marble, with steps of black and a panel of coloured marbles under the dome. In the mosaic borders the following marbles are used: *verd antique* from the ancient quarry of Casambala in Thessaly, and porphyry-coloured *rosso* from Scutari in Laconia, Peloponnesus. The central disc is of red Pavonazetto breccia marble from the Isle of Scyros in the Cyclades; a small bronze cross let into it marks the exact centre of the dome above. Of the four smaller discs two are from the ancient Cipollino quarries at Stura in Euboea. A third disc is of Irish green from the Lousoutur quarry, Recces, Galway, and the fourth is of yellow breccia from Stazema, Tuscany. The white in which these coloured marbles is inlaid is second-quality statuary marble from Crestola, near Carrara. For the rest of the pavement hard white marble from Serravezza is used, and the black comes from Mazy in Belgium. The marble was supplied and laid by Messrs. Farmer & Brindley, of London.

The chapel is heated by the hot-air apparatus of Messrs. Haden & Son, of Trowbridge, which is placed in a vault under the antechapel.

The copper and lead of the roofs was supplied and laid by Messrs. Dent & Hellyer, of Newcastle-street, Strand, London.

The building was erected under Mr. Richard Evans as clerk of works, "of whose care and pains both employer and architect feel they cannot speak too highly." The foreman during the first part of the work was Mr. Bleazard, who was succeeded, on his appointment as Borough Surveyor at Clitheroe, by Mr. Kitchen. The workmen were engaged and paid, and material bought, by the employer without a general contractor, though the labour in the carpentry and joinery was contracted for by Messrs. Brassington Brothers & Corney, of Settle.

CHURCH, BLACKHAM, SUSSEX.—The foundation-stone of a new mission church has just been laid at Blackham. When completed the building will be dedicated to All Saints'. It will consist of a nave and chancel with a stone bell turret. It is being built of stone from the Hackenden quarry at East Grinstead, with Bath stone dressings, prepared by Messrs. Jenner & Grynver, of East Grinstead. The bricks used inside have all been made at Blackham. Sir Charles Day, of Cowden, is the builder, and Mr. Lucy Ridge the architect. The accommodation to be provided is for 150 persons.

Correspondence.

To the Editor of THE BUILDER.

A QUESTION OF RESPONSIBILITY.

SIR,—In a bill of quantities for work which I have now in hand I have put several prime-cost values for materials and fittings to be selected by myself, including a p.c. item for hot-water apparatus with an item attached "Allow for profit and waiting upon same." I find that the contractor whose tender is accepted has put nothing against the latter item. Can he now charge me for waiting upon and making holes, &c., for the hot water engineer?  
OMEGA.

SHAFESBURY HOUSE, LONDON WALL.

SIR,—While there is time and opportunity to amend it, I desire to draw attention to the want of clothing with "architectural grace" displayed by the mass of irregular brickwork at the summit of Shaftesbury House, London Wall. This unsightly aggregation of rooms in the rear of the mansard roof of the Finbury Circus frontage is the closing feature of the vista of Copthall-avenue, which joins London Wall at a right-angle.

It would be a pity for so fine a building to be left with this blot on its SKYLINE.

THE HOARDING BEAUTIFUL.

SIR,—The attempt in Holborn (and recently in the Strand) to make a hoarding, if not a thing of beauty, at least somewhat less of an eyesore than is usually the case, is certainly a laudable effort. A hoarding may be a necessary evil, but it does not follow that it should not be an ornamental one, and help to do what we hope the art poster on hoardings is doing, and that is the exerting of a little influence on the artistic sensibilities of that important person, "the man in the street."

AUGUSTINE C. PASSMORE.

\* \* Our correspondent might also have mentioned the hoarding recently erected by Messrs. Waring in Oxford-street: an excellent example.—ED.

TESTS FOR WHITE LEAD.

SIR,—Could any of your numerous readers inform me through the columns of your paper the best and most effective test to apply in order to find out the quality of white lead?  
E. G.

The Student's Column.

GAS AND GAS FITTINGS.

15.—GAS FIRES.

**LUMINOUS AND NON-LUMINOUS FIRES.**—Gas-fires may be divided into two classes—(1) those fitted with "atmospheric" burners, in which air is allowed to mix with the gas before the point of ignition; and (2) those fitted with burners to which air is not admitted before the point of ignition, and which therefore produce luminous flames. The heat produced per cubic foot of gas consumed is precisely the same in the two classes of fires, provided that the gas be consumed under suitable conditions, but the admixture of air before the point of ignition not only renders the flame non-luminous, but makes it much shorter, and the heat of combustion is therefore concentrated in a smaller area than in a luminous flame.

**Radiated and Convected Heat.**—Radiant heat is that form of heat which is transmitted from one body to another without materially raising the temperature of the atmosphere through which it passes. Convected heat is heat conveyed by particles of heated air or other similar medium. Rooms heated by convected heat alone (*i.e.*, by hot air, steam, or water pipes) are never so comfortable as those heated by the radiant heat from an open coal or coke fire. The temperature may be raised more economically by convected heat than by radiant heat, but the inhalation of heated air is prejudicial to health, and the walls of rooms heated by convected heat remain at a comparatively low temperature, and absorb heat from the human body. In rooms well heated by radiant heat the atmosphere remains comparatively cool, while the walls and furniture are raised to a temperature sufficiently high to prevent them abstracting heat from the body and producing a sensation of chill. Warming by radiant heat alone is, however, too costly for general practice, and a combination of the two systems

is usually adopted. An incandescent gas fire is used as a source of radiant heat, while the hot waste products of combustion are led through channels at the sides and back of the fire and form a source of convected heat (fig. 37). The channels act as hot-air pipes, and raise the temperature of the atmosphere of the room.

Fig. 37.—Gas Fire in Section.

A luminous flame contains solid particles of carbon in an incandescent condition, and therefore emits more radiant heat than a non-luminous flame, but the latter is more useful for indirectly producing radiant heat because it can be used for raising a suitable medium, such as fireclay or asbestos, to incandescence, and when thus employed is more effective as a source of radiant heat than the luminous flame.

**"Atmospheric" Gas Fires.**—Fires fitted with "atmospheric" burners must be supplied with gas under a pressure sufficiently high to prevent the "flashing back" of the flames when subjected to draughts of air produced by open doors or windows, and to enable the gas by its uprush to draw in sufficient air through the air-holes in the burner to produce a non-luminous flame. With London gas a pressure of about 1½ in. is a good working pressure for most of the fires now made. When the pressure becomes lower than this the flames have a tendency to "flash back," and when the pressure exceeds this limit the gas consumption becomes excessive and out of proportion to the heat obtained in the room. It is commonly stated that a pressure of ½ in. is the most suitable pressure for gas fires, but this is certainly incorrect for average working conditions. It is now a common practice to mix carburetted water-gas with the coal-gas sent out from the gasworks. This mixture has a higher specific gravity than the coal-gas, and therefore should be supplied under a higher pressure; it has, moreover, a different chemical composition and requires less air for its combustion than plain coal-gas. As the proportion of water-gas in the mixture varies, so should the proportion of air admitted through the air-holes of the burner be varied. To meet this difficulty Messrs. Richmond & Co. manufac-

short, greenish, noisy flames; which do not reach the upper layers of fuel; but when the size of the air inlet is reduced the flame becomes elongated, the noise almost ceases, and the upper layers of fuel become incandescent.

A somewhat similar effect is produced by the accumulation of dust and dirt over the gas inlets of the burners, owing to the reduction of the volume of gas passing through them, the deflection of the current from its vertical flow, and the excessive proportion of air to gas in the mixture flowing to the point of ignition.

The burners (both nozzles and mixing tubes) of all gas fires require periodical cleaning, and it is an objectionable feature of many otherwise excellent gas fires that the burners cannot be removed and cleaned without the assistance of a gasfitter. Gas fires which are quite satisfactory when first used, often become in the course of a few months exceedingly unsatisfactory, and in many cases the consumer does not know whether the fault is with the gas or the gas fire. Dust from the asbestos or fireclay fuel, or from the atmosphere of the room, gradually accumulates in the mixing tubes and on the burner nozzles, the flames become shorter, greener, and more noisy, and have a strong inclination to "flash back," and at last the climax is reached when the fire cannot be lighted without allowing the flames to flash back, with the result that the flames become luminous and emit an intolerable noise and stench. In nine cases in every ten the burners are fitted in an inaccessible position, and are concealed by the outer casing of the fire, and consequently the average consumer is entirely dependent upon the local gasfitter. There is no reason why the burners should not always be fitted in a readily-accessible position, so that the consumer may, without undue inconvenience or loss of time, himself remove and cleanse them whenever necessary.

**Ball Fuel for Gas Fires.**—The so-called ball "fuel" for incandescent gas fires may be made of any refractory material, but some materials are more suitable than others, and the shape of the ball is a matter of considerable importance. At one time massive lumps of asbestos having only one central hole made through them were extensively used, but these will not become thoroughly incandescent in fires of ordinary size, and have now been superseded to a large extent by balls of more open formation constructed of fireclay or fireclay mixed with other silicates. The two descriptions of fuel are shown in fig. 39.

Fig. 39.

A. Gas Fire Fuel of Bad Shape.  
B. Gas Fire Fuel of Good Shape.

The modern "hollow" fuel (B) becomes more uniformly heated, and is more rapidly heated to incandescence. Instead of using the refractory material in lumps it may with equal advantage be used in the form of vertical strips as in asbestos fibre fires, and even the old-fashioned iron spray fires are quite as effective as the modern ball fires. In the Clamond gas radiator manufactured by the Kern Burner Company, a number of vertical fireclay tubes, perforated throughout their length, are heated by non-luminous flames supplied by horizontal burners constructed on the principal used by Kern in constructing the Kern burner for incandescent gas lighting. The proportion of radiant heat emitted by these fires is unusually high.

**Condensing Stoves.**—When coal-gas is burned the hydrogen it contains unites with the oxygen of the atmosphere to form water vapour, which condenses to liquid water as soon as its temperature becomes sufficiently low. About one pint of water is produced from every 30 cubic feet of gas consumed. In condensing stoves the products of combustion are conducted through a number of vertical pipes, and become cooled below the temperature at which the water vapour condenses before they escape into the atmosphere. The water trickles down the pipes and is collected in a pan beneath the stove. But another compound always produced in large proportion when coal-gas is burned is carbon dioxide, or

Fig. 38.—Water-Gas Attachment for Gas Fires.

ture a simple "water-gas attachment" (fig. 38) for gas fires by means of which the size of the air inlet to the mixing tubes of gas-fire burners can be regulated as required.

The effect of mixing such large volumes of carburetted water-gas as the 30 per cent. and 40 per cent. now commonly used, and burning this mixture in fires adjusted to consume plain coal-gas is to cause the burners to produce

carbonic acid gas. This gas is not condensed in condensing stoves to any considerable extent, and as it is not a supporter of animal life it should not be allowed to escape into the atmosphere of a dwelling-room. Condensing stoves are larger than ordinary fires, because they must contain sufficient condensing area to cause all the water vapour to condense, and are apt to convey an exaggerated impression as to their heat-producing capabilities. Condensing stoves are suitable for halls and greenhouses, but should not be used in dwelling-rooms, unless provided with a flue. The condensed water obtained in the collecting-pan is not pure water, but contains sulphur compounds and other impurities.

**Flues.**—No gas fire or stove should be placed in a dwelling-room without being connected to a flue capable of carrying the products of combustion away from the room. Many condensing and other fires are manufactured which are recommended as capable of burning gas without vitiating the atmosphere of a room even where no flue is employed, but no heed should be given to the assurances of vendors that a flue is unnecessary. A gas fire should never be used in a small dwelling-room unless connected to a flue having a natural updraught. Sometimes a gas fire is used in place of a coal fire because of the nuisance created by a smoky chimney, and, owing to the absence of soot when gas is burned, the fact that the down draught forces the products of combustion into the room is unheeded. Gas fires used under such conditions naturally cause headache and loss of health.

**Vaporising Stoves.**—Some persons complain that gas fires cause an uncomfortable dryness of the atmosphere of a room. Mr. Fletcher has conducted a series of experiments which prove that the atmosphere of a room is not rendered more dry by the use of a gas fire provided with a flue than by the use of the coal fire, and he is of opinion that the alleged dryness is always due to a trace of the sulphur compounds in the products of combustion escaping into the room through a defective flue. Where the flue is perfect and a strong up draught is maintained no such feeling of dryness is experienced. To meet all requirements, however, most of the gas-fire manufacturers now manufacture a fire fitted with a well to contain water, the water being slowly vapourised by the heat from the fire. Arden Hill's "Acme" vapourising fire is a fire of this description and is shown partly in section in fig. 40. A is the front casing of the fire, B the water vessel, and C the firebrick.

Vaporising fires appear to be rapidly growing in popularity, and are very serviceable for sick rooms where a moist warm atmosphere is required. A shallow pan of water placed in front of an ordinary incandescent gas fire may, of course, be used instead of a specially constructed vapourising gas fire, but is not so convenient.

**Reflecting Stoves.**—Small luminous flat or rat-tail flames are employed for reflecting stoves, the flames being placed in front of a reflector of glass or polished metal. If the products of combustion are conducted through suitable tubes or chambers to utilise as much heat as possible before allowing them to escape into the flue, reflecting stoves form very efficient heating agents. They are less liable to get out of order and are more readily repaired than fires with "atmospheric" burners. As the flames never come in contact with any cool surface, they do not, as a rule, evolve any disagreeable odour or poisonous incomplete products of combustion, but they should, nevertheless, be connected to a flue. The temperature of the combustion products as they enter the flue should always be sufficiently high to feel hot to the hand. If cooled to atmospheric temperature, water would be condensed in the pipes, and the remaining combustion products, being heavier than air, would probably fail to rise to the top of the flue.

THE ART OF BUILDING A HOME. By Barry Parker and Raymond Unwin. (London: Longmans, Green, & Co.)  
A PRIMER OF GEOMETRY. By H. W. Croomer Smith, B.A. (Macmillan & Co.)

OBITUARY.

MR. BROOKS.—We greatly regret to announce the death on the 7th instant at his residence "The Grange," Park-lane, Stoke Newington, of Mr. James Brooks, senior member of the firm of James Brooks, Son, & Godsell, of 35, Wellington-street, Strand, W.C., and one of the most eminent architects of the day, especially in church architecture. Mr. Brooks was born at Hatford, Wantage, on March 30, 1825, and received his earlier education at the Grammar School, Abingdon. Coming to London in 1847 he was articled to Lewis Stride, attended Professor Donaldson's classes at University College, and entered as a pupil at the Royal Academy Schools. Having begun to practise just fifty years ago, he became a member of the Architectural Association in 1884; in 1866 he had been elected a Fellow of the Royal Institute of British Architects, of which he was a Vice-President, 1862-6, and member of the Council and of the Art Standing Committee, 1900-1. In June, 1895, he received at the hands of Mr. F. C. Penrose, the President, the Royal gold medal; on that occasion we published his portrait in our columns of June 29, 1895. In June, 1888, he was appointed to succeed Joseph Clarke, deceased, as architect to the diocese of Canterbury; he was architect to the Diocesan Society of Canterbury, and was consulting architect to the Incorporated Society for Building Churches. Some years ago he took his son, Mr. Martin Brooks, into partnership, under the style of James Brooks & Son, in August last Mr. G. H. Godsell, of Hereford, was admitted partner of the firm, under the style of James Brooks, Son, & Godsell.

Of the principal architectural works planned and designed by Mr. Brooks, and more recently by the firm, a large number have been described and illustrated in our columns. Of new churches we should mention the following:—St. Michael's, at the corner of Paul and Mark streets, Shoreditch, and the reredos (executed by Earp), 1865; St. Saviour's, Hyde-road and Penn-street, Hoxton [May 5, 1866, two views\*]; St. Columba's, Kingsland-road, Haggerston [December 11, 1869\*]; St. Chad's, Nichols-square, Hackney-road, Haggerston, 1869; the Church of the Annunciation, Chislehurst, 1870, for which he designed the screen and superintended the designing and execution of the decorative frieze around the triforium stage of part of the church, and of the decoration of the Lady Chapel; St. Mary's, Wednesbury; St. Andrew's, Plaistow, 1870, and the screen (executed by Earp); the Church of the Transfiguration, Lewisham, 1882; St. Peter's, St. Leonard's-on-Sea [May 5, 1883\*]; All Saints', Ipswich [July 28, 1883\*]; St. Michael's, Cottenham [May 17, 1884\*]; St. John the Baptist, Holland-road, Kensington, 1877-8, completed in 1891, and the screen (sculptured by Mr. J. E. Taylorson [April 23, 1892, west front elevation; and June 29, 1895\*]; Holy Innocents', Hammersmith, 1890-1, of which the new west portion was dedicated on April 27, 1901 [January 1, 1887\*]; St. Andrew's, Willesden Green, 1886-7 [January 2, 1886\*]; St. Mary's parish church, Hornsey, 1886-8 [May 13, 1888, and March 30, 1889\*]; All Saints', Southend-on-Sea [October 1, 1887\*]; the Church of the Good Shepherd (originally All Hallows), Mansfield-road, Gospel Oak, Highgate, and the parsonage, 1894-5 [March 23 and 30, 1889, December 29, 1894, June 29, 1895\*]; St. Mary's, Highgate [August 15, 1896\*]; St. Peter's, Hornsey, consecrated on July 1, 1898 [August 15, 1896\*]; St. Luke's, Enfield [September 24, 1898, north-east view; and June 17, 1899, interior of east end\*]; St. Peter and Paul, Charlton, near Dover [May 30, 1891, view, elevation, plan, and section\*]; the Chapel, Tonbridge School [May 14, 1892\*]; and All Saints', Perry-street, Northfleet. To the foregoing should be added a stone pulpit for St. James's, West Hackney (Sir R. Smirke, architect); alterations at St. Mary's, Brunswick-street, Haggerston, in 1861 (Nash, architect, 1827); the remodelling of St. Andrew's, Tottenham, and addition of the chancel and apse, in 1860; oak screen, St. Matthias, Stoke Newington (Butterfield, architect), in memory of the late Mr. Robert Brett, who died in 1874; remodelling of All Saints', Norfolk-square, Paddington, after the fire, and addition of chancel, in 1873; completion of St. Faith's, Stoke Newington (Burgess, architect), and the new mission hall [December 29, 1883\*]; reconstruction and enlargement of St. Margaret's, Lee, upon the model of the Lady Chapel, Salisbury Cathedral, 1875-6 [June 30, 1888\*]; restoration of the parish church, Northleach, Gloucestershire [October 6, 1883\*]. An extensive range of stabling for the Marquis of Londonderry [February 17, 1883\*]; a house at Rondebosch, Cape Town, for Mr. W. H. Stryben [July 13,

1889\*]; and the South-Eastern Railway Company's hotel at Deal [June 17, 1893]. On January 15, 1887, we published Mr. Brooks's designs, with elevations, sections, and plans, for St. Paul's Church, Vicarage Gate, Kensington; his remarkable design for the proposed cathedral at Liverpool, and the Chapel of St. John, was illustrated in the *Builder* of Jan. 9 and 16, Feb. 6, March 6 (views, plans, sections, and elevations), 1886; and April 28, 1888 (study of one bay of choir); and June 8, 1889 (interior and exterior of the Chapel of St. John). In July last the designs and plans prepared by the firm of Messrs. James Brooks, Son, & Godsell for the Hereford Municipal Buildings were, with two other sets, marked "reserved," out of forty-six sets submitted, Mr. Thomas Hlathill being the assessor. Mr. Brooks's designs for the restoration of the parish church at Hatford, his native place, were exhibited at the opening conversation of the Architectural Exhibition, in December, 1885; we believe the work was not carried out until some years afterwards.

MR. LITTLEWOOD.—We regret also to announce the death, on September 25, at his residence in Lansdowne-villas, Old Trafford, of Mr. John Littlewood, in his seventy-third year. Mr. Littlewood—a son of the architect, Joshua Littlewood, of Holmfrith, Yorkshire—was senior member of the firm of Mangnall & Littlewoods, of Manchester, whose practice will, we understand, be carried on by his brother and surviving partner, Mr. William H. Littlewood. Mr. John Littlewood was elected an Associate of the Royal Institute of British Architects in 1882, and a Fellow in 1888; he had been during a long period a leading member of the Manchester Society of Architects. Having served as an articled pupil of the firm of Messrs. Travis & Mangnall, of Manchester, he, after Mr. Travis had retired, was taken into partnership by Mr. William Mangnall. On the death of the latter, he and his brother, Mr. William H. Littlewood, in 1875, entered into partnership under the name of Messrs. Mangnall & Littlewoods, and established an extensive practice as architects and engineers, mainly in association with the construction of workhouses and public baths, and of hotels, piers, concert pavilions, ballrooms and similar structures at Blackpool, Morecambe Bay, Colwyn Bay, Bridlington, and other places of popular resort in the northern counties. Of the principal works designed and carried out by the firm we may mention the following:—The public baths at Broughton for the Corporation of Salford, for which their plans and designs were selected, in October, 1880, out of those submitted by seven competitors; the enlargement, at an estimated cost (for the building) of 58,000*l.*, of the Stockport workhouse, on the Shaw Heath site, to accommodate 1,908 inmates; the public baths, at the corner of Egerton-road and Derby-street, Salford, for the Salford Corporation; the new workhouse at Patriotcroft for the Guardians of Barton-upon-Irwell Union, for about 500 inmates—their plans having been accepted in competition in 1892; the Victoria Pavilion Theatre, as an addition to the buildings in the winter gardens at Morecambe, 1896-7; the Hôtel Métropole, at the end of the West End Promenade, Morecambe, for which their plans were awarded the first premium by Messrs. Harrison, Hall, and Moore, the assessors, in July, 1897; the pier, with pavilion, at Morecambe, opened in July, 1898; the Victorian pier and concert pavilion at Colwyn Bay, begun in May, 1899, and opened on June 2, 1900; the new stands, including a grand saloon and a covered promenade, on the Roodee course at Chester for the Chester Race Company; and the grand stand on the flat-race and steeplechase courses recently laid out on the Low House estate, for the Ripon Racecourse Company. In a competition in January last, Messrs. Mangnall & Littlewoods won the first premium with their plans for the extension of Prince's Parade, with an iron pier and promenade and pavilion at Bridlington; and in 1899 they were appointed architects and engineers for the pavilion and promenade pier at the North Cliff, Bridlington, for the Pier and Pavilion Company, as also of the Grand Hotel, with theatre, arcade, &c., on the Beaconsfield Estate, Bridlington. They were invited in May, 1898, to take part in the competition for the new workhouse buildings at New Cross, Wednesfield, for the Wolverhampton Board of Guardians, on which occasion an honorarium of 100*l.* was awarded, upon the adjudication of Mr. Aldwinckle, in respect of the plans and designs submitted by Messrs. Mangnall & Littlewoods and Mr. M. Johnson, as joint architects. In 1877 the firm were appointed to carry out the design and construction, at an estimated cost of nearly 800,000*l.*, of new gas works for the Manchester City Council upon a site of 39 acres near Philips Park.

MR. W. SWIFT.—We have also to announce the death, on September 24, in his fifty-second year, at his residence, No. 5, The Parade, Truro, of Mr. William Swift, of No. 4, Princes-street, Truro, architect and surveyor. When about thirty years of age Mr. Swift removed from Birmingham to Truro. After having been employed under Messrs. Henderson at the Mining Schools he started in practice independently eight or nine years ago. Of his architectural works during that period we may cite a house at St. Clement's Hill, Truro, for Mr. M. H.

\* Illustrations in the *Builder*.

\* Illustration in the *Builder*.

Williams; the church Sunday-schools at Ferran-ar-Worthal, built of local stone with granite facings; the Hotel Buildings, Truro, for Messrs. Mallett & Co.; an enlargement of the National School Buildings, Falmouth: the Swan Hotel, Truro; a residence, near Tregony, for Mr. T. H. Beard; alterations and improvements of the Fountain Hotel, St. Mawes; and new business premises, for Messrs. J. Grose & Sons, in Porhan-road, Falmouth.

MR. WATSON.—We regret to announce also the death on October 3, at Wakefield, in his sixty-first year, of Mr. William Watson, a well-known member of the profession in the West Riding. One of his latest works was the Canal-Lane Board School, for 400 children, at Lothhouse Gate, near Wakefield. Mr. Watson made the plans and designs for the infirmary and steam laundry at the Wakefield work-house, built in 1807-8, at the rear of the old workhouse buildings in Park-lane, to accommodate 150 patients, a resident medical officer, lady superintendent, nursing staff, and servants, in a central block with two pavilions.

#### GENERAL BUILDING NEWS.

CHURCH, CHICHESTER.—The foundation-stone of a new parish church for the district of Rumboldswyke, one of the suburbs of Chichester, was laid recently. The church is to be called St. George, and, when erected, will provide accommodation for 500 people, the cost under the contract, which is in the hands of Messrs. Dove Brothers, with Messrs. J. E. K. & P. Cutts, of London, as architects, being 3,500l. The edifice, when completed, will consist of nave, north and south aisles, chancel, morning-chapel, organ-chamber, vestries, and west porch. The church is being built of local stock bricks, with moulded red-brick jambs and arches throughout. The roof will be open timber. The body of the church will be paved with wood blocks and seated with chairs, and the chancel will be paved with tiles laid in patterns.

CHURCH EXTENSION, RAVENSTHORPE.—Additions to St. Saviour's Church, Ravensthorpe, were consecrated by the Bishop of Wakefield recently. The addition to the church consists of transepts, a north chapel, and a large vestry chancel, and a north aisle is to be added, with clearstory and arcading to the nave, the cost in all being estimated at 8,500l. Mr. C. H. Fowler, F.S.A., of Durham, prepared the designs, and Mr. Thickett, of Horbury, has carried out the work.

PROPOSED RESTORATION OF KILDWICK CHURCH, YORKSHIRE.—The scheme for restoring the old Church of St. Andrew, at Kildwick, popularly known as the "Lang Kirk o' Craven," will be begun very shortly. The scheme is one prepared by Messrs. Austin & Paley, architects, of Lancaster.

PRESBYTERIAN CHURCH, LIMERICK.—A new Presbyterian church has just been erected at Limerick by Messrs. John Ryan & Sons, builders, from the plans of the architect, Mr. G. C. Ashlin, Dublin.

CHURCH FOR SMETHWICK.—The foundation-stone of a new church for the recently formed parish of St. Stephen's, Smethwick, was laid recently by Mr. G. F. Chance. The architect is Mr. F. T. Beck, of Wolverhampton. It was stated that the total cost of the church will be 47,500l.

PARISH CHURCH, HOVE.—The new parish church, Hove, has just been opened. The church is of Sussex sandstone, from the quarries of Sir Weetman D. Pearson, Bart., M.P., at Paddockhurst, Worth, and has been erected to the designs of the late Mr. J. L. Pearson, R.A. The seating accommodation is for about 1,300, and the church is 160 ft. long and nearly 80 ft. broad. The nave, which, including the transept, is 108 ft. long and 35 ft. wide, is divided into six bays. The two western bays, which open respectively into the baptistry and the base of the tower, are marked by lofty moulded arches springing from clustered piers attached to the north and south walls. The next four open into the north and south aisles, and are each of them 16 ft. wide. The arcades consist of clustered piers, 17 ft. high, from which spring pointed arches. Above these comes the clearstory. The two eastern bays of the nave, which open respectively into the north and south transepts, are somewhat wider than the others, and the arches reach up to the level of the clearstory. The chancel arch is of a similar height and design to that which separates the western bays from the nave proper, but is more rich in detail; and beyond this the three bays of the chancel carry on the design of the nave, and from their width provides space for the choir stalls. One of the features of the church is the sanctuary, which is 23 ft. in length. Although entered by an arch, 58 ft. high and 35 ft. wide, the sanctuary is gradually narrowed in width to 27 ft. The east windows—three in number, with two lights each—are deeply recessed within pointed arches with clustered piers. There are also two lofty windows on either side of the chancel. The two aisles are respectively 21 ft. and 16 ft. wide internally, that on the south side of the nave being the wider of the two, and are lighted with windows of three lights each; while the transept is lighted by a traiered window of five lights at the south end and a rose window at the other end. Leading out of the south transept, a small chapel, 46 ft. by 21 ft., provides accommodation for daily or occasional services. It is 32 ft. in height. Like the baptistry

at the west end of the church, it is vaulted throughout, and at the east end it terminates in a polygonal apse. The south wall of the two western bays of this Chapel, it may be added, is completely filled in with six-light windows of very broad proportions, while those of the apse are of three lights each and are comparatively narrow and lofty. To the north of the choir and sanctuary there is the organ loft and two vestries, the former measuring 50 ft. by 24 ft., and over the vestries there is a church-room with accommodation for about 100 people. The roof, except where it is vaulted, is of oak. In the nave it is divided into six bays by clustered wood shafts rising to a height of 30 ft. From this height a series of cross arches carry it up to within 10 ft. of its extreme height, where it terminates with a simple cornice. The total cost will exceed 40,000l.

ST. BOTOLPH, STOW LONGA.—The ancient church of St. Botolph, Stow Longa, Hunts, was reopened on Wednesday, the 2nd inst., after the rebuilding of the clearstory and erection of new roofs to the nave and aisles from the designs of Messrs. John & S. Inskip Ladds, joint architects, London. The church dates from Late Norman times, and has a fine priests' door with carved tympanum. The nave arcades are Early English, and the aisles are chiefly of Late Decorated date, while the fine west tower and the windows of the chancel are Early Perpendicular. It would appear that the clearstory and nave were destroyed (probably by a storm) in the seventeenth century, when the walls were levelled, and a plain roof of barn-like character put on, and covered externally with tiles. When the chancel was restored, in 1880, certain works were also done in the nave, and amongst other things the broken stones of the clearstory windows were found. These were of simple Perpendicular character, and have given the keynote to the present work. The lower half of the clearstory remained, and the small buttresses at the west end were sufficiently intact to show the original height of the clearstory walls. Weldon stone has been used throughout, and the mason has been Mr. H. Ashley, of St. Neots. No sufficient evidence of the form of the old roof remained—it was probably of flat pitch covered with lead, but owing to the great cost of adopting this form for the new work, it was determined to retain the steeper pitch of the seventeenth-century roof, and to re-use the old tiles, thus preserving some memory of the last roof. Another link with this roof is formed by the old tie beams which have been framed into the three middle principals, where they will still continue to perform the work they have done in the past. The aisle roofs are quite plain, except the eastern part of the south aisle, where an ancient chapel has again been fitted up with an altar (for use as a morning chapel), and here the roof is ceiled with oak boarding, having moulded ribs and carved bosses. The whole of the timber is English oak of large scantlings, supplied by Messrs. Francis & Co., of Huntingdon; Messrs. Wrycroft & Sons, of St. Neots, being the contractors for the carpenters' work. The glass is by Messrs. Pepper & Sons, of London, and the lead work of aisle roofs, &c., by Messrs. Peacock & Sons, of Huntingdon. A new wood block floor has been laid to nave and aisles by Messrs. Goddard & Sons, of Farnham, Surrey. The new side altar, made by Mr. Reid, was also designed by Mr. Ladds. The total cost of the work has been 11,500l. This work practically completes the restoration of the church, which has extended over twenty-five years.

INFECTIOUS DISEASES HOSPITAL, BERWICK.—The Town Council of Berwick having applied to the Local Government Board for sanction to borrow 5,500l. for the erection of an infectious diseases hospital, the Local Government Board held an inquiry at Berwick Town Hall on the 2nd inst. Mr. Wm. Weatherhead, the clerk to the Sanitary Authority; Dr. Heagerty, medical officer of health; Mr. J. L. Miller, architect; and others were heard in support of the scheme.

SCHOOL BOARD OFFICES, KING'S NORTON.—These new offices occupy a site adjoining what was the schoolmaster's house. The style is Free Renaissance, and the building is built of bricks with a liberal use of red terra-cotta dressings, the roofs being tiled. The accommodation consists of a rooey entrance-hall and corridor, from which is entered the boardroom, an apartment 28 ft. long, 17 ft. 6 in. wide, and 18 ft. in height. It is handsomely fitted up, and has a pitch-pine panelled dado, open roof with cut and carved principals, and stone cornels. The clerk's office adjoins the boardroom, and is provided with a fireproof strong-room. There are also a waiting-room, cloakroom, and lavatory; and there is communication with the caretaker's house. The buildings are heated with low-pressure pipes and radiators, in addition to open fireplaces. The buildings have been carried out from designs by Mr. Edward Holmes, Corporation-street, Birmingham, and the contractor is Mr. Harvey Gibbs, of King's Heath.

INFIRMARY, RETFORD.—The new infirmary in connexion with the Retford Workhouse was opened on the 23th ult. The building, which was commenced sixteen months ago, has been erected at a cost of 4,000l. It is built on the north side of the workhouse premises, and extends for nearly 200 ft. The whole of the buildings are of ordinary red wire-cut bricks, and the roofs are slated with Bangor slates. There are three entrances: the main, one

for the males, and another for the females. The whole of the rooms are heated by means of hot-water and circulating pipes. The architect was Mr. W. Southall, of Retford.

SCHOOLS, PRESTWICK, Ayr.—The ceremony of laying the memorial-stone of Prestwick High School was performed on the 24th ult. The building is to accommodate 300 scholars. It contains a hall, 60 ft. by 20 ft., five classrooms, male and female teachers' rooms, cloakroom, and all other conveniences. The building is of red stone, and its total cost will be about 5,000l. The architects are Messrs. J. & H. V. Eaglesham, Ayr, and the contractors are—Masons, Messrs. George Reid & Son, Catrine; joiners, Messrs. Paterson & Anderson, Ayr; slater, Mr. J. C. Hight, Ayr; plumber, Mr. James Lockhart, Prestwick; and plasterer, Mr. William Glen, Ayr.

ADDITIONS TO SCIENCE AND ART SCHOOL, MONTROSE, N.B.—The extensive additions to this building are nearly completed. The principal feature is the workshop, which occupies the eastward portion of the building, and which fronts both to Russell-street and Palmerston-street. It is 40 ft. wide, 24 ft. broad, and 15 ft. from floor to ceiling. The shop is fitted with wood-block flooring, and contains twenty-four benches for workers in wood, eight benches for workers in metal, cabinets for specimens, a forge, &c. Immediately to the west of the workshop is the physical laboratory, 30 ft. by 27 ft. Here there are working benches, desks, demonstrator's table, &c. Next to that is a room, 30 ft. by 20 ft., to be used as physical demonstration room. It is fitted with table for demonstrators, benches for students, and museum cases. Next to that room is the chemical laboratory, in which are benches for twenty-four students, demonstrator's table, and fume boxes. To the west of that, again, is the preparation room, 20 ft. by 8 ft., in which the material to be used by the demonstrators will be stored, and where there is a still. Next to that is the balance room, 14 ft. by 7 ft., which, amongst other apparatus, contains a stone balance table to ensure that in measuring out the chemicals there shall be an absence of vibration. Continuing westward, the chemistry demonstration room is next reached, which is fitted up with the necessary apparatus. There is also room for the storage of casts from the antique, patterns, models, &c.; while what has hitherto been used as an art classroom in the old building has been entirely remodelled and fitted up with cupboards, "stages" for pupils, diagram frames, &c., and storage has also been provided for clay, zinc, and other materials. The walls of all the rooms are lined with pitch-pine to a height of 4 ft. 6 in., and above that are lathed and plastered. The whole building will be heated with hot water from a heating chamber below the cast room. The piping is carried in ducts under the flooring, and these are connected with radiators placed in the various rooms. The whole will be lighted by electricity, but gas has also been introduced into the laboratories and chemistry and other departments to be used in the work of the school when required. The porches leading to the different rooms are floored with encaustic tiles, and the walls of the porches are lined with tiles to the height of 4 ft. The site has cost 1,000l., the contracts amount to about 4,000l., and the cost of furnishings is estimated at 700l. The following were the contractors for the work:—Mason—Messrs. J. Ford & Son, Montrose; joiner—Mr. John Davidson, Montrose; plumber—Messrs. Wood & Co., Montrose; slaters—Messrs. J. Lindsay & Son, Montrose; plasterers—Messrs. J. Burness & Son, Montrose; electricians—Angus Electric Lighting Company; heating apparatus—Messrs. C. Wood & Co. The wood-block flooring has been laid by Messrs. Geary, Walker, & Co., London; and the furnishings have been supplied by Mr. J. Davidson and Mr. G. Fairweather, Montrose, and Mr. John Gill, Aberdeen. The architect is Mr. John Sim, of Montrose.

CONVENT, WATERFORD.—The foundation stone of the new chapel to be erected in connexion with the Good Shepherd Convent in Waterford was laid recently. The new chapel will comprise Nave, choir and avant choir at the west end of the nave. There will be two side aisles—one for the accommodation of the penitents and the other for the children of the Industrial School. The principal entrance to the church will be at the west end, having a doorway with double moulded arch and jambs, together with polished marble columns with carved caps and moulded bases. At the west end there will be a circular window filled in with tracery, and having a moulded arch and label over. An arcade of thirteen arches will extend across the full width of the gable. The buttress will be of octagonal shape, and will go to a height of 75 ft., 9 in., of which will be carried up at the junction of the gable on the penitents' aisle. The Sanctuary will be lighted by a large five-light tracery window. The nave of the church will be divided from the aisles by an arcade of five arches on each side, having polished Aberdeen granite columns with double moulded caps and bases. The nave and Sanctuary on the side will be lighted by circular sexfoil tracery windows, fifteen on each side. The roof will be divided into eight bays, supported by trusses, resting on shafts, with carved and moulded caps and bases, with corbel

carved as angels underneath. At the west end of the chapel there will be a large organ gallery, extending the full width of the nave and aisles, having underneath glazed screens, with doors from avant choirs and cloisters. The work will be carried out by Messrs. John Hearne & Son, Waterford, from the plans and under the superintendence of Mr. Wm. H. Byrne, architect, Dublin.

**BATHS, CHESTER.**—New public baths have just been opened at Chester. The larger of the two baths is the second-class bath, and this, which is only available for the male sex, is 75 ft. long and 35 ft. wide, with a depth of water varying from 3 ft. 6 in. at one end to 7 ft. at the other, and surrounded by dressing compartments, and up above a gallery, in which at water polo and swimming matches there will be accommodation for spectators. When it is not in use as a bath the fittings can be removed, and this bath can be adapted to a gymnasium, or for any other purpose. The first-class plunge bath is rather smaller, being 60 ft. by 30 ft., and so many times a week this will be reserved for ladies. Both baths are lined with white glazed bricks. There are seven second-class slippers and one vapour, three men's first-class slippers and one vapour, and four women's slipper-baths, with waiting-rooms and separate entrances for the sexes. Beside the actual bathing area there are laundry, ironing-room, fitting-shop, and a boiler-house with passage around the whole of the baths, below ground. Then there are the offices and the house of the superintendent. The water used in the baths is taken from the city mains, and heated to what temperature may be required. The baths themselves are heated throughout with steam. The cost of the buildings, which are built in stone and Ruben bricks, was about 115,000. The architects for the baths have been Messrs. Douglas & Minshall, and the contractor Mr. W. W. Freeman.

**BUSINESS PREMISES, SUNDERLAND.**—Plans have been submitted to the Building Committee of the Sunderland Corporation for the erection of business premises on the site of the Wesleyan Church in Fawcett-street, which was recently purchased by Messrs. Lockhart, Smith & Co., Limited, for 15,000. The chapel is to be pulled down, and the building which it is proposed to put up in its place is to be three and a-half stories in height, with a basement, which will be used as a cafe. The ground floor will consist of three shops. The architects are Messrs. W. and T. R. Milburn, of Sunderland.

**BOLTON UNION HOSPITAL.**—New buildings have been erected to accommodate the nurses engaged at the new Townley's Hospital, being the Bolton Union Workhouse at Fishpool. The nurses' home has a frontage of 184 ft. and is in three stories above the basement. The exterior is kept plain; stone sills are put in the windows, but all other dressings are of Ruben red terra cotta, the general brickwork being faced with local stocks. Accommodation is provided for forty nurses, each having a small separate bedroom. The architects are Messrs. Bradshaw & Gass.

**MESSRS. REYNOLDS'S WORKSHOPS.**—The Acorn Works, Edward-street, Blackfriars-road, belonging to Messrs. E. W. Reynolds & Co., the makers of wood-working machinery, have recently been enlarged. The adjoining premises having become vacant, two large workshops, each 75 ft. by 30 ft., have been erected there, one as a machine-shop and the other as an erecting-shop, and also a smith's shop adjoining the other two. A large additional yard space has also been acquired, with frontage to Bear-lane. The machine-shed is fitted with wrought iron gantry extending over the whole surface and carrying a travelling crane. The gantry also supports the line shafts which run the whole length of the building on both sides. The machines driven from these shafts are three large planing machines, eight lathes, one radial drilling machine, one pillar drilling machine, one lathe headstock for large work, one shaping machine, one slotting machine, grindstones, and emery grinding apparatus, &c. A large "bring-out" table has also been erected on a brick foundation, and conveniently placed under the crane. The contract for the buildings was undertaken by Messrs. John Hoare & Son, of Blackfriars-road, under the direction of Mr. Cory, Messrs. Reynolds & Co.'s engineer.

**BOARD SCHOOLS, ROTHERHAM.**—Three new sets of Board schools were opened recently at Rotherham. In the spring of 1898 the Board invited competitive plans for two new schools at Doncaster-road and Park-street. Plans prepared and submitted by Mr. J. E. Knight, architect, Rotherham, were selected by the Board, and approved by the Education Department; the buildings were commenced early in 1899. The contract of Mr. Richard Snell was accepted for Doncaster-road for 10,557*l.*, and that of Messrs. Chadwick & Co. for Park-street for 9,270*l.* 10*s.* The site for the Doncaster-road school was purchased from Earl Fitzgibbon, and contains 1*a.* 2*r.* The buildings are over-storied, and are arranged so as to allow for them and the playgrounds the sunniest aspect, room being left for future extensions. Accommodation is provided for 800 children, comprising boys' department, 240 places; girls' department, 240 places; infants' department, 320 places. Provision for cookery classes in the girls' department is provided. Cloakrooms and lavatories are placed near the entrance. Teachers' and store rooms and lavatories are in the roof. Caretaker's sinks and cupboards are

provided. The basement contains heating chamber and coal place. The floors to all rooms are of pitch-pine wood blocks on concrete; those to the corridors are of concrete checkered to prevent slipping. The fireplaces are in coloured glazed bricks with stone mantels. The buildings are heated independently of the fireplaces by pipes and radiators on the low-pressure system. Play-sheds for each department are provided. There is also a caretaker's house. Externally the buildings are of Dunford Bridge rock-faced wallstone, with Grenoside stone dressings, and have green Westmoreland slated roofs. The style is English Renaissance simply treated. The site of the Park-street schools contains an area of 10,340 square yards. The accommodation is for 800 children in three departments—boys and girls 240 each, and infants 320 places. Uniformity has been gained by placing the boys' and girls' schools at the top of the site, side by side, divided by a division wall. The infants' school is placed in the centre of the site. The internal arrangement of these schools is very similar to those at Doncaster-road, the "classroom" system of planning having been adopted here also. The walls are faced with Dunford Bridge rocks, with St. Bees' stone dressings, and green slates to the roofs. A new infants' school, also built from plans prepared by Mr. J. E. Knight, has recently been opened at Thornhill on a site adjoining the existing schools. The new school is built to accommodate 400 children, and contains seven large classrooms (average size, 23 ft. 6 in. by 23 ft.) and a marching hall. There are also two cloakrooms, two lavatories, teachers' rooms and lavatories, store-rooms, caretaker's sink, and a heating chamber and coal-place in basement. Movable glazed screens divide the classrooms from the marching hall, into which all the rooms open separately. By removal of all screens a large place of assembly is formed. A large covered play-shed is provided in the playground, also the necessary conveniences for the children. The caretaker's house is facing Tenter-street. The buildings are of local bricks, with St. Bees' stone dressings.

**BOARD SCHOOL, NEWTON HEATH, MANCHESTER.**

—A memorial stone was fixed in the wall of the St. Mary's-road Board School at Newton Heath on the 5th inst. The school is the thirty-sixth built by the Manchester School Board. It is designed by Mr. Rawle and is being built by Messrs. Bullivant & Sons, and is meant to accommodate the scholars now attending the Oldham-road Board School, formerly known as the Newton Heath Wesleyan School.

**TECHNICAL SCHOOLS, SOUTHELD.**—The foundation-stone has just been laid of the new technical schools now being erected at the junction of London-road and Victoria-avenue, Southend, as part of a scheme of public buildings, to include town hall and municipal offices. The accommodation in hand will comprise a large lecture hall, laboratories, and demonstration-rooms, classrooms, a complete art school, and all necessary adjuncts. The estimated cost of erecting, equipping, and furnishing the new schools is 10,000*l.*, exclusive of the site, which belongs to the Corporation. The architect is Mr. Henry T. Hare, of Bloomsbury-square; and the builder is Mr. Ernest West, of Chelmsford.

**BOARD SCHOOL, GRIMSBY.**—The foundation-

stones were laid at Grimsby recently of a new Board school. The building will give accommodation for 1,500 children, and the cost is estimated at 27,000*l.* Mr. Herbert C. Scaring is the architect, and Messrs. J. M. Thompson & Sons are the builders.

**LONDON CITY AND MIDLAND BANK, BIRMINGHAM.**—New premises of the London City and Midland Bank, at the corner of Temple-row and Cherry-street, Birmingham, have been opened. The building, which is four stories high, has been erected from the designs of Mr. T. H. Whitney, of London, and Messrs. Mansell & Mansell, Birmingham, and presents a frontage to St. Philip's Church-yard. The style is a rather free treatment of the Italian Renaissance period, the ground floor being boldly rusticated with Tuscan columns, and the story below the main cornice emphasised by carved panels. There is a broad plinth of unpolished Guernsey granite, the main structure being in Portland stone, an iron railing surrounding the building on the pavement level. The whole of the ground floor is occupied by the bank, and in the basement are the strong rooms, voucher stores, lavatories, clerks' rooms, &c. The entrance is on the angle of the building, the corner being carried upwards and finished off in the form of a cupola. Altogether the bank is 80 ft. long, 32 ft. wide, and 22 ft. high, and the upper floors, approached by a lift, are to be utilised as offices, &c. Massive columns of rough royal marble support the carved and decorated ceiling, and are flanked by walnut dado, about 5 ft. high, surrounds the bank inside, and the pavement of the space used by the public is of grey and white marble.—*Birmingham Gazette.*

**APPOINTMENT OF SANITARY OFFICERS.**—The Local Government Board has sanctioned the appointment of the following sanitary officers:—Mr. R. K. Brown, medical officer of Bermondsey; Mr. T. H. Littlejohn, medical officer of Hampstead; Messrs. B. W. Hindhaugh and E. A. Norman, sanitary inspectors in Finsbury; Mr. C. Langstone, sanitary inspector in Shoreditch; Messrs. J. Newby and H. L. Hyde, sanitary inspectors in Southwark; Mr. R. Simpson, sanitary inspector in Stepney.

MISCELLANEOUS.

**PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.**—Mr. Burke Downing, architect, has removed his London office to 12, Little College-street, Westminster, S.W.—Messrs. Hazell & Son, architects, of Nottingham, have removed their offices from Bank Chambers, Market-place, to Burton Buildings, Parliament-street, Nottingham.

**THE STOCK BRICK TRADE.**—A Sittingbourne correspondent states that there is a gloomy outlook for the stock brick trade this winter. The Kent and Essex Brickmasters' and Flint Merchants' Protection Association has found it necessary to lower the price of stocks 4*s.* a thousand, and has given notice that "on and after October 11 the advance hitherto paid in freights will be taken off and the freights paid will be according to the Association lists." This removes the last of the advances made to the brickmakers and barge masters four years ago, when good prices were ruling. The barge masters received an advance of threepence per thousand on the freights at that time, but the advances to the brickmakers was taken off last year. The present reduction will affect practically all the barges engaged in the Kent and Essex brick trade, as all the principal firms are in the Association. In the Sittingbourne and Milton district, which is the centre of production in the stock brick industry, for the first time for several winters men are being "stood off" from their employment; and in other districts barges are being laid up for the season. The brick trade has been brisk, and the exports from Milton Creek for the past six months show an increase over the corresponding period of last year. The flint trade has more than held its own.—*Morning Advertiser.*

**FARE'S BANK, LEICESTER.**—Messrs. Archibald Smith & Stevens ask us to mention that they supplied the lifts in this building, illustrated and described in our issue of the 21st ult.

**ELECTRIC LIGHT INSPECTION BOXES AND THE LONDON BUILDING ACT.**—The Stepney Borough Council proposes to convene a conference of Metropolitan Councils to consider the recent decision of the Divisional Court upholding the finding of the magistrate in the case of Crow v. the Whitechapel Board of Works. In that case the District Surveyor summoned the Board for having failed to give notice, in accordance with Section 145 of the London Building Act, of intention to construct inspection chambers and street boxes for electric lighting mains. It was contended on behalf of the plaintiff that the boxes were "buildings," "structures," or "works" within the meaning of the section in question, and the magistrate, holding that an offence had been committed, inflicted a nominal fine with ten guineas costs. The Divisional Court, which is the final court for a matter of this kind which comes under the Summary Jurisdiction Acts, dismissed the appeal with costs. In consequence of this decision the Stepney Borough Council, which has absorbed the Whitechapel area, approached the London County Council with a request that facilities might be afforded for raising the point in a civil action, so that a decision of the Court of Appeal might be obtained, or that the District Surveyor should be asked not to insist upon strict compliance with the section upon which he founded his action. As the London County Council is unable to grant either request, the Stepney Borough Council has decided to hold a conference to consider the question, and delegates from other borough councils are being asked to attend. It is considered that if the law as laid down by the Divisional Court is allowed to stand, the effect will be to retard the progress of electric lighting, and at the same time involve the boroughs in heavy and unnecessary expense by having to pay fees to the District Surveyors in connection with the chambers and boxes.

**THE LONDON SKETCH CLUB.**—The private view of the Seventh Exhibition of Sketches by the members of the London Sketch Club will be held on Saturday, 12th inst., at the Modern Gallery, 175, Bond-street, W., and the exhibition will be open to the public from the 14th to the 20th inst. inclusive.

**LABOUR MARKET IN THE COLONIES.**—The October circular of the Emigrants' Information Office (31, Broadway, Westminster) states that in *New South Wales* the strike of the ironworkers' assistants, which lasted some weeks, has been settled by reference to arbitration; the men demand a uniform wage of 7*s.* a day, and the employers decline to give that wage to any except first-class men, others to have 6*s.* The building trade is brisk, and there is a continued demand for plumbers and competent labourers. At Broken Hill there is a demand for skilled silver miners, engineers, and fitters. Recent reports show that there is practically no demand for labour at Hillston, Newcastle, Lithgow, Bulli, Young (except for farm and station hands), Mudgee (except for ploughmen), Wilcannia, Walgett (except for farm and station hands and for female servants), or Bourke. In *Victoria* the drought has broken up to some extent in the Mallee and other parts, and this should improve the demand for labour in the country districts. There have been demonstrations of the unemployed in Melbourne, though it is often difficult to procure competent workmen. In *Castlemaine*, Bendigo, Dayleford, &c., there is no demand for labour. In *South Australia* the supply of local labour is sufficient.

Queensland is still suffering from the drought, and emigrants, other than female servants, are not recommended to go there at present, unless they receive nominated passages or take a little money with them. In *Western Australia* the report of the Government Labour Bureau for the quarter ending June 30 last shows as follows:—There is a demand for competent mechanics in the building and other trades at Northern, Perth, and Dongarra, and for sawmill hands at Albany, but otherwise the supply in the colony is quite sufficient, and in some places, as Coolgardie, Kalgoorlie, Fremantle, Collie, and Albany the supply is in excess of the demand. During June, 388 persons called at the bureau in search of work. The serious strike of railway line repairers, which arose on a question of wages, has been settled by arbitration. The repairers are to receive 8s. a day instead of 7s. The last reports from *New Zealand* show that the building and engineering trades continued busy almost everywhere. In *Natal* a few skilled playlayers only are wanted on the railways. They must be from 25 to 40 years of age, and must have had at least five years' experience on railways; candidates must apply to the Agent General for Natal, 26, Victoria-street, London, S.W., stating age, height, and experience, and enclose testimonials. In *Cape Colony* there is officially stated to be a demand for thoroughly skilled mechanics in the building trades. Otherwise all persons are again warned against going to South Africa at present in search of professional or manual work unless they have ample private means to meet the very high cost of living, or have engagements to go to. They will not as a rule be allowed to proceed up country.

**WOLVERHAMPTON ART AND INDUSTRIAL EXHIBITION.**—Another important step in the preparations for the forthcoming Wolverhampton Art and Industrial Exhibition was, says the *Wolverhampton Express*, taken recently, when the Buildings Committee met and considered the tenders sent in for the erection of the great Machinery Hall. This in some respects will be the most important building erected. It will stand next to the Industrial Hall, separated from it by Devon-road. It will be 350ft. in length and 130ft. in width, having a "Belfast" roof in three spans, the centre one being of 60 ft. The two outer spans will be kept down so as to allow direct lighting to the centre. As it is to contain all sorts of machinery, some of great weight, both stationary and at work, the hall will be of somewhat more substantial character than the other buildings, and concrete foundations will be provided for the heavy exhibits. Its chief decorative features will be found at the end facing the Industrial Hall. In the front of the building the main entrance is flanked on either side by an ornamental fountain. Over the main entrance will be a semi-circular ornament, filled in with radiating bars, which at intervals will be fitted at the terminals with coloured electric light. One of the most striking and novel features of the building will be the main doorway. At each end of the front elevation is a dwarf tower, surmounted by a semi-circular dome, two taller towers supporting the centre. Each of the latter will be crowned by ornamental finials, the central ornamentation, flagstaffs, and the like imparting an exceptionally attractive appearance. The portion of the hall towards the Park is to be treated in a style conforming with that of the Industrial Hall. The architects are Messrs. Walker & Ramsay, of Glasgow. In all nine tenders had been received, seven from firms in Wolverhampton, and two from Birmingham firms. The committee decided to accept the lowest tender—that of Mr. J. Herbert, of Wolverhampton, for 7,207l. The erection of the most important of the Exhibition buildings has therefore now been arranged for, the only other building of considerable size to be yet settled being the concert hall, to be erected in the park. Of course there are a number of smaller structures, but they will be agreed upon later. Among these may be included the Japanese pavilion, the executive being in correspondence with the Japanese Government with a view to that nation being officially represented. Then there may be a section for the Indian and an Indian section, to say nothing of side shows, cafes, bandstands, &c.

**BRITISH FIRE PREVENTION COMMITTEE.**—The Executive of the Committee have elected as foreign honorary corresponding members the following members of technical and fire-brigade professions abroad:—M. Bourdon, City Architect, Paris; Herr Reginald Czernack, President Austrian Fire Brigades' Association, Vienna; Señor Fernandez, Inspector-General of Portuguese Fire Brigades, Oporto; M. Henri, Secretary International Fire Congress and Belgian Fire Brigades' Federation, Brussels; Herr von der Hude, President Architects' Association, Berlin; Herr A. Jaffe, Architect of International Fire Exhibition, Berlin; Count Kamarrowsky, President International Fire Congress, Orel, Russia; Herr Kliner, Vice-President Royal Institute of Russian Architects, St. Petersburg; Herr von Lundt, Chief Officer Fire Brigade, Odessa; M. G. de Marie, President Luxembourg Fire Brigades' Association, Luxembourg; Herr Meyer, Chief Officer Fire Brigade, Copenhagen; Herr Ohlshausen, Superintendent of Buildings, Hamburg; and M. le Chevalier Papini, Chief Officer Fire Brigade, Milan.

**EDUCATIONAL PROSPECTIVES.**—The Principal of the Northern Polytechnic, in sending us a copy of the Prospectus for the session 1901-2, draws attention to the recent development of the day-school work. The institution has now four day schools open to boys and girls, one specialising in science, the other in technology (building trades especially); the other two are in subjects out of our province. In the engineering and metal trades and in the building trades department there appears to be every provision made for a complete technical training.—The Birkbeck Literary and Scientific Institution, which has just commenced its winter term, sends us the annual Prospectus and Report. As is well known, the Institution provides in its curriculum for the study of a great variety of subjects in literature, mental and moral science, and physics. During the recent improvements have been made in the arrangements of the building, partly as the result of a special donation of two thousand guineas from Mr. Francis Ravenscroft. The additions comprise a new reading-room, a magazine-room and study, and a tea-room; while in the basement space has been gained for a large metallurgical laboratory. A further increase in the appointments of a student grant has been made by the aid of an equipment grant from the County Council. This includes useful additions to the scientific apparatus in the departments of physics, chemistry, and mechanics, appliances for the art school, and models for building construction; and the departments of botany, geology, and zoology are now (thanks to this assistance) placed on a very efficient footing, and students will pursue their studies of these sciences under highly favourable conditions. Among the special subjects are included building construction, quantity surveying, and drawing.—The Glasgow and West of Scotland Technical College sends us its annual Prospectus and Report. The college occupies buildings scattered over a wide area and consequently difficult of inspection, and advantage has been taken of the Glasgow Exhibition to prepare an exhibit representative of the several departments, the collection being composed entirely of work done in the ordinary course of last session. At present the number of students has been increased to the utmost capacity of the buildings, and the curriculum has been extended in several directions. The subjects taught include natural philosophy, chemistry, technical chemistry, mechanics, and applied mathematics, machine design, steam and steam engines, civil engineering, electrical engineering, architecture, mining and geology, &c. &c.

**A NEW GAS FIRE.**—The Clumond Gas Radiator is a novel description of gas fire which is now being placed on the market by the Kern Burner Company. The fire is described in the current chapter of "The Student's Column." The company have just opened showrooms at Kern Buildings, Gravel-lane, South-west S.E., where fires or "radiators" of various sizes and designs may be seen. We have seen the new fire in action and strongly recommend intending purchasers of gas fires to inspect this novelty before investing in the old forms of gas fire. We should not, however, recommend the use of any of the radiators having less than ten tubes and a nominal consumption of 20 cubic ft. per hour, except for rooms of remarkably small area.

**BRICKWORKS IN THE MARKET.**—At the London Auction Mart, Tokenhouse-yard, on Wednesday, October 3, Messrs. Fuller, Horsey, Sons, & Cassell submitted for sale the freehold property known as the Eye Fletton Brickworks, situate at Eye Green, near Peterborough. The property, it was explained, had a total area of about 0½ acres, the whole of the land containing superior Fletton brick earth extending to a very considerable depth, the quantity being for all practical purposes inexhaustible. There was an abundant supply of water derived from a reservoir on the property. The buildings were of substantial construction and well arranged for the purposes of the business. The plant and machinery were entirely modern and capable of an output of about 200,000 bricks per week. The property was absolutely freehold, there being no title-rent charge, land-tax, or royalties payable. The only drawback to the works was the absence of a railway siding, but the railway company had agreed to construct one at a charge of 10 per cent. yearly interest on the necessary outlay. The bidding was started at 2,000l., and did not advance beyond 2,450l. The auctioneer said he could not sell at that price, and the property was accordingly withdrawn, private offers being invited.

**THE ARTHUR CATES BEQUEST OF BOOKS.**—The late Mr. Arthur Cates bequeathed his architectural library jointly to the Institute of Architectural Association, and to the Surveyors' Institution, the selection of volumes to be at the discretion of his executors. The bequest was, however, subject to Mrs. Cates' enjoyment of it during her life. Mrs. Cates has expressed the wish that the books should fulfil the useful purpose of the testator without delay; and the Architectural Association has now received some 130 works (besides many pamphlets). Among them are such books as "Monuments Anciens et Modernes," by Jules Gailhabaud; "Mottis Historiques," by César Daly; Neale's "Abbey Church of St. Albans;" Jobson's "Specimens of Early French Architecture;" Wickes' "Spires and Towers of Medieval Churches of England;" "Fifteenth Century Italian

Ornament," by Sydney Vacher; Burges' "Architectural Drawings;" Sharpe's "Architectural Parallels;" Richardson's "Architecture of England;" Durand's "Parallèle des Edifices;" "Architecture Civile et Domestique," by Verdier and Cattois; "Entretiens sur L'Architecture," by Viollet-le-Duc, as well as his great work the "Dictionnaire de L'Architecture Française" (11 volumes).

## LEGAL.

## REGENT-STREET BUILDING DISPUTE.

The case of Mappin v. Liberty & Co. came before the Lord Chief Justice of England, sitting as Vacation Judge, on the 9th inst., on an application by the plaintiffs for an interlocutory injunction to restrain the defendants, in completing a vault or cellars, from tunnelling under the subsoil of Regent-street to the injury of the plaintiffs. The plaintiffs alternately alleged that the defendants, in constructing the work in question below their foundations, had not complied with the provisions of the London Building Act, 1864.

Mr. Bramwell Davis, K.C. and Mr. Pollock appeared for the plaintiffs; and Mr. Younger, K.C. and Mr. Roll for the defendants.

At the conclusion of the arguments of counsel his Lordship in giving judgment said that upon the question of title the plaintiffs had not made out a strong *prima facie* case sufficient to justify him in stopping the defendants from carrying out the works in question. With regard to the point under the London Building Act, he did not think there was sufficient evidence to justify him in granting the injunction asked. In these circumstances the motion would stand till the trial, the costs to be costs in the action.

## TORQUAY BUILDING DISPUTE.

The case of the Torquay Hotel Company, Limited, v. Bell came before the Lord Chief Justice of England, sitting as Vacation Judge, on the 9th inst., on a motion by the plaintiffs Company for an interim injunction to restrain the defendant until the trial from the erection of certain buildings.

Upon the case being called on, Mr. Edward Ford, for the defendant, stated that his client had, he thought, pulled down all that the plaintiffs could possibly object to, and he would undertake not to rebuild that portion, except that he would have to put slates on to cover in that portion of the building which was left.

Mr. Bramwell Davis, K.C., for the plaintiffs, said he could not agree that the defendant had taken down everything that the plaintiffs could object to.

His Lordship: It is better that the case should stand over till it is ripe to be heard.

Mr. Davis replied that he would not offer any objection to the motion standing over if the defendant would undertake in the terms of the notice of motion until the trial.

His Lordship (to Mr. Ford): You say you think the defendant has pulled down what the plaintiffs can object to, and you will undertake not to rebuild that except to put slates on to cover in what is left.

Mr. Ford: Yes.

His Lordship: I think that is reasonable. The motion will stand over till the second motion day next sitting.

Order accordingly.

## BUILDING DISPUTE AT EAST SHEEN.

The case of the East Sheen Preservation Society v. The Urban District Council of Barnes came before the Lord Chief Justice of England, sitting as Vacation Judge, on the 9th inst., on an application by the plaintiffs to continue an injunction which his Lordship granted *ex parte* on the 5th inst.

When the case was called on his Lordship stated that he remembered the facts. The plaintiffs wished to prevent buildings at East Sheen from being used as a smallpox hospital.

Mr. St. John said the motion might stand over in order to enable his clients to answer affidavits filed by the plaintiffs in support of the motion.

His Lordship (to Mr. St. John): You must not go on building in the mean time.

Mr. St. John: The building is finished, and I have not the least intention of going on further.

His Lordship: You must not use the place as a smallpox hospital.

Mr. St. John: The notice of motion does not say anything about that.

His Lordship (referring to the notice of motion) said he saw that the plaintiffs' application was that the defendants had not the right to build on the common.

Counsel for the plaintiffs said that if the motion stood over, he should ask that the defendants should undertake not to use the place as a smallpox hospital.

His Lordship: I have nothing to do with that on this motion. The case will stand over till the second motion day next sitting.

Order accordingly.

RECENT PATENTS:

ABSTRACTS OF PATENTED INVENTIONS.

10,506.—A DRILL FOR DEEP BORING: *J. T. Wood, R. Wood and A. H. Wood*.—For vertical boring, a percussive and rotary motion is imparted by either power or the hand, to a twisted drill, which is furnished with a point of hardened steel. As the hole becomes deeper, lengths of plain rod, having screwed or other socket joints, are added.

10,510.—WINDOW CASEMENTS: *E. Goddard*.—The casement is mounted upon pivots at its front, which are cast in one piece with channel bars that are affixed to the frame; sockets or eyes being also cast upon channel bars, which are secured to the casement-rails. When the casement is shut, the overlapping ribs of the channel bars will form a weather-tight joint, whilst a gutter or channel is drained through the sill by means of inclined apertures. In another form of the contrivance (which can be used for pivoted windows and fanlights) pivots and eyes are cast upon a window frame and casement made of metal.

10,522.—A MACHINE FOR DRILLING WOOD: *H. S. Brown and J. T. Wade*.—Drill spindles with pinions that gear with an inner gear-wheel upon a spindle are mounted upon a bar, which is adjusted anglewise in a bearing and is to be locked with a set screw; the thrust of the spindles is taken by a disc upon the gear-wheel, which runs in a covered oil-bath; through the engagement of the set screw with holes in the barrel, the drills, which should be disposed in pairs, can be placed either vertically or horizontally, or at any intermediate angle with the work table.

10,527.—AN ANEMOMETER FOR USE IN COAL MINES: *J. Thompson*.—A cup in a chamber which contains petroleum oil or some other non-conducting liquid, sustains the lower bearing of the vertical spindle that is turned by hemispherical cups; a flange at the upper end of the spindle drops into an oil-cup in the steadying bearing; with the rotation of the spindle a cam will make and break contact alternately with a spring upon an insulating-block, whereby will be closed and opened an electrical current between two terminals on the outside of a sealed casing; the velocity of rotation is regulated with a bell, &c., in the circuit, so that one can calculate the velocity of the current and the amount of air per unit of time.

10,540.—A LIFT-VALVE: *N. N. Shaw*.—A recess in the valve takes an enlargement of the lower end of the quick-threaded spindle for which the cover serves for a nut. Another nut secures a reversible and renewable valve-disc to the valve, which has for its guide the vertical extension of the cover, whilst the amount of opening of the valve is indicated by means of a pointer upon the hand-wheel, a single turn of which completely opens the valve.

10,564.—TUBES FOR HOLDING PAINTS, OILS, LUBRICANTS, &c.: *Gordon Kellogg Company*.—The containers or tubes are fashioned with corrugations and have winders or keys; they are made of thin metal strips corrugated centrally and having serrated ends for their pierced spouts or caps, the strips being soldered or folded into tubes.

10,595.—TREADS FOR FOOT-WAYS, STAIRS, &c.: *C. H. Wilkinson*.—These are made of a sheet of some soft metal or of leather, indiarubber, skin, or hide, with a backing of indiarubber, fibre, felt, or some similar material, secured with metallic wires which are set either straight or slant-wise so that their points shall be flush or may be ground flush with the surface.

10,606.—A FUSE-BOX (ELECTRICAL): *A. D. Smith*.—The fuse-box is devised for use in distributing to general consumers from one set of service cables. In the case of two circuits an insulating block having channels which are separated with ridges is fitted on to a box which has a glazed lid. The main is connected to a bus bar provided with terminals for the isolated fuse wires. There are openings for the conductors in the upper part of the box. Two bus bars are supplied for concentric or similar mains.

10,609.—A DOOR-CLOSING APPLIANCE: *S. Hill*.—The appliance comprises a spring that shuts the door and a pneumatic check that will prevent it from being slammed; a lever is pivoted on to the door-frame and an air cylinder is affixed to the door, two chains join the piston to a drum, one of them being attached to the inner or piston-end, and the other to the outer end, of the piston-rod, to the end of the lever on the door-frame is pivoted a lever which is secured to the axis of the drum; the opening of the door draws in air by a piston through a valve, but as the door is being closed through the working of a spiral spring the escape of the air behind the piston through a small vent-hole beneath a screw controls its movements; the specification extends to other rearrangements of the cylinder and links.

10,637.—ELECTRICAL RESISTANCES: *A. H. Mayes*.—Conducting plates, between which is placed some pulverulent resistant material are secured within a non-conducting box beneath non-conducting pressure plates, grooves (filled with mica or asbestos paper packing) in the box take the corrugated copper conducting plates, and it has lugs for its lid and holes for the binding screws. The pressure-plates and the box and its lid may be made entirely of slate or earthenware, or of metal covered with

an insulating material. Brackets upon the back of a switch-board will carry the box, the terminals being joined to the contact-studs of a common switch.

10,680.—A FASTENING FOR GATES: *H. Swiers*.—An automatic fastening or catch is formed with a loop upon a bar, which is passed through slots in a plate upon the gatepost. Upon the under side of the plate is a spring-catch that will, when the gate is open, keep the loop raised. As the gate is being shut it works a push upon the spring, and so disengages the loop from the catch, whereupon the loop will drop down over the head of the gate and so fasten it; or a crook or bent piece may be employed instead of a loop, having a handle and being set for engagement with one of the gate-bars.

10,714.—CONFIGURATION OF DRAIN-PIPES, GULLIES, CHANNELS, &c.: *D. Read*.—The pipes, chutes, interceptors, and so on are fashioned with an egg-shaped section, having a semicircular curve above and an elliptical curve below, and squared supports, with jointing sockets oval in section.

10,716.—PLIERS: *H. A. Deilers & E. L. Bill*.—The pin on which one jaw is pivoted may be varied as to its position with respect to the other jaw by the turning of an eccentric in the latter jaw, and securing it by a plate with a pin that will enter into a series of holes. The eccentric, which may be either stepped or have lugs that fit a groove in the latter jaw, will enable one to apply the jaws as may be required on to the work.

10,730.—MEANS OF ESCAPE FROM FIRE: *C. R. Harris*.—The inventor devises a rope ladder that can be wound upon a reel and stowed in a case beneath the window sill, it is to be liberated for use by pressing a button that disengages the catch of the door of the case or box, a spring opens the door and the reel will then roll down the bottom, which is sloped, of the box.

10,752.—A CRANE FOR USE BY BUILDERS AND OTHERS: *J. Davie and J. Weir*.—Spans which are passed around pulley-blocks and are wound in opposed directions upon a drum serve to slew the derrick about its support upon a post or mast, the blocks are attached to projections from the head of the post, and worm-gearing turns the drum.

10,763.—SLIDING GATEWAYS, PARTITIONS, &c.: *I. Wishart*.—The sections are hinged on the outside and inside, alternately, so that one can cause them to slide and fold together. Every other section has wheels or rollers at its base with middle flanges that move between guide rails, and rollers at the top, similarly guided; the top rollers have roller bearings, and the bottom wheels revolve upon roller bearings on spindles carried by swivelling spheres or forks moving within ball-shaped casings.

10,778.—ARTIFICIAL STONE GOODS: *L. Schreyer*.—For casting goods made of artificial stone or a marble composition the inventor discards the customary polished glass moulds for sheet metal moulds, which he lines internally with a thin layer of a leaden silicate and (it may be) a vitreous enamel.

10,788.—MAKING OF WIRE FENCING: *W. McCloskey and J. Kay*.—For retaining the horizontal wires in their places whilst one weaves them with the vertical wires is used a spacing-bar. The wires will rest upon cranked pins of the spacing-bar, a pivoted lever or jaw held with a catch at the top of the bar grips the top wire together with the end of the vertical wire that is being interwoven, a shoulder upon the lower end of the bar lies upon the lowest horizontal wire.

10,805.—TILES FOR ROOFS, WALL-LININGS, &c.: *P. Schöge*.—The tiles or sheets are composed of an admixture of tan waste or bark, waste hemp, gelatinous size, alum, resinous soap, sand, and pulverised pumice-stone; an addition of 1 per cent. of tannic acid will precipitate the gelatine and serve for an antiseptic. After having been subjected to a high pressure the goods are dried, and then made waterproof with a solution of stearic acid 5 parts and pine resin 12 parts, heated to 100 deg. C.

10,805.—SPIGOT-AND-SOCKET JOINTS: *R. Ewing*.—An annular shoulder is fashioned upon the socket, with its raised portion, saddle, or rest at the lowest part in order to ensure an even and smooth invert; if liquid cement is used the grouting material is poured through holes in the shoulder, the cement being held by an annular shoulder (of which the lower part constitutes a saddle) formed around the rim of the socket.

10,921.—TREATMENT OF SEWAGE: *C. Lehmann and F. Neumeyer*.—The sewage is conveyed into an air-tight receiver which is joined with a bent pipe to a vessel which (together with the receiver) is connected to a tank by pipes for the passage of the evolved gases, for which an ultimate escape is provided; the tank is partly filled with glycerine. Before the treatment is begun, the air-tight container is filled with water. There are pipes for emptying the vessels, and for indicating when the sludge has reached the highest levels.

MEETINGS.

FRIDAY, OCTOBER 11.

*Architectural Association*.—Annual general meeting; Address by the President, Mr. W. H. Sebbs-Smith, and Distribution of Prizes, Medals, and Certificates. 7.30 p.m.

*Glasgow Architectural Craftsmen's Society*.—Opening Address by the President, Mr. J. McKissack.

*Sanitary Institute (Lectures for Sanitary Officers)*.—Mr. W. Spinks on "Calculations, Measurements, and Plans and Sections." 7 p.m.

SATURDAY, OCTOBER 12.

*British Institute of Certified Carpenters*.—Visit to Lloyd's Registry Offices, Fenchurch-street, E.C. 3 p.m.

*Northern Architectural Association*.—An excursion meeting. Members to assemble at the Newcastle Breweries Offices, Haymarket, at 2 p.m.; after inspecting these buildings, the Electric Power Station will be visited.

MONDAY, OCTOBER 14.

*Circle of Works Association*.—Monthly meeting, Carpenters' Hall. 7.30 p.m.

TUESDAY, OCTOBER 15.

*Architectural Association*.—Preliminary meeting of the School of Design. Addresses will be delivered by Mr. J. Macvicar Anderson and Mr. H. H. Siamham. 7 p.m.

WEDNESDAY, OCTOBER 16.

*Builders' Foremen and Clerks of Works' Institution*.—Quarterly meeting of the members. 8 p.m.

*Sanitary Institute (Lectures for Sanitary Officers)*.—Mr. W. Spinks on "Sanitary Appliances." 7 p.m.

THURSDAY, OCTOBER 17.

*Carpenters' Company, London Wall (Lectures on Sanitary Building Construction)*.—Mr. Mark H. Judge on "Sanitary Architecture." 7.30 p.m.

*Sanitary Institute (Lectures for Sanitary Officers)*.—Mr. W. Spinks on "House Drainage." 7 p.m.

FRIDAY, OCTOBER 18.

*Architectural Association Discussion Section*.—Mr. H. G. Collins on "Stables and Stable Fittings." 7.30 p.m.

PRICES CURRENT OF MATERIALS.

\* \* Our aim in this list is to give, as far as possible, the average prices of materials, not necessarily the lowest. Quality and quantity obviously affect prices—a fact which should be remembered by those who make use of this information.

	BRICKS, &c.
Hard Stocks	1 14 0 per 1,000 alongside, in river.
Rough Stocks and	
Grizles	1 17 0 " " " "
Facing Stocks	2 12 0 " " " "
Shippers	2 8 0 " " " "

Wood Paving Works	Norblet (Kent) U.D.C.	S. Honeycombe, Surveyor, The Hill, Northfleet	do.
Rebuilding the Station Inn, Keighley	Midland Railway Company	Milnes & France, Architects, 99, Swan-arcade, Bradford	do.
Bricks (50,000)	Abertawe U.D.C.	Sir S. Black, Town Hall, Belfast	do.
Sewer, Leslie-road	Aberdeen Town Council	W. Dyack, Borough Surveyor, Town House, Aberdeen	do.
Victoria Stone Paving	Tottenham U.D.C.	W. H. Prescott, 712, High-road, Tottenham	do.
Sewerage Works, Coulsdon	Croydon R.D.C.	Chart, Son & Reading, Union Bank Chambers, Croydon	Oct. 10
Sewerage Works, Mitcham		do.	do.
Road Works, Ordinance-place, Chatham	Watt's Charity Trustees	J. W. Nash, Surveyor, Rochester	do.
Road Metal (2,000 tons)	Ebbw Vale U.D.C.	T. Hughes, Council Offices, Ebbw Vale	do.
Wood Paving, &c., Alexandra-street	Southern-on-Sea Corporation	A. Fidler, Civil Engineer, Town Hall, Southern-on-Sea	do.
Road Works, Onslow-gardens, &c., Wallington	Croydon R.D.C.	R. M. Chart, Surveyor, Town Hall, Croydon	do.
Additions to Isolation Hospital, Beddington Corner		do.	do.
Lodge, &c., St. George's Park	Bristol Corporation	T. H. Yarbrough, Civil Engineer, Queen-square, Bristol	do.
Street Works, Waltra-road, &c.	Ikley U.D.C.	The Surveyor, Council Offices, Ikley	do.
Sewage Disposal Works, Partly	Riccall (Yorks) R.D.C.	E. J. Silcock, Civil Engineer, 10, Park-row, Leeds	do.
Parish Room, Walton, Suffolk	Rev. E. Symonds	H. J. Wright, Architect, 4, Museum-street, Ipswich	do.
Road Works, Dover-street, &c.	Reading Town Council	J. Bowen, Borough Engineer, Town Hall, Reading	do.
Restaurant, &c.	Cork International Exhibition Co.	Il. A. Cutler, Civil Engineer, Municipal Buildings, Cork	Oct. 17
Paving Works, Moors-street, &c.	Luton Town Council	G. Sell, Town Hall, Luton	do.
School, &c.	Chy Cross School Board	Robinson & Son, Architects, 13, Corporation-street, Chesterfield	do.
House, &c., Sea Houses, North Sunderland	Mr. Jas. Young	W. Keavell, Junr., Architect, Alnwick	do.
Road Works	Croydon Corporation	Borough Engineer, Town Hall, Croydon	do.
Earthenware Drain Pipes	Cork County Council	J. J. McCarthy, Court House, Cork	do.
Additions to Hospital	Ballymahon (Ireland) Guardians	P. Macgregory, Workhouse, Ballymahon	do.
Stables, &c., Crown Hotel, Southwood	Colchester Brewery Co., Ltd.	G. H. Page, Architect, Trinity Chambers, Colchester	do.
Underground Convenience, &c., Market Place	Hull Corporation	A. E. White, Civil Engineer, Town Hall, Hull	Oct. 18
Cast-iron Water Pipes	Preston Corporation	Borough Engineer, Town Hall, Preston	do.
Additions to School	Cardiff School Board	E. W. M. Corbett, Architect, Castle-street, Cardiff	do.
Re-building Workhouse	Newry (Ireland) Guardians	W. L. Russell, Architect, Newry	Oct. 19
Six Houses, Brynch	Neath Main Colliery Co.	J. Cook Rees, Architect, Neath	do.
Schools, Pontllyn	Gelligaer School Board	James & Morgan, Architects, Charles-street Chambers, Cardiff	do.
Cast-iron Pipes (21 tons)	Covebury Corporation	J. E. Swindhurst, Civil Engineer, St. Mary's Hall, Coventry	do.
Drainage Works at Hospital	Londonderry Guardians	M. A. Robinson, Civil Engineer, Ribmond-street, Londonderry	do.
Barging Away and Disposal of Rubbish	Metropolitan Borough of Stepney	Borough Engineer, 15, Great Alle-street, Whitechapel, E.	do.
Car Shed and Workshops	Middletown Electric Traction Co.	Secretary, Donington House, Norfolk-street, Strand, W.C.	Oct. 21
Paving, Kerbing, &c., Hoddeston	Hertfordshire County Council	County Surveyor, 41, Parliament-street, S.W.	do.
Retaining Wall, &c.	Radclyffe (Glouc.) U.D.C.	R. L. Rothwell, Surveyor, Council Offices, Radcliffe	do.
Cement, Pipes, &c.	Great Western Railway Co.	G. K. Mills, Paddington Station, W.	do.
Additions to Board Room Offices, &c., Armlay	Bramley Guardians	P. Robinson, Architect, 72, Albion-street, Leeds	do.
Schools, Newquay, Cornwall	St. Columb Minor School Board	J. Pearce, 1, Lehenver-villas, Newquay	do.
Water Pipes	Leeds Gas Corporation	H. M. Valon, Engineer, Town Hall, Beaumont	do.
Road Metal, &c.	Sheerness Town Council	T. F. Berry, Surveyor, Trinity-road, Sheerness	do.
Public Library, &c., Eastbourne	Technical Instruction Committee	W. C. Field, Borough Surveyor, Town Hall, Eastbourne	do.
Street Works, Brand-street, Glasgow	Clyde Navigation Trustees	W. M. Alston, Engineer, 10, Robertson-street, Glasgow	do.
Road-making Works	Bromley U.D.C. Board	Borough Engineer, District Council Offices, Bromley, Kent	Oct. 22
'Artizans' Dwellings, Plaiatow	West Ham Council	Borough Engineer, Town Hall, West Ham, E.	do.
Additions to Hospital	Willesden District Council	O. Claude Robson, Engineer, Dyne-road, Kilburn	do.
Open Shed, Steel Joists and Concrete Roof	Hammersmith Council	Borough Surveyor, Town Hall, Hammersmith	Oct. 23
Additional Wing to Asylum	Cambridgeshire, & Asylum	A. P. Macallister, Architect, 20, St. Andrew's-street, Cambridge	Oct. 24
Enlargement of Head Post Office, York	Commissioners of H.M. Works, &c.	H.M. Office of Works, Storey's Gate, S.W.	do.
Sewerage Works (Contract No. 3)	West Hartlepool Corporation	J. W. Brown, Borough Engineer, West Hartlepool	Oct. 25
Enlargement of Head Post Office, Derby	Commissioners of H.M. Works, &c.	Secretary, H.M. Office of Works, Storey's Gate, S.W.	do.
Sewers, &c.	Newhaven (Sussex) U.D.C.	F. J. Rayner, Town Surveyor, Newhaven	Oct. 28
Drainage Works	Gosport and Alverstoke U.D.C.	R. St. George Moore, Civil Engineer, 17, Victoria-street, S.W.	do.
Car Shed, Workshops and Offices, Northfleet	British Electric Traction Co., Ltd.	Chief Engineer, Donington House, Norfolk-street, W.C.	do.
Sub-District Post Office, West Kensington	Commissioners of H.M. Works	H. Tanner, H.M. Office of Works	Oct. 29
Team Binfection, &c.	Bethnal Green Guardians	Steward's Office, Bishop's-road, Bethnal Green, N.E.	do.
Iron Escape Staircase	Brentford Union	Clerk to Guardians, Union Offices, Isleworth, W.	do.
Artificial Stone, Granite Kerbing, &c.	Middlesex County Council	County Engineer, Guildhall, Westminster	Nov. 1
Isolation Hospital	Chiswick U.D.C.	A. Ramsden, Surveyor, Town Hall, Chiswick	Nov. 6
New Public Offices, Westminster	Commissioners of H.M. Works, &c.	Secretary, H.M. Office of Works, Storey's Gate, S.W.	Nov. 12
Land Surveyors (several)		H. G. Lloyd, Architects, Grosvenor-road, Alderhot	No date
Eight Scullery Houses	Manchester Corporation	Borough Surveyor, Town Hall, Manchester	do.
Setts, &c.	Morley Main Fireclay Works	W. Ackroyd & Bros., Limited, Morley	do.
Kilns, Chimneys, &c., Morley, near Leeds		Davidson & Garden, 12, Dec-street, Aberdeen	do.

Carpenter	Lagos Corporation	200l.	do.

Those marked with an asterisk (\*) are advertised in this Number. Competitions, p. iv. Contracts, pp. iv, vi, viii, x, & xxiv. Public Appointments, pp. xxi, & xxiv.

PRICES CURRENT (Continued).

SLATES.

Table listing slate prices for various types like Bangor, Portland, and Eureka, with columns for size and price per 1000.

TILES.

Table listing tile prices for roofing, floor, and wall tiles, including brands like Best plain red and Do. ornamental.

WOOD.

BUILDING WOOD—YELLOW.

Table listing building wood prices for deals, battens, and timbers, with columns for size and price per standard.

JOINERS' WOOD.

Table listing joiners' wood prices for various deal and batten sizes, with columns for size and price.

Table listing pine prices for various sizes and types like First regular sizes, Second white deals, and Yellow Pine.

Table listing mahogany and other wood prices for Honduras, Selandia, and various types of mahogany.

PRICES CURRENT (Continued).

JOISTS, GIRDERS, &c.

Table listing prices for Rolled Steel Joists, Compound Girders, and Cast Iron Columns and Stanchions.

METALS.

Table listing metal prices for Iron, Sheet Iron, Galvanised, and Best Soft Steel Sheets, with columns for size and price.

LEAD, &c.

Table listing lead and zinc prices for sheet, pipe, and solder, with columns for size and price.

ENGLISH SHEET GLASS IN CRATES.

Table listing prices for English sheet glass in crates in various sizes like 15 oz. thirds and 24 oz. thirds.

OILS, &c.

Table listing oil prices for Raw Linseed Oil, Turpentine, and Genuine Ground English White Lead.

VARNISHES, &c.

Table listing various types of varnishes like Fine Elastic Copal, Best Elastic Carriage, and Best Hard Copal.

TO CORRESPONDENTS.

W. E. W. (Below our limit). NOTE.—The responsibility of signed articles, letters, and papers read at meetings, rests, of course, with the authors.

We cannot undertake to return rejected communications. Letters of communications (beyond mere news items) which have been duplicated for other journals are NOT DESIRED.

We are compelled to decline pointing out books and giving addresses.

Any communication to a contributor to write an article is given subject to the approval of the article, when written, by the Editor, who retains the right to reject it if unsatisfactory.

All communications regarding literary and artistic matters should be addressed to THE EDITOR; those relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

TENDERS.

[Communications for insertion under this heading should be addressed to "The Editor," and must reach us not later than 10 a.m. on Thursdays. N.B.—We cannot publish tenders unless authenticated either by the architect or the building-owner; and we cannot publish announcements of tenders accepted unless the amount of the tender is given, nor any list in which the lowest tender is under £100, unless in some exceptional cases and for special reasons.]

\* Denotes accepted. † Denotes provisionally accepted.

### Artisans' Wages at Home and Abroad.

ALL parts of the civilised world are now brought into such close connexion by the advance of applied science that it becomes more and more important for each country to

know the conditions of others, for unless we are acquainted with the facts relating to other nations it is impossible to form an opinion either on the progress or condition of Great Britain. The Foreign Labour Statistics, therefore—the second volume\* of which is now published by the Board of Trade (why, by the way, are we not furnished with Colonial statistics?)—imperfect though they are at present, have a great deal of importance, for they enable us to form some kind of opinion on the state of labour in foreign countries. "Great caution," says Mr. Bateman in his introductory letter, "must be exercised in making comparisons between the figures for one country and another." This warning is true in regard to the comparison of most figures, but, bearing it in mind, we may at any rate come to some conclusions on the position of labour in foreign countries. It has also to be remembered that high wages or low wages are not always synonymous with the prosperity or the bad fortune of the artisan. The artisan who is best off is he who can obtain the greatest net return, or, it may be called, the most cash after paying for dwelling, food, and clothing.

Bearing these cautions in mind, let us take as far as is possible the earnings of bricklayers in foreign countries. Referring to these in the order in which they are given in the Board of Trade return, we find that a bricklayer and mason earns in Norway 4s. 3½d. per day; in Denmark, 4s. 1½d.; in Altona, the only place in the German Empire

from which there is a return, 5s. 7d.; in Belgium (Brussels), 3½d. an hour; in France, 5s. 0½d. per day; in Switzerland, 3s. 5½d. It is somewhat surprising that the German statistics are so meagre, and in view not only of the spread of Socialism, but also having regard to the competition with this country, it would be most interesting and important to have fuller figures.

When we come to the United States we find a complete table, a table showing rates of wages which are startling. Thus in New York in 1898 the average daily wage of a bricklayer was 16s. 8d., of a mason 16s. 8d., and of a hod carrier 10s. In Philadelphia the same men earned 11s. 6½d., 11s. 5½d., and 8s. 4d. respectively. When we go further west to Chicago, we find the average earnings are for the first two classes 16s. 8d., for hod carriers 8s. 4d. It is pretty clear from the figures in these interesting tables that wages in the United States are to a large extent fluctuating and local, the higher rate in New York and Chicago as against Philadelphia and Baltimore being caused by a demand for bricklayers owing to constant and large building operations. But when we have these figures before us, it is clear why the United States absorbs all the best of our emigrants, since even the ordinary labourer—the hodman—can in New York earn the fine wages of 3l. a week, or 150l. a year. Though the cost of clothes and house rent is high in New York, it is not so extravagant as not to leave the workman in the United States with more money in his pocket at the end of a week after he has paid for the necessities of life than in Great Britain; and in addition he has the use of a first-rate system of free public elementary education so that his children have as good a start as those of his employer, and he has likewise a vast and increasing supply of free public libraries, not regarded, as in this country, as burdens on the ratepayers, but as a necessary and desirable element in the social system. Let us add, too, that in every single city of the United States there is an abundance of cheap and quick means of locomotion, tramways radiating in every direction, and it is clear,

so far as it is possible to judge, that in the United States at the present moment the lot of the artisan is extremely fortunate.

If we turn now to the English statistics—still observing the same trades—we may take the London district, which we may reasonably consider corresponds as nearly as may be with New York, because both are vast towns, in both there is a great growth of buildings, and in both house rent is high. In the London district then we find that in 1900 the standard rate of wages for a bricklayer was 10d. per hour for a week of fifty hours in summer—in other words, 2l. 1s. 8d. a week; or, in order to make the comparison with other countries more exact, and taking each day as of the same length, an average wage of 6s. 11½d. per day, or, let us say, 7s. It would be extremely interesting to know, though this seems to be at present impossible, how much of the New York bricklayer's wages is expended in house-rent, but when we bear in mind that he receives more than double the wages of an English bricklayer, his position must be distinctly the better. The English artisan here has now free education, an addition to his pocket which has certainly in the last few years greatly improved his lot and taken—at any rate, from the prudent workman—a considerable load of anxiety, since, whether trade be bad or good, and employment be brisk or slow, his children can still receive their education. The hodman, who we suppose in England is classed under the head of labourer, in the London district is paid 7d. per hour, which for a week of fifty hours represents 27s. 6d. per week, or 4s. 7d. per week more than the bricklayer earns in Norway or Denmark, nearly as much as he receives in France, and a great deal less than he would earn on the other side of the Atlantic. But we must again repeat that mere cash receipts alone are not the sole element to be regarded, and there is always this in favour of the English workman, that, in spite of short winter days, the open winters of these islands render his lot more favourable, since the time for which he is thrown out of work is probably, on the average, less than in any other country, European or American.

\* "Second Abstract of Foreign Labour Statistics," Board of Trade Labour Department. 1901.

† Report on the "Standard Time Rates of Wages in the United Kingdom in 1900. With Comparative Tables," Board of Trade Labour Department. 1900.

Having taken the London rate, it is unnecessary to go into details as regards other centres, though we may note in passing that the rate, both in Liverpool and Birmingham, for bricklayers, is 9 $\frac{1}{2}$ d. per hour, and we take it that the chief factor in regulating wages is the cost of house rent, because clothes and provisions are pretty much the same all over the United Kingdom. If this be so, then we may also take it, so far as Europe is concerned, that the net receipts of a bricklayer do not greatly vary, but that in the United States the net receipts are, even allowing for much higher rate, certainly greater. When, however, we find that the average cash wages per week in the Midland Counties of an agricultural labourer in 1899 were 14s. 2 $\frac{1}{2}$ d., and that the same man, if strong and sober, could as a bricklayer's labourer in a town earn very nearly double that sum, and when we remember the various minor advantages of the towns, the numerous shops, the better education, the freedom and the amusements, we need not be surprised at what is called the rural exodus, which will not be stopped till the agricultural labourer can put into his pocket on a Saturday night as much net cash as a bricklayer's labourer in a town. The only surprising thing is that every able-bodied agricultural labourer who could manage to cross the Atlantic does not do so at once, and become a bricklayer's labourer in one of the upspringing cities of the States, where he would be in a more comfortable condition than any man in the same position is in any other part of the world.

But again we desire to caution our readers that they should remember that figures such as those in these official reports, while they "throw much light upon the movement of wages," should "be used only with a considerable degree of caution as tests of the average wages earned by the general body of workpeople." But mathematical certainty is impossible, and in default of this, it is certainly both interesting and instructive to endeavour to obtain by means of these statistics some kind of view—imperfect though it may be—of the financial, and so of the general, condition of one class of workmen in Europe and America; from which we may gain also some idea of the condition of other, and not less important, classes.

#### WILLIAM AND MARY CHAPELS.

**B**ESIDES shortcomings in the matters of stability, light, ventilation, and accommodation in the old meeting-houses erected by the earliest Nonconformists, the difficulty of access to the secluded sites chosen for them often resulted in resolutions to erect new buildings in more accessible positions. Hence, out of the thousand chapels computed to have been built after the passing of the Act legalising their erection, but few remain to us, the greater number having been rebuilt either on new sites or on the old ones. In one instance, at Alowick, only the pewter alms-dish, dated 1689, of the original "meeting" remains in the new chapel built on its site.

We have, however, some examples. The William and Mary Chapel at Newbury was founded in 1697, and remains but little changed from its original form. The simple front is in three divisions, each terminating

in a receding gable. On the ground floor there are two large windows with a mural tablet between them and a doorway on either side of them. On the upper floor are four double-light windows, oblong, plain, and uniform. Here for many years ministered Daniel Mace, who was the author of one of the earliest Greek and English New Testaments.

St. Nicholas's old meeting-house in Ipswich, built in 1700, is still in evidence. It has two doorways in the calm, staid frontage, and over each is an eye-shaped panel; between them are two rows of quadrangular diamond-paned windows, three in number; and over all rises a plain sloping roof. The framework is of timber covered with lath and plaster, and the floor is of brick, unless it has been disturbed recently. The pulpit is ornamented with carvings and twisted banisters. As we look upon this and the other placid interiors we can but think of their first congregations faltering in and taking their seats in confiding silence, flower-faced maidens (Puritan pansies, Poe called them), fair matrons, elders, and "white-haired traders" among them. Their costumes, the accents of their speech, the turn of their thoughts, are all matters of curiosity to us now; and the impress of their long-past presence has a peculiar charm.

One of the most interesting of these buildings left to us is at Knutsford, in Cheshire. Authorities differ as to whether it was this chapel or that at Dean's Row, or that at Macclesfield, to which Mrs. Gaskell referred in her story of Ruth, all three being of contemporary date. There are two sets of external stairs attached to the frontage, one at each extremity, and access to the ground floor of the chapel is gained through doorways in the walling that supports them. The diamond-paned windows have mullions and drip-stones, and impart a delightful old-world air; and foliage is not wanting to give an extra charm. Another interesting Cheshire example is in the county town. This is the chapel built for Matthew Henry. Some of the walling has been renewed and a new front built; but within, although his Commentaries may be no longer chained to the gallery as they used to be, we may see the same two lines of massive oaken pillars, and the same pulpit that was originally placed in it. The oaken gallery, too, is the same that was added when there was an influx of three hundred and fifty additional communicants, owing to the retirement of a contemporary minister, though the space below it was partitioned off many years ago to accommodate members who had seceded from the rest.

At Swarthmoor, among the fells and dales, there is a very pathetic little chapel. It is in a lane, and by the side of it is a small graveyard. Over the door is a stone inscribed "Ex dono G. F. 1688," thus intimating it was the gift of George Fox. It is but little more than a room, with whitewashed walls and a floor of blue flagstones. The seats are wooden forms, unpainted. But there is a small gallery, and the passage-way leading to it is supported by posts that are said, reverently, to be portions of the ebony four-post bedstead that once belonged to the donor. On a wooden desk, under glass, is a bible printed in 1541, which is open at the passage, "I am heavy and abashed, is there not yreacle

at Gylyad?" It has a chain and padlock. This William and Mary edifice belonged to the Society of Friends. Pepys wrote, it will be remembered, in 1661, "I find that both here (Baldwick) and everywhere else that I come, the Quakers do still continue, and rather grow than lessen."

There is another early Nonconformist building with chained books still preserved in it at Lydgate, near Huddersfield. These volumes are Tillotson's sermons, and they are chained to a shelf under the Communion table. This chapel was originally constructed in 1695, partially rebuilt in 1768, furnished with a gallery in 1786, and with a turret in 1848. Its windows are long and narrow with semi-circular headings, like those Sir Christopher Wren designed for so many of the London churches after the Great Fire.

A William and Mary chapel at Ramsbottom is all the brighter for the associations that Charles Dickens gave to its frequenters, the brothers Grant, under the name of Cheeryble Brothers. Examples at Coventry, Leicester, and Hinckley are similar in style, plain and quadrangular. On a sundial built into the south wall of another of these fabrics at Blackley may be read the pith of many a searching of heart:—

"My change is sure, it may be soon,  
Each hastening minute leads me on;  
The awful summons draweth nigh  
And every day I live to die. 1697."

Without long-drawn-out arcades of columns, "vapourous grey" or otherwise, with no carved angels in the roofs, no shadowy mouldings, no sculptured mysteries over the doorways, no geometric tracery in the windows, or painted glass, these buildings, with their touch with other times, their indomitable and strenuous continuance, are not without attraction for many minds. One in Nottingham has been altered five times, till it now has a thousand sittings. Another, less favoured, at Stamfordham, in Northumberland, has been turned into a stable; two in Pudding-chare, Newcastle-on-Tyne, and Berwick-on-Tweed into warehouses; one at Whitchurch, Salop, into a school.

We have a few meeting-houses still older than William and Mary's reign. At Horningham there is one with the date 1566 on a tablet in the gable. To this building, says local tradition, came the Scottish Presbyterian masons, disciples of John Knox, who were engaged to build Longleat House for Sir John Thyune. They refused to attend the parish church, being probably the same stern and staunch sort of masons that Carlyle represents his father to have been, and they obtained a grant of this building, which sets forth that it is intended for the use of Protestant Dissenters. A condition was attached to the effect that the walls were not to be raised, and that the roof was to be thatched, in consequence of which stipulation the lowly, simple little place, with its hipped gables and three dormers lifting up the thatch, has been handed down intact. Tavistock Chapel is of a greater antiquity of another kind. When the Vicar of Tavistock was ejected, the Earl of Bedford made over to him the Abbot's Chapel of the monastery suppressed at the Reformation, which has continued in use ever since. Part of a Dominican friary is still used, too, by the Society of Friends at Bristol. At

Haslington, in Cheshire, the chapel of the ancient family of Vernon was licensed for a meeting-house in 1689. But the William and Mary chapels have an interest more distinctly their own, and quite worthy of survey.

NOTES.

IN Wednesday's *Times* Mr. Reginald Blomfield wrote an excellent letter on the subject of the absurd demand for a Liverpool cathedral in the Gothic style. How much chance he has of getting the Committee to understand him is obvious from the answer which he has elicited from Mr. Robert Gladstone in Thursday's *Times*; one of the most amusing things we have read for some time, much more so than its writer has any idea of. Mr. Gladstone totally fails even to understand Mr. Blomfield's argument, but assures us that he has been a student of architecture for forty years; "he has not forgotten that the early Christians converted the available basilicas into churches," nor is he ignorant of the rise and fall of Gothic architecture: "how it emerged from the clumsy grandeur of Norman, attained its most sublime beauty during the 100 years to which I referred, and then by the elaboration of pretty details it gradually deteriorated until architects in despair called in the more sturdy accessories of the Grecian and Roman orders to revivify their expiring art;" and as Sir Gilbert Scott pointed out to the Institute of Architects the beauties of Westminster Abbey, can we do better than imitate that? &c., &c. In short, Mr. Gladstone is just where architectural amateurs were half a century ago; repeating the old formulae and the old superstitions of the Gothic revival, as if the world had not moved since then. It is hopeless; but it is certainly amusing. He should, however, at all events, look up his facts about the basilicas; he will find they are out of date.

IN reference to a passing remark in our report on the new chapel at Giggleswick school last week, to the effect that an octagonal dome is not constructionally a dome in the proper sense of the word, Mr. T. G. Jackson writes to say that the Giggleswick dome is constructionally a true dome, with a circular plan on the interior lines, and is only modelled into an octagonal plan on the exterior. Our remark was not intended exactly as a criticism, but merely as drawing attention to the fact that a structurally octagonal dome, however you may call it a dome, is under quite different statical conditions from a true dome; and the exterior view of the chapel which was exhibited at the Royal Academy, and subsequently, by the architect's consent, published in our pages, gave us the impression that this was an ordinary octagon cupola, as it appears so externally. The object of the treatment of course is to harmonise the cupola externally with the general lines of the architecture, which are Gothic in feeling, though Gothic of a very tree type. The experiment is an interesting one, and was perhaps worth making, though it has the drawback of making the exterior of the cupola a contradiction of the interior. The moral is, perhaps, that you cannot harmonise a spherical dome with the prevalent line and feeling of Gothic architecture. But as an architectural feature the

octagonal cupola is an object far inferior in beauty and impressiveness to the true spherical dome.

It is a matter for regret that the Works Committee of the Westminster Corporation have not seen their way to recommend the planting of trees in Whitehall. But the reasons given seem to put an end to the possibility. It is said that the roadway is so cellared under and so full of pipes that it is impossible to plant trees in this thoroughfare. This is a little surprising, because we should not have supposed that Whitehall was more largely "undermined" than some other thoroughfares where trees are planted. The public must, however, acquiesce in these reasons with their present knowledge. We trust, however, that the Westminster Corporation will look further into this matter and seek for other places where trees could be planted, as, for example, in Waterloo-place, if that be within their jurisdiction. As we recently pointed out, there are many open spaces in London which would be greatly improved in effect if trees were planted in them. Why, we may ask, should not trees be planted in the forecourt of the British Museum? They are doing well in Great Russell-street.

WE welcome the criticism of the Westminster ratepayers upon the circumstance of the paving contract for that borough, because it is only by reason of an interest being taken in municipal affairs by the general body of citizens that their representatives can be kept up to the mark. But at the interview of the deputation of ratepayers with the Works Committee last week the former were much too vague in their charges—vague, that is, because their case clearly rested rather on suspicion than on proved facts. The point that the paving blocks were bad seemed to be entirely disproved by independent evidence. It is true that the Committee had also the evidence of an expert, but on the facts as published his opinion would seem to be erroneous. But the Westminster Corporation seem only to have themselves to thank for the creation of these suspicions. It appears that they admitted that though some tenders were rejected because they were not in accord with the specifications, yet that the tender of the Improved Wood Pavement Company was accepted although that company was not prepared to supply blocks as specified. The moment a public body departs from the proper and straightforward course of rejecting all tenders which are not in accordance with the specifications and accepting one that is not, at that moment suspicion of underhand dealing is aroused, and such facts as close intimacy between the contractor and an official of the corporation appear to suggest some form of conspiracy. The old saying, that Caesar's wife should be above suspicion, is peculiarly applicable to the contracts of corporations, which should always be carried out even with an excess of purity. That being so, there can be no doubt that the public discussion and investigation of the Westminster Paving Contract is wholly to the public advantage.

MR. PULLMAN, whose name may be said now to be a household word among railway travellers, is, after a lapse of twenty-five

years, paying another visit to this country, and has addressed an interesting letter to the *Times* on the subject of the traffic of London. He finds London in as bad if not a worse condition than it was a quarter of a century ago. Many imperfections in the system there no doubt are, but it is impossible to doubt that in many respects it is improved. We have only to look, for example, at the outsides of the omnibuses. But there is one point which Mr. Pullman makes which is worthy of the closest attention, namely, the necessity for a central body to control the London streets. We cannot doubt that the divided authority of the various local bodies over the streets is very injurious to the public interest. It would be an immense gain if the sole highway authority for London were the County Council. The cost of administration would be less because there would not be so many officials, and there would be no clashing of rival authorities. At present one end of a street which belongs to one municipality is well lighted; the other which belongs to another is in darkness. But with the present Government in power we fear that it is hopeless to work for this necessary reform, though some day it will certainly come to pass. The whole question, indeed, of the jurisdictions over London streets and the powers of companies to pull them up requires investigation, and we commend the matter to the attention of Mr. Ritchie, the Home Secretary, who is the man of business of the Cabinet.

It is satisfactory to note a really useful step being taken towards the union of practical and theoretical training for the artisan. For this is the object of the circular issued by the Plumbers' Company and representatives of various important local bodies. Apprenticeship alone can only teach by experience, though here and there there may be a master who will give explanations. But apprenticeship plus purely educational teaching gives the two desiderata. The means suggested by the Plumbers' Company's power of indenture are—attendance at classes as one of the conditions of the contract of apprenticeship, and the cancellation of the articles if the apprentice fails in an examination. But it is clear that, in order that such a scheme should have full results, there must be a complete system of registration of plumbers, or, indeed, of any other artisans, and that only those who are registered should be eligible for important work. If a doctor could practise whether or not he passed the necessary examinations, we should have plenty of unqualified practitioners, and there must always be a number of these men in every trade until efficiency obtains its proper recognition; but it is impossible to confine a trade merely to those who have been pronounced to be competent by examination, however desirable it may be that only those who are efficient should be employed.

SEVERAL electric lighting companies who test their own meters are in the habit of marking them in such a way that consumers are misled into thinking that they have been tested by an independent authority. This seems to us a very objectionable practice, and we should have thought that it would be sufficient to draw the attention of the Board of Trade to it to have it at once

Apprenticeship and Technical Education.

Electric Meters.

Mr. Pullman on London Traffic.

stopped. From the Report submitted last week by the Highways Committee to the London County Council it appears that the Board of Trade regards this practice with great complacency. It considers that the time has not yet arrived for compulsory legislation in the matter owing to the very limited number of types of meter which it has officially sanctioned. This seems to us an extraordinary reason to give. Are we to infer that nearly every type of electric meter is bad, and that, therefore, it is of little consequence what stamp, official or otherwise, is put on it? It was the original intention of the orders granted to electric lighting companies in London that the County Council should duly certify and stamp approved types of electric meters. The Board of Trade standardising laboratory has been in existence for some ten years, and we have often heard complaints from manufacturers of the length of time which elapses before they hear whether their meters, are approved or not. It seems to us that the Board of Trade might very well be content with somewhat less severe tests, and that an accuracy which more than satisfies the standards insisted on by many countries abroad, where electricity is much more extensively employed than in this country, ought to satisfy them. The consumer has a right to have a meter tested by the County Council, and the supply companies, by stamping their own meters, are deceiving the public. The Board of Trade informed the Highways Committee that as the question is one which affects electricity supply generally and not London alone, the expediency of the Council taking action in the matter is doubtful. "Expediency" is a somewhat low standard for an official department to adopt. What dreadful thing would happen if the suspicious practices of a few of the London supply companies were stopped? The supply companies, remembering the ease with which the Board of Trade allowed them to raise the pressure of their supply, must be beginning to look upon it as their natural protector from the London County Council, which acts in what it believes to be the interests of the public.

So far as the eye can judge, the light coming from glow lamps supplied from ordinary direct or alternating current circuits is the same. A very simple experiment will, however, show that there is a notable difference between the two. Take a round disc of cardboard and divide it up into white and black sectors alternately. Fix it on the top of a cork in the lower end of which is stuck a wooden match with a sharp end, thus forming a kind of teetotum. On spinning it round the top of the disc will appear of a uniform grey colour. If it is now illuminated by light coming from an alternating current lamp, preferably one of low candle power, at a particular speed, the sectors will appear to rotate rapidly; they will then slow down until they appear stationary, and after rotating in the opposite direction, will finally disappear, and the disc appear uniformly grey, as it did at the start. This proves conclusively that the filament of the lamp varies in brightness with the frequency of the alternating current. It is well known to electricians that the light from an arc lamp supplied by alternating currents behaves in a similar manner, and it has been used in practice to tell when

The Light from  
Alternating  
Current Lamps.

a dynamo has reached the same speed as the other dynamos in the central station. The spokes of the fly-wheel dynamo illuminated by the light from the station arc lamps appearing stationary when its speed is the same as the other machines. In a remarkable paper recently read by M. Hospitalier to the Société Internationale des Electriciens he describes numerous applications of these stroboscopic methods to the study of the main phenomena of alternating currents, and he exhibited a series of new and useful instruments founded on these methods. By means of one of them, the "Arco-scope," he throws the image of an alternating current arc on a screen and makes it go through all its periodic variations slowly, which in reality it does in the hundredth part of a second. Other ingenious practical instruments he has devised are one which accurately records in ink a curve showing all the variations of the current during the hundredth part of a second, and another entirely novel one showing how the power given out by the dynamo is continually varying, and how during a minute fraction of a second it is actually negative, thus showing that the circuit restores to the dynamo a fraction of the work it receives. These instruments, though designed primarily to help electrical engineers in their every-day work, are obviously of great educational value, and doubtless the coming generation will wonder at the ignorance of vital points in practical theory displayed by electricians at the end of the nineteenth century.

Old Sites and  
New Buildings,  
Shepherdess-  
walk.

A NEW police station, erected after the designs of Mr. J. Dixon Butler, architect to the Receiver for the Metropolitan Police District, and accommodating thirty-four constables, has been recently opened in Shepherdess-walk, Hoxton. The new buildings stand on the sites of the Eagle Tavern and the Grecian Theatre, formerly Day's Saloon, which, after many vicissitudes of fortune, was pulled down in the winter of 1899-1900. The Eagle Tavern had been erected on the site of the Shepherd and Shepherdess teagardens, near Wenlock Barn — cited in "The Picture of London for 1803." In 1841 Thomas Rouse built the adjoining theatre, which was reconstructed and enlarged for Benjamin Conquest seventeen years afterwards. His son, George Conquest, in 1866-7, built a larger playhouse—having a total capacity for more than 4,000 persons—with a stage, including the scene-dock, 60 ft. in depth. The site of the dancing-hall was taken for the new theatre, built by John Garrud, of Spitalfields, contractor, from J. T. Robinson's plans and designs, of which we published the interior view, with a plan, on November 3, 1877. In August, 1882, the premises were leased to the Salvation Army. Three years ago the Charity Commissioners framed a scheme in respect of the Bishopsgate Foundation Charity for the grant of building leases of the Eagle Tavern, the site of the Grecian Theatre, six almshouses, and some adjacent property fronting Nile-street and Shepherdess-walk, at annual rents amounting to 3,500*l.*, the lessee being required to expend in building a sum to yield a rack rental of 17,500*l.* per annum. An Act passed in March, 1898, empowered the Receiver of Police, by an order of the Secretary of State, to acquire a portion,

39,076 sq. ft., of the property, for a ground rent apportioned at 895*l.* per annum. The then lessee under the Commissioners claimed a large sum, varying from 16,000*l.* to 21,000*l.* The matter was referred to arbitration, and in the result Mr. Balfour Browne, K.C., as umpire, assessed the value of the police-station site at 8,375*l.*

THE old parish church of St. Dunstan's Church, Stepney, to which the fire of last Saturday morning did so much damage, had been reopened on December 7, 1899, having been closed during nine months for some extensive repairs and alterations, carried out by Messrs. Dove Brothers, under the directions and superintendence of Messrs. J. E. K. & J. P. Cutts, at a cost of 5,427*l.* The repairs included the re-flooring, reseating, and removal of the galleries, and the organ (by Bryceson, 1872) was rebuilt and enlarged. The church was restored in 1847 by Benjamin Ferrey, and in 1872 by Arthur Shean Newman and Arthur Billing. The fire, which it is conjectured originated in the heating apparatus, has consumed the vestry, the organ and organ loft, and the greater portion of the nave roof. Other parts of the fabric, together with the great east window, have suffered considerable damage by heat, smoke, water, and breakage, but the monuments escaped from injury. The church was rebuilt in the later half of the fifteenth century, its predecessor having been erected, says Matthew Paris, by Archbishop Dunstan in place of one that had been dedicated to All Saints. After Dunstan's death and canonisation, his church was re-dedicated in his name. Hatton records (1708) that a west porch was added in 1612. The fabric is of stone and flint, with a low buttressed tower and embattled parapets. As some of the insurance (11,000*l.*) on the church is unavailable for the injuries to the fabric, it is expected that more than 2,000*l.* will be required, over and above the insurance, to make them good.

The London  
Sketch Club.

WE were at first under the impression that the seventh exhibition of the London Sketch Club, now open at 175, Bond-street, was a distinct advance on its predecessors; but it seems rather that the best works have been hung among the earlier numbers of the catalogue. Mr. Lenfesty's "Storm" (1) and "The Bridge" (7), are very fine examples of broad and powerful sketching of open air effect and wild skies; and Mr. Lionel Edwardes's two studies of horses (4, 12) are admirable in their kind. There is rather a decrescendo as we get further on. Mr. Clifford's "The Village by Moonlight" (28) is a very good piece of light effect, but rather too obviously imitated from Mr. Thaulow. "A Breezy Day" (51), by Mr. Walter Fowler, a kind of De Koenig landscape effect, is powerful; Mr. Wadham's "Gorseland" (66) and Mr. Lenfesty's "Bosham" (69), and Mr. Champion Jones's "Slaughden" (70) are broad free sketches; Mr. Frank Jackson has a good study of local personages and colour in "Market Place, Etaples" (71), and Mr. Fitzgerald's "The Assassin" (83) looks the part. In Mr. H. T. Clifford's small sketch of "St. Paul's" (114) the circular lines of the dome are in true perspective (which we seldom see in a picture); in Mr. Lauder's "St. Paul's from the Boro'" (149) the build-

ing is not upright; and his sketch of "The Westminster Memorial" (39) the column is not only not straight but far too thin in proportion to its height. It is curious how painters will misrepresent the proportions of architecture even with the object itself before them.

#### THE ARCHITECTURAL ASSOCIATION: ANNUAL GENERAL MEETING.

THE annual general meeting of this Association (the first meeting for the session 1901-1902) was held on Friday evening last week in the meeting-room of the Royal Institute of British Architects, No. 6, Conduit-street, Regent-street, Mr. W. H. Seth-Smith, President, in the chair.

#### The Annual Report and Balance sheet.

The minutes of last meeting having been read and confirmed,

Mr. E. W. Mountford proposed the adoption of the Report and balance-sheet of the committee. The Report states that the fifty-fourth session, which terminated on May 31 last, has been a prosperous one in every respect. The membership shows a substantial increase, and financially the session has been a great improvement over previous years. One hundred and sixteen new members were elected, six were reinstated, and the losses by death, resignation, and other causes amounted to thirty-seven, the total membership on the last day of the session being 1,376. In reference to the newly-formed day classes, the committee trusts that architects will support them by aiding their pupils to attend the studio and lectures during their pupilage. The Premises Sub-Committee has come to the conclusion that it is impossible to take advantage of any desirable building sites that may offer themselves until a substantial premises fund has been formed. It is therefore proposed to take steps towards that end.

Mr. Mountford, in proposing the adoption of the Report and balance-sheet, said that for the first time they were able to congratulate themselves on having an excess of income over expenditure, there being something like 100*l.* to the good. That was very satisfactory, and had all the members paid their subscriptions, the result would have been even better.

Mr. F. T. Baggallay formally seconded the motion, which was then agreed to.

The Chairman said he had great pleasure in proposing a hearty vote of thanks to the Royal Institute of British Architects for its tenth grant of 100*l.* towards the educational work of the Association. The money had been of very valuable assistance in the past, and he did not know how the work would have been carried on but for the help of the Institute. It was just as useful now as ever it was—perhaps more so, seeing the heavy financial responsibility they had undertaken.

The motion having been heartily agreed to, the Chairman proposed a hearty vote of thanks to Mrs. Arthur Cates for having presented to the library a handsome donation of books left by her late husband. It was one of the very best donations that had ever been made to the Association. He believed that Mrs. Cates intended to present them with a handsome book-case to hold the books.

The vote of thanks having been carried by acclamation, a vote of condolence was, on the motion of the Chairman, passed to the relatives of the late Mr. James Brooks. Mr. Brooks was well known by his works, which all admired; they were thoroughly English and good.

Messrs. F. R. Herring and F. H. Swinyard were then elected members, and it was announced that there were fifty-one nominations.

Mr. R. S. Balfour, hon. secretary, announced the following donations to the library:—A collection of about twenty books, presented by Mrs. Brydon; the Annual Report of the Smithsonian Institute; "Designing Ironwork," presented by Professor Henry Adams; "The Architecture of Coriolanus," presented by Mr. R. Phené Spiers; "Greek and Roman Orders" (by Mr. G. E. Mitchell), presented by the publisher, Mr. B. T. Batsford; "Early Renaissance Architecture in England" (by Mr. J. A. Gutch), presented by the publisher, Mr. B. T. Batsford.

A vote of thanks having been passed to the donors,

On the motion of Mr. Balfour, a vote of thanks was accorded to Mr. Edmund Sharpe and his brothers and sisters for a collection of diagrams belonging to the late Edmund Sharpe, for use in the day school, and to Mr. R. Phené Spiers for obtaining them.

Mr. H. P. G. Maule, hon. secretary, read letters expressing inability of the writers to be present that evening from the President of the Institute, Mr. Wm. Emerson, and Mr. G. H. Fellowes-Pryne.

The Chairman then delivered the prizes and studentships for session 1900-1901:—

A. A. Travelling Studentship, value 25*l.*, and silver medal, Mr. J. E. Forbes; second prize, value 5*l.*, Mr. L. G. Detmar; A. A. Medal, value 10*l.* 10*s.*, Mr. G. Drysdale; Banister Fletcher Bursary, value twenty-five guineas, and medal, Mr. T. F. Green; Hon. Mention, Mr. A. C. Bossom; Andrew Oliver Prize, value 5*l.* 5*s.*, D. Anderson, R. E. Stewardson (prize divided), *arg.*; Architectural Union Company's Prize, not awarded; Essay Prize, Mr. G. H. Lovegrove.

*Lectures. Division 1.*—Mr. E. Gunn, A. A. Scholarship, value 4*l.* 4*s.*; Mr. H. E. Rider, Prize, value 1*l.* 1*s.*

*Lectures. Division 2.*—Mr. L. W. Ensor, Prize, value 2*l.* 2*s.*

*Studio, Division 1 (Construction).*—Mr. D. W. Stewart, Prize, value 10*s.* 6*d.*

*Studio, Division 2 (Time Sketches).*—Mr. C. M. Crickmer, Prize, value 10*s.* 6*d.*

*Book Prizes.—Lectures. Division 1: Greek and Roman Orders.*—Mr. E. Gunn.

*Elementary Construction.*—Mr. H. E. Rider.

*English Architecture.*—Mr. E. Gunn.

*Medieval and Renaissance Architecture.*—Mr. H. F. Tasker.

*Elementary Physics, Formulae, and Calculations.*—Mr. D. Anderson.

*Plane and Solid Geometry.*—Mr. E. G. Allen.

*Lectures. Division 2: Materials, their Nature and Application.*—Mr. H. Greenly.

*Construction.*—Mr. L. W. Ensor.

*Drainage and Water Supply.*—Mr. L. W. Ensor, Mr. H. Greenly.

*Ventilation, Lighting, and Heating.*—Mr. L. W. Ensor.

*Measurement, Land Surveying and Levelling.*—Mr. L. W. Ensor.

*Elementary Class of Design.*—Prize, value 3*l.* 3*s.*, and Bronze Medal, Mr. E. G. Theakston; Certificate, H. Hyams, R. E. Stewardson, A. E. R. Gill, W. C. Le Maître.

*Advanced Class of Design.*—Prize, value 5*l.* 5*s.*, and Bronze Medal and Pass for Modelling Class, Mr. A. Wingate; Certificate and Bronze Medal and Pass for Modelling Class, Mr. A. Durst; Pass for Modelling Class, A. A. Carter and E. Brantwood Muff.

The Chairman announced that the conversation would be held on the 25th inst at the Royal Institute of Painters in Water Colours, Piccadilly, W., where the Exhibition of International Art was being held.

#### The President's Address.

The following address was then delivered by the Chairman:—

In doing me the honour of calling me to preside over your interests for a second year, you have imposed upon me the difficult duty of having to address you a second time. To prepare a statement of general principles and of one's own views on various points connected with our art and our profession is a task easy of accomplishment as compared with that of choosing a subject sufficiently interesting to form the keynote of another essay. Not that ours is so prosaic a calling as to be lacking in questions of importance; on the contrary, I suppose there is no other profession which gives birth to so many interesting controversies. But as we are an eminently business-like society, I propose this year to be more directly practical, reviewing our recent work and sketching what I conceive to be the policy of the A.A. in the immediate future.

During the past session we have had to say farewell to the nineteenth century, and simultaneously to the longest reign and to the greatest and best Sovereign that ever occupied the throne of this nation; one who for sixty-three years ruled us with wisdom and personal virtue. Two such events would mark any year as memorable.

As regards our own affairs, it has been a session of unparalleled prosperity, clouded only by the losses we have sustained by death, which has claimed eight of our members in the twelve months, and we know we have just sustained another loss in the death of

Mr. James Brooks. But some men there are whose passing leaves a great void, alters in fact for a time the whole complexion of things. Such men were John McKean Brydon, Arthur Cates, and William Young. The first formally joined us only recently, the last was not a member, but all were warm supporters of our work. We can pay them no higher tribute than to say they possessed that admiration and trust to which their professional attainments as well as their personal goodness entitled them. Brydon was especially one of those who win all hearts. By his death many of us have lost a dear friend. Mr. Cates became a member in 1847, and was hon. secretary in 1852 and 1853, so that his interest in this Association covers more than half a century, and that interest was as direct and influential at the end as in the beginning, for at the time of his death he was a most active member of both the Education and the Premises Committees.

Success has attended all departments of our work. We have added 116 new names to our membership roll, besides reinstating six others, and our financial position at the close of the year has been the best on record.

The "Sketch Book," which for thirty-five years has figured so largely in connexion with the work of this Association, but has been hitherto run by an independent committee, with our indefatigable members, Messrs. William G. B. Lewis, William A. Pite as editors, and Mr. Edgar H. Selby as treasurer and secretary, has, at the request of these gentlemen, been taken over by the General Committee. In recording our debt of gratitude to those who have conducted it so long and so ably, and whose services we are fortunate enough to retain for the most part, I am sure you will agree that under the direct supervision of the General Committee such a periodical ought to become a very valuable property. May I urge members to endorse the Committee's action by supporting it, either as authors of plates or as subscribers?

The past history of this Association is a history of education. In accordance with its traditions we have, during the session just closed, tried to meet the demands of the profession and of the public for better education as far as those demands can safely be ascertained by a careful review of art feeling in the community, and the growing sense in the profession that with us lies in great measure the responsibility for raising public taste in building. This sense of the beautiful can only grow as it is nurtured by observing the objects of beauty it is our function to create. You have, after mature consideration, added to the curricula a day school, and with its opening next week we enter upon a course entailing increased responsibility upon this Association. You are probably all conversant with the general principle of which this school is the outcome, namely, that if a young man is not to waste his employer's and his own time it cannot possibly be a good thing that he should be plunged into a busy office without some preliminary training. It is difficult to imagine on what grounds such a principle can be objected to. We are happy in having secured the services of Mr. Arthur Bolton as head master of this school. In his hands it is sure to grow and prosper as the evening studio has done under Mr. Lewis' direction. We feel satisfied it will receive the encouragement of the profession. Success depends on this. I would urge young men whose bent is towards architecture to enter this school, either directly or by agreement with the principals, to whom they may wish to be attached. I believe most principals of standing will be found willing to give such pupils as may be unable to attend the evening school facilities for attendance, if not regularly, at any rate for two or three terms at stated hours for certain courses they particularly need. Such an arrangement will be as advantageous to them as to their pupils, while those whose minds are not fully committed to this line in life will, by entering the school, have an opportunity of reconsidering their decision in the light of experience.

The *Times*, in a recent article on "The Organisation of University Education in the Metropolis," made the following remark:—"Beyond one or two courses of professional lectures, London has nothing in the nature of a school of architecture. It contains far more architects than any other city in the world and annually adds a large quota to the profession than any other centre. But it leaves them to pick up their art in the old-fashioned way and makes no organised attempt to provide modern

instruction. The result is, whether on the constructive or artistic side, we lag far behind the United States, France, and Germany." The last statement is true, but we may be pardoned for expressing mild surprise that the *Times* correspondent is not better informed as to the opportunities of obtaining a systematic training which this Association presents.

In no better way than by mingling socially and educationally as they do here with a body of enthusiastic fellow students and practising architects can men become emulous of the highest excellence. Nor indeed can they ascertain their own true level except by thus comparing themselves with those less, or more, gifted. All this gives a unique value to our Association as a training ground; and more than this, the control and direction of its educational scheme is in the hands of an executive representing, in due proportion, the enthusiasm and aspiration of the youth of the profession not less than the experience of men who have seen considerable practice. Our list of visitors to the School of Design shows that the best London architects are giving their valuable time in teaching us, while our new Advisory Council contains the names of nearly all the architect members of the Royal Academies of the United Kingdom.

A word here to our students in both evening and day schools. The Committee too often observe a desire to go up for the Royal Institute of British Architects' examination after only a few months' direct preparation. This means cramming; cramming means working at high pressure, and high pressure, as surely as a neglected education, spells failure; not perhaps in passing the formal test, but in practical success in after life, which every student will admit is the real goal of professional education, though he may not have grasped the logical conclusion of that admission. The Architectural Association will, I hope, never be a party to this sort of thing. You must go elsewhere if you want it. It is not education at all. Passing the examination will make a man neither a skilled draughtsman nor a good builder; but if he masters these essentials his success is assured, and they can only be attained by a long and patient course of work, systematised as carefully as it has been by this Association. Above all things believe that no system, however complete, can teach you architecture; at its best it can but provide conditions suited to work, and teach you where and how to learn. Your education, viz., your mental development, will be the result of your effort to apply the information offered and to work it out for yourselves.

If the diploma (membership) is sought merely as the Institute's assurance to the world that you have had such a systematic training, as a guide to the subjects which it is necessary to know, and as an incentive to work at them, surely nothing but good can come of the examination which qualifies for that diploma. Let Emerson's testimony to our national character, written fifty years ago, inspire us to-day. In England, he says, "Every man is trained to some one art or detail and aims at perfection in that, not content unless he has something in which he surpasses all other men. He would rather not do anything at all than not do it well. I suppose no other people have such thoroughness."

As our art has a technical basis, this Association, if it is to become the educational power it aims to be, must act upon the universally admitted dictum so well expressed recently by Sir John Gorst, that technical instruction cannot possibly be assimilated by a student unless a proper foundation has previously been laid by a thorough grounding of elementary and secondary instruction. Surely this is also true of art. The more thorough an artist's general education, the more alert will be his mind in all directions and the more rapidly will he appropriate and assimilate the special knowledge needed to fit him for his chosen life-work. I therefore hope that the Committee will before long see their way to make admission to this day school conditional upon passing the Royal Institute of British Architects' preliminary examination or its exempting qualifications. And what is true of a broad grounding in general education in youth is equally true of early professional training. You must not specialise until you have some knowledge of every subject essential to the practice of every ordinary architect. The Association has been most careful not to introduce into its curricula any subject which does not come under this category. We might just

as reasonably continue to educate our youth in the old style as attempt to convey the Metropolitan water supply in the good old wooden pipes we have just removed from the adjoining street.

Perhaps the most striking contribution during the past year to the discussion of this great question was Professor W. R. Lethaby's paper read before the Royal Institute of British Architects, entitled "Education in Building." It is an able history of the conditions under which architecture was carried on in the Middle Ages and up to the time of the Renaissance. He exhorts us by every means within our reach to encourage a high standard of practical excellence on the part of our executants (the British workmen), and to see to it that we ourselves not only understand building construction as the ABC of our profession, but that we endeavour to bring about a more co-operative spirit as between architect, builder, and mechanic. I hope all will read his delightful paper. But even supposing the buildings of those times were not under the control of a "magister" who designed and commanded, but were the creation of an "operator ipse magister," as contended by Professor Lethaby, he appears to us to under-rate the effects of the vast social and educational change the whole community has undergone since the days of which he writes and the impossibility of adjusting the old customs to modern requirements. Then it was only the King, the clergy, and the nobility who were patrons of the building art. We now have a very numerous and educated upper middle class who can afford to build. Their travelling and knowledge makes them critics in the matters of art, and anxious to imitate the ancient work they have seen.

All this has resulted in a demand that those they employ to design and direct their projects shall be of their own class; shall know more than they themselves of the history and structure of these admirable works of old; and shall build with an approximation to the same feeling; shall, in fact, be scientific where they are dilettante. Professionalism is the expression of this demand for a high standard of training. Professional men, including those whose function is design and draughtsmanship, have come to stay. They form a large section of the upper middle class, and they are largely employed, not only by those of their own and of higher social status, but also by the numerous bodies representative of all classes alike who prefer to be advised (in carrying out complicated architectural problems unknown to medievalists) by men who have been thoroughly trained, through long years and at great cost, in the art of planning and in the knowledge of building construction, rather than by mechanics, whose blunders, inevitable where several trades are working without a general superintendent, would not be tolerated in these days of scientific method and exactitude.

It is a fault in our training that our pupils are not on the works enough, and that we do not specialise enough. Highly-trained men, with a diploma from a guild or an institute or what not, ought really, if our building is to be of our best, to confine themselves to design and the supervision of building construction, and not to meddle with surveying, valuations and dilapidations, bills, &c., work which certainly does not savour of art. When as a profession we are more thoroughly trained, and when our occupation has obtained legal protection from the competition of unqualified persons, we shall be in a position to adopt more generally this higher standard of work. And when the last of these conditions is established, the first will naturally follow and the public will employ us more generally.

The absolute necessity of some protection of the title of *architect* and its confinement to duly trained men is being more widely felt every year. In addition to the striking unanimity of continental professional opinion which I mentioned a twelvemonth ago, we now have the weighty and closely reasoned pronouncement of the President of the Institute in favour of something of the kind. A law has just been passed in California with this purpose, and I am convinced that the majority of provincial professional opinions in this kingdom is in favour of it. The Institute's policy, moreover, since the establishment of the examinations is incomprehensible and illogical, excepting as based on this principle. After all, the proposal is only that the State should give us a justly

acquired right to the expensively acquired skill and knowledge which it demands in the same *spirit* as it did to the medieval guilds, but in the *manner* dictated by the political and social conditions of to-day.

Gentlemen, if this Association is not to experience a serious check in its useful career, we must now apply ourselves heart and soul to settling the vexed question of new premises. This may be done without undue labour if we all put our shoulders to the wheel, but not otherwise. I need not utter a word to you as to the urgent need for extension. We have completely outgrown our accommodation, and shall go on wasting money every year in trying to fit our square needs into round spaces until we can find suitable and sufficient room elsewhere. You will recollect that after many years' search for premises adaptable to our wants we abandoned the effort as impracticable, and for the last twelve months or more we have devoted much time and thought to finding a site suitable for erecting a building such as we want. One such came before us this last summer, but it would have involved a capital expenditure of at least 18,000*l.* (including the premium for the existing lease); and the impossibility of ascertaining how much we could collect towards this before it was necessary to close with the offer convinced the Committee that there was no other course than to make an appeal for funds this autumn, and thus be prepared to take up the next suitable site which may come before us.

Freehold we are unlikely to be able to get even if we could raise capital enough. Ground rent, with rates and taxes, repairs and insurance added, are all we can at present afford to pay out of annual income. We must, therefore, be prepared to collect the whole cost of building and equipment, and other expenses, a sum amounting (according to the two last building schemes gone into by the Premises Committee) to at least 20,000*l.* This estimate allows nothing for luxury, but would provide merely a simple building well designed to suit its purpose. The Committee believe they already see their way to something like 3,000*l.* within the next three years, including specific promises they have received.

If every member of the Association would kindly undertake to collect (not necessarily to give) at least a guinea this session we should have made a start, without external help, to the extent of about 5,000*l.*—a satisfactory guarantee of our enthusiasm and determination to have premises worthy of the work we are doing. It is, after all, the public more than the profession who will benefit by this encouragement of architecture in London, and we need not be shy in asking the support of our friends in so good a cause. When technical education is being so well endowed by private and public liberality art surely may claim its due share. Supposing our anticipations are realised so far, there ought to be no great difficulty in raising another 5,000*l.* from other sources within the present session, and with 10,000*l.* we might go forward in anticipation that a scheme so well inaugurated would be the best further appeal to the liberality of the profession and lovers of our art, and we might then reasonably expect to open our building free of debt within three years from the present date.

You may recollect the anecdote relating how Sir Thomas Lawrence offered his cartoons by Raphael and Michelangelo to the Oxford University for 7,000*l.* The offer was accepted, and the Committee, after collecting 3,000*l.*, called on Lord Eldon asking for roof. He put down his name for 3,000*l.* They told him they could easily collect the remainder. "No," said he, "your men have probably collected all they can spare; I can as well give the rest," and he wrote another cheque for the whole 4,000*l.* There are Lord Eldons still in existence; let us hope they still retain enough interest in art to put this great educational effort on a broad basis, for who knows how many Michelangelos, and not mere individual efforts of their prototype, they may thus bestow upon their country!

One of the greatest thinkers of the nineteenth century\* directs our attention to a point which should encourage and stimulate us as individual students as well as an Association of Architects, viz., that "in proportion to the excellence of any form of being is its progress tardy and its cycle fast." He says:—

\* Compare the different faculties and feelings of

the individual mind. You find them appear in the order of their excellence, the noblest approaching their maturity last. Sensation, which belongs to man in common with all other sentient beings, is the endowment of his earliest days. Memory, which simply prevents experience from perishing, which furnishes language to the lips and preserves the materials of the past for future treatment by the mind, ripens next. The understanding, which makes incursions and wins triumphs in the fields of abstract truth, is of later origin; while the great inventive power, which distinguishes all genius, which seems to sympathise with the devising spirit of the artificer of things, to apprehend by natural affinity the most subtle relations he has established, and from old and gross material to create the useful, the beautiful, the true, is the last, as it is the rarest and most glorious, of intellectual gifts."

Elsewhere he shows that the same principle applies to the works created as to the mind which originated them, thus:—

"As every great sentiment of the human mind shapes itself into expression in some form of art, it is fair to infer that a passion which has left no durable memorials . . . cannot have wielded any great power. In measuring the art of any people, you find the proportion of their nature; for precisely here it is that the mind transcends the rule of mere utility and works to the scale not of any outward need, but of an inward affection that must come forth, and the deeper and more durable the feeling the less perishable are the monuments it creates. What, then, are the remains which you can study in the land of the Cæsars or the Romans? The first obvious fact is that the buildings devoted to the convenience of the body are for the most part gone; while those that represent ideas of the mind are standing yet. The provision for shelter, the places of traffic, the treasures of wealth, the home of domestic life . . . have crumbled into the dust . . . but the temple answering to the sense of the Infinite and Holy, the rock-hewn sepulchre where love and mystery blended in a twilight of sunrise; the column or the bust of civic praise, grateful for services to the commonwealth; these survive the shock of war and the waste of centuries, and testify that religion, love, and honour for the good are inextinguishable. . . . Suppose the ages to have done their work on this great metropolis and buried all but its most durable remains. . . . There are the same great monuments of our humanity repeated still. . . . but in the midst of them you discover vestiges to which Greece and Rome present no parallel. . . . Here we have a new sentiment—of sympathy with defective and suffering humanity, which in heathendom has left, so far as I know, not one memorial of itself, and which now vies in the solidity of its creations with the most ancient passions of the soul. . . . Examples these of the Christian sense of the infinite worth, there is in man—his sigh for what he ought to be, his grief for what he is; his faith that the meaneast is but the highest in germ; his vow to clear every burden from the lot, to clear every film from the mind that makes his poor brother seem less than a Son of God."

Yet as students we chafe under the long and patient training required to educate this high faculty, and as a class of artists we sometimes allow our enthusiasm to suffer because national taste is so slow in developing. No one will deny that the art of the European Renaissance is a higher and nobler thing than that of the New Zealand Maoris, or assert that the art of Greece was produced *in spite* of the high intellect and civilisation of that people. Let it suffice that we are progressing and that time must be allowed in proportion to the excellence of our art. To us belongs only the responsibility of doing our best by cherishing at all cost the highest ideals and cultivating our personal talents to their utmost capacity.

Professor Beresford Pite, in proposing a vote of thanks to the chairman for his interesting and suggestive address, congratulated the Association on its state of unexampled prosperity. Having had some little experience in the affairs of the Association, he was overpowered by a knowledge of the present state of their financial affairs. With a membership of over 1,300, and an annual subscription of from half-a-guinea to a guinea, there was a balance on the right side of 500*l.*, and it was very much to be hoped that that condition of affairs would continue. He also thought that the Association was to be very warmly congratulated upon the drawings which were exhibited that evening. He did not think there could be any doubt that the standard of work in the classes and in the annual competitions had greatly improved in recent years. The Association was very much indebted to those kind friends who helped as visitors, and were really sources of inspiration in the School of Design. The

Association was to be congratulated most heartily upon having a number of able and busy men who sacrificed time to visit the School, not for the purpose of teaching design, but to criticise the designs which the students produced. These student designs really gave an idea of the general progress of design in the profession, for, after all, they were produced by men working in architects' offices, and they represented to a great extent what were the current ideas in the profession. About one part of the address they had listened to he would like to take exception to, for it was an important matter to them as an Association—probably more important than the broader question that had been touched on. The President said, "yet as students we chafe under the long and patient training required." He (the speaker) was sorry if that was so. His own view of a student's life was that it was anything but "chafing." He could not understand a student working unless he enjoyed his work in architecture, and if the student did not he had better give it up, and go in for the examinations of a profession more congenial to his taste. Unless a student had enthusiasm imparted to him, or unless it were created in him, he was an unlucky fellow, and then it was that he "chafed under a long and patient training," especially when he saw other students bound ahead and, aided by divine enthusiasm, produce magnificent designs which won prizes. It seemed to him that all schemes of architectural education would fail of any real benefit to the profession unless they aimed at cultivating within the student this faculty of genuine artistic enthusiasm for architecture as a fine art. Students could design without the limitation of clients' requirements, without the bothers connected with estimates, builders, &c., and that ought to give real delight to students. He could assure those who had been studying in the Class of Design that they had been spending what would prove to be some of the best days in their professional life. In designing for a cantankerous client there was nothing like the pleasure that there was in the preparation of designs which were to be criticised by friends. The cultivation of enthusiasm was a difficult subject to dogmatise about, because enthusiasm came in so many ways to different men. It might come at home in England while practising sketching in villages and country towns and getting that wonderful fever for admiring everything that was old. They could look about their own town and district and take an interest in the buildings and in those who built, and then they would begin to feel some enthusiasm for even the commonplace buildings of their own district. They should also cultivate enthusiasm for the great men, and "take up" the life of a great man and work through it—the life of Cockerell, Burges, or some of the men of the Renaissance. Study their work; watch the development of their designs, and with some amount of hope that one day you will have some such opportunities that they had. Try and see in their work your own, and try and get personal enthusiasm to spring up." It was perfectly true that we could not afford to educate in the old style, but somehow or other the old style produced good results. How was it that men who were great architects when there were no schemes of education did such incomparable work, which was so complete in every detail, and showed such perfect mastery of everything? It must have been because of some underlying spirit which we wanted now. The Association was a body of young men most of whom were working in offices where good men did bad work; and the Association gathered all together under its wing and helped them to cultivate the art of architecture apart from office principles. Let them make the most of that—of the ordinary meetings, the visits to works in progress, the country trips, &c.; they were all of great use to students. They should not be easily satisfied with themselves as students or as architects. There was a great deal of truth that the architects' best friend was his indiarubber; still, the work they rubbed out was often their best work, and it was work they never got paid for. They should rub out persistently, for the true artist was never satisfied with himself.

Mr. Francis Hooper, in seconding the vote of thanks, said he thought the thanks of the meeting were also due to the ladies for their presence that evening. He heartily agreed with Professor Pite's remarks as to "chafing

under long and patient training." If present-day students had as happy an experience as he (the speaker) had in his early A.A. days, they would not chafe under their training. He hoped Association students appreciated their opportunities of meeting men of experience prominent in their profession, who gave up valuable time to help younger men in their studies. In regard to the practical part of the work of an architect, it should always be borne in mind what was the object of their work. Take a building erected to the service of God—did it help the work for which it was erected? Take a Government or municipal office—to what extent were the officials indebted to the architect in the planning and arrangement of the building? Were the premises of the business man favourable for carrying on his business, or did the hospital-buildings aid the beneficent work of the doctor? To what extent were the cottager or housewife helped or hindered in their work by the houses they lived in? Was it not a patriotic thing for architects to have as a stimulus, in even the humblest work they undertook, the idea that they were helping human beings to do their work better, to be better citizens, to serve their country better? As to the finances of the Association, he had held the office of Hon. Treasurer so short a time that credit for the favourable balance was due to others. He hoped the fact that a member of Council of the Institute had discovered a balance on the right side would not induce the Institute to think that the Association no longer needed help. The annual donation from the Institute had been a great help to them in the past, and if new premises were to be found for the Association, as they should be, all the help they could get would be needed in the future.

The vote of thanks having been heartily agreed to,

The Chairman, in reply, said he hoped they would never think that he deprecated or underrated in any way the great importance of enthusiasm on the part of students of the Association. What he meant by chafing under long training was this: he had noticed a tendency in some very enthusiastic men, who were sure to do well on the art side of their work, to chafe under the necessity of thoroughly mastering building construction, and to go on producing designs which were thoroughly impracticable in planning and construction. It was against that that he entered a protest. As to great men designing beautiful works in the past without systematic training, that was perfectly true, but great men would be found in all periods, and to great men nothing was insuperable, for they could overcome any difficulties or disadvantages which might beset them. The Association trained the generality of men, and, as all men were not geniuses, one had to be very systematic to economise time in this busy age, and that was done by the progressive courses arranged by the Association.

The meeting then terminated.

The next meeting of the Association will be held on November 1, when Mr. Alexander Wood will read a paper on "Cambridge in Early and Medieval Times."

#### ARCHITECTURAL ASSOCIATION SCHOOL OF DESIGN: PRELIMINARY MEETING.

THE preliminary meeting of the Architectural Association School of Design was held at No. 9, Conduit-street, W., on October 15, the President, Mr. Seth-Smith, being in the chair. There was a good attendance of between fifty and sixty members, Mr. Macvicar Anderson and Mr. Statham having accepted the Committee's invitation to give a short address to the students. The President briefly called upon Mr. Anderson, who first said that he considered it an honour to address them, but he should explain that he had only been asked for an extempore address, and consequently had no written notes. He began by saying that architectural students had two advantages over older men—the advantage of youth and the hope of influencing the architecture of the twentieth century. The man in the street, if called upon to define an architect's work, would probably only think it meant designing, say, a front elevation. But we knew that it should include every part and every detail; and, in his opinion, the most important point of all was panning. He

called it the art of planning, viz., to arrange a plan conveniently and well, and, in the case of a country house, with due consideration to aspect and prospect, and with rooms in their proper relationship to each other. He instanced the Law Courts as a fine building, practically ruined by an inconvenient plan, for which, however, the architect, Mr. Street, was not to blame, as the plan was dictated to him. The speaker went on to warn students against departing lightly from established rules which many generations of mankind have sanctioned. He instanced the Orders, and maintained that it was impossible to improve them; and the established modes of setting them out. But some students were not content to take past ages as a guide, but in the desire to be original made over-bulging entases and other monstrosities which generally had a most ungraceful effect. He did not want them to imagine that they were not to exercise ingenuity and originality, but that beauty must not be sacrificed to originality. In effect, we must design in purity and simplicity, and in public buildings with symmetry. In conclusion, we must set before us lofty ideals and try to attain to a high standard. Unless we did this we should never rise above the ordinary level. We must thrash out and be critics of our own work, and then, by our lives and work, we might improve the century.

Mr. Statham then read a paper which will be published in full in our next issue, with some diagrams, and of which it is therefore unnecessary to give a *résumé* here.

The President then touched upon points in the two addresses, and said that the Association's endeavour was to train men of ordinary average ability for the work of life that they might become good and effective architects holding a high ideal before them. He proposed a hearty vote of thanks to Mr. Anderson and Mr. Statham for their great kindness in coming and giving them the benefit of their experience and knowledge. This was carried by acclamation and after Messrs. Anderson and Statham had briefly replied, a very successful meeting terminated.

#### MANCHESTER SOCIETY OF ARCHITECTS.

THE following forms the most important portion of the address delivered to the Manchester Society of Architects by the President, Mr. A. Darbyshire, at the opening meeting of the session on the 10th ult. :-

"Having briefly attempted to describe the contrast between the architectural epochs of the middle of the last century and of the present time, it will be well to point out some of the defects (which have arisen, perhaps, as natural consequences) in the practice of architecture of the present day.

As a matter of fact, increased numbers generate competition, and with a larger market of architectural practitioners the general public is apt to treat the relationship with the profession from a commercial point of view. Any sympathy with sentimental conditions which may have existed in bygone years entirely disappears. For example, if a building has to be altered or enlarged (although recognised as a satisfactory work, and its author still living), the work is ruthlessly given to a stranger. Some years ago many of us have smarted under this treatment, but now the custom is general, and we accept it as a matter of course, and as evidence of the new commercial order of things. Again, it was the custom in times past, when any work of consequence requiring special knowledge had to be realised, to consult the architect who by accident or inclination might have shown a capability for such work. Nowadays a general competition must be instituted, and hundreds of men must throw away their brains and money in a hopeless effort to win the prize and to achieve renown. Yet another instance of the new order of things: An architect was awarded some years ago—and justly awarded—the first place in competitive designs for a cathedral. The work was postponed. Now it is to be taken up again, and quite recently it has been decreed that a new competition is to be held, and the man who had proved that he was pre-eminently qualified for the work has been set aside. Such is the sweeping policy which ushers in the twentieth century. It seems almost a waste of time to write or talk about this system of

competition. Until very recent times the methods employed were disgraceful, and unworthy of those who used the system to take advantage of professional talent. It is, however, satisfactory to admit that improvement has taken place in recent years in the conduct of architectural competitions, but until competition is limited, each competitor remunerated, and the result adjudicated by a thoroughly competent and honourable architect, the system will remain incomplete and a scandal to our present state of civilisation.

Although I entertain fixed and strong convictions on this matter, I will modify what I have said by this remark. If it were possible by the means I have mentioned to secure genuine and honest results, then any dormant talent might be developed, and reputations made through the medium of competition. Genuine assessment is clearly the pivot on which such a result is to be turned.

I will now offer a few observations upon one or two matters which I think of interest and importance to us as a local society and as practical architects in a great provincial city.

The members of this Society are, no doubt, all cognisant of the fact that the Corporation of Manchester has determined to establish a municipal office of architecture to be presided over by an official who is to be styled 'The City Architect.' I doubt whether we have yet fully realised what this action will mean, or how much will depend upon it. What sort of a man is to hold the office, and with what powers is he to be invested? Is the City Architect to decide the future artistic development of architecture in the city, in addition to the technical points which may arise in the future? If the answer is in the affirmative, it will be evident even to the non-professional mind that the acceptance of such a responsibility involves the appointment of a man of high culture and great artistic knowledge. Again, does the contemplated appointment involve the designing of all public buildings and edifices under the control of the Corporation? If such should be the case, the profession would suffer materially. I venture, however, to think that a result of this kind is not contemplated by the Corporation. I fully appreciate the desire of the Corporation to appoint a City Architect, and I would have him invested with power to condemn all ugliness and purely commercial street architecture, but it would be undesirable to place the future architecture of the city entirely in his hands. Such a decision would be the death-blow to variety of architectural treatment, and the future civic architecture would be 'cribbed, cabined, and confined' to one line of thought. The proposed appointment of a City Architect seemed of such vital importance, that the Council of the Society after careful deliberation resolved to approach the Corporation on the subject, and the following resolution was forwarded to the Town Hall authorities :-

"That this Council hears with pleasure of the intention of the Manchester Corporation to appoint a competent architect as architectural adviser to the Corporation, and would respectfully suggest that this appointment should not prevent the Corporation giving to practising architects all works of architectural importance which they may in the future contemplate, this suggestion being made by them both in justice to the architectural profession [practising in this city] and as a means of securing more varied architectural treatment than would be possible if all designs emanated from one source, and this Council will have much pleasure in furthering the views of the Corporation in any way that it may consider desirable."

In reply to this resolution, communications have been received from the Town Clerk and the Lord Mayor, to the effect that it has been placed before the Committee with whom the appointment of City Architect will rest, and that no decision has yet been arrived at. Should the Corporation accept the suggestion of your Council embodied in the latter part of the resolution, I need not say that any recommendation or advice will be given with a view to a right solution of a problem involving, as it may, the proper application of our art in the future street architecture of the city.

There is another matter which is of great importance to our local profession, and which requires careful consideration. I allude to the establishment of a chair of architecture at Owens College. The idea of a professor of architecture in connexion with the university is not a new one. It has occupied the attention of some of the elder members of the Society for several years past, but it is only recently that the matter has assumed a practical form, and

that steps have been taken towards the realisation of an ideal which I venture to think would be of incalculable value to our profession in this city. It may be within the knowledge of members that a joint committee of the Society and the College has been appointed to take this matter into full consideration. A set of resolutions have been drawn up by the Committee, which fully explain the object of this important movement.

1. That it is highly desirable to establish in Manchester a School of Architecture on the same general lines as those of the Liverpool School of Architecture and Applied Art.

2. That to give effect to this object there should be a Chair of Architecture in the Owens College with arrangements under which adequate preparation could be given for the existing Honours School of Architecture in the Faculty of Arts of the Victoria University.

3. That in order to provide for a complete School of Architecture, it is essential that there should be co-operation between the city, the profession, and the college. In particular it would not only avoid useless expense and overlapping, but would also tend to efficiency if a large portion of the instruction in drawing and building construction were taken in the Municipal School of Art and the Municipal Technical School.

4. That the above objects could be best obtained by the appointment of a representative Committee and of a single Director, who should also be Professor of Architecture at the College.

These resolutions were signed by the Chairman of the College and by myself, and forwarded to the authorities of the Municipal Technical School and the Municipal School of Art. I regret to say that, after several interviews with the committees representing these institutions, our efforts have so far proved unsuccessful. In point of fact, what they have already done by the appointment of Mr. Stannus as their teacher is sufficient, and they fail to see the necessity of employing any portion of the funds at their disposal for the establishment of a chair of architecture in connexion with the Victoria University. They do not understand how the dignity of the profession would be enhanced, its respect increased in the public mind, or how the bestowal of University honours would affect the future students of architecture in our city and locality. I cannot think that the matter will be allowed to rest where it is; it certainly will not be abandoned. It appears to me that we must fix upon the man best fitted to fill the chair of architecture, and then discuss a method of raising the funds to secure his services, for a time at least, or till such time as a permanent fund can be raised for the endowment of the chair at the Owens College.

There is a point in connexion with the practice of architecture to which I must briefly allude, and that is the collaboration of the architect, sculptor, and painter where works are to be carried out in which an artistic ideal has to be realised, or where a symbolic decorative language has to be used on an architectural foundation. It has always seemed to me that, although the architect provides the medium of artistic expression in his work, it is desirable that he should consult those who have to embellish it with high art adornment in sculptured or pictorial language—in other words, that proper preparation should be made for those sister arts which contribute so much towards the monumental character of architecture. I feel convinced that if a harmonious working together of the architect, sculptor, and painter was made a rule instead of an exception, many mistakes would be obviated and grander results would be realised. This is a subject upon which much might be said and written, and justice cannot be done to it on an occasion like the present.

I trust the coming architecture of the twentieth century may give evidence that the minds of architects are not only constructive, but that they will show an extended culture, and a consideration for the harmonious union of the sister arts with our own."

NEW PUBLIC LIBRARY, FALKIRK.—The ceremony of laying the foundation-stone of Falkirk new Public Library took place on the 12th inst. The building is being erected in Hope-street, and is to provide, besides library and reading-room accommodation, a large recreation-room, which is also intended to be used as a lecture-room. To the cost of the erection of the library Mr. Carnegie has contributed 3,000*l.*, and the site is provided by the Town Council. The architects are Messrs. M'Arthy & Watson, of Edinburgh.

## IS A SCHOOL OF NATIONAL ARCHITECTURE POSSIBLE IN IRELAND?

The above question formed the main point of the opening address delivered by Mr. C. J. MacCarthy, the President of the Architectural Association of Ireland, on the 8th inst. After some general preliminary remarks, Mr. MacCarthy continued:—

"But granted that a School of Architecture is possible and necessary, it may still be asked, Will not your attempt to make it national end in making it narrow and provincial? Is not all great art cosmopolitan? To the first of these questions the answer is an unqualified No; to the second a very qualified Yes.

Nationality and provincialism are as far asunder as the poles, and only a very loose habit of thought could ever confuse them.

As to cosmopolitanism in art, here, too, a confusion of thought exists. All great art must in its origin, in its growth, in its making, be instinct with the spirit of the country which has produced it, and therefore, in the true meaning of the word, essentially national. But there is a sense in which great art is cosmopolitan, for as soon as any nation has produced even one solitary work of really great art, that work belongs henceforth to mankind. The sculpture of Greece is to-day the inheritance and the birthright of every cultivated—I may say of every civilised—man. But none the less is it essentially Greek, Greek in its idea, in its spirit, in its character. And so it is with all great art, for to quote again the words of Mr. Beresford Pile already quoted by our late President in his admirable valedictory address, "Architectural art is but the expression of those influences which go to form the character of a nation."

Now if I were asked to what branch of architecture I looked as holding forth the greatest promise of becoming the foundation of an Irish school, I would unhesitatingly say, to ecclesiastical architecture. It is to the Catholic Church, the Church of the majority in Ireland, rather than to the State, the Municipality, or to private enterprise, that we must look for the material out of which a school of national architecture is to be created.

Perhaps few of us realise what vast sums of money have been spent on the building of Catholic churches within the last fifty years. It would be difficult to estimate this amount, but it must, I think, be reckoned by millions. But although the building of churches shows, I think, no falling off as to numbers, it is a lamentable fact that, from the point of view of architecture, there has been for several years a distinct retrogression. We cannot conceal from ourselves that church architecture in Ireland has fallen upon evil days. However much we may be disposed to blame the leaders of the Gothic Revival in Ireland for having, under the influence of Pugin, adopted the English parish church as their model instead of seeking inspiration from such beautiful examples of purely Irish works as are found in Cashel, Holy Cross, Cong, and Kilkenny, to name but a few, still we must admit that they, at all events, were earnest men, and that their works are remarkable for beauty of design, honesty of intention, and sound construction. Can we say as much of our church architecture of to-day? Is it not, on the contrary, too often characterised by the absence of every one of these qualities? Intricate in design, yet absolutely without interest, the majority of modern Catholic churches are nothing short of a disgrace to the country. Flimsy in construction, ill-considered in plan and arrangement, made ridiculous by ill-placed, senseless carving, and pretentious but absolutely inartistic detail, these churches have been decorated internally in a manner of which literally I cannot trust myself to speak. It is safer for me to quote the words of a writer whose opinion on such a subject is valuable, and whose acquaintance with the facts is unquestioned. In an admirable paper read at what is known as the Maynooth Union in June last, Father O'Donovan, of Loughrea, stated as his deliberate opinion that the decorative work in our churches was without exception 'as bad, artistically considered, as one could possibly conceive. We have,' he said (that is, the clergy of the Catholic Church in Ireland), 'hitherto allied ourselves with the Philistines in art, and have followed the lead of incompetent architects and pushful commercial travellers from Birmingham and Munich.' 'There is scarcely a church in Ireland that has not one or more stained glass windows. In some of the larger churches the

cost of these windows runs up to 3,000, or 4,000, and in almost all cases this glass is, from the standpoint of art, beneath contempt.'

With every word of what Father O'Donovan has said I fully agree, yet I do not despair; on the contrary, I am filled with hope, because I believe that the lowest depth has now been reached; and when things have come to this pass they usually mend. But I have another and a brighter reason for hope. We must not forget that Ireland has a sound tradition, interrupted, but, I think, not altogether lost, of fine architecture, distinctively and peculiarly Irish; while in the decorative arts such as stone carving and metal work, our pre-eminence in the past is almost universally admitted.

I know it has been said that outside the early Romanesque work there is little or nothing distinctively Irish in our architecture, and that the Gothic work of, say, the thirteenth, fourteenth, and fifteenth centuries was largely English. This is, however, an erroneous opinion, and here I will call as witness a writer whose authority can hardly be questioned. I mean Mr. James Fergusson, whose 'History of Architecture' is still the standard work on the subject. Writing of the architecture of Ireland, he says: 'After the conquest of 1169, the English introduced their own pointed architecture . . . but beyond the pale their influence was hardly felt. Whatever was done was stamped with a character so distinctively Irish as to show how strong the feeling of the people was, and sufficient to prove how earnestly and successfully they would have laboured in the field of art had circumstances been favourable to its development.' All the Gothic work in Ireland was, in fact, marked by what Mr. Fergusson calls a foreign (that is, an un-English) character; while the cloisters of Muckross, Holycross, and Kiltconnell are, he says, more like those to be met with in Sicily or Spain than anything in the British Islands.

But perhaps I have said enough about the distinctively Irish character of our architecture in the past. Let me turn again to the present, and more especially to the future, for already I think I can see the beginning of an art revival in Ireland. Though little more than a ripple on the surface of the water, it is there all the same, and indicates, if I mistake not, the onward flow of the tide. I do not care in the least whether you call it Celtic or Irish, there is a movement around us which is national in the widest sense—not in any narrow, or party, or political sense—a movement which has already given us that most astonishing revival of the Irish language, and a revival, less marked, but very real all the same, of music and literature. That this—in the true sense—national movement is certain to affect the artistic life of the country I, for one, cannot doubt. And I think that Father O'Donovan's paper from which I have quoted is a remarkable sign of the times; all the more remarkable when we remember the audience to whom it was addressed. I think it indicates that the clergy of the Catholic Church (who, you must remember, are the dispensers of enormous sums of money on architectural and decorative art) are at last awakening to a sense of their responsibility in this matter, and will no longer be led by the incompetent or careless architect or the pushful art-bagman. If this is so, we may indeed be on the threshold of a brighter and a better era, for, as soon as the general level of taste has risen and the demand for real art exists, the artist and the craftsman will be found to supply it.

If I am reminded that all this is largely a question of money, and that one cannot afford to employ artists to paint the walls and windows or carve the capitals and string courses of every country church, the answer is that half the country churches would be very much better without either carving or painting. If in future we will leave out the Carrara marble altar with its bristling reredos, the vulgar stained glass from Germany, and that impertinent carved oak pulpit from Belgium, and put the money into honest masonry instead, it will have cost us nothing, and we shall have done a good stroke of work for architecture and for Ireland. But when carving and painting are desired, let our first care be that they are not only good, but artistically the best that we can possibly procure, and until we have money enough to do this we must omit them altogether. Think how much better many a nave arcade would look to-day if all capitals had been left in the rough, or if

the money wasted on carving ten badly had been spent upon doing one well. That one capital, well carved, would not only have been a joy to all who saw it, but would have served as a model for the emulation of those who in after years might be called on to carve the rest.

The objection on the score of cost must therefore fall to the ground—if good decorative work is too expensive, we can go without, or better still, of course, we can have a little of what is good, though costly, instead of a great deal of what is cheap, but nasty. It is in this spirit I think that we should look at the question of church decoration, but first, and above all, we must see that our architecture itself is beyond reproach, for though bad decorative work will ruin an otherwise beautiful building, no excellence of decoration will atone for errors of design or detail in the building itself. It is therefore to our architectural design that we shall have to devote our attention in the first instance, if we honestly desire better things. And here I must confess I am confronted by a very real difficulty, for even if I saw the way quite clearly myself (which, indeed, is more than I can pretend to do) it would be impossible for me within the scope of a short paper like this to do more than indicate in a general way the path which we should attempt to follow. As a first step on our road we must break with the evil practices of to-day, and then, turning to the past of our own country for inspiration, let us study in the first place at least the simplicity and dignity so characteristic of our earlier Gothic buildings. Thus and thus only, I think, can we hope to lay the foundation of a really national architecture."

## ARCHITECTURAL SOCIETIES.

ARCHITECTURAL ASSOCIATION OF IRELAND.—The annual general meeting of this Association was held in the rooms of the Royal Institute of the Architects of Ireland, 20, Lincoln-place, Dublin, on Tuesday, the 8th inst. The President, Mr. C. J. MacCarthy, occupied the chair. After the usual business was concluded the hon. sec. read the report of the committee for the Session 1900-1, and the hon. treasurer, Mr. J. H. Webb, his statement of accounts. The prizes won during the past session were then distributed by the President, the prize-winners being as follows:—A. A. I. Travelling Studentship, Mr. J. A. Rockett; Institute Prize, Mr. Charles B. Powell; Beckett Prize, Mr. L. O'Callaghan; Class of Design, 1st, Mr. W. Connolly; 2nd (tie), Messrs. J. K. Vinycomb and H. J. Leask; Class of Building Construction, 1st, Mr. H. Lundy, 2nd, Mr. W. Connolly; Technical Demonstrations, 1st, Mr. L. O'Callaghan; 2nd, Mr. H. J. O'Rourke; 3rd, Mr. F. Morley. The President delivered his inaugural address, in which he dealt with the possibility of establishing a national type of Irish architecture, giving it as his opinion that in the buildings of the Roman Catholic Church in Ireland lay the possibilities of such a movement being accomplished. The greater part of this address we print at length in another column. Mr. Joseph Geoghegan moved, and Mr. R. M. Butler seconded, a vote of thanks to Mr. MacCarthy for his very able and interesting address, which was carried with acclamation.

MANCHESTER SOCIETY OF ARCHITECTS.—On Thursday, 10th inst., the President (Mr. A. Darbyshire) opened the session with an address to the members. Briefly describing the conditions that existed when he was a pupil, the lecturer compared the position and practice of an architect of to-day with that of thirty years ago, and alluded to the great educational facilities now to be obtained by those wishing to become architects. In conclusion the President urged the students to avail themselves of their present opportunities, and spoke of the importance of the study of the human figure. In moving the vote of thanks, Mr. J. B. Gass (Vice-President) emphasised many of the points already alluded to. He also thanked the President, in the name of the Society, for the Presidential Badge bearing the arms of the Society, which Mr. Darbyshire had given them. Mr. E. Hewitt (Vice-President) seconded the vote of thanks, and Mr. Royle and Mr. Ely also spoke. The President briefly responded, and at the close of the meeting the badge, which is an artistic piece of jewellery, was handed round for inspection. It is oval in form and is a reproduction of the seal of the Society in gold and enamel, having the City heraldry correctly

Sketches at Haarlem. By Mr. J. H. Coram.

emblazoned. The title of the Society surrounds the device setting forth the date of incorporation. The reverse will have the date of the gift engraved on it.

The prizes offered to students of the Manchester Society of Architects who have been working at the Technical School and School of Art during the past session have been awarded by the Council as follows:—Mr. C. G. Agate, first prize value ten guineas; Mr. J. W. Ramsbottom, second prize value five guineas.

#### SKETCHES AT HAARLEM.

THESE sketches, from a set by Mr. J. H. Coram, illustrate some of the peculiar characteristics of Dutch Renaissance detail. The dormer window is a very amusing specimen, but certainly to be recommended for imitation, but with a kind of fine unconscious humour about it.

#### ASSOCIATION OF MUNICIPAL AND COUNTY ENGINEERS.

A MIDLAND Counties District meeting of the members of the Association of Municipal and County Engineers was held at Nuneaton on Saturday, October 12. The members of the Birmingham Association of Students of the Institution of Civil Engineers attended by invitation. The President (Mr. E. G. Mawbey, Leicester) took the chair, and among those present were Messrs. J. T. Eayrs, Birmingham; J. Wilcox, Birmingham; S. R. Lowcock, Birmingham; A. D. Greatorex, West Bromwich; Berrington, Wolverhampton; J. Lobley, Hanley; Scourie, Rotherhithe; J. Price, Birmingham; W. Lacey, Oswestry; Dawson, Banbury; Smith, Kettering; and others.

Councillor Horton, in welcoming the members of the Association, expressed the hope that the meeting might be interesting, instructive, and enjoyable.

The President, in acknowledgment, said there were exceptionally important and valuable works for the members to see at Nuneaton. There were few districts which had had greater difficulties to contend with in respect of sewage disposal, and the very admirable way in which they had grappled with and overcome those difficulties deserved all praise. The sewage was a very strong one, yielding over 20 tons of pressed cake per 1,000,000 gallons. The volume of sewage was also large, averaging 750,000 gallons per day for the population of 20,000, served at the present time.

Mr. J. S. Pickering, A.M.Inst.C.E., engineer and surveyor, read a paper on "Municipal Work in Nuneaton." He said the town ranked

amongst the most important manufacturing towns in the Midlands, and its rapid growth seemed to point to a still greater future in importance. It had excellent railway accommodation, and its industries were of a very varied character, comprising collieries, brickworks, stone quarries, sanitary-pipe works, hat factories, iron foundries, fellmongers' works, worsted-spinning, plush, elastic web, ribbon, and other factories. The urban district comprised Nuneaton, Chilvers Coton, Attleborough, and Stockingford, an area of over 10,000 acres. The population in 1891 was 15,246, and the recent census showed it to have increased to 24,095. The rateable value was 100,078*l*.

The Council were now considering the desirability of obtaining a charter of incorporation. The total length of roads repairable by the Council was about thirty-seven miles. Ten and a quarter miles of these were main roads, towards the maintenance of which the County Council contributed 1,700*l*. per annum, under an agreement made for a term of three years.

Tar-macadam roads were made with success, and it was proposed to adopt this type of road more extensively. A road so constructed possessed all the advantages of an ordinary macadamised road, and the additional advantages of wearing longer, being more sanitary, and requiring less scavenging and watering. A tar-macadam road could be made complete for about 2*s*. per super yard, with 3 in. of macadam as foundation and 1½ in. of chippings as topping, including cost of material, cartage to depot, heating and tarring material, scarifying road and removing old macadam, cartage from depot, laying and steam-rolling. Concrete slabs for footpath paving were made by the Council, and could be produced of equal quality to any purchased and at a less cost.

New streets were invariably made and completed (with the exception of the footpath pavements) and taken over by the Council before being built upon; consequently, the usual disagreeable proceedings and disputes inseparable from the compulsory making-up and apportionment under the Public Health Acts were avoided. The drainage of the district was carried out on what was known as the "separate" system. The total length of main sewers (apart from surface water drains) was about fourteen miles, and a further length of four miles was about to be laid for the drainage of an outlying district, and to receive the sewage from a portion of the district of the Atherstone Council, which it had been decided to receive and treat for a period of thirty years at 5*d*. per 1,000 gallons.

A large number of 6-in. ventilating shafts had been provided for ventilation and the street gratings closed, and this system was adopted in all extensions. A provisional order

had been obtained by the Nuneaton and District Light Railways Company for the construction of about 8½ miles of electric tramways on the overhead trolley system. The Council purchased the undertaking of the East Warwickshire Waterworks Company in 1897 for 30,000*l*., the Company relinquishing 10,000*l*. of their capital for the benefit of the town. Since then a further capital of 35,000*l*. had been expended on a new pumping station, filter beds, an additional reservoir, and in extending the mains. The works had been designed and carried out by the author. Considerable difficulty had been experienced in obtaining a water supply. Two deep wells sunk by the late company in the permian strata yielded an insufficient supply, but contained a useful reserve of water which could be utilised in case of emergency. In sinking two new shafts for coal Messrs. Stanley Bros. met with so large a quantity of water that they had to be abandoned, and these had been acquired by the Council, together with three Lancashire boilers, chimney-shaft, and a site of two acres of land for a pumping-station. The water from these shafts was used to supply the district. The erection of the pumping machinery and the new engine-house were now nearing completion. The engines and pumps were in duplicate, and each set was capable of raising 50,000 gallons per hour from a depth of 130 yards and delivering the water to the filter-beds under a head of 120 ft.

The consumption of water was about 400,000 gallons per twenty-four hours. The quantity used for domestic purposes worked out at an average of thirteen to fourteen gallons per head of the population supplied. The head of water in the town was 200 ft.

The question of sewage disposal had been a very difficult problem, particularly on account of the foul character of the sewage, due to the waste liquors from the wool scourers, fellmongers, and hat factories. The existing sewage works were in close proximity to the town, and occupied a site of about six acres. For many years the process of treatment was chemical precipitation and artificial filtration. The results were not altogether satisfactory, and the working expenses were very high. Moreover, the Local Government Board refused to sanction any loan for extensions without the acquisition of land for filtration purposes, and this was not available in the neighbourhood of the works. Upon the introduction of the bacterial system some few years ago it was decided to make a trial of the process. This proved so satisfactory that the treatment was applied to the whole of the sewage, with the result that a very considerable saving had been effected in working expenses. After passing through a screening

chamber the sewage flowed into a pump well 50 ft. in depth. From this it was pumped and delivered into two roughing tanks, each 13 ft. deep and 20 ft. diameter. The sludge deposited in these tanks was lifted automatically to within 2 ft. of the surface by the pressure of sewage. It was then dealt with in two of Johnson's sludge presses.

The sewage then flowed into open septic tanks or coarse contact beds. There were three open tanks, each of a capacity of 120,000 gallons. There was an area of 1,708 yards of coarse contact beds, and in order to test various materials they had been filled with coke, macadam, broken pots, ashes, and broken bricks. A portion of the sewage was treated in a closed septic tank having a capacity of 120,000 gallons. From the open and closed tanks and the coarse contact beds the sewage passed into fine contact beds, of which there was an area of 3,564 yards, varying from 3 ft. to 5 ft. in depth, and composed of coke dust, coke breeze, small coal, and fine granite chippings. From the fine grain beds the effluent passed direct into the river.

Most of the contact beds had been made in excavation with artificial walling, the subsoil being a strong marl. There was no objection to this course if the beds were made watertight, but should they leak from one to the other they were a source of trouble, and the results were not satisfactory. Some of the beds had been in operation for over two years. The coke beds give the greatest liquid capacity, but there appeared to be no appreciable difference in the result as regards the various materials composing the beds. The deep roughing tanks had been found most serviceable for intercepting the grit and other heavy matter. One of these tanks had been in regular use for over four years, and had not been emptied during this period. The closed septic tank had been in use for over two years and had not been emptied. It had liquefied (as far as could be ascertained by measurement) about 95 per cent. of the suspended matters passed through it. The open septic tanks had been in operation thirteen months, and it had been found necessary to empty them and remove the sludge once during this period. One tank was emptied after seven months' working, another after eight months', and a third after nine months'; the sludge from the three tanks producing about 320 tons of pressed cake. Whilst, however, the closed tank had dealt with a daily flow of sewage equal to about 50 per cent. of its capacity, the open tanks had dealt with a daily flow equal to 150 per cent. of their capacity. Both the closed and open tanks had done excellent work, particularly when the unusually large quantity of suspended matter in the sewage was taken into consideration. It appeared to be generally considered an essential part of an open septic tank that a coating of scum should be formed.

After thirteen months' working, however, the surface of the sewage was only partially covered with scum, but the process of liquefaction had certainly been in active operation. It was remarkable how quickly a coating was formed by covering a tank, which had been in use some months, with a light roof of boards. In less than twenty-four hours a scum several inches in thickness was formed. He was of opinion that the treatment of sewage in open septic tanks could not be carried on without nuisance. This might not be a serious objection to their use in some places, but it should be borne in mind. The treatment in a closed septic tank was not nearly so offensive as in an open tank, but the effluent from a septic tank had a most offensive odour when put on to the fine grain beds. In designing either closed or open tanks the fact that the deposited matter must sooner or later be removed and treated should not be overlooked. His experience was that the least offensive method of applying the bacterial treatment was by the Dibden system of coarse and fine contact beds. There was no serious nuisance produced by applying the raw sewage in a fresh state to the coarse beds, and no offensive odours were given off during the periods in which sewage was in contact with the material. The beds were so free from offensive smells that it was found impossible, as a rule, by walking over them to detect which were at rest and which were working.

It seemed to be generally agreed that about two hours was the proper time for the sewage to remain in contact with the material, and this was his experience with the sewage of a

manufacturing town. He was of opinion that the most important matter in connexion with bacteria beds was the question of their reduction in treating capacity, owing to choking up. He had not yet been able to agree with the opinions expressed by some authorities that after reaching a certain stage the capacity of the beds should remain undiminished. The present sewage works having become inadequate to properly deal with the increasing volume of sewage, an entirely new scheme of sewage purification was being carried out by the author. The existing outfall works would be utilised as a pumping station and for the treatment of storm water. The sewage would be pumped to the new site, a distance of about 2½ miles. After screening it would pass through detritus tanks, and thence through coarse and fine grain bacteria beds, and finally purified by filtration through land. The estimated cost of the works was 45,000*l.* The new works to meet the requirements of the Local Government Board were designed to treat a million and a half gallons per day, or three times the dry weather flow.

Upon reaching the new site the sewage would pass through two revolving wire screens 5 ft. in width, having ¼-in. square meshes.

Upon leaving the screening chamber the sewage would flow through three covered tanks of the "Dortmund" principle, which were each 34 ft. deep and 24 ft. in diameter, with a combined capacity of 150,000 gallons. These tanks were intended to intercept the heavy mineral matter, which would be automatically discharged by pressure of sewage in the tanks through a line of 9-in. pipes 450 yards in length to the irrigation area, where it would be delivered into furrows, and deodorised with soil until it finally became incorporated with the land. From the detritus tanks the sewage would be conveyed to the coarse-grain bacteria beds.

Each bed was provided with three inlets, and at each of these a fine screen would be placed. This special screening by large quantity of wool fibre in the sewage. The sewage would be distributed over the beds by means of open-jointed socketed pipes laid over the material. The material for the coarse beds would be broken granite about 2½ in. gauge. After contact in the coarse beds the effluent would be conveyed to the fine grain beds, which would be composed of screened coke dust. This material, although somewhat finer than that generally used, had been found to answer admirably at the present outfall works. From the fine grain beds the effluent would be discharged on to the land, an area of sixty acres having been acquired for this purpose.

Mr. J. Price, Birmingham, moved a vote of thanks to Mr. Pickering for his paper, which was seconded by Mr. Berrington, of Wolverhampton.

Dr. Hostock Hill, Medical Officer for Warwickshire, said the question of septic tanks was one of great interest to all engaged in the treatment of sewage. Although the sewage of Nuneaton was one of the strongest he had ever come across, it was admirably adapted for bacterial treatment. It was strong organically, consisting largely of refuse from woolscourers and fellmongers, and was better dissolved than a weaker sewage. With respect to the choking up of the beds, it was certain that with sewage which contained a fair amount of suspended matter the filters would in time get blocked up. Therefore, it would be advisable to make arrangements for getting over this difficulty.

Mr. A. D. Greatorex, West Bromwich, spoke of the necessity of fixing a meter to all bacteria beds so as to have accurate information as to the amount of the choking up of the beds.

Mr. Watson, Birmingham, thought it would be rather misleading to students present to take Mr. Pickering's dictum that open septic tanks could not be carried on without nuisance as applying to every place. Since he had had charge of the largest sewage purification works in the country, he had introduced open septic tanks, and had passed 25,000,000 gallons of water a day through them without nuisance, and with considerable success.

Other members having spoken, the vote of thanks was passed to Mr. Pickering for his paper.

The members then paid a visit to the blue brick and sanitary pipe works of Messrs. Stanley Bros. Limited, where they were entertained to luncheon, and the afternoon was devoted to an inspection of the new sewage disposal works. On returning to Nuneaton, Mr. Pickering entertained the members to tea.

## APPLICATIONS UNDER THE 1894 BUILDING ACT.

At the meeting of the London County Council on Tuesday the following applications under the 1894 Building Act were considered. Those applications to which consent has been given are granted on certain conditions. Names of applicants are given in brackets. Buildings are new erections unless otherwise stated:—

### Lines of Frontage and Projections.

**Hammersmith.**—Buildings on the site of Nos. 283 to 308 (odd), King-street, Hammersmith (Messrs. Boehmer & Gibbs).

**Woolwich.**—Two-story bay windows in front of Nos. 25, 27, and 29, Westmount-road, Eltham (Mr. G. F. Logsdail on behalf of Mr. A. Cameron Corbett, M.P.).—Consent.

**Holborn.**—An enclosed gangway across Onslow-street, Holborn, to connect No. 87, Farringdon-road with a building on the west side of Onslow-street (Messrs. Lander, Bedells, & Crompton on behalf of Messrs. Falk, Stadelmann, & Co.).—Refused.

### Formation of Street.

**Hackney, North.**—Refusal to sanction the formation or laying-out of a new street for carriage traffic to lead from Mount Pleasant-lane to Comberton-road, Hackney.

### Width of Way.

**St. George-in-the-East.**—Widening of parts of Langdale-street, James-street, and Samuel-street, Stepney, to a less extent than the prescribed distance, and also the erection of buildings in those streets at less than the prescribed distance from the respective centres of such streets (Mr. H. H. Collins on behalf of Messrs. N. & R. Davis).—Refused.

### Means of Escape from Top of High Buildings.

**City of London.**—On the top story of a block of offices known as Finsbury-pavement House, Finsbury-pavement (the upper surface of the floor of which story is above 60 ft. from the street level), for the persons dwelling or employed therein (Messrs. Davis & Emanuel).

**Finsbury, East.**—On the fifth floor of a warehouse building in course of erection at No. 88, Old-street, St. Luke (the upper surface of which floor will be above 60 ft. from the street level), for the persons dwelling or employed therein (Mr. A. Gordon).

The recommendations marked † are contrary to the views of the Local Authorities.

## THE LONDON COUNTY COUNCIL.

The weekly meeting of this Council was held at Spring-gardens on Tuesday, Mr. Torrance, Chairman, presiding.

**Loans.**—The following loans were granted:—2,110*l.* to Battersea for extension of municipal buildings and 6,000*l.* for electric light installation; 4,500*l.* to Poplar for sewerage works; 20,000*l.* to Shoreditch for purchase of land for housing scheme; 4,000*l.* to Stepney for purchase of plant for street watering and sweeping; 3,500*l.* to Kensington for street lighting purposes; 31,320*l.* to St. Pancras for baths and wash-houses.

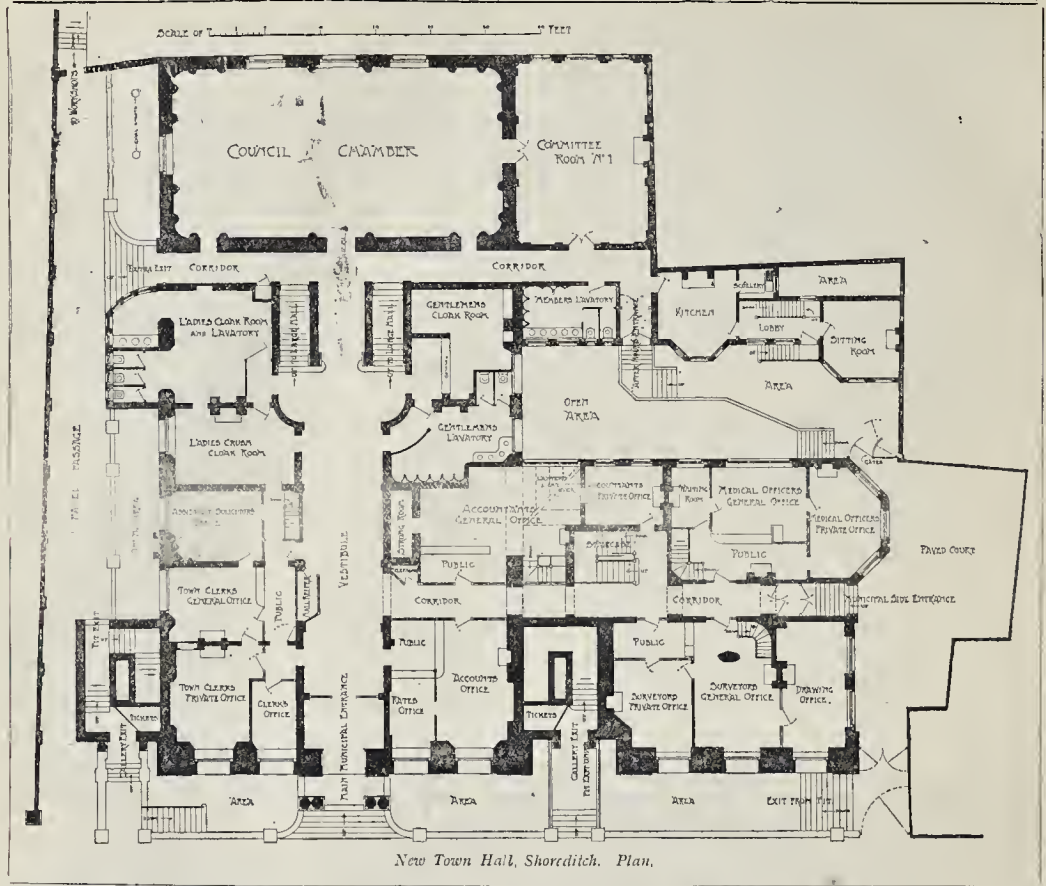

**The Works Department.**—On the recommendation of the Finance Committee 10,000*l.* was voted to the Works Department for the purchase of timber.

**Engineer's Department.**—The Establishments Committee reported the receipt of the resignation of Mr. Edward Bazalgette, District Engineer. It was accepted, and a retiring allowance of 413*l.* 6*s.* 8*d.* a year agreed to.

**The Piccadilly Improvement.**—The Improvements Committee submitted a Report on the circumstances which led to the postponement of the projected Piccadilly improvement. With regard to the alleged intention of the Council to destroy at least sixty trees, the Committee stated that the statement was erroneous; in fact, from the inception of the scheme the Committee never contemplated such an act of vandalism. The Council's plan provided that nearly all the trees should remain untouched on the edge of the new footway, the necessary space being left around them to entirely secure their roots against damage. If the formal consent of the First Commissioner of Works be given within two or three weeks, the Committee proposed to direct the Manager of the Works Department to put the work in hand at once.

**Staple Inn.**—The Local Government and Taxation Committee reported having received from the Commissioners under the London Government Act, 1890, copies of the Borough of Holborn (Staple Inn) draft scheme. This scheme was similar to those affecting Gray's Inn, Lincoln's Inn, and St. Peter, West-

New Town Hall, Shoreditch. Plan.

minster, as far as relates to the levy of the general rate throughout the Inn, to the transfer of the sewers to the Borough Council, and to the retention of the roads under the control of the owners of the Inn. The removal of house refuse was, however, not left to the owners, and instead of the amount to be recovered from the Borough Council in respect of roads being left to agreement or arbitration, the amount was fixed in the Staple Inn case at 50l.

The scheme, with the suggested addition of a qualifying word, was approved.

**Epileptic Colony.**—The Asylums Committee reported that they had accepted the following tenders for work at the Epileptic Colony, namely:—

<i>Electric Light Installation.</i> —Messrs. Benham & Sons, Ltd. ....	£0,252 15 7
<i>Boilers, Pumps, and Fittings.</i> —Messrs. Babcock & Wilcox, Ltd. ....	1,170 0 0
<i>Cooking Apparatus.</i> —Messrs. Morwood, S. and C., Ltd. ....	918 0 0
<i>Fencing.</i> —Mr. R. Nutford (estimated total) .....	1,052 0 0

The four contracts taken, amounting to 9,393l., exceeded the Asylums Engineer's estimate for these works (9,150l.) by 243l., but there was sufficient provision in the amount allowed in the vote for contingencies to cover the excess.

**Housing Schemes.**—Lord Welby stated that the Home Secretary, in conjunction with the Local Government Board, was considering various questions connected with the housing of the working classes, and that he would be ready to receive a deputation from the Council when Ministers meet later in the autumn.

**LECTURES AT CARPENTERS' HALL.**—We are requested to state that the Worshipful Company of Carpenters' examinations on "Sanitary Building Construction" will be held at Carpenters' Hall, London Wall, on November 21 and 23, and not on the dates given in the advertisement in our last issue.

### Illustrations.

#### NEW TOWN HALL, SHOREDITCH.

**T**HIS building, still in progress, is the latest of the new District Town Halls of London, of which no doubt other examples will follow as the local municipal work in the various districts becomes more important and extensive, and calls for greater accommodation.

In the case of Shoreditch it was at first thought that the old building, which, from a political and social standpoint, is historically interesting, should be adapted to modern requirements, but this was found to be impossible, and it was finally decided to buy an adjacent site, upon which should be built an entirely new structure in consonance with the architectural outline of the old one. Competitive designs were publicly invited from architects, and those submitted by Mr. William G. Hunt, of London, were placed first by the assessor and ultimately adopted by the Council.

The work has now been in hand some time, and the facade, which is in best brown Portland stone, is about one half built. The statue in the niche of the tower is to be symbolical of "Progress."

The floors throughout are of fire-resisting construction; an interesting incident in connexion therewith is the fact that the residue from the Borough Council's own destructor, mixed with cement and sand, is utilised for forming the concrete in such floors. Considerable difficulty has been experienced with the foundations of some of the old walls which are intended to be re-used and raised upon, the lower portion of the concrete foundations being found to be very unsound, which may possibly have been caused by the original lime concrete having been thrown into trenches containing matter which prevented its setting.

All the principal Administration Departments are arranged on the ground floor and are self-

contained, each having its own distinct store, record and plan rooms, and lavatories in the basement approached by separate secondary staircases direct from each department. This system has been adopted by the architect in another London town hall, and is found to be of considerable convenience in the prompt and expeditious conduct of municipal business, besides the saving of much valuable ground floor space for more important purposes. The first floor is occupied by the large hall and several committee-rooms (one of them being 43 ft. by 22 ft.), with councillors' lavatories, &c. The heating is by hot air in the large hall and council chamber; hot water radiators in corridors, &c.; and by ventilating grates in the offices.

The quantity surveyors are Messrs. Raven & Crickmay, and the builders Messrs. Kilby & Gayford.

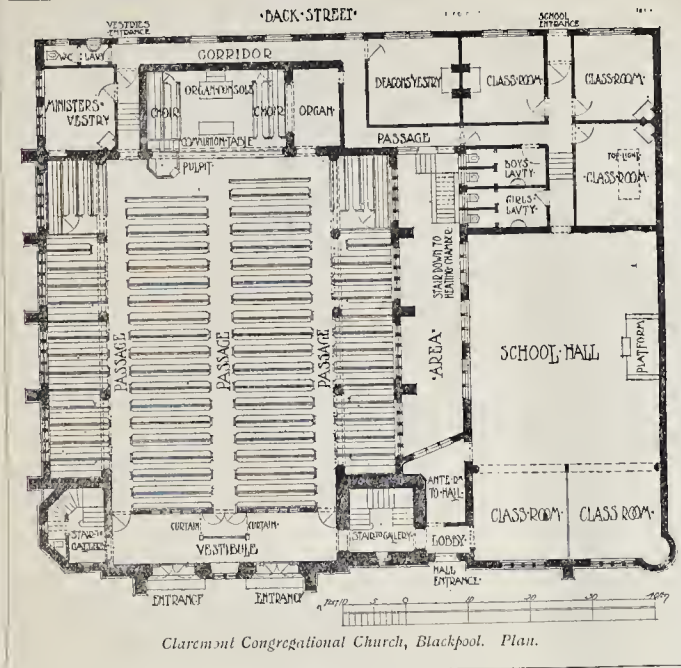

It is not our usual custom to enter into criticisms of the designs and plans that we publish, but we fear that in the present instance we cannot omit a strong comment in regard to the manner in which the ladies' and gentlemen's cloakrooms are planned; the door of the ladies' crush-room immediately facing that of the gentlemen's lavatory on the other side of a not very wide passage. Such an arrangement is worse than unsuitable; it is hardly decent. Attention has been so often directed in our columns to the importance of arranging such rooms so as to keep their entrances completely separated from each other, that we really cannot pass over such an arrangement as this without remark.

#### CLAREMONT CONGREGATIONAL CHURCH, BLACKPOOL.

The plan shows the complete scheme of the building. At present only the nave, tower, and vestries are built, leaving the aisles, school-hall, and classrooms to be added later.

The walls are of brick, faced with local stone parpoints and York stone dressings. The roof

**Books.**

*The Construction of Roads and Streets.* By HENRY LAW and D. K. CLARK, M.M.Inst. C.E. Sixth Edition, Revised, with Additional Chapters, by A. J. WALLIS-TAYLER, C.E. London: Crosby Lockwood & Son. 1901.

AT a time when so much attention has been—and is likely to be—devoted to the question of road-making and the renewal of street pavements, the appearance of the present volume is distinctly opportune. As to the new form in which it is produced there is less reason for congratulation. The original work, written by the late Mr. Henry Law and Mr. D. K. Clark, two well-known civil engineers, was recognised as a thoroughly practical and trustworthy guide, although of late years it could not be regarded as applying in many respects to modern practice. As the preface remarks, "The original authors being both dead, it became necessary to entrust to another hand the duty of bringing it up to date," and the publishers consider themselves fortunate in securing the services of Mr. Wallis-Taylor for the performance of that duty. It is presumably intended to be inferred that this good fortune is due to the intimate acquaintance of the present editor with road construction, but we are bound to admit that we have no knowledge of his qualifications in this direction, except such as may be gathered from the revised edition of the work now before us. We are by no means satisfied as to the desirability of "bringing up to date" the works of authors who are deceased. If preserved in their original condition, the productions of past generations are frequently useful as indications of the stepping-stones by which knowledge has been gradually attained, and they can seldom be adequately modernised without showing signs of patching, or without being "improved" out of all recognition. Examples demonstrating the correctness of this general criticism are, unfortunately, not lacking in the departments of architectural and engineering, as well as of literary work. As for the case in point, we feel sure the public would prefer a new treatise from an expert in modern road-making to the altered and re-decorated version of an old one.

Mr. Wallis-Taylor has been considerate to the original authors. The prelatory "Historical Sketch" by Mr. Clark, and Part I., on the "Construction of Roads," by Mr. Law, are reproduced practically without alteration, and comparatively little evidence is to be found in Part II., on "Recent Practice in the Construction of Roads and Streets," of the "careful revision throughout" promised in the preface. Consequently, the work is not adequately modernised. As an example we may take the first chapter of Part II., describing the "Materials Employed in the Construction of Roads and Streets." No objection can be taken to the original discussion by Mr. Clark of mineral substances, for very little that is new has been learnt about them, but one might expect some recent information as to timber under the sub-heading of "Wood." There is no mention whatever here of the Australian and other woods now so largely employed for street paving, and the tables relied upon to demonstrate the crushing resistance of timber and the endurance of wood-paving are dated 1877 and 1814 respectively. In the next chapter, on "Modern Macadam Roads," some remarks are made as to modern practice in connexion with metropolitan and country roads. These carry the subject beyond the stage reached by Mr. Law in the first part of the work. Nevertheless, it is somewhat curious to find that the most recent development described under the head of "Modern Practice" is an improved country road proposed in the year 1875 by a committee of the Society of Arts. Some details as to the wear and cost of macadam roads are next stated. These are interesting, but eminently archaic, being based upon reports and tables prepared between the years 1831 and 1876, and the price of road metalling quoted is that which prevailed a quarter of a century ago. The value of the data given is further diminished by the fact that they were obtained at a period when the steam-roller was not used in this country. Concrete roads laid in the years 1865-70 are discussed in a brief chapter from which no definite conclusion is to be drawn; and a short

principals are of steel covered with moulded wood ribs and lined between with wood to the form of a pointed vault. The wood dado in the nave is of lining, and the chancel is panelled to a height of 8 ft. The seatings and finishings are of pitch pine, and the pulpit is of oak.

The church is lighted by electricity, and heated by means of hot-water radiators. Seating accommodation for about 440 is provided meantime, but the completed church will seat about 640. Externally the roofs are covered with red tiles, and the whole building is to be surrounded by an open oak paling.

The architects are Messrs. Anderson, Simon, & Crawford, Edinburgh, and the contractor for the general work is Mr. T. H. Smith, Blackpool; carving in wood and stone by Mr. J. J. Millson, Manchester; metal work by Messrs. Thos. Brawn & Son, Birmingham; heating by Messrs. W. Richardson & Co., Darlington; electric lighting by Mr. John Coulson, Blackpool. The total cost of the church amounts to about 5,300l.

**NEW PAROCHIAL BUILDINGS, ST. JAMES-THE-LESS, BETHNAL GREEN.**

The small and inconvenient buildings in which the day schools in this parish were carried on have been superseded by new day schools and parish hall. A part of the site was previously occupied by the boys' school and playground, and the remainder formed part of the churchyard.

Over this a crypt was formed, in accordance with a faculty, and above the crypt a floor of steel joists and concrete covers nearly half the area of the new buildings. These consist of the parish hall, surrounded by five classrooms, which can be thrown into it by sliding back glazed screens, and affording sitting for 1,000 persons.

Girls' and infants' schools are accommodated in these and other classrooms on the ground floor, the boys' school being on the first floor with a separate entrance and staircase. The upper floor contains cookery school and drawing school in the eastern wing, and gymnasium in the western wing.

Red Staffordshire bricks have been used for facing, and Portland stone for dressings. The roofs are covered with red tiles, and copings, mouldings, and panels of moulded brick have been introduced. Two staircases of artificial stone flank this hall and give access to all floors.

Stained-glass and ornamental lead-glazing has been introduced in hall windows and

marble mosaic paving in entrance corridors. The churchyard has been laid out as a recreation-ground.

Mr. E. Hoole is the architect, and Messrs. Coulsell, of Bethnal Green, are the contractors. The heating apparatus is by Messrs. Jones, the electric lighting by Messrs. Sunderland, the gas fittings by Mr. Harris, and the stained-glass by W. Whall, Esq.

Laminated arched ribs have been employed in the roofs of the parish hall and gymnasium, and the beams and buttresses have consequently been dispensed with.

The total expenditure has been 16,000l.

**"HYLAS": DESIGN FOR STAINED GLASS.**

This is a reproduction of a cartoon for stained glass which gained for the artist, Miss Geraldine Morris, a medal in what is called the "National Art Competition" in connexion with the Department of Science and Art at South Kensington.

We are always glad to meet with stained glass treating in an effective manner subjects which are suitable for secular or domestic buildings, as the art has been too much studied as if it were mainly applicable to churches. We cannot help observing, however, that Miss Morris's treatment of the legend of Hylas, a subject essentially Greek, is entirely devoid of Greek feeling; the "nymphs" are mediæval nymphs, not Greek ones. It would have been better to give it another title.

**COMPETITIONS.**

**NORTH LONDON HOSPITAL.**—The Committee of Management of the North London Hospital for Consumption having asked five well known hospital architects to compete for the erection of their proposed Country Branch and Convalescent Home at Northwood, Middlesex, have selected the design submitted by Mr. Frederick Wheeler, of 6, Staple Inn, W.C.

**THE LAND REGISTRY.**—An amended Parliamentary return has just been issued in substitution for the annual returns of which we published an abstract in our issue of September 21. It seems that the returns were at fault in respect of the number of leasehold estates the titles to which had been registered as stated in our issue. The number should have been 8,781, according to the corrected return.

dissertation follows on macadamised roads constructed in France about the year 1843. In none of the foregoing chapters do we find the slightest trace of the modernisation promised in the preface to the present edition. The same criticism applies to the sections dealing with stone pavements in London and elsewhere. Various forms of wood pavement receive more appropriate attention, and here in the hand of the editor may first be observed in the renovation of old material. Prominence is properly given to the principal hard woods employed at the present time for paving purposes. According to Mr. Richards, of Sydney, jarrah and karri are not to be compared with the tallow and blackbutt woods of New South Wales, and it is important to note that the blackbutt imported to this country is the Victorian variety, which is less suitable than the former type. Mr. Richards considers tallow wood to be the best for paving purposes, whilst blue gum is said to be fully capable of holding its own, blackbutt and red gum coming next in order of superiority. Some interesting particulars are quoted as to the forest resources of Western Australia, the authorities being the Conservator of Forests and Sir Malcolm Fraser, the Registrar-General for the Colony. The editor's remarks upon the various processes incidental to the formation of wood pavements appear to be based upon papers contributed in 1884 to the Institution of Civil Engineers by Mr. G. H. Stoyton, formerly of the Public Works Department, Sydney. The superiority of hard woods is wisely emphasised, and soft-wood blocks are properly characterised as unsanitary and expensive. The editor also advocates the adoption of creosoting or other preservative processes, not so much for the increase of durability as for rendering the timber less absorbent and therefore less likely to conduce to unsanitary conditions. This recommendation is worth attention, but the method of treatment adopted should certainly be one that removes none of the natural constituents of the wood, or its last state will be worse than the first.

Passing over the two succeeding chapters, which deal with matters of rather ancient history, we come to a collection of modern opinions on hard wood pavements. Some valuable particulars are quoted from a paper communicated to the Institution of Civil Engineers in 1893 by Mr. W. A. Smith, of the Bridges and Roads Department, Sydney; the "Proceedings" of the Municipal and County Engineers' Association are also freely laid under contribution; and the conclusions of some metropolitan surveyors are stated. All these constitute useful additions to the original treatise, and the editor's own remark that wood paving "should, to ensure sanitary conditions, be kept in a state of scrupulous cleanliness" may well be commended to the authorities, who seem to be impenetrably ignorant of this self-evident necessity. On the subject of preserved wood pavement the only satisfactory report quoted is one by the Surveyor to the Vestry of St. Martin-in-the-Fields, dealing with carbolised wood blocks as applied in Northumberland-avenue and elsewhere in that district. "Other Wood Pavements" are described in a more or less historical manner, none of the records relating to a later period than 1876, except that of Duffy's doweled pavement, adopted by Sir J. Wolfe Barry for the roadways of the Tower Bridge. The practical value of this pavement for ordinary use still remains to be completely demonstrated. There is a good deal of old matter in the chapter on the cost and wear of wood pavements, but at the same time some recent references are to be found, and a series of tables by Mr. Stoyton contains much useful information, though a little out of date.

Chap. xix., on "Asphalt Pavements," furnishes a complete account of the different forms in which this excellent material is found in Nature and employed for the purpose of paving. Speaking of sheet asphalt paving, the editor does well to point out that "the concrete foundation is in reality the paving itself, the upper stratum . . . being only the wearing surface," the duration of the road surface depending largely upon the quality of the foundation and upon the internal combination of the upper layer with its foundation bed. Several patented combinations of rock and Trinidad asphalts with other substances are described, most of these being manufactured in the form of blocks, but very few appear to have proved satisfactory. We observe that the questions of cost and upkeep are judged

almost entirely by the aid of tables contained in a report by Colonel Haywood, dated April 18, 1873. Surely more recent data should be available by this time. A new chapter on "Brick Pavements" is only interesting in a limited sense, because the material is never likely to come into general use for the paving of roadways in this country. When the comparison of carriage-way pavements is reached, much difficulty is experienced in deciding whether the estimates and statistics are those of the reputed author or the ostensible editor. Most of the tables printed date from 1873, and are evidently to be attributed to the hand of Mr. Clark. Statements of cost are given without any clear indication as to whether they be half a century old or of quite recent origin. This is a most serious objection, applying to a greater or less degree to the whole of the present edition. Such words as "the author," "recent practice," "modern practice," "now," &c., and the present tense are used generally without the slightest definition of the person or the period denoted. Whether it is desirable to attempt the rehabilitation of an old work is a matter of opinion; but if the thing is to be done at all, it should be carried out in a clear and intelligible way.

Chap. xxiii., presumably by the editor, deals very fully with footpaths and crossings, and will repay perusal. The remaining chapters are essentially those written by the original author, and so require no comment. A series of four appendices and an ample index bring to its conclusion an edition which, the preface says, cannot fail to prove of augmented usefulness and value. We believe it would better justify this prophecy if carefully revised.

*Sewage and the Bacterial Purification of Sewage.* By SAMUEL RIDEAL, D.Sc. (Lond.), F.I.C., F.C.S., &c. Second Edition. London: The Sanitary Publishing Company, Limited, 1901.

The preface to the first edition of this book was dated May, 1900, and that of the new edition June, 1901. That a new edition should be required in little over a year must be gratifying to the author, but, as we pointed out in our review of the original work, Dr. Rideal deserved success, for his book is one of the best accounts of modern methods of sewage treatment. The scope of the book is wider than is indicated by the title on the title-page, and is better shown by the title on the cover—"Sewage and Sewage Purification"—or the running title in the text—"Sewage and its Purification." One or two small matters to which we drew attention have been corrected in the new edition, and additions, amounting in the aggregate to thirty pages, have been made in nearly every chapter. Dr. Rideal mentions the third report of the London County Council, and also the interim report of the Royal Commission on sewage disposal, but has not found it necessary "to alter the statement of principles" contained in the first edition, nor has he modified the favourable conclusions regarding bacterial treatment which he there expressed. He distinguishes the stages of purification as follows:—*initial*, transient aerobic changes by the oxygen of the water supply; *first stage*, anaerobic liquefaction and preparation by hydrolysis; *second stage*, semi-anaerobic breaking down of the intermediate dissolved bodies; *third stage*, complete aeration, nitrification. His opinion of Dr. Houston's last report to the London County Council is thus stated: "Dr. Houston's conclusions must, however, be regarded as only applicable to beds worked in the way described. The chemical results taken generally show that nitrification was never pushed to a satisfactory point, and the main object of the whole inquiry in London has been to produce an effluent suitable to discharge into tidal waters." Dr. Rideal believes that bacterial treatment "conducted in regular sequence" will deal not only with domestic sewage, but also "with all ordinary manufacturing admixtures." We can heartily recommend the book as a learned and lucid treatise of great practical value.

*The Sanitary Inspector's Handbook.* By ALBERT TAYLOR, M.San.Inst., &c. Third Edition. London: H. K. Lewis, 136, Gower-street, W.C. 1901.

We have already spoken favourably of an earlier edition of this work, and the new

edition is still more worthy of praise. It has been extended and brought up to date by the inclusion of recent Acts of Parliament, legal decisions, and departmental circulars relating to matters within the province of the sanitary inspector, and by a full account of the examinations held by the recently-constituted "Sanitary Inspectors' Examination Board." An attempt has also been made to widen the scope of the work by including in it numerous references to the Public Health (Scotland) Act, 1897, but Scottish law and procedure are so different from English, that it is very doubtful whether the references will be of any use. Indeed, we are inclined to think that they will prove misleading; for example, on page 51 the list of nuisances is copied from the Public Health (London) Act, 1891, and reference is made to Section 16 of the Public Health (Scotland) Act, 1897, but nothing is said about the important differences between the lists of nuisances given in the two Acts. To the English sanitary inspector, however, the work cannot fail to be extremely useful. Mr. Taylor has had great experience both in London and the provinces, and imparts his knowledge clearly and concisely. Special hints with respect to nuisances arising from the keeping of animals, particularly swine, would have been of service, as such nuisances are very difficult to deal with, and we trust that this point will not be overlooked in the next edition.

#### TRADE CATALOGUES.

Messrs. JOHN SPENCER, of Wednesbury, send us their list of iron and steel tubes for gas, water, steam, and hydraulic purposes. We are glad to observe that all tubes and fittings turned out by this firm are screwed to Whitworth's standard threads. This most important detail is not yet universal, even amongst the leading tube makers, and it is one that architects should always consider before issuing specifications. Weldless steel tubes, well tubes and tools, ventilating columns, and a variety of valves and other fittings are catalogued in the list, which is one of the most complete issued in this branch of industry.

Messrs. Knecht Brothers, of Cincinnati, send us a booklet descriptive of their friction sensitive drill-press, a light tool in which the driving mechanism consists of two cones and a friction roller. Thus the speed of the drill spindle can be altered without the necessity for stopping the machine or for shifting belts in the usual way.

Messrs. Bell Brothers and Dorman, Long, & Co., of Middlesbrough, send us a tastefully produced memoir, illustrated with photo-engravings and plans, giving historical sketches and other particulars of the extensive works established by these well-known metallurgical firms, which have lately been amalgamated. At the Britannia and West Marsh works the manufacture of iron has been entirely given up, and all material now rolled is open-hearth steel, of which a large proportion is rolled into girders. The bulk of the steel is made from Cleveland iron, partly at the Britannia and partly at the Clarence works. With the latter establishment Sir Lowthian Bell has been associated since its foundation in the year 1851. Amongst other interesting photographs are some showing the new Westinghouse works at Manchester, Messrs. Vickers, Sons, & Maxim's works at Sheffield, and bridges built for Uganda and for the Egyptian Delta Light Railway.

Messrs. Hartley & Suggden, of Halifax, send us a copy of their new catalogue of heating apparatus, boilers, and kindred appliances. Amongst these we notice several of recent design intended for hot-water and low-pressure steam-heating purposes. Some of the steam-boilers are furnished with automatic regulating devices of the kind adopted in American practice. It is worthy of comment that all the boilers of this firm are constructed of wrought-iron, and so are far less liable to failure than those of cast-iron, which manufacturers in the United States are now attempting to introduce in Great Britain.

Messrs. Keith & Blackman, of London, send us an illustrated pamphlet relating to their exhibits at the Glasgow International Exhibition. The appliances described include hot water boilers, ventilating fans, drying plant, hydraulic rams, compressors for high pressure gas lighting, &c. The system of lighting by high pressure gas was adopted in the exhibition grounds, where it proved to be particularly effective.

Messrs. Ransome & Co., of Newark, send us a copy of their new catalogue of wood-working machinery, a very complete and well-illustrated volume, containing engravings and full descriptions of a large variety of machines, many of which appear to be made from new and improved designs. The specialities dealt with in this catalogue are suited to forestry operations and to the requirements of almost every industry in which timber forms a material of construction.

The Electric Lighting Boards Company, of 80, York-road, King's Cross, N., have sent us a well-illustrated catalogue and price-list of their manufactures. We have already favourably commented on this system of electric lighting, which is admirably adapted for many special purposes. For example, if one of their boards or strips is fixed into a dining-room table, and a standard lamp pillar of their design, with two needles projecting at the base, be placed on the tablecloth over it, the glow lamps on it will at once light up. Their lighting strip is also useful for cornices and dado-rails, doing away entirely with the necessity for lamp holders and sockets. Its most useful applications, however, are for shop-window lighting and theatrical purposes. As a strip of carrying capacity for thirty lamps can be had at 18. 0d. per foot, it will be seen that this method of wiring is an economical one.

We have received from the General Electric Company, of Queen Victoria-street, an illustrated leaflet of their novelties for October. They show a neat little automatic telephone time-recorder, which ought to prove useful to business people, as it tells how the three minutes' time allowance for conversation over trunk lines is passing. Another useful novelty illustrated is the "Robertson Sunshine" lamp, which has been designed for lighting streets. It is a glow-lamp with a detachable opal glass reflector, so that when the lamp is burnt out the reflector can be used with a new lamp. It has two short rigid filaments in series, so that vibration ought not to have much effect on it, and as they can be used for a 250-volt supply, the cost of wiring will not be a heavy item.

Messrs. Ritchie & Co. send us a price-list of their "Lux-Cuber" condensing gas stoves. Some stoves are made to give a luminous flame, while others give a non-luminous flame. As all the heat generated by combustion of the gas is utilised, these stoves form economical and convenient heating agents for halls or conservatories. The claim of "absolute freedom from the least possible pollution whatever of the air of the room in which it (the stove) is used, and that without any chimney or flue," is absurd. A large proportion of carbon dioxide is always present in the products of combustion of coal-gas, and although a small quantity of it may be found in the liquid which condenses in the stove, the greater part of it escapes from every saleable form of condensing stove into the atmosphere of the room. These stoves are excellent for certain purposes, but we do not agree that they are suitable for use in school-rooms. No flueless gas fire should, in our opinion, be admitted in any schoolroom or other place of assembly.

THE "MECHANICAL WORLD" POCKET-BOOK AND DIARY FOR 1902. 64. (Eimhoff & Co.)

SCHOOL BUILDINGS, BELLEVUE, N.B.—These buildings were recently reopened, after having been extensively remodelled. The schools will now accommodate 100 pupils. A large central hall has been provided, through which the children pass to their various departments. This hall will also be a great convenience for drilling. The contractors for the works were:—Mason, Mr. William Mitchell, New Pitligo; carpenter, Messrs. Edward & Rae, Dyce; slater, Messrs. Moir & Scrogie, Newburgh; plumber, Mr. K. Malcolm, Aberdeen; plasterer, Messrs. J. Scott & Son, Aberdeen; painter, Messrs. J. & S. Fyfe, Aberdeen. Messrs. Brown & Watt, of Aberdeen, were the architects.

Correspondence.

To the Editor of THE BUILDER.

WORKMEN'S COMPENSATION ACT.

SIR,—In your note on this subject in your last issue, October 12, you raise the question whether workmen should not be compensated for loss of health in pursuing their calling; and you instance the painter as one whose health may be seriously injured. There are probably to be found a few persons whose constitutions render them extraordinarily sensitive to lead poisoning; but as this would be evident within a few months of their beginning to exercise the vocation of painter, such persons would obviously be very foolish to persist in an occupation for which they are physically unfit.

But it is now quite well understood that, for the ordinary painter, health, so far as his employment is concerned, is entirely a matter of personal cleanliness, and of sobriety as affecting cleanliness. The man who always washes his hands before leaving his work (as all good painters do), and does not therefore contaminate his food, is as healthy a man as the joiner or mason, and, within my experience, as long lived. There could be no more cruel mistake than to undermine the painter's reliance on his own caution by placing before him the expectation that, if his health suffered by laxity in this respect, "compensation" would be forthcoming—I say nothing of the prospect of sham claims.

J. D. CRACE.

THE SAD CASE OF SIR SIMON LEACH—HIS MONUMENT.

SIR,—The remote village of Cadeleigh, not far from Tiverton, in Devon, possesses an interesting village church, the crowning glory of which is a magnificent Jacobean monument with life-size sculptured figures, surmounted by a heavy canopy, a most complete and handsome example of the gorgeous Renaissance period. The monument was erected by Sir Simon Leach, a quondam Sheriff of the County, to commemorate himself and his descendants, and in order to keep his memory green he left also a sum of money to keep the monument in repair.

If fortune, however, attended the family, and it is now, I believe, quite extinct in the direct line. The family mansion is a humble farmhouse, and the money that was left to keep the tomb in repair, although invested in land, has been allowed to lapse, for the incredible reason that no trouble was taken to collect the rent in the sleepy meridian of the last century.

When I saw the tomb a few weeks ago it was doomed to destruction. The canopy was falling backwards, and was endangering the fabric of the church, and in a fortnight for safety's sake was to have been removed. For the time being the parish authorities are holding their hands, while I am doing my best to arouse interest in what is the finest example of the period in Devonshire.

The tomb commemorates a Devon worthy, and it will be a standing reproach if it be destroyed or allowed to be removed from the church in which he worshipped, and in which he desired to rest with his wife and children. The cost of underpinning and preserving the monument will be only 50*l.*, of which about 25*l.* has been promised.

The parish is very poor and the population small. May I appeal through you to the many lovers of the ancient and picturesque relics of our country for help in the work of preservation. It is not desired to restore, only preserve. Many Devonians in London will, I am sure, send a small subscription for the sake of the old county; the most trifling sum will be gratefully received by Miss Chichester, Calverleigh Court, Tiverton, or by

PRESCOTT ROW.

The Homeland Association, 24, Bride-lane, Fleet-street, E.C.

WREN'S CITY CHURCHES.

SIR,—I much regret that the materials of any of Sir Christopher Wren's beautiful churches should be sold by auction, probably for very nominal sums, and would suggest that they should be removed and rebuilt on suburban sites, where churches are required. This would not only avoid the loss of these excellent churches, but would probably prove economical. The proposed demolition of the church of St. George, Botolph-lane, to which you refer, would afford a good opportunity for carrying out this plan.

C. B. A.

"ROMANO'S" RESTAURANT, STRAND.—This property—Nos. 309-400, Strand—was erected as the Café Vaudeville, after Mr. W. Emden's designs, in 1804-5, for Mr. A. N. Romano, lately deceased. In terms of an order of the Court, issued in the suit of Berkeley v. Romano, the restaurant was offered for sale at auction at the Mart on the 2nd inst. It was withdrawn, however, after a solitary bid of 20,000*l.* had been made.

The Student's Column.

GAS AND GAS FITTINGS.

16.—COOKERS, WATER HEATERS, GEYSERS, AND GREENHOUSE BOILERS.

COOKERS.—Gas-cooking appliances are now universally used in all towns provided with a public gas supply, and vary in size from the small griller used in workmen's tenements in conjunction with the penny-in-the-slot meter to the imposing "cookers," over 6 ft. in height and in width, used in many hospitals, hotels, and business premises where meals have to be provided for several hundred persons. For a long period an unreasonable prejudice existed amongst the general public against the use of gas for cooking, but this has gradually been overcome, and gas is now recognised as a more perfect cooking agent than coal. The fact that gas-cooking appliances have been introduced into a great number of hospitals and asylums has satisfied the general consumer that the use of gas for cooking will not result in untimely disease, and the number of cooking-stoves lent out on hire by gas companies has increased rapidly during the past few years, the total number of cookers in use in the United Kingdom being now over 800,000.

A glance through the catalogues issued by the principal firms of gas stove manufacturers will show that cookers are now made to meet almost every conceivable requirement, but a detailed description of these cannot be given in these columns. The ovens should be provided with a jacket or case filled with slag wool or other suitable non-conducting material in order to economise the heat as much as possible, and the interior of the oven should be enamelled to render cleaning less troublesome.

The Odour emitted from Gas Stoves.—When a gas flame comes in contact with, or in very close proximity to, a cold surface the flame becomes cooled, and emits a disagreeable odour owing to the fact that incomplete combustion of the gas then occurs. With many stoves and fires this odour is perceptible for the first few moments after lighting, but is no longer emitted when the stove becomes hot. A similar odour is emitted when the flame flashes back and burns within the mixing tube, owing to incomplete combustion caused by the cooling action of the metal tube and the limited volume of air admitted to the flame. When a cold sheet of metal, such as the bottom of a kettle filled with cold water, is lowered into a flame the odour is at once perceptible, and continues to be emitted until the metal becomes sufficiently hot to allow the flame to rise again to the temperature necessary for complete combustion.

A frequent cause of unpleasant odours from cookers is the accumulation of dirt or grease upon them. Unless a cooker is kept scrupulously clean, it is certain to emit a disagreeable odour immediately the fatty matter becomes strongly heated, and, in many cases the odour is distributed over the building by the down-draught from a defective flue. Gasfitters frequently assure their employers that a flue for a cooker is quite unnecessary, but it is a foolish practice to use any appliance consuming a large volume of gas without providing means for the removal of the combustion products.

Position of Flue.—The flue should, where possible, be carried from the stove into an existing chimney having a good natural up-draught. If the flue be carried through a side wall of a room which also contains a chimney, the up-draught of the chimney is apt to produce a "pull" on the wall orifice and draw air down the stove flue instead of allowing the combustion products to escape. A flue of this description is worse than useless. With an efficient flue and a clean cooking-range, with flames not too close to cold surfaces, a gas cooker is as free from smell as a coal fire.

Water Heaters and Geysers.—When coal-gas is consumed under the best conditions carbon dioxide is formed, and as this gas is not a supporter of animal life, it should be conducted from the room by an efficient flue. When a gas flame is cooled by contact with a cold surface an intensely poisonous gas, termed carbon monoxide, is formed, owing to the fact that the flame temperature is not sufficiently high to cause the complete oxidation of the carbon in the decomposing hydrocarbons of the coal-gas. Carbon dioxide, the product of complete combustion, will not support animal

Fig. 41.—A Rapid Water Heater.

life, but it does not possess the poisoning activity exerted by carbon monoxide. Carbon monoxide has no odour, but when incomplete combustion of the gas occurs other products are simultaneously formed which emit a very penetrating odour and give warning that the poisonous carbon monoxide is being generated. The "smoke" from a coal fire contains both carbon monoxide and carbon dioxide, together with a number of objectionable compounds which are not present in the products of combustion from the purified coal-gas supplied in our towns, but if the visible "smuts" were not present in coal smoke, there is little doubt that a grate would soon be placed on the market with the assurance that coal might be consumed in it with perfect safety in a room not provided with a chimney. Some water heaters are used in bathrooms without any flue, and do not evolve any perceptible odour; while others always produce a disagreeable smell, and have upon several occasions been the cause of death to persons exposed to their influence. In the former cases complete combustion of the gas is effected, while in the latter the combustion is not complete. The fact that bath water heaters are often used in small rooms without exerting any apparent prejudicial influence does not necessarily prove that the combustion products are harmless even when complete combustion occurs, and as it is known that carbon dioxide is not a supporter of animal life, it is a wise precaution to always provide means for its withdrawal in such small rooms as bathrooms of average size.

When an indication of the occurrence of incomplete combustion is obtained by the generation of the characteristic odour emitted by the compounds formed under such condition, it is mere folly to continue the use of the water heater without a flue.

**Bath Heaters.**—A good gas water heater or "geyser" is the cheapest and most convenient agent for heating water for baths. Where possible, the water heater should be fitted outside the bathroom, and the principal manufacturers of water heaters supply appliances which can be fitted in any part of the building, and be arranged to distribute hot water to any or every room in the house. It should be remembered, however, that the greater the length of pipe through which the hot water has to travel the greater is the proportion of heat lost.

Water heaters may be used in small rooms with perfect safety if connected to a flue, and

if the precaution be taken to ascertain that a strong up-draught exists in the flue even when the gas is not burning.

An appliance known as a "geyser" is usually employed for heating bath water. The water is rapidly heated by causing it to travel over a large surface of heated metal, the heat of the waste products of combustion being utilised as completely as is practicable. The apparatus is, as a rule, constructed of copper, and should be kept as clean as possible. So many excellent water heaters are now made by a number of competing firms that it would be impossible to describe them all, and an illustration of one must serve to indicate the general principles upon which water heaters are constructed; but the fact that they are so largely in demand is sufficient evidence as to their utility. Some water heaters are manufactured in which the products of gas combustion come in contact with the water, and contaminate it to a certain extent with soluble impurities. The efficiency of such heaters is very high, but water so heated is not to be recommended for drinking, cooking, or bathing, although it may be used for many other purposes.

Richmond's "Gulf Stream" water heater (fig. 41) is a good example of a rapid water-heating appliance.

The water and gas are turned on simultaneously by manipulating a handle, so that no trouble can arise through forgetting to turn on the water after lighting the gas. A pilot light

Fig. 42.—Greenhouse Boiler.

is also provided which prevents any explosion taking place when the main gas burners are lighted. These water heaters are not intended to actually boil the water, but merely to rapidly raise it to a scalding hot temperature. The rate of gas consumption is necessarily high, but as a large volume of water is heated in a few minutes, it is not usually necessary to keep the gas burning for a long period. With the "Gulf Stream" water heater the consumption is 70 cubic feet per hour, but hot water will be delivered from it in two minutes after the time of lighting and will continue to be delivered as long as the gas is kept burning. The rate of water flow and the rate of gas consumption are simultaneously regulated by manipulating the handle.

**Boilers.**—For heating water to a boiling condition with the aid of gas, boilers are made in all sizes in copper or galvanised iron. They are sometimes fitted with cross tubes around which the flames and hot products of combustion pass. They form, in fact, a description of multitubular boiler, and although when first lighted they may evolve the disagreeable odour due to incomplete combustion, the odour ceases to be emitted as the temperature of the tubes increases. With a good boiler 10 gallons of cold water may be boiled in half an hour with a consumption of 25 cubic feet of gas.

In some cases baths are heated by gas burners placed beneath them, the water being made hot while the bath is being filled. This arrangement is apt to damage the bath and is much inferior to a good geyser.

**Greenhouse Boilers.**—Gas is not an economical agent for heating large greenhouses, but it is exceedingly useful for maintaining a uniform temperature of any required degree, and for small greenhouses its cost is not as a rule prohibitive. The products of combustion must not be allowed to accumulate in the greenhouse, as they exert a prejudicial influence upon plant life. The sulphur compounds, which appear to be the most injurious, may, however, be eliminated to a considerable extent by the use of condensing stoves, and these are often used in greenhouses without a flue.

In order to heat a greenhouse uniformly it is necessary to use hot water or steam circulating pipes. A cast-iron apparatus suitable for heating water pipes known as Arden Hill's "Acme" Greenhouse Boiler, is shown partly in section in fig. 42. It is equally adapted for the heating of conservatories, workshops, or halls. The cross tubes are heated by the ascending current of hot combustion products, and a higher heating efficiency is obtained than when an ordinary boiler is employed.

In every description of gas-heating apparatus the burners and the heated metal must be kept scrupulously clean, and the flames should not be allowed to come in contact with a cold surface.

#### THE NEW ST. PANCRAS BATHS.

THESE baths, which comprise four swimming-baths and 120 slipper-baths, together with a public wash-house with fifty washing compartments, were opened last week. There are two entrances in Prince of Wales-road for first and second class men bathers respectively, with a pay-box between them. These entrances lead directly and without corridors to the two men's swimming-baths and to the slipper-baths. In the Grafton-road are two entrances, one for women bathers and one for the public wash-house.

The men's first class swimming-bath is 115 ft. 6 in. long and 50 ft. wide, the bath pond being 100 ft. by 35 ft. The hall is lined with glazed bricks, the sides of the swimming pond with Balam's patent white glazed bricks, specially designed for baths, and the floor with terrazzo. The gangways are 4 ft. wide at the sides and 6 ft. wide at the ends, and are paved with terrazzo, the nosing to the bath pond being in marble. There are eighty dressing-boxes, all made to remove during the winter. The depth of water in the pond ranges from 3 ft. 6 in. to 7 ft. At the deep end of the bath is a large diving-stage. An overhead shower is provided by means of sprays from the ceiling. The ceiling of the bath has been designed upon a completely new principle. Hitherto all bath ceilings have had a ventilating skylight in the centre, which causes a considerable echo of the water splashing in the bath. In this instance there is a curved ceiling of trefoil section with curved glazed inner sashes on each side and external skylights over. It is expected from this arrangement that the splashing echo will be avoided. But beyond this, and of equal importance, the curved ceiling, without a lantern skylight, will give much better acoustic qualities to the hall, especially for

concerts, &c., during the winter. The bath is warmed and ventilated upon the "plenum" system. Cold fresh air is taken in at a main inlet in Gratton-road, and is driven by a fan through a steam heater, and thus warmed enters the hall at the floor level, and passes out through a large outlet in the ceiling. In addition to this, and with a view to preventing that condensation which is so common an evil in all swimming-baths, there is a supplementary plenum apparatus, which delivers warmed fresh air at the ceiling level. In the men's second-class swimming-bath the bath pond is the same size as in the first-class bath. The internal finishings are, of course, not equal, but otherwise all the accommodation is practically the same. The ladies' first-class swimming-bath is 97 ft. by 40 ft., with a swimming-pond 75 ft. by 25 ft. All the internal finishings to this bath are similar to the men's first-class swimming-bath, and in some cases rather better. An effort has been made to make this bath very bright and cheerful. There are forty dressing-boxes tastefully fitted up with curtains and looking-glasses, and also two douches, and a neatly furnished dressing-room, with lavatory, settee, and toilet-table and looking-glass. The ladies' second-class swimming-bath has a swimming-pond 50 ft. by 20 ft. The arrangements are similar to those in the first-class bath, with somewhat less finish.

There are 29 slipper-baths, twenty-nine men's first-class, sixty-five men's second-class, ten ladies' first-class, and twenty-five ladies' second class. The accommodation in all these slipper baths is of the same character, except that for the first-class baths the partitions and doors are of enamelled slate, and for the second class painted slate. The baths are of glazed fireclay with teak rolls. (Teak rolls have been adopted in place of glazed rolls as being safer.) Each bathroom has a seat, a good sized looking-glass, with shelf, and two hot pipes, together with footboard and cork mat. The bath valves are of the manufacture of Messrs. G. Jennings & Co., and work from both inside and outside of bath, and are so designed that hot water cannot be turned on until the cold water has been set going, thus preventing scalding and damage to the baths. Six of these baths are provided with hot and cold showers. Good waiting-rooms are attached to all slipper-baths.

**Public Wash-house.**—The public wash-house is entered from Gratton-road, and comprises fifty washing compartments, fifty drying-houses (heated and ventilated on the "plenum" system), and a mangling and ironing room. The hydro-extractors in the public wash-house are driven by hydraulic power direct, without belting, and are fitted with automatic covers, so arranged that the cover is closed while the hydro is at work, and is only open when it is at rest. The ironing-room has two mangles, folding-tables, and ironing-tables. Electric irons will be used. In connexion with the public wash-house is a crèche, also a large waiting-room and cloakroom.

**Administrative Departments.**—There is large boiler house, with three Galloway boilers 30 ft. by 7 ft., and an economiser. These boilers will provide steam for warming the water in the swimming-baths, and in connection with the heating apparatus and hot-water supplies generally. The superintendent of the baths has his office close to the men's entrance, and a residence on the second floor. There is a large committee-room on the first floor, which will also be used as a lady artists' room during the winter. The establishment laundry is in the basement, and will be worked by men only. There is one baker's washing-machine, two hydro-extractors, seventeen drying-houses, boiler, and ringer and vertical mangle. A large towel store is provided near the laundry. There is a complete system of subway in the basement for the purpose of administration, and these are in connexion with the superintendent's office and residence and boiler-house, establishment laundry, and towel store. All trolley work in connexion with towels, bathing-drawers, &c., will be done in the basement. The clean towels will be brought by lifts direct into the pay offices, and all dirty towels, &c., will be sent through glazed brick-lined shoots down into the basement. It is expected that a considerable saving in the cost of administration will be the result of this arrangement. Two refreshment-rooms are provided, one for men and one for women, near their respective entrances. The warming and ventilation of the men's first-class swimming-bath have already been described. All other departments are warmed by means of low pressure hot-water apparatus, and ventilated by means of Davidson's "Sirocco" fans electrically driven.

The elevations are all faced with Lawrence's red brick with terra cotta bands, corners and dressings. The whole of the buildings are of fire-proof construction throughout, there not being a timber floor joist in the whole building. The walls of the main departments, including all swimming-baths and slipper-baths, are faced with glazed bricks with acid glazed brick dados. All pavings except to basement are laid in terrazzo. All wood floors are in herring-bone solid wood blocks. The whole of the internal wood, iron and slate work has been painted with "Ripolin" enamel paint. The buildings throughout are lighted by electricity. Also, with the exception of the hydraulic work, all motive power is supplied from electric motors. Two artesian wells are being sunk on the

premises, which it is hoped will yield between about 25,000 gallons of water per hour.

The cost of the buildings, together with all machinery and fittings, has been about 75,000l. The strictest economy has been exercised in the construction and finish of these buildings, and no attempt has been made at elaborate architectural display internally or externally.

The building contractor is Mr. C. Wall, of Chelsea. The chief engineering works have been carried out by Messrs. Z. D. Berry and Sons. The hydraulic work and plenum ventilation has been executed by Messrs. W. J. Fraser & Co. The electric lighting has been carried out by Messrs. Edmundsons. Messrs. Doulton & Co. executed the terra-cotta work, Messrs. W. B. Simpson & Sons the faience work, and Messrs. Diespeker & Co. the terrazzo work. All skylights are laid with Rendle's patent glazing. The glazed fire-clay baths were supplied by the Farley Iron Company. The internal sanitary fittings have been supplied by Messrs. Taylor & Sons. The wood block flooring was supplied by the Westminster Flooring Company. The gearing for opening the fanlights is supplied by Messrs. Jones, Lock, & Co. The whole of the slating and slate masons' work, including enamelled slate partitions, are by Messrs. Shenton, of Kentish Town.

The architect is Mr. T. W. Aldwinckle, who had the assistance of Messrs. Alby & Williamson as consulting engineers in connexion with the electric lighting. Mr. E. T. Larkin has acted as clerk of works throughout. The design and plans were illustrated in the *Builder* for September 23, 1899.

THE PLUMBERS' COMPANY AND APPRENTICESHIP.

The Committee of Representatives of District Councils for the following places:—Belfast, Birmingham, Bradford, Cardiff, Dublin, Edinburgh, Glasgow, Leeds, Liverpool, Manchester, Nottingham, Plymouth, and Sheffield, acting in conjunction with the Plumbers' Company, deem it highly desirable a prescribed apprenticeship or course of training should be recognised in connexion with the National Registration of Plumbers.

A special form of indenture has been prepared for the purpose by a conjoint board composed of representatives of the London Society of Associated Master Plumbers, the United Operative Plumbers' Association of Great Britain and Ireland, and the Plumbers' Company. The indenture is based on the form of indenture authorised by the Corporation of the City of London, and approved by the Court of Chancery. It includes definitions of the character and scope of the work of the registered plumber and of the term "sanitary plumbing," as approved by the Parliamentary Committee on Trade, in order that the sanitary bearing of the work of the registered plumber may be generally recognised by plumbers, as well as by architects, health authorities, and others, as constituting the reason for the registration system and the ground of the application for statutory powers to be conferred on the registered body.

These definitions are in the following terms:—"The trade of a plumber and the art of sanitary plumbing, including all branches of the said trade or of the said art which require technical knowledge of water fittings and other sanitary appliances, and skill to construct and adjust the same in such a manner as to prevent the contamination of air or water in dwelling-houses or other buildings by emanations from drains or sewers."

Covenants are included expressly providing for:—1. The attendance of the apprentice at approved classes of technical instruction. 2. The apprentice presenting himself for annual examinations in technical knowledge and workmanship in conformity with such rules and regulations as may from time to time be prescribed in connexion with the National Registration of Plumbers. 3. The cancelling of the indenture after due notice to the parties, in the event of the apprentice failing to pass a satisfactory examination in the third year of his apprenticeship, provided such cancellation be recommended by the examining body.

It is recommended that this form of indenture (subject to such modifications as may be necessary to meet special cases) should be generally adopted with a view to a uniform qualification being established for the purpose of the National Registration of Plumbers. It is also recommended that a Register of Apprentices should be kept in each district.

A corresponding form of indenture is prepared adapted to the requirements of Scotch law.

**WATER SUPPLY, BRIDGWATER.**—Colonel A. J. Hepper, on behalf of the Local Government Board, recently sat in the Council Chamber to hear an application by the Bridgwater Rural District Council for sanction to borrow sums amounting to 25,000l. for the purpose of a water supply for the parishes of Bawdrip, Chedzoy, Huntspill, North Petherton, Pawlett, and Puriton, including the construction of works in the parishes of Bridgwater Without, Broomfield, Chilton Trinity, and Goat-hurst. The principal evidence was that of medical officers of health, who stated that the water in each parish was very impure.

OBITUARY.

MR. T. HARPER-WALLIS.—We have to record the death, at Littlehampton, of Mr. Thomas Harper-Wallis, of Market Rasen, an octogenarian Lincolnshire builder, who leaves the unique record of having built and restored more than thirty churches and parsonages in his native county alone from designs of the late Messrs. Ewan Christian, G. E. Street, Jas. Fowler (Louth), and others.

GENERAL BUILDING NEWS.

**CHURCH HALL, BARRY, N.B.**—A hall erected in connexion with the parish church of Barry has recently been completed. The building, erected from plans prepared by Mr. Jas. P. Bruce, architect, of Carnoustie, stands on the site of the parochial school, at the south end of Barry Brae, and is entered by a large open porch. The style of architecture adopted is a free treatment of Gothic. The hall has accommodation for 200 people, besides a large platform and anteroom, with lavatory accommodation in connexion. The building is heated by hot-water pipes on the low-pressure system, and ventilated by the "Boyle" system. Internally the walls are lined with pitch-pine lining 6 ft. high, having hinged divisions, whereby the hall can be divided into separate compartments for the use of Sunday school classes. The contractors were Messrs. Mason, Geo. Robertson; Joiner, Geo. Fox; plumber, John M'Andrew; slater, Alexander Hogg; lather, James Fyfe; plasterers, M'Ritchie & Co.; smith work, R. Crighton; ventilation, Robert Boyle & Son, Limited; heating, Wm. Nicoll; glaziers, Donald & Smith; painters, P. & A. Davie.

**NEW BUILDINGS IN THE STRAND.**—Messrs. Ernest Runtz & Co. are the architects of the temporary premises that have been erected for "Short's" upon the site of the Coach and Horse Tavern, Nos. 323-4, Strand. The tavern, rebuilt in 1888-9, after Mr. W. T. Farthing's designs, had been pulled down for the improvements now being carried out on the area between Newcastle and Catherine streets. The new temporary premises have an uncommon elevation, being built after the half-timbered style, and we gather that a large amount of timber taken from the demolished houses roofs was utilised in their construction. The Gaiety Theatre Company have taken from the London County Council a lease for fifty years of the site for their new theatre, to be designed also by Messrs. Ernest Runtz & Co., and into which they hope to remove within eighteen months hence. The Company have undertaken to expend 50,000l. upon the building, but anticipate that the cost will amount to about 15,000l. more. The Company have received 25,000l. in compensation for disposition from the County Council, who, it appears, will also provide the 50,000l. for the new house.

**BUILDING IN FLEET-STREET.**—We gather that Messrs. Gibbs & Flockton prepared the plans and designs for the new London offices of the *Sheffield Telegraph*, for which a site has been cleared at the corner of Fleet-street and Fetter-lane.

**DRILL HALL, BILSTON.**—The new drill hall of the G (Bilston) Company of the 2nd Volunteer Battalion South Staffordshire Regiment has been erected in Mount Pleasant, Bilston, on a site presented by Sir Alfred Hickman, M.P. The accommodation provided comprises an office, sergeants' room, residence for sergeant-instructor, armoury, drill hall, and kitchen, lavatories for officers and men, &c. The exterior of the building is faced with red bricks with Hollington stone dressings, and the roofs are covered with red tiles. The drill hall is 75 ft. long and 40 ft. wide, lighted from the top. It has a dado of salt-glazed bricks, and the floor is formed of wood blocks. The building is heated by hot water, and wired for electric light, which will be installed as soon as the supply is available. In the meantime provision has been made for lighting by gas. The builder is Mr. Thomas Tildesley, of Willenhall, who has carried out the work in a satisfactory manner. The architect is Mr. Henry T. Hare, Hart-street, Bloomsbury-square, London.

**PUBLIC SLAUGHTERHOUSES, BARROW.**—New slaughterhouses have been erected by the Barrow County Council at the north-east end of Cavendish-street and adjoining the electric light station and the refuse destructor, at an estimated cost of 18,000l. The building is erected to the designs drawn by Mr. W. H. Fox, the Borough Engineer, but only about two-thirds of the scheme is being carried out at present.

**LIBRARY BUILDINGS, ROATH, CARDIFF.**—A new branch library was opened at Roath on Thursday, the 10th inst. It provides for storage accommodation for 11,000 volumes, capable of expansion to 17,000 volumes. The cost of the building was 2,480l. Messrs. Teather & Wilson, Queen-street, Cardiff, are the architects.

**NEW POLICE BUILDINGS, WARRINGTON.**—The new police buildings erected for the Borough of Warrington, from designs by Mr. R. Burns Dick, of Newcastle-on-Tyne, were opened on the 11th inst. The architect has given the cells the position of first importance. The chief constable's office is near the magistrates' entrance, which will also be used by the Watch Committee, and the detectives' department is at the south-east corner, near to the public entrance, and midway between the chief constable's

commissioned to rebuild on new lines the palace of the French Legation at Pekin, which was destroyed during the siege of the city. —The jury in the competition opened for the erection, in the mountains of Puy de Dôme, of a "Hôtel des Voyageurs," has awarded the first premium to M. Pierre Valade; the second to M. Gozier; the third to M. Gaston Rapin; the fourth to M. Bruno Pellissier; all of Paris. —The Municipal Council of Calais has decided on the erection of a new town Hall. —M. Injalbert, the sculptor, has just completed, for the town of Cette, the model of a fountain which it is proposed to erect on the site of former fish-market. The fountain, six metres in height, will be surmounted by a statue of a faun, above a group of sailors and fisher-women. —We have to announce the death, at the age of forty-eight, of M. Paul Gaston Aubry, a member of the Société Centrale des Architectes. He was a former pupil of André, and became architect to the diocese of Arr d'Astun. He was the architect for numerous private houses, as well as for the restoration of the châteaux of Villegeugis and Sully.

INDIA.—Extensive alterations and improvements in the exits and waiting halls at the Lahore railway station have been sanctioned. —The military department is constructing a transport siding and platform at Umballa in connexion with the animal detaining depot at that station. —The Madras harbour trustees have decided unanimously in favour of the northern entrance to the harbour being protected by a short groyne, and the sanction of the Secretary of State has been applied for to enable the works to be carried out. —The Barsi Light Railway Company are about to extend their line from Barsi road to Pandharpur; the Secretary of State has issued instructions for the preparation of the necessary contract. —In reference to the electric lighting of Simla, we learn that water power sufficient to provide some 450 horse-power is available within some ten miles of the station, and there is a demand on it both for driving the municipal pumps and for lighting purposes. The scheme is estimated to cost about ten lakhs of rupees. —The heavy rains in the Simla districts during August have resulted in disastrous landslips. As much as nine inches fell during twenty-four hours, which is the heaviest fall since August, 1891. The road from Kalka was blocked by several slips; passenger traffic was stopped for several days. Fortunately, there was but little loss of life. —Additions and alterations on an extensive scale are being made to the Jakhla station in connexion with the entry of the Ludhiana-Jhuri-Jakhla Railway into that station. —The Government of India have decided to construct a building for the joint accommodation of the United Service Institution of India, libraries of the military department, and Army headquarters at Simla.

UNITED STATES.—Mr. J. R. Thomas, a well-known architect of New York, died recently at a summer resort in the Thousand Islands, at the age of fifty-five. Amongst his important works may be mentioned the New Jersey State Reformatory, at Rahway, two large armories in New York city for the State Militia, besides several churches. In 1869 his design for the proposed New York city hall was placed first by commission, and on that project being abandoned he received the commission for the new Hall of Records, now in process of construction.

GERMANY.—A statue of Prince Albrecht, brother of the Emperor William I, erected opposite the castle of Charlottenburg, was unveiled on the 14th inst. in the presence of the Emperor William. —The unveiling of the statue of the Emperor Frederick on the open space between Cronberg and Friedrichshof, which was to have taken place on the 18th inst., has been postponed. —The graves of two celebrated parliamentarians, Lasker and Bamberger, which lie side by side, are about to be covered by a massive monument of polished Norwegian granite flanked with two lofty pillars, between which will be placed a dedicatory tablet of bronze. The monument has been designed by the State architect, Herr Thierbach. —The German Emperor has decided that the right and northern semi-circle outside the Brandenburg gate, towards the Siegesallee and the Reichstag building, shall be the site of a monument to his father. The Emperor has also decided to erect a monument to his mother, the late Empress Frederick, on the southern semi-circle. The houses round the Brandenburg gate will be removed, so that the monuments may be clearly visible from Unter den Linden. The work is to be executed under the direction of Herr Hans Eversing, a young sculptor who won a small gold medal at the Art Exhibition in 1898.

RUSSIA.—A railway is about to be constructed between the ancient city of Bokhara and the new Russian town of the same name which has sprung up around the station on the Trans-Caspian Railway. The line will be about 20 versts in length, and will be constructed at the expense of the Emir of Bokhara.

## MISCELLANEOUS.

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.—Mr. A. H. Ryan-Tension, architect, has removed his offices from 7, Great College-street, to 17, Little College-street, Westminster. —Mr. Arnold Thornely, architect (Liverpool), has removed his offices from 14, Castle-street, to 51, North John-street, Liverpool. —Mr. F. Brice Hobbs, architect (Liverpool), has removed his office from 14, Castle-street to 51, North John-street, Liverpool. —The business of Messrs. Hodkin & Jones (Sheffield), manufacturers of architectural concrete, masonry, &c., has been registered as a limited company.

CHANGES IN LEICESTER-SQUARE.—The new premises which have just been completed on the site of No. 40, on the west side of the square, together with that of No. 62, Whitcomb-street, in the rear, have been built by Messrs. Prestige & Co., of Piccadilly, after the plans and designs of Messrs. E. Wimperis & East, for an old-established firm of billiard-table makers. On the adjoining site, next south, a new house has been built by Mr. T. Stevens. Messrs. C. & E. G. Apprey, New Bond-street, have entered into possession of the block, Nos. 19-22, on the south side of the square, being the freehold lately vacated by the Dental Hospital of London, covering an area of about 2,980 ft. superficial, which they purchased at auction for 23,000l. in July last. The new buildings for the hospital, at the south-eastern corner of the square, recently opened, were built by Messrs. George Trollope & Sons, from designs and plans made by Messrs. Young & Hall.

FIRE AT STEPNEY PARISH CHURCH.—St. Dunstan's, the historic parish church of Stepney, was partially destroyed by fire on Saturday, the 13th inst. The *Standard* remarks that firemen, with at least a score of engines, coming from all parts of the Metropolis, were quickly on the spot, Commander Wells directing their operations. By the time the first engine arrived the fire had got a firm hold of the interior of the vestry, the flames from the roof of it rapidly spreading along the whole length of the double roof of the main building. Examination disclosed the fact that almost the whole of the roof, except that portion which covers one of the aisles, had been completely burned away, only a few charred wooden rafters indicating where it had once rested. Fortunately the ancient square tower, which for upwards of 500 years has stood out as a landmark, was untouched. In the aisle, the roof of which has escaped injury, is a newly-erected altar, and this remains undamaged by the flames. The pews, too, which provide accommodation for some 800 people, have also been preserved, thanks to the energy of the firemen. Of the six stained-glass windows in the church, the one over the altar in the chancel has been slightly damaged, and one other broken to pieces. The altar itself, together with its beautiful draperies, has been completely destroyed by the burning timber which fell from the roof. The vestry, where it is believed the fire originated, and the valuable organ and organ-loft above it, were completely burned out. Only the outer walls, some iron cupboards, and an iron safe resisted the flames. In the cupboards were stored the registers, which date back to the year 1508, and which afford much interesting information about the Great Plague of 1666 and other matters of history, while the safe contained the church plate, a very valuable collection, dating from the seventeenth century. All these interesting relics have, therefore, been saved. It was only two years ago that the edifice was restored at a cost of 6,500l., 700l. of which was expended in rebuilding the organ, which is now only represented by the lead of melted pipes. The church was insured for a sum of 11,000l., and the Rector calculates that this will more than cover the cost of repairing the damage which has been wrought by the fire. It is interesting to note that the parish church of Stepney was already in existence when St. Dunstan was Bishop of London, in 959, and after his death the church, which he rebuilt in 956, became associated with his name. The building as it stands to-day dates from the time of Edward IV. (1471-85), and is a good specimen of Late Perpendicular country church, with some relics of its earlier days still preserved. The church, an imposing building, stands in its own grounds of seven acres, with a fine avenue of lime trees, under which such men as Dean Colet, founder of St. Paul's School, who was born in Stepney and was some time vicar of the parish, worked and conversed with Erasmus and other great Reformers of his day.

ANTOIAN ANTIQUITIES.—The journey of exploration by Dr. Valdemar Beked, has been successful thus far. At Amassia, in Antolia, where the celebrated Royal tombs are situated, he discovered a new Greek rock inscription of the great King Pharnaces, the son of Mithridates. The rocky fort was, to the ancient world, impregnable. A nine days' trip brought Dr. Beked to Tokat, another strong rocky fortress, and then to Guemeuek (Fruica) where he measured the temple ruins. Thence he went to Niksar—Neo Cesaria, the old Cabira—a very strong fortress, where Mithridates' treasury was kept. On his return, he travelled via Herek (Eupatoria) and Ladik, the ancient Laodicea, which played a part in Cesar's swift campaign against King Pharnaces—"Veni, vici, vici"—in the

year 47 B.C., and also four years later, during the campaign of revenge against Cassius.—*Standard*.

ELECTRIC LIGHTING, HEBBURN-ON-TYNE.—Messrs. Warren, Beattie, & Co., of Middlesbrough, have secured the contract for the supply and erection of the motors and cabling in connexion with the electric-power installation about to be put down by Messrs. Robert Stephenson & Co., Limited, at their shipyard at Hebburn-on-Tyne. This comprises thirty-nine motors, varying in power from 6 to 50 horse-power, the main switchboard, distribution boards, and all the cabling in connexion therewith. In addition to this, they have secured the order for the lighting of the shipyard, various shops, and offices. The lighting installation comprises sixty-eight arc lamps of 2,000 candle-power each, and over 550 incandescent lamps.

CLOSING OF LINCOLNSHIRE BRICKWORKS.—A serious depression in trade has overtaken the brick-makers of North Lincolnshire, whose works are studded along the banks of the Humber from Grimsby to Barton. The *Yorkshire Post* states that there was an overwhelming demand for bricks about two years ago, the price ranging from 30s. to 35s. per thousand, and the pressure was such that it was not uncommon for bricks to be shipped hot from the kiln. This prosperous state of the trade led to eight new yards being started, and now that a slump has occurred the adversity is correspondingly wide-spread. In the various yards there are many millions of bricks stacked, and some makers have their whole season's output on their hands. A very disagreeable fact is that at Barrow Haven, Messrs. Turner have closed their three yards for an indefinite period, thus throwing a large number of men out of employment. Winter is the time to "get" the clay to make up in the following season, and this means that Messrs. Turner will "get" none this winter, so it is evident that they do not view the immediate future very hopefully. Many other yards in the vicinity have practically ceased working. Another class of traders severely affected by this state of affairs are the keel-owners and sailors of the district, as most of the transit is by water. Should the coming winter prove a severe one, the situation will be rendered acute for all concerned in the brick trade.

THE DRAINAGE OF SAUNDERSFOOT, TENBY.—At a recent meeting of the Narberth Rural District Council, Dr. W. Clement Evans, Medical Officer of Saundersfoot, reported an outbreak of scarlet fever amongst the children attending the Cressley School. Seven cases had occurred in four families up to the present, and the school had been closed since the 23rd ult. There had been four other cases of scarlet fever, one at Begelly, one at Catershook-gate, and two at the Lower Level. Five cases of typhoid fever had occurred, one at Cross-lanes, one at Begelly, and three at Saundersfoot. The case at Cross-lanes was evidently imported, as the girl came home ill from Merthyr. The case at Begelly proved fatal. He made a thorough examination of the premises and surroundings, and found a drain, which led from a slaughter-house, emptying on the side of the hill and overlooking Begelly Bottom. The well, too, which supplied some of the water was in great need of being protected from surface drainage and decaying vegetable matter, the water tasting very peaty. Whether this case was due to this or to the drain, he was unable to say, but both the well and the drain ought to be looked into. As to the cases at Saundersfoot, he firmly believed the state of the closets and the drains of Saundersfoot were responsible for this outbreak. In conclusion he stated:—"Some time ago I recommended you to erect a public slaughter-house for your parish or group of parishes. These private slaughter-houses are becoming an intolerable nuisance, and more so as they are becoming more numerous. There is not one of the present slaughter-houses in my district either constructed or kept as the law requires them, and unless they are constructed and plentifully supplied with water, they cannot be kept clean." —*Tenby Observer*.

ARTIFICIAL STONE IN GERMANY.—According to a Consular report to the Government of the United States, the artificial building-stone industry has taken a considerable development in Germany. The raw materials are lime, preferably hydraulic, and sand—the cleaner the better. After grinding, and mixing—the cleaner the sand in the proportion of 4 to 6 per cent. of the total bulk. The mixture is then pressed into bricks and transferred to a steel drum, where it is subjected to the action of steam at a pressure of about 120 lb. per square inch for about ten hours. Under the action of the steam a silicate of lime is formed which acts as binding material. The bricks are ready for use on removal from the drum in question. Mouldings are as easily produced as rectangular work. The bricks thus manufactured are said to be both cheaper and stronger than ordinary brick, the crushing strength being about 500 tons per square foot. The factory need is small, as compared with the output, and work can be carried on all the year round.

DAMAGE TO TRURO CATHEDRAL.—It has been reported that certain cracks have appeared in some of the Bath stone of the bases of the pillars of the nave. The committee, in conjunction with the architect and contractor, are thoroughly and carefully dealing with the defects and their remedy, and they feel assured that the matter will be brought to

a satisfactory conclusion. There is not anything amiss with the foundations, nor is there any indication of a settlement in the fabric, and the cracks are perfectly stationary, and show no signs of extending themselves. Not the slightest apprehension exists as to the security of the nave. Excellent progress is reported in the building of the central tower.—*Corinth Telegraph.*

### CAPITAL AND LABOUR.

**SWANSEA BUILDERS' LABOURERS' STRIKE.**—The Swansea builders' labourers six months ago demanded 4d. per hour advance, which was refused, and the men came out on strike. Offers and counter-offers have since been made, arbitration has been refused, and the intervention of a third party unsuccessful. The employers will concede 4d. advance in August next, providing the men will sign on for four years. This offer has now been unanimously rejected, and in all probability the strike will last throughout the winter. In a few cases the advance asked for is being paid, but an effort is being made to get the whole of the labourers engaged in the town to leave work, and so form an organised resistance to the progress of any building operations. Both sides are determined not to give in. The men are being supported by the National Gasworkers and General Labourers' Union. It is estimated that the strike has cost altogether 5,000l.—*Daily Express.*

### LEGAL.

#### TRESPASSERS ON BUILDING LAND:

A QUESTION AS TO RESPONSIBILITY AND RISK.

At Brompton County-court on Monday, before Judge Stonor and a jury, James Booker, a builder's labourer, 25, Byam-street, Fulham, S.W., brought an action against Mr. Joseph Wilson, builder and contractor, 123, Stephendale-road, and Elswick-street, Fulham, claiming damages in respect of personal injuries sustained, owing, it was said, to negligence on the part of the defendant or his servants.

Mr. S. W. Lambert, counsel, appeared for the plaintiff, and Mr. Colam, counsel, defended.

Plaintiff's counsel explained that the defendant was the owner of a large estate bordered by Stephendale-road, Bagley's-lane, and Elswick-street, Fulham. In April last a large portion of the land was not built upon, and it appeared that for some six or seven years previously the public had been in the habit of walking across the land in order to cut off a corner. At one time, it was alleged, a fence had been put up to prevent any one going upon the land, but in April last, and for a long time previously, there was no fence whatever. On April 17 last, late at night, the plaintiff, who for some four years had been accustomed to using the path across the land, had occasion to go to Sand's End, and when about half-way along the path he suddenly fell down a gravel pit which had been dug right in the line of the path. The man seriously injured his shoulder, and was not yet able to resume his work. The plaintiff bore out his counsel's opening statement.

In answer to the Judge he said that he walked across the land about a fortnight prior to the accident, and the nearest gravel pit was then some 30ft. or 40ft. from the path.

In cross-examination the plaintiff stated that there was no notice upon the land warning the public not to trespass, or that the path was dangerous. He had been in the employment of the defendant for a time, and was well aware that there were gravel pits in the field, but he was not aware that the pits were near what he considered to be a public footpath across the land.

Thomas Crawley, a builder's labourer, stated that there was nothing to warn the public of the hole, which could not be seen in the dark as one walked along the path.

Police Inspector Holton stated that about two years ago a fence had been put up on the land, but it was pulled down—he believed by boys—almost immediately afterwards. He had often seen the public using the path across the land.

Cross-examined: No one could accidentally wander from the public footway on to the defendant's land, because the latter was several inches lower than the pavement. There was no well-defined path across the land; people walked across it in various directions. He had never seen a notice warning people not to trespass upon the land. The plaintiff had evidently been drinking on the night of the accident.

F. H. Manning, a sanitary inspector in the service of the Fulham Borough Council, stated that he, as the general public appeared to do, had used the path in question.

Other witnesses gave similar evidence, and two medical men spoke as to the plaintiff's injuries.

Mr. Colam submitted that the defendant could not be held liable in the present case unless it was shown either that the public had a right-of-way across the land, or that there was an invitation to the public to use the path—as in the case of a path leading to a shop or factory—when the hole in question would have been of the nature of a trap. In the present instance, however, any one using the

path was a trespasser. If the evidence had been that a person was likely inadvertently to stray from the public footway on to the land, there might then have been a case to go to the jury.

The Judge: But the defendant appears to have tacitly acquiesced in allowing the public to use the path for two or three years or more. Knowing that people went along the path day and night, they enlarged the pit across the path. I think it a very doubtful point. The question is whether they did not invite the public to use it. It appears that at one time they attempted to stop the public going across the land, but when the boys broke down the fence the defendant appears to have given in and let the public use the path. It does not seem that the public would be trespassers upon the land until it was fenced in again.

Mr. Colam: But if I go across another man's land I am a trespasser. Suppose I sued this man for trespass, could he set up a defence of leave or license? The cases bearing upon the point set up this principle: If you dig a pit, or put a trap so near the public highway that a person without negligence may inadvertently stray, and get into the hole or trap, then you are liable.

The Judge: The public were allowed to use this path.

Mr. Colam: No, your Honour. We could not help them using it. Does your Honour know of any duty on the part of a landowner to put up such a fence that people cannot pull down? Surely, we may assume that persons who trespass upon our land must use their eyes and take the risks. It is the duty of the person who leaves the high road and goes on to my land to see where he goes; it is not my duty to provide light for him.

Mr. Lambert submitted that, in the present instance the hole constituted "something in the nature of a trap." The defendant acquiesced in the public going along the path. The learned counsel went on to quote several cases in support of his contention.

Mr. Colam: I do not agree with my learned friend. I say that I have a right to assume that if a person trespasses on my land in the daytime he must take every care, and if he trespasses and injures himself in the dark he must take the consequences.

The Judge: I think that is so. It appears to be a case where the hole was not a trap. The builder was only using his land in a proper way, and he had a right to assume that a person would not trespass upon the land, especially in the dark. The plaintiff must be non-suited.

### RECENT PATENTS:

#### ABSTRACTS OF PATENTED INVENTIONS.

10,937.—**WINDOW FASTENINGS:** *W. Rudell.*—A fastening-arm is pivoted on to an angle-plate upon the meeting-rail of the lower sash. A hook at the end of the arm engages with the bar of a catch-piece upon the upper sash, the arm can be moved backwards and the sashes can be drawn together with a screw, a slot being cut in the arm for the pivot, and the window may be fastened, when it has been opened, with additional catch-pieces affixed to the middle upright.

10,999.—**A FIRE ALARM:** *H. G. Lynggaas.*—When the temperature exceeds a certain limit an electrical bell circuit will become closed by means of a plate which is cemented with wax to a wire-gauze disc arranged in front of an opening. As the wax is melted the plate is lifted with a spiral spring, and so brings about the meeting of two contact-pieces for the closing of the circuit.

11,007.—**CONSTRUCTION OF BREAKWATERS, GROYNES, &c.:** *E. M. L. Case.*—Plates hold wooden planks or metallic sheets together near their one end, and projecting plates are fitted upon each side of their other end so as to enclose the piles when driven in; lugs on the underside hold a V-shaped or channel-shaped shoe, and a similar weighting-piece is placed above; the piles, tubular in form, should be screw-threaded internally so that their lengths may be joined together.

11,014.—**A PLASTIC COMPOSITION FOR BUILDING PURPOSES:** *W. T. Symons.*—A plastic compound to be moulded into floors, tiles, mantelpieces, and so on consists of an admixture of granulated cork or wood, saturated sugar of lime, cement, and oxidised oil, or other binding material.

11,026.—**AN ELECTRICAL CORD GRID:** *A. F. Lundberg and G. C. Lundberg.*—The grip has a screwed portion, which has grooves that will take the two conductors separately and a plug or nut for holding the conductors in the grooves. For attachment of the grip to a wall plug, the screwed portion is fashioned so as to project from a flat surface against which one can clamp the conductors. The appliance will serve for the coupling-plugs of lamp-holders and for ceiling roses, pear switches, &c.

11,022.—**A CONTRIVANCE FOR FASTENING WINDOWS, GATES, DOORS, DRAWERS, &c.:** *G. C. Smith.*—For retaining the sash in any position required is utilised the end pressure of a plate upon the end of a shaft that is jointed to a bar having a quick thread mounted in a fixed nut. The plate will be drawn inwards when the handle is raised, and adjustment of the window can be effected, the plate being returned with springs to the position for locking. A

bolt that forms part of a rack, worked with a key will prevent the handle from being lifted. For a door, the bar is rotated with inside and outside handles.

11,040.—**TREATMENT OF SEWAGE:** *E. Burmeister.*—To sewage and similar foul effluents are added carbonate of lime and slaked lime, which will also serve for deodorising and disinfecting purposes. The resultant calcareous precipitate may be used again, instead of fresh carbonate of lime, in respect of another quantity of sewage.

11,048.—**WINDING AND HOISTING MECHANISM:** *R. Grison.*—In order to provide for two speeds the inventor fashions the barrel in two parts, having different diameters, and keeps them asunder with a flange in which is a slit. When the barrel is turned in one direction the hauling-rope is wound upon one drum, and *vice versa.*

11,059.—**A GAS-BURNER:** *F. F. Beaumont.*—The atmospheric burner for lighting or cooking, is fitted to the burner tube at its one side with a chamber fashioned in two parts, and at its other side to the gas-jet. One part of the chamber has a partition on to which is pivoted a light fire-proof flap which will open easily for admitting gas and air, but will be closed by any back pressure—thus lighting back is obviated. In another shape a small box is screwed into the enlarged burner tube, having at its inner end a light flap slightly inclined, and at its outer end a gas nozzle and air-inlet holes.

11,084.—**A FLUSHING SYSTEM FOR URINALS:** *T. W. Telford.*—Around the top of the urinal is a gutter into which a pipe delivers the flush and from which the flush overflows down the sides. The gutter is concealed by the overhanging coping stone. In one shape the service-pipe is inserted in the back of the stall and an opening upon a T-piece fits into a conical opening upon the pipe, a screw keeps the lips together, and the overhanging coping stone forms a recess for the sparge-pipes.

11,087.—**A TWO-WAY VALVE FOR FLUSHING APPARATUS:** *T. W. Telford.*—A two-way distributing valve consists of a triangular box, having a flushing inlet and side outlets to the flushing-rims, and provided with a hinged flap. When in its middle position the flap will leave both of the outlets opened, but when in its extreme positions it will leave one or the other of the outlets closed.

11,088.—**AN APPARATUS FOR WINDOWS:** *A. A. Weir.*—The apparatus is devised for opening and shutting pivoted sashes and skylights. A slightly curved rod joins the sash to a nut that is traversed by the twisting of a screw mounted in two fixed brackets, which are set apart at a distance about equal to the length of the rod, and worked with cords passing around a pulley upon the lower end of the screw, and thence around two guide-pulleys upon the lower bracket; a slot in the upper bracket provides for the passage of the curved rod.

11,118.—**A MITERING BLOCK:** *J. W. Oliver.*—The block is fitted with a knife, having inclined edges, reciprocated with a rack and pinion attached to the lever. The pinion will gear on one side with a rack upon the back of the knife, and upon the other side with a fixed rack. A spiral spring returns the knife to its middle position, and spiral springs press the gauge-plates against posts around which they can be turned and clamped at any angle desired.

11,137.—**DUST-BINS:** *G. Oliver.*—The bin has sides that taper upwards. The arms of the lid have slotted ends for engagement with a spindle that is held in a bracket, or they may have bores in their ends for adjustment upon vertical pins.

11,151.—**A CHIMNEY TOP:** *J. Smith.*—A flanged cover provided with openings is fitted on the top of the chimney stack, and a chimney pot is secured in each opening by means of a sleeve on the pot and a collar on the cover. In a variant form the cover and the pots are made in one piece.

11,167.—**AN APPLIANCE FOR USE IN SHARPENING AND SETTING SAWS:** *A. C. Saxton.*—In order that the saw may be adjusted quickly in the clamp of the machine a feeding rack is made on one edge of the slide that clamps the saw, and it is set in place by pressing a tooth into gear upon a transverse slide. Then a tooth upon another similar slide is forced into gear with the teeth of the saw, which can be clamped with screws in its slide, as soon as the contact adjustment is found to be correct.

11,190.—**ELECTRICAL SWITCHES:** *Stevens and Halske A.G.*—In a switch for high-potential currents where the arc is to be extinguished by being drawn within a tube of some insulating material a rod is used for connecting the contacts respectively, a metal ring upon the insulating tube will tend to prevent the latter from becoming overheated.

11,193.—**A CONTRIVANCE FOR WINDOW SASHES:** *A. J. Skillman.*—Central horizontal pivots between sliding stiles carry each sash, which will be held in a vertical plane between the stiles by means of slips which parallel links join to the related sash-stiles; the slips are moved outwards, so as to clear the sash, when one wishes to turn the sash upon its pivots.

11,222.—**TESTING APPARATUS FOR DRAINS:** *R. Ravenor.*—The smoke-test apparatus comprises a cylinder, having an inlet from the blower and an outlet to the drain, which carries the rocket, and there is water beneath for extinguishing sparks, &c. For high-pressure work the bell is removed and a pump—a cycle pump, for instance—is joined up to an inlet in the service-pipe, the gauge being used for indicating the amount of pressure. For low-pressure

work either a gauge or a bell working in an annular sealing-groove is used.

11,273.—APPLIANCES FOR USE WITH ELECTRICAL LIFTS: J. Hoffbauer.—The inventor seeks to furnish means of gradually starting the motor as the well door is closed, and of preventing the motor from being started whilst the well door remains opened. When all the doors are shut the motor-circuit is completed by means of contacts and the arms upon the well doors, but the opening of any one door will break the circuit thereupon, all the other doors being shut, the shutting of that one door completes the circuit through the contacts in turn, the resistances are gradually cut out, and the motor is started.

11,303.—A CONTRIVANCE FOR VENTILATORS: W. B. Johnson.—The vanes, either curved or straight, of the ventilator can be secured at the angles desired or be held with pivots for their adjustment. The lowest vane is so constructed that it will quite shut the inner face of the ventilator—it is pivoted on to the ends of long arms for which a free movement is provided by cutting away the sides of the other vanes, or by pivoting the other vanes upon side brackets.

11,376.—MANUFACTURE OF BRICKS, DRAIN-PIPES, TILES, &c.: C. Chaudler.—The articles are made of dry or damp cement mixed with brick debris, stone, clinker, and similar waste material; after they have been moulded under pressure they are put into a hard water or a liquid charged with alum, soda, silicate of soda, sulphuric acid, and so on, for hardening the binding material.

11,403.—A METHOD OF FIXING FACING-TILES: J. A. Dobbie.—For affixing the tiles on to walls, ceilings, and similar surfaces, the inventor screws through their middle portions and covers the heads of the screws with plugs that have projecting stems which will fit into holes counterbored in the tiles, or may be recessed so as to take the heads of the screws.

MEETINGS.

FRIDAY, OCTOBER 19.

Architectural Association Discussion Section.—Mr. H. G. Collins on "Stables and Stable Fittings," 7.30 p.m.

MONDAY, OCTOBER 22.

Architectural Association of Ireland.—Exhibition of prize and class drawings at 20, Lincoln-place, Dublin (open till the 26th).

SOME RECENT SALES OF PROPERTY: ESTATE EXCHANGE REPORT.

Table listing property sales with columns for date, location, and price. Includes entries for September 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, and October 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30.

Table listing property sales with columns for location, description, and price. Includes entries for Clapton, Breatham, Basingstoke, Notting Hill, Ashstead, Woodfield, North Woolwich, Hoxton, Lewisham, Bermondsey, Leicester, Leytonstone, Walthamstow, Clapton, Stepney, Cubitt Town, Romford, Hornchurch, and many others.

Table listing property sales with columns for location, description, and price. Includes entries for October 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30.

COMPETITIONS, CONTRACTS, AND PUBLIC APPOINTMENTS.

(For some Contracts, &c., still open, but not included in this List, see previous issues.)

COMPETITIONS.

Nature of Work.	By whom Required.	Premiums.	Designs to be delivered

### The Ideal of the Modern Cathedral.

THE correspond-  
ence which has  
been going on in  
the *Times* in re-  
gard to the pro-  
posed Liverpool  
Cathedral —  
clenched as it was  
(we were glad to  
see) by a really  
admirable leading article in the same journal  
—must surely by this time have convinced  
even the fossil minds of the Liverpool  
Cathedral Committee that they have made  
a blunder, and even come near to making  
themselves a laughing-stock, in their obse-  
lete demand for a copy of a mediæval  
cathedral, and in the reasons they give for  
it. It is quite true that the reasoning they  
employ is only what was in common use  
half a century ago; it is the reasoning of  
the Camden Ecclesiological Society resusci-  
tated. But while the artistic work has  
moved away from that position—has recog-  
nised that the Gothic revival, however  
admirable in its enthusiasm, was mistaken  
in its practice, and only succeeded in giving  
us a legacy of sham mediævalism without  
life or reality in it, the minds of Mr. Robert  
Gladstone and his colleagues seem to have  
remained just where the Camden Society  
was half a century ago. So much so is this  
the case, that they apparently cannot even  
understand the existence of any architecture  
other than imitation; and when Mr.  
Blomfield exhorts them not to demand an  
imitation mediæval cathedral, they cannot  
even understand his argument, and reply in  
effect—"What, then, are we to imitate?"

It is not worth while to labour this ques-  
tion further in these pages; most of our  
readers understand the position well enough,  
at all events, and know what is the meaning  
of the protest which has been raised against  
the antiquated proposals of the Liverpool  
Cathedral Committee. But apart from the  
mere question of architectural style which  
affects all important modern buildings

equally, there is the question which may be  
put more particularly with reference to a  
modern cathedral: What is it we want in  
such a building, or what ought we to want?  
What is or should be our ideal in connexion  
with it?

Nearly all our mediæval cathedrals were  
originally built as a portion only of a great  
clerical institution which, though, it has its  
survivals, no longer exists as a part of our  
national life or of our national Church. They  
were each centres of a great monastic estab-  
lishment, and were built for a worship  
carried on by the clerics in the choir, and  
not partaken in by the laity. The long nave  
was nearly useless except for occasional  
processions, but its grandeur, and that of the  
west front, were regarded in the light of an  
offering, an architectural praise of God;  
perhaps also as symbolising the power and  
importance of the special conventual estab-  
lishment. And the church, the material  
building, was also a kind of basis or buttress  
of the conventual plan; the cloister, with the  
numerous buildings for various offices of the  
establishment grouped round it, leaning on  
the church, which usually formed one  
boundary of its central court.

Now a modern cathedral is nothing of all  
this. It is not connected with a great  
religious establishment requiring a train of  
buildings grouped with it. It is not erected  
for an exclusive worship carried on by the  
clerical body on their own behalf. It is  
mainly a great church, principally built for  
the worship of the laity, with a service con-  
ducted by a limited number of priests, for  
and in the name of the lay congregation.  
It will have a chapter house, as the head-  
quarters of the work of the diocese; beyond  
that, it really requires no subsidiary build-  
ings beyond those vestries or robing-rooms  
which are needed in all churches. You may  
choose to build a cloister for the sake of  
effect—and indeed that secluded green  
*temenos* with the arcaded walk around it is  
so charming a feature that it might seem  
worth while to plan and erect it merely for  
its own sake; but its practical necessity or  
utility has gone. And even if all questions

of style were put on one side, there is surely  
in this difference of circumstance and of  
object a sufficient reason why a modern  
cathedral should not be modelled on a  
mediæval one. It is built for a different  
class of people, for a different object, and  
for widely different surroundings.

The modern cathedral, then, is simply a  
great church—the mother church of the  
diocese, with a special official significance in  
that sense, but otherwise a church for public  
worship in the same sense as the parish  
churches. How should this consideration  
affect its plan, as compared with that of the  
mediæval cathedral? For the plan would  
of course be the first consideration, and  
here we must be careful to keep clear  
of the merely utilitarian fallacy. This would  
lead to the planning of a cathedral on some  
such lines as those of Queen's Hall, as  
some recent American churches have  
actually been planned. This would of  
course be a fatal idea, for it would be  
reducing the poetical symbolism of religious  
worship to a mere plain prose question of  
seating and hearing. A church, and espe-  
cially a church on a great scale, is a place  
for indulging in spiritual aspiration, not  
merely for seeing or hearing. The necessity  
for hearing must not be forgotten, but it  
must not appear to be the main object. But  
there are two different theories on which  
the plan may be treated. We may re-  
gard the main space of the plan as the  
church for worship, in which case there  
must be the possibility of hearing (which  
to a certain extent limits its size); or  
we may regard the main space as a place of  
meditation only, and a place of monuments  
to the righteous who have departed, and as  
the vestibule to the actual place of service,  
which would be restricted to more manage-  
able dimensions. This is actually the case  
with the mediæval plan; but the mediæval  
plan, with its character of length with-  
out breadth, and its restricted spaces  
in the choir, is most emphatically not the  
plan for a worship which has become  
essentially congregational, not merely  
priestly. No man asked, without knowledge

of architectural precedent, to plan a building specially suited to congregational worship, would dream of throwing it into such a form as that of the mediæval cathedral. Congregational worship implies large floor spaces, not narrow avenues.

There is nothing so grand in effect, if we want this idea of floor space, as a circular form; and as acoustics (as before agreed) are only a secondary consideration in a church, there is no practical objection to it except when it becomes so vast that a chanting voice cannot be heard across it. But this question of practicable scale depends on what function we give to the circular space. We may make it the actual worshipping space—the choir; with a vestibule in front of it and a chancel at the farther side; or we may make it occupy the position of the nave—a great domed apartment forming a solemn vestibule to the actual church which opens out of it. On a small scale St. Gereon at Cologne gives a suggestion of this, only that the nave is elliptical instead of circular. There is much to be said in favour of this idea of having the great circular space treated as a vestibule for meditation and for grandeur of effect, planning nevertheless so that it can be seen from the choir, as St. Paul's dome, with its misty lights and shadows, is seen so impressively from the choir. But we should only recommend this plan for a cathedral when it was desired to do something on so great a scale that the domed compartment would be practically too large for the conduct of a service. For any dimensions short of that, nothing can be finer and more appropriately expressive of congregational worship than the circular or Greek cross plan with a dome over it. Only whichever scheme of plan is adopted, the actual service should be contained within one compartment. Have, in other words, either a choir or a nave service, but not both combined. The uncomfortable and rambling effect of this is obvious enough at the St. Paul's services.

We have assumed the adoption of a dome as the great feature of the modern cathedral, because it is the grandest possible form in architecture—capable of far more than has yet been done with it, and is the natural and obvious manner of roofing, in a monumental form, a central area such as we have been regarding as the essential element of the modern cathedral plan. Of the detail of the modern cathedral we say nothing here, because detail is a matter which is settled by other considerations than those of plan and general structure. All that can be said in a general way is that it should be essentially symbolical in character, so far as symbolism can be combined with decorative effect. And as far as such higher forms of decoration as stained glass and mosaic pictures are concerned, they should represent the highest artistic power of the present day, not the stiffness and naïveté of an artificial archaism.

One word of warning in conclusion, to those who think they can have nothing more suitable for a modern cathedral than a revived mediæval one. This is not the place to enter on theological questions, but those who are not blind to the signs of the times cannot but see that if a modern mediæval cathedral were built now, it will be out of date, as representing the spirit of modern religious worship, long before the present century is out.

TO THE YOUNGER GENERATION :  
A FEW WORDS ON THE PRESENT SITUATION.\*  
By H. HEATHCOTE STATHAM.

HERE [can be no greater compliment than to be asked, on such an occasion as this, to say a few words to the younger generation in regard to the subject which they have chosen for their life's study and principal occupation. For the request seems to imply a belief that one has got something to say that may be of some use to them. I wish I could feel any confidence myself that there is anything I can say that would be a help or a suggestion to my younger brethren. But at all events, I have promised to try; and I have thought it better to write down my remarks, because I wish to avoid generalities and to keep to the consideration of two or three special points in regard to the conditions of modern architecture.

First, then, I would exhort you not to accept the pessimistic views of those who maintain that all architecture is a sham and a worked-out thing now, and that nothing but an entirely new beginning on a new basis can revive it. Architecture is no worse off now than it has been at any time since the Renaissance, as far at least as its higher possibilities are concerned. It is true that it is on a radically different basis since the Renaissance; but we cannot help that. At the Renaissance the world eat of the fruit of the tree of historical and literary knowledge, and nothing can undo the effect of that dose—nothing can now make it possible for us to develop architectural style in the naïve and spontaneous way in which Romanesque and Byzantine and Gothic architecture were developed, except the extinction of all civilised mankind and the obliteration of their architectural monuments, and a fresh growth of society out of barbarism. We cannot wait for that, I am afraid; nor need we desire it. The Renaissance theory of architecture is not so contemptible after all. It might even be argued that it is the higher theory; that we have exchanged the pursuit of architecture as a craft for its pursuit as an intellectual problem. We have unfortunately had nearly a century, the century just passed away, of sheer copyism—revived Greek; revived Mediæval; revived Queen Anne, whose wraith still haunts us to some extent. But we are shaking off this and coming back to the true attitude of Renaissance architecture, which was not mere revival, but an intellectual use and modification of ancient forms. St. Peter's and St. Paul's may take most of their details from antiquity, but for all that they are original architectural creations. What was done then we can do now—and better, for we have developed in these latter days much more power of invention, and much more sense of character in decorative detail, than the men of the Renaissance possessed.

The lamentations made by what may be called the socialist school of critics over the supposed death of architecture are to my mind as unreal as their remedies are unreal. They remind one of the American story of the young man who saw snakes as the effect of over-indulgence in drink, and whose father brought him home a mongoose to kill

the snakes: they were imaginary snakes, and (naturally) it was an imaginary mongoose. The critics (I suppose they refuse the name of architects) of the school referred to seem to see imaginary snakes in the path of the modern architect, and their imaginary mongoose—a very imaginary one—is that architecture can only be resuscitated by our throwing over all known architectural styles and details, and by working with our own hands in building. The human mind is not made so that it can do the one, nor the human body so that it can do the other. We cannot by an act of will throw away all the influence of precedent in architecture; and it is physically impossible that the architect can erect the building with his own hands; he must have labourers under him, and tell them what to do; and there we come round in the circle again, and the architect becomes, as he now is, not the craftsman but the overseer. But the snakes, as I have said, are imaginary ones. There is, as a matter of fact, a great deal of bad architecture and bad building (the two terms are to some extent synonymous) going on at present, especially in the streets of our towns, owing to the thoughtless manner in which buildings are run up cheap and in a hurry for merely commercial objects. No good architecture, any more than good building, will ever be done cheaply and in a hurry. But apart from that, there is no real reason why we should not now be producing as good architecture as was produced in the early days of the Renaissance—or better. In other words, architecture is not a dead art unless you choose to make it so.

On the other hand, and in fact just because it is not dead, it does not require galvanising into life. That seems one of the dangers just at present, especially with the more earnest and enthusiastic of the younger generation, who have had it so preached to them that architecture is dead, and that copyism has killed it, that they are all on the *qui vive* to do something original, as they think; something picturesque; something out of the common; even something odd and eccentric, with the idea that they are putting new life into architecture. Hence all kinds of vagaries—short stumpy columns, windows in unexpected places, immense rustications enclosing half the shaft of a column, and leaving the other half bare: and so on.\* These devices do impart what is called "character" to a building, no doubt, as long as they are novel; but one very soon gets tired of them. Dr. Johnson's blunt comment on some of the eccentricities in "Tristram Shandy"—"Nothing odd will do for long," is as applicable in art as in literature. Where I think the real life of modern architecture is to be found is a point we will come to just now. But I am sure it is not in this kind of thing. Eccentricities cease to attract as soon as their novelty is worn off, even with those whom they attract at all. Richardson, the American architect, who was a man of much real originality in his way of treating architecture, got hold of one of these devices for being original—the use of rows of short half-columns as a way of modelling the surface of a pier between

\* Perhaps even this is no new thing; human nature does not alter much; and it may be that the sculptor of the lions and columns over the gateway at Mycenæ, who has puzzled architectural historians by carving the column with the thicker end at the top, was only a "new movement" artist seeking originality by using columns upside down.

\* An address delivered to the members of the Architectural Association School of Design, at the opening meeting of the Session on October 15.

windows, &c. It had great acceptance for a time; it became, as one may say, "H. H. Richardson—his mark," and was imitated of many. But where is it gone now? No one imitates it now; he would be rather laughed at if he did. It will be the same with the stumpy columns and exaggerated rustication of recent enthusiasts.

It is possible to be picturesque, no doubt,

without being eccentric; but it is a question whether the picturesque is the true object of architectural design. The picturesque, really and truly, will only come unsought; a sought-out and carefully contrived picturesque defeats its designer's ends. At the present time there is a good deal of tendency to aim at the picturesque, especially in house building. This is only one form of

what may be called the romantic fallacy in art. Goethe, who was not only one of the greatest poets but one of the greatest critics of the modern era, says:—"In all art, the romantic is the false." That seems a hard saying, and no doubt Goethe did not mean it to be taken too literally; did not mean to say that there could be no interest in romantic forms of art. What he did mean

was that the romantic in art was not the truest, not the best, not the most lasting. He wanted balance and perfection of form and ideal in art; and the romantic is essentially the irregular, the unbalanced; the exaggeration of something at the expense of the rest. That may be striking at first, but after you have got over the first impression, you feel it to be imperfect. Just the same line is taken by Horace in his celebrated poem on the "Art of Poetry," which contains a great deal of excellent art criticism, for he throughout compares poetry with painting. We do not want anything in a composition, he says, which, however striking in itself, does not belong to the whole; as if a garment, made for the most part of sober-looking materials, had a patch of purple cloth sewn into it where we did not expect such a thing. That "purple patch" has passed into a proverb. If you are a painter, again, he says, you may be particularly clever at painting cypress trees, but that is no excuse for lugging in your cypress tree when you are commissioned to paint a shipwreck: a criticism with a wide application, and as true now as the day it was written.

The bearings of these remarks lie in their application. A good deal of the work which an architect is called on to do in practice has not, unfortunately, much relation to art in its higher or intellectual sense. The whole thing is mixed up with practical requirements, sometimes of a very prosaic order. But when we can get the opportunity to contemplate and treat a building, large or small, as a whole; a building the uses of which are associated with some of the higher objects of our lives—with the repose and sanctity of life, as in the house—the aspiration to higher life, as in the church—the dignity of corporate life (or, shall we say? the dignity which it *should* have) as in a municipal building; in such cases it is the part of the architect to make of his building an embodied idea—a conception which should be whole and complete in itself; a leading idea, pervading first the plan, and expressed with the same completeness in the design. This is where I think that architecture is or can be still a living art. It is all very well for the pessimists to accuse modern architecture of being only a copied architecture, making use of the detail of preceding styles; it is not within the power of man to avoid that, except to a very limited extent. Even before the Renaissance made such a radical change in the situation, the detail in each generation or in even fifty years, depended largely on that of the preceding fifty years. However rapid and striking may seem the changes in mediæval detail, seen through the foreshortened perspective of past time, they were really very slow and very tentative to the men who were contemporary with them. They only went back, of course, to rather immediate precedent, because that was all that could occupy their attention when there was no history, little or no travel, no books, and no photographs. We have got all styles of detail thrown open to us, and we cannot escape their effect on our minds; and any man who were to resolve, on carrying out a large building, "I will have all new detail of my own invention," would either find it impossible, after all, to escape from precedent, or if he did, he would probably invent

a good deal of very bad detail, doing it worse than his forefathers for the mere sake of doing it differently; simply because it is not in the power of one mind to invent new forms to that extent. It is this rather crazy endeavour to invent something entirely new which is at the bottom of what is called "l'Art Nouveau" in furniture design, in which everything is to look as if made out of ribbons and telegraph-wires; it *is* new, but as it is abominably ugly and for the most part unstructural in character, I fail to see what we have gained by it.

But it is in our power to make a new building a new conception in plan and design, with a dominant idea governing the whole. Now it is in regard to this unity of design, this prevalence of a dominant idea in the building, originating from the plan and expressed throughout the design, that there is too often failure in these days as compared with the days of the Renaissance. We see large modern mansions, for instance, which are supposed to be picturesque, in which the plan is all a ramble without a dominant motive, and the external appearance that of a house which has been added to at different times with no regard to the relation of the additions to the existing portions; and perhaps a couple of half-timbered gables thrust into a building all the rest of which is solid masonry, to make it look still more irregular and (I suppose) "picturesque." That is Horace's "purple patch" in architectural form. I do not call that architecture; I call it throwing a house together, not designing it.

Now it is in this matter of unity and completeness of idea in architecture that I think we get a valuable lesson from some of the Renaissance architects. A great deal of attention has been drawn to their work lately by several fine illustrative publications; among others by Mr. Belcher and Mr. Macartney's book on what they call the "Later Renaissance," but which I think should be called the Renaissance proper, and Mr. Triggs's collection of illustrations of the works of Inigo Jones. And what strikes one in the works of Inigo Jones and Wren especially, as compared with most modern work, is the manner in which they grasped the conception of a building as a whole, and subordinated everything else to a central idea. Every church of Wren's, for instance, is a distinct conception with a dominant idea of its own. The details they used were to a great extent borrowed (though Jones put some originality into his), and the decorative details, in Wren's buildings at all events, are often not good, and perhaps he was not really much responsible for them; but their general conception of a building was nearly always fine and always complete and consistent with itself; an architectural whole. No English architect since then seems to me to have had quite the same power of grasping a design as a whole except Sir Charles Barry, whose detail also we may not care for now, but whose conceptions were always truly architectural in their breadth and comprehensiveness. In the Houses of Parliament he used (by official order) Tudor detail; that in itself is all copyism, of course; but the conception as a whole is quite new and original, and all based upon a grand and yet perfectly simple idea in the plan.

As a further example of this unity of treatment of a building on a great scale,

take the plan of Inigo Jones's intended Whitehall Palace. As a plan for a palace this is one of the grandest conceptions we know of; and observe what a simplicity and unity there is about it; the one great court in the centre; the symmetrical blocks on each side, each with its own smaller courts; the dignity gained by the centralisation of all the leading points of the plan; and the remarkable conception of the varied treatment of the two side courts, the one square, the other circular; but a variety which is kept quite subordinate to the main symmetry of the plan, and is not allowed to disturb it in the least. And what is the significance of this variety? The square court is in the nature of a cloister, for communication; the circular court is to give dignity and a special character to the State approach to the royal presence. There has hardly ever been a finer and more original idea in architecture than this of making the state access to the sovereign not an ordinary straight gallery, but a sweep round a great semi-circular colonnade. It is a real piece of poetry in architectural conception. It is true that the particular monarch in question was not worth such an approach; but that is a matter of detail which does not affect the architectural conception. The example which we have as to the architectural detail with which this palace would have been carried out, in the Banqueting House in Whitehall, though very refined as a treatment of Classic material, may be thought a somewhat cold and academical architectural clothing to have been carried out all over a vast palace such as this was meant to be. I think so myself; but even the academical detail could not destroy the greatness of such an architectural conception; nothing could kill that plan. And in the very fact that it was never carried out it serves to illustrate another point touched upon before. The pessimist critics deny that architecture is anything but building, and are always dinning into us that drawing is not architecture. It is not; but it is a means of showing and putting on record an architectural conception. An idea in architecture is an idea, whether carried into execution or not; and Inigo Jones stands before us as a greater architect than he would otherwise have appeared, in virtue of this one great conception, never built, but fortunately at least existing on paper to excite, as it ought, our admiration and emulation. I do not think there could be a better answer to the nonsense that is talked nowadays about architecture being only building, and properly the work of the craftsman. No mere craftsman could have risen to such a conception as the Whitehall Palace.

As to the use of the detail of a past style there are those, and some of them able and earnest architects, who would have us think that to stand by historical detail is a necessary condition of what they call "continuity" in architecture. It is not an indefensible position; it may at all events be better to have good detail that is old than bad detail that is new. But probably the wiser course, and the one that is most in accordance with the actual tendency of architecture in the past, is not to throw overboard the historical detail, but to regard it as a basis for gradual development and modification, little by little, as we find

Fig. 2.—Part of the Whitehall Plan to a Larger Scale.

A. Grand Vestibule. B B. Circular Gallery forming approach to the Presence Chamber. C. Ante-room or Grand Gallery. D D. The King's Private Rooms

opportunity; which is the way in which all the changes of style in the pre-Renaissance period really came about. They were not the result of sharp and sudden and wilful change, but of gradual modification. At the present moment there is a great leaning towards classic types in architecture, and something more may be developed out of this; but we must get rid of the idea of merely imitating the manner of Queen Anne or Jacobean detail, and try to develop it so as to give a new interest to it. We cannot do this all at once; and it is dangerous to try to break away from it violently for the sake of what is called originality. But that is not of so much consequence as is sometimes supposed. Refinement in detail, of whatever type, is indeed of the greatest importance; it is in the difference between refined and

coarse detail that the hand of the artist is shown. But the particular type of detail employed is a secondary matter. The essential quality of great architecture lies in the main conception of plan and design as a whole. You might hack off all the imitation Tudor detail from the Houses of Parliament and case it all with imitation Classic detail; it would still remain a great building, and its main characteristics as such would remain unaltered.

To come from these very great and exceptional buildings to more ordinary and average erections, I would still suggest that the real object of architecture as an art is to make a building the expression of some distinct and leading idea. So-called picturesque houses and cottages are often only picturesque by association, as it were; by recalling the features and characteristics of

some older buildings. In Ibsen's "Master-BUILDER" (the title of which ought to be "The Architect," for that is its real meaning in the original) there is an effort made to hurry Mr. Solness on behalf of a young couple who are anxious to have their house without delay. "Yes, yes," he replies, "we know all that! And so they're content to take whatever's offered them. They get a—a roof over their heads—an address—but nothing to call a home. No thank you! In that case, let them apply to some one else!" Solness's reply embodies the truth. Even an ordinary small dwelling-house may exemplify this; may have its idea. There is an interesting house at Hampstead figured in Mr. Betcher's book, which exemplifies both the existence of a distinct idea and the failure to carry it through entirely. From the plan (fig. 3) you see that the man who

Fig. 3.

planned that house had a very good and original idea, which gives a special interest to it. He kept the chimneys inside, thereby keeping them away from the cold, and made their position the excuse or occasion for most pleasant little ante-rooms or bays out of the principal rooms. It is really a charming idea for a plan of a small house. But he failed to carry it out completely in the design. At the front of the house the treatment of the plan is recognised, at the back it is not, and the chimneys are left to come crudely through a slope of roof (fig. 4). That is an object-lesson as to the desirability of carrying out an idea thoroughly when you have one. The architect of that house just missed making a complete thing of it. The roof is put on anyhow, and out of centre with the gable; and the projection and gable on the side elevation have no relation to anything in the plan. If it had been treated in some such way as that suggested in fig. 5, the design would have been centralised and would have correctly expressed the plan.

And that reminds us of another point worth mention, viz., not to scruple to find fault with an old building because it is old. There is a weak tendency among modern architects to admire everything in an old building, instead of considering it on its merits as they would a modern building. Then the next thing to this blind admiration is blind imitation. The designers of old buildings were subject to human error like ourselves; and a study of them critically, considering what are their merits and what are their mistakes, is far more useful to our minds than accepting everything as right because it is old.

Two other reflections I would add before concluding; the first I fear an unpalatable one. It is this: not to be sure that you are right in architecture and everybody else is wrong. There is a tendency to this among architects, partly arising, perhaps, from the fact that our aims at present are rather uncertain and conflicting. It is a pity, for it is remarked on by outsiders, and gives a handle against the profession. More than once I have heard the observation—"Oh, we know that architects never admire one another's works." And I confess I have been

pleasantly struck sometimes by hearing a quite young man, who has done nothing but make sketches and prize designs, speak with the most sovereign and sweeping contempt of an eminent architect who has carried out buildings which his youthful critic probably could not even have planned, much less carried out: and this for no better reason, apparently, than that the eminent architect's notion of detail does not suit him. As has been well observed, "We are none of us infallible, not even the youngest"; and it would surely be fitting for youthful critics to consider the work of their eminent seniors at least in a merciful spirit, remembering that—as a Trinity College man said of the members of the smaller Cambridge Colleges—"They, too, are God's creatures."

The other observation I have to make is less disagreeable, and perhaps unnecessary here: it is, to make perfection in architecture for its own sake an object, and not for what you can get out of it. But I think that sentiment will meet with plenty of sympathy here. What has drawn me to the Architectural Association has been the feeling that at your meetings there is really a desire to promote the best study of architecture as an object worth trouble in itself. You do not here waste time and try each others' tempers by wretched wrangles about the wording of by-laws, and who ought to have votes and who ought not, and so on; matters which might be settled in five minutes by sensible people with no axes to grind, and which have truly little enough to do with "the advancement of architecture." And if those who make the love of the art rather than the desire of gain their first object—if they must be content to see others richer than

Fig. 4.

Fig. 5.

themselves in bankers' balances, they have the compensation of keeping their youthfulness of spirit and their appreciation of the beauty of life. There is nothing, I believe, that ages a man's soul like money-getting, considered as a principal object; nothing that keeps the mind and the heart young like the love of Nature and of Art for their own sake; and I put the love of Nature first; for interesting and fascinating as Art is, there is something wrong about an artist who cares for Art more than for Nature. As Wordsworth has beautifully said:—

"Nature never did betray  
The heart that loved her; 'tis her privilege,  
Through all the years of this our life, to lead  
From joy to joy: for she can so inform  
The mind that is within us, so impress  
With quietness and beauty, and so feed  
With lofty thoughts, that neither evil tongues,  
Rash judgments, nor the sneers of selfish men,  
Nor greetings where no kindness is, nor all  
The dreary intercourse of daily life,  
Shall e'er prevail against us, or disturb  
Our cheerful faith that all which we behold  
Is full of blessings."

I can wish those who are young and are beginning life nothing better than that they should live to realise the truth of those words.

## NOTES.

Technical  
Education.

STR HENRY ROSCOE'S address at the Technical Institute last week was more hopeful than have been the recent utterances of most educational experts. He thinks that the country has made up its mind to a reconstruction of the educational system, and that at any rate a complete system of secondary and technical education on the lines of the Government Bill of last Session may be

expected. Perhaps this Administration may manage to carry this measure, but we confess that in the present state of politics we are not very sanguine. But if, as Sir Henry Roscoe points out, it appears feasible to carry out one portion of a new system, it is better to do so than to risk everything by attempting to load the legislative machine too heavily. More and more, in our opinion, it becomes clearer that for the purposes of technical education concentration is necessary. A great deal of money is at this moment being wasted all over England in the winter technical classes which have just begun. They are too much of an amateur character, too much mere winter pastimes which are not followed up. It is absolutely useless for young men to attend carpentry classes in some small country town one evening a week and then cease to do so when spring arrives, and afterwards trouble no more about the subject. One or two may be able to make a rabbit-hutch or a pigeon-house in consequence of these classes, but this is not technical education, and it is no exaggeration to say this is the kind of thing which in many places is now labelled as technical education.

THE opening this week of the Law Courts again directs attention to the state of the appeals under the Workmen's Compensation Act. When the Courts began work on Thursday there were on the list fifty-five cases awaiting decision, as nearly as possible one-eighth of the entire number of appeals to be dealt with by the two Courts of Appeal. It is obvious, as we have already pointed out, that unless the decision of the appeals under the Workmen's Compensation Act is to fall into a chronically backward state, some special effort must be made by the authorities to deal with these appeals. The resignation of his office by the late Master of the Rolls now places as President of the Common Law Appeal Court another Judge, and, as new brooms always sweep clean, it may be that the outlook is more hopeful than it was before the commencement of the last legal vacation. We have no expectation that the Lord Chancellor will move a finger to improve the state of business, but it may be that if the Judges of the Court of Appeal can be made to understand the need for dealing with these appeals quickly, something may be done. The subject is one which the various trade organisations should take up in the interests of workmen generally, since many of these appeals are, when decided, important and governing precedents on the working of the Statute.

We cordially support and echo the protest made by Dr. Winter Blyth, in his speech at the Sanitary Institute dinner, in regard to the inadequate housing of the Parkes' Museum; an institution which as he says, is of national importance, and is constantly visited by strangers from other countries, Americans especially. Yet it is "very difficult to find," and when found is in a building cramped in regard to space and totally without distinction of character. As Dr. Blyth says, if there were a hygienic museum of such importance in Paris or any other continental city, it would be a beautiful building with a marble staircase and

sculptures. It is much to be regretted that, in a country which has led the world in sanitary reform, our chief sanitary museum should be housed in such a way as to convey the impression that the nation, or the Government, are entirely indifferent on the subject.
