Orthoclydon pseudostinaria

From Wikipedia, the free encyclopedia

Orthoclydon pseudostinaria is a species of moth in the Geometridae family. It is endemic to New Zealand. It is classified as critically endangered by the Department of Conservation.

Contents [hide]

- Taxonomy
- Description
- Distribution
- Plant hosts
- Conservation status
- References

Taxonomy [edit]

This species was first described by [George Vernon Hudson](#) in 1918 under the name *Xanthorhoe pseudostinaria*.^{[3][4]} Hudson subsequently placed the species within the genus *Orthoclydon*.^[5]

Description [edit]

Hudson described the species as follows:

The expansion of the wings is $1\frac{1}{8}$ inches. The fore wings are rather broad with the apex very slightly projecting and the termen slightly bowed ; cream-coloured with bright brown markings ; there is a narrow line along the costa ; a faint slightly curved line on the inner edge of the median band ; a small blackish discal dot ; a straight, oblique, very strongly marked line from near the apex to the dorsum at $\frac{3}{4}$, and a very faint wavy subterminal line ; a dark brown terminal line is situated below the apex, where the cilia are also dark brown. The hind wings are cream-coloured with a conspicuous brown line across the middle and very faint traces of one basal and two subterminal lines. Except as above indicated the cilia of all the wings are cream-coloured.^[3]

Distribution [edit]

O. pseudostinaria is endemic to New Zealand.^{[2][6]} Hudson first collected the species at Otira.^[3] The moth was subsequently also found to be present at Goulard Downs near Nelson as well as in the Nelson district, Mount Grey and White Rock in Canterbury.^[5]

Scoparia illota

From Wikipedia, the free encyclopedia

Scoparia illota is a species of moth in the family Crambidae. It is endemic to New Zealand. The larvae of this species are leaf miners.

Contents

- 1 Taxonomy
- 2 Description
- 3 Distribution
- 4 Life stages
- 5 References

Taxonomy

It was described by Alfred Philpott in 1919 using specimens collected at Cromarty in Preservation Inlet as well as specimen collected between Blue Cliffs Beach and the Knife and Steel harbour in Southland.^[2] However the placement of this species within the *Scoparia* genus is in doubt.^[1] As a result, this species has also been referred to as *Scoparia* (s.l.) *illota*.^[3]

Description

Male holotype specimen

Auckland Museum holotype

This species is endemic to New Zealand.^{[1][3]} It is found in the forests of southern New Zealand.^[5] It is locally common in Thomsons Bush in Invercargill as well on the Cascade Road in South Westland.^[5]

Life stages

This species' larvae are leaf miners.^[5] They form silk tunnels amongst the leaves of their host plants.^[5]
