Summary

Total production of fruits in 1940 is likely to be slightly smaller than in 1939. However, since there will be considerably less fruit exported this year, the total supply available for fresh domestic consumption probably will approximate that of a year earlier.

Increased consumers' income has not as yet caused any material improvement over last year in the demand for fresh fruits. Since changes in consumer demand for fresh fruit usually lag several months behind changes in consumer income, expenditures by consumers for fresh fruit for the remainder of the 1940-41 season are expected to be considerably greater than for the same period in 1939-40.

The commercial apple crop this year is approximately 27.6 million bushels smaller than a year earlier. This decrease in total commercial production was the result of a considerable reduction in the crop in the eastern and central regions. The apple crop in the Western States was 1.7 million bushels larger than that of last year.

Farm prices of apples as of November 15 were 13 cents higher for the country as a whole than comparable prices in 1940. Prices in the eastern and central areas averaged about 20 cents higher than in November 1939, while prices in the Western States averaged 2 cents lower. The higher prices in the Eastern and Central States were largely the result of small crops in these areas.

Commercial cold storage holdings of apples as of December 1 totaled 33,388,000 bushels compared with 30,988,000 bushels on December 1, 1939.

It is estimated that the production of fall and winter pears in the Pacific States was approximately 6.8 million bushels compared with 6.0 million bushels in 1939.

In the week ended December 14, prices of all varieties of late pears were considerably higher than in the same week last year. The higher prices this year than last are largely the result of an increased amount of late pears taken by canners, and heavy purchases of pears for relief distribution. Increased consumer income this year may have been responsible for a small part of the increase in prices.

The December 1 estimate of Florida orange production was 11 percent less than the estimate made on November 1. Total orange production in 1940-41 is estimated to be 6.3 million boxes larger than that of a year earlier and grapefruit production in the 1940-41 season is estimated to be 5.4 million boxes larger than in 1939-40. A lemon crop of record size is indicated for this year.

Prices of Florida and California oranges in November averaged considerably above those of a year earlier, whereas prices of Texas grapefruit averaged below those in November 1939.

December 23, 1940

#### APPLES

##### Commercial crop smaller

The commercial apple crop this year is approximately 27.6 million bushels smaller than a year earlier. This decrease in total commercial production was the result of a considerable reduction in the eastern and central crops. The apple crop in the Western States was 1.7 million bushels larger than that of last year.

##### Farm prices higher than a year earlier

Farm prices of apples as of November 15 were 13 cents higher for the country as a whole than comparable prices in 1939. Prices in the eastern and

central areas averaged about 20 cents higher than in November 1939, while prices in the Western States averaged 2 cents lower. The higher prices in the Eastern and Central States were largely the result of small crops in these areas. Increased consumer income has not, as yet, caused any material improvement over last year in the demand for fresh apples. Since changes in consumer demand for fresh apples usually lag several months behind changes in consumer income, apple prices are expected to react favorably to the increased consumer income during the remainder of the 1940-41 marketing season.

Auction and wholesale prices increased  
more than seasonally in November

Auction prices of Washington Extra Fancy Apples, which decreased slightly less than seasonally from September through October, increased more than seasonally from October to November. The price decrease for Extra Fancy Washington Jonathan Apples at Chicago from September through October was seasonal in character. From October to November Jonathan prices increased contra-seasonally. Prices of Extra Fancy Washington Rome Beauties increased contra-seasonally from September through October, and then decreased less than seasonally from October through November. Prices of Extra Fancy Delicious in November were 14 cents higher than a year earlier, prices of Extra Fancy Rome Beauties were 20 cents higher, and prices of Extra Fancy Jonathans were 3 cents higher than in November 1939.

Wholesale prices of eastern and mid-western apples for the week ended December 7 were from 16 to 57 cents higher than comparable prices of last year.

Larger domestic shipments of western apples

Total rail and boat shipments from Western States through December 14 this year corresponded closely to those during the same period in 1939. Since exports of fresh apples were roughly 1.5 million bushels less from July through December 14 of this year than in the corresponding period last year, domestic shipments have been considerably heavier to date this season. Since a large proportion of marketings in the Eastern and Central States are moved by motortruck, and since this movement has been smaller this season, it is probable that total apple marketings have been smaller than a year earlier.

Cold storage holdings on December 1  
largest since 1937

Cold storage holdings of apples as of December 1 totaled 33,993,000 bushels compared with 30,988,000 bushels on December 1, 1939, and the 5-year (1935-39) December 1 average of 31,478,000 bushels. The Surplus Marketing Administration held 605,226 bushels of this total. Although commercial production in the Western States was only 1.7 million bushels larger than in 1939, apples held in cold storage in these States totaled 2.5 million bushels more than a year earlier.

Purchases for relief large this year

From the beginning of the season through December 7, 3.1 million bushels of apples were purchased for relief distributions compared with about 4.5

million purchased during the corresponding period last year. Roughly 1.2 million bushels of the total this year were purchased in the Western States.

Imports from Canada dropped off  
sharply in November

Imports of Canadian apples totaled only 210 cars in November compared with 541 in October. Imports of Canadian apples this season to date totaled 870 cars, roughly 652,000 bushels. It is estimated by the trade that about 85,000 bushels of the apples imported from Canada have been reexported to South America.

PEARS

Larger production of late varieties

Production of fall and winter variety pears in the Pacific States is estimated at approximately 6.6 million bushels compared with 6.0 million bushels in 1939, and the 10-year (1929-38) average of 4.2 million bushels. The Agricultural Marketing Service estimated as of December 1 that 209,000 bushels of late pears were not harvested this year. In 1939, 582,000 bushels of late pears were not harvested. If the amounts unharvested in 1940 and 1939 are deducted from the respective estimates of total late pear production, the amount harvested in 1940 is approximately 985,000 bushels larger than in 1939.

Auction prices of late varieties higher  
than in 1939

The weighted average auction price per box of D'Anjou pears at New York increased seasonally from October through November, and the average price of Bosc at the New York Auction increased contra-seasonally during the same period. Prices of the Bosc variety, which increased from \$1.69 in September to \$2.12 in November, usually decrease from October through January.

In the week ended December 14, prices of all varieties of late pears were considerably higher than in the same week last year. The higher prices this year than last, are largely the result of an increased amount of late pears taken by canners and heavy purchases of pears for relief distribution. Increased consumer income this year may have been responsible for a small part of the increase in prices. It is roughly estimated that canners took 500-700 thousand bushels of late pears this year compared to a negligible quantity taken by canners in 1939.

Relief purchases large

From the beginning of the pear season to November 30, a total of 41,200 boxes of Bartlett pears and 779,688 boxes of late variety pears was purchased for relief distribution.

The purchases of fall and winter pears were distributed among four varieties as follows: (1) Hardy 373,296 boxes; (2) D'Anjou 206,505 boxes; (3) Comice 118,080 boxes; and (4) Bosc 81,717 boxes. No winter Nelis had been purchased up to November 30.

Total relief purchases of late variety pears were equivalent to 62 percent of the total exports in the 1939-40 season, and purchases plus exports through November 30 this year were equivalent to 75 percent of the total exports in the 1939-40 season.

Amount of late pears available for domestic consumption during remainder of marketing season less than last year

It is roughly estimated that the total quantity of late pears available for fresh consumption from December 1 to June 30 will be about 120-125 thousand bushels less than the quantity available in the same period last year.

Cold storage holdings of late pears on December 1 were 239,000 bushels less than on December 1, 1939.

It is estimated that exports of late pears in fresh form during the remainder of this season will be roughly 85 percent less than exports during the same period a year earlier.

CITRUS

Estimate of orange production reduced

The December 1 estimate of Florida orange production was 11 percent less than the estimate made on November 1. The reduction in the estimate was due largely to damage from low temperatures during November, and to retarded sizing and excessive dropping of fruit caused by inadequate rainfall during the fall months. Although the December 1 estimate of early and midseason orange production is 4.3 million boxes larger than the final estimate of production in 1939, it is approximately 1.5 million boxes less than the estimate made as of December 1, 1939. The freeze in the latter part of January 1939 resulted in a drastic reduction in the final estimate of orange production in Florida for that year.

Total orange production in 1940-41 is estimated to be 81.9 million boxes compared with 75.6 million boxes in 1939. Orange production on a July-June basis is estimated to be 7.8 million boxes larger than a year earlier.

Grapefruit production estimate cut

The December 1 estimate of Florida grapefruit production this year was 9 percent less than that of a month earlier. Total grapefruit production in 1940 is estimated to be 40.4 million boxes compared with 35.0 million boxes in 1939, and the 10-year (1929-38) average of 22.0 million boxes. The grapefruit crop this year probably will be smaller than the record crop produced in 1938.

Record lemon crop estimated

A lemon crop of record size is estimated for 1940.

Orange prices higher this year; grapefruit  
and lemon prices lower

Auction prices of early and midseason Florida and California oranges for the week ended December 13 averaged considerably above comparable prices in 1939.

Prices of Texas grapefruit for the week ended December 13 averaged below comparable prices in 1939. Lemon prices for the week ended December 13 were markedly below those of a year ago.

SOME COMMENTS ON THE USE OF A WEIGHTED AVERAGE PRICE  
OF ALL GRADES OF A GIVEN VARIETY OF APPLES TO MEASURE  
THE RELATIVE PRICE MOVEMENTS OF THAT VARIETY

In previous issues of the Fruit Situation series of weighted average prices of all grades of specified varieties of Washington apples have been published. These series have purported to show the level of prices at a given time, and the general movement of prices of these varieties from week-to-week and month-to-month during a given season. This all-grade average price at times yields erroneous conclusions as to the relative level of prices between comparable weeks or months of two different years, and also leads to faulty conclusions as to the relative price change from week-to-week or month-to-month in any given year. In extreme cases the weighted average price of all grades of a given variety may even move in an opposite direction to the movement of all of its component prices. That is to say, the prices of all the different grades may increase from one week to the next, but the weighted average price may decrease. However, a weighted average price of all grades is necessary when consumer expenditures and supply-price relationships are to be measured.

In the discussion that follows, the weighted average price series of all grades of Washington Delicious apples at the Chicago auction will be examined, and an attempt will be made to point out the faults that are inherent in such a series when it is used to measure price changes.

The all-grade weighted average price of Washington Delicious apples at the Chicago auction is usually made up of the prices of the following grades: (1) Extra Fancy, (2) Fancy, (3) Combination Extra Fancy and Fancy, (4) C grade, and (5) Miscellaneous. In many weeks and months, no sales are made of the last three grades. In the 5-year period 1935-39, 57 percent of the total sales were Extra Fancies, 34 percent were Fancies, 6 percent were C grades, and 3 percent were Combinations and Miscellaneous. In certain years the proportionate amounts of the various grades sold differed greatly from these average proportions. In 1933-39, 42 percent of the sales were Extra Fancies, 43 percent were Fancies, 12 percent were C grades, and 3 percent were Combinations and Miscellaneous. The prices of these grades at any given time normally run in the following order, ranging from high to low: (1) Extra Fancy, (2) Combination, (3) Fancy, and (4) C grade. The price of those classed as Miscellaneous may at times be higher than the price of the Combination grade and at other times may be just above the C grade price.

The weekly weighted average price of all grades of Delicious apples is calculated by multiplying the individual grade prices by their respective sales in the given week, totaling the products, and dividing by the total sales in

that week. Since the proportion that the sales of a given grade are of total sales varies greatly from week-to-week and month-to-month, a comparison of the all-grade price for two different periods frequently involves the comparison of an average price weighted heavily by a high-priced grade with an average price weighted heavily by a low-priced grade. This shifting in the weights of the various grades may cause the weighted average price to change relatively more or less than any of its constituents, and may even cause it to move in the opposite direction to all of its various price elements.

The all-grade weighted average price of Washington Delicious apples at the Chicago auction for the months of October and November 1940 may be used as an example of the inaccuracy introduced by using a weighted average price of all grades of a given variety to measure relative price movements from one period of time to another. The all-grade average price increased from \$1.59 in October to \$1.65 in November, an increase of 4 percent. However, the price of three of the grades decreased from 7 to 9 percent from October to November, and the price of the fourth grade increased only 2 percent. The greater relative increase in the all-grade average price was due to a shift in the proportionate amounts of the various grades sold in those 2 months. In October 51.7 percent of the sales were Extra Fancies, 39.2 percent were Fancies, 9.0 percent were C grades, and .1 percent were Combinations, whereas in November 74.6 percent of the sales were Extra Fancies, 12.4 percent were Fancies, 12.7 percent were C grades, and .3 percent were Combinations. Consequently the November average price was weighted more heavily by the high-priced Extra Fancies.

A comparison of the weighted average price of all grades and its separate price elements for the weeks ended November 29 and December 5, 1940 lends support to the statement that the all-grade average price may at times move in the opposite direction to all of its constituents. The average all-grade price decreased 2 cents from the week ended November 29 to the week ended December 5, but the price of Extra Fancies increased 3 cents and the price of Fancies increased 22 cents. The decrease in the all-grade average price was caused by the inclusion of a considerable quantity of the low-priced C grade apples in the average price for the week ended December 5. No C grade apples were sold in the previous week.

The greatest discrepancies in the all-grade price occur when the proportion that C grade sales are of total sales varies considerably in the two periods of time that are being compared. However, a weighted average price of the Extra Fancy and Fancy grades would have similar faults. An average of this type calculated for the months of October and November 1940 shows an increase of 10 cents from October to November, whereas the price of the Extra Fancy grade increased only 2 cents and that of the Fancy grade decreased 11 cents. The average price was distorted because sales of Extra Fancies in October constituted 57 percent of total sales while in November 86 percent of the sales were Extra Fancies.

The weighted average price of all grades of a variety also may lead to faulty conclusions when the level of prices in 1 year is compared with the level in another year. The average all-grade price of Washington Delicious in October 1940 was \$1.59 compared with \$1.56 in October 1939. Thus, the weighted average price of all grades showed an increase of only 3 cents over the preceding year. In October 1939 only the Extra Fancy and Fancy grades entered into the computation of the weighted average price, but in October 1940 the

average was composed of prices of Extra Fancies, Fancies, Combinations, and C grades. Extra Fancies in October 1940 sold for 7 cents more per box than in October 1939, and Fancies sold for 16 cents more. Since 52 percent of the sales in October 1940 were Extra Fancies, and 39 percent were Fancies, the prices of 91 percent of the apples sold in this month were from 7-16 cents higher than those for the same grades a year earlier.

It has been shown that the weighted average price of all grades of a given apple variety at times leads to faulty conclusions as to the relative level of prices between comparable weeks or months of two different years, and that it also yields erroneous conclusions as to the relative price change from week-to-week and month-to-month. Further, in extreme cases the all-grade average price of a given variety may move in the opposite direction to the movement of all of its price elements. These inherent faults, alone, should prevent the use of such an average in the computation of an index of normal seasonal variation. In the computation of such an index covering a period of say 15 years the shifting in weights from year to year might offset each other so that the index as a whole would not be greatly affected. However, even if this were true, the comparison of price changes throughout any 1 year with the normal seasonal trend would yield faulty conclusions. For these reasons the weighted average price of a single grade of a given variety of apples should be compared with the normal seasonal movement derived from a price series for that grade.

In the case of Washington Delicious apples the normal movement of prices throughout the season is not the same for all grades. Figure 1 shows the normal seasonal trend at the Chicago auction of prices of Extra Fancy, Fancy and C grade apples of this variety. The price index for Fancies tends to rise from November to December, whereas the index for Extra Fancies tends to decline slightly. From February to March the price index of Fancies rises sharply, but the index of Extra Fancies remains constant. The price index for C grade Delicious does not fluctuate as much from September to April, as do the indexes of Extra Fancies and Fancies, but tends to fall more sharply from April to May than the indexes of the other two varieties.

In subsequent issues of the Fruit Situation weekly price series of the Extra Fancy grades of specified varieties of Washington apples will be published in place of the series of weighted average prices of all grades of certain varieties that have been published in the past.

The price series of all grades of all leading varieties of apples from Western States that appears currently in the Fruit Situation is of even more dubious significance as an indicator of the general direction and relative changes from time to time of apple prices than is the weighted average price of all grades of any one variety. This average includes not only prices of different grades, but also prices of different varieties from various States. Some varieties consistently sell at prices lower than those of other varieties, and apples from certain States usually sell for less than do apples from other States. Significant shifts in the weights allocated to the prices of various grades, varieties, and States can easily cause this all-inclusive weighted average price to move directly opposite to the movement of all of its constituents. This price series, however, will continue to be published for those who wish to measure consumer expenditures and supply-price relationships. This series should not be used to compare the level of prices at different periods of time.

Compiled from reports of the Agricultural Marketing Service.

1/ For some States in certain years, production includes some quantities unharvested on account of market conditions. In 1938, estimates of such quantities were as follows (tons): Idaho - Sweet, 450; Sour, 100; Washington - Sweet, 3,900; Sour, 1,400; Oregon - Sweet, 3,200; Sour, 400; California - Sweet, 4,800. In 1939, Idaho - Sweet, 70; Sour, 60; Washington - Sweet, 1,350; Sour, 450; Oregon - Sweet, 1,870; Sour, 130; California - Sweet, 3,000.

Compiled from reports of the Agricultural Marketing Service.

1/ Estimates of production include fruit consumed on farms, sold locally, and used for manufacturing purposes, as well as that shipped. Fruit ripened on trees but destroyed by freezing or storms prior to picking, is not included. For some States, in certain years, production also includes some quantities donated to charity and/or eliminated on account of market conditions. In 1938 and 1939, estimates of such quantities were as follows (1,000 boxes): 1938-Oranges, California Valencias, 1,172; Navels and miscellaneous, 1,767; Florida Early and Midseason, 8; Arizona, 3; Grapefruit, Florida Seedless, 360, Other, 1,440; Texas, 1,710; Arizona, 320; California, 25; 1939-Oranges, California Valencias, 589; Navel and miscellaneous, 414; Grapefruit, California, 6.

2/ The indicated production for 1940 is based on reported prospects on December 1. The estimates cover the crop from bloom of the year shown. In California the picking season adopted, extends from November 1 to October 31. In other States the season begins about September 1.

3/ Short-time average.

4/ Production estimated in terms of standard boxes, each equal to about 2 of the "halfstraps" commonly used.

5/ Failure reported.

6/ Net content of boxes varies. In California and Arizona the approximate average for oranges is 70 pounds net and grapefruit 60 pounds; in Florida and other States, oranges 90 pounds and grapefruit 80 pounds, California lemons, 76 pounds net.
