No. 24,066.—WORDEN E. STODDARD, of Horicon, N. Y.—*Improved Stop Gauge for Weather Boarding, &c.*—Patent dated May 17, 1859.—This invention consists in the employment of a pair of adjustable gauges, or stops, for facing the width of the show of clapboards, mouldings, and other boards, and at the same time holding them in their places while fitted and nailed.

*Claim*.—The use of the bar A, forming a stop or support for boards and mouldings, and the knob C, the spur D, and the adjustable slide B, substantially as shown, for the purposes set forth.

No. 24,067.—JOHN THOMPSON and M. L. DOTY, of Chariton, Iowa.—*Improved Paddle Wheel*.—Patent dated May 17, 1859.—The claim and engraving explain the nature of this invention.

The inventors say: We *claim* the buckets of a paddle wheel, arranged in combination with the segments *b*, the weighted pinions F, and the dogs H, or their equivalents, to operate substantially as and for the purposes specified.

And, in combination with the above named parts, we also claim the arrangement of the spurs *j*, or their equivalents, for the purpose of retaining the buckets in the proper position while the wheel is backing, substantially as described.

No. 24,068.—L. E. TRUESDELL, of Warren, Mass.—*Improvement in Connecting Together the Braces of Truss Bridges*.—Patent dated May 17, 1859.—This invention consists in so constructing the diagonal braces that they shall lock, or embrace each other at the points of their intersection, so that when bolted together by means of a clamp of suitable construction, they will be so firmly connected that any dislocation or derangement of the parts will be prevented.

*Claim*.—The method described of constructing and interlocking the diagonal braces, for the purposes set forth.

No. 24,069.—CHARLES R. M. WALL, of New York, N. Y.—*Improved Propeller*.—Patent dated May 17, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim*, first, an apron G, arranged in such relation to a wheel A that it operates to propel a vessel, substantially as described.

Second. The arrangement of the rollers E E<sup>1</sup>, in combination with the apron G, whereby the wheel is made to work at any dip, substantially as specified.

Third. The springs *g*, or their equivalent, arranged in combination with the rollers E<sup>1</sup>, and with the apron G, for the purpose of regulating the strain on the apron, substantially as set forth.

No. 24,070.—CALVIN D. WHEELER, of New York, N. Y.—*Improved Needle Case and Index*.—Patent dated May 17, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—A needle case and index combined for sewing machines, as described, whereby the appropriate sizes of the thread and needles to properly work together is always determined and shown.

No. 24,071.—NICHOLAS WHITEHALL, of Newtown, Ind.—*Improvement in Seeding Cultivators*.—Patent dated May 17, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—The combination of the stirrups *o o*, with the notched handles N N, eye bolts D, and hooks F F, by which I am enabled to raise and secure the plough at any desired height, substantially as set forth.

No. 24,072.—J. CARPENTER WORTH, of township of Little Britain, county of Lancaster Pa.—*Improvement in Cements for Roofing*.—Patent dated May 17, 1859.—In making this improved composition for roofing, the ingredients are mixed in the following proportions:

To one gallon coal tar mix one quart of petrolemm, four ounces India rubber, four ounces sandrolach, four ounces red lead, three ounces massicot, and five ounces calcined plaster of Paris.

*Claim.*—The composition for roofing made up in the manner, and of the ingredients proportioned and mixed, as set forth.

No. 24,073.—JOHN H. YOUNG, of St. Louis, Mo.—*Improved Pump.*—Patent dated May 17, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, dividing the pump cylinder into two chambers *a a*<sup>1</sup>, by the division valve-seat plate *b*, with its valves opening upwards, and uniting them by the water-way *E*, substantially as described and for the purpose set forth.

I also claim the puppet valves *m m*, connected to and operating with the buckets *K L* in the two chambers, so that, whilst they move with said buckets, they shall have action independent of them, as set forth.

I also claim, in combination with the hollow piston and stem passing through it, the causing of the upper valve *m* to close upwards against its bucket, substantially as described.

No. 24,074.—JACOB YOUNGMAN, of Sunbury, Pa.—*Improvement in Railroad Switches.*—Patent dated May 17, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The arrangement of two guards *4 4* so that a space *5* exists between them at the point where the cars take an oblique direction to the switch rails, in order to run upon the lower portion of the main track on a frog plate, which has stationary frogs *1 2*, and a rail *3*, arranged on it, substantially as and for the purposes set forth.

No. 24,075.—ORSON BILLINGS, of La Grange, Ohio, assignor to Himself and MORRIS TRAVER, of Clinton Hollow, N. Y.—*Improved Lock.*—Patent dated May 17, 1859.—This invention consists in the use of a series of guards arranged relatively to each other and to a bolt, whereby the lock is prevented from being picked, or even opened with a proper key, unless the operator has a knowledge of the construction and arrangement of the different parts.

The inventor says: I *claim* the combination of the guards or plates *E F H*, constructed and arranged relatively with each other, and the bolt *B*, to operate as and for the purpose set forth.

I also claim the spring tops *c*, when applied to the guard or plate *E*, and the latter is used in connection with its fellow-guards *F H*, for the purpose described.

No. 24,076.—TYRANNUS P. BUTTERFIELD, of Indianapolis, Ind., assignor to ABIJAH TAYLOR, of Morgan county, Ind., and R. STEVENSON, of said Indianapolis.—*Improved Hand Planing Machine.*—Patent dated May 17, 1859.—*A* is a sliding frame, to which is attached the knife *D*. The pinion *C* raises or lowers the frame *A*, regulating the contact of the knife *D* with the lumber to be planed, as it passes through the machine over the rollers *E E*, the journal of the feed roller *F* working in the sliding box *G*. The pressure given by the feed roller upon the lumber is governed by the spring *H* and screw *I*.

*Claim.*—The combination and arrangement of the frame *A*, knife *D*, feed roller *F*, spring *H*, and screw *I*, when the whole is arranged, constructed, and operated, in the manner substantially as and for the purpose set forth.

No. 24,077.—SUMNER COOPER, of Windsor, Conn., assignor to Himself, THOMAS DENHAM, and JOSEPH W. BRIGGS, of Cleveland, Ohio.—*Improvement in Window Sash Supporters.* Patent dated May 17, 1859.—This improvement in spring pulleys for window sashes consists in the employment of a spring pinion secured in the jamb of the window frame, having a device for locking the same at any given point, with a rack secured to the edge of the sash, and having friction rollers in the upper and lower corners of the opposite edge of the sash, so that, when it is desired, one spring pinion may be used alone to raise the sash, or lock it down, or at any other given point.

*Claim.*—The combination and employment of the spring pinion pulley *C* with the rack or perforated plate *L*, tube or box *I*, pin *J*, key *K*, latch *H*, substantially in the manner and for the purpose described.

No. 24,078.—C. B. COTTRELL, of Westerly, R. I., assignor to Himself and NATHAN BABCOCK, of said Westerly.—Patent dated May 17, 1859.—*Improved Feeding Device for Planing Machines.*—The claim and engravings explain the nature of this invention.

*Claim.*—The combination of the anti-friction and feed rollers *G L* applied to the class of planing machines described, and driven from one and the same shaft *H* by gearing, arranged as shown, to admit of a separate lateral adjustment of each, for the purpose set forth.

No. 24,079.—HARRY H. EVARTS, of Chicago, Ill., assignor to Himself and P. E. MERRIHEW, of said Chicago.—*Improved Machine for Sawing Staves from the Bolt.*—Patent dated

May 17, 1859.—The object of this invention is to expedite the cutting of the staves from the bolt, and to render the operation of the working parts automatic throughout.

The inventor says: I *claim*, first, the employment or use of the reciprocating saws F F, in connection with the swinging bolt frames G G, operated by the wiper wheels s, or their equivalents, substantially as and for the purpose set forth.

Second. The employment or use of the segment racks b, operated substantially as shown, and connected by the pinions g with the right and left screw rods H, having jaws f f placed thereon for the purpose of dogging and undogging the bolts at the proper time, as described.

No. 24,080.—HENRY HOWSON, of Philadelphia, Pa., assignor to ANDREW HARRIS and JOHN W. HARRIS, of said Philadelphia.—*Improvement in Valves for Dry Gas Meters*.—Patent dated May 17, 1859.—This improvement consists in a self-adjusting pin, fitted loosely on the valve, and intervening between the latter and the driver, so that the pin may adjust itself to any irregularity in the movement of the driver, thereby obviating the tendency which such unequal movements have to raise the valve from its seat and allow the gas to escape.

The inventor says: I *claim*, first, a pin E, or its equivalent, fitted loosely to the valve and intervening between the valve and the driver, substantially as set forth, for the purpose specified.

Second. Constructing the driver in the form of an inverted cup D, with the driving pins in the inside, said cup being so arranged in respect to the annular flanch e of the valve, as to serve the double purpose of maintaining the latter in its proper position and of preventing the access of tar to the driving pins.

No. 24,081.—WARREN MILLAR, of Chicago, Ill., assignor to Himself and JOHN NUTT, of said Chicago.—*Improvement in Sewing Machines*.—Patent dated May 17, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the hook h, when constructed and operated substantially as described, in combination with an eye pointed needle, and the spool case c, for the purpose specified.

Second. The combination of the flange b and space x, or their equivalents, of the spool case c, when constructed as and for the purposes described.

Third. The sliding supports s s, or equivalents therefor, when constructed, arranged, and operating in the manner substantially as described, for the purpose specified.

Fourth. I *claim* imparting to the spool case c the tripping or rocking motion, to receive the loop of needle thread from the hook h, or its equivalent, in the manner and for the purpose described.

No. 24,082.—WILLIAM SAILOR, of Philadelphia, Pa., assignor to Himself, W. L. BOYER, and H. K. BOYER, of said Philadelphia.—*Improvement in Corn and Cob Mills*.—Patent dated May 17, 1859.—This invention consists in certain plates with saw teeth on their edges, said plates being secured obliquely to the spindle and adjacent to the burr, and being arranged so as to effectually tear up the cob and direct the broken pieces toward the burr. Also in a peculiar construction of the burr, whereby portions of it may be renewed when the teeth are worn.

The inventor says: I *claim*, first, the plates i i with their saw teeth, when the said plates are secured obliquely on the spindle and adjacent to the burr, and when both the burr and plates are arranged, in respect to the shell, substantially as set forth.

Second. Forming the burr in three or more separate pieces, adapted and secured to each other and to the spindle, substantially as specified.

No. 24,083.—GEORGE W. SIMMONS and GEORGE H. SIMMONS, of Bennington, Vt., assignors to Themselves and NORMAN MILLINGTON, of Shaftsbury, Vt.—*Improved Vinegar Cruet or Bottle*.—Patent dated May 17, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—As a new article of manufacture, a bottle, cruet, or other similar vessel, for containing liquids for table, culinary, or household purposes, provided with the tubes A and B, made and fitted to them in the manner and for the purposes described and represented.

No. 24,084.—HIRAM ALDRIDGE, of Michigan City, Ind.—*Improved Shoe for Grain Separators*.—Patent dated May 24, 1859.—The inventor says: My improvement relates to the manner in which I have constructed and arranged the chaff and straw elevator in connection with the inclined sieve and inclined connection slant board, all of which is incased in a common shoe and placed above the main cleaning sieve in an inclined position, admits of the application of a powerful blast for cleaning the grain.

*Claim*.—The endless incline elevator belt C C, with its lags or cross slats I, in combination with the incline sieve board F and incline extension board R, arranged in the manner and for the purpose set forth.

No. 24,085.—GEORGE W. BAKER, of Cochranon, Pa.—*Improved Bedstead Fastening*.—Patent dated May 24, 1859.—The box E is screwed to the post A, with the cavity side of the box against the rail B B, thereby keeping the hook D in its place; on the convex side of the box E is a slot *m* in which the shaft of the hook D works; F is a toothed rack screwed on the shoulder of the rail, and in which the end S of the hook D hooks.

*Claim*.—The box E, the hook D, and the rack F, when the same are used and combined, substantially in the manner described and for the purposes set forth.

No. 24,086.—E. BARNHART, of Shippensburg, Pa.—*Improvement in Smut Machines*.—Patent dated May 24, 1859.—This invention consists in arranging in a hollow cylinder, with a fluted top and sides, a rotary disk, the surface of which is also fluted, and to which a cylindrical fluted shell is attached, which surrounds four wings placed at the under side of the disk, so that the wheat or the grain as it passes through the funnel on the disk is spread in all directions by means of the fluted surface of the same, assisted by the fluted top and sides of the hollow cylinder and by the fluted shell, and, when so spread, is exposed to the blast created by the wings of the underside of the disk, so that the larger part of the dust and chaff is thrown out by the force of this blast before the grain enters the fan cylinder, in which it is exposed to a second and more powerful blast.

*Claim*.—The disk D arranged with the fluted shell E and with the wings *c*, to operate in combination with the fluted cylinder F, which is provided with a spout *e*, substantially as and for the purpose specified.

No. 24,087.—DANIEL BARNUM, of New York, N. Y.—*Improvement in Surface Condensers*.—Patent dated May 24, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the method, substantially as specified, of making yielding joints between the tubes and tube sheets in the condensing water compartments of surface condensers, and of thus compensating the expansions and contractions in the tubes, by the means of leaving a portion of India rubber, or other elastic packing, immediately surrounding each tube, free, so that its elasticity can yield longitudinally with the tubes and compensate for their varying lengths, without causing the packing to slip on the metal, substantially as and for the purposes specified.

I claim also the combination of a relief valve, with yielding joints (without followers) in the condensing water compartments, of surface condensers, for the purpose of preventing the blowing out of the packing, and thus preserving the joints, substantially as specified.

No. 24,088.—DANIEL BARNUM, of Jersey City, N. J., and S. G. TYLER, of Quincy, Ill.—*Improvement in Hemming Guides for Sewing Machines*.—Patent dated May 24, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The manner substantially as specified in the illustrations, fig. 2, of arranging and constructing a hollow conical U shaped tube and slot *j*, in combination with a horizontally acting spring plate *c*, or its equivalent, bearing against the slot *j*, and tending to press the edge of the flexible material, when the same is placed within the slot, into the tube *b* and against the lower side of the concave surface thereof, for the purpose of aiding the hand in turning the hem on the under side and leaving the fair stitch upon the upper or right side of the garment as specified.

No. 24,089.—JOHN W. BATSON and LEONARD BATSON, of Clarksville, Md.—*Improvement in Cultivators*.—Patent dated May 24, 1859.—H is a concave point applied in a similar manner to the shovel E<sup>1</sup>, this point following in the rear and slightly to one side of the furrow made by the point F; it is unnecessary that a cutter should be applied to it. It is made with the four points *o* *o*<sup>1</sup> *o*<sup>2</sup> *o*<sup>3</sup>, each of which may be used in turn for entering the ground as the others become dull and worn.

*Claim*.—The arrangement of the reversable concave shovel point H, reversable shovel point F and its cutter G, with beam A and standards C and D, the whole being constructed and applied in the manner described, for the purpose specified.

No. 24,090.—THOMAS BELL, of New York, N. Y.—*Improved Rig for Vessels*.—Patent dated May 24, 1859.—A is the mast bench, consisting of a single round stick of wood, or built of several pieces in the ordinary manner of built masts, said bench being stepped into the keelson of the vessel.

C is the mast and B is a spar which is substituted for both boom and bowsprit, the mast being straight and the spar being curved, so that its ends are higher than the middle, where, or at some distance in front of which, it is secured to the mast in the strongest and most permanent manner.

*Claim*.—The arrangement and combination of the mast C, spar B, and revolving forked mast bench A, substantially as and for the purpose shown and described.

No. 24,091.—EZRA R. BENTON, of Cleveland, Ohio.—*Improved Spring Bed Bottom*.—Patent dated May 24, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The construction of a bed bottom, or spring couch, consisting of a series of double springs B B<sup>1</sup> and C C<sup>1</sup>, the longitudinal pieces G G<sup>1</sup> and the transverse slats A A, &c., either with or without the flexible band I, when arranged as set forth, and operating in the manner and for the purposes specified.

No. 24,092.—JOHN BOYD, of Philadelphia, Pa.—*Improvement in Carding Engines.*—Patent dated May 24, 1859.—The operation of the covered roller B and the roller C, in connection with the scrapers D and E, when combined with the doffer cylinder of a carding engine, is to strip off all the fibrous material and discharge it from the machine.

*Claim.*—The combination of the rollers B and C and scrapers D and E, for stripping the ordinary doffing cylinder of a carding engine; the whole being constructed and arranged substantially as described.

No. 24,093.—CORNELIUS R. BRINCKERHOFF, of Batavia, N. Y.—*Improvement in Harvesting Machines.*—Patent dated May 24, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of the crank, operated by the main shaft, with the rake and sweep post, to which it is attached, and the eighth arm, when arranged in the manner described.

Second. The open work divider to divide the grain falling upon the platform from the gavel being removed therefrom by the rake, when arranged upon the rake head, in the manner and for the purpose specified.

Third. The spring catch marked *c* and dog marked *a*, in combination, and the location of said catch, to break the forward motion of the rake, and its return by the spring, arranged substantially as described.

Fourth. The projection on the lower side of the slot or notch in the dog to arrest the catch with certainty, in the manner described.

Fifth. The application and arrangement of the toothed rack connected with the spring, by which the rake is caught and held after its descent upon the gavel, the rebound thereof is prevented, and the gavel removed with greater certainty.

Sixth. The placing of a rake (having spring teeth) in the rear of the machine, for the purpose of gleaning and contracting the gavel sheaf into form, substantially as described.

Seventh. The combination of the cam attached to the main shaft, with the arm of the rear rake, to cause it to pass over the gavels at the proper time.

Eighth. The ratchet cam I and lever, in combination, substantially as described, for throwing both rakes into or out of action, as set forth.

No. 24,094.—JOHN T. BROOKS, of New Albany, Ind.—*Improved Apparatus for Heating the Feed Water of Steam Boilers.*—Patent dated May 24, 1859.—The main object of this invention is to lessen the liabilities to leakage and explosion, by avoiding the introduction of cold or partially cold water.

*Claim.*—The described relative arrangement of the force pump *e*, water supply pipe *f* conveying steam from the upper part of the boiler or steam dome to the heater; the whole operating together in the manner set forth, to heat feed-water on its way between the pump and the boiler, by means of living steam, and inject it into the lower region of the boiler.

No. 24,095.—ROBERT W. BUCKLES, of Grayville, Ill.—*Improvement in Harrows.*—Patent dated May 24, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—Two harrows hung to one frame independent of each other, with two vertical toothed wheels D D also working independently of each other, and connected to the horizontal wheels *c c*, which are actuated by means of pinions E E, as described, for the purpose set forth.

No. 24,096.—WASHINGTON BURNHAM, of Essex, Mass.—*Improvement in Ox Yokes.*—Patent dated May 24, 1859.—The claim and engravings will explain the nature of this invention.

*Claim.*—The method of applying the pole ring to the yoke, viz: by means of the staple rack and the ring carrier, made so as to be capable of sliding on the rack, and with a pin passage arranged with respect to the staple rack, substantially in the manner as described, the whole being for the purpose explained.

No. 24,097.—J. F. CALHOUN, of Wolcottville, Conn.—*Improved Curtain Rack.*—Patent dated May 24, 1859.—The metal plate *a* has an oblong slot *b* placed at the centre of the plate, through which passes a screw *c* having a square head *d*, which fits loosely between the flanges *e* on the inside of the plate *a*. A small washer *f* is placed over the screw on the front side of the plate, and against this is placed an annular collar *g*, which projects out a short distance beyond the side of a pulley *h*, which turns on said collar.

*Claim.*—The combination of tightening screw *c*, collar *g*, pulley *h*, and button *i*, for effect-

ing the required tension on the cord, substantially in the manner and for the purposes herein above set forth.

No. 24,098.—PETER S. CARHART, of Collamer, N. Y.—*Improvement in Sewing Machines.*—Patent dated May 24, 1859.—The claim and engravings will explain the nature of this invention.

*Claim.*—Feeding the cloth by the combined action of the needle and friction pad, when the said needle and pad operate jointly and in unison to propel the cloth as the needle descends therethrough, the cloth being held in its required position by the needle during the intervals of feed, while the pad is retreating to take a fresh feeding gripe on the cloth, essentially as specified.

No. 24,099.—JOSEPH CARRIER, of Marlborough, Conn.—*Improved Bread Knife.*—Patent dated May 24, 1859.—This invention consists in providing an adjustable roller gauge to the outer side of the knife, in such a manner that the roller may be raised above or depressed to, or below, the cutting edge of the knife.

*Claim.*—The employment of the roller F, the adjustable studs D, with the collars C and thumb nuts E, substantially as and for the purpose described.

No. 24,100.—M. C. CHAMBERLIN, of Johnsonsburch, N. Y.—*Improvement in Stove Pipes.*—Patent dated May 24, 1859.—The pipe A is provided with a spring tube B, which is secured on it, extending in a few inches from its mouth. This tube is made smaller at one end, and is joined at one end and left open at the other, so that it may be allowed to expand and contract when required. The pipe A is also provided with a slot *a*, which is made in its end. The slot runs longitudinally first, and then turns at right angles and runs transversely.

The inventor says: First, I *claim* the employment of the spring tube B, in connection with the pipe A, when the same is used, in the manner and for the purpose herein specified.

Second. The arrangement of pipe C, provided with pin *d* and pipe A, provided with slot *a* and spring tube B, substantially in the manner and for the purpose specified.

No. 24,101.—ALBERT R. COLTON, of Athens, Ga.—*Improvement in Horse Power Machines.* Patent dated May 24, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the stationary wheel J and its hub L, when the same are placed centrally with the large driving wheel M, for giving motion to the pinions U V and gear wheels R S, revolving with the driving wheel M, so as to impart a rapid rotary motion to the horizontal shaft E, having its bearing in the axis of both driving wheel M and stationary wheel J; all arranged in the manner and for the purpose herein specified.

Second. I claim the sectional yoke G, as herein described, in combination with the annular collar N and set screws *c*, arranged in the manner and for the purposes herein shown.

No. 24,102.—JOHN E. CRYER, of Peoria, Ill.—*Improved Joiner's Bench.*—Patent dated May 24, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the movable jaw B, constructed and arranged with reference to the permanent jaw *b*, in such manner as to secure properly the lumber to be wrought, and at the same time to form a track or guide for the plane during the operation of jointing and squaring lumber, as herein set forth.

Second. Operating the jaw B by means of guides *e e*<sup>1</sup>, rod *f*, lever *g*, and dog *l*, substantially as herein described.

Third. The gauge *p*, adjustable vertically with reference to the jaws B *b*, in combination with the scale *m*, substantially as and for the purposes set forth.

No. 24,103.—HENRY DAVIS, of Bethlehem, Conn.—*Improved Carpet Sweeper.*—Patent dated May 24, 1859.—This invention consists in arranging under the box of the sweeper two rollers E E<sup>1</sup>, parallel to the brush, and so close to the same that the brush, as it rotates, sweeps against the rollers.

*Claim.*—The arrangement of the rollers E E<sup>1</sup> to operate in combination with the yielding brush B, and with the scraper G, substantially in the manner and for the purpose herein specified.

No. 24,104.—WILLIAM DAVIS, of Middleburg, Md.—*Improvement in Hominy Machines.*—Patent dated May 24, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—Providing the outer cylinder A with apertures *a a*, gauged to such a size, while serving to discharge the hulls also to perform the additional function of discharging the hominy as soon as reduced to the desired degree of fineness, in combination with the inner cylinder B, when the same is driven at the specific speed as herein described, for the purposes specified.

No. 24,105.—JAMES M. DAY and E. H. A. OAKLEY, of Aiken, S. C.—*Improvement in Compositions for Roofing.*—Patent dated May 24, 1859.—This invention consists in a com-

position of coal tar, resin, or asphaltum, plaster of Paris, soda, hydraulic or Roman cement, and lampblack, combined in such proportions as to form, when applied to canvass, a pliable roofing.

*Claim.*—The ingredients, in the proportion set forth in the specification.

No. 24,106.—M. DE CAMP, of South Bend, Ind.—*Improved Millstone Bush.*—Patent dated May 24, 1859.—The object of this invention is to obtain a durable bush for the spindle of the bed stone; one that will admit of a certain degree of adjustability, so as to conform in itself to the position of the spindle, and be self adjusting to a certain extent; one that will also insure a perfect lubrication of the spindle and admit of an easy adjustment of the followers to the collar of the same, and also protect the spindle from foreign substances that might otherwise work between the collar and followers and produce unnecessary friction and wear.

The inventor says: I *claim*, first, the adjustable followers F, provided with convex sides and backs fitted within an oil box A, and arranged in relation with the collar D of the spindle to operate as and for the purpose set forth.

Second. The serrated or notched wheels  $i^1$ , attached to the outer ends of the screws  $i$ , when used in connection with the stops  $j$ , attached to the plates  $k$ , substantially as and for the purposes specified.

No. 24,107.—CHARLES DOUGLAS, of Hebron, Conn.—*Improvement in Chimney Caps.*—Patent dated May 24, 1859.—In the base A there is a neck B sufficiently large inside to receive the smoke pipe, which it is designed to cover. E is an inverted cone, made stationary, directly over the base A, by means of the iron standard F F F F. D is a conical valve, suspended from the inverted cone E upon the round head of the bolt  $e$  at  $d$ . C is a valve equal in diameter to valve D, with a hole through the centre sufficiently large to allow it to play loosely over the neck B.

The inventor says: I *claim*, first, the valves C and D, and the manner and position in which they are suspended, substantially as described and for the purposes set forth.

Second. The arrangement of the neck B, the top E G, and the standard F F F, in combination with the valve D, or its equivalent, as and for the purposes herein specified.

No. 24,108.—SAMUEL DOWN, of New York, N. Y.—*Improvement in Dry Gas Meters.*—Patent dated May 24, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—Constructing or arranging the mouths  $a^1 b^1$  of the channels of communication  $a b$  between the inlet and outlet pipes and the measuring chambers and valve chamber of a dry gas meter, to dip down in the wells below the said pipes, substantially as and for the purpose herein set forth.

No. 24,109.—CHRISTIAN H. EISENBRANDT, of Baltimore, Md.—*Improvement in Railroad Car Couplings.*—Patent dated May 24, 1859.—This invention consists in constructing a car coupling in such a manner as that it is self-coupling and detachable when the cars are thrown off the track, and at the same time acts as a brake or lock in connection with the wheels of the car.

The inventor says: I *claim* the plates  $a a a a$  with the springs  $a^2 a^3$ , the prong clasping grippers  $b c c^2 d e e^2$ , with the spring latch  $f g h i$ , constructed, arranged, and operated, substantially as set forth.

I also claim the hitching pin or bolt K K provided with the chain and button, or ring L L  $m m$ , when arranged, operated, and used in combination with the clasping prong grippers  $b c c^2 d e e^2$ , and brake lever  $q q r$ , substantially as set forth and described.

I also claim the combination and arrangement of the sliding bolts  $n o p$  with the prong clasping grippers  $b c c^2 d e e^2$ , substantially as set forth and described.

No. 24,110.—JOHN A. ENGGREN, of Brooklyn, N. Y.—*Improved Device for Securing Lightning Rods.*—Patent dated May 24, 1859.—The claim and engravings will explain the nature of this invention.

*Claim.*—An insulator for lightning rods, composed of a glass standard A, a spring clasp C, having shanks  $i$  and shoulders  $j$ , and otherwise made as described.

No. 24,111.—KASSON FREEMAN, of Fond du Lac, Wis.—*Improved Device for Clamping the Bolts in Circular Sawing Shingle Machines.*—Patent dated May 24, 1859.—This invention consists in an improved device for operating the jaws or dogs, for the purpose of dogging and undogging the bolts.

*Claim.*—The arrangement of the sliding or adjustable bar K with weights  $s$  attached, or their equivalents, when used in connection with the sliding jaws D, for the purpose specified.

No. 24,112.—EDWARD GARRETT, of New Orleans, La.—*Improvement in Ties for Cotton Bales.*—Patent dated May 24, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The combination of the two plates *a* and *c*, when made and arranged as, or substantially as set forth, to form a tie for iron bands for baling cotton, or for similar purposes.

No. 24,113.—E. L. GAYLORD, of Terrysville, Conn.—*Improved Trunk Lock.*—Patent dated May 24, 1859.—This invention consists in arranging the bolt of the lock with a tumbler and spring, whereby any injury to the lock from the accidental falling of the lid is effectually prevented.

*Claim.*—The arrangement of the bolt *B* with the springs *c c D* and tumbler *C*, to operate substantially as and for the purpose herein set forth.

No. 24,114.—ELISHA GEIGER, of Lancaster, Pa.—*Improvement in Horse Rakes.*—Patent dated May 24, 1859.—*J* indicates flat steel springs with grooved wooden heads, forming clips that rest upon and across the teeth *D* near the rake head *E*. These springs are attached to an operating cross bar *K*, which rests upon the platform *B* near the carriage axle, by which the weight of the devices is concentrated at the carriage axle so as to relieve the horses.

*Claim.*—The arrangement of the cross bar *K* having the flat springs and heads *J*, and provided with arms for actuating the supporting bar *F* with and in relation to the clearing rocker shaft, the whole being constructed and operated as herein set forth.

No. 24,115.—HENRY GLOSSER, of New York, N. Y.—*Improvement in Cases for Steroscopic Pictures.*—Patent dated May 24, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of two or more pairs of eye-glasses on the same side of a stereoscopic case, so that several persons can look at the pictures at one and the same time, substantially in the manner specified.

Second. The piston frames *D* arranged with cogs *i* or their equivalent at their lower edges, in combination with the cams *j j<sup>1</sup> j<sup>2</sup>* and *j<sup>3</sup>*, or their equivalents, whereby the same are made to travel from one pair of eye-glasses to the other, substantially as described.

Third. Giving a double motion to the picture frames, first in a direction transversely through the case by the action of the cam *g*, or its equivalent, on the endless belt *E*; and, second, in a longitudinal direction, by the action of the cams *j*, substantially as and for the purposes set forth.

Fourth. The arrangement and combination of the endless belts *E* and *E<sup>1</sup>*, to operate in relation to the channel *G*, substantially as and for the purpose described.

Fifth. The cams *g* and *g<sup>3</sup>*, arranged in combination with the cams *j j<sup>1</sup>*, &c., or their equivalents, in such manner that they produce the within described motion of the picture frames at alternate intervals, substantially as and for the purpose specified.

No. 24,116.—ARTHUR GRAY, of Naples, Me.—*Improved Washing Machine.*—Patent dated May 24, 1859.—The claim and engraving will explain the nature of this invention.

*Claim.*—An improved washing machine, as made with a set of fluted rollers *B B B*, and a fluted presser or bucking board *C*, arranged, constructed, and applied to the reservoir *A*, substantially as described, in order to enable the clothes to be both rolled and beaten as specified, during the operation of washing the same.

No. 24,117.—BENJAMIN L. GRIFFITH, of Hazletownship, Pa.—*Improvement in Steam Boilers.*—Patent dated May 24, 1859.—This invention consists in the arrangement of the smoke stack *N*, the chamber *F*, the two series of flues *M M*, and the doors *U U*, and diaphragms *K K*.

*Claim.*—The combination of the single smoke stack *N*, single chamber *F*, and double series of flues *M M*, with the hollow hinged doors *U U*, and the diaphragms *K K*, arranged and constructed substantially as and for the purpose set forth.

No. 24,118.—A. HADLEY, of Lynn, Mass.—*Improved Machine for Filing Saws.*—Patent dated May 24, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim*, first, determining the bevel of the teeth of a straight saw by means of pivoting the frame *g*, (which supports the rail *e* and saw-plate *a*) at *h*, and hinging rods *f<sup>1</sup> f<sup>1</sup>* to said frame as seen at *g<sup>1</sup> g<sup>1</sup>*, and confining these rods in their relative position by set screws *h<sup>1</sup> h<sup>1</sup>*, constructed and arranged substantially as described.

Second. Determining the bevel of the teeth of a circular saw by arranging the shaft *z<sup>2</sup>*, of the saw between two points *l* and *m*, one of the points *m* being adjustable by means of a grooved piece *p*, block *n*, and set screw *O*, the whole being constructed and combined substantially as described.

Third. Determining the bevel of the straight and circular saws by combining the frame *v* with grooves *x<sup>2</sup>*, forming arcs of a circle in combination with clamp screws *s<sup>2</sup>*, and slotted plates *z<sup>2</sup>*, substantially as described.

Fourth. Holding the file by clamps *r<sup>2</sup> r<sup>2</sup>*, set screws *o<sup>2</sup> o<sup>2</sup>*, in combination with shaft *n<sup>2</sup>*, set screw *p<sup>2</sup>*, and bracket *m<sup>2</sup>*, constructed and operating substantially in the manner and for the purpose set forth.

Fifth. The combination of the movable table O<sup>1</sup>, with the mechanism for supporting and moving the saws, constructed and arranged thereon as shown and described, whereby the same machine can be quickly adapted for filing either straight or circular saws, as set forth.

Sixth. The combination of the mechanism for supporting and moving the saws with the mechanism for supporting and operating the file, constructed, arranged, and combined as described, and for the purposes set forth.

No. 24,119.—**NAPOLEON J. HAINES**, of New York, N. Y.—*Improvement in Piano Forte Actions*.—Patent dated May 24, 1859.—This invention consists in the employment of a cross shaped or four armed repeating fly, applied and operating in combination with the jack, the key, and the hammer, for the purpose of arresting the hammer at a short distance from the string when it falls after striking, and supporting it in such a manner that by a very slight rise of the front end of the key, the jack is permitted to enter the notch of the hammer butt far enough to permit the repetition of the blow.

*Claim*.—The cross shaped or four armed fly F, applied in combination with the jack, the key, and the hammer butt, to operate substantially as herein set forth.

No. 24,120.—**LUTHER T. HAZEN**, of Coventry, N. Y.—*Improvement in Hubs for Carriage Wheels*.—Patent dated May 24, 1859.—This invention consists in encasing wood hubs entirely with metal, which forms the pipe box and helps to hold firmly the spokes.

*Claim*.—Inclosing wood hubs for carriage wheels or other vehicles with metal cases which form the pipe box and bands, in the manner described and for the purposes set forth.

No. 24,121.—**WILLIAM HENNEY**, of Wapello, Ill.—*Improvement in Machines for Raising Railroad Tracks*.—Patent dated May 24, 1859.—This invention consists in arranging an extension balance on the top of a piston, which is operated by means of an eccentric disk, acting against a roller in the lever end of the piston, in connection with a serrated bar attached to the side of the frame in which the piston operates, this bar serving to retain the piston by means of a pawl attached to the side of the latter, so that the same, as it is raised step by step, is retained by the action of the pawl against the serrated bar, and the vertical arms of the extension balance are provided with hooks to catch under and raise railroad tracks or other heavy articles.

*Claim*.—The balance H, arranged with the arms I and with the extension J, to operate in combination with the piston E, the serrated bar L, the pawl M, and with the eccentric disk C, substantially in the manner and for the purpose described.

No. 24,122.—**JOHN F. HOFFMEISTER**, of Alton, Ill.—*Improvement in Ovens*.—Patent dated May 24, 1859.—This invention consists in arranging a rotary platform over two flues which conduct the heat from the fireplace in opposite directions round to a chamber where the flues unite, and from which the heat is carried back through an additional flue, extending over one half of the space in which the platform rotates, to the chimney, so that the dough placed on the platform, and rotating with the same, is exposed to considerable and uniform heat during the first half of its rotation, and to a less intense heat during the latter half of its rotation.

*Claim*.—The arrangement of the flues F F<sup>1</sup>, which terminate in the chamber H, in combination with the additional flue J, to operate in combination with the rotary platform E, substantially as and for the purposes set forth.

No. 24,123.—**C. R. HURLBUT**, of Yorkshire, N. Y.—*Improved Clothes Dryer*.—Patent dated May 24, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The described article of manufacture, constructed as described, to wit: The arrangement of the standards C C, side rails E E and G G, cross rails F F, D, and I I, and sash B B, provided on their under side with buttons K K, the whole being jointed and the several parts acting conjointly, substantially in the manner and for the purpose specified.

No. 24,124.—**CHARLES JONES**, of Brooklyn, N. Y.—*Improvement in Coolers for Beer*.—Patent dated May 24, 1859.—This invention consists in dividing the water space of a cooler by means of a cylindrical shell placed in the same in two compartments, which communicate by a narrow crevice left between the bottom of the water space and between the edge of the cylindrical shell, while that part of the water space outside the shell is closed perfectly air tight on the top, so that the water in this space is kept up to or near to the top by the atmospheric pressure.

*Claim*.—The shell D, arranged in the cooler so as to form the two compartments a and b, to operate in combination with the coil E, as and for the purpose described.

No. 24,125.—**ALFRED FAUVIN JALOUREAU**, of Paris, France.—*Improvement in the Manufacture of Waterproof Cement Pipes*.—Patent dated May 24, 1859; patented in France December 30, 1857.—This invention consists in forming pipes or tubes intended as water or gas pipes,

tubes for underground telegraph wires, &c., of a number of layers of paper, cotton, flax, or other tissues, &c., lapped together with bituminous or caoutchouc substance between each layer, so as to render the whole impermeable to air or water.

*Claim.*—The manufacture of air and water tight tubes or pipes by the process set forth.

No. 24,126.—G. P. JORDAN, of Burlington, Iowa.—*Improvement in Separators for Smut Machines.*—Patent dated May 24, 1859.—This invention consists in a peculiar arrangement and combination of parts, whereby the desired work, to wit: the separating of smut and other impurities, or foreign substances, from grain is effected by a very simple machine.

The inventor says: I *claim*, first, the combination and arrangement of the scourer I with the spout D, chamber C, and box B, provided with the blast chambers *b b*, spout H, fan F, and screens *u v*, substantially as and for the purposes set forth.

Second. The employment or use of the valves *c<sup>1</sup>*, placed in the partition plates *a a*, when used in combination with the fan F, chamber C, spout D, and scourer I, and arranged relatively therewith, as and for the purpose set forth.

No. 24,127.—WILLIAM KELLY, of Hastings, Mich.—*Improved Churn.*—Patent dated May 24, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The combination of the dashers E E with the slide partition D and connecting rods F F, as described, the parts being so connected to the frame that the oscillations of the churn shall operate the dashers E E and force the cream against and through the slide partition, substantially as set forth; not intending to claim the operation of the dasher or dashers by the oscillations of the churn, but only the combination and arrangement of the vibrating dashers with the movable partition and concomitant parts, as described, for the purposes set forth.

No. 24,128.—JESSE LITTLE, of Chambersburg, Pa.—*Improvement in Harvesting Machines.* Patent dated May 24, 1859.—By means of brace A and the groove or slit sliding on bolt *e*, the tongue *p* is allowed, in turning, to break or move suddenly at an angle of thirty degrees or more, compelling the propelling wheel to revolve in a circuit, and thereby operating the cutters and blades as effectively in a circular as in a forward movement and lessening the area required for turning.

*Claim.*—The inventor says: I claim, first, the arrangement of the sliding brace A in combination with the tongue *p* and bar B, constructed and operating in the manner described, for the purpose specified.

Second. The combination and arrangement of the castor plate *c c*, jaws I I, and segments G G, in the manner and for the purpose described.

No. 24,129.—MURDICK LYTTLE, of Allegheny, Pa.—*Improved Propelling and Steering Apparatus.*—Patent dated May 24, 1859.—This steering and propelling device is adjusted in a frame work, not permanently attached to the boat, so that the frame, together with the machinery, may be moved from one boat to the other, and still remain in working condition.

The inventor says: I *claim*, first, the shaft *b* with a supporting arm or arms *g* and bearing recess *v*, in combination with the propeller or paddle wheel shaft *k*, the whole being constructed and arranged in the manner and for the purposes set forth.

Second. The tubular shaft *c*, with gear wheels at the upper and lower ends, in combination with the shaft *b* and propeller shaft *k*, the whole being constructed and arranged in the manner and for the purposes set forth.

No. 24,130.—LEVI H. MARKLEY, of Lime Lexington, Pa.—*Improved Propeller.*—Patent dated May 24, 1859.—When it is desired to change the position of the paddle blades or flyers F so as to move the vessel sternwise, the rod G is disengaged from the hook J and the block H at its end from the groove, between which and the bar I it moves by the withdrawal of the said bar I and the pivoted frame E is turned so as to reverse the position of the paddles F.

*Claim.*—The arrangement and combination of the peculiarly acting paddle blades, or flyers F, pivoted frame E, rods G, hooks J, sliding block H, and reversing and bracing bar I, as and for the purpose shown and described.

No. 24,131.—GEORGE W. MATTHEWS, of York, Pa.—*Improved Method of Forming Plough Handles.*—Patent dated May 24, 1859.—This invention consists in the employment or use of two rotating cutter heads provided with novel cutters, and used in connection with a carriage in which the *stuff* to be operated upon is centred, and which carriage is provided with a pattern to actuate one of the cutter heads, the axis being fitted in movable bearings.

*Claim.*—The arrangement and combination of the carriage C, provided with the patterns or curved surfaces *f*, the adjustable rotating cutter head I, belt H, adjustable shaft D, provided with pinion *c* and the rack *b* attached to carriage C, substantially as and for the purpose set forth.

No. 24,132.—W. S. MAYO, of New York, N. Y.—*Improved Metallic Pipe*.—Patent dated May 24, 1859.—This invention consists in placing around the outer surface of metallic pipes, longitudinal strips of metal at certain determined distances apart, and coiling around the pipes thus prepared suitable sized wire, or wires, which may be wound in close contact or be separated, according to circumstances.

The inventor says: I *claim* the application of longitudinal strips B to the surface of a metallic pipe, in combination with the coiled wire covering C, whereby I am enabled to insure great strength, with a less thickness of metal, substantially as herein above specified.

No. 24,133.—WILLIAM P. MAXSON, of Albion, Wis.—*Improvement in Bag Fasteners*.—Patent dated May 24, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—The employment of the oblong grooved faced plate A, or its equivalent, having two segments of its middle portion punched out, so as to admit the string, and fasten it to the bag, in combination with the string B and ring E, when constructed to operate upon the principle of the wedge, substantially as and for the purpose set forth.

No. 24,134.—THOMAS McBEAN, of Fowlerville, N. Y.—*Improved Egg Beater*.—Patent dated May 24, 1859.—This invention consists in arranging a double spiral shaped beater or dasher, with its surface formed into steps within a square box, and in communicating to this dasher a swift rotary motion, so as to revolve it horizontally within said box.

*Claim*.—The double spiral dasher A in combination with a square box E, when the same are arranged substantially as shown.

No. 24,135.—JOSEPH McKOWN, of Geardstown, Va.—*Improvement in Seed Planters*.—Patent dated May 24, 1859.—This invention consists in the arrangement, for united operation, of the horizontally moving hand lever, vertical shaft, horizontal elbow lever, and slides, divided hopper, vacuum plate, and seed tube, whereby a simple and effective plough handle, combined seed planter, and guano dropper are produced, and capable of being conveniently operated from the rear of the handles, and after the seed is dropped covering in the same by a share and rollers.

*Claim*.—The arrangement for united operation of the horizontally moving hand lever K, vertical shaft J, horizontal elbow lever I, horizontal slides H H, divided hopper G, seed tube F, and vacuum plate L, substantially as and for the purposes set forth.

No. 24,136.—THOMAS E. McNEILL, of Philadelphia, Pa.—*Improvements in Seats and Couches for Sleeping Cars*.—Patent dated May 24, 1859.—The claim and engravings will explain the nature of this invention.

The inventor says: I *claim* two adjacent seats, each seat having detachable cushioned boards G and E, and each having a permanent end frame D, and a rear frame F, with upper and lower ledges *i h*, in combination with the swing bracket H and rib I, or their equivalents, the whole being arranged substantially as herein set forth, so that the cushioned boards G, of the two adjacent seats may form one couch, and the boards E of the same seats another couch, and so that when the said boards are arranged as couches, there may be a space between them and the permanent end frames D for the purpose specified.

Second. Constructing and arranging the end frames D of four seats, substantially in the manner set forth, so that they may serve as supports for the cushioned platforms which form the two intermediate berths.

No. 24,137.—JOHN MILLER, of Bucyrus, Ohio.—*Improvement in Attaching Thills to Axles*.—Patent dated May 24, 1859.—This invention consists in the peculiar form of the jaws on the clip and the hook on the thill irons, with shoulders so arranged that the thills are always perfectly firm, and secure against accident when in use, easily detached and adjusted without the use of springs or screws, by simply raising them up nearly perpendicular.

*Claim*.—The adjusting and securing of the hooks *s*, on the pin *i* by means of the circular face *b c*, on the jaws D D, and the shoulders *r r*, on the iron E, substantially as and for the purpose set forth.

No. 24,138.—JOHN R. MOFFITT, of Piqua, Ohio.—*Improvement in Threshing Machines*.—Patent dated May 24, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The arrangement of fixed bearings *t*, set screws *e*, (in the line of adjustment,) and hinged concave heads *c d*, the whole operating together to set and rigidly retain the toothed portion of the concave at any desired proximity to the threshing cylinder; while at the side at which the unthreshed grain enters its distance is substantially unchanged.

No. 24,139.—TIMOTHY NEWHALL, of Lynn, Mass.—*Improved Machine for Dressing Kid Skins*.—Patent dated May 24, 1859.—The object of this invention is to produce a gloss on kid and other thin skins, after being colored and gummed, and consists in the employment or use of a rotary brush, in connection with a reciprocating yielding bed.

*Claim.*—The rotary brush F, in connection with the reciprocating bed or carriage C, connected with its guide rods B B, by springs D D, the parts being arranged to operate substantially as and for the purpose set forth.

No. 24,140.—T. A. NOBLE and ERASTUS COY, of Akron, Ohio, and JAMES B. ANGELL, of Allegheny, Pa.—*Improvements in Smut Machines.*—Patent dated May 24, 1859.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, the adjustable hoop C, in connection with the increased chamber *f*, to regulate the blast passing up through the circular opening N, also the adjustable ring D, to regulate the blast coming up through the circular opening E; the operation in both cases being to increase or diminish the blast, as may be required, substantially as set forth.

Second. The chamber G, in combination with the arm F and spout L, when said chamber is placed above the revolving chamber H, to catch the screenings, substantially as set forth.

Third. The revolving chamber H, provided with sides *h* and rim *h*<sup>1</sup>, for distributing the wheat evenly as it falls over the edge of the rim *h*<sup>1</sup>, so as to be more effectually operated upon by the blast passing up the opening E, and also the flange M, upon cylinder L, for the similar distribution of the wheat to the second blast rising through opening N, as set forth.

Fourth. Making the conical scourer O adjustable perpendicularly, both independently of shaft A and disk L, and in connection with said shaft and disk, substantially as set forth.

No. 24,141.—JOHN SMITH SHATTUCK, of Malden, Mass.—*Improvement in Machines for Cutting Soles.*—Patent dated May 24, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the alternating or vibrating segment Q Q<sup>1</sup>, carrying the two cutters T T<sup>1</sup>, having the toe and heel in opposite directions.

I claim the yielding table V, which supports the leather as it is fed forward, and the yielding gauge *c d*, by which the leather is brought to the right position to be operated upon by the cutters.

I also claim the projecting knife edges at the heel and toe of the cutter, by which the scraps are detached from the strip of leather.

No. 24,142.—L. K. SELDEN, of Haddam, Conn.—*Improved Folding Cradle.*—Patent dated May 24, 1859.—This invention consists in constructing the cradle frame in such a manner that the same folds up the length of one of the rockers, the several rockers being slotted so as to form guides for slides to which the several bottom braces and the cross bars, united by pivots, are attached, while the longitudinal bars are constructed of two parts, fastened together and to the cross bars by means of pivots, made rigid by sleeves, which can be drawn over the joints.

The inventor says: I *claim* the rockers A, of a cradle arranged with slots *a*, or their equivalents, and operating in combination with the bottom braces B, the upright cross bars C, the longitudinal bars D, and the top bars E, substantially in the manner and for the purpose herein specified.

Second. The arrangement of the slides *b*, in combination with the bottom braces B, and with the upright cross bars C, to operate substantially as and for the purpose described.

No. 24,143.—ELNATHAN SAMPSON, of St. Johnsbury, Vt.—*Improvement in Platform Scales.*—Patent dated May 24, 1859.—The object of this invention is to adapt "platform scales" to a railroad in such manner that the scales will be rendered durable, and the device simple and efficient.

The inventor says: I *claim* attaching the rails A A of the platform directly upon the sleepers B, which are connected at each end by the links *m* to yokes H, fitted on levers E, the lower ends of said levers at each side of the platform being connected together, and to the shaft G of the scale beam by rods *g*, substantially as and for the purpose set forth.

I also claim the employment or use of the adjustable rods F attached to the levers E, to permit of the compensation of the same, for the purpose specified.

No. 24,144.—GEORGE ROUSHE, of Lima, Ohio.—*Improvement in Straw Cutters.*—Patent dated May 24, 1859.—The claim and engravings will explain the nature of this invention.

*Claim.*—The relative arrangement for united operation in a straw cutter of the reciprocating cutting knife C, when arranged in a circularly moving frame, reciprocating feeding rake E, and rising and falling pivoted press board G<sup>1</sup>, said parts being connected together and operated in the manner set forth.

No. 24,145.—ADOLPH ROESLER, of Warsaw, Ill.—*Improvement in Buckles.*—Patent dated May 24, 1859.—This invention consists in having two metal plates, forming the tug, loosely attached with their lower end to a loop, each plate having a number of semi-circular notches, which, when said plates are closed, form a series of holes through the middle of them. Another plate provided with one or more knobs, with enlarged heads, is fastened to the

upper end of the trace, which is slipped through the above mentioned loop; the tug plates when open will admit the knobs of the trace plate, the tug plates are then closed, and fastened by means of a screw rod that fastens the lame hook to the tug plate, and keeps them close together.

*Claim.*—The tug plates A A, the trace plate D, having one or more knobs *o*, the fork shaped lame hooks *g*, and screw rod *h*, all arranged substantially as described, and for the purpose specified.

No. 24,146.—RICHARD RICKON, of Rochester, N. Y.—*Improvement in Car Couplings.*—Patent dated May 24, 1859.—This invention consists in constructing car couplings in such a manner that they shall uncouple when the engine or any car in the train is thrown off the track. They couple themselves and are uncoupled by changing a lever at the corner of the car with which the chains *f* are connected without going between the cars.

*Claim.*—Constructing self adjusting car couplings, with a series of grooves *g*, as specified, so as to admit of the coupling (with self-couplers) of cars of unequal heights, for the purpose set forth.

No. 24,147.—ROBERT RAMSAY, of Philadelphia, Pa.—*Improvement in Burners for Vapor Lamps.*—Patent dated May 24, 1859.—The fluid having been drawn up the tube B, by means of capillary action, is evaporated by heating the chamber C; the gas thus generated passes around this chamber, as indicated by arrows in the drawing, and through the tube D D D to the jet E.

*Claim.*—The combination of the wick tube B, the gas chamber C C, tube D, and jet E, arranged and operating substantially as shown.

No. 24,148.—RICHARD B. PULLAN, of Cincinnati, Ohio.—*Improvement in Stoves.*—Patent dated May 24, 1859.—The claim and engravings will explain the nature of this invention.

*Claim.*—A rotating vessel, provided with two grates and a central row of grate bars *f g*, arranged within stoves in such manner as to form two fire chambers, one above the other, and which may be used alternately, substantially in the manner and for the purpose set forth.

No. 24,149.—LUTHER E. PORTER, of Lake Mills, Wis.—*Improvement in Machines for Stripping and Cutting Sugar Cane for Grinding.*—Patent dated May 24, 1859.—To the clasp H H are attached the spring cutters *m m*, which are formed to fit the clasp at the point of attachment, and to converge towards and lap over each other at their cutting points; these cutting points *p* are made V shaped, and lap over each other in order that they may be adjusted to the size of the stock, and always expose a cutting edge to the leaves.

The inventor says: I *claim*, first, the divided clasp H H *i i k k*, arranged substantially as set forth.

Second. In combination with the above, I claim the spring cutters *m m*, all constructed, arranged, and operating substantially as herein described, for the purposes set forth.

No. 24,150.—JONAH PLATT and MYRON D. BROOKS, of Akron, Ohio.—*Improvement in Metallic Shields for Boots and Shoes.*—Patent dated May 24, 1859.—The claim and engravings will explain the nature of this invention.

*Claim.*—The construction of boot and shoe shields A, having an opening S in front to prevent water or sand from being entrapped between the shield and the leather, substantially as described.

No. 24,151.—CHARLES PERLEY, of New York, N. Y.—*Improved Seats for Churches, Schools, &c.*—Patent dated May 24, 1859.—This invention consists in a folding seat, combined with a swinging bracket or support, so constructed that the operation of turning the seat up or down retracts or swings out the said bracket.

*Claim.*—The combination of the swinging bracket *g* with the turning seat *d*, connected and acting in the manner and for the purposes specified.

No. 24,152.—RICHARD NUTTALL and JOHN KIRKPATRICK, of Allegheny, Pa.—*Improved Chuck for Screw Cutting.*—Patent dated May 24, 1859.—The claim and engravings will explain the nature of this invention.

The inventors say: We *claim*, first, the ring D, having a portion of the inside cut away or recessed for the purpose of making room for the outer end of the cutting dies, said ring being furnished with cams *e* on the inside, and with a spring catch *h*, lever *g*, cam *k*, and locking stud *l*, on the outside, as described and for the purpose set forth.

Second. The cam chamber *w*, in the die box *b*, when used in connection with the cams *e*, and ring *d*, as described and for the purpose set forth.

Third. The regulating stud when made in three parts, as herein represented, and used in connection with the die box *b*, ring *d*, and spring catch *h*, as described and for the purpose set forth.

Fourth. The combination and arrangement of the die box *b*, cutting dies *f*, and cap *c*, with the ring *d*, the whole being combined, arranged, constructed, and operated as described, and for the purpose set forth.

Fifth. The eccentric lever *j*, on the face plate *d*, when used in combination with the lever *g*, cam *k*, locking stud *l*, and spring catch *h*, as described and for the purpose set forth.

No. 24,153.—RICHARD NUTTALL and JOHN KIRKPATRICK, of Allegheny, Pa.—*Improved Machine for Screw Cutting*.—Patent dated May 24, 1859.—This invention consists in the combination and arrangement of lever, rods, stops, and springs, with the holding head of a screw cutting machine, for the purpose of opening and closing the cutting dies.

The inventors say: First, we *claim* the combination and arrangement of the levers *m* and *n*, rods *k l*, stops *o p*, and springs 2, with the holding or sliding head *d*, and eccentric lever *r*, the whole being combined, arranged, and constructed in the manner described, and for the purpose set forth.

Second. The use of the sliding or holding head *d* and eccentric lever *r*, when used for the purpose of opening and closing cutting dies in chucks for screw cutting.

No. 24,154.—F. H. SMITH, of Plainville, Conn.—*Improvement in Spring Balances for Window Sashes*.—Patent dated May 24, 1859.—This improvement consists in arranging the device in the head jamb of the window directly over the side edge of the sash, which is lifted by cords passing over the edge of a plane spring pulley, or over a conical or spiral groove spring pulley revolving on a spindle *J*, secured from turning by the pawl and ratchet *I*.

*Claim*.—The manner of securing the pulleys *F*, in the head jamb *A*, of the window frame, as described, and the manner of winding up and adjusting the two pulleys through one orifice for the purpose described.

No. 24,155.—JASPER SNELL and JOHN R. DEIHM, of Pottsville, Pa.—*Improved Coal Screen*.—Patent dated May 24, 1859.—This invention consists in so constructing a coal screen of metallic plates or blades *C*, that the coal shall pass over and be discharged at the foot of the screen without passing through it, while all laminated matter shall pass through between the plates or blades of the screen and be deposited under it.

*Claim*.—The arrangement of the plates or blades *C*, in parallel planes with spaces between their edges so as to slope lengthwise of the screen, and crosswise from the centre of the screen, substantially in the manner and for the purpose specified.

No. 24,156.—EDWARD SPAULDING, of Westborough, Mass.—*Improvement in Friction Pulleys*.—Patent dated May 24, 1859.—This invention consists in the combination of a tabular rest with the driving pulley, one of the hangers and shaft of the driving pulley, when such pulleys are applied and made to operate together.

*Claim*.—The combination of the tabular rest *D*, with the driving pulley *A*, the hanger *E*, or its equivalent, and the shaft *C* of the driving pulley *B*, the pulleys being arranged and made to operate with respect to one another essentially as specified.

No. 24,157.—A. WASHINGTON STEWART, of Cambridge, Md.—*Improvement in Sails for Fore-and-aft Rigged Vessels*.—Patent dated May 24, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I do not claim enlarging sails by the addition of bonnets or splices, as these have been before known, but I confine myself to the peculiar improvement of foresails: therefore, what I *claim* as my improvement in foresails is the cluesail *b*, of the form specified, united to the after leach of the foresail and managed by sheets *e e<sup>1</sup>* as herein set forth.

No. 24,158.—STEPHEN L. STOCKSTILL, of Midway, Ohio.—*Improvement in Seed Planters*.—Patent dated May 24, 1859.—This invention consists in an improved arrangement for adjusting the drill tooth.

*Claim*.—The described arrangement of the open notches *l l l*, pivot *m*, drag bar *K*, and pin *p*, the whole being constructed in the manner and for the purpose set forth.

No. 24,159.—JAMES A. STODDARD, of Milford, Mass.—*Improvement in Mechanism for Varying Speed*.—Patent dated May 24, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—Graduating or varying speed by means of pulleys, or their equivalents, operated in connection with surface wheels, or their equivalents, in such a manner as to receive and transmit the motion at variable distances from their centres, when constructed and operated substantially in the manner set forth and described.

No. 24,160.—HENRY STOWELL and LORENZO SPENCER, of Placerville, Cal.—*Improvement in Portable Wagon Jacks*.—Patent dated May 24, 1859.—The lever chest is placed with the piston inserted in a vertical position so as to bring the upper end of the piston directly under the wagon axle or other weight to be raised; the lever is inserted into the chest at the opening *c* so as to bring the knuckle *i* a little forward and under the end of the piston, the fulcrum

pin resting upon one of the pair of notched rests *h*. The outer end of the handle of the lever is then to be depressed, by which means the knuckle turning under the piston forces it up, and with it the weight to be raised, the clopper dog catching it into the rag teeth which holds down the handle of the lever and secures the weight in position.

*Claim.*—The peculiar arrangement, combination, and adaptation, for the purpose of raising the axles of wagons and other heavy bodies to which the foregoing invention may be adapted.

No. 24,161.—FRANCIS M. STRONG and THOMAS ROSS, of Brandon, Vt.—*Improvement in Weighing Scales.*—Patent dated May 24, 1859.—The weight placed upon the platform acts through the balls or spheres and intermediate frame C upon the knife edges of the shafts A A, tending to turn them and consequently depress the ends of the arms B B, and they actuate the beam where the weight is indicated by the “poise” and weights in the usual manner.

The inventors say: We *claim* the employment of an auxiliary frame, substantially such as described, in combination with and interposed between the platform and levers, substantially as described and for the purpose specified.

We also claim constructing such intermediate frame in two parts, connected by movable joints at the angles, substantially as and for the purpose specified.

We also claim the manner of inserting the bearing blocks that rest on the knife edges, substantially as and for the purpose specified.

And we also claim bringing the ends of the arms of the levers immediately one above the other, in combination with the mode of connecting the two with the beam by single and double connecting rods, substantially as described and for the purpose set forth.

No. 24,162.—FRANCIS M. STRONG and THOMAS ROSS, of Brandon, Vt.—*Improvement in Platform Scale.*—Patent dated May 24, 1859.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim* arranging the series of rocking levers which sustain the platform, with their shafts all parallel, and with the arms of all of them in the same line, except those constituting the inner section, which are inclined, substantially as described, in combination with the transmitting lever above, which connects with the scale beam to the short arms, of which they are all suspended at equal distances from the axis of vibration, substantially as and for the purpose described.

We also claim the method of connecting the several sections of the shaft of the transmitting lever by means of projections and links, substantially as described, for the purpose of enabling it to yield freely to the inequalities or variations in the supports, that it may vibrate freely and without binding, and thereby transmit the weight accurately to the scale beam as described.

We also claim suspending the bearing blocks by two links, in manner substantially as described, so that any swinging motion of the levers will not cause the blocks to vibrate on the knife edges, by which means we are enabled the better to preserve the fine knife edges so essential to accurate weighing.

We also claim constructing the bearing pieces with convex face and projecting tenon, substantially as described, whereby they are rendered self-adjusting, that the knife edges may bear without binding, as set forth.

And we also claim, in combination with the nose iron, adjustable by a screw in the end of the transmitting lever, the employment of a spring bearing against the end of the adjusting screws, substantially as described and for the purpose set forth.

No. 24,163.—ISAAC P. TICE, of Baltimore, Md.—*Improved Machine for Cutting Irregular Forms.*—Patent dated May 24, 1859.—The object of this invention is to obtain a simple machine for cutting waved mouldings, one that may be operated or manipulated with facility and work rapidly. The inventor says: This object is attained by having a fence or gauge, as well as a feed and pressure roller, attached to a vibrating bed, and using in connection therewith a rotary cutter head which is fitted in permanent or vibrating bearings.

*Claim.*—The employment or use of the vibrating bed B, with fence or gauge E and feed and pressure rollers F G attached, in connection with the rotary cutter head H fitted in stationary bearings on the platform or table, the whole being arranged to operate substantially as and for the purpose set forth.

No. 24,164.—ROBERT R. TAYLOR, of Reading, Pa.—*Improvement in Sugar Cane Harvesters.*—Patent dated May 24, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The two sets of rotating cutters, one set being situated above and in advance of the other set, in combination with the reel *n* and shield L, the whole being arranged substantially as and for the purpose set forth.

No. 24,165.—JOHN THOMPSON, of Marblehead, Mass.—*Improved Machine for Cutting Soles.*—Patent dated May 24, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—In connection with the entire sole cutter K L, applied to opposite sides of the shaft G, and operated as described, a gauge U and mechanism to operate it in such manner as first to move it up to the path of the cutter and carry it away therefrom sufficiently to enable the sole that may have been cut to be discharged from the supporting bed as may be described.

No. 24,166.—THOMAS H. TATLOW, jr., of Palmyra, Mo.—*Improved Rocking Chair.*—Patent dated May 24, 1859.—This invention consists in extending the arms of the chair down behind the seat to the rockers, so as to form the arc of a circle, the under edge of which is provided with saw teeth, which serve to retain the back in any desired inclination by means of a rod with two rectangular bends at each end.

*Claim.*—A rocking chair, having its arms extending down to the rockers and its back arranged and operated as specified.

No. 24,167.—JAMES L. TOWNSEND, of Newburyport, Mass.—*Improvement in Reefing Fore-and-aft Sails.*—Patent dated May 24, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the application of the gaff C to the mast A, so as to be capable of being dropped downward on either side of the sail into, or about into, parallelism with the mast, as specified, in combination with the application of one or two head reefing lines L L<sup>1</sup> to the gaff and the sail, so as to enable the slack of the leach and the upper part of the sail to be taken up, and also the lower end of the gaff to be secured in order to effect the reefing of the sail, as specified.

I also claim, in combination with the said means of reefing the head and producing the flap of the sail, one or more buntlines, or lap-securing lines M M<sup>1</sup>, N N, applied to the leach and body of the sail.

No. 24,168.—CHAPMAN WARNER, of New York, N. Y.—*Improved Moulding Machine.*—Patent dated May 24, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the method of packing the sand by dropping it from any given height, substantially in manner described.

Second. The mode of obtaining the same result by means of revolving bladed shafts, substantially as described.

Third. The double-hinged flask, constructed and secured by plates and pins, substantially as described.

Fourth. The table, constructed substantially as described, under and independent of the moulding board, capable only of a vertical motion communicated to it by the arrangement described, or any one equivalent thereto, and working in connection with the moulding board, through which latter the patterns, which are fastened on the table, protrude.

Fifth. The mode, substantially as described, of supporting the moulding board from beneath and through the table.

Sixth. I claim the combination of apparatus for packing the sand, with the mode of hinging and securing the flask by plates and pins, and with the vertically working table apparatus for withdrawing the patterns from the sand through the moulding board, supported as above described, and the whole operating substantially as described.

No. 24,169.—JOSEPH W. WATTLES, of Canton, Mass.—*Improvement in Ring Traveller Spinning Frames.*—Patent dated May 24, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The improved arrangement of the ring flanches, by which the traveller is supported and on which it slides, the same consisting in arranging them without reference to the ring or its axis, substantially as shown in Fig. 3 of the illustrations.

No. 24,170.—JESSE WHITEHEAD, of Manchester, Va.—*Improvement in Harvesting Machines.*—Patent dated May 24, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the supplemental discharging rake O, arranged with its actuating mechanism, substantially as shown and described, so as to operate automatically and conjointly with the platform rake K, for the purpose specified.

Second. Attaching or suspending the rake head J to the shaft H, by means of the pulley d, rod I, oblique bars ff, and pulley h, substantially as shown and described, whereby the head J is allowed to vibrate, and is properly guided or retained on the shaft H.

No. 24,171.—W. I. WILSON, of Franklin, Ind.—*Improvement in Cultivators.*—Patent dated May 24, 1859.—When the carriage is set in motion the ploughs a a drag and enter the ground, the depth to which they enter is regulated by means of the foot of the driver, which presses upon the arms d d. By pressing upon the forward ends of the levers the ploughs may be entirely removed from the ground.

*Claim.*—The arrangement of axles A and E, wheels B, levers C C, shanks D D, ploughs

*a a*, cross piece I, guides F F, and arms *d d*, for operating conjointly in a manner and for the purpose set forth.

No. 24,172.—**SOLON WOOD**, of White Pine, Penn.—*Improved Saw Filer*.—Patent dated May 24, 1859.—This invention consists in an arrangement of a series of revolving cutters, which correspond to the shape of the saw teeth on an arbor, having its bearings in a frame, that can be readily attached to the saw; said arbor being so arranged that it can be rotated by means of bevel wheels, and so that the cutters are kept up to the work by spiral springs, the strain of which can be regulated by means of set screws.

The inventor says: I *claim* the arrangement of the cutter C on an arbor B, the bearings of which are so arranged that the cutters are subjected to the action of adjustable spiral springs, or their equivalents, substantially in the manner and for the purpose specified.

I also claim the additional arm *e*, which is hinged to the bar *a*, in combination with the sliding piece *g*, for the purpose of allowing the cutters to follow the action of the springs *h* in two directions, substantially as described.

No. 24,173.—**ISAAC F. WOODWARD**, of Philadelphia, Pa.—*Improved Gong or Bell for Signals*.—Patent dated May 24, 1859.—The object of this invention is to insure the striking of the bell at all times, and, by simplicity of construction, to diminish its liability to accident.

*Claim*.—The escapement bar B, constructed substantially as described, in combination with the end J and pin K of the hammer, or striking arm C; the whole arranged substantially as described.

No. 24,174.—**HENRY AREGOOD**, of Mansfield township, N. J., and **STEPHEN USTICK**, of Philadelphia, Pa., assignors to **JOHN L. MACKNIGHT**, of Bordentown, N. J.—*Improvement in Machines for Making Clay Pipes*.—Patent dated May 24, 1859.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, the annular ring  $q^1$ , upon the core pin H, (which is also provided with a foot,) in combination with a flange upon the inside of the outer front end of the mould G, to retain the core pin in place while forming the bell end of the pipe, operated in the manner and for the purposes specified.

Second. The cam wheel L, in combination with the piston J, trough B, and its connections, mould G and core pin H, for making the bell end and straight part of the pipe at one operation.

Third. The combination of the rock shafts O and  $O^1$  with the two halves of the mould C, the former being operated by the cam wheel M and shaft N, for the purposes described.

Fourth. The slide D, rod R, and cam strip Q, arranged as described, for the purpose set forth.

Fifth. The arrangement and combination of the cam U, rock shaft T, and levers W and V, for operating the knife I, in the manner and for the purpose specified.

No. 24,175.—**HENRY I. BEHRENS**, of New York, N. Y., assignor to **CHARLES S. POMEROY**, of said New York.—*Improved Wrench*.—Patent dated May 24, 1859.—The action of this wrench is as follows: The object to be gripped, a rod for instance, being placed between the jaws, they are made to embrace it by means of the action of the thumb upon the screw; then, upon endeavoring to turn the rod by means of the wrench, the slightest contact is sufficient to induce a motion of the entire jaw D upon the hinge at B, towards the stationary jaw, increasing its bending power by the increase of strain, and holding the object firmly between the two jaws, releasing it instantly by a revolution in the opposite direction.

*Claim*.—Providing the socket C of the screw with a pivot or hinge, substantially in the manner and for the purpose specified.

No. 24,176.—**WILLIAM G. BUDLONG**, of Hartford, Conn., assignor to **HAMILTON W. CONKLIN** and **JAMES W. CORNING**, of said Hartford.—*Improved Carpet Sweeper*.—Patent dated May 24, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—In combination with the gear wheel D and pinion *f*, at either end of the case, the lever C and screw *h*, by which the height of the brush is adjusted and the pinion is engaged with the driving gear, arranged substantially as and for the purpose specified.

No. 24,177.—**JOHN G. CLARK**, of Augusta, Ga., assignor to Himself and **SAMUEL W. HATCH**, of said Augusta.—*Improved Burglar's Alarm*.—Patent dated May 24, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the employment of one or more cap nipples C, on a suspended gravitating breech piece or plate, to receive a percussion cap or caps, when said breech piece forms part of a burglar's alarm, substantially as and for the purpose set forth.

Second. Providing said suspended breech piece or plate with a vertical stem, and arranging to slide over said stem a tubular weight, so that when the alarm detaches from the door and strikes the floor, the percussion force of the breech piece and weight will explode the cap or caps and produce the desired alarm, substantially as set forth.

Third. Arranging the spring on the stem of the breech piece between the breech piece and weight, so that the same shall be held far enough apart to allow the necessary movement of the same toward each other to explode the cap or caps when the alarm strikes the floor, substantially as set forth.

Fourth. Providing serrations on the under side of the suspending bracket, so that said bracket shall move with the door until it clears the framing, substantially as and for the purposes set forth.

No. 24,178.—H. W. HORTON, of Wheaton, Ill., assignor to OLIVER H. HORTON, of Chicago, Ill., and ROSWELL E. ADAMS, of said Wheaton.—*Improved Apparatus for Cooking by Steam.*—Patent dated May 24, 1859.—This invention consists in arranging over a steam boiler a steam chamber, communicating with the boiler by means of a slide, operated from the outside, and part of which forms a separate compartment, smaller than the chamber, that side excepted where it is provided with a door; the whole being so arranged that the chamber serves to cook articles in the steam, or in dry air, and the oven for baking.

*Claim.*—The described arrangement of a steam boiler C, in combination with a steam chamber E, which communicates with the boiler by means of a slide e, or its equivalent, and one end of which contains the oven G; the whole being arranged substantially as and for the purpose specified.

No. 24,179.—N. N. McLEOD, of St. Louis, Mo., assignor to CARROLL E. GRAY, of said St. Louis.—*Improvement in Hose Couplings.*—Patent dated May 24, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—Making the lip C around the conical end D, so as to leave a cavity to receive the end of the pipe B and the screw nut A, when the said pipe C is a part and portion of the same piece that the cone D is, as shown and described.

No. 24,180.—JOHN W. SMITH, of Washington, D. C., assignor to Himself and WALTER W. BERRY, of Baltimore, Md.—*Improved Waterproof Sole.*—Patent dated May 24, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—As a new article of manufacture, the waterproof inside sole, when constructed of the compound described, placed between two sheets of paper, in the manner set forth.

No. 24,181.—JOHN W. WHEELER, of Cleveland, Ohio, assignor to ALDEN B. STOCKWELL, of said Cleveland.—*Improved Splint Broom.*—Patent dated May 24, 1859.—This invention consists in making brooms of wrought wood splints, by first encircling the ends of a sufficient number in a metallic ring or cup, and then compressing them by introducing the handle in the manner described. The brush is then flattened and sewed with twine, to keep it in a proper form.

*Claim.*—The formation of brooms, composed of separate wrought splints, when constructed in the manner described and set forth, as a new article of manufacture.

No. 24,182.—MARTIN WESSON, of Springfield, Mass., assignor to Himself and D. B. WESSON, of said Springfield.—*Improved Machine for Channelling and Edging Soles of Boots and Shoes.*—Patent dated May 24, 1859.—The object of this invention is to produce a cheap and convenient machine for cutting the grooves in the soles of boots and shoes, for the purpose of sewing the uppers to the soles.

*Claim.*—First, the combination of the feed rolls F F, adjustable knives  $b b^1$ , and the guide R, when constructed and operating substantially in the manner and for the purpose set forth.

Second. The combination of the lever L, sliding pieces  $h h^1$ , and knives  $b b^1$ , when arranged and operating as described, and forming a knife holding arrangement for the purpose specified.

No. 24,183.—STEPHEN G. TYLER, of Quincy, Ill., assignor to Himself and G. I. SAAGE and I. W. BARNUM, of said Quincy.—*Improvement in Circular Clamps for Sewing Machines.*—Patent, dated May 24, 1859.—This invention consists in arranging and constructing a central disk e, and combining the same with a convex clamping disk d, and a flat sustaining disk c, for the purpose of dividing the crown and quarters of caps, or equivalent parts of other circular sewing, and in presenting the edge of the fabric to the needle, to be sewed by a sewing machine, without changing any of the parts of said machine.

*Claim.*—The combination of a central disk e, with the convex clamping disk d, and the flat sustaining disk f, substantially in the manner described, for the purpose of dividing the crown and quarters of circular sewing, and presenting the edge of the fabric to the needle in the manner set forth.

No. 24,184.—GEORGE M. ALSOP, of Philadelphia, Penn.—*Improvement in Air Springs for Railroad Cars.*—Patent dated May 31, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the method or arrangement of inclosing an air tight vessel filled with air, in a box or chamber, with a flexible water proof cover, or diaphragm, and surrounding the air vessel with water, or some other suitable fluid, substantially as described and for the purpose set forth.

Second. I claim the arrangement of the convex steel plates  $B^2$ , which are divided into radiating leaves, or segments, connected together at the centre, whose outer edges or periphery rest upon and slide on the metal ring, or plate  $b$ , and in the recess in the bottom of the top  $A^1$ , the whole being arranged as described for the purpose of forming a flexible metallic support or covering to the diaphragm, to prevent its being strained or ruptured, substantially as set forth.

Third. I claim the combination and arrangement of the piston  $D$ , its elastic cushion  $E$ , the flexible steel plate or plates  $B^2$ , metal plate or rings  $b b$ , and the diaphragm  $B B^1$ , the whole being arranged and combined substantially as described and for the purpose set forth.

No. 24,185.—C. F. ANDERSON, of Charlestown, Mass.—*Improvement in Seed Planters*.—Patent dated May 31, 1859.—The object of this invention is to place the seed distributing device under the complete control of the attendant, so that the dropping of the seed may be checked, or continued at greater or less intervals to insure the even dropping of the same in check rows.

*Claim*.—The ratchet shaped projections  $d e$  in the hub  $H$  of wheel  $B$ , and on the disk  $K$  of the tube  $J$ , in connection with the tube  $L$ , provided with the spiral and straight grooves  $f g$ , in which the projection  $h$  of the tube  $j$  is fitted; the tube  $L$  having the side lever  $M$  attached, and also the catch  $i$ , the whole being combined and arranged to operate as and for the purpose set forth.

No. 24,186.—ENSIGN BAKER, of Fredonia, N. Y.—*Improvement in Straw Cutters*.—Patent dated May 31, 1859.—This invention consists in the employment of a cutter wheel and leger knife in connection with a knife lock, and also in the use of a feeding device arranged in a novel way to operate automatically and conjointly with the cutting device, the whole being so arranged that an efficient implement is obtained for cutting straw, stalks, roots, and other substances used as fodder for stock.

The inventor says: I *claim*, first, the employment or use of the leger knife  $J$ , provided with the hook  $a$ , actuated by the cam  $F$ , and used in connection with the knives  $E E$ , attached to the wheel  $D$ , and provided with the hooks  $G G$ , to operate substantially as and for the purpose set forth.

Second. The arrangement of the crank  $H$ , spring  $L$ , with rack  $d$  attached, and the ratchet  $c$  on the shaft of the feed roller  $K$ , substantially as shown, to feed the stuff intermittently to the knives, as described.

No. 24,187.—JOHN A. BAWSEL, of Powhattan C. H., Va.—*Improvement in Tobacco Presses*.—Patent dated May 31, 1859.—This invention consists in an improved machine for pressing and straightening small bundles of tobacco preparatory to their being pressed or struck in mass for packing.

The inventor says: I *claim*, first, the use of the follower  $B^1$ , fitting into the groove of the opposite roller, substantially as set forth.

Second. I claim the springs  $S$ , as constructed and operated for guiding the tobacco and straightening the leaves as they pass between the rollers, substantially as described.

Third. I claim the use of the treadle  $H$ , in combination with the springs  $S$ , and with the rollers  $B$  and  $C$ , operating substantially as described, for separating the springs  $S$ , and also for separating the rollers, as set forth.

Fourth. I claim the oil cup  $O$ , and roller  $V$ , in connection with groove  $r$ , for oiling the groove and the tobacco, substantially as described.

No. 24,188.—ALBERT BETTELEY, of Boston, Mass.—*Improvement in Elevators for Hoisting Goods in Warehouses, &c.*—Patent dated May 31, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—So arranging and combining a rider  $t$ , with a brake, by the means described, or their equivalents, as to operate on a drive pulley to check or prevent its rotation whenever the driving belt breaks or is removed.

No. 24,189.—JOSEPH D. BILLINGS, of Rutland, Vt.—*Improvement in Freight Cars*.—Patent dated May 31, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—Placing a metal shoe, single or continuous, between the studs or sheathing boards and sills of railroad cars, for excluding the water, and thereby preventing the rapid decay of the same, substantially as set forth.

No. 24,190.—JOHN W. BREWSTER, of Stamford, N. Y.—*Improved Wrench*.—Patent dated May 31, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—As a new article of manufacture, a wrench, having a six sided handle  $A$ , sta-

tionary jaw B, and sliding jaw C, with apertures *c*, of the precise form shown, and the article being otherwise made as set forth.

No. 24,191.—JAY H. BROWN, of Grand Lodge, Mich.—*Improved Machine for Punching Metal*.—Patent dated May 31, 1859.—The mode of operating this machine is by moving round the lever L from either stop, to the position first described, when the bars I I will assume a vertical position and drive down the punch. The frusto conical rollers, by rotating when they take the power, prevent injurious friction and obviate the difficulty of keeping flat rubbing surfaces in such a position thoroughly lubricated when subjected to heavy pressure.

*Claim*.—The application and use of the bars I I, in combination with lever L, punching bar E, frusto conical rollers *o o o o*, &c., rod G, and spiral (or equivalent) spring S, for the purposes specified, the whole being constructed and arranged substantially in the manner as described and set forth.

No. 24,192.—FREDERICK BUCHER, of Columbia, Pa.—*Improvement in Stoves*.—Patent dated May 31, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—In combination with the fire cylinder, the double radiators *h*, each inclosing an interior chamber and register, so that the draft may be direct, or checked at pleasure, in its passage through the stove, by which means I obtain much radiating surface and economize much fuel, the whole being arranged substantially as represented.

No. 24,193.—JOHN P. CARR, of Mattapoisett, Mass.—*Improved Pump Gearing*.—Patent dated May 31, 1859.—By turning the cranks F<sup>1</sup> F<sup>2</sup>, the fly wheels are caused to revolve, and consequently the shafts K<sup>1</sup> K<sup>2</sup> are also revolved. By means of the cranks L<sup>1</sup> L<sup>2</sup> on the shafts K<sup>1</sup> K<sup>2</sup>, the connecting rods I<sup>1</sup> I<sup>2</sup> cause the shaft K<sup>4</sup> and consequently the beam G<sup>1</sup> to assume a rocking motion. The two fly wheels E<sup>1</sup> E<sup>2</sup> are caused to rotate with equal velocity by means of the connecting rod I<sup>4</sup> and the cranks L<sup>3</sup> L<sup>4</sup>.

*Claim*.—The device, as set forth and described, for operating pumps on board of ships and in other places where said invention may be useful.

No. 24,194.—JOHN CLACKSON, of Milford, Pa.—*Improved Joiner's Clamp*.—Patent dated May 31, 1859.—The object of this invention is to obtain a clamp that will be perfectly stiff and firm, and one that may be more readily manipulated than those of the usual construction.

*Claim*.—The clamp formed of the bar A with the jaws D F, constructed, arranged, and fitted on it, substantially as described, to form a new and improved article of manufacture.

No. 24,195.—E. P. CLARK, of Holyoke, Mass.—*Improvement in Composition for Pencils*.—Patent dated May 31, 1859.—The component parts of this composition are nitrate of silver, nitric acid, glue, lampblack, and sugar.

*Claim*.—The composition for pencils for indelible writing, made by combining nitrate of silver with the several other ingredients herein specified, substantially in the manner and about the proportions set forth.

No. 24,196.—WILLIAM CLEMSON, of Woburn, Mass.—*Improved Machine for Grinding Saws*.—Patent dated May 31, 1859.—The inventor says: My invention is an improvement upon the patent granted to me May 25, 1858, and consists in arranging the top roll upon the frame so as to produce the requisite degree of pressure upon the saw in grinding by the weight of said roll, and in adjusting the roll to the surface of the saw to be ground.

*Claim*.—The elliptical bearings *a a*, lever L, and double gearing F F and G G, in combination with the adjustable bearing plates D D, when all are arranged substantially as and for the purposes specified.

No. 24,197.—JACOB CLOSS, of Decatur, Ind.—*Improved Churn*.—Patent dated May 31, 1859.—The nature of this invention consists in constructing a tub churn having dashers on a vertical shaft, to operate upon the principle of a propeller screw.

*Claim*.—The use of the screw dashers D E, constructed and operated as set forth, in connection with the wings F F, as specified.

No. 24,198.—T. B. COURSEY, of Fredrica, Delaware.—*Improvement in Corn Crushers*.—Patent dated May 31, 1859.—This invention consists in attaching to the shaft of an ordinary corn or cob crusher, one or more serrated flanches, arranged so that the flanches or saws will perform the double function of crushers and feeders, first cutting or crushing the ears of corn, and then crowding or pressing them down between the conical crushers and shell to be still further reduced or crushed.

*Claim*.—The employment or use of the serrated flanches F F', placed obliquely and eccentrically on the shaft B, in combination with the crushing heads C D and shell A, substantially as and for the purpose set forth.

No. 24,199.—E. HALL COVEL, of New York, N. Y.—*Improvement in Gas Regulators.*—Patent dated May 31, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim*, first, the combining of the rotary pump or air forcer with the air receiver and its fluid valve arrangements, in the manner set forth, whereby the one controls the action of the other, and through their joint action the charging apparatus is controlled, substantially as described.

Second. I claim connecting the commingling chamber of the charging apparatus with the air receiver, for the purpose set forth.

No. 24,200.—E. HALL COVEL, of New York, N. Y.—*Improvement in Hydro-carbon Vapor Apparatus.*—Patent dated May 31, 1859.—This invention consists in constructing the apparatus of several pieces joined together by such means as allow of the various parts being detached, and of its capacity being diminished or increased, and when in use of being supplied and examined interiorly, without interrupting or disturbing its functions.

The inventor says: I *claim*, first, constructing the apparatus, for the purposes set forth, of detachable parts or chambers, substantially as described.

Second. I claim the arrangement of the feed pipes or tubes, and outlet pipes, whereby I am enabled to pass in the material to any one of the chambers, or to let out material, and to examine the interior while the apparatus is in operation and the process of charging going on, as set forth.

No. 24,201.—G. F. DECKER, of Scranton, Pa.—*Improvement in Railroad Car Trucks.*—Patent dated May 31, 1859.—The object of this invention is to allow the axles of the wheels to have a movement independent of each other, so that in passing over curves they may assume radial positions, or form radii of the curve, thereby allowing the trucks to pass over the curvatures with less friction than usual, and without subjecting the axles to the great strain consequent upon the ordinary mode of construction.

*Claim.*—The axles B of a truck, in separate or independent frames *b b*, attached to the bed piece *a*, as shown, and connected by a spring or flexible plate *e*, and used in connection with the spring C, arranged substantially as and for the purpose set forth.

No. 24,202.—EDWARD J. DURANT, of Lebanon, N. H.—*Improvement in Hand Levers.*—Patent dated May 31, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—Combining the forked shaft *a* with the sliding head-piece *b*, the intermediate lever *c*, and the hand lever *d*, in such a manner as to form a compound leverage car-mover, that can be operated substantially as set forth.

No. 24,203.—CELESTIN EASTBURN, of Spencer county, Ky.—*Improvement in Cultivators.*—Patent dated May 31, 1859.—The inventor says: I first use the machine as a seed coverer. In this operation, the wheel F is indispensably necessary, the rake H is taken off, it being of no use in seed covering. When I have used my machine as a seed coverer, I remove the wheel F by drawing out the knees G, and attach the rake H, for the purpose of raking the clods or trash of any kind that may lodge about the young plants. The rake is supported eight inches above the ground by the spring, and works on a space of eighteen inches horizontally, making it convenient to strike anywhere necessary. The rake is taken off by removing the block J.

*Claim.*—The arrangement of the ploughs D, wheel F, block J, spring I<sup>1</sup>, and rake H, as set forth and described, for the purpose specified.

No. 24,204.—FREDERICK EBELING, of New York, N. Y.—*Improvement in Machinery for Crushing and Mixing Sugar.*—Patent dated May 31, 1859.—This invention consists in a peculiar construction and arrangement of devices by which the sugar is forced by a uniform motion upon and against revolving knives, in such a manner that the crushing of the sugar is much more rapid and uniform; at the same time the loaves of sugar only require to be placed in a hopper and are automatically taken therefrom, ground, and mixed in the desired manner.

The inventor says: I *claim*, first, the reciprocating plunger *p*, acting on the sugar loaf, in combination with the revolving cutter-head *e*, in the manner and for the purposes substantially as specified.

Second. I claim the support *r* and latch *s*, actuated as set forth, and acting to drop one loaf of sugar at a time from the hopper, so as to be pressed forward by the plunger *p*, as set forth.

Third. I claim the sliding bar *o*<sup>1</sup>, fitted with the incline 15, in combination with the pins 10 on the wheel *m*, and the weight *o*<sup>2</sup>, or its equivalent, for drawing back the plungers *p p*, in the manner and for the purposes specified.

Fourth. I claim the revolving mixers *y y*<sup>1</sup>, constructed with slats *z z* between the heads, in the manner and for the purposes set forth.

No. 24,205.—JEREMIAH ESSEX, of North Bennington, Vt.—*Improvement in Machines for Drying Fibrous Substances*.—Patent dated May 31, 1859.—The inventor says: I make use of an endless apron of cloth, slats, or other articles, running up over the rollers or cylinders, and down beneath drums or pulleys that act only on the edge of the apron, while the fibrous material that is to be dried is laid on or attached to this apron, and is moved along on the same and carried up over the top rollers and down in the bend formed in the apron at the point where the same passes the pulleys that act on the edges of said apron.

*Claim*.—The manner herein specified of guiding an ascending and descending endless apron by the pulleys *d d*, or their equivalents, acting on the edges of said endless apron, in the manner and for the purposes specified.

No. 24,206.—MERRILL A. FURBUSH and GEORGE CROMPTON, of Worcester, Mass.—*Improvement in Looms for Weaving Plaids, &c.*—Patent dated May 31, 1859.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim* the employment of two sets of ratchet wheels and appendages, each set consisting of reversed ratchets, substantially as described, in combination with two sets of cams and two series of shuttle boxes, substantially as and for the purpose specified.

And we also claim two sets of reversable ratchets and appendages, the two sets of cams, and two series of shuttle boxes, substantially as described, in combination with one pattern chain or cylinder, in manner substantially as and for the purpose specified.

No. 24,207.—GEORGE GEER, of Uniontown, Ill.—*Improved Washing Machine*.—Patent dated May 31, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—A washing machine provided with a lever *I*, cylinder of rollers *F*, clutch *j*, endless belt *B*, adjustable levers *C C*, made as set forth, and otherwise constructed as shown, so that by shifting the lever *I* the motion of the belt will cease and hold the clothes at rest beneath the rotating cylinder of rollers *F*, so that the belt *B* may be loosened or tightened when desired by shifting the levers *C C*, as specified.

No. 24,208.—JACOB GORE, of Milford, N. H.—*Improvement in Tanning Leather*—Patent dated May 31, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—Giving to the liquor or tanning fluid in the vat a rapid motion, commencing across the bottom of the vat and under the suspended hides, for the purpose set forth.

No. 24,209.—JOHN HASSELL, Jr., of Newark, N. J.—*Improvement in Constructions of Pins for Securing Artificial Teeth*.—Patent dated May 31, 1859.—The inventor says: My invention consists in providing an artificial tooth, previous to its being baked, with a split pin, double or single, made of half round or flattened wire introduced into the tooth, by means of which I am enabled to fold the split ends back upon the separate pieces of platina or other metal placed alternately between the teeth on the inside surface in the one case, and to fold back the end of the split pin under the preceding pin, which form a strong basket work or skeleton lining, while in the first instance I form a strong continuous arch.

The inventor says: I *claim* the splint pin, used double or single, half round or flat, for the purposes set forth and substantially as described.

No. 24,210.—HENRY HAVELL, of Newark, N. J.—*Improved Meat Cutter*—Patent dated May 31, 1859.—This invention consists in a peculiar construction of rotary knives, adapted to facilitate the feeding of the machine, and in an arrangement to sustain the ends of the stationary knives and increase the efficiency of their operation.

The inventor says: I *claim*, first, the hook-pointed rotary knives *E e*, arranged in the described relation to the hopper *F*, for the purpose explained.

Second. The combined arrangement of the stationary curved knives *C C*<sup>1</sup>, latitudinal grooves *D*, and rotary knives *E*, substantially as and for the purposes set forth.

No. 24,211.—ROBERT W. HAZLETT and JOHN H. HOBBS, of Wheeling, Va.—*Improvement in Retorts for Distilling Coal Oil*—Patent dated May 31, 1859.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, constructing the horizontal retort, with a pan or flat shaped base *A*, and inclined upper sides or top *B B*, and with open conduits or gutters *b b* running from end to end of the retort, and arranged on the inner sides thereof, and set inclining and emptying into the neck of the retort, the whole for united operation, substantially as and for the purpose set forth.

Second. The drawer or charger *D*, when open at the top, and in no way or at any time attached as a fixture to the retort, and yet serving during the distilling process as a part of the generating chamber, and being kept elevated above the bottom of the generating chamber and allowed to slide in and out without the necessity of removing or disconnecting any portions of the retort or generator, substantially as and for the purpose set forth.

No. 24,212.—J. E. HOLMES, of Newark, Ohio.—*Improvement in Retorts for Distilling Oil from Coal.*—Patent dated May 31, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The employment, in a retort for distilling oil from coal, of a central perforated tube P, suspended from the mouth piece A<sup>1</sup>, an open space being also left below the bottom of the tube P for the removal of the coke residuum through the mouth C, substantially as shown and described.

No. 24,213.—HENRY HOOTON, of Boston, Mass., and JOSEPH G. BICKNEL, of Cambridge, Mass.—*Improvement in Wheel Jacks for Carriages.*—Patent dated May 31, 1859.—This invention consists in so arranging a notched shaft with ratchets and pawls that heavy bodies may be readily, easily, and steadily raised and lowered.

The inventors say: We *claim*, first, the combination of the hollow box A with the lever D, the front jointed pawl C, the back pawl C, and the notched shaft B, operating substantially as described.

Second. The combination of the button E, the spring F, the catch G, the button H, and the jointed connecting rod K, operating substantially as described.

No. 24,214.—MARK HOWLAND, of Waterbury, Conn.—*Improved Door Latch.*—Patent dated May 31, 1859.—The inventor, in speaking of the arrangement of the different parts of his invention, says: By this arrangement of the parts relatively to one another, it is believed that the well known and very desirable character of door latch which can be fitted to the door by merely making an auger hole, is simplified and rendered more compact, and consequently can be introduced into a small auger hole, and can also be conveniently adjusted to compensate for swelling, or allow for shrinkage of the door, without increasing or lessening the tension of the spring which controls the action of the latch.

*Claim.*—The specified relative arrangement for united operation of the latch C with female screw threaded socket s, latch guide plate u, with square opening v, latch shank or rod B, with male screw thread t, on its front end, stationary slotted guide case A b a a, shoulder w on the latch shank or rod B, spiral spring D, sliding connecting link or plate E, with cross heads d d and double acting knob tumbler F c c, all for the purpose set forth.

No. 24,215.—ROBERT W. HUSTON, of Calais, Me.—*Improved Mode of Securing Corks in Bottles.*—Patent dated May 31, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The described fastener, which consists of the metallic pieces 3 3, which are hinged on a wire secured below the enlargement on the bottle neck, and which are provided with teeth 5 5 5, with the strips 6 6, and with the wires 2 and clasps 11; the several parts being arranged substantially in the manner and for the purpose specified.

No. 24,216.—A. B. IRVING, of Terre Haute, Ind.—*Improvement in Sewing Machines.*—Patent dated May 31, 1859.—This invention consists in the arrangement relatively to one another of the following parts, whereby a useful machine is produced, to wit: The upper and lower feeding arms, upper and lower rock shafts, actuating cam, combining and regulating projection, and slotted adjustable spring holding down bar.

*Claim.*—The arrangement, relatively to one another, of the following parts, to wit: the upper and lower feeding arms D D<sup>1</sup>, upper and lower rock shafts E E<sup>1</sup>, actuating cam C, combining and regulating projection J, and slotted adjustable spring holding down bar I, for the purposes set forth.

No. 24,217.—WILLIAM G. W. JAEGER, of Baltimore, Md.—*Improvement in Retorts for Distilling Oil from Coal.*—Patent dated May 31, 1859.—The inventor says: I do not confine myself to the precise means of separating the heavy and light oils, although I prefer those set forth. My improvement consists in separating them, or removing the heavy oils from the action of the fire, so as to prevent their decomposition. The opening g is for the purpose of stirring the coal when required.

In stating his claim, the inventor says: I *claim*, first, the side channels d d, and the trap openings or discharge pipes e e, for the heavy oils, as set forth.

Second. In combination with said side channels, I claim the double inclination or arched form of the bottom of the retort.

Third. In combination with the coal oil retort, constructed substantially as above set forth, I claim the opening g, for the purposes set forth.

No. 24,218.—MATHAUS KAEFER, of New York, N. Y.—*Improvement in Machinery for Transmitting Motion.*—Patent dated May 31, 1859.—This invention consists in arranging the fly wheel in a sliding carriage, in such a manner that the weight of the fly wheel and of the frame itself, assists in carrying the crank over the dead points, and by the action of this weight the crank is always kept in a position most favorable for the motive power to act on the same.

*Claim.*—The arrangement of the carriage C and fly wheel E, in such relation to the crank F that the weight of the carriage and of the fly wheel acts on the crank, substantially in the manner specified.

No. 24,219.—GEORGE LINDLEY, of Chicago, Ill.—*Improvement in Field Rollers.*—Patent dated May 31, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the vibrating scrapers, constructed and arranged so that the driver can operate them to clear the rollers of the earth adhering to them, when the machine is drawn in either direction, substantially as described.

I also claim constructing and arranging the platform so that the ends which support it may vibrate freely under it, substantially as described, when the rollers pass over uneven ground.

No. 24,220.—TINDAL A. MADISON, of Terre Haute, Ind.—*Improvement in the Mode of Connecting and Disconnecting Machinery by means of a Belt.*—Patent dated May 31, 1859.—This invention consists in applying a shifting bar of peculiar construction to a belt used for connecting machinery, in such a way that the belt may be shifted by a motion of the bar, either from a driving pulley to a series of dead rollers, or their equivalent, suitably disposed alongside, or *vice versa*.

The inventor says: I *claim*, first, the combination of the shifting bar K with the belt D D D, the driving pulley A, and the series of dead rollers H H H, or their equivalent, for the purposes described.

Second. The combination of the shifting bar K and box M M with the gate or pawl N, or their equivalents, for the purposes described.

Third. The guide plate S with its slot U U, in combination with the friction roller *h*, or their equivalents, for the purpose of giving both forward and lateral motion to the belt D D D, when moved from a state of rest as described.

Fourth. The series of dead rollers H H H, for the purposes and arranged in the manner set forth.

Fifth. The lever J, in combination with the slots *d* and *e*, the stud *f*, and connecting rod R, for the purpose of operating the gate or pawl N, in the manner described.

No. 24,221.—THOMAS J. MAYALL, of Roxbury, Mass.—*Improved Water Tight Sink.*—Patent dated May 31, 1859.—The inventor says: My invention consists of a new method of making water tight sinks, which are not liable to decay. To accomplish this result I have found desirable compositions of gutta percha and India rubber, and other substances, and a method of forming them into sinks.

*Claim.*—The production, as a new article of manufacture, of water tight sinks, formed from vulcanized India rubber or gutta percha, substantially in the manner and for the purposes set forth.

No. 24,222.—CHARLES MCBURNEY, of Roxbury, Mass.—*Improved Suction Hose.*—Patent dated May 31, 1859.—This invention consists in so forming the rings which retain the hose distended that they shall keep each other in place, each ring having its bore enlarged at one end for the reception of the small end of the adjacent ring.

*Claim.*—The rings B, operating in the manner substantially as set forth.

No. 24,223.—W. H. McCLINTOCK, of Frankfort, Ohio.—*Improved Churn.*—Patent dated May 31, 1859.—This invention consists in the combination of a milk or cream supply chamber, butter separating or collecting chamber, and a suction and force pump, whereby by simply oscillating a piston the cream is kept constantly circulating or moving, and in its movement brought in contact with friction or chafing surfaces, in such a manner as to have its globules broken and the fatty matter contained in the same converted and collected in a separate chamber into a mass of butter.

*Claim.*—The employment of the within specified peculiarly constructed circularly vibrating suction and force pump, in combination with a churn, constructed with a perforated partition, substantially as and for the purpose set forth.

No. 24,224.—ROBERT MCKENNA, of Rossville, Tenn.—*Improved Device for Operating the Index of Time Registers.*—Patent dated May 31, 1859.—This invention consists in making an ordinary spring clock, in combination with it, register and determine the time of events.

*Claim.*—The moving of the pencil in the manner described.

No. 24,225.—THOMAS E. McNEILL, of Philadelphia, Pa.—*Improvement in Seats and Couches for Railway Cars.*—Patent dated May 31, 1859.—This invention relates to improvements in sleeping cars, in which the space used as a central passage during the day is occupied for couches at night, and in which the bases and backs of seats are converted into couches by placing them end to end.

The inventor says: I *claim*, first, the end frame D of the seat, with its slotted stop, and the slotted plate secured to the side of the car, in combination with the back F, and its pins

or bolts, when the several parts are adapted to and arranged in respect to each other, substantially as set forth.

Second. The arms *d*, so hinged to the inside of the end frame as to be folded down under the seat during the day and elevated so as to form supports for the couches during the night, in the manner specified.

Third. The vertical frames *N*, hinged to the side of the car, and furnished with ledges to support two couches.

Fourth. The board *R*, its rod *p*, and the hangers *n*, when arranged as and for the purpose set forth.

No. 24,226.—JOHN McPHERSON, of Pennington, N. J.—*Improvement in Harvesting Machines*. Patent dated May 31, 1859.—The apron *K* is constructed by attaching to an endless apron *r*, passing around the conical rollers *m n*, by any suitable means, the slats *s*, which are made tapering, in order that they may conform to the curved shape of the platform. The slats open in passing around the roller *m* and seize the grain delivered by the apron *i*, and the spaces between the slats likewise assist in the delivery of the grain.

The inventor says: I *claim*, first, the curved slatted flexible apron *K*, when constructed in the manner and for the purposes set forth.

Second. The combination of the endless apron *i*, with the curved slatted flexible apron *k*, the whole being constructed and arranged in the manner and for the purposes set forth.

No. 24,227.—REUBEN M. MELTON, of Criglersville, Va.—*Improvement in Cultivators*.—Patent dated May 31, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of the adjustable links with the adjustable slide, arranged substantially as described, for the purpose of adjusting the distance between the ploughs.

Second. In combination with the curved plough beam, I claim the coulter constructed and arranged substantially as described, whereby the draft of the side ploughs is regulated, by sliding the coulter on the beam, and firm support given to the coulter in passing through compact soil.

No. 24,228.—JAMES R. MOCK, of Elizabethtown, Ky.—*Improvement in Locks for Repeating Fire Arms*.—Patent dated May 31, 1859.—This invention consists of a coiled spring, in combination with a sliding lock, provided with a catch and a catch spring, and a grooved barrel and grooved breech pin.

*Claim*.—The use of the coiled spring *F*, in combination with the sliding lock, the catch No. 6, catch spring No. 7, and grooved barrel and grooved breech pin, substantially as described.

No. 24,229.—RICHARD MONTGOMERY, of New York, N. Y.—*Improvement in the Manufacture of Corrugated Beams*.—Patent dated May 31, 1859.—This invention consists in an improved device for manufacturing corrugated or laminated iron beams designed to be used in buildings, bridges, ships, &c.

The inventor says: I *claim* the roller *A*, with its peculiarly formed projections and recesses, in combination with the roller *B*, with its peculiarly formed projections and recesses, arranged and operating in relation to each other, substantially as and for the purposes set forth.

I also claim the rollers *A* and *B*, in combination with the former *C*; said parts being constructed, arranged, and operating in relation to each other, substantially as and for the purposes described.

No. 24,230.—MORDECAI R. MOORE, of Philadelphia, Pa.—*Improvement in Apparatus for Seasoning Lumber*.—Patent dated May 31, 1859.—This invention consists in providing, for the purpose of drying timber and lumber, a capacious steaming and drying chamber, fitted with internal track rails, steam pipes, and stop cocks, in such a manner that a truck or trucks, piled with lumber to be seasoned, may be readily run into said chamber, inclosed therein steam-tight, and the lumber subjected to the direct action of steam for a sufficient length of time to extract the sap, &c., and immediately after to the drying action of heated air.

*Claim*.—The combined arrangement of the track rails *C C*<sup>1</sup>, or their equivalents, with a steaming and drying chamber or vessel *A*, fitted with steam pipes and stop cocks, or valves, substantially as described, so as to operate therewith, substantially in the manner and for the purposes specified.

No. 24,231.—D. J. OWEN, of Springville Lynn, Pa.—*Improved Broom*.—Patent dated May 31, 1859.—This invention consists in confining the but ends of the wisp of a flat broom in a leather bag of such form, that two of its sides, looking from the flat side of the broom, converge toward the handle; while the other two sides of the same, looking edgewise at the broom, diverge toward the handle, so that a protuberance is formed, which enables a steel spring to confine the wisp in the bag.

*Claim.*—As an improved article of manufacture, a broom provided with a leather bag A, spring C, and otherwise made as shown and described.

No. 24,232.—GEORGE W. PARKER, of Fitzwilliam, N. H.—*Improvement in Cross-Cut Sawing Machines.*—Patent dated May 31, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—The cross head, and the several parts attached to it, whether arranged as shown in figures 1 and 2 or as in figure 3, together with the piece *x* or its equivalent, to work the arms V and N, to raise the saw and the handle *h*, to hold the saw when raised.

No. 24,233.—JAMES ROY PARKER, of Sing Sing, N. Y.—*Improved Churn.*—Patent dated May 31, 1859.—This invention consists in a new mode or apparatus for making butter, founded on the idea that butter exists ready made in the sweet milk, but is contained in little vesicles floating in the milk, and that the ordinary mode of churning butter, by powerful agitation of the milk or cream, is a waste of power.

*Claim.*—The combination of the rotating faces of the disk C with the stationary faces B B, in the manner and for the purposes set forth.

No. 24,234.—JOHN F. PEABODY, of Salem, Mass.—*Improvement in Chairs for Railways.*—Patent dated May 31, 1859.—This invention consists in an arrangement and application of certain bearings to the base plate of a railway chair, provided with an elastic rubber bearing, or its equivalent, and metallic cap piece.

*Claim.*—The arrangement and application of the rail bearers *b b*, with respect to the elastic bearing E, its cap plate F, the base plate *a*, and under the rails A B of the railway chair, substantially as described, and particularly with the elastic bearing and cap plate, arranged and protected by a recess, essentially as explained.

No. 24,235.—ALEXANDER E. PIRKEY, of Bradford, Ill.—*Improvement in Mills.*—Patent dated May 31, 1859.—This invention consists in arranging a series of adjustable slides in the interior of the shell, so that not only the corner pieces which serve as guides to the piston, but also those slides which constitute the grinding-surface of the shell, and are opposite to the flat sides of the piston, can be brought closer to, or further from the piston, and that the same can be set according to the required fineness of the flour or meal, or that it can be used for crushing corn, and the shell is so arranged that not only the weight of the piston itself, but also a certain arrangement of levers and wheels assist in facilitating the work.

*Claim.*—The described arrangement of the adjustable slides, and the corner pieces *b*, to operate in combination with the piston B, which receives its motion by means of a lever E, and wheels H and I, substantially in the manner and for the purposes specified.

No. 24,236.—ALBERT H. PITKIN, of Hartford, Conn.—*Improvement in Screw Dies.*—Patent dated May 31, 1859.—This improvement consists in constructing hand screw plates, complete in one piece of metal, having their openings in the edge for the insertion of the cutting die.

The inventor says: I claim making a screw plate A, with both the top and bottom parts P P<sup>1</sup>, which hold the die N, cast or made upon the screw plate A, in the manner and for the purpose described.

I further claim, making the inlet for the introduction of the die N into its chamber, between the parts P P<sup>1</sup>, through the outside edge of the screw plate A, as and for the purpose described.

No. 24,237.—CHRISTIAN REIF, of Hartleton, Lewis Township, Pa.—*Improvement in Clover Hullers.*—Patent dated May 31, 1859.—This invention consists in a concave composed of a series of cast-iron plates, the faces of which are covered with pyramidal projections, either around or down the concave, as the clover might be carried through the machine without being caught by the projections, were the depressions in a straight row, but by having them at different angles each depression is followed by a projection, thus preventing the clover from running through a series of depressions without coming in contact with a projection.

*Claim.*—The projections at different angles on the concave, in combination with the spiral rows of projections on the cylinder, substantially as and for the purposes set forth.

No. 24,238.—EZRA RIPLEY, of Troy N. Y.—*Improved Nut Cracker.*—Patent dated May 31, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The described nut cracker, or implement, consisting essentially of the fixed jaw A, with its standard *e*, the movable jaw B, with its slide *g*, and the eccentric or cam C, with its handle *d*, and flange *k*, all constructed and arranged in combination for conjoint operation, substantially as described.

No. 24,239.—JOSEPH ROSENKRANS, of Avoca, N. Y.—*Improvement in Self-acting Wagon Brakes.*—Patent dated May 31, 1859.—This invention is designed more particularly for wagons and carriages when used in a hilly country, and is intended to be operated by holding back horses or team.

*Claim.*—The arrangement of means set forth for operating the brake, by the holding back of the team.

No. 24,240.—ANDREW C. ROSS, of Almont, Mich.—*Improved Sawing Machine for Resawing Boards.*—Patent dated May 31, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of circular saw K, stationary divider L, in connection with a permanent horizontal bed in resawing machines, for the purposes set forth.

Second. The bell shaped flanges, or sockets *z*, of the saws, constructed and employed substantially as and for the purpose described.

No. 24,241.—GEORGE H. RUSSELL, of Baltimore, Md.—*Improvement in Stoves.*—Patent dated May 31, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The combination, with the inner fire drum A, of the cold air base D, vertical side pipes E E<sup>1</sup>, and elbow *e*, with their dampers *g g*, cylindrical cover or top drum, with F, its chambers *ff*<sup>1</sup>, *f*<sup>2</sup>, *f*<sup>3</sup>, and connecting tube *f*<sup>4</sup>, horizontal air space G, and outlet *i*, with air drums I K, passage *jj*, front vertical register pipes J J, foot warmer connecting pipes *kk*, and foot warmer L, with its register *l*, ventilating registers *rr*, double smoke pipes N *n*, P *p*, with dampers set as described, and divided outer smoke drum O, with its passage, or passages, substantially as and for the purposes set forth.

No. 24,242.—ALBERT M. SMITH, of New York, N. Y.—*Improved Carpet Fastener.*—Patent dated May 31, 1859.—This invention consists in constructing a hook, or hook part, and an eye or piece with catches or lips to be used in a reversed manner to fasten down carpets, causing the carpet when attached to the hook, hooks, or points of the hook part, to draw back towards or against its head instead of its point or points, thereby and at the same time drawing it back on or under the eye of the catch piece to be fastened to the floor so as to hold the carpet down securely to its place.

*Claim.*—The combination and arrangement of the point A, lips *b b*, slot *c*, bearing *d*, lips *e e*, point *f*, hook *g*, lips *h h*, bearings *i i*, substantially as and for the purposes specified.

No. 24,243.—CHARLES E. SMITH, of Philadelphia, Pa.—*Improvement in the Manufacture of Belting.*—Patent dated May 31, 1859.—This improvement consists in uniting the pieces of belt or band in such a way that a secure joint shall be obtained, together with sufficient flexibility.

*Claim.*—The manufacture of continuous belting, or boards, by uniting pieces of band iron, by lapping and riveting two beveled ends, so as to produce a rhomboidal joint, in the manner and for the purpose substantially as described.

No. 24,244.—GEORGE STEPHENSON, of Northfield, Ind.—*Improvement in Cordage Machinery.*—Patent dated May 31, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—The employment of a series of movable bearing cross bars *i*, with side pivots or gudgeons *k*, the ends of the cross bars being supported by longitudinal slots or grooves *h*, in the flyer bars *a*, and connected to each other by elastic straps or thongs *l*, whereby the cross bars are made to press gently upon the ends of the spools (which are mounted upon the side pivots *k*,) to resist slightly the rotary motion thereof, and also admit of the occasional removal of one or more of the spools, without disarranging others of the series, the cross bars, spools, and elastic straps being arranged in the manner and for the purpose described.

No. 24,245.—LEVI STEVENS, of Fitchburg, Mass.—*Improvement in Axle Boxes for Railroad Cars.*—Patent dated May 31, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—A box made of anti-friction metal and backed with a casing of bronze, the bronze passing through the anti-friction metal, and resting upon the axle, for the purpose described.

No. 24,246.—JOHN SUTTON, of New York, N. Y., assignor to Himself and DE WITT C. VAN TUYL, of said New York.—*Improvement in Condensing Steam Engines.*—Patent dated May 31, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—First, the arrangement of the combined air pump and condenser piston K, to act independently of the walking beam of the engine, so that a portion of the exhaust steam, while the piston F is just completing and commencing a stroke, shall impart a full stroke to the piston K, as shown and described.

Second. The arrangement and combination of the forked levers Q S, the crank E, lever R, and piston rod K<sup>1</sup>, so that by the action of the piston K the crank E will be assisted in

passing the dead points, but during other portions of the crank movement, the parts above named will be disconnected from the crank E, all substantially as shown and described.

No. 24,247.—GEORGE C. TAFT, of Worcester, Mass.—*Improvement in the Manufacture of Wrenches*.—Patent dated May 31, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The peculiar mode of constructing the head and shank of screw wrenches, namely, by first forming or constructing the head *c*, and shank or bar *a*, separately, as shown and described, and then uniting the head and shank after the shank *a* has been inserted into the depression *d*, first made in the head *c*, by welding, the whole operation being substantially as described and for the purposes set forth.

No. 24,248.—THOMAS H. TATLOW, jr., of Palmyra, Mo.—*Improvement in Seeding Machines*.—Patent dated May 31, 1859.—This invention relates to a novel means employed for covering the seed, and also to a novel device for properly pulverizing the ground in advance of the share that forms the furrow to receive the seed.

The inventor says: I *claim*, first, the employment or use of the covering hoe G, operated from the supporting wheel C, through the medium of the rollers *g g*, bar J, and the bars F I, connected by the rod H, substantially as described.

Second. The share O, provided with the curved bars *j j*, in connection with the shares M N, and the hoe G, the whole being arranged for joint operation, substantially as and for the purpose set forth.

No. 24,249.—JOSHUA W. TAYLOR, of Philadelphia, Pa.—*Improvement in Corn Mills*.—Patent dated May 31, 1859.—This invention consists in applying in both the upper and lower concave, or shell of common iron mills, a number of oblique projections for the purpose of increasing the grinding surface.

*Claim*.—The application and arrangement of the oblique projections C to the shell, or concave *a*, operating in the manner and for the purpose set forth and specified.

No. 24,250.—JOSEPH W. THORP, of Hillsboro', N. H.—*Improvement in Tailor's Pressing Machines*.—Patent dated May 31, 1859.—By this invention the goose is suspended from a crane that turns upon bearings arranged in two eccentrics, whereby the goose can travel in every direction.

*Claim*.—Raising the heater from the bottom of the hollow goose, either by means of the projections formed on the bottom of the heater, or by adjusting screws or their equivalents.

No. 24,251.—SIMON H. WALKER, of Somerville, Tenn.—*Improvement in Bee Hives*.—Patent dated May 31, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the moth decoy entrances *c f*, provided with the jutting lips or ledges *b d*, arranged just within the bee entrance *a*, across its entire extent, both above and below, substantially in the manner and for the purpose specified.

I also claim the construction and arrangement of the cross bars *r r*, attached to a supporting cross piece P, and with open spaces S S around their ends, substantially in the manner and for the purpose set forth.

No. 24,252.—JOHN WAUGH, of Elmira, N. Y.—*Improved Boring Machine*.—Patent dated May 31, 1859.—The nature of this invention is to enable artificers in wood to bore holes with an auger bit (from any position) perpendicularly, upward or downward, horizontally, or at any angle of any degree, or any number of degrees, or fractional parts of a degree from 0 to 90, above or below a horizontal line.

*Claim*.—The arrangement of those mechanical appliances, in a peculiar manner, for a new and useful purpose, substantially as set forth.

No. 24,253.—DAVID WHEELER, of Fairfield, Conn., and ISAAC LITTLE, of Bridgeport, Conn.—*Improvement in Gas Regulators*.—Patent dated May 31, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The combination of a self-acting discharge pipe or siphon S T, with the chamber *c*, of a gas regulator, substantially as and for the purposes shown and described.

No. 24,254.—E. D. WILLIAMS, of Philadelphia, Pa.—*Improvement in Friction Springs for Supporting Window Sashes*.—Patent dated May 31, 1859.—This invention consists in providing sash friction springs with a projection or spur on their friction or bearing surfaces sharpened, so that the projection or spur shall cut a groove in which the spur shall slide to prevent the sash from rattling.

*Claim*.—Providing with friction springs having sharpened projections, or spurs, for cutting their own grooves, substantially as set forth.

No. 24,255.—THOMAS S. WILLIAMS, of Enterprise, Miss.—*Improved Musquito Bar*.—Patent dated May 31, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—The folding musquito net, or bar, constructed substantially as described.

No. 24,256.—SAMSON WOLFF, of Vicksburg, Miss.—*Improvement in Cotton and Hay Presses*.—Patent dated May 31, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The combination of a conical spiral wheel or pinion, with an inclined rack, when the latter is set oblique to the axis of the pinion, substantially in the manner and for the purpose described.

No. 24,257.—THEODORE T. WOODRUFF, of Philadelphia, Pa.—*Improvement in Seats and Couches for Railroad Cars*.—Patent dated May 31, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the combination and arrangement of the two frames with each other, and with the supports therefor, connected with each compartment of a car, the said frame, when spread out, forming couches for two persons, on the same level with the seats, and when transformed, one of the said frames forming seats, and the other the back for such seats, substantially as described.

I also claim connecting the frame which forms the seats with the frame which forms the backs by means of links, connected with one of the said frames by means of hinged joints, and with the other of the said frames by means of sliding hinged joints, substantially as and for the purpose specified.

I also claim, in combination with the frame for the main seats, the auxiliary seats, which slide under the frame for the main seats, substantially as and for the purpose described.

And I also claim the frame for an elevated couch, when combined with the car, by means of sliding hinged joints, substantially as and for the purpose specified.

I also claim, in combination with the elevated couch next to the side of the car, or the equivalent therefor, the front elevated couch, so connected with the car, substantially as described, as to admit of being let down to form part of a double couch, and thrown up towards the roof of the car when not wanted as a couch, as set forth.

No. 24,258.—LESTER L. BOND, of Chicago, Ill., assignor to Himself and GILES B. WILLIAMS, of New York city.—*Improvement in Self Acting Presses*.—Patent dated May 31, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement for connecting the press beam B with the levers D D by the connecting bars E E, whereby the press is made to operate from above and below.

Second. The socket shoe I and the ratchet plate H, or their mechanical equivalents, for altering and gauging the power of the press, substantially as set forth and specified.

No. 24,259.—C. A. YOUNG and S. W. YOUNG, of Providence, R. I.—*Improvement in Machines for Making Upholstery Springs*.—Patent dated May 31, 1859.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, the cutters *o r*, attached to the machine and arranged relatively with the rolls D D I, and bar J, when the movable cutter *r* is actuated automatically by suitable mechanism to cut the springs as formed from the continuous wire T.

Second. The bar J, attached to the lever H, or other part of the machine or framing, when provided with a bend *l* to project over the uppermost roller D for the purpose of guiding and insuring the turning or bending of the wire T, as set forth.

Third. The plates *n p*, when used in connection with the shears *o r* for the purpose of cutting off the springs and bending the ends thereof simultaneously, and substantially as described.

No. 24,260.—JOHN W. DRUMMOND, of New York, N. Y., assignor to HORACE H. DAY, of said New York.—*Improvement in Machines for Measuring Cloth*.—Patent dated May 31, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The combination of the measuring wheel, substantially as described, in combination with the spring block, or the equivalent thereof, for holding the cloth to the periphery of the wheel, and for stopping the said wheel the moment the cloth has passed off, substantially as described.

No. 24,261.—D. G. FLETCHER, of Racine, Wis., assignor to Himself and HENRY WEISKOPF, of said Racine.—*Improvement in Coffee Pots*.—Patent dated May 31, 1859.—This invention consists in protecting the spout by a box-like strainer with a hinged top, so that the liquid coffee runs freely, and the strainer can easily be cleaned from each side.

*Claim*.—The box-like strainer D, arranged with a hinge top *c*, so that access can be had to the same from the inside as well as from the outside, and that the same can easily be cleaned, substantially as described.

No. 24,262.—WILLIAM H. LAZELLE, of Boston, Mass., assignor to Himself and ELBRIDGE B. LAZELLE, of said Boston.—*Improved Refrigerator*.—Patent dated May 31, 1859.—This invention consists in causing the ice water from the receptacle C to run into the space at the top on one side of the chamber, pass downward under the bottom and up to the top of the opposite side, whence it is allowed to escape through a pipe running downward in the space and out at the bottom of the refrigerator, by means of which arrangement all the frigorific properties of the ice water are retained.

*Claim*.—The combination and arrangement of the siphon pipe I, water space F, and ice box C, opened and beveled at one end, substantially as set forth and for the purposes described.

No. 24,263.—HUGH LOGUE, of Philadelphia, Pa., assignor to Himself and DANIEL P. VANDERGRIFT, of said Philadelphia.—*Improvement in Dry Gas Meters*.—Patent dated May 31, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—So constructing one of the partitions between two of the chambers of a dry gas meter that it may afford a passage for the gas from the inlet pipe to the central opening of the valve seat, substantially as and for the purpose set forth.

No. 24,264.—HENRY F. MANN, of Laporte, Ind., assignor to Himself and WILLIAM I. WALKER, of said Laporte.—*Improved Hemp Brake*.—Patent dated May 31, 1859.—When, in this machine, it is deemed advisable to diminish the speed of the breaker, without changing the motion of the wheel, it may be effected by withdrawing every alternate cam, so that, at each revolution, instead of four, there will be but two strokes of the breaker.

The inventor says: I *claim*, first, the combination of the adjustable cams or arms *c* with the breaker, as constructed, the whole being arranged and operated substantially as described.

Second. The adjustable spring *h*, as arranged and operated for the purpose set forth.

No. 24,265.—HENRY MESSER, of Roxbury, Mass., assignor to CHARLES RICE, of Boston, Mass.—*Improved Machine for Cutting India Rubber into Threads*.—Patent dated May 31, 1859.—As the carriage D is revolved the cutters *o* are revolved rapidly in contact with the block of rubber E and cut into its edge as it is revolved, the carriage H being at the same time fed towards the centre of the machine by the screw *h*.

*Claim*.—The arrangement and combination of the rotating table D and the adjustable cutters *o*, substantially as and for the purposes shown and described.

No. 24,266.—A. ORVIS, of Niagara, N. Y., assignor to Himself and Downs & Co., of Seneca Falls, N. Y.—*Improvement in Grinding Mills*.—Patent dated May 31, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the construction and arrangement of cylinder D and concave F with supplementary cylinder G, whereby the rhomboidal teeth *f* and *g* serve to adjust the parts to efficient action by means of the longitudinal movement of the collar *e* on the shaft B, substantially as set forth.

I also claim the peculiar conformation of the grinding surfaces of the cast-iron cylinder E and concave H, consisting of the alternate intersection of the raised and depressed corrugations thereof, in the manner and for the purpose shown and described.

I claim the combination and arrangement of the two concaves F and G, spout *j*, and divided winged partition R, or its equivalent, whereby the operation of cracking and grinding in said concaves may be conjoint or separate, substantially in the manner and for the purposes shown and described.

I claim the automatic rapper V, arranged and operated substantially as described, for the purpose of keeping the bolt free from obstructions and rendering its action efficient, as set forth.

No. 24,267.—WILLIAM H. TENDLER, of Cambridge, Mass., assignor to Himself and JOHN F. MOESCHLIN, of said Cambridge.—*Improved Sofa Bedstead*.—Patent dated May 31, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the improved sofa bed, constructed not only with each of its arm rests formed in two parts and hinged together, arranged and applied to the back *b* and bed frame *a*, as described, but with its seat hinged to the bed frame, so as to be capable of being moved with respect to it and the arm rests, as specified.

I also claim the combination of the pillow and foot rests *l m* E and F, with the arm rests and seat frame or seat applied to the frame A, the whole being made to operate together, essentially as explained.

No. 24,268.—FERDINAND WALTERS, of Covington, Ky., assignor to C. F. WALTERS and S. H. STOUT, of said Covington.—*Improvement in Mill Drivers*.—Patent dated May 31, 1859. This invention relates to the construction and arrangement of a divided adjustable millstone driver.

*Claim.*—The driver  $d$   $d^1$ , constructed and arranged with reference to the shaft C and cap  $c$ , substantially as and for the purpose set forth.

No. 24,269.—ALFORD B. WILTON, of Dorchester, Mass., assignor to Himself and CHARLES ADAMS, of said Dorchester.—*Improved Heel for Boots and Shoes.*—Patent dated May 31, 1859.—This improvement consists in constructing the outer bearing surface or tread of the heel or heel cap concave or with a concavity, whereby there is not only a better foot hold, but it is prevented from adhering to the pavement by means of atmospheric pressure while it may be in use.

*Claim.*—The improvement of the dished or concave elastic heel as made with the air channel  $b$ , leading out of the concavity  $a$ , and arranged substantially as described.

No. 24,270.—JAMES ALBRO, of Elizabeth, N. J.—*Improvement in Printing Oil Cloths.*—Patent dated June 7, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—Forming ornamental figured surfaces on oilcloth, by raising parallel ridges or surfaces  $b$  on the ground color, when in a soft or green state, by means of a properly prepared block pressed upon it; and then forming parallel ridges or raised surfaces  $d$ , at right angles thereto, and in the form of the design or desired configuration by means of a properly prepared block. It being understood that I claim the privilege of having either the ground  $b$  or figure  $d$ , one of them only, if desired, composed of dots or broken lines, or ridges, in order to obtain a similar effect.

No. 24,271.—D. HILLEN ARMOUR, of Columbia, Texas.—*Improvement in Breakwaters.*—Patent dated June 7, 1859.—The object of this invention is to protect the channel across a bar from the flow of sand which comes in upon the bar with the tide, and keep the channel open without the necessity of making the channel in the bar narrower than the channel of the river.

*Claim.*—The projecting or overhanging sand plate F, applied in combination with the diagonal walls of the breakwater, substantially as and for the purpose described.

No. 24,272.—DANIEL S. AYRES, of Hope, N. J.—*Improved Washing Machine.*—Patent dated June 7, 1859.—The nature of this invention consists in providing a washing machine with a movable and a revolving disk, inside of a stationary tub or cylinder. The movable disk is operated by two springs and a treadle, and the revolving disk by a crank and cog wheels.

*Claim.*—The revolving disks or heads, with the mode of operating the same as applied to washing machines.

No. 24,273.—J. A. AYRES, of Hartford, Conn.—*Improved Device for Raising Water.*—Patent dated June 7, 1859.—This invention consists in the employment of an endless chain of buckets, a wind wheel and an annular water receiver, the whole being arranged and applied to a well, whereby a simple and economical device is obtained.

*Claim.*—The wind wheel H, vane G, endless chain J, with buckets  $d$ , and weight L attached, the cylinder C and annular receiving trough D, the whole being arranged and combined for joint operation, substantially as and for the purpose set forth.

No. 24,274.—THOMAS BAILEY, of New Orleans, La.—*Improvement in Revolving Fire-Arms.*—Patent dated June 7, 1859; patented in England January 17, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the placing of the within named working or actuating means within the body, as set forth.

Second. The revolving chamber, working on two adjustable centres of suspension instead of in the ordinary way.

Third. The mode described of connecting the barrel to the body.

Fourth. The stopping or retaining of the revolving chamber by means of a spring stop acting on the ratchet, such stop being actuated by a cam on the tumbler.

Fifth. The notch or cavity, in the cap guard or cocknose, to fit upon the solid part of the chamber, and retain the chamber in a safe position.

No. 24,275.—JOHN B. BAKER, of Syracuse, N. Y.—*Improvement in Bridle Bits.*—Patent dated June 7, 1859.—This invention consists in constructing bits in such a manner that when a moderate draft is made upon the reins the bit will act only as a snaffle, but if a strong pull is made, as when the horse is running, the connection between the rein and the bit is drawn downward, causing a change from a snaffle to a curb; and, on the rein being slackened, the connection is drawn upward by a spring to its former position, and the bit serves again as a snaffle.

*Claim.*—The attachment as described, of sliding rings, or rein connections P to the curb bars of bridle bits, when the same are operated upon by springs attached to the bit, substantially in the manner and for the purpose set forth.

No. 24,276.—HENRY BEDLOW, of Newport, R. I.—*Improved Chimney Cowl*.—Patent dated June 7, 1859.—This invention consists in constructing the cowl in such a manner that the upper end of the chimney, to which it is applied, will be encompassed by a chamber provided with a deflecting plate, and communicating with upright tubes or pipes attached to the outer side of the chamber.

*Claim*.—The arrangement and combination of the chimney top, or tube A, chamber F, tubes G, or other external draft passages and deflectors *b b c c*<sup>1</sup> C, the tube chamber and draft passages communicating with each other and the external air, to operate as and for the purpose set forth.

No. 24,277.—N. BOARDMAN, of Fond-du-Lac, Wis.—*Improved Method of Sawing Shingles from the Bolt*.—Patent dated June 7, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the employment or use of two bolt carriages F F, when used in connection with the adjustable planes H, and arranged in the relation with the circular saw C, as shown, so that a shingle may be sawed from each bolt at each movement of its carriage, and the two bolts operated upon simultaneously by means of one and the same saw.

Second. The adjustable or tilting tracks or bolt frames E E, in combination with the reciprocating carriages F F and saw C, the whole being arranged to operate substantially as and for the purpose set forth.

No. 24,278.—JEHU BRAINERD and W. H. BURRIDGE, of Cleveland, Ohio.—*Improvement in Tanning*.—Patent dated June 7, 1859.—This invention relates to the employment of a preparation of liquor, or liquors, in which skins and hides are to be prepared, or treated, after having been unhaired and bated, in order to let them receive more readily the tan; this step in the process being intermediate between the bate and handling in the tan or ooze.

*Claim*.—The described process of treating skins or hides in a preparation liquor or liquors, substantially as set forth for the purposes described.

No. 24,279.—JOHN M. BRUNSWICK, of Cincinnati, Ohio.—*Improved Pocket Handle for Billiard Tables*.—Patent dated June 7, 1859.—This invention relates to the construction of pocket handles for billiard tables, of vulcanized gutta percha, or India rubber, in such form and manner as to be conveniently attached to billiard tables, to take the place of metallic handles now in common use.

*Claim*.—The pocket handles A A<sup>1</sup>, arranged and secured substantially as described, and formed of vulcanized gutta percha or India rubber, as a new article of manufacture, for the purposes set forth.

No. 24,280.—F. A. CALVERT and CHARLES G. SARGENT, of Lowell, Mass.—*Improvement in Machines for Burring Wool and Ginning Cotton*.—Patent dated June 7, 1859.—In the engravings A represents the frame of a cotton gin, B the improved toothed cylinder, C the fluted guard, D the brush cylinder of the ordinary construction. These several cylinders are carried in suitable bearings in the frame A, and are driven at the proper relative speed, by cog wheels not shown in the engravings.

*Claim*.—A cylinder having spaces between the teeth for the accommodation of the seed, as set forth, in combination with a revolving guard, operating in the manner substantially as described.

No. 24,281.—J. C. CLAPP, of Seneca Falls, N. Y.—*Improvement in Corn Huskers*.—Patent dated June 7, 1859.—The operator is supposed to sit upon the bench A, with one foot on the lever, and to place the ear of corn in front of the concave F, holding the stalk in his right hand and the husks in his left hand. As he draws the but end against the crescent E, which serves as a gauge, a movement of his foot impels the carriage forward, carrying the ear against the point of the horizontal knife L, which severs it from the but and husks. At this moment the fly piece *a* darts forward, throwing the ear suddenly off, while the husks are still held by the left hand, by which means they are stripped entirely off the ear.

*Claim*.—The combination and arrangement of the carriage B, fly clearer *a*, cross lever H, concaves and gauge F E, blade L, and tread lever J, operating conjointly, substantially as and for the purpose set forth.

No. 24,282.—DECIUS W. CLARK, of Bennington, Vt.—*Improvement in Enamel Composition for Bricks, &c.*—Patent dated June 7, 1859.—The following are the proportions of the ingredients which compose this invention: 4 lbs. 11 oz. refined boric acid, 4 lbs. 8 oz. refined oxid of zinc, 7 lbs. 8 oz. calcined ground feldspar, 6 lbs. 9 oz. calcined and ground quartz, 6 lbs. 8 drachms washed Paris white, 1 lb. 2 oz. washed kaolin, or China clay, and  $\frac{1}{4}$  drachm oxid of cobalt.

*Claim*.—The enamel or glaze for pottery ware, or other articles formed of the ingredients and substantially as specified.

No. 24,283.—S. C. COFFIN, of Lawrenceville, Pa.—*Improved Method of Jointing Shingles.* Patent dated June 7, 1859.—This invention consists in the application, to shingle machines wherein a horizontal saw is used, of a separate transverse carriage, on which the sawed shingle is traversed past the saw for the purpose of jointing it.

*Claim.*—So combining with the horizontal saw B that saws the shingle from the bolt the transverse piece J, and carriages K upon it, so that the same saw that cuts the shingles from the bolt may be used for jointing said shingles, as set forth and explained.

No. 24,284.—ENOCH COLVIN, of Poultney, Vt.—*Improvement in Knitting Machines.*—Patent dated June 7, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim*, first, the combination of the needle arm *d* and the iron rim upon the ring *e*, constructed as described, for raising each needle by itself, and completing each stitch before another is begun.

Second. The cylinder *o* for reversing and regulating the motion of the machine while forming the heel and toe.

Third. The combination of the notched wheel *t*, the toothed bar *u*, with its pointer *v*, the cylinder *o*, the elevating arm *n*, the elevating bar S, and cam thereon, and the pin on the wheel *l*, by means of all which the motion of the machine is reversed back and forth, and regulated so as to knit upon a straight hose flaps of the proper form for the heel and toe.

Fourth. The wheel P and the elevating arm *n* combined with the several parts and devices mentioned in the last preceding claim or paragraph, as above described, for setting in motion at the proper juncture the machinery for regulating the formation of the flaps for the heel and toe.

No. 24,285.—DAVID CONLAN, of New York, N. Y.—*Improvement in Light Shades for Billiard Tables.*—Patent dated June 7, 1859.—This invention consists in arranging the shades used over the lights in billiard rooms, &c., in such a manner that all the light is concentrated on the tables, while the space beyond the tables is left comparatively dark.

*Claim.*—As an improved article of manufacture, a shade for billiard tables, &c., having two reflecting parts B<sup>1</sup> B<sup>2</sup>, and otherwise made as shown and described.

No. 24,286.—THOMAS CRANE, of Fort Atkinson, Wis.—*Improvement in Rakes.*—Patent dated June 7, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—Improved harvesting rakes for gathering and elevating cut stalks of grain preparatory to binding the same into sheaves, when the said rake is composed of side handles, gathering fingers and swinging legs, or the equivalents of the same, substantially as set forth.

No. 24,287.—THOMAS DOUGHERTY, of Macon, Ga.—*Improved Lock.*—Patent dated June 7, 1859.—The nature of this invention consists in uniting the hasp and lock in one.

*Claim.*—The employment of the spring tumblers C, D, and E, when constructed and operated in the manner described, in connection with the bolt B, the said springs being detained by the key to let the bolt slide, as specified.

No. 24,288.—DAVID DE PRÉ, of Raleigh, N. C.—*Improved Chain Pump.*—Patent dated June 7, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the endless chain for raising water, composed of the curved detachable links M, when said links are constructed and united in the manner and for the purposes set forth.

Second. Keeping the chain stiff between the upper and lower pulleys by means of projections R on the links, substantially as and for the purpose set forth.

Third. The combination of the curved links M with the peculiarly shaped curved buckets N, when constructed and operated substantially in the manner and for the purposes set forth.

No. 24,289.—WILLIAM B. DUNNING, of Geneva, N. Y.—*Improvement in Railroad Chairs.*—Patent dated June 7, 1859.—This invention consists in using a bed plate on the tie, so shaped with slots and raised portions in connection with clamps, as to hold the rail firmly in its place.

The inventor says: I *claim*, first, the peculiar form of a partly raised and double slotted bed plate, as described.

Second. I claim the peculiar form and position of the clamps, one part of them being confined and borne down on the tie by the weight of the rail and all above it, and the other part, viz., the jaw, resting upon the flange of the rail and holding it fast.

Third. I claim the combination of the several parts, as described, or their mechanical equivalent.

No. 24,290.—JAMES FAY, of Baltimore, Md.—*Improvement in Hydrants.*—Patent dated June 7, 1859.—In operating this hydrant, the handle A is turned down in such a manner as to depress the rod E, the ball F fitting tightly in the chamber P. The lower end of the rod E bears upon the stem *n*, and removes the valve *m* from the bottom of the thimble, the water

then passes in at pipe *z*, up through thimble *H*, and out at pipes *y* and *s*; when pressure is removed from rod *E*, the spring *J*, together with the force of the water, presses the valve *m* up to the thimble, and thus prevents the flow of water.

*Claim.*—The arrangement of the stock *L* and chamber *B*, as constructed with the India rubber ball *F*, rod *E*, opening in the top of box *I*, nut *G*, spring *J*, valve stem *n*, valve *m*, and thimble *H*, the several parts being used and operating conjointly, substantially in the manner and for the purpose specified.

No. 24,291.—WILLIAM FIELD, of Providence, R. I.—*Improvement in Horse Power Machines.*—Patent dated June 7, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—Arranging and supporting a hollow driving shaft, and the driven shaft passing through the driver, substantially as described, whereby both driver and driven shaft turn in the same direction, and both ends of the driver are fully supported by boxes independent of the shaft passing through it, while at the same time the bearing of the shaft passing through the hollow driver will be on the driver only at a point directly opposite its journal, so that any slight displacement of either shaft will not cause them to bind on each other so as to increase the friction of the machine.

No. 24,292.—ARCHIBALD FORD, of Newport, Ky.—*Improvement in Machinery for Opening Old Rope.*—Patent dated June 7, 1859.—This improvement consists in an arrangement for the preliminary opening of the rear ends of the rope.

*Claim.*—The elevated bar *K*, provided with cavities *k k*, arranged in the described relation to the feed mechanism and drum, and operating in combination with the latter, to preparatorily open the butts of the rope, as set forth.

No. 24,293.—GEORGE P. FRICK, of Baltimore, Md.—*Improved Mode of Starting City Railroad Cars.*—Patent dated June 7, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the application of a lever, acting temporarily upon the axle of a railway carriage or other wheeled vehicle, in combination with the pulley and chain, substantially as set forth, and whether the pulley is of uniform or different diameters, as described.

I also claim such lever, in combination with the ratchet wheel and catch, substantially as set forth, in their application to railway or other wheeled vehicles.

I also claim the cord, whereby the lever may be loosened from the catch at the will of the driver, in combination with the said lever and catch pulley and chain, when applied to a railway carriage or other wheeled vehicle.

I also claim the combination of the catch and ratchet wheel with the chain and weight, described in the foregoing specification, whereby the engaging and disengaging of the catch is operated by the motion of the draft bar, substantially as described.

No. 24,294.—FELIX GELIN and CHARLES GELIN, of New York, N. Y.—*Improvement in Legs for Pianos.*—Patent dated June 7, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The glass socket *F*, so mounted in the legs of musical instruments that the escape of sound from the instrument to the floor is checked, without injuring the appearance or endangering the strength or durability of the instrument.

No. 24,295.—T. W. GIBBONS, of Franklin, N. J.—*Improvement in Money Boxes for Stages, &c.*—Patent dated June 7, 1859.—This invention consists in having a drawer or till placed within a box, and arranged with a lever, change sides or plates, supplemental drawers, an alarm or signal, and an index dial, whereby passengers may deposit their fares in a drawer, and take the change therefrom, in view of the driver, without the latter having any control over the money.

The inventor says: I *claim*, first, the box *A*, provided with the drawers *B D*, the former having a flap or door *h* in its bottom, and arranged to operate substantially as and for the purpose set forth.

Second. The change slide or plate *G*, one or more, used in connection with tubes *s*, and arranged relatively with drawer *B*, to operate substantially as and for the purpose set forth.

Third. In combination with the drawers *B D* and change plate or plates *G*, the bell *g*, and index *n* and dial *o*, arranged substantially as and for the purpose set forth.

No. 24,296.—DAVID GLOVER, of Cass township, Schuylkill county, Pa.—*Improved Safety Cage for Coal Shafts.*—Patent dated June 7, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The construction of the cage in two separate sections, separated at the guides, and so connected by hinges at the top of the bottom of the sill that, when the rope or chain used in hoisting breaks or the power ceases to operate, the cage shall open at the top where

the sections are joined, and the height and weight of each section shall operate as a lever and weight to force the iron shoe, on the ends of the sills and pieces B B, powerfully against and into the guides, and by this means entirely prevent the dropping of the cage and car down the shaft.

No. 24,297.—ROBERT GREAVES, of Philadelphia, Pa.—*Improvement in Cleaning Spinning Mule Carriage Tops*.—Patent dated June 7, 1859.—This invention relates to a self-acting apparatus for removing the “fly,” or loose particles of cotton, from the top board of spinning mule carriages; and consists in placing a cloth, made of Canton flannel or other similar material, in such a position that, as the mule carriage board travels to and from the roller beam, the wiper shall collect from its face all the fly that may have collected thereon.

*Claim*.—The described mode of cleaning mule carriage tops, or any mechanical equivalent therefor.

No. 24,298.—W. L. GREGORY, of Theresa, N. Y.—*Improvement in Wind Wheels*.—Patent dated June 7, 1859.—This invention consists in arranging two vanes in such relation to the wings that the position of the latter is regulated according to the force of the wind by the action of the vanes; one of which, the main vane, is placed loosely on the shaft, so that it places itself in the direction of the wind; while the other, the regulating vane, is firmly secured to the shaft, and is kept at right angles to the main vane by a weight, and the shaft is connected with the wings by means of pulleys and chains; so that, when the increasing force of the wind forces the regulating vane towards the main vane, the wings are turned out of the wind, whereby the speed of the wheel is regulated; and that the regulating vane returns to its original position, by the action of the weight as the wind slackens, whereby the wings are turned again so as to be in the most effective position.

*Claim*.—The arrangement of the main vane K and the regulating vane L, to operate in combination with the wings E, substantially as and for the purpose described.

No. 24,299.—ALBERT C. GRISWOLD, of Hartford, Conn., and WAIT R. GRISWOLD, of Durham, Conn.—*Improved Rocking Carriage*.—Patent dated June 7, 1859.—A are the rockers made on a greater or less curve, as circumstances may require; B are the seats or cribs, hung or suspended by the pins C to the rockers A, at a desirable point each way from the centre of the rockers; D is a railway track or framework, upon which it may be desirable to arrange and hold the rockers, or steady and guide them in place.

The inventor says: I *claim* the employment of the rockers A, in combination with the seats or cribs B, as and for the purposes described.

Also, the railway track or framework D, with the cords or rods E, springs F, when used as and for the purpose described.

Also, the employment of the elastic substance H, attached to the rocker, for the purpose as described.

No. 24,300.—JOHN W. HARRIS, of Durhamville, N. Y.—*Improved Paddle Wheel*.—Patent dated June 7, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—Constructing paddle wheels for boats in such a manner that the paddles may be folded laterally upon the frame and the wheel thereby withdrawn from projecting beyond the sides of the boat, or extended at pleasure, whether the boat be in motion or at rest, the paddles H being connected to the framework A and D, substantially as described, and their outer edges of the form shown, the whole operating substantially as set forth.

No. 24,301.—WILLIAM A. HAWKES, of Corinth, N. Y.—*Improvement in Rotating Dumping Cars*.—Patent dated June 7, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The arrangement and combination of the rotating platform C, provided with dumping boxes L, with the shaft K, and gearing D E H b G i i<sup>1</sup> m, and the clutches d j; substantially as herein shown and described, so that the car may be propelled and the dumping boxes rotated by turning shaft K, as desired; all as set forth.

No. 24,302.—HENRY W. HENLEY, of New York, N. Y.—*Improved Mattress*.—Patent dated June 7, 1859.—This invention consists in the employment of a series of serrated sections in the manufacture of a mattress, which sections divide the mattress into compartments and form apertures or perforations running vertically through the mattress, for the ingress and egress of the air.

*Claim*.—The use or employment of the serrated section B B, when the same shall be combined for the purpose specified.

No. 24,303.—J. HERALD and C. B. TOMPKINS, of Trumansburg, N. Y.—*Improvement in Harrows*.—Patent dated June 7, 1859.—This invention consists in arranging two plates with suitable recesses and with a central hole, in such a manner that the same serve to secure the bars which constitute the harrow frame, at those places where they cross each other, by the same nut which secures the tooth to the plates.

*Claim.*—The arrangement of the plates B B<sup>1</sup> with recesses *a a*<sup>1</sup> and *b b*<sup>1</sup>, and projections *c c*<sup>1</sup>, and with a hole in their centre for the purpose of securing the bars A A<sup>1</sup>, and the tooth C, substantially in the manner specified.

No. 24,304.—CHARLES HEWITT, of Trenton, N. J.—*Improved Machine for Moving Iron at the Rolls.*—Patent dated June 7, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The movable floors, platforms, or supports A B, for moving iron or other metal at the rolls while in process of manufacture, constructed and operated as described, or otherwise substantially the same.

No. 24,305.—GIDEON HOTCHKISS, of Windsor, N. Y.—*Improved Machine for Working Butter.*—Patent dated June 7, 1859.—In working this machine the crude butter is placed in the oblong bowl in quantities to suit the size of the machine, with one hand hold of the ladle and the other hold of the lever, when all parts of the bottom is arranged at pleasure with the ladle, which being guided by the hand, the lever being raised carries back the ladle; and when a portion of the butter is before the ladle the lever is brought down, by means of which the butter as compressed against the circular or concave back end and under the cope, moving and compressing the butter horizontally or parallel with the bottom, another portion is forced back and thus repeated until the mass is collected or passed through against the back C, which being the highest part of the machine, the butter milk or other liquids pass off through the pipe I, and the process repeated until finished.

*Claim.*—The combination of the lever stern ladle and oblong bowl by means of the revolving joint, the projecting cope and follower ladle, substantially as described.

No. 24,306.—WILLIAM H. HOWARD, of Philadelphia, Pa.—*Improvement in Loom Temples.*—Patent dated June 7, 1859.—This invention consists of two rollers, each having right and left hand screws, turning in bearings, or steps arranged to yield independently of and in contrary directions to each other, so as to allow the rollers to rise and fall in obedience to the varying tension of the warp caused by the constant opening of the threads at each stroke of the lay, thereby relieving the threads from the tendency to break and the loom itself from excessive strains.

*Claim.*—The rollers D and D<sup>1</sup>, twining in bearing or steps, arranged to yield independently of and in contrary directions to each other, on the opening of the warp threads, substantially as and for the purpose set forth.

No. 24,307.—ENOCH JACOBS, of Cincinnati, Ohio.—*Improvement in the Construction of Prisons.*—Patent dated June 7, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—A secret passage or guard chamber around the outside of an iron plate jail, and between said jail and a surrounding enclosure, constructed and arranged substantially as described for the purposes set forth.

No. 24,308.—JOSEPH K. KILBOURN, of Pittsfield, Mass., and EDWARD E. KILBOURN, of Litchfield, Conn.—*Improvement in Manufacturing Knitted Fabrics.*—Patent dated June 7, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—The new knitted fabric described, composed of columns of stitches oblique to each other, having openings at the places where the oblique columns of stitches diverge, the same being a new article of manufacture.

No. 24,309.—T. E. KING, of West Andover, Ohio.—*Improved Saw Filing Machine.*—Patent dated June 7, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The suspending the file holder upon arms, as herein set forth, so that it is susceptible of adjustment horizontally, vertically, and obliquely, and in combination with the curved faced slot in the holder, as described.

No. 24,310.—JOSIAH KIRBY, of Cincinnati, Ohio.—*Improved Bung Cutter.*—Patent dated June 7, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the mode of pointing the lower or last end cut off the plug or bung by forcing it into a separate dog, made and used substantially and for the purpose described.

I also claim the mode of lifting the plug out of the dog, after it has been compressed, by means of rod G<sup>1</sup>, when operated in the manner and for the purpose described.

I also claim the mode of driving the plug out of the cutter into the compressing dog, by movable rod, as at *a*, Fig. 3, when operating in the manner and for the purpose described.

No. 24,311.—Suspended.

No. 24,312.—ALEXANDER LE MAT, of New Orleans, La.—*Improvement in Adjustable Hammers for Revolving Fire-Arms.*—Patent dated June 7, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—Providing the hammer with a hinged head, so arranged that it shall present the same face in different directions for the purpose of discharging, in succession, different barrels, or a grapeshot pistol and a revolving fire-arm, as may be desired, and providing the same with small lateral wings for locking the revolving chambers in position, in the manner and for the purposes set forth.

No. 24,313.—ALEXANDER LE MAT, of New Orleans, La.—*Improvement in Automatic Fingers for Closing the Vents of Cannons, &c.*—Patent dated June 7, 1859.—This invention consists in providing the front end of the percussion lock with an apparatus made of a piece continuous with the hammer and subject to all the movements of the lock.

The inventor says: I *claim*, first, the apparatus B and B<sup>1</sup>, with automatic finger C, substantially as described.

Second. The inclined plane H, in the manner and purpose described, or, as an equivalent, the inclination of the slot of the percussion lock, for the purpose set forth.

No. 24,314.—JOHN LEMMAN, of Cincinnati, Ohio.—*Improved Machine for Sawing Circular Bevels.*—Patent dated June 7, 1859.—This invention relates to an adjustable rest or plane, upon a pivoted movable carriage or bed, with reference to the concave face of a dished saw, in such a manner that lumber may be sawed at any desired bevel.

*Claim.*—The adjustable rest *e*, hinged to the bed *f*, in the manner described, and adjustable vertically with reference thereto, substantially as and for the purposes set forth.

No. 24,315.—H. J. LOMBAERT, of Philadelphia, Pa.—*Improvement in Compound Railroad Axles.*—Patent dated June 7, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The divided tubular axle A and A<sup>1</sup> and the solid undivided centre piece or mandrel C, when the same are constructed and combined together with each other and with the wheels B and B<sup>1</sup>, so that the two said tubular parts A and A<sup>1</sup> shall project through their respective wheels and form their journals, and also rotate out of contact and independently of each other, substantially in the manner and for the purposes set forth and described.

No. 24,316.—WARREN S. LOW, of Albany, N. Y.—*Improvement in Furnace Grate Bars.*—Patent dated June 7, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The combination of the corrugated and circular removable face piece C with the body A of a furnace grate bar, in the manner and for the purposes set forth.

No. 24,317.—WILLIAM J. LYMAN, of East Hampton, Mass.—*Improved Shoe Sole.*—Patent dated June 7, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the use, or application, or employment of a metallic in-sole to shoes, boots, &c.

No. 24,318.—H. H. LUTHER, of Warren, R. I.—*Improvement in Harvesting Machines.*—Patent dated June 7, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, attaching the finger bar P to the frame J suspended on the shaft K, and fitted between bars J J on frame G, and arranged on shaft H, substantially as shown, so that the finger bar D and sickles may, when necessary, be elevated, placed directly over the main wheel and shaft, as described.

Second. Adjusting the finger bar P and sickles *r r* in a more or less inclined position, in order to cut the grass or grain the desired height, by having the finger bar attached to a circular frame G fitted on the arm of the driving wheel F and secured at the desired point by means of the lever I and projections, or any equivalent fastening.

Third. The arrangement and combination of the frames J G applied to the driving wheel F, in connection with the gearing *w t<sup>1</sup> t<sup>1</sup> u* and *v v*, respectively, on the wheel F, shafts *t t*, and in the frame J, substantially as and for the purpose set forth.

No. 24,319.—ROBERT MARCHER, of New York, N. Y.—*Improvement in Burnishing Mouldings.*—Patent dated June 7, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—Attaching a self-adjusting burnisher I to a reciprocating plate or carriage C, when used in connection with a moulding N suspended and attached to the machine, in the manner as shown, or in any equivalent way, to admit of being acted upon by the burnisher, for the purpose set forth.

No. 24,320.—W. S. MAYO, of New York, N. Y.—*Improvement in Machines for Finishing Bricks.*—Patent dated June 7, 1859.—This invention relates to an improved machine for giving a smooth, even surface to bricks previous to the burning of the same, after they have been properly dried.

*Claim.*—The combination of the box A, plunger B, and plates K, with or without the feed block F, substantially as and for the purpose set forth.

No. 24,321.—CHARLES MCBURNEY, of Boston, Mass.—*Improvement in the Manufacture of India Rubber Blankets or Aprons used in the Printing of Fabrics, Books, &c.*—Patent dated June 7, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* bringing the blanket to a uniform thickness and smooth surface by passing it between a revolving emery roll and a revolving feed roll, so arranged with respect to each other that the surface of the feed roll shall be ground by the emery wheel, as set forth, for the purpose specified.

No. 24,322.—J. W. McLEAN, of Lebanon, Ind.—*Improvement in Rotary Harrows.*—Patent dated June 7, 1859.—This invention consists of the arrangement of the teeth on two harrows, revolving in opposite directions, so that they shall set obliquely to a perpendicular, and their points project out beyond the circumference of the rims of the frame, and the teeth of either harrow clear the teeth of its fellow of any obstructions or trash which may collect on it.

*Claim.*—The combination of the specified obliquely set teeth, with two or more harrow frames revolving in opposite directions, substantially as and for the purpose set forth.

No. 24,323.—SAMUEL J. REEVES, of Philadelphia, Pa., and MONTGOMERY C. MEIGS, of Washington, D. C.—*Improvement in Trusses for Roofs, Bridges, &c.*—Patent dated June 7, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The mode of trussing or stiffening a curved or arch beam or rafter for bridges or roofs by means of tension rods or ties of metal, wood, or other suitable material, connected at their outer ends with the arched or curved beam or rafter at various points, and converging towards and connected together at their inner ends at a point within the space contained between the arc or arched or curved beam or rafter and the straight line joining its extremities, substantially as described and as represented in the drawing and model.

No. 24,324.—JAMES STEBBINS MOODY, of Cincinnati, Ohio.—*Improvement in Sewing Machines.*—Patent dated June 7, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the employment of an endless belt, arranged and operated as described, to carry one or more hooks to draw the thread through the cloth, in the manner described.

I claim the tension collar G, embracing the thread and needle, and operating to hold the thread, in the manner set forth.

I claim alternately holding and releasing the double pointed needle by means of sliding keys *c* and *c*<sup>1</sup>, operating so as to pass through notches *d d* towards the ends of said needle at the proper times, arranged and operating substantially in the manner set forth.

No. 24,325.—M. NEWBAUER and P. ADELMAN, of New York, N. Y.—*Improvement in Apparatus for Drying Glue.*—Patent dated June 7, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The arrangement of a chamber of circular or polygonal form, which is provided with a fan blower, or its equivalent, to which air of the proper temperature is conducted by means of a pipe *b* and tube E, for the purpose of drying the cakes of glue, substantially as described.

No. 24,326.—WILLIAM OLDMAN, of Buffalo, N. Y.—*Improvement in Steam Boilers.*—Patent dated June 7, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The central water space F<sup>1</sup>, in the combustion chamber F, arranged in relation to the annular water space F<sup>2</sup> and to the tubes D, or their respective equivalents, substantially as set forth, for the purpose of inducing an active circulation of the water radially among the tubes, with the advantages explained.

No. 24,327.—STUART PERRY, of Newport, N. Y.—*Improved Apparatus for Exhibiting Stereoscopic Pictures.*—Patent dated June 7, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, a movable frame work for holding a series of stereoscopic pictures, from which the pictures are brought to be inspected and then returned to it again by a mechanism operated by the user, substantially as described.

Second. I also claim bringing each individual picture, or pair of pictures, in succession, to the same point or place, before they are projected from their compartments to be exhibited, by mechanism substantially such as described.

Third. I also claim, in combination with a movable picture holder, a reciprocating carrying frame, that catches each picture, or pair of pictures, in succession, and carries them to the place where they are to be inspected, and returns them to their compartment again, substantially as described.

Fourth. I also claim, in combination with a box or case, containing within it a series of

pictures and mechanism for projecting them from said case, a framework on the outside of said box or case for receiving said pictures, substantially as described.

Fifth. I also claim the slots in the picture holder barrier *f*, and in the box or case, so that the picture, from its compartments in the picture holder, may be projected through both slots or openings to the outside of the box, substantially as described.

Sixth. I also claim the friction brake *t*, or its equivalent, for holding the picture holder and prevent it from moving until started by the crank, substantially as described.

Seventh. I also claim making the frame B, in sections or with an opening, for the purpose of introducing the pictures through said frame into the compartments of the picture holder as well as removing them therefrom, substantially as described.

Eighth. I also claim the clamps, as applied to single or double pictures, for the purpose of strengthening them, preventing their warping or bending, and thus facilitating their passage through the slot, which they must pass through, to the place where they are exhibited, as described.

No. 24,328.—EDWARD L. PERKINS, of Roxbury, Mass.—*Improvement in Machinery for Drying Paper*.—Patent dated June 7, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—A new mode of drying paper, which consists in feeding the paper from a roll outside of the drying chamber, through proper openings, to a series of rollers, arranged as described, and then conducting it over said rollers, vertically, through the apparatus, and subjecting it, during its passage, to a gentle current of heated air, produced by forming inlets at the bottom for the reception of the atmospheric air, which passes up and is heated by a suitable heating apparatus, and escapes readily through apertures at the top, as set forth, and then out of the drying chamber through proper openings to a receiving roller, in the manner substantially as described.

No. 24,329.—JOHN PFAFF, of Philadelphia, Pa.—*Improvement in Tail Pieces for Violins*.—Patent dated June 7, 1859.—This invention consists in a metal tail piece with an eye at one end, and with recesses, and a bar at the opposite end for the reception of the strings; the whole being constructed and applied to a violin.

*Claim*.—The metal tail piece A, with an eye *a*, adapted to the detachable pin *h*, recesses 1, 2, 3, and 4, for the reception of the strings, and with the rib *h*; the whole being constructed and applied to a violin, substantially as and for the purpose set forth.

No. 24,330.—SAMUEL M. RICHARDSON, of New York, N. Y.—*Improvement in Cutting Out Strap Hinges*.—Patent dated June 7, 1859.—This invention consists in constructing dies in such a manner that, as a strip of metal is fed into the press, the first blow punches the screw holes; also a relieving hole, which partially separates the strip at the point where the complete separation afterwards occurs, so that when said strip is slid along a gauged distance for the punches again to operate, a cutter completes the separation of the first hinge from the strip, while a properly formed die cuts the end of the hinge into the desired shape, and the relieving hole, previously punched, coming at the end of the hinge, separates the two pieces of scrap, allowing them to fall freely away from the press.

*Claim*.—The relieving die *d*, in combination with the shaping die *f* and cutter *g*, in the manner and for the purposes specified.

No. 24,331.—JOSEPH HALL ROHRMAN, of Philadelphia, Pa.—*Improved Dust Pan*.—Patent dated June 7, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—As a new article of manufacture, a dust pan, having its bottom corrugated and its back edge seamed over, substantially as described, for the purposes of making the bottom of the pan rigid without extending any brace from the handle, and rendering unnecessary the wiring of the back edge of the pan.

No. 24,332.—CHARLES B. SAWYER, of Fitchburg, Mass.—*Improvement in Furnaces and Stoves*.—Patent dated June 7, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of the closed topped fire pots K, gas or combustion chamber X, fire or draft flues H, small gas openings *e*, and air-heating flues G, in relation to each other, substantially as shown and described.

Second. The arrangement of the horizontal ventilating flue J, ventilating chamber I, and exit ventilating flue O, and right angled draft flue F, in relation to each other and in the top of the furnace, as shown and described.

No. 24,333.—GEORGE SCHOTT and JOHN LOUDON, of New York, N. Y.—*Improved Spring Bed Bottom*.—Patent dated June 7, 1859.—This invention consists of a slat, with a hook at its end, combined with an India rubber or elastic band, passed through eyes on the bedstead; also, in forming projecting bearings on the undersides of the slats, in their middle or

at convenient points, in connection with a peculiarly formed intermediate bearing carrying an elastic strap.

The inventors say: We *claim* the arrangement of the eyes *d d*, elastic cord or strap 1, and hooks 2 2, on the ends of the slats *c c*, substantially as and for the purposes specified.

We also claim the studs 3 3 and 5 5, constructed and acting as specified, to sustain the slats *c c* on the strap or elastic cord 4, as set forth.

No. 24,334.—JOSEPH SEDGEBEER, of Cincinnati, Ohio.—*Improvement in Grinding Mills*.—Patent dated June 7, 1859.—This invention relates to the construction and arrangement of grinding teeth, which form the dress upon the grinding surface of iron mills.

The inventor says: I *claim*, first, constructing the rotating plate A, with the same dress or finish upon its grinding face as that of the stationary plate B, substantially as described, for the purposes set forth.

Second. I *claim* the diamond-shaped teeth *a b c e*, constructed and arranged substantially as and for the purposes set forth.

No. 24,335.—CHARLES W. SEELEY and BENJAMIN F. LOCKE, of Wellington, Ohio.—*Improved Manner of Securing the Bits of Bench Planes*.—Patent dated June 7, 1859.—This invention consists in adjusting a steel bit between the cap and bed piece, which cap and bed piece are similar to the common cap and plane bit now generally used, and usually designated as the double plane bit.

*Claim*.—Stopping the upper end of the interposed bit below the screw, and upsetting it so as to catch into the cross serrations in the bed piece, as set forth.

No. 24,336.—M. SEMPLE, of Philadelphia, Pa.—*Improvement in the Mode of Switching Off Railroad Cars from one Track to Another*.—Patent dated June 7, 1859.—The nature of this invention consists in switching the cars from one track to another by vertical inclined planes, and not by the bearing of the car wheels on the rails alone, as is now done by the movable switch.

*Claim*.—The immovable switch or turnout J P, in combination with the guide bars G, when arranged and operating substantially as described.

No. 24,337.—PETER SHANK, of Jefferson township, Ohio.—*Improved Machine for Raising Water*.—Patent dated June 7, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The combination of the horizontal float wheel, the crank motion, (as produced by the three pins,) which gives six motions of the pump to one revolution of the wheel, and the horizontal double pump, substantially as described, for raising water.

No. 24,338.—DEXTER C. SLATER, of Lawrence, Mass.—*Improvement in Operating Machinery by Dog Power*.—Patent dated June 7, 1859.—This invention consists in the use of an inclined head wheel, shaft, cam, and lever, arranged for applying dog power to the propelling of light machinery.

*Claim*.—The arrangement and combination of the wheel G, shaft F, cam H, and lever I, substantially as and for the purpose set forth.

No. 24,339.—DE WITT STEVENS, of Newark, N. J.—*Improved Cheese Cutter*.—Patent dated June 7, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of the platform B, with the projecting rings *g*, to operate in combination with the corrugated cutting edge of the knife, substantially as and for the purpose described.

Second. The arc D, arranged in combination with the platform B, with the handle C, and with the knife F, so that the cheese on the platform can be cut up in slices of any given weight, substantially as set forth.

Third. The arrangement and combination of the lever I, the link J, and the slide G, for the purpose of operating the knife F, substantially as specified.

No. 24,340.—W. D. TEWKSBURY, of Cuylersville, N. Y.—*Improved Rocking Cradle*.—Patent dated June 7, 1859.—This invention consists in arranging on the side of a cradle a hinged arm with two prongs which rest on the floor, and this arm is attached to the escapement or verge of a clock work, and two escapement wheels, which receive motion from a common clock spring, are alternately arrested by coming in contact with the verge, so that they raise the cradle alternately on one side and then on the other; and that, by this arrangement, a rocking motion is imparted to the cradle.

*Claim*.—The two escapement wheels *h* and *k*, arranged in combination with the verge E and with the arm F, and operating substantially in the manner and for the purposes described.

No. 24,341.—ALFRED TICHENOR, of Newark, N. J.—*Improved Method of Printing Bank Notes*.—Patent dated June 7, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the making bank notes and other engraved plates, or sections of plates, with tongue and groove or dowel joints.

Second. The locking together tongue and grooved bank note or other engraved plates, by a "chase," having its sides formed with tongue and groove or with dowels made to match or correspond to the ends and sides of the tongue and grooved plate, which chase is made in pieces fitted together and furnished with set screws *e e*, substantially as described.

No. 24,342.—RUGGLES S. TORREY, of Bangor, Me.—*Improvement in Bee-Hives*.—Patent dated June 7, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—Providing the troughs in the tops of the comb bars, arranged with the series of conducting tubes for conveying the feed to the troughs, and with apertures or slots for the free exit of the moisture to the condenser, in the manner and for the purpose described.

No. 24,343.—WILLIAM S. WATSON, of Madison, Ind.—*Improvement in Brick Machines*.—Patent dated June 7, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination and arrangement with a stationary pressing block *K*, of an intermittently reciprocating press box, formed with one or more chambers *I J*, and provided with one or more plungers *L L<sup>1</sup>*, having a joint motion with the press box and an independent movement thereto, essentially as and for the purpose set forth.

Second. The combination, with the intermittently reciprocating press box, of the top and bottom holding slides *b b<sup>1</sup>*, or either of them, arranged to move conjointly with the press box and independently of it, substantially as specified.

Third. Mounting the intermittently reciprocating press box with a feed box, having one or more chambers *M M<sup>1</sup>*, essentially as and for the purpose set forth.

No. 24,344.—T. F. WESTON, of Salem, Mass.—*Improvement in Machine for Finishing Leather*.—Patent dated June 7, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination and arrangement of the devices herein described, or their mechanical equivalents, for changing the angle of the tool while the machine is in motion, so as to cause it to operate upon the latter, first with a sharp edge, to take out its inequalities, and then with a dull or blunt edge, to smooth the leather, the successive operations producing the peculiar effect desired, for the purposes as set forth.

Second. The arrangement of devices herein described for giving positive motions to the tool, for lifting it from and holding it down upon the bed, the same consisting of the sliding bar and friction box, operating as set forth.

No. 24,345.—ROBERT F. WHITE, of New York, N. Y.—*Improved Omnibus Register*.—Patent dated June 7, 1859.—This invention consists in arranging a spring platform in such relation to a hand lever, a bell and ratchet wheel, that whenever a passenger deposits his fare on the platform and pulls the lever, the platform flies out so that the driver can reach the money, he being advised of this fact by the stroke of a hammer against a bell. The number of fares received by the driver is registered on the index plate.

*Claim*.—The spring platform *B*, arranged in combination with the hammer *K* and with the index *k*, and operated by the lever *F*, or its equivalent, substantially in the manner and for the purpose specified.

No. 24,346.—JOHN M. WILSON, of Philadelphia, Pa.—*Improved Lock Attachment*.—Patent dated June 7, 1859.—This invention consists in a peculiar arrangement of the parts, in combination with an ordinary lock in such a way as to prevent the lock being picked, and also prevent access to its working parts, so that impressions in wax cannot be taken with the view of constructing keys to fit the lock.

*Claim*.—The arrangement, in combination with a lock *A a* and door *B d*, of the box *C*, keyholes *c b*, wards *e*, guard *E*, plate *F*, pivoted stops *G G h h i i*, and springs *H H*, the whole being constructed and arranged for united operation, in the manner and for the purpose set forth.

No. 24,347.—SAMUEL WISWALL, of Hyde Park, Vt.—*Improved Washing Machine*.—Patent dated June 7, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The arrangement and combination, within the oscillating cylinder *B*, of a receiving chamber *d*, having plates *e e*, and a door *f*, when said door *f* is corrugated on one side and hinged to one of the plates *e*, so that said door *f* may serve as a rubbing board and also as a presser; all substantially as shown and described.

No. 24,348.—JOHN YOUNG, of Joliet, Ill.—*Improvement in Cultivators*.—Patent dated June 7, 1859.—This invention consists in the combination of the screw extension *A*, on the bottom of the standard *B*, with the oblique slotted castings *C C*, attached to the front side of the cross bar *D* of the beam *E*; also, in the combination of the stationary vertically perforated bar *G*, with the adjustable rake or harrow *H*, arranged on a cultivator, whereby

the harrow teeth can be cleared of all obstruction by raising the rake or harrow, so that its teeth rise through the vertical perforations in the transverse bar.

The inventor says: I *claim*, first, the combination of the screw extension A, on the bottom of the standard B, with the oblique slotted castings C C, attached to the front side of the cross bar D of the beam E, substantially as and for the purposes set forth.

Second. The combination of the stationary vertically perforated bar G, with the adjustable rake or harrow H, arranged on a cultivator, substantially as and for the purposes set forth.

No. 24,349.—JOHN G. CLARK, of Augusta, Ga., assignor to Himself, D. G. COLTING, and SAMUEL W. HATCH, of said Augusta.—*Improved Burglar's Alarm Pistol*.—Patent dated June 7, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, a pistol arranged on a vertical suspension guide of a hammer, so that the explosion of its cap and the firing of its charges may be accomplished by concussions of the pistol and hammer, substantially as and for the purposes set forth.

Second. Holding the pistol suspended by the means and in the particular manner described, for the purpose set forth.

No. 24,350.—J. D. CUSTER, of Norristown, Pa., assignor to Himself and J. M. ROBERTS, of Perth Amboy, N. J.—*Improvement in Machines for Tempering Clay*.—Patent dated June 7, 1859.—This invention relates to an improvement in driving or propelling the wheel whereby power other than animal, such as water and steam, may be applied in a simple and economical way.

*Claim*.—The arrangement and combination of the stationary toothed rim O, encompassing the pit A, the frame H, with the gearing *k M l* attached to its outer ends; the pinion *b* of the shaft N gearing into the rim O, and the rod or shaft F connected with the frame H, the hollow shaft *g*, on the shaft B, and the belt *e i*, passing around the pulleys K *f h j*, substantially as and for the purpose set forth.

No. 24,351.—WILLIAM GOODSOE, of Manchester, Mass., assignor to Himself and ISAAC AYRES, of said Manchester.—*Improved Steering Apparatus*.—Patent dated June 7, 1859.—This improvement has for its object to enable the helmsman to secure his helm in position, and again instantly to release it, when required.

*Claim*.—The combination of the toothed segment M, and the curved way P, operating as set forth, for the purpose specified.

No. 24,352.—C. HARRIS and PAUL W. ZOINER, of Cincinnati, Ohio, assignors to Themselves and J. LANGSTAFF, of said Cincinnati.—*Improvement in Stoves*.—Patent dated June 7, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The arrangement and combination of the damper G, chamber *f*, double walled case *a*, and pipe E, substantially as shown, so that the damper G, which pertains to the oven, shall, when drawn out, extend across the bottom of the pipe E, and cause the products of combustion to circulate as described, and when closed, shall permit a more direct draft, for the purposes set forth.

No. 24,353.—GEORGE L. INGERSOLL, of Cleveland, Ohio, assignor to J. E. INGERSOLL, of said Cleveland.—*Improved Apparatus for Heating Water*.—Patent dated June 7, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the double cylinder heater C C, the same being united by the plates G F H I, so as to form the space J J for the ascension of the heat, and by the pipes D E for the passage of the water, the heating space being covered by the cap K, and the parts here named being arranged as set forth.

I also claim, in combination with the two cylinders C C<sup>1</sup>, the ingress pipe O, extending to near the bottom of the cylinder C, the exit pipe O<sup>1</sup>, and the pipe N, in connection with the pipes D E, for the purpose of establishing a circulation and rapid heating of the water.

No. 24,354.—IRA MERRITT, of Abington, Mass., assignor to Himself and L. S. MERRITT, of South Weymouth, Mass.—*Improvement in Shoe Knives*.—Patent dated June 7, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The described knife holder, in combination with an extensible blade, so arranged that as the blade is worn it may be protruded, as set forth, for the purpose described.

No. 24,355.—CHARLES MILLER, of St. Louis, Mo., assignor to HENRY DANFORD, of said St. Louis.—*Improvement in Spirit Gas Burners*.—Patent dated June 7, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The arrangement of the valve over the tube and wick, for the purpose of extinguishing the flame, or regulating its size and altering its direction, in the manner set forth.

No. 24,356.—FELIX MILLER and ALOIS WIRCHING, of New York, N. Y., assignors to FELIX MILLER and H. H. HAYDEN, of said New York.—*Improved Diaphragm for Photographic*

*Cameras.*—Patent dated June 7, 1859.—This invention relates to the manner of operating a number of curved plates placed within a tube in front of the lens, so as to form apertures of different sizes for increasing or diminishing the intensity of light in the camera from the object in taking photographic pictures.

*Claim.*—The arrangement and combination of the plates  $a a^1$ , the notched plate C, and springs  $m$ , as and for the purpose shown and described.

No. 24,357.—JEDEDIAH MORSE, of Canton, Mass, assignor to the S. P. RUGGLES POWER PRESS MANUFACTURING COMPANY, of Boston, Mass.—*Improvement in Power Printing Presses.* Patent dated June 7, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the improvement in the construction of each of the platen rails  $x^3 a^3$ , the same consisting in the chute  $k$ , and a notch or depression  $l$  arranged therein, and with reference to the rollers or tapes, substantially in manner and for the purpose specified.

I also claim the arrangement and combination of the slider R with the operating cam and the pin or stud O on the rocker toggle, such slider being actuated by a foot treddle  $n$ , a spring  $\gamma$ , and the cam  $r$  of the toggle, substantially as described.

I also claim the mode of insuring the return movement of the toggles, and their gradual forward motion, after each impression has taken place, the same being accomplished by the notched wheel  $u$ , or its notch  $x$ , as described.

I also claim the mode of constructing the gears  $a^1$  and  $b^1$  for operating the frisket carrier, viz: with the toothed arcs  $c^1 c^1 d^1 d^1$  and the concave and convex arcs  $e^1 e^1$  and  $f^1 f^1$ , unprovided with teeth, the whole being arranged so as to operate together, substantially as specified.

I do not claim the subject of the United States patent No. 7,205, but I claim the combination of the two, or any other suitable number of wheels  $r^2 r^2$ , lever nippers  $t^2$ , (applied respectively to them,) and their opening and closing bars  $x^2 y^2$ , or mechanical equivalents for such bars, the same being substantially as and for the purpose described.

I also claim the specified mode of constructing each of the nippers  $v v$  for receiving the sheet of paper from the table G, viz: so that each jaw may move away from the other while the upper is being raised, the same producing the advantages, not only of insuring the passage of the lower jaw underneath the sheet of paper simultaneously with that of the other jaw over it, but of both jaws closing upon the paper at one and the same time so as not to lift it out of place.

I also claim the mode of constructing the lower jaw  $g^4$  of each pair of nippers  $v$ , viz: with a lip or bend  $h$  arranged thereon, and for the purpose described.

I also claim the mode of applying and operating each of the points  $l^2$ , viz: hinging or jointing it to the table G, and combining with it a stop  $m^2$  and lever  $k^2$ , or the equivalents therefor, the whole operating or being made to operate substantially as described.

I also claim the improved method of operating the frisket carrier, the same consisting in causing it to descend and pass in an inclined position under the delivering tapes and rollers while the nippers  $v v$  may be approaching the sheet table G, the same enabling the press to be made lower and shorter than when the frisket carrier is moved horizontally under the said delivering tapes or rollers.

No. 24,358.—WILLIAM NOYES, Jr., of West Newbury, Mass., assignor to S. C. NOYES & Co., of West Roxbury, Mass.—*Improvement in Machinery for Cutting Comb Teeth.*—Patent dated June 7, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, in combination with the saw, or the same and its peripheral guide or guides, a mechanism or means of pressing or bending the saw laterally, substantially as and for the purpose specified.

I also claim the mode of producing the lateral and longitudinal movements of the carriage of the comb carrier, viz: by means of the cam and its screw thread periphery, arranged and operating in conjunction with a rack applied to said carriage, substantially as described.

No. 24,359.—LEWIS PLANER, of New York, N. Y., assignor to Himself and JOSEPH AUGER, of said New York.—*Improvement in Machines for Converting Oscillating Motion into Direct Circular Motion.*—Patent dated June 7, 1859.—This invention consists in a novel arrangement of a dog, a lever, and a spring, in combination with each other and the smooth rim of a wheel, whereby an oscillating movement, imparted to the lever by suitable means, causes the dog to operate with certainty to turn the wheel in one direction.

*Claim.*—The grooved dog F, having its tail resting in a recess  $b c$ , or equivalent resting place, in the lever E without being pivoted or otherwise attached thereto, and having a spring G applied in combination with it and the said lever, and the whole being applied and combined with the wheel A and its axle E, substantially as described.

No. 24,360.—THOMAS SHAW, of Philadelphia, Pa., assignor to Himself and JOHN C. BAILEY, of said Philadelphia.—*Improvement in Moulds for Pressing Glass.*—Patent dated June 7, 1859. This invention consists in forming on the plunger of glass moulds a shoulder coinciding with the upper edge of the recess in the base of the mould, and in limiting the downward move-

ment of the plunger, so that vessels or other glass articles pressed in the mould shall have a clear, smooth, and solid edge, and the article shall be invariably of the same thickness.

*Claim.*—Forming on the plunger B a shoulder *f* of a size corresponding to that of the upper edge of the recess in the base A of the mould, and limiting the downward movement of the plunger, so that the said shoulder shall coincide or be slightly below the said upper edge of the recess, substantially in the manner and for the purpose set forth.

No. 24,361.—JACOB J. SMITH, of Philadelphia, Pa., assignor to himself and I. HENRY PUGH, of said Philadelphia.—*Improved Plug Bedstead Fastening.*—Patent dated June 7, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, a double plug fastening for bedsteads, consisting of two distinct parts A and A, so constructed as to be adapted for being driven or secured into the post and rail respectively, and also fitted with a wedge shaped dovetail tenon *d* and a corresponding groove *e*, operating together so as to cause the end of the rail to be drawn tightly against the post in the downward pressure of the said rail after they are connected together, all substantially in the manner and for the purpose set forth and described.

Second. I also claim making the post plug A<sup>1</sup>, with the inclined dovetail groove *g* across in one side of the same, so as to operate in combination with the wedge shaped tenon *e* on the rail plug A, substantially in the manner and for the purpose set forth and described.

No. 24,362.—ANTHONY WALLACH, of New York, N. Y., assignor to Himself and ADOLPH WALLACH, of said New York.—*Improvement in Hooks for Vest Chains.*—Patent dated June 7, 1859.—This invention consists in a clasping hook and bolting pin so fitted that there is no possibility of removing said hook so long as the parts remain perfect without drawing back and unbolting the clasping hook.

*Claim.*—The clasping hook *c*, in combination with the bolt *i*, in the body *b* of the vest chain hook, for the purposes and as specified.

No. 24,363.—PLEASANT ARMSTRONG, of Camden, Ala.—*Improved Washing Machine.*—Patent dated June 14, 1859.—This invention consists in the arrangement of the complete stationary rounds of the convex swing frame on two semi-circular lines of different diameters; also, in the arrangement of the journals of the shaft of the convex swing frame in the slots of the main standards of the box or tub, and in the slots of auxiliary perpendicularly sliding standards, which are arranged in guides against the outside of the main standards and pivoted by their lower ends to a treadle which vibrates up and down.

The inventor says: I *claim*, first, the arrangement of the complete stationary rounds of the convex swing frame on two semi-circular lines of different diameters, so that the rollers on the smallest semi-circle shall stand above and opposite the spaces between the rollers on the largest semi-circle, in combination with the arrangement of the stationary rounds of the concave, substantially as and for the purposes set forth.

Second. The arrangement of two auxiliary treadle standards with the main standards of the tub, in the manner described and for the purpose set forth.

No. 24,364.—JOHN A. BARRINGTON, of Fredericktown, Ohio.—*Improved Machine for Printing Addresses, &c.*—Patent dated June 14, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, a cylinder constructed with grooved ribs, or their equivalents, for holding forms of type, presenting them at a proper point to perform the office of printing, and afterwards allowing them to be delivered from the cylinder, substantially as described.

Second. In combination with the cylinder B, I claim the ribs *k*, arranged upon an endless chain in such manner as to receive the forms of type, as described.

Third. Securing the forms *i* within the ribs *b* in such manner as to present said forms properly for printing by means of the follower *j j n*, catch *j*<sup>2</sup>, and spring *j*<sup>3</sup>, substantially as described.

Fourth. Adjusting the forms of type for printing, and delivering them from the cylinder after printing, by means of a reciprocating bar, operating substantially as described, or its equivalent in effect.

Fifth. The inclined feed wheel W, constructed with adjustable spring conveyors *v v*<sup>1</sup>, and operating substantially as described.

Sixth. Regulating and adjusting the speed of the endless apron T by means of the inclined disk *t*, friction wheel *t*<sup>1</sup>, set screws V<sup>1</sup> V<sup>2</sup> V<sup>3</sup>, and crank screw V, all constructed, arranged, and operating substantially as described, for the purpose set forth.

No. 24,365.—VICTOR BEAUMONT, of New York, N. Y.—*Improved Gauge for Measuring the Pressure of Fluids.*—Patent dated June 14, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, so arranging, respectively, dome-shaped elastic disks of one or more spring chambers in pressure gauges as that the pressure of steam or other fluid within said chamber is indicated by the motion of the disk or plate, which presents its convexity to the pressure.

Second. The manner, substantially as described, of guiding the free end of a spring consisting of one or more chambers, expanding by pressure from within, in order to prevent it from vibrating in any direction but that of its axis.

Third. In pressure gauges with a hollow spring chamber mechanism, I claim partially filling the space inside of chambers with a solid substance or substances, in the manner and for the purposes set forth.

No. 24,366.—JAMES M. BOTTUM, of New York, N. Y.—*Improved Instrument for Measuring the Strength of Watch Springs*.—Patent dated June 14, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—An arbor, having a measuring spring affixed thereto, together with an index, substantially as described, and an attachment for attaching the hair spring to be measured, combined and arranged in the manner and for the purposes set forth, and constituting a ready means of determining the exact force of said hair springs, as specified.

No. 24,367.—WILLIAM OLAND BOURNE, of New York, N. Y.—*Improved Ore Separator*.—Patent dated June 14, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, a sieve bed, in which the opening or openings for the passage of the air or water through it are so contracted as to enforce an uniform action of the air or water through the entire surface of the sieve bed, which may be made of sheet metal, or of any textile material, either separately or in combination, or of their equivalent, as set forth.

Second. The application of a vibrating and shaking motion to a sieve bed, in combination with a blast or current of air or water, in the manner and for the purpose described.

Third. The described adjustable blades for agitating the substance, on the sieve bed and for regulating the discharge of the refuse substances over the front edge of the table, as described.

Fourth. The separation of metals or other heavy substances from ores or other materials, when upon a sieve bed, by the gravitation of the lighter substances towards and over the front or waste edge when acted upon by a current of air or water through a sieve bed, in the manner and for the purpose set forth.

No. 24,368.—E. C. BRACKETT, of Newton Corner, Mass.—*Improved Marine Hand Propeller*.—Patent dated June 14, 1859.—The oars are operated so as to be raised, or plunged into the water, by a lever H, which has its fulcrum near the top of the vertical beam B, the shorter arm of which extends out from the vessel and is pivoted to a connecting rod N, which is carried down and pivoted to a bent arm P, fixed at right angles to the line of the oar blades.

*Claim*.—The arrangement and combination of the adjustable oar B, arms D, oscillating shaft E, hinged blades F, rods G, arms K P, rod N, and lever H, as and for the purposes set forth and described.

No. 24,369.—WILLIAM BRAMWELL, of New York, N. Y.—*Improved Valve*.—Patent dated June 14, 1859.—This invention consists in combining with a swinging valve, a screw slide and connecting link, whereby the said valve can be turned up entirely out of the way of the passing current of fluid or liquid, or pressed down into its seat with the combined power of a toggle joint and screw.

*Claim*.—The sliding nut *k*, actuated by the screw *i*, in combination with the hinged valve *m* and the toggle links *l l*, substantially as specified.

No. 24,370.—JOSEPH FRANCIS BROUARD, of Havre de Grace, France.—*Improvement in Reefing Sails*.—Patent dated June 14, 1859; patented in France, February 2, 1855.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, supporting the rolling yard F (Fig. 12, sheet No. 3) between its points of suspension, by the hook N, the said hook being constructed and operated as described, for the purpose of staying the rolling yard and holding it in position, when the sail attached to it is acted upon by the wind, as set forth.

Second. The construction of the boom iron, shown in Fig. 9, sheet No. 3, for the purpose of placing the boom in position, to prevent the chafing of the sail, as described.

No. 24,371.—ROBERT BROWN, of New London, Conn.—*Improvement in Projectiles for Killing Whales*.—Patent dated June 14, 1859.—This invention consists of the flukes working on a pivot on the shank of the bomb, supported by the ribs and a projection on the flukes inserted into the flange that fits against the barrel of the bomb when screwed together, lines rove through the ribs on the shank at the lower or wad end, with a groove

or indentation along the bomb for the line, that it may be inserted into the gun with the bomb, and at the explosion of the bomb have the shank as a harpoon, with the line attached, in the whale.

*Claim.*—The flukes on the shank of the bomb, the line attached thereto, the groove or indentation in the barrel of the bomb, for the line, as stated.

No. 24,372.—J. S. BUTTERFIELD and SIMEON MARSHALL, of Philadelphia, Pa.—*Improvement in Self Priming Gunlocks.*—Patent dated June 14, 1859.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, the extension *g* on the carrier *c*; in the manner and for the purpose as substantially set forth.

Second We claim disconnecting each primer from the roll, with the raising of the hammer, in the manner and for the purpose substantially as set forth.

Third. We claim the adjustable centre projection *h h* and thumbscrew *q q*, arranged and operated in the manner and for the purpose as substantially set forth.

No. 24,373.—ROGER S. CADWELL, of Andover, Ohio.—*Improved Method of Attaching the Capping to Fence Posts.*—Patent dated June 14, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The projection or tongue *A*, formed on the top of the post, in connection with the mortise *l* in the capping, for attaching the said capping to the post, and securing it by a batten, as described.

No. 24,374.—THOMAS CHAMPION and THOMAS MOTLEY, of Washington, D. C.—*Improved Mode of Fastening Letters to Sign Boards, &c.*—Patent dated June 14, 1859.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim* the placing or casting on the back of letters projections with solid cast or wrought shanks therefrom.

We claim holes in said projections to fasten by screws, nails, or rivets, substantially as described.

No. 24,375.—ISAAC S. CLOUGH, of Brooklyn, N. Y., and SAMUEL R. BURRELL, of New York, N. Y.—*Improved Fly Trap.*—Patent dated June 14, 1859.—This invention consists in constructing a trap for the purpose of catching and retaining flies and mosquitoes

*Claim.*—The combination of the stationary cone, revolving catcher, and start and receptacle, when constructed as described and for the purpose specified.

No. 24,376.—THOMAS CRANE, of Fort Atkinson, Wis.—*Improved Sugar Cane Press.*—Patent dated June 14, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the combination of the pressure rollers *B C* with the main bearing wheel *A* of a frame, which is so proportioned and supported that it can be rotated around a pivot post; but this I only claim when a fluid receiving vessel *a a*, conducting tube *i*, an annular channel *j*, and a delivery spout *k* are combined with the said frame, substantially in the manner and for the purpose represented and described.

No. 24,377.—SAMUEL S. CROCKER and GEORGE E. MARSHALL, of Lawrence, Mass.—*Improvement in Manufacturing Paper.*—Patent dated June 14, 1859.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, the combination of internally heated drying cylinders *a*, with a steam box, or boxes, arranged for the purpose of continuously first thoroughly drying paper, and then superficially moistening it, by the direct application of steam prior to the operation of calendering.

Second. The combination of a steam box or boxes, so arranged as to moisten paper superficially by the steam therein contained, with rolls, which calender by pressure as described.

No. 24,378.—CHARLES CROSSLEY, of Ellington, Conn.—*Improvement in Looms.*—Patent dated June 14, 1859.—My improvement consists in the application to a Brussels carpet loom of a peculiar combination and arrangement of devices, intermediate between the lay and the harness or heddles, the object of which is to throw the worsted or tuft-forming thread to the right and left alternately, over and above the cotton warp threads.

The inventor says: I *claim*, first, the combination of the series of vibrating tuft formers *K K<sup>1</sup> K<sup>2</sup>* and the vibrating reed *G H*, arranged and operating substantially as above described.

Second. The combination of the weights *3* and *4*, the knotted cord and slotted arm *5*, for the purpose of controlling the set-off of the tufting yarn beam, as described.

No. 24,379.—JOHN DAINES, of Birmingham, Mich.—*Improvement in Drain Tile Machines.*—Patent dated June 14, 1859.—The nature of this invention will be understood by referring to the claim and engravings.

The inventor says: I *claim*, first, the bar G and hooks D, in combination with the cross bar E, when used for the purpose of opening the lid C, automatically, as described.

Second. I claim the bar B combined with the frames M, in the manner mentioned, with the levers L, for cutting off the tile by the returning of the plunger.

No. 24,380.—HORACE B. DAVIS, of Lexington, Mass.—*Improved Horse Bracket*.—Patent dated June 14, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The improved mode of fastening and confining it to the foot, by having the points of attachment bear directly upon the shoe, so as not to injure the ankle or fetlock by galling on the hoof by compression, and also the machinery by which the bracket is adjusted to the size of the foot, and held more firmly and securely than by any other mode of attachment now known.

No. 24,381.—E. R. DENNISTON, of Middletown, N. Y.—*Improved Milk Can*.—Patent dated June 14, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—As an improved article of manufacture, a milk can, having its cover C hinged to a flanch *f*, and provided with a plate *h*, stopper *k*, and having the guard hoop B attached to the body of the can *b*, all as shown and described.

No. 24,382.—PATRICK S. DEVLAN, of Reading, Pa.—*Improved Churn*.—Patent dated June 14, 1859.—G is the float, which consists of a wooden disk, perforated and having projections *g*, the whole so formed as to float and move up and down with the mass of cream when disturbed, and have many projections and surfaces to collect the particles of butter as they are formed.

*Claim*.—The employment in a churn, in which the cream is acted upon by a blast only of a float G, substantially as and for the purpose described.

No. 24,383.—CHRISTIAN H. EISENBRANDT, of Baltimore, Md.—*Improvement in Attachments to Locomotive Engines, for Removing Objects from the Track*.—Patent dated June 14, 1859.—This improvement consists in attaching to the front of a locomotive engine a suspension net work fender, connected with a lifting platform, provided with a hinged part or frame, forming a compound device, and having a stuffed cushion or inflated sack deposited thereon. This is intended to preserve life and remove obstacles from the track.

*Claim*.—The double suspension lifting platform, composed of the parts *c c c<sup>2</sup>, d d, e e, ff, gg, hh, J J, K K, L L, m m*, the yielding net work or flexible fender guard, or its equivalent *iii*, when constructed, combined, and arranged substantially in the manner set forth and described.

No. 24,384.—CHARLES FOSTER, of Eldridge's Hill, N. J.—*Improvement in Operating Switches on Railroads*.—Patent dated June 14, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—The mode of operating switches by means of movable cams *i i*, or their equivalents, on the car, acting on a cam A, or its equivalent, connected by means of levers with the switch rail *c*, substantially as described.

No. 24,385.—H. B. GILL, of Ogden, N. Y.—*Improvement in Machines for Dressing Millstones*.—Patent dated June 14, 1859.—The arm *o* works on a longitudinal slot in the lever and is pivoted at *h*. The opposite extremity is formed of the segment of a circle, and passes through the end of the slide plate N. As the arm forms the place of contact with the cam M in actuating the lever G, the raising or lowering of it diminishes or increases the force of the blow, which is given in part by the aid of the lever and pick in falling.

*Claim*.—The combination and arrangement of the pivoted segmental arm O and slide N with the striking lever G and cam M, or its equivalent, substantially in the manner and for the purpose set forth.

No. 24,386.—THOMAS I. GOFF, of Warren, R. I.—*Improvement in Machines for Making Hay*.—Patent dated June 14, 1859.—This invention consists in the use of a gathering and a revolving rake fitted in a frame, which is mounted on wheels and arranged and combined, whereby the grass, as it is left by the mowing machine, may be expeditiously turned for the purpose of being properly cured.

*Claim*.—The combination of the gathering rake D and revolving rake E, when arranged for joint operation, substantially as and for the purpose set forth.

No. 24,387.—GEORGE D. GREENLEAF, of Chateaugay, N. Y.—*Improvement in Ventilators*. Patent dated June 14, 1859.—The object of this invention is to ventilate apartments that are heated by stoves, by allowing the impure air to escape into the pipe of the stove by which the apartment is heated, the impure air escaping through the stove pipe with the products of the combustion of the stove.

*Claim.*—In combination with the cylinder A, bell shaped casting G and plates B D, the cup J, and register *f*, for the purpose specified.

No. 24,388.—DEXTER D. HARDY, of Cincinnati, Ohio.—*Improvement in Rotary Engines.*—Patent dated June 14, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of the rings  $e^1 e^2 e^3$ , operating in the described combination with the pipes *s s*, to pack the revolving shaft C in its connection with the stationary cylinder A, by the use of steam or water pressure, as explained.

Second. The combination and arrangement of the revolving shaft C, containing the receiving and discharge ports J K, with the stationary cylinder A B and valves E E, substantially as described.

No. 24,389.—HENRY HERSH, of Lancaster, Pa.—*Improvement in Horse Rakes.*—Patent dated June 14, 1859.—C is the frame which is attached to the axle to support the shafts D, cleaner frame E having an eye G formed by a clip surrounding the end of the frame, in the eye of which the axle B revolves; H are the teeth, which are of steel, one end on the one side of the axle bent downwards, and the opposite end bent upwards, or reversed, so as to form a letter S; the teeth are fastened to the axle by ordinary screws and staples, and revolve with the axle.

*Claim.*—The arrangement and combination of the S shaped teeth H, lock I, revolving axle B, and clearers M, as described and for the purposes set forth.

No. 24,390.—HENRY CHARLES HOWELLS, of New York, N. Y., and JOSEPH CHARLES HOWELLS, of Madison, Wis.—*Improved Omnibus Register.*—Patent dated June 14, 1859.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, the employment of a yielding platform to determine the value of the entry or fare, and, in combination with doors or equivalent devices, to secure the registration of persons standing upon it, previous to their ingress or egress, substantially as specified and set forth.

Second. We also claim the employment and use of the circular or segmental doors, or equivalent devices, having within the area of their action a yielding platform, operating substantially as set forth and specified.

Third. We claim, in combination with the yielding platform G, an operative lever N and vertical rod M and puppet Q, or their equivalents, substantially as set forth and for the purpose specified.

Fourth. We claim the pin or bolt *s*, in combination with the arm O, attached to the vertical rod M, or their equivalents, for communicating motion to the registering levers S and T, by the action of the jointed arm P, substantially as specified and set forth.

Fifth. We also claim the registering levers S and T, operated as set forth, or their equivalents, and in combination with the registering ratchet wheels U and V, and the spring pawls *m m*, together with the double dial X, for registering the whole or half entries or fares, substantially as set forth and specified.

Sixth. We also claim the stationary brushes, and the arrangement and combination of levers and rods, or their equivalents, for operating the doors and steps, substantially as set forth and described.

No. 24,391.—SOLON P. HUBBELL, of Unadilla, N. Y.—*Improvement in Sowing Machines.*—Patent dated June 14, 1859.—This invention consists in the arrangement and combination of devices for the purpose of sowing plaster, lime, and various kinds of grain.

The inventor says: I *claim* the combination of the bar I, having teeth W, angular notches X, and clearers V, with hopper D, its pins Y, and slide blocks O; the whole being constructed and arranged as and for the purpose set forth.

I also claim, in combination with the hopper D, pins Y, slide blocks O, and regulating plate E, the reciprocating bar F, with its clearers R R<sup>1</sup> and stirrers S; these several devices being constructed and arranged for operation conjointly in the manner and for the purpose described.

No. 24,392.—RICHARD HUMPHREYS, of Jonesborough, Tenn.—*Improved Tuning Key Board.*—Patent dated June 14, 1859.—This invention consists in combining, on a neat rectangular board, any desired number of octaves of properly tuned reeds, similar to those used in melodians, to represent a corresponding number of octaves of the natural scale of musical notation for the white keys of the pianoforte, and another set of correctly tuned reeds representing the semi-tones of the octaves first named for the black keys of the pianoforte, in such a manner as to enable the musician, by comparing the tones of his instrument with those of the key-board, to detect and correct the least departure from the correct tone.

*Claim.*—As a new article of manufacture, the described compound tuning reeds, necessary to represent the corresponding keys in the general scale of musical notations, substantially as described.

No. 24,393.—HENRY L. KENDALL, of Providence, R. I.—*Improvement in Wood Screws.*—Patent dated June 14, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* a wood screw, having a thread of a ratchet tooth shape, in combination with wide spaces between the convolutions thereof, on a stem cylindrical, or nearly so, and on a point of any suitable form; substantially as set forth.

I also claim making the threaded point of a wood screw in such a manner that the thread thereof (except the terminal convolution) shall be of the same, or nearly the same, depth on its upper and lower sides, to give the screw a firmer hold of the wood, especially on its first entrance, than it would have if the threads on the point were made of gradually less depth toward the apex, substantially as set forth.

I also claim so forming the thread of a wood screw that it shall be of the same depth on the upper and under sides, on the point and on the stem, (except the terminal convolution of the point, which is contracted rapidly in depth and width,) substantially as set forth.

No. 24,394.—DANIEL LEAVITT, of Chicopee, Mass.—*Improvement in Breech Loading Fire-Arms.*—Patent dated June 14, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—Effecting the locking and unlocking of the upwardly opening breech, and the starting of the same from its seat to open it, by means of a detached lever having a locking dog *f*<sup>1</sup> to enter a notch in the breech, and a toe *g* to act against the bottom of the breech, substantially as described.

No. 24,395.—JAMES S. McCURDY, of Brooklyn, N. Y.—*Improvement in Sewing Machines.*—Patent dated June 14, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of a reciprocating needle with a pair of loopers, or their equivalent; the combination as a whole operating in such manner that each successive needle-loop is encircled by a tight coil of the thread of the preceding loop, substantially as described.

Second. The combination and arrangement of two loopers, substantially such as described, with a driver, operating substantially in the manner and for the purpose described.

Third. Constructing and operating one of the loopers in such manner that a supplementary movement is imparted to it while the other is at rest, for the purpose of tightening the stitch.

No. 24,396.—H. T. MERRILL, of Galena, Ill.—*Improvement in Musical Instruments.*—Patent dated June 14, 1859.—This invention consists in the employment, in combination with a vertically sliding name board, or board occupying the usual position of the name board, of a pianoforte or other keyed instrument, extending the whole length of the key board, of a fixed board called the gamut board, having represented upon it the base and treble staves, and the indicating letters of the notes arranged above their respective keys; said staff board being so arranged behind the name or its equivalent as to be exposed by sliding up, and concealed by sliding down the last mentioned board.

*Claim.*—The gamut board *C* applied above and behind the keys, in combination with a sliding name board *B*, or its equivalent, substantially as specified.

No. 24,397.—RUFUS S. MERRILL, of Lynn, Mass.—*Improvement in Lamps.*—Patent dated June 14, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—In coal oil burners of otherwise ordinary construction, the combination with a flat wick tube, of the removable director, constructed as described, with inclined side walls and vertical ends, the latter being corrugated or grooved to fit the ends of the wick tube, as a means of securing the director to the wick tube, and for directing or conveying the heated vapors mixed with atmospheric air to the sides of the flame, substantially in the manner and for the purpose set forth.

No. 24,398.—LEMAN C. MINER, of Hartford, Conn.—*Improvement in Hanging Carriage Bodies.*—Patent dated June 14, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the application of the double jointed shackle *H*, to the front axle, whereby the vertical position of the spring and axle is sustained, and the fifth wheel and appendages dispensed with.

Second. The back axle braces with double joints *B B*, to admit a free and easy vertical motion of the springs and supporting the axle in its upright position, substantially in the manner as described.

No. 24,399.—ELY MOORE, of Slabtown, S. C.—*Improvement in Ploughs.*—Patent dated June 14, 1859.—This invention consists in attaching to the common plough beam *A* of wood, an elongated iron brace *B*, terminating at one end in a clevis *C* at the end of the beam, and at the other in an iron foot *D*, which takes the place of the wooden foot *E* in the common plough.

*Claim.*—The arrangement of the beam A, brace B, clevis C, foot D, stock E, and ring F, the whole being constructed as described for the purposes specified.

No. 24,400.—JAMES D. OSBORN, of Constantine, Mich.—*Improvement in Machines for Binding Grain in Bundles.*—Patent dated June 14, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—A binding knot composed of three loops passed through each other, when said passing of the loops through each other is effected by machinery driven or moved from any of the moving parts of a harvesting machine, and whether accomplished by the means herein stated, or by their substantial equivalents.

No. 24,401.—DUBOIS D. PARMELEE, of New York, N. Y.—*Improvement in Vulcanizing Caoutchouc.*—Patent dated June 14, 1859.—In preparing the composition used in this invention the inventor says: I take caoutchouc, or gutta percha, or their compounds, masticated and mixed with sulphur, according to any convenient method known or practiced heretofore, and after shaping the same into any desired form, I immerse it in a solution either of the coal of naphtha, bisulphuret of carbon, chloroform, or sulphuric ether, saturated with bromine.

*Claim.*—The preparation and use of the ingredients described with bromine, whether combined or not with sulphur, substantially as described and for the purposes set forth.

No. 24,402.—A. P. PITKIN, of Hartford, Conn.—*Improved Steam Pressure Regulator.*—Patent dated June 14, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the forming a connection with the reduced pressure pipe or chamber A, and diaphragm spring or piston B, or their equivalents, for the purpose of opening and closing a passage C, between the high and reduced pressure pipes or chambers A and D, as and for the purpose described.

Also, the combination of passage C, piston or valve E, rod I, lever F, diaphragm spring or piston B, and safety valve H, arranged to operate in relation to each other as and for the purpose described.

No. 24,403.—R. B. PRINDLE, of Coventry, N. Y.—*Improvement in Devices for Securing the Clevis to Ploughs.*—Patent dated June 14, 1859.—This invention consists in a method of fastening clevises to plough beams.

*Claim.*—The arrangement of the pin C, feather or rib *c*, spaces *e e*, clevis B, beam A, and groove *a*, as described, for the purposes set forth.

No. 24,404.—JOSEPH HOFFACKER and JOSEPH RICHARDS, of New York, N. Y.—*Improvement in Keys, &c., for Piano Fortes.*—Patent dated June 14, 1859.—This invention consists in improvements of the finger keys and of the action of the piano forte.

The inventors say: We *claim*, first, the construction of the key board, by substituting, instead of the usual keys, knobs connected with the main levers, substantially as described.

Second. The pivoted rod *a*, in combination with the main levers *m*, substantially as described.

Third. The construction of the damper O, substantially as set forth.

Fourth. The construction of the trigger *n*, and its action on the damper O, substantially as described.

Fifth. The construction of the hammer *s*, and its action in combination with the principal lever *m*, substantially as described.

No. 24,405.—DANIEL J. RIKER, of Harlem, N. Y.—*Improvement in Clips for Carriage Thills.*—Patent dated June 14, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—Extending the plate *c* of the carriage clip, in the form of a spring, to the eye of the shafts, and causing said spring to operate on the aforesaid eye, in the direction of the pull, to keep the parts of the bolt and eye in contact, for the purposes and as described.

No. 24,406.—JOHN N. SAWTELL, of Chicopee, Mass.—*Improvement in Speeder and Stretcher Flyers.*—Patent dated June 14, 1859.—A description of this invention is too long for a place in this publication. (See engravings and specification.)

*Claim.*—The new article of manufacture described for a flyer for spinning frames, when constructed essentially in the manner and for the purposes set forth.

No. 24,407.—NOAH SEITZ, of Mellmore, Ohio.—*Improvement in Ventilating Corn Houses.*—Patent dated June 14, 1859.—This invention consists in a certain combination of devices, whereby a free passage of air through the body of the corn is obtained, and rats and other vermin excluded.

*Claim.*—The arrangement of the openings O and O<sup>1</sup>, with the wire grating, in combination with the secondary perforated floor *d*, lathing *c*, and ventilator *f*, substantially as and for the purposes set forth.

No. 24,408.—ALEXANDER SHOEMAKER, of Carey, Ohio, assignor to JAMES G. HUNT, of Reading, Ohio.—*Improved Saw Set*.—Patent dated June 14, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the adjustable arm O, with the fingers and adjusting screw, in combination with the spring trip hammer.

I also claim the spring I, and the trip hammer, in combination with the adjusting frame L, and rollers N N, and adjusting screws; these several devices I claim, when arranged substantially as set forth for the purposes described.

No. 24,409.—ISAAC C. SHULER, of Amsterdam, N. Y.—*Improvement in Constructing Sheet Metal Coffins*.—Patent dated June 14, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of strengthening the lower part of a sheet metal coffin, by folding over and soldering together, consecutively in several thicknesses, the surplus metal of the sides and ends of a sheet metal tray *c*, forming a rim all round the outside circumference of the base, and fastening the walls of the coffin firmly thereto. I claim, also, the arrangement of fastening to the under side of this tray, or bottom of the coffin, the frames *b b*, for the purpose of stiffening it.

Second. The arrangement of placing on the inside of a sheet metal coffin a metal tray *d*, with scrolled edges, which rests on a flange formed by turning in the walls of the coffin all round their lower edges, and fastening this tray firmly thereto and also to the walls, for the purpose of strengthening the structure. I also claim the bars *b*, for strengthening this tray.

Third. The arrangement of scrolling, or folding outwardly, and soldering, consecutively, each fold of the surplus edges of the walls of a sheet metal coffin, forming a rim all around the upper edge of the walls, for the purpose of strengthening and securing the same in straight lines for jointing, substantially as described.

Fourth. The arrangement of forming on the inside of the upper edges of the walls of a sheet metal coffin, a scrolled rim on the piece *e*, for the purpose of more firmly supporting the air tight cover, and also for the purpose of securing the cover by screws as well as by solder when desirable.

Fifth. The arrangement of fastening on the outside of a sheet metal coffin between the stiffening rims of the upper and lower edges of the walls, the studs or pillars *o*, at the corners and along the sides and ends in any required number, according to the size of the coffin, for the purpose of stiffening the sheet metal, in order that the structure may sustain a heavy weight.

Sixth. The arrangement of scrolling and soldering together the surplus edges of the air tight cover of a sheet metal coffin, and beading the same, which, on being turned under, serves to fit the grooves *i*, as well as to stiffen the cover; also the stiffening bars *b*, substantially as described.

Seventh. The arrangement of pressing a recess in the sheet metal all round the windows of a sheet metal coffin for receiving and supporting the glass. I also claim the arrangement of supporting the glass, by a flange formed by the extension of a second inside sheet of the double cover.

Eighth. The arrangement of fastening the glass in these recesses, by means of metal sashes fastened to the coffin lid, as described.

Ninth. I claim the flanges formed on the outer edges of the sheet metal blinds *m m*, for the purpose of closing around the metal sash, and securing the glass from the intrusion of dust and from other annoyances.

Tenth. I am aware that I have claimed the bisection of a hinged cover for the joint of the lid of a sheet metal coffin, according to the brakes in the side walls; I claim the cover *j*, as applicable to a coffin with straight side walls, in two hinged sections, as described.

No. 24,410.—ANDREW SIMMONS, of Nora, Ill.—*Improvement in Seeding Machines*.—Patent dated June 14, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The arrangement of the boxes T, in relation to the agitators C, plates N and O, and in combination therewith the hollow drill tooth V, the several parts being so constructed as to form a broad cast seed planter and drill.

No. 24,411.—AZEL SMITH, of Westfield, Ohio.—*Improvement in Cultivators*.—Patent dated June 14, 1859.—This combined plough and cultivator is so constructed that it may be readily changed from one form of cultivator to another, or to several kinds of ploughs.

*Claim*.—The adjusting brace plates C C, frames B B, and cutters D D, when arranged as described, and in combination with the adjustable mould boards.

No. 24,412.—JOHN M. SPOONER, of Springfield, Mass.—*Improvement in the Construction of Sled Runners*.—Patent dated June 14, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—Making both of the runners and the bearers of a sled or sleigh, or other similar vehicle, of one continuous piece or rod of steel or other metal, substantially as set forth.

No. 24,413.—ENOS STIMSON, of Plainfield, Vt.—*Improvement in Seeding Machines*.—Patent dated June 14, 1859.—The inventor says: By this invention two different kinds of seed may be sowed simultaneously, one broadcast and the other in hills or drills. Turnip seed, for instance, may be sowed broadcast, while wheat or rye is sowed in drills, and either the broadcast distributor or the other may be used separately, when desired, by throwing the respective driving parts out of gear.

*Claim*.—The arrangement and combination of the shaft F, box E, shaft M, arm O, and box N, as and for the purpose shown and described.

No. 24,414.—WILLIAM MONT STORM, of New York, N. Y.—*Improvement in Breech Loading Fire-Arms*.—Patent dated June 14, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim* such an arrangement of the links, as described, and their connection with the breech piece and lever, that they shall jam forward and firmly hold the former against the rear of the bore of the barrel after it has ceased its motion transversely to the latter, and, *vice versa*, release the breech piece (in opening the breech) before its momentum commences.

Second. I claim the perforated breech piece, in the manner and for the purpose described.

Third. I claim arranging the horn or head of the hammer, in the manner and for the purpose described.

No. 24,415.—R. SUTTON, of East Avon, N. Y.—*Improvement in Running Gear of Sleds*.—Patent dated June 14, 1859.—The back bolster F is braced at each end by a rod *o*, said rod being attached to opposite sides of the collar G, and the front ends of the back runners are connected by the curved rods *p p* with the collar G, said rods being pivoted to the collar, and having journals *q* at their back ends, which are fitted loosely in the back runners.

*Claim*.—The arrangement and combination of the sliding collar G, rods *o*, reach E, sliding bolster F, pendants *i*, links *j*, and runners B, as shown and described.

No. 24,416.—ISAAC C. TATE, of New London, Conn.—*Improved Stop Cock*.—Patent dated June 14, 1859.—This invention consists in the application of a spring, or its equivalent, placed in the centre division to raise the package or valve from its seat.

*Claim*.—The application of the spring A, in the manner substantially as set forth and described, and for the purpose described.

No. 24,417.—LEWIS C. TERRY, of Chenango, N. Y.—*Improvement in Whiffletree Hooks*.—Patent dated June 14, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim* a hook, pivoted or hinged to its supporting eye, which is cut away or flattened on its back, in the manner described, so that the point of the said hook, being in contact, or nearly so, with its said holding eye, will securely confine a link, a ring, a staple, a trace, or similar object, in all positions, excepting when turned back upon the said flattened or eccentric part of the eye, substantially as set forth in my description.

I also claim the right, in addition to the above, to so construct the hook and eye that the hook shall have but one motion, viz: a horizontal motion directly around the circle formed by the said eye, so that the said hook shall not drop or work from side to side; and the exclusive right to use the same in either or both the forms above mentioned and described, for all purposes for which they may or can be used, when constructed substantially as set forth.

No. 24,418.—JOSEPH THIRLWELL, of Galesburg, Ill.—*Improvement in Cultivators*.—Patent dated June 14, 1859.—At the extreme end of the frame A, a chain is passed over the tongue and fastened to the frame on each side, for the purpose of raising the cultivator from the ground when a change of position is required. Upon the underside of the frame are six teeth, three on each side, with shanks passing up through the frame and secured by nuts at the top. Also a brace extends back from each tooth and is secured to the frame by a bolt or otherwise.

*Claim*.—The arrangement of the frame A A, the iron bows B B, the hinge bow C, the tongue braces D D, and fitting chain F, when constructed and used in combination for the purposes set forth.

No. 24,419.—FRANKLIN VEAL, of Hallettsville, Texas.—*Improvement in Seeding Machines*.—Patent dated June 14, 1859.—This invention consists in arranging the hopper box and a harrow and smoothing roller in such a manner that all of them, or each for itself, can be operated from the driver's seat, the hopper box being hinged and provided with a lever, whereby the box can be brought in such a position that the flapboard or valve is not opened by the cam, or that the same is opened for the purpose of discharging seed, and the harrow is suspended from a rope or chain in such a manner that the same can be lifted clear from the ground by means of a hand lever.

The inventor says: I *claim*, first, the arrangement of the windlass K, the hand lever H,

and the lever N, in combination with the smoothing roller L, the hopper F, and the harrow M, and in such relation to the driver's seat I that they can be operated from the same, substantially as and for the purpose described.

Second. The combination of the fan cylinder  $ff^1$  with the hopper, substantially as and for the purpose described.

No. 24,420.—DAVID WARREN, of Gettysburg, Pa.—*Improvement in Railroad Car Couplings* Patent dated June 14, 1859.—This invention consists in the employment of a rock shaft beneath one of the trucks, to which are attached depending arms, which, by contact with the rails in event of the departure of the car from the same, will turn the shaft and lift the other arm connected with the coupling bolt, so as to separate the cars.

*Claim.*—The arrangement of the adjustable plate  $a$ , as constructed with the pin  $b$ , arm A, rock shaft R, and guards B when the same are operated and used substantially in the manner and for the purpose set forth.

No. 24,421.—LYMAN WHITE, of Davenport, Iowa.—*Improvement in Rock Drills.*—Patent dated June 14, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, placing the bearings  $e$  of the shaft D, to which the box M and drill carriage N are attached, in bars C C, which are fitted in annular parts  $c$  of the supports B and arranged substantially as shown, so as to admit of the facile adjustment of the drill P to any angle or position required.

Second. The employment or use of the racks E on the bars C C, in connection with the wheels F G on the shaft D, the screws H attached to the sliding bearings  $e$  by the bars  $f$ , the wheels I on the upper ends of the screws H, and the pins  $o^1$  on the cranks J, the whole being arranged substantially as shown, to feed the drill to its work.

No. 24,422.—GILBERT YATES, of West Dresden, N. Y.—*Improvement in Car Couplings.*—Patent dated June 14, 1859.—The inventor says: To use my invention, put the coupling link into one of the coupling pieces of one car, then take hold of the downward part of the rod B and turn it upward, thereby raising the coupling pin up; then run the cars together and let loose the rod, and the coupling pin will drop into its place and the cars will be coupled together.

*Claim.*—The combination of the chains H H, clasps J J, with the bent and lifting rods B B, grooved parts C C, and chains H, arranged in relation to each other, substantially in the manner and for the purposes set forth.

No. 24,423.—WILLIAM ZIMMERMAN, of Quincy, Ill.—*Improvement in Grain Hulling Machines.*—Patent dated June 14, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The conduits arranged to receive the grain scoured or operated upon by the first or each revolving scourer, when operated on a horizontal shaft, and conduct it to the centre or central part of the second or next revolving scourer, and so on in succession through the whole series of scourers, until it passes out of the machine.

No. 24,424.—DANIEL D. BADGER and WILLIAM S. SAMPSON, of New York, N. Y., assignors to DANIEL D. BADGER, aforesaid.—*Improvement in Grain Bins.*—Patent dated June 14, 1859. The lower part of the bins A rest upon arches B C, composed of brick, stone, or iron, which arches are placed one above the other, the upper surface of the upper arches B being so fashioned as to form conical bottoms for the bins, and also conical bottoms for the spaces  $A^1$  between the bins. The centres of these conical bottoms are provided with apertures D through which the contents of the bins and spaces are discharged, the apertures being provided with suitable valves for that purpose.

*Claim.*—The arrangement and combination of the metallic bins A, in the manner and for the purposes substantially as shown and described.

No. 24,425.—JOHN E. COFFIN, of Portland, Me., assignor to A. F. GERRISH, of said Portland.—*Improvement in Machines for Shaping the Backs of Books.*—Patent dated June 14, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of the sliding holding jaws and the reciprocating roller carriage, substantially as described.

Second. Combining the toggle mechanism which operates the clamping jaws and the screw which operates the roller carriage with a cam and pulley, or its equivalent, on the same shaft, in such manner as to make a machine for shaping the backs of books, which is perfectly continuous and automatic in its operation, and to and from which the books only require to be introduced and removed by the attendant at the proper stage in its operation, substantially as described.

No. 24,426.—JOSEPH W. COX, of Malden, Mass., assignor to HORACE H. DAY, of New

York city.—*Improved Machine for Cutting India Rubber into Threads.*—Patent dated June 14, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, in combination with the concave rotary cutter, substantially as described, the employment of a tube placed in the concavity thereof, substantially as described, for the discharge of a jet of water against the cutting edge, as described.

Second. I also claim the carriage, with its divided clamps and follower, substantially as described, in combination with a rotary cutter, substantially as described, or any equivalent cutter, for the purpose set forth.

Third. And, finally, I claim, in combination with the carriage, clamp, and follower, the mechanism, or any equivalent thereof, for operating the follower, substantially as described.

No. 24,427.—DANIEL DUNHAM, of Pawtucket, R. I., assignor to D. D. SWEET, JAMES BROMILY, and E. W. FRENCH, of said Pawtucket.—*Improved Machine for Boring Blind Slats.*—Patent dated June 14, 1859.—This invention consists in arranging a rack made of a series of converging slats, in such relation to the sliding carriage on which the blind slats or other similar articles are fastened for the purpose of laying out the spaces for holes or mortises, that the length of these spaces can be regulated by moving the rack in or out, and that the carriage can be adjusted by means of a suitable gauge to correspond to different spaces; and the sliding carriage is arranged in such relation to the boring or mortising machine, that by the operation of the treadle which serves to depress the augur or chisel, the dog which retains the rack in its position is released and allowed to follow the action of a weight, and to move the distance of one space.

The inventor says: I *claim*, first, the rack J, or its equivalent, arranged in combination with the sliding carriage F, and with the dog o, as described.

Second. The lever M, arranged with the nose  $p^1$ , in such relation to the treadle D, that by its action the dog o is operated, as specified.

No. 24,428.—BENNET HOTCHKISS, of New Haven, Conn., assignor to Himself and F. S. COLLINS, of said New Haven.—*Improvement in Trip Hammers.*—Patent dated June 14, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* my improved means of operating the hammer; that is, by an air spring cylinder, substantially as described, or its equivalent, applied to the piston and combined with mechanism, by which a rapid reciprocating rectilinear motion may be imparted to such cylinder, essentially in manner and so as to operate the piston and hammer as specified.

I also claim, in combination with the piston trip hammer, the air spring cylinder and the mechanism for imparting to the latter reciprocating rectilinear motions, as described, mechanism substantially as specified, for varying the altitude of the path of movement of the cylinder under circumstances as explained, such mechanism, as above described, consisting of an eccentric bearing shaft H, applied in boxes I I, and to the crank shaft G of the cylinder B, substantially as specified.

No. 24,429.—JOB JOHNSON, of East Brooklyn, N. Y., assignor to CHARLES D. ARCHIBALD, of London, England.—*Improvement in Composition for Cementing Iron.*—Patent dated June 14, 1859.—The inventor says: I take quick and caustic lime, free from earthy or foreign substances, and add to it an equal quantity of bone dust, or baked bones finely divided, and a like quantity of charcoal, of which I prefer oak. I then mix these ingredients intimately, and expose them to the influence of the weather for one or two days, according to the hygrometric condition of the atmosphere, dry weather being most favorable.

*Claim.*—The combination and use of lime, bone dust, and charcoal, in the manner and for the purposes substantially as described.

No. 24,430.—FRANCIS MILWARD, of Cincinnati, Ohio., assignor to H. HOMAN, W. L. THOMAS, and D. D. HARDY, of said Cincinnati.—*Improvement in Spinning Tops.*—Patent dated June 14, 1859.—This invention is a philosophical toy, designed to illustrate, in a compact and inexpensive form, various motions and forces incident to gyroscopes and to spinning tops.

*Claim.*—A combined gyroscope and spinning top, constructed and operating substantially in the manner set forth.

No. 24,431.—DANIEL NICHOLS, of Onarga, Ill., assignor to CHARLES RUMLEY and EDWARD RUMLEY, of said Onarga.—*Improvement in Seeding Machines.*—Patent dated June 14, 1859.—This invention consists in combining with a plough a seed planter, so arranged that it can be made adjustable according to the depth to which the seed is to be planted, at the same time adapting itself to the irregular surface of the ground and the motions of the plough in turning over the sod.

*Claim.*—The combination and arrangement of hinged bars E H, slotted arc I, driving wheel J, and auxiliary seed hopper F, when the same are arranged and operating in the manner and for the purposes specified.

No. 24,432.—JOHN S. PALMER, of Providence, R. I., assignor to Himself and CHARLES S. CAPRON, of said Providence.—*Improvement in Rolling Metal for Jewelry.*—Patent dated June 14, 1859.—This invention consists in arranging a tapering die with a suitable groove in such a manner that when the stock is placed on the same, and it, together with the die, is passed through between a pair of pressing rollers, these rollers take first on the middle of the groove, and it is drawn out towards one end and formed as directed by the groove, and by turning it the other end is rolled out in the same manner.

*Claim.*—The employment of a tapering die A in combination with the pressing rollers, substantially as and for the purpose specified.

No. 24,433.—E. T. QUIMBY, of New Ipswich, N. H., assignor to Himself and NEWTON BROOKS, of said New Ipswich.—*Improved Attachment for Alarm Clocks.*—Patent dated June 14, 1859.—The object of this invention is to arrange a clock in such a manner that it can be adjusted to give a warning at certain given intervals.

*Claim.*—First, the wheel A, or its equivalent, having a series of projections *a* which, or some of which, can be covered up or removed, and operating in combination with the hammer B, substantially as and for the purpose described.

Second. The arrangement of the slides F to operate in combination with the wheel A and with the hammer B, substantially in the manner and for the purpose specified.

No. 24,434.—GEORGE W. RICHARDSON and JAMES W. WHITE, of Grayville, Ill., assignors to Themselves and GEORGE M. WEED, of White county, Ill.—*Improvement in Corn Harvesters.*—Patent dated June 14, 1859.—This invention consists in the combination of screw threaded terete rollers, flaring plates or guides, vertical flanges, and gathering wheels.

The inventors say: We *claim* the combination of the gathering wheels L L, terete rollers H H, stripping plates M, and guide plates N, as set forth.

And we also claim the combination of the fender or guide plates N meeting the points of the rollers H, with the terete rollers and stripping plates, as set forth.

No. 24,435.—ROBERT ROSS, of St. Albans, Vt., assignor to Himself and GEORGE J. STANARD, of said St. Albans.—*Improved Water Wheel.*—Patent dated June 14, 1859.—This invention consists in having a gate fitted in the water passages of the wheel, and arranged so that the dimensions of said passages may be varied by an ordinary regulator or governor, and the speed of the wheel rendered uniform.

*Claim.*—The plate or gate F placed within the water passages *a* of the wheel provided with the vertical projections *f* at the issues *e*, and attached to the rod E within the shaft C of the wheel, substantially as and for the purpose set forth.

No. 24,436.—HENRY WEBB, of Cincinnati, Ohio, assignor to S. L. WILDER, of said Cincinnati.—*Improvement in Railroad Bars.*—Patent dated June 14, 1859.—This invention relates to certain improvements in the construction and arrangement of railway bars, by means of which the use of chairs is dispensed with, and a desirable elasticity is given to the track.

*Claim.*—The angular rail herein above described, when constructed so as to be convertible and present a new surface after the first surface has been worn out, in the manner and for the purpose specified.

No. 24,437.—THOMAS BAILEY, of New Orleans, La.—*Improvement in Actuating the Movable Parts of Fire-Arms.*—Patent dated June 14, 1859; patented in England, December 3, 1858.—The claim and engravings explain the nature of this invention.

*Claim.*—Combining a toothed wheel or pinion on a travelling centre and working between guides, with a pair of racks, one of which is stationary and the other movable, having connected to it the part of the fire-arm to be moved, the toothed wheel changing its position or travelling in the same place with the guides, substantially as set forth.

No. 24,438.—JOHN K. BARNEY, of Warren, R. I.—*Improved Instrument for Gauging Casks.*—Patent dated June 21, 1859.—The claim and engravings explain this invention.

*Claim.*—The calliper rod, fig. VIII, the slides IX and X, the triangular calliper, bracket, and pins, as described, and their combinations in the instrument, by which the true diameter at the bung can be obtained however thick the sediments therein may be. The inventor says: I do not confine myself to the particular manner of confining the parts in the instrument, but to the principles of construction of the instrument.

No. 24,439.—RICHARD C. BRISTOL, of Chicago, Ill.—*Improvement in Slide Valves for Steam Engines.*—Patent dated June 21, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim* the construction and arrangement of the partial rollers E, when sustained in their respective positions, substantially in the manner and for the purposes set forth.

I also claim the described arrangement of the supported back piece B, loose face piece A,

cut off means D, and the united passages *a b a b* in the respective parts A B, whereby the parts A B are allowed to work to a limited extent relatively to each other without effecting the action of the steam, nor allowing an escape of the same through the joint.

I also claim, in connection with the above arrangement of the several parts, the described method of adjusting the parts A B relatively to each other; that is to say, working the parts A B for a period in a free relation and then tightening the union by the set screws C C, or their equivalents, until it becomes rigid, substantially as shown and described.

No. 24,440.—JOHN BURGE, of Terre Haute, Ind.—*Improvement in Sugar Mills*.—Patent dated June 21, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—The combination and arrangement of one large and two or more small cylinders with the strippers for stripping the leaves off the cane and the scraper or separator for cleaning the cylinder and carrying off pressed cane, the whole constructed and operating as and for the purpose substantially as described.

No. 24,441.—WILLIAM BURTON, of Cazenovia, N. Y.—*Improved Double Seaming Machine*. Patent dated June 21, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the use of a working head in combination with a disk or "former," when arranged to produce an outward or eccentric draft, and at the same time accomplish the turning down of the double seam, substantially as and for the purpose set forth.

Second. The working head *a b c d*, in combination with the shaft, which is adjustable up and down, and supports a taper or straight sided "former" or disk, and with the working head frame adjustable longitudinally, substantially as and for the purposes set forth.

No. 24,442.—O. S. CAMP, of Fairfield, Iowa.—*Improved Boiler*.—Patent dated June 21, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—A boiler made of double walls and a single top and bottom, said top having flanges to fit against each wall, and the communication between the interior of the inner boiler and the space between the walls being made by closed passages, such as described.

No. 24,443.—MARION CARPENTER, of Cincinnati, Ohio.—*Improvement in Railway Chairs*.—Patent dated June 21, 1859.—This invention consists in the construction of the chair and the parts contained therein for sustaining the elastic cushion and metal follower.

*Claim*.—The combination of the lugs *h h k k* with the base piece S for sustaining the elastic cushion and its follower in the manner and for the purpose set forth.

No. 24,444.—JAMES W. CHAPMAN, of Trinity Spring, Ind.—*Improvement in Sugar Mills*.—Patent dated June 21, 1859.—This invention consists in the arrangement of two or more compressing wheels or cylinders in pairs, so that they can have a lateral adjustment and be brought closer together and separated at pleasure while the machine is in motion.

*Claim*.—The combination and arrangement of the forked lever crushing wheels B B, bearings and table or bed timber, the table being prepared with notches to receive the projections on the seat of the bearings and key wedge, substantially as set forth.

No. 24,445.—C. G. CONOVER, of Jefferson, Wis.—*Improved Shingle Machine*.—Patent dated June 21, 1859.—This invention relates to certain improvements in that class of shingle machines in which the shingles are rived or cut from the bolt by means of a reciprocating knife, and has for its object the riving of the shingles from the bolt, the tapering of them in proper form, and also the jointing of them by a novel automatic mechanism.

The inventor says: I *claim*, first, the employment or use of the fence F, in combination with a reciprocating splitting knife O, and reciprocating or shoving plate N, arranged to operate substantially as and for the purpose set forth.

Second. The reciprocating splitting knife O, shoving plate N, tapering knives E E, jointers *o*, and clamp K, combined and arranged to operate substantially as and for the purpose specified.

Third. Operating the bolt carriage G, by means of the revolving arm I, on the shaft B, and the obliquely toothed rack *a*, at the underside of the carriage G, substantially as described.

No. 24,446.—REUBEN DANIELS, of Woodstock, Vt.—*Improvement in Straw Cutters*.—Patent dated June 21, 1859.—The feed roller D extends across the feed box B, near its discharge end and its axis *a* is fitted in a swinging or adjustable frame E, which works on pivots or centres *b*, at the sides of the framing A. The feed roller is formed of a cylinder *c*, the periphery of which is provided with teeth *d*, placed in longitudinal and parallel rows, the teeth of alternate rows being in line with each other circumferentially with the cylinder *c*, while the teeth of the intermediate rows are also in line with each other and with the spaces between the alternate rows first mentioned.

The inventor says: I *claim*, first, the combination, with the roller D, of the convex teeth *d*,

having the major diameter of their bases arranged parallel with the axis of the roller D, as and for the purpose shown and described.

Second. The arrangement and combination of the roller D, cutter C, and cylinder E E<sup>1</sup>, substantially as and for the purpose shown and described.

No. 24,447.—NATHANIEL EAMES, of Hanover, Pa.—*Improvement in Machines for Hulling Clover*.—Patent dated June 21, 1859.—This invention consists in the construction and arrangement of different kinds of a clover huller.

*Claim*.—The combination of the screen D with the cylinder B, when said cylinder is provided with a spiral groove *i i*, and a spiral strip of rubber H, the same being constructed, arranged, and operating substantially in the manner and for the purpose specified.

No. 24,448.—HENRY EHRENFELD, of New York, N. Y.—*Improved Device for Converting Reciprocating into Alternate Circular Motion*.—Patent dated June 21, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim*, first, arranging the lever C, and dog B, in combination with the grooved wheel A, or its equivalent, in such a manner that the dog acts on the wheel entirely independent from the centre, or hub, of the wheel, and that the lever can be brought in such a position as to impart motion to the wheel in either direction, substantially as and for the purpose specified.

Second. In combination with the lever C, dog B, and wheel A, I claim the arrangement of the groove *d*, or its equivalent, in the hub of the wheel, for the purpose of keeping the dog in the proper position, and to prevent the lever from tipping over sidewise, substantially as specified.

No. 24,449.—A. H. EMERY, of Mexico, N. Y.—*Improvement in Cheese Presses*.—Patent dated June 21, 1859.—This invention consists in constructing a press for the purpose of pressing cheese, and for pressing cotton, tobacco, hay, or for any other purpose where it can be advantageously used in an effectual manner, by means of an arrangement of cams in combination with a system of wheels and axles, so that by the use of a weight or any other power applied thereto, a continued and downward pressure is had and obtained by means thereof.

The inventor says: I *claim* the method of moving the follower *f* upwards, by means of the weight *h*, the cords *i i*, and the pulleys *j j*, the whole arranged and operated as and for the purposes described and set forth.

I also claim the arrangement of the arm *a*, the ratchet *w*, the pinion *t*, the crank arm *v*, together with the wheel *p*, with the cogs either on the inside or outside, the whole being arranged and operated as and for the purposes described and set forth.

No. 24,450.—A. H. EMERY, of Mexico, N. Y.—*Improved Sash Fastener*.—Patent dated June 21, 1859.—This invention consists in providing for windows a cheap and durable fastener manufactured from drawn pipe.

The inventor says: I *claim* the construction of a window sash spring and fastener of drawn pipe, with the end *g*, and the end *h*, arranged and fastened therein, as described.

I also claim the construction of the knob rod, or bolt *c*, as and for the purpose described and set forth.

No. 24,451.—THOMAS EVANS, of Watkins, N. Y.—*Improved Attachment of Handles to Tin Pails*.—Patent dated June 21, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—Forming metallic ears for pails, buckets, and other vessels, with concentric angular corrugations, surrounding the bail orifice, in combination with the flattened hook at the end of the bail, provided with an additional bearing against the surface of one or more of said corrugations, and the drop opening or downward continuation of the outer corrugation, substantially in the manner and for the purposes shown and described.

No. 24,452.—P. H. FREYLINGHOUSEN and JAMES G. HEILMAN, of Johnstown, Pa.—*Improvement in Corn Planters*.—Patent dated June 21, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—The perforated wheels G, when hung to the sliding bars I, and situated in respect to the hopper *a* and wheels H, and otherwise arranged as set forth, so that on moving the said bars I inwards, the wheels G may be drawn out of gear, and the orifices of the hopper at the same time closed by the wheels.

No. 24,453.—JOHN H. GAGE, of Nashua, N. H.—*Improved Roll for Forming Tires*.—Patent dated June 21, 1859.—This invention consists in the peculiar construction and relative arrangement of the parts composing the roll. The roll is used for rolling tire, the flanges B C are intended to form the sides, the recesses *o*, the flange, and the part L, the tread of the tire.

*Claim*.—The combination of the flange B, recess or depression O, wide shoulder or tread

L, flange C, and short shoulder D, with a series of thin metallic disks F, said parts being constructed, arranged, and operating relatively to each other, substantially in the manner and for the purpose set forth.

No. 24,454.—HENRY P. GENGEMBRE, of Allegheny, Pa.—*Improvement in Retorts for Distilling Coal Oils*.—Patent dated June 21, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim*, first, the use of an L shaped retort, combined with charging boxes, crusher, and discharging tube, as described, capable of being subjected to a degree of temperature at the end of the horizontal part at which the residuum of the substance under treatment is discharged higher than at the upright part at which the coal is charged, the whole so arranged as to avoid the admission of atmospheric air.

Second. The combination with my retort, constructed substantially as described, of a crusher suited to the material to be distilled, placed within the retort at a point intermediate between the points where the heat is highest and lowest, for the purpose of breaking up the coal or other substance before the process of distillation is complete.

No. 24,455.—H. H. GOODWYN, of New Orleans, La.—*Improvement in Sewing Machines*.—Patent dated June 21, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim*, first, the combination of the loosely fitted double conical sleeve D, with the soft leather or elastic backed and bearing eye *c*, and a spring pressure, whereby the spool is brought to a proper centre, and the requisite tension produced, the cone sleeve revolving simultaneously with the spool and pivoted arm, and the friction or tension being obtained by the action of the outer end of the double cone against the elastic eye, in the manner and for the purpose described.

Second. The arrangement with the above of the peculiar spring pressure described, consisting of the pivoted or rocking standard B, rod *f*, spring *i*, and rosette or nut *h*, for operation together and with the spool, in the manner described.

Third. The attachment to the stationary shell or outer case G of the tension arm *p*, substantially in the manner and for the purposes described.

Fourth. Hanging the bobbin F on, and so as to rotate together with, a cylinder *l*, when the same is combined with a spring *m*, inducing friction in the run of the bobbin, and operating in connection with a tension arm or elbow *p*, acting on thread from the bobbin, as described.

No. 24,456.—SAMUEL F. GOLD, of Cornwall, Conn.—*Improved Apparatus for Heating Buildings*.—Patent dated June 21, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim* constructing the generator of a series of similar cast metal sections, each complete in itself, and united, substantially as described, so that the capacity of the generator will be governed by the number of sections used, and may be increased or diminished by adding or removing any desired number of the internal sections.

I also claim constructing these sections so that, when united, there will exist the chambers E rising above the water line, and out of the draft of the furnace, substantially as and for the purposes set forth.

I further claim, in combination with the generator, the supplementary steam chambers, made up of flat cast metal sections, substantially as specified.

No. 24,457.—JACOB GOVE, of Milford, N. H.—*Improvement in Tanning*.—Patent dated June 21, 1859.—This invention consists of an apparatus for stirring the liquor in the tanning vat, and arranged so that the top of the vat will be left entirely unobstructed for the purpose of allowing the hides to be freely handled and the vat to be covered or boarded over if desired, while at the same time the liquor shall be stirred from the bottom of the vat.

*Claim*.—Stirring the liquor or tanning fluid in the vat by means of a stirrer, constructed, arranged, and operated substantially in the manner set forth.

No. 24,458.—JOHN GREENWOOD, of Rochester, N. Y.—*Improved Machine for Chamfering Barrel Heads*.—Patent dated June 21, 1859.—This invention consists in placing rotating clamps, in which the stuff is secured, in a sliding frame, and using in connection therewith a cam and rotating disk shaped saw and cutters, the whole so arranged as to render the manipulation of the machine easy, and perform the desired work expeditiously.

*Claim*.—The arrangement of the sliding frame B, clamps C D, cam F, lever G, and gearing E *h*, substantially as shown, in connection with the circular disk shaped saw Q, and cutters R R, the whole being arranged for joint operation, as and for the purpose specified.

No. 24,459.—THOMAS HALL, of Boston, Mass.—*Improved Electro-Magnetic Machine*.—Patent dated June 21, 1859.—This improvement relates solely to the connection of the battery and the machine, by means of an elastic bar or spring, and the movable or switch connec-

tion, by which the machine is started or stopped at pleasure, both the battery and the machine being inclosed in the same box.

*Claim.*—The combination of the spring connecting bar H and the switch O, placed between the machine and the battery, and operating with reference to each other, substantially as described.

No. 24,460.—JOEL T. HAM, of Covington, Ky.—*Improvement in Connecting Iron Girders of Bridges.*—Patent dated June 21, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, combining the posts and braces with the chords by means of the metal saddles E E<sup>1</sup>, and the metal stirrups or straps F F<sup>1</sup>, applied substantially as described, whereby the expansion and contraction of the chords, pests, and braces, by changes of temperature, are provided for.

Second. The India rubber blocks or springs L L, applied between metal blocks M N, in combination with the saddles and stirrups, substantially as and for the purpose set forth.

No. 24,461.—A. HOTCHKISS, of Sharon, Conn., and JOHN P. ADRIANCE, of New York, N. Y.—*Improvement in Guard Fingers for Harvesters.*—Patent dated June 21, 1859.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, the angular cavity D, for the free admission of the front end of the face plate C, to permit its shoulders, at the rear end, to be inserted, whereby the ends of said plate are firmly secured, substantially in the manner and for the purpose specified.

Second. Confining the back end C<sup>2</sup> of the steel face plate C, by bending down the metal of the finger at *a a* upon the reversely beveled edges of C<sup>2</sup>, in the manner and for the purposes described.

No. 24,462.—DANIEL H. HULL, of Plantsville, Conn.—*Improved Trace Fastener.*—Patent dated June 21, 1859.—This invention consists in riveting to the outside of a trace, where it is placed upon a button on the end of a whiffletree, a metal plate of a somewhat elliptical form, or of any other suitable shape, and forming the cock eye of the usual size and shape in the plate so as to admit the flat button of the whiffletree, and securing the trace to said button by means of a spring lever or latch.

*Claim.*—The combination and arrangement of metal plate A, spring latch C, spring D, and knob F, substantially in the manner and for the purposes set forth.

No. 24,463.—W. S. HUNTINGTON, of Andrusville, N. Y.—*Improved Snow Plough for Railroads.*—Patent dated June 21, 1859.—This invention consists in the use of scrapers attached to shafts which have springs connected with them and arranged in such a manner that the scrapers, as the car moves along, are kept to their work, and are made to cast the snow from the inner sides of the rails, and at the same time allowed to yield or give to pass over any obstructions, and also rendered capable of being elevated above the rails when not required for use.

*Claim.*—The employment or use of the plates or scrapers E E, attached to arms D of the shafts C, which shafts have springs G attached, and are connected to an adjusting bar I, by means of the arms F and rods H, the whole being applied to a car, and arranged to operate as and for the purpose set forth.

No. 24,464.—E. A. JEFFERY, of Corning, N. Y.—*Improvement in Tools for Fastening Bale Hoops.*—Patent dated June 21, 1859.—The object of this invention is to facilitate the application of locks to the end of hoops, and enable the ends of hoops to be drawn towards each other with considerable force commensurate with the strength of the operator, so that the hoops when locked may fit snugly to the bale before the same is relieved from the pressure.

The inventor says: I *claim*, first, the employment or use of the combined pliers and die B, constructed and arranged substantially as and for the purpose set forth.

Second. The combination of the pliers and hammer A, with the pliers and die B, arranged for joint operation, substantially as described.

No. 24,465.—WILLIAM JOHNSON, 2D, of Hampstead, N. H.—*Improved Chamfering Tool.*—Patent dated June 21, 1859.—The tool exhibited in the engravings is composed of a knife carrier A, a stationary edge bearer B, a sole rest C, a spring presser D, and a knife E, the said knife being provided with a handle *a*.

*Claim.*—Supporting the knife F, and adjusting it with reference to the sole rest and the edge bearer, viz: by means of a carrier A and adjusting screws *h h i*, applied and arranged with respect to the sole rest C, the edge bearer B, and the presser B<sup>1</sup>, substantially as described.

No. 24,466.—K. H. KINNE, of Mexico, N. Y.—*Improved Apparatus for Cutting Teeth in Saws.*—Patent dated June 21, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the movable curved switch *p*, in conjunction with the curved groove *F*, for the purpose of adapting the machine to the cutting of teeth, on setting or sharpening the teeth of straight as well as circular saws, substantially as described.

I also claim operating and feeding the burr, by means of the shaft *Q*, turning within the hollow screw shaft *D*, when applied to a saw sharpener, substantially in the manner and for the purpose described.

I also claim the bed piece or anvil *c*, for the purpose of supporting the saw teeth while being sharpened, substantially as described.

I also claim, in combination with the burr *E* and the anvil *c*, the clamps *ff* for gauging and firmly holding the saw whilst being acted upon, substantially as described.

No. 24,467.—DAVID KNOWLTON, of Camden, Me.—*Improved Ship's Capstan*.—Patent dated June 21, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—Fixing the shafts of the stud gears in a revolving plate, arranged to turn with the barrel and head when they are locked together, and to be stationary when they are unlocked, in combination with two stud gears, by which the head and barrel are turned in the same direction, when used as a geared or simple capstan.

No. 24,468.—ANDREW LANERGAN, of Boston, Mass.—*Improvement in Exhibition Rockets*.—Patent dated June 21, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* making the rocket with a match *b*, arranged and fixed in the choke, and protected or covered by a plane or thin disk *c*, having no opening into the choke, nor any cavity or recess to hold the match or catch sparks, as described.

And I particularly claim attaching the match, as described, to the inner surface or side of the choke, or arranging the attachment *d* therein, and with respect to the lower end of the match, substantially as described, the same not only enabling the match to be confined to the choke of the rocket, but to have a portion of it, after breakage of the cap, capable of being bent downward out of the choke, into a convenient position for being fired.

No. 24,469.—ALBERTUS LARROWE, of Cohocton, N. Y.—*Improvement in Sled Brakes*.—Patent dated June 21, 1859.—The evener *X*<sup>1</sup> is pivoted to the brake rod at *F*. When the horses pull, the strain on the evener causes the brake rod to move forward together with the ferrule. This motion of the brake rod pulls the upper part *L* of the rod *L O J* forward, so as to raise the hooks or breaks *Q* at the ends of the rod above the ground and keep them in this position as long as the horses pull. The fulcrum of the rod *L O J* is at the lower ends of the brake eyes *R R*.

The inventor says: I *claim*, first, constructing the brake eyes *R R* in the peculiar form shown and described, and for the purposes set forth.

Second. The combination of the brake eyes *R R* with the brake *Q*, substantially as described.

No. 24,470.—LUCIUS LEAVENWORTH, of Trumansburg, N. Y.—*Improved Whip and Line Holder for Guiding Horses Without the Use of the Hands*.—Patent dated June 21, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The arrangement of the rein hooks or knobs *a a*, which are united by one or more cross bars or braces, and which are provided with a whip socket, or without the same, in such a manner that a frame is formed, which, by the aid of suitable shoulder straps, or their equivalents, may be secured to the body of a person, substantially as and for the purpose described.

No. 24,471.—HARVEY LOCKE, of South Boston, Mass.—*Improved Cork Machine*.—Patent dated June 21, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the employment or use of a reciprocating knife stock *E*, when provided with necessary knives, and arranged in combination with a rotating mandrel *N*, traversing clamp *H*, and feed spout or trough *f*, so that, as the knife stock moves back and forth, pieces of cork *a*\* will be cut from the bar or slab *T*, and said pieces turned in suitable conical form, substantially as described.

Second. I claim, in connection with the reciprocating knife stock *E*, attaching the mandrel *N* and head *u* to an adjustable bar *O*, fitted in the framing *A*, and arranged substantially as described, so as to admit of the adjusting of the pieces of cork *a*\*, more or less obliquely, with the knife *c*, and vary the taper of the corks as may be desired.

Third. I claim placing the clamp *H* in a reciprocating plate *G*, operated by the lever *Q*, from the wheel *C* and the lever *R*, from the reciprocating knife stock *E*, substantially as shown and described, for the purpose of giving the traversing movement to said clamp, to convey the pieces of cork *a*\* from the jaws *n*<sup>1</sup> *o* to the mandrel *N*.

No. 24,472.—JAMES K. LUM, of Spookumchuck, W. T.—*Improvement in Wind Mills*.—Patent dated June 21, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The employment or use of the fly or frame *I*, placed on the arbor *J*, and having

the ends of the cords *i* passing through it and attached to said arbor; said cords being also attached to the rope *W* of the weight *P*, the fly being operated by the wind wheel in such a manner as to admit of a simultaneous rotation of the arbor *J*.

No. 24,473.—*J. C. LYON*, of Auburn, N. Y., and *HENRY F. PHILLIPS*, of Seneca Falls, N. Y.—*Improvement in Grinding Mills*.—Patent dated June 21, 1859.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, the arrangement and combination of the clasp *i*, pin *j*, screw *k*, hand wheel *J*, and shaft *C*, whereby the said shaft and grinding cone *D* may be readily adjusted and firmly secured, whether the machine is in operation or at rest, as set forth.

Second. The arrangement and combination of the double flanged pulley *a*, shaft *C*, fork *n*, rod *m*, and shell *L*, as herein shown and described, so that by the adjustment of the shaft *C* the shell *L* will also be adjusted.

No. 24,474.—*PERRY MARCY*, of Tunkhannock, Pa.—*Improvement in Potato Diggers*.—Patent dated June 21, 1859.—This invention consists in constructing and arranging the several parts of this machine as named in the claim and shown in the engravings.

*Claim*.—The arrangement of the inclined smooth belt *N*, tightening pulley *u*, shield *o*, ratchet wheel *J*, levers *a a*, and bars *I I*, provided with teeth *i i i*, the whole being constructed and operated substantially in the manner set forth.

No. 24,475.—*JAMES MASSEY*, of Thomasville, Ga.—*Improvement in the Construction of Driving Shafts for Mills, Cotton Gins, &c.*—Patent dated June 21, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—Suspending the driving shaft *C*, in the manner described, to allow it to rise or fall with the floor, to which it is attached, operating substantially in the manner set forth and for the purposes described.

No. 24,476.—*THOMAS J. MAYALL*, of Roxbury, Mass.—*Improved Drainage Pipe*.—Patent dated June 21, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—Combining, with a stationary washing bowl sink, washing tub, or other similar articles, the elastic drainage pipe, terminating in a wedge shape, for the purposes and in the manner described.

No. 24,477.—*H. D. McGEORGE* and *D. S. GREER*, of Morgantown, Va.—*Improvement in Corn and Cane Harvesters*.—Patent dated June 21, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—Providing a corn or cane harvester with a vertical reciprocating cutting apparatus, for the purpose of cutting the stalks into two or more pieces, substantially in the manner described.

No. 24,478.—*ANDREW T. MERRIMAN*, of Chicago, Ill.—*Improvement in Machines for Sawing Stone*.—Patent dated June 21, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—Lowering the saw frame by means of the long screws *s s* acting on the sliding bars *f f*, and the stiff connecting rods *r r* hung with the hinge joints at the saw frame, and the sliding bars *f f*, (instead of chains or ropes,) for the purpose of holding the saw frame steady and prevent any jumping motion, all in the manner described.

No. 24,479.—*PURCHES MILES*, of New Britain, Conn.—*Improved Window Curtain Fixture*.—Patent dated June 21, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the compound hanging bracket, capable of being raised up to permit the opening and closing of blinds, or for other purposes, as described.

Second. Constructing and combining the parts, as described, so that the bracket can be attached to the top, side, or back of the window frame, and at either side of the window.

Third. Holding the band against a pulley having a friction surface, by an arm or arms, as set forth.

No. 24,480.—*RICHARD MONTGOMERY*, of New York, N. Y.—*Improvement in Corrugating Metallic Sheets*.—Patent dated June 21, 1859.—The inventor says: My improvement will be readily understood from Figs. 1 and 2, where, it will be seen, the corrugations *A B* are not straight, as in my former patent, but are waved, so that each of the ribs *A B* of the corrugated plates has a double curvature—one in the direction of its length, and one across its width.

*Claim*.—The waved corrugated wrought metal plate for boilers, as herein described, in combination with flat margins of greater thickness than its middle, substantially as described.

No. 24,481.—JOHN R. NEWBROUGH, of St. Louis, Mo.—*Improved Instrument for Adding Numbers.*—Patent dated June 21, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the bent arm K, underlying the dial G, so as to operate it without obstructing the vision.

Second. The stud Q, operating in the described connection with the pawl j, to permit the backward motion of the dial, for the purpose set forth.

Third. The combination and arrangement, substantially as set forth, of the rib N, cavity n, catch i, and teeth h, operating, as explained, to shift the obstructing plate at each revolution of the dial and arrest the reverse motion of the latter at the right instant in setting the machine.

Fourth. The described arrangement and combination of the pins p p and hook O, operating in the manner and for the purposes set forth.

No. 24,482.—S. VAN RENSSELAER NEWMAN, of Covington, N. Y.—*Improvement in Machines for Harvesting Beans.*—Patent dated June 21, 1859.—This invention consists in the employment or use of rotary sickles peculiarly arranged for cutting the bean stalks, and using in connection with said sickles guide plates, an endless conveying chain, platform, and discharging plate or rake, the whole being placed in a mounted frame and arranged in such a manner that the beans may be cut and discharged in gavels on the ground.

The inventor says: I *claim*, first, the employment or use of the rotary sickles K K, provided with scolloped shaped teeth, and arranged to operate substantially as and for the purpose set forth.

Second. The combination of the endless chain of rods O with the rotary sickles K K.

Third. The combination of the rotary sickles K K, endless chain of rods O, platform Q, with or without the rake o, placed in a mounted frame A and arranged for joint operation.

No. 24,483.—ANDREW O'NEILL, of Portsmouth, Va.—*Improved Fire Back for Stoves and Fireplaces.*—Patent dated June 21, 1859.—This invention relates to the construction and arrangement of a radiating fire back, also in combination with the back to a hooded damper.

*Claim.*—The hooded damper c in combination with a radiating fire back A, constructed and arranged substantially as described, for the purpose set forth.

No. 24,484.—JOSEPH B. PALSER and GARDNER HOWLAND of Fort Edward, N. Y.—*Improvement in Apparatus for the Manufacture of Paper Pulp.*—Patent dated June 21, 1859.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, having the pipe b, which passes through the hollow journal of the boiler, divided by a partition, so that the steam may find exit through one compartment of the pipe and the contents of the boiler through the other compartment, as set forth.

Second. The employment of the perforated diaphragm p p<sup>1</sup>, when arranged substantially as described, to protect the pipes h h<sup>1</sup> s s<sup>1</sup>, and strain the liquids from the "stock," as and for the purposes set forth.

Third. The arrangement of the boilers J J<sup>1</sup>, with the surrounding envelope, substantially as shown and described, so that the resultant liquids of the boiling may be evaporated, and also employed to cool down the boilers and surrounding envelope, as set forth.

Fourth. The arrangement of the basin g g below the boiler, to receive the falling liquid, as and for the purposes described.

Fifth. The injection of the steam arising from the boiling of the alkaline and other contents of boiler J<sup>1</sup> into boiler J, and *vice versa*, substantially as and for the purposes shown and described.

Sixth. The arrangement of the warming chamber S between the two boilers, and the combination therewith of the pipes T V W W<sup>1</sup>, as and for the purposes described.

Seventh. The arrangement and combination of the boilers J J<sup>1</sup>, furnace A, and doors D D<sup>1</sup>, E E<sup>1</sup>, F F<sup>1</sup>, so as to apply the furnace heat to either or both boilers at pleasure, substantially as shown and described.

Eighth. The combination of the cylindrical bottomed vats K K<sup>1</sup>, having the chimneys N N passing through them, with the boilers J J, as and for the purposes described.

No. 24,485.—JAMES PEELER, of Tallahassee, Fla.—*Improvement in Machines for Sowing Fertilizers.*—Patent dated June 21, 1859.—When the wheel turns round, the corrugations of the strip F catch the metallic strip x on the board d and elevate the bar, and consequently the apron; and as the end of the strip x falls from one corrugation to another, an up and down motion is communicated to the apron, and the manure is shaken off by this operation as it continues.

*Claim.*—The arrangement of the frame A, wheels B B, axle C, and apron D, attached to the frame by means of straps a and c, with the bar d, metallic strip x, corrugated wheel F, bar i, chuck J, hopper E, and slide L, the whole being constructed and placed in the relative positions set forth, and operating in the manner specified.

No. 24,486.—JAMES PEELER, of Tallahassee, Fla.—*Improvement in Cultivators*.—Patent dated June 21, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—The arrangement of the bars D and E, beam A, handles B B, and standard C, the bar E forming a brace, a colter, and a landside, and bars D being provided with an inclined or tapering point, on which any style of blade may be secured, the two bars being pivoted together at  $x$ , and the whole operating substantially in the manner and for the purpose specified.

No. 24,487.—ALBERT PHILIPP, of Mayville, Wis.—*Improvement in Machines for Cutting Sugar Cane*.—Patent dated June 21, 1859.—The operation of this machine is as follows: The machine is drawn through a field planted with sugar cane, and as the upper cutters  $H^1$  come in contact with the canes they draw them in between the prongs of the arms M and the tops of four canes are cut simultaneously, and these tops are deposited on the endless aprons  $p$  and carried off. After the tops of the canes have thus been cut, the lower cutters begin to act, and as the tops are cut off before the canes are deposited on the platforms  $C^1$ , the canes are ready for bundling without subjecting them to any further operation.

*Claim*.—The arrangement of the cutters  $H^1$  with the forked arms  $I^1$  and with the endless apron  $p$ , in combination with the cutters H, the forked arms I, the reels J, and the additional platforms  $C^1$ , to operate substantially in the manner and for the purpose specified.

No. 24,488.—RENSSELAER REYNOLDS and GORDON B. REYNOLDS, of Stockport, N. Y.—*Improvement in Brakes for Power Looms*.—Patent dated June 21, 1859; antedated February 8, 1859.—The claim and engraving explain the nature of this invention.

The inventors say: We *claim* applying and arranging the two faces of the brake relatively to its centre of motion, and the said centre of motion relatively to the centres of the crank and cam shafts, in the manner substantially as described, whereby the brake is not only rendered automatic in case of recoil after the stoppage of the loom by the action of the protector, but self liberating when the loom is started again, as fully set forth.

No. 24,489.—WILLIAM RICE, of Philadelphia, Pa.—*Improved Filter*.—Patent dated June 21, 1859.—This invention consists in a certain arrangement of two casings, with perforated plates on the inside and a body of sand confined between the plates, together with a system of pipes and three way cocks, whereby the water may be conducted first in one direction and then in another through the sand, and thereby cleansed.

The inventor says: I *claim*, first, the general arrangement of the two casings, the perforated plates, the wire gauze, body of sand, system of pipes, and three cocks, as described.

Second. Confining a body of sand D between the perforated plates B and  $B^1$  by means of a ring C, constructed in the manner set forth, or any equivalent thereto, by which the said ring may be made to compress the body of sand without disturbing the said perforated plates.

Third. The orifices  $m m$ , at the lower ends of the pipes H and  $H^1$ , for the purpose specified.

No. 24,490.—CHRISTIAN RITTER, of Reading, Pa.—*Improvement in Cider Presses*.—Patent dated June 21, 1859.—This invention consists in separating the juice or fluid, such as cider, wine, lard, or tallow, out of its pomace and cracknels, and securing the flow of the juice or fluids out of the inner part of the bulk, in much less time than by other processes now in use.

*Claim*.—The application of the chamfered and grooved inner slats and partitions, with their fastenings and arrangements, which will produce the intended effect.

No. 24,491.—PHILIP C. ROWE, of Boston, Mass.—*Improved Brush for Washing Windows*.—Patent dated June 21, 1859.—This invention consists of a brush constructed with a spray jet tube and a water conductor or pipe so applied to its stock and handle that water may be led into the brush and discharged among the bristles thereof, and against the window, or the surface against which the brush may be operating.

*Claim*.—The hydraulic window-washer, or brush, constructed with the spray jet tube, and the conduit or pipe applied to its stock and handle, substantially in manner and to operate as specified.

No. 24,492.—W. G. RUGGLES, of Worcester, Mass.—*Improvement in Cooking Ranges*.—Patent dated June 21, 1859.—This invention is an improvement on a cooking apparatus patented by this inventor May 18, 1858; and it is designed to carry out more perfectly in the present invention the principles set forth and involved in the former one.

*Claim*.—The arrangement and combination of the oven D, provided with a central hollow shelf  $b$ , the oven G provided with a hollow shelf  $m$ , fire-chamber B, damper E, chambers  $h d$ , flues C H  $n n^1$ , substantially as and for the purposes shown and described.

No. 24,493.—PAUL A. SABBATON, of Albany, N. Y.—*Improved Door Frame for Furnaces.*—Patent dated June 21, 1859.—The claim and engravings explain the nature of this invention

*Claim.*—The combination of the mouth of the furnace of the door frame A and door B, when the said door frame is provided with an opening larger than the door into which the door shuts, so as to close against the furnace, or against a shield or false frame C, as and for the purposes set forth and described.

No. 24,494.—HENRY SAUERBIER, of Newark, N. J.—*Improved Tool for Planing and Finishing the Edges of Boot and Shoe Soles.*—Patent dated June 21, 1859.—This invention consists in combining in one the two tools used by shoemakers, termed the edge plane and the collis, in such a manner as to enable workmen to use both alternately without laying either out of hand.

*Claim.*—The combination of the collis and edge plane, substantially in the manner and for the purpose specified.

No. 24,495.—WILLIAM SCHNEBLY AND THOMAS SCHNEBLY, of Hackensack, N. J.—*Improvement in Harvesting Machines.*—Patent dated June 21, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The arrangement and combination of the inclined tapering discharge trough I, with the concave or curved platform and raker reel, whereby the grain is made to fall from the machine in compact gavels, as shown and described.

No. 24,496.—WILLIAM SCHNEBLY, AND THOMAS SCHNEBLY, of Hackensack, N. J.—*Improvement in Harvesting Machines.*—Patent dated June 21, 1859.—The inventors say: By this mode of attaching the cutter bar *j* to the fingers I, the teeth *k* are kept in close contact with the upper surfaces of the fingers I without the aid of a cap or top bearings on the upper surface of the sickle, and consequently no obstruction is offered to the passage of the cut grass or grain over the sickle. The friction which also attends the employment of the top bearings or cap on the sickle is avoided.

*Claim.*—The employment, in combination with the pendulous levers *d d*<sup>1</sup>, of the toggle levers *g g*, as shown, whereby the levers *d d*<sup>1</sup> may, without shifting their axes of motion *f f*, be thrown in or out of connection with the drivers B B.

No. 24,497.—JONAS SMITH, of Westport, Conn.—*Improved Water Wheel.*—Patent dated June 21, 1859.—A represents the wheel which is formed by having buckets *a* between two annular plates *b b*, placed one over the other, and secured by arms *a*<sup>1</sup> concentrically to a vertical shaft B placed in a proper framing.

*Claim.*—The arrangement and combination of the annular gate D, when provided with the tangential vertical plates *i*, stationary rim C, interposed between the gate D and wheel A, when provided with buckets *a*, having lips *c*, all as shown and described, for the purposes set forth.

No. 24,498.—JOSEPH SMITH, of Cincinnati, Ohio, and G. B. GRIFFIN, of Madison, Wis.—*Improvement in Measuring Faucets.*—Patent dated June 21, 1859.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, operating the plunger by means of the cam grooves on the face of wheel G, in connection with the pins on the sleeve, when both are constructed and operated in the manner and for the purpose set forth.

Second. The serrated circular register plate H, in connection with the ratchet *p*, and pointer *m*, the same being arranged and operated substantially in the manner and for the purpose specified.

Third. We claim the disk *c*, constructed as described, in combination with the inlet pipe B, and the outlet pipe C, the same being used substantially in the manner and for the purpose fully set forth.

No. 24,499.—JOHN G. STEPHENSON, of Buffalo, N. Y.—*Improved Machine for Jointing Staves.*—Patent dated June 21, 1859.—This invention consists in the use of yielding planers, feed rollers, and a pressure plate, arranged for joint operation, whereby staves are jointed in a perfect manner.

*Claim.*—The adjustable plates I I, with yielding cutter stocks or plates K K, attached in connection with the feed rollers D D, and yielding pressure plate *c*, or its equivalent, the whole being arranged to operate substantially as and for the purpose set forth.

No. 24,500.—J. C. STODDARD, of Worcester, Mass.—*Improvement in Cultivators.*—Patent dated June 21, 1859.—The object of this invention is to obtain a scraper wheel that may be rendered available for earthing various kinds of plants, and its operation otherwise modified according to the work required of it.

*Claim.*—The arrangement and combination of the slotted adjustable reversible blades *h*, arms *E*, and hub *e*, as and for the purposes shown and described.

No. 24,501.—GILES M. STONE, of Fredericksburg, Va.—*Improved Panoramic Attachment for Clocks to Indicate the Comparative Time in all Longitudes.*—Patent dated June 21, 1859.—The claim and engravings explain the nature of the invention.

The inventor says: I *claim*, first, the chronometer dial divided off into twenty four equal parts for indicating the twenty four hours of day and night, by one revolution of the index point, substantially as set forth.

Second. The revolving disk representing the northern or southern hemisphere, for indicating the relative time of day or night, at any and all localities thereon, in the manner specified.

Third. The combination of the revolving disk with the twenty four hour dial, for demonstrating the cause of day and night by the diurnal revolutions of the former, representing the revolutions of the earth on its own axis, substantially as described.

No. 24,502.—JOHN F. STURDY, of Attleborough, Mass.—*Combined Case for Pen, Pencil, Knife, Tooth Pick, &c.*—Patent dated June 21, 1859.—The object of this invention is to combine within a case of peculiar construction a knife, pencil, tooth pick, and pen, whereby the several parts may be very compactly arranged in a durable manner, and a case obtained equally as portable as an ordinary pencil case.

*Claim.*—The case *A*, constructed as shown and provided with the blade knife *i*, operated by the spirally slotted tube *f*, pencil tube *l*, tooth pick *m*, and pen slide *n*, arranged and combined to form a new and improved article of manufacture.

No. 24,503.—WILLIAM H. TOWERS, of New York, N. Y.—*Improved Clothes Pin.*—Patent dated June 21, 1859.—This invention consists in forming the clamp in two parts, and jointing them together at one end in such manner as to enable their opposite pronged ends to be separated from each other before being applied to the line, and when closed upon the same to clamp the clothes securely in their place.

*Claim.*—The described improved article of manufacture, to wit: a clothes clamp formed of two parts *A*, jointed together at their upper ends, substantially as set forth.

No. 24,504.—CYRUS B. THAYER, of Boston, Mass.—*Improved Apparatus to Hold and Turn the Leaves of Books and Music.*—Patent dated June 21, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the combination and arrangement of the wedge acting back pieces *B B* and clamps *C C*, with their connecting dovetail tongues and grooves *b b*, substantially as described, so that simply raising the clamps, shall unclamp, and depressing them shall clamp, the music sheets, as specified.

I also claim the arrangement and combination, substantially as specified, of the leaf turning cords *D D D*, arms *G G G*, lever *E*, and catch *m*, for the purpose set forth.

No. 24,505.—GEORGE S. TIFFANY, of Palmyra, Mich.—*Improvement in Machines for Digging Potatoes.*—Patent dated June 21, 1859.—This invention consists in arranging in front of a plough for digging potatoes an inclined fork, so that the points of its teeth will rest upon the point of the shovel, or plough, and allow the earth and potatoes to pass freely on the plough, but effectually prevent the potatoes from falling off, at the same time it is so arranged with respect to the machine that it is always in position to act.

*Claim.*—The hinged fork *P*, in combination with the plough *L*<sup>1</sup>, when the same are arranged and operate as and for the purpose set forth.

No. 24,506.—CHARLES N. TYLER, of Washington, D. C.—*Improvement in the Manufacture of Gas.*—Patent dated June 21, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* combining hydrogen gas with the volatile and easily condensable products of coal, resin, tar, &c., in their nascent state, in the manner and for the purposes substantially as set forth.

No. 24,507.—FRANKLIN VEAL, of Hallettsville, Texas.—*Improvement in Cultivators.*—Patent dated June 21, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—Arranging the dovetailed projections *i*, at equal distances from the cutting edges of the shears, in combination with the slots *j* and recesses *k* in the arms and for the purpose of securing the shares to the arms, and to render them reversible, substantially as described.

No. 24,508.—JULES JEAN BAPTISTE VERGNE, of Paris, France.—*Improved Screw Propeller.* Patent dated June 21, 1859.—This invention consists in arranging the grooving or fluting, or ribs in the form of a series of steps rising one above the other as they approach from the centre towards the periphery.

*Claim.*—The arrangement of the grooving fluting or ribs in the form of a series of steps, substantially as and for the purpose set forth and described.

No. 24,509.—ANTON VON SCHUTTENBACH, of St. Petersburg, Russia.—*Improvement in Fluid Lamps.*—Patent dated June 21, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The combination of the gas holder or gasometer A, the vessel I, the pipe N, with its branches, the pipe F, the chamber H, the chimney I, the oil reservoir A, and the burner G, the whole being applied and made to operate together, substantially as specified.

No. 24,510.—EDWARD WALCOTT, of Providence, R. I.—*Improvement in Gas Retorts.*—Patent dated June 21, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the combination with the lid D, of the projecting incline plane *a a*, substantially as and for the purpose set forth and described.

Second. The employment, for securing the lid of the mouthpiece of the retort in place, of a horizontal eccentric or cam G and lever H, attached to and combined with a cross bar F, and applied to the mouthpiece of the retort, substantially as described.

No. 24,511.—F. F. WAGNER and P. P. DICKINSON, of Harrisburg, Pa.—*Improvement in Railroad Car Seats.*—Patent dated June 21, 1859.—In order to change the seat into a sleeping couch, the arms D<sup>1</sup> are inclined as much as convenient for the person occupying the seat, and the cushions F and F<sup>1</sup> are unfolded in order to have a convenient support for the legs as well as for the head, and in this position the arms D, together with the cushions, are retained by the notched bars G.

*Claim.*—The arrangement and combination of the wheels I<sup>1</sup> J, arms D D<sup>1</sup>, cushions E E<sup>1</sup>, and bars G, as and for the purpose shown and described.

No. 24,512.—AMBROSE WARD, of Altoona, Pa.—*Improvement in Body Bolsters for Railway Cars.*—Patent dated June 21, 1859.—The inventor says: Instead of mortising the sills and bolsters together, and throwing the weight upon the extremities of the bolsters, I combine with the ends of the sills G two inclined truss timbers F, which extend from the inner sides of the sills G downward to and against lugs K, which rise vertically from the centre plate D, with which they are cast, and of which they are a part. The sills G, trusses F, and centre plate D, are all firmly combined, or held together by means of transverse tension I, of wood or iron.

The inventor says: I *claim*, first, the arrangement and combination of the trusses F, centre plate D, sills G, and tension rods I, substantially as and for the purpose shown and described.

Second. Providing the centre plate D with lugs K, protecting flange or cap *b*, lateral bearing flange *e* at the centre, fitting into cup in plate B, the vertical bearing flange *d*<sup>1</sup>, fitting into the cup or groove in plate B, the whole combined and arranged as and for the purposes shown and described.

No. 24,513.—D. WARREN, of Gettysburg, Pa.—*Improved Method of Opening and Closing Farm Gates.*—Patent dated June 21, 1859.—The catch D is provided with a slot and, just above this slot, with a curved piece marked *a*, which has its convexity downwards; catch D is pivoted to post B near its top, in such a manner that it will drop of its own gravity when desired; S is a staple driven in the top of post B, over the bar *d*, to prevent its moving too far from one side or the other, or to keep it from coming off the post.

*Claim.*—The arrangement of the lever F, and bar *d*, with the bar E, and falling catch D, as constructed, substantially in the manner and for the purpose described.

No. 24,514.—HENRY WELLS, of Walnut Grove, Ill.—*Improvement in Cultivators.*—Patent dated June 21, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The arrangement of the share F, mould boards G G, rods H H and I I, the latter having the parts *d d* formed on them, the said parts passing respectively through the bar C and beam A, thus making a very firm structure, in the manner and for the purpose set forth.

No. 24,515.—SOLON R. ATKINS and D. H. HULL, of Plantsville, Conn., assignors to D. H. HULL aforesaid.—*Improved Trace Fastener.*—Patent dated June 21, 1859.—This invention consists in fixing to the ends of the traces, where they are attached to the buttons on the end of the whiffletree, a metallic box corresponding to the size and shape of the trace.

*Claim.*—The metallic box A, having a semicircular ring B on its end, and provided with a slide C, which is to be operated by a knob H, and held against the neck of the button on the whiffletree by springs D E, all arranged and operating in the manner and for the purposes set forth.

No. 24,516.—WILLIAM BROWN, of Shelbyville, Ind., assignor to Himself and FONTAIN G. ROBERTSON, of said Shelbyville.—*Improved Device for Feeding Bees.*—Patent dated June 21, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—As a new article of manufacture, the bottle stopper, consisting of the cork A, tube

B, and cup D D, secured together by the screw and nut C, substantially as described and for the purposes specified.

No. 24,517.—WALTER HUNT, of New York, N. Y.—*Improvement in Heels for Boots and Shoes.*—Patent dated June 21, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* making the external form of the heels of boots and shoes of a metallic shell with an inner flanch at the upper edge, to fit over the usual heel seat of the sole and between that and the counter or back portion of the upper, substantially as described, and to be provided with an inner core, and the whole to be secured to the heel seat, substantially as described.

I also claim, in combination with the shell and upper flanch, and inner core, substantially such as described, making the said shell with an inner flanch at the lower edge, substantially as and for the purpose specified.

And I also claim, in combination with a heel constructed substantially as above described, and consisting of the shell with the upper and lower flanches and the enclosed core, the employment of a rotating top lift, substantially as and for the purpose specified.

No. 24,518.—WILLIAM M. JEFFERS, of Elmira, N. Y., assignor to Himself and WILLIAM L. GIBSON, of said Elmira.—*Improvement in Double Cannon for Chain Shot.*—Patent dated June 21, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The use of a partition intermediate between the breech and muzzle of the piece, in combination with the slot *c*, so arranged that the charge of the barrels shall mingle at the fuse, so that immediately on the ignition thereof the expansive force shall be wholly expended in projecting the two balls, and not weakened by a continuous connection between the barrels, substantially as and for the purpose shown and described.

No. 24,519.—ROBERT H. MATHIES, of Boston, Mass., assignor to A. N. CLARK, of Beverly, Mass.—*Improvement in Water Gauges for Steam Boilers.*—Patent dated June 21, 1858.—The claim and engravings explain the nature of this invention.

*Claim.*—The combination, with the partition that separates the upper and lower main tubes of the gauge, of the independent steam and water tubes or courses, arranged to unite the spaces in the main tube, substantially as specified and for the purposes set forth.

No. 24,520.—H. K. MOORE, of Malden, Mass., assignor to A. W. ADAMS and G. W. DANE, of Boston, Mass., and W. G. HOWE, of Haverhill, Mass.—*Improvement in Water Gauges for Steam Boilers.*—Patent dated June 21, 1859.—This invention consists in combining with "Hoyt's single balanced valve" an auxiliary steam receiving space and two or any other suitable number of raised or nipple valve seats, the same being designed to overcome a difficulty incident at times.

*Claim.*—Combining therewith the auxiliary steam space *t* and the nipple or raised valve seats *s s*, arranged substantially as specified.

No. 24,521.—E. L. PRATT of Philadelphia, Pa., assignor to Himself and R. B. FITTS, of said Philadelphia.—*Improved Cheese Cover.*—The claim and engravings explain the nature of this invention.

*Claim.*—As an improved article of manufacture, for the purposes described, a ventilating cover constructed of tin plate or other suitable material, so as to protect articles placed therein from the rays of light and heat and the ravages of animals or insects, and at the same time secure perfect ventilation by means of a series of small perforations at or near the base or bottom for the inlet of cool air, and another series of perforations at or near the top for the escape of warm air, moisture, and gases, as set forth and described.

No. 24,522.—ARCHIBALD PUTNAM and JAMES H. PUTNAM, of Wellsville, Ohio, assignors to Themselves and PHILIP F. GEISSE, of Wellsville aforesaid.—*Improvement in Railroad Turn Tables.*—Patent dated June 21, 1859.—This invention consists in the application of an adjustable spindle to compensate for wear, and equalize the bearings of the table.

*Claim.*—The adjustable spindle *g*, applied and adapted in the manner and for the purpose set forth.

No. 24,523.—LAURENCE SCHRODER, of Cincinnati, Ohio, assignor to JOHN H. SCHRODER & Co., of said Cincinnati.—*Improved Lock Guard.*—Patent dated June 21, 1859.—This invention relates to certain improvements in lock guards, intended to be inserted within the locks of doors for the purpose of preventing them from being opened by means of other keys; and at the same time being made adjustable so as to be used in any ordinary lock.

*Claim.*—The arrangement of the several tumblers, in combination with intervening springs, which vary the spaces between said tumblers and operate the lock, in the manner and for the purpose substantially as set forth.

No. 24,524.—JOHN W. SMITH, of Washington, D. C., assignor to Himself and JESSE H. WHITEHURST, of Baltimore, Md.—*Improvement in Gas Retorts*.—Patent dated June 21, 1859.—This invention relates to that class of apparatus in which oil or other fatty matter is introduced into a retort placed in a stove or furnace for the purpose of generating illuminating gas for domestic use.

*Claim*.—The described arrangement of the pipes  $e$  and  $e^1$ , when combined with the retort and condensing chamber, in the manner and for the purpose set forth.

No. 24,525.—ROBERT WILLIAM SIEVIER, of Upper Holloway, Middlesex county, England, assignor to WILLIAM LILLEY, of Ohio.—*Improved Smelting Furnace for Iron*.—Patent dated June 21, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the use of the exhaust pipe, in connection with a fan pump, or other means, to exhaust the foul air and gases, and cause a current of air to pass through the bottom or apertures of the furnace of sufficient density for the smelting and purifying iron and other ores, in the manner and for the purposes set forth.

I also claim the exhaust fan, constructed and operating as explained.

I further claim the use of the movable crucible, as described and for the purposes set forth.

No. 24,526.—BENJAMIN TOLMAN, of Pembroke, Mass., assignor to Himself and ASA F. RAMSDELL, of said Pembroke.—*Improved Edge Plane for Boots and Shoes*.—Patent dated June 21, 1859.—This improvement consists in a new arrangement of devices for supporting the cutter and its gauge.

*Claim*.—The improved edge plane, as constructed, with cutter and gauge bearings, flanges and confining devices arranged on the stock and with respect to the cutter and gauge, substantially as specified.

No. 24,527.—CHARLES TEUESDALE and A. J. SENNETT, of Cincinnati, Ohio, assignors to WILLIAM RESOR and JACOB RESOR, of said Cincinnati.—*Improvement in Patterns for Casting Stove Covers*.—Patent dated June 21, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—Constructing patterns for stove covers and centres with an opening in their under sides, by means of which a draw bar  $f$  may be withdrawn from the mould before removing the pattern, and also with a perforation  $g$ , substantially as and for the purpose set forth.

No. 24,528.—JAMES N. ALLEN, of Providence, R. I.—*Improvement in Constructing Rims and Field Pieces for Watch and Locket Cases*.—Patent dated June 28, 1859.—The inventor says: My invention consists in taking a piece of sheet metal stock as it comes from the plate workers and cutting it into narrow strips, as shown in Fig. 1; I then take a piece of one of these strips, equal in length to the circumference of the rim which I desire to make, and solder the two ends together; after shaping it upon a mandrel I have it in the form shown in Fig. 2; by means of a suitable die and former I swedge it into the form of a male rim, or into the form of a female rim as I may desire.

*Claim*.—Making the rim and field piece for watch or locket cases from a strip of sheet metal, substantially as described.

No. 24,529.—C. M. ALEXANDER, of New Albany, Ind.—*Improvement in Vapor Lamp Burners*.—Patent dated June 28, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—The combination of a retort, having converging sides, and constructed substantially in the manner set forth, with an inlet pipe, an outlet pipe, and a burner, for the purpose of forming a gas generating apparatus, to be used in connection with fluid lamps, as fully described.

No. 24,530.—JOSHUA C. BEAN, of Grayville, Ill.—*Improvement in Seeding Machines*.—Patent dated June 28, 1859.—A represents the frame of the machine, arranged upon wheels B. Transversely across the frame is arranged a cylindrical seed hopper C, having an opening in front, provided with partitions  $d$ ; within the hopper is arranged a shaft  $e$ ; passing at right angles through the shaft  $e$  are arms  $i$ , provided at their extremities with cups  $i^1$ , by means of which the seed contained in the hopper may be discharged.

*Claim*.—The arrangement of the hopper C and arms  $i$   $i^1$ , in combination with the inclined equalizer, the whole being constructed substantially as and for the purposes set forth.

No. 24,531.—WILLIAM BEAUMONT, of Paterson, N. J.—*Improvement in Gas Retorts*.—Patent dated June 28, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—Making all that part of a retort which is most subject to expansion and contraction, corrugated, to prevent fracture, as described.

No. 24,532.—EDWARD BECK, of Allentown, Pa.—*Improved Contrivance by which the Workman Operates Scroll Saws*.—Patent dated June 28, 1859.—This invention consists in the

peculiar means employed for operating the saw, whereby the operator may drive the saw, and at the same time have perfect control over the work, so that the same may be readily manipulated and properly presented to him by the saw.

*Claim.*—The oscillating platform L, connected with the shaft C by means of the strap *h h* and pulley D, or their equivalents, the arm E, pitman F, and spring I, arranged for joint operation, substantially as and for the purpose set forth.

No. 24,533.—HENRY BETTS, of Hamilton city, Canada West.—*Improvement in Railroad Bars or Rails.*—Patent dated June 28, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—The angle rail, in combination with the outside bar, where the space between them is filled in with cement prepared by boiling sand and coal tar in such proportions as will best resist the action of the elements, cold, heat, and moisture, and the wear of the wheels.

No. 24,534.—MILTON B. BIGELOW and ANSON HARDY, of Boston, Mass.—*Improved Fireproof Desk.*—Patent dated June 28, 1859.—The purpose of this invention is to give greater or more certain and convenient security to valuable papers and other articles than is afforded by the fireproof safes now in use.

The inventors say: We *claim* the movable table *d*, or any device essentially the same, in combination with the fireproof case *a a a*, said table being constructed and made so as to operate in the manner substantially as and for the purposes specified.

We also claim the slide *f*, or any device essentially the same, in combination with the movable table *d* and the fireproof case *a a a*, for supporting or assisting to support said movable table, whenever said table is drawn out to the position shown in Fig. 2, said slide and table being connected and made so as to operate in the manner and for the purpose substantially as specified and shown.

We also claim the brackets *q q*, or any device substantially the same, in combination with the fireproof case *a a a*, for supporting or assisting to support the movable table *d* and the slide *f*, in the manner and for the purpose substantially as shown and explained.

No. 24,535.—NELSON BIRDSALL, of Port Jervis, N. Y.—*Improved Spring Hinge.*—Patent dated June 28, 1859.—This invention consists in so combining and arranging a spring with a hinge that it shall automatically close the door or entrance, while, at the same time, it is invariably out of the way.

The inventor says: I *claim* the combination and arrangement of the spring E, and adjusting pieces G and H, applied to a hinge, as described and specified.

I also claim inserting within the spiral spring E the tubular spring I, as described, for assisting the action of the spiral spring and preventing it from setting or getting out of plane with the other parts, as set forth and specified.

No. 24,536.—L. E. BURDIN, of Paris, Ky.—*Improvement in Ploughs.*—Patent dated June 28, 1859.—The inventor says: In practice the cone A is caused to revolve freely on the shaft or spindle E by the action of the soil upon the same, which lessens the draft very materially.

*Claim.*—The arrangement of the beam M, the handles N, the standard K, brace H, share B, landside F, cone A, spindle or shaft E, braces C and G, and lug *o*, as described for the purpose set forth.

No. 24,537.—ALEXANDER CAMPBELL, WILLIAM CAMPBELL, and JAMES CAMPBELL, of Harrison, Ohio.—*Improvement in Corn Planters.*—Patent dated June 28, 1859.—This invention consists in a peculiar arrangement of gravitating slides and their accessories. Each seed aperture becomes visible to the operator just as it is on the point of discharging, so that he can see whether each slide is effective; also the levers J J assist the eye in judging of the perfect action of the valves, and afford the means of the temporary working of the valves by hand should occasion require.

*Claim.*—The described arrangement of the inclined slides or valves H H<sup>1</sup>, levers J J<sup>1</sup>, adjustable rods *o o*, and cam wheel K *k*, for the purpose explained.

No. 24,538.—JAMES A. CAMPBELL, of New Orleans, La.—*Improved Job and Card Printing Press.*—Patent dated June 28, 1859.—This invention consists in the peculiar mode of constructing and operating the inking roller frame, and the distributing and impression cylinder of a printing press.

The inventor says: I *claim* fastening the cylinder permanently on its solid axle E, and also fastening the ends of this axle securely into the slides F.

I also claim, in combination with the cylinder L, the revolving of the roller frame H on the solid axle E as its working centre, while the axle itself does not revolve, either by eccentric wheels, which are to be used when the cylinder vibrates, or by plain ones when it is stationary.

I also claim the eccentric wheels G and G<sup>1</sup> in combination with the cylinder L, for the purpose specified.

I also claim the cranks R and connecting rods D in combination with the cylinder L, the inking frame H, and the eccentric wheels G and G<sup>1</sup>.

I also claim the combination of the cranks S, the connecting rods T, the slots Y, the pins W, and the bottoms X, with this press, as specified and described.

No. 24,539.—WILLIAM I. CANTELO, of Burlington, N. J.—*Improvement in Stoves*.—Patent dated June 28, 1859.—This invention consists in a certain combination and arrangement of an exterior casing, an inner casing adjustable vertically, a fire pot and cone shaped grate, so that by raising or lowering the said inner casing the amount of ignited fuel may be increased or diminished at pleasure.

*Claim*.—The exterior casing A and inner adjustable casing H, in combination with the fire pot F and cone shaped grate G, when the several parts are arranged substantially as and for the purpose set forth.

No. 24,540.—THOMAS F. CHRISTMAN, of Wilson, N. C.—*Improvement in Machines for Hoisting Bricks*.—Patent dated June 28, 1859.—This invention consists in the use of buckets attached to an endless chain revolving on rollers placed one above the other for elevating the bricks to the required height.

*Claim*.—The combination of the rollers D D with the saddle and buckets E F, supported by rollers J J, the whole combined and described as a machine for elevating brick, and made to operate in the manner as set forth.

No. 24,541.—GILES CRAMTON, of Marshall, Mich.—*Improvement in Seed Planters*.—Patent dated June 28, 1859.—This improvement consists of a mode for regulating the distances each way at which the corn is to be planted, and for ensuring the correct planting of the first and subsequent hills in every row planted, by the use of a pair of cone pulleys, with an intermediate driver operating by friction, in connection with a system of spring stops W, the several parts being arranged and operated relatively to each other.

*Claim*.—The application and use of the pulleys P<sup>1</sup> P<sup>2</sup> P<sup>3</sup>, in combination with the adjustable hanger T, tension bar R, lever H<sup>2</sup> and yoke U, with its spring stops W W, the whole being arranged, constructed, and operated substantially as and for the purposes specified.

No. 24,542.—CALEB B. DAVIS, of Lawrenceburg, Tenn.—*Improvement in Machines for Sowing Fertilizers in Drills*.—Patent dated June 28, 1859.—The design of this machine is to put lime or any other kind of manure into the ground.

*Claim*.—The arrangement of hopper A, wheels B<sup>1</sup> B<sup>2</sup>, frame C C, handles D D, shoe E, handle of shoe H, pins on wheel b b, and axletrees G G, as described for the purposes set forth.

No. 24,543.—AURELIUS DICKINSON, of Claremont, N. H.—*Improvement in Apparatus for Purifying Gas*.—Patent dated June 28, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The washer constructed as described with horizontal plates B B corrugated, or with their bottoms partly or wholly concave, with upright plates projecting above and below said plates, and dipping into the water below said plates, and with orifices so arranged in the highest portions of the said horizontal plates as to cause the collection of the gas in the concave portions of the said plates below and around said orifices, substantially as described.

No. 24,544.—GEORGE DIEFFENBACH, of New York, N. Y.—*Improvement in Bases for Artificial Teeth*.—Patent dated June 28, 1859.—This invention consists in making a compound applicable to dental bases and to other articles, capable of developing and retaining color or color, s incorporated into the compound, while the same is in a soft state, after the curing or hardening of the same.

*Claim*.—The composition of matter consisting of sulphate of alumina and other ingredients, substantially as described for the purposes set forth.

No. 24,545.—GEORGE DIEFFENBACH, of New York, N. Y.—*Improvement in the Process for Coloring Artificial Teeth*.—Patent dated June 28, 1859.—This invention consists in coloring a certain composition of matter, of which sulphate of alumina forms an indispensable ingredient, by incorporating the color into the composition while in its plastic or uncured state, and by developing the said color in the cured or hardened composition through the agency of solar light.

*Claim*.—Developing the color of a curved or hardened composition, by the agency of solar light, when the coloring matter is incorporated into the said composition while in its plastic or uncured state, substantially as described.

No. 24,546.—WILLIAM T. DE GOLYER, of Schenectady, N. Y.—*Improvement in Connecting*

*Boards for Roofs, &c.*—Patent dated June 28, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—Covering the joints of boards or planks for roofing, by means of sheets of metal bent in the form shown at *a b c*, so that the strips of wood or other packing used shall lie on as well as against the flanges turned on said sheet metal, as represented.

No. 24,547.—JOHN H. DUHME, of Cincinnati, Ohio.—*Improvement in Furnaces.*—Patent dated June 28, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The arrangement of the flue spaces *A A*<sup>1</sup>, controlled by dampers *H* and *G*, for the purpose of increasing and perfecting the combustion, substantially as set forth.

No. 24,548.—J. HENRY FERGUSON, of Baltimore, Md.—*Improvement in Cartridges.*—Patent dated June 28, 1859.—The object of this invention is the production of a water proof and inflammable cartridge, adapted more especially to small arms. This object is effected by the application of a chemically prepared inflammable and water proof paper for the purpose of making the cartridge.

*Claim.*—A water proof and inflammable cartridge, made substantially as described.

No. 24,549.—BENJAMIN C. FITZHUGH, of Frederick, Md.—*Improvement in Harvesting Machines.*—Patent dated June 28, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The combination of a rake and reel revolving on the same shaft, when the rake is so made as to deliver the cut material in a line oblique to the swath of the machine, substantially as described.

No. 24,550.—MOSES R. FLANDERS, of Parishville, N. Y.—*Improvement in Grain Cradles.*—Patent dated June 28, 1859.—This invention consists in the novel mode of attaching the finger standard to the snath and bracing the fingers, whereby the several parts are rendered capable of being readily adjusted to suit the operator.

*Claim.*—Attaching the finger standard *B* to the snath *A* by means of the rod *C* and eye *b*, secured respectively to the standard and swath, in connection with the compensating or adjustable braces *H J*, the whole being constructed substantially as and for the purposes set forth.

No. 24,551.—PETER FONTAIN, of Philadelphia, Pa.—*Improvement in Gas Purifiers.*—Patent dated June 28, 1859.—This invention has for its object the regulating and cleansing of the stream of gas as it flows from the meter, in order that a steady current of pure gas may flow to the burner.

*Claim.*—The receptacle or receiver *E*, in combination with the filtering and purifying apparatus, arranged and operating substantially as described for the purpose set forth.

No. 24,552.—JOHN GALT, of Philadelphia, Pa.—*Improved Reciprocating Propeller.*—Patent dated June 28, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I claim combining the buckets *E E* and *E*<sup>1</sup> *E*<sup>1</sup> with the frames *D D*<sup>1</sup> and with the dividing rods *F F*<sup>1</sup>, or their equivalents, by means of cross heads *G G*<sup>1</sup> and *H H*<sup>1</sup>, link connections *f f f*<sup>1</sup>*f*<sup>1</sup>, and slots *c c c*<sup>1</sup>*c*<sup>1</sup> and *d d d*<sup>1</sup>*d*<sup>1</sup>, substantially as and for the purpose specified.

I also claim the construction of the propellers with the frames *D D*<sup>1</sup> of flaring form, and with their buckets fitted to the smaller front portions thereof, substantially as and for the purpose specified.

I also claim constructing the driving rods, each in two parts, one of which, connected with the buckets, is capable of being connected with, or disconnected from, the other at pleasure, for the purpose either of closing the buckets before the backward movement, and opening them before the forward movement of the propeller frame *D* or *D*<sup>1</sup> commences, or of causing the closing of the buckets before the forward, and the opening of them before the backward movement, as may be desired, and thereby enabling the action of the propeller to be reversed without reversing the engine.

No. 24,553.—W. H. GRAY, of Dover, N. H.—*Improvement in the Let Off Motion of Looms.*—Patent dated June 28, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The board plate *K* and springs *n n*, applied to the breast beam of the loom, and combined with a clutch, by which the yarn beam can be thrown into gear with the cam shaft or crank shaft of the loom, to operate substantially as and for the purpose described.

No. 24,554.—CHRISTIAN GINGRICH and JOSEPH K. GINGRICH, of Aunville, Pa.—*Improvement in Rotary Harrows.*—Patent dated June 28, 1859.—This invention consists in arranging clearers upon the weighted arm of a rotating harrow, so as to precede the traveller or fric-

tion roller which supports the weight and keeps the annular ring, upon which the traveller rolls, clear of dirt in using the harrow.

*Claim.*—The clearers H, in combination with the roller G and ring B, when arranged substantially as and for the purposes set forth.

No. 24,555.—C. P. GRONBERG, of Montgomery, Ill.—*Improvement in Raking Attachment for Harvesters.*—Patent dated June 28, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—The peculiar arrangement of the mechanism, namely: the reciprocating rack bar D and semi-circular toothed bar *d*, in connection with the bent rake shaft E, provided with a spring *h*, arm *m*, and part pinion G<sup>1</sup>; and semi-circular bar *j* on the support *e*<sup>1</sup>, provided with the teeth *k* and a projecting arm *n* for joint operation, substantially as and for the purpose set forth.

No. 24,556.—HEINRICH GUTH, of New York, N. Y.—*Improvement in Alcohometers.*—Patent dated June 28, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—An alcohol indicator, substantially such as described, by which the evaporation of a fixed quantity of alcoholic liquid is made to indicate the exact percentage of alcohol contained in the said liquid, for the purpose set forth.

No. 24,557.—JAMES HARRISON, JR., of New York, N. Y.—*Improvement in Machines for Making Upholstery Springs.*—Patent dated June 28, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, giving one or more of the forming rollers a positive rotary motion at a velocity which causes its or their periphery or peripheries to move faster than the periphery of that part of the mandrel in conjunction with it or them at any time in the operation, substantially as and for the purpose set forth.

Second. Connecting the axle of the roller *g*<sup>2</sup>, or any of the forming rollers, by a link and two universal joints, with a shaft having a longitudinally sliding and also a rotary motion, for the purpose of giving the said roller a rotary motion and a motion along the mandrel, and allowing it to accommodate its position to the varying diameter of the mandrel, substantially as described.

No. 24,558.—I. F. HOLLOWAY, of Saline Mines, Ill.—*Improved Ship's Capstan.*—Patent dated June 28, 1859.—The object to be obtained by this invention, is so arranging it that it can be readily lowered below deck and covered with a plate when it is not wanted, thus leaving the deck of the vessel clear.

*Claim.*—A capstan having a vertical movement, as well as a rotary one, substantially in the manner and for the purpose specified.

No. 24,559.—MARCUS L. HORTON, of Lebanon, N. H.—*Improvement in Stoves.*—Patent dated June 28, 1859.—This invention consists in so combining and arranging an elevated oven with a cooking stove, as that while the flame and hot products of combustion shall be made to pass entirely around and heat the oven, a current of air shall also be heated and made to pass around the oven to be conducted away for the purpose of giving warmth elsewhere; at the same time a portion of such heated air shall find its way into the oven to equalize its temperature and act as an absorbent of moisture.

*Claim.*—The ventilator I, with valve *h* and hood *g*, as arranged and in combination with chambers H H<sup>1</sup>, E E<sup>1</sup>, and flues G G, and D, operating as described and for the purpose set forth.

No. 24,560.—D. L. HUBBARD, Glastenbury, Conn.—*Improvement in Apparatus for Tanning.*—Patent dated June 28, 1859.—This invention consists in the use of a wheel or cylinder having a periphery formed of slats and placed within a proper vat, the whole being so constructed that the hides may be turned and all their parts may be properly exposed to the action of the tannin, and fresh bark added, as well as spent bark allowed to be removed from the liquor in the vat without agitating the liquor sufficiently to deteriorate it by the absorption of the oxygen.

The inventor says: I *claim* the wheel or cylinder B, having its periphery formed of oblique slats *c*, placed within the vat A, and arranged to operate as and for the purpose set forth.

I further claim in combination with the wheel or cylinder B, constructed as described, the apron C for the purposes specified.

No. 24,561.—WILLIAM G. W. JAEGER, of Baltimore, Md.—*Improvement in Apparatus for Condensing Coal Oils.*—Patent dated June 28, 1859.—This invention consists of certain improvements in the condensation of vapors in the process of distilling coal oil.

The inventor says: I *claim* the employment of a fan blower, when the same is used to draw the vapors from the retort in the manner and for the purpose set forth.

Second. And in combination with the fan blower or draft so used, I claim the escape pipe  $x$  and trap  $a^1$ , arranged and operating as set forth.

No. 24,562.—J. C. JEFFRIES, of Mount Vernon, Ind.—*Improved Bedstead Fastening*.—Patent dated June 28, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—The construction and application of a bedstead fastening formed with male and female plates  $a a, g g$ , figures 2 and 3, provided with tongues  $b b, h h$ , and hooks  $c c, i i$ , when arranged in combination with a post and rail, substantially in the manner as set forth and described.

No. 24,563.—EDWARD C. KNIGHT, of Philadelphia, Pa.—*Improvement in Arranging Couches in Railroad Cars*.—Patent dated June 28, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the mode of arranging berths or couches over backs of railroad car seats, substantially as set forth.

Second. I claim the manner of supporting the backs of the seats by slides E and rod F, for the purpose shown and described.

No. 24,564.—MELVIN W. KNOX, of Sheriden, N. Y.—*Improved Crosscut Sawing Machine*.—Patent dated June 28, 1859.—These improvements relate to a machine for sawing fire wood by hand power into suitable lengths for domestic use.

The inventor says: I *claim*, first, the arrangement of the several parts of a sawing machine, as herein described, whereby the operator can manage the sawing, elevating and depressing the saw and opening and closing the clamp without changing his position in relation to the machine.

Second. The guides O and blocks  $r$ , when arranged in combination with the saw, in the manner specified.

No. 24,565.—ISAAC W. LAMB, of West Novi, Mich.—*Improvement in Braiding Machines*.—Patent dated June 28, 1859.—This invention consists of a machine for the braiding of whip lashes and other articles, in a manner similar to that in which the braiding is performed by hand.

The inventor says: I *claim*, first, the combination of the two sets of shuttle carriers K K K<sup>1</sup> K<sup>1</sup>, rotating in opposite directions in concentric circles, and the shuttle changers N N<sup>1</sup>, having the movements described; the whole operating substantially as set forth.

Second. The construction of the shuttles, each with two openings  $r s$  and with a spring dog  $u$  entering both openings, to operate in combination with the inclined surfaces and stops of the shuttle carriers and shuttle changers, substantially as and for the purpose described.

Third. The combination with the shuttles of the nippers  $v v$  and their several appendages and appliances, by which their bite or friction upon the plaits are regulated and rendered uniform, substantially as and for the purposes described.

No. 24,566.—WILLIAM D. LUDLOW, of New York, N. Y.—*Improvement in Preserve Cans*.—Patent dated June 28, 1859.—This improvement consists in an arrangement and combination of the lugs and key by which the cover is held down.

*Claim*.—The described combination of the key D with the lugs E attached in the manner shown to the sides of a cavity  $a$  in the top of the can, in order to prevent the disruption of the said lugs during the act of closing the can, to avoid projections above or beyond the periphery.

No. 24,567.—WILLIAM H. MAIN, of Liverpool, Ohio.—*Improvement in Machines for Folding and Packing Wool*.—Patent dated June 28, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The herein named devices for rolling fleece into a compact cylindrical form, namely: the combination of the belt G, rod H, hooks I, and pins K, the same being operated by means of the windlass E and screw S, in the manner and for the purpose set forth.

No. 24,568.—GARDINER MAYNARD, of Ilion, N. Y.—*Improvement in Cultivator Teeth*.—Patent dated June 28, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—The arrangement of the tooth A, stay C, and wrought iron stem and brace B, when the stem is welded between the wings of the tooth and made to form a brace, substantially as set forth, the whole being constructed and used in the manner specified.

No. 24,569.—CHARLES MCBURNEY, of Roxbury, Mass.—*Improvement in Packing for Stuffing Boxes of Pistons*.—Patent dated June 28, 1859.—In describing this improvement, the inventor says: I take 25 pounds of India rubber, 2 pounds of sulphur, and from 4 to 8 pounds of silica or plumbago. With this compound, after it is suitably ground and mixed, canvas,

or other suitable fabric of cotton, or linen, or hemp, is coated upon each side, and a sufficient number of plies of such fabric are united by a heavy pressure or by rolling.

*Claim.*—A packing for stuffing boxes, composed of canvas or India rubber, as set forth.

No. 24,570.—SAMUEL MILLS and GEORGE E. MILLS, of New York, N. Y.—*Improvement in Machines for Pulverizing Minerals.*—Patent dated June 28, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—A series of circular grooved and roughened metallic plates, working upon their edges, side by side, in a trough or cylinder, the circle being larger than the plates, which having an alternating motion in combination with each other and the cylinder, and in connection with the rock shafts and levers for operating the same, substantially as described, and for the purposes set forth.

No. 24,571.—THOMAS MITCHELL, of Lansingburg, N. Y.—*Improved Machine for Finishing Hair Brush Handles.*—Patent dated June 28, 1859.—This invention consists in the use of rotating cutters, guards and guides, and clamps, combined with patterns, the whole being arranged whereby the backs or stocks of brushes may, by manipulation, be shaped and cut in proper form.

The inventor says: I *claim* the rotating cutter wheels D D and guards and guides F, in combination with the clamps G K, provided with patterns H H<sup>1</sup>, arranged substantially as and for the purpose set forth.

I also claim centring the unfinished brushes in the clamp G by means of the bristles *i*, in connection with the strip or plate J and the inner edge of the pattern H or its extension H<sup>2</sup>, substantially as described.

No. 24,572.—MARIE HELOISE NICOLAS and LOUISE JOSEPHINE CHAMPAGNE, of Thibodeaux, La.—*Improvement in Defecating Sugar Juices.*—Patent dated June 28, 1859.—This invention consists in the employment, in the bleaching and defecating of sugar juices, of the combination of sulphur and lime.

*Claim.*—The employment, in the bleaching and defecating of sugar juices, of the described combination of sulphur and lime, prepared in the manner substantially as set forth.

No. 24,573.—HENRY S. NORTH and JOHN O. COUCH, of Middletown, Conn.—*Improved Animal Trap.*—Patent dated June 28, 1859.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, the combination of the many chambered cylinder A with the breech pin C by means of a central counter-bore in the said cylinder meeting the chambers *a a*, and a groove or recess *c* all around the end of the breech pin, substantially as described, whereby communication is made between the chambers of the cylinder and all are enabled to be fired at once with a single vent.

Second. Fitting the hammer in the form of a ring to slide along the exterior of the breech pin C, as described.

Third. The combination, with the hammer applied to slide along the exterior of the hollow breech pin, of a rod B, sliding through the centre of the cylinder and within the breech pin, and a spring sear *j* attached to the said rod and working through a slot K in the breech pin, substantially as described.

Fourth. The combination with the hammer applied outside of the hollow breech pin of a collar *g*, or its equivalent, applied within the breech pin, and having pins or cars *h h* projecting through slots *i i* in the sides of the breech pin behind the hammer, and a helical spring F applied within the breech pin behind the said collar, or equivalent, substantially as described.

Fifth. The extension of the central rod B which carries the sear directly through the cylinder and through the hollow breech pin, so that it may be operated either by a pull at its front end or by a push at its rear end, substantially as described.

Sixth. In combination with the many chambered cylinder A, hollow breech-pin C, hammer E, central rod B, sear *j*, and spring F, and collar *g*, as described, we claim the stock D and trigger *p*, applied as described, to make a weapon that can be baited and set for shooting game by the seizure of the bait, or that can be used in the hand like an ordinary pistol or firearm, as set forth.

No. 24,574.—CHARLES PECK, of New Haven, Conn.—*Improvement in Tool Holders for Lathes.*—Patent dated June 28, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of the tool rest *g* with the segment *i*, or their mechanical equivalents, so as to elevate or depress the cutting instrument, when arranged substantially in the manner and for the purpose described.

Second. I claim the T slotted bed plate, with the tool rest *g* connecting the tool posts *d d*, when combined substantially in the manner described, so as to allow the cutting tool to be placed at any required angle horizontally.

No. 24,575.—GEORGE RACE, of Norwich, N. Y.—*Improved Clothes Dryer*.—Patent dated June 28, 1859.—This invention consists in the employment of a hollow post, which incloses the arms on which the materials to be dried rest, together with devices for raising, extending, and lowering said arms.

The inventor says: I *claim*, first, the employment of a hollow post enclosing the arms of the reel, in which the arms may be elevated and depressed through its top, in the manner and for the purpose set forth.

Second. The combination of the sliding head H and the arms D, hinged to said head at their lower extremities, and connected by cords, or other equivalent connection, at their upper extremities, substantially as and for the purpose described.

Third. The combination with the foregoing of the cord and pulleys, the pinion *m*, rack F, and latch *t*, for elevating and securing the head H in the hollow post, when the whole is constructed and operated substantially in the manner set forth.

No. 24,576.—WILLIAM RAYMOND, of Marlboro', N. H.—*Improved Machine for Driving Hoops, on Pails, &c.*—Patent dated June 28, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The employment of a driver, when either fixed or turning loosely in its bearings, and operated by means of a jointed lever or otherwise, so as to press against and drive the hoop upon the tub when a rotary motion is given to said tub, as described.

No. 24,577.—WILLIAM RESOR, of Cincinnati, Ohio.—*Improvement in Cooking Ranges*.—Patent dated June 28, 1859.—This invention relates to certain improvements in regulating the draft in cooking ranges and stoves.

*Claim*.—The peculiar construction of the plate A B, which constitutes the upper plate of the stove, forming as it does the plate of the stove, the arched roof of the damper chamber, and part of the chimney pipe, in the manner and for the purpose set forth.

No. 24,578.—DELOS E. RICE, of Detroit, Mich.—*Improvement in the Mode of Lifting Stamps for Crushing Ores*.—Patent dated June 28, 1859.—This invention consists of a box, or band B B, Fig. A, and in the section figure S, which moves freely up and down upon the stem, or rods R R, attached to the stamp head P. Between the rods R R, and inclosed in the box, or band *b b*, are three wedges, as seen in the section figure S.

*Claim*.—The application of the folding wedges *c c* and *w*, in combination with the band *b b*, or their equivalents, substantially as described, thereby producing as desired a uniform lift of the rods together with the stamp head.

No. 24,579.—ALEXANDER RICKURT, of Schoharie, N. Y.—*Improved Machine for Turning Hubs*.—Patent dated June 28, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the graduated scale 1, in combination with the index 2, and the sliding frame and hub blank and mandrel, operating in connection with the cutters, in the manner and for the purpose described.

Second. I claim the constructing the sliding sleeve with an opening at the angle, so as to slide over and upon the large cutter on the shaft, so as to cut any required size of hub without change of knife, as described.

And I claim the constructing the sliding sleeve (or cutter and stock) to pass over and mask the fixed knife on the shaft, in connection and combination with the making one of the sides of the sleeve thicker and heavier than the other, in order to approximate to an equipoise of the shaft.

Third. I claim the setting and adjusting (by means of the slot and screw bolt in 19) the arm 18, so as to cut any required length of hub, and so arranged upon the bar 19 as to allow it to vibrate, for the purpose of bringing up the cutters to the hub, or throwing them back when required, and without interfering with the screw or the adjustment of the arm.

No. 24,580.—WILLIAM I. RIVERS, of Sumpter District, S. C.—*Improvement in Cotton Cultivators*.—Patent dated June 28, 1859.—This plough is to enable the planter to thoroughly pulverize the land, breaking up the clods of earth, at the same time tearing out all grasses of all kinds, being more especially adapted to the joint grass, with which some cotton lands are infested, and at the same time making the drill in which the cotton is to be planted.

*Claim*.—The handles 1, helves 2, beam 3, foot bar 10, plough 20, harrow 45, roller frame 6 7, and roller 8, when the whole are arranged for joint operation, as described and for the purpose set forth.

No. 24,581.—CHARLES B. SAWYER, of Fitchburg, Mass.—*Improved Apparatus for Heating, Cooking, and Ventilating*.—Patent dated June 28, 1859.—By means of the dampers and flues connected with the range and oven, all vapors arising from the process of cooking are conveyed at once to the chimney, and are therefore prevented from mixing with the air by which rooms are warmed, so that by the use of this combined furnace, range, and ventilator

the air passing through the rooms may be fresh and 'pure, even through the process of cooking.

*Claim.*—The combination of the oven O and range e, with the fire pot d, fire flues T, and warm air pipes P Q S, substantially as described.

No. 24,582.—PHILO B. SHELDON, of Prattsburg, N. Y., assignor to Himself and I. T. UPSOM, of Huron, N. Y.—*Improved Broom Clasp.*—Patent dated June 28, 1859.—The claims and engravings explain the nature of this invention.

The inventor says: I *claim* the feathers or ribs g g in combination with the screw threads of the shanks ff, and with the handle D constructed as described, for the purposes specified.

I also claim the combination of the conical screw shanks ff, conical screw ferrule s, and screw bolts and nuts m n, arranged substantially as and for the purpose set forth.

I also claim the wires B B attached to the jaws A A, and arranged in combination therewith, in the manner and for the purpose described.

No. 24,583.—ADON SIDDALL, of Ransom, Mich.—*Improvement in Corn Huskers.*—Patent dated June 28, 1859.—This machine is designed to shell corn, either wet or dry, large and small, with the same facility; and the cobs are discharged from the machine separate from the corn.

*Claim.*—The arrangement of the stirrup M, with the levers J J for operating the adjustable sliding pressure bar H, in the manner described for the purpose set forth.

No. 24,584.—WILLIAM SKENE and ROBERT SKENE, of Louisville, Ky.—*Improvement in Power Pulley Presses.*—Patent dated June 28, 1859.—This invention consists in arranging a scroll with a conical right and left hand screw windlass, in such relation to the follower of a press, that a weight attached to a rope, which runs over the scroll, acts by means of ropes running from one follower over a series of pulleys to the other follower, and to the conical windlass with continually increasing power, so that a substance placed between the two followers of the press is subjected to a long continuing and ever increasing pressure; and the scroll, together with the conical windlass, is arranged on a shaft which has its bearings on slides attached to the upper follower, so that the weight of these parts assists in doing the work.

The inventors say: We *claim*, first, the arrangement of the scroll D, and the conical windlasses E E<sup>1</sup>, to operate in combination with the windlass H, and with the two followers B B<sup>1</sup>, or their equivalents, substantially as and for the purpose specified.

Second. Arranging the scroll D and the windlasses E E<sup>1</sup>, or their equivalents, on slides C, which are rigidly attached to the upper follower B, so that the weight of those parts assists in increasing the pressure on the substance placed between the two followers, substantially as described.

Third. The arrangement of the two followers B B<sup>1</sup>, with pulleys k k<sup>1</sup> and l l<sup>1</sup>, to operate in combination with the scroll D, the cone windlasses E E<sup>1</sup>, and the ropes d and e e<sup>1</sup>, substantially as and for the purpose set forth.

No. 24,585.—WILLIAM SKENE and ROBERT SKENE, of Louisville, Ky.—*Improvement in Power Gear Presses.*—Patent dated June 28, 1859.—This invention consists in arranging a windlass and a scroll, or fusee, in combination with a series of gear wheels and pinions, and with a rack toothed on both sides in such a manner that by means of a weight suspended from a rope which extends from the windlass to the scroll, a progressive power is created on a follower attached to the lower end of the rack, so that the substance placed between the follower and the press bottom can be exposed to an ever increasing power during a certain period of time.

*Claim.*—The arrangement of the windlass J, the weight L, the scroll I, and the pinion H, to operate in combination with the cog wheel G, the pinions E and E<sup>1</sup>, the double rack D, and the follower B, substantially as and for the purposes specified.

No. 24,586.—M. D. SNYDER and S. A. SNYDER, of Clarendon, N. Y.—*Improved Carpet Fastener.*—Patent dated June 28, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—An improved carpet hook, consisting of the barbed shank a, gauge notch d, throat c, and rectangular clinching hook b, all constructed and combined substantially in the manner and for the purposes shown and described.

No. 24,587.—JOHN L. STEWART, of East Boston, Mass.—*Improvement in Retorts for Distillation of Coal.*—Patent dated June 28, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* my improved revolving web retort, constructed not only with its induction and eduction openings arranged at or near one end of it, but with an endless or other proper carrier, made so as to operate to receive the coal or matter to be distilled from or near one end of the retort, and carry or force the same toward the opposite end thereof,

and from thence backward toward the front end, and there discharge such, the same causing the coal or matter to be distilled to pass twice through the retort or carbonizing chamber, in manner and for securing advantages specified.

And furthermore, I claim, in combination with the retort, or its discharging mouth, a water sealing trough and an endless carrier to operate in such trough, substantially as specified, to receive or carry away from the retort the discharged coke or products, the water of the trough, under such application of it to the discharging mouth, serving to furnish vapor or steam to the retort in manner and to effect an advantage in the distillation of the coal or matter therein, as specified.

No. 24,588.—J. C. STODDARD, of Worcester, Mass.—*Improvement in Machines for Making Hay*.—Patent dated June 28, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—Arranging the rakes in radial slots between the two drum heads K, and fixing them therein, so as to serve the purpose of a hay making and, by a simple change, a hay raking machine, substantially in the manner set forth.

No. 24,589.—JOSEPH SOUTER, of Chicago, Ill.—*Improvement in Apparatus for Drying Grain*.—Patent dated June 28, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—The drying of grain by means of heated air within a vertical cylindrical chamber, which is provided with a series of tapering rims *r* and a central shaft *y*, which is armed with a series of winged scattering wheels *w*, when a fan or some other equivalent means is employed for producing an upward current of heated air through the said chamber, in the manner set forth.

No. 24,590.—GEORGE S. G. SPENCE, of Boston, Mass.—*Improved Apparatus for Heating Buildings*.—Patent dated June 28, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—The arrangement of the elevated sides of the boiler in combination with the pipe H, or its equivalent, depressed within the same, for heating and distributing the air, in the manner and for the purpose set forth.

No. 24,591.—A. G. STIPHER, of Richmond, Ind.—*Improvement in Harvesting Machines*.—Patent dated June 28, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim*, first, the employment or use of the tilting spring raker D in combination with the sliding raker frame *d*, constructed and arranged substantially as and for the purposes set forth.

Second. Operating the raker frame *d* and raker D by means of the reciprocating bar F F<sup>1</sup> through the medium of the rack F<sup>2</sup>, cog wheel *j*, pulley *g*, and cord *g*<sup>2</sup>, all being arranged substantially as and for the purposes set forth.

Third. In combination with the raker D, the sliding trap doors E, operated by means of the levers G, springs *k*, and cams *b*, substantially as and for the purposes set forth.

No. 24,592.—A. H. TAIT, of New York, N. Y., assignor to GEORGE B. HARTSON, of said New York.—*Improvement in Defecating Sugar Juices*.—Patent dated June 28, 1859.—The claim explains the nature of this invention.

*Claim*.—The employment of the sulphate of tin, applied in the manner substantially as described, for defecating cane juice and sirups, as set forth.

No. 24,593.—RICHARD P. THOMAS, of Syracuse, N. Y.—*Improvement in Frames for the Manufacture of Soap*.—Patent dated June 28, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—Lining soap frames in ordinary use with flexible metallic plates, substantially in the manner and for the purpose set forth.

No. 24,594.—CALVIN G. UDELL, of Morris, Ill.—*Improvement in Corn Planters*.—Patent dated June 28, 1859.—The measuring rods, marker, and guide are braced by cords, one of which is tied to a screw in one of the short tubes and passes to the top of the rod M, around which it is wound, thence to a screw in the other short tube.

Another cord P is tied around the front ends of the measuring rods and the rod M, and extends to the standard I I, to which it is tied near the top of the seed box.

The inventor says: I *claim*, first, the arrangement of the grain box A, tubes B B, connecting bars E E, and legs I I, the whole being constructed and operated substantially in the manner set forth.

Second. In combination with the above, I claim the measure L L, marking rod M, and guide K, the whole being constructed and operated substantially in the manner and for the purpose set forth.

No. 24,595.—THOMAS F. WAGONER, of Trenton, N. Y.—*Improvement in Machines for Hulling and Scouring Grain.*—Patent dated June 28, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The combination of two surfaces, one of which is elastic and the other hard, when the planes of said surfaces are placed on a plane with the horizon, and one of them having a circular motion for the purpose of hulling and scouring grain, substantially as set forth.

No. 24,596.—H. L. WATTS, of Chester, Mass.—*Improved Horse Shoe Machine.*—Patent dated June 28, 1859.—A is the bed plate, or horizontal frame, which carries the working parts of the machinery; B is a carriage to which the die C for forming the interior of the shoe is attached, said carriage resting and travelling on a planed surface provided for it on the bed plate A, and being confined thereto by tongs *a a* on its sides, fitting to grooved ways *b b* provided in the bed plate.

*Claim.*—The arrangement and combination of the slotted carriage B, the die C, and the rollers J, as and for the purpose shown and described.

No. 24,597.—JOHN YOUNG, of Joliet, Ill.—*Improvement in Rotary Cultivators.*—Patent dated June 28, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—The arrangement and combination of a skeleton or open rotary ploughing cylinder, when the mould boards therefor are set tangential and extend from end to end of the cylinder in a straight or oblique direction, in combination with a rotary shaft or circular edged disk, the whole being operated substantially as and for the purposes set forth.

No. 24,598.—McCLINTOCK YOUNG, Jr., of Frederick, Md.—*Improvement in Harvesting Machines.*—Patent dated June 28, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* combining the handle S of the rake C with the shaft R by means of the supporter *c*, the shaft arms *g g*, the crank *e*, the pitman *h*, and the pitman *i*, and in such a manner that the rotation of said shaft will steadily and positively impart the desired movements to the rake, substantially as set forth.

I also claim the combination of the cams D D<sup>1</sup> and the guides *a b*, or either of them, with the above described mechanism for operating the rake, constructed and arranged in the manner and for the purposes substantially as described.

No. 24,599.—EDMUND B. CHEREVY, of New York, N. Y., assignor to Himself and THOMAS W. WEATHERED, of said New York.—*Improvement in Furnaces.*—Patent dated June 28, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the hollow dome *k* over the fire, in combination with the dome *h*, in the manner and for the purpose specified, whereby the heat ascends into said dome *k* and then passes away between the domes *h* and *k*, heating the circulating water, as specified.

I also claim the thimbles *o o* passing through the flanges 2 and 3, and forming openings for the circulating water, substantially as specified.

No. 24,600.—SAMUEL CLARK, of New York, N. Y., assignor to WILLIAM OLAND BOURNE, of said New York.—*Improved Mode of Imparting Motion to a Sifting Apparatus.*—Patent dated June 28, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim*, first, the imparting a short, quick, or jarring motion to a sifting apparatus, or machinery of any kind, where such motion is desirable, by means of an oscillating, vibrating, or reciprocating weight, brought, at the end of its motion, into contact with the said apparatus or its attachments, the same being arranged and constructed in the manner described at *d e f h* and *i*, or its equivalent.

Second. Suspending the object to which the motion is applied by means of a suspending or supporting link or rod, with concave bearing parts uppermost at both ends, and convex bearing parts undermost, constructed as set forth at *l m n k* and *r*, or in an equivalent manner.

No. 24,601.—DANIEL FOREMAN, of Navarre, Ohio, assignor to Himself, G. W. SWERINGEN, and JONATHAN PENoyer, of said Navarre.—*Improvement in Seeding Machines.*—Patent dated June 28, 1859.—On the shaft D a crank *f* is formed, said crank being connected by a rod *g* with a slide E, the upper end of which is fitted in a case or guide box F attached to the back side of the seed box C. The slide E is formed of a semi-cylindrical bar, the upper part of which is hollow, and a recess *h* is made in its outer or convex side to form a cap. In the upper and hollow part of the slide a plate *i* is placed, the lower end of said plate projecting over the recess or cap *h*.

*Claim.*—The arrangement and combination with the interior of the peculiarly formed hollow slide E of the adjustable plate *i*, substantially as and for the purposes shown and described.

No. 24,602.—WILLIAM H. GRAY, of Dover, N. H., assignor to Himself and LUTHER ROBINSON, of Melrose, Mass.—*Improvement in Let Off Motion for Looms.*—Patent dated June 28, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, combining the clutch *h h i i*, or its equivalent, by which motion is imparted to the let off mechanism, with the yarn beam by means of a worm gear *d* on the yarn beam and an endless screw *e* and spring *g*, applied, substantially as described, to the shaft E, which controls the rotation of the beam, and operating as set forth.

Second. In combination with the worm gear *d*, endless screw *e*, and spring *g*, applied as described, I claim the lever H applied between the said spring and the surface of the yarn on the beam, and operating substantially as specified.

No. 24,603.—LEVI C. JOHNSON, of Buffalo, N. Y., assignor to Himself and JOSIAH B. SMITH, of said Buffalo.—*Improved Portable Door Fastener*.—Patent dated June 28, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The sliding bar D, including the plate F, when so constructed as to form the slot H, and so connected and arranged with the plates A and A<sup>1</sup> and bolt B as that when placed in the door for use the bar D will stand at right angles with the bolt B, and when folded for carrying in the pocket the plate F will cover the teeth or spurs of the plate A, substantially as described.

No. 24,604.—EBENEZER G. POMEROY, of New York, N. Y., assignor to JULIUS R. POMEROY, of Brooklyn, N. Y.—*Improvement in the Method of Protecting Iron from Oxidation*.—Patent dated June 28, 1859.—The claim will explain the nature of this invention.

*Claim*.—The preparation of iron by corroding or oxidizing its surface for the express purpose of making the same rough and capable of being closely and firmly united with the covering of fire-proof paint by means of rolling, or other mechanical force, and the application of other processes, as described, to iron so prepared in combination therewith.

No. 24,605.—AUSTIN POTTER, of Williamson, N. Y., assignor to Himself and JOEL W. NORTON, of said Williamson.—*Improvement in Grain Separators*.—Patent dated June 28, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim* the application of the adjustable slide board D to the endless riddle E in such a manner that the grain and straw can be made to impinge upon the end, or more open meshes of the same, or upon the top, thereby varying and adapting the action to the quantity of grain and straw, and employing the force with which it leaves the cylinder as a means of separating the two, substantially as and for the purposes described.

I also claim the combination and arrangement of the parts consisting of the fan H, self vibrating riddle E, with pulleys *u x* driven directly from the cylinder B, elongated shaker and board R G, and intermediate adjustable slide board D, operating conjointly, substantially as described, to form a portable, cheap, and effective separating attachment of threshing machines, as set forth.

No. 24,606.—CHARLES A. STEBBINS, of Boston, Mass., assignor to Himself and REUBEN J. TODD, of said Boston.—*Improvement in Apparatus for Oiling the Cylinders and Pistons of Steam Engines*.—Patent dated June 28, 1859.—This invention consists of a hollow vessel or reservoir A, carrying within it a force pump, the barrel of which is exhibited at B and the piston thereof at C. The said pump is furnished with an induction valve *a*, and an eduction valve *b*. The latter valve opens downward, and under ordinary circumstances is pressed towards its seat *d*, by means of a spring *c*.

*Claim*.—The combination of the lifter *f* and tubular holder *h*, or their equivalent or equivalents, with the valve *b* and the piston C, the whole being constructed and applied together and to a reservoir A and its pump barrel B, substantially in the manner and to operate as specified.

No. 24,607.—DEMAS S. BARNES, of New York, N. Y.—*Improved Furniture Caster*.—Patent dated July 5, 1859.—This invention consists in constructing the ball of the caster to run on an axle supported by a framework covering, but not touching the top of the ball, and said framework is to rest against the bottom of the object to be supported at a single point, to facilitate the horizontal rotation of the framework and ball, the whole being enclosed in a conical or cylindrical case.

*Claim*.—The spherical roller B, with its axle running in the framework C C, in combination with the two convex surfaces E and F, or with the convex and concave surfaces E and F, so as to enable the same readily to revolve on a vertical axis, the whole being constructed, combined, and enclosed in the tube or case A, substantially as herein described, and for the purposes set forth.

No. 24,608.—BENJAMIN BILLINGS, of Macedon, N. Y.—*Improved Water Wheel*.—Patent dated July 5, 1859.—This improvement consists in making the crown A and wheel B conical, in such a manner that the sluices or guide curves *g g* of the one, and the channels *h h* of the other, shall have an inclination downward and outward, the channels being in continuation of the sluices, as represented in the engraving.

*Claim.*—The conical crown A and conical wheel B, constructed and combined substantially in the manner and for the purposes specified.

No. 24,609.—LEWIS BISHOP, of Talladega, Ala.—*Improvement in Cotton Harvesters.*—Patent dated July 5, 1859.—This invention consists in the employment of a series of endless picker chains, placed on a revolving cylinder and used in connection with a revolving stripping brush, the above parts being attached to a cart or to a box mounted on wheels, so that as the cart is drawn along the cotton will be picked from the bolls by the picker chains, and the cotton stripped therefrom by the revolving brush, and deposited in the box on the body of the cart.

*Claim.*—The endless picker chains F, placed on the cylinder E, in connection with the brush cylinder D, the above parts being attached to a cart or to a box or receptacle A, mounted on wheels, and the whole arranged to operate as and for the purpose set forth.

No. 24,610.—SNOWBALL BOTTERILL, of Westmoreland, N. Y.—*Improvement in Hooks for Whiffletrees.*—Patent dated July 5, 1859.—E is a spring button or bolt, with a head which plays back and forth within the chamber F of the barrel C, and is held against the ends of hooks D D, an helical spring G, which presses respectively against the button E and piece H.

*Claim.*—The combination and arrangement of hooks D D and spring button E, in the manner and for the purposes set forth.

No. 24,611.—HENRY W. BOWEN, of Providence, R. I.—*Improved Wind Engine.*—Patent dated July 5, 1859.—This invention consists in the employment of a series of horizontal pivoted sails, placed in a frame, having certain mechanism connected with them and arranged so that the wind acting upon the sails is made to give, in connection with the weights or springs, either or both, a reciprocating movement to the device, and an engine is obtained for transmitting power by the action of the wind.

*Claim.*—The frame D, provided with sails E, and attached to the shaft C, in connection with the bent lever G, connected with the sails by the rods F and arms b, the links H, spring rod I, and the weight J and spring K, or their equivalents; the whole being arranged substantially as and for the purpose set forth.

No. 24,612.—ROBERT BROWN, of Stroudsburg, Pa.—*Improved Washing Machine.*—Patent dated July 5, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—The arrangement in the trough E of the chambers S S, and transverse strips h h with the bars a a, when the chambers stand behind the strips, and the strips are placed in such a relation to the bars a a that they will pass between them, and thus at the same time press and rub the clothes, the several parts being constructed and operating substantially in the manner and for the purpose set forth.

No. 24,613.—THOMAS B. BUTLER, of Norwalk, Conn.—*Improvement in Harvesting Machines.*—Patent dated July 5, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—The employment of the cams and guides S, for the purpose of giving a forward and backward motion to the cutter bar and cutters, substantially as set forth.

No. 24,614.—W. I. CANTELO, of Burlington, New Jersey.—*Improved Method of Reducing Wood, &c, to Sawdust or Finer Grains.*—Patent dated July 5, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—Reducing glutinous fibrous, and other tough materials, to powder, by placing the ends of blocks of the same opposite to and in contact with each other, and presenting them simultaneously, and at the point of junction, to the edge of a circular or reciprocating saw, with the aid of the appliances described, or any equivalent to the same.

No. 24,615.—MICHEL CELERIER, of Philadelphia, Pa.—*Improvement in Machinery for Webbing Single Strands of Thread.*—Patent dated July 5, 1859.—B is the bobbin containing the single thread; C, the bobbin containing the thread when tripled; D D D, the car; E, a bell shaped pulley connected by a compound lever G G G with a handle F, and H a fork connected by a lever with a handle J.

*Claim.*—The combination of the pulley E, the sliding car D D D, the fork H H, and the eyepiece L, arranged and operating substantially as described, for preparing silk for making twist.

No. 24,616.—CHARLES CLARENI, of New York, N. Y.—*Improved Wrought Nail Machine.* Patent dated July 5, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim* the combination of the top and side hammers and vibratory anvil, substantially as described, so as to form two or more nails at a time without turning the rod, as specified.

I also claim the apparatus for connecting the driving shaft with the top hammer, by which it receives its motion in a proper manner, as specified.

I also claim the connection of the side hammers with the driving shaft to produce the requisite motions thereof, and allow said hammers to be raised and lowered, as and for the purposes set forth.

I also claim the arrangement and operation of the cutter, as described, for severing the nail from the rod.

No. 24,617.—ISAAC COOK and JOHN T. BEVER, of Haynesville, Mo.—*Improvement in Ploughs*—Patent dated July 5, 1859.—This invention consists in the combination of a double pointed reversible mould board A B C, made without landside bars, and of a revolving landside wheel D, which has a circular cutting plate E attached to its landside face.

*Claim.*—The combination and arrangement of the sharp edged landside wheel D E with a reversible, double pointed mould board A B C, which has no landside bars, substantially as and for the purposes set forth.

No. 24,618.—GEORGE H. CORLISS, of Providence, R. I.—*Improvement in Steam Engines.*—Patent dated July 5, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim* imparting to the liberated slide valve of steam engines their closing movements by springs, so connected with the valve gear that whilst these springs impart the same initial force to the valves, at every operation, the expansive force, which these springs exert, varies with every change in the range of movement given to the valves.

I also claim imparting to the liberated slide valves of steam engines their closing movements, by springs combined with a curved moving support, in such manner that the spring applies itself tangentially to the said support, and that the effective length of the spring varies with the tensive force which it exerts.

No. 24,619.—B. M. DORR, of Kewanee, Ill.—*Improved Method of Opening and Closing Farm Gates.*—Patent dated July 5, 1859.—This invention consists in arranging under the gate a pinion which engages with two racks on opposite sides, said racks to be connected by means of suitable levers and rods with the two panels of a sliding gate, so that by giving the pinion an oscillating motion, the two panels slide to or from each other in opposite directions. By this invention gates are opened or closed as the wheels of vehicles pass over the pinion.

*Claim.*—The arrangement of the pinion  $i$ , the toothed racks  $n n^1$ , and the levers  $d d^1$ , to operate in combination with the slotted rods K K<sup>1</sup> and the crank levers E E<sup>1</sup>, for the purpose of opening and closing the gate A A<sup>1</sup>, substantially as described.

No. 24,620.—EPES E. ELLERY and JOHN F. ELLERY, of New York, N. Y.—*Improvement in Water Proof Paints.*—Patent dated July 5, 1859.—The inventors say: We take 12 pounds of India rubber and dissolve it by heat in 6 gallons of linseed oil. We then take 12 pounds of gutta percha and dissolve it by heat in 12 gallons of linseed oil. These articles are then mixed together, and into the mixture thus obtained we put 3 gallons of shellac varnish—made by dissolving 6 pounds of gum shellac in 3 gallons of alcohol—and the mixture is then thoroughly incorporated by stirring. From 2½ to 3½ gallons of this mixture is then mixed with 100 pounds of coloring matter, such as is needed, by passing the whole through a paint mill.

*Claim.*—The composition prepared and composed of the materials as described, in the proportion set forth, for the purpose of making water proof paint.

No. 24,621.—H. C. EMERY, of Lincoln, Ohio.—*Improvement in Mills for Crushing Cane.*—Patent dated July 5, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—The adjustable shafts of the rollers in slide bearings, at top and bottom, operating them in a rectilinear frame, in a direct manner for giving a wedge pressure, providing them near their top with flanges and a groove and a bevel on their bottoms, from the periphery toward the shafts, substantially as described, the several parts standing in the relation to each other as specified, for the purpose set forth.

No. 24,622.—A. L. FLEURY, of Baltimore, Md.—*Improvement in Lamps.*—Patent dated July 5, 1859.—This invention relates to certain improvements in devices for burning coal and other oils, by means of which intense heat may be produced, without the generation of smoke.

The inventor says: I *claim*, first, the quick lime cones  $c c^1$ , or their equivalents, arranged substantially as described, for the purposes set forth.

Second. In combination with the above, I claim the flanged cap  $n n^1 n^2$ , substantially as described.

No. 24,623.—REUBEN FRETZ, of Montville, Ohio.—*Improved Machine for Finishing the Exterior of Rims of Carriage Wheels.*—Patent dated July 5, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim* combining, in the arm that gauges the plane, devices for varying the height of the radial arm, with the devices for varying its length, so as to enable the operator to dress a wheel straight or square across the edge, substantially as described.

I claim making the arm or bar K, which guides the plane in the arc of a circle, to vibrate in the stock, so as to adjust and fasten it in the position desired.

No. 24,624.—P. W. GATES, D. R. FRASER, and THOMAS CHALMERS, of Chicago, Ill.—*Improvement in Cut Off Gear for Steam Engines*.—Patent dated July 5, 1859.—The claim and engraving explain the nature of this invention.

The inventors say: We *claim* the combination of the two levers D D<sup>1</sup>, and their dogs E E<sup>1</sup>, the lever or levers C, and its or their teeth b b<sup>1</sup>, and the eccentric curved plate or plates H, the whole applied to the stem or stems of the valve or valves, to operate substantially as set forth.

And we also claim, in combination with the said levers, teeth and dogs, and the eccentric curved plate or plates of the arm j on the valve stem, and the spring or stationary curved surface K, applied and operating together substantially as and for the purposes specified.

No. 24,625.—IRA GLYNN and MIKEL BOROWSKY, of Placerville, Cal.—*Improved Machine for Cutting the Ends of Billiard Cues True*.—Patent dated July 5, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—The application of the reversed A knife or cutter E, and the spring jaws c c, for holding the cue so as it can be cut off square for the leather; these jaws will open or close to suit the size of the cues, the whole as set forth in our specification.

No. 24,626.—GEORGE P. GORDON, of New York, N. Y.—*Improved Printing Press*.—Patent dated July 5, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, taking the sheet from the feed board by grippers or their equivalents, and presenting it directly to or upon the form of types, thence conveying it to the place of impression, so that it may be printed.

Second. The combination of a reciprocating bed with a set of sheet receiving grippers, so that the movements of the bed may control the action of the grippers, in order that the sheet may be taken from the place of feeding to the place of printing by such grippers.

Third. The combination of a vibrating platen, having a stationary or fixed axis upon which to vibrate, with a reciprocating bed.

Fourth. The combination of a set of sheet piling grippers, which will peel or take the printed sheet from the face of the type and pile it on its place of deposit, with a reciprocating bed operating substantially as described.

Fifth. By use of automatic grippers, piling the sheets directly before or in front of, and under the eye of the operator, so that he may at once detect any imperfection in the impression.

Sixth. The combination in one and the same machine of a set of grippers to take the sheet and carry it to the place of printing, with another set of grippers to take the sheet from the form and pile it, substantially as described.

Seventh. The arrangement and construction of a chase, as described, in combination with the piling grippers, substantially as set forth.

Eighth. The giving a reciprocating vibratory motion to a bed, or carriage, allowing the necessary intervals of time for the purpose of receiving the sheet, or the impression, either or both of them, by means of the cam forming part of the bed, the cranked shaft, the vibrating arm, and the connecting rod, or their equivalents, all of which is fully described and set forth.

No. 24,627.—WILLIAM GORMAN, of New York, N. Y.—*Improved Paddle Wheel*.—Patent dated July 5, 1859.—This invention consists in having the paddles placed in or attached to sliding frames which are fitted between suitable guides and arranged in such a manner that the desired object is attained without any appreciable loss of power by friction.

*Claim*.—The sliding paddles or floats D, placed between the traverse bars a of the arms C C of the wheel, and arranged with the catches F, and stationary cam G, or their equivalents, to operate as and for the purpose set forth.

No. 24,628.—S. N. GRAGG, of Shelburne Falls, Mass.—*Improvement in Corn Huskers*.—Patent dated July 5, 1859.—The person using this device sits on the seat B, with the ears of corn to be husked placed in a convenient position alongside of him; placing his foot on the treadle he grasps the ear of corn, with one hand on the stock or stem m and the other on the point of the ear. He thus holds the ear against the curved edge of the rest E, with part of the stem next to the but of the ear opposite to the point of the knife k, and, by pressing his foot on the treadle d, he drives the bolt D in the direction of its arrow, and forces the knife through the husks and stem, separating the ear from its stem; when, by bending the ear around the curved rest E, the but of the ear is projected out of its husk, and the ear may be then thrown aside separated from its husk.

*Claim.*—The curved or convex rest *E*, in combination with the reciprocating knife *k*, arranged and operating as described, for the purpose set forth.

No. 24,629.—WILLIAM GROUT, of Worcester, Mass.—*Improvement in Sewing Machines.*—Patent dated July 5, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of the feeding bar, needle, and looper, in the manner described, so that the movement of the cloth shall aid in extending the looper thread and in tightening the needle thread, and this when the needle is out of the cloth.

Second. The arrangement of the looper and forceps, as described, so that the forceps shall draw the loop of the needle thread across the path of the looper and in line with the movement of the cloth.

Third. The combination of the needle and looper, when arranged as described, so that both shall reciprocate in straight lines, and also so that, by merely changing the length of the looper, a single or double stitch may be formed, in the manner described.

No. 24,630.—BENJAMIN A. GROVER, of Momence, Ill.—*Improvement in Abdominal Supporters.*—Patent dated July 5, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim*, first, constructing an adjustable spring steel frame of the form described, by combining, arranging, and securing together a series of spring bars, substantially in the manner and for the purpose described.

Second. I claim covering the concave portion of said frame with a canvas or other cloth *Z*, whose edge or border is gathered and drawn together over the outside edges of the said spring frame, by an India rubber or other elastic cord *C*, so as to give the covering portion of said canvas or other cloth the character of an elastic cushion, no matter what may be the extent of the contraction or expansion of the spring frame, as described.

Third. I also claim attaching the upper and lower straps *P P<sup>1</sup>*, which respectively branch upward and downward from the band *v* of the main strap *S O*, at the points of the spring frame, and in the relation to each other and the centre or main straps *S O*, described and represented, so as to give an upward pressure to the spring frame, and for other purposes set forth.

No. 24,631.—ELIJAH HARRIS, of Princeton, Ill.—*Improvement in Horse Rakes.*—Patent dated July 5, 1859.—This invention consists in providing a grain or hay rake with a discharge lever *D*, which, commencing at a point even with the front bar of the lever truck *C*, runs back on the under side of the same about two thirds of its length, when it is bent and passed through one or both sides of the truck pivoted at *e*, which pivot forms the fulcrum of the lever; after passing through the truck it is again bent at a line nearly parallel with its arm, at the end of which is a side projection or finger *c*, which, coming in contact with a similar projection *a*, on the tooth passing nearest to it, holds the rake in place while in operation, until the pressure of the accumulated matter beneath lifts the lever and allows the rake to discharge itself.

*Claim.*—The lever *D*, with the arms *d d* and the projection or finger *c*, in combination with the stop *a*, substantially as set forth and specified.

No. 24,632.—W. HARTSFIELD, of Thomaston, Ga.—*Improved Door Fastening.*—Patent dated July 5, 1859.—This invention consists in arranging, on the inside of a door, a bar, fitting into a socket attached to one side of the frame, and under a bolt, which is secured to the other side of the frame, and which, when drawn up, is retained by a pin, projecting from a spring placed under the bolt; and when the door is closed the bar, by striking against the lower end of this spring, releases the bolt, so that it drops down and secures the bar.

*Claim.*—The arrangement of the bar *C*, which is attached to the inside of a door, to operate in combination with the staple *D* and with the bolt *E* and spring *d*, substantially as and for the purpose described.

No. 24,633.—HENRY HAYS, of New York, N. Y.—*Improved Machine for Boring.*—Patent dated July 5, 1859.—In making heads for barrels and casks, it is usual to bore holes on opposite sides of the meeting edges and insert a wooden dowel.

This invention relates to an arrangement of machinery for performing this operation, which has heretofore been done by other means.

*Claim.*—The arrangement of the adjustable head block *c*, carrying the spindles *d* of the boring tools, when combined with the spring tightening pulley *o*, in the manner and for the purposes specified.

No. 24,634.—JOHN HENDERSON, of Horseheads, N. Y.—*Improvement in Stoves.*—Patent dated July 5, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The construction and arrangement of the ventilating passages *i i* and concealed flues *m m*, the former having their origin in the heating chamber *K* and terminating at or near the top of the oven, and the latter starting from the lower part thereof and terminating

in the flue G, whereby external air is admitted, and currents thereof passed through the oven, substantially as and for the purposes specified.

No. 24,635.—ISAAC C. SHULER, of Amsterdam, N. Y.—*Improvement in the Construction of Sheet Metal Coffins.*—Patent dated July 5, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of stiffening the lower part of a sheet metal coffin by locking together the scrolled edges of the sides and bottom, forming a firm rim, when they are soldered together, substantially as described.

Second. I claim the sheet metal rim *c* on the outside of the walls as a means of stiffening the base, either with or without a filling of molten metal, according to the size of the coffin.

Third. I claim the rim *d* of sheet metal, single or scrolled, forming an inside chamber, which may be filled with molten metal or left hollow, according to the size of the coffin.

Fourth. I claim a cast metal rim *f*, with a deep groove on the under side, which receives, straightens, and stiffens the walls, and which serves to support the lids.

Fifth. I claim setting the pillows or braces *x* at the corners and around the body of the coffin, between the inward projections of the rims *d* and *f*, which give them an extended purchase, for the purpose of stiffening the walls, substantially as described. I also claim the peculiar braces *K* to prevent the lateral racking of the bottom.

Sixth. I claim the arrangement of pressing inverted beads or recesses, in any required number, in the sheet metal of the lid, walls, and bottom of a metal coffin, on the inside and on the outside of the same, which may be filled with molten metal in the large size and left empty in the small size coffins, for the purpose of securing, by a peculiar mode of manufacture, of a level surface between the indented parts described.

Seventh. The arrangement of fastening firmly on the under side, near the outer edge of the air tight lid of a sheet metal coffin, a cast metal rim, or its equivalent, for the purpose of strengthening this lid, and also for fitting into the groove in the rim *F*, on the upper edge of the walls of the coffin, substantially as described.

Eighth. The arrangement of fastening around the face window, on the under side of the air tight lid of a sheet metal coffin, a cast metal sash or rim *m*, which receives and supports the face glass when it is cemented in its proper place.

Ninth. I claim the arrangement of fastening permanently, on the under side near the outer edge of the sheet metal blind *m*, which covers the glass in the face window of a sheet metal coffin, a cast metal brim *O*, or its equivalent, for the purpose of strengthening and furnishing a means of securing the same to the outer lid which covers the air tight joint, substantially as described.

Tenth. I claim the arrangement described of two entire, distinct, separate sheet metal lids.

No. 24,636.—G. W. SMITH, of Hartford, Conn.—*Improved Butter Cooler.*—Patent dated July 5, 1859.—This invention consists in arranging the cover of a butter plate with an additional ice chamber, which is hermetically closed, whereby the ice is preserved in a solid state, and so that the butter on the plate may be surrounded with ice on all sides, and thus kept cool.

*Claim.*—The arrangement of the air tight ice chamber *D* in combination with the butter plate *A* and with the cup *B*, substantially as and for the purpose set forth.

No. 24,637.—DANIEL HESS, of West Union, Iowa.—*Improved Device for Heating Steam Boilers.*—Patent dated July 5, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim*, first, the combination with a steam boiler of the tight external casing *A* and fan *H* for the purpose of producing currents of air around the boiler, substantially as set forth.

Second. In combination with the subject of the first claim, the stove *D*, provided with a smoke pipe *E* through which the products of combustion pass, while the heat passes into the casing, substantially as set forth.

No. 24,638.—HENRY HOFFMAN, of New York, N. Y.—*Improved Automatic Fan.*—Patent dated July 5, 1859.—This invention consists in arranging the wings of the fan on a fan carrier, suspended from a rock shaft by means of two cords or belts, which are secured to the extreme ends of two arms, and which wind in opposite directions on rollers, so that by tipping the rock shaft alternately to one side and to the other, the gravity of the fan carrier, assisted by the weight of the fan itself, causes the latter to assume a swinging motion, no more power being required than just enough to tip the rock shaft from one side to the other.

*Claim.*—The arrangement of the rock shaft *D*, arms *F F*<sup>1</sup>, belts *f f*<sup>1</sup>, and rollers *G*, or the equivalents, to operate in combination with the fan carrier *H*, substantially as and for the purpose specified.

No. 24,639.—ISAAC B. HOWE, of Northfield, Vt.—*Improvement in Railroad Chairs*.—Patent dated July 5, 1859.—This invention consists in a peculiar one lip chair, in connection with a fishing piece secured permanently to the sleepers, and a method of securing both chair and rail in place by a bolt; the whole so arranged that on withdrawing this bolt the rails and chair may be removed without the necessity of disturbing the fishing.

*Claim*.—The one-lip chair, secured by the single bolt, in combination with the permanent fishing piece, arranged and operating in the manner set forth for the purpose specified.

No. 24,640.—JULIUS C. HURD and MOSES A. JOHNSON, of Dorchester, Mass.—*Improvement in Manufacturing Wadding*.—Patent dated July 5, 1859.—This invention consists in slightly felting the two surfaces of the bat, a thin layer of wool or other suitable felting material being deposited upon each side of it when the material of which it is composed will not of itself consolidate by felting.

*Claim*.—As a new article of manufacture, the described wadding, having its two surfaces felted, as set forth, for the purpose specified.

No. 24,641.—OBED HUSSEY, of Baltimore, Md.—*Improvement in Mowing Machines*.—Patent dated July 5, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—In combination with the ordinary apparatus fixed to the extreme end of the finger beam, and called a track clearer, a similar apparatus at the opposite or frame end of said beam, when so arranged as to sweep the cut grass towards the centre of the swath, and leave it in a windrow behind the machine, substantially as described.

No. 24,642.—JOSHUA IRVING, of New York, N. Y.—*Improved Machine for Turning Ovals*.—Patent dated July 5, 1859.—This improvement consists of light central mandrel *a*, having a grooved guide piece *a*<sup>1</sup> in its front end, in which a sliding bar *b* is guided.

*Claim*.—The sliding disk and driving rim combined with the centre mandrel and slides, substantially as and for the purposes set forth.

No. 24,643.—JOSEPH JOREY, of Rocky Hill, Conn.—*Improved Horse Shoe*.—Patent dated July 5, 1859.—This improvement consists in providing a detachable plate, made so as to cover the under surface of the shoe, over the head of the nails after they are driven and clinched, in connection with detachable screw corks, by means of which the said plate is readily secured to or removed from the shoe when desired.

*Claim*.—The combination of the plate *B*, corks *C*, shoe *A*, substantially in the manner as and for the purpose described.

No. 24,644.—PHILIP KRIBS, of Jefferson Furnace, Pa.—*Improvement in Cultivators*.—Patent dated July 5, 1859.—In the drawings *A* is the centre and *B B* the side bars, which are framed into the front bar *C*, with their ends fastened together by the bolt *D*, the whole making a strong frame, to which the other parts of the cultivator are fastened.

*Claim*.—The arrangement of the bars *A B C*, metal frame *G*, handles *H*, shanks *E*<sup>1</sup>, teeth *E*, bar *I*, and shafts *F*, as described, for the purposes set forth.

No. 24,645.—PHILIP LEBZELTER, of Lancaster, Pa.—*Improvement in Horse Rakes*.—Patent dated July 5, 1859.—The axle of the rake is made of two counter shouldered pieces *A B*, sliding in and embraced by the bands *C*, each piece having a band bolted to it, while the opposite side of the band is free for its adjoining piece to slide in; one or both of these bands have a binding screw *D* for securing the adjustment.

*Claim*.—The double axle *A B*, brace and sliding bands *c*, hinged braces *E*, slot hook and staple *F x*, binding screw *D*, hinged rod and beam *G* and *H*, when these parts are combined, substantially in the manner and for the purpose specified.

No. 24,646.—LEWIS LILLIE, of Troy, N. Y.—*Improvement in Vault Doors and Cast Iron Safes*.—Patent dated July 5, 1859.—This invention consists in the arrangement and combination of hollow pipes or tubes, and the filling of the same with refined cast-iron, with round and hardened bars of cast-steel, or any other material, so as to prevent any hole or holes being drilled into and through the same.

*Claim*.—The arrangement and combination of a series of pipes or tubes *a b* and *c*, and the filling of the same with cast-steel, hardened, or with refined cast-iron, as and for the purposes described.

No. 24,647.—LEWIS LILLIE, of Troy, N. Y.—*Improved Door Knob Bolt*.—Patent dated July 5, 1859.—*A* is the knob which is securely fastened to the larger end of the knob bolt or spindle *B*. This knob bolt or spindle is made of wrought-iron, so as not to be easily broken, with an even taper from the outside end, where the knob *A* is fastened, to the inside end, to which the nut *c* and switch *D* are attached.

The inventor says: I *claim* the knob bolt or spindle *B*, constructed in the manner as and for the purposes substantially described.

I further claim the switch D and the nut *c*, arranged and fastened to and upon the knob bolt or spindle B, in the manner as set forth.

No. 24,648.—MATTHIAS LUDLUM, of Fair Haven, Vt.—*Improvement in Trunks*.—Patent dated July 5, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—The combination, with a water tight shell or body part A to a trunk or box, having ordinary or any other suitable inner and outer lids C and D, of a valvular spring borne lid B, of water tight construction, and arranged to occupy an intermediate position in relation to the inner and outer or ordinary lids C and D, essentially as and for the purpose or purposes set forth.

No. 24,649.—THOMAS P. MARSHALL, of Trenton, N. J.—*Improvement in Buckles*.—Patent dated July 5, 1859.—This invention consists in arranging one part of the buckle in such a manner that it slides easily on the strap, which is kept in the same by the action of a spring so that it can adjust itself to any length, and the two parts are united by means of a slot in the movable part.

*Claim*.—A buckle constructed of a sliding case A, with the platform *d* and slot B, in combination with the nose *i*, and otherwise arranged as set forth.

No. 24,650.—JARRETT MEGAW, of Wilmington, Del.—*Improvement in Rotary Pumps*.—Patent dated July 5, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—Combining the water packing chambers formed around the axis or shaft, between the suction pipe and stuffing boxes, with the descending main or discharge pipe of the pumps, substantially as and for the purpose set forth.

No. 24,651.—RICHARD L. MILLS and PAUL CARPENTER, of Lancaster, Ohio.—*Improvement in Railroad Car Couplings*.—Patent dated July 5, 1859.—This invention consists in the arrangement of a sliding frame in connection with a vibrating frame and locking key.

*Claim*.—The arrangement of the sliding frame K and vibrating frame J, in combination with the flat locking key L, the whole being constructed and arranged for joint operation, substantially as set forth.

No. 24,652.—Z. N. MORIEL, of Cameron, Texas.—*Improvement in Machines for Planting Cotton Seed*.—Patent dated July 5, 1859.—This invention consists in the peculiar means employed for distributing the seed, whereby it is intended to avoid the difficulties hitherto attending the planting of cotton seed by mechanical means.

The inventor says: I *claim*, first, the combination and arrangement of the one side wheel D, cylinder F *e*, stirrer E *c*, gear wheels *a b*, mortised beam A *d f*, share H *h*, and boot I, substantially as and for the purpose described.

Second. The arrangement of the V shaped fender, with the harrow teeth and with the devices included in the first claim, substantially as and for the purpose set forth.

No. 24,653.—A. A. MOSS, of Philadelphia, Pa.—*Improved Elastic Friction Roller*.—Patent dated July 5, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—The elastic friction apparatus described, the same consisting of the ball or sphere A, spring B, and case or hole C, constructed, arranged, and combined together in relation to each other in the manner set forth and described, irrespectively of the plate *e*, or the conical form of the spiral spring B.

No. 24,654.—J. W. NARAMORE, of Derby, Conn.—*Improved Pin Sticking Machine*.—Patent dated July 5, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, operating the driver or drivers and the crimping and feeding apparatus, or any portion of the same, by means of a clutch or clutches, carried by a constantly rotating shaft, and thrown into gear therewith, to effect such operation, by the action of the sliding bed or pin carriage, as the latter, after having received the pins, completes its movement to the necessary position for the sticking operation substantially as described.

Second. The combination, with a single reciprocating sliding bed or pin carriage and a single conductor, of two drivers, and two sets of crimping and paper feeding apparatus, arranged on opposite sides of the mouth of the conductor in such a manner that the said bed or carriage, in every movement in either direction, is caused to be filled with pins from the conductor, and to convey them to a proper position relatively to one or the other of the drivers, to be thereby driven into the paper supplied, and crimped by its respective feeding and crimping apparatus, substantially as described, whereby I effect a saving of the time heretofore lost in running the bed twice under the conductor to be once filled.

Third. Effecting the combination between the sliding bed or carriage and a clutch, carried by a constantly revolving shaft, to operate a driver, a crimper, and a feeding apparatus, or either of them, by means of a toothed lever R or R<sup>1</sup>, a spring T, or notched slide P or P<sup>1</sup>, plate U or U<sup>1</sup>, with an inclined edge and a sliding tooth *i*, the whole applied and operating

substantially as described, to permit one and only one revolution of the loose portion of the clutch, and hence but a single operation of the part or parts driven by it.

No. 24,655.—A. NEWBURY and B. NEWBURY, of Windham Centre, N. Y.—*Improvement in Hand Printing Presses*.—Patent dated July 5, 1859.—In using this press the table L is supplied with a requisite quantity of ink, the form D locked on the bed C; if the frame E is in an elevated position the platen F will be raised, and the ink rollers in the frame K will be at the inner side of the form D, having passed over the form as the frame E was elevated. As the frame is depressed by the operator a blank card is inserted between the guide bars *a a* and the platen F is forced down by the downward movement of the frame in consequence of the rollers *j j* fitting in the slots *k* of the bars *c c*.

*Claim*.—The arrangement and combination of the slotted frame E, adjustable bar G, platen F, roller frame K, and rotating ink table L, substantially as and for the purposes shown and described.

No. 24,656.—ELLIS NORDYKE and A. H. NORDYKE, of Richmond, Ind.—*Improvement in Flour Bolts*.—Patent dated July 5, 1859.—The principal features of this machine are the manner of governing the wrapping arms, that one set may be in motion while the other is stopped, all as the case may require; it may be operated while the bolt is in motion.

The inventors say: We *claim* the band *c* encircling the shaft M, in combination with the spring catches S S S, for the purpose described.

Second. We also claim making the movable slide H F in two parts, jointed, substantially as and for the purpose set forth.

No. 24,657.—ANTHONY OVEROCKER, of McHenry, Ill.—*Improvement in Clover Hullers*.—Patent dated July 5, 1859.—A A represent a square frame; within this frame is secured a metallic concave box C; said concave being provided with burrs. D D represent a series of ribs, which are secured in the concave C at a suitable distance apart. The tops of these ribs are concave, and their sides are provided with burrs or rasps similar to those on the concave C.

*Claim*.—The combination of the concave C and cylinder E, with the adjustable sliding door F, the several parts being arranged and constructed substantially in the manner and for the purpose described.

No. 24,658.—ANDREW PATTERSON, of Birmingham, Pa.—*Improvement in the Manufacture of Hoes*.—Patent dated July 5, 1859.—This invention consists in casting the head or eye of the hoe on or around the blade, which has been previously prepared and placed in a mould so as to receive the molten metal of which the head or eye is to be cast.

*Claim*.—The combination of the two jaws *d d* which clasp the blade with the head *b*, and the blade arranged and constructed substantially as set forth.

No. 24,659.—JOHN PERCIVAL, of Auburn, N. Y.—*Improvement in Piano Hammers*.—Patent dated July 5, 1859.—This invention consists in giving to the wooden head of the hammer a broad, flat face, and forming the cushion on the top of the hammer, by a series of layers of some elastic material, arranged one above the other, without extending down upon the sides of the hammer head, and then covering the whole by a single thickness of soft, flexible, and elastic material, extending over the top of the cushion and down the sides of the hammer.

*Claim*.—Constructing and arranging the cushion forming the elastic covering to the hammer head, substantially as described for the purpose as set forth.

No. 24,660.—ALBERT POTTS, of Philadelphia, Pa.—*Improvement in Setting Gas Meters in the Walls of Buildings*.—Patent dated July 5, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—The manner described of adjusting a gas meter to an auxiliary case of the character substantially as specified, so that the meter is applied to a building in a neat and secure manner, and, at the same time, the examination of the same, to ascertain its condition or the amount of gas consumed, from the outside of the building, is rendered practicable and convenient, all as and for the purposes set forth.

No. 24,661.—THOMAS B. QUIGLEY, of Galion, Ohio.—*Improvement in the Mode of Regulating the Exhaust in Locomotive Engines*.—Patent dated July 5, 1859.—This improvement relates to apparatus for increasing and diminishing the draft in locomotives, by regulating the area of the orifices through which the exhaust steam passes into the smoke stack.

The inventor says: I *claim*, first, the sliding throttle valves *g* and *f*, when combined with the exhaust pipes of a locomotive engine, substantially in the manner and for the purpose specified.

Second. The sliding box *o*, with apertures *r*, in combination with the chest *b*, as set forth.

No. 24,662.—D. B. RAY, of Galena, Ill.—*Improved Apparatus for Punching Stereotype*

*Plates.*—Patent dated July 5, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the arrangement of stamping bars D upon A B, when provided with the characters to be printed or stereotyped, so that they will all work to a common centre and imprint the characters upon the face of the type metal, substantially in the manner and for the purposes set forth.

I also claim arranging upon the end of bar F knives *a b*, for the purposes specified.

No. 24,663.—JOHN A. REED, of Jersey City, N. J.—*Improvement in Trunnion Box Lining for Oscillating Engines.*—Patent dated July 5, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The employment, in combination with the conical trunnions, of slit cap like linings D D, applied to the boxes with screws and nuts, or other equivalent means of forcing them up towards the sides of the cylinder, substantially as described.

No. 24,664.—GEORGE P. SANBORN and WILLIS MANSFIELD, of New Haven, Conn.—*Improvement in Elastic Railroad Frogs.*—Patent dated July 5, 1859.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim* an elastic frog, constructed of layers of plate metal and wood, substantially in the manner specified, and either with or without layers of vulcanized rubber.

Also, we claim constructing an elastic frog with end slots, suitable to receive the lower flange and neck of a rail, as specified, whereby the frog may be kept in alignment as described.

No. 24,665.—THADDEUS SELLECK, of Greenwich, Conn.—*Improvement in Protecting Surfaces of Articles of Iron.*—Patent dated July 5, 1859.—The claim explains the nature of this invention.

*Claim.*—As a new article of manufacture, a horse shoe, or other article, as indicated, made by uniting Franklinitic pig metal with the surface of iron, as set forth.

No. 24,666.—HORACE SMITH and D. B. WESSON, of Springfield, Mass.—*Improvement in Revolving Fire-Arms.*—Patent dated July 5, 1859.—It is the object of this invention to furnish a stop that will be simple, durable, and entirely separated from the lock of the pistol, thereby simplifying the lock and placing the stop in such a position that it can be detached for repairs, or other purposes, without interfering with the lock.

*Claim.*—The wedge *n*, on the top of the nose of the hammer, the spring *m*, and stop bolt *k*, when combined for the purpose and operating in the manner as described.

No. 24,667.—JAMES SPEAR, of Philadelphia, Pa.—*Improved Ironing Pan for Ranges and Stoves.*—Patent dated July 5, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—An ironing pan, constructed with a perforated bottom, in the manner and for the purpose described.

No. 24,668.—WILLIAM STEARNS, of Manchester, N. H.—*Improvement in Picker Motion for Power Looms.*—Patent dated July 5, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* extending the picker staff down through and below the rocker, and through the rail, as described.

I claim the rocker D, made to receive the staff, in the way and manner described.

And, in combination with the rocker D, I claim the hook G or G<sup>1</sup>, whether made separate or cast on the rocker, for the purposes set forth.

I claim making the picker staff adjustable in the rocker, in the manner described, or in some equivalent manner.

I claim making the stud surrounded by the coiled spring P, smaller in the middle than at the ends, to allow the spring to contract in diameter in the middle as it is drawn in working.

I also claim, making that portion of the stud surrounded by the stationary end of the coiled spring permanent or stationary, and that portion surrounded by the moving end of the spring to revolve, to facilitate the working of the spring.

No. 24,669.—JOSEPH W. STRANGE, of Bangor, Me.—*Improvement in Scales for Weighing.*—Patent dated July 5, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, arranging the beam in such a manner that the several indications or scales marked on the same, can be brought before the eye of the operator by turning the beam, substantially as described.

Second. The arrangement of the socket C, so that its end forms the common index pointer *c*, for the several indications marked on the sides of the beam, substantially as and for the purpose specified.

No. 24,670.—WILLIAM STRATTON, of Philadelphia, Pa.—*Improvement in Gas Retorts*.—Patent dated July 5, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The employment of an upright partition B dividing the D retort into chambers, in the manner and for the purposes substantially set forth in the specification.

No. 24,671.—JOHN STOCK, of New York, N. Y.—*Improvement in Photographic Cameras*.—Patent dated July 5, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of the front plate of a camera, to which the lens tube is attached, in such a manner that the centre of the tube may be removed in any desired position, for the purpose as described and in the manner substantially as specified.

Second. I claim the arrangement of the plates 5 and 8, for the purpose described.

Third. I claim attaching the ground glass holder to the end of the camera, and the manner of supporting the weight of the same, substantially as specified.

No. 24,672.—ELAM STOCKBRIDGE, of Houston, Texas.—*Improvement in Cotton and Hay Presses*.—Patent dated July 5, 1859.—This invention consists in the arrangement, in combination with the ordinary ropes, chains, and windlass used in the toggle presses, of auxiliary ropes or chains for drawing a horizontal follower out of a horizontal pressing box, and the horizontal toggle and main cords or chains into operative position, or bringing the same in position for operation, after the first pressing operation has been performed by them.

*Claim*.—The arrangement, in combination with the horizontal ropes or chains  $a^1 a^1$ , vertical windlass G, horizontal toggles E E, and horizontal follower C, of the auxiliary horizontal ropes or chains  $a^1 a^1$  and  $h$ , in the manner and for the purposes set forth.

No. 24,673.—JOSIAH STUBBS, of Dublin, Ind.—*Improved Churn*.—Patent dated July 5, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—Operating the butterfly wings  $d$  and  $d$ , with the single crank  $k$  confined to one side of the cylinder  $g^1$ , being made to cross the body of the cylinder obliquely to effect this movement, in the manner and for the purpose set forth.

No. 24,674.—GIUSEPPE TAGLIABUE, of New York, N. Y.—*Improvement in Mercurial Barometers*.—Patent dated July 5, 1859.—This invention consists in an improved mode of applying a gauge, attached to an adjustable scale, in combination with the cistern or lower limb of a mercurial barometer, for the purpose of enabling the scale to be adjusted to the level of the mercury in the cistern.

*Claim*.—The external slotted sleeve gauge D, applied in combination with the cistern or lower limb of the barometer, and with the adjustable scale, substantially as and for the purposes described.

No. 24,675.—LOUIS TREGRE, of the parish of St. John the Baptist, La.—*Improvement in Bagasse Furnaces*.—Patent dated July 5, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the employment of a double feeder, arranged substantially as described, with springs through the blades of the lower feeder to allow the hot air from the furnace to pass from the lower feeder to the upper feeder, for the purpose set forth.

And I also claim arranging between the two feeders an intermediate chamber to receive and retain the bagasse as it passes from the upper to the lower feeder; and I claim constructing the upper feeder of larger size than the lower feeder, with or without an increased number of blades, or in an equivalent manner, for the purpose set forth.

And I further claim introducing an independent current of hot, dry air into the chamber between the two feeders, substantially as described for the purpose set forth.

No. 24,676.—JACOB W. TRUOX, of Richford, Vt.—*Improved Handblock for Saw Mills*.—Patent dated July 5, 1859.—This invention consists in operating a slide to which the log to be sawed is spiked, by means of a lever and pawl, in such a manner that a lateral movement can be imparted to the log corresponding to the desired thickness of the boards to be sawed, and gauging the same by a gauge wheel.

The inventor says: I *claim*, first, the combination and arrangement of the ratchet wheel F, setting lever P, cam wheel R, gauge wheel M, and spur wheel I, with the spring latch H, in the manner and for the purposes specified.

Second. I claim the clamps V, the lever W, and eccentric lever  $y$ , arranged and operating as specified.

No. 24,677.—MARIANUS X. TSCHUS, of Bloomington, Ill.—*Improved Spring Snap for Bridle Reins*.—Patent dated July 5, 1859.—The inventor says: I construct my buckle snap by casting, or otherwise forming it, so that it will all be one piece of metal, except the tongue of the buckle, for the purpose of giving strength and beauty to the whole.

*Claim.*—The combination of the two in one, in the manner described and for the purpose described.

NO. 24,678.—LEVI B. TYNG, of Lowell, Mass.—*Improvement in Cast-iron Tires for Railroad Wheels.*—Patent dated July 5, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the wedge shaped braces  $d d^1$ , arranged in the chamber C, between the rims A and B of a hollow cast-iron tire, so that the chamber is continuous throughout, substantially as and for the purpose set forth.

Second. In combination with the continuous chamber, I claim the groove  $b$  in the inner rim, arranged substantially as and for the purpose described.

Third. Arranging the ribs  $c$  alternately on the inner and outer rim, for the purpose of strengthening them without tying them together, substantially as described.

NO. 24,679.—WILLIAM W. VIRDIN, of Baltimore, Md.—*Improvement in the Mode of Propelling Locomotive Engines on Railroads.*—Patent dated July 5, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The placing of the friction wheels under the driving wheels of locomotives, or other vehicles, in the manner substantially the same as described in this specification.

NO. 24,680.—WILLIAM W. VIRDIN, of Baltimore, Md.—*Improvement in the Mode of Braking Locomotive Engines on Railroads.*—Patent dated July 5, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The introduction of air into the cylinders of locomotives, in the manner as set forth and for the purpose of offering a yielding resistance to the movement of the piston, and by this resistance overcome the momentum of the train.

NO. 24,681.—JOSEPH W. WATTLES, of Canton, Mass.—*Improvement in Ring and Traveller Spinning Mechanism.*—Patent dated July 5, 1859.—The nature of this invention consists in the application and arrangement of a bearing annulus outside of and concentric with the circular ring or rail on which the traveller runs and is supported.

*Claim.*—The combination and arrangement of the bearing annulus  $b$ , with the ring or its traveller carrier  $a$ , substantially in the manner and to operate with the traveller, as described.

NO. 24,682.—JOHN S. WERTZ, of Middletown, Iowa.—*Improvement in Machines for Boring Post Holes in the Earth.*—Patent dated July 5, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement and combination of the screw shaft D, cross head C, grooves  $k$ , pinion  $m$ , and toothed cylinders B, as and for the purpose shown and described.

Second. The arrangement and combination with the cylinders B of the shaft F and rotary scrapers G, as and for the purpose shown and described.

Third. The arrangement and combination with the frame A of the jointed bars  $c c$ , sectors  $e$ , and adjusting rods  $h$ , as and for the purpose shown and described.

NO. 24,683.—J. W. WEST, of Hillsboro', Ohio.—*Improvement in Corn Planters.*—Patent dated July 5, 1859.—The nature of this invention relates to the arrangement and operation of a plunger, by means of which corn may be forced from the planter into the earth, and the certainty of seeding secured.

*Claim.*—The arrangement of cords  $o$  and  $n$ , with the pulleys  $i$  and  $j$ , working in arms  $h h$ , for operating the slotted plunger  $l$  and seeding bar  $g$ , the whole operated together and in the manner and for the purpose substantially as set forth.

NO. 24,684.—WILLIAM WHEELER, of West Poultney, Vt.—*Improvement in Manufacturing Machine and Animal Cards.*—Patent dated July 5, 1859.—By this invention for hand cards, the plate A is secured to a wooden back B by screws or nails  $d d$ ; the handle C is secured to the wooden back by screws or nails  $g g$ . For machine or revolving cards, the plates A A are formed in long, narrow, continuous strips of metal, grooved lengthwise; and, after soldering the teeth therein, they are wound or coiled around a wooden cylinder, and secured thereto by nails, or otherwise.

*Claim.*—The construction and arrangement of the sheet metal backs and wire teeth, in combination, substantially as described, when united by solder applied thereto by immersion, or otherwise.

NO. 24,685.—E. B. WHITE, of Nashua, N. H.—*Improved Alarm Attachment for Tills.*—Patent dated July 5, 1859.—The claim and engravings explain the nature of the invention.

The inventor says: I *claim*, first, the bolt plate  $b$ , provided with bolts C, connected by a joint  $c$  to the box B, and connected to a bell striking apparatus, substantially as shown, in

connection with the keys *k* and a stop *D*, the whole being applied to the till, substantially as and for the purpose set forth.

Second. In combination with the bolt plate *b*, bolt *C*, and keys *k*, the bars *j* and screws *e*<sup>1</sup>, in the parts *k*<sup>1</sup> of the keys, when the bolt plate and bar *j* are both connected with the lever *h* on the bell striking apparatus in any proper way.

Third. The employment or use of the sliding plate *G*, combined and arranged with the bolt plate *b* and stop *D*, to operate automatically as and for the purpose set forth.

Fourth. The employment or use, for the purpose specified, of a supplemental spring *u*, fitted in a socket *t*, or otherwise arranged to resist the movement of the bar *j*, when said bar *j* is used in connection with spring bolts *C*, substantially as described.

No. 24,686.—LORAN J. WICKS, of Racine, Wis.—*Improved Churn*.—Patent dated July 5, 1859.—This machine is operated as follows: Milk being placed in the box *A*, the crank *P* is turned with considerable rapidity; the milk entering the pipe at the bottom of the box *A* seeks to rise to its level; the pulley *H*, revolving on pipe *B*, forces the milk up, and around, into box *c* with a great deal of force, against the gauze wire partitions *E E*; the globules being thus broken, the milk passes out through screen *D* into box *A*; thus a continued stream is ejected until the butter is all separated from the milk.

The inventor says: I *claim* the combination of the box *A*, the pipe *B*, and the box *C*, when the same are used in the manner and for the purpose set forth.

Second. Placing the box *C* over the box *A*, and providing said box *C* with a screen *D* and depending wire gauze partitions *E E*, substantially in the manner and for the purpose specified.

No. 24,687.—HENRY WILEY, of Frankfort, Ohio.—*Improvement in Corn Planters*.—Patent dated July 5, 1859.—This invention consists in an improved construction and arrangement of a seed planter for operating the feed valves or slides, and dropping the seed when planting in cross furrows.

*Claim*.—The arrangement of the gate *H*, wheel *K*, bars *B*, hopper *g*, rods *d*, slides *N*, and seed tubes *y*, being all constructed, arranged, and operated substantially as set forth.

No. 24,688.—LEONARD WORCESTER, of Lebanon, N. H.—*Improved Machine for Boring or Mortising Blind Stiles*.—Patent dated July 5, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* combining the transversely reciprocating carriages *A A* with the cam cylinders *L L*, by means of the pairs of vibrating levers *E E* and *ff*, substantially in the manner and for the purposes set forth.

I also claim the notched plates *N N* for sustaining the stiles during the operation of mortising or boring the same, when the said plates are combined with reciprocating bearings and other suitable mechanism, in such a manner that the necessary laterally reciprocating and longitudinally feeding movements will be imparted to said plates, substantially as set forth.

I claim combining the bearings of the bit shaft *G* with the reciprocating carriage *C*, when the said shaft is so arranged with relation to the notched plates *N N* that the bits which project from the ends of said shaft will act upon the stiles as they are automatically presented to them, substantially as set forth.

I also claim the combination and joint operation with each other of the reciprocating carriages *A A*, the notched plates *N N*, the pairs of levers *E E* and *ff*, the cam cylinders *L L*, the reciprocating spring pawls *k k*, and the bit-carrying cylinder *G*, substantially as set forth.

No. 24,689.—W. E. WORTHEN and H. B. RENWICK, of New York, N. Y.—*Improvement in Corrugating Sheet Metal*.—Patent dated July 5, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The method of corrugating or moulding sheet metal by several dies acting in succession, substantially in the manner specified, upon a sheet resting upon a bed, die, or dies, so as to cause the metal to conform to shape, substantially in the manner described.

No. 24,690.—JOHN WRIGHT, of Worcester, Mass.—*Improvement in Self-Acting Spinning Mules*.—Patent dated July 5, 1859.—This invention consists in the means of effecting the drawing in and running out of the carriage of a self-operating mule, and the driving of the drawn rollers and of the quadrant form, from which motion is communicated to the spindles.

*Claim*.—The shaft *F*, with its screw thread *d e f*, arranged and applied substantially as described, in combination with the carriage, the quadrant, and the shaft which drives the drawing rollers, for the purpose set forth.

No. 24,691.—FREDERICK BAARE and JULIUS G. GARELLY, of New York, N. Y., assignors to HORACE H. DAY, of same place.—*Improvement in Manufacturing Corrugated Fabrics*.—Patent dated July 5, 1859.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim* the combination of two or more parallel series of corrugations in the same fabric in such manner that the ridges of the adjacent series alternate.

We also claim combining rubber strands (one or more) with a textile material, in such manner that when the rubber contracts the compound fabric gathers up into two or more parallel series of corrugations whose numbers alternate.

We also claim combining rubber strands with a textile material, in such manner that the strands are alternately secured to the fabric and left free therefrom at alternating parts of their length, so that the secured parts of one rubber strand corresponds with the free part of an adjacent one.

We also claim forming the fabric sleazy at the division lines between the corrugations of adjacent series, so as to insure uniformity in the form of the adjacent extremities of the corrugations.

No. 24,692.—FRANCIS W. BACON, of West Newton, Mass., assignor to EDWARD H. ASHCROFT, of Boston, Mass.—*Improvement in Gauge Cocks for Steam Boilers.*—Patent dated July 5, 1859.—This invention consists in the application of a throat clearer to the screw plug of a gauge cock, so as to extend into the throat of the cock and be rotated therein with and by the screw plug; the object of the clearer being to prevent the throat from becoming clogged by foreign matter or mineral deposits.

*Claim.*—The combination of the throat clearer C with the throat and the screw plug gauge cock, and so as to operate therewith, substantially as specified.

No. 24,693.—HENRY W. BEINS, of New York, N. Y., assignor to the NEW ENGLAND CAR SPRING COMPANY, of the same place.—*Improvement in Vulcanized Rubber Car Springs.*—Patent dated July 5, 1859.—A is the middle part or section of a spring; *b b* two projections, one on each side, serve to receive the two end sections B B in their perpendicular direction, and keep them together until they are put in their place in the car.

*Claim.*—The sectional gum car spring, of two or more pieces, vulcanized in the manner set forth.

No. 24,694.—E. CULVER, of Shelburne Falls, Mass., assignor to Himself and R. N. FIFE, of the same place.—*Improved Table and Clothes Dryer.*—Patent dated July 5, 1859.—This invention consists of a table with a hinged top, having a clothes dryer so connected therewith that it may be unfolded, and when not in use may be folded up and stowed within the table.

*Claim.*—The described combination of ironing table and clothes dryer, the table furnishing a support to the dryer, and a receptacle in which it may be stowed away, as set forth.

No. 24,695.—A. K. EATON, of New York, N. Y., assignor, through J. S. L. CUMMINS, J. EDWARDS, J. J. FIELDS, and HENRY W. JOSLIN, to the JOSLIN INDIA RUBBER COMPANY.—*Improvement in Vulcanizing Rubber.*—Patent dated July 5, 1859.—This invention consists in the combination of the sulphide of manganese with India rubber. When the combination is effected, the matter is submitted to the action of a gradually increasing heat for several hours, the thermometer ranging during the time from 250° to 310° Fahrenheit. By this treatment the rubber is rendered more elastic and no longer affected by changes of the weather.

*Claim.*—The use of the sulphide of manganese in the curing of India rubber, in the manner specified.

No. 24,696.—O. F. FULLER, of Lamonte, Mich., assignor to Himself and W. M. FERRY, of Ferrysburgh, Mich.—*Improvement in Railroad Brakes.*—Patent dated July 5, 1859.—This invention consists in the relative arrangement, for united operation, of the toggle, or radius compensating levers, pulleys, sections of chains or cord, and connecting rods, sliding bumpers or draw heads, steam cylinder and brakes. By this arrangement, the train is so completely under the management of the engineer as to do away with the necessity of employing brakemen.

*Claim.*—The brake blocks C, pins *a a*, and levers D D, constructed and operating together, substantially as and for the purpose described.

No. 24,697.—JOSEPH R. GATES, of Indianapolis, Ind., assignor to Himself and J. J. DUMONT and E. F. SINKER, of the same place.—*Improvement in Sugar Mills.*—Patent dated July 5, 1859.—In operating this mill, the cane is fed into the rollers, between the strippers G, which are rapidly revolved outward upon the same by the gearing E, and by which the leaves are stripped.

*Claim.*—The grooved friction rollers G G G G, when used for stripping the blade from the stalk, substantially as set forth.

No. 24,698.—JOSEPH JONES, of Philadelphia, Pa., assignor to Himself and JAMES G. BRYCE, of the same place.—*Improved Butter Worker.*—Patent dated July 5, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—The use of the yielding beater G, whether solid or constructed with an open or with a perforated bottom, inclosing an absorbing material, as set forth, in combination with a travelling tray; the whole operated as described.

No. 24,699.—LANSING MARBLE, of Vassar, Mich, assignor to Himself and TOWNSEND NORTH, of the same place.—*Improved Method of Manufacturing Baskets.*—Patent dated July 5, 1856.—The claim and engraving explain the nature of this invention.

*Claim.*—The described method of forming baskets by passing a series of staves or splints through proper guides over a mould, and pressing the same in the proper shape by a suitable piston and form, as set forth.

No. 24,700.—LEWIS MILLER and JACOB MILLER, of Canton, Ohio, assignor to C. AULTMAN & Co., of the same place.—*Improvement in Harvesters.*—Patent dated July 5, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—Extending the finger or platform bar, one or both, far enough under the yielding bars, by which they are hung to the main frame, as that the two may be united by suspension rods, which allows them a yielding motion in one direction and makes them rigid in another direction, and prevents the motions of the main frame from being communicated to the finger bar, substantially as described.

No. 24,701.—CHARLES NEALE, of Philadelphia, Pa., assignor to FREDERICK LIBRANDT and W. L. McDOWELL, of Philadelphia, aforesaid.—*Improvement in Moulding Beads on Hollow Wax.*—Patent dated July 5, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—Moulding for the production of beads, flanges, or other projections, and ornaments on the outer sides of cast metal pots, kettles, and other vessels, so as to form the said vessels in two part flasks; the pattern bead flange, or other projecting ornament, being so constructed, arranged, and operated, as to admit of its being drawn in and pushed out of the vessel pattern, substantially in the manner described.

No. 24,702.—ALFRED S. PHILLIPS, of Boston, Mass., assignor to Himself and ISAAC ADAMS, of South Boston, Mass.—*Improved Hawse Pipes for Ships.*—Patent dated July 5, 1859.—This improvement consists in an improved manufacture of cable guide, as made with its body or pipe curved in longitudinal sections, the external surface of the flange being made in continuation of the curve of the body, and so that the chain, while either running out or being drawn in, shall pass over and on a curved surface, such as will prevent the links from being stopped thereon.

*Claim.*—A tubular cable guide curved substantially as described.

No. 24,703.—PETER PLATTER, of Moore's Hill, Ind., assignor to Himself and JAMES S. FLEMING, of Moore's Hill, aforesaid.—*Improvement in Corn Planters.*—Patent dated July 5, 1859.—This invention consists in certain improvements in corn planters, by which corn may be planted at desired intervals by the use of the shield T.

*Claim.*—The arrangement of the shield T, hammer G, sliding feed bar I, lever O, crank shaft K, and spring H, the whole being constructed for operation conjointly, as and for the purpose set forth.

No. 24,704.—JOHN I. ROLLOW, of Fredericksburg, Va., assignor to CHARLES C. WELLFORD, of Fredericksburg, aforesaid.—*Improvement in Threshing Machines.*—Patent dated July 5, 1859.—This invention has reference to that class of machines in which the thresher and cleaner are combined, all of which heretofore constructed are cumbersome, complicated, laborious to operate, and liable soon to get out of order. To obviate these difficulties is the object of this invention.

*Claim.*—The combination of the inclined carrier H with the shoot I and curved screen J, the whole being constructed, arranged, and operated, in the manner and for the purposes set forth.

No. 24,705.—WILLIAM SPINK, of Providence, R. I., assignor to OLIVER A. WASHBURN, jr., of Providence, R. I.—*Improved Machine for Pointing Nails and Spikes.*—Patent dated July 5, 1859.—This invention consists in providing the Reed nail machine, or any other invention to which this machine may be applied, with an apparatus for the purpose of pointing nails and spikes.

*Claim.*—The combination of the bunter G, the pointer F, and the spring I with each other and with the back piece and other parts of the Reed machine, or with the corresponding parts of any other nail machines, constructed and operated substantially in the manner as set forth.

No. 24,706.—GEORGE C. WHEELER, of Graysville, Ga., assignor to Himself and GEORGE CALVERT, of Upperville, Va.—*Improved Machine for Washing and Amalgamating Gold.*—Patent

dated July 5, 1859.—This invention consists in the combination of a series of horizontally revolving vertical hollow tubes with a series of horizontally revolving rakes and vessel or receiver.

It also consists in arranging the body of the vessel to receive, so as to be adjusted or elevated independently of its dish shaped bottom.

The inventor says: I *claim*, first, the relative arrangement for united operation of the hopper I, horizontally revolving vertical tubes H H H, horizontally revolving rakes G G<sup>1</sup> G<sup>2</sup>, and stationary washing vessel B C, substantially as and for the purpose described.

Second. Making the receiver or washing vessel into two parts B C, and combining with the part C an adjustable device D a a, substantially as and for the purpose described.

No. 24,707.—WILLIAM W. W. WOOD and HENRY HOWSON, of Philadelphia, Pa., assignors to JOHN RICE, of Philadelphia aforesaid.—*Improved Device for Operating the Cut Off Valve of Steam Engines.*—Patent dated July 5, 1859.—The claim and engravings explain the nature of this invention.

The inventors say: We limit our claim to causing the positive power of the engine to operate the throttle valve by the employment of two vibrating, reciprocating, or rotating strikers, actuated by any positive movement of the engine, in combination with two inclined planes intervening between the said strikers, and the valve or appliances connected therewith, any governor being so connected to the strikers or to the inclined planes that the movement of the governor, caused by any increase or diminution in the speed of the engine, shall change the position of the inclined planes in respect to the striking or that of the strikers in respect to the inclined planes, and that the latter may thereby be the intermediate means of regulating the extent of the opening of the valve to suit the speed of the engine while the actual movement of the valve is effected through one or the other of the strikers by the power of the engine itself, as set forth.

No. 24,708.—E. H. ANGAMAR, of New Orleans, La.—*Improvement in the Mode of Staying Piles for Wharves, Piers, &c.*—Patent dated July 12, 1859.—The sleeves *a* make the hinges for braces *b* that support the piles. After the frames S S have been settled to the base, the sleeves *a*, having the braces attached, are passed over the head of the piles and rest on the frames S S, which support the braces *b*; after this they are framed into piles, the links *o* allowing the frames to assume their position on the bottom to meet the inequality of the surface at the foot of each pile.

*Claim.*—In combination with the piles, the frames *s s* and sleeves *a* and the braces *b*, when made and arranged as, or substantially as and for the purpose set forth.

No. 24,709.—STEBEN T. BACON, of Boston, Mass.—*Improvement in Locks.*—Patent dated July 12, 1859.—This invention consists of improvements upon a lock patented by Linus Yale, June 13, 1844, in which the bolt B is thrown out and in by a pin C, on the face of what is termed a rotating tumbler D, which works in a groove in the face of the bolt; the rotating tumbler being operated by a key which is inserted, forces out to the required distance a series of radial stops or pistons *i i i* and *k k k k* that move in the holes *o o o o*, in a cylindrical or rotating tumbler D, and corresponding holes in a surrounding cylinder E.

*Claim.*—The construction of one or more pistons or drivers, or both; also one or more holes in the rotating tumbler or surrounding cylinder, or both, substantially as and for the purpose specified.

No. 24,710.—STEBEN T. BACON, of Boston, Mass.—*Improvement in Bank and Safe Locks.*—Patent dated July 12, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, arresting and holding the tumbler in an exact locked position.

Second. Preventing the displacement of the tumbler, in the direction of unlocking, by means of pins *l l l l*, in combination with the sliding bottom key hole guard and the tenons.

Third. Preventing the displacement of the tumbler at and beyond the locked position, by means of the slotted collar, in combination with the cylinder, the tumbler, and the tumbler pin.

Fourth. Preventing the displacement of the tumbler inwardly, by means of the collar, in combination with the cylinder and the bolt of the lock.

Fifth. Enlarging the piston holes throughout the lock, for the purpose specified.

Sixth. Enlarging the holes in both tumbler and cylinder, in each direction from the dividing line between them, for the purpose specified.

Seventh. Constructing the key hole guard of two or more pieces of metal hardened, for the purpose specified.

Eighth. Making one or more chambers between the several parts of the key hole guard, for the purpose specified.

Ninth. Dividing the air chamber or chambers with one or more narrow ridges, for the purpose specified.

No. 24,711.—JOSEPH M. BATCHELOR, of Foxcroft, Me.—*Improvement in Lamps*.—Patent dated July 12, 1859.—This invention consists in arranging, upon the stem of the button spindle, in connection with the small spur wheel commonly employed for adjusting the wick, a large spur wheel, meshing into a rack projecting from the side of the wick tube, so that the wick and tube can be both raised or depressed, by turning the button spindle in exact relative distances, to produce the proper amount of light required.

*Claim*.—The arrangement and combination of adjustable tube B with the wick L, button spindle F, spur wheels D J, and friction spring H, or the equivalents thereof, as set forth.

No. 24,712.—JOHN T. BEVER, of Haynesville, Mo.—*Improvement in Devices for Trimming Pea Vines*.—Patent dated July 12, 1859.—This improvement consists in so constructing the posts between which the rope or twine is strained, that, being hollow, they shall form a box for the purpose of containing, when not in use, the cords and pins, each pair of posts forming a couple box.

*Claim*.—The posts B B, when forming a box as described, and combined with cords g g, rope f, and pegs h h, the whole constructed and arranged in the manner and for the purposes set forth.

No. 24,713.—DANIEL EDWARD BISHOP, of New York, N. Y.—*Improvement in Railroad Chairs*.—Patent dated July 12, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The formation of a bridle A in the centre of the continuous lift D of a railroad chair, constituting a new article of manufacture, as described.

No. 24,714.—J. L. BOOTH, of Cuyahoga Falls, Ohio.—*Improvement in Grain Separators*.—Patent dated July 12, 1859.—The object of this invention is to receive the grain, both the sound and the light portions, as it is projected from the machine, and to more fully separate and collect the same into distinct parts and to graduate the separation as may be required.

*Claim*.—The box A, provided with an inclined bottom or flooring and adjustable strips or valves, arranged to operate substantially as and for the purpose set forth.

No. 24,715.—J. BORTON, of Middlebourne, Ohio.—*Improvement in Rat Traps*.—Patent dated July 12, 1859.—This invention consists in the employment of a combination of devices for closing the spring doors of a trap, constructed for the purpose of catching rats, or other similar animals.

*Claim*.—The combination of the spring doors D D, rods O O, dog d, and rod r, when arranged substantially in the manner and for the purpose set forth.

No. 24,716.—CHARLES B. BRISTOL, of Naugatuck, Conn.—*Improved Combination of Flesh Fork and Skimmer*.—Patent dated July 12, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—As a new article of manufacture, the combination of the fork and skimmer, when constructed, attached, and fitted for use, substantially as described.

No. 24,717.—J. H. BUTLER and P. G. VAN HOUTEN, of Cohocton, N. Y.—*Improved Mode of Operating Farm Gates*.—Patent dated July 12, 1859.—The claim and engraving explain the nature of this invention.

The inventors say: We *claim* actuating the traps L L, by means of the weight M and cord o, arranged in combination with the lever F, or its equivalent, for operating automatic gates, substantially in the manner and for the purposes shown and described.

We also claim the construction and operation of the double acting latch, in combination with an automatic gate for carriages substantially in the manner and for the purpose set forth.

No. 24,718.—ANSEL CAIN, of Holyoke, Mass.—*Improvement in Walking Canes*.—Patent dated July 12, 1859.—This invention consists in constructing a walking stick containing within itself a lamp, the flame of which shall be surrounded by glass, and ventilation properly provided for, in such manner that the staff can be used for walking, and at the same time made to furnish sufficient light to light the way to the person using it in a dark night.

*Claim*.—The combination of the lamp, constructed and arranged in the manner described with the walking cane, for the purpose set forth.

No. 24,719.—JAMES H. CASE, of Lyons, N. Y.—*Improvement in Hanging the Bodies of Vehicles*.—Patent dated July 12, 1859.—This invention consists in combining metallic leaf springs with thorough braces in such a manner as to combine the effect of flexible and tensile elasticity, and in the method of applying the same to sulkies, gigs, and other light carriages.

The inventor says: I *claim* the combination of the metallic springs with thorough braces, substantially in the manner and for the purpose set forth.

I also claim, the combination and arrangement of the combined thorough braces a b, with

the circular body E, and supplementary spring G, substantially as and for the purpose described.

No. 24,720.—MATTHEW CHAMBERS, of New York, N. Y.—*Improvement in Skirt Supporters*.—Patent dated July 12, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—Combining with and securing to a corset band extending in the rear, or in the rear and front downwards from the waist, to clasp the body around the hips of the wearer, the frame work of a skirt or bustle, when said frame work is composed of hoops disconnected and fastened in front, or thereabouts, substantially as described and for the purposes set forth.

No. 24,721.—DENISON CHESEBRO, of Syracuse, N. Y.—*Improved Method of Telegraphing from Railroad Cars while Moving*.—Patent dated July 12, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The combination of a sufficient number of pendants, arranged as described, and each having a movable vertical tongue, as described, and so constructed as to admit of a telegraph wire being attached to each of them in the particular manner specified with the metallic plates, wood scantling, or equivalent, and conducting internal wires attached to the roof of a railroad car, the whole being constructed, operated, and operating in the manner described and for the purposes set forth.

No. 24,722.—WILLIAM A. CLARK, of Bethany, Conn.—*Improved Device for Fastening the Cutters of Hollow Augurs*.—Patent dated July 12, 1859.—This invention consists of a device for securing the cutters in position, it being made of an angle wedge resting against a shoulder upon the stock and secured in place by the pressure of the cutter upon the portion of the wedge which passes between the cutter and the stock.

*Claim*.—The angle wedge *e*, in combination with the cutters, face plate, screws *c*, and ledges *H*, substantially as described and for the purposes set forth.

No. 24,723.—DAVID COOK, of New Haven, Conn.—*Improved Fruit Basket*.—Patent dated July 12, 1859.—This invention consists in making a fruit basket of thin slats of wood, curved, or bent laterally or transversely to fit the shape of the bottom, as shall be found most convenient to give the desired shape to the article.

Also, in binding the top and bottom with a suitable band of sheet metal to strengthen the article and make the shape permanent.

*Claim*.—Making a metal bound wooden fruit basket, either plain or ornamental, when constructed and fitted for use, substantially as described.

No. 24,724.—JOHN DAVIS, of New Bedford, Mass.—*Improved Mode of Connecting the Ends of Railway Bars*.—Patent dated July 12, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, connecting the rails of railroads in continuous chains with hinge joints in any practical mode.

Second. I claim securing the rails in the couplings, by inserting wedges longitudinally under the rails, and clinching their margins.

Third. I claim wedge *D*<sup>2</sup>, in Fig 2, to secure wedge *D*<sup>3</sup>, in Fig. 3, and *vice versa*, by means of the hinge joint or bolt *C*, in Fig. 1.

No. 24,725.—PERRY DAVIS, of Providence, R. I.—*Improvement in the Wheels of Buggy Boats*.—Patent dated July 12, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—Arranging paddles upon the spokes of the wheels of a buggy boat, so that the wheels perform the twofold purpose of paddle wheels and carriage wheels, substantially in the manner and for the purposes set forth.

No. 24,726.—WILLARD C. ELLIS and JOHN N. WHITE, of Springfield, Mass.—*Improvement in Revolving Fire-Arms*.—Patent dated July 12, 1859.—The claim and engraving explain the nature of this invention.

The inventors say: We *claim* the projection *C* at the bottom of the chambers of the cylinders on which the fulminate of the cartridge rests and is struck by the hammer in the discharge.

We also claim the flange *B* of the cartridge parallel with the barrel, the two in combination, for the purpose specified.

No. 24,727.—LEWIS C. ENGLAND, of Owego, N. Y.—*Improvement in Apparatus for Tanning*.—Patent dated July 12, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, in combination with the leach vat and the conveyer trough,

the pair of rollers to crack the wet bark before it is delivered into the leach vat, substantially as set forth.

No. 24,728.—DANIEL FITZGERALD, of New York, N. Y.—*Improved Fireman's Ladder*.—Patent dated July 12, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, suspending a ladder upon the standard E, so that it may be elevated and turned in any direction, constructed and arranged substantially as described.

Second. The arrangement of the branch pipes C with the stop cocks K, for use at various heights, as described.

Third. I also claim making the main pipe B serve as a hand rail to the ladder, and to give it stiffness, by setting it up a little above and parallel to it, as described.

No. 24,729.—W. A. FOSTER, of Chester, Conn.—*Improved Method of Hanging Pictures, Looking-Glasses, &c.*—Patent dated July 12, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—Adjusting picture frames or mirrors to different positions and at different angles, by means of a central hinge and levers, substantially as described and for the purposes set forth.

No. 24,730.—M. I. GALLAGER and WILLIAM H. GLADDING, of Savannah, Ga.—*Improvement in Breech Loading Fire-Arms*.—Patent dated July 12, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—Forming the chamber in the barrel and breech of the gun of the shape of two frustrums of cones, or of a frustrum of a cone, and a section of a parabolic spindle, whose bases meet at or near the line of the joint between said barrel and breech, for the purpose of containing a cartridge case of the form substantially as represented.

No. 24,731.—JOSEPH GASSER, of Toledo, Ohio.—*Improved Clothes Frame*.—Patent dated July 12, 1859.—When this invention is in use, the frame rests entirely on the legs C, the feet of which are spread far apart, so as to give the frame a broad base, rendering it very difficult to overthrow the frame when laden with clothes. The standard A is about as long as the legs C, and does not rest upon the ground. The arm E, legs C, and braces D will fold together somewhat like the arms and braces of an umbrella.

*Claim*.—The arrangement of the braces D and arms E in connection with the standard A and legs C, substantially as set forth.

No. 24,732.—DAVID GLOVER, of Cass township, Pa.—*Improvement in Dumping Cars*.—Patent dated July 12, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—The construction of a revolving tip placed upon a movable frame or truck, the side pieces of which form, at a certain stage of the operation, a continuation of the main track or foundation, by means of which the wagon or car can be taken without handling from the main track or foundation, with the load, moved to the place required, and there dumped in any direction, substantially as and for the purposes set forth.

No. 24,733.—FREEMAN GODFREY, of Grand Rapids, Mich.—*Improved Shingle Machine*.—Patent dated July 12, 1859.—This invention relates to that class of shingle machines in which a reciprocating knife is used for riving shingles from the bolt. It consists in the means employed for feeding the bolt to the knife, whereby an automatic and positive feed movement is obtained.

*Claim*.—The cams G G, gearing into rack bars F F, attached one to each end of the carriage E, said cams being fitted in a yielding or adjustable centre-poised frame I, and operated from the power lever D, through the medium of the pawl O, ratchet M, and gearing *l m*, substantially as and for the purpose set forth.

No. 24,734.—WILLIAM GOODALE, of Clinton, Mass.—*Improved Machine for Making Paper Bags*.—Patent dated July 12, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, making the cutter which cuts the paper from the roll or piece of the form herein described, that, in cutting off the paper, it also cuts it to the required form to fold into a bag without further cutting out.

Second. The attachment of the former F directly to the cutter to operate in combination therewith, and with a folding table C, substantially as described.

Third. The described mode of applying and arranging the paster *f* to operate in combination with the folding table C and the former F.

Fourth. The construction of the side lappers with angular ends *e e*, substantially as described, for the purpose of partly folding the side of the bag.

Fifth. The knock off I, operating in combination with the former, substantially as and for the purpose described.

Sixth. The vibrating frame J with its rollers *i i*, operating in combination with the former and the knock off, substantially as and for the purpose described.

Seventh. The arrangement of the table, the cutter, the former, the side lappers, the bottom paster, the knock off, and the vibrating frame J, to operate in relation to and in combination with each other, substantially as described.

No. 24,735.—DARWIN A. GREENE, of New York, N. Y., administrator of ELIAS DAVIS, deceased, late of New York, aforesaid.—*Improved Machine for Splitting Fire Wood.*—Patent dated July 12, 1859.—This invention consists of a set of duplicate horizontal acting knives, operating upon the wood while resting against two vertical stationary plates, which are connected together by four bolts, also forming guides for the reciprocating cross heads having the knives secured to them; the wood, before and after the operation of splitting, is brought forward by two endless belts, which are advanced by ratchets, rods, and levers, operated by cross heads while in motion.

*Claim.*—The slabbing knife *a* and splitting knives *b c d e f*, as secured to one cross head O, acting simultaneously at the forward movement of the latter, substantially as described and for the purpose set forth.

No. 24,736.—TOBIAS GRODJINSKI, of New York, N. Y.—*Improvement in Dry Gas Meters.*—Patent dated July 12, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—Attaching each pair of the plates B B<sup>1</sup>, or their substantial equivalents, to the flexible part C of the diaphragms of dry gas meters, by overlapping parts of the one upon the other, substantially in the manner and for the purpose set forth and described.

No. 24,737.—GEORGE HENSEL, of New York, N. Y.—*Improvement in Sewing Machines.*—Patent dated July 12, 1859.—This invention consists in an improved contrivance for working and regulating the feed.

*Claim.*—The construction of the disk W with an elastic plate R, attached and operated by means of a cam, in the manner and for the purpose substantially as set forth.

No. 24,738.—S. EMILIUS HEWES, of Albany, N. Y.—*Improvement in Stoves.*—Patent dated July 12, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—A revolving fire pot, arranged to traverse perpendicularly or to be raised and lowered, substantially as described, for the purpose of supplying air to and shutting it from the openings in the sides of the fire pot, so as to effect a ready and perfect combustion and consumption of the fuel.

No. 24,739.—H. J. HOLMES, of Warren, Mass.—*Improved Clothes Frame.*—Patent dated July 12, 1859.—This invention consists in combining together a series of clothes frames for drying clothes, so that each frame will have independent bearings in two segmental pieces, which form the foot and cap pieces, and so that when the frames are closed and shut together there will be a great economy of space.

*Claim.*—A series of vertical frames, one of which has permanently affixed to it a foot piece A and cap B, when said cap and foot pieces form suitable bearings for other frames, arranged and operating as and for the purpose set forth.

No. 24,740.—JOHN P. HUGHES, of Spout Spring, Va.—*Improvement in Water Wheels.*—Patent dated July 12, 1859.—The inventor says: By making the arms in sections the capacity of the wheel may be readily varied to adapt it to different circumstances, by simply adding or extracting a section as the case may require, while at the same time the whole apparatus may be more readily made, transported, and put together and taken apart.

*Claim.*—Making the water arms in sections, essentially as described, for the purpose set forth.

No. 24,741.—ANTHONY ISKE, of Lancaster, Pa.—*Improvement in Dumping Wagons.*—Patent dated July 12, 1859.—The side pieces F are grooved from the front to the centre, in which groove the rollers I on the box A move and are kept in place; on the rear end are the rollers H which move in the grooves in the bottom of the box A; L is a cogged spindle operated by a handle or windlass K, by means of which the box is moved back and forward; G is a bent upright for retaining the box in place when run forward; M is a stay peg or pivot against which the catch plate N with its notch to receive the peg comes when the box is run back and stays it, while it becomes the pivot of the dumping box.

*Claim.*—The drop door D with its lever E, the partitioned box A with its rack bar *c* on the bottom, the handled spindle E K for moving the same, as specified, when the several parts are combined as and for the purpose set forth.

No. 24,742.—JOHN W. KENNEDY and JOHN T. PLUMMER, of Plainfield, Conn.—*Improvement in Machines for Dressing Mill Stones.*—Patent dated July 12, 1859.—The pick may be adjusted to any part of the face of the stone, the plate *o* being movable on the case G and

radial or tangential furrows cut therein. The operator moves the plate *o* by hand and the strength of the spring *T*, and consequently the force of the blow of the pick is regulated by turning the shaft *U*, which causes the spring *T* to have greater or less strength. The shaft *U* is prevented from casually turning by means of the ratchet *V* and pawl *W*.

*Claim.*—The arrangement and combination of the arbor *Q*, forked arm *S*, spring *T*, shaft *U*, ratchet and pawl *V W*, wiper *N*, bar *A*, movable case *G*, shaft *K*, and adjustable plate *O*, as and for the purpose shown and described.

No. 24,743.—*J. KURTZEMAN*, of Lancaster, Ohio.—*Improved Head Block for Saw Mills.*—Patent dated July 12, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The sliding rack bar placed longitudinally in the carriage *A* and adjusted therein by the wedges *e e*, in connection with the gearing *H I F*, whereby the two sides *C C* may, by a suitable adjustment of the wedges, be actuated both simultaneously and separately as may be desired.

No. 24,744.—*WILLIAM LANCE*, of Olney, Ill.—*Improved Method of Constructing Mallets.*—Patent dated July 12, 1859.—This invention consists of circular convex cast iron, wrought iron, or steel heads, which, by being contracted in sections and secured, prevent the blocks or sections of wood from working from the centre when fastened by the bolts *D*.

*Claim.*—The manner of their construction and arrangement, as shown and described, for the uses and purposes set forth.

No. 24,745.—*JOHN K. LEEDY*, of Woodstock, Vt.—*Improvement in Bee-Hives.*—Patent dated July 12, 1859.—The pipes *E E* are designed to protrude on the outside of the wall to furnish the bees a free passage and the same advantages that they would possess from the ordinary mode of treating them. The pipes *a b c* are designed for the purpose of conveying the bees from one compartment to the other when they swarm, and the faucets serve to confine them to either of the compartments desired.

The inventor says: I *claim*, first, the boxes *e*, constructed and arranged in the manner and for the purpose specified.

Second. I claim, in combination with the boxes *e*, the pipes *E E* and *a b c*, and their faucets, all arranged in the manner and for the purpose set forth.

No. 24,746.—*ROBERT H. LONG*, of Philadelphia, Pa.—*Improved Salinometer.*—Patent dated July 12, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The means of drawing into a vessel water from a steam boiler, as a means to facilitate testing the density of the water in the same, constructed and arranged for the purpose substantially as set forth.

No. 24,747.—*A. G. MACK*, of Rochester, N. Y.—*Improved Life Preserving Raft.*—Patent dated July 12, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—Surrounding a cask or chamber *A* with conical floats *B*, arranged radially with said chamber and hinged thereto, and covering the cone with canvas or other suitable material, and bracing the whole together by a rope suitably arranged, all substantially in the manner and for the purposes specified.

No. 24,748.—*JOHN W. MASURY*, of Brooklyn, N. Y.—*Improvement in Paint Cans, &c.*—Patent dated July 12, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—The construction of a metallic can for hermetically sealing paints and other substances, having attached thereto a rim or ring of thin brass or other soft metal, in such a manner that the top or cover may be removed by severing the said rim or ring of brass or other soft metal with a penknife or other sharp instrument, in the manner and for the purposes described and represented, or its equivalent.

No. 24,749.—*A. A. McMAHEN*, of Oxford, Me.—*Improvement in Earth Boring Augers.*—Patent dated July 12, 1859.—This invention consists in the method of bracing together the two ends of the spiral portion of the auger by means of a rod, which constitutes the elongation of the auger shaft, for the purpose of stiffening said spiral portion and preventing it from being twisted or compressed during the operation.

The inventor says: I *claim* bracing the two ends of the spiral portion of the auger by means of the central rod *E*, substantially in the manner and for the purposes described.

I also claim the manner of securing the boring tools *F G*, rod *H*, to the spiral *D*, by which they may be removed and replaced without making any changes on the spiral *D*, substantially in the manner and for the purposes described.

No. 24,750.—*ANTON MENGE*, of Pointe à la Hache, La.—*Improvement in Dredging Machines.*—Patent dated July 12, 1859.—The principal feature in this invention consists in arranging the bucket or cutter frame in an inclined position in front of the boat, and constructing it so that it can be readily slewed from right to left of the boat by proper machinery

adapted to this purpose; also, in an improved bucket, which acts as a cutter, and is provided with a hinged bottom, in order to open and to cause, by the pressure of the air upon the hinged bottom, the earth or mud to fall at the proper place of discharge.

The inventor says: I *claim*, first, the bucket frame B, when resting upon adjustable casters or friction rollers, and operated so as to be swung from right to left of the boat upon a circular track *b*, in combination with the oscillating shaft C, all arranged and operating substantially in the manner and for the purposes set forth.

Second. I claim the buckets F, having a hinged back T, arranged and operating for the purposes specified.

No. 24,751.—F. O. MORE, of Bellefontaine, Ohio.—*Improvement in Preserve Cans*.—Patent dated July 12, 1859.—This invention consists of a peculiarly formed cap, provided with a lip fitting into a corresponding groove in the top of the can, in combination with a lip of peculiar form upon the top of the can itself.

*Claim*.—The peculiarly formed cap B, in combination with the curved spring lip E.

No. 24,752.—Z. N. MORREL, of Cameron, Texas.—*Improved Portable Oven*.—Patent dated July 12, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—Forming the pin on the handle on the cover of a Dutch oven or skillet, in combination with the tube under the centre of the frying pan or gridiron, substantially as and for the purposes set forth.

No. 24,753.—CHARLES NEER, of Albany, N. Y.—*Improved Dynamometer*.—Patent dated July 12, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the combination of the rigid arm or arms *c* and yielding incline or inclines *d*, with the loose pulley *a*, or its equivalent, whereby the power exerted to rotate the shaft *a* is denoted by the motion resulting from the pressure against said yielding incline or inclines, for the purpose of forming a rotary dynamometer, substantially as specified.

I also claim the revolving and sliding cone *h*, adjusted in its position according to the power applied from the pulley *a* to the shaft *b*, when combined with a registering apparatus, substantially as set forth, to record the amount of power made use of, as described.

No. 24,754.—CHARITY PENDLETON, of Galena, Ill.—*Improved Washing Machine*.—Patent dated July 12, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of the two horizontal bars or rails J and M, having a circular reciprocating motion, with the fixed corrugated cylindrical surface forming the bottom of the machine and having its axis coincident with the axis of motion of the said bars J and M, the parts being constructed and arranged as hereinbefore described, and operating so as to produce the effect previously stated.

Second. The combination of the slot or mouth K, in the arm D and the tenon I I<sup>1</sup>, at the ends of the corrugated rubbing bar M with the perforated bar J, by which the portion of the said corrugated rubbing bar M may be altered with respect to the bottom of the machine, so as to increase or diminish its distance therefrom, substantially as set forth, and without altering the position of the bar J.

Third. The combination of the corrugations on the lower surface of the rubbing bar M with similar corrugations on the bottom or concave of the machine, but so arranged that the direction of the two sets of corrugations will be at right angles to each other, as fully described, and for the purpose set forth.

No. 24,755.—PETER PHILIP, of Ghent, N. Y.—*Improved Method of Operating Windlasses When Applied to Hay Presses, &c.*—Patent dated July 12, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim*, first, attaching the wheel or table C to the capstan A, so as to be operated upon by the loose or boom sweep B, as a brake, for the purpose of stopping the press at any point of descent while being filled, and of regulating and controlling the motion of the capstan in the uncoil.

Second. Providing the capstan A with the arms *e e*<sup>1</sup> and the loose or broom sweep B, in combination with the check lever D, substantially in the manner and for the purpose set forth.

No. 24,756.—DANIEL QUIMBY, of Littleton, N. H.—*Improved Machine for Boring Hubs*.—Patent dated July 12, 1859.—This invention consists in the use of an adjustable rotating clamp, stationary cutter, and feed screw, combined and arranged whereby hubs may be bored in taper form to receive their boxes, and the machine rendered capable of being adjusted to bore hubs of varying sizes, and with holes of greater or less taper form, as may be desired.

The inventor says: I *claim* the shaft A, the boss B, placed on said shaft, and provided with a conical bore *d*, and having the collar *p* and arms *q* attached, the screw rod C connected with the collar *p* by the gearing *n o*, and provided with the divided nut D, attached to

the upright *f*, the whole being arranged to operate substantially as and for the purpose set forth.

I further claim, in combination with the parts above named, the convex projection *m*, placed on the shaft *A*, to operate as and for the purpose specified.

No. 24,757.—P. D. RICHARDS and F. N. THAYER, of New Orleans, La.—*Improved Pocket Register of Count*.—Patent dated July 12, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The construction and arrangement of a hand operating tally, specifically as described, consisting of three indexes and corresponding wheels to indicate count, as specified, the whole being operated by a projecting stud *G* and spring brake *I*, with its gauge *S*, for the purpose set forth.

No. 24,758.—JOHN RICHARDSON, of New York, N. Y.—*Improvement in Pen and Pencil Cases*.—Patent dated July 12, 1859.—This invention consists in the employment of two sleeves with spiral grooves turning in the same direction, and arranged around the same tube connected with the penholder and the pencil, and also with a sectional outer case, or shell, in such manner that by turning the outer case either the penholder or pencil may be moved independently of each other, so that on drawing one within the case, by continuing the same movement of the outer shell the other is thrown out.

*Claim*.—The arrangement of the spiral grooved sleeves and their connection with the penholder and pencil, and also with the outer shell of the case, substantially as described, for the purposes set forth.

No. 24,759.—JOHN ROBERTSON, of Brooklyn, N. Y.—*Improvement in Hydrostatic Lifting Jacks*.—Patent dated July 12, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—The employment of the exterior movable hydraulic cylinder *E* with toe piece upon its surface, in combination with the standard *B*, which serves also as piston and eduction pipe, as and for the purpose shown and described.

No. 24,760.—WILLIAM G. RUSSELL, of Winchester, Va.—*Improvement in Self Detaching Whiffletrees*.—Patent dated July 12, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—A swingle or whiffletree, provided with a lever turn bar *e e e f f g h h*, as shown in Fig. 3, together with the spring clasp *o o*, Figs. 1, 4, 5, and the hinged or jointed hooking ferrules *K K L L n n*, when constructed and arranged substantially as set forth and described.

No. 24,761.—SILAS T. SAVAGE, of Albany, N. Y.—*Improvement in Coal Sieves*.—Patent dated July 12, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The employment of the two half globes *A* and *B*, in which there are interstices *c c c*, as a coal sifter, when said half globes are provided with grooves *b b*, tongues *a a*, and shoulders *x x*, the same being used in connection with a box or cylinder, by means of which the two portions of the globe are prevented from moving endwise of the trunnions and are prevented from separating, substantially as set forth.

No. 24,762.—I. W. SCHMIDT, of Philadelphia, Pa.—*Improved Sawing Machine*.—Patent dated July 12, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The combined arrangement of the stationary frame *A*, fitted with the adjustable holders *d e* and *n*, as described, and the saw carriage *B*, operated by the crank *o*, shaft *f*<sup>1</sup>, spur wheels *l*, shaft *m*, and rope or chain, as set forth and described, whilst the saw *k* is at the same time rotated through the media of the gear wheel *f* and *g*, pulley *h* and *i*, and band *7*, arranged and combined as set forth and described, the said stationary frame *A* and the said moving saw carriage *B*, operating together as and for the purpose set forth and described.

No. 24,763.—CORNELIUS R. SHAEFFER, of Gettysburg, Pa.—*Improved Machine for Making Hand Rails for Stairs*.—Patent dated July 12, 1859.—This invention consists in constructing and arranging a machine so that the length, the twist joint, and curve of any piece of a stair rail may be obtained by a mechanical process.

*Claim*.—The combination of the perpendicular square post erected upon the base *A* with the draft board *B*, pitch boards *B* and *G*, rod *C*, and arm *D*, the several parts being arranged substantially as and for the purpose set forth.

No. 24,764.—REUBEN SHALER, of Madison, Conn.—*Improved Confectionary Safe*.—Patent dated July 12, 1859.—This invention consists in so constructing the sides of the safe that they will fit into a groove, the said groove being filled with India rubber, or any other suitable elastic substance, in combination with a number of hooks or catches attached to the bottom of the safe, which can be hooked to a flange projecting from the side of the safe; also, in constructing the sides and top of the safe in one piece.

*Claim.*—The confectionary safe above described, constructed substantially as specified, as a new and useful article of manufacture.

No. 24,765.—GEORGE F. SHAW, of Woburn, Mass.—*Improvement in Corn Huskers.*—Patent dated July 12, 1859.—This invention consists in the use of a cylinder and a concave roller, arranged in such a manner that the axis of the one shall be slightly inclined to that of the other, so that as the ear is driven forward parallel with the cylinder, the husks shall be stripped backwards from the tip of the ear towards the but, and carried in a different direction between the cylinder and concave roller.

*Claim.*—The combination and arrangement of the cylinder A and concave roller C, substantially as set forth and for the purposes described

No. 24,766.—CHRISTIAN SHUNK, of Canton, Ohio.—*Improvement in Refining Iron.*—Patent dated July 12, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—The use of the external crucible or hearth, having the tuyere pipe C, the projecting stone D, and the escape pipe E, constructed as described, operating in such a manner that the blast shall deflect from the side of the upright stone and produce a rotary movement in the melted metal for the purpose of refining the same, as specified.

No. 24,767.—JOSEPH H. SIDDALL, of Philadelphia, Pa.—*Improvement in Threshing Machines.* Patent dated July 12, 1859.—In operating this machine when the crank revolves, the slides move rapidly up and down, and the straps, acting alternately on the lower and upper part of the circumference of the roller, will give it a reciprocal motion, and the flails, descending with a quick elastic blow and instantly rising to a vertical position, will allow the straw to pass under them without obstruction.

*Claim.*—The combination of flails F, rollers E, slides C, and straps  $g^1$ , when said flails are constructed with the flexible joints J, the arrangement and operation being substantially as and for the purpose set forth.

No. 24,768.—MICHAEL TROMLY, of Mount Vernon, Ill.—*Improvement in Locks for Fire-Arms.* Patent dated July 12, 1859.—The inventor says: This improved lock contains many of the features embraced in the lock patented by me on the 13th day of October, 1857, and its construction is such as to make it impossible for the hammer to descend when placed at half cock without being previously raised to a full cock, thereby guarding against accidental discharge when in this position, and to enable the trigger to discharge the hammer with more ease than heretofore.

The inventor says: I *claim*, first, the combination of the hooks  $G^2$  I, or their equivalents, respectively formed on the claw  $G^1$ , of the link G, and the trigger K, substantially as described.

Second. I also claim widening the upper end of the trigger K, so as to form a projection  $K^1$  in front, whose lower curved edge shall operate on the curved surface of the claw  $G^1$ , in the manner and for the purpose set forth.

No. 24,769.—I. L. G. WARD, of Adrian, Mich.—*Improvement in Artificial Stone.*—Patent dated July 12, 1859.—The claim explains the nature of this invention.

*Claim.*—A cement composed of pumice stone, silicate of soda, fluor spar, and Roman cement, as set forth.

No. 24,770.—OLIVER N. WEAVER, of Dover, Ky.—*Improvement in Preserving Cans.*—Patent dated July 12, 1859.—This invention consists in the application of a finely punctured plug of gum (catouchouc) to a screw threaded, tapering mouth or nozzle of a can or jar, the exhaust being effected through a tube adapted to readily penetrate the plug through the puncture without tearing its substance, and to be as readily withdrawn at the proper moment.

*Claim.*—The perforated elastic plug D d, secured in the top of a provision can, in the described combination, with a nozzle E and tube F communicating with an exhausting chamber, substantially as set forth.

No. 24,771.—LOREN WETMORE, of Tioga county, Pa.—*Improved Trap for Animals.*—Patent dated July 12, 1859.—This invention consists of a simple trap with a peculiar arrangement for springing it.

The inventor says: I *claim* the peculiar construction and arrangement of the manifold trap, substantially as set forth.

Second. I claim the arrangement of the trip C, provided with a fulcrum or fulcra c, guide pin e, and arched wire D, for operating the trap, substantially as set forth.

No. 24,772.—JAMES WILSON, CHARLES GREEN, and WILLIAM WILSON, jr., of Wilmington, Del.—*Improvement in Attaching the Heads of Metallic Powder Kegs, &c.*—Patent dated July 12, 1859.—In one head a hole is struck by the die in such a manner that upon the

upper side an elevation is produced around the hole, as shown at E E. Upon the under side a small plate F F, having a corresponding opening, but smaller, is riveted to the head. A cap G G fits upon the opening in the plate F F. After the keg is filled with powder this cap is sealed upon the head.

*Claim.*—The double seaming of both heads of the keg and the opening in one head, in the manner substantially as described.

No. 24,773.—ARCALOUS WYCKOFF, of Elmira, N. Y.—*Improved Hollow Augur.*—Patent dated July 12, 1859.—This invention relates to the cutting portion of those tubular augurs which in boring remove only a portion of the wood, leaving a core or rod in the centre. In this invention, the cutter head is constructed with the cutting lips *a a*, which start at the periphery of the bit, and extend toward the centre in a concave line till they terminate in the interior portion of the tube at *b*, where their direction approaches a line longitudinally with the augur.

*Claim.*—Combining the transverse auxiliary cutters *d d*, with the prime cutters *a a*, and elliptic opening of the annular cutter head, as described, substantially as and for the purpose set forth.

No. 24,774.—PETER ALTMAIR, of Lewistown, Pa., assignor to Himself and MYRON M. FAXON, of Lewistown, aforesaid.—*Improvement in Breech Loading Fire-Arms.*—Patent dated July 12, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—In combination with a fixed breech piece, a hinged barrel, so arranged as that the said barrel shall swing upward and expose the chamber of the breech piece, below the rear end of the barrel for inserting the charge, substantially as described and represented.

No. 24,775.—ROBERT M. CAMPBELL, of East Cambridge, Mass., assignor to Himself and BENJAMIN S. WRIGHT, of Boston, Mass.—*Improved Money Drawer Alarm.*—Patent dated July 12, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim* the combination and arrangement of the two levers F G, and the spring latch E, with the clock alarm apparatus D, the striker *a*, and bell *b*, and the combination of the same and a series of perforated key slides and a set of T bars applied together and to such levers so as to actuate the same, substantially as specified.

I also claim the combination and arrangement of the T bars and the perforated key slides, to operate in manner as described.

I also claim, in combination with the key lock M, and the T bar I, a latching apparatus placed in the case K, and constructed so as to lock both the cover and the T bar, or either, substantially as specified.

I also claim the combination of the detector or indicator with the case cover and the T bar, and operated in manner as specified.

No. 24,776.—SAMUEL GREEN, of Lambertville, N. J., assignor to Himself and W. R. GREEN, of Philadelphia, Pa.—*Improved Safety Apparatus for City Railroad Cars.*—Patent dated July 12, 1859.—This invention consists in providing a swinging frame and bolt, in connection with brake blocks in front of the forward wheels of a city railroad passenger car, so arranged in relation to each other that should a person fall upon the track in getting in or out at the forward end of the car while it is in motion, the swinging frame coming in contact with the falling person will so operate upon the brakes as to stop the wheel.

*Claim.*—The swinging frame C, in connection with the bolt *l*, and cover *v*, the brake blocks D D, in connection with the chains *r r*, and rods *t t*, and the stationary supporting piece *n*, the same, or their equivalents, being arranged, applied, and operated substantially in the manner and for the purpose set forth and described.

No. 24,777.—SAMUEL B. GUERNSEY, of Waterbury, Conn., assignor to WILLOUGHBY H. REED and GEORGE W. ZEIGLER, of New York, N. Y.—*Improvement in Clasps for Skirt Hoops.*—Patent dated July 12, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim* connecting the hoops with the straps, or equivalents thereof, for connecting and suspending them by means of plates bent to embrace the hoops, and formed with two slots or apertures, through which the straps or equivalents pass, thus clasping the straps or equivalents to the hoops, substantially as described.

And I also claim the employment of the metal clasps, constructed as above described, in combination with and as a means of connecting the ends of the hoops, substantially as described.

No. 24,778.—MOSES HALL, jr., of Osborn, Ohio, assignor to Himself and SAMUEL H. JUDY, of Osborn, aforesaid.—*Improvement in Cattle Gates for Railroads.*—Patent dated July 12, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—Constructing a cattle guard or gate, with its cross bar or shaft below the rail of the railroad track, and operated by springs, substantially as described.

No. 24,779.—ROBERT LAW, of Lockport, N. Y., assignor to Himself and P. P. DIX, of Olcott, N. Y.—*Improvement in Apparatus for Packing Fruit*.—Patent dated July 12, 1859.—The inventor says: For packing fruit in barrels, I employ two clamping levers A A, connected together by the fulcrum link B, and V shaped nut or yoke c. This yoke forms the nut of the hand screw D, which works in a socket in the follower E. The lower ends or long arms of the lever are provided with claws f f, having teeth which enter the staves of the barrel by pressure, while the upper ends are inclined to the centre or screw D, in the form of an arch, and are provided with hooked recesses g g, which enter slots in the end of the yoke and are secured there by the pins h h.

*Claim*.—The V shaped or wedge acting yoke C, provided with fulcrum pins h h, and the hooked recesses g g, in the upper ends of the bent clamping levers A A, arranged and acting in combination with the screw D, fulcrum link B, and claws f f, or their equivalents, substantially in the manner and for the purpose specified.

No. 24,780.—SIDNEY PARKER, of New York, N. Y., assignor to Himself and HUGH HERRINGSHAW, of Sing Sing, N. Y.—*Improvement in Sewing Machines*.—Patent dated July 12, 1859.—This invention mostly respects the feeding apparatus, and the principal piece of mechanism involved therein is the combination of a certain hook with a feeding arc piece.

The inventor says: I claim the combination of the hook I, and the feeding arc H, in the manner and for the purpose substantially as set forth.

I claim, also, the method of adjusting the feed, by means of the combination of the spring piece G, and the feeding arc H, in the manner described.

No. 24,781.—JOHN PAYNTER, of Shelbyville, Ind., assignor to Himself and JOHN McCORKLE, of Shelbyville, aforesaid.—*Improvement in Sugar Mills*.—Patent dated July 12, 1859.—A is a frame which is revolved by the lever B, and turns upon the upright journal C. The beveled wheel D gears with the pinion E which is upon the same shaft, and gives motion to the wheel F and crushing rollers I. The wheel F gears with the wheels G and H, which being upon the same shaft revolve the rollers J and K.

*Claim*.—The combination and arrangement of the journal C, wheel D, gearing E F G and H, and rollers I J and K, the whole being suspended in a frame A, and constructed and operated substantially as described.

No. 24,782.—ASA T. RING, of Newton, Mass., assignor to NATHANIEL T. SPEAR and A. J. ROBINSON, of Boston and Milton, Mass., respectively.—*Improved Device for Winding Skeins of Thread*.—Patent dated July 12, 1859.—Each of the bobbins b turns loosely upon a shank e, which is a little longer than the length of the bobbin, so as to allow it free play, as seen at o, and provided with a milled head d. The shank e screws on the screw threaded end l of rod t, the lower portion of the shank being hollow and screw threaded, as seen at i.

*Claim*.—The combination of the clamping spring c, screw and guide pin or rod t t l, with the tightening and supporting shank e, and bobbin b, when said parts are constructed and arranged in relation to each other substantially as and for the purpose specified and shown.

No. 24,783.—THEODORE ADAMS, of Harrisburg, Pa.—*Improvement in Machines for Breaking Stone for Turnpike Roads*.—Patent dated July 12, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—Hanging the breaking rolls of stone breaking machines in boxes supported on rubber springs or their equivalent, so that said rollers will yield to any and all undue strains upon them, and thus prevent the breaking of the machinery, substantially as represented.

No. 24,784.—LEWIS ALLEN, of Sleepy Creek, Va.—*Improved Washing Machine*.—Patent dated July 19, 1859.—The operation of this machine is as follows: Sufficient water and soap being put into the washing box, the clothes are arranged upon the main cylinder r r s s, and the net work u u, adjusted over the clothes, and the ends of the net held together by being tied. The crank n o P is turned when the cylinders q q s s rotate inwardly toward each other, carrying the clothes between them. The upper cylinder q q bearing down on the clothes by the action of the springs g<sup>3</sup> g<sup>3</sup>, and thereby pressing and squeezing the clothes against the grating or open bars of the main cylinder r r s s, and in the revolution thereof the clothes are pressed, squeezed, and dipped, and the dirt removed therefrom, the netting preventing the clothes from falling off the cylinders.

The inventor says: I claim the construction of the open, hollow washing, rinsing, and dipping cylinder, composed of a series of bars r r s s placed at regular intervals from each other and provided with open net work u u as described.

I also claim, in combination therewith, the fluted or ridged pressure squeezing cylinder q q and detachable framing e e, 2, f f, g g, g<sup>2</sup> g<sup>2</sup>, h h, i i, k k, when arranged and operated in the manner substantially as set forth and described.

No. 24,785.—JACOB BARNEY, of Chicago, Ill.—*Improvement in Variable Exhaust Devices for*

*Steam Engines.*—Patent dated July 19, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the employment of two cylinders B B, so provided with gradually tapering grooves in each that when revolved together an expanding and contracting circular opening will be formed for the purpose of regulating the passage of the exhaust steam from locomotive and other engines, substantially as set forth.

Second. I claim the cylinder B B, as constructed, when used in combination with the tight metallic case C C, and packing *o o*, the same being arranged and operating in the manner and for the purpose fully set forth.

No. 24,786.—JAMES BAYLOR, of Canton, Ill.—*Improvement in Universal Joints.*—Patent dated July 19, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—Connecting shafts, when placed angularly with each other, by means of the universal joints, constructed as represented and described, by which a rotary motion may be transmitted from one shaft to the other.

No. 24,787.—W. H. BETTES and I. H. PARKER, of Kokomo, Ind.—*Improvement in Boot Trees.*—Patent dated July 19, 1859.—This invention consists in expanding the toe, instep, and sides, all simultaneously.

The inventors say: We *claim*, first, the employment of the sleeve *c*, in connection with the screw shaft *g*, the two being arranged and operating substantially as set forth.

Second. The arrangement of the cords *e h* and *i* with the levers *d<sup>1</sup> d<sup>1</sup>* and *m*, substantially in the manner and for the purpose set forth.

Third. The combination of the instep K, side pieces H H<sup>1</sup>, and toe piece 1, when the whole are so arranged and constructed that they will operate simultaneously, substantially as and for the purpose described.

No. 24,788.—JOHN T. BEVER, of Hainesville, Mo.—*Improved Bedstead Cord Pin.*—Patent dated July 19, 1859.—A in the engraving represents an ordinary bedstead frame; B B, the cords which support the sack or form the bottom for the bed to rest upon.

*Claim.*—A bedstead cord pin consisting of two parts *a b*, which are constructed and operated in the manner and for the purpose substantially as described.

No. 24,789.—WILLIAM BULL, of New California, Wis.—*Improvement in Sugar Cane Presses.* Patent dated July 19, 1859.—In operating this machine motion is given to the shaft B, either by hand or other power, and the cane is placed on the more elevated trough or spout L and passes between the rollers D J, which rotate in the direction indicated by the arrows. The juice is expressed from the cane by the pressure of the rollers D J, the crushed cane passing down the spout L<sup>1</sup> and the juice falling into the reservoir G, from which it is discharged through the spout H. The pressure of the rollers on the cane is graduated by adjusting the wedge F.

*Claim.*—The arrangement and combination of the hinged adjustable frame E, roller J, frame A, wedge F, inclined spouts L L<sup>1</sup>, and roller D, as and for the purpose shown and described.

No. 24,790.—A. H. BURDINE, of Chulahoma, Miss.—*Improved Cotton Gin Sharpener.*—Patent dated July 19, 1859.—This invention consists in the combination of two crossed reciprocating files, with a circular feeding disk, which is constructed with an angular recess, and an inclined hook at one point of its circumference. It also consists, in the combination with the above, of a jointed slotted frame and a driving cam, whereby the machine is rendered more convenient for use in filing saws attached to the gin.

The inventor says: I *claim*, first, the combination of two crossed reciprocating files F F, with a circular feeding disk *r*, which is constructed with an angular recess and an inclined hook *r<sup>1</sup>* at one point of its circumference, substantially as and for the purposes set forth.

Second. The combination of the above with a jointed slotted frame and a driving cam, substantially as and for the purposes set forth.

No. 24,791.—PETER N. BURKE, of Buffalo, N. Y.—*Improvement in Stoves.*—Patent dated July 19, 1859.—The regulation of the passage of air through this stove is effected by common registers, placed below and on each side of the hearth; and when it is desired to radiate the heated air into the room the damper S in the hot air pipe L is closed, when the air passes out through apertures in said pipe arranged below the damper, as shown in the engraving.

*Claim.*—The arrangement and combination of the perforated plates N R, the partitional plates B, the flue H, the fire guard I, hot air pipe L, and chamber K, as and for the purpose shown and described.

No. 24,792.—JEREMIAH CARHART, of New York, N. Y.—*Improvement on Machines for*

*Planing Metal.*—Patent dated July 19, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the pressure plate or plates, in combination with the reciprocating bed and feeding strip, when said plates extend substantially the length of the blank to be planed, and the bed travels far enough to carry the feeding end of the strip entirely past the facing cutter at each operation, substantially as set forth.

Second. I also claim rebating the inner edges of the pressure plate or plates, as described, in such manner as to furnish at once edge guides and pressure for the blank while being fed to the cutters.

Third. I also claim, in combination with the pressure plates and cutters, the shields extending downwards from the pressure plates to protect the space between the plates from shavings and other foreign matter, as described.

Fourth. I also claim, in combination with the reciprocating bed and feeder, the scraper and brush, acting in combination for cleaning the bed and feeder or feeding strip, substantially as described.

No. 24,793.—HEMAN CARTER, of Greene, N. Y.—*Improvement in Harvesters.*—Patent dated July 19, 1859.—This invention consists in the arrangement and combination of a vibrating discharger with a horizontally revolving rake.

*Claim.*—The vibrating discharger *F*, in combination with the rake *e*, arranged and operated in the manner described, for the purposes specified.

No. 24,794.—ROBERT CARTWRIGHT, of Ithaca, N. Y.—*Improved Canal Boat Propeller.*—Patent dated July 19, 1859.—This invention consists in applying gearing to drive the propeller, said propeller being placed in the rudder, or at the back of the rudder, by which, in combination with the gearing, the vessel can be propelled and steered.

*Claim.*—The step or bearing block *I*, constructed and arranged relatively to the rudder and vessel, substantially as described, to receive the end thrust of the propeller shaft, and thus relieving the gearing and rudder from pressure, the whole end thrust of the propeller being upon the step block *I*, which is arranged to admit of any lateral motion to the vessel's centre line, thus forming a steering as well as propelling power, and being all placed externally, it entirely obviates the necessity of entering the vessel below the water line.

No. 24,795.—WILLIAM CHESTERMAN, of Centralia, Iowa.—*Improvement in Coffee Pots.*—Patent dated July 19, 1859.—The strainer *E* serves the double purpose of strainer and piston, being tightly packed. If, by the descent of the contents of tube *D*, the vacuum in *A* becomes so much impaired that the whole of the contents of *D* do not pass below the coffee grounds, it is only necessary, in order to increase the vacuum, to raise the strainer gently with the hand. The strainer being packed tight, the vacuum below it will be thus increased, and the contents above the coffee grounds will then descend and leave the grounds entirely dry.

*Claim.*—The arrangement and combination of the piston packed strainer *E*, cylinder *D*, receiving vessel *A*, socket *H*, and condenser *F*, as and for the purpose shown and described.

No. 24,796.—JOHN CLARY, of Dayton, Ohio.—*Improved Vegetable Cutter.*—Patent dated July 19, 1859.—The operation of this machine is as follows: The cutters *h* being first adjusted to the thickness of the slices required to be cut, the vegetables will be placed against the plate *b*, upon the side opposite the pinion *p*, and held down against the disk *f*; the crank will then be operated so as to rotate the disk *f* in the direction of the arrow, and, as said disk is made to rotate, the vegetables will be sliced by means of the cutter *h*, the slices so cut falling into the receiving pan *A*.

*Claim.*—The arrangement of the cutting disk suspended from the cross piece *b*, in connection with the convex cutting edge of the cutters *h*, substantially in the manner and for the purpose set forth.

No. 24,797.—WILLIAM H. DAVIS, of Austin, Ind.—*Improvement in Double Acting Pumps.*—Patent dated July 19, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The construction and arrangement of the air chamber, side pipe, and cylinders, and flange at the top, all in one piece of casting, for the purpose of suspending the cylinders sufficiently deep in the well to prevent freezing, in combination with the bottom plate, substantially as set forth.

No. 24,798.—RUFUS DAWES and WARREN C. CHOATE, of Washington, D. C.—*Improvement in Stoves.*—Patent dated July 19, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The combination of a new fire room for a downward draft, having a lid to close the opening at the top containing a valve in the lid and an open grate in front, having a door to close this opening air tight, with a system of ovens heated and ventilated, as specified.

No. 24,799.—BENJAMIN F. FIELD, of Sheboygan Falls, Wis.—*Improvement in Rotary Cultivators*.—Patent dated July 19, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The combination of two or more wheels on one crank eccentric, or equivalent axle, when the said wheels are arranged in pairs on the axle, one wheel within the other, and so that the spades or forks attached to the inner wheels shall pass out and in through the apertures in the outer wheels, for the purpose of displacing and pulverizing the soil over which they pass, in the manner described.

No. 24,800.—JAMES D. FIELD, of Davenport, Iowa.—*Improvement in Stoves*.—Patent dated July 19, 1859.—The object of this invention is to obtain a cooking stove in which the full benefit of the heat generated by the combustion of the fuel will be obtained, and consequently a saving of the latter effected.

*Claim*.—The fire chambers D I, flue F, and water heater H, the latter being provided with inclined tubes *a*, to form the grate of the fire chamber D, the above parts being arranged relatively with each other, the oven B, and the smoke pipe C, to operate as and for the purpose set forth.

No. 24,801.—AMBROSE FOSTER and NOAH SUTTON, of New York, N. Y.—*Improvement in Variable Cut Off Gear for Steam Engines*.—Patent dated July 19, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The employment, for operating either the main valve or valves of an engine or a separate cut off valve or valves, of a compound cam, composed of two parts C and D, constructed and combined with each other, and applied to the main or a counter shaft, substantially as described.

No. 24,802.—AUGUST FREUTEL, of New York, N. Y.—*Improved Locks for Safes, &c.*—Patent dated July 19, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the slotted wheels *m*, on the tumbler *l*, and the plates *7*, in combination with the wheels *6*, of the knobs *k*, when said wheels *m* are so arranged that the act of unlocking, or attempting to unlock the bolt moves the wheels *m* away from the wheels *6*, in the manner and for the purpose specified.

Second. In combination with the tumbler *l*, carrying the wheels *m* and acting as aforesaid, I claim the cross piece *n* and tumbler *o*, substantially as and for the purposes set forth.

No. 24,803.—C. B. GARLINGHOUSE and G. B. GARLINGHOUSE, of Allensville, Ind.—*Improvement in Harvesters*.—Patent dated July 19, 1859.—In operating this machine the bar *b* being hung in the gear with the cam B<sup>1</sup>, and the wheel being made to rotate, the bar *b* will be made to reciprocate vertically, thereby operating the bent lever *j*, and imparting a corresponding reciprocating motion horizontally to the sickle attached to the end *j*<sup>2</sup> of the lever *j*, thereby operating the sickle in an efficient manner.

*Claim*.—The peculiar arrangement of the disk C, in relation to the mechanism for operating the cutters, the standard K, and sliding frame *m*, in the manner and for the purpose specified.

No. 24,804.—HALVOR HALVORSON, of Cambridge, Mass.—*Improved Trimmer for Lamp Wicks*.—Patent dated July 19, 1859.—This invention consists in the use of gauges in connection with a proper cutting device, the gauges being so arranged as to retain the wick, or hold it in proper position while acted on by the cutter or cutters, thereby effecting the desired end.

*Claim*.—In combination with a knife D and bed or anvil E, or other suitable wick cutting devices, gauges *e f*, constructed and arranged as shown, or in such a manner as to hold or retain the wick and prevent it expanding laterally, while under the action of the cutting device, for the purpose set forth.

No. 24,805.—JACOB HESS, of Niagara Falls, N. Y.—*Improvement in Lathes*.—Patent dated July 19, 1859.—The disks are provided with keys, playing into the slot *p* in the disk shaft *m*, while they are allowed to slide horizontally upon it so as to adapt the distance between the disks to the length of the piece to be turned. The disks are provided with necks *b*<sup>2</sup>, and can be fastened to the shaft *m* when set at the desired distance from each other, by means of set screws *a*<sup>2</sup> passing through the necks.

*Claim*.—The combination of the grooved central shaft *m* with its movable disks *e f*, adjusting gears *k i*, and index spring hook *n*, all of said parts being constructed and arranged in relation to each other, as and for the purpose set forth.

No. 24,806.—GROVE HOWARD, of Westfield, Ohio.—*Improvement in Machines for Raking and Loading Hay*.—Patent dated July 19, 1859.—In operating this machine, power being applied, the points of the teeth R are lowered by means of lever *m*, and secured in such a manner that they will pass under and catch the hay up from the ground as the ma-

chine runs over it. The endless belt F being set in motion, its teeth  $x x$  passing around, receive the hay from the curved teeth, and convey it to the top of the frame, and when the belt changes its direction to come down again, the hay falls from the teeth and drops into the body I.

*Claim.*—The arrangement of the endless belt F, pulleys D and E, curved teeth  $r$ , rods K, lever  $m$ , and catch  $d$ , in the frame A, and with the body I, the whole being constructed and operating substantially as and for the purpose specified.

No. 24,807.—LEWIS S. HOYT and BENJAMIN B. BEERS, of New Fairfield, Conn.—*Improved Bit Stock and Wrench.*—Patent dated July 19, 1859.—The claim and engraving explain the nature of this invention.

The inventors say: We *claim*, first, The above described wimble or bit stock wrench, with one permanent and one movable jaw, which may be readily adjusted to turn nuts or screws of different sizes, substantially as described.

Second. We also claim the block  $k$ , or its equivalent, with a socket adapted to receive and hold the shanks of common bits, and fitted to the permanent or movable jaw, or both, so as to hold the block and bits, substantially as described.

Third. We also claim the screw N, so arranged as to fasten the block to the jaw C and the bit in the socket L at the same time, substantially as described.

No. 24,808.—WILLIAM JOHNSON and MARTIN SILMSER, of Auburn, N. Y.—*Improved Steam Cock.*—Patent dated July 19, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—A plug cock, with a sectional plug, whose sides are inclined to its axis, in combination with a single casing, through which, and directly opposite, are openings, whose sides are parallel to the axis of the plug, and constructed as described.

No. 24,809.—DAVID KNOWLTON, of Camden, Me.—*Improvement in Joints for Pump Pipes.* Patent dated July 19, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—Making the joint hemispherical, in combination with the stiff or rigid flanges, by which the parts joined hemispherically may be held at the desired angle, substantially as described.

No. 24,810.—DAVID KNOWLTON, of Camden, Me.—*Improved Ship's Warping Chock.*—Patent dated July 19, 1859.—This improvement consists in making the stock or base and standards of cast-iron, and narrowing and hollowing out the stands behind the rollers so as to let the rope or warp run freely around the rollers without being chafed by the stand.

*Claim.*—The cast-iron warping chock described, as a new article of manufacture.

No. 24,811.—A. HENRY LOWELL, of Manchester N. H.—*Improved Hose Coupling.*—Patent dated July 19, 1859.—This invention consists in the arrangement of certain locking devices in combination with a screw and cap, arranged in connection with said locking devices.

*Claim.*—The locking devices described in combination with the screw tube K, arranged in connection with and on the outside of said locking devices, substantially as described.

No. 24,812.—FRANKLIN I. MAY, of Beverly, N. J.—*Improvement in Grain Separators.*—Patent dated July 19, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim*, first, the two side or supplementary inclined planes C and C<sup>1</sup>, in combination with the short inclined plane B, and the two adjustable guides  $r$  and  $r^1$ , the same being constructed and arranged together so as to operate substantially as and for the purposes described and set forth.

Second. I claim the employment of the sliding board E in the shaker E, when the said board is arranged to operate in combination with the screens therein, in the manner described, and for the purpose of better preparing the grain, &c., for the inclined planes B C and C<sup>1</sup>, and the rotary screen A, as described and set forth.

No. 24,813.—JAMES H. MAYDOLE, of Eaton, N. Y.—*Improvement in Foot Stoves.*—Patent dated July 19, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—In combination with a foot stove, the several parts thereof being arranged in the order specified, the employment of a lamp constructed with an intermediate space P filled with plaster of Paris, or the equivalent thereof, whereby I am enabled to prevent the heating of fluid contained therein, for the uses and purposes set forth.

No. 24,814.—ISAAC C. MAYER, of Jersey City, N. J.—*Improved Machine for Turning Skins.* Patent dated July 19, 1859.—A is the body of the implement, made of rod iron and having a pointed screw cut on its lower end, which can be screwed into the side of a work bench or ceiling, or into the floor to secure it and hold it in position; B is the head of the implement made by welding another rod at each of its ends to the body, and then bending each of the

rods, forming the head into a bow shape; the top of the head is pointed so as to enter and pass through the skin with facility.

*Claim.*—The implement constructed and operated as herein described, for the purpose of turning the skins used by furriers, as herein set forth.

No. 24,815.—E. J. McCARTHY, of Saugerties, N. Y.—*Improvement in Furnace Grates.*—Patent dated July 19, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—A furnace with a series of stationary grate bars A B in combination with a series of movable blades, so arranged as to pass between and above the bars, and descend below so far as not to obstruct the draft and be beyond the influence of the intense heat of the furnace, as described, for the purpose set forth.

No. 24,816.—Z. N. MORREL, of Cameron, Texas.—*Improvement in Excavating and Grading Machines.*—Patent dated July 19, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the employment of a revolving cylinder of blades, arranged at the lower end of the inclined digger, in combination with said digger, and with a series of coulter ploughs arranged at the front end of the machine, substantially as and for the purposes set forth.

Second. The employment of a revolving cylinder of teeth or blades, arranged at the upper end of the inclined digger, in combination with said digger, substantially as and for the purposes set forth.

No. 24,817.—WILLIAM NEWELL, of Philadelphia, Pa.—*Improved Machine for Scouring and Polishing Coffee.*—Patent dated July 19, 1859.—This invention relates to the employment of two cylinders, one within the other, and having a steam space between them, said cylinders being armed with proper beaters or polishers, and running in opposite direction to a centre shaft, which is armed in a similar manner with beaters for the purpose of polishing coffee.

*Claim.*—The combination of the two cylinders B and E, having a space between them, with the scarified arms or beaters L M, moving in contrary directions, substantially in the manner and for the purpose described.

No. 24,818.—WILLIAM PERKINS, of Plympton, Mass.—*Improvement in Railroad Car Brakes.*—Patent dated July 19, 1859.—This invention consists in arranging the brakes in such a manner that they can be applied either by the momentum of the cars themselves or by hand, the brakes being connected by means of a lever with the buffers, said lever to be fulcrated in a bar secured to one of the brakeheads, and to connect with the other brakehead by means of hooked rods.

The inventor says: I *claim*, first, the arrangement of the sliding buffers J, brake levers N, rod *i*, hooked rods *b b*<sup>1</sup>, and staple *n*, to operate in combination with the brake, substantially as and for the purpose specified.

Second. Arranging the brake shoes L in combination with the staple *n* and hooks *m m*<sup>1</sup>, substantially as described.

Third. The arrangement and combination of the hooked rods *l l*<sup>1</sup>, and the rods *o o*<sup>1</sup>, and with the staple *n*, so that the hooks *m m* can be adjusted according to the direction in which the car is to run, substantially as set forth.

Fourth. The arrangement and combination of the sliding buffer J, lever P, and spring Q, substantially as specified.

No. 24,819.—A. P. PITKIN, of Hartford, Conn.—*Improvement in the Mode of Heating Drying Cylinders by Steam.*—Patent dated July 19, 1859.—The pump is kept in constant operation while the cylinders A are in use, and whenever any condensed steam or water is deposited in the discharge pipe or close vessel, the pump will immediately return the same into the boiler, and in case the steam should at any time be shut off from the drying cylinders, and the pump continue to work, the vacuum valve will open and thereby prevent the collapsing of the cylinders.

*Claim.*—In combination, the closed heating cylinders, force pump, vacuum valve and connecting tubes, substantially in the manner as and for the purpose set forth.

No. 24,820.—WILLIAM PORTER, of Mexico, N. Y.—*Improved Saw Gummer.*—Patent dated July 19, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement and combination of the lever *p* with the sliding box *g*, by means of the bar *m*, so as to give a continued and downward action upon the cutter or burr *f*<sup>1</sup> by the use of the coiled springs *g*<sup>1</sup> *g*<sup>1</sup>, thereby feeding the said cutter or burr, as and for the purpose described.

Second. The arrangement and combination of the index pointers *h*<sup>1</sup> *h*<sup>1</sup> with the index B and the bars *t t*<sup>1</sup> connected to the frame A, so as to give any required direction to the cutter or burr *f*<sup>1</sup>, as and for the purpose set forth.

Third. I also claim the use of the set screw *b*<sup>1</sup>, by means of which the distance between

the blocks  $a^1 a^1$  is adjusted proportionally to saw plates of different thicknesses prior to being fastened thereto by the eccentric lever  $c c$ .

No. 24,821.—JOHN A. REED, of Jersey City, N. J.—*Improvement in Oscillating Steam Engines*.—Patent dated July 19, 1859.—This invention consists in a certain arrangement of a reversing valve and steam passages, in combination with stationary induction and eduction valves on the inner ends of the trunnion boxes, constituting a means of reversing an oscillating engine.

*Claim*.—The arrangement of the reversing valve E, in a steam chest, on the top of a bridge piece D, in combination with the separate passages in the bridge piece communicating with the chambers in the trunnion boxes, substantially as described.

No. 24,822.—BENJAMIN ROBBINS, of Machias, Me.—*Improved Apparatus for Working Pumps*.—Patent dated July 19, 1859.—This invention relates to an improved arrangement of means for operating two reciprocating pumps, and consists in having the piston rods attached to the ends of a walking beam, which is operated by segment gear from an oscillating arm put in motion by a crank or driving shaft.

*Claim*.—The combination and arrangement of the crank  $f$ , fly wheel J, lever H, walking beam E, and piston rods D D, as and for the purpose set forth.

No. 24,823.—EDWARD A. L. ROBERTS, of New York, N. Y.—*Improved Furnace for Dental Purposes*.—Patent dated July 19, 1859.—This invention consists in constructing a furnace, intended to be compact in form, not expensive, simple in operation, and which gives and secures an intense heat with little fuel, and in a much less time than can be obtained in ordinary furnaces.

The inventor says: I *claim* the arrangement and application of the double inclined grates  $c c$ , substantially as and for the purposes set forth.

I also claim, in combination with such inclined grates, the parts B, to contain the muffle C, retort, &c., the whole arranged substantially as and for the purposes set forth.

No. 24,824.—CHARLES RUNDLETT, of Alden, and JOHN W. DRUMMOND, of Winslow, Me.—*Improved Hay Press*.—Patent dated July 19, 1859.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim* the arrangement of the driving drum or windlass K and the driving gear I, with reference to the press box B and the platen screws D E and their pinions disposed on the sides of the press box.

We also claim the combination and arrangement of the connecting rods F F and rings G G, with each platen elevating screw E, and the bars of the cover of the press box, the whole being arranged to operate as specified.

We also claim the mode of applying the draft rope guide M to the press frame and the driving pulley, that is, by means of a fulcrum  $r$  and the screw or projection made to enter the helical groove of the driving pulley.

No. 24,825.—HENRY SAUERBIER, of Newark, N. J.—*Improvement in Edge Planes*.—Patent dated July 19, 1859.—This invention consists in arranging and adapting means for edge trimming and finishing in the manufacture of shoes, and combining the same with facilities for shaping and trimming edges in harness making, such as the edges of traces, &c.

*Claim*.—The bevel wheel  $e$ , pinion  $b$ , worm  $a$ , wheel  $o$ , socket shaft  $p$ , pinion D, feed wheel C, cutter head B, gauges  $i$ , roller J, lever piece  $t$ , and corliss head Fig. 3, constructed, combined, and arranged substantially as hereinabove set forth, and for the purposes specified.

No. 24,826.—MORRILL A. SHEPARD, of Orio, Ill.—*Improved Hydraulic Motor*.—Patent dated July 19, 1859.—This invention consists in a method of giving motion to a water wheel, without the necessity for the formation of a dam as ordinarily employed for such purpose.

*Claim*.—The combination of the vacuum tube  $e$  and tube  $c$ , for giving motion to the water wheel by the action of an undammed stream, substantially as described.

No. 24,827.—T. BRIGGS SMITH, of Marietta, Ohio.—*Improved Metallic Bung*.—Patent dated July 19, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—A metallic screw bung, for casks or other wooden vessels for holding liquids, with a knifelike thread, and an elevation at any point between the threads, and a shoulder on the bung, let into the stave, substantially as and for the purposes specified.

No. 24,828.—LEWIS SOLOMON, of New York, N. Y.—*Improvement in Furnaces*.—Patent dated July 19, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—So constructing a desulphurizing furnace for roasting the ores of precious metals as that the heat shall be applied first beneath the sole of the furnace and afterwards on the surface of the ore, when the same is combined with a chamber arranged in the base of the

chimney for the reception of such volatilized particles of ore, &c., as may be driven off by heat or carried over by the draft, substantially as described.

No. 24,829.—M. B. SPAFFORD, of Warsaw, N. Y.—*Improvement in Snow Ploughs*.—Patent dated July 19, 1859.—This invention consists of a vertical shaft placed in front of the locomotive and driven thereby, having spiral wings, which serve to cut and elevate the snow, a horizontal reciprocating cutter close to the rails acting in connection with the elevator and excavator.

*Claim*.—The vertical rotary shaft S, with its spiral wings W W<sup>1</sup>, for the removal of snow from the railroad track, as described.

No. 24,830.—OBED S. SQUIRE, of North Haven, Conn.—*Improvement in Lasts*.—Patent dated July 19, 1859.—This last for shoes, or boot trees for high boots, is cast in two halves or longitudinal sections A B; between these sections are placed strips of metal or other suitable material, which are made tapering so as to give symmetry or shape to the shoe. When it is necessary to extend the toe part of the shoe, only a stationary strip D, like a wedge, is used, and in the same manner with the heel or instep.

*Claim*.—The arrangement and combination of the longitudinal sections A B, strips C D, and bolt E, as and for the purposes shown and described.

No. 24,831.—GEORGE STORER, of New Britain, Conn.—*Improved Meat Masher*.—Patent dated July 19, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The hollow or solid cylinders with pointed angular teeth, the base of which teeth has nearly in contact and in combination therewith the device for adjusting the cylinders, all constructed substantially as and for the purpose specified.

No. 24,832.—JOHN G. TREADWELL, of Albany, N. Y.—*Improvement in Stoves*.—Patent dated July 19, 1859.—The damper D and the door E are connected together by means of a rod *a* in such manner that when the damper is closed the door E is pushed back and the opening unclosed, and when the door is closed the flue *d* is unclosed by the damper; *e* represents a small flue, which is never closed.

*Claim*.—The combination of the division C with the damper D and doors E, when the same are arranged substantially in the manner and for the purpose specified.

No. 24,833.—JOHN G. TREADWELL, of Albany, N. Y.—*Improvement in Stoves*.—Patent dated July 19, 1859.—The inventor says: When the ordinary hearth plate is placed in proper position, air frequently passes down into the ash pit; this air passes to the fire and assists combustion, but when the plate J is raised it effectually cuts off the draft, and thus the fire may be kept in the stove a long time.

*Claim*.—The employment of the hinged plate J, in combination with the hearth plate above, the two being used and operated in the manner and for the purpose specified.

No. 24,834.—A. K. TUPPER, of Clarkston, Mich.—*Improved Elbow for Stove Pipes*.—Patent dated July 19, 1859.—This invention consists in having a flange around each piece of pipe at their joint, the one lapping over the other, so that by turning one piece of the pipe the flange moves in the lap of the other and the pipe can be turned at any desired angle.

*Claim*.—Constructing the joint of pipes P and P<sup>1</sup> with flange *f*<sup>1</sup> and the overlapping flange *f*<sup>1</sup>, so as to allow the pipe to be adjusted at any desired angle, substantially as described.

No. 24,835.—ALBERT WARREN, of Jefferson, Ohio.—*Improved Machine for Cutting Heels and Soles for Boots and Shoes*.—Patent dated July 19, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I claim the bent knife Y, resting on the shoulders *x x x x x* of the movable slides, as herein described, and for the purposes herein specified.

I also claim the knife Y resting on shoulders *x x x x x*, as herein described, in combination with the knife Q, adjusted as set forth, and by which any size or shape of leather may be cut, ready to be sewed or pegged upon the boot or shoe.

No. 24,836.—W. A. WOOD and I. W. ROSEBROOK, of Hoosick Falls, N. Y.—*Improvement in Harvesters*.—Patent dated July 19, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—In combination with a main frame, supported upon two driving wheels, and which frame carries the shaft D and main cog wheel E, a second frame, hinged to said shaft D, so that the crank shaft on said second frame shall always be in a radial line to the main cog wheel E, however much said second frame may vibrate on the main frame, as set forth.

No. 24,837.—GEORGE W. WATROUS, of Hartford, Conn.—*Improved Fastening for Bedstead Drapery*.—Patent dated July 19, 1859.—This invention consists in making a shield case

with a hook made secure to either the back of the case or to the case proper, without a back, so that a link sewed to the drapery may be inserted into the case from the underside on to the hook, thereby affording a ready means of attaching or detaching the drapery to or from the bedstead, and, at the same time, make it ornamental in its appearance when arranged on a bedstead.

*Claim.*—As a new manufacture, or a new and improved article of manufacture, a drapery fastening, constructed of a case A, hook C, link D, substantially as and for the purpose described.

No. 24,838.—HENRY R. WORTHINGTON, of Brooklyn, N. Y.—*Improvement in Pumping Engines.*—Patent dated July 19, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim*, first, the combination set forth and exhibited of two direct acting pumping engines, propelled by steam or other fluid, so arranged as that each engine shall actuate the inlet and outlet valves, governing the motive power of the other, thereby insuring the constant action of at least one pump piston upon the water, and relieving the action of the pump from shocks and concussions.

Second. I claim the arrangement shown of two distinct systems of levers adapted to the steam and exhaust valves of each engine, the one system to be operated upon for producing motion and for determining the duration of the repose of the piston at the termination of the stroke; the other for bringing the pistons to a state of rest, all substantially as explained and set forth.

No. 24,839.—JACOB BEACHLER, of Anderson, Ind., assignor to J. F. BRICKLEY, of Anderson, aforesaid.—*Improvement in Railroad Switches.*—Patent dated July 19, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The obstruction or “scotch” E, applied to the turn out and connected with the switch so as to be operated automatically by the movement of the same, substantially as and for the purpose set forth.

No. 24,840.—NORMAN BEDELL, of Albion, N. Y., assignor to STEPHEN P. BEDELL, of Albion, aforesaid.—*Improvement in Elbows for Stove Pipes.*—Patent dated July 19, 1859.—This invention consists in the use and construction of the frame and clasp, by means of which the pipe is joined.

The inventor says: I *claim*, first, the employment of the metallic frame C, constructed and used substantially in the manner and for the purpose set forth.

Second. The combination of the clasp D, with the frame C, as constructed for the purpose of holding the mitre edges of the pipe together, substantially as set forth.

No. 24,841.—HENRY F. COX, of Jersey City, N. J., and ALEXANDER MILLAR, of New York, N. Y., assignors to HENRY F. COX, aforesaid.—*Improved Machine for Polishing Corks.*—Patent dated July 19, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The cork polishing machine, consisting of a series of rollers roughened by a surface of pumice stone, or equivalent abrading material, and a brush or brushes acting in conjunction to polish the cylindrical portion of machine made corks, as described.

No. 24,842.—LEVI DODGE, of Waterford, N. Y., assignor to Himself and DODGE & BLAKE, of Waterford, aforesaid.—*Improvement in Dies for Shaping Articles in Metal.*—Patent dated July 19, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The forming of articles of iron or other metal, when such articles are to be shaped by a simultaneous action or pressure of dies on several or all sides, the employment of the movable dies *e* operating substantially upon the principles set forth.

No. 24,843.—MOSES H. GRAGG, of South Boston, Mass., assignor to Himself and THOS N. PAGE, of South Boston, aforesaid.—*Improvement in Corn Huskers.*—Patent dated July 19, 1859.—While the two external rollers A B are alike in size, the middle roller C is much less in diameter or size. They are placed together so that the external curved surfaces of the middle shall touch, or nearly touch, those of the others. The shaft of one of the rollers carries a fly wheel E and a crank F.

*Claim.*—The arrangement and combination of the small intermediate conical roller C, larger conical rollers A B, guard G, and hopper D, as and for the purpose shown and described.

No. 24,844.—JOSEPH C. HENDERSON, of Albany, N. Y., assignor to RATHBONE & Co., of Albany, aforesaid.—*Improvement in Stoves.*—Patent dated July 19, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the air space *m*, between the oven and the fire, when so constructed and arranged that a descending draft the whole width of the stove passes through

said space, and thence to the fire, for promoting combustion, and at the same time rendering the temperature of the oven more uniform, as set forth.

Second. I claim the damper *n*, at the front end of the oven, in connection with the descending flue between the front plate and fire box, whereby the oven can be entirely closed when the stove is in use for roasting, as specified.

No. 24,845.—LORENZO LAKE, of Middleburg, Pa., assignor to Himself and WILLIAM PATTON, of Middleburg, aforesaid.—*Improved Churn*.—Patent dated July 19, 1859.—This invention consists in arranging the several parts together. *L L* represent the dashers which consist of two or more pieces of boards, of a proper length secured together; these dashers have *V* shaped slots cut in their ends, and are so placed upon the staff that the sharpened ends of the boards will cover the spaces left between the boards in the dasher immediately above or below, so that when operated in the churn the cream will be more thoroughly cut, and the globules more speedily broken.

*Claim*.—The dasher, made in the manner as described in my specification and shown in drawings at *L*, when the same shall be operated by the devices as described for the purpose set forth.

No. 24,846.—ROBERT McWILLIAMS, of Philadelphia, Pa., assignor to SAMUEL H. HOFFMAN, of Philadelphia, aforesaid.—*Improvement in Journal Boxes of Railroad Cars*.—Patent dated July 19, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* first, the upper half *A* of the box, with its socket, formed by the flanges *h*, in combination with the lower half *B* of the box, when the two halves are arranged substantially as set forth, so that on adjusting the lower half to its place it may assume the position shown in Fig. 1, and so that when adjusted the end *w* of the oil chamber shall be close to the axle, as and for the purpose specified.

Second. The self adjusting leather packing *E*, and the metal plate *F*, when both are dependent upon the lower half of the box for their proper position within the other half, and when they are otherwise arranged in respect to both upper and lower half of the box, as and for the purpose set forth.

No. 24,847.—LOUIS PLANER, of New York, N. Y., assignor to Himself and JOSEPH AUGER, of New York, aforesaid.—*Improvement in Sewing Machines*.—Patent dated July 19, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The combination of the peculiarly constructed notch *a b c*, which is confined to the upper half of the shuttle and leaves the lower half intact, with a driver having a single horn or finger, which entering the said notch constitutes a guard to prevent the flying up of the heel of the shuttle, substantially as described.

No. 24,848.—GEORGE W. RICHARDSON, of Grayville, Ill., assignor to Himself and GEORGE M. WEED, of Grayville, aforesaid.—*Improvement in Harvesting Machines*.—Patent dated July 19, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim* the application of the rack *d*, upon the reciprocating bar *D D*, and pinion *i*, upon the vertical shaft *H*, connected and arranged for operating the two sickles at the same time by the cam wheel *c*, in manner described.

No. 24,849.—LYMAN L. THOMAS, of Dighton, Mass., assignor to the DIGHTON FURNACE COMPANY.—*Improved Damper for Cooking Stoves*.—Patent dated July 19, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The damper *D*, substantially as set forth, or in other words, I claim a damper placed in the outlet of the return flue of a cooking stove, near the termination of said flue, and of such a form that when secured or hinged at its lower end to the side of the flue opposite the oven, and when partially or fully closed it shall stand in a position more or less diagonal across the flue, and of such a length that it can never be moved more than twenty-five degrees from a perpendicular.

No. 24,850.—ASA BROOKS, of Tolland, Conn.—*Improved Mode of Setting Logs in Saw Mills*. Patent dated July 26, 1859.—This invention consists of a self acting apparatus to shift the tail block of a saw mill frame to saw any given thickness required.

*Claim*.—The application and combination of the gear *A* and screw shaft *L*, the travelling ratchet *E*, and chock *c*, the stops *F* and *K*, the spring pawl *B D*, for the purpose described substantially as set forth.

No. 24,851.—HENRY F. BOND, of Hudson, Wis.—*Improved Bread Slicer*.—Patent dated July 26, 1859.—This invention consists in the employment of a movable tray on which the loaf is secured and which is fed forward the required distance at each stroke of the knife.

*Claim*.—The movable tray *G*, operated automatically by the motion of the knife *C*, in the manner substantially as set forth.

Second. I claim the bar *T*, arranged substantially as described for the purpose specified.

No. 25,852.—S. L. BOND, of Greenwood, S. C.—*Improved Tuyere*.—Patent dated July 26, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The arrangement and combination of the two pipes C C, having their orifices opposite to each other, with the air chamber B, so that the two currents of air on entering the chamber will oppose each other and thus uniformly diffuse the air, as shown and described.

No. 24,853.—JOHN BIBERTHALER, of New York, N. Y.—*Improved Iron Folding Bedstead*.—Patent dated July 26, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the arrangement of the bed bottom in two parts, one of which A being about two thirds of the whole length of the bed, and to which the legs are attached, capable of being turned under said part when required, and attaching the other part D (and which forms the upper or head part of the bed) to the legs nearest the head in such manner that the said part D may be turned over the top of the bottom part A while the legs to which the same is attached are turned under the said part A, in the manner and for the purpose substantially as described.

I further claim fixing the head part of the bed D when unfolded, either to the legs B or to the bottom part A, by means of bolts or pins *n*, in such a manner that by said bolts the inclination of said part D may at the same time be regulated to any desired position, substantially as described and set forth.

No. 24,854.—HENRY BESSLING, of New York, N. Y.—*Improvement in Reefing Sails*.—Patent dated July 26, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the slides *d d*<sup>1</sup>, applied to work along the jack stay or other suitable portion of the yard, in combination with reef points extended from the back of the sail up through the jack stay or yard and with the reef pendants, substantially as described.

And, without confining myself to the peculiar construction of the pawls I I, I claim securing the reef by means of pawls, applied to the yard to operate in combination with portions of the reef pendants, made of chain, substantially as described.

No. 24,855.—ALEXANDER BECKERS, of New York, N. Y.—*Improvement in Stereoscopic Instruments*.—Patent dated July 26, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, placing the eye glasses B in a movable cylinder A in such a manner that opaque pictures O<sup>1</sup> and O<sup>2</sup>, placed back to back, may be viewed by the same pair of glasses, the direction of the said eye glasses being varied by the partial rotation of the cylinder to suit the opposite position of the pictures, substantially as described.

Second. The construction of the picture holders with double hook N, substantially as described.

No. 24,856.—EDWIN C. CUSTER, of Evansburg Pa.—*Improved Machine for Stoning Cherries*.—Patent dated July 26, 1859.—In operating this machine when the stripping plate E has been set close to the face of the cylinder A to prevent any downward passage of the stones of the size contained in the cherries, the hopper D is filled with cherries and the cylinder A revolved by means of crank B in the direction of the arrow. The cherries which are by this means successively carried into the suddenly narrowing space between A and E will burst and, following the motion of the cylinder, pass the bottom point of E, whereupon they are free to fall into any convenient receptacle, while the stones follow the motion imparted to them by the spiral grooves *i i* until they are ejected through the aperture G.

*Claim*.—The described machine for stoning cherries, constructed in a manner substantially as specified, with its spirally grooved cylinder A and adjustable stripper E, arranged and operating as set forth.

No. 24,857.—JAMES M. CLARK, of Philadelphia, Pa.—*Improvement in Flour Bolts*.—Patent dated July 26, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—Slide valve *d*, or a series of slide valves *d*, without holes in them, so arranged and operating with the apertures *e* and *e*<sup>1</sup> in the sides of the bolting chest that either of these apertures can be opened or closed when required, for the purpose of turning the material as desired in either of three directions, as set forth.

No. 24,858.—B. WELLS DUNKLEE and W. B. MOORE, of Boston, Mass.—*Improved Steam Heating Apparatus*.—Patent dated July 26, 1859.—The inventor says: By the use of water and steam as extracting and transmitting agents we are enabled to take away the heat from the radiating surface of the furnace much faster than by the use of air alone, without increasing the combustion of the fuel.

*Claim*.—The combination of the tubes E, casing P, inner and outer reservoirs C and D, and vaporizing pipe *b*, and the use of the iron known as the Polenx patent metal alloy coating, substantially as and for the purposes set forth in the specifications and drawings.

No. 24,859.—CHARLES FROST, of Waterbury, Conn.—*Improved Door Fastening*.—Patent dated July 26, 1859.—This invention consists in the employment or use of a drop plate, applied to the door or gate in such a manner as to insure a proper fastening, and at the same time dispense with the use of auxiliary fastenings or bolts hitherto required on one of a pair of folding doors.

*Claim*.—The employment or use of the drop plate D, constructed of the form and applied to the door or doors, substantially as and for the purpose set forth.

No. 24,860.—HENRY FISHER, of Alliance, Ohio.—*Improvement in Harvesters*.—Patent dated July 26, 1859.—The frame of the machine consists of the pieces I I<sup>1</sup>, J J<sup>1</sup>, K K<sup>1</sup>. The upright parts I J K are rigidly attached to the axletree B in any convenient manner. The two outside ones, I and K, extend nearly a foot above the axletree, as seen at L L<sup>1</sup>, and serve as points of attachment for the draw bars M M<sup>1</sup>, to which the neap N is attached.

The inventor says: I *claim* attaching the draft or draw bars M M<sup>1</sup> to the arms L L<sup>1</sup>, in the manner and for the purposes substantially as set forth.

I also claim the peculiar arrangement and combination of frames I K and M, tongue N, spur e, and arm g, in relation to each other and to the main shaft B, to operate in the manner and for the purpose specified.

No. 24,861.—GEORGE H. FERGUSON and SYLVESTER FERGUSON, of Malden Bridge, N. Y.—*Improved Machine for Feeding Paper to Printing Presses*.—Patent dated July 26, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—Feeding sheets of paper singly to a printing press, paper ruling, or other machine requiring the feed of a single sheet at a time, by means of the feed roller G, feed roller I, and adjustable friction stop J, or the equivalents thereof, when arranged essentially as specified.

No. 24,862.—BENJAMIN L. GRIFFITH, of Hazleton, Pa.—*Improvement in Locomotive Boilers*.—Patent dated July 26, 1859.—This invention consists of certain deflectors arranged in a space between the fire box and tube plate of a locomotive boiler, in combination with openings in the side of the fire box for the admission of jets of atmospheric air, so that the latter may be thoroughly mixed with the gaseous products of combustion as they pass from the fire box and impinge against the deflectors, thereby igniting the gases, which would otherwise pass off unconsumed to the chimney.

*Claim*.—The deflectors G G<sup>1</sup> and H arranged within the space C, between the fire place and the tube sheet of a locomotive boiler, substantially as described, in combination with the openings in the fire box for the admission of atmospheric air, for the purpose specified.

No. 24,863.—E. A. GOODES and E. L. MILLER, of Philadelphia, Pa.—*Improvement in Sewing Machines*.—Patent dated July 26, 1859.—This invention relates to the formation of a stitch of a novel character, suitable for working button holes and eyelet holes, over seaming, and for other kinds of work in which it is necessary or desirable for the stitches to pass over an edge. It consists in a certain combination of mechanical devices for making such stitch.

*Claim*.—The combination of the needles n and b, the hook h, and the tongue L; the whole applied, arranged, and operated substantially as described.

No. 24,864.—CHARLES M. GOULD, of Worcester, Mass.—*Improved Submarine Helmet Window*.—Patent dated July 26, 1859.—The nature of this invention consists in confining two separate plates of glass a a in one common bezel B, with a space e between them.

*Claim*.—The application to submarine helmets of the described window, substantially in the manner and for the purpose described.

No. 24,865.—CHARLES GLASSBOROW, of Philadelphia, Pa.—*Improvement in Piano Fortes*.—Patent dated July 26, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* constructing the string frame of an upright piano with two pin blocks and other appliances for receiving two sets of strings and two distinct sounding boards, the strings being arranged one set on one side and the other set on the opposite side of the frame, the two sounding boards being connected together, and the whole being otherwise constructed substantially in the manner and for the purpose set forth.

No. 24,866.—JAMES GILFILLAN, of Hartford, Conn.—*Improvement in Valves for Water Closets*.—Patent dated July 26, 1859.—In operating this invention, by pressing down the stem H by a connection with the ordinary mechanism used in water closet arrangements, the valve C will open and the water will flow through said openings until it is gradually shut off by the action of the elastic tubular spring K and piston D. The amount of the flow of the water may be regulated by a screw thimble upon the upper end of the spindle H.

*Claim*.—The combination of the elastic tubular spring K, piston D, and chamber E, operating in the manner and for the purpose described.

NO. 24,867.—RICHARD GILL and GEORGE W. GRIER, of Altoona, Pa.—*Improvement in the Furnaces of Locomotive Engines.*—Patent dated July 26, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—In combination with the fire box of a coal burning locomotive boiler, a water deflector, having a series of small openings through it, and extending up over the fire, as represented, and an air passage behind or over it, which communicates with the external air, for the purpose of introducing atmospheric air in small jets over the fire, substantially in the manner and for the purpose set forth.

NO. 24,868.—ENOS HARTZLER, of Orville, Ohio.—*Improved Pump.*—Patent dated July 26, 1859.—This invention consists in arranging the several parts together in the manner described.

*Claim.*—The arrangement of pipes E F G H, valves *c c c c*, springs *x x x x*, and spring *a*, with the rod I, box C, and stock A; the several parts being combined and operating substantially as and for the purpose specified.

NO. 24,869.—E. H. HANCOCK, of Augusta, Ga.—*Improved Sawing Machine.*—Patent dated July 26, 1859.—This invention is more particularly adapted to that class of machines in which a series of circular saws are mounted on a common shaft, in order to effect the cutting of the entire log at one operation.

The inventor says: I *claim*, first, the combination of the yielding guard levers, or their equivalent, with the rotary saws, substantially as and for the purpose described.

Second. The head blocks D, swinging guide E, circular saws A, and guard levers C, when arranged and operating substantially as and for the purpose set forth.

NO. 24,870.—WILLIAM HALL, of North Adams, Mass.—*Improvement in Sewing Machines.* Patent dated July 26, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of the needle carrier B, pivoted bar M, connecting rod J, slide I, pitman H, and crank G, when arranged and operating in the manner and for the purpose substantially as set forth.

Second. The combination of the slide I and rod J, or its equivalent, with a vibrating needle carrier, in such manner as to produce two vertical motions on the needle during each single horizontal motion of the slide I, substantially in the manner fully set forth in my description.

NO. 24,871.—GEORGE HALL and ALONZO SCUDDER, of Morris, N. Y.—*Improved Washing Machine.*—Patent dated July 26, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The employment of a corrugated flexible metallic concave B, stretching across the lower part of the machine, substantially as and for the purpose shown and described.

NO. 24,872.—CHARLES H. HERSEY, of Boston, Mass.—*Improvement in Rotary Pumps.*—Patent dated July 26, 1859.—In this invention the cone moves around with the flange shaft and the sides of the cone roll upon the flange. There is but little friction produced by the passage of the hinge valve through the cone, as the power is not transmitted through the cone, its only office being to revolve within the shaft and form the steam and exhaust chambers.

*Claim.*—The combination of the flanged shaft with the hinged valve and cone, substantially as described, for the purpose specified.

NO. 24,873.—BENJAMIN HINKLY, of Troy, N. Y.—*Improved Bedstead.*—Patent dated July 26, 1859.—This invention consists in uniting the end rails to the posts of bedsteads by means of dovetailed tenons *m* or *m*<sup>1</sup> on the end rails, and corresponding dovetailed mortises *n* or *n*<sup>1</sup> in the posts.

*Claim.*—The arrangement of the dovetailed tenons *m* or *m*<sup>1</sup> on the end rails B, and corresponding dovetailed mortises *n* or *n*<sup>1</sup> in the full posts K, with the side rails J and longitudinal tension rods *a*, as and for the purpose set forth.

NO. 24,874.—FRANCIS A. HOYT, of Boston, Mass.—*Improved Water and Alarm Gauge for Steam Boilers.*—Patent dated July 26, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—The arrangement of the balanced valve chamber and valve, the leading pipe thereof, and the whistle, with reference to the dry steam chamber C, the indicator chamber B, and the valve lever and the indicator hand connected together and arranged in the two chambers B and C, as specified.

NO. 24,875.—RICHARD M. HOE, of New York, N. Y.—*Improvement in Printing Machines.* Patent dated July 26, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—Stopping the sheet of paper as it issues after its first side is printed, and imparting

to it a retrograde motion, thus returning it backwards, or in reverse order, to the impression cylinder for the purpose of printing the second side, by the means substantially as described.

No. 24,876.—FREDERIC KETTLER, of Milwaukie, Wis.—*Improvement in Force Pumps*.—Patent dated July 26, 1859.—This engine has one horizontal pump, which is intended to throw out every minute seven hundred gallons of water, when the engine is of common size. Through the operation and construction of the machinery, the water will be forced more regularly and in a greater quantity through the discharge pipes of the engine.

*Claim*.—The combination and arrangement of a force pump as described, for the purpose set forth.

No. 24,877.—FREDERIC KETTLER, of Milwaukie, Wis.—*Improved Force Pump*.—Patent dated July 26, 1859.—A A are two cylinders, which are fastened on the right and left below the back part of the vessel *a*. The pipes S are fastened to the cylinders, and are intended to draw the water out of the well, and to force it, by means of the pipes *t*, into the vessel *a*, as indicated by the arrow heads.

*Claim*.—The combination and arrangement of a force pump as described, for the purpose set forth.

No. 24,878.—GEORGE T. KEARSING and WILLIAM F. KEARSING, of Butte City, Cal.—*Improvement in Mills for Crushing Quartz*.—Patent dated July 26, 1859.—The runner is suspended from arms B, which extend in a horizontal direction from the driving shaft C by means of rods A, and additional rods E serve to impart motion to the runner. The upper ends of the rods A are furnished with screws and nuts, which latter are turned by means of arms A<sup>1</sup>, so that the runner can be raised and lowered without much labor.

*Claim*.—The arrangement and combination of the driving shaft C, arms B, rods A, and runner *h*, substantially as and for the purpose described.

No. 24,879.—ROBERT MARCHER, of New York, N. Y.—*Improvement in Machines for Enamelling Mouldings*.—Patent dated July 26, 1859.—This invention consists in an improvement in the hopper, which contains the necessary composition for enamelling, whereby the hopper is rendered capable of contracting and expanding to compensate for the inequalities of the moulding; also, in the adaptation of feeding devices, which permit the employment of any power as a motor.

The inventor says: I *claim*, first, the elastic or yielding sides *a a* of the hopper B, arranged to operate substantially and for the purpose set forth.

Second. In combination with the hopper B the reciprocating dog S, attached to the bed E, and operated as shown, and also in combination with said hopper the feed rollers L L<sup>1</sup>, P P<sup>1</sup>, either or both feeding devices being employed for the purpose specified.

No. 24,880.—CHARLES MESSENGER, of Warren, Ohio.—*Improved Bedstead*.—Patent dated July 26, 1859.—The nature of this invention relates to the method of connecting the rails to the posts, by which the bedstead may be folded up, from the position in Fig. 1 to that in Fig. 2, and *vice versa*, without detaching the rails from the posts.

*Claim*.—The angular and oblique slot F and pin G, in combination with the plate or key D, when arranged in connection with the jointed rails, substantially as described and for the purpose set forth.

No. 24,881.—JOSEPH W. MORTON, of Plainfield, N. J.—*Improvement in Sewing Machines*.—Patent dated July 26, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* my improved loop check for the Wheeler and Wilson sewing machine, viz: a loop check or thread holder, which is composed of hair, bristles, or other suitable fibres, by compacting them into a firm mass of suitable size and then combining the same with a sewing machine in such a manner that the ends of the said fibres will bear against a portion of the rotating hook of said machine, substantially as set forth.

No. 24,882.—RICHARD MONTGOMERY, of New York, N. Y.—*Improvement in Machines for Manufacturing Waved and Corrugated Metal Plates*.—Patent dated July 26, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the combination of the peculiarly constructed roll I, with the peculiarly constructed roll arranged and operating in relation to each other as shown, whereby the manufacture of the waved corrugated metallic plate, with margins of greater thickness than the middle, as patented to me on the 21st of June, 1859, is facilitated, while a portion of each corrugation is formed at the same time, as described.

No. 24,883.—RICHARD MONTGOMERY, of New York, N. Y.—*Improved Machine for Manufacturing Waved and Corrugated Metal Plates*.—Patent dated July 26, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the combination of the peculiarly formed roll I<sup>1</sup>, with the

peculiarly formed roll J<sup>1</sup>, arranged and operating in relation to each other as shown and set forth, whereby the manufacture of the waved corrugated metallic plate, with margins of greater thickness than the middle, as patented by me on the 21st of June, 1859, is facilitated while only one corrugation is formed at the same time, as described.

No. 24,884.—DANIEL MORRIS, of Bangor, Me.—*Improvement in Shirt Studs*.—Patent dated July 26, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I do not claim a shirt stud made entirely of metal, or entirely of a material which will not tarnish or crack, but I *claim* the improved manufacture of shirt studs as constructed with a metallic facing A, and an anti-soiling spool or guard B, arranged and combined together, substantially as specified.

No. 24,885.—JOSEPH NEWMAN, of Baltimore, Md.—*Improvement in Platforms between Railroad Cars*.—Patent dated July 26, 1859.—This invention consists in forming the bridge of net or lattice work of iron, or other suitable material, which net or lattice work is so put together that the same may be expanded or contracted in length as the car platforms are further or nearer to each other, and so attached as to allow for the swaying and surging of the cars or other objects, and for the stowage of the bridge when there is a disconnection.

*Claim*.—The expanding mesh or lattice work described, when attached by a single point at each end, substantially in the manner set forth, to be used as a bridge or gangway between railroad cars.

No. 24,886.—Suspended.

No. 24,887.—IRA ROBBINS, of Hughesville, Pa.—*Improvement in Gates for Railroads*.—Patent dated July 26, 1859.—This invention consists in the combination of devices by which a sliding gate G, connected by lever A, with a horizontal shaft s having an arm a, is moved back by the passing of the car wheel over the said arm a and held by a spring detent until the train having passed, it is closed by the action of the spring f on the shaft s.

*Claim*.—The shafts s s<sup>1</sup> having arms a b, as described, in combination with the shaft B, lever A, train of wheels c c c, spring detent g, spring f, and the several rods connecting the aforesaid parts, substantially as set forth for operating the sliding gate G.

No. 24,888.—DAVID B. ROGERS and JOEL A. WOOD, of Pittsburg, Pa.—*Improvement in Springs for Railroad Cars*.—Patent dated July 26, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the combination of a series of plate springs, constructed and arranged as described, with a box, in which they are inserted, and a follower; the spring box being either separated from or forming part of the truck, substantially in the manner and for the purpose set forth; also making and using the plates of the spring, constructed and arranged as described, of different thicknesses in the same, for the purpose of adapting the spring to the varying degrees of pressure to which it may be subjected from time to time.

No. 24,889.—HARRISON ROBERTS, of Mormon Island, Cal.—*Improvement in Gold Washers*.—Patent dated July 26, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The arrangement of the sluice B in combination with the hopper A and with the supply channel C in such a manner that the water strikes the dirt from below, and that the hopper is made self supplying, substantially as specified.

No. 24,890.—ISAAC R. SHANK, of Buffalo, Va.—*Improved Biscuit Boards*.—Patent dated July 26, 1859.—This invention consists in arranging within a chest, and at a convenient height from the floor, a board which is provided with trap doors resting upon slats, having beveled eyes, and operated so as to be readily opened by levers and pins.

*Claim*.—The arrangement and combination of trap boards H H, beveled straps G G, levers I I, and vertical pins J, substantially in the manner and for the purpose set forth.

No. 24,891.—HENRY SIMON, of Providence, R. I.—*Improvement in Shirt Studs*.—Patent dated July 26, 1859.—This invention consists in a certain construction of, and mode of applying, a spring to the inner portion or fastening of the stud or button, whereby it may be easily inserted in and removed from the holes in the shirt or vest, and made secure when in place.

*Claim*.—The movable elbow piece d e, spring g, and lever h, applied in combination with each other, and with the fixed shank c, and in relation to a fixed elbow piece a b, substantially as described.

No. 24,892.—ISAAC M. SINGER, of New York, N. Y.—*Improvement in Sewing Machines*.—Patent dated July 26, 1859.—This invention consists in securing two or more needles in a mortise in the needle carrier, or stock, by means of interposed blocks grooved on their

parallel faces to receive the body of the needles, and all clamped by a clamp screw, or equivalent means, whereby any number of needles can be secured to each other, and the spaces between the several needles varied at pleasure to suit the required width of seams, by taking out one set of blocks and substituting blocks of a different thickness.

*Claim.*—Making the needle carrier with a mortise, substantially as described, in combination with the needles, a series of blocks having parallel sides grooved to receive the needles, and with a clamp screw or its equivalent, all substantially as described and for the purpose set forth.

No. 24,893.—JOHN TAGGART, of Roxbury, Mass.—*Improvement in Ninepin Balls.*—Patent dated July 26, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The new or improved article of manufacture, or ninepin ball, as composed of a hollow metallic body A and covering B of India rubber, or other suitable elastic material, the same being constructed and arranged in manner as set forth.

No. 24,894.—GEORGE I. WASHBURN, of Worcester, Mass.—*Improvement in Boring Tools.*—Patent dated July 26, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—Giving the stock or shaft of a boring, screw driving, or other tool, a continuous rotary motion in one and the same direction, by means of a nut or sleeve which is moved in a rectilinear reciprocating direction on said shaft, when constructed and arranged substantially in the manner described.

No. 24,895.—AMOS WEBB, of Savannah, Ga.—*Improvement in the Construction of Railroads.*—Patent dated July 26, 1859.—A represents a series of railroad ties, or sleepers, of the usual quadrilateral form. These ties or sleepers are placed on the ground B at the usual or any suitable distance apart in an angular position, that is to say: one edge of the bottom of the sleepers is placed lower than the other, so that the lower as well as the upper surfaces will be inclined from a horizontal position, and the sides consequently inclined from vertical planes.

*Claim.*—The arrangement of the ties A in alternate reversed inclined positions, as and for the purpose shown and described.

No. 24,896.—CHARLES A. WILSON, of Cincinnati, Ohio.—*Improvement in Apparatus for Warming by Steam.*—Patent dated July 26, 1859.—This invention has for its object the more efficient and economical heating of apartments by steam, and consists in the construction and arrangement of self acting valves in the discharging ends of the branches, coils, or radiators.

*Claim.*—The valves F F, *f g*, adapted substantially as set forth in the lower or discharge ends of the branches, coils, or radiators of a system of steam heating pipes, and closable automatically by heat, in the manner and for the purpose explained.

No. 24,897.—CHARLES A. WILSON, of Cincinnati, Ohio.—*Improved Steam Radiator.*—Patent dated July 26, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The described arrangement of a series of tubes or boxes 1 2 3, &c., provided with corresponding apertures A and nozzles B, to permit circulation of steam and receive bolts or rods D, which extend from top to bottom of the tier, the whole being adapted in the manner set forth to admit of varying the extent of radiating surface, while that of the floor room occupied remains unchanged.

No. 24,898.—PARKER WINEMAN, of Loydsville, Ohio.—*Improvement in Churn Dashers.*—Patent dated July 26, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—A cylindrical dasher for churns, formed with a perforated top, provided with a movable cap or cover and with hinged valves, arranged in such a manner that cream may be received within the dasher at each downward motion thereof, and all operating substantially as described for the purpose set forth.

No. 24,899.—EDWARD F. WOODWARD, of Brooklyn, N. Y.—*Improved Safety Guard for Ferry Wharves.*—Patent dated July 26, 1859.—This invention consists in the adaptation to floating bridges, docks, or wharves, of a pliable self extending apron of net work or canvas, or other material placed below the footway on the outer end, or side of the structure, and next to the vessel when receiving or delivering passengers; and so arranged that, as the boat recedes from the dock, the net will be drawn out to a distance of several feet beyond which it is impossible for a person to leap.

*Claim.*—The employment of the apron *g*, for the purpose set forth.

No. 24,900.—GEORGE H. WOODWORTH, of Brooklyn, N. Y.—*Improvement in Venetian Blinds.*—Patent dated July 26, 1859.—This invention consists in providing eyes or staples on the edges of the slats that secure the tapes to said slats, and pass cords by which the blind is drawn up or lowered down, thus dispensing with the cross tapes heretofore used.

*Claim.*—The eyes 2 2, or staples passing the cords *f f*, and attaching the tapes *d d* to the blind slats *e e*, in the manner and for the purpose substantially as specified.

No. 24,901.—JOHN N. WYCKOFF, of Brooklyn, N. Y., and THOMAS M. FELL, of Orange Mines, Va.—*Improved Ore Washer and Amalgamator.*—Patent dated July 26, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—A concentrator, constructed with a series of boxes, or partitions having curved bottoms communicating one with the other, and driven transversely for the purpose of separating poor from rich deposit, all as described.

No. 24,902.—JOHN N. WYCKOFF, of Brooklyn, N. Y., and THOMAS M. FELL, of Orange Mines, Va.—*Improvement in Gold Amalgamators.*—Patent dated July 26, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The application of heat by steam, or otherwise to vessels, pans, or cylinders, keeping the contents well triturated or mixed at an elevated temperature, the whole operating in the manner described, so as to amalgamate the prepared ore by the use of mercury and alkali, as specified.

No. 24,903.—ELIZA BLAKE, of Albany, N. Y., executrix of ROBERT BLAKE, deceased, assignor to BLAKE & SON, of the same place.—*Improved Wood Saw.*—Patent dated July 26, 1859. The saw blade is strained by means of a screw and nut *a b*; the ends of the frame *c d* are of wood, and made in the usual manner; the middle brace *e* is of wood, but instead of being provided at its ends with a rocking tenon, the tenon is square shouldered, so as not to rock or allow the frame to rock when the whole is properly braced.

*Claim.*—The manufacture of wood saws in the manner set forth, meaning by this to claim only the sole right to manufacture according to the mode of construction set forth, the special kind and character of saws known as wood saws, and clearly defined and represented in the description and drawings.

No. 24,904.—JOHN BURR, of Baltimore, Md., assignor to GEORGE H. FAYMAN, of Washington, D. C.—*Improved Clothes Frame.*—Patent dated July 26, 1859.—This invention is designed to obviate many of the defects existing in articles of this character, by causing the radial arms to bear against a seat which is incapable of rotary motion in itself, while at the same time the expanded system is free to rotate about the axis of the upright shaft without any contact between the shaft and the lower connection of the radial arms.

*Claim.*—The seat S capable of movement on the shaft in one direction only, and provided with the weighted detent, as set forth, and the ring R movable thereon, without being against the shaft, in combination with the shaft A, arms D, braces B, and cords E, arranged and operating as and for the purposes described.

No. 24,905.—JOHN W. FISCHER, of New York, N. Y., assignor to Himself and CHARLES S. FISCHER, of the same place.—*Improvement in Pianofortes.*—Patent dated July 26, 1859.—This invention consists in providing a bar beneath the dampers and above the edge of the rest plank, acted on by the pedal in such a manner that said bar is lifted and raises the outer ends of the dampers, allowing the inner or fulcrum ends to remain in their jaws on the plate, which in this instance is stationary, thus the strain is removed from the fulcrums of the dampers, and the whole pedal attachment works much more easily and is more durable.

*Claim.*—The bar *l* beneath the dampers *i i* and above the piano strings, actuated by the levers *m n*, or their equivalents, in the manner and for the purposes specified.

No. 24,906.—SIMEON GOODFELLOW, of Troy, N. Y., assignor to Himself and JOHN FISH, of said Troy.—*Improvement in Screw Stocks.*—Patent dated July 26, 1859.—This invention consists in arranging in combination with a circular die or dies, a vibrating die or chasing tool, which is held by a vibrating plug in the movable die holder in such a manner as to accommodate itself to the inclination of the thread, when the die begins to cut on the surface, as described.

*Claim.*—The cutting die G in combination with the vibrating circular plug F, and the movable holder D, when the same are arranged and operated essentially as specified.

No. 24,907.—ALFRED GUTHRIE, of Chicago, Ill., assignor to WARDELL GUTHRIE, of said Chicago.—*Improved Churn.*—Patent dated July 26, 1859.—My invention consists in such an arrangement of machinery as will impart to the milk or cream a rotating and centrifugal motion inside of the churn, without the intervention of paddle blades or stirring arms, relying upon the concussion of the particles against the periphery of the revolving churn, either with or without roughened or corrugated surfaces inside.

*Claim.*—The combination and arrangement of the cranks *c c c c*, connected by the plate D or its equivalent, operating in the manner and for the purpose set forth and explained substantially as described.

No. 24,908.—ALBERT H. HOOK, of New York, N. Y., assignor to WILLIAM H. HORSTMANN, of Brooklyn, N. Y.—*Improvement in Glass Polishing Machines*.—Patent dated July 26, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—The combination of the apparatus for producing the reciprocating longitudinal motion and continuous lateral motion given to the polishing blocks, consisting of the screws *k*, worm wheel *l*, worm *m*, and its connections with the driving power, arranged and operated in the manner set forth.

No. 24,909.—HEZEKIAH JOHNSTON and WILLIAM I. MATTHEWS, of Collinsville, Ill., assignors to HEZEKIAH JOHNSTON, of said Collinsville.—*Improvement in Fire Escape Ladders*.—Patent dated July 26, 1859.—This invention consists in combining an endless apron, belt, or chain with a set of folding ladders, and also in combining with the said ladders a movable platform.

*Claim*.—The combination of the endless belt *F* with the folding ladders and platform *M*, in the manner described.

No. 24,910.—JAMES H. MURRILL, of Baltimore, Md., assignor to EGERTON, DOUGHERTY, WORDS & Co., of Baltimore aforesaid.—*Improvement in Machines for Cracking Sugar*.—Patent dated July 26, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim* the employment of a vibrating saw *H*, when constructed and operated in the manner described, in combination with a gauge plate *P* and hopper *O*, arranged substantially in the manner and for the purpose of sawing slabs of sugar and directing them between the crushing rollers.

I claim the employment of rollers *A A* moving in unison with each other, when constructed with cruciform cutters *a a*, as described, for the purpose of perfectly dividing slabs of sugar into regular cubic portions, substantially as set forth.

I claim the construction of a hopper *O*, when provided with parallel grooves, or their equivalent, when used in combination with a circular saw, constructed and operated in the manner and for the purposes as set forth.

No. 24,911.—W. H. NICHOLS, of East Hampton, Conn., assignor to A. H. MARKHAM, W. H. NICHOLS, and DAVID STRONG, of East Hampton, aforesaid.—*Improved Coffin Screw*.—Patent dated July 26, 1859.—The caps *B* are spun of sheet brass, all of the same size, and so that they fit nicely to the plates *A*, which latter are cast, and need no finish or additional labor, with the exception of those serving to retain the caps of the screws, in which case it is necessary to cut screw threads on their edges.

*Claim*.—The employment of plates *A*, or their equivalent, for the purpose of securing or retaining the caps, or covers *B*, of coffin screw tacks, substantially as set forth.

No. 24,912.—J. Y. PARCE, of Fairport, N. Y., assignor to Himself and D. B. DE LAND, of Fairport, aforesaid.—*Improvement in Hoisting Cranes*.—Patent dated July 26, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The main arm *E* of a crane, arranged with the double diagonal braces *I*, and with the guide rollers *m*, to operate in combination with the arm *F*, jointed to the same by means of the oval pin *d*, substantially as and for the purpose set forth.

No. 24,913.—SAMUEL R. SMITH and PHILANDER P. LANE, of Cincinnati, Ohio, assignors to LANE and BODLEY, of Cincinnati, aforesaid.—*Improved Portable Sawing Machine*.—Patent dated July 26, 1859.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, the idle friction pulley *Z*, operating substantially in the manner set forth, in combination with the arbor and feed drum of a circular saw.

Second. In the described connection with the transverse rack *h*, the gearing *q q*<sup>1</sup>, ratchet wheels *r*, pawls *t*, lever *s*, and stop *v*, which operate by their rigidity in one direction to transmit a forward movement of the rack *h* to the knee *f*, yet permitting the retraction of said rack *h*, as set forth.

Third. The described arrangement and adaptation of the weighted eccentric friction pawl for the exact retention of the knee to the place of setting, as set forth.

Fourth. The described arrangement and adaptation of the perforated rack *h*, pinions *q q*<sup>1</sup>, knee *f*, and screw *Y*, for the exclusion of dust, as explained.

No. 24,914.—PAUL FRANCIS AERTS, of London, England.—*Improvement in Axle Boxes for Lubricating Railway Rolling Stock, &c.*—Patent dated August 2, 1859; patented in England March 19, 1858.—This invention consists in a novel mode of lubricating the journals of railway rolling stock and the moving parts of machinery working in fixed bearings.

*Claim*.—The wheel *a*, fixed on the end of the journal in railway rolling stock, raising water by centrifugal force, and the divergent *c*, for conducting the water over the greased surface of the journal or moving parts of machinery working in fixed bearings, when constructed and arranged substantially as set forth.

No. 24,915.—FREEBORN ADAMS, of Somerville, Mass.—*Improvement in Casting Copper Cylinders*.—Patent dated August 2, 1859.—This invention consists in the production of a new article of manufacture, viz: a cast copper tube or cylinder without blow holes made by rotating the mould in which it is cast, and using a core.

*Claim*.—As a new article of manufacture, a tube or cylinder cast out of copper, and free from blow holes and other similar defects, when produced as stated.

No. 24,916.—JONAS BRADLEY AIKEN, of Manchester, N. H.—*Improvement in Knitting Machines*.—Patent dated August 2, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the lever Q, grooved eccentrically to its fulcrum, applied in combination with the sliding loop regulator to adjust the same for different lengths of loop, substantially as specified.

Second. The stop motion, consisting of the lever Y, and its self-adjusting dog 11, the ring X, with its pins 13 13, or their equivalents, and the sliding bolt W, or its equivalents, carrying the slipper W<sup>1</sup>, the whole combined, applied, and operating substantially as described.

No. 24,917.—WILLIAM BAKER, of East Templeton, Mass.—*Improved Tool for Riving Hoops*.—Patent dated August 2, 1859.—The hoop riving tool shown in the engravings, and which is designed to cut hoops for barrels or kegs of various kinds or sizes, is formed in part of a stock A, the back of which may be arranged to lie uppermost when the tool is in use. The inner side of the stock is provided with a longitudinal and central, or intermediate projecting strip B, designed to form guiding surfaces  $a a^1$  on either side of it to direct and steady the tool in its run along or over the edge of a plank.

*Claim*.—A hoop riving tool, formed of a stock A, provided with suitable guiding surfaces  $a a^1$ , and differently arranged or set stock faces  $b b^1$ , and knives D D<sup>1</sup>, for operation, essentially as set forth.

No. 24,918.—THOMAS C. BALL, of Keene, N. H.—*Improvement in the Mode of Hanging Brake Rubbers*.—Patent dated August 2, 1859.—This invention consists in so suspending each brake head upon a spring that the tread of the brake head shall be adjustable to the periphery of the wheel, as its relative position to the car track shall vary with the weight of the car, the flexibility of the spring allowing all the movements of the brake head without a hinge joint; in so attaching the brake head to the spring suspender by bolts as to be readily exchanged when worn, and in so suspending the brake beam that its action shall bring the brake heads to the wheel without being attached to them by bolts.

The inventor says: I *claim* the combination of the brake head and spring, as above described, also the arrangement of the brake beam F, Fig. 1, so as to allow its independent action upon brake head and spring A and D, as described.

No. 24,919.—THOMAS LAWRENCE BALL, of New York, N. Y.—*Improved Show Case*.—Patent dated August 2, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The construction of a case or box divided into compartments, each box having a sliding cover, arranged as set forth, in combination with the spring covers G and compartments F, constituting a new article of manufacture.

No. 24,920.—WILLIAM T. BARNES, of Buffalo, N. Y.—*Improvement in Apparatus for Condensing Coal Oils*.—Patent dated August 2, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the employment of tube K, the lower extremity of which is provided with tubular arms L L, the same being made to revolve, and being used in connection with a tank partially filled with water, and a conducting pipe F, substantially in the manner and for the purpose set forth.

Second. The arrangement and employment of the tanks A B C, constructed and used substantially in the manner specified and for the purpose set forth.

No. 24,921.—WILLIAM T. BARNES, of Buffalo, N. Y.—*Improvement in Apparatus for Generating Coal Oils*.—Patent dated August 2, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of the levers L K and J, and rod I, whether operated by a cam or otherwise, for the purpose of forming an automatic dust clearer to coal oil retorts, as is substantially set forth.

Second. The employment of the spiral or screw flanges on the head of the retort for pushing the material away from the hole in the journal, as fully described.

No. 24,922.—DANIEL BASSETT, of White Water, Wisconsin.—*Improvement in Mills for Crushing Sugar Cane*.—Patent dated August 2, 1859.—A A are tongued rollers, mounted on a horizontal shaft Z. These tongued rollers run into corresponding circular channels in the

peripheries of the rollers B B, which are similarly mounted below on the shaft Z<sup>2</sup>, thus constituting pairs, of which one or more may be placed on shafts.

The bar V is bolted to the framework across the front and immediately opposite the points of contact of the pairs of rollers, and serves as a support for the stripper and packing, or wiper F.

The inventor says: I *claim*, first, the arrangement and combination of the tongue and groove rollers A B, wiper F, and "stripper," as and for the purpose shown and described.

Second. The "stripper," when composed of spring caps and a movable cam G, and when arranged and combined with rollers A B, substantially as and for the purpose shown and described.

No. 24,923.—ALBERT BETTELEY, of Boston, Mass.—*Improvement in Elevators for Warehouses, Factories, Mines, &c.*—Patent dated August 2, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of an automatic safety shipper and brake apparatus with an elevator, substantially as described, arranged to operate only to prevent an elevation of the car beyond a fixed limit.

Second. The combination of the weight *q*, flexible rope or chain *e*, with the shipping and brake controlling mechanism, substantially in the manner and for the purpose set forth.

No. 24,924.—CYRUS C. BISBEE, of Rochester, N. Y.—*Improved Spring Bed Bottom.*—Patent dated August 2, 1859.—This invention consists in the application of the head and foot rollers J, from which are suspended the slats D, they being riveted to the straps Y which pass over the rollers and are hooked to the pins on the under side, and the springs P and P<sup>1</sup>, the cords R R<sup>1</sup>, and the cams B B<sup>1</sup>.

The inventor says: I *claim* the arrangement described of the slats D, belts Y, rollers J, cords R and R<sup>1</sup>, and springs P P<sup>1</sup>, in the construction of spring bed bottoms.

I also claim the unequal cams B and B<sup>1</sup>, for the more perfect automatic adjustment of spring beds.

No. 24,925.—ABRAHAM BOWER, of Pekin, Ill.—*Improvement in Machines for Raising Water, &c.*—Patent dated August 2, 1859.—This invention consists in a combination of levers, bucket, and slide trough, whereby an elevating machine is obtained.

*Claim.*—The combination of the lazy tongs G, the slide trough J, and valvular bucket H, arranged for joint operation, substantially as and for the purpose set forth.

No. 24,926.—SAMUEL BOYD, of Brooklyn, N. Y.—*Improvement in Manufacturing Hoes.*—Patent dated August 2, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The employment of an anvil, having an inclined face *a*, groove or recess *c*, and socket D, in combination with a mandrel F, as shown and described, whereby the bevel or set of the blade and eye, and the form, thickness and bevel of the interior of the socket or eye will be uniformly and simultaneously produced as set forth.

No. 24,927.—JAMES R. BROWN, of Boston, Mass.—*Improved Pipe Tongs.*—Patent dated August 2, 1859.—This improvement has reference to the peculiar arrangement and application of devices for adjusting and fixing in position the fulcrum screw pin of the two jaw levers.

*Claim.*—The arrangement and application of the serrated surface or rack *h*, the spring F, and toothed stopper D, with respect to the two jaw levers A B, the clamp nut E, and the screw pin C, applied to the toothed jaw lever A, substantially as described.

No. 24,928.—MOSES BUCLIN, of Grafton, N. H.—*Improved Draining Machine.*—Patent dated August 2, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of the platform E, with the cutter blade F, and ploughshare G, for the purpose of cutting underground drains, substantially in the manner specified.

Second. Arranging the blade F with a sloping cutting edge *d*, so that the same may readily pass over obstructions which may come in its way, substantially as described.

Third. The arrangement and combination of the platform E, the cutter blade F, and the ploughshare G, with the adjustable bars D and wheels B, to operate substantially in the manner and for the purpose described.

No. 24,929.—JOHN F. GALLEY, of New York, N. Y.—*Improved Ironing Table.*—Patent dated August 2, 1859.—This invention consists in applying the power of a treadle in a direct way; in the use of a hollow collar around the upright shaft worked by the treadle to diminish friction in the motion of the arms; in giving greater range and variety of motion to the goose, or smoothing iron, and in a new mode of securing and holding the pressboard.

The inventor says: I *claim*, first, the treadle C, the fulcrum arm D, the upright shaft E, the side jaws 6 and 7, the spiral spring 8, and the thumb screw 9, when arranged and combined substantially as described and for the purposes set forth.

Second. The hollow screw collar F on the shaft E, constructed and applied substantially as described and for the purposes set forth.

No. 24,930.—THOMAS B. GARSIDE, of Danville, Iowa.—*Improved Portable Field Fence*.—Patent dated August 2, 1859.—This invention consists in the combination of the long main posts of the fence, which are held out of the ground by short auxiliary posts driven into the ground, and by a pivoted triangular brace, or its equivalent, when the main posts, auxiliary posts, and brace are arranged in relation to one another.

*Claim*.—The combination of the long main posts *d*, short auxiliary posts *e*, and triangular pivoted brace *a b*, or its equivalent, when arranged in relation to one another, and to operate substantially as and for the purpose set forth.

No. 24,931.—FREDERICK AUGUSTUS GENTH, of Philadelphia, Pa.—*Improvement in the Manufacture of Phosphoric Acid and Phosphates*.—Patent dated August 2, 1859.—The claim explains the nature of this invention.

*Claim*.—The process of manufacturing phosphoric acid or phosphates by treating the phosphates of iron, alumina, or lead, substantially as described, by means of sulphuric acid or its equivalent.

No. 24,932.—JAMES GILFILLAN, of Hartford, Conn.—*Improvement in Gas Burners*.—Patent dated August 2, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The improvement in gas burners described, consisting of a central exit tube supplied with apertures, surrounded by the gas chamber, having its discharge regulated by the mercury cap, the upper end of said pipe being furnished with a nozzle, or jet burner, the whole constructed and operating substantially as set forth.

No. 24,933.—CHARLES F. GREELEY, of East Kingston, N. H.—*Improved Cloth Holder for Washing Crockery, &c.*—Patent dated August 2, 1859.—This invention consists in having the article so constructed as to receive and hold the cloth or substance necessary to be immersed in hot water, for the purpose of washing dishes, crockery, or other articles, while the handle portion of it allows its effectual use by hand, without having the hands immersed at all in hot water.

*Claim*.—The described washing vise, constructed as and for the purpose set forth.

No. 24,934.—W. S. HALL, of Quincy, Mass.—*Improved Churn*.—Patent dated August 2, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—The combination of the frame of stationary transverse bars with the rotary hollow shaft, and hollow arms thereto attached for the introduction of air and the solid arms attached to the shaft, as substantially described.

No. 24,935.—PIERRE JEAN HARDY, of Boston, Mass.—*Improved Recumbent Chair*.—Patent dated August 2, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the peculiar construction and arrangement of mechanism described for actuating the back and leg rest, whereby they can not only be brought from a vertical into horizontal, or nearly horizontal position, so as to constitute a couch, but be maintained in such or any intermediate positions that may be desirable, such mechanism consisting of the levers *c c* and *d d*, connected with each other, the back and leg rest, or leg rest frame *f*, respectively, in manner as set forth.

And, in combination with the said construction and arrangement of mechanism for actuating the said back and leg rest, I claim the arrangement of the locking contrivance (constructed and applied as described,) whereby the back and leg rest, when placed in any desirable position, may be firmly secured in such position or be released therefrom as circumstances may require.

No. 24,936.—ALBERT V. HILL, of Hinsdale, N. Y.—*Improvement in Breech Loading Fire-Arms*.—Patent dated August 2, 1859.—This invention consists of the combination of a chamber wherein the charge is inserted, the bed piece, (wherein the chamber rests,) and the breech pin; the bed piece and breech pin being each composed of strips of iron, so as to admit the one to slide into the other, which, when brought together, grasp the chamber and hold it firmly until it is discharged.

*Claim*.—The combination of the bed piece, breech pin, and connecting rod, which in connection form the sliding process, and operating as described.

No. 24,937.—HIRAM W. HAYDEN, of Waterbury, Conn.—*Improvement in Sewing Machines*.—Patent dated August 2, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the attachment of the looping hook I, to an arm I, or its equivalent, which has a revolving motion, and also a vibrating motion, in a direction trans-

verse to its revolution, and operates substantially as described, in combination with a bobbin K, arranged relatively to it, substantially in the manner set forth.

Second. The stationary cam J, applied in combination with the revolving arm I, which carries the looping hook, and with a spring R, and sleeve Q, or their equivalent, for holding the said arm in contact with the said cam, to produce the vibrating motion of the said hook, substantially as described.

Third. The combination of the stationary cam J and the fixed portion L of the bobbin holder, substantially as described.

Fourth. The looping hook, made and fitted to turn in the revolving and vibrating arm I, as described, and provided with a pin or projection *h*, operating in combination with a fixed stop *m*, substantially as and for the purpose set forth.

Fifth. The extension of the mandril E forward of the rotating hook, as described, for the purpose of carrying the spring R, and a sleeve Q, or its equivalent, by which the revolving and vibrating arm I<sup>1</sup>, which carries the hook, is kept in contact with the cam from which it derives its vibrating motion.

Sixth. The adjustable pin *r*, applied and operating substantially as described, in combination with the revolving and vibrating looping hook and the bobbin for the purpose set forth.

Seventh. Feeding the cloth or material to be sewed by means of one or more smoothed faced angular projections, 14 14, on the feed bar, or its equivalent, and one or more ratchet like wheels *y y*, attached to the presser, said wheels being arranged with the lowest portions of their peripheries, above the bottom of the presser foot, and the said projections pressing the material into one notch at a time of each wheel, and operating in combination therewith, substantially as described.

No. 24,938.—EDWARD L. KEELER, of Pittsburg, Pa.—*Improvement in Car Couplings*.—Patent dated August 2, 1859.—This improvement consists in the use of beveled head coupling bars, as shown in the engraving, in combination with a spring to each coupling bar, whereby they are caused to receive their position for repeated action and kept firmly in place when coupled.

*Claim*.—The combination of a beveled coupling head *c*, shaped substantially as described, with a spring *e*, as a coupling for railroad cars, constructed and arranged in the manner described.

No. 24,939.—DAVID KELSEY, of Harper's Ferry, Va.—*Improvement in Sewing Machines*.—Patent dated August 2, 1859.—This invention consists in a certain arrangement of, and mode of combining the pressure pad and feeding dog, whereby, when the dog is pressed upon the material, the pad is caused to be raised therefrom, and is prevented from interfering with the action of the dog in the feeding operation.

*Claim*.—The horned eccentric, or cam L, applied substantially as described, in combination with the vibrating pressure pad E, and the feeding dog, sliding on the stem of said pad, and operated for the purpose specified, by means of a stud *l*, or its equivalent, attached to the needle bar.

No. 24,940.—BENJAMIN F. KILLAM, of Braintree, Vt.—*Improvement in Tooth Keys*.—Patent dated August 2, 1859.—This invention consists in so applying the mechanical force to the tooth as to lift it out in a direction that is perpendicular to the jaw, instead of breaking or prying it over in the manner of the instruments heretofore in use.

*Claim*.—The hollow fulcrum, as described.

No. 24,941.—OBED H. KING, of Salem, Iowa.—*Improvement in Harvesters*.—Patent dated August 2, 1859.—This invention consists in the peculiar arrangement and combination of devices shown in the engravings, with a circular platform for operating the rake and holding it to the platform while it is carrying off the grain, and retaining it in an elevated position while it is returning to rake a new quantity of grain.

*Claim*.—The arrangement and combination of the circular platform A, rake B, rods C, guide way E E, endless chain or belt G, wheels F F, and pin H, all constructed, arranged, and operating together, substantially as and for the purposes set forth.

No. 24,942.—S. C. LEWIS and F. P. PFLEGAR, of Whitneyville, Conn.—*Improvement in Revolving Fire-Arms*.—Patent dated August 2, 1859.—The claim and engraving explain the nature of this invention.

The inventors say: We *claim*, first, the centre pin E F, made in two pieces, one of which is fitted to the rotating cylinder and to a rotating recoil shield with fins *b b*, and has applied to it within the cylinder a spring *a*, and the other of which is fitted to slide and turn in the front part of the frame, and is capable of being locked to the frame, substantially as described.

Second. The dog *n*, constructed and applied, as described, to constitute its own spring, and operating traasversely to the hammer, in combination with a peripheral ratchet *ll*, substantially as and for the purpose set forth.

Third. The stop  $p$ , constructed with a tooth  $p^1$  in its front and a projection  $u$  on its back, and applied and operating in combination with a spring  $v$ , a ring of notches  $m m$  on the rear of the recoil shield or cylinder, and a tooth  $u^1$  on the tumbler, substantially as described.

Fourth. The recoil shield, constructed with a peripheral ratchet  $l l$ , a ring of notches  $m m$ , a central bore  $j$ , and slots  $k k$ , substantially as and for the purpose specified.

No. 24,943.—HENRY A. LINCOLN and HEBRON T. DOUGLASS, of New Haven, Conn.—*Improvement in Brakes for Railroad Cars*.—Patent dated August 2, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The combined arrangement described of brake shoes, truck wheels, equalizing beams and springs, the former being outside of the wheels, and so supported as to rise and fall practically with the wheels, while the equalizing beams support the springs, and the springs are arranged between the wheels, and transfer the weight to be carried to the equalizing beams, the several parts acting in combination, substantially in the manner and for the purposes specified.

No. 24,944.—STEPHEN A. LINDSAY, of Unionville, Md.—*Improvement in Harvesters*.—Patent dated August 2, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim* the combination of the hinged guide piece  $S$ , with the hinged platform  $T$ , for the purpose of retaining the rake and the reels in their proper relative positions toward the platform, when the latter is raised or lowered, substantially in the manner described.

I also claim the combination of the bar  $3$ , shaft  $5$ , and the hinged bar  $7$ , with the movable frame of the machine and the finger bar  $U$ , for the purpose of raising and lowering the latter, without interfering with the free movements of the platform on its hinges, substantially in the manner described.

No. 24,945.—FREDERICK MEYER, of Naperville, Ill.—*Improvement in Machines for Cutting and Binding Grain*.—Patent dated August 2, 1859.—This invention consists of an ordinary reaping machine; attached to this machine is an apparatus for bundling the grain as it is cut, operated by being connected with the motive power of the reaping machine.

The inventor says: I *claim*, first, the combination of the movable gates, the sliding divider, and the movable platform, as described.

Second. The construction of the tongs, and the mode of operating them, as described.

Third. The tucker  $H$ , for the purpose of fastening the free end of the band, substantially as described.

No. 24,946.—WARREN P. MILLER, of Marysville, Cal.—*Improved Machine for Excavating and Grading*.—Patent dated August 2, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim* the use of the cylinders or wheels  $k k$ , for the purpose of depressing the chains  $h h$  so as to give to the excavators  $i i$  a proper inclination, and thereby facilitate the feeding and working of the same.

I claim the construction and arranging of the excavators attached to endless chains, worked in the manner described, to wit: to fill and discharge while traversing from one tumbler to the other on the lower plane, (from  $A$  to  $B$ ), for the use and purpose of excavating and grading rail and turnpike roads, substantially as set forth.

No. 24,947.—JOHN A. MONTGOMERY, of Williamsport, Pa.—*Improvement in Journal Boxes*.—Patent dated August 2, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* a journal box formed of a sphere or segment of a sphere fitting into a cup or concave, and prevented from revolving with the shaft or journal by a pin and slot, as described, or their equivalent.

No. 24,948.—JARVIS T. MUDGE, of Dayton, Ohio.—*Improved Washing Machine*.—Patent dated August 2, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—Arming the side of the tub and the plunger  $F$  with round headed knobs or pins, to act on the clothes, substantially as described, and allow the water to escape freely as it is pressed out of the clothes being washed.

No. 24,949.—EDMUND T. D. MYERS and CHARLES F. THOMAS, of Washington, D. C.—*Improved Apparatus for Tapping Water or Gas Mains*.—Patent dated August 2, 1859.—By

means of the tool  $e$  the workman pierces the pipe to the required depth for tapping, leaving a thin film of iron on the interior surface of the pipe to prevent the escape of water or gas while tapping; then by means of tool  $f$  the workman cuts a thread to the bottom of the hole drilled; the stop cock  $a$  is then screwed into the hole, the plug  $d$  being open to admit the drill  $g$  down the passageway of the stop cock.

*Claim*.—The method of drilling, tapping, and inserting stop or other cocks into cast-iron

water or gas mains or supply pipes, in the manner as set forth, or other manner substantially the same.

No. 24,950.—JOSEPH R. PALMENBERY, of New York, N. Y.—*Improved Branch Holder for Bonnet Stands*.—Patent dated August 2, 1859.—This branch holder is secured upon the rod B through the set screw *s* in any desired position. The branches C C are inserted into holes *v* in the top part of the holder drilled through the metal and into the wooden part.

*Claim*.—As a new article of manufacture, a branch holder, made and constructed in the manner substantially as described.

No. 24,951.—HENRY PEMBERTON, of East Tarentum, Pa.—*Improvement in the Manufacture of Common Salt*.—Patent dated August 2, 1859.—The claim explains the nature of this invention.

The inventor says: I *claim* the combination of processes described for the purification of common salt, to wit: Washing common salt, procured by the evaporation of salt water containing chloride of calcium and other impurities, with a saturated solution of chloride of sodium or brine, rendered pure by the use of chemical reagents, substantially in the manner described, and the repeated use, for that purpose, of the same brine for an indefinite number of operations, by treating it, after each process of washing the salt, with suitable chemical agents, whereby it is restored to its original purity.

No. 24,952.—HENRY PEMBERTON, of East Tarentum, Pa.—*Improvement in Refining Coal Oils*.—Patent dated August 2, 1859.—The claim explains the nature of this invention.

*Claim*.—Recovering the sulphuric acid used from the residuum resulting from the process of the purification of coal oils with sulphuric acid, by treating the residuum with water heated or caused to boil by steam or otherwise, substantially in the manner described.

No. 24,953.—JOHN G. PERRY, of Kingston, R. I.—*Improved Meat Cutter*.—Patent dated August 2, 1859.—The improvement in this machine is mainly upon the knives and the parts immediately connected with them. These knives are made with holes in their centres, through which is put the rod E to hold them and allow them to turn round on or with it, as the meat is pressed against them by the studs, or by connecting the rod E with the cylinder shaft by gears, or otherwise, making a rolling and drawing cut that will divide the meat easily and thoroughly.

*Claim*.—Combining the revolving knives with a cylinder or block having studs on its surface, substantially as set forth.

No. 24,954.—PHINEAS POMEROY and I. G. ALLEN, of Middletown, Ohio.—*Improvement in Machinery for making Roofing Cement*.—Patent dated August 2, 1859.—This invention consists in the employment of hollow metallic cylinders, arranged in such manner that steam may be applied to their interior surfaces for heating purposes; also, in the construction and arrangement of a double walled tank, having an interior chamber capable of receiving steam for heating the contained composition for roofing, and preventing the same from adhering to the inner surface of the tank and facilitating its flow to the paper or other material upon which it is to be laid.

*Claim*.—The employment of the double walled tank *c* in combination with the hollow metallic cylinders B and valves *p*, all being constructed and arranged to operate substantially as and for the purpose set forth.

No. 24,955.—JESSE PRUETTE, of Aurora, Ill.—*Improvement in Carriage Hubs*.—Patent dated August 2, 1859.—This invention consists in casting upon the but end of the box an annular flange with a concave recess formed on its inner surface, and driving it into the hub and screwing upon the opposite end of the box a metallic nut, having a flange upon its inner surface which projects into a corresponding cavity in the hub.

*Claim*.—The enlargement C upon box B, having an annular flange *a*, for the purposes specified, in combination with the nut F and its flange *b*, when the same are both arranged substantially as and for the purposes set forth.

No. 24,956.—LUMAN P. ROOD, of Deposit, N. Y.—*Improved Machine for Turning Hollow Ware*.—Patent dated August 2, 1859.—This invention consists in the use of a rotating mandrel, in connection with a slide, provided with a tool rest and cutter; the above parts being attached to a suitable bed, and the whole arranged so that the bodies of wooden vessels may be cut out from the solid wood.

*Claim*.—The combination of the rotating mandrel B with the adjustable slide F, provided with the tool rest G and cutter H, arranged as and for the purpose set forth.

No. 24,957.—ANDREW SHOGREN, of Chicago, Ill.—*Improvement in Sickle Guards for Harvesters*.—Patent dated August 2, 1859.—This invention consists in improvements in the

guard or fingers of reaping machines. The claim and engraving will give some idea of their nature.

*Claim.*—The cutter guard C, constructed in the manner described, in combination with the guard socket B and wedge shaped bolt D, substantially as described.

No. 24,958.—DANIEL C. SMITH, of Tecumseh, Mich.—*Improvement in Corn Huskers.*—Patent dated August 2, 1859.—This invention consists in so constructing a husking machine that it frees the corn from the silk at the same time that it frees it from the husk, and removes the husks from the machine after it has husked an ear of corn, while opening it to husk another.

The inventor says: I *claim*, first, the combination of forceps A, lever B, stop C, spring E, and post G, in the manner and for the purposes specified.

Second. I claim the combination, with the forceps A, of the slotted post M, nut N, and fork O, in the manner and for the purposes specified.

No. 24,959.—JOHN S. SNIDER, of Lancaster, Ohio.—*Improvement in Seeding Ploughs.*—Patent dated August 2, 1859.—This invention consists of an ordinary plough having a seed hopper, with discharge openings and slide at the bottom of it; also, a rod from the landside of the plough to the mould board, on which is hung a swinging frame containing a longitudinal crank shaft, the crank of which is inserted into a slot of the arm of the discharge slide, and having arms *a a*<sup>1</sup>.

*Claim.*—The arrangement of the swinging frame F, wheel W, crank shaft A, with the hopper H and mould board M, together with the devices connecting said parts, so as to operate as set forth.

No. 24,960.—GEORGE A. STANLEY, of Cleveland, Ohio.—*Improvement in Machinery for Moulding Candles.*—Patent dated August 2, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the moving of the moulds any distance lengthwise of the candles to detach the moulds from the candles formed in them, and to withdraw the moulds from the candles and place the jaws of the clutches around them.

Second. Moving the moulds by the weight of the moulds, and boxes containing the moulds, to adjust the jaws of the clutches to the candles, and attach the clutches firmly to the candles, so that they may be raised at the same time at which the moulds are returned empty to their first position

No. 24,961.—RICHARD A. STEWART, of St. Bernard Parish, La.—*Improvement in Apparatus for Defecating Sugar.*—Patent dated August 2, 1859.—A represents a horizontal cylindrical vessel or retort, nearly closed, within and along the bottom of which common limestone is burned, with a small supply of air, so that the product of combustion may be sulphurous gas instead of sulphuric acid, and the combustion may be slow and continuous.

*Claim.*—The combination of the retort, the vacuum cylinder, and the receiver, substantially in the manner and for the purpose set forth; and these I also claim, in combination with the steam boiler, substantially operating as described and for the purpose set forth.

No. 24,962.—H. W. STILLMAN, of Port Washington, Wis.—*Improvement in Brick Machines.*—Patent dated August 2, 1859.—This invention consists in the employment of a series of rotating moulds, provided with movable bottoms, operated by eccentrics, in connection with a feeder and resisting plate; the whole being arranged for joint operation.

*Claim.*—The combination of the revolving moulds D, feeder G, and plate I, when arranged and operated in the manner described and for the purpose specified.

No. 24,963.—SAMUEL TAGGART, of Indianapolis, Ind.—*Improvement in Flour Packers.*—Patent dated August 2, 1859.—This invention will be understood by an examination of the claim and engravings.

The inventor says: I *claim*, first, the oil pot H H, with cap G<sup>2</sup> G<sup>2</sup>, when operated in connection with the clutch wheel G and shaft D.

Second. The cam V, in combination with the barrel lifter T T, when constructed and operated as and for the purposes set forth.

Third. The combination and arrangement of the friction brake Q, rod K, walking beam C, packing shaft D, and barrel lifter T T, when the whole is combined and operated as and for the purposes set forth.

No. 24,964.—N. G. THOM, of Cincinnati, Ohio.—*Improved Machine for Pointing and Threading Wood Screws.*—Patent dated August 2, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, as a part of my invention, the combination of a rotating head containing two or more spindles or blank holders, revolving round a central point with an intermittent motion, with an apparatus for pointing and threading screw blanks, so

arranged and operated that while one blank is being pointed and undergoing the other operations necessary thereto, another blank is being threaded by another part of the same machine.

Second. I claim, in combination with an apparatus for pointing and threading screw blanks, simultaneously, or nearly so, by the same machine, the apparatus so constructed and operated that while the spindles are rotated, or changing positions, the threading cam or other device for operating the threading tool and its connections remains stationary, and when the motion of the spindles around the central point is arrested, the other part, and all necessary parts of the machine, recommence motion.

Third. I claim the spring brake  $C^2$ , so constructed and operated that when the spring is being depressed to withdraw it from the notch in the plate  $S$ , it acts as a brake upon the periphery of the plate  $T$ , to arrest its motion, and the parts connected with it, at the same time relieving the plate  $S$ , and allowing it to revolve with the spindles.

Fourth. I claim the quadrant shaped grooved arm, on the pointing tool stock, which, in connection with the spring  $i^1$ , or its equivalent, receives the blank from the hopper, and conveys it to the grippers, and supports it while being pointed, substantially as described.

Fifth. In combination with the quadrant, I claim the reciprocating motion of the hopper for the purpose of depositing the blanks in the quadrant, to be conveyed to the grippers.

Sixth. I claim the triangular grooved cam  $J J^1$ , in combination with the hopper  $L$ , so constructed that when moved in one direction by the action of the tool stock or otherwise, the hopper is depressed, and when moved in a contrary direction the hopper is elevated, for the purpose of depositing the blanks in the quadrant, or other mechanical device for receiving them.

Seventh. In combination with an apparatus for threading and pointing screw blanks by the same machine, I claim the worm  $F$ , when combined with the gears  $b c$  and  $e$ , or equivalent arrangement, by which the revolution of the worm causes the spindles to rotate round a central point, substantially as described.

Eighth. I claim the rocking feed levers  $o^1 o^2 o^3$ , constructed substantially as described, for the purpose of regulating the depth of cut of the threading tool.

Ninth. I claim the ratchet  $S$ , and revolving cam  $r$ , when combined with the feed lever, substantially as described, for the purpose of raising the cutting tool out of the thread, in its backward motion, and increasing the depth of cut of the threading tool.

Tenth. In combination with the rod for opening the grippers, I claim the movable nut  $u^1$ , which acts upon the thread in the edge of the rod  $Z$ , to withdraw the cone and release the screw.

Eleventh. I claim the traversing arm  $e^1$ , in combination with the spring lever  $f^1$ , or its equivalent, for the purpose of removing the screw from the grippers, when released.

Twelfth. I claim the sliding cam  $w^2$ , in combination with the threading cam, for the purpose of removing the screw from the grippers and releasing it, substantially as described.

Thirteenth. I claim the arm  $m^2$  on the threading tool stock, in combination with the threading tool and rod  $n^2$ , or its equivalent, for the purpose of giving the proper form to the thread, and curvilinear shape to the point of the screw.

Fourteenth. In combination with the spindles or blank holders, I claim the gears  $f^1 g^2 h^3$ , on the spindles, for the purpose of equalizing their motion and causing them to revolve round the shaft  $c$ , while changing their position, whether the driving belt rests or acts on one or both the spindles.

No. 24,965.—HORACE VAUGHN, of Providence, R. I., and WILLIAM HUTTON, of Baltimore, Md.—*Improvement in Lubricating Compounds*.—Patent dated August 2, 1859.—The inventors say: The manner of making this compound is as follows: Take a 40 gallon cask and put from 40 to 50 pounds of lime therein; pour into the cask soft water till the lime is nearly slaked; then put in one pound of sulphur and a half pound of soapstone, or a pound and a half of sulphur without any soapstone. The proportions of these compounds may be varied.

*Claim*.—The cooling compound solution, as described.

No. 24,966.—ALLEN WILSON and GEORGE C. FLETCHER, of St. Thomas, Mo.—*Improvement in Hemp Brakes*.—Patent dated August 2, 1859.—On each side of the framing  $A$ , a board  $c$  is placed obliquely, and between these boards the plates  $M M^1$ ,  $N N^1$ , and  $O O^1$  are placed. The rods  $d$  of the plates  $M N$  are connected to the cranks of the shaft  $I$ , while the rods of the plates  $M^1 N^1$  are connected to the cranks of the shaft  $L$ .

*Claim*.—The arrangement and combination of the plates  $M M^1$ ,  $N N^1$ ,  $O O^1$ , each pair of plates  $M M^1 N N^1$  moving in opposite directions, through the medium of double cranks upon shafts  $I L$ , as and for the purposes shown and described.

No. 24,967.—D. J. WILCOXSON, of Milan, Ohio.—*Improved Ship's Hoisting Apparatus*.—Patent dated August 2, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I claim, first, arranging the pawl and ratchet substantially as described, so as to allow the hoisting shaft to turn backward in lowering without disconnecting the pawl from the ratchet.

Second. Forming the connection between a friction pulley and hoisting shaft by means of a pawl and ratchet, substantially so that the friction pulley is only in connection with the shaft while lowering.

Third. The combination of the friction pulley, friction brake, and friction lever, arranged substantially as described, so that by the movement of the brake the friction pulley is released to revolve with the shaft, and power of the brake simultaneously applied to the pulley to regulate the velocity of the shaft in lowering.

Fourth. Combination of the vibrating pawl plates G, cam levers H, and the eccentrics, arranged as described, to give motion to the hoisting shaft.

No. 24,968.—WILLIAM F. WARBURTON, of Philadelphia, Pa.—*Improvement in the Manufacture of Hats*.—Patent dated August 2, 1859.—This invention consists in perforating hats by means of metal points heated to such a degree that as they pass through the material they will melt the stiffening with which the hats are prepared, thus making a clear opening which will not close on the withdrawal of the points, and leaving a strong edge to the orifice, thereby avoiding the weakening of the hat, which is the result of the perforations made by punches or by cold metal points.

*Claim*.—The process described of perforating the bodies of hats by means of heated metal points, for the purpose specified.

No. 24,969.—AUGUSTUS WATSON, of Walnut Run, Ohio.—*Improvement in Mole Ploughs*.—Patent dated August 2, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* suspending the coulter C to the lever D and guiding it between rollers, so that it may be raised or lowered independently of the beam or frame of the plough, substantially in the manner and for the purpose described.

I also claim making one or both of the beam plates G H adjustable, for the purpose of adjusting the position of the coulter, so as to give it the proper tip or inclination, substantially in the manner and for the purpose described.

I also claim, in combination with the beam plates and the coulter C, the grooved guide rollers *f g*, for the purpose of guiding the coulter in its vertical motion, and preventing any side or twisting motion of the same, substantially as described.

I also claim, in connection with the coulter and mole, the pivoted tongue *p*, substantially in the manner and for the purpose described.

I also claim, in combination with the coulter and the mole, the link P, whose ends are secured by a screw sleeve, for the purpose described.

No. 24,970.—ROBERT D. DWYER, of New York, N. Y., assignor to ABRAHAM B. SANDS and DANIEL SANDS, of said New York.—*Improvement in the Manufacture of Lint*.—Patent dated August 2, 1859.—In preparing this lint, the flax is first to be cut into suitable lengths by any suitable knife or chopper. It is then to be soaked in water of a temperature not to exceed 70° Fahrenheit, for some eight or ten hours, and in a wooden tub or other vessel of anti-corrosive character. From this vessel it is taken and submitted to a breaker. It is then submitted to the action of ley of wood ashes, at a temperature of 120° Fahrenheit, for ten hours; after which, it is washed in clear water, and then immersed in a bath of diluted pyroligneous acid; after this, the material is to be dried between steam heated rollers, and then carded, spun, and woven.

*Claim*.—The new article of manufacture described, being surgeons' lint, produced directly from new flax, in the manner substantially as set forth.

No. 24,971.—JOHN G. ERNST, of York, Pa., assignor to Himself and S. R. SLAYMAKER, of said York.—*Improved Machine for Bending Plough Handles*.—Patent dated August 2, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the employment or use of the form block H, fitted in the frame A, with the chain R attached, with or without the weight *c\**, in connection with the roller P, and the toothed segments *o o*, and stop N, the latter being attached to the bed K, in carriage B, the whole being arranged to operate as and for the purpose set forth.

Second. The arrangement of the lever *h*, connected with clutch *g*, the connecting bar *j*, and the lever *k*, attached to shaft G, in connection with the rod *h<sup>1</sup>*, and lever or button *i<sup>1</sup>*, substantially as shown, whereby the operation of the machine, so far as the gigging back motion is concerned, is rendered automatic throughout.

Third. The movable rack C, when adjusted and arranged substantially as shown, with the wheel F<sup>1</sup>, for the purpose of stopping the feed or forward movement of the carriage B.

No. 24,972.—JAMES A. HAMER, of Reading, Pa., assignor to Himself and NORRIS MARIS, of Kimberton, Pa.—*Improvement in Brick Moulds*.—Patent dated August 2, 1859.—This invention consists in so constructing and arranging, in relation to each other, the various component parts of a brick mould, that by means of a simultaneous action thereof the side boards M M may be moved apart, and the end boards A A, and mould partitions B B C, be withdrawn so as to disengage all the upright sides of the bricks from contact with

the side and end boards and partitions of the mould, preparatory to removing the latter from the bricks.

The inventor says: I *claim*, first, the construction, combination, and arrangement of the operating parts of the brick mould, substantially as set forth for the purpose described.

Second. The combination of the sides and partitions of the mould, operating substantially as and for the purpose described.

Third. The combination of the levers D D, with the arms F F, and pins, J J, for operating the sides and partitions of the mould, as and for the purpose set forth.

No. 24,973.—GEORGE L. JENCKS, of Providence, R. I., assignor to Himself, GEORGE KENDALL, and JOHN KENDRICK, of said Providence.—*Improvement in Sewing Machines*.—Patent dated August 2, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination in a single thread sewing machine of a perforated barbed needle, which is arranged obliquely to the feed movement of the cloth or material being sewed, with a pair of nippers or other equivalent device, which will, as the inclined needle is operating to assist in forming the stitch, retain and present the thread to the needle, in a manner to allow the necessary loop to be formed, shortened, and drawn into or tight on the cloth, substantially as and for the purposes set forth.

Second. The combination with a barbed needle of the spring nippers, thread guide, and adjusting nipper closing bracket, when constructed, arranged, and operating substantially as and for the purposes set forth.

No. 24,974.—DANFORTH JOHNSON, of Chicago, Ill., assignor to BENJAMIN B. WORDEN and WILLIAM CADWELL, of said Chicago.—*Improved Clothes Dryer*.—Patent dated August 2, 1859.—Into a base B is inserted a suitable standard, or spindle A, so as to turn freely therein. Upon this slides a collar E, and on the top is a socket cap D, which may be simply held in place by a screw, or pin g, but is allowed to turn round freely on the spindle. Both the cap and the collar are provided with eyes *d d* and *e e*, respectively, which are cast therewith, so that both cap and collar are each cast in one piece.

*Claim*.—The employment of flexible braces H H, in combination with the freely sliding collar E, on the spindles A, for the purpose specified.

No. 24,975.—WILLIAM JOHNSON, of Milwaukie, Wis., assignor to Himself and EIBERT SCHUMACHER, of said Milwaukie.—*Improvement in Bank Locks*.—Patent dated August 2, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, operating the regulator wheels or guard plates by the screw pins, which are susceptible of being changed in the holes of the plates, and in relation to each other, as set forth.

Second. I claim the tapered indicators, stem, and beveled plate of the stem, fitting into the tapered recesses, as and for the purposes set forth.

Third. In combination with a series of regulator wheels or guard plates, operated as described, I claim the means for indicating the position of such plates, constructed and arranged as set forth.

Fourth. I claim the cock wheel, or toothed disk, in combination with the tumbler and the regulator wheels or guard plates, as described.

No. 24,976.—ROBERT POOLE, of Baltimore, Md., assignor to Himself and GERMAN H. HUNT, of said Baltimore.—*Improvement in Casting Chilled Plates*.—Patent dated August 2, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—Making the chill for casting plates in sections, when said sections are secured to a bed plate in such a manner as to leave spaces between them, which are filled with sand or other yielding material, substantially in the manner and for the purpose described.

No. 24,977.—JOHN B. POWELL, of Philadelphia, Pa., assignor to Himself and GEORGE B. FRICK, of said Philadelphia.—*Improved Machine for Winding up Clocks*.—Patent dated August 2, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: Without confining myself to any specific arrangement of parts, I *claim* the spring lever D, spring pawl or catch C, and ratchet wheel B, with the supplementary lever H, and permanent pin *e*, or their equivalents, when applied substantially in the manner set forth, to the winding up of clocks, or other machines, in which a spring or weight is used as a prime mover.

No. 24,978.—H. O. AMES, of New Orleans, La.—*Improvement in Apparatus for Heating Evaporating Pans*.—Patent dated August 9, 1859.—This invention consists in a certain arrangement of the evaporating, supply, and escape steam pipes and their connections, whereby provision is made for heating all parts of the pan to a uniform, or very nearly uniform, temperature; the collection of the water of condensation to any extent in the evaporating pipes is prevented; all the connections of the pipes are brought outside of the pan.

*Claim*.—The arrangement of the parallel evaporating pipes D D, with their elbows and

collars and screw nozzles *a a*, passing through the bottom of the pan, and the parallel external supply and escape pipes B and C, with the nozzles *d d*, and union couplings *l l*, for making the connections with the nozzles *a a*, substantially as described.

No. 24,979.—JOHN ANDREWS, of Clinton, Mass.—*Improvement in Seeding Machines*.—Patent dated August 9, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The arrangement and combination of the vibrating bars or blocks *g*, frame *a*, axle *d*, cam *c*, and seed slide *n*, as set forth, whereby the cam which operates the harrow also moves the seed slide, and the harrow bars *g* have a horizontal vibration, and also a vertical play with the frame upon the axle *d*.

No. 24,980.—JOHN ANDREWS, of Clinton, Mass.—*Improvement in Seeding Machines*.—Patent dated August 9, 1859.—*a a a* represent the two side or bed pieces, and the cross piece in front of the harrow; *b b b* represent a series of joist or rectangular blocks, arranged parallel with each other, so as nearly to fill the space between the two side or bed pieces. The blocks are not brought close to each other, but are placed a short distance apart, and are made nearly the length of the side pieces, leaving a space between the cross piece on the front of the harrow and the ends of the blocks.

The inventor says: I *claim*, first, the arrangement and combination of the blocks *b*, circular plates *g*, teeth *f*, levers *u*, and seed sliders *p*, substantially as shown and described.

Second. The arrangement and combination of the covering apron *l*, bar *d*, blocks *b*, rod *y*, and lever *x*, as shown and described.

No. 24,981.—FRANCIS ARMSTRONG, of New Orleans, La.—*Improvement in Brakes for Railroad Cars*.—Patent dated August 9, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* making the adjustment from the pull or the coupling, when actuating on distinctly detached parts, namely: the latch *c* and tongues *t*, when constructed and operated as, or substantially as, described.

I also claim, in combination, the arms *n*, bar *r*, and levers *m*, when arranged and operated substantially as described and for the purpose set forth.

No. 24,982.—MOSES S. BEACH, of Brooklyn, N. Y.—*Improvement in Machinery to Feed Sheets of Paper to Printing Presses*.—Patent dated August 9, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, feeding sheets to the impression cylinders of printing presses by means of revolving arms or scrapers *a*, operating in combination with rollers *b*, in the manner substantially as described.

Second. Retaining the paper in connection with the impression cylinders of printing presses, during the process of printing, by means of holders *f* and *g*<sup>1</sup>, in the manner substantially as described.

Third. Detaching the paper from the impression cylinders by means of deflectors *p* and *q*, operating substantially as described.

No. 24,983.—GEORGE W. BEARD, of Canton, Miss.—*Improvement in Cotton Cultivators*.—Patent dated August 9, 1859.—This invention consists in combining, with two right and left turn ploughs, having their standards fixed in a laterally adjusting frame, peculiar shaped scrapers or cutters, which are made laterally and longitudinally adjustable on the mould boards of the ploughs, for acting on both sides of a ridge at a single operation.

*Claim*.—The peculiar shape given to the scrapers or cutters *J J*, and their lateral and vertical adjustment, in combination with the adjustable plough beams *C C*, when the same are all arranged in the manner and for the purposes set forth.

No. 24,984.—ELIJAH P. BEAUCHAMP, of Preston, Ga.—*Improvement in Cotton Seed Planters*.—Patent dated August 9, 1859.—The box 1 is attached to the rear end of the side pieces or frame 4. This frame is secured to the beam, as seen at 5, by a bolt, and is so constructed as to allow the beam 6 and stock 7 to move up and down freely between the side pieces. The wheel 3 carries the seed box clear of the ground, being arranged to run on each side of the furrow made by the plough.

*Claim*.—The arrangement of the box 1, axle 2, wheels 3, side pieces or frame 4, bolt 5, beam 6, stock 7, follower 8, furrow opener 9, and brace 10, as described, for the purposes set forth.

No. 24,985.—LAURENT BEAUDREAU, of Fond-du-Lac, Wis.—*Improved Shingle Machine*.—Patent dated August 9, 1859.—This invention consists in a novel combination and arrangement of means for regulating one saw so as to cut shingles alternately from each side of the bolt.

*Claim*.—The relative arrangement, for united operation, of the intermediate circular revol-

ing saw B, open reciprocating double carriage C,  $c c^1$ , toothed clamps G G<sup>1</sup>, bars H H, rollers  $m m^1$ , springs I I<sup>1</sup>, inclined or curved guiding plates  $n n^1$ , horizontal rocking cradles J J, cams  $r r^1$  and S S<sup>1</sup>, shafts  $t t^1$ , bars  $u$ , and hinged flaps or pawls  $v v^1 v^2 v^3$ , all substantially in the manner and for the purpose described.

No. 24,986.—PHILIP BETTLE, of London, England.—*Improvement in Watch Cases*.—Patent dated August 9, 1859; patented in England, November 18, 1857.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the attachment of the inner case, containing the movement of the outer case, by means of pins or pivots, so that the movement case can be turned over, to face the open or closed side of the outer case, without being removed from the outer case.

Second. Attaching the pendant handle to the movement case, so that it forms one of the centres or pivots on which the watch turns, in connection and combination with a pin or pivot on the opposite side of the case.

Third. The particular form and manner of constructing the pendant, and attaching the same to the inner or movement case before described and shown.

No. 24,987.—WILLIAM BILLINGHURST, of Rochester, N. Y.—*Improved Fishing Reel*.—Patent dated August 9, 1859.—This invention consists in so constructing the reel that when the line is wound up it shall form a ring instead of a cylinder, thus providing for its drying without unwinding the line and spreading it out, while at the same time the weight and cost of the reel are reduced.

*Claim*.—The combination of the skeleton ring R R R with the other parts of the reel, the whole being arranged in the manner and for the purpose substantially as set forth.

No. 24,988.—EDMOND BLANCHARD, of Greenfield Mills, Md.—*Improvement in Composts*.—Patent dated August 9, 1859.—The claim explains the nature of this invention.

*Claim*.—As a new article of manufacture, a fertilizing compost, composed of lime, chloride of sodium, wood ashes, charcoal, wheat bran, chimney soot, and gypsum, combined in the proportions and manner described.

No. 24,989.—E. BURROUGHS, of Rochester, N. Y.—*Improvement in Machines for Cutting Paper*.—Patent dated August 9, 1859.—This invention consists in the use of an oscillating reciprocating knife, arranged and operating in a peculiar way, and used in connection with a movable bed for adjusting the paper beneath the knife, and a clamp for holding the paper in proper position on the bed while being cut.

The inventor says: I *claim*, first, the employment or use of the reciprocating and oscillating knife G, when arranged to operate substantially as and for the purpose set forth.

Second. The knife G, in connection with the cone of pulleys T, attached to the shaft S, the hollow shafts  $y z$ , with their respective gearing  $a^1 h^1 h^1$  and  $a^2 i^1 j^1$ , and the shaft R, with its gearing  $v w$ , and the racks I I, attached to the knife bar F by the rods H H, the whole being arranged to operate substantially as set forth.

Third. The arrangement of the shaft U, with spring  $g^1$ , the arm  $f$ , cone of pulleys T, levers V W, rack  $l^1$ , substantially as shown, for the purpose of automatically changing the movement of the knife from a descending to an upward movement.

Fourth. The clamp formed of the vertical and horizontal plates  $p q$ , when arranged as shown, so as to be adjusted by the screw  $s$ , and pinion or worm wheel  $r$ , pinions  $u u$ , and racks P P, the latter serving in the capacity of both racks and guides, substantially as and for the purpose specified.

Fifth. Attaching to the shaft F an index  $b$ , arranged to move over a graduated stationary plate  $c$ , attached to the frame A, substantially as shown, for the purpose of enabling the operator to accurately adjust the paper beneath the knife.

No. 24,990.—JOHN T. CAMPBELL, of Rockville, Ind.—*Improved Adding Machine*.—Patent dated August 9, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the arrangement of a series of wheels provided with ten cogs or teeth, and carrying the ten numeric figures on their outward faces, in combination with the stationary plate containing like numeric figures arranged on the circle, surrounding each of the wheels in the series, substantially as described.

And in combination with the parts above claimed, arranged as described, I claim the stop bars Y Y, and spring slides G G, and oscillating arms or pawls F F, with the cam  $e e$ , the whole being constructed and arranged for joint operation, substantially as set forth.

No. 24,991.—WALTER CLARK, of Palmyra, Ohio.—*Improvement in Seed Planters*.—Patent dated August 9, 1859.—This invention consists in an arrangement of devices, which is made up of a series of pins on the wheel of the planter, in combination with a frame having an arm resting upon the pins on the wheel, and a swinging rod passing through the discharge opening in the hopper, so that by revolving the wheel the arm of the frame is

raised by the pin on which it rests, and it having passed, falls on the next, thus raising and lowering the frame and constantly keeping the rod in motion through the discharge, so as to prevent the seed from clogging the opening, and assisting its free passage therefrom.

*Claim.*—The arrangement of the reciprocating agitating rod *r*, when passing through the adjustable seed discharge opening in the side of the hopper, with the frame *F*, wheels *W*, pins *P*, teeth *a b c*, hopper *H*, and adjustable slide *S*, the whole being constructed as and for the purposes set forth.

No. 21,992.—W. COGSWELL and C. A. MATHEWSON, of Ottawa, Ill.—*Improvement in Corn Harvesters.*—Patent dated August 9, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The circular cutter *F*, and the reciprocating sickle *r*, with its stationary toothed plate *s*, in connection with movable bed, or fingers *I*, the whole being placed on a mounted frame, and arranged for joint operation substantially as and for the purpose set forth.

No. 24,993.—JAMES P. COONLEY, of Farmington, Mich.—*Improvement in Corn Planters.*—Patent dated August 9, 1859.—The seed is dropped in the usual manner from the roller *H* through the tooth *E*. This tooth is of peculiar construction, consisting of two tubes, one sliding within the other and connected together by the spiral spring *e* and pin *f*, which serves to prevent the outer tube *g* from turning on the other, and at the same time it is free to move upward as the spring is compressed by pressure from beneath, by means of the slot *h*.

*Claim.*—The arrangement of seeding roller *H*, gear wheels *d d*, slide plate *I*, levers *c*, adjustable teeth *E*, coverers *F*, and tracking gauge *M*, constructed and operated substantially as and for the purposes set forth.

No. 24,994.—B. T. CURRIER, of Bath, Me.—*Improvement in Corn and Cane Harvesters.*—Patent dated August 9, 1859.—This invention is more particularly intended for cutting the stalks of the sugar cane, which from the peculiar character of the stalk require to be held steady and firm while being cut. For this purpose, says the inventor, I construct a suitable frame *A*, mounted upon wheels, and having a cross piece *B* fixed to the front of this frame, in the centre of which piece are two scythe shaped cutters *B*<sup>1</sup>, pivoted together like a pair shears at *a*, and secured to the piece *B* by a nut *C*.

*Claim.*—The arrangement and combination of the scythe shaped cutters *B*<sup>1</sup> *B*<sup>1</sup>, rods *D* *D*<sup>1</sup>, cranks *E* *E*<sup>1</sup>, adjustable frame *J*, and standards *A*, as and for the purposes shown and described.

No. 24,995.—EDWARD DAVIDSON, of Batesville, Ark.—*Improvement in Hoop Fastenings for Cotton Bales, &c.*—Patent dated August 9, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—Forming the socket of two parts to admit of the same being opened to receive the bent or doubled and lapped ends of the bale hoop, and closed to secure the ends of the hoop together, substantially as and for the purpose specified.

No. 24,996.—ALVAH GOODRICH DE WOLFE, of Seymour, Conn.—*Improvement in Vulcanized Gums.*—Patent dated August 9, 1859.—*A A* is the body of the mould, *B B* the cavity for receiving and pressing the rubber article, previously dusted over with the vulcanized rubber; *C C* are ears to aid in clamping the moulds together during vulcanization.

*Claim.*—The use of pulverized, vulcanized rubber, gutta percha, or other vulcanized gum, in the manner and for the purpose specified.

No. 24,997.—CHARLES S. DICKINSON, of Cleveland, Ohio.—*Improvement in Centrifugal Guns.*—Patent dated August 9, 1859.—This invention consists in constructing and arranging the several parts together for the purpose of discharging balls from the barrel of a centrifugal gun.

The inventor says: I *claim*, first, the employment of lever *C*, provided with a collar which surrounds the shaft *B*, pivoted or hinged at *x*, and provided with a pin or rod *I*, when the same is used, substantially as and for the purpose specified.

Second. Operating lever *C*, in one direction, by means of rod *D* and its connections through the centre of the shaft *B*, and in the other direction by means of spring *F*, for the purpose of discharging the balls from the barrel at the proper time, substantially as set forth.

No. 24,998.—RUDOLPH DIRKS, of Philadelphia, Pa.—*Improvement in Seats for Sleeping Cars.*—Patent dated August 9, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the cushioned platform *E* and the frame *F*, with its detachable cushion *f* and movable legs *h* in combination with the permanent partitions *D D*, the said platform and frame being hinged together and otherwise arranged, as set forth.

Second. The boards G and K, adapted to and sliding in or against the partitions D D, and arranged as specified, so as to form the foot and head boards for the couches.

Third. The frame H, as hinged to the side of the car, and the frame I so hinged to the frame H that both frames may assume the positions illustrated in Figs. 1 and 2, in combination with the partitions D D and their sliding frames G.

Fourth. Forming the upper couch of the board L hinged to the side of the car, and one or more boards M hinged to the board L, when arranged as set forth, in combination with the permanent partitions D D.

No. 24,999.—ZACHARIAH FEAGAN, of Palmyra, Mo.—*Improvement in Hemp Brakes.*—Patent dated August 9, 1859.—This invention consists in an arrangement and combination of stationary bars, under which the hemp is introduced, finger guards for preventing the forward motion of the hemp, vibrating spring levers for breaking the hemp, and cams for operating said spring levers.

*Claim.*—The arrangement and combination of the stationary bars L L, finger guards O O, vibrating spring levers E E, and cams D D, the whole being constructed and operated substantially in the manner and for the purpose set forth.

No. 25,000.—ANDREW DOUGHERTY, of Brooklyn, N. Y.—*Improvement in Printing Presses.*—Patent dated August 9, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the combination of the inking apparatus at the side of the main cylinder of a press, with a carriage that can be moved from and towards the main cylinder and with a stop that controls the position of the carriage; the combination, as a whole, operating substantially as set forth.

No. 25,001.—ALBERT EAMES, of Bridgeport, Conn.—*Improved Die for Swaging Bolt Heads.*—Patent dated August 9, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* making dies for swaging bolt heads and other articles in two or more parts, the parts forming the bottom being fitted to and in the part forming the periphery, substantially as described, and the whole fitted to and secured within the drop, or equivalent therefor, as set forth.

And I also claim, in combination with the die, the bottom of which is made separate from and inserted in the part forming the periphery, grooving the periphery of the part forming the bottom for the escape of air, substantially as described.

No. 25,002.—J. P. EMSWILER, of Knight's Town, Ind.—*Improvement in Sewing Machines.*—Patent dated August 9, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim* the combination of the slide M, or its equivalent, arranged substantially as described, with the feeding mechanism, for the purpose of adjusting the bed to the feeding mechanism for materials of various thicknesses, without changing the position of the feeding mechanism.

And I also claim, in combination with the bobbin, arranged as described, to vibrate on the shuttle, the longitudinal arched pressure spring, arranged substantially as described for the purpose set forth.

No. 25,003.—MOSES G. FARMER, of Salem, Mass.—*Improvement in Windlasses.*—Patent dated August 9, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim* the combination of the roller A, the ratchet wheel B, the retaining ratchet F, and the actuating ratchet D, with the lever C and toggle joint E, so arranged that the thrusting power of the toggle joint E shall be wholly exhausted, when the lever C is fully depressed, and the joint E brought into a straight line, which intersects the axis *l*, and the point of the actuating ratchet which is in contact with a tooth of the wheel B.

I claim the means described of permitting the backward motion of the roller A, viz: by causing the motion of the lever C to release alternately the actuating and retaining ratchets through the agency of such means as the springs K, the projecting arms L M, and the proper position of the collar J, substantially as described.

No. 25,004.—CHESTER N. FARR, of Philadelphia, Pa.—*Improvement in Sewing Machines.*—Patent dated August 9, 1859.—This invention relates to the manner of adjusting and controlling the motions of a looper which enters the loop of a needle thread, and then crosses the needle's path when the needle has risen, so that on the needle's again descending it takes a loop of second thread on the opposite side of the looper, and the said looper, retiring, drops the loop of the needle thread around the loop of the second thread, and then moves laterally, and again passes on the other side of the needle and takes a loop, and proceeds as before.

The inventor says: I *claim* the arrangement of the fulcrum slide *r*, stops *q* and *s*, and loop-bar *p*, for regulating and adjusting the motions of the looper, as set forth.

And in combination with said looping bar, adjusted as described, I claim the rocking lever *o*, fitting and acting as specified.

No. 25,005.—BENAIHA FITTS, of Worcester, Mass.—*Improvement in Governor Valves*.—Patent dated August 9, 1859.—This invention consists in the peculiar manner of mounting the valve, so as to dispense with the use of stuffing boxes, whereby the resisting action of pressure of steam and of friction upon the valve is diminished.

*Claim*.—The manner of mounting the valve, substantially as described, that is to say, resting or supporting the valve, as shown at M, and retaining it into its seat, as shown at N, for the purposes set forth.

No. 25,006.—PARLEY F. FREELAND, of Newark, Ill., assignor to V. R. DAVID, of Morris, Ill.—*Improvement in Cultivators*.—Patent dated August 9, 1859.—The object of this invention is to obtain a cultivator which may be made to answer equally well for eradicating weeds and pulverizing the soil and for hilling, or earthing up plants; an instrument that may be used for general work in the cultivation of what are generally termed "hoed crops," or such as are grown in hills or drills.

*Claim*.—The arrangement of the tongue A, curved or segment bar B, beams E E, with screw rod *c*, and pendants *d*<sup>1</sup>, and shares F, attached, substantially as and for the purpose set forth.

No. 25,007.—EDWIN GOMEZ, of New York, N. Y.—*Improved Apparatus for Folding or Wrapping Papers*.—Patent dated August 9, 1859.—From the folder *f* the paper passes into the first twister *i*, which is composed of a piece of sheet metal bent into a U shape and having a compound twist, so that the folded edge of the paper entering horizontally comes out vertically, or nearly so, and proceeds to the second folder and then to the second twister, and so on until the desired number of twists or folds are obtained.

*Claim*.—The folders *ff*, formed with the lips 4 4, and volutes 3 3, in combination with the intermediate twist-ers *i i*, in the manner and for the purposes specified.

No. 25,008.—GEORGE P. GORDON and F. O. DEGENER, of New York, N. Y.—*Improvement in Printing Presses*.—Patent dated August 9, 1859.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, combining with the tympan frame the sheet-holding and relieving nippers or grippers, for the purpose of holding the sheet, and for relieving the sheet from the type.

Second. We claim the combination of a cylinder, or segment of a cylinder, with its wheel bearers, the impression cylinder, roller pendants, and the racks or gearing.

Third. We claim the frictionless roller, or its equivalent, in combination with the tympan frame, for the purpose of closing the tympan and properly laying the sheet upon the form in advance of the passage of the impression cylinder or its equivalent.

Fourth. We claim operating the sheet-holding and relieving grippers by or through the motion of the tympan.

Fifth. We claim attaching a tympan frame to an adjustable bed in such a manner that they, at all times, shall retain their relative positions towards each other, in the manner described.

Sixth. We claim hanging, hinging, or attaching the inking apparatus to the frame of the press, or to the press, in such a manner that it may be turned, swung, or set aside, so as to allow the workmen to get at the form to make any necessary alterations, or to make the form ready, or for the purpose of using the bed as a imposing stone.

No. 25,009.—RALPH GREENWOOD, of Altoona, Pa.—*Improvement in Fire Boxes for Locomotive Engines*.—Patent dated August 9, 1859.—This invention consists in the use of a "midfeather," or water chamber, placed directly over the fire, and provided with a plurality of small flues, which form a communication between the fire box and a gas chamber above, into which, as well as into the fire box below, air is admitted through hollow stay bolts at the sides and end of the boiler.

The inventor says: I *claim* the midfeather C, when used in connection with a gas chamber D and fire box A, provided with openings *e f g h*, the parts being arranged relatively with each other to operate substantially as and for the purpose set forth.

I further claim the cylinders E F, when applied to the orifices of the gas chamber and fire box and connected by a lever G, to operate simultaneously as and for the purpose set forth.

No. 25,010.—LEONARD B. GRISWOLD, of Pennfield, N. Y.—*Improvement in Potato Diggers*.—Patent dated August 9, 1859.—This machine is drawn by a team, the truck wheels passing in the space between the rows, and the fork operating directly on the row. It can be raised or lowered on the spindle, by means of a nut *c* and washers *a*, to work deep or shallow, as the nature of the soil and the position of the tubers require. The forward prongs *d* enter the ground, raising the potatoes from the earth and carrying them by its revolving motion to the gutter on one side, where they are deposited and left on the surface.

*Claim.*—The employment of a rotating head or disk, having teeth or spurs arranged around an upright shaft in a direction oblique to the axis thereof, in combination with the truck B and driving wheels G F, or their equivalents, for giving the required motion, substantially as and for the purpose set forth.

No. 25,011.—W. D. HARRAH and B. S. BALDWIN, of Davenport, Iowa.—*Improvement in Seed Planters.*—Patent dated August 9, 1859.—This invention consists in certain peculiar arrangements of mechanism of a seed drill, whereby the accurate disposition of seed in rows is secured; and at the same time the operation of the machine is facilitated.

The inventors say: We *claim*, first, the combination and arrangement of the peculiarly constructed hopper F  $f f^1 f^2 f^3$ , regulating plate G, sliding frame H, slides  $h^2$ , pitman  $b$ , edged leading wheels B, hinged seed tubes I, grooved covering wheels C C, foot lever J, caster wheel D, and hand lever K, all substantially as and for the purpose described.

Second. In combination with the hopper F, the arrangement of the foot lever J and hinged bar  $i$ , when the latter is so hinged as to throw the points of the seed tube forward in their adjustment, or when the foot lever is depressed, substantially as and for the purpose described.

No. 25,012.—ROBERT S. HARRIS, of Galena, Ill.—*Improved Water Gauge for Steam Boilers.* Patent dated August 9, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The within specified manner of constructing and attaching the float stem to the boiler, whereby it is made to answer for carrying the float and as an index for indicating the height of the water in the boiler, and, if desirable, as a trip for opening a valve for an alarm whistle, all in the manner and for the purpose described.

No. 25,013.—JAMES HARRISON, jr., of New York, N. Y.—*Improvement in Sewing Machines.* Patent dated August 9, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the switching lever  $n$ , constructed and operated as set forth, for directing the thread to the beard or barb of the needle, and preventing the escape of the thread therefrom.

Second. I claim controlling the feed and the stitch by the raising or lowering of the needle, as set forth.

Third. I claim rotating the needle and carrying with it the thread, thus forming a twisted threaded loop, as described.

No. 25,014.—GEORGE R. HAY, of Berea, Ohio.—*Improved Machine for Cutting Out Wooden Ware.*—Patent dated August 9, 1859.—The saw is revolved by means of a pinion having short pointed teeth which fit into the holes I in the saw H. This pinion is supported by a cross bar M extending across the inner portion of the semi-circular groove J. The pinion L is revolved by means of the pulley N upon the shaft of said pinion. As all these parts are attached to the shaft K, if this shaft is rotated, the saw and pinion are rotated with it.

*Claim.*—The rock shaft K, in combination with the hoop saw H, constructed and arranged as described, and operated by means of the pinion L, in the manner and for the purpose substantially as set forth.

No. 25,015.—JAMES HAYNES, of Hollis, Me.—*Improved Wood Saw Frame.*—Patent dated August 9, 1859.—The inventor says: In this invention, an inclined plane ratchet is fastened to the outer edge of the lower piece of the frame, at the bottom end, having a slot in it corresponding with the slot in the piece to which it is attached. This ratchet piece is thinner at the lower end and grows considerably thicker as it extends up, so as to form the inclined plane of sufficient increase in giving additional strain to the saw as the setter or strainer is advanced up a notch in straining the saw.

*Claim.*—The inclined plane, ratchet, and the nipper or strainer, applied to the saw and frame, as described and represented in the drawing accompanying these specifications.

No. 25,016.—STANISLAS HOGA, WILLIAM PETER PIGGOTT, and SEPTIMUS BEARDMORE, of Middlesex county, England.—*Improved Mode of Generating and Applying Electric Currents in Telegraphing.*—Patent dated August 9, 1859.—This invention consists in transmitting the electric current directly through and by means of the earth or natural body of water, using the line wire only for the return current.

*Claim.*—The application to telegraphic instruments of currents of electricity, produced from metals or substances arranged in the earth, or in natural bodies of water, in the manner and for the properties and relations described.

No. 25,017.—ROBERT HOOPER, of Baltimore, Md.—*Improvement in Steam Boilers.*—Patent dated August 9, 1859.—The nature of these improvements is explained by the claim and engravings.

The inventor says: I *claim*, first, contracting that part of the boiler immediately above the fire flues, in combination with the widening and extending of that part which is beyond or in the rear, and above the end of the fire box, substantially as and for the purposes set forth.

Second. Forming a water circulating passage below, in rear, and above the fire box, and nearly or wholly isolating said passage from the fire box, by means of a large space existing between the fire box and the partition walls of the said water circulating passage, substantially as and for the purposes set forth.

No. 25,018.—ANTHONY ISKE, of Lancaster, and JACOB B. ERB, of Conestoga township, Pa.—*Improved Approach Opening Gate*.—Patent dated August 9, 1859.—In this invention two sills *c c* are laid across the road; between those sills is the iron rail *D*; the hinged platforms *G* are connected to one end of the lever *J* by the pieces *H*; the lever has its fulcrum at *I* under the sills; the other end has a rod *K* hinged to it and connected with the projecting arm *o* on the top of the rear slat *Q* of the gate.

*Claim*.—The arrangement of the platforms *G*, uprights *H*, to the lever *J*, with the connecting rod *K*, attached to the arm *O* on the slat *Q*, the groove *b* on the inside of the post *B*, for operating a series of cross slats, connected by pivots to the slats *Q R*, as shown when combined in the manner set forth, or substantially the same.

No. 25,019.—JOHN W. KINGMAN, of Dover, N. H.—*Improvement in Machines for Milking Cows*.—Patent dated August 9, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the teat cups or tubes, partially covered at their upper ends, with an elastic flange, substantially as described, which will yield for the insertion of the teat, and gripe it so as to hold the cup upon the teat during the process of milking, and form a packing between the edge of the cup and the teat, which will be pressed against the teat by the external air when the internal air is exhausted; and, in combination with the device above claimed, I claim a vessel provided with an air pump, and connected with said cup or cups by flexible tubes, so arranged as to exhaust the air and draw the milk from the cow or other animal, substantially in the manner described.

No. 25,020.—EBENEZER A. LESTER, of Boston, Mass.—*Improvement in Railroad Car Wheels*. Patent dated August 9, 1859.—This invention consists in a peculiar manner of attaching the wheels to their axle so that an independent motion is given to each wheel, while both have a secure and durable attachment to their axle.

*Claim*.—Attaching the wheel *D* to its axle, by means of the auxiliary hub *E*, with its recess *f*, and groove *e*, and the segmental ring *H*, or its equivalent, connected with the wheel, in the manner substantially as set forth.

No. 25,021.—THEODORE LIPSHUTS and DANIEL C. JONES, of Balston Spa, N. Y.—*Improved Self Acting Battery for Scaring Crows, &c.*—Patent dated August 9, 1859.—This invention consists in arranging a rising and falling box in such relation to a revolving battery that the same when it is filled with sand sinks down and causes a hammer to discharge one of the chambers of the battery, and the box itself is so arranged that its contents are discharged as it strikes the ground, so that it is raised by the action of weights ready for a new charge and ready for renewed action.

*Claim*.—The rising and falling box *K*, arranged with the slide *g*, and apertures *p*, and operating in combination with the dog *J* and pulley *E*, substantially in the manner and for the purpose specified.

No. 25,022.—SAMUEL W. LOWE, of Philadelphia, Pa.—*Improvement in Machines for Milking Cows*.—Patent dated August 9, 1859.—This invention consists in providing a cup on which is stretched a diaphragm perforated with holes for receiving the cow's teats, and also adapted for being connected with an air pump in any suitable manner.

*Claim*.—The cup *A*, with the perforated diaphragm *B*, when constructed as described, to receive all the teats of the cow's bag, by having an opening in the diaphragm for each teat, and combined with an exhausting apparatus, constructed substantially as described and for the purpose set forth.

No. 25,023.—MOSES MARSHALL, of Lowell, Mass.—*Improved Device for Making Electro-Magnetic Currents Constant or Intermittent*.—Patent dated August 9, 1859.—This invention consists in obtaining both the single and double electric current in the same machine, and changing it from the double to the single, or from single to the double.

*Claim*.—The spring *g*, so constructed and arranged as to be insulated from or connected to the two ends of the helical wires by springs *l* and *k*, or otherwise, essentially in the manner and for the purposes fully set forth.

No. 25,024.—W. McELWEE, of Shelbyville, Ind.—*Improved Kitchen Safe*.—Patent dated August 9, 1859.—This invention consists in mounting the body of the safe upon hollow

posts extending from the floor to the top of the same, provided with water cups near the bottom of each leg, and perforated so as to form a communication of the external air with each compartment of the safe.

*Claim.*—The combination and arrangement of hollow posts B with water cups D, arranged in the manner and for the purpose specified.

No. 25,025.—E. McKENNEY, of Montgomery, Ohio.—*Improvement in Seeding Machines.*—Patent dated August 9, 1859.—This invention consists in arranging the distributing disks in combination with check valves and with a bell hammer in such a manner that the time when the check valve opens and when the corn is deposited on the ground is indicated by a stroke of the hammer against the bell.

*Claim.*—The arrangement and combination of the distributing disks L, levers N, check-valves *q*, and buttons *u*, to operate together with the hammer *o* and with the bell M, substantially as and for the purposes set forth.

No. 25,026.—J. B. McMILLAN, of Tipton, Ind.—*Improvement in Seed Planters.*—Patent dated August 9, 1859.—This improvement relates to that class of machines which deposit seed in rows and in hills of any required distance from each other. The machine is constructed in the general form of a cart.

*Claim.*—The planting and covering apparatus, when constructed and arranged in the manner and for the purposes set forth.

No. 25,027.—ADAM MILLER, of Mount Pleasant, Iowa.—*Improvement in Underground Draining Machines.*—Patent dated August 9, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—The combination and arrangement of the mole with the drain protectors, as described, for the purpose of expeditiously and economically giving protection to the upper part of the ditch, and of disengaging the protectors from the mole plough with facility after they are laid.

No. 25,028.—ALEXANDER MILLER, of Newbern, N. C.—*Improvement in Drivers for Millstones.*—Patent dated August 9, 1859.—This invention consists in having a friction roller attached to each end of the driver at opposite sides, and having steel plates fitted in the eye of the stone to form durable and plane bearing surfaces for the rollers.

*Claim.*—The employment or use of the friction rollers B B applied to the driver A, in connection with the plates C C, or their equivalents, fitted in the recesses adjoining the eye of the stone or runner, for the purpose of forming proper bearing surfaces for the rollers, the whole being arranged substantially as and for the purpose set forth.

No. 25,029.—SAMUEL C. MOORE, of Providence, R. I.—*Improvement in Hoops for Skeleton Skirts.*—Patent dated August 9, 1859.—This invention consists in an improved hoop made of thin sheet metal, corrugated so that the folds or wrinkles run lengthwise of the strip of metal forming the hoop.

*Claim.*—The corrugated sheet metal hoop for ladies' skirts described, as a new article of manufacture.

No. 25,030.—OLIVER P. MORAN, of Haynesville, Mo.—*Improved Device for Holding Together the Panels of Portable Fences.*—Patent dated August 9, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The arrangement of the notched projections or projecting pieces of the upper and lower rails in combination with the right angled notches *i i*, in the end battens, substantially in the manner and for the purpose specified.

No. 25,031.—SAMUEL MOWRY, of Wornelsdorf, Pa.—*Improvement in Cultivators.*—Patent dated August 9, 1859.—A is the tongue or draft piece, B the wheels, B<sup>2</sup> the seat, C a wheel connected with the hub of the wheel working the pinion C<sup>1</sup>, for the purpose of working the wheels D D, which give motion to the seed regulations F, attached to and at the bottom of the box E.

*Claim.*—The arrangement of the axles B<sup>3</sup>, wheels B, stretch bars L, levers H, I, and L<sup>3</sup>, frames M, wheel C, ratchet bar J, and cultivator bar P, the whole being constructed as described and set forth.

No. 25,032.—A. A. MOSS, of Philadelphia, Pa.—*Improvement in Hydro-Carbon Vapor Apparatus.*—Patent dated August 9, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The steam generator A, and dryer E, in combination with a distinct hydro-carbon vaporizer C, the same being also connected with the retort D, and the whole arranged together so as to generate the steam and hydro-carbon vapor separately, and for their subsequently mingling and combination, substantially in the manner and for the purpose described.

No. 25,033.—MATTHEW MITCHELL, of Alton, Ill.—*Improvement in Corn Planters*.—Patent dated August 9, 1859.—This invention consists in the arrangement and combination of the parts of a seed planter, designed to plant sod ground by cutting through and depositing the seed under the sod, or to plant in old and mellow ground.

*Claim*.—The arrangement of the frame B, seats E and G, hoppers H, shoes S, and cutters N, with the device for operating them, in combination with the frame K hung on the axle D, and with the slides operated as described, the whole being constructed and arranged substantially in the manner and for the purposes set forth.

No. 25,034.—DON J. MOZART, of Yellow Springs, Ohio.—*Improved Arrangement of Dead Beat Escapements*.—Patent dated August 9, 1859.—In the engravings a wheel D gears into the pinion *p* of the scape wheel E, the said wheel may be the main wheel of the movement, the ratchet wheel *s*, for winding up, may be on the axis or spindle *b* of the scape wheel. The crescent scapers G G have counter plates G<sup>1</sup> G<sup>1</sup> to receive the opposite journals of the pallet rollers *f f*, and the counter plates are secured to the pivots *d d*, on which the scapers vibrate to keep them in place.

*Claim*.—The improved arrangement of the double “scapers” G G, with the star scape wheel E, or its equivalent, substantially as and for the purposes specified.

No. 25,035.—EDWARD NORTON, of Boston, Mass.—*Improvement in Skates*.—Patent dated August 9, 1859.—This invention consists in making the heel and toe straps for securing the skate to the foot of sheet metal, which are secured tightly to the foot by a peculiar fastening.

*Claim*.—The metal straps D and E, and the slotted plates J, and screw G, for tightening the skate to the foot, substantially as shown.

No. 25,036.—MARCUS P. NORTON, of Troy, N. Y.—*Improvement in Post Marking Stamps*.—Patent dated August 9, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The blotter J, connected or attached to the main part of any “post office post marking stamp,” for the purpose of cutting and inking, blotting and effacing, so as to successfully cancel the frank or postage stamp of any letter or any package at the same time and operation of making upon such letter or package the name of any post office, the year, the month, and the day of the month, substantially as and for the purpose set forth.

No. 25,037.—LEONARD PACKARD, of Galesburg, Ill.—*Improvement in Cultivators*.—Patent dated August 9, 1859.—To the plough beams are attached four arms S, one on each side of the beam, to which the blades T are fastened in a diagonal position right and left, so that by changing them they will turn the soil to or from the grain. To the arms, and near the steel blades T, are braces W, running up and forward to the beams that hold the blades in a proper position. The blades T may be made in a diamond or shovel form.

*Claim*.—The arrangement of the beams P, the irons Z Z<sup>1</sup>, and the projection X, on the ends of the beams, the adjustable arms S, braces W, blades T, lifting rods 1, adjusting bar 3, levers 5, fulcrum 6, and hinged pole L, as described, for the purpose set forth.

No. 25,038.—J. J. PARKER, of Marietta, Ohio.—*Improved Egg Beater or Churn*.—Patent dated August 9, 1859.—This invention consists in making a tube of tin, or any other metal, of any desired size or height, with a piston head neatly fitted in it, with a rod attached so as to move the piston up and down, in the manner of a pump, by means of a crank or handle attached to the rod.

*Claim*.—The tube A, in combination with the band C and grated bottom M; all constructed, arranged, and operating substantially in the manner described.

No. 25,039.—HORACE PARKHURST, of De Kalb, Ill.—*Improved Clothes Frame*.—Patent dated August 9, 1859.—This invention consists in constructing the frames in such a manner that, when closed, they occupy less space in every direction than most other clothes racks, so that they may be set away in the most compact form; also, with intervening posts to break the length of line, whereby they are enabled to hold the largest articles spread out.

*Claim*.—The combination and arrangement of the standards A, the rails B, the head blocks C, the clasps E, the cords F, substantially as and for the purpose specified.

No. 25,040.—DUBOIS D. PARMELEE, of New York, N. Y., assignor to JOHN A. GREEN, of Beverly, Mo.—*Improvement in the Mode of Uniting Solid Substances*.—Patent dated August 9, 1859.—The claim explains the nature of this invention.

The inventor says: I *claim* the method and process described of uniting various substances or bodies of the same or different character and properties, by the interposition between the surfaces of said substances or bodies to be united, of one or more sheets or layers of India rubber and gutta percha, separately, or when combined with the substances, such sheets or layers having previously been treated in the manner described, to produce the change specified; whereby, on completion of said change, a water proof cement is obtained, which, while it possesses the requisite rigidity and coherence to keep the bodies firmly and strongly

united, possesses a sufficient degree of elasticity to compensate for the expansion or contraction of the fibres of the bodies, for the purposes substantially as set forth.

No. 25,041.—LAWSON G. PEEL, of Webster county, Ga.—*Improvement in Corn Planters*.—Patent dated August 9, 1859.—A is the hopper; B, a wheel; C, a cylinder attached firmly to the shaft of wheel B. This cylinder revolves on the bottom of the hopper, and contains a depression of capacity sufficient to supply seed to each hill, which it deposits in the furrows made by the plough at each revolution of wheel B. D is a frame, composed of two side pieces.

*Claim*.—The arrangement of the beam F, stock E, frame D, bolt *a*, hopper A, wheel B, and cylinder C, as described, for the purposes set forth.

No. 25,042.—COLWELL P. POOL, of New Market, Ala.—*Improvement in Filing Cotton Gin Saws*.—Patent dated August 9, 1859.—This invention consists in arranging, in a common file case, a series of files in suitable sockets, in such a manner that a reciprocating as well as an oscillating motion can be given to the files, and that, when the same are brought in the proper relation to the saws of a gin cylinder, the teeth of the several saws may be scored by one and the same operation, and also whetted and rounded, so that it is not necessary to go through the same operation for every single saw.

*Claim*.—The arrangement of the file case B with the file holder *b* and sleeves *b*, to operate in combination with the bar C and with the slide E and ridge *e*<sup>1</sup>, substantially in the manner and for the purpose specified.

No. 25,043.—WILLIAM F. PRATT, of Bristol, Pa.—*Improvement in Sewing Machines*.—Patent dated August 9, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The construction of the thread case with an angular projection *j* extending across its centre, and the construction of the slide ring or its equivalent, with a similar angular projection *l* fitting to the said projection *j*, as described, and operating in combination therewith in the manner substantially as specified, not only to prevent the twining of the thread case, but to check and control the loops in their passage over said case, thereby avoiding the use of separate thread controlling apparatus.

No. 25,044.—JAMES M. QUIMBY, ALBERT H. BROWN, GEORGE H. RENTON, and JAMES CRISWELL, of Newark, N. J.—*Improved Furnace for Making Iron Direct from the Ore*.—Patent dated August 9, 1859.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim* the arch K, the hopper damper E, the rods or bars *o o o o*, arranged and operated substantially as described in the drawings.

We also claim the dampers at the bottom of the tubes for discharging one or more tubes at the same time into one box or hopper, as shown.

No. 25,045.—JOHN B. READ, of Cold Spring, N. Y.—*Improvement in Apparatus for Tanning*.—Patent dated August 9, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* an improved apparatus for tanning and other purposes, said apparatus consisting of one or a number of smooth porous or perforated surfaces of wood, or other fixed material, placed singly or in succession in open or closed vats or vessels, or arranged in pairs so as to form closed hollow cases, upon which skins or other substances to be operated upon are to be smoothly stretched, and then the tannin or other fluids forced through them by hydrostatic or other pressure into the interior, whence means of escape are provided, as described.

I claim, also, the use of tarpaulin sheet metal, or other waterproof substances in form of sheets, to cover over the perforated parts of the cases not overlaid by the skins, &c., that the fluids used may be afforded no passage except by percolating through the skins, &c.

No. 25,046.—CHARLES A. ROBBE, of Augusta, Ga.—*Improvement in Gas Retorts*.—Patent dated August 9, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—A gas generating chamber of a retort, made in two parts, when the said parts are constructed so as to lock together and form a tight joint by the simple act of sliding one portion into gear with the other, substantially as set forth.

No. 25,047.—THEODORE B. ROGERS, of Wetherfield, Conn.—*Improvement in Seed Planters*.—Patent dated August 9, 1859.—This improvement consists in so constructing and operating parts of seed planters, that the operator is enabled to sow and drop various kinds and sizes of seed, in drills or at any desired intervals; also, to cut the seed when it is larger than the ordinary size (the potato, for instance,) while the machine is in operation; also, forming the drill, covering it up again as the seed is planted, and marking off the ground on the right or left for the return of the row or drill, by the use and arrangement of the devices in this machine.

*Claim.*—The arrangement of slides I I<sup>1</sup> I<sup>2</sup>, lever L, former G, floats H, adjustable pins E, and markers R, as described, for the purpose set forth.

No. 25,048.—JAMES RUE, of Englishtown, N. J.—*Improvement in Cultivators.*—Patent dated August 9, 1859.—The draft animals are hitched to the bolt *h*, and the front end of the pole is secured to a cross bar resting on the necks of the animals, and as long as the rear of the pole is confined to the guide rods H by the pin *g*, the front ends of the shares will be raised from the ground, and the cultivator can be drawn from place to place.

*Claim.*—The arrangement of the loose draft pole G, bracket *f*, cultivator frame B H, hinged rods *a b*<sup>1</sup>, devices *i j h*, bracket *d*, and pin *c*, all arranged and operating substantially in the manner and for the purposes described.

No. 25,049.—EZRA D. SARGENT, of Indianapolis, Ind.—*Improvement in Seats and Couches for Railroad Cars.*—Patent dated August 9, 1859.—This invention consists in providing a simple and economical form and arrangement of seats and their backs, which can be changed into night couches from day seats, by a simple process.

The inventor says: I *claim*, first, the side lounge G, or nurse couch, constructed and arranged as and for the purpose set forth.

Second. Its combination with the backs *a L M*, seats F G H J, partitions P, brackets Z, and stops V; all arranged, constructed, and operated substantially as set forth in the specification.

No. 25,050.—JOHN SHAEFER, of Lancaster, Pa.—*Improvement in Grinding Cylinders for Apple Mills.*—Patent dated August 9, 1859.—The inventor says: The peculiar tangential curves of the teeth on the cylinders obviate the necessity of other cog gearing, their cutting edges allowing space for a large sized apple to lodge, which cannot escape, and is necessarily cut and effectually bruised into minute divisions as it passes between the cylinders.

*Claim.*—The tangential, curved, longitudinal, toothed cylinders A B, as set forth and described.

No. 25,051.—JOHN P. SHERWOOD, of Fort Edward, N. Y.—*Improvement in Nail Plate Feeders.*—Patent dated August 9, 1859.—This invention consists in a novel system of mechanism applied, in combination with the plate holder, for the purpose of producing all the necessary movements of the nail plate.

*Claim.*—The employment of the stationary inclined plane N, and the tumbler O, having an inclined face *k*, in combination with the arms *m m*<sup>1</sup> of the hollow shaft P of the plate-holder, and with the feed screw and nut, and the driving cam D, or their equivalent, the whole operating together substantially as described to produce the several movements specified

No. 25,052.—EVAN SKELLY, of Plaquemine, La.—*Improvement in Apparatus for Heating Evaporating Pans.*—Patent dated August 9, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The employment, in an evaporating pan, of a conical steam heater, with a central opening and a passage around its exterior and under its bottom, substantially as described.

No. 25,053.—N. B. SLAYTON, of Madison, Ind.—*Improvement in Securing Artificial Teeth.*—Patent dated August 9, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, securing artificial teeth on plates of gold or silver, by means of an amalgam of gold or silver, or both, combined with mercury, substantially as described, for the purposes set forth.

Second. I *claim* forming, by means of said amalgam, an outer flange or rim *a*, covering and supporting the base of the teeth, substantially as and for the purpose set forth.

No. 25,054.—SOLOMON P. SMITH, of Crescent, N. Y.—*Improvement in Straw Cutters.*—Patent dated August 9, 1859.—The inventor says: By arranging the crank shaft and pitman with the knee jointed lever, knife, and straw box and cutter block, so that the crank shaft makes just one complete revolution while the knife makes one cut through the straw or other substance, and against the block D, and returns, the knee jointed lever F not only exerts a progressively increasing pressure upon the knife as the resistance offered by the straw increases, but the crank and the pitman M N at the same time also exert a progressively increasing pressure upon the knee jointed lever.

*Claim.*—The arrangement of a crank shaft M, pitman N, knee jointed lever F, knife C, with a straw box B and cutter block D, for conjoint use, as specified and shown by the drawings.

No. 25,055.—ABEL SPENCER, Jr., of South Port, N. Y.—*Improved Mortising Machine.*—Patent dated August 9, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The frame made with cross heads connected together by means of the jointed rods

J J, and having those rods jointed at or nearly in line with the cutting edge of the chisel, and the mode of applying or using it, or any other manner substantially the same.

No. 25,056.—LAFAYETTE STEVENS, of Elmira, N. Y.—*Improved Machine for Tenoning Blind Slats*.—Patent dated August 9, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* constructing the cutter head with grooved cheeks *f*, clamping nuts *k*, and bearing studs *j*, whereby the plane cutter knives *g*, are held in an oblique position with the plane of rotation, with the cutting edge of the operating one terminating in conjunction with that of the hollow hub *h* and shoulder *e*, arranged and operating substantially as and for the purpose set forth.

I also claim the combination and arrangement of the rest *K*, with stationary and movable upper and lower jaws *o p*, and gauge *q*, substantially in the manner and for the purpose described.

I further claim the arrangement of devices for gauging the length of the slat, consisting of the automatic stop bolt *t*, as operated by inclined plane *u*, and lever *v*, to cause the carriage to stop alternately at the fixed stop gauges *s* and *w*, substantially as described.

No. 25,057.—STEPHEN STEWART, of Philadelphia, Pa.—*Improved Burglar's Alarm*.—Patent dated August 9, 1859.—A is a box, of which one end is a hollow chamber, open at one end and having its sides extended, as shown at C, forming guides. B is an air chamber, airtight except at the open end, which receives the piston D. E is the piston rod connecting D with the crosshead F, and having notches in its upper side. G is a gum spring, fast at one end to the back end of box A and at the other end to the crosshead F. There is a similar spring on the other end of the box A. H is a lever, moving freely on a fulcrum on the upper side of box A.

*Claim*.—The combination of the several parts A B C D E F G H I J K L M N and O, as described, and arranged to operate substantially as and for the purposes set forth.

No. 25,058.—WILLIAM A. SUDDITH and JOHN F. SUDDITH, of Charlestown, Va.—*Improved Washing Machine*.—Patent dated August 9, 1859.—This invention consists in a semi-cylinder with a diagonal corner and spiral spring attached to the hinge part of the cylinder.

*Claim*.—The hinged part of cylinder as set forth in drawing at Fig. 7.

No. 25,059.—GEORGE S. TAPLEY, of Bristol, Conn.—*Improvement in Sewing Machines*.—Patent dated August 9, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim* the movable cup *g* and its appendages, for gripping and automatically releasing the shuttle at intervals, substantially as specified.

I also claim the construction and arrangement of the feed apparatus, as and for the purpose set forth.

No. 25,060.—HORACE TRUMBULL, of Jersey City, N. J.—*Improvement in Machines for Washing and Separating Ores after being Pulverized*.—Patent dated August 9, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—The application to a rotary buddle or table, such as described, of vibrating brushes, when the same are arranged and operated essentially as specified.

No. 25,061.—OTIS TUFTS, of Boston, Mass.—*Improvement in Elevators or Hoisting Apparatus for Hotels, &c.*—Patent dated August 9, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim*, first, for the purposes of elevating, the combination of the screw and the passenger car or platform.

Second. I claim the construction of a screw for elevating, having stays or bearers at intervals, attached to the wall of a building or any fixed adjacent structure.

Third. I claim the construction of a nut with a slot or opening in the back or side, to enable it to pass by the bearings or stays before referred to, and as described.

Fourth. I claim constructing a nut or carriage with wheels or rollers running upon the thread of the screw, substantially as described.

Fifth. I claim controlling the descending motion of elevators or hoisting apparatus by means of fluid retarders, constructed substantially as described.

Sixth. I claim regulating the action of fluid retarders by means of a fly ball governor, or its equivalent, substantially as described.

Seventh. I claim the construction, arrangement, and operation of passenger cars of an elevator or hoisting apparatus, substantially as described; that is, providing the platform with side walls and doors or gates, said doors or gates being combined with suitable mechanism arranged in relation to stationary cams or projections on the gallery floors, or any contiguous parts of the building, so as to open and close automatically, in the manner and for the purposes substantially as set forth.

Eighth. I claim opening and closing the doors of the galleries or landings automatically,

y means of cams or projections on the car through a system of compound or multiplying levers, constructed and arranged substantially as described and for the objects set forth.

Ninth. I claim fastening and unfastening, automatically, the doors or gates of the cars by spring latches, or their equivalents, operated by cams or projections upon the gallery floors or adjacent walls of the building, substantially as described.

Tenth. I claim fastening and unfastening, automatically, the doors or gates of the galleries or landings by spring latches, or their equivalents, operated by cams or projections upon the car, substantially as described.

Eleventh. I claim the arrester  $w^1$ , in combination with the fluid retarder, for the objects and purposes set forth.

Twelfth. I claim passing the shipping rods and the cord or rod that operates the friction brake through the car or platform, for the objects and purposes set forth.

No. 25,062.—WILLIAM B. TWIFORD, of Chincoteague, Va.—*Improvement in Dumping Wagons*.—Patent dated August 9, 1859.—This invention consists of an open frame which has no rear end piece, and is fitted to have four wheels hung to it in combination with a crank axle, which is made stationary with said frame, and arranged so that it braces the frame near the centre of its length, and yet provides journals near the ends of the side pieces for the said wheels to turn upon, and with a wagon body, which works freely between the side pieces of the frame, and is pivoted to the same at a point near the centre of its length.

The inventor says: I claim the three sided, four wheel, open frame C, stationary crank axle B, and long wagon body D, when constructed and arranged for operating together, in the manner and for the purpose described.

No. 25,063.—FELIX TYLEE, of Cleveland, Ohio.—*Improved Spring Bed Bottom*.—Patent dated August 9, 1859.—The operation of this machine is as follows: Each part being constructed and properly adjusted, the mattress is placed upon the slats D D, of which a sufficient number must be provided to afford ample support. As the slat D receives the weight it is communicated to springs  $d d$  by means of supports  $f f$ ; the slats B B having also a portion of the weight imparted to them, a double or compound spring is thus given to the mattress.

The inventor says: I claim, first, the central support C, when the same shall be constructed substantially in the manner and for the purpose set forth and described.

Second. I claim the combination and arrangement of upper slat D, pin  $e$ , supports  $f f$ , with central support  $c$ , spring  $d d$ , and blocks  $a a$ , when all shall be constructed and arranged in relation to each other as fully set forth and described.

No. 25,064.—LORENZO TYLER, of Havana, New York.—*Improvement in Machines for Sowing Fertilizers*.—Patent dated August 9, 1859.—The inventor says: To use my invention put the fertilizer into the forward part of the box and raise the slide M, open the valve L, and adjust the slide J and proceed, and find by trial the quantity that is sown.

Claim.—The arrangement of the frame A, hopper B, partition N, adjustable slide M, valve L, cylinder H, concave I, adjustable slide J, and flexible clasps K, the whole being constructed and operated as and for the purpose set forth.

No. 25,065.—GEORGE H. VAN VLECK and HORACE TUPPER, of Buffalo, N. Y.—*Improved Hose Coupling*.—Patent dated August 9, 1859.—The inventors say: By turning down the edge of the male screw, whereby the same is provided with a guide, the use of double, or triple threads has been rendered practicable, and the rim E protects the ends of the threads from bruising, so that our couplings can be set up under all circumstances with equal facility.

Claim.—The arrangement on the thimble  $A^1$  of the head C, with two or more screw threads D, having its upper end turned down, as described, and being provided with a projecting rim E, to operate in combination with the thimble A and with the nut B, substantially as and for the purpose set forth.

No. 25,066.—AMSEY WARREN, of Westport, Conn.—*Improvement in Cultivators*.—Patent dated August 9, 1859.—This invention consists in the use of a rake, hoe blade, or shares, and a parting or deflecting bar attached to a mounted frame, having a handle secured to it by which the device may be shoved along manually between the rows of the crop under cultivation, and the soil pulverized and weeds eradicated.

Claim.—The parting or deflecting bar D, hoes or shares E E F G, and rake C, when applied to a suitable frame A provided with wheels B, the whole being arranged and combined to operate as and for the purpose set forth.

No. 25,067.—JAMES F. WATERHOUSE, of Germantown, Pa.—*Improvement in Knitting Machines*.—Patent dated August 9, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I claim first, the application of a drum 5, or its equivalent, with detachable pegs, to operate a series of independent thread guides having independent springs, when constructed and operating substantially as set forth and for the purposes specified.

Second. The striker V, or its equivalent, constructed and arranged in respect to the thread guides, and operating substantially as specified, so as to control such of the thread guides as are not under the control of any of the pegs in the drum.

Third. Moving the pegged drum, or its equivalent, at intervals, first in one direction and then in another, by means of the revolving disk 3, and its two inclined projections, in combination with the ratchet wheel 2.

Fourth. Imparting a combined lateral and vertical reciprocating motion to the needle bars, by means of the devices described, or their equivalents.

No. 25,068.—JEPHTHA AVERY WILKINSON, of Brooklyn, N. Y.—*Improved Machine for Receiving and Piling Paper*.—Patent dated August 9, 1859.—This invention consists in projecting the sheets through the air in such a manner that they fall in regular succession upon each other, and are taken away by an endless apron, or equivalent device, to be stacked up in reams, or folded ready for use.

The inventor says: I *claim*, first, the accelerating bands  $p^1 p^3$  and roller  $o$ , arranged and acting as set forth, to project the sheets of paper successively over each other, as they subside in the air, and in combination with the foregoing parts, I claim the endless apron receiving such sheets as specified.

Second. I claim the retarding bands  $q$  and  $s$  and  $q^2$ , in combination with the delivering bands  $p^1 p^3$ , for the purposes specified.

No. 25,069.—JEPHTHA AVERY WILKINSON, of Brooklyn, N. Y.—*Improvement in Rotary Presses*.—Patent dated August 9, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim*, first, the curved demi-grab  $c$ , with the sliding clamp 6 and lip 5, for the purposes as specified.

Second. I claim the curved compositors' shield  $C^3$ , for the purposes specified.

Third. I claim the arrangement of the proof cylinder B, and rollers  $c b$  for inking the type on the proof cylinder, as described and shown.

Fourth. I claim the plate  $a^1$  and roller  $b^2$ , for giving pressure in taking a proof from the types on the cylinder B, as set forth.

Fifth. I claim the horizontal gudgeon  $a^3$  and binding screw to secure the proof cylinder, and facilitate the correcting of the types, as set forth.

Sixth. I claim the movable clamping segments  $d^1$  at the heads of the type or proof cylinders to secure the types in place, and also allow for the removal of portions thereof, as specified.

Seventh. I claim revolving the type cylinders in a trough containing alkaline or other suitable solution for washing the types as specified.

Eighth. I claim the apron  $f$  for leading the paper into the press, and on which said paper lies, while receiving the first impression against the cylinder K, thereby said feeding apron becomes also the tympan sheet, as set forth.

Ninth. I claim a curved arch or bridge, over which the paper or fibrous material passes, to give direction thereto and prevent buckling or twisting, as described and shown.

Tenth. I claim corrugating or forming ribs on said curved bridge in diverging lines, so as to spread the paper widthways, as the same passes over the bridge, as specified.

Eleventh. I claim the auxiliary frame F, hinged into the main frame F, and carrying the upper linking apparatus, by the elevating of which both type and cylinders are exposed to view or can be lifted out of their place for varying the composition or otherwise, as set forth.

Twelfth. I claim the manner specified of throwing off both impressions by raising the auxiliary frame  $F^1$  and lowering the impression roller K, for the purposes and substantially as described and shown.

Thirteenth. I claim in a rotary printing press an endless tympan sheet, let off a sufficient distance, and so fitted that the offset from the ink of the first impression does not again reach the paper until removed or sufficiently dry, so as not to produce blurring or offset on the paper, as specified.

Fourteenth. I claim the arrangement of the ink rollers  $l^1 l^2 l^3 l^4$ , in the manner and for the purposes set forth, whereby the rollers  $l^1 l^2$  act to supply the required amount of ink to the rollers  $l^3 l^4$ , that supply and work the ink on the cylinder I or  $I^1$ , as specified.

Fifteenth. I claim the arrangement of the ink rollers  $i^1$  and workers  $k k^1$ , in their adjustable bearings  $i^2 k^2$ , substantially as and for the purposes set forth.

No. 25,070.—ERI WILLS, of Augusta, Me.—*Improvement in Stump Extractors*.—Patent dated August 9, 1859.—The engravings represent a perspective view of the machine, which consists of a frame O O, tongue P, shaft A, two wheels R R, ratchet device H G I, levers F F, and rope or chain B.

*Claim*.—The combination of the frame O O, tongue P, and shaft A, with the wheels R R, ratchet device H G I, levers F F, and chain B, constructed and arranged in relation to each other as and for the purposes set forth.

No. 25,071.—A. P. WINSLOW, of Cleveland, Ohio.—*Improvement in Roofs for Railroad*

*Cars.*—Patent dated August 9, 1859.—The inventor says: The plates here shown are curved for the purpose of conveying all moisture or wet that may get under the roof A to the centre of the plates from the sides and grooves. Straight, angular, or corrugated plates may be employed instead of plates D.

*Claim.*—The plates D, caps F, and grooved rafters B, when arranged substantially as set forth for the purpose described.

No. 25,072.—J. F. WISNEWSKI, of Cincinnati, Ohio.—*Improvement in the Preparation of Glycerine.*—Patent dated August 9, 1859.—The object of this invention is to produce pure glycerine from the refuse or waste water resulting from the manufacture of stearic acid, which is usually thrown away as useless. For a description the reader is referred to the specification.

*Claim.*—The employment or use and introduction of the within named chemicals, in the relative quantities, manner, and combination described, for the purposes set forth.

No. 25,073.—EDWARD F. WOODWARD, of Brooklyn, N. Y.—*Improvement in Skeleton Skirts.*—Patent dated August 9, 1859.—This invention consists in the employment of an extending elastic sectional skirt, attached at the top and sides to the extension skirt behind, thereby making a double skirt at that part, and forming from the intersecting lines two sections of circles of nearly equal radii, whose centres are separated according to the distance required.

*Claim.*—The sectional extension skirt, when combined and attached to the circular skirt, the whole being arranged and constructed in the manner and for the purpose set forth.

No. 25,074.—ALBERT H. WRIGHT, of Camden, N. J.—*Composition of Matter for Ornamental Purposes.*—Patent dated August 9, 1859.—The claim explains the nature of this invention.

*Claim.*—The composition of the matter described, the same consisting of the clay and sulphur with the emery, or its substitute, combined together substantially as and for the purposes described.

No. 25,075.—JOHN K. WRIGHT, of Philadelphia, Pa.—*Improved Machine for Printing in Different Colors.*—Patent dated August 9, 1859.—This improvement consists in hanging the rollers for imparting one color to frames independent of those to which are hung the rollers for printing the other colors, and the frames being adjustable longitudinally in respect to each other, whether one printing roller on each independent frame be used to print on one side of the fabric or two rollers be used on each frame for printing both sides of the fabric simultaneously.

*Claim.*—Hanging the rollers used for printing separate colors and patterns on separate frames D E, and constructing and arranging the said frames so that they may be adjusted independently of each other on the rails B, as and for the purpose set forth.

No. 25,076.—NATHAN AMES, of Saugus, Mass., assignor to Himself and WARD McLEAN, of New York.—*Improvement in Revolving Stairs.*—Patent dated August 9, 1859.—This invention consists in arranging steps or stairs upon an inclined endless belt, chains, or ropes, or in attaching the stairs or steps together by links or joints, so as to form an endless inclined flight of steps or stairs, which are placed on, over, or around rollers, so that the stairs or steps shall serve as elevators when motion is transmitted to the rollers.

The inventor says: I *claim*, first, arranging steps or stairs upon an endless belt, or in any manner equivalent, and placing them over rollers, substantially as described, so as to form a revolving flight of stairs which may be used both as a common flight and as an elevator.

Second. The triangular arrangement of the stairs, as shown substantially in Fig. 3, whereby an endless flight is made to pass around three rollers, B D D, for the purpose described.

Third. The double parallel arrangement, as shown substantially in Figs. 1 and 3, whereby ascending and descending flights are placed side by side.

Fourth. The use of auxiliary stationary steps or stairs, to operate in connection with the revolving stairs, substantially as and for the purpose set forth.

Fifth. The employment or use of rods or slots, to operate in connection with the slotted stairs, substantially as described, and for the objects specified.

No. 25,077.—L. S. BALDWIN and LUCIUS PARKS, of Le Roy, N. Y., assignor to L. S. BALDWIN, aforesaid.—*Improved Construction of Lightning Rods.*—Patent dated August 9, 1859.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim* the employment of a quadrangular tube of sheet metal, with spiral fluted sides A, in combination with the straight central supporting rod B, substantially in the manner and for the purpose set forth.

No. 25,078.—R. EICKEMEYER, of Yonkers, N. Y., assignor to Himself and E. UNDERHILL,

of said New York.—*Improvement in Sewing Machines.*—Patent dated August 9, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of the angular supporting plate F, with a needle applied and arranged to work through an opening in the angle of the said plate, and obliquely to both faces of the said plate, substantially as described, for the purpose of sewing obliquely through any substance supported in the angle of said plate.

Second. I claim the combination of the angular supporting plate, the obliquely arranged needle, and a looper, applied and operating so as in its movements to follow the angle of said plate, substantially as described.

Third. I claim the combination of the looper *v w*, constructed with a two pronged hook, and having a triple movement, as described, with a stationary guide 25, applied and arranged relatively to the needle and the angular supporting plate, substantially as described.

Fourth. I claim the arrangement of the feeding dog and presser, in a swinging frame I, so applied, in combination with the angular supporting plate, as to provide for the introduction and removal of the hats to and from the machine, substantially as described.

Fifth. I claim the slide, fitted as described to the angular plate F, opposite the feeding dog, with its face recessed behind the general surface of the plate, as shown in Fig. 7, and having applied to it a spring S, by which it is operated as described, in combination with the feeding dog, for the purpose set forth.

Sixth. I claim the plate 26, with its lips 27 28, applied substantially as described, in combination with the plate F.

No. 25,079.—ASAHEL ELMER, of Shabbona Grove, Ill., assignor to NATHAN ELMER and R. M. PRICHARD, of said Shabbona Grove.—*Improvement in Portable Capstans and Crabs.*—Patent dated August 9, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—So combining with the truck wheels or ground supports a capstan and crab, and a flexible rigging, as that the power of the team that draws the apparatus and works the capstan may be used for setting or anchoring the said crab and capstan, as well as to raise it up, reload it on the truck, and transport it from place to place, substantially as described.

No. 25,080.—ISAAC GOODSPEED, of Norwich, Conn., assignor to Himself and GEORGE A. MANSFIELD, of Boston, Mass.—*Improvement in Bomb Lances.*—Patent dated August 9, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the compound wing described, consisting of the wing proper *d*, the lever *f*, and the pin and slot at *g*, the whole being combined, arranged, and operated substantially as herein set forth.

Second. I claim the construction of a projectile having a prismatic shank with guiding wings of copper or any thin substance, fixed to the exterior surfaces of the prism in such a manner as to expand in coincident plates, substantially in the manner and for the purposes set forth.

No. 25,081.—LOUIS KOCH, of New York, N. Y., assignor to himself and H. FORSTRICK, of said New York.—*Improvement in Railroad Station Indicators.*—Patent dated August 9, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The apron or band K, with the names of the streets or stations on the line of the route marked thereon, attached to and working on rollers I I, or a revolving plate, or stationary plate and revolving index, when said apron, plate, or index are operated from the running gear of the car by suitable mechanism to give the same a continuous movement and simultaneous with that of the car, for the purpose set forth.

No. 25,082.—MORRIS POLLAK, of Hoboken, N. J., assignor to MORRIS TALKEMAN, MORRIS POLLAK, and SOLOMON WEIMER, of said Hoboken.—*Improved Double Clasp Hook for Watch Chains, &c.*—Patent dated August 9, 1859.—This invention consists in a peculiar construction of double clasp hook that becomes an independent article and is used to connect the ring of the watch with the ring or eye on the guard or vest chain or other article, said hooks being so constructed that the spring mouths are simultaneously opened, so that the operator is aided, for he can open one mouth and insert the ring in the other.

*Claim.*—The S shape or double clasp hook formed by the disks *b b*, and clasp jaws *d d*, on the centre pin *c*, that passes through the middle of the bent piece *a*, substantially as set forth.

No. 25,083.—GILBERT L. BAILEY, of Portland, Me.—*Improved Machine for Punching Holes in Leather.*—Patent dated August 16, 1859.—This invention consists in providing a hollow tube or cutter, and so connecting it with a lever, connecting rod, and treadle, that it may be operated by the foot of a person, while the hands are left free to handle the article to be punched.

The inventor says: I *claim*, first, the arrangement and combination of the bed piece L, lever A, and hollow cutter C, provided with a standard D, connecting rod E, and treadle H, as and for the purpose set forth and described.

Second. I claim the arrangement, as set forth, of the circular adjustable cutter bed D, in such a relative position to the cutter C as to accomplish the object specified.

No. 25,084.—WILLIAM T. BARNES, of Buffalo, N. Y.—*Improvement in Sewing Machines.*—Patent dated August 16, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, working the needles vertically and alternately in the same hole in the bed plate, substantially in the manner and for the purpose set forth.

Second. I claim the arrangement of springs 5 and 7, wedge 10, finger 6, spring 18, and stop 20, substantially in the manner specified.

Third, I claim the arrangement of lever 13, slide 11, and lever 12, when said lever 12 is provided with points, is pivoted to slide 11, and made to operate substantially in the manner described.

Fourth. I claim the arrangement of the ratchet wheel *a*, serrated bar *c*, and ratchet *e*, with the spool rod and lever C C<sup>1</sup>, substantially as set forth.

No. 25,085.—MELLEN BATTEL, of Albany, N. Y.—*Improvement in Steam Generators.*—Patent dated August 16, 1859.—This invention consists in the employment in the furnace or flue of a boiler of vertical water tubes, with closed bottoms, suspended from the crown sheet or top plate and extending downward near to the fire or bottom of the furnace or flue and upward through the crown sheet above the surface of the water and combined with inner tubes which extend to near the bottoms of those first named.

*Claim.*—The combination with the tubes C C, extending downward through the tube sheet, or crown of the fire box, or downward into a flue, and upward through the water above the tube sheet of the inner tubes D D, applied in the manner described for the purpose set forth.

No. 25,086.—THEOPHILUS D. BERRY, of Lowell, Mass.—*Improved Clothes Rack.*—Patent dated August 16, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the construction of my clothes rack, with divided centre, or of two sections, each to consist of centre piece A, slats F, braces H, and circumferential pieces E, united to each other as described, when these two sections are combined with each other by plates C, so hinged as to allow the rack to be folded and opened, both vertically and circumferentially, in the manner described, to obtain by this divided centre a rack suitable for use, when folded closely and circumferentially, for the purposes set forth.

No. 25,087.—EZEKIEL BOOTH, of Troy, N. Y.—*Improvement in Sewing Machines.*—Patent dated August 16, 1859.—This invention relates to that class of sewing machines in which two threads are used for forming a loop stitch, by means of a needle and looper. It consists in providing said looper with an auxiliary lever, which, when the needle is descending, will force the looper thread away from the looper, thus leaving a space between both, through which the needle may descend.

The inventor says: I *claim*, first, the combination of an eye pointed vibrating lever, and a looper, operating together substantially in the manner and for the purpose set forth.

Second. I claim the vibrating of the eye pointed lever by a positive motion given to it by the rollers *t t* entirely, and as contradistinguished from the use of a spring of any kind, by which means I ensure its reliable action under its rapid motions, as set forth.

No. 25,088.—MARO BRADLEY, of Dundee, Ill.—*Improvement in Horse Rakes.*—Patent dated August 16, 1859.—A represents the thills of the rake; B is the rake head, which is of cylindrical form and fitted in a suitable bearing *a*, at the back part of the thills; C represents the rake teeth, which are constructed of wire coiled around the rake head, and having their ends secured to the metal bars *b*, which are bolted or screwed longitudinally to the rake head, and having recesses *c* formed in their inner sides, to receive the coils of the teeth.

*Claim.*—The use of the recessed metal bar *b*, spurs E F, rods or shoes B, elastic bar I, lever J, slide rod K, and projection G, the whole being constructed and employed together, in the manner and for the purpose substantially as described.

No. 25,089.—JOHN DAVID BROWNE, of Cincinnati, Ohio.—*Improved Cabinet Furniture.*—Patent dated August 16, 1859.—This invention consists in the mode of constructing cabinets, so as to form either an inclosed or open front cabinet, and also to enlarge or extend the top.

*Claim.*—The arrangement of the folding ends C C<sup>1</sup>, as set forth, and the flaps or leaves E E<sup>1</sup>, hinged on the inside, for the purpose substantially described.

No. 25,090.—HENRY BURT, of Newark, N. J.—*Improved Door Fastener.*—Patent dated August 16, 1859.—This invention consists in an improved construction of metallic fastenings for the inside of doors, &c. These fastenings are to be placed on the door casings or jamb, instead of upon the door itself.

*Claim.*—A permanent door bolt, made with the fastening plate *b*, bolt case *a*, and bolt *c*, secured and operated as described.

No. 25,091.—JOSEPH CALEF, of Buffalo, N. Y.—*Improvement in the Running Gear of Carriages.*—Patent dated August 16, 1859.—This invention consists in the arrangement of jointed arms, or braces, in connection with the forward gear.

The inventor says: I *claim* the journal box E, constructed substantially as described, and combined with the friction rollers B, or slides W, for the purposes set forth.

The combination of the axle A, journal box E, friction rollers B, and equivalents, and hub D, for the purposes set forth.

The arrangement of the jointed braces L M N, in combination with the running gear of carriages, for the purposes set forth.

No. 25,092.—WILLIAM S. CARR, of New York, N. Y.—*Improved Water Closet.*—Patent dated August 16, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* regulating the action of the cock or valve in water closets by the joint operation of the lever and weight of water in the pan, substantially as specified, whereby the cock or valve is kept open until the weight of water in the pan regulates the closing thereof.

I also claim the construction of the valve *c*, with the balancing diaphragm 12, valve 10, and spring 13, as set forth.

No. 25,093.—H. CHANCEY, of Perry, Ga.—*Improvement in Machines for Dressing Stones.*—Patent dated August 16, 1859.—The shaft R is placed directly under the pick or hammer shafts N N, and one end of the shaft has an arm *k* attached to it at right angles, said arm having a rod *l* connected to it; S is a driving shaft, which is placed on the framing A, and has a fly wheel T placed on it, and also a pulley *m*, the latter having a belt *n* passing around it from pulley K.

*Claim.*—The arrangement of the pick or hammer shafts N N, adjustable shaft R, and adjustable traverse bar P, when combined or used in connection with the reciprocating carriage C, and laterally moving or adjustable bed U, in the manner and for the purpose set forth.

No. 25,094.—ABRAM H. CLEAR, of Providence, R. I.—*Improvement in Pipe Connections for Steam Boilers.*—Patent dated August 16, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—Making the connections between the injection pipe or other similarly submerged pipe of a steam vessel, or any other vessel, with the side or exterior of the vessel, by means of a valve box situated within or between the inside and outside planking of the vessel fitted with a valve, capable of being operated by a screw, or its equivalent, by a person on or above the deck of the vessel, substantially as described.

No. 25,095.—JOSEPH H. CLIFTON, of New Castle, Pa.—*Improvement in the Manufacture of Machine Belting.*—Patent dated August 16, 1859.—The object of this invention is to obtain an article of belting that shall be strong, durable, and cheap.

This invention consists in so preparing goods of almost any fibrous material by successive coatings of size, rosin, and plumbago, that they shall possess, when completed, the above-named qualities in a high degree.

*Claim.*—The process of manufacturing belting for machinery from fibrous materials, substantially as described.

No. 25,096.—JOSEPH H. CLIFTON, of New Castle, Pa.—*Improvement in Belting for Machinery.*—Patent dated August 16, 1859.—This invention consists of a new article of manufacture made by so preparing a belt or band of fibrous material by successive coatings of size or starch, resinous substance, and plumbago, that it shall, when completed, be cheap, strong, and durable, and answer as a substitute for India rubber, gutta percha and leather.

*Claim.*—As a new article of manufacture, belting made of fibrous material by the process set forth.

No. 25,097.—EDWARD K. COLLINS, of Chili, N. Y.—*Improvement in Clover Bolts.*—Patent dated August 16, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The combination and arrangement of two bolts in clover machines, when said bolts have a counter and upward movement produced in the manner and for the purposes specified.

No. 25,098.—THOMAS S. COX, of Lafayette, Ind.—*Improvement in the Mole of Drain Ploughs.*—Patent dated August 16, 1859.—This invention consists in forming the terraducts B on either side of the shank A in such a shape as to carry from the bottom of the ditch to the top, and deposit it in the rear of the shank A, which, by means of the elevated end of the mole C, entirely closes up the perforation made by the shank A.

*Claim.*—The peculiar shape of the mole C. By the forward movement of the mole C the

earth is carried from the bottom of the ditch by means of the terraducts B, from the point of the mole D, to the rear of the shank A, and pressed more densely by the increased earth coming in contact with the convex end of the mole C, in rear of the shank A, in such a manner as to make a better arch, and more durable than any heretofore made, leaving the bottom of the ditch almost entirely uncompressed; hence I do not claim anything except the invention of the terraducts B, ending in the convex on the top of the mole C.

No. 25,099.—JOHN H. CRANE, of Charlestown, Mass.—*Improved Carpet Sweeper*.—Patent dated August 16, 1859.—This invention consists in the means described, for extending, to any desired distance, the length and amount of surface of the belt, in contact with the carpet.

*Claim*.—The arrangement of belt, rotating guides, and driver pulley, operating in combination with carpet sweepers, essentially as set forth.

No. 25,100.—THOMAS B. DE FOREST, of New York, N. Y.—*Improvement in India Rubber Springs for Railroad Cars, &c.*—Patent dated August 16, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—Composing a spring of a series of blocks or segments of a circle of vulcanized India rubber, placed and held between two parallel plates, or equivalents, substantially as described; but this I only claim when the series of blocks are so arranged and held between the two parallel plates that their contiguous faces shall not come in contact under light loads, but shall come into contact and give mutual support as the load increases, substantially as and for the purpose specified.

No. 25,101.—THOMAS DOUGHERTY, of Macon, Ga.—*Improvement in Switches for Railroads*. Patent dated August 16, 1859.—This invention consists in two movable flat bars of steel or iron, for the purpose of preventing the train from running off the rails when the switch is wrong.

*Claim*.—The combination and arrangement of the flat bars A A and the stationary end plates C C, provided with the guide rails D D in connection with the rails G, when constructed and operated substantially as and for the purpose set forth.

No. 25,102.—EUGENE DUCHAMP, of St. Martinsville, La.—*Improvement in Self Releasing Whiffletrees*.—Patent dated August 16, 1859.—This invention consists in having two rods fixed longitudinally on the back of a whiffletree by metal guards, each provided with an oblique slot, through which passes a pin projecting from the rods; and in operating these rods with a rocking motion, so that they will recede from each other in locking or affixing the traces, and approach each other in detaching them.

*Claim*.—Operating the two rods simultaneously by means of the slotted guards D D, in combination with boxes G G and lips c c, in the manner and for the purposes specified.

No. 25,103.—EUGENE DUCHAMP, of St. Martinsville, La.—*Improvement in Attaching Thills to Vehicles*.—Patent dated August 16, 1859.—This invention consists in attaching to the axle swivel coupling boxes, having elliptical eyes in their ends, and in forming on the ends of the thill irons fluke shaped enlargements, which will pass freely through the eyes in the coupling boxes when the boxes are turned so that the eyes stand perpendicular to the axle; and then, by turning the boxes one quarter round and fixing them in this position by hinged gates, the shafts will be securely attached to the axle.

*Claim*.—The combination of the swivel coupling boxes E, having an elliptical slot through their ends, thill irons having fluked portions G, and hinged gates J, or their equivalents, substantially as shown and for the purposes specified.

No. 25,104.—JACOB EDSON, of Boston, Mass.—*Improved Carpet Sweeper*.—Patent dated August 16, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* producing the motive power of the machine by means of a belt of rubber or gutta percha interposed and running between the pulley or roller n and the surface to be swept or passed over, as set forth.

I also claim arranging the guiding wheel i upon the stationary hollow shaft or bushing K, through which the axle of the bush shaft passes, as described and for the purposes specified.

No. 25,105.—ASAHEL ELMER, of Shabbona Grove, Ill., assignor to NATHAN ELMER and REUBEN M. PRICHARD, of said Shabbona Grove.—*Improvement in Mole Plough*.—Patent dated August 16, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, in combination with the adjustable block B on the plough beam, the scoring or levelling plough D in advance of it, substantially as and for the purpose described.

Second. I also claim, in combination with the plough beam and coulter, the swinging

weighted crane or lever for preventing the careening of the plough or for recovering its proper position after it has careened, substantially as described.

Third. I also claim the combination of a forked coulter, for cutting a wedge shaped or tapering slice over the coulter gash, with a pressing or driving device for forcing down said slice, and thus packing the coulter gash, as described.

Fourth. I also claim a mole or former, made of a series of conical shaped sections, which increase in size as they recede from the coulter, and which are so linked together as that they may move in a horizontal plane, but be comparatively rigid in a vertical plane, substantially as described and represented, and for the purpose set forth.

Fifth. I claim, in combination with the mole *L*, the scorer or shoe *m* on its rear section or end, said scorer forming a groove or channel in the bottom of the finished drain for admitting the water into it, the sides of the drain being so closely packed as to prevent the water from entering there, said scorer being constructed and arranged as represented.

No. 25,106.—DAN R. ERDMANN, of Philadelphia, Pa.—*Improved White Lead Apparatus*.—Patent dated August 16, 1859.—This invention consists of certain improvements in the machinery for producing white lead, to wit: a cylinder which rotates in a vat containing water, and both ends of which are closed by means of a double layer of wire netting with a piece of flannel between them, so that none but the very finest particles of pure white lead can escape from the cylinder; the vat is furnished with a tube which is carried nearly all the way round on the inside of the vat and near its top, and from which a number of branches extend nearly down to the bottom of the same.

*Claim*.—A rotary cylinder *C*, arranged with double wire nettings *d*, in combination with a vat *A*, provided with a tube *F*, substantially in the manner and for the purpose specified.

No. 25,107.—ALEXANDER FOROT, of Paris, France.—*Improvement in Fabrics*.—Patent dated August 16, 1859.—The claim explains the nature of this invention.

*Claim*.—The manufacture of a new kind of fabric without weaving, composed simply of threads glued upon a base of paper or any other suitable kind of material, such fabric being left plain or ornamental, by embossing, or any other process, substantially as described.

No. 25,108.—BENJAMIN FULGHUM, of Richmond, Ind.—*Improved Sawing Machine*.—Patent dated August 16, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the combination and arrangement of the two frames *B C*, placed one within the other, and arranged substantially as described, so as to admit of the saws being adjusted vertically, and also moved horizontally, forward and back, for the purpose set forth.

Second. The arrangement of the shafts *g*<sup>1</sup> and *F*, with their respective gearing *f*<sup>1</sup> *p*, and the pulley *J*, in connection with the two reciprocating frames *B C*, whereby the saws are rotated, and at the same time have a reciprocating motion communicated to them.

Third. In combination with two circular saws *d*<sup>1</sup> *w*, the inclined ways *e e*<sup>1</sup>, of the log carriage *I*, for the purpose set forth.

No. 25,109.—H. P. GENGEMBRE, of Allegheny, Pa.—*Improvement in the Manufacture of Coal Oils*.—Patent dated August 16, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The continual progressive and gradual destructive distillation of coal, or other bituminiferous substance, for the purpose of obtaining therefrom the different products of distillation by means and with the use of the apparatus described or other equivalent.

No. 25,110.—CHARLES GOODYEAR, of New Haven, Conn.—*Improvement in the Manufacture of Porous Rubber Cloth*.—Patent dated August 16, 1859.—The claim explains the nature of this invention.

*Claim*.—As a new porous manufacture, pervious to air and water repellant, composed of a woven or equivalent fabric, and a thin porous coating of India rubber or allied gum, substantially as described.

No. 25,111.—CHARLES GOODYEAR, of New Haven, Conn.—*Improvement in India Rubber Fabrics*.—Patent dated August 16, 1859.—The claim explains the nature of the invention.

*Claim*.—The porous and water repellant manufacture, composed of a bat or fleece of cotton or other fibre and India rubber, or allied gum, united and rendered porous, substantially as specified.

No. 25,112.—JOSEPH GRUNWALD, of New York, N. Y.—*Improvement in Clasps for Skeleton Skirts*.—Patent dated August 16, 1859.—*A* is a plain clasp or buckle through which the tape is drawn, so as to form a loop through which the steel springs are passed and held tight by the friction as soon as the tape is pulled tight. *B* is similar to *A*, only provided with a small projection or nose *o*, which enters the tape when pulled tight to give an addi-

tional security and prevent the tape from moving when the same should become a little loose.

*Claim.*—The combination of the hoops or springs with the tape, by means of clasps, constructed substantially as described and represented by Figs. 3, 4, and 5, and for the purpose specified.

No. 25,113.—JAMES HAMILTON, of New York, N. Y.—*Improved Cross Cut Sawing Machine.*—Patent dated August 16, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the manner herein described of arranging the shaft *d*, and its gear wheel *f*, and bevel gear *r*, in connection with the bevel gear *s*<sup>1</sup>, and gear *s*, on the shaft *l*, so that said shaft *d* can be changed to stand horizontally and give motion to the saw, whether the said saw and the gearing thereof be in a horizontal or vertical position, substantially as specified, thereby adapting one machine to be moved by hand in felling trees or sawing up logs, as set forth.

I also claim, in combination with the aforesaid machine for sawing logs, the detachable frame *v*, buck *w*, and variable lever *x*, for holding smaller logs while being sawed for firewood, substantially as specified.

No. 25,114.—A. HAMMOND, of Jacksonville, Ill.—*Improvement in Mole Ploughs.*—Patent dated August 16, 1859.—This invention consists in extending a portion of the tooth out behind the standard and forming a furrow or groove in the upper surface of the same diminishing as it reaches the extreme end, for the purpose of closing up the opening left by the standard to prevent the ditch from filling up again; it also consists in forming, or affixing in any suitable way, a fin or angular shaped knife to the sole of the shoe, to open a place along the bottom of the ditch for allowing the water to pass up into the same and be drained off from below the ditch.

*Claim.*—The shoe *E*, provided with a knife *N*, and projection *L*, when the same are arranged and operate in the manner and for the purposes herein set forth.

No. 25,115.—B. S. HEALEY, of Cohocton, N. Y.—*Improvement in Self Acting Wagon Brakes.*—Patent dated August 16, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the combination of a forked pole, arranged substantially as described, with the hounds, whereby the pole is free to slide in its forks and operate the brakes without moving the forks backward in the hounds.

In combination with brakes pivoted to a fixed bar, as described, I claim the brake blocks, arranged and connected with the brakes as set forth, whereby the friction of the wheels on the blocks draws the brakes toward and causes them to press with greater force against the wheels.

No. 25,116.—WILLIAM M. HENDERSON, of Baltimore, Md.—*Improvement in Car Seats.*—Patent dated August 16, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the construction of a railway reclining chair or couch securely attached to the floor of the car, with the whole chair reversible, so as to face either end of the car, substantially as described.

Second. The mode of varying the height of the back of the chair, by making it in two pieces and suspending the lower portion, substantially as described.

Third. In combination with a chair, reversible as aforesaid, I claim the double acting foot board, single reversing leg rest, and means for extending it by the action of the arms of the chair, substantially as herein described.

No. 25,117.—ROBERT HENEAGE, of Buffalo, N. Y.—*Improved Hose Coupling.*—Patent dated August 16, 1859.—The male part of the coupling has a conical part *A*, on which two screw segments *B* and *C* are formed; a shoulder *D* is also formed at the base of the conical part; the hose is attached in the usual manner to the cylindrical extension *E*; upon the cone extension, and beyond the screw sections, is placed a packing of rubber or leather, as shown at *K*.

*Claim.*—The arrangement of the screw sections *B* and *C*, and packing *K*, upon the cone extension *A*, as set forth.

No. 25,118.—H. C. HUNT, of Ottumwa, Iowa.—*Improved Vise.*—Patent dated August 16, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—Constructing a vise in such a manner that it will self retain itself upon a table or bench, substantially in the manner set forth.

No. 25,119.—JOHN W. HUNTLEY, of Lanes Creek, N. C.—*Improvement in Cotton Seed Planters.*—Patent dated August 16, 1859.—This invention consists in the employment of a

vertical rotating arbor shaft placed centrally within a conical hopper or seed box armed with teeth and used in connection with a follower and gatherer.

*Claim.*—The vertical rotating toothed shaft H, in connection with the follower or gatherer J, placed within the hopper G, and arranged for joint operation, substantially as and for the purpose set forth

No. 25,120.—LEVI S. IVES, of Brooklyn, N. Y.—*Improvement in Millstone Bushes.*—Patent dated August 16, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the placing, substantially as set forth, of a cylinder D, which contains the spindle collar B, blocks F, and the adjusting wedges G, within a cylinder M, secured within the centre of the bedstone, the cylinder D being allowed a vertical movement or play within the cylinder M, to permit of the vertical adjustment of the spindle, and consequently the runner or upper millstone, with but little friction, and keeping all the parts in position so as to prevent their derangement.

Second. The arrangement of the plates J K L, with the washer I and ring H, or their equivalent, in connection with the projection *d*, on the inner side of the cylinder D, substantially as described, to prevent the casual turning of the blocks with the spindle.

Third. The plate N, provided with the flanch O, and the dome shaped cap P, provided with the flanch Q, in connection with the cap T and plate *g*, the above parts being attached respectively to the cylinder D, spindle collar B, and driver R, to form an air and a dust chamber, substantially as and for the purposes set forth.

No. 25,121.—H. R. JEROME, of Monroeville, Ohio.—*Improvement in Mole Ploughs.*—Patent dated August 16, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of a beam, carrying a mole plough, with the front and rear standards of the front and rear propelling wheels, and with the adjusting device, substantially as and for the purposes set forth.

Second. Providing the coulter with a series of notches and arranging the draft chain in one or other of said notches, and thus having the draft applied directly to the coulter, substantially as and for the purposes set forth.

Third. The combination of a coulter which is elliptical in form, in its transverse section, with a mould which is conical at its front and rear ends, substantially as and for the purposes set forth.

No. 25,122.—WILLIAM B. JOHNS, of the United States Army.—*Improvement in Apparatus for Lighting Gas Burners.*—Patent dated August 16, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—Giving the wrench staff the jointed sections E and F, so that a match inserted in the extreme section may illuminate the burner key while the gas is being turned on, and also serve as a torch to ignite the gas.

No. 25,123.—THOMAS J. JOLLY, of Olean, Ind.—*Improved Washing Machine.*—Patent dated August 16, 1859.—This invention consists in an arrangement of a sliding table operated by a treadle in combination with a revolving rubber.

*Claim.*—The described arrangement and combination of the treadle I, sliding table C, and rotary rubber D, the whole being constructed and operating in the manner and for the purpose set forth.

No. 25,124.—MORRIS L. KEEN, of Rogers' Ford, Pa.—*Improved Machinery for Manufacturing Artificial Fuel.*—Patent dated August 16, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination and arrangement of the mills, conveyors, mixing and heating cylinders, moulding and conveying apparatus, substantially in the manner and for the purpose described.

Second. I also claim the combined use of the moulding apparatus, and of the tank or reservoir of water, for the purpose of receiving and moulding the heated and plastic material in said tank of water, for cooling the machinery and fuel, and for preventing the material from adhering to the machine, substantially as described.

Third. I also claim the combination of the endless apron with the moulding apparatus, operating in a tank or reservoir of water, substantially in the manner and for the purposes described.

No. 25,125.—HAZARD KNOWLES, of New York, N. Y.—*Improvement in Clasps for Fastening Bands on Cotton Bales, &c.*—Patent dated August 16, 1859.—The leading objects of this invention are so to couple the ends of the straps that but little time and skill will be required in making the application, and to effect the coupling by simply inserting the end in the coupling or clasp, and so, without punching holes, or bending, or otherwise weakening the strap or hoop, the ends thereof shall be firmly griped to resist any force applied to draw them out.

*Claim.*—The method of securing straps by means of a roller, substantially such as described, in combination with the wedge formed mortise of the sleeve, which receives the strap, substantially as described.

No. 25,126.—S. S. LANGDON, of Cleveland, Ohio.—*Improved Churn.*—Patent dated August 16, 1859.—This invention consists in an improved construction and arrangement of rotary churns.

*Claim.*—The described construction and arrangement of rotary churns, when the same are provided with the dash frame K and chambers E, and the whole constructed, arranged, and operated substantially as set forth.

No. 25,127.—JOEL LEE, of Galesburgh, Ill.—*Improvement in Mole Ploughs.*—Patent dated August 16, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the two swords fitting closely together, the front one attached to the mole near the forward point, the rear sword pivoted near the rear point of mould.

Second. The lever, in combination with the swords, for operating or adjusting the front sword and the mould.

No. 25,128.—JOHN MAGEE, of Lawrence, Mass.—*Improvement in Stoves.*—Patent dated August 16, 1859.—This invention consists in an arrangement of a pot, grate, hot air chamber, ring, ash grate and register and ash pit together, and with direct and descending and base flues.

*Claim.*—The arrangement of the pot grate A, the hot air chamber F, the ring grate B, the register G, and the ash chamber H, together and with direct, descending, and base flues, substantially as specified.

No. 25,129.—JOSEPH P. MARKHAM, of Penfield, Mich.—*Improved Tuyere.*—Patent dated August 16, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the use of the indented valve K, in combination with the outlet passages H, constructed and arranged substantially as herein described, in such manner that, by moving said valve back and forth underneath the outlet, it will admit the wind to or shut it off from said outlet, equally and gradually, on each side of the central tube I.

Second. I claim the mode of making the loose nozzle J, independent of the masonry for support, by the use of the tube I and its socket, in combination with the ribs G G G G and corresponding rebates, substantially as set forth.

No. 25,130.—RUFUS MAXWELL, of Tucker county, Va.—*Improved Towel Rack.*—Patent dated August 16, 1859.—The inventor says: I make an opening at *c* of a fourth of an inch, through which the towel is passed into the slot. The screws 1 and 2 are to fasten the rack to the wall or ceiling, or it may be suspended from the wall or ceiling by cords.

*Claim.*—The construction of racks for endless towels, with a slot *a b* and opening *c*, substantially as and for the purpose described.

No. 25,131.—CHARLES H. McALEER, of Chambersburg, Pa.—*Improvement in Binding Apparatus for Harvesters.*—Patent dated August 16, 1859.—In operating this machine the raker, who rides upon the machine, by a sweep of his rake deposits the cut grain upon the curved arms *b b* of the apparatus, when one of the binders placing his foot upon the treadle *f* elevates the gavel and compresses it between the curved arms *b b* and the posts of frame D D, and grasps the band which he had previously thrown longitudinally across the shaft *e* and tie *t*, when he transfers the sheaf to the tables or seats C C, where it is bound and discharged.

*Claim.*—The apparatus or elevator for raising and compressing the gavel, constructed and operating in the manner substantially as described.

No. 25,132.—WILLIAM HOWARD MITCHELL, of San Francisco, Cal.—*Improvement in Rotary Movement.*—Patent dated August 16, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, two or more reversed, self-detaching pawls or catches, working on opposite sides of the periphery of the ratchet wheel, by being attached to arms working in parallel lines and in the same direction, constructed and operating substantially as and for the purposes specified.

I also claim the combination of the ratchet wheel R, with the pawls or catches P and P<sup>1</sup>, and flanges E, and the cross beam B with parallel arms G, substantially for the uses and purposes set forth.

I also claim the combination of the ratchet wheel with the flanged casing or flanges.

No. 25,133.—GEORGE I. MONTJOY and JOEL B. SAWYER, of Houston, Texas.—*Improved Rotary Steam Engine.*—Patent dated August 16, 1859.—This invention consists of a rotary engine with a new arrangement of passages and a reversing cock or valve, in combination

with the passages in a stationary hollow shaft and abutment, and with a suitable system of pistons.

*Claim.*—The arrangement of the passages in the double elbow piece  $E E^1$  and the reversing cock or valve  $F$ , in combination with the passages in the stationary hollow shaft  $D$  and its abutment  $H$ , the whole applied in connection with the cylinder and its sliding pistons, to operate substantially as described.

No. 25,134.—WILLIS G. MURPHY, of Seguin, Texas.—*Improvement in Seed Planters.*—Patent dated August 16, 1859.—This invention consists of certain devices for dropping corn and cotton seed at the same time, or in dropping one kind of seed alone.

*Claim.*—The arrangement of the beam  $A$ , hopper  $C$ , wheels  $D J H$  and  $E$ , seeding wheel  $R$  and  $B$ , helve  $14$ , plough  $T$ , covers  $Q$ , and conductor  $V$ , as described, and for the purposes set forth.

No. 25,135.—RUDOLPH A. NATHURST and JOHN L. STEWART, of Nashville, Tenn.—*Improved Safety Rein for Bridles.*—Patent dated August 16, 1859.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim* the connection of the choke strap with the common or ordinary driving reins, so as to act and serve for both purposes of driving and safety rein, substantially as described, and this we *claim*, whether it be temporarily or permanently affixed to the bridle or halter, whether a bit is used or not.

No. 25,136.—CÆSAR NEUMANN, of New York, N. Y.—*Improved Skeleton Skirt.*—Patent dated August 16, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The combination of the jointed or hinged hoop supporters, and a series of horizontal hoops, when arranged and operated in the manner described and for the purpose set forth.

No. 25,137.—J. J. PARKER, of Marietta, Ohio.—*Improvement in Steam Slide Valves.*—Patent dated August 16, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—Placing the valves loosely on the hollow arms of the side pipe and contracting the supply openings from the valves, substantially in the manner described, for the purpose of employing the pressure of the steam to keep the valves in contact with their seats, as specified.

No. 25,138.—JOHN C. PEDRICK, of Washington, D. C.—*Improved Ball Furniture Casters.*—Patent dated August 16, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—Inserting into a metal cup containing the ball of a caster a separate anti-friction bearing  $f$ , against which the ball revolves, thereby lessening the friction of the ball in the metal cup or socket, as described.

No. 25,139.—THOMAS E. ROBERTS, of Alamance, N. C.—*Improvement in Trucks for Railroad Cars, &c.*—Patent dated August 16, 1859.—This invention consists in the construction of two cast-iron concave chilled plates, and securing one upon the bottom sill of the car, and the other upon the bolster of the car truck, with a double sided cast-iron chilled convex plate between; and in connecting and combining this centre bearing with self-oiling friction rollers at the ends of the bolster, to impart to the car body an easy motion, while the truck yields to all inequalities of the road.

*Claim.*—The construction and arrangement of the concave chilled plates  $B$  and convex chilled plates  $C$  with each other, in the manner described, and their combination with the self-oiling friction rollers  $G O H$ , for the purposes fully set forth.

No. 25,140.—JAMES H. ROOME, of New York, N. Y.—*Improvement in Shears.*—Patent dated August 16, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—Combining one limb  $C D$  of a pair of shears, or other similarly operating hand cutting instrument, with its handle  $E$  forming part of a separate lever  $E G$ , and combining the said limb and handle with the other limb of the shears by means of an arm  $f$  attached to the said lever  $E G$ , and operating on the rear portion  $D$  of the first mentioned limb, a link  $F$  connecting the said limb with the said lever, and a movable fulcrum connection  $g h$  between the said lever and the other limb, the whole operating substantially as described, to cause the power of the said lever to increase as the shears close.

No. 25,141.—WILLIAM N. ROWE, of Sharpsburg, Md.—*Improvement in Carriage and Wagon Jacks.*—Patent dated August 16, 1859.—This invention consists in combining a grease box with a carriage or wagon jack, in such a manner that the act of jacking the vehicle will open the grease box.

*Claim.*—The adjustable sliding catch plate  $B$ , operating as described, in combination with the grease box  $F$  and jack, as set forth and described.

No. 25,142.—JACOB RUPERTUS, of Philadelphia, Pa.—*Improvement in Percussion Pellets for Fire-Arms.*—Patent dated August 16, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—The employment, for enclosing the detonating compound, of a metal capsule of spherical form, substantially as described.

No. 25,143.—JOHN SCHEEPER, of New York, N. Y.—*Improvement in Stoves.*—Patent dated August 16, 1859.—This invention consists in a peculiar arrangement of a fire chamber with ovens and flues whereby the radiation of heat from the stove is in a great measure prevented and retained to heat the several ovens, effecting a saving of fuel.

*Claim.*—The arrangement and combination of the fire chamber A, ovens B C D, and flues *k l l q q n n*, substantially as and for the purpose shown and described.

No. 25,144.—HENRY W. SHIPLEY and ZOHART BLAIR, of Mount Vernon, Ohio.—*Improvement in Grist Mills.*—Patent dated August 16, 1859.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim* the husk A and cup A<sup>1</sup>, composed of lower and upper sections, the same being turned and fitted together as described, and supported upon a frame C for the purpose of making the whole portable and complete in itself.

We claim cementing the stone to the interior of the cup A, which also forms the upper husk, as specified.

We claim the cup M, constructed and fitted substantially as described, and cementing the stone thereto, so that both will revolve together.

We claim the bridge trees D and G, in combination with the husk A, cup A<sup>1</sup>, and frame C, when arranged and operating substantially as set forth.

No. 25,145.—HENRY SOGGS, of Columbus, Pa.—*Improved Butter Worker.*—Patent dated August 16, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The tray *d*, with convex bottom and ends, set on an inclined plane of rollers, working in combination with the cylinder *a* and ribs *b*, for the purpose of working the milk and superfluous matter from the butter, at the same time leaving channels in said butter, through which the milk, &c., may escape.

No. 25,146.—DAVID STODDART, of San Francisco, Cal.—*Improvement in Slide Valves of Steam Engines.*—Patent dated August 16, 1859.—A is the steam chest, *a a* the valve seat, which is raised above the bottom of the steam chest, and B the slide valve; C is the balance frame, faced to fit the back of the valve, which is parallel with the face thereof, and D the flexible plate securing the balance frame to the cover E of the steam chest.

The inventor says: I *claim*, first, the employment of the elastic plate D, in combination with a cavity B and a balance frame C, substantially as and for the purpose shown and described.

Second. The combination of an adjusting spring *m* and screw *n*, with the elastic plate D, substantially as and for the purpose shown and described.

No. 25,147.—WILLIAM MONT STORM, of New York, N. Y.—*Improved Steam Generator.*—Patent dated August 16, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the plan or method of conveying water from a closed tank or reservoir to the heating surfaces of a steam generator by capillary attraction, for the objects described.

Second. I claim so constructing and locating the said supply tank that the influence of the heat upon the water contained therein for feed, while elevating its temperature, shall in no case bring it up to the steam generating or boiling point under the given pressure.

No. 25,148.—FRANCIS M. STRONG and THOMAS ROSS, of Brandon, Vt.—*Improvement in Weighing Scales.*—Patent dated August 16, 1859.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim* the arrangement of the bars C D, of the larger platform B, as shown, to wit: one lever crossing the other at about right angles, so that the knife edged bearings *b* of the foot pieces *a* of one lever will be at right angles to those of the other, and the lateral movement of the foot pieces on the bearings prevented.

We further claim attaching the arms E E of the levers C D, either separately or when connected direct to the beam G, and having the bar I of the scoop or smaller platform H rest on knife edged bearings *k k* on the beam, substantially as and for the purpose set forth.

No. 25,149.—B. F. STURTEVANT, of Boston, Mass.—*Improved Blank for Shoe Pegging Machines.*—Patent dated August 16, 1859.—This invention consists in the production of a ribbon, or blank of shoe pegs, cut from the circumference of the log of wood by revolving the log in contact with suitable cutters, by which the operator is enabled to make a blank of shoe pegs of uniform width and thickness, with smooth surfaces.

*Claim.*—As a new article of manufacture, a blank or strip of shoe pegs cut around the log, substantially as described.

No. 25,150.—N. G. THOM, of Cincinnati, Ohio.—*Improved Machine for Nicking and Trimming Heads of Screws.*—Patent dated August 16, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, a revolving or rotating head, which revolves around a series of spindles or blank holders, with an intermittent or interrupted motion, carrying upon it the necessary apparatus and tools for shaving, nicking, and trimming, or otherwise finishing the heads of screw blanks.

Second. In combination with the spindles or blank holders, I claim the annular cam *m*, having internal and external inclined surfaces, for the purpose of raising the spindle in the nicking process and operating the grippers by acting upon the one rod *b*.

Third. In combination with the spindles or blank holders, I claim the rod *d* and spring *e*, or its equivalent, when such a spring or equivalent is made to act upon the rod at required intervals, to discharge the blank, by being attached to some rotating or reciprocating portion of the machine.

Fourth. I claim the lever *r* and spring *n* and catch *l*, or other mechanical equivalent, which acts upon the machine, for the purpose of arresting one part while it releases another, substantially as described and for the purposes set forth.

Fifth. I claim the arrangement of the spindles and driving shaft in such a manner that, while the spindles containing the blanks to be shaved and trimmed are acted upon by the driving belt, the spindle containing the blank to be nicked is not acted upon, and the necessary tension is given the belt at all points in the revolution of the head without the use of a binder, substantially as described.

Sixth. In combination with the worm wheel *w*, or its equivalent, for giving motion to the cams, I claim the cam *Y* and tool cam *x*, when acted upon, in such manner that the said cams remain stationary while the head revolves, or nearly so, and the cams revolve while the head is stationary, substantially for the purposes set forth.

Seventh. I claim finishing the heads of screw blanks, by an apparatus, by which the necessary tools for finishing the head are revolved around the spindles or blank holders, whether such blank holders are stationary or otherwise.

No. 25,151.—ANDREW TURNEY, JR., of Fairfield, Conn.—*Improvement in Laying Submarine Telegraph Cables.*—Patent dated August 16, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The construction and use of an apparatus consisting of two hollow cylinders A and B, with longitudinal joints or hinges, and two disks or flanges E and F, set obliquely to the cylinders, and a guide or regulating disk G, to be attached to a telegraph cable, while the cable is being submerged, to check the rapidity of the sinking and to afford a constant strain on it in the direction of the vessel which is paying out the cable, to avoid kinks or festoons, when the whole is constructed, arranged, and made to produce the result substantially as described.

No. 25,152.—JOHN WAGONER and ABRAM SEVERSON, JR., of Guilderland Centre, N. Y.—*Improved Washing Machine.*—Patent dated August 16, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—Mounting the revolving platform K and the pulleys and gearing P Q R, or their equivalents, on the hinged platform M, and so arranging the whole that, when M is turned up, the driving belt O<sup>1</sup> is slackened, and the whole lies within or by the side of the main frame; and when M is turned down the gravity of the tub, or equivalent vessel, tightens O and causes the several parts to operate without any labor in adjusting.

No. 25,153.—SAMUEL WETHERED, of Baltimore, Md.—*Improvement in Carding Engines.*—Patent dated August 16, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, a card clothed main cylinder for carding engines, which performs a lateral vibrating movement simultaneously with its revolution, substantially as and for the purposes set forth.

Second. A card clothed "fancy" or upper cylinder, which is capable of performing a lateral vibration as it revolves, in combination with a laterally vibrating card clothed main cylinder, substantially as and for the purposes set forth.

No. 25,154.—JULIUS WEHLE, of New York, N. Y.—*Improvement in Hat Measurers.*—Patent dated August 16, 1859.—This invention consists in making a hat measure with internal double handles, and a scale parallel with the circumference of the said hat measure, and fastened to the handles.

The inventor says: I *claim*, first, the dividing handle, in combination with the elastic oval strip A, for the purpose of contracting the said oval strip, substantially as described.

Second. The scale D secured to one of the handles, and passing through an incision of the other handle, in combination with the screw N, substantially as described, for the purpose set forth.

No. 25,155.—F. B. WILLIAMS, of Freeport, Ill.—*Improvement in Horse Power Machines*.—Patent dated August 16, 1859.—This invention consists in arranging a series of bevel wheels, toothed rings, shafts, and pulleys, in such a manner that the greatest velocity is obtained with the least amount of power, and that power may be transmitted from different places according to the required velocity.

*Claim*.—The arrangement and combination of the circular standard B, toothed rim B, ring C, pinions D, wheels E, pinion *e*, toothed ring G, and pinion H, to operate substantially as and for the purpose specified.

No. 25,156.—WILLIAM L. WILLIAMS, of New York, N. Y.—*Improved Machine for Bundling Kindling Wood*.—Patent dated August 16, 1859.—This invention consists in a machine that takes fire wood, as split up by a competent machine, and bundles the same by passing a wire, or its equivalent, around it, so as to secure the said kindling wood in such bundles of a convenient size for sale or handling.

The inventor says: I *claim*, first, the feeding clamps *f* and slides *d*<sup>1</sup>, arranged and actuated in substantially the manner and for the purposes set forth.

Second. I claim the combination of the separating and dividing knife *h*, with the concave wood carrier *h*<sup>2</sup>, to convey the wood to the bundling apparatus, as specified.

Third. I claim the sliding support *g*<sup>1</sup>, arranged and acting as set forth, to sustain the kindling wood as fed into the machine, and keep it in place, as described and shown.

Fourth. I claim the curved gatherers *i*<sup>1</sup>, fitted and acting as set forth, to deliver the bundle of wood and gather the next loose wood into a bundle, as specified.

Fifth. I claim the conical gathers *l* and *m*<sup>1</sup> to concentrate and compress the bundle of wood, as described and shown.

Sixth. I claim the stationary plate *k* and segments 15, in combination with the conical gatherer *l*, to sustain the wood while acted upon, as specified.

Seventh. I claim the plunger or press block *m*, acting to bring the ends of the bundle of wood level, as set forth.

Eighth. I claim the vertical moving frame *o*, forming the receptacle for the wire, and the guide for the apparatus that wraps said wire around the bundle of wood, as set forth.

Ninth. In combination with the frame *o*, I claim the chain 28 to wrap the wire around the bundle of wood, and the clamp *s*<sup>1</sup> to hold the wire near the middle part thereof, as described and shown.

Tenth. I claim the circular twisting jaws 30, moving in dovetails, and acting, when revolved by competent means, to twist the ends of the wires together, in the manner and for the purposes specified.

Eleventh. I claim the arrangement of the sliding and revolving shaft *t*, in combination with the twisting jaws 30, for the purposes set forth.

Twelfth. I claim the spring guides 25, to keep the wire straight while passed into the machine, in combination with the travelling jaw or clamp *p*, and with the shear 26, as described and shown.

No. 25,157.—JOHN ALEXANDER, of Brooklyn, N. Y., assignor to Himself and JAMES RICHIE, of said Brooklyn.—*Improvement in Patterns for Moulding*.—Patent dated August 16, 1859.—This invention consists in employing a "former," which may be made of wood, plaster of Paris, or other suitable substance, the exterior of the "former" corresponding in shape to the work to be cast, and equal in dimensions to its interior.

*Claim*.—The employment or use of a "former" C, with the pattern D, constructed of a plastic substance, and formed on or over the "former" C, substantially as described, to produce moulds in sand for the casting of hollow ware and other castings of the exact thickness required.

No. 25,158.—CHARLES BRADFIELD, of Philadelphia, Pa., assignor to C. STEWART BRADFIELD, of said Philadelphia.—*Improvement in Hanging the Bodies of Wheeled Vehicles*.—Patent dated August 16, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, attaching the wheels C to the body A by means of the arms *e*, secured to the traverse bars *d* of the shafts or arbors *b b*, which are fitted on the flanches *a* and bearings *c c* of the plates B of the body A, and have springs D placed between their flanches *a*, and traverse bars *d*, substantially as and for the purpose set forth.

Second. Attaching the thills E to the body A, by means of the bars G fitted in the eyes *g*, and secured thereon at the desired height by set screws *h*, substantially as described.

No. 25,159.—CALVIN FLETCHER, of Cincinnati, Ohio, assignor to ADDISON C. FLETCHER, of said Cincinnati.—*Improved Apparatus for Supplying Furnaces with Hot Air*.—Patent dated August 16, 1859.—This invention consists in the employment or use of a series of metallic

steam chambers communicating at each end with chambers, one to receive the escape steam from an engine, and the other to receive the water of condensation; the above parts being used in connection with a fan, and the whole arranged so that the boiler or furnace may be supplied with a requisite amount of hot air.

*Claim.*—The specific arrangement, as hereinbefore described, of the fan I, and the steam chambers A, communicating with the chambers B C, together with the inlet steam pipe E, the cold air passages *a*, hot air pipes G I I, and the pipes F, for the discharge of the water of condensation, for the purposes set forth.

No. 25,160.—HIRAM L. HALL, of Beverly, Mass., assignor to the BEVERLY RUBBER COMPANY, of said Beverly.—*Improvement in Restoring Waste Vulcanized Rubber.*—Patent dated August 16, 1859.

The inventor says: In restoring rubber by this new process I first grind the rubber and reduce it to a finely divided state, and then place it in a close steam boiler, or other suitable vessel, into which steam is conducted through a steam pipe.

*Claim.*—The restoring of waste vulcanized rubber or gutta percha by the use of superheated steam, substantially in the manner and for the purpose described.

No. 25,161.—MILES B. HAND, of Handsboro', Miss., assignor to Himself and SHELDON B. HAND, of said Handsboro'.—*Improvement in Cotton Presses.*—Patent dated August 16, 1859.

This invention consists in operating the follower of the press by a combination of toggles and screws, arranged so that the same are rendered capable of a general application to all forms of presses, whether designed for animal or other power.

*Claim.*—The combination of the toggles C C, and screws E E, when the latter are connected to the driving or power shaft, or to a shaft connected therewith, by means of universal joints H H, substantially as and for the purpose set forth.

No. 25,162.—JOHN J. LAHAYE, of Reading, Pa., assignor to Himself and JOHN TUCKER, of Philadelphia, Pa.—*Improved Churn.*—Patent dated August 16, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—The vessel B, cylinder C, and reciprocating plunger E, adapted to and arranged in respect to each other, substantially as set forth, in combination with the devices described, or their equivalents, for enlarging or contracting at pleasure the communication between the said cylinder and vessel, for the purpose specified.

No. 25,163.—CÆSAR NEUMANN, of New York, N. Y., assignor to ABRAHAM PRINCE, of Boston, Mass.—*Improved Machine for Making Hooped Skirts.*—Patent dated August 16, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the combination of a series of twisting apparatus, with guide rods, for the purpose of forming a hoop skirt, substantially in the manner and for the purposes set forth.

I also claim, in combination with the twisting apparatus, the elevating screw and its appendages, and the mode of operating the same, as described.

I also claim collapsing the guides to form different sized skirts and to deliver the same, as specified.

No. 25,164.—ROBERT POOLE, of Baltimore, Md., assignor to Himself and GERMAN H. HUNT, of said Baltimore.—*Improvement in the Fifth Wheel of Fire Engines and other Vehicles.*—Patent dated August 16, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—Hanging the pivoted fifth wheel of a steam fire engine, or other heavy carriage, to a bolster when the latter plays within or over the axle of a vehicle, and is suspended to springs which have their bearings or seats on said axle, substantially in the manner and for the purposes described.

No. 25,165.—E. L. PRATT, of Philadelphia, Pa., assignor to Himself and R. B. FITTS, of said Philadelphia.—*Improved Meat Safe.*—Patent dated August 16, 1859.—This invention consists in the combined arrangement of a close cover perforated with numerous small holes at or near its upper part, and a stand or horizontal platform likewise perforated with numerous small holes, and supported at a short distance above the ground or floor in such a manner as to subject its contents to a free circulation of the lowest and coldest portion of the air of the said apartment.

*Claim.*—A new article of manufacture, being a combined arrangement of a cover A, perforated with small holes at the upper part *d*, and a stand B, also perforated with small holes *f*, substantially as and for the purpose specified.

No. 25,166.—JOHN B. WICKERSHAM and HENRY JENKINS, of Brooklyn, N. Y., assignor to the NEW YORK WIRE RAILING COMPANY.—*Improvement in Iron Fences.*—Patent dated August 16, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—Constructing railways, fences, and other articles by metallic bars intersecting each other, and united by a cast-iron ornament or connection, when one or more bars running parallel, or in one direction, pass through between two or more bars running in another direction, substantially as specified.

No. 25,167.—*ARCHELAUS WILSON*, of New York, N. Y., assignor to *D. A. HEALD*, A. L. *WILMARTH*, C. T. *MARTIN*, and *H. A. HURLBURT*, of said New York.—*Improved Mode of Lighting Gas by Electricity.*—Patent dated August 16, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* combining, with a gas or other burner, metallic points approaching but not coming in contact with each other, substantially as described; but this I only claim in combination with the inductive apparatus, substantially as described, for the purpose of effecting ignition by means of the electric discharge or spark, as specified.

I also claim combining with a galvanic battery, an inductive apparatus or coil, metallic points, and an electro-magnet, for the purposes specified and substantially as described.

No. 25,168.—*PETER ARNESON*, of Newark, N. J.—*Improvement in Machinery for Forming Hat Bodies.*—Patent dated August 23, 1859.—The inventor says: By this invention hat bodies may be formed in a very rapid and perfect manner, and as the plates *K K* are adjustable, the thickness of the layers of fur may be modified as required. By having the former, or cone *S*, placed relatively to the picker *O* and rollers *L L* no deflector or guide spout is required, the fur being drawn on the former or cone direct from the rollers *L L* and below the picker *O* by means of the suction blast, the picker serving to throw out the heavier mass of fur, so that it may be drawn on the “former” at a point opposite to the lighter portion.

*Claim.*—The arrangement and combination of the adjustable plates *K K*, perforated apron *C*, case *M*, feed rollers *L L*, and pickers *D O*, substantially as and for the purposes shown and described.

No. 25,169.—*ALFRED BETTELEY*, of Boston, Mass.—*Improvement in Shipper Gear for Pulleys.*—Patent dated August 23, 1859.—This invention consists in making the brake independent from the brake lever or bar operating it, and hanging upon a spring or its equivalent, which shall tend to keep it away from the surface of the pulley, excepting when borne and pressed against the same by a friction roller applied to the end of the brake lever.

*Claim.*—The combination of a brake lever, a friction roller, and an independent brake, applied and operating together and with shipping apparatus, substantially in the manner and for the purpose set forth.

No. 25,170.—*R. F. BILLINGS*, of Portland, Me.—*Improved Bed Bottom.*—Patent dated August 23, 1859.—This invention consists in having the bed bottom formed of a series of longitudinal slats, the ends of which are attached by straps to the hinged lids of boxes in which spiral springs are placed, and on which the lids rest, the ends of the boxes being fitted in slots on the ends of side rails, and retained therein by the slats and tension of the springs.

*Claim.*—The arrangement and combination of the side rails *A A*, boxes *B B*, provided with the springs *C* and hinged lids *d d*, and the slats *D* attached to the lids *d* by the straps *g*, substantially as and for the purpose set forth.

No. 25,171.—*A. BINGHAM*, of Talladega, Fla.—*Improved Bed Bottom.*—Patent dated August 23, 1859.—This invention consists in having the bed bottom formed of a series of longitudinal inclined slats, placed at suitable distances apart, their lower ends attached to a foot rail, which is pivoted to the side rails, and their upper ends attached to a head rail, the ends of which are fitted in curved guides attached to the side rails, each slat resting on a spiral spring, and the whole so arranged as to form an elastic bed bottom.

*Claim.*—The arrangement and combination of the longitudinal slots *C*, rocking foot rail *B*, rising and falling head rail *F*, and segment guides *G*, as and for the purpose shown and described.

No. 25,172.—*SEBA BOGERT*, of New York, N. Y.—*Improvement in Finger Rings.*—Patent dated August 23, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—An extension or divided finger ring, having its ends provided with a catch or fastening, substantially as and for the purpose set forth.

No. 25,173.—*CHARLES W. BROWN*, of Boston, Mass.—*Improvement in Grinding Mills.*—Patent dated August 23, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, regulating the adjustable stone of a grinding mill that the stone may have a vertical adjustment, so as to grind finer or coarser at the same time; and that the pressure of the runner with respect to the stationary stone will be automatically equalized and be raised and lowered to free itself of any foreign substance getting between the two stones, by means of levers *I J* and vertical rod *N*, toggles *n n*, sliding collar *m*, and

weighted arms T T acting upon the movable bearing plate S, or the equivalents thereof, when the same are arranged and operated in the manner essentially as specified.

Second. I claim the method set forth for regulating the flow of the grain from the hopper M by adjusting the same vertically in the manner set forth.

Third. I claim the dead eye L, arranged with the eye in the upper stone A, and capable of being depressed or raised with the spindle G, for the purposes and in the manner specified.

No. 25,174.—C. P. BUCKINGHAM, of Mount Vernon, Ohio.—*Improvement in Cut Off Gear for Steam Engines.*—Patent dated August 23, 1859.—In this invention, when the stems E are raised by the action of the lifter L, the arms K, which extend near to the centre of the framing H, strike against the tripper N, adjusted in the top plate G of the framing H, so that the arms K strike sooner or later.

*Claim.*—The employment of the tripper N, when constructed and arranged as shown, so as to be adjusted and to trip both valves in combination with drops J, arms K, and lifters L, as set forth.

No. 25,175.—WILLIAM BURNET, of New York, N. Y.—*Improved Inkstand.*—Patent dated August 23, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—The construction of an adjustable apparatus, made substantially as described, connected with the cover and a flexible bottom of an inkstand, so that at whatever height above the lower orifice of the funnel the ink in the main reservoir may be there shall always be a sufficiency and never an overflow in the funnel on opening the inkstand cover.

No. 25,176.—J. CARL, of Grenada, Miss.—*Improvement in Grinding Mills.*—Patent dated August 23, 1859.—The object of securing the upper stone to the shaft B by means of the hinged lever *a* is threefold: In the first place, the upper bearings of the shaft are thereby brought in such a position that it can be oiled, and that the dust and the flour from the stone cannot get to it so easily; secondly, by attaching the stone to the lever, which is pivoted to the shaft, its grinding surface can always adapt itself to the surface of the lower stone; and, thirdly, when the lower stone is raised by the action of the rod *f* and nut *h*, a direct pressure is exerted on the substance between the grinding surfaces of the stones independent of the weight of the upper stone which is secured to the shaft.

The inventor says: I *claim*, first, the arrangement and combination of the pivoted lever *a*, shaft B, stone C, and screws *d*, substantially as and for the purpose herein shown and described.

Second. The employment of a hinged top bar *g*, in combination with shaft B and stones C D, as and for the purpose shown and described.

No. 25,177.—H. M. COOMBS and L. W. NELSON, of Portland, Oregon.—*Improved Washing Machine.*—Patent dated August 23, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—The construction of the clothes cylinder A, surrounded with air tubes having orifices for discharging air into the water, in the manner substantially set forth, in combination with the drying and washing cylinder D and fire chamber I, all arranged and combined in the manner and for the purposes specified.

No. 25,178.—CYPRIAN U. CRANDALL, JAMES H. CRANDALL, and HOZA A. HAWKINS, of Cameron, Ill.—*Improvement in Mole Ploughs.*—Patent dated August 23, 1859.—This plough is intended for cutting and forming subterranean ditches for the purpose of draining, &c. The two principal parts of which it is composed are the ditching or opening piece A G and the follower or former piece C D E H I. The ditching or opening piece is attached to the lower end of the standard F, to the upper part of which the team is hitched.

*Claim.*—The combination of the opening or ditching piece A G with the standard F and the peculiarly formed hinged follower or former, constructed and operating in the manner as and for the purposes set forth.

No. 25,179.—ELLIOTT H. CRANE, of Burr Oak, Mich.—*Improved Rat Trap.*—Patent dated August 23, 1859.—A represents a box trap; D is the door of the trap, said door being hinged at its upper end at *s*, near the top of the box, so that it hangs and swings backward and forward when required.

*Claim.*—The arrangement of platform *a*, spring C, strap *x*, spring *i*, and check *p*, with arms B B, provided with projections *n n*, spring H, and box A, provided with hanging door D, when the several parts are combined and operated substantially as and for the purpose specified.

No. 25,180.—HORACE H. DAY, of New York, N. Y.—*Improvement in the Manufacture of Ribbed Elastic Cloth.*—Patent dated August 23, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the method substantially set forth of manufacturing ribbed

elastic cloth; that is to say, elastic cloth containing strands of rubber, by forming the strands of rubber upon the covering cloth to which they are to be permanently attached, in contradistinction to forming the strands separately and afterwards attaching the covering material to them.

I also claim the method substantially as set forth of spreading the gum upon the covering cloth and dividing into strands at one process, so that two operations are effected simultaneously, at different parts of the same apparatus.

No. 25,181.—LUCIUS DIMOCK, of Hebron, Conn.—*Improvement in Machines for Winding Thread*.—Patent dated August 23, 1859.—This invention consists in a method of cutting the grooves by which the operator substitutes for the single series of parallel grooves in each guide, two separate and distinct series of grooves, arranged obliquely, in opposite directions to the planes of revolution of the spools; the direction of one series corresponding with the direction which the thread has in one of its spiral layers, and the direction of the other series corresponding with the direction which the thread has in the next layer, and the two series being so arranged that neither interferes with the operations of the other.

*Claim*.—The arrangement and combination with the guide A of two separate and distinct series of grooves *b c*, having their channels cut on opposite angles, as and for the purpose shown and described.

No. 25,182.—JOSEPH DITTO and HENRY VAN BERGEN, of New York, N. Y.—*Improvement in Composition for Cement Roofing*.—Patent dated August 23, 1859.—This invention consists in the use of the residuum in the manufacture of kerosine oil with other waterproof glutinous materials, such as coal tar oil, turpentine, varnish, &c., all, or either of them, to be compounded and spread on the object to be covered, with a stiff brush, and then covered with fine dry mica; the residuum being the product of cannel coal in the manufacture of kerosine oil.

*Claim*.—The composition prepared and composed of the materials described, and in the proportions set forth, for the purpose of forming cement for roofing purposes.

No. 25,183.—DANIEL DODGE, of Keesville, N. Y.—*Improvement in Nail Machines*.—Patent dated August 23, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* a griper having a reciprocating movement towards and from forging or pointing machinery, and opening automatically at the outer extremity of its stroke, so as to allow the introduction, feeding forward, or removal of the rod, while it is in this position, but holding the rod fast at every other stage of its operation, and while in any other position, substantially as described.

And in combination with a so operating griper, I claim the employment of a gauge and a cutter, or cutters, operating in the described order of succession with respect to each other and the griper.

No. 25,184.—SETH W. EELLS, of Mansfield, Ohio.—*Improvement in Writing Fluids*.—Patent dated August 23, 1859.—The nature of this invention or discovery is in combining the following articles, viz: indigo, fuming (Nordhausen) sulphuric acid, iron, tannin, oil of cloves, creosote, and water.

*Claim*.—The manner of combining the above materials so as to prevent the oxidation of the indigo and other coloring ingredients, as specified.

No. 25,185.—EDGAR S. ELLS, of Troy, N. Y., assignor to C. G. KEENEY, of Manchester, Conn.—*Improvement in Knitting Machines*.—Patent dated August 23, 1859.—The inventor says: In the application of my improvement the needles may be of either the "spring hook" kind or of the "latch" variety, and arranged in the form of a cylinder, disk, or truncated cone; the sinker or device for feeding the yarn into the needles, and all other knitting appliances, excepting the devices for casting the loops of yarn off from the needles, remain as in any of the well known machines, and so does the position of the casting off device when in action.

*Claim*.—The combination and arrangement of the lever *e*, arm *h*, pin *j*, and slot *k* with the lever *l*, detent *n*, and springs *o* and *p*, substantially as and for the purposes described.

No. 25,186.—JAMES J. ESSEX, of Newport, R. I.—*Improvement in Elastic Bulb Syringes*.—Patent dated August 23, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* so combining and arranging the bulb, air chamber, and delivery valve with each other and with the flexible section and delivery tubes, that the air chamber shall be above the delivery valve, and shall be, and shall remain while in use, upright, or nearly so, and under the control of the hand, which grasps and operates the bulb.

No. 25,187.—ALBERT FICKETT, of Rochester, N. Y.—*Improved Belt Fastening*.—Patent dated August 23, 1859.—This invention consists in inserting small loops or links made of

any suitable material into the ends of straps, and fixing them there by means of rivets *r*, as shown, where A B are two sections of a leather belt, one end of the links *l* being inserted and riveted into the end of the strap A and the other ends of the same links being attached to the end of the section B in a similar manner.

*Claim.*—The combination of the links *l l l* with the rivets *r r r*, said links being inserted in the ends of the belt, in the manner and for the purpose substantially as described.

No. 25,188.—ELBRIDGE FOSTER, of Hartford, Conn.—*Improved Easy Chair.*—Patent dated August 23, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the application and insertion of the quadrant slide into the centre of each of the arms or scroll of the side rail, so as to be unseen when the back is up, in the manner as described.

Also, the application of the spring adjustable and extension back centre leg, in the manner and for the purpose described, the whole constituting a new article of manufacture for household use.

No. 25,189.—JAMES F. GAMBLE, of Concord, Pa.—*Improved Method of Feeding the Saw to the Stuff in Sawing Machines.*—Patent dated August 23, 1859.—This invention consists in moving the saw forward to the lumber, and not the lumber towards the saw.

*Claim.*—Moving the saw forward when cutting whilst the lumber is held stationary, substantially as set forth.

No. 25,190.—STACY A. GARRISON, of Union, N. Y.—*Improved Hub Reamer.*—Patent dated August 23, 1859.—A represents an arbor or shaft, on one end of which a screw thread *a* is formed; at the opposite end a square *b* is formed to receive a crank, with which to turn the arbor or shaft. In the arbor A two cutters *c d* are secured.

*Claim.*—The arrangement and combination of cutters *c d* and arbor A, as and for the purposes set forth.

No. 25,191.—WILLIAM GOODALE, of Clinton, Mass.—*Improved Machine for Making Paper Bags.*—Patent dated August 23, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the pasting apparatus, consisting of the roller G, fitted to work in an opening in the bottom of a paste box, the spring H, or its equivalent, and the adjustable stopper *a*, all combined to operate substantially as described.

Second. The combination of the continuously revolving measuring rollers I I<sup>1</sup>, and the intermittently revolving feed rollers J J<sup>1</sup>, operating substantially as and for the purpose described.

Third. The drop N, operating in combination with the cutter B and the feed rollers, substantially as and for the purpose specified.

Fourth. Folding the paper around a plate Q, or flat piece of any material narrower than the bag itself, or of the same width but shorter than the bag itself, substantially as specified.

Fifth. The folders R R<sup>1</sup>, applied and operating in combination with the inclined planes *l l*, at the sides of the folding table C, substantially as and for the purpose set forth.

Sixth. The combination with the folding table and with a plate Q narrower than the bag to fold the bag upon, of one or more movable inclined planes *l*<sup>1</sup>, and creasing blades U, operating substantially as described.

Seventh. The drop Z, applied and operating substantially as and for the purpose described.

Eighth. The bar 21, applied to the vibrating roller frame, and operating in combination with the knock off *n*, substantially as and for the purpose set forth.

No. 25,192.—CHARLES GOODYEAR, of New Haven, Conn.—*Improvement in Porous Napped Rubber Fabrics.*—Patent dated August 23, 1859.—The claim explains the nature of this invention.

*Claim.*—A new porous manufacture or fabric, composed of a woven or other cloth, or equivalent therefor, and India rubber, or allied gum, rendered pervious to air and impervious to water, substantially as described, and with a face of flocks, clippings, or shearings of woolen or other fibres, or equivalents therefor, substantially as and for the purpose described.

No. 25,193.—RENSSELAER D. GRANGER, of Philadelphia, Pa.—*Improvement in Cooking Stoves.*—Patent dated August 23, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—Placing across the upper flue of a cooking stove a hollow box formed partition communicating with the external air, the said partition having two openings arranged in respect to the boiler holes in the top of the plate, as herein set forth, and the said openings having their inner surfaces perforated, as and for the purpose specified.

No. 25,194.—JOHN S. HAWKINS and REZIN HAWKINS, of Greenfield, Ind.—*Improvement in Harvesters.*—Patent dated August 23, 1859.—This invention consists in the construction of a mower and harvester, with a peculiar arrangement of the main frame and team shaft, in

combination with an adjustable frame for elevating and depressing the grain table, cutter, and reel; and also in an improved flexible shoe for grinding the points of the cutters in order to cut the grass close and yet prevent the cutters from being thrust into the ground, and also to avoid the heavy dragging of the front of the machine.

*Claim.*—The arrangement of the main frame and the team shaft in combination with the adjustable frame L, and hinged shoe or cutting apparatus T, constructed and operated in the manner substantially as described and for the purpose specified.

No. 25,195.—THOMAS R. HOPKINS, of Petersburg, Va., assignor to Himself and R. E. ROBINSON, of said Petersburg.—*Improvement in Screw Presses.*—Patent dated August 23, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The use, in combination with the power screw of a press, or other machine, of two revolving nuts F F which are fitted to gear into the thread of said screw, and so arranged and operated upon, in order to give motion to the screw, that the upper one remains stationary while the lower one revolves, and *vice versa*, substantially as and for the purposes set forth.

No. 25,196.—ROBERT W. HILL, of Naugatuck, Conn.—*Improvement in Cooking Apparatus.*—Patent dated August 23, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The portable cooking or heating apparatus described, composed of the hot air chamber A and fire pot B, when provided with ports C furnished with registers, with the partition c and draft apertures a, the whole being constructed and arranged as specified.

No. 25,197.—HERMANN HIRSCH, of Berlin, Prussia.—*Improved Marine Propeller.*—Patent dated August 23, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The peculiar form and construction, substantially as described, of a propeller, whereby the centrifugal force obtained is made to cooperate with and increase the effect of the screw.

No. 25,198.—HERMANN HIRSCH, of Berlin, Prussia.—*Improvement in the Construction of Ships.*—Patent dated August 23, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The form and construction, substantially as set forth, of the hull of ships, or vessels, whereby the possibility of the breakage of the keel is removed, and a normal form giving the maximum of steadiness, without retardation of velocity, is imparted to the bottom.

No. 25,199.—RICHARD M. HOE, of New York, N. Y.—*Improvement in Feeding Paper to Printing Presses.*—Patent dated August 23, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the combination of the feeding mechanism, cutting apparatus, and the printing machine, or their equivalents, in the said combination for feeding the paper from a roll to a printing machine, and cutting or partially cutting it into sheets, as it passes along to be printed, as set forth.

I also claim making the cutter so as to leave the several sheets united in certain places, substantially as described, in combination with the conducting tapes, as described, or the equivalents thereof, so that the conducting tapes may pass around the cutter cylinder, as set forth.

And I also claim, in combination with the cutter cylinder and the grooved cylinders, substantially as specified, or the equivalents thereof, the employment of the two pressure rollers, or their equivalents, as described, for keeping the sheet distended.

No. 25,200.—CHARLES H. HUNTER, of Shelbyville, Ind.—*Improvement in Machines for Weighing Grain.*—Patent dated August 23, 1859.—This invention consists in the arrangement of parts by which the mouth of the sack is stretched open while the grain is put in and weighed by the scale to which the sack holder is attached.

*Claim.*—The combination of the scale beam or lever g, with bag holder H, secured to one end, and the standard C E, with rack and pinion for elevating and depressing the scale beam, when the whole is constructed and arranged substantially as described, for the purpose set forth.

No. 25,201.—OBED HUSSEY, of Baltimore, Md.—*Improvement in Harvesters.*—Patent dated August 23, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the combination of the main ground wheel, seat, and platform when hinged to the main frame, substantially as described.

I also claim the raising and lowering of the entire frame, finger bar, and outside divider upon the two ground supports in a horizontal position, by means of a lever and its connections therewith, operated by the driver from his seat substantially as described and for the purpose set forth.

No. 25,202.—JACOB JENKINS, of Lynn, Mass.—*Improved Mechanism for Protecting the Upper of a Boot or Shoe while Applying the Sole.*—Patent dated August 23, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the described arrangement of a shoe jack, (or the mechanism for supporting the toe and heel parts of a boot or shoe,) a guard or protector constructed essentially as set forth, (the same to be made to encompass the upper of a boot or shoe, or as much of it as extends above the bottom surface of the last,) and a clamping contrivance for adjusting the protector to the contour of the shoe, the whole being made to operate together, as and for the purpose set forth.

I also claim the above described application and arrangement of an adjustable guard to the protector, whereby the fitting of the outer sole to the insole and upper is not only greatly facilitated, but is rendered certain of being fixed in its true and proper position.

No. 25,203.—WALTER W. KELLY, of Reedtown, Ohio.—*Improvement in Scales.*—Patent dated August 23, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The adjustable rack G, and platform H, constructed and arranged as described, in combination with the centre piece I upon which the rack and platform are placed, so that either one can be used at pleasure in the manner as specified.

No. 25,204.—W. R. LANDFEAR, of Hartford, Conn.—*Improved Pegging Machine.*—Patent dated August 23, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the employment, in combination with the bar A, of the vertically and laterally moving box C, having a plate D, awl *h*, punch *i*, and inclined face *j*, arranged substantially as described and shown, so that on the descent of the plate D, the awl will enter the sole, and the inclined face *j*, will, while the awl remains in the leather, shove the bar A along laterally, thus insuring certainty and regularity of feed; and on the elevation of the plate D, the box C will be moved laterally by the spring *l*, the awl will be carried over the point where a new hole is to be made, and the punch brought over the previously made peg hole in readiness to drive home the peg on the next descent of the plate D.

Second. The combination with the vertically and horizontally moving box C, of the spring *l*, for giving a lateral movement to said box, and the adjusting screw *m*, for regulating the space between the peg holes, as shown and described.

Third. The arrangement and combination with the bar A, of the adjustable elastic plate E, against which the peg block is pressed, said plate being adjusted by means of the screw *p*, to suit any size of pegs, as herein shown and described.

No. 25,205.—D. L. LONG, of Dayton, Ohio.—*Improvement in Sleeping Berths for Railroad Cars.*—Patent dated August 23, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The arrangement and combination of the jointed supporter *i i i<sup>2</sup> i<sup>2</sup> m n r*, and hinged seat and back A with folding berth *g g<sup>1</sup>*, screen *k*, and rest *l*, all constructed and operating so as to form two sleeping berths, substantially as described.

No. 25,206.—EUGENE MARTIN, of Waterbury, Conn.—*Improvement in Alloys.*—Patent dated August 23, 1859.—The inventor says: In my process I employ the following ingredients, and for the production of an alloy resembling jeweller's gold of from fourteen to sixteen carats. I employ them in the following proportion:

First, Lake Superior copper, 100 pounds; second, pure silver, (20 dwts to the ounce,) 16 ounces; third, quick lime, well pulverized, 1 pound 14 ounces; fourth, tartar, non-purified and pulverized, 12 pounds; fifth, zinc, 18 pounds 12 ounces: sixth, pulverized glass, 4 pounds 10 ounces.

*Claim.*—The process or mode or procedure, substantially such as described as applied with the ingredients such as described, and for the purpose specified.

No. 25,207.—JOHN M. MAY, of Janesville, Wis.—*Improvement in Pumps.*—Patent dated August 23, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* cylinder B, in combination with part A, when constructed, arranged, and operated with piston C and pipe E, substantially as described, and for the purpose set forth.

I also claim the screw D, when used for the purposes of fastening and unfastening the stationary part of the pump in the well, or reservoir, to any suitable substance, substantially as and for the purposes described.

I also claim set screw N, in combination with the notch O, or projection P, or their equivalents, to form a catch or wrench for turning the screw D, and pump nearly in the path of a horizontal circle, in fastening and unfastening the stationary part of the pump in the well, or reservoir, substantially as described; the set screw N also serving to gage the descent of the piston and to protect the valves from injury, as set forth.

I also claim the devices consisting of springs G G, segment J, and lever H, when connected together substantially as described, and for the purposes set forth.

No. 25,208.—JOHN M. MAY, Janesville, Wis.—*Improvement in Pumps*.—Patent dated August 23, 1859.—This invention consists in using two cylinders in the construction of a pump, one working inside the other, and kept together by a set screw passing through the outside cylinder and the joint passing into a channel, or longitudinal groove in the inside cylinder, for the double purpose of gauging the stroke of the pump and keeping the two cylinders together while lowering the pump to its place for operating and removing it when necessary for repairs, the inside cylinder being attached to and moving with the pipe that conducts the water.

The inventor says: I *claim* the device for connecting together the cylinders and regulating the stroke of the pump in combination with the point or spike I, or its equivalent, when used in open wells; and I claim said device in connection and combination with the rod H, when used in drilled wells, substantially as and for the purpose set forth.

I also claim the collar F and springs *g g g g*, *g g g g*, when used in combination with the pump, or with the eduction pipe, and arranged substantially as shown.

No. 25,209.—HIPPOLYTE MONIER, of Paris, France.—*Improvement in Argand Gas Burners*.—Patent dated August 23, 1859.—This invention consists in a certain mode of combining metal with burnt clay, porcelain, or other incorrodible refractory non-conductor in an argand gas burner, whereby the manufacturer is enabled to use such incorrodible substance for those parts of the burner for which it is desirable, and to use metal for those other parts which it serves better.

*Claim*.—The construction of the argand burner, with its grate *a* and external tube *b*, of clay, porcelain, or other incorrodible refractory non-conducting material, and with its inner tube or stem of metal; the several parts being combined substantially as described.

No. 25,210.—RICHARD MONTGOMERY, of New York, N. Y.—*Improvement in Corrugated Iron Bridges*.—Patent dated August 23, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of the corrugated arch A B with the corrugated arch M N, constructed and arranged in relation to each other substantially as described and shown.

Second. The combination of the peculiarly formed blocks C and bed plates F with the abutment ends of the arches A B and M N, substantially as and for the purposes set forth.

Third. The combination of the blocks D and the bottom plates G with the rails K L and arches A B and M N, substantially as and for the purposes set forth.

No. 25,211.—BENJAMIN F. MOORE, of New York, N. Y.—*Improvement in Ladies' Bustles*.—Patent dated August 23, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—An inflated bustle for ladies' dresses, formed with the projecting points, or scallops *d d*, in the manner and for the purpose specified.

No. 25,212.—DANIEL MURRAY, of Fairfield, N. C.—*Improvement in the Mode of Measuring Grain*.—Patent dated August 23, 1859.—This invention consists in the movable slides for cutting off the grain.

*Claim*.—The arrangement of the arms *a* and *h* in combination with the slides *b* and *f*, constructed and operating as described for the purpose set forth.

No. 25,213.—WILLIAM MURRAY, of Baltimore, Md.—*Improvement in Stamping Machines for Crushing Ore, &c.*—Patent dated August 23, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the combination of two or more stampers arranged on the same radial line, with two or more semi-circular inclined revolving lifting and dropping cams, which move together, and with a central driving shaft, substantially as and for the purposes set forth.

Second. Providing the semi-circular lifting and dropping cams, with a vertical joint about midway between their terminating ends and an oblong vertical slot at their rear, or highest ends, and attaching said ends by means of a set screw, or its equivalent, to the frame of the cams, so that the inclination of said cams may be adjusted to lift the stampers to a greater or less height, according to the force required to perform the operation of stamping, substantially as and for the purposes set forth.

No. 25,214.—RICHARD H. OSGOOD, of Columbus, Ohio.—*Improved Reciprocating Saw*.—Patent dated August 23, 1859.—This invention consists in providing square notches on the upper corner or top front of those of the teeth which do not pass through the whole of the log or timber, for the purpose of more easily raising the sawdust from the kerf.

*Claim*.—Providing the upper edges of saw teeth with notches *ff*, Fig. 1, substantially as described and represented, for the purpose of assisting to clear the kerf of sawdust.

No. 25,215.—JOHN L. POTT, of Pottsville, Pa.—*Improvement in Hoisting Apparatus*.—Patent dated August 23, 1859.—This improvement consists in placing the drum at such an

angle that it shall revolve in a plane parallel, or nearly so, to the two lines of rope, when the latter have traversed half their distance in combination with certain devices for guiding the lines of hoisting rope to their proper position on the drum.

*Claim.*—The inclined drum M, revolving in a plane parallel, or nearly so, to the lines of hoisting rope, in combination with the guide pulleys Q Q on the cross head R, the latter being operated from the shaft of the drum, through the medium of the screw K, or its equivalent, substantially as and for the purpose set forth.

No. 25,216.—JOHN B. QUIGLEY, of Trenton, N. J.—*Improvement in Tapping Water Mains.* Patent dated August 23, 1859.—When the hole is so far bored out as to leave only a thin shell, it is ready for the introduction of the female drill K, which is previously attached in the usual way to a service pipe; the female drill is then introduced and the piece E placed upon its head and held thereon by a pressure upon the end of the beam D, and by one or two blows it is driven through the pipe.

*Claim.*—The employment of the pivoted standards B, jaws C, adjustable beam D, adjustable swivel F, chain G, vertical sliding piece E, and female K, when the above parts are arranged and combined as shown and described.

No. 25,217.—THOMAS ROBJOHN, of New York, N. Y.—*Improved Inkstand.*—Patent dated August 23, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—The arrangement and combination of the ring D, cover D<sup>1</sup>, arm e, slotted projection E, and diaphragm G, so that by pressing down the ring D, the cover will open and the ink rise, and by releasing the ring the ink will fall and the cover D<sup>1</sup> will close, as and for the purpose shown and described.

No. 25,218.—CHARLES W. RUSSELL, of Philadelphia, Pa.—*Improved Method of Shaping Bonnets.*—Patent dated August 23, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The described method of shaping bonnets, &c., by means of a cord, or its equivalent, which is wound over the several parts of the bonnet, and which is retained in its position by hooks a and d, or their equivalents, substantially as specified.

No. 25,219.—CHARLES W. RUSSELL, of Philadelphia, Pa.—*Improved Machine for Pressing Bonnets.*—Patent dated August 23, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The arrangement of the adjustable roller l, or its equivalent, in such relation to the chain or rope which connects the treadle with the press lever D, that the direction in which the pressing iron acts can be controlled, substantially in the manner and for the purpose described.

No. 25,220.—AUGUSTIN P. SAMUEL, of New York, N. Y.—*Improvement in Rotary Engines.* Patent dated August 23, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the method of governing and working the pistons C D, by connecting their piston rods K K, through the roller holders L L and rollers M M, directly with the eccentric curve F, substantially as and for the purposes set forth.

I also claim the combination and arrangement, substantially as described, of the valves a and b, with and within the movable pistons C D, whereby such valves a and b are opened by the first motion of the piston rods K K, and before any motion is given the pistons C D, so that a passage is given to the steam within such pistons, and the steam admitted on both sides thereof, for the purpose of producing an equilibrium of pressure on each side of such pistons before they are put in motion.

I claim, also, the construction and arrangement, as above described, of the packing rings r s, acting against each other by inclined surfaces, the outer ring s being conical or tapering on both sides, and the inner ring r being tapering on one side only, towards the ring s, and the inner ring acting against the other by means of the spring z, or its equivalent, expanding it outward against the cylinder, and inward against the piston, for the purposes specified.

No. 25,221.—HEZEKIAH B. SMITH, of Lowell, Mass.—*Improved Mortising Machine.*—Patent dated August 23, 1859.—This invention consists in the arrangement of the adjustable fulcrum, lever, table, and extension rod with each other when they are combined with power mortising machines, for the purpose of giving in all cases only the necessary movement of the foot, and so that the foot may always, when operating the machine, be as near the floor as possible.

*Claim.*—The relative arrangement of the fulcrum D, lever E, connecting rod G, and table B with each other in the manner described, when combined with power mortising machines, for the purposes set forth.

No. 25,222.—GEORGE S. G. SPENCE, of Boston, Mass.—*Improvement in Stoves.*—Patent dated August 23, 1859.—The object of this invention is the better or more perfect combustion

of the smoke and gaseous or volatile products that may escape from the fuel while it may be in a state of ignition.

The inventor says: I *claim* the use of the conical inverted cup B, combined with the chain *f*, or its equivalent, in the manner and for the purpose set forth.

I also claim the combination of the air deflector in the fire place door register, and so as to operate therewith and deflect the entering currents of air upon or towards the ignited surface of the fuel as described.

No. 25,223.—ORANGE N. STODDARD, of Oxford, Ohio.—*Improvement in Sewing Machines*.—Patent dated August 23, 1859.—The subject of this invention is a yielding metallic loop check, which enters a channel or groove in a portion of the periphery of the hook.

*Claim*.—The yielding metallic loop check B *b*, operating in combination with a grooved hook A *a*, or its described equivalent, in the manner and for the purpose set forth.

No. 25,224.—ZURIEL SWOPE, of Lancaster, Pa.—*Improved Animal Trap*.—Patent dated August 23, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the sinking bottom N, constructed as described, for closing the trap when acting in combination with the spring *g* and bait lever M, substantially as specified.

Second. I claim the counterbalance chamber H, constructed as described, and operating for the purpose of resetting the trap, as set forth.

No. 25,225.—H. K. SYMMES, of Newton, Mass.—*Improvement in Gas Retorts*.—Patent dated August 23, 1859.—The inventor says: In this invention, I close the openings of the flues by valves, which can be operated from the outside, and I charge the two ends of the retort at different times, so that one end is hot while the other is charged; and that, by closing the flue on this end, the gas arising from the fresh charge can be forced to pass through the whole length of the retort to the flue on the opposite end.

*Claim*.—The arrangement of the movable flues D with valves E in combination with retorts of double length, substantially as and for the purpose described.

No. 25,226.—CHARLES TAYLOR, of Little Falls, N. Y.—*Improved Ticket Holder for Railroads, &c.*—Patent dated August 23, 1859.—This invention consists in providing a ticket holder for railroads and other purposes with a spring clasp and an eye on the end of the spring clasp, and a spring hook and a link to connect them together.

*Claim*.—The eye E, spring clasp *c*, and spring hook B, in combination with the link D, or its equivalent, for the purpose described.

No. 25,227.—STEPHEN R. WEEDEN, of Providence, R. I.—*Improvement in Preparation of Candle-Wicks*.—Patent dated August 23, 1859.—This invention consists in the use of a plaited cotton wick, saturated with acetate of lead and then coated with silicate of soda or silica combined with any suitable alkali, whereby the wick is stiffened so that it will not bend too readily.

*Claim*.—A plaited or braided candlewick *c*, saturated with a solution of acetate of lead, or other substance, to aid combustion, and coated with a silicate, as and for the purpose set forth.

No. 25,228.—J. W. WETMORE, of Erie, Pa.—*Improvement in Railroad Chairs*.—Patent dated August 23, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The T lip or jaw, as at *k l m* or *k<sup>3</sup> l<sup>3</sup> m<sup>3</sup>*; notching the web of the rail as at *e e*, and through these notches having the bottom of the jaw pass down and riveted or keyed under the base *g h*.

No. 25,229.—IRA WISEL, of Newbury, Min.—*Improvement in Water Wheels*.—Patent dated August 23, 1859.—This invention consists in making any wheel longer than the scroll or inlet or gate of water, with concave hooking brackets, and heads to support said brackets.

*Claim*.—The peculiar form of the buckets in combination with the rest of the wheel.

No. 25,230.—F. L. BUEL, of Manchester, Conn., assignor to C. G. KEENEY, of said Manchester.—*Improvement in Knitting Machines*.—Patent dated August 23, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* attaching the mechanical device set forth to a knitting machine, namely, the thread guide *b*, lever *c e*, and arm *i*, substantially in the manner and for the purpose set forth.

Second. The arrangement of the lever *k*, connections *m n*, frame *h*, and arm I, substantially as described, and for the purpose set forth.

No. 25,231.—JONAS HINKLEY, of Clarksfield, Ohio, assignor to Himself and FREDERICK A.

WILDMAN, of said Clarksfield.—*Improvement in Sewing Machines.*—Patent dated August 23, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of the looper H and receiving spring hook J, when arranged so as to operate in the manner and for the purpose set forth.

Second. The combination of the deflecting hook G, the looper H, and the receiving hook J, essentially as specified.

Third. The lifting finger K, or its equivalent, operating substantially as set forth.

Fourth. The combination of the lifting finger K with the looper H and receiving hook J, substantially as described.

Fifth. The combination of the lifting finger, the deflecting hook G, the looper, and the receiving hook, arranged and operating substantially as described.

Sixth. the combination of the arm D<sup>5</sup>, link D<sup>6</sup>, and lifting bar D<sup>3</sup>, with the vibrating bar D<sup>4</sup>, and feeding hand D<sup>7</sup>, for the purpose described.

No. 25,232.—THOMAS R. HOPKINS, of Petersburg, Va., assignor to Himself and R. E. ROBINSON, of said Petersburg.—*Improvement in Cam Presses.*—Patent dated August 23, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—Operating a press follower, or other part of the machine, which is calculated to give a gradual pressure by means of the combined agency of two differently toothed disks D D<sup>1</sup>, which revolve at unequal speeds, two sets of reverse acting cams *h g*, and intermediate friction rollers E, or their equivalents, substantially as described.

No. 25,233.—WILLIAM LINTON, of Baltimore, Md., assignor to JOHN JONES, of said Baltimore.—*Improvement in Machines for Making Clay Pipes.*—Patent dated August 23, 1859.—The plate A has an opening H, over which the two jaws C D move towards each other by means of levers or otherwise, and meet at the centre. The core mandrel E has two sizes, the larger F corresponding to the opening B in the plate A, and the smaller size E corresponding with opening G.

*Claim.*—The two sized permanent core or mandrel, in combination with the fixed die A and adjustable jaws C D, are constructed, arranged, and operated in the manner described.

No. 25,234.—EDWARD P. STEEN, of San Francisco, Cal., assignor to Himself and B. S. NICHOLS, of Sacramento, Cal.—*Improvement in Quartz Mills.*—Patent dated August 23, 1859.—This invention consists in arranging two stampers in a double cylinder, in such a manner that, by the action of the upper ends of the stems of the stampers (which at the same time form the pistons) as they strike against two valve pistons, the steam is changed and conducted to the two cylinders by means of cross passages, arranged in such a manner that when steam is admitted to one cylinder on the top it is exhausted from the bottom.

*Claim.*—The employment of stampers E E<sup>1</sup> when the same are operated by means of steam cylinders H H<sup>1</sup>, which communicate by the cross passages *e e*<sup>1</sup>; the change of steam being effected by the valve pistons J J<sup>1</sup> operating on the working beam L, and operated by the pistons G G<sup>1</sup>; the whole being arranged and combined substantially in the manner described.

No. 25,235.—BERNARD LAUTH, of Pittsburg, Pa., assignor to JONES & LAUTH, of same place.—*Improvement in the Manufacture of Iron.*—Patent dated August 23, 1859.—The claim explains the nature of this invention.

*Claim.*—A new article of manufacture made by rolling iron or steel in a cold state, for hardening and adding strength to it, without injury to its fibre, and at the same time reducing it in size, as set forth.

No. 25,236.—EDMUND BELLING, of New York, N. Y.—*Improvement in Lozenge Machines.*—Patent dated August 30, 1859.—This invention consists in the combination of a revolving or reciprocating knife with a power press, in such a manner that, after the lozenge dough is pressed through the perforated bottom in said press in a continued string, the lozenge will be cut off by the action of the said knife the required thickness.

*Claim.*—The combination of a revolving reciprocating knife with the lower part of a press, and operated simultaneously with the same, in the manner and for the purpose substantially as described.

No. 25,237.—ABRAHAM ANDREWS and HARRISON HALBACH, of Bernville, Pa.—*Improved Horizontal Wheel.*—Patent dated August 30, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—The curved concave buckets, having curved or eccentrically formed tops and bottoms, in combination with a spiral waterway or chamber underneath, and arranged within a box A, substantially as described and represented.

No. 25,238.—DOUGLAS BLY, of Rochester, N. Y.—*Improvement in Artificial Legs.*—Patent dated August 30, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim*, first, the combination of the segment of rubber B, or its equivalent, with the foot F and leg A, in the manner and for the purpose substantially as described. Second. I claim connecting the foot to the leg, by means of the cord C, or its equivalent, thereby dispensing with all joints, bolts, hinges, and metal straps, and the friction and noise to which they give rise.

No. 25,239.—JOHN C. BOYD, of Boston, Mass.—*Improvement in Elastic Hose Tubing*.—Patent dated August 30, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—As a new article of manufacture, the hose made of flexible tubes, the same consisting of a woven fabric of cotton, hemp, or other fibrous materials, lined with or fastened to a layer or sheet of India rubber, or gutta percha, or any other waterproof composition, and the whole secured by rivets, substantially as described.

No. 25,240.—WILLIAM BOYD, of New Orleans, La.—*Improvement in Iron Ties for Cotton Bales*.—Patent dated August 30, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—In combination with the splits, the use of a key having wings at each end to form the lock to the tie, when made and arranged as and for the purpose set forth.

No. 25,241.—JENN BRAINERD and W. H. BURRIDGE, of Cleveland, Ohio.—*Improvement in Tanning*.—Patent dated August 30, 1859.—The claim explains the nature of this invention.

*Claim*.—The improvement in tanning set forth, consisting in the immersion of the skins and hides in a tan liquor made from the digestion of the beforementioned plants, and the accompanying treatment of the skins and hides, by their immersion in the preparing liquid; the whole process being conducted in the manner set forth, whereby the valuable properties of the plants may be preserved for use; and this we claim, whether the above described tan liquor be used separately, or in connection with other substances containing tannin.

No. 25,242.—HENRY BREVOORT, of San Francisco, Cal.—*Improvement in Gold Amalgamators*.—Patent dated August 30, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim* the drag, having upon its lower surface or shoe the combination of the blocks of rubbing surfaces *o* and channels *i*, the two being arranged reciprocally in the manner described.

I also claim combining with a revolving drag F a pan A, whose bottom is inclined and has the form of a circular trough, as represented in the drawing, so as to collect the mercury in mass.

I also claim combining an amalgamating pan and revolving drag with a galvanic battery, arranged in such manner that its poles are extended into the mass of material in the pan, and that the parts of the material are subjected in succession to the action of the galvanic current.

I also claim the employment of a solution of the nitrate of mercury, in connection with a galvanic battery and a friction amalgamator containing mercury, substantially as set forth.

No. 25,243.—HENRY BREVOORT, of San Francisco, Cal.—*Improvement in Quartz Crushing Machines*.—Patent dated August 30, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the relative arrangement and combination of the curved grinding shoes E<sup>1</sup> E<sup>1</sup>, having their front edges beveled and inclined backwards from their outer corners, and caused to revolve, as described, so as to gather in and return the coarser fragments towards the centre of the series, substantially as set forth.

I also claim the arrangement and combination of a series of grinding shoes E<sup>1</sup>, with their front edges curved or inclined backwards, as described, with a corresponding inner series of reducing shoes E, so that the coarser fragments are redelivered in an inward direction to the reducing shoes, while the grinding and outward movement of the fine particles proceed continuously, substantially as set forth.

No. 25,244.—WILLIAM BRIGGS, of Norristown, Pa.—*Improvement in Gunlocks*.—Patent dated August 30, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—Constructing the stock A, and breech of barrel D, so as to be susceptible of and united to each other by the tang or breech pin C, and tapering screw pin E, and the spring hammer guard H, and trigger P, arranged and combined with stock A, essentially in the manner and for the purposes fully set forth.

No. 25,245.—R. S. CHURCH, of Manhattanville, N. Y.—*Improved Water Meter*.—Patent dated August 30, 1859.—This invention consists in arranging in an air tight vessel, or air chamber, a series of buckets of known capacity and of a peculiar form, in such relation to a hollow rotary chamber, which communicates with the supply pipe, that the water as it enters from the chamber into the buckets causes the same to rotate and to discharge their contents;

and it also consists in arranging in the above named air tight vessel a trough and discharge pipe which terminates in a separate chamber communicating with the air tight vessel by a passage closed by a valve in such a manner that the pressure of the air chamber regulates itself according to the head of water entering through the supply pipe.

The inventor says: I *claim*, first, the arrangement of a drum A, with the chamber B, and buckets C, as described, in combination with the trough G and the air chamber D, and operating substantially as and for the purpose set forth.

Second. The arrangement and combination of the trough G, the pipe H, the chamber I, the air chamber D, and the drum A, to operate substantially as and for the purpose specified.

No. 25,246.—H. S. CLARK, of Wyalusing, Pa.—*Improvement in Carriage Springs*.—Patent dated August 30, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—The arrangement and combination of the U shaped leaves B B, with the elliptical springs A A, as shown and described, so that the extremities of the leaves B B will approach each other, and will be secured to the centres of the springs A A, as specified.

No. 25,247.—F. J. CRISSEY, of Leesburg, Va.—*Improvement in Washing Machines*.—Patent dated August 30, 1859.—This machine is operated as follows: The frame E being removed from the shaft D, a sufficient quantity of water is put in the tub, and the articles to be washed are put around the shaft D and the frame E is again replaced; then by pressing on the handles equally on both sides, and revolving the rollers to and fro, the articles will be thoroughly washed.

*Claim*.—The arrangement of frame E, supports *i i*, upright shaft D, rollers B, supports *c c c*, and collar G, in combination with the bottom of the tub, when the parts shall be constructed and arranged in relation to each other, as substantially set forth.

No. 25,248.—ADDISON CROSLY, of Fredonia, N. Y.—*Improved Valve for Steam Engines*.—Patent dated August 30, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—The employment, as an induction or eduction valve in a steam engine, of a rolling or oscillating valve, composed of two segments, having their faces *a a* eccentric to its axis of oscillation, and with an opening *d* between the segments, substantially as described.

No. 25,249.—HORACE H. DAY, of New York, N. Y.—*Improvement in Elastic Cloth*.—Patent dated August 30, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—The new elastic cloth described, consisting of stockinet cloth, elastic gum, and flock combined, substantially as set forth, so that the elastic gum is covered on one side by the stockinet, and on the other by the flock, the said elastic cloth being a new manufacture.

No. 25,250.—SAMUEL DE VAUGHAN, of Washington, D. C.—*Improved Scroll Sawing Machine*.—Patent dated August 30, 1859.—This invention consists in the use of compound guides for regulating the motion of the saw, and the manner of applying a driving belt to a pulley wheel and improvement in swivel bearings.

The inventor says: I *claim* the vertical plates *g* and guide blocks *h*, plates *m* and *m*<sup>1</sup>, and guide arm *i*, for the purpose of a compound guide, as set forth.

I claim the manner of operating link *k* on bearing *u*, in combination with block *h*, and guide arm *i*, for the purpose set forth.

No. 25,251.—JOHN A. FALK, ANDREW JOHNSON, and G. A. ERICKSON, of Alton, Ill.—*Improvement in Harvesters*.—Patent dated August 30, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The arrangement of the wheel H, which is provided with the pin *a* near its periphery, with the bar *i* and pulley *s*, the same being constructed in the manner set forth, for the purpose of operating the bands which drive the endless belt K, substantially as described.

No. 25,252.—THEODORE F. FRANK, of Ischua, N. Y.—*Improvement in Ophthalmic Vapor Apparatus*.—Patent dated August 30, 1859.—This invention consists in the construction of an apparatus called the ophthalmological vapor bath, to be used in the process of disengaging the medical properties from drugs by steam, and bringing the medicated vapor produced therefrom in an applicable condition to the eyes.

*Claim*.—The ophthalmological vapor bath, constructed and operating as before described, for producing medicated vapor.

No. 25,253.—ALBERT FULLER, of Cincinnati, Ohio.—*Improvement in Faucets*.—Patent dated August 30, 1859.—The inventor says: The body of my faucet is cast in two pieces A and B, which are screwed together. The cap C is also screwed to the piece A. By a common handle L the cam shaft K is turned, giving motion to the valve stem D, thus opening and closing the valve. The valve is elastic, and may consist of a body E of India rub-

ber encased in a metallic shield made in two parts, a thimble F and a head G, the head being movable in a thimble.

*Claim.*—Encasing an elastic plug valve in the above described metallic shield, for the purpose set forth.

No. 25,254.—QUINCY A. GILMORE, of New York, N. Y.—*Improved Machine for Cutting and Screening Bituminous Limestone or Asphalte.*—Patent dated August 30, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the rotary cylinder or drum *a* carrying knives or cutters *b b*, substantially of the form described, arranged in rows, either with or without the raised bands, substantially as shown, or in rows parallel or oblique to the axis of the cylinder, for cutting asphalte, sometimes known under the name of bituminous limestone, substantially as described.

Second. I also claim the application of the machine as a whole, substantially as described, to the purpose of cutting and screening asphalte or bituminous limestone.

No. 25,255.—A. GOLARY, of Mobile, Ala.—*Improvement in Cord Guides for Sewing Machines.*—Patent dated August 30, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—The arrangement and combination with the adjustable plate D of the groove *f* and guides *c d e*, substantially as shown and described, so that the cord may be guided and conducted between two or more thicknesses of cloth, as set forth.

No. 25,256.—ELIAS GRAHAM and ISAAC N. PATTON, of Elizabethtown, Ky.—*Improvement in Flour Bolts.*—Patent dated August 30, 1859.—This invention consists of an arrangement whereby the radial arms of the reel, over which the cloth is stretched, can be extended, thereby increasing the diameter of the bolting reel, and stretching the bolting cloth tight thereon and keeping it stretched.

*Claim.*—The combination of the wedged sliding ribs C with the rods and screws for adjusting the same, in the manner and for the purposes set forth.

No. 25,257.—JONATHAN H. GREEN, of Christianburg, Iowa.—*Improved Billiard Cue Tip.* Patent dated August 30, 1859.—The inventor says: In this improvement I make a composition of gutta percha or India rubber (vulcanized) with pulverized chalk, or any calcareous substance; (the shape of the tip thus prepared is made like those in common use;) I then attach the tip with glue, either to the ferrule to be screwed to the end of the cue, or to the end of the cue itself.

*Claim.*—A tip or point for billiard or bagatelle cues, made of any compound described so as to dispense with the external application of chalk or other substance to the point of the cue.

No. 25,258.—BENJAMIN L. GRIFFITH, of Reading, Pa.—*Improved Hollow Grate Bar for Steam Boilers.*—Patent dated August 30, 1859.—This improvement consists of two or more tubes connected at each end to the hollow boxes which are attached to the fire box of the boiler by means of hollow screw plugs, so that the water in the boiler can have a free circulation through the bars, and so that the latter can be readily removed and replaced in sections.

*Claim.*—Two or more tubes C attached to hollow boxes D, connected to the fire box by means of hollow perforated screw plugs G, and arranged in sets to complete the grate, as and for the purpose set forth.

No. 25,259.—HENRY GROSS, of Tiffin, Ohio.—*Improvement in Breech Loading Fire-Arms.* Patent dated August 30, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, giving the chamber its longitudinal motion upon a bed piece which remains fixed during such motion, and in revolving carries with it the chamber, substantially as specified.

Second. The roller *r*, or its equivalent, upon the check piece, and its combination with the groove *g d*, substantially as and for the purpose set forth.

Third. The double eccentric head of the lever L, when connected with the chamber and bed piece, substantially as described.

Fourth. The adjustable bearing piece for the eccentric *g* of the lever L.

No. 25,260.—ALBERT W. HALE, of New York, N. Y.—*Improved Fastening for Hooped Skirts.*—Patent dated August 30, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The method of connecting and fastening the ends of the hoops B, by means of the cap A, one part of such cap, with the end of the hoop, forming a point or extension *b*, to enter a recess *a* in the cap on the other end of the hoop; and such cap also furnishing the

recess to receive the said points or extension of the other end of the hoop, when the cap and hook are bent in the manner and for the purpose described.

No. 25,261.—WILLIAM H. HAMMOND, of New York, N. Y.—*Improved Escapement for Chronometers.*—Patent dated August 30, 1859.—This invention relates to improvements in watches and chronometers, with the view to render the escapement more sure and guard against irregularity of movement.

The inventor says: I *claim* the employment of the hollow semi-cylinders on the vibrating lever, substantially as described, in combination with the escapement wheel, and the balance and verge, as set forth.

I also claim, in combination with the escapement, substantially such as described, or any equivalent therefor, the employment of the holding spring, substantially as and for the purpose specified.

No. 25,262.—JAMES HARRISON, Jr., of New York, N. Y.—*Improvement in Sewing Machines.*—Patent dated August 30, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of the frame or feeding lever *j*, bar *m*, spring *o*, and regulating screw *p*, all constructed and operated as described, with the needle and needle frame *i*, for carrying the mechanism for rotating the needle, as described.

Second. I claim the adjustable bar or band *z*, affixed to the lever or frame *J*, in combination with the frame *i*, for controlling the upward movement of the feed lever, as described.

Third. I claim the bar or band *z*<sup>1</sup>, in combination with the bar *m*, screw *p*, spring *o*, and lever *j*, as and for the purposes set forth.

No. 25,263.—ROYAL HATCH, of Strafford, Vt.—*Improved Bed Bottom.*—Patent dated August 30, 1859.—This invention relates to an improvement on a spring for bedsteads, patented December 30, 1857. Its object is to render the bottom more durable, and also to render the sacking capable of being taken up or tightened, if necessary, to compensate for the stretching of the same.

*Claim.*—The arrangement of a central supporting bar *F*, with a sacking *E*, both provided with double loops *d*, and attached respectively to the bedstead, as and for the purpose set forth.

No. 25,264.—ALEXANDER HAY, of Philadelphia, Pa.—*Improvement in Springs for Railroad Cars, &c.*—Patent dated August 30, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, as a new article of manufacture, the construction of vulcanized India rubber springs, in which the threads or warp or fabric, out of which they are formed, is made non-elastic before it is woven or knit, substantially as described.

Second. In combination with India rubber springs, to be acted on by tension or stretching, I claim the tubes *A A*, with their flanges, substantially as described and for the purpose set forth.

Third. In combination with the springs acting as described, I claim the supporter *P*, with the opening *F* in each end, and holes *B B B* for tightening the spring, when constructed and operated substantially as set forth.

No. 25,265.—MILO A. HOLCOMB, of Granby, Conn.—*Improved Metallic Razor Strop.*—Patent dated August 30, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—A razor strop made of polished steel, of the requisite degree of hardness, when possessing a sufficient degree of flexibility to enable the angle which its surface forms with the edge of the razor to be lessened to the desired extent, in the manner and for the purpose as herein specified.

No. 25,266.—DANIEL HUSSEY, of Nashua, N. H.—*Improvement in Machinery for Winding Warps Upon the Beam.*—Patent dated August 30, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—The peculiar combination for maintaining uniformity of wind, or surface speed of wind, on the yarn beam, the same consisting of the friction wheels *G F*, the lifter rack *K*, the pinion *l*, and the compound motion mechanism, or their mechanical equivalents; the whole being applied to the yarn guide rollers, and the mechanism for adjusting the yarn beam, substantially in the manner, and so as to operate, as specified.

No. 25,267.—JOSEPH HALBASH and ISAAC HALBASH, of Bernsville, Pa.—*Improvement in Furnaces for Smelting Zinc Ores.*—Patent dated August 30, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—Constructing the crucible with a detachable bottom, and attaching it to the arch of the cylinder or collar and to the bed plate, by the rings or annular plates, whereby we are enabled to empty the crucible at its bottom, and to remove the entire crucible through the

bottom or the arch of the heat chamber, as may be required; the whole being arranged and susceptible of being used as herein set forth.

No. 25,268.—ELEAZER B. KNIGHT, of Malden, N. Y.—*Improvement in Machines for Holding Stones.*—Patent dated August 30, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—Providing the stone holding machine with the suspending arms *c c*, plates *j* and *n*, rod *i*, and adjusting bolts *k k*, or their equivalents, whereby said machine may readily be adjusted, vertically and also horizontally, in the arc of a circle, substantially as described and for the purposes specified.

No. 25,269.—CHARLES LIVINGSTON, of Redwood City, Cal.—*Improved Wind Mill.*—Patent dated August 30, 1859.—This invention consists in the employment of a rotating cowl, wind tube, and wheel, arranged so that the wind may be conducted from elevated points down into valleys, and made to actuate wheels placed near the machinery to be driven.

*Claim.*—The cowl *D*, with tubes *j g* and wheel *B*, combined and arranged for joint operation, substantially as and for the purpose set forth.

No. 25,270.—ISAAC MALLERY, of Etna, New York.—*Improved Chute for Horizontal Water Wheels.*—Patent dated August 30, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—Constructing and arranging the scroll within the penstock, so that it can be turned, so as to partially close the orifice for the admission of water upon the buckets, and to thereby regulate the flow of water for any head, or for any quantity of water, essentially as above specified.

No. 25,271.—E. E. MARCY, of New York, N. Y.—*Improvement in Curing and Treating Caoutchouc.*—Patent dated August 30, 1859.—The claim explains the nature of this invention.

*Claim.*—The improved process of curing India rubber by combining India rubber with the sulphuret of lead and carbonate of lead, or the protoxide of lead, in the manner hereinbefore described, and without the use of free sulphur in combination with the rubber, or with said compound, and the exposure of these compounds to steam or water, at the temperature hereinbefore stated, and in the mode pointed out.

No. 25,272.—E. E. MARCY, of New York, N. Y.—*Improvement in Curing and Treating Caoutchouc.*—Patent dated August 30, 1859.—The claim explains the nature of this invention.

*Claim.*—The improved process of curing India rubber by combining it with the sulphuret of zinc and the hyposulphite of zinc, in the manner hereinbefore described, and subjecting the compound to steam and water, at the temperature stated, without the use of free sulphur, in combination with said compound, substantially as set forth.

No. 25,273.—E. E. MARCY, of New York, N. Y.—*Improvement in Curing and Treating Caoutchouc.*—Patent dated August 30, 1859.—The claim explains the nature of this invention.

*Claim.*—The improved process of curing India rubber, and producing an improved article of India rubber, by combining India rubber with the hyposulphite of zinc, in the manner hereinbefore described, and without the use of free sulphur in combination with the rubber, or with said compound, and the exposure of this compound to steam or water, at the temperature hereinbefore stated and in the mode pointed out.

No. 25,274.—R. D. NESMITH, of Franklin, N. H.—*Improvement in Machines for Picking Mill Stones.*—Patent dated August 30, 1859.—This invention relates to an improved machine for picking mill stones, and of that class which are operated automatically by the rotation of the spindle of the stone, or by the rotation of any shaft, or arbor placed concentrically therewith.

*Claim.*—The spring *Q* upon rod *P* provided with head *I*, for limiting the extent of its action upon the picks, as arranged with the inclined plane *T* and cam *F*, and the operating parts with which they are connected, in the manner and for the purpose specified.

No. 25,275.—SAMUEL NOLAN, of New York, N. Y.—*Improvement in Apparatus for Manufacturing Illuminating Gas.*—Patent dated August 30, 1859.—This improvement has for its object the drawing off, in a novel and advantageous manner, the gas from the retort at a comparatively low temperature and pressure, and as fast as evolved, and by the same means expelling the gas so drawn off or exhausted, and urging it with all the necessary force to and through the condenser and other intermediate apparatus into the gasometer.

*Claim.*—The gas exhaust and expelling wheel, interposed between the retort and the condenser, constructed and arranged so to operate substantially in the manner and for the purposes set forth.

No. 25,276.—JOHN H. PEIN, of Hoboken, N. J.—*Improvement in Apparatus to Photograph Uneven Surfaces.*—Patent dated August 30, 1859.—This invention consists in obtaining the focus on the uneven surface of a solid direct, by a device for moving the said solid in the camera without moving the camera, and for placing the said solid in any desired position, sideways, backward, or forward.

*Claim.*—Photographing on vases, or other uneven solids, by means of an apparatus substantially as herein described, and in the manner substantially as set forth.

No. 25,277.—EDMUND QUERN, of New York, N. Y.—*Improvement in Gelatinizing Oils.*—Patent dated August 30, 1859.—The inventor says: I take of white refined sugar one pound and three quarters, and boil the same with water until it becomes a concentrated or thick syrup. I take of isinglass three ounces and a half, which I put in a warm water bath with five ounces of water; when well dissolved I pour in the syrup very warm, and stir the whole constantly until it is thoroughly mixed. I then take one pound of this mixture and put it in a clean warm water bath, and place the same on the fire; when the water is nearly boiling I add, by small quantities at a time, three pounds and a half of fine castor oil, constantly stirring the same with the spatula until thoroughly mixed together.

*Claim.*—The jellification of castor oil by means of the process hereinbefore described.

No. 25,278.—CHARLES H. RAYMOND, of Southington, Conn.—*Improvement in Tinman's Machines.*—Patent dated August 30, 1859.—This invention consists in the construction, arrangement, and combination of the cap plate E and movable stand M attached thereto, carrying its revolving box L and the shaft I therein, and the screw J relatively.

*Claim.*—The movable and adjustable stand M and its revolving box L, when combined with shaft I, cap plate E, and screw J, in the manner described and for the purposes fully set forth.

No. 25,279.—CHARLES B. SAWYER, of Fitchburg, Mass.—*Improved Furnace and Ventilator.*—Patent dated August 30, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—Providing the fire pot with a series of small holes or openings, substantially as and for the purposes set forth.

No. 25,280.—EDWARD L. SEYMOUR, of New York, N. Y.—*Improved Ore Concentrator.*—Patent dated August 30, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the rotating sieve in combination with the bellows, or their equivalents, operated by the act of rotation of the former, substantially as described.

Second. The application of two or more rotary sieves, combined with such an arrangement of "waste tubes" *e* that the refuse of the upper sieve shall be led to constitute the supply or feed of the sieve next below it, as described.

Third. I claim rendering the receiving mouths of the "waste tubes" *e*  $c^1$   $e^2$  adjustable, as described, and for the reasons given.

Fourth. I claim the use of the closed chambers or "traps" *y*  $y^1$   $y^2$  below the sieves, as described and for the purposes explained.

No. 25,281.—PHILO B. SHELDON, of Prattsburg, N. Y.—*Improved Composition for Destroying Insects Injurious to Fruit Trees.*—Patent dated August 30, 1859.—This invention consists of the following ingredients: Potash, 4 ounces; common salt, 16 ounces; copperas, 4 ounces; blue vitrol, 2 ounces; saltpetre, 1 ounce.

*Claim.*—Combining and employing the ingredients herein described in substantially the mode and proportions set forth, for the purpose of destroying borers, and other insects on fruit trees.

No. 25,282.—J. H. SHIPMAN, of Yorkville, N. Y.—*Improved Letter File.*—Patent dated August 30, 1859.—This invention consists in arranging opposite to the points which serve to retain the letters sliding hinged guards, that are turned up over the points when the letters are on, for the purpose of preventing the letters coming off when the letter file is handled.

*Claim.*—The arrangement of the movable hinged guards B in combination with the metal back A and points *b*, substantially as and for the purpose described.

No. 25,283.—WILLIAM H. SMITH, of Newport, R. I.—*Improvement in Hose Couplings.*—Patent dated August 30, 1859.—This invention consists in the combination of a set screw with an open spiral flange, so constructed as to connect the parts somewhat on the principle of the bayonet catch; the parts being so constructed and arranged that the set screw may perform the two-fold duty of a lug to support one of the outwardly projecting flanges upon the inner portion of the coupling, and at the same time also to act as a set screw to secure the parts in position.

*Claim.*—The new article of manufacture, or hose coupling described, made by combining the open spiral flange *a* with a screw *D*, as set forth.

No. 25,284.—JAMES SPEAR, of Philadelphia, Pa.—*Improvement in Stove Urns.*—Patent dated August 30, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—The arrangement of the register in the base of the urn, with the ornamental receptacle for the cup, constructed in the manner and for the purpose described.

No. 25,285.—A. L. SPERRY, of Auburn, Ind.—*Improvement in Churns.*—Patent dated August 30, 1859.—This invention consists in a particular arrangement of a hook, which serves to connect or disconnect the breaker frame with the shaft, and the arrangement of a spring hook and button, whereby the breaker frame can be arrested, so that the dasher can be operated independent of the breakers, both the hook and the spring hook being operated from the top of the churn.

*Claim.*—The arrangement of the hook *i* and button *k*, to operate in combination with the dasher *D* and breaker frame *E*, in the manner and for the purpose herein specified.

No. 25,286.—HENRY D. STOVER and J. W. BICKNELL, of Boston, Mass.—*Improved Rotary Planing Cutter.*—Patent dated August 30, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The adjustable revolving guard *J*, as constructed and connected adjustably to the cutter head, carried by and having all its movements to effectually protect the operator from mutilation, and to hold down the material receiving shape, essentially in the manner fully set forth.

No. 25,287.—PETER SWEENEY, of Buffalo, N. Y.—*Improvement in Stone Saws.*—Patent dated August 30, 1859.—Between the plates *A A*, a series of circular plates are placed. These cutters may be of steel, or chilled cast iron, and project beyond the peripheries of the plates *A A*. Any proper number of cutters may be used, and their peripheries serrated, or cut like a saw or rasp.

*Claim.*—The employment of two plates *A A*, in combination with the dish formed cutter *C*, arranged substantially as and for the purpose herein shown and described.

No. 25,288.—JOSEPH SWEOTSER, of Biddeford, Maine.—*Improvement in Shingles.*—Patent dated August 30, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—Fluting shingles.

No. 25,289.—GEORGE TAYLOR and GEORGE H. BURGER, of Worthington, Ohio.—*Improved Auger for Cutting Round Tenons.*—Patent dated August 30, 1859.—Fitted into the inside of the tube *A* is a cylindrical plug *C*, which is provided with a central point *b*, and the upper end of which is turned down, so as to form a shank *D*, extending up into the tube, where it serves as a guide for a spiral spring *E*, the lower end of which is secured in a groove *c*.

*Claim.*—The arrangement and combination of the spring *E* with the shank *D* and tube *A*, substantially as herein shown and described, whereby the plug *C* is rendered self acting, as set forth.

No. 25,290.—JOSEPH B. THOMPSON, of Warrenton, Ga.—*Improved Feed Water Apparatus for Steam Boilers.*—Patent dated August 30, 1859.—This invention has for its object regulating the feeding of the water into the steam boiler, and consists in a certain combination of devices for that purpose.

*Claim.*—The exterior water chamber *G*, communicating with the supply tank *B* by pipe *a*, and with the boiler *A* by force pump *P* and pipe *b*, and provided with a valve *J*, as set forth, in combination with the peculiarly constructed float *C*, rods *E*, and lever *F*, operating as and for the purpose specified.

No. 25,291.—WILLIAM H. THOSS, of San Francisco, Cal.—*Improvement in Fire Plating Iron.*—Patent dated August 30, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—Preparing the iron after it has been cleansed with dilute acid, by immersion in a solution of borax, and after being dried passing it through the molten copper, maintained at the required heat in a furnace constructed substantially as herein described, with a roof to concentrate the heat over the basin of molten copper, and with an aperture at one side to insert the iron to be plated, and a corresponding one on the opposite side, to receive the iron as it is drawn from the copper plate, substantially as described and for the purpose specified.

No. 25,292.—WILLIAM A. VERTREES, of Winchester, Mo.—*Improvement in Hemp Brakes.*—Patent dated August 30, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—Constructing the rocking breaker frame of hemp or flax breakers in the manner

described, and operating it by means of a slotted pitman in such manner as that while the vibratory motion is communicated from the prime motor to the breakers by machinery, yet they fall on the hemp or flax with a free stroke or flail motion, substantially as hereinbefore described.

No. 25,293.—NATHANIEL WATERBURY, of Fond-du-Lac, Wis.—*Improved Shingle Machine*.—Patent dated August 30, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—First, the reciprocating bolt carriage D, tilting beds J J, circular saw I, and sliding jaws G G, arranged relatively with each other, as shown and operated respectively by the cam C, cam ratchets K K, and pendants *o o*, belt *t*, and levers and weights J<sup>1</sup> J<sup>2</sup>, substantially as and for the purpose set forth.

Second. In connection with the reciprocating belt carriage D, saw I, and tilting beds J J, the bars L L, provided with inclined slots *p q*, and connected with the frames *d*<sup>1</sup> *d*<sup>2</sup> of the jaws G G, by means of the pins *r*, fitting in said slots for the purpose of elevating the bolts during their return movement, as described.

Third. The employment or use of the cam ratchets K K attached to the framing A, in connection with the pendants *o o* attached to the reciprocating bolt frame D, arranged substantially as shown for automatically tilting the beds J.

No. 25,294.—PETER L. WEIMER, of Lebanon, Pa.—*Improved Machine for Coiling Metal Pipe*.—Patent dated August 30, 1859.—This invention consists of a suitable spiral grooved cylinder and two guide wheels so arranged that a piece of metal pipe can be coiled on the grooved cylinder without altering its cross section by bending; also, in the peculiar arrangement of the coiling cylinder, whereby the cylinder and finished coil may be removed from the shaft of the machine and the cylinder removed from the coil without injury to the coil or cylinder.

The inventor says: I *claim*, first, the coiling cylinder E, with the peculiar shaped groove, constructed and arranged as herein fully described and specified.

Second. I claim the arrangement of the two guide wheels M, triangular piece K, and shaft L, when used in combination with the coiling cylinder, and for the purpose as herein fully described and specified.

Third. I also claim the movable plate F and jack screws G, for the purpose of adjusting the guide wheel shaft L, to any angle required.

No. 25,295.—ASA WHEELER, of Brattleboro', Vt.—*Improvement in Skates*.—Patent dated August 30, 1859.—This invention is an improvement in fastening the skate to the boot or shoe and tightening the same thereto after the skate has been strapped to the foot.

*Claim*.—The arrangement and combination of the adjustable heel piece F, heel case D, stock E, screw H, and front straps C, as and for the purpose herein shown and described.

No. 25,296.—JOHN M. WHITE, of New York, N. Y.—*Improvement in Heating the Feed Water of Steam Engines*.—Patent dated August 30, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The arrangement of the division chamber C, supply and discharge pipes F and G, and heating pipes *b b*<sup>1</sup>, placed within the exhaust side pipe B, as described, in combination with the relief pipe H, by which, when necessary, the water may be passed directly to the boiler without being passed through the heating pipes *b b*<sup>1</sup>.

No. 25,297.—ABNER WHITELY, of Springfield, Ohio.—*Improvement in Harvesters*.—Patent dated August 30, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, so arranging the mechanism of the automatically operating door or shutter for preventing scattering and admitting the gavels to be discharged at regular intervals as to permit the attendant to increase the intervals of time for the discharge of the gavels where the grain is thin upon the ground, substantially as described.

Second. The combination of the rake *q* with the door or shutter R for discharging the gavel at the time the door or shutter is opened for the purpose, whether it is at regular intervals or less frequently, substantially as described.

No. 25,298.—JEPHTHA AVERY WILKINSON, of Brooklyn, N. Y.—*Improved Shears for Separating Paper*.—Patent dated August 30, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, separating paper or other material by the joint operation of a revolving shear and a stationary surface, when said stationary surface is so formed and placed as gradually to approach the path described by the shear in its revolution, and compress the said paper or other material on to the edge of said revolving shear, in the manner and substantially as specified.

Second. I claim the elastic roller or rollers *e e*, in combination with the stationary surface E and revolving shear *c* on the cylinder D, whereby the paper is passed through and separated progressively as at two operations, as set forth.

Third. I claim the arrangement of the shaft carrying the rollers *e e*, the springs 12, and cams 10 for elevating the rollers and preventing traction on the paper, as set forth.

No. 25,299.—FRANK BROWN, of Philadelphia, Pa., assignor to WILLIAM BROWN, of the same place.—*Improvement in Turnouts for Railways*.—Patent dated August 30, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—The addition of grooves on the circumference of car wheels, as now constructed, with a single flange and tread, and the placing of curved bars at turnouts on the track of the road, to enter and operate on such grooves for the purpose of changing the direction of cars, substantially as and for the purpose set forth.

No. 25,300.—SETH BOYDEN, of Newark, N. J., assignor to Himself and H. H. JACQUES, of the same place.—*Improvement in Machinery for Hardening Hat Bodies*.—Patent dated August 30, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the employment of a cloth M, or its equivalent, in combination with a cone E, in the manner and for the purpose substantially as shown and described.

Second. The arrangement and combination of the frame I, shaft J, eccentrics *h*<sup>1</sup>, rods *i* tubes *j*, arms *l*, shaft K, eccentrics *p*, rods *q*, bars L, and cloth M, substantially as shown and described, so that the cloth M will be operated with a compound movement, as set forth.

No. 25,301.—WILLIAM P. GOOLMAN, of Dublin, Ind., assignor to Himself, S. B. MORRIS, and WILLIAM HOLLINGSWORTH, of the same place.—*Improvement in Rotary Harrows*.—Patent dated August 30, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the described application of friction rollers between rotary concentric harrows, to elevate opposite sides of the respective harrows, in the manner and for the purposes set forth.

Second. The reversible arm F, arranged between concentric harrows A and B, to change the direction of the rotation of the said harrows, as explained.

Third. The reversible bent spindle C, adapted in the manner set forth, to correspond with the relative obliquity of two concentric harrows.

Fourth. The described arrangement of the friction rollers *e e*<sup>1</sup> and adjustable washers *g* on the arm F, operating in the manner set forth, to vary the relative obliquity of the harrows.

No. 25,302.—DANIEL G. GREENE, of North Bridgewater, Mass., assignor to Himself and WILLIAM NASH, of South Weymouth, Mass.—*Improvement in Wrenches*.—Patent dated August 30, 1859.—This invention consists of a stationary jaw A and a movable jaw B, provided with a hole through which the shank D of the stationary jaw A passes, so as to allow the jaw B to be moved back and forth on the shank D.

*Claim*.—The combination of the movable jaw B, inclined shoulders U, with the pawl H, and inclined shoulders V, and enlarged hole J, and ratchet teeth H, said parts being constructed and arranged to operate in relation to each other in the manner and for the purposes set forth.

No. 25,303.—MICHAEL IRION, of Utica, N. Y., assignor to Himself and JACOB HEIDEL, of Oneida county, N. Y.—*Improvement in Shears*.—Patent dated August 30, 1859.—This invention consists in the combination and arrangement of parts consisting of a punch and hollow cylinder and a pair of cutting edges attached to two handles or levers at or near their extremities, the said handles, or levers, being fixed together so as to operate like a pair of common shears.

*Claim*.—The combination of the cutting plates C C<sup>1</sup>, the circular punch D, and the circular die E, to receive the punch, and surrounded by a cutting edge, as described, in connection with a pair of movable jointed arms, the whole so combined and arranged to operate in the manner as before more fully set forth.

No. 25,304.—GEORGE MARLOW and MICHAEL RALPHE, of Cincinnati, Ohio, assignors to A. D. BROWN, W. C. VALLETTE, and GEORGE MARLOW, of the same place.—*Improvement in Lamps*.—Patent dated August 30, 1859.—The first part of this invention consists in a peculiar arrangement of divided reflector to facilitate giving access to the lamp without removing it from the lanterns.

The second part relates to a manner of applying and arranging glazed doors of different colors, to adapt the lantern to purposes of signaling.

The inventors say: We *claim*, first, the described arrangement of the separate cup formed back reflector J, upon the inside of the door K, in the described combination, with an open backed parabolic or conical reflector I, constructed as set forth.

Second. The described arrangement of glazed doors M and M<sup>1</sup>, hinged vertically to the front angles of the lantern, and adapted in the manner set forth, to be fixed either in front of the lantern or against one or other of its sides, for the purpose explained.

No. 25,305.—THEODORE MARSCHALL, of New York, N. Y., assignor to LIGHTE and BRADBURY, of the same place.—*Improvement in Piano Forte Actions*.—Patent dated August 30, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The spring supporting post K M N O, when used in the described combination with a stud L, separate and distinct from the moving parts, to detain the hammer at any determined height, while the jack descends sufficiently to reëngage beneath the hammer but.

No. 25,306.—E. L. PRATT, of Philadelphia, Pa., assignor to Himself and R. B. FITTS, of the same place.—*Improvement in Churns*.—Patent dated August 30, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, in combination with the rotary case or body A of a churn, a diaphragm, or piston C, adapted both to move upon and be moved by a screw shaft D, or its equivalent, placed horizontally in the said case, as described, the said diaphragm C and shaft D being constructed and combined together as set forth.

Second. I also claim the series of perforations *o o*, through the diaphragm or piston C, in combination with the movable perforated adjusting disk or plate *n*, or their equivalent, the same operating together in the case A, substantially as and for the purpose set forth and described.

No. 25,307.—WILLIAM F. PRATT, of East Bridgewater, Mass., assignor to the E. CARVER COMPANY, of the same place.—*Improvement in Cotton Gins*.—Patent dated August 30, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The use of a naked or unshielded augur or cleaver, operating in the end of a ginning roll of a cotton gin at or near the centre thereof, substantially in the manner and for the purpose described.

No. 25,308.—ALLEN SHERWOOD, of Auburn, N. Y., assignor to E. P. SENTER, A. H. GOSS, WILLIAM HILLS, and AMRETTA SHERWOOD, of the same place.—*Improvement in Grain Binding Mechanism*.—Patent dated August 30, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of the shield F and lever L, both removable and located at one side of the delivery portion of the platform, so that the shield shall protect the lever from the cut material, and from one side of an open ended grain receiver (the fence E forming the other side thereof) where the grain is deposited previous to being bound up as described.

I also claim, in combination with the raker's stand B, and binders seat C, the shield F, and lever L, so arranged that the raker from his stand may sweep the cut grain into the receiver, and the binder, from his seat, reaches beyond the receiver to catch the lever L, as set forth.

I also claim, in combination with the grain receiver, the inclined ledges G H, under which the wire is passed, so as not to catch or interfere with the entrance of the grain therein, as set forth.

I also claim the slot and flanges in the shield I, said flanges serving as a guide for properly bringing down the foot of the lever to insert the wire in the twisting wheel, as set forth.

I also claim, in combination with the lever L, the clamp *s*, located in close proximity to the handle *v*, so that the binder, as he draws up the gavel, may check the paying out of the wire, and thus bring it tightly around the bundle, as set forth.

I also claim, the combination of a removable shield and lever F L on the platform, with a removable twisting mechanism on the fence or side of the platform G, for the purpose of adapting an ordinary hand delivery mowing machine into a self binder, or *vice versa*, without in any manner altering the parts which enables it to be so exchanged, except to attach or detach them, as set forth.

No. 25,309.—DANIEL DODGE, of Keeseville, N. Y.—*Improvement in Nail Machines*.—Patent dated August 30, 1859.—This invention consists in the combination of a fixed anvil, a fixed die, having its face forming a right angle with the face of the anvil, a roller revolving opposite to the face of the anvil, a hammer having a reciprocating motion towards and from the face of the die, and a vibrating carrier, or guide, for placing the nail, rod, or other article to be operated upon, against the face of the anvil and the face of the die alternately, the whole operating together to effect the reduction of metal to the required form.

The inventor says: I *claim* the combination of an anvil B and fixed die C, or other equivalent fixed surfaces a roller E, hammers F G, and a vibrating guide I, the whole operating substantially as described.

And I also claim the operation of a hammer, in combination with the roller E and anvil B, by means of an eccentric on the roller shaft, and a universal joint at the connection of the hammer with the connecting rod of the eccentric, substantially as described.

No. 25,310.—HENRY W. ADAMS, of Brooklyn, N. Y.—*Improvement in Lamps*.—Patent dated September 6, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—Constructing the upper end of the wick tube B, with the elevated ends *a a*, so as to inclose the ends of the wick C, and prevent said ends from burning too high, when the central part is sufficiently elevated above the central part *b* of the wick tube to be allowed to burn, substantially as and for the purpose set forth.

No. 25,311.—WILLIAM ADAMSON, of Philadelphia, Pa.—*Improved Apparatus for Making Decoctions.*—Patent dated September 6, 1859; antedated April 6, 1859.—This invention consists in placing within a circular tank, or boiler, a conical roller, made either solid or open, and in revolving the same during the process of boiling, for the purpose of thoroughly intermixing the ingredients to be extracted by the water or other fluid, by keeping them always agitated and stirring.

*Claim.*—The conical roller arranged within the caldron A, when the same is used for the purpose of thoroughly intermixing the ingredients to be extracted during the process of boiling, as set forth.

No. 25,312.—THOMAS D. AYLESWORTH, of Ilion, N. Y.—*Improvement in the Cutting Apparatus of Harvesters.*—Patent dated September 6, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—A cutting apparatus for harvesting machines, composed substantially of the cutters *c* and guards *b*, when constructed and operating together without any motion except that of being advanced or drawn over a field, substantially as described.

No. 25,313.—H. H. BAKER, of New Market, N. J.—*Improved Tonguing and Grooving Machine.*—Patent dated September 6, 1859.—This invention consists in passing the boards to be tongued and grooved under rollers which serve as feed and pressure rollers, having flanges cast on their outer edges, which press the faced edge of the board, as it is fed to the cutters, firmly against a ring keyed to the roller shaft by helical or other suitable springs, which permit the rollers to be laterally adjusted and set to suit the various thicknesses of the same board.

*Claim.*—The employment of flanged feed rollers, having a lateral play, and acted upon by suitable springs, in combination with the fixed intermediate rings or flanges P P<sup>1</sup>, or their equivalents, when arranged and operating essentially in the manner and for the purpose specified.

No. 25,314.—E. O. BAXTER, of Foreston, Ill.—*Improvement in Railroad Excavators.*—Patent dated September 6, 1859.—This invention is an improvement in machinery for removing the earth which washes down from embankments and fills up the drains on either side of the railway where it passes through deep cuts, and consists in the employment of ploughs or excavators of a peculiar construction, which are connected to suitable arms extending out from the sides of a car by strong chains, so that as the car progresses the earth can be taken up and removed.

*Claim.*—The arrangement and combination of adjustable timbers or arms B C, plough and excavator, as above described, when the same are employed in the manner above shown, for the purpose of loosening and removing the earth and keeping the ditch free from the wash of the slopes on railroads.

No. 25,315.—JEHU BRAINERD and WILLIAM H. BURRIDGE, of Cleveland, Ohio.—*Improvement in Tanning.*—Patent dated September 6, 1859.—The claim explains the nature of this invention.

*Claim.*—The use of the described compound for tanning consisting of a solution of the named mineral salts, in mixture with a solution of tannin, either with or without the addition of aloes.

No. 25,316.—LEOPOLD RICHARD BREISACH, of New York, N. Y.—*Improvement in Making Gas from Wood.*—Patent dated September 6, 1859.—The claim explains the nature of this invention.

*Claim.*—The process of manufacturing illuminating gas from wood, by distilling the same in two retorts of varying temperatures, as set forth; one of which retorts is charged with charcoal, varying in amount according to the conditions indicated, the whole process being conducted as set forth.

No. 25,317.—ARCHIBALD CAMERON, of Charleston, S. C., and DAVID MATTHEW, of Philadelphia, Pa.—*Improvement in Railroad Wheels.*—Patent dated September 6, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—The peculiar construction of car wheels, having elastic curved arms B with chilled cast tread A and cast hub C, forming one combined wheel, substantially as set forth.

No. 25,318.—CHARLES W. CLEWLEY, of Providence, R. I.—*Improvement in Machines for Making Watch Rims, &c.*—Patent dated September 6, 1859.—The nature of this invention consists in the combination of the male plunger A with the female plunger B.

*Claim.*—The combination of the male and female plungers, substantially as described and for the purposes set forth.

No. 25,319.—R. W. DAVIS and DANIEL DAVIS, of Yellow Springs, Ohio.—*Improved Machine for Printing the Addresses on Newspapers, &c.*—Patent dated September 6, 1859.—The claim and engravings explain the nature of this invention.

The inventors say: We claim, first, the arrangement of wooden blocks *r*, of suitable size for a single address, with indented letters in their faces, and attached, by means of small tacks or equivalent, to a flexible band or belt, in close compact columns, and operated substantially as described.

Second. The use of the triangular stationary bed piece *l*, over which the belt slides, by means of belt pulley *p*, and regulated and adjusted by means of lever *n*, substantially in the manner and for the purpose set forth.

No. 25,320.—JEAN JUSTIN ALBERT DE BRONAC and AUGUSTIN JOSEPH MARTIAL DEHERRY-PON, of Paris, France.—*Improvement in Treating Metallic Ores with Spongy Iron.*—Patent dated September 6, 1859.—The claim explains the nature of this invention.

The inventors say: We claim the treatment of metallic sulphurets, or other ores or metallic bodies, with a spongy iron, for purposes substantially as set forth, by the combination of the several processes specified in the order stated, viz:

First. Pulverizing the ore and the spongy iron separately.

Second. Mixing the two powders in definite proportions.

Third. Compressing the mixed powders into the form of cakes or small bricks.

Fourth. Treating the thus prepared ores in suitable furnaces, as described.

No. 25,321.—R. DENSMORE, of South Haven, Mich.—*Improved Machine for Sawing Staves.*—Patent dated September 6, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I claim, first, surrounding the stationary drum B with a series of saws, all hung in one gate and having the same movement, in combination with the rotating table *c*, for the purposes and in the manner represented and specified.

Second. I claim, in combination with the rotary table and drum B, the sliding carriages, when the same are arranged radially around said drum, and operated automatically to feed the bolts up against the drum B, for the purposes and in the manner specified.

Third. I claim the rolling spring guides P, in combination with the drum B, for discharging the staves from the machine after they have been sawed, as set forth.

No. 25,322.—CHARLES A. DESOBRY, of Plaquemine, La.—*Improvement in Bagasse Furnaces.*—Patent dated September 6, 1859.—This invention consists in a novel system of air ducts, combined with an air chamber, for supplying the fire chamber with the air necessary for combustion, and for tempering the heat of the furnace.

*Claim.*—The combination of the upright air chamber D, having a vertical partition wall *a*, and the system of ducts E E F G and H, and the damper or shutter I, the whole applied in connection with the fire chamber and the flue C, or its equivalent, substantially as herein described.

No. 25,323.—HUGH T. DOUGLAS, of Zanesville, Ohio, and JOHN COOPER, of Mount Vernon, Ohio.—*Improvement in Portable Evaporating Apparatus.*—Patent dated September 6, 1859.—The apparatus consists of two parts: the evaporating pan proper A<sup>1</sup>, Fig. 1, and the furnace L, Figs. 1 and 2, with the several flues.

*Claim.*—The combination of the diving flue H I, the valves E<sup>1</sup> F<sup>1</sup> and *i*, and the damper J, when the several parts are arranged in relation to the evaporating pan, and operating in the manner substantially as set forth.

No. 25,324.—M. D. DUBOIS, of Newburg, N. Y.—*Improved Roofing Cement.*—Patent dated September 6, 1859.—The inventor says: My composition is composed of the following ingredients: 18 gallons coal tar, 2 gallons India rubber solution, 1 gallon gum shellac varnish, 2½ gallons asphaltum solution, and 2 gallons linseed oil.

The India rubber is dissolved in turpentine, the gum shellac is dissolved in alcohol, and asphaltum is dissolved in turpentine, to form the solutions above specified.

*Claim.*—A composition formed of the ingredients or substances compounded in the proportions and in the manner as herein specified, for the purpose set forth.

No. 25,325.—LEWIS DUVALL, of Big Spring, Ky.—*Improvement in Boots.*—Patent dated September 6, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The within described method of cutting the piece of leather or other suitable material A, and uniting the same with the gore B, so that when it is folded in the lines *b b*<sup>1</sup> and *ff*<sup>1</sup>, and if the gore is brought in the proper position, said piece A, together with the gore, assumes the required shape of the upper of a boot, substantially as specified.

No. 25,326.—WILLIAM F. EDSON, of Philadelphia, Pa.—*Improved Machine for Cutting and Finishing Shoe Heels*.—Patent dated September 6, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The combination of the movable post F, the former H, (on the upper of the shoe,) the guide K, and the cutter wheel D, or an emery or burnishing wheel, with the hand lever G, bow guide O, springs N N, and radius bar J, acting substantially as set forth, for cutting or shaping, smoothing and burnishing the heels of shoes, either before or after they are fastened to the shoe.

No. 25,327.—BENJAMIN G. FITZHUGH and McCLINTOCK YOUNG, Jr., of Frederick, Md.—*Improvement in Automatic Rakes for Reaping Machines*.—Patent dated September 6, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The locating of an automatic sweep rake at the rear left hand or outside corner of the platform, when said rake has a rising and falling motion that will admit of its passing over the outside division board or fence, and then drop into or on to the extreme outer end of the platform, and sweep it of the cut grain, substantially as described.

No. 25,328.—THOMAS G. GARDNER, of Mount Pulaski, Ill.—*Improved Foam Collector for Steam Boilers*.—Patent dated September 6, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—Fitting a boiler with one or more plates, so applied as to present inclined surfaces above the surface of the water, with one or more outlets *b b* for steam and foam at the highest parts of said plate or plates, and as to provide a receptacle for foam above the said plate or plates, substantially as described, and to operate substantially as set forth.

No. 25,329.—EDWARD HAECKEL, of Cincinnati, Ohio, assignor to HAECKEL & Co., of said Cincinnati.—*Improved Apparatus for Mashing*.—Patent dated September 6, 1859.—This invention consists in the attachment to the common central beater shaft in malt mashing tubs of satellite beater shafts, for the purpose of effecting a more uniform, speedy, and complete mashing, stirring, or mixing of the material in which they operate.

*Claim*.—The described combination and arrangement of the central shaft C and satellite shafts N, the whole being armed with beaters Q, and rotated simultaneously, substantially in the manner and for the purpose set forth.

No. 25,330.—E. H. HANCOCK, of Augusta, Ga.—*Improvement in Flood Gates*.—Patent dated September 6, 1859.—This invention consists of a flood or dam gate, which is so arranged that as long as the water of the dam exerts a uniform pressure and flows regularly over the top of the structure to which the gate is attached, it will have a tendency to remain firmly closed; but as soon as the water of the dam rises and flows over said structure with such a rapidity as to cause an overflowing and consequent washing down of the embankment, it will suddenly open and allow a free escape of the water.

*Claim*.—The combination of the flood or dam gate C, tilting trough D, and the draining structure A B, or its equivalent, substantially as and for the purpose set forth.

No. 25,331.—JASON W. HARDIE, of New York, N. Y.—*Improvement in Sewing Machines*. Patent dated September 6, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim*, first, the method of making the "knot stitch" as described, namely: by taking the needle thread back of the needle, or at the side opposite to the position of the bobbin, and first doubling it upon itself around the needle and then looping it over the bobbin thread, substantially as specified.

Second. I claim the employment of two hooks *h h*, acting in opposite directions, when they take the thread at the back of the needle, or at the side opposite to the position of the bobbin, for the purpose of forming either the knot stitch or the ordinary shuttle stitch, by simply reversing the motion of the driving shaft, as set forth.

Third. I claim making the feed eccentric *i* self-adjusting by means of the loose sleeve *u*, slot *v*, and pin or stop *i*<sup>4</sup>, so that the feeding shall take place during the descent of the needle, whichever way the driving shaft may be turned, as described.

No. 25,332.—HIRAM H. HERRICK, of East Boston, Mass.—*Improved Carpet Sweeper*.—Patent dated September 6, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim*, first, providing the end of the box with a groove, as from *x* to *x*, when the same is used in connection with the flaring brush on the end of the shaft F, substantially as and for the purpose specified.

Second. Dividing the box into two parts, and providing each with a partition dividing the bottom of the box into two parts, through which the brushes protrude, and providing these parts of said bottom with flanges which hold the dirt; the several parts being connected and arranged together substantially in the manner set forth.

No. 25,333.—KELSEY HAZEN, of Brooklyn, N. Y.—*Improved Amalgamator*.—Patent dated September 6, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* compelling the water having the particles of gold in suspension to flow within a certain small distance of the heated mercury, under conditions substantially as set forth.

I also claim, in connection with the above, the employment of a series of vibrating agitators and scrapers P, acting in the space under E and of an adjustable gate G, for regulating the facility of egress of the least suspended particles, when combined and arranged substantially as and for the purpose set forth.

No. 25,334.—IRIS HOBSON, of Stout's Grove, Ill.—*Improvement in Mole Ploughs*.—Patent dated September 6, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The combination of a ditching plough beam, having a horizontal joint forward of the mole and coulter, with a rod arranged over the top of said joint, and with a horizontal adjusting and stop plate, substantially as set forth.

No. 25,335.—LEWIS G. HOFFMAN, of Waterford, N. Y.—*Improved Door Bolt*.—Patent dated September 6, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—The combination of a common door bolt with a barrel containing a wheel, with an arm acting on a slot in the bolt, so that when operated by a key the door may be fastened or unfastened on the outside; the whole being so constructed and arranged as not to interfere with the ordinary mode of using the bolt on the inside.

No. 25,336.—LORENZO HOLTSLANDER, of Oberlin, Ohio.—*Improvement in Propellers*.—Patent dated September 6, 1859.—This invention consists of a device to change the location of the valves and valve seats of a water propeller, or pump used for water propulsion, and thus reverse the motion of a vessel; and the combination forward, or in the bows, of a reservoir and several small pipes, through which a supply of water is obtained for the propellers.

The inventor says: I *claim* the device described for changing valve seats, as applied to water propellers, to reverse the motion of vessels or boats.

And also the combination of the small forward pipes *p p p p s*, with the reservoir R *v*, substantially as described.

No. 25,337.—GEORGE HUTCHISON, of Allegheny, Pa.—*Improved Apparatus for Printing the Addresses on Newspapers, &c.*—Patent dated September 6, 1859.—This invention consists in the combination and arrangement of a metallic belt, furnished with a series of conveyors, pulleys, press roll, inking roller, type or address frame and hopper, the whole being combined, arranged, and constructed for printing names or addresses on newspapers, cards, &c.

The inventor says: I *claim*, first, the inclined hopper *j*, with the slides or guides *m* and *n*, in combination with the ways *k* and conveyors *g* on the belt *f*, as described and for the purpose set forth.

Second. The use of a metallic belt, furnished with the conveyors *g* and *h*, as described and for the purpose set forth.

Third. The arrangement of the pulleys *d* and *e*, the belt *f*, press roller *p* and inking roller 4, as described and represented.

Fourth. The use of the lug *y* on the end of the type frame, when used in connection with the notch *o* in the conveyor *h*, as described and for the purpose set forth.

No. 25,338.—DAMASE LAMOUREUX, of New York, N. Y.—*Improvement in Parlor Grates*.—Patent dated September 6, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, so constructing the grate that the fuel box and the ash pit are distinct from and independent of the bars, and capable of being removed, while the bars remain undisturbed, thereby enabling me to effect the removal of the ashes and cinders with much less trouble than by the ordinary mode, and thereby keep the apartment free from the dust and dirt which are inseparable from the common method of removal, as fully described.

Second. The combination of the crank L, the rod I, and the movable bottom E of the fuel box, constructed and arranged as described, by which an easy and convenient means of giving a reciprocating horizontal circular motion of the grate bottom is secured without the necessity of cutting an opening in front for the passage of an arm by which to vibrate the grate, substantially as described and for the purpose set forth.

Third. The arrangement, in a parlor grate, of the bottom grate upon which the fuel is supported, in the manner described, by which it is made capable of being vibrated through the back of the fuel box, upon a fixed axis placed entirely back of the space devoted to fuel, the wings of said bottom grate being so extended as to cover or compensate for the necessary vibration which is made into open space back of the fire box, as set forth.

No. 25,339.—PIERSON LEFFEL and J. H. MULHOLLAND, of Springfield, Ohio.—*Improved*

*Method of Centring in Watchmakers' Lathes.*—Patent dated September 6, 1859.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, a vibrating mandrel, arranged within a socket or hollow spindle in such a manner that its inserted end may fit closely within said socket, and its outer end allowed to vibrate, substantially as described for the purposes set forth.

Second. In combination with the vibrating mandrel D, we claim the rocking collar *f*, spring *e*, key *k*, and nut *j*, all constructed and arranged to operate substantially as described for the purposes set forth.

No. 25,340.—HOSEA LINDSEY, of Ashville, N. C.—*Improved Submerged Pump.*—Patent dated September 6, 1859.—This improvement consists in arranging two valved pistons on the ends of a short reciprocating piston rod, which is supported and guided centrally within the stationary double chambered cylinder by means of the central diaphragm, or division plate of said cylinder, the piston rod with its pistons having a parallel reciprocating motion imparted to it by means of chains, pulleys, and a vibrating brake or lever, and its pistons acting together at the same time, the right one to admit water at the right end of the cylinder and the left one to expel the water at the left side of the central division or diaphragm of the cylinder, and *vice versa*.

*Claim.*—The arrangement of the short reciprocating piston rod E, open pistons F F, sliding ring valves G G, cylinder B B<sup>1</sup>, having a conducting pipe D, with the chain H and brake I, in the manner and for the purpose set forth.

No. 25,341.—GEORGE M. LONGACRE, of New Orleans, La.—*Improvement in Steam Pans for Clarifying Sugar.*—Patent dated September 6, 1859.—The pipes *m* are made the same length as the inside width of the pan. There is on the outside of the pans, and on a line with the pipes *m*, chocks for the purpose of making a packed joint from *m* to the parts attached thereto, through which the steam passes in and out of the pans; these chocks being designated by letter *c*, and the parts to be joined by X and P, both being pipes, and valves V; through these joints are pipes *o* for the purpose of supporting the joints and allowing the pipes *m* to turn, so that the pipes *r* can be turned up to clean them.

*Claim.*—In combination with the pans, the relief valve V and the check valve *t*, when arranged and operated as, or substantially as, and for the purpose set forth.

No. 25,342.—JUSTUS R. LOOMIS, of Winsted, Conn.—*Improvement in Lamps.*—Patent dated September 6, 1859.—I I<sup>1</sup> are metallic heating radiating wires, tubes, or rods, formed into the desirable shape, so as to allow the pointed ends to be inserted through the wick, while the others, the looped ends, pass up between the tubes G.

*Claim.*—The arrangement of the cylindrical corrugated skirting J, perforated tubes G, adjustable radiating wires I I<sup>1</sup>, in the manner as and for the purpose described.

No. 25,343.—EDWARD M. MANIGLE, of Philadelphia, Pa.—*Improvement in Stoves.*—Patent dated September 6, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The arrangement of the series of distinct or uncommunicative hollow open air chambers *ff*, or their equivalents, in combination with the cross piece of the top plate B of a cooking stove, substantially in the manner and for the purpose set forth and described; and this I claim, whether the said cross piece A be either movable or stationary in the said top plate.

No. 25,344.—ALVIN C. MASON, of Springfield, Vt.—*Improved Machine for Wiring the Joints of Clothes Pins.*—Patent dated September 6, 1859.—This invention consists in the use of a clamping device, pliers, adjusting forks and shears, arranged to operate, whereby the wire joints or hinges of jointed clothes pins may be secured in the pins in an expeditious manner.

The inventor says: I *claim*, first, the intermittingly rotating pliers E E, in connection with a clamping device formed of the jaws *l*, recess *a*\*, and lever R, or their equivalents, and shears L L, arranged to operate substantially as and for the purpose set forth.

Second. In combination with the pliers E, and shears L, and clamping device, the sliding forks *g*, arranged for joint operation, as set forth.

Third. The particular manner of opening and closing the pliers E E, and operating the arbors D, to wit: by means of the sliding cones F, in connection with the springs *f* and permanent bosses *g* on the arbors D, whereby the jaws of the pliers are opened and closed, and the arbors D shifted by a very simple mechanism.

No. 25,345.—THOMAS J. MEAD, of Port Byron, N. Y.—*Improvement in Brakes for Railroad Cars.*—Patent dated September 6, 1859.—The inventor says: My invention consists in the manner in which I combine the pairs of short brake blocks with a bent or U shaped piece of iron and a single lever, so that the brakes are applied with certainty, with uniformity of pressure, quickly and efficiently.

*Claim.*—The combined use of the U shaped yoke, the brake bars, and the short brake

blocks, for the purpose of adapting the brake to a simple lever that acts directly upon it, as stated.

No. 25,346.—WILLIAM MOSHER and ISAAC H. MOSHER, of Green, N. Y.—*Improved Machine for Bending Wagon Tires.*—Patent dated September 6, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—The clutch or clasp to hold the end of the bar, in combination with the former being made three fourths of the circle, and the arrangement of the lever for operating as specified and for the purpose set forth.

No. 25,347.—JACOB PARKER, of St. Louis, Mo.—*Improvement in Trunks.*—Patent dated September 6, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the forming the lid of the trunk in the shape of a semi-cylinder as specified, for the purposes set forth.

Second. The impervious box *g*, or sponge carrier, arranged in the tray as described.

Third. The peculiar formation of the division boards *n n* in such manner that they will come down on to the rim of a gentleman's hat placed in the middle hat box, as specified.

No. 25,348.—HENRY PENNIE, of Buffalo, N. Y.—*Improvement in Bits for Cutting Washers.*—Patent dated September 6, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of the cutters *D* and *D* upon the ends of the sliding bars *C* and *C*, and at right angles thereto, the said sliding bars passing through a mortise in the shank *A*, and lying parallel with each other, and one above the other, so that the cutters will work upon the same side of the centre point *B*, substantially as described.

Second. I claim the recess *g*, made in the lower end of the shank *A*, so as to allow the inner cutter to slide close up to the point *B*, and thereby adapt the instrument to cutting very small washers, as set forth.

No. 25,349.—JAMES POWELL, of Cincinnati, Ohio.—*Improved Faucet.*—Patent dated September 6, 1859.—This invention relates to the class known as valve cocks, and consists in a peculiar combination of a guarded elastic valve seat, with a plug of metal or other hard material.

*Claim.*—The elastic annular valve seat *S*, and sliding collar *O*, in the described combination, with an adjustable plug valve *L* of hard metal.

No. 25,350.—ISAAC C. SHULER, of Amsterdam, N. Y.—*Improvement in the Construction of Sheet Metal Coffins.*—Patent dated September 6, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the construction of a sheet metal coffin in two sections, stiffened with frames or straps; and, in dividing the coffin into two sections, I do not confine myself to any particular locality on the sides for making the joints, but claim forming the joint on the side of the wall at any convenient point between the flange *o* and the rim *b*, and concealing the same with an adjustable moulding.

Second. I claim the frames *c d e f g h* and *i*, for stiffening the coffin, substantially as described; and also the scrolled rim or joint *b*, substantially as described.

No. 25,351.—DAVID G. STAFFORD, of Syracuse, N. Y.—*Improvement in Stoves.*—Patent dated September 6, 1859.—This invention consists in combining a self regulating valve applied to the smoke flue, or pipe, of a coal stove, with an air flue surrounding the fire box and open to the room at the bottom of the stove.

*Claim.*—The combination of a self regulating valve applied to the smoke pipe of coal stoves, and operating substantially as set forth, with an air flue surrounding the fire box, constructed as described, the whole arranged substantially as stated.

No. 25,352.—JOSEPH TIBERI, of St. Louis, Mo.—*Improvement in Grates.*—Patent dated September 6, 1859.—The object of this invention is to provide a better method of throwing the heat of the furnace either in or out of the room, or up the chimney at pleasure, and also in providing an escape for the dust and ashes from the grate behind the furnace, so that the dust and ashes shall pass up the chimney instead of coming out into the room.

*Claim.*—Arranging the adjustable furnace back *B* in the furnace place, and constructing and operating the same substantially as set forth.

No. 25,353.—WILLIAM S. TODD, of Mechanicsville, Iowa.—*Improved Joiner's Clamp.*—Patent dated September 6, 1859.—This invention consists in arranging, upon a slotted frame, a sliding head block provided with rack teeth, and in operating the head block by means of a pawl and lever, the latter being made adjustable to the frame so that a greater purchase can be maintained in clamping very wide or very narrow boards.

*Claim.*—The combination of the adjustable lever F, with the frame A and sliding block C, when the same are arranged and operate in the manner and for the purposes set forth.

No. 25,354.—LOUIS TREGRE, of Parish of St. John the Baptist, La.—*Improvement in the Construction of Cane Juice Boxes.*—Patent dated September 6, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—The method of separating the pure from the impure parts of the juice when the latter have settled to the bottom of the box, so that the pure parts can be drawn off without disturbing the impure, by dividing the one from the other by means of a movable partition valve, or its equivalent, arranged within the box substantially as described.

No. 25,355.—EDWARD A. TUTTLE, of Brooklyn, N. Y.—*Improved Hot Air Register.*—Patent dated September 6, 1859.—The inventor says it will be observed that the axis of the roller F moves upon the shelf G, and in consequence of this movement I am enabled to use a very small roller with success.

*Claim.*—The arrangement and combination with the leaves C of the roller F, having its axis movable and travelling on a shelf G, with or without springs *b*, as and for the purpose shown and described.

No. 25,356.—STEPHEN D. TUCKER, of New York, N. Y., assignor to R. M. HOE, R. HOE, and P. S. HOE, of said New York.—*Mode of Operating the Fingers of Printing Presses.* Patent dated September 6, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—Operating the finger shaft C by means of a grooved disk E attached thereto, and the roller  $j^1$  attached to a plate or proper support, so as to be respectively within and without the path of rotation of the finger shaft, substantially as and for the purpose set forth.

No. 25,357.—LEMUEL T. WELLS, of Cincinnati, Ohio.—*Improvement in Printing Presses.* Patent dated September 6, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: In the described combination with stationary butments C on the ways, I claim the attachment to the bed of a closed cylinder D, its piston E F having a stroke relatively less than that of the bed, and acting to simultaneously condense and rarify the air at alternately opposite ends of the cylinder, as set forth.

No. 25,358.—S. H. WILDER, of Grinnell, Iowa.—*Improved Method of Opening Valves to Extinguish Fire.*—Patent dated September 6, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I claim the arrangement, essentially as described, of a reservoir or other means of producing pressure, combined with a system of tubes, cross tubes, and valve shafts, with valves and stop-cocks, arranged as described, when used as a means of operating upon a cylinder and piston, or a water wheel, for the purpose of starting and afterwards stopping the wheel or engine without the intervention of any person than the one who discovers the fire.

I also claim the use of gear wheel *i*, rack bar *h*, and blank wheel H, or their equivalents, arranged to move the gate of a water wheel out and in alternately by a repetition of the same motion.

No. 25,359.—WILLIAM C. ALLISON, of Philadelphia, Pa., assignor to Himself and JOHN MURPHY, of said Philadelphia.—*Improved Apparatus for Watering and Sweeping Railways.*—Patent dated September 6, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I claim, first, The horizontal perforated pipe T T<sup>1</sup> and the swing pipes W, in combination with a truck having wheels adapted to the rails of a passenger railway, the said truck carrying a tank L, and the said swing pipes being arranged and operated by the devices described, or their equivalents, substantially in the manner and for the purpose set forth.

Second. The combination of the adjustable revolving brushes 19 with the truck, when the brushes are arranged in respect to the rails, substantially as and for the purpose specified.

Third. I claim, in combination with the brushes, any convenient number of projections 20 revolving simultaneously with the said brushes, and so arranged in respect to the rails as to clean the grooves or corners of the treads from all obstructions.

No. 25,360.—WILLIAM BARNES, of Troy, N. Y., assignor to PHILLO P. STEWART, of said Troy.—*Improved Feed Water Apparatus for Steam Boilers.*—Patent dated September 6, 1859. The claim and engravings explain the nature of this invention.

The inventor says: I claim, first, in combination with a steam boiler A and a close chamber B, placed higher than or at the same height as the boiler, and having communication therewith by a steam passage *e* and a water passage *f*, each provided with a stop cock or

valve, substantially as described, a close receiver C, located lower than the boiler, and having a steam passage from the boiler and a water passage into the chamber B, substantially as set forth, for use in raising water from a place lower than, and introducing it into, the boiler while the boiler is charged with steam.

Second. And I also claim, in combination with the matter above claimed, making the receiver O in two parts Y and X, with the steam pipe C from the boiler A, and the cold water supply pipe *b*, both entering one part, and the hot water supply pipe *a* entering, and a water pipe *d* to the chamber B leaving the other part, and with the two parts of the receiver connected together by a passage *h*, substantially as and for the purpose set forth.

No. 25,361.—DELECTUS DURFEY, of Fort Seneca, Ohio, assignor to Himself, L. A. LYON, and H. P. TYLER, of Clarksfield, Ohio.—*Improvement in the Mode of Applying Power to Machinery*.—Patent dated September 6, 1859.—This invention consists in the manner of applying power to machinery by groove wheels, levers, and springs.

*Claim*.—The combination of the treadle levers *g*, arms *g*<sup>2</sup>, and springs *c*, with the grooved wheel B and spring braces *k*, operating as described and for the purposes set forth.

No. 25,362.—N. A. DYER, of Medford, and J. F. AUGUSTUS, of Boston, Mass., assignors to JOSEPH C. TUCKER, of Brookline, N. H.—*Improved Compound Illuminating Fluid*.—Patent dated September 6, 1859.—The inventors say: In making our compound, our practice is to take of resin oil three parts, with one part of fusil oil and one part of alcohol, mixing them thoroughly. This proportion is varied when the resin oil is heavy, using proportionately of the alcohol and fusil oil.

*Claim*.—The combination of ingredients for the purpose set forth, and essentially in the proportions described.

No. 25,363.—GEORGE HENDERSON, of Allegheny, Pa., assignor to Himself and GEORGE HUTCHISON, of said Allegheny.—*Improvement in Printing Presses for Addressing Newspapers, &c.*—Patent dated September 6, 1859.—This invention consists in the arrangement and combination of a guide table and pulley, press wheel, conveying pulley, and inking rollers, with a type frame and open hopper, the whole being combined and arranged for the purpose of printing names and addresses on envelopes, &c.

The inventor says: I *claim*, first, the combination and arrangement of the guide table *g* and pulley *h*, the press wheel *d*, the conveying pulley *c*, and inking rollers *k*, with type frame *j*, and the open hopper, the whole being combined, arranged, and constructed in the manner and for the purpose specified.

Second. The use of the open hopper, when constructed as described and used for the purpose set forth.

Third. The use of the pins *o*, or their equivalent, on the type frame *j*, for the purpose of carrying forward the papers, as set forth.

No. 25,364.—CHARLES E. JACOT, of New York, N. Y., assignor to SALTZMAN, JACOT & Co., of said New York.—*Improvement in Watches*.—Patent dated September 6, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, constructing the bridge or plate *c*, with the curve *i* and index 8, for the purposes and as specified.

Second. I claim constructing the bridge plate *c*, separately from, but screwed to the three quarter plate *b*, for giving access to the centre, second, and third wheels, without removing said three quarter plate, as described and shown.

Third. I claim attaching the three quarter plate *b* to the dial plate *a*, by riveting the columns 1 to the plate *b*, and inserting the screws 2 at the dial plate *a*, for the purposes and as set forth.

Fourth. I claim constructing the click spring *e*, as specified, for preventing the ratchet teeth being broken, as specified.

No. 25,365.—JOHN MARTINO, of Philadelphia, Pa., assignor to D. STUART and RICHARD PETERSON, of said Philadelphia.—*Improvement in Stoves*.—Patent dated September 6, 1859.—This invention consists of a plate peculiarly arranged within the stove, above the fire pot, so as to divide the interior of the stove into two chambers, and thereby avoid the necessity of employing the extraneous return flue common to this class of stoves.

*Claim*.—The division plate L, with its damper N, the plate *k*, with its openings, and the casing J, with its wings *t t*, where the several parts are arranged in respect to each other and to the outer casing and fire pot, as and for the purpose set forth.

No. 25,366.—ROBERT POOLE, of Baltimore, Md.; assignor to Himself and GERMAN H. HUNT, of said Baltimore.—*Improved Forcing Pump*.—Patent dated September 6, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—Enlarging the areas of the inlet and exit openings, where they connect with the

pump cylinders, by means of the swells O P, substantially in the manner and for the purpose set forth.

No. 25,367.—ROBERT POOLE, of Baltimore, Md., assignor to GERMAN H. HUNT, of Baltimore, aforesaid.—*Improvement in Pistons of Pumps*.—Patent dated September 6, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* a valve made of flexible material, hung loosely upon the piston rod, and having for its bearings the round edged wings of the nut by which it is fastened to the piston, substantially in the manner and for the purposes described.

I also claim, in combination with a flexible valve and winged screw nut, a piston constructed of ribs, which present sharp edges to the water, while they are flat at the end, which constitutes the seat of the flexible valve, substantially in the manner and for the purpose described.

No. 25,368.—JOHN B. POWELL, of Philadelphia, Pa., assignor to Himself and G. B. FRICK, of said Philadelphia.—*Improved Automatic Fan*.—Patent dated September 6, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The spindle M, with any convenient number of cog wheels of different sizes, in combination with a similar number of cog wheels, also of different sizes, on the crank spindle S, when the said spindle and its wheels are rendered adjustable, and are applied to and combined with the work of the automatic fan, substantially as and for the purpose set forth.

No. 25,369.—CHARLES H. RAYMOND, of Southington, Conn., assignor to THE PECK SMITH MANUFACTURING COMPANY, of said Southington.—*Improvement in Tin Folding Machines*.—Patent dated September 6, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The arrangement of the clamp E and G with bed piece D and folder N, when combined with revolving gauge R, so that the width of the crimp or fold may be first gauged, and then that portion of the tin contiguous to the part intended to be folded be first firmly clamped and held fast, and then the fold or crimp formed thereon in the manner described, all by one simple movement of folder N and parts in connection, and without marring the tin, all in the manner fully set forth.

No. 25,370.—G. W. RICHARDSON and ROBERT GLOVER, of Grayville, Ill., assignors to Themselves, J. B. WILLIAMS, and W. A. HORREL, of said Grayville.—*Improvement in Harvesting Machines*.—Patent dated September 6, 1859.—This invention consists in the provision of detachable cams of peculiar form, having an acute angular bearing to fit a corresponding projection upon the side of the wheel, and within the tire or band under which the cam is inserted. Cams are attached to the driving wheel by means of suitable bolts and nuts, and they are detachable and removable therefrom.

*Claim*.—The cams *a*, cast in sections of one or more, and secured to the driving wheel by means of a bolt or screw C and flange *b*, in the manner described for the purpose specified.

No. 25,371.—IVES SCOVILLE, of Chicago, Ill., assignor to Himself and W. H. SCOVILLE, of said Chicago.—*Improvement in Machines for Breaking Stone for Turnpike Roads, &c.*—Patent dated September 6, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The arrangement, in the manner set forth, of the funnel shaped hopper C, constructed substantially as described, with the two vertical cylinders A A, constructed substantially as described, for the purpose of breaking stones for ballasting railroads and macadamizing streets, turnpikes, &c.

No. 25,372.—DANIEL H. SOLLIDAY, of Philadelphia, Pa., assignor to EDWARD H. ASHCROFT, of Boston, Mass.—*Improvement in Gas Burners*.—Patent dated September 6, 1859.—This invention consists in combining, with an ordinary burner, whether of the batwing or fishtail kind, or one provided with one or more discharging orifices at its upper end, a chambered cap, tube, or thimble, made to fit loosely thereon, and have one or more discharging orifices at its top, and so applied to the main burner as to form a gas expansion chamber between the eduction orifice of said burner and that of the cap or thimble, made to slip on and fit loosely at its lower edge to the main burner, or to be screwed thereto, or be otherwise applied, so as to be capable of being easily detached therefrom as occasion may require.

*Claim*.—The application of the conical or chambered burner A to the main burner B, in the manner and for the purpose substantially as set forth.

No. 25,373.—SILAS B. TERRY, of Terrysville, Conn., assignor to SILAS B. TERRY, JR., of said Terrysville.—*Improved Machine for Making Paper Boxes*.—Patent dated September 6, 1859.—This invention consists in the employment of a rotating clamp, gauge or socket, discharging ring, pressure roller, and guide; these parts being arranged as described,

and used in connection with a folding device, whereby the manufacture of the boxes is expedited.

The inventor says: I *claim*, first, the pressure roller L, in connection with the rotating clamp formed of the head D and disk *f*, arranged substantially as and for the purpose set forth.

Second. In combination with the pressure roller L, head D, and disk *f*, the ring or band E, provided with the pins or stripes *i*, the socket F, provided with the screws or pins *j*, and the guide plate G, arranged for joint operation as and for the purpose described.

Third. The arrangement of the pressure lever H and sliding mandrels B C, for the purpose specified.

Fourth. The employment or use of the folding device formed of the plate N, provided with the ledge *u* and the pivoted bar *v*, when said folding device is used in connection with the pressure roller L, rotating head D, and disk *f*, for the purpose set forth.

No. 25,374.—JOSEPH WESLEY, of Providence, R. I., assignor to JOSEPH B. WESLEY, of said Providence.—*Improvement in Skeleton Skirts*.—Patent dated September 6, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—A new article of manufacture, to wit: a skirt having its hoops supported by tapes or straps, which are rendered adhesive by the application of caoutchouc or gutta percha, in the manner and for the purpose substantially as described.

No. 25,375.—HENRY ADAMS, of New York, N. Y.—*Improvement in Saddle Trees*.—Patent dated September 13, 1859.—This invention consists in connecting the two bars of the tree by a bridge, at a point which corresponds with the hollow, or lowest parts of the back or dorsal vertebræ of the animal, and dispensing with the head which has hitherto connected the front ends of the bars directly over the withers of the animal, the several parts forming the tree being arranged so as to attain the desired object.

*Claim*.—A tree for side or ladies' saddles, constructed by connecting the bars A A by a bridge B, at the point specified, and with an open space *a* between the front ends of the bars, at their junction with the horns C D, for the purpose set forth.

No. 25,376.—GEORGE S. AVERY, of Cross River, N. Y.—*Improvement in Rails for Railroads*.—Patent dated September 13, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—An improvement in railroad iron bars or rails, by an offset or bend made in one end of the rails, and the lapping on of the other end of the rails, and inserting a key between them at the lap, and riveting or bolting them together, substantially as and for the purposes described.

No. 25,377.—E. S. BARTLETT, of Romulus, N. Y.—*Improvement in Ditching Ploughs*.—Patent dated September 13, 1859.—The principal features of this invention consist in the peculiar mode of securing the shares firmly and strongly beneath the beam A, and of adjusting them so as to cut ditches of different widths.

The inventor says: I *claim* the combination of the arms D D D, brace H, rods *d d*, and blocks F F, substantially as and for the purpose set forth.

I also claim the mode of attaching and adjusting the shares E E E, by means of the packing blocks *l l l*, in combination with the bolts *b b* and arms D D, substantially in the manner specified.

No. 25,378.—ANDREW F. BLUNK, of Indianapolis, Ind.—*Improvement in Straw Cutters*.—Patent dated September 13, 1859.—In using this machine, the straw is placed upon the endless belt I I, when, by turning the wheel E, which carries the knives upon its arms, the endless belt is set in motion and carries the straw up to the knives between the rollers; the straw being thus compressed by passing between the rollers, is cut; the knives having an elbow shape on their backs, and an angular concavity on their edges, and so adjusted that when they sweep past the face of the box, they cut with a drawing motion, in close imitation of the motion of the common hand cutting box having but a single knife.

*Claim*.—A straw cutter, constructed as shown and specified, that is to say, with angular knives T, arms K, wheel E, feed rollers B C and D, slides P S, springs O, band N, pulleys J J, and endless belt I, when these several parts are constructed and arranged to operate conjointly, as and for the purposes described.

No. 25,379.—ELIAS K. BRECKENRIDGE, of West Meriden, Ct.—*Improvement in Window Sash Fasteners*.—Patent dated September 13, 1859.—This invention consists in placing two cams on a common arbor, and connecting both by a single spring, the parts being placed in the stile of a window casing, and in such relation to the sash as to bear against its edge.

*Claim*.—The employment or use of two cams B B<sup>1</sup>, placed on a common arbor *b*, with a spring E F applied to them, and a lever C, the whole being fitted within a frame A, and arranged to operate substantially as and for the purpose set forth:

No. 25,380.—ZERAH B. BROWN and MELVIN C. GODARD, of Granby, Conn.—*Improvement in Seed Planters*.—Patent dated September 13, 1859.—This invention consists in planting corn and other seeds in two rows at a time, by means of a suitable framework mounted on wheels, and so arranging and combining the several parts of the machine that the furrow is opened for the reception of the seed; the seed dropped in required quantities, and at a required distance, and covered or stamped by the joint action of the shares and wheels.

*Claim*.—The arrangement and combination of the carrier and stamping wheels F F, cams and marker device I I upon the wheel F<sup>1</sup>, the reciprocal levers H H, seed slides or valves D D, hoppers B B, drill formers J J, and covering shares K K, substantially in the manner as and for the purpose described.

No. 25,381.—JONATHAN S. BUELL, of Buffalo, N. Y.—*Improvement in Sewing Machines*.—Patent dated September 13, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, in combination with the stationary corrugated surface O O, the corrugated foot piece Q, constructed, arranged, and operating therewith, as set forth.

Second. I also claim, in combination with the needle or its thread, the conical spool X, and guide U, for causing the slack in the thread to form the loop, and holding said loop from turning until seized by the looper, as set forth and explained.

No. 25,382.—STEPHEN BURROWS, of Lima, Wis.—*Improvement in Seed Drills*.—Patent dated September 13, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The employment of a grooved ring B C, fitted on the axle or shaft of a seed drill, in combination with the peculiarly constructed tube D E, leading from the hopper into the groove of the ring, substantially as and for the purposes set forth.

No. 25,383.—WILLIAM CAMPBELL, of Waterloo, Pa.—*Improved Churn*.—Patent dated September 13, 1859.—This invention consists of perforated hinged floats in the dasher head.

*Claim*.—The perforated and hinged floats F, as an improvement in the construction of dasher heads for churns.

No. 25,384.—ROSANNA CARPENTER, of Medford, Mass.—*Improvement in Extracts of Fruits*.—Patent dated September 13, 1859.—In describing this invention or discovery, the inventor says: Take the fruit from which the extract is to be made, (quinces or apples,) and having wiped them clean, either cut them in half or put them whole in a suitable boiler and cover them with water; let them boil until tender, press out the juice, return the juice to the boiler again, and put in it as much fruit as the juice will cover, and let it boil as before; this process must be repeated until the juice is sufficiently strong; return the juice to the boiler, and add thereto the white of eggs, well beaten up, at the rate of about one egg to six quarts of juice; let it boil for a few minutes, and skim it as the impurities rise to the top. The juice is then put hot into bottles and corked while hot.

*Claim*.—As a new article of manufacture, the above described extract of fruit, prepared in the manner substantially as specified.

No. 25,385.—RICHARDSON P. CLARK, of Johnstown, N. Y.—*Improvement in Hand Mills for Grinding Apples, &c.*—Patent dated September 13, 1859.—This invention consists essentially of a rotary cylindrical wheel or drum A, mounted in a suitable frame B, upon a horizontal axis C, provided with a hand crank D, or an equivalent device by which the cylinder can be easily turned by hand, which cylinder has its whole periphery composed of uniform sharp and shallow ratchet like teeth *e*, arranged at equal distances apart with their edges pointed in the direction in which the cylinder turns, and a yielding concave bed in which the cylinder revolves, having teeth similar to those on the cylinder.

*Claim*.—The described improved hand mill for household use, in reducing apples, potatoes, and other fruits and roots to pomace; the teeth *e l* of the combined cylinder, and adjustable yielding concave, being formed and arranged in the particular manner set forth.

No. 25,386.—BARNES CLAYTON, of Philadelphia, Pa.—*Improved Fastening for Shirt Studs*.—Patent dated September 13, 1859.—This invention consists in the combination and arrangement of a hollow sliding case containing a spring, with a tie or post, which rigidly connects the front or ornamental part of the stud to its back or fastening bar in such a manner that the sliding case will yield to pressure so as to admit of a ready and convenient application of the stud, and afterward by the reaction of the spring, when the pressure is removed, so change its relative position as to cause the latter to prevent the stud from being removed from the garment in an irregular manner, or by a direct pull.

*Claim*.—The hollow sliding case A and spring B, in combination with the tie or post E, and the bar D, the same being arranged to operate together, substantially in the manner and for the purpose set forth and described.

No. 25,387.—P. S. CLINGER, of Conestoga Centre, Pa.—*Improvement in Wire Fences.*—Patent dated September 13, 1859.—The inventor says: The advantages obtained by the use of the combined pin and ratchet wheel, in connection with the hooks to the one set of wires passed through and around the pins, does not affect the wires fastened to the hooks passed over or around the pins.

*Claim.*—The combination of the pin S with the ratchet T, in connection with the mortised posts and the hooked wires H W, when these several parts are arranged substantially as described for the purpose set forth.

No. 25,388.—T. T. COLLIER and H. W. S. COLLIER, of Lavernia, Texas.—*Improvement in Cotton Seed Planters.*—Patent dated September 13, 1859.—This invention consists in arranging in the hopper a stirrer consisting of two disks united by horizontal rods, the same revolving over and feeding the seed to the distributor that consists of a roller, the face of which is cut out in the shape of ratchet teeth, forming a series of seed cells, to carry the seed to the discharge tube and in the furrow made by the hollow ploughshare, which serves as a discharge tube; and after the seed has thus been deposited on the ground, it is pressed by a packing wheel with a broad face, which is kept clean by a scraper.

*Claim.*—The arrangement of the distributor E and the stirrer H, constructed as described, to operate in combination with the packing wheel I, substantially as and for the purpose set forth.

No. 25,389.—HENRY W. COLVIN, of Pendleton county, Ky.—*Improvement in Sight for Fire-Arms.*—Patent dated September 13, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The semi-circular form of the foresight with its range piece or bead and shades, and triangular form of the hind sight, with its needle or rings and shades, substantially as described and for the purpose set forth.

No. 25,390.—GEORGE COOK, of Paris, Ill.—*Improvement in Rotary Harrows.*—Patent dated September 13, 1859.—This invention consists in arranging the teeth of a rotary harrow on triangular frames, which revolve on oblique pins in such a manner that they form hollow segments, said teeth to be set on lines which do not pass through the centres of the frames, so that they clean themselves more readily, and cause the frames to revolve without any extra weight.

*Claim.*—The arrangement of the teeth *d*, placed eccentrically on triangular frames E, which rotate on oblique pivots *c*, substantially as and for the purpose specified.

No. 25,391.—SOLOMON CROWELL, Jr., of Palmyra, N. Y.—*Improvement in Coffee Pests.*—Patent dated September 13, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The combination of the perforated diffusing chamber C, having a tight conical bottom *f*, with the concentric perforated digester D, whereby the coffee is exposed in a thin layer of nearly uniform thickness to the water percolating nearly uniformly through all parts, for the purposes specified.

No. 25,392.—HENRY DAVIS, of Baltimore, Md.—*Improvement in Brakes for Railroad Cars.*—Patent dated September 13, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—Increasing the frictional action of the car brakes upon the peripheries of car wheels, by the introduction of sand, or its equivalent, between the frictional surfaces at the time that the brakes are brought in contact with the car wheels, substantially as set forth.

No. 25,393.—DAVID DECKER, of New York, N. Y.—*Improvement in Piano Forte Actions.*—Patent dated September 13, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, attaching the relieving jacks, regulating screw F<sup>3</sup>, directly to the key, or to some part carried by the key, so that the repeating lever shall govern the action of the relieving jack by or through the said regulating screw, whether constructed in this precise manner, or in an equivalent, for the purpose described.

Second. I claim the groove in combination with the tongue, pin, or equivalent, for the purpose of keeping the lifting jack in its proper position in relation to the repeating lever, and for preventing any binding or sticking of said repeating lever and lifting jack.

Third. I claim so arranging the adjustable piece D, and repeating lever E, both or either of them, so that their regulating screws D<sup>2</sup> and F<sup>3</sup>, both or either of them shall be at or near the end next toward the front of the key, in front of the hammer rail, for the purpose of being thus conveniently placed for regulating.

No. 25,394.—SYLVANUS A. DENIO, of Boston, Mass.—*Improved Prison Lock.*—Patent dated September 13, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The lock or part *b*, with its parts *c* *i* and *k*, arranged with each other as described,

to move, hold and lock the bolt *k* in door *l*, when combined, positioned, and secured with lock *h*, which in turn locks the shaft *c*, all by turning a single knob; all the parts being constructed and operated in the peculiar manner described and for the purpose set forth.

No. 25,395.—SIMEON DODGE, jr., and BENJAMIN POTTER, jr., of Marblehead, Mass.—*Improved Heel for Boots and Shoes*.—Patent dated September 13, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—As a new article of manufacture, a heel having a concave seat and a flat tread, with its rises united by cement, as set forth.

No. 25,396.—THOMAS DOUGHERTY, of Macon, Ga.—*Improvement in Switch Stands for Railroads*.—Patent dated September 13, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—The combination of eccentric *B* with the pin *C* through lever *D* to bar *E*, for the purpose of locking and unlocking the main pin *A* to and from notches *M M M*, substantially as and for the purposes set forth.

No. 25,397.—EUGENE DUCHAMP, of St. Martinsville, La.—*Improved Faucet*.—Patent dated September 13, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—The arrangement and combination of the oblique slot *G*, handle *F*, stem *C*, and tube *A*, so that on turning the handle *F* the stem *C* will rise and fall with a spiral or screw movement, thus ensuring ease of operation and tightness of packing, as shown and described.

No. 25,398.—EUGENE DUCHAMP, of St. Martinsville, La.—*Improved Filter*.—Patent dated September 13, 1859.—This invention relates to the process of separating liquids from the substances suspended mechanically in them by passing them through materials sufficiently compact to retain the insoluble matter.

*Claim*.—The employment of fine spun glass arranged in the manner and for the purposes set forth, in combination with the reservoir *G*, floating valve *J*, chamber *E*, and pure water chamber *F*, essentially in the manner represented and described.

No. 25,399.—EUGENE DUCHAMP, of St. Martinsville, La.—*Improvement in Boilers for Bleaching Clothes*.—Patent dated September 13, 1859.—This invention relates to the boiling and bleaching of clothes so as to extract grease and dirt therefrom, preparatory to submitting them to a washing operation by rubbing, &c.

*Claim*.—The combination and arrangement with the false bottom *G* and tank *A* of the perforated casing *D*, fire chamber *C*, draft pipe *F*, smoke pipe *H*, as and for the purpose shown and described.

No. 25,400.—JOHN FAZIG, of West Salem, Ohio.—*Improved Mop Head*.—Patent dated September 13, 1859.—This invention consists in such a form of construction that the rod which holds the cloth forms a lever with a series of fulcrum notches that fit into a slot at one end of a cross head of the mop, the opposite or long arm of the lever being supplied with a screw and nut, by means of which the cloth may be firmly secured between the cross head and lever.

*Claim*.—The herein named construction of a mop head, consisting of the piece *B* with the slot *C* and hole *D*, in combination with the rod *E* and notches *a e*, screw and nut *G*, when the several parts are arranged and operated substantially as set forth.

No. 25,401.—JACOB FASSMACHT, of New Milltown, Pa.—*Improvement in Harnesses*.—Patent dated September 13, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The device of combining the hip strap and breech band in one continuous piece *A* for each half, united at *B B*, to form the breeching, as set forth.

No. 25,402.—WILLIAM R. FEE, of Cincinnati, Ohio.—*Improvement in Hydraulic Oil Presses*.—Patent dated September 13, 1859.—This invention consists, first, in a new construction of follower, composed of peculiarly grooved dies for oil presses.

Second. In an improved construction of truss.

Third. In a hinged box for packing the cake and adjusting it in the press.

The inventor says: I *claim*, first, the peculiar construction of the dies *D<sup>1</sup>* and followers *D*, having the grooves *G* and conduits *G<sup>1</sup>*, and also the oil passages *d* to facilitate the expression of oil, substantially as set forth.

Second. I claim the solid truss *K*, when made a part of the press and worked by means of the rack and pinion, substantially as set forth and for the purposes described.

Third. I claim the hinged hoop *F* for charging the press, substantially as set forth.

No. 25,403.—J. H. FRAMPTON, of Hopewell, Ohio.—*Improvement in Cultivators*.—Patent dated September 13, 1859.—This invention consists in a novel way of attaching the shares to the plough, whereby they may be readily adjusted nearer together, or further apart, or higher, or lower, as the nature of the work may require.

*Claim.*—The adjustable share standards G G attached to the parallel adjustable bars D D, which are secured to the beam A by the bars E E<sup>1</sup>, the whole being combined and arranged substantially as and for the purpose set forth.

No. 25,404.—DANIEL K. FRANCE, of Congress, Ohio.—*Improved Churn Dash.*—Patent dated September 13, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The metallic strips B attached to the convex surface of the slats, by slots and screws, and operating in the manner and for the purpose substantially as set forth.

No. 25,405.—C. L. GILPATRICK, of Saco, Maine.—*Improved Churn.*—Patent dated September 13, 1859.—This invention consists in the employment of the two slides operated upon by the two dasher staffs.

*Claim.*—The combination of the crank shaft D and staffs B B with the top A<sup>1</sup>, when said top is provided with boxes F in which play slides through which the staffs pass, the same being arranged and operating substantially as and for the purpose specified.

No. 25,406.—ELIAS J. HALE, of Foxcroft, Me.—*Improvement in Lamp Chimneys.*—Patent dated September 13, 1859.—This invention consists in forming in the chimney, at a point above the flame, a contraction which will centralize the ascending current of hot air, and, in connection therewith, admitting, at or near this same point, a current of air which may rise in contact with the inner surface of the chimney and prevent the contact of the smoke with this surface above the throat or contraction, whilst the said throat or contraction will act to draw the smoke away from the surface of the chimney to all points above it.

*Claim.*—Contracting the chimney above the flame, and admitting, at or near the same point, a current of air, in the manner and for the purpose substantially as set forth.

No. 25,407.—ROBERT HALL, of Roxbury, Mass.—*Improved Exhaust Pipe for Steam Engines.*—Patent dated September 13, 1859.—This invention has for its object to lead off a portion of the exhaust steam of locomotives, for the purpose of heating the water within the tank.

*Claim.*—An exhaust pipe, constructed as described, and having an opening B and a steam pipe C, in combination with a lip *f*, operating in the manner set forth, for the purpose specified.

No. 25,408.—WILLIAM HAMILTON, of St. Catherine, Mo.—*Improved Excavator.*—Patent dated September 13, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: First, in combination with an excavator frame constructed as described, having the side timbers braced in front only, I *claim* four wheels, when arranged in relation to the said frame, substantially as described, so that a common cart may either be backed between the hind wheels, or pushed over said wheels and frame, under the excavator, when the same is hoisted to be discharged, as specified.

Second. The combination of an excavator with a frame having the rear ends of each of the side timbers bifurcated for the reception of the wheel, the same being arranged to turn on a pin or journal, extending transversely through the two forks, as described.

Third. I claim the peculiar arrangement of hanging the excavator to the frame by means of arms, the same being so pivoted at the ends respectively to the excavator and side timbers as that they shall be exposed to a tensile strain in the draft line, or thereabout, during the excavating operation of the machine, substantially as shown and described.

No. 25,409.—STEPHEN P. HART, of Boston, Mass.—*Improvement in Barrel Syringes.*—Patent dated September 13, 1859.—This invention consists in the insertion of a spring within a metallic syringe, so arranged as to raise the piston after it is depressed by hand, by which means it may be operated by one hand.

*Claim.*—The spring *g*, as applied to the syringe, operating in the manner substantially as set forth.

No. 25,410.—MALACHI B. HASSLER, of Columbia City, Ind.—*Improved Churn.*—Patent dated September 13, 1859.—This invention relates to certain improvements in the dashers of churns, by means of which the operator is enabled to gather butter by a reversed motion of the dasher.

*Claim.*—The arrangement of the hinged curved leaf *g*, in combination with the wings *ff*<sup>1</sup>, constructed and arranged to operate substantially as described, for the purposes set forth.

No. 25,411.—R. K. HAWLEY, of Baltimore, Md.—*Improved Construction of Segmental Circular Saws.*—Patent dated September 13, 1859.—This invention consists in attaching the segmental blades of the saw to the central flange or chuck, by means of lug pins, and holding the plates in position by means of a concavo-convex clamp plate placed on the saw shaft, and held against the saw plate by means of a nut working on the saw shaft; and it further consists in making segmental saw blades of an even thickness throughout, and bend-

ing them so that they shall be adapted to the angle of the common bevel on the outer edge of the chuck and clamp plate.

*Claim.*—A segmental veneer saw, the blades of which are formed, hung, and clamped in the manner described.

No. 25,412.—DAVID HINMAN, of Berea, Ohio.—*Improvement in Grinding the Teeth of Mowers and Reapers.*—Patent dated September 13, 1859.—This invention consists of such a form of the stone and other devices connected therewith, that mower and reaper cutters may be ground at a uniform bevel and closely into the angle between the blades, and at the same time the form of the stone may be preserved unimpaired.

*Claim.*—The circular grooves *a a*, on the faces *e e* of the grindstone, in connection with the standards *F F<sup>1</sup> G G<sup>1</sup>* and holder *H*, arranged and operating in the manner specified.

No. 25,413.—W. W. HOLLMAN, of Eddyville, Ky.—*Improved Mangle.*—Patent dated September 13, 1859.—This mangle is arranged in a wardrobe, and consists in two horizontal rolls *C D*, one above the other, the shaft of the upper roll being held in fixed bearings in the side of the wardrobe, and the shaft of the lower roll being supported by the slotted ends of lever arms *K J K<sup>1</sup> J<sup>1</sup>*.

*Claim.*—The combination of the levers *K J K<sup>1</sup> J<sup>1</sup>*, with one of the rolls, and balancing lever *H H<sup>1</sup>*, substantially as and for the purposes set forth.

No. 25,414.—WILLIAM H. HORSTMANN, of Brooklyn, N. Y.—*Improved Mode of Manufacturing Telegraph Cables.*—Patent dated September 13, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* constructing the cable by the apparatus, substantially as described, consisting of the reservoirs, wrapping apparatus, &c., or their equivalents, as specified.

I also claim the final reservoir *m*, for coating a telegraph cable after it has passed all the other apparatus, and before it has entered the water or ground, constructed and applied substantially as specified.

I also claim the manufacturing of the cable, substantially in the manner described, at the time it is laid, so as to perfect it and at once launch it into the place where it is to remain, whereby I avoid all the chances for injury and imperfections arising herefrom, growing out of stowing and handling the cable after it has been made, as heretofore has been done.

No. 25,415.—A. H. INSKEEP, of Middleburg, Ohio.—*Improvement in Harvesting Machines.* Patent dated September 13, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of the revolving spiral cone-shaped cutter or gatherer with the base of the cone in front, to gather up and draw the grain back to either stationary or reciprocating cutters, substantially as described for the purpose specified.

Second. The combination of the spirally formed gatherer or cutter, arranged as described, with the divider *D*, guards *D<sup>1</sup> D<sup>1</sup>*, and stationary cutters *e*, substantially as described, for the purposes specified.

No. 25,416.—W. D. JOHNSON, of Raleigh, N. C.—*Improvement in Cultivators.*—Patent dated September 13, 1859.—This invention consists in a peculiar mode of constructing the frame of the implement, whereby, in combination with double shares, the same may be readily adapted for the cultivation of various crops.

*Claim.*—The bars *A A*, curved so as to form handles at one end, and having horizontal oblique positions to form the body of the frame, the draft bar *C*, and guide or retaining bar *D*, the front ends of the bars *A A*, being connected or secured together by the collar or loop *B*, in combination with the double scraper *F*, substantially as described and for the purpose set forth.

No. 25,417.—W. D. JOHNSON, of Raleigh, N. C.—*Improvement in Seeding Machines.*—Patent dated September 13, 1859.—The object of this invention is to obtain a seeding machine capable of planting two different kinds of seed in alternate hills, and also drop therewith a fertilizing material in such a manner that a stratum of earth will intervene between the fertilizer and seed, so that the germinating principle of the latter will not be injured by direct contact with the former, and also the ready adjusting of a gauge roller, to vary the depth of the furrow according to the depth the seed may be required to be planted.

*Claim.*—The arrangement of two distributing slides *E F*, with the projections *H H* on the wheels *C C*, and two or more compartments in the hopper *B<sup>1</sup>*, inclined tube *G*, inclined draft bar *B*, and adjustable roller standard *I*, substantially as and for the purpose set forth.

No. 25,418.—MORRIS L. KEEN, of Rogers' Ford, Pa.—*Improvement in Boilers for Making*

*Paper Pulp from Wood.*—Patent dated September 13, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—A boiler for boiling, under pressure, wood and ligneous materials for making paper pulp, constructed with an expansion chamber, stirrers, and discharge valve or cock, arranged for the purposes and in the manner substantially as stated.

No. 25,419.—ASA M. KEITH, of Kosciusko, Miss.—*Improvement in Cultivators.*—Patent dated September 13, 1859.—This cultivator is intended to bar off and scrape both sides of a row, chop out twelve inches and leave four, and to hill and dirt cotton, and to bar off, scrape, and hill or dirt corn all at the same time and by the same movement, thereby saving a great amount of time and labor.

*Claim.*—The arrangement of the double scraper, the hoe drum, and the hillers or coverers in their relation to each other and to the parts of the frame to which they are attached, as and for the purposes set forth.

No. 25,420.—JOHN C. KIMBALL, of New Haven, Conn.—*Improvement in Movable Tops for Carriages.*—Patent dated September 13, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* so constructing the standards or supports of a standing carriage top, and attaching them by means of screws, that the top and standards or supports may be readily removed, when the whole is constructed and connected substantially as described and for the purposes set forth.

Second. I claim the combination of the standards with the body when the standards are secured by being screwed into the upper ends of the studs, and the whole is constructed, arranged, and made to serve the purpose intended, substantially as described.

No. 25,421.—NELSON J. KNAPP, of Chicago, Ill.—*Improvement in Locomotive Lamps.*—Patent dated September 13, 1859.—This invention consists in combining an ellipsoidal and paraboloidal reflector, whereby the person can obtain a large flame and have the rays of light which issue therefrom projected parallelly within the limited dimensions required in order to receive the full benefit thereof.

*Claim.*—The combination of the ellipsoidal and paraboloidal reflectors E D and burner C, arranged substantially as and for the purpose set forth.

No. 25,422.—JESSE LADD, of Holderness, N. H.—*Improved Machine for Arranging Pegs.*—Patent dated September 13, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* a machine or combination, consisting of the following devices, or their mechanical equivalents, viz:

1. The grooved cylinder D, furnished with a hopper or other proper means of supplying it with pegs.
2. The guiding receivers H.
3. One or more advancers L L, and the operative mechanism thereof.
4. A device or mechanism for discharging from the guiding receiver H the refuse pegs.
5. The springs N N, or devices for preventing the discharge of the pegs from the guiding receiver, when they may be disposed therein with their butts in advance of their points.
6. The receiving spout M.
7. The peg carrier O.
8. Mechanism for advancing the pegs through the said carrier.

I also claim, in combination with the said machine, or its hopper and grooved cylinder, an agitator E, or means of shaking or agitating the mass of pegs in the hopper or its conductor.

I also claim, in combination with said machine, or its receiving spout M, the serrated bar P, operated as described, or mechanism for insuring the descent of the pegs within the receiving spout, as specified.

I also claim, in combination with the said machine, or with the receiving spout and peg carrier thereof, the device or part U, made to operate in manner and by means substantially as specified.

I also claim, in combination with the said machine, or with the receiving spout M thereof, the door R and its operative mechanism, whereby the surplus pegs may be discharged from the spout after it may have become sufficiently supplied with pegs.

I also claim, in combination with the said machine, or its spout M, the finger O<sup>1</sup>, or equivalent, to be operated in manner and by means and for the purpose substantially as described.

No. 25,423.—AUGUSTUS LAFEVER, of Battle Creek, Mich.—*Improved Board Measurer.*—Patent dated September 13, 1859.—The object of this invention is to obtain a portable instrument, by which the aggregate number of square feet in a lot of lumber composed of pieces of various lengths and thicknesses may be ascertained, by simply passing the instrument

transversely over the pieces in the direction of their width, the instrument being capable of adjustment to suit the length and thickness of the pieces.

The inventor says: I *claim*, first, the employment or use of the cone gears E J and sliding pinions F L, in connection with an endless toothed or serrated chain T, fitted within a suitable case, arranged with gearing and indexes, and with or without the arm C and lever D, substantially as and for the purpose set forth.

Second. The arrangement of the yielding frames H K with the pinion F and cone gear J, respectively attached to levers  $b^1 c^1 g^1 h^1$ , and racks  $a^1 f^1$ , substantially as and for the purpose specified.

No. 25,424.—JOHN S. LASH, of Carlisle, Pa.—*Improvement in Dumping Carts*.—Patent dated September 13, 1859.—This invention consists in applying to an ordinary dumping cart a segment rack and pinion, spring, and pressure bar, in such a manner that the cart body may be readily tilted by the attendant, and its load dumped and the body made to right itself, automatically, by the forward movement of the cart.

The inventor says: I *claim* the employment or use of the curved or segment rack F, attached to the rod E, and provided with the ledge  $i$ , the pinion  $g$ , and hooks  $l l^1$ , arranged for joint operation, as and for the purpose set forth.

I further claim the rod H, provided with the spring  $r$ , and connected to the sliding or pressure bar I, provided with the arm  $p$ , the above parts being applied to the cart and arranged relatively with each other, to operate substantially as and for the purpose set forth.

No. 25,425.—WILLIAM LEES, of Germantown, Pa.—*Improvement in Corn Planters*.—Patent dated September 13, 1859.—This invention relates to a device for feeding and dropping the corn, or other seed, which is to be planted.

*Claim*.—The cylinders  $d d^1$ , in combination with the hoppers  $c^1 b$ , with reference to the feed bar D, arranged to operate substantially as described.

No. 25,426.—FERDINAND C. LIGHTE, of New York, N. Y.—*Improvement in Piano Fortes*. Patent dated September 13, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the crystal reverberator G, of glass or other material, applied below or at the back of the soundboard, in combination with openings  $a a$  therein, substantially as and for the purpose described.

Second. The insulators  $f f$ , applied between the iron frame or plate G and the wrest plank and wooden blocking of the instrument, in such manner that the said frame or plate will bear upon the plank and blocking only at a few points, substantially as and for the purpose described.

No. 25,427.—GEORGE LINDSAY and WILLIAM CAMERON, of Petersburg, Va.—*Improvement in Tobacco Presses*.—Patent dated September 13, 1859.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim* a portable hydraulic jack, or other powerful press, so constructed as to be readily applied to an ordinary, or to a series of ordinary screw presses, for the purpose described, and adjustable as to height on the truck on which it rests, in combination with the railroad track E, at right angles with the track B, when said press is used for increasing the pressure of the screw press and converting it into a retaining press, substantially as and for the purpose described.

No. 25,428.—JOHN H. LYON, of New York, N. Y.—*Improved Lock and Detector*.—Patent dated September 13, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* combining with a padlock, or any lock provided with a shackle, a supplemental shackle, arranged with a lead or soft metal tube E, so as to be temporarily secured thereby to the lock case, and admitting of being released only by the severing of said tube, which thereby serves as a detector, substantially as described.

I further claim forming the lock case A of two parts  $a b$ , with a division plate  $p$  between, whereby the construction of the lock is rendered extremely simple, and the invention enabled to be carried out or produced at a moderate cost.

No. 25,429.—MURDICK LYTLE, of Allegheny, Pa.—*Improved Steering Apparatus for Barges in Rivers*.—Patent dated September 13, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The application of a wheel C to the bow of a barge, so that said wheel shall revolve at right angles to the direction of the barge, in combination with an apparatus for operating said wheel by the power of the propelling boat, substantially as and for the purposes specified.

No. 25,430.—JACOB MAIZE, of Wooster, Ohio.—*Improvement in Seeding Machines*.—Patent dated September 13, 1859.—From the cultivators K extend the arms as seen at  $K^1$ , which

pass up through the guides M, so as to allow the cultivators to rise and fall as the nature of the case may require.

The guides M and arms K act also as braces and supports for the cultivators, to retain them in place and in an inclined or angular position.

*Claim.*—The adjustable cultivators K, provided with the arms K<sup>1</sup>, guides M, and the adjustable jointed harrow Q, when arranged in relation to each other, as described, and acting conjointly with the seeding apparatus, in the manner and for the purpose set forth.

No. 25,431.—W. A. McDONALD, of Mott Haven, N. Y.—*Improved Dovetailing Machine.*—Patent dated September 13, 1859.—This invention consists in the employment of two rotating cutter wheels, the planes of rotation of which have oblique positions relatively to each other, which cutter wheels are provided at their peripheries with spiral saw toothed cutters; and in using in connection with the above an adjustable gauge so arranged as to permit the cut to be commenced at any desired point in the work, and also in using an adjustable platform, whereby the position of the work relatively to the cutters may be regulated as required.

The inventor says: I *claim*, first, the employment or use of spiral saw cutters G G<sup>1</sup> and G<sup>2</sup> G<sup>3</sup>, attached to the rotating heads F, connected by gearing E, for the purpose specified.

Second. In combination with the cutters G G<sup>1</sup> and G<sup>2</sup> G<sup>3</sup>, the adjustable platform L.

Third. The combination of the cutters G G<sup>1</sup> G<sup>2</sup> G<sup>3</sup>, platform L, and gauge M, operated by the screw c, for the purpose set forth.

No. 25,432.—EDMUND MILLER and BENJAMIN MILLER, of Rising Sun, Ind.—*Improvement in Cultivators.*—Patent dated September 13, 1859.—The subject of this improvement is a device by means of which the more friable earth is forwarded to the plants, while clods and larger masses are thrown into the furrow behind the share.

*Claim.*—The combined arrangement of the guard H, elevated wing I, curved horizontally in two directions, adjusting shank G and bracket E F, operating in connection with a shovel plough, in the manner and for the purpose set forth.

No. 25,433.—HENRY MILLER, of Grafton, Va.—*Improved Shingle Machine.*—Patent dated September 13, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the manner of tilting the bed, as shown, to wit, by means of the adjustable wheel I on shaft J, actuated by the ratchet K also on said shaft, the pawl L on the framing A, spring w attached to the carriage E, and spring t<sup>1</sup> attached to the framing A and acting on the bed F, the whole being arranged substantially as and for the purpose set forth.

I further claim the arrangement of the bed F and rods G H attached to the framing, as shown, to admit of the vertical adjustment of the bed, for the purpose of graduating the thickness of the shingles.

No. 25,434.—JONATHAN H. MITCHELL, of Germantown, Tenn.—*Improvement in Cotton Scrapers.*—Patent dated September 13, 1859.—This invention consists in so arranging the several parts of the scraper as to perfectly clean the ridge up to the standing stalks, and at the same time, like the common scraper, throw the dirt and weeds to the centre of the furrow, and this too while the beam is held parallel to the plane of the ground and in the most favorable line of draft.

The inventor says: I *claim*, first, the combination and arrangement of the beam d, chair c, mouldboard a, and share b, when operating substantially as set forth.

Second. The adjustable and changeable share b, when constructed, arranged, and operating substantially as and for the purpose set forth.

No. 25,435.—WILLIAM MORRISON, of Carlisle, Pa.—*Improvement in Corn Planters.*—Patent dated September 13, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—A corn planter constructed substantially as shown and specified, that is to say, with the mouldboards m m<sup>1</sup>, adjustable cutters or coverers d d, hopper B, slides q q, and clearers N and e, when these several parts are constructed and arranged for joint operation in the manner and for the purposes described.

No. 25,436.—WILLIAM O'NEILL, of Pine Level, Ala.—*Improvement in Ploughs.*—Patent dated September 13, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The lapping landsides of the ploughs and the bar A, attached to the beam as specified, in combination with the bolts, nuts, and braces described, whereby they may be formed at pleasure into a double or hill-side plough, as set forth.

No. 25,437.—WILLIAM O'NEILL, of Pine Level, Ala.—*Improvement in Ploughs.*—Patent dated September 13, 1859.—This invention consists in attaching to the share of the plough on each side of the stock, by a bolt, a movable section or small mouldboard, for the pur-

pose of throwing more dirt over the corn or rice, or other seed or grain, when required by the continued growth of the article

*Claim.*—The arrangement of the adjustable mouldboards  $M M^1$ , attached to the share by bolts  $a$ , and constructed as described, with braces  $z$  and  $T$ , stock  $S$  and share  $S^1$ , and point  $P$ , substantially as and for the purposes specified.

No. 25,438.—GEORGE T. PARKHURST, of Baltimore, Md.—*Improvement in Lamps.*—Patent dated September 13, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The flattened air tubes, bent at right or other convenient angles, with a slit or opening at the outer angles, in combination with flat wick tubes, and the combination of the above parts with the cap or dome, made or operating substantially as described.

No. 25,439.—STEPHEN P. PEET, of New York, N. Y.—*Improvement in Carriage Springs.* Patent dated September 13, 1859.—This invention consists in the combination of a volute coil with elliptic leaves in such manner that the two elements when combined constitute a carriage spring suitable for ordinary vehicles.

*Claim.*—A compound spring, composed of a combination of an elliptical leaf or leaves and a volute coil, substantially as set forth.

No. 25,440.—JOHN G. PERRY, of Kingston, R. I.—*Improved Sausage Stuffer.*—Patent dated September 13, 1859.—The distinctive feature of this machine consists mainly in using a cylinder having a spiral cavity in its periphery in combination with a nozzle or nozzles and a follower or leaf cam, fitted into and working in this cavity, so that by their combined action the meat is forced out of the nozzle into the cases.

*Claim.*—Combining the cylinders  $c$ , having a spiral cavity or cavities, with the follower  $D$ , substantially as described, for the purposes set forth.

No. 25,441.—ORRIS PIER, of Ludlow, Vt.—*Improvement in Horse Rakes.*—Patent dated September 13, 1859.—The object of this invention is to obtain a rake that may be readily raised and lowered for the purpose of having its load discharged, and also readily adjusted, so that the ends of the teeth may be at the desired height from the surface of the ground, and the rake may gather the hay without having its teeth run into the ground.

*Claim.*—The arrangement and combination of the adjustable bar  $I$ , lever  $H$ , bar  $E$ , rods  $G$ , rake  $F$ , strap  $J$ , and seat  $I^1$ , as and for the purpose set forth and described.

No. 25,442.—DANIEL R. PRINDLE, of Bethany, N. Y.—*Improvement in Boilers and Steamers.*—Patent dated September 13, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—So turning or forming the flange of the upper section that it will contain water, to prevent the fire from burning the packing beneath the flanges, substantially as described.

No. 25,443.—S. G. RANDALL, of New Braintree, Mass.—*Improvement in Seeding Machines.*—Patent dated September 13, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—The arrangement and combination of the series of plate wheels  $D D$ , seed boxes  $A$ , and horizontal bar  $B$ , substantially as shown and described, so that, as the bar  $B$  is drawn along, the plate wheels shall assume an oblique position, as set forth.

No. 25,444.—J. A. SAFFORD, of Winchester, Mass., and JOHN W. CHASE, of North Weare, N. H.—*Improvement in Skiving Machines.*—Patent dated September 13, 1859.—In this invention, the gauge is rigidly held by a catch, or rest, while the skiving is performed, and a spring is employed for the purpose of raising it, preparatory to inserting a fresh piece of leather. This invention also consists in passing the edge of the spring apron a short distance beneath the edge of the knife, whereby it is prevented from springing up past the knife and producing an uneven surface.

The inventors say: We *claim*, first, hanging the gauge roll  $K$  in vibrating frames  $I$ , in combination with the spring  $h$ , and retaining spring catch  $N$ , and adjustable stops  $k l$ , the whole arranged and operating as specified, for the purposes set forth.

Second. We claim the overlapping knife  $L$ , in combination with the adjustable spring apron  $M$ , arranged and operating as specified, for the purpose set forth.

No. 25,445.—FRANCIS C. SCHAFFER, of Brooklyn, N. Y.—*Improvement in Carriage Tops.* Patent dated September 13, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The arrangement and combination, with the curtains  $D$ , of the hooks  $l$ , guides  $d$ , and supporters  $c$ , as shown and described, so that the curtains  $D$  may be kept stretched and be readily lowered or raised and secured overhead, within the carriage, at any desired point, as set forth.

No. 25,446.—THADDEUS S. SCOVILLE, of Rochester, N. Y.—*Improved Spirit Level*.—Patent dated September 13, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—Employing a single transparent cell or cistern of spirits, or other fluids, in combination with the scale *c*, and rectangular stock *A*, in such a manner that the surface line of the liquid shall indicate both the horizontal and perpendicular, with the intermediate degrees, substantially in the manner and for the purposes set forth.

No. 25,447.—HERVEY SLOAN, of Franklin, Ind.—*Improvement in Seeding Machines*.—Patent dated September 13, 1859.—In using this machine, the seed slide which distributes small grain is operated by the rollers, or wheels, while the slides for seeding corn are operated by hand power. The operator stands upon the machine and operates the corn slides and the cultivator teeth. *M M* represent peculiar shaped bars attached to the shanks which work behind the teeth and act as coverers for the corn.

The inventor says: I *claim*, first, the arrangement of shanks *I I*<sup>1</sup>, drag bars *K K*<sup>1</sup>, levers *J J*<sup>1</sup>, bar *G*, rest *H*, and support *h*, the same being combined and operating substantially as and for the purpose specified.

Second. In connection with the subject of the first claim, the arrangement of rollers *B B*, seed boxes *C* and *D*, slides *a* and *d d d*, when the same are constructed substantially as and for the purpose specified.

No. 25,448.—C. A. SMITH, of Piermont, N. Y.—*Improvement in Railroad Car Seats*.—Patent dated September 13, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of the back and bottom of a car seat, as described, so that when the seat is adjusted to an inclined position, both parts move together on the same pivot *a* on which the back moves, independent of the bottom, when the seat is reversed, substantially as specified.

Second. I claim the spring catch *e*, notched arc *f*, bottom *A*, and back *D*, when the same are arranged and combined as described.

No. 25,449.—P. M. SMITH and T. T. COLLIER, of Lavernia, Texas.—*Improvement in Cotton Seed Planters*.—Patent dated September 13, 1859.—This invention consists in arranging, over a reciprocating slide, an agitator which serves to facilitate the discharge of the seed from the hopper, through a hollow wrought iron ploughshare, said agitator being operated from a pulley on the same shaft which gives motion to the slide, so that both move simultaneously.

*Claim*.—The arrangement and combination of the wheels *B*, axle *C*, crank *a*, pulley *H*, slide *D*, agitator *F*, fender bar *S*, ploughshare *G*, and scraper *h*, substantially as and for the purpose described.

No. 25,450.—JAMES CHRISTIAN RIST STEIRLY, of Brooklyn, N. Y.—*Improved Thimble*.—Patent dated September 13, 1859.—This improvement consists in a small attachment of brass, steel, or other hard metal, on the side of the thimble near the opening, and containing an edge of fine tempered steel, from one eighth of an inch in length, and about three sixteenths of an inch in width, the whole fixed on the thimble by brazing, as seen in the engravings, in which *a* is the thimble and *b* the cutter.

*Claim*.—The combination of the thimble and cutter in the manner and for the purpose set forth.

No. 25,451.—DAVID STUART, of Philadelphia, Pa.—*Improvement in Cooking Stoves*.—Patent dated September 13, 1859.—This invention is an improvement in gas consuming cooking stoves; and for the purpose of heating the air on its passage to the distributor *a*, it enters aperture *a*<sup>1</sup>, and is passed into and through the middle of the rear part of the hollow cross piece *b*, on the top of the stove, and thence down through the divider *m*.

*Claim*.—Combining with the hollow cross piece *b*, the distributor *a*, constructed and arranged as set forth.

No. 25,452.—J. H. SWAN, of New York, N. Y.—*Improved Folding Chair*.—Patent dated September 13, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of the back *E*, seat *F*, and arms *G G*, substantially as shown, so that the back and seat, when occupied, will be nearly counterpoised, and the arms *G* moved with the seat and back, for the purpose specified.

Second. In combination with the back *E*, seat *F*, and arms *G G*, the curved legs *A A B B*<sup>1</sup>, when the whole are arranged substantially as shown, so as to admit of being completely folded.

No. 25,453.—JAMES TAYLOR, of Rushville, Ill.—*Improved Churn*.—Patent dated September 13, 1859.—This invention consists in a peculiar construction and arrangement of perforated brakes and auxiliary reflectors, in combination with a dasher having its blades flattened gradually from near the shaft to their ends, whereby the cream is powerfully agitated and

moves toward the side of the churn, and there broken and deflected, or thrown back again toward the centre.

*Claim.*—The peculiar construction and arrangement of perforated brakes and auxiliary reflectors, in combination with a dasher, having its blades flattened out gradually from near the shaft to their ends, substantially as and for the purposes set forth.

No. 25,454.—JAMES S. TAYLOR, of Danbury, Conn.—*Improvement in Machinery for forming Hat Bodies.*—Patent dated September 13, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The combination of the two perforated cones and exhaust, with one picker and feed arrangement, so arranged that the current of impelled fur is alternately shifted from the tip of one cone across on to the tip of the other in such a manner as to give the required proportions in forming a perfect hat body.

No. 25,455.—GEORGE W. TOLHURST, of Liverpool, Ohio.—*Improved Washing Machine.*—Patent dated September 13, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—The inside bottom box B, constructed air-tight, so that when the pressure of the upper rubber is removed it will float, and expose the clothes to be handled.

No. 25,456.—M. L. TOURTELETT, of Neshonoc, Wis.—*Improvement in Seeding Machines.* Patent dated September 13, 1859.—As the machine is drawn along the cam I gives a reciprocating motion to the slides F F and L through the medium of the levers G H and traverse rod *l*. The stirrers *i* cause the seed to pass out from the hoppers E through the perforated bottoms *a a*, the amount of the discharge being regulated or entirely cut off by adjusting the perforated slides *b b*. The slide L, which works in the hoppers M, distributes the seed from said hoppers in the usual way. The spring K ensures a regular movement of the working parts which actuate the seed distributing device.

*Claim.*—The combination and arrangement of the levers G H, connected by the traverse rod *e*, the cam I, the slides F F and L, for joint operation, for the purpose set forth

No. 25,457.—LOUIS S. ULLMAN, of Nashville, Tenn.—*Improved Hygrometer.*—Patent dated September 13, 1859.—As the spiral portion *d* of the plant winds up, or unwinds itself with the changes in the hygrometric condition of the atmosphere, the capsule *c* having the index attached, is caused to turn back and forth, and if the dial is properly graduated the index will indicate the degree of moisture in the atmosphere, and so foretell the changes in the weather.

*Claim.*—The combination of the capsule and naturally spiral tail like appendage of either of the plants specified, with an index and dial, or their equivalents, substantially as described, to constitute a hygrometer.

No. 25,458.—JOHN VAN HORNE, of Magnolia, Ill.—*Improvement in Machines for Weighing Grain, &c.*—Patent dated September 13, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—Weighing by means of a round ball or self acting weigher O, operating in a concave beam, or balance and blocks, and spiral springs N N, working in the bottom of the beam by means of the grooves P P, so as to weigh different weights or drafts, and board H, combined for the purposes set forth, as above described.

No. 25,459.—THOMAS J. WALLACE, of Cameron, Ill.—*Improvement in Machines for Raking and Loading Hay.*—Patent dated September 13, 1859.—In this invention a sled frame A A<sup>2</sup> is hinged to the part A<sup>1</sup> of the main frame at *b*, by having the two pivots *c* (one projecting from each side of the upper end of the sled frame) arranged in slots *d* in arms *a*, extending from the sides of the lower end of the part A<sup>1</sup> of the main frame.

The inventor says: I *claim*, first, a hay raker and loader, all the parts of which are constructed, arranged, and combined together for joint operation, substantially as described.

Second. The combination of the inclined part A with its pivot *c*, with the part A<sup>1</sup> of the main frame and slot *d*, substantially as and for the purposes set forth.

No. 25,460.—HAMLIN WHITMORE and DAVID M. SMITH, of Springfield, Vt.—*Improved Carpenters' Rule.*—Patent dated September 13, 1859.—This invention consists in having the spiral springs fitted on the pintles of the joints bearing against elastic plates at the central portions of the joints, said plates being notched and provided with projections, so as to form snaps or catches, to effect the desired object.

*Claim.*—The spiral springs *h h* applied to the pintle *e* of the joint, in combination with the elastic bearings *d*<sup>1</sup> of the plates *c c*, provided with notches *f* and projections *g*, as and for the purpose set forth.

No. 25,461.—CHARLES WHITAKER, of Davenport, Iowa.—*Improvement in Corn Planters*

Patent dated September 13, 1859.—This invention consists in a peculiar distributing device arranged in connection with a seed receptacle within each wheel, whereby a very simple and efficient machine is obtained.

*Claim.*—The arrangement of the seed boxes or receptacles *F*, slides *g*, stationary plates *G*<sup>1</sup>, and movable plate *G*, with the arms and weights *m* attached, substantially as and for the purpose set forth.

No. 25,462.—J. S. WILLIAMS, of St. Louis, Mo.—*Improvement in Grates.*—Patent dated September 13, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The combination of the stove grate *A*, having register plates *D D* and valves *H H*, which admit unheated air from the room at all times through the bottom of said plates, but control the flow of heated air into the room, as described, with the ordinary fireplace *C*, when the latter is separated from the flue above by a simple fireboard *b*, in the manner and for the purpose described.

No. 25,463.—WILLIAM B. WILLIAMS, of Warrenton, N. C.—*Improvement in Ploughs.*—Patent dated September 13, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of screw bolts *S*, nut *n* in beam *B*, standard *A*, cuff *c*, and slotted brace *b*, to regulate the depth of ploughing, substantially as described.

Second. And, in combination with the above, the curved arm *D*, for collecting weeds, substantially as described.

No. 25,464.—WILLIAM B. WILLIAMS, of Warrenton, N. C.—*Improvement in Ploughs.*—Patent dated September 13, 1859.—This invention consists in having a piece set in the front of the standard and held in position by two oblique rings attached on either side of the standard, for the purpose of preventing wear on the standard.

*Claim.*—The combination of standards *S*, plate *P*, and oblique wings *W*, substantially as and for the purpose set forth, with share *C*.

No. 25,465.—ALBERT BROUGHTON, of Malone, N. Y., assignor to Himself and A. LINDSAY, of said Malone.—*Improvement in Converting Rotary into Reciprocating Rectilinear Motion.*—Patent dated September 13, 1859.—This invention consists in combining two opposite toothed racks with a single interposed rotating pinion, for the purpose of converting rotating into reciprocating rectilinear motion, by so applying the shaft of the pinion in combination with a divided journal box having two bearings closed by springs, and applying means of shifting the pinion shaft from one bearing to the other of the journal box, that the pinion is made to gear with the two racks alternately, and so caused, by its revolution, to give the carriage to which the racks are attached a movement back and forth.

*Claim.*—The combination of the divided journal box *F F*<sup>1</sup>, containing two bearings, and closed by springs *G G* and the spring *I*, or toothed plate *I*<sup>1</sup>, with the vibrating pinion shaft *E*; the whole operating substantially as and for the purpose specified.

No. 25,466.—J. H. GOULD, of Alliance, Ohio, assignor to Himself and E. N. HARTSHORN, of Mount Union, Ohio.—*Improved Cover for Stove Plates.*—Patent dated September 13, 1859.—This invention consists in the use of a wire handle in such relation to the common circular, or other shaped lid, used for covering the boiler holes in the top plates of stoves, that said handle will always keep an erect position, and at the same time will not be liable to be bent or broken off, or lie in the way in using the top of the stove.

*Claim.*—The self erecting handle *A*, in combination with weights *C*, arranged essentially as and for the purposes set forth.

No. 25,467.—JAMES A. HAMER, of Reading, Pa., assignor to Himself and NORRIS MARIS, of Kimberton, Pa.—*Improvement in Brick Machines.*—Patent dated September 13, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of the blades *I*<sup>1</sup> and rods *L*<sup>1</sup> with the valves *J*<sup>1</sup> and spiral *K*<sup>1</sup>, constructed, arranged, and operating in relation to each other, substantially as and for the purposes set forth.

Second. The combination of the adjustable cover *D* with spiral *K*<sup>1</sup> and trough *B*, for the purpose of relieving or increasing the pressure upon the clay in the moulds, as set forth.

Third. The combination of the hinged smoothing piece *Q* with the hinged vertically reciprocating piece *P*, as and for the purposes set forth.

Fourth. Providing the hinged smoothing piece *P* with the slot *O* and tube *S*, as and for the purposes set forth.

No. 25,468.—S. P. LA DUE, of Rockford, Iowa, assignor to THOMAS S. LA DUE, of said Rockford.—*Improvement in Calendar Clocks.*—Patent dated September 13, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement and combination of the wheels *C D E*

and G, and the ring M and Q, the faces of which are marked with the proper figures and letters, so that they indicate the seconds, the minutes, the hours, and the days of the week and month, substantially in the manner specified.

Second. Arranging the wheel G in such a manner that it serves the double purpose of actuating the bell hammer and to indicate the hours of the day, substantially in the manner described.

Third. Placing the figures and dials on the faces of the driving wheels to indicate the seconds and minutes by a continuous motion; also, to indicate the hours by a continuous or intermittent motion, substantially in the manner described.

No. 25,469.—JOSEPH B. OKEY, of Indianapolis, Ind., assignor to Himself and WILLIAM H. KENDRICK, of said Indianapolis.—*Improvement in Straw Cutters*.—Patent dated September 13, 1859.—This invention consists in providing a common cutting box with a movable bottom, said bottom having a vibrating movement forward and backward, by means of which the straw is carried up to the knife. This bottom is moved by two cams upon the end of the lever, which operates the gate carrying the knife, said cams operating in a groove or notch cut in a horizontal bar, and this bar connected to the bottom by a yoke.

The inventor says: I claim, first, the combination of sliding bar B, when constructed as set forth, with yoke C and vibrating bottom D.

Second. The combination of cams F and G with lever A, when constructed and used as described; all operating substantially as and for the purposes mentioned.

No. 25,470.—JOSEPH RIDER, of Newark, Ohio, assignor to Himself and E. REMINGTON & SONS, of Ilion, N. Y.—*Improvement in Breech Loading Fire-Arms*.—Patent dated September 13, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I claim the combination of the movable breech pin F and the cap tube E, applied to a pistol, substantially as described.

And, in combination with a hammer of the form described, I claim the arrangement of the main-spring and trigger, relatively to each other, to the hammer, and to the stock and barrel, substantially as described.

No. 25,471.—JOSEPH C. SILVY, of New Orleans, La., assignor to THOMAS J. DOBYNS, of St. Helena Parish, La.—*Improvement in Sewing Machines*.—Patent dated September 13, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I claim, first, operating the needle arm, by means of a grooved eccentric G and a pin b on the needle arm, arranged relatively to each other, to operate in the manner described and illustrated.

Second. The construction or arrangement of the portion of the feed plate or table B, through which the needle and the feeding dog work, to form an inclined plane relatively to the direction of the movement of the feeding dog, substantially as described and illustrated, for the purpose set forth.

Third. The combination of springs R T and M, applied in the manner described, to effect the tightening of the stitch, and otherwise control the thread between the perforating needle and its spool by the automatic operation explained.

No. 25,472.—SETH D. TRIPP, of Stoneham, Mass., assignor to Himself and LUTHER HILL, of said Stoneham.—*Improvement in Apparatus for Feeding Pegs*.—Patent dated September 13, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I claim, first, winding up the blank or strip of pegs with the ribbon f, so that, as the ribbon is wound off by the movement of the machine, the blank will be fed up in the manner substantially as set forth.

Second. I claim hanging the spool I on a vibrating arm F, so that the spool and trough M may follow the motions of the swinging gate or part of the pegging machine, to which the trough M is attached.

No. 25,473.—ANDREW TURNBULL, of West Meriden, Conn., assignor to Himself and JAMES D. FRARY, of Meriden, Conn.—*Improvement in Scales*.—Patent dated September 13, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I claim, first, the combination of the beam lever F with scoop platform C attached, with the spring K, rack J, adjustable or fixed pinion e with index or indexes N attached to its arbor d, and traversing over a graduated plate or plates M, substantially as and for the purpose set forth.

Second. I claim attaching or suspending loosely the rack J to the beam lever F, by means of a pivot f, and having spring g acting on said rack in order to keep the same in gear with the pinion e, for the purpose set forth.

Third. I claim attaching the lower end of the spring K to the traverse bar h, by means of the screw L and nut i, in order to regulate the tension of the spring and preserve its uniformity, substantially as and for the purpose set forth.

Fourth. I claim, in combination with the beam lever F, spring K and indexes N, connected with the beam lever, the stop *j* on the arbor B, for the purposes specified.

No. 25,474.—O. H. WATERS, of Baltimore, Md., assignor to ALFRED HUNTER, of Washington, D. C.—*Improved Clothes Dryer*.—Patent dated September 13, 1859.—The inventor says: I construct the upright box A to contain the perpendicular post B that runs freely in the box A, and is suspended upon a cord C that runs in groove K<sup>2</sup>, cut in the bottom of the post B, and is wound upon the cylinder D by crank E. Upon the top of the adjustable grooved post B are placed four revolving radial arms F, upon which is arranged the line G upon which the clothes are hung. A box H is placed above the arms in which is a cylinder attached to a crank I for the purpose of winding the line G, when not in use, to protect it from the weather.

*Claim*.—The combination and arrangement of the adjustable grooved post B, its radial arms F, and box H, with box A, cylinder D, and protector K, the whole being constructed in the manner and for the purpose set forth.

No. 25,475.—LEWIS WHITE, of Hartford, Conn., assignor to Himself and DANIEL McLAUGHLIN, of New York city.—*Improvement in Lamps*.—Patent dated September 13, 1859. This invention consists in the application and arrangement of a series of gear wheels and movements for raising and lowering and adjusting the lamp wick while burning, and also an improved method in putting in the tube.

The inventor says: I *claim* the application and arrangement of the operating gears, when placed in the manner and for the purpose herein described.

I also claim the movable flaps B B, in the manner and for the purpose substantially as described.

No. 25,476.—LEMUEL ALLEN, of Pekin, Ill.—*Improved Planetarium*.—Patent dated September 20, 1859.—This invention consists in constructing a planetarium as a piece of common school apparatus, to be used as a hand implement.

The inventor says: I *claim* the representation of the planets and their orbits suspended on a diametric rod, and capable of rotating on said rod within a broad belt which represents the zodiac, substantially as set forth.

I also claim the arrangement of devices by which the earth may be adjusted to represent its relative position to the sun, and to the plane of its orbit at any point thereof, in the manner and for the purpose set forth.

No. 25,477.—ASTLEY C. ANCONA, of Reading, Pa.—*Improvement in Slide Valves for Steam Engines*.—Patent dated September 20, 1859.—This invention consists in corrugating the seat upon which the valve slides, so that the steam may act upon the under side of the valve, and thereby counteract the pressure of steam on the top of the valve, and also for the purpose of keeping the valve and its seat at all times well lubricated.

*Claim*.—The corrugated valve seat, in combination with the cavities *c c c c* in the face of the valve, substantially the same as and for the purpose set forth.

No. 25,478.—P. I. ANKNEY and DANIEL MCGREEVY, of New Lexington, Ohio.—*Improvement in Grain Separators*.—Patent dated September 20, 1859.—In operating this machine, the grain, which has previously been cleaned from the chaff, is put into hopper *h*; trough *b* is then oscillated until the opening in the screen is in a proper position; the hopper is then tilted down until the mouth thereof is in conjunction with the aperture; the grain thus passes from the hopper into the screen.

The inventors say: We *claim*, first, the oscillating hopper or trough *b*, as constructed, in combination with the revolving screen *e*, constructed and operating jointly, as described and for the purpose set forth.

Second. We claim the combination of the screen *e*, and trough and hopper *b*, with the adjustable hopper or trough *h*, and the spout *j*, with gauge *j*<sup>1</sup>, cut off *k*, and valve *k*<sup>1</sup>, the whole operating as described and for the purpose set forth.

No. 25,479.—WILLIAM R. AXE, of Beloit, Wis.—*Improvement in Mortising Machines*.—Patent dated September 20, 1859.—This invention consists in the employment of a square hollow chisel, inclosing a rotary auger of a peculiar shape, for the purpose of boring and squaring the hole at the same operation, at the same time obviating the clogging up of the bit, as is usually the case where a chisel and bit are combined for boring and mortising at the same moment; also, in combination with the above instrument, a reciprocating table, which is operated by a foot lever.

*Claim*.—The gauge plate R<sup>1</sup> and slides *x x*, in combination with the reciprocating table W and adjustable table W<sup>1</sup>, arranged in the manner and for the purpose set forth.

No. 25,480.—HORACE BERTOLET, of Reading, Pa.—*Improvement in Steam Engines*.—Patent dated September 20, 1859.—In operating this apparatus, if the lever D be drawn to P, the

whole mechanical arrangement changes its position to that indicated by the dotted lines, thus raising or opening the valves in two or four cylinder cocks simultaneously.

*Claim.*—The peculiar arrangement of the bar I I in the slotted valve stem, and the connection of the arms R R with the cylinder cocks C C.

No. 25,481.—JONATHAN BIGELOW, of Brighton, Mass.—*Improved Changeable Stencil.*—Patent dated September 20, 1859.—In the construction of this stencil, each end of each separate plate is bent at a right angle, and then bent again so as to be parallel with that part of the plate in which the character is cut. The central or main holding frame is provided with a handle *a* for convenience, being an extension of the top bar *b* through which the screws *c* act upon the follower *d*, to press it firmly upon the different plates which are inserted between *d* and *g*, and extend outward from either side of the main frame.

The inventor says: I *claim* the character plate formed at its ends as described, for the purpose specified, whether the same be swaged at one edge or not.

Also, the stencil formed by the combination of said character plates and a frame or frames, or clamps, as described.

No. 25,482.—PETER S. BISHOP, of Smithfield, R. I.—*Improvement in the Manufacture of Thimbles.*—Patent dated September 20, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The new article of manufacture described, namely, a thimble made from plated or overlaid metal, either in the common form with fluted sides, or with sides in the form of a regular geometrical figure, the whole article being substantially such as specified.

No. 25,483.—ALPHEUS BISSELL, of Berlin, Wis.—*Improved Washing Machine.*—Patent dated September 20, 1859.—The bottom *c* is pressed against the rollers H by means of the chuck E, which bears the platform D down, thus, by means of the cords *a a*, elevating the bottom *c*. P is a bar placed longitudinally with the box over the rollers *m m* of the frame F, in such a manner that when the bottom *c* presses the said frame upwards, the rollers *m m* will bear against the bar P and thus keep the frame in its proper position.

*Claim.*—The arrangement of the false bottom C, cords *a a*, pulleys *x x*, platform D, and cam chuck E, with the frame F, provided with corrugated rubbers H H, with rollers *m m*, and with levers I I, said frame being operated by means of cranks J J, the whole being combined and operating substantially as and for the purposes set forth.

No. 25,484.—J. L. BOOTH, of Cuyahoga Falls, Ohio.—*Improvement in Grain Separators.* Patent dated September 20, 1859.—This invention consists in the employment of a series of inclined zigzag screens and boxes, having a proper motion communicated to them, and used in connection with a fan and blast spout.

*Claim.*—The inclined zigzag screens and boxes B C, and troughs E, having a shake motion given them, and used in connection with the revolving fan G and spout H; the parts being arranged relatively with each other, to operate as and for the purpose set forth.

No. 25,485.—J. H. BOYD, of Baltimore, Md.—*Improvement in Spring Saddle Trees.*—Patent dated September 20, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The employment of the double head or gullet plates C and D, when the front head or gullet D is connected to the body of the tree by means of springs E E, in such manner that when the straining web is attached to said head and to the back of the tree, a spring seat will be formed, substantially as set forth.

No. 25,486.—SAMUEL W. BROWN, of Lowell, Mass.—*Improved Steam Pressure Indicator or Alarm.*—Patent dated September 20, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—The arrangement and combination of cylinder A, rod F and *c*, tube G, and valve H, with each other, in the manner described, for indicating or giving the alarm with steam from the same or contiguous chamber, essentially in the manner and for the purposes fully set forth.

No. 25,487.—MORGAN CHITTENDEN, of Danbury, Conn.—*Improved Sash Fastener.*—Patent dated September 20, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—The combination of a T shaped wedge C, with a bolt case B, having an opening corresponding thereto, whereby the two sashes are uniformly and closely secured together, substantially in the manner and for the purpose set forth.

No. 25,488.—M. H. CLARK, of Danville, Va.—*Improvement in Hydraulic Presses.*—Patent dated September 20, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of the water reservoir D<sup>1</sup>, force pump or pumps E, main supply pipe F, branches G G, stop cocks H, and a series of hydraulic presses A B C, for united operation, substantially as and for the purpose set forth.

Second. Arranging a leather packing ring on a disk which is divided radially into a series of parts, and fitted loosely on a conical extension of the piston, and held in contact with said extension by means of an undivided disk, which is suspended loosely so as to have vertical play on a screw or head pin of the piston, substantially as and for the purposes set forth.

No. 25,489.—RICHARDSON P. CLARK, of Johnstown, N. Y.—*Improved Apple Parer*.—Patent dated September 20, 1859.—This invention consists of a certain combination and arrangement of parts whereby the requisite semi-circular reciprocating movements are given to the paring knife A from a revolving shaft c, which is geared with a revolving apple fork B, by which combination and arrangement of parts the rate of movement of the knife while cutting or moving from the rear to the front of the apple may be readily varied in two certain different ways, or by two different adjustments of the contrivances used in respect to the rate of the rotary motion of the apple fork, so that the machine is conveniently altered to be accurately suited to paring apples of different sizes.

*Claim*.—The combination and arrangement of the paring knife A, lever g N M, spring R, cord L, clutch drum K, and spring U, with shaft C, band g, and pulleys H and J, and wheels D and E, and apple fork B, substantially as and for the purposes described.

No. 25,490.—V. P. CORBETT, of Washington, D. C.—*Improvement in Stoppers for Preserve Cans*.—Patent dated September 20, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—The arrangement of the plate m, screw p, conical nut b, and disk A, composed of two or more sections a, when the same are used in connection with an elastic band or rim h, when the whole is adapted to be used as a stopper for preserve cans, substantially as specified.

No. 25,491.—GEORGE B. CORNISH, of New York, N. Y.—*Improved Apparatus for Reefing Sails*.—Patent dated September 20, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—Constructing the slip bands G G in one piece with four flanges, a a a<sup>1</sup> a<sup>1</sup>, the spaces between a a and a<sup>1</sup> a<sup>1</sup> serving as slip bands, and the central space between flanges a a<sup>1</sup> serving as a band on which the reef pennant J is wound, said flanges serving to prevent any lateral movement of the yard, and also to prevent the reef pennant from coming into contact with and being injured by the quarter bands H, all as shown and described.

No. 25,492.—RILEY DOTY, of Cardington, Ohio.—*Improved Device for Steadying Logs in Saw Mills*.—Patent dated September 20, 1859.—This invention relates to a mode of sustaining the log in a steady position upon the carriage during the process of sawing.

*Claim*.—The employment of the adjustable frames F F<sup>1</sup>, provided with journal bearings n n and with rollers a a, the same being operated in one direction by means of the head and tail blocks, and in the other direction by means of a cord and weight, one of said frames being stationed as described by a spring H, provided with a shoulder c and an inclined plane x, the whole being arranged substantially as and for the purpose specified.

No. 25,493.—JOHN L. DRAKE, of Cincinnati, Ohio.—*Improvement in Lamps*.—Patent dated September 20, 1859.—The object of this invention is to make suitable provision whereby the flame may be supplied with a requisite amount of warm oxygen to feed the flame, and, at the same time, the top or cap be kept in a sufficiently cool state to permit the same to be detached by the fingers, for the purpose of trimming the wick or supplying the fount with oil.

*Claim*.—The employment or use of the disk E, applied to the wick tube B, and used in connection with the cap C, and arranged relatively with it, for the purpose set forth.

No. 25,494.—EUGENE DUCHAMP, of St. Martinsville, La.—*Improvement in Derricks*.—Patent dated September 20, 1859.—In this invention, on turning the screw, by a crank or otherwise, both the fulcrum of the boom and the weight on the end of the cable will be elevated at the same time.

*Claim*.—The combination of the toggles and right and left screw boom H, when the latter has its fulcrum movable, as above shown, with the pulleys J J L N and P, when the same are arranged essentially in the manner and for the purposes described.

No. 25,495.—OLIVER T. EDDY, of Philadelphia, Pa.—*Improvement in Coffee Pots*.—Patent dated September 20, 1859.—This invention consists of an annular cone shaped deflecting plate, resting on the bottom of a pot and arranged in respect to a cone shaped tube and a perforated plate.

*Claim*.—The annular, cone shaped deflecting plate E, resting on the bottom of the pot, and arranged in respect to the tube F and perforated plate G, substantially as set forth.

No. 25,496.—MOSES G. FARMER, of Salem, Mass.—*Improved Electro-Magnetic Steam Boiler Gauge*.—Patent dated September 20, 1859.—This apparatus is designed to show the

height of water or other liquids in steam boilers and reservoirs, the rise and fall of tides, or the position, within certain limits, of any traversing rod or lever.

*Claim.*—The combination of an indicator, an electric circuit or circuits, one or more circuit breakers, with a float, in any manner substantially as described.

No. 25,497.—L. R. FAUGHT, of Atlanta, Ga.—*Improvement in Horse Power Machines.*—Patent dated September 20, 1859.—This invention consists in a novel arrangement of gearing, whereby it is designed to transmit the power of the animals to the machinery to be driven, with as little loss by friction as possible.

*Claim.*—The arrangement and combination of a stationary geared rim A, movable rim E, supporting bar D fitted in the pinions C C, the shaft G G, provided with pinions F F and wheels H H, and the shaft F<sup>1</sup>, substantially as set forth.

No. 25,498.—GEORGE FINN, of Oswego, N. Y.—*Improved Method of Operating Crozing Knives.*—Patent dated September 20, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—Arranging the cam c that works the cutter on the bevel wheel O, so that it will not occupy more space on the arm that carries them than that occupied by said bevel wheel, for the purpose of simplifying the mechanism and economizing space on said arm, which is necessarily limited in length, as represented and shown.

No. 25,499.—ELI WHEELER, of Elmira, N. Y.—*Improvement in Railroad Car Seats.*—Patent dated September 20, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of box formed supports c c, cushions C<sup>2</sup> C<sup>2</sup>, and cushioned seat backs D D, of a pair of car seats, in the manner specified, whereby when the bottoms of the seats are turned over, to fill up the space between the seats, the bed clothing contained in the box will be exposed so as to be readily removed, and then, when the backs are turned down to fill the place occupied by the bottoms, the said boxes will be closed up and a continuous bed formed from one back edge to the other of the seat, as and for the purpose set forth.

Second. The short open stationary partitions B B in combination with sliding panels b b, which, when elevated, serve as head and foot boards, and allow ventilation under and above the berth during night time, and when lowered during the day time, afford more room to the upper portion of the body of passengers, as they pass through the aisle of the car, substantially as set forth.

Third. The short sliding closed blinds C C, arranged to operate as described, and serve as foot and head boards and allowing ventilation above and below the upper berth, in combination with the upper berths E and partitions c c, substantially as set forth.

No. 25,500.—JOHN FRETZ, of Angel, Cal.—*Improved Furnace and Apparatus for Treating Pyritous Ores.*—Patent dated September 20, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the hollow stationary cylinder F, its revolving worm, and its openings, for the admission of the pyrites, and the introduction of air and discharge of the fumes of sulphur, in combination with the rotating cylinder C, and its internal ribs, the said stationary and rotating cylinders communicating with each other through a pipe k, the whole being arranged in respect to the furnace A, substantially as and for the purpose set forth.

Second. The system of vertical boxes or chambers J K and L, communicating with each other, with the steam pipes k<sup>1</sup>, the rotating cylinder C, and the exit pipe M, and arranged substantially as set forth and for the purpose specified.

No. 25,501.—RICHARD Garsed and CLAYTON DENN, of Philadelphia, Pa.—*Improvement in Machinery for Warping Yarn.*—Patent dated September 20, 1859.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, the form of the drop wires as in Fig. 4, arranged in the manner and for the purpose specified.

Second. The cylinder 20, for the purpose of marking the cuts, operated substantially as above described.

Third. The employment of a register, constructed substantially as above specified, for the purpose of registering the number of cuts while the machine is in motion.

Fourth. The employment of the bar A, for the purpose of taking the leas, constructed with fingers either on one or both sides, as above described.

Fifth. The combination of the vibrating tube V, the stationary hook 52, the movable hook 55, and the pin 57, for the purpose of forming the yarn into links, constructed and operated in the manner substantially as above described.

No. 25,502.—SAMUEL GISSINGER, of Allegheny, Pa.—*Improved Churn*.—Patent dated September 20, 1859.—This invention consists in an arrangement of oscillating churns furnished with dashers and wings in combination with a revolving shaft armed with wings, the whole being arranged in a frame and placed in a case.

The inventor says: I *claim* the arrangement in the movable frame *e*, of the oscillating churns *i*, furnished with dashers *m*, and wings *h*, in combination with the revolving shaft *f*, armed with wings *g*, the whole being arranged and combined as described and represented, and for the purpose set forth.

No. 25,503.—EUGENE GRENET, Jr., of Paris, France.—*Improved Galvanic Battery*.—Patent dated September 20, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the method of agitating the exciting liquid of a galvanic battery by forcing a current of air through it, in the manner and for the purposes substantially as set forth.

Second. Arranging and constructing the zinc and charcoal elements, in combination with the exciting fluid, substantially in the manner described, whereby they may be operated, the one by the other, substantially as set forth.

Third. Forming the charcoal elements by pressing into or on to the surface of plates of lead, when yet in a semi-liquid state, small pieces of charcoal, in the manner substantially as described.

No. 25,504.—COLLINS W. GRIFFITH, of Dayton, Ohio.—*Improved Gauge and Box for Casting Journals in Soft Metal*.—Patent dated September 20, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* in combination with a hollow box, a loose removable gauge, or centring plate, fitted and fastened to, or held against the box, so as to hold the shaft in its proper position in the box, and at the same time retain or prevent the melted metal that is poured into the hollow box to form a box around the shaft from running out.

No. 25,505.—VALENTINE HALL, of New York, N. Y.—*Improvement in Apparatus for Cooling Liquids*.—Patent dated September 20, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim* the employment or use of one or more receivers A B, placed within a tank F, and connected with the barrel or cask H by means of a siphon I, and with a pump E within or at the outer side of the tank, for the purpose set forth.

I further claim combining a pump E with one or more receivers A B, connected together and made to communicate with each other by siphons C D, when said parts are submerged within a tank F, and made to communicate with a cask or barrel H by means of a siphon I extending over the top of the tank, substantially as and for the purpose set forth.

No. 25,506.—HALVOR HALVORSON, of Cambridge, Mass.—*Improvement in Lamps*.—Patent dated September 20, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the employment or use of the valve C, in connection with the wick tubes B B, for the purpose of regulating the supply of air to the interior of or between two planes of the wicks *g g*.

Second. The arrangement of the shafts *e f* and their wheels *e<sup>1</sup>* so that the wheels *e<sup>1</sup>*, on one shaft, may gear into those on the other, for the purpose of raising and lowering the wicks simultaneously by the turning of one shaft *f*.

No. 25,507.—RILEY HASKELL, of Painesville, Ohio.—*Trolling Bait for Catching Fish*.—Patent dated September 20, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, constructing the body of an artificial representation of a natural fish, in two detached parts, to be used in combination—one portion thereof revolving and the other remaining fixed or stationary, both portions being on one shaft, as particularly described and for the purpose set forth.

Second. I claim, in connection with my first claim, filling the upper part of said fixed portion with a light substance, and weighting the lower part thereof, for the purpose of keeping the said fixed portion vertical in the water, as described.

No. 25,508.—ROCHUS HEINISCH, of Newark, N. J.—*Improvement in Tailors' Shears*.—Patent dated September 20, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—Constructing the lower bow, with its upper portion widened and with the projection *p* thereon, so as to form a bearing for the forefinger within the bow, substantially as and for the purpose set forth.

No. 25,509.—W. M. HURLBERT, of Northfield, Vt.—*Improved Variable Exhaust for Steam Engines*.—Patent dated September 20, 1859.—This invention consists in making the upper

ends or nozzles of the blast pipes each in the form of an elbow or the inverted letter L, and fitting the regulating slides to the horizontal portions of the elbows.

*Claim.*—Applying the slides to operate in elbows or inverted L shaped nozzles, arranged substantially as described.

No. 25,510.—EDWARD T. JENKINS and FRANK B. POLLEY, of Williamsburg, N. Y.—*Improved Steam Trap.*—Patent dated September 20, 1859.—This invention is intended to be attached to a steam heating apparatus for warming buildings, &c., and is used for the purpose of retaining steam in the same, and allowing or facilitating the water of condensation to pass from the same.

*Claim.*—The round pipe B, in combination with the valve seat J, valve *a*, ring *c*, opening K, and float D, when arranged in the manner described and for the purpose specified.

No. 25,511.—CHRISTIAN KIEFFER, of Lancaster, Pa.—*Improvement in Boilers.*—Patent dated September 20, 1859.—This invention consists in the construction and arrangement of extension and perforated pipes, and frying pan with side pipes.

*Claim.*—The construction of the extension and perforated steam pipe C, with the extension hot air flue B, with the pan H, with pipes I I and perforated pipe K, arranged and combined substantially as described and for the purposes set forth.

No. 25,512.—JOSIAH KIRBY, of Cincinnati, Ohio.—*Improved Bunghole Borer and Reamer.*—Patent dated September 20, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the conical shaped stock when made with a throat, cut through from the edge of the bit on one side to the opposite side of the stock, so that the shavings are made to pass through the stock and out on the opposite side, substantially as described.

I also claim the combination of the auger bit C with reamer, when made in the manner and for the purpose substantially as described.

No. 25,513.—LEVI L. LANCASTER, of Rocky Mount, N. C.—*Improvement in Seed Planters.*—Patent dated September 20, 1859.—*e* is a wooden frame of oblong shape, of dimensions sufficient to admit two wheels *c c* to be placed on the inside of the same, and leave sufficient space to receive the hopper *m* between them. The wheels are permanently fixed on a shaft which runs on bearings attached to the under frame *e*; on the centre of the shaft is a cylinder *b* with pockets, or depressions *r*, for the purpose of conveying the seed in proper quantities from the hopper *m* to the conveying tube D, which deposits the seeds in a furrow made by the opener F *u*; X is a coverer with arms extending to within a short distance of the front end of the machine, where they are pivoted loosely to the frame *e* by bolts *p p*. H H represents a leveller or cleaner.

*Claim.*—The frame *e*, wheels *c c*, hopper *m*, cylinder *b*, pockets or depressions *r*, carrying tube D, furrow opener F *u*, coulter Z, leveller H H, and bottom I I, the whole being arranged for operation conjointly as and for the purpose described.

No. 25,514.—LEWIS W. LEEDS and CALVERT VAUX, of New York, N. Y.—*Improved Thermometric Regulator for Heating Apparatus.*—Patent dated September 20, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—So applying the vessel, which we have termed the secondary heater, containing the fluid to act upon the piston, or its equivalent, in combination with the primary heater, and so applying the piston, or its equivalent, in combination with said secondary heater and with the regulating valve, as described, that the secondary heater is exposed at the same time to the heating influence of the primary heater and the cooling influence of the incoming cold air, and the fluid contained therein is, by its expansion and contraction, made to control the admission of the steam or other heating agent, and cause the supply of such agent to the heater to vary inversely with variations in the atmospheric temperature, as set forth.

No. 25,515.—JULIUS S. LLOYD, of Philadelphia, Pa.—*Improved Approach Opening Gate.*—Patent dated September 20, 1859.—This improvement consists in operating the angular bar by means of a carriage having two pulleys and a guard, in combination with a rod having a projecting arm, and two cranked and weighted rods, the whole being arranged for joint action so that the said angular bar may be operated with much ease.

*Claim.*—Operating the angular bar D by means of the carriage I with its pulleys J and J<sup>1</sup> and guard L, in combination with the projecting arm *f*<sup>1</sup> of the rod F, and the cranked and weighted rods N and N<sup>1</sup>, and their respective cords or chains, the whole being arranged for joint action as and for the purpose set forth.

No. 25,516.—GEORGE LUTZ, of Logan, Ohio.—*Improved Water Indicator for Steam Boilers.*—Patent dated September 20, 1859.—These improvements have special reference to that class of gauges for indicating the height of water in steam boilers, in which the vertical movements of a ball or float are made by means of suitable mechanisms to give an alarm

signal whenever the water attains an unsafe level, and thus warn the attendant in order that he may at once apply the proper remedy.

The inventor says: I *claim*, first, operating auricular and visual alarms, either severally or conjointly, at will, by mechanism such as is described, for the purpose set forth.

Second. The combined index and tripping levers  $e e^1$ , arranged substantially in the manner and for the purpose set forth.

Third. The combination of the tripping levers  $e e^1$ , balance lever K, and bifurcated rocking lever J, substantially as and for the purpose described.

Fourth. The combination of the catch  $d$  and dogs  $j j^1$ , when arranged and operated substantially as and for the purpose set forth.

Fifth. The combination of the bent lever D, thumb screw  $d^1$ , and slotted bracket L, substantially as and for the purpose described.

No. 25,517.—AUGUSTUS MILLER, of Grafton, Ohio.—*Improved Method of Making Soap*.—Patent dated September 20, 1859.—In compounding this soap the following ingredients are used: Six gallons pure soft water, six pounds German erasive soap, one pound of soda, four ounces sulphuric ether, three ounces aqua ammonia, two ounces nitric ether, two ounces nitric passa, two ounces spirits of camphor, one ounce common alum, and two ounces gum resin.

*Claim*.—Soap manufactured from the herein-named ingredients and chemicals, when the same are compounded substantially in the manner and for the purpose specified.

No. 25,518.—G. I. MIX, of Wallingford, Conn.—*Improvement in the Manufacture of Iron Spoons*.—Patent dated September 20, 1859.—The object of the tongue  $D^1$  and recess D is to afford greater strength to the spoon at the points of union between the handle and bowl.

When the spoon is bent vertically the tongue also bends and prevents any opening of the joint. When the spoon is bent laterally the sides of the inlet or recess D prevent the projection  $D^1$  from moving out of place or becoming loose.

The inventor says: I *claim* first, the method, substantially as described, of making the handles of iron spoons.

Second. Forming a tongue  $D^1$  upon the bowl blank, and a corresponding recess or inlet D upon the handle, or *vice versa*, substantially as and for the purposes set forth.

No. 25,519.—GEORGE G. NOYES, of Worcester, Mass.—*Improved Carpet Fastener*.—Patent dated September 20, 1859.—This invention consists in having a hook at the outer end of a small metal bar, the opposite or inner end being provided with spurs, whereby the bar may be readily and securely adjusted to the floor without a permanent attachment and readily detached.

*Claim*.—The bar A provided with the hooks B, knife edge  $a$ , and spurs  $d$ , substantially as shown, so that it may be readily secured to and detached from the base board and floor, for the purpose set forth.

No. 25,520.—WILLIAM A. NUGENT, of Susquehanna Depot, Pa.—*Improvement in Railroad Chairs*.—Patent dated September 20, 1859.—This invention consists, first, of the shell or body  $a$ ; second, the cam jaws  $b b$ , which are adjusted to the rail  $c$ . The keys  $d d$  are intended to assist in retaining the chair immovably in its place, aided by the spikes  $e e$ .

*Claim*.—The shell or body  $a$ , with the cam jaws  $b b$ , and the chair, substantially as arranged and for the purpose specified.

No. 25,521.—JOHN K. O'NEIL, of Kingston, N. Y.—*Improved Horizontal Water Wheel*.—Patent dated September 20, 1859.—The inventor says: I employ a vertical cylindrical penstock A, in which are arranged two wheels C D, revolving closely within the penstock and working together in relation to each other and to the other parts connected therewith.

*Claim*.—The arrangement of the guide partitions  $b b g g$ , cylinders B E, wheels C D, and wheel or buckets  $f f$ , in the manner and for the purposes substantially as specified.

No. 25,522.—THOMAS S. PAGE, of Milan, Ohio.—*Improved Composition for Tanning Leather*.—Patent dated September 20, 1859.—The claim explains the nature of this invention.

*Claim*.—A liquor composed of terra japonica, sulphate of alumina and potassa, muriate of soda, nitrate of potash, and sulphate of soda, when combined in the proportions and for the purpose described.

No. 25,523.—COLLIN G. POLLOCK, of Cincinnati, Ohio.—*Improved Boring and Mortising Machine*.—Patent dated September 20, 1859.—The object of this invention is to perform the work of both boring and mortising with a single shaft, so arranged with certain necessary parts as to be capable of operating in a vertical direction, as the shaft of an ordinary mortising machine, and also being capable of being secured and prevented from moving in said direction and have a rotary motion imparted to it when used for boring.

*Claim*.—The arrangement and combination of the bar  $o$  on the arbor F, projection  $p$  on

the upright A, lever K, connected with the arbor F by the knuckle joint M and the bevel gear G H, for joint operation, substantially as set forth.

No. 25,524.—CHARLES POTTER, Jr., and C. B. COTTRELL, of Westerly, R. I.—*Improvement in Feeding Paper to and from Printing Presses.*—Patent dated September 20, 1859.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim* the securing of the registering points I firmly to a fixed portion of the machine, and releasing the paper therefrom at the proper time by elevating the adjacent surface J J, as set forth.

We also claim depositing each sheet face upwards on the pile, by carrying it between a vibrating series of tapes R S, operated substantially in the manner set forth.

We likewise also claim the arrangement of the cylinders  $n n^1 p p^1$ , and the series of tapes R S, or their respective equivalents, in the vibrating frame P, which vibrates on the shaft F as a centre, and receives its proper vibratory motion from the hook *w*, or its equivalent, whereby the frame P may be readily unhooked and swung out of the way, to allow access to the bed of the press without deranging or disturbing any of the mechanism.

No. 25,525.—WILLIAM H. RACEY, of New York, N. Y.—*Improvement in Burners for Vapor Lamps.*—Patent dated September 20, 1859.—This invention relates to an improvement in a lamp for burning without a chimney the hydro carbons containing an excess of carbon, for which letters patent were granted to the above named inventor, June 29, 1858; the object being to obtain a lamp more portable than the one previously patented and that will still burn the material aforesaid more perfectly.

*Claim.*—The burner F and curved rods G G, one or more in combination with one or more deflecting caps D E and draft tube C, arranged for joint operation, substantially as and for the purpose set forth.

No. 25,526.—PETER REYNARD, of New York, N. Y., and VICTOR VARIN, of Brooklyn, N. Y.—*Improved Insect Powder Blower.*—Patent dated September 20, 1859.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim* the divisions *c c* in the powder chamber, to insure the powder being in a position to be acted on by the air blown through the perforated diaphragm *d*, as and for the purposes set forth.

And in combination with said powder chamber, constructed as aforesaid, we claim the India rubber perforated ball, fitted and acting as specified, to give the blast of air.

No. 25,527.—JOSHUA ROLLMAN, of Sinking Springs, Pa.—*Improvement in Threshing Machines.*—Patent dated September 20, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The application to a threshing machine of one or more independent fan blowers, which are attached outside of the machine, and in such position as to prevent any dust, arising from the operation of threshing, from reaching the attendant on the machine, when arranged and operated substantially in the manner described.

No. 25,528.—GELSTON SANFORD, of Poughkeepsie, N. Y.—*Improvement in Horse Power Machines.*—Patent dated September 20, 1859.—This invention consists, first, in arranging and combining a pair of internal toothed wheels and their pinions in such relation to each other as to make the driving gear occupy a less amount of space upon the floor or ground than is required for other machines of like kind, where the same amount of speed of the driving pulleys is attained.

Second. In elevating the driving pulleys to a height that places them above and out of the way of the operator, by elevating the driving shaft on a hollow standard.

Third. In making the line of the driving shaft adjustable to any required angle to the line of the bed of the machine, so that the machine can be employed to operate different machines, placed in different positions, without changing the position of the bed of the horse power.

The inventor says: I *claim*, first, the combination of the internal toothed wheels C and F, and their connected pinions, with the hollow standard B, when arranged in the manner and for the purpose set forth.

Second. The combination of the hollow standard B with the shaft K and its connected gearing I and J, in the manner and for the purpose described.

Third. The combination of the adjustable bearing or frame M with the hollow standard B and shaft K, as and for the purpose set forth.

No. 25,529.—NATHAN SARGENT, of Charlestown, Mass.—*Improved Tops for Tables.*—Patent dated September 20, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, as an improved article of manufacture, a panoramic table or table top, the same being constructed and operated in the manner and for the purpose set forth.

I also claim the peculiar mechanism described, whereby the canvas or panoramic cloth is maintained with proper tension upon each of the rollers, however such cloth may vary in thickness or in number of folds upon such rollers.

No. 25,530.—CASPER SCHULTZE and J. FREDERICK SCHROEDER, of Covington, Ky.—*Improvement in Straw Cutters*.—Patent dated September 20, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—A cutting box, constructed as shown and specified—that is, with adjustable compound knife wheel H, in combination with feeding chute C, when these several parts are constructed and arranged for operation conjointly as and for the purposes described.

No. 25,531.—WILLIAM W. SHIPMAN, of New Haven, Conn.—*Improvement in Machines for Making Sewing Machine Needles*.—Patent dated September 20, 1859.—This invention consists in stamping and cutting off the wire, punching the eye of the needle, and counter sinking the same by each revolution of the machine.

*Claim*.—The feeding plier formed by the lever F and block D, in combination with the punching die P<sup>2</sup> and die P<sup>3</sup>, and 21 31, Fig. 8, the cutter N, and clamp formed by J J and I I; the whole in combination as set forth, and operated in the manner and for the purposes specified.

No. 25,532.—GEORGE B. SIMPSON, of Washington, D. C.—*Improved Electrical Heating Apparatus*.—Patent dated September 20, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the insulation of the metallic coil or helical electrode, which I call an electro-heater, and the successful generation of heat by passing currents of electricity over a coil or coils of platina, or other metallic wire, resting on and supported by a non-conducting electrical base, or encased in metallic tubes, or open vessels insulated with any of well-known substances non-conducting of electricity, as described.

No. 25,533.—JOHN JOSEPH CHARLES SMITH, of Covington, Ky.—*Improved Mode of Constructing Matrices, &c.*—Patent dated September 20, 1859.—The claim explains the nature of this invention.

*Claim*.—The discovery of rendering a composition or alloy of copper and tin pliable, and in such a state as to admit of an easy impression of any figure or design on or in metal, whether engraved or produced by means of electrotyping, as a copy of any figure, design, or object, thus yielding a perfect matrix or mould; and this process I further claim as my invention, in connection with the manufacturing of types of the alloy of copper and tin, as already described, and which will and shall produce the intended effect.

No. 25,534.—CHARLES STEARNS, of Lowell, Mass.—*Improvement in Making Lightning Conductors*.—Patent dated September 20, 1859.—This invention consists in constructing twisting rollers, and so combining them with corrugating rollers as to produce corrugated and twisted lightning conductors or rods.

*Claim*.—The twisting rollers, constructed as described, in combination with the corrugating rollers, for producing the corrugated twisted copper rod.

No. 25,535.—THEODORE J. STEFFE, of Lancaster, Pa.—*Improvement in Horse Rakes*.—Patent dated September 20, 1859.—This invention relates to an improvement in horse rakes, by which the several devices all operate on the axle of the machine at their common centre.

The inventor says: I *claim* the arrangement and combination of the teeth heads E, key N, spiral spring attachment F, lifters B B, levers G H, cleaners c C, when these several parts have their centre of motion on the axle of the machine.

I also claim, in combination with the above, the foot brace K L, hinged at I I, slide M, and slot O, substantially as and for the purpose specified.

No. 25,536.—GEORGE STRAUSE, of Boonsboro', Md.—*Improvement in Hominy Mills*.—Patent dated September 20, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—Giving to the shaft D substantially the shape represented, when the said shaft is armed with toothed segments, and is also operated within a tube which is also armed with counteracting segments, substantially in the manner set forth.

No. 25,537.—DAVID H. VAN DUZER, of Sugar Loaf, N. Y.—*Improvement in Bridges*.—Patent dated September 20, 1859.—The engravings and claim will give an idea of the nature of this invention.

*Claim*.—In combination with the blocks E F G H I, rods B B<sup>1</sup>, blocks C C<sup>1</sup>, and bolts D D<sup>1</sup>, arranged as shown, the arrangement of the plates L, all substantially as and for the purposes shown and described.

No. 25,538.—SAMUEL WALKER, of Roxbury, Mass.—*Improvement in the Take Up for Trimming Looms.*—Patent dated September 20, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—Giving to the take up roll of a trimming loom a reciprocating motion longitudinally on its axis, for the purpose specified.

No. 25,539.—Suspended.

No. 25,540.—CHARLES FONTAYNE, of Cincinnati, Ohio.—*Improved Photographic Printing Machine.*—Patent dated September 20, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the described machine for printing or multiplying photographic pictures.

Second. The described art of multiplying positive photographic pictures or expressions from the same negative upon the same sheet of sensitive paper or other material.

Third. Causing the sensitive material used for the reception of photographic impressions, latent or otherwise, made by the agency of solar or other light, passing through a negative, to traverse the aperture or negative employed.

Fourth. The traversing bed, whether cylindrical or plane, confined within a dark chamber, whose surface may be moved by ratchets, screws, cranks, or their equivalents, for the purpose of carrying the sensitive material when the same is used in connection with a negative, from which it receives positive impressions, substantially as described.

Fifth. The employment of continuous sliding or revolving disks, with springs and spring stops, or their equivalents, to give them a uniform motion, and overcome the momentum or rebound, for admitting and shutting off light uniformly to and from all parts of the surface to be acted upon in printing positive photographic pictures from a negative, substantially as described.

Sixth. The application of a lens or lenses for the purpose of condensing light, when used in combination with negative 28, the sensitive material, and slide or cut off for admitting or shutting off light, for the purpose of photographic printing.

Seventh. The combination of condensing lens 33, negative 34, daguerreotype tube 75, with its lenses 76, the sensitive material, and slide or cut off for photographic printing, substantially as described.

Eighth. The combination of the sensitive material, negative 28, (as distinguished from negative 34,) and slide or cut off, for the purpose of photographic printing.

Ninth. The method of raising the glass negative or other matrix 28 from the sensitive material, to permit the motion of the latter, and the method of lowering again, substantially as described.

Tenth. The method of supporting and adjusting negative 28, substantially as described.

Eleventh. The use of the glass negative, (when negative 28 is used,) or the use of a piece of plain glass in the place of it, (when negative 34 is used,) or the use of a skeleton frame for the purpose of pressing the sensitive material smoothly and evenly on roller 5, or traversing bed, while the photographic impression is being made.

Twelfth. The alternate admission and exclusion of light passing through a negative to act upon a traversing sensitive material, confined in a portable dark chamber, substantially as described.

Thirteenth. The rod 8 working through hollow slotted shaft 6, and affixed to roller 5 by plate 9, for the purpose described.

Fourteenth. The combination of the lever 12 with its spring catch 13, with the ratchet wheel 14, nose 82 of shield 15, and slotted stop 11, substantially as and for the purposes described.

No. 25,541.—HENRY WHITTINGTON, of Philadelphia, Pa.—*Improvement in Cut Off Gear for Steam Engines.*—Patent dated September 20, 1859.—The nature of this improvement will be understood by examining the claim and engraving.

*Claim.*—The inclined spiral edges  $xx$  on the revolving and sliding sleeve B, when the latter is applied to operate the cut off valve G, the descent of which is caused by the pressure of steam above the valve, and when the inclined edges serve to retard the descent of the valve, as set forth.

No. 25,542.—ASBURY WILKINSON, of Madison, Ind.—*Improved Washing Machine.*—Patent dated September 20, 1859.—This invention consists in providing two self-adjusting circular shaped washboards, between which a corrugated roller is made to revolve, thus converting the reciprocating motion into continuous rotary motion.

*Claim.*—The combination of circular boards B and C, suspended from a frame above by springs  $b b b$  and  $c$ , with a rotary corrugated roller working between them, all constructed and operated substantially as set forth.

No. 25,543.—JEPHTHA AVERY WILKINSON, of Brooklyn, N. Y.—*Improved Registering Ap-*

*paratus*.—Patent dated September 20, 1859.—This invention relates to an arrangement of circular dials that are provided with a screw thread around the periphery taking teeth on the next dial, whereby all the disks have a movement that is rapidly decreased, so that if the screw around the periphery of one disk be a single thread, and its matching gear have one hundred teeth, the first disk must revolve one hundred times to give one revolution to the next, and so on.

The inventor says: I *claim* a series of counting disks standing at right angles, or nearly so, to each other, and each formed with a thread or worm around its periphery, taking teeth on the next counting disk in the manner and for the purpose specified.

I also claim the arrangement of the counting disk  $q^9$  and  $q^{10}$ , in the manner specified, whereby they can be disconnected and set to commence counting when required, as and for the purpose described and shown.

No. 25,544.—JOHN F. COOK, of Baltimore, Md., assignor to Himself and GEORGE F. PAGE, of said Baltimore.—*Improved Try Cock for Steam Boilers*.—Patent dated September 20, 1859. The claim and engravings explain the nature of this invention.

*Claim*.—Combining with the barrel of a try cock, a two armed lever, one provided with springs or weights, and the other with a rubber or other equivalent disk, so that the weighted arm shall hold the valved or disk arm against the bore of the barrel of the cock, substantially as described and represented.

No. 25,545.—HENRY W. GRAY, of Cleveland, Ohio, assignor to Himself and W. H. ALVORD, of Homer, N. Y.—*Improvement in Railroad Chairs*.—Patent dated September 20, 1859. The claim and engravings explain the nature of this invention.

*Claim*.—Forming the railroad chair in two sections, having the outer surfaces F convex, as described, in combination with the gripe C and beam D, the several parts being arranged in the manner and for the purpose set forth.

No. 25,546.—HORATIO FRANCIS HICKS, of Grand View, Ind., assignor to HICKS BROTHERS, of said Grand View.—*Improvement in Presses*.—Patent dated September 20, 1859.—The object of this invention is to reduce friction in cotton presses, hay presses, &c., by means of stepped bearings and friction rollers, adapted to operate in connection therewith without tendency to displacement.

*Claim*.—The described combination of stepped bearings G and I with rollers  $K^1$ , adapted to operate in connection therewith, without endwise pressure or tendency to displacement, in the manner and for the purpose set forth.

No. 25,547.—GEORGE W. McCORD, of Centralia, Ill., assignor to Himself and J. F. LOBDELL, of Centralia, Ill., and P. V. N. DAVIS, of Rush, N. Y.—*Improved Deep Sea Sounding Apparatus*.—Patent dated September 20, 1859.—This invention relates to the arrangement of a piston within a suitable cylinder, in such a manner that the pressure of the water will force the piston into the cylinder as the instrument descends into the water, and also in combining therewith a graduated scale and provision for measuring the depth to which the instrument descends.

*Claim*.—The arrangement of the cylinder *a*, piston *p*, graduated scale *f*, cap *i*, and vernier or register *k*, constructed and operating substantially as described, for the registration of marine soundings upon the principle of hydraulic pressure.

No. 25,548.—G. H. SANBORN, of Boston, Mass., and JOHN E. COEFIN, of Portland, Me., assignors to G. H. SANBORN, aforesaid.—*Improved Machine for Shaping and Finishing the Backs of Books*.—Patent dated September 20, 1859.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, the employment, for shaping or finishing the backs of books, of a divided roll or pair of segments C  $C^1$  operating across the backs from the centre to both sides thereof, substantially as described.

Second. The combination of the cam T, slide R, toggle P P, spring Q, link *y*, lever *o*, link *u*, and toggles F F, with the book holder, for the purpose of raising the holder and causing it to close upon the book before each operation of the divided roll or pair of segments, substantially as described.

Third. Attaching the segment levers G  $G^1$ , or their equivalents, to levers H H, operated substantially as described, by cams N N, on the constantly revolving main shaft for the purpose of throwing the segments out of the way of the holder at the proper stage of the operation of the machine, to permit the removal and introduction of the books.

No. 25,549.—THOMAS SHAW, of Philadelphia, Pa., assignor to Himself and J. C. BAILEY, of said Philadelphia.—*Improvement in Stoves*.—Patent dated September 20, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the adjustable legs *a* when combined with the casing

A and its gauge cylinder, and arranged as set forth, so as to serve the double purpose of tilting the stove more or less on one side, and regulating the admission of air into the casing.

Second. Operating the valve D for regulating the flow of gas into the casing, by means of the object to be heated by the flame, in conjunction with the devices set forth, or their equivalents.

No. 25,550.—A. T. UNDERHILL, of New York, N. Y., assignor to C. R. UNDERHILL, of New Castle, N. Y.—*Improvement in Converting Reciprocating into Rotary Motion*.—Patent dated September 20, 1859.—The wheels G G<sup>1</sup> turn loosely upon the shaft H, which has its bearings in the standards I I, and the motion communicated to these wheels by the two racks E E causes them to turn in opposite directions. On either side of each of the spur wheels G G are ratchet wheels J J<sup>1</sup> J<sup>2</sup> J<sup>3</sup>, which are all made fast to the shaft H.

*Claim*.—The arrangement and combination of the frame I, guards S S<sup>1</sup> S<sup>2</sup> S<sup>3</sup>, and ratchet wheels J J<sup>1</sup> J<sup>2</sup> J<sup>3</sup>, substantially as shown and described, so that the rotation of the shaft H may be reversed, as set forth.

No. 25,551.—WILLIAM F. WARBURTON and WILLIAM B. ATKIN, of Philadelphia, Pa., assignors to WILLIAM F. WARBURTON aforesaid.—*Improvement in Machinery for Perforating Hat Bodies*.—Patent dated September 20, 1859.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, the system of pointed pins *m*, hung independent of each other to the cross head *j*, furnished each with a separate spring, and arranged and operated substantially as set forth, in combination with the hat block attached to the face plate F, on the spindle E, for the purpose specified.

Second. The ratchet wheel G, of the same form, or thereabouts, as that presented by a transverse section of the hat to be perforated, in combination with the face plate F, and its hat block, the said wheel being operated by the pawl *f*, and the appliances connected therewith, or their equivalents, in the manner and for the purpose set forth.

No. 25,552.—MORRIS L. KEEN, of Rogers Ford, Pa.—*Improved Mode of Distilling Liquids from Coal Tar*.—Patent dated September 20, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The application of additional heat at or near the surface of the coal tar, or other similar hydro carbon, when used in combination with pressure in the boiler, for the purpose of preventing the tarry foam from rising and overrunning the still, and thus endangering the operator as well as the premises, as described.

No. 25,553.—ABEL AUSTIN, of Alton, Ill.—*Improved Churn*.—Patent dated September 27, 1859.—The inventor says: My invention uses the old principle of the up and down dasher, and for the purpose gives the greatest possible effective motion to the milk in a breaking and dashing manner. The side dashers having a lateral stroke are added; they are also designed to gather the butter after it is churned, and press and work out the butter milk.

*Claim*.—The arrangement of the shaft *a*, cranks *a*<sup>1</sup> *a*<sup>2</sup>, dashers D E E, handles D<sup>1</sup> *e* *e*, links *b* *b* *b*, springs *c* *c* *c*, box *i* *i*, spring *g*, and lid F F together, the same being connected, combined, and constructed substantially as and for the purpose specified.

No. 25,554.—WILLIAM B. BARNARD and EDMUND JORDAN, of Waterbury, Conn.—*Improved Rotary Blower*.—Patent dated September 27, 1859.—This invention consists in the combination of double propeller fans, with an intermitting diaphragm applied within the case of the blower in such a manner that the propellers in being rotated cause the air to pass through between the diagonal blades into the intervening space, and the aforesaid diaphragm standing across this space at the line of the blower's mouth causes the air, that would otherwise be carried around between these double propellers, to be deflected off through the mouth and trunk of the blower.

*Claim*.—The diaphragm *l*, in combination with the revolving propeller or propellers *k*, to deflect the blast to the mouth or opening *f*, as the blower revolves in the case *e*, substantially as set forth.

No. 25,555.—ELBRIDGE G. BELKNAP, of Philadelphia, Pa.—*Improved Camp Stool*.—Patent dated September 27, 1859.—The seat frame consists of a block B of wood, or metal, the centre of which receives the thrust of the arms A *m*, and to which they are attached by means of the hinge plate H. It has also projections P on its surface between which the arms rest, and by which they are held in position.

*Claim*.—The combination of the base and the seat frame, with the swivel blocks, braces and connecting rod, the whole being arranged substantially in the manner specified and described.

No. 25,556.—LEWIS REESE CARPENTER, of Lancaster, Ohio.—*Improvement in Seed Planters*.—Patent dated September 27, 1859.—This invention consists in the arrangement of devices for joint operation in planting corn and other seeds.

*Claim.*—The arrangement of the beam A, handles C C, braces D D, furrowing scraper E, and seed box F, with the planting slide H, lever N, wheel S, and covering scrapers L L, the whole being constructed for joint operation, for the purpose set forth.

No. 25,557.—EDWIN S. COLLINS and THOMAS N. READ, of Aspen Wall, Va.—*Improvement in Machines for Preparing Tobacco for Pressing.*—Patent dated September 27, 1859.—This invention is intended for straightening, stretching, pressing, and oiling bundles of tobacco, preparatory to prizing or packing the same into hogsheads for shipment.

The inventors say: We *claim* the arrangement of two, three, or more pairs of progressive pressure rollers with each other, substantially in the manner and for the purpose set forth.

We also claim combining a series of oil vessels and oiling pads with the aforesaid pairs of pressure rollers, substantially in the manner set forth.

No. 25,558.—JOHN CRITCHELSON and ERI S. MOULTON, of Boston, Mass.—*Improvement in Machines for Splitting Welts.*—Patent dated September 27, 1859.—This invention consists in arranging an adjustable cutter between, and parallel with, two cylinders grooved in a peculiar manner, the grooves on the cylinder to which the crank is attached being provided with short projecting points or their equivalents, to prevent leather from slipping; by which means welts can be split more evenly, more rapidly, and with less effort and waste of leather than by most other machines.

*Claim.*—The beveled grooves *n* and *x*, constructed and arranged in reference to each other on the cylinders C and D, and operating in combination with the adjustable cutter H, substantially as set forth and for the purposes described.

No. 25,559.—TOBIAS CRUMLING, of Hellam, Pa.—*Improvement in Harvesters.*—Patent dated September 27, 1859.—In cutting grain, binders stand on the platform K, and the cut grain falls on the apron M<sup>1</sup>, which conveys it to the platform directly behind the main frame A, where it is bound and placed on the platform M<sup>2</sup>, which, when filled, or when it arrives at the proper place, is tilted and the sheaves discharged from the machine, so as to form shocks.

*Claim.*—The arrangement and combination, as shown and described, of the independent platform K with the frame L<sup>1</sup>, belt M, and driving axle C, for the purpose set forth.

No. 25,560.—GEORGE S. CURTIS, of Chicago, Ill.—*Improvement in Reels for Harvesters.*—Patent dated September 27, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The employment of sliding heads B, and pivoted arms C, and bars E, in combination with the reel shaft A and beaters D, substantially as shown and described, so that the diameter of the reel can be contracted or expanded, as and for the purpose set forth.

No. 25,561.—JACOB D. CUSTER, of Norristown, Pa.—*Improvement in Harvesters.*—Patent dated September 27, 1859.—The operation of this machine is as follows: The castor wheel controlling lever S S is set so as to prevent side draft. The machine moves forward, and the escapement teeth vibrate the palates C C, the connecting rods D D, the cross bar E, the shaft F and arm F, which vibrates the cutter bar; the reel moves and the grain falls off the platform, the lifting and operating cam Q comes up under the self acting rake arm P, and lifts up and moves it forward over the grain on the platform, when it falls and sweeps the grain off the platform.

The inventor says: I *claim*, first, the main shoe A A A, constructed in the manner described, in combination with the bars J J of main frame and supporting bar T, arranged and operating in the manner described, for the purpose specified.

Second. The castor wheel L, in combination with the lever M and adjustable plate N, when the parts are constructed, arranged, and operated in the manner described, for the purpose specified, substantially as set forth.

No. 25,562.—J. S. DAVISON, of Cranberry, N. J.—*Improved Telegraphic Cable.*—Patent dated September 27, 1859.—This invention consists of a series of loose strips of copper wire that are hooked on, or otherwise united to the coil, and which fill up the space in the inside of the coil, so that when the coil stretches, each of said strips assumes a longitudinal sliding motion, and as the coil, by being stretched, diminishes its diameter, said strips are brought close together, and the current passes through without interruption.

*Claim.*—Arranging a series of loose metal strips *a* in a coil A, or its equivalent, substantially as and for the purpose described.

No. 25,563.—EBEN EATON, of Cincinnati, Ohio.—*Improved Bedstead.*—Patent dated September 27, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The construction of bed posts with the wedge formed part and the square piece attached, so as to form a shoulder to receive the rail, in combination with the bottom or

platform of a bedstead, with the rails formed so as to fit the posts described, and all permanently connected together by means of cross pieces, substantially as specified.

No. 25,564.—G. D. FOOTE, of Danbury, Conn.—*Improvement in the Mode of Coloring Woolen Hats*.—Patent dated September 27, 1859.—The stiffening used in this process consists of a solution of shellac.

*Claim*.—The described process of restoring the color of the hats after they have been dipped in the stiffening and rubbed off with sand paper, by applying the hot dyeing liquid, substantially in the manner herein specified.

No. 25,565.—JOHN FRITZ and GEORGE FRITZ, of Johnstown, Pa.—*Improvement in Rolling Mills*.—Patent dated September 27, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The application to each of the pairs of drawing or forming rolls of a feed roll, such as described, and driven by gearing or other machinery, and turning in the same direction with said drawing or forming rolls, for the purpose of carrying and feeding into them the pile or bar of heavy iron, substantially as described.

No. 25,566.—HARVEY GUILD, of New Orleans, La.—*Improvement in Apparatus for Purifying Gas*.—Patent dated September 27, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The arrangement of the water pipe G and rose H within the inlet pipe of the wash box A, in combination with the perforated plate or diaphragm F, at the junction of the inlet pipe with the wash box, substantially as described.

No. 25,567.—NOAH E. HALE, of Nashua, N. H.—*Improved Belt Hook, Pliers, and Punch*. Patent dated September 27, 1859.—The object of this tool is to facilitate the use of hooks, such as designed by the letter Q in the engravings, for the purpose of fastening together the two ends of belts used for driving machinery.

The inventor says: I *claim*, first, the combination of the roughened surfaces O and H with the triangular wedge end G, arranged in relation to each other substantially as and for the purposes set forth.

Second. The combination of the jaws E F with the punch J, roughened surfaces O H, and wedge end G, the whole being constructed and arranged as and for the purposes set forth.

No. 25,568.—JOHN HOWARTH, of Salem, Mass.—*Improvement in the Method of Distilling Oil from Coal*.—Patent dated September 27, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* forming oleaginous vapors from coal or other substances yielding pyrogenous oil, by passing through the material to be acted on a current of superheated steam in combination with steam direct from the boiler, substantially in the manner and for the purpose set forth.

I also claim forming oleaginous vapors from coal or other substances yielding pyrogenous oils, by passing through the material to be acted upon air combined with superheated steam, substantially in the manner and for the purpose as set forth.

No. 25,569.—TYLER HOWE, of Cambridgeport, Mass.—*Improved Bedstead Slat*.—Patent dated September 27, 1859.—The object of this invention is to produce spring slats for a bed bottom, and those that will not permanently sag or set down, but, on the contrary, by the application of a lifter, the centre of each slat is made to bend upwards, giving to the bed, when made, a neat, full appearance.

The inventor says: I *claim* the described bed slat, consisting essentially of the lifter A, in combination with the slat, constructed and operating in the manner substantially as set forth; also, the construction of the ends of the slats, by which they are connected with the bedstead or springs, as shown by C and D, and as described.

No. 25,570.—EDWARD C. KNIGHT, of Philadelphia, Pa.—*Improved Mode of Arranging Couches in Railroad Cars*.—Patent dated September 27, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the arrangement of couches in railroad cars by means of the double hinged rod C C, constructed as described, in such a manner that the couch, when not in use, may be folded up against the ceiling and retained there by means of a button, or other suitable device, substantially as described.

No. 25,571.—W. KULENSCHMIDT, of New York, N. Y.—*Improved Screw Wrench*.—Patent dated September 27, 1859.—This invention consists in arranging a conical disk, with a helical groove, on a pin put obliquely in a pendant attached to the movable jaw of the wrench; said groove to gear into corresponding cogs on the back of the shank to which the stationary jaw

is attached, so that, by turning this disk, the movable jaw is closed or opened, and the disk is forced against the cogs on the shank by means of a spring, so that the same can be drawn back and the helical groove disengaged from the cogs, and so that the movable jaw slides on the shank that it can be rapidly opened and closed.

*Claim.*—The arrangement and combination of the conical disk E with the helical groove c, the spring d, the movable jaw C, and the shank B, to operate substantially as and for the purpose set forth.

No. 25,572.—JAMES ALLEN LOWE, of New York, N. Y.—*Improvement in Moulding Water Traps.*—Patent dated September 27, 1859.—The claim and engravings will give an idea of the nature of this invention.

*Claim.*—The application of a metallic core, constructed and operating substantially as described, to cast water traps.

No. 25,573.—JAMES L. MEAFROY, of Middletown, N. Y.—*Improvement in Cooking Stoves.*—Patent dated September 27, 1859.—This invention consists in having a fire chamber of cylindrical form placed in the front part of the stove, and encompassed by an air chamber communicating with the upper part of the fire chamber by small orifices, and having a water heater adjoining the air chamber; the above named parts being placed directly in front of the oven, and also used in connection with a perforated and equalizing draft plate, whereby the desired end is attained.

The inventor says: I *claim* the cylindrical fire chamber F and air chamber G, communicating with the fire chamber F and the heater chamber I, when combined and arranged relatively with each other and the oven B, for the purpose set forth.

I also claim, in combination with the fire chamber F, air chamber G, and heater chamber I, arranged as shown, the perforated plate K placed in the flue C, relatively with the fire chamber, for the purpose set forth.

No. 25,574.—Z. N. MORREL, of Cameron, Tex.—*Improvement in Machines for Distributing Fertilizers.*—Patent dated September 27, 1859.—This invention consists, not in any of the devices taken separately, but in the combined arrangement of a single side wheel D, a distributing wheel C placed in a slot in the beam, a slide I for regulating the amount of fertilizer distributed, revolving arms L within the hopper, a boot k under the distributing wheel, set screw J, shares d d, cog wheels E<sup>1</sup> E<sup>2</sup>, draft rod s, sprocket and wheels F<sup>1</sup> F<sup>2</sup>.

*Claim.*—The combined arrangement of the single side wheel D, distributing wheel C, regulating slide I, revolving arms L, boot K, set screw J, shares d d, cog wheels E<sup>1</sup> E<sup>2</sup>, draft rod s, sprocket wheels F<sup>1</sup> F<sup>2</sup>, roller H, and chain G, in the manner and for the purpose set forth.

No. 25,575.—GEORGE M. MOWBRAY, of Green Point, N. Y.—*Improvement in the Process of Distilling Oils from Coal.*—Patent dated September 27, 1859.—The claim explains the nature of this invention.

The inventor says: In the manufacture of coal oil, and other pyrogenous oils, by exposing the coal or other materials to the products of combustion generated in a separate furnace, I *claim* igniting said products of combustion previous to admitting the same into the distilling kiln by admixture of a sufficient proportion of the air to burn the oxide of carbon into carbonic acid, substantially as described and for the purposes set forth.

No. 25,576.—GEORGE MUNGER, of New Haven, Conn.—*Improved Writing Tablet.*—Patent dated September 27, 1859.—The claim explains the nature of this invention.

*Claim.*—A new article of manufacture, to wit: an argillaceous surface wood writing slate, which is formed by uniting several layers of veneering, or thin wood together, so that their grains run antagonistic to one another, and then coating the exterior surfaces of the compact mass with a composition of slate, emery, or other similar argillaceous material, substantially as and for the purposes set forth.

No. 25,577.—S. D. NEWBRO, of Lansing, Mich.—*Improved Bed Spring.*—Patent dated September 27, 1859.—This invention consists in constructing and securing together oblong plates of wood or metal in a peculiar way.

*Claim.*—The employment of the oblong plates a a a, whether made of wood or of metal, or of any other suitable material, when the same are secured together, substantially as and for the purposes set forth.

No. 25,578.—RUFUS NUTTING, of Randolph, Vt.—*Improved Manufacture of Wire Cloth.*—Patent dated September 27, 1859.—In the engravings A represents a specimen of the wire cloth in its ordinary condition, and B a specimen of similar cloth after it has been compressed.

*Claim.*—Compressing wire cloth by passing it through rollers suitably constructed, or by

equivalent means, whereby its surfaces are rendered smooth and even, in the manner and for the purpose substantially as specified.

No. 25,579.—OSCAR PADDOCK, of Watertown, N. Y.—*Improvement in Stoves*.—Patent dated September 27, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The damper *c*, arranged over the pipe *b*, through which a direct communication between the fire place and the chimney is effected and operated by means of a rod *k*, or its equivalent, which is secured to the door *B*, and which acts against a forked lever *g*, substantially as and for the purpose specified.

No. 25,580.—ANDREW PATTERSON, of Birmingham, Pa.—*Improvement in the Manufacture of Hoes*.—Patent dated September 27, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The improvement in the manufacture of hoes, as substantially described, viz: forming the head or eye of a hoe and attaching it to the blade at the same time, by pouring the molten metal to form the head on or around the blade, substantially as described and set forth.

No. 25,581.—EDWARD L. PERKINS, of Roxbury, Mass.—*Improved Construction of Packing Boxes*.—Patent dated September 27, 1859.—The claim and engravings explain the nature of this invention.

The inventor *claims*, first, forming the sides, ends, bottom, and top of the box with, or attaching thereto, the right angular shaped braces or shoulders *g g*, &c., formed with beveled corners, so as to make a close and binding joint, as described.

Second. In combination with the above the cover formed in two wedge shape pieces, or in any manner substantially similar, whereby all the parts constituting the box are drawn and held rigidly together, as set forth.

No. 25,582.—JANE PHILLIPS, of New York, N. Y.—*Improvement in Muffs*.—Patent dated September 27, 1859.—The claim and engraving explain the nature of the invention.

*Claim*.—A muff *A*, arranged with a cut *b* in its outside covering or shell, an annular space or pocket *a*, and a portmonnaie *D*, secured in its upper part, the whole constructed in a manner and for the purpose specified.

No. 25,583.—JOSEPH F. POND, of Cleveland, Ohio.—*Improvement in the Hoops of Skeleton Skirts*.—Patent dated September 27, 1859.—This invention consists in having an eye on one extremity of the hoop, and on the other a series of set offs, so that when the hoop is run through the back in the skirt, the one end is passed through the eye on the other end, and said eye catching against the set off, holds it securely; and by moving the eye to either of the set offs, the circumference of the hoop is increased or diminished, as desired.

*Claim*.—The combination of the eye *e* on one extremity of the hoop with the series of set offs *a* on the other, constructed and operated substantially as and for the purposes set forth.

No. 25,584.—C. W. PYLE, of Galveston, Texas.—*Improvement in Securing Iron Bands on Cotton Bales*.—Patent dated September 27, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—A plate constructed with a short, open slot, a long, closed slot, and a turned down lip or flange, substantially as described and for the purposes set forth.

No. 25,585.—CORNELIUS I. ROONEY and DAVID RENSHAW, of New York, N. Y.—*Improved Spring Hinge*.—Patent dated September 27, 1859.—This invention consists in the manner of combining and arranging the spring and the parts of the hinge in connection with each other, by which the removal and replacement of a broken spring, without interfering with the connection of the parts of the hinge or its attachment to the door, is facilitated, and the hinge made more convenient to use and graduate.

*Claim*.—The arrangement of the coiled spring *E*, shaft *C*, and wings *A B*, in combination with each other, as described, for the purposes stated, when the parts are constructed substantially as herein set forth.

No. 25,586.—ABBOTT Q. ROSS, of Cincinnati, Ohio.—*Improvement in Burglars' Alarm*.—Patent dated September 27, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* connecting the doors and windows of a house to an alarm mechanism, through a system of strained wires, so that the forcing of a door or the cutting of any wire shall let off the alarm mechanism, substantially in the manner described.

I also claim so connecting the panels of a door with the strained wires that unite the door with the alarm mechanism, as that the cutting out of a panel, or the cutting of one of the wires, shall let off the alarm mechanism, substantially as described.

I also claim the combination of the swinging lever *t*, on the bolt *r*, with its inclined plane *s*, that locks the spring drum *J*, for the purpose of putting said door in connection with the

alarm mechanism, when said door is drawn to and shut from the outside, substantially as described and represented.

No. 25,587.—JOHN ROUSE, of Port Gibson, N. Y.—*Improvement in Horses' Harness*.—Patent dated September 27, 1859.—This invention consists in dividing the hame strap used in double harness, which connects the collar of the yoke placed upon the end of the tongue of the vehicle to enable the horses to back or to hold back the vehicle, into two sections, in the direction of its length, and connecting the outer end of each section to the eye of a double eyed hook, which is placed over and upon the ring at the end of the yoke, and which serves to keep the yoke and the tongue to which it is attached steadily in position, and prevents the tongue swaying or vibrating from side to side, when the vehicle is in motion.

*Claim*.—The double eyed hook D, arranged as described in the yoke ring C, so as not to be withdrawn therefrom, in combination with said ring and with the divided hame straps E E<sup>1</sup>, which are respectively secured to the opposite eyes of the hook, for the purposes specified.

No. 25,588.—JOHN SPARROW, of Portland, Me.—*Improved Steam Punching Machine*.—Patent dated September 27, 1859.—This invention consists in the employment, in a machine for punching, riveting, or cutting metals, of a single acting cylinder and piston, operated by the pressure of steam, water, or other fluid, and a toggle, combined and applied to the punch or cutter, substantially as described, to effect the necessary pressure thereon for the riveting, punching, or cutting operation.

*Claim*.—The employment, for the purposes specified, of a single acting cylinder and piston, operated by the pressure of steam, water, or other fluid, and a toggle, combined with and arranged and applied relatively to each other and the punch or cutter, substantially as described.

No. 25,589.—PETER M. STATZELL, of Philadelphia, Pa.—*Improved Method of Operating Independent Second Hands of Stop Watches*.—Patent dated September 27, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the independent second hand M adapted to a watch substantially in the manner described, so that by means of the devices described, or their equivalents, the said hand may be connected to or disconnected from the time train of the watch, without interfering with the movements of the latter, for the purposes specified.

Second. The stop arm N with its forked end so adapted to the hollow arbor L as to serve the purpose of stopping and releasing the said arbor, and at the same time serving to maintain it in its proper vertical position.

Third. The wheel P with the springs *ff*, in combination with the hollow arbor L of the independent second hand; the wheel being hung loosely to, and the spring bearing against the said arbor, as and for the purpose set forth.

No. 25,590.—W. S. STETSON, of Baltimore, Md.—*Improved Safety Envelope*.—Patent dated September 27, 1859.—The claim explains the nature of this invention.

The inventor says: What I *claim* as my invention is the mode of giving security to letter and other envelopes, substantially as set forth, the same consisting in waterproofing that part of the envelope upon which the adhesive material is applied.

No. 25,591.—JOHN STEVENS and JOHN JOHNSON, of New York, N. Y.—*Improvement in the Construction of Gas Burners*.—Patent dated September 27, 1859.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim* the apertures B B<sup>1</sup> in combination with the movable slide C or its equivalent, substantially as described, whereby the area of the passage for the gas or vapor is contracted at pleasure at the point of its exit into the atmosphere, and the volume of the flame is diminished without substantially changing its character.

We also claim the arrangement of the branches B B<sup>1</sup> diverging from a single pipe A, and pressing, by their elasticity, against the opposite sides of the slide C, for the purposes explained.

No. 25,592.—J. C. STODDARD, of Worcester, Mass.—*Improved Chamber Utensil*.—Patent dated September 27, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—A chamber vessel provided with a flange *a c* and elastic ring *b*, made as shown and described, so as to form a tight joint and also prevent noise, as set forth.

No. 25,593.—JOSEPH N. TREADWELL, of Redding, Conn.—*Improvement in Machines for Scouring and Hulling Buckwheat*.—Patent dated September 27, 1859.—These improvements relate to the arrangement of the huller, scouring cylinders, conveyors, and hoppers, by means of which the operation is effectually performed.

*Claim*.—The arrangement of the revolving and graduated screens, with the hoppers, conveyors, blasts, and conductors, in the manner as and for the purpose described.

No. 25,594.—RICHARD WARD, of Edinburg, Ind.—*Improvement in Smut Machines*.—Patent dated September 27, 1859.—This invention relates to the preparation of the iron plates which form the cylinder within which the grain is operated upon, and their arrangement in the formation of said cylinder.

*Claim*.—The employment of the corrugated iron plate C having the horse shoe perforations *c*, in combination with the iron plate D having the diamond perforations *b*, in the construction of a perforated scouring and separating cylinder B, all arranged to operate substantially as and for the purposes set forth.

No. 25,595.—S. J. WASTERBARG, of Altona, Ill.—*Improvement in Seed Planters*.—Patent dated September 27, 1859.—In the operation of this invention the grain is placed in the hopper H through a suitable door in it, and thence it passes down and enters the four chambers B. By pressing down the handle F it bears upon the rod or shaft *a*, and thus depresses the rods D, the ends of said rods bear upon the grain which has passed into the chamber C from chambers B, and bearing against the beveled ends of the slides E they revolve partially around and allow the grain to pass out into the discharge spouts, from whence it falls to the ground.

*Claim*.—The arrangement of the block A provided with chambers C and chambers B, with the rods D, shaft *a*, handle F, hopper H, spring I, slides E, and spring G, substantially in the manner and for the purpose set forth.

No. 25,596.—C. L. WHITNEY and SAMUEL REED, of Geneseo, Ill.—*Improvement in Stoves*.—Patent dated September 27, 1859.—This invention consists in the arrangement of flues and flue spaces, so that the hot air is carried from the fire chamber under a deflecting plate and passed up through pipes arranged in the rear of the oven, and thence out into the smoke pipe, and in the manner of obtaining a regular increased draft in its passages through the stove; also in the arrangement of pipes of clay, or other similar substance, within the oven and between the flue pipes, in order to abstract and to retain the heat and give it out slowly into the oven during the operation of baking.

The inventors say: We *claim* the arrangement of the deflecting plate F, chamber C, graduating damper J, and flue pipes H H in the four corners of the oven, all in combination for the purposes set forth; and also, in combination with this, we claim the use of pipes of clay, or other similar material, when the same are arranged in the manner and for the purpose set forth.

No. 25,597.—A. B. WEAVER, of Carthage, Ind. —*Improved Abdominal Supporters*.—Patent dated September 27, 1859.—This invention relates to certain improvements in abdominal supporters.

*Claim*.—The employment of the hip pads F F and centre straps *i i*, in combination with the straps A A<sup>1</sup>, arranged substantially as described for the purposes set forth.

No. 25,598.—ZATTER F. WILDER, of Painted Post, N. Y.—*Improvement in the Method of Raising Water by Animal Power*.—Patent dated September 27, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The arrangement of a series of platforms in combination with a pump, so that a series or a succession of strokes of the pump piston shall be produced before the cattle arrive at the drinking trough, substantially as and for the purposes set forth.

No. 25,599.—REUBEN WOOD, of Grand Ledge, Mich.—*Improved Hand Punch*.—Patent dated September 27, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the peculiar relative arrangement of the two series of inclined planes on the contact faces of the circular plates C C<sup>2</sup> C<sup>3</sup>, to be used either with or without interposed balls or rollers, in the manner and for the purposes substantially as specified.

Second. I claim the use of the slotted tube I, in combination with the two inclined ways P P and cross bars J, (with or without the rollers R R,) constructed and arranged substantially as described, for the purpose of extricating and lifting a punch, or other tool in the bar E, by a reversed motion of the lever.

No. 25,600.—JOHN WILSON, of Anderson C. H., S. C.—*Improvement in Cotton Gins*.—Patent dated September 27, 1859.—This invention consists in the use of three or more finely toothed or serrated cylinders set vertically, and so arranged or disposed as to rotate nearly in contact one with another, and form a cotton chamber or inclosure at their inner sides, the contiguous cylinders rotating in the same direction, so that they will present, at the space between them, oppositely moving surfaces to the cotton, and, by the action of said surfaces, effectually separate the cotton from the seed.

It also consists in using, in connection with the cylinders aforesaid, stripping brushes and a register, the former to strip the bait from the cylinders and the latter to regulate the discharge of the seed from the cotton chamber.

*Claim.*—First. The employment or use of three or more toothed or serrated cylinders D, arranged and disposed so as to operate substantially as and for the purpose set forth.

Second. In connection with the cylinders D, thus arranged and disposed, the rotating stripping brushes M and adjustable plug or register P, to ensure respectively the proper discharge of the lint and the seed.

No. 25,601.—HENRY WILLIAM WIMSHURST, of Dalston, England.—*Improved Manufacture of Sheet Metal.*—Patent dated September 27, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The improvement described in the manufacture or production of the sheet metal, or metal foil, as an article of manufacture and trade, by cutting the same from a block or solid mass by means of a cutting mechanism, in lieu of rolling or beating the same by means of a rolling or beating mechanism, as this has heretofore been done.

No. 25,602.—O. D. BARRETT, of Cleveland, Ohio, assignor to Himself and J. F. KEELER, of said Cleveland.—*Improved Door Spring.*—Patent dated September 27, 1859.—By the action of the levers D and E the pressure on the door gradually diminishes as the door is opened, and ceases when opened a little more than ninety degrees, and, when past that point, the spring will hold the door open; thus the greatest pressure on the door is obtained just as it shuts.

*Claim.*—The levers D and E, in combination with the connecting rod F and springs H H, constructed and operated as specified.

No. 25,603.—JAMES DECKER, of Reidsville, Ga., assignor to Himself and A. P. McRAE, of said Reidsville.—*Improved Stave Machine.*—Patent dated September 27, 1859.—This invention consists in the employment of concave and convex rotating cutters with a suitable bed piece, tonguing and grooving cutters, and a pressure roller and cam, combined and arranged for joint operation, whereby the staves may be dressed at both sides and ready for use as they leave the machine.

*Claim.*—The combination and arrangement of the convex and concave cutters *a f*, bed piece C, tonguing and grooving cutters in the heads L L<sup>1</sup>, and the cam H, attached to the pressure hub or roller G and lever N, connected with said cam and the shaft of the cutter head L, substantially as and for the purpose set forth.

No. 25,604.—FRANCIS DIXON, of Lynn, Mass., assignor to Himself and MOSES SWEETSER, of Newburyport, Mass.—*Improvement in the Manufacture of Cigar Wrappers.*—Patent dated September 27, 1859.—The claim explains the nature of this invention.

*Claim.*—A new article of manufacture for the special purpose as set forth, the same consisting of tobacco leaf reduced to pulp, and subsequently converted into sheets or other desirable form suitable for use, or the making of cigar wrappers, as explained.

No. 25,605.—LUTHER HALL, of Boston, Mass., assignor to Himself and S. S. HEMENWAY, of said Boston.—*Improved Machine for Shaping Heels for Boots and Shoes.*—Patent dated September 27, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the combination of the stationary bed plate A, the movable cutter carriage D, provided with self adjusting cutters O P, and carriers J K, adjustable clamps S T, a guide friction wheel N, and a curved rack and pinion, the whole being arranged and made to operate substantially as and for the purposes set forth.

I also claim combining with the adjustable clamps S T, constructed as described, an adjustable holder and former Y, so constructed and arranged as not only to cooperate with the clamp in maintaining the heel of the boot or shoe firmly in position, but to serve as a pattern to give the heel any desirable contour on its bearing surface.

I also claim the peculiar construction of the secondary cutter carriage set forth, and the arrangement of the secondary cutter with respect to the primary cutter, the guide friction wheel, and the heel tread former Y, whereby the secondary cutter is rendered capable of giving to the lower or bearing surface of the heel any form that may be desired.

No. 25,606.—JOHN KEANE, of New York, N. Y., assignor to Himself and ANDREW McLEAN WOOD, of said New York.—*Improvement in Bungs of Casks.*—Patent dated September 27, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* providing a bung or spigot, with reservoir for spirit, and a system of pipes or passages *a b* or their equivalent, so arranged as to cause all the air entering the cask to pass through the spirit in said reservoir, substantially as and for the purpose specified.

And in combination with such a reservoir and system of pipes and passages, or their equivalents, I claim a valve *c* applied to the bung or spigot, substantially as and for the purpose specified.

No. 25,607.—JAMES McFARLAN, of Brooklyn, N. Y., assignor to JAMES McFARLAN, JR.,

and E. McFARLAN, of said Brooklyn.—*Improved Portable Gas Holder*.—Patent dated September 27, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The construction of the gasometer with the upper portion B C of conical form, with flexible sides and with a stiff head and of such size that it may be introverted, substantially as described, within the stationary tank like portion A, to which its flexible sides are attached.

No. 25,608.—JEFFERSON NASH, of Jamesville, Wis., assignor to Himself and ALONZO K. CUTTS, of Fulton, Wis.—*Improvement in Grain Separators*.—Patent dated September 27, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The arrangement and combination of the vibrating lever E, the elbow crank *f*, and the rods *e* and *h*, whereby the motion of the shoe can be changed from a longitudinal to a transverse direction and *vice versa*, substantially as described.

No. 25,609.—AUGUST SCHMIDT, of New York, N. Y., assignor to Himself, CHARLES SCHMIDT, EDWARD SCHMIDT, and HERMAN SCHMIDT, of said New York.—*Improvement in Apparatus in Making Gas from Wood*.—Patent dated September 27, 1859.—This invention consists in the construction of a retort used for heating, whereby a larger surface is exposed to the heat, and that under circumstances which render the heat effective in accomplishing the desired result.

*Claim*.—The arrangement of the arch shaped retort *a*, and narrow flues  $g^1$   $g^2$ , &c., within the arch of the retort, in the manner and for the purposes substantially as specified.

No. 25,610.—AUGUST SCHMIDT, of New York, N. Y., assignor to Himself, CHARLES SCHMIDT, EDWARD SCHMIDT, and HERMAN SCHMIDT, of said New York.—*Improvement in Apparatus for Making Gas from Rosin*.—Patent dated September 27, 1859.—This invention consists in arranging a retort and heating flues in such a manner as to receive a regulated supply of rosin or other material, rendered fluid by heat, upon coke contained in said retort, and thereby form an illuminating gas of superior quality and quantity.

*Claim*.—The retort *c* and its flues *e e*, combined with the receptacle or kettle *g*, and arranged in the manner and for the purpose specified.

No. 25,611.—GEORGE HAND SMITH, of Rochester, N. Y., assignor to SILAS O. SMITH, of said Rochester.—*Improved Apparatus for the Production of Hare's Hydro-Oxygen Light*.—Patent dated September 27, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the use of carburetted hydrogen gas, in combination with atmospheric air, or oxygen gas, in proportion as desired, operating under condensation through a proper regulator, and discharging through jets of minute orifice, upon and rendering incandescent any proper radiating material of any form, being independent of any atmospheric circumstances or situation, in the manner and through the means and machinery, substantially as described.

Second. The arrangement of four jets, or burners, for directing the impact of gases on incandescent surfaces, such burners having minute orifices pointing to a common centre, three are placed so that their orifices of discharge shall be within or nearly within one quarter of a circle drawn through them from the centre to which they point (being not more than one eighth of such circumference distant) and the orifice of the fourth being diametrically opposite in such circle to the middle orifice of the other three, substantially as described.

No. 25,612.—JAMES G. ABBOTT and ARCHELAUS LAWRENCE, of Philadelphia, Pa.—*Improvement in Stoves*.—Patent dated October 4, 1859.—R is the air ring around which the sheet-iron cylinder is fixed. It receives its supply of air through the openings *a*, and discharges them through the small openings *o* in the usual way. The openings *a* are made through the lower portion of the door frame F, and are closed by a slide B.

*Claim*.—The combination of the ring R, perforated door frame F, extending down over the ring and slide B, with the stove cylinder, as set forth.

No. 25,613.—J. C. ADAMS, of Greensburg, Ind.—*Improvement in Corn Planters*.—Patent dated October 4, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The arrangement of the clevis device *t* on the rear of the pole *s*, when said pole is received through the mortise in the bar, and when the said bar is made adjustable by means of bolts and bolt holes through its ends and through the frame pieces A, said clevis device being made so as to clasp together cross pieces *c* and  $c^1$ , all in the manner and for the purpose set forth.

No. 25,614.—CHARLES ALDEN, of New York, N. Y.—*Improvement in Apparatus for Evaporation*.—Patent dated October 4, 1859.—This invention consists in employing, in connection with the application of heat, such a system of agitation as will effect the almost instantaneous

discharge from the liquid of the vesicle of steam formed at the bottom and sides of the dissector, as well as away from the vessel itself.

*Claim.*—The agitator so constructed as to be capable of acting as a blower as well as a stirrer, substantially as set forth.

No. 25,615.—ALBERT J. ALLEN, of Buffalo, N. Y.—*Improved Steam Gauge.*—Patent dated October 4, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, capsule G of peculiar construction, having the steam admitted at one side and through the centre of that side, and using the flexibility of both sides (such capsule being made of a permanently elastic metal, and not injuriously oxidized by steam or water, preferring for that purpose the metal used in making melodeon reeds,) in combination with fulcrum block F, lever H, spring P, rod O, rod I, swivel block J, radius bar L, and segment K, having tail pin *k*, pinion N, index pointer E, dial plate D, and friction pressure spring M, substantially as shown and described.

Second. I claim radius bar L in combination with rod I, swivel block J, segment K, having tail pin *k*, pinion N, index pointer E, and dial plate D, having increasing divisions on its face, substantially as shown and described.

Third. I claim swivel block J, in combination with rod I, radius bar L, and segment K, having tail pin *k*, substantially as shown and described.

No. 25,616.—JOHN P. ALLEN, of Midville, Ga.—*Improvement in Seed Planters.*—Patent dated October 4, 1859.—This invention consists in a peculiar arrangement and combination of a coverer, hopper, and distributing device, whereby the hopper is prevented from becoming choked or clogged, the machine allowed to work smoothly, and the seed perfectly covered.

*Claim.*—The arrangement and combination of the frame E, provided with the armed hub g, the hopper F, and its bar G, in connection with the adjustable bar I, provided with the self adjusting covering plate or bar K, substantially as and for the purpose set forth.

No. 25,617.—THOMAS ARMITAGE, of Philadelphia, Pa.—*Improvement in Feed Apparatus for Steam Boilers.*—Patent dated October 4, 1859.—This invention consists of a vessel immersed in a well and furnished with a valve opening inwards, in combination with a system of pipes, the whole being arranged in respect to a steam boiler, so as to form a cheap and serviceable substitute for the ordinary feed pump.

*Claim.*—The vessel C with its valve *c* opening inwards, in combination with the pipes D E F H and I, with their respective cocks and the drum B, the whole being arranged in respect to the boiler, substantially as and for the purpose set forth.

No. 25,618.—HENRY F. BAKER, of Centreville, Ind.—*Improvement in Mole Ploughs.*—Patent dated October 4, 1859.—In using this invention the team is attached to the beam A, the same as to an ordinary plough, and, as the implement is drawn along, the knife C and share G enter the earth to the depth of the share G, being regulated by adjusting the knife C and rollers B. The knife merely makes a narrow cut in the earth, which is closed by the pressure of the roller I; but the conical share G makes a cylindrical hole, which is increased by the packer H; said packer rotating in consequence of the resistance offered by the earth to its spirally fluted periphery.

The inventor says: I *claim* the arrangement and combination of the screw E, key F, knife C, share G, and revolving packer H, as and for the purpose shown and described.

I also claim the employment of a revolving mole or packer H, substantially as and for the purpose shown and described.

No. 25,619.—H. H. BAKER, of New Market, N. J.—*Improvement in Weeding Hoes.*—Patent dated October 4, 1859.—This invention consists in so constructing an implement for cutting or dressing weeds from plants growing in drills, as to avoid the reciprocating or shuffling motion, and enable the operator to proceed rapidly, as on a common walk, without endangering the plants, and removing from them lumps of dirt or pebbles, and delivering next to the plants a layer of fine soil, leaving the surface of the plants flat as before, and at the same time forming a subsoil groove at a given distance from the plants, for the purpose of admitting moisture and air into the soil around the roots.

*Claim.*—The arrangement of the piece B, standard D, plate A, concave E, and ferrule F, as described, as and for the purposes substantially as set forth.

No. 25,620.—O. D. BARRETT, of Cleveland, Ohio.—*Improvement in Rotary Harrows.*—Patent dated October 4, 1859.—The team being attached to the two hooks H H by proper appliances, the draft will cause the two harrows to tend toward each other. This causes the jointed arms F F to rise at D, which rising is controlled by the spring C. Thus the two harrows must run lighter in the soil on their adjacent sides than on their opposite sides, and being free to turn on their centre pins, they rotate in opposite directions.

*Claim.*—The arrangement of the hooks H H, draft bars G G, centre pins B B<sup>1</sup> B B<sup>1</sup>,

arms F F, and spring joint D, in relation to each other and to the harrows, as and for the purpose set forth.

No. 25,621.—WILLIAM W. BATCHELDER, of New York, N. Y.—*Improvement in the Construction of Vapor Burners*.—Patent dated October 4, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I claim arranging the orifice of discharge *i* from the retort, in reference to the open end of the gas pipe *d*, so that the sediment from the orifice cannot fall into said pipe nor remain about and choke the orifice, substantially in the manner and for the purposes set forth.

I also claim the entire disconnection of the pipe *d*, and retort, as set forth.

I also claim the combination of the circular form of the gas pipe *d* with the horizontal discharge, as set forth.

I also claim connecting the retort with the ascending part of the gas pipe near the burner, as set forth.

No. 25,622.—MAHLON BONNELL, of New York, N. Y., and ISAAC I. COLE, of Tappan, N. J.—*Improved Machine for Cutting Veneers*.—Patent dated October 4, 1859.—This invention consists, first, in arranging the rotary log carrier, by means of cams, in such a manner that the same receives a longitudinal motion whenever one of the logs comes in contact with the knife, and during the whole time which it takes the knife to pass through the log. This operation is intended to facilitate the cutting. This invention also consists in combining with the log carrier a tank containing hot water, so that each log is passed through the water and reheated with every revolution of the carrier, and just before the log comes in contact with the knife.

The inventors say: We claim, first, the arrangement of the cams *a a*<sup>1</sup> or their equivalents, in combination with the log-carrier A, substantially in the manner and for the purpose specified.

Second. The arrangement and combination of the log carrier A, with the tank M or its equivalent, substantially as and for the purpose described.

No. 25,623.—NATHANIEL BOURNE, of Peosta, Iowa.—*Improvement in the Construction of Evaporating Apparatus*.—Patent dated October 4, 1859.—This invention consists in providing an evaporating pan with a double bottom, having applied to it a system of shutters, by which the boiling or evaporation can be regulated.

*Claim*.—The arrangement and combination with the evaporating pan A of a series of partitions and shutters, substantially as and for the purpose shown and described.

No. 25,624.—B. B. BRIGGS, of Sharon, Ohio.—*Improvement in Apparatus for Laying Drain Tile*.—Patent dated October 4, 1859.—The clutch D has two fingers F F connected to the clutch block by the pins G, which pass through the clutch block. In the others (E E<sup>1</sup> E<sup>2</sup>) there are three fingers H H<sup>1</sup> H<sup>2</sup>, which are secured to the blocks by the pins I.

*Claim*.—The described clutches, consisting of the block or body and the fingers H H<sup>1</sup> H<sup>2</sup> and F F<sup>1</sup>, constructed and operating as set forth, in combination with the rope C, or its equivalent, and hook B, when these several parts are arranged and operated substantially as specified.

No. 25,625.—ROBERT C. BUCHANAN, of the United States Army.—*Improvement in Knapsacks*.—Patent dated October 4, 1859.—The knapsack may be made in the ordinary shape of the usual material. On the upper and inner seam, in the line *a a a* is fastened a yoke *b b b*, made after the fashion of a shirt yoke, passing over the shoulders, terminating in two ends *c c* on the breast, and passing backward, is sewed on the inner side from *x* to *y* of the knapsack.

*Claim*.—The combination of the body yoke and end pockets to the knapsack, the whole being combined and operating substantially as set forth.

No. 25,626.—J. A. BUCKWATER, of Kimberton, Pa.—*Improvement in Brick Moulds*.—Patent dated October 4, 1859.—The plates *c c*<sup>1</sup> and *h*<sup>\*</sup> work within the frame A<sup>1</sup>. When the plates *c c*<sup>1</sup> and *h*<sup>\*</sup> are in the frame A<sup>1</sup> the moulds receive the clay and the clay is compressed therein by the followers when said plates are within the frame. When the clay is fully compressed the frame A<sup>1</sup> is raised, and the plates *c c*<sup>1</sup> *h*<sup>\*</sup> are expanded and the capacity of the moulds is increased, so that the moulded clay may be readily discharged.

*Claim*.—The expanding frame B<sup>1</sup>, formed of the movable plates *c c*<sup>1</sup> *h*<sup>\*</sup>, and fitted within the frame A<sup>1</sup>, provided with the inclined or taper pendants *d* and inclined slats L L<sup>1</sup>, the plates *c c*<sup>1</sup> *h*<sup>\*</sup> being connected respectively to the pendants *d* and slats L by the pins *f* and staples *g*, substantially as and for the purpose set forth.

No. 25,627.—ERASTUS TOUCEY BUSSELL, of Covington, Ky.—*Improved Measuring Faucet*.—Patent dated October 4, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* operating the cut off by a rotary movement of the exhaust chamber, which comprises the measure proper, whereby the fluid is first admitted into said measure and then discharged therefrom.

I also claim a graduated plunger rod, square or otherwise, so as to admit of stop notches on each side, independent of the others, into which a pin is forced by a spring, as set forth, or its equivalent.

No. 25,628.—LYSANDER BUTTON and ROBERT BLAKE, of Waterford, N. Y.—*Improvement in Supporting the Carriage Bodies of Fire Engines.*—Patent dated October 4, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The propping of fire engines which are mounted upon springs by means of cams *a* or mechanical equivalent thereof, so arranged and operated as, by lever power, to throw the weight of the engine from and upon the springs, substantially in the manner and for the purposes set forth.

No. 25,629.—G. A. CLARK, of Farmington, Conn.—*Improvement in Fireplaces.*—Patent dated October 4, 1859.—This invention relates to the heating of apartments by an economy of the heat of the ordinary fireplace, and instead of conducting the hot air and smoke directly up the chimney, as in ordinary fireplaces, it is retained and radiated wheresoever it may be desired, while at the same time the heat, by reflection into the room, is obtained as with the common fireplace.

*Claim.*—The described arrangement of caliducts C D E E F G G H H<sup>1</sup> and C<sup>1</sup>, when the same are applied to a fireplace, in the manner and for the purposes set forth.

No. 25,630.—POWHATTAN ELLIS COLLINS, of Mobile, Ala.—*Improvement in Cotton Gins.* Patent dated October 4, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* an adjustable hopper, as described, for changing and regulating the feed of cotton to a gin, as set forth.

I also claim, in combination with an adjustable and regulating hopper, the toothed cylinder D, for conveying the cotton from the hopper to the ginning or saw cylinder, as set forth.

I also claim the arrangement of the hopper, feeding toothed roller, saw and brush cylinders, as shown, so as to operate in connection with each other, in the manner described.

No. 25,631.—GARRET COOPER, of Jersey City, N. J.—*Improved Tray Bolt.*—Patent dated October 4, 1859.—The bolt has at its back end an elongated slot D, and is held and retained in its position between the shield B and plate H by means of a nipple C punched up from the underside of the plate H into slot D, giving the bolt A the necessary backward and forward motion and retaining it in its position.

*Claim.*—The general arrangement of bolt A, shield B, nipple C, and plate of metal H, when said bolt shall effect its own spring, and when the said parts shall be arranged and operated in the manner described and for the purpose specified.

No. 25,632.—PEARSON CROSBY, of New York, N. Y.—*Improved Manner of Hanging Reciprocating Saws.*—Patent dated October 4, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* connecting the two plates *b b* of the caps B by means of rivets *d* and pins *g k*, the ends of which are fitted in holes countersunk at the inner sides of the plates to admit of the vertical adjustment of the plates *b*, for the purpose set forth.

I also claim encompassing the rivets *d* of the cap B by tubes or cases *f*, to form a bearing for the plates *b b* and prevent an undue pressure of the caps against the saw, so that the latter may be adjusted to compensate for wear, as specified; it being understood that I do not claim, broadly, the tubes or cases *f*, but only when used in connection with or applied to the caps B, for the purpose set forth.

No. 25,633.—JOSHUA DAVIES and SARAH A. DAVIES, of Muskegon, Mich.—*Improved Bread and Vegetable Cutter.*—Patent dated October 4, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The arrangement and combination of the adjustable slotted plates H, gauge I, rod *h*, spring J, and lever F, as shown and described, so that the slice of bread shall be supported by the gauge until the stroke of the knife is almost finished, and so that the gauge I shall fall outwardly on the depression of spring J, all as set forth.

No. 25,634.—WILLIAM H. DAVIS, of Taunton, Mass.—*Improved Blind Fastener.*—Patent dated October 4, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The application to the catch of a box to secure it from getting out of place, and of the hook on a blind a rest to prevent the blind from sagging, as described.

No. 25,635.—ROBERT DICK, of Toronto, Canada.—*Improvement in Accountant Labels for*

*Periodicals, &c.*—Patent dated October 4, 1859; patented in Canada, July 26, 1858.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim* the contrivance of keeping accounts in printed form by the use of printer's type or their equivalents, kept so arranged as to admit readily of all the readjustments which the currents of business may require, in the manner substantially as set forth.

Based on this primary invention, I also claim the device of rendering or transmitting accounts thus, or substantially thus kept in type, by sending printed impressions taken therefrom, though the particular form of sending may not be mine. While at the same time I claim, in the broadest and fullest terms, the special mode and form set forth by use of the machine described, as constituted by the combination of fluid vessel, reel, apron movement and cutter stamp, which machine I also claim, with all the modes indicated for operating the same, and in connection with the recited claims I thus formally make.

I also claim all other means and appliances substantially the same as those claimed or intended to be claimed.

No. 25,636.—MASON H. FORD, of New York, N. Y.—*Improvement in Borers for Excavating Mud, &c.*—Patent dated October 4, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the construction of revolving excavating scoops provided either with openings and wings or flanges on its sides, capable of opening and shutting or so constructed that part of the sides may be opened, and act in that position as wings or flanges, by which the dirt, mud, or sand is, during the revolving of the scoop, thrown into the inside of the scoop, as described.

Second. I claim the manner of attaching scoops to the shafts, so that the same will be made to turn with the shaft when the same is revolving, and at the same time capable of being raised above the surface of the water, when filled for the purpose of being emptied, without requiring to raise the shaft, substantially as described.

No. 25,637.—PETER GETZ, of Lancaster, Pa.—*Improvement in Cooking Stoves.*—Patent dated October 4, 1859.—By pouring water in the boiler tank O, it finds its way through the openings s and pipes K L into the steam generating box B, in immediate contact with the fire chamber M; thus steam is generated and imparted to the water in the tank and boilers, which is thereby brought into brisk ebullition.

*Claim.*—The specific arrangement of the boilers O H H, drumhead oven C, and their combination in manner as set forth, for the purpose specified.

No. 25,638.—WILLIAM D. GUSEMAN, of Morgantown, Va.—*Improvement in Weighing Scales.*—Patent dated October 4, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the triangular recess cut out on the under side of the journals of the pendulum drum or shaft, to enable said drum to swing or roll on its axis on the upward pointing knife edges g, substantially in the manner and for the purpose described.

I also claim, in combination with an upward pointing knife edge, a roller or pendulum drum, the journals of which are formed with triangular recesses and a counterpoise weight, or its equivalent, vibrating below the centre of the drum or roller, substantially in the manner and for the purpose described; and this I claim, whether the counterpoise be adjustable on its lever or not.

No. 25,639.—HENRY HAYS, of New York, N. Y.—*Improved Stave Machine.*—Patent dated October 4, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—Dressing staves by a continuous operation, regardless of length or thickness, by the combined action of the feed rollers c d and cutters u v, when said parts are arranged as set forth, to remove a shaving from the outer side of the stave, under all circumstances, and split out more or less from the inner side, to reduce the stave to a uniform thickness, as specified.

No. 25,640.—JOSEPH HARRISON, Jr., of Philadelphia, Pa.—*Improved Steam Boiler.*—Patent dated October 4, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the construction of a boiler of distinct globular or spherical parts, single or in groups, substantially as described, united in the manner specified, or any other analogous thereto, and wherein the strength of the globular form of such parts is common to the entire structure; this claim being intended to include not true spheres only, but elliptical, conical, polyhedral, or any other analogous forms also, where the results looking to strength and construction of the boiler are substantially the same as those enumerated.

I also claim the employment, as units of construction, as hereinbefore explained, of separate chambers of cast-iron or other metal, of uniform size and shape, substantially as

described, to be used as wanted, wherewith boilers of different forms and dimensions may be built up, being united together in the manner specified, or any other analogous thereto.

Both of the above claims involve an outside casing for the particular construction, with furnaces, substantially as described. It is not, however, my intention to confine myself to any special form of boiler, or mode of casing the same.

No. 25,641.—JOEL HAINES, of West Middleborough, Ohio.—*Improved Device for Connecting the Panels of Portable Field Fences.*—Patent dated October 4, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The jointed link J, for connecting the ends of the panels, so arranged that by using a tapering key in the link, the angle of a zigzag fence may be made more or less obtuse, as required, to make the fence stand firm in the position in which it is placed.

No. 25,642.—WILLIAM M. HENDERSON, of Baltimore, Md.—*Improvement in Pumps.*—Patent dated October 4, 1859.—The object of this invention is to simplify the construction and operation of pumps, by a certain combination of valves, pistons, and water ways, causing a continuous flow of water in the same direction.

*Claim.*—The two ball valve cages, with the suction valves in their interior, attached to the extremity of a central perforated tube, or its equivalent, in combination with the water ways and discharge valve, when constructed and operated substantially in the manner and for the purposes set forth.

No. 25,643.—THOMPSON HERSEE and PIERRE JOS. BOURGNON, of Buffalo, N. Y.—*Improvement in Faucets.*—Patent dated October 4, 1859.—When it is proposed not to draw from the cask for a given time, the keg or plug B may be turned so as to shut off the issue of the chamber C, the same as in a common faucet.

The inventors say: We *claim*, first, the relative arrangement of the valve H, chamber F, and spherical part D, in combination with the plug B, said valve having a lifter K, and stem L, the whole operating substantially as described.

Second. The combination and arrangement of the lifting rod N, valve o, tube P, and pipe 4, with the cross piece L, for the purpose of ventilating the barrel at each draft, substantially as described.

No. 25,644.—JOHN B. HOLMES, JR., of New York, N. Y.—*Improved Curtain Fixture.*—Patent dated October 4, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the spring *d*, in combination with the roughened V shaped, grooved pulley *b*, an endless cord or band *b*<sup>1</sup>, said parts being arranged to operate in relation to each other, as specified.

I also claim the brackets *c c*<sup>1</sup>, provided with the centre pins 1, entering the roller ends *b b*<sup>2</sup>, in the manner and for the purpose specified.

I also claim forming the bracket *c*, with the slot and open ring 3, and the bracket *c*<sup>1</sup>, with a hook shaped slot 2, to afford opportunity of removing the whole of the parts without having to draw the screws or nails passing through said brackets, as specified.

No. 25,645.—LEWIS HOVER, of Flushing, N. Y.—*Improvement in Signal Lanterns.*—Patent dated October 4, 1859.—This invention consists in the arrangement and combination within the lantern case and above the lamp, of a metallic cylinder and a colored glass cylinder, the metallic cylinder serving to protect the glass from the heat and smoke of the lamp, and also serving as a guide and support, or fastening for the rise and descent of the glass.

*Claim.*—The arrangement and combination with the case A, and lamp C, of the metallic cylinder D, and glass cylinder E, substantially as and for the purpose shown and described.

No. 25,646.—JOB F. HOWLAND, of New York, N. Y.—*Improved Tool for Cutting Gas Pipes.*—Patent dated October 4, 1859.—This invention consists in the arrangement of a stationary iron frame with a slot in it which terminates in a conical form at one end, in combination with a sliding jaw having a V shaped tongue with an adjustable sliding cutter, whereby the tool is made to answer for cutting gas pipes of various diameters, and the necessity of using a plate with a series of holes of different sizes avoided.

*Claim.*—The arrangement of a stationary iron frame with a slot in it, which terminates in a conical form at one end, in combination with a sliding jaw having a V shaped tongue, and with an adjustable sliding cutter, substantially as and for the purposes set forth.

No. 25,647.—J. W. HOWLETT, of Greensboro', N. C.—*Improved Mode of Disinfecting Feathers.*—Patent dated October 4, 1859.—This invention consists in disinfecting feathers by placing the same in a suitable retort into which a combination of steam and chlorine gas is injected, the steam and chlorine gas being generated in a suitable boiler containing water and chloride of lime, or other substance, which would generate chlorine gas, and the whole arranged, whereby the desired work is accomplished.

*Claim.*—The injection of combined steam and chlorine gas among the feathers, substantially as shown and described.

No. 25,648.—B. C. HOYT, of Port Washington, Wis.—*Improved Vegetable Cutter.*—Patent dated October 4, 1859.—This invention consists in pivoting a lever or frame, to a standard fixed to a bench or any suitable stand, upon the top of which lever is fixed an angular box provided with longitudinal slots extending from end to end, under which the articles to be cut are placed, and in operating a slide which is immediately under this box, armed with vertical knives passing through the slots in said box, by means of a jointed arm spring and the lever upon which the box itself is fixed, so as to give the knives a reciprocating motion and a draw cut upon the inclined edges of the box.

The inventor says: I *claim* the arrangement of the cutting box upon a vibrating lever C, when the lever is supported by a spring E, actuating arm D, for keeping the whole in an elevated position, as set forth.

I also claim the combination of slide H, angular slotted box K, and vertical cutters J, arranged and operating substantially in the manner and for the purpose set forth.

No. 25,649.—RAMETH HUSSEY and URIAH THORNBURGH, Sr., of Walnut Run, Ohio.—*Improvement in Mole Ploughs.*—Patent dated October 4, 1859.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim* suspending the plough beam that carries the mole to the plough frame by means of ropes or chains, connecting its ends to one capstan, in combination with suitable catches for holding it at any adjusted height thereon, the whole being arranged in the manner and for the purpose set forth and explained.

We also claim, in combination with the rotary mole, suspending the plough beam by both its ends to ropes or chains which connect with a common capstan on the plough frame, in combination with racks and pawls for holding said beam when adjusted, the whole being arranged for the purpose and substantially in the manner stated.

No. 25,650.—ISAAC E. JONES, of Cincinnati, Ohio.—*Improvement in Spark Arresters.* Patent dated October 4, 1859.—This invention relates to the employment of a water tank, so constructed and arranged upon the top of a cab or housing of locomotives, that all the smoke, sparks, and cinders coming from the smoke stacks of said locomotives be received within said tank, the sparks and cinders being arrested and extinguished and the smoke discharged, in combination with a wind wheel and an agitator, by means of which the upper part of the tank may be filled with fine spray for the purpose of extinguishing sparks, &c.

*Claim.*—The arrangement of the tank A A<sup>1</sup>, wind wheel g, and agitator k, with reference to the receiving trunk F and valve l, all being constructed and arranged to operate conjointly as described, and for the purposes set forth.

No. 25,651.—MARTIN C. KILGORE, of Washington, Iowa.—*Improvement in Rotary Harrows.*—Patent dated October 4, 1859.—The object of this invention is to raise the harrow from the ground, for the purpose of transportation, &c., at the same time arranging the parts in such a manner that one side of the harrow can be slightly raised from the ground, in order that the other may preponderate, and thus effect a rotary motion without weights.

*Claim.*—The arrangement and combination of the windlass E, arms I, socket N, collar J, harrow P, and spindle K, as and for the purpose shown and described.

No. 25,652.—H. B. KNOWLES, of Providence, R. I.—*Improved Attachment to Treadles of Sewing Machines.*—Patent dated October 4, 1859.—This invention consists in the employment of a yielding, adjustable rod, having a cross head with hooks at its upper end, in combination with a shackle bar, crank shaft, and treadle.

*Claim.*—The employment of a yielding adjustable rod, having a crosshead with hooks at its upper end, in combination with a shackle bar, crank shaft, and treadle, substantially as and for the purposes set forth.

No. 25,653.—PHILIPP KOCH, of New Haven, Conn.—*Improvement in Punching Metals.*—Patent dated October 4, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the employment or use of a series of arbors, to which punches or shear blades are attached, fitted in a rotating or adjustable head d, when said head is connected with an arbor B, having a plate c attached, provided with bolsters e<sup>1</sup> and shear blades f, corresponding with the punches and shear blades of the head, substantially as and for the purpose set forth.

Second. The means employed for actuating the yoke H, and consequently the arbors e, to wit: the adjustable shaft K, provided with the eccentric J, pin w, fitted within the block L of yoke H, the adjustable shaft P, provided with the lower crank r, and the recess v in the back part of plate o to receive pin w, substantially as and for the purpose set forth.

No. 25,654.—E. D. LEE and Z. W. LEE, of Blakely, Ga.—*Improvement in Ploughs.*—

Patent dated October 4, 1859.—To the lower end of the bar D the share F is attached. This share is of shovel form, and its upper end has a shank *f* formed on it, leaving a shoulder *g* at each side. On the foot D and around the shank *f* of the share, a metal band G is placed, and a metal wedge or key H is driven through the band G at the back side of the foot. Near the lower end of the foot D there is a pin or projection *h*, which fits in a hole or recess in the back side of the share.

*Claim.*—The arrangement of the peculiar curved clevis I, beam A, curved rod E, bar D, band G, wedge H, shank *f*, projection *h*, and share F, as specified, for the purpose set forth.

No. 25,655.—LEVI E. LINCOLN, of Lowell, Mass.—*Improvement in Safety Apparatus for Steam Boilers.*—Patent dated October 4, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The application of a low water alarm to more than one boiler (or to one) by means of a two or more legged tube, a simple or a compound siphon, in such manner that said tube shall keep said alarm charged with water, when all its pendant ends are covered by water, and shall cause said alarm to be supplied with steam, when any one of its pendant ends is exposed to steam, substantially as set forth and described.

No. 25,656.—W. T. LITTLEJOHN, of Kalamazoo, Mich.—*Improved Mangle.*—Patent dated October 4, 1859.—This invention consists in an improved mode of graduating the pressure of the rollers on the clothes, whereby the mechanism is placed under the complete control of the operator.

*Claim.*—The arrangement of the levers D D, with roller C at their upper end, the spring F, bar G, connected to the treadle I by the rope H, in combination with stationary roller B, substantially as and for the purpose set forth.

No. 25,657.—CORNELIUS MAHONY, of New York, N. Y.—*Improvement in Musical Notation for the Blind.*—Patent dated October 4, 1859.—This improvement consists in the combination of raised or embossed letters and notes, so as to represent music for the blind.

*Claim.*—The combination of letters and characters or notes, in embossed print, so as to represent music for the blind, substantially as set forth.

No. 25,658.—NEWTON S. MANROSS, of Bristol, Conn.—*Improvement in Valves for Retarding and Arresting the Flow of Gases, &c.*—Patent dated October 4, 1859.—The nature of this invention is explained by the claim and engravings.

The inventor says: I *claim* the use of a recurved or V shaped tube, or passage, having its lower part connected with a well or reservoir, containing quicksilver, which is made to rise within the tube, by means of a plug or other equivalent pressure, substantially in the manner and for the purpose specified.

I also claim the combination of such recurved tube, closed by quicksilver, with the regulating apparatus, consisting of a tapering shoulder and movable rod, secured from leakage, by passing through the quicksilver.

No. 25,659.—H. MARSHALL, of Cincinnati, Ohio.—*Improvement in Coffins.*—Patent dated October 4, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The new article of manufacture named, to wit: a coffin having its bottom, ends, and sides wholly constructed of corrugated sheet metal, which is rolled or stamped into proper form, and surrounded at the upper edge of its body with a wrought or cast-iron frame, which serves as a brace to the body and a hold fast for screws, substantially in the manner and for the purpose described.

No. 25,660.—NATHAN B. MARSH, of Cincinnati, Ohio.—*Improvement in Hydrants.*—Patent dated October 4, 1859.—The hydrant represented in the engravings is of that class in which an upper large and lower small packed piston or plunger are used to work together in cylinders or valve chambers, into which the water is made to enter by holes in the sides of the smaller cylinder, above and below which holes the small piston is made to play, while the large piston has its action restricted to play on one side only or above the discharge outlet which may be in the bottom of the large cylinder that is in open connection or constant water communication with the small cylinder.

*Claim.*—The arrangement, in connection with the main casing G, discharge pipe S, and air chamber E of a hydrant, of the upper and lower plunger or valve chamber A C, made in one piece F, upper plunger or valve D, when composed of parts *k l m n r*, and lower conical guide and stop plunger, composed of parts *B h i*, the whole being constructed, arranged, and used together, in the manner and for the purpose described.

No. 25,661.—J. PLYMPTON MARSHALL, of Millbury, Mass.—*Improvement in Breech Loading Fire-Arms.*—Patent dated October 4, 1859.—These improvements consist in combining the catch or lock bolt of the movable breech with the discharging lock of the arm, in such a manner that removing the catch so as to raise the movable breech, will put a stop catch on

the lock so as to prevent its discharge; also, in arranging the lock for the tape primers in such a manner that the coil of caps may be put in edgewise, and the end of the coil laid upon the mechanical device for carrying them out, instead of crowding them in sidewise.

The inventor says: I *claim*, first, the combination of the lock bolt (of the movable breech) or its equivalent, and the discharging lock of the arm, with intermediate parts, for the purpose above set forth.

Second. Arranging the lock for the tape primers, in the manner above described, and for the purpose specified.

No. 25,662.—EDWIN MAY, of Indianapolis, Ind.—*Improvement in the Construction of Prisons*.—Patent dated October 4, 1859.—The object sought by this invention is avoiding the necessity of actual contact with the prisoners, while the keeper has perfect knowledge and control of their actions, and preventing the escape of prisoners, which has often been done by knocking the keeper down.

The inventor says: I *claim*, first, the angle door D, in combination with the safe lock or bolt I, when constructed and operated substantially as set forth.

Second. The safe J, containing the drum *p*, and bolt I, and being held by the outer door C, when constructed and operated substantially as and for the purpose set forth.

Third. The endless chain or rope *e*, in combination with the levers *d*, when constructed and operated substantially as and for the purpose set forth.

Fourth. The combination and arrangement of the levers *b*, bar *a*, and bolts or lugs *s*, when operated from without the grating *i*, substantially as and for the purposes set forth.

No. 25,663.—EDWARD MAYNARD, of Washington, D. C.—*Improvement in the Back Sights of Fire-Arms*.—Patent dated October 4, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the device as set forth, viz: the grooved cylindrical end of the sight carriage in combination with a spring bolt or pin of such form that it shall fall into the grooves and bear against their two sides, and yet not touch the bottoms of the grooves, so that as it wears it will still press on the sides of the grooves, and hold the carriage firm in either of its positions.

Second. I claim the device as set forth of placing the spring and its bolt or pin within the stock or breech of the gun for its more perfect protection from wet and damage by accident, the opening through which the pin acts being susceptible of being closed without oil or packing.

No. 25,664.—EDWARD MAYNARD, of Washington, D. C.—*Improvement in Fire-Arms*.—Patent dated October 4, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—The permanent union of a cap or nipple *a*, with the closed end of the tube *b*, whose open ends has screw threads formed within it, by which I am enabled to combine the said nipple and its tubular seat with the abutment *d* of the breech piece of a fire-arm, by means of a transverse perforation in said abutment, for the reception of the tubular nipple-seat, and a nick headed screw *c* inserted into the left hand end of said perforation, and working into the screw threads in the open end of said tubular nipple-seat, substantially as herein set forth.

No. 25,665.—JOHN McCLUSKEY, Jr., of South Boston, Mass.—*Improvement in Skates*.—Patent dated October 4, 1859.—This invention consists in making the skate so that the toe strap may have a longitudinal adjustment upon the runner, and provided with an adjusting screw for fixing it at any desired point adapted to the size of the foot. It also consists, in conjunction with the toe strap, in hinging the heel strap and plate to the rear end of the runner, and fixing it rigidly to the runner when the skate is on the foot, by a spring catch or thumb screw.

*Claim*.—The jointed heel strap C, as set forth, in combination with the toe strap B, when the latter is made longitudinally adjustable upon the runner A, substantially as specified.

No. 25,666.—WILLIAM HOWARD MITCHELL, of San Francisco, Cal.—*Improvement in Window Sash Supporters*.—Patent dated October 4, 1859.—This invention consists in the combination roller, double jointed arm, self adjusting spiral spring, and stationary stop; also, in the combination of the above named parts with a semi-circular recess in the window frame.

The inventor says: I *claim*, first, the roller A arranged on an angular double jointed arm B B C C, so as to have slight play up or down between two stops E G, accordingly as it is operated upon by a spring F, or the weight of the sash N, substantially as and for the purposes set forth.

Second. The combination of the angular double jointed arm B B C C, spring F, thumb piece H, friction roller A, and semi-circular recess *m* in the window frame, substantially as and for the purposes set forth.

No. 25,667.—MORTIMER NELSON, of New York, N. Y.—*Improved Gold Washer*.—Patent dated October 4, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of a series of concave plain pans with a series of convex rifled pans, said pans all being arranged on the same vertical shaft, substantially as and for the purposes set forth.

Second. The arrangement of a horizontal cam wheel, ball, horizontal friction roller, two bevel wheels, a rising and falling driving shaft, and a collar on the vertical shaft, for operation together, substantially in the manner and for the purposes set forth.

Third. The combination of a revolving perforated platform or grating, with a non-revolving, but yielding raking device, substantially as and for the purpose set forth.

Fourth. The combination of the stationary case with the revolving perforated platform, raking device, and the horizontally revolving pans, substantially as and for the purpose set forth.

No. 25,668.—NELSON ORCUTT, of Binghamton, N. Y.—*Improvement in Composition for Soap*.—Patent dated October 4, 1859.—The inventor says: In carrying out my invention I use the following named articles in the quantity and proportion stated: 100 pounds of sal-soda, or  $33\frac{1}{3}$  pounds of soda ash put into 23 gallons of boiling water, for forming the lye; 20 pounds of limestone put into 20 gallons of water; 100 pounds of untried or unrendered tallow or crude grease; 50 pounds of rosin; and 1 pound of alum.

*Claim*.—Making soap from untried or unrendered tallow or grease, and the other ingredients named, the ingredients being in the proportions as stated.

No. 25,669.—LEWIS PAGIN, of Elmore, Ohio.—*Improved Combined Table and Clothes Dryer*.—Patent dated October 4, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—A combined table or stand and a clothes dryer, composed substantially of a table or stand with a reversible top, and a box, drawer or recess, and two or more jointed arms that will fold up and lie within said box, drawer or recess, the whole being combined and arranged for the purposes set forth.

No. 25,670.—BENJAMIN S. PARDEE, of Mount Carmel, and THOMAS RAWLING, of New Haven, Conn.—*Improved Upholstery Nail*.—Patent dated October 4, 1859.—This invention consists of a paper headed nail or tack, and constitutes a new article of manufacture.

*Claim*.—As a new article of manufacture, the paper headed nail or tack, substantially as described.

No. 25,671.—SENECA PIERCE and FREDERICK F. BEARDSLEY, of Castle Grove, Iowa.—*Improvement in Composition for Tanning*.—Patent dated October 4, 1859.—This invention consists in the employment of terra japonica, alum (sulphate of alumini), Glauber salts (sulphate of soda), and saltpetre (nitrate of potassa), dissolved in water, in certain proportions, for the purpose of tanning skins and hides, and converting them into leather by a short and cheap process.

*Claim*.—A composition for tanning, made of terra japonica, alum, Glauber salts, and saltpetre, in the proportions and manner herein set forth.

No. 25,672.—JOSIAH W. PRENTISS, of Pultney, N. Y.—*Improved Mode of Restoring Rancid Butter*.—Patent dated October 4, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The mode described of restoring rancid butter in the firkin, by removing the hoops so as to open the joints, inclosing it in a bag, or other textile fabric, and then surrounding the whole with charcoal, substantially as described, and for the purpose set forth.

No. 25,673.—J. PURINTON, Jr., of Lynn, Mass.—*Improved Machine for Lasting Boots and Shoes*.—Patent dated October 4, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the clamps A A A A, in combination with the slides B B B and C, for the purposes described, said clamps and slides being carried to their place by their levers I I I I and J J J J, or their equivalents.

I also claim the opening and closing slide C, and Fig. 2; also, the roughing or cutting slide D, Fig. 3, for the purposes described.

No. 25,674.—EDWARD A. L. ROBERTS, of New York, N. Y.—*Improved Lathe Chuck*.—Patent dated October 4, 1859.—This invention consists in so constructing the chuck and mandrel that the parts shall have free motion upon each other in every direction, so that any tool can be quickly, easily, and perfectly centred, and can also, when desired, be set at any angle.

*Claim*.—The application and use of the ball and socket joint, in combination with the mandrel or chuck of lathes, substantially as and for the purposes set forth.

No. 25,675.—CHRISTIAN ROPP, of McLean County, Ill.—*Improvement in Corn Planters*.—Patent dated October 4, 1859.—The inventor says: My invention relates to certain improvements in corn planters, by means of which I am enabled to plant two rows of corn at a time, and to adjust and regulate the distance between said rows, and also the distance between the hills of corn.

*Claim*.—The arrangement of the dog wheel P, levers  $u^2$  and  $u^3$ , stops  $u$  and  $u^1$ , with stops  $f$ , springs  $s$ , bent rods  $g$ , and feed wheels F F<sup>1</sup>, the whole being constructed substantially as and for the purpose set forth.

No. 25,676.—O. SAGE, of Wellington, Ohio.—*Improvement in Cheese Vats*.—Patent dated October 4, 1859.—B is the frame of the milk box  $c$ , which is placed in the water box  $b$ , and to the bottom of which is attached an equalizer or fender plate G. The milk box has a curd strainer  $c^1$ . The furnace D is provided with a door  $f$ , for the insertion of fuel, &c., while the smoke pipe  $e$  has an extension  $e^1$ , for the purpose of affording a ready means of cleaning it out.

*Claim*.—The combination of the furnace D and smoke pipe  $e$  with the open and curved bottom  $b^1$  of the water box  $b$ , pipe E, equalizer G, and milk box  $c$ , said parts being constructed, arranged, and combined and operating substantially as and for the purposes set forth.

No. 25,677.—JACOB SEEBOLD, of New Berlin, Pa.—*Improvement in Grain Separators*.—Patent dated October 4, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—Attaching the separator to the thresher by rocking frames  $c$  and  $f$ , in combination with wheel W, rod  $d$ , slotted arm  $b$ , and spring  $s$ , for producing its reciprocating movement, substantially as described.

No. 25,678.—SAMUEL R. SEIBERT, of Munising, Mich.—*Improved Surveying Instrument*.—Patent dated October 4, 1859.—This invention consists in constructing the supports of the telescope in such a manner as to allow it to be revolved upon its axis and be brought to bear upon any object appearing between the zenith and horizon; the construction also admits of a magnetic needle and an improved sextant in principle the same as that invented by William Burt.

*Claim*.—Constructing the "Ys" or supports of the telescope in a surveying instrument, as set forth; also constructing a clamping pinion in the manner and for the purposes described.

No. 25,679.—J. H. SHIREMAN, of East Berlin, Pa.—*Improvement in Dividers for Harvesters*.—Patent dated October 4, 1859.—This invention consists in providing certain means for the convenient adjustment of its width, whereby it may be adapted to use in harvesting various kinds of grass.

*Claim*.—The combination of the adjustable case B, with the stationary horizontal dividing point A, the parts being constructed and arranged in the manner and for the purpose set forth.

No. 25,680.—THOMAS P. SINK, of Fairton, N. J.—*Improvement in Oyster Dredges*.—Patent dated October 4, 1859.—In the use of this device the rope to which the dredge is attached is placed over the pulley, and the block or chuck, by its capacity to rotate, readily adapts itself to any change in the direction the rope may take, in consequence of a change in the course of the boat as the dredge is dragged along after it.

*Claim*.—The arrangement and combination of the chuck or block A, and its pulley B, with the roller E, the respective parts being formed and operating substantially in the manner and for the purpose set forth.

No. 25,681.—SEYMOUR SMITH, of Sharon, Conn.—*Improved Saw Set*.—Patent dated October 4, 1859.—This invention consists in the arrangement of an angular, or V shaped stock or body, an adjustable slide carrying a face parallel to the angular portion thereof with suitable means for gauging the angularity of the teeth, and an adjustable gauge extending across to the gauge the depth of the nip or set, the whole mounted so as to be operated.

*Claim*.—The mill saw set described, as a new article of manufacture; the several parts A, B, and F, being constructed and arranged substantially in the manner and for the purposes set forth.

No. 25,682.—LEONARD SNIDER, of Indianapolis, Ind.—*Improvement in Covering Coffins*.—Patent dated October 4, 1859.—The claim explains the nature of this invention.

*Claim*.—Using and applying flock as a covering for coffins, whether the same is prepared or secured in the manner set forth, or in any other manner substantially the same.

No. 25,683.—CHARLES L. STACY, of Cincinnati, Ohio.—*Improvement in Hydrants*.—Patent dated October 4, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The relative arrangement of the cup formed disks F, G, and G<sup>3</sup>, and the apertures K and L, adapted in the manner set forth, to form a chamber I, closed on all sides (with the exception of the ingress aperture K,) while the hydrant is open, for the purpose of expanding the flanges *f* and *g*, and upon the closing of the hydrant to uncover the aperture I, and thereby empty the discharge pipe C.

No. 25,684.—JAMES E. B. STUART, of Wytheville, Va.—*Improved Method of Attaching Sabres to Belts*.—Patent dated October 4, 1859.—This invention consists in having the sabre attached to the belt so as to enable the wearer to detach it at pleasure in an instant, so that when mounted troops are called upon to dismount and fight, they can by this method leave the sabre hanging to the pommel of the saddle, and when they remount by the same method they can attach the sabre to the belt.

*Claim*.—The attachment hook H, in combination with the ring O, P, or its equivalent, attached to the waist belt, as indicated in the drawing M, the whole being constructed and operated substantially as and for the purpose set forth.

No. 25,685.—W. H. STUART, of Millington, Md.—*Improvement in Seed Planters*.—Patent dated October 4, 1859.—The slides *e e*<sup>1</sup>, on one side, are connected to the corresponding slides on the other side by means of pins or hooks *g g*<sup>1</sup>, taking into holes in the plates G G<sup>1</sup>. The slides *e e*<sup>1</sup> are connected at one side of the frame by means of the springs *h h*<sup>1</sup>, and at the other end by a rope H or its equivalent, while a second rope H<sup>1</sup> is attached to the rope H.

The inventor says: I *claim*, first, a double corn planter, the parts of which are constructed, combined, and arranged to operate in relation to each other, as described.

Second. Connecting the two independent sets of valves by means of the flexible connection H, in combination with single operating chain or cord H<sup>1</sup>, as and for the purposes set forth.

No. 25,686.—H. K. SYMMES, of Newton, Mass.—*Improvement in the Construction of Gas Burners*.—Patent dated October 4, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The combination with the inverted cup D, and tube C, and the quicksilver basin or basins or their equivalents, forming a movable connection between the base and tip of the burner, operating as described, of the pawl like rod or its equivalent, attached to the cup, and a rest for said rod attached to the base of the burner, the whole operating as described, to shut off the gas from the tip by the temporary increase and subsequent reduction of the pressure in the pipes.

No. 25,687.—GEORGE S. TIFFANY, of Palmyra, Mich.—*Improvement in Tile Machines*.—Patent dated October 4, 1859.—Within the hopper A a shaft C is placed longitudinally, one end of this shaft extends through the end of the box or hopper, and has either a driving pulley or a crank *a* attached to it. The opposite end of the shaft C is fitted in the tube B, and it has a spiral flanch D on it, which flanch fits in the tube B.

*Claim*.—The extension of the flanged feeding shaft C, as to form a revolving core C<sup>1</sup>, operating substantially as shown and described.

No. 25,688.—GEORGE W. TOLHURST, of Liverpool, Ohio.—*Improvement in Corn Shellers*.—Patent dated October 4, 1859.—The inventor says: To the toothed side of the disk, I apply a flexible apron which extends about one third of the surface of the disk, and is placed in a manner so as to cause the cob to be separated from the corn as soon as it is shelled and carried off in one direction, while the corn is thrown into another.

*Claim*.—The flexible hinged apron in combination with the disk B, and flange wheel D, when the several parts are constructed and arranged for operation, in the manner described and for the purposes specified.

No. 25,689.—PHILIP ULMER, of New York, N. Y.—*Improved Spring Bed Bottom*.—Patent dated October 4, 1859.—This invention consists in an improved application or manner of attaching elastic webbing or other similar materials, (used as a spring,) to the rails and slats of a bedstead, forming a spring bottom to the same.

*Claim*.—The method described of connecting the spring *b*, or its equivalent means, by which the same is secured in place by contact between compressing surfaces, substantially as and for the purposes set forth.

No. 25,690.—RUFUS M. VARNER, of Oxford, Miss.—*Improvement in Corn Planters*.—Patent dated October 4, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the arrangement of the table *r*, delivering tube *h*, furrow plough *j*, feeding disk *g*, hopper *f*, all attached to the rear end of the tongue, and placed between and

subject to the action of the straps and the springs, as herein described and in connection therewith.

I claim the combination of the spaces  $p$  of the hopper's side, with the India rubber strip, the beveled edge of the hopper's bottom, and the gouged holes of the feeding disk, as and for the purposes set forth.

No. 25,691.—JOHN WAGNER, of Philadelphia, Pa.—*Improvement in Machines for Hoisting Ice.*—Patent dated October 4, 1859.—This invention consists in attaching anti-friction rollers to the slides on which the carriages are hung, and the peculiar manner of hanging, supporting, and tilting the carriages.

The inventor says: I *claim*, first, the combination of the slides, carriages, supporters, and projections on the chutes, arranged and operating in the manner and for the purpose specified.

Second. The anti-friction rollers  $y y y^1$ , &c., in connection with the slides, arranged and operating as specified.

Third. The counterbalancing rope or chain and rollers  $K$  and  $K^1$ , in combination with the pulley  $B$  and the slides  $S$  and  $S^1$ , operating in the manner and for the purpose specified.

No. 25,692.—KASIMIR VOGEL, of Chelsea, Mass.—*Improvement in Sewing Machines.*—Patent dated October 4, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the employment, in combination with two or more needles  $a b$  or their equivalents, which work together to perforate or pass from one side to the other of the cloth or other material to be operated upon, and with suitable means of carrying a locking thread through the loops of the threads of these needles, of a thread conductor  $Y$ , so applied and operated as to effect the interlacing of the threads of said needles on the opposite side of the material to that on which they are interlaced with the locking thread, substantially as described, whereby they are made to produce the different kinds of stitching represented.

Second. The employment of a movable needle plate  $K$ , containing two or more needle holes, of a different size, form, or arrangement, applied to the bed plate or work plate of a sewing machine, in such a manner as to be capable of adjustment to bring either of its holes into position for the proper needles to work in it, substantially as described.

No. 25,693.—HENRY PRITCHARD, of Brooklyn, N. Y.—*Improvement in Guide Rings for Fishing Rods.*—Patent dated October 4, 1859.—This invention consists in combining a movable thimble, (having the eye permanently attached thereto,) with a ferrule securely fastened to the fish pole, in such a manner as to allow the thimble to turn freely on the ferrule, thereby adjusting the eyes on the thimbles to one and the same line, in case the pole should get warped or twisted.

*Claim.*—The combination of the fixed ferrule  $f$  and the movable thimble  $c$  with its eye  $d$ , constructed substantially as described, for the purpose set forth.

No. 25,694.—JOHN I. VINTON and EDWARD JOHN, of Ironton, Ohio.—*Improvement in Furnaces.*—Patent dated October 4, 1859.—This invention consists in make the liner of malleable iron.

*Claim.*—The employment in reverberatory furnaces of the water-space, as described, when constructed and fitted in place in the manner set forth.

No. 25,695.—CHAPMAN WARNER, of New York, N. Y.—*Improved Clothes Clamp.*—Patent dated October 4, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The mode of securing, between the buttons  $A$  and  $C$ , the garment, or whatever else may be placed between them, by means of binding or wedging effect of the pin  $B$  in the hole of button  $C$  with the spiral spring  $D$ , as and for the purpose specified.

No. 25,696.—A. L. WHIPPLE, of Elmira, N. Y.—*Improvement in Machines for Trimming Wall Paper.*—Patent dated October 4, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The manner of constructing the spool, with fixed rotating head  $D$ , and yielding head  $C$ , in combination with the movable bed  $B$ , for holding the roll firmly in the proper relative position to the knives, substantially as described.

No. 25,697.—DAVID ZUG, of Shaefferstown, Pa.—*Improvement in Harvesters.*—Patent dated October 4, 1859.—The elastic spring brace  $V$  embraces the supporting bar  $Y$  at  $v$ , in which the bar can vibrate to adapt it to the folding over of the sickle bar  $2$  and finger supports  $1$  on the truck when desired; the other end of the spring brace  $V$  is hinged to a bolt passing through a box  $P$  with a nut and screw.

*Claim.*—The combination of the brace  $V$  with the gum elastic stuffing box  $P$  and the sup-

porting bar Y, when the several parts are constructed and arranged in the manner described, for the purpose specified.

No. 25,698.—WILLIAM BINKLEY, of Manchester, N. H., assignor to SAMUEL N. BELL, of said Manchester.—*Improvement in Knitting Machines*.—Patent dated October 4, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The hollow cone 2, cut off elliptically, and with the parallel elliptical cam R on its inner surface, together with the projection P on the lower side, supported by the shaft O passing through the hollow shaft S, and attached to the arm Q of the standard No. 3, or other equivalents, substantially as described for the purposes set forth.

No. 25,699.—WALDREN BEACH, of Baltimore, Md., assignor to Himself and JOHN L. REESE, Jr., of said Baltimore.—*Improvement in Corn Harvesters*.—Patent dated October 4, 1859.—This invention consists of oblique cutters on each side for cutting off the corn, which are vertically adjustable, by means of the axle of the wheels fitting into boxes having screws on the top, by which the wheels are moved up or down, thus regulating the distance from the ground at which the corn is cut.

*Claim*.—The vertically adjustable cutting apparatus C in combination with rests R R<sup>1</sup>, lever L, jointed arms A, and spring f, operating substantially as and for the purposes set forth.

No. 25,700.—A. D. BROWN, of Columbus, Ga., assignor to SALLIE C. BROWN, of said Columbus.—*Improvement in Straw Cutters*.—Patent dated October 4, 1859.—A represents the frame of the machine supporting the straw box B; C is a shaft or drum provided with a suitable number of feed wheels D which are similar to circular saws, and acting to feed the straw to the knife like those in common use. These feed wheels are rotated by a ratchet wheel E and pawl F, so as to impel the straw forward at each revolution of the fly wheel G, to which the pawl is attached by a connecting rod H.

*Claim*.—The arrangement and combination of the yielding strips a, constituting guard R, with the wheels D, sash L, and trough B, as and for the purpose shown and described.

No. 25,701.—JAMES DRAPER, of New York, N. Y., assignor to Himself and SAMUEL H. DOUGHERTY, of said New York.—*Improvement in Skeleton Skirts*.—Patent dated October 4, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The new manufacture of skeleton skirts described, in which the hoops B are secured by glue or equivalent cement, between separately woven parts of the tapes, in contradistinction to the stitched or clasped skirt when the parts are woven together as single tapes between the hoops, and separately as distinct tapes, at the points where the hoops are received.

No. 25,702.—NATHAN C. LEWIS, Jr., of Boston, Mass., assignor to Himself and EDWIN BRUCE, of said Boston.—*Improvement in the Construction of Dentists' Chairs*.—Patent dated October 4, 1859.—This invention is intended to provide, in connection with a chair for the reception of a patient, a means not only of sustaining the body but also the elbow of the operator.

The inventor says: I *claim* the combination of the adjustable body-rest with the chair.

I also claim the combination of the auxiliary or elbow-rest and the body-rest, applied to a chair.

I also claim the mode of applying the body-rest to the elbow-rest, that is, by means of an adjustable arm c applied and operating with respect to the elbow-rest as set forth.

No. 25,703.—JAMES C. MILLER, of Irwin, Ohio, STILLMAN A. CLEMENS, of Rockford, Ill., and GILBERT H. CLEMENS, of Urbana, Ohio.—*Improvement in Lining Underground Drains*.—Patent dated October 4, 1859.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, the method of making covered field drains by lining the inside with hydraulic lime, mortar, or other suitable material.

Second. A conducting tube connected with a couler.

Third. A forcing bar, with valve pistons attached, and working in a conducting tube.

Fourth. A follower of less transverse dimensions than the mole to which it is attached, all substantially as described and for the specified purposes.

No. 25,704.—JAMES MOLYNEUX, of Bordentown, N. J., assignor to the BORDENTOWN MACHINE COMPANY.—*Improvement in Rotary Dredging Machines*.—Patent dated October 4, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination and arrangement of devices, substantially as set forth and described, for raising, lowering, and holding the levers C C which support and carry the dredging wheel as required.

Second. I claim the rams on the dredging wheel, for the purposes set forth, substantially as described.

Third. I claim the chute, hinged substantially as described, so that it may be raised when

the socket passes under it, and lowered to receive the contents of the buckets, substantially as described.

Fourth. And, in combination with a hinged chute, I claim the arm *c* on the wheel B just before the bucket, for the purpose of raising the chute and allowing the bucket to pass under it.

Fifth. I claim a chute arranged to traverse on ways, so as that it may be adjusted to the dredging wheel.

Sixth. I claim the levers M and links M<sup>1</sup>, arranged to operate substantially as described, for the purpose of traversing the chute as described, for the purposes set forth.

Seventh. I claim the traversing bars P P armed with picks or chisels, and arranged to operate on the bottom of the river, in advance of the dredging wheel, substantially as described.

Eighth. I claim the shaft and wipers, in combination with the traversing bars, carrying picks, chisels, &c., for the purposes specified, substantially as described.

No. 25,705.—JOHN SLOAN, of Pittsburg, Pa., assignor to Himself and EBERHARD H. DIERKER, of said Pittsburg.—*Improvement in the Construction of Distilling Apparatus*.—Patent dated October 4, 1859.—This invention consists in furnishing the steam or heating pipes of stills with valves, for the purpose of regulating the admission of steam or heat into the pipes, the valves being operated by a governor, which is moved by an incased wheel and the flow of liquor from the condenser. It also consists in dividing the still into three or more compartments, which are furnished with conducting pipes, and with one or more steam heating pipes traversing the whole series of chambers or compartments.

The inventor says: I claim, first, the combination and arrangement of the condensing worm or pipe F, the wheels *h i* and *j*, the receiving chamber *x*, with the governor *g* and valve *o*, for the purpose of regulating the quantity of steam in the heating pipe *d*, as described, and for the purpose set forth.

Second. The combination and arrangement of the chambers A B C and D with the conducting pipes *e*, when used in connection with the condensing worm or pipe F, as described, and for the purpose set forth.

No. 25,706.—ADOLPH STEMPEL, of Newark, N. J., assignor to Himself and OWEN McFARLAND, of said Newark.—*Improved Trace Trimmer*.—Patent dated October 4, 1859.—This invention consists in arranging a vertically sliding spring bar in combination with laterally adjustable bed pieces and suspended curved cutters, in such a manner that leather belts and traces of all sizes, when drawn through between the cutters, are rounded on their edges. It also consists in combining with the cutters and bed pieces adjustable jaws, for the purpose of guiding the belts laterally and of regulating the depth of the cut.

The inventor says: I claim, first, the arrangement and combination of the vertically sliding spring bar C, laterally adjustable bed pieces D D<sup>1</sup>, and suspended curved cutters F, substantially as and for the purpose described.

Second. In combination with the bed pieces D D<sup>1</sup> and cutters F, I claim the adjustable jaws E or their equivalents, arranged substantially as and for the purpose specified.

No. 25,707.—DAVID L. STILES, of Rochester, N. Y., assignor to JOHN M. FRENCH & Co., of said Rochester.—*Improvement in Moulding Stove Covers*.—Patent dated October 4, 1859.—A is the plate which forms the cover, and B the portion which forms the recess C in the reverse side for the reception of the cover lifter. This invention is designed to obviate the difficulty of moulding the lips or projections *d d* for the handle and the necessity of setting wire in the mould for that purpose.

Claim.—The employment of the cone form plugs *d d* and pivoted thumb levers *ff* in combination with that portion of the pattern which forms the recess of the cover, substantially in the manner and for the purposes specified.

No. 25,708.—WILLIAM F. STEUART, of Patuxent Forge, Md.—*Improvement in Railroad Car Brakes*.—Patent dated October 4, 1859.—The claim and engravings explain the nature of this invention.

Claim.—The combination of the various parts of the apparatus described, when so constructed and arranged in relation to the means by which they are actuated as to apply and release the brakes upon the whole train, upon sections, or upon single cars, by the engineer, or by one or more of the brakemen, or by all or part of them, collectively or individually, the brake apparatus of each car or of each section being complete in itself when the cars are uncoupled or the train divided into sections.

No. 25,709.—W. H. ALLEN and A. J. BENTLEY, of New York, N. Y.—*Improved Rope Nipper*.—Patent dated October 11, 1859.—The object of this invention is to obtain an instrument which will gripe the rope to which a block and tackle are to be hooked, so securely that there will be no liability of its slipping, and which will be readily attached and detached from the rope, at the same time offering no injury to the surface or fibre of the rope.

*Claim.*—The rope pinchers, composed of the grooved pivoted jaws D and levers A, and otherwise constructed, as shown and described.

No. 25,710.—THOMAS C. AVERY, of New York, N. Y.—*Improved Galvanic Battery.*—Patent dated October 11, 1859.—This invention consists in amalgamating the outside of the zinc cups by an amalgam very little susceptible to any action from the sulphuric acid, and thus leaving the inner surface of the zinc to be acted upon by the nitro-sulphuric acid, directly opposite to the surfaces of the platinum, to prevent local action in consequence of the difference of degree of intensity of the exciting fluids on the external and internal surfaces of the zinc.

The inventor says: I *claim*, first, the use of the insulating amalgam, substantially as described, in combination with the surfaces of the zincs of galvanic batteries for telegraphic purposes, for obtaining the results before set forth.

Second. I also claim the use of two or more independent strips of platinum in the construction of galvanic batteries for telegraphic purposes, as an improvement on the Grove Battery, for the purpose of obtaining the results before set forth, but irrespective of their use in combination with the insulated amalgamated zincs before described.

No. 25,711.—AUGUSTUS BAILEY, of Gardiner, Me.—*Improved Machine for Bending Wood.*—Patent dated October 11, 1859.—This machine consists of a frame B, in which is hung the semi-cylinder A upon, and revolving with, the axis C, by means of the pinion D and the internal segment E. This frame is also provided with a horizontal roll G, connected with and attached to the sliding bar H by the bolts P P, the whole being operated and made to move freely back and forth through the slots K K by the two screws J J. There are also a stationary clamp M and a movable, graduated hook Q, attached to this machine.

*Claim.*—The combination of the aforesaid horizontal sliding roll G and graduated hook Q, with the semi-cylinder A, acting substantially in the manner and for the purpose set forth and described.

No. 25,712.—JAMES D. BALDWIN, of Columbus, Ga.—*Improvement in Composition for Paint Oil.*—Patent dated October 11, 1859.—In making this paint oil, the inventor says, I take one gallon and three pints of rain water, two ounces of saleratus, which is allowed to dissolve; then add half a pound of gum shellac, and boil all together in any suitable pot, without stirring, till all is dissolved and well mixed. I now add three quarts more of rain water, put the mixture in a tin vessel, and taking four ounces of ground flaxseed and two ounces of slippery elm bark in powder, tie these two ingredients together in a machine cloth and put them in the tin vessel and allow the whole to remain for twelve hours. I then draw from the vessel one gallon of the composition, put it into a pot, and as soon as it begins to boil add one quart of linseed oil, which will stop the boiling; then increase the fire and add one gallon more of linseed oil, and stir and boil the whole together five minutes longer.

*Claim.*—As a new or improved article of manufacture, the paint oil composed of the ingredients specified, essentially in the proportions named and prepared, substantially as described, for use as set forth.

No. 25,713.—W. D. BALLARD, of Kansas City, Mo.—*Improvement in Steam Boiler Furnaces.*—Patent dated October 11, 1859.—This invention consists in a novel arrangement of a fireplace, setting and external flues, in combination with what is known as a two flue boiler, whereby the several parts of the heating surface are exposed in an effective manner to the action of the fire.

*Claim.*—The arrangement of the fireplace B, the partitions *f f g h h* of the setting, and the chimney F, substantially as described, with the two flued boiler.

No. 25,714.—GEORGE F. BENCKERT and DAVID H. BENCKERT, of Philadelphia, Pa.—*Improved Signal Bell.*—Patent dated October 11, 1859.—This invention consists in the peculiar arrangement of the straight pull bar, latch, and spring, when used in combination with the hammer and bell.

The inventors say: We *claim*, first, the latch D, operating with the hammer and pull bar, with the one spring, as specified.

Second. Placing the working parts of a signal bell within the sounding box, substantially as and for the purpose specified.

No. 25,715.—SOLOMON E. BLAKE and THOMAS JOHNSTON, of Louisville, Ky.—*Improvement in Hemming Guides for Sewing Machines.*—Patent dated October 11, 1859.—This invention relates to provisions for turning and folding hems and tucks, and for folding them flat and at any uniform width.

The inventors say: We *claim*, first, the combination and arrangement of the spiral tongue G, flanged roller F *f*, and yielding plate B, for the purpose set forth.

Second. The spring plate B B<sup>1</sup>, constructed as described, with an oblique slot in the limb B, combined with the adjustable gauge C, in the manner and for the purpose set forth.

Third. The yielding pressure roller K, adapted and applied substantially as set forth, to smooth and flatten the hem previous to stitching.

No. 25,716.—REINHOLD BOEKLEN, of Jersey City, N. J.—*Improvement in Connecting Rods Applied to Cranks*.—Patent dated October 11, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—Giving the rod elasticity, both longitudinally and in a lateral direction, parallel with the plane of revolution of the crank, by extending it in the form of a bow or arc, beyond the crank pin or wrist, and making such bow elastic, substantially as and for the purpose specified.

No. 25,717.—JOHN K. BOOTON, of Luray, Va.—*Improvement in Machines for Breaking and Cleaning Hemp*.—Patent dated October 11, 1859.—The nature of these improvements is explained in the claim and engravings.

The inventor says: I *claim*, first, the combination and arrangement of the cylindrical grating J J K K K, and lever arms *x x y y*, and swords *z z*, and concave grating *b<sup>2</sup> b<sup>2</sup>*, with the hurder cylinder P, formed with alternate plain edges and serrated ridges or ribs *q r q r*, substantially as set forth and described.

Second. I claim the combination and arrangement of a fan or blast wheel C<sup>2</sup> C<sup>2</sup> C<sup>2</sup>, with the hurder cylinder P *q r* and endless apron *u u*, substantially as set forth and described.

No. 25,718.—L. BRADLEY, of Tolsom, Cal.—*Improved Telegraphic Machine*.—Patent dated October 11, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, arranging the type and mechanism for closing the circuit, substantially as described, or in an equivalent manner, so that a double closing of the circuit is effected as each tooth of the type comes in contact with the closing mechanism.

Second. The combination of the type and composing sticks with a yielding insulating plate, carrying the mechanism for breaking and closing the circuit, whereby the contact of the closing mechanism with the face of the type is insured.

Third. The vibrating hook *g* and bar *i* or their equivalents, in combination with a yielding insulating plate and type and sticks, for the purpose of closing the circuit.

Fourth. The combination of the composing stick and type with the spring *c* or its equivalent, arranged substantially as described, so that the type are made to form a portion of the circuit for the purpose set forth.

Fifth. The combination of the carrying band and mechanism for closing the circuit with the composing sticks, and type arranged on the band, in relation to each other, substantially as described, so that the sticks are successively carried forward in the order in which they are arranged, brought into the current, and the message transmitted without interruption.

Sixth. The combination of the movable platform carrying the recording mechanism, with the rotating cylinder carrying the record paper, arranged substantially as described, so that the message as transmitted is recorded in parallel lines on the paper.

Seventh. Constructing the composing sticks and types, substantially as described, so that the sticks when filled with the type shall present an even and flat surface on either side.

Eighth. The application of a siphon pen, constructed and arranged substantially as described, for the purpose of recording the messages.

Ninth. The inclined plane B, arranged substantially as described, in combination with the band D, whereby the composing sticks are received from the band in such manner as not to interfere with each other's delivery, and in the same order in which they were placed on the band.

No. 25,719.—T. B. BURTIS, of Chicago, Illinois.—*Improved Refrigerator*.—Patent dated October 11, 1859.—This invention consists in a peculiar arrangement of an ice chamber, water chamber, air passages, and provision chambers, whereby currents of cool air are made to pass simultaneously through a series of separate provision chambers, keeping the contents cool and removing impurities, &c.

*Claim*.—The employment or use of the ice chamber B, water chamber C, air passages D E G, and a series of provision chambers F, arranged relatively with each other, for the purpose set forth.

No. 25,720.—JOHN BUZBY, of Moorestown, N. J.—*Improvement in Grate Bars*.—Patent dated October 11, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—Making the mortises *m* and the tenons on the grate bars, alternately, one above the other, so that the mortises may be made entirely through the bar, without interfering with the tenons, and so the tenons may extend entirely through the bar without interfering with one another, and be made so long as not to be drawn out of the mortise by the warping or springing of the grate bars.

No. 25,721.—A. S. CAPRON and D. S. DAVIS, of Grass Lake, Mich.—*Improvement in Potato Diggers*.—Patent dated October 11, 1859.—When the machine is set in motion, the wheel C communicates motion to the pinion F, the crank shaft E, and thence to the rake D; the handle of the rake resting upon the roller *x*, and operated by means of the crank on shaft E, the rake will have a motion given to it similar to the movement of the ordinary rake—it will be dragged along on the ground, then raised and pushed back, and then dragged along on the ground again.

*Claim*.—The arrangement of axle B, wheels A A<sup>1</sup>, and wheel C; pinion F, crank and shaft E, guides *e e*, roller *y*, rake D, apron H, and hooks *i i*, the whole being connected together, and operating substantially as and for the purpose specified.

No. 25,722.—TISDALE CARPENTER, of Providence, R. I.—*Improvement for Operating the Valves of Steam Engines*.—Patent dated October 11, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the adjustable graduated scroll shaped side cam, so arranged as to be traversed and adjusted by a regulator or governor, while the engine is in motion, substantially as described, or adjusted and fixed or set by hand while the engine is stopped.

No. 25,723.—SAMUEL CHACE, of Providence, R. I.—*Improvement in Awnings*.—Patent dated October 11, 1859.—G G<sup>1</sup> are dogs fastened to the rod *c* in such manner that they may turn and not move longitudinally thereon. These dogs have rollers attached to their lower extremities by pivots *e*, which rollers being underneath the tracks prevent the awning from being raised perpendicularly therefrom while the flanges F prevent it sliding off.

*Claim*.—The application of the various devices described, viz: the gear toothed tracks C C, with the pinions E E; also the dogs G G, and finally the box or covering K, to an awning, the whole being constructed substantially as and for the purposes set forth.

No. 25,724.—JAMES S. COLVIN, of Allegheny, Pa.—*Improved Gasket for Steam and Other Joints*.—Patent dated October 11, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—A joint gasket, composed of a ring of India rubber, encased with copper or other metal, substantially as described.

No. 25,725.—NORMAN COWLES and A. HURLBURT, of Edgefield, S. C.—*Improvement in Spring Back Carriage Seats*.—Patent dated October 11, 1859.—This invention consists of an upper back, called a "lazy back," attached by hinged uprights to the frame work of the seat, when employed with a pair of springs at the sides of the seat for giving the back a support and forming an arm rest for the occupant of the carriage.

*Claim*.—The employment of springs D D, substantially as described, when in connection with a back B, supported by hinged uprights, in the manner and for the purposes set forth.

No. 25,726.—BIRAM C. DAVIS, of Binghamton, N. Y.—*Improved Hand Machine for Wiring Blind Rods*.—Patent dated October 11, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the setting form A, which sets over the rod C and straddles the slats D, and which is secured under the blind by means of the stationary bar B, in such a manner as to let the staples through the eye of the staple in the rod C into the slats, D D being the equivalent means employed for setting the staple into the rod C in combination with the adjustable arrangement K, operating substantially as described.

Second. I *claim*, in combination with the form A, the joint lever G, flange rod or drivers H, dividing slide I, inclined needle bar J, the whole being arranged substantially as described and for the purpose set forth.

No. 25,727.—E. DOUGHERTY, of Cedarville, Ohio.—*Improved Wheelwright Machine*.—Patent dated October 11, 1859.—This invention consists in a combination of devices by which the spokes are sawed of equal lengths, the tenons are made at equal distances from the hub, and the felloes bored at regular distances so as to fit in the spokes.

*Claim*.—The combination of devices as specified, substantially as and for the purposes set forth.

No. 25,728.—H. F. DROTT, of Cumberland, Md.—*Improved Shutter Hinge*.—Patent dated October 11, 1859.—This invention consists in the arrangement of a plate provided with a projection and a spring provided with a projection, the two being secured to different sides or parts of the hinge and catching together when the hinge is open.

*Claim*.—The employment of the spring E, as constructed, when used in connection with the plate *n*, as constructed, the two being used in combination with any common shutter hinge, substantially as and for the purpose specified.

No. 25,729.—B. WELLS DUNKLEE, of Boston, Mass.—*Improvement in Furnaces*.—Patent

dated October 11, 1859.—The object of this invention is to construct a furnace so that the heated air shall be conducted from the hot air chamber to the discharge flues, without coming in contact with the open air or any other cooling surfaces; and also to increase rather than diminish the quantity of heat in its passage to, and until it enters, the flues, thus economizing heat and fuel.

*Claim.*—The general arrangement, as described, of the space Q, the chamber or dome I, the dampers M and N and the pipe or T—L and the ventilating pipe S and smoke drum G and ventilating pipe P and smoke pipe *t* and air duct R and series of dampers in flues F, in relation to each other and with respect to the flue F and hot air chamber E, the whole being made to operate substantially in the manner and for the purposes set forth.

No. 25,730.—WILLIAM O. GROVER and WILLIAM E. BAKER, of Boston, Mass., and O. B. POTTER, of New York.—*Improvement in Sewing Machines.*—Patent dated October 11, 1859.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim* a non-penetrating instrument and a piercing eye pointed needle, acting together to make an interlocking of threads, substantially as represented, in combination with a clamping apparatus, acting substantially as specified, the combination being substantially such as set forth, and acting to make a double looped stitch substantially in the manner described.

Second. We claim mounting a spool or bobbin, from which thread is to be delivered for the purpose of sewing by machinery, upon two truncated cones, substantially as set forth.

No. 25,731.—HORACE GUSHEE and JOHN G. DAWES, of San Francisco, Cal.—*Improvement in Bee Hives.*—Patent dated October 11, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The combination of the comb frames D, rods E, staples *a*<sup>1</sup> *a*, and cleat H, arranged as described, whereby the comb frames may be readily removed or inserted in the manner described and for the purpose specified.

No. 25,732.—JOHN R. GUY, of Springfield, Ohio.—*Improved Bedstead.*—Patent dated October 11, 1859.—This invention relates to the construction of bedsteads, so as to employ the cross rail, self tightening arrangement, in connection with the heads of ordinary form.

*Claim.*—The arrangement of the frame C D E, with reference to the heads B A, and their connection by means of the joints H G and slides I and plates J or their equivalents, substantially as described.

No. 25,733.—JOSHUA HENDY, of San Francisco, Cal.—*Improved Double Friction Coupling.* Patent dated October 11, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The application of two such truncated cones to one coupling (one at either end), and operated by a single lever, so as to work in cavities or conical sleeves attached to pulleys or wheels arranged on one shaft, so that said shaft may be run slow, or fast, or backward, or forward, or entirely stopped, without stopping the primè motor or changing its speed, substantially as set forth and explained.

No. 25,734.—HATSEL HIGGINS, of Orleans, Mass.—*Improved Steering Apparatus.*—Patent dated October 11, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The arrangement, substantially as specified, of the rudder head intermediately between the supports which, respectively, serve as bearings to the hand wheel shaft and the rudder operating gear, said shaft extending back of and over said gear, whereby the rudder may be operated either by the gear or by a tiller from the wheel shaft, as described; and also compactness of steering apparatus and economy of deck space are obtained.

No. 25,735.—ISAAC H. HOBBS, ABRAHAM W. RAND, and GEORGE H. SELLERS, of Philadelphia, Pa.—*Improvement in Hot Air Furnaces.*—Patent dated October 11, 1859.—The object of this invention is the heating of a larger amount of air with the same heating surface, than has heretofore been done, and to make the furnace better adapted to the distributing of the hot air to different parts of the building.

The inventors say: We *claim*, first, the general arrangement of the subdivided air chamber, in connection with the separate receiving and discharging openings, substantially in the manner and for the purpose specified.

Second. We also claim the deflecting diaphragms, in combination with the above described arrangement, in the manner substantially and for the purpose set forth.

No. 25,736.—HENRY S. HOGLE, of Cleveland, Ohio.—*Improvement in Rotary Harrows.*—Patent dated October 11, 1859.—A hub of suitable shape receives the inner ends of the radial arms E E of the rotating central frame of this harrow, and the outer ends of said arms may be connected with each other by bolting them to a metallic rim G, or the said central frame of the harrow may be constructed in any suitable manner. The rotating central frame is

pivoted to the draft bar A, in such manner as to allow the same to rotate freely beneath the draft bar.

*Claim.*—The combination of a series of individually rotating toothed frames or wheels, with a rotating central frame or wheel, in such a manner that the said parts will operate substantially in the manner set forth.

No. 25,737.—D. E. HOLMES, of Halifax, Mass.—*Improved Clothes Frame.*—Patent dated October 11, 1859.—This invention consists in the arrangement of the racks upon which the clothes are hung, in such a manner that they can be spread out for receiving a large amount of clothing, and supported by suitable braces while in this position, and hinging and jointing the parts constituting the frame, so that when not in use it can be closed in a very compact state.

*Claim.*—The combination of the standards A A, horizontal hinged frames C C, when the same are sustained and braced by slotted braces F F, all arranged substantially in the manner as and for the purposes set forth.

No. 25,738.—BOLD R. HOOD, of Clinton, N. C.—*Improvement in Ploughs.*—Patent dated October 11, 1859.—This invention consists in the manner in which the standard is constructed for the purpose of making it susceptible of receiving the several changes of shovel points and mould boards which are ordinarily used on a farm and even a harrow, thus making a one stocked standard serve the purpose of holding the several varieties of plough points and mould boards.

*Claim.*—The combination of the standard D, with the standard C, and land sides E, when the parts are constructed as described, and adapted to receive the various forms of shovel points and mould boards in use, in the manner described, for the purpose specified.

No. 25,739.—WILLIAM H. JOHNSON, of Springfield, Mass.—*Improved Telegraphic Cable.*—Patent dated October 11, 1859.—In this invention *a* is the tube or conductor, *b* a coating of gutta percha which surrounds it; over this are placed the wires *c*, which lie parallel to the axis of the tube, and are held in position during the construction of the cable by a thin wire *d*, which is wound spirally around them, the outer coating *f* of gutta percha, is then applied binding the whole in one solid mass.

*Claim.*—An electric telegraphic conductor, constructed in the manner and for the purpose set forth.

No. 25,740.—WILLIAM M. KEAGUE, of Brooklyn, N. Y.—*Improved Omnibus Register.*—Patent dated October 11, 1859.—This invention consists in a particular arrangement of parts for the purpose of transmitting the vibrating motion of the step to the registering apparatus, the whole being so arranged and adjusted that certain known weights placed on the step send the index hand of the registering apparatus around one half of the space between two successive marks on the dial plate, and that for every full grown person, as the same steps into the omnibus and out again, one fare is registered. Persons of less than the standard weight will cause the index hand to move only in stepping out.

The inventor says: I *claim*, first, the arrangement and combination of the platform D, vibrating lever C, and adjustable spring G, substantially as and for the purpose specified.

Second. In combination with the platform D and spring G, I claim the sliding bar H, spring catch *n*, and wheel K, substantially as and for the purpose described.

Third. Arranging the step A, in combination with the registering apparatus, substantially as described, so that it registers half fares as well as full fares.

No. 25,741.—MILES KEELY and G. W. CRESSMAN, of Barren Hill, Pa.—*Improvement in Hydraulic Motors.*—Patent dated October 11, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The arrangement and combination with the levers M, lever frames K L, and bottoms *k*, of the adjustable slots *r* and bars *t*, by which the speed of the machine, length of stroke of the levers, and distance of water may be regulated at pleasure, as shown and described.

No. 25,742.—ARCHIBALD C. KETCHUM, of New York, N. Y.—*Improvement in Tea Kettles.*—Patent dated October 11, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The combination of the tin top, copper bottom, and sheet iron skirt, when the same are all united by one and the same lap joints, and just below the spout of the kettle, as described, constituting a new article of manufacture.

No. 25,743.—ISAAC R. LAWRENCE and GEORGE E. GOULD, of Green Island, N. Y.—*Improvement in Endless Chains for Horse Power Machines.*—Patent dated October 11, 1855.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, extending both the lugs A and links B, of such

chainst *o* or beyond the treads *q* of the friction wheels *c*, carried by axles *h*, cast on the links, substantially as and for the purpose described.

Second. We also claim forming and arranging projections *r* and *s*, on the links *B* of the chain, substantially as and for the purpose set forth, the links being provided with male lugs *d* and female lugs *f*, substantially as described.

No. 25,744.—LUCIUS LEAVENWORTH, of Trumansburgh, N. Y.—*Improvement in Straw Cutters*.—Patent dated October 11, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the arrangement and combination of the rockers *C* and *E*, and springs *d*, substantially as described, for the purpose of giving a double motion to the knife and to avoid friction of the working parts.

No. 25,745.—SYLVESTER MARSH, of West Roxbury, Mass.—*Improved Apparatus for Stirring and Delivering Grain*.—Patent dated October 11, 1859.—These improvements will be understood by an examination of the claim and engravings.

The inventor says: I *claim*, first, the combination, with the reticulated bed or other suitable drying table, of a reciprocating truck, armed with paddles or stirrers for agitating the grain on the drying surface.

Second. The arrangement, substantially as specified, of the truck paddles in rows, one in advance of the other, and the paddles of each preceding row intermediate of those next behind them.

Third. Giving to the paddles of the reciprocating truck an oblique set for and during the forward travel of the truck, and giving them an edge presentation or set for and during the back travel of the same, essentially as and for the purposes set forth.

Fourth. Giving to said paddles reverse obliquities, for and during the forward travel of the truck, so as to throw the grain to the right and to the left, alternately, in the feed forward of the grain by the paddles.

Fifth. The combination with the reciprocating truck and its paddles of a cross sliding frame, made to gear by cranks or their equivalents, with the several paddles, for simultaneously changing the latter from an oblique to a straight set, and *vice versa*, substantially as specified.

Sixth. The combination, with the cross sliding frame to the reciprocating truck, of one or more adjustable inclines and stops for automatically reversing the position of the paddles in their one direction.

Seventh. Drawing the cross frame back to its original position to give to the paddles a different set, by means of a clip lever, acted on by a weight, weighted catch, and inclined projection, connected with the reciprocating truck or their equivalents; also, afterwards returning said lever to its former position, to be locked by the weighted catch by an inclined plane on the truck, acting against and over a swell on the lever, substantially as set forth.

Eighth. Varying the range of motion of the reciprocating truck on or over the drying surface and relatively to the feed or delivering ends thereof, by means of a lengthening and shortening driving pitman, made adjustable, substantially as specified.

No. 25,746.—ANDREAS MAURER, of New Carlisle, Ind.—*Improvement in Seed Planters*.—Patent dated October 11, 1859.—This invention relates to an improved arrangement of the seed distributing device, whereby the same may be adjusted with ease so as to be rendered, as the machine moves along, operative and inoperative when desired.

*Claim*.—The arrangement and combination of the vertically moving and seed distributing supporting axle *D* and boxes *E* and lever *F*, as and for the purpose set forth.

No. 25,747.—THOMAS J. MAYALL, of Roxbury, Mass.—*Improvement in Method of Combining Emery with Caoutchouc*.—Patent dated October 11, 1859.—The claim explains the nature of this invention.

*Claim*.—The new process described of making emery sharpening and polishing tools, by combining emery with India rubber, gutta percha, or other substances, and then submitting them, while under great pressure, to a high degree of artificial heat, substantially as set forth, whereby, with a given quantity of rubber, emery may be combined in much greater quantities than it could be heretofore done.

No. 25,748.—JAMES McALEER, of Chambersburgh, Pa.—*Improvement in Harvesters*.—Patent dated October 11, 1859.—This invention relates to certain improvements in the binding apparatus of *C. H. McAleer*, patented August 16, 1859, and consists in the arrangement of two seats, which face at right angles to each other, directly behind the forked elevating device of *C. H. McAleer*, and by the side of a combination gavel trough and platform.

*Claim*.—The arrangement of the two seats *D D*<sup>1</sup>, one facing at right angles to the other, conducting trough and binding table *F F*<sup>1</sup>, and the elevating device *C*, all for use together, in the manner and for the purposes set forth.

No. 25,749.—J. McDougall, of Masonville, Mich.—*Improved Mode of Forming Joints in India Rubber Belting*.—Patent dated October 11, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—The employment, in combination with the belt ends A B, of the tongues and cavities *c c*, so that the sides of the tongue portion shall be protected by the selvages of the cavity parts, substantially as shown and described.

No. 25,750.—S. T. McDougall, of New York, N. Y.—*Traveller's Ticket Holder*.—Patent dated October 11, 1859.—This machine consists of a clamp so constructed that it will readily secure any ticket, tag, or badge placed within its grasp, combined with a pin similar to that used for securing shawls or breastpins, by which such clamp may be securely and readily attached to a cloak, shawl, or other article of dress.

*Claim*.—The levers C, spring C<sup>1</sup>, point *i*, or other equivalents, in combination with an ordinary shawl pin; the whole constructed and operating as set forth.

No. 25,751.—JAMES P. McLEAN, of New York, N. Y.—*Improvement in Skates*.—Patent dated October 11, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the arrangement and use of the side or ankle springs A A<sup>1</sup> with parts B B<sup>1</sup> and instep projections 2 and 3, adjustable or otherwise, in combination with the heel spring *h*, having a pad at its top end, and with the cork sole *m* in the form of a shoe or otherwise, as set forth.

Second. I claim the combined arrangement and use of the railroad attachment K K<sup>1</sup> and Y Y<sup>1</sup>, as applied to a skate, the same forming a toe strap loop if required, in the manner and for the purpose set forth.

No. 25,752.—JAMES C. MILLER, of Union Township, Pa.—*Improvement in Horse Power Locomotives*.—Patent dated October 11, 1859.—This invention principally consists in the combination of a sweep lever horse power by frame work and gearing with one or more ground wheels, which, by the revolution of the axis of the horizontal sweep levers, are made to roll upon the surface of the ground and move the whole machine, and by the adhesion of the ground wheels to the surface may be made to exert a powerful tractive force upon any resisting object.

*Claim*.—Horse power sweep levers connected with one or more ground wheels, substantially as described and for the purposes specified.

No. 25,753.—GEORGE F. MILLIKEN, of Somerville, Mass.—*Improved Electro-Magnetic Burglar Alarm*.—Patent dated October 11, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the combination of a galvanic battery, an electric circuit, a circuit breaker, operated by a window or door, with a step by step indicator, substantially as described.

I claim causing a window or door automatically to prevent any alteration upon the circuit during the closing of the window or door until it is nearly closed, in any manner, substantially as described.

I claim the use of the armature J for the double purpose of regulating the movements of the points and setting in motion the alarm apparatus.

No. 25,754.—B. S. MORGAN, of Delhi, Iowa.—*Improvement in Cultivators*.—Patent dated October 11, 1859.—By throwing the hand lever *f* in the direction of the arrow 1, the levers *h h i* are turned so as to come to a more upright or vertical position, and the frame A is raised; when the hand lever *f* is thrown in the direction of arrow 2, the frame A is lowered. The raising as well as the lowering of the frame is done parallel to the ground.

*Claim*.—The arrangement and combination of the side wings D and wheels H H I of a cultivator, with the levers *h h i*, bar *d*, rods *e*, and hand lever *f*, substantially as and for the purpose specified.

No. 25,755.—WILLIAM A. MORRISON, of Morrisania, N. Y.—*Improved Boot and Shoe Brush and Scraper*.—Patent dated October 11, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The arrangement of the springs B in combination with screws A in such a manner as to throw the brushes C forward parallel with the scraper D, as and for the purpose specified.

No. 25,756.—ABEL R. NIXON, of Rhea Springs, Tenn.—*Improvement in Hand Looms*.—Patent dated October 11, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, in combination with the lay beam and spring picker staffs, the toggle levers *b b*, triggers *f f*, and flexible connections *e h*, for effecting the setting and tripping of the picker staff substantially as described.

And I also claim, in combination with the lay and the treadles for working the harness or sheds, the toggle levers *q* and trigger cords *h*, so that the shed shall be properly made before the trigger is drawn to let the shuttle fly, thus ensuring a perfect sequency of operation and with great saving of manual labor on the operator, as set forth.

No. 25,757.—SAMUEL PAGE, of Chelsea, Mass.—*Improved Varnish*.—Patent dated October 11, 1859.—This invention consists in mixing together a distillate of coal tar, produced by distillation at a certain temperature and the residuum left from a further distillation at a higher temperature.

*Claim*.—The described varnish, made of the materials specified.

No. 25,758.—WILLIAM MUNROE, of West Auburn, Maine.—*Improvement in Sole Cutting Machines*.—Patent dated October 11, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of the vertical slots *i i* in the arbor E, elastic bars *q r*, with their projections *s*, fitting respectively in said slots, the weight P, bar *f*, and the shafts I N, provided respectively with the cam K, spring P<sup>1</sup>, pinions M, part pinion L, and strap O, substantially as described, to operate the arbor E and its die or cutting flanch *l*.

Second. The stop S attached to a shaft Q provided with springs *j<sup>1</sup> k<sup>1</sup>*, and actuated by the pin *h<sup>1</sup>* on the rod F, and the notched block *f<sup>1</sup>* attached to the bar R, substantially as and for the purpose set forth.

No. 25,759.—HENRY PFARRER, of New York, N. Y.—*Improvement in Gear Cutting Engines*.—Patent dated October 11, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* a pattern *t* mounted on a shaft or spindle, which also carries the gear to be cut, in combination with a fixed dog or guide *u*, when said dog or guide is so located that the pattern runs off and is clear of the same, so as to be turned at the time the gear is clear of the cutter, and said pattern again takes and is held by said dog, as the cutting commences, and is proceeded with as set forth.

I also claim the arrangement of the lever *x*, pawl *y*, and adjustable stop *z*, to give motion to the pattern *t*, when not in contact with the stop or dog *u*, as described.

In combination with the pattern *t* and dog *u*, I also claim the stock carrying the shaft or spindle *s*, and actuated by the lever *k*, for the purposes as specified.

No. 25,760.—MATHIEU PHILIPPI, of Troy, N. Y.—*Improvement in Key Boards for Piano Fortes*.—Patent dated October 11, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—So constructing the upper surfaces of the keys of a piano forte, that while the ordinary form of the key board is retained, portions of all the keys are brought to the same level in the key board, substantially as and for the purpose specified.

No. 25,761.—HENRY R. RAMSEY, of Indianapolis, Ind.—*Improvement in Harvesters*.—Patent dated October 11, 1859.—The following is the operation of this machine: As it is moved forward, revolving the wheel B, which gears with the pinion C, this pinion being upon the same shaft with and giving motion to the wheel D, gearing with the pinion G, which operates the crank H, motion is thereby given to the sickle bar T by means of the pitman I and lever J. The machine is guided by operating the chain wheel M, which carries the back part of the frame K K K K and the front part of the frame O to the side required, while the joint or bolt S being nearly at the same equal distance from the ground as the bearing or tread wheels A A and Q, the machine is carried around a true curve which prevents it from sweeping sideways over the grain.

*Claim*.—The combination of the frames N O and K, chain L, chain wheel M, crank V, screw rod X, friction bearers *b b*, and grain table Y, when the several parts are constructed and arranged for operation in the manner and for the purpose set forth.

No. 25,762.—L. B. RICHARDSON, of Athol, Mass.—*Improvement in Lasting Pincers*.—Patent dated October 11, 1859.—This invention consists in the application of a movable fulcrum A to the pincers in such a manner as to permit the jaws B B to swing with the work, accommodating themselves to the form of the last, and increasing the facility of using them.

*Claim*.—The application of a swinging fulcrum to lasting pincers, constructed and arranged substantially in the manner and for the purpose set forth.

No. 25,763.—ROBERT E. ROGERS, of Philadelphia, Pa.—*Improvement in Umbrella Frames*.—Patent dated October 11, 1859.—This invention has reference to umbrella and parasol frames constructed of tubes, and consists in combining with tubular ribs and stretchers means for uniting the different parts of the frame and giving strength to the same.

*Claim*.—Combining, with the tubular ribs and stretchers, constructed as described the

means for uniting the ribs and stretchers, and for strengthening the tubular parts of the frame, as set forth.

No. 25,764.—WILLIAM SULLY, of Chillicothe, Ill.—*Improvement in Cultivators*.—Patent dated October 11, 1859.—The object of this invention is to enable one person to perform as much work in a day by using two horses as can be done by two persons with the single ploughs or cultivators in the usual way. For this purpose there is made a double shovel plough, having its frame elevated above what is to be cultivated, high enough to clear the row of plants which pass under the middle of the frame, having two horses harnessed so as to travel on each side of a row.

*Claim*.—The arrangement of the post D, arms E, cross bar F, lever H, wheels W, shovels B and C, chains R and Q, arms U, cross bar K, vertical lever Y and Y<sup>2</sup>, rods Z, whiffletree X, and draft hook A<sup>2</sup>, the whole being constructed and combined in the manner and for the purpose described.

No. 25,765.—JOSEPH SEYMOUR, of Syracuse, N. Y.—*Improvement in Making Spoons*.—Patent dated October 11, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The machine known as the "rolls," having the form or figure of any article to be made up plain, of silver or other metal, cut upon one or both of them, so much larger than the same article when finished, that the article itself can be cut with a punch, of the desired size and shape, out of a piece of metal after it has been passed between the rolls and entirely within the margin or edge of the impression made upon the metal by the form or figure cut into one or both of the rolls, substantially as described and set forth.

No. 25,766.—H. O. SHEIDLEY, of Republic, Ohio.—*Improved Invalid Bedstead*.—Patent dated October 11, 1859.—This invention consists in so constructing the bedstead that the whole bottom thereof slides forward and backward upon the frame, the bottom being so divided and hinged that that section which is next to the head of the bedstead can, by means of a crank, be raised from its horizontal position as near to a vertical one as desired.

*Claim*.—The combination of the sliding hinged bottom B B<sup>1</sup> B<sup>2</sup>, with the crank shaft, cords, and attached levers, and the movable foot board F, substantially as and for the purposes set forth.

No. 25,767.—JOHN H. SHROTE, of Baltimore, Md.—*Improvement in Cutting and Panning Cakes*.—Patent dated October 11, 1859.—The claim and engravings give an idea of the nature of this invention.

*Claim*.—The cutters A, as constructed, or their equivalents, in combination with the pan E and bottom board D, for the purpose of facilitating the cutting and removing the cakes to the oven, as set forth and described.

No. 25,768.—CHARLES R. SMITH, of Haverhill, N. H.—*Improved Device for Bracing and Ventilating Fence Posts*.—Patent dated October 11, 1859.—This invention consists in the peculiar construction and arrangement of the wire loop K, in combination with one pair of braces, a post, and sill. It also consists in providing grooves in the posts and cleats of the panels for the purpose of allowing air to circulate between the rails, posts, and cleats to obviate rot and decay.

The inventor says: I *claim*, first, the peculiar construction and arrangement of the wire loop K, in combination with one pair of braces, a post, and a sill, substantially as and for the purposes set forth.

Second. The grooved post E, and the grooved cleats D and F, in combination with the lengthwise boards or slats B B B B, substantially as and for the purpose set forth.

No. 25,769.—H. D. SNOW, of Rochester, N. Y.—*Improvement in Governors for Steam and Other Engines*.—Patent dated October 11, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the use of collar T, first, to control the passage of steam through the valve A, on starting the engine; secondly, to control the extreme downward movement of the valve A by means of the stops I I, so connected with the valve openings E E, as to close them at either extreme of the movement.

I also claim locating the weights X, beneath and partially entering the tube of the valve A, as represented.

No. 25,770.—C. M. SPENCER, of Manchester, Conn.—*Improved Apparatus for Cutting and Attaching Labels*.—Patent dated October 11, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—Cutting and affixing labels upon spools by one or the same action of a machine as the dies M L, or the tubular cutters e, followers c, or their equivalents, substantially in the manner and for the purpose described.

No. 25,771.—JOSEPH ANDREW STEPHAN, of Lafayette, Ind.—*Improvement in Adjustable Rails for Replacing Cars on the Track.*—Patent dated October 11, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the fish pieces B C D, clamped to the permanent rails A A and elevated high enough above said rails to carry the flanges of the car to be replaced over them, substantially as described.

Second. I also claim, in combination with an elevated temporary track, secured to and high enough above the permanent track, to carry over the flanges of the wheels, the sections G G<sup>1</sup> and their switches *e h*, extending to each of the pairs of wheels of the car, said sections having all the elements of switches, frogs, and rails, substantially as described.

No. 25,772.—DAVID STEWART, of Annapolis, Md.—*Improved Method of Preparing Bones for Fertilizing Purposes.*—Patent dated October 11, 1859.—The claim explains the nature of this invention.

*Claim.*—The stratification of the bones with materials, animal, vegetable, and mineral, substantially in the order and upon the principles set forth, using the materials above designated or their equivalents, whereby bones are reduced, in a most economical manner, to an available condition for manure, and a thorough compost obtained adapted to all the necessities of growing and fruiting plants without any mechanical labor other than that of stratifying, cutting down, and screening, as set forth.

No. 25,773.—WILLIAM H. TAMBLING, of Berlin, Wis.—*Improved Milk Safe.*—Patent dated October 11, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The described safe, as an article of manufacture, constructed in the particular manner set forth, to wit: with gauze wire sides and doors, and with shelves, which consist of longitudinal slats C C, to which are secured a series of wooden cross slats D D, which are made broad at their base and beveled to an edge on their tops, the whole being arranged together and used in the manner and for the purpose specified.

No. 25,774.—WILLIAM H. TAMBLING, of Berlin, Wis.—*Improved Washing Machine.*—Patent dated October 11, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of the buckets D D, in the four corners of the interior of the box A, said buckets being made in a triangular form and open at one angle, as at *x x*<sup>1</sup>, the same being used in the manner and for the purpose specified.

Second. The arrangement of the bars *a a*, as provided with pins *n n*, and in the form represented when used in connection with the box A and the buckets D D, as constructed, the whole operating substantially as and for the purpose specified.

No. 25,775.—FRANCIS C. TREADWELL, Jr., of New York, N. Y., and HENRY McCULLOM, of Windham, Conn.—*Improved Mode of Making Cylindrical Strips of Dough in the Manufacture of Crackers.*—Patent dated October 11, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The described improved method of forming skin covered strips from a sheet of previously smoothed rolled dough, by passing it between a pair of grooved rollers, arranged and constructed substantially as described, with the groove separated by portions of the plain surface of the rollers.

No. 25,776.—JOHN G. TREADWELL, of Albany, N. Y.—*Improvement in Apparatus for Ventilating Railroad Cars.*—Patent dated October 11, 1859.—In using this invention water is first placed in the tank F, thence it passes into the main pipe E, and is then distributed in all the smaller pipes *e e e* and is sprinkled upon the porous partitions C C, and passing down it leaves the boxes through the openings B B.

*Claim.*—The arrangement of the boxes A<sup>1</sup> of the porous partitions C C, and the pipe *e*, provided at its lower end with a sprinkler O, when the same are used in connection with the openings D, substantially in the manner and for the purpose specified.

No. 25,777.—ISAAC WAIT, of Watertown, N. Y.—*Improvement in Grain Cleaners.*—Patent dated October 11, 1859.—This invention consists in effecting the combination of the separating sieves, scouring surfaces, and driving gear, by means of a single vibrating lever which gives a contrary motion to the sieves and scouring surfaces, at each revolution of the crank or driving shaft.

*Claim.*—The combination of the separating sieves and the burr surfaced plates, by means of the vibrating lever, which gives a contrary motion to each at every revolution of the wheel or crank, substantially in the manner and for the purpose described.

No. 25,778.—JOHN WALKER, of Sunbury, Ohio.—*Improved Locomotive Crosscut Sawing Machine.*—Patent dated October 11, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of an upright steam engine A, on a truck frame B, with a horizontal crank shaft D, and a vibrating saw L, substantially as set forth.

Second. The employment of conical pulleys Q Q<sup>1</sup> Q<sup>2</sup> Q<sup>3</sup> and shiftable bands R R, in combination with the other machinery and the engine which operates the saw, for the purpose of guiding the machine when moving from place to place, substantially as and for the purposes set forth.

No. 25,779.—CALEB C. WALWORTH, of Boston, Mass.—*Improvement in Cutting Screw Threads on Gas Pipes*.—Patent dated October 11, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the combination of two or more mandrels parallel, or nearly parallel to each other, and arranged to carry cutting tools with two or more vises, when these are arranged to revolve round a common centre.

I also claim the combination of two or more sets of mandrels, as above, with two or more sets of vises, as above, when each set of mandrels is arranged to operate in unison with its corresponding set of vises.

I also claim the combination of two or more series of vises, one beyond the other, and arranged to revolve about a common centre.

I also claim operating two or more vises, independently of each other or together, by one wrench, and by the means and in the manner substantially as specified.

No. 25,780.—DANIEL WINDER, of Cincinnati, Ohio.—*Improved Bed Bottom*.—Patent dated October 11, 1859.—This invention relates to that class of bed bottoms whose web or cording is gathered radially from all sides to a centre ring, and consists in an appliance or provision for the cheap, effective, and easy sustaining of the cord or webbing.

*Claim*.—The combination of the rings *a* and *b*, and tension screw *c*, operating in connection with a radial bed cord or webbing, in the manner and for the purpose set forth.

No. 25,781.—OLIVER EVANS WOODS, of Philadelphia, Pa.—*Improved Life Preserving Buoy*. Patent dated October 11, 1859.—When this buoy is to be used and inflated through the agency of gravity, the inventor says: then let the upper frame be sustained, and upon opening the valve F the adjacent frame immediately descends, and the air rushing into and through the valve opening inflates the buoy. The valve F is now closed, and the air prevented from escaping. When the buoy is to be inflated through the mechanical agency or the stays, then open the valve as before, and simultaneously with making the stays rigid, the two frames will be separated, and the air rushing through the valve opening will fill the buoy.

*Claim*.—A buoy arranged with two frames A A<sup>1</sup>, stays D, and cross braces E, and with a valve or valves F, and otherwise constructed and operated as described.

No. 25,782.—FRANCIS G. WOODWARD, of Worcester, Mass.—*Improvement in Sewing Machines*.—Patent dated October 11, 1859.—The novelty of this invention consists in the manner of working the looping hook *d*, by means of the wheel F and the double joint E.

*Claim*.—The peculiar manner of working the looping hook *d*, by means of the wheel F and the double joint E<sup>1</sup>, substantially as specified.

No. 25,783.—LEROY S. WHITE, of Waterbury, Conn.—*Improved Burnishing Machine*.—Patent dated October 11, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of the burnisher or burnishers in a burnishing machine in a sliding gate or its equivalent, carried by and working perpendicularly to a rectilinearly reciprocating shaft or its equivalent, substantially as and for the purposes described.

Second. Providing for the burnisher or burnishers employed on one side of the article to be burnished, in a so applied gate or its equivalent, such a movement, independently of that or those employed on the opposite side, substantially as described, as to produce the greater movement that is necessary or desirable, for the reason explained, on the convex side of any article of curved form.

Third. Fitting a burnisher in a burnishing machine to a suitable holder *g* or its equivalent, in which it is permitted a free vibration, laterally, to the movement it makes in the burnishing operation, substantially as and for the purpose specified.

No. 25,784.—GEORGE W. BANKER, of Medford, Mass., assignor to Himself and G. O. CARPENTER, of South Reading, Mass.—*Improved Mode of Manufacturing Barrels, &c.*—Patent dated October 11, 1859.—The lower head B is secured in the ordinary manner, the stave being chamfered and crozed, and the hoops *a* and *b* driven on to hold the head in place; the upper head C, to which this improvement is applied, is left of a uniform thickness throughout, and is slightly beveled around its edge, as shown at 5, and the chine is beveled to correspond thereto.

The inventor says: I *claim* the method described of securing the heads of casks by means of the chamber 5 and shoulder *e*, as described.

Second. I claim a keg furnished with ears and a bail, as described, for the purpose specified.

No. 25,785.—OLIVER D. BARRETT, of Cleveland, Ohio, assignor to Himself and SEARS E. SMITH, of said Cleveland.—*Improvement in Sewing Machines*.—Patent dated October 11, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the crank, consisting of the disk Q and pin O, in combination with the pin *o*<sup>1</sup> in the pulley Q<sup>1</sup>, and hinge R, whereby I am enabled to turn the machine up from the table designed for it to stand on, in order to adjust or thread the under needle *d*, without unbanding the machine, substantially in the manner and for the purpose described.

Second. Hinging the footholder F to the head of the goose necks B, in a position vertical to the feeding surface of the feeder Y, substantially in the manner and for the purpose described.

Third. The footholder F, constructed and hinged as set forth, in combination with the rod H, spring I, foot K, and feeder Y, substantially in the manner and for the purpose set forth.

No. 25,786.—THOMAS A. EARL, of North Attleborough, Mass., assignor to Himself and CHARLES A. DURGIN, of New York city.—*Improvement in Bustles*.—Patent dated October 11, 1859.—The bustle being placed upon the wearer, the clasp F on the piece E being up to the belt, there is little or no expansion, and to adjust it at any degree, it is only necessary to reach back the hand and move the clasp F on the projecting piece E down, which, by means of the strip G, draws back the segments and thereby expands the dress to the desired position.

*Claim*.—The segment C, supported as described, in combination with the projecting strut E, slide F, and strip G, the whole being constructed and operated substantially as set forth and described.

No. 25,787.—WILLIAM GLUYAS, of San Francisco, Cal., assignor to Himself and WILLIAM H. O'NEILL, of said San Francisco.—*Composition for Preparing Gold and Silver Ores for Amalgamation*.—Patent dated October 11, 1859.—The mixture consists of the following articles and proportions: One gallon of water, one half pound of unslaked lime, one pound of common salt, and one and a half pounds of soda ash.

*Claim*.—The mixture or composition described, used with pulverized ores or tailings, the whole being brought to a boiling heat and being constantly agitated, thereby preparing the precious metals for a more perfect amalgamation with quicksilver.

No. 25,788.—STOUGHTON B. HOLDEN, of Woburn, Mass., assignor to Himself and PARKER NICHOLS, of Reading, Mass.—*Improved Burglar's Alarm*.—Patent dated October 11, 1859.—This invention consists of an improved apparatus for sounding an alarm and giving a light, in case an attempt is made to enter a house during the night, or it may be employed for waking a person at any hour during the night.

*Claim*.—The arrangement of the candle carrier D and its hammer *b* upon the torpedo post or standard B, the trigger lever *g*, and the grate or friction plate C, the whole forming an improved, efficient, and simple alarm, to operate as specified.

No. 25,789.—JOHN S. LASH, of Carlisle, Pa., assignor to Himself and FRANKLIN KNAUSS, of Allentown, Pa.—*Improvement in Straw Cutters*.—Patent dated October 11, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—Forming the bed F; in sections *c*, each being provided with a spring *e*, and having the spiral beaters or followers provided with shoulders *g*, substantially as shown, to prevent the lateral movement of the straw or stalks in the feed box, under the action of the beaters or followers.

No. 25,790.—ALFRED MARSH, of Detroit, Mich., assignor to JOHN Q. DUDLEY, of said Detroit.—*Improved Method of Preventing the Deposition of Carbon in Gas Retorts*.—Patent dated October 11, 1859.—The claim explains the nature of this invention.

*Claim*.—The introduction into the retort, during the gas making process, of chlorate of potash, or other substance which evolves oxygen, when heated for the purpose set forth.

No. 25,791.—CHARLES O'BRYAN, of Salem, Ohio, assignor to Himself and JOSEPH S. HALDEMAN, of said Salem.—*Improved Tool for Cutting Round Tenons*.—Patent dated October 11, 1859.—The rear of the stock or head A has a screw thread cut in it, into which a screw shank D is run, the inner end of which screw defines the length of tenon to be cut when doing such work, said adjusting shank being held firmly in its proper position when adjusted by a jam nut E or its equivalent.

*Claim*.—The combination of the hollow conical head A, external nut B, and plate C, con-

structed and arranged as described, for adjusting and holding, when adjusted, the bits or cutters, or their guides, substantially as represented.

No. 25,792.—ROBERT PATTERSON, of Philadelphia, Pa., assignor to HORACE VAUGHN, of Providence, R. I.—*Solution for Thinning a Lubricating Compound*.—Patent dated October 11, 1859.—The claim explains the nature of this invention.

*Claim*.—A thinning solution applicable to the reduction of the lubricating compound described in the patent of Vaughn & Hutton, dated August 2, 1859, made of the substances and applied substantially in the manner specified.

No. 25,793.—THOMAS D. RICHARDSON, of New York, N. Y., assignor to WILLIAM RICHARDSON, of said New York.—*Improvement in Pen and Pencil Holders*.—Patent dated October 11, 1859.—A represents a wooden handle or holder; B is a metal tube encompassed by a ring *a*, to which a pen slide B is attached, the pen slide being within tube B, and of the usual form; within the tube B a tube C is placed; this tube is smaller than tube B, but somewhat longer; the part *h* of the tube is fitted in a recess *i* in the handle, and a pin *j* passes through the handle and the part *h* of the tube C.

*Claim*.—The arrangement and combination of the elongated tube *h* with the handle A and tubes B C, as and for the purpose shown and described.

No. 25,794.—NATHAN C. TRAVIS, of Alton, Ill., assignor to Himself, NATHAN JOHNSON, and RICHARD EMERSON, of said Alton.—*Improved Regulator Valve for Steam Engines*.—Patent dated October 11, 1859.—C is the annular steam casing surrounding the lower part of the valve box A and communicating therewith by means of the openings *d d*. This casing forms a base to the valve box and has an outlet *g* in the bottom surrounded by a flanch *f*, by which it is to be bolted to the steam chest or steam pipe of the engine.

The inventor says: I *claim*, first, the arrangement and combination of the valve box A and casing C, as and for the purposes shown and described.

Second. The arrangement and combination of the screw socket *k*, stem *j*, rod *l*, arm *p*, groove *q*, and band wheel J, so that by turning the band wheel J the stem *j* may be elevated and depressed irrespective of the rise and fall of the rod *l* and without rotating the latter, all as shown and described.

No. 25,795.—SAMUEL C. ABBOTT, of Zanesville, Ohio.—*Improvement in the Adaptation of Wads to Shot and Shells*.—Patent dated October 18, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—In combination with a shot or shell that receives its rotation by the action of the atmosphere in its flight, and which has an open funnel shaped base, a similarly shaped open wad or packing, that when expanded by the gas shall impinge both upon the bore of the gun and the interior of the shot or shell, as described and represented.

No. 25,796.—AVERY BABBETT, of Auburn, N. Y.—*Improvement in Jacquard Machines*.—Patent dated October 18, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, Arranging two or more trap boards in one frame in such manner that when all the said trap boards, so arranged, are lifted for the purpose of opening the shed, all the untrapped knot cords may pass said trap boards without obstruction, in combination with an ascending and descending suspension board, substantially as above described.

Second. In combination with the Jacquard machine, I claim the device represented on the sides of the machine for working the journals or parts of journals, consisting of the pin wheel Z, shaft B<sup>1</sup>, hooks *y y y y*, and the hooks *o o o o*, and the dog E<sup>1</sup>, substantially in the manner and for the purposes specified.

Third. Dividing the journals commonly used in two or three ply Jacquard weaving machines, and working them in any required order, substantially in the manner and for the purpose specified.

No. 25,797.—E. BALL, of Canton, Ohio.—*Improvement in Harvesters*.—Patent dated October 18, 1859.—In moving the machine from field to field, the finger bar D, together with the cutting apparatus being turned up, they are held in that position by means of a hook or catch I<sup>1</sup> on the lever I being inserted into a slot in the track clearer, and held firmly in place by the bolt *p*<sup>2</sup>, which can be moved back and forth in connection with the arms *p p*; the latter can be moved so as to grasp firmly anything placed in the slot in which the bolt *p*<sup>2</sup> works.

The inventor says: I *claim*, first, the hinged plated G, constructed as shown and specified, in combination with the finger bar D and brace plate E, substantially as described.

Second. I claim the combination of the coupling arm *t*, (swiveled only at the point of connection with the main frame,) in combination with hinged plate G, hinged brace plate E, and guide piece F, substantially as set forth.

Third. I claim the guide piece *F*, in combination with the brace rod *q*, hinged plate *G*, brace plate *E*, coupling arm *t*, and chain *V*, substantially as described.

Fourth. I claim the combination and relative arrangement of spur *k*<sup>1</sup>, with coupling arm *t*, and pitman *k*, as and for the purposes set forth.

Fifth. I claim the combination of the hinged plate *G*, and adjusting screw *s*, with the slotted guide piece *F*, hinged brace plate *E*, and chain *b*<sup>2</sup>, arranged as and for the purposes set forth.

No. 25,798.—DANIEL BARNUM, of New York, N. Y.—*Improvement in Steam Engines*.—Patent dated October 18, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I claim the method of constructing and combining adjustable cut off cams and adjusting screws, and a revolving and sliding rock shaft, substantially as specified, and of combining these with the means described, for working puppet valves in steam engines, substantially as and for the purposes specified.

I claim the method of constructing or using or adjusting the cut off cams *l* *l*<sup>1</sup> for the purpose of enabling me to fix or to adjust the point at which the steam is to be cut off, during any portion of the stroke, whether it be done while the engine is in motion or at rest, substantially as described and shown.

No. 25,799.—WILLIAM W. BATCHELDER, of New York, N. Y.—*Improvement in the Construction of Vapor Lamp Burners*.—Patent dated October 18, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I claim modifying the flame under the retort, by means of the wires *a*<sup>1</sup> *a*<sup>2</sup> or their equivalents, in such manner that the deposit of carbon shall be prevented and the blue flame produced, as set forth.

I claim deriving the gas for heating the retort from the gas pipe *d*, after its commixture with air, and before it reaches the illuminating jet *m*, by means of the aperture *n*, as set forth.

No. 25,800.—JOHN BEACH, of De Ruyter, N. Y.—*Improvement in Cheese Hoops*.—Patent dated October 18, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I claim, first, a hoop having a cross cut or division at its periphery, and constructed to open and close as described, when provided, on opposite sides of said division, with hook or eye straps, united by a tie band or oval configuration, or other similar shape, and serving, in connection with the eye straps, to open and close the hoop, and to hold the same, when expanded or contracted, substantially as set forth.

Second. Providing the oval tie band to the hook or eye straps of the opening and closing hoop, with a lever or handle arranged to cross the oval band, at points intermediate to the intersections therewith of the transverse and conjugate axis of the band, and secured to the band on its one side, but projecting freely through it on the opposite side, essentially as specified.

No. 25,801.—CHARLES G. BLOOMER, of North Kingston, R. I.—*Improvement in Operating Window Blinds*.—Patent dated October 18, 1859.—To produce a device which, when attached to one of the slats of a window blind, shall render the blind capable of being adjusted and held at any angle, and also secure the slats when closed from the danger of being changed from the outside, is the object of this invention.

Claim.—The segmental disk *D* or its equivalent, and the spring *F* or its equivalent, in combination with one of the slats of a blind, when arranged to operate in the manner substantially as described for the purposes set forth.

No. 25,802.—M. S. BRINGIER, of New Orleans, La.—*Improved Steam Boiler*.—Patent dated October 18, 1859.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of a series of horizontal tubes or pipes, connecting two cylindrical chambers or reservoirs of water and steam, in combination with the steam cylinder *C*, connecting the same chambers, substantially as described.

No. 25,803.—WILLIAM M. BRYANT, of Washington, D. C.—*Improved Smoking Tube*.—Patent dated October 18, 1859.—The claim and engravings explain the nature of this invention.

Claim.—A tubular tobacco pipe which contains the supply of tobacco within it, and is furnished with a spring and follower or their equivalents, that force up the tobacco to the burning point or chamber, as fast as it is consumed, substantially in the manner and for the purpose set forth.

No. 25,804.—S. N. CAMPBELL, of Elgin, Ill.—*Improved Churn*.—Patent dated October 18, 1859.—On the lowermost part of the rod *F*, under the crosspiece *J*, is fixed a button *K*, which can be revolved with the rod. The object of this button is to regulate the distance between the slats *H*, through which the cream passes according to its consistency, and this is effected by having two inclosed surfaces *b* on either side of said button, which project

from its sides and incline up in opposite directions, so that by turning this button in one direction the slats are kept open, and by turning it half around the slats close, when the dasher is pushed down upon the cream.

*Claim.*—The arrangement and combination of the button K, dasher rod F, movable slats H H<sup>1</sup>, pieces L, and bar J, as and for the purposes set forth and described.

No. 25,805.—JOHN H. CARTER, of Cincinnati, Ohio.—*Improvement in the Construction of Hydrants for Filtration.*—Patent dated October 18, 1859.—This invention is an improvement in hydrants, by means of which water is filtered as it is received from the pipes, and is discharged as required for use, properly filtered and freed from sediment.

*Claim.*—The cylindrical inner vessel g within the case A, and made removable as represented, in combination with the receiver B, for receiving the sediment, as described, and the cap e<sup>1</sup>, for favoring the direction of the sediment downward, in the manner and for the purpose set forth.

No. 25,806.—ASA L. CASWELL, of Lansingburgh, N. Y.—*Improvement in Operating Gun Carriages.*—Patent dated October 18, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim*, first, returning the gun up to the port hole after being discharged by means of a roller and cords or chains, operated by a lever or its equivalent, when the same are arranged in the manner, and dispense with the use of gun tackle, as set forth.

Second. I claim the manner described, or equivalently the same, for securing the gun and carriage in a fixed position upon the truck, so as to maintain a given range for any number of discharges, as set forth.

No. 25,807.—LEVERETT CLARK, of Monticello, N. Y.—*Improvement in Hem Folders.*—Patent dated October 18, 1859.—This invention consists of a folder of a novel character, for the purpose of folding cloth or other material preparatory to hemming, which provides for folding hems of different widths and for turning the hem either over or under the main portion of the material as may be desired, said guide being suitable for use in a sewing machine or for turning a hem for sewing by hand.

*Claim.*—The hem folder, composed of a straight gauge a and adjustable plate C, constructed as described, and a bar h, the whole combined as described, either arranged as shown in Figs. 1, 3, and 4, or as in Figs. 2, 5, and 6, and operating substantially as described.

No. 25,808.—R. R. COLE, of Geneva, N. Y.—*Improved Method of Opening and Closing Gates.*—Patent dated October 18, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The arrangement of the bar G<sup>2</sup> to the levers G<sup>3</sup> and G<sup>4</sup>, at such points as to give their lower ends the same motion inward or outward at the same time, substantially as set forth.

No. 25,809.—JONATHAN CREAGER, of Cincinnati, Ohio.—*Improvement in Machines for Sawing Beveled Curves.*—Patent dated October 18, 1859.—The object of this invention is to make a machine for the rapid, accurate, and varied manufacture of the curved tops and slats of chairs and analogous forms of cylindrical segments.

The inventor says: I *claim*, first, the combination of the inclined rest R with a crown saw, for the production of a crowning cylindrical segment.

Second. The combination of a rocking rest H with a crown saw, for the manufacture of a cylindrical segment having oblique axes.

No. 25,810.—JAMES CUMMING, of Boston, Mass.—*Improved Try Cock for Steam Boilers.*—Patent dated October 18, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—The combination with an ordinary try cock E of a straight hollow tube D moving vertically on axis C, and which is also the indicator at its outer closed end, and extending through the end or side of the boiler, and at certain periods remaining elevated above the level of the water, but capable of being brought below the same whenever necessary, substantially as and for the purposes set forth.

No. 25,811.—WILLIAM P. CURRY, of Vincennes, Ind.—*Improved Feed Water Apparatus for Steam Boilers.*—Patent dated October 18, 1859.—This invention consists in employing for the connection between the float in the boiler and between the stop valve in the feed pipe, double rods, in such a manner that one of the rods always pulls as well when the float rises as when it sinks down, and that the slightest motion of the float affects the valve, no matter what distance between said valve and the boiler.

*Claim.*—The arrangement of the rods G G<sup>1</sup> H H<sup>1</sup> I I<sup>1</sup>, or their equivalents, to operate in

combination with the disks *i e k m*, or their equivalents, and with the float B and stop valve K, substantially as and for the purposes set forth.

No. 25,812.—ANDREW J. CURTIS, of Frankfort, Me.—*Improvement in Operating Field Gates*.—Patent dated October 18, 1859.—This invention consists in a peculiar arrangement of mechanism for opening and closing a gate, the same consisting of a two armed lever and two connecting rods applied to the said lever and the outer vertical parts of the gate; also, in combining therewith a peculiar locking contrivance, whereby the two parts of the gate are firmly maintained either open or closed.

The inventor says: I *claim* the improved arrangement of mechanism described, for opening and closing a gate, the same consisting of the lever G and the connecting rods M N, applied to the said lever and the gate posts H I, substantially as and for the purpose set forth.

And, in combination therewith, I claim the peculiar arrangement of the block *f*, the same operating in connection with the lever G, in the manner and for the purpose specified.

No. 25,813.—J. B. DAGNE, of Ashley, Ohio.—*Improvement in Construction of Evaporating Apparatus*.—Patent dated October 18, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The employment of the pan F, which is provided with two or more compartments and situated over a furnace, when said pan is used in connection with the slides F and C and damper D, the whole being combined and arranged substantially in the manner set forth, for the purpose of forming a sugar evaporator, as described.

No. 25,814.—JOHN DANNER, of Canton, Ohio.—*Improvement in Sleeping Cars*.—Patent dated October 18, 1859.—Each alternate back is made narrower than the others and is hinged to the seat, while each alternate back is provided with a back *a*, the frame of which is rigidly secured to the seat frame D, while the false backs *d* thereof are so hinged to the back of the seats *c* that they can be let down as shown in the engravings.

The inventor says: I *claim*, first, the combination of the hinged false back *d* with the permanent back *a*, as and for the purposes set forth.

Second. I claim making each alternate back *a* with a false back *d*, in combination with making each alternate back *a*<sup>1</sup> shorter than the backs *a*, and hinged to the seat *c*, substantially as and for the purpose set forth.

No. 25,815.—JOHN EBNER and FRANK LEUTHY, of Lancaster, Pa.—*Improvement in Harvesters*.—Patent dated October 18, 1859.—The double eccentric *c* is used in heavy or thickly standing grain and clears the platform twice in each revolution of the driving wheel A; the single or banded eccentric D is used in thin standing grain, raking but once to each revolution. This change is effected by slipping the forked end *g* of the rod G from one peg 10 to the other peg 11.

*Claim*.—The arrangement of the three eccentrics C C D, revolving shaft of the driving wheel, in combination with the rake connecting mechanism, constructed and operating in the manner described.

No. 25,816.—DAVID ELDRED, of Monmouth, Ill.—*Improvement in Ploughs*.—Patent dated October 18, 1859.—The object of this invention is to obtain a plough that will be capable of turning a furrow from the same side of the land, while moving in either direction across the field, and also to obtain one that may be readily manipulated, and on which the driver may ride while the plough is in operation.

*Claim*.—The arrangement, for joint operation, of the share frames B B, axle H, and coulter L, as and for the purpose set forth.

No. 25,817.—GILMORE EMERY and AARON C. WILSON, of Newfield, Me.—*Improvement in Ploughs*.—Patent dated October 18, 1859.—In the engravings, B is the mould board, connected with the landside A by bolts passing through the projections *n n* on the landside, and through corresponding ones on inside of the mould board; C is the point, D the beam, perfectly straight, bolted on either side; the beam can be elevated or depressed at pleasure to regulate the depth of the furrow.

*Claim*.—The arrangement of the various parts of the plough, when constructed as described for the purposes set forth.

No. 25,818.—FRANK P. GOODALL, of Deering, N. H.—*Improvement in Pruning Knives*.—Patent dated October 18, 1859.—This invention consists in combining with, or applying to the ordinary pruning knife an arm rest or support, for the purpose of aiding in more effectually and easily operating the knife.

*Claim*.—The improved article of manufacture, or combination of pruning knife and arm rest, arranged substantially as specified.

No. 25,819.—MERRITT GOODMAN, of Whitlock, Cal.—*Improvement in Machines for Crushing Quartz.*—Patent dated October 18, 1859.—This invention consists in constructing a stamp and shaft, with an aperture large enough to pass the one from a hopper connecting with said aperture at pleasure anywhere on said shaft, the aperture extending from the hopper through the shaft to the place of stamp L.

*Claim.*—A revolving mortar I, or stamping bed, in combination with a hollow stamp and shaft A, as described.

No. 25,820.—OLIVER C. GREEN, of Dublin, Ind.—*Improvement in Clothes Racks.*—Patent dated October 18, 1859.—This invention consists of a device by which the cords of a folding clothes frame may be tightened at pleasure, without previous loosening and without requiring to be either shortened or changed in position; the same device also allowing the feet of the frame to be adjusted to suit an uneven floor; it also consists in constructing the frame of a rhomboidal shape.

*Claim.*—The arrangement and combination of the centre posts A a, arms B C, and braces D E, operating in the manner and for the purposes set forth.

No. 25,821.—JOEL HAINES, of West Middleburgh, Ohio.—*Improvement in Field Fences.*—Patent dated October 18, 1859.—This invention consists in rounding the upper ends of the braces where they come in contact with the keys that lock the fence, so that the fence may be either set at a right angle with the sill or inclined; and in making one or more notches in the sill, so as to hold the fence at a right angle to the sill or inclined, as may be preferred, to adapt the fence to side hills and uneven ground.

*Claim.*—The peculiar construction of the braces so as to adapt them to the keys, when combined with a sill having one or more notches, so as to hold the fence perpendicular when the sill is inclined substantially as described.

No. 25,822.—WILLIAM HALL, of Indianapolis, Ind.—*Improved Apparatus for Preventing Horses from Running Away.*—Patent dated October 18, 1859.—This invention consists in attaching a frame work to the upper part of a horse's headstall or bridle, which is so constructed as to throw a blind across the horse's eyes in a moment at the will of the rider or driver.

*Claim.*—The apparatus described, when constructed and operated in the manner and for the purpose described.

No. 25,823.—WILLIAM HALL, of Indianapolis, Ind.—*Improvement in Lightning Rods.*—Patent dated October 18, 1859.—The inventor, in describing the mode of manufacturing his improved lightning rod, says: I cut a strip of copper-plate the desired width and any length convenient; I then have a steel rod, about half an inch in diameter, with a groove on one side, coming close to a guard or plate, upon which is placed the strip of copper; I then turn the rod by means of a crank and thus wind the sheet around the rod, afterwards slipping it off, which gives me one section; these sections are slipped into each other, continuously, and fastened together by means of a rivet, until the rod is of sufficient length. In order to get any amount of surface, I cut the strip as wide as I desire, so that I can wind it several times around the steel rod, still leaving the edges open, giving unbroken play to the electricity over both the inside and outside surfaces.

*Claim.*—As an article of manufacture, the construction of a lightning rod presenting a great amount of conducting surface in a compact form, when the same is constructed in the manner set forth.

No. 25,824.—SAMUEL W. HAMSHER, of Decatur, Ill.—*Improvement in Harrows.*—Patent dated October 18, 1859.—This improvement consists in a certain arrangement of the parts, whereby the roller and harrow may be so adjusted as that the roller is the means of defining the extent of the penetration of the frame teeth, whilst either may rise and fall to accommodate itself to the inequalities of the ground without influencing the other.

*Claim.*—The arrangement of the harrow frames, toothed roller, and hinged adjustable arms, as set forth and explained, and for the purpose stated.

No. 25,825.—JOSEPH HARRIS, of Allegheny, Pa.—*Improvement in Railroad Brakes.*—Patent dated October 18, 1859.—The brakes are applied from the rear end of the last car of the train, thereby causing a retarding motion of the train; or they can be applied from the front end of the train, by placing the apparatus for winding the chain or rope on one of the running axles of the tender. In the engravings it is represented on the rear of the truck of the last car of the train.

The inventor says: I *claim*, first, the combination of the winding apparatus, the weight  $w^1$ , lever  $t$ , rod  $r^1$  bent lever  $e^1$ , sliding ring  $d^1$ , sleeve  $r$ , anti-friction ring  $z^1$  and  $z^2$ , conical centre piece  $p$ , collar  $c^2$ , with friction plates  $a^1$  and  $a^2$ , and spring plates  $b^1$  and  $b^2$ ; also screws  $n^1$  and  $n^2$ , arranged in the manner and for the purpose substantially of operating a railroad brake.

Second. The combination of the pawl  $t$  and spring  $u$  with ratchet  $s$  and drum  $l$ , with short chains  $k k$ , and rods  $h h$ , the arm  $m m$ , with pulleys  $q q$ , connected by chains, rods, or ropes,

for applying and maintaining the strain of a railroad brake at the centre of each car, substantially as described and set forth.

Third. The combination of the rod *v*, with the long arm of the pawl *t*, and the cross lever *y*, connecting the shaft of the bunter *x*, to pawl *t*, for the purpose of setting the brakes free; the whole substantially as described and set forth.

No. 25,826.—JAMES HAWKINS, of Wilkins Township, Pa.—*Improvement in Steam Ploughs*.—Patent dated October 18, 1859.—This invention acts on the principle of a lever instead of a screw or inclined plane. It has also a shaft with circular knives *P* on it, to cut or separate the sod before the teeth act upon it.

*Claim*.—The arrangement of the frames *A* and *F*, levers *J* and *E*, caster wheels *G* and *I*, drivers *B*, crank shaft *S*, cutter *P*, toothed cylinders *C* and *H*, levers *D* and *N*, operating conjointly as set forth for the purposes specified.

No. 25,827.—JOSEPH HOLLEN, of Fostoria, Pa.—*Improvement in Knitting Machines*.—Patent dated October 18, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—The combination of a needle, the barb of which is pressed by its own spring into its own groove, with a thread carrier, to release the barb and lay the thread therein, and a supporting guide to sustain the needle, when arranged and operated substantially in the manner and for the purpose described.

No. 25,828.—FRANCIS A. HOYT, of Boston, Mass.—*Improved Water Gauge for Steam Boilers*.—Patent dated October 18, 1859.—This invention consists in the peculiar arrangement of a steam whistle, its valve conduit, and valve seat, relatively to the dry steam chamber and the operating lever of the float.

*Claim*.—The described arrangement of the steam whistle, its valve, conduit, and valve seat, relatively to the dry steam chamber and the operating lever of the float.

No. 25,829.—THOMAS J. HUDSON, of Newbern, N. C.—*Improvement in Packing Piston Rods of Steam Engines*.—Patent dated October 18, 1859.—This invention consists in a combination of stuffing boxes and glands, one within the other, with hemp or rubber packing intervening, the first layer of which receiving the full heat of the steam prevents the heating of the second layer, which, being always moist and elastic, preserves the valve stem or piston rod from cutting or rusting, and by this means prevents the escape of steam between the packing and the rod.

*Claim*.—The method of packing the glands *a a* and applying the gland *c*, with the packing in *d d*.

No. 25,830.—WILLIAM H. HUNT, of Brooklyn, N. Y.—*Improvements in the Construction of Vapor Burners*.—Patent dated October 18, 1859.—This invention consists in so arranging a vapor gas burner as to prevent, in a great degree, the deposit of rosin, or other matter, from accumulating within or around and closing the opening. It also consists in the manner of constructing the air and hydro-carbon reservoir and burner separately, and combining them with the conical frustrum of inclined planes and draft holes and with each other, so as to enable any one to clean out from the interior any resinous or other substance which may collect within the reservoir and burner.

*Claim*.—The combination in a vapor burner of a conic frustrum *i* and draft holes *k*, substantially as specified, in combination with the orifice *n* and damper *v*, the whole being constructed and combined substantially as and for the purpose specified.

No. 25,831.—GEORGE P. HUNT, of New York, N. Y.—*Improvement in Oil Cans*.—Patent dated October 18, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The arrangement of the valve with the point of the tube or spout as described, in combination with the extension of the point of the valve for operating it, by which arrangement, when the point of the valve is relieved from pressure, the further discharge of oil from within the tube is prevented as set forth.

No. 25,832.—J. BURROWS HYDE, of Newark, N. J.—*Improvement in the Construction of Compound Blowpipes*.—Patent dated October 18, 1859.—This invention consists in the employment of inflammable gas for soldering, heating &c., by means of two distinct tubes placed one within the other, the inner tube being slightly less in diameter than the inner diameter of the outer tube, so that the gas may flow through one tube while the atmospheric air is blown through the other.

The inventor says: I *claim* the compound conical nozzle *g*, constructed with the projecting tubes *n* and *k*, as described, combined with the concentric elastic tubes *e* and *f*, as described.

Second. The receiving tubes *a* and *b*, with their projecting tubes *c* and *d*, for attaching thereto the elastic tubes, as described.

No. 25,833.—A. KIRLIN, of New Boston, Ill.—*Improvement in Corn Planters*.—Patent dated October 18, 1859.—This invention consists in arranging on each side of the machine the markers for spacing the ground as the machine proceeds forward, and upon the shaft of these markers a cam, by a peculiar arrangement of which the corn is dropped from the hoppers at desired intervals as the markers rotate.

*Claim*.—The cam I, spring arm J, ratchet and pawl K L, when the same are arranged as set forth and operated by the marker wheels G G, for giving motion to the rotary hopper bottoms for planting the corn, as described.

No. 25,834.—GEORGE H. KITCHEN, of New York, N. Y.—*Improvement in the Construction of Gas Regulators*.—Patent dated October 18, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The construction of the valve chamber A, having the valve fitted within it, substantially as described, with a series of recesses *d d*, whose width increases in an upward direction, or an equivalent series of passages surrounding the valve and having their area of opening increased by the ascent and diminished by the descent of the valve, as described.

No. 25,835.—ADAM KLAUS, of Belleville, Ill.—*Improvement in Seed Planters*.—Patent dated October 18, 1859.—This invention consists in arranging the dropping apparatus in a particular manner, by means of a valve and a sliding door, which are both operated simultaneously with the seed slide, so that always one throw of the seed or corn is kept in store in the lower part of the discharge to be ready to drop as soon as the sliding door opens.

*Claim*.—The valve *r*, in combination with the sliding door *p*, when the same is operated simultaneously with the seed slide, substantially in the manner and for the purpose described.

No. 25,836.—JESSE S. LAKE, of Smith's Landing, N. J.—*Improved Steering Apparatus*.—Patent dated October 18, 1859.—O is a collar on or near the outer end of the pin F and works in the recess H in the periphery of the barrel C; one end of the braces L L are hinged to the catches I I, the other is hinged or pivoted to the barrel C at X X.

*Claim*.—The arrangement of catches I I, braces L L, collar O, pin F, in combination with the barrel C, substantially in the manner and for the purpose set forth.

No. 25,837.—JAMES LANCELOTT, of South Providence, R. I.—*Improvement in Making Ornamental Chains*.—Patent dated October 18, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the employment or use of the fillings *b*<sup>1</sup> in the female die Q, when used in connection with a travelling die *r*, for the purpose of ensuring the proper presentation of the blanks to the latter, and at the same time admitting of a proper cutting edge for the female die Q.

Second. The employment of a forming die J in connection with a rotating or partially rotating die *r*, arranged substantially as shown to ensure, simultaneously with the process of swaging the blanks into the proper shaped links, the proper adjustment of the latter for interlocking of the same.

Third. The decreased diameter of the upper portion of the forming die J, so as to ensure the adhesion of the cap, cup, or link to it, and enable the said die to perform the double function of die and carrier, when said die J is used in connection with the die *r*, to operate conjointly as and for the purpose set forth.

Fourth. Constructing the die *r* with a rod *v*<sup>1</sup> with or without shares or projections *a*<sup>1</sup>, and arranged substantially as and for the purpose set forth.

Fifth. The clearer rod *h* and collar *n*, either or both applied to the forming die J, and arranged to operate in connection with the die *r* and rod *v*, substantially as and for the purpose set forth.

Sixth. The clamps *j* in connection with the swage or clinching tool R or its equivalent, arranged to operate conjointly, as shown, and for the purpose specified.

Seventh. The guide plate *f*, in connection with the swage or clinching tool R, the former serving as a guide to the latter and ensuring its proper action.

Eighth. The swage or clinching tool R, when constructed as shown, to bend or clinch the arms of the links, and at the same time keep the arms of the uppermost link in proper position, so that the latter may readily receive the succeeding link.

No. 25,838.—S. E. LANPHEAR and O. D. BARRETT, of Cleveland, Ohio.—*Improved Washing Machine*.—Patent dated October 18, 1859.—This invention consists in attaching to the centre of the tub A the permanent standard B, on which is placed the sleeve C, having its upper end soldered and square, and having on its lower end a flange for fastening to it the disk D.

*Claim*.—Supporting the disk E, by its stem C, on the standard B, as and for the purpose set forth.

No. 25,839.—EVAN LEIGH, of Manchester, England.—*Improvement in Cotton Spinning*

*Machinery.*—Patent dated October 18, 1859; patented in England, February 26, 1858.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the construction of top rollers and spindles with the arrangement of one or more of the bosses loose revolving thereon.

Second. The application of a journal, or all kinds of shafting spindles, studs, or axles, having the bearing part of the shaft, spindle, or axle, or stud, larger in diameter than the part immediately outside the bearing.

Third. The rounding out or dishing the edges of the steps or bosses, in combination with the tapering of journals or axles, of all kinds, by which I obtain the action of capillary attraction, for the purpose set forth.

Fourth. I also claim the application of a top roller of a spinning machine to its spindle in such a manner as to enable such top roller to rotate on the spindle and to rock in a longitudinal direction, in order that it may properly adjust itself to the under rollers, while the two may be in use.

No. 25,840.—FRANK MAXSON, of San Francisco, Cal.—*Improved Amalgamator.*—Patent dated October 18, 1859.—A is a cast iron pan, with a concave bottom, surrounded by a rim, on one side of which is a discharge spout; this pan is suspended by three rods B, attached to eyes in the top of frame C, the rod on the opposite side of the spout to have a screw for the purpose of raising or lowering the spout D; bolted to C<sup>1</sup> is the wood D<sup>1</sup>, C being arranged with slotted holes to give more or less throw to the pan A, D<sup>1</sup> being in two parts, with part of a hole in each to conform to the size and shape of the projection pin F.

The inventor says: I *claim* the use of the eccentric revolving pan, constructed and operated as described, in connection with the amalgamated plate, as specified.

I also claim the arrangement of the shaft E, projection pin F, with the slotted piece C<sup>1</sup> and wood D<sup>1</sup>, whereby a more or less eccentric motion is imparted to the pan A, as described.

No. 25,841.—THOMAS J. MAYALL, of Roxbury, Mass.—*Improvement in the Composition of Emery for Grinding and Polishing Tools.*—Patent dated October 18, 1859.—The claim explains the nature of this invention.

*Claim.*—My new compound for emery sharpening and polishing tools, the same being made by combining fifteen pounds of emery, one pound of India rubber or gutta percha, and five ounces of sulphur.

No. 25,842.—C. A. McEvoy, of Richmond, Va.—*Improvement in Metallic Seals for Letters, &c.*—Patent dated October 18, 1859.—This invention consists of two metallic concave disks, to be used together, having sharp points projecting from their circumferences, said points having an inclination toward the centre of the disks.

*Claim.*—The use together, in the manner described, of the metallic concave disks, having sharp points projecting from their circumferences, substantially as set forth.

No. 25,843.—THOMAS McQUISTON, of Morning Sun, Ohio.—*Improvement in Cultivators.*—Patent dated October 18, 1859.—This is an improvement in double wheeled cultivators, and consists in a construction and arrangement of parts having for their object the greater manageability and more effective action of this class of implements.

*Claim.*—The described arrangement of the elevated axle D, beam A A<sup>1</sup>, brackets C C<sup>1</sup>, and rods B B<sup>1</sup>, the whole being constructed in the manner and for the purposes set forth.

No. 25,844.—JOHN H. MEARS and GEORGE CAMERON, of Oshkosh, Wis.—*Improvement in Car Couplings.*—Patent dated October 18, 1859.—This invention consists in the construction of car couplings in such a manner that when a car runs off the track it will uncouple itself from the rest of the cars.

The inventors say: We *claim*, first, the tongue G, for retaining link H, constructed and operating as described.

Second. The arrangement of yoke A, lever C, and spring B, and connecting rod F, constructed and operating as described.

No. 25,845.—ADAM MILLER, of Mount Pleasant, Iowa.—*Improvement in Mole Ploughs.*—Patent dated October 18, 1859.—This invention consists in the peculiar arrangement and combination of parts for forming a mode of detaching the mole in drain ploughs.

*Claim.*—The employment of the rod H, in combination with the coulter B, provided with staples *o o*<sup>1</sup>, and the mole J, provided with the hooks *m n* and *s s*, substantially as and for the purposes specified.

No. 25,846.—JOHN MORRISON, of De Witt, Ill.—*Improvement in Mole Ploughs.*—Patent dated October 18, 1859.—This invention consists in a novel means employed for varying the position of the line of draft relatively with the beam and mole, whereby the implement may be guided or moved by the draft alone.

*Claim.*—The draft chain G, bar F, loops H H, and the adjusting screw rods J J, or their

equivalents, combined, arranged, and applied to the plough, substantially as and for the purpose set forth.

No. 25,847.—WILLIAM HENRY MORRISON, of Nottingham, England.—*Improved Machine for Manufacturing Bonnet and Cap Fronts, &c.*—Patent dated October 18, 1859.—These improvements relate to the means of folding goffered or fluted lace, or net, and for the application to the back or folded part thereof of bands or tapes.

The inventor says: I *claim* the application, in apparatus or machinery of the character referred to, of bars or gauges *h h*, operated to move simultaneously towards the lace or other fabric, substantially as explained.

I also claim the adaptation of plates *ff*, operating in manner and for the purpose substantially as explained, when employed in the manufacture of bonnet and cap fronts, ruches, and such like articles of millinery.

No. 25,848.—ENOCH OSGOOD, of Boston, Mass.—*Improvement in Cotton Gins.*—Patent dated October 18, 1859.—This invention relates to an improvement in the roller gin, whereby the advantage attending the use of this kind of gin is obtained, to wit: the separating the seed from the staple without injuring the latter, and at the same time a great speed obtained, so that the work will be done expeditiously and in a perfect manner.

The inventor says: I *claim*, first, the rollers *B B*, plates *C C*, and bands *D*, arranged substantially as and for the purpose set forth.

Second. The combination and arrangement, in a cotton gin or wool burring machine, of the clearer *K*, rollers *B B*, angular plates *C C*, bands *D*, slotted arms or bars *J J d d*, pinion *G*, and wheel *I*, in the manner and for the purpose described.

No. 25,849.—SEWALL PEARSON, of Boston, Mass.—*Improved Cabinet Chair.*—Patent dated October 18, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—Arranging in a bureau, chair, or other piece of furniture *A*, in combination with a perforated seat *B*, and with a self-closing pot *G*, a water tank *C*, which forms the back for the seat, and which communicates with the pot by means of a spout *E*, substantially as and for the purpose specified.

No. 25,850.—GEORGE J. PRENTISS, of Fall River, Mass.—*Improved Polishing Iron.*—Patent dated October 18, 1859.—The object of this invention is to furnish the ironer with a polishing iron of a novel construction, whereby he can apply both hands to the work, and in this manner exert a much greater pressure upon the iron, the result of which is, that the garments receive a much finer polish and in less time, than where one hand is used.

*Claim.*—The polishing cup *A*, as set forth, having two handles *C E*, arranged as represented and described, or in any other manner substantially the same, for the purposes mentioned.

No. 25,851.—HIRAM M. SMITH, of Richmond, Va.—*Improvement in Trusses for Relieving Piles.*—Patent dated October 18, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, as improvements in the construction of anti-hemorrhoidal pads, first, the manner of sustaining such pads by means of springs passing from the pad to the front of the patient, and in a spiral form along the groin to a point over the hip joint, in combination with the plan of sustaining the instrument by flexible fastenings attached above the hip joints, thus making the instrument self-adjusting and enabling the patient to exercise in any position without inconvenience.

Second. The manner of balancing the instrument by means of flexible fastenings attached over the hip joints, no matter how the arms of the pad may be varied.

No. 25,852.—JOSEPH W. SPRAGUE, of Rochester, N. Y.—*Improvement in the Tubular Connections of Bridges.*—Patent dated October 18, 1859.—This invention consists of a series of clutches of peculiar construction, in combination with tubular sections and with braces for making trussed bridges.

*Claim.*—The described series of clutches *C*, provided with bands *c*, in combination with the tubular sections *B*, for the purposes substantially as set forth.

No. 25,853.—DAVID H. STICKNEY, of Cincinnati, Ohio.—*Improvement in Cocks.*—Patent dated October 18, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—The supplementary chamber *D* and stationary stuffing box *C* in combination with a hollow piston *E*, having ingress apertures *G*, adapted to be placed on either side of the said stuffing box by the motion of the piston, as set forth.

No. 25,854.—AUGUSTUS J. THOMPSON, of Malden, Mass.—*Improvement in Bustles.*—Patent dated October 18, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The combination of a spring bustle of a flat spring or springs *b*, united at their

ends to form the perimeter of the bustle, or its frame work, and spread or divided to establish a base at their bearing surface or surfaces against the body of the wearer, and spiral springs *c* of conical configuration, and arranged to form cross ties to the flat springs with their bases resting against the base formed by the latter, and for action in concert with the latter, and unitedly, essentially as set forth.

No. 25,855.—ELIJAH THORN, of Selma, Ohio.—*Improvement in Portable Crabs for Mole Ploughs*.—Patent dated October 18, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The arrangement of the frame *F*, as constructed with the boxes *a a*, which are attached to the rear of the frame *A*, and with the axle *I* and wheels *J J*, the several parts being connected together and used, not only for elevating the machine, but for guiding its rear and changing its position, substantially as set forth.

No. 25,856.—EBEN C. TUTTLE, of Naugatuck, Conn.—*Improvement in the Manufacture of Hoes*.—Patent dated October 18, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—The construction of a hoe, as a new article of manufacture, by securing the eye in the blade by two projecting swells or beads *a* and *b*, when constructed and fitted for use, substantially as described.

No. 25,857.—BENJAMIN F. WELLS, of Georgetown, D. C.—*Improvement in Naval Architecture*.—Patent dated October 18, 1859.—This invention consists in giving the model or shape to vessels by means of drafts prepared entirely by the compass or slide rule without the use of solid models or moulds, by reason of lines being all arcs of circles, or derived from a solid whose outlines are arcs of circles.

*Claim*.—Deriving the lines of vessels of all kinds and dimensions from sections of a circular spindle of any dimensions or proportions, substantially as described and shown.

No. 25,858.—WILLIAM WHEELER, of West Poughkeepsie, N. Y.—*Improved Carpet Stretcher*.—Patent dated October 18, 1859.—This apparatus, complete, is in three parts, each performing its own function, viz: the spacer, the fastener, and the stretcher; but only the stretcher is claimed in the specification, the other parts being represented and described to show their connection with the use of the stretcher.

*Claim*.—The stretcher *C*, when provided with the notch *r* and the heel points *t t*, for the purpose set forth.

No. 25,859.—J. T. WILDER, of Greensburgh, Ind.—*Improved Horizontal Water Wheel*.—Patent dated October 18, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, constructing a water wheel with two sets of involute buckets, whose capacity shall be in the relative proportion to each other, as specified, for the purpose set forth.

Second. The combination, with a wheel such as has been described, of a casing provided with two channels of different capacities, and with two gates arranged as described, the whole being constructed and operated substantially as and for the purpose specified.

No. 25,860.—CHARLES A. WILSON, of Cincinnati, Ohio.—*Improvement in Thermostats*.—Patent dated October 18, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—A tubular thermostat, forming a part of the steam or other passage to be regulated and adapted by means of the unequal expansion of the metals of which it is composed, to close the said passage by lateral deflection, as explained.

No. 25,861.—GEORGE W. YERBY, of New York, N. Y.—*Improvement in Bustles*.—Patent dated October 18, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The bustle as described, in which the waistband has a back piece *S*, and a corset or part corset *n* in front, provided with one, two, or more sets of pockets, into which the springs of the bustle are inserted, the whole being constructed and operated in the manner and for the purpose substantially as described.

No. 25,862.—JAMES M. ADAMS, of Canton, Mass., assignor to Himself and ALONZO JOHNSON, of said Canton.—*Improvement in Weeding Hoes*.—Patent dated October 18, 1859.—The object of this invention is to construct a hoe for weeding and cultivating the ground, which, while it presents a large amount of cutting edge, and is of a form that will easily enter the ground to cut the roots of the weeds, will also lighten and loosen up the soil at the same operation.

*Claim*.—The arrangement of the two blades with the bifurcated handle, the whole being constructed in the manner and for the purposes set forth.

No. 25,863.—BENJAMIN L. AGNEW, of Indiana, Pa., assignor to G. P. REED, of said Indiana.—*Improvement in Preserve Cans.*—Patent dated October 18, 1859.—This invention consists of a preserve jar constructed with an inner rim or flanch of less depth than the outer rim forming the mouth proper of the jar, whereby the V groove between the two flanches or rims and also the entire top of the stopper can be supplied with cement in a manner to render the jar air tight.

*Claim.*—The combination in a preserve jar of a deep outer flanch or rim E with a shallow inner flanch B, in the manner and for the purpose described.

No. 25,864.—JOHN G. BAKER, of Washington, D. C., assignor to Himself and ASA L. CARRIER, of said Washington.—*Improvement in the Rods of Window Blinds.*—Patent dated October 18, 1859.—This invention consists in using thin, cheap, sheet metal, such as zinc, tin, sheet iron, or other metal, forming it into small tubes, the edges coming together in such a manner as to leave small ears at suitable distances, with a hole through each, to connect with the slats by staples, or in any suitable manner.

*Claim.*—The peculiar construction of thin metallic tubes, the two edges so forming the ears or rings *e e e*, in combination with wire staples or rings, to connect wood slats for movable blinds, substantially as set forth.

No. 25,865.—BARRON DAVIS, of Brooklyn, N. Y., assignor to OSBORN & VINCENT, of New York city.—*Improvement in Bustles.*—Patent dated October 18, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—Attaching the hoops *c d e*, &c., to the extension B, by fixed and immovable connections, so that the hoops cannot be thrown forward or outward, when the hoops are connected to the band A by means of the cross bands *g g*, in combination with the back point or extension C, as and for the purposes set forth.

No. 25,866.—J. BURROWS HYDE, of Newark, N. J., assignor to PHEBE BANNAN, of said Newark.—*Improvement in the Method of Making Gas from Peat.*—Patent dated October 18, 1859. The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, exposing such peaty matter to thorough desiccation by artificial heat, and conveying it to the retort without permitting it to absorb moisture from the air.

Second. Granulating or powdering such peaty matter, distilling and cooling it in closed cases, as described.

Third. Employing the heat evolved in cooling the carbonized material to aid in desiccating the peaty matter, as described.

No. 25,867.—JOHN MACLURE, of Newark, N. J., assignor to Himself and SAMUEL E. TOMPKINS and SAMUEL C. NORTHRUP, of said Newark.—*Improved Machine for Covering Saddle Trees.*—Patent dated October 18, 1859.—The object of this invention is to facilitate and expedite the covering of the seats of saddle trees, work which has hitherto involved time and manual labor at considerable expense.

The inventor says: I *claim* the employment of an elastic bed or cushion D in combination with the cover and seat J, substantially as and for the purpose described.

Second. The arrangement and combination of the box B, adjustable sliding bars E, elastic cushion D, seat J, clamp K<sup>1</sup>, and pressing lever G, as and for the purpose shown and described.

No. 25,868.—S. W. PALMER and J. F. PALMER, of Auburn, N. Y., assignor to S. W. PALMER, N. PALMER, and JOHN PATTY, of said Auburn.—*Improved Clothes Frame.*—Patent dated October 18, 1859.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, hinging the arms of a clothes frame to the sliding hubs by means of the pins *d*, which are supported by the open lugs C, when the said arms are constructed and the several parts arranged substantially in the manner and for the purpose described.

We also claim, in combination with the shaft and its grooves, the sliding catch ring F with its spring *h* and projection *i*, for retaining the frame in its position, substantially as described.

We also claim, in combination with the central post or shaft and sliding frame, the hoisting apparatus, consisting of the clutch rings *k* and *m* with their springs *o*, lever *p*, and link *q*, substantially in the manner and for the purpose described.

No. 25,869.—CONRAD RODER, of Ceralvo, Ky., assignor to Himself and J. T. ILER, of said Ceralvo.—*Improvement in Fancy Looms.*—Patent dated October 18, 1859.—This invention consists in the construction and arrangement of the hooks from which the harnesses are suspended, in combination with an adjustable bed plate and elevating sash, by means of which said hooks are rendered self-adjusting with reference to said sash, without the aid of springs or catches of any kind.

*Claim.*—The combination and arrangement of the double catch hooks  $h h^1$ , adjustable guide plate  $j$ , the sash  $E$  and  $J$ , with the lifting bar  $k$ , in the manner and for the purpose described.

No. 25,870.—WILLIAM DAVID SLOAN, of New York, N. Y., assignor to A. B. CHAPMAN, of said New York.—*Improved Clasp for Skeleton Skirts.*—Patent dated October 18, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The clasp  $c$  for uniting the tapes or galloons to the hoops in skeleton skirts; said clasp being formed with a narrow ribbed or V shape back piece 2, for the purpose specified.

No. 25,871.—JAMES SPEERS, of West Manchester, Pa., assignor to Himself and ALEXANDER POSTLEY and JOHN WIBLE, of Allegheny county, Pa.—*Improved Paddle Wheel.*—Patent dated October 18, 1859.—This invention consists in arranging two or more buckets or floats of paddle wheels of steamboats, ships, and other vessels, in a zigzag position; said buckets or floats being twisted or curved for the purpose of giving to each bucket or float, and to each series of buckets or floats, a double action, viz: to throw the water from right to left and toward each series of buckets, thereby giving to the wheel or wheels a sculling action.

*Claim.*—The arrangement of the flanges  $a$  and  $a^1$ , the arms  $b$  with points  $x$ , the braces  $c$ , and floats  $d$ , when used for the purpose of constructing a propeller, substantially in the manner set forth.

No. 25,872.—STEPHEN F. VAN HAGEN, of Albany, N. Y., assignor to GEORGE KILBOURN, of said Albany.—*Improvement in Banjos.*—Patent dated October 18, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the combination in one instrument of the banjo parchment covered open body, with the neck and fretted finger board of the guitar; the thumb string of the banjo being added to the usual strings of the guitar, substantially in the manner and for the purpose set forth.

I also claim the formation of the front part of the body of the instrument, of an acute oval or lancet form, in the manner and for the purpose set forth.

No. 25,873.—BENJAMIN F. AVERY, of Louisville, Ky.—*Improvement in Moulding Ploughs.*—Patent dated October 25, 1859.—This invention consists in constructing the pattern for the short landside of the plough, patented by this inventor January 8, 1856, in two parts, so that they may be drawn at opposite angles from each other, and in this manner forming the holes or depressions and ridges or depressed squares upon the outer surface of the short landside.

*Claim.*—The peculiar construction of the patterns  $B C$  of the short landside, as set forth, so that they may be drawn at opposite angles from each other, for the purpose and in the manner specified.

No. 25,874.—G. H. BABCOCK, of Westerly, R. I.—*Improved Bronzing Machine.*—Patent dated October 25, 1859.

The inventor says: I *claim*, first, in combination with mechanism for conveying the sheet, the use of rubbing cylinder  $E$  and brush  $F$ , one or more of each, for the purposes, and operating substantially in the manner described.

Second. I claim the use of one or more stationary rubbers  $H$  or their equivalents, for the purpose specified.

Third. I claim the wires  $x x x x$ , or their equivalents, for freeing the brush from the powder.

Fourth. I claim constructing the griper, in the manner described, whereby I obtain the advantages set forth.

Fifth. I claim the rubbing and brushing cylinders in a case, for the purpose of retaining the powder and preventing waste.

No. 25,875.—JOHN W. BARCROFT, of Friendship, Va.—*Improvement in Ditching Machines.* Patent dated October 26, 1859.—This invention consists in a combination of a revolving wheel with buckets or scoops set in rectangular form, with a stationary circular guard and an adjustable scraper; also in having the buckets or scoops hung on an axis at the centre of their length and adjustable at both ends; and also in providing sharp cutters projecting at right angles from the centre of the scoop.

The inventor says: I *claim*, first, the combination of a revolving wheel  $B^2$  having its buckets or scoops  $C$  set tangentially, with a stationary circular guard  $I$  and an adjustable scraper  $G$ , substantially as and for the purpose set forth.

Second. Having the buckets or scoops hung on axis  $D$  at the centre of their length, and adjustable at both ends, substantially as and for the purposes set forth.

Third. Providing sharp cutters  $a$  projecting at right angles from the centre of the scoop, substantially as and for the purpose set forth.

No. 25,876.—WILLIAM T. BARNES, of Buffalo, N. Y.—*Improvement in Sewing Machines.*

Patent dated October 25, 1859.—This invention consists in the arrangement and peculiarities of devices named in the claim.

*Claim.*—The arrangement of the threaded elastic looper H, as constructed, with a receiving and transferring spring G, when the two are secured on opposite sides of the needle, and operated to and from the needle by means of levers E and F, connecting rods D and D<sup>1</sup>, and frames C C, the several parts being combined and connected substantially as and for the purpose specified.

No. 25,877.—MELLEN BATTEL, of Albany, N. Y.—*Improvement in Coal Sifters.*—Patent dated October 25, 1859.—This invention consists in the employment in the vertical section of an upright or vertical shaft turning on a pivot below, fastened to a cross bar attached to the side of the box A. On the top of said vertical shaft is a bevel or mitre wheel, together with four arms, upon which the sieve revolves. Connected with this shaft is a horizontal shaft and bevel wheel working into the bevel on the upright shaft hanging on a cross bar fastened to the outside shell of the box, on the end of the horizontal shaft is a crank for the purpose of putting the sieve in motion.

*Claim.*—The stationary ploughs and brushes and rubbers in combination with the horizontal revolving sieve, as described and set forth and made to operate.

No. 25,878.—C. F. E. BLAICH, of Elyria, Ohio.—*Improved Apparatus for Operating Rudders.*—Patent dated October 25, 1859.—This invention consists in the arrangement of one or more spiral ribs on the rudder shaft, and having a sliding tube fitted to said ribs by means of spiral grooves formed in its eye, said tube having ears and being dovetailed to a plate on the stern of the ship so as to slide up and down on said plate and on the shaft within a groove or space provided in the back of the rudder.

*Claim.*—The combination of the rudder B C, spiral ribs D, and spirally grooved sliding tube E, substantially in the manner and for the purpose set forth.

No. 25,879.—C. C. BOMBERGER, of West Carlisle, Ohio.—*Improved Method of Elevating Water.*—Patent dated October 25, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The arrangements of the air tight boxes C F, connected by the pipe G, and communicating respectively with the pipes A D, in connection with the open vessel E, tube H, and the valves *b o* placed in the tube H and pipe P, and operated automatically as shown, or in an equivalent way, for the purpose set forth.

No. 25,880.—W. NEWTON BROWN, of New York, N. Y.—*Improvement in Mechanism for Converting Rotary into Reciprocating Motion.*—Patent dated October 25, 1859.—This invention consists in the use of an oblong swivelled ring, in combination with the hub of a rock shaft and cam of a rotating axis passing through the opening of the oblong ring and hub, so that as the cam is rotated the upper and lower sides of the ring are alternately depressed and raised; as the axis of the ring is supported in car pieces on the end of the hub it allows of a swivel like motion in the sides of the ring to accommodate itself to the throw of the cam, which pressing either up or down, as the position of the cam may indicate, causes the hub of the rock shaft to rock on its axis, and thus through an arm attached to its upper or lower sides, communicate a reciprocating motion to any desired piece of mechanism.

*Claim.*—Rock shaft D, having a hollow hub F, substantially as described, in combination with the oblong ring H, and rotating cam J, the said parts being made to operate in the manner set forth and for the purposes specified.

No. 25,881.—MARTIN I. BUTLER, of Nashville, Tenn.—*Improved Floating Safety Cabins.* Patent dated October 25, 1859.—The inventor says: In the operation of this invention, in the case of a fire in the lower hold of the ship, the water can be let into the hold by a person on the deck of the ship, withdrawing the plugs from the holes in the bottom. By the operation of the floating cabin the crew and passengers can be saved in case of a vessel sinking from springing a leak. This floating cabin is navigated by the propeller shown in the engravings.

*Claim.*—The arrangement of the detached boat shaped cabin A, gate propeller I J K M, jointed hinged straps D D, wedge E, rudder F, windlass G, ordinary vessel O, valve S R Q, passage P, and stairs N, all in the manner and for the purpose set forth.

No. 25,882.—MORTIMER M. CAMP, of New Haven, Conn.—*Improved Surf Life Boat.*—Patent dated October 25, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of the water ballast chamber D, with the aperture E, and air pipe H, for the purpose of ballasting the boat when she enters the water, and of lightening it when she touches and reaches the shore, as set forth.

Second. The combination of the valve F with the ballast chamber D and aperture E, for the purpose specified.

Third. The combination of the floors C and G, for the purpose of forming the air chamber E beneath the working floor and between the two floors, as described.

Fourth. The combination of the divisions I I, with the working floor G, to form receptacles between said divisions and the sides of the boat, as and for the purpose set forth.

No. 25,883.—JOHN R. CANNON, of New Albany, Ind.—*Improvement in the Construction of Glass Coffins*.—Patent dated October 25, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—Constructing a coffin of glass, the body of which is provided with a groove  $x x$ , and the lid with a flange  $a a$  and a pump B, the lid being secured to the body by means of metallic bands D D, substantially as and for the purpose specified.

No. 25,884.—M. H. COLLINS, of Chelsea, Mass.—*Improvement in Machines for Bolting Flour, &c.*—Patent dated October 25, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, a curved frame, in which are placed one or more bolting sieves  $d q$ , this frame being open at each end for the discharge of bran or other coarse material, substantially as and for the purposes set forth.

Second. The combination with the curved frame and sieves of a corrugated rubber  $t$ , the frame and sieves having a vibrating motion in the path of a circle, while the rubber remains stationary, substantially as and for the purposes set forth.

Third. The arrangement of sieves of different sized meshes, and having the same vibrating motion on the circular vibrating frame, and in the relation shown to a fan wheel, which causes a draft at the back of the machine, substantially as and for the purposes set forth.

No. 25,885.—CHAUNCEY O. CROSBY, of New Haven, Conn.—*Improvement in Sewing Machines*.—Patent dated October 25, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the rotary bobbin case H (armed with the inclined loop spreader  $H^1$ , and supporting on a pin  $w$ , in its centre, the bobbin G which holds one of the threads) in combination with the loop detainer  $x$ , when the whole is constructed and arranged and made to operate substantially as and by the means described.

Second. I claim the method of detaining the loop of the needle thread after the loop has passed the full diameter of the bobbin case, by the projection and inclined plane terminating in a point on the buffer.

Third. I claim the frame, or form composed of the curved bar O, bar R, and foot  $k$ , in combination with the bolt  $D^1$ , elbow shaped lever  $i$ , (carrying the pieces  $g$ ,) and friction cap  $a^1$ , when the whole is constructed, arranged, connected, and made to feed the material, substantially as described.

No. 25,886.—JAMES CUMMINGS, of Boston, Mass.—*Improvement in Drilling Machines*.—Patent dated October 25, 1859.—This invention consists in the employment of two interlocking slides, moved by two right and left screws, in combination with four gear wheels, a transverse shaft, a horizontal bed plate, and a vertical drill; also, in the manner of allowing vertical play in the connecting rod between the swivel of the drill and the weighted or counterpoised lever, whereby, at every elevation of the drill by the counterpoised lever, said rod rises from its seat and allows oil to flow into the same.

The inventor says: I *claim* the arrangement of the notched interlocking slides H  $H^1$ , right and left screws G G, pinions E E  $d d$ , shaft D, bed plate C I, and upright drill J, all for operation together in the manner and for the purpose described.

Second. The combination of the drill arbor J, hollow swivel oiling cap K L, independently rising and falling rod  $j$ , and disk  $k$ , attached in the manner and for the purpose described.

No. 25,887.—R. C. CYPHERS, of Milledgeville, Ga.—*Improved Washing Machine*.—Patent dated October 25, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of the elastic suspended concave B, with slats  $f$ , pivoted to elastic strips  $g$ , in combination with the jointed spring rubber C, substantially as and for the purpose described.

Second. In combination with the jointed spring rubber C, I claim the employment of a flexible band or rope  $m$ , for the purpose of securing the clothes to the rubber, substantially as specified.

Third. The arrangement of the central slat  $f^1$ , in combination with the elastic suspended concave B and grooves  $n$ , substantially as and for the purpose set forth.

No. 25,888.—HORACE L. EMERY, of Albany, N. Y.—*Improvement in Harvesters*.—Patent dated October 25, 1859.—This invention consists in attaching a small adjustable wheel to the outer end of the cutter bar of mowing machines.

The inventor says: I *claim*, first, combining with the cutter bar an adjustable arm or lever,

provided with a roller or other means of sliding easily upon the ground, for the purpose of sustaining the cutter bar at any required distance from the ground, or allowing it to rest upon the ground at pleasure, for the purposes set forth.

Second. I also claim placing said arm directly in rear of the shoe, in order that it may be prevented by said shoe from clogging, as described.

Third. I also claim connecting said arm by a rod along the back of the cutter bar with a lever near the frame of the machine, so that the attendant may elevate and depress the cutter bar at pleasure.

No. 25,889.—GEORGE M. EVANS, of Pittsburg, Pa.—*Improvement in Seed Planters*.—Patent dated October 25, 1859.—This invention consists in the combination and arrangement of ratchets, ratchet wheels, springs, cranks, and connecting rods, with the hoppers, seed drums, pulleys, endless conveyor, and plough.

*Claim*.—The combination and arrangement of the seed drums *x*, elevators *e* on the belt *f*, with the compartments 1 2 3 of hopper *d*, the cranks *i* and *j*, the connecting rods *k*, the ratchet wheels *g* B and B<sup>1</sup>, and wheel *b*<sup>1</sup>, as described and for the purpose set forth.

No. 25,890.—H. B. FAY, of New York, N. Y.—*Improvement in Coffee Pots*.—Patent dated October 25, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—The arrangement of the tube *d* in combination with the adjustable double strainer D that is arranged in a pot A between the spout and the liquid, substantially as and for the purpose specified.

No. 25,891.—FELIX A. FINN, of New York, N. Y.—*Improvement in Studs and Sleeve Fasteners*.—Patent dated October 25, 1859.—This invention consists of a mode of fastening buttons to shirt sleeves and other like articles of dress, and in the construction thereof.

The inventor says: I *claim*, first, the swivel bar and arm, arranged and operating as specified, for the purpose set forth.

I also claim, in combination therewith, the dovetail stud *m*, to confine the front end of the arm *f* when closed upon it, as and for the purposes set forth.

I also claim the projecting screw *c* against which the spring acts, as described.

I also claim, in combination with the above devices, the spring, constructed and arranged as set forth.

No. 25,892.—FREDERICK O. DEGENER, of New York, N. Y.—*Improved Automatic Fan*.—Patent dated October 25, 1859.—This invention consists in the peculiar construction and combination of an automaton fan, which is arranged in such a manner that part of the machine will set the air in motion and thus cause a current of air which will be sent or thrown in different directions by another movable part or parts of the machine or fan.

*Claim*.—The arrangement and combination of a rotary fan blower, with the hollow vibrating or distributing fan, for the purpose of producing a current of air, and causing it to be distributed, substantially as and for the purpose specified.

No. 25,893.—B. WELLS DUNKLEE, of Boston, Mass.—*Improved Valve for Stoves, Furnaces, &c.*—Patent dated October 25, 1859.—This invention has reference to a double action valve and damper, for regulating the entrance and exclusion of air from the smoke flue, by which the quantity of air admitted into the stove is regulated, and also the draft of the fire.

*Claim*.—The side plates *a c* projecting from and connected with the hoe valve *b*, as related to each other, and in respect to the openings *h h* and flue F, substantially in manner and for the purpose specified.

No. 25,894.—WILLIAM FRIDLEY and FREDERICK CORNMAN, of Carlisle, Pa.—*Improvement in Preserve Cans*.—Patent dated October 25, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The employment of a perforated cover B in combination with a gasket C and mouth *b b*, as shown and described, so that the gasket constitutes virtually a portion of the cover, and an index to the condition of the contents of the vessel.

No. 25,895.—W. C. GEER, of Rockville, Conn.—*Improvement in Machines for Cleaning and Opening Flock*.—Patent dated October 25, 1859.—This invention consists in the employment of a toothed cylinder and concave fan and a cone provided with projecting toothed ledges and fitted within a corresponding shaped shell, also provided with teeth.

*Claim*.—The employment or use of a revolving cone or cylinder C, provided with toothed lugs *a*, and placed within a correspondingly shaped toothed shell B, in combination with the toothed cylinder I, concave J, and fan G, arranged for joint operation.

No. 25,896.—DANIEL GORDON, of Evansville, Ind.—*Improvement in Implements for Boring Earth*.—Patent dated October 25, 1859.—The peculiarity of this invention consists in the form and arrangement of the parts of the lower portion of the boring cylinder.

The inventor says: I *claim* arranging the blades *c* on the convex surface of the bottom of the auger, and extending to the cut beyond the periphery, as represented.

I also claim arranging the valves in the concave sides of the bottom of the auger, as set forth.

No. 25,897.—DANIEL HESS, of West Union, Iowa.—*Improvement in Machinery for Cleaning Cotton*.—Patent dated October 25, 1859.—In the operation of this invention the duster is made to stand in close proximity to the cotton gin, the flues which convey the cotton from the gin carrying it up against the bolting cloth at *x x*. The bolting cloth being set in motion by turning the rollers *B B*, it is made to revolve, while at the same time the blast from the cotton gin drives the cotton with a force against the bolting cloth.

The inventor says: I *claim*, first, the curved metallic division *F*, in combination with the front rollers *B B*, and the bolting cloth, substantially in the manner and for the purpose set forth.

Second. The combination of the fan *C*, and case *E*, with the back rollers *B B*, and the bolting cloth *D*, for the purpose of cleaning the cloth from fibres of cotton, substantially as specified.

No. 25,898.—SILAS HEWIT, of Seneca Falls, N. Y.—*Improvement in Pumps*.—Patent dated October 25, 1859.—The inventor says: To prepare the frame of the plunger *I*<sup>3</sup>, I make it just to fill the cylinder, and so that it will work freely without friction, I then turn in a groove to receive the packing *H* to any desired thickness; having done this, I sink another groove still deeper, this last groove serves as a chamber for the water which enters through the holes *H*<sup>2</sup>, formed in the sides of the frame *I*<sup>3</sup>, for the purpose of pressing and expanding the packing *H* out against the cylinder, as the piston or plunger rises, thereby forming a complete packing.

*Claim*.—The plunger or bucket when constructed in the manner and for the purposes set forth.

No. 25,899.—ISAAC HOSKINS and JOSIAH HOSKINS, of Wilmington, Ohio.—*Improvement in Ditching and Grading Machines*.—Patent dated October 25, 1859.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim* making the side wheel adjustable so as to raise and lower the side of the frame, to bevel or adjust it, as desired.

We claim a bell made of bars, with projections or flanges at each end arranged to travel under cleats on the sides of the frame or trough, substantially as described.

No. 25,900.—ANTHONY ISKE and JACOB TEUFEL, of Lancaster, Pa.—*Improved Door Latch and Lock*.—Patent dated October 25, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The arrangement and combination of the curved swivel lever *D*, bolt *H*, with its peg *f* and projecting end, to answer both for turning, pulling, and pushing, as shown, together with the revolving lever *s* for operating the lock, when the several parts are made for the purpose, and in the manner described or specified.

No. 25,901.—EDWARD H. JONES, of Albany, N. Y., and ROBERT STEVENSON, of Schenectady, N. Y.—*Improvement in Furnaces of Steam Boilers*.—Patent dated October 25, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The arrangement of the hopper shaped grate box *B D*, so constructed as to be adjustable in height, combined with the grate *E E*, having means attached for rocking or agitating them in their relation to each other and to the boiler fire box *A*, in the manner and for the purpose set forth.

No. 25,902.—SAMUEL F. JONES, of St. Paul, Ind.—*Improvement in Mole Ploughs*.—Patent dated October 25, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the employment of the ball *a*, not generally, but when said ball is secured in such a manner, upon the top of the rear of the mole, that it will revolve when the mole is in motion for the purpose of arching the top of the drain and closing an opening left by the coulter, substantially as and for the purpose set forth.

Second. The combination of the nose *E*, mole *D*, ball *a*, rod *d*, and wheel *F*, when the same are used for the purpose of forming and arching the drain and closing the opening of the coulter, substantially as and for the purpose set forth.

No. 25,903.—LOUIS KOCH, of New York, N. Y.—*Improvement in Moving Tread Power*.—Patent dated October 25, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the described mechanism, or its equivalent, when operated by the feet of man or animal in stepping on the ends of bands or cords during the act of walking.

Second. I claim using the weight of man or animal in stepping on bands, or their equivalents, as a cause of resistance against the propelling of the machine, and giving motion by the walking of said man or animal to said mechanism, or its equivalent, independently of the motion of the wheels on which the whole mechanism is supported, substantially as described.

No. 25,904.—CHARLES N. LOVEJOY, of Columbia, S. C.—*Improvement in Cotton Presses.*—Patent dated October 25, 1859.—This invention consists of the follower I, connected to toggle levers by block J, so as to be slid therefrom and from the cotton box when raised and made self-parallel by cords V, operated by windlass T and Z to adjust this parallel, and in guides Y for effectually retaining the chains in grooves of fusee wheels.

*Claim.*—The guides Y for guiding the chains W and X upon fusee wheels S, and the follower I, block J, and windlass T and Z, arranged and operated with each other and in the manner as described and for the purposes fully set forth.

No. 25,905.—JOHN McNEVEN, of Brooklyn, N. Y.—*Improvement in Skirt Supporters.*—Patent dated October 25, 1859.—This invention consists in a certain novel form and arrangement of short bows with a semi-circular bow of cane, whalebone, metal, or other material in which stiffness, flexibility, and elasticity are suitably combined, covered with suitable material and furnished with a waistband and strings; the whole used as a supporter for skirts.

*Claim.*—The described dress supporter consisting of a hoop A and stiffeners C branching off from said hoop A, the waistband G, and tapes J J, when the same are arranged and combined and applied to the body, substantially in the manner and for the purposes described.

No. 25,906.—L. H. MILLER, of Baltimore, Md.—*Improvement in Doors for Iron Safes.*—Patent dated October 25, 1859.—This invention is designed to render the joint or crevices between the side, top, and bottom of the door, water, dust, steam, fire, smoke, and powder proof, as far as practicable, without the use of packing, and at the same time avoid the inconveniences from bind between the sides, top, and bottom of the door and front plate.

*Claim.*—The combination of the tongue *f*, groove *d*, flanges *b b<sup>1</sup> b<sup>2</sup> b<sup>3</sup>*, V shaped mouldings *c c*, and V shaped grooves *e e*, in the construction of a fireproof safe or bank vault, substantially in the manner and for the purpose described.

No. 25,907.—THOMAS MOORE, of Minneapolis, Minn.—*Improved Apparatus for Generating Steam.*—Patent dated October 25, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The employment, in combination with a steam-engine or other apparatus in which steam is used and the boiler which supplies it, of a system or arrangement of one or more condensers and heaters, with connecting pipes and a tank, whereby the exhaust steam, after passing along a pipe running through the boiler itself, is condensed by delivering up its remaining latent heat to water, which, after having been previously condensed in the same manner, is on its way back to the boiler, and whereby the water obtained by the condensation of the exhaust steam is heated on its way back to the boiler and partly converted into steam again by the combined agencies of the latent heat it absorbs from the escaping steam, and by the heat it absorbs from the escaping waste production of combustion, substantially as described.

No. 25,908.—JAMES W. NEFF, of Sacramento, Cal.—*Improvement in Wind Mills.*—Patent dated October 25, 1859.—The inventor says: My invention allows the sails to regulate themselves by the pressure of the wind, for the harder it blows the further open the sails become, so that my windmill will make the same number of revolutions in a high or low wind.

*Claim.*—The arrangement of the sails D, arms or spokes G, and hub E, as described, and placing them in rear of the spiral spring A and flange B and connecting flange B<sup>1</sup>, with sails D, by rods F; the whole operating as described and for the purposes set forth.

No. 25,909.—GEORGE NEILSON, of Boston, Mass.—*Improvement in Coffee Pots.*—Patent dated October 25, 1859.—Within the vessel A there is a deep filtering biggin or long box B, whose bottom and sides are foraminous, as shown at *x y*; the biggin is supported by the vessel A by means of a lip *f* extending from the upper edge of the biggin and resting upon a corresponding lip *g* projecting from the inner surface of the upper part of the vessel A; a foraminous cap or strainer C fits closely upon the top of vessel A, or within the same.

The inventor says: I claim the reversible cafetiere, as composed of the boiler A, the filtering biggin B, the foraminous cap or strainer C, and the condensor or coffee pot D, having a spout *h* and cap *i*, the whole being arranged in manner and so as to operate as explained.

I also claim the combination of the air and tell-tale pipe *c* with the boiling vessel A, the condensing vessel D, the biggin B, and the strainer or cap C, the object or purposes of the said pipe being as explained.

No. 25,910.—ADRIAN V. B. ORR, of Lancaster, Pa.—*Improvement in Nail Machines.*—Patent dated October 25, 1859.—This invention consists in so arranging and constructing the machine that the fibres of the iron, which are necessarily separated in the act of cutting the nail from the plate, shall be again condensed together by the action of the cutting die in its descent.

The inventor says: I *claim*, first, combining in a simple pair of dies, constructed as described, the operation of cutting, pressing, and gripping the nail or spike substantially as specified.

Second. I claim the slide point *g*, operating as described, in combination with the slide *h*, arranged as specified and for the purpose set forth.

No. 25,911.—GEORGE F. OUTTEN, of Norfolk, Va.—*Improvement in Car Brakes.*—Patent dated October 25, 1859.—The inventor says: The brake itself is simply a lever *G*, with a long handle or continuation *F*; attached to the upper end of this is the chain *I*, running over the irons placed between the ratchet wheels *B B*, for that purpose; this chain *I* is then attached to the spring end of the slide plate *H*; by means of this slide plate direct motion is given to the brake lever *G*.

*Claim.*—The combination and arrangement of slide *H*, pawl *g*, spring *a*, ratchet wheels *B* and chain *I*, levers *d* and *b*, and spring *h*, operating automatically or by hand, as may be desired, as set forth and described.

No. 25,912.—ELHANAN PUFFER, of Oxford, N. Y.—*Improved Apparatus for Raising Water from Wells, &c.*—Patent dated October 25, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* producing and controlling the movements of the windlass roller *A*, upon and with its actuating shaft *B*, in such a manner as to prevent the necessity of ever imparting a reverse rotary movement to the windlass shaft whilst operating said apparatus, and by means substantially the same as those represented and described.

I also claim combining the valve *j*, which closes the discharging aperture in the bottom of the bucket *C*, with the inner end of the lever *h*, which is pivoted to the after edge of the mouth of said bucket, when a rod *l*, or the equivalent of the same, is so situated within the curb as to be taken hold of by the hooked-shaped outer end of said lever just before the bucket reaches its highest position, for the purpose of causing the further upward movement of said bucket to throw forward its bottom and discharge its contents, substantially as set forth.

No. 25,913.—T. J. W. ROBERTSON, of New York, N. Y.—*Improvement in Sewing Machines.*—Patent dated October 25, 1859.—When the under needle has reached the position shown in Fig. 3 the plug *Q* advances, as shown also in Fig. 3; as the needle *C* again descends, the under needle *N* retreats, and the projection *o* on the carrier *M* coming in contact with the plug *Q* causes the needle *N* to cross the path of the vertical needle *C* so as to open the loop of the under thread; as the needle *N* continues to recede, the carrier *M* slips off the plug *Q*, and is carried back to its original position by the spring *P*.

*Claim.*—The arrangement and combination of the carrier *M*, spring plug *Q*, and vibrating arm *L*, substantially for the purposes shown and described.

No. 25,914.—ALFRED ROSE, of Penn Yan, N. Y.—*Improved Churn Dasher.*—Patent dated October 25, 1859.—*A* is the centre piece with a hole in the centre to receive the dasher staff; the outer ends are made into breakers, oval in shape, or with the upper and lower edges nearly sharp as a cutting instrument; there are two parallel holes bored horizontally through it in which to put rods that hold the other breakers.

*Claim.*—The churn dasher, when made in the manner substantially as specified and set forth.

No. 25,915.—ALBERT W. ROBERTS, of Hartford, Conn.—*Improved Disengaging Hook.*—Patent dated October 25, 1859.—These improvements consist in its construction, management, and adaptation for attaching and detaching a chain or cable to or from a boat, &c., when necessary, by means of a jointed ring, hook link, crank, or lock pin, and trip lever; said hook link being provided with a bearer on one side thereof, which rests on the collar of the crank or lock pin, all combined to produce a more sure and speedy detachment of the crank or lock pin from the lock when the lever is pulled.

*Claim.*—As a new article of manufacture a hook, consisting of a hook link *E*, with bearer *G* on its side, in combination with the jointed ring *A*, lever *D*, crank pin *c*<sup>1</sup>, and collar *c*, substantially as described.

No. 25,916.—F. M. ROBINSON, of Conneautville, Pa.—*Improvement in Mills for Crushing Sugar Cane.*—Patent dated October 25, 1859.—This invention relates to certain improvements in that class of mills in which three rollers are employed, the first or main roller being somewhat further from the first of the secondary rollers than from the other, with a scraper

between the two last named rollers, which is so arranged that the cane has to pass from the first pair of rollers under the main roller, and between the second pair of rollers.

*Claim.*—The combination of flange journal boxes D, with the flanged sockets *e*, in connection with the flanges *g h* of the above parts, all as and for the purpose shown and described.

No. 25,917.—SAMUEL SAMUELS, of Brooklyn, N. Y.—*Improvement in Reefing Fore and Aft Sails.*—Patent dated October 25, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* supporting the rolling boom in two bearings; one of which is in a truss connected with the mast by a hoop or its equivalent, and the other in a ring which is held by the lift and braces, substantially as specified.

And I further claim the combination with the rolling boom of the gipsey purchase as described.

No. 25,918.—IRVIN B. SAWYER and T. ALSOP, of Springfield, Ill.—*Improvement in Sewing Machines.*—Patent dated October 25, 1859.—The wheel F has cam grooves upon each side and upon its edge, and is fastened upon a shaft F<sup>1</sup>; upon this is fastened the shaft wheel H, by which the machine is moved. Upon the same shaft is a cam *g*, which, in turning, raises the lever *c* and the rod *d*<sup>1</sup>, turning the ratchet wheel *f* by the pawl *e*, from which the motion is communicated to the cylinders A and B.

The end of the shaft carrying the crank *e*<sup>1</sup> has bearing *t* in the plate *l*<sup>1</sup>, the bearing for the other end is fast to the plate D at a point vertical with the point of the needle, and on a level with the bottom of the shuttle race, the hook *q* lying close to the plate D, so that its point, when moved forward, shall pass close to the needle.

*Claim.*—The use of the hook *q*, formed and moving substantially as described, combined with the shuttle and needle, substantially as described and for the purpose specified.

No. 25,919.—THOMAS S. SEABURY, of Stony Brook, N. Y., assignor to R. B. GORSUCH, of New York city.—*Improved Piano Forte Action.*—Patent dated October 25, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim*, first, pivoting the hammer but to a post, or its equivalent, carried by its respective key, substantially as specified, for the purpose of enabling it to be drawn from the instrument along with the key.

Second. The suspended jack or fly lever E, attached to the hammer but, and provided with a notch *e*, operating in combination with stationary rail F, substantially as described.

Third. The arrangement of the regulating screw in the suspended jack or fly lever, in combination with the inclined plane *f* on the post erected upon the key, to carry the hammer substantially as described; but I wish to be understood as not claiming, generally, either the placing of the regulating screw in the jack, or the employment of an inclined plane or wedge, to act in combination with an inclined or wedge like surface.

Fourth. The check H applied to the bottom of the key, and operated in combination with the suspended jack or fly lever, substantially as described.

No. 25,920.—ISAAC M. SINGER, of New York, N. Y.—*Improvement in Carriages.*—Patent dated October 25, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the arrangement, in the main body of the carriage, of the low seats, in combination with the elevated seats, arranged in manner substantially as described and for the purposes set forth.

I also claim, in combination with the back, depressed and elevated seats, as described, the arrangement of the hinged partition to answer the threefold purpose of a step to get to the elevated back seats, and back to the middle depressed seat, and to separate the feet of persons sitting on the elevated seats from the persons sitting on the depressed seats.

I also claim, in combination with the front elevated seats, as described, the arrangement of hinged step leading to the elevated seats, together with its dirt-flap, as described, for the threefold purpose of a step to the elevated seats, a dirt protector, and of a seat in case of necessity.

I also claim the arrangement of the boot for baggage in the space between the bottom and the front elevated seats, with doors at the sides, as described, thus placing the weight below, and concentrating it on the front axle, as described.

I also claim the combination with the main body of the carriage, the placing the coupe at the rear thereof, and communicating therewith by a door-way through the back, as described.

I also claim depressing the coupe at the back of the main body, that the bottom of both may extend below and leave the required open space for the rear axle and its connections; and that the top of the coupe may form a foot board to the seats at the back edge of the main body, as described.

I also claim, in combination with the coupe, the open spaces under the back elevated seats of the main body opening into the coupe, as described and for the purposes set forth.

No. 25,921.—GEORGE A. STONE, of Roxbury, Mass.—*Improvement in Thrust Bearings for Rotating Shafts*.—Patent dated October 25, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of these four things, namely: a collar or collars on the shaft; washers, provided with grooves on their faces, extending from their outer to their inner edges, made substantially as described; a reservoir of oil or other lubricating material; and a pillow block or stationary resistance; all being and acting in combination, as described, and for the purposes set forth.

Second. In combination with washers provided with grooves on their faces, a reservoir of lubricating material, a pillow block or its equivalent, and a collar on a shaft, all as specified in my first claim, I claim grooves extending from face to face of the washers, made substantially in the manner and serving the purposes described.

No. 25,922.—F. SWIFT, of Hudson, Mich.—*Improvement in Grain Separators*.—Patent dated October 25, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The employment or use of a supplemental shoe C placed within the shoe B, provided with screws *c*, and having an independent longitudinal shake movement given it, while the shoe B, with its screens *b*, has the usual lateral shake movement imparted to it, substantially as and for the purpose set forth.

No. 25,923.—PETER VAN ANTWERP, of New York, N. Y.—*Improvement in Keys for Locks*.—Patent dated October 25, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—Constructing the stems of keys with a hole near the end, instead of the usual permanent bow or ring handle, and to be fitted loosely to the usual ring for connecting a series of keys, and in such manner, substantially as described, that said connecting ring shall answer the further purpose of the usual bow or fixed ring for turning the keys when inserted in the lock, as set forth.

No. 25,924.—JOHN L. WHIPPLE, of Detroit, Mich.—*Improved Spring Bed*.—Patent dated October 25, 1859.—This invention consists in constructing and arranging the several parts of the bedstead in a peculiar form and position, by which the slats are sustained in their proper relative connection, while they have the yielding elasticity required for their easy play upward and downward.

*Claim*.—The general arrangement of the slat S, spring W, and the strap L, when constructed in the form described and combined for the purpose in the position, as set forth.

No. 25,925.—JOHN L. WENTWORTH, of Spread Eagle, Pa.—*Improvement in Field Fences*.—Patent dated October 25, 1859.—This invention consists in the peculiar manner of constructing the sections of a fence.

*Claim*.—Constructing each section of a fence of the two end posts A and B, the upper and lower longitudinal rails C and D, any suitable number of intermediate rails E and F, and the vertical bar G, when the several parts are arranged in respect to each other, substantially as and for the purpose set forth.

No. 25,926.—FRANKLIN WESSON and NATHAN S. HARRINGTON, of Worcester, Mass.—*Improvement in Breech Loading Fire-Arms*.—Patent dated October 25, 1859.—This improvement relates to that class of breech loaders in which the breech of the barrel is elevated to receive the charge, and in which the cartridge used is made with a projecting flange around its base.

The inventors say: We *claim*, first, the arrangement of the mechanism for locking and unlocking the barrel and the arrangement of the trigger, substantially as described.

Second. We also claim in combination with the locking and unlocking mechanism the spring *k*, arranged substantially as described for elevating the breech.

Third. We claim in combination with the barrel the wedge shaped recess in the recoil plate, arranged substantially as described for the purpose set forth.

No. 25,927.—J. S. VOORHEIS, of Catlettsburg, Ky.—*Improved Portable Shelves*.—Patent dated October 25, 1859.—This invention consists in the manner of folding and removing shelves, &c., of stores, street stands, book cases, &c., for security from thieves and fire.

*Claim*.—Constructing portable box shelving for stores, book cases, and all similar purposes, in the manner described, and for the purposes set forth.

No. 25,928.—DUTEE WILCOX, of Providence, R. I.—*Improvement in Shirt Studs*.—Patent dated October 25, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The described new or improved mode of making a shirt stud or button, viz: of the two parts or plates A B, and the two hooks or curved plates C D, constructed and applied, or arranged together, substantially in the manner and to operate as described.

No. 25,929.—JOSEPH ADAMS, of Cleveland, Ohio, assignor to Himself and B. BARKER, of said Cleveland.—*Improvement in Cannon*.—Patent dated October 25, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the use and application of a piston for the purpose of loading, cleaning, and cooling a cannon, the stem or end G of which passes through the breech or rear end of the gun, and is attached to a head or metallic piston, the circumference of which is equal to that of the bore of the cannon, and is made to fit the same exactly, and which piston head, when drawn back, rests upon the main shoulder or substance of the breech at the point where the rod G connects therewith, and is of sufficient length to cover and serve as a valve to close the lateral opening at the breech end of the cannon, through which water is admitted to fill the bore of the gun when said piston is forced forward towards the muzzle, and which piston plays forward and backward, the entire length of the bore of the gun, so as to protrude sufficiently at the muzzle when forced forward, thus carrying out any substance of the exhausted cartridge after firing, and to which piston head or bulb the new cartridge is attached and drawn back to the breech or but of the gun by the force applied to said rod, and in which condition the gun is loaded and ready to be again discharged.

Second. I claim the construction and employment of a lateral opening from the main chamber or bore of the gun, either passing through the breech pin or otherwise, at or near the rear end thereof, and where the same will be closed and covered by the piston head, when the same is fully drawn back into, (or by means of a tube or pipe connecting with a water sack or vessel,) and by means of which arrangement water is admitted and drawn into the gun by the same force which carries the piston forward to receive the charge at the muzzle and is returned to the vessel again by the same force which carries in the charge, thus washing and cooling the gun at every discharge, without any other movement than that necessarily employed in the act of loading alone.

No. 25,930.—M. C. CRONK, of Auburn, N. Y., assignor to WILLIAM BOYNTON, Jr., and ALBERT H. GOSS, of said Auburn.—*Improved Mode of Feeding Fuel to the Fire Boxes of Cooking Stoves*.—Patent dated October 25, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, in combination with a stationary upper fire box, a rocking or swinging fire box underneath it, having a flange or cut off *c* connected thereto, substantially as described.

I also claim in combination with the rocking or swinging fire box and cut off a rising and falling grate H, substantially as described.

I also claim in combination with the rocking or swinging fire box and rising and falling grate a single rod or shaft with its cams for operating both, substantially as described.

No. 25,931.—D. W. C. FARRINGTON, of Lowell, Mass., assignor to TUTTLE & MUDGE, of Boston, Mass.—*Improvement in Stoves*.—Patent dated October 25, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—A parlor stove having an oven, which is opened by raising the top, in the manner substantially as set forth.

No. 25,932.—CHARLES YOUNGLOVE HAYNES, of Philadelphia, Pa., assignor to C. Y. HAYNES & Co., of said Philadelphia.—*Improvement in Razor Straps*.—Patent dated October 25, 1859.—This invention consists in attaching an oval, elastic or flexible cushion to one side of the strap, constructed in such a manner that it will adjust itself to the edge of the instrument used upon it without any chance of becoming uneven, or danger of rounding the edge when used.

*Claim*.—The strap, when constructed in the manner and for the purposes described.

No. 25,933.—W. H. HOWLAND, of San Francisco, Cal., assignor to Himself and JOHN O. HANSCOM, of said San Francisco.—*Improved Amalgamator*.—Patent dated October 25, 1859.—This invention consists in the employment of a conical grinder, in connection with a horizontal oscillating disk, provided with annular chambers.

*Claim*.—The combination of a pair of grinding cones F G<sup>1</sup>, revolving in different directions, with a horizontally oscillating disk G, substantially as and for the purposes shown and described.

No. 25,934.—JOSEPH IVES, of Bristol, Conn.—*Improvement in Watches*.—Patent dated October 25, 1859.—The spring lever and cam are for the purpose of producing an equalized power to watch movements at all times.

*Claim*.—First. The combination of the spring B, lever C, and cam D, substantially in the manner and for the purpose described.

Second. The substitution of ribbed or corrugated, planished or unplanished, tin plate for running gear, &c., (for other metal,) when used in combination with the rolling pinion, substantially as and for the purpose described.

Third. Making a crown wheel with rollers instead of teeth to prevent slide and friction upon the verge of palate, in the manner as and for the purpose described.

No. 25,935.—GEORGE W. SLAGLE, of Washington, D. C., assignor to Himself and O. A. DAILEY, of said Washington.—*Composition for Mixing with Paints.*—Patent dated October 25, 1859. The inventor says: My improved oil is intended as a substitute for linseed oil, and to make one gallon of it I take of linseed or other vegetable oil possessing similar qualities one part, of water two parts, of sal soda or other similar suitable alkali about one two hundred and fortieth part, and, after dissolving the sal soda in the water, mix the whole together in a vessel.

*Claim.*—Making melanaline oil, or a substitute for linseed oil, by mixing together linseed oil, or other vegetable possessing similar qualities, water and sal soda, or other similar suitable alkali, substantially in the manner set forth.

No. 25,936.—EDWARD R. ARNOLD, of Providence, R. I.—*Improvement in Cut Off Valves of Steam Engines.*—Patent dated November 1, 1859.—In this invention the valves are opened by a cam or tappet having a curvilinear motion operating upon valve rods having a rectilinear motion, when the cam or tappet passes by the rods in opening the valves; the valves are closed by their gravity, by weights or springs connected therewith, or by other suitable means to enable them rapidly to close their parts.

The inventor says: I *claim*, first, making the tappet C, Fig. 4, and the ends of the jointed valve rods D D<sup>1</sup>, Fig. 3, inclined in a direction at right angles to their lines of motion, and combining and arranging them substantially as set forth.

Second. The combination of the regulator with a tappet, constructed and operated substantially as described and for the purpose specified.

No. 25,937.—L. S. BALLOU, Jr., of New York, N. Y.—*Improvement in Shirts.*—Patent dated November 1, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—A shirt, formed by having its yoke made of two pointed projections *c c* extending down from the shoulders, or inclined front ends *a* of the yoke on the shoulder blades of the wearer, in such a manner as to leave a recess *d* between the projections, which recess extends upward nearly to the neckband, substantially as and for the purpose set forth.

No. 25,938.—HENRY A. BARNES, of Milwaukie, Wis.—*Improvement in Railroad Car Couplings.*—Patent dated November 1, 1859.—In this invention by a quick and simple act of the hand or foot upon the lever or treadle G, in case of an emergency, the connection will be severed by the joint action of the cam C and the lever or treadle G.

*Claim.*—The arrangement of the latch in the draw head A, in combination with the cam D, latch or hook connection B, lever or treadle G, substantially in the manner and for the purpose described.

No. 25,939.—E. F. BARNES, of Brooklyn, New York.—*Improved Method of Protecting Telegraphic Instruments against Atmospheric Electricity.*—Patent dated November 1, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the application and use in a telegraphic line, or in connection with telegraphic instruments, of a vessel A, containing acidulated water or fluid, as described, and having a platinum or other metallic wire B of better conductability than the contents of such vessel passing through such vessel, and connecting by one end with the main wire and by the other with the telegraphic machine, the whole arranged substantially as and for the purposes set forth.

I *claim*, also, in combination or connection with such vessel of fluid A and wire B, the arrangement of the metallic points *b c d*, on the wire of the main line, and extending into the fluid in A, substantially as and for the purpose set forth.

No. 25,940.—J. BARTHOLOMEW, of Union, N. Y.—*Improvement in Machines for Packing Flour in Barrels.*—Patent dated November 1, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination with the packing screw or its equivalent, of a cylinder or its equivalent, so that the flour will be first packed within the said cylinder or its equivalent, and then discharged therefrom, in a packed state, into a bag, barrel, or other receptacle, as set forth.

Second. The arrangement of the rod L, levers Q K, block *l*, connected with the shaft J, by the cord or chain *u*, and the hub or boss *k*, on screw shaft F, for the purpose of automatically discharging the packed flour from the cylinder or measure M.

Third. The arrangement of the lever D, with pinion E, attached block *l*, hub or boss *k*, levers O P, and spring *t*, for the purpose of automatically discharging the pinion E from the wheel *d*, and thereby stopping the rotation of the screw G, at the proper time.

No. 25,941.—RICHARD L. BATE and JARVIS CAULKINS, of Adrian, Mich.—*Improved Coffee Roaster.*—Patent dated November 1, 1859.—This invention consists of a vertical stationary

inner cylindrical chamber, having escape passages at its sides and a movable top, in combination with a revolving skeleton or open stirrer, and a vertical cylindrical outer casing which is open at its bottom, and arranged around the inner chamber so as to form a circulating passage for the heated current, and for the gases escaping from the coffee being roasted.

*Claim.*—The combination of the stationary cylindrical chamber, revolving skeleton stirrer, and outer vertical cylindrical casing, all constructed in the manner and for the purposes set forth.

No. 25,942.—G. W. R. BAYLEY, of Brashear, La.—*Improvement in Rails for Railroads.*—Patent dated November 1, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the reversible Z rail for railways, that is to say, I claim the rail with its stem placed inside of the vertical centre of its head outside of the vertical centre of its base, with the inner and outer portions of its head and of its base of different thickness and form, with its head and its base similar in transverse section as to outline, though reversed as to relative position and connection to the rail stem; the stem being nearest to the inside thick lip of the rail head, and to the outside thick lip of the rail base, while the thin lip of the rail base is inside, and the thin lip of the rail head is outside, substantially as described and specified.

No. 25,943.—BENJAMIN G. BEADLE, of Memphis, Tenn.—*Improvement in Cotton Gins.*—Patent dated November 1, 1859.—The object of this invention is to prevent the pods from passing the ribs and to separate from the cotton such minute pieces of the pods or other impurities as will unavoidably be carried past the ribs and not allow them to pass out with the cotton, but to take them to another delivery.

*Claim.*—Uniting the knuckles or projections *b* on the ribs, by a back or brace *c*, extending through the series, for the purpose of strength, and for keeping them in proper position, substantially as set forth.

No. 25,944.—T. G. BEECHER, of Beaver Dam, N. Y.—*Improved Farm Fence.*—Patent dated November 1, 1859.—This fence is designed for permanency, and is adapted to those regions where stones abound.

*Claim.*—The improved method of construction, as shown, namely, combining with the posts *A*, arranged as described, the rails *B*, made removable and replaceable by means of the locking device *e f g*, substantially as specified.

No. 25,945.—WILLIAM H. BITZER, of Muscatine, Iowa.—*Improved Shingle Machine.*—Patent dated November 1, 1859.—This invention relates to an improvement in that class of shingle machines in which the shingles are cut in taper form from the bolt by a circular saw, and at the same time placed at one side.

*Claim.*—The arrangement of the frame *Q* and planer *R* upon the self adjusting swinging bar *P*, and the combination of the parts thus arranged with the pivoted lever *U* and reciprocating carriage *F*, as and for the purpose shown and described.

No. 25,946.—WILLIAM G. BUDLONG, of Hartford, Conn.—*Improvement in Sewing Machines.*—Patent dated November 1, 1859.—This improvement consists in the peculiar construction and arrangement of the movements underneath the bed.

*Claim.*—The combination of the adjustable groove segment with the looper bar *J* fitted loosely therein, feeder arrangement *P Q R*, operating rod *X*, having cams 1 2 3 secured thereto, and connected by arms *c d e G*, the whole being arranged and operating substantially in the manner and for the purpose described.

No. 25,947.—SAMUEL F. BURDETT, of Keokuk, Iowa, and HENRY STILL, of Leavenworth City, Kansas.—*Improved Scale for Cutting Boots and Shoes.*—Patent dated November 1, 1859.—The nature of this invention is explained by the claim and engravings.

The inventors say: We *claim*, first, the lines of average ankle, heel, instep, and ball measures, running from the point "A" (in Fig 1 "A"), or any other given point that will produce the same result, with the lines of increase and decrease intersecting them at such an angle and at such a distance from each other as will produce the purpose set forth.

Second. We claim the device of so arranging the heel and instep measures, as in Figs. No. 1 B and No. 2 B, that any required size of said heel and instep may be marked at one stroke, with or without the combination of the average measures of the same.

Third. We claim the one third of an inch increase and decrease of average heel measures upon the different lengths of lasts, or such portions of an inch as will produce the same effect, substantially as set forth.

No. 25,948.—LEVI BURNELL, of Milwaukie, Wis.—*Improvement in Water Meters.*—Patent dated November 1, 1859.—This invention consists in arranging the induction pipe, which also forms a gudgeon or arbor, around which the bucket wheel rotates, with a narrow slot, in combination with lips formed by the inner edges of the buckets, in such a manner that

when one of the buckets is filled to the required height, the water is cut off instantaneously and made to flow into the next succeeding bucket; and it further consists in the arrangement of a counterpoise, in combination with stops on the outside of the bucket wheel.

*Claim.*—The arrangement of the hollow arbor B, with a narrow slot *j*, in combination with the lips *h*, formed by the inner edges of the buckets D, substantially as and for the purpose specified.

No. 25,949.—ROBERT H. CHAMPLIN, of East Greenwich, R. I.—*Improved Washing Machine.*—Patent dated November 1, 1859.—In operating this machine, the clothes, water, &c. are put into the cylinder and the opening C closed, when a rotary motion is given to the cylinder by means of the crank M; the clothes R resting on the slats depress them and they are carried up the side of the cylinder by its motion, until the pressure of the springs overcomes the weight of the clothes, when they are thrown from the side towards the centre and fall at the bottom of the cylinder; this suddenly depresses the slats at that part, which has the effect of driving the water that is between the slats through the clothes and removing the dirt from them.

*Claim.*—The combination of the rounds or slats and springs with the cylinder, when constructed and operating substantially as described.

No. 25,950.—EDWARD C. CLAY, of Malden, Mass.—*Improved Electro-Magnetic Burglar's Alarm.*—Patent dated November 1, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the combination, in an electric burglar's alarm, of a galvanometer, with a resistance coil and an automatic switch, for the purpose of indicating the point where a burglar is attempting to effect an entrance, substantially as described.

I claim, also, the combination, in an electric burglar's alarm, of a galvanometer and a bell, with suitable mechanism to ring it, for the purpose of simultaneously giving an alarm and of indicating the place of attack.

I claim, also, the use, in a burglar's alarm, of a regulating coil, in combination with the resistance coils, substantially as described, for the purpose of maintaining a constant relation between the strength of the current and the varying resistance of the circuit, when the respective resistance coils are included.

No. 25,951.—JOHN WEBSTER COCHRAN, of New York, N. Y.—*Improvement in Projectiles for Ordnance.*—Patent dated November 1, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—Constructing and combining the body of the projectile and its shirt or case of soft metal, substantially as described, to wit: so that the passages for the gases of the exploded powder are formed partly in the body of the projectile, and partly in the shirt or case with their entrances in the shirt or case, without perforating the body of the projectile, and that the shirt can be carried separately from the body, and slipped on when required for use, in such manner as to remain secured thereon during the flight of the projectile, as set forth.

No. 25,952.—NATHAN COPE, of Cincinnati, Ohio.—*Improvement in Slide Valves of Steam Engines.*—Patent dated November 1, 1859.—In the operation of the valves B and C, the steam which enters between them from the cylinder, after the supply from the steam chest to the latter has been cut off, forms a cushion to prevent concussion between the ends of the valves. To prevent too much steam being confined at either end, grooves *g* are provided in the interior of the main valve B, such grooves extending nearly to the ends of said valve, so that steam may pass freely from one end to the other of valve B.

*Claim.*—The combination with the valves B C of the grooves *g g* and notches *h h*, as and for the purposes set forth.

No. 25,953.—THOMAS CROSSLEY, of Rockville, Conn.—*Improvement in Electrotpe Printing Blocks.*—Patent dated November 1, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—An electrotpe printing block for printing fibrous and textile fabrics, which is prepared from a mould formed of at least three different lengths of type, as represented at *c d e*, so as to have a highly raised printing face, composed of metal margins surrounding a felt or other equivalent ductile or plastic substance, to lift and carry the color, substantially as represented.

No. 25,954.—BRADFORD DEAN, of Clayville, N. Y.—*Improved Meat Slicer.*—Patent dated November 1, 1859.—A is a board with a pair of legs C attached to one end by a hinge at J, for the purpose of raising up and supporting one end. In board A are set one or more knives D and D<sup>1</sup>, in a beveled and angular position, secured by screws passing through slots at G G<sup>1</sup>, allowing the knives to be varied; also one or more knives, as shown at I and I<sup>1</sup>, in an upright position.

*Claim.*—The arrangement of the knives I and I<sup>1</sup>, knives D and D<sup>1</sup>, and the adjustable guide B, as shown and described, substantially as and for the purpose specified.

No. 25,955.—JAMES CUMMING, of Boston, Mass.—*Improvement in Steam Engines.*—Patent dated November 1, 1859.—This invention relates particularly to horizontal stationary engines, and oscillating engines, but may be used on upright or oblique engines.

The inventor says: I *claim*, first, the combination with a square piston chamber A of a square piston, which is constructed of a series of angular sections of packing D, joined loosely together by lap joints, and made adjustable and kept steam tight, substantially in the manner and for the purpose set forth.

Second. In combination with the above, the use of a square piston rod C and a square stuffing box F F, substantially in the manner and for the purpose set forth.

No. 25,956.—JOHN K. DERBY, of Jamestown, N. Y.—*Improved Stave Jointing Machine.*—Patent dated November 1, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the employment of two conical cutter heads B B, provided with suitable knives C, connected by teeth *d*, or other means, so as to insure a simultaneous rotation, and placed on frames A A connected by hinges or joints *a a*, substantially as and for the purposes set forth.

Second. The attaching of the knives C C to the cutter heads B B in reverse positions, so that they will cut from the centres of the staves outwards, for the purpose specified.

No. 25,957.—GEORGE DIEFFENBACH, of New York, N. Y.—*Improved Method of Making a Hard Compound of Rubber.*—Patent dated November 1, 1859.—This invention consists in curing or hardening a composition of matter containing sulphate of alumina as an indispensable ingredient, by subjecting the said composition to the action of artificial heat.

*Claim.*—The application of artificial heat to a composition of matter consisting of sulphate of alumina and other ingredients, substantially as described, for the purpose of curing and hardening the said composition, substantially as specified.

No. 25,958.—WILLIAM DOULIN, of Youngstown, Ohio.—*Improvement in Hanging Carriage Bodies.*—Patent dated November 1, 1859.—This invention consists in combining with the springs at the ends of the carriage body an elliptic spring on the reach, which latter has its segments hinged to the plate and its leaves reversed, that is, placed within the ellipse, instead of on the outer side thereof.

*Claim.*—In combination with any of the ordinary springs of a carriage an elliptic spring G on the reach of the wagon, said elliptic spring being constructed and arranged in the manner and for the purpose set forth and explained.

No. 25,959.—C. DUCKWORTH, of Hartford, Conn.—*Improvement in Locks.*—Patent dated November 1, 1859.—This invention consists in the employment of a series of tumblers, arranged with a slotted arm attached to the bolt, and used in connection with a key of peculiar construction.

*Claim.*—The tumbler E, slotted arm D, attached to the bolt B, lever G, or its equivalent, and the key F, provided with lever H, combined and arranged substantially as and for the purpose set forth.

No. 25,960.—I. A. DUFIELD, of McHenry, Ill.—*Improvement in Harvesters.*—Patent dated November 1, 1859.—Motion being given to shaft D by the driving wheel B operating the wheel C on the end of said shaft, a reciprocating motion is at once imparted to the cutters by pins *c*, which operate alternately at the ends of diamond shaped plates F F.

The machine may be thrown either in or out of gear or regulated to any pitch by means of lever H.

*Claim.*—Wheels *a a* provided with pins *c c*, and diamond shaped plates F F, in combination with cutter bar P, shaft D, wheel D, and lever H, the whole being combined and arranged in relation to each other, substantially as and for the purposes set forth and described.

No. 25,961.—AARON EAMES, of Kalamazoo, Mich.—*Improved Fly Traps.*—Patent dated November 1, 1859.—This invention consists in the employment of a wire cloth fly receptacle, register bait board, annular gate, and rotating clearer, arranged, whereby a proper article is obtained for the intended purpose.

*Claim.*—The combination of the fly receptacle B, register C, rotating clearer F, bait board H, and gate G, arranged substantially as and for the purposes set forth.

No. 25,962.—THADDEUS FAIRBANKS, of St. Johnsbury, Vt.—*Improvement in Platform Scales for Railroads, &c.*—Patent dated November 1, 1859.—This invention consists in an arrangement of the supporting standards and the loops or supports of the longitudinal levers and

platform, with respect to each other, and so as to extend within the space between the side timbers of the platform.

*Claim.*—The arrangement of the supporting standards and the loops or supports of the longitudinal levers and platform, with respect to each other, and so as to extend within or into the space between the side timbers of the platform, substantially as specified.

No. 25,963.—WILLIAM A. FOSKET and ELLIOT SAVAGE, of Meriden, Conn.—*Improvement in Sewing Machines.*—Patent dated November 1, 1859.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, the presser-foot in combination with the spring and with the needle stock, when so arranged that by the operation of the latter, the force of the spring will be taken from the presser-foot at the time the feed of the cloth is to be given—that is, when the needle is out of the cloth, but without raising the said presser-foot from the cloth, in the manner and for the purposes substantially as described.

Second. The needle guard constructed and operating substantially as set forth, in combination with the needle and with the thread carrier or looper.

Third. We claim so combining and arranging the double jointed stock of the thread carrier with the two levers *o* and *r*, as that the said parts shall vibrate in the same plane, and also that the said stock shall form a link between the two levers which are operated to have their arcs of vibration opposed to each other, whereby, with the least throw of the said levers, the greatest vibration of the thread carrier is produced.

No. 25,964.—JAMES P. GAGE, of New York, N. Y.—*Improvement in Mills for Crushing and Pulverizing Quartz, &c.*—Patent dated November 1, 1859.—This invention consists mainly in the construction and arrangement of the rolls, their axles, journals and journal-boxes, and of the hopper feed box, and of guard and distributing guide plates within the feed box or chamber, and in combining and arranging these parts together, so that the feed or supply to the rolls is distributed over the whole width of the rolls as nearly in an equable amount as can be obtained, and the material acted upon by the rolls is kept over the line of contiguity of the rolls, and not permitted to fly or scatter so as to obstruct or injure the journals and other parts of the mill, and so as to maintain the work or strain upon the rolls equably and steadily across their faces.

The inventor says: I *claim*, first, the combination of cast rolls upon wrought-iron shafts (the rolls cast solid upon the shafts) with the wrought-iron box or frame the conicals upon the shaft, and the sliding cast-iron journal boxes, arranged and operating for the purposes and in the manner described.

Second. The combination of the rollers, the case or frame *D*, the box, and the wide shoe, and the diagonal plates, operating in the manner and for the purposes described.

No. 25,965.—WILLIAM HALL, of St. Louis, Mo.—*Improvement in Bran Dusters.*—Patent dated November 1, 1859.—This invention consists in constructing a machine for separating flour from bran. The object is to do it more perfectly than it has hitherto been done and at less cost.

*Claim.*—The combination of the flange *M* with its arms *t*, and the head *o*, with the scuppers *N*, with the brushes and fans *K* and *P*, substantially as described for the purpose specified.

No. 25,966.—C. A. HARPER, of Fort Worth, Texas.—*Improvement in Converting Rotary into Reciprocating Motion.*—Patent dated November 1, 1859.—This invention consists in having two vertically moving racks with a cog wheel on a small shaft between them, which gears into the teeth of the racks and thus produces the reciprocating motion.

*Claim.*—Producing the rotary motion of shaft *S*<sup>1</sup> and saw *C* by the reciprocating racks *R* *R*<sup>1</sup>, in combination with the gear wheel *a*, spring pawls *p*, drum *D*, shafts *S*, and wheels <sup>1</sup>*B* and *W*, substantially as described.

No. 25,967.—JOHN HOLROYD, of Washington, D. C.—*Improvement in Projectiles for Fire-Arms.*—Patent dated November 1, 1859.—This invention consists in having an elongated conical shell with a flat base, on the rear end of which are six or more curved grooves, running inward from the point *a*, about one fourth the length of the shot; also in having reversed curved grooves running from point *a* toward the point of the shell, and in cutting away the body of the shell toward the front grooves, so as to allow the air to act upon them.

*Claim.*—Constructing the projectile with the reversed curved grooves *A* and *B*, on the rear and front, substantially as and for the purpose set forth.

No. 25,968.—HENRY HUDSON, of Three Springs, Pa.—*Improvement in Sewing Machines.*—Patent dated November 1, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The carrying of a self feeding automatic stitch forming device, like that shown and

described, or its equivalent, over the surface of the stretched or stationary fabric, substantially as and for the purpose set forth.

No. 25,969.—WILLIAM IAMS, of Baltimore, Md.—*Improvement in Hydrants*.—Patent dated November 1, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The movable cylinder B and tube C, when combined with the fixed piston E, upon the supply pipe A, and so constructed and arranged in relation to the supply pipe that its elevation shall open a direct communication with the main, in the manner and for the purposes specified.

No. 25,970.—A. LIVINGSTON JOHNSON, of Baltimore, Md.—*Improvement in Machines for Preventing Engines and Railroad Cars from Being Thrown from the Track*.—Patent dated November 1, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, in combination with a locomotive and a pioneer safety car in advance of it, the bars A, fastened to one and extending into loops or mortises in the other, to prevent the lighter car from leaving the track, or one from mounting or riding on the other, in case of accident or sudden stoppage, substantially as described.

I also claim, in combination with the locomotive and pioneer safety car, an advance of the link or drag bar B, so connected thereto as that the propelling force transmitted through it shall tend to hold the forward part of the safety car to the track, substantially as described.

No. 25,971.—GEORGE W. LA BAW, of Jersey City, N. J.—*Improved Life Boat*.—Patent dated November 1, 1859.—The sides of the boat are constructed so that the top and bottom are the same, and which contain the air chambers; the ribs are arranged in their proper places by means of pivots at the ends of each rib, the pivots resting on the sides of the boat, and made to turn freely. The keel is secured in its proper place by means of the ribs passing directly through it.

*Claim*.—The arrangement of ribs D, with the main rib K, and keel E, and cutwaters I I, the whole being constructed substantially as and for the purpose specified.

No. 25,972.—SYLVESTER LITTLEFIELD, of Alfred, Me.—*Improvement in Sawing Machines*.—Patent dated November 1, 1859.—This invention consists in combining with a circular saw, on a vibrating adjustable arm, an auxiliary saw, in such a manner that the same can readily and instantaneously be adjusted to the varying thickness of the log. It also consists in arranging an arm with two guides in such a manner that it vibrates on the arbor of the saw, so that it can be raised and lowered instantaneously, and that it, together with the guides, can be adjusted according to the diameter of the saw.

The inventor says: I *claim*, first, combining with a circular saw A, on a vibrating adjustable arm D, an auxiliary saw G, substantially as and for the purpose described.

Second. Arranging an arm B, with two guides C, in such a manner that it vibrates on the arbor of the saw, and that it can be raised and lowered instantaneously, substantially as and for the purpose described.

No. 25,973.—I. I. MAGEE, of Fernandina, Fla.—*Improved Machine for Unloading Vessels*.—Patent dated November 1, 1859.—This invention consists in arranging in two hinged frames a series of rollers, to which a rotary motion is imparted by an endless screw that gears into worm wheels which are firmly secured on the axles of the rollers, and these screws are connected by a universal joint, so that when one part of the frame is turned down into the vessel, and the other part towards the car, by imparting motion to one of the screws the several rollers are caused to rotate, bringing the bale or package that is placed on one end to the other end by the motion of the rollers.

*Claim*.—The arrangement of the frames A and H, with rollers C and I, and with screws G and J, or their equivalent, substantially as and for the purpose specified.

No. 25,974.—C. K. MARSHALL, of Vicksburg, Miss.—*Improved Apparatus for Printing Addresses on Newspapers, &c.*—Patent dated November 1, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, a chain of plates or solid links, having characters of the description substantially as described, placed, cut, or set into the face of its links, and arranged to wind in scrolls upon one pulley or roller from another, substantially as and for the purposes set forth.

Second. The combination of the above with an inking device that supplies the characters made on the faces of the links with ink, and with a stamping device, which will cause the respective links of the chain, as they come into play, to produce a clear impression upon the article being directed or superscribed, substantially as and for the purposes set forth.

Third. The employment of an inclined hopper having openings in its bottom and furnished with a spring stop, in combination with the revolving bulk feeding arms, substantially as and for the purposes set forth.

Fourth. The combination with the features embraced in the third claim, of the raking, single feeding device, substantially as and for the purposes set forth.

Fifth. The use of the scroll winding, post office indicating belt, with the superscribing chain or other superscribing device, substantially as and for the purposes set forth.

Sixth. The manner, substantially as described, of effecting a combination between said belt and chain.

Seventh. The combination of the features embraced in the fifth claim with the "mail" assorting box, substantially as and for the purpose set forth.

Eighth. The use of the State indicating belt with the post office indicating belt, and with a superscribing device, substantially as and for the purposes set forth.

Ninth. The organization of an apparatus, by means substantially as described, for accomplishing, by one continuous operation, the several results specified.

No. 25,975.—JOHN MAYRHOFER, of New York, N. Y.—*Improvement in the Process for Preparing Paper Pulp*.—Patent dated November 1, 1859.—The claim explains the nature of this invention.

*Claim*.—In making paper impervious to water, mixing the alkaline solution of rosin with the pulp, and then adding what is known as English sulphuric acid, and after the sheets have been formed, drying them by contact with heated metallic surfaces, all substantially as and for the purposes specified.

No. 25,976.—CÆSAR NEUMANN, of New York, N. Y.—*Improvement in Skeleton Hoop Skirts*.—Patent dated November 1, 1859.—The inventor says: My invention consists in cheapening the construction of skirts by the employment of strands of cord so twisted as to retain the hoops of spring steel, or other material forming the hoops, in their places, by which great facility and cheapness of construction is obtained.

*Claim*.—Combining a series of spring hoops, as set forth, by means of a series of twisted cords, and thus forming a skeleton skirt, as specified.

No. 25,977.—JOHN S. McCLURE, of Mobile, Ala.—*Improved Method of Mounting Ambrotypes*.—Patent dated November 1, 1859.—The picture is secured in the usual frame C<sup>1</sup> of thin sheet brass, which is pressed or raised so as to have an ornamental appearance, and which leaves an oval or any other shaped opening *c* for the picture. Secured to a concave surface D is the back ground *d*, namely, a landscape or other design, drawn in perspective on a piece of paper, which is fastened to the surface D.

*Claim*.—The employment of a concave background or surface D in combination with an ambrotype picture, substantially as and for the purposes shown and described.

No. 25,978.—I. E. PALMER, of St. Louis, Mo.—*Improved Tackle Block*.—Patent dated November 1, 1859.—This invention consists in the peculiar formation of the block and pulley, and in a certain relative position of said forms, when the two are so combined that a rope or fall may be jammed in any required position.

*Claim*.—The form of the block in the inside and the form of the pulley, when the two are combined and arranged substantially as described and for the purposes specified.

No. 25,979.—JOHN W. PALMER, of Port Republic, Va.—*Improvement in Beehives*.—Patent dated November 1, 1859.—The hives consist of oblong boxes marked C C<sup>1</sup> C<sup>2</sup>, and the separating boxes contained in these boxes are marked D. When the separating box D is placed in the box C the division *i i* divides the box C into two feeding apartments. The side J of the hive which is presented to the box is provided with two long apertures *g g*.

*Claim*.—Providing the described beehives with one or more partitions I, with opening *a m e<sup>1</sup> c* and *g g<sup>1</sup>*, and with feed boxes *c*, which contain separating boxes D, constructed substantially as described, the whole being arranged and used in the manner and for the purpose set forth.

No. 25,980.—WALTER RALSTON, of Manchester, England.—*Improvement in Embossing and Finishing Woven Fabrics*.—Patent dated November 1, 1859; patented in England, November 23, 1858.—The claim explains the nature of this invention.

*Claim*.—The employment of grooved, fluted, engraved, milled, or otherwise indented rollers of metal, wood, or other suitable material, driven at a greater speed than the bowl or bowls connected with them, so as to exert a rubbing or friction upon the fabric submitted to their action, and thereby produce an indefinite variety of pattern as well as a bright finish or lustre, and also reversing the operation by giving the bowl a quicker motion than the pattern roller.

No. 25,981.—CHARLES E. ROWAN, of New York, N. Y.—*Improvement in Machines for Polishing Rice*.—Patent dated November 1, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of the conductors H H<sup>1</sup>, when constructed

substantially as described, and secured within a loose wire cloth cylinder A, with the scouring disks G G<sup>1</sup> G<sup>2</sup>, constructed substantially as shown, and secured to the driving shaft B, as set forth, so that the friction of the grain will cause the cylinder A to revolve and lift and deliver the grain through the machine, all as specified.

Second. In combination with the parts described, I claim the tubes *k*\*, and openings *l m*, arranged as shown, so that the dust may escape, and air may enter to cool the contents of the cylinder A during the scouring operation.

Third. I claim placing the feeding screw E upon the same shaft B that carries the scouring disks G G<sup>1</sup> G<sup>2</sup>, as set forth.

No. 25,982.—WILLIAM R. SATTERLY, of Setauket, N. Y.—*Improvement in Reefing Fore and Aft Sails*.—Patent dated November 1, 1859.—The claim and engravings explain the nature of the invention.

*Claim*.—The combination with and above the triangular sail G of another triangular sail H, which has a boom C attached to it, so that when the two sails and boom are put together they form the ordinary fore and aft sail, operating in the usual manner; but when the sail H and its attached boom C are removed, as described, the small triangular sail G remains, all substantially as set forth.

No. 25,983.—NATHANIEL SNOW, Jr., of Boston, Mass.—*Improved Steering Apparatus*.—Patent dated November 1, 1859.—A is the deck of a vessel, B the rudder head, to which is attached a yoke C; to the end of each arm of this is pivoted a stout rod D. A knob *a* is placed on top of the rudder head, the shank of this knob serves as one bearing for a shaft E, which carries the steering wheel F and a pinion G; the other end of this shaft has its bearing in a stanchion H.

*Claim*.—The described steering apparatus, consisting essentially of the wheel I, pinion G, rods D, and yoke C, arranged and operating substantially as described.

No. 25,984.—N. SPOFFORD, of Haverhill, Mass.—*Improved Bit Stock*.—Patent dated November 1, 1859.—This invention consists in arranging the socket of a brace with a slot that extends a certain distance into the arm of the brace, dividing said socket into two parts, which are forced together by means of a thumb screw, so that the same accommodates itself to different sizes and different bevels of the shanks of bits.

*Claim*.—Arranging the socket A of a brace with a slot *a*, as described in combination with a thumbscrew *b* and projections *d*, or their equivalents, substantially as and for the purpose specified.

No. 25,985.—E. N. SPRINKLE, of Marion, Va.—*Improved Churn*.—Patent dated November 1, 1859.—The perforated dashers C are attached to a shaft D by which they are rotated. To the side of the churn, just below the lower end of the dashers C, is attached an inclined guard F, the end next the bottom of spindle D being the highest.

*Claim*.—As an improvement on the churn patented to Hatfield & Goldsmith, on July 13, 1858, the combination of the perforated obliquely arranged dashers C C C, with the single inclined stationary guard F, substantially as and for the purposes set forth.

No. 25,986.—ROBERT STEEL, of Philadelphia, Pa.—*Improvement in the Construction of Burners for Vapor Lamps*.—Patent dated November 1, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The combination of a metallic gas generating chamber and burner, applicable to a lamp, chandelier, or other gas fixture, for the purpose of generating vapor or gas from burning fluid and consuming the same as fast as it is generated, thereby producing a superior artificial gas light, as is described and particularly set forth in the specification.

No. 25,987.—JOHN G. TREADWELL, of Albany, N. Y.—*Improvement in Stoves*.—Patent dated November 1, 1859.—The object of this arrangement of the different parts is to give more or less ventilation to a room by means of the door H, without opening the damper D. The door does not operate the damper until it is almost closed, at which time it is desirable to close the ventilation, and at the same time give more draft to the fire.

*Claim*.—Providing the door H with an inclined projection *a* on one side, and a hinged rack bar *d* on the other, when said door is used in connection with the cross bar *c*, and with the damper D, as constructed, the whole being arranged and operated substantially as and for the purpose described.

No. 25,988.—GEORGE WHITCOMB, of Springfield, Ohio.—*Improvement in Mole Ploughs*.—Patent dated November 1, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The construction of a flexible mole, by the combination of sections which are not attached to each other, but by being held in place by the chain J, or its equivalent, as set forth.

No. 25,989.—LUKE H. WOOD, of Marlborough, Mass.—*Improvement in Pegging Machines*. Patent dated November 1, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The particular arrangement and combination of the feeding apparatus, consisting of the levers R Q and O, spring P, and wheels N L, in connection with the lever U and its stud I, and the awl and driver operated by the levers W and X, in connection with the peg feeding apparatus and pointed saw for cutting off the pegs, when constructed and operating as set forth and described.

No. 25,990.—SIMEON WOOD, of Worcester, Mass.—*Improved Auger*.—Patent dated November 1, 1859.—This invention consists in surrounding the chipping cutters of an auger, or other instrument for boring holes, with a band or hoop having a tooth or teeth, or a cutter or cutters on its bottom edge, to cut the circumferences of the hole.

*Claim*.—The combination of the chipping bit or bits with a band or hook, having teeth or cutters on its bottom edge, substantially as and for the purpose set forth.

No. 25,991.—R. F. WOLCOTT, of Claremont, N. H.—*Improvement in Platform Scales*.—Patent dated November 1, 1859.—The object of this invention is to enable the platform to adjust itself properly to the levers on which it rests; also, to make suitable provision against difficulties attending the winding or twisting of the platform timbers, and to facilitate the movement or adjustment of the weight of the beam and the noting of the weight of the articles counterpoised on the platform.

The inventor says: I *claim*, first, the combination of the two graduated wheels Q R, screw s, and bar r, arranged substantially as and for the purpose set forth.

Second. Attaching the lever I to the platform B, levers H H, and rod J, when the above parts are arranged to operate as described.

Third. The construction and arrangement of the fulcrum arms g of the shaft D, projections b, and plates e, of the hangers C, and the plates G l of the beams F F, substantially as and for the purpose set forth.

No. 25,992.—JEAN LOUIS BAUDELLOT, of Harancourt, France, assignor to HENRY MIGEON, of Wolcottville, Conn.—*Improvement in Apparatus for Cooling Liquids*.—Patent dated November 1, 1859; patented in France, April 13, 1856.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* a cooling apparatus for liquids, composed of a vertical range of pipes passing the liquid successively from the lower to the upper pipes in said range, in combination with the perforated trough d, or its equivalent, supplying the other liquid which trickles over the surface of said range of pipes, as set forth.

I also claim, in such a cooling apparatus, a series of teeth or projections on the underside of the horizontal pipes, for the purpose of conducting or distributing the liquid falling successively from one pipe to the other, substantially as specified.

No. 25,993.—EDWARD BEHR and L. FROELICH, of New York, N. Y., assignors to EDWARD BEHR, aforesaid.—*Improvement in Skate Straps*.—Patent dated November 1, 1859.—This invention consists in a novel arrangement of parts, whereby both the toe and heel straps may be adjusted and the skate secured to the foot by the turning of a single rod, and the straps relaxed on the foot, and the skate consequently detached therefrom, by the simple pressing of a button at the side of the stock near each strap.

*Claim*.—The rod F, fitted longitudinally in the stock A, provided with screw sections c f, with cylinders E H fitted thereon, and one end of the heel and toe straps D G attached to said cylinders, the latter being provided with the ratchets d k, into which the pawls e l catch, substantially as and for the purpose set forth.

No. 25,994.—THOMAS BISHOP, of Plainville, Conn., assignor to Himself and JAMES H. BISHOP.—*Improvement in Tea and Coffee Pots*.—Patent dated November 1, 1859.—This invention consists in constructing an area around the upper and inside portion of the pot, and providing or forming the lid of the pot, one or more projecting rims extending therefrom nearly to the bottom of the area, and also providing a tube or nozzle, or a portion thereof, conducting from the area into the nozzle proper, which nozzle has a cap fitting closely thereto.

*Claim*.—The arrangement of the area E, flanges X upon the lid G, with the apertures F and D, in the manner and for the purpose described.

No. 25,995.—D. G. CHASE, of Boston, Mass., assignor to GEORGE PARR, of Buffalo, N. Y.—*Improved Shank Laster*.—Patent dated November 1, 1859.—This invention relates to a new and improved shank laster—an implement or tool used by shoemakers in drawing leather over lasts. The object of it is to enable the leather to be drawn over on the last and be tacked thereto with greater facility than usual.

*Claim*—The jointed crossbars A A, provided with the swivel jaws E E and swivel nuts a

*a*, in connection with the right and left screw shaft *C*, the whole being arranged substantially as and for the purpose set forth.

No. 25,996.—JOHN COLVILLE, of Wilmington, N. C., assignor to Himself and T. L. COLVILLE, of said Wilmington.—*Improved Method of Adjusting Circular Saws*.—Patent dated November 1, 1859.—This invention relates to a novel mode of adjusting circular saws upon their arbors or shafts, so that they may be set up and made to run perfectly true before the operation of sawing commences, or when the saw has worked out of a true line.

*Claim*.—The expansion ring or plate of copper *G*, or any other suitable metal capable of being expanded, for setting or adjusting the saw properly upon the shaft at any given point or points, when the same is interposed between the saw and the fixed collar, as set forth.

No. 25,997.—WILLIAM ELWELL, of Gardiner, Me., assignor to Himself and N. O. MITCHELL, of said Gardiner.—*Improved Fly Trap*.—Patent dated November 1, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The two boxes *A A*<sup>1</sup> of a quadrangular or other shape, provided with sliding glass tops and sliding bottom *G*, in combination with the perforation *B*, surrounded with projecting pins, for the purposes and when the same are all arranged in the manner set forth.

No. 25,998.—JOHN A. EVARTS, of West Meriden, Conn., assignor to HOMER CURTIS, of said West Meriden.—*Improved Cast Metal Pulleys*.—Patent dated November 1, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—Forming the core *D* of the shell *B* by covering the wheel *A* with the sand *b*, and having the hole *c* made through the core, so that, in casting the shell, the pintle or axis *E* of the wheel will be cast simultaneously with the shell, and the wheel, when the sand *b* is removed, be properly adjusted with the shell, substantially as described.

No. 25,999.—JOHN JEWELL FLANDERS, of Manchester, N. H., assignor to Himself and E. G. W. BARTLETT, of said Manchester.—*Improvement in Rotary Pumps*.—Patent dated November 1, 1859.—This invention consists of a revolving annular inverted gear in combination with a pinion and stationary stop or crescent, arranged to operate in a case.

*Claim*.—The combination of the revolving annular inverted gear, the pinion *S*, and stationary crescent *U*, the whole being arranged to operate in the case, substantially as described for the purposes set forth.

No. 26,000.—H. K. SYMMES, of Newton, Mass., assignor to Himself and R. W. HOLMAN, of said Newton.—*Improvement in Apparatus for the Manufacture of Coal Oil*.—Patent dated November 1, 1859.—This invention consists in drawing the gas from the oil retort by means of a pump, and in forcing the same through a gas retort, in which it is exposed to the influence of better gas, obtained by heating resin, pitch, or some other bituminous substance in this gas.

The inventor says: I *claim* first, an oil retort *A* in combination with the gas retort *D*, or its equivalent, for the purpose of saving the gas which escapes from the oil retort, and to improve its quality, substantially as specified.

Second. In combination with the two retorts *A* and *D*, I claim the pump *G*<sup>1</sup>, or its equivalent, for the purpose of imparting to the gas the necessary pressure, substantially as set forth.

No. 26,001.—ISAAC GOODSPEED, of Norwich, Conn., assignor to Himself and GEORGE A. MANSFIELD, of Boston, Mass.—*Improved Pocket Alarm*.—Patent dated November 1, 1859.—The object of this invention is the production and manufacture of a pocket alarm, which consists of a shell or case of such form and size as to be conveniently carried about the person, with suitable mechanism inclosed therein for causing the explosion of a percussion cap upon the removal of any article to which the alarm is attached.

The inventor says: I *claim* the pocket thief and burglar alarm, constructed in the form and manner represented and described.

I also claim the combination and arrangement of the independent lever *K*, adapted to cap and cock the alarm, and while both the cap tube and hammer are arranged within, and do not project outside the shell or case.

No. 26,002.—STEPHEN H. HEAD, of Boston, Mass., assignor to Himself and WILLIAM P. PARROTT, of said Boston.—*Improvement in Steam Boilers*.—Patent dated November 1, 1859.—*A* is the boiler, *B* and *C* fire spaces, which are separated by the water space or partition *D*<sup>1</sup>, and are fed alternately by fuel introduced through the doors *b* and *c*.

*Claim*.—In combination with the furnaces *B C*, and the lateral passage *E*, and damper *e*, chamber *F*, located at the front of the furnaces, and between them and flues, for the purpose and in the manner substantially as set forth.

No. 26,003.—GEORGE M. PHELPS, of Troy, N. Y., assignor to the AMERICAN TELE-

GRAPH COMPANY.—*Improvement in Telegraphic Machines.*—Patent dated November 1, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, producing from a magneto-electric battery the momentary electric currents required for actuating the printing mechanism by giving momentary motion to the armature or other current inducing part of the magneto-electric battery, by means of a set of finger keys, which, when depressed, are controlled in their action upon the current inducing part of the magneto-electric battery by a mechanical contrivance which constantly moves in harmony with the unintermittingly revolving type wheel, substantially as described.

I also claim increasing the capability of the instruments for telegraphing by so increasing the speed of the transmitting device and type wheel, in relation to the motion of the parts which perform the printing, that two or more types shall pass the platen while the printing mechanism is acting once, as described.

I also claim turning the cylindrical platen while each impression is being made, by means of rings of teeth R and T, upon the type wheel and platen, as and for the purpose set forth.

And, finally, I claim making a revolving wheel or shaft U or *i*, turn the corrector M, armature C, or another wheel or shaft, a certain fixed distance, with the same speed as itself, at any time and any desired number of times, by the use of a ratchet wheel V or *h*, catch W or *f*, guide X or *k*, and detent K or *e*, all arranged together, and with the said driving and driven wheel or shaft, for conjoint operation, as set forth.

No. 26,004.—CHARLES A. GALE, of Boston, Mass., assignor to ALBERT S. HALL, of Malden, Mass., and A. R. DAVIS, of Cambridge, Mass.—*Improved Clothes Dryer.*—Patent dated November 1, 1859.—This invention consists in combining with a portable shelf or mantle a series of folding slats, so that when said slats are unfolded or turned out they may be used as a clothes dryer, and, when not wanted for that purpose, may be folded up under the shelf out of the way while the shelf is ready for use.

*Claim.*—The combination, substantially as described, of the mantle or shelf and the folding slats, arranged and operating as set forth for the object specified.

No. 26,005.—CORINTHA ALDEN, of Cassadaga, N. Y.—*Improved Clothes Ironing Apparatus.* Patent dated November 8, 1859.—This invention consists in arranging a box with a follower that can be forced down by means of screws, or by other suitable means, in combination with a tank provided with a grate to sustain the bottom of the box in such a manner that the clothes can be compressed in the box and heated by filling the tank with water and placing it on a stove, thus rendering the clothes smooth.

*Claim.*—The arrangement of the box A with the follower B, or its equivalent, in combination with the tank D, substantially as and for the the purpose specified.

No. 26,006.—EPHRAIM C. ALLEN, of Le Roy, N. Y.—*Improvement in Corn Planters.*—Patent dated November 8, 1859.—When the machine is in operation, as the main wheel revolves, the cam wheels at the ends of the shaft, with the pins or screws on the outer edges, catch the pitmans on the ends of the slides and draw them through a partition on the seed boxes, when and where the cavities are filled; then as the slides are drawn back through the partition, the brush sweeps off the superfluous seed, and the seed is dropped through the hole in the timber and tube.

*Claim.*—The arrangement of the various parts of the seeding machine described, when the whole are constructed and combined for operation conjointly, as and for the purposes in this specification set forth.

No. 26,007.—JOHN ASPINALL, of London, England.—*Improvement in Refining Sugar.*—Patent dated November 8, 1859; patented in England February 8, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The method described of effecting the blowing up or melting of raw sugars; that is to say, by so supporting or upholding the sugar that successive portions will be brought into contact with the water, whereby the sugar will be melted at or near the surface, for the purposes and substantially in the manner set forth.

No. 26,008.—MERRICK BEMIS, of Ashburnham, Mass.—*Improved Compensating Pendulum.* Patent dated November 8, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The improved mode of making a compensating pendulum, namely, by arranging a part of the rod in the form of a bow or sectoral bend, and applying to such bend or part a clasp or bow of metal having a different expansive ratio, the whole being substantially as specified.

No. 26,009.—ROBERT BLAIR, of Malugin Grove, Ill.—*Improved Device for Applying Steam as a Motor.*—Pated November 8, 1859.—This invention consists in placing a traction steam engine in an annular way, and having said engine attached to a radius frame, the centre shaft

of which is provided with a toothed wheel or pulley, from which the power is taken as the engine passes around the annular way.

*Claim.*—The combination with a radial lever or frame D, and circular railway A, and central revolving power transmitting shaft C, of a traction steam engine B, when the crank axes of said engine radiate from the central shaft C, and the inner traction wheels are made of smaller diameter than the outer one, the whole arranged and operated substantially in the manner and for the purpose set forth.

No. 26,010.—NELSON BURR, of Batavia, Ill.—*Improvement in Corn Shellers.*—Patent dated November 8, 1859.—This invention consists in a peculiar arrangement of the shell, the latter being provided with a door and wing, whereby a corn sheller and cob grinding mill is obtained, which can be used in either capacity by proper adjustment.

*Claim.*—The peculiar arrangement of the section *e*, provided with the ring *j*, and placed relatively with the cylinder A, and adjoining sections *d f*, to effect the object set forth, substantially as described.

No. 26,011.—THOMAS CARPENTER, of Battle Creek, Mich.—*Improved Shoe Making Table.* Patent dated November 8, 1859.—The bench A has a firm bed *a* and sides a few inches high all around. Over the bed *a* is situated a movable bottom D, on the middle of which is secured a revolving block E for receiving the shoe last *c*, and there are holes *b b* in the movable bottom and bed for the holding strap *d* to extend down through.

*Claim.*—The movable bottom D, arranged in combination with the bench A and compartment box B, constructed as described, substantially in the manner and for the purpose specified.

No. 26,012.—R. CARKHUFF and B. CHALFANT, of Lewisburg, Pa.—*Improvement in Steam Valves.*—Patent dated November 8, 1859.—This invention consists of a peculiar means employed for regulating and applying the power of the driving wheels of the engine, whereby the latter may be turned or guided and placed under the control of the engineer more readily than usual.

*Claim.*—The peculiar arrangement of the slide T, and transverse bar *t*, which form the valve of the steam chest K, the bar U, and the cross arm *r* of rod S, whereby said valve is allowed a lateral as well as a longitudinal movement within the chest, for the purpose set forth.

No. 26,013.—LUCIUS C. CHASE, of Boston, Mass.—*Improvement in Girth Buckles.*—Patent dated November 8, 1859.—This invention consists in constructing the buckle with wings B B, or their equivalents, and furnished with holes *b b* for the reception of rivets or screws, by means of which the buckle can be confined to the girth or strap.

*Claim.*—Constructing a buckle with wings B B, or their equivalents, and furnished with holes *b b*, substantially as set forth and for the objects specified.

No. 26,014.—B. S. CHURCH, of Manhattanville, N. Y.—*Improvement in Water Meters.*—Patent dated November 8, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of the partitions *g g*<sup>1</sup>, in the trough G, as described, in combination with the air tight chamber D, chamber F, and tubes 1, whereby that portion of the water which does not pass through the measuring buckets is prevented carrying off any of the air in the chamber D.

Second. Arranging in the air chamber D, a float *j*, in combination with a valve *h*, or its equivalent, substantially as and for the purpose described.

No. 26,015.—GEORGE CLAY, of New York, N. Y.—*Improvement in Packing for Sliding Gas Lights.*—Patent dated November 8, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The combination, with the pipe D, shell A, and pipe B, of the elastic tube C, when the latter is fitted so that its central portion will contract and press upon the burner or upon the sliding pipe so as to form a gastight joint, all as shown and described.

No. 26,016.—J. W. COCHRAN, of New York, N. Y.—*Improvement in Projectiles for Rifled Ordnance.*—Patent dated November 8, 1859.—The object of this invention is to prevent windage between the bore or rifle grooves of the gun and to obtain a rotary motion of the projectile, and to keep the front portion steady during its passage out of the gun, without meeting with either of the two great difficulties which generally attend the firing of rifled ordnance, viz: the tearing or rapid wearing off of the edges of and the "leading" of the rifled grooves.

The inventor says: I *claim*, first, the band C, of copper or other wire, applied substantially as described, in combination with the cup or cup like frame B attached to the rear of the projectile, for the purpose described.

Second. The expanding ring D, applied substantially as described, in combination with a conical surface *f*, formed behind a shoulder on the front part of the projectile, for the purpose set forth.

No. 26,017.—J. W. COCHRAN, of New York, N. Y.—*Improvement in Projectiles for Rifled Ordnance*.—Patent dated November 8, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The application to a projectile for rifled ordnance of a covering or of one or more bands, composed of a coil or coils of copper or other wire wound upon its exterior, substantially as described, for the purpose specified.

No. 26,018.—D. W. COMSTOCK, of Chicago, Ill.—*Improvement in Railroad Gates*.—Patent dated November 8, 1859.—This invention consists in placing the ends of two pairs of adjoining rails on a rising and falling platform that is suspended from the short arms of crank levers, to the long arms of which the two panels of the gate are secured, so that a slight depression of said platform causes the gate to swing open.

*Claim*.—Placing the ends of two pairs of adjoining rails B<sup>1</sup> on a rising and falling platform C, when the latter is suspended from the short arms *d* of crank levers *d e*, the long arms *e* of which carry the panels F of a gate, substantially in the manner and for the purpose described.

No. 26,019.—WILLIAM F. CONVERSE, of Harrison, Ohio.—*Improvement in Railroad Car Springs*.—Patent dated November 8, 1859.—This invention consists in a method of clamping steel disk springs in such manner as to insure their effective action; and also in the combination of a series of concentric disks of unequal diameter.

The inventor says: I *claim*, first, the combination of a clamp *f g h* with a disk spring, in the manner and for the purpose explained.

Second. In connection with the above, I claim the series of annular steel disks of unequal diameter, arranged in manner and for the purpose described.

No. 26,020.—N. B. COOPER, of Gratis, Ohio.—*Improved Churn Dasher*.—Patent dated November 8, 1859.—The inventor says: The operation of the levers and agitators is of such a character as to force the cream rapidly from one side of the churn to the other, and such currents are forcibly interrupted by the agitators upon either side, thereby securing a rapid churning operation.

*Claim*.—The arrangement of the arms *d d* on the two points *b<sup>1</sup> b<sup>1</sup>*, one on each side of the upright B, when the upright B is made removable by means of the ways *x x*, substantially as set forth.

No. 26,021.—EDWARD CRANE, of Dorchester, Mass.—*Improved Steam Boiler*.—Patent dated November 8, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* a fire box surrounded by a water jacket, the combination of the tubes in the fire box, with the boxes or chambers, as described, so that a number of tubes shall have the same connections through the said boxes or chambers with the water jacket and steam chamber, and shall also be capable of being put in and taken out of the boiler at the same time.

I claim the use of tubes coiled or folded into the fire box, and connected with the water jacket and steam chamber through the boxes or chambers *a* and *b*, and *a<sup>2</sup>* and *b<sup>2</sup>*, as described, of such length in proportion to their diameter that all the water entering them at the lower end as shall be converted into steam in the lower portion, and the steam be superheated in the upper portion before it is discharged into the steam chamber.

I claim the use of tubes in the steam chamber for discharging the steam generated in the tubes in the fire box, so bent that the superheated steam issuing therefrom shall be discharged into a drum around the chimney and against the chimney, in the first instance, and then against the surface of the water, as described.

I also claim the use of the drum around the chimney in the steam chamber for securing the discharge from the tubes, and checking the disturbance of the water through the whole extent of the steam chamber, arranged and constructed as described.

I claim the combination of the blow off cocks *e* with the stop cocks *g*, for the purpose of blowing off each section of tubes separately, as described.

I claim the use of the tube coiled around the chimney, for the purpose of taking the steam from the steam chamber, at the point where it has the highest temperature.

No. 26,022.—EDWARD CRANE, of Dorchester, Mass.—*Improvement in Railroad Car Wheels*.—Patent dated November 8, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—A wheel having its rim and tire secured together by India rubber vulcanized in place, as set forth.

No. 26,023.—MUNSON C. CRONK, of Auburn, N. Y.—*Improved Clothes Dryer*.—Patent dated November 8, 1859.—This invention consists in the arrangement of devices for closing up or bringing together the radial arms of the dryer so as to make them portable and easily moved from place to place.

*Claim*.—The combination and arrangement of the hollow post A, the sliding piece R, brace cords M N O P Q, the hub B, the stands W X Y Z, the radial arms C D E F G, and the ring V, substantially in the manner and for the purpose specified.

No. 26,024.—CHARLES A. DESOBRY, of Plaquemine, La.—*Improvement in Pans for Evaporating Cane Juices*.—Patent dated November 8, 1859.—This invention consists of a system of heaters arranged within an evaporating pan, in combination with a suitable system of connections, with two series of pipes arranged below the pan for supplying steam to the said heaters and conveying away the water of condensation.

The inventor says: I *claim* the heaters B B of inverted cup form, applied within the pan, in combination with the system of connections E E F F and the two series of pipes S S and W W below the pan, substantially as described.

And in combination with the said heaters, connections, and two systems of pipes, I claim the pipes *b b* passing through the said heaters, substantially as described.

No. 26,025.—JACOB EDSON, of Boston, Mass.—*Improvement in Pumps*.—Patent dated November 8, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the peculiar manner in which I support the cylinder upon the flanges L, in combination with the vacuum chamber H, for the purpose of insuring an unobstructed passage between the said chamber and the induction pipe below the valves, in the manner and for the purpose substantially as set forth.

Second. I claim the manner described of securing the induction pipe to the pump by means of the projecting bearing points *m*, operating in the manner substantially as set forth.

Third. I claim the described combination and arrangement of the division plate K and the cylinder I, whereby the body of the pump is divided into two distinct chambers, the one serving as an air or water-chamber, and the other as a vacuum chamber, as set forth.

No. 26,026.—THADDEUS FAIRBANKS, of St. Johnsbury, Vt.—*Improvement in Letter Scales*.—Patent dated November 8, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* my improved manufacture of letter scale as made, not only with its pendulous weight K connected with the scale pan F by a forked arm H H I<sup>1</sup>, provided with bearings *h i* for receiving and resting on knife edges of a bar I extended from the steelyard, as specified, but with a bar steelyard E made without any fork, and extended into a stationary staple or stop *g*, the whole being arranged in manner to operate as specified.

No. 26,027.—JOHN M. FORREST, of Norfolk, Va.—*Improved Sash Fastener*.—Patent dated November 8, 1859.—A is the window frame, B the outer sash strips, *b* the inner sash strips, C the spring catch and lock, D the operating lever or thumb piece for catch C, C<sup>1</sup> and D<sup>1</sup> catch and operating lever for upper sash; E the sashes, G the metallic ratchets firmly attached to the sashes, F a cord attached to the sashes and passing over a pulley.

*Claim*.—The springs C and C<sup>1</sup>, and the ratchets G and G<sup>1</sup>, as constructed in combination with the levers D and cord F, operating as described, for the purposes set forth.

No. 26,028.—LEONARD D. GALE, of Washington, D. C.—*Improvement in the Manufacture of Gas*.—Patent dated November 8, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The treatment of bitumen, bituminous coal and their distillates, or their equivalent, by first converting the volatile portions to a state of vapor, at a temperature below a cherry red heat, and then forcing the vapor so generated into contact with a red hot surface in such a manner that the gas generated may be instantaneously removed from the said heated surface, and thus be prevented from further decomposition.

No. 26,029.—THADDEUS A. GRANGER, of Wilson County, N. C.—*Improvement in Machines for Hoisting Marl, &c.*—Patent dated November 8, 1859.—This invention consists in the simplified construction and arrangement of the framework and the attachment of the pulley blocks, so that the marl can be conducted to any distance and discharged at any point, either in carts or around the pit.

*Claim*.—The construction of the cap timber C, in combination with the supporting timber D, which forms the swivel, to allow the beam D to be moved to any point desired.

No. 26,030.—LEONARD D. GALE, of Washington, D. C.—*Improvement in the Manufacture of Gas*.—Patent dated November 8, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The treatment of all woody, resinous, and fatty bodies, as well as all tarry

matter, except bitumen, bituminous coal, and other distillates, by first converting the volatile portions to vapor at a temperature below a cherry red heat, and afterward forcing the vapor so generated into contact with a red hot surface, in such a manner that the gas generated thereby may be instantly removed from said heated surface, and thus be prevented from further decomposition.

No. 26,031.—NOAH E. HALE, of Nashua, N. H.—*Improvement in Applying Pressure to Top Rollers of Drawing Machinery.*—Patent dated November 8, 1859.—At the middle of the length of the parallel bars G G, a hole is bored in each to receive one of the two journals provided at the ends of a short shaft I, which carries a lever J, one end of which is bent upward, so that its point may bear under the top piece A, and the other end of which has suspended upon it a weight K. This weight will, by its action through the lever J, the bars G G, and stirrup rods H H, press equally upon the saddles at both ends, and serve to apply the necessary pressure to all the rolls.

*Claim.*—The arrangement and combination of the drawing rolls C<sup>1</sup> D<sup>1</sup>, straps H, attached at the ends of said rolls, adjustable bars G, lever J, weight K, rod N, bell crank lever L, and hanger O, as and for the purpose shown and described.

No. 26,032.—E. H. HARRIS, of Palmetto, Ga.—*Improvement in Carriage Seats.*—Patent dated November 8, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—Attaching the seat B to the body A of the vehicle, by means of the bars *a* and rods *c*, or their equivalents, so as to permit of a certain degree of play of the seats, or movement thereof, independent of the body A, for the purpose specified.

No. 26,033.—I. P. HARRIS, of Byhalia, Miss.—*Improvement in Ploughs.*—Patent dated November 8, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—The combination of the separately adjustable and removable mould board E, with a subsoil share C situated behind and below it, the said subsoil share being also separately removable, to allow the separate use of said mould board, substantially as specified.

No. 26,034.—HORATIO F. HICKS, of Grand View, Ind.—*Improvement in Machines for Pulling and Cutting Cotton and Corn Stalks.*—Patent dated November 8, 1859.—This invention consists in an automatic provision for uprooting standing cotton stalks and reducing them to fragments suitable for tillage and manure.

*Claim.*—The combination of the reel D, paddle H, drum G, and cutter I, operating substantially as and for the purpose set forth.

No. 26,035.—WILLIAM CLEVELAND HICKS, of Boston, Mass.—*Improvement in Sewing Machines.*—Patent dated November 8, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* my method of controlling needle thread in sewing machines, by a combination of mechanism, substantially as described, by which a bar or wire, through which the thread passes, and by which the thread is tightened and loosened, shall have the described motion combined, first, to be drawn up by the needle bar, or its equivalent, during its entire upward motion; second, held at rest until the needle eye is at or near the material to be sewed; and third, to be disengaged and allowed or caused to fall by its own gravity, or by the assistance of a spring, for the purpose of gaining the amount of motion lost by remaining at rest during the first part of the downward motion of the needle bar, all substantially as described and specified.

No. 26,036.—N. E. HINDS, of Cooperstown, N. Y.—*Improved Horse Shoe.*—Patent dated November 8, 1859.—The claim and engravings explain the nature of these improvements.

The inventor says: I *claim*, first, the wider and thicker enlargement of the toe or fore part of the shoe.

Second. I claim the trough like concave form of the underside of the shoe and the raised edges B B and C, that ensue, as a consequence of the construction of said concave form.

Third. I claim the construction of caulks made in a V or double V form, all of which is constructed and claimed substantially as and for the purposes set forth and specified.

No. 26,037.—A. D. HOFFMAN, of Belleville, Mich.—*Improvement in Cider Mills.*—Patent dated November 8, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The combination of the crushing rollers B B<sup>1</sup>, pressure rollers E F, and endless apron G, when the crushing rollers B B<sup>1</sup> are provided respectively with teeth *a* and recesses *b*, and the pressure roller E, provided with the yielding bars *c* and canvass covering *g*, substantially as and for the purpose set forth.

No. 26,038.—S. F. LEWIS, of San Francisco, Cal.—*Improvement in Pulley Blocks.*—Patent dated November 8, 1859.—This invention consists in the employment or use of an eccentric

and shoe placed within the block and arranged relatively to the pulley, whereby said parts, when used in connection with stops on the pulley and a stop on the shoe, enable the attendant to control the movement of the rope, checking or stopping it entirely when the article to be elevated is at the proper height and the power is to be detached, and regulating the descent of the article as may be required.

The inventor says: I *claim*, first, the arrangement and combination of the pulleys C, shoe D, and eccentric E, within the block A, as and for the purpose specified.

Second. The teeth or projections *b*, and stop *c*, formed respectively on the pulley C and shoe D, to operate as and for the purpose set forth.

No. 26,039.—JAMES M. McLEAN, of New York, N. Y.—*Improvement in Abdominal Corsets*.—Patent dated November 8, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—A corset or belt with cork brackets or projections B B B<sup>1</sup> on its zone, the upper or top edge of such brackets being beveled, as shown in the drawings, in combination with the abdominal pads A<sup>1</sup> A<sup>1</sup> A<sup>2</sup> A<sup>2</sup>, which form a part of the lower section of the corset or bandage and are held in their places by the same, in the manner and for the purpose set forth in the drawings.

No. 26,040.—JAMES McNAMEE, of Easton, Pa.—*Improved Knife Cleaner*.—Patent dated November 8, 1859.—This invention consists of an upper socket containing a pad and operated by a lever, a lower socket with a pad, and a reservoir, containing the polishing material, the lower pad being rendered adjustable in respect to the reservoir, and the several parts being arranged so as to form an apparatus for cleaning knives and forks.

*Claim*.—The upper socket D with its pad I, operated by the socket F with its pad, and the reservoir B, when the pad of the lower socket is rendered adjustable, in respect to the reservoir, and when the several parts are arranged in respect to each other, as and for the purpose set forth.

No. 26,041.—ALLEN N. MERRILL, of Batavia, Ill.—*Improvement in Seeding Machines*.—Patent dated November 8, 1859.—This invention consists in a peculiar arrangement and combination of parts, whereby different kinds of seed may be planted with one and the same machine, and at different distances apart as may be required.

The inventor says: I *claim*, first, the employment or use of a longitudinal adjustable shaft H, provided with cylinders J, having different sized seed cells in connection with perforated bars *g*, slides *i*, and plate *k*, arranged to operate substantially as and for the purpose set forth.

Second. The arrangement and combination of the spout *l*, conductors K, shoe spouts L, and elevating arms E on shaft D, connected to the conductors K, the whole being arranged substantially as and for the purpose set forth.

No. 26,042.—JOHN H. MILLER and SAMUEL ALBRIGHT, of Grafton, Va.—*Improvement in Portable Gas Apparatus*.—Patent dated November 8, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—A portable gasometer C, furnished with a central gas discharge pipe E, a central guide rod S, a flexible connecting pipe F, and one or more ratchet bars H H, and arranged in a frame A A B B, which is provided with one or more spring pawls I I, for use in a railroad car, or other travelling apparatus, which is subject to a jolting or vibrating motion, for the purpose of supplying gas to a series of gas burners, substantially as and for the purposes set forth.

No. 26,043.—CHARLES MINZISHEIMER, of New York, N. Y.—*Improvement in Shirts*.—Patent dated November 8, 1859.—This invention consists in the employment of an expansible joint and strings at the back of the shirt, in combination with perforations in the collar, whereby it is secured without affecting the working of the joint.

*Claim*.—The expanding joint D D, and strings E E, or their equivalents, at the back of the shirt, in combination with the openings *m m* in the other, substantially as and for the purposes specified.

No. 26,044.—OLIVER P. MORAN, of Haynesville, Mo.—*Improvement in Corn Planters*.—Patent dated November 8, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the combination of the curved concentric aperture *o*, in the bottom of the seed box G, with the sliding strike N, and measuring holes *m m*, for the purpose of charging said holes from the seed box with the least possible weight upon and impediment to the motion of the dropping wheel D, as specified.

I also claim the combination of the concentric vibratory arm *h*, and projecting pin *l* thereon, with the measuring holes *m m*, substantially as specified, for the purpose of imparting the proper movement to the dropping wheel D.

I also claim the arrangement of the instant valve M upon the curved weighted hinge *t*,

which is pivoted to the sides of the chamber G, in a position nearly vertically over the valve, in combination with the slotted connecting rod S, for the purpose of producing a superior quickness and delicacy of action on the valve, substantially as specified.

No. 26,045.—AUSTIN W. MOSES and JOSEPH H. SPRINGER, of Philadelphia, Pa.—*Improvement in Casting Car Wheels*.—Patent dated November 8, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The described method of casting railroad car wheels by pouring the central portion of the wheel, independently and in advance of the tread, to allow said central portion to cool and contract to any desired degree before adding the metal forming the tread of the wheel; when said end is accomplished by the employment of a ring, composed of any convenient number of segments F F, or their equivalents, and arranged to operate in combination with the annular part D of the flask, substantially in the manner and for the purpose specified.

No. 26,046.—JACOB H. MUMMA, of Harrisburg, Pa.—*Improvement in Straw Cutters*.—Patent dated November 8, 1859.—This improvement consists in the employment of feed rollers of such form, when arranged and combined with a hawk bill cutter and bar, that in chaffing corn-stalks, they can be split lengthwise by said rollers; and in cutting hay or straw, said rollers divide it into separate and distinct parcels, and more perfectly retain the material to be cut by the revolving knives.

The inventor says: I *claim*, first, the employment of a hawk bill cutter *a a*, constructed and arranged as described, in connection with a cutter bar *c* of a straw cutter, operating in the manner as and for the purposes set forth.

Second. I claim the slat bed *h* for the purposes of not only cleaning the material from dirt, but also as a feed to the rollers, substantially in the manner and for the purposes set forth.

Third. I claim the employment of the rib *d<sup>2</sup>* feed rollers for crushing and dividing the sheet of material to be cut, when arranged and combined with a hawk bill cutter *a a* and bar *c*, substantially in the manner set forth.

No. 26,047.—ADRIAN V. B. ORR, of Lancaster, Pa.—*Improvement in Sawing Machines*.—Patent dated November 8, 1859.—This invention consists in combining the alternate action of two saws, so as to divide a cordwood stick into three pieces in the time and with less power than is used at present to divide into two; and, also, in so arranging the attachments of these saws, by means of bifurcated extremities to oscillating levers, as to do away with the necessity for guides and make them self feeding.

*Claim*.—The oscillating lever D B in combination with the spring T and feed lever *ll*, when constructed as described, and operating either a single saw or a pair of saws, as specified.

No. 26,048.—GEORGE R. OSBREY, of Providence, R. I.—*Improvement in Heating Apparatus*.—Patent dated November 8, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the combination of the alcohol reservoir and vaporizer with a lamp for heating the same, when such vessels are connected by a liquid pipe E and a vapor pipe F, said pipes acting in such connection to maintain a constant level within the vaporizer, in the manner and for the purpose substantially as set forth.

I also claim, combining with such device for vaporizing, a conical disseminator I and a convex deflector K, arranged substantially as specified and for the purpose set forth.

No. 26,049.—GEORGE W. PARROTT and CHARLES K. BRADFORD, of Lynn, Mass.—*Improved Machine for Cutting Boot and Shoe Soles*.—Patent dated November 8, 1859.—This invention consists of the oscillating and reciprocating stock, conveying the knives and the feeding presser clamps.

*Claim*.—The combination and arrangement of an automatic feed, sole by sole, with the cutting knives, substantially as described.

No. 26,050.—HERMAN G. C. PAULSEN, of Flatlands, N. Y.—*Improvement in Clarifying and Refining Sugar, Juices, &c.*—Patent dated November 8, 1859.—The claim explains the nature of this invention.

*Claim*.—The application of alcohol, in combination with water, in all the proportions as stated, and at the temperature of boiling of said combined liquids to the melting or dissolving, boiling or treating raw sugars or juices of saccharine substances, as described, for the purpose and to the effect of producing the intended making and refining of said sugars.

No. 26,051.—WILLIAM PETTET, of New York, N. Y.—*Improved Cooking Range*.—Patent dated November 8, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The combination, with a central fire grate having openings in its side and with the side roasting chambers or spits, of dampers which can be adjusted so that the roasting may either be effected in the side chambers, by direct action of the burning coals, or by the

heat radiated from the sides of the fire chambers, substantially as and for the purposes set forth.

No. 26,052.—EDWARD R. PYE, of New York, N. Y.—*Improved Sweat Knife for Cutting Hat and Cap Linings.*—Patent dated November 8, 1859.—This invention relates to a tool for simultaneously cutting out and perforating for sewing the trimming of hats and caps, technically termed "sweats."

*Claim.*—The employment or use of the knife on the projection C of the bar B, and secured thereto by the set screw c, in connection with the pointed wheel E attached to the projection C; the whole being arranged substantially as and for the purpose set forth.

No. 26,053.—JOHN ROBINSON of Eli, of Sharptown, Md.—*Improvement in Portable Turntable.*—Patent dated November 8, 1859.—The inventor says: My invention designs the construction of a simple and effective railroad, which can not only be quickly laid down in low or marshy grounds for the hauling of timber and other similar purposes, but can also be easily shifted in its parts so as to admit of renewing the trucks in any and all directions desired.

*Claim.*—The adjustable sliding turntable E E G; the whole constructed and operating substantially as specified and for the purpose set forth.

No. 26,054.—JOSIAH M. READ, of Boston, Mass.—*Improvement in Stoves, Ranges, &c.*—Patent dated November 8, 1859.—The flue G, at its entrance into the outer atmosphere, is provided with a sliding door h for the purpose of supplying fuel to the same and regulating the draft thereof, which is provided with a clamp, screw, or handle o, to hold it in place in any desirable position.

*Claim.*—The application and construction of the flue G with its door h, substantially in the manner as and for the purposes described.

No. 26,055.—PETER REYNARD, of New York, N. Y., and VICTOR VARIN, of Brooklyn, N. Y.—*Improved Insect Powder Blower.*—Patent dated November 8, 1859.—The claim and engravings explain the nature of this invention.

The inventors say: We claim, first, the ball c, attached directly to the chamber or neck b, and acting to blow the powder out of the neck or chamber, as set forth, and either with or without the valves 1 and 2, for the purposes and as specified.

Second. We claim the holder, composed of the rod e and ring f, when provided with the rod g, or its equivalent, and the button h, to act on the elastic ball c, for the purposes as described and shown.

No. 26,056.—C. BIRD PATE, of Moore's Hill, Ind.—*Improvement in Stump Extractor.*—Patent dated November 8, 1859.—This machine is operated by placing hook chain R in a notch in the front end of lever L, and fastening the hooks into the roots of the stump or tree to be extracted, lever E being in a horizontal position, and placing the point of spar H against the stump or tree, then applying at the link in the end of the chain P, causing lever F to approach a perpendicular position, and, raising the end of lever E, spar H is thrown forward and the front lever L is raised; thus combining the double action of lifting and pushing at the same time, and throwing the stump or tree from the machine and team.

*Claim.*—The arrangement of levers E F and L and spar H; the whole being for operation conjointly as and for the purpose set forth.

No. 26,057.—ISRAEL M. ROSE, of New York, N. Y.—*Improvement in Sewing Machines.*—Patent dated November 8, 1859.—This invention consists in a mode of combining and operating two needles and a shuttle, or their equivalents, to make a stitch of a novel character with three threads.

*Claim.*—The combination of two needles and a shuttle, or their equivalents, to operate substantially as set forth, for the purpose of producing a stitch of the structure described and represented.

No. 26,058.—CHRISTIAN CHARLES SCHIEFERDECKER, of Baltimore, Md.—*Improvement in Stoves.*—Patent dated November 8, 1859.—The inventor says: I construct a stove, of any suitable form, in such manner that it shall contain a central space or chamber, through which the air passes to be warmed, surrounded by a series of ascending and descending flues, the said chamber being fitted with lumps or pieces of some material refractory to heat, such as lumps of fine clay, broken pieces of sandstone, cannon balls, &c., for the purpose of accumulating and retaining the surplus heat, whilst the fire is active, and gradually imparting it to the air of the apartment as it passes through its interstices, and thus preserve an almost uniform temperature.

*Claim.*—The combination of the central air space f, containing material refractory to heat, with the series of surrounding ascending and descending smoke flues n o p, when arranged substantially as set forth, for the purposes described.

No. 26,059.—CHARLES SCOFIELD, of Adams, N. Y.—*Improvement in Sewing Machines.*—Patent dated November 8, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the auxiliary feeding plate Q, with pins or teeth on its surface, in combination with the perforated slotted main feeding plate N, when said plate Q combines in itself the properties of a spring and of a feed bar, and is otherwise constructed and arranged so as to operate in the manner described.

Second. The arrangement of the pivoted lever S, adjustable collar *q*, pressure pad F F<sup>1</sup>, and needle lever D, in the relation shown to one another and for united operation in the manner and for the purpose set forth.

Third. The lever S, when made elastic, laterally pivoted at *n*, provided with a pin *p*, and coupled to the pressure pad F F<sup>1</sup>, by an adjustable collar *q*, in combination with the needle lever D, and the recess S in the standard C, substantially as and for the purpose set forth.

Fourth. The looper W x U T, when the part U T is made rigid and attached to the horizontal rock shaft V, and the part W x is made yielding or with a spring and formed or arranged on one side of part U T, and in the relation shown to a projection on the peripheral surface *x* of the actuating cam, in the manner and for the purpose described.

Fifth. The combination of the adjustable intermediate plate 13, with the jaws T x of the looper, substantially as described, for the purpose of adapting the same looper, without removing it from the machine which is used, for sewing either in the double looped or other stitch made with two threads, for sewing in the chain stitch, as set forth.

No. 26,060.—JAMES STIMPSON, of Baldwinsville, Mass.—*Improved Machine for Making Box Joints.*—Patent dated November 8, 1859.—This invention consists of a machine for making an improved joint for jointing or putting together boxes, &c., which is shown in the engraving, where A represents the front and B the side of a drawer; on the piece A is formed a series of round tenons *a*, which enter corresponding holes *c* in the piece B; a lap or rebate *b* is formed on the piece A in the thickness of the stuff, which laps over the end of the piece B when in place, the whole forming a joint.

The inventor says: I *claim*, first, the combination of the hollow bit *r*, the cutters *w* and *d*<sup>2</sup> or their equivalents, operating as set forth, to form the tenons *a*.

Second. In combination with the above, I claim the augur bit 12, operating as described, to form the holes *c* to correspond with the tenons *a*, as set forth.

No. 26,061.—CHESTER W. SYKES, of New York, N. Y.—*Improved Carving Knife.*—Patent dated November 8, 1859.—This invention consists in the combination of shears with the ordinary carving knife, so that the advantages of each instrument are attained.

*Claim.*—The combination of a knife and shears, substantially as described, as an instrument especially adapted for carving meats.

No. 26,062.—HARVEY TRUMBULL, of Central College, Ohio.—*Improvement in Straw Cutters.*—Patent dated November 8, 1859.—The inventor says: My present improvement is more or less immediately connected with the feed of the material in the hopper, and for this purpose I employ an automatic rake to urge forward the straw under a rising and falling pressure cap or piece, that coming down retains the straw fed by the rake, and holds it firm and compact for the action of the knife.

*Claim.*—The combination of a self adjusting spring pressure clasp L to or with an automatic rake, for the purpose of feeding the material to the knife, substantially as specified.

No. 26,063.—NATHANIEL WATERBURY, of Fond-du-Lac, Wis.—*Improvement in Gates.*—Patent dated November 8, 1859.—The rod J and weight K constitute a pendulum swinging at right angles to the axis and movement of the gate. By this arrangement, the gate may be turned entirely down level with the ground; but, by the attachment of a weight to a lever extending from the rear part of the gate, it cannot be turned down level; the levers also present an obstruction by their lateral projection.

*Claim.*—The arrangement and combination of the pendulous rod J and weight K, with the axis of the pulley H, as and for the purpose shown and described.

No. 26,064.—JAMES WHITEHILL, of Frederick, Md.—*Improvement in Hot Air Furnaces.*—Patent dated November 8, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, a furnace constructed with two separate fire chambers and grates, with an air passage between the chambers closed at their sides, but open at the bottom and top, substantially as and for the purposes set forth.

Second. The combination of the peculiar labyrinthian air passage described and the peculiar furnace described, in the manner and for the purpose set forth.

Third. The combination, with the peculiar furnace and peculiar labyrinthian air passage described, of the curved cold air pipe M, substantially in the manner and for the purpose set forth.

No. 26,065.—FERDINAND WUTRICH and JACOB KOERBER, of New York, N. Y.—*Improvement in Cotton Gins*.—Patent dated November 8, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The arrangement of the finger shafts C and D, operating and constructed in the manner described, and acting together so that, while the fingers of the shaft C, during its revolution, pull the cotton out of the hopper, the fingers of the shaft D take the cotton from the former, and deposit the same upon the guiding rollers, substantially as specified.

No. 26,066.—WILLIAM C. ALLISON, of Philadelphia, Pa., assignor to Himself and JOHN MURPHY, of said Philadelphia.—*Improvement in the Mode of Confining the Seat of the Driver on City Railroad Cars*.—Patent dated November 8, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The combination of the board D, rod E with its collar *f*, and the catch *h*, when the said rod serves the double purpose of supporting the seat, and, in conjunction with the catch *h*, of maintaining the seat folded up out of the way, and when the several parts are arranged in front of the car as and for the purpose set forth.

No. 26,067.—HENRY C. BROWN, of Buffalo, N. Y., assignor to CHARLES O. BROWN, of Dalton, Mass.—*Improved Handle for Smoothing Irons*.—Patent dated November 8, 1859.—A is a hollow metallic cylinder of a convenient size and length to be grasped by the hand; B are heads inserted in the ends of cylinder A; a rib *c* fits into a groove *c*<sup>1</sup> and holds the head firmly; D are the legs which connect the handle to the smoothing iron.

*Claim*.—A ventilated smoothing iron handle, constructed for the purposes substantially as described.

No. 25,068.—WILLIAM E. COOPER, of Dunkirk, N. Y., assignor to CHARLES D. GIBSON, of New York city.—*Improvement in Railroad Car Springs*.—Patent dated November 8, 1859. This invention consists in the manner and means of arranging and operating such springs in groups or series of four or more springs placed in double lines vertically, so as to possess the length of elastic action, which two series of the springs would have if placed the one above the other, while the space which they occupy vertically is less than if the springs were placed in pans one above the other.

*Claim*.—The combination and arrangement of groups of four springs by and with the suspension bracket or stirrup B B, &c., constructed, arranged, and operating in the manner above described.

No. 26,069.—JOHN DANNER, of Canton, Ohio, assignor to J. M. JAY, of said Canton.—*Improvement in Sleeping Cars*.—Patent dated November 8, 1859.—The frames D of the backs B<sup>1</sup> are rigidly attached to the seats C C<sup>1</sup> and B, and are also provided with false backs *d* hinged to the backs of seats C, and capable of being let down so as to rest on the bottoms *f* attached to the underside of seats C<sup>1</sup>.

*Claim*.—The combination of the hinged back *d*<sup>1</sup> with the hinged and reversible frame D<sup>1</sup>, and removable piece E, constructed and arranged to operate in relation to seat C<sup>1</sup> and false backs *d* of the back B<sup>1</sup>, substantially as and for the purposes set forth.

No. 26,070.—PEARSON B. KITCHEN, of Philadelphia, Pa., assignor to WILLIAM M. MARSHALL, of said Philadelphia.—*Improvement in Apparatus for Heating Hydro-Carbon Liquids*.—Patent dated November 8, 1859.—This invention consists in the use of an air chamber or bellows and a generating tank, said air chamber to have a conical or other shaped bottom, with the application of a heating frame to heat the air when necessary before coming in contact with the chemicals, and said air chamber to have one or more pipes passing from it into the generator, to be partially submerged in the liquid; all for the purpose of thoroughly producing evolution and a perfect commingling of other gases and the atmospheric air, and also producing a steady and uniform light.

*Claim*.—The application to gas generators of a hot air chamber, as previously described, and the submerging of one or more air pipes therefrom into and upon the chemicals, for the purposes set forth and described, or any other substantially the same and which will produce the intended effect.

No. 26,071.—A. H. KNAPP, of Newton Centre, Mass., assignor to Himself, E. H. BARTOW, and A. R. TROWBRIDGE, of said Newton Centre.—*Improvement in Lamps*.—Patent dated November 8, 1859.—The inventor says: I employ a wick protector I placed around the projecting part of the wick, and at a little distance therefrom, sufficient to allow room for the combustion to take place, and extending upward about as high as the wick ordinarily extends. It is secured on the upper end of the wick holder G.

*Claim*.—The wick portion I, arranged and operating substantially as and for the purpose described.

No. 26,072.—AMBROSE LOVIS, of Boston, Mass., assignor to Himself and CHARLES E.

HODGES, of said Boston.—*Improvement in Composition for Detergent Purposes.*—Patent dated November 8, 1859.—This invention consists in the employment of silicate of soda or silicate of potash impregnated with chlorine, the silicate cleansing the fabric, while the chlorine disinfects and whitens it.

*Claim.*—The above described cleansing, bleaching, and disinfecting liquid, consisting of an alkaline silicate combined with chlorine, for the purpose specified.

No. 26,073.—JAMES A. WHIPPLE, of Boston, Mass., assignor to Himself and GEORGE A. STONE, of Roxbury, Mass.—*Improvement in the Method of Driving Piles.*—Patent dated November 8, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The method or process of driving piles by exploding charges of gunpowder, or its equivalent, between the pile and a fulcrum of resistance, so that the force of the explosion shall wholly or partially act to drive the pile in the direction of its length, or nearly so.

No. 26,074.—JOSEPH BARRANS, of County of Surrey, England.—*Improvement in Portable Traction Locomotives.*—Patent dated November 8, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the method herein described of supporting the front portions of traction or portable steam engines, by means of a spring or elastic beam or lever at or near the middle thereof; the said beam or lever being arranged constantly to occupy a position in a vertical plane passing through the axis of the boiler, and by having its rear and front ends applied and jointed respectively to the bottom of the barrel of the boiler and to the fore carriage, substantially as and for the purpose set forth.

Second. The application and use, in traction engines, of tension rods or bars for retaining the driving wheel centres at the proper distance asunder from the axis of the ground driving wheels.

Third. The application and use, in traction and portable steam engines, of ground driving wheels, in two or more sections capable of being put in and out of working action for the purpose described, and such wheels having teeth holding projections upon their peripheries of the form and arrangement described.

No. 26,075.—JAMES ALBRO, of Elizabeth, N. J.—*Improved Method of Printing Floor Cloths.* Patent dated November 15, 1859.—This invention consists in a novel way of charging the blocks with color, so that the latter may be distributed on the face of the block in such a manner that it will be transferred, under suitable pressure of the block, direct to the cloth, and produce the desired effect.

*Claim.*—The production of grained or variegated designs upon oil cloth, by applying the printing blocks to cushions or pads upon which the colors have been previously "grained" or "combed," as herein set forth.

No. 26,076.—WILLIAM H. ARNOLD, of Washington, D. C.—*Improvement in Breech Loading Fire-Arms.*—Patent dated November 15, 1859.—This fire-arm is designed to be used with the inventor's tail guide projectile.

The inventor says: I *claim*, first, the combination of the cap lever L, shackle piece C, pin e, and grooves i, with the breech piston P, for operating the same, substantially as described.

Second. The combination of slide piece k, joined as described, with the pin a, and hammer H, operating substantially as and for the purpose set forth.

Third. The cavity m in the piston P, for the reception of the rear projecting tail piece of the projectile, as set forth.

No. 26,077.—J. M. BAIRD, of Wheeling, Va., and LEVI F. SMITH, of Stonington, Conn.—*Improved Reclining Chair.*—Patent dated November 15, 1859.—The object of this invention is to effect a more convenient, easily adjusted, and comfortable reclining chair than any now in use, being so constructed that by a simple and self-adjusting arrangement the occupant may by his own specific gravity, control and operate the chair at will, placing himself permanently at any angle or inclination desired, the foot board at the same time adjusting itself to the position of the feet and the desired length of the legs.

The inventors say: We *claim*, first, the combination and arrangement of the oscillating pedestal A, vertical lever B, the sliding seat frame C, and stand D, substantially as and for the purpose described.

Second. We claim, in combination with the fall L, the vibrating foot board P, the oscillating bars H, and pitman F, or their equivalents, operating in the manner and for the purposes described.

No. 26,078.—WILLIAM H. BAKER, of Tamaqua, Pa.—*Improvement in Mechanical Movement.*—Patent dated November 15, 1859.—The object of this invention is to obtain a simple mechanism for applying the power of a weight to a reciprocating driving shaft. The inven-

tion is more especially designed for operating light machinery, such as churns, washing machines, &c., and save the labor required by the manual operation of them.

*Claim.*—The drum B, placed loosely on the shaft C, and having ropes or chains *l m*, and a weight or weights attached to it as shown, in connection with the toothed spring L, toothed wheel E, train of wheels *i*, fly wheel G, and cam H, fitted between the friction rollers *j* of the shaft I, the whole being combined and arranged to operate as and for the purpose set forth.

No. 26,079.—WILLIAM C. BAMBERGER, of Washington, D. C.—*Improved Gauge for Iron Axles.*—Patent dated November 15, 1859.—The inventor says: To set the gauge for the “gather,” proceed as follows: Lay off upon arm C a distance equal to twice the length of the arm or journal; then move the arm inward, at the point just ascertained, equal to the whole taper of the journals, and clamp it; now measure off upon arm C a distance equal to half the diameter of the wheel, and at this point move the arm outward a distance equal to half the “gather,” previously determined; clamp it, and it is ready for use.

*Claim.*—An axle gauge, constructed and operated substantially in the manner described.

No. 26,080.—JACOB W. BANTA, of Buffalo, N. Y.—*Improvement in Ship Building.*—Patent dated November 15, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—Extending the planking upon both sides of the bow, and uniting their contiguous ends forward of the dead wood, the planking and dead wood being chamfered to admit of such extension and union, substantially as described.

No. 26,081.—JAMES BIDWELL, of New York, N. Y.—*Improved Burr Cylinders.*—Patent dated November 15, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—Securing the toothed plates D in place by providing them with projections or recesses to fit to corresponding recesses or projections provided in or on the interposed packing rings fitting to the body of the cylinder, substantially as described.

No. 26,082.—AARON BOWERS, JACOB H. GRIGGS, and JOHN WILSON, of Monmouth, Ill.—*Improvement in Mole Ploughs.*—Patent dated November 15, 1859.—As the mole or plough is drawn along, the front of the mole A raises up the earth and the ridge G separates it so as to pass it on each side of the coulter and up the inclined groove F to be packed up into the cut made by the coulter, by the rounded end near the mole part A, while at the same time the scrapers *a a* scrape any loose earth thrown out above into the cut made by the coulter, where it is closely packed down by the presser D.

*Claim.*—The combination of the peculiarly constructed mole A, with the scrapers *a a* and presser D, arranged and operating in relation to each other, as and for the purpose set forth.

No. 26,083.—ADOLFUS BRASS, of Newark, N. J.—*Improved Tool for Cutting Corks.*—Patent dated November 15, 1859.—This invention consists of a cutter adapted for the purpose of cutting conical corks, consisting of two curved blades, two spring or hinged arms, and a sliding ring with extensions, the latter being fitted to grooves of the arm, and as the cutter progresses through the block, sliding longitudinally on the arms by reason of the ring coming in contact with the cork block, and consequently causing the arms and blades to gradually approach nearer together and thus give the proper taper to the cork.

*Claim.*—A cutter consisting of two curved blades *z z*, two spring or hinged arms *x x*, and a sliding ring *c<sup>l</sup>*, with extensions, substantially as and for the purposes set forth.

No. 26,084.—ISAAC A. BROWNELL, of Providence, R. I.—*Improvement in Machines for Packing Starch, &c.*—Patent dated November 15, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the tunnel T, as constructed for the purpose, substantially as described.

Second. I claim attaching the cans *i i* to upright strips of wood or metal, which receive and transmit to the said cans the motions which reduce in bulk the commodity placed therein.

Third. The wheel F, or its equivalent, for holding and carrying the blocks *h h*, in combination with the cam wheel G, or its equivalent, and the studs *l l*, &c., for imparting the motions which reduce the commodity in bulk, and also the intermittently rotary motion to the wheel F, for the purpose set forth.

Fourth. I claim the arrangement of the foot lever *u*, and the rod *v*, and the punch S, with the rod and plate *j*, for the purposes specified. I also claim, in combination with the punch S, the pawl *w*, rod *y*, and sliding hub *x*, for liberating the wheel F, at the proper time.

Fifth. I claim the rail *a a* and studs *r r*, &c., with the stop O, for withholding motion, in the manner and for the purpose specified.

No. 26,085.—JOSEPH BULLOCK, of Cohoes, N. Y.—*Improvement in Knitting Machines.*—

Patent dated November 15, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The employment, in combination with such a circular series of stationary needles of a series of lever like jacks F, applied substantially as described, and having a movement between the needles in a direction radial to the centre of the machine, as described, but no rotary motion.

No. 26,086.—GEORGE T. BUSHNELL, of Birmingham, Conn.—*Improved Martingale Ring.*—Patent dated November 15, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—As a new article of manufacture, a martingale ring whose exterior edge is thinner than the interior, in combination with an exterior band, whose edges extend down upon the sides of the ring, forming a hollow or corrugated band on its surface, substantially as described, for the purposes as aforesaid.

No. 26,087.—JOHN T. BUTLER, of Natchez, Miss.—*Improvement in Fastening Metal Hoops on Cotton Bales.*—Patent dated November 15, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The combination of the buckle frame A, when made without any opening in the border of it, with the hooks C C<sup>1</sup>, when the latter are received through the former and held in place by the pressure of the bale against them, substantially as described and represented.

No. 26,088.—LYSANDER BUTTON and ROBERT BLAKE, of Waterford, N. Y.—*Improvement in Nozzles for Fire Engines, &c.*—Patent dated November 15, 1859.—This invention consists in a certain improvement in the nozzles or adjustages of fire engines and other hydraulic machines.

*Claim.*—The removable ring B, constructed and combined with the adjustage, substantially as set forth.

No. 26,089.—WILLIAM L. CARTER, of Marietta, Pa.—*Improved Ore Washer.*—Patent dated November 15, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—A double conical shaped vessel, provided with teeth or cutters inside at the end where the ore is received, and the grinders G, with the means described for supporting and adjusting the same, substantially as specified.

No. 26,090.—CYRUS CHAMBERS, Jr, of Philadelphia, Pa.—*Improvement in Machines for Folding Paper.*—Patent dated November 15, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, so arranging the drop roller that it shall coöperate with one of the feeding rollers in feeding in the sheet.

Second. Forming grooves in the folding rollers for the reception of the adjustable guides, as described.

Third. The combination of the carrying roller with the folding roller for carrying in the sheet.

Fourth. Giving the curved bars a projection beyond the surface of the rollers, for the purpose of raising or bearing off the sheet from the folding roller, substantially in the manner described.

Fifth. Moving the folding knife in an arc around one of the folding rollers, as and for the purpose specified.

Sixth. Placing the centre of the arc in which the folding knife moves, near and within the periphery of the roller around which it moves, substantially as and for the purpose set forth.

Seventh. Corrugating the sheet as it passes from one folding mechanism to a position to be acted upon by the next, for the purpose described.

Eighth. Turning or conducting the paper by means of the bent bars 13 or 22, or their equivalents, substantially in the manner specified.

Ninth. The combination of the bent bars with the straight bars and adjustable stop, arranged substantially in the manner described.

Tenth. The combination of the bent bars with the tapes and stop, for the purpose specified.

Eleventh. The oscillating packer or plunger R, having its centre of motion below the point of contact with the folded sheets, as set forth.

Twelfth. The yielding catches for preventing the return of the packed sheets, constructed and operating substantially as described.

Thirteenth. Making one or more notches in the plunger for cleaning the yielding catches, as set forth and shown.

No. 26,091.—GEORGE E. CHENOWETH, of Baltimore, Md.—*Improvement in Harvesters.*—Patent dated November 15, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The described arrangement and combination of the finger bar and main frame, whereby the bar can be folded forwards to the side of the machine with its front downwards, so that the platform can remain attached to the bar, and occupy a vertical plane therewith when folded to this position, all as described and represented.

No. 26,092.—PHILIP L. CLOW, of Cohoes, N. Y.—*Improved Churn.*—Patent dated November 15, 1859.—This is an improvement on such churns as have within a tub-like cream vessel, two upright plate like dishes, running in contrary directions with equal speed on vertical axes at their centres, which are so separated that the paths of the dashers in their horizontal revolutions cross each other, as indicated by the dotted circular lines marked Z Z<sup>1</sup>.

The inventor says: I *claim*, first, hanging the outer parts *a a a<sup>1</sup> a<sup>1</sup>* of two contrarily revolving dashers B B<sup>1</sup> to the central portions *c c<sup>1</sup>* by hinges *d*, in the manner and for the purposes set forth.

Second. The arrangement of the air pump E and water reservoir F, with the revolving dashers B B<sup>1</sup> and cream vessel G, as and for the purpose described.

No. 26,093.—AARON L. CORNELL, of New York, N. Y.—*Improved Rotary Churn.*—Patent dated November 15, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The arrangement of the rotating shafts armed with the concave or recessed crags or dashers within the two concave or half-cylinder chambers, placed back to back, as described.

No. 26,094.—HUNTER DAVIDSON, of the United States Navy.—*Improved Apparatus for Working Ships' Boats.*—Patent dated November 15, 1859.—This invention consists in lowering the boat by means of a reel placed inside the ship, by which one man can by the means of a single rope and chain lower a boat with its crew; also of a detaching apparatus, by which both ends of the boat may be simultaneously detached, and if need be by one man; and also of an attaching apparatus by which the boat is again attached in a proper manner.

*Claim.*—The boat apparatus, consisting of the reel, the attaching and detaching hooks, constructed and operating substantially as specified.

No. 26,095.—THOMAS H. DODGE, of Washington, D. C.—*Improvement in Mowing Machines.*—Patent dated November 15, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement and combination of the levers, standards, and cords *i i*, or their equivalents, with shoe C, whereby the driver, from his seat on the machine, can elevate either end of the finger bar independently of the other, or the entire bar, substantially as described for the purpose specified.

Second. I claim the combination of the cutting apparatus with the main frame and mechanism represented in Figs. 2 and 16, or its equivalent, so constructed and arranged that the driver can, without leaving his seat on the machine, fold up and unfold the finger bar without taking hold of it with his hand, substantially as and for the purpose stated.

Third. I claim the combination and arrangement of the levers G G<sup>1</sup> with the driver's seat E and cord or chain *h<sup>1</sup>*, whereby the driver may, when necessary, employ both his hands and his feet, together with the power of the team, to raise the finger bar and cutting apparatus substantially as set forth.

Fourth. I claim so combining mechanism with the machine as that the driver can employ the power of the team to assist to elevate the finger bar and cutting apparatus at pleasure, without changing the horizontal position of the main frame, substantially as described.

Fifth. I claim in a reaping and mowing machine the folding guard F and rein hitch *h*, in combination with the driver's seat, substantially as and for the purposes set forth.

Sixth. I claim the flexible or adjustable draft connection *b<sup>1</sup>* or X, to which the team is attached, in combination with the coupling arm *a* and shoe C, substantially as and for the purposes set forth.

Seventh. I claim the spiral cutters *k*, when constructed and arranged as shown in Fig. 11, and operating substantially as and for the purposes set forth.

Eighth. I claim hinging the track clearer to the extension piece *j<sup>1</sup>*, or its equivalent, by means of the crank *j j*, for the purposes described.

Ninth. I claim so constructing the track clearer that its weight may be adjusted in the manner and for the purposes substantially as set forth.

No. 26,096.—MILES EARNHART, of Cold Water, Miss.—*Improvement in Cotton Scrapers.* Patent dated November 15, 1859.—In this invention, a beam A of ordinary construction is provided, to which are attached handles B B. The principal parts of the scraper consist of a stock or landside C, bottom D, and mould board E. The brace G can be raised or lowered, if desired, to vary the adjustment produced by the holes *f*.

*Claim.*—The arrangement and combination of the double adjustments of the mould board E with the stock C and rigid supporting brace G, substantially as and for the purpose specified.

No. 26,097.—MOSES G. FARMER, of Salem, Mass.—*Improvement in Telegraphic Machines.* Patent dated November 15, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The use of a key or circuit breaker, which shall close one circuit before or at the same time that it opens another, in connection with an electro-magnet with two sets of helices operating on one and the same armature lever, or two separate electro-magnets operating upon one and the same armature lever, for the purpose of transmitting two messages simultaneously upon a single wire.

No. 26,098.—WILLIAM FROST, of Amenia, N. Y.—*Improved Milk Can.*—Patent dated November 15, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—A milk can provided with tinned iron hoops B, with their ends connected together by rivets *b* and solder *a*, either or both, and secured on the can by solder, to form an improved article of manufacture, as set forth.

No. 26,099.—ROLLIN GERMAIN, of Buffalo, N. Y.—*Improvement in the Construction of Ships and other Navigable Vessels.*—Patent dated November 15, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, vessels for navigation, when the bow and stern sections shall taper uniformly, and the vessel, below its water lines, be of the form and model substantially as described, and when the relative proportions as to length, breadth of beam, and draft of water, shall be such that, if a right line be drawn longitudinally through the middle, commencing at the water line at the bow, and terminating at the water line at the stern, (when the vessel is loaded,) and another line be drawn at right angles to said line along the water surface, from the water line on one side to the water line on the other side, at the middle of the part of the vessel where a cross section below the water line is greatest, and from every point in this last described line right lines be drawn to each end of the first described line, the average of all the angles made by these last lines with the first described line shall not exceed two degrees.

Second. The combination of the fin like projection V with a vessel, constructed below its water lines, substantially as described.

Third. The combination of the overhanging deck with a vessel, constructed below its water lines, substantially as described.

Fourth. Constructing the pilot house and smoke stacks (separately) in respect to their forward and rear parts, in a tapering or wedge like form, substantially as described.

Fifth. The combination of the notched plates C C, the iron knee D, and rivets E, with a vessel, constructed substantially as described, for the purposes set forth.

No. 26,100.—JAMES GILES, of Dryden, N. Y., and C. B. TOMPKINS, of Ulysses, N. Y.—*Improvement in Cylinders for Smoothing Walks, &c.*—Patent dated November 15, 1859.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim* making cylinders for rollers, and other purposes, with grooved metal flanges, into which wood staves are fitted, which form the rolling surface, substantially as described and for the purposes specified.

Also, the mode of making and applying cross bars between rollers, when two or more cylinders are required for smoothing surfaces, as described.

No. 26,101.—GEORGE HAMEL, of Abington, Pa.—*Improvement in Apparatus for Starting City Railroad Horse Cars.*—Patent dated November 15, 1859.—This invention consists in the relative arrangement and combination of certain devices whereby the horse cars used on city railways may not only be readily started from a state of rest with greatly diminished strain upon the horses, but the forward motion of the cars on an upward as well as a level grade will readjust the said devices after each starting, at the will of the driver, and without impeding the said forward motion of the cars.

The inventor says: I *claim* the relative arrangement of the levers E E, the pawls F F, in combination with the rest pins *u* and inclined planes  $u^1 u^1$ , the draw bar D, in combination with the inclined pieces *s s* and the staying pins *p* and *q*, or their equivalents, for holding and releasing the draw bar D; the same being constructed and arranged to operate substantially in the manner and for the purposes specified and described.

I also claim, in combination with the said draw bar D, the devices H, I, K, L, and M, the same being arranged so as to be operated by the cam N for their readjustment, substantially in the manner set forth and described.

No. 26,102.—JACOB E. HARDENBERGH, of Fultonville, N. Y.—*Improvement in Potato Harvesters.*—Patent dated November 15, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the employment or use of an adjustable share N in connection with the rotary screen P and with or without the discharging device Q; the parts

being applied to a mounted frame and arranged to operate substantially as and for the purpose set forth.

Second. The rotary discharging device Q, placed eccentrically on the screen P, kept in proper relative position therewith by the plate R, and rotated from the screen P by the projection q, substantially as described.

Third. The combination of the share N, rotary screen P, and discharging device Q, when attached to a mounted frame A and arranged substantially as shown, so that the screen and the discharging device may be adjusted independently of the share, and the discharging device Q rotated by the screen P and kept in an eccentric position thereon, for the purpose specified.

No. 26,103.—ALBERT H. HOOK, of New York, N. Y.—*Improvement in Machines for Grinding Glass.*—Patent dated November 15, 1859.—Before putting this machine into operation, the plate of glass is put upon the bed c, resting against a ledge at the foot of said bed, by which it is held. The machine is put in motion and the bed is drawn up under the cylinder that is in rapid rotation. The grinding sand, &c., is fed in and the work commences, the screws feeding the bed steadily up the inclined plane as the work progresses, and the inclination keeping the work free, while a plentiful supply of grinding material is freshly furnished to do the most efficient execution.

*Claim.*—The combination of the inclined carriage c and cylinder i, arranged and operated in the manner and for the purposes specified.

No. 26,104.—ELISHA G. HOPKINS, of Penn Yan, N. Y.—*Improved Bedstead Fastening.*—Patent dated November 15, 1859.—The inventor says: To use my invention, bore the holes as specified, insert and secure the irons as directed, then put the bedstead together, and turn the rails outward or inward, and the bedstead will be fastened together. If a cord be used, apply it to the pins on the rails, and apply as much force as is necessary to tighten the cord and there will be no risk of pulling out the rings or bolts.

*Claim.*—The construction and arrangement of the parts C, D, E, and F, substantially as specified, and for the purpose set forth.

No. 26,105.—M. G. HUBBARD, of New York, N. Y.—*Improvement in Harvesters.*—Patent dated November 15, 1859.—These improvements consist in combining a universal joint O with the reel G, by means of which a flexible reel is attained that will conform to the position of the platform on uneven ground; also, in combining the flexible platform D with a flexible reel, by means of which the front edge of the platform and the lower reel wing will be kept parallel and the grain laid evenly on the platform, whatever may be the surface of the ground.

The inventor says: I claim the universal joint O in the reel in which the arms and wings are pivoted or flexible and yielding, substantially as specified.

I also claim the combination of the flexible reel G with the flexible platform D, substantially in the manner and for the purposes specified.

I also claim the outer reel arm S, in combination with the flexible reel and platform, as described.

No. 26,106.—DANIEL HUGHES, of Rochester, N. Y.—*Improved Propeller.*—Patent dated November 15, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The arrangement of the spiral screw propellers C C<sup>1</sup>, so that their blades shall work nearly in contact, and thus present a broad, unbroken, resisting surface, substantially as and for the purposes shown and described.

No. 26,107.—WILLIAM J. INNIS, of Providence, R. I.—*Improved Belt Awl and Punch.*—Patent dated November 15, 1859.—This invention consists in making an awl and punch of one continuous piece of metal, with the awl at one end, and the punch at the opposite end of the bar, and placing the same within a spring handle, so that it may be rotated, and the awl and punch be presented alternately to the belt as occasion requires.

*Claim.*—The combination of the punch, awl, and spring handle, substantially as described.

No. 26,108.—ENOCH JACOBS, of Cincinnati, Ohio.—*Improved Fastenings for Jail Doors.*—Patent dated November 15, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I claim, first, making the castings of heavy iron doors of double angle iron, substantially as described.

Second. Fastening iron doors by swinging bars, working in the outside cavity of the double angle iron casing, substantially in the manner and for the purposes set forth.

No. 26,109.—THOMAS A. JEBB, of Buffalo, N. Y.—*Improved Churn.*—Patent dated November 15, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The arrangement of the short dash blades H and long dash blades H<sup>2</sup> relatively to each other and to the segmental stave B, so that the short dash blades will revolve within,

and the long dash blade under the lower beveled end of the segmental stave, substantially as set forth.

No. 26,110.—ARTHUR E. JEROME, of Monroeville, Ohio.—*Improvement in Seeding Harrows*.—Patent dated November 15, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, making the axis on which the harrows rotate hollow, and in the form of a drill tooth, substantially as and for the purposes set forth.

Second. Combining a corn planter or a broadcast sower with the harrows, substantially as and for the purposes set forth.

No. 26,111.—W. T. JONES, of Joliet, Ill.—*Improvement in Ploughs*.—Patent dated November 15, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the attaching of the mould board E, landside F, and share G, to the standard C, by means of a joint or hinge, the plates or leaves *e f* of which are provided with screws, and arranged substantially as and for the purposes set forth.

I also claim constructing the standard C with a forked upper end, in connection with the rod D, lug *h\**, and flanch *f*, arranged substantially as shown, to admit of the proper attachment of the beam and handles to the plough.

No. 26,112.—J. G. KAPPNER, of New York, N. Y.—*Improved Billiard Table*.—Patent dated November 15, 1859.—This invention consists in the employment of a half circular guide plate, which is rigidly attached to the under side of the cushion rail, and to which the arm carrying the cup is pivoted; said arm is also furnished with a hook that catches over the inner periphery of the guide plate, thereby steadying the cup in whatever position it may be brought.

*Claim*.—The combination with the cushion rail B of the circular guide plate C, pivoted cross arm E, and hook *c*, as for the purpose shown and described.

No. 26,113.—JOHN KIMBALL, of Boston, Mass.—*Improved Machine for Rabeting Wooden Soles for Shoes*.—Patent dated November 15, 1859.—This invention consists in a novel guide rest, in connection with pressure roller and feed wheel for keeping the sole in its proper position with respect to the cutters during the operation of forming the rebate. It further consists in combining with the rotary cutters a fixed tool, which shall precede said cutters, and prevent the edges of the wooden sole from splintering as the cutters perform their work, and the various curves of the sole are presented to them.

The inventor says: I *claim*, first, the combination of the convex guide rest G with the pressure roller J and feed roller E, when arranged substantially as and for the purposes set forth.

Second. I claim, in combination with the rotary cutters and feed rollers E, the fixed tool P, when used in the manner and purposes set forth.

No. 26,114.—WILLIAM A. KIRBY, of Buffalo, N. Y.—*Improvement in Harvesters*.—Patent dated November 15, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—Locating the raker's seat over the open space at the side of the platform, so that the delivery may be at any point along the whole side of said platform that the raker may desire, substantially as described and represented.

No. 26,115.—WILLIAM S. MATHERS, of Meriden, Conn.—*Improved Beer Pitcher*.—Patent dated November 15, 1859.—This pitcher is arranged with two strainers in a partition behind the spout, one of the strainers being near to the bottom of the pitcher and the other one near to its top, whereby that portion of the liquid which would otherwise accumulate between the bottom strainer and the top of the vessel is enabled to find its way to the spout, without allowing more of the froth to mingle with it than is necessary to give the beer a lively appearance.

*Claim*.—A pitcher A, with two strainers F and G, one at the bottom and the other at the top of a partition E, and otherwise constructed, as specified.

No. 26,116.—LOUIS MEYER, of Columbus, Ga.—*Improved Extension Table*.—Patent dated November 15, 1859.—This invention consists in the employment of beveled or tapering arms, to which the leaves to be extended are fixed, which serve for braces for said leaves when extended, and rest upon the frame of the table in suitable guides, and press against a central cross strip, which strip serves as a central support for the top of the table when the leaves are drawn out.

*Claim*.—The beveled arms or braces G G G<sup>1</sup> G<sup>1</sup>, central cross piece B, and stops *b b b b* on the brace arms, when they are all combined and arranged as and for the purposes set forth.

No. 26,117.—DAVID MUMMA, Jr., of Harrisburg, Pa.—*Improvement in Mode of Operating Brakes on Railroad Cars*.—Patent dated November 15, 1859.—This improvement consists in

the employment of a friction wheel *n* secured on an auxiliary axle placed by the side of the axle of the driving wheel of the locomotive, which also carries a friction wheel *a* as a mate of the other.

The inventor says: I *claim* the employment of the movable plate *E* or its equivalent, provided with a shoe *x*, when in combination with a friction wheel *n*, a lever *D*, and wheel *a*, all so arranged that friction from said shoe and plate may be applied in the manner and for the purposes substantially as set forth.

I claim the arrangement of the brake chain attached to the axle *o*, as described, so the said axle may be employed as a lever, for the purposes set forth.

No. 26,118.—J. D. OTSTOT, of Springfield, Ohio.—*Improvement in Potato Harvesters*.—Patent dated November 15, 1859.—This invention consists in the combination and arrangement of the several parts enumerated in the claim.

*Claim*.—The arrangement and combination of the bent lever *h h*, excavator *d*, rotary rake *k k<sup>1</sup> k<sup>2</sup>*, hopper *l l*, and driving wheels *B B*, substantially in the manner and for the purpose set forth.

No. 26,119.—GEORGE F. PALMER, of Farmington, N. H.—*Improved Machine for Making Wooden Boxes*.—Patent dated November 15, 1859.—This invention consists in arranging on a rotary shaft two cutters for grooving and tonguing, together with two stationary and two movable saws for the purpose of preparing the boards for jointing, and to cut them off the proper width and length; and it also consists in the employment of two expanding sliding platforms, one to determine the width and the other the length of the boards for a box of any given size.

The inventor says: I *claim*, first the arrangement of the cutters *a b*, in combination with the stationary saws *H* and *K*, and with the adjustable saws *J* and *N*, substantially as and for the purpose specified.

Second. The employment of the expanding sliding platforms *I* and *M*, arranged in combination with the saws *H K J* and *N*, substantially as and for the purpose specified.

No. 26,120.—JOHN PATTON, of Arcadia, Ind.—*Improved Washing Machine*.—Patent dated November 15, 1859.—In operating this machine, after the tub is filled with the required amount of water, put the garments to be cleaned into the space between *A* and *B*, pass one end of the garment to be washed into the clamp *I*, secure it fast by means of the hook *K* and by the crank *L*, rotate the cylinder *C* as long as it is necessary to remove the dirt from the garment being washed to the water in the tub.

*Claim*.—The spiral springs *J*, clamp *I*, the hook *K*, in combination with the groove in the cylinder *C*, poles *H*, chains *F*, cross piece *G*, rollers *D*, board *B*, compound wringer and rinser *O* and *O<sup>1</sup>*, cylinder *C*, when operated as described.

No. 26,121.—ISAAC N. PYLE, of Decatur, Ind.—*Improvement in Cultivators*.—Patent dated November 15, 1859.—This invention consists in an improved mode of adjusting the wings of the cultivator, and also the central beam, so that the wings may be spread out or contracted.

*Claim*.—The arrangement and combination of the curved pivoted wing rods *A A*, curved adjustable central rod *C*, looped sockets *F*, vertical movable standards *J*, rods *M*, braces *L*, and handles *E*, as and for the purpose shown and described.

No. 26,122.—J. R. PERRY, of Port Clinton, N. Y.—*Improved Machine for Cutting Tenons*.—Patent dated November 15, 1859.—These improvements relate to that class of machines which cuts tenons the sides of which are parallel planes in use for carpentry and joinery.

The inventor says: I *claim*, first, the combination of the right and left hand screw *L* with the cutter heads *K*, in the manner and for the purpose set forth.

Second. Constructing the cutter bits with lugs to receive the shoulder bits, as specified.

No. 26,123.—JOHN PYNE and WASHINGTON BARR, of Harrisburg, Pa.—*Improved Egg Beater or Ice Cream Freezer*.—Patent dated November 15, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The ice cream freezer or egg beater, the bottom having corrugated perforated circles, in which the shaft and wires of the dasher revolve, as and for the purposes set forth and described.

No. 26,124.—GEORGE M. RANSOM, of the United States Navy.—*Improvement in Apparatus for Elevating Cannon*.—Patent dated November 15, 1859.—The object of this cannon elevator is to determine the angle of elevation or depression of a gun preparatory to its being discharged.

The inventor says: I *claim* the application of trunnions and bearings, or equivalents, to the nut, in combination with jointing or hinging the upper end of the upper screw to the cascable, or to a saddle attached to or supporting the cascable.

I also claim the combination of the cascable saddle with the elevating screw and cascable of the gun.

No. 26,125.—JOHN H. REDSTONE and ALBERT E. REDSTONE, of Indianapolis, Ind.—*Improved Lath Machine*.—Patent dated November 15, 1859.—B represents an eccentric, operating the yoke A, to which is attached the sliding bar C C; on the end of this is the projection D D, in which is the yoke groove E, the sides serving as bearings for the friction roller F, attached to the knife plate H by the pin G, upon which it revolves; J is the bench under which the knife I is passed when cutting; K K are standards supporting the lumber while it is cut; P P are rests, in which are the slots Q and O, in which the pins L are operated by the rod M, attached thereto. The knife guides or slides V and V operate in the boxing W.

The inventors say: We *claim*, first, operating the knife plate H H by the sliding bar C C and groove or yoke E, in combination with the roller F, when attached to the knife plate H H, substantially as set forth.

Second. The guides Q and Q, roller R, slide S S, pins T L and L, and slots Y O and O, when combined and operated as set forth.

No. 26,126.—NATHAN F. RICE, of New Orleans, La.—*Improvement in Bakers' Ovens*.—Patent dated November 15, 1859.—This invention consists in arranging a series of ovens on the different floors of a bakery, one above another, and heating them in succession by so directing the heat from the furnace, by means of flues, that it shall pass successively under and over each oven, beginning with the lowest and ending with the highest, and in so arranging a series of dampers as to control the supply of heat to the several furnaces at will, according to the requirements of the work to be done.

*Claim*.—The bakery described, constructed, arranged, and operating as specified, the same consisting of a series of ovens placed on different floors of a building, and heated successively by products of combustion, directed and controlled by the described combination of flues, dampers, and air chambers, arranged and coöperating as shown.

No. 26,127.—ALBERT C. RICHARD, of Newtown, Conn.—*Improved Letter Envelope*.—Patent dated November 15, 1859.—This invention consists in constructing a letter envelope in such a manner that the official stamp of the post office, which is usually fixed on every letter before being conveyed through the mails, by one and the same operation of stamping, be likewise impressed on the letter which may be enclosed in this envelope in an indelible manner.

*Claim*.—As a new article of manufacture, a letter envelope, having the properties fully set forth, for the purpose as described.

No. 26,128.—GEORGE D. SHARP, of New York, N. Y.—*Improved Billiard Table Cushion*.—Patent dated November 15, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The combination of the hollow cushion with a square or slightly beveled face for the ball to impinge against, thus producing a spring of greater ductibility than other billiard table cushions have.

No. 26,129.—S. A. SHURTLEFF, of North Carver, Mass.—*Improved Fore-Iron for the Use of Shoemakers*.—Patent dated November 15, 1859.—This invention relates to an improved tool used by shoemakers for burnishing or finishing the edges of the soles of boots and shoes. Its object is to obtain an implement that may be adjusted to compensate for wear, so that it is rendered more durable than those of ordinary construction.

*Claim*.—The adjustable beading plate D applied to a stock B, and arranged substantially as shown, to form an improved article of manufacture, for the purpose specified.

No. 26,130.—E. C. SINGER, of Port Lavaca, Texas.—*Improvement in Sewing Machines*.—Patent dated November 15, 1859.—The nature of this invention relates to the construction and mode of operation of the feed device.

*Claim*.—The feed device, the essential features of which are the plate *l*, the block *p*, and the lever *m*, and stop *s*, operated by the grooved sliding bar Q, arranged and constructed substantially in the manner and for the purposes set forth.

No. 26,131.—FERDINAND M. SOFGE, of Macon, Ga.—*Improved Billiard Register*.—Patent dated November 15, 1859.—The springs *a* are so placed as to prevent the tally *d* from coming through the aperture *i*; the springs are made so as to permit the tally *d* to pass freely through the aperture *i*; the aperture *i* is situated above the tally, in the box D, so that by pressing the springs *a*, tally *d* will pass freely through the aperture *i*, and thus each tally, pressed by the player on springs *a*, will show the amount of billiards made by the player.

The inventor says: I *claim* the arrangement of springs *a*, *b*, and *c*, operated by means of cylinder A, upon tally *d*, as and for the purpose described.

I also claim, in combination with the above, the cylinder C, in connection with the tally

1 and 2, or any number of tallies and springs *h*, constructed and operated as and for the purpose forth.

No. 26,132.—W. H. TUPPER, of New York, N. Y.—*Improvement in Pouncing Hat Bodies*.—Patent dated November 15, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The employment of an air blast to cleanse and hold the body *G*, within the hollow cone *F*, while the said body is being rotated and pounced, as shown and described.

No. 26,133.—JOHN T. TOWNSEND, of Brenham, Texas.—*Improvement in Ploughs*.—Patent dated November 15, 1859.—This invention consists in a peculiar arrangement and combination of braces, landside, mould board, and standard, whereby said parts may be attached to iron beams and a durable and efficient implement is obtained.

*Claim*.—The arrangement and combination of the landside *A*, standard *B C*, mould board *H*, share *F*, braces or arms *D E I*, and cross bar *G*, substantially as and for the purpose set forth.

No. 26,134.—WILLIAM H. RODGERS, of New York, N. Y.—*Improvement in Machines for Inserting Eyelets*.—Patent dated November 15, 1859.—The inventor says: In this machine there is no trouble in removing the punch or taking out the cutter, the whole machine can be easily taken apart. The yielding guide pin that holds the eyelet in its place is a great improvement, whereby the eyelet is held in the centre of the countersink until the punch fixes it in.

*Claim*.—Single punch *B*, operated as described, in combination with the connection lever *A*, cutter *D*, and yielding spring guide point *F*.

No. 26,135.—WILLIAM T. VOSE, of Newtonville, Mass.—*Improved Portable Pump*.—Patent dated November 15, 1859.—This invention consists of an improved pump in combination with a stirrup, or foot stand, by which the pump may not only be supported on the ground, but be maintained by the foot of a person while he may be employed in operating the pump.

*Claim*.—An improved pump, as constructed with a barrel and the foot stand or rest, combined and arranged together, substantially as described.

No. 26,136.—EDWARD WIEBE, of Brooklyn, N. Y.—*Improved Mode of Advertising*.—Patent dated November 15, 1859.—The object of this invention is to present to the eye a continued succession of notices, &c., as the band revolves. It is intended to be used in public conveyances, hotels, or other public places. The motive power may be derived from fixed machinery, or by suitable connection with the axles of vehicles on the machinery by which they are actuated.

*Claim*.—The above described mode of exhibiting advertisements, when operated automatically, substantially in the manner set forth.

No. 26,137.—JOSEPH A. WOODWARD, of Philadelphia, Pa.—*Improved Signal Bell*.—Patent dated November 15, 1859.—The object of this invention is to ensure the striking of the bell at all times, and by simplicity of construction to diminish its liability to accident.

*Claim*.—The lever escapement bar *L E B*, constructed substantially as described, with the elliptical slot and projecting point *x x*, in combination with the projecting point *x*, of the hammer or striking arm *S A*, the whole arranged substantially as described and for the purpose set forth.

No. 26,138.—WILLIAM WRIGHT, of Hartford, Conn.—*Improvement in Steam Pumping Engines*.—Patent dated November 15, 1859.—The claim and engravings explain the nature of the invention.

The inventor says: I *claim*, first, the application of the forked yoke inclined arms and levers, in conjunction with an independent hydraulic cylinder or engine, for working the valves of a steam engine properly, opening and closing them, and effecting the cut-off at the proper points, and performing all the offices and obtaining all the useful results of a well regulated and effective valve gearing.

Second. The combination of the forked frame and inclined arms for controlling and regulating the length of stroke between certain points or the faces of said planes, and graduating it between these points at the will and pleasure of the engineer, so as to reduce the clearance in the steam cylinder to a minimum.

Third. The manner in which the main valve of the hydraulic cylinder is brought into action at proper and fixed intervals, and working the steam valves of the engine independently of the forked frame and its inclined arms, should the latter part of the gearing fail, from any cause, to assist in performing their duty.

Fourth. The application of the auxiliary valve, in combination with the main valve of the hydraulic cylinder, for effecting at the proper point the opening of the steam valves instantaneously.

neously and ahead of the steam piston; or in other words, for giving the lead to the valve as effectually as an eccentric will on a crank engine, and forming a cushion for the piston at the end of the stroke, reversing the movement and holding the valves wide open until the cut off is accomplished, substantially in the manner described.

Fifth. The mechanism for accomplishing, positively, the cut off and ensuring the closing of the valves, and in connection therewith, the method of regulating and adjusting the same to any required point of the cut off that the beneficial working of the engine may demand, as explained.

No. 26,139.—WILLIAM WRIGHT, of Hartford, Conn.—*Improvement in Pumps*.—Patent dated November 15, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the construction of the pump by the application of an auxiliary barrel to the working or brick barrel, and connecting both barrels by a double beat valve, thus effecting a combined opening through the auxiliary and the bucket valves with a minimum lift of said valves greater than the area of the pump itself, and obviating to a great degree the frictional resistance that would be produced by passing all the water through the pump bucket valves alone, preventing all throttling, and permitting the engine to work more regularly and economically, substantially as described.

Second. The placing of one pump above the other, when made as above described, and connecting both together, and passing the load of one through the working and auxiliary barrels and the bucket and auxiliary valves of the other, and *vice versa*, thus allowing the engine to have complete control over the column of water, substantially as described.

No. 26,140.—SAMUEL K. ZOOK, of New York, N. Y.—*Improved Mode of Telegraphing*.—Patent dated November 15, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The construction of the telegraphic lines of metallic conductors of a high conducting power, having the portions of the wire conductors which are between the two telegraphic extremes in the earth, or submerged in the ocean or rivers, not artificially insulated, but using the earth or water as the natural insulator of those parts, in combination with the artificially insulated portions of the wire on each or other side of the battery or batteries, in the manner and for the purposes described.

No. 26,141.—CHARLES F. BENNETT, of Warehouse Point, Conn., assignor to JULIUS H. BAKER, of East Windsor, Conn.—*Improvement in Machinery for Drying Cloth*.—Patent dated November 15, 1859.—This invention consists in the construction and arrangement of a machine with two adjustable revolving reels, with transverse rollers, suction blowers, and pipes, to force or drive dry or hot air through the cloth while it encircles the reels and revolves with them.

*Claim*.—The extra adjusting vibratory arrangements, plate 2, Fig. 7, whereby the cloth can be spread and straightened on the selvage while passing over the rollers, in the manner substantially as set forth and described.

No. 26,142.—JOHN BUTLER, of Buffalo, N. Y., assignor to JAMES A. SAXTON, of Canton, Ohio.—*Improvement in Harvesters*.—Patent dated November 15, 1859.—When the machine is to be arranged for reaping, the cutters and finger bar can be raised up, and the heel of the finger bar sustained at the side of the machine, as shown in the engravings, where the plate M is raised, it being provided with a series of holes for this purpose, or any suitable appliances may be made to the rod or coupling arm N for holding it up.

*Claim*.—The combination of the shoe L, with hinged and adjusting rods *c* and N, plate M and cup *k*, constructed, arranged, and operating in relation to each other and the main frame, as and for the purposes set forth

No. 26,143.—WILLIAM DARKER, of West Philadelphia, Pa., assignor to J. B. THOMPSON, of Philadelphia, Pa.—*Improvement in Tempering Steel Wire*.—Patent dated November 15, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—Combining the drum D, by which the steel ribbon or wire is drawn through the fire and bath, with the main or counter shaft, from which it derives motion, by means of a pair of cone pulleys or belt, substantially as and for the purpose specified.

No. 26,144.—JOHN H. DOOLITTLE, of Ansonia, Conn., assignor to WALLACE & SONS, of said Ansonia.—*Improvement in Making Clasps for Hoop Skirts*.—Patent dated November 15, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—Manufacturing metal clasps for fastening the tapes on hoop skirts, and for similar or analogous purposes, by cutting the scraps from the metal strips A so that the blanks *b* will be attached thereto, and while thus connected fed to the swaging or raising device, and swaged in proper form to produce the clasps, substantially as described.

No. 26,145.—DARIUS WELLINGTON, of Boston, Mass., assignor to C. WELLINGTON, of said Boston.—*Improved Cocks for Water Closets*.—Patent dated November 15, 1859.—This invention consists in constructing a cock which is attached to a pipe containing water under pressure in such a way that when its handle is released from the hand of the occupant of the closet and the basin pan allowed to close, the cock will close gradually so as to admit water direct from the pipe in a sufficient quantity into the basin or bowl, to seal the foul pipe.

*Claim*.—The employment or use of the valve *b* and plunger *B*, connected by the stem *C*, placed within a suitable cylinder *A*, and arranged relatively with the supply and discharge pipes *D E*, to operate as and for the purpose set forth.

No. 26,146.—LEWIS WHITE, of Hartford, Conn., assignor to Himself and E. P. MILLER, of said Hartford.—*Improved Curtain Fixture*.—Patent dated November 15, 1859.—This invention consists in the improved method of regulating the unrolling of the curtain and rendering the same easily adjustable in any position.

*Claim*.—The application of the bracket and brake *E* in combination with the pulley, cord, and pendant lever *K*, thus forming a double brake, in the manner substantially as set forth and described.

No. 26,147.—WILLIAM L. WILLIAMS, of New York, N. Y., assignor to Himself and THOMAS J. O'CONNOR, of said New York.—*Improved Machine for Bundling Kindling Wood*.—Patent dated November 15, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the follower *c*, acting to lift a bundle of wood through a ring or opening, and separate the same from the mass of split kindling wood in the trough *b*, substantially as specified.

Second. I claim the ring separator or the knife *p*, arranged substantially as set forth, and acting to split or separate from the mass of kindling wood a bundle, as described and shown.

Third. I claim the combination of the follower *c* and ring separator or knife *p*, in the manner and for the purposes set forth.

Fourth. I claim two or more slides *h h*, with curved ends, acting against and on opposite sides of a bundle of kindling wood, to compress the same previous to being secured by a wire or string, as and for the purposes specified.

Fifth. I claim the compressing levers *n n*, in combination with the slides *h h*, to act in compressing the bundle of wood, as set forth.

Sixth. I claim the twisting jaws or pincers *t t<sup>1</sup>*, fitted to receive the wire in the manner specified, so that the act of revolving said jaws to twist the wire shall first draw the wire tight, as set forth.

Seventh. I claim the weight *l*, hung on the levers *m m*, and acting to bring the ends of the wood level, as set forth.

No. 26,148.—HENRY C. RICE, of Worcester, Mass, administrator of the estate of John H. Hathaway, deceased, late of Millbury, Mass.—*Improvement in Rotary Engines*.—Patent dated November 15, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the combination with the crosshead, or its equivalent, which carries the abutment or cylinder head *F* of the rock shaft *I*, the toggle *J L*, and the vibrating arm *M*, the whole applied and operating substantially as described, in combination with the guide arms *H*, for the purpose specified.

And in combination with the above mentioned rock shaft, I claim the arm *K*, slide *N*, lever *P*, and eccentric *Q*, applied substantially as described, to produce an intermittent or remittent motion of the said rock shaft, as set forth.

No. 26,149.—THOMAS W. GILMER, of Charlottesville, Va., administrator of John B. Gilmer, deceased, of said Charlottesville.—*Improvement in Type Setters and Distributors*.—Patent dated November 15, 1859.—This machine consists of three distinct parts, a case *A* for holding the type, a composing stick *B* for withdrawing the type from the case and setting them in line, and a distributing stick *C* for transferring the type from the line to the type cases.

The claim will further explain the nature of this invention.

The inventor says: I *claim* withdrawing the type from the type case and setting them in line in the composing stick without the aid of intermediate carrying mechanism, but by the direct application of the composing stick to the type case, substantially as described.

I also claim distributing the type to the type case by the direct application of the distributing stick to said case, substantially as described.

I also claim, in combination with the type case, the holding dog, or its equivalent, arranged and operated substantially as described, so as to retain the type as they descend opposite the mouth of the case, and release the type when the mouth of the composing stick is in position to receive them.

I also claim arranging the type case, substantially as described, so that, by a retrograde movement of the case, the type is discharged into the composing stick, as described.

I also claim, in combination with the composing stick, the spring mouth plate, to hold the type as they enter the stick.

In combination with the spring mouth plate I claim the lip *l*, or its equivalent, arranged substantially as described, to assist in withdrawing the type from the case, and to prevent their turning or falling out of the composing stick as they are withdrawn from the case.

I claim discharging the type into the case through the bottom of the distributing stick, substantially as described.

And I also claim, in combination with the distributing stick, a separating and discharging mechanism to the type, arranged substantially as described, so as to separate the front type from the rear, and force them into the type case.

No. 26,150.—CHARLES J. ADDY, of Roxbury, Mass.—*Improved Clock Escapement*.—Patent dated November 22, 1859.—This invention consists in the employment of two independent pallets, one of which is pivoted to some permanent portion of the clock frame, and is thrown down into the path of the teeth of the scape wheel by the movement of the pendulum; the other being pivoted to an arm which is vibrated with the pendulum and is carried along with the scape wheel, while the latter is giving its impulse to the pendulum.

*Claim*.—The independent gravity pallet *f*, pivoted to a fixed bearing, in combination with a recoil pallet swinging with the pendulum, in the manner substantially as set forth.

No. 26,151.—MOSES ALLAN, of Utica, N. Y.—*Improvement in Metal Planing Machines*.—Patent dated November 22, 1859.—This invention consists in the construction of certain mechanical parts, and so attaching and connecting them with the ordinary planing machine, as to enable the operator to use this machine to dress off to the proper shape and curve the sides of the teeth or cogs of iron wheels, thus enabling a single hand to do the work of several.

The inventor says: I *claim*, first, the construction of the apparatus F E g, and its adaptation to the use of the ordinary planing machine and its combination therewith, as described and for the purposes described.

Second. The combination of the bearing stands H I and the disk M with the carriage of the machine, connected and arranged substantially as described, and for the purposes described; the whole being constructed and operating substantially in the manner set forth.

No. 26,152.—E. G. ALLEN, of Boston, Mass.—*Improved Combination Steam Gauge*.—Patent dated November 22, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The combination and arrangement of the several instruments requisite to enable the engineer to regulate the proper working of steam machinery, substantially as set forth, the said instruments being inserted in one case and having the hands or other indicators upon one face or dial of the plate, in the manner and for the purposes specified.

No. 26,153.—SAMUEL BARBER, of South Brunswick, N. J.—*Improved Washing Machine*.—Patent dated November 22, 1859.—This invention consists in the employment of a segmental extension guide piece attached to the frame of the dash board and operated by a friction roller attached to a hand lever, so that the motion of the frame can be regulated and the pivot of the lever placed at its least possible working distance from the fulcrum; and it also consists in regulating the dash board by means of a segmental rack extending from the top in the rear of the dash board, and a pin passing down through a cross tie of the swinging frame into the teeth of said rack.

The inventor says: I *claim* the combination, with the lever N for operating the frame D, of a curved extension guide R, for adjusting the frame in the manner set forth.

Second. The arrangement, with the above, of the serrated arc J on top of the dash board G, for adjusting the inclination of said board, for the purposes and in the manner specified.

No. 26,154.—ELI BARTHOLOMEW, of Cleveland, Ohio.—*Improvement in Bee Hives*.—Patent dated November 22, 1859.—The cover G is rabbeted around the edge, as seen at I, for the purpose of receiving the false top K, which incloses the honey boxes L L placed over the openings H in the top of the hive proper. These boxes L can be removed at pleasure by lifting the false top K.

*Claim*.—The arrangement of the outer casing A and the inner casing B, in relation to each other, and the ventilating openings H in cover G, which cover is furnished with a top K and boxes L L, in the manner and for the purposes specified.

No. 26,155.—JERRED BEACH, of Freeport, Pa.—*Improved Saw Set*.—Patent dated November 22, 1859.—This invention consists in a mechanical arrangement of set screws, graduating rest plate, guide, gauge, levers, anvil, and set.

*Claim*.—The arrangement of the guide *c*, with slot *g*, levers *f* and *m*, connecting link *o*, set screws 1 2 3 4 and 5, when used in connection with the gauge *a*, graduating rest plate *d*,

regulating screw *e*, anvil *i*, and set *j*; the whole being arranged and constructed substantially as described for the purposes set forth.

No. 26,156.—D. BERRY, of Huntington, Ind.—*Improvement in Automatic Canal Bridges*.—Patent dated November 22, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The bridge I, arranged to work on inclined ways F E and connected by a chain and wheel M N, or their equivalents, to a shaft O, which is connected by gearing to segments Q, in line with the bridge and the boat, so that the former can be actuated by the movement of the latter, substantially as described.

No. 26,157.—MILTON B. BISHOP, of Whitingham, Vt.—*Improvement in Washing Machines*. Patent dated November 22, 1859.—In this machine two wash boards are employed, one being arranged over the other, and the two having brakes so applied to them as to enable each by the vibration of the levers or brakes of the lower board to be put into reciprocating movements in opposite directions.

The inventor says: I *claim* the means of operating the two wash boards, viz: the arrangement and application of the two sets of levers or brakes F E, together and with respect to the wash boards B C, disposed one over the other and in the tub, as described.

I also claim, in combination with the upper wash board B and its brake H, the rocker shaft K, the slide bar L, and the springs M M; the same being for the purpose or objects specified, meaning, also, to claim the combination of the said rocker shaft, the slide, and springs.

No. 26,158.—WENDLIN BLESER, of New York, N. Y.—*Improved Composition Cement or Mortar*.—Patent dated November 22, 1859.—The inventor says: In making this mortar, I first mix together seventeen parts by weight of silicious gravel, fifteen parts of soda, and ten parts of charcoal. I melt these ingredients together under a strong heat till the whole mass is perfectly fused, and afterwards reduce it to powder by stamping or grinding. I then mix this flour with water, in the proportion of about one quart to three quarts of water, and boil it about two hours until it is about as thick as molasses. I then take one part of this mixture and mix it with finely pulverized fire brick sufficient to make it as stiff as mortar.

*Claim*.—The mortar described, made and employed substantially as set forth.

No. 26,159.—J. W. BRADLEY, of New York, N. Y.—*Improvement in Ladies' Bustles*.—Patent dated November 22, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—A bustle consisting of a waist band, composed in part of strips *a a* of metal or other elastic material, and a spiral spring A, tapered from the middle towards each end, applied to and combined with such waist band, substantially as described.

No. 26,160.—LOCKWOOD B. BROOKS, of New York, N. Y.—*Improvement in Steam Valves*. Patent dated November 22, 1859.—This invention consists in connecting the two parts of the valve by a yoke or strap on the valve stem, so that by slackening the nuts and holding one valve firmly in its seat by any external force the other may be adjusted, by allowing it to find its seat by the action of the steam thereon, and then securing it firmly in that position relatively to the other by setting the nuts tightly to secure the yoke.

*Claim*.—Rendering the two parts B and C of the balanced puppet valve adjustable relatively to each other, by connecting the stem B<sup>1</sup> to the sleeve C<sup>1</sup> by the yoke D, or its equivalent, arranged and operated substantially in the manner and for the purposes set forth.

No. 26,161.—GEORGE CAWARD and DAVID C. CAWARD, of Prattsburg, N. Y.—*Improvement in Road Scrapers*.—Patent dated November 22, 1859.—The claim and engravings will give an idea of the nature of this improvement.

The inventors say: We *claim* the reversible revolving and adjustable blade B, with the adjusting boxes C, when made and operated as and for the purpose specified.

Also, the circular arms D with the wheels E, when made and used as specified and for the purpose set forth.

No. 26,162.—A. J. CHAPMAN, of Bayou Goula, La.—*Improvement in Bagasse Furnaces*.—Patent dated November 22, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the employment of the central air heating chamber *n*, having discharge passages *n*<sup>2</sup>, leading into the furnace in its sides, and a central descending flue *i*, in combination with a double walled furnace F, having an air heating chamber *f* between its walls, and discharge passages *z*, through its inner wall, leading into the fire chamber, substantially as and for the purposes set forth.

Second. The combination of the partitioned and valved air heating chamber *f* V X, be-

tween the walls of the furnace, with the upper and lower hot air passages *a b* and mixing chamber *e*, substantially as and for the purposes set forth.

Third. The combination of the auxiliary valved flue *Y r*<sup>1</sup>, leading directly to the chimney, with the valve *d*, boiler flue *B*<sup>1</sup> *r*, and the furnace *F*, substantially as and for the purposes set forth.

Fourth. The combination of the valve *O*<sup>1</sup>, in the hopper, with the cylinder feeder *S*, carrier drum *h*<sup>3</sup>, cam *t*<sup>1</sup>, and lever *O*, substantially as and for the purposes set forth.

No. 26,163.—MATTHIAS P. COONS, of Brooklyn, N. Y.—*Improvement in Apparatus for Generating Illuminating Gas*.—Patent dated November 22, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the particular form and manner of constructing and combining a gas generating retort, consisting of a fusion chamber and barrel, as represented in Fig. 1, A, Nos. 1 and 3, as combined for the purpose specified.

Second. I also claim the diaphragm *J*, in combination with the chamber *F* and *D*, and diaphragm *N*, as represented in Fig. 4, in the manner and for the purpose specified.

Third: I also claim the chamber *H*, (Fig. 7,) constructed as and in combination with the other apparatus specified.

Fourth. I also claim the chamber *K*, (Fig. 9,) as attached to the cover *M*, in connection with the escape pipe *L*, with a stop cock, or its equivalent, attached in the manner and for the purpose specified.

Fifth. I also claim, in combination with the apparatus specified, the projecting ridge on facing rim or flange *O*, and the corresponding groove *P*, in the door *N*; and I also claim, in combination, the yoke or bar *R*, and crank screw *S*, as combined; and also the hook hinges *X*, (all of which are represented by Fig. 10,) as set forth and specified.

No. 26,164.—BENJAMIN P. CRANDALL, of New York, N. Y.—*Improvement in Childrens' Sleds*.—Patent dated November 22, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—Connecting the head and neck *A* of the horse to the bottom or in front thereof of a child's sled, having spring or other runners, in such a manner that the pole may be secured under the bottom *B* of the sled, substantially as shown in the drawings at Fig. 1, and for the purpose set forth.

No. 26,165.—EDWARD CRANE, of Dorchester, Mass.—*Improvement in Locomotive Engines*.—Patent dated November 22, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The combination, in a locomotive, of a boiler and engine, with a water tank, coal box, blower, and baggage department, on one long truck frame suspended underneath the axles of the wheels, arranged substantially as described.

No. 26,166.—EDWARD CRANE, of Dorchester, Mass.—*Improvement in Railroad Cars*.—Patent dated November 22, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the use of a single long truck for the support of a railroad car, when the frame of said truck is constructed and suspended substantially as described:

I also claim the use of cylindrical bars of iron, passing under the frame of the truck, and nearly in contact with the rails, for the purpose of keeping the truck frame from striking the rails or ground in case the cars leave the track.

No. 26,167.—D. M. CUMMINGS, of Enfield, N. H.—*Improvement in Harrow Teeth*.—Patent dated November 22, 1859.—This invention consists in arranging each tooth with three prongs that are furnished with sharp pointed shields serving to gauge the depth to which the teeth cut; and it also consists in combining with each tooth a wedge shaped plate in such a manner that the teeth can be adjusted according to the soil in which they have to work.

The inventor says: I *claim*, first, constructing the tooth *A* of a harrow with prongs *B*, sharp pointed shields *C*, substantially as and for the purpose specified.

Second. In combination with the above, the wedge shaped plate *D*, substantially in the manner and for the purpose described.

No. 26,168.—JOHN DAVIS and EBENEZER DAVIS, of Mateldaville, Pa.—*Improvement in Launching Flat Boats*.—Patent dated November 22, 1859.—This invention consists in constructing a fixed staging, on which the boat is built, with its top beams arranged in pairs, between which are hinged beams projecting from the side of the staging, having shoulders on the projecting ends, and on the other end pulleys; also, ropes attached to the shoulder ends and passing across the boat into the pulleys on the other end of the beams, so as to allow the gradual descent of the boat from the staging, in launching it.

*Claim*.—The combination of the hinged projection beams *C*, with the shoulders *a*, pulleys

*p*, and ropes *d*, substantially as and for the purpose set forth, when used in connection with the permanent staging *S*.

No. 26,169.—HARRISON DOTY, of Cardington, Ohio.—*Improved Apparatus for Supplying Sawdust to Furnaces*.—Patent dated November 22, 1859.—This invention consists in arranging the different parts of the machine as shown in the claim.

The inventor says: I *claim* the employment of the latch *D*, when the same is constructed and arranged to operate substantially in the manner and for the purpose set forth.

I also claim the arrangement of the hinged bottom *B*, provided with the adjustable weight *d*, with the latch *D*, provided with adjustable weight *a* and with stationary box *A*, for the purpose set forth.

No. 26,170.—CHARLES DOUGLAS, of Hebron, Conn.—*Improvement in Wagon Jacks*.—Patent dated November 22, 1859.—When it is necessary to lower the rod *C* to the lowest point, the instrument may be canted over until the pawl *F* will hang clear of the teeth *d*. When the rod *C* is down to its lowest point, the lever lies back partly in the slot in plate *D* and renders the instrument compact. The stock *A*, base *B*, and rod *C*, are made of wood, and the lever *E*, pawl *F*, and ratchet plate *D*, are of cast-iron.

The inventor says: I *claim*, first, the combination and arrangement of the lever *E*, pawl *F*, ratchet plate *D*, rod *C*, and stock *A*, substantially as described, for the purpose set forth.

Second. The pawl *F*, when used for the double purpose of a pawl on the ratchet plate *D*, and a fulcrum for the lever *E*, as and for the purpose described.

No. 26,171.—C. H. DURKEE, of Hartford, Wis.—*Improvement in Grain Binders*.—Patent dated November 22, 1859.—This improvement relates to that class of machines for binding grain into sheaves before it leaves the platform of the harvester, by an automatic arrangement which requires only one attendant and which will gather the grain as it falls upon the platform of the harvester, and bundle it, and at the same time secure the band around the bundle.

The inventor says: I *claim*, first, the combination of the travelling segment *D*, jointed arm *G*, its rod *G*<sup>1</sup>, connecting rod *I*, and rack *H*, operated by pinion *J*, rack *J*<sup>1</sup>, when the same are arranged and operate as set forth.

Second. I claim the swinging rack *K*, in combination with the travelling segment *D*, for receiving and holding the pinion *J* while the end of the arm *G* is being passed through the loop, in the manner set forth.

Third. I claim the loop holder *c*, trip block *d*, and block *e*, arranged and operating substantially as and for the purposes set forth.

No. 26,172.—ASAHEL K. EATON, of New York, N. Y.—*Improvement in Vulcanizing Rubber Compounds*.—Patent dated November 22, 1859.—This invention consists in the use of a metallic bath, so constituted as to fuse at or below the lowest degree of temperature required in the process.

The inventor says: I *claim* the use of a metallic bath, substantially as described, for the purposes of vulcanization.

No. 26,173.—GUSTAVUS G. ELIAS, of Lancaster, Pa.—*Improved Cabbage Cutting Machine*.—Patent dated November 22, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The specific arrangement and combination of the sliding box *C*, with its notches *P*, flat spring *N*, and retaining plates *I*, the double coned spiral spring *K*, with its square bottom *L*, and armed top *H*, the counter cutting knives 1 2 and central division 3, on the table *A*, provided with legs, the wheel *E*, crank or connecting rods *F*, when these several parts are made substantially as and for the purpose specified.

No. 26,174.—E. N. ELLIOTT, of Port Gibson, Miss.—*Improvement in Cotton Presses*.—Patent dated November 22, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the employment of the hinged forms *B*, forming part of the box *A*, in combination with the follower *R*, said forms being so arranged as to receive the cotton and to act as guides for the follower, substantially as described.

Second. I claim the employment of the weighted follower *R*, in connection with the spring bolts *g*, or their equivalent, whereby the loose cotton is instantly, at the proper time, brought down and held in the proper space, to be acted upon by the followers *F*, substantially as described.

Third. I claim the arrangement of the doors *S S* and *T* with reference to the box *A* and the position of the bale therein, when fully compressed, by means of which I am enabled to apply and secure the covering without sewing, substantially as described.

Fourth. I claim the arrangement of the rod *M* and stops *N N*<sup>1</sup>, with reference to nut *H*.

and its movement, whereby the clutch L is not only disconnected from the pulleys J and K at the proper times, but also prevented from connecting by accident or otherwise, as described.

No. 26,175.—GEORGE AUGUST ENGELHARD, of New York, N. Y., and RUDOLPH FRANZ HEINRICH HAVEMANN, of New Brunswick, N. J.—*Improvement in Compounds of Caoutchouc and Allied Gums*.—Patent dated November 22, 1859.—By this invention, or process, solid lumps of gutta percha are dissolved in one of the well known solvents used for the purpose, and this solution is brought in contact with the chlorine by passing a stream of gaseous chlorine into the same, in order to bring the chlorine in immediate contact with the gum contained in said solution. When the combination of the gum with the chlorine is perfected the solvent is removed by evaporation at a low temperature. After removing the liquid by filtering or evaporation the composition of gum and chlorine is well washed with alcohol and then pressed and dried, when it forms a white hard mass.

*Claim*.—The described product, obtained by the action of chlorine on gums, such as India rubber or gutta percha, whether in solution or in substance, in either of the modes pointed out, or in any other that is substantially the same and which will produce a like effect.

No. 26,176.—A. J. EMLAW, of Grand Haven, Mich., and ELLIOTT RICHMOND, of Kelloggsville, Mich.—*Improvement in Saw Mills*.—Patent dated November 22, 1859.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, the arrangement of the friction wheel M and pulleys I J, in connection with the shafting E H K, for the purpose of giving the feed and giggering back movement to the carriage M<sup>1</sup>, as set forth.

Second. The arrangement of the adjustable bars O on the carriage M<sup>1</sup>, screw rods P, and adjustable wheels Q on shaft R, whereby the bars O may be adjusted nearer to or further from each other, to suit the length of the stuff to be sawed.

No. 26,177.—DENNIS C. GATELY, of Newtown, Conn.—*Improvement in Rubber Belting*.—Patent dated November 22, 1859.—The claim explains the nature of this invention.

*Claim*.—As a new article of manufacture, machine belting or banding, manufactured with surfaces of India rubber or gutta percha, and having surfaces which are as nearly as is practically possible perfectly smooth, as described.

No. 26,178.—DENNIS C. GATELY, of Newtown, Conn.—*Improvement in Making Rubber Belting*.—Patent dated November 22, 1859.—*a* represents the supporting frame work of the machine; *b* is a large roll of rubber belting, wound upon a shell or hollow shaft *c*, placed upon a square shaft *d* in such a manner that it can be slipped off the same when the said shaft is taken out of its bearings. The rubber belt is then fed to another shell, or mandrel *e*, arranged upon a square shaft *f* in such a manner that it can be slipped off.

*Claim*.—The method described for manufacturing machine belts or bands of India rubber or gutta percha, by rolling them in thin sheets of flexible metal and then heating them, substantially in the manner and for the purposes described.

No. 26,179.—OLIVER C. GREEN, of Dublin, Ind.—*Improvement in Harrows*.—Patent dated November 22, 1859.—This invention consists in an arrangement for elevating the harrow on wheels, at the same time throwing the teeth backward to clear them of trash, and also to facilitate moving the implement from place to place.

*Claim*.—The described arrangement of the harrow teeth *a*, beams *b*, wheels *c*, arms *d*, lever *e*, rod *g*, and rack *h*, the whole being constructed and operating together in the manner and for the purposes set forth.

No. 26,180.—JOHN GRIFFIN, of Louisville, Ky.—*Improvement in Cotton Harvesters*.—Patent dated November 22, 1859.—The object in having the perforations *b* in a spiral line is to effect a gradual detachment of the cotton from the bolls as the cups are placed over them, and thereby guard against the choking or clogging of the tubes.

*Claim*.—The employment or use of annular chambers E communicating with the cups D of the suction tube or tubes A C, by means of perforations *b*, and communicating with a steam or air chamber by means of flexible tubes G, substantially as and for the purposes set forth.

No. 26,181.—P. GRISWOLD and H. H. SEELEY, of Hudson, Mich.—*Improvement in Grain Separators*.—Patent dated November 22, 1859.—This invention consists in giving the lowermost screen in the shoe of the separator a compound movement, and using in connection therewith a supplemental screen having a vertical movement only, whereby the separator is rendered efficient.

*Claim*.—The combination, with the screen D, of the rocking bar I and vibrating bar E, as shown and described, for the purpose set forth.

No. 26,182.—JOHN P. HALE, of Kanawha C. H., Va.—*Improvement in Evaporating Ves-*

sels.—Patent dated November 22, 1859.—This invention consists in the employment of superheated steam generated from the liquid at one stage of the evaporating process, or in one part of the evaporating apparatus, by passing it through suitable heaters and employing it when so superheated to heat and evaporate the liquid, which is at another stage of the process, or in another part of the apparatus.

*Claim.*—The superheating of the steam or vapor arising from the evaporation of the brine, substantially as and for the purpose shown and described.

No. 26,183.—A. J. HALL and RUSSELL PATTEN, of Morristown, Vt.—*Improvement in Carriage Tops.*—Patent dated November 22, 1859.—This invention consists in constructing the bows with joints, so that the desired stiffness will be given to the top when spread by the bows themselves, and when folded the top will be packed close around the seat of the vehicle.

*Claim.*—The construction of bows for folding carriage tops with joints, substantially as and for the purposes set forth.

No. 26,184.—LOUIS HARPER, of Riceville, N. J.—*Improvement in Fertilizers.*—Patent dated November 22, 1859.—The claim explains the nature of the invention.

The inventor says: I *claim*, first, the preparation of the peat or muck or lignite, and their mixture with sulphate of lime, soda, potash, and magnesia, when required to form the basis of the preparation intended for composition of the fertilizer.

Second. The addition of phosphate and the biphosphate of lime to the above basis, and the impregnation of the above mixture with ammonia, in the manner described, so as to be converted into simple and double salts, as above stated.

Third. The combination of peat or muck or lignite, prepared as described, with green sand marl.

No. 26,185.—LEWIS G. HOFFMAN, of Waterford, N. Y.—*Improved Door Fastening.*—Patent dated November 22, 1859.—This invention consists of a metal plate or case, made circular, or in some other form, with a recess on one side for the button to turn in, which button is fastened to the shank of a knob, arranged on the opposite side of the case so as to turn the button and pull the door open with the same knob, the case or plate being made in two parts, one to hold the button and knob which is fastened to the door and the other to form the catch or keeper, which is fastened to the door frame by screws or nails.

*Claim.*—The described button, as a new article of manufacture.

No. 26,186.—JULIUS HORNIG, of Newark, N. J.—*Improved Cut Off Arrangement for Steam Valves.*—Patent dated November 22, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The employment, for opening and controlling the closing of the cut off valve, of a revolving and swinging cam C, applied in combination with and operated by a revolving wrist plate D, or its equivalent, and a grooved disk E, substantially as described.

No. 26,187.—JOSHUA L. HUSBAND, of Philadelphia, Pa.—*Improved Propelling Wheel.*—Patent dated November 22, 1859.—The operation of the arms A A<sup>1</sup> and guides E F will turn the paddles completely round, so as again to present their broad flat surfaces to the line of the jet, or the direction of the boat or vessel at the point where the propelling power of the paddles begin to operate.

*Claim.*—The combination of the guides E and F, the arms A and A<sup>1</sup>, the connecting rods D and D<sup>1</sup>, the double crank L and M, and the sectional paddles H, operating together, in the manner and so as to produce the effects described.

No. 26,188.—R. W. HUSTON, of Calais, Me.—*Improvement in Coal Hods.*—Patent dated November 22, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The arrangement of the bucket C, with the external casing A, when the bucket is provided with a rim or flanch c around its top, and with a pin on its bottom, upon which it revolves, and when the external casing is provided with a top which fits snugly around the bucket and over the rim or flanch with a channel D, and with a door to said channel, the whole being used substantially as and for the purpose specified.

No. 26,189.—GEORGE E. INMAN, of Buffalo, N. Y.—*Improvement in Ditching Machines.*—Patent dated November 22, 1859.—L shows a roller placed under the elevated part of the plough c; M is a cutter hinged to the main frame at m<sup>2</sup>, with a crooked arm m<sup>3</sup>, which is acted upon by pins m<sup>4</sup>; I is the caster wheel connected with the draft beam, and running forward of the ploughs for the purpose of graduating the depth which the ploughs shall cut; K is a roller which rolls on the ground in front of the caster wheel.

The inventor says: I *claim*, first, the cutter M, arranged and operating substantially as set forth.

Second. I claim the arrangement of the adjustable roller L, under the elevated part of the share C, substantially as set forth.

Third. I claim the arrangement of the caster wheel I, plough G, cutter M, adjustable roller L, and ploughshare  $c c^1$ , and side pieces D, relatively to each other, substantially as described.

Fourth. I claim the arrangement of the two driving wheels B B, on the same shaft, when placed so near together as to track within the ditch cut by the horizontal share  $c$ , substantially as described.

No. 26, 190.—LUTHER JOHNSON, of Grand Ledge, Mich.—*Improvement in Rotary Steam Engines*.—Patent dated November 22, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the employment, in combination with a sliding abutment fitted to the outer stationary cylinder, of an inner revolving cylinder, having a concentric groove or channel closed permanently in one place by a piston extending all across it, substantially as described.

Second. Operating the abutments E E<sup>1</sup>, and the cut off valves G G<sup>1</sup>, by means of the same cams F F<sup>1</sup>, through the agency of rollers  $g h g^1 h^1$ , or their equivalents, applied to the abutments, and yokes  $k k^1$ , rods L L<sup>1</sup>, and levers M M<sup>1</sup>, and arms  $n n$ , applied to the cut off valve, the whole arranged and operating substantially as described.

Third. The two sliding reversing valves, applied in combination with the two sets of steam pipes in relation to the abutments, and operated simultaneously by a single lever, substantially as described.

No. 26,191.—H. P. JUDSON, of Bethlehem, Conn.—*Improvement in Ox Yokes*.—Patent dated November 22, 1859.—This improvement in self-locking bolts for ox yokes consists in a novel combination of rotary spring disk and curved and horizontally moving bolts.

*Claim*.—The arrangement of the peculiar rotary spring disk D, curved rods F G<sup>1</sup>, and horizontally moving locking bolts B B<sup>1</sup>, as and for the purpose shown and described.

No. 26,192.—CHENEY KILBURN, of Burlington, Vt.—*Improved Lathe Attachment*.—Patent dated November 22, 1859.—This invention consists in the employment of the finishing knife D applied to a common turning lathe A, generally used for turning beaded or ornamental work of wood, and arranged and operated with the parts of lathe A.

*Claim*.—The rotating reciprocating knife D, in combination with the carriage B, provided with the gouging tool F, and V shaped cutter G, pattern L, recess H, and support L<sup>1</sup>, when arranged and operated as set forth and for the purpose specified.

No. 26,193.—ELISHA C. LEONARD, of New Bedford, Mass.—*Improvement in the Manufacture of Paraffine Candles*.—Patent dated November 22, 1859.—The claim explains the nature of this invention.

*Claim*.—My improvement or improved process of treating paraffine in the manufacture of candles therefrom, whereby I am enabled to dispense with a refrigerating air bath cooled by artificial means; my improvement or invention consisting in the employment, in the manner described, of the atmospheric temperature and the refrigerating water bath after the first cooling of the candle in the water bath.

No. 26,194.—EDWARD J. MALLET, of New York, N. Y.—*Improvement in Railroad Car Axles*.—Patent dated November 22, 1859.—This invention, to modify or remedy the extra friction, consists in a peculiar and novel manner of running one axle within the other and then coupling them.

*Claim*.—The combination and arrangement of the parts as represented for the purpose of forming an axle on which the wheels shall have an independent motion; the whole constructed substantially as described for the purpose set forth.

No. 26,195.—CHARLES F. MANN, of Troy, N. Y.—*Improvement in Traction Locomotives Carrying their Own Railway*.—Patent dated November 22, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—So applying the endless chains A as to make them not only the track for the supporting wheels B of the locomotive to run on, but also the means by which the engine propels the locomotive along the ground, substantially as described.

No. 26,196.—JAMES J. MAPES, of Newark, N. J.—*Improvement in Fertilizers*.—Patent dated November 22, 1859.—The claim explains the nature of this invention.

*Claim*.—The production of a fertilizer by combining guano and sulphate of ammonia, or its equivalent, with burnt bones, or their equivalents, when the said bones, or equivalent, have been treated by sulphuric acid, as specified; the whole being prepared substantially in the manner and for the purpose set forth.

No. 26,197.—THOMAS J. MAYALL, of Roxbury, Mass.—*Improvement in Scythe Rifles*.—Patent dated November 22, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—As a new article of manufacture, a rifle for sharpening scythes, &c., formed of India rubber or gutta percha, with which emery, sand, or other suitable gritty substances, are incorporated, substantially as set forth.

No. 26,198.—WILLIAM MORRISON, of Carlisle, Pa.—*Improvement in Harvesters*.—Patent dated November 22, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* providing the rear end of the finger with the open slot *d*, whereby I am enabled to readily remove the stationary cutters and fingers, and to replace them without detaching the bolts or nuts which secure the fingers to the finger bar, in the manner and for the purpose specified.

No. 26,199.—MARTIN NIXON, of Philadelphia, Pa.—*Improvement in Boilers for Treating Paper Stock*.—Patent dated November 22, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The close spherical kier or boiler A, journaled on hollow trunnions B, and provided with a perforated floor F G, steam pipes D and E, and elevating and distributing pipes I and J; the whole being constructed and arranged and operating substantially in the manner set forth, to boil paper stock under a heavy pressure, by the combined action of an upward current of steam and a downward current of hot alkaline solution, and admitting of the ready inversion of the said boiler for the discharge of its contents when cooked.

No. 26,200.—JOHN K. O'NEIL, of Kingston, N. Y.—*Improvement in Vapor Lamps*.—Patent dated November 22, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The arrangement of the auxiliary burner G, in connection with the gas generating chamber E, in such a manner that a cessation of its action on said chamber may at any time be effected without extinguishing its light by the separation of said burner from its influence on said chamber, as described, and for the purpose specified.

I also claim the spiral revolving shade in combination with the auxiliary burner, as described, and for the purpose set forth.

I also claim the construction and arrangement of the burner G and graduating tube g, in combination, as described and for the purpose specified.

No. 26,201.—WILLIAM PEARSON, of Windsor Locks, Conn.—*Improvement in Sewing Machines*.—Patent dated November 22, 1859.—This invention consists in the combination of the vibrating looper and, with the cam flange by which it is operated, of a vibrating bar, or hanger, carrying two friction rollers, and attached to the looper, or the arm of the looper, by a pivot, the axle line of which is located midway between the friction rollers, whereby the said friction rollers are made capable of adjusting themselves to the inclination of the cam flange, and are thus prevented from binding upon it, while at the same time they are allowed to come up snugly and thus prevent loss of motion.

*Claim*.—The combination of the vibrating looper, the cam flange which operates it, and the vibrating bar J, carrying the friction rollers *j j*, the parts being constructed, combined, and arranged substantially as and for the purposes set forth.

No. 26,202.—J. B. PALSER and G. HOWLAND, of Fort Edward, N. Y.—*Improvement in the Manufacture of Paper Pulp*.—Patent dated November 22, 1857.—The claim explains the nature of this invention.

*Claim*.—The boiling of the straw or other stock for about four hours, under a pressure of from 110 pounds to 130 pounds, in a solution of caustic alkali, of a strength indicating from  $3\frac{1}{2}^{\circ}$  to  $3\frac{3}{4}^{\circ}$  Beaume, substantially in the manner and for the purpose set forth.

No. 26,203.—WILLIAM PHELPS and W. H. HANFORD, of Sycamore, Ill.—*Improvement in Horse Power Machines*.—Patent dated November 22, 1859.—This invention consists of a horizontal track B forming a perfect circle made of iron, or any other material sufficiently hard to prevent indentation by the rollers resting or rolling upon it.

*Claim*.—The combination and arrangement of the wheels and rollers C C C and D D D on truck B and wheel H, and friction rollers I I I and J J J on track H, and friction rollers R R R on rotary track O, with rotary drive wheel N, and friction rollers U, constructed and operated substantially as described.

No. 26,204.—FRANCIS B. RICHARDSON, of Boston, Mass.—*Improvement in Elastic Enema Syringes*.—Patent dated November 22, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The improvement in India rubber syringes, as an article of manufacture, which consists in combining the India rubber or gutta percha, or other waterproof bag, with the suction end of the syringe, in the manner substantially as described.

No. 26,205.—T. J. W. ROBERTSON, of New York, N. Y.—*Improvement in Sewing Machines*.—Patent dated November 22, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the employment, in combination with the needle of a sewing machine, of a plate K, constructed and operating substantially as shown and described, for the purpose of laying and holding braid, gimp, or other material upon the surface of the fabric, as set forth.

Second. The arrangement of the guides *e e e*, to extend past the centre and on each side of the needle hole, as and for the purpose set forth.

Third. The employment, in combination with a braid holder M, of the adjustable slide N, for the purpose of flattening and opening the braid and preventing its kinking, as shown and described.

No. 26,206.—JOHN A. SEAMAN, of St. Louis, Mo.—*Improved Machine for Chamfering and Crozing Kegs or Casks*.—Patent dated November 22, 1859.—The object of this invention is to obtain a machine whereby kegs may be dowed, crozed, the chimes formed complete ready to receive the heads, and the work performed expeditiously in a perfect manner, and with the aid of a single attendant.

*Claim*.—The rotating arms *a*, provided with the adjustable jaws *b*, the adjustable rotating ring G, fitted to the annular plate D by the screws and guides E F, the plate D being provided with the tool holding levers I J, attached to the guide shafts C, and supported by the springs E, and the shafts C, connected to a treadle frame H, the whole being combined and arranged to operate substantially as and for the purpose set forth.

No. 26,207.—LEMUEL W. SERRELL, of Brooklyn, N. Y.—*Improvement in Guides for Sewing Machines*.—Patent dated November 22, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, a spring tucker B, acting to fold the edge of the hem against the plate of the hem when combined with the adjusting screw 5, or its equivalent, whereby the pressure of the tucker on the goods and the opening or mouth left for their passage are regulated, as set forth.

Second. I claim the horn 5, in combination with the tongue *e*, for the purposes and as specified.

Third. I claim the arrangement of the hem spreader stock *h* and gauge *d*, for the purposes and as specified.

Fourth. I claim attaching the guide or hemmer to the sewing machine by a cylindrical pin or hinge to permit the said guide or hemmer to be turned up or inverted, so that the edge of the cloth, at the beginning of the hem, can be properly entered and folded while in this position, as set forth.

No. 26,208.—DANIEL SPENCER, of Cortlandt, N. Y.—*Improvement in Grain Separators*.—Patent dated November 22, 1859.—On the shaft H a series of wheels I is placed and allowed to slide back and forth. The wheels are permanently connected to each other and vary in size like a set of cone pulleys. The shaft is hollow and a rod J is fitted therein and attached by a pin *a* to a hub *b* on one of the wheels.

*Claim*.—The combination with a grain separator between the fan shaft and the separating screens of a shaft H and a series of sliding wheels I, substantially as shown for the purpose set forth.

No. 26,209.—JOHN F. STARK, of Greensburg, Pa.—*Improved Composition for Protecting and Ornamenting the Surface of Wood*.—Patent dated November 22, 1859.—This invention consists in the use of sulphur, in combination with alcoholic varnish, for the purposes of covering surfaces of wood or other material, to give an ornamental appearance thereto.

*Claim*.—The employment of a compound composed of sulphur and alcohol, or sulphur and the alcoholic varnish described, in the proportions and manner shown and described for the purpose set forth.

No. 26,210.—JAMES STRATTON, of Brooklyn, N. Y.—*Improved Apparatus for Regulating the Pressure of Water in Pipes*.—Patent dated November 22, 1859.—This invention consists in the use of an air chamber provided with a plunger or yielding bottom, to which a valve stem is attached, the air chamber and valve being arranged in connection with suitable pipes, and in such relation to the supply pipe, so as to effect the desired object.

*Claim*.—The employment or use of the air chamber E, diaphragm D or its equivalent, with valve C attached, the pipe B containing valve C and communicating with the air chamber by pipe F provided with the cocks H I, and the pipe G communicating with the pipe F and B; the above parts being arranged in relation with each other and the supply pipe A, to operate as and for the purpose set forth.

No. 26,211.—L. TAYLOR, of Jordan, Wis.—*Improvement in Apparatus for Elevating Water from Wells, &c.*—Patent dated November 22, 1859.—This invention relates to certain improvements in that class of water elevating devices in which the buckets or pails are connected to carriages that run on inclined wires or ways from the well or spring to the house.

The inventor says: I *claim*, first, the employment or use of the springs D, arranged in connection with travelling jackets G I and receivers B B, to operate as and for the purpose set forth.

Second. The means, substantially as shown, of connecting the bucket I to the carriage J, to wit: the lever *x* on the carriage, provided with the loop *w*, and the bail *w*<sup>1</sup> of the bucket,

with its pulley *v*, in connection with the pulleys *e*<sup>2</sup> on the carriage and the taper rod *g*<sup>1</sup> and catch *h*<sup>1</sup> in the well house *L*, whereby the bucket is drawn up the wire or way and dropped and raised from the well.

No. 26,212.—SAMUEL THOMAS and JOHN THOMAS, of Catasauqua, Pa.—*Improvement in Air Heating Pipes for Blast Furnaces*.—Patent dated November 22, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—Supporting both of the legs of the arched pipes *G* upon one bottom tube, constructed substantially as described, so that injury to said pipes by the displacement of the bottom tubes will be prevented; and so that each bottom tube, with its connected arched pipes, may be removed and replaced without disturbing any of the remaining arched pipes or bottom tubes, all as set forth.

No. 26,213.—THOMAS TRIPP, of Buffalo, N. Y.—*Improved Propeller Water Wheel*.—Patent dated November 22, 1859.—For a description of this invention the reader is referred to the inventor's specification. The claim and engravings give some idea of its nature.

*Claim*.—A propeller wheel having blades formed in respect to their main propelling surfaces, and also in respect to their outward arcs, substantially as described.

No. 26,214.—DAVID WALLING, of Garrettsville, N. Y.—*Improvement in Washing Machines*.—Patent dated November 22, 1859.—This invention consists in a peculiar arrangement of levers and weighted arms, with a vibrating dash board or beater, and a fixed vibrating dasher, so that the operation of cleansing the clothes is effected with very little manual labor.

*Claim*.—The combination of weighted arms *D D*, jointed connecting rod *H*, angular lever *G*, rod *a*, vibrating dash board *K*, and dash board *M*, when the same are all arranged and to operate as set forth.

No. 26,215.—MOSES D. WELLS, of Morgantown, Va.—*Improved Washing Machine*.—Patent dated November 22, 1859.—This invention consists in having a ribbed reciprocating plunger moving upon guides, and attached by a pitman to a pendulum rod and weight depended from a shaft above, by the rocking of which the reciprocating movement of the plunger is produced.

*Claim*.—The reciprocating plunger, operated as described, in combination with the rack piece *D*, moved by the plunger in its backward motion, and springs *d d*, throwing said rack in place, the whole operated as specified.

No. 26,216.—J. WHITESIDE and H. F. CRABILL, of Fuller's Corners, N. Y.—*Improvement in Cultivators*.—Patent dated November 22, 1859.—This invention consists in arranging the curved shovel beams in such a manner that they can be used with their concave sides facing each other, and also reversed, bringing their convex sides towards each other, whereby the cultivator may be adapted to different kinds of work. It consists also in combining with said hinged and curved shovel beam a crossbar with a gauging wheel in such a manner that, by shifting said bar, the width of the shovel beams is adjusted, and that the depth to which the shovels cut is governed by said gauging wheel.

The inventors say: We *claim*, first, the arrangement and combination of the hinged curved shovel beams *A A*, crossbar *D*, and gauging wheel *F*, substantially as and for the purpose set forth.

Second. The curved draft beam *B*, arranged as described, in combination with the crossbar *D*, handles *G*, and rod *h*, substantially in the manner and for the purpose specified.

No. 26,217.—R. G. WILKINS, of Burns, N. Y.—*Improved Washing Machine*.—Patent dated November 22, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of an upper rotary rubber, with revolving slats, with two or more lower rotating rubbers with revolving slats, arranged substantially as described for the purpose set forth.

Second. I claim arranging the undulating surface of the slats in the upper rubber so the projections come opposite to each other throughout, when the same is combined with a lower rotating rubber in which the projections of one slat are arranged opposite the depressions in the adjacent slats, and also when the slats of the upper rubber are arranged in relation to the slats of the lower rubber, as described, for the purpose set forth.

No. 26,218.—JOHN WILLIAMS, of Ashfield, Mass.—*Improved Washing Machine*.—Patent dated November 22, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The combination of straight fluted rollers, placed in the box of the machine, in the form seen in the model, and two arms connected by a handle at one end, and attached by the other to the extremities of the frame which holds the four rollers.

No. 26,219.—EPENETUS A. WILLIS, of Cold Spring, N. Y.—*Improvement in Floating Bat-*

*teries.*—Patent dated November 22, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The combination of the central upright shaft, so applied that it may serve to anchor the battery, and that the battery may revolve around it, and a system of propellers by which the battery may be either caused to revolve around the said central shaft while at anchor, or propelled from place to place when the said central shaft is elevated, substantially as described.

No. 26,220.—THOMAS W. WILSON and LEWIS RAYMOND, of New York, N. Y.—*Improved Disengaging Hook for Liberating Ships' Boats.*—Patent dated November 22, 1859.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim* the combination of a detachable hook, consisting of an open eye and pin combined with each other, substantially as set forth, with a pulley block for lowering a boat.

We also claim the combination of a detachable hook with the davit or object from which a boat is lowered by means of a lanyard, that is independent of the lowering tackle, in such manner that the combination as a whole operates to free the boat from the tackle by the tautening of the lanyard.

No. 26,221.—MICHAEL WERK, of Cincinnati, Ohio.—*Improvement in Lining Tanks for Fatty Acids.*—Patent dated November 22, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—The lining of the tank or metal vessel used with wood and cement, in the manner set forth.

No. 26,222.—C. M. WILKINS, of Madison, Ohio.—*Improved Cheese Vats.*—Patent dated November 22, 1859.—This improvement consists in part in providing the bottom of an ordinary metallic cheese vat or tank, with truss braces J, which extend across the bottom of the tank from one side to the other, and about in the centre of these trusses, and connected with them and the bottom of the tank is a brace K, which gives additional strength to the trusses.

*Claim.*—The arrangement of the valves N and O, within the water chamber and vat, substantially as described.

No. 26,223.—SYLVESTER P. WHEELER, of Bridgeport, Conn., assignor to MOSES H. WHEELER & Co., of said Bridgeport.—*Improvement in the Manufacture of Nitrate of Silver Crayons.*—Patent dated November 22, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The manufacturing or forming of sticks or pieces of nitrate of silver or lunar caustic, with one or more wires or ribbon of metal running through the same, to which the nitrate of silver or lunar caustic adheres and still holds to the wire, wires, or ribbon, when used or otherwise, when broken.

No. 26,224.—HARRY ABBOTT, of North Huron, Ind., assignor to Himself and EMERSON ABBOTT, of said North Huron.—*Improvement in Centrifugal Water Wheels.*—Patent dated November 22, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The combination, with a centrifugal water wheel A, of a valve E, located and arranged within said wheel so as to turn with it, and, at the same time, be adjustable while the wheel is in motion, by means of a bail c, concentric rod H, and adjusting lever I, substantially as set forth.

No. 26,225.—J. A. ALTHOUSE, of Philipstown, Ill., assignor to Himself and F. W. LECHTENBERGER, of New Harmony, Ind.—*Improvement in Machines for Raking and Loading Hay.* Patent dated November 22, 1859.—This invention consists in the use of a stationary revolving and vibrating rake, mounted on wheels, and arranged for joint operation, whereby hay or grain may be thrown into or loaded on a wagon or cart with greater facility than by the usual manual process.

*Claim.*—The combination of the stationary rake C, revolving rake I, and vibrating rake K, placed on a mounted frame, and arranged for joint operation, substantially as and for the purpose set forth.

No. 26,226.—GILLETT BUNTING, of Liberty, Ind., assignor to Himself and W. M. JARRELL, of said Liberty.—*Improved Churn Dasher.*—Patent dated November 22, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—Producing the vibratory movement in the cylindrical churn dasher by means of the combination of said arms with the crank portion of the driving wheel and intermediate connecting rod, when these are used in connection with the current breaker K, as set forth.

No. 26,227.—JAMES T. COXELL, of Brooklyn, N. Y., assignor to Himself and EDWARD

JONES, of said Brooklyn.—*Improved Mangle*.—Patent dated November 22 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of the rollers A B B, above the table, so that the fabric will be folded by the machine, substantially as shown and described.

Second. The combination with the weighted levers L, of the lifting ropes F or their equivalents, so that the downward pressure of the roller A may be released, and the roller lifted at the will of the operator to allow such portions of the linen that have buttons or other elevations to pass through the machine uninjured, all as shown and described.

No. 26,228.—H. E. TICKET and JOHN W. SUMMERS, of Glenn's Falls, N. Y., assignor to H. E. TICKET, aforesaid.—*Improved Bed Bottom*.—Patent dated November 22, 1859.—This invention consists in constructing a bed bottom, so that the slats B being supported by the springs C attached to the end pieces G by means of the screws H and the wires D, running beneath each slat its entire length, and the supports E resting on the wire D, and placed directly beneath the centre of each slat, the bed bottom shall not sag in its centre, as in the case where a sacking or yielding bed bottom is used.

*Claim*.—The arrangement of the slats B B B B, with the spiral springs C C C C, wires D D, central supports E E E E, and cross brace F, arranged and operated in the manner described and for the purpose specified.

No. 26,229.—HORATIO P. GATCHELL, of Ravenna, Ohio, assignor to E. J. BATES, of Bedford, Ohio.—*Improvement in Coffee Pots*.—Patent dated November 22, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The forming of the walls of the cups B C and F, with male and female screws, as described, in combination with the perforated bottoms E and E<sup>1</sup>, for the purpose of compressing the ground coffee and extracting the strength of the drug by displacement, in the manner specified.

No. 26,230.—WILLIAM DARKER, Jr., of Philadelphia, Pa., assignor to Himself and J. B. THOMPSON, of said Philadelphia.—*Improved Mode of Applying Steam as a Motor to City Railroad Cars*.—Patent dated November 22, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, placing a steam engine and steam generator on the top of a city railroad car, when the engine, by suitable driving mechanism, is connected with the wheels of the car, to propel the same.

Second. Connecting the governor N with a throttle valve and brake, arranged substantially as shown to operate as set forth.

Third. The particular arrangement of the brake, formed of the strip Z on wheel K, and actuated by the movement of the yoke Y on its bent ends *e e*, connected with the hand lever rod V, substantially as shown, so as to allow of the adjustment of the throttle valve by hand independently of the automatic connection.

Fourth. The arrangement of the bar A<sup>1</sup>, cam N, lever B<sup>1</sup>, and rod H, connected with the bar A<sup>1</sup> by the arm G, whereby the brake is operated automatically, as set forth.

No. 26,231.—AUGUSTUS J. GOFFE and DAMUS GOFFE, of Cohoes, N. Y., assignors to DOWNS & Co., of Seneca Falls, N. Y.—*Improvement in Knitting Machines*.—Patent dated November 22, 1859.—The inventors say: In this invention, we use a rotary burr or pinion M, having teeth corresponding in size with the interstices between the needles at the point where it is applied, which, by gearing with them, as the top plate A, to which it is pivoted, revolves, causes it to rotate and lay the thread so close to the needles as to ensure its being drawn under the hubs as the needles are made to slide back by the eccentric groove.

*Claim*.—The rotary burr presser M, having inclined planes *a* between the teeth, in combination with the sliding needles, arranged and operating substantially in the manner and for the purpose shown and described.

We also claim varying the eccentricity of the groove *f* by means of the movable pulley *g*, spring *k*, adjusting screw *h*, and friction pulley *l*, substantially in the manner and for the purposes herein described.

No. 26,232.—LIVERAS HULL, of Charlestown, Mass., assignor to Himself and A. WHEELER, of Boston, Mass.—*Improved Method of Making Copal Varnish*.—Patent dated November 22, 1859.—The claim explains the nature of this invention.

*Claim*.—The new manufacture of varnish, as composed of gum copal, camphene, and alcohol, united in the proportions in a cool state in a close or airtight vessel, substantially as specified.

No. 26,233.—HENRY W. JOSLIN, of Trenton, N. J., and A. K. EATON, of New York, N. Y., assignors to the JOSLIN INDIA RUBBER COMPANY, of New York.—*Improvement in the Treatment of India Rubber*.—Patent dated November 22, 1859.—The claim explains the nature of this invention.

*Claim.*—The treatment of the argillaceous red shale of New Jersey or other similar geological localities, in combination with sulphur and caoutchouc, substantially in the manner and for the purpose described for the manufacture of India rubber.

No. 26,234.—JAMES S. McCURDY, of Brooklyn, N. Y., assignor to J. M. MYERS, of New York city.—*Improvement in Sewing Machines.*—Patent dated November 22, 1859.—This invention consists of a compound shuttle driver that acts in a reliable manner, avoiding wear, and thereby insuring a continuance of the proper timing between the needle and the shuttle.

*Claim.*—The vibrating lever *g*, carrying the shuttle driver *h*, and provided with the spring *k* to keep the shuttle driver to the raceway; the whole constructed and operating as and for the purposes specified.

No. 26,235.—HENRY M. SCOTT, of Portland, Me., assignor to Himself and SAMUEL ADLAM, of said Portland.—*Improved Bed Bottom Spring.*—Patent dated November 22, 1859.—This invention consists in a particular arrangement of a spring hook and clamp that serve to attach the webbing to the frame of the bedstead in such a manner that the slack can readily be taken in.

*Claim.*—The employment of spring hooks A and clamps D, substantially as described, for the purpose of attaching strips of webbing to the frame of a bedstead.

No. 26,236.—PAREMUS P. PARKHURST, of Princeton, Mass.—*Improved Ore Separator.*—Patent dated November 22, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The washing box or chamber *a*, constructed with the pipe *b* entering near the bottom to cause a whirl and circulation, as specified, and with the gate or overflow *c*, for the purposes and as described and shown, and in combination with such washing box *a*, I claim the receptacle or box *e* and chamber *f*, to receive the metallic particles when the gate *d* is raised, as set forth.

No. 26,237.—JOHN THOMAS, of Indianapolis, Ind., assignor to Himself and JOHN M. LORD, of said Indianapolis.—*Improvement in Piling Railroad Bars for Re-rolling.*—Patent dated November 22, 1859.—The engraving represents six pieces of "T" rail arranged in a "pile," having two tiers of three rails in each, numbering 1, 2, 3, 4, 5, and 6, with their tie number 7 prepared for re-working.

*Claim.*—The tie No. 7, or its equivalent, when used for interlocking T rail or other old iron, and forming the pile of six rails, shown in Fig. 1, when constructed and arranged as and for the purposes set forth.

No. 26,238.—E. T. WEEKS, of Franconia, N. H., assignor to S. H. BABCOCK, of said Franconia.—*Improved Shoe Peg Machine.*—Patent dated November 22, 1859.—This invention consists of the means employed for clamping the bolt and feeding the same to the knife; also, in the use of a gauge in connection with the knife for properly adjusting the bolt relatively to the knife.

The inventor says: I *claim* the feeding device formed of bar L, to which the jaws are connected, operated by the screw K, ratchet S, and pawl T, lever U, and pitman V, substantially as and for the purposes set forth.

I also claim, in connection with the riving or splitting knife, the gauge I, arranged as and for the purpose specified.

I further claim the elastic or yielding bar Q, when attached to the arbor M, provided with cam *d* and used in connection with the segment rack P, curved bars N O, and jaws *k l*, for the purpose set forth.

No. 26,239.—REUBEN L. ALLEN, of Providence, R. I.—*Improvement in Sleeve Fasteners.*—Patent dated November 29, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The new article of manufacture described, namely, a sleeve fastening, composed of springs A, cylindrical arms B C, hinge and catch *b c*, and hooked bar D, arranged in the relations, and so as to operate together, in the manner set forth.

No. 26,240.—SETH A. ANDRUS, of Roscoe, Ill.—*Improved Washing Machine.*—Patent dated November 29, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of the circular plate or crank I with the rubber, as described, and so constructed and arranged that by operating the said crank I am enabled to communicate to the said rubber J two motions at the same time, that is, a vertical reciprocating motion and a lateral vibratory motion.

Second. The combination of the caster rollers *m m* with the double spring K, constructed and arranged in connection with the rubber J, as fully set forth and for the purpose stated.

No. 26,241.—Evens BACKUS, of Stuyvesant, N. Y.—*Improvement in Cooking Ranges.*—

Patent dated November 29, 1859.—The use of the damper L is, when closed, to throw the products of combustion around the baking oven G, also around the broiling oven E and the roasting oven D, and then to allow a direct access to the chimney, or what is termed the "direct draft," by the way of the common exit.

*Claim.*—Attaching to a stove, or range, the curved plate I, and the movable plate n, and the continuous flue F, when arranged in the manner and for the purpose set forth.

No. 26,242.—G. W. BEERS, of Bridgeport, Conn.—*Improvement in Making Hub Bands for Wagon Wheels.*—Patent dated November 29, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—Casting slits, or holes, through the band, sufficiently large to allow the solder, or other suitable metal used in connecting the cap to the band to flow through them and unite them, as described.

No. 26,243.—WILLIAM BOCH, Sr., of Green Point, N. Y.—*Improved Water Closet Basin.*—Patent dated November 29, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—A water closet basin, having a covered annular water passage B at its upper edge, as shown and described.

No. 26,244.—HENRY F. BOND, of Hudson, Wis.—*Improved Machine for Registering Music.*—Patent dated November 29, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the application of the bell pull action with knees and wires to act upon the markers, substantially as described.

Second. The arrangement of the levers J J J and K K K by which the sharps are marked with double lines on the spaces or lines in music, with their corresponding naturals, the levers or markers K K K being made each of two pieces of tin or other metal, and the levers or markers J J J playing between those two pieces.

Third. The arrangement of levers or markers, of both kinds, in a row, with proper intervals to record the music on paper ruled, substantially as represented in Fig. 6, the staves of music being ruled of one color, with just leger lines enough of another color to write directly up or down from one staff to another, the leger lines between the two staves belonging alike to both of them, and the whole number of lines and spaces being equal to the compass of the instruments.

Fourth. Application of the ink or coloring matter to the cylinder A, as described, and the producing of colored marks by pressing the paper against the inked cylinder.

Fifth. The action of the lever E upon the bar marker L, substantially after the manner set forth.

Sixth. The mode in which the loud pedal action is marked, substantially as set forth.

No. 26,245.—S. L. BOND, of Greenwood, S. C.—*Improved Hub Boring Machine.*—Patent dated November 29, 1859.—This invention consists in the combination of an augur or bit and a centring device, arranged substantially as described, whereby hubs may be expeditiously centred and bored for the purpose of receiving their boxes.

*Claim.*—The V shaped bars or jaws F H, in combination with the bit arbor D, when the whole are arranged substantially as shown to operate as and for the purpose set forth.

No. 26,246.—JAMES A. BOUGHTON, of Poughkeepsie, N. Y.—*Improvement in Making Hub Bands for Wagon Wheels.*—Patent dated November 29, 1859.—This invention consists in furnishing an open band with a movable cap to allow its being taken out for the insertion of a wrench to unscrew the nuts on the end of a half patent axle, and the time to present the appearance and finish of a band for a patent axle.

*Claim.*—The combination of the flange C and projection D on the leaf B and the set screw E, in the open band A, or their equivalents, for the purposes set forth.

No. 26,247.—JOHN CALVIN BROWN, of Providence, R. I.—*Improvement in Machines for Making Chain.*—Patent dated November 29, 1859.—This invention relates to a method of forming chain without turning each link after it has been placed in position, the fractional part of a circle necessary to present the arms of each link to the bending instrument.

*Claim.*—The circular disk I, provided with the wedged form projections E F G H, arranged as described, in combination with the bell crank levers D D<sup>1</sup>, which operate the several bending instruments, such combination operating in the manner substantially as described for the purposes specified.

No. 26,248.—PETER BROWN, of Brooklyn, N. Y.—*Improvement in Paint Cans.*—Patent dated November 29, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the employment of a strengthening wire within the bead a, as and for the purpose shown and described.

Second. The combination of the pivoted ears *c*, with the cover B, lug *b*, and can A, as and for the purpose shown and described.

No. 26,249.—THOMAS S. BROWN, of New York, N. Y.—*Improvement in Quartz Crushers*.—Patent dated November 29, 1859.—This invention consists in the peculiar construction of the pestles, and employing therewith nipples or cones for the purpose of preventing the pestles from wearing unevenly.

*Claim*.—The employment or use of the tubular pestle C, having a reciprocating and rotary movement, in connection with the nipple or cone *e* in the box or mortar D, substantially as and for the purpose set forth.

No. 26,250.—JOHN BRUBAKER and HENRY BRUBAKER, of Lancaster county, Ohio.—*Improvement in Tools for Handling Tire*.—Patent dated November 29, 1859.—The grip handle *c* with B can be adjusted to any diameter required by pushing it back or forth on the rod handle A.

*Claim*.—The rod handle tong Fig. 2, with its sliding leg *c*, hooked end *a*, in combination with the ring E, Fig. 3, when made substantially as described, for the purpose specified.

No. 26,251.—JOHN P. BURNHAM, of Rockford, Ill.—*Improvement in Harvesters*.—Patent dated November 29, 1859.—To each end of the lever J a friction roller *c* is attached, and these rollers are kept in contact with the teeth of the cam E by means of a spiral spring *d*, which is placed on an arm or shaft *e* attached to the slide I; to the lower end of the arm *b* a connecting rod L is attached, said rod being also attached to the end of sickle *c*.

*Claim*.—The employment of a spring *d*, in combination with the lever J, and connecting rod L, substantially as and for the purpose shown and described.

No. 26,252.—ZE BUTT, of Lincolnton, N. C.—*Improved Harness Yoke*.—Patent dated November 29, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the manner described of constructing and arranging the yoke so that its weight, or the greater portion of it, may rest upon the back instead of the neck of the horses.

I also claim, in combination with the yoke, giving a wide base to the line of draft, either by the bolt and clevis, or any other equivalent device, for the purpose and in the manner set forth and described.

No. 26,253.—ANDREW J. CHAPMAN, of Scipio, N. Y.—*Improvement in Vegetable Cutters*.—Patent dated November 29, 1859.—This invention consists in the arrangement and combination of the hinged tail board, hinged follower, and stationary slatted cutting bed.

*Claim*.—The arrangement and combination of the hinged guard or feed board, hinged follower, and stationary slatted cutting bed, when constructed and operating substantially in the manner and for the purposes set forth.

No. 26,254.—WILLIAM B. COATES, of Philadelphia, Pa.—*Improved Potato Parer*.—Patent dated November 29, 1859.—This invention consists in submitting to the action of a steel blade ground flat on the under side, and a combined laterally and part circularly moving guard secured to a removable gauging ferrule, sliding on another by means of serrations, vegetables and fruit for the purpose of paring them evenly and preventing a waste by thick paring, the paring passing out between the edge of the blade and guard, the latter being forward of the former.

*Claim*.—The handle A, ferrules B and C, guard D, and blade G, the whole being arranged and constructed substantially in the manner and for the purposes set forth.

No. 26,255.—SETH L. COLE, of Burlington, Vt.—*Improvement in Gas Burners*.—Patent dated November 29, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The construction from some good conducting material, as set forth, of a gas burner with an enlargement of the tube at the point where gas is discharged and burned in the form of a globe, or the like, furnished with a slot aperture, as described, so that the gas shall be heated to the utmost at the point where it is consumed.

No. 26,256.—JOHN WEBSTER COCHRAN, of New York, N. Y.—*Improvement in Breech Loading and other Fire-Arms*.—Patent dated November 29, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim*, first, so constructing and applying one or more accelerating chambers in combination with the plunger or elastic cushion that the charge or charges in the accelerating chamber or chambers are fired by the driving back of the plunger or cushion, and that the plunger or cushion serves as a safety valve to the accelerating chambers, substantially as described.

Second. Combining the movable breech piece B, containing the plunger or elastic cushion,

with a ring or circular frame E hinged to a slide F, which works longitudinally to the gun, the whole operating substantially as described.

Third. In combination with the breech piece B, secured in place by a screw or its equivalent, I claim the adjustable screwed cushion G applied to the gun, substantially as and for the purpose described.

Fourth. The combination of the plunger C, accelerating chamber *c c*, volute spring D, movable breech piece B, ring or frame E, and slide F, the several parts constructed and applied to the gun, and operating substantially as described.

No. 26,257.—GEORGE COOPER, of Concord, N. H.—*Improved Cooking Range*.—Patent dated November 29, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim* the combination and arrangement of the leading flues A B C, (each provided with a damper *a b* or *c*, arranged in it as explained,) with flues D E F G H, disposed around the ovens as specified.

And in combination therewith, I claim the separate insulating flues I K, arranged between the ovens and on opposite sides of the leading flue A, and made to open into the bottom flues D and G, and to communicate with the flue A by openings provided with dampers, all as specified.

No. 26,258.—P. DAVEY, of Ironton, Ohio.—*Improvement in Buttons*.—Patent dated November 29, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The construction of the double flanged shank piece at the basis of the button, forming on one end thereof a button and on the other a fastening, and in the middle two flange guards, to receive the button hole and protect it from too much abrasion and friction, substantially as set forth.

No. 26,259.—A. A. DICKSON, of Anderson, S. C.—*Improvement in Ploughs*.—Patent dated November 29, 1859.—This invention consists in an improved mode of constructing the plough, whereby the same is rendered simple and capable of being adapted to various kinds of work.

*Claim*.—The arrangement of the peculiar shaped bar D with the shares E F and G, beam A, and handles C C, substantially as described for the purpose set forth.

No. 26,260.—PATRICK H. DUFFY, of Somerset, Ohio.—*Improved Detective Register for Watchmen*.—Patent dated November 29, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* dropping the balls by which the action of the apparatus is indicated into the cells of a revolving wheel, by operating a rod O and slide Q, substantially in the manner and for the purpose herein described.

I also claim locking and releasing the rod O by devices, substantially in the manner and for the purpose set forth.

No. 26,261.—HENRY EHRENFELD, of New York, N. Y.—*Improvement in Machines for Converting Reciprocating into Intermittent Rotary Motion*.—Patent dated November 29, 1859.—This invention consists in arranging in a recess formed by the wheel or roller to which the intermittent rotary motion is to be imparted, a circular plate that fits closely into said recess, and is cut or split open through its centre, and furnished with an oblong hole forming a socket for an oblong pin attached to the lever, serving to communicate motion to the wheel, so that the slightest motion imparted to the outer end of said lever causes the oblong pin, as it turns in its socket, to force the edges of the plate tightly up to the sides of the recess, and to bind the same as long as the strain on the lever continues.

*Claim*.—The plate B or its equivalent, arranged with a socket *c*, and cut or split through its centre, as described, to operate in combination with the wheel A and lever C, which latter is furnished with an oblong pin *d* or its equivalent, substantially in the manner and for the purpose specified.

No. 26,262.—WILLIAM M. FERRY, Jr., of Ferrysburg, Ohio.—*Improved Journal Box for Saw Mill Carriages*.—Patent dated November 29, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—A new article of manufacture, to wit: a single casting A moulded with an intermediate space B, and with offsetting boxes C D on each side of the space, substantially as and for the purposes set forth.

No. 26,263.—HENRY FISHER, of Alliance, Ohio.—*Improvement in Railroad Hand Cars*.—Patent dated November 29, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The manner described of combining the hand crank shaft F with the axle of a railroad hand car, so that when the crank shaft F meets with any obstruction, it disconnects

automatically from the axle, and ceases its revolution with the same, and thus prevents a sweeping off of the operators from the platform, as set forth.

No. 26,264.—DENNIS C. GATELY, of Newtown, Conn.—*Improvement in the Manufacture of Rubber Belting*.—Patent dated November 29, 1859.—The claim explains the nature of this invention.

*Claim*.—The method described of imparting a smooth and finished surface to belts or bands of India rubber or gutta percha, the same consisting in placing them in contact with sheets or strips of vulcanized India rubber or gutta percha, and then vulcanizing them by applying heat, substantially in the manner and for the purposes set forth.

No. 26, 265.—DENNIS C. GATELY, of Newtown, Conn.—*Improvement in the Manufacture of Rubber Belting*.—Patent dated November 29, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The manner of manufacturing belting or banding, composed either wholly or in part of India rubber or gutta percha, which consists in vulcanizing the belt or band, and giving it a smooth friction surface at one operation, by feeding the belt or band around or in contact with a series of smooth heated rollers, substantially as described.

No. 26,266.—GEORGE A. GRAY, Jr., of Cincinnati, Ohio.—*Improved Bench Vise*.—Patent dated November 29, 1859.—This invention consists in a provision whereby the workman is enabled to increase the gripe or bite of the jaws.

*Claim*.—The described combination of the handle G, loose head F, and catch H, with the jaws, screws, and endless chains of a parallel bench vise.

No. 26,267.—JONATHAN H. GREEN, of Christiansburg, Iowa.—*Improved Composition for Metals*.—Patent dated November 29, 1859.—This invention consists of an improved elastic composition for covering metals, hard wood, or any other substances, which from their nature are capable of receiving it, and which may also be used for coating the inside of vessels and water pipes, and for luting in chemical experiments.

This composition is made as follows: Take six ounces of emery, four ounces of pumice stone, two ounces of Paris white, one ounce of lamp black, two ounces of magnesia, three ounces of gutta percha or India rubber cement, consisting of saturated solution of India rubber in camphene, or a similar solution of gutta percha, one pint of linseed oil, half a pint of turpentine, and one gill of slow japanner's varnish. These are all ground together to the thickness of paint and then subjected to proper heat.

*Claim*.—The composition described.

No. 26,268.—WILLIAM I. HORTON, of La Grange, Ala.—*Improved Machine for Riving Basket Splints, &c.*—Patent dated November 29, 1859.—This invention consists in the use of rollers and a riving knife, arranged to operate conjointly and thereby effect the desired end.

*Claim*.—The employment or use of the rollers C C D, three or more, knife H placed in the gate G, and the guide plates E E arranged for joint operation, substantially as and for the purpose set forth.

No. 26,269.—JOSEF JOHNSON, of New York, N. Y.—*Improved Toy Gun*.—Patent dated November 29, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I claim, first, so arranging the spring D relatively to the bore A that D is, by single movement of the finger, used both as a trigger and a propelling power to discharge the projectile through A, substantially as shown and described.

Second. I claim in connection with the above receiving the impact of the spring D upon the single bearing g, so that the free portion of D moves by its momentum beyond its original position, for the purpose shown and described.

Third. I claim the detaching surface a arranged relatively to the spring lever D and barrel A, substantially as shown and described.

No. 26,270.—FRANCIS H. JOYNER, of Richmond, Vt.—*Improvement in Railroad Switches*.—Patent dated November 29, 1859.—e e are switch rails with the nearer ends slightly curved inwards, and resting on chairs in which they have some slight play as on pivots. The other ends curve inward still more and slide on suitable chairs, and are moved by a switch rod in any usual manner. The curve is such that when thrown to the left, the left rail presses against the left wheel of the car going out and forces it into the left track, and the reverse when thrown to the right.

*Claim*.—A pair of switch rails in connection with stationary bearing rails, the whole constructed and arranged as is described.

No. 26,271.—BERNHARD KOEGEL, of New York, N. Y.—*Improvement in the Manufacture of Vinegar*.—Patent dated November 29, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim* converting wine or other alcoholic liquors rapidly into vinegar or acetic acid, by means of pumice stone, or its equivalent; and I also claim the tub or apparatus, substantially as described, when pumice stone is used in the same, for the purpose as set forth.

No. 26,272.—JOHN M. LANIER, of Eufaula, Ala.—*Improvement in Apparatus for Taming Horses*.—Patent dated November 29, 1859.—The object of this invention is to effectually prevent horses from rearing, kicking, or running away, by the employment of certain devices.

*Claim*.—The employment of the straps A A, loop B, and straps D C and E, when the same are constructed, arranged, and used substantially as and for the purpose specified.

No. 26,273.—OLIVER LINDSAY and ROBERT F. STREAM, of Washington, Pa.—*Improvement in Grain Fans*.—Patent dated November 29, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The combination of division board A with the inclined plane B<sup>1</sup>, the screen board G, and the riddles C and F, when the same are united in the peculiar manner described and arranged to operate in the relation to each other and to the currents of wind thrown off by the fan, as fully shown in Fig. 1, substantially as and for the purpose set forth and described.

No. 26,274.—WILLIAM LINTON, of Baltimore, Md.—*Improvement in Filters*.—Patent dated November 29, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—Arranging a clamping plate B of less diameter than the filtering cylinder on adjusting screws g of the removable head c of the cylinder A, substantially as and for the purpose set forth.

No. 26,275.—PETER LOUIS, of New York, N. Y.—*Improvement in Valve Gear of Steam-Engines*.—Patent dated November 29, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the auxiliary cylinder D, having a partition g, and arrangement of steam and exhaust passages, substantially as described, and fitted with a valve T, or its equivalent, and with the two pistons F F<sup>1</sup>, on opposite sides of its partition, applied substantially as described, in combination with the induction and eduction valves and the shaft of the main engine, so that each of said pistons, acted upon by steam admitted to its compartment of the auxiliary cylinder by the valve T, or its equivalent, serves to open one induction and the opposite eduction valve of the main engine at the proper time, substantially as described.

Second. In combination with the auxiliary cylinder D, and its pistons applied and operating as described, to open the induction and eduction valves of the main engine, I claim the employment of the rock shaft N and its toes O O<sup>1</sup>, so applied in combination with the said eduction valves that, while they permit the said valves to be opened by the action of the steam on the pistons of the auxiliary cylinder, they keep the said valves open as long as may be desired, substantially as described.

No. 26,276.—THOMAS J. MAYALL, of Roxbury, Mass.—*Improvement in the Manufacture of Waterproof Hose*.—Patent dated November 29, 1859.—The claim explains the nature of this invention.

The inventor says: I *claim* my improvement in the manufacture of India rubber or gutta percha hose or tubing, which consists in impregnating the fibrous fabric, which forms the basis thereof, with protective or preservative substances, and subsequently coating with India rubber or gutta percha, and forming the same into hose or tubing, substantially as described.

No. 26,277.—THOMAS J. MAYALL, of Roxbury, Mass.—*Improvement in Steels*.—Patent dated November 29, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—As a new article of manufacture, a "steel," or implement for sharpening table knives, &c., formed of India rubber or gutta percha, with which emery, sand, or other suitable substances, are incorporated, substantially as set forth.

No. 26,278.—THOMAS J. MAYALL, of Roxbury, Mass.—*Improvement in the Manufacture of Packing and Tubing*.—Patent dated November 29, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* my new method of forming packing hose or tubing, and other similar articles; the same consisting in rolling or wrapping the fabric to be used around the core or mandrel, by rolling or passing the said core or mandrel and the fabric or wrapper together between two surfaces, one of which exerts a self-adjusting, yielding pressure upon the article to be formed, while the other surface has the necessary motion imparted to it to roll or wind the fabric used around the core or mandrel, substantially as set forth.

No. 26,279.—ALBERT E. MCGAUGHEY and SAMUEL N. MCGAUGHEY, of Wastedo, Minn.—

*Improvement in Steam Ploughs.*—Patent dated November 29, 1859.—This invention consists in the use of a series of intermittingly rotating and oscillating ploughs, and oscillating or vibrating harrows, so arranged as to operate in a transverse direction with the movement of the machine, substantially as described.

The inventor says: I *claim*, first, the ploughs S attached to radial arms *m*, or oscillating shafts *k*, and arranged with the pinions *n*, racks T, ratchet toothed hubs *l*, and stop rods *r s*, to operate substantially as and for the purpose set forth.

Second. In connection with the ploughs S, arranged and operated as described, the rakes or harrows V, attached to the bars *i i*<sup>1</sup>, for the purpose specified.

No. 26,280.—JAMES H. McNEELY, of Indianapolis, Ind.—*Improved Means for Climbing Telegraph Poles.*—Patent dated November 29, 1859.—This invention consists in preparing a piece of iron A, shaped as shown in the engravings, to the bottom of which are attached the loops D E F, in which works the adjustable hook B, secured by the thumb screw G.

The hook C is riveted to the loops D E F, and the whole implement is attached to the foot of the user by the toe and heel straps H and I, in the manner of an ordinary skate.

*Claim.*—The combination and arrangement of the hooks B and C with the loops D E F and set screw G, when constructed and operated substantially as set forth.

No. 26,281.—REUBEN MILLER, of Pittsburg, Pa.—*Improvement in Cut Off Apparatus for Steam Engines.*—Patent dated November 29, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The employment, in combination with the tappets F F<sup>1</sup> for opening the valve to effect the induction of steam, of the collars G G<sup>1</sup> attached to the same valve rod, and the tappet levers H H<sup>1</sup> with independent arms *g g*<sup>1</sup>, said collars and tappet levers being applied and operating substantially as described, to effect the cutting off of the steam at such point in the stroke of the piston as may be desired.

No. 26,282.—JOHN MILLER and SILAS MERRICK, of New Brighton, Pa.—*Improvement in Railroad Cars.*—Patent dated November 29, 1859.—The claim and engravings explain the nature of this invention

The inventors say: We *claim*, in the construction of railroad cars, inserting strips of wood between the angle iron which forms the frame work of the car, in combination with panel plates formed of a single piece of iron struck up, whether plain or ornamented, substantially as described.

We also claim constructing the ribs and frame work of the car of two strips of L iron with a bar of wood interposed where these wires and the wood are united by rivets, substantially in the manner described.

No. 26,283.—JOHN R. MOFFIT, of Piqua, Ohio.—*Improvement in Grain Separators.*—Patent dated November 29, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, in the described combination, with a reversible spout adapted to discharge grain at either side of a threshing and separating machine, the screen N placed placed within or above said spout, and operated by the motion of the shoe, for the purpose of screening grain after the action of the winnowing apparatus.

No. 26,284.—F. I. PALMER, of Knoxville, Tenn.—*Improvement in Car Trucks.*—Patent dated November 29, 1859.—The object of this invention is to bring the weight of the car body, or cause the same to bear directly over the journal boxes of the axles, and at the same time employ a swinging cross beam so as to admit of a certain degree of lateral play or movement of the car body independently of the trucks, whereby an uneven wear of the journals is prevented, an easy yielding capacity given the car both laterally and vertically while in motion, and much wear and tear avoided in the running parts.

*Claim.*—The arrangement and combination of the bars I K L H H, substantially as and for the purpose set forth.

No. 26,285.—J. J. PARKER, of Marietta, Ohio.—*Improvement in Paper Files.*—Patent dated November 29, 1859.—This invention consists in placing a hinge down the middle of a book back, and arranging within a back thus hinged a pair of spring bars, in combination with two or more pointed file wires for the purpose of receiving and filing pamphlets, documents, &c., that it may be desired to preserve.

*Claim.*—The combination, with a hinged book back, of bars, springs, and rods, arranged for conjoint operation, substantially in the manner described.

No. 26,286.—DUBOIS D. PARMELEE, of Salem, Mass., assignor to JOHN A. GREEN, of Beverly, Mass.—*Improvement in the Manufacture of Hollow Moulded Rubber Goods.*—Patent dated November 29, 1859.—The claim explains the nature of this invention.

*Claim.*—The method described of shaping the said articles in moulds preparatory to

their being vulcanized or hermized—*i. e.*, treated in the cold way by any known process, by applying heat to bags made of India rubber, its equivalent, or their compound, free from sulphur, and inflated with air so as to snugly fit the moulds in the manner substantially as set forth.

No. 26,287.—FRANCIS A. PARMELEE, of New Haven, Conn.—*Improvement in Twine Spools*. Patent dated November 29, 1859.—This improvement consists in constructing an apparatus, so that, by the use of a double spool and the spindle, the operator is enabled, by the act of drawing off the twine from one part of the spool to fill up the other part, by winding the twine from a ball on the spindle, so that when the twine is exhausted from one part of the spool, by using it, the other part will be filled ready for use.

*Claim*.—The combination of the double spool C C, with the spindle D; when the whole is constructed substantially as described.

No. 26,288.—G. H. PEABODY, of Columbus, Ga.—*Improvement in Cotton Pickers' Wallets*. Patent dated November 29, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—Applying a sponge, or other equivalent device to a cotton picker's wallet, for the purpose of enabling the picker to readily moisten his fingers, and thus facilitate his work as described.

No. 26,289.—SIMEON T. PEEK, of Penfield, Ga.—*Improvement in Ploughs*.—Patent dated November 29, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The manner of attaching the share E to the foot bar D, to wit: having the back part of the share notched and fitted in a rebate *a* in the foot bar and receiving the shoulder *b* formed by the rebate, while the ends *f* of the share fit underneath the projections *c c* and the lever F is pressed on the outer side of the share by means of the wedge G, substantially as shown.

No. 26,290.—WILLIAM PETERS, of Baltimore, Md.—*Improved Propeller and Paddle Wheel Shaft*.—Patent dated November 29, 1859.—The inventor says: The principle upon which my shaft is constructed is opposed to direct fracture, as the strain is necessarily distributed and removed from the line of its force, *i. e.*, from the line of direct fracture at right angles to the line of the shaft.

*Claim*.—A propeller or paddle wheel shaft constructed as set forth.

No. 26,291.—S. M. PERKINS, of Albany, Ill.—*Improvement in Whiffletree Hooks*.—Patent dated November 29, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of the stud with a revolving spring button, arranged substantially as described for the purpose set forth.

Second. In combination with a revolving spring button, I claim a stationary stop D, so arranged as to prevent the eye of the trace in all positions from passing over the button.

Third. I claim the combination of the spiral spring, the projecting stud, and the inner stop, arranged substantially as described, for the purpose set forth.

And I also claim constructing the button with a hooked end, substantially as described, for the purpose set forth.

No. 26,292.—CHARLES PERLEY, of New York, N. Y.—*Improved Chain Cable Stopper*.—Patent dated November 29, 1859.—This invention consists in providing a clamping bridge or plate over and in combination with said stopper, whereby the chain is forced into the jaw and effectually stopped.

*Claim*.—The bridge *k* over the chain, in combination with the cable stopper, for the purpose of forcing the chain into said stopper, in the manner and substantially as specified.

No. 26,293.—GIDEON PEIRCE, of Ercildown, Pa.—*Improvement in Horse Rakes*.—Patent dated November 29, 1859.—In order to discharge the teeth *f*, it is only necessary to withdraw the foot from the lever *j* and place it upon the lever I. This action, bringing the rack *c* into gear with the wheel *b*, causes the rack to be drawn downward by the motion of the machine, thereby elevating the teeth through the agency of the frame *d* and bar G.

*Claim*.—The arrangement of the cog wheel *b*, rack *c*, lever I, frame *d*, bar G, standard *g*, and teeth *f*, operating substantially as and for the purpose set forth.

No. 26,294.—MATHIAS REAZER, of Reading, Pa.—*Improvement in Horse Hay Rakes*.—Patent dated November 29, 1859.—In operating this machine, the draft is applied through the single tree H to the bar I, which is now thrown back and retained in the position shown in the engravings by the catch *m* on the foot lever K, and the machine is drawn forward until a sufficient quantity of grass is collected thereon, when the driver presses his foot upon the lever K, releasing the catch *m* from the notch in the bar I, when said bar is drawn forward and acts through the link I<sup>2</sup> upon arm M of the rake head N, causing the rake head

partially to revolve, thereby throwing up the rake teeth, and thus clear the grass from the teeth of the rake.

*Claim.*—The combination of the rock shafts N and O, clearers P, teeth *c*, brace guides L, spring bar F, pins *e* and *f*, springs *d* and *g*, with the draft bar I, when the several parts are arranged and operated in the manner and for the purpose described.

No. 26,295.—CHARLES W. RICHTER, of Madison, Ga.—*Improvement in Lamps.*—Patent dated November 29, 1859.—This invention consists of a novel means employed for adjusting or raising and lowering the wick within the wick tube, so that the wick is allowed to remain loose and free from pressure within the tube, thereby favoring the capillary ascent of the viscid oil, and ensuring a proper supply of the same to the flame.

*Claim.*—The employment or use of the wick adjuster, formed of the bar *f*, provided with a toothed plate *r* at its inner end, and so arranged as to have a certain degree of longitudinal adjustment in relation with the wick *u*, for the purpose set forth.

No. 26,296.—WILLIAM SALISBURY, of Wheeling, Va.—*Improved Catch Bolt.*—Patent dated November 29, 1859.—This invention consists in attaching to an ordinary catch bolt, a lever arranged and applied so as to avoid the friction and consequent wear usually attending the operation of bolts.

*Claim.*—The employment or use of the lever C, combined and arranged with the catch bolt B, to operate substantially as and for the purpose set forth.

No. 26,297.—HENRY SANDERS, of Utica, N. Y.—*Improvement in Cultivator Teeth.*—Patent dated November 29, 1859.—This improvement consists of two pieces of metal, exclusive of the bolt, the tooth being formed of sheet steel, or iron with flanches on the upper end of it next to the frame; the other piece is made of cast-iron, with flanches on it corresponding with the flanches on the tooth, for the purpose of securing the tooth firmly to the cultivator frame, by means of a bolt passing through it and the frame.

*Claim.*—The flanches *a a*, and semi-circular projection B on the tooth, and the flanches *c c* and pin *e* on the chair, and arranged in relation to each other in the manner substantially as described and for the purposes set forth.

No. 26,298.—SAMUEL SMITH, of Philadelphia, Pa.—*Improvement in Cooking Stoves.*—Patent dated November 29, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the grate G, having hollow bars communicating with each other, and arranged in respect to the hollow back L and its zigzag passages, as set forth, for the purpose specified.

Second. The plates *r* and *s*, and the grate G, when arranged as specified, so as to serve the double purpose of connecting the bars of the grate together, and forming a chamber for heating the air, preparatory to the same being discharged in jets into the front of the fire.

No. 26,299.—JAMES SPEERS, of West Manchester, Pa.—*Improved Water Heater for Steam Engines.*—Patent dated November 29, 1859.—This invention consists in furnishing the water heaters of steam engines, which supply the force pump with heated water, with a self regulating waste valve, and also in dividing the heater into two compartments, and so arranging the pipe which conveys the water to the force pump that it will receive from the top, or near the top, of the water in the heater.

The inventor says: I *claim*, first, the arrangement of the float *h*, lever *f*, valve *o*, partition *k*, and pipes *b c* and *x*, when arranged substantially as described, for the purpose of constructing water heaters for supplying the force pump of steam engines with heated water.

Second. The use of the branch pipe *x*, when used in connection with pipe *c* and valve *o*, as described and for the purpose set forth.

No. 26,300.—HENRY STEINWAY, JR., of New York, N. Y.—*Improvement in Piano Fortes.*—Patent dated November 29, 1859.—This invention consists in providing the cast iron plate with a projection on its under side to lap over the edge of and abut against the tuning block, and screwing the agraffs down from the upper surface of the said plate into the said projection.

*Claim.*—The employment, in combination with the agraffs C C, of the projection *a* on the under side of the plate, lapping over and abutting against the edge of the tuning block, substantially as described and for the purpose specified.

No. 26,301.—DAVID STODDART, of San Francisco, Cal.—*Improvement in Valve Gear for Steam Engines.*—Patent dated November 29, 1859.—The purpose of this invention is the usual office of a steam engine cut off to open the steam valve at the commencement of a stroke, and afterwards close it again at some required period of the stroke, and thus permit the steam to work expansively.

*Claim.*—The use of the fixed cam A, in combination with the adjustable cam B and the working bar E, which is connected to the cam rod, and also connected to and operated by the cam yokes, substantially in the manner described.

No. 26,302.—J. E. STURDY, of Augusta, Me.—*Improvement in Shingle Machines*.—Patent dated November 29, 1859.—The object of this invention is to plane the face and side of shingles as they are sawed from the bolt, without any additional aid or attendance in the manipulation of the machine to which the invention is applied.

*Claim*.—The employment or use, in connection with the shingle sawing machine described, of the guides I I attached to the bolt carriage E, and actuated alternately to perform their proper function to the planer L, the whole being arranged substantially as and for the purpose set forth.

No. 26,303.—JOSEPH R. SWIFT, of New Orleans, La.—*Improvement in Railroad Car Couplings*.—Patent dated November 29, 1859.—The inventor says: This invention provides sufficient leverage in the hook itself, whereby the cars can be uncoupled while in motion, or exerting longitudinal strain upon the links, by an upward pull of the train hand, and thus the power of the train hand obtained, instead of only his weight, as in the lever links which are operated by a downward thrust.

*Claim*.—The combination of the peculiarly constructed draw head A B *f a g b c*, with the peculiarly constructed elbow shaped gravitating lever hook C *m n*, in the manner and for the purpose described.

No. 26,304.—J. B. THOMPSON, of Philadelphia, Pa.—*Improvement in Metal Strings for Pianos, &c.*—Patent dated November 29, 1859.—The claim explains the nature of this invention.

*Claim*.—The employment for the strings of piano fortes and other musical instruments of hardened and tempered steel wire, as described.

No. 26,305.—S. H. TIFT, of Morrisville, Vt.—*Improvement in Apparatus for Elevating Water*.—Patent dated November 29, 1859.—This invention consists in having over the well a wheel with flanges on each side, said flanges being notched at regular distances.

*Claim*.—The buckets B curved at the rear, as described, in combination with the trunnions T, band *b*, notched flanged wheel W, roller R, and frame F, constructed and operating substantially in the manner and for the purpose set forth.

No. 26,306.—GEORGE W. TOLHURST, of Liverpool, Ohio.—*Improved Composition for Making Soap*.—Patent dated November 29, 1859.—The claim explains the nature of this invention.

*Claim*.—A soap compound, when prepared of the ingredients proportioned in quantities hereafter mentioned, viz: five ounces of common bar soap, four ounces of sal-soda, half ounce of borax, half drachm of sugar, burned, and one teaspoonful of linseed oil; add as much rain water as to make a soap of suitable consistency; after it is boiled, it is ready for use.

No. 26,307.—ALFRED F. TOULMIR, of Ellicott's Mills, Md.—*Improvement in Railroad Car Brakes*.—Patent dated November 29, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I claim as my invention the mode described of simultaneously applying or putting down brakes by means of the brake cord E *c d*, the box spring W, the crank lever *k*, the trigger P, the cross piece *x*, the slide *l*, and the swivel bar *b*, with springs SS and SS, arranged as described.

I also claim the mode described of instantaneously freeing, relieving, or raising the brakes and of keeping them free when raised until the engineer, conductor, or brakeman shall desire to apply them, by means of the forward, or tractive, movement of the train in combination with the slide *l*, the cross piece *x*, and the trigger, with its shoulder P, arranged and operating as described.

No. 26,308.—JOHN G. TREADWELL, of Albany, N. Y.—*Improvement in Stoves*.—Patent dated November 29, 1859.—This invention consists in casting a ventilating flue immediately under and in contact with the bottom of the stove, which communicates at the rear of the stove with a vertical flue passing up through the smoke pipe and entering the chimney, thus creating an independent ventilating draft from the room.

*Claim*.—The arrangement of the stove A, flue B, door F, flue D, and smoke pipe C, when the flue B is secured to or made part of the underside or bottom of the stove, the several parts being connected and constructed substantially as and for the purpose specified.

No. 26,309.—HENRY GEORGE TYER, of Andover, Mass.—*Improved Composition for Soles and Heels of Shoes and Boots, Veneers, Packing, and other Purposes*.—Patent dated November 29, 1859.—The following are the proportions of this composition: Of leather scraps, eight pounds, old vulcanized India rubber, two pounds, raw gutta percha, two pounds.

*Claim*.—A composition made of vulcanized India rubber, leather, gutta percha, in the proportions and the manner set forth.

No. 26,310.—I. T. VANVIRK, of Frankfort, Pa., and WILLIAM M. FULTON, of Cranberry,

N. J.—*Improvement in Lamps*.—Patent dated November 29, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The spindle B, with its cog wheels D, the said spindle being confined to its place by and acted upon by a spring attached to the wick tube, and arranged in respect to the latter, as and for the purpose set forth.

No. 26,311.—D. S. WAGENER, of Penn Yan, N. Y.—*Improvement in Grain Separators*.—Patent dated November 29, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The case *i*, with flanges or divisions *t*, surrounding distributor or sheath *r*, for distributing the grain in a circular form within said case and separating the impurities from the grain at said point by means of a suction and blast fans, or by a suction and blast fan, operating as described and for the purposes set forth.

No. 26,312.—JOHN H. WELLS, of Brooklyn, N. Y.—*Improved Rocking Chair*—Patent dated November 29, 1859.—This invention consists in the arrangement of parts by which difficulties are obviated, and a favorable disposition of material to resist the strain imposed is secured.

*Claim*.—The arrangement described of legs 1 2 3 4, the hinge joint at 7 7 connecting the seat with the underwork, and the springs 8 and 9, substantially as and for the purpose set forth.

No. 26,313.—CALVIN D. WHEELER, of New York, N. Y.—*Improvement in Machines for Cleaning Animals*.—Patent dated November 29, 1859.—The nature and object of this invention consists in combining and arranging with a portable case a rotating comb, wheel, and brush, operated by proper mechanism, whereby the operator is enabled to comb and brush an animal at a single operation.

*Claim*.—Arranging and combing with a portable case or frame a rotating comb and brush, substantially as set forth and for the purpose specified.

No. 26,314.—C. W. WILLIAMS, of Port Jervis, N. Y.—*Improvement in Canal Locks*.—Patent dated November 29, 1859.—This invention consists in the peculiar mechanism employed for operating the upper wickets and gate, and also in a guard attachment applied to the upper gate.

The inventor says: I *claim*, first, the arrangement of the sliding shaft R, gearing S M P, sliding rack N, rods O *i i i*, wickets F, and gate E, applied to a canal lock, substantially as and for the purpose set forth.

Second. The employment or use of the guard strip I, applied to the gate E, and arranged substantially as and for the purpose set forth.

No. 26,315.—SETH WILMARTH, of Charlestown, Mass.—*Improved Machines for Drawing Bolts*.—Patent dated November 29, 1859.—The operation of this machine is as follows: On its being applied to a bolt, the jaws *f* are drawn back upon the inclined surface upon which they rest by the pipe or ram *h*, being at the same time forced apart or opened by the spring *g*; they are then ready to receive the bolt; the machine being placed, the jaws are made to gripe the bolt by being forced or driven upon it by the pipe or ram *h*, which is free to move the length of the slots in the handles marked *l*.

*Claim*.—The combination and arrangement of the several parts specified and illustrated, substantially as and for the purposes set forth.

No. 26,316.—WILLIAM WILMINGTON, of Toledo, Ohio.—*Improvement in Grain Separators*. Patent dated November 29, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of the endless belt D, the dividing board H, and the rotary reciprocating bars G, the belt being separated from the bars by means of the board H, and used for delivering the straw and unseparated grain to the bars at its turning point, substantially as and for the purpose specified.

Second. I claim the combination of the teeth on the underside and end of the bars, with the fingers or combs, for the purpose described.

No. 26,317.—MARTIN WINGER, of Lancaster county, Ohio.—*Improved Machine for Shaving Bark*.—Patent dated November 29, 1859.—There is between roller No. 1 and the conducting roller No. 2 a bearing pulley *h*, supported on the vertical shaft H to prevent the possibility of the bark from turning upwards as it passes through under the pressing roller No. 1 to the conducting roller No. 2, which latter presents it to the action of a series of knives V mounted, as shown by 3.

*Claim*.—The combination of the convex travelling bed O W, with the rotary knives V and pressure rollers 1, 2, 4, and *h*, in the manner and for the purpose set forth.

No. 26,318.—JOHN E. WOOTTEN, of Philadelphia, Pa.—*Improvement in Moving Locomotive Engines by Hand Power*.—Patent dated November 29, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The application of the hydraulic piston D to the purpose of propelling a locomotive engine or railroad car upon the track by its direct action upon the periphery of the wheel as described, combined with the peculiar arrangement of the plunger, by aid of atmospheric pressure and without the intervention of valves, in the manner and for the purpose substantially as set forth.

No. 26,319.—OSCAR M. ANDREWS, of Hecla Works, N. Y., assignor to A. K. SEYMOUR, of said Hecla Works.—*Improved Blind Fastener*.—Patent dated November 29, 1859.—The object of this invention is to fasten a blind or shutter, when the same is open, in such a manner that the fastening can be reached without putting the head and body out of the window; and it consists in arranging, on that side of the frame to which the shutter is hinged, a rotary cam of particular construction that catches into a hook formed by that part of the but hinge which is secured to the blind, or by a separate piece secured to the blind in any convenient place.

*Claim*.—Arranging on the side of the frame B of a shutter or blind A, rotary wedge shaped cam D, in combination with hook a.

No. 26,320.—GEORGE BRADLEY, of Paterson, N. J., assignor to JACOB S. ROGERS, of said Paterson.—*Improvement in Can Bottoms for Roving*.—Patent dated November 29, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—So mounting two or more ordinary can bottoms C C<sup>1</sup> that the filled can may be removed from under the coiler and an empty one substituted in its place by means simply of a partial revolution of the frame H, substantially as described.

No. 26,321.—JOHN P. BROADMEADOW, of Bridgeport, Conn., assignor to Himself and ALBERT EAMES, of said Bridgeport.—*Improvement in Moulding for Metal Casting*.—Patent dated November 29, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the combined use of a half flask, of a sufficient size to hold the quantity of loose sand required to form a half mould, and a follow board small enough to enter the said half flask and act as a piston to compress the sand therein when pressure is applied, substantially as set forth.

I also claim the combined use of a half flask, as described, and of a strike whose profile corresponds in form with the transverse section, or profile of the pattern, substantially as set forth.

I also claim the combined use of a half flask, as described, constituting the cope of a ribbed cope plate fitted to enter therein, and of sustaining pins in said cope, the whole substantially as set forth.

I also claim the combined use of the aforesaid cope plate, of a bottom plate fitted to enter the drag of the flask and of clamps, substantially as set forth.

I also claim combining the sprue pattern with the follow board, when this combination is used in connection with a match board having an opening to permit the descent of the lower end of the sprue pattern, substantially as set forth.

I also claim the combination of projections, or indentations, or both, with the follow board in contradistinction to constructing the flasks with projections and indentations.

No. 26,322.—ALMON COOLEY, of Hartford, Conn., assignor to E. W. SPERRY, J. H. ASHMEAD, E. HURLBERT, and HENRY E. ROBBINS, of said Hartford.—*Improvement for Holding Knife Handles for Soldering*.—Patent dated November 29, 1859.—This improvement consists in securing the handle and blade in their proper place and position, and holding them while the parts are soldered together, by the use of spring clamps, screw clamps, or their equivalents.

*Claim*.—The described device for holding knife blades, handles, &c., for soldering together, or their substantial equivalents the rod C, cap D, bar E, springs I, operating in the manner substantially as set forth for the purpose specified.

No. 26,323.—ALMON COOLEY, of Hartford, Conn., assignor to E. W. SPERRY, J. H. ASHMEAD, E. HURLBERT, and HENRY E. ROBBINS, of said Hartford.—*Improvement in Holding Knife Handles for Soldering*.—Patent dated November 29, 1859.—This invention consists in the use of yielding clamps to hold the two halves of a handle in the proper position for soldering; also in arranging yielding clamps upon a turn table, or its equivalent, so as to turn or accommodate to the blaze while the soldering is done.

The inventor says: I *claim* the described device for holding or securing handles, (formed of two parts,) &c., for soldering, or their substantial equivalents, the adjustable yielding clamps, or brackets G L, substantially in the manner for the purpose described.

The combination of the yielding clamps, or brackets G L, with a turn table D, or their substantial equivalents, substantially in the manner as and for the purpose described.

No. 26,324.—THOMAS HARVEY, of Wooster, Ohio, assignor to Himself and DAVID KRAMER, of said Wooster.—*Improved Washing Machine*.—Patent dated November 29, 1859.—The nature of this invention consists in the arrangement of parts whereby the operator is enabled to move two vertical plates up and down two inclined planes in such a manner that they will still remain in a vertical position.

*Claim*.—The combination of the two vertical movable plates L L<sup>1</sup> with the inclined planes D D<sup>1</sup>, and the fixed perforated corrugated partition N, the whole constructed, combined, arranged, and operated as described and for the purposes set forth.

No. 26,325.—WHEELER HEDGES, of Chicago, Ill., assignor to Himself and P. W. GATES, of said Chicago.—*Improvement in Pans for Evaporating Sugar Juice*.—Patent dated November 29, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of the pipes E E with the pipe F in the pan B, so that the application of the steam to the pipes E E will cause the greatest ebullition, and the foam to raise highest longitudinally in the middle of the pan B, for the purpose of causing all impurities to be deposited upon the flaring sides P P of the pan B.

Second. The construction and application of the flaring sides, or beaches P and P, that by their great obliqueness obtain all the scum thrown upon them, substantially as specified.

Third. The construction and application of the defecator D, in combination with the evaporator, substantially as specified and for the purpose set forth.

Fourth. The stop boards Q Q, in combination with the evaporator, as described, and for the purpose set forth.

No. 26,326.—MATTHEW HODKINSON, of Pittsburg, Pa., assignor to MATTHEW HODKINSON, Jr., of said Pittsburg.—*Improvement in Retorts for Distilling Coal Oil*.—Patent dated November 29, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The stationary retort with a shaft armed with knives whose edges are at right angles with the shaft passing through it, by which, when motion is given to the shaft, the coal is broken and pulverized more effectually than by any other method.

No. 26,327.—FRANCIS J. LA FORME, of Boston, Mass.—*Improvement in Nursing Bottles*. Patent dated November 29, 1859.—This invention consists in applying within, or to the mouth or neck of, a nurse bottle, a flexible tube, whereby the nutriment contained in such bottle can not only be drawn out of the same with equal facility, in whatever position the bottle may be placed, but the child prevented from inhaling air therefrom. The tube has an enlargement at each end.

*Claim*.—An improved nurse bottle, or one having an elastic tube constructed and applied thereto, in manner and for the purpose set forth.

No. 26,328.—DANIEL PENMAN and ELISHA FITZGERALD, of New York, N. Y., assignors to WILLIAM C. WALKER and M. PENMAN, of said New York.—*Improved Machine for the Manufacture of Ruches*.—Patent dated November 29, 1859.—This improved machine is used or forming and making ruches used in millinery

*Claim*.—The pressing bar A, attached to the shaft L by the arms M, (said shaft having a crank B at its end, for the purposes described,) in combination with the adjustable gauge bar I, hook rods D, and treadles H, the whole being constructed and operated substantially in the manner and for the purposes set forth.

No. 26,329.—NEWMAN SILVERTHORN, of Prescott, Wis., assignor to JAMES M. ALLEN, of Fredericktown, Ohio.—*Improved Boot and Shoe Tip*.—Patent dated November 29, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—As a new article of manufacture, a boot or shoe tip A, made of any of the known preparations of India rubber or gutta percha, and to be applied to the boot or shoe in the manner substantially as described.

No. 26,330.—G. M. ATHERTON, of Friendsville, Ill.—*Improvement in Hub Boring and Mortising Machines*.—Patent dated December 6, 1859.—This invention consists in arranging upon the inside of one of the standards, two spring rods, one on each side of the reciprocating gate, to which rods are pivoted two pawls, which may be made to engage alternately with suitable racks upon the carriage, by a lever working in a guide, so as to move the carriage simultaneously with the upward movement of the reciprocating gate for carrying the mortising chisel.

*Claim*.—The arrangement of the pawls S S<sup>1</sup>, with spring rods P P<sup>1</sup>, and arms V V, projecting from the reciprocating gate L, for operating the same, in combination with lever M, for relieving either one or both pawls from racks T T<sup>1</sup>, the whole being arranged and combined for the purpose of moving the carriage, with the hub up, to the mortising tool, as set forth.

No. 26,331.—WILSON AGER, of Rohrsburgh, Pa., assignor to THOMAS J. WOLF and P.

J. JORDAN, of Philadelphia, Pa.—*Improvement in Machines for Cleaning Rice.*—Patent dated December 6, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, giving the grain a positive outward motion from under the pressing wings by the clearer *k*, or its equivalent, situated and operating substantially as set forth.

Second. The adjustable leaves *l*, upon the wings, for aiding the upward movement of the grain.

No. 26,332.—C. P. BUCKINGHAM, of Mount Vernon, Ohio.—*Improvement in Grinding Mills.*—Patent dated December 6, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the improved method of securing the spindle to the runner stone of a grinding mill, by combining the flanch *m*, at the end of the spindle *I*, and the ring *N*, attached to the metal cap *O* of the runner *C*, said ring being provided with projections *n*, which shall permit a rocking motion of the stone upon the spindle, and a key *p*, or its equivalent, substantially as and for the purposes set forth.

Second. The use, in connection with the bed stone *B*, of the elastic bars *h*, for the purpose specified.

No. 26,333.—P. N. BURKE, of Buffalo, N. Y.—*Improvement in Steam Boilers.*—Patent dated December 6, 1859.—This invention consists in a novel arrangement of direct or return flues within the body of a boiler, for the purpose of effecting economy of fuel, the rapid generating of steam after firing up, and the perfect circulation of water in contact with the heating surfaces of the flues and of the shell. It also consists in a certain system of draft distributors employed in combination with such arrangement of flues for the purpose of producing an equable diffusion of heat over the whole surface of the flues.

*Claim.*—The employment, in combination with flues arranged substantially as described, of draft distributors *E E*, applied and furnished with apertures of varying size, substantially as specified.

No. 26,334.—B. F. CAMPBELL, of Roxbury, Mass.—*Improvement in Steam Boilers.*—Patent dated December 6, 1859.—The object of this invention is to obtain a boiler for the generation of steam under a low pressure, to be used for heating purposes, that shall present a great amount of heating surface in a small space, and that shall not be liable to be injured should the water within it, through the negligence of those having it in charge, fall below the proper level.

*Claim.*—The combination of the exterior water chamber *A* and interior water chamber *B*, the interposed smoke flue *C*, and the basin *F*, the whole arranged to operate substantially as and for the purposes set forth.

No. 26,335.—C. CARTER, of Franklin, Iowa.—*Improved Washing Machine.*—Patent dated December 6, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the inclined washboard *C*, fitted between ways and guides *b b*, which have a sliding or reciprocating rubber frame *F* fitted on them by being hinged to slides *D D*, the above parts being fitted within a suitable box or suds receptacle *A*, and arranged to operate as and for the purpose set forth.

I further claim the arrangement of the rubbers *G H* filled within the hinged reciprocating frame *F*, and used in connection with the inclined washboard *C*, for the purpose specified.

No. 26,336.—EDWIN CLARK, of Windsor, Vt.—*Improvement in Sewing Machines.*—Patent dated December 6, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The combination of bar *G*, which has its front end or needle *a* controlled by a double fulcrum guide *d*, so as to describe an ellipse, and its rear end attached to a rotating disk, or crank pin, with a perforating needle *n*, as shown and described.

No. 26,337.—JOHN W. COCHRAN, of New York, N. Y.—*Improvement in Projectiles for Rifled Ordnance.*—Patent dated December 6, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* fitting a projectile with a hollow case, jacket, or band containing gunpowder or other explosive material, which, when ignited by the firing of the charge of the gun will, by its explosion, cause the said case, jacket, or band to be expanded toward the bore of the gun, and to be compressed around the projectile, substantially as and for the purpose set forth.

And in combination with an expanding case, jacket, or band, applied to a projectile, I claim the use of an outer covering of wire cloth to constitute a packing, substantially as and for the purpose specified.

No. 26,338.—WILLIAM COGSWELL and IRA COGSWELL, Jr., of Ottawa, Ill.—*Improvement in*

*Harvesters.*—Patent dated December 6, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The combination of the shifting pinion I with the eccentric axle D and adjusting frame E, substantially as shown, so that by turning the said axle the pinion I will be thrown into gear with either of the concentric wheels C H, or out of gear with both as desired, and so that the height of the main frame may be readily adjusted to correspond with the adjustment given the axle D and pinion I, as set forth.

No. 26,339.—JAMES P. COLLINS, of Troy, N. Y.—*Improved Water Wheels.*—Patent dated December 6, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of the lighter plate L, in the particular manner specified and for the purpose set forth.

Second. The arrangement, in the particular manner specified, of the packing ring *i*, for the purpose set forth.

Third. The arrangement, in the particular manner specified, of the lip or projecting piece *e* of the buckets, for the purpose set forth.

Fourth. The arrangement, in the particular manner specified, of the regulating plate J, in combination with the peculiar specified device for operating it, for the purpose set forth.

Fifth. The employment or use of the dividing strip, or annular ring inserted in the buckets, substantially as and for the purpose set forth.

Sixth. The employment, for united use, in one wheel of the lighter plate B, packing ring *i*, projecting lips or flanches *e*, gauge or regulating plate J, and annular dividing plate A, the whole being constructed, arranged, and operating in the manner and for the purpose set forth.

No. 26,340.—JOHN COOPER, of Mount Vernon, Ohio.—*Improvement in Oiling Boxes for Vertical Sugar Mills.*—Patent dated December 6, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The concentric cups H and I upon the upper sides of the heads C C<sup>1</sup>, the same being furnished with the openings *e* and *o* for the conveyance of the oil from the upper box to the stationary cup J, which surrounds the shaft upon the lower bed plate K in combination with the cups J, substantially as described for the purpose set forth.

No. 26,341.—THOMAS P. COSTELLO, of Buffalo, N. Y.—*Improvement in Skate Fastenings.*—Patent dated December 6, 1859.—This invention consists in the attachment of the blade, or runner, of a skate to a boot made for the purpose, without the aid of exterior straps or ligaments to bind the boot and runner together.

*Claim.*—A boot, with sockets therein, as described, and upright bolts welded to a steel blade, or skate runner, both being made and arranged as shown and described, and attached to each other, for the purpose specified.

No. 26,342.—E. G. CUSHING, of Dryden, N. Y.—*Improvement in Horizontal Water Wheels.*—Patent dated December 6, 1859.—A represents two rims which are connected by arms to a vertical shaft B. The rims are encompassed by a spiral scroll C applied to the rims in the usual way. Between the rims the buckets D are placed.

*Claim.*—The combination of the tubes *b* with the bolts *c* and buckets D, the whole being constructed and arranged as and for the purpose shown and described.

No. 26,343.—G. W. R. BAYLEY, of Brashear, La.—*Improvement in Hook Headed Spikes.*—Patent dated December 6, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The improved railroad spike, having the sides and front of its head beveled downwards and inwards, but convex, and having the peculiar projecting lip or hook behind, for facilitating its easy withdrawal, as a new article of manufacture.

No. 26,344.—CHARLES G. BURKE, of Utica, N. Y.—*Improvement in Melodeons.*—Patent dated December 6, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* fitting a melodeon or other reed instrument of the same class, with a series of swell valves D, so applied as to be capable of being operated by the keys, in playing, substantially as described, for the purpose of giving expression to any note, independently of the proceeding or succeeding ones or of the other notes of a chord.

And I also claim the employment of a stop H, applied and operating substantially as described, in combination with the keys and the swell valves, for the purpose set forth.

No. 26,345.—JACOB DICKERSON, of Sacramento, Cal.—*Improvement in Wind Mills.*—Patent dated December 6, 1859.—This invention relates to that class of wind mills which have their sails regulated by the centrifugal force resulting from the revolution of the wheel. This improvement is intended to lessen the cost of construction and bring the different parts more compactly together.

*Claim.*—The arrangement of the curved iron sections E<sup>1</sup>, sails B, arms D, slides E, hollow

drum I, scroll spring H, flexible connecting rods J, and links G, in the manner and for the purpose described.

No. 26,346.—CHARLES W. DICKINSON, of Newark, N. J.—*Improvement in Sewing Machines*.—Patent dated December 6, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The construction of a pendently swinging, gravitating self adjusting pressure pad or stripper X X, formed with an adjustable slotted end X<sup>2</sup>, suspended on an adjusting pin or stud B<sup>3</sup>, the said pad having no feed pressure spring, but substantially as described, set forth, and shown.

No. 26,347.—JEPHTHA DYSON, of Fulton, S. C.—*Improvement in Carding Engines*.—Patent dated December 6, 1859.—This invention relates to certain improvements in feeding and forwarding the cotton from the lap to the main cylinder in carding engines, and differs essentially from all others for the same purpose where feed rollers and lickens are employed, by dispensing with the use of both, and substituting in lieu thereof a small cylinder clothed with strong coarse card teeth, adapted to the end in view, as a regulator for the uniform delivery of the lap, and as a worker to the feeder.

The inventor says: I *claim*, first, the combination and arrangement of the feed regulating and working cylinder *a*, feeder A, worker *c*, and clearer *b*, substantially in the manner and for the purpose described.

Second. The combination and arrangement of the feeder A, worker B, cleaning and delivering cylinder C, and main cylinder D, substantially as and for the purpose described.

Third. The combination and arrangement of the feed regulating and working cylinder *a*, feeder A, worker *c*, clearer *b*, worker B, clearing and delivering cylinder C, and main cylinder D, substantially in the manner and for the purpose set forth.

Fourth. The combination, with the features included in the third claim of the stripper E, substantially in the manner and for the purposes set forth.

No. 26,348.—A. B. FURBEE, of Dresden, Ohio.—*Improvement in Corn Cribs*.—Patent dated December 6, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the arrangement of the inclined flooring C, with the trunks or boxes D, substantially as and for the purpose set forth.

I also claim covering the posts A of the crib, with sheet metal *d*, when said posts are used in connection with a crib provided with an inclined flooring C, and trunks or boxes D, as and for the purpose specified.

No. 26,349.—JACKSON GORHAM, of Bairdstown, Ga.—*Improvement in Ploughs*.—Patent dated December 6, 1859.—This invention consists in a peculiar manner of constructing a plough for the purpose of making it strong, light, durable, and cheap.

*Claim*.—The arrangement of the vertical curved standard B, shovel C, curved handle straps D, hooked inclined brace E, and adjustable beam A, as shown and described.

No. 26,350.—CALEB H. GRIFFIN, of Lynn, Mass., assignor to JOHN WILLIAMS, assignor to WALTER D. RICHARDS, of said Lynn.—*Improvement in Machinery for Cutting Leather into Soles for Boots and Shoes*.—Patent dated December 6, 1859; antedated June 6, 1859.—This improvement relates more particularly to the operation of the knife, and it consists in communicating to it a vibrating motion in the arc of a circle, or in a curve approximating thereto. It further consists in combining with the knife certain devices by means of which, though vibrating in the arc of a circle, it is still made to enter or cut out the leather at right angles to the plane of the latter, as fed up to be cut into soles.

The inventor says: I *claim*, first, vibrating the knife or knives L, in the arc of a circle or a curve approximating thereto, in the manner substantially as set forth.

Second. I claim the arm M, stud *n*, and slot N, or their equivalents, as combined with the knife or knives L, for the purpose substantially as described.

No. 26,351.—DANIEL M. HALL, of Bridgeport, Conn.—*Improvement in Railroad Car Blinds*.—Patent dated December 6, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The use of the flexible blind C, arranged with the rollers *ll*, fitted within the curved grooves *e e*, and applied to a window of the car, or other wheel vehicle, so that it may be raised above the sash B, and drawn within the roof of the vehicle, substantially as described.

No. 26,352.—ALEXANDER HAY, of Philadelphia, Pa.—*Improvement in the Bearings for Railroad and other Machinery*.—Patent dated December 6, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—Imbedding the bearings of journals or surrounding the same with India rubber or

other suitable elastic material, so as to cause them to yield in every direction when subjected to strains and thrusts, and readjust themselves upon the pressure being removed, substantially as described.

No. 26,353.—GEORGE G. HENRY, of Mobile, Ala.—*Improvement in Drying Wet Seed Cotton*.—Patent dated December 6, 1859.—The inventor says: In this invention I construct a house or closet of any suitable material and size, with three sides tightly closed (with the exception of small holes near the roof for the escape of the vapor produced by the evaporation of the moisture contained in the cotton) and the fourth capable of being closed. Within this closet there is a series of drawers or shelves, upon which the wet seed cotton is to be placed; these drawers are arranged in such a manner that they can readily be slid in and out to facilitate the deposition and removal of the cotton. By means of pipes or flues the room is heated to a sufficient degree to dry the cotton as rapidly as may be necessary.

*Claim*.—The application of artificial heat for the purpose of drying wet seed cotton by means of mechanism, substantially as described.

No. 26,354.—JOHN HERALD and C. B. TOMPKINS, of Trumansburg, N. Y.—*Improvement in Pitchforks*.—Patent dated December 6, 1859.—This invention relates to that class of pitch or hay forks that are operated by a horse and attendant. Its object is to render the fork more durable than usual, and at the same time reduce the cost of construction.

*Claim*.—The arrangement of the hollow head A, tines B passing through the head socket b, handle C, screw D, plugs c, and screw tongs d, as and for the purpose shown and described.

No. 26,355.—F. E. HINCKLEY, of Galesburgh, Ill.—*Improvement in Mole Ploughs*.—Patent dated December 6, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of the clearer or hanging coulter F and the rotating coulter G, constructed and arranged as described for conjoint operation.

Second. I claim constructing the sword M of a mole plough with a hole or bore N through it, of sufficient size and suitable shape to admit at the same time a rod of metal large enough to raise and lower the point of the mole, and also to admit the air to pass free into the drain through the sword and mole, as described.

Third. I claim expanding and contracting the mole of a mole plough, substantially as and for the purpose described, or by any other mechanical means.

Fourth. I claim constructing the mole of a mole plough in sections consisting of two sides and a top, hinged to a head block and operated by a wedge, as described.

Fifth. I claim two revolving cutters, with plain outsides and conoidal insides, which may be placed upon a common axle and adjusted to the beam in such a manner as to be forced to cut into the ground and press the earth laterally into the sword cut and firmly close it up, substantially as described.

No. 26,356.—TRUMAN J. HOMER, of St. Louis, Mo.—*Improved Portable Collection Box*.—Patent dated December 6, 1859.—The object of this invention is the construction of a portable box to receive money, which, when deposited therein, will be secure from abstraction.

The inventor says: I *claim* the whole box as original, as a portable collection box, in the peculiar arrangement of its component parts of glass, wood, and metal.

I particularly claim the money inlet l as original, it being in the shape of a box without a bottom, through the top of which is inserted a narrow flat tube, and between it and the sides of the box are two ranges of disks, which disks close the aperture of the tube when the box is inverted.

No. 26,357.—SHELDON A. HOTCHKISS, of New Haven, Conn.—*Improvement in Machines for Raising Weights*.—Patent dated December 6, 1859.—This invention consists in gearing a drum to an upright shaft, with a screw cut on the surface of the shaft, and connecting the drum by means of a hook to a lever, so that by means of the drum and lever operating together increased power and facilities are obtained for raising weights, and by means of a knee, which is attached to the shaft above the screw and near the lower end of the outer angle of which a sheave is attached, over which the rope is made to pass, and by the use of the screw the drum rises as it revolves, and by the aid of a zone which surrounds the drum and is attached to the knee, adjusts the coil of the rope which is attached to the weight.

*Claim*.—The zone J and the screw drum, pawl hook, knee, and sheave, in combination, substantially as and for the purposes set forth.

No. 26,358.—E. E. MARCY, of New York, N. Y.—*Improvement in India Rubber Fabrics*.—Patent dated December 6, 1859.—The claim explains the nature of this invention.

*Claim*.—The improved India rubber fabric made by the combination of India rubber with hypo-sulphite of zinc, and by the exposure of the said compound to steam or water at the temperature stated, substantially as described, without any admixture of free sulphur.

No. 26,359.—E. E. MARCY, of New York, N. Y.—*Improvement in India Rubber Fabrics.*—Patent dated December 6, 1859.—The claim explains the nature of this invention.

*Claim.*—The improved India rubber fabric made by the combination of India rubber with sulphuret of lead and carbonate of lead, or the protoxide of lead, and by the exposure of said compound to steam or water at the temperature stated, substantially as described, without any admixture of free sulphur.

No. 26,360.—E. E. MARCY, of New York, N. Y.—*Improvement in India Rubber Fabrics.*—Patent dated December 6, 1859.—The claim explains the nature of this invention.

*Claim.*—The improved India rubber fabric made by the combination of India rubber with the sulphuret of zinc and hypo-sulphite of zinc, and by the exposure of said compound to steam or water at the temperature stated, substantially as described, without any admixture of free sulphur.

No. 26,361.—EMANUEL MARQUIS, of Bloomington, Ind.—*Improved Apparatus for Setting and Copying Music for the Blind.*—Patent dated December 6, 1859.—This invention consists of a tablet A, provided with raised staves B B and raised sockets *b b b*, placed at equal distances between, above, and below the lines of the staves, in combination with detached solid notes *c c c*, rests *d d d*, and other signs of musical notation *e e e*, which, by means of a peg or pivot attached to each, may be inserted into the sockets of the table in such a manner as to represent a musical composition sensible to the touch of the blind.

*Claim.*—The tablet A, or its equivalent, with raised staves and sockets, in combination with detached solid notes and other signs of musical notation, or their equivalents, capable of being transposed on and fixed in the tablet, substantially as and for the purpose described.

No. 26,362.—SAMUEL W. MARSH, of Washington, D. C.—*Improvement in Breech Loading Fire-Arms.*—Patent dated December 6, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The construction and application of a detachable headed breech pin *h h I J K* (Fig. 6) with a split female expanding ring or collar L (Fig. 7) and a non-expanding male collar or ring M (Fig. 8) and a detachable adjusting screw head O, (Fig. 9,) forming a compound expanding detachable headed breech pin, as shown complete at *h h L O*, (Fig. 4,) substantially as described and set forth.

No. 26,363.—EDWIN MAY, of Indianapolis, Ind.—*Improved Apparatus for Sanding Painted Surfaces.*—Patent dated December 6, 1859.—This invention consists in the forcing of sand on a painted surface by means of a current of air from the air chamber A, which is produced by the fans F on the revolving shaft I; said sand being supplied by the tube N or hopper C, in the line of the current of air, after it is produced by the fans F and while it is discharged from the chamber, through the conductor B, upon the painted or cemented surface.

*Claim.*—The combination and arrangement of the blast fan F, in cylinder A, conductor B, adjustable mouth piece D, with the elastic tube N, or its equivalent, when constructed and arranged substantially as set forth.

No. 26,364.—EDWARD MAYNARD, of Washington, D. C.—*Improvement in Breech Loading Fire-Arms.*—Patent dated December 6, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the peculiar manner of connecting the barrel to the breech piece, viz: the hook *e*, on the underside of the barrel, taking hold of the pin *f* or the equivalent thereof, at the front end of the breech piece, while the link C, the lever D, and the joint pins of said link and lever are arranged in such a manner, with relation to the slot in the breech piece and the ears on the underside of the but of the barrel, as to form a treble jointed and compound leverage connection between the breech piece and the but of the barrel, of such a character that the barrel can be instantly thrown from a firing position to a loading position, and *vice versa*; and also of such character that the barrel can be easily and quickly detached from the breech piece or be securely united thereto, substantially in the manner set forth.

Second. I also claim the combination of the metallic block *b*, the screw *c*, and the screw *a*, with each other and with the front portion of the breech piece, in such a manner, with relation to the shoulder *d* on the underside of the barrel, that the joint between the but of the barrel and the abutment of the breech piece can be tightened or loosened, substantially in the manner set forth.

Third. I also claim retaining the pivot pin *w*, in its position within the breech piece by means of the overlapping head of the screw *a*<sup>1</sup>; but this I only claim when the longitudinal groove *z*, in one side of a portion of the length of said pivot pin, is so located that when the pin is turned to the position shown in Fig. 12, or any other previously determined position, it may be drawn out far enough (and only far enough) to detach the said pin from its hold upon the lever D, and thereby allow the barrel to be separated from the breech piece substantially in the manner set forth.

Fourth. When the pivot pin  $w$  is retained in its position within the breech piece by the overlapping head of the screw  $a^1$ , in such a manner that it can be loosened by partially turning the same upon its axis, I also claim the arm  $b^1$ , upon the outer end of said pin which enables it to be readily turned upon its axis, and partially withdrawn from its place without any mechanical assistance, substantially as set forth.

Fifth. When the barrel is connected to the breech piece in the within described manner, I also claim the producing of a tight joint between the but of the barrel and the abutment of the breech piece by combining therewith a flange bottomed metallic cup, substantially as set forth.

Sixth. I also claim giving the opposite faces  $r r$  of the but of the barrel such a shape that the flange bottomed metallic cup  $v$  can be easily taken hold of by the thumb and finger of the free hand of the user when the barrel is thrown into the loading position, substantially as set forth.

No. 26,365.—G. W. MITCHELL, of Jackson, Tenn.—*Improvement in the Mode of Operating Car Brakes*.—Patent dated December 6, 1859.—This invention consists of a pair of beveled wheels, of which the smaller one is placed on a horizontal shaft A, driven by the crank B; the large beveled wheel C is placed on a perpendicular shaft D, and is driven by the small beveled wheel E.

The inventor says: I claim the flanged or ratchet wheel and its hooked pawl, as described and shown at F G.

I also claim the spring platform and the pin attached and stop pin I, as described and for the purpose set forth.

No. 26,366.—GEORGE W. MITCHELL, of Jackson, Tenn.—*Improvement in Sewing Machines*.—Patent dated December 6, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I claim, first, the combination of the crank I, on the driving shaft, the slotted arm H, forming a portion of the same lever with the needle arm, and so extended as to operate the lever  $F^1$ , and the lever  $E^1$ , carrying the shuttle or looper, the whole arranged and operating, substantially as described, to drive the needle and shuttle.

Second. The vertically and horizontally elastic arm L, having the presser attached, and constructed and applied substantially as described, so as to be operated upon by an appendage of the needle to feed the material, substantially as set forth.

Third. The polygonal collar M, fitted to turn upon the needle arm, so that any one of its sides may be presented to act upon the presser arm for the purpose of feeding the cloth more or less, according to the wish of the operator, as set forth.

No. 26,367.—RICHARD MONTGOMERY, of New York, N. Y.—*Improvement in Iron Ships*.—Patent dated December 6, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I claim, first, forming the supports or frame to which the side covering E is attached, of iron or other metal corrugated, in the form and for the purposes substantially as described.

Second. I claim the combination and arrangement of the corrugated cross beams B and corrugated bottom supports A, with the iron divisions D, substantially as and for the purpose set forth.

No. 26,368.—OSCAR F. MORRILL, of Boston, Mass.—*Improvement in Broiling Apparatus*.—Patent dated December 6, 1859.—The claim and engravings explain the nature of this invention.

Claim.—The improved steak broiler, as made with the deflector in its grid or grating, a flame and heat passage under the deflector, and, with the gravy trough, to surround or encompass the heat passage, as specified.

No. 26,369.—JOHN KNICKERBACKER, of Stockport, N. Y.—*Improvement in Clutches for Pulley Couplings*.—Patent dated December 6, 1859.—This invention is designed to actuate and stop machinery at pleasure, without jar or concussion, thereby preventing the wear and tear consequent upon all abrupt checks of their motions. It consists in providing the disk of the movable pulley E, with three or more vibratory lever blocks suspended in radiating slots, extending from the hub to the rim through the said disk, and having attached to their extremities friction clutches or impellers in the form of arcs, corresponding in curvature with the inner surface of the periphery, or band of the fixed pulley F.

Claim.—Suspending the clutches or impellers A A A in radial slots in the disk of the movable pulley E, so as to allow them to vibrate, substantially in the manner and for the purpose set forth.

No. 26,370.—N. W. LANGLEY, of East Cambridge, Mass., and HENRY S. JONES and AARON S. DRAKE, of Stoughton, Mass.—*Improved Mode of Securing Photographs, &c., to*

*Tombstones.*—Patent dated December 6, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—Securing daguerreotypes, photographs, &c., upon tombstones, by inclosing them in a glass case, the opening to which is closed by a glass stopper, and affixing the same to the stone.

No. 26,371.—THOMAS J. LINTON, of Providence, R. I.—*Improvement in Mounting Precious Stones.*—Patent dated December 6, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The improvement in making mountings for precious stones and other articles of jewelry, which are to be mounted by forming the border setting and beveled edge from a single sheet of metal at one operation, by the use of a die, in the manner described, the mountings being in an oval, round, square, or other form, as the article to be mounted may require.

No. 26,372.—CHARLES A. LOWBER, of Medina, N. Y.—*Improvement in Cotton Seed Hoppers.*—Patent dated December 6, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* making the runner with the surface next to the shaft smooth, to receive the cotton seeds from a suitable hopper and cause them to be properly distributed thereon and to be carried towards the periphery, and with that part, or the surface within the periphery and outside of the smooth part, armed with teeth in the form of long cutting edges, having continuous channels or furrows between them of sufficient size to receive a cotton seed and permit it to pass and roll therein, substantially as described, in combination with an upper plate surrounding the eye or aperture for the passage of the cotton seeds to the smooth part of the surface of the runner, the under surface of the said plate being parallel with the surface of the runner, and armed with a rim of teeth in the form of long cutting edges, and formed with interposed channels or furrows similar to those of the runner, but of reversed inclination, substantially as and for the purpose specified.

I also claim making the said teeth of long cutting edges, and surrounding the smooth surface of the runner of varying lengths, as described, that is, having some of them approaching the shaft nearer than others, that the seeds, while travelling outward on the smooth surface of the runner may arrange themselves and properly enter the furrows or channels one by one, as described.

And I also claim surrounding the periphery of the runner and upper plate with a trough which extends within the periphery of the runner, leaving an open space or air passage between, substantially as described, in combination with the vanes, or equivalent means, for blowing in a current of air, substantially as and for the purposes specified.

No. 26,373.—WASHINGTON A. PEASLEE and JOHN O. D. LILLEY, of Indianapolis, Ind.—*Improvement in Spark Arresters and Chimneys of Locomotive Engines.*—Patent dated December 6, 1859.—This invention consists in providing a perforated spark and smoke cone within the chimney stack proper, and forcing or drawing all the products of combustion through the perforation by a centrifugal action given to said products by means of a continuous current of exhaust steam passed up along the outside of the perforated cone, and between it and the inside of the chimney.

*Claim.*—The construction of a chimney or spark arrester by the combination and arrangement of the various parts, substantially as they are described in the foregoing specification and for the purposes mentioned.

No. 26,374.—NATHAN PUCKETT, of Deming, Ind.—*Improved Boiler Feeding Apparatus.*—Patent dated December 6, 1859.—The valve E is provided with the usual gibs I and set screws for keeping its face firmly against the bearing surface of the valve chest A; and, when it reaches its highest point, its chamber D is in full communication with the aperture B leading to the supply or feed pipe of the heater, which, from its superior height, fills the chamber D with water heated to a boiling point, while the lower aperture C is closed by the body of metal between the chamber D and the bottom valve E, in which it is formed.

*Claim.*—The arrangement of the chamber D, valve E, chest A, and openings B C, as and for the purpose shown and described.

No. 26,375.—SAMUEL M. RICHARDSON, of New York, N. Y.—*Improvement in Hinges.*—Patent dated December 6, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—Constructing hinges for blinds by the bent straps *f g*, passing around the outer edges of the blind, and inclosing the angle thereof, combined with the eye *d*, connected to said bent strap *f g* by the part *e*, the whole applied and acting in the manner and for the purpose specified.

No. 26,376.—D. SANFORD, of Taylor, Ill.—*Improvement in Harvesters.*—Patent dated De-

ember 6, 1859.—This invention consists in a novel arrangement of a rake and grain or gavel passage, and also in a tilting gavel receiver and a box, whereby the grain, as it is cut, is raked into gavels and into the receiver, in which they are bound by the attendant and thrown by him into a box, which is tilted intermittingly, so as to cast the sheaves in bundles on the ground.

The inventor says: I *claim*, first, the sliding rake bar E fitted within the bent arm D, and provided with a jointed rake head F, in connection with the guide strip *m*, and a gavel passage *n* on the platform A, substantially as described.

Second. The combination of the tilting gavel receiver H with the tilting box J, when arranged to operate together automatically, as and for the purpose set forth.

No. 26,377.—HENRY ROHRER, of Strasburg Township, Lancaster county, Pa.—*Improved Churn*.—Patent dated December 6, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The application of the tube I K to enter the rear head of the churn, the connecting pipes C and H, and its wide mouth *m*, partition *l*, and connecting tubes L M, with the dashers D, elevated on an open step F, when combined in the manner and for the purpose specified.

No. 26,378.—WILLIAM SELPHO and JAMES WALBER, of New York, N. Y.—*Improvement in Artificial Hands*.—Patent dated December 6, 1859.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, the arrangement of the cords or catguts *m* and *o*, and the pulley *n*, as set forth, for applying a double purchase in opening the hand, as described and shown.

Second. We claim the arrangement of the wrist joint and hand spring *l*, whereby the said spring *l* can be adjusted by the rod *k* that passes through the pipe *h*, in the manner specified.

Third. We claim the cord *p* or its equivalent passing from the elbow pad *r*, and giving motion at the wrist *g*, for the purposes and as specified.

No. 26,379.—ISAAC C. SHULER, of Amsterdam, N. Y.—*Improvement in Sheet Metal Coffins*.—Patent dated December 6, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of stiffening the base of a sheet metal coffin by locking together the surplus edges of the walls and bottom, forming a rim *c* surrounding the base, also the frame D.

Second. The inside tray E, whose bottom is in permanent contact with the exterior bottom S, and whose sides may be soldered directly to the walls A, or set away, leaving a chamber to be filled with molten metal, as described.

Third. The arrangement of scrolling or double locking the walls at the corners, in order, by making a voluminous joint, to stiffen and brace the general structure, whether the body of the joint be formed on the inner or outside of the coffin.

Fourth. I claim the slotted or double rim H I, through which the walls protrude, as described, for the purpose of stiffening the upper edges of the walls, and sustaining the lid or cover; also, the arrangement of folding the surplus edges of the walls over the frame I, for the purpose specified.

Fifth. I claim stiffening the cover J with the frame *r* near its outer edge on the upper side, inclosing the surplus sheet metal over the same.

Sixth. I claim, for the purpose of stiffening their respective portions of the coffin, the frames of cast or wrought metal P for the blind V; K for the cover; J, G and F, for the walls in the vicinity of the handles; *t* for the upper edge of the tray E, and *q* for the exterior bottom S.

Seventh. I disclaim hinging the sections of the concave sides of the cover to the body of the same, but—

I claim hinging them to the body of the coffin.

No. 26,380.—J. C. STODDARD, of Worcester, Mass.—*Improvement in Hay Making Machines*.—Patent dated December 6, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the rake head shaft, furnished with friction wheels or rollers, which are arranged on pivoted lever bearings, in combination with driving wheels which are furnished with a plain flange for the friction rollers to act against, so that the necessary friction may be produced either by means of the specified lever arrangement or by the same in combination with the gravity of the rake head, substantially as and for the purpose set forth.

Second. I claim the adjustable spurred ring P, set screws *p p*, with the wheels *u*, on the ends of the rake bars N, arranged and combined as set forth and for the purposes specified.

No. 26,381.—SAMUEL TARVER, of White county, Ark.—*Improvement in Saw Mills*.—Patent dated December 6, 1859.—This invention consists in so arranging its parts, as that great

saving in motive power and timber is effected, by accomplishing with a small thin circular saw all that can be done with a large thick one, and in so suspending the log upon the pivots as to make it most easily controlled whilst sawed; and in setting the saw at every line run to the log, instead of setting the log to the saw; and of causing the saw to feed along to the log on a light carriage and to a perfectly true guide, instead of the log to the saw.

The inventor says: I *claim*, first, the arrangement of the parts A B C D E H I J K L of Fig. 1; I say arrangement, because I cannot claim the invention of pulleys, saws, rollers, shafts, &c., these being in use everywhere, but simply claim the peculiar manner in which they are arranged.

Second. I claim the construction of the saw carriage, as described above, and by drawing of Fig. 3.

No. 26,382.—THOMAS THORP, of New York, N. Y.—*Improved Machine for Making Cigars*.—Patent dated December 6, 1859.—By treading alternately on the rings a continuous motion may be imparted to D, and consequently the wheels A and B and to the belt C, or by giving a proper impulse at the moment of introducing the material upon the belt, may be moved to such a distance as is necessary to complete the operation and allow it to be stopped at exactly the right moment, without continuing the rolling process too long, thereby injuring the cigar.

The inventor says: I *claim*, first, the arrangement of the drums or pulleys A B, in connection with the rollers M and belt C, with or without the rollers N, substantially as and for the purpose set forth.

Second. I claim in connection with the above, the runged wheel D, or its equivalent, arranged and operated in the manner and for the purposes set forth.

Third. I claim the means, substantially as described, of regulating the pressure on the cigar.

Fourth. I also claim, as my invention, the arrangement of a machine substantially as set forth, as an arrangement not heretofore known, for the purpose before mentioned.

Fifth. I also claim the peculiar steady curves or bends given to the belt C, for the purposes mentioned.

No. 26,383.—I. P. TICE, of Baltimore, Md.—*Improved Rotary Cutter Head*.—Patent dated December 6, 1859.—This invention consists in having the cutters placed in such relation to a cylinder, or a segment of a cylinder, as to prevent any undue action of the cutters on the stuff, so that the former cannot follow the grain of the wood and draw it suddenly along, thereby spoiling the work and endangering the hands of the operator.

*Claim*.—The employment or use of a cylinder C, or any segment or section thereof, applied to rotary cutters, to operate substantially as and for the purpose set forth.

No. 26,384.—GEORGE W. TOLHURST, of Liverpool, Ohio.—*Improved Washing Machine*.—Patent dated December 6, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim* constructing the round follower of washing machines of two sets of rings or hoops, and furnishing each set of rings with a handle, so that the surface that comes in contact with the clothes can move in opposite directions at one time, and this I claim when the same is arranged for operation, in the manner and for the purpose as described and set forth and for the purpose specified.

No. 26,385.—A. P. TORRENCE, of Oxford, Ga.—*Improved Machine for Girdling and Felling Trees*.—Patent dated December 6, 1859.—This invention consists in attaching a cutter to a proper handle and connecting said cutter and handle to a draft lever in such a way that when the implement is applied to its work, the necessary power applied to the draft lever and the cutter handle properly manipulated by the operator, the cutter will be moved around the tree, and cut the same circumferentially and towards its centre.

*Claim*.—The employment or use of the handle B, provided with a cutter A, and connected to a draft lever G, by the bars C D E, or any equivalent means, so as to operate substantially as and for the purpose set forth.

No. 26,386.—HIRAM VAN DEUSEN, of Phelps, N. Y., assignor to Himself and HIRAM ROCKEFELLER, of Clifton Springs, N. Y.—*Improved Clapboard Gauge*.—Patent dated December 6, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—A gauge for fitting clapboards for railing, composed of the bar A, the arm B, the slide D, with the cam and lever by which it is actuated, the stop H, and the straight edge k, or their equivalents, constructed and arranged substantially as set forth.

No. 26,387.—THEODORE VAN DEVENTER, of New Brunswick, N. J.—*Improvement in Rollers for Printing Paper Hangings*.—Patent dated December 6, 1859.—This invention consists in a certain combination of conically bored bushes fitted into the ends of the rollers, conical sliding collars fitted with feathers and grooves both to shaft and bushes; and nuts

fitted to screw threads on the shaft, by which the truth of the several rollers upon the shaft is ensured and provision is made for adjusting the rollers lengthwise upon the shaft.

*Claim.*—The combination of the conically bored and grooved bushes B, the concentric feathered collars D D, the feathered and screwed shaft U, and the nuts E E, the whole applied and operating as described.

No. 26,388.—NAHUM WASHBURN, of Bridgewater, Mass.—*Improvement in Dental Apparatus for Relief of Pain While Operating.*—Patent dated December 6, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The combination of dental forceps, or instrument for operating upon the teeth, with electro-magnetic mechanism, substantially as described, or its equivalent, so that the electrical current or currents may be made to flow through the nerve or nerves of the tooth, or the jaw or flesh immediately contiguous thereto, in order to benumb the same and render such more or less insensible to pain during the performance of the dental operation.

I also particularly claim the application of the electrical apparatus to the dental instrument, so that the latter may be in or form part of the circuit, as specified.

No. 26,389.—D. A. WILLBANKS, of Harmony Grove, Ill.—*Improvement in Threshing Machines.*—Patent dated December 6, 1859.—The operation of this invention is as follows: The beater cylinder is rotated in the direction indicated by arrow 1, and the grain to be thrashed is fed into the trough K and passes through the opening *f*, between the beater cylinder and concave B, and is thrashed by the action of the flails I in connection with the concave B, the latter being adjusted nearer to or further from the beater cylinder by turning the set screws D D. The thrashed grain and straw are discharged at the lower end of the concave B, the impurities and dust are arrested by the guard L and discharged from the machine over the top of the cap J. The guard L protects the operator from dust.

*Claim.*—The peculiar construction of the wrought-iron ribs I, in combination with the peculiar construction and arrangement of the cylinder heads H, to wit: the ribs with angular hooks *e e*, and the cylinder heads with key seats, and with the slotted projections *c c* and radial slots *d*, as and for the purpose set forth.

No. 26,390.—WILLIAM F. YEAGER, of Starkville, Miss.—*Improvement in Ploughs.*—Patent dated December 6, 1859.—The mould board B is attached to the share A by two screws *c c*. The letters *d d* represent the bolts attaching B to a handle of the plough. From the lower part of handle D a rod T passes to and through the beam F on the end of which is a screw nut for the purpose of bracing and securing the parts of the plough in place. The upper end S of the cutter K also passes through the beam F, to the top of which it is secured by a screw P.

*Claim.*—The arrangement of the landside G, the shank S, slot P, brace T, lug U, beam F, brace X, handles E D, share A, cutter K, and mould board B, the whole being constructed as described, for the purposes set forth.

No. 26,391.—GEORGE W. ATKINS, of Milton, Del., and WILLIAM B. AITKEN, of Philadelphia, Pa., assignor to GEORGE W. ATKINS and I. B. HENRY, of Delaware City, Del.—*Improvement in Registering Apparatus.*—Patent dated December 6, 1859.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, making the ratchet wheels C C<sup>1</sup>, in pairs secured together, with their notches inclined in opposite directions, as described, in combination with both an actuating and a checking pawl, operating together simultaneously, as described, the same being constructed and arranged together, substantially in the manner and for the purpose set forth and described.

Second. We claim the employment of a self righting cover G G<sup>1</sup>, operating in combination with the platform A, or its equivalent, substantially in the manner and for the purposes set forth and described, and this we claim whether the said cover G G<sup>1</sup> be applied either to a fixed platform or floor A, or to the moving platform of a weighing scale, connected with a registering machine, as described.

Third. We also claim the bell striker F, when the same is constructed with the arms 5 6 7, and operated by the notches of the ratchet wheel C, as and for the purpose set forth and described.

No. 26,392.—CHARLES H. DENISON, of Guilford, Vt., assignor to A. MILLER, of Brattleboro', Vt.—*Improved Tool for Finishing Felloes.*—Patent dated December 6, 1859.—In using this invention, the inventor says: after the felloes have been squared, I subject them to the action of revolving cutters A A, carried by an arbor B. This arbor, when in use, rises perpendicularly through a table or bench.

The inventor says: I *claim*, first, the described washer, and the described iron gauge for trimming and shaping the internal surface of felloes, &c.

Second. The described collar gauges for squaring the external and internal curved surfaces of the felloe.

No. 26,393.—WILLIAM B. DUNBAR, of Waterbury, Conn., assignor to Himself and GEORGE H. SEYMOUR, of Plymouth, Conn.—*Improved Ladle and Fork*.—Patent dated December 6, 1859.—This invention consists in hinging to the rear part of a ladle, made of suitable wire, which is formed into a handle of any required length and secured in the end of a wooden holder, a fork having curved tines, and operating said fork so as to grasp the vegetables while in the boiler with the boiling water by a rod connected to the head of the fork, which is crank shaped, and passing through tubes which serve to keep the connecting rod in place.

*Claim*.—The combined ladle and fork, constructed in the manner described and represented for the purpose set forth, as a new article of manufacture.

No. 26,394.—THOMAS ELLIS, of Philadelphia, Pa., assignor to Himself, W. A. ELLIS, and A. D. ELLIS, of said Philadelphia.—*Improvement in Casting Boxes for Wheel Hubs*.—Patent dated December 6, 1859.—The object of this invention is to cast the boxes with internal diameters of uniform size, by obviating the difficulty hitherto attending the varying position of the core relatively to the other parts forming the mould.

*Claim*.—Supporting the sand core E, between two sand heads F, when the above parts are employed in connection with a sand mould C, in the manner shown and represented.

No. 26,395.—RICHARD FITZGERALD, of Newark, N. J., assignor to JAMES BOOTH, of said Newark.—*Improvement in Machines for Forming Hat Bodies*.—Patent dated December 6, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim*, first, distributing the fur C on the former L, by discharging the same through an annular opening  $b^1$ , over and cocentric with the former L, substantially as set forth.

Second. The employment or use of the stationary shell O, provided with the recess  $p$ , cards or pickers  $q r$ , and having within it the cocentric rotary wheels P Q, one or more, also provided with cards or pickers  $v u$ , and with or without fan blades  $w$ , when said parts are arranged relatively with the former L, to operate substantially as described.

Third. The employment or use of the slide G, with the sliding tube or pipe H fitted therein, containing the former shaft J, the box F, and elastic belt  $l$ , or its equivalent; the above parts being arranged relatively with the suction fan C, and the shell O, and wheels P Q, substantially as and for the purpose specified.

No. 26,396.—GEORGE N. HALL, of Mamakating, N. Y., assignor to Himself, S. ARTHUR, and J. PIERCE, of said Mamakating, and S. D. ARTHUR, of New York city.—*Improvement in Horse Hay Rakes*.—Patent dated December 6, 1859.—This invention consists in the arrangement of the main lever, intermediate link, auxiliary lever, connecting rod, rake head, slotted brace bar, and driver's seat.

*Claim*.—The arrangement of the main lever H, intermediate link  $h$ , auxiliary lever  $e$ , connecting rod  $d$ , cam  $k$ , arm  $c$ , rake head G  $b$ , and slotted brace bar F, and driver's seat D, substantially as and for the purposes set forth.

No. 26,397.—JAMES W. McLEAN, of Indianapolis, Ind., assignor to Himself and EDWIN MAY, of said Indianapolis.—*Improvement in Steam Ploughs*.—Patent dated December 6, 1859.—The steam pipes K K conduct the steam from the boiler A to the cylinders B B, where it comes in contact with and operates the piston E. To the staff  $c$  is attached the wheel F, gearing with the wheel D, and that with the wheel O, which gears with the pinion  $n$  upon the shaft R, giving motion to the wheels D and O; the wheel D being fastened to the bearing wheel G; the wheels F and O are attached to the shafts M and U; upon the shaft U is attached the pinion P, gearing with the pinion Q upon the shaft R, giving motion to the machinery by being geared with the wheels F D and O and N.

*Claim*.—The arrangement of the ploughs  $h$ , gearing V W X, cutters  $b$ , lever T, and connecting rod S, in combination with the universal jointed shaft U M M, when operated in connection with the steam engine, substantially as set forth.

No. 26,398.—JOHN P. KEMP, of Charlestown, Mass., assignor to N. F. STEVENS, of Moultonbro', N. H.—*Improvement in Peg Tubes and Drivers*.—Patent dated December 6, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—Constructing the interior peg guiding portion of the tube of a form made up of angles or corners and surfaces, substantially as described, and so that, while the cross section or area thereof is materially greater than that of the peg, to admit of a driver of increased strength and materially greater cross section or area than that of the peg working therein, said tube in its peg guiding portion serves by its corners or angles and surfaces to restrain the peg from lateral shake or play.

No. 26,399.—WARREN NICHOLS, of Lima, Ohio, assignor to Himself and THOMAS GHORMLEY, of Stokes, Ohio.—*Improvement in Cattle Pumps*.—Patent dated December 6, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the combination with the covers L L<sup>1</sup> of stops which will open

the trough when its corresponding platform rises to its highest position and close it when the platform descends to its lowest position, as described, for the purposes set forth.

Second. The arrangement described of the spout I, in combination with the arm *k*, or with some other part operated by the descent of one of the platforms, by which the direction of the water is changed, near the close of the descent of the platform, as set forth, for the purpose stated.

No. 26,400.—GEORGE H. REYNOLDS, of New York, N. Y., assignor to CALEB BARSTOW and D. D. BADGER, of said New York.—*Improvement in Cut Off Valves of Steam Engines.*—Patent dated December 6, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The arrangement, within each steam chest of a rotary engine, of the starting and reversing valve having the cut off valve in combination therewith, the two being so coupled and operating that the starting or reversing may be effected without coupling or uncoupling any of the connecting parts, substantially in the manner set forth.

No. 26,401.—NANCY POINDEXTER BRASHEAR, of Pattersonville, La., executrix of ROBERT B. BRASHEAR, deceased, late of said Pattersonville.—*Improved Mode of Applying Sulphurous Acid Gas in the Defecation of Cane Juices.*—Patent dated December 6, 1859.—The claim explains the nature of this invention.

*Claim.*—Subjecting sugar cane juice or other saccharine liquid to the direct action of the fumes of burning sulphur, such liquid being employed in a diffused state, as set forth, so that every or nearly every portion of the whole body of liquid is brought in contact with the same almost simultaneously, substantially as and for the purpose set forth.

No. 26,402.—REBECCA H. WILLSON, of Washington, D. C., administratrix of the estate of JOHN M. WILLSON, deceased, late of said Washington.—*Improvement in Fastenings for Cartridge Boxes.*—Patent dated December 6, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—A cartridge box fastening composed of hinged lever and spring, said spring serving to hold the lever open or closed, and said lever by the aid of said spring clamping the flap of the cartridge box between itself and the side of said box, substantially as herein represented.

No. 26,403.—LUTHER ADAMS, of Blanchester, Ohio.—*Improvement in Car Couplings.*—Patent dated December 13, 1859.—This invention relates, first, to the construction and arrangement of latches by means of which the cars may couple of themselves as they are made to come together; second, in combination with the coupling latches, the arrangement of a rubber spring, by means of which said latches are made to act as elastic bumpers.

*Claim.*—The combination and arrangement of the latch *c f*, spring *b*, and plates *h h*<sup>1</sup>, when constructed and made to operate substantially as described for the purposes set forth.

No. 26,404.—PETER B. BAKER, of Wall Hill, Miss.—*Improvement in Cotton Seed Planters.* Patent dated December 13, 1859.—In order to complete the covering of the seed, a drag board or scraper *G* finally follows, its under edge being hollowed in the middle to leave the surface of the ground in proper shape. This scraper is secured to long wooden springs *E E* extending forward and upward to the sides of the frame *A*, to which they are secured. In order to get access to the interior of the drum *D* one of the segments *f* may be removable, as at *m*, for the purpose.

*Claim.*—The arrangement of the teeth *b b* in front of the drill opener *C* and the scraper *G*, secured upon the spring runners or shoes *E E*, in combination with the seed drum *D*, substantially in the manner and for the purpose specified.

No. 26,405.—NELSON BARNUM, of St. Louis, Mo.—*Improved Sash Fastener.*—Patent dated December 13, 1859.—When it is desired to raise the sash the lever *H*, which is hinged to the sash *r*, is depressed, drawing the spring *J* back to the bottom of the groove in which it operates, and then by a still further compression of the lever the strip *B* is drawn back in the groove *D*, which releases the sash and allows it to move with ease.

*Claim.*—The lever *H*, the adjustable connection *G*, and the springs *J* and *F*, and bolt *I*, or their equivalents, in combination with the yielding strip *B*, for the purpose specified.

No. 26,406.—A. R. BARTRAM, of Redding, Conn.—*Improvement in the Running Gear of Vehicles.*—Patent dated December 13, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—Attaching the front axle *A* to the bolster *B*, by means of the sleeves *b b* fitted loosely on the bolster and connected with the bar *C*, which is attached to a circle plate or any suitable swivel connection between the said bar and axle, when said parts, substantially thus arranged, are used in connection with thills or a draft pole attached rigidly to the axle *A*, for the purpose set forth.

No. 26,407.—ALEXANDER BECKERS, of New York, N. Y.—*Improved Double Eye Piece for Optical Instruments.*—Patent dated December 13, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—Connecting a stereoscope or other optical instrument with double eye tubes, sight tubes, or eye pieces, each of which being shaped or turned of one piece in the form of an obliquely intersected and moulded hollow cylinder, substantially in the manner and for the purposes as described.

No. 26,408.—ELIZABETH BELLINGER, of Mohawk, N. Y.—*Improved Composition for Kindling Fire.*—Patent dated December 13, 1859.—The claim explains the nature of this invention.

*Claim.*—The inflammable gum paste composed of Kaurie gum, camphor, and wax, in about the proportions stated, when combined with friction match paste, placed on kindlers for fires, in the manner and for the purposes set forth.

No. 26,409.—JOHN C. BIRDSSELL, of West Henrietta, N. Y.—*Improved Machine for Cleaning Clover Seed.*—Patent dated December 13, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, operating the bolts A A so as to impart to them an oblique alternately rising and falling motion, by means of the double crank D E, guide rods F F, arms G H, and connecting rods B B, or their equivalents, in the manner and for the purposes set forth; it being understood that I claim the above only when applied to bolting clover seed.

Second. I claim arranging a trough I provided with endless conveyors J, as set forth, for the purpose of returning the unhulled seed or tailings to be again submitted to the operation of hulling, as described.

No. 26,410.—WILLIAM BLESSING, of Jeffersonville, Ohio.—*Improvement in Seed Planters.*—Patent dated December 13, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The arrangement of the top portion of the distributor, made with a semi-lunar opening, and the recess under the covered portion of the said top, when the periphery of the top is made with the chaff openings H on either side of the reciprocating seed bar, so that said bar, by its reciprocating action, shall work out the chaff through the passages H H on either side of the seed bar, and thus prevent choking the distributor.

No. 26,411.—JEREMY W. BLISS, of Hartford, Conn.—*Improved Striking Apparatus for Gongs.*—Patent dated December 13, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, arranging the striking mechanism of a bell substantially within the hollow of the bell, when the wire which actuates that mechanism moves in lines parallel to the axis of the bell, or nearly so, as described.

And lastly, I claim a rock shaft arm, arranged with reference to the bell, substantially as described, in combination with a slide, a swing catch, and a hammer, and hammer wire and proper springs; the whole constituting a striking apparatus substantially as herein set forth.

No. 26,412.—JOHN DROUGHTON, of New York, N. Y.—*Improvement in Grinding Mills.*—Patent dated December 13, 1859.—B is a revolving grinder, secured to a shaft C by a set screw e; D is a cob cutter or cracker keyed to the shaft C; E is a stationary grinder bolted by the flanches F to the open end of drum A; G is a vertical spout communicating with the interior of the stationary grinder E, and into which spout the grain or other substance to be ground is fed from a suitable hopper; J J are wings or fan blades, secured to the revolving grinder B.

The inventor says: I *claim*, first, the double and reverse acting conical grinding surfaces B F, constructed and operated substantially as herein set forth.

Second. In combination with a revolving grinder and hollow case or drum A, I claim the wings or fan blades J, operating substantially as and for the purpose set forth.

No. 26,413.—PETER M. BROWN, of Carrollton, Ill.—*Improvement in Portable Fences.*—Patent dated December 13, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—Giving such a shape to the slots at each end of the sections of my improved fence that the said sections can be securely interlocked with each other by means of supporting posts of the within described shape, in such a manner that the said sections can be either lengthened or shortened when they are put up for use, substantially as set forth.

No. 26,414.—ISAAC Y. CHUBBUCK, of Roxbury, Mass.—*Improvement in Fan Governors for Steam Engines.*—Patent dated December 13, 1859.—The nature of this invention is explained by the claim and engravings.

*Claim.*—Combining the main spindle C of the fan governor with the stem or spindle B of the valve, by means of a toothed arc formed upon or attached to the extremity of the crank

arm which carries the fan and a toothed sector upon the valve stem, the said crank arm being attached to a sleeve fitted to the spindle C, and the whole being otherwise arranged substantially as described.

No. 26,415.—HEZEKIAH CONANT, of Willimantic, Conn.—*Improvement in Machines for Winding Thread on Spools.*—Patent dated December 13, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination, substantially in the manner set forth, of a traverse changer with right and left hand screws, and with nuts which are alternately in gear with such screws, the combination operating as a whole, substantially in the manner and for the purpose described.

Second. I claim a traverse changer, provided with successive steps or teeth, substantially such as is before described, and acting upon lips as set forth.

Third. I claim a stop motion, substantially such as is described, for causing the machine to come to rest when a spool is filled, in combination with automatic apparatus, substantially such as set forth, for regulating the length of motion and change of direction of motion, of a guide through which the thread is delivered on a bobbin or spool.

Fourth. I claim adjustable lips, substantially such as set forth, in combination with a traverse changer, whereby spools of different lengths may be wound by the use of the same traverse changer.

Fifth. I claim mounting the presser and thread guide directly upon or attaching it firmly to the traverse rod, as before described, whereby the machine is cheapened and performs its work more accurately.

And lastly. In combination with apparatus, substantially such as described, for governing automatically the motions of a thread guide, I claim a tension apparatus and stop motion which arrests the motion of a machine when a thread breaks, substantially by the mode of operation set forth.

No. 26,416.—JOHN B. CORNELL, of New York, N. Y.—*Improvement in Sash Weights.*—Patent dated December 13, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—As a new article of manufacture, my improved metallic sash-weight, the peculiarity of which consists in its having a series of annular grooves formed at suitable distances from each other, in the lower portion of said sash-weight, for the purpose set forth.

No. 26,417.—THOMAS R. CROSBY, of Newark, N. J.—*Improved Machine for Wiring Blind Rods.*—Patent dated December 13, 1859.—The wire, while in the act of entering the rod, is firmly held in proper position within the yielding mouth formed by the lower end of D pressing, by means of the spring H, upon the plate T.

The inventor says: I *claim*, first, the use, in wiring machines, of the yielding mouth to hold the wire when being driven and formed, substantially as described.

Second. I claim the use of the adjustable slide K, substantially in the manner and for the purposes described.

Third. I claim in said machines the use of the dog V in the end of the arm E, substantially in the manner and for the purposes described.

Fourth. I claim the combination together of the driver O and the yielding mouth formed by the rack D and plate I, substantially as described.

No. 26,418.—R. CROWLEY, of New York, N. Y.—*Improvement in Needle Wrappers.*—Patent dated December 13, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—The incision of the wrapper, as shown at *d d*, so as to expose the heads of the needles and produce a covering or flap B of the form shown, or equivalent form, as and for the purposes set forth and described.

No. 26,419.—JONATHAN CUTTER, of Chicopee, Mass.—*Improved Machine for Making Clasps.*—Patent dated December 13, 1859.—This invention consists in the general arrangement and application of a series of cams, slides, and other attachments, to partially form an automatic machine to make metal clasps.

The inventor says: I *claim*, first, the sliding former A and the vibrating lever B, in combination with the die and punches, in the manner described.

Second. The reciprocating ring C to actuate the slide former A, in combination with the revolving cam D and lever arm I and pin M.

Third. The centre spring pin W, to press the blank down through the die plate on the forming bed Y, in the manner described.

Fourth. I claim the whole arrangement in combination as an organized automatic machine, in the manner and for the purpose specified, substantially as set forth.

No. 26,420.—OLIVER H. DENNIS, of Altona, Ill.—*Improvement in Seeding Machines.*—

Patent dated December 13, 1859.—The front end of the frame is supported by two wheels *g g* on an axle *B*, which has a king bolt *e* to give freedom of action in turning, &c., as in carriages; the shank of the king bolt extends upward through and is movable in a cross piece of the frame for the purpose of adjusting the height of the machine, so that its cultivating parts may be entirely raised from the ground when not to be used, as in transporting and turning the machine, or be brought into action in the ground, and adjusted to different depths therein, as desired.

The inventor says: I *claim* the combination and arrangement of the cylinder *G*, of circular cutters *l l*, with the cultivating and opening teeth *c c*, and with the sowing cylinder *H*, substantially in the manner and for the purposes set forth.

I also claim, in combination with the above, the arrangement of the loosely hinged harrows *N N* in relation to each other, and to the frame of the machine, and in combination with the arms *P P*, rack shaft *O*, lever *Q*, and catch *R*, substantially as specified.

No. 26,421.—DAVID S. FANCHER, of Logansport, Ind.—*Improvement in Stone Loading Wagons*.—Patent dated December 13, 1859.—The frame bed *A* is fixed upon the gearing of a common log or other wagon; the drop *B B* is secured to the rear end of the bed by the hinged joints *K K*, and is made to rise or lower, to suit the occasion, and can be secured at any desired position above or below the bed by the hooks *G G*, which enter the staples *P*; the levers *E* and the slotted cross bars *D* are made with pin holes through the bars; the levers are provided with strong loops *l l* for catching upon the hoops *h h*.

The inventor says: I *claim*, first the inclined frame or bed *A*<sup>1</sup>, and the hinged drop *B*, in combination with the friction rollers *c c*, and the windlass *a b b*, for the purpose set forth.

Second. I claim the receiving table *A*, in combination with the clamps *E E D*, substantially as described and for the purpose set forth.

No. 26,422.—J. W. FAWKES, of Christiana, Pa.—*Improvement in Steam Ploughs*.—Patent dated December 13, 1859.—This invention consists in a peculiar arrangement of mechanism employed for elevating the plough frame, whereby the latter may be actuated so as to incline the ploughs, and the mechanism stopped automatically when the frame and plough are sufficiently elevated; also, in combination with the first named feature, of a holding pawl and brake to facilitate the adjustment of the ploughs to their work.

The inventor says: I *claim*, first, the arrangement of the clutch *r*, levers *M N*, rod *O*, lever *b*<sup>1</sup>, and button or projection *c*<sup>1</sup>, on the chain *F*, whereby the chains *F F* are wound on the pulleys *e e* of the shaft *E*, and stopped automatically at the proper time for the purposes set forth.

Second. In combination with the above, the brake *R* and pawl *d*, when applied to the machine to operate simultaneously, as and for the purpose described.

No. 26,423.—THOMAS B. FOGARTY, of Charleston, S. C.—*Improvement in Gas Meters*.—Patent dated December 13, 1859.—This invention consists, first, in the combination of an inclined wheel with a separate water reservoir and the measuring drum, the periphery of said wheel having suitable buckets arranged on it so as to dip up the water contained in said reservoir, as the wheel is operated by the drum and convey the same into the measuring chamber. It consists, second, in the method of preventing the meter chamber and the water reservoir from being overcharged, and also in the arrangement of the water inlet pipe, so that it will have no communication with the body of the meter chamber, while it has free communication with the water reservoir.

The inventor says: I *claim*, first, the combination, with the water reservoir *B* and the revolving measuring drum *H*, of an inclined feed wheel *E*, substantially as and for the purposes set forth.

Second. The arrangement of the overflow pipe *K* in combination with the water reservoir, meter chamber, and dry well *L*, and pipe *N*, in the manner substantially as set forth.

Third. The arrangement of the water inlet *S R*, substantially in the manner and for the purposes set forth.

No. 26,424.—ADDISON M. FORD and CHARLES W. WARNER, of Jericho, Vt.—*Improvement in Horizontal Water Wheels*.—Patent dated December 13, 1859.—The buckets are made in what is termed "ogee form," and are placed in the wheel as shown at points *a b*, and each bucket projects inwardly obliquely in such a manner that the ends of the buckets at the outer edge of the wheel are nearly twice as far from each other as the other ends of the buckets are in the inner part of the wheel.

*Claim*.—The construction and arrangement of the lifter *e* and band *d*, as shown in Fig. 1, and of the buckets *a* and *b*, combined in the manner and for the purposes substantially as set forth.

No. 26,425.—GEORGE FOSTER, of Brooklyn, N. Y.—*Improvement in Axles or Shafts*.—Patent dated December 13, 1859.—This invention consists in the formation of a shaft or axle by combining cast-iron with wrought-iron in a cellular form in such a manner that the cast-

iron shall be melted around the wrought iron and form the journal wheel, bearing section wheel, or pulley.

*Claim.*—A shaft or axle, cellular in its character, and composed of a series of wrought iron rods or tubes, covered and held together by a casting cast upon the same, and forming the journal wheel, bearing section wheel, and pulley.

No. 26,426.—WILLIAM P. GOOLMAN, of Dublin, Ind., assignor to Himself and SAMUEL B. MORRIS, of Wayne county, Ind.—*Improvement in Mole Ploughs.*—Patent dated December 13, 1859.—This invention consists, first, in an arrangement for adjusting the pitch of the mole in respect to that of the beam; second, in a provision for inclining the coulter at will, to compensate for the downward tendency of the mole.

The inventor says: I *claim*, first, the lever F, rigidly attached to a pivoted mole R, in the described combination with the rack F, the whole being constructed and arranged and operating substantially as and for the purposes set forth.

Second. The cam D, in the described combination with the coulter Q, and adjustable pivot mole R, operating substantially as and for the purpose set forth.

No. 26,427.—MAGNUS GROSS, of Washington, D. C.—*Improvement in Preserving Flesh and Meats.*—Patent dated December 13, 1859.—This invention consists in the application of an air tight apparatus for displacement, to which hydrostatic pressure is applied.

*Claim.*—The application of an air tight apparatus of displacement to which hydrostatic pressure is applied, for the purpose and in the manner set forth in the specification.

No. 26,428.—CHARLES HADFIELD, of Brooklyn, N. Y.—*Improvement in Sticks for Exhibition Rockets.*—Patent dated December 13, 1859.—This invention consists in furnishing the usual rocket stick with a magazine of powder, the said charge of powder being connected with the charge of the rocket, so that on, or immediately after, the burning of the rocket charge, the magazine of powder of the rocket stick shall be exploded and the stick broken into two or more pieces.

*Claim.*—The rocket stick inclosing or in connection with a magazine of powder, in the manner and for the purposes set forth

No. 26,429.—H. HALVORSON, of Cambridge, Mass.—*Improvement in Candle Moulds.*—Patent dated December 13, 1859.—This invention consists in constructing the mould of two tubes, one fitted within the other, and with a tip of elastic or yielding material, the outer tube being rigid and so much larger than the candle as to admit within it the inner one, whose interior is of the desired size of the exterior of the candle, and which is made with a longitudinal slit and to possess such elasticity that when not confined within the outer one to such a degree as to keep the edges of the slit close together, it will expand and release the candle which has been moulded in it, and the tip being fitted into the inner tube.

The inventor says: I *claim* the combination with an outer tube A, of an inner elastic slit tube B, applied and operating substantially as and for the purpose set forth.

And, in combination with the elastic tube B, I claim the tip c, of elastic or yielding material, applied and operating substantially as and for the purpose described.

No. 26,430.—IRA HANN, of Hope, N. J.—*Improved Washing Machine.*—Patent dated December 13, 1859.—The inventor says: While the board m is caused to reciprocate it may be made to exert any desired pressure upon the clothes, and by virtue of the combination of the levers and the construction of the pressure carriage such result is accomplished in a desired manner without much friction. The parts are so constructed and arranged together that the moving rubber carriage, &c., are readily thrown out of the way for the insertion or extraction of the clothes.

*Claim.*—The combination of the fixed rubber board n, with the removable rubber m, friction roll, presser carriage a b, and operating lever F B and M, the whole arranged and operating as specified for the purposes described.

No. 26,431.—JOHN S. HARBISON, of Sacramento, Cal.—*Improvement in Bee Hives.*—Patent dated December 13, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—Placing the bee comb, known as worker cells, in a horizontal or nearly horizontal position, so that the cells shall be vertical or nearly vertical instead of horizontal, by the means, or their equivalents, substantially as set forth and represented.

No. 26,432.—WILLIAM HOFFMAN, of Benicia, Cal.—*Improved Butler's Tray.*—Patent dated December 13, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—As a new article of manufacture, a single handed butler's tray, furnished with a hinged, or pivoted handle, so as to be detached or swing out of the way, to facilitate the placing or removing of articles upon it, and to economize room and space in carrying or stowing it away, as set forth and explained.

No. 26,433.—JOHN B. HOLMES, Jr., of New York, N. Y.—*Improved Ratchet Pulleys for Blind Cords*.—Patent dated December 13, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the metallic bar *a* projecting from the window casing, and having teeth on the back thereof, in combination with the bridle pawl *b* passing around said bar *a* and carrying the pulley for the cord, as set forth.

I also claim the porcelain roller *d* on the centre pin 4, in combination with the bridle pawl *b* and bar *a*, substantially as set forth.

No. 26,434 —ALBERT H. HOOK, of New York, N. Y.—*Improvement in Clamps for Metal Straps*.—Patent dated December 13, 1859.—This invention is constructed as follows: A hollow metal cylinder is made with two flanches, one at each end *b b*; the part between the flanches has two narrow openings from flanch to flanch opposite each other, as seen at *c*; through these openings the ends of the band *d d* are passed, and the wedged form of the nail *e* being driven between the two ends of the band, they are thereby fastened securely.

*Claim*.—The outer griper *a* and nail *e*, for fastening the ends of bale and other straps, constructed substantially as and for the purposes set forth.

No. 26,435.—DANIEL HUGHES, of Rochester, N. Y.—*Improvement in Hoop Locks*.—Patent dated December 13, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—The case or box *A*, having slots *a a* in two opposite sides, and provided with a clamp or jaw *B*, arranged substantially as and for the purpose set forth.

No. 26,436.—PETER KEFFER, of Reading, Pa.—*Improvement in Boots*.—Patent dated December 13, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The above described mode of making the leg of the boot, the leather being folded in front and the crimp hammered in, instead of crimping in the usual way, and the ankle being completed by a single seam and one piece of leather, substantially as set forth for the purposes described.

No. 26,437.—L. G. KNIFFEN, of North Salem, N. Y.—*Improvement in Harvesters*.—Patent dated December 13, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—Constructing, as a whole, the shoe on which the cutter and finger bars are supported and adjusted in one piece, combining the guide box *a* for the cutter bar, the recess *b* for the finger bar, the slotted bracket *m* for the caster wheel to be attached to the vertical locking portion *d* or its equivalent, the vertical pivot or gudgeon *G* for the whole to be suspended or adjusted on, horizontally, to a position parallel with the inner side of the main frame, as set forth.

No. 26,438.—GEORGE A. LATHROP, of East Saginaw, Mich.—*Improvement in Metallic Window Blinds*.—Patent dated December 13, 1859.—The object of this invention is to produce a shutter or blind that is simple, cheap, easily operated, and fireproof. It consists in combining with a metallic plate provided with slots and water sheds or slats, a slotted side, in such a manner that the light may be admitted or excluded at pleasure.

*Claim*.—The arrangement of the plate *A* with slots *a*, slats or water sheds *c*, and grooves *d*, in combination with the slotted side *B*, substantially as and for the purpose specified.

No. 26,439.—JAMES H. LEE, of Camanche, Iowa.—*Improvement in Seed Planters*.—Patent dated December 13, 1859.—This invention operates as follows: In drilling in seed, such as wheat, rye, &c., the seed box *G* is supplied with a requisite quantity of seed, and as the machine is drawn along a reciprocating movement is communicated to the slide *H* by the lever *E*, which is vibrated by the pins *b* as the axle *D* rotates, the slide distributing the seed as usual, the quantity to be planted on a given area being regulated by adjusting the plate *f*, which may be secured at any point within the scope of its movement by pin *l*.

*Claim*.—The arrangement of the bar *F*, cord *J*, rotary shaft *K*, sliding seed box *G*, bars *c*, lever *B*, and sliding axle *D*, as and for the purposes shown and described.

No. 26,440.—HORATIO LEONARD and HENRY RYDER, of New Bedford, Mass.—*Improved Apparatus for Moulding Candles*.—Patent dated December 13, 1859.—This invention consists in a peculiar construction and application of a removable receiver or trough to the top surface of the mould or series of moulds, whereby, when the moulds are filled with paraffine or the material to be moulded, the surplus left in the receiver shall form a plate or serve as shoulders to the candles. It also consists in a peculiar mode of packing or closing the orifices at the lower parts or tips of the moulds, in order to prevent leakage therefrom.

The inventors say: We *claim* making the receiver or trough *E* separate from the body of the mould or series of moulds, and so constructed and arranged as to operate therewith, substantially in the manner and for the purpose set forth.

We also claim the described improved mode of packing the lower orifice of the mould,

viz: by means of a spring *a*, furnished with rubber or other proper elastic material, the same being arranged and made to operate with respect to the said orifice, as set forth.

No. 26,441.—BENJAMIN A. MASON, of Newport, R. I.—*Improved Machine for Cutting Railroad Bars*.—Patent dated December 13, 1859.—The object of this invention is to cut the ends of T-rails for railroads, so as to form the kind of lap joint represented in the engraving.

*Claim*.—For giving to rails the form, substantially such as herein described, the combination of the series of cutters, arranged in relation to each other, substantially as described.

No. 26,442.—O. C. McCUNE, of Darby Creek, Ohio.—*Improvement in Corn Planters*.—Patent dated December 13, 1859.—A rod L connects with the curved bar G and passes vertically through a slot in the plough beam and connects with a bent lever M. The rod L is furnished with rack teeth, which, in connection with a pawl N, prevents the coverer G<sup>1</sup> from rising until it has formed the hill over the seed; then the pawl is disengaged from the rack by projections *a a* on the wheel E, and the coverer raised at the same time by the projections *a<sup>1</sup> a<sup>1</sup>* on the ring F coming in contact with a small cam *c*, which draws forward the arm *d* and one arm of the bent lever M, and raises the rod L, and the operation of the corn is effected.

*Claim*.—The arrangement of the peculiarly formed rack bar rod L, bent lever M, pawl N, ring F, cam *c*, and arm *d*, as and for the purpose shown and described.

No. 26,443.—CHAUNCEY PARMELEE, of Wilmington, Vt.—*Improved Vegetable Slicer*.—Patent dated December 13, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* supporting the front end of the adjustable plane of bottom K on the fixed bottom board of the hopper, so that it shall be stationary relatively to the gate, and arranging at the end of the plane K the mechanism for raising it.

I also claim the application of the board or partition O to the hopper and the adjustable platform K, substantially in the manner and for the purpose as specified.

No. 26,444.—WILLIAM H. PECKHAM, of Hoboken, N. J.—*Improved Spectacle Frame*.—Patent dated December 13, 1859.—This invention consists in providing a clasp socket on the end of the temple, receiving divided spring catches at the ends of the grooved wire surrounding the glass, the parts being so constructed that the socket clasp can be slid off and the glasses changed.

*Claim*.—Connecting the end pieces *c c* of spectacle frames by the clasp sockets *d d*, in the manner and for the purposes substantially as specified.

No. 26,445.—CHARLES A. SEELY, of New York, N. Y.—*Improved Method of Protecting Frictional Electrical Machines from Moisture*.—Patent dated December 13, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* inclosing an electrical machine in a covering or box, which is nearly or quite air tight; and, by means of an absorbent moisture, preserving the air about the machine nearly uniformly dry.

I also claim the insulating covering or box, substantially as described and for the purposes specified.

No. 26,446.—ANDREW J. SHEPHARD, of Buffalo, N. Y.—*Improvement in Nut Machines*.—Patent dated December 13, 1859.—The bar is fed to the punches, the motions of the various parts being so arranged and regulated that the cam N will first move the part M of the nut box until it comes nearly in contact with the part L, when the angular punch D<sup>1</sup> and central punch *f*, by means of cams H<sup>1</sup> and H<sup>2</sup>, commence their upward movement.

The inventor says: I *claim*, first, perforating the punch *e* as described, for the purpose set forth.

Second. The cutters *t* and *t<sup>1</sup>*, when constructed and arranged relatively to the dies L and M, as described.

Third. The combination of the dies L and M with the water chambers *l* and *m*, when arranged and operated substantially as described for the purpose set forth.

Fourth. The combination and arrangement of the punch D (Fig. 1) with the water chamber 7, and openings 8 9, substantially as and for the purpose described.

No. 26,447.—JOEL Y. SCHELLY, of Hereford, Pa.—*Improvement in Attaching Spokes of Carriage Wheels*.—Patent dated December 13, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the ferrule D, when furnished with rings *a a*, and applied in the manner and for the purpose set forth.

Second. The screw plates *b* welded upon the inside face of the tire, in the manner and for the purposes set forth.

Third. I claim the combination of (with suitable slots made in the inside face of the tire)

the bolt *e*, key bolt *g*, and plate *h*, all arranged in the manner specified for securing the tire rigidly in its place upon the wheel as stated.

No. 26,448.—G. B. SINGLETARY, of Greenville, N. C.—*Improvement in Manure Drills*.—Patent dated December 13, 1859.—This invention consists in the employment of a bilge shaped rotating hopper applied to a plough, whereby the desired end is attained.

*Claim*.—The arrangement of the plough B, guide board E, lifting bar F, guiding bar G, and rotating hopper or receptacle D, as and for the purposes shown and described.

No. 26,449.—STEPHEN STAFFORD, of Carrollton, Mo.—*Improvement in Hemp Breaking Machines*.—Patent dated December 13, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—Constructing the brake with two disks and heads, and uniting said disks by means of rounds or slats armed with obliquely set teeth, and arranged so that spaces shall exist between them, and they can be adjusted to give the teeth any required obliquity, substantially as and for the purposes set forth.

No. 26,450.—JOHN F. STIRLING, of San Francisco, Cal.—*Improvement in Watch Keys*.—Patent dated December 13, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—As a new article of manufacture, a watch or door key with a hollow stem or pod, open at both its ends, so that anything getting into it that would obstruct its action will drop or be punched out through the open stem, as set forth.

No. 26,451.—EUCLID C. THAYER, of Providence, R. I.—*Improvement in Belting for Pulleys*.—Patent dated December 13, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The manufacture of round belting by preparing the leather or other material in the mode described, and rolling and twisting the same in a spiral form with any required number of conical layers in the cylinder, either with or without a cylindrical space in the centre of the belt, and cementing the layers in the process of manufacture, substantially as described.

No. 26,452.—T. S. UNDERHILL, of St. Johnsville, N. Y.—*Improvement in Bee Hives*.—Patent dated December 13, 1859.—The object of this invention is to render the frames more accessible than hitherto, and also capable of being manipulated or adjusted with much greater facility, so as to permit the combs to be thoroughly examined and removed, if necessary.

It has also for its object the varying of the capacity of the hive to suit the size of the colony.

The inventor says: I *claim*, first, the arrangement of the movable frame E, in combination with the sliding hive A, and adjustable side *e*, substantially as and for the purpose set forth.

Second. The arrangement of the adjustable boards G, H, and D, placed on a frame F, when said parts are constructed as described, and used in connection with the sliding hive A, for the purpose specified.

No. 26,453.—ANTONY WELSCH, of Chicago, Ill.—*Improvement in Hand Cars for Railroads*.—Patent dated December 13, 1859.—A A is a platform working in bearings B B attached to the platform, and about midway between its centre and end is a crank C, which connects with the brakes at D; on the axle of this crank is fastened the wheel E, which works in the pinion F on the axle of the car, and on the other side of the centre of the platform at G a rod is fastened connecting with the brakes at H.

*Claim*.—The movable platform, and the attachment thereto of the crank and wheel, in the manner and for the purposes set forth.

No. 26,454.—WILLIAM WHARTON, Jr., of Philadelphia, Pa.—*Improvement in Dispensing with Switches on Railroads*.—Patent dated December 13, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: The employment of a car wheel provided with one or more treads in addition to the ordinary tread, upon either the outer or inner side of said ordinary tread, and of the same or different diameter as said ordinary tread, in combination with additional raised rail or rails with a gradual rise, either curved or straight, so placed that such of the said extra treads as desired shall be caused to run upon them, thereby raising the car entirely clear of the ordinary track, and causing it to follow the direction of said raised rail or rails, whether curved or straight, for the purpose of avoiding the necessity for railroad switches, arranged and operated substantially as set forth.

No. 26,455.—WILLIAM H. WORTH and LEONARD FINLAY, of Canton, Mo.—*Improvement in Seed Planters*.—Patent dated December 13, 1859.—The frame E extends out in front and on either side of the wheels and carries two seed hoppers F F, through which passes later-

ally a seed slide G to be operated by a hand lever H, so as to deposit the seed in the hollow shoes I I.

*Claim.*—The arrangement of the longitudinally moving slotted plate N, vertical gate L, sliding bar G, operating lever H, shoes I, and the rotary coulters K, as and for the purpose shown and described.

No. 26,456.—HENRY BELL, of Clinton, Ill., assignor to FENTON H. BOGAR and JOSEPH W. TIDBALL, of said Clinton.—*Improvement in Seed Planters.*—Patent dated December 13, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement and combination of the rock shaft J, cog segments I, pinion K, crank shaft Q R, ratchet bars H H, springs S S, feed slide G, and discharge regulating valve O, when the same are arranged and combined in the manner set forth.

Second. In combination with the above, the arrangement of the treadle V and hand lever U together and on the same fulcrum, so that the feed slide can be worked either by the hand or foot, substantially as and for the purposes set forth.

Third. The combination with the foregoing peculiar arrangement of parts for dropping the seed, the arrangement of *a b c d* for regulating the depth of the furrow openers, substantially as and for the purpose set forth.

No. 26,457.—WILLIAM BELLOWS, of Cincinnati, Ohio, assignor to CHARLES W. SMITH, of said Cincinnati.—*Improvement in Revivifying Bone Black.*—Patent dated December 13, 1859.—This invention consists in new mechanical details of construction in a furnace for reburning bone black.

The inventor says: I *claim*, first, an improved apparatus for revivifying bone black, arranged and constructed as described.

Second. The flaring bottoms of the retorts *a a*, when arranged and combined with the described apparatus, for the purpose specified.

Third. The flanches *c c*, in combination with the retorts *a a*, for the purpose of allowing for expansion and contraction and replacing of retorts, as well as protecting internal heating surface, substantially as described.

Fourth. The chamber between flanches *c c*, and the lower plates *d d*, when for the purpose of preventing undue radiation of heat, and for the purpose of passing off the offensive gases arising from retorts when said chamber is combined with the flanches *c c*, and cover plates *d d*, for the purpose described.

No. 26,458.—GEORGE H. BRONSON, of Cincinnati, Ohio, assignor to Himself and DAVID MILLARD, of said Cincinnati.—*Improvement in Hydro-carbon Vapor Apparatus.*—Patent dated December 13, 1859.—This invention relates to the arrangement of the zigzag passages through a carbonizing or naphthalizing apparatus.

*Claim.*—The arrangement and combination of the zigzag folded surfaces extending over the projecting edges F, with the projecting edges E C C c c, &c., in each of the several cells or chambers of the impregnating apparatus, substantially in the manner and for the purpose set forth.

No. 26,459.—MORTIMER S. HARSHA, of Sycamore, Ill., assignor to Himself, RUFUS S. SANBORN, and H. B. JONES, of said Sycamore.—*Improved Churn.*—Patent dated December 13, 1859.—The nature of this improvement will be understood by an examination of the claim and engravings.

*Claim.*—An entirely stationary brake dash, in combination with a cream receiver, made to rotate on a vertical or upright shaft, as described and for the purposes set forth.

No. 26,460.—THOMAS C. HENDRY, of Conyers, Ga., assignor to Himself, J. DILLWORTH, and F. E. ASKIN, of said Conyers.—*Improvement in Gravel Cars.*—Patent dated December 13, 1859.—The object of this invention is to obtain a gravel car which may have its load readily discharged simultaneously from both sides.

*Claim.*—The combination of the double inclined bottom D D and swinging doors G G, the latter being operated by the rods H, bar *i*, and lever J, substantially as and for the purpose set forth.

No. 26,461.—JAMES W. LAWRENCE, of New York, N. Y., assignor to Himself, HENRY BREWSTER, and JOHN W. BRITTON, of said New York.—*Improvement in Connecting Elliptic Springs to Vehicles.*—Patent dated December 13, 1859.—This improvement lies in the manner of affixing the elliptic spring, generally preferred, upon the back axletree, and of securing the parts in place.

*Claim.*—The manner of combining and securing the back axle and the elliptic spring, specifically as described.

No. 26,462.—CHARLES MILLER, of New York, N. Y., assignor to GEORGE RICARDO, of

said New York.—*Improvement in Sewing Machines.*—Patent dated December 13, 1859.—This invention consists in effecting the releasing movement of the releasing plate by means of a wedge like projection, or its equivalent, formed upon or carried by a shuttle driver.

The inventor says: I *claim*, first, the combination with the shuttle driver K, of the releasing plate and lifter g, as and for the purpose shown and described.

Second. The employment of a shuttle made of two springs *i j*, in the peculiar manner shown and described, in combination with the bobbin *l*, as set forth.

No. 26,463.—E. R. MORRISON, of Brooklyn, N. Y., assignor to S. C. HILLS, of said Brooklyn.—*Improvement in Shingle Machines.*—Patent dated December 13, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of the knife H and projection *v*, in connection with the reciprocating bed, substantially as shown, whereby the bolt is supported as the bed passes underneath it during the cutting or riving operation.

Second. The employment or use of the planers or knives C C, operated by the plates D D, bar E, and ledge or projection F on the bed G, substantially as and for the purposes described.

No. 26,464.—JOHN I. ARMPFIELD, of Jamestown, N. C.—*Improved Apple Parer, Corer, and Slicer.*—Patent dated December 20, 1859.—This invention consists in attaching the cutter that cuts or quarters the peeled apples to a lever connected to another lever, one end of which is fitted on the arbor of the fork, the parts being so arranged that by actuating the lever to which the cutter is attached for the purpose of cutting the apple, the other lever, fitted on the fork arbor, will move toward the cutter and bear against the inner end of the apple, and force the same against the advancing cutter.

*Claim.*—The combination of the levers B C, connected by the link *b*, one lever B being provided with the cutter F, and the other lever C having one end fitted on the arbor D, substantially as and for the purpose set forth.

No. 26,465.—JOHN AUGSPURGER, of Trenton, N. J.—*Improvement in Cattle Pumps.*—Patent dated December 20, 1859.—This invention consists of a device for preventing concussion and violence at the termination of the upward motion of the bucket, and an arrangement by which the quantity of water raised from the well as it comes from the well is at all times proportioned to the weight of the animals, so that the speed of the bucket in being raised from the well may be the same under the operation of different weights of animals.

The inventor says: I *claim*, first, the combination and arrangement of the platform B, levers N N, springs *f*, weight P, rods O, and brake wheels F, operating substantially as and for the purpose set forth.

Second. The arrangement of the float *l*, rod *i*, and valve *k*, in the described combination with and relation to the bucket K and hinged platform B, operating in the manner and for the purpose explained.

No. 26,466.—JOHN H. BAILEY, of Sand Ford, Ind.—*Improvement in Locomotive Traction Vehicles.*—Patent dated December 20, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the means employed for rotating or communicating power to the wheels D D, to wit: the fixed pinion *p* on the shaft H, loose or sliding pinions *q q*, wheels *s*, pinions *v*, and toothed rims *w w*, substantially as described.

Second. The combination of the wheels J D D, when applied to a traction engine and arranged for joint operation, substantially as and for the purpose set forth.

No. 26,467.—S. W. BAKER, of Providence, R. I.—*Improvement in Blankets for Printing.*—Patent dated December 20, 1859.—This invention consists in forming a new kind of India rubber or other elastic blanket, having either its edges or margins, or the whole of its surface, sufficiently roughened to prevent the coloring matter received by it from the printing rollers from running or flowing back upon the edges of the fabric printed.

*Claim.*—A rubber of gutta percha, or other elastic printing band or blanket, having either roughened selvages or margins, or the whole of its surface roughened, substantially as set forth.

No. 26,468.—A. J. BELL, of Greensburg, Ky.—*Improved Wrench.*—Patent dated December 20, 1859.—This invention consists in attaching a jointed lever to the movable or sliding jaw of the wrench, and having a wedge connected to said lever and a tooth, the stem of the wrench being serrated or toothed.

*Claim.*—The combination of the jointed lever F, wedge E, and tooth *e*, with the sliding jaw D and bar A, as and for the purpose shown and described.

No. 26,469.—ALBERT BETTELEY, of Boston, Mass.—*Improvement in Hoisting Machines.*—Patent dated December 20, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, bringing the car to a stop whenever (while in motion) its door may be opened by causing the shipper rope to be pinched or held, substantially as described.

Second. The arrangement, substantially as specified, for causing the car to be stopped at proper times or places; said arrangement consisting of cam *m*, spring *i*, levers K G, operating together and upon the shipper cord.

No. 26,470.—LOUIS BRANDT, of Indianola, Texas.—*Improvement in the Arrangement for Supplying Air to the Furnaces of Steam Boilers from the Wheel-Houses of Steamers.*—Patent dated December 20, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—Supplying air under pressure to the furnace or furnaces of steamers by means of the paddle-wheel and the peculiar curved pipe, with water escape passage leading down from the casing or housing of the same to the fire, or under the grates of the furnaces, substantially as and for the purposes set forth.

No. 26,471.—B. BRIDENDOLPH, of Clear Spring, Md.—*Improvement in Corn Shellers.*—Patent dated December 20, 1859.—The shaft B is rotated in the direction of the arrow; the ears of corn are fed point downward into the spout or trunk G; the wheel C rotates the ears in the spout or trunk G, and also rotates the shaft E; the lower part *d* of the screw F, assisted by the screw corrugations *e* in the lower part of the spout or trunk, feeds the ears downward, while the other part *c* of the screw, in consequence of its quicker thread, shells the corn from the cob.

*Claim.*—The differential feeding and shelling screw F, constructed as described, in combination with the spout or trunk G and surface wheel C, when these several parts are arranged and operate together, in the manner described, for the purpose specified.

No. 26,472.—ROBERT D. BROWN, of Prattsburg, N. Y.—*Improvement in Wagon Brakes.*—Patent dated December 20, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The combination and arrangement of the brake mechanism, lever E, and connecting rod F, when the latter is attached directly to the front axle so as to be operated by the backward movement of the front truck; the said movement being allowed by the slot H, in the reach or coupling bar, and the roller G, in the bolster, substantially as set forth.

No. 26,473.—HENRY F. BROWN, of Chagrin Falls, Ohio.—*Improvement in Skirt Supporters.*—Patent dated December 20, 1859.—This skirt supporter consists of two parts, the body A and expanded portion A<sup>1</sup>.

*Claim.*—An improvement in the supporter, by connecting the hoops or bands by a clasp or inflexible joint, substantially as described.

No. 26,474.—JOSEPH B. BUCKLAND, of Chicopee Falls, Mass.—*Improvement in Coal Sifters.*—Patent dated December 20, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, a dumping or tipping sieve provided with a movable tail piece or gate, so arranged that the tipping or slanting of the sieve causes the opening of the end or side of the same for the free passage of the coal or other substance sifted.

Second. A combination of the scrolls C C and cams D D, with the sieve A, when arranged and operating substantially in the manner and for the purpose as described.

No. 26,475.—BETHEL BURTON, of Brooklyn, N. Y.—*Improvement in Breech Loading Fire-Arms.*—Patent dated December 20, 1859.—*f* is a sliding breech supporter, formed hollow and receiving the rear end of the breech pin *d*, which is formed as a pin 7 setting within the breech supporter, and the two are connected by a cross pin or screw entering a groove 8 around said pin, so that the breech supporter is free to turn without revolving the breech itself, but both are tightly connected together and a space is left at 9 to form a chamber for oil or grease.

*Claim.*—The combination and relative arrangement of the breech supporter *f*, with the sliding breech *d*, sectional screw 10, and guide slot 11, and pin 12, substantially as set forth.

No. 26,476.—R. W. CARRIER, of Sherburne, N. Y.—*Improvement in Hold Backs.*—Patent dated December 20, 1859.—This invention consists in the combination and arrangement of the open hold back loop or eye pivoted lever bar, which has an extension or heel on its lower end, and the flat spring.

*Claim.*—The combination and arrangement of the open hold back loop or eye pivoted lever stop bar, which has an extension or heel on its lower end, and the flat spring, substantially as and for the purposes set forth.

No. 26,477.—S. W. CHAMBERLAIN, of Three Oaks, Mich.—*Improved Gate.*—Patent dated December 20, 1859.—This invention consists in connecting together, by means of suitable

levers, two gates in such a manner that they swing open in opposite directions, and that neither will move independent of the other.

*Claim.*—The arrangement and combination of the gates A A<sup>1</sup>, posts B B<sup>1</sup>, arms D, links E, and levers F, in connection with the cords *f h h<sup>1</sup> h<sup>2</sup> and h<sup>3</sup>*, constructed and operated substantially as set forth.

No. 26,478.—MATTHEW CHAPMAN, of Greenfield, Mass.—*Improvement in Attaching Handles to Cutlery.*—Patent dated December 20, 1859.—This invention will be understood by referring to the claim and engravings.

*Claim.*—Securing handles to cutlery and other tools or implements, by having a screw thread *a* formed on the tangs B, and provided with plain longitudinal surfaces *b*, in connection with the cylinder or nut C, fitted in the handle and hammered or compressed to fit the screw *a* and its plain surfaces *b*, substantially as and for the purpose set forth.

No. 26,479.—JOHN B. CORNELL, of New York, N. Y.—*Improvement in the Construction of Vault Lights.*—Patent dated December 20, 1859.—This invention consists in surrounding each one of any desired number of glasses with a thin band of iron, or some other suitable hard metal, then placing the glasses thus prepared in a suitable shape, and pouring a sufficient quantity of fused iron or some other suitable metal into said mould to embrace the peripheries of said glasses and fill the mould.

*Claim.*—Producing an improved illuminated plate by the process of combining the illuminating and the metallic portions of said plate with each other, substantially in the manner set forth.

No. 26,480.—C. W. CORR, of Carlinville, Ill.—*Improvement in Steam Valves.*—Patent dated December 20, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, providing the extremity of the driving shaft F within the steam chest, with a slot to receive the head *k* of the valve stem, and permit the self adjustment of said head within the slot, as set forth.

Second. The arrangement of the screw threads upon the valve stem, substantially as shown, so that the valve will adjust itself if the friction becomes too great, as set forth.

No. 26,481.—LOUIS MICHEL FRANÇOIS DOYERE, of Paris, France.—*Improvement in Apparatus for Preserving Grain.*—Patent dated December 20, 1859.—By this invention vaults, cellars, and other similar constructions, as well as rooms, may be rendered suitable for preserving corn by lining them internally with the bituminous and metallic cases Y Z, applied one over the other, which form with the material composing the vault or cellar, a strong and impervious granary.

*Claim.*—The method of constructing or arranging air tight chambers or granaries for the preservation of corn or other grain, as described and shown in figures of the engravings.

No. 26,482.—NATHANIEL DRAKE, of Newton, N. J.—*Improvement in Stone Loading Wagons.*—Patent dated December 20, 1859.—This invention consists in a peculiar arrangement of windlasses, placed on a frame mounted on wheels and provided with pawls devised in a novel way.

*Claim.*—The employment, or use, of the shaft D, with one or more drums G placed loosely on it, the shafts and drums being provided with ratchets, in combination with the pawls I and the adjustable bar K, provided with pulleys L, the whole being applied to a mounted frame, and arranged substantially as and for the purpose set forth.

No. 26,483.—JOSEPH L. DUTTON, Sr., of Philadelphia, Pa.—*Improvement in Anti-Friction Boxes.*—Patent dated December 20, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—Interposing between a revolving stationary surface any convenient number of beveled anti-friction rollers, so formed that the portion of each roller on which the revolving surface bears shall be larger in diameter than the portions, or portion, of the roller which bear on the stationary plate, as set forth.

No. 26,484.—THADDEUS FAIRBANKS, of St. Johnsbury, Vt.—*Improvement in Platform Scales.*—Patent dated December 20, 1859.—This invention consists principally in a peculiar application and arrangement of a yoke, stirrup, pivots, and bearings, whereby the lapped ends of the two multiplying levers A B are supported and connected with the depending rod of the steel yard.

The inventor says: I *claim* the arrangement and application of the yoke, stirrup, their concave steps or bearings, and the pivots of the two multiplying and transmitting levers, substantially as specified, the whole being for the purpose and to operate as described.

I also claim, combining with the rod I and the yoke applied thereto, as described, the cap or bonnet *a<sup>2</sup>*, the same being for the purpose as specified.

No. 26,485.—THADDEUS FAIRBANKS, of St. Johnsbury, Vt.—*Improvement in Platform Scales.*—Patent dated December 20, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* supporting the fulcrum of a transmitting lever D by the platform or an extension therefrom, essentially as specified.

I also claim the combination of the rocker block with the stirrup link and the bearing pins, or knife edges of the connected levers C D, substantially as described.

I also claim, constructing the platform frame with the passages  $a^3 a^3$  through each of its end timbers, and for the reception of the inferior arms of the multiplying levers, as described.

And I also claim, providing such platform with loop passages, leading downward out of the lever passages made in the end timbers, as and for the purpose described.

No. 26,486.—JOHN FIRTH and JOHN INGHAM, of Phillipsburg, N. J.—*Improvement in Pipe Moulding.*—Patent dated December 20, 1859.—The object of this invention is to form the moulds without joints, for casting with belts, or bosses, and blackwash the same in a perfect manner.

The inventors say: We *claim*, first, the employment or use of the flexible, or elastic ring E, in connection with the body pattern D, flasks B C, and bottom plate A or its equivalent, for the purpose specified.

Second. Blackwashing the moulds by means of a brush F, or an equivalent device, supplied with the blackwash and passed through the moulds, substantially as and for the purpose set forth.

No. 26,487.—WILLIAM FOSTER and ROBERT FOSTER, of New York, N. Y.—*Improvement in Screw Taps.*—Patent dated December 20, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The combination of the oblique taps C and slotted collar B, with the tapering or conical stock A, substantially as shown and described, so that by turning the collar the cutting threads of the taps will be released from the nut, and thus allow the tool to be drawn, all as specified.

No. 26,488.—WILLIAM FRAZIER, of Hartford, Conn.—*Improvement in Belt Fastenings.*—Patent dated December 20, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The arrangement of duplicate plates A B, of raw hide, or leather, or elastic material, and in providing one, or both, of the plates A B with metallic hooks D, which hooks are made to pass through the perforations in the belt F and in the plate A or B, to connect and hold the two ends of the belt F together, in contradistinction with the use of metallic plates, screws, lace leather, &c., substantially in the manner and for the purpose described.

No. 26,489.—DENNIS C. GATELY, of Newtown, Conn.—*Improvement in the Manufacture of Caoutchouc Belting.*—Patent dated December 20, 1859.—The claim explains the nature of this invention.

*Claim.*—The method described of manufacturing belts or bands of India rubber or gutta percha, the same consisting in placing them in contact with sheets, or strips of paper or cloth, having a smooth enamelled, or polished surface, substantially as set forth, and then heating them as described.

No. 26,490.—W. G. GOODALE and R. L. T. MARSH, of Centralia, Ill.—*Improvement in Steam Excavators.*—Patent dated December 20, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim*, first, the combination, with a locomotive steam engine, of an earth elevator J, or its equivalents, so that the machine may be moved by its own power, under the guidance of an attendant, to the spot to be excavated, then made to load itself and transport the load to the desired place for discharge, in the manner set forth.

Second. The combination, with an excavating machine made as set forth, of a railroad track O, as shown, with or without the turn tables, as set forth.

No. 26,491.—D. B. HALE, of New York, N. Y.—*Improvement in Skirt Supporters.*—Patent dated December 20, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The waist A in combination with the extension B, expanded by the insertion of hoops  $b b^1 b^2$ , having their ends connected by tying them and forming entire circles, substantially in the manner and for the purposes set forth.

No. 26,492.—HAYWARD A. HARVEY, of New York, N. Y.—*Improvement in Chairs for Railroads.*—Patent dated December 20, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* forming the chair with lips extending over the web, or base, of the rails, and with a groove or equivalent reception for a wedge to be driven across the

longitudinal plane of the rails, and passing under the base of the two rails to force and hold them up against the lips of the chair, and to form a base or rest for the ends of the two sections of rails to rest on, substantially as and for the purposes specified.

No. 26,493.—ALEXANDER HAY, of Philadelphia, Pa.—*Improvement in Shoes and Gaiters*.—Patent dated December 20, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—Inserting in the shoe or gaiter, at the points where it is to be fastened, a piece or pieces of elastic rubber cloth for the purpose of fastening the shoe or gaiter, with hooks and eyes, or buttons, or buckles, substantially as described, and thereby dispensing with shoe strings.

No. 26,494.—GEORGE V. HAZARD, of Torrey, N. Y.—*Improved Door Fastener*.—Patent dated December 20, 1859.—To apply this fastener to a door, draw the pivot to the points of A, place the hook or teeth of B against the rabbet of the door and the bar across it, the part A being held in a direct line with B, or nearly so, then shut the door upon the bar, driving the hook or teeth into the jamb, turn down A upon the door or casing and crowd it along upon the pivot, thereby forming a catch resting close against the door and casing and held by the bar B.

*Claim*.—The part A, constructed and arranged as and for the purposes set forth.

No. 26,495.—SIMSON S. HENDERSON, of Oxford, Ohio.—*Improved Rat Trap*.—Patent dated December 20, 1859.—The inventor says: In the operation of this trap I put, in the first place, bait on bait wire *d*, the triggers being self setting. I now take hold of the crank and turn until the springs are almost brought down to the spools H. If now a rat pull on the bait attached to wire *d*, detent *b* will be discharged from dog *a*, which being freed permits striker G to fly round rapidly and strike the rat with force, instantly killing it and throwing it out of the way.

*Claim*.—The combination of springs D with cone spools H, catch *a*, detent *b*, and bait wire *d*, forming the trigger and striker G, the whole operating substantially in the manner and for the purpose set forth.

No. 26,496.—D. K. HICKOK, of Morrisville, Vt.—*Improved Clothes Dryer*.—Patent dated December 20, 1859.—This invention consists in having the shaft of the dryer hollow at the head for the admission of a headed pin which passes through the upper hub to confine it on the shaft.

*Claim*.—The internally grooved hub H and spring catch *c*, in combination with hollow headed shaft S, headed pin P, and securing cord *d*, substantially as and for the purpose set forth, when arranged with hub H<sup>1</sup>, braces B, arms A, and cord *c*<sup>1</sup>.

No. 26,497.—LEVI L. HILL, of Greenport, N. Y.—*Improvement in Hydro-Carbon Vapor Apparatus*.—Patent dated December 20, 1859.—The pressure of air is regulated by the weight N and by the weight on the top F of the air receiver, which must be properly loaded to balance the weight N. By the combination of the two alternately operating bellows with an air receiver a uniform supply of air is obtained.

*Claim*.—The combination, with a vaporizing vessel, of the bellows, air receiver and education pipe, as shown, or in an equivalent manner, for the purpose set forth.

No. 26,498.—EDWIN HOSMER, of Bedford, Mass.—*Improvement in Stump Extractors*.—Patent dated December 20, 1859.—This invention consists of an improved lever and hook stump extractor, as constructed with a combination of a holding tongue and supporter, and with such united by a universal joint in manner and so as to operate, or enable the parts to operate.

*Claim*.—The improved lever and hook stump extractor, as constructed with the combination of the holding tongue H and its supporter K, and with each united by a universal joint, in manner and so as to enable the parts to operate substantially as specified.

No. 26,499.—THOMAS W. HOUCHIN, of Worcester, Mass.—*Improved Machine for Cutting Paper*.—Patent dated December 20, 1859.—A is the frame of the machine, B is the base to which the frame A is attached by means of screws *j* passing through the feet *k* of the frame. The paper to be cut is placed upon the top of the frame, which is covered to form a table, as shown at *d*. The paper is held down firmly on the table while cut, by means of a platen or pressing plate F.

*Claim*.—The combination and arrangement of the knife H, slides I I, and connecting bar L, with coupling arms J J, eccentrics *f f*, and shaft K, substantially as and for the purposes set forth.

No. 26,500.—ENOCH JACOBS, of Cincinnati, Ohio.—*Improvement in Iron Plate Jails*.—Patent dated December 20, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—Improved iron walls for jails and prison houses, consisting of the following parts,

arranged and united as set forth, to wit: The entire wall plates A, having their edges closely abutting the joint plates *e*, united to and uniting the plates A by rivets *i*, which have their riveted ends inwards and countersunk to the depth of the thickness of the plates A, all in the manner and for the purposes set forth.

No. 26,501.—WILLIAM A. KENRICK and GEORGE H. WHITCHER, of Boston, Mass.—*Improvement in Graving Docks*.—Patent dated December 20, 1859.—The claim and engravings explain the nature of this invention.

The inventors say: We claim the floating dock A and the stationary receiving basin or tank B in combination, and as furnished not only with one or more connection pipes and gates for discharge of water from the dock into the tank, or *vice versa*, but with one or more passages and gates arranged in the tank so as either to discharge water therefrom into the sea, or admit it to pass from the sea into the tank, all substantially in the manner and for the purpose as specified.

And we also claim the elevating slide *d* in combination with a connection pipe of the dock and a deep opening *e* made in the tank, the said side being arranged therewith and connected with the dock, substantially as specified.

No. 26,502.—HENRY KIPPLE and JACOB D. BULLOCK, of Philadelphia, Pa.—*Improvement in Car Trucks*.—Patent dated December 20, 1859.—This invention consists of a bolster and platform with intervening springs of any suitable construction, in combination with combined links having sockets below adapted to pins on the under side of the platform, and having similar sockets above adapted to pins on the permanent beams of the track, the whole being arranged on the beams so that the bolster may have a lateral play limited by the links, thus imparting to the car an easy lateral movement as it passes over the curves and uneven portions of the track.

*Claim*.—The bolster D and platform G with the intervening springs I, of any suitable construction, in combination with the inclined links H H, their sockets *h* and *i*, and the pins *a*, the whole being arranged on the truck, substantially as set forth and for the purpose specified.

No. 26,503.—JOHN G. KUNZE, of New York, N. Y.—*Improvement in Piano Fortes*.—Patent dated December 20, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I claim, first, supporting the bridge F on columns or distance pieces *n* to admit of any number of braces for the hitch plate D between the strings and the top of the sounding board, and likewise to admit of a greater vibration of the sounding board, in the manner and for the purpose substantially as described.

Second. I claim the arrangement of additional braces G to the hitch plate D, situated between the strings and the top of the sounding board, and connecting said braces with the braces B on the wooden truss work, situated between the frame A, in the manner and for the purpose set forth.

Third. I claim the application of the bottom sounding board P when in connection with a lower metallic frame or hitch plate L covered with strings, in the manner and for the purposes substantially as described.

Fourth. I claim the elastic spring brace J, to connect the two sounding boards together, for the purpose substantially as described.

Fifth. I claim the arrangement of the strings in two rows, and the use of a curved hammer line in piano fortes where the action strikes the strings from above downwards, as set forth.

No. 26,504.—RICHARD S. LAWRENCE, of Hartford, Conn.—*Improvement in Breech Loading Fire-Arms*.—Patent dated December 20, 1859.—The claim and engravings explain the nature of these improvements.

The inventor says: I claim, first, the combination of the detachable plate B between the barrel and the sliding breech, with the expanding ring *c c*, substantially as and for the purpose set forth.

Second. In combination with the sliding breech plate I claim the hollow nipple *f*, situated in the centre of the gas chamber and projecting forward nearly or quite to the face of the breech, substantially as and for the purpose set forth.

No. 26,505.—JAMES LITTLE, of Evansville, Ind.—*Improvement in Stave Machines*.—Patent dated December 20, 1859.—The inventor says: The nature of my invention relates to certain improvements in stave jointing machines, by means of which, with the use of saws, I am enabled to joint staves, of any length or curve required, upon both sides at the same time.

*Claim*.—The adjustable bed *n* in combination with the rod *r* and lever *r*<sup>1</sup>, all being constructed and arranged to operate, substantially as and for the purposes set forth.

No. 26,506.—JAMES A. LOWE, of New York, N. Y.—*Improvement in Water Traps*.—Patent dated December 20, 1859.—These traps are cast in a metallic mould with a metallic core,

constructed and operating as shown in the specifications of a patent granted to James A. Lowe, bearing date September 27, 1859.

*Claim.*—The water trap shown, when cast without a seam, in lead or composition, as a new article of manufacture.

No. 26,507.—JAMES J. MAPES, of Newark, N. J.—*Improvement in Fertilizers.*—Patent dated December 20, 1859.—The claim explains the nature of this invention.

*Claim.*—The production of a fertilizer for soils by the combination of dried blood with the compound specified as the inventor's improved phosphate of lime, or any equivalent therefor substantially the same.

No. 26,508.—M. R. MARGERUM and T. P. MARSHALL, of Trenton, N. J.—*Improved Clasp for Hitching Straps.*—Patent dated December 20, 1859.—This invention consists in arranging one part of the buckle or clasp in such a manner that it slides freely on the strap when required, having a key hole perforated through the upper side thereof. The other part of the buckle, which is firmly secured to the end of the strap, is provided with a key to fit into the aforesaid hole in the sliding part of the buckle.

*Claim.*—The arrangement of the hole H and key K, in combination with the sliding part A B, for fastening hitching straps, substantially as described and for the purposes set forth.

No. 26,509.—CHARLES MILLER, of Utica, N. Y.—*Improvement in Wood Screws.*—Patent dated December 20, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The construction of wood screws, having a shank or that portion of the wire lying between the thread and the head of the screw reduced in its diameter, so that, without any enlargement of the orifice beyond that made by the stem, the screw may be driven home without increase of friction at the shank, and without injury to the screw or to the hold thereof upon the fibres of the wood, as described.

No. 26,510.—GEORGE MILLER and CALEB M. ANDREWS, of Providence, R. I.—*Improvement in Leather Washers.*—Patent dated December 20, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—A washer constructed of a leather strip, wound in coil form, and with or without the interposition of other substances between its convolutions, substantially as set forth.

No. 26,511.—G. W. MITCHELL, of Jackson, Tenn.—*Improvement in Shuttles for Sewing Machines.*—Patent dated December 20, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The shuttle formed with an open cavity through it in a transverse direction to its movement, with a bobbin to fit the cavity, the heads of the bobbin forming a part of the sides of the shuttle, and being kept in position by the sides of the shuttle race or carrier, substantially as described and set forth.

No. 26,512.—AMOS B. MOREY, of St. Louis, Mo.—*Improvement in Platform Scales.*—Patent dated December 20, 1859.—This invention consists in a new way of constructing and bracing the lever of a platform scale.

*Claim.*—The specific arrangement of the braces B B C C d e and f with the lever A and the head H, as shown and described.

No. 26,513.—JOHN NEWELL, of Lowell, Mass.—*Improved Nail Plate Feeder.*—Patent dated December 20, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, in combination with a magazine for containing a pile of plates, an automatic driver that takes the under plate of the pile and feeds it towards the cutters in regular succession, substantially as described.

I also claim, in combination with the automatic driver, the geared wheel and segment and hinged lever R for turning and moving the nail plate to the driver and to the cutters, substantially as described.

I also claim, in combination with the driver, or the carriage to which it is connected, the lever S with its several connected parts for throwing out and holding out of gear the feeding devices whilst the driver is in the act of bringing up a fresh nail plate, as set forth.

I also claim, in combination with the feeding shaft F and its grooves 1, 2, and 3, the pivoted switch d on the carriage, for the purpose of giving said carriage a rapid retreating and partial advanced motion, and a slow feed motion, substantially as set forth.

No. 26,514.—CÆSAR NEUMANN, of New York, N. Y.—*Improvement in Skeleton Skirts.*—Patent dated December 20, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The spring joint or hinge, arranged and constructed as specified, by which the hoop can be contracted and expanded, substantially in the manner and for the purposes set forth.

No. 26,515.—CARLTON NEWMAN, of Birmingham, Pa.—*Improvement in Preserve Cans.*—Patent dated December 20, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The use of the loose or detached elastic band, when used in connection with the flaring rim *c* on lid *b*, rib, or ridge *e* on, and groove *f*, in the neck of the jar, or the equivalents of said rim, ridge, and groove, arranged, constructed, and used as described, and for the purpose set forth.

No. 26,516.—D. G. OLMSTED, of Vicksburg, Miss.—*Improvement in Cotton Gins.*—Patent dated December 20, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, feeding the cotton into the roll box through a hulling grate *H*, so as to exclude the principal hulls and trash while the seed cotton is admitted, as specified.

Second. I also claim the projections *SS* at the intersection of the ribs of the ginning grate *F* and extension *G*, for the purpose of directing the cotton past the seed space of the lower edge of the hulling grate *H*, in combination with said grate *H*.

Third. I also claim the arrangement of the air directing partition *a*, constructed substantially as described, in combination with the hatchel cylinder *E*, for the purpose specified; at the same time disclaiming its use in any other manner or connection.

Fourth. I also claim the extensions *o o*, when arranged as continuations of the brush wings *d d* around the ends or heads of the brush cylinder, for the purpose specified; while I disclaim the use of wings or fans on the ends of the brush cylinder unconnected with the brush wings *d d*.

No. 26,517.—CHARLES G. PAGE and RALPH J. FALCONER, of Washington, D. C.—*Improvement in Pipe Couplings.*—Patent dated December 20, 1859.—This invention consists in an improvement upon the slide coupling, patented by R. J. Falconer, June 7, 1853.

*Claim.*—Combining with the lateral or transverse movement of the male and female sections *a b*, an endwise movement to effect the tightening of said sections, as set forth.

No. 26,518.—CHARLES GRAFTON PAGE, of Washington, D. C.—*Improvement in Door Bolts.*—Patent dated December 20, 1859.—To effect the purposes of locking and leverage by the loose handle, when the bolt is large and heavy, the inventor says: I use the modification where the handle *c* is in the form of a crank, upon the axle of which is fixed a pinion *s*, which meshes into the rack *t*, this rack being on a part of the guard of the bolt. This bolt is moved back and forth by turning the crank *c* and is locked by the engagement of pawl *x* in the teeth of the pinion *s*.

*Claim.*—The locking of bolts when bolted or shut, by means of rotary handles moving with the bolts, and operating substantially upon the principles set forth.

No. 26,519.—DUBOIS D. PARMELEE, of Salem, Mass., assignor to JOHN A. GREENE, of Beverly, Mass.—*Improvement in the Manufacture of Rubber Articles.*—Patent dated December 20, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The employment in the manufacture of India rubber sheets, whether combined or not, with cloth, and when the same are to be treated in the cold way to effect the change, as described, on either side of the tank containing the hermizing solution, of a feeding mechanism so arranged and operated, that the sheet may be fed in and out of the tank at a uniform rate, and free from injurious handling and draft or strain, substantially in the manner and for the purpose set forth.

No. 26,520.—WILLIAM PATTERSON, of Constantine, Mich.—*Improved Machine for Forming Hubs.*—Patent dated December 20, 1859.—This improvement relates to the manner of cutting the shoulder on the interior of the hub for short boxes, in a plane parallel to the end of the hub, while the cutter is fed by an inclined screw shaft.

It further relates to the combination and arrangement of an adjustable spring bar, with the cutter shaft and adjusting slide, for the purpose of cutting out the interior of the hub, to cut off the ends of the spokes, and thereby prevent them from resting and pressing unequally on the box.

The inventor says: I *claim*, in combination with the swivel nut *i*, having a yielding or spring seat *M*, the adjustable collar *L* and cutter shaft for causing the cutter to form a shoulder in the hub in a plane parallel to the end of the hub, while the cutter is carried and fed by the inclined screw shaft, as described.

I also claim the combination of the guiding spring bar *I* and its adjusting screws *m n*, with the slide *D*, centre disk *G*, and cutter shaft, for the purpose of boring out the interior of the hub, and cutting off the end of the spokes, and thereby prevent the latter from resting and pressing unequally on the box, or on the exposed part of the axle, as described.

No. 26,521.—CALVIN PEPPER, of Albany, N. Y.—*Improvement in Heating Apparatus.*—

Patent dated December 20, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the use of fine silicious sand for radiating heat according to the application thereof, substantially as described, the radiation being principally from the sand, and the radiation from the sand coming from between the meshes of the fine wire gauze screens or openings of minutely perforated metal, or other solid substance, the metallic gauze or perforated metal being used for the purpose of retaining the sand while admitting radiation through its meshes, and the sand being heated by fuel of wood, coal, gas, burning fluid or other fuel, or from hot metal, hot air, hot water, or steam, in stoves, tubes, conductors, or other heating apparatus, substantially as described, and subject to the disclaimers and exceptions, as before stated.

No. 26,522.—ALBION RANSOM, of Albany, N. Y.—*Improvement in Stoves*.—Patent dated December 20, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The application and use, with sheet or thin metal stoves, of an independent hood flue, formed and fitted for attachment to such stoves, as described, for the purpose set forth in the specification.

No. 26,523.—ABRAHAM REESE, of Pittsburg, Pa.—*Improvement in Rails for Street Railroads*.—Patent dated December 20, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—Making iron rails for street railways, of the shape, substantially as described, having on each side a head or projection at one edge of the rail with a flat base extending from the projection or head, to the other side, both sides or faces being finished alike so that the rail may be used either side up, and reversed when one side is worn out.

No. 26,524.—CELESTIN RINGEL, of San Francisco, Cal.—*Improved Gold Washer*.—Patent dated December 20, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The combination of a water wheel with a separating or reducing machine into one apparatus, by using the inner space of a wheel, partly or wholly inclosed as a receiver, dispensing in this manner with couplings or connections, and with a second vessel or receiver, which would have to be set in motion by the water wheel, substantially as and for the purpose described.

No. 26,525.—THOMAS C. ROCHE, of New York, N. Y.—*Improved Stereoscopic Apparatus*.—Patent dated December 20, 1859.—This invention consists in the employment of a skeleton wheel, for the purpose of bringing the pictures one after the other before the eye glasses; and in a particular arrangement of the pictures in such a manner that two pictures are always placed back to back, and that one is upright while the other is upside down, the whole number being connected by tapes into a chain.

The inventor says: I *claim*, first, the employment of a skeleton wheel D, substantially as described, for the purpose of bringing the pictures before the eye glasses.

Second. Placing the pictures C back to back, and so that one is upright while the other is upside down, substantially as and for the purposes specified.

Third. In combination with the chain of pictures C, I claim the arrangement of the sliding partition G, and door F on the slide, and near to the bottom of the box A, substantially as and for the purpose set forth.

No. 26,526.—J. HUNTER SEARS, of Brantford, Canada West.—*Improvement in Breech Loading Fire-Arms*.—Patent dated December 20, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—Combining and applying the hinged breech piece D and the breech screw E, substantially as specified, so that the force applied to a lever attached to a screw, may serve first to withdraw the screw and afterwards throw out the breech piece, as described.

No. 26,527.—JOSIAH SEYMOUR, of Coventry, N. Y.—*Improvement in Working Butter*.—Patent dated December 20, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The construction and arrangement of the tray to retain the fluids, when desired, in washing and working butter; also the manner of securing the tray to the platform or table, so as to be easily tipped up to drain off the fluids in cleansing; the detachable arch frame and rounded wedged shape butter worker for spreading thin while salting, all in combination as specified for the purposes set forth.

No. 26,528.—GEORGE W. SLATER, of New Haven, Conn.—*Improvement in Ships' Stoves*.—Patent dated December 20, 1859.—This invention consists in hanging the stove by means of adjustable or independent thimbles, whereby said thimbles may be cast separately instead of with the whole flue, as formerly, and perfect joints obtained.

*Claim*.—Turning the joints C D D of the thimble *b* and sockets *c*, attached respectively to

the swinging flue *a*, stove A, and stationary flue C<sup>1</sup>, substantially as and for the purpose set forth.

No. 26,529.—ANANIAS SMITH, of Niagara Falls, N. Y.—*Improvement in Surface Condensers for Steam Engines*.—Patent dated December 20, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the employment, in connection with a steam engine and its boiler, of a revolving bucket wheel arranged to receive the exhaust steam from the engine, and made to rotate in a reverse direction to its issues in a cylinder or vessel containing water from which the boiler of the engine is fed, the exhaust steam being condensed by direct impingement with and adding to said feed water, essentially as specified.

Second. The combination with the revolving bucket or wheel constructed to receive the exhaust steam from the engine and cylinder, or vessel containing the condensing liquid or feed water in which the wheel rotates, and by direct contact with which water the exhaust steam is condensed in the manner described, of a surface cooling apparatus formed by providing said feed water vessel with a jacket or tubes, or their equivalents, through which a cooling liquid is made to pass or circulate, free from admixture with the water in the vessel that directly effects the condensation of the steam, substantially as specified.

No. 26,530.—GEORGE SMITH, of New York, N. Y.—*Improvement in Pipe Nippers*.—Patent dated December 20, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The combination, with the slotted lever A, of the movable claw B, grooved pin C and holding spring D, as shown and described, so that the claw may be readily removed from one side of the lever to the other, thus forming a right or left handed instrument at pleasure, all as set forth.

No. 26,531.—NATHAN SPICER, of St. Paul, Minn.—*Improved Lever Escapement for Time Pieces*.—Patent dated December 20, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The combination of the two sets of teeth on the scape wheel and the single pair of pallets, or their equivalent, with two, or more, forks on the lever operating upon and operated upon by a single pin or cylinder, attached to the balance, the whole operating substantially as set forth for the purpose specified.

No. 26,532.—HENRY STEINWAY, of New York, N. Y.—*Improvement in Grand Pianos*.—Patent dated December 20, 1859.—This invention consists in a certain arrangement of the strings of a grand piano forte, whereby, says the inventor, the performer is enabled not only to obtain all the results obtained in piano fortes of other forms by overstringing, but is enabled to bring the bridges nearer to the middle of the sound board than they are in any other grand piano forte.

*Claim*.—The arrangement of the strings *b b* of the lower notes, and those *c c* of the higher notes of a grand piano forte, substantially as shown and described.

No. 26,533.—OREN STODDARD, of Busti, N. Y.—*Improved Device for Feeding the Bolt in Shingle Machines*.—Patent dated December 20, 1859.—This invention consists in a novel arrangement of the feeding device for presenting the bolt obliquely and automatically to the knife, so that the shingles will be rived from the bolt in taper form.

*Claim*.—The ratchets *j j*, attached to the feed shafts H H<sup>1</sup>, provided each with alternate long and short teeth, and operated by the pawls *k k* and slide K from the knife gate, or frame E, in the manner specified.

No. 26,534.—C. L. TAILLANT, of New York, N. Y.—*Improved Invalid Couch*.—Patent dated December 20, 1859.—This invention consists in the mode of constructing and arranging an adjustable back, or head and shoulder supporter, and removable chair back with a couch having drawers and service basins concealed in the bottom thereof, in such a way as to afford the patient any desired change of position.

*Claim*.—The method of constructing an invalid couch, arranged and operating in the manner and for the purposes set forth.

No. 26,535.—ROBERT N. TATE, of New London, Conn.—*Improved Mast Scraper*.—Patent dated December 20, 1859.—This invention consists in having a steel plate provided with a concave edge, or edges, corresponding with the convexity of the mast, or masts, to be scraped, said plate being attached to a suitable tang, or handle, so that the plate may be drawn down against the mast and a comparatively long concentric scraping service made to act upon it.

*Claim*.—An implement, or tool, composed of a steel plate A, provided with one or more concave edges and attached to a suitable tang, or handle, to form a new and useful article of manufacture, for the purposes set forth.

No. 26,536.—JOSEPH THORNE, of New York, N. Y.—*Improvement in Sewing Machines.*—Patent dated December 20, 1859.—This invention consists in the arrangement of the parts for giving the motions to the needle bar, and also to the bar which drives the shuttle.

*Claim.*—The specific arrangement of the parts described, for giving the appropriate motions to the needle bar and to the shuttle driver.

No. 26,537.—E. L. PRATT, of Philadelphia, Pa.—*Improvement in Thread Tension for Sewing Machines.*—Patent dated December 20, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—Separating and holding the coil B<sup>1</sup>, at the openings through which the thread E<sup>1</sup> passes in and out between it and its fellow B, or support, by means of the strips D and D, or their substantial equivalents, for the purpose of allowing a free passage of the said thread without causing friction on the openings, and for the better adjusting or changing the thread whilst the spring remains at the proper working tension, as described.

No. 26,538.—G. TIGNERES, of Covington, La.—*Improvement in Repeating Pistols.*—Patent dated December 20, 1859.—This invention consists in the cock *h* assuming a position to strike on a cap which fires each barrel separately, beginning at the upper one and continuing to the lower one. This movement is effected by the draw on the trigger, which is a sliding one. The trigger is allowed to slide forward after the firing of each barrel preparatory to making the connection required to secure this movement.

The inventor says: I *claim* the rack *t*<sup>1</sup> and dog *u*, in combination with a sliding trigger, when arranged and operated as or substantially as and for the purpose set forth.

I also claim in combination the plate *c*, the arm *o*, the bar *x*, and the plate *a*, when arranged and actuated on as described.

No. 26,539.—JOHN G. TREADWELL, of Albany, N. Y.—*Improvement in Gridirons.*—Patent dated December 20, 1859.—This invention consists in the employment of a gauze wire screen or its equivalent, when the same is used in combination with an ordinary gridiron.

*Claim.*—The employment of the gauze wire screen A or its equivalent, the gridiron C and the cover D, when the same are used substantially as and for the purposes specified.

No. 26,540.—THOMAS SPURR WHITMAN, of New York, N. Y.—*Improvement in Attaching Skates to Boots.*—Patent dated December 20, 1859.—This invention consists in furnishing the soles of boots or shoes with metal plates, the front part of the sole having a plate with a box passing through the sole and flush with its surface, in which box are a recess and a transverse bar for receiving and holding a tongue projecting from the sole plate of the runner, and on the inside of the heel is a recessed plate for receiving a spring pin, which is attached to the heel plate of the skate iron.

*Claim.*—Uniting the skate iron to the sole of the boot or shoe essentially in the manner and for the purposes stated.

No. 26,541.—H. WILVERTH, of Caseyville, Ky.—*Improved Artificial Fuel.*—Patent dated December 20, 1859.—This composition is made in the following proportions: One hundred parts of coal dust, eight parts of coal tar, one part of common salt or alum, and two parts of cream of lime.

*Claim.*—A composition formed by mixing the above mentioned ingredients together, in the proportions and in the manner specified and for the purpose set forth.

No. 26,542.—EDWARD WIRTHS, of New York, N. Y.—*Improvement in Skate Fastenings.*—Patent dated December 20, 1859.—This invention consists in so attaching the side pieces B B to the ordinary skate A, that the same being adjustable by means of the screws G G, shall accommodate the skate to a foot of any size, and at the same time answer as a covering for the front portion of the foot, and serve, in connection with the heel band E, to attach the skate firmly to the foot.

*Claim.*—The mode of attaching the side pieces B B to the skate A, for the purpose of adapting the same to feet of different sizes, when the same shall be arranged and operated as set forth.

No. 26,543.—ROBERT W. WRIGHT, of New Haven, Conn.—*Improvement in Machines for Feeding Up, Cutting, and Pasting Directions on Newspapers.*—Patent dated December 20, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—In combination with a strip, or fillet of paper, on which the names or addresses are equi-distantly arranged, an intermittent feed motion, and a pasting, cutting, and carrying device working automatically together, substantially as described and represented.

No. 26,544.—JAMES R. BROWN, of Boston, Mass., assignor to Himself and J. HENRY NORTON, of Medford, Mass.—*Improved Pipe Cutter.*—Patent dated December 20, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The inventor says: I *claim*, as a new or improved article of manufacture, the pipe cutting instrument, as constructed with the hinged and recessed jaws, the movable cutter, the adjusting screw, and the spring shank or shanks, extending from the jaws and having a connection hook, or its equivalent, all substantially as specified.

No. 26,545.—THOMAS H. BURRIDGE, of St. Louis, Mo., assignor to Himself and THOMAS W. USTICK, of said St. Louis.—*Improvement in Printing Presses.*—Patent dated December 20, 1859.—This invention consists in imparting the ordinary motion to the table of a printing press by applying steam power directly to the table of the press, without complex machinery of any kind intervening between the table and the piston rod of the engine.

*Claim.*—The direct application of steam power to the type table of a printing press, and in causing the same piston that actuates the said table to arrest the momentum thereof, substantially as described.

No. 26,546.—LEWIS S. CHICHESTER, of New York, N. Y., assignor to H. G. EVANS, of said New York.—*Improvement in Cotton Packers.*—Patent dated December 20, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—Pressing cotton and other fibrous substances into sacks H by placing the same on a hollow cylinder G, fitted over an aperture of corresponding diameter in the flooring A, and having clamps I I bearing or pressing against the sack on the cylinder, and so arranged as to allow the sack to render or give over the cylinder under the pressure of a plunger D while pressing the substance into the sack, substantially as described.

No. 26,547.—HOMER H. DIKEMAN, of New Haven, Conn., assignor to IRA DIKEMAN & SON, of said New Haven.—*Improvement in Shifting Tops for Wagons.*—Patent dated December 20, 1859.—This invention consists in making the bows to sustain the cover of wagons with hinge or knee joints, and in attaching the side or curtain to the bows in such a manner by screw bolts and nuts that the top can be readily removed and attached to another wagon, or stored away.

*Claim.*—The shifting side or curtain rail in combination with the jointed bows, when the whole is constructed, connected, and made to serve the purposes designed, substantially as described.

No. 26,548.—WILLIAM D. HALL, of Hamden, Conn., assignor to the QUINNISSIAK COMPANY, of said Hamden.—*Improvement in Fertilizers.*—Patent dated December 20, 1859.—The claim explains the nature of this invention.

*Claim.*—Preparing concentrated artificial manure by boiling fish in common fresh water until the whole is thoroughly cooked; then removing it from the vessel, and when sufficiently drained, sprinkling on it from one to three per cent., (usually about two per cent.,) by weight, of sulphuric acid, mixing thoroughly and drying by solar or artificial heat, when the whole is effected, substantially in the manner and by the process described.

No. 26,549.—BENJAMIN F. LEE, of New York, N. Y., assignor to the NEW YORK RUBBER COMPANY.—*Improvement in India Rubber Belting.*—Patent dated December 20, 1859.—The claim explains the nature of this invention.

*Claim.*—As a new and useful article of manufacture, the combination belting or banding specified, and consisting of two or more thicknesses or layers of fibrous material cemented and quilted together, substantially as set forth.

No. 26,550.—FREDERICK MATHUSHEK, of New York, N. Y., assignor to Himself and WELLINGTON WELLS, of said New York.—*Improved Piano Forte Action.*—Patent dated December 20, 1859.—The inventor says: The operation and effect of these improvements are, that the auxiliary jack sustains the weight of the hammer, relieving the main jack and allowing it to return easily under the knuckle. It also adds stiffness and force to the blow of the hammer.

*Claim.*—The combination of the auxiliary jack A D, the regulating screw E F and J, the improved but G, and improved arrangement of spiral spring I with the French action, arranged substantially as set forth.

No. 26,551.—DUBOIS D. PARMELEE, of Salem, Mass., assignor to JOHN H. GREENE, of Beverly, Mass.—*Improvement in the Manufacture of India Rubber Hollow Moulded Articles.*—Patent dated December 20, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—Making hollow articles of India rubber, or its equivalent, or their compounds, when the same are to be treated in the cold way after moulding to effect the "change," as described, by shaping the articles in moulds from bags formed of such rubber, and exhausting the air from between said moulds and the bags, substantially as set forth.

No. 26,552.—SYLVENUS WALKER, of Boston, Mass., assignor to D. W. SMITH, of Somer-

ville, Mass.—*Improved Boot Strap Fastener*.—Patent dated December 20, 1859.—This invention consists of a thin metal plate of a convenient form, to which is attached a series of hollow rivets or eyelets, which are to be passed through corresponding holes made through the strap and boot leg, and are then to be riveted, by means of a suitable tool, so that they can be closed down upon the boot leg at a single operation.

*Claim*.—As a new article of manufacture, the above described boot strap fastener, consisting of the plate or shield C and hollow rivets or eyelets *b*, substantially as described.

No. 26,553.—NORMAN ALLEN, of Unionville, Conn.—*Improved Vise and Saw-Set*.—Patent dated December 27, 1859.—This invention consists in attaching a saw-set to a slotted bar, which is hinged to a vise and provided with an adjustable centre, the parts being so arranged that, when the vise is required to be used in order to hold the saw while filed, the slotted bar is allowed to hang by the side of the vise out of the way, and when the saw-set is required for use the bar of the saw-set is allowed to be secured in the vise in a proper working position.

*Claim*.—The vise formed by the bars A A, with the jaws *b b* attached, the movable bar being actuated by the treadle B, rod C, and toggle D, or their equivalents, in combination with the saw-set formed of the bar or bed G attached to the vise by the rod F, and provided with the beveled plate *i*, gauge *j*, and adjustable centre H, substantially as and for the purpose set forth.

No. 26,554.—WILLIAM H. BAKER, DANIEL DEAN, and B. L. FETHEROLF, of Tamaqua, Pa.—*Improvement in Straw Cutters*.—Patent dated December 27, 1859.—This invention consists in the employment of a double edged reciprocating knife, feed mechanism, and pressure bed.

The inventors say: We *claim*, first, the double edged reciprocating knife C, in connection with the bed P, arranged to operate substantially as and for the purpose set forth.

Second. The arrangement of the eccentric H, yoke I, slide J, lever frame M, and bars O, substantially as shown and described, for operating conjointly the feed bar L and pressure bar P.

Third. The eccentric plate *o*, placed in the shaft *i*, when used in connection with the slide J, to control its longitudinal movement, for the purpose set forth.

No. 26,555.—WILLIAM BANHAM, of San Francisco, Cal.—*Improvement in Machines for Pulverizing Quartz*.—Patent dated December 27, 1859.—This machine consists of a circular cast-iron trough, seen at T, made in segments or sections, four or six segments completing the circle, having flanges on each end of the segment on the under side, by which they are bolted together, forming one continuous circle, without obstruction or unevenness on the inside; four cast-iron drags or grinders D made to conform upon the bottom with the inside of the trough.

*Claim*.—The circular troughs T T<sup>1</sup>, constructed as described, in combination with the drags D D<sup>1</sup> at the extremities of the radial arms *a*; the whole constructed and operated substantially in the manner and for the purpose set forth.

No. 26,556.—RUSSELL D. BARTLETT, of Bangor, Me.—*Improvement in Veneering Machines*.—Patent dated December 27, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The application of the throat gauge to the main and secondary cutters, so that both the gauge and the secondary cutters can be turned upward away from the log, under circumstances and for the purpose or object substantially as set forth.

No. 26,557.—GEORGE W. BEARDSLEE, of Flushing, N. Y.—*Improved Magneto-Electric Machine*.—Patent dated December 27, 1859.—This invention consists in the employment of two oppositely vibrating conductors, insulated from each other and simultaneously operated by the alternately reversed currents from a magneto-electric machine, which conductors vibrate between two sets of conductors, each set of which is connected with one of the terminal wires of a magneto-electric machine, so that each vibration shall break the connection between one of the vibrating conductors and one of the terminal wires, and establish the connection with the other terminal of the machine, and *vice versa* with the other vibrating conductors.

*Claim*.—The mode of operation of the pole charger, by which the current is made to travel in the same direction, substantially as described.

No. 26,558.—GEORGE W. BEARDSLEE, of Flushing, N. Y.—*Improved Magneto-Electric Machine*.—Patent dated December 27, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the compound magnet described, consisting of radial poles arranged about a common centre and connected together at their inner ends, substantially as and for the purpose described.

I also claim forming such a compound magnet with radial poles connected at their inner ends by cutting out the radial poles and connecting rings from a single plate, substantially as and for the purpose specified.

I also claim, in combination with rotating magnets, the insulated rings to which the terminal wires of the helices are connected, substantially as described.

No. 26,559.—JAMES BOUTON, of Macon City, Mo.—*Improvement in Seeding Machines.*—Patent dated December 27, 1859.—The scraper for covering the seed is shown at E; it is attached to the end of the beam G by means of a pin, the attaching end being made in the form of a crotch, so as to straddle the pipe D; the scraper is kept upon the ground with more or less force by means of a fixed spring F fastened to the beam G; the distance the valve *f* is open is regulated by the lever *t*, which is held in notches *r r* in any required position.

*Claim.*—The arrangement of the wheels *b b*, pipes C D, coverers E, springs F and *n*, and the yielding beam *c*, in the manner described; and also, the arrangement of the valve *f* in the hopper P, in the manner described, for the purpose specified.

No. 26,560.—SAMUEL BOYD, of Brooklyn, N. Y.—*Improvement in the Manufacture of Hoes.* Patent dated December 27, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The combination with the drop G and anvil B, of the drop opening *f* and mandrel C, so that after the drop has given its blow, it will hold the hoe in place and allow the mandrel C to be passed through into the hoe to form and finish the eye thereof, all as shown and described.

No. 26,561.—OLIVER G. BRADY, of New York, N. Y.—*Improvement in Guiders for Sewing Machines.*—Patent dated December 27, 1859.—This invention consists in a certain construction and arrangement, relatively to each other, of a guiding tube and a grooved presser, whereby the cord can be inserted within a fold, or between two thicknesses of fabric, in straight, curved, or zigzag lines, in such manner as to bring all the fullness produced by the cord on one side of the fold or plait, leaving the opposite side perfectly even or flat.

*Claim.*—The combination of the presser, having its sole formed with a curve *d*, a grooved toe *f*, and a recess *e*, as described, and the curved guide tube *g*, arranged relatively to the edge and toe of the presser, as described, and operating as and for the purpose specified.

No. 26,562.—RHODOM M. BROOKS, of Greenville, Ga.—*Improvement in Cotton Seed Planters.* Patent dated December 27, 1859.—H is the seed box; I is the driving wheel, which has an iron tire or band around its periphery; J J are iron scrapers, intended to cover the seed; they are attached by bolt V to an arm K, which is connected with the handles; the action of J J is governed by the elevation or depression of the handles D D; L L represent guards and braces for the seed box.

*Claim.*—The arrangement of the wheels I E F G and N, the seed box H, the handles D D, the bar S, the braces L, coulter or opener B, coverers J, arm K, and brace W, as described, and for the purpose set forth.

No. 26,563.—RHODOM M. BROOKS, of Greenville, Ga.—*Improvement in Ploughs.*—Patent dated December 27, 1859.—A is the plough hoe or scraper, which is so arranged that it can be turned and sharpened by its operation in ploughing; B is the turning wing or share, secured to the plough beam J by clamps U and screw bolt C; D is a piece of iron attached to the plough foot and extending back to protect the rod F from damage; E E are the nuts and washers on the end of rod F, by which the plough hoe A is confined.

*Claim.*—The arrangement of beam J, screw foot F, notch *v*, plough hoe A, opening P, mould boards O, openings W, nuts E E, holes I I I, constructed as described for the purpose set forth.

No. 26,564.—GEORGE COOK and HANNIBAL I. KIMBALL, of New Haven, Conn.—*Improvement in Top Props for Carriages.*—Patent dated December 27, 1859.—This improvement consists in passing the shank of the screw bolt (which is the standard of the prop) through the bow of the carriage top, and passing a loose collar on this screw bolt or standard, this thimble reaching through the whole extent of the socket of the joint bar of the carriage top.

*Claim.*—The combination of the thimble or pipe *e* or *g*, with the screw bolt or standard *a* or *b*, and the joint bars B or C, when the whole is constructed and used substantially as described.

No. 26,565.—SAMUEL F. COVINGTON, of Indianapolis, Ind.—*Improved Register for Railroad Cars.*—Patent dated December 27, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The indicator A, when operated in connection with the telegraph instrument, or its equivalent, using the Roman numerals or their equivalents, and operating the same substantially as and for the purposes set forth.

No. 26,566.—ISAAC R. CRANE, of Warsaw, Me.—*Improvement in Ditching Machines.*—Patent dated December 27, 1859.—This invention consists in constructing, arranging, and combining certain mechanical devices in a machine for the purpose of ditching.

*Claim.*—The arrangement of the guide wheel P with the frame A, and with the arrangement of devices for operating the said wheel, as described.

No. 26,567.—LEBBEUS B. MILLER, of Newark, N. J., assignor to AARON D. CRANE, of Boston, Mass., D. F. TOMPKINS and L. B. MILLER, and C. T. TOMPKINS, of Newark, N. J., and DANIEL HOLSMAN, of Passaic, N. J.—*Improved Machine for Turning Irregular Forms.* Patent dated December 27, 1859.—In operating this machine, the cutter head A A<sup>1</sup> and material E being set in motion at a high rate of speed, the centrifugal force will throw the cutters c as far out as they can go, and until the small rollers in O O are brought in firm contact with the consolidated cams former B. The material is then brought up into contact with cutters c, and the cutter head is made to move along the shaft S in a direction longitudinal to the work, and the consolidated cams or former B are brought also along the shaft S in a longitudinal direction at the proper speed, and into or out from the cutter head by means of the contact of the rollers in c.

The inventor says: I *claim*, first, the double disk cutter head A A<sup>1</sup>, constructed substantially in the manner and for the purposes described.

Second. I claim the consolidation of the separate cams b b, Figs. 5 and 6, into a solid former or consolidated cams B, Figs. 1, 2 and 7, and the use of such consolidated cams or former, in combination with the said Crane's lathe.

Third. I claim the use of the levers m m, Figs. 1 and 2, formed and adjusted in the cutter head, substantially as described.

No. 26,568.—I. G. GOSHON, of Shippensburg, Pa., assignor to Himself, H. RUBY, JOHN WONDERLICH and H. R. RUBY, of said Shippensburg.—*Improvement in Railroad Car Couplings.*—Patent dated December 27, 1859.—This invention consists of a longitudinally moving shaft held in position by a semi-circular spring, and to which the bolt is attached.

*Claim.*—The longitudinal moving shaft A, in combination with the spring s, bolt a, arm b, and projection c, substantially as and for the purpose set forth.

No. 26,569.—GEORGE W. DANA, of Durand, Ill.—*Improved Lock.*—Patent dated December 27, 1859.—The object of this invention is to obtain a burglar proof and powder proof lock, one admitting of change or permutation, and one also that may easily be manipulated, both as regards the effecting of the change and the locking and unlocking of the lock.

The inventor says: I *claim*, first, the employment or use of a series of spindles G K, provided with slots or recesses h m, and with lettered caps Q, connected by catches p, the spindles being arranged directly with the bolts as with C, or indirectly by means of a wheel F as with B, either or both, for the purpose set forth.

Second. The slide bar D provided with the projections f f, arranged relatively with the slots B C, and connected with the guard wheel H, as shown, in connection with the wheel F and spindles G, arranged to operate as and for the purpose set forth.

No. 26,570.—NEWELL DANIELS, of Milford, Mass.—*Improved Cloth Holder in Needle Work.*—Patent dated December 27, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—As a new article of manufacture, a lady's work holder to hold the work by the action of the piece B, towards and in connection with the solid part of the frame A, when constructed and operating substantially in the manner and for the purpose as set forth and described.

No. 26,571.—JOHN DANNER, of Canton, Ohio.—*Improvement in Sleeping Chairs for Railroad Cars.*—Patent dated December 27, 1859.—A represents the floor of the car to which are fastened the frames B of the seats C. The frames B and seats C do not differ materially from the frames and seats in common use. To the top of the inside of the frames B are attached the back supporting pieces b, having long slits or openings c, and curved bottom openings d.

The inventor says: I *claim*, first, the link supporting device F G H, in combination with the seats, constructed substantially as described and for the purpose set forth.

Second. I claim the combination with the seats C and frames B of the backs D, folding head rests I, slotted pieces b, arranged and operating in relation to and in combination with the limb supporting device F G H, substantially as and for the purposes set forth.

No. 26,572.—L. A. DOLE, of Salem, Ohio.—*Improved Washing Machine.*—Patent dated December 27, 1859.—This invention consists in the combination of the slotted arms of the rubbing board with the hinged inclined suspending links of the pivoted lever frame, whereby as the lever frame is moved forward the rubber is caused first to move downward in the path of the vertical circle, until it is resisted by contact with the clothes and the stationary vertical board, and then by reason of a continuance of the pressure, caused to rise perpendic-

ularly, and thus subject the clothes to a rubbing action similar to that performed by the hand on a washboard.

*Claim.*—The arrangement, consisting of the tub A, rubber B, hinged rubber C, slotted arms *a b*, lever frame D, and hinged inclined links E E, in the manner and for the purpose described.

No. 26,573.—FRANCISCO DOMENECH, of Ponce, Island of Puerto Rico.—*Improvement in Clarifying Cane Juice.*—Patent dated December 27, 1859; patented in the Island of Puerto Rico, August 17, 1858.—This invention consists of a method of determining with accuracy the quantity of lime necessary to be added to the raw juice or syrup as it comes from the mill to defecate or purify the same.

*Claim.*—The method of determining the amount of lime necessary to be added to the raw juice to defecate the same, by the employment of the volumetric method, as set forth.

No. 26,574.—EUGENE DUCHAMP, of St. Martinsville, La.—*Improvement in Apparatus for Evaporating Sugar Juices.*—Patent dated December 27, 1859.—This invention consists in arranging in the front end of the furnace a vertical boiler which shall serve as a steam boiler to generate steam for the machinery employed in the crushing of the cane, and to construct this vertical boiler so that the cane trash, or bagasse, may be fed down through its centre and be supplied to the fire in a state fit for combustion, so that the bagasse may be used directly from the crushing mill as a suitable fuel.

The inventor says: I *claim*, first, the arrangement of a vertical boiler F in front of the furnace having a funnel I, spiral conveyer J, and cone K, when the whole are combined for the purpose and in the manner set forth.

Second. I claim in combination with the above vertical boiler, the semi-cylindrical concentrating boiler N, when the same is constructed and arranged in the manner and for the purposes represented and specified.

No. 26,575.—A. M. DYE, of Clinton, Ill.—*Improved Bed Bottom.*—Patent dated December 27, 1859.—This invention relates to an improvement in that class of bed bottoms in which wire upholstery springs are used to impart a requisite degree of elasticity; its object is to obtain a facile mode of straining or tightening the webbing of the bottom.

*Claim.*—The attaching of the traverse bars *d d* of the frame A to the side strips *c c*, by means of the dovetail slides *e* and sockets or guides *f*, provided with the screws *g*, and attaching the bars *a* of the frame B to the side strips *b b* by means of the set screws *k*, substantially as and for the purpose specified.

No. 26,576.—LUCIUS EDDLEBLUTE, of Garden Valley, Cal.—*Improved Amalgamator.*—Patent dated December 27, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The combination of the bars *b* with the inclined or beveled slats *a* and inclined top A and bottom B, as shown, so that the water has an easy access, and its fall first strikes the edges of the bars *b*, and thus avoids the washing out of the quicksilver, all as set forth.

No. 26,577.—SERAPHIN ESPACH, of Cincinnati, Ohio.—*Improved Bedstead.*—Patent dated December 27, 1859.—This invention consists in the arrangement and combination of parts for the construction of bedsteads, as shown in the claim.

*Claim.*—The described arrangement and combination of parts consisting essentially of the foundation J and its springs L M, the posts A, rails C D, hooks F and their sockets, the braces P Q and their adjusting screw O, and the lattice work head and foot boards, all substantially as and for the purpose set forth.

No. 26,578.—FRANCIS J. FLOWERS, of Rahway, N. J.—*Improvement in Extension Seats for Carriages.*—Patent dated December 27, 1859.—This invention consists in folding a seat so that the space occupied by the permanent seat is filled, forming a level surface to receive its cushion when the extension seat is folded. When open the width of the extension seat is decreased and its height raised, whereby foot and leg room is gained.

The inventor says: I *claim*, first, the operation and combination of the raising bar H, or its equivalent, with the parts A and B.

Second. I claim the combination of the recess J J with the legs B B.

Third. I claim forming the joints L L L L, in combination with the boot, for the purpose set forth.

No. 26,579.—HENRY GARBANATI, of Brooklyn, N. Y.—*Improved Carving Fork.*—Patent dated December 27, 1859.—This invention consists in providing the carving fork with two guards, spurs, or projections, one on each side of the fork, to be used as guards or fulcrum when the fork is operated as a lever, and so made permanent, or a part of the body of the fork that no space is offered for the lodgment of dirt.

*Claim.*—The permanent spur guard *c* and the fulcrum guard *b*, in combination with a carving fork, substantially as described.

No. 26,580.—DENNIS C. GATELY, of Newtown, Conn.—*Improvement in the Manufacture of India Rubber Belting*.—Patent dated December 27, 1859.—The claim explains the nature of this invention.

*Claim*.—The improvement in the manufacture of machine belting or banding, composed wholly or in part of India rubber or gutta percha, the same consisting in rolling or winding up the belt or band with any suitable non-adhesive substance or composition interposed between its folds or layers, and then heating it, substantially in the manner and for the purpose described.

No. 26,581.—HENRY GILLIARD, of Mount Hope, Wis.—*Improvement in Cultivators*.—Patent dated December 27, 1859.—This invention consists of a circle fastened permanently to the beam, and provided with holes for the bolts which hold the jointed bars carrying the cultivator teeth, which bars are hinged to the beam in the centre of the circle, so that they can be vibrated and arranged to stand forward opposite to or behind the centre of the circle.

*Claim*.—The arrangement of the permanent circle G and jointed bars J J, when the whole is constructed for joint operations, as set forth.

No. 26,582.—JOHN GORE, of Brattleboro, Vt.—*Improvement in Harvesters*.—Patent dated December 27, 1859.—In the construction of this invention, D is the oscillating draw bar of the cutting apparatus; E is the curved guide to which the bent foot lever is connected for raising or lowering the cutter bar; F is the lower guide or bearing; I is the foot lever for opening the segment or curved guide E, and by it elevating the cutters; N is the hook, on which the draw bar D turns.

*Claim*.—The use of the lever M<sup>1</sup>, constructed as described, in combination with the tapering draw bar D for elevating the cutting apparatus of the harvesters, in the manner described.

No. 26,583.—JOHN GRAY, of Nashville, Tenn.—*Improvement in Self Adjusting Counter Braces of Truss Bridges*.—Patent dated December 27, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The application to counter braces in truss bridges of a socket at the top, a heel and key at the bottom, by which the counter braces in truss bridges are made self tightening and adjusting, as described.

No. 26,584.—J. P. GROSVENOR, of Lowell, Mass.—*Improved Machine for Planing Curved Surfaces*.—Patent dated December 27, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the employment or use of the adjustable or yielding feed rollers L L, when combined with a bearing roller M or a proper bearing surface, and arranged relatively with each other, as shown and described, to admit of the feeding of circular, oval, and serpentine form to the cutters.

I further claim placing the rollers L L in an adjustable frame or box G fitted in an adjustable box E, and used in connection with the elastic bars N N or their equivalent and the bearing roller M, whereby the frame or pattern may be properly adjusted and retained in proper position between the rollers while being acted upon by the cutters.

No. 26,585.—JOHN A. GRUMWALD, of New York, N. Y.—*Improvement in Circular Looms*.—Patent dated December 27, 1859; patented in France, September 20, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the manner of weaving in a horizontal circular plane by means of two or more wefts, and an arrangement of warps placed alternately above and below the weft threads, arranged and constructed in the manner substantially as described.

Second. I claim the arrangement of the weft bobbin carriage, in combination with the arrangement of regulating the extension of the weft thread, substantially as described.

Third. I claim the arrangement and construction of the tension levers for the purpose of maintaining the tension of the warp threads as well as the friction against the warp bobbins, acting together in the manner and for the purpose substantially as set forth.

Fourth. I claim the arrangement of the serrated pulley W, in combination with the rollers W<sup>1</sup> and W<sup>2</sup>, operating together in the manner described, and for the purpose of delivering the manufactured article as fast as finished and at a regular tension, substantially as specified.

Fifth. I claim the arrangement of the disengaging gear, constructed as described, and for the purpose of throwing the loom out of gear as soon as one of the weft threads breaks, the same being operated by a lever attached to the weft bobbin carriage and acted upon by the weft thread, in the manner substantially as set forth.

No. 26,586.—JAMES HARRISON, Jr., of New York, N. Y.—*Improvement in Sewing Machines*.—Patent dated December 27, 1859.—The claim and engravings give an idea of the nature of this invention.

The inventor says: I *claim*, first, the rotary needle guide disk c, constructed and operated in the manner and for the purpose described.

Second. The arrangement of the following devices for holding and operating the shuttle,

viz: the arm *l*, the revolving button *m* slotted to receive the arm *l*, the shuttle case *o*, rod *i*, and its head *j*, spring *k*, and legs *h*, all constructed and operating substantially as described.

Third. Constructing the shuttle with the ridge and holes and thread space, as described.

Fourth. Inserting the lever bar *x* in the needle bar *w*, and operating it as described.

No. 26,587.—T. S. HEPTINSTALL, of Mendota, Ill.—*Improvement in Gang Ploughs*.—Patent dated December 27, 1859.—The front wheel A and hind wheels B, by means of the front shaft C, the rod G, the triangle F, its spindle E, and the hind shafts D, and their crank axles X, are connected with each other, and the triangle F and hind shafts D being fastened to and made firm on the hind spindle E, the action of the front wheel A and the hind wheels B is mutually dependent and regulated by the action of each other.

*Claim*.—The arrangement of the wheels A B B, shafts C and D D, spindle E, triangle F, rod G, lever pole H, regulator I, and rollers K K, as described and for the purpose set forth.

No. 26,588.—HOMER HOLLAND, of Westfield, Mass.—*Improved Process of Making Sulphuric Acid*.—Patent dated December 27, 1859.—The claim explains the nature of this invention.

*Claim*.—The generation of sulphuric acid by treating sulphides and nitrates commingled in close vessels in connection with the ordinary sulphuric acid chamber, in the manner and for the purpose substantially as set forth.

No. 26,589.—HOMER HOLLAND, of Westfield, Mass.—*Improved Process for the Production of Sulphate and Oxides of Copper*.—Patent dated December 27, 1859.—The claim explains the nature of this invention.

*Claim*.—The production of the sulphate of copper, together with oxides of copper from its various sulphurets, by the use of nitrate of soda, according to the process described.

No. 26,590.—HOMER HOLLAND, of Westfield, Mass.—*Improvement in the Mode of Treating Metalliferous Sulphurets*.—Patent dated December 27, 1859.—This invention consists in the use of the nitric acid of certain specific bases which control the decompositions of the metallic sulphides in the ores to be treated.

*Claim*.—The treatment of metalliferous sulphides with the native nitrate of lime, or nitrate of lime and magnesia, in iron vessels, in the manner and for the purpose substantially as set forth.

No. 26,591.—JESSE JACOBS, of Yellow Springs, Ohio.—*Improvement in Bee Hives*.—Patent dated December 27, 1859.—The valve pedal is so shaped as to allow the bees to step on and off readily. A case C surrounds the valve, or valves, the top *f* thereof serving as a platform for the bees to alight upon before stepping on the valve pedals. A cover *g* over the valves protects them from the weather.

*Claim*.—The valve, composed essentially of the vestibule D and adjustable counter-weighted valve pedal G, arranged and operating substantially in the manner and for the purposes specified.

No. 26,592.—AARON E. JAMES, of Decatur, Ill.—*Improvement in Straw Cutters*.—Patent dated December 27, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—Feeding the straw towards the knife by means of two feed rolls between which the straw passes, when said rolls or cylinders are both operated simultaneously by the positive action of separate pawls or their equivalents, working in ratchets made and arranged in said rolls, substantially in the manner and for the purpose described.

No. 26,593.—HENRY BOEHM, of Trenton, N. J.—*Improvement in Watches*.—Patent dated December 27, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—Controlling the active length of the pendulous, or hair spring of a watch, or other time keeper governed by a balance, by means of combined laminæ of different metals so applied to act upon the end of the spring which has been commonly fixed, that by an increase or diminution of temperature, the said spring is caused to be taken up or let out through the curb pins or their equivalent, and so to compensate for the expansion and contraction of the said spring and the balance, substantially as described.

No. 26,594.—GEORGE JAQUES, of Somerville, Mass.—*Improvement in Preparations of Tobacco*.—Patent dated December 27, 1859.—In this invention, or discovery, after the tobacco is sufficiently boiled, the contents of the still are discharged, the liquid drawn off and the residue pressed to extract all the juice, which is mixed with the solution which is afterwards concentrated by the evaporation if necessary; to this extract is added the nicotine and volatile oils which have been produced or separated by distillation.

*Claim*.—As a new article of manufacture the described preparation of tobacco, consisting of the soluble and volatile portions, as set forth.

No. 26,595.—JAMES M. JAY and JOHN DANNER, of Canton, Ohio.—*Improved Apparatus for Heating Water*.—Patent dated December 27, 1859.—This invention is operated as follows: A suitable quantity of alcohol, or other fluid which will burn, being put into the chamber *a* and a wick introduced into or through the hole *f* and lighted, the flame and heated air rise up against the bottom of *D*, which contains the water to be heated, the air to support the combustion being admitted through the openings *b c* in the base *A*, while the gas and vitiated air pass out of the openings in the case *C*.

*Claim*.—The combination and relative arrangement of the parts composing the water heater, substantially as and for the purposes set forth.

No. 26,596.—CHARLES KESLER and FRED. REINHARD, of Columbus, Texas.—*Improvement in Cotton Seed Planters*.—Patent dated December 27, 1859.—This invention consists in arranging in a hopper a roller armed with stirring and feeding teeth, in combination with an inclined perforated partition and a distributing roller with seed cells, which latter are filled by the action of the toothed roller so as to insure a correct distribution of seed.

*Claim*.—The arrangement in a hopper of the roller *B* with stirring teeth *a* and feeding teeth *b*, in combination with the perforated partition *C* and the distributing roller *D*, substantially as and for the purpose specified.

No. 26,597.—JOHN R. KING, of Raleigh, Tenn.—*Improvement in Cotton Cultivators*.—Patent dated December 27, 1859.—The claim and engravings will give an idea of this invention.

*Claim*.—The arrangement of the frame *p q b c* and wing or mould board *m*, cast solid together, extra landside *s* with its tenons *d n n* and brace *a*, with the cotton scrapers *g*, as described for the purposes specified.

No. 26,598.—JOHN P. KOCH, of New York, N. Y.—*Improved Folding Bedstead*.—Patent dated December 27, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The combined arrangement of the shoulder *S* and eccentric *E*, both situated below the rails and inside of the bedstead, to secure the side rails in their proper place when the bedstead is unfolded, and at the same time to relieve the pins *C* of the strain, in the manner and for the purpose substantially as specified.

No. 26,599.—SAMUEL LESSIG, of Reading, Pa.—*Improvement in Horse Hay Rakes*.—Patent dated December 27, 1859.—In using this rake the operator is seated in seat *h*, and when it is desired to discharge the load, he merely presses the foot spring *n* down with his foot, releasing the sliding bar, and causing it to move forward by the horse pulling thereon, which instantly throws the rake into a discharging position, as seen in the dotted lines in the engraving. When the load is discharged the operator brings the teeth down by pulling the handle or shaft *O* toward himself, which brings the sliding bar back, and the foot latch enters the slot in the sliding bar, and the rake is again ready to proceed.

*Claim*.—The singletree *g*, sliding bar *3*, spring *n*, braces *6*, axles *z*, bar *g*, sleeves *r*, beam *8*, braces *j*, slotted guides *i*, rollers *c*, arms *f*, and connecting bars *l l*, the whole being constructed and arranged for operation conjointly as and for the purpose set forth.

No. 26,600.—S. M. LOGAN, of Richmond, Ind.—*Improved Roofing Composition*.—Patent dated December 27, 1859.—This composition is made of the following ingredients: Copal varnish, two pints; Japan dryer, one pint; eggs, seven, or one pint; lamp black, 4½ ounces, or three pints dry; yellow ocre, two pounds; common salt, one pint.

*Claim*.—The described composition, constructed and used substantially as and for the purpose specified.

No. 26,601.—THOMAS R. MARKILLIE, of Winchester, Ill.—*Improvement in Excavating Machines*.—Patent dated December 27, 1859.—This invention consists in the arrangement and combination of a plough, with an elevating wheel of peculiar construction; and also in combining therewith a carrier for elevating and transporting the dirt to the place required at which it is to be deposited.

The inventor says: I *claim*, first, the combination of the carrying wheel *C*, as constructed and operated with the reversible plough, as arranged for the purposes set forth.

Second. In combination with the carrying wheel *C* and plough *M*, I claim the elevator *D*, as arranged and operated for the purposes described.

Third. I claim the hinged wheel frame *b*, as arranged and combined with the lever *d* and rack bar *f*, for the purposes set forth.

No. 26,602.—V. L. MAXWELL, of Wilkesbarre, Pa.—*Improvement in the Manufacture of Gunpowder*.—Patent dated December 27, 1859.—The claim explains the nature of this invention.

*Claim*.—The employment of alcohol in lieu of water as the vehicle to unite the particles of the ingredients of which the powder is composed, substantially as and for the purposes shown and described.

No. 26,603.—THOMAS J. MAYALL, of Roxbury, Mass.—*Improvement in Apparatus for Making Rubber Belting.*—Patent dated December 27, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the use of the two rollers *u* and *v* acting together, so as to form the belt into a gutter shape, whereby the first step in the process of folding the outside sheet or covering of rubber or gutta percha over the body, or inner fabric of the belt or band, is effected as set forth.

Second. The roller *x* having two taper surfaces and a central disk, whereby the overlapping of the covering or outer sheet over the inner fabric is completed, and the edges of the outer sheet or covering, brought to a true and even line before being united.

Third. Bringing the two edges of the outer sheet or covering evenly together, so as to form a complete and perfect joint, and complete the formation of the belt or band, by the employment of two or more rollers arranged in relation to each other, so that the said belt or band shall be drawn partially around the periphery of either of all the said rollers, substantially in the manner as set forth.

Fourth. In combination with the machinery for forming the belt or band, I claim the devices for cutting both the outer and inner sheets into strips of any desired width, as described.

No. 26,604.—WILLIAM McLENDON, of Greenville, Ga.—*Improvement in Cotton Gins.*—Patent dated December 27, 1859.—This improvement has reference to the roll box of cotton gins, and consists in beveling the ends of the roll box, so that the cotton will expand on the outside, and thus cause the saw to pass through it at different points every turn.

*Claim.*—Beveling the ends of the roll box from the saws, substantially as and for the purposes set forth.

No. 26,605.—JAMES T. MERCER, of Seneca Township, Ohio.—*Improvement in Seed Planters.*—Patent dated December 27, 1859.—The inventor says: I construct a shoveling plough with the beam *m* and the stock, as represented in the engravings; and to the same I attach a wheel *K* by arms or shafts *L* framed together, which serve likewise for handles *L*, and are fastened to the beam or stock by the bolt or pivot *i* and stirrup *J*, thus permitting an up and down motion to the wheel, &c.

*Claim.*—The arrangement of the handles *L*, beam *m*, pivot *i*, stirrup *J*, wheel *K*, arms *b*, lever *e*, slide *d*, hopper *c*, spring *f*, markers *a a*, and coverers *h h*, the whole being constructed as described for the purpose set forth.

No. 26,606.—PETER MONAGHAN, of Camak, Ga.—*Improvement in Cotton Cultivators.*—Patent dated December 27, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—In combination with the hinged frame of a cotton cultivator, the spring *H*, which is secured to the tongue of said cultivator for the purpose of automatically raising the rear end of the machine, when the same is released by the operator, substantially in the manner described.

No. 26,607.—RICHARD MONTGOMERY, of New York, N. Y.—*Improvement in Rolling Corrugated Metal.*—Patent dated December 27, 1859.—*A* represents the frame which supports the corrugating rolls *E E*, and *D D* the frame which supports the holding and smoothing rolls *G G*, together with the arched forming roll *H*. Both frames are securely fastened to a base *C*.

*Claim.*—The combination and relative arrangement of the corrugating rolls *E E* with the holding and smoothing rolls *G G*, forming roll *H* and carriage *e*, operating in relation to each as and for the purposes set forth.

No. 26,608.—CONRAD NORPEL, of Newark, Ohio.—*Improvement in Railroad Car Couplings.*—Patent dated December 27, 1859.—This coupling will connect itself by simply pushing the cars together, and disconnect itself in case a car gets off the track, or in case of the breaking of a bridge or culvert, prevent that part of the train which remains on the track from being thrown down.

The inventor says: I *claim*, first, the jaw *A*, with the beam *B* and pin *D*, for the purpose described.

Second. The jaw *K*, with the pin *L*, combined with the coupling bar *q*, and fish tailed end *R*, for the purpose described.

Third. The two wings *G G*, combined with the slide *E*, for the purpose described.

No. 26,609.—A. B. NORRIS, of St. Louis, Mo.—*Improved Mode of Operating Saw Mill Blocks.*—Patent dated December 27, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The use of a lever with a vibrating fulcrum in combination with the dog or reciprocating carriage *f* or its equivalent, as the means of communicating to the sides or knees *P P* of saw mill head blocks, substantially as described; and, also, the combination of the cam lever *u* with the knee *P*, and the manner of operating the same for the purpose of securing the said knees, substantially as described.

No. 26,610.—Suspended.

No. 26,611.—WORDEN P. PENN, of Belleville, Ill.—*Improvement in Seeding Machines.*—Patent dated December 27, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—Arranging the grass seed hopper in front of the grain hopper, with the reflector *d* fixed against its under side in relation to the grass seed box and the grain box, and the pipe *H* and leader *J*, as shown and described.

No. 26,612.—WORDEN P. PENN, of Belleville, Ill.—*Improvement in Seed Drills.*—Patent dated December 27, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—The arrangement of the endless chain *f* with the eccentric bar *T*, and valve bar *t* with the valves *r*, thereto attached, for the purpose of closing and opening the said valves and raising the flukes simultaneously, in the manner described.

No. 26,613.—NAPOLEON B. PHELPS, of Rochester, N. Y.—*Improved Augur.*—Patent dated December 27, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—Uniting and combining the terminating coil with the preceding one, by means of the thin supporting wall *d* acting as a brace to sustain and strengthen the cutting portion of the bit or augur, substantially in the manner and for the purpose shown and described.

No. 26,614.—BRADFORD S. PIERCE, of New Bedford, and MASON R. PIERCE, of Mansfield, Massachusetts.—*Improvement in the Manufacture of Porous Ware.*—Patent dated December 27, 1859.—The claim explains the nature of this invention.

*Claim.*—The manufacture of porous drain pipes and other vessels which require to possess the property of porosity when formed from the ingredients set forth and made to cohere by the process of tamping, or other equivalent mode of pressure, as described, and receiving its porosity from the small proportion of water used in mixing the ingredients, as set forth and described.

No. 26,615.—JOSIAH W. PRENTISS, of Pultney, N. Y.—*Improvement in Seeding Machines.*—Patent dated December 27, 1859.—*A* is the cylinder, with the axle passing through the centre and securely fastened to the heads of the cylinder; the cylinder has holes made in lines, or rows, to allow the seed to pass out when it is revolved; it is made in two parts and secured with hinges, or otherwise, so that it may be opened to put in the seed; *B* is one of a series of slides that cover the holes in the cylinder, *G* is one of a series of drilling instruments, made so as to receive the seed as it drops from the cylinder and allows the same to pass through it to the place prepared in the earth.

*Claim.*—The divided revolving cylinder *A* and slides *B*, when made, arranged, and operated as set forth, in combination with the peculiar formed spring teeth *G* within their cups, when made and used substantially as specified.

No. 26,616.—SAMUEL N. PURSE, of Ashley, Mo.—*Improvement in Harvesters.*—Patent dated December 27, 1859.—This invention consists in a novel arrangement and combination of devices for changing the velocity of the knives.

*Claim.*—The arrangement and combination of shafts *o* and *j*, with the driving wheel and cutter, and the pinions *l m* and *n*, as shown, for the purpose of changing the velocity of the knives, in the manner described.

No. 26,617.—CLINTON RICE, of New York, N. Y.—*Improved Stair Carpet Fastener.*—Patent dated December 27, 1859.—In order to use the fastener the eye *c* and the slot headed catch being in their proper places, and the stair carpet being laid upon the stairs, the hook *b* is placed in the eye *c*, and the main piece brought down over the carpet pressing it forcibly into the slot headed catch until the spring bolt catches, and thus all hold firmly.

*Claim.*—The general combination and application of the main piece with the hook and eye, and the spring bolt and catching apparatus, as described and for the purpose set forth.

No. 26,618.—MORGAN L. ROGERS, of Spring, Pa.—*Improvement in Cultivators.*—Patent dated December 27, 1859.—The blades are attached to the plough frame as follows: Two bolts 7 and 8 pass through the blades and frame, and also through a flat bar of iron 9, and the plough blades by the screw bolts are held firmly in their places; by this arrangement the blades are raised or lowered, or turned out as desired.

*Claim.*—The arrangement of the hooked and double curved central bar *C N*, curved slotted arm *F*, wheel *G*, handles *H I*, sliding plates *E D*, frame pieces *A B*, and cross piece *D*, substantially as and for the purpose shown and described.

No. 26,619.—ROBERT E. ROGERS, of Philadelphia, Pa.—*Improvement in Steam Engines for Land Carriages.*—Patent dated December 27, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—Connecting the safety valve, the gauge, or try cocks, and all the steam escape

orifices of an engine and boiler with a condensing apparatus, whereby the steam which may escape, or be let off either occasionally or continuously, may be prevented from producing its peculiar harsh noise, as described.

No. 26,620.—GEORGE W. RONEY, of Bailey's Mill, Fla., assignor to Himself and WALTER F. LLOYD, of said Bailey's Mill.—*Improvement in Ploughs*.—Patent dated December 27, 1859. A is the plough beam, B a standard, and C C the handles united to each other; to the bottom of the standard is bolted a shoe D, and the parts A B C D are permanent.

*Claim*.—In combination with a beam, standard, handles, and shoe, rigidly connected together, as shown, the hinging of the coulter E to the shoe at *a* by its lower end, and the adjusting devices in the beam at its upper end, as stated, and for the purpose set forth, the whole being constructed, arranged, and operating as represented.

No. 26,621.—RILEY ROOT, of Galesburg, Ill.—*Improved Surveying Instrument*.—Patent dated December 27, 1859.—A represents the plate to which are attached a graduated half circle, the double spirit level, the sights or telescope, and the axle around which the plate revolves; B a graduated circle; C a double spirit level; D the sights; E the axle; F the double spirit level.

*Claim*.—The arrangement of a revolving double spirit level adapted to a graduated circle, as seen in the drawing and set forth in the specifications, for astronomical and engineering purposes.

No. 26,622.—CHRISTOPHER E. RYMES, of Charlestown, Mass.—*Improvement in Retainers for Hydraulic Presses*.—Patent dated December 27, 1859.—A is the bed plate, from which two metallic bars or posts D D<sup>1</sup> extend upward vertically, or at right angles to the top surface of the bed. Each bar D D<sup>1</sup> is furnished with a toothed rack *a*, which is made to receive and engage with one of two gears or pinions *b b*, fixed on a key shaft *c* that extends through and is supported on a platen or follower F, through which the bars D D<sup>1</sup> pass.

The inventor says: I *claim* the arrangement and application of the two wedges and their operative screw shaft (provided with screws as described) in the follower and with respect to, and so as to operate with, slots formed and arranged in the bars D D<sup>1</sup>, substantially as specified.

And in combination with the slots and the wedges, and their operating mechanisms, applied to the follower as described, I claim the elevating racks and pinions *b b*, arranged in, and applied to, the follower and its upright bars, essentially in manner as set forth.

No. 26,623.—RICHARD S. SCHEVENEL, of Athens, Ga.—*Improvement in Hernial Trusses*.—Patent dated December 27, 1859.—*c c* are two clamps, one for each pad, composed of a piece of brass or other metal plate, folded to receive within it the belt *a*, and each having a screw *d* passing through its open end, said screws also passing through eyes formed at the extremities of the springs *b b*, and being furnished with nuts *e*, which serve to attach the pads to the clamps.

*Claim*.—Combining one or more spring pads A A, and one or more thigh straps with the belt by means of one or more clamps *c*, screws *d*, and nuts *e*, applied substantially as described.

No. 26,624.—LEANDER SHEARER, of Duncannon, Pa.—*Improvement in Railroad Chairs*.—Patent dated December 27, 1859.—The body B being fastened to the ties by spikes, the rails A A are placed against the lip C, so that the cavities *e e* on the side towards the lip C interlock with its lugs *d d*. The securing block E is then slid in between the ears *e e* until its lugs *d<sup>1</sup> d<sup>1</sup>* enter the cavities of the rails A A.

*Claim*.—In the combination with the chair B, formed with a lip C and ears *b b*, the sliding securing block E, and lugs *d<sup>1</sup> d<sup>1</sup>* and *d d*, and cavities *e e* in the ends of the rails, the whole constructed and arranged to operate substantially as specified, for the purpose set forth.

No. 26,625.—FRANCIS O. J. SMITH, of Westbrook, Me.—*Improvement in Electric Telegraphing Apparatus*.—Patent dated December 27, 1859.—With the keys throughout the circuit at rest upon their respective anvils *g*, the metallic circuit is complete without any generator in action; and whenever the key of either station is pressed downwards, and the metallic points *h* and *i* are brought into contact, the aforesaid metallic circuit is broken at *g* at that station only, and the circuit is reformed through the generator *k* of that station, and the sectional conductors connected with the opposite poles of that generator, and the current of electricity or galvanism acts throughout the entire circuit, and brings into use each aforesaid instrument or machine combined therewith at each of the stations in the circuit, but leaves every other generator in the circuit out of action.

*Claim*.—The new and improved mode and combination of apparatus, instruments, and machines, used conjointly in the manner and for the purposes above described, and dispensing therein with all artificial insulations of conducting circuits for telegraphic purposes.

No. 26,626.—JOHN STEPHENSON, of New York, N. Y.—*Improvement in Brakes for Horse*

*Cars*.—Patent dated December 27, 1859.—This invention relates particularly to brakes applied to one horse city cars.

*Claim*.—Arranging the brakes of a reversible car or other vehicle, substantially as described, so that the same can be applied from the driver's seat with equal facility in whatever direction the car or vehicle may be turned.

No. 26,627.—B. F. STURTEVANT, of Boston, Mass.—*Improved Lathe Attachment for Cutting Veneers*.—Patent dated December 27, 1859.—This invention consists in applying a considerable amount of pressure to the surface of the wood in the immediate vicinity of the cutting edge of the knife, by which means the splitting or crippling of the wood is prevented.

The inventor says: I *claim* compressing the wood in the immediate vicinity of the edge of the knife by means of the presser bar C or its equivalent, arranged and operating substantially as set forth.

Second. I claim the cutters E E<sup>1</sup> E<sup>2</sup>, or their substantial equivalents, for the purpose specified.

No. 26,628.—CHARLES F. TAYLOR, of New York, N. Y.—*Improvement in Apparatus for Relieving Spinal Curvature*.—Patent dated December 27, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, a spinal supporter or assistant, in which the longitudinal dorsal plates or supports are jointed together in sections in the manner described for the purpose set forth.

Second. Arranging the dorsal plates, in the manner described, by which the pressure which is exerted in a forward direction is thrown upon the angles of the ribs, as set forth, instead of upon the vertebræ and vertebral column, as formerly.

No. 26,629.—WILLIAM THOMSON, of Buffalo, N. Y.—*Improved Brush for Finger Nails*.—Patent dated December 27, 1859.—The object of this invention is to form a neat and compact finger nail brush, with which the nail of each finger and thumb of one hand may be cleaned at the same operation.

*Claim*.—The combination of a stationary or movable cylinder D, with a circular brush, as described, forming a new article of manufacture.

No. 26,630.—SAMUEL D. TRACY, of Vernon, N. Y.—*Improvement in Seeding Cultivators*.—Patent dated December 27, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* giving the zigzag or alternate opposite inclinations to the blades of the spur wheels C C, in the manner and for the purpose herein set forth.

I also claim the combination of the movable or adjustable cutters D D and their slotted supports g g with the zigzag spur wheels C C, in the manner and for the purposes herein specified.

I also claim the arrangement of the seed box H, in grooves, in the underside of the hinged seat G, so as to be adjustable beneath it, removable therefrom, or turning up therewith, substantially as herein described.

I also claim the vibrating seed distributor I, constructed, operated, and operating substantially as and for the purpose herein specified.

No. 26,631.—JOHN G. TREADWELL, of Albany, N. Y.—*Improvement in Stoves*—Patent dated December 27, 1859.—This invention will be understood by reference to the claim and engravings.

*Claim*.—Arranging the dampers a and c, with the ventilating flue E, and with the draft flue in such a manner that the ventilating flue may be opened or closed, while the draft flue is either open or closed, or *vice versa*, the damper a being made to subserve a double purpose, substantially as set forth.

No. 26,632.—WALTER J. VAN HORN and WILLIAM ALEXANDER, of Louisiana, Mo.—*Improvement in Machines for Preparing Plug Chewing Tobacco*.—Patent dated December 27, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—A machine for pressing and cutting tobacco, consisting of a central cylinder B, endless belts C G, belt rollers D, pressing rollers F, receiving table J, and cutting rollers I I M N or their equivalents, constructed, arranged, and operating substantially as herein shown and described, so that the leaf tobacco on being fed from the table will be pressed, cut, and delivered in the form of plugs, as herein set forth.

No. 26,633.—SAMUEL WALKER, of Kingston, Ga.—*Improvement in Ploughs*.—Patent dated December 27, 1859.—This invention is designed for what are known as "shovel-ploughs," used in the cultivation of southern crops, but it may be applied to other small ploughs used as cultivators in tilling growing crops.

*Claim*.—The arrangement of the beam A, bars D D, foot B, and handles E E, as shown

and described, in order to admit of the adjustment of the parts, as and for the purpose set forth.

No. 26,634.—J. W. WETMORE, of Erie, Pa.—*Improvement in Railroad Chairs*.—Patent dated December 27, 1859.—The inventor says: I propose to prevent the irregularities in the vertical and lateral variations of the adjacent ends of the rails by means of an iron adjustable yoke, forming the bearing surface and sides of the joint, and a plate and wedge key under the ends, to complete the band surrounding the joint.

*Claim*.—The use of the yoke band as "C," passing through notches in the heads and webs of the T or H rail, at the joint, and keyed by a wedge plate F; all combined, constructed, and arranged, substantially as described.

No. 26,635.—PAUL WILLIAMS, of Lodi, Miss.—*Improvement in Cotton Presses*.—Patent dated December 27, 1859.—A piston rod or beam E connects the platen G with a sliding crosshead D, which is held in place by guide pieces D<sup>1</sup> as it slides back and forth between the upper and lower timbers of the main frame, while on the rear of the crosshead D are hinged the levers H H and J J, as seen at *h*; the levers H H are hinged to levers I I by links H<sup>1</sup> H<sup>1</sup>, as seen at *i*; the levers I I are in turn hinged at their inner ends to the inner ends of levers K K by joints *k*, while the levers J J are hinged by joints *j* to the outer ends of the levers K K, which turn on journals *m m* in the main frame.

*Claim*.—The combination of the levers H H and J J with the levers I I and K K, links H<sup>1</sup> H<sup>1</sup>, and projections I<sup>1</sup> I<sup>1</sup>; the whole arranged and operating substantially as and for the purposes set forth.

No. 26,636.—CYRIEL E. BROWN, of Millbury, Mass., assignor to Himself, JOHN TENNEY, and JOHN RHODES, of said Millbury.—*Improvement in Spindles and Fliers*.—Patent dated December 27, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the arrangement of the secondary or tubular stationary bearing *d* with the flier and spindle, as specified; also, the combination of a helical eye with the flier arm and its hook, and to open into the hook; also, making the top of the bearing *d* and that of the flier neck with an oil channel, so arranged as not only to receive or catch the oil that runs off the spindle, but direct or conduct it between the rubbing surfaces of the said neck and bearing.

I do not claim an oil cup as ordinarily applied to the foot of a spindle, nor as applied to a cop tube and spindle, as shown in the United States patent No. 16,298; but I claim combining or arranging an oil receiver and bearing *e* with the secondary bearing tube *d*, and so as to surround it, the spindle, and the flier neck, substantially in manner and for the objects and purposes as specified.

No. 26,637.—FRANKLIN B. HUNT, of Cincinnati, Ohio, assignor to R. D. VAN DEURSEN and J. B. GIBBS, of said Cincinnati.—*Improvement in Straw Cutters*.—Patent dated December 27, 1859.—The material to be cut is placed in the spout B, and is carried forward by feed rollers Q L, and, passing over the shear blade T, is cut by the revolving knife or knives J, and falls into any suitable receptacle arranged below.

*Claim*.—The feeding device, consisting essentially of the rolls Q L, link bearings M, rest blocks V, and springs W; all arranged with reference to each other, and so as to operate conjointly as and for the purpose set forth.

No. 26,638.—JAMES ROWE, of Cincinnati, Ohio, assignor to Himself and MARTIN B. EWING, of said Cincinnati.—*Improvement in Sewing Machines*.—Patent dated December 27, 1859.—The claim and engravings will explain the nature of this invention.

*Claim*.—The bar or bracket *h*, on the lower end of the needle bar, so that it shall drive, in combination, the looper bar *k k*<sup>1</sup> and the feeding levers *j* and *o*, by positive movement, when it is driven by the crank pin *b*<sup>1</sup>; all operating in the manner and for the purpose set forth.

No. 26,639.—CHARLES S. WATSON, of Philadelphia, Pa., assignor to Himself, ALBERT S. ASHMEAD, and E. W. CARR, of said Philadelphia.—*Improved Portable Register*.—Patent dated December 27, 1859.—This invention consists in the arrangement, within a small portable outer case, of a number of concentric annular plates L M N, with mechanism for moving the same, and for announcing audibly each movement for the purpose of registering any succession of numbers that it may be desired to record.

The inventor says: I *claim*, first, a portable alarm register, constructed and operating substantially as described.

Second. The dogs on the annular plates, in combination with the pins on the inner front plate, as described.

Third. The combination of the dog *r* with the notches or pins *x x* of the annular plates L M N, and the openings in the rims through which the dogs operate, as described.

No. 26,640.—MARY E. HERMANS, of Henderson, Texas, administratrix of the estate of

Alva Hermans, deceased.—*Improved Peach Parer*.—Patent dated December 27, 1859.—This invention consists in the employment or use of a revolving holding fork provided with elastic tines or prongs, in connection with a paring knife attached to or fitted in a stock.

*Claim*.—The combination of the rotating and elastic or yielding tines or prongs *b b*, knife stock *I*, frame *H*, and plate or bed *G*, arranged for joint operation, as and for the purpose set forth.

No. 26,641.—JOSEPH GRULER and AUGUSTUS REBETY, of Norwich, Conn., assignors to THE MANHATTAN FIRE-ARMS COMPANY.—*Improvement in Revolving Fire-Arms*.—Patent dated December 27, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The use of the intermediate recesses *r r*, in combination with the stop *d*, actuated by the hammer in pistols where the cylinder is revolved in the act of cocking the pistol, as described, thereby effecting a self-acting lock of the cylinder, midway or otherwise, between any two cones.

---

## CLAIMS OF REISSUES GRANTED DURING THE YEAR 1859.

---

No. 643.—*Improvement in Regulating the Flow of Oil to the Wick in Carcel Lamps*.—What I claim as my invention and improvement in lamps, in which the oil is forced to the wick so as to overflow, is regulating the supply of oil to the burner by means of the self-emptying drip cup operating upon the supply valve as herein set forth.

I claim also placing the fountain or reservoir for the oil above the lens, with its draft opening *B* and its supply pipe *d* within the barrel or chamber of the lens, all arranged and operating substantially as set forth.

ABR. COATES.

No. 644.—*Improved Machine for Making Hames*.—What we claim and wish to secure by letters patent is the forging of metal into useful forms by the employment of two or more pairs of rolls having their surfaces cut away as described, and combined and rotating and pressing the metal progressively into shape as described, being conducted from one pair of rolls to another through the agency of the guides, substantially as described.

HENRY BURT.  
J. T. HEDDEN.

No. 645.—*Improvement in Machinery for Dressing Screw Heads*.—What is claimed as the invention of the said Thomas W. Harvey is, first, the employment of a pair of spring pincers, which receives the blanks one at a time, and presents them to the jaws point foremost, substantially as described.

Second. In combination with the mandrel and jaws, or equivalent means for receiving and holding the screw blanks, the employment of a punch or driver for inserting the blank to the required distance, substantially as described.

Third. The combination of the pincers for transferring and presenting the blank to the jaws, or equivalent therefor, with the punch or driver, substantially as described, for driving the blanks out of the pincers and into the jaws, as set forth.

Fourth. The combination of the movable rest with the movable cutter head, substantially as described, and for the purpose of giving support to the blank while under the operation of the cutter, and to relieve the blank and get out of the way so soon as the cutting operation is completed; and this is claimed, whether the cutting operation be performed on the head or any other part of the blank.

Fifth. The particular manner herein described of constructing the adjustable turning head, the slide or seat piece *C*, the tool holder *D*, sliding on the piece *C* between the check pieces *B*<sup>1</sup>, with the respective adjustments thereof combined, arranged, and operating so as to effect the setting of the tool, substantially as herein set forth.

The manner of operating the grinding dies and of separating the blanks in the hopper and conveying them to the feeding fingers, being similar to those described and used in the machine for cutting the threads, are not herein claimed.

H. A. HARVEY,  
*Assignee.*

No. 646.—*Improvement in Sewing Machines.*—What is claimed as new and desired to be secured by letters patent as the invention of William Lyon, is as follows:

First. The combination of a feeding foot *i* pressed on to the cloth and moved to feed the cloth, and then released from said cloth and returned to its former position, with a clamping foot *G* that is raised when the feed of the cloth takes place, as set forth.

Second. The vibrating bar *H*, feeding foot *i*, arm *k*, and revolving studs *m n*, arranged and acting substantially as specified, to communicate motion to the feeding foot, as set forth.

Third. A looping instrument constructed with cavity or notch, and an eye carrying the second thread, and receiving a side wise movement after the said looper has passed through the loop of needle thread, for the purpose of carrying the second thread across and beyond the descending path of the needle, when said looper remains in a position for the needle to enter said cavity or notch as it descends between the looper and the second thread, and then said looper receives a sidewise movement to its original position to clear the needle in drawing back, as described and shown.

Fourth. The reciprocating looper *I* formed with the cavity, as set forth, and with an incline *p*, in combination with a stationary screw, or its equivalent, to communicate the required sidewise movement to the looper, as specified.

Fifth. The arrangement of the segmental spring looper *I* and arm *O* on the rocking shaft *K*, for the purpose of adjusting and securing by the screws  $x^1$  and  $x^2$  the looping point in the desired position with great ease and accuracy, as set forth.

In witness whereof we, the assignees of the patent of William Lyon, of December 12, 1854, have hereunto set our signatures, in the presence of the witnesses subscribing hereto.

A. W. GOODELL.  
NELSON R. SCOVEL.

No. 647.—*Improvement in Safety Indicators for Steam Boilers.*—What I claim as my invention and desire to secure by letters patent, is a feed apparatus controlled by expansion and contraction, in combination with an expansion "tell tale," placed below the desired water level and above the level to which it would not be safe for the water in the boiler to descend, substantially as set forth.

Second. I claim the within described arrangement of the vessels *C* and *D*, as applied and connected with the feed pumps and steam whistle, for the purpose of regulating the pump and sounding an alarm, as set forth.

Third. I claim connecting the pipe *I* with the boiler, by means of the feed pipe *B*, as set forth, for the purpose described.

L. J. KNOWLES.

No. 648.—*Improvement in Lamps.*—What I claim as my invention, and desire to secure by letters patent, is securing the chimney to the removable deflector, and both of them to the lamp cap by means of a spring operating in the manner substantially as set forth.

Second. I claim a detached deflector in combination with a chimney, when the chimney is secured to the cap independently of the deflector, as set forth.

EDWARD F. JONES.

No. 649.—*Improvement in Ventilating Windows for Railroad Cars.*—I therefore claim the convergent ventilating window, as made with deflecting and light penetrating sides or surfaces, and an air opening *F*, and a closing window or cover *E*, essentially as above explained, and to be applied to the opening of a side of a railway car, substantially as specified.

And I claim the arrangement of a deflector guard entirely around the window opening, and in respect to the deflecting sides *A B C D*, as specified, not intending to claim a deflector or guard as applied to a car window opening, but to claim its arrangement on four deflecting sides or planes, and entirely around the opening between them, as set forth.

GEORGE NEILSON.

No. 650.—*Improved Reclining Chair.*—I claim, first, the general arrangement of devices, herein described, for actuating and sustaining both the back and foot rest, the same consisting of the arms  $f^1 f^1$  attached to the back in a projection thereof, and having a shaft which travels in grooves, formed in the supporting frame work of the chair and the arms, the whole being combined with the foot rest and frame, as set forth herein.

Second. I claim the combination of devices herein described, whereby the back can be placed and held in any desired position, and at the same time the proper length of arms retained; the same consisting of the hinged rails *p p*, sliding arms *s s*, locked upon said rails in any desirable manner, and mortises to receive the said rails, as set forth.

Third. I claim the foot rest, constructed and arranged substantially as described, when combined with a spring or weight, or its equivalent, to operate as set forth, so that the said foot rest may be raised or lowered at will, to adapt itself to the length of the limb of the occupant, substantially as described.

Fourth. In combination with a reclining chair, constructed as described, I claim the peculiar joint between the back and arms; the same consisting of the arm  $g^1$  attached to the

back, and turning upon a pivot in the groove or mortised sliding arm, whereby a very long arm may be obtained, as set forth.

AUGUSTUS ELIERS.

No. 651.—*Improvement in Hulls of Steam Vessels.*—What we claim under this patent as our improvement in steam vessels, is constructing the hull in form of a spindle, substantially as above described.

ROSS WINANS.  
THOMAS WINANS.

No. 652.—*Improvement in Revolving Fire-Arms.*—I claim, first, the combination of revolving breech and stationary barrel, with a lock so constructed as that the trigger used to fire the pistol, when drawn back, raises the hammer to full cock, and there holds it, the revolving breech being at the same time rotated so far as to bring one of the chambers in a direct line with the bore of the barrel, and fastened in that position preparatory to firing the piece, substantially in the manner described.

The peculiar arrangement of the parts of my lock, hereinbefore described, whereby the trigger is drawn back to raise the hammer, the heel of the hammer, on the point against which the main spring bears, is brought so nearly under the centre of motion of the hammer, that the force of the main spring is counterbalanced by the pressure of the trigger on the toe of the hammer, and thus it will stand at full cock, or may be fired at once, as may be desired.

The use of the tubular extension on the fore part of the rotating breech, extending beyond and underneath the breech end of the stationary barrel, through which tubular extension the end of the spindle projects, and into which the spindle fits closely, for the purpose of preventing the fouling of the spindle by the residuum of the smoke in firing.

The use of the collar at the end of the tubular extension, for the purpose of forming, in combination with the spindle, a locking connection between the revolving breech and the stationary barrel, with a corresponding recess for the reception of the collar, as hereinbefore set forth.

Forming that part of the spindle which enters the bore of the rotating breech of smaller diameter at the front extremity than at the end nearest the lock, but by reducing its diameter suddenly, so as to form a step or shoulder at one or more points within the rotating breech, in combination with the rotating breech having a bore of correspondingly diminished diameter, for the double purpose of sustaining the recoil of the breech in firing, and of aiding to prevent the fouling of the spindle by presenting an obstruction to the passage of the smoke between the spindle and the surface of the bore of the rotating breech.

Also, the connecting and locking the barrel and breech to the lock plate by means of a bracket and spring extending in front of the lock plate, in the manner described.

I disclaim originality in the combining of a rotating chambered breech with a barrel and lock, excepting in the particular manner set forth. Neither do I claim the use of the recoil shield as such, the collar on the tubular extension, or if the collar is not used the spindle of the shape hereinbefore described, sustaining or preventing the actual recoil of the breech. I also disclaim originality in the use of the vibrating tooth and spring in the hammer.

JOSIAH ELLS.

No. 653.—*Improvement in Vault Lights.*—What I claim in the continuation of illuminating vault covers is the open frame with its large aperture or apertures closed with glass, substantially as herein described, in combination with the protection grating, substantially as and for the purpose described.

THADDEUS HYATT.

No. 654.—*Improvement in Devices for Putting Up Caustic Alkalies.*—I claim the putting up of the caustic alkalies of soda and potassa in small quantities in airtight wrappings, cases, or boxes, in the manner hereinbefore described, or its equivalent, for the purpose of introducing into general use for domestic and other purposes these articles, which, owing to their peculiar chemical properties, have not heretofore been susceptible of general use in small quantities.

GEORGE THOMPSON.

No. 655.—*Improved Steam Valve.*—I claim, first, the valve D with a projecting hollow stem E, which is reduced so that its end presents an area only equal, or nearly so, to the receiving ports in the face of the valve, in combination with the main steam chest or chamber J, and an auxiliary steam chest or casing I, furnished with a stuffing box *d*, and constructed so as to cover the whole of the back of the valve, excepting the end of the stem or a portion of the back equal or nearly equal to the receiving ports in its face, substantially as and for the purposes set forth.

Second. In combination with the above, the peculiar manner herein specified of making the face of the valve D with six ports F F<sup>1</sup> F<sup>2</sup> G G<sup>1</sup> G<sup>2</sup>, three for receiving and three for ex-

hausting, said ports being arranged in such relation to each other that when the valve is applied to an oscillating engine, one receiving port always stands in line with an exhaust port, and that only four of the ports shall be in use when the engine is working, the other two being kept in reserve, so that by shifting the valve the engine will be instantaneously reversed under a full pressure of steam without shutting off the steam between the engine and the boiler, as herein described and set forth.

GEORGE RIESECK.

No. 656.—*Improved Machine for Threading Bolts.*—What I claim is the use of rotating dies in combination with cams, or their equivalent, when both are so arranged as to be capable of revolving about a common centre at different velocities, for the purpose of opening and closing the dies, substantially as described.

I claim the arrangement of cams with open spaces between them in combination with the die box and dies, substantially as described, to facilitate the changing of the dies.

I also claim the mode of attaching the lap holder to the revolving die box, substantially as described.

WILLIAM SELLERS.

No. 657.—*Improvement in Boxes for Preserving Alkalies.*—I claim the use of metallic boxes constructed as described, and united with cement infusible at the degree of heat at which the caustic alkalies of soda and potassa remain fluid, for the purpose of putting up those caustic alkalies in small quantities, as described.

GEORGE THOMPSON.

No. 658.—*Improvement in Self Dumping Coal Buckets.*—What I claim is the combination of a bucket suspended by the handle at points below its centre of gravity in combination with self acting detachable latch operated by the bucket touching the ground.

JOHN WÜST.

No. 659.—*Improvement in Lamps.*—I claim the arrangement of small tapers or wick tubes below and on both sides of the main or illuminating burner, in combination with a suitable cap, for the purpose of producing a more complete combustion, substantially as set forth.

WM. W. BATCHELDER.

No. 660.—*Improvement in Machines for Folding Paper.*—I claim, first, the employment of adjustable points or register pins, or their equivalents, for the purpose of correctly presenting printed sheets to a paper folding machine, substantially in the manner and for the purpose set forth.

Second. The combination of a registering apparatus with a paper folding machine, substantially in the manner described.

Third. The combination of the register pins with the fingers, reciprocating carriage, and slotted bar, for the purpose specified.

Fourth. The combination of the slotted reciprocating carriage with the knife *d*, as described.

Fifth. The combination of the slotted reciprocating carriage with the first pair of folding rolls and knife *d*, as specified.

Sixth. The combination of a folding knife, the edge of which is smooth, with one or more needle points projecting beyond and in a line with the edge thereof, as shown.

Seventh. Securing the needle points to the folding knife, in the manner and for the purpose specified.

Eighth. Securing the needle point or points to the folding knife in such a manner as that they shall have their main support back of the edge of said knife, as specified.

Ninth. So constructing paper folding machines, as that the sheet while being folded shall occupy the same time, or nearly so, while passing from the position for receiving its first fold, to that of the next and succeeding folds; as specified.

E. N. SMITH.

No. 661.—*Machine for Folding Paper.*—I claim as the invention of North the use of a stationary folding knife in a machine for folding printed sheets of paper, substantially as herein described, and as the invention of said North.

I also claim the combination of the folding knives *k k*, with the reciprocating carriage, as set forth, and as the invention of the said North.

I also claim giving to the reciprocating carriage its proper motion by means of the crank *K*, and slotted connection rod *M*, in combination with lever *N* and link *P*, substantially as described, and as the invention of the said North.

I also claim the device for raising and depressing the fingers, as fully shown Fig. 6, and as the invention of the said North.

I also claim the combination of the folding and carrying nippers with the stationary folding knife, substantially as described, and as the invention of the said North.

I also claim releasing the sheet from the nippers by means substantially as described, and as the invention of the said North.

I also claim the circular knives  $c^1$   $c^1$ , for separating the sheets, when operated substantially in the manner described, and as the invention of the said North.

I also claim the combination of the levers T and T<sup>1</sup>, with double concentric rock shafts D and E, substantially in the manner and for the purposes set forth, and as the invention of the said North.

I also claim the adjustable check, and the mode of releasing its hold by the absence of the nippers, as set forth.

STEUBEN T. BACON,  
*Assignee of John North.*

No. 662.—*Improvement in Machines for Folding Paper.*—I claim, first, forcing the paper required to be folded between the first set of folding rolls by the knife while the sheet is on the run.

Second. Forcing the paper to form the first fold between two converging and continuously moving, flexible, yielding surfaces.

Third. Forcing the sheet of paper required to be folded upwards, for the purpose specified.

Fourth. The use of a cord or curved edged knife for the purpose of forcing the sheet between the folding rolls.

Fifth. The stops for determining the proper position of the sheet for receiving its second and succeeding folds.

Sixth. The combination of the carrying bands with a stop for regulating the sheet in proper position to receive its second and succeeding folds, as specified.

Seventh. The combination of the rolls and endless aprons or bands with the guides, substantially as described.

Eighth. So arranging the knives, aprons, and rolls in a paper folding machine, as that the sheet may receive two or more parallel folds in succession.

Ninth. So arranging the carrying and folding rolls in a paper folding machine as that only a single series of endless aprons, or bands, shall remain in contact with the sheet, to conduct it while it is receiving more than one fold.

Tenth. The tightening pulleys and cords or bands hung upon the movable bar, for the purpose of giving proper direction to the sheet for receiving the next fold, after having received a parallel fold, as described.

Eleventh. So constructing a machine for folding paper as that one or more folds may be omitted at pleasure, and the folded sheet delivered outside of the frame and working parts of the machine, by simply detaching the knives and removing the stops, as described.

Twelfth. Supporting the folding rolls in adjustable boxes, bearings, or frames, for the purpose of squaring them with the print or register of the sheet to be folded, and providing for the contraction and expansion of the endless aprons or bands.

Thirteenth. The movable guides for the purpose of squaring the knives to correspond with the print or register of the sheet.

Fourteenth. Conveying motion to any pair of folding rolls, running at right angles to the preceding pair, by means of bevel gears placed at or near the centre of a roll and between the apron or bands, substantially as shown, whereby the machine is rendered more simple and perfect in its operation.

Fifteenth. Pressing the folded sheet previous to its delivery for passing it between two converging and continuously moving yielding surfaces.

E. N. SMITH.

No. 663.—*Improvement in the Distillation of Oils from Coal.*—We claim the destructive distillation of coal or other bituminous substances for the obtaining the liquid products thereof, in what is known as coal oils, by the process hereinbefore described, viz: combining the use of a low temperature not exceeding a low red heat, say about eight hundred and fifty degrees Fahrenheit, with the use of retorts so constructed as to have a rotary or other equivalent motion for the purpose of agitating their contents, substantially in the manner and for the purposes hereinbefore set forth.

DAVID ALTER,  
SAMUEL A. HILL.

No. 664.—*Improved Arrangement of Means for Working and Stopping Chain Cables.*—I claim the flaring and radially flanged annular recess in the capstan of working a cable of any given size or cables of several different sizes, the same being constructed and operating in the manner and for the purposes substantially as set forth herein.

I also claim, in combination with a capstan, a windlass which is capable of working a chain cable when only a partial turn is taken, a set of removable rollers so arranged in relation to the capstan, the deck pipes, and hawser holes, that either a port or starboard chain cable can be continuously hove in by means of said capstan and rollers, or can be directly run out of its locker without any previous overhauling, substantially as herein set forth.

I also claim the within described arrangement of bow stopper and after stoppers whereby more cable can gradually and controllably be given to a vessel whilst riding heavily at anchor, substantially as set forth.

I also claim the clearing guide in combination with the annular recess of a capstan or windlass which is capable of working a chain cable when only a partial turn is taken, for the purpose and in the manner substantially as set forth.

THOMAS BROWN.

No. 665.—*Improvement in Bandages.*—I claim the exterior spring frame *a*, constructed and arranged substantially as described, so that when the sides are closed by the pressure of the limbs the rear of the frame will remain open, for the purpose set forth.

I also claim the combination with the exterior frame, or when constructed and arranged substantially as described for the purpose herein set forth.

N. JENSEN.

No. 666.—*Improvement in Machines for Making Nuts, Washers, &c.*—I claim, as the improvement of William Kenyon, first, making nuts for bolts by subjecting the blanks of which the nut is to be formed, at a welding heat, to compression between swages or dies in a close die box or matrix, and punching the eye of the nut during the continuance of such pressure for the purpose of welding up any imperfections in the iron and giving a symmetrical shape and smooth finish to the nut, and of the preventing any injury to the nut which it might suffer by the passage of the punch through it, if it were not thus sustained by the sides of the die box, and forcibly compressed between the dies.

Second. The use of a die box, closed at the sides, for surrounding the nut, and sustaining its sides while it is subjected to pressure, substantially in the manner hereinbefore described.

Third. The combination of the compressing dies P and T, with the die box M, for the purpose of compressing the nut while it is sustained at the sides, and thus welding up any imperfections in the iron, and compacting its fibre so as to give strength as well as exterior finish and symmetry to the nut.

Fourth. The combination of the punch L, with the die box M, and compression dies P and T, for the purpose of compressing, confining, and restraining the opposite faces of the nut during the passage of the punch through it, and thus preventing any injury to the nut during the process of punching; and also for the purpose of ensuring the making of the nut in the proper relative position to its upper and lower surfaces.

Fifth. The combination of the die box M, the compressing dies T and P, and punch L, constructed and arranged substantially as hereinbefore described, for the purpose of making hot pressed nuts at a single operation by severing a blank from a bar of heated metal, compressing it into shape, and punching a hole, or eye, through it while under compression and delivering the finished nut from the machine.

Sixth. Arranging the compressing dies in relation to the punch, and regulating their relative motion in such manner substantially as hereinbefore described, that any excess of iron in the blank shall be forced into the path of the punch in the compressing dies, thus securing the compression of the nut without risk of damage to the machine.

JAMES WOOD.

No. 667.—*Improvement in Railroad Car Springs.*—We claim, as the invention of Henry M. Paine, a railroad car spring, consisting of a body of felt or other fibrous material condensed to a given density between two rigid plates, and prevented from expanding beyond that density by a bolt or bolts, substantially as herein set forth.

H. G. LEISENRING,  
NATHAN MIDDLETON,  
WILLIAM S. NOBLE.

No. 668.—*Extension Finger Ring.*—We claim a divided springing finger ring, constructed substantially in the manner and for the purposes specified, whereby the springing of the ring permits the same to pass the joints as set forth.

SAMUEL FRIEND,  
GEORGE SEILER.

No. 669.—*Improved Shutter Operator.*—I claim the employment of a single shaft operated internally and operating externally upon a window blind, when said shaft is made to effect the double purpose of operating both the blind and the slats; and this whether I construct and arrange the hinge and levers in the manner herein specified or not.

CHARLES R. EDWARDS.

No. 670.—*Improvement in Grinding Mills.*—I claim constructing a grinding mill with flat plates dressed on both sides, having a longitudinal reciprocating vertical and oscillating motion, in combination with flat stationary plates likewise dressed on both sides, the whole constructed and operated substantially as described.

Second. I claim the notched form of the upper edges of the plates for the purpose of preventing the mill from choking, and to facilitate the feeding of the article to be ground between the grinding surfaces, as described.

GELSTON SANFORD.

No. 671.—*Improved Handle for Table Cuttlery.*—I claim forming the handle of two parts *a b*, which are encompassed at their junction by a ferrule *d*, the tang *A* passing through both parts of the handle, and the parts being secured thereon by a nut or washer *e* or a rivet *e*<sup>1</sup>, substantially as described.

JOSEPH W. GARDNER.

No. 672.—*Improvement in Machinery for Preparing Oval Picture Frames.*—I claim a lathe, with a face plate revolving in an oval path, in combination with a scraper adapted to the form of the desired moulding of the oval frame when the said scraper is so arranged as to be self-adjusting laterally with the said moulding, substantially as and for the purpose herein set forth.

WILLIAM GARDNER.

No. 673.—*Improvement in Harvesting Machines.*—I claim, first, the combination of the single plate *H* and main wheel, substantially as described.

I also claim the combination of the main wheel *K*, single plate *H*, and rim *L*, when connected together, and operating in the manner and for the purpose set forth.

I also claim placing the vibrating wheel on the outside of the frame, or so that the outside of the frame does not bear on the outside of the wheel, in combination with the triangular shaped frame on the inside of the wheel, substantially as described.

I also claim hanging the seat to the plate *H* and to the standard *S*, in the manner and for the purpose set forth.

I also claim a hinged lever seat and outside stirrup or supporter, in combination with a wheel having no outside frame or support, substantially as herein represented.

WM. A. KIRBY.

No. 674.—*Improvement in Machinery for Enamelling Mouldings, &c.*—What I claim in coating or enamelling the surface of mouldings is the employment of a plate whose lower edge is formed the reverse of the transverse form of the moulding to which it is applied, when such plate is made self-adapting to the surface of the moulding during the longitudinal movement substantially as herein described and for the purpose set forth.

I also claim the employment of a hopper to contain the composition for enamelling when the lower edges of the end plates thereof are formed the reverse of the transverse form of the moulding, and the moulding to be enamelled is employed as the bottom of such hopper, substantially as described and for the purpose set forth.

ROBERT MARCHER.

No. 675.—*Improved Amalgamator.*—I claim, first, the use of elongated amalgamating chambers *I*, when arranged to operate in the manner and for the purposes specified.

Second. The arrangement of the amalgamating chambers *I*, within a heated chamber *A*, for the purposes specified.

LEWIS SOLOMON.

No. 676.—*Improvement in Steam Gauges.*—I claim the combination of a case, perforated at both ends, with a spring valve, the spring forming the sides of the valve being arranged so as to cut off communications between the perforations in the opposite ends of the case, and perform the duty of a manometer spring, as described.

I also claim the combination of valve stem, disk, and gland, with the interposed rubber spring, arranged substantially as described, so as to press the valve towards its seat, and pack the valve stem, without the spring binding the valve stem on the valve case.

THOS. STUBBLEFIELD.

No. 677.—*Improved Smelting Furnace.*—I claim constructing furnaces, with the hearth and boshes of an elliptical or elongated form, substantially as described, in combination with the application of the blast at sides, so arranged as to introduce the blast in the direction of the breadth, and for the purposes specified.

I also claim, in combination with the hearth and boshes made of an elliptical or elongated form, substantially as described, the construction of such furnaces with two mouths, one at each end, for working and tapping, substantially as and for the purpose specified.

CHAS. C. ALGER.

No. 678.—*Improvement in Reclining Chairs for Railroad Cars and Other Uses.*—What I claim as the invention of Samuel M. Perry is, first, to so combine the back *D* with the two end frames *B C*, by means of bars *E F* jointed to it, one, or two studs *a*, and one or two series of notches *d d*, or equivalents therefor, that the said back, when not a reversible one, may be

raised and inclined in various positions so as to not only support the back but the head of a person at the same time.

Second. Making the back reversible by means of two series of notches *d d* and *e e*, &c., and two sets of studs *b* or their equivalents, the same being arranged on opposite sides of the chair, and made to operate as specified.

Third. The improvement of making each arm or bar *E F* with a rack or racks of teeth, or succession of notches, or equivalents therefor, for the purpose of adjusting and securing the back in the desired position, whereby the occupant can alter or vary said position without rising from the seat, substantially as set forth.

ISAAC L. DEVOE,  
Assignee

No. 679.—*Improvement in Making Illuminating Gas.*—I claim the process which consists, first, in mixing materials, substantially such as are herein specified:

Second. In introducing them into a chamber, substantially such as is described, located when the process is going on within retort.

Third. In causing the products of distillation of the mixture to pass out of such interior chamber, and then be subjected to a higher degree of heat by passing in contact with the heated surface of the retort itself, substantially as specified, not intending to claim any one step of the process separately, but only the process substantially as herein set forth as a whole.

N. AUBIN.

No. 680.—*Improvement in Gas Generators.*—I claim the combination with a gas retort of a removable interior chamber, open at bottom, and having such relative shape with regard to the retort and so located therein, substantially as is specified and for the purposes hereinbefore set forth; and this I claim irrespective of the location of the opening through which said removable chamber can be introduced or withdrawn, and either with or without an apparatus for introducing steam into the retort.

N. AUBIN.

No. 681.—*Improvement in Tight Joints for Gas Retorts.*—I claim a joint between a gas retort and its cover, made by fusible metal contained in a groove into which enters a rim; the joint being substantially such and for the purposes hereinbefore set forth.

N. AUBIN.

No. 682.—*Improved Tubular Elastic Valve.*—I claim, first, the flexible valves herein described, for the purposes specified.

Second. The method herein described of adapting the said flexible valves to pump or other tubes of any kind, whether rigid or elastic, and inserting them therein, in the manner set forth and shown, or in any equivalent mode.

FRANKLIN PEALE.

No. 683.—*Improvement in Spring Bed Bottoms.*—I claim the within described spring bed bottom, consisting of the combination: the frame *a*, slats *b*, and radial springs *c*, essentially as described.

HIRAM TUCKER.

No. 684.—*Improvement in Machinery for Making Wood Screws, &c.*—What is claimed as the invention of Cullen Whipple, is: In combination with a mandrel, which carries chuck or griping jaws, an automatic mechanism for closing said jaws upon the blank, keeping them closed to hold the blank while being dressed, and then opening them to release the dressed blank, arranged and operating in such manner to leave the mandrel (during the time the blank is being acted on by the cutter) free from endwise pressure by the chucking mechanism; also, the combination of toggle levers carried by the mandrel; a stop or hold-fast, also carried by the mandrel, to lock and hold the toggle levers when pushed beyond a straight line; and griping jaws, with shanks having sufficient elasticity to maintain a firm hold of the jaws upon the blank, when the toggle levers have passed a straight line, substantially as herein set forth.

NEW ENGLAND SCREW COMPANY,  
By HENRY L. KENDALL, *Agent*.

No. 685.—*Improvement in Machinery for Making Wood Screws, &c.*—What is claimed as the invention of Cullen Whipple, is: A feeding punch, and mechanism for causing it to approach within different distances of the griping jaws; griping jaws adapted to receiving and holding screw blanks in variable positions and of different lengths, in combination with a suitable tool holder and cutting tool, substantially as herein set forth.

NEW ENGLAND SCREW COMPANY,  
By HENRY L. KENDALL, *Agent*.

No. 686.—*Improvement in Machinery for Making Wood Screws, &c.*—What is claimed as the invention of Cullen Whipple, is: The spring discharging punch, in combination with the mandrel and griping jaws, when the punch and spring are both carried by the mandrel, substantially as herein set forth.

NEW ENGLAND SCREW COMPANY,  
By HENRY L. KENDALL, *Agent*.

No. 687.—*Improvement in Machinery for Making Wood Screws, &c.*—What is claimed as the invention of Cullen Whipple is, first, the feeder, composed of a sectional trough, with a close bottom and open top, into which the blank drops and arranges itself before a traversing rod, which pushes it into the griping jaws, as described.

Second. The combination of an adjustable automatic feeding punch and a spring discharging punch, with an intermediate trough or equivalent means for bringing the blank into line with the two punches, substantially as herein set forth.

Third. The arrangement of a spring discharging punch, with its end far enough within the end of the grooves in the griping jaws to leave an opening for admitting the end of a blank and guiding it against the end of the discharging punch, thereby rendering the chucking more certain, substantially as herein set forth.

NEW ENGLAND SCREW COMPANY,  
By HENRY L. KENDALL, *Agent*.

No. 688.—*Improvement in Printing Presses.*—I claim, first, the combination and arrangement of the feed table, the fly or pile board, the platen and bed, with the set or sets of independent revolving nippers or grippers, for the purposes described.

Second. I claim the fly board, with its adjustable gauge or guide, in combination with the grippers or nippers, to ensure the even piling of the sheets of paper, or their equivalents, whatever the size of the sheet may be.

Third. I claim the vibrating double cam for throwing off and on the impression.

Fourth. I claim two or more distributing rollers, having a lateral motion upon a main distributor, which shall move independent of, and in opposite direction to, each other, and thus alternately cross and recross each other's distribution, for the purpose of giving a uniform inking to the form.

Also, the two distributions given to the inking rollers, upon one cylinder, for each impression, (heretofore patented by me,) in combination with the rotating reciprocating bed, with the spring extensions attached; all of which is herein described and set forth.

GEO. P. GORDON.

No. 689.—*Automatic Grippers for Carrying Sheets of Paper in Printing Presses.*—I claim, first, one or more sets or grippers, nippers, or fingers, to revolve, independent in themselves, upon an axis, for the purpose of carrying the sheets of paper to the place of impression, or for carrying the sheet, after it has received the impression, to its place of deposit upon the pile board or fly board, or for either or both of these purposes; thus receiving and piling the sheets of paper in an even and regular heap, by the acts of my automatic grippers, or independent revolving nippers, or their equivalents.

Second. I claim the combination of the independent revolving grippers with the vibrating feed board, or its equivalent.

Third. I claim the combination of the independent revolving grippers with a pile or fly board, to be used as described, or in some equivalent way.

Fourth. I claim the combination of the independent revolving grippers with a feed board and a pile or fly board, or their equivalents, substantially as herein described.

GEO. P. GORDON.

No. 690.—*Improvement in Harvesters.*—I claim, first, the shoe piece *v*, and rack 14, to adjust the height of the outer end of the finger board, substantially as and for the purposes specified.

I also claim the shaft *f* passing across the end of and nearly at right angles to the shaft *I* of the main wheel *a*, when fitted in such a manner that its pinion *i* can be thrown into and out of gear with the face wheel *K*, for the purposes and substantially as specified.

THOMAS D. BURRALL.

No. 691.—*Improvement in Coffee Roasters.*—I claim, first, the within specified arrangement of the plates or shelves *D D*<sup>1</sup>, for the purposes set forth.

Second. The combination of a window or windows in a coffee roaster, with agitating or elevating plates or shelves, substantially as and for the purposes set forth.

THEO. HEERMANS.

No. 692.—*Improvement in Grain and Grass Harvesters.*—I claim, first, the device for adjusting the cutting apparatus, which may be raised or lowered without changing the height of

the main frame, in combination with the finger bar, either with or without the removable platform, substantially in the manner specified.

Second. The combination of the inner projecting ends of the main frame, with the adjustable cutting apparatus, substantially in the manner and for the purpose specified.

Third. Supporting the clamp and finger bar by means of the slotted iron frames *K K*, and locking bolts *i i*, in combination with the cross pieces *T T*<sup>1</sup> of the main frame, substantially as described.

Fourth. The mould board *L*, constructed and arranged substantially in the manner and for the purpose set forth.

Fifth. Extending or widening out the upper part of the guard finger, substantially as represented by the overhanging bars *m m*, in combination with the central bar *n*<sup>1</sup>, in the manner and for the purposes specified.

Sixth. Arranging the three pronged fingers above described, so that they mutually brace each other in front of the finger bar, as set forth; and are also braced and supported at each end of the cutter bar by the projections *J* and *m*<sup>3</sup>, substantially in the manner and for the purpose specified.

Seventh. The raking apparatus, constructed and operating in the manner substantially as described.

Eighth. The movable fulcrum upon which the rake is suspended and operated, in the manner substantially as described.

ELIAKIM B. FORBUSH.

No. 693.—*Improvement in Grain and Grass Harvesters.*—I claim, first, the manner of constructing and uniting the inner rear corner of the main frame, so as to depress or drop the shoe and cutting apparatus, and serve as a continuation of the shoe for treading down the stubble and mown grass, in the manner and for the purposes specified.

Second. The combination of the guide stirrup *B B* with the front of the main frame, so as to permit the draft pole *P* to play above and below the front of the main frame, substantially as described.

Third. Connecting the draft pole to the machine by the oscillating pendant, substantially as and for the purposes described.

Fourth. So connecting the draft pole to the machine as that the draft shall be from the axle or centre line of the driving and supporting wheel, in connection with rear extension of the pole, in the manner and for the purposes specified.

Fifth. The combination of the extended finger bar with the adjusting shoe *E*, and adjustable hinged runner *q*, substantially as described for the purpose specified.

Sixth. The combination of the main frame, draft pole *P*, guide stirrup *B*, and adjustable shoe *E*, arranged with each other in the manner and for the purpose substantially as specified.

Seventh. The adjusting shoe *E*, constructed and operating in the manner above set forth.

Eighth. The arrangement of the caster wheels *d* and *d d*, with adjustable connecting bars, in relation to the finger bar platform and frames of the machine in the manner and for the purpose substantially as described.

ELIAKIM B. FORBUSH.

No. 694.—*Improved Washing Machine.*—I claim, first, the vessel *B*, with its yielding valved diaphragm *J* and the perforated diaphragm *I*, or its equivalent, in combination with a pipe *G*, communicating with the vessel at a point above, and the pipe *H* at a point below the said diaphragm, and both pipes communicating with any suitable heating apparatus, substantially as and for the purpose set forth.

Second. The reciprocating plunger *C*, with its enlarged end constructed as set forth, namely, with the recess *m*, flanch *n*, and perforations *p*, in combination with the yielding diaphragm *I*, for the purpose specified.

Third. Providing the plunger *C* with an upper enlargement *q*, concave on the under side, and arranged in respect to the lower plunger, substantially as and for the purpose set forth.

HAMILTON E. SMITH.

No. 695.—*Improvement in Grain Harvesters.*—I claim, first, the additional apron, to convert the usual rear discharge into a side discharge of the cut grain, substantially as herein described.

I also claim the combination of the curved supports and the adjustable journal box piece, to preserve the relative positions of the cogs in the mitre gearing, and at the same time allow of raising and depressing the driving wheel, substantially as described.

I also claim the notches in the back corners of each knife, to prevent clogging or lodgement of fine grass in the cavities of the guards, said notches effecting a good purpose and not weakening the cutter, as herein represented.

THOMAS D. BURRALL.

No. 696.—*Improvement in Grain Harvesters.*—I claim the location of the raker's seat with regard to the drive wheel and platform, as described and for the purpose set forth.

I also claim, in combination with a raker's seat, located as described, extending off the rear of the platform far enough back to allow the raker from his seat to turn the grain upon the platform and rake it off in an arc of a circle by a circular sweep or quarter turn movement of his rake, substantially as described.

THOMAS D. BURRALL.

No. 697.—*Arrangement of Buckets of Paddle Wheels.*—I claim arranging the floats or buckets of a paddle wheel upon its arms or the equivalent thereof, whereby the buckets shall be continuously increasing and diminishing their depth in the water as the said wheel revolves, as and for the purposes herein set forth.

M. A. CROOKER.

No. 698.—*Improvement in Machines for Pegging Boots and Shoes.*—What I claim is driving the pegs into boot and shoes automatically by means of a peg driver operated up and down by a positive mechanical movement, whether impelled by a cam, eccentric, or crank, or other equivalent, substantially as and for the purposes specified.

J. J. GREENOUGH.

No. 699.—*Improvement in Machines for Pegging Boots and Shoes.*—What I claim is the moving the sole of the shoe along by means of the awl that forms the hole in which the peg is inserted, in combination with the peg driver, whether the peg driver be or be not employed to perform the additional function of presenting the peg, whereby each hole made by the awl is brought in succession in line for inserting the peg before the awl is withdrawn, as set forth.

J. J. GREENOUGH.

No. 700.—*Improvement in Machines for Pegging Boots and Shoes.*—What I claim is cutting off shoe pegs from a strip of peg wood or other material by means of a lateral or side cut that will cut straight across, substantially as and for the purposes set forth, when combined with suitable ways, in which the strip slides, and machinery for driving the pegs, as specified.

I also claim inclosing the peg by the cutter until it is driven as specified, by making the cutter, when in position, a part of the guiding tube, substantially as set forth.

I also claim the combination of the endless feed, with a cutter for severing the pegs in a shoe pegging machine, as above specified.

J. J. GREENOUGH.

No. 701.—*Improvement in Machines for Pegging Boots and Shoes.*—I claim connecting the last with a horizontal slide or plate capable of presenting the shoe or boot, substantially as described, so that the shoe or boot attached thereto may be turned and moved in any direction in a horizontal or inclined course, in combination with a mechanism, substantially such as described, which tends constantly to force it upward against a rest or guide, but which will permit it to yield downward, as described; but this combination I claim only when combined with the pegging mechanism above described or any equivalent therefor.

And I also claim, as an automatic means of moving and guiding the last to present it to the pegging apparatus in the required line of pegging, the guide groove and guide and pinion and curved rack, substantially as described, in combination with the mechanism above described or the equivalent thereof, which permits the last to be moved in any desired direction, as set forth.

J. J. GREENOUGH.

No. 702.—*Improvement in Machines for Pegging Boots and Shoes.*—I claim the combination of the universal movement carriage and lateral awl movement for properly presenting the shoe to receive the pegs in succession, as herein specified.

I also claim the combination of the mechanism for the cutting and feeding of the pegs, as herein described, or any equivalent therefor, with the automatic peg driver, as described.

I also claim the combination of the following elements or their mechanical equivalents, namely, the peg former, the peg feeder, the peg driver, and the mechanism for moving the shoe, herein described; thus constituting an automatic machine for pegging shoes, as set forth.

J. J. GREENOUGH.

No. 703.—*Improvement in Machines for Pegging Boots and Shoes.*—I claim the pegging of boots and shoes with nails, or pegs of drawn wire, substantially as above described.

I also claim driving the pegs by means of the cutting nippers, said nippers cutting off the peg after it is driven, substantially as specified.

J. J. GREENOUGH.

No. 704.—*Improvement in Tailor's Shears.*—I claim the oblique rectilinear slot C in the elongated shank of the lower blade A, in combination with the fulcrum D and a lever con-

necting the two portions of the shears behind the fulcrum, the whole constructed and operating substantially as and for the purposes set forth.

R. HEINISCH.

No. 705.—*Improved Machine for Making Paper Bags and Envelopes.*—First. We claim the bar K to relieve the end of the under sheet of the weight of the pile, partially or wholly.

Second. The friction bar I to separate the under sheet.

Third. The guide bar L, in connection with bar I, to hold the sheet in place for the jaws.

Fourth. The lifter M to relieve the sheet from the weight of the pile.

Fifth. The feeding from the bottom of the pile.

Sixth. The combination of weight bar, friction bar, guide bar and lifter, constituting a feeding apparatus.

Seventh. The jaws to place the paper in position.

Eighth. In combination with machinery for making bags from paper of any size, we claim a former, of the shape and dimensions required by the nature of the work to be done, over or around which the paper is to be folded for the purpose of producing the bag or bags, substantially as described. We wish it understood, however, that we distinctly disclaim the use of a series of moulds in a machine for making paper boxes, such a series having been used in the paper box machine of R. L. Hawes, patented January 16, 1855. Nor do we claim moulds placed at the extremities of the arms of a wheel, and used in the manufacture of paper boxes, such an arrangement having been employed in the box machine of Louis Koch, patented March 13, 1855.

Ninth. The pasters and side folders.

Tenth. The combination of the table, the bar B, the side folders and pasters, all constructed as herein set forth, or any other substantially the same.

JOHN H. LEWARS, *President.*

CHARLES C. BERGMANN,

*Secretary and Treasurer.*

No. 706.—*Improvement in Sewing Machines.*—I claim as the invention of George W. Stedman, deceased, first, the tube herein described, receiving thread in the manner specified and acting in combination with the needle, so that each forms a series of loops, each of which loops receives one, and is received by the next one of the other series, as set forth.

Second. I claim the auxiliary plate carrying the guide for the looping tube, and secured to the bed plate substantially in the manner specified, so as to be adjustable to any desired position relatively with the needle, for the purposes set forth.

Third. I claim a reciprocating tube or equivalent device coöperating with an eye-pointed needle to concatenate or form the stitch, and produce sewing essentially as specified, combined with and receiving its motion from one end of a lever, the fulcrum of which is at or near the bed or table of the machine, while the other end carries the said needle, substantially as described.

Fourth. I claim feeding the cloth by means of a needle which is made to pass through the same in a position, with respect to its length, diagonal to its line of movement, as specified, in combination with a spring to throw the needle into position to feed the cloth the next stitch, and the screw, or its equivalent, to determine and regulate the length of the stitch, substantially as specified.

EMELINE M. STEDMAN,

*Executrix of George W. Stedman, deceased.*

No. 707.—*Improvement in Grain and Grass Harvesters.*—I claim, first, the arrangement and connection of the rear cross timber X in relation to the main frame, in the manner and for the purposes specified.

Second. The peculiar construction and arrangement of the gear frame B, in relation to the main frame, driving wheel, and gearing, in the manner and for the purpose specified.

Third. The gear key D, in combination with the gearing shaft, constructed, arranged, and operated substantially in the manner described, for the purpose specified.

Fourth. The locks *n* and *r s* in the clamp, as and for the purpose set forth.

Fifth. The track clearer M *m* provided with the arms *y y*, arranged in relation to each other and socket piece *m*, to operate in the manner and for the purpose substantially as described.

Sixth. A recess IX made in the outside shoe, in the rear of the cutter bar, as and for the purpose specified.

Seventh. The second angle (at *c r*) formed by the brace bars of the guard finger, substantially as herein described.

ELIAKIM B. FORBUSH.

No. 708.—*Improvement in Gas Burners.*—I claim producing a light which may be increased or diminished at pleasure, by means of the adjustable heater D, or heat receivers *ee*, operating

in connection with a wick tube or holder B and the flame of the lamp or burner, substantially as herein specified; or within the meaning and intention thereof.

JOHN K. O'NEIL.

No. 709.—*Improvement in Knitting Machines.*—I claim stopping a knitting machine when the yarn accumulates in the needles, by the action of the accumulated yarn, substantially as herein set forth.

NELSON P. AIKIN.

No. 710.—*Improvement in Shuttles for Weaving Cloth.*—I claim furnishing the shuttle with a spring and catch, so arranged that the bobbin will be received or released at one operation, substantially as described.

JAMES BALDWIN.

No. 711.—*Improvement in the Mode of Converting the Backs of Car Seats into Beds or Lounges.* I claim, first, the use of the backs of car seats for forming upper horizontal beds or lounges, substantially as set forth.

Second. So arranging the backs of contiguous seats that they may meet and remain in the same horizontal plane, substantially as and for the purposes set forth.

Third. The use of a cushioned surface intermediate between the cushioned surfaces of two car seats, so as to form with the same a horizontal bed, berth, or lounge; said intermediate cushion forming an attachment to and appearing as part of the car seat when not adjusted to aid in forming a berth, bed, or lounge, substantially as set forth.

Fourth. Forming a continuous line of lower horizontal beds, berths, or lounges of a series of car seats in railroad cars, by uniting the several seats so as to fill up the entire space between the seats with adjustable cushioned attachments of the seats, whatever be the character or disposition of said attachments, so long as they form and appear as parts of the seats, when not adjusted to form said continuous line of lower beds, berths, or lounges, substantially as and for the purposes set forth.

HENRY B. MYER.

No. 712.—*Improvement in Retorts for Distilling Oils from Coal.*—I claim, first, the use of a straight or curved blade or blades placed on the agitators or arms *h* of shaft *e* for the purpose of agitating, lifting, mixing, and bringing all parts of the mass within the retort in contact with the heat, as herein described and set forth.

Second. The arrangement near the outer edge of one end of a retort of four or more supply and discharge openings, and on the other end near the outer edge of four or more exit pipes placed on a line with and opposite to the supply and discharge openings as herein described.

JOHN NICHOLSON.

No. 713.—*Improvement in Coffee Pots.*—I claim, first, the combination of boiler *a*, still worm condenser *b*, conducting plate *g*, and the external opening of the still worm at *g*<sup>1</sup>, when these devices are so arranged in relation to each other that an opening to the external air shall be provided for the non-condensable gases, while the condensable vapors are reduced to a liquid, without coming in contact with the condenser water, and then turned by conductors into the boiler, as and for the purposes specified.

Second. The arrangement of the joint *c*, below the spout, so that no vapor can pass through the spout without first entering the joint, as set forth.

Third. The employment of conductors in combination with the condenser, for the purpose of filling the water joints or keeping it full, as and for the purpose specified.

W. H. ELLIOT.

No. 714.—*Improvement in Mowing and Reaping Machines.*—I claim, first, connecting the frame of the platform with the frame carrying the driver and raker's seat, in the manner substantially as set forth, namely: securing the relative position of the two frames by means of the brace *S* in the rear, and the laterally inclined draw shoe in the front, when the above parts are constructed and arranged, as described.

I claim, secondly, the shoe *K*, in combination with the tongue attachment in front thereof, the said shoe being constructed and arranged, substantially as described, to perform the functions as set forth herein.

I claim, thirdly, the rod *4* and the rails *5*, connected in the manner described, in combination with the pole *N*, the rocking shaft *3*, and the lever *2*, the whole being constructed, arranged, and operated in the manner specified, and for the purpose set forth.

I claim, fourthly, the arrangement, in relation to the driver's seat, of the lever and mechanism connected therewith for raising and lowering the cutter bar, substantially as set forth herein, whereby the sickle may be raised in the manner described.

J. W. MULLEY.

No. 715.—*Improvement in Grain Separators.*—I claim the endless chains  $d$ , composed of metallic links provided with protuberances or depressions, when used in combination with suitable driving chain gears, to impart a positive motion to the straw carrier of a threshing and separating machine, as explained.

J. R. MOFFITT.

No. 716.—*Improvement in Grain Separators.*—I claim in combination with a receptacle in which the tailings are deposited by the winnowing apparatus, the arrangement of the screw elevator  $O$ , in relation to the threshing cylinder, for the purpose of returning the tailings to be rethreshed, as set forth.

J. R. MOFFITT.

No. 717.—*Improvement in Grain Separators.*—I claim the reversible screen  $k^2$ , and delivery spout  $l^2 m^2$ , arranged, adapted, and constructed substantially in the manner described, with and to the discharging spout of the “fanning mill” or “shoe” of a threshing machine, so as to be isolated from the winnowing arrangement, and made to deliver at either one side or the other of the machine, as set forth.

J. R. MOFFITT.

No. 718.—*Improvement in Grain Separators.*—I claim the construction and arrangement, substantially as described, of the rotary beater  $A$ , within the apron, in combination with the falling sections  $B^3$ , operating in the manner and for the purposes set forth.

J. R. MOFFITT.

No. 719.—*Improvement in Grain Separators.*—I claim the arrangement of disconnected shafts  $H H^1$  carrying pinion chain gears  $E e, E^1 e^1$ , rotated at equal speeds from a single shaft or driver, and acting to drive the endless apron from its lower end, while permitting the escape of the straw through the lower openings of the apron, as set forth.

J. R. MOFFITT.

No. 720.—*Improvement in Machinery for Preparing Oval Picture Frames.*—I claim the combination of a scraper adapted to the form of the moulding with the revolving face plate of a lathe, when the said scraper is arranged to be self adjusting laterally to the said moulding, for the purpose herein set forth.

WILLIAM GARDNER.

No. 721.—*Improvement in Grain and Grass Harvesters.*—What is claimed as the invention of Sylla & Adams is, first, an elevated binding table in combination with the platform for receiving the grain as it is cut, substantially as set forth.

Second. The combination with the binding table of more binders' stands on a lower level than that of the table, substantially as set forth.

Third. The combination of a binding table with a binders' stand, having an elevated side for the binder to rest his legs against, and thereby steady himself without the aid of his arms, both of which are thus left at liberty to do the binding, substantially as set forth.

Fourth. The arrangement of the rakers' and binders' stands, substantially as herein set forth, so that grain may be raked from the platform and delivered upon the binders' table before the several binders' stands, in the manner substantially as set forth.

Fifth. The arrangement of the dumping tray with the rakers' and binders' stands, substantially as set forth.

CORNELIUS AULTMAN,  
LEWIS MILLER,  
THOMAS R. TONNER,  
JACOB MILLER,  
GEORGE COOK,

Composing the firm of C. Aultman & Co.

No. 722.—*Improvement in Grain and Grass Harvesters.*—What is claimed as the invention of Sylla & Adams is, first, the combination of the finger beam and the main frame with a yielding coupling arm  $J$ , whereby the progressive movement of the finger beam over the ground will be controlled by the main frame, and its upward and downward movements by the undulations of the ground over which it is drawn, substantially as herein set forth.

Second. The combination of a yielding coupling arm  $J$ , and a yielding brace bar  $K$ , with the finger beam and main frame, substantially as herein set forth.

Third. The combination of the yielding bars  $J K$  and  $K^1$ , and the removable bolts  $L^1 L^2$ , or the equivalent thereof, with the finger beam and main frame, whereby the finger beam may

be allowed to slide loosely on the ground, to adapt the machine to mowing, or be held firmly above the ground to adapt the machine to reaping, substantially as herein set forth

CORNELIUS AULTMAN,  
LEWIS MILLER,  
THOMAS R. TONNER,  
JACOB MILLER,  
GEORGE COOK,

*Composing the firm of C. Aultman & Co.*

No. 723.—*Improvement in Grain and Grass Harvesters.*—What is claimed as the invention of Sylla & Adams is, the short finger beam, in combination with the yielding connection with the main frame or its equivalent, substantially as herein set forth.

CORNELIUS AULTMAN,  
LEWIS MILLER,  
THOMAS R. TONNER,  
JACOB MILLER,  
GEORGE COOK,

*Composing the firm of C. Aultman & Co*

No. 724.—*Improvement in Grain and Grass Harvesters.*—What is claimed as the invention of Sylla & Adams is, the combination of the finger beam, with the hinges by which it is drawn, arranged above the plane of the cutter, substantially as herein set forth.

CORNELIUS AULTMAN,  
LEWIS MILLER,  
THOMAS R. TONNER,  
JACOB MILLER,  
GEORGE COOK,

*Composing the firm of C. Aultman & Co.*

No. 725.—*Improvement in Grain and Grass Harvesters.*—What is claimed as the invention of Sylla & Adams is, the combination of a counterpoise weight, or the equivalent thereof, with that end of the finger beam next the main frame, to equalize its pressure upon the ground, substantially as set forth.

Also, the combination of a counterpoise weight or the equivalent thereof, with each or either end of the finger beam to diminish its pressure, upon the ground substantially as set forth.

CORNELIUS AULTMAN,  
LEWIS MILLER,  
THOMAS R. TONNER,  
JACOB MILLER,  
GEORGE COOK,

*Composing the firm of C. Aultman & Co.*

No. 726.—*Improvement in Grain and Grass Harvesters.*—What is claimed as the invention of Sylla & Adams is, the combination of a stop with the mechanism for connecting the finger beam with the main frame and allowing it to rise and fall, substantially as herein set forth.

CORNELIUS AULTMAN,  
LEWIS MILLER,  
THOMAS R. TONNER,  
JACOB MILLER,  
GEORGE COOK.

*Composing the firm of C. Aultman & Co.*

No. 727.—*Improvement in the Manufacture of India Rubber Goods by means of Zinc Compounds.*—What is claimed as the invention of Tyer & Helm is, India rubber fabrics made by the combination of caoutchouc in its several varieties with the sulphuret of zinc, or the bisulphuret of zinc, or the hyposulphite of zinc, or the sulphite of zinc, and also with zinc compounds in their several forms, as herein set forth, and sulphur, and in combination with these in either case, the submitting said compound to the action of steam at a high temperature, the whole being combined and manufactured substantially as above described.

HORACE H. DAY.

No. 728.—*Improvement in Apparatus for Raising Water.*—I claim, first, the combination of a casing whose sides slope outward from the induction opening, with a revolving piston, the edge of whose blades conform to and run near to the sloping sides of the casing or the spiral rib, substantially as described for the purpose set forth.

Second. In combination with a casing whose sides slope outward from the eduction open-

ings, I claim a rotating piston with fixed blades inclined upon the face to the axis of the piston rod, for the purpose set forth.

Third. Dividing the stream of liquid as it enters the casing containing the rotating piston by causing it to pass through two or more induction openings, arranged substantially as described, so that the blades of the piston pass over these openings.

WILLIAM T. BARNES.

No. 729.—*Improvement in Ink Stands.*—I claim, first, the arrangement for flexing the elastic diaphragm, by so attaching a mechanism in connection with the cover for the ink cup that the opening and closing thereof shall effect the raising or discharge of the ink or other fluid into or from said cup, as specified.

Second. The cover arranged and operating, as above set forth, in combination with the elastic or flexible diaphragm and a non-corrosive fountain or ink cup, when operating as and for the purposes hereinabove specified.

Third. The combination and arrangement of cam lever *d* and plunger *i*, or the equivalents thereof, for effecting the raising or discharge of the ink by raising or closing the cover of the non-corrosive fountain cup, substantially as specified.

Fourth. Arranging the cam centres in such relation to each other that by raising the cover the requisite depression of the diaphragm will be produced to obtain the required result as specified.

THOMAS ROBJOHN.

No. 730.—*Improvement in Cracker Machines.*—I claim the combination of adjustable springs with a cracker cutter and its resisting surface or bed, substantially as hereinbefore described, and substantially for the purposes hereinbefore set forth.

JOHN McCOLLUM.

No. 731.—*Machine for Creasing and Blacking Leather for Harnesses.*—I claim, first, the pressure roller *F*, and the creasing and embossing rollers *i*, in combination with the color fountains *K* and *L*, and felt rolls *M M*, arranged to operate as and for the purpose set forth.

Second. The arrangement of the embossing rollers *i*, with their projecting flanges *K<sup>1</sup>*, to operate in combination with the guides *d d<sup>1</sup>*, substantially in the manner and for the purpose specified.

ADOLPH STEMPEL.

No. 732.—*Improvement in Plates for Boiler Holes and Tops of Stoves.*—We claim, as the invention of John B. Chollar, constructing a cross piece for cooking stoves and ranges with a hollow chamber and with the openings *e e*, to allow air to pass into the said chamber, substantially as set forth.

DAVID STUART.  
RICHARD PETERSON.

No. 733.—*Improvement in Grinding and Polishing Knives.*—What I claim, is grinding and polishing articles and forming their surfaces upon or against the periphery of a grindstone or polishing wheel, or other analogous reducing surface, by attaching them to the periphery of a revolving drum or cylinder, substantially as herein set forth.

I also claim making matrices in the periphery of a wheel, to which a series of articles to be ground are attached, said matrices being adapted to give the required shape to the articles to be ground so as to grind, polish, and shape such articles in a uniform manner, substantially as and upon the principles herein set forth.

I also claim, in combination with said matrices, attaching and supporting the articles to be ground upon the cylinder in such manner as to allow them to rock or to accommodate themselves thereon, whereby their surfaces may be shaped either convex, flat, or concave, substantially as herein set forth.

JAMES DODGE.

No. 734.—*Improvement in Gas Lamps.*—I claim as the invention of Horatio G. Sickels, first, forming a valve within the adjustable gas chamber *P*, and a seat for the said valve on the tube which contains the wick *t*, so as to regulate and extinguish the light when required, whether the said valve be made and arranged in the manner described or other modes, substantially the same, by which similar results may be produced.

Second. The employment of the safety valve *C D E*, in combination with the guard *T*, constructed substantially as described.

Third. I also claim the guard *T*, in combination with the combined burner and generator, arranged and operating in the manner and for the purpose set forth.

Fourth. I likewise claim combining the generator *Q R*, burner *P*, ring *U*, and guard *T*, in a single piece, made to ascend and descend simultaneously in the manner and for the purpose substantially as herein set forth.

GEO. H. BECHTEL.

No. 735.—*Improved Shingle Machine.*—I claim, first, the combination of the vibrating frame 2<sup>1</sup>, with the obliquely slotted side piece 11, and the cam wheel 12, arranged and operating substantially as and for the purpose set forth.

Second. The relative adjustment of ratchet *o* and sheave *g*<sup>1</sup>, substantially as and for the purpose specified.

Third. The arrangement of the pinions 7 7, with levers 7<sup>1</sup> 7<sup>1</sup>, and dog 6 6, as herein set forth.

Fourth. I claim raising and securing the weighted arm of lever L<sup>1</sup>, prior to the engagement of the traversing mechanism, substantially as hereinbefore set forth.

E. WEBBER

No. 736.—*Improvement in Cotton Gins.*—I claim the revolving screen, cylinder, or shaft, situated in the hopper or roll box, so that the "roll" moves around it, when constructed and arranged substantially in the manner described, whether as a single or double device, so as to perform any or all of the functions, as herein specified.

I also claim discharging the hulls and trash from the roll box through the sides of the cotton gin, as above set forth.

DAVID G. OLMSTED.

No. 737.—*Improvement in Fastening Centre Bits.*—I claim fastening a bit in its stock by means of a projection on one and a suitable recess for it on the other, when combined with mechanical pressure or friction that will hold the projection and recess together, substantially as described.

ABEL W. STREETER.

No. 738.—*Improvement in Water Backs for Ranges.*—I claim protecting the water backs of ranges by the introduction of a movable fire brick, soap stone, or equivalent material between the fire and said water back, substantially as specified.

I also claim arranging said water back, substantially as set forth, whereby the same can be moved away from the fire to allow space for introducing said protecting fire brick or its equivalent.

And in combination with said water back I claim the lever *k* and weight *g* or their equivalents to move the intervening soap stone or fire brick, substantially as specified.

JAMES INGRAM.

No. 739.—*Improvement in Bridges.*—I claim so combining the arch chord or beam, the arch brace, and the abutment or pier of a bridge, so that the thrust of the arch shall be thrown down upon the abutment or pier, and any deflection in the lower chord be counteracted by an upward force at the upper ends of the arch braces, substantially as described.

I also claim the method of lengthening or shortening the braces of a bridge truss or girder, by which the truss may be elevated or depressed, as required, by means of the yoke *a*, the plate *b*, on the end of the brace, and the straining pieces *c c*, with their nuts *d*, substantially in the manner herein described.

D. C. McCALLUM.

No. 740.—*Improvement in Governors for Steam Engines.*—First, in combination with arms and very small balls or their equivalents, revolving at a velocity several times greater than would be due or natural to them considered as a conical pendulum, I claim the employment of a counterpoise, applied substantially as described, and so proportioned in weight as to balance or nearly so the centrifugal force developed by the revolution of the said arms and balls or their equivalents.

Second. I claim the employment, at the connection between the arms and the central spindle of the governor, of a joint, constructed substantially as described, and illustrated in Fig. 2, whereby each arm is brought to the outside of the joint on one side, and made to thrust against the joint pin close to one end thereof at a right angle and at a distance from the axis of revolution, as herein described.

CHAS. T. PORTER.

No. 741.—*Improvement in Veneers.*—I claim the embossed veneers described, the same being adapted for subsequent application in the construction and ornamenting of furniture and other articles to which veneers are or may be applicable.

ISRAEL AMIES.

No. 742.—*Improvement in Reaping Machines.*—I claim the combination of side and cross bearings of the guards, with flush edges at and near the forks of the blades, substantially as described.

OBED HUSSEY.

No. 743.—*Improvement in Reaping Machines.*—I claim scalloped cutters, with their blades beveled, as herein described.

OBED HUSSEY.

No. 744.—*Improvement in the Process of Grinding Paper Pulp* —What I claim is the process of reducing fibrous substances to pulp suitable for making paper, while such fibrous substances are suspended in water, by subjecting them to the operation of grinding or beating action in a closed vessel to which it is supplied by the hydraulic power of a descending column of water so charged with the fibrous substance, and permitting it to escape and be discharged so soon as it is sufficiently reduced, substantially as set forth.

And I also claim separating the fibres from the mass, so soon as they are sufficiently reduced, and discharging them by the hydrostatic pressure of the column of water in which the fibres are suspended, and which, in flowing upward to the discharge, carries with it only the fibres which are sufficiently reduced, substantially as described.

JOSEPH KINGSLAND, JR.

No. 745.—*Improvement in Machinery for Grinding Paper Pulp.*—What I claim in machinery for reducing fibrous substances to pulp suitable for making paper, is the combination of the rotating grinder, with and inclosed in a surrounding case, which constitutes the opposing grinding surface, and which is provided with a feeding pipe and discharge aperture, suitable for feeding and carrying the fibrous substances to and from the grinder in the inclosed vessel by the hydraulic pressure of a descending column of water, as set forth.

JOSEPH KINGSLAND, JR.

No. 746.—*Improvement in Brick Machines.*—I claim, first, the yoke constructed of the form above described, by which the converging planes are held firmly in the same position relative to each other, whether the same be composed of one or more pieces of metal.

Second. The radial, sliding, and revolving chargers, in combination with the mould wheel.

Third. The arrangement of the guide stem on the side of the pressers instead of on the end, whereby I am enabled to place the pressing roller in the cavity of the piston.

Fourth. What I claim is making the piston or presser hollow, and inserting the pressing roller in the cavity thereof, instead of placing it upon the guide stem as heretofore done.

JOSEPH W. JAYE.

No. 747.—*Improvement in the Process of Manufacturing Wire Grating, &c.*—I claim manufacturing screens or other articles from metallic wires or bars that are bent or crinkled at the point of intersection previously to being laid or woven up, whereby I am enabled to form meshes of any desired size or shape by such intersecting bars or wires, so that they shall be rigid and durable, as set forth, and this I claim irrespective of the mechanism for bending or crinkling said wires, or interweaving them to form the requisite meshes.

HENRY JENKINS.

No. 748.—*Improved Washing Machine.*—I claim, first, providing a stop board at the lower portion of the rear end of the rubber, substantially as and for the purposes set forth.

Second. Providing an oblong slot, the lower termination of which is of scroll form, in each of the pendulous arms of the rubber, substantially as and for purposes set forth.

Third. The combination with said slot of a back trip board, substantially as and for the purposes set forth.

M. VAN AUKEN.

No. 749.—*Improved Machine for Finishing Brush Handles.*—I claim, first, the combination of the crown wheel saw O, with the adjustable platform Y Y and stop g, substantially as and for the purpose set forth.

Second. The wheel K, provided with the oblique cutters y, in combination with the guard or gauge piece L, the cutter wheel and gauge piece being arranged relatively with each other, substantially as and for the purpose set forth.

Third. The arrangement and combination of mechanical devices herein set forth and described, to wit: the platform D, with revolving cutters shaped and operating as described, crown saw O, with the arms d d, and the adjustable platform and cutter wheels K and M, with their cutters, substantially as described.

JOHN AMES.

No. 750.—*Improvement in Valves for Dry Gas Meters.*—What we claim as the invention of Lloyd is, first, the construction of the rotary valve c c, with series of breaks or edges as at f p p and q q, arranged and operating so as to scrape the upper surface of the valve seat.

Second. The drip K and the valve seat g g, arranged and operating so as to collect and carry off any liquid deposit in the meter.

Third. The valve carriage D D, arranged and operating substantially as above described.

Fourth. The combination of the valve c c, the valve seat g g, the shafts E E E, attached to

the diaphragms, arranged and operating as above described for the purpose of restraining a reverse movement in the meter, and thus dispensing with the click and ratchet.

WILLIAM HOPPER.  
ROBERT H. GRATZ.

No. 751.—*Improvement in Ice Cream Freezers.*—I claim a scraper or scrapers which act or bind during the process of freezing cream with a yielding spring force against the inner surface or surfaces of the cream chamber, substantially as and for the purposes set forth.

H. B. MASSER.

No. 752.—*Improved Faucet.*—I claim the elastic plug valve, attached to a stem when operated by an eccentric or its equivalent, substantially as set forth, for the purposes described.

Second. I claim the elastic plug valve, constructed as described, in combination with the cup shaped cap to prevent the plug from spreading, substantially as described.

ALBERT FULLER.

No. 753.—*Improvement in Faucets.*—I claim the described arrangement of the cam F, flanges J and J<sup>1</sup>, longitudinal slot *i*, and spurs K, combined and operating in the manner and for the purposes set forth.

JAMES POWELL.

No. 754.—*Improved Billiard Table Cushion.*—I claim that order in the arrangements of the materials composing a billiard table cushion, which places the cork in the rear, the rubber in front of it, and the paper, leather, and cloth, or equivalents thereof outside, in the manner and for purpose set forth.

JOHN M. BRUNSWICK.

No. 755.—*Improvement in Fire Engines.*—We claim placing the cylinders diagonally to the line of the rock shaft, substantially in the manner and for the purpose herein set forth.

We claim combining with the water way or channel *i*, the chamber *d*, divided into two compartments by the contraction *r*, at or about one half the height of said air chamber above its base or point of attachment to said water way, substantially in the manner and for the purposes herein set forth.

We claim in combination with the hour glass contraction of the air chamber the ring enlargement *s* of the rock shaft, as herein set forth.

LYSANDER BUTTON,  
ROBERT BLAKE.

No. 756.—*Improvement in Cleansing Caoutchouc.*—I claim the use of alkali, or its equivalent, for separating bark, sticks, and other foreign bodies, from crude caoutchouc and other vulcanizable gums to prepare them for manufacturing.

AUSTIN G. DAY.

No. 757.—*Improvement in the Treatment of Crude Caoutchouc.*—I claim charging the caoutchouc or other like gum with alkaline liquor or its equivalent, by means of the exhausting apparatus herein described and represented.

AUSTIN G. DAY.

No. 758.—*Improvement in Cut Off and Working Valves of Steam Engines.*—I claim the method, substantially as described, of operating the slide valves of steam engines, by connecting the valves that open and close the ports at opposite ends of the cylinder, with separate crank wrists or other mechanical equivalents, so that from the motion thereof each valve, while its port is closed, shall move a less distance than it moves in opening and closing its port, while at the same time the two wrists by which the two valves are opened have the same range of motion, as described, whereby I am enabled to save much of the power heretofore expended in working the slide valve of steam engines, and by which also I am enabled to make a greater proportion of the movement of the valve available for effecting a free passage of the steam through the ports of the cylinder.

GEORGE H. CORLISS.

No. 759.—*Improvement in Cut Off and Working Valves of Steam Engines.*—I claim the combination of liberating valve gear with valves which are moved parallel to their seats and continue their closing motion after their ports are closed, and commence their opening motion before their ports open, substantially as described.

GEORGE H. CORLISS.

No. 760.—*Improvement in Cut Off and Working Valves of Steam Engines.*—I claim the combination, substantially as described, of an air cushion with the liberating valve gear of steam engines.

GEORGE H. CORLISS.

No. 761.—*Improvement in Cut Off and Working Valves of Steam Engines.*—I claim the combination with the port of the valve gear that appertains to a liberated steam valve, of an instrument moved by the power of the engine in such manner as to effect the closing of the liberated valve, whenever the independent means provided for that purpose fail to act in time.  
GEORGE H. CORLISS.

No. 762.—*Improvement in Cut Off and Working Valves of Steam Engines.*—I claim the combination of a helical cam, with the opening and closing mechanism of the steam valve substantially as described.  
GEORGE H. CORLISS.

No. 763.—*Improvement in Cut Off and Working Valves of Steam Engines.*—I claim the method, substantially as described, of regulating the velocity of steam engines, by combining a regulator with a liberating valve gear.  
GEORGE H. CORLISS.

No. 764.—*Improvement in Harvesters.*—I claim hinging the finger beam to the main frame, so that it can be folded up thereon, substantially as herein described.  
LEWIS MILLER.

No. 765.—*Improvement in Harvesters.*—I claim hinging the coupling arm to the frame of one side of the main axle, and supporting it by a brace hinged to the frame on the opposite side of the axle, in such manner as to obtain, among other things, a wide basis for bracing on a short frame, without interfering with the folding up the finger beam against or upon the frame to render the machine more portable, substantially as described.  
LEWIS MILLER.

No. 766.—*Improvement in Harvesters.*—I claim the combination of the crank and the bearing for its journal, the cutter, the coupling arm, and the hinge of its inner end, with a hanger, which is made the common support for the hinge of the coupling arm and the journal of the crank, arranged and operating substantially as herein set forth.  
LEWIS MILLER.

No. 767.—*Improvement in Harvesters.*—I claim the method of folding the finger beam upon the frame by aid of the coupling arm with a lifting lever and cord, or the equivalent thereof, substantially as herein set forth.  
LEWIS MILLER.

No. 768.—*Improvement in Harvesters.*—I claim, first, the combination of knuckle with the joint which connects the finger beam and coupling arm, and the lever for raising the finger beam off the ground, the several parts being constructed and arranged as set forth.

Second. The combination of a lever arranged to turn on a pivot and to vibrate laterally, with notches and a catch to support the lever at any required elevation, together with the coupling arm and finger beam suspended to it, substantially as herein set forth.  
LEWIS MILLER.

No. 769.—*Improvement in Harvesters.*—I claim the arrangement of the hand lever R, driver's seat V, and foot lever P, whereby the driver may when necessary employ both his hands and his feet to raise the finger beam, substantially as set forth.  
LEWIS MILLER.

No. 770.—*Improvement in Harvesters.*—I claim the combination of the spring pawl and the teeth with the gib and key of the connecting rod, the connecting rod and cutter, substantially as herein set forth.  
LEWIS MILLER.

No. 771.—*Improvement in Mowing Machines.*—We claim the combination of the shoe which carries the end of the finger beam next the main frame, with a hinged brace bar, whose axis of motion at the end connected to the main frame is in a line with that of the corresponding end of the hinged coupling arm, substantially as herein set forth.  
CORNELIUS AULTMAN.  
LEWIS MILLER.

No. 772.—*Improvement in Mowing Machines.*—We claim the combination with the hinged coupling arm of a hinged base, whose axis of motion at the end next the main frame coincides with that of the corresponding end of the coupling arm, substantially as herein set forth.  
CORNELIUS AULTMAN  
LEWIS MILLER.

No. 773.—*Improvement in Mowing Machines.*—We claim the construction and arrangement of the finger beam and the main frame, so that the beam may be turned on its hinge into an upright position, and then raised and leaned against the frame to elevate it out of the reach of obstructions, and distribute the weight more equally upon the carrying wheels, when the machine is to be removed from one place to another where the mowing is to be done, substantially as described.

CORNELIUS AULTMAN.  
LEWIS MILLER.

No. 774.—*Improvement in Mowing Machines.*—We claim the combination of a hinged coupling arm, the finger beam, and catch, substantially as described, whereby the finger beam can be turned, raised, and held up, to render the removal of the machine from place to place more convenient and secure.

CORNELIUS AULTMAN.  
LEWIS MILLER.

No. 775.—*Improvement in Mowing Machines.*—We claim mounting the two driving wheels and one main gear wheel upon a common axle, in combination with a ratchet wheel for each driving wheel, each ratchet wheel fitted with a pawl that can be made to stand in or out of gear with the ratchet teeth at will, the whole arranged and operating substantially as described.

CORNELIUS AULTMAN.  
LEWIS MILLER.

No. 776.—*Improvement in Mowing Machines.*—We claim the combination of a ratchet wheel, a ratchet pawl, a spring acting on the pawl, and a bearing pin, or the equivalent thereof, for the spring, with the driving wheel and the axle of the main gear wheel, whereby one spring is made to perform the two duties of holding the pawl both in and out of gear with the ratchet wheel, substantially as described.

CORNELIUS AULTMAN.  
LEWIS MILLER.

No. 777.—*Improvement in Harvesters.*—I claim the combination of the inner shoe with a leading wheel, arranged substantially as herein set forth.

LEWIS MILLER.

No. 778.—*Improvement in Harvesters.*—I claim the combination with the shoe of an adjustable sole of the peculiar double runner form herein described, whereby the sole can be adjusted directly to the heel of the shoe without the intervention of a link rod and joint, as herein set forth.

LEWIS MILLER.

No. 779.—*Improvement in Harvesters.*—I claim connecting the handle of the rake to a transverse shaft in such a manner that the rotation of the said shaft when aided by the curved guiding rod R, or its equivalent, will impart the within described movements to said rake, viz: a sweeping axial movement from the inner edge of the sector shaped platform (or a little beyond the same) over to the forward portion of said platform, and at that point instantly changing to an axial horizontal movement across the platform to the starting point, and so onwards in regular succession, substantially as herein set forth.

McCLINTOCK YOUNG, JR.

No. 780.—*Improved Cut Off Gear.*—I claim combining with the rocking levers or their equivalents for operating the valves, the shoulders on the spring bars, or their equivalents, substantially as described and for the purpose specified.

And I also claim, in combination with the shoulders on the spring bars that operate the rocking levers, substantially as described, the employment of the gauge bars, or any equivalent therefor, to regulate the periods of closing the valves, whether the said gauge bars be regulated by a governor or by other means, as set forth.

GEORGE H. CORLISS.

No. 781.—Suspended.

No. 782.—*Improvement in Railroad Car Springs.*—I claim constructing a carriage or car spring of a series of two or more plates of steel, each of which is so curved or twisted that the longitudinal curve on one edge or side of each leaf or plate shall be the reverse of the curve on the other side or edge, a longitudinal section through the centre of the plate, midway from either edge is a straight line or nearly so, said plates being so arranged relatively to each other that on both sides the curve at the edge of each leaf or plate shall be in the reverse direction to the curve at the edge of the leaf or plate next above or below it.

DAVID B. ROGERS.

No. 783.—*Improvement in Trigger Operating Revolving Breech Fire-Arms.*—I claim, first, so constructing the lock of revolving breech fire-arms, in the mode substantially as hereinbefore described or its equivalent, as that the trigger used to fire the pistol, when drawn back, raises the hammer to full cock, and there retains it, the revolving breech or barrels being at the same time rotated so far as to bring the nipple of one of the chambers or barrels in the proper position to be struck by the hammer on its descent, and the trigger being held in a drawn position ready for instantaneous firing.

Second. The use of a fly-tumbler, or vibrating tooth intermediate between the hammer and trigger, in trigger operating fire-arms, and the peculiar arrangement of the parts of the lock in connection therewith, hereinbefore described, whereby the tendency of the main spring to cause the descent of the hammer is neutralized when the hammer reaches the point of full cock, so that the hammer having been raised by the trigger, may either be permitted to stand cocked or fired immediately, at pleasure, and greater ease in firing and steadiness of aim are secured, substantially as hereinbefore described.

JAMES M. COOPER.

No. 784.—*Improvement in Skeleton Skirts.*—I claim a skirt formed of elastic hoops and tape, or equivalent material, when the tapes are disposed across the hoops in opposite diagonal directions and interlock on opposite sides of the hoops at the point of crossing and are confined thereto, substantially as described.

I also claim connecting the hoops by means of a series of loops formed by a continuous tape, or equivalent material, passing around the skirt from one hoop to the other in opposite diagonal directions without interlooping or interlocking between the hoops, substantially as described for the purpose set forth.

E. G. ATWOOD.

No. 785.—*Improvement in Skeleton Skirts.*—I claim a skirt formed of elastic hoops and tape, or equivalent material, disposed across the hoops in opposite diagonal directions without being connected between the hoops, but connected to the hoops at suitable intervals, substantially as described.

E. G. ATWOOD.

No. 786.—*Improvement in Balancing Mill Stones.*—I claim the employment or use of weights *i*, placed within boxes or recesses in the back of the stone and arranged substantially as described, so that they may be adjusted vertically and more or less be used in each box or recess, to admit of the balancing of the stone or runner both while in motion and at rest.

JOHN FAIRCLOUGH.

No. 787.—*Improved Nail Machine.*—I claim making cut nails in such a manner that each nail will be seized the instant after it is cut from the nail plate and be compressively operated upon at the point thereof in the manner as herein specified, to bring the flat point of said nail to an equal sided sharp point, or to substantially the same character of point that is ordinarily given to wrought nails.

JAHAZIAH S. KING.

No. 788.—*Improved Machine for Matting the Ends of Match Blocks.*—I claim matting the ends of match blocks by pressure of a roller or rollers, for the purpose set forth, and in this claim I wish to be understood that I do not confine myself to the precise arrangements of the parts herein described, but shall vary them at pleasure, while I attain the same ends by means substantially the same.

HENRY E. PIERCE.

No. 789.—*Improved Clothes Dryer.*—I claim the combination of the slotted perforated hub B, and slotted, bored, cap hub C, with the arms D, and braces E, connected with the hubs by wires as described, and the arrangement the same with the shaft A, collar F, and ratchet catch G, as specified.

S. H. TIFT.

No. 790.—*Improvement in Ploughs*—I claim constructing mould board and landside of cylindrical surfaces of equal diameters intersecting along the cutting edge of the plough in combination with the standard S, curving landward from the top of the mould board to a position nearly over the base of the landside, as herein set forth.

GEORGE WATT.

No. 791.—*Improvement in Breech Loading Ordnance.*—I claim combining the movable breech pin with the bore of the cannon by means of movable locking or abutting pieces or segments, substantially such as described, and which after the breech pin is inserted are shifted and made to cross the joint of the breech pin and bore, to hold the breech pin against the force of the discharge, as set forth.

G. W. BISHOP.

No. 792.—*Improvement in Ash Sifters*.—I claim the employment of a conical sieve, or sieve of an equivalent form, in combination with the two receptacles, one for the sifting and the other for the substance sifted, substantially as and for the purpose described.

I also claim the conical deflector, for deflecting the substances to be sifted and concentrating them, in combination, with the spreader, substantially as described, whether the spreader be itself the sieve, or employed with a sieve below, as described.

I also claim, in combination with the sieve, the under conical surface of the deflector, for preventing the escape of dust from the apparatus, as described.

And I also claim, in combination, the deflector, the spreader, the conical sieve, and the receptacles, for the siftings and the substances sifted, substantially as and for the purpose specified.

ALLAN CUMMINGS.

No. 793.—*Improved Sash Fastener*.—What I claim, in window fasteners of the class above specified, is extending the cap portion  $m^1$  of the catch  $m$  over and along the front edge of the catch plate  $n$ , to form a catch opening  $x$ , flush with the edge of plate  $n$ , so that the window cannot be unfastened without having the point of the hook  $a$  withdrawn entirely clear from the meeting rail of the upper sash and out of the way of the bars above when the lower sash is raised.

Second. And, in combination with the catch  $m$ , hook  $a$ , and plate  $e$ , I claim the check  $a^1$ , or equivalent thereof, for the purposes herein above specified.

RALPH J. FALCONER.

No. 794.—Suspended.

No. 795.—*Improvement in Valve Cocks*.—We claim, first, the method of constructing valves, valve cocks, and gates, substantially as specified, so that, when the port or ports therein are uncovered, there shall be a straight passage or passages from the induction port or ports in the valve chamber to the eduction port or ports in the same, for the purposes described, whether the valves in such valves, valve cocks, and gates, are made in one or more than one piece; and, second, making the valves, in valves, valve cocks, and gates, in separate or detached pieces, substantially as and for the purposes described.

J. R. ROBINSON.

H. S. ROBINSON.

No. 796.—*Improvement in Machines for Making Paper Bags*.—I claim, first, the combination of the creaser  $C$  and lappers  $F G$ , arranged and operating substantially in the manner and for the purpose herein described and set forth.

Second. The folding of a lap in the manufacture of a bag of paper or other material, by means of a creaser blade and two rolling surfaces operating in combination with each other, substantially as herein described.

Third. The revolving lapper shaft  $U$ , in combination with the creaser  $V S$ , the feed roller  $M$ , and aprons  $u q$ , substantially as herein described, the creaser being brought into operation on the lap during the intermission in the motion of the feed rollers.

FRANCIS WOLLE.

No. 797.—*Improvement in Treating Caoutchouc and other Vulcanizable Gums*.—I claim the mode of operation, or mode of procedure, substantially such as herein described, which said mode of operation consists in the employment of a pliable or flexible envelope, substantially such as herein described, or the equivalent thereof, applied by pressure to the hard compound of vulcanizable gum, while in the green or plastic state, so as to insure the contact of such covering with the surface of the compound, and, while thus covered or protected, subjecting it to the vulcanized heat, and when vulcanized stripping off such covering; the whole process being substantially such as specified.

L. OTTO P. MEYER.

No. 798.—*Improvement in Refining Iron in the Hearth of a Blast Furnace*.—I claim the employment, immediately before the tapping of the furnace, of an auxiliary tuyere pipe or pipes, within the hearth of the common blast furnace, when charged with molten iron, at such an inclination as to cause the blast of air to commingle with the particles of iron, and give to the whole mass in the hearth a spiral or rotary motion, substantially as described.

CHRISTIAN SHUNK.

No. 799.—*Improvement in Billiard Table Cushions*.—I claim composing cushions for billiard tables with a body or back of what is known as the soft compound of vulcanizable India rubber or allied gum, in combination with a facing of India rubber or allied gum, rendered less compressible by fibrous matter, or the equivalent thereof, substantially as described.

HUGH W. COLLENDER.

No. 800.—*Improvement in Railroad Station Indicators.*—I claim presenting a movable sign or symbol to passengers of a railroad car, so that both sides of said sign shall be visible, and utilized as annunciators, by passing each sign in turn through an opening of the case, by the revolving of the drum, to which the said signs are attached.

C. A. McEVOY.

No. 801.—*Improvement in Faucets.*—I claim, first, the valve stem H, formed with projecting flanges J and J<sup>1</sup>, when confined to a rectilinear path and operated by a cam or eccentric, which engages with it at two opposite points, in the manner and for the purpose set forth.

Second. The described arrangement and combination of the slotted head I, *i*, pivot *c*, socket E, and cam F, operating in the manner set forth, to prevent lateral motion of the valve stem.

JAMES POWELL.

No. 802.—*Improvement in Lamps.*—I claim combining the deflector with the chimney band by mechanical devices, so as to retain the former in its proper relative position without the use of solder.

MICHAEL A. DEITZ.

No. 803.—*Improved Device for Converting Reciprocating into Intermittent Rotary Motion.*—I claim, first, arranging the lever C and dog B, in combination with the grooved wheel A or its equivalent, in such a manner that said lever and dog act on the wheel without a connection to the centre or hub of the wheel, substantially as and for the purpose specified.

Second. In the combination with the lever C, dog B, and wheel A, I claim the arrangement of the groove *d* or its equivalent in the hub of the wheel, substantially as and for the purpose specified.

Third. I do not claim the arrangement of the lever and dog in the relative position to each other which has been described, except when the two are made of one piece, or if the dog is permanently attached to the lever; but I claim arranging the lever C with the dog B permanently attached to it in such a manner that the direction of said lever, when it is in its place, makes an angle of ninety degrees, or nearly so, with a line drawn from the centre of the wheel through the dog, substantially as herein specified.

H. EHRENFELD.

No. 804.—*Improvement in Harrows.*—I claim causing the points of the teeth of a rotating harrow to descend deeper into the ground on one side of their axis of rotation than they do upon the opposite of the same, for the purpose of enabling the dragging force which may be exerted upon said harrow to impart a positive rotary motion thereto without the aid of gearing wheels.

SIDNEY S. HOGLE.

No. 805.—*Improved Eraser and Pencil Sharpener.*—I claim, first, the curved blade eraser, as above specified, forming on one side a convex surface, substantially as and for the purposes set forth.

I also claim, in combination therewith, the pencil sharpener and pointer, as described.

A. G. SHAVER.

No. 806.—*Improvement in Revolving Fire-Arms.*—I claim, first, the use of a stud in the trigger vibrating laterally in combination with a bevel edged hammer, for the purpose of raising the hammer to full cock and firing the piece by simply pulling the trigger, which, after the discharge of the piece, will regain its position for repeated action; or (as a mere modification of arrangement) the use of a stud in the hammer vibrating laterally, in combination with a bevel edged trigger, for the purpose above specified.

Second. The use of a bevel edged hammer, with or without a notch in its toe, and trigger with vibrating stud, and cam for the trigger spring, constructed and arranged substantially as hereinbefore described, for the purpose of causing the hammer, trigger, and revolving breech to assume their proper relative positions at full cock by simply pulling the trigger; and retaining them in that positions, and securing the breech from rotation or displacement preparatory to firing.

Third. The notch or depression in the toe of the hammer at the point of contact of the stud and edge of the hammer, in combination with the laterally vibrating stud for the purpose of preventing the slipping of the stud and the more easy retention of the hammer at the point of full cock.

Fourth. The mode hereinbefore described of locking the rotating breech at the moment of firing, by means of the locking bolt operated by the trigger, in combination with the hexagonal neck of the rotating breech, which, nevertheless, permits the breech to be freely rotated by hand or otherwise, when the trigger is not drawn back.

Fifth. The use of a double trigger spring or spring and lever, for the purpose hereinbefore set forth.

JOSIAH ELLS.

No. 807.—*Improved Ornamental Connection of the Parts of an Iron Fence.*—I claim forming the ornament or cast-iron connections for a railing fence, or other article of iron, cast into a divided iron mould, substantially as and for the purposes specified.

HENRY JENKENS.

No. 808.—*Improvement in Straw Cutters.*—I claim the combined application, to straw cutting machines, of a changeable feed gear, with two edged revolving cutters or blades, when so made as that, by changing them end for end on their arms or supports, they shall bring a different cutting edge into action, or when run in either direction shall always feed in the material in one and the same direction, substantially as and for the purpose stated.

I also claim the combination of the feed rollers, acted upon by tappets, and the crushing rollers, controlled by gum elastic springs, when arranged in relation to, and acting in connection with, the cutting apparatus, as herein described and represented.

JACOB H. MUMMA.

No. 809.—*Improvement in Sewing Machines.*—First. I claim the combination of a slide A, provided with its guard E and its slot, or slots C D, with the foot piece M, with its guide N and slots, arranged and operating substantially as described.

Second. I claim the combination, with the sewing apparatus or its equivalent, of a movable knife, operated by a connection with the sewing machine, so as to trim or cut the work whilst being sewed, substantially in the manner and for the purposes as above set forth and described.

JOHN W. MARSH.

No. 810.—*Improvement in Lamps.*—I claim, first, the perforated plate or air distributor C or its equivalent, as shown in Fig. 2, for the purpose of regulating the elastic force of the air, so that it may be presented evenly to the flame, (when applied to flat wick lamps,) it being placed horizontally.

Second. I claim the perforations *b*, in the lower part of the cap D, as shown at Fig. 1, in combination with the perforated or air distributing plate C, as shown in Fig. 2.

Third. I claim the register, formed of the perforations *e* in the top A, as shown in Fig. 3, in combination with the perforated plate or air distributor C, as shown in Fig. 2, and the holes *b* in the lower part of the cap D, as shown in Fig. 1; the whole being arranged substantially as and for the purpose described.

WILLIAM FULTON.

No. 811.—*Improvement in Heating Elevated Ovens.*—I claim the arrangement and combination of revertible flues in elevated ovens of cook stoves with partition walls, in the manner and for the purpose herein described and set forth.

I also claim the arrangement and combination of the oven plate *c* in and with the inner plate and ends of the oven, as and for the purpose herein described and set forth.

I claim the arrangement of the damper *e*, immediately between the main part of the stove and the bottom and lower part of the elevated oven, thereby combining it with said oven, the stove, and the double flue *c*, for the purpose of controlling and regulating the heat in its passage into the flues of the said elevated oven, as herein described.

P. A. PALMER.

No. 812.—*Improvement in the Manufacture of India Rubber Fabrics.*—I claim as the invention of Nelson Goodyear, deceased, making fabrics by thoroughly intermingling and incorporating the shearings or clippings of fibrous substances with the gum, while rendered plastic by heat, substantially as and for the purpose specified.

H. B. GOODYEAR,

*Administrator of the estate of Nelson Goodyear, deceased.*

No. 813.—*Improvement in Magnetic Printing Telegraphs.*—I claim, first, a series of keys, each corresponding to a character, in combination with a revolving part of a circuit, so that the touching of one of the former may cause circuit to be broken or closed for the purpose of printing, substantially as specified, when the revolving part of the circuit is in a certain required angular position, properly corresponding to the key struck.

Second. I claim a series of keys, each corresponding to a character, in combination with a revolving portion of a circuit and a shaft provided with pins arranged in a helix, all substantially such as specified, or the equivalents of the whole acting to cause circuit to be broken or closed when the revolving part is in a certain angular position, in proper correspondence with the key struck, for the purpose of printing a proper corresponding letter by means of any suitable machinery.

Third. I claim a key board or series of keys, in combination with a rotating portion of a circuit, and a type wheel, or its equivalent, so governed as to present a proper letter corresponding with a key touched to produce an impression, the combination being substantially such as set forth.

Fourth. I claim in combination a single circuit of conductors, a key board, or series of keys, a revolving portion of a circuit, and a type wheel, substantially such as specified; and these also in combination with a printing press, and with a key shaft, or either of them, each part being substantially such as described.

Fifth. I claim a series of keys, each corresponding to a character in combination with a type wheel having similar corresponding characters, both substantially as specified, when so connected by any appropriate devices that a certain type shall be in a certain locality, when a corresponding key is actuated; and I claim these two elements in combination with a single circuit of conductors, and with a printing apparatus, or either of them.

Sixth. I claim actuating or driving a revolving portion of a circuit, or a key shaft, or both of them, by means of a prime mover acting upon them through a friction connection, the mode of operation being substantially as specified, and doing away with sudden jars and increasing rapidity of operation, when contrasted with a positive connection between such parts and a prime mover, and also permitting the two to move with varying velocities.

Seventh. I claim actuating or driving a key shaft and a revolving portion of a circuit, or either of them, by means of a friction connection with a prime mover, when the velocity of such prime mover is controlled by a governor, or some equivalent, for the purpose which either prevents its moving too fast, or increases its velocity when going to slow, or performs both these duties substantially under the mode of operation described.

Eighth. I claim governing or controlling the motions of a prime mover, which actuates a printing apparatus by the breaking and closing of an electric or galvanic circuit, so that such apparatus is put in operation both by the breaking of a circuit and by the closing thereof, substantially in the manner specified, and also the controlling of a printing apparatus, so that it shall be permitted to print when a spring returns to its normal position, at the time when a circuit is broken, the mode of operation being substantially such as set forth.

Ninth. I claim in a printing telegraph moving the paper to the types to produce an impression on the former, substantially in the manner described, as distinguished from the former modes of operation by which the types were moved towards the paper.

Tenth. I claim in combination a revolving type wheel and a roller, or its equivalent, charged with coloring matter so as to deposit such matter on the types as they in succession come in contact with the roller, the combination being substantially such as set forth, and this I claim also when the roller is grooved as described.

Eleventh. Being aware of the facts that type wheels have been permitted to revolve step by step, when controlled by escapements, and when such escapements have been actuated either by a prime mover governed by a pendulum, or by electro-magnetic force, I claim actuating an escapement which controls the motions of a type wheel by a prime mover whose motions are regulated by the breaking and closing of a circuit, under a mode of operation substantially such as described, whereby a small force derivable from magnetism controls any necessary power of a prime mover, there being a breaking and a closing of circuit corresponding with each vibration of the escapement.

Twelfth. I claim a hydraulic regulator, substantially such as described and for the purposes set forth.

Thirteenth. I claim a hydraulic regulator in combination with a type wheel and a printing apparatus and a prime mover, the combination being substantially as specified, and causing the press to point when the type wheel ceases to move for a longer time than usual.

Fourteenth. In combination with a type wheel and a printing press or apparatus, I claim apparatus substantially such as specified, for making an alarm when that apparatus is permitted or caused to act by the breaking and closing of the same circuit of conductors, which by its breaking and closing permits the printing apparatus to come into action.

ROYAL E. HOUSE.

No. 814.—*Improved Machine for Bending Metal Pipe.*—We claim the mandrel *d*, substantially as described, and therewith the traversing roller *b*, or its equivalent, for bending coils of metal pipe, and in combination therewith the furnace, in the manner and for the purposes set forth.

JAMES PERKINS.  
WILLIAM H. BURNET.

No. 815.—*Improvement in Cultivator Teeth.*—I claim making the shank or upper part of cultivator teeth of thin plate steel, U shaped, or curved round in front, substantially as hereinbefore described, for the purpose of securing the necessary strength to permit the tooth to be made, entire shank and blade, of a single piece of metal, and also of enabling the tooth to be secured in its place in the beam by means of a wedge driven into the cavity of the shank, substantially as hereinbefore described.

DAVID B. ROGERS.

No. 816.—*Improvement in Reaping Machines.*—I claim the arrangement, substantially as described, of a cutting apparatus and a reel, with respect to a driving wheel and a grain wheel, or its equivalent, and a raker's seat, or its equivalent, so that the major part of the

weight of the cutting apparatus and reel shall be in advance of the axis of oscillation of the machine on the said wheels, while the raker's seat or stand shall be located behind that axis and the machine, with the raker thereon, nearly balanced on its axis of oscillation, substantially as described.

C. H. McCORMICK.

No. 817.—*Improvement in Reaping Machines.*—I claim the combination of a tongue or its equivalent, to draw the machine by a driving wheel and gearing arranged at the side of the frame; a short platform; a reel to gather the grain to the platform; and a stand or seat for the raker fixed upon the machine so as to enable the raker conveniently to discharge the grain and lay it in gavels upon the ground at the side of the swarth and out of the return path of the horses, substantially as described.

C. H. McCORMICK.

No. 818.—*Improvement in Reaping Machines.*—I claim a seat or stand on the reaping machine for the support of the raker laterally and in front, substantially as described.

C. H. McCORMICK.

No. 819.—*Improvement in Reaping Machines.*—I claim the combination of the reel, the divider, and the raker's seat or stand, cooperating together in such manner that the grain deposited upon the platform by the reel and divider may readily be grasped and discharged from the machine by the raker at his seat, substantially as described.

C. H. McCORMICK.

No. 820.—*Improvement in Reaping Machines.*—I claim the combination, in a reaping machine, of the following elements, namely: the draft and the gearing arranged at the side of the machine; two compressors, one arranged at each end of the cutter; the short reel to sweep over the space between the compressors; and the short platform, substantially as described.

C. H. McCORMICK.

No. 821.—*Improvement in Reaping Machines.*—I claim the combination of the grain guarded platform, to receive and retain the cut grain, with the divider and the reel, the whole arranged substantially in the manner and for the purposes described.

C. H. McCORMICK.

No. 822.—*Improvement in Reaping Machines.*—I claim the combination of the reel support at the rear part of the outer side of the platform with the low flat frame and the divider, arranged substantially as described.

C. H. McCORMICK.

No. 823.—*Improvement in Reaping Machines.*—I claim, first, a dividing board, having a surface inclining towards the cutter and platform, and an outer dividing line and an inner dividing line, arranged and acting substantially as described.

Second. I claim the combination of the inclined dividing board with a guide bar, substantially as described.

Third. I claim the combination of a reel with the inclined dividing board, substantially as described.

Fourth. I also claim the combination of a reel with the dividing board and guide bar, substantially as described.

C. H. McCORMICK.

No. 824.—*Improvement in Reaping Machines.*—I claim a reaping machine frame consisting mainly of two principal beams  $D$   $D^1$  and  $M$ , crossing each other and arranged, relatively to the supporting wheels, so as to give firm support to a platform not extending behind the gearing, and without interfering with the cutter on one side or the gavelling space on the other, substantially as described.

C. H. McCORMICK.

No. 825.—*Improvement in Reaping Machines.*—I claim the arrangement of the frame, the finger beam, the platform, and the driving wheel and gearing, relatively to each other, so as to secure an unobstructed gavelling space  $G$  at the side of the platform behind the finger beam, substantially as herein described.

C. H. McCORMICK.

No. 826.—*Improvement in Machines for Threading Screw Blanks.*—I claim the method herein described of causing the chasing tool to act upon the screw blank in producing both the cylindrical part and the tapering point, that is to say, by so governing the relative positions of each to the other that while threading the cylindrical portion the chasing tool shall be presented at a right angle to the axis of rotation of the blank, and while cutting the tapering

part shall be so inclined acutely to said axis that the line of travel of the face of the chaser shall finally intersect said axis, substantially as set forth.

ELLIOT SAVAGE.

No. 827.—*Improvement in Machines for Threading Screw Blanks.*—I claim as an improved article of manufacture a wood screw, of which the entering end is made to taper in the manner and for the purposes substantially as set forth, that is to say, by giving to the core thereof a form bounded in any plane which passes through the axis of rotation, by lines which converge toward, and, if produced, will intersect said axis, in contradistinction to the known form wherein the bounding lines in such planes are parallel to said axis.

ELLIOT SAVAGE.

No. 828.—*Improved Waste Device for Hydrants.*—What we claim as of John Culver's invention, and of which we have become the owners by assignments, is the described arrangement of the plunger relative to the discharge pipe, and capable of elevation proportional to the capacity of said pipe for forming a chamber in the lower portion of the hydrant, for the reception of the contents of the discharge pipe.

Also, in combination, the arrangement of the valve C, and means for operating it by the spring H, substantially as and for the purposes specified.

JOSHUA REGESTER.  
WM. GEO. WEBB.  
JOHN L. ROCHE.  
JOHN McCART.

No. 829.—*Improvement in Sewing Machines.*—I claim, as the invention of O. L. Reynolds, first, the employment and use in a sewing or tambouring machine of a needle or thread carrier having a movable or flexible beard or hook, and also the combination with said needle or thread carrier of a mechanism for closing the beard thereof.

Second. The combination with a bearded instrument, used as before described, of a thread guide V, having the motions described, such as shall carry the thread across the path of the bearded instrument and present it to the action thereof without carrying the thread around the shank of the said bearded instrument, in the manner set forth and described.

Third. The combination of the cam G, lever O, and guide V, with a spring, whereby the thread is presented to the action of the bearded instrument, as set forth.

J. W. BARTLETT.

No. 830.—*Improvement in Clothes Dryers.*—I claim, first, tilting the reel to the desired position to enable a person to place the clothes on the lines without high reaching, and elevate them in good position to dry, and out of the way of injury, substantially as set forth.

Second. Arranging and combining with a rotary tilting reel the ratchet G and pawl H, or their equivalents, for preventing backward rotary motion of the reel as the clothes are placed on the lines and moved along, substantially as set forth.

Third. Operating the reel by the combined action of the arm C, jointed arm or lever E, and loop or staple F, or its equivalent, substantially as set forth and for the purpose specified.

SAMUEL MORRILL.

No. 831.—*Improvement in Mowing Machines.*—First. I claim the combination of the short curved arm R, with the bar Q, and finger bar P, the whole being constructed and arranged for joint operation, substantially as and for the purposes above set forth.

Second. I claim the combination of the coupling arm with bar Q, wrist *f*, socket *h*, hinge *g*, and short finger beam P, substantially as and for the purposes set forth.

Third. I claim extending the coupling arm R outside of the frame, in combination with the front hinges of bar Q, also outside of the main frame, when the parts are constructed and arranged in the manner substantially as described, whereby greater freedom of the movement of the cutting apparatus is secured.

E. BALL.

No. 832.—*Improvement in Mowing Machines.*—I claim the combination of the independent driving wheel B<sup>1</sup> at the grain side of the machine, with the hinged bar Q, to which the short finger beam is rigidly attached and the hinged coupling arm, whereby the cutting apparatus may rise and fall freely, and the cutters be kept in operation while turning to the left upon uneven ground, substantially as described.

E. BALL.

No. 833.—*Improvement in Flour Bolts.*—I claim the slide valve or valves *d*, so arranged and operating with the apertures *e e*<sup>1</sup> in the sides of the bolting chest, that either of these apertures can be opened or closed, or both closed when required, for the purpose of turning the material as desired in either of three directions, as set forth.

I claim, in combination with the valves, the concave M and scrapers  $a^1$  upon the bolt, all arranged and operating as herein set forth.

JAMES M. CLARK.

No. 834.—*Improvement in Machines for Burnishing Metals.*—I claim, first, the burnishing of silver plated, and other metallic ware, such as spoons, knives and forks, or other similar articles which have a concave, convex, or bevel surface, by an organized machine, requiring no other attention than being kept in proper order, adjusted to suit the article about being burnished, set in motion, and having the articles properly introduced to it, successively, substantially in the manner herein set forth.

J. STEVER.

No. 835.—*Improved Furnace for Smelting Iron.*—I claim, first, the combination with the cone of a furnace of one or more arched recesses or chambers A A, substantially as and for the purposes set forth.

Second. The combination of an opening I with the crown of the arch A, substantially as and for the purposes set forth.

Third. The combination with the arch recess A, opening I in the crown of the same, of a movable tympan B B, to be applied to the outer ends of the arched recesses or chambers A A, instead of the permanent tympan now in use; which movable tympan is kept in place by a cross bar that can be removed at pleasure, substantially as and for the purposes set forth.

S. M. FALES.

No. 836.—*Improvement in Coffee Pots.*—We claim the employment in a condensing boiler, in which the water in the condenser is impregnated with the aroma of the coffee, or other articles under treatment, of a syphon, or equivalent self-acting device, for the discharge of the contents of the condenser into the body of the boiler, substantially as described.

CHARLES B. WAITE.  
JOSEPH W. SENER.

No. 837.—*Improved Calendar Clock.*—I claim, first, the extra movable tooth  $m$  and leap year wheel G, applied to or controlled by the year wheel F, to operate in the manner described for the purpose of regulating the effective length of the tooth which represents the month of February.

Second. The arrangement of the month wheel C, its attached pinion  $t$  and pin 4, the rack bar H and its pawl  $q$ , the spring  $v$  or its equivalent, the lever D E and its stud  $i$  or their equivalents, the catch K or its equivalent, and the stop 7, the whole being applied to operate upon and be controlled by the year wheel of a calendar movement, as and for the purpose herein set forth.

Third. Arranging the month wheel in such a manner that the same at the end of each month returns to its original position by the action of the spring or its equivalent, gathered up or strained by the action of the clock work, substantially in the manner and for the purpose herein described.

HOLLY SKINNER.

No. 838.—*Improved Construction of Cylinders and Pistons for Pumps and Steam Engines.*—I claim the combination of the cylinder, open at both ends, with three pistons and their connections, arranged substantially as herein set forth.

WALLACE WELLS.

No. 839.—*Improvement in Leather Finishing Machines.*—What we claim is, first, in machines for finishing leather, the employment of a soft elastic bed, substantially as described.

Second. The combination of an elastic bed and tool, both constructed and operating together, to produce the desired effect upon the leather, as set forth.

Third. In combination with the soft elastic bed and elastic finishing tool, the cord  $p$ , secured to the tool stock for the purpose of keeping the tool clear of the leather during its retrograde movement over the bed, as herein above set forth.

C. WESTON.  
T. F. WESTON.  
JOHN W. WESTON.

No. 840.—*Improved Clap Board Machine.*—What I claim is resawing and bringing plank to an equal width at the same time.

Second. The flange rollers, with their springs or equivalents, in combination with the adjustable back rest, for the purposes hereinbefore described.

ARETUS A. WILDER.

No. 841.—*Improvement in Journal Boxes for Railroad Cars.*—We claim as the invention of the said McWilliams, first, the upper half A of the box with its socket formed by the flanges

*h*, in combination with the lower half B of the box, when the two halves are arranged substantially as set forth, so that on adjusting the lower half to its place it may assume the position shown in Fig. 1, and so that when adjusted the end *w* of the oil chambers shall be close to the axle, as and for the purpose specified.

Second. The self-adjusting leather packing E and the metal plate F, when both are dependent upon the lower half of the box for their proper position within the other half, and when they are otherwise arranged in respect to both upper and lower half of the box, as and for the purpose set forth.

S. W. HOFFMAN.  
ADAM J. FREDERICK.

No. 842.—*Improvement in Harvesters.*—I claim, in combination with a main frame H, supported upon two carriage wheels A A<sup>1</sup>, which frame bears the shaft M and main cog wheel S, a second frame hinged to and vibrating about said shaft M, so that the crank shaft on said second frame shall always be in a radial line to the main cog wheel S, however much said second frame may vibrate on the main frame, as set forth.

Second. I claim supporting the crank shaft V upon a vibrating frame R, intermediate between the cutter bar, or its shoe X, and the main frame H, when said main frame bears the main cog wheel S, and said intermediate frame vibrates or turns about an axis parallel to the axis of the driving or carriage wheels, as set forth.

W. S. STETSON.

No. 843.—*Improvement in Harvesters.*—I claim, first, the main frame H, which bears the pinion K, and has its vibratory motions up and down independent of the motions of the platform and pole, in combination with the vibrating frame R intermediate between the said main frame and cutter bar, as set forth.

Second. I claim combining the adjusting lever Z with the platform C and main frame H, in the manner and for the purposes set forth.

Third. I claim giving to the main frame H, which bears the driving pinion K, a back and forth motion upon the axletree, as set forth.

W. S. STETSON.

No. 844.—*Improvement in Harvesters.*—I claim the combination of shoe X with the vibrating frame R, by means of axis *y*, at the rear end of said frame, as set forth.

Second. I claim horsing or supporting the knife bar in a position at right angles, or nearly so, to the carriage axle by two movements, substantially as described.

W. S. STETSON.

No. 845.—*Improvement in Machines for Cleaning Grain.*—What we claim as the invention of the said William H. Orr is the arrangement and application of the stirrer K in the described relation to the riddle or shoe of a grain separating machine, operating in the manner and for the purpose set forth.

W. M. GRIFFITH,  
SYLVANUS MOORE,  
*Composing the firm of W. M. Griffith & Co.*

No. 846.—*Improvement in Revolving Fire-Arms.*—I claim combining the driving pin that works in the grooves to rotate and hold the breech in line with a slide below adapted to the reception of and to be operated by the trigger finger, and acting on the lock at the end of the back motion to liberate the cock or hammer and discharge the load, substantially as described.

And I also claim combining the plunger with the many chambered rotating breech pistol or other fire-arm, by means of a lever with a cogged sector engaging the cogs of a straight rack, substantially as and for the purpose specified.

E. K. ROOT.

No. 847.—*Improvement in Straw Cutters.*—I claim, first, operating the adjustable lower feed roller by means of a spur wheel hung in a vibrating frame or yoke, the axis of which is connected with the said roller by means of an universal coupling, when said roller is supported on spring bearings independent of each other, substantially as and for the purpose specified.

Second. The employment of a cylinder provided with a knife or knives which have an upward cylindrical cut, when the same is arranged with two independent feed rollers, the lower one of which being supported on a spring or springs in such a manner that it can adjust to act with greater or less pressure on the material to be cut, substantially as set forth.

DEWITT C. CUMINGS.

No. 848.—*Improvement in Pumps.*—I claim the two ball valve cages with the suction valves

in their interior, attached to the extremities of a central perforated tube, or its equivalent, in combination with the water ways and discharge valve or valves, the water entering between the plunger valves and being alternately discharged from the ends of the pump barrel in direction of the stroke, the whole being constructed and operated, substantially in the manner and for the purposes set forth.

WILLIAM M. HENDERSON.

No. 849.—*Improved Lock and Detector*.—I claim combining with a padlock, or any lock provided with a shackle, a lead or soft metal tube or seal so arranged as to be temporarily secured thereto, and admitting of being released only by the removing or breaking of said tube or seal, which thereby serves as a detector, substantially as set forth.

JOHN H. LYON.

No. 850.—*Rim for Lockets*.—I claim a rim for lockets and similar metallic cases formed of sheet metal in such manner that the face of the fieldpiece within the case and the exterior surface of the rim are both formed from the same side or surface of the original sheet metal, and that the fieldpiece and rim are of one piece of metal.

CHARLES G. BLOOMER.

No. 851.—*Mode of Constructing Lockets*.—I claim the method of imparting the finished shape to case rims of sheet or thin metal, in which the external ring and fieldpiece are one piece of metal, by means of dies, substantially as herein set forth.

CHARLES G. BLOOMER.

No. 852.—*Machine for Wetting and Cutting Paper for Printing Presses*.—I claim, first, the combination with the printing machine of the mechanism herein described, or its equivalent, so arranged as that the paper, as it passes along from the reel to be printed upon, shall be dampened, as set forth.

Second. The combination with the cylinder C D or their equivalents, of the adjustable rollers E F or their equivalents, to supply the moisture for the paper, and also to regulate the quantity of that moisture, as set forth.

Third. The combination with the printing machine of the moisture vessels G H or their equivalents, as set forth.

Fourth. The combination of the cutting knife with the dampening roll, or cylinder, or its equivalent, as set forth.

Fifth. Simultaneously wetting or moistening both sides of the paper, in the manner substantially as described.

Sixth. Leaving the paper dry at the point or line of cutting, substantially as described.

Seventh. The employment of spring pressure to project the knife, in the manner substantially as herein shown or described.

Eighth. Retiring the knife within circumference of the cylinder by means of the cams R, or their equivalents, as set forth.

Ninth. Catching the knife when retired within the circumference of the cylinder C, retaining it while so retired, and releasing it for the operation of cutting, by means of the catches *e f*, the springs *j*, and the tripping pins I, or their equivalents, in the manner substantially as described.

Tenth. The employment of cylinders C D, or their equivalents, to draw the paper from the reel, to be afterwards cut into sheets and fed into the printing machine, as set forth.

Eleventh. Breaking or tearing asunder any fibres of paper left uncut by the knife by the grasp of the cylinder M and roller Q, or their equivalents, as set forth.

Twelfth. Giving the conducting or guide tapes K, or their equivalents, a speed greater than that of the paper, as set forth.

Thirteenth. The combination of the feeding mechanism, cutting apparatus, and the printing machine, or their equivalents in the said combination, for feeding the paper from a roll to a printing machine, and cutting or partially cutting it into sheets as it passes along to be printed, as set forth.

M. S. BEACH.

No. 853.—*Improvement in Bending Wood*.—I claim my improved method of bending wood, substantially as hereinbefore described.

THOMAS BLANCHARD.

No. 854.—*Improvement in Apparatus for Cooling Liquids*.—I claim, as executrix and in trust for the heirs of Valentine Hall, deceased, first, the employment or use of one or more receivers A B, with or without the pump E, placed on a tank F, containing ice water or water at a low temperature, and connected together and to the liquid supply pipe, substantially as and for the purpose set forth.

Second. The employment and use of one or more receivers A B, placed within a tank F,

and connected with the barrel or cask H, by means of a syphon I, and with a pump E within or at the outer side of the tank, for the purpose set forth.

Third. The combining of a pump E, with one or more receivers A B, connected together and made to communicate with each other by syphons C D, when said parts are submerged within a tank F, and made to communicate with the cask or barrel H, by means of a syphon I, extending over the top of the tank, substantially as and for the purpose set forth.

BERRESFORD M. KING.

No. 855.—*Improvement in Machines for Ploughing.*—I claim, first, the employment in combination with the locomotive of a bilge shaped driving wheel, substantially as set forth.

Second. I do not claim broadly the invention of movable spurs, but I claim the combination of the sliding spurs K K, with the bilge shaped driving wheel E, as herein shown and described.

Third. The arrangement of the adjustable frame, ploughs, gauge wheel, driving wheel, engine, boiler, and guiding wheels, as herein shown and described.

J. W. HAWKES.

No. 856.—*Improvement in Running Gear of Locomotive Engines.*—I claim the combination of a free vibrating truck, with six or more driving wheels, when the front pair of drivers is placed in advance of the centre of gravity of the entire engine, substantially as and for the purposes herein set forth.

SEPTIMUS NORRIS.

No. 857.—*Improvement in Steam Boilers.*—I claim, first, the central water space F<sup>1</sup>, in the combustion chamber F, arranged in relation to the annular water space F<sup>2</sup> and to the tubes D, or their respective equivalents, substantially as within set forth.

Second. Placing the annular sheet G and horizontal plate I (which with the jacket form the smoke box M,) outside of the water space W, and sufficiently above the bottom of the water space to allow the sediment to be conveniently removed from the water space, in combination with the described arrangement of the return tubes D, substantially as set forth.

WILLIAM OLDMAN.

No. 858.—*Improvement in Making Brass Kettles.*—What I claim, in forming kettles and other analogous vessels of brass or other ductile metal or alloys, is the employment of two rotating rollers for griping, turning, and rolling the disk of metal substantially as described, in combination with the clamps or holders for holding the disk of metal at any desired angle with the axis of the rollers, substantially as described and for the purpose specified.

And I also claim the concave and convex clamping plates substantially as described, in combination with the rollers or any equivalent mode of rolling the metal, substantially as described.

And I also claim the combination with the rollers for rolling the disk of metal, the supporting rest for supporting the metal beyond the point of action of the griping rollers, substantially as set forth

O. W. MINARD.

No. 859.—*Improvement in Reaping and Mowing Machines.*—I claim so constructing and arranging the platform of a reaper as that it or a portion of it may be made to form a track clearer when it is desired to convert the machine into a mower, substantially as herein specified.

J. W. MULLEY.

No. 860.—*Improvement in Reaping and Mowing Machines.*—I claim the hollow reel shaft, made of sheet metal, or its equivalent, formed with boxes or bearings at or near each end, and made to revolve on an arm supported at one end only, substantially as specified.

J. W. MULLEY.

No. 861.—*Improvement in Reaping and Mowing Machines.*—I claim, first, the manner herein described of securing the detachable cutters or blades to or in their place on the cutter bar, and relatively to each other, by means of central holding screws, in combination with pins or studs on the bar to fit the recesses in the adjoining sides of the blades, substantially as set forth.

Second. Providing the fingers with the laterally projecting lips, in front and rear of the slot in which the cutter bar plays, substantially in the manner and for the purposes specified.

Third. The finger bar, arched as described, in combination with the fingers, made with a swell or convex projection in their rear, substantially as herein set forth.

J. W. MULLEY.

No. 862.—*Improvement in Coating Metallic Surfaces.*—We claim the combined process, substantially as herein described, of coating metals with the composition made of India

rubber or allied gum dissolved in and combined with linseed oil in a heated state, in proportions substantially such as set forth, by first heating the metal to be coated to about 350 degrees, applying the composition to the metal surface while so heated, and then subjecting the metal so coated to about 200 degrees of heat, substantially as described.

WM. BUTCHER.  
WM. A. BUTCHER.

No. 863.—*Improvement in Ploughs.*—I claim moving and adjusting the beam A laterally upon the standard B, by means of the head L and dovetailed connections *m m* and *j j* or their equivalents, in such a manner that the line of draft, or direction of the beam, shall always remain parallel with the landside of the implement, substantially as and for the purposes herein shown and described.

ISAAC RULOFSON.

No. 864.—*Improvement in Boilers and Steamers.*—I claim the construction and arrangement of the two sections A and B, so that the section A may be used separately, as a caldron, or both sections be securely united and employed as an enclosed boiler for generating steam, as herein specified.

I also claim the combination of the cylindrical or cylindroidal support and fire-box C, entirely open at the top, with the uniting and supporting flanges *e f* of the spherical or spheroidal sections A B, constructed as described, so that, by presenting a thin edge only to the flanges, it allows the utmost facility of clamping and unclamping the sections, and of moving or adjusting the same, while it firmly sustains the boiler and shields the packing between the flanges from the heat of the fire, substantially as herein set forth.

I also claim the trough F, formed by the lip projecting above the upper flange *f*, for the purpose of containing water to protect the packing between the flanges from injury by heat, substantially as described.

DANIEL R. PRINDLE.

No. 865.—*Improvement in Pumps.*—I claim the arrangement of two or more cylinders B B, piston heads C C, ball valves *a a*, air chamber F, and valves *a<sup>1</sup> a<sup>1</sup>*, said valves being kept in position by proximity to each other and the sides of the chamber F, substantially in the manner and for the purpose herein specified.

JOHN M. LUNQUEST.

No. 866.—*Improvement in Harvesters.*—I claim giving the rake the two within described regularly succeeding axial movements over and across the platform of said machine—that is to say, an elevated curvilinear movement from rear to front over said platform, and a horizontal movement from front to rear upon or near to said platform, by means substantially as herein described and for the purpose set forth.

McCLINTOCK YOUNG, JR.

No. 867.—*Improvement in Pans for Evaporating Cane Juice.*—I claim, first, the combination, with a fire furnace, of a sugar evaporating pan, when said pan is constructed and arranged so as to allow of a continuous circulation of the syrup in an indirect course over its surface during the process of boiling, substantially as and for the purposes set forth.

Second. So arranging the pan on the furnace that a portion of its bottom surface near each side shall not be exposed to the direct heat of the furnace, and thus, while the intermediate surface of the bottom of the pan is intensely heated, the other portions remain comparatively cool, substantially as and for the purposes set forth.

Third. Retarding the escape of the syrup, or facilitating its escape, either by giving the pan a vibrating motion or a greater or less inclination, substantially as and for the purposes set forth.

Fourth. An evaporating apparatus, which allows of a circulation of the stream of syrup, boils it at the centre of the pan, and cools it at the sides of the same, and affords facilities for regulating the flow of the steam, substantially as and for the purposes set forth.

D. M. COOK.

No. 868.—*Improvement in Stop Cocks.*—I claim the arrangement and combination of the collar I, flexible washer H, metallic washer G, as and for the purpose described.

Second. The chambered, square, nut, or valve, when its seat is formed in the body of the cock, in the manner substantially as and for the purpose described.

ERASTUS STEBBINS.

No. 869.—*Improved Machine for Splitting Fire Wood.*—First. I claim feeding the wood to be split by the endless chain I I, when so arranged that the chain can receive a lateral movement for the purposes and as specified.

Second. In combination with the endless chain to feed the wood as aforesaid, I claim the rollers *j j*, for permitting a lateral movement and taking up any slack, as set forth.

Third. I claim the yielding pawls  $h^2 h^2$ , in combination with the feeding chains I I, for permitting backward movement to the wood as the knife enters the same, thereby preventing the wedging of the wood or injury to the parts, as set forth.

Fourth. I claim the spurs  $f^1$  to give lateral motion to the chains I I, in combination with the arms  $d^1$ , and yielding connection to the rods  $b^1 b^1$ , as described and shown.

Fifth. I claim the yielding end pieces  $e e$ , to regulate the delivery and sustain the wood while being split and prevent the same falling over before being separated by the second cut as specified.

W. L. WILLIAMS.

No. 870.—*Improvement in Skeleton Skirts*.—I claim the new manufacture of skeleton skirt herein described, in which the hoops B are fastened between separately woven parts of the tapes, substantially as herein described, when the parts are woven together as single tapes between the hoops, and separately as distinct tapes at the points where the hoops are received.

J. DRAPER.

No. 871.—*Improved Table Caster*.—We claim, first, the combination of the caster and egg stand.

Second. The combination of the caster and bell.

Third. The combination of the caster, egg stand, and table bell, substantially as described.

ROSNELL GLEASON.

R. GLEASON, JR.

EDWARD GLEASON.

No. 872.—*Improved Evaporating Apparatus*.—I claim a pan for containing solutions to be heated in combination with a vessel contained therein, the top and bottom of which are connected by a series of vertical or nearly vertical tubes, the interior of such vessel being connected with proper pipes for the supply of steam and the escape of steam or condensed vapor, and the whole being constructed substantially in the manner and for the purpose specified.

JAMES McCracken.

No. 873.—*Improvement in Cooking Stoves*.—I claim, first, the flaring enlargement of the side flues C C and D D, from the space above the oven to the flue space E, which extends under the entire front end of the oven; and also the flaring enlargement of the central flues F and G, from the flue space E to the upper end G, for the purpose of increasing the draft of the stove, substantially as herein set forth.

I also claim separately the front of the oven from the front plate of the stove, and also from the hearth plate and from the back plate of the fire chamber, by means of the flue space H, which communicates freely with the flue space E, and is closed at all other points; the said arrangement enabling the flue space H to arrest the great amount of heat that will be radiated from the back plate of the fire chamber, and conduct the same (by means of the circulation which it will create in said flue space) into the flue space E, for the purpose of producing the beneficial results herein particularly set forth.

GILES F. FILLEY.

## CLAIMS OF PATENTS FOR DESIGNS GRANTED DURING THE YEAR 1859.

---

No. 1,075.—*Design for Dining Room Stoves.*—We claim the scrolls, figures, and fluting, as set forth in the annexed drawings, thereby forming an ornamental design for dining room stoves, to be called the trio.

CONRAD HARRIS.  
PAUL W. ZOINER.

No. 1,076.—*Design for Cooking Stoves.*—We claim the scrolls, foliage, and mouldings, as set forth in the annexed drawings, and thereby forming an ornamental design for coal cooking stoves, to be known and called the Pluto.

CONRAD HARRIS.  
PAUL W. ZOINER.

No. 1,077.—*Design for Parlor Stoves.*—I claim the combination of ornaments and ornamental configuration of the different plates of parlor Franklin stoves, as described and set forth in the accompanying drawings.

S. W. GIBBS.

No. 1,078.—*Design for Ink Bottles.*—I claim the general configuration of the parts herein shown and described, to form a new and original design for an ink bottle.

THADDEUS DAVIDS.

No. 1,079.—*Design for Cooking Stoves.*—I claim ornamenting the doors, front plate, side plates, and feet of cooking stoves, as herein specified and represented in the annexed photographic drawings.

JAMES R. HYDE.

No. 1,080.—*Design for Stoves.*—I claim, first, the form and pattern of the plates A, B, and E. Second. The beadings and escutcheons of the design shown.

Third. The design of the moulding H, the whole forming an ornamental stove, as herein described.

APPOLLOS RICHMOND.

No. 1,081.—*Design for Hot Air Furnaces.*—I claim the shape and configuration of the said furnace, as herein described and shown in the drawings.

HIRAM BISSELL.

No. 1,082.—*Design for Gas Burners.*—I claim a design for portable gauze gas burners, represented in the accompanying drawings.

H. B. MUSGRAVE.

No. 1,083.—*Design for Carpets.*—I claim the design or pattern for carpets, herein set forth.

ELEMIR J. NEY.

No. 1,084.—*Design for Carpets.*—I claim the within described design or pattern for carpet and other fabrics.

ELEMIR J. NEY.

No. 1,085.—*Design for Stereoscope Cases.*—What I claim as a new and ornamental design is making a stereoscope case in the form of a book, as described and shown.

WILLIAM LOYD.

No. 1,086.—*Design for Stereoscope Cases.*—I claim forming a case A, with the column B, the entablature C, and the lid D, arranged so as to form a new and ornamental design, in the manner herein described.

ALEX. BECKERS.

No. 1,087.—*Design for Table Bells.*—I claim a design for a tea bell composed of an ornamented base mounted by a female figure, as herein represented.

HENRY C. FOOTE.

No. 1,088.—*Design for Parlor Cook's Stoves.*—I claim the ornamental design for a parlor cook stove herein described and represented in the annexed photographic drawing.

DAVID HATHAWAY.

No. 1,089.—*Design for a Cooking Stove.*—I claim the new design for the side plate of a cooking stove consisting of the ornamental configurations hereinabove described and represented in the drawings.

A. C. BARSTOW.

No. 1,090.—*Design for Hat Racks.*—I claim the new ornamental design of hat racks as represented and described.

EDWARD REYNOLDS.

No. 1,091.—*Design for Floor Cloth.*—I claim the above described arrangement of ornamental figures forming a design as shown by the accompanying drawings.

JAMES PATERSON.

No. 1,092.—*Design for the Plates of a Stove.*—I claim the combination and arrangement of ornamental figures and forms represented in the accompanying drawings, forming together the ornamental design for the plates of a stove.

S. H. RANSOM.

No. 1,093.—*Design for the Plates of a Cooking Stove.*—I claim the combination and arrangement of ornamental figures and forms represented in the accompanying drawings, forming together the ornamental design for the plates of a cooking stove.

S. H. RANSOM.

No. 1,093½.—*Design for Air Tight Stoves.*—We claim the design, configuration, and arrangement of the several ornaments in bas relief, as above set forth and shown in the annexed drawing, as a new stove design.

GARRETTSON SMITH.  
HENRY BROWN.

No. 1,094.—*Design for Stoves.*—We claim the design and configuration of the mouldings and ornaments as herein described, forming an ornamental design for stoves.

GARRETTSON SMITH.  
HENRY BROWN.

No. 1,095.—*Design for Cooking Stoves.*—We claim the ornamental configuration and design for the plates of a stove, as herein described and shown in the accompanying drawings.

SHERMAN S. JEWETT,  
FRANCIS H. ROOT.

No. 1,096.—*Design for Tea Pot, &c.*—I claim giving tea and coffee pots and other articles of tea and coffee sets, the configurations, flutings, and ridges, embossings, and other adornments before described, so as to produce a simple, chaste, and highly ornamental design.

GEORGE W. SMITH.

No. 1,097.—*Design for a Burial Case.*—I claim the design for a burial case of the form and style represented in the accompanying drawings.

JOHN McMURTRY.

No. 1,098.—*Design for Spoon and Fork Handles.*—I claim the configuration of a grape vine foliage upon both sides of a spoon, fork, or other handle, as shown in Figs. 1 and 2 of the accompanying drawings.

WILLIAM H. LEWIS.

No. 1,099.—*Design for Stoves.*—We claim the ornamental configuration and design for the plates of a stove, as described and shown in the accompanying drawings.

SHERMAN S. JEWETT.  
FRANCIS H. ROOT.

No. 1,100.—*Design for Watch Guards.*—I claim making a watch guard to represent a fire engine, hose, and pipe, as represented in the accompanying drawings.

GEORGE BLANCHARD.

No. 1,101.—*Design for a Stove Plate.*—I claim the star and crescent in alto relievo, forming a border for circular plates for stoves, when arranged as above described and represented.

J. W. LANE.

No. 1,102.—*Design for Stove Plates.*—I claim the ornamental design for a door or plate of a stove, as herein described and shown in the annexed photographic drawing.

DAVID HATHAWAY.

No. 1,103.—Suspended.

No. 1,104.—*Design for Sepulchral Monuments.*—I claim the ornamental design for the shaft or faces of the obelisk, as represented and described.

RICHARD BARRY.

No. 1,105.—*Design for Sewing Machines.*—I claim the design for a sewing machine, illustrated and shown in the accompanying drawing.

S. B. ELLITHORP.

No. 1,106.—*Design for Cooking Stove.*—We claim the arrangement and combination of the ornaments that form the design herein above specified and represented in the accompanying drawings.

ANTHONY JOHN GALLAGHER.  
JACOB BEESLEY.

No. 1,107.—*Design for Stove Plates.*—I claim the ornamental configuration of the plates of a premium cooking stove, as fully set forth and described.

S. W. GIBBS.

No. 1,108.—*Design for Stove Plates.*—I claim the ornamental configuration and combination of ornaments for a six plate wood stove.

S. W. GIBBS.

No. 1,109.—*Design for the Tops and Bases of Sheet Iron Stoves.*—I claim the combination of the different ornamental figures and forms, and configuration of the mouldings of the top, and base, and door, of a sheet iron parlor or wood stove, as herein set forth and described.

S. W. GIBBS.

No. 1,110.—*Design for the Arms of Sewing Machines.*—I claim the ornamental design of the arms for sewing machines, as shown in the drawing.

JAMES S. McCURDY.

No. 1,111.—*Design for Match Boxes.*—I claim the configuration of the bases or lower terminals C, the same being in the form of a scollop shell, and constituting a new and ornamental device for a match safe.

P. J. CLARK.

No. 1,112.—*Design for a Cooking Stove.*—We claim the design for a cooking stove, exhibited in the accompanying drawing.

JAMES GREER.  
RUFUS I. KING.

No. 1,113.—*Design for the Sides and Doors of Cooking Stoves.*—We claim the design exhibited in the accompanying drawings for the side and doors of a cooking stove.

JAMES GREER.  
RUFUS I. KING.

No. 1,114.—*Design for Spoon and Fork Handles.*—I claim the combination and arrangement of the several devices hereinbefore described, with the handle of a spoon, fork, or other article of table cutlery, whether made of silver or other metal, for the purpose of ornamenting the handles thereof.

HENRY HEBBARD.

No. 1,115.—*Design for Sun Dials.*—I claim the new and improved configuration of sun dials, as set forth in the specification and accompanying drawing.

WM. W. WILSON.

No. 1,116.—*Design for Floor Oil Cloth.*—I claim this design, of whatever size, in whatever colors, in kind or number, or in whatever contrasts or blending of colors, or of light and shade.

JAMES BOGLE.

No. 1,117.—*Design for Floor Oil Cloth.*—I claim the design, of whatever size, in whatever colors, in kind or number, or in whatever contrasts or blending of colors, or of light and shade.

JAMES BOGLE.

No. 1,118.—*Design for Stoves.*—We claim the design and configuration of the ornamental castings as above described and set forth in the annexed drawing.

GARRETTSON SMITH.  
HENRY BROWN.

No. 1,119.—*Design for Fire Frames.*—I claim the configurations, ornaments, and mouldings above described, as shown in the drawings, as a design for fire frames.

WM. W. STEVENS.

No. 1,120.—*Design for a Carpet Pattern.*—I claim the design or pattern for carpets herein set forth.

ELEMIR J. NEY.

No. 1,121.—*Design for a Carpet Pattern.*—I claim the design or pattern for carpets herein set forth.

ELEMIR J. NEY.

No. 1,122.—*Design for a Carpet Pattern.*—I claim the design or pattern for carpets herein set forth.

ELEMIR J. NEY.

No. 1,123.—*Design for a Carpet Pattern.*—I claim the design or pattern for carpets herein set forth.

ELEMIR J. NEY.

No. 1,124.—*Design for Clock Cases.*—I claim the general design and configuration herein described.

JOSEPH A. MUNN.

No. 1,125.—*Design for a Cook's Stove.*—I claim the ornamental design for the front and sides of a cook stove, herein described.

DAVID HATHAWAY.

No. 1,126.—*Design for a Cook's Stove.*—We claim the ornamental design for a cook stove herein described and represented in the annexed photographic drawings.

GEORGE W. PITTOCK.  
JOHN PITTOCK.

No. 1,127.—*Design for Parlor Cooking Stoves.*—I claim the configurations, ornaments, and mouldings as a design for an urn, top, door and frame, base, bottom, and legs, to be used with a sheet iron body in making a coal parlor or coal parlor cooking stove, as above described and represented in the accompanying drawings.

WM. W. STEVENS

No. 1,128.—*Design for Parlor Stoves.*—I claim the above described ornamental design for a parlor stove.

ROBERT HAM.

No. 1,129.—*Design for Carpet Patterns.*—I claim the design or pattern for carpets herein set forth.

ELEMIR J. NEY.

No. 1,130.—*Design for Carpet Patterns.*—I claim the design or pattern for carpets herein set forth.

ELEMIR J. NEY.

No. 1,131.—*Design for Parlor Coal Stoves.*—I claim the ornamental shape and configuration of the stove plates and doors, represented in the accompanying drawings.

ISAAC DE ZOUCHE.

No. 1,132.—*Design for Table Forks.*—I claim the configuration of the neck and stem, as shown and described, to form a new and original design for a table fork.

NATHANIEL E. RUSSELL.

No. 1,134.—*Design for Stoves.*—We claim the design, configuration, and arrangements of the ornaments on the plates as described, forming a new stove design.

GARRETTSON SMITH.  
HENRY BROWN.

No. 1,134.—*Design for Floor Oil Cloth.*—I claim the ornamental design for floor oil cloths represented in the accompanying pattern.

JAMES BOGLE.

No. 1,135.—*Design for Floor Oil Cloth.*—I claim the ornamental design for floor oil cloths represented in the accompanying pattern.

JAMES BOGLE.

No. 1,136.—*Design for Spoon or Fork Handles.*—What I claim is the use of the ornamental devices on the obverse and reverse sides of the spoon, as hereinbefore described, for the purpose of ornamenting the handles of spoons, forks, and other articles of table cutlery, whether made from silver or other metals.

HENRY HEBBARD.

No. 1,137.—*Design for Scales.*—We claim the configuration of the parts herein shown and described, to form a new and original design for the cases of what are known as the Union scales.

FRANCIS M. STRONG.  
THOMAS ROSS.

No. 1,138.—*Design for a Floor Oil Cloth.*—I claim the combination and arrangement of figures and devices herein specified and represented in the accompanying photographic impression, to form an ornamental pattern or design for a floor oil cloth.

J. B. VIROLET.

No. 1,139.—*Design for a Carpet Pattern.*—I claim the configuration of the design hereunto annexed, when made by being inwrought into three-ply, ingrain, or other carpeting, in the form similar to the drawings accompanying this specification.

HENRY G. THOMPSON.

No. 1,140.—*Design for a Carpet Pattern.*—I claim the configuration of the design hereunto annexed, when made by being inwrought into three-ply, ingrain, or other carpeting, in the form similar to the drawings accompanying this specification.

HENRY G. THOMPSON.

No. 1,141.—*Design for a Carpet Pattern.*—I claim the configuration of the design hereunto annexed, when made by being inwrought into three-ply, ingrain, or other carpeting, in the form similar to the drawings accompanying this specification.

HENRY G. THOMPSON.

No. 1,142.—*Design for a Three-Ply Carpet Pattern.*—I claim the configuration of the design hereunto annexed, when made by being inwrought into three-ply, ingrain, or other carpeting, in the form similar to the drawings accompanying this specification.

HENRY G. THOMPSON.

No. 1,143.—*Design for the Handles of Spoons and Forks.*—I claim the ornamental configuration herein represented, as applied to the handles of spoons and forks, as set forth.

P. B. GILBERT.

No. 1,144.—*Design for a Carpet Pattern.*—I claim the design or pattern for carpets herein set forth.

ELEMIR J. NEY.

No. 1,145.—*Design for the Handles of Spoons, Forks, &c.*—I claim the use of the ornamental devices hereinbefore described, for the purpose of ornamenting the handles of spoons, forks, and other articles of table cutlery, whether made of silver or other metal.

HENRY HEBBARD.

No. 1,146.—*Design for a Skating or Riding Cap for Ladies.*—I claim the design above described, and as shown more particularly in the drawings, of a cap for ladies, misses, and children, the same to be made of Berlin or Shetland worsted, or any other suitable material capable of being knit into the form as above described.

ELIZA A. MURDOCK.

No. 1,147.—*Design for a Cooking Stove.*—I claim the combination and arrangement of ornamental figures and forms represented in and by the accompanying drawing, as forming together an ornamental design for the front, side, and top plates of a cooking stove.

JOHN MARTINO.

No. 1,148.—*Design for Cylinder Stoves.*—We claim the combination and arrangement of the ornamental figures and forms represented in and by the accompanying drawing as forming together the plates of a cylinder stove.

JOHN MARTINO.  
JAMES HORTON.

No. 1,149.—*Design for the Frame of a Sewing Machine.*—I claim the design for a sewing machine illustrated and shown in the accompanying drawing.

S. B. ELLITHORP.

No. 1,150.—*Design for Gas Cocks, &c.*—I claim the use of the devices hereinbefore described as adapted and used for ornamenting cocks, couplings, brackets, and other parts of gas fixtures and chandeliers, as set forth.

B. M. JOHNSON.

No. 1,151.—*Design for a Box Stove.*—I claim the ornamental design and configuration of stove plates, such as herein described and shown in the annexed drawings.

E. J. CRIDGE.

No. 1,152.—*Design for the Arms of Sewing Machines.*—I claim the ornamental design of the shape or configuration of the sewing machine arm, as represented.

JAMES S. McCURDY.

No. 1,153.—*Design for Stoves.*—We claim the design, configuration, and arrangement of the several ornaments in bas relief, as herein described and set forth in the drawing, as the design for stove "Patapsco cook."

GARRETTSON SMITH.  
HENRY BROWN.

No. 1,154.—*Design for a Clock Case Front.*—What I claim as a new design is the semi-octagonal top in combination with the corner blocks and tips, when the whole is constructed, arranged, and made to present the symmetry of the new design, as herein described and represented.

ROSWELL KIMBERLY.

No. 1,155.—*Design for a Trade Mark.*—I claim the design shown by the annexed drawing and described herein, to be used as a trade mark upon an article of manufacture, with the name thereon described.

J. H. McLEAN.

No. 1,156.—*Design for Ornamenting Sewing Machines.*—I claim the combination and application of the devices hereinbefore described, for ornamenting the frame and working parts of sewing machinery, as set forth.

WM. NEWTON BROWN.

No. 1,157.—*Design for Cooking Stoves.*—I claim the arrangement and combination of the ornaments that form the design herein above specified and represented in the accompanying drawings.

ANTHONY JOHN GALLAGHER.

No. 1,158.—*Design for Parlor Stoves.*—We claim the scrolls, flutings, and mouldings, as set forth in the accompanying drawings, as forming an ornamental design for wood parlor stoves.

S. HARRIS.  
PAUL W. ZOINER.

No. 1,159.—*Design for Floor Cloths.*—I claim the ornamental design represented in the accompanying pattern.

JEREMIAH MEYER.

No. 1,160.—*Design for Cooking Stoves.*—The general design and configuration represented in the accompanying photograph.

THOMAS H. WOOD.  
JOHN E. ROBERTS.  
HENRY S. HUBBELL.

No. 1,161.—*Design for Ornamenting Bottles.*—I claim the ornamental design described and represented in the drawing for pine tree tar cordial bottles.

L. Q. C. WISHART

No. 1,162.—*Design for Clock Cases.*—I claim the design for a clock case, as herein above illustrated and set forth.

CHARLES T. FOOTE.

No. 1,163.—*Design for a Trade Mark.*—We claim the within described design of picture to be affixed to our wares and manufactures, and to be designated as the peach brand.

THOMAS HARGROVE.  
SAMUEL HARGROVE.

No. 1,164.—*Design for a Base for Casters.*—I claim the shape and configuration, as described for a centre base.

ALLEN LEONARD.

No. 1,165.—*Design for Caster Handles.*—I claim the configuration of a tasteful and artistical wrought figure for an ornamental design for a handle or lift, substantially as described, for a caster, &c.

ALLEN LEONARD.

No. 1,166.—*Design for Fork or Spoon Handles.*—I claim the configuration and ornamentation, the shield, the urn, or vase, the strawberry fruit, vine, and foliage combined, as described, to produce an ornamental design for a handle.

WILLIAM H. LEWIS.

No. 1,167.—*Design for Stoves.*—We claim the design and configuration, in bas relief, on the ornamental castings, for a stone design, as above set forth and represented by the annexed drawing.

GARRETTSON SMITH.  
HENRY BROWN.

No. 1,168.—*Design for Carriage Bodies.*—I claim the design consisting of the grooved seat B, with the round corners to ornament the seat of a carriage or buggy body.

HARRISON GROSH.

No. 1,169.—*Design for Carpet Patterns.*—I claim the design or pattern for carpets herein set forth.

ELEMIR J. NEY.

No. 1,170.—*Design for Carpet Patterns.*—I claim the design or pattern for carpets herein set forth.

ELEMIR J. NEY.

No. 1,171.—*Design for Floor Cloths.*—I claim the combination of figures and devices herein described and represented in the accompanying photographic impression, to form an ornamental pattern or design for a floor oil cloth.

I. B. VIROLET.

No. 1,172.—*Design for a Trade Mark.*—We claim a picture to be used as a trade mark, and designed as described, with the Bragg's Arctic liniment printed or engraved thereon.

OLIVER T. BRAGG.  
MICHAEL BURROWS.

No. 1,173.—*Design for a Trade Mark for Soap Boxes.*—We claim the new design for a label for boxes of soap consisting of the words and ornamental devices as above described and represented in the drawings.

THOMAS LINCOLN.  
SAMUEL LINCOLN.

No. 1,174.—*Design for Floor Oil Cloths, Carpets, &c.*—I claim the ornamental design represented in the accompanying pattern.

JEREMIAH MEYER.

No. 1,175.—*Design for Carpets, &c.*—I claim the design or pattern for carpets or other fabrics, herein set forth.

ELEMIR J. NEY.

No. 1,176.—*Design for Carpets, &c.*—I claim the design or pattern for carpets or other fabrics, herein set forth.

ELEMIR J. NEY.

No. 1,177.—*Design for Parlor Stoves.*—We claim the design and configuration of the ornamental castings as above described and set forth in the annexed drawing, and as forming the plates of a parlor stove.

GARRETTSON SMITH.  
HENRY BROWN.

No. 1,178.—*Design for Carpet Patterns.*—I claim the configuration of the design hereunto annexed, when made by being inwrought into two-ply, ingrain, or other carpeting, in the form similar to the drawings accompanying this specification.

HENRY G. THOMPSON.

No. 1,179.—*Design for Carpet Patterns.*—I claim the configuration of the design hereunto annexed, when made by being inwrought into three-ply, ingrain, or other carpeting, in the form similar to the drawings accompanying this specification.

HENRY G. THOMPSON.

No. 1,180.—*Design for Carpet Patterns.*—I claim the configuration of the design hereunto annexed, when made by being inwrought into two-ply, ingrain, or other carpeting, in the form similar to the drawings accompanying this specification.

HENRY G. THOMPSON.

No. 1,181.—*Design for Carpet Patterns.*—I claim the configuration of the design hereunto annexed, irrespective of colors and width, when made by being wrought into a twilled Venitian or other carpet, in form similar to the drawings accompanying this specification.

HENRY G. THOMPSON.

No. 1,182.—*Design for Carpet Patterns.*—I claim the configuration of the design hereunto annexed, when made by being inwrought into two-ply, ingrain, or other carpeting, in the form similar to the drawings accompanying this specification.

HENRY G. THOMPSON.

---

## CLAIMS OF ADDITIONAL IMPROVEMENTS GRANTED DURING THE YEAR 1859.

---

No. 215, to original Letters Patent No. 21,256.—*Improved Cross Cut Sawing Machine.*—We claim attaching the bar or beam C to the vertical bar B, by a pivot *a*, and securing the bar or beam C and beam B in a proper relative position with each other, by means of the rod D, loop *b*, and nut *d*, or their equivalents, so that the bar or beam C may be more or less inclined according to the thickness of the log, and the bar B always retained in a vertical position.

We further claim, in combination with the oscillating platform E, lever H, and saw bar J, the bar L, provided with an adjustable weight M, and arranged substantially as shown, to operate as and for the purpose set forth.

ALBERT HETH.  
GAYLON HALL.

No. 216, to original Letters Patent No. 19,507.—*Improvement in Hominy Mortars.*—I claim the application and combination of the slide S, with its spring D, and roughening of the lower end of the pestle at G, for the uses and purposes specified and substantially as set forth.

JOHN KEEZER.

No. 217, to original Letters Patent No. 18,681.—*Improved Shingle Machine.*—I claim, first, the use of the bridles or guides *d*<sup>1</sup> *d*<sup>2</sup>, in combination with the wrists *a*<sup>1</sup> of the shaving knives and the converging grooves and vertical slots, for the purpose of communicating to the shaving knives a combined drawing knife and approximating motion during the process of shaving the shingles, substantially as described.

Second. The use of the spring check plate E, in combination with the movable gate D, to

permit one only at a time of the shingle bolts to pass to the shaving knives, and prevent the bolt being drawn back on the retrocession of the feed board.

Third. The use of a feed-board composed of elastic bars or fingers, each capable of a slight depression at its extremity, so as to accommodate the surface of the feed board to any unevenness or twist in the shingle bolt.

JAMES CRARY.

No. 218, to original Letters Patent No. 16,416.—*Improved Method of Hanging and Operating Reciprocating Saws.*—I claim the adjustable ways D and E and the friction wheels H and I, arranged and operating in the manner and for the purposes specified.

I also claim the vibrating beams B and C, in combination with the ways D and E, and their dependent parts, constructed and operating in the manner and for the purpose set forth.

CARLYLE WHIPPLE.

No. 219, to original Letters Patent No. 21,710.—*Improvement in Machines for Trimming the Edges of Paper Hangings.*—I claim the framed ways W X, moving in a curvilinear path on a centre at one angle of frame, the hand lever  $x$ , that operates on frame way, and the springs  $b b$ , which keep the frame in position, in combination for the purposes as substantially set forth.

JOHN WAUGH.

No. 220, to original Letters Patent No. 18,357.—*Improvement in Spring Bed Bottoms.*—I claim supporting the fixed end of the longitudinal slots in spring bottoms for bedsteads by means of longitudinal spring bars substantially as described, so that the elasticity or yielding of both ends of the slots may be equalized for the purpose set forth.

HENRY S. SMITH.

No. 221, to original Letters Patent No. 16,532.—*Improved Tool for Tenoning Spokes.*—I claim, first, the adjustable gauge D, attached to the tube A, substantially as and for the purpose set forth.

Second. The employment or use of the temper or set screws B C, applied to the tube A, as and for the purpose set forth.

Third. The gauges H, fitted in the bars F F<sup>1</sup> of the clamp cutter head, all the above parts being arranged and operating as herein specified.

JOHN J. CROY.

No. 222, to original Letters Patent No. 18,228.—*Improvement in Locks.*—I claim the combination of the disk D and centre V, toothed or corrugated, substantially as represented, for the purpose of fastening them securely together, but I do not confine myself to any particular size or shape or number of teeth, nor to any particular position on the disk or centre.

HENRY W. COVERT.

No. 223, to original Letters Patent No. 20,091.—*Improved Fly Trap.*—I claim the cover or shade  $a$ , the rim or front marked  $e$ , and the pan marked  $b$ , as described above.

WILLIAM RILEY.

No. 224, to original Letters Patent No. 22,456.—*Improved Bedstead Fastening.*—I claim constructing the locking bolt A of a flat or rectangular form, so as to work against the surface of the side board C, to obviate the reducing of the bearing surface of the recess of the wrench B, and hold the parts to the required position without the usual guide pin, substantially as described.

I also claim elevating the hook  $j$  above a right line through the centre of the bolt A, substantially as and for the purpose set forth.

I also claim uniting the point  $i$  of the circular wedge with the stock of the wrench, whereby greater strength and a better adaptation to the recess or seat of the same is secured, substantially as described.

I further claim adapting the cam  $l$ , or raised part of the wrench lever to pushing and holding forward the bolt for ready connection with the pin  $f$ , substantially in the manner herein described.

OLIVER ROBINSON.

No. 225, to original Letters Patent No. 20,450.—*Improvement in Cooking Stoves.*—I claim the combination of the openings A in the side plate F, with the back fireplate B, and connecting tube C, with the centre plates D and E, constructed and combined in the manner and for the purpose set forth.

Second. I claim the openings  $ff^1$ , in side plate F, with the centre plate E<sup>1</sup>, constructed in the manner and for the purpose set forth.

Third. I claim the flue or opening L L, from the front plate H, to the top plate I, constructed in the manner and for the purpose set forth.

JAMES SPEAR.

No. 226, to original Letters Patent No. 17,756.—*Improved Railroad Car Stove.*—First, I claim the combination of the cone damper J, with the smoke pipe H and the top plate D, constructed in the manner and for the purpose set forth.

Second. I claim the combination of the head or deck collar L, with the cold air pipe G, and the smoke pipe H, constructed in the manner and for the purpose set forth.

JAMES SPEAR.

No. 227, to original Letters Patent No. 9,601.—*Improved Machine for Making Axes.*—I claim the groove G, the arm X, with the tongs T or T<sup>2</sup>, in combination with each other, substantially in the manner and form and for the purposes set forth in the within specification.

JONAS SIMMONS.

No. 228, to original Letters Patent No. 18,852.—*Improvement in Seeding Machines.*—I claim the arrangement of the stationary roof like screen N, lateral sloping projections e<sup>1</sup>, septum O, slides G<sup>1</sup> and G<sup>2</sup>, slotted bars f, and shoes I I, with slides E and trough F, the above part being constructed substantially as described and used in combination with the features covered by my patent December 15, 1857.

CHARLES COX JAMES.

No. 229, to original Letters Patent No. 21,941.—*Improved Arithmometer, for Addition.*—I claim the combination of the rocker, keys, and shifting pawl, in any equivalent manner and for the purposes set forth.

O. L. CASTLE.

No. 230, to original Letters Patent No. 14,859.—*Improvements in Machines for Dressing Mill Stones.*—We claim the bed piece A, with the cam B, bar or lever C, and rods p p, attached, provided with springs r, in combination with the frame or carriage D, with pick shaft i attached, provided with the forked arm o, the whole being arranged to operate as and for the purpose set forth.

SIMON W. DRAPER.

REUBEN M. DRAPER.

No. 231, to original Letters Patent No. 18,322.—*Improvement in Machines for Packing Wool.*—I claim forming either or both of the leaves B B of my improved wool packing machine of two or more connected longitudinal sections, when the said jointed leaves are so arranged as to operate with the other parts of said machine, substantially in the manner and for the purpose herein set forth.

CHARLES CARLISLE.

No. 232, to original Letters Patent No. 22,523.—*Improvement in Corn Shellers.*—I claim the guide B, in combination with the weighted or spring presser C, made movable and adjustable with reference to the centre of a disk A, in the manner and for the purpose set forth.

WILLIAM WELLS.

No. 233, to original Letters Patent No. 17,957.—*Improvement in Automatic Lubricators for Railroad Car Axles.*—I claim, first, placing a cylindrical coiled spring around the piston immediately above the socket, to be used instead of the volute spring below the piston and within the socket, as described.

Second. I do not claim generally a ball valve, as this is in common use in various connections, but I claim the use of the ball valve T, in combination with the enlarged chamber P, and the arrangement described for communicating and sustaining the oil in contact with the journal.

Third. I claim the use of the flat spring e, (Figs. 2 and 3,) constructed and arranged as described, to be used for vibrating the piston, together with the arrangement I have described for seating the piston on the spring, as herein set forth.

WILLIAM BAKER.

No. 234, to original Letters Patent No. 21,044.—*Improvement in Mangles.*—I claim the employment or use of the cylinder C, having an elliptical surface upon a portion of its periphery, and having a fixed axis of rotation, the cylinder D having a movable axis of rotation, and the eccentric cams h arranged upon a movable rod, and their pressure being regulated by suitable springs, the whole being arranged to operate substantially as and for the purposes set forth.

D. CUMMING, JR.

No. 235, to original Letters Patent No. 12,818.—*Improvement in Railroad Car Ventilators.*—We claim the construction of the fan chambers  $D D^1$ , with outlets at each extremity, and their combination with the other portions of the ventilating apparatus, as described.

D. H. FOX.  
JOHN FINK.

No. 236, to original Letters Patent, No. 17,374.—*Improvement in Ore Crushing Machines.*—I claim the alternate lifting and dropping of a stamper or hammer by means of the combination of the vertical rod with two or more clamping rollers, the peripheries of which are not complete circles.

SAMUEL F. HODGE

No. 237, to original Letters Patent No. 20,668.—*Improvement in Cooking Stoves.*—I claim the extension of the flues under the hearth, substantially as described, for the purposes set forth.

SAMUEL B. SPAULDING

No. 238, to original Letters Patent No. 21,267.—*Improvement in Harnesses.*—I claim the bearing bar, the chain and braces attached thereto, and the padded swivel joint, to be used in combination with my improvement in harness, disclaiming the original invention heretofore patented.

FREEDOM MONROE.

No. 239, to original Letters Patent No. 22,648.—*Improvement in Apparatus for Evaporating Saccharine Juices.*—I claim, first, the application of one or more dampers  $H$  to the movable furnace  $A$ , also the cooling surface on the evaporator connected therewith, for the purposes set forth.

Second. I claim the movable flue  $I$ , as described.

Third. I claim the broad hook or supporter  $K$ , or its equivalent, as set forth.

L. P. HARRIS.

No. 240, to original Letters Patent No. 19,582.—*Improvement in the Spring Seats of Chairs, Sofas, &c.*—I claim the spring plate  $D$ , arranged and operating in combination with the supporting blocks  $B B$ , substantially as herein specified.

CHARLES ROBINSON.

No. 241, to original Letters Patent No. 22,941.—*Improvement in Railroad Car Springs.*—I claim the box  $A$  and cover plate  $C$ , secured together by a bolt  $D$ , or other suitable fastening, in combination with one or more loose plates  $H$ , placed within the box so as to divide the latter into two or more compartments, as and for the purpose herein set forth.

A. B. DAVIS.

No. 242, to original Letters Patent No. 23,343.—*Improved Mode of Preparing and Mounting Slate.*—I claim the combination of leather, or cloth, or felt, (or felting,) instead of or in addition to India rubber and gutta percha so far as beauty and economy, and desirableness in use may require, with the metallic band or rim around the edge of the slate, as patented March 29, 1859.

I also claim as my improvement the combination of leather and cloth with my metallic rim, or with a water proof cement of such strength and stiffness as will warrant to some extent the disuse of said metallic rim, especially in mounting slates in port folio form, or forms, as set forth in the above specification and accompanying drawings.

HUBBARD BEEBE.

No. 243, to original Letters Patent No. 22,365.—*Improvement in Hanging Window Sash.*—I claim the improved arrangement of cords, pulleys, and weights, hereinbefore described, for hanging the sashes of windows, so that either or both sash can be retained in any desired position in the frame, the sash and weights being suspended and moving in cords attached to the frame.

T. F. HALL.

No. 244, to original Letters Patent No. 17,626.—*Improvement in Picker Sawing Machines.*—I claim attaching the saw guides to the overhanging bearing, so as to adjust them to the sawing of small logs, substantially as set forth.

JOHN HAW.

No. 245, to original Letters Patent No. 19,321.—*Improvement in Ploughs.*—I claim the combination of the eccentric roller  $r$ , beam  $B$ , notches  $i$ , and cuff  $f$ , substantially as set forth.

GEORGE WATT.

No. 246, to original Letters Patent No. 22,980.—*Improvement in Locks.*—I claim the arrangement of the spring *f*, collar *a*, ring *X*, screw *u*, brake wheel *W*, and arbor *S*, in the manner above described, so as to produce friction between the ring *X* and wheel *W* and arbor *S*; and also the arrangement of the brake *k*, indented flange *W*, and stem *O*, as above described, so as to prevent the revolution of the wheel *W* and arbor *S*, and ring *X*, and the external dial hand substantially as above described.

AMOS A. RICHARDS.

No. 247, to original Letters Patent No. 22,913.—*Improved Instrument for taking Altitudes of the Sun.*—I claim, in combination with the rotary bar *E*, the arrangement of the adjustable bar *F* and dial plate *R*, and rotary cylinder *H*, and adjustable disk *D*, in connection with the bar *K* and plates *a a* holding the lens, and *e e* having on its face a small square 3 to receive the sun's image through the lens, in such relation to each other, and to the rotary bar *E* that it operates substantially as and for the purposes specified.

FREDERICK YEISER.

No. 248, to original Letters Patent No. 22,928.—*Improvement in Mole Ploughs.*—I claim the employment of the cap *d* in combination with the mole *B*, constructed and arranged substantially as and for the purposes set forth.

MOSES BALES.

No. 249, to original Letters Patent No. 22,648.—*Improvement in Apparatus for Evaporating Saccharine Juices.*—I claim the application of partial transverse or oblique partitions to evaporating pans, for the purpose of preventing a continuous transverse channel when the said partitions shall be arranged, substantially in the manner as herein fully set forth and described.

L. P. HARRIS.

No. 250, to original Letters Patent No. 23,251.—*Improvement in the Mode of Oiling Journals.* I claim, first, the hinging the dish or bucket *G* to the rod *J*, as shown, for the purpose set forth.

Second. The dish or bucket *G* in combination with the several parts marked *C D E F* and *I*, for the purposes set forth and described.

DOUGLAS B. JORDAN.

No. 251, to original Letters Patent No. 24,537.—*Improvement in Corn Planters.*—We claim, first, the described arrangement of the weighted valve *V*, rod *v*, tappet *X*, wheel *K k*, slides *H*, and tube *D*, for the purpose set forth.

Second. In the described combination with a cam wheel *K k*, crank shaft *M*, rod *O*, and rocking lever *J j*, we claim the inverted arch yoke *Y y*, constructed and operating as set forth.

A. CAMPBELL.

W. CAMPBELL.

JAMES CAMPBELL.

No. 252, to original Letters Patent No. 19,256.—*Improvement in Tobacco Presses.*—We claim, first, the top plate of the press, marked in two drawings *A* and No. 5 *A*, in connection with the bottom plate of said press, marked in drawing as *c*, used for retaining pressure and forming the bed of the main truck, constructed as described.

Second. The groove nuts for raising and lowering the top plate of the press without taking it from the bars, as described.

WILLIAM R. MUSSER.

JOHN COLEMAN.

No. 253, to original Letters Patent No. 23,549.—*Improvement in Attaching Thills to Vehicles.* I claim combining with the hook *A a* collar *G*, having a reverse hook or lip *k*, corresponding with the point of *A*, to form an eye therewith, together with the screw shank and binding nut *H*, substantially as and for the purpose herein specified.

DOUGLAS BLY.

No. 254, to original Letters Patent No. 19,560.—*Improved Curtain Fixture.*—I claim the application of the lever as before explained, and as it is represented in Fig. 2, in combination with the cord and tassel, with the pulley or eye in the end of the tassel, and for the purposes described.

JOSEPH F. HALL.

No. 255, to original Letters Patent No. 25,667.—*Improved Gold Washer.*—I claim, first, imparting to the shaft *b*, and the series of pans thereon, an intermitted or oscillating movement for the purposes and as specified; and in combination with the shaft *b* and pans having

the intermitted or oscillating movement set forth, I claim the cam *h* and ball *i* to give the vertical or jiggling movement as specified.

Second. The conical hoods or funnels *o*<sup>1</sup> *o*<sup>2</sup>, in combination with the pans *n n*, for the purposes and as specified.

M. NELSON.

No. 256, to original Letters Patent No. 25,359.—*Improved Apparatus for Watering and Sweeping Railways.*—I claim combining a fireplace and flues or other equivalent heating apparatus with the water tank *L*, for the purpose specified.

W. C. ALLISON.

No. 257, to original Letters Patent No. 25,857.—*Improvement in Naval Architecture.*—I claim making the lines of every section of a vessel, from the keel to the water line, arcs of circles, when said arcs have separate and independent centres determined, substantially in the manner described.

B. F. WELLS.

No. 258, to original Letters Patent No. 19,779.—*Improvement in Straw Cutters.*—I claim the combination and arrangement of the devices for operating the knife and feeding box, substantially as above described.

W. W. HOLLMAN.

No. 259, to original Letters Patent No. 14,110.—*Improved Machine for Making Clothes Pins.*—What I claim, is adding bits to the machine so as to bore the stuff at the time it is being shaped and turned at the same operation.

I also claim as above the boring the stuff first and then putting it up on a small mandrel which revolves, so that the work shall be turned and shaped to the right pattern, and finished at each end upon its own centre hole, all at one operation.

I claim the above improvements as before set forth, or any equivalent which substantially effect either of the above objects by any other arrangements of mechanism or mechanical devices.

EPHRAIM PARKER.

No. 260, to original Letters Patent No. 22,897.—*Improved Refrigerator.*—I claim the arrangement severally of the escape pipe *G* in combination with the induction pipe *E*, so as to operate conjointly therewith, and in connection with a flue *K*, substantially as and for the purposes set forth.

WILLIAM SIMS.

---

## CLAIMS OF EXTENSIONS GRANTED DURING THE YEAR 1859.

---

Letters Patent No. 3,885, dated January 16, 1845.—Reissue No. 92, dated May 1, 1847.—*Improvement in Cotton Presses.*—I claim combining the piston of a steam engine with the follower or platen of a press, by the interposition of the two progressive levers, substantially as herein described, whereby the direct and constant force of the steam piston shall operate the follower or platen by a force increasing in the ratio of the increased resistance, or nearly so, as described.

PHILOS B. TYLER.

Letters Patent No. 3,915, dated February 20, 1845.—*Improvement in Buttons.*—What I claim as the invention of John Hatch, deceased, is my improvement in the modes usually adopted for forming or making the eyelet holes or thread passages of buttons, composed of two circular plates of metal, the one of said pieces being confined to the other, as above described; the said improvement consisting in punching holes through the plates (so as to leave a bur projecting on one side of the plate from each hole) before they are applied and connected to each other, and (in combination with) applying the said holes of one plate to those of the other, in such manner that their burred projecting edges may be in direct contact, and the countersunk portion of each of the holes of the plate (there being the same number of holes in each plate) be opposite to that of the corresponding hole of the other plate, thereby forming eyelets or passages, countersunk on *both sides* of the *button*, by which mode of construction the above wear of the threads, which secure the button when sewed to

cloth or other material, is to a very great degree obviated; the whole being substantially as above described.

JOSEPH B. THAXTER,  
*Administrator of John Hatch, deceased.*

Letters Patent No. 3,974, dated March 26, 1845.—*Improvement in Making Boats and other Vessels of Sheet Iron or other Metal.*—I claim constructing boats of sheet metal pressed into form in moulds, with beads, flanches, and mouldings, as herein described, for the purpose of taking up the surplus metal, in forming the boat, to prevent wrinkles in the sides thereof, and for stiffening it, as above set forth.

I further claim the recess moulding and flanch to receive the gunwale, which takes up the surplus metal along the upper edge of the boat, and gives sufficient strength and stiffness, without frames or timber inside; constructed substantially in the manner and for the purposes above specified.

JOSEPH FRANCIS.

Letters Patent No. 3,987, dated April 10, 1845.—Reissue No. 146, dated October 9, 1849.—*Improvements in Power Looms for Weaving Plaids, &c.*—1. I claim regulating the delivery of the unwoven warps, as required for the weaving of the cloth, by the tension of the said warps, substantially as described, in combination with a brake or stop motion, substantially as described, to prevent the tension given to the warps by the beat of the lay from effecting the delivery motion, as set forth.

2. I also claim, in combination with the method of regulating the delivery of the warps by their tension, and controlled by a brake, the taking up of the woven cloth by a regular and positive motion, substantially as described, that the figures produced thereon may be regular and well matched, the irregularities of the weft threads being by this means taken up in the thickness instead of the length of the cloth.

3. I also claim, in combination with the roller of a positive and regular take up motion of a weaving loom, the measuring wheel and hand or pointer, operated substantially as described, whereby the quantity of cloth woven is at all times indicated, as described.

4. I also claim communicating the shifting motion for shifting the shuttle boxes up and down when a change of color is required in the weft, by the gravitating force of a weight, or the equivalent thereof, substantially as described, whereby all injury to the mechanism is avoided, should anything be interposed to arrest the motion of the moving parts, as described.

5. I also claim arresting the motion of the shuttle, and relieving the picker from the end thereof, preparatory to the shifting of the shuttle boxes, by combining with the lay and picker a spring lever, one arm of which moves in a slot, or the equivalent thereof, to give it the required motion, substantially as described.

6. And, lastly, I claim stopping the loom and arresting the momentum of the moving parts at a given and determined point by means of a lever, which, when the weft thread is not carried through, is brought into contact with a spur on the crank shaft, or the equivalent thereof, which forces it back to shift the belt, when this is combined with the fingers which enter recesses in the lay, and which, when the weft thread is carried through, are pushed forward to prevent the lever from stopping the loom, as described.

E. B. BIGELOW.

Letters Patent No. 3,761, dated September 24, 1844.—*Improvement in Chairs for Invalids.*—I claim the manner in which I have combined the seat, the back, and the apron, with each other, and with the lower segment or legs of the chair, as herein set forth, by which combination and arrangement the person occupying the chair is enabled, by the action of his own gravity, to govern the position of the movable parts; the whole being connected and combined substantially as herein set forth.

JAMES G. HOLMES.

Letters Patent No. 4,004, dated April 22, 1845.—*Improvements in Wooden Bridges.*—I claim the combination of one or more series of iron screw rods *b b*, &c. with the suspension posts and chords or string pieces of a truss, in the manner and so to operate substantially as herein above specified.

I do not claim the combining with the posts, braces, and strings of a truss a series of supplementary braces *k k*, &c., but what I do claim is the arrangement of such a series of braces upon the *outer sides of the truss*, and so that they shall extend above and below the chords thereof, and be confined to the truss, substantially as above described.

GEORGE W. THAYER.

Letters Patent No. 4,013, dated April 26, 1845.—*Improvement in Machines for Making Match Splints and Arranging them in the Dipping Frames.*—We claim the combination with the series of cutters *o* of the passages *e e*, &c., leading from the cutters, whether there be one or more series of said cutters and passages, the whole being for the purpose of making match splints from a block or blocks, as described. Also, the combination with the aforesaid cutters and

passages of one or more dipping frames, arranged and operating with respect to them, substantially as hereinbefore described. Also, our improved manner of making the dipping frames, viz: in sections of separate pieces or plates *h h h*, as described.

Also, the combination of mechanism by which each of the blocks of wood is held down upon the carriage B and progressively forced forward against the board F, the said mechanism being applied to the carriage B and board F, and constructed and operating together substantially as hereinbefore set forth.

Also, the combination of machinery by which the dipping frames are progressively moved forward, the said machinery being connected with, and intervening between, the carriage B and the said dipping frames, and operating substantially in the manner as hereinbefore explained.

ASA FESSENDEN.  
LUKE L. KNIGHT.

Letters Patent No. 4,023, dated May 1, 1845.—*Improvement in the Machine for Ginning Cotton and Wool.*—I claim arranging the metallic rings composing the burring cylinder so near together that no burrs or seeds, &c., can fall in between them, the rings *e*<sup>1</sup> having hooked teeth cut in the periphery, as described, and so placed around the cylinder as not to have the teeth on any two adjoining rings to come opposite each other, by which the wool or cotton is drawn in below the surface of the rings, and the seeds or burrs are cleaned off.

Second. I claim the combination of the burring cylinder *e*<sup>1</sup>, constructed as above described, with the feeding cylinders *d* and trash cylinder *g*, to separate the fibres of cotton or wool from foreign or useless substances.

STEPHEN R. PARKHURST.

Letters Patent No. 4,025, dated May 1, 1845.—*Improvement in Printing Presses.*—I claim, first, the manner in which I have combined the flying sheet frisket with the cylinder printing press, as set forth. I do not claim this frisket as being new in itself, it having been applied to the bed and platen press, but never, as I verily believe, so modified as to adapt it to the cylinder press. I claim, therefore, the manner described of passing the ends of the slats between the adjustable tape rollers F F, by which they are enabled to conduct the sheet on to the frisket in the position which it must assume in the cylinder press, said frisket being governed in its motion by the cam G, arranged and operating substantially as herein made known.

I claim the lifting of the cylinder when it is desired that it should not bear on the form as it revolves, such lifting being effected by means of the apparatus connected with the lever J, arranged and operating substantially as described.

I claim the manner herein made known of constructing the spring box or apparatus used by me for checking the momentum of the bed in a cylinder press, but which may be advantageously applied in other machines for a like purpose, said spring box or apparatus being furnished with a centre shaft carrying a toothed wheel, that gears into wheels or pinions on several surrounding shafts, the whole of which shafts carry spiral springs, arranged and combined as herein made known, so as to cooperate with each other in the manner described.

RICHARD M. HOE.

Letters Patent No. 4,032, dated May 7, 1845.—*Improvement in Stoves.*—I claim the particular manner as above set forth, in which I arrange and combine the flue and air heating spaces and the pedestal of my stove, the hot air space being between the ascending and descending draft, the descending draft spreading around the base of the stove.

FRANCIS L. HEDENBERG.

Letters Patent No. 4,047, dated May 13, 1845.—*Improvement in the Manufacture of India Rubber Fabrics.*—I claim, as the invention of Nelson Goodyear, deceased, the intermingling and combining fibrous substances with the gum in forming India rubber fabrics, solid and firm in the body, with a smooth surface resembling leather.

HENRY B. GOODYEAR,  
*Administrator of Nelson Goodyear, deceased.*

Letters Patent No. 4,072, dated June 7, 1845.—*Improvement in Machines for Casting Types.* I claim the combination of the slide I and rod H with the horizontal moving crane A, substantially in the manner described, the crane receiving its reciprocating motion from the combination of the crank shaft M Y, cam R, roller U, connecting link V, rocking shaft T, lever W, and weight X, or by other means substantially the same.

I also claim the arrangement of the adjustable socket *e e* for the upper centre B of the crane A, as described, for adjusting the mouth of the mould to the orifice of the nipple plate, in combination with the crane.

DAVID BRUCE, JR.

Letters Patent No. 4,097, dated July 5, 1845.—*Improvement in Machines for Raising and*

*Lowering Weights.*—I claim the manner of combining the barrel disks  $f f^1$  with the wheel  $c$ , for the purpose of hoisting, lowering, or suspending weights by means of the ribs and grooves, or any analogous device, and I claim the further combination therewith of the means employed to govern and regulate the action of said parts, namely, the friction band  $g$  or  $g^1$  and lever  $h$  or  $h^1$ , the attaching and detaching lever  $l$  or  $l^1$ , rolling shaft and bit 4 or  $4^1$ , pin 3 or  $3^1$ , and slide key 2 or  $2^1$ , substantially as such manner and combination are shown and set forth, irrespective of the power employed to work the machinery, and also irrespective of the mode by which the power is connected to the working parts.

EPHRAIM MORRIS.

Letters Patent 4,105, dated July 10, 1845.—*Improvement in Fan Mills.*—I claim the manner in which I have arranged the screen  $F$  and the chess board  $H$ , and combined them with the screens ordinarily used, so as to obtain two distinct currents of wind, and to subject the falling grain to the stronger current below the screen and chess board, thereby blowing off the heavier portions of foreign matter, whilst the chaff is blown off by the ordinary currents in the upper compartments of the shoe.

ISAAC T. GRANT.

Letters Patent No. 4,120, dated July 22, 1845.—*Improvement in Shaping Irregular Surfaces in Wood.*—We claim the method herein above described of copying or forming the longitudinal irregularities of piano legs and other similar articles, on rough blocks of wood, by means of a carriage moving *horizontally* against the *revolving* cutter, and holding both the pattern and the rough block, the cutting tool being raised and depressed for depths of cut by rollers resting on the patterns, the whole method or *modus operandi* being substantially as herein above set forth.

WARREN HALE.  
ALLEN GOODMAN.

Letters Patent No. 4,141, dated August 9, 1845.—*Improvement in Gas Burners.*—I claim the combining with the space  $d d$  directly beneath the orifices of discharge of the gas, and with the supply or branch tubes  $ff$  an expansive chamber  $e e$ , so as to operate in the manner and for the purpose hereinbefore set forth.

I also claim making the lower part of the inner case of the burner with a bell shaped opening or mouth, in the manner and for the purpose as above specified.

WILLIAM BLAKE.

Letters Patent No. 4,149, dated August 16, 1845.—*Improvement in Grinding Mills.*—I claim making the grinding teeth of mills in concentric rows projecting from the surface of the plates so that the teeth of one plate shall run in the spaces between the teeth on the other, and *vice versa*, in combination with the grooves or furrows running towards the periphery of the plates, through which the substances acted upon are carried outwards, whether these furrows be arranged radially, according to what is technically termed the eight quarter dress, or in any other manner leading from the inner to the outer range of teeth.

And I also claim, in combination with the teeth, arranged as expressed in the above claim, the breaking teeth on a cylinder or cone, arranged substantially as herein described and for the purpose specified.

BERIAH SWIFT.

Letters Patent No. 4,184, dated September 9, 1845.—*Improvement in Cooking Stoves.*—I claim the forming of the bottom plate of the oven with a number of tubes or boxes, usually of sheet-iron or other substance thinner than the bottom plate, that descend from it through the lower flue space, the same being effected under an arrangement of their respective parts, substantially the same with that herein described, and for the purpose set forth.

C J. WOOLSON.

Letters Patent No. 4,201, dated September 19, 1845.—*Improvement in the Mode of Tripping Cut Off Valves.*—I claim tripping the drop valve of the cut off by a motion independent of the lifters, substantially in the manner and for the purpose herein described.

I also claim combining the wiper that drops the valve of the cut off, whether working horizontally or vertically, with any of the moving parts of the engine, other than the lifters, or their rocking shaft, by means of the sector and arm or arms, by means of which the extent of the cut off can be regulated at pleasure, during the action of the engine, from the full to the least portion of the stroke, as herein described.

FREDERICK ELSWORTH SICKELS.

Letters Patent No. 4,218, dated October 1, 1845.—Reissue No. 132, dated March 10, 1845.—*Improvements in Barrel Machinery.*—I claim, first, the combination of the slide rest  $k$ , guided in the manner set forth, with the tool  $L$  for turning of the cask, constructed and arranged in the manner set forth.

Second. I also claim the apparatus for chamfering and howelling and crozing—that is to say, the combination of cylinder E open at both ends, so that both ends of the cask can be worked off without changing, with the ring chucks O for fastening the cask into the cylinder, and with the tools as herein described for chamfering and howelling.

Third. I also claim the crozing tool V with the changeable face plate *w*, as herein set forth.

Fourth. I likewise claim the combination of the stock *l*, cutter *l*<sup>1</sup>, adjustable and guage plate *l*<sup>2</sup>, constituting the tool for turning and smoothing the outside of the cask, as above described and represented in Fig. 4.

Fifth. I likewise claim the peculiar construction of the tool for howelling the cask, as above described and represented at Fig. 9.

Sixth. I likewise claim the peculiar construction of the tool for chamfering the ends of the cask, as above described and represented in Fig. 8.

Seventh. I likewise claim the mode of edging and jointing *bilge* staves for making barrels and other *bilge work*, by the employment of a swing frame, having a *concave* or *convex bed*, in or against which the stave is sprung and secured to the required bilge, in combination with the revolving edging saw and straight jointer, be constructed, arranged, and operated in the manner herein set forth, or in any other mode or manner that may be substantially the same, and by which analogous results shall be produced.

WM. TRAPP, JR.

Letters Patent No. 4,223, dated October 9, 1845.—*Improvement in Ruling Machines*.—I claim causing the pens to be raised by the edge of the paper in its passage through the machine, thus causing each sheet to determine the length of its own lines.

LEWIS EDWARDS.

Letters Patent No. 4,245, dated November 1, 1845.—Reissue No. 815, dated September 20, 1859.—*Improvement in Cultivator Teeth*.—I claim making the shank or upper part of cultivator teeth of thin plate steel, U shaped or curved round in front, substantially as hereinbefore described, for the purpose of securing the necessary strength to permit the tooth to be made entire, shank and blade, of a single piece of metal; and, also, of enabling the tooth to be secured in its place in the beam by means of a wedge driven into the cavity of the shank, substantially as hereinbefore described.

DAVID B. ROGERS.

Letters Patent No. 4,266, dated November 12, 1845.—Reissue No. 303, dated April 3, 1855.—*Improvement in Vault Covers*.—What I claim, in covers for openings to vaults in floors, decks, &c., is making them of a metallic grating or perforated metallic plate, with the apertures so small, that persons or bodies passing over or falling on them may be entirely sustained by the metal, substantially as described; but this I only claim when the apertures are protected by glass, substantially as and for the purpose specified.

And I also claim, in combination with the grating or perforated cover and glass fitted thereto, the knobs or protuberances on the upper surface of the grating or perforated plate for preventing the abrasion or scratching of the glass, substantially as specified.

THADDEUS HYATT.

Letters patent No. 4,273, dated November 18, 1845.—*Improvement in Forges*.—I claim the combination of the curved sliding shutters for inclosing the space over the fire, and the device for admitting a draft of air to keep up the combustion during the intervals in which the bellows are not employed, the same being effected for the purpose, and substantially in the manner made known.

CHRISTIAN V. QUEEN.

Letters Patent No. 4,283, dated November 21, 1845.—*Improvement in Planing Machines*.—I claim the manner of forming, arranging, and combining with the revolving cutter wheel the revolving platform, and the endless aprons between which the board to be planed is to be passed; by means of which arrangement and combination it is firmly held along the whole length of such apron, and carried regularly forward without deviation.

JOHN M. FARRAR,

*Administrator of Joseph E. Andrews, deceased*

Letters Patent No. 4,288, dated November 26, 1845.—*Magnetic Water Gauge for Boilers*.—I claim the method, herein described, or any other substantially the same, of indicating the rise and fall of water in the steam boiler or generator, by means of an indicator outside thereof, actuated by a magnet connected with a float, or any other body within the boiler, that rises and falls with the water, and connected with the magnet, substantially as herein described.

JOHN S. RAPPE,

*Administrator of George Faber, deceased.*

Letters Patent No. 4,300, dated December 6, 1845.—*Improvement in Corn Shellers*.—I claim making the *concave plate or disk*, with a concave face and circular opening, provided with a lower and upper lip for the discharge of the cobs in combination with the sheller, and with the shell or bottom; and, also, with the door or valve in the side for broken cobs, &c.; and, also, the cylindrical *hopper and spring in combination with the feeder*, all as herein described.

THOMAS D. BURRALL.

Letters Patent No. 8,840, dated March 30, 1852; antedated December 16, 1845.—*Improvement in Dredging Machines*.—I claim the shovels or scoops *h*, forming the bottoms of compartments in a proper frame, and moving at one end on a hinge or similar contrivance, the other end being lowered to cause the scoop, as the frame is moved along, to collect the sand or mud, or other material operated on, and retain the same by suitable mechanical means, operating to lift the scoop and close the bottom, as described and shown.

JAMES HAMILTON.

Letters Patent No. 4,299, dated December 6, 1845.—Reissue No. 91, dated April 24, 1847.—Again Reissued, No. 99, dated July 31, 1847.—*Improvement in Cooking Stoves*.—I claim making the top of the metal ovens of cooking stoves of fire brick or other earthy substance when this is combined with a stove in which the products of combustion from the fire chamber pass first over the top of the oven, substantially as described, whereby the heat in the oven is equalized and the vapors or gases evolved in the oven are absorbed and carried off as described.

I also claim the arrangement of parts by which I supply the fire with heated air, said arrangement consisting mainly of the apertures in the front plate or doors and the plate *s*, in front of which the air must descend on its passage to the grate bars; the heating of the admitted air has been attempted under other arrangements, and I limit myself under this particular therefore to the special combination of parts by which I attain this end.

And, finally, I claim making the plate of that part of the oven which extends under the grate in the manner substantially as described, and connected with a receptacle for ashes at the bottom for the purpose of discharging the ashes that fall from the grate as described, whereby I am enabled to heat this part of the oven more effectually and equally and to avoid the burning out of the grates, as described.

SAMUEL PIERCE.

Letters Patent No. 4,321, dated December 20, 1845.—*Improvement in Machinery for Dressing Combs*.—I claim the manner in which I have arranged the apparatus for carrying the plates between the cylinders, consisting of the box *B*, the slide *N*, with its piece and the wheel *C*, connected by the rod *S* to the slide *N*, and to the shaft *D* by the small wheel *c i* and the gripe *A A*, heretofore described and seen in Fig. 1, and operating substantially as before stated. I claim the manner in which I have arranged the top bed *G*, whereby plates varying in thickness are equally scraped, not reducing the thickness of one more than another, said arrangement consisting of the spring *S* and piece *S i*, as seen in Fig. 5, and the position of said bed with its space *A B*, as seen in Fig. 7. I claim the manner in which I have arranged the chisels for scraping, smoothing, and shaping the plate, said arrangements consisting of the levers *J* and *Ja*, the cross pieces *L L*, and the apparatus for securing the chisels to the cross pieces seen at *P i*, Fig. 8, and for securing the cross pieces to the levers as seen at *n n n n*, Fig. 1, or at *H H*, Fig. 8, and for the movement up or down for the same by the screws as seen at *L i L i*, Fig. 8. I claim the manner in which I arranged the box *F* to receive the plates from the top bed *G*, consisting of the spring *Z* on the under side of the lid seen in Fig. 6, and the bed with its tapering rod *X i* clasped by the springs *r r* under the said box, operating as before stated. And I hereby declare that I do not intend by these claims to limit myself to the exact form or arrangement of the respective parts and combinations as herein described and represented, but to vary these as I may deem expedient, while such arrangements and combinations are substantially the same with those herein fully made known.

CALVIN B. ROGERS.

Letters Patent No. 4,331, dated December 26, 1845.—Reissue No. 122, dated August 15, 1848.—*Improvement in Steam Boilers*.—I claim the employment of vertical or nearly vertical water tubes for steam boilers or generators that open into water chambers at top and bottom, which water chambers are connected together by a surrounding jacket or water space made singly or in sections to admit of the free circulation of the water, which rising in the tubes by the effect of the heat will descend in the surrounding jacket or external water space or spaces, and thus by this circulation carry off the heat from the tubes and prevent them from overheating as described when this is combined with the fire chamber placed at the side of the boiler and outside of the series of tubes substantially as described whereby the tubes are prevented from being overheated and unequally expanded to an injurious extent and the water kept cooler in the jacket than in the series of tubes, as described.

I also claim as my invention, in combination with vertical or nearly vertical tubes and surrounding water space or spaces, the employment of a fire chamber outside of the series of tubes and so arranged and located substantially as described as to apply the most intense

heat at their upper ends and the reduced heat towards their lower ends, substantially as herein described, whereby a greater circulation and evaporation is obtained with a given amount of fuel than by any other plan known to me, thereby not only economizing fuel but effectually preventing the incrustation of the tubes by the deposit of mineral and other solid matter, as described.

I also claim as my invention the employment of a diaphragm or partition in the flue space between the series of tubes surrounded by the water space or spaces, and in combination therewith to divide the same into two parts that the products of combustion after passing around the upper end of the tubes may pass around their lower ends substantially as described, and thus more effectually expose the upper end of the tubes to a more intense heat than their lower, as described.

And I also claim the making of the bottom of the boiler of a conical or dished form, with a mud or blow off valve in the lowest part of the concavity, in combination with the vertical tubes communicating with the bottom in the manner herein described to permit the deposit of the sediment, there being a water space surrounding them to induce circulation of the water up the tubes towards the mud or blow off valve, as herein described.

JAMES MONTGOMERY.

## DISCLAIMERS ENTERED DURING THE YEAR 1859.

Letters Patent No. 15,957, dated October 21, 1856.—Reissue No. 654, dated February 1, 1859.—*Improvement in Devices for Putting up Caustic Alkalies.*—Your petitioners therefore hereby enter their disclaimer to so much of the claim in the aforesaid specification, forming part of said reissued patent as might be construed as claiming as the invention of the said George Thompson, the putting up of small sticks or pieces of hydrate of soda or hydrate of potassa in closely sealed or stoppered glass bottles for surgical, medical, and scientific purposes.

GEORGE THOMPSON.

T. G. HOLLINGSWORTH,

*President Pennsylvania Salt Manufacturing Company.*

GEORGE THOMPSON,

*Secretary Pennsylvania Salt Manufacturing Company.*

Letters Patent No. 4,141, dated August 9, 1845.—*Improvement in Gas Burners.*—I disclaim the “bell shape or mouth of the lower part of the inner case of said burner.”

WILLIAM BLAKE.

Letters Patent No. 18,259, dated September 22, 1857.—*Improved Nut Machine.*—I disclaim as follows, to wit: the use of the preparatory punch marked *b*, on the drafts annexed to said patent for the purpose of forcing the core of the blank into the body of the nut or washer, and thereby saving the scrap produced by punching.

The use of the punch marked *J* on said drafts in finishing the puncher of the nut and washer.

The combination of the two punches *b* and *J*, operating on opposite sides of the nut or washer, that combination as set forth in the specification and shown by the drafts attached to said patent being a mere colorable change from the combination in which the punches operating on opposite sides are used in a line.

The use of said preparatory punch *b*, and the punch or mandrel *J*, for the purpose aforesaid and in the position aforesaid in the combination mentioned in said specifications.

The use of the spring in combination with the punch *b*, in order to retract said punch after the operation of punching is performed.

The use of the punch *b*, and the punch or mandrel *J*, in combination with each other and the dies *N* and *L* and counter die *K*, whereby a nut of definite thickness is formed by first partially punching the blank while joined to the bar, then separating the blank and completing the punching.

An improvement in the art of making metallic nuts by making them of definite thickness, not materially varying from that of the bar and so as to save the scrap produced by punching by forcing the core into the substance of the nut.

SAMUEL C. TATUM.

Letters Patent No. 17,534, dated June 9, 1857 —*Improved Nut Machine.*—I disclaim as

follows, to wit: The taper punch marked *b*, on the draft annexed to said patent or taper pointed mandrel marked *J* and a hollow plunger, combined and operating as described in said specification on opposite sides of the bar of iron so as to avoid waste from cores or burrs, and I acknowledge that punch is the proper name for the tool, and that the word mandrel is a mere colorable change therefrom, and that the taper pointed punch is a mere colorable change from the parallel sided punch; the spring *f* alone, or in combination with the hollow sleeve *K*, by which the sleeve *K* is forced up and made to accommodate itself to the thickness of the nut or washer.

In claiming the arrangement of the cams *C* and *G G* in their yoke or yokes, by which the plunger *L* and sleeve *K* are enabled to accommodate themselves to the increased thickness of the nut or washer produced by squaring or finishing its exterior.

The use of the taper punch *b*, to punch a taper hole through or nearly through the blank without forcing out any core.

The use of the mandrel *J* in entering the smallest portion of the hole formed by the punch *b*, and gradually enlarging it and passing entirely through it making it parallel and of the required size.

The employment of two punches entering the nut or washer from opposite sides, the taper form and side by side arrangement of the punch *b* and mandrel *J* being mere colorable changes from the parallel sided punches and the arrangement in line.

The employment of a taper punch *b* and a hollow plunger *L*, or its equivalent, and a taper pointed mandrel *J*, combined and arranged substantially as in said specification set forth.

An improvement in the art of making hot pressed nuts and washers by avoiding all waste from cores or burrs by forcing the same into the substance of the nut or washer.

SAMUEL C. TATUM.

Letters Patent No. 21,860, dated October 19, 1858.—*Improvement in Nut Machines*.—I disclaim as follows, to wit: The use of the punches marked *D* and *G*, on the drafts annexed to said patent in combination with each other operating in a line and on opposite sides of the nut or washer in order to incorporate most of the core with the bar or nut.

The use of the stationary punch marked *I* on said drafts, in combination with the other punches in order to give the nut or washer its final pressure and finish.

The use of the punch *D*, in combination with the die box *N e f g*, operating as set forth in said specifications as to embody the greatest portion of the wad or core in the nut or bar.

The arrangement of the punches *D G* and *I*, in combination with the dies *E* and *H*, and perforated bridge *N*, or equivalent devices, operating together substantially in the manner described in said specifications for the automatic and economical manufacture of hot pressed nuts.

An improvement in the art of making metallic nuts by causing most of the core or punching to be incorporated in the substance of the bar or nut.

SAMUEL C. TATUM.
