

C. A. NEALE.

22500487602

REPORT  
OF THE  
COMMISSIONER OF PATENTS  
FOR THE YEAR 1859.

---

ARTS AND MANUFACTURES.  
IN TWO VOLUMES.

---

VOLUME I.

WELLCOME INSTITUTE LIBRARY	
Coll.	WeIMOmec
Coll.	
No.	

IN THE HOUSE OF REPRESENTATIVES OF THE UNITED STATES,

June 12, 1860.

*Resolved*, That there be printed, in addition to the usual number of the Mechanical part of the Patent Office Report for 1859, ten thousand copies for the use of the Patent Office, and forty thousand for the use of the members of the House of Representatives.

Attest:

J. W. FORNEY, *Clerk*.

## DESCRIPTIONS AND ILLUSTRATIONS.

Invention or Discovery.	Name of Patentee.	No.	Text.		Plates.	
			Vol. I.	Vol. II.	Vol. I.	Vol. II.
<b>A.</b>						
Abdominal Supporter . . . . .	B. A. Grover . . . . .	24,630	472		371	
Abdominal Supporter . . . . .	A. B. Weaver . . . . .	25,597	609		535	
Acid, Phosphoric, and Phosphates, manufac- ture of.	F. A. Genth . . . . .	24,931	513		.....	
Acid, Sulphuric, making . . . . .	H. Holland . . . . .	26,588	753		.....	
Acids, Fatty, treatment of . . . . .	J. C. Appenzeller . . . . .	22,691	179		37	
Added, Noting the Sums of Numbers . . . . .	I. W. Arndt . . . . .	23,537	311		183	
Adding Machine . . . . .	C. Winter . . . . .	23,637	327		203	
Adding Machine . . . . .	J. T. Campbell . . . . .	24,990	522		430	
Adding Numbers, Instrument for . . . . .	J. R. Newbrough . . . . .	24,481	451		349	
Advertising . . . . .	E. Wiebé . . . . .	26,136	688		640	
Air, blowing uniform currents of . . . . .	J. Griffin . . . . .	23,084	241		97	
Air, supplying, to furnaces of boilers . . . . .	L. Brandt . . . . .	26,470	737		704	
Alarm Attachment for Tills . . . . .	E. B. White . . . . .	24,685	479		380	
Alarm, Money Drawer . . . . .	R. M. Campbell . . . . .	24,775	492		394	
Alcoholometer . . . . .	H. Guth . . . . .	24,556	461		359	
Alkalies, Caustic, manufacture of . . . . .	H. Pemberton . . . . .	22,888	212		69	
Alloys . . . . .	E. Martin . . . . .	25,206	554		.....	
Altitudes of the Sun, taking . . . . .	F. Yeiser . . . . .	22,913	215		73	
Amalgamator . . . . .	J. and E. W. Barker . . . . .	22,616	167		25	
Amalgamator . . . . .	A. M. Church . . . . .	22,704	181		39	
Amalgamator . . . . .	H. P. Russ . . . . .	23,313	275		137	
Amalgamator . . . . .	E. P. Cavannah . . . . .	23,881	364		252	
Amalgamator . . . . .	K. Hazen . . . . .	25,333	572		487	
Amalgamator . . . . .	F. Maxson . . . . .	25,840	645		581	
Amalgamator . . . . .	W. H. Howland . . . . .	25,933	658		599	
Amalgamator . . . . .	L. Eddleblute . . . . .	26,576	751		722	
Amalgamator, Gold . . . . .	J. N. Wyckoff and T. M. Fell . . . . .	24,902	509		415	
Amalgamator, Gold . . . . .	H. Brevoort . . . . .	25,242	559		472	
Ambrotypes, mounting . . . . .	J. S. McClure . . . . .	25,977	665		608	
Anchor Tripper . . . . .	T. L. Baylies . . . . .	23,654	330		206	
Animals, cleaning . . . . .	C. D. Wheeler . . . . .	26,313	713		674	
Anti-friction Boxes . . . . .	J. L. Dutton, sen . . . . .	26,483	738		706	
Apple Cutting and Coring Machine . . . . .	A. F. Ledbetter . . . . .	23,095	243		99	
Apple Parer . . . . .	R. P. Clark . . . . .	25,489	594		516	
Apple Parer, Corer, and Slicer . . . . .	J. I. Armfield . . . . .	26,464	736		702	
Apples, grinding . . . . .	A. Dean . . . . .	23,231	263		122	
Arm, Fore, Artificial . . . . .	B. F. Palmer . . . . .	22,575	160		18	
Arm and Hand, Artificial . . . . .	B. F. Palmer . . . . .	22,576	160		18	
Auger . . . . .	S. Wood . . . . .	25,990	667		610	
Auger . . . . .	N. B. Phelps . . . . .	26,613	756		726	
Auger, Earth Boring . . . . .	A. A. McMahan . . . . .	24,749	488		390	
Auger, Expanding . . . . .	C. Meyer . . . . .	23,381	285		151	
Auger for cutting round tenons . . . . .	G. Taylor and G. H. Burger . . . . .	25,289	565		479	
Auger, Hollow . . . . .	A. Wyckoff . . . . .	24,773	492		394	
Augers, Hollow, fastening cutters of . . . . .	W. A. Clark . . . . .	24,722	485		386	
Awl (Belt) and Punch . . . . .	W. J. Innis . . . . .	26,107	684		634	
Awnings . . . . .	S. Chace . . . . .	25,723	628		557	
Axles, Compound Railroad . . . . .	H. J. Lombaert . . . . .	24,315	426		324	
Axles, preventing friction on . . . . .	Theo. S. and Thos. S. Minniss . . . . .	22,971	224		81	
Axles, Railroad Car . . . . .	E. J. Mallett . . . . .	26,194	697		653	
Axles or Shafts . . . . .	G. Foster . . . . .	26,425	730		695	
Axle-boxes for railroad cars . . . . .	L. Stevens . . . . .	24,245	416		313	
Axle-boxes for railroad cars, &c . . . . .	P. F. Aerts . . . . .	24,914	510		418	
<b>B.</b>						
Bag, Carpet . . . . .	J. M. Matthews . . . . .	23,596	320		194	
Bags, Paper, making . . . . .	W. Goodale . . . . .	24,734	486		388	
Bags, Paper, making . . . . .	W. Goodale . . . . .	25,191	552		462	
Bait for catching fish . . . . .	R. Haskell . . . . .	25,507	596		519	
Balloon . . . . .	J. P. Gage . . . . .	23,163	253		109	
Balls, Ninepin . . . . .	J. Tuggart . . . . .	24,893	508		414	
Band, Metallic Cotton . . . . .	R. Lewis . . . . .	23,474	301		172	

Invention or Discovery.	Name of Patentee.	No.	Text.	Plates.
			Vol. I.	Vol. II.
Band, Metallic Cotton.....	R. Lewis.....	23,475	301	172
Band, Metallic, for baling.....	G. Brodie.....	23,291	272	133
Band for binding grain, hemp, &c.....	A. Ralston.....	23,496	304	176
Bands, fastening, on bales and packages.....	H. Knowles.....	23,092	243	98
Bands, Iron, fastening, on cotton bales.....	C. G. Wells.....	23,518	307	180
Bands, Iron, securing, on cotton bales.....	C. W. Pyle.....	25,584	607	532
Bandbox.....	G. H. Dickerman.....	22,493	147	3
Banjos.....	S. F. Van Hagan.....	25,872	649	586
Bank Notes, printing.....	A. Tichenor.....	24,341	429	327
Bark, shaving.....	M. Winger.....	26,317	713	675

Fire Box for locomotive engines .....	R. Greenwood.....	25,009	525	433
Fireplaces.....	G. A. Clark.....	25,629	614	540
Fire Plug.....	J. L. Lowry.....	23,034	234	90
Fire-escape .....	J. M. Hancock.....	23,462	299	170
Fire and Ventilating Apparatus for ships .....	J. W. Richards .....	22,827	202	59
Fires, extinguishing, in steam vessels.....	W. Arthur.....	23,435	294	163
Fireman's Protector.....	C. D. Woodruff.....	23,212	260	118
Fishing Reel.....	W. Billingshurst.....	24,987	522	429
Fishing Rods, Guide Rings for.....	H. Pritchard.....	25,693	623	551
Flail Cap.....	T. J. Hubbard .....	22,557	158	16
Flax, scutching.....	W. C. McBride.....	22,738	186	45
Flock, cleaning and opening.....	W. C. Geer.....	25,895	652	591
Floor, Fire-proof.....	J. B. Cornell.....	22,939	219	76
Flour, packing.....	J. Bartholomew .....	25,940	659	600
Flour, &c., bolting.....	W. H. Collins .....	25,884	651	589
Flour Bolt.....	E. and A. H. Nordyke.....	24,656	476	376
Flour Bolt.....	J. M. Clark.....	24,857	503	409
Flour Bolt.....	E. Graham and I. N. Patton.....	25,256	561	474

Invention or Discovery.	Name of Patentee.	No.	Text.		Plates.	
			Vol. I.	Vol. II.	Vol. I.	Vol. II.
Flour Mills, Friction Bolt for .....	L. S. Reynolds.....	23,394	287		154	
Flour Packers .....	S. Waggart.....	24,963	517		425	
Fluid, Burning .....	J. Griffin .....	23,167	254			
Fluid, Burning .....	W. Wilber .....	23,210	260			
Fluid, Compound Illuminating .....	N. A. Dyer and J. F. Augustus...	25,362	576			
Fluid, Writing .....	S. W. Eells.....	25,184	551			
Fluids, compressing Elastic .....	J. Jameson .....	22,956	221		79	
Fluids, raising and forcing.....	M. Alden.....	22,773	192		51	
Fluid Measurer.....	J. L. Perry and M. Burt.....	23,701	337		215	
Fluxes for puddling Iron .....	J. Burnish, J. Talbot, and T. W. Yardley.	22,779	194			
Fogs, Direction of Sounds in .....	B. R. Smith .....	23,718	340		218	
Fore Iron for the use of shoemakers .....	S. A. Shurtleff.....	26,129	687		639	
Forging Machine .....	E. Schlanker .....	23,400	288		155	
Fork, Carving .....	H. Garbanati .....	26,579	751		722	
Fork, Flesh, and Skimmer .....	C. B. Bristol.....	24,716	484		385	
Fork, Pitch.....	J. Herald and C. B. Tompkins....	26,354	719		682	
Framing Square .....	W. Ripley.....	22,585	162		20	
Freezing Cream .....	S. W. Smith.....	23,271	269		129	
Frog, Railroad.....	D. D. Lewis .....	24,034	385		278	
Frog, Railroad, Elastic.....	G. P. Sandborn and W. Mansfield.	24,664	477		377	
Fruit, Packing.....	R. Law.....	24,779	493		395	
Fruits, Extracts of.....	R. Carpenter.....	25,384	579			
Fuel, Artificial .....	H. A. Achereau.....	23,005	230		86	
Fuel, Artificial .....	M. L. Keen.....	25,124	542		450	
Fuel, Artificial .....	H. Wilverth .....	26,541	746			
Furnace.....	S. Pierce.....	22,670	175		33	
Furnace.....	J. H. Duhme .....	24,547	460		358	
Furnace.....	E. B. Cherevy .....	24,599	467		367	
Furnace.....	L. Solomon .....	24,828	499		404	
Furnace.....	J. I. Vinton and E. John .....	25,694	623		552	
Furnace.....	B. W. Dunklee.....	25,729	628		558	
Furnace, Bagasse.....	L. Tregre.....	24,675	478		379	
Furnace, Bagasse.....	C. A. Desobry .....	25,322	570		485	
Furnace, Bagasse.....	A. J. Chapman .....	26,162	692		647	
Furnace for dental purposes .....	E. A. L. Roberts.....	24,823	499		403	
Furnace, Distilling Zinc .....	S. Wetherill.....	22,758	189		48	
Furnace for heating buildings.....	B. W. Dunklee.....	23,907	367		256	
Furnace for heating tire.....	M. Batel .....	23,653	330		206	
Furnace, Hot Air .....	I. H. Hobbs, A. W. Rand, and G. W. Sellers.	25,735	629		559	
Furnace, Hot Air .....	J. Whitehill.....	26,064	677		625	
Furnace for making iron direct from ore.....	J. M. Quimby, A. H. Brown, G. N. Benton, and J. Criswell.	25,044	530		438	
Furnace for locomotive engines.....	R. Gill and G. W. Grier.....	24,867	505		410	
Furnace for smelting iron.....	S. M. Fales.....	22,861	207		65	
Furnace for smelting iron.....	R. W. Seivier.....	24,525	457		355	
Furnace for smelting zinc ores.....	J. and I. Halbash .....	25,267	562		476	
Furnace for steam boilers .....	W. D. Ballard .....	25,713	626		555	
Furnace for steam boilers .....	E. H. Jones and R. Stevenson....	25,901	653		592	
Furnace for treating pyritous ores .....	J. Fretz .....	25,500	595		518	
Furnace and Stove.....	C. B. Sawyer.....	24,332	428		326	
Furnace and Ventilator .....	C. B. Sawyer.....	25,279	564		477	
Furnaces, Bridge Walls of Boiler.....	W. G. Hamilton .....	22,530	154		11	
Furnaces, Door Frame for.....	P. A. Sabbaton .....	24,493	453		350	
Furnaces, increasing the draft of .....	J. B. Martin .....	22,814	200		57	
Furnaces, supplying sawdust to .....	H. Doty .....	26,169	694		648	
Furnaces, supplying, with hot air.....	C. Fletcher .....	25,159	547		457	
Furniture, Cabinet.....	J. D. Browne.....	25,089	537		445	
Furniture, Triangular Stand for.....	T. W. Currier.....	23,013	231		87	
G.						
Garments, securing, to hooks.....	G. Woodward and F. S. Hathaway	22,996	228		85	
Gas, Apparatus for Generating .....	M. P. Coons.....	23,828	536		240	
Gas, Apparatus for Generating Illuminating .....	S. Nolan .....	25,275	563		477	
Gas, Apparatus for Generating Illuminating .....	M. P. Coons.....	26,163	693		647	
Gas, lighting, by electricity.....	A. Wilson.....	25,167	549		458	
Gas, lighting, by galvanic battery .....	W. W. Hopkins.....	22,952	221		78	
Gas, manufacture of .....	C. N. Tyler.....	24,506	454		352	
Gas, manufacture of .....	L. D. Gale.....	26,028	672		618	
Gas, manufacture of .....	L. D. Gale.....	26,030	672		618	
Gas from Peat .....	J. B. Hyde .....	25,866	648		585	
Gas, Purifying .....	A. Dickinson .....	24,543	459		357	
Gas, Purifying .....	H. Guild.....	25,566	605		530	
Gas from Rosin .....	A. Schmidt.....	25,610	611		537	
Gas from Wood.....	L. R. Breisach.....	25,316	569		484	
Gas from Wood.....	A. Schmidt.....	25,609	611		536	
Gas Apparatus, Portable.....	J. H. Miller and S. Albright.....	26,042	674		620	
Gas Burner .....	A. Ostrander.....	22,574	160		18	
Gas Burner.....	W. Wright .....	22,609	166		23	

Invention or Discovery.	Name of Patentee.	No.	Text.	Plates.
			Vol. I.	Vol. II.
Gas Burner.....	W. Blake.....	23,441	295	164
Gas Burner.....	J. Gilfillan.....	24,932	513	421
Gas Burner.....	D. H. Solliday.....	25,372	577	494
Gas Burner.....	J. Stevens and J. Johnson.....	25,591	608	534
Gas Burner.....	H. K. Symmes.....	25,686	622	550
Gas Burner.....	S. L. Cole.....	26,255	705	664
Gas Burner, Argand.....	H. Monier.....	25,209	555	465

Steam Boiler.....	S. H. Head.....	26,002	668	612
Steam Boiler.....	E. Crane.....	26,021	671	616
Steam Boiler.....	P. N. Burke.....	26,333	716	678
Steam Boiler.....	B. F. Campbell.....	26,334	716	678
Steam Boiler Furnace.....	J. Amory.....	23,650	329	205
Steam Boilers, blowing off.....	J. H. Washington.....	22,757	189	48
Steam Boilers, Feed Apparatus for.....	T. Armitage.....	25,617	612	538
Steam Boilers, Feed Water Apparatus for.....	J. B. Thompson.....	25,290	565	479
Steam Boilers, Feed Water Apparatus for.....	W. Barnes.....	25,360	575	492
Steam Boilers, Feed Water Apparatus for.....	W. P. Curry.....	25,811	640	575
Steam Boilers, Foam Collector for.....	T. G. Gardner.....	25,328	571	486
Steam Boilers, heating.....	D. Hess.....	24,637	473	372
Steam Boilers, heating feed water of.....	S. Lamon and W. S. Gaskill.....	23,588	319	192
Steam Boilers, heating feed water of.....	J. T. Brooks.....	24,094	394	289

Invention or Discovery.	Name of Patentee.	No.	Text.		Plates.	
			Vol. I.	Vol. II.	Vol. I.	Vol. II.
Steam Boilers, Low Water Alarm for.....	S. Dustin.....	23,761	346		227	
Steam Boilers, purifying the feed water of.....	J. Guhmann.....	23,244	265		124	
Steam Boilers, skinning the water in.....	A. M. Sprague.....	23,320	276		138	
Steam Boilers, Safety Apparatus for.....	L. E. Lincoln.....	25,655	618		545	
Steam Boilers, supply of water to.....	I. L. Colman.....	23,229	233		122	
Steam Boilers, Water Indicator for.....	J. L. Frisbie.....	24,017	333		275	
Steam Boilers, Water Indicator for.....	G. Lutz.....	25,516	597		521	
Steam Engine.....	G. Sandford.....	22,981	226		740	
Steam Engine.....	J. A. Conover.....	23,450	297		167	
Steam Engine.....	J. Black.....	23,524	308		181	
Steam Engine.....	E. Lyneh.....	23,594	320		194	
Steam Engine.....	W. W. Burgoyne.....	23,754	345		226	
Steam Engine.....	G. F. Lombard.....	23,992	379		271	
Steam Engine.....	J. A. Whipple.....	23,993	379		271	
Steam Engine.....	G. H. Corliss.....	24,618	470		369	
Steam Engine.....	H. Bertolet.....	25,480	592		514	
Steam Engine.....	D. Barnum.....	25,798	639		572	
Steam Engine.....	J. Cumming.....	25,955	662		603	
Steam Engine, Condensing.....	J. Sutton.....	24,246	416		313	
Steam Engine for land carriages.....	R. E. Rogers.....	26,619	756		728	
Steam Engine, Marine.....	W. Kennish, jr.....	22,736	186		44	
Steam Engine, Oscillating.....	J. A. Reed.....	24,821	499		403	
Steam Engine, Rotary.....	H. B. Thomas.....	22,832	203		60	
Steam Engine, Rotary.....	M. Smith.....	23,956	374		265	
Steam Engine, Rotary.....	J. I. Montjoy and J. B. Sawyer.....	25,133	543		451	
Steam Engine, Rotary.....	L. Johnson.....	26,190	697		652	
Steam Engines, heating the feed water of.....	J. M. White.....	25,296	566		480	
Steam Engines, oiling cylinders, &c., of.....	C. A. Stebbens.....	24,606	468		368	
Steam Engines, regulating draft of.....	W. S. Hudson.....	22,808	199		56	
Steam Engines, Water Heater for.....	J. Speers.....	26,299	711		672	
Steam Generator.....	A. B. Latta.....	23,589	319		192	
Steam Generator.....	M. Battel.....	25,085	537		445	
Steam Generator.....	W. M. Storm.....	25,147	545		454	
Steam Generator, Portable.....	W. C. Grimes.....	23,528	309		182	
Steam Pressure Indicator, Alarm.....	S. W. Brown.....	25,486	593		515	
Steam Pressure Regulator.....	A. P. Pitkin.....	24,402	439		337	
Steam Radiator.....	C. A. Wilson.....	24,897	508		414	
Steam Trap.....	E. T. Jenkins and F. P. Polley.....	25,510	597		520	
Steam Vessels, construction of.....	J. Montgomery.....	23,105	245		100	
Steam Vessels, extinguishing fires in.....	W. Arthur.....	23,435	294		163	
Steamer, Side Wheel.....	A. McD. Sprague.....	23,507	306		178	
Steel, manufacture of.....	F. A. Lohage.....	22,687	178		.....	
Steel, manufacture of.....	F. A. Lohage.....	23,139	250		.....	
Steel, Cast, manufacturing tools from.....	P. G. Gardiner.....	22,864	205		.....	
Steel, Cast, manufacturing tools from.....	P. G. Gardiner.....	22,865	208		.....	
Steels.....	T. J. Mayall.....	26,277	708		668	
Steels for sharpening knives, making.....	S. Lee.....	23,982	377		269	
Steering Apparatus.....	G. W. Robinson.....	23,265	268		128	
Steering Apparatus.....	W. Goodsoe.....	24,351	431		329	
Steering Apparatus.....	H. Higgins.....	25,734	629		559	
Steering Apparatus.....	J. S. Lake.....	25,836	644		580	
Steering Apparatus.....	N. Snow, jr.....	25,983	666		609	
Steering Apparatus for barges.....	M. Lytle.....	25,429	585		506	
Steering Apparatus, Ship's.....	W. Beers.....	23,150	251		107	
Steering Apparatus, Ship's.....	D. J. Wilcoxon.....	23,534	310		183	
Stencil, Changeable.....	J. Bigelow.....	25,481	593		514	
Stereoscope.....	W. Loyd.....	23,257	267		127	
Stereoscopic Apparatus.....	J. Lee.....	22,838	204		61	
Stereoscopic Apparatus.....	T. C. Roche.....	26,525	744		713	
Stereoscopic Case.....	A. Beckers.....	23,543	312		184	
Stereoscopic Instruments.....	A. Beckers.....	24,855	503		408	
Stereoscopic Pictures, Cases for.....	H. Glosser.....	24,115	397		292	
Stereoscopic Pictures, displaying.....	J. Beckel.....	22,695	180		37	
Stereoscopic Pictures, exhibiting.....	A. Beckers.....	23,438	295		164	
Stereoscopic Pictures, exhibiting.....	S. Perry.....	24,327	427		325	
Stereotype Plates, casting.....	W. Blanchard.....	23,009	230		87	
Stereotype Plates, punching.....	D. B. Ray.....	24,662	476		377	
Sticks, tapering.....	H. S. Hall, A. D. Hunt, and C. J. Winchester.....	23,570	316		189	
Stirrup.....	W. J. Hamersley.....	23,572	316		189	
Stitches, Single Thread.....	J. S. McCurdy.....	23,984	378		270	
Stone, Artificial.....	I. L. G. Ward.....	24,769	491		.....	
Stone, breaking, for roads.....	T. Adams.....	24,783	493		395	
Stone, breaking, for roads.....	I. Scoville.....	25,371	577		494	
Stone, dressing.....	H. Chancey.....	25,093	538		446	
Stone, sawing.....	A. T. Merriman.....	24,478	450		348	
Stones, &c., from clay, separating.....	C. Bamberg and R. Blaser.....	23,888	365		253	
Stones, Machine for holding.....	E. B. Knight.....	25,268	563		476	
Stone Cutting Machine.....	G. Morgan.....	22,569	160		17	
Stool, Camp.....	E. B. Belknap.....	25,555	603		528	
Stove.....	P. Shreiner.....	22,754	189		47

Thermometric Regulator for heating .....	L. W. Leeds and C. Vaux .....	25,514	597	520
Thermostat .....	C. A. Wilson .....	25,860	647	584
Thermostat for steam boilers .....	O. M. Stillman and S. Wilcox, jr. ....	23,747	344	224
Thills, attaching, to axles .....	G. Kenny .....	22,604	165	22
Thills, attaching, to axles .....	F. L. Kidder .....	23,173	255	111
Thills, attaching, to axles .....	J. Miller .....	24,137	400	296
Thills, attaching, to vehicles .....	R. B. Prindle .....	22,672	176	34
Thills, attaching, to vehicles .....	D. Bly .....	23,549	313	186
Thills, attaching, to vehicles .....	E. Duehamp .....	25,103	539	447
Thills, Wagon, attaching harness breeching to ..	A. Parker .....	23,854	360	246
Thimble .....	J. C. R. Steirley .....	25,450	588	508
Thimbles, manufacture of .....	P. S. Bishop .....	25,482	593	514
Thread, webbing single strands of .....	M. Celerier .....	24,615	469	369
Thread, winding .....	L. Dimock .....	25,181	551	461
Thread, winding, on spools .....	H. Conant .....	26,415	729	693
Thread, winding skeins of .....	A. T. Ring .....	24,782	493	395
Threshing Machine .....	J. B. Ford, A. Sullivan, & A. Gregg ..	22,718	183	41
Threshing Machine .....	J. J. Sigler .....	23,647	329	204
Threshing Machine .....	J. R. Moffitt .....	24,138	400	296
Threshing Machine .....	J. I. Rollow .....	24,704	482	383
Threshing Machine .....	J. H. Siddall .....	24,767	491	393
Threshing Machine .....	J. Rohman .....	25,527	599	523
Threshing Machine .....	D. A. Willbanks .....	25,389	725	688
Throistle Frames, regulating the twist in .....	J. Smith .....	22,899	213	70
Tickets, Railroad and other, printing .....	R. M. Hoe .....	23,172	255	111
Ticket Holder for railroads, etc .....	C. Taylor .....	25,226	557	469
Ticket Holder, Travellers' .....	S. T. McDougall .....	25,750	632	562
Ties for cotton bales .....	E. Garrett .....	24,112	396	292
Ties, Iron, for cotton bales .....	J. Nuttall .....	23,940	371	262
Ties, Iron, for cotton bales .....	W. Boyd .....	25,240	559	472
Tile, Drain, laying .....	B. B. Briggs .....	25,624	613	539
Tile Machine .....	G. S. Tiffany .....	25,687	622	550
Tile Machine, Drain .....	J. Daines .....	24,379	435	333
Tin Foil, manufacture of .....	W. W. Huse .....	23,088	242	.....
Tin Folding Machine .....	C. H. Raymond .....	25,369	577	494
Tinman's Machine .....	C. H. Raymond .....	25,278	564	740
Tire, bending .....	W. Patterson .....	23,388	286	153
Tire, Cast-iron, for railroad wheels .....	L. B. Tyng .....	24,678	479	379
Tire, Tools for handling .....	J. and H. Brubaker .....	26,250	705	664
Tire, upsetting .....	C. L. Crowell and R. Smith .....	24,009	382	274
Tire, Wagon, bending .....	W. and I. H. Mosher .....	25,346	574	490
Tire, Wheel, rolling .....	N. Washburn .....	23,414	291	158
Tobacco, Plug Chewing, preparing .....	W. J. Van Horn and W. Alexander ..	26,632	758	730
Tobacco, preparations of .....	G. Jaques .....	26,594	753	.....
Tobacco, preparing, for pressing .....	E. S. Collins and T. N. Read .....	25,557	604	528
Tobacco, squeezing and straightening .....	M. D. Elson .....	22,944	220	77
Tobacco Stems, coloring and curing .....	B. Payn .....	22,668	175	.....
Tongs, Ice .....	J. Tyler .....	22,991	227	84
Tongs, Pipe .....	J. R. Brown .....	24,927	512	420
Tonguing and Grooving Machine .....	H. H. Baker .....	25,313	569	484
Top, Spinning .....	F. Milward .....	24,430	443	341
Towel Rack .....	R. Maxwell .....	25,130	543	451
Toy, Roeking .....	J. A. Crandall .....	24,008	382	273
Toys, Elastic .....	L. P. Porter .....	23,001	229	86
Trace Fastener .....	D. H. Hull .....	24,462	448	345
Trace Fastener .....	S. R. Atkins and D. H. Hull .....	24,515	455	354

Invention or Discovery.	Name of Patentee.	No.	Text.	Plates.
			Vol. I.	Vol. II.
Trace Fastenings .....	A. Zink .....	23,523	308	181
Trace Trimmer .....	A. Stempel .....	25,706	625	554
Tram Staff for facing mill stones .....	T. Brown .....	23,074	240	96
Trap, Animal .....	A. S. Blake .....	23,750	344	225
Trap, Animal .....	H. S. North and J. O. Couch .....	24,573	463	362
Trap, Animal .....	L. Wetmore .....	24,771	491	393
Trap, Animal .....	Z. Swope .....	25,224	557	469
Trap, Fish .....	R. Gray .....	22,644	171	29
Trap, Fish .....	D. Bowman .....	23,154	252	108
Trap, Fly .....	R. Shaler .....	22,840	204	61
Trap, Fly .....	S. W. Smith and H. Bigelow .....	22,986	226	84
Trap, Fly .....	E. D. Blakeman .....	23,422	292	160
Trap, Fly .....	I. S. Clough and S. R. Burrell .....	24,375	435	333
Trap, Fly .....	A. Eames .....	25,961	662	604
Trap, Fly .....	W. Elwell .....	25,997	668	611
Trap, Rat .....	H. Gortner .....	23,917	368	258
Trap, Rat .....	J. Borton .....	24,715	484	385
Trap, Rat .....	E. H. Crane .....	25,179	550	461
Trap, Rat .....	S. S. Henderson .....	26,495	740	707
Trap, Water .....	J. A. Lowe .....	26,506	741	709
Traps, Water, moulding .....	J. A. Lowe .....	25,572	606	531
Tray, Butler's .....	W. Hoffman .....	26,432	731	696
Treadle Stand .....	H. C. Spalding .....	23,048	236	92
Tread Power, moving .....	L. Koch .....	25,903	653	593
Treecing Sticks .....	L. L. Pollard .....	23,606	322	196
Trees, girdling and felling .....	A. P. Torrence .....	26,385	724	688
Trip Hammer .....	B. Hotchkiss .....	24,428	443	341
Trip Hammer, Foot .....	C. V. Statler and G. W. Wilson .....	22,589	163	20
Troughs, Wooden, manufacture of .....	S. F. Field .....	22,792	196	54
Trucks for Railroad Cars .....	T. E. Roberts .....	25,139	544	452
Trunk .....	H. Clifton .....	23,156	252	108
Trunk .....	M. Ludlum .....	24,648	475	374
Trunk .....	J. Parker .....	25,347	574	490

REPORT  
OF THE  
COMMISSIONER OF PATENTS  
FOR THE YEAR 1859.

---

UNITED STATES PATENT OFFICE,  
*January 26, 1860.*

SIR: In compliance with the fourteenth section of the act entitled "An act in addition to the act to promote the progress of science and useful arts," approved March 3, 1837, I have the honor to submit the following report of the operations of this office during the year terminating the 31st of December, 1859.

WILLIAM D. BISHOP,  
*Commissioner.*

No. 1.

Number of applications for patents during the year 1859.....	6,225
Number of patents granted, including designs, reissues, and additional improvements.....	4,538
Number of caveats filed.....	1,097
Number of applications for extension of patents.....	41
Number of patents extended.....	32
Number of patents expired 31st December, 1859.....	563

Of the patents granted there were—

To citizens of the United States.....	4,491
To subjects of Great Britain.....	23
To subjects of the French empire.....	16
To subjects of other foreign governments .....	8

The patents issued to citizens of the United States were distributed among the several States, Territories, &c., as follows:

New York.....	1,237
Pennsylvania.....	532
Massachusetts.....	492
Ohio.....	390
Connecticut.....	256
Illinois.....	206
Indiana.....	142
New Jersey.....	119
Maryland.....	116
Rhode Island.....	85
Wisconsin.....	71
Virginia.....	65
New Hampshire.....	65
Michigan.....	64
Vermont.....	63
Missouri.....	63
Georgia.....	58
District of Columbia.....	58
Maine.....	51
Louisiana.....	51
California.....	43
Kentucky.....	41
Iowa.....	37
Tennessee.....	31
Texas.....	29
North Carolina.....	26
Alabama.....	26
Mississippi.....	25
South Carolina.....	15
Delaware.....	12
Arkansas.....	5
Minnesota.....	5
Florida.....	4
Oregon.....	1
Washington Territory.....	1
United States army.....	4
United States navy.....	2
Total.....	<u>4,491</u>

## No. 2.

*Statement of money received at the Patent Office during the year 1859.*

Received on applications for patents, reissues, additional improvements, extensions, caveats, disclaimers, and appeals.....	\$228,864 00
Received for copies, and for recording assignments.....	17,078 15
Total.....	<u>245,942 15</u>

No. 3.

*Statement of expenditures from the patent fund during the year 1859.*

For salaries.....	\$93,242 36
Temporary clerks.....	43,475 25
Contingent expenses.....	41,561 48
Payments to judges in appeal cases.....	875 00
Refunding money paid into the treasury by mistake	391 00
Refunding money on withdrawals.....	30,733 32
	<hr/>
Total.....	210,278 41
	<hr/> <hr/>

No. 4.

*Statement of the condition of the patent fund.*

Amount to the credit of the patent fund 1st January, 1859.	\$50,241 88
Amount paid in during the year.....	245,942 15
	<hr/>
Total .....	296,184 03
Deduct the amount of expenditures during the year.....	210,278 41
	<hr/>
Which leaves in the treasury, 1st January, 1860, the sum of.....	85,905 62
	<hr/> <hr/>

No. 5.

*Table exhibiting the business of the office for seventeen years ending December 31, 1859.*

Years.	Applications filed.	Caveats filed.	Patents issued.	Cash received.	Cash expended.
1843.....	819	315	531	\$35,315 81	\$30,776 96
1844.....	1,045	380	502	42,509 26	36,344 73

1859.....	6,225	1,097	4,538	245,942 15	210,278 41

The above statement of the transactions of the Patent Office during the year 1859 affords a gratifying indication of the advancement of our country in the arts of civilized life, and demonstrates the wisdom of Congress in enacting laws to protect the inventor in the enjoyment of the fruits of his labor. The patent laws of this country are based upon the idea that, if the inventor is afforded a reasonable protection for his invention, his energies and talents will be constantly exerted in devising something new and useful to the public.

These laws have answered, to a great extent, the purposes for which they were intended; but experience has proved that they are yet defective in many respects.

The necessity of further legislation, on the part of Congress, for the purpose of remedying these defects, has been urged by my predecessors for the last five years. Congress, however, has failed to afford the remedies so urgently desired. Notwithstanding this, I deem it my duty again to call its attention to this subject, in the hope that the still greater necessity which now exists for further legislation, and the important bearing which the patent laws now have upon all sections of the country, will prove sufficient to engage its immediate attention.

Under existing laws, no provision is made for securing the testimony of witnesses in contested cases pending before this office. As a natural consequence of this, cases are frequently decided involving thousands and even hundreds of thousands of dollars upon the testimony of merely voluntary witnesses. Many persons whose testimony is important in such cases, well knowing that there is no law by which they can be compelled to testify, either decline to appear as witnesses at all, or govern their action according to the amount of money which may be offered by the parties in interest. The result of this is, that in such cases the poor are completely in the power of the rich, the weak in the hands of the strong. This is not only repugnant to the great principle of equality upon which our government is based, but is at war with every principle of justice and equity.

There are many other alterations and amendments to the present patent laws required in order to adapt them to the wants and necessities of inventors and the public. These have been so frequently alluded to by my predecessors, in their annual reports, and so urgently recommended by them to the favorable consideration of Congress, that I deem it unnecessary to do anything more than to indorse the recommendation made by them.

The practice of the office, however, has suggested one or two additional features which have not heretofore been brought to the attention of Congress, but which deserve serious consideration at their hand. Under the eighth section of the act of July 4, 1836, the Commissioner is required, whenever an application is made for a patent which would interfere with any other application already pending, or with any unexpired patent already granted, to declare an interference between the parties in order to establish the question of priority of invention. It has been held by the judges, on appeal, and is now held by this office, that he is the first and original inventor, within the meaning of the patent law, who first conceived the idea of the invention and first gave such an expression to that idea, either verbally or in any other manner

as would enable any person skilled in the art to which such invention appertains, to construct therefrom a working model or machine.

Scarcely a patent is granted which proves profitable to the inventor and important to the public but that, under this section of the law, is brought into interference with subsequent applications. Thus, not only the first patentee, but all those who have purchased rights under him, on the strength of letters patent issued by the United States, are liable to be deprived of their property upon the testimony of witnesses that a subsequent applicant for a patent for the same invention had conceived and explained to others the same idea previous to the date of the invention of the patentee. The ease with which testimony of this kind can be obtained, and the liability on the part of witnesses to be mistaken in regard to the extent and details of an invention explained to them many years before, renders property in patents extremely precarious and uncertain. An honest and *bona fide* inventor, who has expended years of labor and large amounts of money in perfecting and patenting an invention and creating a market for it, is liable to be deprived of his property by any person who can find witnesses to swear that he conceived and described the same invention prior to the invention of the patentee. There is no species of property in this country subject to the same hazards and uncertainty as property in patents, subject as it is to the above-named contingencies. Neither are there any cases in which false testimony can be presented with as little liability to detection as in the trial of interferences to establish priority of invention. The error in the law, as it now stands, consists in awarding priority to the person who first conceived and described the invention, and in giving no consideration to the *bona fide* inventor who first reduced his invention to practice, or first notifies the office of his invention either by a caveat or by an application for a patent. As, between two independent inventors, he certainly is entitled to the most credit, and best deserves the reward, who first reduces his invention to a practical shape and first gives the public the opportunity to use it. One man may conceive an invention and yet require years before he may be able to reduce it to practice. In the meantime, another, conceiving the same invention, may reduce it to practice and present it to the public as a perfect working machine, secured by letters patent of the United States, before the first inventor has even commenced a drawing or written description of the same. Still, in this case, the first but tardy inventor, by the aid of the very working machine of his more diligent rival, may finally succeed in reducing his invention to practice, and then obtain a patent for the same device, and thus render the well-earned property of the other perfectly worthless. In order to remedy this defect in the law, I would recommend that, in interference cases, he shall be deemed the first and original inventor who, previous to the application of either party for a patent, first filed a caveat in the Patent Office describing his invention, and in case no caveat is so filed, he who first presented to the office and completed his application for a patent shall be entitled to the patent, unless it shall appear from the testimony submitted that the person first filing such caveat, or first making such application, was not an original and *bona fide* inventor of the device for which he seeks a patent. Such an amendment to the

present law would work no hardship to an honest inventor, and would prove an effectual bar to a vast amount of perjury, while it would render the rights of patentees and of the public more secure. In addition to this, it would very materially reduce the number of contested cases before the Patent Office as well as before the courts.

I believe this recommendation will be sanctioned by most men of standing and respectability who have been accustomed to the investigation and trial of patent cases. At the same time, it is not at all improbable that a certain class of patent agents, who seek to make profit by aiding dishonest men in annoying and robbing honest inventors of their just rights rather than by an honorable practice of their profession, may endeavor to defeat any amendment of the law which will diminish litigation, fraud, perjury, and corruption. It is a matter of regret that the present law affords so many facilities for the dishonest practices of such men, by whom innocent inventors are continually plundered. The business of the Patent Office is rapidly increasing from year to year, as is evinced by the fact that the number of applications for patents during the year 1859 was nearly sixty per cent. more than during the year 1855. Notwithstanding this, the number of principal and first-assistant examiners remains the same. To these gentlemen is intrusted the examination of all applications for patents, in order to determine their novelty and patentability. The labor of performing this duty on every application for a patent must necessarily increase in proportion to the number of applications for similar inventions previously made. Hence, it follows that the labor and time necessary to investigate thoroughly the novelty and patentability of an invention increases from year to year. Unless, therefore, authority is given by law for the increase of the number of these officers, in proportion to the increase of the number of applications for patents, one of two evils must necessarily occur: either hasty and imperfect examinations, or great delay to the business. The former results in continual and almost endless litigation, while the latter would soon become so annoying and troublesome to inventors as to prevent them from seeking to obtain patents at all.

Rather than suffer the business of the office to become seriously delayed we have been compelled to grant patents upon hasty examinations. As a natural consequence, many things have been patented which ought to have been rejected. This difficulty must continue to exist unless Congress confers upon the Commissioner authority to add to the force of examiners from time to time, as the necessities of the business require. As the inventors of the country pay for all the expenses of these examinations, it is no more than just to them that their business should be transacted properly and with dispatch. I would therefore recommend that such authority be conferred upon the Commissioner, subject, however, to the provision that the annual expenses of the office shall in no case exceed the annual receipts. For some time past, three of the principal examiners have been withdrawn from their appropriate duties, and have been entirely occupied in the examination of appeals from the decisions of the examiners in rejected applications for patents. In the meantime, their duties have been performed by first assistant examiners. Under these circumstances, it

is no more than right that such first assistant examiners should be allowed the salaries of principal examiners for the time that they have performed their duties. They have performed the duties assigned to them with credit and fidelity, and I earnestly recommend that they be allowed the salaries as suggested.

For several years in succession Congress has been appealed to by the Patent Office, by the public, and by the inventors of the country, to revise and amend our patent laws. These inventors are an intelligent, deserving, influential, and important portion of our citizens, whose just demands and urgent necessities should no longer be disregarded.

For these reasons it is to be hoped that Congress will no longer delay taking such action upon this subject as will fully meet the wants and necessities of the country.

The fourth section of the act of Congress approved March 3, 1859, and entitled "An act making appropriations for the legislative, executive, and judicial expenses of the government for the year ending the thirtieth of June, 1860," provided "that the Secretary of the Interior be and he is hereby directed to cause the Annual Report of the Commissioner of Patents on Mechanics hereafter to be made to the Senate and House of Representatives, to be prepared and submitted in such manner as that the plates and drawings necessary to illustrate each subject shall be inserted so as to comprise the entire report in one volume not to exceed eight hundred pages."

The fourteenth section of the act of Congress approved March 3d, 1837, entitled "An act in addition to an act to promote the progress of science and useful arts," requires the Commissioner to report annually to Congress, in the month of January, a list of all patents granted during the preceding year, designating under proper heads the subject of such patents, and furnishing an alphabetical list of the patentees, with their places of residence. Also, a list of all patents which shall have become public property during the same period, together with such other information of the state and condition of the Patent Office as may be useful to Congress and the public.

It will be observed from the foregoing provisions of law, that the Commissioner is required to report annually to Congress :

1st. A list of all patents granted during the year preceding, and an alphabetical list of the patentees with their places of residence.

2d. A list of all patents which shall have expired during the preceding year.

3d. Plates and drawings, to illustrate each subject.

4th. Such other information of the state and condition of the Patent Office as may be useful to Congress and the public.

Every effort has been made to limit the size of this mechanical report, so that it might be embraced within 800 pages, as required by law; but this is found to be a physical impossibility.

The list of patents expired and granted during the year 1858, will occupy about 260 pages of the printed report. The drawings or plates necessary to illustrate each subject will require about 340 pages, while the claims and descriptions necessary to explain the drawings, and without which the report would be utterly worthless, will require about 1,200 pages more. This information, which is required by law to be reported, cannot, therefore, be published in less than 1,800 pages.

We have thus been reluctantly compelled to present a report exceeding the limit prescribed by the last Congress by 1,000 pages, and have no doubt but that Congress, in view of these facts, will so modify the law that future embarrassments of this kind may not arise. Nothing is embraced in this report but such information as is believed to be absolutely necessary to enable Congress and the public to understand the condition of the Patent Office and the character of the inventions which have been patented during the last year, while even this is condensed into the smallest space that the nature of the case will admit of.

The act of Congress approved February 5, 1859, entitled "An act providing for keeping and distributing all public documents," authorized and directed a transfer of all matters pertaining to copyrights, from the State Department to the Department of the Interior. The Secretary of the Interior has very properly placed this matter under the immediate supervision of the Commissioner of Patents. It therefore becomes my duty to call the attention of Congress to this subject.

The object of the copyright law is to protect authors in the exclusive ownership and control of their own literary productions, in a similar manner in which inventors of mechanical improvements are protected in the exclusive enjoyment of their own new and original inventions. The law now requires a person who may desire to secure the benefit of a copyright, to make his application to the clerk of the district court of the United States for the district in which the applicant resides. The clerk of said court is directed to keep a record of all such applications, and to transmit at least once in each year to this office a certified list of the said records, and all copies of books or other works deposited in his office in accordance with the provisions of the copyright law. The copies of records and books, &c., thus received are to be preserved in this office. The only fee paid by the person to whom a copyright is granted is a fee of fifty cents to the clerk of the district court, no provision being made by which the necessary expenses incurred by this office in taking charge of and preserving the records and books are to be paid by those for whose benefit this law was established. I see no good reason why authors should not be required to pay these expenses in the same manner that inventors are required to pay the expenses incurred in transacting their business before this office. Neither can I discover any good and sufficient reason why applications for the benefit of the copyright act should not be made direct to this office, instead of being made to the clerks of the United States courts. It is found to be impossible to conduct the business with uniformity and accuracy under the present system. This evil must necessarily continue to exist as long as the execution of the law is committed to the hands of so many different persons in various sections of the country. The law should, therefore, be amended in such a manner as to remedy this objection. The amount of fees to be paid by those who desire to avail themselves of the benefit of the copyright law should also be sufficient to meet the necessary expenses of the office in attending to that particular branch of the public business.

WILLIAM D. BISHOP,  
*Commissioner.*

Hon. WILLIAM PENNINGTON,  
*Speaker of the House of Representatives.*

ALPHABETICAL LIST OF PERSONS WHOSE PATENTS FOR INVENTIONS AND DISCOVERIES HAVE EXPIRED DURING THE YEAR 1859.

No.	Patentee.	Invention or discovery.	Date.	Class.
3998	Allen, Ethan.....	Pistols, and other fire-arms.....	April 16, 1845.....	XIX.
4313	Allen, John.....	Teeth, setting.....	Dec. 16, 1845.....	XX.
4020	Allen, Oliver.....	Excavating or dredging.....	May 1, 1845.....	IX.
4060	Alrichs, Jacob.....	Latch, door.....	May 24, 1845.....	II.
4281	Anderson, Alexander.....	Spindle, mode of steadying the live.....	Nov. 21; antedated May 21, 1845.....	III.
4155	Anderson, Solomon.....	Hammers.....	Aug. 20, 1845.....	II.
3900	Andrews, John.....	Cloth, felting apparatus for.....	Jan. 31, 1845.....	III.
3927	Arndt, Jacob.....	Saws, machine for filing.....	Feb. 24, 1845.....	II.
4160	Arthur, Charles.....	Grindstones for dressing tools.....	Aug. 26, 1845.....	XIII.
3975	Atwood, Anson.....	Stoves, air-tight.....	Mar. 26, 1845.....	V.
3959	Aylesworth, Chadial.....	Water-wheels.....	Mar. 21, 1845.....	XI.
4077	Babeock, Charles.....	Stoves, coal.....	June 10, 1845.....	V.
4241	Badlam, Edward.....	Piano-fortes.....	Oct. 25, 1845.....	XVIII.
3989	Baker, Arrow.....	Gates, balance-sliding, for fences.....	April 10, 1845.....	IX.
4261	Baker, J. W., and William W. Riley.....	Teeth, instrument for extracting.....	Nov. 8, 1845.....	XX.
4239	Baldamus, C. F., and F. W. Siemens.....	Printing, anastatic.....	Oct. 25, 1845.....	XVII.
3918	Ball, E.....	Ploughs.....	Feb. 20, 1845.....	I.
4263	Ball, John.....	Ploughs.....	Nov. 8, 1845.....	I.
4319	Ball, Jonathan.....	Pipes, machinery for riveting.....	Dec. 20, 1845.....	II.
4203	Barlett, Nelson.....	Baths, portable.....	Sept. 23, 1845.....	XX.
4094	Barlow, Thomas H.....	Hemp, process of preparing.....	June 25, 1845.....	IV.
3968	Barnum, Daniel.....	Loom, power.....	Mar. 26, 1845.....	III.
4301	Barrows, Ebenezer.....	Furnaces, air-heating.....	Dec. 11, 1845.....	V.
4215	Baxter, William.....	Spinners, mode of driving bobbins in.....	Sept. 30, 1845.....	III.
4232	Bean, Samuel H.....	Cars, railroad, manner of replacing upon the track.....	Oct. 11, 1845.....	X.
4311	Bebee, William.....	Hot-water, apparatus for the circulation of.....	Dec. 16, 1845.....	V.
4195	Bennett, Charles.....	Mortising machines.....	Sept. 17, 1845.....	XIV.
3890	Bennett, James H.....	Flax-pullers.....	Jan. 21, 1845.....	I.
4177	Bennett, Phineas.....	Raising wrecks, mode of discharging and.....	Sept. 2, 1845.....	IX.
4328	Benson, Benjamin S.....	Rams, hydraulic.....	Dec. 26, 1845; antedated Aug. 5, 1845.....	XI.
4162	Bentzen, J. C., and H. W. Zimmermann.....	Washing-machine.....	Aug. 26, 1845.....	XVII.
3884	Beverley, Charles F.....	Straps, fastening.....	Jan. 16, 1845.....	XVI.
5589	Bewley, Henry.....	Gutta-percha, making flexible syringes, tubes, &c., of.....	May 23, 1848; antedated Sept. 4, 1845.....	IV.
3961	Bicknell, Benjamin.....	Planing lumber, method of fastening the cutters in machinery for.....	Mar. 21, 1845.....	XIV.
3925	Bigelow, Erastus B.....	Looms, weaving, jaw-templates for.....	Feb. 24, 1845.....	III.
3926	Bigelow, Erastus B.....	Looms, regulating the tension of warps in.....	Feb. 24, 1845.....	III.
3948	Bigelow, Erastus B.....	Tenoning-machines.....	Mar. 12, 1845.....	III.
4268	Biggs, James.....	Hemp-rotting.....	Nov. 12, 1845.....	XIV.
4041	Billings, G. W., and John Harrison.....	Hemp, breaking and cleaning.....	May 10, 1845.....	IV.
4071	Billings & Harrison.....	Paper, machinery for separating sand, &c., from pulp in the manu- facture of.....	June 7, 1845.....	III.
4341	Bishop, William.....	Paper, machinery for separating sand, &c., from pulp in the manu- facture of.....	Dec. 31, 1845.....	III.
3932	Bissell, Levi.....	Ship's cables, apparatus relieving, &c.....	Feb. 28, 1845.....	VII.
3943	Black, James.....	Engine, steam, reacting-rotary.....	Mar. 12, 1845.....	VI.

*Persons whose patents for inventions have expired.*

No.	Patentee.	Invention or discovery.	Date.	Class.
4135	Bliss, John, and Frederick Creighton.....	Time-keepers, composition balance of.....	Aug. 4, 1845 .....	VIII.
4294	Bogardus, Abraham A.....	Tailor's measures.....	Nov. 29, 1845 .....	XXI.
4278	Bogardus, James.....	Shirring-machine.....	Nov. 21, 1845 .....	IV.
4280	Bogardus, James.....	India-rubber into shreds, machine for cutting.....	Nov. 21, 1845; antedated May 21, 1845.	IV.

22773	Alden, Manoah	New York, N. Y.	Evaporating, apparatus for.	Oct. 4, 1859.
33886	Alden, Milton	Philadelphia, Pa.	Fluids, apparatus for raising and forcing.	Feb. 1, 1859.
24084	Aldridge, Hiram	Auburn, N. Y.	Cultivators	May 10, 1859.
24529	Alexander, C. M. (See Willoughby, James D., assignor.)	Michigan City, Ind.	Separators, grain, shoe for.	May 24, 1859.
25157	Alexander, Edward. (See Rousseau, Auguste, assignor.)	New Albany, Ind.	Lamp-burners, vapor	June 28, 1859.
23000	Alexander, John, assignor to self and James Ritchie	Brooklyn, N. Y.	Moulding, patterns for	Aug. 16, 1859.
25615	Alexander, Thomas I.	Westerville, Ohio	Saws, reciprocating, method of operating.	Feb. 22, 1859.
22843	Alexander, W., and W. J. Van Horn. (See Van Horn & Alexander.)	Buffalo, N. Y.	Gauge, steam	Oct. 4, 1859.
22774	Allen, Albert J.	Philadelphia, Pa.	Rivets, bullets, &c., machine for making.	Feb. 8, 1859.
26206	Allen, Charles B.	Indianapolis, Ind.	Lamps, vapor, burners for	Feb. 1, 1859.
26152	Allen, Charles F.	Le Roy, N. Y.	Planters, corn	Nov. 8, 1859.
24528	Allen, E. C.	Boston, Mass.	Gauge, steam, combination	Nov. 22, 1859.
25616	Allen, E. G.	Providence, R. I.	Watch and locket cases, constructing rims and field-pieces for.	June 28, 1859.
23068	Allen, J. G., and P. Pomeroy. (See Pomeroy & Allen.)	Midville, Ga.	Planters, seed	Oct. 4, 1859.
25476	Allen, James, <i>et al.</i> (See Beggs & Allen.)	Worcester, Mass.	Tables, invalids'	Mar. 1, 1859.
24784	Allen, James N.	Pekin, Ill.	Planetarium	Sept. 20, 1859.
26151	Allen, John P.	Sleepy Creek, Va.	Washing-machine	July 19, 1859.
26553	Allen, John P.	Utica, N. Y.	Metal planing-machine	Nov. 22, 1859.
22612	Allen, Jonathan M.	Unionville, Conn.	Vise and saw-set	Dec. 27, 1859.
	Allen, Lemuel	New York, N. Y.	Potato-diggers	Jan. 18, 1859.
	Allen, Lewis			
	Allen, Luelus C., assignee. (See Ferguson, J. Henry, ass'r.)			
	Allen, Moses			
	Allen, Norman			
	Allen, R. L.			

26239	Allen, Reuben L.	Providence, R. I.	Sleeve-fastener	Nov. 29, 1859.
23336	Allen, T. F.	Dyersville, Iowa.	Car-trucks, railroad	Mar. 29, 1859.
23997	Allen, V. R.	St. Louis, Mo.	Stencil-brush	May 10, 1859.
25709	Allen, W. H., and A. J. Bentley. (See Bentley & Allen.)	New York, N. Y.	Rope-nippers	Oct. 11, 1859.
23538	Allen, W. H., and A. J. Bentley.	Dubuque, Iowa.	Composition for friction-matches	Jan. 11, 1859.
22539	Allen, William P.	New London, Conn.	Clothes, roller for expressing water from	Jan. 11, 1859.
25559	Allison, William C., assignor to self and John Murphey	Philadelphia, Pa.	Watering and sweeping railways, apparatus for	Sept. 6, 1859.
26066	Allison, William C., assignor to self and John Murphey	Philadelphia, Pa.	Cars, city railroad, mode of confining the seat of the driver on	Nov. 8, 1859.
24184	Alsop, George M.	Philadelphia, Pa.	Cars, railroad, air-springs for	May 31, 1859.
23421	Alsop, T., and I. B. Sawyer. (See Sawyer & Alsop.)	Nolensville, Tenn.	Lock, ring	Jan. 18, 1859.
26213	Alston, William J.	Phillipstown, Ill.	Raking and loading hay, machines for	Nov. 22, 1859.
26225	Alter, David, <i>et al.</i> (See Hill & Alter.)	Lewistown, Pa.	Fire-arm, breech-loading	July 12, 1859.
24774	Althouse, J. J., <i>et al.</i> (See Worthen & Althouse.)	New Orleans, La.	Evaporating-pans, apparatus for heating	Aug. 9, 1859.
24978	Alunair, Peter, assignor to self and M. M. Faxton.	Saugus, Mass.	Stairs, revolving	Aug. 9, 1859.
25076	Alvord, W. H., <i>et al.</i> (See Gray, Henry W., assignor.)	Saugus, Mass.	Press for printing cards and bill-heads, self-feeding	Mar. 29, 1859.
24978	Ames, H. O.			
25076	Ames, Martin P., <i>et al.</i> (See Wentworth & Ames.)			
23421	Ames, Nathan, assignor to self and Ward McLean.			
23421	Ames, Nathan, assignor to self and Nathaniel Evans, jr.			
23421	American Telegraph Company. (See Hughes, David E., assignor.)			
23421	American Telegraph Company. (See Phelps, George M., assignor.)			
23650	Amory, Jonathan.	West Roxbury, Mass.	Boiler-furnaces, steam	Apr. 5, 1859.
25477	Ancona, Astley C.	Reading, Pa.	Slide-valves for steam-engines	Sept. 20, 1859.
24185	Anderson, C. F.	Charlestown, N. H.	Planters, corn	May 31, 1859.
23614	Andres, S. R. & Samuel, and McD. Bucklin.	New York, N. Y.	Drying grain, malt, &c., apparatus for	Jan. 18, 1859.
23037	Andrews, A., and H. Kalbaeh	Bennville, Pa.	Water-wheel, horizontal	Aug. 30, 1859.
25266	Andrews, Abraham	Bennville, Pa.	Engines, rotary	Mar. 1, 1859.
23144	Andrews, Abraham	Bennville, Pa.	Water-wheel	Mar. 8, 1859.
23067	Andrews, C. M., and George Miller. (See Miller & Andrews.)	Norristown, Pa.	Brick-molds	Mar. 1, 1859.
24979	Andrews, Joel W.	Clinton, Mass.	Seeding-machines	Aug. 9, 1859.
24980	Andrews, John, (No. 1)	Clinton, Mass.	Seeding-machines	Aug. 9, 1859.
26319	Andrews, John, (No. 2)	Hecla Works, N. Y.	Fastener, blind	Nov. 29, 1859.
26240	Andrews, Oscar M., assignor to A. K. Seymour	Roscoe, Ill.	Washing-machine	Nov. 29, 1859.
23816	Andrews, Seth A.	Chicago, Ill.	Gauge, alarm water	May 3, 1859.
24780	Andrews, W. R., & John Oswald	New Orleans, La.	Wharves, piles, &c., mode of staying	July 12, 1859.
24780	Angamar, E. H.			
25478	Angell, Coy., & Noble. (See Noble, Coy., & Angell.)	New Lexington, Ohio.	Separators, grain	Sept. 20, 1859.
22691	Ankney, P. J., and Daniel McGreevy.	Cincinnati, Ohio.	Treatment of fatty acids	Jan. 25, 1859.
23844	Appenzeller, J. C.	Burlington, Vt.	Railroad safety-switch	Feb. 8, 1859.
23844	Appleton, Giles S.	Paris, France	Fuel, artificial, preparation of	Feb. 22, 1859.
23005	Appleton, Traey, &c. (See Bigelow, John K., assignor.)			
23005	Archerau, Henry Adolphe			
23005	Archibald, Charles D. (See Johnson, Job, assignor.)			
24174	Argood, Henry, and Stephen Ustiek, assignors to	Mansfield Township, N. J.	Clay-pipes, machines for making	May 24, 1859.
26464	John L. Macknight.	Philadelphia, Pa.	Apple parer, corer, and slicer	Dec. 20, 1859.
25617	Arnfield, John I.	Jamestown, N. C.	Boilers, steam, feed-water apparatus for	Oct. 4, 1859.
24271	Armitage, Thomas	Philadelphia, Pa.	Breakwater	June 7, 1859.
24271	Armour, D. Hillen	Columbia, Texas		

Patentees for inventions and designs, 1859.

No.	Name of patentee.	Residence.	Invention or discovery.	Date.
24981	Armstrong, Francis	New Orleans, La	Cars, railroad, brakes for	Aug. 9, 1859.
22925	Armstrong, Joseph	Woburn, Mass	Hides and skins, treatment of	Feb. 15, 1859.
24363	Armstrong, Pleasant	Camden, Ala	Washing-machine	June 14, 1859.
23537	Arndt, I. Wallace	Green Bay, Wis	Added, machine for noting the sums of numbers	Apr. 12, 1859.
25168	Arnason, Peter	Newark, N. J.	Hat-bodies, machinery for forming	Aug. 23, 1859.
25936	Arnold, Edward R.	Providence, R. I.	Valves for steam-engines, cut-off	Nov. 1, 1859.
23998	Arnold, Edward R.	Providence, R. I.	Engines, steam, cut-off gear of	May 17, 1859.
23538	Arnold, William H.	Washington, D. C.	Fire-arms, projectile for	Apr. 12, 1859.
26076	Arnold, William H.	Washington, D. C.	Fire-arms, breech-loading	Nov. 15, 1859.
23435	Arthur, Pierce & Arthur. (See Hall, George N., assignor.)	Brooklyn, N. Y.	Fires in steam-vessels, arrangement for extinguishing	Apr. 5, 1859.
26007	Asker, F. E., et al. (See Hendry, Thomas C., assignor.)	London, England	Sugar refining	Nov. 8, 1859.
26330	Atherton, G. M.	Friendsville, Ill.	Boring, hub, and mortising machines	Dec. 6, 1859.
26391	Atkins, George W., and William B. Atkins, assignors to G. W. Atkins and J. B. Henry	Milton, Del.	Registering-machines	Dec. 6, 1859.
24515	Atkins, Solon R., and D. H. Hull, assignors to D. H. Hull.	Philadelphia, Pa.	Trace-fastener	June 21, 1859.
22775	Atkinson, Zachariah	Plantersville, Conn.	Press, cotton	Feb. 1, 1859.
23145	Atwater, J. B.	Richmond, Ga.	Car-couplings	Mar. 8, 1859.
22776	Atwater, J. B.	Berlin, Wis.	Car-couplings	Feb. 1, 1859.
23539	Atwood, J. E.	Mansfield Center, Conn.	Thread-gauging	Apr. 12, 1859.
23006	Atwood, Luther	Brooklyn, N. Y.	Distillation, apparatus for destructive	Feb. 22, 1859.
23337	Atwood, Luther.	Brooklyn, N. Y.	Distillation, apparatus for destructive	Mar. 29, 1859.
26465	Auehampaugh, Brothers. (See Stewart, Philemon, ass't.) Auehampaugh, Jacob J. & Levi. (See Blakeman, Elisha D., assignor.)	Trenton, Ohio	Pumps, cattle	Dec. 20, 1859.
23887	Auger, Joseph, et al. (See Planer, Louis.) Auger, Joseph, et al. (See Planer, Louis, assignor.)	Brighton, Iowa	Shingles, machine for sawing	May 10, 1859.
25553	Augustus, J. F. (See Dyar & Augustus.)	Altona, Ill.	Churn	Sept. 27, 1859.
25873	Aultman, C. & Co. (See Miller, Lewis & Jacob, assignors.)	Louisville, Ky.	Moulding-plows	Oct. 23, 1859.
25376	Austin, Abel	Cross River, N. Y.	Rails for railroads	Sept. 13, 1859.
25710	Avery, Benjamin F.	New York, N. Y.	Galvanic-battery	Oct. 11, 1859.
25479	Avery, Thomas C.	Beloit, Wis.	Mortising-machines	Sept. 20, 1859.
24272	Axe, William R.	Hope, N. J.	Washing-machine	June 7, 1859.
24273	Ayres, Daniel S. (See Godsoe, William, assignor.) Ayres, Isaac, et al.	Hartford, Conn.	Water, device for raising	June 7, 1859.

23845	Ayres, J. A.	Hartford, Conn.	Gates, method of opening and closing by weight of the carriage	Feb. 8, 1859.
23338	Aylesworth, Thomas D.	Illion, N. Y.	Hop-frams	Mar. 29, 1859.
25312	Aylesworth, Thomas D.	Illion, N. Y.	Harvesters, cutting-apparatus of	Sept. 6, 1859.
24691	Baare, Frederick, and Julius G. Garally, assignors to H. H. Day.	New York, N. Y.	Fabrics, manufacturing corrugated	July 5, 1859.
25796	Babbett, Ivory.	Auburn, N. Y.	Jacquard-machines	Oct. 18, 1859.
25874	Babcock, G. H.	Westerly, R. I.	Bronzing-machine	Oct. 25, 1859.
26241	Babcock, Nathan, <i>et al.</i> (See Cotterell, C. B., assignor)	Stuyvesant, N. Y.	Ranges, cooking	Nov. 29, 1859.
24692	Bacon, Francis W., assignor to Edward H. Ashcroft.	West Newton, Mass.	Boilers, steam, gauge-cocks for	July 5, 1859.
24709	Bacon, Steuben T.	Boston, Mass.	Locks	July 12, 1859.
24710	Bacon, Steuben T.	Boston, Mass.	Locks, bank and safe	July 12, 1859.
23146	Bader, D. D., and C. Barstow. (See Reynolds, George H., assignor.)	Boston, Mass.	Paper, register for sheets of	Mar. 8, 1859.
24224	Badger, D. D., and W. S. Sampson, assignors to D. D. Badger.	New York, N. Y.	Grain-bins	June 14, 1859.
22615	Bagnicki, Ernst.	New York, N. Y.	Syringing-apparatus	Jan. 18, 1859.
25711	Bailey, Augustus.	Gardiner, Me.	Wood, machine for bending	Oct. 11, 1859.
25083	Bailey, Gilbert L.	Portland, Me.	Leather, machine for punching holes in	Aug. 16, 1859.
26466	Bailey, John H.	Sand Ford, Ind.	Vehicle, locomotive-traction	Dec. 20, 1859.
22692	Bailey, J. E., <i>et al.</i> (See Shaw, Thomas, assignor.)	Troy, N. Y.	Valve for steam-engines	Jan. 25, 1859.
23436	Bailey, R.	New London, Conn.	Clothes, machine for wringing	April 5, 1859.
23147	Bailey, S. A.	Friendship, Va.	Wagon, dumping	Mar. 8, 1859.
24274	Bailey, Theodore	New Orleans, La.	Fire-arm, revolving	June 7, 1859.
24274	Bailey, Thomas	New Orleans, La.	Fire-arms, means for actuating movable parts of	June 14, 1859.
24437	Baird, J. M., and Levi F. Smith.	Whceling, Va., and Stonington, Conn.	Chair, reclining	Nov. 15, 1859.
26077	Baker, Grover, & Co. (See Grover, Baker, &c.)	Fredonia, N. Y.	Straw-cutters	May 31, 1859.
24186	Baker, David, <i>et al.</i> (See Dennisson, J. N., assignor.)	Cochvanton, Pa.	Bedstead-fastening	May 24, 1859.
24085	Baker, Ensign	Nepouset, Ill.	Gate, farm	Mar. 29, 1859.
23339	Baker, George W.	New Market, N. J.	Hoes, weeding	Oct. 4, 1859.
25619	Baker, George W.	New Market, N. J.	Tonguing and grooving machine	Sept. 6, 1859.
25313	Baker, H. H.	New Market, N. J.	Planing-machines, wood, arrangement of the feed-roller	Feb. 15, 1859.
22926	Baker, H. H.	Centerville, Ind.	Plough, mole	Oct. 4, 1859.
25618	Baker, Henry F.	Syracuse, N. Y.	Bridle-bitts	June 7, 1859.
24275	Baker, John B.	Mechanicsburgh, Ohio	Planters, seed	Mar. 1, 1859.
23069	Baker, John C.	Washington, D. C.	Window-blinds, rods of	Oct. 11, 1859.
25864	Baker, John G., assignor to self and Asa L. Carrier.	Wall Hill, Miss.	Planters, cotton-seed	Dec. 13, 1859.
26404	Baker, P. B.	Providence, R. I.	Printing, blankets for	Dec. 20, 1859.
26467	Baker, S. W.	Walpole, Ind.	Car-seats and couches	Jan. 25, 1859.
22693	Baker, W. M.	East Templeton, Mass.	Hoop-riving machine	Aug. 2, 1859.
24917	Baker, William	Chicago, Ill.	Locomotive-engines, variable exhaust of	May 17, 1859.
23999	Baker, William S. G.	Tamaqua, Pa.	Straw-cutters	Dec. 27, 1859.
26554	Baker, W. H., Daniel Deau, and B. L. Fetheroff	Tamaqua, Pa.	Movement, mechanical	Nov. 15, 1859.
26078	Baker, William H.	West Meriden, Conn.	Ramrod, adjustable wormer for	Mar. 15, 1859.
23223	Baldwin, B. S., and W. D. Herral. (See Herral & Baldwin.)			
	Baldwin, George E.			
	Baldwin, J., and L. Kimball. (See Buxton, L. W., ass'r.)			
	Baldwin, James C., <i>et al.</i> (See Schott & Baldwin.)			

## Patentees of inventions and designs, 1859.

No.	Name of patentec.	Residence.	Invention or discovery.	Date.
25712	Baldwin, James D.	Columbus, Ga	Paint-oil, composition of	Oct. 11, 1859.
25077	Baldwin, Josephus, <i>et al.</i> (See Kenny, George, assignor.)	Leroy, N. Y.	Lightning-rods, composition of	Aug. 9, 1859.
23540	Baldwin, L. S., and Lucius Parks, assignors to L. S. Baldwin.	Milwaukee, Wis.	Gas-regulators	April 12, 1859.
22928	Baldwin, Silas D.	Big Plain, Ohio.	Plough, mole	Feb. 15, 1859.
25797	Bales, Moses	Canton, Ohio.	Harvesters	Oct. 18, 1859.
22478	Ball, E.	Elmira, N. Y.	Umbrella-rings, manufacture of	Jan. 4, 1859.
24918	Ball, Jonathan.	Keene, N. H.	Mode of hanging brake-rubbers	Aug. 2, 1859.
24919	Ball, Thomas C.	New York, N. Y.	Show-case.	Aug. 2, 1859.
25713	Ballard, W. D.	Kansas City, Mo.	Furnaces, steam-boiler.	Oct. 11, 1859.
23937	Ballou, L. S., jr.	New York, N. Y.	Shirts	Nov. 1, 1859.
23888	Bamberg, Charles, and Roman Blaser.	Chicago, Ill.	Clay, machines for separating stones, &c., from	May 10, 1859.
26079	Bamberg, William C.	Washington, D. C.	Gauge for iron-axles	Nov. 15, 1859.
23694	Bamman, Phebe. (See Hyde, J. B., assignor.)	New York, N. Y.	Brick-machines	Jan. 25, 1859.
23992	Bancker, Gerard	Havancourt, France.	Cooling liquids, apparatus for	Nov. 1, 1859.
26555	Bandelot, Jean Louis, assignor to Henry Migeou.	San Francisco, Cal.	Quartz, machine for pulverizing	Dec. 27, 1859.
25784	Banham, William	Medford, Mass.	Barrels, &c., mode of manufacturing	Oct. 11, 1859.
26080	Banker, G. W., assignor to self and G. O. Carpenter	Buffalo, N. Y.	Ship-building	Nov. 15, 1859.
23224	Banta, Jacob W.	Brideseburgh, Pa	Fire-arm, breech-loading	Mar. 15, 1859.
26153	Barber, Jos., and P. C. Reinfried.	South Brinwick, N. J	Washing-machine	Nov. 22, 1859.
25875	Barber, Samuel.	Friendship, Va	Diteling-machine	Oct. 25, 1859.
22846	Baneroff, John W.	Ellsworth, Me	Sewing-machines	Feb. 8, 1859.
23541	Barker, Benjamin.	Lawrence, Mass.	Shuttle-operator	April 12, 1859.
22616	Barker, B., <i>et al.</i> (See Adams, Joseph, assignor.)	Baltimore, Md	Amalgamator	Jan. 18, 1859.
22847	Barker, James K.	Wayne, Ohio	Excavators, earth	Feb. 8, 1859.
23817	Barker, Jno., and Edward W.	Hartford, Conn	Faucet	May 3, 1859.
22540	Barker, Jos. P.	Weston, Mo.	Spring, door	Jan. 4, 1859.
23542	Barkley, James	New York, N. Y.	Dovetail joints, for wood, &c.	April 12, 1859.
25554	Barnard, Frederiek S.	Waterbury, Conn	Blower, rotary	Sept. 27, 1859.
24607	Barnard, Wm. B., and E. Jordon	New York, N. Y.	Caster, furniture.	July 5, 1859.
25939	Barnes, Demas S	Brooklyn, N. Y.	Telegraphic instruments against atmospheric electricity, method of protecting.	Nov. 1, 1859.
23652	Barnes, E. F.	Providence, R. I.	Burial-cases	April 19, 1859.
26154	Barstow, A. C.	Cleveland, Ohio.	Bee-hives	Nov. 22, 1859.
22927	Barstow, Caleb, and D. D. Badger. (See Reynolds, George H., assignor.)	New York, N. Y.	Hydrants	Feb. 15, 1859.
25940	Barstow, Trowbridge & Knapp. (See Knapp, A. H., assignor.)	Union, N. Y.	Packing flour in barrels, machinery for.	Nov. 1, 1859.
24000	Bartholomew, Eli.	New York, N. Y.	Sewing-machines	May 17, 1859.
23651	Bartholomew, Frederiek H.	New York, N. Y.	Motion, alternate circular, into direct circular motion, device for converting.	April 19, 1859.

23437	Bartlett, Abel H.	Spuyten Duyvil, N. Y.	Condensing-covers	April 5, 1859.
26536	Bartlett, Russell D.	Bangor, Me.	Veneering-machines	Dec. 27, 1859.
26074	Barrans, Joseph	Surrey, England	Locomotive, portable-traction	Nov. 8, 1859.
25602	Barrett, O. D., assignor to self and J. F. Keler	Cleveland, Ohio	Spring, door	Sept. 27, 1859.
25630	Barrett, O. D.	Cleveland, Ohio	Harrow, rotary	Oct. 4, 1859.
	Barrett, O. D., and E. S. Lamphear. (See Lamphear & Barrett.)			
25785	Barratt, Oliver D., assignor to self and S. E. Smith.	Cleveland, Ohio	Sewing-machines	Oct. 11, 1859.
24364	Barringer, H. V., and John Van. (See Van & Barringer.)	Fredericktown, Ohio	Printing addresses, &c., machine for	June 14, 1859.
24438	Barrington, John A.	Warren, R. I.	Gauging casks, instruments for	June 21, 1859.
24086	Barney, John K.	Shippensburg, Pa.	Smut-machines	May 24, 1859.
24087	Barnhart, E.	New York, N. Y.	Condensers, surface	May 24, 1859.
25798	Barnum, Daniel	New York, N. Y.	Engines, steam	Oct. 18, 1859.
24088	Barnum, Daniel, and S. G. Tyler	Jersey City, N. J.	Sewing-machines, hemming guides for	May 24, 1859.
25405	Barnum, Nelson	St. Louis, Mo.	Fastener, sash	Dec. 20, 1859.
25938	Barr, Washington, and John Pyne. (See Pyne & Barr.)	Milwaukee, Wis.	Car-couplings, railroad	Nov. 1, 1859.
25380	Barnes, Henry A.	Troy, N. Y.	Boilers, steam, feed-water apparatus for	Sept. 6, 1859.
25084	Barnes, William, assignor to Philo P. Stewart.	Buflalo, N. Y.	Sewing-machines	Aug. 16, 1859.
25876	Barnes, William T.	Buflalo, N. Y.	Sewing-machines	Oct. 23, 1859.
24920	Barnes, William T.	Buflalo, N. Y.	Oils, coal, apparatus for condensing	Aug. 2, 1859.
24921	Barnes, William T.	Buflalo, N. Y.	Oils, coal, apparatus for generating	Aug. 2, 1859.
24785	Barney, Jacob	Chicago, Ill.	Engines, steam, variable exhaust, device for	July 19, 1859.
25377	Bartlett, E. G. W., et al. (See Flanders, John Jewell.)	Romulus, N. Y.	Plough, ditching	Sept. 13, 1859.
26406	Bartram, A. R.	Redding, Conn.	Vehicles, running gear of	Dec. 13, 1859.
23740	Basnagie, Francis, assignor to Beverly Rubber Company.	Wenham, Mass.	Rubber, restoring waste vulcanized	April 19, 1859.
23805	Basnagie, Francis, assignor to Beverly Rubber Company.	Wenham, Mass.	Rubber, restoring waste	April 19, 1859.
23138	Bassett, Joel R., assignor to self and A. E. Bateman.	Cincinnati, Ohio	Bolts and rivets, making	Mar. 1, 1859.
24922	Bassett, Daniel	White Water, Wis.	Mills for crushing sugar-cane	Aug. 2, 1859.
22848	Bassett, Samuel K.	Galesbury, Ill.	Plough, steam	Feb. 8, 1859.
23340	Bassford, Abraham	New York, N. Y.	Billiard-tables, cushions for	Mar. 29, 1859.
23341	Bassford, Abraham	New York, N. Y.	Billiard-table, cushion-rail for	Mar. 29, 1859.
23889	Batchelder, Jacob	Salem, Mass.	Sole-cutting machines	May 10, 1859.
25621	Batchelder, William W.	New York, N. Y.	Burners, vapor, construction of	Oct. 4, 1859.
25799	Batchelder, William W.	New York, N. Y.	Lamp-burners, vapor, construction of	Oct. 18, 1859.
24711	Batchelor, Joseph M.	Foxcroft, Me.	Lamps	July 19, 1859.
23288	Batchelor, S. B.	Lowville, N. Y.	Scythe-snath	Mar. 22, 1859.
25941	Bate, R. L., and J. Caulkins.	Adrian, Mich.	Roaster, coffee	Nov. 1, 1859.
24089	Batson, J. W. (See Gatehell, Horatio P., assignor.)	Clarksville, Md.	Cultivators	May 24, 1859.
23653	Battel, Mellen	Albany, N. Y.	Furnace for heating tire	April 19, 1859.
25085	Battel, Mellen	Albany, N. Y.	Generators, steam	Aug. 16, 1859.
25877	Battel, Mellen	Albany, N. Y.	Coal-sifters	Oct. 23, 1859.
23070	Battin, Joseph	Newark, N. J.	Sawing, machine for cross-cut	Mar. 1, 1859.
24187	Bawvel, John A.	Powhatan C. H., Va.	Presses, tobacco	May 31, 1859.
24001	Baxter, E. O.	Foreston, Ill.	Seeding machines	May 17, 1859.
25314	Baxter, E. O.	Foreston, Ill.	Excavators, railroad	Sept. 6, 1859.
23213	Baxter, E. O., assignor to self, E. H. Riley, and W. T. Sweet.	Foreston, Ill.	Seeding-machines	Mar. 8, 1859.
23741	Baxter, Thomas, assignor to William H. Baxter	Petersburg, Va.	Presses, hydraulic	April 19, 1859.

*Patentees of inventions and designs, 1859.*

No.	Name of patentee.	Residence.	Invention or discovery.	Date.
25942	Bayley, G. W. R.	Brashear, La	Rails for railroads.	Nov. 1, 1859.
26343	Bayley, G. W. R.	Brashear, La	Spikes, hook-headed.	Dec. 6, 1859.
23654	Baylies, T. L.	Richmond, Ind	Anchor-tripper	April 19, 1859.
24786	Baylor, James	Canton, Ohio	Joints, universal.	July 19, 1859.
26155	Beach, Jerred	Freeport, Pa.	Saw-set	Nov. 22, 1859.
25800	Beach, John.	De Ruyter, N. Y.	Hoops, cheese.	Oct. 18, 1859.
24982	Beach, Moses S.	Brooklyn, N. Y.	Printing-presses, machinery to feed sheet of paper to	Aug. 9, 1859.
25699	Beach, Waldren, assignor to self and John L. Reese, jr.	Baltimore, Md.	Harvesters, corn	Oct. 4, 1859.
24839	Beachler, Jacob, assignor to self and J. F. Brickley	Anderson, Ind.	Railroad switches.	July 19, 1859.

22682	Bliss, W. H., <i>et al.</i> (See Lavton & Bliss.)	Rochester, N. Y.	Legs, artificial.	May 17, 1859.
25801	Bliven, Daniel, and T. H. Pollock. (See Pollock & Bliven.)	Rochester, N. Y.	Legs, artificial.	Aug. 30, 1859.
25378	Bloom, Joseph, assignor to R. E. Rogers.	Fond-du-Lac, Wis.	Sawing shingles from the bolt, method of.	June 7, 1859.
25378	Bloomer, Charles G.	Green Point, N. Y.	Basin, water-closet.	Nov. 29, 1859.
23549	Blunk, Andrew F.	Jersey City, N. J.	Cranks, connecting rods applied to.	Oct. 11, 1859.
23656	Bly, Douglas.	Williamstown, N. J.	Bottles and jars, revolving plugs for manufacturing.	April 12, 1859.
24002	Bly, Douglas.	New York, N. Y.	Rings, finger.	Aug. 23, 1859.
25238	Bly, Douglas.			
24277	Boardman, N.			
26243	Boch, William, sr.			
25716	Bocklen, Reinhold.			
23640	Bodine, John F., assignor to self and W. H. Jock A. Bodine.			
	Bodley & Lane. (See Miles & Lane, assignors.)			
	Bogar, F. H., and J. W. Tidball. (See Bell, Henry, ass'r.)			
	Bogert Seba.			

## Patentees of inventions and designs, 1859.

No.	Name of patentee.	Residence.	Invention or discovery.	Date.
23879	Bomberger, C. C.	West Carlisle, Ohio.	Water, method of elevating	Oct. 25, 1859.
22481	Bomberger, M.	Hummelstown, Pa.	Corn-shellers	Jan. 4, 1859.
24851	Bond, Henry F.	Hudson, Wis.	Bread-slicer	July 12, 1859.
26244	Bond, Henry F.	Hudson, Wis.	Music, machine for registering	Nov. 29, 1859.
24258	Bond, Lester L., assignor to self and Giles B. Williams. Bond, Lester L., and George Colesworth. (See Carter, Charles W., assignor.)	Chicago, Ill.	Presses, self-acting	May 31, 1859.
24852	Bond, S. L.	Greenwood, S. C.	Tuyere	July 26, 1859.
26245	Bond, S. L.	Greenwood, S. C.	Boring-machine, hub	Nov. 29, 1859.
22851	Bonholtzer, H., and John Brubaker. (See Brubaker & Bonholtzer.) Bonwill, William G. A. Boon, William C., and George W. Pittman. (See Pittman & Boon.)	Dover, Del.	Dental operations, application of electricity in	Feb. 8, 1859.
25087	Booth, Ezekiel.	Troy, N. Y.	Sewing-machines	Aug. 16, 1859.
23153	Booth, J. L.	New York, N. Y.	Separators, grain	Mar. 8, 1859.
24714	Booth, James. (See Fitzgerald, R., assignor.)	Cuyahoga Falls, Ohio	Separators, grain	July 12, 1859.
25484	Booth, J. L.	Cuyahoga Falls, Ohio	Separators, grain	Sept. 20, 1859.
25717	Booton, John K.	Luray, Va.	Hemp, machine for breaking and cleaning	Oct. 11, 1859.
24715	Booton, J.	Middlebourne, Ohio	Traps, rat	July 12, 1859.
22619	Bordentown Machine Co. (See Molyneux, Jas., assignor.)	New York, N. Y.	Sofa-frame	Jan. 18, 1859.
23806	Born, Peter. Borren, K., assignor to Peter Schneider. Borowsky, M., and Ira Glynn. (See Glynn & Borowsky.)	New York, N. Y.	Bedstead-sofa	April 26, 1859.
23820	Ross, James	Philadelphia, Pa.	Watch-cases, manufacture of	May 3, 1859.
24366	Bottum, James M.	New York, N. Y.	Watch-springs, instruments for measuring the strength of	June 14, 1859.
24610	Botterill, Snowball	Westmoreland, N. Y.	Whiffletrees, hooks for	July 5, 1859.
25246	Boughton, James A.	Poughkeepsie, N. Y.	Hub-bands for wagon-wheels, making	Nov. 29, 1859.
25622	Bonnell, M., and I. I. Cole. Bourgnon, P. J., and F. Hersee. (See Hersee & Bourgnon.)	New York, N. Y.	Veneers, machine for cutting	Oct. 4, 1859.
25623	Bourne, Nathaniel.	Peosta, Iowa	Evaporating-apparatus, construction of	Oct. 4, 1859.
24367	Bourne, William Oland. Bourne, William Oland. (See Clark, Samuel, assignor.)	New York, N. Y.	Ore-separator	June 14, 1859.
26559	Bouton, James	Macon City, Mo	Seeding-machines	Dec. 27, 1859.
24611	Bowen, Henry W.	Providence, R. I.	Wind-engine	July 5, 1859.
24925	Bower, Abraham	Pekin, Ill.	Water, machine for raising	Aug. 2, 1859.
26082	Bowers, A., J. H. Griggs, and J. Wilson	Monmouth, Ill.	Plow, mole	Nov. 15, 1859.
22542	Bowers, A. J.	Richmond, Va.	Metal columns, cast, mode of securing together the sides of	Jan. 4, 1859.
23154	Bowman, Daniel	Tampico, Tenn.	Traps, fish	Mar. 8, 1859.
21003	Boyd, Amos H.	Saco, Maine	Sewing-machines	May 17, 1859.
25485	Boyd, J. H.	Baltimore, Md.	Saddle-trees, spring	Sept. 20, 1859.
24952	Boyd, John	Philadelphia, Pa.	Carding-engines	May 24, 1859.
25249	Boyd, John C.	Boston, Mass.	Elastic hose-tubing	Aug. 30, 1859.
24926	Boyd, Samuel	Brooklyn, N. Y.	Hoes, wrought-metal	Aug. 2, 1859.

26560	Boyd, Samuel.....	Brooklyn, N. Y.....	Hoes, manufacture of.....	Dec. 27, 1859.
25240	Boyd, William.....	New Orleans, La.....	Bales, cotton, iron-ties for.....	Aug. 30, 1859.
23347	Boyden, Pardon.....	Sandy Creek, N. Y.....	Carriage-tops.....	Mar. 29, 1859.
22698	Boyden, Seth.....	Newark, N. J.....	Hat-bodies, machinery for forming.....	Jan. 25, 1859.
25300	Boyden, Seth, assignor to self and H. H. Jaques.....	Newark, N. J.....	Hat-bodies, machinery for hardening.....	Aug. 30, 1859.
22915	Boyer, Michael, assignor to Chas. S. Rohner and Wm. Gunkel.....	Germanatown, Ohio.....	Seed-drills.....	Feb. 8, 1859.
22852	Boyer, W. L. and H. K., <i>et al.</i> (See Sailor, William, ass'or.).....	Albany, N. Y.....	Photography on wood.....	Feb. 8, 1859.
24004	Boyle, Chas. B.....	Roxbury, Mass.....	Beer, apparatus for cooling.....	May 17, 1859.
23285	Boyle, James.....	New York, N. Y.....	Sewing-machines.....	Mar. 15, 1859.
23226	Boynton, Edward S., assignor to Peter R. Roach.....	Canton, N. Y.....	Fire-arm, magazine.....	Mar. 15, 1859.
24368	Boynton, Paul.....	Newton Corner, Mass.....	Propeller, marine hand.....	June 14, 1859.
23657	Brackett, E. C.....	Abington, Ill.....	Washing-machine.....	April 19, 1859.
25158	Bradbury, Benjamin.....	Philadelphia, Pa.....	Vehicles, wheel, hanging the bodies of.....	Aug. 16, 1859.
23658	Bradfield, Chas., assignor to C. Stewart Bradfield.....	Lynn, Mass.....	Faucets.....	April 19, 1859.
26320	Bradford, Charles K.....	Paterson, N. J.....	Roving, can-bottom for.....	Nov. 29, 1859.
26470	Bradford, Charles K., and G. W. Parrot. (See Parrot & Bradford.).....	New York, N. Y.....	Bustles, ladies'.....	Nov. 22, 1859.
26320	Bradley, George, assignor to Jacob S. Rogers.....	New York, N. Y.....	Telegraphic-machine.....	Oct. 11, 1859.
26159	Bradley, J. W.....	New York, N. Y.....	Rakes, horse.....	Aug. 16, 1859.
25718	Bradley, L.....	Dumec, Ill.....	Tanning.....	June 7, 1859.
25988	Bradley, Lewis, and Thomas Birch. (See Birch & Bradley.).....	Cleveland, Ohio.....	Tanning.....	Aug. 30, 1859.
25988	Bradley, Maro.....	Cleveland, Ohio.....	Tanning.....	Sept. 6, 1859.
24278	Brainerd, John, and W. H. Burridge.....	Cleveland, Ohio.....	Sewing-machines, guider for.....	Dec. 27, 1859.
25241	Brainerd, John, and W. H. Burridge.....	Cleveland, Ohio.....	Carpet-stretcher.....	Feb. 15, 1859.
25315	Brainerd, J., and W. H. Burridge.....	Cleveland, Ohio.....	Valve.....	June 14, 1859.
26561	Bradshaw & Burnap. (See Burnap & Bradshaw.).....	New York, N. Y.....	Boilers, steam, arrangements for supplying air to the furnaces of, from the wheel-house of steamers.....	Dec. 20, 1859.
22930	Brady, Oliver G.....	Newark, N. J.....	Corks, tools for cutting.....	Nov. 15, 1859.
24369	Bragg, Isaac W.....	Pattersonville, La.....	Acid gas in the defecation of cane juice, mode of applying sulphurous.....	Dec. 6, 1859.
26470	Braunwell, Wm.....	Folkstone, England.....	Traction-engines, wheels of.....	Mar. 22, 1859.
26083	Brandt, Louis.....	Rochester, N. Y.....	Staves, machine for cutting.....	April 12, 1859.
26401	Brass, Adolphus.....	West Meriden, Conn.....	Window-sash fastener.....	Sept. 13, 1859.
26329	Brashear, R. B., deceased, by N. P. Brashear, executrix.....	New York, N. Y.....	Gas from wood, making.....	Sept. 6, 1859.
23289	Bray, William.....	San Francisco, Cal.....	Quartz-crushing machines.....	Aug. 30, 1859.
23550	Brayer, Michael.....	San Francisco, Cal.....	Amalgamators, gold.....	Aug. 30, 1859.
25379	Breekenridge, Elias K.....	Stamford, N. Y.....	Wrench.....	May 31, 1859.
25316	Breisach, Leopold Richard.....	Paris, France.....	Composition for ornamenting glass.....	Jan. 18, 1859.
25243	Brevoort, Henry.....	Clear Spring, Md.....	Corn-shellers.....	Dec. 20, 1859.
25242	Brevoort, Henry.....	Clear Spring, Md.....	Raker, horse.....	Jan. 4, 1859.
24190	Brewster, H., <i>et al.</i> (See Lawrence, James W., assignor.).....	New York, N. Y.....	Telegraph-cable, submarine.....	Mar. 22, 1859.
22620	Brewster, John W.....	Springfield, Mass.....	Wrench-screw.....	April 26, 1859.
26471	Brinchon, J. J. H.....	Sharon, Ohio.....	Tile-drain, apparatus for laying.....	Oct. 4, 1859.
26471	Brinkley, J. F., <i>et al.</i> (See Beachler, Jacob, assignor.).....	Michigan Bluffs, Cal.....	Amalgamating rifles.....	Mar. 1, 1859.
22526	Bridendolph, B.....			
23290	Bridges, Francis J.....			
23751	Bridwell, H. L., <i>et al.</i> (See Windall, Thomas, assignor.).....			
25624	Briggs, Albert D.....			
23072	Briggs, B. B.....			
23072	Briggs, J. S.....			

## Patentees of inventions and designs, 1859.

No.	Name of patentee.	Residence.	Invention or discovery.	Date.
25244	Briggs, Joseph W., <i>et al.</i> (See Cooper, S., assignor.)	Norristown, Pa.	Gun-lock.	Aug. 30, 1859.
23752	Briggs, R. D., <i>et al.</i> (See Crumbie & Briggs.)	Marlborough, Mass.	Thread, dishes for waxing.	April 26, 1859.
25802	Briggs, William	New Orleans, La.	Boiler, steam.	Oct. 11, 1859.
24093	Brigham, George A.	Batavia, N. Y.	Harvesting-machines.	May 24, 1859.
23896	Brinckerhoff, Cornelius R.	Upper Sandusky, Ohio.	Planters, corn.	May 10, 1859.
22931	Brinton, Joseph H.	West Chester, Pa.	Rollers, yielding feed, method of operating.	Feb. 15, 1859.
24716	Bristol, Charles B.	Naugatuck, Conn.	Flesh fork and skimmer, combination of.	July 12, 1859.
24439	Bristol, Richard C.	Chicago, Ill.	Valves for steam-engines, slide.	June 21, 1859.
26321	Broadmeadow, John P., assignor to self and Albert Eames.	Bridgeport, Conn.	Metal casting, moulding for.	Nov. 29, 1859.
23291	Britton, John W., <i>et al.</i> (See Laurence, Jos. W., ass't.)	Little Rock, Ark.	Bands for baling, metallic.	Mar. 22, 1859.
22699	Brodie, George	St. Louis, Mo.	Lounge.	Jan. 25, 1859.
26458	Bronson, J. G.	Cincinnati, Ohio.	Hydro-carbon vapor apparatus.	Dec. 13, 1859.
24850	Brooks, Asa.	Tolland, Conn.	Saw-mills, setting logs in.	July 26, 1859.
24094	Brooks, John T.	New Albany, Ind.	Boilers, steam, apparatus for heating feed-water of.	May 24, 1859.
26160	Brooks, L. B.	New York, N. Y.	Valves, steam.	Nov. 22, 1859.
24005	Brooks, Merritt S.	Chester, Conn.	Drill-stock.	May 17, 1859.
23434	Brooks, Myron D., and J. Platt. (See Platt & Brooks.)	Great Falls, N. H.	Saw-set.	Mar. 29, 1859.
26562	Brooks, Newton, <i>et al.</i> (See Quimby, E. T., assignor.)	Greenville, Ga.	Planters, cotton-seed.	Dec. 27, 1859.
26563	Brooks, Olive Ann, administratrix of Lebbeus Brooks, deceased.	Greenville, Ga.	Ploughs.	Dec. 27, 1859.
24370	Brooks, Rhodom M.	Havre de Grace, France.	Sails, reefing.	June 14, 1859.
25465	Brouard, Joseph Francis	Malone, N. Y.	Motion, converting rotary into reciprocating rectilinear.	Sept. 13, 1859.
23660	Broughton, Albert, assignor to self and A. Lindsay.	New York, N. Y.	Governors for steam-engines.	April 19, 1859.
26412	Broughton, John	New York, N. Y.	Mills, grinding.	Dec. 13, 1859.
25700	Broughton, John	Columbus, Ga.	Straw-cutters.	Oct. 4, 1859.
25173	Brown, A. D., assignor to Sallie C. Brown and others.	Boston, Mass.	Mills, grinding.	Aug. 23, 1859.
26636	Brown, A. H., <i>et al.</i> (See Quimby, Brown, and others.)	Millbury, Mass.	Spindles and fliers.	Dec. 27, 1859.
25299	Brown, Charles W.	Philadelphia, Pa.	Railways, turn-outs for.	Aug. 30, 1859.
23227	Brown, Cyriel E., assignor to self, J. Tenney, and J. Rhodes.	Newfane, N. Y.	Wood for felions, machine for bending.	Mar. 15, 1859.
26067	Brown, F. C., and D. P. Shaw. (See Shaw & Brown.)	Buffalo, N. Y.	Smoothering irons, handle for.	Nov. 8, 1859.
26473	Brown, Frank C., assignor to William Brown.	Chagrin Falls, Ohio.	Skirt-supporter.	Dec. 20, 1859.
23897	Brown, George A.	London, England.	Paper and paper-pulp, manufacture of.	May 10, 1859.
24927	Brown, Henry F.	Boston, Mass.	Pipe-tongs.	Aug. 2, 1859.
26544	Brown, J. D., <i>et al.</i> (See Marlow & Ralph, assignors.)	Boston, Mass.	Pipe-cutter.	Dec. 20, 1859.
24191	Brown, James R., assignor to self and J. Henry Norton.	Grand Ledge, Mich.	Metal, machine for punching.	May 31, 1859.
26267	Brown, James H.	Providence, R. I.	Chain, machines for making.	Nov. 29, 1859.
22853	Brown, John Calvin.	Indianapolis, Ind.	Laths from the block, machine for riving.	Feb. 8, 1859.
22853	Brown, John L.	Indianapolis, Ind.	Laths from the block, machine for riving.	Feb. 8, 1859.

23753	Brown, John L., and A. C. Greenleaf.....	Indianapolis, Ind.....	Mills, sugar.....	April 26, 1859.
23442	Brown, Mannevillette E. D.....	Utica, N. Y.....	Boat, life.....	April 5, 1859.
26268	Brown, Peter.....	Brooklyn, N. Y.....	Paint-cans.....	Nov. 29, 1859.
26413	Brown, Peter M.....	Carrollton, Ill.....	Fences, portable.....	Dec. 13, 1859.
23661	Brown, Peter G.....	Schenectady, N. Y.....	Lubricator.....	April 19, 1859.
	Brown, Richard T., and Charles W. Kennedy. (See Kennedy & Brown.)			
24371	Brown, Robert.....	New London, Conn.....	Projectile for killing whales.....	June 14, 1859.
24612	Brown, Robert.....	Strondburgh, Pa.....	Washing-machine.....	July 5, 1859.
26472	Brown, Robert D.....	Plattsburgh, N. Y.....	Wagon-brake.....	Dec. 20, 1859.
25485	Brown, Samuel W.....	Lowell, Mass.....	Steam-pressure, indicator or alarm.....	Sept. 20, 1859.
23073	Brown, T. D.....	Steubenville, Ohio.....	Harness, attachment for supporting driving-lines.....	Mar. 1, 1859.
23074	Brown, Thomas.....	Kenwood, N. Y.....	Mill-stones, tram-staffs for facing.....	Mar. 1, 1859.
26249	Brown, Thomas S.....	New York, N. Y.....	Crushers, quartz.....	Nov. 29, 1859.
22932	Brown, Thomas W.....	Boston, Mass.....	Skates.....	Feb. 15, 1859.
24516	Brown, William, assignor to self and Fountain G. Robertson.	Shelleyville, Ind.....	Bees, device for feeding.....	June 21, 1859.
22482	Brown, William H.....	Middletown, N. Y.....	Rakes, horse.....	Jan. 4, 1859.
25880	Brown, William Newton.....	New York, N. Y.....	Motion, mechanism for converting rotary into reciprocating.	Oct. 18, 1859.
23443	Brown, William R.....	Cleveland, Ohio.....	Pumps.....	April 5, 1859.
23380	Brown, Z. B., and M. C. Godard.....	Granby, Conn.....	Planters, seed.....	Sept. 13, 1859.
25089	Brown, John David.....	Cincinnati, Ohio.....	Furniture, cabinet.....	Aug. 16, 1859.
22621	Browne, Reuben R.....	Buffalo, N. Y.....	Lubricating compounds.....	Jan. 18, 1859.
26084	Brownell, Isaac A.....	Providence, R. I.....	Packing starch, &c., machine for.....	Nov. 15, 1859.
22483	Brownlich, A. C.....	Buffalo, N. Y.....	Harvesters.....	Jan. 4, 1859.
23075	Brownlich, Charles.....	Buffalo, N. Y.....	Harvesters.....	Mar. 1, 1859.
26250	Brubaker, John, and H. Donholtzer.....	Lancaster, Pa.....	Fire, tools for handling.....	Nov. 29, 1859.
	Bruce, Edwin, et al. (See Lewis, Nathan C., jr., assignor.)			
22544	Bruce, Duncan.....	Paspebiac, Canada.....	Manure, artificial.....	Jan. 11, 1859.
22933	Bruner, James D.....	Alton, Ill.....	Stoves.....	Feb. 15, 1859.
24279	Brunswick, John M.....	Cincinnati, Ohio.....	Billiard-tables, pocket-handle for.....	June 7, 1859.
23898	Bryan, C. M.....	Wright City, Mo.....	Ploughs.....	May 10, 1859.
22484	Bryant, Joel.....	Brooklyn, N. Y.....	Planters, seed.....	Jan. 4, 1859.
23444	Bryant, Joel.....	Brooklyn, N. Y.....	Hydrants.....	April 5, 1859.
25803	Bryant, William M.....	Washington, D. C.....	Smoking-tube.....	Oct. 18, 1859.
	Bryce, James G., et al. (See Jones, Josef, assignor.)			
22545	Buchanan, George.....	Hickory, Pa.....	Desks, school, and chair combined.....	Jan. 11, 1859.
25325	Buchanan, Robert C.....	United States army.....	Knapsack.....	Oct. 4, 1859.
24192	Bucher, Frederick.....	Columbia, Pa.....	Stoves.....	May 31, 1859.
26322	Buckingham, C. P.....	Mount Vernon, Ohio.....	Mills, grinding.....	Dec. 6, 1859.
25174	Buckingham, C. P.....	Mount Vernon, Ohio.....	Engines, steam, cut-off gear for.....	Aug. 23, 1859.

25383	Campbell, William	Grass Lake, Mich.	Potato-diggers.	Oct. 11, 1859.
22487	Cannaday, Calvin			
25583	Cannon, John R.			
22700	Causler, William W.			
24539	Cantelo, William I.			
24614	Cantelo, William I.			
25721	Capron, A. T., and D. S. Davis.			

## Patentees of inventions and designs, 1859.

No.	Name of patentee.	Residence.	Invention or discovery.	Date.
22488	Capron, Charles S., <i>et al.</i> (See Palmer, John S.)	Lynn, Mass.	Carpet-fan, sweeper.	Jan. 4, 1859.
24792	Carey, Augustus C.	New York, N. Y.	Metal, machines for planing.	July 19, 1859.
24098	Carhart, Jeremiah.	Collamer, N. Y.	Sewing-machines.	May 24, 1859.
26012	Carkhuft, R., and B. Chalfant.	Lewisburgh, Pa.	Valves, steam.	Nov. 8, 1859.
25176	Carl, J.	Grenada, Miss.	Mills, grinding.	Aug. 23, 1859.
22546	Carpenter, G. O., and G. W. Banker. (See Banker & Carpenter.)	Cincinnati, Ohio.	Saws, circular, device for setting laterally.	Jan. 11, 1859.
25556	Carpenter, J. D. C.	Lancaster, Ohio.	Planters, seed.	Sept. 27, 1859.
24443	Carpenter, Lewis Reese.	Cincinnati, Ohio.	Railway-clairs.	June 21, 1859.
25384	Carpenter, Marion.	Cincinnati, Ohio.	Extracts of fruits.	Sept. 13, 1859.
25722	Carpenter, Paul, and R. L. Mills. (See Mills & Carpenter)	Medford, Mass.	Valves of steam-engines, operating the.	Oct. 11, 1859.
26011	Carpenter, Rosanna.	Providence, R. I.	Table, shoe-making.	Nov. 8, 1859.
24193	Carpenter, Tisdale.	Battle Creek, Mich.	Pump-gearing.	May 31, 1859.
25092	Carpenter, Thomas.	Mattapoisett, Mass.	Closet, water.	Aug. 16, 1859.
23423	Carr, E. W., <i>et al.</i> (See Watson, Charles S., assignor.)	New York, N. Y.	Car-coupling.	Mar. 29, 1859.
24099	Carr, John P.	Springfield, Mass.	Bread-knife.	May 24, 1859.
26476	Carr, William S.	Marlborough, Conn.	Hold-backs.	Dec. 20, 1859.
23348	Carricr, Asa L., <i>et al.</i> (See Baker, John G.)	Sherburne, N. Y.	Plough, mole.	Mar. 29, 1859.
26335	Carrier, Cyrus and A. H. Crozier. (See Crozier & Carrier)	Avoca, N. Y.	Washing-machine.	Dec. 6, 1859.
23424	Carrier, James W., assignor to self and Abel B. Howe.	Franklin, Iowa.	Corn-sheller.	Mar. 29, 1859.
24793	Carrier, Joseph.	Westville, Ind.	Harvesters.	July 19, 1859.
26089	Carrington, Joel.	Green, N. Y.	Hydrants for filtration, construction of.	Oct. 18, 1859.
24794	Carter, Charles W., assignor to Lester L. Bond and George Coatsworth.	Cincinnati, Ohio.	Ore-washer.	Nov. 15, 1859.
24719	Carter, Heman.	Marietta, Pa.	Propeller, canal-boats.	July 19, 1859.
22701	Carter, John H.	Ithaca, N. Y.	Veicles, hanging the bodies of.	July 19, 1859.
22780	Carter, William L.	Lyons, N. Y.	Plough, mole.	Jan. 25, 1859.
25806	Carver, Co. E. (See Pratt, William F., assignor.)	Bloomington, Ill.	Washing-machine.	Feb. 1, 1859.
23755	Cartwright, Robert.	Liberty, Ind.	Gun-carriages, operating.	Oct. 18, 1859.
23881	Case, James H.	Lansingburgh, N. Y.	Governor for steam-engines, marine.	April 26, 1859.
22781	Case, Jarvis.	Georgetown, D. C.	Amalgamator.	May 3, 1859.
24615	Casterline, Ziba.	Pioneer Mills, N. C.	Metals, machine for polishing.	Feb. 1, 1859.
25723	Caswell, Asa L.	Louisville, Ky.	Road-scraper.	Nov. 22, 1859.
	Cathcart, James L.	Plattsburgh, N. Y.	Thread, machinery for trebling single strands of.	July 5, 1859.
	Caulkins, J., and R. L. Bate. (See Bate & Caulkins.)	Philadelphia, Pa.	Awnings.	Oct. 11, 1859.
	Cavanaugh, F. P., assignor to self and R. H. Northrop, W. A. McColloch, and E. E. Alkeu.	Providence, R. I.		
	Cave, Reuben.			
	Caward, George and David C.			
	Celerier, Michael.			
	Chace, Samuel.			
	Chalfant, B., and R. Carkhuft. (See Carkhuft & Chalfant.)			

23900	Chalmers, Thomas, <i>et al.</i> (See Gates, Fraser & Chalmers.)	West Roxbury, Mass.	Leather, machines for splitting.	May 10, 1859.
26477	Chamberlain, Dexter H.	Three Oaks, Mich.	Gate	Dec. 20, 1859.
23756	Chamberlain, S. W.	Olean, N. Y.	Harvesting-machines	April 26, 1859.
24100	Chamberlin, George and H.	Johnsontown, N. Y.	Stove-pipes	May 24, 1859.
23445	Chamberlin, M. C.	Philadelphia, Pa.	Paper-folding machines	April 5, 1859.
26090	Chambers, Cyrus, jr.	Philadelphia, Pa.	Paper, machines for folding.	Nov. 15, 1859.
24720	Chambers, Cyrus, jr.	New York, N. Y.	Skirt-supporters	July 12, 1859.
	Champagne, L., and H. Nichols. (See Nichols & Champagne.)			
24374	Champion, Thomas, and T. Motley.	Washington, D. C.	Sign-boards, &c., mode of fastening letters to.	June 14, 1859.
25949	Champlin, Robert H.	East Greenwich, R. I.	Washing-machine	Nov. 1, 1859.
25093	Chaney, H.	Perry, Ga.	Stones, machines for dressing.	Aug. 16, 1859.
	Chandler, C. H., <i>et al.</i> (See Hale & Chandler.)			
	Channing, W. F. (See Fanner, Moses G., assignor.)			
	Chapman, A. B. (See Sloan, William D., assignor.)			
26162	Chapman, A. J.	Bayou Goula, La.	Furnaces, Bagasse.	Nov. 22, 1859.
26253	Chapman, A. J.	Seipio, N. Y.	Vegetable-cutter	Nov. 29, 1859.
23076	Chapman, J. L.	Kimmunity, Ill.	Harvesters, corn	Mar. 1, 1859.
24444	Chapman, James W.	Trinity Springs, Ind.	Mills, sugar	June 21, 1859.
26478	Chapman, Mathew.	Greenfield, Mass.	Cutlery, attaching handles to.	Dec. 20, 1859.
23527	Chapman, Mathew, assignor to Russell Manufacturing Company.	Greenfield, Mass.	Cutlery, attaching handles to.	Jan. 4, 1859.
23821	Chapman, William Z. W.	New York, N. Y.	Carriages, &c., fastenings for curtains of.	May 3, 1859.
23349	Charlton, John.	Newark, N. J.	Skates, mode of fastening.	Mar. 29, 1859.
25995	Chase, D. G., assignor to George Parr.	Boston, Mass.	Laster, shank.	Nov. 1, 1859.
	Chase, John W., and J. A. Safford. (See Safford & Chase.)			
26013	Chase, Lucius C.	Boston, Mass.	Girth-buckles	Nov. 8, 1859.
23446	Cheek, E. C., <i>et al.</i> (See Purlier, Harlan & Cheek.)			
22854	Cheetham, William H., jr.	New York, N. Y.	Looms, power	April 5, 1859.
23822	Cheever, John H.	Boston, Mass.	Hose-pipes, rubber, manufacture of.	Feb. 8, 1859.
23703	Cheney, Chandler	Milford, Mass.	Skate-fastening	May 3, 1859.
22702	Cheney, Samuel.	Cleveland, Ohio.	Lamps	Jan. 25, 1859.
22855	Cheney, Seth.	Kiantone, N. Y.	Fence, field	Jan. 25, 1859.
23077	Chenoweth, George E.	Baltimore, Md.	Harvesters	Feb. 8, 1859.
26091	Chenoweth, George E.	Baltimore, Md.	Harvesters	Mar. 1, 1859.
24599	Cherey, Edmund B., assignor to self and Thomas W. Weathered.	New York, N. Y.	Furnaces	Nov. 15, 1859.
				June 28, 1859.
24721	Chesbro, Denison.	Syracuse, N. Y.	Telegraphing from railroad-cars while moving, method of.	June 7, 1859.
24795	Chesterman, William.	Centralia, Iowa.	Pots, coffee	June 14, 1859.
23058	Chichester, Lewis S., assignor to David L. Winteringham.	New York, N. Y.	Bottles, machinery for corking	Feb. 22, 1859.
26546	Chichester, Lewis S., assignor to H. G. Evans.	New York, N. Y.	Packers, cotton	Dec. 20, 1859.
22782	Childs, Willis L.	Piermont, N. Y.	Car-seats, railroad	Feb. 1, 1859.
22489	Chilson, Gardner	Boston, Mass.	Range, cooking	Jan. 4, 1859.
25487	Chittenden, Morgan	Danbury, Conn.	Fastener, sash	Sept. 20, 1859.
23447	Choate, W. C., and R. Dawes. (See Dawes & Choate.)			
24540	Christian, John B., and Abner Beeler.	Mount Carroll, Ill.	Pumps	Apr. 5, 1859.
	Christman, Thomas F.	Wilson, N. C.	Hoisting bricks, machine for	June 28, 1859.
	Christopher, J., <i>et al.</i> (See Stewart, Christopher & Forward.)			

*Patentees of inventions and designs, 1859.*

No.	Name of patentee.	Residence.	Invention or discovery.	Date.
23012	Chubb, Alouzo	Painesville, Ohio	Wood, machine for bending	Feb. 22, 1859.
26414	Chubbuck, Isaac T.	Roxbury, Mass.	Governors for steam-engines, fan	Dec. 13, 1859.
22704	Church, A. M.	Augusta, Ga.	Amalgamator	Jan. 25, 1859.

25630	Collins, P. E.	Mobile, Ala.	Gins, cotton	Oct. 4, 1859.

## Patentees of inventions and designs, 1859.

No.	Name of patentee.	Residence.	Invention or discovery.	Date.
23229	Coleman, I. L.	Vincennes, Ind.	Boilers, steam, apparatus for regulating the supply of water to.	Mar. 15, 1859.
23553	Colman, J. M.	Milwaukee, Wis.	Valve, variable cut-off for steam-engines	April 12, 1859.
22625	Colson, Nelson, et al. (See King, Wm. H., assignor.)	Hartford, Conn.	Gun-stocks with pistols, mode of coupling	Jan. 18, 1859.
22627	Colt, Samuel	Hartford, Conn.	Gun-stocks	Jan. 18, 1859.
23230	Colt, Samuel	Hartford, Conn.	Cartridges, packing	Mar. 15, 1859.
24101	Colton, Albert B.	Athens, Ga.	Horse-power machines	May 24, 1859.
22706	Colton, Francis	Brooklyn, N. Y.	Bedstead, portable	Jan. 25, 1859.
22629	Colton, G. D.	Galesburgh, Ill.	Ploughs	Jan. 18, 1859.
25995	Colville, John, assignor to self and T. L. Colville	Wilmington, N. C.	Saws, circular, method of adjusting	Nov. 1, 1859.
24284	Colvin, Enoch	Poultney, Vt.	Knitting-machine	June 7, 1859.
25389	Colvin, Henry W.	Falmouth, Ky.	Fire-arm, sight for	Sept. 13, 1859.
25724	Colvin, James S.	Allegheny, Pa.	Gasket for steam and other joints	Oct. 11, 1859.
23901	Colvin, Robert I.	Lancaster, Pa.	Carriage-shafts, convertible	May 10, 1859.
23425	Couler, Henry B., assignor to self and Joseph S. Levis	Temperanceville, Pa.	Iron, machine for rolling	Mar. 29, 1859.
23827	Coutins, P. B.	San Francisco, Cal.	Bomb-lance	May 3, 1859.
26018	Constock, D. W.	Chicago, Ill.	Railroad-gate	Nov. 8, 1859.
26415	Conant, Hezekiah	Willimantic, Ct.	Thread on spools, machines for winding	Dec. 13, 1859.
	Cone, Alfred M., et al. (See Parsons & Cone.)			
	Conklin, H. M., and J. W. Corning. (See Budlong, Win. G., assignor.)			
24985	Conlan, David	New York, N. Y.	Billiard-tables, light-shade for	June 7, 1859.
23351	Connel, James M.	Newark, Ohio	Telegraph cable, submarine	Mar. 29, 1859.
22628	Connel, James M.	Newark, Ohio	Boot-blackening apparatus	Jan. 18, 1859.
23450	Conover, Jacob A.	New York, N. Y.	Engines, steam	April 5, 1859.
24445	Conover, C. G.	Jefferson, Wis.	Shingle-machine	June 21, 1859.
26019	Converse, W. F.	Harrison, Ohio	Car-springs, railroad	Nov. 8, 1859.
23451	Cook, A. M., and A. B. Vant. (See Vant & Cook.)	Hillsborough, N. H.	Shoe-peg machines	April 5, 1859.
24723	Cook, Caleb	New Haven, Conn.	Basket, fruit	July 12, 1859.
25390	Cook, David	Paris, Ill.	Harrows, rotary	Sept. 13, 1859.
26564	Cook, G. W., and S. P. Snyder. (See Snyder & Cook.)	New Haven, Conn.	Carriages, top-props for	Dec. 27, 1859.
24617	Cook, George, and H. I. Kimball	Haynesville, Mo.	Ploughs	July 5, 1859.
25544	Cook, Isaac, and John T. Bever	Baltimore, Md.	Boilers, steam, try-cock for	Sept. 20, 1859.
23743	Cook, John F., assignor to self and George F. Page.	Washington, D. C.	Engines, holding keys for strap connections for	April 19, 1859.
	Cook, J. W., et al. (See Selser, George, assignor.)			
	Cook, Truman, assignor to A. Thomas Smith			
	Cooke, Benjamin F., et al. (See Mayall, Thos. J., assignor.)			
22598	Cooke, Benjamin F., et al. (See Whipple, Jas. A., assignor.)	Middletown, Conn.	Webbing, manufacturing	Jan. 4, 1859.
26322	Cooke, James C., assignor to Russell Manufacturing Co.	Hartford, Conn.	Soldering, holding knife-handles for	Nov. 29, 1859.
	Cookey, Almon, assignor to E. W. Sperry, J. H. Ashmead, E. Hurlbert, and Henry E. Robbins.			
26323	Cookey, Almon, assignor to E. W. Sperry, J. H. Ashmead, E. Hurlbert, and Henry E. Robbins.	Hartford, Conn.	Soldering, holding knife-handles for	Nov. 29, 1859.
24993	Coonley, James P.	Farmington, Mich.	Planters, corn	Aug. 9, 1859.

23298	Coons, Matthias P.	Brooklyn, N. Y.	Gas, apparatus for generating.	May 3, 1859.
26163	Coons, Matthias P.	Brooklyn, N. Y.	Gas, illuminating, apparatus for generating.	Nov. 22, 1859.
25631	Cooper, Garret.	Jersey City, N. J.	Bolt, tray.	Oct. 4, 1859.
26257	Cooper, George.	Coneord, N. H.	Range, cooking.	Nov. 29, 1859.
26340	Cooper, John.	Mount Vernon, Ohio.	Mills, sugar, oiling boxes of vertical.	Dec. 6, 1859.
23157	Cooper, John, and H. T. Douglas. (See Douglas & Cooper.)	Philadelphia, Pa.	Sewing-machines.	Mar. 8, 1859.
26020	Cooper, John H.	Gratis, Ohio.	Churn-dasher.	Nov. 8, 1859.
24077	Cooper, N. B.	Windsor, Conn.	Window-sash supporter.	May 17, 1859.
26068	Cooper, Sumner, assignor to self and Thomas Denham, and Joseph W. Briggs.			
26068	Cooper, W. E., assignor to Charles D. Gibson.	Dunkirk, N. Y.	Car-springs, railroad.	Nov. 8, 1859.
23663	Cooper, William E.	Dunkirk, N. Y.	Car-brake, railroad.	April 19, 1859.
23902	Cope, N., and W. Hodgson.	Cincinnati, Ohio.	Valves, butterfly.	May 10, 1859.
23352	Cope, Samuel.	Eaterprize, Ill.	Presses, cheese.	Mar. 29, 1859.
25952	Cope, Nathan.	Cincinnati, Ohio.	Valves, steam-engines, slide.	Nov. 1, 1859.
25490	Corbett, V. P.	Washington, D. C.	Cans, preserve, stoppers for.	Sept. 20, 1859.
23353	Corduan, Joseph.	Brooklyn, N. Y.	Bells, &c., house, apparatus for sounding.	Mar. 29, 1859.
24618	Corey, Alexander, et al. (See Gates, Joseph R., assignor.)	Providence, R. I.	Engines, steam.	July 5, 1859.
26093	Corliss, George H.	New York, N. Y.	Churn, rotary.	Nov. 15, 1859.
22939	Cornell, Aaron L.	New York, N. Y.	Floors, fire-proof.	Feb. 15, 1859.
22547	Cornell, John B.	New York, N. Y.	Safes, burglar-proof.	June 11, 1859.
26479	Cornell, John B.	New York, N. Y.	Vault-lights, construction of.	Dec. 20, 1859.
26417	Cornell, John B.	New York, N. Y.	Sash-weight.	Dec. 13, 1859.
25491	Cornish, George B.	New York, N. Y.	Sails, apparatus for reefing.	Sept. 20, 1859.
26480	Corrman, F., and W. Fridley. (See Fridley & Corrman.)	Carlinville, Ill.	Valves, steam.	Dec. 20, 1859.
26341	Corr, C. W.	Buffalo, N. Y.	Skate-fastenings.	Dec. 6, 1859.
23536	Costello, Thomas P.	Washington, D. C.	Signals, night, pyrotechnic.	April 5, 1859.
24078	Coston, B. Franklin, deceased, Martha J. Coston, administratrix.	Westerly, R. I.	Planing-machines, feeding-device for.	May 17, 1859.
24198	Coston, Martha J. (See Lilliendahl, Gustavus A., assignor.)	Frederica, Del.	Crushers, corn.	May 31, 1859.
22783	Cotting, D. G., et al. (See Clark, John G., assignor.)	Troy, N. Y.	Water-wheel.	Feb. 1, 1859.
22856	Cottrell, C. B., assignor to self and Nathan Babeock.	New York, N. Y.	Pots, coffee.	Feb. 8, 1859.
24199	Cottrell, C. B., and C. Potter, jr. (See Potter & Cottrell.)	New York, N. Y.	Gas-regulators.	May 31, 1859.
24200	Couch, John O., and H. S. North. (See North & Couch.)	New York, N. Y.	Hydro-carbon vapor-apparatus.	May 31, 1859.
24198	Coursey, T. B.	Indianapolis, Ind.	Register for railroad ears.	Dec. 27, 1859.
22783	Coutie, William.	Keene, N. H.	Variating wood, method of.	Feb. 1, 1859.
22856	Covell, E. Hall.	Edgefield, S. C.	Carriage-seat, spring-back.	Oct. 11, 1859.
24199	Covell, E. Hall.	Danbury, Conn.	Hat-bodies, machinery for hardening.	May 17, 1859.
24200	Covell, E. Hall.	Jersey City, N. J.	Corks, machine for polishing.	July 19, 1859.
26565	Covington, S. F., et al. (See Hoffner, P., assignor.)	New York, N. Y.	Stoves, cooking.	May 3, 1859.
22784	Covington, Samuel F.	Philadelphia, Pa.	Rubber into filreads, India, machine for cutting.	June 14, 1859.
22784	Cowee, Joel, jr.	Malden, Mass.	Plough, drain, mole of.	Aug. 16, 1859.
25725	Cowells, Norman, and A. Hulburt.	Lafayette, Ind.	Mangle.	Nov. 22, 1859.
24007	Cowperthwait, George E.	Brooklyn, N. Y.		
24841	{ Cox, Henry F., and A. Miller, assignors to Henry F. Cox.			
23829	Cox, Joseph.			
24426	Cox, Joseph W., assignor to H. H. Day.			
25098	Cox, Justice, et al. (See Belfield, Henry, assignor.)			
26227	Cox, Thomas S.			
	Coxell, James T., assignor to self and E. Jones.			
	Coy, Noble, & Angell. (See Noble, Coy, & Angell.)			

## Patentees of inventions and designs, 1859.

No.	Name of patentec.	Residence.	Invention or discovery.	Date.
23354	Crabill, H. F., and J. Whiteside. (See Whiteside & Crabill.)	Newport, Ky.	Pile-driver	Mar. 29, 1859.

24026	Hawthorn, Joseph	Thomas County, Ga.	Press, cotton	May 17, 1859.
25264	Hay, Alexander	Philadelphia, Pa.	Cars, &c., railroad springs for	Aug. 30, 1859.
23352	Hay, Alexander	Philadelphia, Pa.	Railroad and other machinery, bearings for	Dec. 6, 1859.
26483	Hay, Alexander	Philadelphia, Pa.	Shoes and gaiters	Dec. 20, 1859.
25014	Hay, George R., assignor to self and R. Phelps	Berea, Ohio	Wooden-ware, machine for cutting out	Aug. 9, 1859.
	Hayman, R. R., <i>et al.</i> (See Pease & Hayman.)			
24937	Hayden, H. H., <i>et al.</i> (See Miller & Wirsching, assignors.)	Waterbury, Conn.	Sewing-machines	Aug. 2, 1859.
25932	Haynes, Charles Y., assignor to C. Y. Haynes & Co.	Philadelphia, Pa.	Razor-straps	Oct. 25, 1859.
23371	Haynes, Jacob	Cameron, Ill.	Planters, corn	Mar. 29, 1859.
25015	Haynes, James	Hollis, Me.	Saw-frame, wood	Aug. 9, 1859.
23087	Haynes, William C.	McIntosh, Texas	Fire-arm, revolving	Mar. 1, 1859.
25639	Hays, Henry	New York, N. Y.	Stave-machine	Oct. 4, 1859.
24633	Hays, Henry	New York, N. Y.	Boring, machine for	July 8, 1859.
26494	Hazard, George V.	Torry, N. Y.	Fastener, door	Dec. 20, 1859.
25333	Hazen, Kelsey	Brooklyn, N. Y.	Amalgamator	Sept. 20, 1859.
24120	Hazen, Luther T.	Coventry, N. Y.	Carriage-wheels, hubs for	May 24, 1859.
24211	Hazlett, Robert W., and John H. Hobbs	Wheeling, Va.	Distilling coal-oils, retorts for	May 31, 1859.
26002	Head, Stephen H., <i>et al.</i> (See Parrott & Head.)	Boston, Mass.	Boilers, steam	Nov. 1, 1859.
25115	Heald, Stephen H., assignor to self and W. P. Parrot	Cohocton, N. Y.	Wagon-brakes, self-acting	Aug. 16, 1859.
22800	Healy, B. S.	Boston, Mass.	Shirt-collars	Feb. 1, 1859.
	Heard, George W.			

## Patentees of inventions and designs, 1859.

No.	Name of patentee.	Residence.	Invention or discovery.	Date.
22801	Ilelden, John.....	Medford, Mass.....	Washing-machine.....	Feb. 1, 1859.
23301	Hecker, John and William Hontine.....	New York, N. Y.....	Dough-rolling machine.....	Mar. 22, 1859.
22501	Hedenberg, John W.....	St. Louis, Mo.....	Pots, coffee.....	Jan. 4, 1859.
22802	Hedges, Isaac A.....	Cincinnati, Ohio.....	Mill for grinding cane, &c.....	Feb. 1, 1859.
23325	Hedges, Wheeler, assignor to self and P. W. Gates.....	Chicago, Ill.....	Sugar-juice, pans for evaporating.....	Nov. 29, 1859.
22349	Heermans, Theodore.....	Mitchellsville, Tenn.....	Coffee-roasters.....	Jan. 18, 1859.
23170	Heermans, Theodore.....	Mitchellsville, Tenn.....	Cultivators.....	Mar. 8, 1859.
25508	Heimisch, Roelus.....	Newark, N. J.....	Tailor's shears.....	Sept. 20, 1859.
22950	Hely, Gorges.....	Laporte, Ind.....	Horse-power equalizer.....	Feb. 13, 1859.
23572	Hemphill, Francis M.....	Newport, Ky.....	Mills, grinding.....	Mar. 29, 1859.
25363	Henderson, George, assignor to George Hutchinson.....	Alligheny, Pa.....	Printing-presses for addressing newspapers, &c.....	Sept. 6, 1859.
24844	Henderson, Joseph C., assignor to Rathbone & Co.....	Albany, N. Y.....	Stoves.....	July 12, 1859.
26495	Henderson, Simson S.....	Middlebourne, Ohio.....	Trap, rat.....	Dec. 20, 1859.
25116	Henderson, William M.....	Baltimore, Md.....	Car-seats.....	Aug. 16, 1859.
25642	Henderson, William M.....	Baltimore, Md.....	Pumps.....	Oct. 4, 1859.
23171	Henderson, John.....	Bluff Springs, Miss.....	Cotton-scraper.....	Mar. 8, 1859.
24634	Henderson, John.....	Bluff Springs, Miss.....	Stoves.....	July 5, 1859.
22803	Hendrick, James A.....	Providence, Pa.....	Saws, machine for grinding and polishing.....	Feb. 1, 1859.
25733	Hendy, Joshua.....	San Francisco, Cal.....	Coupling, double-friction.....	Oct. 11, 1859.
23450	Hendry, Thomas C., assignor to self, J. Dillworth, and F. E. Askin.....	Conyers, Ga.....	Car, gravel.....	Dec. 13, 1859.
25117	Hencage, Robert.....	Buffalo, N. Y.....	Hose-coupling.....	Aug. 16, 1859.
24392	Heuley, Henry W.....	New York, N. Y.....	Mattress.....	June 7, 1859.
24121	Henney, William.....	Wapello, Ill.....	Railroad-track, machine for raising.....	May 24, 1859.
26353	Henry, George G.....	Mobile, Ala.....	Drying wet seed-cotton.....	Dec. 6, 1859.
23465	Henry, J. B., et al., (See Atkins & Altin, assignors.)	New York, N. Y.....	Matches water-proof, rendering friction.....	April 5, 1859.
23920	Henry, Levi J., assignor to D. Beurino.....	Chenoo, Ill.....	Seeding-machines.....	May 10, 1859.
24737	Henry, Samuel.....	New York, N. Y.....	Sewing-machines.....	July 12, 1859.
22804	Henshaw, George.....	Fitchburg, Mass.....	Clothes-frame.....	Feb. 1, 1859.
26587	Henshaw, Dexter.....	Mendota, Ill.....	Ploughs, gang.....	Dec. 27, 1859.
24303	Herald, John, and C. B. Tompkins.....	Trumansburgh, N. Y.....	Harrows.....	June 7, 1859.
26354	Herald, John, and C. B. Tompkins.....	Trumansburgh, N. Y.....	Pitchforks.....	Dec. 6, 1859.
26640	Hermans, Alva, by Mary E. Hermans, administratrix.....	Henderson, Texas.....	Peach-parer.....	Dec. 27, 1859.
25332	Herrick, Hiram H.....	East Boston, Mass.....	Carpet-sweeper.....	Sept. 6, 1859.
25643	Herringshaw, Hugh, et al., (See Parker, Sidney, assignor.)	Buffalo, N. Y.....	Faucets.....	Oct. 4, 1859.
24872	Hersee, Thomson, and F. J. Bourgnon.....	Boston, Mass.....	Pumps, rotary.....	July 26, 1859.
24389	Hersey, Charles H.....	Lancaster, Pa.....	Rakcs, horse.....	June 14, 1859.
24637	Hersh, Henry.....	West Union, Iowa.....	Boilers, steam, device for heating.....	July 5, 1859.
25897	Hess, Daniel.....	West Union, Iowa.....	Cotton, machinery for cleaning.....	Oct. 25, 1859.
24805	Hess, Daniel.....	Niagara Falls, N. Y.....	Lathes.....	July 12, 1859.

24738	Hewes, S. E.	Albany, N. Y.	Stoves.	July 12, 1859.
25893	Hewit, Silas.	Seneca Falls, N. Y.	Pumps.	Oct. 25, 1859.
24304	Hewitt, Charles.	Trenton, N. J.	Iron from the rolls, machine for moving.	June 7, 1859.
26034	Hicks, Horatio F.	Cooperstown, N. Y.	Cotton and corn stalks, machines for pulling and cutting.	Nov. 8, 1859.
25546	Hicks, Horatio F., assignor to Hicks Brothers.	Grandrew, Ind.	Presses.	Sept. 20, 1859.
23577	Hicks, William Cleveland.	Boston, Mass.	Sewing-machines.	April 12, 1859.
26035	Hicks, William Cleveland.	Boston, Mass.	Sewing-machines.	Nov. 8, 1859.
26496	Hickok, D. K.	Morrisville, Vt.	Clothes-dryer.	Dec. 20, 1859.
23373	Hickok, Russell.	Fort Edward, N. Y.	Lightning-rods, insulator for.	Mar. 29, 1859.
22871	Hickok, Samuel.	Buffalo, N. Y.	Refrigerator.	Feb. 8, 1859.
23025	Hickok, William O.	Harrisburg, Pa.	Straw and hay, machine for cutting.	Feb. 22, 1859.
23247	Hidden, Enoch.	New York, N. Y.	Ship's lights.	Mar. 15, 1859.

## Patentees of inventions and designs, 1859.

No.	Name of patentee.	Residence.	Invention or discovery.	Date.
22958	Lawrence, Richard S.	Hartford, Conn	Fire-arms, adjustable sight for	Feb. 15, 1859.
23590	Lawrence, Richard S.	Hartford, Conn	Gun-locks, self-priming.	April 12, 1859.
26304	Lawrence, Richard S.	Hartford, Conn	Fire-arms, breech-loading	Dec. 20, 1859.
23033	Lawton, Robert B., and William H. Bliss.	Newport, R. I.	Horse-coupling	Feb. 22, 1859.
22657	Layland, William	Mixerville, Ind	Car-couplings	Jan. 18, 1859.
24262	Lazelle, William H., assignor to self and Elbridge B. Lazelle.	Boston, Mass	Refrigerators	May 31, 1859.
22505	Leach, John H.	Oakville, Md	Guano and other fertilizers, machines for sowing.	June 20, 1859.
22920	Leach, William, assignor to self and George P. Tisdale.	Clarkson, N. Y.	Press, cheese, self-acting.	Feb. 8, 1859.
23981	Learnard, Charles, assignor to self and George P. Stevens.	Indianapolis, Ind	Seed-drills	May 10, 1859.
23178	Leavenworth, Lucius	Trumansburg, N. Y.	Clothes-fastener	Mar. 8, 1859.
24470	Leavenworth, Lucius	Trumansburg, N. Y.	Whip and line-holder for guiding horses without the use of the hands.	June 14, 1859.
25744	Leavenworth, Lucius	Trumansburg, N. Y.	Straw-cutters	Oct. 11, 1859.
24394	Leavitt, Daniel	Chicopee, Mass.	Fire-arms, breech-loading	June 14, 1859.
24645	Leavitt, William D. (See Lee, Rufus S., and William D. Leavitt.)	Lancaster, Pa.	Rakes, horse.	July 5, 1859.
23095	Lebzelter, Philip.	Westminster, N. C.	Apple-cutting and coring-machine	Mar. 1, 1859.
26549	Lechtenberger, F. W., et al. (See Althouse, J. A., assignor.)	New York, N. Y.	Rubber-belt, India	Dec. 20, 1859.
25654	Lee, Benjamin F., assignor to New York Rubber Company.	Blakely, Ga.	Ploughs	Oct. 4, 1859.
22838	Lee, E. D., and Z. W. Lee.	New York, N. Y.	Stereoscopic apparatus	Feb. 1, 1859.
26439	Lee, James, assignor to self and Milton Finkle.	Camauche, Iowa	Planters, seed	Dec. 13, 1859.
25127	Lee, James II.	Galesburg, Ill.	Plough, mole	Aug. 16, 1859.
23377	Lee, Rufus S., and William D. Leavitt.	Cincinnati, Ohio	Shafts, saw, rocker-boxes for	Mar. 29, 1859.
23982	Lee, Samuel, assignor to James S. Pomeroy	Taunton, Mass	Knives, making steels for sharpening	May 10, 1859.
24745	Leedy, John K.	Woodstock, Va.	Bee-hives	July 12, 1859.
22658	Leeds, Joseph	Philadelphia, Pa.	Ventilating-registers	Jan. 18, 1859.
23179	Leeds, Joseph	Philadelphia, Pa.	Chimneys	Mar. 8, 1859.
23096	Leeds, Lewis W.	New York, N. Y.	Heating buildings, apparatus for	Mar. 1, 1859.
25514	Leeds, Lewis W., and C. Vaux	New York, N. Y.	Heating apparatus, thermometer-regulator for	Sept. 20, 1859.
25425	Lees, William	German town, Ohio	Planters, corn	Sept. 13, 1859.
23848	Lefebvre, L.	Donaldsonville, La.	Boilers, steam	May 3, 1859.
25339	Lefel, P., and J. H. Mulholland	Springfield, Ohio	Watchmaker's lathes, method of centering in	Sept. 6, 1859.
25162	Lehay, John J., assignor to self and John Tucker.	Reading, Pa.	Churn	Aug. 16, 1859.
22659	Lehr, Ferdinand.	Hoboken, N. J.	Umbrella-ribs, machine for bending	Jan. 18, 1859.
25839	Leigh, Evan.	Manchester, England	Spinning-machines, cotton	Oct. 18, 1859.
24312	Leibbrandt, McDowell. (See Neale, Charles, assignor.)	Washington, D. C.	Fire-arms, adjustable hammer for revolving	June 7, 1859.
24313	Le Mat, Alexander	Washington, D. C.	Cannons, &c., automatic finger for closing the vent of	June 7, 1859.
24314	Le Mat, Alexander	Cincinnati, Ohio	Sawing-circular levels, machine for	June 7, 1859.

22960	Lennon, S. N.	Deposit, N. Y.	Lanterns, railroad signal.	Feb. 15, 1859.
26193	Leonard, Elisha C.	New Bedford, Mass.	Candles, paraffine, manufacture of.	Nov. 22, 1859.
26440	Leonard, Horatio, and Henry Rydler.	New Bedford, Mass.	Candles, apparatus for moulding.	Dec. 13, 1859.
29221	Leonard, Horatio, assignor to self and H. Rydler.	New Bedford, Mass.	Candles, moulding paraffine.	Feb. 8, 1859.
23983	Leonard, H. G., assignor to L. M. Leonard.	Taunton, Mass.	Stoves, cooking.	May 10, 1859.
24033	Leshner, Henry S.	Brooklyn, N. Y.	Pads, breast, and perspiration shields.	May 17, 1859.
26599	Lessig, Samuel.	Reading, Pa.	Rakes, horse-hay.	Dec. 29, 1859.
25020	Lester, Ebenezer A.	Boston, Mass.	Car-wheels, railroad.	Aug. 9, 1859.
22563	Lestey, Henry.	Cincinnati, Ohio.	Roofing-composition.	Jan. 11, 1859.
	Lenthy, F., and J. Ebner. (See Ebner & Lenthy.)			
	Lewis, Joseph S., et al. (See Comer, B., assignor.)			
23473	Lewenberg, Alron.	New York, N. Y.	Teeth, moulds for forming artificial.	April 5, 1859.
24034	Lewis, David D.	Tamaqua, Pa.	Railroad frogs.	May 17, 1859.
23428	Lewis, Henry J., assignor to self and Richard A. Lewis.	Brooklyn, N. Y.	Camera-stands.	Mar. 29, 1859.
23925	Lewis, Jabez.	New Orleans, La.	Water to cistern, apparatus for conducting.	May 10, 1859.
25702	Lewis, Nathan C., jr., assignor to self and Edwin Bruce.	Boston, Mass.	Dentists' chairs, construction of.	Oct. 4, 1859.
23474	Lewis, Richard.	Charleston, S. C.	Bands, cotton metallic.	April 5, 1859.
23475	Lewis, Richard.	Charleston, S. C.	Bands, cotton, metallic.	April 5, 1859.
24942	Lewis, S. C., and F. P. Pflagar.	Whitneyville, Conn.	Fire-arms, revolving.	Aug. 2, 1859.
26038	Lewis, S. F.	San Francisco, Cal.	Block, pulley.	Nov. 8, 1859.
22812	Lewis, William W.	Cincinnati, Ohio.	Horse-shoe machine.	Nov. 8, 1859.
23256	Liggett, Shields.	Staunton, Va.	Railroad-gates.	Feb. 1, 1859.
25426	Lighte, Ferdinand C.	New York, N. Y.	Piano-fortes.	Mar. 15, 1859.
	Lilley, William. (See Sievet, Robert W., assignor.)			
24646	Lillie, Lewis.	Troy, N. Y.	Vault-doors and cast-iron safes.	July 5, 1859.
24647	Lillie, Lewis.	Troy, N. Y.	Bolt, door-knob.	July 5, 1859.
22959	Lilliendahl, G. A.	New York, N. Y.	Alarm, buglar.	Feb. 15, 1859.
23529	Lilliendahl, G. A., assignor to Martha J. Coston.	New York, N. Y.	Signals, pyrotechnic night.	April 5, 1859.
	Lilly, John O. D., and W. A. Peaslee. (See Peaslee & Lilly.)			
23180	Lilly, N. J.	Selma, Ala.	Presses, cotton.	Mar. 8, 1859.
24943	Lincoln, H. A. and H. T. Douglas.	New Haven, Conn.	Car-brakes, railroad.	Aug. 2, 1859.
25655	Lincoln, Levi E.	Lowell, Mass.	Boilers, steam, safety apparatus for.	Oct. 4, 1859.
23378	Lindner, Edward.	New York, N. Y.	Fire-arm, breech-loading.	Mar. 29, 1859.
24219	Lindley, George.	Chicago, Ill.	Rollers, field.	June 8, 1859.
26273	Lindsay, Oliver, and Robert F. Streat.	Washington, Pa.	Fans, grain.	Nov. 29, 1859.
24944	Lindsay, Stephen A.	Unionville, Md.	Harvester.	Nov. 29, 1859.
25427	Lindsey, George, and W. Cameron.	Petersburg, Va.	Presses, tobacco.	Aug. 2, 1859.
23925	Lindsey, Hosea.	Asheville, N. C.	Pump, submerged.	Sept. 13, 1859.
26371	Linnel, Charles L.	Truro, Mass.	Vessels, jib-boom for.	Sept. 6, 1859.
26274	Linton, Thomas J.	Providence, R. I.	Precious stones, &c., mounting.	May 10, 1859.
25233	Linton, William.	Baltimore, Md.	Filters.	Dec. 6, 1859.
25233	Linton, William, assignor to John Jones.	Ballston Spa, N. Y.	Clay-pipe, machines for making.	Nov. 30, 1859.
25021	Lipshut, Theodore, and Daniel C. Jones.	Ballston Spa, N. Y.	Batteries, self-acting, for scaring crows, &c.	Aug. 23, 1859.
	Little, Isaac, et al. (See Wheeler & Little.)			
23181	Little, James.	Evansville, Ind.	Staves from the block, machine for cutting.	Mar. 8, 1859.
26505	Little, James.	Evansville, Ind.	Stave-machines.	Dec. 20, 1859.
24128	Little, Jesse.	Chambersburgh, Pa.	Harvesting-machines.	May 24, 1859.
25972	Littlefield, S.	Alfred, Me.	Saving-machines.	Nov. 1, 1859.
23091	Littlejohn, Hiram.	Troy, N. Y.	Barrels, machine for crozing and chamfering.	Mar. 1, 1859.
25656	Littlejohn, W. T.	Kalamazoo, Mich.	Mangle.	Oct. 4, 1859.
22880	Littlepage, C. V.	Austin, Texas.	Water-wheel.	Feb. 8, 1859.
25269	Livingston, Charles.	Redwood City, Cal.	Wind-mill.	Aug. 30, 1859.
23849	Lloyd, A. W.	Otis, Mass.	Pumps.	May 3, 1859.

25028	Miller, Alexander.	Newbern, N. C.	Mill-stones, drivers for.	Aug. 9, 1859.
25517	Miller, Augustus.	Grafton, Ohio	Soap, method of making.	Sept. 20, 1859.
23852	Miller, Charles.	Belleville, Ill	Engine, rotary.	May 3, 1859.
24355	Miller, Charles, assignor to Henry Danford.	St. Louis, Mo	Gas-burners, spirit.	June 9, 1859.
23645	Miller, Charles, and Thompson W. Decker, assignors to T. W. Decker.	New York, N. Y.	Files, cutting.	April 12, 1859.
26462	Miller, Charles, assignor to George Richards.	New York, N. Y.	Sewing-machines.	Dec. 13, 1859.
23307	Miller, E.	Janesville, Wis	Stamp, post office hammer.	Mar. 22, 1859.
25432	Miller, Edmund and Benjamin. Miller, E. P., <i>et al.</i> (See Whitte, L., assignor.)	Rising Sun, Ind.	Cultivators.	Sept. 13, 1859.
24356	Miller, Felix, and Alois Wirselsing, assignors to Felix Miller and W. H. Hayden.	New York, N. Y.	Photographic cameras, diaphragm for.	June 7, 1859.
26510	Miller, George, and C. M. Andrews.	Providence, R. I.	Leather-washers.	Dec. 20, 1859.
25433	Miller, Henry.	Grafton, Va	Shingle-machine.	Sept. 13, 1859.
25752	Miller, Henry, and J. Reamer. (See Reamer & Miller.)	Irwin, Ohio	Locomotive, horse-power.	Oct. 11, 1859.
25703	Miller, James C.	Union, Ohio	Drains, lining under-ground.	Oct. 4, 1859.
24137	Miller, James C. and S. A., and Gilbert H. Clemens.	Bucyrus, Ohio	Axles, attaching thills to.	May 24, 1859.
26042	Miller, John H., and Samuel Albright.	Grafton, Va	Gas-apparatus, portable.	Nov. 8, 1859.
26567	Miller, Lebbeus B., assignor to A. D. Crane, D. F. Tompkins, L. B. Miller, C. T. Tompkins, and Daniel Holsman.	Newark, N. J.	Forms, machine for turning irregular.	Dec. 27, 1859.
25906	Miller, L. H.	Baltimore, Md.	Iron-safes, doors for.	Oct. 25, 1859.
24700	Miller, Lewis and Jacob, assignors to C. Aultman & Co.	Canton, Ohio	Harvesters.	July 5, 1859.
26281	Miller, Reuben.	Pittsburg, Pa	Engine, steam, cut-off apparatus for.	Nov. 30, 1859.
23853	Miller, Warren P.	Marysville, Cal	Ploughs, &c., locomotive for propelling.	Nov. 3, 1859.
24946	Miller, Warren P.	Marysville, Cal	Excavating and grading machine.	Aug. 2, 1859.
22885	Miller, William K.	Canton, Ohio	Harvesters.	Feb. 8, 1859.
25753	Milliken, George F.	Somerville, Mass	Alarm, burglar, electro-magnetic.	Oct. 11, 1859.
24651	Millington, Norman, <i>et al.</i> (See Simmons, George W. and George H., assignors.)	Lancaster, Ohio	Car-couplings, railroad.	July 5, 1859.
24570	Mills, Temple, & Stout. (See Temple, John, assignor.)	New York, N. Y.	Pulverizing minerals, machines for.	June 28, 1859.
22817	Mills, Samuel and George E.	Galesburg, Mich.	Clover-pickers.	Feb. 1, 1859.
24430	Mills, William T.	Cincinnati, Ohio	Spinning-tops.	June 14, 1859.
26282	Millward, Francis, assignor to Henry Homan, William L. Thomas, and Dexter H. Hardy.	New Brighton, Pa.	Cars, railroad.	Nov. 29, 1859.
24398	Milward, J. F. (See Bennett, Richard, assignor.)	Hartford, Conn	Carriage bodies, hanging.	June 14, 1859.
22971	Miner, John, and Silas Merrick.	Meadville, Pa.	Axles, preventing friction on.	Feb. 15, 1859.
26043	Minnis, Theodore S., and Thomas S.	New York, N. Y.	Skirts.	Nov. 8, 1859.
26365	Minzsheimer, Charles.	Jackson, Tenn.	Car-brakes, mode of operating.	Dec. 6, 1859.
26511	Mitchell, George W.	Jackson, Tenn.	Sewing-machines, shuttles for.	Dec. 20, 1859.
26366	Mitchell, George W.	Jackson, Tenn.	Sewing-machines.	Dec. 6, 1859.

Patentees of inventions and designs, 1859.

No.	Name of patentee.	Residence.	Invention or discovery.	Date.
23186	Mitchell, Jeremiah	Gosport, N. Y.	Churn	Mar. 8, 1859.
23104	Mitchell, John G.	Collington, Md.	Motive-power	Mar. 1, 1859.
23382	Mitchell, John G.	Collington, Md.	Planters, corn	Mar. 29, 1859.
25434	Mitchell, Jonathan H.	Germanstown, Tenn.	Cotton-scrapers	Sept. 13, 1859.
25033	Mitchell, Mathew	Altona, Ill.	Planters, corn	Aug. 9, 1859.
24571	Mitchell, N. O. (See Elwell, William, assignor.)	Lansingburg, N. Y.	Handles, hair-brush, machine for finishing	June 28, 1859.
25132	Mitchell, Thomas	San Francisco, Cal.	Movement, rotary	Aug. 16, 1859.
25666	Mitchell, William Howard	San Francisco, Cal.	Window-sash supporter	Oct. 4, 1859.
25318	Mix, G. I.	Wallingford, Conn.	Iron spoons, manufacture of	Sept. 20, 1859.
24228	Mock, James R.	Elizabethtown, Ky.	Fire-arms, lock for repeating	May 31, 1859.
24138	Moeschlin, John F., et al. (See Teudler, William H., assignor.)	Piqua, Ohio	Threshing-machines	May 24, 1859.
26283	Moffitt, J. R.	Piqua, Ohio	Separators, grain	Nov. 29, 1859.
23933	Moltrup, James C.	Bucyrus, Ohio	Ploughs	May 10, 1859.
25704	Molyneux, James, assignor to the Bordentown Machine Co.	Bordentown, N. J.	Dredging-machine, rotary	Oct. 4, 1859.
23934	Monach, James	Rahway, N. J.	Hats, manufacture of felt	May 10, 1859.
25606	Monaghan, Peter	Canak, Ga.	Cultivators, cotton	Dec. 27, 1859.
25209	Monier, Hyppolyte	Paris, France	Gas-burners, argand	Aug. 23, 1859.
22742	Monroe, B. F. S.	Utica, N. Y.	Bed-bottom	Jan. 25, 1859.
23694	Monroe, James F. and	Fitchburg, Mass.	Egg-beater	April 19, 1859.
22664	E. P. Monroe, assignors to E. P. Monroe.	New York, N. Y.	Lamps, holders for	Jan. 11, 1859.
23039	Monson, Charles	Brooklyn, N. Y.	Separators, grain	Feb. 22, 1859.
23038	Montgomery, Henry, and Simcon Howes	New York, N. Y.	Pavement, corrugated-iron	Feb. 22, 1859.
23105	Montgomery, James	New York, N. Y.	Vessels, steam, construction of	Mar. 1, 1859.
23188	Montgomery, James	New York, N. Y.	Pavement, iron	Mar. 8, 1859.
23189	Montgomery, James	New York, N. Y.	Pavement, iron	Mar. 8, 1859.
23598	Montgomery, James	New York, N. Y.	Propeller, screw	April 12, 1859.
24947	Montgomery, John A.	Williamsport, Pa.	Journal-boxes	Aug. 2, 1859.
24229	Montgomery, Richard	New York, N. Y.	Beams, corrugated, manufacture of	May 31, 1859.
25210	Montgomery, Richard	New York, N. Y.	Bridges, corrugated-iron	Aug. 23, 1859.
22565	Montgomery, Richard	New York, N. Y.	Pavement and railroad-track, mode of constructing combined street.	Jan. 18, 1859.
23599	Montgomery, Richard	New York, N. Y.	Metal plates, machine for corrugating	April 12, 1859.
23774	Montgomery, Richard	New York, N. Y.	Metal, machine for corrugating sheet	April 26, 1859.
24043	Montgomery, Richard	New York, N. Y.	Excavator, screw	May 17, 1859.
24480	Montgomery, Richard	New York, N. Y.	Metallic sheets, corrugating	June 21, 1859.
24882	Montgomery, Richard	New York, N. Y.	Metal plates, waved and corrugated, machines for manufacturing	July 26, 1859.
24883	Montgomery, Richard	New York, N. Y.	Metal plates, waved and corrugated, machines for manufacturing	July 26, 1859.
26367	Montgomery, Richard	New York, N. Y.	Ships, iron	Dec. 6, 1859.

	Cannon, apparatus for elevating	.....		.....	

## Patentees of inventions and designs, 1859.

No.	Name of patentee.	Residence.	Invention or discovery.	Date.
22977	Rawson, David W., <i>et al.</i> (See Colby, Daniel C., assignor.)	Baltimore, Md.	Harvesters	Feb. 15, 1859.
24662	Rawson, E., <i>et al.</i> (See Lyman, Hodgkins, & Rawson.)	Galena, Ill.	Stereotype-plates, apparatus for punching	July 5, 1859.
23707	Ray, B. F.	Alliance, Ohio.	Harvesting-machines	April 19, 1859.
25278	Ray, Samuel, and Moses R. Shalters.	Southington, Conn.	Tinman's machine	Aug. 30, 1859.
25369	Raymond, Charles H., assignor to Peek Smith Manufacturing Company.	Southington, Conn.	Tin-folding machine	Sept. 6, 1859.
24576	Raymond, L., and T. W. Wilson. (See Wilson & Raymond.)	Marlborough, N. H.	Hoops on rails, &c., machine for driving	June 28, 1859.
23392	Raymond, William	Hamilton, N. Y.	Clothes-frame	Mar. 29, 1859.
25045	Read, Daniel	Cold Spring, N. Y.	Tanning, apparatus for	Aug. 9, 1859.
23312	Read, John B.	Philadelphia, Penn.	Boots and shoes, heels for	Mar. 22, 1859.
26054	Read, Joseph.	Boston, Mass.	Stoves, ranges, &c.	Nov. 8, 1859.
22583	Read, Josiah M.	Conrad's Store, Va.	Harvesters, corn	Jan. 11, 1859.
23783	Read, T. N., and E. S. Collins. (See Collins & Read.)	Conrad's Store, Va.	Harvesters, corn	April 26, 1859.
26294	Reamer, Isaac.	Reading, Pa.	Rakes, horse-lay	Nov. 29, 1859.
23944	Reamer, Isaac, and Henry Miller.	Norwich, Conn.	Tools for manufacture of fire-arms	May 10, 1859.
23990	Reazer, Mathias	Norwich, Conn.	Tools for manufacturing pistols	May 10, 1859.
22891	Rebety, Augustus, assignor to Manhattan Fire-arms Manufacturing Company.	Fredonia, N. Y.	Cheese, manufacture of	Feb. 8, 1859.
26125	Rebety & Gruler. (See Gruler & Rebety.)	Indianapolis, Ind.	Lath-machine	Nov. 15, 1859.
22978	Redington, F. A., and George McCluer.	Marshfield, Mass.	Windlass	Feb. 15, 1859.
23499	Redstone, John H., and A. E.	Marshfield, Mass.	Capstan	April 5, 1859.
23494	Reed, G. P. <i>et al.</i> (See Agnew, B. F., assignor.)	Marshfield, Mass.	Shoe-pegs, machine for pointing and splitting	April 5, 1859.
24663	Reed, Jesse	Jersey City, N. J.	Engines, oscillating, trunnion-box lining for	July 5, 1859.
24821	Reed, Jesse	Jersey City, N. J.	Engines, oscillating steam	July 19, 1859.
23784	Reed, John A.	Providence, R. I.	Stove-polish mixer and scraper	April 26, 1859.
23784	Reed, John C.	Pittsburg, Pa.	Rails for street railroads	Dec. 20, 1859.
26523	Reed, John H., and G. W. Ziegler. (See Gurrusey, S. B., assignor.)	Brooklyn, N. Y.	Seat, folding	April 19, 1859.
23708	Reed, W. M. (See Dugdale, Thomas A., assignor.)	Brooklyn, N. Y.	Seat, folding	April 19, 1859.
23708	Reese, Abraham	Hartleton, Pa.	Clover-hullers	May 31, 1859.
24227	Reese, John L., jr., <i>et al.</i> (See Beach, Waldren, assignor.)	Rogersville, Ind.	Stumps and raising heavy weights, mode of applying power for extracting	April 12, 1859.
23708	Reeve, T., and M. B. Swezey.	Rogersville, Ind.	Stumps and raising heavy weights, mode of applying power for extracting	April 12, 1859.
24227	Reeves, Samuel J., <i>et al.</i> (See Meigs & Reeves.)	Hartleton, Pa.	Clover-hullers	May 31, 1859.
23608	Reid, Alfred, <i>et al.</i> (See Payne & Reid.)	Rogersville, Ind.	Stumps and raising heavy weights, mode of applying power for extracting	April 12, 1859.
24227	Reif, Christian	Hartleton, Pa.	Clover-hullers	May 31, 1859.
23608	Reiman, Henry, jr.	Rogersville, Ind.	Stumps and raising heavy weights, mode of applying power for extracting	April 12, 1859.
24227	Reinhard, F., and C. Kesler. (See Kesler & Reinhard.)	Hartleton, Pa.	Clover-hullers	May 31, 1859.
23608	Reinhard, F., and C. Kesler. (See Kesler & Reinhard.)	Rogersville, Ind.	Stumps and raising heavy weights, mode of applying power for extracting	April 12, 1859.

24577	Remington, E., and Sons, <i>et al.</i> (See Rider, Joseph, assignor.)	Cincinnati, Ohio.....	Ranges, cooking.....	June 28, 1859.
25526	Remson, W. (See Joslin & Eaton, assignors.)	New York, N. Y. } Brooklyn, N. Y. }	Insect powder-blower.....	Sept. 20, 1859.
26055	Renshaw, D., and C. J. Rooney. (See Rooney & Renshaw.)	New York, N. Y. } Brooklyn, N. Y. }	Insect powder-blower.....	Nov. 8, 1859.
22892	Renton, George H., <i>et al.</i> (See Quimby, Brown, and others.)	Ogden, Ind.....	Saw-gates, device for preventing tremulous vibrations of.....	Feb. 8, 1859.
23943	Renwick, H. B., and W. E. Worthen. (See Worthen & Renwick.)	East Bethel, Vt.....	Rakes, horse-hay.....	May 10, 1859.
26400	Resor, William..... (See Tuesdale & Sennett, assignors.)	New York, N. Y.....	Valves for steam-engines, cut-off.....	Dec. 6, 1859.
22747	{ Reynard, Peter, and. Victor Varim.....	Buffalo, N. Y.....	Trusses, belt.....	Jan. 25, 1859.
23394	{ Reynard, Peter, and. Victor Varim.....	Indianapolis, Ind.....	Mills, flour, friction bolt for.....	Mar. 29, 1859.
23393	{ Reynard, Peter, and. Victor Varim.....	Manchester, N. H.....	Loom-harness needles, machines for filling.....	Mar. 29, 1859.
24488	Reynolds, David.....	Stockport, N. Y.....	Looms, power, brakes for.....	June 21, 1859.
23709	Reynolds, George S.....	Baltimore, Md.....	Railroads, snow-ploughs for.....	April 19, 1859.
	Reynolds, George H., assignor to Caleb Barstow and D. D. Badger.			
22747	Reynolds, Hiram H.....			
23394	Reynolds, L. Simpson.....			
23393	Reynolds, Lewis L.....			
24488	Reynolds, Rensselaer and Gordon B.....			
23709	Rhoads, Willard.....			
	Rhodes, I., <i>et al.</i> (See Brown, Cyril E., assignor.)			
	Ricards, Thomas W., and J. Creamer. (See Creamer & Ricards.)			
23495	Ricardo, George. (See Griffin, Caleb, assignor.)	Clinton, Mass.....	Air-engines.....	April 5, 1859.
26617	Rice, Benjamin F.....	New York, N. Y.....	Carpet-fastener, stair.....	Dec. 27, 1859.
24578	Rice, Charles. (See Messer, Henry, assignor.)	Detroit, Mich.....	Crushing ores, mode of lifting stamps for.....	June 26, 1859.
	Rice, Clinton.....			
	Rice, Delos E.....			
	Rice, Henry G., administrator. (See Hathaway, John H., deceased.)			
22825	Rice, J. E.....	Oneida, Ill.....	Mills, fanning.....	Feb. 1, 1859.
22826	Rice, Nathan F.....	New Orleans, La.....	Filtering-apparatus.....	Feb. 1, 1859.
26126	Rice, Nathan F.....	New Orleans, La.....	Ovens, baker's.....	Nov. 15, 1859.
24489	Rice, William.....	Philadelphia, Pa.....	Filters.....	June 21, 1859.
24054	Rich, Reuben.....	South Easton, Pa.....	Water-wheels.....	May 17, 1859.
22584	Richard, Albert C.....	Newtown, Conn.....	Gum, vulcanized, method of detaching paper from.....	Jan. 11, 1859.
26127	Richard, Albert C.....	Newtown, Conn.....	Envelope, letter.....	Nov. 15, 1859.
22980	Richards, Amos A.....	Urbana, Ohio.....	Locks.....	Feb. 15, 1859.
22827	Richards, John W.....	New York, N. Y.....	Ships, fire and ventilating apparatus for.....	Feb. 1, 1859.
24757	Richards, P. D., and F. N. Thayer.....	New Orleans, La.....	Register of count, pocket.....	July 12, 1859.
24404	Richards, Joseph, and Joseph Hoffacker..... (See Griffin, Caleb H., assignor.)	New York, N. Y.....	Piano-fortes, keys, &c., of.....	June 14, 1859.
22537	Richardson, Charles E. H.....	Philadelphia, Pa.....	Coffins.....	Jan. 4, 1859.
26204	Richardson, Francis B.....	Boston, Mass.....	Syringes, elastic énama.....	Nov. 23, 1859.
23002	Richardson, G. W., and R. Glover, assignors to themselves and John J. Tanquerly.	Grayville, Ill.....	Motion, converting rectilinear into rotary.....	Feb. 15, 1859.
24434	Richardson, G. W., and J. W. White, assignors to themselves and George M. Weed.	Grayville, Ill.....	Harvesters, corn.....	June 14, 1859.

Patentees of inventions and designs, 1859.

No.	Name of patentec.	Residence.	Invention or discovery.	Date.
22772	Richardson, G. W., and Robert Glover, assignors to themselves, J. B. Williams, and William A. Horrall.	Grayville, Ill.	Harvesters.	Jan. 25, 1859.
23812	Richardson, G. W., assignor to self and John P. Williams.	Grayville, Ill.	Seeding-machines.	April 26, 1859.
24848	Richardson, G. W., assignor to self and George M. Weed.	Grayville, Ill.	Harvesting-machines.	July 19, 1859.
25370	Richardson, G. W., and R. Glover, assignors to themselves, J. B. Williams, and William A. Horrall.	Grayville, Ill.	Harvesting-machines.	Sept. 9, 1859.
24758	Richardson, John.	New York, N. Y.	Pen and pencil cases.	July 12, 1859.
25762	Richardson, L. B.	Athol, Mass.	Lasting-pincers.	Oct. 11, 1859.
24330	Richardson, Samuel M.	New York, N. Y.	Hinges, cutting out strap.	June 7, 1859.
26375	Richardson, Samuel M.	New York, N. Y.	Hinges.	Dec. 6, 1859.
23945	Richardson, Sylvanus.	Jerico, Vt.	Water-wheels.	May 10, 1859.
24055	Richardson, Sylvanus.	Jerico, Vt.	Water-wheels.	May 17, 1859.
25793	Richardson, T. D., assignor to William D. Richardson.	New York, N. Y.	Pen and pencil holder.	Oct. 11, 1859.
	Richmond, E., and A. J. Emlaw. (See Emlaw & Richmond.)			
23044	Richter, Charles W.	Madison, Ga.	Lamps.	Feb. 22, 1859.
26295	Richter, Charles W.	Madison, Ga.	Lamps.	Nov. 29, 1859.
24146	Rickey, R. S. (See Root, A. R., assignor.)			
24579	Rickkon, Richards.	Rochester, N. Y.	Car-couplings.	May 24, 1859.
23861	Rickurt, Alexander	Schoharie, N. Y.	Turning hubs, machine for.	June 29, 1859.
25470	Rider, Joseph.	Newark, Ohio	Fire-arm, revolving.	May 3, 1859.
22674	Rider, Joseph, assignor to self and E. Remington & Sons.	Newark, Ohio	Fire-arm, breach-loading.	Sept. 13, 1859.
24405	Riggs, John W.	New York, N. Y.	Truss-springs.	Jan. 11, 1859.
	Riker, Daniel.	Harlem, N. Y.	Carriage-thills, clip for.	June 14, 1859.
	Riley, E. H., et al. (See Baxter, E. O., assignor.)			
23785	Rineck, Jacob	Easton, Pa.	Rope, machines for laying hemp around wire in making.	April 26, 1859.
23946	Rinehart, John W.	Lexington City, Mo.	Hemp-brake.	May 10, 1859.
24782	Ring, Asa T., assignor to Nathaniel T. Spear and A. J. Robinson.	Newton, Mass.	Thread, device for winding skeins of.	July 12, 1859.
26524	Ringel, Celistin	San Francisco, Cal.	Gold-washer.	Dec. 20, 1859.
24238	Ripley, Ezra.	Troy, N. Y.	Nut-cracker.	May 31, 1859.
22585	Ripley, William	Edgarton, Mass.	Square, framing.	Jan. 11, 1859.
22748	Rison, M. H.	Paris, Tennessee	Photographic plate-vises.	Jan. 25, 1859.
24490	Ritchie, James, et al. (See Alexander, John, assignor.)			
	Ritter, Christian	Reading, Pa.	Presses, cider.	June 21, 1859.
23947	Ritter, S. S.	Philadelphia, Pa.	Trusses, hernial.	May 10, 1859.
24580	Rivers, William I., (See Boynton, Edward S., assignor.)	Sumter, S. C.	Cultivators, cotton.	June 28, 1859.
25046	Robbe, Charles A.	Augusta, Ga.	Gas-retorts.	Aug. 9, 1859.
24822	Robbins, Benjamin.	Machias, Me.	Pumps, apparatus for working.	July 19, 1859.
23609	Robbins, D. F., and Simeon Morrison.	De Witt, Ill.	Plough, mole	April 12, 1859.
23396	Robbins, H. R.	Baltimore, Md.	Stoves.	Mar. 29, 1859.
24887	Robbins, Ira.	Hughesville, Pa.	Railroads, &c., gates for.	July 26, 1859.

2293	Roberts, Albert W.	Hartford, Conn.	Leather, machines for stretching.	Feb. 8, 1859.
25915	Roberts, Albert W.	Hartford, Conn.	Hook, disengaging.	Oct. 25, 1859.
23948	Roberts, Edward A. L., and William Demorset.	New York, N. Y.	Apparatus for vulcanizing.	May 10, 1859.
24893	Roberts, Edward A. L.	New York, N. Y.	Furnace for dental purposes.	July 19, 1859.
25674	Roberts, Edward A. L.	New York, N. Y.	Lath-chuck.	Oct. 4, 1859.
23264	Roberts, E. L.	Brooklyn, N. Y.	Fastening for folding-doors.	Mar. 15, 1859.
24889	Roberts, Hanson.	Mornau Island, Cal.	Gold-washers.	July 26, 1859.
25139	Roberts, J. M., et al. (See Custer, J. D., assignor.)	Allamance, N. C.	Cars, &c., railroad, trucks for.	Aug. 16, 1859.
24759	Robertson, Thomas E.	Brooklyn, N. Y.	Jack, hydrostatic lifting.	July 12, 1859.
23395	Robertson, John.	Washington, D. C.	Cultivators.	Mar. 29, 1859.
25913	Robertson, Thomas A.	New York, N. Y.	Sewing-machines.	Oct. 25, 1859.
26205	Robertson, T. J. W.	New York, N. Y.	Sewing-machines.	Nov. 23, 1859.
22749	Robie, R. V., et al. (See Morse, A. W., assignor.)	Lenox, Pa.	Wagon-brake.	Jan. 25, 1859.
25916	Robins, Henry E., et al. (See Cooley, Almon, assignor.)	Conneautville, Pa.	Mills for crushing sugar-cane.	Oct. 25, 1859.
23295	Robinson, George W.	Boston, Mass.	Steering-apparatus.	Mar. 15, 1859.
26053	Robinson, of Eli, John.	Sharptown, Md.	Turn-table, portable.	Nov. 8, 1859.
23610	Robinson, Luther. (See Gray, William, assignor.)	Gypsum, N. Y.	Dirt-scraper.	April 12, 1859.
25217	Robison, A. J.	New York, N. Y.	Inkstand.	Aug. 29, 1859.
23065	Robjohn, Thomas.	Worcester, Mass.	Blackeng.	Feb. 23, 1859.
26525	Rockwood, L. K., assignor to J. L. Clough.	New York, N. Y.	Stereoscopic-apparatus.	Dec. 21, 1859.
25869	Roche, Thomas C.	Ceralvo, Ky.	Looms, fancy.	Oct. 18, 1859.
26134	Roder, Conrad, assignor to self and J. T. Iler.	New York, N. Y.	Eyelets, machines for inserting.	Nov. 15, 1859.
22979	Rodgers, William H.	Warsaw, Ill.	Match-box, pocket.	Feb. 15, 1859.
24154	Roesler, A., and C. Frey.	Warsaw, Ill.	Buckles.	May 25, 1859.
22513	Roesler, Adolph.	Deep River, Conn.	Combs, hair, machine for pointing the teeth of.	Jan. 4, 1859.
23949	Rogers, C. B.	Pittsburg, Pa.	Grain-shovels.	May 10, 1859.
24888	Rogers, David B.	Pittsburg, Pa.	Car-springs, railroad.	July 26, 1859.
24056	Rogers, David B., and J. A. Wood.	Sacramento, Wis.	Washing-machines.	May 17, 1859.
26618	Rogers, Jacob S. (See Bradley, George, assignor.)	Spring, Pa.	Cultivators.	Dec. 27, 1859.
25763	Rogers, Morgan L.	Philadelphia, Pa.	Umbrella-frances.	Oct. 11, 1859.
26619	Rogers, R. E. (See Bloom, Joseph, assignor.)	Philadelphia, Pa.	Engine, steam, for land-carriages.	Dec. 29, 1859.
25047	Rogers, Robert E.	Wethersfield, Conn.	Planters, seed.	Aug. 9, 1859.
26377	Rogers, Theodore B.	Strasburg Township, Pa.	Churn.	Dec. 6, 1859.
24331	Rohmer, Charles S., and William Gunckel. (See Boyer, Michael, assignor.)	Philadelphina, Pa.	Pan, dust.	June 7, 1859.
23745	Rohrer, Henry.	Newport, Ohio.	Plough, molo.	April 19, 1859.
23266	Rohrman, Joseph Hall.	Albany, N. Y.	Brewers, preparing hop-liquor for distillers and	Mar. 15, 1859.
24704	Roland, H. W., and E. Forbis, assignors to themselves and W. Withrow.	Sinking Springs, Pa.	Threshing-machines.	Sept. 20, 1859.
26620	Rollins, Archelaus S.	Fredricksburg, Va.	Threshing-machines.	July 5, 1859.
24956	Rollman, Joshua.	Baley's Mill, Fla.	Ploughs.	Dec. 27, 1859.
	Rollow, John I., assignor to Charles C. Wellford.	Deposit, N. Y.	Hollow-ware, machine for turning.	Aug. 2, 1859.
	Roney, George W., assignor to self and W. F. Lloyd.			
	Rood, Lumau P.			

Patentees of inventions and designs, 1859.

No.	Name of patentee.	Residence.	Invention or discovery.	Date.
23500	Rooker, Thomas N	New York, N. Y	Printing type-eases	April 5, 1859.
25140	Roome, James H	New York, N. Y	Slicans	Aug. 16, 1859.
25585	Rooney, C. J., and D. Renshaw	New York, N. Y	Hinge, spring	Sept. 27, 1859.
23430	Root, A. R., assignor to R. S. Riekey	Keokuk, Iowa	Seeding-machines	Mar. 29, 1859.
22675	Root, E. K	Hartford, Conn	Cartridges, method of packing	Jan. 18, 1859.
26621	Root, Riley	Galesburg, Ill.	Surveying-instrument	Dec. 27, 1859.
23950	Root, S. E.	Bristol, Conn	Clock-dial	May 10, 1859.
23267	Roots, P. H.	Connerville, N. Y	Water-wheel	Mar. 15, 1859.
25675	Ropp, Christian	MeLean County, Ill.	Planters, corn	Oct. 4, 1859.
25914	Rose, Alfred	Penn Yan, N. Y	Churn-dasher	Oct. 25, 1859.
26057	Rose, Israel M.	New York, N. Y	Sewing-machines	Nov. 8, 1859.
22057	Rose, Timothy	Corlandtville, N. Y	Water-wheel	May 24, 1859.
	Rosebrooks, J. M., and W. A. Wood. (See Wood & Rosebrooks.)			
22536	Rosenerantz, E. D., and W. H. Smith, assignors to Rosen- erantz, and Barton E. Clark.	New York, N. Y	Lamps, vapor, burners for	Jan. 4, 1859.
23862	Rosenkrans, Joseph	Avoea, N. Y	Mills, eider	May 3, 1859.
24239	Rosenkrans, Joseph	Avoea, N. Y	Wagon-brake, self-acting	May 31, 1859.
25586	Ross, Abbott Q	Cincinnati, Ohio	Alarm, burglar's	Sept. 27, 1859.
24240	Ross, Andrew C.	Almont, Mich.	Sawing-machine for resawing boards	May 31, 1859.
24435	Ross, Robert, et al. (See Willard & Ross.)			
	Ross, Robert, assignor to self and George J. Stannard	St. Albans, Vt.	Water-wheel	June 14, 1859.
	Ross, Thomas, and F. M. Strong. (See Strong & Ross.)			
23397	Roux, J. G	Raymond, Miss.	Presses, cotton	Mar. 29, 1859.
25587	Rouse, John	Port Gibson, N. Y	Harness, horses	Sept. 27, 1859.
24144	Roushe, George	Lima, Ohio	Straw-cutters	May 24, 1859.
23884	Rousseau, T. Auguste, assignor to Edward Alexander	Belleville, France	Organs, reed	May 3, 1859.
25981	Rowan, Charles E.	New York, N. Y	Rice, machines for polishing	Nov. 1, 1859.
26638	Rowe, A., jr., et al. (See Howard, A. P., and A. Rowe, jr.)			
23195	Rowe, James, assignor to self and Martin B. Ewing	Cincinnati, Ohio	Sewing-machines	Dec. 27, 1859.
24491	Rowe, John L.	New York, N. Y	Pen-wiper and paper-weight	Mar. 8, 1859.
22894	Rowe, Philip C.	Boston, Mass.	Brush for washing windows	June 21, 1859.
25141	Rowe, William N.	Sharpsburg, Md.	Corn-huskers	Feb. 8, 1859.
23611	Rowell, J. S., D. C. Teller, and M. F. Lowth	Beaver Dam, Wis	Jack, carriage and wagon	Aug. 16, 1859.
23258	Rowley, James L.	Angola, Ind.	Water-wheels	April 12, 1859.
23398	Rowley, James L.	Angola, Ind.	Washing-machine	Mar. 15, 1859.
	Ruby, H., and H. R., et al. (See Goshou, J. G., assignor.)		Railroad cattle-guard	Mar. 29, 1859.
23863	Ruddaell, Washington	Baltimore, Md.	Mail-bags	May 3, 1859.
25048	Rue, James	Englishtown, N. J.	Cultivators	Aug. 9, 1859.

22912	Worden, Benjamin B., and Wm. Caldwell. (See Johnson, Danforth, assignor.)	Lebanon, N. H.	Boring or mortising blind-stiles, machine for	July 5, 1859.
23801	Work, Thomas K.	Hartford, Conn	Odometer	Feb. 8, 1859.
24072	Worl, Brothers. (See Black, James, assignor.)	Goodwinsville, N. J.	Wicks, lamp	April 26, 1859.
26455	Worl, W. S. (See Black, James, assignor.)	Colerain, Pa.	Roofing, cement for.	May 17, 1859.
23973	Wortendyke, J. B.	Canton, Mo	Planters, seed	Dec. 13, 1859.
23877	Worth, J. Carpenter	New York, N. Y.	Blinds, mode of constructing slats for	Jan. 11, 1859.
24689	Worth, Wm. H., and Leonard Finlay.	New York, N. Y.	Lath, metallic	May 3, 1856.
24688	Worthen, W. E., and J. J. Althouse.	New York, N. Y.	Curb and gutter, street, combined metallic	May 10, 1859.
23973	Worthen, W. E.	New York, N. Y.	Metal, corrugating sheet	July 5, 1859.
24689	Worthen, W. E., and H. B. Renwick.	New York, N. Y.	Pumping-engine	July 19, 1859.
24688	Worthington, Henry R.	Brooklyn, N. Y.	Evaporating, apparatus for	Jan. 11, 1859.
22601	Worthington, Wm. S.	Newtown, N. Y.	Evaporating, apparatus for	Jan. 11, 1859.
25074	Wright, Albert H.	Camden, N. J.	Composition of matter for ornamental purposes	Aug. 9, 1859.
25074	Wright, Benjamin, et al. (See Bean & Wright.)	Camden, N. J.	Composition of matter for ornamental purposes	Aug. 9, 1859.

Patentees of inventions and designs, 1859.

No.	Name of patentee.	Residence.	Invention or discovery.	Date.
24690	Wright, Benj. S., <i>et al.</i> (See Campbell, Robert M., ass'r.)	Worcester, Mass.	Spinning-mules, self-acting	July 5, 1859.
25075	Wright, John K.	Philadelphia, Pa.	Printing in different colors, machine for.	Aug. 9, 1859.
22765	Wright, R. A., and L. J. Fouché	Paris, France	Process for decomposing fats	Jan. 25, 1859.
26543	Wright, Robert W.	New Haven, Conn.	Newspapers, &c., machines for feeding up, cutting, and pasting directions on.	Dec. 31, 1859.
22609	Wright, Wm., assignor to self and Frederick Wright.	New York, N. Y.	Gas-burners	Jan. 11, 1859.
26138	Wright, Wm.	Hartford, Conn.	Pumping-engine, steam	Nov. 15, 1859.
26139	Wright, Wm.	Hartford, Conn.	Pumps	Nov. 15, 1859.
23879	Wulze, August.	St. Louis, Mo.	Barley, pearl, machine for making.	May 3, 1859.
26065	Wuterich, F., and J. Koerber.	New York, N. Y.	Gins, cotton	Nov. 8, 1859.
24773	Wyckoff, Arealous.	Elmira, N. Y.	Augers, hollow	July 12, 1859.
24901	Wyckoff, J. N., and T. M. Fell.	Brooklyn, N. Y.	Amalgamators, ore-washer and.	July 26, 1859.
24902	Wyckoff, J. N., and T. M. Fell.	Orange Mines, Va.	Amalgamators, gold	July 26, 1859.
23283	T. M. Fell.	Brooklyn, N. Y.	Table, bread-making	Mar. 15, 1859.
23283	Wyckoff, W. K.	Orange Mines, Va.	Amalgamators, gold	July 26, 1859.
23738	Yeardley, T. W., <i>et al.</i> (See Burnish, Talbot, & Yeardley.)	Ripon, Wis.	Table, bread-making	Mar. 15, 1859.
24422	Yates, Gilbert	West Dresden, N. Y.	Gates by hand, method of opening and closing farm.	April 19, 1859.
23522	Yates, Gilbert	West Dresden, N. Y.	Car-couplings	June 14, 1859.
26396	Yates, Wm. H. and George.	Chittanooga, N. Y.	Sawing shingles from the bolt, method of	April 5, 1859.
22913	Yeager, Wm. F.	Starkville, Miss.	Ploughs	Dec. 6, 1859.
25861	Yeasley, P., <i>et al.</i> (See Cullom, John B., assignor.)	Lexington, Ky.	Altitudes of the sun, instrument for taking	Feb. 8, 1859.
23803	Yeiser, Frederick	New York, N. Y.	Bustles	Oct. 18, 1859.
24259	Yerby, George W.	New York, N. Y.	Refrigerator	April 26, 1859.
23685	Yost, Abraham	Providence, R. I.	Springs, upholstery, machines for making	May 31, 1859.
23804	Young, C. A. and S. W.	West Galway, N. Y.	Railroad-chairs	Jan. 18, 1859.
24348	Young, John	West Galway, N. Y.	Railroads, construction of	April 26, 1859.
24597	Young, John	Joliet, Ill.	Cultivators	June 7, 1859.
24073	Young, John H.	Joliet, Ill.	Cultivators, rotary	June 28, 1859.
24598	Young, MeClintock, jr.	Springfield, Ohio	Pump	May 17, 1859.
22766	Young, MeClintock, jr. (See Fitzhugh & Young.)	Frederick, Md.	Harvesting-machines	June 28, 1859.
24074	Young, Wm. D.	Baltimore, Md.	Boot-jaek	Jan. 25, 1859.
23739	Youngman, Jacob	Sunbury, Pa.	Railroad-switches	May 17, 1859.
23638	Zeigler, George W., and W. H. Reed. (See Guernsey, S. B., assignor.)	Tiffin, Ohio	Fan, automatic	April 19, 1859.
25523	Zeigler, George W.	Mill Creek, Pa.	Horse-power machines, mode of applying and constructing.	April 12, 1859.
24423	Zeller, William	Lancaster, Ohio	Trace-fastenings	April 5, 1859.
26140	Zink, Anthony	Quincy, Ill.	Grain-hilling machines.	June 14, 1859.
25697	Zimmerman, William	New York, N. Y.	Telegraphing, mode of	Nov. 15, 1859.
25697	Zook, Samuel K.	New York, N. Y.	Telegraphing, mode of	Nov. 15, 1859.
25697	Zug, David	Shaferstown, Pa.	Harvesters	Oct. 4, 1859.

*Alphabetical list of persons to whom patents have been reissued during the year 1859.*

No.	Names of patentees.	Residence.	Invention or discovery.	Date of reissue.	Date of original patent.
709	Adams, Augustus, and Philo Sylla. (See Sylla & Adams.)	Troy, N. Y.	Knitting-machines	May 3, 1859	July 13, 1858.
677	Aiken, Nelson P.	Newburgh, N. Y.	Furnace, smelting	Mar. 29, 1859	July 30, 1857.
663	Alger, Charles C.	Freeport, Pa.	Distillation of oils from coal	Feb. 8, 1859	April 27, 1858.
	Alter, David, and S. A. Hill, assignors to themselves and W. F. Johnson, G. S. Selden, J. L. Russell, J. I. Johnson.				
741	Amies, Israel, assignor to John A. Jackson.	Philadelphia, Pa.	Veneers	June 21, 1859	Dec. 11, 1855.
784	Ames, John. (See Mitchell, Thomas, assignor.)	Derby, Conn.	Skirts, skeleton	July 26, 1859	} Division, Oct. 19, 1858.
785	Atwood, E. G., assignor to The Shelton and Osborn Skirt Manufacturing Co.	Derby, Conn.	Skirts, skeleton	July 26, 1859	
679	Atwood, E. G., assignor to The Shelton and Osborn Skirt Manufacturing Co.	Albany, N. Y.	Gas, making illuminating	April 5, 1859	} Division, Jan. 8, 1856.
680	Aubin, N.	Albany, N. Y.	Gas-generators	April 5, 1859	
681	Aubin, N.	Albany, N. Y.	Gas-retorts, tight joints for	April 5, 1859	
771	Aultman & Co. (See Sylla & Adams, assignors.)	Canton, Ohio	Mowing-machines	July 19, 1859	} Division, June 17, 1855.
772	Aultman, C., and Lewis Miller, assignors to C. Aultman & Co.	Canton, Ohio	Mowing-machines	July 19, 1859	
773	Aultman, C., and Lewis Miller, assignors to C. Aultman & Co.	Canton, Ohio	Mowing-machines	July 19, 1859	
774	Aultman, C., and Lewis Miller, assignors to C. Aultman & Co.	Canton, Ohio	Mowing-machines	July 19, 1859	
775	Aultman, C., and Lewis Miller, assignors to C. Aultman & Co.	Canton, Ohio	Mowing-machines	July 19, 1859	
776	Aultman, C., and Lewis Miller, assignors to C. Aultman & Co.	Canton, Ohio	Mowing-machines	July 19, 1859	
708	Aultman & Co. (See Miller, Lewis, assignor.)	Philadelphia, Pa.	Gas-burners	May 3, 1859	Oct. 12, 1858.
831	Bacon, S. T. (See Smith, E. N., assignor.)	Nashua, N. H.	Shuttles for weaving	May 3, 1859	Jan. 31, 1840; extended.
832	Bacon, S. T. (See North, John, assignor.)	Canton, Ohio	Mowing-machines	Sept. 27, 1859	} Division, Dec. 1, 1857.
728	Bailey, Yarnall, assignor to John K. O'Neil	Canton, Ohio	Mowing-machines	Sept. 27, 1859	
	Baldwin, James	Buffalo, N. Y.	Water, apparatus for raising	May 24, 1859	Mar. 20, 1849.
	Ball, E.				
	Ball, E.				
	Barnes, William T.				
	Bartlett, Joseph W. (See Reynolds, O. L., assignor.)	New York, N. Y.	Lamps	Feb. 8, 1859	Dec. 28, 1858.
659	Batchelder, William W.	Brooklyn, N. Y.	Printing-presses, machine for wetting and cutting paper for	Nov. 15, 1859	Aug. 25, 1857.
852	Beach, Moses S.	Brooklyn, N. Y.	Ox-druance, breech-leading	Aug. 16, 1859	Sept. 9, 1856.
	Bechtel, George H. (See Sichel, H. G., assignor.)				
791	Bishop, G. W.	Brooklyn, N. Y.	Wood, bending	Nov. 15, 1859	Dec. 18, 1849.
853	Blake, David, et al. (See Dodge, James, assignor.)	Boston, Mass.	Lockets, rim for	Nov. 15, 1859	} Division, April 28, 1857.
850	Blanchard, Thomas.	Wickford, R. I.	Lockets, mode of constructing	Nov. 15, 1859	
851	Bloomer, Charles G.	Wickford, R. I.			

*Alphabetical list of persons to whom patents have been reissued during the year 1859.*

No.	Names of patentees.	Residence.	Invention or discovery.	Date of reissue.	Date of original patent.
664	Brown, James, <i>et al.</i> (See Draper, James, assignor.)	London, England.	Cables, chain, arrangement of means for working and stopping.	Feb. 15, 1859	July 25, 1854; antedated April 20, 1847.

	Root, Francis H., and S. S. Jewett. (See Jewett & Root.)			

LIST OF DISCLAIMERS ENTERED DURING THE YEAR 1859.

No.	Name of patentee.	Residence.	Design.	Date.
	Blake, William.	Boston, Mass.	Gas-burners.....	Aug. 5, 1859.
	Tatum, Samuel C. (Sec Whittaker, S. H., assignor.)	East Tarentum, Pa.	Caustic, alkalies, device for putting up.....	Feb. 23, 1859.
	Thompson, George.	Cincinnati, Ohio.	Nut-machine.....	Aug. 27, 1859.
	Whittaker, S. H., assignor to Samuel C. Tatum.	Cincinnati, Ohio.	Nut-machine.....	Aug. 27, 1859.
	Whittaker, S. H., assignor to Samuel C. Tatum.	Cincinnati, Ohio.	Nut-machine.....	Aug. 27, 1859.

ALPHABETICAL LIST OF PATENTEES TO WHOM ADDITIONAL IMPROVEMENTS WERE GRANTED DURING THE YEAR 1859.

Names.	Residence.	Invention.	Date of patent.
Allison, W. A., assignor to self and John Murphy.	Philadelphia, Pa.	Railways, apparatus for watering and sweeping.....	Sept. 6, 1859.
Baker, William.	Utica, N. Y.	Lubricator for railroad car-axles, automatic.....	Aug. 11, 1857.
Bales, Moses	Big Plain, Ohio.	Plough, mole.....	Feb. 15, 1859.
Beebe, Hubb	New Haven, Conn.	Slates, mode of preparing and mounting.....	Mar. 29, 1859.
Bly, Douglas	Rochester, N. Y.	Vehicles, attaching thills to.....	April 12, 1859.
Campbell, Alexander, William, and James.	Harrison, Ohio.	Planters, corn.....	June 28, 1859.
Carlisle, Charles.	Woodstock, Vt.	Packing-wool, machine for.....	Oct. 6, 1857.
Castle, Orlander L.	Upper Alton, Ill.	Arithmometer for addition.....	Nov. 2, 1858.
Covert, H. W., assignor to M. Briggs	Rochester, N. Y.	Locks.....	Sept. 15, 1857.
Cravy, James.	Middleport, Ohio.	Shingle-machine.....	Nov. 24, 1857; reissued Sept. 28, 1858.
Croy, John J.	Caledonia, Mo.	Spokes, tools for tenoning.....	Feb. 3, 1857.
Cummings, D., jr.	Mobile, Ala.	Mangles.....	July 27, 1858.
Davis, Augustus B.	Philadelphia, Pa.	Car-springs, railroad.....	Feb. 15, 1859.
Draper, Simon W., and R. M.	South Dedham, Mass.	Mill-stones, machines for dressing.....	May 13, 1856.
Fink, John, and D. H. Fox.	Reading, Pa.	Ventilators, railroad car.....	May 8, 1855.
Hall, Joseph F.	Bangor, Me.	Curtain-fixture.....	Mar. 9, 1858.
Hall, Theodore F.	Marietta, Ohio.	Sash, window.....	Dec. 21, 1858.
Harris, L. P.	Mansfield, Ohio.	Evaporating saccharine juices, apparatus for.....	July 18, 1859.
Harris, Lyman P.	Mansfield, Ohio.	Evaporating saccharine juices, apparatus for.....	Jan. 18, 1859.
Haw, John	Old Church, Va.	Sawing-machine, picker.....	June 23, 1857.
Heth, Albert, and Gaylor Hall	Adams Center, N. Y.	Sawing-machine, cross-cut.....	Aug. 24, 1858.
Hodge, Samuel F.	Detroit, Mich.	Crushing-machine, orc.....	May 26, 1857.
Hollman, W. W.	Eddyville, Ky.	Straw-cutters.....	Mar. 30, 1858.
James, C. C.	Dayton, Ohio.	Seeding-machines.....	Dec. 15, 1857.
Jordan, Douglas B.	Cumberland, R. I.	Journals, mode of oiling.....	Mar. 15, 1859.
Keezert, John.	Chillicothe, Ohio.	Hominy-mortars.....	Mar. 2, 1858.
Monroe, Freedom.	Romeo, Mich.	Harness.....	Aug. 24, 1858.

ALPHABETICAL LIST OF PATENTEES WHOSE PATENTS WERE EXTENDED DURING THE YEAR 1859.

Names.	Residence.	Invention.	Date of patent.
Musser, William R., and J. Coleman	Lynchburg, Va.	Presses, tobacco.	Feb. 2, 1858.
Nelson, Mortimer	New York, N. Y.	Gold-washer.	Oct. 4, 1859.
Parker, Ephraim	Marlow, N. H.	Clothes-pins, machine for making	Jan. 15, 1856.
Riehards, Anos A.	Urbana, Ohio	Locks.	Feb. 15, 1859.
Riley, William	Camden, Miss.	Trap, fly.	April 27, 1858.
Robinson, Oliver	Cambridgeport, Mass.	Chairs, sofas, &c., spring-seats of.	March 9, 1858.
Robinson, Oliver	Rochester, N. Y.	Bedstead-fastening.	Dec. 28, 1858.
Simmons, Jonas	Coloes, N. Y.	Axes, machine for making	March 1, 1853.
Sims, William	Dayton, Ohio	Refrigerators.	Feb. 8, 1859.
Smith, Henry T.	Washington, D. C.	Bed-bottoms, spring	Oct. 6, 1857.
Spaulding, Samuel B.	Brandon, Vt.	Stoves, cooking	June 22, 1858.
Speat, James	Philadelphia, Pa.	Stoves, cooking	June 1, 1858.
Speat, James	Philadelphia, Pa.	Stoves, railroad-car	July 7, 1857.
Watt, George	Riehmond, Va.	Ploughs	Feb. 9, 1858.
Waugh, John	Elmira, N. Y.	Paper-hanging, machines for trimming the edges of.	Oct. 5, 1858.
Wells, Benjamin F.	Georgetown, D. C.	Naval architecture.	Oct. 18, 1859.
Wells, William	Boston, Mass.	Corn-shellers	Oct. 4, 1859.
Whipple, Carlisle	Cleveland, Ohio	Saws, reeiprocating, method of hanging and operating	Jan. 13, 1857.
Yeiser, Frederick	Lexington, Ky.	Altitudes of the sun, instruments for taking.	Feb. 8, 1859.
Andrews, Joseph E., John M. Farrar, administrator of.	Manchester, N. H.	Planing-machines.	Nov. 21, 1845.
Bigelow, Erastus B.	Boston, Mass.	Looms, for weaving plaids, &c.	April 10, 1845.
Blake, William	Boston, Mass.	Gas-burners	May 19, 1845.
Bruce, David, jr.	Brooklyn, N. Y.	Types, machines for casting.	June 7, 1845.
Burrall, Thomas D.	Geneva, N. Y.	Corn-sheller.	Dec. 6, 1845.
Edwards, Lewis	Norwich, Conn.	Ruling-machines	Oct. 9, 1845.
Faber, George, deceased, John S. Rappe, administrator.	Canton, Ohio	Boilers, magnetic water-gauge for.	Nov. 26, 1845; reissued Mar. 10, 1859.
Fessenden, George, and Luke L. Knight.	Templeton, Mass.	Match-splints, and arranging them in different frames, machinery for making.	April 26, 1845.
Francis, Joseph	New York, N. Y.	Boats and other vessels of sheet-iron or other metal, making	Mar. 26, 1845.
Goodyear, Nelson, deceased, Henry B. Goodyear, administrator of.	New York, N. Y.	India-rubber fabrics, manufacture of.	May 13, 1845.
Grant, Isaac T.	Schaghticoke, N. Y.	Fan-mills.	July 10, 1845.
Hale, Warren, and A. Goodman	Dana, Mass.	Wood, shaping irregular surfaces in.	July 22, 1845.
Hamilton, James	New York, N. Y.	Dredging-machines.	Mar. 30, 1852; French patent Dec. 16, 1845.
Hatch, J., deceased, J. B. Thaxter, administrator of.	Hingham, Mass.	Buttons	Feb. 20, 1845.
Heddenberg, Francis L.	New York, N. Y.	Stoves.	May 7, 1845.
Holmes, James G.	Charleston, S. C.	Chairs for invalids.	Sept. 24, 1845.
Hoe, Richard M.	New York, N. Y.	Printing-presses.	May 1, 1845; reissued May 1, 1847.

*Alphabetical list of patentees whose patents were extended during the year 1859.*

Names.	Residences.	Invention.	Date of patent.
Hyatt, Thaddeus.....	New York, N. Y.....	Vault-covers, illuminating.....	Nov. 12, 1845.
Montgomery, James.....	New York, N. Y.....	Boilers, steam.....	Dec. 26, 1845.
Morris, Ephraim.....	New York, N. Y.....	Raising and lowering weights, machines for.....	July 5, 1845.
Parkhurst, Stephen R.....	New York, N. Y.....	Ginning cotton and wool, machine for.....	May 1, 1845.
Pierce, Samuel.....	Troy, N. Y.....	Stoves, cooking.....	Dec. 6, 1845; reissued April 24, 1847.
Quecn, Christian V.....	Peekskill, N. Y.....	Forges.....	Nov. 18, 1845.
Robertson, William H.....	Residing in Havana.....	Mattresses.....	Dec. 17, 1846; European patent January 2, 1846.
Rogers, Calvin B.....	Saybrook, Conn.....	Combs, machine for dressing.....	Dec. 20, 1845.
Rogers, David B.....	Pittsburg, Pa.....	Cultivator-teeth.....	Nov. 1, 1845; reissued Sept. 20, 1859.
Sickles, Frederick E.....	New York, N. Y.....	Valves, cut-off, mode of tripping.....	Sept. 19, 1845.
Swift, Beriah, Jane Swift, and J. G. Lane, executors of.....	Washington, N. Y.....	Mills, grinding.....	Aug. 16, 1845.
Thayer, George W.....	Springfield, Mass.....	Bridges, wooden.....	April 22, 1845.
Trapp, William.....	Elmira, N. Y.....	Barrel, machinery.....	Oct. 1, 1845; reissued Mar. 10, 1859.
Tyler, Philos B.....	Springfield, Mass.....	Presses, cotton.....	Jan. 16, 1845; reissued May 1, 1847.
Woolson, Thomas J.....	Cleveland, Ohio.....	Stoves, cooking.....	Sept. 9, 1845.

DESCRIPTIONS AND CLAIMS OF PATENTS,

ISSUED IN THE YEAR 1859.

ILLUSTRATED WITH ENGRAVINGS.

No. 22,477.—HENRY B. ADAMS, of Brooklyn, N. Y.—*Improved Automatic Feed Boiler.*—Patent dated January 4, 1859.—The channels  $e$  and  $e^*$  communicate with tubes  $J J^1$  which are rigidly attached to the shell  $K$ , and which form sockets into which the oscillating chambers  $L L^1$  fit closely, and the channels  $d d^*$  communicate with pipes  $M M^1$ , which extend upward and through the covers of the oscillating chambers so that they communicate with the upper portion of the same, and float-valves  $P$  are hinged to the covers of the chambers  $L L^1$ , so that the openings of the pipes  $M M^1$  will be closed by the action of those valves. A rod  $N$  extends from the middle of the lower half  $I^1$  of the shell, and a weight  $O$  slides on this rod.

The inventor says: I *claim* the arrangement and combination, substantially as shown and described, of the chambers  $L L^1$ , shell  $K$ , and adjustable weight  $O$ , for the purposes set forth.

I also claim the combination of the valves  $P$  with the chambers  $L$ , as and for the purposes shown and described.

No. 22,478.—JONATHAN BALL, of Elmira, N. Y.—*Improved manufacture of Umbrella Rings.*—Patent dated January 4, 1859.—This invention consists in casting the ring  $A$  in a metal mould, in which mould are placed the bases of the ribs  $B$  and the wire to secure them, the wire being secured in place by the metal which is poured into the mould surrounding and inclosing it, thereby retaining the said bases more firmly in position and preventing it from being broken.

The inventor says: I *claim* as a new article of manufacture, an umbrella ring having the ends of the ribs or the stretchers and the wire to confine them, cast within, as set forth.

No. 22,479.—THOMAS BENNETT, of New York, N. Y.—*Improvement in Grinding Mills.*—Patent dated January 4, 1859.—This invention relates to an improvement in that class of grinding mills in which a rotary grinding cone  $H$  is placed within a similar-shaped shell  $D$ , and consists in having the conical shell adjustable instead of the grinding cone and shaft.

The inventor says: I *claim* the adjustable conical shell  $D$ , in combination with the grinding cone  $H$ , placed or secured upon a shaft  $C$ , having no end play or longitudinal or adjusting movement, the parts being arranged substantially as and for the purpose set forth.

I further claim, in combination with the adjustable shell  $D$  and cone  $H$ , the cob-cutter  $D^1$  permanently attached to the shaft  $C$ , and having its shell  $I$  fitted over the end of shell  $D$ , for the purpose set forth.

No. 22,480.—LEWIS BISHOP, of Talladega, Ala.—*Improvement in Elastic Saddles.*—Patent dated January 4, 1859.—This invention consists in having the seat  $C$  of the saddle suspended on springs  $B$  by means of loops  $a$  and eyes  $b$ , whereby the saddle is made to conform to the movements of the animal.

The inventor says: I *claim*, as an improved article of manufacture, a saddle having a seat  $C$ , suspended on springs  $B$ , by means of loops  $a$  and eyes  $b$ , and otherwise made as shown and described.

No. 22,481.—MICHAEL BOMBERGER, of Hummelstown, Pa.—*Improvement in Corn-Shellers.*—Patent dated January 4, 1859.—The nature of this invention consists in providing the shellers with flanged rollers  $E E$  revolving on stationary shafts or axles placed at right angles to the shelling cylinder  $B$ , which works in combination with loose rings  $h h$ , also placed on other shafts at right angles to the shelling cylinder  $B$ . It also consists in arranging a loose bar  $D D$  against which the springs  $f$  press, so that the springs will assist each other.

The inventor says: I *claim* so arranging the rollers  $E E$  (provided with helical springs, as described,) in combination with the loose rings  $h h$  as to operate in the manner and for the purposes as set forth.

I also claim the employment of the loose bar  $G$  when arranged with rollers  $E E$ , helical

springs *f*, adjusting bars *D D* and shelling cylinder *B*, substantially as and for the purposes described.

No. 22,482.—WILLIAM H. BROWN, of Middletown, Pa.—*Improvement in Horse-Rakes*.—Patent dated January 4, 1859.—To the rake *F* a segment rack *e* is secured, and to a longitudinal bar *f* in the frame *E* a toothed sector *g* is attached, said sector gearing into the rack *e*. The sector *g* is provided with an arm *h*, the upper end of which is connected by a link *i* with a lever *j*, the lower end of which is attached by a fulcrum pin *k* to the bar *f*, the lever *j* extending up in front of the driver's seat *D*.

The inventor says: I *claim* the arrangement and combination of the segment rack *e*, toothed sector and arm *g h*, rod *i*, lever *j*, and frame *E*, as and for the purpose shown and described.

No. 22,483.—A. C. BROWNLICH, of Buffalo, N. Y.—*Improvement in Harvesters*.—Patent dated January 4, 1859.—The nature of this invention consists in so constructing the axle *F* of a harvesting machine as to form, in connection with its adjuncts, the frame to which to attach the gearing.

The inventor says: I *claim* the axle *F* in combination with the pinions *o t v D*, shaft *H*, and pillow block *N*, constructed, arranged and operating substantially in the manner described, for the purpose specified.

No. 22,484.—JOEL BRYANT, of Brooklyn, N. Y.—*Improvement in Seed-Planters*.—Patent dated January 4, 1859.—The nature of this invention consists in providing cultivating ploughs with a seed-planting apparatus *P*, so that the said ploughs may be used either as cultivator or as seed-planter

The inventor says: I *claim* in connection with the cultivating plough *A* the seed-planting apparatus *P*, consisting of the drill-plough *c*, seed-box *d*, seed-slide *e*, driving-rod *r*, covering-wheel *o*, and sod-clearer *k*, the same being constructed and operating substantially as described and for the purposes set forth.

No. 22,485.—JOHN BURT, of Hartford, Conn., and WILLIAM W. WILLARD, of Syracuse, N. Y.—*Improved construction of Spectacles*.—Patent dated January 4, 1859.—The nature of this invention consists in employing a link-joint *A* in the nose-piece *x*, and arranging short bows *F* with tension springs *H*, and holding cups *E* or pads on the ends of said bows.

The inventors say: We *claim* the employment of the link-joint *A* to the nose-piece *x*, for the purpose described.

We also claim the construction and arrangement of the short bows *F*, springs *H*, cups *E* or pads, substantially in the manner and for the purpose as set forth and described.

No. 22,486.—DAVID BUZZELL, of Charlestown, Mass.—*Improved Rocking Chair*.—Patent dated January 4, 1859.—The nature of this invention will be understood by reference to the claim and engraving.

The inventor says: I *claim* in combination with the chair-stand or frame the movable leg-rest *D* and the sliding foot applied to such leg-rest, essentially as described, a mechanism by which, when the leg-rest is moved or swung upon its fulcrum *ff* or bearings, the sliding foot-rest *F* shall be moved on its supports either toward or away from the seat, substantially as specified.

I also claim the combination of the foot-levers *G G* and the rockers applied to the chair or seat-frame *A*, so as to operate together, substantially as described.

I also claim the combination of the toggles *L M*, the lifting-levers and their connections with the foot-levers and rockers *I*, the same being for the purpose of so operating the said rockers and levers as to cause the chair to be supported on the ground or floor either by the two rockers or the four foot-levers, as set forth.

I also claim so combining a foot-rest with a movable or turning leg-rest that the former shall be movable relatively to the latter, as specified.

No. 22,487.—CALVIN CANNADAY, of Indianapolis, Ind.—*Improvement in Cotton Cultivators*.—Patent dated January 4, 1859.—The nature of this invention consists in arranging the shears or blades *E E*<sup>1</sup> of the implement, whereby the same are prevented from being choked or clogged, and also rendered capable of being adjusted to suit the form of the ridges of the rows of cotton plants. It also consists in a thinning hoe *L* arranged and operated automatically so as to thin out the cotton plants in the drills the required distance apart as the implement is drawn along.

The inventor says: I *claim*, first, the two shears or blades *E E*, when placed obliquely with each other, pivoted to their respective standards *c c* and adjusted by the rod *G*, nut *g*, and fork *F*, substantially as and for the purpose set forth.

Second. The employment or use of the reciprocating hoe *L* attached to the bar *K*, which is connected with the rod *I*, the hoe being operated substantially as shown, to wit, through the medium of the cam *J* and spring *j* in connection with the pin *l* and springs *n n*, so that the transverse movement of the hoe relatively with the row of the plants will be obtained, and also

a vertical movement to allow the hoe to clear the plants when passing over them previous to each thinning out stroke, substantially as shown and described.

Third. The lever N when applied to the rod I and used in connection with the thinning hoe L, substantially as and for the purpose set forth.

No. 22,488.—AUGUSTUS C. CAREY, of Lynn, Mass.—*Improved Car Fan-Sweeper*.—Patent dated January 4, 1859.—The invention consists in the employment of a revolving fan F, which is so adjusted as not to come in contact with the carpet, but to revolve in close proximity thereto, by which the dust and dirt are blown into the pan or receptacle.

The inventor says: I *claim* the use of a fan F for the purpose of sweeping the carpet or other surface, in place of the revolving brush heretofore employed for the purpose.

No. 22,489.—GARDNER CHILSON, of Boston, Mass.—*Improvement in Cooking-Range*.—Patent dated January 4, 1859.—The nature of this invention consists in the mode of making the upright flue D leading from the fire-place to the flue space or spaces about the oven, and in the arrangement of a curved valve or damper N and recess M with reference to the diving and top flues of the ovens F F<sup>1</sup>. Also in the application of a protector plate H with reference to the fire-place, the two ovens, and the flues between and in rear of the ovens so as to support the ovens.

The inventor says: I *claim* as my improved arrangement of flues against the bottoms, the outer sides, the tops, the inner sides, and in rear of the two ovens, whereby the smoke, after passing over the tops of the two ovens or either is made to descend between them and pass out into the back flue in manner as described. And with the said arrangement of flues or the parts thereof to which the same specially belong, or, in other words, the top and diving flues of the two ovens, I claim the arrangement and application of a curved valve N and its arched recess M, the whole being made to operate substantially in manner described.

I also claim the protector plate H as combined and arranged with reference to the fire-place, the two ovens, and the flue between the two ovens, so as to support the ovens, as set forth.

I also claim the described mode of making the upright flue D leading from the fire-place or boiling chamber to the flue space about the oven, such being made with a reflecting back and tapering sides, and in other respects substantially as specified.

I also claim the expansion safety plate *t* as arranged with respect to the fire-place and applied on the top plate of the boiling chamber, in the manner and for the purpose substantially as specified.

No. 22,490.—EVERARD M. CLARK, of Lancaster, Penn.—*Improvement in Smut-Machines*.—Patent dated January 4, 1859.—As the grain is fed into the machine by the spout D at I it is arrested and scattered by the upper wings or beaters Q, and much of the lighter materials driven off in the spout D through the valve H before it enters the machine, in combination with the lower diagonal wings or beaters S a powerful suction is induced, keeping the grain suspended while it is beaten to and fro between the grooved wings and sides of the cylinder, and thereby effectually scouring off the fuzzy end of the grain; hulling it from all appending chaff.

The inventor says: I *claim* the diagonal grooved wings or beaters S, the upper and lower grooved wings or beaters Q, the two sliding valves O O on the bottom of the machine for regulating the draft, when combined substantially as set forth.

No. 22,491.—H. W. COLLENDER, of New York, N. Y.—*Improved Billiard-Cue Tips*.—Patent dated January 4, 1859.—The claim and engraving will explain the nature of this invention.

The inventor says: I *claim* the new article of manufacture named, to wit, a cue-leather or cue-tip, coated on its flat surface with a soluble gum or cement, as described for the purpose set forth.

No. 22,492.—W. B. CALVER, of Scranton, Penn.—*Improvement in apparatus for hoisting and dumping coal*.—Patent dated January 4, 1859.—The loaded cars D are shoved along one at a time on the portable rails *a a*, which when depressed rest on the sleepers I I. When a loaded car is on the rails *a a* the bar E is raised by means of power applied to rope A<sup>1</sup> attached to bail H, and the bars *i i* rise with the shaft E, the hooks *j j* catching underneath the axle *k k* of the car D; the car D is raised vertically and in a horizontal position until the rollers *d* reach the inclined portions *e* of the guides, when the bar E follows the inclination and the car D is tilted.

The inventor says: I *claim* the arrangement and combination of the rod G, bars *f*, E, *c c*, *i*, *j j*, bail H, and inclined guides *e*, as and for the purpose shown and described.

No. 22,493.—GEORGE H. DICKERMAN, of Boston, Mass.—*Improvement in Band-boxes*.—Patent dated January 4, 1859.—This invention consists in making the standard within the band-box on which the bonnet rests.

The inventor says: I *claim* the combination of a removable standard with the paper band-box, arranged substantially in the manner described and for the purposes set forth.

No. 22,494.—JOHN B. DUANE, of Schenectady, N. Y.—*Improvement in Cultivators*.—Patent dated January 4, 1859.—The frame D is formed of two parallel bars *c c*, connected at their outer ends by a traverse bar *d*. The front ends of the bars *c c* are connected by bolts or pins *e* to opposite sides of the frame A. To the end of each projection *f* a wheel *g* is attached. To the right side of the frame A a bar F is attached by a bolt or pin *h*, the bar F being allowed to work freely on said bolt; near the centre of the bar F a castor-wheel G is secured, and to the frame A in line with the front part of the bar F a bearing *i* for the bar F is attached.

The inventor says: I *claim* the arrangement and combination of the frame D, having wheels *g*, bar F, wheel G, bar E, and frame A, as and for the purpose shown and described.

No. 22,495.—JOHN W. EINHANS, of New York, N. Y.—*Improved Escapement for time-keepers*.—Patent dated January 4, 1859.—The nature of this invention consists in the mode of constructing an escapement-wheel C by arranging on the surface of the wheel in two lines of curvature alternating series of escapement-pins or teeth D E, and combining therewith a triangular block lever pallet F, so that as the escapement-wheel rotates, the outer and inner series of pins are alternately brought into contact with the opposite inclined planes of the pallet.

The inventor says: I *claim* the use of a triangular-shaped pallet-lever for an escapement-pallet for clocks, watches, &c., with an escapement-wheel constructed in the manner set forth; but irrespective of such use of my block-pallet I make no claim to the construction of the escapement-wheel of itself, as my invention relates exclusively to the use and application of the block-pallet substantially as set forth.

No. 22,496.—GEORGE B. FIELD, of St. Louis, Mo.—*Improvement in Spading Machines*.—Patent dated January 4, 1859.—The claim and engraving will explain the nature of this invention.

The inventor says: I *claim* propelling the shovels H by means of single cranks G attached to handles X, and guided by adjustable arms or levers L, so that the lower end of the shovels when in motion shall run in separate lines or furrows, the whole being constructed, arranged, and operating substantially as described.

No. 22,497.—MICAH GILLAM, of Alba, Penn.—*Improvement in Washing-Machines*.—Patent dated January 4, 1859.—The beaters or lifters *ff* are made up of two plates, forming a structure like the letter A, the brace connecting the two plates having the place of the cross mark of that letter. The shaft to which the beaters or lifters *ff* are attached is a horizontal rocker-shaft, and is actuated by the hand-lever *h*, there being interposed between the hand-lever and the rocker-shaft connecting rods *i i*, arms *k k*, vertical rocker-shaft *l*, connecting-rods *m m*, and crank-arms *n n*.

The inventor says: I *claim* the beaters or lifters arranged upon the rocker-shaft within the half cylindrical tub, lined with anti-friction rollers, the rocker-shaft being operated by the lever, vertical shaft, and connecting rods, and the whole being constructed and operated as set forth.

No. 22,498.—WILLIAM GOURLEY and ISAAC KREBS, of Winchester, Va.—*Improvement in the means of operating Carriage-Brakes*.—Patent dated January 4, 1859.—The nature of this improvement consists in constructing and applying brakes to vehicles in such a manner as that the power applied to the brake can be so regulated as to accommodate itself to the amount of weight on the *vehicle*, and compensate for the varying depression of the springs L, while at the same time the brake or rubber-rod *g h i* in its action supports in a measure the weight of the shafts.

The inventors say: We *claim* the construction and application of the compound or double lever *d d e e*, as described, and the crank-shaped rubber-rod or brake-bar *g h i* and T-shaped spring L, when combined and operated substantially as set forth and described.

No. 22,499.—E. H. HANCOCK, of Augusta, Ga.—*Improved Machine for Sawing Laths*.—Patent dated January 4, 1859.—This invention consists in the employment of a front set of feed rollers G G<sup>1</sup> having their teeth arranged around their circumference in spiral lines, the spirals of the upper roller running just the reverse of those of the lower roller, in combination with an ordinary back set of straight fluted feed-rollers H H<sup>1</sup> and with a stationary guide or gauge-strip *o*, which is set oblique to instead of parallel with the face of the saw. It also consists in the combination of a table B with hinged-top arbor *a* with saws, which can be set nearer together or further apart by means of collars *d d d*, feed-rollers with spiral and straight teeth, swinging or yielding frames A, and obliquely-set guide or gauge-set.

The inventor says: I *claim*, first, the combination of the peculiar spirally-toothed feed rollers G G<sup>1</sup>, ordinary toothed or fluted feed rollers H H<sup>1</sup>, and obliquely-set guide or gauge

O, when the whole is arranged as described and relatively to the saws for the purposes set forth.

Second. The combination of the rollers  $G^1 H$ , swinging frames  $L^1 L^1$ , shaft  $J$ , pinions  $K K$ , spur-wheel  $L$ , and cog-wheel  $D$ , substantially as and for the purposes set forth.

Third. The arrangement of the swing-table  $B$ , bearing a portion of the machinery, with respect to the frame  $A$ , and the rest of the machinery thereon, as set forth.

No. 22,500.—JOHN S. HARBISON, of Sacramento, Cal.—*Improvement in Bee Hives*.—Patent dated January 4, 1859.—The claim and engraving will explain the nature of this invention.

The inventor says: I *claim*, first, the graduating chamber  $B$  in combination with the curtain  $C$  and ventilating passages  $E$  and  $F$ , whereby air is admitted without light into the hive, arranged substantially as and for the purpose described.

Second. Providing the adjustable sectional comb-frames  $K$  with the flexible metal clamps  $b b$ , when the frames are constructed and arranged in the manner described for the purposes specified.

While not claiming, broadly, the removal of a tier of boxes at one operation, nor the boxes of a tier separately, by means of a clamp, irrespective of the mode of construction, I do claim—

Third. The device composed of the parts  $L f d c$  in combination with a horizontal tier of boxes, arranged and operated as and for the purposes described.

No. 22,501.—JOHN W. HEDENBERG, of St. Louis, Mo.—*Improvement in Coffee Pots*.—Patent dated January 4, 1859.—This improvement is applied to a coffee-pot having a reservoir and condenser attached for the purpose of condensing the steam as fast as generated, and it consists in making an air-chamber  $D$  between the reservoir  $C$  and coffee-pot, so as to prevent the water in the reservoir from becoming heated by immediate contact with the coffee-pot.

The inventor says: I *claim* the application of the chimney or pipe to the open space between the coffee-pot and the condenser, for the purpose of causing a current of cold air to pass between the coffee-pot and condenser, as set forth.

No. 22,502.—CHARLES HOWELL, of Cleveland, O.—*Improvement in Rotary Harrows*.—Patent dated January 4, 1859.—In the engraving the harrow  $A$  is of a triangular form, through the angles of which oblique mortises are formed, through which the axis  $a$  of the harrow  $B$  passes. The axis of the front harrow is inclined, but as the inclination of the latter would necessarily increase the drag on that side in which the teeth of the harrow are most depressed, the drag is neutralized by arranging the drag-hook  $c$  of the harrow on the other side of its axis.

The inventor says: I *claim*, first, the arrangement and combination of three rotary harrows, when the axis of each is inclined in the manner and for the purposes substantially as described.

Second. The arrangement of the hook  $c$  in relation to the front harrow, when combined with two harrows in the rear, arranged to operate in the manner set forth.

No. 22,503.—LUCIUS J. KNOWLES, of Warren, Mass.—*Improved Method of Operating the Valves of Pumping Engines*.—Patent dated January 4, 1859.—In the engraving  $A$  is the steam cylinder,  $B$  the piston,  $C$  the exhaust, and  $D E$  the steam passages,  $F$  the slide valve, which controls the main piston  $B$ , and to which is attached a hollow plunger  $G$ , that slides longitudinally in a cylinder in the steam chest  $H$ . Attached to the main steam chest  $H$  is an auxiliary steam chest  $I$ , in which slides the valve  $K$ . This valve is actuated by means of an arm  $L$ , attached to the piston rod  $M$ , through which passes the rod  $N$  attached to the valve. As the piston  $B$  reaches either end of its stroke, the arm  $L$  strikes one or the other of the adjustable nuts  $f g$  upon the rod  $N$ , and the valve  $K$  is moved.

The inventor says: I *claim* controlling the motions and positions of the plunger  $G$ , exclusively by steam admitted from the steam chest, and by suitable exhausts as set forth, for the purpose specified.

Second. I claim the described arrangement of the induction ports  $a$  and  $p$ , with respect to the exhaust ports  $z$  and  $h$ , and with respect to the throw of the plunger  $G$ , for the purpose specified.

Third. I claim admitting a quantity of steam before the advancing plunger through the passages  $s h$  and  $i r$ , for the purpose of arresting its motion, as set forth.

Fourth. I claim the secondary exhaust ports  $v v$ , operating as described, for the purpose set forth.

Fifth. The peculiar construction of the main valve  $F$ , whereby the pressure upon the same is relieved, as it passes the centre of its throw, and the piston is caused to start more gradually, as set forth.

No. 22,504.—ISAAC KREBS, of Winchester, Va.—*Improvement in the Means of Operating Carriage Brakes*.—Patent dated January 4, 1859.—The nature of this invention consists in constructing brakes for vehicles, in such a manner as to enable the application to the circumference of the but-end  $b b b$ , of the nave or hub part of wheels, two rubber blocks  $r s$  simultaneously, and in such a way as that the said rubber blocks  $r s$ , when they become worn

away to a great extent, can be brought up closer to the circumference of the hub, and be regulated by a sliding fulcrum *g*, and slotted clips *d e f*.

The inventor says: I *claim* the levers *h I J*, with movable fulcrum *g g*, the sliding adjusting connection rod and tap *n n P*, the slotted clip or fulcrum support *d e f*, and the spring rubber *r s*, when constructed and arranged in combination, as before set forth and described.

No. 22,505.—JOHN M. LEACH, of Oakville, Md.—*Improvement in Machines for Sowing Guano and other Fertilizers*.—Patent dated January 4, 1859.—This drill is designed to prepare the ground for setting out tobacco plants, and is made up of four sections, the outer one *a* for making the furrow, a second section *b* for distributing guano or any other fertilizer into the furrow, a third section *c* for covering the turned up earth upon the guano in the furrow, and a fourth section *d* for levelling and pressing down the earth constituting the bed for the tobacco plants.

The inventor says: I *claim*, first, the arrangement of the covering section of the drill within the frame of the roller section, as and for the purposes set forth; and, in connection therewith, I claim the arrangement of the box between the hopper and distributing-spout, the box being attached to the hopper by pliable or elastic material, and being vibrated with the spout by the toothed wheel upon the axle, as described.

No. 22,506.—THEODORE LUCE and JOHN H. MORRISON, of Detroit, Mich.—*Improvement in Railroad Sleeping-Car*.—Patent dated January 4, 1859.—This invention consists in attaching a series of folding berth bottoms *C* to each side of longitudinal central partition *B*, placed within the car *A*, and using, in connection with said partition and berth bottoms *C*, a double row of single seats *E E* at each side of the car *A*.

The inventors say: We *claim* the folding berth bottoms *C*, attached to each side of a central partition *B*, within the body of the car, in connection with the double row of single seats *E E* at each side of the car, with a passage-way *n* between them, the innermost row of seats at each side of the car being provided with falling backs, and the whole arranged substantially as and for the purpose set forth.

No. 22,507.—HENRY MAULE, of Philadelphia, Pa.—*Improvement in Railway Alarms*.—Patent dated January 4, 1859.—This invention has for its object the sounding of the steam-whistle at all places where the road is crossed by common roads, or on curves or other dangerous places, and consists in an arrangement of a middle rail *I I<sup>1</sup>* along the line of the track, which coöperates with a device attached to the locomotive, whereby the valve of the steam-whistle is always opened at that part of the road where the extra rail is placed.

The inventor says: I *claim* the employment of the lever *C D*, or its equivalent, in combination with an extra rail *I I<sup>1</sup>*, and with the steam-whistle; the whole arranged and operating, substantially as described, for sounding the steam-whistle at any desired part of the road.

No. 22,508.—R. C. MAUCK, of Conrad's Store, Va.—*Improvement in Corn-Harvesters*.—Patent dated January 4, 1859.—This invention consists in a bearing-wheel *G* rotated by the stalk, by which the cut product is thrown across the machine, and which serves by bending the stalk over a rest-block *a* at the time of cutting. It further consists in the manner of attaching the cutter *E*, and in providing longitudinal pieces below the frame and behind the knife, whereby a channel or groove *I* is formed, which, by passing over the stumps, keep the machine in line.

The inventor says: I *claim*, first, the bearing-wheel *G*, arranged substantially as and for the purpose set forth.

Second. The combination of the bearing-wheel *G* and the rest-block *a*, for submitting the stalk to the knife in the best manner to effect the cut.

Third. Guiding the machine by the passage of the groove *I* over the stumps of the cut products.

No. 22,509.—NATHAN OLNEY and CHARLES H. KELLOGG, of Amherst, Mass.—*Improved Spoke-Machine*.—Patent dated January 4, 1859.—The claim and engraving will explain the nature of this invention.

The inventors say: We *claim* the expanding cutter-heads *D*, in connection with the guides or patterns *G G I* attached to the reciprocating-carriage *F*, in which the stick *A<sup>1</sup>* to be operated upon is placed; the guides or patterns *G G I* actuating the cutter-heads respectively by means of the mechanism, substantially as shown and described for the purpose set forth.

We further claim, in combination with the expanding cutter-heads *D* and the guides or patterns *G G I*, on the carriage *F*, the circular-saws *Y Y*, fitted in the frame *V*, operated automatically by the carriage *F*, substantially as set forth.

No. 22,510.—A. J. PEAVEY, of South Montville, Maine.—*Improved Machine for Cutting and Punching Iron*.—Patent dated January 4, 1859.—In this invention it will be seen that, by turning the die-box *B* with the cutter *C*, saw-teeth of various pattern may be cut with one

triangular and one die, and that the axis of any circular-saw may be so adjusted as to bring the lower edge of the saw to the cutter; and by bringing the sliding-catch V into the variously-graduated circles in the plate O, the same variety in the number of teeth will also be produced.

The inventor says: I *claim* the cylindrical die-box B, in combination with the circular punch-socket D, both punch and die being by their means capable of revolution upon their axis and adjustment to the required angles of the teeth of the saw to be gummed, as specified.

I do not claim the dividing-plate and the parts necessary for its convenient operation, nor operating the punches by lever and cam, separately considered.

But I do *claim* the combination of the dividing-plate O and its appendages, substantially as described, with the punching-apparatus, in the manner and for the purpose specified.

No. 22,511.—C. S. PETTENGILL, of New Haven, Conn.—*Improvement in Revolving Fire-Arms.*—Patent dated January 4, 1859.—This invention relates to that kind of revolver which is in most common use, having its chambered cylinder C arranged to rotate on an axis D parallel with the bore of the barrel. It consists in the combination and arrangement of parts of the lock for the purpose of effecting the cocking of the hammer *f*, the rotation of the cylinder and the locking of the cylinder with its chambers in position for firing, all by the movement of the trigger T.

The inventor says: I *claim*, first, combining the hammer and the rotating-dog with the trigger by means of a forked tumbler H and a cam L working on the same pin, the said cam being formed with a notched tail *m* to engage and operate in combination with a horn on the trigger, substantially as and for the purpose set forth.

Second. The bent-dog I applied as described on a fixed conical steed on the centre of the rear of the breech, supported and combined with a cam L on the tumbler-pin *c*, to operate substantially as described.

Third. The arrangement of the helical main-spring upon a bolt, which is jointed to the hammer, and which slides through a fixed guide in the rear thereof, substantially as described.

No. 22,512.—WILLIAM PROVINES, of Columbus, Mo.—*Improved Machine for Ditching, Grading, &c.*—Patent dated January 4, 1859.—The back end of the scoop L projects over the scoops I so that the latter will be filled as they rotate, and each scoop I as it passes underneath the back end of scoop L assumes a horizontal position to receive its load owing to the eccentric position of the rod or shaft *f* relatively with the disk H, the scoops being actuated by the rods K; and for the same reason the buckets I assume a radical or a proximate position as they pass over the upper part of their path of rotation.

*Claim.*—The arrangement and combination of the elevators I, rods K, shaft *f*, disk H, and shaft G, substantially as and for the purpose shown and described.

No. 22,513.—C. B. ROGERS, of Deep River, Conn.—*Improvement in Machinery for Pointing the Teeth of Hair-Combs.*—Patent dated January 4, 1859.—By this manner of arranging the cutting portion of the device, the feed movement is not interrupted in any way, and the teeth of the comb are not liable to be broken while operated upon.

The inventor says: I *claim* forming the recesses *c*, at the centre and from the edges of the periphery of the wheel B, toward its centre, so that each recess shall extend only partially across the periphery of the wheel, and still cutting surfaces be formed entirely across it, without breaking or dividing the screw thread *b*, entirely across the wheel at any one point, substantially as and for the purpose set forth.

No. 22,514.—PAUL A. SABBATON, of Albany, N. Y.—*Improvement in Sifting-Shovels.*—Patent dated January 4, 1859.—The object of this invention is to make the shovel light, strong, and durable, by forming it of a material that shall combine these characteristics when the bars and its other parts are cast thin.

The inventor says: I *claim* as an improved article of manufacture, a screening-shovel, composed of malleable cast-iron, and otherwise made as shown and described.

No. 22,515.—GELSTON SANFORD, of Poughkeepsie, N. Y.—*Improvement in Grinding and Crushing Mills.*—Patent dated January 4, 1859.—The claim and engraving will explain the nature of this invention.

The inventor says: I *claim* first, the arrangement and combination of a conical grinding-surface with a concentric shell composed of stationary and adjustable wedges or staves, which are provided with a means of adjustment, substantially as described, and for the purposes set forth.

Second. The arrangement of the projecting surfaces C<sup>1</sup>, of the cone, substantially as described and shown, so that by reversing the direction of the rotation of the cone, small or large bodies may be crushed and ground in the mill.

No. 22,516.—WILLIAM F. SHAW, of Boston, Mass.—*Improvement in Lamps*.—Patent dated January 4, 1859.—The bottom of the chimney holder A is made of perforated metal for the purpose of admitting the air for the supply of the combustion uniformly and steadily to the air-chamber beneath the deflector, the wick *f*, within the tube D, is raised or lowered in the ordinary manner. The deflector F is made of fine wire gauze.

The inventor says: I *claim* the foraminous deflector described, operating in the manner substantially as set forth.

Second. I claim the foraminous deflector, in combination with the perforated bottom air-chamber, as set forth.

No. 22,517.—ISAAC M. SINGER, of New York, N. Y.—*Improvement in Sewing-Machines*.—Patent dated January 4, 1859.—The claim and engravings will explain the nature of this invention.

The inventor says: I *claim* placing the spool within the shuttle *c*, without any attachment, so that the heads thereof shall run in contact with the case of the shuttle, to give the required drag substantially as described.

I also claim, in combination with the shuttle-case *c*, and the spool placed therein without any connection, substantially as described, the employment of the spring-plates, substantially as described, to form spring bearings for the pivots of the spool as set forth.

And I also claim the shuttle-case and spool placed therein, without any attachment, as described, in combination with the inclosing plate and the face of the shuttle-race, substantially as described, by means of which combination the spool is held in place by simply placing the shuttle in its race substantially as described.

No. 22,518.—DAVID STUART, of Philadelphia, Pa.—*Improvement in Franklin Stoves*.—Patent dated January 4, 1859.—The claim and engravings will explain the nature of this invention.

The inventor says: I do not claim forming an air-space or chamber in which air circulates behind, or in contact with the fire-backs of stoves, and passes thence in a heated condition into the apartment, as that has been long known and used.

But what I do *claim* as my improvement in Franklin stoves is forming the fire-back of such stoves by the front wall of a cell or chamber D, around or on both sides of which the draft passes, and through which the air circulates as set forth, said cell or chamber being constructed and connected with the stove in the manner set forth.

No. 22,519.—WILLIAM HERRMANN STUBBE, of Boston, Mass.—*Lithographic Printing Press*.—Patent dated January 4, 1859.—The operation is as follows: The stone X<sup>3</sup> first passes under the "wiper" L, and is then inked; while this is going on, the toothless portion 10, of the gears C<sup>2</sup>, being opposite to the racks D<sup>2</sup>, the tympan *i* and nippers *g* remain stationary, the nippers being retained open by the pin *d*<sup>2</sup> resting upon the portion of the cam G<sup>2</sup>, and the stops rest upon the tympan, when the paper is placed on the nippers, when the bar L<sup>2</sup> passes out of the switch M<sup>2</sup> upon the carriage, the nippers are closed by the sudden motion of the cams G<sup>2</sup>, and the stops 7 are raised to permit the revolution of the tympan. The cams *f*<sup>2</sup>, upon the shaft F, move the lever E<sup>2</sup>, and engage the gears C<sup>2</sup> with the racks D<sup>2</sup>, and as the carriage now commences to return the gears are revolved, and the nippers *g* and tympan *i* are carried around, so that the paper is brought in contact with the stone.

The inventor says: I *claim* the cylinder of rollers *m*, in combination with a revolving tympan and scraper, operating as set forth for the purpose described.

Second. I claim the method of interrupting the motion of the gears *c*<sup>2</sup>, and of again engaging them with the rack by means of the cams *f*<sup>2</sup>, lever F<sup>2</sup>, and pin *a*<sup>2</sup>, operating in the manner set forth.

Third. I claim hanging the parts which operate the scraper on springs 17, in the manner substantially as specified.

No. 22,520.—GEORGE W. TOLLHURST, of Liverpool, Ohio.—*Improvement in Cultivators*.—Patent dated January 4, 1859.—The inventor says: I support the lower part of the tooth by the braces C C<sup>1</sup>, said braces are secured to the frame at the front end, the back end to the tooth about two thirds the way down. After placing the tooth at the desired point it is secured by means of the hooks E and quadrant F.

*Claim*.—The arrangement of the flanged quadrants F, pivots D, clamp-hook E, braces C and C<sup>1</sup>, teeth A B, and rigid frame G, in the manner and for the purposes set forth and described.

No. 22,521.—ALONZO WARNER and CYRUS A. WARNER, of Bristol, Conn.—*Improved Catch for Hanging Drapery*.—Patent dated January 4, 1859.—The nature of this improvement consists in securing wood or metallic springs or holders B upon a bedstead-rail or other places for the purpose of holding drapery, &c.

The inventors say: We *claim* for hanging drapery the spring-catch B, as a new and improved article of manufacture, constructed as and for the purpose specified.

No. 22,522.—DANIEL WATSON, of Newport, Ohio.—*Improved mode of Operating Drain Ploughs*.—Patent dated January 4, 1859.—In the engravings H is a crab or anchor, which is carried ahead in the line of the drain to be formed, and is secured to the ground in said line. From this crab extends a rope, or chain *f*, back through a ring in the point of the tongue *g*, to guide it, and thence to the drum I, of the travelling capstan J; the rope or chain is fastened to the drum at *i*, and thence continues to pass backward through a ring in the point of the tongue *k* to guide it.

The inventor says: I *claim* combining with the crab or anchor H, and the plough *a*, travelling capstans J, which are connected together by a rope or chain, as herein represented, for the purpose of working said plough as described.

No. 22,523.—WILLIAM WELLS, of Boston, Mass.—*Improvement in Corn-Shellers*.—Patent dated January 4, 1859.—The inventor says: The nature of this invention consists in the form which I give to the acting face of the shelling-wheel A and in its position, in combination with the direction or position of the guide B, and also in the use of the yielding presser C, in combination with the beater D.

*Claim*.—The arrangement and combination of the shelling-wheel A, guide B, clearer D, and weighted or spring-presser C, constructed and operating in the manner described and for the purpose specified.

No. 22,524.—ALONZO WHITCOMB, of Worcester, Mass.—*Copying Press*.—Patent dated January 4, 1849.—The claim and engravings will explain the nature of this invention.

The inventor says: When the screw is arranged to pass through and traverse a nut in the cross-bar, I *claim* connecting the screw D and platen F with each other in presses, by means of a cap on the upper side of the platen, with a spiral thread in its interior, to correspond with the thread on the lower end of the screw, substantially as described and for the purpose set forth.

No. 22,525.—BENJAMIN F. BEE, of Harwich, Mass.—*Improved Screw Propeller*.—Patent dated January 4, 1859.—The nature of this invention consists in inclosing the common screw propeller with a metallic cylinder *a*, for the prevention of the centrifugal tendency of the water when the propeller is in operation; the same being combined with metallic plates *e* extending lengthwise through the cylinder with perforations for the passage of the blades of the propeller.

*Claim*.—The combination of the cylinder *a* with the longitudinal plates *e*, substantially as described.

No. 22,526.—B. BRIDENDOLPH, of Clear Spring, Md., assignor to Himself and O. K. BOVEY, of said Clear Spring.—*Improvement in Horse Rakes*.—Patent dated January 4, 1859.—This rake is so constructed that it may readily be unloaded or emptied of its contents, the teeth of the rake being capable of adjustment to the desired height from the ground.

*Claim*.—The arrangement, substantially as shown, of the handles *c c*, rake-head A, shafts D D, runners F F, and links or rods E, for the purpose set forth.

No. 22,527.—MATTHEW CHAPMAN, of Greenfield, Mass., assignor to the J. RUSSELL MANUFACTURING COMPANY, of said Greenfield.—*Improvement in Attaching Handles to Cutlery*.—Patent dated January 4, 1859.—This invention consists in forming the handles by pressure by means of dies and from the rough, when secured on the tang *a* of the implement, whereby the handles are riveted to the tangs, and firmly closed around or on them.

The inventor says: I *claim* placing the handles in the rough on the tangs *a* of the implements, with or without the rivets, and compressing the same, while on the tangs, into proper form by means of dies, substantially as and for the purpose set forth.

No. 22,528.—JAMES C. COOKE, of Middletown, Conn., assignor to the RUSSELL MANUFACTURING COMPANY, of said Middletown.—*Improvement in Manufacturing Webbing*.—Patent dated January 4, 1859.—The claim and engravings will explain the nature of this invention.

*Claim*.—As a new manufacture, a fabric or belting made not only of two or more sets of body warps, 1, 2, 3, 4, 5, and a single filling thread passed through the decussations of the said warps, alternately or otherwise, but with confining warps arranged and crossed on the filling, and between the body warps and at various or numerous intervals between the two edges of the fabric, so as to bind together the cloths made by the body warps, and form them with no straight or continuous parallel ridges.

No. 22,529.—ROBERT FITTS, of New Ipswich, N. H., assignor to C. & G. C. WINCHESTER, of Ashburnham, Mass.—*Improved Method of Bending Wood*.—Patent dated January 4, 1859.—The claim and engravings will explain the nature of this invention.

The inventor says: I *claim* bending a piece of wood around a fixed form by means of the series of blocks, levers, and connecting bars, arranged and operating in the manner set forth.

Second. And, in combination with the above, I claim the spring face plate *u*, attached to the blocks *E*, substantially in the manner and for the purpose specified.

No. 22,530.—WILLIAM G. HAMILTON, of New York, N. Y., assignor to JOHN C. HAMILTON, of said New York.—*Improvement in Bridge Walls of Boiler Furnaces*.—Patent dated January 4, 1859.—The claim and engravings will explain the nature of this invention.

*Claim*.—The hanging of the bridge wall *M* upon an axis, in the manner described, or equivalent, by which it is made capable of being folded down out of the way, as set forth, and also the making of the axis hollow, terminating with an opening forward, as described and shown, for the purpose stated.

No. 22,531.—DAVID E. HUGHES, of New York, N. Y., assignor to the AMERICAN TELEGRAPH COMPANY, of said New York.—*Improvement in Electro-Magnetic Telegraphing*.—Patent dated January 4, 1859.—The claim and engravings will explain the nature of this invention.

The inventor says: I *claim* introducing into that portion of the electric current which passes to the opposite pole of the machine at the station where the operator is working, a retarder *g*, such substantially as herein described, whereby said portion shall not reach the near ground plate until after the other portion of the same current shall have passed over the line wire and reached the distant ground plate *d*, whereby said current is enabled to flow through the machine situated at the place of the operator, as aforesaid, without setting said machine in motion, substantially as described.

No. 22,532.—DAMASE LAMOREUX, of New York, N. Y., assignor to ALEXANDER DOUGLAS & SAMUEL S. SHERWOOD, of said New York.—*Improvement in Manufacturing Corsets and Bustles*.—Patent dated January 4, 1859.—This invention consists in combining in one garment a corset and bustle, which may also serve as a skirt supporter, the necessary rotundity and fulness for the bustle being attained by hoops *e e*, inserted in the lower part of the corset, which extends down, and is enlarged at the bottom to form the bustle.

The inventor says: I *claim*, the new article of manufacture constituting a corset and bustle, when constructed in the manner described and for the purpose set forth.

No. 22,533.—STEPHEN G. MENDENHALL, of Richmond, Ind., assignor to ISAAC LAMB, of said Richmond.—*Improvement in Looms*.—Patent dated January 4, 1859.—The claim and engravings will explain the nature of this invention.

The inventor says: I *claim*, first, the treadle roller *G*, carrier *E F*, and spring *H*, in combination with the scroll cam *I*, arranged in the box *D*, for the purpose of operating the treadles substantially in the manner described.

Second. The hook *J* having an adjustable and hinged attachment to the breast-beam, when combined with a set screw to determine its position, and operating in the scroll cam in the manner set forth.

Third. The combination with the treadle of the graduated series of mortises *Z*, and pin *Y*, for the purpose of regulating the width of the shed.

Fourth. The combination of the picker spring *P*, sliding catches *O*, triggers *U*, and straps *Q T*, for the purpose of throwing the shuttle as set forth.

Fifth. The combination of the double eccentric pulley *R S* and straps *Q T*, with the set-screws *6*, arranged substantially in the manner described for the purpose of expanding the picker-spring *P*, in such a manner as to equalize the power at each forward motion of the lay or batten.

No. 22,534.—GOODLOE H. TAYLOR, of Shelburne, Mass., assignor to Himself and WILLIAM SHERWIN, of Shelburne Falls, Mass.—*Improvement in Lasts*.—Patent dated January 4, 1859.—This invention consists in so arranging the spring and bent lever or hook *c*, as that while the spring may act to throw the hook *c* on or under the plate on the last.

The inventor says: I *claim* so pivoting the hook or lever *c*, as that the strain shall come upon said pivot and not upon the spring, by which means I effect a better and more certain fastening, as set forth and explained.

No. 22,535.—JAMES D. WILLOUGHBY, of Carlisle, Penn., assignor to C. M. ALEXANDER, of Washington, D. C.—*Improvement in Sealing Cans and Bottles*.—Patent dated January 4, 1859.—The claim and engravings will explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of the disks *B* and *E*, screw *F* and top *C*, with the rubber *D*, in such a manner that when the rubber is compressed its periphery will press tightly against the insides of the can or bottle mouth, while its centre presses against the rod or screw *F* for the purpose of effectually excluding the air, as fully described.

Second. I also claim the subject of the first claim in combination with the neck of the bottle or can, as constructed for the purposes set forth.

No. 22,536.—EPHRAIM D. ROSENCRANTZ and WILLARD H. SMITH, of New York, N. Y., assignors to said ROSENCRANTZ and BARTON E. CLARK, of said N. Y.—*Improvement in Burners for Vapor Lamps*.—Patent dated January 4, 1859.—The tube A holding the wick being closed with a plate *a* near its upper end, which arrests the rising of the fluid and gummy matter and prevents its flowing upon the under surface of the cap D and down its sides, thus preventing the closing of the apertures *d d* in the cap D by said gum.

The inventors say: We *claim* the employment of a tube A for holding the wick when provided with a plate *a* and perforations *ff*, for the purpose set forth.

We claim the employment of a cap D, or heater having perforations *b b* tangential to its periphery, substantially as set forth, when used with a wick tube A, in the manner and for the purpose set forth.

No. 22,537.—CHARLES E. H. RICHARDSON, of Philadelphia, Penn.—*Improvement in Coffins*.—Patent dated January 4, 1859.—The casket A A<sup>1</sup> is lined throughout with heavy silk or duck, the lining is then covered with a coat of metallic paint. Sheets of sound smooth and prepared cork is soaked in collodion long enough to fill up the pores and to coat the surfaces of the sheets. When the collodion is dry a coat of oil varnish is to be laid on the cork over it, and when the coat of paint on the lining is dry this cork is laid in a proper position on the bottom and around the sides of the coffin.

The inventor says: I *claim* the construction of a coffin or casket made air and moisture-tight by a double lining of cloth and cork, prepared and combined in the manner and for the purpose substantially as described.

No. 22,538.—WILLIAM PAGGET ALLEN, of Dubuque, Iowa.—*Improvement in Composition for Friction Matches*.—Patent dated January 11, 1859.—The inventor says: The method I pursue in mixing this composition is as follows: I take one part of sandarach and two parts of shellac by weight, dissolve them in alcohol with or without heat, using such a quantity of alcohol as will produce a paste of about the consistency of honey. To this paste I add phosphorus in the proportion of one part of phosphorus to two parts of the paste by weight. I then raise the temperature of the whole sufficiently to melt or dissolve the phosphorus, after which I stir the whole until it is cold.

The inventor says: I *claim*, first, the combination of phosphorus with the substances marked B and C, in the proportions and manners substantially and for the purpose set forth in the specification.

Second. The combination of phosphorus with the substance marked D and E, in the said proportions and manner and for said purpose.

Third. The combination of phosphorus with the substance marked A, in said proportion and manner and for said purpose.

No. 22,539.—JOHN ALLENDER, of New London, Conn.—*Improved Roller for Expressing Water from Clothes*.—Patent dated January 11, 1859.—The claim and engravings will explain the nature of this invention.

The inventor says: I *claim* a roller I consisting of a spirally coiled spring J, arranged on a shaft or roller made smallest in the middle, (to allow the spring to yield,) covered with India rubber, or some flexible material, that will yield or bend readily as the spring J yields to the cloth, clothes, or other article being squeezed by the rollers.

No. 22,540.—JAMES BARKLEY, of Weston, Mo.—*Improved Door-Spring*.—Patent dated January 11, 1859.—In the engravings B is a spring, one end of which is secured to the casing by means of two half staples, one being driven into the casing above and the other below the spring, the upper one projecting downward and the lower one upward, and the spring being caught between the two is held securely. The other end of this spring is provided with a hook *a*, said hook catching upon the rod B.

*Claim*.—The employment of the spring B, which shall be provided with a hook *a* at one end, and which shall be secured to the casing at the other by means of two half staples, thus making a spring, which is adjustable at both ends, capable of being detached from either the door or casing in a moment of time, as is specified.

No. 22,541.—BENJAMIN BEERS, of New Fairfield, Conn.—*Improvement in Canteens*.—Patent dated January 11, 1859.—The claim and engravings will explain the nature of this invention.

*Claim*.—The combination with said canteen of an additional vessel, made by hollowing out a piece of wood and inserting its edge in a groove D D in the end or head C C.

No. 22,542.—A. J. BOWERS, of Richmond, Va.—*Improved method of securing together the sides of Cast Metal Columns*.—Patent dated January 11, 1859.—The two sides A B are secured together by fitting the projections *a* of the plate A in the notches *d* of the plate B, the edge of the plate A bearing against the ledge *c*. Wedges or keys *f*, which may be of wrought-iron, are then driven down between the projections *e e* and *a a*, and the two sides are firmly secured together.

The inventor says: I *claim* securing the plates or sides of metal columns together by means of the projections *a a e e*, ledge *c*, provided with notches *d*, and the wedges *ff*, substantially as shown and described.

No. 22,543.—THOMAS BIRCH and LEWIS BRADLEY, of Hartford, Conn.—*Improved Water Closet*.—Patent dated January 11, 1859.—The nature of this invention consists in constructing an air vessel, or in the employment of an air vessel to produce a gradual stoppage of the flow of water, as applied to water closets.

*Claim*.—The arrangement of the metallic rim *B*, arm *C*, disk *F*, cap *G*, lever *Q*, in the manner as and for the purpose described.

No. 22,544.—DUNCAN BRUCE, of Paspebiac, Canada.—*Improvement in Artificial Manure*.—Patent dated January 11, 1859.—This invention has reference to the preparation of nitrogenous manures from animal matters, and has for its object so to fix the ammonical and other gases, that they may be ready to act at once upon the crop, without the necessity of waiting for the decomposition of the ammonical compounds.

The inventor says: I *claim*, as a new article of manufacture, the manure manufactured by the within described process, the animal matters being first decomposed in the manner set forth, and subsequently disinfected by charred shale, or its equivalent, as described.

No. 22,545.—GEORGE BUCHANAN, of Hickory, Pa.—*Improved School-Desk and Chair combined*.—Patent dated January 11, 1859.—The claim and engravings will explain the nature of this invention.

The inventor says: I *claim* a seat *C* pivoted near its front edge to a stationary frame *A*, and hinged near its rear edge to a movable back *c*, and having its arms pivoted by their rear ends to the movable back and hinged to the stationary frame, substantially as and for the purposes set forth.

No. 22,546.—J. D. C. CARPENTER, of Cincinnati, Ohio.—*Improved Device for Setting Laterally Circular Saws*.—Patent dated January 11, 1859.—The saw *B* is supported by the shaft *C*, carrying two band pulleys *D* and *d*. From the pulley *D* is a band which passes to the wheel *E* to set in motion the feed-rollers *K*. The saw shaft *C* is capable of moving endwise so as to adjust the saw to the right or left. This adjustment is effected by means of the rock shaft *F*, to which the arms *e* are attached by a pin placed some distance from the centre of the end of the rock-shaft so as to form an eccentric. The arms *e* are attached to the bar *G*, which slide backward and forward upon the frame *A*, carrying the saw-shaft *C* and also the spreader *H*.

*Claim*.—The rock-shaft *F*, connected with arms *e*, and acting as an eccentric, or as two cranks, for adjusting the saw-shaft laterally, substantially as set forth.

No. 22,547.—JOHN B. CORNELL, of New York, N. Y.—*Improved Burglar-Proof Safe*.—Patent dated January 11, 1859.—The claim and engravings will explain the nature of this invention.

The inventor says: I *claim* combining a cast-iron door frame *a b* with the wrought-iron portions of the frame of a safe, in such a manner that the molten iron, which is afterward, whilst in a melted state, combined with the said safe frame, will form a burglar-proof protecting casing around the said door frame, substantially as set forth.

No. 22,548.—ELIJAH H. DANFORTH, of Jamestown, N. Y.—*Improved Lathe Attachment for Finishing Dental Plates*.—Patent dated January 11, 1859.—To the bed pieces *a a* are attached two boxes *b b*, which receive and carry the piston *c c*. Under the boxes *b b*, and between the bed pieces *a a*, is a slide *e e*; this slide is held in its place by a thumb-screw *h*. The adjustable crank consists of a block of brass or other metal *i*, either round or octangular; in one end of this is a hole to receive the mandrel of a lathe. In the other end is a dove-tailed groove to receive a slide *j*.

The inventor says: I *claim* the combination of the mechanical devices specified, consisting of the piston *c c*, bed pieces *a a*, boxes *b b*, slides *e e*, and *j*, and the crank constructed and operated for dental and other purposes, as described.

And I also claim the adjustable crank, as it is arranged and attached to the specified parts of this machine, as set forth.

No. 22,549.—THOMAS DANIELS, of Toledo, Ohio.—*Improved Soda-Water Apparatus*.—Patent dated January 11, 1859.—The claim and engravings will explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of the whole apparatus, the sirup cans being elevated above the refrigerator, which is provided with the group stop-cock *e*, substantially as set forth for the purposes described.

Second. The arrangement of the tubes *d* and *G*, for conducting the sirups and the water to the top of the ice chamber without cooling them, and concentrating the cooler portion of these liquids below the ice, near the place of discharge, substantially as described.

No. 22,550.—A. L. DENNISON, of Waltham, Mass.—*Improved Method of Securing the Cylindrical Balance-Springs of Watches.*—Patent dated January 11, 1859.—The top plate A is cut away at *a* immediately beneath the balance, of which the shaft *f* is supported by the cock *c*, and the lower part *b*. At the bottom of the shaft *f* is the collet *g*, which is vibrated by the fork *x*. Above the roller is placed the cylindrical spring *h*, one end of which is attached to the balance and the other to a stud which is attached to the *potence* or to the pillar or lower plate.

The inventor says: I *claim* placing the cylindrical spring *h*, beneath the balance and between it and the fork, and cutting away the upper plate to furnish room for its accommodation, as set forth.

No. 22,551.—EUGENE DUCHAMP, of St. Martinsville, La.—*Improved Lewis for Attaching Tackles to Blocks of Stone.*—Patent dated January 11, 1859.—A semi-spherical metallic shell A has a detachable air-pump D attached to its side capable of exhausting the air from the chamber when it is pressed on huge blocks of stone, to which it will adhere by the pressure of the atmosphere, to enable the stone to be elevated by tackle.

The inventor says: I *claim*, as an improved article of manufacture, a lewis, composed of a shell A, air-pump D, nozzle or tube B, packing E, staple G, and otherwise made as shown and described.

No. 22,552.—SAMUEL FALWELL, of Memphis, Tenn.—*Improvement in Endless Conveyors for removing Earth.*—Patent dated January 11, 1859.—The endless conveyor C consists of a series of cars *e e*, which are each composed of sections *ff*, hinged together upon the axis of the small wheels *g g*. These sections are sufficiently narrow to turn readily upon the end rollers or wheels *c c*. The wheels *g g* are of less diameter than the truck wheels *h h*, each section is furnished with checks or shoulder-stops *k k*, against which the side panels *m m* of the cars abut, which prevent the swagging of the sections of the cars.

The inventor says: I *claim*, first, the series of sectional cars *e e*, in an endless connection, each car being provided with terminal or truck wheels *h*, and intermediate wheels *g g*, of varying and lesser diameter than the truck wheels, and shoulder stops *k k*, or equivalents thereof, substantially as set forth.

Second. I claim the combination of such cars, with an upper and lower track and wheels *c c*, as set forth.

No. 22,553.—MOSES G. FARMER, of Salem, Mass.—*Improved Electro-Magnetic Fire-Alarm Apparatus.*—Patent dated January 11, 1859.—This invention consists, first, of a circuit wheel *a*, and the means of actuating it and regulating its motion. Secondly, of the means by which the signal indicated upon the circuit wheel is transmitted to the central station.

The inventor says: I *claim* the circuit wheel *a*, and the crank or handle by which it is actuated, in combination with the key H, and the electro-magnetic circuit, operating in the manner substantially as set forth, to send a definite signal from a sub-district to the central station.

Second. I claim the method of completing the circuit, when the door of the signal box is closed, through the springs M and N, as set forth for the purpose described.

No. 22,554.—JOHN S. GRAY, of New York, N. Y.—*Improved Door-Spring.*—Patent dated January 11, 1859.—The socket *a* has an extension *b* cast with it. In this socket there is a turning bolt *c*, which has a square hole *e* in its upper end at its centre, into which the end of the spring *d* fits. *f* is a hold-fast, and consists of a collar that fits over the upper end of the bolt *c*.

*Claim.*—The combination of the socket *a b*, bolt *c*, and hold-fast *f*, with the torsion-spring, constructed and arranged substantially in the manner and for the purposes set forth.

No. 22,555.—I. R. HALDEMAN and J. S. HALDEMAN, of Bloomington, Ill.—*Improved Washing Machine.*—Patent dated January 11, 1859.—This invention consists in the manner of mounting the rolls J, on which the endless apron is placed by means of which any number of fluted rolls H may be used. It also consists in the arrangement and combination of devices, by means of which the operation is materially facilitated.

The inventors say: We *claim*, first, the arrangement of the springs F, and supporting beams E, in connection with the sliding-frame G, that carries the lower series of fluted rolls H, for the purposes set forth.

Second. The clasp *o*, as constructed and operated for the purposes set forth.

Third. The sliding-standard R, or its equivalent, in combination with the rack-bar Y, and pawl X, the whole being arranged and operated in the manner and for the purposes substantially as set forth.

No. 22,556.—EDEN S. HOWELL, of Hope, N. J.—*Improved Washing-Machine.*—Patent dated January 11, 1859.—In using this machine the live-rubber *k* is kept continually oscillating on its axis, and periodically pressed against and removed from the dead-rubber. During this operation upon the piece of the clothes, the water in the piece is at each pressure

of the live-rubber partially forced through the apertures *aa*, causing the water in that portion C<sup>1</sup> of the shell included between the head I and partition E to rise higher than in the other part of the said shell, and at each receding of the live-rubber, or while it continues to press and rub the surplus water in the portion C<sup>1</sup> of the shell flows back through the apertures *aa*, keeping the piece flooded.

The inventor says: I *claim*, first, the combination of the live-rubber *k*, with the horizontal sliding and rotating shaft G, vibrating pressing lever H, and ratchet *g*, or its equivalent, the whole arranged and operating substantially as described for the purposes set forth.

Second. In combination with the rocking and pressing rubber K, the perforated rubber partition E, substantially as described.

Third. The detachable lever *m*, and bar O, substantially described for the purpose set forth.

No. 22,557.—THOMAS J. HUBBARD, of Hamilton, N. Y.—*Improvement in Flail-Caps*.—Patent dated January 11, 1859.—The inventor says: I construct the flail-caps of cast iron or brass, in two equal parts or longitudinal sections A A, with a crescent tongue or lip B formed in the interior of each section, so that when adjusted to the staff C, with the groove D to match the tongue or lip B, and fastened with a wire E, it makes a perfect and durable cap.

*Claim*.—The construction of flail-caps, of casting metals in separate parts or sections, with the lip or crescent tongue formed upon the interior thereof as described.

No. 22,558.—EDWARD HUNT and HENRY DAVIS POCHIN, of Talford, England.—*Improvement in Preparation of Resins*.—Patented in England, April 27, 1858.—Patent dated January 11, 1859.—The claim will explain the nature of this invention.

The inventors say; We are aware that stills and steam worms, capable of distributing small jets of steam, have been before used in a somewhat similar way for the treatment of oils and fatty matters, and for improving the quality of resin oil, obtained from substances similar to those used by us in the processes described. But such a process has never, so far as far as we can ascertain, been applied to any such substances, as are proposed to be operated upon by our processes for the purpose of obtaining the resinous and solid products specified as the result of our said processes.

We therefore *claim* the new articles of commerce specified, as produced by the processes mentioned, or by any similar mode or process, said articles or products not having been hitherto known in commerce or used in the arts.

No. 22,559.—R. V. JONES, of Johnstown, Pa.—*Improved Sausage Stuffer*.—Patent dated January 11, 1859.—In the engravings A is a hollow cylinder, into which the minced meat is placed through the hopper or funnel H; the cylinder is open at one end for the admission of the piston M, and at the other having a nozzle or tube P.

*Claim*.—The piston rod and supporting recess, constructed as described, in combination with the prolonged nut and screw for the purpose specified.

No. 22,560.—HENRY W. JOSLIN, of Trenton, N. J.—*Improvement in Treatment of India Rubber*.—Patent dated January 11, 1859.—The nature of this invention consists in combining sulphuret of zinc with India rubber or caoutchouc, and submitting the compound thus formed to the action of heat, by which in its nature and qualities it becomes so altered as not to be affected by heat unless of a higher temperature than that used in its preparation.

*Claim*.—The use and employment of sulphuret of zinc, either artificial or native, substantially prepared by the aforesaid process described, in combination with India rubber, for the purpose of curing or vulcanizing it in form and manner as set forth, without the use of free sulphur in any way in combination with the rubber.

No. 22,561.—JOHN L. KNOWLTON, of Glassborough, N. J.—*Improvement in Stump-Extractors*.—Patent dated January 11, 1859.—This invention consists in forming a simple device for extracting stumps by combining a vibrating lever C, catches G G<sup>1</sup>, and springs M M<sup>1</sup> with a hauling chain H, the chain being so guided as to be incapable of twisting or of moving vertically or laterally at the point where it is acted upon by the catches G G<sup>1</sup>.

*Claim*.—The lever C, with the catches G and G<sup>1</sup>, in combination with its hauling chain H, and the springs M and M<sup>1</sup>, or their equivalents, when the said chain is guided, so as to prevent it from twisting or from moving laterally or vertically, as set forth.

No. 22,562.—OLIVIER LAFREMIERE, of New York, N. Y.—*Improvement in Horse-Collars*.—Patented January 11, 1859.—The claim and engravings will explain the nature of this invention.

The inventor says: I *claim*, as an improved article of manufacture, a horse collar, having its lower part provided with a metallic tube C, to give form to and hold the packing, and otherwise made as set forth.

No. 22,563.—HENRY LESTER, of Cincinnati, Ohio.—*Improvement in Roofing Compositions*.—Patent dated January 11, 1859.—The nature of this invention consists in mixing the following ingredients: pitch, rosin, coal, tar, rubber, or gutta percha, calcined plaster of Paris, soap-

stone, rosin oil, linseed oil, turpentine, gum copal, fire-proof paint, charcoal, japan, and white-lead, in such proportions that the roofing when finished will not run, crack, or scale off.

The inventor says: I *claim* a composition for roofing and similar purposes, produced from the mixture of the ingredients described, in the proportion and for the purposes set forth.

No. 23,564.—JOHN MARVIN, of Bellport, N. Y.—*Improved Taper-Gauge for Carpenters*.—Patent dated January 11, 1859.—The object of this invention is to obtain a gauge that will scribe a line having an oblique position relatively with the edge of the *stuff*, plank, or board, against which the force of the gauge bears as it is shoved along, and from which the work is to be cut or formed, and one that is capable of being so adjusted that the line may be made more or less taper as required.

The inventor says: I *claim* the employment and use of a conical roller C, applied to a block or a stock B of the gauge, and connected with a rack *a*, or the pencil bar A, in the manner shown, or in any equivalent way, so that the roller will be rotated as the gauge is shoved along, and the bar A moved longitudinally by the rotation of the roller, so as to produce the desired result.

I further claim, in combination with the conical roller C, the adjustable band *c*, and fence *e*, applied to the block or stock B, for the purpose of regulating the degree of taper of the line *h*, substantially as described.

No. 22,565.—EDWARD MAYNARD, of Washington, D. C.—*Improvement in Metallic Cartridge Cases*.—Patent dated January 11, 1859.—This metallic-cartridge is produced by soldering a steel disk *b*, to the exterior surface of the bottom of a brass cap *c*, which is of less diameter than the disk *b*, and then drilling a small central aperture through the combined brass and steel bottom of said cartridge.

The inventor says: I *claim* as a new manufacture, an improved metallic-cartridge, composed of a brass cup, combined with an exterior steel disk, substantially as set forth.

No. 22,566.—CHARLES MCBURNEY, of Roxbury, Mass.—*Improvement in India Rubber Hose-Pipes*.—Patent dated January 11, 1859.—The material of which the pipe is made is compounded as follows: 12 pounds of rags, cuttings or trimmings of cloth that have been coated with unvulcanized India rubber, 12 pounds rubber, 25 pounds flour of sulphur, and 6 pounds oxyd of zinc. These materials are ground or mixed together into one mass, and the compound is rolled into sheets, which are then cut into strips and formed into a tube upon a tube. The pipe is then submitted to the vulcanizing or heating process.

*Claim*.—As a new article of manufacture, a semi-elastic composition pipe, compounded of the ingredients, and in the proportions substantially specified, when vulcanized, as set forth.

No. 22,567.—ALEXANDER B. McCANS, of Ashley, Mo.—*Improved Machine for Sawing Shingles from the Bolt*.—Patent dated January 11, 1859.—This invention consists in the combination of devices for swinging the saw past the bolt, so as to saw off the shingles, and for returning it again for the next succeeding similar operation. Also in setting the bolt, to give the proper taper to the shingles which are cut *butt* and *point* therefrom.

The inventor says: I *claim*, in combination with a saw hung in a swinging arm, the spur *h*, rack *i*, and sliding-bar E, for drawing said saw through the bolt to sever the shingle therefrom, and to trip and allow the saw to fall back for the next similar operation, substantially as described.

I also claim, in combination with a pivoted table for holding the bolt, the shifting bars R R, arranged and operating substantially as herein described, for bringing the bolt up to the saw in such a manner as to alternately reverse the ends of said bolt from which the butts and points of the shingles are cut, as set forth.

No. 22,568.—THOMAS E. McNEILL, of Philadelphia, Pa.—*Improvement in Railroad Car Seats*.—Patent dated January 11, 1859.—These seats are constructed so that they can swing round on pivots at one of their ends, and the backs can be detached so as to form berths for sleeping.

The inventor says: I *claim*, first, jointing the ends of the arm-rests I to the ends of the upright standards L, at the corners of the seats, and providing their opposite ends with sliding bolts or bars M, and right-angled plates P, and half pivots or pins I<sup>1</sup>, for enabling their attachment, when in a horizontal position, by the bars H, and their upright elevation to form a support for the hinged portions G<sup>1</sup> of the backs G, when the seats are swung round upon the crank bars B, substantially in the manner and for the purpose described.

Second. I claim the combination of the hinged board T, with the projecting ledges T<sup>1</sup> on its surface, with the box-like frame A<sup>2</sup>, forming the rest of the bottom A<sup>1</sup>, of the seat next the end of the ear, in which it can be inclosed as described.

Third. In combination with the swinging seats, I claim the box-like frames N, and the platforms U V, attached to the same by the cranks U<sup>1</sup> and jointed bars W, arranged and operating in the manner and for the purpose set forth.

No. 22,569.—GEORGE MORGAN, of Brooklyn, N. Y.—*Improvement in Stone Cutting Machines*.—Patent dated January 11, 1859.—A series of cutters I, of gradually increasing length, are arranged in frames J J, under hammers G, in such a manner that, by the action of the hammers on the cutters, a rip is made through the whole length of a block of stone which is fed against the cutters, and of the depth of the longest cutter.

*Claim*.—The arrangement of cutters I, of gradually increasing length, in such relation to hammers G, and to a sliding carriage T, that by the action of the hammers on the cutters an incision is made through the whole length of a block of stone which is placed on the carriage, substantially as and for the purpose specified.

No. 22,570.—ANTOINE NIEL, of Brooklyn, N. Y.—*Improvement in Apparatus for Increasing the draft of Chimneys*.—Patent dated January 11, 1859.—The claim and engravings will explain the nature of this invention.

*Claim*.—The arrangement of the exterior tube *a* having the expanded conical and cylindrical portions *d* constituting the chamber of compression, and the contracted annular space between the two tubes above the conical part of the tube *c*, with the inner tube, the two tubes bearing the relation to each other as herein set forth, and forming an apparatus for improving the draft of chimneys, as described.

No. 22,571.—ANTOINE NIEL, of Brooklyn, N. Y.—*Improvement in Bridle Bits*.—Patent dated January 11, 1859.—This invention consists in attaching the griper bars *f* to the ordinary bit, and operated so as to grip the nose of the horse when the rider or driver wishes to check him. The griper bars *f* are fitted upon the end of the frame bars *g* and *a* of the bit and have a sliding motion upon them.

The inventor says: I *claim*, first, the combination of the griper bars, constructed substantially as described with the bars of the bit of the horse.

Second. Attaching the griper bars *f* by their double-eyed ends and by the screw nuts to the bars *g* and *a*, as set forth.

No. 22,572.—THEODORE S. NOEL, of Memphis, Tenn.—*Improved Spectacle Frames*.—Patent dated January 11, 1859.—This invention consists in the employment of springs *b b*, applied in such a manner to the frames that the springs, by their elasticity, will hold the eye-pieces closed upon the glasses, and cause the glasses to be confined in their place until it is desired to remove them, when the springs permit the eye-pieces to be sprung open far enough to permit the removal.

*Claim*.—The employment of springs *b b* applied to the frame, substantially as and for the purposes specified.

No. 22,573.—JAMES O'HARA, of Pittsburg, Pa.—*Improvement in Retorts for Distilling Oils from Coal*.—Patent dated January 11, 1859.—The claim and engravings will explain the nature of this invention.

*Claim*.—The employment in an upright retort A for distilling coal, of a revolving screw B, of a circumference smaller than the interior of the retort, so applied, that while by its revolution, it produces a continuous elevation of the central portion of the charge, it permits and causes a continuous descent of the surrounding portion by gravitation, and thus produces a positive continuous and uninterrupted upward and downward circulation, substantially as and for the purpose set forth.

No. 22,574.—ALBERT OSTRANDER, of New York, N. Y.—*Improvement in Gas-Burners*.—Patent dated January 11, 1859.—The object of this invention is to make an indestructible gas burner free from the corrosive effects of the impurities of gases.

*Claim*.—The manufacture of gas-burners, made of the composition of felspar, quartz, and abestos, having the peculiar formation of the vents set forth.

No. 22,575.—B. FRANK PALMER, of Philadelphia, Pa.—*Improvement in Artificial Fore-Arms*.—Patent dated January 11, 1859.—The flexor tendons F and the extensor tendons L operate as they do in the arm, but the closing of the hand is effected by means of a strap or muscle G, to which the flexor tendons F are attached. The muscle G is clamped by means of the clamp H, which prevents its receding after being pulled.

The inventor says: I *claim*, first, closing the hand by means of a strap G, operated by an attachment to the shoulder of the opposite arm, substantially in the manner described.

Second. The clamp H, constructed and operating as described, and applied to the purpose specified.

No. 22,576.—B. FRANK PALMER, of Philadelphia, Pa.—*Improvement in Artificial Arm and Hand*.—Patent dated January 11, 1859.—The claim and engravings will explain the nature of this invention.

The inventor says: I *claim*, first, giving a sinuous course to the flexor tendons F of the fingers, by means of the sheaves, for the purpose described.

Second. Opening the fingers by means of extensor tendons E, antagonizing the flexors by means of springs M, substantially as described.

Third. The wrist-joint G, constructed as described, of a ball and socket held in contact by cords Z Z, arranged and operating substantially as specified.

Fourth. Giving a soft and elastic covering to the shaft V and the wrist C for the purpose of imitating the changes of form which take place in the natural arm during the movements of the radius and the play of the pronator and supinator muscles, substantially as described.

Fifth. The mode described of attaching the arm to the body.

No. 22,577.—EDWIN R. PEASE and RICHARD H. HAYMAN, of Poughkeepsie, N. Y.—*Improvement in Peg-Cutters*.—Patent dated January 11, 1859.—The nature of this invention consists in the construction and arrangement of mechanical devices to enable the operator to give a rapid rotary motion to the rasp or cutter  $g g^1$ , which removes the nails or pegs at pleasure.

*Claim*.—As a new article of manufacture the described machine for cutting off or removing pegs and nails from the insides of boots and shoes, substantially as described.

No. 22,578.—EDMOND PESIER, of Valenciennes, France.—*Improvement in the Manufacture of Sugar*.—Patented in France March 29, 1858; patent dated January 11, 1859.—This invention consists in the application to the manufacture of sugar of alcohol and agents capable of effecting, when mixed with this liquid, the elimination of mineral or organic matter incorporated with the sugar, in the juice of sacchariferous plants.

*Claim*.—The treatment of the saccharine juices of plants in the manner described by the use of alcohol, in combination with other special agents.

No. 22,579.—WARREN B. POTTER, of Boston, Mass.—*Improvement in Nursery-Bottles*.—Patent dated January 11, 1858.—The inventor says: I make a glass bowl or bottle A, with a neck *a* surrounding its opening *b*, and around this neck I secure a metallic boss *c*. A screw-thread is cut on this boss *c*, into which a corresponding screw-cut in the metallic cap *d* fits. The cap *d* has a metallic lacteal tube *e* fastened to it, which tube, extending downward into the bottle, curves around until its end nearly meets the swell of the bottle. A flange *f* is raised on top of the cap *d*, which flange is slightly cut under or rounded out so as to securely hold the elastic nipple B to it when placed thereon.

*Claim*.—A nursing bottle of glass, having a metallic cap *d* screwed upon it, and a metallic lacteal tube *e*, when said cap is provided with a flange *f* for the reception of the elastic nipple B, and the whole is made and put together, substantially as set forth.

No. 22,580.—ALFRED PROSENS, of Philadelphia, Pa.—*Improvement in Grinding-Mills*.—Patent dated January 11, 1859.—This improvement consists in placing across the recesses formed by the shell or those of the burr D small obstructing strips *i i*, so as to prevent the material from passing from the mill before it is sufficiently ground.

*Claim*.—Placing across the recesses formed by the teeth of the shells, or of those of the burrs, or of both, of conical grinding-mills, any convenient number of obstructing strips, as and for the purpose set forth.

No. 22,581.—AUGUSTUS PRENATT, of Buffalo, N. Y.—*Improved Machine for Dressing Hoops*.—Patent dated January 11, 1859.—The nature of this invention relates to the position of the cutters *c*, in the cutter-head D, in reference to their axis of motion and their consequent action upon the hoops to be dressed, and in the arrangement of a cutter *g* in a vertically moving frame or gate F for the purpose of dressing the edge of the hoop, and for giving the hoop any required width.

The inventor says: I *claim* placing the cutters *c*, in the cutter-head D, in such position that the plane of their cutting edge will cross their axis of motion at an angle of  $45^\circ$ , (or nearly so,) and also stand inclined to the horizontal plane of their axis, at an angle of  $45^\circ$ , (or nearly so,) substantially as set forth.

Second. I claim the arrangement of the cutter *g* in the vertically moving gate F, including the adjustable roller H, for the purpose of dressing the edge of the hoop, and for giving the hoop any required width, as described.

No. 22,582.—GEORGE M. PRENTISS, of Worcester, Mass.—*Inkstand*.—Patent dated January 11, 1859.—When it is desired to cause the ink to flow from the cup into the inkstand, the stem or plunger E is turned so as to respectively bring the slots or depressions G H and CD on the shoulder F, an opening in which it fits, and the lower part of the stem or plunger, and well or depression B, in the bottom of the inkstand opposite each other, thus opening the communication between the outside and inside of the inkstand for the admission of air between the channel-way in the stem or plunger and the interior of the inkstand A.

*Claim*.—As an improved article of manufacture an inkstand, having a plunger E, constructed and fitted as shown and described.

No. 22,583.—ISAAC REAMER, of Conrad's Store, Va.—*Improvement in Corn-Harvesters*.—Patent dated January 11, 1859.—The nature of this invention consists in the arrangement of guides or ways *a e* to conduct the corn to the reel, and otherwise assist in directing the run and hold of the machine travelling on sliding runners against; also, in a novel arrangement of a swinging clearer *G* for discharging the cut corn from the platform.

The inventor says: I *claim*, first, the combination of the elastic lower guide *a* with the adjustable upper guide *e*, when these parts are arranged for joint operation in the manner described, for the purpose specified.

Second. The arrangement and combination of guide *h* and swinging clearer *G* for removing the corn from the platform in the manner described.

No. 22,584.—ALBERT C. RICHARD, of Newtown, Conn.—*Improvement in Detaching Paper from Vulcanized Gum*.—Patent dated January 11, 1859.—The claim and engraving will explain the nature of this invention.

*Claim*.—Subjecting the surface or surfaces of vulcanized India rubber, gutta percha, or other elastic gum, sheets, valves, belts, or other objects which have been so vulcanized or cured between, or on paper, and to which the paper adheres to a mechanical process of regular bending and continual elongation, substantially as described, having the continuous effect of drawing or detaching the filaments or atoms of the elastic gum, which adhere to, or which have entered into, the pores of the paper, gradually and regularly therefrom and thereout, simultaneously across the whole width of the surface operated upon, in the manner as set forth, or in any other manner producing substantially the same result.

No. 22,585.—WILLIAM RIPLEY, of Edgartown, Mass.—*Improved Framing Square*.—Patent dated January 11, 1859.—The claim and engravings will explain the nature of this invention.

The inventor says: I do not claim the mere repetition of the bevel or mitre slots and square arms, as applied to the rule *A*, provided with a lip *B*.

But what I *claim* is the improved manufacture of framing square, as made with its bearing ledge *B*, its squaring arms *C*, mitre slots *O D*, and mortising slots *E F G*, arranged together, and with respect to a base rule *A*, substantially as set forth.

No. 22,586.—STEPHEN SCOTTON, of Richmond, Ind.—*Improvement in Machinery for Oiling the Journals of Locomotives*.—Patent dated January 11, 1859.—The nature of this invention consists of a metal box *C*, through which passes an upright shaft *B*, the lower end of which goes down through the bottom of said box, and has on it a piece of leather, made to fit tight against the bottom side of said box, to prevent the escape of oil through the aperture around said shaft when it is at rest. The upper end of said upright shaft passes up through a hole in a portion of the upper end of said oil box, and on the upper end of this shaft is a nut *J*, which can be raised or lowered to increase or diminish the amount of play up and down of the upright shaft.

The inventor says: I *claim*, first, the combination of the weighted shaft *B*, the spiral spring *F*, and the box *C*, with the journal of a locomotive carriage, substantially as set forth.

Second. I claim the metal cup *H*, in combination with the box *C* and upright shaft *B*, or their equivalents, for the purposes specified.

Third. I claim the nut *J*, when combined with the upright shaft *B* and cup *H*, or their equivalents, in the manner and for the purposes specified.

No. 22,587.—LEWIS SOLOMON, of New York, N. Y.—*Improvement in Treating Auriferous and Argentiferous Pyrites*.—Patent dated January 11, 1859.—A detailed description of this invention would require too much space to be given here. The reader will form some idea by referring to the claim and engravings.

The inventor says: I do not intend to confine myself to the specific times and proportions mentioned in the specification, these being merely incidental to and not of the essence of the invention.

But I *claim*, first, extracting gold and silver from auriferous and argentiferous pyrites, in the manner substantially as set forth.

Second. The application of wood ashes to the roasted ore during the process of grinding, and of soda ash, for the purposes specified.

No. 22,588.—OTIS W. STANFORD, of Cincinnati, Ohio.—*Improvement in Grinding-Surfaces for Mills*.—Patent dated January 11, 1859.—The grain is, by means of the peculiar shape of the teeth or circular portions, ground and carried over a large grinding surface as it tends toward the periphery or discharge of the disks *C*, and as these circular surfaces *c c* pass each other they tend to equally distribute the grain throughout the whole system of teeth. When the flouring is equally effected the flour passes out through the channels formed by the *V* shaped teeth *e e e*, and from thence it is conveyed through the passage *H*.

The inventor says: I *claim* the employment of a system of circular grinding teeth, when arranged in the manner and for the purposes set forth.

I also claim arranging around the outer surface of the disk intercepting V shaped teeth, to operate in the manner and for the purposes specified.

No. 22,589.—CASPER V. STATLER and GEORGE W. WILSON, of Walnut Grove, Ill.—*Improvement in Foot Trip-Hammers*.—Patent dated January 11, 1859.—This invention consists in arranging a hammer by means of a series of levers in such relation to an anvil, that the same can be operated either by a foot or hand, and that it can be brought to strike with force on a bar of iron placed on the anvil.

The inventors say: We *claim* arranging a hammer B in such relation to an anvil I, by means of levers E and F, and links D D, that the same can be operated by means of a hand lever L, or by foot levers J J, substantially as described.

And we also claim the arrangement of the hand lever L in such relation to the foot levers J and to the chisel O, that both the hammer B and the chisel O may be operated by the motion of the hand lever in the manner and for the purpose substantially as specified.

And, in combination with the above described hammer, we further claim connecting the handle N of the chisel with the arm M, by means of an adjustable rod g, so that the cutting edge of the chisel may be accommodated to different thicknesses of iron, substantially as set forth.

No. 22,590.—RICHARD A. STEWART, of Parish of St. Bernard, La.—*Improvement in Defecating and Clarifying Cane Juice*.—Patent dated January 11, 1859.—This invention consists in passing or disseminating, throughout the saccharine matter, sulphurous acid or gas, produced by a slow combustion, in a nearly closed retort r, of sulphur or common roll brimstone.

*Claim*.—The defecation and clarification of cane juice and other liquid or semi-liquid forms of saccharine matter, by disseminating throughout the same sulphurous gas, or sulphurous acid gas, for the purposes set forth.

No. 22,591.—H. K. SYMMES, of Newton, Mass.—*Improvement in Gas Retorts*.—Patent dated January 11, 1859.—To the forward end of the passage C is secured the joint, or elbow D, with the upper end of which f, the stand pipe, is connected. E is a door which closes the opening through which the retort is charged, and the door g closes an opening through which either the passage C, or the stand pipe, may be inspected or cleaned.

*Claim*.—Dispensing with the mouth-piece of the ordinary horizontal gas-generating retort, and dividing the mouth of the retort into two portions, one of which is brought into permanent connection with the stand pipe, the other being employed for the purpose of charging the retort as set forth.

No. 22,592.—JOEL H. TATUM, of New York, N. Y.—*Improvement in the Manufacture of Candles*.—Patent dated January 11, 1859.—The claim and engraving will explain the nature of this invention.

*Claim*.—As an improved article of manufacture, a candle, having its stock composed of tallow, stearic acid, and gum camphor, with or without beeswax, in about the proportions specified, and the exterior of the candle covered with a compound composed of stearic acid, gum camphor, and gum damar, or equivalent flux, in about the proportions set forth.

No. 22,593.—BENJAMIN C. TILGHMAN, of Philadelphia, Pa.—*Improvement in Hardening Fatty Substances*.—Patented in England May 2, 1857; patent dated January 11, 1859.—The claim will explain the nature of this invention.

The inventor says: I *claim* the hardening of acid and neutral fatty substances, by subjecting them to the action of sulphurous acid at elevated temperatures, either with or without pressure, as described.

I also claim the use of oxide of copper, or its chemical substitutes, to remove from fat acids the sulphuretted impurity, produced therein by treatment with sulphurous acid, as described.

I also claim the methods of preserving the color of white neutral fats, when treated by sulphurous acid at elevated temperatures, by using the sulphurous acid entirely free from air or oxygen, and by using fats pure and neutral, and free from any mixture of acid, rancid, or decomposed fats.

No. 22,594.—JEREMIAH C. TILTON, of Sanbornton Bridge, N. H.—*Improvement in Temples for Looms*.—Patent dated January 11, 1859.—In the engravings the cloth bearer, which extends over the points or spurs b b b, is shown at C, as supported by a bar or carrier D, which is hinged to the arm A at h, and so as to be capable of being moved backward from the spring. A screw i passes upward through the carrier and enters a recess k.

*Claim*.—The application of the cloth bearer carrier to its support by a hinge, arranged in

manner substantially as described; that is, so as to allow the carrier and its bearer to be drawn backward under circumstances as described.

No. 22,595.—ARTEMAS B. VANT and ARLON M. COOK, of Milford, Mass.—*Improvement in Corn-Shellers*.—Patent dated January 11, 1859.—A is the case or frame, B is a convex wheel having teeth on its convex surface and turning with the shaft C, which receives motion from D. D also gives motion to the shaft F, on which is a gear to give motion to the wheel F; this wheel turns on a bearing or stud G, and is placed obliquely so as to incline the side toward the discharge considerably toward the convex wheel; H is a circular plate connected to the wheel F by four studs or arms I, which pass through and have springs on them between F and H, whose action is to press up toward the wheel B. J J<sup>1</sup> are two guiding plates, the lower one being made with slots or apertures to allow the corn to fall through.

*Claim*.—The combination and arrangement of the smooth revolving pressure-plate or wheel H with the convex toothed wheel B, and guard-plates *i* and *j*, when constructed and operating substantially in the manner and for the purposes set forth and described.

No. 22,596.—JAMES WANSBROUGH, of Southwark, County of Surrey, England.—*Improvement in Hydrofuze Fabrics*.—Patented in England December 13, 1853; patent dated January 11, 1859.—The nature of this invention consists in giving to water repellent fabrics an artificial face or finish different from that of the fabric itself, so as to resemble woollen cloth, or such other materials as are capable of being worked into flock or other fine division.

The inventor says: I *claim* securing the flocks, or other finely divided substance, after it has been sifted or spread on to the surface and calendered, by applying to the surface thereof a solution of India rubber, or allied gum, substantially as described.

And I also claim, in combination with the method of securing the flock, substantially as described, the subjecting of the same to a steaming process, substantially as and for the purpose specified.

No. 22,597.—ROSS WINANS, of Baltimore, Md.—*Improvement in Locomotive Engines*.—Patent dated January 11, 1859.—This invention consists in so proportioning the smallest diameter of the blast-pipe *c c h h* to the smallest diameter of the smoke-pipe, that the transverse area of the latter pipe will be double that of the former. It also consists of a blast-pipe smaller in diameter than the upper section of the chimney, with a bell mouth or bonnet *b b d d* on its lower end, arranged in near proximity to the bottom *a a*, on which the cinders and sparks rest.

The inventor says: I *claim* the blast equalizing-pipe proportioned to the chimney, and arranged substantially as set forth.

I likewise claim a blast-pipe of less diameter than the smoke-pipe, and having a bell mouth, in combination with an exhaust-nozzle and the bottom on which the sparks lie, substantially as set forth.

No. 22,598.—GEORGE WINDLE, of Edenburg, Va.—*Improved Surveying Instrument*.—Patent dated January 11, 1859.—The claim and engraving will explain the nature of this invention.

The inventor says: I *claim*, first, attaching the adjusting weight C of the magnet-case D directly to the universal joint E, on which said case turns and swings, substantially as and for the purposes set forth.

Second, The arrangement of the pointer *n*, which designates the number of degrees at which the movable frame and telescope stand, adjusted on an adjusting screw, which has the surface of its head graduated so as to indicate minutes, in combination with a stationary pointer and with an extension formed on the pointer which comes opposite the degrees on the magnet case, substantially as and for the purposes set forth.

No. 22,599.—JOHN E. WOOTTEN, of Philadelphia, Pa.—*Improvement in Steam-Valves*.—Patent dated January 11, 1859.—The inventor says: Steam having been admitted within the pressure chamber, the upward pressure against piston D is exerted upon stirrup G by means of nut M and stem H, and transmitted to valve B by means of an anti-friction roller L interposed between the stirrup G and the plate K. The slide-valve B is therefore subject to a force tending to lighten it upon its seat, equal to the upward pressure exerted upon piston D.

*Claim*.—The application of the anti-friction roller L, in combination with a diaphragmatic piston D, or an equivalent therefor, substantially as and for the purpose set forth.

No. 22,600.—WILLIAM E. WORTHEN and JOHN J. ALTHOUSE, of New York, N. Y.—*Improved mode of Constructing Slats for Blinds*.—Patent dated January 11, 1859.—The claim and engravings will explain the nature of this invention.

*Claim*.—A sheet-metal blind-slat or luffer-board, made up of the combination of a slit-tube B B B with two thicknesses of sheet-metal *a a a*, the whole being substantially such as before specified.

No. 22,601.—WILLIAM S. WORTHINGTON, of Newtown, N. Y.—*Improvement in Apparatus for Evaporating*.—Patent dated January 11, 1859.—The objects of this invention are the economical use of coal as fuel for heating evaporating pans, and the application of heat in such a manner as to prevent the burning of the salt or substance precipitated on the bottom of the pan and the burning out of the pan.

*Claim*.—The arrangement of a series of two or more grated fire-places *a b c* and communicating passages *f g* and flues *h h* in a casing *c* on each or either side of a pan or train of pans, substantially as and for the purpose set forth.

No. 22,602.—MOSES G. FARMER, of Salem, Mass., assignor to WILLIAM F. CHANNING, of Boston, Mass.—*Improved Electro-Magnetic Apparatus for setting Water-Engines in Motion*.—Patent dated January 11, 1859.—The nature of this invention consists in the application of an electro-magnetic escapement to the cock controlling the supply of water of a water engine, and to a pawl or detent arresting the motion of said water engine in such manner that it may be set in motion and stopped by the agency of electricity directed to it through conductors from a distance.

The inventor says: I *claim*, first, the combination of an electro-magnetic escapement with the cock or water-valve *k*, and with the detent *Q* of a water-engine, separately or conjointly, for the purpose of controlling its motion from a distance, especially in its application to a fire-alarm telegraph.

Second. I claim the employment of two or more arms, of progressively increasing weight, in combination with a water-engine and with an electro-magnet, or its equivalent, for the purpose of releasing machinery, as set forth; the first of the weighted arms being liberated by the electro-magnet, while the last one of the series releases the machinery, each of the weighted arms being returned to its normal position by the action of the water-engine.

No. 22,603.—JOSEPH R. GATES, of Indianapolis, Ind., assignor to Himself and ALEXANDER COREY, of Shelbyville, Ind.—*Improvement in Automatic Grain Scales*.—Patent dated January 11, 1859.—The claim and engravings will explain the nature of this invention.

The inventor says: I *claim*, first, the lever *h* and spring *q*, when used for the treble purpose of operating the cut-off gate *r*, discharging or loosening the bottom valve *l*, and preventing the weights *e* and *f* from raising the scale-box *C*, and drawing the slide *r* until the bottom *l* is closed, thereby regulating the cut-off and flow of grain without using the weight of the grain while the same is being weighted.

Second. The combination and arrangement of the spring and weight *m*, with the elbow-lever *k*, connecting-rod *j*, and lever *i*, when constructed and operated substantially as and for the purposes described.

No. 22,604.—GEORGE KENNY, of Milford, N. H., assignor to Himself and JOSEPHUS BALDWIN, of Nashua, N. H.—*Improved mode of Attaching Thills to Axles*.—Patent dated January 11, 1859.—When the device is to be made ready for use, a washer is placed at each end of the tube *E*, and a bolt *D* passed through the tube *E*. The nut *e* is then screwed on the end of the bolt *D* until the washers *c c* are close down on the outer ends of the eyes *a a*. The tube *E* thus compressed will closely fill the space between the bolt *D* and the inner surface of the eyes *a b a*.

*Claim*.—The combination of the pressing and locking India rubber tube *E* with the eyes *a a b* and bolt *D*, with its nut *e*, substantially in the manner and for the purposes described.

No. 22,605.—JAMES LYON, of New York, N. Y., assignor of JESSE J. DAVIS, of said New York.—*Improvement in Machine for Sawing Marble*.—Patent dated January 11, 1859.—The nature of this invention consists in a reciprocating slide *d*, communicating motion by adjustable rollers *f f* acting in inclined slots to slides *h h* that are so fitted in adjustable frames *g g*, that their position can be varied as desired, and said slides being connected to the frames carrying the marble saws, impart to the same a reciprocating movement.

*Claim*.—The arrangement of the reciprocating bar *d*, adjustable rollers *f f*, adjustable frames *g<sup>1</sup> g<sup>1</sup>*, and diagonally slatted sides *h h*, in relation to each other, and to parts that connect with and guide the saws, for the purposes substantially as specified.

No. 22,606.—THOMAS J. MAYALL, of Roxbury, Mass., assignor to Himself and GEORGE N. DAVIS, of Boston, Mass.—*Improvement in Manufacture of Emery Wheels and Sticks*.—Patent dated January 11, 1859.—The claim and engravings will explain the nature of this invention.

*Claim*.—The employment of vulcanized rubber, tempered with olive oil, as set forth, in combination with powdered emery, or its equivalent, for the manufacture of polishing wheels and sticks, as specified.

No. 22,607.—THOMAS J. MAYALL, of Roxbury, Mass., assignor to Himself and BENJAMIN F. COOKE, of Boston, Mass.—*Improvement in Elastic Draw-Bar and Bumper*.—Patent dated January 11, 1859.—A *A<sup>2</sup>* are cross-heads, which slide freely upon the side-bars *B*. These bars are connected with the eye *C*, through which passes the coupling-pin, and they also

carry the collars D, which interrupt the motion of the head A<sup>2</sup> in one direction, the motion of the other head A upon the bars B being limited by the nuts *f* upon the ends of the bars. Through the centre of the cylinder E, and also through the holes *g* of the heads A A<sup>2</sup> passes a rod K, having at one extremity an eye L, for the reception of the other coupling-pin, also a collar *h*, and at the other end a nut *m*.

*Claim.*—The described combined draw-bar and bumper, consisting of the elastic cylinder E, the heads A A<sup>2</sup>, bars B, spring *d*, and bolt K, constructed and operating in the manner substantially as set forth.

No. 22,608.—THOMAS WINDELL, of New Albany, Ind., assignor to J. B. FORD, JAMES W. SHIELDS, and H. L. BRIDWELL, of said New Albany.—*Improvement in Mowing Machines.*—Patent dated January 11, 1859.—The claim and engravings will explain the nature of this invention.

The inventor says: I *claim*, first, the employment, in connection with a single frame-piece A<sup>1</sup>, of the box D<sup>1</sup>, which is cast in the manner specified, with axle P, journal-bearing *t* and *u*, and flanges *s s*<sup>1</sup> in one piece, for the purpose of connecting and securing all the gearing necessary for the operation of the machine, as fully set forth.

Second. The spring *c*, secured at one end to the front of the outer guard, and playing freely in the opening of the rear of said guard, in combination with the adjusting screw *o*, whereby the convexity of the spring-shoe is increased and diminished with the elevation or depression of the cutter, in the manner and for the purpose described.

No. 22,609.—WILLIAM WRIGHT, of New York, N. Y., assignor to Himself and FREDERICK WRIGHT, of said New York.—*Improvement in Gas-Burners.*—Patent dated January 11, 1859.—This invention consists in a double flanged cup C, containing an arrangement of passages applied with a gas-burner, for the purpose of checking any excessive pressure of the gas before its arrival at the tip of the burner.

*Claim.*—As an improved article of manufacture, a gas-burner provided with a double flanged cup C, having openings *d d*, *e e*, and otherwise constructed, substantially as shown and described.

No. 22,610.—ERNEST OTTO POHL, of Philadelphia, Pa.—*Improved method of enabling Moving Railroad Trains to Telegraph their own Passings at certain stations.*—Patent dated January 11, 1859.—The object of this invention is to enable the operatives and employes at the main and other stations on the road and on moving trains to know the whereabouts of trains on the road between certain points whether the same be approaching any station or train or going away from it; to apprise the engineers, &c., of trains of the situation of each tunnel, bridge, switch, or dam, by an electro-magnetic apparatus acting reliably of itself.

*Claim.*—The use of a self-acting electro-magnetic railway alarm telegraph, acting reliably of itself without the necessity of human intervention, and arranged and operating in the manner and for the purposes substantially as described.

No. 22,611.—F. O. DEGENER, of New York, N. Y.—*Improvement in Printing Presses.*—Antedated July 11, 1858; patent dated January 11, 1859.—The claim and engravings will explain the nature of this invention.

The inventor says: I *claim* so arranging or hanging an oscillating bed N, with an oscillating platen M, in such manner that the motion of one will control the action of the other, so that by their forward movement they shall close and give an impression, and upon their reverse movement the form shall be inked, and the platen be brought into the proper position necessary for the reception of the sheet, and thus alternate from one of their positions to the other.

Second. I claim the arrangement of an oscillating bed and platen, as described, with the cam U, to cause the frisket to assume the desired position, so as to hold the sheet of paper while it is conveyed from one position to the other, all of which is described.

No. 22,612.—R. L. ALLEN, of New York, N. Y.—*Improvement in Potato Diggers.*—Patent dated January 18, 1859.—In the engravings A represents the beam, B the handles, C the standard, D the share and point, E the clevis, *a* is the central wing, *b* and *c* the two side wings between which the dirt is allowed to fall while the potatoes are allowed to fall or roll off, *d* is the joint where the side wings *b* and *c* are let into the rear part of the share by means of tenon and mortise and held in position by means of strong screws.

The inventor says: I *claim* the arrangement and combination of removable wings *b c*, with the double mould-board, substantially as set forth.

I also claim the arrangement and combination of the central or dividing bar *a*, with the standard C, by means of the notched fastening *c* and *d*<sup>1</sup>, substantially as set forth.

No. 22,613.—WILLIAM I. ALSTON, of Williamson County, Tenn.—*Improved Ring Lock.*—Patent dated January 18, 1859.—This invention consists in arranging between the inner ring C, and the barrel A, of the lock a "friction spring," so that the adhesion of the ring D to the barrel is made greater than the friction between the adjacent ends of the rings by which means on turning a ring, those on either side are not liable to be moved by it.

*Claim.*—The friction springs arranged substantially as described, in combination with the inner rings of the locks, for the purpose set forth.

No. 22,614.—STEPHEN R. ANDRES, of Troy, N. Y., SAMUEL ANDRES, and McDONOUGH BUCKLIN, of New York, N. Y.—*Improvement in Apparatus for Drying Grain, Malt, &c.*—Patent dated January 18, 1859.—The claim and engravings will explain the nature of this invention.

The inventors say: We do not confine ourselves to the precise form of our machine, described in this specification, as the same may be changed without changing the character of our invention.

We *claim* the use or employment of a blast or current of hot air introduced into the cylinder A, through a hollow journal C, or its equivalent, when said current of hot air is brought into direct contact with the substance to be dried thereby, in combination with a cylinder made adjustable to any angle, as described.

No. 22,615.—ERNST BAGNICKI, of New York, N. Y.—*Improvement in Syringing Apparatus.*—Patent dated January 18, 1859.—In making this apparatus there is constructed in the lower part of a chair a tank A, divided by means of a very fine sieve *a* into two parts *c* and *d*. In the part *c* the water or other suitable fluid is poured through the spout *f*, and filters through the sieve *a* into the other part *d* of the tank, in which latter part a pump B is placed, by which the fluid is forced up and injected through a flexible tube *g* into the womb. Above the tank A another vessel D is placed, over which the person operated on sits, and which receives the waste, which is then allowed to run off at the back through an opening or cock *h*.

*Claim.*—The construction of a chair, substantially as described, and containing a pump, with an arrangement of the valve chambers, in the manner and for the purpose as specified.

No. 22,616.—JOHN BARKER and EDWARD W. BARKER, of Baltimore, Md.—*Improved Amalgamator.*—Patent dated January 18, 1859.—The claim and engravings will explain the nature of this invention.

The inventors say: We do not confine ourselves to the precise arrangement or form or construction of the parts as described, as other forms and arrangements may be used in carrying out the principles of our improvements.

We *claim*, first, the combination of a set of crushing or attrition rollers B B, with an upper and lower rubber, arranged substantially as described for the purpose set forth.

Second. We also claim introducing an independent current of water into the amalgamator, substantially as described, so as to flow around the lower end of the feed pipe, and meet and mingle with the inflowing current of material, for the purpose as set forth.

Third. In combination with the rollers we claim constructing the lower rubber hollow E, with openings to admit the quicksilver into the interior for the purpose set forth.

Fourth. Constructing the lower rubber with a vertical passage through its centre, arranged substantially as described for the purpose set forth.

Fifth. The combination of the concave plate T, arranged substantially as described, with the rollers, for the purpose of directing the inflowing current to the centre and between the rollers.

Sixth. Constructing recesses on the interior of the casing over the journals, arranged substantially as described for the purpose set forth.

No. 22,617.—JAMES F. BECKWITH and ADIN G. GAGE, of South Alabama, N. Y.—*Improvement in Seed Planters.*—Patent dated January 18, 1859.—By shutting the hand with the fingers at M, the connecting rod G acts directly upon the bar D, which also acts directly upon the seed slides C C, moving them backward for discharging the seed which falls into a furrow made by the tooth O, and is covered by the double scrapers I I. These scrapers are attached at their upper end by a bolt to the tooth O and swing loosely.

*Claim.*—The arrangement of the tooth O, discharge spout Z, coverers I, hoppers B B, frame-piece A A, lever F, and bar D, substantially in the manner and for the purpose fully set forth.

No. 22,618.—WILLIAM H. BELL, of Washington, D. C.—*Improvement in Self-Primers for Fire-Arms.*—Patent dated January 18, 1859.—The nature of this invention consists in combining with the plunger *i* and spring *k* that operate it, together with the screw *h* used for securing them in the hammer, a shield *f* for the reception of the caps in such manner that the whole shall be withdrawn from the hammer simultaneously, so that the caps may be inserted in the shield, and the whole replaced and secured in the hammer *a*; also in providing the side of the hammer *a* with a slot *m*, arranged at the front or discharging end of the magazine chamber *b*.

The inventor says: I *claim* first, the combination of the shield *f*, plunger *i*, spring *k*, and screw-head *h*, in the manner described, with the magazine-chamber *b*, for the purposes set forth.

Second. The arrangement and combination of the pin *n*, on the piston *i*, and slot *m*, in the shield *f*, with the slot *o*, in the side of the hammer, for the purpose specified.

Third. The removable guard-plate *q*, as arranged and operated for the purposes set forth.

No. 22,619.—PETER BORN, of New York, N. Y.—*Improved Sofa-Frame*.—Patent dated January 18, 1859.—This invention consists in constructing a form of wood *A* in such a manner that the complete frame of a sofa may be pressed and formed over it, said form being constructed of a number of parts, which are united by clamps *F*, fitting over dove-tailed projections *a*, so that the same may be removed when the frame has been finished.

*Claim*.—As a new and improved article of manufacture, a complete frame of a sofa made of thin layers of wood in the manner substantially as specified.

No. 22,620.—JULES JOSEPH HENRI BRIANCHON, of Paris, France.—*Improvement in Composition for Ornamenting Glass*.—Patent dated January 18, 1859.—The claim will explain the nature of this invention.

*Claim*.—The yellow coloring composed of resin, nitrate of uranium, essence of lavender, and the flux of bismuth; also the orange red coloring, composed of resin, nitrate of iron, essence of lavender, and the flux of bismuth; also the imitation gold coloring, composed of the above described orange red coloring and the yellow coloring mixed together, with additional parts of the preparation of uranium and iron; also the variegated prismatic coloring, composed of ammoniuret or cyanuret of gold or gold dye, turpentine, essence of lavender, the bismuth flux and uranium; also the mother of pearl coloring, composed of bismuth flux, the flux of lead, chloride of antimony, resin, lavender, and other essence, and colophony; all of the above colorings being made and applied in the manner and in proportion substantially as set forth.

No. 22,621.—REUBEN R. BROWN, of Buffalo, N. Y.—*Improvement in Lubricating Compounds*.—Patent dated January 18, 1858.—The inventor says: To make one gallon of this compound take three quarts of weak ley, one quarter of a pound of common bar soap, and two grains of saltpetre, and mix well together in a wooden vessel, then take one ounce of sulphur and one quart of common fish oil and grind the sulphur in the oil, and then mix all the ingredients together.

*Claim*.—A lubricator made of the ingredients and in the proportions substantially as set forth.

No. 22,622.—W. G. BULGIN, of West Jersey, Ill.—*Improvement in Seeding Machines*.—Patent dated January 18, 1859.—The object of this invention is to properly prepare the soil by levelling and pulverizing the same, and in distributing the seed in a uniform manner in the prepared soil.

*Claim*.—The rotary coulter *I*, leveller *F*, with share *H* attached, and harrow teeth *K*, arranged relatively with respect to each other and to the seed box *A*, provided with a suitable seed distributing device, so as to operate substantially as and for the purpose set forth.

No. 22,623.—ABNER L. BUTTERFIELD, of West Dummerston, Vt.—*Improved Wind-Wheel*.—Patent dated January 18, 1859.—The claim and engravings will explain the nature of this invention.

The inventor says: I am aware that collapsible sails for wind-wheels have been previously used, and I am also aware that valves have been employed and arranged similar to those shown and described; I therefore do not claim, broadly, the sails *E*, nor the valves.

But I *claim* attaching the sails *E* to the frames *D* of the arms *C*, substantially as shown, so as to permit of a self-lateral adjustment of the same, and using the catches *o* and slides *g*, with the cords attached, for respectively locking the sails and freeing them from the locks or catches substantially as described.

No. 22,624.—GEORGE CHURCHILL, of Hartford, Conn.—*Improvement in Belt-Clasps*.—Patent dated January 18, 1859.—The nature of this improvement consists in making a belt-clasp of two plates *A A*<sup>1</sup>, one of which is provided with pins *B*, which are designed to pass through the holes cut in the ends of the belt, and entering the holes in the other plate corresponding to the pins, and thus compressing the ends of the belt firmly between the plates.

*Claim*.—The combination of the plates *A A*<sup>1</sup>, pins *B*, screws *F*, as and for the purpose described.

No. 22,625.—JOHN CLARK, of Williamsburgh, N. Y.—*Improved Mode of Operating Window-Blinds*.—Patent dated January 18, 1859.—By turning the knob *h* the rack-bar *D* will be actuated, and the slats *C* opened, and closed, or turned, as desired. The friction attending the movement of the working parts is sufficient to prevent any casual movement of the slats, and the slats may be secured in a closed state, so that they cannot be turned at the outer side of the blind by inserting the pin *k* in the spindle or arbor *g*.

*Claim*.—Attaching toothed flanches *d*, or pinions, to the tenons *c*<sup>1</sup> of the slats *C*, and having the flanches or pinions gear into a sliding rack-bar *D*, placed in the stile *B* of the blind, and

actuated by the pinion *f* and supplemental rack-teeth *e*, or their equivalents, substantially as and for the purpose set forth.

No. 22,626.—SAMUEL COLT, of Hartford, Conn.—*Improved Mode of Coupling Gun-Stocks with Pistols*.—Patent dated January 18, 1859.—The neck piece  $B^1$  is so shaped as to fit over or embrace a portion of the stock, or handle *A*, of the pistol, while its forward extremities  $B^2$   $B^2$  run under shoulders formed by cutting away the lower portion on either side of the semi-spherical part  $C^1$  of the lock-frame, and over the holder pins *d d* which project from the said lock-frame.

*Claim*.—The neck-piece  $B^1$ , with its projecting end  $B^2$   $B^2$  passing under shoulders in the lock-frame, in combination with the holder-pins *d d*; and clamping-bar *f*, arranged and operating substantially as described for the purpose set forth.

No. 22,627.—SAMUEL COLT, of Hartford, Conn.—*Canteen Gun-Stock*.—Patent dated January 18, 1859.—The gun-stock *A* is made of hollow metal, or other suitable material, in which is formed a short neck or mouth *B*, having an internal or female screw cut on it to accommodate a screw-stopper *C*; said stopper is furnished with an India rubber or other suitable packing *i*, and is attached by a small swivel *c* to a short chain *d*, which is connected by means of a loop *a* to the neck of the stock.

*Claim*.—So constructing the stock of a gun that it shall constitute a canteen, substantially as described.

No. 22,628.—J. M. CONNEL, of Newark, Ohio.—*Improved Boot-Blacking Apparatus*.—Patent dated January 18, 1859.—The claim and engravings will explain the nature of this invention.

The inventor says: I make no claim to the construction of brushes of two sections, as shown in several patented knife-polishers.

But I *claim*, as an improvement on the patented boot-blacking machine of J. M. & J. Connel, the concave-edged self-adjusting brush-wheel *B* in combination with the spring foot-piece *F*, constructed, arranged, and operating as described.

No. 22,629.—G. D. COLTON, of Galesburg, Ill.—*Improvement in Ploughs*.—Patent dated January 18, 1859.—By pressing upon the lever *E*, as long as the pole *C* rests stationary upon the neck-yoke, the beam *D* will be elevated, and by raising the back end, the beam will be depressed; thus raising or lowering the point of the plough and making it run deeper or shallower, as the operator may desire.

*Claim*.—Combining and arranging together the beam *D*, the standards *d* and *e*, upright *a*, lever *E*, axle *B*, brace *Z*, bar *H*, and pole *C*; said pole reaching forward and resting upon the neck-yoke, in the manner and for the purpose specified.

No. 22,630.—JESSE CUNNINGHAM, of Marshall, Mo.—*Improvement in Cultivators*.—Patent dated January 18, 1859.—The claim and engravings will explain the nature of this invention.

The inventor says: I do not claim the reversible bar *J*, with a marker or wheel *g* attached, for such device has been previously used.

But I *claim* attaching the furrow shares *H* to a swinging frame formed of the shaft *E*, bar *F*, and arm *b*, placed in a mounted frame *A*, in combination with the buttons *C C*, provided with step-like projections *d* for regulating or adjusting the height or inclination of said share-frame, and consequently the depth of the furrows, substantially as described.

No. 22,631.—WILLIAM M. C. CUSHMAN, of Albany, N. Y.—*Improvement in Railroad Chairs*.—Patent dated January 18, 1859.—This invention consists in combining with an outside jaw, flanch, or rib *D*, a buttress *E E* at each end thereof, which jaw, flanch, or rib, shall project upward even with the top of the track rail, or beyond the top, for the purpose of receiving a part of the tread of the car-wheels, and thereby relieve the joint of the rail where two rails meet.

*Claim*.—The buttress *E E*, at each end of the outside jaw, flanch, or rib *D*, in combination with the top or bearing surface *c*, as and for the purposes described and set forth.

No. 22,632.—LEVI S. DEMING, of Newington, Conn.—*Improvement in Horse-Rakes*.—Patent dated January 18, 1859.—The end which is secured to the shaft *A* is bent at right angles, and is then bent into a circle, to give the required elasticity to the finger *B*. After the fingers are thus formed, the end prepared is put into a hole in the shaft or flange and so fitted and secured as not to allow of a sidewise motion, by means of a strip of wood *E* to hold them in place, and having bearer *e* to give support and additional elasticity to the fingers. *F* is a cam or notch-wheel secured to the shaft *A*. *G* is a lever which holds the rake from revolving.

*Claim*.—The combination of the fingers *B*, shaft or axle *A*, cam *F*, and lever *G*; these several parts being constructed, arranged, operated, and operating in the manner described, for the purpose specified.

No. 22,633.—L. J. DICKASON and JOHN FRAZEE, of Georgetown, Ohio.—*Improved Spoke-Machine*.—Patent dated January 18, 1859.—The claim and engravings will explain the nature of this invention.

The inventors say: We *claim*, first, the described mode of operating the cutter-frame J with its cutters K, and also the emery wheel *h* and its frame L, so as to throw them all clear of the spoke S, after the operation of twining and smoothing; that is to say, we claim the employment of the two arms R<sup>1</sup> R<sup>2</sup> upon the shaft R operated by means of a hand lever R<sup>3</sup>, in the manner and for the purposes set forth.

Second. We claim the adjustable spring-rests N<sup>1</sup> N<sup>2</sup> when arranged and operating in the manner and for the purposes set forth.

Third. We claim the spring-arm *n*, spring-catch *m*<sup>1</sup>, pitman *n*<sup>1</sup>, and bent lever *n*<sup>2</sup>, in combination with the lever K<sup>2</sup>, clutch I, and rod *l*; all arranged and operating so as to throw the pulley-wheel H in and out of gear with the shaft G, substantially in the manner and for the purposes set forth.

No. 22,634.—RICHARD DOBLE and M. ANGELO STARR, of Richmond, Ind.—*Improved Machine for Making Printer's Rules*.—Patent dated January 18, 1859.—The guide-bars J J have each attached two clamps *h h*, fitted with screws *i i*, to secure the rules which are passed through the said clamps. The arcs on the plates H H<sup>1</sup> H<sup>2</sup> H<sup>3</sup> are graduated in distances from their centres, and consequently from that face of the saw D, which is contiguous, to suit the various lengths of rules commonly used; and the radial lines are graduated according to the angles which they form with the faces of the saw.

*Claim*.—The combination of the graduated plates H H having arc-formed and radial graduations, and guide-bars J J, with their clamping-screws *g g*, and screw-clamps *h i h i*, the whole applied, arranged, and operating substantially as described, in relation to the saw D, for the purpose set forth.

No. 22,635.—WILLIAM H. DRAPER, of Greenfield, Mass.—*Improvement in File-Handles*.—Patent dated January 18, 1859.—The handle A is formed with a cylindrical socket or chamber *a* for the reception of a helical spring B, whose lower end rests on the bottom of the said chamber. The upper end of the spring B is fastened to a centering socket-piece C, formed with a conical or tapering recess *b*. On the handle is screwed a metallic ferrule D, within which a short tube E is screwed, such tube having hinged to its bore two tapering jaws F F, formed and arranged in the ferrule.

*Claim*.—The centralizing socket, or socket-piece and spring, in combination with the handle and the fastening-jaws, and their operated mechanism, applied within the said handle, the whole being made to operate substantially in the manner as described.

No. 22,636.—CHARLES ESCUDIER, of Pattersonville, La.—*Improvement in Bathing Apparatus*.—Patent dated January 18, 1859.—The boilers and furnace A B are placed on a table or stand, and by means of a small metal pipe bent and fixed to the faucet of the main boiler D, connecting the same to the steam-pipe. The stand L is made lower at one of its extremities, so that the water condensed in it tends towards it, from which it is taken out by a faucet P and received into a vase Q.

*Claim*.—The new application in bathing apparatus of two boilers and steam-pipe connected thereto, affording, when united, an apparatus for the application of whatever kind of bath may be desired.

No. 22,637.—JAMES D. FOSTER, of Montgomery, Ala.—*Improvement in Ox Yokes*.—Patent dated January 18, 1859.—This invention consists in forming each bow B of the yoke of four parts *a a b b*<sup>1</sup>, the two upper parts *a a* of each bow being permanently attached to the stock A, and the lower parts *b b*<sup>1</sup> attached to the upper parts by hinges or joints *c c*, so that the lower parts may be opened or distended to be readily fitted and secured on the necks of the animals, or removed therefrom.

*Claim*.—Constructing the bows B of four parts, *a a b b*<sup>1</sup>, the parts *a a* being permanently attached to the stock A, and the parts *b b*<sup>1</sup> attached by hinge-joints *c c* to the parts *a a*, and provided with a fastening C, substantially as and for the purpose set forth.

No. 22,638.—AMBROSE FOSTER and HARVEY BROWN, of New York, N. Y.—*Improvement in Machinery for Moving Cars on Railways*.—Patent dated January 18, 1859.—The claim and engravings will explain the nature of this invention.

The inventors say: We do not claim the moving of cars on railroads by stationary power and an endless rope or chain, for that is an old device.

But our improvement consists in the mode of attaching to and removing the cars by means of the devices set forth.

We *claim*, first, the rope-supporter H, constructed and arranged substantially in the manner and for the purposes set forth.

Second. We claim the sliding-rods E, with the coiled springs F attached, or their equivalent, for the use and purpose set forth.

Third. We claim the grab or catch G, constructed, arranged, and operated substantially in the manner and for the purposes set forth.

No. 22,639.—J. FRASER, of Rochester, N. Y.—*Improved Vegetable-Cutter*.—Patent dated January 18, 1859.—The hole through the bed B is larger than the rod K, and a groove *f* is provided in its side which receives the lip *i* or eccentric portion of the rod K; a thumb-piece *l* is attached to the rod, by turning which the bed B is moved on its axis *d* for the purpose of elevating the edge of the knife G more or less above the plane of A.

*Claim*.—The combination of the eccentric rod *k*, arranged substantially as described, with the pivoted or adjustable bed B, which bears the knife G, for the purposes specified.

No. 22,640.—HUGH GERRED, of Sparta, Ill.—*Improved Cattle-Pump*.—Patent dated January 18, 1859.—When the animal passes on the platform E towards the trough F, it will be depressed, and the bucket D raised; the water being discharged when it reaches the end of its upward movement in consequence of the clasp *d* striking against a cross-piece *a*\* in the framing C, and liberating the valve *c*, which opens and allows the water to pass into the spout G, by which it is conveyed into the trough F.

*Claim*.—The arrangement and combination of the guides *f*, bucket D, the latter having a valve *c*, clasp *d*, and spring *e*, the trough F, platform E, and wheels *m l i g*, as and for the purposes shown and described.

No. 22,641.—HENRY GOULDING, of San Francisco, Cal.—*Improved Steam-Valve*.—Patent dated January 18, 1859.—The claim and engravings will explain the nature of this invention.

The inventor says: I *claim*, first, supplying the working cylinder of the engine or machine at each successive stroke with its impelling gas or vapor from reservoirs previously charged therewith, and under the control of a valve or valves, essentially as set forth, the same serving as a substitute for a cut-off to work the gas expansively, in the manner described.

Second. Operating a valve in part or in whole by the gas or steam, at full pressure, from the supply pipe acting to propel it in one direction, when the same is used in concert with an opposing force to the valve, produced by the expansion of the gas in its passage to or performance of its work, substantially as specified.

Third. The combination of the valve B and valve cylinder or case A, with its reservoirs E F, and the several inlets or outlets for action together, in the manner described, and whereby the one valve B is made to govern the ingress and egress of the gas to or from the reservoirs, as well as to control the inlet and exhaust of the working cylinder, as set forth.

No. 22,642.—RENSSELAER D. GRANGER, of Philadelphia, Pa.—*Improvement in Heating Apparatus*.—Patent dated January 18, 1859; antedated November 24, 1858.—The claim and engravings will explain the nature of this invention.

The inventor says: I do not claim, broadly, an air-chamber situated in a casing and exposed to the action of the fire within the same, as such a device has been heretofore used.

But I *claim* combining the air-chamber C with the separate perforated chamber H, having an independent communication with the air, substantially as set forth, so that the said perforated chamber may serve the double purpose of consuming the gases arising from the ignited fuel, and of preventing the rapid destruction of the bottom of the chamber G by the action of the fire.

No. 22,643.—RENSSELAER D. GRANGER, of Philadelphia, Pa.—*Patent in Coal-Stoves*.—Patent dated January 18, 1859; antedated November 24, 1858.—The claim and engravings will explain the nature of this invention.

*Claim*.—Hanging within the stove, and immediately above the fire, a perforated chamber H, when so constructed and arranged that the air shall have free access to the interior of said chamber, and when the latter shall admit of being readily raised and lowered, or its position in regard to the fire otherwise altered, for the purpose specified.

No. 22,644.—ROBERT GRAY, of Anson, Me.—*Fish-Trap*.—Patent dated January 18, 1859.—The fish, in trying to pass along the stream, will enter the mouth of the trap, go along the throat X, press between the vibrating slats T T<sup>1</sup>, and enter the chamber V V V<sup>1</sup>, and not being able to proceed further, and attempting to return, they fall back into those parts of the chambers near *m n* or *py*, and thus fail to detect the throat by which they entered the chamber.

*Claim*.—The strainer, the vibrating slats T T<sup>1</sup>, and the V shaped chambers V V<sup>1</sup>, all in the manner and for the purposes specified.

No. 22,645.—BENJAMIN F. GRINNELL, of New York, N. Y.—*Fastening for a Breastpin, &c.*—Patent dated January 18, 1859.—The claim and engravings will explain the nature of this invention.

*Claim*.—The permanent hook D and spring E, in combination with the hinged-pin C of a breastpin, or other article of jewelry, when the spring is so bent as to direct the pin, when

the latter is depressed, into the hollow of the hook; and when the spring and hook are otherwise arranged in respect to each other, substantially as set forth.

No. 22,646.—JOHN H. GRISCOM, of New York, N. Y.—*Improvement in House Ventilation*.—Patent dated January 18, 1859.—The nature of this invention consists in using a part or the whole of the heated air from the heater or hot air furnace of the house as the means of warming a flue or tube V S<sup>1</sup>, and thus converting it into a ventilating shaft.

*Claim*.—The employment of an auxiliary flue or tube, connecting the hot air flue with the ventilating flue in the manner and for the purpose proposed.

No. 22,647.—JOHN M. HALL, of Warrenton, Ga.—*Improvement in Cotton-Cultivators*.—Patent dated January 18, 1859.—As the machine is drawn along, the scrapers K cut off the excess of plants in the land, leaving only a row between them, and the driving wheels A impart a rotary motion to the bevel wheel C, which, meshing into the wheel D, causes the shaft E and the hoc-wheel G to revolve the hoes H, chop out the cotton in a transverse direction, and thus leave what remains in hills.

*Claim*.—In combination with the series of adjustable revolving hoes, the scrapers K K, in advance of them, substantially in the manner and for the purpose described.

No. 22,648.—LYMAN P. HARRIS, of Mansfield, Ohio.—*Improvement in Apparatus for Evaporating Saccharine Juices*.—Patent dated January 18, 1859.—The nature of this invention consists in providing the channelled evaporator 10 and heater 8 with a portable furnace A and fire-place B, so constructed as to afford an easy and ready control over the inclination of the furnace and evaporator; also of providing the heater and evaporator with one or more valves 1 and strainers 2.

The inventor says: I *claim*, first, the stationary, yet portable, fire-place B, with the stops C C and the springs H.

Second. I claim the portable and inclined furnace A, and its combination with the stationary fire-place.

Third. I claim the handles M and their springs L, and their combination with the springs H; also the rod F, or its equivalent.

Fourth. I claim the racks O and their combination; also the movable flue or plate P and its rod R, and their combination with the movable furnace A and stationary fire-place B.

Fifth. I do not claim the heater 8, nor evaporator 10, as my invention; but I claim, as an improvement, the application of one or more strainers 2 and valves 1 to the heater and evaporator.

No. 22,649.—THEODORE HEERMAN's, of Mitchellville, Tenn.—*Improvement in Coffee-Roasters*.—Patent dated January 18, 1859.—As the cylinder revolves the coffee is picked up by the plate D or shelf and elevated, and when said plate or shelf stands over, or nearly over, the axle, the coffee descends on the inclined plane and passes to the end of the cylinder, from which position it is elevated by the plate or shelf D<sup>1</sup>.

The inventor says: I *claim*, first, the specified arrangement of the plates or shelves D D, for the purposes set forth.

Second. The combination of a window or windows F in one or both ends of a coffee-roaster, with the inclined elevating plates or shelves, substantially as and for the purposes set forth.

No. 22,650.—JOHN L. HOAG, of Genoa, Ill.—*Improvement in Corn-Planters*.—Patent dated January 18, 1859.—The driver by operating the lever *j* by hand may elevate the shares when desired, so that they will be above the surface of the ground, and by applying his foot to the lever K the distributing device will be rendered inoperative, and the machine may be drawn from place to place the same as an ordinary vehicle.

The inventor says: I *claim* the arrangement and combination of the arm *g*, lever K, and bar H, said lever serving as an oblique brace to hold the bar H, (as is shown in fig. 2,) as and for the purposes set forth.

I also claim the arrangement and combination of the lever *h*, slide *i*, lever *j*, upright Q, bar P, and swinging-frames O M, as and for the purposes shown and described.

No. 22,651.—MARK W. HOUSE, of Cleveland, Ohio.—*Improvement in Revolving-Harrows*.—Patent dated January 18, 1859.—The wheels D D<sup>1</sup> are attached to the frame A by means of the axle-boxes F and the spindle G. In the central axis of spindle G a female screw-thread is cut for the reception of screw *i*. This screw confines the cap *e* on the top of the spindle G and the box *d*.

*Claim*.—The combination with the spindle G of a revolving-harrow, of the cap *e*, and box *d*, for the purpose, and substantially in the manner described.

No. 22,652.—JAMES HUGHES and NATHAN STONECIPHER, of Cambridge, Ind.—*Improvement in Corn-Planters*.—Patent dated January 18, 1859.—D is a hollow-scorer or drill-tooth through which seed is deposited. The seed-box contains two hoppers *e e*<sup>1</sup>, separated by a partition

$e^2$ . The slide F has two apertures  $ff^1$ , beneath the centre of the partition  $e^2$  a passage  $d$  leads into the scorer D.  $G G^1$  are cut-off brushes of any approved construction. H is a gravitating trigger, operated by the thumb of the driver, so as to impart motion to the slide F by means of connecting rods I.

*Claim.*—The detached arrangements of the gravitating trigger H, connecting rods I, perforated slide F, hoppers  $e$  and  $e^1$ , and scorer D, operating as described, to deposit seed at each pressure and relaxation of the thumb of the driver.

No. 22,653.—JOHN H. IRWIN, of Carlinsville, Ill.—*Improved Cattle Pump.*—Patent dated January 18, 1859.—The cattle walk upon a platform that is capable of rising and falling, and which is connected by means of ropes or chains to a drum C, that has a pulley  $D^1$  of comparatively large diameter placed loosely upon it. The weight of the cattle depresses the platform  $BB^1$ , rotates the drum C and pulley D, which can only move in one direction, and so elevates the water.

*Claim.*—The platforms  $B B^1$ , weight F, drum C, and pulley  $D^1$ , placed loosely on the drum C, and connecting with it by the pull  $e$  and ratchet D, the whole being combined and arranged to operate as and for the purpose set forth.

No. 22,654.—WILLIAM JOHNSTON and HUGH FORBES, of Brooklyn, N. Y.—*Improvement in Composition for Lining Metal Pipes.*—Patent dated January 18, 1859.—The nature of this invention consists in the lining of lead or other metallic pipes for carrying water by a composition of gutta percha and bitumen.

*Claim.*—The composition of matter, substantially as set forth, for lining metallic or other pipes, or surfaces of a similar kind, substantially as set forth.

No. 22,655.—WILLIAM F. KETCHUM, of Buffalo, N. Y.—*Improvement in Harvesters.*—Patent dated January 18, 1859. The claim and engravings will explain the nature of this invention.

The inventor says: I do not claim the use of a cap, or an opening in the guard-tooth, generally to prevent clogging, but I *claim* the combination of the openings in the guard-tooth below the cutters, with the caps above the cutters D, substantially as described.

No. 22,656.—HENRY A. LANDRY, of Camden, N. J., assignor to A. B. STOUGHTON, of Washington, D. C., assignor to F. G. RAMFORD, of Troy, N. Y.—*Improvement in Railroad Chairs.*—Patent dated January 18, 1859.—The claim and engravings will explain the nature of this invention.

*Claim.*—The improvement of a projecting piece  $a$ , of metal either cast on the railroad chair, or made of wrought-iron or steel, and affixed and rising up alongside of the rails on railroads where two rails meet, and of sufficient height to receive all or a part of the weight of the machinery, while passing over that particular part of the rails as described, disclaiming any right to any particular form or pattern of chair to which my improvement may be applied.

No. 22,657.—WILLIAM LAYLAND, of Mixerville, Ind.—*Improvement in Car-Couplings.*—Patent dated January 18, 1859.—When it is required to uncouple the cars the lever I C will be depressed, by means of which the bolt  $c$ , working in the support M, will be turned toward the car, and the outer end of the clevis N elevated free from the latch T; when it is required to couple the cars, the clevis M rides upon the latch T until it falls over the catch.

*Claim.*—The employment of the combined adjustable latch and catch F T, when constructed and operated substantially as described for the purposes set forth.

No. 22,658.—JOSEPH LEEDS, of Philadelphia, Pa.—*Improvement in Ventilating Registers.*—Patent dated January 18, 1859.—The nature of this invention consists in arranging the swing valve A of a register in such a manner as to introduce hot air into an apartment through said register, or entirely or partially close it against such ingress.

*Claim.*—In combination with a register, the hanging of the valve A, by its centre, as shown so as to make said valve a regulator or cut-off to the ascending current of air from N to M, and at the same time a regulator of the ingress or egress of air to or from an apartment, and thus causing a register to serve the purpose of a ventilator, as described.

No. 22,659.—FERDINAND LEHR, of Hoboken, N. J.—*Improved machine for Bending Umbrella Ribs.*—Patent dated January 18, 1859.—The claim and engravings will explain the nature of this invention.

The inventor says: I *claim*, first, a reciprocating pincer, taking the wire from a fixed, and drawing the same through the machine, dropping from said wire, and then returning below to its previous position, so as to be out of the way of the bending or coiling of the wire into eyes or loops, as set forth.

Second. I claim attaching said pincers on a travelling carriage by one side thereof, while the power for sliding said pincers lengthwise of the machine is applied to the other jaw, whereby the clamping and releasing of the wire is effected by the act of moving said pincers, as set forth.

Third. I claim attaching one end of said pincers on a stud or shaft, in combination with

the stops 6 and 7, spring 9, and slotted connecting link *f*, whereby the sliding, clamping, depressing, and elevating motions are given to the pincers by the reciprocations of said rod *f*, as set forth.

Fourth. I claim the shear *i i*, receiving the compound motion set forth from the cams *h* and 10, in the manner and for the purpose specified.

Fifth. I claim the clamping-levers *k k*<sup>1</sup>, in combination with the ledges 13 14, and shafts *p p*<sup>1</sup>, that press against and hold the wire while the loops are formed as set forth.

Sixth. I claim the mandrels, in combination with the turning shafts and stubs, when the said mandrels are projected from the blocks, or their equivalents, for the wire to be bent around the same, to form the loops or eyes in the spokes or ribs, and withdrawn from said eyes when the same have been bent, substantially as set forth.

Seventh. I claim the arrangement of the sliding-bar *l*, and the connections therefrom to the clamping-levers *k k*<sup>1</sup>, and slides *m m*<sup>1</sup>, whereby the clamps and mandrels *z* are simultaneously actuated as set forth.

Eighth. I claim the sliding-stocks *o o*, carrying the shafts *p*, and turning stubs, for allowing the withdrawal of said stubs out of the way of the travelling pincers, substantially as set forth, and in combination therewith, I claim the bar *n*<sup>1</sup>, and connections therefrom to said stocks *o o*, for communicating endwise motion to said stocks, for the purpose, and as specified.

Ninth. I claim the sliding-mandrel *z*<sup>1</sup>, and turning shaft *p*<sup>2</sup>, connected as set forth in combination with the jaws 32, or their equivalents, for turning the eye or loop in the end of the spoke, or rib, as described and shown.

Tenth. I claim the arrangement of the cranks *q* and *t*, and slotted connecting rods *q*<sup>1</sup> and *t*<sup>1</sup>, for communicating motion successively to the slides *r* and *u*<sup>1</sup>, and from the same to the turning-stubs or loop formers, as set forth.

No. 22,660.—JOSEPH MANSFIELD, of Jefferson, Wis.—*Improvement in Milk Coolers*.—Patent dated January 18, 1859.—The water enters by the pipe *W* at the lowest part of the tube, and passes upward, and the milk being poured in at the top passes down through all the tubes *T T T*, until the space below the disk *D*<sup>2</sup> is filled.

*Claim*.—The improved portable milk-cooler, when constructed in the manner and for the purpose set forth.

No. 22,661.—RICHARD MANSLEY, of Philadelphia, Pa.—*Improvement in Hemp-Brakes*.—Patent dated January 18, 1859.—This invention consists in operating the slide by means of an arm *G*, cam *H*, and spring *J*, the spring being so graduated that when the slide has been impelled to the limit of its outward movement it shall instantly recede, thereby effectually opening the fibres and shattering the ligneous pith of the hemp.

*Claim*.—Operating slide *D*, with its transverse bars by the cam *H*, arm *G*, and spring *J*, when arranged substantially as described, and when the said spring is so graduated that the slide shall instantly recede after reaching the limit of its outward movement, as and for the purpose set forth.

No. 22,662.—RICHARD MANSLEY, of Philadelphia, Pa.—*Improvement in Machinery for Tarring Oakum*.—Patent dated January 18, 1859.—The claim and engravings will explain the nature of this invention.

*Claim*.—The perforated vessel *F*, or its equivalent, placed within a stationary vessel *D*, which contains the compound for tarring oakum, a jet of steam being admitted to the stationary vessel, while a reciprocating motion is imparted to the perforated vessel, as and for the purpose set forth.

No. 22,663.—BENJAMIN A. MASON, of Newport, R. I.—*Improved Horse Shoe Nail Machine*.—Patent dated January 18, 1859.—The claim and engravings will explain the nature of this invention.

The inventor says: I *claim* the combination of the four hammers *B B B*<sup>1</sup> *B*<sup>1</sup>, arranged in pairs, the two constituting each pair being mounted to strike simultaneously, and in opposite directions, and the two pairs working at right angles with each other, or nearly so, substantially as described and for the purpose set forth.

I also claim the employment of an elastic bush, in the connection of the hammers with the cranks by which they are operated, substantially as and for the purpose set forth.

No. 22,664.—CHARLES MONSON, of New Haven, Conn.—*Improvement in Holders for Lamps*.—Patent dated January 18, 1859.—The claim and engravings will explain the nature of this invention.

The inventor says: I *claim* the mode or means, substantially specified, of counterbalancing the system of levers or lazy-tongs *D D*, or the same and one or more articles suspended from, or supported by them, and this, whether the counterbalance weight be applied so as to push or pull on the levers of the lazy-tongs, as explained.

I also claim the method, substantially as described, of steadying the tube or rod, or its equivalent, suspended or extending from the lower termination of the system of crossed

levers or lazy-tongs, viz: by the collar or slide *p*, the levers *o o*, and the connections *f g*, applied to the part *e* and the lazy-tongs, and made to operate essentially as specified.

No. 22,665.—RICHARD MONTGOMERY, of New York, N. Y.—*Improved Mode of Constructing a Combined Street Pavement and Railroad Track*.—Patent dated January 18, 1859.—The arches A B C D consist of parallel corrugations *a a a*, which are intersected by two or more rail tracks *b b*, the rails and corrugations being cast in one piece. The bottom part of the arches is provided with projections *d d*, for the purpose of strengthening the central portion of the arches between the rails *b b*.

*Claim*.—A combined street pavement and railroad track constructed substantially as shown and described.

No. 22,666.—HENRY S. NORTH, of Middletown, and EDWARD SAVAGE, of Cromwell, Conn.—*Improvement in Revolving Fire-Arms*.—Patent dated January 18, 1859.—The claim and engravings will explain the nature of this invention.

The inventors say: We are aware that many applications of packing rings or thimbles have been made to breech-loading fire-arms, to be acted upon by the force of the explosion, to close the joint between the chamber and the breech, and the application has been made to fire-arms of the same kind, of a thimble to be acted upon by a similar agency, to close a joint between the chamber and barrel. We therefore disclaim entirely the use of rings or thimbles when not applied as herein described, in combination with a rotating chambered cylinder, having also a longitudinal movement.

But we *claim*, first, the employment of the movable, cylindrical bushing-rings or thimbles *b b*, applied substantially as herein described within cavities *i i*, formed in the front portions of the chambers of a rotating chambered breech, which has a longitudinal movement to operate and be operated upon, substantially as specified in combination with a valve-like seat *e e*, which is formed upon the rear of the barrel.

Second. The combination of the slide F, working in the bottom of the cylinder frame A, and the double jointed trigger-guard D E, part of which constitutes also a part of the lever, through whose agency the rotation of the cylinder and cocking of the hammer are effected, the whole operating substantially as and for the purpose specified.

No. 22,667.—JOHN K. O'NEIL, of Kingston, N. Y.—*Improved Washboard*.—Patent dated January 18, 1859.—To the lower rod or edge of the rubber B cords *d d* are attached, and extend thence upward into an inclosed space D, at the top of the washboard A, where they are wound around pulleys *f f*, on a shaft C, which is provided with a coiled spring *g*, for the purpose of keeping the said cords *d d* wound around the pulleys.

*Claim*.—The flexible rubber B, constructed as described, and combined with the washboard A, so that its upward movement shall be assisted by a spring, or its equivalent, arranged substantially as specified.

No. 22,668.—BENJAMIN PAYN, of Albany, N. Y.—*Improvement in Coloring and Curing Tobacco Stems*.—Patent dated January 18, 1859.—The stems, stripped from the leaves in the usual manner, are placed loosely upon a grated platform in a close room; steam is then admitted under the grated platform, and passes freely through the heap of stems, and by its action dissolves the thick gummy juices they contain.

*Claim*.—Coloring and curing tobacco stems at one operation, by subjecting them to the action of steam, as and for the purposes set forth.

No. 22,669.—THOMAS PAYNE, of Ridgefield, Conn.—*Improved Clothes-Sprinkler*.—Patent dated January 18, 1859.—To fill the clothes-sprinkler with water, the nozzle of the pitcher may be made to rest upon the stopper *d*, the stopper is pressed down by the weight of the pitcher, the orifice D is opened, and the water can be poured in. On removing the pitcher the orifice D is closed by the action of the spring E.

*Claim*.—A clothes-sprinkler, having an interior self closing stopper, and made and operating substantially in the manner and for the purpose set forth.

No. 22,670.—SAMUEL PIERCE, of Troy, N. Y.—*Improvement in Furnaces*.—Patent dated January 18, 1859.—The claim and engravings will explain the nature of this invention.

The inventor says: I *claim* the series of detachable or removable heat radiating plates J J, constructed with points or stems *a a*, projecting from their surfaces, both of the surfaces being radiating surfaces, in the manner and for the purposes substantially as described.

Also, in combination with a horizontal fire-box and fire-chamber, and the outer casing K, I claim a series of plain heat radiating plates, or a series of corrugated heat radiating plates, arranged substantially in the manner and for the purposes as described.

No. 22,671.—SAMUEL F. PRATT, of Roxbury, Mass.—*Improved Carpet-Sweeper*.—Patent dated January 18, 1859.—The claim and engravings will explain the nature of this invention.

The inventor says: I *claim*, in combination with the case A, and the rotary brush B, of

carpet-sweeper, a serrated or toothed clearer E, applied so as to cleanse the brush during and by its revolutions.

I also claim the arrangement of serrated or toothed clearers on opposite sides of the brush, in order that it may be cleansed while being rotated in either direction.

I also claim the arrangement of the serrated clearer in the case of the carpet-sweeper in such manner that the said clearer shall form part of, or be maintained by the dust-receptacle. I do not claim the application of a single elastic-tired driving-wheel to the driving-wheel affixed on the brush shaft; but claim the arrangement of two of the elastic-tired wheels on opposite sides of the driving-wheel of the brush shaft, as described, and so applying the said shaft in the case and to the fork of the handle, as to enable the brush-wheel to be forced in close contact with its drivers, not only when the machine is moved in either direction, but by the force exerted through the handle, and to so move the machine, the same insuring the rotary motion of the brush, whenever the machine may be in the act of being moved on and over a carpet.

No. 22,672.—R. B. PRINDLE, of Coventry, N. Y.—*Improved Mode of Attaching Thills to Vehicles.*—Patent dated January 18, 1859.—In the engravings C is the bolt or pin to hold the thills or shafts B B in their places, and is made round with a flange *c* projecting on one side and is fitted into the slot *e*, in the portion of the hinge *b b*, that is made fast to the shaft and turns with it, in one side of the cock-eye *a* there is a corresponding slot *f* to admit the flange bolt or pin being easily inserted.

*Claim.*—The flange on the bolt or pin so made and inserted that it cannot be removed when the joint is varied from the position in which the bolt is introduced.

No. 22,673.—WILLIAM W. PURDY, of Liverpool, Ohio.—*Improvement in Rolling and Pressing Wool.*—Patent dated January 18, 1859.—The roller is made in two or more sections I and I<sup>1</sup>, and the straps F are attached to the several sections of the roller by means of hooks H, the sections of the roller may be worked independent of each other, and they are provided with pins or catches so that they may be connected together and form one roller.

*Claim.*—The combination of the sectional rollers I and I<sup>1</sup>, with the strap F, and breast-piece E, for the purpose of rolling and pressing fleeces of wool, as described.

No. 22,674.—JOHN W. RIGGS, of New York, N. Y.—*Improvement in Truss Springs.*—Patent dated January 18, 1859.—This improvement consists in coating the steel or other metal of the spring with a composition which has elasticity and a sufficient degree of hardness, and which is also anti-corrosive in its character.

*Claim.*—Constructing springs for trusses in the manner and for the purposes substantially as set forth.

No. 22,675.—E. K. ROOT, of Hartford, Conn.—*Improved Method of Packing Cartridges.*—Patent dated January 18, 1859.—The claim and engravings will explain the nature of this invention.

The inventor says: Not wishing to confine myself to any exact shape of package, peculiar mechanical construction of box, or arrangement of the cartridges and caps, what I *claim* is putting up cartridges between two blocks A A<sup>1</sup>, or their equivalents, substantially as described.

I also claim forming in the package or holder, as described, a receptacle or receptacles for containing caps or other primings, substantially as described.

No. 22,676.—JOHN F. SEAMAN, of Clyde, New York.—*Improvement in Seeding Machines.*—Patent dated January 18, 1859.—The claim and engravings will explain the nature of this invention.

The inventor says: I do not claim the distributing device formed of seed cells *f*, made in a cylindrical head *e*, in connection with cut-off brushes *h*, for this is an old and well known device.

Neither do I claim, broadly, rotating covering shares, irrespective of the construction and arrangement shown.

What I *claim* is operating the seed-distributing device by means of the part *b*, of the handle C<sup>1</sup>, attached by pivot *d* to the other part *c* of said handle, and connected at its lower end to the shaft E, by a cord or chain *i*, the above parts being used in connection with the spring F, attached directly to the other handle C of the implement, and to the shaft E, by a card or chain *k*, the whole being arranged substantially as and for the purpose set forth.

No. 22,677.—SOLOMON SHETTER, of Allegheny, Penn.—*Improved Horse-Shoe Machine.*—Patent dated January 18, 1859.—The nature of this invention consists in an arrangement of a sliding table, roll, shears, swage, levers, cams, springs, clamps, friction rollers, and lifter, all of which are arranged and combined for the purpose of making horse-shoes.

The inventor says: I *claim*, first, the curved arms *w* 1, of clamps *s*, moved and operated

by the friction rollers 2, and the backward and forward movements of table *c*, when clamps are used in connection with the dies *t* and *w*, as described and for the purpose set forth.

Second. The use of the flexible strip *n*, for the purpose of operating the clearer *u*, as described and for the purpose set forth.

Third. The arrangement on the upper surface of table *c*, of dies *t* and *w*, springs *x*, the under jaw *v* of the shears and the clearer *u*, when used and operated in connection with the clamps *s*, friction rollers 2, roll *t* 1, shear *d*, and swage *f*, as described and for the purposes set forth.

No. 22,678.—STEPHEN WILLIAM SMITH, of Brooklyn, N. Y.—*Improved Sweeping-Machine*.—Patent dated January 18, 1859.—Motion being given to the machine in the direction from left to right, the traction wheel E will bear upon the surface to be swept and cause the gear F to rotate the pinion G, and consequently the brush in the opposite direction, and the rapid revolutions of the brush will take up the dirt and dust and deposit it in the dirt pan J.

The inventor says: I *claim*, first, the combination of the gears F and G with the driving wheel, constructed and operating substantially as described and for the purposes specified.

Second. The method of adjusting the brush by the plate K, which admits of both vertical and lateral adjustment, as described and specified.

Third. I also claim preventing the escape and rising of the dust, by means of the flexible curtain L, arranged and operating substantially as described and specified.

No. 22,679.—BENJAMIN F. SMITH, of New York, N. Y.—*Improvement in Manufacture of White Lead*.—Patent dated January 18, 1859.—The claim and engravings will explain the nature of this invention.

The inventor says: I *claim* the manner of filling the chamber with metallic lead by means of the open work tables or racks *a*, in which the lead in detached pieces rests, arranged one above the other, in successive and close series, substantially as described, and whereby a more thorough and equal circulation of the fumes or gases amongst the lead is produced.

I also claim constructing the converting chamber A with an inclined bottom, substantially as and for the purposes set forth.

I also claim the method described of extracting from the converting chamber the carbonate of lead, and other incidental products, by means of a current or currents of water passing through said chamber from top and bottom, substantially in the manner and for the objects set forth.

I also claim subjecting the carbonate of lead and other incidental products, previous to their extraction from the converting chamber, to the action of steam, substantially in the manner and for the purpose specified.

No. 22,680.—FERDINAND M. SOFGE, of Columbus, Ga.—*Improvement in Horse-Power*.—Patent dated January 18, 1859.—The nature of this invention consists in constructing the wheel A in such a manner as to support the wheel B without clamping the cogs in wheels A and B.

*Claim*.—The combination of the cogged wheel A, having the supporting flange No. 1 and the wheel B, with corresponding cogs and bearing, revolving upon the supporting ring I; the whole constructed and operating substantially as and for the purpose set forth.

No. 22,681.—P. P. STEWART, of Troy, N. Y.—*Improvement in Cooking-Stoves*.—Patent dated January 18, 1859.—The claim and engravings will explain the nature of this invention.

The inventor says: I *claim*, in combination with a stove, such as described, making the front plate *c* of the oven open with doors, and an apron *l* to receive and hold a tin kitchen or roaster, substantially as specified, that the heat radiated by the front plate of the fire-chamber may be aided by the heat radiated by all the oven-plates, as specified, when combined with an end door, whereby the draft may be controlled without the aid, and independent of the front doors. And I also claim the boiler, having a removable cover and two inclined flues, which are separate at the lower end, united into one at the top to connect with the chimney, substantially as described, in arrangement with the exit-flue space, to which the boiler is fitted, and into which the gaseous products of combustion are discharged from the series of direct and return-flues, substantially as and for the purpose specified.

No. 22,682.—W. M. WAGGONER, of Middletown, Ind.—*Improvement in Devices for Gathering Grain into Gavels*.—Patent dated January 18, 1859.—This invention consists in having stationary and adjustable fingers E E G G attached to a frame-work mounted on wheels and provided with handles A A, the parts being so arranged that the operator may shove the device along and underneath a windrow of grain, and gather the same into gavels and bind each gavel into a sheaf.

*Claim*.—The stationary fingers E E G G and the fly or gathering fingers H H, attached to a suitable framing or stanchions, mounted on wheels and arranged to operate substantially as and for the purposes set forth.

No. 22,683.—LOUIS B. WAKEMAN, of Baltimore, Md.—*Improvement in Devices for Reefing Sails*.—Patent dated January 18, 1859.—The manner of working this improvement is as follows: To take the sail in, let go the standing and rolling halyards  $d^2 d^1$ , keeping taut the windlass-ropes  $d d$ , when the yard will descend by its own weight, winding the rolling halyard  $d^1$  with the sail on the yard.

The inventor says: I *claim* the employment of the smooth surfaced clamp  $E E$ , as described, when in combination with the forked screw-bolt 5, or its equivalent, carrying the blocks through which the rolling halyards  $d^1 d^1$  pass for the purposes set forth.

I also claim giving direction to windlass-ropes  $d d$ , by the bent arm  $b$ , in combination with the clamp  $E E$  and forked screw-bolt 5, when fitted with an ordinary block, operating in the manner and for the purposes set forth.

No. 22,684.—WILLIAM N. WHITELY AND ANDREW WHITELY, of Springfield, Ohio.—*Improvement in Harvesters*.—Patent dated January 18, 1859.—The claim and engravings will explain the nature of this invention.

The inventors say: We *claim* a finger so constructed that the slot or opening above the cutters  $D$  shall increase in capacity from front to rear, in combination with the clearing projection described, passing directly into the rear corner of said opening in the manner described for the purpose specified.

We also claim forming the clearing projections  $d$  of a bent extension of the cutter, substantially as described.

No. 22,685.—JOHN YOUNG, of West Galway, N. Y.—*Improvement in Railroad Chairs*.—Patent dated January 18, 1859.—The chair consists of two parts,  $a b$  and  $a^1$ . The former consisting of a double branched plate  $b$ , from whose arms rise the bearing pieces  $a$ . By drawing the ends  $e$  toward each other, the inclinations of the bearing faces of  $a a$  are altered so as to press firmly against two rails which depart from a straight line.

*Claim*.—The combination of bearing surfaces  $a$ , capable of forming any desired angle with each other, and the securing portion  $a^1$  of the chair, substantially as and for the purpose set forth.

No. 22,686.—JOSEPH BLOOM, of Philadelphia, Pa., assignor to R. E. ROGERS, of said Philadelphia.—*Improvement in Umbrella Frames*.—Patent dated January 18, 1859.—The claim and engravings will explain the nature of this invention.

The inventor says: I *claim*, first, the bow or rib  $c$ , constructed substantially as described. I am aware that the bow or rib and the brace or sustaining rod have been attached to collars upon the standard by a piece of metal having an enlarged end affixed to the end of the bow or rib, and a like piece of metal affixed to the end of the brace, the enlarged end fitting into a slit of a sheet metal collar, the flange of which must be swaged down upon the enlarged end in order to hold it in place, and I therefore do not claim this method; but I claim connecting the bow or rib and the brace  $d$  or sustaining rod to the collars  $ff$  upon the stem or standard  $g g$  by the means set forth. I am also aware that the end of the brace or sustaining rod has been connected to the bow or rib by the end of the brace being riveted to a band, which may be sprung into a groove in the inner surface of the bow or rib, and I therefore do not claim this method of connecting the two parts here named; but I claim connecting the brace or sustaining rod to the bow or rib by the spring-board  $e$  embracing the bow as set forth.

No. 22,687.—FRANZ ANTON LOHAGE, of Unna, Prussia, assignor to EDMUND LEOPOLD BENZON, of Boston, Mass.—*Improvement in the Manufacture of Steel*.—Patent dated January 18, 1859.—The claim will explain the nature of this invention.

The inventor says: I would observe that the commencement of the process—that is, the fusing and boiling of the pig iron, is similar to the operation usually carried on in the puddling furnace in the manufacture of wrought iron. I do not, therefore, intend to claim such part of the process.

But I *claim* regulating the heat and stopping the decarbonization of the fused mass of metal in the finishing process in the puddling or reverberatory furnace, as set forth, before it becomes converted into malleable or wrought iron, and whereby I obtain steel in the manner specified.

No. 22,688.—NELSON ORCUTT, of Binghamton, N. Y., assignor to Himself and G. W. GREGORY, of said Binghamton.—*Improved Paddle-Wheel*.—Patent dated January 18, 1859.—The claim and engravings will explain the nature of this invention.

*Claim*.—The centrally suspended paddle  $c$ , or bucket, without any stop, means, difference of area or of weight for holding it in a working position, but left entirely to the action of the forces exerted upon it during the revolution of the wheel, as set forth.

No. 22,689.—HAMILTON E. SMITH, of Philadelphia, Pa., assignor to Himself, D. B. NELSON, of Cortland County, N. Y., and JOHN L. MYERS, of Chemung County, N. Y.—*Improved Grain, Fan, and Corn Shelter*.—Patent dated January 18, 1859.—The claim and engravings will explain the nature of this invention.

The inventor says: I do not claim, broadly, combining a grain-fan and a corn-sheller in one instrument. I claim arranging the spiked roller C and slotted shield D, of a corn-sheller, on the frame of a grain-fan, in respect to, and in combination with, the sieve-frame E, blower G, and inclined plane J, of the said grain-fan, in the manner herein described, so that the said blower, sieve-frame, and inclined plane, may serve the purpose of separating the cobs from the shelled kernels of corn, and the latter from the chaff and other refuse.

No. 22,690.—CYRUS B. THAYER, of Boston, Mass., assignor to Himself and CHARLES ROBINSON, of Cambridgeport, Mass.—*Instrument for Turning the Leaves of Music-Books, &c.*—Patent dated January 18, 1859.—If the leaves to be turned are sheet-music, the backs of the leaves are placed between the clamp-jaws C D, and secured therein by means of the eccentric I. Each leaf to be turned is then placed respectively between a pair of the cords E E, and the upper end of said cords are all placed in the notch b, at the top of the back B. When they are thus arranged, the escapement-catch H is unsprung from the rod F by pressing it downward with the hand.

The inventor says: I claim the double holding cords E E E, elastic springing cords G G G, or their equivalents, back, or catch-band B, provided with clamps C D and notch, and the curved concentric rod or way F, arranged and operating in connection with, and in relation to, each other, substantially in the manner and for the purpose specified.

I also claim the escapement-catch H, constructed, arranged, and operating in connection with the curved rod F and thimbles of the holding cords E E E, substantially as described.

No. 22,691.—J. C. APPENZELLER, of Cincinnati, Ohio.—*Improvement in Treatment of Fatty Acids*—Patent dated January 25, 1859.—The tank I is for the purpose of first treating the fatty matters with steam, and afterwards, by the application of heat to the exterior of the tank, which contains a rotary stirrer L M, keeping the fatty matters and alkalies constantly agitated during the process of saponification.

The inventor says: I claim as my invention, after subjecting the mixture for a time to the direct action of steam, shutting off the steam from it, and raising its temperature by the application of heat to the exterior of the vessel, substantially as described.

No. 22,692.—ROBERT BAILEY, of Troy, N. Y.—*Improvement in Valves for Steam-Engines.*—Patent dated January 25, 1859.—The puppet-valves of a steam-engine are, in this invention, constructed with hollow tubular stems, fitting with stuffing boxes G directly to the induction and eduction pipes of the engine, and making communication directly through their interiors and around the exteriors of their seats between the pipes and the cylinder, thus making them balanced valves.

The inventor says: I claim the arrangement and combination of the tubular valve I, seat C, induction-pipe D, eduction-valve E, levers H M, and cams J J N, substantially as and for the purpose shown and described.

No. 22,693.—W. M. BAKER, of Walpole, Ind.—*Improvement in Car-Seats and Couches.*—Patent dated January 25, 1859.—This invention consists in having an upright rod I placed at each end or side of an ordinary reversible car-seat, and having a supplemental seat and couch fitted between the rods, and allowed to slide up and down on them, these parts being used in connection with the curtains and a sliding couch.

The inventor says: I claim, first, the arrangement and combination of the boards G F, arms i, curved bar e, legs K, fenders l, slide E, seats B, and rods C, as shown and described.

Second. The arrangement and combination of the curtain H, the seat-backs D, drums Z, weights v, curtains u, and rod I, as shown and described, so that when the rod I descends the curtain u will fall and the curtain H rise; and when the rod I is released, all the curtains will be simultaneously rolled up.

No. 22,694.—GERARD BANCKER, of New York, N. Y.—*Improvement in Brick-Machines.*—Patent dated January 25, 1859.—The nature of this invention consists in the mode of constructing a dry pressing, brick-forming machine, by the arrangement and use of a horizontal rotary table C, having in it, transversely of its axis, a moulding box G.

The inventor says: I claim, first, the combination of the adjustable plunger K with the side-rods L, and rods  $j^1$  and  $j^2$  of the rotating mould-box, for operating the compressors, in the manner described, and for the purposes specified.

Second. I also claim the use of the cleft Q, in combination with the rotating moulding box G and semi-circular stationary cap-plate N, substantially as described and for the purposes set forth.

Third. I also claim the use of an elevator plunger R, operating as set forth, in combination with the rectangular rotating mould-box G, adjustable compressors  $H^1$  and  $H^2$ , and cap-plate N, as a device for moulding and compressing clay into bricks, and discharging the same therefrom.

No. 22,695.—JOSEPH BECKEL, of New York, N. Y.—*Apparatus for Displaying Stereoscopic Pictures.*—Patent dated January 25, 1859.—The prism *a a a* has journals which revolve in bearings in the side of the box, and is turned by means of the handle *B*. The pictures are arranged in an endless chain *b b*, and pass over the prism *a a a* as it is turned. The pads 1, 2, 3, &c., cause the outer edges of the pictures to form a larger arc, so that the whole series will conform to the shape of the concave *D d D*.

The inventor says: I *claim*, first, in combination with an endless chain of pictures constructed and arranged as described, the revolving prism *a a a*, arranged and operating as described.

Second. The rest or stop *C*, arranged and operating as specified.

Third. The concave *D d D*, arranged and operating in the manner described.

Fourth. The pads or cushions 1, 2, 3, 4, &c., arranged and operating as specified.

No. 22,696.—W. H. BENSON, of Wetumpka, Ala.—*Improvement in Wind-Wheels.*—Patent dated January 25, 1859.—This wheel is constructed of a series of thin strips *a* of wood, or other suitable material; placed on a common axis, which passes through their centres, and the strips *a* are so dispersed one above the other as to form something like a screw propeller.

The inventor says: I *claim* constructing a wind-wheel of a series of strips or slats *a*, placed centrally on a shaft *A*, spread and overlapped and secured together and to the shaft *A*, substantially as shown and described.

No. 22,697.—EDMUND BIGELOW, of Springfield, Mass.—*Improved Soda-Water Apparatus.*—Patent dated January 25, 1859.—This invention consists in having a set of reservoirs or vessels on a common base *B*, with a metallic hollow shaft *E* running through a thimble *I* set in an ice chamber, two arms *SS* leading from the head *X* of the shaft *E* through which the soda water flows, and from which it is discharged in the ordinary way.

The inventor says: I *claim* the arrangement of a set of sirup cans, ice chamber, and draft pipe, substantially as described.

I also claim the combination of a measuring faucet with the described and claimed arrangement of devices for drawing sirups and soda water.

No. 22,698.—SETH BOYDEN, of Newark, N. J.—*Improvement in Machinery for Forming Hat-Bodies.*—Patent dated January 25, 1859.—The cone *E* is placed on the plate *c* and the fur is placed on the apron *C*. This apron conveys the fur to the picker *B*, which by a rapid rotation throws the fur outward, so that the steam which issues from the tubes *d* will convey it to the cone *E*, the tubes being so adjusted as to give the jet of steam the proper direction.

The inventor says: I *claim* conveying the fur from the picker *B* to the perforated cone *E* by means of jets of steam issuing from the tubes *d*, arranged relatively with the picker *B* and cone *E*, substantially as described, to effect the desired purpose.

No. 22,699.—JOHN GOTTLIEB BROEMSER, of St. Louis, Mo.—*Improved Lounge.*—Patent dated January 25, 1859.—This invention consists in making the head piece *B* of the lounge adjustable by attaching the same to the seat *A* by means of hinges *D*, one of which is provided with ratchet teeth *e* into which a pawl *f* gears, which is released by the operation of a spring catch *G* at the top of the back of the lounge, which serves to steady the head piece by means of a serrated arc *F*, which is attached to the same near its top.

The inventor says: I *claim* the described arrangement of the spring catch *G* and the serrated arc *F* in combination with the pawl *f*, which gears into ratchet teeth *e* at the lower edge of the hinges *D*, and which is attached to a rocking cross-bar *E* and connected to the catch *G*, substantially as and for the purpose set forth.

And I also claim the valve *K* in the seat *A*, which is operated by an arbor *L* and by means of a cam *l* and a hook *m* in combination with the sliding frame *N*, constructed substantially as and for the purpose specified.

No. 22,700.—WILLIAM W. CAUSLER, of Baltimore, Md.—*Improved Boot-Jack.*—Patent dated January 25, 1859.—This invention consists in a metallic boot-jack with pointed prongs *H H* at one end, and a point *I* at the other, so as to serve as a brace to fasten the door of a room.

The inventor says: I *claim* the metal folding boot-jack described, with pointed prongs and pointed end, as a new article of manufacture.

No. 22,701.—JARVIS CASE, of Bloomington, Ill.—*Improvement in Mole Plough.*—Patent dated January 25, 1859.—The nature of this invention will be understood by reference to the claim and engravings.

The inventor says: I *claim*, first, so suspending the mole to the beam or coulter *G* as that it cannot go vertically beyond a given depth, whilst it may move laterally, substantially as described.

Second. I also claim extending the nose *r* of the mole into the rear of the coulter, so that

it cannot at any time run out of the line or cut of said coulter at its point, substantially as described.

No. 22,702.—SETH CHENEY, of Kiantone, N. Y.—*Improved Field Fence*.—Patent dated January 25, 1859.—A A A A are sticks or pieces of timber laid across each other in such a manner that the ends which rest on the ground will be about six feet apart. a a are strips of board or timber fastened to the legs of the posts with nails. e e e e represent lock rails or poles inserted in the crossings of the legs of the posts.

*Claim*.—The particular construction of panels and their combination with the rails, in the manner and for the purposes set forth.

No. 22,703.—SAMUEL CHENEY, of Cleveland, Ohio.—*Improvement in Lamps*.—Patent dated January 25, 1859.—The operation of the lamp is as follows: The gas tube G is placed over the wick tube C and caused to rest upon the diaphragm F, so as to cover the openings E E upon each side of the wick tube in the diaphragm F. The wick is then elevated to a point a little below the top of the gas tube G and ignited. The cap H and chimney are then placed upon the body of the lamp.

The inventor says: I *claim* the gas tube G and openings E E in combination with the wick tube C and cap H, when these several parts are constructed and arranged as described, and operating substantially in the manner and for the purpose set forth.

No. 22,704.—AUGUSTUS M. CHURCH, of Augusta, Ga.—*Improved Amalgamator*.—Patent dated January 25, 1859.—The trough N is of sheet-iron, and is furnished with *riffles* extending across it from side to side, but only every alternate riffle is in contact with and fastened to the bottom of the trough N, the other riffles have an opening between their lower edges and the bottom of the trough.

The inventor says: I *claim* the arrangement described of the vibrating riffles of the inclined trough, constructed and operated as set forth, by which it is proposed to save the finest particles of the gold by amalgamation.

No. 22,705.—JOHN C. CLIME, of Philadelphia, Pa.—*Improved Method of Hanging Reciprocating Saws*.—Patent dated January 25, 1859.—W W<sup>1</sup> are two balance-wheels, C cranks attached to fly-wheels, i i iron rod connecting one end of the pitman-bar P with the crank-wheel W, the other end of the bar being connected by means of a link L with the saws S, F the fulcrum upon which the pitman-bar P works.

*Claim*.—The employment of a spring either straight or spiral to suspend the fulcrum of pitman-bars, or other reciprocating levers, in the manner substantially set forth in the foregoing specification.

No. 22,706.—FRANCIS COTTON, of Brooklyn, N. Y.—*Improved Portable Bedstead*.—Patent dated January 25, 1859.—To the central stand A A the side-rails C C are attached at a given point G. Two end supports B B are joined to the side-rails C C at the point H. A series of straps E E E E are fastened to the end supports B B in such a manner that the line of tension shall be below the point G.

The inventor says: I *claim* the arrangement of the stand-rails, straps, and end supports, the whole forming a new and improved article of manufacture, namely, an improved portable bedstead.

No. 22,707.—ISAAC N. CREHORE, of Boston, and FRANCIS STILES, jr., of Leicester, Mass.—*Improvement in Paper Rag Engines*.—Patent dated January 25, 1859.—The plates *f* are formed with a series of angles *m*, and arranged side by side between the blocks A, with washers *i* between them, the bolts *b* pass through holes *g* in the plates and through corresponding holes in the washers *i*. By tightening the nuts *c* the whole is bound compactly together to form the bed-plate.

The inventors says: We *claim* a bed-plate composed of sheet-metal knives, corrugated, or formed with a series of angles or curved lines through their entire length, in the manner described, and for the purpose specified.

No. 22,708.—D. W. CROCKER, of Deposit, N. Y.—*Improvement in Railroad Chairs*.—Patent dated January 25, 1859.—This invention consists in a novel method of applying a key B in combination with a railroad chair, which is divided centrally into two parts, whereby the weight of the engines and cars passing over the track is made to draw the jaws *b* of the chair towards each other, and make them clamp the sides, bases, and lower portions of the heads of the rails at their joints very closely.

The inventor says: I *claim* the arrangement and combination, substantially as shown and described, of the inclined grooves *c c*, keys B, jaws *b*, and rail A, so that the weight of the cars will depress the base parts *a a* of the chair, and thereby cause the jaw parts *b* to grip the rail A more firmly.

No. 22,709.—DANIEL S. CURTISS, of Madison, Wis.—*Improved Field Fence*.—Patent dated January 25, 1859.—A A are the fence boards, B B the battens or slats, C c the key or wedge and the groove in which it is placed in the edge of the board under it, to keep it more firm in its place, a a the notched or dove-tailed ends of the boards, b b the beveled edges of the upright battens.

*Claim*.—The mode of notching the ends of the rails, and keying together the ends of the panels in the manner and for the purpose described and set forth.

No. 22,710.—ABBOTT R. DAVIS, of East Cambridge, Mass.—*Improvement in Corn-Husk-ers*.—Patent dated January 25, 1859.—In order to husk, the operator turning the crank G drops one ear of corn at a time upon the spring-board D, with the but end towards the slotted projection K, when the husks and silk are stript from the ear by the action of the rolls, the husked ear remaining between the rolls and spring-board until released by the introduction of another unhusked ear, which presses back the spring-board sufficiently for that purpose.

The inventor says: I *claim* the combination of the rolls B and C, spring-board D, slotted projection K, and conical projection J, when these several parts are constructed and arranged for operation in the manner described, and for the purpose specified.

No. 22,711.—WILLIAM T. DENNIS, of Richmond, Ind.—*Improvement in Sugar-Cane Mills*.—Patent dated January 25, 1859.—The nature of this invention consists in covering or plating the iron rollers of the sugar-cane mill with tin or other anti-corrosive metal or substance so as to prevent the corroding of the iron, and thereby discoloring the juice of the cane.

The inventor says: I *claim* the plating or covering of the iron roller of sugar-cane mills with tin, or other anti-corrosive metal or substance, for the uses and purposes described.

No. 22,712.—JOHN DROWN, of HIRON, N. Y.—*Improved Construction of Posts for Field Fences*.—Patent dated January 25, 1859.—The notches *ff* are made in the outer edges of the upper rails at their joints, and are wide enough to admit the edges of the braces C C. The braces project above the rails, and are connected together by means of a clamp *h* put over the ends of the braces, and fitting into small notches *ii* in the braces.

The inventor says: I *claim* the arrangement of the braces C C, one fixed and the other hinged or pivoted thereto, in combination with the rails A A, and chair B, substantially as specified.

No. 22,713.—RICHARD DUDGEON, of New York, N. Y.—*Improvement in Hydraulic Presses*.—Patent dated January 25, 1859.—The engravings represent these improved presses as applied to the punching of metallic plates, and especially adapted to the kind of punching now performed by what is called a screw-punch; A is the injection-piston to which the force is applied; D the ram, or piston, upon which the pressure is exerted; B and C the corresponding chambers. The packings to prevent leakage are colored yellow.

The inventor says: I *claim* the described hydraulic press, consisting of the injection-piston A, chambers B and C, and ram D, the whole constructed and operating substantially as and for the purposes set forth.

No. 22,714.—DANIEL E. EATON, of Boston, Mass.—*Improvement in Shoe-Horns*.—Patent dated January 25, 1859.—The inventor says: The purpose of the ordinary shoe-horn is to guide the heel of a person's foot into the heel of a shoe during the act of putting the shoe on the foot. To an instrument of such kind I have added a nipper-jaw, or lever B, so applied as to enable the shoe-horn to perform two functions, viz: that of guiding the foot into the shoe, and of drawing the shoe on the foot by a pull on the instrument and compression of the heel of the shoe between the jaws.

*Claim*.—The improved shoe-horn, as made with a heel-guide and nipper-jaw, applied to two cross-levers, so as to operate together substantially as specified.

No. 22,715.—LEWIS EICKENBERRY, of Eaton, Pa.—*Improvement in Iron Bridges*.—Patent dated January 25, 1859.—The nature of this invention will be understood by reference to the claim and engravings.

The inventor says: I *claim*, first, having the uprights and diagonals of the side-formings of the bridge so united together that they shall be capable of turning on their points of connection, and thus, whenever expansion or contraction in the metal occurs, they may be able to compensate therefor without ceasing to brace the bridge at the top and bottom, substantially as and for the purposes set forth.

Second. The combination of lattice side-frames of bridges, formed of diagonal braces and angular iron-uprights, which are united together, so as to turn on their points of connection, as above stated, with tubular, semi-tubular, and angular iron-arches, substantially as and for the purposes set forth.

No. 22,716.—W. H. ELLIOT, of Plattsburg, N. Y.—*Improvement in Coffee Pots*.—Patent dated January 25, 1859.—The claim and engravings will explain the nature of this invention.

The inventor says: I *claim*, first, the combination of boiler *a*, stillworm condenser *b*, conducting or discharge tube *g*, the external opening of the stillworm at *g*, when these devices are so arranged in relation to each other that an opening to the external air shall be provided for the non-condensable gases, while the condensable vapors are reduced to a liquid without coming in contact with the condenser water, and then turned by conductors into the boiler, as and for the purpose specified.

Second. The arrangement of the joint *c*, below the spout, so that no vapor can pass through the spout without first passing the joint as set forth.

Third. The employment of conductors in combination with the condenser for the purpose of filling the water-joint or keeping it full, as and for the purpose specified.

No 22,717.—LEWIS C. ENGLAND, of Owego, N. Y.—*Improvement in Tanning*.—Patent dated January 25, 1859.—This invention consists in the mode of causing the bark to be conveyed from the grinding mill to the leach vat, by pumping a continuous stream of the liquid from the "junk" into the trough or tube which leads from said mill to the vat, and in heating successive portions of the liquor, and discharging the same upon successive portions of the dry bark, in the conveyor trough. It also consists in passing the bark through a pair of crushing rollers before discharging it into the leach vat.

The inventor says: I *claim*, first, applying the liquor to the bark while said bark is discharged from the mill, for the two-fold purpose of making it a conveyor of the same and a preserver of the dust thereof, as set forth.

I claim, second, the method of applying the heated liquor to the bark, for the purposes and in the manner substantially as set forth.

No. 22,718.—JOHN B. FORD, ADDISON SULLIVAN, and ALBERT GREGG, of New Albany, Ind.—*Improvement in Threshing Machines*.—Patent dated January 25, 1859.—In the engravings A A represent two cylinders, which are provided with knives, and placed in such relation to each other that the knives of the one will interlap with those of the other. C is a cylinder, which is provided with teeth or beaters, and is located immediately over a concave B, which is also provided with teeth. D D are two screens, which are secured in a vibrating frame. E is a fan with arms, for the purpose of creating a current of air when operated.

The inventors say: We *claim* the combination of the cutting cylinders A A, provided with knives, the cylinder C and concave B provided with teeth, the screens D, and the fan E, substantially in the manner specified and for the purpose set forth.

No. 22,719.—WILLIAM A. FOSKET and ELLIOT SAVAGE, of Meriden, Conn.—*Improvement in Sewing Machines*.—Patent dated January 25, 1859.—The claim and engravings will explain the nature of this invention.

The inventors say: We *claim* the feeding device, constructed and arranged substantially as set forth, and so operating as to cause the cloth to progress by grasping the same with a positive force, in contradistinction to the employment of spring-pressure, between two surfaces moving in unison while feeding.

We also claim setting the shank of the revolving and reciprocating looping hook at an angle to the bed-plate, substantially as specified, when said looping hook is constructed in the manner herein described or referred to, for the purpose of avoiding the motion of the said hook in the direction of the axis of revolution.

We also claim operating the slide-plate O from above the sewing table by means of a feed-foot having two motions—one vibratory in the line of feed, the other reciprocatory and perpendicular to the table or thereabouts.

No. 22,720.—CARL FRANK, of Cleveland, Ohio.—*Improvement in Smut Mills*.—Patent dated January 25, 1859.—The grain falls through sieve *a* upon sieve *b*. The meshes of sieve *b* are such that the smaller particles of dirt, &c., will pass through the sieve and falling upon the inclined board *a*<sup>1</sup> will pass out of the machine through spout *b*<sup>1</sup>, while the grain rolling down the sieve *b* finds its way through slot *c* into trough *c*<sup>1</sup>. The cylinder *d* revolves within a hollow cylinder *e*<sup>1</sup>, which latter has a slot on top to correspond with slot *d*<sup>1</sup>, and has also a slot *l* at its bottom.

The inventor says: I *claim* arranging between the trough C, containing the grain to be scoured and the scouring cylinder K, a slotted hollow cylinder *d*, revolving within another hollow cylinder *e*, as described.

No. 22,721.—JOHN FREZER, of Newberry, Pa.—*Improvement in Horse Powers*.—Patent dated January 25, 1859.—The central shaft Q is supported at the bottom by the bearing box O, and has a pinion K upon it, which gears into the bevel wheel or pinion I, which is firmly attached to the horizontal shaft J. The shaft J has also a wheel H attached to it by which it is geared to the segment wheel L. A pinion M, attached to the inner end of the shaft J, gears into the pinion N, which is supported in a fixed position by the braces S, attached to the timbers D, the braces S terminating in a collar R for that purpose.

*Claim.*—The combination of the flange A, upon the end of the sweep-shaft, with the groove in the collar R, or its equivalent, for securing the shaft J, against the longitudinal motion, as set forth, in connection with the wheel H and pinion M, attached to the sweep-shaft and the stationary wheel and pinion L and M, which keeps the shaft J in a directly radial position.

No. 22,722.—F. J. GARDINER, of Washington, N. C.—*Improved Combined Chair and Lounge.*—Patent dated January 25, 1859.—This invention consists in the manner of constructing and arranging the several parts of the device so that they may be readily adjusted to form either a rocking chair or recumbent stationary chair or lounge, as may be desired.

The inventor says: I *claim* the seat A, back B, and supplemental back C, connected together by joints, and provided, respectively, with the legs *d d*, arms E E, and rockers D D, the whole being arranged substantially as and for the purpose set forth.

No. 22,723.—CONRAD GERSTEN, of Brooklyn, N. Y.—*Improvement in Lanterns*—Patent dated January 25, 1859.—The nature of this invention will be explained by reference to the claim and engravings.

The inventor says: I *claim* the mode of controlling the currents of air which feed the flame, by taking the air from the top of the lantern and causing it to pass down in a narrow annular passage to the apertures leading to the burner, in combination with the deflector which encloses the burner chamber, substantially as described.

I also claim, in combination with a lantern in which the flame is protected against disturbing causes outside, the arrangement for controlling the wick from outside the lantern, as described.

I also claim, combining with the burner and the oil reservoir, and interposed between the two, an air chamber for preventing the oil from being overheated, as described.

No. 22,724.—E. A. GOODES, of Philadelphia, Pa.—*Improved Boring Machine.*—Patent dated January 25, 1859.—The feed of this drill may be changed to modify the motion of the drill either quicker or slower, and the tool can be prevented from entering the work beyond a certain depth, and the tool can also be “gigged” back rapidly after it has bored the hole.

The inventor says: I *claim*, first, the adjustable worm H, attached to its shaft D, and arranged substantially as and for the purpose set forth.

Second. The gauge plate E, attached to the bow F, in connection with the index *q*, on the mandrel *c*, for the purpose specified.

Third. The arrangement of the tube *j*, on the shaft *k*, pinion *l* on said shaft, the pulley *l*, on the tube *j*, and also the pinion *i*, and the rack *h*, on the mandrel *c*, substantially as and for the purpose set forth.

No. 22,725.—JOHN HINDMAN, of Haynesville, Mo.—*Improvement in Hemp Brakes.*—Patent dated January 25, 1859.—This invention consists in the employment or use of a reciprocating beater D, stationary bar E, and a reel F, placed within a suitable frame, and arranged in such relation with each other that the hemp, as it is fed to the machine, is properly bruised or broken, and the woody portion separated from the fibre.

The inventor says: I *claim* the reciprocating beater D, stationary bar E, and reel F, combined and arranged to operate substantially as and for the purpose set forth.

No. 22,726.—JOHN C. HINTZ, of Cincinnati, Ohio.—*Improved Machine for Sawing Winding Forms.*—Patent dated January 25, 1859.—The claim and engravings will explain the nature of this invention.

The inventor says: I *claim*, first, in the described combination with one or more shifting supports or rests, the rocking bench J, suspended at or near its midwidth, by journals *j*, and provided with suitable feeding and canting mechanism, substantially as set forth.

Second. In the described connection with a carriage E and crane D, and with a rocking bench J, having the described or equivalent feeding or canting mechanism, I claim the vibratory and arched rest F, armed with spikes *f*, the whole being arranged and operating substantially as set forth.

Third. In the described combination with a rocking rest J, and spheroidal feed roller B, I claim the pointer S *s*, adjustable in height, and having the described automatic retrograde motion, so as to indicate on the top of the slab the relative position of the bottom of the kerf, as set forth.

Fourth. In the described combination with the rocking bench J, I claim the prying lever D, constructed and operating substantially as set forth.

No. 22,727.—E. N. HORNER, of New Brighton, Pa.—*Improvement in the Method of Extracting Oil from Coal.*—Patent dated January 25, 1859.—The claim and engravings will explain the nature of this improvement.

*Claim.*—The use of a mixture of cream of tartar, common salt, and slaked lime, for the purpose of condensing the oleaginous vapor produced by the dry distillation of coal, shale, or other bituminous minerals, extracting the oil from the gas, and depriving the gas of its inflammable quality, and throwing off the sulphurous vapor, in the manner described.

No. 22,728.—BENJAMIN ILLINGWORTH, of Freeport, Ill.—*Improved Washing-Machine.*—Patent dated January 25, 1859.—A rotating cylinder is encompassed by a series of smaller pressure cylinders which are fitted within a suitable case, the upper part of which is connected to the lower part by hinges or joints; the cylinder case being placed in a box which is fitted in a frame, and the box rendered adjustable by means of a lever or an equivalent device.

The inventor says: I *claim*, as an improved article of manufacture, a washing-machine, having a tilting-box B, cylinder D, spring-tollers *f j*, and otherwise constructed, as shown and described.

No. 22,729.—RICHARD JENKINS, of Covington, Ky.—*Improvement in Lamps.*—Patent dated January 25, 1859.—The nature of this invention consists in the employment of an inner and outer cone or semi-sphere, in such relation to each other that a space shall exist between them at all parts of their surfaces, the cones being arranged over the lamp-tube so that the inner one is some distance above the same, and furnished with flame passages and passages for the introduction of oxygen to the wick-tube and to the space existing between the cones or semi-spheres.

*Claim.*—The combination of the inner and outer cones when arranged in relation to the wick-tube and each other, substantially as specified, and supplied with air or oxygen, for the purpose of maintaining a perfect combustion of the heavier gases or matter arising, by capillary attraction, in the space or chamber existing between the cones, and thus producing, with coal-oil, a brilliant flame, with very little, if any, blue appearance at the base above the outer cone, substantially as set forth.

No. 22,730.—JOHN JONES, of Baltimore, Md.—*Improvement in Machines for making Clay Pipe.*—Patent dated January 25, 1859.—The plate A has an opening B, over which the two jaws C D move parallel to each other by means of a lever, and meet at the centre. The core-mandrel E has two sizes, the larger F corresponding to the opening B in the die-plate A, and the smaller size E corresponding with the opening G in the jaws C D. When in use the jaws are closed, and the material forced through the small opening G, and when the tube has attained a sufficient length, the jaws C D are thrown open, and the tube continued through the opening B of a larger size.

The inventor says: I *claim* a two-sized permanent core or mandrel, in combination with the fixed die A and adjustable jaws C D, constructed, arranged, and operating in the manner described and for the purpose specified.

No. 22,731.—AUGUSTUS JOUAN, of San Francisco, Cal.—*Improved Screw-Propeller.*—Patent dated January 25, 1859.—This invention consists in making elastic a part of a ship's propeller blades, cutting off for that purpose a portion of the ordinary rigid blades, and substituting for it elastic blades.

The inventor says: I *claim* combining with the rigid blades of a propeller, an elastic blade, substantially as described.

No. 22,732.—AUGUSTUS JOUAN, of San Francisco, Cal.—*Improvement in Apparatus for Evaporating Sugar Juice.*—Patent dated January 25, 1859.—The claim and engravings will explain the nature of this invention.

The inventor says: I *claim* the floating cover *a* applied to the evaporation of saccharine liquids, or for concentrating heat for other purposes, constructed, arranged, and operated substantially as set forth.

No. 22,733.—WILLIAM W. KARSHNER, of Cincinnati, Ohio.—*Improvement in Electric Bathing Apparatus.*—Patent dated January 25, 1859.—In the engravings, C is the positive pole of the battery connected with the bathing-tub, *d* is the negative pole connected with the patient's feet, *insulated from the tub a*, *g* is a non-conducting insulating substance, *h* the conducting foot-plate from the bathing-tub, *f f f f* supporting bands attached to the sides of the bath-tub *a*.

The inventor says: I *claim* first, the suspending non-conductor bands *f f f f*, the conducting foot-plate *h* insulated from the bath-tub by the non-conducting substance *g*, all substantially as set forth.

Second. I *claim* the combined use of the above described non-conducting bands *f f f f*, the conducting foot-plate *h*, and the non-conducting substance *g*, or their equivalents, for the purpose of administering an electric bath for therapeutic purposes, as described.

No. 22,734.—HENRY KATTENHORN, of New York, N. Y.—*Improvement in Revivification of Bone-Black.*—Patent dated January 25, 1859.—This invention consists in washing the black

in a vessel, so constructed that the pressure of the atmosphere can be applied to the surface of the washing water to drive it rapidly and forcibly through the mass.

The inventor says: I *claim* the method of washing bone-black, or animal charcoal, in the purifying of sugar, substantially as described

No. 22,735.—CHAUNCEY G. KEENEY, of Manchester, Conn.—*Improvement in Knitting-Machines*.—Patent dated January 25, 1859.—The nature of this invention consists in securing one or more cards E on the periphery of the knitting-machine, so that they may be withdrawn and replaced at pleasure just below the needles outside of and bearing against the stockinet, so that the surface of the stockinet will be presented to the card surface several times as it works off from the machine

The inventor says: I *claim* the employment of a card attachment to knitting-machines, substantially in the manner and for the purposes described

No. 22,736.—WILLIAM KENNISH, jr., of New York, N. Y.—*Improvement in Marine Steam-Engines*.—Patent dated January 25, 1859.—The nature of this invention consists in placing an elbowed pipe in the race caused by a vessel's progress through the water. In a side-wheel steamer this pipe is placed immediately behind the paddle, in order that the race rushing over the middle of the pipe A will be increased by the back-water of the wheel. In a screw-propeller the pipe is placed on the stern of the vessel in front of the screw in order to increase the race past the pipe A by the draft-water of the propeller.

The inventor says: I *claim* the application of an auxiliary pipe to the present discharge-pipe of a marine steam-engine, in the manner and for the purpose described in the specification

No. 22,737.—COLUMBIA G. LOYNES, of Lenox, Mass.—*Improved Machine for Cutting and Setting Saw-Teeth*.—Patent dated January 25, 1859.—In the engraving E is a sliding screw on the bed-plate, to which is attached the die F; a is a screw with which the blades of the saw are raised or lowered so as to give a greater or less set to the saw. B B are two screws at the sides of the upright part of the bed-piece, which are used in guiding the saw-blade. F is the die which can be used either for the cutting of the saw-teeth, shearing the blade, cutting and straightening iron, or for punching any metal as the same is used with punches Nos. 6, 7, 8, 9, 10, 11.

The inventor says: I *claim* the devices for punching and shearing metals, as described, arranged in connection with the saw-gummer and saw-set, the whole constructed and operating in the manner set forth

No. 22,738.—WILLIAM C. McBRIDE, of Raritan, N. J.—*Improvement in Machinery for Scutching Flax*.—Patented, in England, May 20, 1856; patent dated January 25, 1859.—The claim and engravings will explain the nature of this invention.

The inventor says: I do not claim either set of feeders, separately, as making part of my present invention, having described a similar arrangement in letters patent granted to me by the government of Great Britain in the year 1852.

What I *claim* is the mode of operation of the combined rotating blades or beaters, with the interposed stocks, substantially as described.

I also claim combining two scutching machines, substantially such as described, or equivalents thereof, by means of the two feeding wheels, with their bands, arranged substantially as described, for transferring the fibres which have been scutched at one end, that the other end may be properly presented to the second scutcher, as set forth.

I also claim, in combination with the two sets of feeding bands and wheels, or their equivalents, the sustaining and guiding table, substantially as described, by which the upper unscutched ends of the fibre are held up, guided, and properly presented to the second scutcher, as set forth.

No. 22,739.—ANTONIO MEUCCI, of Clifton, N. Y., assignor to D. B. LORAINI, of said Clifton.—*Improvement in the Manufacture of Candles*.—Patent dated January 25, 1859.—The mould consists of two parts, the staff A, and the bead B. The lower end of the mould has a piece of India rubber c cast in it, which is perforated to admit the wick, and which, by its elasticity, pinches the latter so that it may be strained sufficiently to keep it straight in the mould, and also prevent the escape of the candle material in casting.

*Claim*.—The method of forming mould candles in saturated porous candle-moulds, substantially as set forth, in contra-distinction to the method in general use of forming them in candle moulds of the impervious metal.

No. 22,740.—U. D. MIHILLS, of Hartford, Wis.—*Improvement in Heating Apparatus*.—Patent dated January 25, 1859.—The object of this invention is to prevent the free or rapid passing onward of the products of combustion from the fire-box into the chimney or escape flue.

The inventor says: I *claim* a heat controlling cylinder, in which the regulating disks, shaped as described, are connected with a detachable frame, the same being arranged and operated as specified.

No. 22,741.—WILLIAM H. MILHOUSE, of Sugartown, Pa.—*Improved Washing-Machine*.—Patent dated January 25, 1859.—In the engravings *a* is a lever which connects with the bottom of the frame *F*, and *b* is a lever which operates lever *a*; *d* is a pitman which connects at one end with an arm on rubber *E*, and at the other with a crank on shaft *e*; *c c c* are strips of India rubber, which are placed edgewise on the rubber *E*, and concave *D*; *i i i* are slats which are secured between these strips of India rubber on the rubber *E* and concave *D*.

The inventor says: I *claim*, first, securing strips of India rubber edgewise in slots in the concave *D*, and rubber *E*, by means of the slots which are bolted in between the successive strips, as fully set forth.

Second. The arrangement of the adjustable frame *F*, levers *a* and *b*, swinging rubber *E*, pitman *D*, and shaft *e* with the concave, when the whole are combined, constructed, and operated in the manner and for the purpose set forth.

No. 22,742.—B. F. S. MONROE, of Utica, N. Y.—*Improved Bed-Bottom*.—Patent dated January 25, 1859.—The object of this invention is to allow the outermost rows of springs in a bed-bottom, chair-seat, or other article in which they may be placed, equal freedom of movement with the innermost springs without lateral play, so that each spring will be permitted to bear its proportion of weight.

*Claim*.—The two frames *A C*, with the spring *B* secured between them, the frames being connected by the cross bands *F* covered or enclosed by any suitable fabric *E*, and the upper frame supporting the seat or mattress, the whole being arranged substantially as and for the purpose set forth.

No. 22,743.—WALTER PECK, of Rockford, Ill.—*Improvement in Pumps*.—Patent dated January 25, 1859.—This pump is intended to be and is particularly applicable to deep bored, or drilled wells, of which the *diameters* are generally small, and with which the whole pump fixture must be placed down through the mouth of the well. The object of the spring-strap *B* is to hold the cylinder *D* at the bottom, or any other desired point in the well, and to support it and the pipe *A* centrally in the well.

The inventor says: I *claim* the combined arrangement of the stationary standard *c*, vibrating lever *a*, and lifting-spring *b*, with the plunger *A*, as specified, for the purposes set forth.

I also claim the combined arrangement of the hollow plunger *A*, having a cylinder *C*, and spout *f*, and attached directly to the handle, with the stationary chamber *D* and the steadying springs *B*, as specified.

No. 22,744.—FRANK P. PFLEGHAR, of Whitneyville, Conn.—*Improvement in Combined Punch and Awl*.—Patent dated January 25, 1859.—This invention is designed to facilitate the sewing together of the ends of machine belts, and consists in combining a rotating punch-stock in a manner whereby the desired end is attained.

The inventor says: I *claim* the rotating hollow head *b*, provided with a series of cutter-tubes *d* of different sizes, in combination with the awl *h* attached to or forming a part of the bent bar or rod *E*, which, as well as the head *b*, is attached to the jaw *c*, and provided with a spring-plate or stop *m*, the whole being arranged substantially as and for the purpose set forth.

No. 22,745.—GEORGE W. PITTMAN, of Bushwick, N. Y.—*Improvement in Machinery for Twisting Fibrous Substances*.—Patent dated January 25, 1859.—This invention consists in a certain mode of applying a flyer, or its equivalent, in combination with other mechanism, whereby it is made to spin a sliver or roving, and by the same operation to twist the yarn thus produced with one or more yarns or threads which have been previously spun.

The inventor says: I *claim* the application of the flyer *B*, or its equivalent, substantially as described, in combination with the rollers *D D*<sup>1</sup> and spool *F*, or other equivalent means of holding the sliver, and taking up the twist produced by the flyer, whereby the same operation is made to spin the sliver into yarn, and twist the same with one or more other yarns, simultaneously as set forth.

No. 22,746.—MICHAEL POSZ, of Shelbyville, Ind.—*Improvement in Razor-Strops*.—Patent dated January 25, 1859.—This razor-strop is composed of a short handle *A*, into which the screw *B* is firmly fastened; *x* is a metal nut to which is firmly attached leathers *u u* on opposite sides of nut *x*. Notches *x*<sup>2</sup> *x*<sup>2</sup> fit slides *K K*, so that nut *x*, with leathers *u u* attached, may slide toward either end of screw *B*.

The inventor says: I *claim*, as a new article of manufacture, the self-lubricating razor-strop, when constructed in the manner described.

No. 22,747.—HIRAM H. REYNOLDS, of Buffalo, N. Y.—*Improvement in Belt-Trusses.*—Patent dated January 25, 1859.—The perineal strap C is made of soft, pliable leather, and is fastened to the belt; it incloses the perpendicular part of the T-spring E, which is made of brass or other suitable metal. The perpendicular part of the T-spring passes through the slide I, and is fitted to it so that the plate G, conical spring H, and pad A, may be moved up or down on the T-spring.

The inventor says: I *claim* the combination of the T-spring E, with the conical spring H, pad B, belt A, and perineal strap C, the whole being arranged substantially as shown.

No. 22,748.—M. H. RISON, of Paris, Tenn.—*Improvement in Photographic Plate Vises.*—Patent dated January 25, 1859.—This invention consists in the application of a grooved or hooked eccentric lever E, to operate upon one jaw of a photographic plate vise, in combination with a spring-pawl *d*, attached to the other jaw, to operate in a toothed ratchet on the bed-piece A, for the purpose of permitting the adjustment of the vise to plates of different size, and the speedy clamping and release of the plates.

The inventor says: I *claim*, as an improved article of manufacture, a photographic vise, having its eccentric lever E provided with a groove *g*, a clamping-jaw D provided with a catch *f* to engage *g*, a jaw C provided with a spring-pawl, which engages a rack *e*, and otherwise constructed as shown and described.

No. 22,749.—DANIEL ROBINSON, of Lenox, Penn.—*Improvement in Wagon-Brakes.*—Patent dated January 25, 1859.—This invention consists in attaching shoes E to rock-shafts D D, which are fitted in the bed or truck of the vehicle, and having curved bars *d* attached to said rock-shafts, the bars passing through a sliding frame F fitted in the bed A, the frame having the draft-pole attached to it. The brake is operated by the momentum of the vehicle when the speed of the same is checked.

The inventor says: I *claim* the combination and arrangement of the sliding frame F, curved bars C attached to the rock-shafts D D and passing through the traverse bars *d* of the frame F, and the shoes E attached to the ends of the rock-shafts, the several parts being fitted in the truck or bed A, substantially as and for the purpose set forth.

No. 22,750.—PHILIP P. RUGER, of New York, N. Y.—*Improved Machine for Splitting Wood.*—Patent dated January 25, 1859.—The inventor says: I introduce a spring *f* just at the splitting point where the knives are playing, and in this way relieve the cross bars *e* from all danger of breaking. I cast an iron guide plate *x*, and through it form holes or oblong slits *i* just sufficient for the knives to play through at the ends or angles of these slits. I cast in one piece, with the plate upright, ways *y* that project up perpendicularly from the upper side of the plate, and serve as slide-ways to guide and steady the knives.

The inventor says: I *claim* the spring or yielding guide for relieving the cross bars *e* in the manner specified and for the purposes set forth.

I also claim the guide-plate *x* with the uprights *y*, constructed and arranged in combination with the wood splitters, as specified.

No. 22,751.—B. A. RUSSELL, of Deep River, Conn.—*Improved Ball-Furniture Casters.*—Patent dated January 25, 1859.—The nature of this invention consists in lessening the friction of the ball in the casing enclosing the upper portion of the same, by causing its bearing-surfaces to be confined to the surface of a horizontal plate D at its upper part, on which the weight of the table to which it is attached rests, and to the ends or points of a series of horizontally set screws G or vertical ribs G<sup>1</sup>, inserted radially in the casing on a line with the axis of the ball F at its sides.

The inventor says: I *claim* a new article of manufacture in my improved furniture-caster, when composed of the cylinder or casing A, either with or without the radially set screws G, or ribs G<sup>1</sup>, in combination with the plate D and ball F, when constructed, arranged, and operated in the manner and for the purposes set forth.

No. 22,752.—CHRISTIAN SHARPS, of Philadelphia, Penn.—*Improvement in Breech-loading Fire-Arms.*—Patent dated January 25, 1859.—This invention consists in forming on the outer end of a sliding bush G an annular inclined projection with a sharp annular edge *b*, coinciding with the smallest portion of the bore of the bush, so that when the explosion of the cartridge takes place no obstacle may be presented to the backward movement of the bush. This bush has an annular termination *e* fitting into an annular recess *d* in the barrel, which prevents the termination of any refuse matter between the end of the bush and the barrel when the discharge takes place.

The inventor says: I *claim*, first, forming on the outer end of the sliding bush G, as the sole bearing point against the breech, an annular inclined projection with a sharp annular edge *b*, coinciding with the smallest portion of the bore of the said bush, as and for the purposes set forth.

Second. The annular termination *e* of the sliding bush fitting into an annular recess *d* formed

in the barrel, and overlapped by the sharp edged annular projection, substantially as set forth and for the purpose specified.

Third. The convex base *n*, as fitted into a concave socket in the breech, so as to form a self-adjusting base for the end of the barrel.

No. 22,753.—CHRISTIAN SHARPS, of Philadelphia, Penn.—*Improvement in Breech-loading Repeating Fire-Arms*.—Patent dated January 25, 1859.—The claim and engravings will explain the nature of this invention.

The inventor says: I do not desire to confine myself to the use of a barrel-block with four bores, or to the precise devices described, for altering the position of the projection *S*, inasmuch as a barrel-block, with more or less than four bores, may be used in connection with my improvement, and as different devices for changing the position of the said projection.

But I *claim*, first, exploding, in succession, a number of cartridges of the class described, by means of a projection caused to revolve by the movements of the hammer, when the said cartridges are so arranged, in respect to the said projection, that the latter shall strike the edge only of each cartridge in succession, as set forth.

Second. The catches *t t* so arranged on the stock, in respect to the bores of the barrel-block, that on moving the latter from the breech they may be the means of withdrawing the whole of the cartridges simultaneously from their respective bores, as set forth.

No. 22,754.—PHILIP SHREINER, of Columbia, Penn.—*Improvement in Stoves*.—Patent dated January 25, 1859.—The nature of this invention consists in placing in the upper part of a stove and over the fire one or more cylinders or drums, with air-pipes or tubes extending through or outside of the stove to the floor. Cold air is conveyed from the floor through the tubes *H I* to the drums or cylinders *C E*, and while passing is heated and may be carried to another room.

The inventor says: I *claim* the air-supplying tubes and air-heating cylinders, when combined with a stove, the heat of which is unobstructed by outside casings.

No. 22,755.—STILLMAN THORP, of Portland, and WESLY THORP, of Turner, Me.—*Improvement in Boot-Heels*.—Patent dated January 25, 1859.—In the engravings, *A* represents the heel and *B* the outer part of the sole of the shank portion of a boot or shoe, the latter having a metallic spring or elastic stiffener *C* laid on the upper surface of the same, so as to extend between it and the insole, and from the upper end a screw-pin or bolt *D* extends down through the middle of the heel and carries a circular lift or plate of metal *E* which is screwed on it.

The inventors say: We *claim* the combination of the metallic plate, spring, or shank-stiffener, and the rotary heel-piece, connected together and applied to the heel and shank of a boot or shoe, substantially as specified.

No. 22,756.—WILLIAM B. TWIFORD, of Chincoteague, Va.—*Improved Washing-Machine*.—Patent dated January 25, 1859.—The nature of this invention consists in the opposing inclined planes *c c* on the underside of the ends of the sliding roller-frame *E*, in combination with fixed concave projections or ledges *c c* on the sides of the tub or box, and with grooves *B* of greater width than the diameter of the journals of the roller in the sides of the box, so that when the roller is moved back and forth it is caused to nearly touch the bottom of the box or tub when it arrives at the centre, and to rise considerably above the bottom of the same when it arrives at either end of the tub.

The inventor says: I *claim* the opposing incline planes *e e* on the underside of the ends of the sliding roller-frame *E*, in combination with fixed concave projections or ledges *c c* on the sides of the tub or box, and with grooves *B* of greater width than the diameter of the journals of the roller in the sides of the box, substantially as and for the purposes set forth.

No. 22,757.—JAMES H. WASHINGTON, of Baltimore, Md.—*Improved Method of Blowing off Steam-Boilers*.—Patent dated January 25, 1859.—The nature of this invention consists in making a joint or hinge *a* in the blow off pipe *B*, and connecting with said hinged pipe *C* a float *D*, that will keep the blow off opening always at a fixed position with regard to the surface of the water in the boiler.

The inventor says: I *claim* connecting the pipe *C* by an elastic or yielding joint to the stationary pipe *B*, and furnishing its opposite end with a float *D*, that will keep the inlet into said pipe *C* at or a little below the surface of the water in the boiler, so as to blow off sediment, &c., at the surface, however much it may rise or fall, or vary, substantially as described.

No. 22,758.—SAMUEL WETHERILL, of Bethlehem, Penn.—*Improvement in Furnaces for Distilling Zinc*.—Patent dated January 25, 1859.—The claim and engravings will explain the nature of this invention.

The inventor says: I *claim* the employment of vertical retorts with movable caps at the top and movable cups at the bottom, substantially as described, in combination with the fire-

chamber of a furnace, and suitable chambers for the circulation of heat, substantially as described, when applied to the reduction of ores of zinc to the metallic state, as set forth.

I also claim, in combination with retorts for the reduction of the ores of zinc to the metallic state, the mode of mounting the vertical retorts, by having them sustained by the lower ends resting in suitable sockets, substantially as described, and unconfined at their upper ends, whereby they are free to yield to unequal expansion, as set forth.

I also claim, in combination with retorts for the reduction of the ores of zinc to the metallic state, the employment of two fires with separated ash-pits, substantially as described, whereby the fires can be separately cleansed and stocked, to admit of applying a continuous heat to the retorts, as set forth.

I also claim, in combination with vertical retorts for the reduction of the ores of zinc to the metallic state, the employment of perforated central tubes, substantially as described, for the discharge of the metallic vapors from the charge, and the condensation thereof to the metallic state, as described.

And I also claim the combination of the vertical retorts, the perforated central tubes, and the movable cups and appendages at the bottom, and the movable caps at the top, substantially as described, all concurring in the more ready changing of the retorts, the working of the charge, the escape and condensation of the metallic vapor to the metallic state, and the delivery thereof, and the discharge of the residuum from the retorts, and the re-charging of them, as set forth.

No. 22,759.—JESSE WHEELLOCK, of Lancaster, N. Y.—*Improvement in Boats for Transporting Railroad-Cars.*—Patent dated January 25, 1859.—The claim and engravings will explain the nature of this invention.

The inventor says: First, I *claim* the arrangement of the ropes or chains Y, pulleys Z, and timbers C, when applied to each end of the boat, for the purpose of holding the boat steady at the bow and stern while the cars are transferred to or from the boat, the whole constructed and operated substantially as set forth.

Second. I claim the arrangement of the bumper-dock A<sup>1</sup>, relatively, to the dock A and slip F, for the purpose of arresting the headway of the boat, and allowing it to be drawn sidewise into the slip F, so that the track which runs lengthwise of the boat may be brought into line with the suspended track, as described.

Third. I claim the combination of the suspended track, with or without the short portion N, with the track of the boat, for the purpose of conveniently transferring the cars to or from the boat, at whatever height the boat may stand in the water, substantially as described.

No. 22,760.—GEORGE W. WILLIAMSON, of Scranton, Pa.—*Improvement in Heating Apparatus.*—Patent dated January 25, 1859.—The nature of this invention consists in so arranging, within a fire-chamber, smoke-flue, or steam-boiler, a series of plates D, so that the heat will in its passage be delayed or retarded as it were within combustion-chambers formed by said plates, and thereby throw off or give out a greater amount.

*Claim.*—The application to fire-chambers or smoke-flues of a double series of plates, when the same are constructed, combined, and arranged, in the manner and for the purpose set forth.

No. 22,761.—GEORGE W. WILSON and ANDREW JOHNSON, of Walnut Grove, Ill.—*Improved Washing-Machine.*—Patent dated January 25, 1859.—The operation is as follows: The clothes to be washed are secured to the cylinder C by means of the plate g, which is secured by a rod i. The part a of the box A is supplied with suds, and the cylinder C is rotated. The clothes are carried around on the cylinder C, saturated as they pass through the suds, and are rubbed by the rubber D.

The inventors say: We *claim* as an improved article of manufacture a washing-machine, having upon the central cylinder C a plate g, arms h h, curved slats j, and rod i, for securing the clothes; and in the upper part of the cover B a rubbing device D, consisting of a slat m, with slats or corrugations o at its sides, and rollers p, and otherwise constructed as shown and described.

No. 22,762.—GEORGE WINGATE, of Philadelphia, Pa.—*Improved Rotary Pump.*—Patent dated January 25, 1859.—The bucket-wheel, which is secured to a flanch m on the shaft E, has its periphery divided into a number of chambers i by a partition j, and each chamber is furnished with a snugly fitting piston or sliding block n, the position of which within the chamber is controlled by the cam K, secured to the sleeve G.

The inventor says: I *claim* the revolving bucket-wheel, with any suitable number of pistons, operated by the cam K, in combination with the exterior casing B, its chambers and partitions; the whole being arranged for joint action, substantially as and for the purpose set forth.

No. 22,763.—HERMAN WINTER, of New York, N. Y.—*Improvement in Valve-Gear of Oscillating Steam-Engines.*—Patent dated January 25, 1859.—The nature of this invention

consists in causing a shaft *e*, attached to an oscillating cylinder, to revolve by means of the combination of a crank *d* on such a shaft, with a cam *l* on the main shaft of the engines, by means of a lever; and in combining a cam upon a revolving shaft, with an adjustable swinging toe *m*<sup>1</sup>, and with a toe *m*<sup>1</sup> attached to a lifter for moving a valve.

The inventor says: I *claim*, first, the method, substantially as specified, of causing a shaft, by means of which the valves of an engine are moved, to revolve through the agency of a cam, a lever, and a crank, and the oscillation of the cylinder to which the shaft is attached, all the parts being substantially such as specified, and acting in combination, substantially in the manner specified.

Second. I claim the combination of a toe keyed to a rod, which actuates a valve or valves, with an adjustable swinging toe and a revolving cam, the combination being substantially such as set forth, to serve the purpose described.

No. 22,764.—GEORGE L. WITSIL, of Wilmington, Del.—*Improved Washing-Machine*.—Patent dated January 25, 1859.—In the engravings A is the tub; B is the corrugated or ribbed centre-piece which revolves in the act of washing; C is the cross-piece which holds the centre-piece in its place, being attached to the uprights *d d*, fastened to the stand D which holds the tub in place; *e* is the false bottom; *f*, the space between it and the bottom of the tub *g*; *h* is the lever or arm which moves the centre-piece.

The inventor says: I *claim* the combination of the corrugated or fluted conical cylinder, placed vertically with the corrugated or fluted sides of the conical tub, arranged and operated as shown and described, for the purpose specified.

No. 22,765.—ROBERT ALFRED WRIGHT and LOUIS JULES FOUCHI, of Paris, France.—*Improvements in Process for Decomposing Fats*.—Patent dated January 25, 1859.—The inventors say: The superheated water in the boiler *a* acquires an ascending motion on account of the difference in the temperature of the two capacities *a* and *h*; a current is thus created whence it results that the heated water in the boiler *a* ascends through the tube *g* into the cylinder *h*, and, being forcibly driven out through the holes in the rose-jet, passes through the fatty bodies and descends again through the tube *f* to the bottom of the boiler *a*, where it is again warmed in order to recommence its ascending motion, and so on.

*Claim*.—Producing a continuous automatic circulation of highly heated water in a very finely described state through the bodies under treatment, by means of an apparatus constructed and employed substantially as shown and described.

No. 22,766.—WILLIAM D. YOUNG, of Baltimore, Md.—*Improved Boot-Jack*.—Patent dated January 25, 1859.—The nature of this invention consists in combining, with an ordinary chair, an arrangement for aiding the removal of boots from the feet of the wearer, and also in the construction of the jack by the addition of a self-adjusting toe-piece.

The inventor says: I *claim* the construction of a boot-jack substantially as set forth, when used in combination with a chair, as described.

No. 22,767.—DANIEL C. COLBY, of Keene, N. H., assignor to Himself and DAVID W. RANSOM, of Croydon, N. H.—*Improved Clothes' Frame*.—Patent dated January 25, 1859.—In the engravings D is a lever attached to the shaft G, its upper arm entering the socket *x*; E is a lever connected by the stud *n* with the lever D, and with the lever F by the metallic socket *q* and the rivet *r*; *o* is the fulcrum upon which the lever E revolves; F is a lever connected by the socket *q* and the rivet *r* to the lever E.

The inventor says: I *claim* the arrangement of the levers D, E, and F, as above described, in combination with the pawl K and the shaft G, operating substantially as set forth.

No. 22,768.—SILAS C. DURGIN, of Holyoke, Mass., assignor to Himself and AMMON R. DURGIN, of Nashua, N. H.—*Improvement in Drawing Frames for Drawing Fibrous Materials*.—Patent dated January 25, 1859.—The claim and engravings will explain the nature of this invention.

The inventor says: I *claim* the arrangement of the conical draft rollers between the gauge trumpet and the other reducing rollers, and supporting such trumpet by a mechanism essentially as described, or the equivalents therefor, which will enable the said trumpet to operate both as a gauge to the sliver and to guide it to the rollers, and to be vibrated with regard to the conical rollers, in the manner and for the purpose explained.

I also claim the combination of mechanism for supporting and vibrating the trumpet, the same consisting of the bent lever E<sup>1</sup>, the overbalance carrying lever F, and the stationary stud, and when such combination of mechanism is employed in the manner and for the purpose described.

I claim the arrangement of the supporting arm *g* of the weight *h* above the fulcrum of the lever F in such a manner as to operate with reference to the lateral drag of the sliver on the trumpet as specified.

No. 22,769.—JONATHAN HILLER and JOSEPH BULLOCK, of Cohoes, N. Y., assignors to WILLIAM SMITH, of Albany, N. Y.—*Improvement in Knitting Machines*.—Patent dated January 25, 1859.—The slide  $G$  is drawn inwards and kept in that position by a pawl  $g$ , with its spring pivoted upon the plate  $G$ , the pawl having two arms, the one letting into a notch  $h$  and the other extending over the slide  $H$ , upon which slide a movable gauge  $i$  is fixed. As long as the slide  $G$  shall be held by the pawl, its outer end will pass behind the pins  $p$ , but the moment that the outward pressure of  $H$  by the gauge touching the pawl trips  $g$  and releases  $G$ , its outer end springs between the pins and by contact with one moves the ring  $R$  and disengages the driving power.

The inventors say: We *claim* the apparatus attached to the top carriage, viz: the combination of the slides  $H$  and  $G$ , pawl  $g$ , gauge  $i$ , and arm  $m$ , operating together upon the breaking of the fabric to uncouple the driving powers by and in combination with the ring  $R$ , pin  $J$ , and spring  $d$ , which releases the detent  $V$ , substantially in the manner and for the purposes set forth in the specification.

No. 22,770.—DAVID E. HUGHES, of New York, N. Y., assignor to the American Telegraph Company, of said New York —*Improvement in Telegraphing Machines*.—Patent dated January 25, 1859.—The claim and engravings will explain the nature of this invention.

The inventor says: I *claim*, first, giving to the key, while still pressed by the operator, a second motion at the instant that the circuit is closed or broken, as the case may be, so that an indication of said closing or breaking will be given to the operator for the purposes set forth.

Second. The method described for governing the position of the letters upon the type-wheel, with respect to that of the platen or roller over which the paper travels, in order to insure an exact position of my particular letter at the moment of printing the same, viz: by so advancing or retarding the said type-wheel upon its shaft, whenever it has lost or gained in time in regard to the travel of the circuit breaker at the distant station, that the letter indicated will be certain to stand directly over the said platen, at the moment the latter brings the platen into contact with said letters.

Third. Effecting the printing of each letter without arresting the motion of the type-wheel, by causing the platen to revolve in the same direction and with the same speed as the type-wheel, while said platen is bringing up and holding the paper in contact, whereby the paper advances with the type or letter from which it is receiving an impression.

Fourth. The devices by which the type-wheel is started from its zero by an operator at a distant station, consisting of the shaft  $g$ , set in motion by the electric current, and acting in combination with the clutch lever  $n$  and the wheel  $E$ , whereby the type-wheel will be advanced up to the time that it becomes engaged with its driving shaft, substantially as set forth.

No. 22,771.—HEZEKIAH KNOWLES, of New London, Conn., assignor to FELLOWS, HOFFMAN & Co., of New York, N. Y.—*Improvement in Lamps*.—Patent dated January 25, 1859.—Above the wick-tube is placed the deflector  $i$ , it is formed in the shape of a semi-sphere, with an elongated aperture at the top of the form of a horizontal section of the wick-tube, but a little larger. The base spreads out and is provided with a cylindrical ring  $j$  to fit over the upper part of the ferule. A series of holes  $k$  are made around through the base for the admission of air to feed the flame above the wick.

The inventor says: I *claim* the lower or diaphragm reflector surrounding the wick-tube at or near its upper edge, substantially as and for the purpose specified, in combination with the upper deflector and the chimney, having suitable openings for the supply of a draught of air to the inside and to feed the flame outside of the upper deflector substantially as and for the purpose specified.

No. 22,772.—GEORGE W. RICHARDSON and ROBERT GLOVER, of Grayville, Ill., assignors to Themselves, J. B. WILLIAMS, and WILLIAM A. HERRALL, of White county, Ill.—*Improvement in Harvesters*.—Patent dated January 25, 1859.—This invention refers to certain improvements in machinery for raking-in harvesters, by means of which the operator is enabled to gather the cut grain into sheafs upon the platform and deposit the same upon the ground behind the platform as the machine moves forward.

The inventors say: We *claim*, first, the jointed spring-arm  $a^2$ , arranged and operating in the manner and for the purposes set forth, in combination with the spring-catch  $i^1$ , operating so as to catch and hold the arm  $a^2$  when it has gathered the grain, and retain it in this position until the bundle is ready to be deposited free from the platform  $p$ .

Second. The raker  $a^1 a^2$ , in combination with the rod  $r$ , crank  $c$ , rest  $n^2$ , and retracting weight  $w$ , arranged and operating to produce the reciprocating movements for gathering and delivering the gavel in the manner described.

Third. In combination with the arm  $a^2$ , the connecting rod  $m$ , and bent lever  $l$ , operated through the medium of rod  $n^1$ , pin  $n^2$ , and rest  $n^3$ , by the driving wheel  $C$ , substantially in the manner and for the purposes set forth.

No. 22,773.—MANOAH ALDEN, of Philadelphia, Pa.—*Improved Apparatus for Raising and*

*Forcing Fluids.*—Patent dated February 1, 1859.—This improvement consists in a bucket of a peculiar construction, in combination with a wheel-race, or chamber adapted to the form of said bucket-wheel, and a spiral chamber. The whole being arranged so that a steady and uniform supply of water may pass through the apparatus without causing excessive and detrimental friction.

*Claim.*—The wheel B, with any convenient number of buckets formed by the opposite curved vanes *e*, said vanes being placed obliquely to the plane of rotation, and being of a tapering form, so that the buckets may be broader near the centre of the wheel than at the edge of the same, in combination with a wheel-race or chamber adapted to the form of the buckets, and with the spiral channel D, the whole of the parts being arranged in respect to each other and constructed as and for the purpose set forth.

No. 22,774.—CHARLES F. ALLEN, of Indianapolis, Ind.—*Improvement in Burners for Vapor Lamps.*—Patent dated February 1, 1859.—A is a tube designed to be attached to the supply-pipe by the screw B, and leading to the retort C. The tube A is filled with metallic filings or other substance which will allow the fluid to pass gradually through and prevent a rapid flow. D is a tube leading to the burner E from the retort C. The tube F is a tube leading from the tube *a* to the lighter G, which is a small metallic cup containing a roll of gauze wire. H and J are valves for checking and regulating the flow of the fluid in the tubes A and F.

*Claim.*—The combination and arrangement of the tube F and lighter G, when constructed and arranged substantially as and for the purposes set forth.

No. 22,775.—ZACHARIAH ATKINSON, of Richmond, Ga.—*Improvement in Cotton Presses.*—Patent dated February 1, 1859.—Upon turning the windlass G and drawing up the ropes H, the lower ends of the levers D are brought towards each other. This pushes the upper ends of levers E towards each other and rocks the rollers F upon the cross-bar of the frame A. As the levers D are elevated, the cams *f* come more and more into action, so as to operate more powerfully at the last moment of motion when the levers D and E approach the perpendicular position, and the force of the windlass upon them is increased.

*Claim.*—The cam rollers F, in combination with the levers D and E, substantially as set forth for the purposes described.

No. 22,776.—J. B. ATWATER, of Berlin, Wis.—*Improvement in Car-Couplings.*—Patent dated February 1, 1859.—When it is desired to connect two cars, the several parts seen in the illustrations stand in the position there represented, the tumbler *c* is erect, and the pin is raised in order that the link may pass in. When the link *e* strikes the tumbler it is thrown down in the position seen in the figure. As it falls it turns the rod C, which, by means of its crank, operates upon the piece D, and it in turn operates upon the lever E, which serves to throw the pin *d* down into the link, and thus secures it.

*Claim.*—The arrangement of the tumbler *e*, rod C, connecting piece D, lever E, which is provided with a foot piece *o*, pin *d*, rollers *m n*, and door or platform *i*, the whole being combined and operated in the manner and for the purpose specified.

No. 22,777.—CHARLES F. BELLOWS, of Seneca Falls, N. Y.—*Improvement in Pumps.*—Patent dated February 1, 1859.—The nature of this invention consists in providing two sets of screws—one set of which is composed of what is usually termed a right hand and left hand screw on the same axis, and the other set is also composed of a right hand and a left hand screw on the same axis—as shown in figure 2, and arranging them in such a manner as that the threads of one set of screws move in the grooves of the other set as they revolve on their respective axes; and then placing the screws, thus arranged, in a case fitted to their peripheries, as nearly water and air tight as will admit of their revolution.

*Claim.*—The arrangement and construction of a pump, as set forth, by means of right-handed and left-handed screws, the threads of one operating within those of the other, as described, or other mode substantially the same.

No. 22,778.—D. P. BURDON, of Brooklyn, N. Y.—*Improvement in Ovens.*—Patent dated February 1, 1859.—The claim and illustration explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of a series of hinged cars *a* around a disc plate *d*, so that they will deliver bread pans with their contained bread at the proper place of discharge, and also receive the said pans in their revolution, substantially in the manner set forth; and in combination therewith I claim the circular track A A, so arranged as to support the ends of said cars *a* upon friction rollers *n*, while at the same time allowing each car *a* to deposit its pan at the proper place, and restore said cars *a* to their proper positions to receive the return pans with their bread, in the manner and for the purposes set forth.

Second. I claim operating the sliding doors E B by means of the radial arms *b*, or their equivalents, projecting from the driving shaft *g*, so that the doors E B will be alternately opened and closed at the proper time for delivering and receiving the bread to be baked.

Third. I claim operating the traversing follower *rr*<sup>1</sup> by means of radial arms *c*, or their

equivalents, for feeding the pans into the oven, when the same is so arranged that the pans will be fed into the cars *a* while the door B is open; and in combination therewith I claim the compensating pulley wheel *w* and weight *v* for equalizing the motion and returning the traversing follower *r r*<sup>1</sup>.

No. 22,779.—JOHN BURNISH, JAMES TALBOT, and THOMAS W. YARDLEY, of Pottsville, Pa.—*Fluxes for Puddling Iron*.—Patent dated February 1, 1859.—This invention consists in the use as a flux during the process of puddling “red short iron” of a composition of silicious sand, loam, alum, clay, lime, oxide of iron, and talcose rocks, so that the iron may be deprived of its “red short” quality, and rendered available for many purposes from which its use has been hitherto excluded.

*Claim*.—Silicious sand, loam, alum, clay, lime, oxide of iron, and talcose rocks, when used collectively, in or nearly in the proportions described, as a flux in the process of puddling iron.

No. 22,780.—ZIBA CASTERLINE, of Liberty, Ind.—*Improved Washing-Machine*.—Patent dated February 1, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—The employment of balls *h h h* attached to the rubber E of a washing-machine, when said rubber has a reciprocating movement in the tub, constructed and operating in the manner and for the purpose set forth.

No. 22,781.—REUBEN CAVE, of Louisville, Ky.—*Improved Machine for Polishing Metals*.—Patent dated February 1, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—The running of two polishing grit stones A A edge to edge, in opposite directions, one immediately above the other, and both running at the same time, the upper stone running one third faster than the under one.

No. 22,782.—WILLIS L. CHILDS, of Piermont, N. Y.—*Improvement in Railroad-Car Seats*.—Patent dated February 1, 1859.—This invention relates to that class of car seats which may be used as an ordinary reversable day seat, and rendered capable of being converted into a sleeping couch at night.

The inventor says: I do not claim broadly a reversable car seat; neither do I claim, irrespective of arrangement and construction, a car seat capable of being converted from an ordinary day seat into a sleeping couch at night, and *vice versa*; neither do I claim suspending a seat upon the point *a*, irrespective of arrangement and construction, for many plans have been devised for effecting such purpose.

But I *claim* attaching to each end of the planes or boards A and B curved or segment bars, lapping by each other, so that they will form an arc, having for its centre the point at which the planes or boards A and B are hinged or jointed.

I also claim suspending a car seat upon the point *a* in combination with the hinging of the planes or boards A and B, substantially as shown, so as to enable it to be reversed without concussion, and also to be used as a reclining seat or sleeping couch.

No. 22,783.—WILLIAM COUTIE, of Troy, N. Y.—*Improved Water Wheel*.—Patent dated February 1, 1859.—This invention consists in the use and arrangement of certain stationary plates, by which a rotary motion of the water is prevented and made to act with more effect on a screw wheel. Also in the arrangement of the wheel with the gate and suction tube, the gate being placed at the bottom of the tube and behind the wheel.

The inventor says: I *claim* the stationary plates arranged as described, so as to prevent a rotary motion in the water when acting on a screw wheel.

I also claim placing the gate below the surface of the back water, in connection with the draft tube, for the purpose specified.

No. 22,784.—JOSEPH COWEE, Jr., of Keene, N. H.—*Method of Variegating Wood*.—Patent dated February 1, 1859.—By this invention the timber which is to have a variegated appearance on its surface is placed between the two rollers H and B, that side which is intended to be variegated down towards a fluted roller, and in such a direction that the sides of the rollers are at right angles, or nearly so, with the fibres of the wood, and motion is given to the wheels, and sufficient weight applied to the end of the lever G so that the projections of the roller B leave depressions or indentations on the surface of the timber.

*Claim*.—The employment of rollers B B, in the manner substantially as described, for the purpose of variegating wood, all as set forth.

No. 22,785.—WILLIAM M. C. CUSHMAN, of Albany, N. Y.—*Improvement in Splice for Bar Rails*.—Patent dated February 1, 1859.—This invention consists in making a “splice of bar rails,” with an upper and lower flanch, or rib, so that the lower one shall be directly under the rail, for the purpose of giving greater strength to the base-plate of the splice and better

support the immediate ends of the rails, while the upper one extends outside of the rail and close thereto until it reaches the top thereof.

*Claim.*—In combination with the flat bar rail, the splice-plate, or piece constructed in the manner and for the purposes described.

No. 22,786.—CHARLES G. DICKINSON, of Poughkeepsie, N. Y.—*Improvement in Harvesters.*—Patent dated February 1, 1859.—In operating this machine the platform is attached to a harvester, the harvester and platform moving together, the grain as cut falls upon the front of the platform across the slots G, the upright arms O are moved through the endless chains, or belts, through the slots, outside the curb, towards the fore end of the platform where they turn at K, pass through the openings H, and moving toward each other along the front of the platform, commence gathering and compressing the grain lying and still falling across the slots, and having arrived at curve P turn, bringing the arms in the position as shown in the engraving.

*Claim.*—The combination of the curved arms O, curved feet E, and braces or compressors F, with endless belts or chains B, when arranged with relation to each other and to the platform A, and operating together in the manner described and for the purpose specified.

No. 22,787.—PORTER DODGE, of Frankestown, N. H.—*Improvement in Stoves.*—Patent dated February 1, 1859.—This stove is constructed of an iron frame and stone panels, put together in a peculiar manner. The iron frame is composed of a base A, which may be wholly or in part of cast-iron, or formed with a cast-iron rim *a*, a cap rim, or frame B, and vertical corner posts *c*. Each of said posts has a flange *d* extended from each outer edge. It is also provided with a flange *e* projecting inward. These flanges are intended to secure in place an inner and outer series of stone panels D, which are arranged in them, and extend upwards from the bottom.

*Claim.*—An improved air-tight stove, the several parts being constructed and arranged in relation to each other substantially as shown and described.

No. 22,788.—JAMES B. DUFF and THOMAS W. KEATING, of New York, N. Y.—*Envelope Machine.*—Patent dated February 1, 1859.—The claim and engraving explain the nature of this invention.

The inventors say: We do not claim, broadly, the invention of oscillating lappers to fold envelopes. Nor do we claim the arrangement and combination of a half circle with the heels or base of the lappers.

We distinctly disclaim the folding flaps projecting from the centre, or nearly so, from the end of a shaft or shafts, and having their bearings on one end or on each end thereof, whether with or without the half circles, as set forth in the third claim of Milton G. Puffers' patent, November 23, 1858, and we hereby disclaim all and every part covered by said Puffers' invention.

First. We *claim* the combination of the pasters *a a*, the grooved pressure fingers S S, and the spring plates K<sup>1</sup> K<sup>1</sup>, the whole being applied to operate substantially as set forth.

Second. In combination with a feeding table, having its surface composed of India rubber or other elastic substance, we claim the use of a plunger operating through a die above the said table, and provided with sharp projecting edges for the purpose, after it has forced the blank through the die, and thus turned back the flaps, of making a sharp crease where the fold is to be made, by pressure between said edges and the elastic surface.

Third. We claim placing the faces of the lappers I<sup>1</sup> I<sup>2</sup> I<sup>3</sup> I<sup>4</sup>, in front of their centres of motion, and their axes above the level of the table, as shown and described, so that the plunger E, when it descends, shall pass close against the faces of the lappers and the heels of the lappers, when the latter close, will move outward away from the paper, as shown and described.

Fourth. We claim having an open space between the heel of the lappers I<sup>1</sup> I<sup>2</sup> I<sup>3</sup> I<sup>4</sup>, to receive and hold the edges of the paper, when it is pressed therein by the descent of the plunger, as and for the purposes shown and described.

No. 22,789.—WRIGHT DURYEA, of Glen Cove, N. Y.—*Improvement in Apparatus to Manufacture Starch.*—Patent dated February 1, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim*, first, the described system of arranging and combining the grinding, washing, and bolting apparatus, to wit: the arrangement of all the stoves side by side, with their respective washers conveniently placed below them, with the arrangement of the bolting cylinders below their respective stones in horizontal series, with one or more interposed endless chain elevators P, combining them with the stones next in order of succession in the series, as set forth, whereby the whole apparatus is brought within two stories of a building, and convenience is afforded for its supervision, and the other advantages set forth are obtained.

Second. The combined arrangement of the lower bolting cylinders I I, and inclined plane or table O, with the troughs or gutters *m* and *t*, substantially as described, whereby I am

enabled to convey away the starch water and the tailings from the said cylinders by a single conductor for each purpose.

No. 22,790.—CHARLES O. FARRINGTON, of Brewer, Me.—*Improvement in Machines for Turning or Edging Bricks.*—Patent dated February 1, 1859.—The nature of this invention consists in having a series of slats attached by joints or hinges to a suitable frame and connected to a spring; the whole being arranged so that the unburned bricks, during the process of drying, may be turned from a flatwise position, as they are left in the moulds, to a position edgewise.

*Claim.*—The slats E, attached by joint hinges *a* to the bars A A, and connected by joint *c* to the bar F, which has the spring G attached to it, the whole being arranged substantially as and for the purpose set forth.

No. 22,791.—CHARLES FASOLDT, of Rome, N. Y.—*Improved Escapement for Time-Keepers.*—Patent dated February 1, 1859.—L is a straight detent lever, having its centre C between and in a right line drawn from centre to centre of the balance and escapement wheels. H is a hook attached to the lever with the like centre of motion. One extremity of the lever terminates in a fork F, vibrating in the partial rotation of the balance wheel. The other extremity of the lever has a peculiar form, such that the tooth of the escapement wheel may, at stated periods, rest against it, and be readily unlocked so as again to allow the rotation of the wheel.

*Claim.*—The employment of a straight lever and collateral hook in the position and form indicated and described.

No. 22,792.—SAMUEL F. FIELD, of Worcester, Mass.—*Improved Machine for Manufacturing Wooden Troughs.*—Patent dated February 1, 1859.—The object of this invention is to saw out the curved groove in the stick to form the gutter, so that the part sawed off will be in one piece, and also to manufacture the piece while sawed out into some other article as spouts or mouldings.

The inventor says: I *claim* arranging the bearings of the saw and the mechanism by which it is driven, substantially as described, whereby the upper surface, and also the interior of the saw, are left unobstructed, for the purpose set forth.

I also claim, in combination with a cylindrical saw, a secondary cutter, arranged substantially as described, so as to groove the core of the stick while it is sawed out by the cylindrical saw.

No. 22,793.—JOSEPH FOX, of Lansingburg, N. Y.—*Improved Cracker-Machine.*—Patent dated February 1, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the depressions in the spaces between the grooves in one or both of the rollers that form the strips of dough from the sheet, as described, for the purpose specified.

Second. I also claim forming short sections of skin-covered strips of dough into discs or crackers by pressure applied to the ends of the sections by the devices substantially as described.

Third. I claim the rollers, substantially as described, by which the crackers are rolled on the apron, and by which the skin on the upper surface of the pressed crackers is improved.

Fourth. I also claim the combination of the straight edges for evening the rows of crackers before rolling, and also for docking, as specified, with the dockers, substantially as set forth.

Fifth. I also claim the employment of the clamp bars II<sup>1</sup> in combination with the knife H, as described, to cut off and hold the sections of the strips of dough as the strips are fed through the bars G, as specified.

Sixth. I claim the plane T, follower U, and second endless apron S, substantially as combined and arranged among themselves and with the other endless apron, for the purpose of taking rows of crackers from a moving endless apron and placing them upon the bake-pans.

No. 22,794.—JAMES FREELAND and ROBERT H. LECKY, of Allegheny, Pa.—*Improvement in Slide-Valves of Steam-Engines.*—Patent dated February 1, 1859.—The nature of this invention consists in a mechanical arrangement for avoiding a full pressure of steam on the upper side and around the slide-valves of steam-engines, and for making the pressure on the lower sides of the valve about equal.

The inventors say: We *claim*, first, the arrangement of the armed flange M on the steam-pipe L, the columns R, the studs O, with nuts P, and the cap K, the whole being arranged and secured to the valve seat A as described and represented.

Second. The arrangement of chamber G with opening H, as described and represented, and for the purpose set forth.

Third. The combination and arrangement of the armed flange M on the steam-pipe L, columns R, studs O, with nuts P, stuffing-box N, cap K, and slide-valve B, with the valve-seat A, the whole being arranged, combined, and operated as described and for the purpose set forth.

No. 22,795.—JOSEPH W. GARDNER, of Shelburne Falls, Mass.—*Improved Handles for Table Cutlery*.—Patent dated February 1, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim* as an improved article of manufacture a table-knife having its handle composed of two or more parts *a b*, the ends of which are encompassed by ferules *d* and otherwise constructed as shown and described.

No. 22,796.—DWIGHT GIBBONS, of Rochester, N. Y.—*Improvement in Spermatic Rings*.—Patent dated February 1, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim* the employment, in a ring encircling the penis, of a sharp pin or point attached to a spring, which is held by a roller *i* or other equivalent rest, so as to prevent the protrusion of the said pin within the interior surface of the ring till distension of the penis occurs and by its action on the spring causes its liberation from the roller or rest, and thereby permits the said spring to force the pin or point into the penis, substantially as described, with a sudden action, instead of with the gradual action peculiar to the points of other rings for the same purpose.

Second. The combination of the two semi-circular or nearly semi-circular springs with the two rigid sockets, substantially as described, by means of a slot and set screw in one of the sockets, which permits the ring of the instrument to be adjusted to organs of various sizes.

No. 22,797.—JOHN W. GOULD, of Elmira, N. Y.—*Improvement in Railway-Chairs*.—Patent dated February 1, 1859.—This improved railway-chair is applicable either as a chair proper, resting on the cross-tie, as shown in the engraving, or as a "splice" uniting the ends of the rails between the cross-ties or sleepers, in which case the lock-wedge C acts as a "fish piece."

*Claim*.—The self-securing "lock-wedge" C, arranged in combination with the rail A, chair-seat B, and key D, substantially in the manner and for the purpose specified.

No. 22,798.—NATHANIEL B. HATCH, of Lawrenceville, Pa.—*Improvement in Retorts for Distilling Coal Oil*.—Patent dated February 1, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim* the application and use in retorts used in distillation of coal, or other substances from which oil or gas is produceable, of a sweep-bar B B or arm, with plates attached, substantially as described, and operated so as to push or spread the material placed within over the floor or bottom and at intervals discharge the same continuously in openings A at or near the edge of the retort, substantially as set forth in the specification and drawings.

No. 22,799.—ASA P. HAWSE and LUTHER J. ADAMS, of Morrisville Vt.—*Improved Scrubbing Pail*.—Patent dated February 1, 1859.—The rollers R R<sup>1</sup> constitute the handle of the pail by which it is transported, and in their natural position permit the insertion of the mop on either side thereof. To wring the mop, the toe of the operator is inserted under portion D of piece C, producing a movement of said piece about pins *b* and causing a separation of the rollers R R<sup>1</sup>. The mop is inserted between them, the feet of the operator are placed upon both bow pieces B and D, and the mop is drawn up between the rollers, the moisture being extracted therefrom by the pressure of the rollers.

*Claim*.—The combination of pail P, rollers R R<sup>1</sup>, and pieces *a a* and C, arranged and operated substantially as and for the purposes set forth.

No. 22,800.—GEORGE W. HEARD, of Boston, Mass.—*Improvement in Shirt Collars*.—Patent dated February 1, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim* as an improvement in the "turn down collar," the construction of the same with four cravat-slots or passages *a b c d*, arranged therein, or with respect to the ends of the inner fold of the collar, and for the purpose of receiving a cravat or tie-ribbon, substantially as specified.

I also claim the described mode of applying or arranging a cravat or neck tie in the collar, constructed with the four slots or passages *a b c d*, arranged within it or with respect to the ends of the inner fold essentially as explained.

No. 22,801.—JOHN HEBDEN, of Medford, Mass.—*Improved Washing-Machine*.—Patent dated February 1, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—The machine constructed substantially in the manner and to operate as described, that is to say, with a removable dasher, or its equivalent, and a removable platform combined and arranged with the suds reservoir and mangle rollers, essentially as set forth; the whole not only aiding the operations of washing the clothes, expressing the water from them, and mangling them to be carried on consecutively, but causing clothes to be drawn out of the suds reservoir and the express water to be received into it, as specified.

No. 22,802—ISAAC A. HEDGES, of Cincinnati, Ohio.—*Improvement in Mills for Grinding Cane, &c.*—Patent dated February 1, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim*, first, surrounding the openings in the top and bottom plates with annular ledges, when employed in connection with rollers having recesses corresponding with them in their top and bottom ends, substantially as described.

Second. I claim the regulator and adjuster, substantially as for the purposes described.

Third. I claim the oil-tubes H, when used in connection with a recess containing waste oil to conduct the same through the rollers to the bearings below.

Fourth. I claim the corrugated shells, in combination with the rollers, for the purpose of readily converting the mill into a corrugated mill, constructed and adapted substantially as set forth.

No. 22,803.—JAMES A. HENDRICK, of Providence, Pa.—*Improved Machine for Grinding and Polishing Saws.*—Patent dated February 1, 1859.—This invention consists in the employment of a grindstone, or polishing-wheel, in connection with feed-rollers placed in an adjustable frame and arranged relatively with a stone or wheel, whereby a very simple device is obtained for grinding edge-tools.

*Claim.*—The grindstone or emery-wheel B, in combination with the feed-rollers D D, placed in the adjustable frame C, the whole being arranged to operate substantially as and for the purpose set forth.

No. 22,804.—DEXTER HENSHAW, of Fitchburgh, Mass.—*Improved Clothes-Frame.*—Patent dated February 1, 1859.—When this frame is in use the arms stand, as shown in the engraving, at an angle of about forty-five degrees to each other; *d d* is a cord, or cords, on which the clothes are to be placed, running around the arms through the staples *e*, placed in the arms at different distances from the block *c*; *f f* are two braces which are attached at the end to opposite arms to hold them firm and steady when the frame is open.

*Claim.*—The combination of the four arms and the block with the cords, screws, and braces, as described and for the purposes aforesaid.

No. 22,805.—W. T. HILDRUP, of Harrisburg, Pa.—*Improvement in Rotary-Harrows.*—Patent dated February 1, 1859.—The nature of this invention consists in rendering the harrow adjustable by the resistance to be overcome in the operation.

*Claim.*—Giving the sleeves B B an invariable connection at one extremity, and a variable connection attached to the draft-bar at the other, substantially as and for the purpose set forth.

No. 22,806.—GEORGE W. HOLMAN, of Beloit, Wis.—*Improvement in Machines for Making Meal and Flour.*—Patent dated February 1, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I do not claim adjustable knives for the purpose of grinding grain, or screws for feeding grain to grinding surfaces in mills, or cone-pulleys, or tangent-screws, or emery-wheels for sharpening knives.

But I *claim* placing a series of knives supported by gudgeons in a circle, or part of a circle, so that the thickness of the shaving cut by the edge of one knife shall be gaged by the back of the knife next to it, as and for the purpose specified.

And I also claim the placing of a series of knives, supported by gudgeons, so that the rankness of set of all of them may be uniformly graduated by one operation, and so that their faces may be thrown back into one uniform surface for grinding or sharpening, as set forth.

I also claim the band *f*, at the end of the knives, constructed and operating substantially as described.

I also claim the arrangement of the reversed screw-threads on the arbor *n*, and the reversed screw-threads on the core, for the purpose of moving grain in opposite directions at the same time, as combined with the other parts of my machine, substantially as set forth.

No. 22,807.—WILLIAM H. HOPE, of Washington, D. C.—*Improvement in Mills for Grinding Grain.*—Patent dated February 1, 1859.—The nature of this invention consists in making a triplicate portable mill, (requiring but small power to drive it,) of cylinders running in concaves, for the purpose of grinding different materials, such as corn on the cob, corn meal, and wheat flour. Also in the mode of setting the stone and cylinders to grind coarse or fine, as the case may require.

The inventor says: I *claim* the combination of a cylindrical corn and cob-cutter and crusher for grinding food for cattle, with two sets of grinding surfaces, arranged and operating substantially as and for the purposes set forth.

Second. I claim the arrangement by which the cylindrical rollers or cutters and crushers and grinding surfaces may be operated together or separately, as and for the purposes set forth and described.

Third. The mode of regulating the cylinders and stone for the purpose of grinding coarse or fine by the use of the screw-lever *l*, attached to the journal-boxes *e*, which move on cars or lugs firmly attached to frame *F*, in the manner described and specified.

No. 22,808.—WILLIAM S. HUDSON, of Paterson, N. J.—*Improved Apparatus for Regulating the Draft of Steam-Engines.*—Patent dated February 1, 1859.—The nature of this invention consists in arranging a vertical diaphragm transversely in the upper portion of the smoke-box, in front of the steam-pipes and between them and the exhaust-pipes, and extending from near the top of the smoke-box down to near the level of the lowest tubes for the purpose of compelling the gaseous products, or a portion thereof, to descend and pass under it. It also consists in making the opening or openings above the base of said diaphragm of such area that when the fire is kindling, and when the locomotive is standing still, the small quantity of gases flowing from the tubes passes freely through these openings, and when the combustion is increased by the action of the blast, a large portion is compelled to pass underneath.

The inventor says: I *claim*, first, the interposition of a perforated diaphragm *E*, constructed substantially as described between the steam and the exhaust-pipes, and extending down to or near the level of the lower tubes, substantially as and for the purpose shown and described.

Second. Making the apertures above the base of the diaphragm *E* of such area that when the locomotive is standing still the gaseous products of combustion may flow through without serious obstruction, but that, when the combustion is increased by the blast, a large portion is compelled to pass underneath, substantially as set forth.

No. 22,809.—GEORGE C. JENNISON, of Ware, Mass.—*Improvement in Ovens.*—Patent dated February 1, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I do not claim an endless carrier, in combination with and arranged in a baking chamber separated from a furnace or chamber of combustion by a partition wall, or equivalent, through which the heat from the furnace has to pass in order to obtain access to the baking chamber.

But I *claim* the application of the baking chamber of the endless carrier to the furnace in such manner that the air within the said baking chamber may come into direct contact with the furnace charge or heated volatile products arising therefrom, and be heated thereby, without the heat having first to pass through any dividing wall or partition, or its equivalent.

I also claim the arrangement of the baking chamber with respect to the furnace and its discharge flues, substantially as described and as represented in the drawings, whereby the advantage of the ascending power of the heat is secured, while the smoke is carried off by the flues.

I also claim the arrangement of the charging and discharging orifices of the baking chamber, with reference to it and the lower smoke eduction passage leading into the discharge flue of the oven.

I also claim the arrangement and application of the pendulous platforms and the endless carrier, together and within the vertical baking shaft.

I also claim the combination and arrangement of one or more openings *i*, and their dampers, with the baking chamber and its furnace and flues, arranged as specified.

No. 22,810.—O. W. JIPSON, of Rochester, N. Y.—*Improvement in Weighing-Scales.*—Patent dated February 1, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I do not claim, separately, any of the parts shown and described.

But I *claim*, first, the sliding block *H*, when provided with the rollers *k l* and slide or supplemental weight *I*, arranged and combined as shown, for the purpose specified, and with or without the rack *j* and pinion *m*.

Second. The adjustable block *J*, provided with the slide or weight *s*, graduated bar *r*, in combination with the nut or supplementary weight *q*, as and for the purpose set forth.

Third. The attachment of the lever *C* to the platform frame, whereby the same may be adjusted further in or out from the frame, as circumstances may require.

Fourth. The arrangement of the bars *L L L L K K* with their sockets *v v b b<sup>1</sup>*, and with the frame *B*, substantially as shown, to admit of the adjustment of the bars to receive platforms of greater or less size, as required.

Fifth. The employment or use of the sleeve *E*, attached or applied to the beam *C*, as and for the purpose specified.

No. 22,811.—EDWARD JONES, of Brooklyn, N. Y.—*Improvement in Floating and Revolving Derricks.*—Patent dated February 1, 1859.—The nature of this improvement in derricks consists in making the turn table, or frame, which carries the derrick, to turn on the bottom of the scow below its deck; also, in supporting the turn table, or frame, which carries the derrick, by means of a circle and wheels at or about the height of the deck of the scow which carries it.

The inventor says: I *claim* the arrangement of the turn table, or frame, which carries the derrick, when placed on the bottom of the scow, or below the deck, substantially as described.

I also claim supporting the upper turn table or frame of the derrick by means of a circle and wheels, substantially as described.

No. 22,812.—WILLIAM W. LEWIS, of Cincinnati, Ohio.—*Improved Horse-Shoe Machine*.—Patent dated February 1, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination in a pair of rolls of a groove  $b b^1$  and creasers  $a$ , which will, by their joint operation, exert pressure in a lateral as well as a longitudinal direction, substantially as and for the purposes set forth.

Second. In combination with the above, I claim dividing the rollers radially and vertically, substantially as and for the purposes described.

No. 22,813.—HENRY MARTIN, of Louisville, Ky.—*Improved Tool for Crozing and Chamfering Barrels*.—Patent dated February 1, 1859.—This invention consists in the use of a stock or gauge, constructed or arranged in a novel way, so as to admit of the attachment of either of the crozing or chamfer tools, or a trowel, and whereby one and the same stock is rendered capable of being applied to casks of various dimensions.

*Claim*.—The stock A, provided with the rollers C C, arranged so as to be capable of being adjusted longitudinally and laterally in the stock, substantially as and for the purpose set forth.

No. 22,814.—J. B. MARTIN, of Wilmington, N. C.—*Improvement in Apparatus for Increasing the Draft of Furnaces*.—Patent dated February 1, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim*, first, the combination of a fan, with the exhaust, when arranged within the smoke-stack, substantially as described, so that the exhaust steam, as it issues from the exhaust-pipe, acts directly on the blades of the fan, and then passes with the products of combustion in a direct path through the fan and through the smoke-stack, thus causing the fan to turn with high velocity, and thereby accelerating the draught of the furnace, as set forth.

Second. The combination of the deflecting plates with the blades of the fan, for the purpose of intercepting sparks and cinders, as described.

No. 22,815.—THOMAS E. McNEILL, of Philadelphia, Pa.—*Improvement in Sleeping Cars*.—Patent dated February 1, 1859.—This improvement consists in a peculiar construction of the back and seat of this class of car-seats, whereby the same may be readily converted into couches for sleeping purposes.

The inventor says: I *claim*, first, constructing the seat C of the swing seat of a railway car, with guiding strips, or their equivalents, and padded leaves H and H hinged together and to the seat, so that the latter may be extended and form a comfortable couch for sleeping purposes.

Second. The frame  $e^1$  arranged to receive the padded board  $e$ , when the frame is hung to one end D of the couch, and the board to the opposite end by rods  $f$ , and when the whole is combined with the swing seat of a railway car, so as to form a rest for the back during the day, and a sleeping couch for the night, as set forth.

No. 22,816.—C. A. MERCHANT and G. L. PATTERSON, of Frankfort, Ky.—*Improvement in Coffee Pots*.—Patent dated February 1, 1859.—In using this invention the boiler A is filled with hot water and coffee; the reservoir B is placed on the top and filled with cold water, a red-hot iron is then put in to the tube C; as soon as the steam generates in the boiler it passes through tube D into cylinder H, and is condensed and turned back to the coffee boiler through tube E.

*Claim*.—The combination and arrangement of the cylinder H in the reservoir B, and the tubes D E and F C, in the manner and for the purpose described.

No. 22,817.—WILLIAM T. MILLS, of Galesburgh, Mich.—*Improvement in Clover Pickers*.—Patent dated February 1, 1859.—The nature of this invention consists in constructing a clover picker in such a manner that the heads of the clover may be removed without the employment of a knife scraper.

*Claim*.—Providing the teeth F F with the holes  $i i$  and angular plate H, when arranged at the front edge of the adjustable platform or box A, and in relation to each other, in the manner described and for the purpose specified.

No. 22,818.—STEPHEN F. PALMER, of New York, N. Y.—*Improvement in Discharging Water from Floating Dry Docks for Canals*.—Patent dated February 1, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—The manner of discharging the water from a floating dock by means of the underground trunk in combination with the flexible apparatus, to convey the water from the dock without interfering with its rise and fall. Not confining myself to any particular manner,

provided it produces the same result of giving the water a self-acting discharge, substantially as before described.

No. 22,819.—WILLIAM P. PARROTT and STEPHEN H. HEAD, of Boston, Mass.—*Improved Variable Exhaust-Pipe*.—Patent dated February 1, 1859.—By this invention the regulation of the orifice of the blast-pipe of locomotive and other furnaces is placed under the control of the engineer, which is done by the use of the contracting nozzle.

*Claim*.—The described contracting orifice for blast-pipes, constructed and operating in the manner and for the purpose, substantially as set forth.

No. 22,820.—JONES PATRICK, of Chicago, Ill.—*Improvement in Variable Exhaust-Pipes*.—Patent dated February 1, 1859.—The nature of this invention consists in the manner in which it combines the rotating cylinder of adjustable exhaust openings with a mechanism in convenient position to the engineer or fireman, for the purpose of turning said cylinder, and thus to increase or diminish the area of exhaust opening at pleasure.

*Claim*.—In combination with a revolving cylinder or plate of variable sized exhaust openings, the rock shaft, pawl radius bar, their several connections, substantially in the manner and for the purposes set forth.

No. 22,821.—JOHN F. PEABODY, of Salem, Mass.—*Improvement in Sash-Supporters*.—Patent dated February 1, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—The inventor says: I do not claim the invention of a rack and a catch, nor the arrangement of a rack, or its equivalent in the grooved jamb of the window-frame, so as to be covered by the sash while in the act of rising; whether such rack be placed on the bottom of the groove and against the edges of the sash, or against the rear side of the groove and against the rear or outer side of the sash.

But I *claim* my improved application or arrangement of the rack-bar *D*, with reference not only to the groove *a* of the window-frame, but to the inner side of the sash *B*, and to the catch applied thereto, as described, the rack-bar, under such arrangement, not only being in full view with the catch, at any altitude at which the window-sash may be placed in the frame, but operating not only to support the sash at such altitude, but to maintain it within the groove *a*, as specified.

No. 22,822.—SYLVESTER W. PEARSALL and WASHINGTON L. PEARSALL, of New York, N. Y.—*Photographic Plate Vise*.—Patent dated February 1, 1859.—This invention consists in a peculiar spring-clamping jaw and releasing lever, combined with an adjustable sliding jaw fitted to move on a rod and retained by a thumb-screw; these jaws are so mounted on a vertical stud that they can be turned around horizontally into the desired position and held firmly.

The inventors say: We *claim* the spring rocking jaw and lever *f*, in combination with the movable jaw *e*, substantially as described and shown.

We also claim the jaw pieces or facings of hard rubber or gutta-percha, for the purpose specified.

And we claim the arrangement of the rod *d*, stock *c*, and gudgeon *b*, entering the socket *a*, and having the set screw *k*, by which the apparatus is retained in position horizontally, as specified.

No. 22,823.—G. W. PENNISTON, of North Vernon, Ind.—*Improvement in Cotton-Bale Press*.—Patent dated February 1, 1859.—The nature of this invention consists in the peculiar manner of constructing the iron tie, or friction key, and its ready adjustment to the ends of the piece of hoop made use of in baling cotton and other materials, and also in the ready manner of detaching it from the bale.

The inventor says: I *claim* the tie *A*, or friction key, constructed as described, with convex inner bearings, 1 and 2, figure 3, when constructed and operated in the manner and for the purposes specified.

No. 22,824.—SYLVESTER PEARSONS and ALFRED M. CONE, of Panama, N. Y.—*Improvement in Harvesters*.—Patent dated February 1, 1859.—The claim and engraving explain the nature of this invention.

The inventors say: First, we *claim* arranging and operating the chain cutters upon an adjustable and vibrating cutter frame, in the manner and for the purposes substantially as described.

Second. We claim the arrangement of two or more rollers *J J*, relatively to the chain cutters, multiplying wheel *c*, and adjustable vibrating cutter frame, so that the rollers will form a bearing for the chain cutters, and support and hold the chain in gear with the multiplying wheel, whatever may be position of the adjustable vibrating cutter frame in passing over unlevel surfaces, substantially as set forth.

No. 22,825.—J. E. RICE, of Oneida, Ill.—*Improvement in Fanning Mills*.—Patent dated February 1, 1859. Within the spout *E* a curved plate *F* is placed, the lower end of said plate

being connected with the spout by a hinge, or joint *k*. To the upper end of the plate *F* a rod *l* is attached, said rod leaning down below *F*, and connected to a vertical slide *m*, which works by the side of a ledge *n*, between the spout *E* and chamber *D*.

*Claim.*—The arrangement and combination of the suction chamber *D*, spouts *E j*, plate *F*, and shoe *B*, substantially as and for the purpose shown and described.

No. 22,826.—NATHAN F. RICE, of New Orleans, La.—*Improvement in Filtering Apparatus.*—Patent dated February 1, 1859.—The nature of this invention consists in receiving the water to be filtered at the bottom of the cistern or other receptacle, and filtering it upwards through a filtering medium.

The inventor says: I *claim*, first, passing the water through the filtering medium from below upwards in the manner described.

Second. I claim the concavo-convex perforated false bottom or diaphragm, constructed and arranged substantially as described.

Third. I claim the air tube *K*, leading from the lower chamber *F*, as and for the purpose specified.

No. 22,827.—JOHN W. RICHARDS, of New York, N. Y.—*Improved Fire and Ventilating Apparatus for Ships.*—Patent dated February 1, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim*, first, arranging and applying the pipe *F F*<sup>1</sup>, or their equivalents, leading to the different parts of the vessel, in combination with suitable connections with a boiler and blower, or air forcing apparatus, that the said pipes may be used as required, to supply either air for ventilation or steam for the extinction of fire, substantially as described.

Second. Applying the several lengths of pipe in a train so that they are capable of being turned in their joint boxes or supports, for the purpose of giving such direction to the ventilating air supplied by each length, as the occupants of the berth or part of the vessel supplied by it may desire, as described.

No. 22,828.—THOMAS RUSSELL, of New York, N. Y.—*Improvement in Ovens.*—Patent dated February 1, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I do not claim to be the first inventor of an oven in which the substance to be baked travels horizontally from a door where it enters to a door on the same side where it is discharged.

But I *claim* the employment in such an oven, in combination with permanent ways or tracks, arranged at right angles to each other within, without, and through the doorways, substantially as described, and with a series of carriages to run on such ways, of a system of horizontal screws and endless chains, applied substantially as specified, and of teeth, or their equivalents, on said carriages, to connect with said screws and chains, the whole operating substantially as and for the purpose set forth.

And I also claim the opening of the oven doors to admit the carriages and permit their exit by the direct action of the doors of the carriages themselves, substantially as described, thereby dispensing with special machinery for that purpose.

No. 22,829.—GELSTON SANFORD, of Poughkeepsie, N. Y.—*Improvement in Burr Stone Mills.*—Patent dated February 1, 1859.—The nature of this invention relates to the securing a burr block of conical form to a shaft, and also in fitting two other blocks of burr or other stone thereto in such a manner that each piece shall form a half circle, and fitted together with a vertical joint, and also the manner of securing the last mentioned blocks to a bed-piece, or frame of a mill.

The inventor says: First, I *claim* the mode of constructing the casing or shaft with a vertical or upright joint *J*, in combination with the lever *G* and edges *R* as a fastener for the shell.

Second. I claim the grinding part *Q Q*<sup>1</sup>, and the elevating part *1*, in combination with the cone *B* and shell *B*<sup>1</sup>, when constructed and operated in the manner and for the purposes specified.

No. 22,830.—SAMUEL S. SQUIRE and THEODORE SCHARFENBERG, of Brooklyn, N. Y.—*Improved Hinge.*—Patent dated February 1, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The inventors say: We are aware that hinges have been constructed with a separate pin for each core, and also that centres have been cast on one leaf, and fitted by recesses on the other leaf by means of cores or chills, and we therefore disclaim such devices.

We *claim* providing the half leaves on one side of a butt with the hinge pins *G G* or *I*, which are solid, with the pattern, and form part thereof when cast in the manner specified.

No. 22,831.—ALBERT SHEEK, of Smith Grove, N. C.—*Improvement in Dressing Mill Stones.*—Patent dated February 1, 1859.—The nature of this invention consists in making a

slight shoulder or depression where the "land" and "furrow" unite, and making the furrow convex from that point to where it unites with the shoulder of the next land. The object being to crack or crush the grains between the two convex surfaces of the runner and bed, preparatory to its being ground or reduced, at the slight shoulders formed where the furrows join the lands.

*Claim.*—In combination with a plane surfaced land *a*, the depression *c*, and convex furrow or surface from *c* to *e*, the whole forming a new milldress, for the purpose and in the manner described.

No. 22,832.—H. B. THOMAS, of Portage City, Wis.—*Improved Rotary Steam Engine.*—Patent dated February 1, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim*, first, so constructing and combining a piston wheel and sliding pistons with two eccentric cylinders, one outside and the other inside the said wheel, that with a proper arrangement of induction and eduction passages, those parts of the pistons within the rim of the wheel, as well as those without, are rendered effective in the operation of the engine, as described, and it is thereby rendered double-acting, either in its employment as a motor or as a pump, or as a combined motor and pump.

Second. The combined arrangement described of the passages and cavities in the cylinder head B, ring-valve I, and bonnet N.

No. 22,833.—WILLIAM W. WADE, of Longmeadow, Mass.—*Improvement in Sewing Machines.*—Patent dated February 1, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the application to sewing machines of the ratchet C or corrugated wheel and pawl, the pawl B being kept in place by a friction cam D, or its equivalent, and the motion being communicated to the machine, either by a double crank, as described, or by a single crank, or other appropriate means.

I do not claim a pawl and ratchet operated by a lever moved by a limb of a person using the machine.

No. 22,834.—GEORGE WALKER, of Port Jervis, N. Y.—*Improved Machine for Grinding Saws.*—Patent dated February 1, 1859.—The engraving exhibits the application of this invention to the grinding of circular saws, but the same machinery there represented can be made applicable by changing the rotating for a reciprocating saw-bed to the grinding of straight saws.

The inventor says: I *claim*, first, the arrangement and combination of the wheel I, and bed-plate F, substantially as shown and described, whereby said driving wheel is made to drive the bed-plate, and also to compensate for the pressure of the grindstone, as set forth.

Second. I claim the flat-bottomed water recess *c c* in the face of the bed-plate F, as shown.

No. 22,835.—CHAPMAN WARNER, of New York, N. Y.—*Improvement in Cast-Iron Pavement.*—Patent dated February 1, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—I *claim* the mode of constructing pavements of iron frames of any size, substantially of the form described and illustrated by the drawings, placed at right-angles to each other, each surmounted by a single boss, which constitutes the travelling surface, it being so arched and placed upon the frame, and the frames so connected with each other, that the pressure arising from a weight imposed upon any boss, or upon any part of it, shall not be borne exclusively by one part of the frames, but shall be diffused over it, and over the adjoining frames, the manner of connection, at the same time preserving the regularity of the surface, by preventing the elevation or depression of any one boss above or below the surface of the others; the space left by the frames to be filled with any material which the circumstances of each particular case may determine.

No. 22,836.—CHARLES WILLIAMS, of Philadelphia, Pa.—*Improvement in Sizing for Colored Papers.*—Patent dated February 1, 1859.—The nature of this invention is described in the claim of the inventor.

*Claim.*—The employment or use, in a sizing for marbled and other colored papers of the solution of the gum resin lac, in combination with a solution of either soap or beeswax or both, the said solutions being made and incorporated together in sizing, substantially in the manner and for the purposes described.

No. 22,837.—AURIN WOOD, of Worcester, Mass.—*Improved Machine for Shaving the Heads of Screw Blanks.*—Patent dated February 1, 1859.—This invention relates to machinery for separating the blanks, one by one, from a column moving between ways, and delivering them in a horizontal position, and inserting them at the required distance into suitable jaws by which they are gripped and rotated that the heads may be shaved or turned by a suitable cutter.

The inventor says: I *claim* the wheel with its volute and twisted slot, substantially as described, in combination with the ways, or the equivalents thereof, to present the blanks in order, by means of which combination the blanks are separated, one by one, and gradually brought to a horizontal or nearly horizontal position, as set forth.

I also claim, in combination with the wheel, having a volute and twisted slot, substantially as described, for receiving the blanks, one by one, from the separating wheel, as set forth.

And I also claim the combination of the inclined ways, the separating wheel, with its volute and twisted slot, the feeding tube and punch rod, or the equivalent thereof, with the jaws on the mandrel as described, and for the purpose set forth.

And I also claim communicating motion to the separating wheel by an interposed spring spur or catch or the equivalent thereof, substantially as described, that the spring connection between the impelling mechanism and the separating wheel, or its equivalent, may yield to any obstruction, and thus prevent injury to the mechanism, as set forth.

No. 22,838.—JAMES LEE, of New York, N. Y., assignor to Himself and MILTON FINKLE, of said New York.—*Stereoscopic Apparatus*.—Patent dated February 1, 1859.—The object of this invention is to combine in one machine an apparatus by which an indefinite number of stereoscopic views may be brought before the object glass with ease and facility.

The inventor says: I am aware that revolving stereoscopic machines have been in use previous to this time, operated in a variety of ways, one of which is by an endless band, patented by Alexander Beckers, April 7, 1857, of the city of New York, but to my knowledge there is none constructed and operated upon the principle here claimed.

I, therefore, *claim* the fan or segment hinge I, fig. 2, or its equivalent, in combination with the picture-holders F F, for the purpose specified.

I claim the controlling band H, or equivalent, for the use specified.

I claim the elastic band E, or its equivalent, in combination with the pulley B, and rollers C C and D, for the purposes specified.

I claim the picture-holder, figs. 4 and 5, as described for the purposes set forth. Finally, I claim the combination as set forth and described, but do not confine myself to the exact proportions, as I may vary the same while I obtain the same end by means essentially the same.

No. 22,839.—EZRA POLLARD, of Albany, N. Y., assignor to Himself and JOHN GRAY, of Westfield, Mass.—*Improved Meat Cleaver*.—Patent dated February 1, 1859.—The nature of this invention consists in a meat masticator at one end of a stock, and a cleaver or axe on the other end and combining both to the same stock, which is formed with an eye to receive a handle so that either can be used at pleasure.

*Claim*.—I claim the meat masticator C, in combination with the cleaver D, substantially and for the purposes specified.

No. 22,840.—REUBEN SHALER, of Madison, Conn., assignor to IRA W. SHALER, of New York, N. Y.—*Fly-Trap*.—Patent dated February 1, 1859.—This invention consists in the combination of a cover or door, which closes the entrance to the upper story or chamber of the trap, with a post or stop attached to the lower portion by which attachment of the upper portion of the lower part of the trap is made to open the door or lid, which otherwise closes the entrance.

*Claim*.—The combination of the stud E, and cover g, when arranged in connection with the chambers B and C, as described and for the purpose set forth.

No. 22,841.—SAMUEL E. TOMPKINS and JOHN MACLURE, of Newark, N. J., assignors to SAMUEL E. TOMPKINS, aforesaid.—*Improvement in Harness Saddle-Trees*.—Patent dated February 1, 1859.—This invention consists in a novel way of attaching the seat-block of the saddle to the tree, whereby a wooden seat-block, or one constructed of any soft materials, may be secured to the tree equally as firm and without any greater liability of working loose than the ordinary metal seat-block.

*Claim*.—The tubular projection *a* on the bow A of the tree, substantially as shown, so as to form a case for the bolt D, and permit the securing of the wooden seat-block to the tree, without injuring the same or allowing it to work loose, and at the same time securing the check-rein hook C to the tree.

No. 22,842.—MILTON D. WHIPPLE, of Charlestown, Mass., assignor to the WHIPPLE FILE COMPANY.—*Improvement in Machines for Cutting Files*.—Patent dated February 1, 1859.—The object of this invention is to cut files by machinery, and its main feature consists in the employment of a circular chisel, which, in lieu of being brought up to the blank and forced into its surface by the pressure of the blow of a hammer, is allowed to roll over it, it being so adjusted to the surface of the blank that it shall sink a given distance into it whether it be more or less wide.

The inventor says: I *claim* the circular rolling-cutter *f*, operating in the manner substantially as set forth.

Second. I claim holding the face of the blank which is cut up to a face-plate or rest by pressure upon its opposite sides, for the purpose specified.

Third. I claim clamping the blank rigidly, while a cut is made, and releasing it preparatory to its being fed, as set forth.

Fourth. I claim the wedges *o*, operating as set forth, for the purpose of clamping the blanks, as described.

Fifth. I claim the shield *z* against which the blank rests, and which is fed up with the blank in the manner and for the purpose substantially as set forth.

Sixth. I claim the described machine for cutting files, consisting essentially of the combination of the elements above claimed, and operating in the manner substantially as set forth.

No. 22,843.—CHARLES B. ALLEN, of Philadelphia, Pa.—*Improved Machine for making Rivets, Bullets, &c.*—Patent dated February 8, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I claim the revolving shafts C C with their inclined planes *e e<sup>1</sup> e e<sup>1</sup>* and former, as described, and the mould-wheels or formers D D attached thereto, in combination with the yoke F and wheel G, whereby the extremities of the shafts to which the mould-wheels or formers are attached are made to approximate and separate.

I also claim the bar N and the inclined plane *n*, in combination with the rod *f* and cutter-wheel *g*, constructed and operated substantially as described, whereby the portion of metal which has been moulded or formed may, when so desired, be severed or detached.

No. 22,844.—GILES S. APPLETON, of Burlington, Vt.—*Improvement in Railroad Safety-Switches.*—Patent dated February 8, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I claim, first, the combination of the broad and even switch-rails E E<sup>1</sup> with the broad and even traverse-rails F F<sup>1</sup>, long guide-rails H H<sup>1</sup>, and short lift and guide-rails *a b c* and *a<sup>1</sup> b<sup>1</sup> c<sup>1</sup>*, when the same are arranged in relation to each other substantially as shown and described.

Second. Allowing the wheels to play upon the wide traverse and switch-rails, after leaving the short lift-ways and guide-rails, before they reach the main track, substantially in the manner and for the purposes as described.

No. 22,845.—J. A. AYRES, of Hartford, Conn.—*Improved Method of Opening and Closing Gates by the weight of the Carriage.*—Patent dated February 8, 1859.—This is an improvement in that class of automatic gates in which a movable or vibrating platform is employed and actuated in the first instance by the gravity of the vehicle or team approaching the gate, the platform being connected with the gate by mechanism so as to open and close it as the platform rises or falls.

The inventor says: I claim the counterpoised or loaded platform E, formed of two parts *d d*, connected by joints or hinges *g*, and placed in the carriage-way A beneath the gate, and extending a requisite distance at either side of it, when said platform is connected by suitable mechanism with the gate, substantially as described, to operate said gate, as and for the purpose set forth.

I further claim, in connection with the platform E, the locking device formed of the drop-bars L L, the jointed levers M M connected with the bars N N, which are provided with the upright arms *r r* extending through the platform, the whole being arranged to operate conjointly, as and for the purpose set forth.

No. 22,846.—BENJAMIN BARKER, of Ellsworth, Maine.—*Improved Sawing-Machine.*—Patent dated February 8, 1859.—The object of this invention is to enable the circular saw to cut lumber while moving in either direction, so as that the time hitherto spent in "gigging back" will be more usefully employed. It also has for its object the trimming of the ends of the lumber, so that the edging and slitting or trimming may be performed at one operation.

The inventor says: I claim, first, the sawdust-spout H, arranged relatively with the edging-saw D and feed-table C, substantially as and for the purpose set forth.

Second. The trimming saw K, when used in connection and arranged relatively with the edging-saw D, to operate conjointly therewith, as described.

No. 22,847.—JOSEPH P. BARKER, of Wayne, Ohio.—*Improvement in Earth-Excavators.*—Patent dated February 8, 1859.—This invention relates to a new method of arranging and adjusting an apron, so as to conveniently discharge the earth taken up at any desirable point.

The inventor says: I claim the manner of arranging and adjusting an apron, and operating the same by means of the bent-levers J, for the purpose of conveniently discharging the earth taken up at any desired point, as set forth and used in connection with the adjustable wheels, as described.

No. 22,848.—SAMUEL K. BASSETT, of Galesburg, Ill.—*Improvement in Steam-Ploughs.*—Patent dated February 8, 1859.—This invention consists in a peculiar manner of arranging

the wheels of the track of a traction steam-engine, whereby the track may be readily guided and turned, and the engine rendered available for drawing a gang of ploughs to turn over the earth in the usual way.

The inventor says: I *claim* having the wheels B of the truck A attached to separate axles C, with pivoted or swiveled inner bearings *b*, the outer bearings of the axles being fitted in guides D and the outer ends of the axles being connected by rods E, with racks F into which the pinions of the shaft G gear, the shafts being connected by the endless chains J passing around cone pulleys I, placed in reverse positions on the shafts, the whole being arranged to operate substantially as shown and described, to facilitate the guiding and turning of the machine, as set forth.

No. 22,849.—HENRY I. BEHRENS, of New York, N. Y.—*Improved Billiard-Register*.—Patent dated February 8, 1859.—The nature of this invention is described by the claim and engraving.

The inventor says: I *claim* the use of numbers instead of balls—technically called “points”—so arranged and worked by mechanism that any number of points made by the player may be readily marked on the number itself, and the amount of the thus successively marked points is made to be shown by the register, the whole arranged and operated by mechanism substantially the same as described.

No. 22,850.—JACOB BERGSTRESSER, of Berrysburg, Pa.—*Improvement in Monumental Daguerreotype-Cases*.—Patent dated February 8, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim* the combination of the central frame encased by a central raised bead *b* on the rear side of a glass plate, with the outer frame encased by an outer raised bead *a*, the central frame and outer frame being cast together on the same glass-plate, and the outer one being deeper than the inner or central frame, substantially as and for the purposes set forth.

No. 22,851.—WILLIAM G. A. BONWILL, of Dover, Del.—*Improvement in the Application of Electricity in Dental Operations*.—Patent dated February 8, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I do not claim the application of electricity to dental purposes as this is shown in the patent of J. B. Francis.

But I *claim*, in the application of electricity to dental purposes, the mode described of extracting or extirpating the dental pulp or internal nerve of teeth, to wit: by the application of a current of electricity, through the instruments made use of in the performance of said operation, directly and constantly to the dental pulp, or internal nerve, during the operation of cutting out or extracting the same, as set forth, and for the purposes described.

No. 22,852.—CHARLES B. BOYLE, of Albany, N. Y.—*Improvement in Photography on Wood*.—Patented in England January 7, 1859; patent dated February 8, 1859.—The claim explains the nature of this invention.

The inventor says: I *claim*, first, the described or substantially equivalent method of applying albuminous matter and afterwards coagulating it by heat, so as to form an insoluble base within the pores of the wood, for the purpose set forth.

Second. Taking photographic pictures upon wood, the pores of which have been filled with gelatine, or its equivalent, and subsequently removing the gelatine from the block, without injury to the picture, by the application of a warm solvent.

No. 22,853.—JOHN L. BROWN, of Indianapolis, Ind.—*Improved Machine for riving Laths from the Blocks*.—Patent dated February 8, 1859.—In operating this machine, the lumber being placed against the upright posts H H, between the guides O O, drops upon the rests I I, in front of the knife E. The crank B operating the yoke D, which is attached to the knife-bar C, forces the knife E through the lumber in a direction parallel to the motion of the guides F and G, which govern the direction of the knife's movement, thus producing a drawing cut, instead of cutting straight across the grain of the lumber. As the crank D continues its revolutions the knife is withdrawn. The pitman N, by its connection with the elbow extension upon the guide bar G, operates the lever L.

*Claim*.—The combination and arrangement of the yoke D, knife-plate C, guides F and G, with the pitmen N and M, elbow-levers K and L, rests I and I, when constructed and operated substantially as and for the purposes set forth.

No. 22,854.—JOHN H. CHEEVER, of Boston, Mass.—*Improvement in Manufacture of Rubber Hose-Pipes*.—Patent dated February 8, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I do not claim the vulcanizing process, or any compounds of rubber referred to, because, with the exception of the cross-fibre compound, they are old; nor heat-

ing the hose or pipes on rods or tubes of iron; nor any peculiarity in the construction of the machine.

Neither do I intend, in this application, to claim forming a cross-fibred fabric, as these will constitute the subject of other patents.

But I *claim* the new article of manufacture consisting of hose or pipe made of fibrous rubber by powerful pressure, and without seams or joints, substantially as described.

No. 22,855.—GEORGE E. CHENOWETH, of Baltimore, Md.—*Improvement in Harvesters*.—Patent dated February 8, 1859.—The nature of this invention consists in the construction and arrangement of parts for the better and more convenient communication of the power of the driving wheel to the knife-bar of the machine.

The inventor says: I do not claim making the shells of the cam cylinder adjustable, to compensate for wear, as that has been secured to me in a former patent.

But I *claim* the combination of the cam-cylinder with the cross-arm, slide-bar, and slotted or jaw lever, constructed, arranged, and operating substantially in the manner and applied to the purpose specified.

I also claim a slide-bar having two cross-arms provided with friction-rollers and working in the slotted box L, as described.

No. 22,856.—E. HALL COVEL, of New York, N. Y.—*Improvement in Coffee-Pots*.—Patent dated February 8, 1859.—This invention consists in providing a largely increased amount of surface against or in which the vapor of the boiling coffee is condensed, to be returned to the body of the pot to mingle with its contents, and in placing a water-valve in the steam-pipe of the pot to act as a safety-valve.

The inventor says: I *claim*, first, the combination of the chamber C with the condensing chamber D and condensing pipes E E<sup>1</sup>, as and for the purpose set forth.

Second. The combination of the condensing pipes E E<sup>1</sup> with the steam pipe F and trap G, as described, and for the purposes set forth.

No. 22,857.—FLORIAN DAHIS, of Williamsburg, N. Y.—*Improved Valve-Bung*.—Patent dated February 8, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—A bung A, provided with an air-passage *a*, terminating in a recess or chamber *b*, in which a disk-valve *c* of rubber or other suitable material, is placed and secured therein by a plate *e*, provided with a hole *f*, specifically as and for the purpose set forth.

No. 22,858.—BERIAH DOUGLAS, of Appleton, Wis.—*Improved Washing-Machine*.—Patent dated February 8, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: My claim is not for the tub or rocker described, which are novel only in part.

But I *claim* the washing-seat and the foot-box, as combined with the washing-rocker and the hand-supporters, and the clothes-holder or wringer, as combined with the washing-tub, all for the purposes assigned to them.

No. 22,859.—JAMES DUNDAS, of Little Rock, Ill.—*Improvement in Cultivators*.—Patent dated February 8, 1859.—The nature of this invention consists in arranging a number of plough shaped shovels to a proper frame, suspended to a single axle, which is sustained by a pair of common wagon-wheels having a tongue attached for the purpose of harnessing thereto a pair of horses or other animals; also by a peculiar arrangement of the shovels by which the earth is thrown from the young corn plants, and the same shovels readily arranged to throw the earth toward the plant; also in arranging the shovels so that they may be raised above the surface of the earth when required.

*Claim*.—The arrangement of the half-shovels *w w*, in connection with the bars *h h* and *i*, to be moved to the right or left at pleasure of the operator.

No. 22,860.—GEORGE ESSINGTON, of Plainfield, Ohio.—*Improvement in Cultivators*.—Patent dated February 8, 1859.—The nature of this invention consists in the arrangement of mould-boards and centre-piece in the combination with the standard point and shares.

*Claim*.—The arrangement of the mould-boards T T, centre-piece P, in combination with the coulter or standard H, point I, and shares J J, the whole being constructed substantially as described and for the purpose set forth.

No. 22,861.—SQUIRE M. FALES, of Baltimore, Md.—*Improved Furnace for Smelting Iron*.—Patent dated February 8, 1859.—The nature of this invention consists in connecting with the cone of a furnace one or more arched recesses or chambers, with openings in the crown of each for the introduction, from the outside, of any fluxes necessary to make the furnace work properly, through which the blast is made to circulate before it rises to the cone of the furnace; also in introducing a movable "tymp," to be applied to the outer ends of the arched recesses, instead of the permanent tymp now in use.

*Claim*.—The combination with the ordinary furnace of the arched chambers or recesses at

the sides of the furnace, as described, the opening in the crown of the arched recess or chamber, as set forth, and the movable tympan at the external openings of the arched chambers or recesses, as specified.

No. 22,862.—DANIEL P. FARNHAM, of Johnstown Centre, Wis.—*Improvement in Cattle-Pumps*.—Patent dated February 8, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I do not claim raising water by the weight of an animal upon a platform.

But I *claim*, first, the combination of the lever and rod, or their equivalents, with the gate and inclined platform, arranged and operating substantially as described and for the purpose set forth.

Second. The strips of metal *e*, secured on the inside of the barrel of the pump *G*, to prevent the valves from coming in contact with the plunger *H*, as it works up and down, in combination with the barrel, as set forth.

Third. The packing ring *I*, constructed as described, and kept up to the plunger by weights on the back side, as set forth.

No. 22,863.—J. B. FISHER, of Beaver Dam, Wis.—*Improved Mortising Chisel*.—Patent dated February 8, 1859.—This tool is formed with two cutting edges, the cutting portion at one end being considerably shorter than the other; they are so arranged that the mortises may be cut without reversing the tool.

*Claim*.—Constructing the tool with two cutting edges or portions *a*<sup>1</sup> *b*, of different lengths, substantially as shown and described, for the purpose set forth.

No. 22,864.—PERRY G. GARDINER, of New York, N. Y.—*Improvement in Manufacture of Cast-Steel*.—Patent dated February 8, 1859.—The claim explains the nature of this invention.

The inventor says: What I claim is not simply the gradual and prolonged cooling of the metal after melting.

But I *claim* the process, as a whole, of pouring the melted metal into intensely heated moulds, and then placing them, thus filled, immediately into the heated oven or furnace where they congeal, away from the external atmosphere, down to a cherry red heat, and then immediately plunging the ingots or bars into the highly heated oil, and retaining them immersed in it for a considerable time, as described.

No. 22,865.—PERRY G. GARDINER, of New York, N. Y.—*Improvement in Manufacturing Tools from Cast-Steel*.—Patent dated February 8, 1859.—The claim explains the nature of this invention.

*Claim*.—The process of treatment of the cast-steel, by pouring it, in a molten state, into moulds of the shape and size required for tools, instruments, axes, &c., previously heated to a high degree of heat, the steel being melted in a closed oven or furnace, and then replacing the moulds so filled in an oven or furnace, away from the external air, and keeping them there until they have been cooled down to a cherry red heat, and then immersing the tools, axes, &c., into the fluid mixture, of a temperature of from 100° to 150° Fah., as described.

No. 22,866.—JOHN C. GARLAND, of Chicago, Ill.—*Improvement in Mail-Bag Fastenings*.—Patent dated February 8, 1859.—This invention consists in a sliding steel strap having oblong slots working in connection with stationary pins.

*Claim*.—The employment of a slotted sliding-strap *F*, when made of a single steel-spring, and used in combination with a series of narrow stationary iron guides *E*, attached to the perforated flap of the bag, and with the steel-spring *R*, having headed stop-pins *C*, fitted between the front portion of the binding and the upper edge of the mail bag, substantially as and for the purposes set forth.

No. 22,867.—GEORGE W. B. GEDNEY, of New York, N. Y.—*Improvement in Rotary Spading-Machines*.—Patent dated February 8, 1859.—The claim and engraving explain the nature of the invention.

The inventor says: I *claim* a series of spades *e*, which are operated substantially as set forth, so as to descend edgewise into the soil, successively in each other's track, and then to move laterally to detach the slice of soil upon which they operate from the undisturbed land.

I also claim combining an endless series of spades, operating substantially as set forth, with a cam *H*, or its equivalent, that controls their positions by means of spade-handles, or their equivalents, that are connected with the blades of the spades.

I also claim adapting the machine to be moved either end forward, by constructing the device that imparts lateral movement to the spades in such manner that its position may be changed, and that it may be made fast in either position.

No. 22,868.—JAMES C. GILBERT, of Winthrop, Me.—*Improvement in Skirt Hoops*.—Patent dated February 8, 1859.—In the engraving A denotes the hoop, it being composed of a series of stationary spools or abutments *a*, movable abutments *b*, helical springs *c*, and sundry wooden cylinders *d d*, strung on an inelastic cord *e*.

*Claim*.—In connection with the movable spools and springs placed or strung on the cord, a series of stationary abutment blocks *a*, fastened at intervals to the cord, and operating in the manner and for the purpose specified.

No. 22,869.—JOHN A. GOEWEY, of Albany, N. Y.—*Improvement in Padlocks*.—Patent dated February 8, 1859.—The upper tumbler E has its under side cut out so that the key does not operate upon it until it strikes the face *d*<sup>2</sup>; it is held up by the spring *d*<sup>1</sup>; it has also another spring F, working under the point *e*<sup>1</sup>, for the purpose of throwing out the shackle B when the tumblers are down. The stump G is fastened to the lower tumbler D, and prevents the upper tumbler E from being forced back until the lower tumbler is raised to a sufficient height to release it.

*Claim*.—The combination of the tumbler E, having attached to it the spring F, with the tumbler D, having attached to it the stump G, when arranged and operated in the manner set forth.

No. 22,870.—HENRY J. HALE, of Indianapolis, Ind.—*Improvement in the Arms of Broadcast Seeding-Machines*.—Patent dated February 8, 1859.—In this invention the arm has an extension beyond the slide C, which is hinged at D, and adjusted and held at any desired angle of elevation or depression by means of the slotted segments and set screws E E.

*Claim*.—The combination and arrangement of the segments E E and hinge D, when constructed and arranged as and for the purposes set forth.

No. 22,871.—SAMUEL HICKOK, of Buffalo, N. Y.—*Improved Refrigerator*.—Patent dated February 8, 1859.—The nature of this invention relates to the construction and use of a cold water tank and tube, for receiving, holding, and distributing into each apartment of the case a stratum of cold water.

*Claim*.—The combination of the tube B, arranged as shown, with the tank A, when combined with the case G G G, for the purposes substantially as described.

No. 22,872.—JOSEPH S. HOARD and VALOROUS O. SPENCER, of Mansfield, Pa.—*Improved Door-Latch*.—Patent dated February 8, 1859.—The nature of this invention is explained by the claim and engraving.

The inventors say: We *claim*, first, the combination of the key with the flange *h* and plate H, by which the key is made to operate as a detent to prevent the return of the plate H, which covers the outer key-hole, as set forth.

Second. The combination of the stop *j* upon the bolt with the key in such manner that, when the key is in the position represented in figures 3 and 5, the stop *j* will strike against the key and prevent the return of the bolt.

Third. The stop *i*, on the flange *h*, when combined with the key in the manner described, to prevent said key from being turned too far, as stated.

No. 22,873.—ALBION P. HOWARD and ALLEN ROWE, Jr., of Stoneham, Mass.—*Improvement in Sole-Cutting Machines*.—Patent dated February 8, 1859.—The claim and engravings explain the nature of this invention.

The inventors say: What we *claim* is arranging the sole-cutter on the lower end of and at right angles to a vertical shaft, and combining with such mechanism, not only for elevating and depressing such shaft in the line of its axis, but mechanism for producing successive semi-rotations of such shaft and cutter, the same operating so as to carry the sole-cutter toward and away from the bed, and to give to such cutter an intermittent rotary motion, in the manner and for the purpose specified.

And in combination with the mechanism for elevating and depressing the cutter, and that for rotating it under an arrangement of the said cutter, with respect to its shaft, as specified, we claim the guide-tooth *y* and the clutch recesses *x x*, arranged to operate in the manner and for the purpose as set forth.

We do not claim the combination of a sole-bender with a sole-cutter, unprovided with a sole-discharger, as such is found in the United States patent No. 11,147.

But we claim the combination and arrangement of the concave sole-discharger and the convex sole-former or bender with the cutter, and so as to operate together, in the manner and for the purpose specified.

No. 22,874.—GILBERT L. HUDSON, of Conneaut, Ohio.—*Improvement in Door-Springs*.—Patent dated February 8, 1859.—The nature of this invention, as an improvement for a gate and door closer, consists in a standard A, coil-spring B, stirrup C, crotch-lever D, connecting wire E and the connecting link F to the gate or door G.

*Claim*.—The use of the standard A, coil-spring B, stirrup C, crotch-lever D, connected

with rod F, link F, as operating *vice versa*, to the gate or the door G; the whole arranged and connected, and operating substantially in the manner and for the purpose set forth.

No. 22,875.—FREDERICK HULL, of Derby, Conn.—*Improvement in Ladies' Hoop Skirts*.—Patent dated February 8, 1859.—This invention consists in arranging the bustle springs so that the ends of the springs are brought near to and in contact with the upper hoop, while the end of each successive spring, from the upper to the lower one of the series constituting the bustle, is attached to the skirt further back from the front than the one next above, and in connecting the bustle thus arranged, by means of the skirt-tapes, with a waistband H, so constructed and arranged as to be capable of being contracted and expanded both at the back and front.

*Claim*.—The combination of the sloping bustle springs with the waistband, adjustable at the back and front, the whole arranged substantially as described, whereby the adjustment of the bustle is effected by the waistband alone.

No. 22,876.—MARSHAL INGERSOLL, of Grafton, Ohio.—*Improved Surveying Instrument for Determining Inaccessible Heights and Distances*.—Patent dated February 8, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim* the construction of a surveying instrument for taking distances and altitudes upon the general principle set forth in the description and specification.

I claim, especially, the arrangement of the three sights E F G, or their telescopic equivalents, one of which is adjustable upon a scale, by which means, and the adjustment of a target having the same horizontal scale, the distance of any object within the range of vision can be determined.

In this claim I do not intend to confine myself to the precise arrangement set forth, but to use a telescope in which a similar adjustment of hair-sights (or filaments of silk) are provided for upon a definite scale, as set forth; neither do I intend to confine myself to any particular scale, but to adopt a decimal scale, or any other that I may see fit.

I also claim, especially, a horizontal target, having marked upon it a scale corresponding to that of the accompanying instrument, which target is to be used in connection therewith, as described, the same forming a part of my invention.

I further claim the scale of altitude, in combination with the scale of distance to be used, in the manner and for the purpose specified.

No. 22,877.—AUGUSTUS JOUAN, of San Francisco, Cal.—*Improved Deep Sea Sounding Apparatus*.—Patent dated February 8, 1859.—A description of this invention is too long for a place in this report. The reader is referred to the specification and drawings.

The inventor says: I do not claim the external form of the instrument; neither the mode of calculating the depth by the time of submersion; neither that, as set forth, for testing the highest pressure.

I *claim* the combination and arrangement of the several essential devices described, operating in the manner and for the purposes set forth.

No. 22,878.—FREDERIC KUHLMANN, of Paris, France.—*Improvements in Methods of Varnishing and Protecting Surfaces*.—Patent dated February 8, 1859.—This invention relates to a new process for printing, painting, and dressing, on walls or fibrous and textile surfaces.

The inventor says: I *claim*, first, the process described of fixing the surfaces of fabrics (fibrous or textile) or solid surfaces, as walls or masonry, by the application of a weak solution of an alkaline silicate, as the silicate of potash and soda, to said paint basis.

Second. I also claim, for a similar purpose, the method described of laying a coating of artificial leather, produced as set forth, over the surface of the basis pigment.

Third. I also claim the described method of fixing and rendering printed papers and fabrics water-proof, and fixing the same by hot calendaring.

Fourth. I also claim the described method of rendering the surface of plaster of Paris water-proof, and of preserving the same by forming a coating of artificial sulphate of baryta upon said surface.

No. 22,879.—RUFUS LAPHAM and RILEY P. WILSON, of New York, N. Y.—*Improved Churn*.—Patent dated February 8, 1859.—The nature of this invention consists in churning butter, by means of the combined action of compressed or expanded atmosphere and agitation in an air-tight vessel.

*Claim*.—The use of an exhausting or condensing pump, in connection with the cream reservoir, as set forth, for the purpose of forcing air upon the upper surface of the cream or withdrawing it from it, in the manner described and for the purpose set forth.

No. 22,880.—C. V. LITTLEPAGE, of Austin, Tex.—*Improved Water Wheel*.—Patent dated February 8, 1859.—This is an improvement in horizontal water wheels, which are provided with curved buckets, and placed over a spiral water passage into which the water passes

from the penstock, and acts upon these buckets as it passes through them, the water being discharged at the outer ends of the buckets above the spiral water passage.

The inventor says: I do not claim, separately, the curved buckets *f*.

But I *claim* the wheel *G*, provided with curved buckets *f*, and attached to the shaft *E*, stepped in the block *D*, and otherwise arranged as shown, in connection with the spiral water passage *C*, in the block or bed *D*, the whole being arranged to operate as and for the purpose set forth.

No. 22,881.—JAMES A. LOWE, of New York, N. Y.—*Improvement in Gunlocks*.—Patent dated February 8, 1859.—The cock *A* is connected to the trigger *C* by the link *L*, which has the rule joint *E* at or near the middle, the pivot of which joint passing slightly beyond the line drawn through the pivots of connection on the cock and the trigger forms a set joint, which enables the link *L* to act as one piece until the cock is raised so that the pivots on each end of the link are on a line with the pivot on which the trigger moves.

*Claim*.—The rule joint, or its equivalent, in the link, substantially as described and for the purpose set forth.

No. 22,882.—LUCIUS LYMAN, JAMES P. HODGKINS, and EDMUND RAWSON, of Carthage, N. Y.—*Improved Machine for Riving Staves from the Block*.—Patent dated February 8, 1859.—The object of this invention is to obtain gauges that will rise and fall simultaneously with the knife, in order to perform their proper function without interfering with the operation of the knife, and at the same time admit of being set with facility for the purpose of cutting "stuff" of various thicknesses.

The inventors say: We *claim*, first, having the tube *j*, of the rod or gauge *o*, fitted in blocks *k*, which are adjusted by the screws *l m*, or their equivalent, for the purpose specified.

Second. Placing the rod or gauge *o*, in tube *j*, in the lower end of which spring *p* is placed, and on which springs the rod *o* rests, for the purpose set forth.

No. 22,883.—JOHN F. MASCHER, of Philadelphia, Pa.—*Improvement in Alarm Clocks*.—Patent dated February 8, 1859.—The nature of this invention consists in applying a ratchet or other shaped pinion wheel *A* to the arbor of one of the wheels of the running part of a clock. The clock so constructed is designed to be used for the purpose of timing and starting passenger-railroad cars, omnibuses, &c.

*Claim*.—The application of the rack, pinion, and snail, in the manner set forth, to the running part of a clock or watch, for the use and purpose described.

No. 22,884.—JOHN MAY, of Columbus, Ga.—*Improved Paddle-Wheel*.—Patent dated February 8, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—So applying and arranging a frame *I* outside of the wheel, and in combination with the axle, or centre *H*, on which the floats rotate, or its equivalent, that the said frame may be turned about the wheel, and by being so turned will change the position of the said axle, or centre *H*, or its equivalent, relatively to the centre of the drum, and thereby cause the floats to be projected from the drum, in such positions relatively to the axis thereof, as may be desired, substantially as and for the purpose set forth.

No. 22,885.—WILLIAM K. MILLER, of Canton, Ohio.—*Improvement in Harvesters*.—Patent dated February 8, 1859.—This invention relates, first, to the manner of connecting the finger bar to the frame of the machine through the intervention of a rock shaft, so that it may swing up, over, or underneath said frame; and secondly, to an adjustable hinge plate, at or near the point of connection between the finger bar and the braces.

The inventor says: I *claim*, first, the combination of the braces and rocking bar, substantially as and for the purpose set forth.

I also claim the adjustable hinge plate *K*, for the purpose described.

And finally, I claim the combination of the shoe hinge plate, braces, and rocking bar, substantially in the manner and for the purposes described.

No. 22,886.—NELSON W. NORTHRUP, of Greene, N. Y.—*Improvement in Stoves*.—Patent dated February 8, 1859.—The nature of this invention consists in the peculiar construction and application of the coal box, or drawer, and the manner of adjusting it with keys; also the front fire plate used instead of doors, in the usual way, and of extending the partition, or division plates between the ovens, for the purpose of equalizing the heat upon the upper oven.

*Claim*.—In a stove constructed as described, the combination and arrangement of the partition *K*, with the flues *H H*, and dampers *I I*, in the manner and for the purpose specified.

No. 22,887.—WASHINGTON ABRAM PEASLEE, of Indianapolis, Ind.—*Improved Soot and Spark Arrester*.—Patent dated February 8, 1859.—The inventor says: When this invention is placed upon a stove, and the heated current, or smoke, is passed into the flue *E* and wall

G, forming a curve at the bottom of the wall G, it passes up between the walls G and D over the wall D, and passing down under the wall F it rises between the wall F and the casing, or outer wall C, passing under the wall A over the wall Q, and out at the flue B. The force of the current, or draft, is regulated by operating the windlass P, thereby increasing or lessening the passage between the plate L, and wall A or D, and the bottom of the case C.

*Claim.*—The combination and arrangement of the cap L, rod H, walls G F and Q, with the case, or outer wall C, flues B and E, and wall D, when constructed, arranged, and operated, substantially in the manner and for the purposes set forth.

No. 22,888.—HENRY PEMBERTON, of East Tarentum, Pa.—*Improvement in the Process of Manufacturing Caustic Alkalies.*—Patent dated February 8, 1859.—The inventor says: By my invention I have entirely surmounted the obstacles to the successful use of filtration for the separation of the caustic soda from the residuum of carbonate of lime. This is accomplished by pouring the solution of soda, after it is mixed with the hydrate of lime, through a filter made of bricks or tiles of fire clay, or other similar material.

*Claim.*—The mode described of separating the solution of caustic soda or other caustic alkaline liquid, from an insoluble precipitate, by the use of a filter, constructed substantially in the manner described.

No. 22,889.—JOSEPH A. PERLEY, of Lynn, Mass.—*Improvement in Heel and Spoke Shaves.*—Patent dated February 8, 1859.—This invention consists in forging the blade of two shanks in one piece, and in applying to said shanks, beveled in a peculiar manner, an adjustable gauge, thus making the gauge adjustable to the knife.

*Claim.*—The combination and arrangement of the adjustable gauge C, and beveled shanks A A, substantially as described, so that the gauge may be moved in a plane but slightly inclined to the convex side of the knife toward the edge or from it, for the object specified.

No. 22,890.—N. B. PRATT, of Deep River, Conn.—*Improved Carpet Sweeper.*—Patent dated February 8, 1859.—This invention consists in the use of a rotating brush cylinder, formed in two parts, and placed loosely on a stationary rod within a suitable box or case, the bottom of which is formed of yielding or elastic flaps or aprons, the edges of the aprons bearing upon the floor or carpet.

*Claim.*—The arrangement of the bearings of the friction driving rollers *e e*, in oblong slots *g g*, of the box A, and the rollers *d d*, in the specified relation to the ends of the revolving broom or brush, substantially as and for the purpose set forth.

No. 22,891.—F. A. REDINGTON and GEORGE McCLUER, of Fredonia, N. Y.—*Improvement in the Manufacture of Cheese.*—Patent dated February 8, 1859.—This invention consists in the employment of a boiler, hot water box, hot water reserve box, and suitable water pipes connected therewith and with the boiler, and used in connection with a six-way cock and milk pan or vat, whereby the milk in the vat may be heated to the proper temperature, and the temperature checked when at the proper height.

*Claim.*—I claim the combination of the water box A, milk vat B, the reserve water box G, boiler E, pipes *g h j k*, and the six-way cock F, arranged to operate substantially as and for the purpose set forth.

No. 22,892.—DAVID REYNOLDS, of Ogden, Ind.—*Improved Device for Preventing Tremulous Vibration of Saw Gates.*—Patent dated February 8, 1859.—The nature of this invention consists in securing to the frame work, in which the saw sash is worked, a straight bar of wood, iron, or other metal, as near the saw as possible, and near the middle of the lower part of the sash, and passing through boxing which fits it accurately.

*Claim.*—Combining the guide bar D and boxing E, with the sash saw and fender posts, for the purpose set forth and substantially as described.

No. 22,893.—ALBERT W. ROBERTS, of Hartford, Conn.—*Improvement in Machines for Stretching Leather.*—Patent dated February 8, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the constructing of the jaws B of leather stretchers, with ways for the wedges E to slide on, that the wedges may be so relieved from the leather when drawn back that the leather can be put in without removing the wedge from the jaw.

I also claim making the frames of hollow tubes A, on which the jaws slide, and also the application of steam to said frame, for drying purposes. Also the shaft and gears for throwing back the wedge, all of which is set forth and described.

No. 22,894.—WILLIAM N. ROWE, of Sharpsburgh, Md.—*Improvement in Corn Huskers.*—Patent dated February 8, 1859.—The nature of this invention consists in so arranging the parts of the machine that the ears of corn in the husk when presented to it may have their

butt, or stalk ends cut off, and then be received within it, stripped of their husks, and be discharged clean at the rear end.

*Claim.*—The combination of the adjustable plate K, armed with spikes, with the endless apron I, and knives D and E, when these several parts are constructed, arranged, and operated in the manner described for the purposes specified.

No. 22,895.—N. C. SANFORD, of Meriden, Conn.—*Improvement in Skates.*—Patent dated February 8, 1859.—In this invention the runner of the skate is attached to the stock by means of elliptic or other shaped springs, for the purpose of giving elasticity to the stock, and connecting the stock and runner durably together.

*Claim.*—Attaching the runner *b*, of the skate to its stock *a*, by means of the spring *c c*, substantially as and for the purpose set forth.

No. 22,896.—SILAS T. SAVAGE, of Albany, N. Y.—*Improvement in Cast-Iron Pavement.*—Patent dated February 8, 1859.—This invention consists in a method of connecting or combining polygonal, or circular blocks to form a continuous cast-iron pavement, by means of dovetails upon the said blocks, and locking pieces of peculiar construction fitting between said blocks and into the dovetails thereon.

*Claim.*—Combining the blocks by the peculiarly arranged dovetails cast on the blocks, and the locking pieces composed of heads and feet fitting between the blocks and into their dovetails, substantially as described.

No. 22,897.—WILLIAM SIMS, of Dayton, Ohio.—*Improved Refrigerator.*—Patent dated February 8, 1859.—The object of this improvement is to freely carry off all septic gases without producing a wasteful circulation of air in the portion of the refrigerator in which the ice and articles to be preserved are placed.

*Claim.*—The described arrangement of the ventilating passages E and F, communicating with the upper part of a receptacle C, in the lower part of which are placed ice and articles to be cooled or preserved, and in whose lower part the circulation of air is avoided, in the manner and for the purpose set forth.

No. 22,898.—JEREMIAH P. SMITH, of Hummelstown, Pa.—*Improvement in Corn Shellers.*—Patent dated February 8, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—The arrangement of the groups of short teeth *f f*, alternating with the smooth space *d*, which is provided with raised ribs, in combination with the sharp-edged teeth *h* (with curved or straight edges), when arranged circularly in lines parallel with the axis of the wheel, and operating in connection with the ear-holder D so as to act on the ears of corn nearly lengthwise thereof, substantially in the manner and for the purposes specified.

No. 22,899.—JOEL SMITH, of Northbridge, Mass.—*Improvement in Regulating the Twist in Throstle-Frames.*—Patent dated February 8, 1859.—The nature of this improved mode of regulating, graduating, and equalizing the twist of yarn or ring-traveller spinning frames, consists in communicating a gradually accelerated motion to the delivering rollers by means of a gradually expanding pulley, arranged to increase the speed of the rollers which yield the slivers to form the yarn spun.

*Claim.*—The expanding pulley D, arranged to operate as described, for the purpose set forth in the specification.

No. 22,900.—JOHN B. STONER, of Bennington, Ill.—*Improvement in Grain Weighers.*—Patent dated February 8, 1859.—This invention is designed to be used on all occasions where it is desirable to ascertain the quantity of grain passed from one spot or locality to another, as in transferring it from a storehouse to a vessel, a barn to a wagon, &c.

The inventor says: I *claim*, first, the rotary hopper, constructed and operating substantially as described.

Second. I claim suspending the rotary hopper upon the lever or scale arms, as set forth.

Third. I claim the arrangement of means described for operating and controlling the valve or door to the chute of the stationary hopper.

Fourth. I claim operating the indicators by means deriving their motions from the weighted end of the scale arms, in combination with the springs or their equivalents, as described.

Fifth. In combination with the suspending of the rotating hopper as described, I claim the suspending of the weight as described.

No. 22,901.—JOHN TEMPLE, of Middletown, Ohio, assignor to TEMPLE, MILLS, & STOUT, of said Middletown.—*Improved Sluice for Water Wheels.*—Patent dated February 8, 1859.—This invention relates to a construction of scroll sluice gates, whereby the feed passages while retaining their ratio of conveyance may be expanded or contracted with facility and accuracy under any head of water.

*Claim.*—The winged gates B C, constructed, arranged, and operating in combination with a series of scroll shutes A, substantially in the manner and for the purpose set forth.

No. 22,902.—JOHN TEMPLE, of Middletown, Ohio, assignor to TEMPLE, MILLS, & STOUT, of said Middletown.—*Improvement in Water Wheels.*—Patent dated February 8, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—The construction and arrangement in central discharge water wheels of buckets E, which have the described compound cyma-reversa and downward and outward curve, whereby the water acts on the wheel by percussion, reaction, and gravitation, and escapes freely without back action, as set forth.

No. 22,903.—WEBSTER THOMAS, of Oxford, Ohio.—*Improved Machine for Tenoning Spokes.*—Patent dated February 8, 1859.—Beneath the cutter *d* is the bed I, resting upon a fulcrum piece, so as to possess the power of rocking, and thus adjusting itself to the inclination of the lower edge of the spoke for cutting the shoulder to the desired disk of the wheel T is the support point of the spoke whose elevation is regulated by the wedge V to the required disk of the wheel. The bed B is attached and regulated in inclination by the support T and the wedge V. The cutters *e e*, operate in connection with this bed for cutting the square shoulder after the tenon has been formed by the lower cutter *d*.

*Claim.*—The combination of the beds I and B, constructed as described, with the support pieces T, the wedge V, and the double series of cutters *d e*, in the same cutter bearer, the construction and operation being as described.

No. 22,904.—DANIEL M. TRUE, of Rockland, Maine.—*Improvement in Lasts.*—Patent dated February 8, 1859.—This invention consists in arranging within the last block a bolt which passes into the last diagonally with the face of the block, thereby preventing the block from rising or slipping from its place.

*Claim.*—As a fastening for last blocks the bolt *a*, when formed with the notches *f* and *g*, and combined and arranged with the spring *b*, the pin *c*, and last hook hole *e*.

No. 22,905.—JOHN WALCH, of New York, N. Y.—*Improvement in Revolving Fire-Arms.*—Patent dated February 8, 1859.—The nature of this invention consists in constructing a revolving chamber, with two ranges of nipples connecting with the middle and rear part of the breeches, in combination with double hammers so fitting and acting that upon pulling the trigger the hammers fall, the one before the other, and explode the caps upon the nipples, that fire in succession charges contained in the forward and rear parts of each breech.

*Claim.*—The revolving chambers or breeches fitted with two ranges of nipples, and firing the respective charges in succession, substantially as specified.

No. 22,906.—AUGUSTUS WATSON, of Walnut Run, Ohio.—*Improvement in Underground Drain Ploughs.*—Patent dated February 8, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—So hanging a coulter C, to which a mole is attached as that by revolving a key, or its equivalent, that restrains said coulter, and by advancing the plough, said coulter and mole will run out of the ground, substantially as described and represented.

No. 22,907.—A. H. WEBSTER, of Hudson, N. Y.—*Improvement in Apparatus for supplying Hydro-Carbons with Oxygen.*—Patent dated February 8, 1859.—This invention is designed for supplying, by mechanical means, coal tar, naphtha, benzole, and other hydro-carbons, with a necessary amount of oxygen to support proper combustion for illuminating purposes, in such a regular manner that a steady flame will be produced without the least flicker.

*Claim.*—The bellows B actuated by the tappit-wheels D and attached to the chest C, provided with a cover or weight *d*, and an eduction opening *e*, combined and arranged to operate as and for the purpose set forth.

No. 22,908.—WILLIAM L. WEST, of Elmira, N. Y.—*Improvement in Bee-Hives.*—Patent dated February 8, 1859.—The inventor says: I attach an elliptic-spring *d* to the outer side of each section, at or near the centre. This spring is made large enough to press against the inner side of the case when the sections are shrunk to their smallest dimensions, and exert a constant pressure, which serves to keep the movable partitions F F in contact at all times.

*Claim.*—The use of the opposing springs *d d* for the purpose of insuring a contact of the parts contiguous to the passage-way *c*, substantially as described.

No. 22,909.—SYLVANUS A. WHEAT, of Franklin, N. Y.—*Improved Apparatus for Drawing Water.*—Patent dated February 8, 1859.—This invention consists in constructing a bucket so as to fill and empty from the bottom; also in constructing a windlass so as to wind the rope upon the barrel without a tendency to overlap the preceding coil.

*Claim.*—Giving the barrel a longitudinal motion on the shaft, also connecting the valve to the rope by the rod, substantially for the purpose described.

No. 22,910.—THOMAS WILLIAMS and WILLIAM C. JOSLYN, of Fisherville, Conn.—*Improved Ellipsograph*.—Patent dated February 8, 1859.—This invention consists in having a slotted bar supported by legs, and a slide fitted into the slot, the slide having the axis of a circular disk passing through it, to the lower end of which axis a bar is attached, carrying an adjustable pencil stock. The disk is perforated with holes, in any of which the pin of an arm, which is pivoted to the slotted bar, may be fitted.

*Claim*.—The slotted bar A provided with the slide B, the arbor *c* passing through the slide B with the disk C and slotted bar D attached, and the elastic bar G pivoted to the bar A, and connected eccentrically with the disk C the bar D having the pencil stock E attached, and the whole arranged substantially as and for the purpose set forth.

No. 22,911.—JOHN P. WILSON, of Frankfort, and JOHN F. THOMAS, of Ilion, N. Y.—*Improvement in Burglar's Alarm*.—Patent dated February 8, 1859.—The claim and engravings explain the nature of this invention.

The inventors say: We do not claim securing the alarm by means of a screw to the casing of the door, or the use of fire-arms *a* as a means of alarm and defence in cases of attempted robbery.

But we claim, first, the employment, in connection with the described gun-alarm, of an adjustable gimlet-screw D which is secured in a dovetailed groove in the body while in use, and which is secured in the barrel or bore by a screw when not in use, substantially as is set forth.

Second. The employment of the two sides A<sup>1</sup> A<sup>1</sup> between which the hammer falls, which serve to prevent particles of the cap from flying off, and at the same time forming a snug protection for the hammer, and causing a louder report of the cap, as is fully set forth.

No. 22,912.—THOMAS K. WORK, of Hartford, Conn.—*Improved Odometer*.—Patent dated February 8, 1859.—This improvement is intended to prevent any inaccuracy in the registration of distances, by the jolting of the weight, when the vehicle passes over uneven roads.

*Claim*.—The curved or segment weight *m* pivoted to the arm *l* which is attached to the pinion *e*<sup>1</sup>, and fitted between the annular ledges *n o*, substantially as and for the purpose set forth.

No. 22,913.—FREDERICK YEISER, of Lexington, Ky.—*Improved Instrument for taking Altitudes of the Sun*.—Patent dated February 8, 1859.—This invention consists in determining the plane of the meridian at any time in the forenoon, or afternoon, by means of a spirally slotted cylinder, which is attached to a horizontal rotary frame in such a relation to a vertical pin, and to a line which is strongly defined on the upper surface of the frame, and which is provided with a toothed sector gearing into cogs on the top of a stationary disk in such a manner that when this cylinder is placed in such a position that when the ray of the sun passes through the inner end of the spiral slot, and the frame is slowly rotated on its axis, the ray of the sun ceases to pass through said spiral slot at the moment when the plane, which is determined by the above named vertical pin, and by the strongly defined line on the upper surface of the rotary frame, coincides with the plane of the meridian.

The inventor says: I *claim* the arrangement of the spirally slotted cylinder L on a rotary frame E, in such relation to a pin G and to a strongly defined line 3 4, that it operates substantially as and for the purposes specified.

And in combination with the rotary frame E, I also claim operating the cylinder L, by means of a toothed sector I, which gears into cogs J, attached to the stationary disk C, in the manner and for the purpose substantially as described.

No. 22,914.—JOHN K. BIGELOW, of Waltham, Mass., assignor to APPLETON, TRACY & Co., of said Waltham.—*Improved Mechanism for Stopping Watches*.—Patent dated February 8, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim* a peculiar mode of making the ratchet, viz., with trapezoidal teeth, and with a notch in each of them, as described and represented.

I also claim the arrangement or application of the stop-lever E with respect to the stopping stud and the ratchet, so as to serve not only as a carrier and actuator of the former, but as a stop to the latter under the circumstances specified.

No. 22,915.—MICHAEL BOYER, of Germantown, Ohio, assignor to CHARLES S. ROHNER and WILLIAM GUNCKEL, of said Germantown, Ohio.—*Improvement in Seed Drills*.—Patent dated February 8, 1859.—The object of this invention is to enable the discharge spouts of seeding machines to pass over firm obstructions without injury to themselves or the machine. When one of these spouts is drawn back by any obstacle in the passage of the machine the spring is acted upon, and the moment the spout passes the obstacle the spring draws the spout forward to its proper position.

*Claim*.—Arranging the spring C, ratchet-wheel *b*, ratchet *a*, link D, drag-bar A, arm E, and discharge-spout B, substantially in the manner and for the purpose specified.

No. 22,916.—JOHN N. DENNISON, of Newark, N. J., assignor to Himself, JOSEPH DENNISON, and DAVID BAKER, of said Newark.—*Improvement in Steam Condensers*.—Patent dated February 8, 1859.—The nature of this invention consists in providing for the escape of the air, gas, and steam.

When the plunger in the pump K rises and the water follows it in the barrel of the pump, the water will also rise up the pipe g.

*Claim*.—A feed-pump with its attachments and connections, substantially as described, in combination with a condenser, constructed and arranged as set forth.

No. 22,917.—E. B. HALL, of Woodbury, N. J., assignor to Himself and JOSEPH C. FARLEY, of Pine Grove, N. J.—*Improvement in Stump Extractors*.—Patent dated February 8, 1859.—This invention consists in the combination of a cam of peculiar construction with two sliding rods, having rollers against which the cam operates, and two hooks, the whole of the parts being arranged in respect to each other so that a stump may be extracted by a continuous rotation of the single cam.

The inventor says: I am aware that in the stump extractor, for which letters patent were granted to Jason S. Wood, on the 3d February, 1857, cams, in conjunction with other appliances, are used. I, therefore, do not claim broadly such a device, but I *claim*, as an improvement, on the patent of J. S. Wood, the cam J, when constructed in the peculiar manner herein described, in combination with the rods G and G<sup>1</sup>, their respective rollers and hooks K and K<sup>1</sup>, the whole of the above parts being arranged in respect to each other for joint action, substantially as set forth.

No. 22,918.—PETER HOFFNER, of Rising Sun, Ind., assignor to Himself and SAMUEL F. COVINGTON, of Indianapolis, Ind.—*Improved Die for Cutting Screws*.—Patent dated February 8, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—The construction of a solid die, in which the bottom of the groove is so thrown up in the rear of the cutting point or edge of the same as to avoid the friction occasioned by the rubbing upon the top of the thread of the bolt cut or threaded.

No. 22,919.—GEORGE HINMAN, of New Haven, Conn., assignor to Himself and CHARLES MONSON, of said New Haven.—*Improved Knife Sharpener*.—Patent dated February 8, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I am aware that cutting edges set at different angles have been used for knife sharpeners for many years, but in all such cases the angle varied as the cutting edges were more or less separated at the upper ends. I therefore do not claim a knife sharpener made of two pieces of steel, with the edges fitted to abrade the sides of the edge of the knife, as such, as my invention.

But I *claim* the use of the two cutters (B and C) when made susceptible of being adjusted to any desired angle, by means of a slot while using any portion of the length of the cutting edges, and the whole is constructed and made to operate, substantially, as described.

Second. I also claim the rest D, in combination with the adjustable cutters B and C, when the whole is constructed and fitted for use, substantially as described.

No. 22,920.—WILLIAM LEACH, of Clarkson, N. Y., assignor to Himself and GEORGE P. TISDALE, of Chili, N. Y.—*Improvement in Self-acting Cheese Press*.—Patent dated February 8, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I do not claim simply a self-acting press, but I *claim* the pitman D D, arranged substantially as described, in combination with the pairs of cross levers B B so as to keep said cross levers at equal heights at opposite ends of the press, and consequently at the same relative angle to the table A, in all positions, for the purpose of securing uniformity of pressure upon all parts of the articles pressed.

I also claim the combination of the rod l, handle r, and pawls m, mounted in one pair of cross levers B B, with the notches o o o, or their equivalents, in the other pair of cross levers, arranged and operating substantially in the manner and for the purpose set forth.

No. 22,921.—HORATIO LEONARD, of New Bedford, Mass., assignor to Himself and H. RYDER, of said New Bedford.—*Improvement in Moulding Paraffine Candles*.—Patent dated February 8, 1859.—The object of this invention is to make a paraffine candle not only with an external surface smooth and free from external cavities, but having a regular semi-lucent, or semi-pellucid appearance.

The inventor says: I do not claim manufacturing candles by means of moulds, but I *claim* in moulding paraffine candles the improved process, substantially as described, the same involving the employment of a heated mould and water and air baths at temperatures and in the manner substantially as mentioned.

No. 22,922.—EDWARD MAYNARD, of Brooklyn, N. Y., assignor to Himself, R. K. SLAUGHTER, and THOMAS E. PURDY, of said Brooklyn.—*Improved Method of Covering with*

*Fibrous Material Submerged Spiral Electrodes for short Distances.*—Patent dated February 8, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—Constructing submarine telegraph cables of metallic conductors, twisted in helical form, in combination with layers of cords or strings, parallel, or nearly so, with the axis of the cable, that are confined together by serving or winding, and are saturated with water-proof non-conducting material, as set forth.

No. 22,923.—LOREN J. WICKS, of Racine, Wis., assignor to Himself and THOMAS BURBECK, of said Racine.—*Improved Boot-Jack.*—Patent dated February 8, 1859.—The arms A and B are pivoted together at *d* in such a manner as to allow them to play freely like a pair of scissors. *a* represents a pin secured to the arm A, against which the rear of arm B strikes when said arms are separated for use as a boot-jack. The arm A is provided at its heel with a hammer, which consists of the head D and claws E, the front end of this arm being so constructed as to form a screwdriver.

*Claim.*—The described boot-jack, as a new article of manufacture, with the tools formed on the rear or front of its arms, said arms being made to open or shut, substantially in the manner specified.

No. 22,924.—GEORGE C. AIKEN, of Nashua, N. H.—*Improvement in Bee-Hives.*—Patent dated February 15, 1859.—In the arrangement of the honey boxes two of them, viz: G G<sup>1</sup>, are larger than the others, and meet together in the middle of the hive, while the other two are disposed at right angles and lap on them. This arrangement of the boxes forms, with the sides *m m* of the hive, four chambers K K K K, for the reception of bell-glasses or tumblers, or separate boxes.

*Claim.*—The arrangement of the boxes G G<sup>1</sup> H H<sup>1</sup> in the hive so as to form, with the case thereof, the auxiliary or bell-glass chambers K K K K, in the manner described.

No. 22,925.—JOSEPH ARMSTRONG, of Woburn, Mass.—*Improvement in the Treatment of Hides and Skins.*—Patent dated February 15, 1859.—The claim explains the nature of this invention.

The inventor says: I *claim* the described improvement on my patented process of treating hides, or, in other words, I claim in combination with the application and use of a press, in connection with the impregnation of the hide with grease, by a peg-lined cylinder, or any equivalent means, the employment of scraps of hide, or other suitable absorbents, in the press, and against the edges and other necessary parts of the hides, so as, during the operation of the press, to absorb the liquor from such edge or parts on or in which it would be likely to remain, as specified.

No. 22,926.—H. H. BAKER, of New Market, N. J.—*Improved Arrangement of the Feed-Roller in Wood Planing Machines.*—Patent dated February 15, 1859.—This invention consists in placing the feeding device under the complete control of the attendant or operator, so that the said device may be thrown in and out of gear with the work without stopping the working parts of the machine.

*Claim.*—Arranging the feed-roller N, substantially as shown, to wit: connecting it with a vibrating shaft K, box L, slide O, spring P, and with the necessary gearing, so that said roller may be kept to the work or moved out free from it without stopping the working or running parts of the machine.

No. 22,927.—FREDERICK H. BARTHOLOMEW, of New York, N. Y.—*Improvement in Hydrants.*—Patent dated February 15, 1859.—The nature of this invention consists in so constructing and arranging the several parts of the hydrant and stop-cock as to afford increased facility for detaching, withdrawing, replacing, repairing, and keeping in order various parts of the same, so as to avoid the necessity of shutting off the water at other places than at the hydrant, or of digging up when repairs or thawing out is required.

The inventor says: First, I *claim* the combination of the valve E with the main valve, and its fixed valve seat C, the whole constructed, arranged, and operating substantially as and for the purposes described.

Second. I claim the arrangement of chamber D, within the trunk of the hydrant surrounding the seat of the main valve, having a waste passage at the bottom, substantially as and for the purposes described.

Third. I claim the arrangement of the waste passage, the waste plug, and rod, in combination, substantially as and for the purposes described.

No. 22,928.—MOSES BALES, of Big Plain, Ohio.—*Improvement in Mole Ploughs.*—Patent dated February 15, 1859.—This invention relates to certain improvements in mole ploughs for subterranean draining, by means of which the operator is enabled to arrange one or more ploughs upon a cutting shaft in such manner as to produce drains at any desired depth from the surface of the ground.

*Claim.*—The adjustable mole ploughs D *d d*<sup>1</sup> *g g*<sup>1</sup> *e*, upon a cutting shaft A, arranged and operating substantially as and for the purposes set forth.

No. 22,929.—CHARLES E. BISHOP, of Brooklyn, N. Y.—*Improvement in Reefing and Furling Sails*.—Patent dated February 15, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim*, first, the employment of supplementary sheets to the topsails and other upper square sails of a vessel, in order that said sails may be kept more "flat," and that the strain upon the ends of the yard may be lessened, as set forth.

Second. I claim constructing topsails in the manner described, that is to say, with supplementary sheets, clew-lines, and lee-ropes, and with a central tackle, by the employment of which in due order, as set forth, the topsail may be reduced and secured in successive portions, substantially as described.

No. 22,930.—ISAAC W. BRAGG, of Cincinnati, Ohio.—*Improved Carpet Stretcher*.—Patent dated February 15, 1859.—This invention relates to a device adapted for attachment at the side of the room toward which the carpet is to be stretched.

The inventor says: I *claim*, first, the dog E c, operating substantially as described, to attach the stretcher to that part of the floor next the wall, toward which the carpet is to be stretched.

Second. The combination and arrangement of the trip lever F, for disengaging the dog, as set forth.

Third. The combination and arrangement of the apron C, feet B, and slides G, operating substantially as described, in combination with the rake H, to prevent the teeth from grazing the floor.

Fourth. The combination and arrangement, substantially as set forth, of the stock A, dog E e, driver H I K, and actuating worm M, operating in the manner and for the purpose explained.

No. 22,931.—JOSEPH H. BRINTON, of West Chester, Pa.—*Improved Method of Operating Yielding Feed Rollers*.—Patent dated February 15, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim* a pair of feed rollers, one of which is yielding, and both driven by the same screw-shaft, and in gear with it at all times, substantially in the manner described.

No. 22,932.—THOMAS W. BROWN, of Boston, Mass.—*Improvement in Skates*.—Patent dated February 15, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the rocker and angular heel or straight-edge runner, made substantially in the manner described, and applied to the bearing plates or their equivalent, so as to be capable of being reversed with respect to the same, and used with either edge downward, as may be desirable.

I also claim the application of the heel plate to the heel screw, so as to be adjustable on, or with reference thereto, substantially in the manner and for the purpose described.

No. 22,933.—JAMES D. BRUNER, of Alton, Ill.—*Improvement in Stoves*.—Patent dated February 15, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim*, first, connecting and arranging with an oven which has no bottom, and between which and the passages of the products of combustion there is no communication, and the fire-box of the stove, air chambers or cells, as and for the purposes set forth.

Second. Combining with a detachable grate surface the detachable air cells or chambers, as described.

No. 22,934.—S. S. BURLINGAME, of Warwick, R. I.—*Improvement in Instruments for Threading Needles*.—Patent dated February 15, 1859.—This instrument is made of a thin flat piece of steel, of a width not greater than the length of the eyes of the needles for which it is to be used, having one end curled as shown at *a*, or otherwise formed so that it can conveniently be held between the thumb and fingers, but having the whole remaining portion straight and its opposite end in the form of a fork, whose prongs *b b* are provided with barbs *c c*.

*Claim*.—The needle-threader, consisting of an internally barbed elastic pronged fork, substantially as described.

No. 22,935.—ADAM SCOTT CAMERON, of New York, N. Y.—*Improved Cut-off Valve for Steam-Engines*.—Patent dated February 15, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim* the employment of the trip hinged valves, with their hook rods *k l*, and appendages for operating them, or the equivalents thereof, in combination with the side valve *b*, substantially as described, for cutting off the steam in steam-engines, as described.

I also claim, in combination with the slide and the trip hinged valve, operated substantially

as described, the so forming of the seat *c* of the slide valve relatively to the steam passages in the slide valve, as to admit the steam to the under face of the hinged valve and balance the pressure before they are opened, as set forth.

I also claim, in combination with the slide and trip hinge valves, combined and operating substantially as described, the employment of the adjustable cone, or its equivalent, to regulate the period of cutting off the steam, as described.

And I also claim the cone, or its equivalent, in combination with the eccentric tube, or its equivalent, substantially as described, as a means of adjusting the relative periods of closing the two valves, as set forth.

No. 22,936.—DANIEL CLOW, of Janesville, Wis.—*Improvement in Harvesters*.—Patent dated February 15, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I claim constructing the main supporting wheel thereof in such a manner as to form therein an outer and an inner zigzag groove, but this I only claim when the said grooves have differently proportioned reaches, and bear such a relation to the T-headed sliding bar *n*, and the other parts of the machine which are connected with said bar and with the cutting apparatus, that the number of the movements imparted to the cutter bar *g* can be varied at pleasure by shifting the bearings of the said sliding bar *n* from one position to another, substantially as set forth.

No. 22,937.—HENRY COGSWELL, of Greenwich, N. Y.—*Improvement in Hames*.—Patent dated February 15, 1859.—The nature of this invention consists in applying to the "eye" a movable slide *A*, so constructed that the eye and slide shall form a solid piece, which slide, by means of a screw *B*, can be raised and lowered upon a hame so as to change the point of draft to any desired position.

*Claim*.—I claim the application of the shifting slide, to hames as they are now used, by means of which slide the point and position of the draft of the hames can be altered as desired.

No. 22,938.—BENJAMIN COLE, of Brooklyn, N. Y.—*Improved Pen-Holder*.—Patent dated February 15, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—The construction of a pen-holder with three or more elastic shanks or fingers *b*, so arranged that the spring of said fingers will hold the pen by pressing it against and under the shoulder *c* of two lateral fingers, and thus admit the introduction of, and be adapted to, pens of any ordinary size or thickness.

No. 22,939.—JOHN B. CORNELL, of New York, N. Y.—*Improvement in Fire-Proof Floors*.—Patent dated February 15, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—Constructing a fire-proof foundation upon a series of wooden girders *a a*, for the reception of a flooring surface formed of boards or other suitable materials, substantially as set forth.

No. 22,940.—FREDERICK CURTISS, of Saugus Centre, Mass.—*Improvement in Breech Loading Fire-Arms*.—Patent dated February 15, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: When a breech slide is used in connection with the barrel of a fire-arm, I claim a movable breech, separate from the breech slide, and arranged and applied therein, so as to be adjustable to the rear end of the barrel, substantially in the manner and for the purpose described.

I also claim the arrangement of the priming-nipple and the touch-hole thereof, with respect to the movable adjustable breech *B*<sup>1</sup>, applied to the breech slide *B*, as specified, or with respect to the same, and a primer arranged in the stock, substantially as explained, such arrangement being productive of advantages as before mentioned.

No. 22,941.—AUGUSTUS B. DAVIS, of Philadelphia, Pa.—*Improvement in Railroad Car Springs*.—Patent dated February 15, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I lay no claim to any specific part or any particular device, when viewed as disconnected from the entire spring.

But I claim as a new and useful article of manufacture and merchandise the entire railroad car spring described; that is to say, a spring composed of a box or casing, with a lid attached to the same by means of a bolt or bolts, the said box containing a number of spiral springs confined longitudinally between the bottom of the box and the lid, and retained in their proper position laterally by means of lugs, or other suitable devices, the said lid having a limited movement in the direction of the springs, but having no lateral movement independent of the box, so that each spiral spring may be independent of the other, although the whole act in combination, the entire spring thereby retaining its elasticity, even should one or more of its spiral springs be broken or damaged.

No. 22,942.—JOHN C. F. DEECKEN, of New York, N. Y.—*Improvement in Shoe-Lasts*.—Patent dated February 15, 1859.—The nature of this invention consists in so constructing a last that the wooden pegs of the boot or shoe may be cut conveniently while the boot or shoe is on the last.

The inventor says: I do not limit myself to the particular shape of the endless chain, the wheels, or the knives.

But I *claim* the endless chain or band in combination with a knife or knives, operated in the manner and for the purpose substantially as described.

No. 22,943.—CHARLES DE SAXE, of New York, N. Y.—*Improvement in Umbrella Fastenings*.—Patent dated February 15, 1859.—This invention consists in such an arrangement of parts that the two parts of the rods may be easily extended or shut together, and such that when extended they may be firmly and quickly fastened together; and also in having a tube or socket attached to the ends of the two parts of the rod, which tubes or sockets are hinged together by a solid hinge, one of the tubes having a sliding or revolving bolt, working into the other tube.

*Claim*.—The arrangement of the bolt *a*, substantially as described, operating without springs, and by a double or sliding and rotating motion in combination with the tubes or sockets B B, for the purposes set forth.

No. 22,944.—MARTIN D. ELSOM, of Howardsville, Va.—*Improvement in the Mode of Squeezing and Straightening Tobacco*.—Patent dated February 15, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—Squeezing and straightening bundles of tobacco, with a view of their being afterwards “struck” by passing them through a straightening and compressing mechanism, substantially such as represented.

No. 22,945.—JOHN U. FIESTER, of Winchester, Ohio.—*Improved Churn*.—Patent dated February 15, 1859.—A is the tub in which the milk is put, B the lid or cover, C the shaft or spindle, F the cross tie attached to the spindle, D the dasher blades, E a yoke attaching the dasher blades to the spindle, *c* is the crank, *d* are beveled mortices cut partly through the dashers, and serve to retain a portion of the atmosphere during the downward motion of the dashers, which is thus carried down to the bottom of the milk, *e* is a journal box, *f* holes in the dashers for the cream to pass through and be better agitated.

*Claim*.—The adjustable dasher, constructed with two blades D, yoke spring E, cross tie F, with slots *a*, and pins *b*, together with holes *f*, and air cavities *d*, operating substantially as set forth and described.

No. 22,946.—WILLIAM P. FORD and THEODORE H. FORD, of Concord, N. H.—*Improvement in Cultivator-Teeth*.—Patent dated February 15, 1859.—This invention consists in so forming the front edge of a cultivator-tooth that it shall tend to run into the ground to the required depth, and yet shall not be liable to be clogged; also, in bringing the top of the wings together at a point so low down on the body of the tooth that the surface soil may close back over the path of the tooth and not leave a furrow.

*Claim*.—The described cultivator-teeth, formed substantially as specified.

No. 22,947.—DANIEL P. FOSTER, of Shelburne Falls, Mass.—*Improved Wrench*.—Patent dated February 15, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—Making the hinge-joint between the stationary and movable jaws of the wrench at *a*, viz: by the projections *c* on the stationary jaw and the depression *e* in the washer that is on the shank of the movable jaw, for the purpose of allowing the movable jaw to change its position in relation to the stationary one, as set forth and for the purpose explained.

No. 22,948.—GEORGE GILMOUR, of Chelsea, Mass.—*Improvement in Shackles of Telegraph Cables, &c.*—Patent dated February 15, 1859.—In the engraving, A denotes the frame of the shackle, the same being applied at one end with an eye *a* for suspending the apparatus from a rope. At or within the other end of the frame is a friction drum or roller, arranged in the frame and made to turn on an arbor or pin *b* connecting the two sides *cc* of the frame. At a suitable distance from arbor *b* is another arbor or pin *d*, which also extends through and connects the sides and serves to support one or two turning and sliding jaws C.

The inventor says: I *claim* the telegraph cable or rope shackle, as constructed with one or more jaws, and mechanism to operate the same, substantially as described.

I also claim combining either the wing *l* or the knife *m*, or both, with the shackle, so as to operate therewith in the manner and for the purpose or purposes specified.

No. 22,949.—GEORGE HAMMER, of Philadelphia, Pa.—*Improved Cork Cutting Machine*.—Patent dated February 15, 1859.—This invention relates to that class of machinery for cutting corks in which a revolving cylindrical cutter is employed, and consists in an improved arrangement for guiding and feeding the cork while undergoing the process of cutting.

The inventor says: I do not desire to confine myself to the described construction and combination of the parts in minutiae.

But I *claim* the described arrangement of guiding rollers O and P and sliding wedge S, or their equivalents, in combination with the stop s, the whole being constructed and operating substantially in the manner and for the purpose set forth.

No. 22,950.—GORGES HELY, of Laporte, Ind.—*Improvement in Horse-Power Equalizer*.—Patent dated February 15, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim*, first, connecting the eveners G I by a rope or chain that passes over a pulley at the centre of the shaft A, substantially as described.

I also claim, in combination with the eveners, the method of connecting the points or parts to which the horses are hitched, and by which they draw, by means of a system of ropes or chains and pulleys connected with the draft bars, substantially as described.

No. 22,951.—Cancelled.

No. 22,952.—W. W. HOPKINS, of Amelia, Ohio.—*Improved Method of Lighting Gas by Galvanic Battery*.—Patent dated February 15, 1859.—In this invention a gas burner is combined with an electro-magnetic seat to control the letting on and shutting off the gas; and there is also a certain arrangement of the conducting wires, in which an electro-magnetic valve is placed, by which a piece of platinum, constituting a part of the same circuit, and occupying a position over the burner, is heated by the same action by which the valve is opened, and so ignite the gas.

*Claim*.—The arrangement and combination of the hollow permanent magnet A, valve chamber C, coil F, electro-magnetic valve E, and tube D, as and for the purpose shown and described.

No. 22,953.—MOSES G. HUBBARD, of Penn Yan, N. Y.—*Improvement in Harvesters*.—Patent dated February 15, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim* connecting the cutting apparatus with the machine by an adjustable attachment, which can be changed from a free hinge to a joint, rigid in one direction or in both directions, for the purposes and in the manner substantially as set forth.

I also claim the employment of a raising lever of the second order with a gradually increasing purchase, by which it is made self-sustaining.

And I also claim keeping the lever in a convenient position for the operation by the hand of a driver, by means of a spring, substantially as and for the purpose specified.

No. 22,954.—WILLIAM HUEY, of Christiana, Pa.—*Improvement in Elevators for Window Sashes*.—Patent dated February 15, 1859.—This invention is designed to facilitate the raising and lowering of the sashes and supersede the weights and other appliances that have been previously used.

The inventor says: I *claim* the arrangement and combination of the rods E E, pawls f, ratchets  $d^2$ , loose drums  $c c^1$ , sliding shaft D, pins  $d e$ , and cords  $b b$ , as and for the purpose shown and described.

No. 22,955.—SAMUEL HUSE, of Chicago, Ill.—*Improved Rotary Engine*.—Patent dated February 15, 1859.—The operation of this engine is as follows: Steam enters through the inlet pipe  $h$  to the steam space  $e$ , thence through the holes  $o^1 o$  to the space 8 between the head  $m$  and cam E and behind the valve  $n$ , which happens to be in position to receive the pressure of the steam, by which this valve is driven, in the direction of the arrow on the head  $m$ , and the shaft B is revolved. The steam continues to act on this valve  $n$  until cut off from it by the next valve passing the port  $o$ . The valves are thus acted upon in succession by the steam, and as each one passes the port  $p$  the steam exhausts through this port into the space  $e^2$  on the outside of the cylinder C and thence through the eduction pipe  $i$  as indicated by the arrows.

*Claim*.—The cams E E<sup>2</sup> with their steam and exhaust ports, in combination with the heads  $m m^2$ , pistons  $n n^2$ , and cylinder C, operating in the manner substantially as set forth

No. 22,956.—JOHN JAMESON, of 10 Catharine Terrace, Gateshead, county of Durham, England.—*Improved Apparatus for Compressing Elastic Fluids*.—Patent dated February 15, 1859; patented in England March 13, 1858.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim* the compression and expansion of aeriform fluids by an apparatus of the nature described, the same consisting of a combination and arrangement of a series of cylinders or vessels, perforated or tubular pistons, induction and connecting pipes, valves, a reservoir, a rotary shaft, and means of heating or heating and cooling the cylinders

or vessels, the whole being constructed and made to operate in manner and for the purpose substantially as described.

No. 22,957.—THEODORE T. S. LAIDLEY, of the United States Army.—*Improvement in Tape Primers for Fire-arms.*—Patent dated February 15, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The combination of two different materials in the manufacture of tape primers—one a metal or like substance to receive and protect the percussion powder, into which it can be firmly pressed; and the other to connect the former into a series—something that can be easily severed by the edge of the hammer.

No. 22,958.—RICHARD S. LAWRENCE, of Hartford, Conn.—*Improvement in an Adjustable Sight for Fire-Arms.*—Patent dated February 15, 1859.—The nature of this invention consists in a spring-base *a*, the forward end of which is secured to the barrel with either a stud or a screw. On the rear end of the base spring is constructed a hinge-joint, in connection with an elevator *c*, so as to hold the elevator with the requisite firmness in either a perpendicular or horizontal position.

*Claim.*—The application of said hinge-joint to the spring-base and elevator, constructed and arranged substantially as described.

No. 22,959.—C. A. LILLIENDAHL, of New York, N. Y.—*Burglar's Alarm.*—Patent dated February 15, 1859.—This invention is intended to be applied to a door or window, and when either are interfered with so as to press upon a slide, the slide discharges a cartridge filled with some highly explosive material.

*Claim.*—The arrangement of the slide *C* and plate *A* with the lips *c* and *b*, so that a cartridge placed on the slide and between the two lips is exploded by pushing the slide in, substantially as and for the purpose specified.

No. 22,960.—S. N. LEMMON, of Deposit, N. Y.—*Improvement in Railroad Signal Lanterns.*—Patent dated February 15, 1859.—A signal switch lamp was patented by this inventor July 27, 1858. The present one is an improvement on it, and is designed to simplify, to a considerable extent, the patented article so as to reduce the cost of construction.

*Claim.*—Suspending within the lantern *A* at two opposite sides, and over or behind the colorless glass plates *a a*, the frames *C C*, provided with the colored glass plates *c d*, and arranged as shown, or in an equivalent way, to operate as and for the purpose set forth.

No. 22,961.—CLARK MARSH, of New Millford, Mass.—*Improvement in Sewing Machines.*—Patent dated February 15, 1859.—This invention consists in a gauge applied to or in combination with the slide-ring, by which the bobbin is confined in proper relation to the rotating hook for the purpose of adjusting the ring to permit exactly the amount of play to the bobbin between the face of the hook and the bobbin.

*Claim.*—The ring-gauge *D E*, with the pins *c c c*, spring *d* and cam *e*, or their equivalents, constructed or applied in combination with the slide-ring *B C*, substantially as and for the purpose set forth.

No. 22,962.—JAMES F. MARTIN and HENRY C. NICHOLSON, of Mount Washington, Ohio.—*Improvement in Preserve Cans.*—Patent dated February 15, 1859.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, as a new and useful article of manufacture, a fruit or provision can, to be hermetically sealed, constructed of metal, lined on the inside with a vitrious enamel, capable of withstanding the action of the acids contained in the fruits, &c., to be preserved, substantially in the manner set forth.

We also claim the combination of a metallic cover, vitriously enamelled on the inside, with a fruit or provision can, substantially as set forth.

No. 22,963.—DAVID N. MARTIN, of Lawrence, Mass.—*Improvement in Stoves.*—Patent dated February 15, 1859.—In the operation of this stove the heat and volatile products of combustion, when the direct damper is open, will pass through its opening and rush directly into and through the air-register case, but when the damper is closed they will descend through the flues *D D* and enter the ascending flue *E* and pass upward through the same before escaping into the air-register.

*Claim.*—The arrangement of the air-register *G* at the upper part of the ascending discharge flue *E*, and with respect to the direct damper *F*, substantially as described and represented, the ascending discharge-flue being arranged between the two descending flues of the stove-case, substantially as set forth.

No. 22,964.—JOHN M. MAY, of Jonesville, Wis.—*Improvement in Wind-Mills.*—Patent dated February 15, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim*, first, a standard *D* arranged in the head *a* of the frame-work,

and so constructed that it serves as a guide for the central vertical shaft B, receptacle for gear E, or gear E<sup>1</sup>, or gear E<sup>2</sup>, support and axis for the horizontal axle or shaft of the wind wheel, and as a guide for the sliding thimble O, substantially as and for the purpose set forth.

Second. Furnishing each of the stems of the sails with a cogged segment, for the purpose of revolving the sails on their radial axis, the segments being operated by cogged rack bars attached to the sliding thimble K, substantially as and for the purpose set forth.

Third. The arrangement consisting of the main governor and the forked adjusting rod N, connected with each other for the purpose of operating the thimble O in regulating or controlling the wind wheel as set forth.

Fourth. Providing each of the stems of the sails with a weighted arm, projecting forward of the front surface of the sails, for the purpose of governing the velocity of the wind wheel by regulating the obliquity of the sails to the wind current, substantially as set forth.

Fifth. The covering made in two sections, which are constructed and arranged as shown, the tubular section T revolving with the wind wheel, independently of section S, when the wind wheel moves in the path of a vertical circle and with it when the wind-wheel moves in the path of a horizontal circle, as and for the purposes set forth.

No. 22,965.—JOHN M. MAY, of Janesville, Wis.—*Improvement in Wind-Mills*.—Patent dated February 15, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim*, first, the peculiarly constructed stationary central vertical shaft A, in combination with the peculiarly constructed revolving tubular shaft or hollow column B, the shaft A providing axes for the wind wheel and the tubular column B to revolve upon in the paths of horizontal circles, and serving as a support and guide of the structure of the wind wheel, and the tubular column B serving for receiving the power of the wind wheel and transmitting it to machinery, substantially as set forth.

Second. Enlarging the axle C at its shoulder, in the form of a hub or pipe-box *c*, that the axis *d* of the shaft A may pass up directly through it, so that the centre of the axis of the shaft A and axle C intersect, and in themselves form vertical and horizontal centre bearings within the angle formed by the gear-wheels D and E, and the shaft A and axle C also serve as bearings for the gear-wheels, substantially as and for the purposes set forth.

Third. The combination of a horizontal lever S, the vertical governing rod or bar Q, guide bar R, and thimble G on the tubular column, substantially as and for the purposes set forth.

Fourth. The employment of a revolving conical cover, for the purposes of protecting the mechanism of the wind wheel, and dividing the wind current at the front and centre of the wind wheel head and guiding it upon the sails, and relieving the weighted elbow levers used for revolving the sails on their radial axis of the countervailing influence of the wind current so as to enable them to act by centrifugal force with certainty in governing the velocity of the wind wheel, substantially as set forth.

No. 22,966. JOHN McCOLLUM, of New York, N. Y.—*Improved Cracker Machine*.—Patent dated February 15, 1859.—The claim and engraving explain the nature of these improvements.

The inventor says: First. I *claim*, in combination with the carrying apron B, the roller A, with its doffer F, or the equivalent thereof, and the supporting or feed roller D and supporting table C, or their substantial equivalents in the combination, the rollers and apron moving with simultaneous intermittent progressive motion, the whole being so arranged and operated, substantially as set forth, described, and shown, as to progressively flat pellets of dough suitable for crackers, ship biscuit, and similar articles, placed in proper order upon the apron, and at suitable distances from each other to permit of the extension of diameter resulting from the operation as they pass under the roller A without materially disturbing the order of their arrangement on the apron.

Second. I claim the reciprocating docker in combination with the carrying apron, bed, and stationary perforated clearer plate, substantially as described and for the purposes set forth, and with or without adjustable springs in combination therewith to make yielding pressure at the docking point, substantially as described.

Third. I claim the flattening apparatus, as set forth and described in the specification and in the first claim, when combined with or used in combination with a docking apparatus, such as is set forth and described in the specification and the second claim, or the substantial equivalent thereof, when used, combined, and operated for the purpose of docking flattened pellets of dough for crackers as they are progressively brought to and under the docker from the flattening apparatus without materially disturbing the order of their arrangement on the apron, substantially as set forth and described.

No. 22,967.—W. A. McDONALD, of Mott Haven, N. Y.—*Improved Dovetailing Machine*.—Patent dated February 15, 1859.—This invention consists in a cutter head constructed in a novel way and used in connection with an adjustable bed so as to form one portion of dovetailed joints by a continuous operation.

*Claim*.—Cutter head D formed of a screw thread *g* on a cylinder *f*, the screw thread being

provided with cutters *h*, and arranged substantially as described and for the purpose set forth.

No. 22,968.—GORDON MCKAY, of Boston, Mass.—*Improvement in Printing Presses*.—Patent dated February 15, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—The combination of an impression cylinder and nippers operating in conjunction with a blast-pipe or mechanical means for producing an inequality of atmospheric pressure on the sheet when released by the nippers, and as said sheet is forced onwards by or with the impression cylinder in its rotary movement, substantially in the manner and for the purpose set forth.

No. 22,969.—HENRY H. MCKENNY and FREDERICK GOTH, of Biddeford, Maine.—*Improvement in Repeating Fire-Arms*.—Patent dated February 15, 1859.—The claim and engraving explain the nature of this invention.

The inventors say: We do not claim a fire-arm constructed only with its nipples or primers arranged one in advance of the other on the barrel, but with a lock having a hammer or striker to operate with each nipper or primer.

But we *claim* the combination of two strikers, one trigger, and a mechanism which will not only enable each striker to be set and maintained at full cock, but by retraction of the trigger will cause both strikers, when at full cock, to be discharged or set free consecutively, so as to be forced against their respective nippers, or the percussion caps, or priming thereon, or the equivalents of such, and cause explosion of the priming of the charges in the order as specified.

We also claim the specified application of the lock-case with respect to the barrel in combination with the construction and arrangement of the trigger-rod or slider in separate parts, and in such manner as to be capable of being locked together, and of being unlocked or disconnected under circumstances as specified.

We also claim the application and arrangement of the two main springs of each striker in the lock-case, as explained.

We also claim the combination of the trigger-slide *F* and the lever-sears, arranged and operating with respect to the two strikers, as specified.

No. 22,970.—JOHN O. MEAD, of Philadelphia, Pa.—*Improved Cruets or Bottles for Castors*.—Patent dated February 15, 1859.—This invention consists in so constructing the cruets and bottles of cruet-stands that they may be adapted to each other and to the stand, in order that they may occupy but little space without any diminution of their requisite capacity.

The inventor says: I do not desire to confine myself to the use of four bottles, or cruets, only, inasmuch as more or less than that number may be adapted to each other, and comprised within a small compass in the same manner as the four.

But I *claim* constructing the cruets or bottles of cruet-stands so that they may be adapted to each other and to the stand, substantially as set forth and for the purpose specified.

No. 22,971.—THEODORE S. MINNISS and THOMAS S. MINNISS, of Meadville, Pa.—*Improvement in preventing Friction on Axles*.—Patent dated February 15, 1859.—This invention consists in a shaft, or other moving body, so prepared with alternate bearings and depressions, that in combination with sectors *a a* and stays *j j*, all friction will be taken from the moving surface in the direction of the points of vibration of the sectors, whether in a vertical or horizontal position.

The inventors say: We *claim* the employment of sectors, to avoid friction on rolling or sliding surfaces, substantially as set forth.

We also claim the combination of the shaft-sectors and their adjusters, the whole being arranged, constructed and operating substantially as described.

No. 22,972.—A. R. MORRILL, of Northfield, Vt.—*Improvement in Wheels for Railroad Carriages*.—Patent dated February 15, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I do not claim the interposition of wood between the hub and rim of railroad wheels, when the wood is arranged in a tapering block, the grain of which runs radially the wheel; neither do I claim any wheel having a wrought-iron rim or tire, as such wheel would by no means attain the ends which I have in view.

But I *claim* a wheel for railroad purposes, having a cast-iron hub *B* and rim *C* and a body of wood formed of double plates, as described, and secured to the hub and rim by bolts, as set forth.

No. 22,973.—JOHN NICHOLSON, of Allegheny, Pa.—*Improvement in Retorts for Distilling Oils from Coal*.—Patent dated February 15, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I do not confine myself to any particular number or to any peculiar form of the agitators, or to any number of shafts armed with agitators, as three or more shafts

may be arranged as represented in figure 5, (marked *m*,) nor do I confine myself to any particular manner of arranging the agitators *h* or the shaft or shafts, neither do I claim a revolving or oscillating retort.

But I *claim*, first, furnishing retorts used for extracting the oleagenous matter from coal and other substances with agitators, or a shaft or shafts armed with agitators, as described and for the purpose set forth.

Second. In so arranging the supply and discharge openings 1 2, and the exit pipes, in connection with the trunnions, that when one portion of the retort is weakened by the action of the fire another part may be exposed to it, as described and represented.

No. 22,974.—EDWARD NUGENT, of Brooklyn, N. Y.—*Improvement in Machines for making Bullets, &c.*—Patent dated February 15, 1859.—The object of this invention is to provide means of casting and cooling small projectiles more rapidly and with less labor than heretofore. It consists in making the cavities in which the shot are cast in the sides of thin rings, the peripheries of which work in tight contact with a mouth on the side of the kettle or reservoir of melted metal, the lead in the kettle pressing constantly against the peripheries of the rings, and each cavity being filled as it passes the open mouth or slot, no superfluous metal being allowed to escape.

The inventor says: I *claim*, first, the revolving self-cutting mould *E E*, working in contact with the mouth *D* of the lead kettle, through which the cavities *e e* are supplied with metal, substantially in the manner and for the purposes set forth.

Second. I claim the end motion of the two series of mould rings *E E*<sup>1</sup> and the opening and closing of the several rings in one series, while the cavities in the other series are filling, substantially as set forth.

Third. I claim the tumbling-bars, or their equivalents, operating substantially as described, by which a concussion is produced when the mould rings are opened, and allowance is made for any obstruction between the rings when closed, as set forth.

No. 22,975.—N. B. PRATT, of Deep River, Conn.—*Improved Carpet Sweeper.*—Patent dated February 15, 1859.—The nature of this invention consists in the arrangement of the rotating brush on adjustable swinging lever bearings, in connection with an elastic driving belt, whereby the brush can be adjusted so as to compensate for any considerable wear, and is held down to its work with a greater or less spring pressure, so as to allow it to rise and fall as may be required.

*Claim.*—The arrangement of the rotating brush, on adjustable swinging lever bearings *G*, in combination with an elastic driving belt *H*, substantially as and for the purposes set forth.

No. 22,976.—CLARK S. PUTNAM, of New York, N. Y.—*Improved Apparatus for Vulcanizing Caoutchouc.*—Patent dated February 15, 1859.—The object of this invention is to simplify the construction of an apparatus by making it of a portable, compact form, and adapting its size to the articles to be vulcanized, and to save room, trouble, and expense, by dispensing with the pump and its gearing.

*Claim.*—The combination of the boiler *A*, the vulcanizing chest *B*, and the condensing chamber *G*, constructed, arranged, and operating substantially in the manner described, the same constituting a portable automatic apparatus for the purposes specified.

No. 22,977.—B. F. RAY, of Baltimore, Md.—*Improvement in Harvesters.*—Patent dated February 15, 1859.—This invention consists in actuating the means that operate the reciprocating cutter-bar, by a conical anti-friction roller traversing a cam groove *a* in the main or power-wheel *b*.

*Claim.*—The conical roller, in combination with the cam groove, for actuating the means that operate the cutter-bar.

No. 22,978.—JESSE REED, of Marshfield, Mass.—*Improved Windlass.*—Patent dated February 15, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—The combination of the windlass drums *D E*, pawls *g*, with the wheel *F* and knee or sampson post *H*, whereby the central wheel *F* is supported on both sides, and the windlass rendered more simple and sure in its action, substantially as described.

No. 22,979.—ADOLPHE ROESLER and CHARLES FREY, of Warsaw, Ill.—*Improved Pocket Match-Box.*—Patent dated February 15, 1859.—The nature of this invention consists in having two tapering cylinders so that when one is set in the other, a space, the thickness of a match, is left between them. To the bottom of the outside cylinder a rod or tube *E* is attached, to which is slipped loosely through an opening in both the bottom and top of the inside cylinder. A spiral spring *O* is wound around the tube and attached to one end of it, the other end of the spring is fastened to the inside cylinder, which is provided with a catch for the purpose of winding the spring up.

The inventors say: We *claim*, first, the cylinders *A* and *B*, provided with strips *a* and *e*, and spring *d*.

Second. The tube E with spring O, the whole being arranged substantially as described and for the purpose specified.

No. 22,980.—AMOS ADAMS RICHARDS, of Urbana, Ohio.—*Improvement in Locks*.—Patent dated February 15, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the arrangement of the wheels *a* and *a*<sup>1</sup>, with their rings *x x*<sup>1</sup>, and the spring *e* and slides *c* for producing friction between them, and the arrangements of the bolt B and its stems *o* and *o*<sup>1</sup>, and the use of the hands *h* and *h*<sup>1</sup>, and dial *d*, by which the principle of the above friction-wheels and rings is applied to this lock, as described.

And I also claim the arrangement of the eccentric E, brake *k*, brake-lever L, check-bolt C, and catch *l*, by which the pressure of the stems *o o*<sup>1</sup> on the rings *x x*<sup>1</sup>, simultaneously with the revolution of the hands *h h*<sup>1</sup> and rings *x x*<sup>1</sup>, is prevented, as described.

And I further claim the manner or arrangement above described of revolving the dial *d*, by removing the screws L L, as detailed.

No. 22,981.—GELSTON SANDFORD, of Poughkeepsie, N. Y.—*Improved Steam Engine*.—Patent dated February 15, 1859.—This invention relates to elongating the cylinder, by which means it becomes a part of the frame used for the support of the crank-shaft, and so constructed that when bored out forms a guide and rest for the crosshead to which the piston rod and connecting rod are attached.

*Claim*.—The inside head H, in combination with the crosshead E, and elongated cylinder A B, when constructed and operated in the manner and for the purposes specified, as an article of manufacture.

No. 22,982.—JOSEPH SAXTON, of Washington, D. C.—*Improved Mode of Sealing Letters, &c.*—Patent dated February 15, 1859.—The metal to be used in this invention is one of the more fusible metals, such as tin, or one of the alloys of bismuth, lead, and tin, known as "fusible metal." The proportions for the metals in this alloy is two parts of bismuth, one of lead, and one of tin, forming an alloy which melts at a temperature between 200° and 201° Fahrenheit.

*Claim*.—The process of sealing, by means of fused metals or alloy, whereby the impression is made and the seal secured simultaneously, substantially as described.

No. 22,983.—GEORGE SHONE, of St. Louis, Mo.—*Improved Machine for Punching Railway Bars*.—Patent dated February 15, 1859.—In this invention a sliding gate is fitted in a suitable framing, and provided with punches operated by means of cams and yokes, the punches working over a steel bolster, and the gate being recessed over the rail.

The inventor says: I do not claim, broadly, the employment or use of cams for operating punches, for cams are a well known mechanical device, and have been previously used for the same and analagous purposes.

But I *claim* the arrangement and combination of the recessed gate H, triple cam shaft C, clamping screws J K, and adjustable buttons M, substantially as and for the purpose shown and described.

No. 22,984.—E. A. SMEAD, of Tioga, Pa.—*Improvement in Converting Reciprocating into Rotary Motion*.—Patent dated February 15, 1859.—This invention consists in having an adjustable wrist-pin attached to a fly-wheel, and fitted within a slotted vibrating arm, which has a rod pivoted to it at right angles, the parts being arranged so that the conversion of a rotary into a reciprocating motion, and *vice versa*, is attained by a simple arrangement of means.

*Claim*.—The fly-wheel A, with the adjustable wrist-pin *h*, attached in connection with the slotted bar or rod B, and rod C, the whole being arranged to operate substantially as and for the purpose set forth.

No. 22,985.—T. BRIGGS SMITH, of New York, N. Y.—*Improved Method of Burning the Threads on Wooden Screws*.—Patent dated February 15, 1859.—Patented in England, January 1, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim* the application of a screw made on a bung, and another screw made in the stave corresponding with that upon the bung, both being formed by burning. This bung is to be used for all casks or vessels made of wood for liquids.

I also claim forming a screw C, by burning, on a bung J, or stopple, to be used in any vessel made of any material, whether wood, metal, glass, or other material.

No. 22,986.—STEPHEN WILLIAM SMITH, of Brooklyn, and HUBBARD BIGELOW, of New York, N. Y.—*Improved Fly-Trap*.—Patent dated February 15, 1859.—The object of this invention is to attract the insects to an endless web, kept in motion by machinery, and move the web over a fluted or serrated roller by which they are either killed, stunned, or injured, and drop those that are stunned or injured into water, or a fluid mixture to destroy them.

The inventors say: We *claim*, first, the combination of the endless web or apron B, with

the plate or scraper H, and the rollers C C<sup>1</sup> and F, operated as described and for the purpose set forth.

Second. The combination of the endless web B, with the roller F, and the pan G, in the manner and for the purpose described.

No. 22,987.—WATSON SNYDER, of Newark, N. J.—*Improvement in Sewing Machines.*—Patent dated February 15, 1859.—This invention consists in the combination with two fixed guides (one for the under edge of the binding and one for the edge of the fold thereof) of an elastic plate, operating in combination with the foot or pressure pad, so as to adapt itself to different thicknesses of binding, and of the materials to be bound, for the purpose of effecting the gradual turning over of the binding on the upper surface of the material to be bound, and of holding the same flat as it approaches the foot piece of the pressure pad.

*Claim.*—The combination of the fixed lipper guide C, for the under edge of the binding, the fixed but adjustable guide D, for the edge of the folder of the binding, and the elastic plate E, operated upon by the pressure pad or foot, the whole applied and operating substantially as and for the purpose set forth.

No. 22,988.—JOHN SPANGENBERG, of New York, N. Y.—*Improvement in Defecating and Clarifying Saccharine Juices.*—Patent dated February 15, 1859.—The claim explains the nature of this invention.

*Claim.*—The application of hydrated oxide of tin, prepared with sulphurous acid, substantially as set forth, for the purpose of decolorizing or bleaching and defecating sirups, saccharine solutions and liquids from sugar cane and other saccharine and vegetable juices, whether the same be used alone or in combination with aluminum, as set forth.

No. 22,989.—OREN STODDARD, of Busti, N. Y.—*Improved Churn.*—Patent dated February 15, 1859.—This machine derives its motion from a weight, so that it is automatic in its nature.

The inventor says: I do not claim, broadly, the employment or use of a weight in connection with the gearing, escape-wheel, and pallets, applied to a churn for operating the same, irrespective of the particular manner of adapting the power to the churn, as shown and described, for such parts form a portion of a simple clock movement, and is a well known device.

But I *claim* the combination of the crutch M, with the interior of the churn-box N, so that the lower end of the said crutch shall act as and constitute the dasher, substantially as described.

No. 22,990.—LUKE TAYLOR, of North Springfield, Vt.—*Improved Mop Head.*—Patent dated February 15, 1859.—In this invention a jaw is secured permanently to the end of the handle of a mop head, and a screw is left fitting loosely in the handle, so that it may turn freely thereon and actuate a nut to which a movable jaw is attached. The movable jaw, by turning the nut, being made to secure or clamp the cloth in the head or free it therefrom.

*Claim.*—As an improved article of manufacture, a mop head having a loose collar C, provided with a screw thread, and otherwise made as described.

No. 22,991.—JOHN TYLER, of Providence, R. I.—*Improved Ice Tongs.*—Patent dated February 15, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—The combination of a pick *a* and cutter *b*, or either of them, with a pair of ice tongs, by forming or attaching the same upon or to the back of either leg of the tongs, substantially as described, thus making an instrument of novel character.

No. 22,992.—JOHN L. WAGER, of Deposit, N. Y.—*Improvement in Railroad Signal Lanterns.*—Patent dated February 15, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I am aware that switch lanterns have been previously devised, in which colored glass plates have been operated, or certain parts so adjusted by the movement of the switch-bar or lever, that different colored lights are shown, to indicate the position of the switch. I therefore do not claim, broadly, the automatic switch lamp.

But I *claim* the lantern case B, provided with the colorless glass plates *ff*, and loosely attached or suspended to the rod or shaft O, which is connected with the switch bar or lever A. The case is provided with the oscillating or partially rotating frame C, containing colored glass plates, and connected with the rod or shaft *o*, by means of the arm *n*, the whole being arranged substantially as and for the purpose set forth.

No. 22,993.—LAWRENCE B. WATERMAN, of Chicago, Ill.—*Improved Clothes Frame.*—Patent dated February 15, 1859.—This invention consists in the manner in which the several operating parts are arranged and combined, with a stand or post, so that the weight of the frame that supports the clothes shall come upon the top of the post, and so that said frame may be readily raised and lowered by a device that keeps it at all times under the control of the operator.

*Claim.*—The combination of the stationary top support B, with the movable parts D G, when operated through the segmental racks *e f*, and arranged for the purpose of forming a tipping clothes-dryer frame, substantially as set forth.

No. 22,994.—ELISHA WEST, of Ogden, N. Y.—*Improved Method of Locking and Supporting the Panels of Field Fences.*—Patent dated February 15, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I do not claim panels constructed as described, either with battens alternately on opposite sides, or entirely on one side of the rails, nor do I claim a triangular or brace support for the panels of a fence.

But I *claim* the combination of the panels and the triangular brace or jack G, constructed as described, when so arranged in connection with the recesses *e* of the panels, that by drawing the adjacent panels in opposite directions till the jack G shall enter said recesses *e*, the sections of the fence shall be securely locked together, in the manner specified.

No. 22,995.—CARL WINZEN, of Albany, N. Y.—*Improvement in Coating Metals with Tin.*—Patent dated February 15, 1859.—In describing his improvement the inventor says: To twenty pounds of water add three ounces of sulphuric acid; stir the mixture well together, and then add four ounces of tin; dissolve two ounces of alum in a sufficient quantity of tepid water, and add this solution to the above described mixture; then take a piece of spelter of any convenient size and connect it with the metal to be tinned, either by direct contact or by means of an iron wire of suitable length and flexure. After the lapse of five minutes remove the metal from the fluid and scour it with sand, using for the purpose a stiff brush, piece of woolen cloth, or other convenient thing adapted for the purpose. Then again immerse the metal and spelter it as before.

*Claim.*—The solution composed of the ingredients in substantially the same proportions, applied to accomplish the process of tinning, and used substantially in the manner described.

No. 22,996.—GILMAN WOODWARD and FRANKLIN S. HATHAWAY, of Keene, N. H.—*Improvement in Securing Garments to Hooks.*—Patent dated February 15, 1859.—The nature of this invention consists in securing a hook to a sliding plate, for the purpose of causing an arm to fall upon the head of the hook by means of a weight being suspended therefrom, or by other means forced downward and securing it in its position; also, in providing the arm and hooks at their points of contact with spurs for the purpose of retaining any article of a textile nature that may be secured therein.

The inventors say: We *claim*, first, securing the hook B to the vertical sliding plate C, in the manner and for the purposes described and set forth.

Second. The manner of operating the arm F in combination with the movement of the hook B and sliding plate C.

Third. Arming the hook B and the arm F at their points of contact with movable spurs, in a manner and for the purposes described and set forth.

Fourth. The tumbler S, when operated as described, or otherwise to produce the same effect, as specified and set forth.

No. 22,997.—JOHN DE FRAIN, of Philadelphia, Pa., assignor to WILLIAM CALLAHAN and WILLIAM GRANT, of said Philadelphia.—*Improvement in Corn and Cob Mills.*—Patent dated February 15, 1859.—The main feature of this invention consists in making the hopper of the cob crusher serve the purpose of varying the feed of the cob into the crusher, by making it adjustable on the shell of the same, so as to enable the operator to adjust the one to the other, that either the inner corner edge of the shell at its mouth, or the lower corner of the inner side of the hopper, shall abut the cob while the latter is broken off by the teeth of the rotating crusher or nut.

The inventor says: I *claim*, first, making the hopper N of the crusher M, adjustable on the shell of the same, so as to present to the ear of corn either the corner edge 7 of the hopper N, or the inner edge 8 of the shell M, as occasion may require, substantially in the manner and for the purposes set forth and described.

Second. I claim the carrier K, the inverted cup K<sup>1</sup>, and its adjusting bolt and nut *v*, and arch-piece, in combination with the hopper C and spindle F, the same being constructed and arranged together, substantially as shown, and operating together in the manner and for the purposes described.

Third. I claim the combined arrangement of the scrapers S S, on the bottom of the rotating disk E, the annular groove P, in the diaphragm A<sup>1</sup>, and the outlets and tubes L L, the same operating together, substantially in the manner and for the purpose set forth and described.

Fourth. I also claim the combined arrangement consisting of the outlets L L, and the opening *u*, through the diaphragm A<sup>1</sup>, the same operating together with the rotary disk E, in the manner and for the purpose specified.

No. 22,998.—THOMAS A. DUGDALE, of Richmond, Ind., assignor to WILLIAM M. REED.

of New Castle, Ind.—*Improved Washing Machine*.—Patent dated February 15, 1859.—The nature of this invention consists in resting two wash boards, one fronting the other, upon two inclined planes, and under two double inverted inclined planes, the two first are at the bottom of a box, and are so constructed that when acted upon by the water they will rise, and in rising will raise the wash boards against the two double inverted inclined planes at the top of the wash box.

*Claim*.—Combining and arranging the inclined planes F F, the plate H, and pins I and J, with the double inverted inclined planes D, rollers E, and wash boards A, the whole being constructed, arranged, and operated substantially as described, and for the purposes set forth.

No. 22,999.—**JOSIAH J. DUTCHER**, of Brooklyn, N. Y., assignor to **NOAH MOSHER**, of Norwalk, Conn.—*Improved Pail*.—Patent dated February 15, 1859.—This invention consists in having the body of the pail constructed of porcelain pottery, or glass, or other similar non-absorbent substance, and inclosing the body in a sheet-metal jacket to serve as a protection.

*Claim*.—The pail constructed of the body A and jacket B, of the materials specified, to form a new and useful article of manufacture.

No. 23,000.—**EZRA POLLARD**, of Albany, N. Y., assignor to Himself and **JOSHUA GRAY**, of Westfield, Mass.—*Improvement in Securing Sheet Metal Roofs*.—Patent dated February 15, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I do not claim, broadly, the attachment of the sheet metal coverings of roofs and other portions of buildings by interlocking connections, which have the metal free to move in all directions, as I am aware that slotted plates, set up edgewise, have been attached to the roofs in pairs, to receive small bars attached by loops or eyes to the metal covering, making a much less simple contrivance than any interlocking strips.

But I *claim*, first, securing the edges of sheet metal coverings of roofs and other portions of buildings by means of strips of India rubber *b*, united to the said edges by lap-joints, and nailed to the building, substantially as described.

Second. The interlocking metal strips *fg*, formed, applied, and operating substantially as set forth.

No. 23,001.—**LUCIUS P. PORTER**, of New York, N. Y., assignor to the **NEW YORK RUBBER COMPANY**, of said New York.—*Improvement in Elastic Toys*.—Patent dated February 15, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the combination of a reed or other speaking device, with a hollow, elastic toy made of caoutchouc or gutta-percha, or their compounds for acting together, the former by the latter, substantially as specified.

And I further claim, the manner described of securing the reed frame to the toy by grooving the frame on its edges or periphery, and inserting it in a hole in the toy, so as to be clasped in the groove by the edges of the elastic material in which the receiving aperture is made.

No. 23,002.—**GEORGE W. RICHARDSON** and **ROBERT GLOVER**, of Grayville, Ill., assignors to Themselves and **JOHN I. TANQUERRY**, of White county, Ind.—*Improvement in Converting Rectilinear into Rotary Motion*.—Patent dated February 15, 1859.—This invention relates to the peculiar arrangements of parts by means of which the use of the crank and pitman is dispensed with in producing rotary motion, the said result being effected by means of alternate racks, with a segment wheel between them, said racks being pivoted at their centres to a working frame.

*Claim*.—The arrangement of the rocking-racks K K, in combination with the segment-wheel I, substantially as described for the purposes set forth.

No. 23,003.—**ARAD WOODWORTH**, 3d, of Boston, **DANIEL WOODWORTH**, of Warren, and **M. T. HITCHCOCK**, of Springfield, Mass., assignors to **ARAD WOODWORTH**, 3d, and **DANIEL WOODWORTH**, aforesaid.—*Improved Rocking-Horse*.—Patent dated February 15, 1859.—The claim and engraving explain the nature of this invention.

The inventors say: We *claim* as a new article of manufacture a rocking-horse, consisting of the head and neck of a horse, made as in the ordinary rocking-horse, combined with a hollow box or cradle, so that the child can be placed therein, and which rocks longitudinally, thereby uniting the advantages of a rocking-horse and cradle, and preventing the liability of accidents to the child by falling, as set forth.

No. 23,004.—**THOMAS J. ALEXANDER**, of Westerville, Ohio.—*Improved Method of Operating Reciprocating Saws*.—Patent dated February 22, 1859.—The claim and engravings will explain the nature of this invention.

*Claim*.—Reciprocating the saw by means of right and left hand rocking levers or drivers C, jointed to, or otherwise connected with, the saw, when said levers are separately hung or

pivoted and geared together for reverse action, and so arranged as to admit of being worked by the hands of the operator, substantially in the manner specified.

No. 23,005.—HENRY ADOLPHE ACHEREAU, of Paris, France.—*Improvement in Preparation of Artificial Fuel.*—Patent dated February 22, 1859; patented in France August 11, 1856.—The claim will explain the nature of this invention.

The inventor says: I *claim* producing artificial fuel by stirring, mixing, or incorporating coal dust or small coal, peat, turf, lignite, or other combustible substances, with rosin, pitch, tar, or other resinous, bituminous, or carbonaceous matters or substances, in any suitable proportions, according to the nature of the materials employed, and by causing steam, hot air, or gases, to pass through the mass during the stirring or mixing operation, or while the carbonaceous and bituminous particles are in motion.

I also claim mixing vulcanized carbonaceous matter with melted pitch, tar, or other bituminous substances, when the latter are worked up into a frothy state as described.

No. 23,006.—LUTHER ATWOOD, of Brooklyn, N. Y.—*Improvement in Apparatus for Destructive Distillation.*—Patent dated February 22, 1859.—The nature of this invention consists in combining a vertical combustion tower or fireplace A, in which fuel is burned with a downward draft, with a vertical distilling tower or chamber A, when the substance acted on is placed, and with a continuous strain blast or other controllable means of producing a draft through the apparatus in such manner that the products of combustion from the combustion tower enter the distilling tower at the bottom and pass up through it, and the mass of fragments it may contain.

*Claim.*—The arrangement and combination of the combustion tower, distilling tower, and steam blast, or their substantial equivalents, when arranged and operated substantially as described.

No. 23,007.—HENRY BENTER, of Wheeling, Va.—*Improved Machine for Jointing Staves.*—Patent dated February 22, 1859.—This invention consists in the employment or use of adjustable guides *a b* placed on a frame A, in which a rotary cutter head *e* is secured and used in connection with a carriage C, and clamp *j k*, provided with rollers *i*.

The inventor says: I *claim*, first, the carriage C, provided with rollers *i*, and used in connection with the adjustable guides *a b*, and rotating cutter head *e*, substantially as and for the purpose set forth.

Second. The adjustable plate *s*, in connection with the stationary jaw *j*, and sliding jaw *k*, attached to the carriage C, substantially as and for the purpose specified.

No. 23,008.—EDMUND BIGELOW, of Springfield, Mass.—*Improved Measuring Faucet.*—Patent dated February 22, 1859.—The claim and engraving will explain the nature of this invention.

*Claim.*—An improved self-measuring faucet, whose supply valve is closed and discharge valve opened by a single movement, and whose discharge valve is closed and supply valve opened by a single movement, produced by a spring J, and which is supplied with a vent pipe for letting out the air, and another vent pipe for letting in the air when the faucet is to be discharged, which last vent pipe is shut off when the faucet is to be filled or is standing full, substantially as described.

No. 23,009. WILLIAM BLANCHARD, of Washington, D. C.—*Improvement in Casting Stereotype Plates.*—Patent dated February 22, 1859.—The claim and engraving will explain the nature of this invention.

The inventor says: I do not claim anything new in the method described of fastening the flexible mould plates.

I do not claim the casting of stereotype plates for printing, by immersion, as a novelty.

But I *claim* casting stereotype plates for printing by immersing a metallic mould plate *a*<sup>1</sup> with a mould or matrix *b*<sup>1</sup> formed upon and adhering to it, substantially as described.

I claim the manner of casting any number of stereotype plates, by immersion, or otherwise, in which each mould plate holds, on one of its sides, a matrix *b*<sup>1</sup>, whereon the face of the stereotype plate is cast, in one compartment, while its reverse side, in any compartment, is used as a matrix whereon to cast the back of another stereotype plate, substantially as described.

No. 23,010.—BENJAMIN BURLING, of Buffalo, N. Y.—*Improved Propeller for Canals.*—Patent dated February 22, 1859.—The boat A has a well hole *a* in its stem. This well hole corresponds in shape to a steam-tug B, which is fitted within it, and secured to the boat by a link or shackle *b*, is attached to a stanchion *c* at the bow of the tug B, and fitted loosely over a corresponding stanchion *d* on the boat A, and at the front end of the well hole *a*.

*Claim.*—Propelling canal boats or other craft by means of a steam tug B, placed within a well hole *a*, at the stern, and connected therewith by the shackle *b*, and stanchions *c d*, or their equivalents, substantially as and for the purpose set forth.

No. 23,011.—N. F. BURNHAM, of Laurel Factory, Md.—*Improved Water Wheel*.—Patent dated February 22, 1859.—The claim and engravings will explain the nature of this invention.

The inventor says: I am aware that the French turbine (Jonval) receives power from the lower part of the bucket the same as mine.

I do not claim, therefore, the lower end of the bucket R.

But I *claim*, first, the concave hub P as represented, in combination with the bucket Q as represented, which forms the wheel.

Second. I claim the chutes or guides H in combination with the wheel, by which one fourth, one half, three fourths, or all the water can be admitted to the wheel, and in each case get the same percentage from the amount of water used.

No. 23,012.—ALONZO CHUBB, of Painesville, Ohio.—*Improved Machine for Bending Wood*.—Patent dated February 22, 1859.—This invention consists in the employment of a band or strap U and a guide M, the former being connected and confined to the latter by an apparatus, so that the said band keeps the wood to be bent always in a line tangent to every part of the curve or circle during the process of bending it, the band being kept taught while traversing the guide, so that the wood is held tightly to the band by the friction of their contact surfaces.

The inventor says: First, I *claim* the combination and arrangement of the strap U with the guides M, in the manner and for the purposes set forth.

Second. I claim making the guides adjustable by the use of the slots therein, and of corresponding ones in the bed timbers, as shown, and for the purposes set forth.

No. 23,013.—THOMAS W. CURRIER, of Lawrence, Mass.—*Improved Triangular Stand for Furniture*.—Patent dated February 22, 1859.—In the drawings A represents the legs of the stand, and are fixed so as to turn on the axle E, with the cog H attached to the plate C. B is a triangular plate with flanges I on the upper end and lower side, so arranged that the cogs H will, when the stand is spread, abut on one side of the flanges and prevent its opening further, and when shut they will abut against the sides of the other flanges.

*Claim*.—The arrangement of the triangular plates B and C, with legs A on the axle E, as and for the purpose specified.

No. 23,014.—WILLIAM C. DAVOL, of Fall River, Mass.—*Improved Vegetable Cutter*.—Patent dated February 22, 1859.—The vegetables to be cut or sliced are placed in the hopper D and the follower E placed on them. The plate-lever B is then vibrated right and left, the operator grasping the handle *e*. The vegetables rest on the plate-lever B, and the knife C cuts or slices the vegetables while moving in either direction, the slices passing down through the slot *h*.

*Claim*.—The bed-plate A, having the hopper D attached, provided with the follower E, the vibrating plate-lever B, provided with the double-edged knife C and hook *f*, and attached to the bed-plate A, the whole being arranged and combined to operate as and for the purpose set forth.

No. 23,015.—HENRY N. DEGRAW, of Green Island, N. Y.—*Improved Boot-jack*.—Patent dated February 22, 1859.—This invention consists in connecting a swinging platform D of two movable jaws C, by means of a guide-piece G of such construction that the jaws open and close by raising or depressing the front end of the platform without the aid of springs.

*Claim*.—The arrangement of a guide-piece G for the purpose of operating the jaws C, as described, in combination with a swinging platform D, which rests on pivots *e*, at points between its front and back ends, so that it can be operated by throwing more or less weight on the heel or on the toes of the foot placed on the same, substantially in the manner and for the purpose specified.

No. 23,016.—BENNEVILLE DEWALT and CHARLES E. SCHRADER, of Reading, Pa.—*Improved Meat Cutter*.—Patent dated February 22, 1859.—The claim and engraving will explain the nature of this invention.

*Claim*.—The arrangement of the knives D in a screw form in different directions from the ends of the cylinder B to the centre thereof, to discharge the meat at the adjustable opening F in the bottom, in the manner and for the purposes described.

No. 23,017.—M. DOHERTY, of Boston, Mass.—*Improvement in Cricket-Bats*.—Patent dated February 22, 1859.—The claim and engraving will explain the nature of this invention.

The inventor says: I *claim*, first, constructing the blade A of the bat of a wooden shell with a filling of cork, or other materials, substantially as described.

Second. Constructing the handle B of the bat of a wooden tube, with a central strip of whalebone *d*, or other elastic material of similar character, running down into the blade, substantially as described.

No. 23,018.—JOHN EVANS, of New Haven, Conn.—*Improved Machine for Bending and Setting Springs*.—Patent dated February 22, 1859.—This invention consists in using, in connection with suitable pressure or forming dies, an adjustable bed *i* and side clamps or straighteners

*b e*, so constructed and arranged that the form of the bed may be varied to suit the desired shape of the leaf or portion of the spring to be bent or set, and springs of different sizes.

The inventor says: I *claim*, first, the adjustable or sectional bed, formed of the bars *i*, connected to the weights *k*, and arranged substantially as shown, for the purpose specified.

Second. The adjustable clamps or straighteners, formed of the strips *b e*, placed on rails or bars *F G*, and arranged as and for the purpose set forth.

Third. The adjustable or sectional bed formed of the bars *i*, as described, and the adjustable clamps or straighteners, formed of the strips *b e*, placed on the rails *F G*, in combination with the adjustable dies *M M*, arranged to operate as and for the purpose set forth.

No. 23,019.—JAMES L. FAGAN, of Anaqua, Texas.—*Improved Pump*.—Patent dated February 22, 1859.—The claim and engraving will explain the nature of this invention.

The inventor says: I do not claim, separately, any of the parts shown and described, irrespective of their particular arrangement and adaptation for a submerged pump, for rotary pumps, or those having a partial rotating reciprocating movement, have been arranged similarly to the described invention.

But I *claim* the cylinder *A* and hollow shaft *B*, connecting with each other as shown, and having a reciprocating partially rotating movement, when said cylinder is perforated, as at *h*, and provided with valves *i*, and also provided with the piston *G*, with the stationary plate *I* fitted within it, the whole being arranged as and for the purpose set forth.

No. 23,020.—WINFIELD S. FOSTER, of Marilla, N. Y.—*Improved Clothes-Rack*.—Patent dated February 22, 1859.—This clothes-rack is composed of a series of single racks or panels, which are each made of two side pieces, connected together by transverse rounds or bars placed horizontally, upon which the clothes are to be placed to dry.

*Claim*.—The combination of the rods *B* and heads *A C* with the side pieces of the expanding clothes-rack, in the manner and for the purpose specified.

No. 23,021.—JAMES H. FREETO, of Wheaton, Ill.—*Improvement in Coffee-Pots*.—Patent dated February 22, 1859.—The claim and engraving will explain the nature of this invention.

The inventor says: I *claim* the arrangement of valves *i* and *l* in the condensing chamber *H*, in connection with the pipes *L* and *K*, whereby the steam which escapes through the valve *i* is carried off and deposited, in a liquid state, into the spout, while at the same time, by the action of the steam, a jet of cold water is admitted into the chamber *H*, substantially as and for the purposes specified.

I also claim closing the opening *C* through which the spout *D* communicates with the coffee-pot *A*, by means of a flat valve *E*, which is operated by a rod *d* when the same is applied to a coffee-pot which is hermetically closed by a gasket *g* in connection with the air tube *o*, substantially as and for the purpose specified.

No. 23,022.—GEORGE W. GARDNER, of Troy, N. Y.—*Improvement in Moulding Covers of Cook-Stoves*.—Patent dated February 22, 1859.—In the engraving, *a* represents that part of the pattern which gives form to the recess, and *c c*<sup>1</sup> the pivoted projections or lips for forming the lifter projections, the projection *c* turns inwardly in the position in which it makes its impression on the sand, and *c*<sup>1</sup> turns outwardly, or in the position in which it does not project upon the sand.

*Claim*.—Combining with that part of the pattern which gives form to the recess of the cover, the pivoted projections, as and for the purposes set forth.

No. 23,023.—JOHN M. HALL, of Warrenton, Ga.—*Improvement in Ploughs*.—Patent dated February 22, 1859.—*A* is the beam or stock, *B* the handles, *C* the adjustable bar to which is attached the shoe by the bolt *k*. *D* is the screw bolt passing through the beam, in which there is a slot, to allow the screw bolt to move front or rear. *E* is the shear, attached to the point *f*<sup>1</sup> of the bar *C* and bolt *D*. *F* is the shoe fitting on the bar *C*; *d* is the band for attaching the sword or cutter *G* to the beam.

*Claim*.—The arrangement of the adjustable coulter bar *C*, point *f*<sup>1</sup>, holes *f*, shoe *F*, mould-board *E*, adjustable screw bolt *D*, attachment *Z*, pins *g*, key *h*, bolts *j*, and slot in beam *A*, operating as described, and for the purposes set forth.

No. 23,024.—JOHN S. HALL, of Manchester, Pa.—*Improvement in Plough Beams*.—Patent dated February 22, 1859.—The claim and engravings will explain the nature of this invention.

*Claim*.—An iron or steel plough beam *C*, of an inverted *U* form throughout its main length, and welded or compressed at its ends, and so made as to be capable of receiving the top of the standard *c* into its hollow portion, and be otherwise conveniently connected to or with the other portions of the plough, so as to make a cheap and efficient junction of the several parts thereof, and produce a cheap, strong, and durable plough beam, as set forth.

No. 23,025.—W. O. HICKOK, of Pittsburg, Pa.—*Improved Machine for Cutting Straw and*

*Hay*.—Patent dated February 22, 1859.—The claim and engraving will explain the nature of this invention.

The inventor says: I do not claim, broadly, connecting the pinion on the cutter shaft with the feed rollers, vibrating in guides.

Neither do I claim the arrangement of a shaker between the feed rollers and the cutters.

But I *claim* the arrangement, in combination with the upper or yielding feed roller E, and the cutter shaft *f*, of the coupling lever G, when the said lever G connects the said feed roller E with the cutter shaft *f*, by having its fulcrum around the said shaft *f*, and also carries the pinion 6, which connects the pinion 7 of the shaft *f* with the spur wheel 8 of the near journals of the feed roller E, as set forth, the journals of the said feed roller E working in grooves, which are curved, so as to be concentric with the said cutter shaft *f*, as described, the same operating together in the manner and for the purpose set forth and described.

No. 23,026.—CHARLES HILTON, of Albany, N. Y.—*Improvement in Railroad Splices for Railroad Track Bars*.—Patent dated February 22, 1859.—The claim and engravings will explain the nature of this invention.

The inventor says: I do not claim the use of the plates nor the wedge, broadly.

But I *claim* deep wrought-iron fish plates *a c*, secured to the sides of the rails A B by bolts or keys, and extending downward below the base of the rail, in combination with the gib *g*, and wedge *k*, substantially in the manner and for the purposes set forth in the specification.

No. 23,027.—N. E. HINDS, of Cooperstown, N. Y.—*Improvement in Horse and Ox Shoes*.—Patent dated February 22, 1859.—The nature of this invention consists in constructing the heel calks B B in a semi-circular or curved form with their corners turned inwards, or more towards the central points of the shoe, and in locating both toe A and heel calks B B somewhat away or back from the extreme forward point and heel ends of the shoe, thereby concentrating the calks more towards the centres of the shoes.

*Claim*.—The curved or semi-circular form of the heel calks, with the corners thereof turned inwards or towards the central part of the shoe.

No. 23,028.—L. B. HOIT, of New York, N. Y.—*Improvements in Fountain Brushes*.—Patent dated February 22, 1859.—This invention consists in arranging the passage leading from the cistern to the brush in a screw which screws into the lower part of the cistern A, and in such relation to a stationary valve *c* that by turning the screw D the flow of ink is regulated. It also consists in fastening the brush on the outside of a conical tube G, which forms a passage for the marking ink to the brush.

*Claim*.—As a new article of manufacture a marking brush, consisting of a cistern A which is provided with a stationary valve *c*, and having the brush attached to a conical tube G which fits into a shell E, and otherwise constructed substantially as described.

No. 23,029. MOSES G. HUBBARD, of Penn Yan, N. Y.—*Improvement in Harvesters*.—Patent dated February 22, 1859.—The inner end of the finger bar is hinged to the projecting end of the left side sill at *a*, and this bar is bent on a gradual curve down to the ground at *b*, where it is strongly connected to the spring *d*, which passes up and down and is bolted to the front end of the machine. The wear plate *c* is bolted firmly under the spring *d*, and locked on to the finger bar, and is connected with the inner shoe P by the hinge joints E and F, and the projecting portion of the finger bar is firmly secured to the inner shoe which is located directly behind the supporting wheel G, and runs in the path thereof.

The inventor says: I *claim* the combination of the curved portion of the finger bar hinged at *a*, with the spring *d* forming a yielding and elastic corner or point of attachment of sufficient strength to securely connect the cutting apparatus thereto, substantially as and for the purposes set forth.

I also claim the auxiliary adjustable spring H, or its equivalent, substantially as and for the purposes described.

No. 23,030.—EDWARD KENDALL, of Cambridgeport, Mass.—*Improvement in Steam Boilers*.—Patent dated February 22, 1859.—This invention consists in certain arrangements of water spaces F F, flues H H, and heating surfaces, whereby several advantages are obtained. It also consists in the arrangement of passages for the air, the escaping gaseous products of combustion, and the exhaust steam in a heater for heating air to supply the furnace.

The inventor says: I *claim*, first, the arrangement of the water walls A A B B, the suspended water spaces F F, flues H H, fire box G, lower and upper smoke boxes J M, and tubes L, within the shell of the boiler, substantially as set forth.

Second. In combination with the described arrangement of water spaces and heating surfaces, I claim the arrangement of the hollow fire bridge O, the pipes *a* and *b*, the cylinder N, and pipes *c*, the whole operating substantially as set forth.

Third. The arrangement of the passages for the gaseous products of combustion, the exhaust steam, and the air in the air heater, substantially as and for the purpose set forth.

No. 23,031.—ZEBULON KINSEY, of Dubuque, Iowa.—*Improvement in Packing Bar Lead*.—Patent dated February 22, 1859.—The claim and engravings will explain the nature of this invention.

*Claim*.—The use of the bar or bolt B, made substantially as described, when inserted in perforations made in bars or ingots, and clenched or fastened in the manner substantially and for the purpose aforesaid.

No. 23,032.—THOMAS WILSON LANE, of Merideth, N. H.—*Improved Steam Pressure Gauge*.—Patent dated February 22, 1859.—The claim and engraving will explain the nature of this invention.

The inventor says: I *claim* so combining the indicating tube E with the pipe C, through which the pressure within the boiler is transmitted to the gauge, that the length of the tube in either direction from its junction with the pipe shall not exceed a semi-circle C<sup>2</sup>, and placing the tube in such a position that it shall descend at every point towards its junction with and drain back into the pipe.

Second. I claim joining the pipe from the boiler with the indicating tube E at a point between its two ends, and bending the latter as set forth, so that the ends of the tube shall be nearly over the points where its two branches are rigidly supported, whereby the tube is rendered less sensitive to the vertical shocks to which it is subjected.

Third. I claim bending the two portions of the indicating tube symmetrically, or nearly so, upon opposite sides of a vertical line, as described, and connecting the two extremities of the tube with the lever *i*, as set forth, for the purpose of preventing the horizontal vibrations of the tube from being transmitted to the index hand.

Fourth. I claim pivoting the lever *i*, to the indicating tube without attachment to the case, for the purpose specified.

No. 23,033.—ROBERT B. LAWTON and WILLIAM H. BLISS, of Newport, R. I.—*Improvement in Hose Couplings*.—Patent dated February 22, 1859.—This invention consists in having a metal thimble or tube C D attached to each end of the hose, one thimble C fitting within the other, and the inner one D grooved circumferentially, to receive one or more taper or conical rollers *g*, that are adjusted by screw caps *i*, so as to secure the two thimbles together.

*Claim*.—The thimble C D, provided with the shoulder *b*, and ground seat or packing *c*, and the thimble D, provided with the groove *e*, with inclined sides and fitted within the thimble C, the above parts being used in connection with the conical roller or rollers *g*, fitted in the screw caps *i*, and the whole arranged to operate as and for the purpose set forth.

No. 23,034.—JOSEPH L. LOWRY, of Pittsburg, Pa.—*Improvement in Fire Plugs*.—Patent dated February 22, 1859.—The claim and engraving will explain the nature of this invention.

The inventor says: I *claim*, first, making a single chamber serve the purpose of a cross pipe, when each main leading into said chamber is furnished with its own stop-cock, and access is had to each stop-cock through said chamber for repairs, &c., thus making one chamber and one cover common to two, three, four, or more mains, substantially as set forth.

I also claim arranging the fire plug immediately over the chamber, for the purpose of effecting a circulation of the water in the pipe between the main and the fire plug to prevent its freezing, as stated.

I also claim in combination with the valve *v* and its wing *w*, as described, the hollow set screws *s*, for wasting the water from the fire plug when said valve is closed, substantially as described.

I also claim the removable gasket *c*, in the ends of the branches or bowls *y*, so as to renew the seats for the valves *b*, when necessary, without disturbing the main or stop-cock, access to these gaskets being through the common chamber *j*, as stated.

No. 23,035.—LOUIS MABILLE, of New York, N. Y.—*Improvement in Watch Cases*.—Patent dated February 22, 1859.—The claim and engraving will explain the nature of this invention.

The inventor says: I do not claim the movable plate D when applied and fitted to and combined with the case otherwise than as described.

But I *claim* the construction of the case substantially as described, with the front plate D, fitted to the ring or frame C, with a projecting rim *e*, and bezel *i*, all the way round, when combined with an internal cavity *d d* in the back, to receive and contain the said plate, when removed from the front.

No. 23,036.—SAMUEL MARSHALL, of Wilmington, Del.—*Improved Curtain Lock for Carriages*.—Patent dated February 22, 1859.—The plates A B are made concave, so that a spring stop, or fastening D, may be admitted between the upper plate and the curtain. The spring stop D consists of a scroll spring, which has one of its ends wound round a stationary

pin *d*, and its other end free, and terminating in a knob or handle, and passed loosely down through a space *e*, existing between the lower edge of the outer plate and the curtain.

*Claim.*—The employment of the two metal plates, constructed as described, in combination with the button and button hole of the carriage and curtain, and with the spring fastening, the whole being arranged and used in the manner and for the purposes set forth.

No. 23,037.—ALEXANDER MILLER, of Cleveland, Ohio.—*Improved Water Gauge for Steam Boilers.*—Patent dated February 22, 1859.—The claim and engraving will explain the nature of this invention.

The inventor says: I do not claim, broadly, attaching an index to the stem of the alarm valve of an alarm water gauge.

But I *claim* operating the valve *d*, of an alarm gauge to produce the alarm when necessary, by means of a cam or wiper *h*, on a valve stem *D*, and a stationary inclined projection *g*, on the socket or tube *A*, or its equivalent, the several parts being arranged and applied in combination with a float attached to the stem, substantially as set forth.

No. 23,038.—JAMES MONTGOMERY, of New York, N. Y.—*Improvement in Corrugated Iron Pavement.*—Patent dated February 22, 1859.—Between the large corrugations *A A*, smaller corrugations *B B* are produced. *C C C* are spurs or projections formed on the corrugations *A*, for the joint purpose of affording foothold for horses, and to prevent the shifting of the concrete or other matter with which the grooves are filled.

The inventor says: I *claim*, first, the arrangement and combination, substantially as described, of the unequal ribs, or corrugations *A* and *B*, for the purposes set forth.

Second. The described form and application of the laterally projecting spurs *C*, for the purposes explained.

Third. The dovetailed groove shown, applied to metallic paving, and employed as set forth, to retain within it concrete and other matter.

No. 23,039.—HENRY MONTGOMERY and SIMEON HOWES, of Siver Creek, N. Y.—*Improvement in Grain Separators.*—Patent dated February 22, 1859.—A current of air regulated in intensity according to circumstances, entering at the aperture *U*, beneath the inclined board *S*, meets the light grain in its descent, and carries the dust and chaff upward, and into the pan, whence it is discharged.

*Claim.*—The aperture *U*, when situated immediately below the inclined board *S*, and in combination therewith, for the purpose specified.

No. 23,040.—L. F. MÜNCHER, of Rochester, N. Y.—*Improvement in Locks.*—Patent dated February 22, 1859.—The claim and engraving will explain the nature of this invention.

The inventor says: I am aware that sliding tumblers have been previously used, and also saw plates, or thin flat keys, provided with notches of varying depths, corresponding with the varying positions of the slots in the tumblers. I therefore do not claim separately these parts.

But I *claim* the arrangement and combination of the knob *E*, with the tumblers *C* and bolt *B*, the said knob having studs *g* and *h*, out of line with each other, one stud *h* being in line with the bolt, and the other stud *g* being in line with the tumblers, so that when the key *G* is inserted, one of the studs *g* shall pass by the tumblers, while the bolt *B* is shot out by the other studs *h*, and when the key *G* is withdrawn, and the knob *E* reversed, the stud *g* shall lift the tumblers, and thus prevent the picking of the lock by the insertion of the key, all as shown and described for the purpose set forth.

No. 23,041.—PUTNAM D. NICHOLS, of Hartford, Conn.—*Improved Screw Plate.*—Patent dated February 22, 1859.—The die *B* is connected with the sliding plate *K*, which travels back and forward by the operation of the adjusting screw *G* and rod *H*, which runs up inside of the handle *I*, to which it is fastened by the screw pin *L*, and turned by the pin *M*.

*Claim.*—The adjusting steady pins and set screws, with the sliding plate *K*, attached to the regulating rod and screw *G H*, in the manner as described in combination with the method of adjusting and regulating the dies for operation, in the manner substantially as set forth.

No. 23,042.—HENRY OLIVER, of Philadelphia, Pa.—*Improvement in Brooches, Ear Rings, &c.*—Patent dated February 22, 1859.—The claim and engraving will explain the nature of this invention.

The inventor says: I am aware that sun pictures have been produced upon the inner surfaces of planes of transparent material, and that temporary concave fields have been suggested to overcome the spherical aberration of the lenses, in the production of pictures having a plane surface.

But I *claim* photographic or sun pictures upon concave surfaces of glass, and backing them up with cement, in the manner and for the purpose substantially as specified.

No. 23,043.—RUFUS PORTER, of Washington, D. C.—*Improved Blind Fastening*.—Patent dated February 22, 1859.—The claim and engraving will explain the nature of this invention.

*Claim*.—The combination of the lateral catches *c c* with the elevated finger socket *h*, the whole consisting of a single plate *A*, which is so formed that while the catchend thereof is horizontal, and constitutes right and left catches, and is connected to the bottom of the shutter, the opposite end is vertical, and is connected to the face of the shutter at some distance above the bottom thereof, and constitutes a finger socket or hook *h*, near the hinged edge of the shutter, to be drawn back by a finger for the purpose of unfastening the shutter when open, and closing the same as herein described.

No. 23,044.—CHARLES W. RICHTER, sen., of Madison, Ga.—*Improvement in Lamps*.—Patent dated February 22, 1859.—The tubes *I I* have their outlets in the cap plate *P*, and communicate with the external air by the openings *d*, so that a flow of cold air constantly enters the chamber *D*, which tends to cool the lower portion of the tube *T*. Between the cap and the plate *P* is inserted a disk of cork *c*, to prevent any heat from being conducted to the plate *P*. The wick *B* is connected at the bottom with a piece *f*, held by the guide rod *m* and the screw *b*, and made to move vertically by turning the screw.

The inventor says: I *claim* the combination of the chamber *D*, and the tubes *I I T*, with the non-conducting medium *C c*, above the plate *P*, the arrangement being substantially as described.

I also claim the manner of moving the wick within the tube *T*, in combination with the construction described.

No. 23,045.—SAMUEL SAMUELS, of Brooklyn, N. Y.—*Improved Stalls for Horses on Ship-board*.—Patent dated February 22, 1859.—The claim and engraving will explain the nature of this invention.

The inventor says: I *claim* suspending a horse box on board of a ship or other vessel, on pivots or centres, having the axis arranged transversely to the box, and parallel or thereabouts with the length of the vessel, substantially as and for the purpose set forth.

And I also claim combining a series of two or more so suspended boxes *D D D*, substantially as and for the purpose described.

No. 23,046.—JOSEPH SAXTON, of Washington, D. C.—*Improvement in Seal Presses*.—Patent dated February 22, 1859.—This process consists in placing a fusible metal or alloy in the fluid state upon the place of the seal, and by a sharp and quick blow causing the metal or alloy to penetrate the parts to be secured while the device is imprinted, and the metal solidified simultaneously.

The inventor says: I *claim*, first, a sealing press, operated by a lever *C*, to which the stamp is attached by an adjustable joint, the whole being adapted to the purpose of sealing with fusible metal or alloy, substantially as described.

Second. The guard for retaining the excess of metal driven off from the seal in the act of making the impression.

No. 23,047.—HENRY C. SPALDING, of Brooklyn, N. Y.—*Improved Curtain Fixture*.—Patent dated February 22, 1859.—When the cord *F* is pulled downward in one direction the roller *B* is forced by the combined action of the cord and flange *c* against the shield or head *E*, which stops the endwise motion of the roller, while the curtain continues to ascend until it is rolled up.

The inventor says: I *claim*, first, the narrow rim *f*, in combination with a roller having end play, as described.

Second. The combination of the roller, flange, and cord, as set forth.

Third. The combination of the two hangers with the roller, the cord, and the rack, constructed substantially as described, and operating in the manner set forth.

No. 23,048.—HENRY C. SPALDING, of Brooklyn, N. Y.—*Improved Treadle Stand*.—Patent dated February 22, 1859.—The claim and engraving will explain the nature of this invention.

*Claim*.—A new and improved article of manufacture, a self-sustaining skeleton treadle-frame, composed of sections secured together at right angles, substantially as described, so that the frame is self-braced crosswise and lengthwise with the table *A* which it supports.

No. 23,049.—ROBERT R. TAYLOR, of Reading, Pa.—*Improvement in Apparatus for Ventilating Railroad Cars*.—Patent dated February 22, 1859.—The claim and engraving will explain the nature of this invention.

*Claim*.—The blowing cylinder *G*, hung to one of the trucks of the car, and operated from one of the axles by means of an eccentric *D*, or other equivalent device, in combination with the flexible or self-accommodating inlet and discharge pipes, *I* and *H*, and the distributing pipes *K*, the whole being arranged substantially as and for the purpose set forth.

No. 23,050.—G. H. WALDIN, of Burlington, Iowa.—*Improved Chuck for Watchmaker's Lathes.*—Patent dated February 22, 1859.—The chuck *b* has on its outer extremity a small cylindrical core, or spindle *C*, over which slides the accurately fitting cylindrical thimble *d*. The length of the thimble and spindle can be made greater or less, according to the length of the article intended to be turned. Upon the outer end of this spindle is a conical depression *e*, having its apex in the axis of rotation whenever the lathe is set in motion.

*Claim.*—The use of the cylindrical core, or spindle *C*, in connection with the thimble *d* for containing sealing-wax or its equivalent, the whole constructed and operated as specified.

No. 23,051.—J. L. G. WARD, of Adrian, Mich.—*Improvement in Cementing Roofs.*—Patent dated February 22, 1859.—The claim and engraving will explain the nature of this invention.

The inventor says: I do not claim, broadly, the use of alkaline silicates, applied as a protection to the walls or other parts of buildings; but I *claim* the covering of roofs of buildings by laying bricks or tiles, or slabs of other material, in a bed of cement consisting of an alkaline silicate, and subsequently treating the surface of said cement with an acid which combines with the alkali thereof, and leaves a surface of pure silica, substantially as described.

No. 23,052.—FRANCIS F. WELLS, of Texana, Texas.—*Improvement in Pessaries.*—Patent dated February 22, 1859.—To permit the introduction or withdrawal of the pessary, the sliding collar *m* is slipped along the main arm and off the stem *d*, and the arm *i* then brought as nearly as possible in line with the standing and sliding supports and pushed up towards the ring which causes the pin of the hinge joint *j* to slide up the slots *k k*, and also causes the sliding support *g* to throw up the back part of the ring *A* till the latter lies close against the three supports.

*Claim.*—The combination with the ring *A* of the hinge-jointed and slotted standing supports *c*, and their stem *d*, the hinged sliding support *g*, the hinged arm *i*, the collar *m*, or its equivalent, and the plate *B*, the whole applied and operating in relation to each other, substantially as set forth.

No. 23,053.—CHARLES WESTON, of Salem, Mass.—*Improvement in Apparatus for handling Hides.*—Patent dated February 22, 1859.—This invention consists of a series of long arms *d d*, having proper feet *e e* for moving the hides, turning upon bearings placed below the point at which the driving power is applied, and being driven so as to receive a forward and backward motion by an arrangement of devices at the top of said arms.

*Claim.*—The apparatus described for keeping hides in motion, while exposed to the action of the tanning liquid, the same consisting of parts constructed and arranged, in relation to each other, as described, so as to operate substantially in the manner and for the purposes set forth.

No. 23,054.—PHILIP P. WEIS and F. SCHUTLE, of Philadelphia, Pa.—*Improved Feeding Mechanism for Sawing Machines.*—Patent dated February 22, 1859.—This invention consists in the combination of an adjustable frame *N* with rollers *h*, a pressure frame *P*, also furnished with rollers *i*, and a feeding screw *M*, the whole being arranged for the purpose of moving the lumber towards the saw, and at the same time retaining it steadily in its position as it is operated on by the saw.

*Claim.*—The adjustable frame *N* with its rollers *h*, the pressure frame *P* with its rollers *i*, and the feeding screws *M*, in combination, the whole being arranged substantially as and for the purpose specified.

No. 23,055.—C. P. WILHELM, of Bridgeport, Pa.—*Improvement in Key-bolts for Attaching Carriage Thills.*—Patent dated February 22, 1859.—When this bolt is used, the key *b* is brought in line with the shank *B*, is passed through the bolt hole, the spiral spring *C* passed on the shank and forced up past the upper end of the slot or mortise, so as to allow the tenon *a* to swing out, when the key *b* is forced with the tenon to a position at right angles with the shank *B*.

*Claim.*—The manner described of fastening shafts and poles to carriages by the arrangement of the bolt *B b*, spiral spring *c*, and clips *c*<sup>1</sup>, arranged and operating as set forth.

No. 23,056.—WALTER A. WOOD, of Hoosick Falls, N. Y.—*Improvement in Harvesters.*—Patent dated February 22, 1859.—The nature of this invention consists in the manner of connecting the finger bar *J* to the main frame *A*, so that whilst the driver in his seat may ease the machine over the greater obstructions, the finger bar by its own elasticity, and the loose connection of it in part to the frame, will raise and lower itself over the lesser inequalities in the ground.

The inventor says: I *claim*, first, connecting the bent bar *J* to the axle, and allowing its other end free vertical motion between guides, substantially in the manner described.

I also claim, in combination with the bent bar *J*, for sustaining the finger and cutter bars, the continuation of the finger bar and its attachment to the main frame, substantially in the manner and for the purpose set forth.

No. 23,057.—WALTER A. WOOD, of Hoosick Falls, N. Y.—*Improvement in Mowing Machines.*—Patent dated February 22, 1859.—This invention has been gotten up with a view of making a grass cutting machine that in price will fall within the reach of every farmer, and in size and weight be capable of being worked by any ordinary team, and yet have the requisite strength and endurance to stand the work it is to perform.

*Claim.*—Connecting the bent bar that carries the finger and cutter bar to the main frame by the spring-plate M and to the axle by the loop *d*, so that the finger bar may rise and fall independently of the wheel or main frame, or the main frame independently of the finger bar, substantially as described.

No. 23,058.—LEWIS S. CHICHESTER, of New York, N. Y., assignor to DAVID L. WINTINGHAM, of Jersey City, N. J.—*Improvement in Machine for Corking Bottles.*—Patent dated February 22, 1859.—In this invention toggles E E are employed, connected with a lever frame G and driving bar F, in connection with an adjustable bottle stand K, so that corks may be driven into bottles, and the same machine rendered capable of corking different sized bottles, and also of driving the corks a greater or less distance into the necks of the bottles.

The inventor says: I *claim* the toggles E E, frame G, and bar F, provided with the plungers *d*, in connection with an adjustable bottle stand K, and bar C, provided with the tubes  $a^1 a^2$ , for the purpose specified.

I further claim the particular manner of adjusting the bottle stand K, to wit: attaching the same to the frame G, by means of the lever I, bar J, arms *k k*, cross-bars *m*, and plates *l*, substantially as shown and described.

No. 23,059.—CHARLES E. CLARK, of Boston, Mass., assignor to Himself and GEORGE W. CLARK, of Boston, aforesaid.—*Improvement in Catamenial Bandages.*—Patent dated February 22, 1859.—The claim and engraving will explain the nature of this invention.

*Claim.*—The improved manufacture of a menstrual receiver, as made of two inflatable, water-proof crescent-shaped vessels A B, united by a water-proof system, and arranged together, and with the septum C, and provided with means of supplying them with air and discharging it therefrom, substantially as specified.

No. 23,060.—MOSES G. FARMER, of Salem, Mass., assignor to WILLIAM F. CHANNING, of Boston, Mass.—*Improved Electro-Magnetic Fire-Alarm Apparatus.*—Patent dated February 22, 1859.—The claim and engraving will explain the nature of this invention.

*Claim.*—The combination of two or more key-boards B C D E, or fire-alarm strikers, constructed and operating substantially as described, with one or more electro-telegraphic alarm machines, in the same closed electric circuit, or independent closed electric circuits, by means of a mechanism that will make and break a circuit, as shown and described.

No. 23,061.—JONATHAN GOOD, of Philadelphia, Pa., assignor to Himself and B. L. H. DABBS, of said Philadelphia.—*Improvement in Railroad Car Seats and Couches.*—Patent dated February 22, 1859.—In order to arrange the seats for sleeping couches, every other seat is raised, as seen in fig. 3, by means of the hand-wheel E, the backs are let down to a horizontal position, and the cushions F and G are brought to a horizontal position and fastened by means of the bolt *g*, and secured to the roof of the car by means of the hooks  $h^1 h^1$ . The pillow L is turned up, and the curtains *l* are raised and fastened to the roof by means of the rings *n*.

*Claim.*—The arrangement and combination of the pivoted horizontally and vertically moving plate C, curved ratchet plates J, rack extension D, and pinion C, as and for the purpose shown and described.

No. 23,062.—WILLIAM HINDS, of Little Falls, N. Y.—*Improvement in Straw Cutters.*—Patent dated February 22, 1859.—The nature of this invention consists in the employment of a series of stationary cutters *c c*, arranged with their cutting edges on a level with the cutter *n*, and at right angles to a revolving cylinder B having upon it a series of knuckles *k k* that pass on either side of the cutters, and cuts the straw by carrying and forcing it across the cutting edges.

*Claim.*—The arrangement of the cutters *c c*, in combination with the cutter *n*, fig. 1, constructed substantially as and for the purpose set forth.

No. 23,063.—LYMAN HYDE, of Ellenville, N. Y., assignor to the ELLENVILLE GLASS COMPANY.—*Improvement in Machines for Finishing Carboys.*—Patent dated February 22, 1859.—This invention consists in connecting a treadle F to the ordinary shears C or tool by which the head is formed, and having a furnace B placed in the frame A, and in such relation to the shears that, while the latter are performing their work, the carboy or vessel operated upon will be prevented from suddenly cooling.

*Claim.*—The shears C, treadle F, or equivalent, mandrel *b*, and furnace B, placed within a suitable frame A, and arranged for joint operation, substantially as and for the purpose set forth.

No. 23,064.—A. W. MORSE, of Eaton, N. Y., assignor to Himself and R. V. ROBIE, of said Eaton.—*Improved Bed Bottom*.—Patent dated February 22, 1859.—The rod B is pierced with holes for the lever F, by moving the said lever and thereby rotating the rod B, motion is communicated to the rod B<sup>1</sup> through the gear-wheels A A, the pawl E works into the ratchet roller D, thereby retaining the wires at their proper tension.

*Claim*.—The combination and arrangement of the rods B, the gear-wheels A, the staples G, the pins H, the wires C, or their equivalents, the lever F, the ratchet roller D, the pawl E, for the purpose of giving the proper tension lengthways and sideways simultaneously, substantially as set forth.

No. 23,065.—L. R. ROCKWOOD, of Worcester, Mass., assignor to J. L. CLOUGH, of said Worcester.—*Improvement in Blacking*.—Patent dated February 22, 1859.—The inventor says: The manner of making this blacking is as follows: Dissolve one and a half pounds of the best flake gum tragacanth in flour and a half gallon of soft water, strain and add eight ounces of sulphuric acid, stir frequently for twenty-four hours, then add one gallon of good olive oil, thoroughly incorporate and stir frequently for forty-eight hours. Then to 25 gallons of soft water heated to near the boiling point add 10 pounds of the best extract of logwood, when well dissolved add 10 pounds of gum arabic dissolved in 5 gallons of hot water, cool the mixture to about 125° Fahrenheit, and add 40 pounds of sulphate of iron, which dissolve and cool the whole to about 90 degrees and add the first mixture, mix well and add 28 ounces of sulphuric acid, stir well and add the following, which is to be prepared at the same time as the above: 40 ounces bicromate of potash dissolved in 2 gallons of hot water, then cooled to 125 degrees, and four ounces of sulphuric acid added, after adding this to the former, add to the whole water enough to make 41 gallons, (the one gallon to allow for evaporation in cooling.) It is then put into a wooden vessel and stirred until cool, then allowed to stand thirty days, after which it may be bottled for use.

*Claim*.—Edge blacking, when composed of the mentioned materials in the proportions and manner substantially as set forth and described.

No. 23,066.—ABRAHAM ANDREWS, of Bernville, Pa.—*Improvement in Rotary Engines*.—Patent dated March 1, 1859.—The plungers P are attached to a frame R at each side, and this frame raises and lowers the plungers by means of the rollers S revolving in the eccentric grooves T of the wheels U, which are fastened to and revolve with the shaft B. To reverse the engine, the lever at the grooved hub V, of the cam wheel L, operates the connecting rods K, so that the cam wheel L, will be easily moved in or out.

The inventor says: First, I claim the mortised valve I, and its connection with the rod K, as operated by the cam wheel L, in combination with the said axle or shaft.

Second. I claim the arrangement of the plungers P, with their side rollers S, and cam wheels U, in combination with the axle or shaft B, substantially as described and for the purpose set forth.

No. 23,067.—JOEL W. ANDREWS, of Norristown, Pa.—*Improvement in Brick Moulds*.—Patent dated March 1, 1859.—This invention consists of pivoted handles D D, connected by links H H to longitudinal bars F F, to which the bottoms C C of the moulds are secured in such a manner that when the moulds are inverted the weight of the bottoms of the moulds assist the pivoted handles, &c., in ejecting the bricks from their respective moulds.

*Claim*.—The arrangement of the pivoted handles D D, links H H, and bars F F, connected to movable bottoms C C, all substantially in the manner and for the purpose set forth.

No. 23,068.—JONATHAN M. ALLEN, of Worcester, Mass.—*Improved Invalid's Tables*.—Patent dated March 1, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—The combination in the construction of a table for invalids as set forth, of the revolving table bed or leaf G, with the column made adjustable and capable of being fastened in position substantially as described, the whole constituting a new and useful article of manufacture.

No. 23,069.—JOHN C. BAKER, of Mechanicsburg, Ohio.—*Improvement in Seed Planters*.—Patent dated March 1, 1859.—The seed being placed in the seed compartment, and a fertilizer in the other compartment, and the friction roller *n* being adjusted to the cams *k*, the planter made to move forward the roller *n* rises upon the first elevation of the cam *k*, and the cut-off *e*, by means of the lever L, rod *e*, disk *a*, and rod *u*, is made to vibrate sufficiently to expose the bottom of the seeding tube *p*, the tube *p* being closed by the projection *g* of the cut-off *e*.

*Claim*.—The arrangement of the wheels E and C, cams *k l*, lever L, friction roller *n*, and disk *a*, the whole being constructed as and for the purposes set forth.

No. 23,070.—JOSEPH BATTIN, of Newark, N. J.—*Improved Machine for Cut-Cross Sawing*.—Patent dated March 1, 1859.—This invention consists in a novel way of applying a driving belt to the saw mandrel, whereby the saw as it rotates may be fed to its work and also giggered back, the saw mandrel being under an equal tension of the belt at all points of the movement of the carriage.

*Claim.*—The driving pulley *e* of the saw mandrel, in connection with the pulleys *ff*<sup>1</sup>, one or both, placed in the carriage B, and the driving belt H, the parts being combined and arranged to operate substantially as and for the purpose set forth.

No. 23,071.—J. C. BENTHALL, of Oakland, Texas.—*Improvement in Seed Planters.*—Patent dated March 1, 1859.—This invention consists in the mode of arranging the operating parts of a seed distributing device, whereby it may be attached to the leg of the attendant and operated by his natural movement while walking behind the machine.

*Claim.*—The arrangement of the rock shaft K, connecting rod J, arm *h*, spring *i*, and pendant M, substantially as shown and described, for the purpose of enabling the seed distributing device to be actuated by the leg of the operator.

No. 23,072.—J. S. BRIGGS, of Michigan Bluffs, Cal.—*Improvement in Amalgamating Rifles.*—Patent dated March 1, 1859.—The nature of this invention consists in completely saturating the riffles used in sluice boxes in placer mining with quicksilver, so that the riffles after being once charged will until completely worn out give in an equal and uniform quantity of quicksilver to the gold; also, the quicksilver will be equally distributed over the surface where the water and gold will run.

*Claim.*—The cup punch D E D, as constructed for saturating wood with quicksilver.

No. 23,073.—S. D. BROWN, of Montville, Ohio.—*Improved Harness Attachment for Supporting Driving Lines.*—Patent dated March 1, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—As a new article of manufacture an attachment or line supporter, to be placed on a horse's rump, by securing it to the harness in the manner shown, or in any equivalent way, said attachment consisting of the adjustable strap A, pin and clasp B and C, cross piece D, adjustable standard F, and arms G G, the whole arranged and combined as described, and for the purpose set forth.

No. 23,074.—THOMAS BROWN, of Kenwood, N. Y.—*Improvement in Tram Staff for Facing Mill Stones.*—Patent dated March 1, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—The arrangement and combination of the supporting ring A, arranged to rest or lie on the face of the stone with the triangular frame G and adjustable staff M, by which millstones may be faced more accurately and with greater facility, either plain or with suitable concavity or bosom.

No. 23,075.—CHARLES BROWNLICH, of Buffalo, N. Y.—*Improvement in Harvesters.*—Patent dated March 1, 1859.—The pivoted shoe E has length outwardly from the bolt *f*, so to give sufficient lever purchase through the action of the compound levers *g h i*, to raise the finger bar from the ground; *h* lies parallel with the frame, and is connected thereto by means of two journal bearings; *g* is connected to *h* at one end, and *i* at the other end. By lifting *g*, *i* is turned downwards against the end of the shoe, and the bolt *f* serving as a fulcrum or pivoted centre, the finger bar A is raised from the ground.

*Claim.*—The pivoted shoe E, constructed as described, and connected to the rear end of the frame of the machine by means of the bolt *f*, upon which it oscillates, in combination with the levers *g h i*, as arranged for the purpose set forth.

No. 23,076.—J. L. CHAPMAN, of Kinmundy, Illinois.—*Improvement in Corn Harvesters.*—Patent dated March 1, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim*, first, the combination with a corn harvester frame, having V shaped conductors B, of sickle shaped revolving cutters F, partially serrated and partially plain edged stationary cutters E, upper and lower horizontal spring guides C C and D D, and an endless apron J, all arranged and operating substantially as and for the purpose set forth.

Second. The partially serrated and partially plain edged stationary cutters E, of the form described and shown, in combination with the rotary cutters F, substantially as and for the purposes set forth.

No. 23,077.—GEORGE E. CHENOWETH, of Baltimore, Md.—*Improvement in Harvesters.*—Patent dated March 1, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I do not claim a rectangular four-sided step or standard, whether oblong or square, for such has been used before, though without any view to the object sought by my invention.

But I *claim* a polygonal step L, having more than four sides, in combination with a standard or post, the lower of which corresponds in figure with the interior of said step, as and for the purpose described.

No. 23,078.—GEORGE H. CLARKE, of East Washington, N. H.—*Improvement in Bee-*

*Hives.*—Patent dated March 1, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I do not now claim the hollow bars D, for the same was secured to me by letters patent dated January 8, 1856.

But I *claim* the construction and arrangement of the bars B, the same consisting in making each of them with a salient, angular, or sharp, or nearly sharp, lower edge or surface, extending lengthwise and downward, substantially as described and represented; the several bars being arranged at convenient distances for the bees to pass between them or upward into the chambers A A, as described.

No. 23,079.—WILLIAM CLEMMONS, of Nicholasville, Ky.—*Improvement in Hemming-Guides for Sewing Machines.*—Patent dated March 1, 1859.—The nature of this improvement will be understood by examining the claim and engraving.

The inventor says: I make no claim to the general construction of the hemmer, or any portion of the devices for forming and turning over the hem.

Neither do I claim forming a recess in its under side to relieve the teeth of the feeder, as this has already been done.

I *claim* the combination with the hemming attachment of the spring E placed in the groove under the pressure-pad A, substantially as described, and for the purpose set forth.

No. 23,080.—HENRY L. DE ZENG, of Geneva, N. Y.—*Improved Sausage Stuffer.*—Patent dated March 1, 1859.—When the machine is to be used, the receiver F is shoved over the screw D so as to bring one of the spurs *c* above and the other below the claws *b*, and by turning the receiver F partially around by means of the cars *x* it will be firmly connected to the standard A by the spurs *c* locking under the claws *b*.

*Claim.*—The construction and arrangement of the parts A, D, F, substantially in the manner and for the purpose set forth.

No. 23,081.—L. A. DOLE, of Salem, Ohio.—*Improved Washing Machine.*—Patent dated March 1, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of two winged rollers with a flexible adjustable apron clothes bed *c*, in the particular manner specified, and for the purpose set forth.

Second. The use of a flexible apron clothes bed, when made adjustable, substantially as and for the purposes set forth.

Third. The use of an adjustable swinging self-opening and self-closing rubber or leather packed valve or partition, in combination with the adjustable flexible apron bed, substantially as and for the purposes set forth.

No. 23,082.—CHARLES R. EDWARDS, of Suspension Bridge, N. Y.—*Improvement in Spice and Coffee Mills.*—Patent dated March 1, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—The burr *hh* provided with the flanch *aa* and handle, cast in one piece, in connection with the concave grinder, having the axle D cast upon the same, arranged and constructed substantially as and for the purposes set forth.

No. 23,083.—CARLOSS EGGELSTON and DARWIN E. EGGELSTON, of Beloit, Wisconsin.—*Improvement in Seeding Machines.*—Patent dated March 1, 1859.—As the machine is drawn over the field the seed in the hopper A is fed continually to the openings *bb* by the revolving pockets D, which are arranged on and rotate with the shaft B, through which openings it passes down through the spouts H and falling upon the convex surface of the distributors *i* is scattered over the surface of the ground. The quantity of seed to be sown while the machine is passing over a given area is regulated by the adjustment of the slide F, which is effected by the shipper G.

The inventors say: We *claim*, first, the arrangement, in the manner and for the purposes described, of the rotating shaft B, in two or more parts, driving-pulleys *d*, pulley encasement E, seed pockets D, stationary perforated bottom piece *a*, adjustable slide F, and cut-off *h*.

Second. In combination with the above we also claim the shipper G and adjustable slide bar or gauge *g*, when the shipper is pivoted to the gauge to operate as specified, and for the purpose described.

No. 23,084.—JONATHAN GRIFFIN, of Harpersfield, N. Y.—*Machine for Blowing Uniform Currents of Air.*—Patent dated March 1, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim*, first, operating the feeders F alternately by means of the cross arms E with the rollers traversing the curvilinear elevating ways G G, substantially as set forth.

Second. Regulating the quantity of air admitted into the air chamber H, according to the quantity required, by means of the check wire *f* and sliding arm or brake *h* operating on the balance-wheel K, arranged substantially as described.

Third. Connecting the top and bottom of the air chamber H by means of India rubber straps or other springs, when used in combination with the mechanism for driving the feeders, as described, to overcome and stop the operation of the motive power when the chamber is full, and thereby steady the current of air, and prevent too great strain on the chamber.

No. 23,085.—ELIAS J. HALE and CHARLES H. CHANDLER, of Foxcroft, Me.—*Improvement in Lamps*.—Patent dated March 1, 1859.—The claim and engraving explain the nature of this invention.

The inventors say: We *claim* our improved rack wick-holder as constructed and applied to the wick C and the spur wheel, so that the teeth of the latter may pass through the rack and act on both the rack and the wick at one and the same time.

Second. The flange or collar J for the purpose of equalizing the aerial current as it strikes the flame of the wick.

No. 23,086.—BEVERLY HARRIS, of New Orleans, La.—*Improvement in Applications for Restoring the Hair*.—Patent dated March 1, 1859.—The claim explains the nature of this invention.

The inventor says: I do not claim the use of castor oil, bay rum, alcohol, or quinine for hair tonics, as I am aware these ingredients have heretofore been used for this purpose.

But I *claim* the use of bitter apple and gunpowder in combination with the before stated ingredients, when used in substantially the same proportion as set forth and for the purpose of hair tonics, as described.

No. 23,087.—WILLIAM C. HAYNES, of Melrose, Texas.—*Improvement in Revolving Fire-Arms*.—Patent dated March 1, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—Combining with a stationary barrel D having several tubes or chambers for shot a rotating cylinder having groups of chambers, each group of chambers being so arranged as to correspond with the chambers or tubes in the barrel, and also so arranged in connection with a single cone, or its equivalent, to each group, that the explosion of the cap, or its equivalent, shall fire the whole group to which the cone upon which it was exploded belongs, the whole being constructed and operating substantially as set forth.

No. 23,088.—WILLIAM W. HUSE, of Brooklyn, N. Y.—*Improvement in Manufacture of Tin Foil*.—Patent dated March 1, 1859.—The claim explains the nature of this invention.

The inventor says: I do not claim to have invented the manufacture of tin foil with a filling of lead.

But I *claim* the production of tin foil having but an outer casing of tin, or its alloy, covering a filling of lead, or its alloy, by the reduction by pressure of a cylindrical bolt of the latter metal or alloy, which has been previously coated by dipping with the former metal or alloy, and the repetition of the dipping at suitable stages of the reducing process, substantially as described.

No. 23,089.—PETER KESSLER, of Bellville, Ill.—*Improvement in Apparatus for Distilling*.—Patent dated March 1, 1859.—In this invention the gaseous liquor is conducted from the still into the hollow cylindrical space, which is partly filled up by a conical vessel of water, so that the impurities contained in the liquor are condensed by coming in contact with the cool sides of the water vessel, and the pure liquor may be drawn off by a pipe leading to a suitable cooler, the water vessels being so arranged in the space surrounding the same that the strength of the liquor may be determined by the quantity of water contained in the vessel, whilst the impurities are sent back to the first still by means of the faucet without pumping.

*Claim*.—The employment of the stills B B, and cooler Q, in combination with the vessels E I K, as described and shown, when said vessels are arranged so as to have a tapering space L, and an intermediate circulating passage G a b J c between them, substantially as and for the purposes set forth.

No. 23,090.—DAVID P. KINYON, of Raritan, N. J.—*Improvement in Harvesters*.—Patent dated March 1, 1859.—By this invention the height of the frame can be regulated, and with it the sickle or cutting device, so that the grass may be cut any desired height from the surface of the ground without interfering with the driving mechanism.

*Claim*.—The arrangement of the frame H, which supports the driving wheel F, so that the adjustment of the relative position of the driving wheel and cutter is effected by the leverage of the inner frame in the manner described, for the purpose as set forth.

No. 23,091.—F. C. KNEELAND, of Hartford, Conn.—*Improvement in Horse Rakes*.—Patent dated March 1, 1859.—A revolving rake is employed in this invention, peculiarly arranged, or applied to a mounted frame.

*Claim*.—The arrangement and combination of the shaft c<sup>1</sup>, pivoted within the frame F,

and provided with the treddle *G*, arms *h*, and bar *i*, with the frame *F*, when the latter is pivoted to the axle *A*, as and for the purpose shown and described.

No. 23,092.—HAZARD KNOWLES, of New York, N. Y.—*Improvement in Fastening Bands on Bales and Packages*.—Patent dated March 1, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—The method substantially as described of fastening the ends of a metallic strap *a* or hoop, by passing each end of the strap or hoop through a slot in a metal plate *b*, one edge of which slot is formed with a bent lip on the outer face, bending the end of the strap or hoop over and outside of such lip, and hammering or clenching down both the end of the strap and the lip *e e*, that the strap or hoop may be clasped or held irrespective of the body which is to be strapped or hooped, substantially as described.

No. 23,093.—JOSEPH G. E. LARNED, of Brooklyn, N. Y.—*Improved Boiler for Generating Steam*.—Patent dated March 1, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim*, first, the substitution for the parallel or concentric sheets of boiler plate ordinarily used to form the fire box of steam boilers, of a continuous row or rows of upright water tubes *1*, set side by side, to connect the steam drum *A*, or water space above the fire with a water bottom below it, in such way as to form by themselves a water jacket; said tubes being inserted in the sheet above and below by means of necks *d e*, or smaller continuations, the diameter of which is so much less than that of the tubes as to leave a sufficient thickness of metal between adjacent perforations of the sheet when the tubes are placed near enough together to answer the purpose of inclosure; expressly disclaiming, however, the use of such necks or smaller continuations, in themselves considered, or for any other purpose, or in any other arrangement than that set forth.

Second. The combination of rows of water tubes, set side by side, to inclose the furnace, with tubes arranged annularly, to give increased surface, without reference to the particular method of inserting the inclosing, or arranging the annular tubes.

Third. The method of inserting the innermost of the tubes when arranged in pairs, one within the other, as described, so that they may be taken out and put back at pleasure, and without injury, by means of a screw or lock nut joint at one end, and a combined screw and expansion joint at the other.

No. 23,094.—EDWIN LAWRENCE and ROBERT SAFLEY, 2d, of Waterford, N. Y.—*Improvement in Pumps*.—Patent dated March 1, 1859.—The nature of this invention consists of a circular reciprocating double acting pump, in which the reciprocating motion is obtained by the movement of the arms or piston *1 2*, upwards and downwards simultaneously on opposite sides of the cylinder through a space less than that of the whole circle, and in which the double action is obtained by the same motion of the arms or piston, in conjunction with valves *3, 4, 5*, fixed to the outer surface of the cylinder, as well as to the partitions inside, in connection with pipes or water ways outside of it.

*Claim*.—A circular reciprocating double acting pump, that will both raise and propel water on both sides of the cylinder at one and the same time, and by the same motion of the arms or piston, substantially as set forth.

No. 23,095.—A. F. LEDBETTER, of Westminster, N. C.—*Improved Apple Cutting and Coring Machine*.—Patent dated March 1, 1859.—This cutter is formed of a tube with radial knives attached, the cutter being secured to the lower end of a vertical frame, or gate, which works directly over a bench in which a circular bed or support, encompassed by an annular opening, is formed, the whole being so arranged that the slices and cores are discharged separately from the machine.

The inventor says: I *claim* the cutter *E*, attached to the reciprocating frame *C*, in connection with the annular opening *i*, in the bench *A*, and with or without the spout *g*, the parts being arranged to operate as and for the purpose set forth.

No. 23,096.—LEWIS W. LEEDS, of New York, N. Y.—*Improvement in Apparatus for Heating Buildings*.—Patent dated March 1, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I do not claim, broadly, the use of steam as an agent for heating water.

But I *claim* combining the uses of steam and water for heating buildings, by means of one or more water vessels combined with a separate steam boiler, and applied in such manner that the steam from the said boiler is employed only to heat the water in the said water vessel or vessels, and that the said water vessel or vessels constitute the heater or heaters of the air, as described.

No. 23,097.—HIRAM LITTLEJOHN, of Troy, N. Y.—*Improved Machine for Crozing and*

*Chamfering Barrels.*—Patent dated March 1, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—Crozing and chamfering barrels, kegs, or casks, by turning the bulging cylinders of staves in upon or against suitable rests or supports, and around rotating cutters, which turn in opposite directions, and describe circles of less diameter than the inside of the ends of the cylinders of staves, the cutters and the rests being so arranged together, and one or both of them made movable, that the cylinders of staves can be conveniently applied to and removed from the rests and cutters, substantially as set forth.

No. 23,098.—WILLIAM H. LONG, of Lancaster, Pa.—*Improvement in Horse Rakes.*—Patent dated March 1, 1859.—The regulating screws L enter a nut in the axle beam A, by means of which the hinged tooth beam B is thrown up or out below with its teeth supporters, and the points of the teeth elevated from  $G^1$  to  $G^3$ , above the ground line X. The lever O to dislodge the contents of the rake, by means of the shifting plate M and binding screws Q, is adjusted to any alteration in the tooth beam B by the screws L.

*Claim.*—The arrangement of lever O, shifting lever plate N, and tooth beam B, with axle A, and regulating screw L, the whole being constructed and operated as and for the purpose set forth.

No. 23,099.—HENRY LOWE, of Belleville, N. J.—*Improvement in Paper Made from Reeds.*—Patent dated March 1, 1859.—The claim explains the nature of this invention.

The inventor says: I am aware that reed fibre has been reduced to a sort of pulp; but previous to my invention it has been found impossible, practically, to manufacture paper therefrom.

I do not claim the described process for preparing reed fibre, a patent for the same having been granted me by the United States in 1858.

Nor do I here claim the art of making reed pulp.

I do not limit myself to the described process of making reed paper, or to any other process equivalent thereto.

But I *claim* the use of reed fibre in making paper, said fibre being prepared from the reeds called *Arundinaria*, *Macrosperma* of Michaux, and employed in the manufacture of paper, substantially as set forth.

No. 23,100.—JOHN M. LUNQUEST, of Griffin, Ga.—*Improvement in Pumps.*—Patent dated March 1, 1859.—The water enters the cylinders BB through the apertures *ii* in the piston heads CC as they descend. When the heads ascend the balls *aa* fall into the apertures *ii* and close them, the water in the cylinders being raised and forced through the openings *nn* in the bottom of the air chamber F.

*Claim.*—The arrangement of cylinders B B, piston heads C C, ball valves *aa*, air chamber F, and valves  $a^1 a^1 a^1 a^1$ , said valves being kept in position by proximity to each other and the sides of the chamber F, substantially in the manner and for the purpose specified.

No. 23,101.—SAMUEL MACFERRAN and STRICKLAND KNEASS, of Philadelphia, Pa.—*Improvement in Crossings for Railways.*—Patent dated March 1, 1859.—The claim and engraving explain the nature of this invention.

The inventors say: We wish it to be understood that we do not claim broadly the application of inclined surfaces on railroads for receiving the flanges of the car wheels.

But we *claim* the employment of inclined surfaces at the point where two rails intersect each other, when the said surfaces are arranged in respect to the intersecting rails, substantially as and for the purpose set forth.

No. 23,102.—EDWARD MAYNARD, of Brooklyn, N. Y.—*Improvement in Carriage Springs.*—Patent dated March 1, 1859.—This invention consists in the manner of attaching the ends of the heart shaped spring *a* so that they are in contact with each other, and the operation of a weight tends to draw the spring into a smaller compass, and the ends of said spring coiling or bearing against each other are brought into a straight form.

*Claim.*—Attaching the returned ends of the spring directly to each other by means of the shackle *b*, substantially as and for the purpose specified.

No. 23,103.—MORRIS MATTSON, of Boston, Mass.—*Improvement in Treatment of Caoutchouc.*—Patent dated March 1, 1859.—The claim explains the nature of this invention.

The inventor says: I do not claim any invention described in the patent of N. Hayward, dated February 24, 1839; and especially I do not claim the combination of caoutchouc and sulphur broadly.

But I *claim* as my new or improved India rubber composition or manufacture, as made in manner substantially as specified, without any of the oxide of lead, but of caoutchouc, sulphur, and one or more ochres, or an earth or earths, containing one or more finely divided oxides of iron, and employed in a quantity much greater than necessary for simply affording

color to the compound, the quantity being essentially in the proportions as stated, or such as will afford the economical and useful results as explained.

No. 23,104.—JOHN G. MITCHELL, of Collington, Md.—*Improvement in Motive Power.*—Patent dated March 1, 1859.—The nature of this invention consists in the adaptation of weights for the production of mechanical power.

*Claim.*—The application of weights A A<sup>1</sup> and B B<sup>1</sup> in connection with the shaft C and treddle K, so that when disconnected from the treddle K the weights A A<sup>1</sup> and B B<sup>1</sup> are in equilibrium, and subject to be moved by any agency applied to either weight at the end of the lever or arms, so as to produce motion in the machinery at the termination of the machine proper at I, arranged and operating in the manner and for the purpose described.

No. 23,105.—JAMES MONTGOMERY, of New York, N. Y.—*Improvement in the Construction of Steam Vessels.*—Patent dated March 1, 1859.—The claim and engraving will explain the nature of this invention.

The inventor says: I *claim*, first, constructing the hulls of vessels with one or more cavities B in the bottom, commencing at or nearly the stem, increasing in capacity sternwards, substantially as and for the purposes set forth.

Second. Constructing the bottoms of vessels with corrugations extending from stem to stern, as set forth, which give strength to the hull A and a portion of which form the cavity or cavities referred to.

Third. The described combination, an inclined screw propeller with a hull, constructed as set forth.

Fourth. Two or more rudders operating as set forth, in combination with the described longitudinal cavities in a ship's bottom.

No. 23,106.—ROBERT NIVEN, of Gates, N. Y.—*Improvement in Potato Diggers.*—Patent dated March 1, 1859.—The inventor says: On the axle of a pair of truck wheels A, I support a frame B by means of slots C in the side plates D which rests on the axle. These plates are firmly bolted to the sides of the frame and extend forward and downward, terminating in a point at F, where the two are connected by the share or shoe G. A riddle or screen H, consisting of iron rods taking into links of an endless chain at each side, receives the potatoes and earth as they are ploughed up by the shoe G and separates the tubers, delivering them back to the machine.

*Claim.*—The combination and arrangement of the shoe or share G, endless screen H, and pendant or supplementary riddle N, with the frame A and side plates D, sinuous slots C, and slotted levers R, operating conjointly, substantially as and for the purposes set forth.

No. 23,107.—A. H. NORDYKE, of Richmond, Ind.—*Machine for Printing the Address on Newspapers, &c.*—Patent dated March 1, 1859.—The claim and engraving will explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of an endless conveyor A for feeding the envelopes under the forms to receive the impressions, and delivering the same after printing, in combination with a driving set wheel D, as set forth.

Second. I claim the two inclined tracks K and L, arranged one above the other in such manner that the forms may be carried up the inclined track K and delivered upon the inclined track L, and brought by their own gravity down said track and under the pressure rollers N, and from thence to the point of discharge, as described.

Third. I claim the arrangement and combination of endless band g, catch i, and jointed track K, for taking the forms from the end of said track K and delivering them upon the lower track L, arranged and operating as described.

No. 23,108.—OSCAR S. OAKS, of South Rutland, N. Y.—*Improvement in Roofing Cement.*—Patent dated March 1, 1859.

The inventor says: To make my improved mastic compound, I take 25 gallons of coal tar, 2 of boiled linseed oil, 2 of India rubber solution, 2 of alkaline solution of shellac, 5 pounds of asphaltum, 5 of pulverized soapstone, 5 of litharge, 5 of sulphate of baryta pulverized, and 5 of plaster of Paris. I place the whole in a kettle, or other vessel, over a fire, and boil till thoroughly mixed, stirring from time to time during the boiling process.

*Claim.*—The employment, in combination with the other substances specified, of the alkaline solution of shellac and the sulphate of baryta, the whole being compounded substantially as and in about the proportions set forth.

No. 23,109.—ANSON OLCOTT, of Lakeport, N. Y.—*Improved Rotary Shingle Machine.*—Patent dated March 1, 1859.

The inventor says: This is a rotary shingle machine, with a single knife, against which the bolt is to be fed in the usual manner, and consists in the combination of devices for shifting the position of the bolt so as to cut the butts alternately from opposite ends thereof.

*Claim.*—The combination of guides c, springs d, connected therewith, slide o, reciprocating

cated from the movement of the cutter wheel, and the shingle cutter *k*, the whole constructed, arranged, and operating substantially as described.

No. 23,110.—GEORGE T. PARRY and HAMPTON W. EVANS, of Philadelphia, Pa.—*Improvement in Governors for Steam Engines*.—Patent dated March 1, 1859.—The claim and engravings will explain the nature of this invention.

*Claim*.—One or more revolving weighted spring levers *KK*, in combination with the sleeve *I*, and the connections described, or their equivalents, between the said sleeve and levers, when the latter are hung to pins placed at such a distance from the centre round which they revolve, that the weights at the ends of the levers shall move in the arc of a circle, contained within or partially within the circle described by the said pins, as set forth and for the purpose specified.

No. 23,111.—ANDREW PATTERSON, of Birmingham, Pennsylvania.—*Improved Churn*.—Patent dated March 1, 1859.—This invention consists in the combination of the adjustable dash wheel *x y*, and adjustable partition *w*, in such manner that the wheel, when it strikes the cream, shall impel or throw a portion of it over the said partition, where it shall be at rest, until displaced by successive portions, so that it shall sink down and pass through or under the bottom of said partition, to be again in its turn operated upon by the wheel.

*Claim*.—The combination of the chamber *a* with the chamber *b*, when said chamber *b* serves the double purpose of a lid or covering for the cream in chamber *a*, and a frame for the dash wheel, driving wheel, and crank, substantially as described and set forth.

No. 23,112.—JOHN K. PETERS, of New York, N. Y.—*Improved Ship's Propeller*.—Patent dated March 1, 1859.—This propeller consists of one or more blades or floats *C*, attached, each at one end or edge, by a flexible joint, to an arm *A*, lever, rod, bar, or frame, which has imparted to it a reciprocating motion, either vertically or in a direction transverse to the length of the vessel, by which motion the blade or float is caused to receive a vibrating motion which causes them to present their opposite faces alternately to the water in a direction oblique to that of the reciprocating motion of the arm to which they are attached and to the length of the vessel, and thereby exert a pressure upon the water in such a way as to propel the vessel.

*Claim*.—The arrangement and combination of stops *c d*, arm *A*, and blade *C*, (more than one blade with the stops being combined with the arm *A*, when desired,) substantially as and for the purpose shown and described.

No. 23,113.—DANIEL POWERS, of Philadelphia, Pa.—*Improved Lock*.—Patent dated March 1, 1859.—This improvement consists in the expanding and contracting guards or fence of two pieces *ff*, jointed on the bolt *b*, between which the tumblers *t* must stand when the bolt *b* is thrown back to unlock it. This arrangement prevents the feeling out the proper position of the tumblers *t*, in attempting to pick the lock.

The inventor says: I *claim* the independent movable expanding and contracting fence, or its equivalent, substantially as set forth.

I also claim the union of the upper and lower halves thereof, as specified.

No. 23,114.—NOAH PRATT, of Nicholson, Pa.—*Improved Centre Board for Vessels*.—Patent dated March 1, 1859.—The claim and engraving will explain the nature of this invention.

*Claim*.—Applying the centre board *D* and appliances for operating the same in a movable box or curb *C*, which is so fitted into a well hole, or a stationary curb built into the vessel, as to be capable of being lifted out of said well hole or curb with the centre board, and all its appliances, substantially as described.

No. 23,115.—DANIEL RANCK, of Intercourse, Pa.—*Improvement in Harvesters*.—Patent dated March 1, 1859.—The front or sickle side of the platform *A* is at a right angle to the driving wheel *o*, having a side projection for the curved support *C*, upright *T*, post *G*, with its projecting arm for the reception of the spindle or pivot *E*. The sliding head *R* of the rake *D* is slipped over the pivot *E* at its common centre, the outer edge and rim *B* on the platform and the upright *T* being arcs of a smaller circle. The upper edge of the rim *B* corresponds with the side piece *H*, forming an inclined plane, gradually rising forward to a point over the sickle, from whence it tapers into the projecting shoe.

*Claim*.—The combination of the inclined planes *H*, and springs *I*, crank *K*, and connecting rod *L*, spindle or pivot *E*, sliding rake head *R*, and curved supports *B T* and *C*, when these several parts are arranged in the manner described, for the purpose specified.

No. 23,116.—ISAAC RULOFSON, of Penn Yan, N. Y.—*Improvement in Ploughs*.—Patent dated March 1, 1859.—By reference to the claim and drawings, the reader will obtain an idea of this invention.

*Claim*.—The arrangement of beam *A*, standard *B*, landside strip *D*, share *E*, mould board *C*, and piece *H*, the whole being constructed and united as and for the purpose set forth.

No. 23,117.—GEORGE E. SAFFORD, of New York, N. Y.—*Improved Screw Propeller*.—Patent dated March 1, 1859.—This invention consists in hanging the blades C to the shaft by means of a double hub B, made in two parts, with diagonal notches in the boss, in which notches the blades are secured.

*Claim*.—The hub B B, made in two disks, with spiral or inclined slots to receive the floats, when the floats are removably secured to the hub, in the manner described, and the whole being constructed substantially as and for the purpose set forth.

No. 23,118.—EMILIUS N. SCHERR, of Philadelphia, Pa.—*Improved Automatic Bell Ringer*.—Patent dated March 1, 1859.—This invention consists in the employment of a barrel or cylinder A, the periphery of which is provided with any desired number of holes for the reception of steel pins *b b*, placed on parallel lines and secured to their places by nuts on the inside, but easily removable for the purpose of changing their position so as to vary the airs to be played; B is a bar which rests at each end in the frames C, and acts as a fulcrum for the keys D.

*Claim*.—The described manner of automatically producing music from bells by the employment of adjustable pins *b*, in the barrel A, actuated by clock-work or other motive power, and giving motion to the hammers D, in any manner equivalent to that shown and described.

No. 23,119.—D. P. SHAW and F. C. BROWN, of Rochester, N. Y.—*Improvement in Smut Machines*.—Patent dated March 1, 1859.—This invention consists in the employment of a blast spout K L, fan, and scouring device, arranged relatively to each other, so that a very compact and efficient machine is obtained, the grain being subjected to a blast before entering the scourer, while passing through the same, and also after leaving the scourer just previous to leaving the machine.

*Claim*.—The arrangement of the blast spouts K L, with the scouring device inclosed within the cylinder I, and the fan box C, in connection with the tubes J, substantially as shown, whereby the grain is subjected to a continual blast during the whole of its passage through the machine, to wit: prior to its advent into the cylinder I, while acted upon by the scourer, and after it leaves the scourer, substantially as described.

No. 23,120.—WILLIAM N. SLASON, of South Reading, Mass.—*Improved Washing Machine*.—Patent dated March 1, 1859.—In each of the washing chambers D E is a horizontal grated dasher I K, which is suspended from the lever C by a bar *d* and a connection bar *c*, the two being jointed together and connected to the brake so as to admit of the dasher being alternately raised and lowered within the washing chamber while the brake C is moved or worked up and down on its fulcrum. Over each dasher, and extending horizontally and parallel therewith is a set of squeezing gratings L L or boards M M.

The inventor says: I *claim* the arrangement and combination of the squeezing gratings or boards with the reciprocating dasher or washer, or rinsing chamber.

I also claim the application of the separate soap chamber to the wash or rinsing chamber, in the manner and for the purpose set forth.

I also claim the arrangement of the windlass with reference to the box A, and brake C, and for the purpose specified.

No. 23,121.—JACOB STEAR, of Smicksburg, Pa.—*Improvement in Water Wheels*.—Patent dated March 1, 1859.—The wheel consists of a solid disk L, which is cut through near its perimeter in such a manner as to form a series of dished buckets L<sup>1</sup>, which overlap each other on the under side of the wheel, and is arranged and secured in a surrounding rim or cylinder *i* to the face of said disk, said rim is so constructed as to have an annular flange around its upper edge; from the inner side of this flange extend downward a series of inclined ribs *k*, which are equal in width to, and unite with the disk at the spaces *h*, between the buckets L<sup>1</sup>.

*Claim*.—The combination of the cylinder *i*, inclined ribs *k*, and disk L, with its buckets L<sup>1</sup>, the whole constructed and operating essentially as described.

No. 23,122.—ALEXANDER STEPHENS, of Baltimore, Md.—*Improvement in Constructing Wharves*.—Patent dated March 1, 1859.—The claim and engraving will explain the nature of this invention.

*Claim*.—Brace piles driven at a suitable angle, and having their heads so drawn back as to secure a purchase from the footing of the pile, when combined with vertical piles P and capping logs *u c l*, substantially as described.

No. 23,123.—ROBERT L. STEWART and JOHN CHRISTOPHER, of Ligonier, and ROSS FORWARD, of Somerset, Pa.—*Improved Hearth for Working and Refining Iron*.—Patent dated March 1, 1859.—The pipe D conducts the steam from the boilers at G into the steam chamber C, from which it presses through the perforations into the liquid metal. A hole H is left in one of the side pieces S S for letting out the metal when the process is finished.

*Claim.*—The steam chamber C, and perforated hearth B, as in the specifications and drawings described, for the uses and purposes set forth.

No. 23,124.—G. W. B. STOR, of Carlisle, Pa.—*Improvement in Apparatus for Slaughtering Hogs.*—Patent dated March 1, 1859.—The inventor says: To use my apparatus, I fasten the posts *o o* in the bar D, and apply the top bar P to them, and perforate it for the upper end of the shaft Q to turn in, the lower end of said shaft being coupled to the pivot of the shaft E, so as to be turned by and with the shaft E, and carry the bar R fastened in the shaft Q, which bar R is provided with a pulley in each end, and there is also a pulley S in the upper part of the shaft Q. The rope T is fastened to the long end of the lever G, and passes over each of the above-mentioned pulleys and the end fastened near the operator, who raises the long end of the lever G with one hand, while he places the hook K under the gambrel with the other hand; by pulling the rope T, which hangs below the lever, he can raise the hog from the slaughtering bench and hang it on one of the arms M of the rotating shaft N.

*Claim.*—The arrangement of the vertical shafts E Q, lever G, and bar R, with the vertical rotating shaft N, and the rectangular frame B C D and O P, the whole being constructed as and for the purpose set forth.

No. 23,125.—N. G. THORN, of Dayton, Ohio.—*Improvement in Mashing.*—Patent dated March 1, 1859.—The nature of this invention consists in introducing, by means of pipes *e e e*, and hollow shafts *d d d<sup>1</sup>*, water, steam, and air at different times, as may be required in the *mash tub* during the process of mashing.

The inventor says: I *claim*, first, the perforations in the pipes *e e e*, &c., attached to the hollow arms *d d d<sup>1</sup>*, or any analogous device, by which water, steam, or air is admitted into the *mash tub* in such manner as to distribute it equally, or nearly so, to all parts of the mash.

Second. The spiral agitators *fff*, when attached to any revolving machinery for the purpose set forth.

Third. The surface agitators *g g*, of whatever form when attached to revolving tubes for the purpose set forth.

Fourth. The use of a self-packing joint *h*, applied to *mash tubs* when used for the purpose set forth in whatever form it may be constructed.

Fifth. The combination of the surface agitators, with a stationary or revolving blast.

No. 23,126.—AMOS G. THOMPSON and ANDREW J. THOMPSON, of Belleville, Ohio.—*Improvement in Corn Planters.*—Patent dated March 1, 1859.—In the engraving B B are plungers passing down behind the seed hoppers C C, which plungers are passed downwards by the operator pressing on the cross-bar E, by means of which motion the seed is separated from the bulk of seed in the hopper and passed through the aperture through the plungers into the seed chambers F F, which cross-bar and plungers are thrown back to their proper position by the spiral springs *a a*, and held in position by means of said springs and straps *o o*.

*Claim.*—The arrangement of spiral springs *a a*, in combination with cross-bar E, and straps *o o* for regulating the movement of the plungers B B, substantially as specified.

No. 23,127.—JOSEPH N. TREADWELL, of Reading, Conn.—*Improvement in Machines for Scouring and Hulling Grain.*—Patent dated March 1, 1859.—The grain to be operated upon is fed in at the eye *f*, and as it is slowly carried towards the skirt of the runner F is scoured and hulled, and dropping off said skirt falls into the curb B.

*Claim.*—In combination with a bed-stone and runner for scouring and hulling grain, the grooves *c*, and rasping plates H I skirting said grooves, said parts being arranged and operating together substantially as and for the purpose set forth.

No. 23,128.—A. VAN TRUMP, of Lancaster, Ohio.—*Improvement in Sugar-Cane Mills.*—Patent dated March 1, 1859.—The nature of this invention consists in the combination, in a sugar-cane mill, of two or more intermediate small feed rollers C C, with four or more large crushing rollers B B<sup>1</sup>, the small feed rollers being arranged between the large crushing rollers at such a point that their peripheries work in concert on the same line as do the peripheries of the large crushing rollers, and thus form a support and act as a feed motion at the centre of the machine to the ends of the cane-stalks as soon as they emerge from between the first pair of crushing rollers, and until they pass in between the second pair of crushing rollers.

*Claim.*—The combination in a sugar-cane mill of two or more intermediate small feed rollers C C with four or more large crushing rollers B B, B<sup>1</sup> B<sup>1</sup>, substantially as and for the purposes set forth.

No. 23,129.—MATTHIAS VANDENBURG, of Newark, N. J., assignor to FRANKLIN BERRY, of Owego, N. Y.—*Improvement in Skates.*—Patent dated March 1, 1859.—The nature of this invention consists in confining the skate firmly to the foot, by substituting for the ordinary method an elastic covering A to the front of the foot, and in constructing the foot-board of the skate in sections E.

The inventor says: I *claim*, first, an elastic front to confine the foot to the skate.

Second. Rendering the foot-board adjustable to feet of various widths by constructing it in sections.

No. 23,130.—GEORGE VOGT, of Philadelphia, Pa.—*Improvement in Pianofortes*.—Patent dated March 1, 1859.—This invention consists in the employment of an improved rest, consisting of a combination of ivory, wood, and metal, and through which the strings *ff* pass in a manner avoiding the side bearing produced by receiving them against the side of a pin *L*, and which allows the strings a free undisturbed vibration in equal directions.

*Claim*.—The employment of the described rest and bridge, either separately or combined, when the same are constructed and operate substantially in manner and for the purpose set forth.

No. 23,131.—ALEXEY W. VON SCHMIDT, of San Francisco, Cal.—*Improved Water Metre*.—Patent dated March 1, 1859.—In the drawings *A* is a portion of the current water pipe, within which is a propeller *B* mounted upon an axis *b*, the bearings of which are in the cross pieces *a a*. The propeller is of a screw or scroll form, and the pitch of the screw is  $3\frac{3}{4}$  inches for a pipe 2 inches in diameter, and the hub or axis *b* of this propeller is of hollow metal, so as to give buoyancy, by which means the pressure and friction are taken off from its bearings to a great extent.

*Claim*.—Combining with the propeller *B* the radial partitions or feathers *k k*, and the reacting shuttes *m m*, said feathers and shuttes being arranged and operating as set forth.

No. 23,132.—RUSSELL WARNER of Brattleboro, Vt.—*Improvement in Harvesters*.—Patent dated March 1, 1859.—This invention consists in a peculiar construction and arrangement of the cutting device, whereby it is made to act very efficiently, and with but a moderate application of power; also in a peculiar arrangement of the pole, whereby the machine can be turned with much greater ease than usual.

The inventor says: I *claim*, first, the circular cutters *q* attached to bars *r* at the lower ends of rotating shafts *k*, and having an independent rotating motion given them by means of the gearing *s a*.

Second. The combination of the cutters *x*, plates *u p*, and shafts *k*, with or without the sharpeners *a* or *c*, arranged as shown to operate as and for the purpose set forth.

No. 23,133.—WILLIAM H. WHITE, of Garrattsville, N. Y.—*Improvement in Horse Rakes*.—Patent dated March 1, 1859.—The nature of this invention consists in the employment of two levers *A C*, which are crossed diagonally and pivoted together at *d*, in combination with the turning rake and with the frame *C* and seat of the carriage; when one of the levers is arranged to be depressed by the weight of the driver on the seat *B B<sup>1</sup>* of the carriage, and thus made to serve for holding the rake *D* down to the ground, and the other arranged to be operated by hand, and to serve for throwing up the rake, and thus freeing it of its load.

*Claim*.—The employment of the two levers *A C* when crossed diagonally and pivoted together at *d*, in combination with the turning rake-head *D*, frame *C*, and seat *B B<sup>1</sup>*, substantially as and for the purposes set forth.

No. 23,134.—JOHN M. WHITNEY, of Bolton, Mass.—*Improvement in Ploughs*.—Patent dated March 1, 1859.—As the plough is started to form the furrow, the wheel *H*, with its frame *C D* on the land side, and sufficiently heavy to control the other parts of the apparatus, travels upon the ground and governs the rim of the plough by controlling the angle at which the mould board *I* works.

*Claim*.—The arrangement of the hinged arms *C D*, adjustable brace *E*, and standard *A*, with the wheel *H* and plough beam *G*, the whole being constructed for operating substantially as and for the purpose described.

No. 23,135.—JOHN M. WHITNEY, of Bolton, Mass.—*Improvement in Cultivators*.—Patent dated March 1, 1859.—The thills *J* are placed one side of the centre of the apparatus, in order that the horse may travel one side of the row of stalks to be cultivated; the thills *J*, by being attached to the frame *H*, which is swiveled to the cultivator frames *A B* by means of the connecting frame *L*, allows the horse also to travel unevenly, while the cultivator frame *A B* may be kept by the operator always at right angles to the frame *H*, and in proper course.

*Claim*.—The arrangement of the teeth *a*, adjustable mould-boards *D*, frames *A A<sup>1</sup>*, and cross-beam *B*, with the branched swivel bar *L*, and frame *H*, the whole being constructed as and for the purpose described.

No. 23,136.—JOHN E. WOOTTEN, of Philadelphia, Pa.—*Improved Gauge Cock*.—Patent dated March 1, 1859.—The nature of this invention consists in providing a tube *A a*, the arm *a* of which should be fixed as near at a right angle with tube *A* as may be desired, and of such length as that when swung upward or downward it may reach the highest or lowest level of water which should be contained within the boiler. At the upper end of arm *a* is

seated a valve E, which is actuated by rod F, by means of cam C; tube A passes through stuffing-box B, and revolves free therein.

*Claim.*—The arrangement of the tube A a, in combination with the cam c, rod F, and valve E, for the purpose and in the manner set forth.

No. 23,137.—ALBERT A. WOOD, of New York, N. Y.—*Improvement in Valve Gears.*—Patent dated March 1, 1859.—This invention consists in the combination of two links D and E E<sup>1</sup>, placed within the strap, said links being operated by an eccentric B to give motion to the valves, and made adjustable to regulate the admission of steam to the cylinder.

*Claim.*—The combination of the links D and E E<sup>1</sup>, attached to the eccentric rod, and arranged with adjusting gear, as described, or in a manner equivalent.

No. 23,138.—JOEL R. BASSETT, of Cincinnati, Ohio, assignor to Himself, and A. E. BATEMAN, of said Cincinnati.—*Improvement in making Bolts and Rivets.*—Patent dated March 1, 1859.

The inventor says: The operation is as follows: Upon a suitable iron frame is arranged a rotary stock. A portion of this stock being formed of a diameter somewhat greater than the other part, is called the die-stock, and the remaining portion is called header-stock. To the face of the periphery of the die-stock, at suitable intervals, are hinged clamps. These clamps are made to fit and lie closely upon the face of the die-stock. Dovetailed cavities are formed across the face of the die-stock, and also across the corresponding face of the clamps. The die pieces are inserted into these cavities in such manner that when the clamp lies closely upon the die-stock the die pieces will be fitted exactly to each other, so as to form the die ready for the reception of the rod as the die rotates. The rod to be worked is fed to the die; after which, the loose end of the clamp is caught by a compressing roller attached to the frame and compressed so as to be held firmly against the die-stock. The blank now being grasped tightly within the die, is severed from the rod, by means of a cutter attached to the same.

*Claim.*—The die A A<sup>1</sup>, a a, i i, g<sup>1</sup> g<sup>1</sup>, f f, and k k, substantially as described, for the purposes set forth.

No. 23,139.—FRANZ ANTON LOHAGE, of Unna, Prussia, assignor to EDMUND LEOPOLD BENZON, of Boston, Mass.—*Improvement in the Manufacture of Steel.*—Patent dated March 1, 1859.—The claim will explain the nature of this invention.

*Claim.*—The new or improved art of manufacturing steel of any desired temper, or hardened according to the various purposes or uses for which the steel may be required, by arresting the decarbonization of the mass of metal in the furnace at certain points or stages thereof, ascertained and recognized by means of certain phenomena, or external indications manifested by the material, substantially as described.

No. 23,140.—PHILEMON STEWART, of New Lebanon, N. Y., assignor to AUCHAMPAUGH BROTHERS, of said New Lebanon.—*Improved Cast-iron Fence Post.*—Patent dated March 1, 1859.—The claim and engraving will explain the nature of this invention.

*Claim.*—As a new article of manufacture, a cast-iron fence post, constructed with flanges h m, to protect the ends of the fence rails against being split, as well as against moisture, substantially in the manner described.

No. 23,141.—DAVID E. PAYNTER, of Philadelphia, Pa., assignor to Himself and ISRAEL M. BISSELL, of said Philadelphia.—*Improvement in the Manufacture of Precipitated Sulphur.*—Patent dated March 1, 1859.—This invention consists in boiling water mixed with the ashes resulting from the combustion of gypsum and coal-dust, until a yellow solution is obtained; in adding to the boiling solution a quantity of ordinary brimstone; and finally in precipitating the sulphur by an excess of muriatic acid.

*Claim.*—Manufacturing precipitated sulphur from the ashes resulting from the combustion of gypsum and coal-dust, in the manner described and for the purpose specified.

No. 23,142.—JAMES JENKINSON, of Williamsburgh, N. Y., assignor to Himself and EMANUEL MANDEL, of said Williamsburgh.—*Improvement in Tempering Steel Springs.*—Patent dated March 1, 1859.—The claim and engraving will explain the nature of this invention.

*Claim.*—Arranging the wires c c in such a manner that by tying one end of each of the same to one of the arms of the wheel A, on which the coil is formed, and by extending the ends so tied down to the hub of the wheel, the loose ends of the wire serve to fasten the several rings of the coil, substantially as described.

No. 23,143.—W. W. HOLLMAN, of Eddyville, Ky.—*Improved Measuring Faucet.*—Patent dated March 1, 1859.—The claim and engraving will explain the nature of this invention.

The inventor says: I claim, first, in combination with a faucet piece having an induction and eduction pipe, a receiving and variable chamber, so constructed and arranged that by

partially rotating it within the said faucet-piece the liquid will be alternately received and discharged through a port or ports, substantially as described.

Second. Making the rod B polygonal, when used in combination with the variable measuring chamber and its piston, substantially as described and for the purpose set forth.

NO. 23,144.—ABRAHAM ANDREWS, of Bernville, Pa.—*Improved Water-Wheel*.—Patent dated March 8, 1859.—In the engravings A is a square block having a spiral chamber B curving upwards through which the water flows; the water entering at the opening C and passing up and over the wheel which is above the spiral chamber B. D is the wheel with buckets E curving downwards, so that the water strikes the concavity of the buckets and passes off between the buckets above.

*Claim*.—The curved concave buckets in combination with the spiral chamber beneath, substantially as described.

NO. 23,145.—J. B. ATWATER, of Berlin, Wis.—*Improvement in Car-Couplers*.—Patent dated March 8, 1859.—In the engravings C is a gate, secured to the body of the coupler A A, back of the front piece F. The projection *n* is secured to the bottom of the gate C. E is the pin attached at its upper end to the top of the gate by means of a hook *e*. *a* is a door which is loosely hinged on the bottom piece of the body of the coupler. This door is turned over at its top and is provided on its side with an inclined projection *o*. D is a lever, one end of which is secured to the pin E.

*Claim*.—The arrangement of the falling gate C, provided with projection *n*, loosely-hinged door *a*, turned over at its top, and provided with inclined projection *o*, adjustable piece *i*, pin E, lever D, and catch *m*, the several parts being combined and operated substantially in the manner and for the purpose specified.

NO. 23,146.—STEBEN T. BACON, of Boston, Mass.—*Improved Register for Sheets of Paper*.—Patent dated March 8, 1859.—The claim and engraving will explain the nature of this invention.

*Claim*.—Punching or cutting holes in sheets of paper, for the purpose of securing a more perfect and rapid register in printing and paper folding machines, substantially as described.

NO. 23,147.—THEODORE BAILEY, of Friendship, Va.—*Improvement in Dumping-Wagons*.—Patent dated March 8, 1859.—The body is hung at the centre of its length, and is arranged to slide over the hind axle until its axis passes the centre of gravity, at which point the body tilts and dumps its load. A spring catch H locks the body when the team is moving forward.

The inventor says: I *claim*, first, a wagon which dumps itself by the approximation of the wheels, as set forth.

Second. The combination of a spring catch H with the divided reach, substantially as and for the purposes set forth.

NO. 23,148.—DAVID BEARD, of Shippensburg, Pa.—*Improvement in Connecting Hubs and Axles of Vehicles*.—Patent dated March 8, 1859.—The claim and engraving will explain the nature of this invention.

The inventor says: I *claim*, first, the peculiar manner of effecting a combination of the hub A, short auxiliary axles B, and intermediate stationary axle, whereby internal auxiliary bearings for the short axle and an external main bearing for the hub are provided, substantially as and for the purposes set forth.

Second. Making the end of the main axle C convex, and the main bearing in the inner end of the hub concave, substantially as and for the purposes set forth.

NO. 23,149.—WILLIAM BEERS, of Milan, Ohio.—*Improved Yokes of Ships' Rudder-Posts*.—Patent dated March 8, 1859.—The claim and engraving will explain the nature of this invention.

The inventor says: I am aware that India rubber has been employed in various ways for producing tight joints and for protecting parts of machines liable to injury from friction or concussion; therefore, I do not claim the use of rubber as a new device.

But I *claim* the construction of a divided yoke A B for rudder-posts, in combination with the employment of a guard of India rubber C, or other elastic packing, between the yoke and the post, in order to prevent injury to the rudder-post, and also to facilitate the repair of damages produced by the common yoke, substantially as set forth.

NO. 23,150.—WILLIAM BEERS, of Milan, Ohio.—*Improved Ships' Steering Apparatus*.—Patent dated March 8, 1859.—This invention consists in a peculiar construction and arrangement of arms I upon the rudder-post K, and also an arrangement of rollers L, collars S, and guards P, for preventing friction and concussions.

The inventor says: I *claim*, first, the slotted arm or arms, constructed, arranged, and employed in the manner and for the purposes substantially as set forth.

Second. I claim the elastic friction collar or collars S and the elastic guard or guards P, in combination with the above-described steering machine, for preventing concussion and friction, substantially as described.

Third. I claim the friction rollers L in combination with the screw nut G, for preventing the nut from binding upon the screw, substantially as set forth.

No. 23,151.—HENRY WILLIAM BEINS, of New York, N. Y.—*Improvement in the Treatment of Vulcanized Rubber.*—Patent dated March 8, 1859.—The nature of this invention consists in covering the surface of the article to be reheated with a layer of unvulcanized India rubber composition, by which it is secured against the injurious action experienced in exposing the same surface more than once to the vulcanizing process.

*Claim.*—The process described of cementing vulcanized India rubber to and covering it with a new layer of unvulcanized India rubber composition, in the manner and for the purposes set forth.

No. 23,152.—I. B. BLAIR, of Philadelphia, Pa.—*Improved Attachment to Ruling Machines.*—Patent dated March 8, 1859.—The claim and engravings will explain the nature of this invention.

*Claim.*—The application of one or more magnets (electro-magnets) to any ruling machine for ruling paper, in such manner that the magnets shall, either directly or indirectly, be made to control the operations of the pens, through the agency of the paper in breaking, closing, or changing the circuit of electricity.

No. 23,153.—J. L. BOOTH, of New York, N. Y.—*Improvement in Grain Separators.*—Patent dated March 8, 1859.—Foreign substances are, in this invention, separated from the grain, and one kind of grain is separated from another by impelling it by suitable machinery, and with the proper velocity, against the air, so that the difference in the specific gravity of the parts to be separated, aided by their form and shape, will effect the desired end.

*Claim.*—As an improved article of manufacture, a grain separator, composed of a box A, belt B, plates *d*, hopper C, pulleys *b b*, and otherwise constructed, substantially as shown and described for the purpose specified.

No. 23,154.—DANIEL BOWMAN, of Tampico, Tennessee.—*Improvement in Fish-traps.*—Patent dated March 8, 1859.—The claim and engraving will explain the nature of this invention.

The inventor says: I *claim* making the dams incline towards each other and up stream, so as to shelve over and make a dark recess, to induce the fish to run towards the shute and trap when the water is clear as well as when it is muddy.

I also claim the cover of the shute E for the purpose of shading the water and making it dark, so that the fish will be induced to enter the shute and trap.

No. 23,155.—ISAIAH C. BURGET, of Davenport Centre, N. Y.—*Improvement in Horse Rakes.*—Patent dated March 8, 1859.—The claim and engraving will explain the nature of this invention.

The inventor says: I *claim*, first, The arrangement of the treddles J J, hung to the frame, in combination with the rake-bar and yoke, for raising one end of the rake without disturbing the other, substantially as set forth.

Second. The combinations of the springs *g* with the arm E, and catch plate I, for holding the rake-bar in position, and at the same time to allow it to yield bodily to any obstruction there may be upon the ground, substantially as set forth.

No. 23,156.—HENRY CLIFTON, of Buffalo, N. Y.—*Improvement in Trunks.*—Patent dated March 8, 1859.—The claim and engraving will explain the nature of this invention.

*Claim.*—In combination with a trunk A, made up of a series of drawers D D, such as described, the hinged plates E E for holding and locking said drawers to the frame of the trunk through the intervention of the lid B and its lock, substantially as described and represented.

No. 23, 157.—JOHN H. COOPER, of Philadelphia, Pa.—*Improvement in Sewing Machines.*—Patent dated March 8, 1859.—This invention consists in operating the shuttle N of a sewing machine by attaching its holder *n* to an arm or carrier M, operated by a rotating crank K, and guided by a vibrating arm L, or its equivalent.

*Claim.*—The combination of the shuttle-holder *n*, arm L, crank K, and arm M, or its equivalent, when the said holder *n* is attached to, or forms a part of the arm L, when the latter is carried by the crank K, and when the whole of the parts are arranged for joint action, substantially as and for the purpose set forth.

No. 23,158.—ALLAN CUMMINGS, of New York, N. Y.—*Improvement in Ash Sifters.*—Patent dated March 8, 1859.—The claim and engraving will explain the nature of this invention.

*Claim.*—The combination of the pyramidal or conical-formed distributor B interposed between the entrance and the sieve, the latter being of similar form inverted, these being arranged in relation to each other and to the diaphragm and receptacles, substantially as and for the purpose explained.

No. 23,159.—C. H. DAWSON, of Jacksonville, Ill.—*Improvement in Cultivators*.—Patent dated March 8, 1859.—A series of ploughs G I are attached to an adjustable frame, which is connected to an axle A, and so arranged that they may be placed higher or lower as desired, and the device is capable of being used as a gang or subsoil plough. In connection with the ploughs a roller O is placed, that crushes and rolls down weeds before them.

*Claim*.—The plough-beams D D<sup>1</sup> arranged as shown in connection with the roller O applied to the machine, substantially as and for the purpose set forth.

No. 23,160.—MICHAEL A. DEITZ, of Brooklyn, N. Y.—*Improvement in Lamps*.—Patent dated March 8, 1859; ante-dated September 8, 1858.—This invention consists in forming the lower part of the top into an air-chamber *d*, near the bottom of which a series of holes *z* are pierced for the admission of fresh air, and at the upper part of which a narrow aperture is left on each side of the wick-tube for the passage upward of the air from the air-chamber beneath, by means of which a continuous current is established, running up along the wick-tube.

*Claim*.—The arrangement of an air-chamber *d* in the top of a lamp having a flat wick, when said lamp is provided with a cone or deflector B for feeding air to the flame, and the air-chamber *d*, with a series of holes *z* for the admission of fresh air, and openings *f* for its passage upwards along the sides of the wick-tube, or their or either of their equivalents, in the manner and for the purposes substantially as set forth.

No. 23,161.—A. F. ENDRISS, of New York, N. Y.—*Improvement in Machines for Folding and Registering Paper*.—Patent dated March 8, 1859.—This invention consists in making the required bend into a sheet of paper by means of folding knives F F<sup>1</sup> F<sup>2</sup>, which are placed over a gap made in the top of horizontal tables, and in such relation to two rollers H H<sup>1</sup> H<sup>2</sup>, which revolve in opposite directions, under the table, that a sheet of paper on the table is depressed by the knives between the rollers, when it is caught and folded over by being drawn through between these rollers. An apparatus is also attached which registers the number of sheets folded.

The inventor says: I *claim* the arrangement of a series of folding knives F F<sup>1</sup> F<sup>2</sup> at right angles to one another in the same sliding-frame B, which is constructed and operated substantially as set forth.

I also claim arranging the sliding-frame B in such a manner that it operates a registering apparatus K by means of a lever *o*, substantially as and for the purpose specified.

No. 23,162.—JAMES L. FAGAN, of Anaqua, Texas.—*Improved Rotary Pump*.—Patent dated March 8, 1859.—The object of this invention is to obtain a submerged pump of simple construction, one to which the motive power may be readily applied, and that will be efficient in its operation, and not liable to get out of repair. A rotating cylinder A is employed, provided with a valve or piston H, and used in connection with a stationary stop or cut-off I, placed within the cylinder, the latter being attached to a tubular shaft B.

*Claim*.—The combination of the rotating hollow shaft B, provided with a valve *b*, the cylinder A attached to said shaft perforated at *a*, and having the adjustable or hinged valve or piston H secured within A, and the stationary stop or cut-off I attached to the bed-plate C and fitted within the cylinder A, the whole being arranged and applied for joint operation substantially as and for the purpose set forth.

No. 23,163.—JAMES P. GAGE, of New York, N. Y.—*Improvement in Balloons*.—Patent dated March 8, 1859.—The claim and engraving will explain the nature of this invention.

The inventor says: I am aware that the idea of producing an advance or lateral motion of balloons by pressure upon the air of flat surfaces, fans, or wings, has been before entertained. I do not, therefore, claim that as my discovery and invention.

But I *claim* operating upon the air by the instrumentality of the balloon itself, constructed in a diamond or lozenge-shaped figure C, or any other substantially similar figure presenting a flat surface to the air, arranged and adjusted with the car *d*, suspended from the lowest central point of the balloon by a rod *d*<sup>1</sup>, with link-joints or their equivalents, and operated by the fore-and-aft and side halyards *a b*, in the manner and for the purposes described.

I also claim the manner of arranging and adjusting a diamond-shaped flat frame or surface (or any similar shape) to a spherical balloon, with the car suspended underneath, as shown, operating in the manner and for the purposes described.

No. 23,164.—CHARLES C. GARRETT, of Spring Hill, Ala.—*Improvement in Cotton Seed Planters*.—Patent dated March 8, 1859.—In this invention a rotating toothed wheel J is employed in connection with stationary stripping brushes *j j*, the wheels and brushes being placed in the bottom of a seed box, which is provided with adjustable plates *k k*, the parts being arranged to operate, so that cotton seed may be planted in the same state that they are discharged from the gin, and the discharge of seed regulated as may be desired.

*Claim*.—In combination with the wheel J and brushes *j j*, the adjustable plates *k k* arranged substantially as and for the purpose specified.

No. 23,165.—SAMUEL GATY and AMOS HOWE, of St. Louis, Mo.—*Improved Method of Operating Puppet Valves of Steam Engines.*—Patent dated March 8, 1859.—The claim and engravings will explain the nature of this invention.

The inventors say: We *claim*, first, the steam lifters J J<sup>1</sup>, exhaust lifters K K<sup>1</sup>, and puppet heads B B<sup>1</sup>, with their respective faces, as described, for the purpose of operating steam and exhaust valves and puppet valve steam engines.

Second. The lifter J, in combination with the jointed lifting piece T, puppet head B, and graduated cut-off ring or sector M, for the purpose of producing a variable expansion motion, self-regulating or otherwise, substantially as described.

Third. The relative adjustment of the cut-off ring M M<sup>1</sup>, for the purpose of admitting steam in equal quantities in each end of the steam cylinder, in the manner described.

No. 23,166.—W. Y. GILL, of Henderson, Ky.—*Improved Steam Gauge.*—Patent dated March 8, 1859.—The claim and engraving will explain the nature of this invention.

The inventor says: I *claim* constructing a steam gauge, in which a piston acts in opposition to a spring, in such a manner that the lower portion of the same acts as an alarm by means of openings *c*, and so that the indication may be marked on one or more sides of the upper portion E of the stem, substantially as specified.

Second. Constructing the portion *c* of the piston of a smaller diameter than the lower and upper portion E B, and arranging the spring F, on the portion C, above the lower packed portion B, and below the indicating portion E, substantially as and for the purposes set forth.

No. 23,167.—JONATHAN GRIFFIN, of Stanford, N. Y.—*Improvement in Burning Fluids.*—Patent dated March 8, 1859.—This invention is an improvement in the means of producing light and heat, and is composed of certain chemical ingredients, a description of which is too long for a place in this report.

*Claim.*—The burning fluids A C and D, formed in the manner and of the materials substantially and for the purposes set forth.

No. 23,168.—JOHN GRIFFIN, of Louisville, Ky.—*Improvement in Cotton Harvesters.*—Patent dated March 8, 1859.—The inventor connects a flexible tube *b*, with a cylinder C, provided with a perforated plate *a*, and connected with a steam boiler A, so that a vacuum may be produced within the cylinder, and the cotton picked from the bolls on the standing stalks by atmospheric pressure, the tubes being presented to the cotton by suitable attendants.

*Claim.*—The cylinder C, one or more, provided with a perforated plate *a*, flexible tube or tubes *d*, and made to communicate with the steam boiler A, by means of the tubes *f g D*, substantially as and for the purpose set forth.

No. 23,169.—A. J. HAMILTON, of Kewanee, Ill.—*Improved Method of Operating Farm Gates by Approaching Vehicles.*—Patent dated March 8, 1859.—This invention relates to the construction of automatic gates for farm or other fences, and consists in certain improvements in the mechanism for operating the gate automatically or by the passage of a vehicle.

The inventor says: I *claim*, first, in combination with the two road levers D D<sup>1</sup>, constructed as described, the rigid actuating rods K and *m*, crank levers *h*, latch rod *g*, swivel bar *b*, and latches *e* and *d*, substantially as described, for the purpose set forth.

Second. In combination with the road levers D D<sup>1</sup>, the elevations or hedges E and E<sup>1</sup>, as described, for the purpose set forth.

No. 23,170.—THEODORE HEERMANS, of Sumner, Tenn.—*Improvement in Cultivators.*—Patent dated March 8, 1859.—This invention consists in making the hindmost teeth A A much smaller or of less width than the front tooth B, and intermediate teeth C C, and arranging the same so that they stand out beyond the side edges of the front tooth, and in beyond the inner side edges of the intermediate teeth.

The inventor says: I *claim*, first, the screw tapped shoulder or flange *c*, and screw shank *b*, of the cultivator teeth A B C, in combination with the screw nut *d*, having a series of auxiliary screws *f*, in the manner and for the purpose described.

Second. In combination with the above the specified arrangement of large and small cultivator teeth A B C, for the purposes described.

No. 23,171.—JOHN HENDERSON, of Bluff Springs, Miss.—*Improvement in Cotton Scrapers.*—Patent dated March 8, 1859.—The inventor says: The double winged cotton scraper is drawn by one horse, and scrapes both sides of the row at the same time and by the same movement, thus doing with one horse and hand the work of two horses and two hands, and at the same time dispensing with the usual mode of burring off.

*Claim.*—The forked bar F, and brace bar C, in combination with the beam B, and wings A, of a double winged cotton scraper, when constructed and arranged in the manner set forth.

No. 23,172.—RICHARD M. HOE, of New York, N. Y.—*Machine for Printing Railroad and other Tickets.*—Patent dated March 8, 1859.—The claim and engraving will explain the nature of this invention.

The inventor says: I *claim*, first, the peculiar mechanism, or its equivalent, for moving the registering disks on their axis at the proper times, by which means the tickets are numbered consecutively, substantially as described.

Second. I claim giving such a movement to the registering disks as will cause said disks to approach, press against, and travel with the impression cylinder, thus giving an impression to the roll of paper, then recede to change the figures of the disks, and allow the inking roller  $c^{31}$  to perform, and then again to approach the impression cylinder, and so on as before, substantially as described.

Third. I claim the adjustment of any derangement of the registering disks caused by slip, jar of the machine, or other cause, by means of the plates  $c^{32}$  and  $c^{33}$ , or any other means, substantially the same.

Fourth. I claim inking in a different color the registering figures, by means of a separate inking apparatus, substantially as described.

Fifth. I claim the printing the numbers on the tickets, while the said tickets are continuously advancing in the manner substantially described.

Sixth. I claim the guide  $c^{39}$ , placed between the impression cylinder and the cutter Y, or its equivalent, for retaining the strip of continually advancing paper, in its proper direction, while its lower end is stopped by the action of the cutter when separating a ticket from the roll.

Seventh. I claim the combination of the parts by which the tickets are deposited (after being cut) in a vertical position, in contradistinction to flatwise, in the trough  $c^{43}$ , destined to receive them.

Eighth. I claim the combination of the slide  $c^{46}$ , the spring catches  $c^{44}$   $c^{44}$ , and the sliding block  $c^{45}$ , by which the accumulating tickets are kept in a vertical position.

No. 23,173.—FRANCIS L. KIDDER, of Williamsburg, N. Y.—*Improvement in Attaching Carriage Thills to Axles.*—Patent dated March 8, 1859.—In this invention pins or rods are fitted between projecting ears that are attached to clips which encompass the front axle, one near each end, having metal hooks D, or clasps encompassing the pins of the clips, and are secured on the clips by keys  $d$ , in connection with hinged pressure plates.

*Claim.*—The arrangement and combination of the pivoted spring plate E, thill C, spring  $f$ , hook D, and self-adjusting key  $d$ , as and for the purpose shown and described.

No. 23,174.—JOSEPH H. KITE, of Conrad's Store, Va.—*Improvement in Corn Harvesters.*—Patent dated March 8, 1859.—The nature of this invention consists of the combination in a corn harvester of the horizontally revolving cutters  $i i$ , on the lower end of the reel shaft G, the vertical bevel wheels K K, with peripheries which serve for the horizontal cutters to act against, and the apron V V, which revolves at intervals by means of a peculiar spring clutch.

*Claim.*—The combination and arrangement of the horizontally revolving cutters  $i i$ , vertically revolving bevel-wheels K K, having plain peripheries, endless apron V V V, axle G, hollow shaft H, and peculiar spring clutch arrangement N N, P S<sup>1</sup>,  $g r$ , substantially as and for the purposes set forth.

No. 23,175.—DANIEL H. KRAUSER, of Pottsville, Pa.—*Improved Machine for Turning Irregular Forms.*—Patent dated March 8, 1859.—The nature of this invention consists of so arranging and combining the parts of the machine as that the cutters are made to approach or recede from the axis of the article to be shaped, whilst it is caused to traverse over said cutters, and is turned upon its axis at the proper time, so as to present a new face to the action of the cutters.

The inventor says: I *claim*, first, the manner of causing the carriage L, which supports the work, to traverse over the cutters by means of the pulleys E F,  $e$ , and G, belts  $c$  and K, endless chain  $m$ , crank-arms I, and connecting-rods K, arranged and operating as before described, in combination with the means described for turning the work on its axis through the plates M, bent levers N, pawl  $s$ , and ratchet-wheel  $o$ , substantially as set forth.

I do not claim the reverse pattern wheel W, in itself, as new; but I claim, secondly, the arrangement of the pulley Q, belt  $v$ , spindle R, in frame S, with the reverse pattern-wheel W, arranged and operating as set forth and described.

No. 23,176.—EDWARD L. LAMB and SAMUEL WOOD, of Keokuk, Iowa.—*Improvement in Moulding Female Screws.*—Patent dated March 8, 1859.—The claim and engravings will explain the nature of the invention.

*Claim.*—The match-plate  $a a^1$ , having both the exterior and interior of the pattern formed on it, when the same is divided vertically on a centre line, adapted to a suitable flask, and resting guides, on which the two halves of the plate can be withdrawn laterally in opposite directions from the core, substantially as described, for the purpose of moulding female

screws, or other articles which do not admit of having the pattern removed vertically from the core.

No. 23,177.—THOMAS LAVENDER, of Philadelphia, Pa.—*Improved Metallic Lining for Water Coolers.*—Patent dated March 8, 1859.—The pure tin is first hardened, cast into ingots, and then rolled to the required thinness. The plate of tin alloy thus formed is fitted to the interior of the vessel to be lined, and there fastened by soldering it.

*Claim.*—The lining or casing of an ordinary metallic vessel, with tin prepared and applied in the manner and for the purpose substantially as described.

No. 23,178.—LUCIUS LEAVENWORTH, of Trumansburgh, N. Y.—*Improved Clothes Fastener.*—Patent dated March 8, 1859.—The claim and engravings will explain the nature of this invention.

*Claim.*—A clothes fastener made of a single piece or block A, and having an open, angular, or curved groove B C therein to receive and hold the line and clothes upon it, by diverging or kinking said line, substantially as described, and thus simplifying and cheapening the clasp, by dispensing with the button heretofore used.

No. 23,179.—JOSEPH LEEDS, of Philadelphia, Pa.—*Improvement in Chimneys.*—Patent dated March 8, 1859.—The claim and engraving will explain the nature of this invention.

*Claim.*—In combination with an outer chimney or casing A, and an inner passage B, two or more ducts or passages between the two for heat, ventilation or draft, when said inner passages or flues are made by setting on top of each other iron sections with flanges 1 2 3 4 upon them, substantially as described.

No. 23,180.—NATHANIEL I. LILLY, of Selma, Ala.—*Improvement in Cotton Presses.*—Patent dated March 8, 1859.—As the follower F moves into a box B, the catch *d* will slip along the ratchet, and at any stoppage hold the follower. By a movement of the lever *l*, shaft C is turned, releasing the ratchet from the catch, and bringing the other ratchet within the action of said catch, which being held against it by the weight *w*, acts in the same manner as the rack is moved in the other direction, on a bale compressed in the other box.

*Claim.*—The combination of the boxes B B<sup>1</sup>, bar A, and followers F F<sup>1</sup>, with the shaft C, having the opposite ratchets thereon, and the swinging weighted catch *d*, hung in the bar A, together with the rack R, and pinion P; the whole operating as set forth.

No. 23,181.—JAMES LITTLE, of Evansville, Ind.—*Improved Machine for Cutting Staves from the Block.*—Patent dated March 8, 1859.—This invention consists in the employment of a revolving hollow cylinder E, provided with knives *h h*, and gauges K, and having a stationary bed-plate B and feeding device H H fitted within it.

*Claim.*—The hollow cylinder E, provided with the knives *h h* and gauge-strips K, in connection with the bed B and the feeding belts H H, or their equivalents, the parts being arranged to operate substantially as and for the purpose set forth.

No. 23,182.—DANIEL MARKHAM, A. S. MARKHAM, and DAVID ELDRED, of Monmouth, Ill.—*Improvement in Cultivators.*—Patent dated March 8, 1859.—The object of this invention is to obtain a cultivator with which corn and other *hoed* crops may be cultivated until they attain a considerable height, without being thrust down or at all injured by the cultivator, and the parts of the implement so arranged that it may be readily manipulated.

*Claim.*—The frame A, formed of two parts *a a*, connected by the traverse bars *b*, and provided with the sliding or adjustable frames C C, with the bars E and ploughs F attached, substantially as and for the purpose set forth.

No. 23,183.—DANIEL MARKHAM, A. S. MARKHAM, and DAVID ELDRED, of Monmouth, Ill.—*Improvement in Seeding Machines.*—Patent dated March 8, 1859.—The furrows which receive the seed are, by this invention, formed of an improved manner, so that all roots, weeds, the remains of previous crops, and such rubbish, are prevented from interfering with the proper forming of the furrows, and the ground, when planted, is left in a proper state for the early use of the cultivator or other implement used in subsequent cultivation.

*Claim.*—The adjustable standards H<sup>1</sup> M, knife L, share K, wings or mould-boards J J, with or without the tube I, arranged for joint operation, substantially as and for the purpose set forth.

No. 23,184.—H. L. McAVOY, of Baltimore, Md.—*Improved Refrigerator.*—Patent dated March 8, 1859.—This invention consists in the combination of a dumb-waiter with a refrigerator. The dumb-waiter shelves rise through the top of the refrigerator, and expose the articles on them to view. The elevation is effected by cords and pulleys.

*Claim.*—The combination of rising and falling shelf-frame with a non-conducting refrigerator casing, substantially as and for the purposes set forth.

No. 23,185.—JOSIAH V. MEIGS, of Nashville, Tenn.—*Improvement in Cooking Stoves.*—Patent dated March 8, 1859.—The claim and engraving will explain the nature of this invention.

*Claim.*—The arrangement of the bottom plate G of the oven in the same plane as the top plate M of the fire-pot E, in connection with the arrangement of the flues F F leading from the side of the fire-pot directly beneath the bottom of the oven and around it, substantially as described and for the purpose set forth.

No. 23,186.—JEREMIAH MITCHELL, of Gosport, N. Y.—*Improved Churn.*—Patent dated March 8, 1859.—The nature of this invention consists in the employment of a revolving box *a* partially surrounded by a warm or cold water jacket *d*, into which the cream is introduced and butter made without the use of paddles or dashers.

*Claim.*—The revolving box or churn when constructed and operated substantially in the manner and for the purpose set forth.

No. 23,187.—WILLIAM F. MORGAN, of Rochester, N. Y.—*Improvement in Machines for Shearing Sheep.*—Patent dated March 8, 1859.—This invention consists in applying a spring *f* through certain mechanism to a cutting device *s* to act as a motor, the whole being arranged whereby a very simple and efficient implement is obtained for shearing sheep.

The inventor says: I *claim* the arrangement of the cutting device, scroll-spring *f*, and necessary gearing, substantially as described and for the purpose set forth.

I further claim the pressure lever *t*, substantially as and for the purpose described.

No. 23,188.—JAMES MONTGOMERY, of New York, N. Y.—*Improvement in Iron Pavement.*—Patent dated March 8, 1859.—The claim and engravings will explain the nature of this invention.

The inventor says: I *claim*, first, a metallic pavement, consisting of a series of ribs or laminae in planes, parallel, or nearly so, connected at alternate or varying levels by webs of metal, substantially as and for the purpose set forth.

Second. Constructing metallic paving plates with ribs or arches of greater vertical depth in their intervening portion than at or near their sustained edges.

Third. The described combination of a concave or other suitably formed rail E, with the projecting edge *a*<sup>1</sup>, and the paving plate A, and the underlying edges of the plates A and A<sup>1</sup>, for the purposes set forth.

Fourth. The described construction and application of the buttress-plate B, in connection with the plate A, and curb stones C, for the purpose explained.

Fifth. Connecting the edges of ribbed or arched paving plates by tongue and grooved joints, as shown in figs. 9 to 13, or in any mechanically equivalent form.

No. 23,189.—JAMES MONTGOMERY, of New York, N. Y.—*Improvement in Iron Pavement.*—Patent dated March 8, 1859.—A is a metallic plate, which is rolled or cast in the ribbed or corrugated form, the vertical ribs having imparted to them a series of horizontal sinuosities. The sides of said ribs may be either vertical or inclined.

*Claim.*—A street paving, presenting on its upper surface a series of ribs corrugated or winding in a horizontal plane, substantially as and for the purposes set forth.

No. 23,190.—JAMES WILLARD PATTERSON and LEVI HANFORD COLBORN, of Baltimore, Md.—*Improvement in Harvesters.*—Patent dated March 8, 1859.—The inner angles of the cutting knife *b* extend to the rear of the projections *o* upon the guards *i*, forming with the rear edge of said projections a cutting or shearing apparatus, which clears the machine from any obstructions arising from grass or straws insinuating themselves between the knife and the guards.

*Claim.*—The combination of the cutting knife *b*, the bar *e*, and projections *o*, upon the guards *i*, arranged substantially in the manner and for the purposes described.

No. 23,191.—RICHARD PETERSON, of Philadelphia, Pa.—*Improvement in Cooking Stoves.*—Patent dated March 8, 1859.—The claim and engraving will explain the nature of this invention.

The inventor says: I do not claim, broadly, introducing jets of air at the rear of the fire in cooking stoves, various devices for accomplishing this end having been heretofore used, but I *claim* the protecting plate H, with its perforations *m*, when arranged in respect to the oven, the fire-place A, and the flues D D of an elevated oven cooking stove, in the manner herein set forth, so that the products of combustion, after passing from the body of the fuel, and at the point where they impinge against and are dispersed by the said protecting plate, prior to passing some over and others under the oven B, may be met by and intermixed with jets of heated air for the purpose specified.

No. 23,192.—WILLIAM POWERS, of Youngstown, Ohio.—*Improvement in Bee-Hives.*—Patent dated March 8, 1859.—The object of this invention is to construct a bee-hive in such a man-

ner that it may be perfectly exposed and still an even temperature maintained within it, thereby avoiding the use of bee-houses or apiaries.

*Claim.*—The cap or cover C of double walls, the inner one perforated as shown at *e e*, and the space between filled with charcoal, in the manner and for the purpose specified.

No. 23,193.—ANDREW RALSTON, of West Middletown, Pa.—*Improvement in Cleaning Castings.*—Patent dated March 8, 1859.—The casting is placed on the leaf *h*, and by proper movement of lever *k*, in connection with the various movements of the leaves *f g* and *h*, the casting may be adjusted and brought in contact with the pickers or cleaner *c* on drum *b*, and by the reciprocating alternate or oscillating movement of the drum the sand and other matter are removed from the casting.

*Claim.*—The combination of flexible pickers, brooms, or brushes, having a reciprocating, alternate, or oscillating movement, with an elevating and depressing table, the whole being arranged, combined and operated as described and for the purpose set forth.

No. 23,194.—ANDREW RALSTON, of West Middletown, Pa.—*Improvement in Harvesters.*—Patent dated March 8, 1859.—The nature of this invention consists in attaching to harvesters an arrangement for raking, gathering, and binding grain in sheaves, and also an arrangement for depositing the sheaves in shocks.

The inventor says: I *claim*, first, the arrangement of the receiving apron *d*, sheaf-trough *e*, compressing hook *u*, and levers *h*, *i*, and *j*, when used in connection with the horizontal and inclined gathering aprons *w*<sup>1</sup>, as described and for the purpose set forth.

Second. The use of the shocking carriage *o*, furnished with a shock-chamber, having a movable bottom in two parts *p* and *q*, as described and for the purpose set forth.

No. 23,195.—JOHN L. ROWE, of New York, N. Y.—*Improved Pen Wiper and Paper Weight.*—Patent dated March 8, 1859.—To any of the ordinary paper weights a cup or receptacle *j*, in which a sponge K or suitable absorbent is placed, is attached, and a frame in which the arbor of an absorbent pressure-pad *i* is placed and fitted.

*Claim.*—The base or weight A, with cup *j* attached, provided with the sponge K, in connection with the pressure pad or sponge *i*, connected with the base by means of the frame B, and arranged as shown and described, or in an equivalent way, for the purpose set forth.

No. 23,196.—ARCHIBALD G. SHAVER, of Hartford, Conn.—*Improved Eraser and Pencil Sharpener.*—Patent dated March 8, 1859.—The blade A is made of steel, with a flat shank B fastened into the handle *c* in a proper manner between the blade and the shank; on each end are circular indents D D with keen edges to form the cutters to sharpen pencils; on the face of the shank *c* is an acute triangular groove E with teeth, this groove is to finish sharpening the pencil by rubbing it up to a fine needle point.

*Claim.*—The curved blade eraser with the circular edge pencil sharpener, and the groove for finishing the pencil point, in combination, in the manner and for the purposes, substantially as set forth and described.

No. 23,197.—GEORGE SMITH, of Brooklyn, N. Y.—*Improved Cradle Wagon.*—Patent dated March 8, 1859.—A child's wagon is by this invention made to serve the extra purpose of a cradle, merely taking off the wheels and draft-pole and turning out the four wings, which are jointed to the ends of the rockers that are attached to the bottom of the wagon, the wings forming a part of the rocker when turned out, and giving the cradle increased stability.

*Claim.*—A cradle and wagon combined, when the several parts are constructed and operated substantially in the manner described.

No. 23,198. HORACE W. SMITH, of Hartford, Conn.—*Improvement in Cocks for Water Basins.*—Patent dated March 8, 1859.—The nozzle A is attached to the spindle B, which passes down through the spindle guide C, through the stuffing box D, and is connected with the intermediate spindle E by means of the male and female lefthand screw F F, and the intermediate spindle E connects with the vertical valve H by means of the righthand male and female screw G G.

*Claim.*—The intermediate spindle E, in combination with the vertical valve H, in the manner and for the purpose substantially as set forth.

No. 23,199.—SIMON P. SNYDER and GEORGE W. COOK, of Minneapolis, Minn.—*Improved Propeller.*—Patent dated March 8, 1859.—The propeller shaft *o* inclines towards the bow *s* of the boat, and also inclines from the side of the boat, and has one bearing at *w* near the edge of the deck, and another bearing in the frame *r q r*, which extends from the deck upward. The paddles *b* are conically arranged around the shaft *o*, so that the lines of the paddles if prolonged would meet in a point in the mathematical axis of the shaft *o* some distance below the lower bearing *w* of said shaft.

*Claim.*—The arrangement and construction of a propeller, substantially as shown and described, also inclining the shaft of a propeller in relation to the boat in two directions as

set forth. Also, the combination of a screw thread on the propeller shaft, with a screw thread in the brace plates forming the hub of the propeller, and with keys for the purpose of adjusting and fastening the wheel on the shaft, the whole being arranged as set forth.

No. 23,200.—JAMES H. STIMPSON, of Baltimore, Md.—*Improved Ice Pitcher*.—Patent dated March 8, 1859.—The claim and engraving will explain the nature of this invention.

*Claim*.—A double or treble walled ice pitcher, having its inside wall or shell B composed of iron or other metal lined or coated internally with porcelain *a a*, as described, the same constituting a new article of manufacture.

No. 23,201.—URIAH T. STUART and CALVIN E. STEWART, of Fayette county, Tenn.—*Improvement in Cotton Presses*.—Patent dated March 8, 1859.—The rope *a*, windlass, rack bar, and pinion *b*, are attached to the shaft B, and the shaft is turned by levers. The pinion *b* works in a rack *c*, which is fastened to the driver, and the driver moves the plungers E back and forth. The press is a horizontal framework, and the boxes D<sup>1</sup> in which the cotton is packed stand on the edge, and the bale when finished stands on end.

*Claim*.—The combination of the rack and pinion with the rope and windlass for operating a press with two pressing boxes constructed substantially as described.

No. 23,202.—CHARLES B. TATHAM, of Brooklyn, N. Y.—*Improvement in Manufacture of Shot*.—Patent dated March 8, 1859.—This invention consists in connecting the set pan or perforated cullender *k* with the melting pot *a*, by means of a conductor *d*, governed by a valve *f*, so that the molten metal shall run directly into the set pan, the valve enabling the workman to control and regulate the flow thereof.

*Claim*.—The combination of the netting pot, the regulating valve, the conductor, and the set pan, substantially as described, for dropping shot, as set forth.

No. 23,203.—LEOPOLD THOMAS and JOSEPH THOMAS, of Brooklyn, N. Y.—*Improvement in Lamp Lighters*.—Patent dated March 8, 1859.—This invention consists in feeding a band, which winds on a roller D underneath the lamp, (and which is prepared so that it takes fire by friction), up through a channel, and in such a position before the wick of the lamp that a short piece of this fuse, striking out over the top of the channel, is lighted by means of a serrated sector K, which is moved by the same trigger I which serves to operate the feed wheel G, and that by so lighting this fuse light is imparted to the lamp.

The inventors say: We *claim* the arrangement of a trigger I, or its equivalent, in such a relation to a serrated sector K, and to a ratchet wheel G, that by the motion of the trigger a piece of fuse from a roller D is fed up and lighted, substantially in the manner and for the purpose specified.

And we also claim the arrangement of a continuous fuse in combination with the lamp, substantially as and for the purpose set forth.

No. 23,204.—JOHN VAN RISWICK, of Washington, D. C.—*Improvement in Brick Machines*.—Patent dated March 8, 1859.—This invention relates to an improvement in the double cam revolving brick machine, and consists in the arrangement of the hopper C, in such relation to the mould disk A, as to permit the employment of plungers D having direct vertical reciprocating movement immediately above the moulds thereof.

*Claim*.—The combination and arrangement of the curved or angular hopper C, with the mould disk A, and vertically reciprocating plungers D, whereby the upper plungers are caused to pass the hopper without lateral movement, in the manner and for the purposes specified.

No. 23,205.—HUGH WALLACE and WILLIAM MELLON, of North Sewickly, Pa.—*Improvement in Grain Cleaning Machines*.—Patent dated March 8, 1859.—D is the wind duct, which is divided into two distinct ducts D<sup>1</sup> D<sup>2</sup>, by a partition *a*; *b* a valve having its fulcrum at *b*<sup>1</sup> *b*<sup>2</sup> at the end of the partition *a*; *c* a rod attached to the valve. By means of this rod, which is provided with a number of holes, the angle piece *d* on the outside of the frame A and the pin *e*, the valve may be secured in any desired position or angle.

*Claim*.—The arrangement of the valve *b*, ducts D<sup>1</sup> and D<sup>2</sup>, and sieves *w* and *r*, substantially as described and for the purpose set forth.

No. 23,206.—GEORGE WATT, of Richmond, Va.—*Improvement in Seed Planters*.—Patent dated March 8, 1859.—The operation of this machine is as follows: The rollers R R<sup>1</sup> form the furrows by pressing upon the soil, the fertilizer and grain are deposited as in other seed planters, and the coverers I removing the earth from the sides of the angular furrows, complete the operation by covering the seed.

*Claim*.—The series of angular faced rollers, arranged relatively to their shaft E, as described, for opening the furrows, in combination with the seed tubes D D, and covers, substantially as specified.

No. 23,207.—CHARLES WELLS, of Monroeton, and WILLIAM DOUGLASS, of Bradford county, Pa.—*Improvement in Water Wheels*.—Patent dated March 8, 1859.—As each jet or head passes in through its respective passage or entrance between the scrolls H, it strikes the vertical bucket F, upon which it acts directly, and after spending its momentum upon said vertical bucket, the body of water descends into the lower bucket G, upon which a reaction is produced by the weight of the column of water which acts on the double inclination of said lower bucket in an increasing proportion, until it discharges itself at the bottom of the periphery of the wheel.

*Claim*.—The combination of the scrolls H, vertical buckets E, and lower buckets G, the whole constructed and arranged as described and for the purpose set forth.

No. 23,208.—LOREN J. WICKS, of Racine, Wis.—*Improved Churn*.—Patent dated March 8, 1859.—By turning the crank S motion is given to the shaft B and wheel E, thus communicating a rotary motion to the shaft G and its attachments, in a direction which will keep the mouths of the funnels *k k* constantly receding from the cream, as the funnels recede from the cream a vacuum is produced in the tubes *j j*, and the external air rushes in at the tops of the tubes and is conveyed through them to the bottom of the churn, where it escapes and rises through the cream to the top of the churn again.

*Claim*.—The arrangement in a square churn A, which is provided with a ventilating top, of the shaft G, inclined arms *j j j j*, cross pieces *i i*, and funnels *k k k k*, the same being combined and operated in the manner and for the purpose specified.

No. 23,209.—C. S. WHEELER, of Flowerfield, Mich.—*Improvement in Apparatus for Evaporating Fluids*.—Patent dated March 8, 1859.—The claim and engraving will explain the nature of this invention.

The inventor says: I *claim* combining the evaporating pan A, with the steam boilers *a a a*, in such a manner as to cause the upper sides of said boilers to form highly efficient heating surfaces within said evaporating pan, substantially as set forth.

I also claim conducting the steam from the boilers *a a a* to the engine, which may be combined therewith through the medium of a series of pipes *b b b*, C, *d d d*, and *e*, which are so located that their peripheries form portions of the heating surface of the evaporating pan, but this I only claim when the said evaporating pan is combined with a series of steam boilers, substantially as set forth.

I also claim combining the spaces between the double bottoms of the clarifying pans *h h h*, with the steam boilers *a a a*, when the said pans and boilers are arranged with each other and with the evaporating pan A, substantially as set forth.

I also claim the passing of the fluid to be reduced through a coil of pipe *l*, located within the chimney or flue space, before discharging the same into the clarifying pans; but this I only claim when the said clarifying pans are arranged with the evaporating pan A, and the series of steam boilers *a a a*, substantially as set forth.

No. 23,210.—WILLIAM WILBER, of New York, N. Y.—*Improvement in Burning Fluids*.—Patent dated March 8, 1859.—The claim will explain the nature of this invention.

*Claim*.—A fluid compound for burning in lamps, &c., made of coal tar, camphene, and alcohol, substantially in the proportions and manner set forth.

No. 23,211.—SOLOMON WILLIAMS, Jr., of Hume, N. Y.—*Improvement in Ploughs*.—Patent dated March 8, 1859.—The object of this invention is to render the draft of the plough as light as possible, by diminishing the friction attending the passage of the land side D and mould-board through the soil, and also by the same means regulating the plough, so that it will form furrows of greater or less depth, as may be required.

*Claim*.—The arrangement of the adjustable wheel G with the land side D of the plough, substantially as shown and described, for the purposes set forth.

No. 23,212.—CHAUNCEY D. WOODRUFF, of Toledo, Ohio.—*Improved Firemen's Protector*.—Patent dated March 8, 1859.—This invention is a fire proof house D<sup>1</sup> on wheels B B, provided in front with a hole *d* in a sliding plate *e*, through which the butt *g* can be placed and the water directed to any spot. This can be placed close to the fire, and the occupant will be protected from the heat and flames.

*Claim*.—The double walled sheet or plate metal house D<sup>1</sup>, and mounted on wheels B B, and provided with look-out holes *d* and an adjustable plate *e* to receive the nozzle or butt *g*, the house being placed on rollers *i* in the platform, and secured by buttons *j*, or their equivalents, the whole being arranged substantially as and for the purpose set forth.

No. 23,213.—E. O. BAXTER, of Forreston, Ill., assignor to Himself, E. H. RILEY, and W. T. SWEET, of said Forreston.—*Improvement in Seeding Machines*.—Patent dated March 8, 1859.—The object of this invention is to prevent, by a very simple means, the operation of the seed slides as the machine is backed. The invention also has for its object the arrangement of seed slide levers in such a manner that they may be placed under the com-

plete control of the driver, and any irregularity as regards the dropping of the seed which might ensue on account of the irregularities of the ground prevented.

The inventor says: I *claim*, first, the cam *n*, one or more, attached to wheel *c*, in combination with the jointed pendant *F*, attached to the lever *E*, substantially as and for the purpose set forth.

Second. The levers *E E*, connected together and arranged respectively with each other and the driver's seat *I*, substantially as and for the purpose specified.

No. 23,214.—W. H. BURNAP and JOHN A. BRADSHAW, of Lowell, Mass., assignor to W. H. BURNAP, aforesaid.—*Improvement in Electro-Magnetic Machines*.—Patent dated March 8, 1859.—The claim and engraving will explain the nature of this invention.

*Claim*.—Applying the oscillating balance wheel *D* with its shaft *j*, in line with, but detached from, a rock shaft *g*, or its equivalent, carrying an arm *f*, which derives a positive oscillating movement from the train of gearing, driving the magnetic-electro machine, and connecting the spring *k*, which is attached to said balance wheel, with the so arranged moving arm, substantially as and for the purpose specified.

No. 23,215.—ROBERT M. CAMPBELL, of East Cambridge, Mass., assignor to WILLIAM G. CROMBIE, of Boston, Mass.—*Improved Burglar's Alarm*.—Patent dated March 8, 1859.—The fastener *G* is applied to a bar or plate *H*, affixed to the rear side of the case *A*, or arranged thereon, the bar being made to extend through an opening *d* made through the fastener *G*, such fastener being secured in the plate *H* by a hinge pin *e*, which passes downward through the fastener and in rear of the part *H*, so as to enable the fastener not only to be slid or moved on the said part *H*, but of being either turned down parallel to the case *A*, or at right angles thereto.

*Claim*.—The application of the spring fastener *G* to the alarm or its case, so as to be capable of sliding and turning with reference to the same, substantially in the manner as specified.

No. 23,216.—Cancelled.

No. 23,217.—MOSES G. FARMER, of Salem, and WILLIAM F. CHANNING, of Boston, Mass.—*Improved Electro-Magnetic Fire-Alarm Apparatus*.—Patent dated March 8, 1859.—The claim and engraving will explain the nature of this invention.

The inventors say: We *claim* the independent keys *D E F*, with their pins *d e f*, in combination with the rack *A*, and a means of liberating the rack, for the purpose set forth.

Second. We also claim the arrangement of the segments on the circuit wheel, in combination with the springs, or their equivalents, for throwing the electric current successively on to different circuits.

Third. We claim the double circuit wheel, or its equivalent, for the purpose of completing and interrupting an electric circuit at both ends, essentially as set forth.

No. 23,218.—R. GLEASON, Jr., of Dorchester, Mass., assignor to R. GLEASON & SONS, of said Dorchester.—*Improvement in Table Casters*.—Patent dated March 8, 1859.—The claim and engraving will explain the nature of this invention.

The inventor says: I do not claim, separately, any of the parts shown and described, when separately considered, but I *claim*, as a new and useful article of manufacture, a caster, egg-stand, and table-bell, arranged and combined as shown and described.

No. 23,219.—THOMAS GRAY, of Philadelphia, Pa., assignor to Himself and JAMES M. SANKEY, of said Philadelphia.—*Improved Extension Table*.—Patent dated March 8, 1859.—This improvement consists in the manner of connecting together the two central cross bars *H H<sup>1</sup>*, which form a part of the extension device, and also in a screw *I*, blocks *G*, and bars *E F*, in combination with the two ends of the table, the whole being arranged for joint action.

The inventor says: I *claim*, first, the method of constructing and of connecting together the two cross bars *H* and *H<sup>1</sup>*—that is to say, constructing one bar *H* in two parts, and connecting the two parts together by the two plates *e* and *e<sup>1</sup>*, which admit the bar *H<sup>1</sup>*, and afford a means of joining it to the bar *H<sup>1</sup>*, as set forth.

Second. The combination of the screw *I*, block *G*, bars *E* and *F*, and cross bars *H* and *H<sup>1</sup>*, with the two ends of the table, the whole being arranged for joint action, substantially as and for the purpose set forth.

No. 23,220.—GEORGE W. MILES, of Michigan City, Ind., and PHILANDER P. LANE, of Cincinnati, Ohio.—*Improved Machine for Hewing out Hubs*.—Patent dated March 8, 1859.—A block is pressed down upon the rotary disk *J*, its most overhanging end downward. The carriage *E* is then advanced until the largest *practicable circle* of the block is tangential with the sweep of the axis, while the block, being slowly rotated by the crank *N*, is reduced to the form of a rough cylinder suitable for *chucking* in the lathe.

The inventors say: We *claim*, first, the described arrangement and combination of the axles C C<sup>1</sup>, stud shaft I, and rotating rest J, for hewing out cylindrical forms, in the manner set forth.

Second. In combination with the above, the ways D D, carriage E, feed arm F, pawls G, and rack H, arranged and operating together, substantially as and for the purposes explained.

No. 23,221.—JOHN NORTH, of Middletown, Conn., assignor to Himself and D. Appleton & Co., of New York, N. Y.—*Improved Register for Sheets of Paper*.—Patent dated March 8, 1859.—The claim and engraving will explain the nature of this invention.

The inventor says: I *claim* first, The attaching to the feed table B of the printing press of two or more register points in addition to those commonly used for printing, so as to make register point holes in the sheet to be printed at the exact points required for the purpose of feeding the sheet in register to the folding machine to be folded.

Second. I claim the application for that purpose of the described mechanism, or other suitable mechanism of the same general description, attached to the feed table, frame, and carriage D of printing press, and which will produce the intended effect.

No. 23,222.—SAMUEL McQUERNS, of the District of Abbeville, South Carolina, and WILLIAM LYON, administrator of BENJAMIN M. LYON, deceased, late of said district.—*Improved Bedstead*.—Patent dated March 8, 1859.—The claim and engraving will explain the nature of this invention.

*Claim*.—The use of the hinges in the middle of both the cross and longitudinal rails, in combination with the hinges between the rails and posts, substantially as and for the purposes specified.

No. 23,223.—GEORGE E. BALDWIN, of East Meriden, Conn.—*Improvement in Adjustable Wormers for Ramrods*.—Patent dated March 15, 1859.—The claim and engraving will explain the nature of this invention.

*Claim*.—A wormer G that can be run out of or into a ferule B on the end of a ramrod A, so that the ramrod can be practically shortened or lengthened at pleasure, as represented.

No. 23,224.—JOSEPH BARBER and P. C. REINFRIED, of Bridesburgh, Pa.—*Improvement in Breech-loading Fire-Arms*.—Patent dated March 15, 1859.—This invention relates to fire-arms which have a chambered breech hinged to the stock. It consists of a sliding bolt connected with a toggle *k k* below the stock, with an elastic spring trigger-guard E acting in combination with a beveled catch in the breech, to lock the latter in line with the barrel for discharging, and also to unlock it for loading. A spring is also arranged below the breech to raise it to the position for loading when it is unlocked.

*Claim*.—The arrangement and combination of the spring trigger-guard E, pin *g*, toggles *k k*, sliding bolt *j*, and catch, substantially as and for the purpose shown and described.

No. 23,225.—ZEBULON B. BELLOWS, of Cortlandville, N. Y.—*Improved Chair Bottoms*.—Patent dated March 15, 1859.

The inventor says: I take the boards and saw them to the required length for a single seat. I then boil or steam them, then put them into a mould, and apply the power of a press sufficient to form them in a concave form and of the desired shape.

*Claim*.—The application to chairs of a bent, stamped, or pressed board for a seat.

No. 23,226.—PAUL BOYNTON, of Canton, N. Y.—*Improvement in Magazine Fire-Arms*.—Patent dated March 15, 1859.—This invention consists in providing for the loading at the movable breech with loose powder from a magazine within the stock, and with balls from a magazine under the barrel, whereby the operations of loading and firing are executed with great rapidity. By the act of cocking the hammer, a contrivance combined with the breech furnishes the priming for every charge.

The inventor says: I *claim*, first, Combining the powder magazine in the stock with the barrel of a fire-arm by means of the faucet like chambered breech, applied and operating as described to measure its own charge.

Second. Combining the bullet loading slide H with the faucet like chambered breech by means of the ears on the slide and the horns *m n* attached to the breech, so that the slide may be operated in combination with the breech in the manner specified.

Third. The combination of the faucet like breech of the priming-box J and its perforated collar *q*, operated by a connection with the hammer, substantially as described.

No. 23,227.—GEORGE A. BROWN, of Newfane, N. Y.—*Improved Machine for Bending Wood for Felloes*.—Patent dated March 15, 1859.—The claim and engraving will explain the nature of this invention.

*Claim*.—The arrangement of the platform E, screws *d* and *i*, and spring *c* with the mould-block, the several parts being constructed and operating substantially in the manner and for the purpose specified.

No. 23,228.—SAMUEL S. CAMPBELL, of Montreal, Canada.—*Improved Machine for Grinding and Polishing Saws.*—Patent dated March 15, 1859.—The claim and engraving will explain the nature of this invention.

The inventor says: I *claim*, first, The specified arrangement of the longitudinal carriage-ways D on supports E G, so that they, with the carriage D<sup>1</sup> and all attachments, may be inclined laterally, and caused to stand obliquely to the horizon, or the circumference of the lap or grinding stone, for the purposes set forth.

Second. Arranging one of the supports of the machine on a pivot e, and the other on a truck H, which reciprocates on a circular railway, so that the carriage-ways and carriage, with all attachments thereof, may be adjusted in the path of a circle, so as to stand oblique to the shaft of the lap or grindstone, substantially as and for the purposes set forth.

Third. Providing the longitudinal reciprocating carriage with a stationary stop R, and a capping or holding-down plate L, which is adjustable up and down, but stationary longitudinally, substantially as and for the purposes set forth.

No. 23,229.—I. L. COLMAN, of Vincennes, Ind.—*Improved Apparatus for Regulating the Supply of Water to Steam Boilers.*—Patent dated March 15, 1859.—The claim and engraving will explain the nature of this invention.

The inventor says: I do not claim the float in boiler, or the cranks, levers, water-chest, valve, or detector.

But I *claim* the combined arrangement of these to effect the object desired, to regulate the water in a steam boiler at any desired point, from which it cannot materially change.

No. 23,230.—SAMUEL COLT, of Hartford, Conn.—*Improvement in Packing Cartridges.*—Patent dated March 15, 1859.—The claim and engraving will explain the nature of this invention.

The inventor says: I do not wish to limit my invention to the use of the string, though I have shown it, and found it to work well in practice, for a wire or other equivalent might be made to answer the purpose; neither do I confine myself to the exact arrangement shown of the string, or its equivalent, in the package.

But I *claim* the application of a string B, wire, or other equivalent, to a cartridge package or box, by which the package or box may be opened.

No. 23,231.—ALEXANDER DEAN, of Jerusalem, N. Y.—*Improvement in Grinding Apples.*—Patent dated March 15, 1859.—The nature of this invention consists in a new mode of crushing apples, corn, or other seeds, when it is not desirable to flour the same, such as crushing barley or other grains for malt, and corn and other grains for hogs and cattle.

The inventor says: I *claim*, first, the crushing lever H, and horizontal wheel I, constructed as described, and for the purpose set forth.

Second. I claim the eccentric wheel B, and carriage D, in combination with the cutter H and wheel I, when constructed and operated in the manner and for the purposes before described.

No. 23,232.—ABRAHAM DEHUFF, of York, Pa.—*Improvement for preventing Collisions on Railroads.*—Patent dated March 15, 1859.—The claim and engraving will explain the nature of this invention.

*Claim.*—The spring carrier A, hung on two inclined staples B B, beneath the car or truck, to hug or embrace the wheels, cross-bar C, long-bar E, lever F, rod G, lever H, rod I, levers J J, and levers K, when arranged for joint operation with each other, substantially as and for the purpose described.

No. 23,233.—SAMUEL F. DEXTER, of Paris, N. Y.—*Improvement in Hanging Well Buckets.*—Patent dated March 15, 1859.—The nature of this invention relates to the manner or mode of attaching the buckets to the chain B, so that the water may be emptied out without being taken hold of by the person operating the crank, by which the chain is made to revolve.

The inventor says: I *claim*, first, the iron strap C, with the levers D, and notch E, to receive the spring stretcher E<sup>1</sup>, in combination with the chain B, Fig. 1, and the manner of detaching the same by coming in contact with the rod J.

Second. I claim the springs G G, Fig. 3, and G, Fig. 4, when operated as described, or in any equivalent manner.

Third. I claim hanging the buckets at or below the bottom, as described, in combination with the spring or springs or springs and levers, as above described, or in any equivalent manner.

No. 23,234.—RANDOLPH D. M. EDWARDS, of Franklin, Mich.—*Improvement in Machines for Folding Wool.*—Patent dated March 15, 1859.—A detailed description of this invention would take up too much space to be given here.

*Claim.*—The above described machine for folding wool, consisting of the table-rim D, the folding lids Q R S T, operated by catches, levers, and springs, riser H, and platform Z,

the whole arranged, constructed, and operating substantially as and for the purposes set forth.

No. 23,235.—STEPHEN ELLIOTT, of Washington, Ind.—*Improvement in Corn Planters.*—Patent dated March 15, 1859.—This invention consists in the manner of combining and arranging the wheel F, the plough or cover H, rod E, indicator G, block B, rod D, spiral spring C, and box A.

*Claim.*—The arrangement of the wheel F, and pins L and K, the spiral springs C C, the boxes A A, blocks B B, the rod E, indicator G, and levelling plough K, the whole being arranged, constructed, and operated as above described, and for the purpose set forth.

No. 23,236.—WILLIAM H. ELLIOT, of Plattsburgh, N. Y.—*Improved mode of obtaining Curved Printing Surfaces.*—Patent dated March 15, 1859.—The claim and engravings will explain the nature of this invention.

The inventor says: I do not claim casting stereotypes by immersion, in moulds formed upon and adhering to metallic plates. Nor do I claim a compound flexible matrix for casting stereotypes, as that is the subject of an English patent granted to Brunel in 1820.

But I *claim*, first, the combination of screws *k* with the concave cylindrical form *a*, when these devices are used for bringing the compound flexible matrix, or impression sheet, to the required shape, or for holding it there while metal is deposited or cast upon it, for the purpose of constructing electrotypes, or stereotypes, as specified.

Second. The employment of bars *d*, in combination with the flexible sheet *c*, for holding the matrix in a cylindrical form, when said bars are so applied to the ends of said sheet that they shall prevent its being displaced or springing up from the concave face of the outer shell *a*, as set forth, whether said bars are attached to or rest against the edge of said sheet.

Third. The grooves *m m*, in the inner shell *b*, for casting upon the back of cylindrical type-plates, lugs or flanges, by which said plates may be fastened upon a cylinder, as and for the purpose set forth.

No. 23,237.—RALPH EMERSON, jr., of Rockford, Ill.—*Improvement in Sugar Mills.*—Patent dated March 15, 1859.—This invention consists in the combination of rollers C D E F G, between which the cane, as it passes through, (entering at *a* and issuing at *z*,) receives several successive pressures. The pan to receive the expressed juices is divided into two separate receptacles, L and N, the former located beneath the roller D, to receive the product of the lighter pressure, and the latter beneath the roller F, to receive the product of the heaviest pressure.

The inventor says: I *claim* the combination of parts in the machine in such manner as to subject the cane first to a lighter pressure, and afterwards to a heavier pressure, and to deliver the respective juices expressed by said lighter and heavier pressures into separate receptacles, for the purposes specified.

I also claim the combination of the gauge fillets with the pressure rolls, whereby any unskilled operator is enabled to adjust and work the machine, substantially as set forth.

No. 23,238.—RALPH EMERSON, jr., of Rockford, Ill.—*Improvement of the process for Extracting and Assorting Vegetable Juices by Pressure.*—Patent dated March 15, 1859.—The claim and engraving will explain the nature of this invention.

The inventor says: As I have procured a separate patent for the said mill, I refer to that patent for a more full description of it. In this patent I do not mean to limit myself to any special means for the extraction and separation of the pith and rind juices.

But I *claim*, first, the process of expressing and collecting the juice of the pith separately from that of the rind, for the purpose set forth.

I also claim, as one of the methods, (and the best to me known,) whereby the process of extracting the juices separately may be beneficially carried into effect, the subjection of the cane to a light pressure, to express the juice of the pith previously to the employment of a heavier pressure to express the juice of the rind, whether the said pressures be successively performed in the same or in different machines.

No. 23,239.—HENRY EPSTEIN, of New York, N. Y.—*Improvement in Watch Chains, &c.*—Patent dated March 15, 1859.—The claim and engraving will explain the nature of this invention.

*Claim.*—Constructing a watch chain, which may be made stiff or inflexible at pleasure, by the turning of a part of the tubular casing, to which an interior chain is attached, substantially in the manner and for the purpose described.

No. 23,240.—BENAIAM FITTS, of Worcester, Mass.—*Improved Method of Operating Feed Rollers for Planing Machines.*—Patent dated March 15, 1859.—By revolving the cylinder B motion is given to pulley G and eccentric S, causing gear H to move round a point a short distance from the centre of gear D, this motion causes the gears to mesh in and move round

similar to other gears, there being one tooth less in gear H than in I it gives a motion of only one tooth, and as H is made fast I must move forward one tooth.

*Claim.*—The arrangement of the gears H and I, in combination with the eccentric S, when constructed and operating in the manner and for the purposes set forth

No. 23,241.—G. W. B. GEDNEY, of New York, N. Y.—*Improvement in Self-Priming Fire-Arms.*—Patent dated March 15, 1859.—The claim and engraving will explain the nature of this invention.

The inventor says: I *claim* the pivoted chamber *c*, or magazine, within a recess in the hammer head *a*, substantially as set forth, and operated by a link *h*, pivoted to the lock plate *i*, or some other stationary part of the pistol or other arm.

I also claim cutting off the priming of the edge of the hammer face, as specified, and carrying the same into the proper position for exploding upon the nipple or cone, as described.

No. 23,242.—ELIAS B. GLEASON, of Boston, Mass.—*Improved Combined Letter and Envelope.*—Patent dated March 15, 1859.—The object of this invention is to combine a letter and its envelope in one sheet of paper, in order that the envelope may be permanently fixed to the letter, and retain the address and post office mark after it may have passed through the mail.

*Claim.*—The combination therewith (that is, the letter sheet) of the envelope B, composed of the superscription and post mark portion *d*, and the single flap *e*, or the same and the two flaps *c* and *f*, arranged together and with respect to the letter or billet portion A, as described.

No. 23,243.—WILLIAM H. GLASSGOW, of New York, N. Y.—*Improvement in Barrel Packer.*—Patent dated March 15, 1859.—This invention consists in giving the barrel while being filled a rotary motion, and subjecting it to a lateral and vertical jarring movement, either or both, simultaneously with the rotary movement, which shakes the contained powder into a compact state.

The inventor says: I *claim*, first, the rotary cam C, with barrel J, attached in connection with the vibrating hammer H, arranged to operate as described.

Second. The plate E, having a rotary and a vertical reciprocating movement for the purpose specified.

Third. The cam C, plate E, and hammer H, arranged for joint operation, substantially as and for the purpose set forth.

No. 23,244.—JACOB GUHMANN, of Rochester, N. Y.—*Improved Apparatus for Heating and Purifying the Feed Water of Steam Boilers.*—Patent dated March 15, 1859.—The claim and engraving will explain the nature of this invention.

*Claim.*—The combination and arrangement of the bent siphon shaped tube D, constructed as described, having the induction and eduction openings at the highest parts thereof, with low receiving portion D<sup>1</sup>, whereby the water is made to pass a considerable space of vertical pipe the more effectually to deposit its impurities in D<sup>1</sup>, both while descending and ascending, together with the waste cock G and conjoint cocks I H, lever K, and connecting rods and cranks, as described, for simultaneously opening and closing the same, the whole constructed and operating substantially as and for the purposes set forth.

No. 23,245.—HORATIO GUILD and LUTHER HALL, of Boston, Mass.—*Improvement in Machines for Dressing the Heels of Boots and Shoes.*—Patent dated March 15, 1859.—The nature of this invention consists in the combination of adjustable heel jaws F G, and a pattern with a curved supporting rack E, and a self-adjusting knife or knife frame I. This machine is intended for holding or clamping a boot or shoe while on a last, and for giving proper shape or form to the edge of the heel with reference to the contour of the heel part of the upper leather of the said boot or shoe.

*Claim.*—Combination of the adjustable hub jaws and pattern thereof, with their curved supporting rack and the self-adjusting knife, or knife frame, applied together and to a bed or table, or the equivalent thereof, and made to operate substantially as specified.

No. 23,246.—ALBERT W. HALE, of New Britain, Conn.—*Improved Meat Mincer.*—Patent dated March 15, 1859.—The claim and engraving will explain the nature of this invention.

*Claim.*—A cutting or mincing machine, operating by means of a cylinder or cylinders, having tapering grooves extending from end to end, in combination with, and revolving in, fluted or ribbed cases A and B, and acting against a stationary knife or knives, placed in a plane, parallel with the axis of the cylinders, the whole arranged substantially as and for the purposes set forth.

No. 23,247.—ENOCH HIDDEN, of New York, N. Y.—*Improved Ship's Lights.*—Patent dated March 15, 1859.—The nature of this invention consists in the construction of ship's lights, whereby the frame *b* containing the glass may be removed at pleasure, and in constructing the fastening of a button *e* with an inclined face, having its bearing above the frame and pro-

vided with a swivel handle or lever *f*, capable of being brought into use when desired, and then susceptible of being removed out of the range of the light.

The inventor says: I *claim*, first, the swivel wrench of the button, and supporting the shaft or spindle thereof by the brace piece *o*, above the frame, substantially as and for the purpose set forth.

Second. The inclined surfaced button *e*, as described, with swivel wrench, in combination with the slotted lug of the main frame, as set forth.

Third. In combination with the aforesaid construction, the attachment of the light frame *b* to the main frame *a*, by means of the hook and pin, as described.

No. 23,248.—JOHN HOBRECKER, of Quincy, Ill.—*Improvement in Compositions for Roofing*.—Patent dated March 15, 1859.—The inventor says: I provide a suitable covered vessel of iron, in which I place, first, two parts of unslaked lime, then one part of pulverized cannel coal, one part of pulverized asphaltum, and one part of coal tar. The cover of the vessel is then bolted down, and a small quantity of water introduced through a hole which is left in the cover, the hole being then stopped with a plug.

*Claim*.—The process described of preparing plastic material of the composition stated without the aid of external heat, for the purposes set forth.

No. 23,249.—P. C. INGERSOLL, of Green Point, N. Y.—*Improvement in Hoop Locks for Securing the Ends of Metallic Bands*.—Patent dated March 15, 1859.—A metal loop *A* is employed in this invention, in connection with a metal key *B*, so formed within the loop as to securely lock the ends of the hoop in the loop when properly adjusted.

*Claim*.—The loop *A* and key *B*, fitted together and applied to the hoop, substantially as and for the purpose set forth.

No. 23,250.—H. C. INGRAHAM, of Guilford, and H. S. INGRAHAM, of Granger, Ohio.—*Improved Rotary Planing Machine*.—Patent dated March 15, 1859.—The claim and engraving will explain the nature of this invention.

The inventors say: We *claim* the arrangement of the cylinder *F*, with the two upper feed rollers and the matching burrs, in combination with the vertical sliding frame *I*, for the purpose of preserving the same thickness of timber between the face of the board and the tongue and groove, as set forth.

We further claim the sliding gripe *V*, in combination with the ways *W W*<sup>1</sup>, lever *X*, and ratchet *X*<sup>1</sup>, all arranged and operating in the manner and for the purpose set forth.

No. 23,251.—DOUGLAS B. JORDAN, of Woonsocket, R. I.—*Improvement in the Mode of Oiling Journals*.—Patent dated March 15, 1859.—The tube *F* is filled to the desired point with oil. The oil is forced or discharged through the hole *8* in the disk *G*, and from thence through the hole in the valve *H* into the main spout *6*, when it falls by its gravity through the branch spouts *I* into the holes *10* through the box *11* on to the shaft *C*.

*Claim*.—The combination and arrangement of the shafts *C* and *2*, the disk *G*, the sliding valve *H*, and the spout marked *6*, constructed and operating substantially as and for the purpose described.

No. 23,252.—JAMES KENISTON, of Cincinnati, Ohio.—*Improved Spark Extinguisher*.—Patent dated March 15, 1859.—The claim and engraving will explain the nature of this invention.

*Claim*.—A tank *B* arranged beneath the boilers of furnaces *A* in such manner as to receive the sparks and cinders therefrom and extinguish and discharge them, by means of a current of water passing through the tank, substantially as described and for the purposes set forth.

No. 23,253.—W. M. KIMBALL and K. HARTMANN, of Cleveland, Ohio.—*Improvement in Lanterns*.—Patent dated March 15, 1859.—In putting the parts *A* and *B* together, the hooks *L L*<sup>1</sup> with the lower section of the mounting *B* pass down inside of the bottom *A* until the hooks *L L*<sup>1</sup> are even with the ends of the segments *DE*. The part *B* is then rotated towards the right until the hook *L* passes behind the arm *H*, which is again pressed against the segment, and the hooks are thus prevented from moving backward, at the same time, the angles *F* preventing them from moving in the opposite direction.

*Claim*.—The segments *D* and *E*, the spring *G*, and arm *H*, or their mechanical equivalents, in combination with the hooks *L* and *L*<sup>1</sup>, arranged and operating in the manner and for the purpose specified.

No. 23,254.—WILLIAM S. KIRKHAM, of Branford, Conn.—*Improvement in Locks and Latches*.—Patent dated March 15, 1859.—This invention consists in so arranging the bolts of the latch or lock, and also the *nosing* or keeper, whereby the lock is capable of being applied in proper position to a right or left hand door, as may be desired.

*Claim*.—The combination of the nosing *D*, provided with the double inclined flanch *E*,

with the bolt or latch C, having its outer end rounded and levelled in a vertical plane, to operate in and for the purpose set forth.

No. 23,255.—JOHN C. KUHN, of Boonville, Ark.—*Improvement in Peach Cutting and Stoning Apparatus*.—Patent dated March 15, 1859.—For preserving and drying, the stones have to be extracted from the peaches, and this invention is designed to cut them in pieces and remove the stones at one operation. It consists of two curved knives E E, which cross each other and are attached to elastic bars D D used in connection with a tube B placed vertically within a box, and a pressing lever F.

The inventor says: I *claim* the knives E E, curved and crossing each other, as shown, and attached to the elastic bars D D, in combination with the lever F provided with the pin *i*.

I further claim the above parts when placed on the box A, provided with a tube B, and the several parts arranged relatively to each other, so that the stones H will be separated from the pulp or flesh, substantially as described.

No. 23,256.—SHIELDS LIGGETT, of Staunton, Va.—*Improvement in Railroad Gates*.—Patent dated March 15, 1859—A stud upon the car coming in contact with the upper edge of lever G forces the lever G G<sup>1</sup> with the bars I I<sup>1</sup> into the position shown in the drawings and by reason of connections force the gate open. The said stud pressing upon the bar I during the transit of the car holds the bars in position.

*Claim*.—The opposite sliding sectional gate, in combination with the levers F F<sup>1</sup>, rods g g<sup>1</sup> and h h<sup>1</sup> levers G G<sup>1</sup>, sliding bars I I<sup>1</sup> and springs i i<sup>1</sup>, arranged and operating as set forth.

No. 23,257.—WILLIAM LOYD, of Philadelphia, Pa.—*Improvement in Stereoscopes*.—Patent dated March 15, 1859.—The claim and engravings will explain the nature of this invention.

The inventor says: I *claim* a stereoscopic instrument having eye glasses at opposite sides and double reflectors, in combination with a revolving picture holder, arranged substantially as described.

I also claim the grooves c e on opposite sides of the frames b for the purpose of holding two pictures in contact with each frame, as specified:

No. 23,258.—WILLIS E. MOORE, of Crawfordsville, Ind.—*Improvement in Loading Ordnance*.—Patent dated March 15, 1859.—The claim and engraving will explain the nature of this invention.

The inventor says: I *claim*, first, the combination with a cannon A, or other piece of ordnance, of a system of mechanism which will receive the charge, carry it opposite the bore of the cannon, force the same to the breech of the cannon, and then be capable of being moved out of line with the bore of the same, substantially as and for the purpose set forth.

Second. In combining with the above system of mechanism a needle, I, for pricking the cartridge after it has been forced up to the breech, said needle coming into action simultaneously with the retreat out of line with the bore of the cannon, of the mechanism employed for introducing the charge, and then retreated out of the way, ready for the application and explosion of the cap, substantially as and for the purposes set forth.

Third. The combination of a cap-charger and exploding hammer with the first and second systems of mechanism above claimed, whereby, simultaneously with the retreat of the needle, a cap is brought over the touch-hole and exploded, substantially as and for the purposes set forth.

Fourth. A cartridge-box, which has a yielding spring stop, in combination with the first system of mechanism above-mentioned, substantially as and for the purposes set forth.

No. 23,259.—WILLIS E. MOORE, of Crawfordsville, Ind.—*Improvement in Car Brakes*.—Patent dated March 15, 1859.—The nature of this invention will be understood by reference to the claim and engravings.

The inventor says: I *claim*, first, making the windlass chain shaft in two parts F K, and uniting said parts by a universal joint L, and arranging the main friction roller J on one section of the shaft F K, and the windlass drum on the other, substantially as and for the purposes set forth.

Second. The employment of an auxiliary friction roller O, in combination with main roller J, and locomotive driving wheel B, when said auxiliary roller O is arranged to rise between the main friction roller J and the locomotive wheel B, through the peculiar scale-beam or weighing arrangement G G<sup>1</sup>, N, i s k d e F, substantially as and for the purposes set forth.

Third. The employment of a pivoted pawl H, in combination with a ratchet drum G<sup>2</sup>, having two circles of reverse set teeth f f<sup>1</sup>, which incline on their deepest faces toward the centre of the drum, substantially as and for the purposes set forth.

No. 23,260.—GEORGE W. MORGAN, of Prattsburgh, N. Y.—*Improvement in the Mode of applying Springs as a Motive Power*.—Patent dated March 15, 1859.—The claim and engraving will explain the nature of this invention.

The inventor says: I do not claim the use of wheels and pinions, operated by springs, nor

two or more shafts, nor the duplication of wheels, nor the application of springs on both sides of the motor wheels, for all these are known devices.

But I do *claim* the arrangement of the springs B B, &c., wheels D D, &c., with lugs *a a a*, pinions E E, &c., concentrating the power on the pinions H H, on each side of the wheel I, and the pinions N N, and shafts R R, for winding up at the same time all the springs on either side of the wheel I, when the whole are constructed and operated, for joint action, as described.

No. 23,261.—DAVID S. NEAL, of Lynn, Mass.—*Improved Speaking Tubes for Ships*.—Patent dated March 15, 1859.—D D is a gutta percha or rubber tube; A A mouth-piece at each end, to be used when unscrewed near keg B, which is used as a float to carry the tube attached on shore; *c* a brass coupling to screw the tube together, and lengthening to any requisite distance.

*Claim*.—The arrangement of the speaking tube with a cask, or equivalent float, substantially as and for the purpose specified.

No. 23,262.—JOHN G. PERRY, of Kingston, R. I.—*Improved Meat Cutter*.—Patent dated March 15, 1859.—The meat or other substance to be cut is placed in hopper J, and the crank turned, when the studs D D, as fast as the projections F between the plates come in contact with the sides of the recesses E, will assume the spiral form and drive the meat around against the knives G, and, as it is cut, towards the other end of the case.

The inventor says: I *claim*, first, placing the knives on or across the shaft B, and holding them by their ends, to prevent them from turning, substantially as described.

Second. I claim the manner of constructing the shaft and stud-plates, substantially as and for the purpose set forth.

No. 23,263.—HENRY W. PUTNAM, of Cleveland, Ohio.—*Improvement in Bottle Stoppers for Fastenings*.—Patent dated March 15, 1859.—The claim and engraving will explain the nature of this invention.

*Claim*.—The bottle stopper fastening formed of two pieces of wire, the same being united by means of the points B B, passing through the loops E E, constructed and having the wire A adapted to them, as herein described; thus forming a hinge, and securing the same to the neck of the bottle, by looping together the ends of the wire D; the several parts being constructed in the manner and operating as set forth.

No. 23,264.—E. L. ROBERTS, of Brooklyn, N. Y.—*Improved Fastening for Folding Doors*.—Patent dated March 15, 1859.—The object of this invention is to supersede the vertical slide bolts, as they have hitherto been applied to one pair of folding doors, by combining the bolts with a horizontal slide bolt, so arranged in relation to the lock on the other door of the pair, that both doors cannot be closed and locked without first moving the vertical bolts and locking the door to which they are applied, thereby answering the purpose of fastening and securing both doors.

*Claim*.—The combination of the sliding bolts D D and H, applied to folding doors, to operate substantially as and for the purpose set forth.

No. 23,265.—GEORGE W. ROBINSON, of Boston, Mass.—*Improved Steering Apparatus*.—Patent dated March 15, 1859.—As the wheel I is turned, it gives motion through the shaft G and pinion F to the wheel E, on the vertical shaft *e*; this shaft carries the pinion D, which is thus revolved and traverses the cogged face of the segment M, moving the tiller C toward one side or the other of the vessel as required.

*Claim*.—The segment M, having teeth on the interior vertical face of the curve, in combination with the gears D E and F, and shaft G, connected with the tiller and moving therewith, and arranged and operating in the manner substantially as set forth.

No. 23,266.—ARCHELAUS S. ROLLINS, of Albany, N. Y.—*Improvement in preparing Hop Liquor for Distillers and Brewers*.—Patent dated March 15, 1859.—This process consists in boiling or steeping hops within a closed vessel, and condensing the vapors evolved, so as to prevent such pressure from the interior as to cause the escape of volatile matters.

*Claim*.—The preparation of hop liquor, for the purposes of distilling and brewing by the process set forth.

No. 23,267.—P. H. ROOTS, of Connorsville, Ind.—*Improved Water Wheel*.—Patent dated March 15, 1859.—This invention consists in using, in connection with a horizontal wheel A provided with radial buckets, a rotating breast or abutment E, and a concave or apron D so arranged that the water is made to act in a very direct and efficient manner on the wheel.

*Claim*.—The wheel A, and rotating breast or abutment E, moving with different degrees of velocity, in combination with the apron or concave D, the whole being arranged to operate as and for the purpose set forth.

No. 23,268.—JAMES L. ROWLEY, of Angola, Ind.—*Improved Washing Machine*.—Patent dated March 15, 1859. The claim and engraving will explain the nature of this invention.

*Claim*.—Constructing the bottom of the box with three sides of an octagon, the two outer sides to have ribs of an octagonal shape, set at an angle of  $45^{\circ}$  with the sides of the box and bottom to be horizontal, with two rows of rubbing pins or knuckles set alternately with the valleys between the ribs D D, in combination with the vibrating rubber, having the rubbing surface octagonal, and the rubbing knuckles set so as to work alternately, with the spaces between the pins in the bottom of the box, and diagonally with the ribs on outer sides of the bottom B B, in the manner and for the purposes set forth.

No. 23,269.—JAMES E. RUSSELL, of Brooklyn, N. Y.—*Improvement in Cast-Iron Rails for Railways*.—Patent dated March 15, 1859.—These cast-iron rails are constructed with their necks corrugated vertically, by which form of the neck the necessary support for the head is not only obtained with less metal than would be requisite in a straight neck, but the liability of the rails to be fractured by their contraction in cooling is obviated in a great degree.

*Claim*.—As an improved article of manufacture, a cast-iron railroad rail, having its neck vertically corrugated, as shown and described.

No. 23,270.—JAMES SMART, of Mansfield, Ohio.—*Improvement in Apparatus for Evaporating Sugar Juices*.—Patent dated March 15, 1859.—The claim and engraving will explain the nature of this invention.

The inventor says: I *claim*, first, in the construction of pans, the combination of the inclined bottom A, with the inclined zigzag partition C D, substantially as and for the purposes set forth.

Second. The combination of two pans B B<sup>1</sup>, and two flame chambers G G<sup>1</sup>, of the peculiar construction described, substantially as and for the purposes set forth.

Third. Supporting the pans at or near the centre of their length by pivots *a a*, and at their ends by spiral springs *b b*, substantially as and for the purposes set forth.

No. 23,271.—STEPHEN WILLIAM SMITH, of Brooklyn, N. Y.—*Improvement in Machines for Freezing Cream, &c.*—Patent dated March 15, 1859.—This invention consists in the employment and use of cylinders D E provided with refrigerating material, and working each other to dechrysalize the cream by its passage between the cylinders, and combining therewith scrapers H H to remove the cream from the cylinders and allow it to drop into the reservoir below.

The inventor says: I *claim*, first, the cylinders D E, in combination with the scrapers H H and reservoir K, constructed in the manner substantially as described and for the purpose specified.

Second. Combining with the cylinders a perforated distributing reservoir I, for the purpose of furnishing the material in the desired quantities to the cylinders, and operating in the manner substantially as set forth.

No. 23,272.—HEINRICH SOLTSMANN, of New York, N. Y.—*Improved Electro-Magnetic Medical Apparatus*.—Patent dated March 15, 1859.—The claim and engravings will explain the nature of this invention.

The inventor says: I do not claim the vibrating armature, neither do I claim the glass cylinder, in itself, as a regulator of electrical currents, but I *claim* the arrangement of the vibrating spring armature and the connections therefrom, in combination with the key S, arranged and acting as specified, to throw the shock off the person, or repeat the same, as set forth.

I also claim the regulating cylinder *t*, constructed as specified, in combination with the medical electrical machine, fitted and acting in the manner and for the purposes set forth.

No. 23,273.—FREDERICK STAMM, of Lampeter, Pa.—*Improvement in Lever Jacks*.—Patent dated March 15, 1859.—On the inside of the rod C are angular shaped link seats G, in which the link F rests when the lever is to be used for raising carriages. The block E is placed under the axle of a carriage, and the lower end of the lever A rests upon the ground. By pressing the lever A towards the link-rod C the carriage is raised.

*Claim*.—The combination and arrangement of the lever and link-rod, hinged together, with the block and link seats, as described and for the purposes set forth.

No. 23,274.—GEORGE STARKWEATHER, of Hartford, Conn.—*Improved Rotary Stave Machine*.—Patent dated March 15, 1859.—Power being applied to the pulleys E and F, motion is given to the revolving cutting rims D C. The staves are introduced into the machine through the feed-boxes X, and thus passing through between the cutters G in the rims D C, and as soon as they pass through the cutting surface they are caught by the feed arrangement, and are thus fed through the machine.

The inventor says: I *claim* the horizontal revolving cutting rims D C, for dressing staves on the two opposite sides at the same time, arranged and operating substantially as described.

Second. The arrangement of one or more feed-boxes X upon the plate *u* over the cutters G with the feeder, produced from the worm *a*, for the purpose described.

No. 23,275.—DANIEL E. TEAL, of Norwich, N. Y.—*Improvement in Devices for Raising Water*.—Patent dated March 15, 1859.—The claim and engraving will explain the nature of this invention.

*Claim*.—The arrangement of the means recited, the same consisting of the rope or chains, the hooks K, bail F of the cast-iron box A; adjustable flanges, collars on the windlass, and the windlass D, whereby the bucket can be lowered, filled with water, raised, and emptied by merely turning the windlass, as described.

No. 23,276.—GEORGE W. TOLHURST, of Liverpool, Ohio.—*Improved Washing Machine*.—Patent dated March 15, 1859.—C is a semi-circular rubber, which is formed by screwing slats to the outer periphery of two solid heads C<sup>1</sup> C<sup>1</sup>; near the centre of the rubber is secured a handle D, connected to the rubber by means of the cross-piece E; F is a small shaft which forms bearings for the rubber C; to each end of the rubber is secured a wedge G G; as the rubber is oscillated, the wedges G come in contact with the side-blocks H H, which cause the rubber to be moved sideways or endways at the same time it is oscillating.

*Claim*.—The shaft F, blocks H H, and wedges G G, or their equivalents, in combination with the oscillating rubber C, slatted bottom B, dirt chamber A<sup>1</sup>, and box A, the whole being arranged and operating in the manner and for the purpose as set forth.

No. 23,277.—WILLIAM THOMAS, of Benton county, Arkansas.—*Improvement in Sail Wagons*. Patent dated March 15, 1859.—The claim and engraving will explain the nature of this invention.

The inventor says: I do not claim the application of sails and steering apparatus to vehicles for transportation by land; neither do I claim the splayed spokes and suspension rods used in the strengthening of the wheel; they are well known.

But I *claim*, first, The combination of the spars and cargo-box on the rocking shaft *a*, thus lowering the centre of gravity and increasing the stability of the fabric, not only in this way, but by also, and as another effect thereof, allowing the sails to yield to violent gusts of thwart wind, receiving their force gradually, and spilling it more and more as they decline.

Second. I claim the invention of the hollow wheel-hub, which I have called the barrel-hub, to be used for the purposes of freight, thereby relieving the axle, avoiding friction, and adding to the power of the vehicle to stand up safely against strong cross-winds, the various parts being arranged in the manner and for the purposes set forth and described.

No. 23,278.—WILLIAM R. THOMAS, of Catasauqua, Pa.—*Improvement in Locomotive Fire-Boxes*.—Patent dated March 15, 1859.—This invention consists in a certain construction of a hollow lining B for the fire-box of a locomotive or other boiler, and mode of combining the same with the water-spaces *a a* of the fire-box and body of the boiler, whereby provision is made for a free supply of water to the said lining, and for the exit of steam generated therein, and also for the removal of the lining for repairs, or its replacement by a new one when burnt out.

*Claim*.—The removable lining B fitting with the shell and under the permanent water-spaces *a a* of the fire-box, having inwardly projecting inclined sides, and combined with the water-spaces of the boiler by means of two rows of vertical tubes *c c* entering the crown sheet, and a pipe *e* connecting with the body of the boiler, substantially as described.

No. 23,279.—PHILIP UMHOLTZ, of Tremont, Pa.—*Improvement in Railroad Car Journal Boxes*.—Patent dated March 15, 1859.—The nature of this invention consists in the spring yoke bolt *c* and sliding clamp, for pressing the rubber disks closely around the journal, and operating in a mortise D.

*Claim*.—The spring yoke bolt *c*, in combination with the follower *b*, and packing *g*, operating in mortise D, of box A, in the manner described and for the purposes set forth.

No. 23,280.—JAMES S. UPTON, of Battle Creek, Mich.—*Improvement in Horse Power*.—Patent dated March 15, 1859.—The wheel G being revolved by the levers, gives motion (through the intervention of the pinions E E), to the spur wheels F F; these spur wheels gearing internally with the annular wheel O, causes that wheel to revolve, and one of its faces being toothed to match the beveled pinion P, revolves the horizontal coupling shaft S.

*Claim*.—The arrangement of driving wheel G, with the pinions E E E, and wheels F F F, in combination with the annular wheel O, with toothed gear on its internal edge and on one of its faces, for the purpose and in the manner substantially as set forth.

No. 23,281.—CHAPMAN WARNER, of New York, N. Y.—*Improvement in Clasps for the Ends of Bands of Iron*.—Patent dated March 15, 1859.—The claim and engraving will explain the nature of this invention.

*Claim*.—The construction of a clasp of any material or dimensions substantially of the form

described, and illustrated by the accompanying drawings, with two wedged shaped projecting tongues *b b*, placed in the position, fitted with sleeves, and protected by sides, as mentioned.

No. 23,282.—NOAH H. WENTWORTH and MARTIN L. AMES, of Somersworth, N. H.—*Improvement in Railroad Car Couplings*.—Patent dated March 15, 1859.—This coupling is made up of a frame or case *a*, having a catch *b*, a lever *c*, a shaft *d*, to which is affixed the latch and the lever, a crank arm *e*, for operating the shaft *f*, and two cams *g g*<sup>1</sup>—*g* being under the latch, and *g*<sup>1</sup> under the lever—and a spring *h* for forcing the latch downwards and holding it in position when the parts are coupled.

*Claim*.—Combining with each latch, or catch, a lever, as described, and providing the latch and lever, when thus combined with the cams and their shafts and crank arms, for actuating them, as and for the purposes set forth.

No. 23,283.—WILLIAM K. WYCKOFF, of Ripon, Wis.—*Improved Bread Making Table*.—Patent dated March 15, 1859.—The flour chest A is designed to contain flour and meal, the moulding board or table top B, to mould or knead the dough upon. The tray C is designed for mixing the flour into dough, and has a cover to prevent the accumulation of dirt.

*Claim*.—The combination and arrangement of the flour chest A, the table or moulding board B, the mixing tray C, and the closet D, substantially as described and for the purpose specified.

No. 23,284.—C. F. E. BLAICH and PETER A. BISHOP, of Elyria, Ohio, assignors to PETER A. BISHOP, aforesaid.—*Improved Steering Wheel*.—Patent dated March 15, 1859.—D represents a sliding dog, secured in suitable brackets, and is forced between the projections *a* by means of a spiral spring *b*, thus securing the wheel A firmly in its position. The sliding dog is provided at the lower end with a foot piece which projects forward through the post by which the wheel is supported.

*Claim*.—The vertically sliding dog secured in suitable brackets, and provided with a foot piece, pawl, and joint, as described, in combination with the spiral spring and ratchet, the whole being constructed and operated as set forth.

No. 23,285.—EDWARD S. BOYNTON, of New York, N. Y., assignor to PETER R. ROACH, of Elizabeth City, N. J.—*Improvement in Sewing Machines*.—Patent dated March 15, 1859.—The claim and engraving will explain the nature of this invention.

*Claim*.—The use of the adjustable fulcra for controlling the feed of the needle, in combination with an annular or ring shaped shanked wire needle G, as attached directly to the crank shaft, without the intervention of a needle box, substantially as set forth.

No. 23,286.—ADDISON CROSBY, of Fredonia, N. Y., assignor to H. S. STEVENS, of said Fredonia.—*Improved Method of Hanging Reciprocating Saws*.—Patent dated March 15, 1859.—The ends of the saw in this invention are grasped each by two jaws B B, so connected and arranged within an adjustable swinging frame C, that a universal joint connection is obtained and the saw at all times subjected to an equal strain, and rendered capable of being set in line with its work.

*Claim*.—The two jaws or plates B B, applied to the saw A, connected together and suspended within the swinging or pivoted adjustable frame C, which is attached to the plates *g g*, the whole being arranged as and for the purpose set forth.

No. 23,287.—THOMAS E. HUNT, of Indianapolis, Ind., assignor to Himself and NATHAN T. HUNT, of said Indianapolis.—*Improvement in Sugar Mills*.—Patent dated March 15, 1859.—The roller frame B revolves upon the bolt G, which extends up through the top of the cone D, and is held by the nut H. In the top of the roller frame B is the groove or oil cup *s s*, in which the flange upon the washer M operates. Between the washers M and I, and surrounding the bolt G, is the gum spring J, which gives elasticity to the pressure or force effected by the bolt G and nut H upon the rollers C C C C. The flange K operates in the oil cup L.

The inventor says: I *claim*, first, the combination and arrangement of the frame B, rollers C C C C, and gearing E E E E, with the cone D, gearing F, bolt G, and spring J, when constructed and operated substantially as and for the purposes set forth.

Second. The trough N, with aperture O, when constructed as and for the purposes set forth.

No. 23,288.—S. B. BATCHELOR, of Lowville, N. Y.—*Improvement in Scythe Snaths*.—Patent dated March 22, 1859.—This invention consists in securing the scythe to a stationary plate B by means of two united hooks D D and a headed screw E, the plate being firmly secured to the but of the snath A, so that the scythe may be firmly fastened to the snath and set to any desired angle required by the operator.

*Claim*.—The arrangement of the hooks D D, screw E, ring C, and plate B, with slot F and sliding block G, the whole being constructed for joint operation in the manner set forth and described.

No. 23,289.—WILLIAM BRAY, of Folkstone, England.—*Improvement in the Wheels of Traction Engines.*—Patented in England December 31, 1856; patent dated March 22, 1859.—

The inventor says: I construct the wheels with teeth or blades K K, which enter the ground and obtain a firm hold. These teeth are made to slide or move in and out by an eccentric O, or other mechanical means, so that they clear themselves of the soil and are again ready to enter the ground.

*Claim.*—Constructing traction engines with driving wheels with blades or teeth which are capable of being protruded and withdrawn, substantially as described.

No. 23,290.—FRANCIS J. BRIDGES, of New York, N. Y.—*Improved Submarine Telegraph Cable.*—Patent dated March 22, 1859.—The conductor *n* is covered with a suitable electric *e*, (gutta percha,) and this is overlaid with a braided coat *a* of hemp, flax, cotton, or wire, after the manner of a whip or curtain cord.

*Claim.*—The braided or plaited coat, covering, or layer for conductors, cords, or cables for electric telegraphic purposes, as set forth.

No. 23,291.—GEORGE BRODIE, of Little Rock, Ark.—*Improvement in Metallic Bands for Baling.*—Patent dated March 22, 1859.—The claim and engraving will explain the nature of this invention.

The inventor says: I *claim* preparing the hoops or bands for tying before they are passed around the bale by bending one or both ends of the hoops or bands and placing in the inside of each band a suitably prepared metallic pin similar to those I have already described, around which pins the bent end of the hoops are securely pressed, for the purpose of keeping the pins in place, and also making the ends of the hoops wider or thicker as the shape of the connecting links used may require.

I also claim forming the connecting links like those shown.

I also claim bending one or both ends of the hoop or band, as shown in Figs. 11 and 12, around the outer ends of the connecting link, thereby strengthening the ends of the link and preventing it turning or getting out of place and the tie from untying.

I also claim making metallic hoops for bending bales with a tie on each side of the bale, for the uses and purposes expressed.

I also claim using strips of cloth, paper, or other suitable material, under the metallic hoops, as shown, for the purpose described, substantially as set forth.

No. 23,292.—BARNES CLAYTON, of Philadelphia, Pa.—*Improved Fastening for Shirt Studs, &c.*—Patent dated March 22, 1859.—The claim and engraving will explain the nature of this invention.

*Claim.*—A stud fastening, consisting of the stem *e* rigidly fixed to the piece *d* of the back part B, the vertically moving lever plate *f*, and the screw stem *h* fixed to the front or ornamental part A, the same being constructed and arranged to operate together as set forth, and for the purpose of fastening the stud in place, so that it cannot be pulled out or removed therefrom without first rotating the screw *h* as described.

No. 23,293.—ELIJAH H. DANFORTH, of Jamestown, N. Y.—*Improvement in Adjustable Dental Swages.*—Patent dated March 22, 1859.—The adjusting swage is constructed of two outer side plates A of wrought iron, steel, or other metal, supported apart by and fastened by two end bars B of the same metal by means of screws or rivets *a a*. The space between them is filled with a number of movable pieces of metal or hard wood C C. There is also enclosed between the plates and fastened to one of them by screws or rivets *b b* a stop describing the segment of a greater or lesser circle E and F F.

*Claim.*—Forming the labial and the lingual curve of dental plates for the inferior maxillary alveolar ridge by swaging it into form with the compound die and malleable plates in the curve of the plate, as set forth.

No. 23,294.—BRUTUS DE VILLEROI, of Philadelphia, Pa.—*Improved Instrument for ascertaining the Distance between itself and the Target without Chaining.*—Patent dated March 22, 1859.—The claim and engraving will explain the nature of this invention.

*Claim.*—The addition by means of a screw of a tube containing the lens and divided throughout its whole length by a vertical partition or diaphragm. At the extremity of this tube next the eye piece is placed a ring containing a bisect lens D E G K, the two halves of which are equally inclined on opposite sides of the vertical plane perpendicular to the axis of the telescope.

No. 23,295.—HERMAN A. DOSTER, of Bethlehem, Pa.—*Improvement in Corn-Huskers.*—Patent dated March 22, 1859.—This invention consists in the use of a guard-board C attached to the machine, and arranged relatively with the rollers A<sup>1</sup>, so that the ears of corn may be fed to the machine with great facility and as rapidly as the machine can husk them.

*Claim.*—The arrangement and combination of the lever D with the adjustable roller A<sup>1</sup>, so

that when the roller  $A^1$  is adjusted, the distance between the cam  $i$  and the fulcrum of the lever  $D$  will be correspondingly changed, as and for the purpose shown and described.

No. 23,296.—JOHN L. FABER, sen., of South Hadley, Mass.—*Improvement in Weather Strips*.—Patent dated March 22, 1859.—As the door closes the end  $r$  of the bottom strip  $F$  comes in contact with the inner side of the door frame and is gradually forced downward towards and closely upon the sill  $A^1$ , while at the same time the rear top corner of the holder  $E$  comes in contact with the lower end of bar  $G$ . After the bars  $F$  and  $G$  have commenced moving, and before they have ceased, the beveled ends, bars  $D$  and  $I$ , come respectively against the corner of frame  $A$  and inclined edge of stop  $H$  and are forced into their desired positions.

The inventor says: I *claim*, first, the bar  $G$  in combination with the parallel vibrating links  $aa$ , when said bar is so arranged as to fall by its own weight and be forced against the door by the closing of the latter, as set forth.

Second. The combined arrangement of the several strips and their attachments to close up the frame sides of the door, as described.

No. 23,297.—JOHN FITCH, of Seneca Falls, N. Y.—*Improvement in Filters*.—Patent dated March 22, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I do not claim the ordinary cask or tub filters, with a pot or reservoir filled with charcoal or other filtering material, the same having been known and used.

But I *claim* the combination of the cylinder  $B$ , constructed and partly filled, as described, with the outside case  $A$ , having the perforated plates and the filtering material disposed and arranged as described, by means of which the fluid to be filtered is made to pass through the filtering material for a greater distance, and a more perfect purification is effected. I also obtain, by the same combination, a convenient mode of cooling the fluid, and also of cleansing the filter, without deranging its parts, by means of reversing its action in the manner described, the whole constructed and operating in the manner and for the purposes mentioned.

No. 23,298.—R. B. FITTS, of Philadelphia, Pa.—*Improvement in Coffee Mills*.—Patent dated March 22, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I am aware that a single crushing cylinder has been employed before, in combination with a horizontal grinding cylinder, fitted with an adjustable shell or concave, the said crushing cylinder rotating at a slower speed than the grinding cylinder, for the purpose of crushing or grinding coffee. Therefore I do not claim such a combination.

But I *claim* the cylinders  $B$  and  $B$ , in combination with the grooved cylinder  $C$ , and its adjustable concave  $D$ , the whole being constructed and arranged together beneath the hopper  $A$ , so as to operate in the manner and for the purpose set forth and described.

No. 23,299.—JACOB GEYSER, of Allegheny, Pa.—*Improvement in Fly-Wheels for Rolling Mill Machinery*.—Patent dated March 22, 1859.—The nature of this invention will be explained by reference to the claim and engraving.

The inventor says: I do not claim any particular shape, or form, or material for the construction of the rim of a fly-wheel, as great variations can be made in this respect.

But I *claim* constructing the rim of a fly-wheel hollow, with partitions, in such a manner that when the heavy materials are piled in, laid in concrete, it may be held stiff and steady, as described.

I claim using any heavy and hard material, along with suitable cement, to fill up such a rim, when constructed and operating as and for the purpose described.

No. 23,300.—EMANUEL HARMAN, of Washington, D. C.—*Improvement in Letter Envelopes*.—Patent dated March 22, 1859.—The surfaces  $a$   $a^1$  of the former, and bed plate, are ribbed and grooved,  $b$   $c$ , making a die and counter die. By this means the face of the envelope is embossed with lines parallel to its sides, during the operation of forming it.

*Claim*.—The method or process of preparing letter envelopes, ready ruled in the process of manufacture, substantially in the manner and for the purpose set forth.

No. 23,301.—JOHN HECKER and WILLIAM HÖTINE, of New York, N. Y.—*Improved Dough Rolling Machine*.—Patent dated March 22, 1859.—The claim and engraving will explain the nature of this invention.

The inventors say: We *claim* the combination of an inclined endless apron  $l$ , for receiving and returning the dough, substantially as described, in combination with the cylinders  $a$   $b$   $c$ , for rolling the dough, substantially as described.

We also claim, in the above combination, the curving in of the apron around the upper roller  $j$ , or the equivalent thereof, substantially as described, for the purpose of returning the dough to the feed table  $h$ , substantially as described, in combination with the cylinders for rolling the dough, as described.

And we also claim the rotating screen  $r$ , as described, in combination with the arrange-

ment of cylinders for rolling and working the dough, substantially as and for the purpose described.

And, finally, we claim, in combination with the rotating screen, as described, the hopper  $z$ , and apparatus therein, for insuring a regular supply of flour, as set forth.

No. 23,302.—A. JAMINET, of St. Louis, Mo.—*Improvement in Filters*.—Patent dated March 22, 1859.—The nature of this invention will be understood by reference to the claim and engraving.

The inventor says: I *claim*, first, circulating the water to be filtered through tiers or courses of pipes, arranged within a drum, having a current of waste steam passing through it, and then passing said water into separators for further circulation, and for depriving it of mud and other foreign matters.

Second. Arranging the separators  $C^{12345}$  within the steam drum B.

Third. Making the apparatus self-cleansing, at intervals, by operating the valves at the bottom of the separators and filters, by levers, acted on by toothed disks, ratchet wheel, and pawl, or their equivalents, actuated by the automatic movement of the clear water trough in tipping or tilting, to discharge, essentially as set forth.

Fourth. Controlling the automatic discharging action of the clear water trough, by means of a flutterer, or float, arranged therein, and serving, by connection with an unlocking lever, a stop piece, and catch or hook, to hold the trough from prematurely tilting.

No. 23,303.—JAMES LANCELOTT, of Cranston, R. I.—*Improvement in making Ornamental Chains*.—Patent dated March 22, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—The method described of weaving a chain from sheet metal, by forming the base of each link into a geometrical figure, and by bending each arm, longitudinally, at the same angle as one of the outer angles of the base, so that a cross-bar on the extremity of the next preceding link shall, when bent down, bear against the angular side of two of the arms of the next succeeding link, and thereby enable the chain to withstand a strain nearly equal to the cohesive strength of the metal of which the links are formed.

No. 23,304.—THOMAS MACKENZIE and ALBERT TROCHSLER, of Boston, Mass.—*Improved Mode of Marking and Ornamenting Paper*.—Patent dated March 22, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—As an improved article of manufacture, paper for writing, printing, and other purposes, having indelible marks or designs stamped thereon, by condensing the fibres thereof by pressure, as shown and described.

No. 23,305.—CHARLES MANS, of Danville, Pa.—*Improvement in Motive Power*.—Patent dated March 22, 1859.—In this machine the power is obtained by the descent of weights, and it consists in the subdivision of the weights W, in order to lessen the power necessary for their elevation.

*Claim*.—The arrangement of the drums D and  $c$ , wheels E and  $c$ , pinions P and  $c$ , fly-wheel R, and sectional weights W, when the whole are combined and operated as described.

No. 23,306.—JAMES H. MERRILL, of Baltimore, Md.—*Improvement in Breech Loading Cannons*.—Patent dated March 22, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim*, first, the combination of the breech piece C and frame B, so that the former may move back and forth, and have its bore raised up and lowered on the latter automatically, and fastened or locked, substantially as described.

I also claim, in combination with the screw D, for running the breech piece forward and backward, the mechanism for lowering and raising the rear of said breech piece, substantially as described.

No. 23,307.—EZRA MILLER, of Janesville, Wisconsin.—*Improved Post Office Hammer Stamp*. Patent dated March 22, 1859.—A is a cross-head, secured to a handle B. The upper end of the cross-head is provided with a socket C, to receive the types D. The type is secured by the thumb-screw  $a$ . E is a screw tenon at the lower end of the cross-head, to which is secured the marker F. The types and figures G G are secured to their place in the marker F by the thumb-screw  $b$ .

*Claim*.—A post office marking stamp, which has its handle running parallel, or nearly so, with its marking face or faces, substantially as and for the purposes set forth.

No. 23,308.—J. J. PARKER, of Marietta, Ohio.—*Improved Device for Equalizing the Tension of Watch Springs*.—Patent dated March 22, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—Making and constructing a barrelled cog-wheel, or drum, for time pieces, or for

other purposes, so as to equalize and regulate the power of a spring S, in the manner and form substantially as set forth.

No. 23,309.—S. E. PETTEE, of Philadelphia, Pa., assignor to the NORTH AMERICAN PAPER BAG AND ENVELOPE MANUFACTURING COMPANY, of said Philadelphia.—*Improved Envelope*.—Patent dated March 22, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I am aware that an envelope has been made, with a narrow fold at the side; but in that case the fold is carried down the sides of the back and flap, as well as of the body of the envelope, and the fold of the back is pasted to that of the body, having a stiff projecting piece in the interior of the envelope, very inconvenient and objectionable, totally useless and unnecessary. Such a form I distinctly disclaim.

But I do *claim* the form of the envelope blank described and represented, whether cut from a continuous roll of paper, or from separate sheets.

No. 23,310.—JAMES POWELL, of Cincinnati, Ohio.—*Improvement in Faucets*.—Patent dated March 22, 1859.—The longitudinal motion necessary to open and close the valve is imparted to the valve-stem H, through the medium of two flanges J and J<sup>1</sup>, on its head I playing on each side with the cam F. K K are spurs or projections on the valve-stem H, which serve to confine it to a central position within the chamber A, and guide the valve to its seat in the act of closing.

*Claim*.—The described arrangement of the cam F, flanges J and J<sup>1</sup>, longitudinal slot *i*, and spurs K, combined and operating in the manner and for the purposes set forth.

No. 23,311.—TREAT T. PROSSER, of Fond-du-Lac, Wis.—*Improved Rotary Engine*.—Patent dated March 22, 1859.—The nature of this invention consists in constructing a spiral passage C from the centre of a wheel to the periphery or outside, in such a manner that a current or force, in passing from the centre to the circumference in said spiral passage, will communicate its force to the wheel, and cause it to revolve until it escapes.

*Claim*.—A wheel with a spiral passage, diminishing in size from the centre to the periphery, for the purpose substantially as described.

No. 23,312.—JOSEPH READ, of Philadelphia, Pa.—*Improvement in Heels for Boots and Shoes*.—Patent dated March 22, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—A composition heel for boots and shoes, consisting of the composition A, moulded into the form of a heel, with the concavity *m*, in the upper side of the same, as described, and the leather lift, or bottom piece B or B<sup>1</sup>, in combination with the leather edge piece C, applied and secured thereto, substantially as set forth, the said heel being adapted for subsequent application to a boot or shoe, as described, and for the purposes specified.

No. 23,313.—HORACE P. RUSS, of San Francisco, Cal.—*Improved Amalgamator*.—Patent dated March 22, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—Portable or movable cups or cones of copper, galvanized, or amalgamated with quicksilver inside, or manufactured of other materials, such as wood, cast-iron, &c., to be placed in holes in sluice-boxes or other apparatus used in mining the precious metals, substantially as and for the purposes specified.

No. 23,314.—L. B. SCHAFER, of Baltimore, Md.—*Improvement in Pumps*.—Patent dated March 22, 1859.—This improvement relates to that class of pumps which are used on board of ships in case of accidents, and consists in the arrangement and combination of levers C, which cause the piston B to travel a greater distance at every stroke of the hand-lever E, as in common pumps, without increasing the circumference of the same.

*Claim*.—The arrangement for operating together the pump barrel A, shear C, link D, hand-brake E, and piston-rod I, substantially as and for the purpose set forth.

No. 23,315.—JOHN F. SCHUFFENECKER, of Keokuk, Iowa.—*Improvement in Brick Machines*.—Patent dated March 22, 1859.—The quadrant C, turning on its axle *q*, rises at the proper time to allow the clay to pass into the moulds, when it is brought back again, and its inferior surface is pressed down upon the mortar sufficiently to fill the moulds. The apertures D D allow the superfluous mortar to pass out, and to be deposited in the empty moulds in the rear of those which are thus filled. The shutter B is held in place by a forked brace R, which is sustained in position by the coiled spring S<sup>1</sup>. This brace stands vertically upon this shutter, and no upward pressure will open the shutter while the brace remains in that position. When the shutter B is to be raised, a shoulder upon the scraper A strikes the end of the lever L, by which means the brace R is pressed backward so as to allow the shutter to open.

The inventor says: I *claim*, first, the safety openings D, in combination with the quadrant C, arranged and operating in the manner and for the purpose specified.

Second. I claim the shutter B, operated by the fork R, spring S<sup>1</sup>, and bar L, in the manner represented.

Third. I claim the manner of levelling the mortar in the moulds by means of the two scrapers A and A A, as shown in the specification.

NO. 23,316.—DAVID SHIVE, of Philadelphia, Pa.—*Improved Instrument for Enlarging Photographs*.—Patent dated March 22, 1859.—The illuminating lens F consists of a convex, or plane convex lens as large in its diameter as can be adapted to the size of the swivelling instrument, which is fixed across at the sun end thereof, so as to converge the direct rays of the sun upon the translucent picture placed in the box A, through the slot 2, from which the required photograph is to be produced upon the paper, which has been fixed upon the holder C.

*Claim*.—The arrangement of the illuminating lens F, in the usual open end of a photographic camera, supported, in connection with the adjustable paper holder C, upon a stand D, substantially as described, so as to operate in the manner and for the purposes specified.

NO. 23,317.—WILLIAM H. SMITH, of Philadelphia, Pa.—*Improvement in Casting and Annealing Articles made of Scoria*.—Patent dated March 22, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I do not confine myself to the precise details described and represented, as various modifications can be made in the process and apparatus without affecting, substantially, the principle of my invention. Nor do I claim any of the processes and apparatus, separately, except as stated below.

I *claim*, first, the construction and use of the horizontally revolving casting wheel B, for facilitating the casting of slag and similar mineral products.

Second. The construction of an annealing chamber C, having various modes of retaining and regulating the heat therein, viz: by a series of dampers, by the construction of grooves and troughs in the walls, in connection with the flanges and dippers of the bed D, with or without the use of sand, by the devices at the ends of the wagons, and by the uses of the ante-chambers, substantially as described.

Third. The use and combination of a series of rollers R R<sup>1</sup> with a traversing bed, substantially as described, for imprinting an entire pattern of different colored figures.

Fourth. The construction and employment of segmental sliding moulds, as shown, or of similar character, and the mode of arranging and working the same, substantially as described.

NO. 23,318.—JAMES SPEAR, of Philadelphia, Pa.—*Improvement in Gas Burning Stoves*.—Patent dated March 22, 1859.—The nature of this invention consists in the burning of gas arising from coal in heating stoves, by introducing jets of heated air over the fire, which jets of air, mingling with the gas arising from the coal, aid the combustion of the same.

*Claim*.—The combination of the sled E, in the door frame F, with the ring M and the cylinder B and the body of the stove A, as constructed, in the manner and for the purpose set forth.

NO. 23,319.—CHARLES F. SPENCER, of Rochester, N. Y.—*Improved Carpet Fastener*.—Patent dated March 22, 1859.—The claim and engraving will explain the nature of this invention.

*Claim*.—A carpet fastener made of a single piece of plate metal, of triangular or three-pointed form, one point *b*, serving as the shank, to be driven into the floor; another point *d*, as the hook for receiving the carpet, and the third point *a*, as a head so shaped as to enable the fastener to be driven with facility into the floor, all substantially as specified.

NO. 23,320.—A. M. SPRAGUE, of Mobile, Ala.—*Improved Apparatus for Skimming the Surface of the Water in Steam Boilers*.—Patent dated March 22, 1859.—The operation is as follows: The sediment passing through the openings *i* into the skimmer B, is, by the pressure of the steam, forced into the discharge pipe F and out of its mouth *w*.

*Claim*.—The surface skimmer B, constructed, arranged, and operating substantially as described, and for the purpose of removing the sedimentary water from the upper water surface of steam boilers.

NO. 23,321.—CHARLES E. STEVENS, of New York, N. Y.—*Improvement in Car Couplers*.—Patent dated March 22, 1859.—The claim and engraving will explain the nature of this invention.

*Claim*.—The combination of the yielding support within the mouth of the aperture of railway car boxes, with one or more blocks *i* inside, and the annular flange outside the said boxes, when said parts are arranged in relation to each other, substantially as described, to effect the coupling of the boxes, automatically, by the action of straight links and locking bolts, in the manner specified, and for the purposes set forth.

NO. 23,322.—EDWIN L. SWARTWOUT, of Utica, N. Y.—*Improved Mode of Fastening Sheets*

*of Paper Together.*—Patent dated March 22, 1859.—The nature of this invention consists in providing a metallic clasp A with teeth *b b*, and a perforated metal plate, the holes of which correspond with the teeth of the clasp to which they are secured.

*Claim.*—The new and improved article of manufacture, the metallic clasp A, in combination with the perforated metal plate B, for fastening together legal and other documents, constructed as described, in the manner and for the purpose substantially as specified.

No. 23,323.—CHARLES TAYLOR, of Little Falls, N. Y.—*Improvement in Cheese Presses.*—Patent dated March 22, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim*, first, attaching one end of the press bar *l* to the bottom of the box K, and the other end to the crank pin on the wheel L, as set forth, whereby I am enabled to shorten the movements of the follower, and have an eccentrically operating press, completely arranged, as described.

Second. I claim the spring bed piece *q*, and the spring P P, acting upon the wheel L, on the extreme upward movement of the follower, and thus holding up the follower, as described.

No. 23,324.—NATHAN THOMPSON, of Bridgeport, Conn.—*Improved Paddle Wheel.*—Patent dated March 22, 1859.—This improvement in paddle wheels consists in making the floats D of the form of a triangular prism, by which many advantages are obtained over common flat floats.

*Claim.*—The arrangement and combination, in the manner shown and described, of the triangular floats D, with the arms C, to prevent the formation of the vacuum, the lifting of back water, &c., as set forth.

No. 23,325.—LOUIS TILLIERS, of West Morrisiana, N. Y.—*Improved Filter.*—Patent dated March 22, 1859.—The water to be clarified is introduced into the chamber G, passes through the strainer of wire cloth, the sponge, and the cast-iron strainer *a*, into the compartment H, passes through the layers of sand, pulverized charcoal, and sand L M N, and thence into the inner chamber, and is then drawn off by means of the faucet F.

*Claim.*—A hygienic purifier, constructed in the manner described, operated as described, and for the purpose set forth.

No. 23,326.—WILLIAM TUCKER, of Blackstone, Mass.—*Improved Method of Securing Bits in the Stock.*—Patent dated March 22, 1859.—By turning the screw *d* the button *g* will enter the notch *h*, and be drawn upward, so as to act against the upper part of the notch, and draw the bit or tool close up into the socket *c*, and there hold it until the screw is turned backward, so as to carry the button out of the notch.

*Claim.*—The application or arrangement of the screws *d e*, and the segmental button *g*, with respect to the bit, or boring tool socket, and to operate with or on the tool, substantially as specified.

No. 23,327.—WILLIAM P. VALENTINE, of Fond-du-Lac, Wis.—*Improved Shingle Machine.*—Patent dated March 22, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I do not intend to limit myself to the special mechanical devices employed in my machine, as these may be somewhat varied, and yet accomplish the same result. I am aware that small chissels have been placed upon the convex side of a thick saw flange for the purpose of cutting away splinters, to prevent the latter from catching behind the spreader.

I am also aware that shingle machines have been fed by hand at a varying rate of feed.

I *claim*, first, varying the rate of feed, by the mechanical means set forth, so as to feed the lumber to the saw more rapidly during the first half of a cut, when the saw has the highest velocity, and slower during the latter half of a cut, in order to keep the saw constantly at a uniform velocity.

Second. I claim the use of the two carriages P and P<sup>1</sup>, operating in the particular manner described, for the purpose of cutting alternately on both sides of the saw, thus keeping the saw constantly at work, and preventing the loss of time, or power, whilst the lumber is returning with the carriage to be ready for the next cut.

Third. I do not claim the concavo-convex saw, or the planes upon its surface, as separate mechanical devices, but I claim the concave saw and the planes, in combination with the saw carriage, for giving rake to the saw, and for sawing and planing shingles at a single operation, substantially as described.

Fourth. I claim the arrangement of springs S S and S<sup>1</sup> S<sup>1</sup>, the head blocks R R and R<sup>1</sup> R<sup>1</sup>, and the spreaders C C and C<sup>1</sup> C<sup>1</sup>, for alternately holding and dropping the shingle block, substantially as set forth.

No. 23,328.—BENJAMIN C. VANDUZEN, of Cincinnati, Ohio.—*Improved Machine for Heading Bolts*.—Patent dated March 22, 1859.—In this invention a peculiar heading device and clamp are so arranged that the blank while being headed may be firmly clamped, the clamps or dies being rendered capable of adjustment so as to render a perfect contact with a requisite degree of pressure at all times, and the heading device so arranged that it may be adjusted to form heads of different thickness and a requisite length of the blank of which the head is made, and commensurate with the size of the required head, allowed to pass with the recess or chamber of the die where the head is formed.

*Claim*.—The arrangement and combination of the adjustable spring fork rod G, lever H, upper lever b, and heading die F, substantially as shown and described, for the purpose of regulating the movements of the lever H and die F, and controlling the size given to the head of the bolt.

No. 23,329.—HASKELL WALKER, of Hartford, Vt., assignor to Himself and BENJAMIN P. DRIGGS, of Fairlee, Vt.—*Improved Odometer*.—Patent dated March 22, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—The peculiar arrangement of the parts thereof, by which an actuating tooth upon the hub of one of the wheels of a carriage will cause each revolution of said wheel to unerringly impart a small portion of a revolution to the shaft K of the odometer, whilst the spring l, by its action against the faces of the angular portion of said shaft, will accurately govern and control the movements thereof, substantially as set forth.

No. 23,330.—WILLIAM A. WILSON, of Berlin Falls, N. H.—*Improved Construction of Saw Teeth*.—Patent dated March 22, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—Combining the planing tooth B with the sawing tooth A, so that the cutting edge of the former shall be in the rear of, and at about right angles to, the back of the latter, having the throat C between, as set forth and shown.

No. 23,331.—WILLIAM WOOD, of Hartford, Conn.—*Improvement in Brick Machines*.—Patent dated March 22, 1859.—The nature of this invention consists in the application of slides A A and rotating arms B B, to throw forward the brick moulds M when filled.

*Claim*.—The arms B B, in combination with the slides A A, provided with the lever C and tappet c, for operating the moulds M, as described.

No. 23,332.—LEWIS E. CLOW, of Albany, N. Y., assignor to S. H. RANSOM & Co., of said Albany.—*Improvement in Pot Hole Covers for Cooking Stoves*.—Patent dated March 22, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—A cover, or division plate e e, constructed of two perforated plates d d, and the unperforated rim, or ring A A, as set forth.

No. 23,333.—JOSEPH DAVENPORT, of Masillon, Ohio, assignor to Himself and C. M. RUSSELL, of said Masillon.—*Improvement in Iron Railroad Cars*.—Patent dated March 22, 1859.—The claim and engraving will explain the nature of this invention.

*Claim*.—The combination with the platform or bottom of a railroad car of a laterally and longitudinally supporting truss brace, when said brace consists of a four sided frame s s t t, a series of transverse ties B, and transverse diagonal braces C C, a central longitudinal skeleton, or diagonally braced girder A e d b b, and bearing plates or shoes D D g g, substantially as and for the purposes set forth.

No. 23,334.—W. P. GOOLMAN, of Dublin, Ind., assignor to Himself, SAMUEL B. MORRIS, and W. HOLLINGSWORTH, of said Dublin.—*Improvement in Mole Ploughs*.—Patent dated March 22, 1859.—The operation is as follows: The mole R is first introduced to a proper depth into the ground, and the nut n<sup>1</sup> elevated on its rod N, so as to allow the plough to rise sufficiently to pass over slight inequalities in the ground without elevating the mole. The beam P is then adjusted by means of the screw rod N to a horizontal position, or to accord with any inclination desired in the drain, and so maintained while the plough is drawn forward.

*Claim*.—The arrangement substantially as set forth, of devices for producing or preventing lateral curves in a drain by adjusting the presentation of the mole independently of the point of draft.

No. 23,335.—DARIUS WELLINGTON, of Boston, Mass., assignor to CHARLES A. WELLINGTON, of said Boston.—*Improved Water Closet*.—Patent dated March 22, 1859.—The object of this invention is to dispense with the mechanism hitherto employed below the basin, and substitute a simple and efficient device for allowing the excrement to escape freely, and also to retain the cleansing water at a suitable height in the basin, so that the soil pipe cannot become choked or any effluvia escape from it through the basin into the room in which the closet may be.

*Claim.*—The arrangement and combination of the hollow valve rod *F*, perforated at *d d*, cap *G*, basin *B*, pipe *H*, tube *H*<sup>1</sup>, and reservoir *I*, as and for the purpose shown and described.

No. 23,336.—T. F. ALLEN, of Dyersville, Iowa.—*Improvement in Railroad Car Trucks.*—Patent dated March 29, 1859.—The nature of this invention consists in a car truck sustaining the weight of the car body upon the centre in a manner to perfectly balance or keep it in equilibrium and free from contact with the side timbers of the truck frame, whatever may be the motion imparted to it, and yet provide but the one common central axis or bearing for it to turn upon.

*Claim.*—A car truck, sustaining the weight of the car body upon the centre, in a manner to balance or keep it in equilibrium and free from contact with the side timbers of the truck frame, whatever be the motion imparted to it, and yet provide but the one common axis or bearing for it to turn upon, substantially as described and for the purposes set forth.

No. 23,337.—LUTHER ATWOOD, of Brooklyn, N. Y.—*Improvement in Apparatus for Destructive Distillation.*—Patent dated March 29, 1859.—The nature of this invention consists in combining a vertical distilling tower, or chamber *A*, arranged so as to receive both the fuel and the substance operated on with a condenser *h*, and a means of controlling or regulating the draft by which the products of combustion of the fuel are circulated through the mass acted on, so that the process of decomposition can be carried on below a temperature that would effect combustion before the liquid and volatile products have been driven off by the heat.

*Claim.*—The combination of the vertical distilling tower *A*, and appurtenances, with the condenser *h*, and the adjustable draft passage *c*, or their substantial equivalents in combination, when arranged and combined substantially as described, so as to use the current of heated products of combustion in its upward or natural direction.

No. 23,338.—THOMAS D. AYLSWORTH, of Ilion, N. Y.—*Improvement in Hop Frames.*—Patent dated March 29, 1859.—The claim and engraving will explain the nature of this invention.

The inventor says: I *claim* so hanging the main wire *B* upon the supports *F*, as that said supports will prevent the wire from slipping through them, should it accidentally become loose or broken, substantially as described.

And I also claim, in combination with the main wire, suspended as represented, the uniting thereto of the training wires *a* by spring hooks, substantially as described and shown.

No. 23,339.—GEORGE W. BAKER, of Neponset, Ill.—*Improved Farm Gate.*—Patent dated March 29, 1859.—The wheel of the vehicle coming in contact with the lever *C* depresses it, and by reason of the connections draws the slide piece *D* half its length. The rollers in the jaws of rods *f* following slots *m m*, the two sections of the gate separate and the vehicle passes through.

*Claim.*—The slide *D*, and levers *C C*, in combination with the rods *ff*, levers *ll*, rods *cc*, and bars *bb*, arranged for joint operation, in connection with the gate sections, substantially as set forth.

No. 23,340.—ABRAHAM BASSFORD, of New York, N. Y.—*Improved Cushion for Billiard Tables.*—Patent dated March 29, 1859.—The claim and engraving will explain the nature of this invention.

*Claim.*—Constructing the cushion of a billiard table of a metal plate *B*, the edge of which is protected by a thin strip of India rubber, or other suitable substance, substantially as and for the purposes set forth.

No. 23,341.—ABRAHAM BASSFORD, of New York, N. Y.—*Improved Cushion Rail for Billiard Tables.*—Patent dated March 29, 1859.—This invention consists in supporting the rail by means of romb shaped studs *C*, which leave room enough in their centre for bolts *a* to pass through, while they are beveled down towards both ends, so that an open space is left between the bed and the rail nearly all the way around, it also consists in forming the pocket bows of the same pieces which form the rail, joining the same in the middle of the bows, and giving them a bevel underneath.

The inventor says: I *claim*, first, the arrangement of the cushion rail of a billiard table, in such a manner that a space is left between the bed and the rail, by securing the same to the bed by means of studs *C* and bolts *a*, substantially as and for the purpose specified.

Second. The arrangement of the pocket bows *D*, which are made of one piece with the rail, and secured together by a lap joint *f*, and which are beveled down at their lower edge, substantially as and for the purpose set forth.

No. 23,342.—ALEN BECKERS, of New York, N. Y.—*Improved Hinge for the Reflectors of Stereoscopes, &c.*—Patent dated March 29, 1859.—This invention consists in arranging two

ears *a a*, one on each side of the reflector, and made of thin elastic sheet metal, which ears are rigidly attached to the sides of the case, and each ear is provided with a hole through which a screw *b b* passes freely, which screws into the side of the reflector or other part which is to be adjusted.

*Claim.*—The arrangement of the ears *a a*, one on each side of the reflector of a stereoscopic case, or attached in a corresponding manner and for the same purpose to any like part of another similar instrument, in combination with the screw *c*, substantially as and for the purpose described.

No. 23,343.—HUBBARD BEEBE, of New Haven, Conn.—*Improved Mode of Preparing and Mounting Slates.*—Patent dated March 29, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim* the combination of a metallic band or rim and vulcanized India rubber frame or mounting, with or without a lining of cloth, to the school slate, whether of stone, slated paper, or wood, substantially in the manner and for the purposes specified and set forth.

I also claim as my invention, the application of the vulcanized India rubber or gutta percha frame or mounting, substantially in the manner described, without the metallic rim, to slates of stone or other material of sufficient strength and stiffness to warrant its disuse in any case; but I deem it preferable in all cases to combine the two where durability, as well as noiselessness, are deemed important.

No. 23,344.—EDWARD BEHR, of New York, N. Y.—*Improved Mode of Fastening Skates.*—Patent dated March 29, 1859.—This invention consists in fastening the skates by means of screws *a* and *b*, which are attached to a toe cap B, and to a heel strap C, in such a manner that the strain of the cap and of the strap can be adjusted by turning the screws, and that the foot can be cramped in the toe strap.

*Claim.*—The arrangement of the screws *b*, and the screws *i*, or their equivalent, in combination with the toe cap B, and with the heel strap C, substantially as and for the purpose described.

No. 23,345.—FREDERIC B. BETTS, of Brownhelm, Ohio.—*Improved Method of Opening and Closing Gates by the Weight of the Vehicle.*—Patent dated March 29, 1859.—The nature of this invention consists in constructing an apparatus for the purpose of opening and closing gates by the action of carriage or other wheels upon levers, which are so constructed and arranged that by their operation they shift the position of the lower hinge and thus alternately change the centre of gravity, and thereby cause the gate to swing either out or in as the case may be.

*Claim.*—The combination of the roller B, and its appurtenances, with the levers F F', and connecting rods D, and with the gate, for the purpose specified and substantially as set forth.

No. 23,346.—LYMAN W. BLANCHARD, of Whittingham, Vt.—*Improved Construction of Mallets.*—Patent dated March 29, 1859.—The inventor says: I construct the body of the mallet A of iron of about three and a fourth inches in length on the front side where the flanges go on, about three and a half inches in length on the back or opposite side, about two and three fourth inches in width and two and a half inches in thickness. I have the centre of this mallet concave on the middle of the three sides, and near the ends convex; the front side I have straight, with a spur I I on each side of the centre hole that receives the handle E at B.

*Claim.*—The mode of constructing mallets with wooden head blocks and iron flanges, and a tapering screw, arranged substantially in the manner and for the purpose set forth.

No. 23,347.—PARDON BOYDEN, of Sandy Creek, N. Y.—*Improvement in Carriage Tops.*—Patent dated March 29, 1859.—When the top B is raised, the jointed bars D D retain it in such a position, or prevent it from casually falling or descending. When the top is down it is back of the seat A, the bars D D being sufficiently long to permit such position.

*Claim.*—The arrangement and combination of the bows E, bars D D, bars H H, and seat rail *a*\*, substantially as and for the purpose shown and described.

No. 23,348.—JOEL CARRINGTON, of Avoca, N. Y.—*Improvement in Mole Ploughs.*—Patent dated March 29, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—The combination and arrangement of a replaceable pointed coulter, with a continuous plate or solid standard carrying the mole, and a brace in the rear, connecting the said mole to the beam, and also to the handles, in the manner substantially as described.

No. 23,349.—JOHN CHARLTON, of Newark, N. J.—*Improved Mode of Fastening Skates.*—Patent dated March 29, 1859.—This invention consists in arranging at the front part of the skate a cap D, which adjusts itself by means of slides to the size of different feet, and which is drawn up to the toes by means of the straps F F', which serve to fasten the skates to the feet.

*Claim.*—The arrangement of the self-adjusting toe cap D, which is attached to the stock of a skate, substantially as and for the purpose specified.

No. 23,350.—HUGH W. COLLENDER, of New York, N. Y.—*Improvement in Billiard Table Cushions.*—Patent dated March 29, 1859.—The claim explains the nature of this invention.

*Claim.*—Making cushions for billiard tables of what is known as the soft compound of vulcanizable India rubber, faced with what is known as the hard compound of vulcanizable India rubber, or allied gum, united in the green or plastic state, and together subjected to the heating process for vulcanization, substantially as described.

No. 23,351.—JAMES M. CONNEL, of Newark, Ohio.—*Improved Submarine Telegraph Cable.*—Patent dated March 29, 1859.—In the drawing, *a* is the central core of gutta-percha or other flexible material. Around this core the conducting wire *b* is wound spirally. Upon this is placed a covering *c* of oiled silk or other suitable material which will prevent the wire *b* from becoming imbedded in the insulating covering *d* with which it is wrapped.

*Claim.*—The introduction of the smooth surfaced wrapping between the coil and the insulating covering, and the employment of this last covering as a core for other wires, substantially as described.

No. 23,352.—SAMUEL COPE, of Enterprise, Ohio.—*Improvement in Cheese Presses.*—Patent dated March 29, 1859.—The water placed in the reservoir F is conveyed down through the tube T and enters the bottom of the bellows B. A stop-cock S is placed in the connecting pipe P, by which the water is kept back until it is requisite to let on the pressure.

The inventor says: I do not claim a hydrostatic press, as that has been used for many purposes.

But I *claim* graduating the force of a hydrostatic cheese press by drawing the water slowly through the stop-cock S, as described, for the purpose set forth.

No. 23,353.—JOSEPH CORDUAN, of Brooklyn, N. Y.—*Improved Apparatus for Sounding House Bells, &c.*—Patent dated March 29, 1859.—The inner tube in which the escape bolt G and spring attached is held, is drawn back by means of the curved spring K pressing down the escape end of the bolt to lock on the edge of tube I until it comes in contact with the stud L in bottom of the cylinder, thereby extending both the inner and outer springs sufficiently to perform the individual action required of each.

*Claim.*—The arrangement of the three separate springs, in combination with the two tubes and escapement bolt, as described.

No. 23,354.—WALDO P. CRAIG, of Newport, Ky.—*Improvement in Pile Drivers.*—Patent dated March 29, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim*, first, the described application and arrangement of the guides K and K<sup>1</sup>, attached to their upper ends by universal joints, to the frame, and at their lower ends sliding in apertures *l* and *l*<sup>1</sup> in a collar L adapted to fit over the end of a pile and follow the same in its descent.

Second. In combination with the above the turn-table J, constructed and operating substantially as and for the purpose set forth.

No. 23,355.—WILLIAM H. CRITTENDEN, of Grafton, Ohio.—*Improved Sawing Machine.*—Patent dated March 29, 1859.—This invention will be explained by reference to the claim and engraving.

*Claim.*—The manner of arranging the compensating levers K K and rods N N in combination with the straining levers H H, straining rod I, adjustable slotted holder P, saw J, the whole being arranged and operating in the manner and for the purpose as set forth.

No. 23,356.—A. H. CROZIER and CYRUS CARRIER, of Oswego, N. Y.—*Improved Chopping Block for Stave Machines.*—Patent dated March 29, 1859.—The operation of the machine is as follows: Motion being given by means of the hand, the bolt of timber to be cut is placed on the bed plate O, and when the knife is at the highest point the lower edge of the bolt is placed against the gauge M. The knife then descends and cuts off a stave, which is forced up and held between the knife stock K and springs N. As each successive stave is cut it forces out the preceding one, which falls into any proper receptacle.

*Claim.*—The grooved metallic chopping block, constructed and operating as described.

No. 23,357.—F. M. DAVIS, of Footville, Wis.—*Improvement in Seeding Machines.*—Patent dated March 29, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I am aware that reciprocating seed slides J have been previously used, and also that slides *k* with oblique slots *l* have been used for operating seed slides, I therefore do not claim the reciprocating seed slides, nor the slides *k*.

But I *claim* the arrangement and combination of the caster wheel C, lever D, spring rack bar E, pinion bar F, pinion G, rod H, slide *k*, and share L, as shown and described, so that

when the bar F is thrown back and lever D is depressed, the bar F will carry the pinion out of gear with the wheel M, and thus render the seed slides *k* inoperative, while the front part of the machine will be lifted on the caster wheel and the share L raised out of the ground, all as set forth.

No. 23,358.—JAMES E. EMERSON, of Sacramento, Cal.—*Improved Pick Handle*.—Patent dated March 29, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—The iron heading of a handle fitted to the under side of the pick or other instrument, by means of a pin and hole on corresponding plane surfaces, or a swelling and hollow, corresponding to each other, and securely fastened thereto by means of a stirrup extending over the pick or other instrument, and secured to the handle by means of a key and wedge, which will, by such combination, form a durable and permanent mode of fastening handles on picks or other instruments, without eyes therein.

No. 23,359.—ELISHA E. EVERITT, of Philadelphia, Pa.—*Improved Bedstead Fastening*.—Patent dated March 29, 1859.—The nature of this invention consists in a peculiar manner of constructing the inclination of the dovetail, or coupling part of the fastening for bedsteads, and in making both the rail and post parts of the said fastening, in the *plug* form A and A<sup>1</sup>, with fins *e* attached thereto.

*Claim*.—A plug fastening, consisting of the two plug pieces A and A<sup>1</sup>, constructed as set forth and described, the same being applied and arranged in combination with the post and rail of a bedstead, in the manner and for the purposes specified.

No. 23,360.—THOMAS T. FURGUSSON, of New York, N. Y.—*Improvement in Tanning Hides and Skins*.—Patent dated March 29, 1859; patented in France August 10, 1858.—This invention consists in impregnating hides and skins with a suitable liquid, by a filtration of the liquid through the same, while subjected to a sustained and regulated hydraulic pressure in a vacuum chamber previously exhausted. The apparatus consists of a vacuum chamber A, to receive the articles to be acted upon, a receptacle or vat H for the liquid, and of pumps P, by which the vacuum chamber is exhausted of air and charged with the liquid.

*Claim*.—The method described of impregnating hides or skins with the required liquid, by subjecting them to the action of a current of the liquid, under a sustained and regulated pressure, after they have been deprived of air by a preliminary exhaustion.

No. 23,361.—ALPHEUS C. GALLAHUE, of Northeast Centre, N. Y.—*Improvement in Machines for Pegging Boots and Shoes*.—Patent dated March 29, 1859.—The object of this invention is to obtain a machine that will perform the whole of the work that relates to the pegging of boots and shoes, to wit: The making of the holes in the soles to receive the pegs and the driving of the pegs in the holes; and also the splitting of the pegs from the strip or block, as well as the duplicating of the rows of pegs entirely around the sole, or at certain points of the sole, each at right angles to the surface of the sole where driven.

The inventor says: I do not claim a rack block E, arranged so as to feed the shoe with a continuous motion underneath the awl and peg driver, for such device has been previously used.

But I *claim*, first, forming the rack bar E, of two parts *e f*, arranged as shown, so as to admit of being lengthened and shortened, to compensate for different length of shoes.

Second. The adjustable or swinging plate G, in connection with the inclined planes *i i*, or an equivalent device, for actuating the plate G, for the purpose set forth.

Third. The inclined peg gauge *y*<sup>1</sup>, in connection with the peg or feed box S, so as to gauge the pegs from their lower ends, as described.

Fourth. The vibrating socket *e*<sup>1</sup>, in connection with the plunger rods *u v*, arranged in the same slide bar *t*, to operate as set forth.

Fifth. The bar R, provided with the shoulder or bearing *s*<sup>1</sup>, and rendered capable of being operated, when necessary, by the adjustable yoke *o*<sup>1</sup> and cam *p*<sup>1</sup>, for the purpose of duplicating the row of pegs when required.

Sixth. The combination of the swinging bed plate D, with a rack E, arranged to operate substantially as and for the purpose set forth.

No. 23,362.—JAMES GILLESPIE, of Freeport, Pa.—*Improvements in Revolving Retorts for Distilling Coal Oil*.—Patent dated March 29, 1859.—This invention consists in keeping the mouth of the eduction pipe of a revolving coal oil retort stationary in the upper part of the retort, and thereby preventing, as far as practicable, the entrance therinto of solid matters.

*Claim*.—Securing the hopper-like cup I in position, by means of the pins *o o*, or their equivalents, surrounding the exit journal *h* of each retort, the square headed shaft J, passing through a hollow journal at the opposite end of the retort, and the external plate *p*, the whole applied and operating substantially as described.

No. 23,363.—FRANCIS GILLILAND, of Port Jackson, N. Y.—*Improvement in Stoves*.—Patent dated March 29, 1859.—This invention relates to an improvement in stoves which have

sheet iron cases or body, and consists in a novel way of lining the same and controlling the draft, whereby the sheet iron casing or body will be protected from the fire, and the latter at the same time allowed to diffuse its heat without being materially absorbed or obstructed by the lining.

*Claim.*—In combination with the lining E, and sheet metal case B, the cylinder F, placed within the body of the stove, and provided at its top with the register or sliding band *h*, and a register or slide *f*, on its flanch *d*, for the purpose set forth.

No. 23,364.—L. F. GOODYEAR, of New Haven, Conn.—*Improved Tool for Cutting Metal.*—Patent dated March 29, 1859.—The knives, or cutters C, are adjusted within the rings or bands A by regulating the screws B, so that the knives or cutters may be adjusted perfectly horizontal or in oblique positions, the wedges D retaining the cutters at equal distances apart at whatever distance they may be from the inner peripheries of the rings.

*Claim.*—The arrangement and combination of the adjustable wedges D, cutters C, and ring A, substantially as and for the purpose shown and described.

No. 23,365.—CHARLES GORDON, of Washington, D. C.—*Improved Protractor.*—Patent dated March 29, 1859.—This invention consists of an instrument having a heavily weighted base A, to an arm of which is firmly attached a graduated arc D, a vernier E and parallel rule F, by means of which engineers, surveyors, and draughtsmen can protract triangles or other right lined figures.

*Claim.*—The improved protractor, as described, consisting of the base, the meridian limb, the vernier, the arc, and rulers, with the clamping screw, the whole arranged and operated as specified.

No. 23,366.—ALBERT GRANGER, of New York, N. Y.—*Improved Metallic Pen Holder.*—Patent dated March 29, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—The holding of a pen on the outside of a metallic tube (commonly called a pen holder) in such a manner, by reason of pierces, cracks, and indentations, as to leave the entire length of a pen, when inserted in proper writing position, uncovered.

No. 23,367.—WILLIAM A. GREENE and JOHN G. TREADWELL, of Albany, N. Y.—*Improvement in Gridirons.*—Patent dated March 29, 1859.—This improvement consists in attaching a check plate on the under side of the gridiron B, immediately behind the reservoir G, and riveted thereto. Said check plate extends across the whole width of the hearth A and descends down within a short distance of the bottom of the same, for the purpose of separating the fire from the air chamber J, situated between said check plate and the front of the hearth.

*Claim.*—The check plate I attached to a stove gridiron B when the same is constructed and arranged in the manner and for the purpose set forth.

No. 23,368.—SMITH GROOM, of Troy, N. Y.—*Improved Hose Coupling.*—Patent dated March 29, 1859.—By having the wedge-shaped flanges *ee* and notched lugs *hh* arranged upon the outside of the movable ring B and fixed part C for conjoint operation, there is a combination of advantages thereby secured of much practical value; for this coupling makes a packed joint which is increased in tightness according to the increase of power applied in turning up the ring of the coupling, and the length of hose or pipe is not required to be twisted in being united thereby, so that in these respects it is not inferior to the common screw coupling in general use.

The inventor says: I *claim* the arrangement of the notched lugs *hh* and wedge-shaped flanges *ee* for conjoint operation upon the outside of the fixed part C and movable ring B of the two halves of the coupling, as and for the purpose described.

And in combination with the lugs *hh* and flanges *ee*, constructed and arranged upon the coupling for conjoint operation, as described, I also claim the ratchet teeth *j* and catch *k*, when arranged upon the two halves of the coupling, as described, for the purpose specified.

No. 23,369.—WILLIAM J. GRIFFIES, of Marietta, Ga.—*Improvement in Ploughs.*—Patent dated March 29, 1859.—The nature of this invention is a plough stock A, upon which any kind of plough hoe may be readily fitted, moved, and adjusted. The lower part of the foot or helve to which the plough hoe is attached is iron, made open or forked at BB, into which the upper part of the stock, which is made of wood, is let and fastened by two iron bolts CC.

*Claim.*—The arrangement of the stock A, forked and slotted foot BB, screw E, shovel F, brace G, wedge C, beam H, and handles II, the whole being constructed as and for the purposes set forth.

No. 23,370.—ELIJAH HARRIS, of Princeton, Ill.—*Improvement in Watchmakers' Lathes.*—Patent dated March 29, 1859.—The nature of this invention consists in constructing a lathe for drilling and turning which will combine both and do the work of either, and in constructing different standards to be used in the same slide head, in finishing them with perforations or holes, with rimmer *b*, to support the substance and the drill, and with dovetail slide *d*.

*Claim.*—The standard F with rimmer *b*, the standard shown at Fig. 3, and the standard shown at Fig. 4, with dovetail slide *d*, the extra slide head E, in combination with the standards F, Figs. 3 and 4, and the slide tongs shown at Fig. 8, substantially as shown and described.

No. 23,371.—JACOB HAYNES, of Cameron, Ill.—*Improvement in Corn Planters.*—Patent dated March 29, 1859.—The claim and engraving will explain the nature of this invention.

The inventor says: I *claim* the hinged shoe T, formed with a serrated plate, and with the wings V and W, substantially in the manner and for the purpose described.

I also claim the combination of the movable seat A<sup>1</sup> with and supported by the hinged radius bars B<sup>1</sup> and by the sliding bars C<sup>1</sup>, for the purpose of enabling the driver to raise or lower the front end of the machine, substantially in the manner and for the purpose described.

No. 23,372.—FRANCIS M. HEMPHILL, of Newport, Ky.—*Improvement in Grinding Mills.*—Patent dated March 29, 1859.—The nature of this invention will be explained by reference to the claim and engraving.

The inventor says: I *claim*, first, in the described combination with an adjustable bridge tree, the spindle E, confined below to the tree and hinged above to the cup formed driving and feeding ryne N *n n*, having a hinged attachment to the runner, and enabling a discretionary increase of the stress of the runner on the grain by the lighter screw operating wholly from below, as set forth.

Second. The described arrangement of the cup formed driving and feeding ryne N *n n*, gudgeons P, bolts Q, sleeves *q q*, and metallic eye R, having the described or equivalent connection with a runner and spindle, respectively, for the purposes set forth.

Third. The cup formed driving and feeding ryne N *n n*, having the described or equivalent hinged attachments to the spindle and the runner, respectively, and operating as set forth.

Fourth. The frame A B C, constructed substantially as and for the purpose set forth.

No. 23,373.—RUSSEL HICKOK, of Fort Edward, N. Y.—*Improved Insulator for Lightning Rods.*—Patent dated March 29, 1859.—This invention consists in attaching lightning rods to buildings through the intervention of insulators D, each of which consists of a single piece of glass or other suitable insulating material, which surrounds the rod B, and which has alternate ribs or projections *e* and grooves or spaces *f*, so arranged around its interior surface that while the ribs or projections hold the rod so closely as to prevent disagreeable or injurious shaking of the rod, there is also, at the same time, abundant room in the spaces *f* for the water which runs down on the rod to pass through the insulator.

*Claim.*—A lightning rod insulator, made in one piece, so as to support and insulate the rod, and also leave open spaces for water to pass through it, and for air, when suddenly expanded, to escape from within it, as set forth.

No. 23,374.—GARDNER P. HOPKINS, of Cabot, Vermont.—*Improved Churn.*—Patent dated March 29, 1859.—The wheels *i* on the axle *f* run over the inclined planes *n* and thereby cause an up and down motion of the dashers *g*, while the same revolve in different directions when the churn is in operation. By means of the dashers revolving in different directions and by means of the cogs *o* in the inside of the barrel *b* of the churn, the cream is prevented from acquiring a circular motion in the process of churning.

*Claim.*—The construction of the churn in the manner hereinbefore described, so as to combine the rotary motion of the barrel with the up and down and rotary motion of the dashers, and so to prevent the cream from acquiring a circular motion in the process of churning.

No. 23,375.—ROBERT JOBSON, of Wordsley, England.—*Improvement for Making Moulds for Casting.*—Patent dated March 29, 1859; patented in England May 31, 1856.—This invention has for its object a combination of apparatus to facilitate the making of moulds for casting metals, with a view to render it unnecessary that the workmen should turn over the flasks or boxes by hand.

*Claim.*—Constructing the table platform or bed *b* so that it may turn on or about necks or axes, substantially as described.

No. 23,376.—HENRY R. KEESE, of Bridgeport, Vt.—*Improvement in Harvesters.*—Patent dated March 29, 1859.—By the raising of the outer end of the lever J it will actuate the arms *p p*, and the latter, in consequence of being connected to the back end of the draft pole H by the link *o*, will throw up the front end of the main frame A, and the front ends of the fingers of the bar C, thereby allowing said fingers to pass over slight obstructions, or preventing them from catching against them, so that the finger bar may rise and pass freely over.

The inventor says: I *claim*, first, the employment of a hinged supplemental frame D, in combination with the main frame A and driving wheel B, when the said frame D is provided with an adjustable bearing wheel E, or its equivalent, all substantially as and for the purpose shown and described.

Second. The combination of a driver's seat G with the supplemental frame D and driving wheel B, as set forth, so that, by lateral change of his position, the driver may elevate or depress the cutters, or diminish the traction, and otherwise balance and govern the machine, as shown and described.

Third. Hinging the supplemental frame D to the main frame A, substantially as and for the purpose set forth.

No. 23,377.—RUFUS S. LEE and WILLIAM D. LEAVITT, of Cincinnati, Ohio.—*Improvement in Rocker Boxes for Saw Shafts.*—Patent dated March 29, 1859.—This invention consists in combining with a rocker box B an interior box D that has its end motion therein, the box D resting and moving upon friction rollers *h h*, and against or with a spring *i*, also combined within the rocker box.

The inventors say: We *claim* so connecting the inner to the outer box, through the medium of a spring, as that said inner box or bearing may have end motion in the outer one against the action of said spring, substantially as described and for the purpose set forth.

And we also claim, in combination with the elastic or spring connexion between the inner and outer box, the rollers *h h* for the inner box to move on, substantially as set forth and described.

No. 23,378.—EDWARD LINDNER, of New York, N. Y.—*Improvement in Breech Loading Fire-Arms.*—Patent dated March 29, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim*, first, the method described for operating or closing the breech, and forming a tight joint at the junction of the barrel with the breech by the employment of a screw ferule or sleeve, fitting an outer screw thread on the barrel, and provided with a projecting annular flange for grasping and releasing the breech, and for drawing the same backwards and forwards in the direction of the barrel, to or from the rear end thereof, upon said screw threaded sleeve, being operated substantially as described.

Second. I claim, in combination with a movable box within the breech, constructed and operating as described, the packing thereof by means of asbestos, or its equivalent, substantially in the manner and for the purposes described.

Third. Locking the screw threaded sleeve that operates the breech, by forming the pivoted lever which serves to turn said sleeve with an eccentric or cam, arranged to act upon a locking pin by pressing down said lever after the breech is drawn tight, as set forth.

No. 23,379.—WILLIAM H. LOCHMAN, of York, Pa.—*Improved Portable Writing Desks.*—Patent dated March 29, 1859.—In the drawing, 1 and 2 are different parts of the lid, 3, the back; 4, the bottom or lower part; 5 5, side or end pieces; 6, the front part; and 7 7, the springs to keep the side pieces firm.

*Claim.*—The mode and manner of uniting the different parts of a writing desk by hinges, or their equivalents, so as to admit of its being folded up into a comparatively small space, in the manner substantially as set forth.

No. 23,380.—MATTHIAS LUDLUM, of Fairhaven, Vt.—*Improved Life-Boat.*—Patent dated March 29, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim* providing the exterior of the boat with adjustable side-floats, constructed and hung, or arranged to operate in, or at different fixed positions or distances, to or from the sides of the boat, substantially as set forth.

Also, providing either float, arranged along the outsides of a boat, with an open or trellis-work railing, made to project below the float, essentially as specified.

No. 23,381.—CHARLES MEYER, of Fond-du-Lac, Wis.—*Improved Expanding Augur.*—Patent dated March 29, 1859.—This invention consists in arranging the cutters E on sections D D, which slide in and out in slots *a*, made in the stock C of the augur, and which sections are operated and retained by a scroll groove *d*, so as to be always at equal distances from the centre, and the cutters are attached to the lower face of two of those sections in such manner that the bottom of the hole made by this augur is flat and even.

*Claim.*—As a new article of manufacture, an expanding augur, constructed and operated substantially as described.

No. 23,382.—JOHN G. MITCHELL, of Collington, Md.—*Improvement in Corn Planters.*—Patent dated March 29, 1859.—In the lower portion of the hopper H is the seed roller R, which turns on a shaft *b*, and is moved by the meshing of a pinion *p* on the end of said shaft, with the cog wheel W<sup>1</sup> attached to the main wheel W. The covers consist of a double mould board M, upon an inclined stock D, supported by the axle bar F; a lever *l*, on the head of the shank passing through the bar, serving to turn the stock.

*Claim.*—The combination of the swinging hopper H, constructed and arranged as described, with the adjustable cover and dropping tubes, the whole arranged for joint operation in the manner set forth.

No. 23,383.—J. A. MOORE and A. H. PATCH, of Louisville, Ky.—*Improvement in Harvesters*.—Patent dated March 29, 1859.—This invention relates to an improvement in that character of combined reaper and mower which employs standards G, having long curved slots *g*, said slots serving for the axle I of the driving wheel to be hung and adjusted in, and said standards, with the axle, when the harvester is used bracing the frame laterally.

The inventors say: We *claim*, first, the enlargement, as at *z*, of the curved slots *f* of the standards G, substantially as and for the purposes set forth.

Second. The arrangement, relatively to each other, of the vertically perforated curved stop bar H, slide *d*, constructed as described, and lever F, for the purpose set forth.

No. 23,384.—SAMUEL MORRETT, of West Pennsboro', Pa.—*Improvement in Preserve Cans*.—Patent dated March 29, 1859.—The nature of this invention consists in closing an aperture of any size in fruit cans by a circular convex cover B, adjusted on the can while the fruit is hot; and with the cover firmly compressed the can is inserted in cold water until an equilibrium of temperature is obtained, when the can is removed the lid is held in its position by the outward pressure of the atmosphere.

*Claim*.—The covering of fruit cans by means of the concave cover B, when the same is constructed and applied as described, and retained in place solely by atmospheric pressure.

No. 23,385.—HENRY W. MOSHER and JOSEPH A. CONBOIE, of New York, N. Y.—*Improved Apparatus for Cleansing Bristles*.—Patent dated March 29, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—The inventors say: We do not confine ourselves to any particular number of clamps on the shaft D, nor to any particular arrangement thereof, for various modifications of the same may be used.

But we claim the rotating bristle clamps E, placed within a cylindrical box or case A, provided with diagonal plates *c*, and used with or without the brush C, and soap bar or other cleansing substance *h*<sup>1</sup>, substantially as and for the purpose set forth.

No. 23,386.—JOHN PACKER, of Philadelphia, Pa.—*Improvement in Hay Mangers*.—Patent dated March 29, 1859.—The nature of this invention consists in combining with the hay manger A a falling rack B, which, lying on top of the hay, prevents the horse from throwing it out, and which rack continues to fall and lie upon the hay so long as any remains in the manger, the horse getting at the hay through the slats of the rack.

*Claim*.—Combining with a hay manger a falling rack B, to prevent the horses from pulling out and unnecessarily wasting the hay therein, as described and represented.

No. 23,387.—JOHN PATRICK, of New York, N. Y.—*Improvement in Ventilating Vault Covers*.—Patent dated March 29, 1859.—This invention consists in the introduction of a perforated plate *a*, a short distance below the roof or sidewalk *b*, the perforations in which are formed at the apex of thimbles or projections, and the ends or edges of these plates are turned down into troughs or gutters *c*.

The inventor says: I *claim* the perforated plate and gutter, in combination with the metallic roof, ceiling, or walk, for forming a ventilating space and catching any water of condensation, in the manner and for the purposes specified.

And, in combination therewith, I claim the ventilating pipe *d*, as and for the purposes specified.

No. 23,388.—WILLIAM PATTERSON, of Constantine, Mich.—*Improved Machine for Bending Tire*.—Patent dated March 29, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim* connecting the clevis to the lever and segment in such a manner that the lever will cause the clevis to grasp and release its hold on the bar to be bent, independently of and before said segment commences to move, as illustrated by the red lines in the drawings.

Second. Providing the outer end of the clevis with an arm *L v*, so arranged in relation to the circumference of the segment as to bear against the outer side of the tire and support it (while being bent) above the end of the segment as represented, thereby preserving the circle of the tire by preventing it from springing back during the descent of the lever.

Third. Making the clevis adjustable for the purpose of adapting it to the use of different sized segments in the same machine, as described.

No. 23,389.—HENRY C. PEIRSON, of Philadelphia, Pa.—*Improved Hoop Machine*.—Patent dated March 29, 1859.—The nature of this invention consists in the arrangement of a series of bending rollers *D D*<sup>1</sup>*D*<sup>2</sup> in rear of the cutter B, so as to operate together upon the hoops as the latter are passed from under the cutter, and render them more pliable or ready for use.

*Claim*.—The arrangement of the series of bending rollers *D D*<sup>1</sup>*D*<sup>2</sup>, or their equivalents, in rear of the cutter B, or its equivalent, so as to operate upon the hoops, substantially in the manner and for the purpose specified, as the said hoops pass between them directly from the said cutter.

NO. 23,390.—RANSOM S. POTTER, of Chicago, Ill.—*Improvement in Railroad Coupling Chairs*.—Patent dated March 29, 1859.—This is an improvement on a rail coupling chair, for the purpose of confining the ends of iron rails used in the construction of railroad tracks, so that they are held vertically and horizontally in line with each other, so as to prevent displacement in either direction, secure the ends of rails from injury, and to relieve the rolling stock from the wear and tear consequent upon uneven tracks.

*Claim*.—The use of two wedges or keys, in combination with a railroad chair, when the outer lip of said chair is overhung in the manner described and shown, and its inner surface is of a conoidal form, as specified.

NO. 23,391.—DANIEL R. PRINDLE, of Bethany, N. Y.—*Improvement in Seed Planters*.—Patent dated March 29, 1859.—This invention relates to a machine for planting seeds of any kind in rows on which the operator may ride, and which is so constructed as that the planting devices may be adjusted on the main frame, and the shock or motions imparted to either the seeding or main frame shall not be communicated to the other frame, whilst, at the same time, the two frames are so united as that they may be both raised by one lever.

The inventor says: I *claim*, first, hinging the frame that carries the seeding devices and the beams that carry the furrow opener and coverer to the axle, substantially as and for the purpose set forth.

I also claim, in combination with the axle and hinged frame and beams, the tongue and lever, for raising, lowering, or controlling the planting and covering devices, substantially as described.

I also claim the adjustable hinged clevis irons, made, arranged, and operating as set forth.

I also claim the combination of the curved spring plates *g* and spring *s i*<sup>1</sup>, as applied to the seeding wheels or cylinders, for the purpose explained.

NO. 23,392.—DANIEL READ, of Hamilton, N. Y.—*Improved Clothes Frame*.—Patent dated March 29, 1859.—The metallic catch and brace *EFG* is made of cast-iron and flat upon the sides, through the centre of which is an open space, and is bolted by a small iron bolt to the top of the standard *ii*, so as to readily turn upon the bolt, said bolt being constructed with a flat head; and the other end is fastened to the side of each of the arms *ABCD* by a flat-headed bolt, which freely slides up and down the open space in shutting and expanding said arms.

*Claim*.—The combination and arrangement of the standard with the arms *ABCD*, the standard *ii*, and braces *EFG*, substantially as and for the purposes specified.

NO. 23,393.—LEWIS L. REYNOLDS, of Manchester, N. H.—*Improvement in Machinery for filling Loom Harness Needles*.—Patent dated March 29, 1859.—This invention consists of a bail *E* for carrying the twine from side to side of the needle, hooks *F* for receiving the same, taking it through the eye, over the tongue, and depositing it upon the outer sides of the score of the needle; also, an intermittent rotary oval pin *O* and cams *A*, the joint action of which causes the twine to be evenly laid around the end *P* of the needle.

The inventor says: I do not claim the mere passing of the twine over the tongue of the needle, as it is old, having been done some twenty years since by a Mr. Wilson, of Lowell, Massachusetts.

But I *claim* the hooks *F*, or the equivalent thereof, for depositing the twine or cord upon the outer sides of the score of the needle, when combined with a device for delivering the twine or cord to said hooks.

Second. The combination of the intermittent rotating oval shaped pin *O* with the cam *N*, or their equivalents, for depositing the twine or cord evenly around the end *P* of the needle.

NO. 23,394.—L. SIMPSON REYNOLDS, of Indianapolis, Ind.—*Improvement in Friction Bolts for Flour Mills*.—Patent dated March 29, 1859.—The following is the operation of this bolt: The flour being fed into the bolt in the usual mode is carried as the reel revolves to an elevation equal to the top of the reel or highest part of its revolution, being held upon the sides of the ribs *HHH*, which is effected by their peculiar shape. The flour then falls from them over the shaft, striking the bolting cloth just after the action of the balls or knockers *DDD* has cleared the section or part upon which it falls of all the gumming flour, thereby allowing the clear, raspy meshes of the cloth, as the offal falls forcibly upon the same, to dust the bran, thereby saving the necessity of a bran duster. When the action of only a part of the balls *DDD* is required, any number of them may be stopped by confining them with the rods *EEE*.

The inventor says: I *claim*, first, the sliding knockers *DDDDDD*, in combination with the shaft *K*, ribs *HHHHHH*, and rods *EEEEEE*, when constructed and operated substantially as and for the purposes set forth.

Second. The springs *GGGGGG*, in combination with the knockers *D*, &c., when operated substantially as and for the purposes set forth.

Third. The elastic bridge tree *I*, when used substantially as and for the purposes set forth.

No. 23,395.—THOMAS A. ROBERTSON, of Washington, D. C.—*Improvement in Cultivators*.—Patent dated March 29, 1859.—The point *d* of the plough being started between the rows of plants in such positions that the divider B will run as near to the plant as desirable, the plough is *put in* to such a depth that the cutter G will cut under the surface slightly, and shear off the weeds at the right depth, while the scraper and gatherer A carries them over, and leaves them with the loose earth in the middle of the furrow or in the rear of the plough standard.

*Claim*.—The wing A, extended obliquely from the rear standard E, to a point *d*, from which point projects a straight portion, or divider B, in combination with the oblique cutting bar G, as described.

No. 23,396.—H. R. ROBBINS, of Baltimore, Md.—*Improvement in Stoves*.—Patent dated March 29, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—The combination of the fire chamber A, with the inclined front encircling transparent face plate E, heat pot B, pedestal F, with its doors *b b*, upper back encircling chamber H, with its doors *f*, and divided horizontally as described; smoke and heat pipes I and *g g i*, and back case or reflecting bonnet K, having a conduct *m*, arranged to conduct air to the perforated passage of the upper back encircling chamber H, as described, the whole being arranged for operation, substantially as specified.

No. 23,397.—I. G. ROUX, of Raymond, Miss.—*Improvement in Cotton Presses*.—Patent dated March 29, 1859.—This invention consists in operating the follower I of the press by means of the rotating platform B, having a helical ledge or flanch on its upper surface, and placed below the body of the press, the follower of which has two levers J J attached to its underside, the lower ends of said levers bearing against blocks E E, which are placed on two helical ledges or rails F F, and are made to operate the follower, when in the act of pressing with a progressive or gradually increasing power, as the platform is rotated.

*Claim*.—The rotating platform B, provided with helical ledges, or rails F F, in combination with the blocks E E, placed on the ledges or rails, the levers J J, attached to the follower I and the stationary press box G, the whole being arranged to operate as and for the purpose set forth.

No. 23,398.—JAMES L. ROWLEY, of Angola, Ind.—*Improvement in Railroad Cattle Guard*.—Patent dated March 29, 1859.—The nature of this invention relates to the manner of placing the springs C C to carry the main bar D, to which the chains E E and fender rods G G are attached; and in such a manner that the cars will pass and repass, pressing the spring down, and as the cars leave it, it resumes its standing position across the track.

*Claim*.—The springs C C and bar D, in combination with the chain fender F E, and post J, when constructed and operated in the manner and for the purpose described.

No. 23,399.—ISAAC S. RUSSELL and HENRY R. RUSSELL, of New Market, Md.—*Improvement in Harvesters*.—Patent dated March 29, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—The peculiar arrangement of mechanism, consisting of two segment level wheels G H, two spur wheels K K, an independently turning hub E, having a slotted plate F attached to it, and a crank arm L, having a turning crank pin J, for giving motion to the rake round the reel in the path of a vertical circle, and over the platform in the path of a horizontal circle, substantially as set forth.

No. 23,400.—ERHARD SCHLANKER, of Buffalo, N. Y.—*Improved Forging Machine*.—Patent dated March 29, 1859.—The nature of this improvement will be understood by reference to the claim and engraving.

The inventor says: I am aware of the revolving forging machine of D. Noyes, of Abington, Mass., and of attaching the hammer or hammers, each by a pivot to a revolving disk or crank, so as to revolve therewith, and controlling the position thereof, by stops attached to the face of the disk, or crank, and of drawing the hammer or hammers lengthwise of the anvil, which I disclaim, as being original in principle but defective in operation, by the use of the stops affixed to the disks, or imaginary crank.

I *claim* that portion of the hammer shaft Q Q, from the centre pins *v v*, extending towards the driving shaft W, to be used as a lever in controlling the hammers D D, the centre pins *v v* being the fulcrums, in connection with the wrists and friction rollers Y Y and X X, the location and position of the spring cams S S, upon the duplicate face plates F a F b.

The sections E E, and the independent operating crank cams R R, guide plate *a*, cranks *h h*, levers *c* and *f*, connecting rods *d d u*, as described in the specification.

No. 23,401.—ISAAC C. SHULER, of Amsterdam, N. Y.—*Improvement in Coffins*.—Patent dated March 29, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim*, first, the manner of forming a recess in the sheet metal all around the base inside of a metal coffin, also the arrangement of placing an iron frame, or

its equivalent, into the recess described, fastening it firmly to the sheet metal, around the body of the coffin, for the purpose of stiffening the lower edges of the same.

Second. I do not claim the ribs X, separately, as I do not consider them patentable; but the ribs being peculiarly arranged, by being placed under the flange which supports the rim E, and fastened to the frame D in the recess at the bottom, I claim this peculiar arrangement for the purpose of stiffening the sides and end, so as to sustain a heavy weight of earth; also for the purpose of preventing the sides from bulging out, when the handles are placed about an equal distance between the upper and lower edges of a sheet metal coffin, substantially as set forth.

Third. The arrangement of pressing or rolling around the outer edge of the cover of a sheet metal coffin an inverted bead which forms a tongue on the under side of the cover, so arranged as to fill the groove in the upper surface of the rim E, for the purposes of soldering; or cementing the joints, as described and set forth.

Fourth. The arrangement of placing a galvanized iron rim, or its equivalent, on the outside and over the upper edge of the walls of a sheet metal coffin, fastening the same permanently to a flange formed around the upper edge of the walls, for the purpose of shaping and strengthening the upper part of the coffin, and at the same time furnishing a means of securing the coffin top at the joints.

Fifth. I am aware that I have claimed in a former patent an iron frame as a cover over the soldered joints on the top of a sheet metal coffin; I, therefore, disclaim it as an entire frame, but I claim the bisection of the frame A and its reconnection by means of spring catches at the widest part or break of the coffin, substantially as set forth.

No. 23,402.—JOHN SMALLEY, of Bound Brook, N. J.—*Improvement in Cultivators*.—Patent dated March 29, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—The inventor says: I do not claim, broadly, hanging the main wheels of a cultivator to cranked axles for the purpose of deciding the depth to which the teeth shall penetrate the ground, as such a device has been heretofore used in cultivators.

Nor do I claim a central lever for operating the cranked axle or the plough formed teeth, or any other part of the machine, separately.

I claim the frame, its adjustable pole, its teeth  $m^1 n^1$ , and detaching teeth  $p p^1$ , the cranked shaft C, its central lever E, and driver's seat G, when the said seat is so situated as regards the handle that the driver can operate the latter without moving from the seat, and when all the parts are arranged in respect to each other, substantially as set forth.

No. 23,403.—MICHAEL SIMMONS, of Ira, N. Y.—*Improvement in Seeding Machines*.—Patent dated March 29, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I claim, first, the use of the eccentrically cut gear wheel D, so as to enable me to place my pinion  $a$  and pinion shaft  $b$  on top of the frame and above the centre of the wheel that drives it, substantially as described.

I also claim the arrangement of the beams H, with their skewed shovels and adjustable connections, so that they may be transposed from side to side of the machine at pleasure, in the manner and for the purpose set forth and explained.

No. 23,404.—CHARLES F. SPENCER, of Rochester, N. Y.—*Improved Spring Bedstead*.—Patent dated March 29, 1859.—The slats E F are arranged by placing one end of each between the bars A B, the end being below A and resting on the top of B, at a little distance back, the opposite end being free to move up and down as its flexibility will allow. A series of horizontal slats G is placed longitudinally on the top of them, one end resting on the free end E and the other on that of F, forming a level stop or surface for the reception of the mattress.

*Claim*.—The combination and arrangement of the spring slats E F, with the bars A A and fulcrum B B, the latter arranged to increase or diminish the effect, and horizontal slats G, resting at once on the free ends of each reverse series, substantially in the manner and for the purpose described.

No. 23,405.—GEORGE H. STARBUCK and L. D. GILMAN, of Troy, N. Y.—*Improvement in Smut Mills*.—Patent dated March 29, 1859.—The claim and engraving explain the nature of this invention.

The inventors say: We claim, first, the combination of the two scouring plates  $a a a$ , placed one above the other, with their roughened or burred surfaces towards each other, in combination with the funnelling plates E, for depositing the grain at the centre of the scourers between which it is passed, forming a double scourer, attached to and revolving with the shaft R, operated in the manner and for the purpose set forth. We do not confine ourselves to any number of scourers for a machine.

Second. The vertical cylindrical opening, as shown, at I, in combination with the outer case K, screen  $f$ , and fans  $h$ , for the purpose of giving free discharge to all light impurities and foreign matter, and preventing the discharge of grain.

No. 23,406.—R. H. ST. JOHN, of Bellefontaine, Ohio.—*Improvement in Watchmakers' Lathes*.—Patent dated March 29, 1859.—A cap G, having a perforation through its centre, is screwed upon the projection H, which projection is screwed to the centering plate E, and has a hole passing through it to receive the centre points. The cap G secures the centre points in the chuck in the centre of the centering plate E; the desired centre is then obtained by loosening the steel ring D, by unscrewing the thumb screws *a a*, which operation allows a free play to the centering plate E.

The inventor says: I *claim* the combination and arrangement of the steel ring D, spring *d d*, set screws *a a*, and centering plate E, substantially as described and for the purpose set forth.

I also claim the employment of the screw cap G, for clamping the article to be centered, in the manner specified.

No. 23,407.—J. C. STODDARD, of Worcester, Mass.—*Improvement in Cultivators*.—Patent dated March 29, 1859.—As the machine is drawn along, the share A and wings C plough up the soil between the hills, the shares *m* eradicate any weeds that may be in close proximity to the plants, and the scraper wheels J loosen the soil, and, by their rotation, cast more or less earth to the plants, as may be desired; the amount of earth cast towards the plants being regulated by adjusting the flanches *h<sup>1</sup>*, and also the wheels J.

The inventor says: I *claim*, first, the share A and wings or blades C, arranged relatively with the wheel or wheels H—that is to say, placing the wheel or wheels behind the share A and between the wings or blades C, substantially as and for the purpose set forth.

Second. The adjustable rotating scrapers J, applied to the wings or blades C, and arranged to operate as and for the purpose set forth.

Third. The combination of the lateral adjustable hoes *m*, share A, adjustable wings or blades C, rotating scrapers J, wheels H, one or more, arranged for joint operation, substantially as and for the purpose set forth.

No. 23,408.—J. C. STODDARD, of Worcester, Mass.—*Improvement in Machines for Digging Potatoes*.—Patent dated March 29, 1859.—This invention consists in the employment or use of an adjustable endless carrier F, attached to an inclined screen, a weed eradicator, levelling and opening shares N E, and a receptacle D provided with screens, the whole being mounted on wheels, and used in connection with a guiding device, whereby potatoes may be dug from hills or drills, separated from dirt, and also assorted, the large from the small, and placed in proper receptacles.

The inventor says: I *claim*, first, the weed eradicator, formed of the vibrating plate *g<sup>1</sup>*, with serrated flanges *h<sup>1</sup>* attached, and arranged to operate as and for the purpose set forth.

Second. The inclined adjustable screen box D, provided with a share E and spur *j<sup>1</sup>* at its lower end, in combination with the endless chain of carriers F, arranged to operate in grooves *o o*, substantially as and for the purpose set forth.

Third. The combination of the weed eradicator, levelling share N, inclined adjustable screen box D, with share E attached, and endless chain of carriers F, with or without the receptacle C, arranged for joint operation, substantially as and for the purpose set for.

Fourth. The adjustable or movable roller shaft L, applied to the machine, and arranged to operate as and for the purpose set forth.

No. 23,409.—N. G. THORN, of Cincinnati, Ohio.—*Improved Manufacture of Wood Screws*.—Patent dated March 29, 1859.—The nature of this invention consists in constructing a wood screw, with two or more threads, as a triple and as a double thread screw, which threads terminate around a central, tapering point, which point may end with or continue beyond the termination of said threads.

*Claim*.—As a new manufacture, the described wood screw, the characteristic feature of which consists in its having two or more parallel threads that terminate at or near the point of a tapering core, substantially as described.

No. 23,410.—JOHN S. THOMPSON and MARVIN J. SEYMOUR, of Glenn's Falls, N. Y.—*Improvement in Cressets for Heating Barrels*.—Patent dated March 29, 1859.—The barrel H, to be operated upon, has its staves secured together by truss hoops, and the barrel is placed on the bed D, and a cover *e* is placed on the barrel H. When the fire in the stove A is lighted, the products of combustion pass up the cylinder or drum B, and down the flue C, and out at the back of the stove. The bed D supports the barrel in proper position, and prevents it from burning at its lower end.

*Claim*.—The arrangement of the annular bed D at the base of the apparatus, and above the escape flue C, to receive and support the barrel, as and for the purpose shown and described.

No. 23,411.—SAMUEL E. TOMPKINS, of Newark, N. J.—*Improvement in Saddles*.—Patent dated March 29, 1859.—This invention consists in so constructing, or forming, the saddle-tree, that large trees for gig harness saddles, and the like, may be of metal, the tree at the

same time being so formed as to admit of the ready attachment to the tree of the material which receives the nails of the covering, and also to admit of the attachment of a crupper loop, which is made to serve as a support to the material that receives the nails of the covering.

The inventor says: I am aware that cast metal saddle-trees have been previously used, and also that safety guards or bridges have been attached to trees to keep the back band from the back of the horse; I therefore do not claim, broadly, the above.

But I *claim* the bow pieces *b e*, connected with the sides *a a*, and provided respectively with the head *c* and cantel *f*, in connection with the central bow piece or "safety guard," when the parts are placed relatively to each other, so as to admit of being cast in one piece, to form a new and improved saddle-tree, as set forth.

I further claim, in connection with the saddle-tree, formed as above, the crupper loop *j*, attached to the cantel bow piece *e* by means of the plate *i*, substantially as and for the purpose specified.

No. 23,412.—FREEMAN E. TUPPER, of Nashua, N. H.—*Improvement in Stoves*.—Patent dated March 29, 1859.—The coal being kindled as represented at *g*, the heated air and gas rise up until they reach the top *E*, when the draft causes them to diverge from the centre of the stove towards the space *h*, between the air chamber *C* and the upper end of *A*, thus causing a partial vacuum directly under the centre of the lower side of *C*, and under the apertures *d*, by which the cool air which is admitted through the tubes *G* is caused to descend, through the apertures *d*, down to the heated coal, as shown by the arrows.

*Claim*.—The arrangement of the air chamber *C* with its air passages or tubes *G*, and apertures *a*, and openings *i i i*, with the casing *A*, supporting and deflecting collar *F*, substantially in the manner and for the purposes set forth.

No. 23,413.—SAMUEL W. TYLER, of Greenwich, N. Y.—*Improvement in Harvesters*.—Patent dated March 29, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—Giving such a shape to the portions *a* and *b* of the finger bar, and to the flanged portions or heads of the fingers *d d*, that the same set of rivets will unite all the said parts with each other into a fingered bar of unusual stiffness, strength, and narrowness, and at the same time form a dovetail groove for the reception and guidance of the cutter bar, substantially as set forth.

No. 23,414.—NATHAN WASHBURN, of Worcester, Mass.—*Improved Machine for Rolling Wheel Tires*.—Patent dated March 29, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—The combination of a set of reducing rollers *A B*, a series of adjustable carrying rollers *d d d*, &c., or their equivalents, and a frame or holder *G*, supported so as to be capable of rising upward within the wheel tire in proportion as the diameter of the inner periphery of the said tire may increase during the process of rolling the tire, and having the said carrying rollers arranged and made adjustable with respect to it and the reducing rollers, in the manner substantially as specified.

No. 23,415.—E. B. WAY, of Jerseyville, Ill.—*Improvement in Clod Crushers*.—Patent dated March 29, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—The employment of the oblique sided, double tapered slats *f*, in combination with the rims *d<sup>1</sup> d<sup>1</sup> e*, so that the clods that wedge between the slats will be carried up, and then dropped, and then broken within the wheel, as shown and described.

No. 23,416.—JOHN WAGNER, of Pittsburg, Pa.—*Improved Sausage Stuffer*.—Patent dated March 29, 1859.—The nature of this improvement consists in a certain arrangement of the gear, for operating the piston, made in such a manner that, by means thereof, the piston is forced forward with the proper slow motion, and, after having accomplished its forward stroke, is drawn back again in a speedy manner.

*Claim*.—The arrangement of using, in addition to the operating crank *c*, for the forward motion, another operating crank *s*, or its equivalent, for the backward motion, when applied to the wheel gear arrangement of worm and wheel, in the manner as described, viz: when set on the spindle *a* of the screw wheel *F*, substantially as and for the purpose set forth.

No. 23,417.—WILLIAM WEBBER, Jr., and JOHN WEBBER, of Rocton, Ill.—*Improvement in Harvesting Machines*.—Patent dated March 29, 1859.—As the arm *c* moves backward it carries the rake *b* in a radial sweep across the platform. When the rake has reached the end of its backward stroke, the arm *h* is prevented by the stop *s* from moving further back; the arm *c*, however, continues to move outward till it reaches the position shown in the engraving. The arm *h* being fixed, and the arm *c* moving, the rod *g*, by reason of its attachment to the arm *k*, raises the rakehandle *f*. At the same time that the arm *c* moves outward, after the arm *h* has stopped, the latch *i* descends along arm *h* until the notch in the latch catches the arm and holds it at a fixed distance from the hinge of the rakehandle. The rake is thus held

while the arm *c* is returning to the initial position. Just before reaching the inclined under side of latch *i* comes in contact with the frame at *t*, which forces up the latch, releases the arm *h*, and suffers the rake to fall upon the platform at its front edge, ready for a repetition of the operation.

*Claim.*—Operating the rake of a harvester, by means of the horizontally oscillating arms *c* and *h*, the rod *g*, and the latch *i*, when the said parts are arranged relatively to each other, and to the other parts of the machine, in the manner set forth.

No. 23,418.—T. J. WHITEHEAD, of South Paris, Maine.—*Improvement in Stoves.*—Patent dated March 29, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—The combination with the fire chamber described, and with an oven having hollow walls filled in with non-conducting material, of a removable fire chamber casing, which has hollow walls filled in with a non-conducting material, and is in shape, externally, nearly the counterpart of the fire chamber, and serves for incasing the whole of the exposed portion of the fire chamber, and at the same time allows access to the holes in the top of the fire chamber, and to the fuel door thereof, substantially as and for the purposes set forth.

No. 23,419.—W. L. WILLIAMS, of New York, N. Y.—*Improved Foot Scraper.*—Patent dated March 29, 1859.—This invention consists in combining, with a scraper plate, a series of brushes, so arranged that the action of the foot or shoe, on the scraper, in cleaning the dirt from the sole, will actuate the brushes in such a way that they will come in contact with and clean or brush off the dirt from the sides of the shoe and all around it.

*Claim.*—The employment or use of the scraper *B* and the brushes *F G*, either with or without the brush *J*, combined and arranged to operate substantially as and for the purpose set forth.

No. 23,420.—JOHN WOOD, of Brooklyn, N. Y.—*Improved Method of Operating the Knife in Riving Shingles.*—Patent dated March 29, 1859.—This invention consists in giving the frame in which the gate is placed, and works, an intermittingly oscillating or vibrating movement simultaneous with the forward feed movement of the bolt, in such a manner that the knife, as it descends to its work, will have its cutting plane in an oblique position with the edge of the bolt, and consecutively in reverse positions, so that the shingles will be cut from the bolt in taper form, the shingles being cut alternately from each side of the bolt.

*Claim.*—Giving the frame *C*, in which the reciprocating knife gate *O* is placed, an intermittingly vibrating movement simultaneously with the feed movement of the bolt, substantially as and for the purpose set forth.

No. 23,421.—NATHAN AMES, of Saugus, Maine, assignor to Himself and NATHANIEL EVANS, Jr., of Boston, Mass.—*Improved Self Feeding Press for Printing Cards and Bill Heads.*—Patent dated March 29, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim*, first, the little cams or projections *a b*, arranged in reference to the ink-rollers, and operating in connection with them and the vibrating type-bed, substantially as and for the objects described.

Second. The combination and arrangement of the spring *P*, hinged piece *H*, type-bed *E*, and spring *L*, substantially in the manner and for the purposes set forth.

Third. Attaching the type-bed *E*, as shown, at one of its sides only, to the arm *D*, so that the inking rollers *N N*<sup>1</sup> may pass over and under it, substantially as described.

Fourth. The pitman *r*<sup>1</sup>, screw *r*, top piece *X*, slot *j*, and slides *e e*<sup>1</sup>, when combined, arranged, and operating substantially as set forth.

Fifth. Attaching the feeding plate *f*, as described, to the slide *e*, and causing the latter to move in the groove *g*, so that while the upper side of *f* bears on the surface of *X*, the thickness of *e*, extending below it, prevents the card from ever getting between the surfaces of *f* and *X*.

Sixth. The adjustable guide *l*, constructed and arranged substantially as and for the purpose described.

Seventh. The adjustable lateral guides *m m*, arranged as set forth and for the purpose described.

Eighth. The card pusher *Z*<sup>1</sup>, provided with the slots *P P* and *8*, substantially in the manner and for the purposes described.

No. 23,422.—ELISHA D. BLAKEMAN, of New Lebanon, N. Y., assignor to JACOB J. AUCHAMPAUGH and LEVI AUCHAMPAUGH, of said New Lebanon.—*Improved Fly Trap.*—Patent dated March 29, 1859.—This invention consists in the combination and arrangement of the poison cups with the main body of the fly trap, one being made in the form of a *V*, surrounding the apex of the conical chamber, and secured thereto by hooks, the other being made in the form of a funnel, or inverted cone, and suspended to the centre of the opening of the conical chamber, the two cups being connected together by a continuation of the bail.

*Claim.*—The combination and arrangement of the poison cups *m* and *n*, with the conical chamber *B* and bed plate *A*, substantially as and for the purpose set forth.

No. 23,423.—JAMES W. CARRIER, of Springfield, Mass., assignor to Himself and ABEL B. HOWE, of said Springfield.—*Improvement in Car Couplings*.—Patent dated March 29, 1859.—The object of this invention is to produce a car coupling which shall be self acting when two cars are brought together, thereby saving the operatives the danger encountered in going in between the cars for the purpose of coupling them together, and also one that can be uncoupled from any convenient position on the platform of the car, or any other position.

*Claim*.—The sliding bunter A, connection pin *d*, pin *p*, springs *r* and *l*, straps *m*, sliding pin B, springs *k k*, rack *f*, pinion *g*, ratchet *s*, pawl *t*, and pin *v*, when constructed and arranged substantially as described.

No. 23,424.—CHARLES W. CARTER, of Westville, Ind., assignor to LESTER L. BOND and GEORGE COATSWORTH, of Chicago, Ill.—*Improvement in Corn Shellers*.—Patent dated March 29, 1859.—The nature of this invention consists in constructing a machine with two cones revolving in opposite directions, the internal cone P accommodating itself to the size of the ears of corn passing through by being made in sections, which sections are hinged at the top by the hinge R, held in place at the bottom by the pintle *s*, and made to operate against the external cone O, by means of a guide spring *u*.

*Claim*.—The sectional truncated cone P, constructed as described, with the pintle *s*, guide spring *u*, and hinge R, and arranged to operate in combination with the outer cone O, in the manner and for the purpose specified.

No. 23,425.—HENRY B. COMER, of Temperanceville, Pa., assignor to Himself and JOSEPH S. LEWIS, of said Temperanceville.—*Improved Machine for Rolling Iron*.—Patent dated March 29, 1859.—The nature of this invention consists in a mechanical arrangement for rolling iron, by causing the iron to be rolled to pass between a series of rolls and through guides, the grooves in the rolls and the form of the guides being adapted in form and size to the article desired.

*Claim*.—Furnishing rolls which are placed in front of each other and on parallel lines with guides placed between each set of rolls, said guides being so constructed that they will guide and change the position of the iron as it passes from one set of rolls to another set, as described and set forth.

No. 23,426.—ELEAZER S. GARDNER, of New York, N. Y., assignor to GARDNER & DECKER, of said New York.—*Improved Machines for Preparing Mouldings for Picture Frames*.—Patent dated March 29, 1859.—This invention consists in certain revolving rollers, arranged and operating in combination with a scraper cut to the desired form of the moulding, the said rollers to push forward the strips, one after another, and to pass them under the scraper while the cement is being applied to the mouldings.

*Claim*.—The revolving rollers, arranged and operating substantially as described, in combination with the scraper *n*, for the purpose specified.

No. 23,427.—JOSEPH E. HOLMES, of Newark, Ohio, assignor to Himself and JOSEPH PALMER, of New York city.—*Improvement in Retorts for Distilling Coal Oil*.—Patent dated March 29, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I do not claim the invention of a revolving retort, that being specified in the French patent of M. Ajasson de Grandsague, dated October 9, 1839; neither do I claim the introduction of steam into the retort during the distilling process.

But I *claim*, first, the combination with the internal vapor pipe E F, of leg E<sup>1</sup>, so applied as to keep the mouth of the said pipe in the upper part of the retort, either by the direct action upon it of the force of gravitation, or by its dragging in the coal or other matter in the lower part of the retort.

Second. The arrangement of the steam pipe *a*, to communicate through the hollow journal with a passage in the leg E<sup>1</sup>, of the vapor pipe E F, for the admission of steam directly into and among the charge, substantially as specified.

No. 23,428.—HENRY J. LEWIS, of Brooklyn, N. Y., assignor to Himself and RICHARD A. LEWIS, of New York city.—*Improvement in Cameras*.—Patent dated March 29, 1859.—The nature of this invention consists in combining with a tripod hinged braces so attached and sliding in slots in the tripod that the legs are firmly held when distended, or can be shut up with ease without detaching any of the parts.

*Claim*.—The combination of the braces *f f f*, and screw clamping blocks *i i i*, or their equivalents, with the legs *a*, in substantially the manner and for the purposes specified.

No. 23,429.—E. L. PRATT, of Philadelphia, Pa., assignor to Himself and R. B. FITTS, of said Philadelphia.—*Improved Milk Pan*.—Patent dated March 29, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—As new manufacture, a pan, with a detachable or hinged cover, forming when combined a vessel closed, with the exception of a series of minute perforations below for the access of cold air, and, a suitable distance above the latter, another series of perforations for

the exit of warm air and gases, and otherwise constructed, substantially as set forth and for the purpose specified.

No. 23,430.—ALONZO R. ROOT, of Keokuk, Iowa, assignor to RUFUS S. RICKEY, of said Keokuk.—*Improvement in Seeding Machines*.—Patent dated March 29, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—The inventor says: I do not claim the invention of the revolving head of Mr. Ring's improvement, nor the application of the centrifugal force to the purpose of seed sowing, nor any other principle secured to A. Ring, Esq., by letters patent.

But I do *claim*, first, in combination with the hopper I and the revolving tubes or arms, the regulator B, constructed and operating therewith substantially as described.

I also claim, in combination with the regulator and revolving tubes or arms, the vertical and inclined partitions C C and lip D, for the purpose of directing the seed to be sown from the hopper to the openings in the arms or tubes, and to prevent the seed from escaping unduly through the arm or tube, for the time being, immediately under the lip, substantially as described.

No. 23,431.—GEORGE SELSER, of Philadelphia, Pa., assignor to Himself, J. COOK, and W. COOK, of said Philadelphia.—*Improvement in Grinding Mills*.—Patent dated March 29, 1859.—A is a box containing a drawer for receiving the ground materials. To the top of the box is secured a stand C, in the upper end of which turns the hollow spindle D, the burr E being secured to the lower end of this spindle. F is the shell of the mill, secured between the underside of the stand C and the cross bar G, by means of screws *a a*, the lower end of a rod H, which passes through the interior of the hollow spindle, being secured to the cross bar.

*Claim*.—Attaching the hollow steel burr to the spindle D, by screwing or otherwise securing the end of the latter to a plate I, which is fitted snugly to the inside of the burr, a shoulder *e* on the spindle bearing on the top of the burr, as set forth.

No. 23,432.—JOHN TAGGART, of Roxbury, Mass., assignor to Himself and GEORGE R. SAMPSON, of Brookline, Mass.—*Improved Marine Propeller*.—Patent dated March 29, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim* my improved mode of propelling a navigable vessel through the water, viz: by the conjoint action of two separate rotary or screw propellers E and F, respectively operating in the water and air, arranged and combined substantially as described, and propelled by a steam engine, or motor within, or carried by the vessel.

I also claim arranging the air screw propeller F, or its axis, at an inclination upward from the keel or plane of flotation of the vessel, substantially as shown, in order that the said propeller, while being rotated, may operate not only to draw the vessel ahead but to lift her bow more or less out of water.

No. 23,433.—DAVIS L. WEATHERHEAD, of Philadelphia, Pa., assignor to Himself and S. E. SOUTHLAND, of said Philadelphia.—*Improvement in Gas Retorts*.—Patent dated March 29, 1859.—This invention relates to an improvement in that class of gas retorts which consist of an upper and lower chamber, the latter for the generation of the gas and the former for the passage of the gas to the exit pipe; and it consists in the forming of a box on the outside of the cap of the retort, and in the peculiar situation of the said box in respect to the upper and lower chambers and outlet pipe.

*Claim*.—The cap E, with its box or reservoir F, when arranged in respect to the lower chamber A, the upper chamber B, and exit pipe D of the retort, substantially as and for the purpose set forth.

No. 23,434.—OLIVE ANN BROOKS, of Great Falls, N. H., administratrix of the estate of LEBBEUS BROOKS, deceased, late of said Great Falls.—*Improved Saw Set*.—Patent dated March 29, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—The arrangement and application of the benders and bending screw together, and with respect to the two handles, substantially as set forth, whereby the centre of motion of the benders is at the place of contact, or the vertex of the angle of their upper surfaces, and no fulcrum pin is employed for the support and connection of the levers.

No. 23,435.—WILLIAM ARTHUR, of Brooklyn, N. Y.—*Improved Arrangement of Extinguishing Fires in Steam Vessels*.—Patent dated April 5, 1859.—The nature of this invention consists in the application of the ample power and supply of water, furnished and always ready in every vessel having a condensing engine for propulsion, for the purpose of flooding the decks or holds of the vessel in case of fire, by using the power of the engine communicated to the air pump and the discharge water from the air pump for that purpose.

*Claim*.—The application of the waste water discharged from the air pump raised to such

height as to flood the steam vessel with water for the purpose of extinguishing fire, as described, instead of discharging it, as usual, as waste water from the sides of the vessel.

No. 23,436.—S. A. Bailey, of New London, Conn.—*Improved Machine for Wringing Clothes*.—Patent dated April 5, 1859.—A represents the box which is rectangular; from the sides of said box are erected two perpendicular supports B B, said supports being constructed with a rectangular slot through them, in which the journal bearings *h h* are allowed to move up and down freely. C C represents two cylinders through which pass the shafts E E, said shafts having their bearings in the journal boxes *h h*.

*Claim*.—The employment of the cylindrical wooden spring piece *a a*; which is divided in two parts at its centre, each part being slotted from the place of division, as shown, towards its outer end, the same being covered by a rubber cylinder, substantially in the manner and for the purpose specified.

No. 23,437.—ABEL H. BARTLETT, of Speyten Duyvil, N. Y.—*Improvement in Condensing Covers*.—Patent dated April 5, 1859.—A A represents the lower portion of the cover; B, the handle; I I, the lower water reservoir; H, the handle; G G, the flange projecting over the lower reservoir, with its edge turned down to keep the reservoirs in position; F, the overflow pipe; E, the pipe opening into and leading to the reservoir; C, the opening through the reservoir and leading to the space D between the reservoirs I and R; M M, pieces of isinglass fastened under the openings in the cover by means of the flanges *k*; and J represents a frying pan, showing the manner of fitting the cover to it.

*Claim*.—The reservoirs I and R, the pipes F and E, when made and arranged substantially as and for the purposes specified.

No. 23,438.—ALEX. BECKERS, of New York, N. Y.—*Improved Apparatus for Exhibiting Stereoscopic Pictures*.—Patent dated April 5, 1859.—The nature of this invention consists in constructing an apparatus for exhibiting stereoscopic pictures, which apparatus will be capable of containing a large number of pictures, by placing the endless belt or chain in an oblique position to the base of the apparatus, and by placing the slides or frames of the pictures in an oblique position to the endless belt.

The inventor says: I *claim*, first, placing the endless belt, chain, band, or apron *o o* in such a position as to form an acute or obtuse angle with the base F of the box or chamber of the apparatus, substantially as described.

Second. Placing the slides or frames holding the pictures in such a position as to form acute or obtuse angles with the endless belt or with the line of motion, substantially in the manner and for the purpose as described.

No. 23,439.—ASA G. BILL, of Cuyahoga Falls, Ohio.—*Improvement in Metallic Piston Packing*.—Patent dated April 5, 1859.—This invention consists in expanding the rings all round by means of two levers, which are placed in the central hub of the piston, and which operate on a ring placed in the packing ring, and cut open on one side so that the levers, by pressing on the opposite edges of this cut or gap, expand this ring equally all round, and that, by the action of this ring on the packing rings, the latter are expanded and pressed against the sides of the cylinder, said levers to be operated by a cam, to which a ratchet wheel is attached, so that the ring may be gradually expanded without opening the piston.

*Claim*.—The arrangement of the arms F F<sup>1</sup> on the central hub B of the piston, which act on a ring E, and which are operated by means of a cam G, substantially as and for the purpose set forth.

No. 23,440.—ROBERT B. BENSON, of New York, N. Y.—*Improvement in Reefing Sails*.—Patent dated April 5, 1859.—This invention consists of a method of taking the reefs from the lower part of the sail instead of from the head, as is usually done in the square sails.

The inventor says: I have described my invention in connection with a topsail, but I do not wish to limit myself to that use only, as it is evident that the same general principles are also applicable to other sails.

I *claim* reefing the sail from the deck by the use of a supplementary foot rope, or its equivalent, in combination with the auxiliary sheet and with the reefing lines, substantially in the manner and for the purposes set forth.

No. 23,441.—WILLIAM BLAKE, of Boston, Mass.—*Improvement in Gas Burners*.—Patent dated April 5, 1859.—The nature of this invention consists in the arrangement and application of one or more tubes of small bore, or the equivalent in the burner or its chamber, so as to project upward from the bottom thereof, and the gas entrance passage or passages, in a spiral or inclined direction, with respect to the bottom of the chamber, and to discharge the gas above the said bore. And it further consists in an annular outlet orifice in combination with such means of producing spiral or helical currents within the burner chamber.

The inventor says: I *claim* the arrangement of one or more conduit tubes *h h* in the burner

or jet chamber, and with respect to the base of the said burner or jet chamber and its inlet passage or passages, as described.

And in combination with the arrangement of the inlet conduit or conduits in such manner as to cause the gas to pass around in the expansion jet chamber in one or more helical currents, I claim an annular or ring exit orifice *i*, whereby the current or currents of gas may be thrown out of the burner in one or more helical streams, so as to equalize the height of the flame and prevent it from flickering.

No. 23,442.—MANNEVILLETTÉ E. D. BROWN, of Utica, N. Y.—*Improved Life-Boat*.—Patent dated April 5, 1859.—This invention consists mainly in the combination of three boats in one. To the ship rudder a groove (or grooves) is made in the rudder iron, a peg of suitable size is inserted in the rudder bolt *c*, so that the rudder when shipped may not easily be unshipped by the action of the waves.

The inventor says: I *claim* the construction of a life-boat with three recesses, substantially in the manner and form and for the purposes specifically set forth.

Also, in combination with the foregoing, the making of a groove in the rudder iron and a peg in the rudder bolt, as above described, for the purpose substantially set forth.

No. 23,443.—WILLIAM R. BROWN, of Cleveland, Ohio.—*Improvement in Pumps*.—Patent dated April 5, 1859.—The bicuspid valve is formed by dividing a hollow cone into two or more equal parts, as seen at *U*<sup>1</sup>. The apex of the cone must be placed upward, its base to rest upon a horizontal valve seat whose circumference is equal to the circumference of the base of the cone. The sides of the valve rise vertically from the outside of the valve seat to a height equal to the length of the cone.

The inventor says: I am aware that pumps with an oscillating diaphragm are not new.

But I *claim*, first, the bicuspid valve, constructed substantially as described.

Second. I claim the arrangement of the bicuspid valve in connection with the oscillating pump, the whole being constructed, arranged, and operated substantially as set forth for the purposes described.

No. 23,444.—JOEL BRYANT, of Brooklyn, N. Y.—*Improvement in Hydrants*.—Patent dated April 5, 1859.—The nature of this invention consists in constructing hydrants with a shaft tube, or rod, extending down from the top of the hydrant through the barrel and main valve, and to a considerable distance below the valve, so that water may be obtained through the medium of the shaft, tube, or rod, without operating the main valve in the ordinary way of opening hydrants. In connection with the shaft, the hydrant is provided with a perforated open top and banded chamber, which, in connection with the bottom plate and the inside of the barrel, serves as the main valve and for closing and setting free the opening for the waste water.

The inventor says: I *claim*, first, in the construction and use of hydrants, the shaft *A* (whether hollow or solid, naked or encased,) when used for obtaining water, substantially as described and for the purposes set forth.

Secondly. And in connection with the said shaft *A*, I claim the perforated open top and banded chamber valve *B*, constructed and operating substantially as described and for the purposes set forth.

No. 23,445.—CYRUS CHAMBERS, Jr., of Philadelphia, Pa.—*Improvement in Paper Folding Machines*.—Patent dated April 5, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I do not desire to confine myself to the precise construction of the devices described, as several modifications of, or equivalents to, the same might be substituted, without departing from the main features of the invention.

But I *claim*, first, the register pins *e* and *e*<sup>1</sup>, so constructed and so attached to a paper folding machine that they shall retain a position proper for the adjustment of the sheet, and yield by the movement of the latter.

Second. Adjusting one of the register pins *e*<sup>1</sup> laterally and longitudinally, independently of the other pin, by means of the slides *n*<sup>1</sup>, or their equivalents.

Third. Adjusting both pins simultaneously, both laterally and longitudinally, by the frames *X* and *Y*, or their equivalents, the frame *X* being adjustable in one direction on the frame *Y*, and the latter, together with the frame *X*, being adjustable in another direction on the frame of the machine, or any attachment thereto.

Fourth. Any convenient number of rods 1, 2 and 3, terminating at one of the folding rollers, the ends of the rods passing into grooves in the said rollers, as and for the purpose specified.

Fifth. The adjustable stop *Z*, with its inner edge of a curved or angular form, or otherwise, so constructed that the end of the folded edge only of the sheet shall be in contact with the said stop, for the purpose specified.

Sixth. The plunger 6, with its adjustable plate 8, in combination with the adjustable plate 9, the said plate being arranged substantially as and for the purpose set forth.

Seventh. The curved wires 15 and 16, or their equivalents, attached to the machine in any convenient manner, situated under the folding apparatus and adjacent to the trough, for the purpose specified.

Eighth. The combination of an alarm or indicating apparatus with a paper folding machine, when the said indicator is operated by a sheet folded by the machine.

Ninth. Causing the sliding board  $O^1$ , to move along the trough with a diminution of friction as the folded sheets accumulate by means of the springs 4, attached to the said board, and arranged to bear against the wedge formed or inclined strips 5, substantially as set forth and for the purpose specified.

No. 23,446.—WILLIAM H. CHEETHAM, Jr., of New York, N. Y.—*Improvement in Power Looms*.—Patent dated April 5, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim*, first, the employment of a frame L, to contain the shuttles which are inoperative, constructed so as to hold the said shuttles, arranged in proper order, in two tiers, and applied in such a manner in front of either or each set of shuttle boxes of the loom, as to be capable of receiving in one tier the shuttles which are required to be thrown out of operation, and of supplying from the other tier the proper shuttles to take their places, substantially as described.

Second. The box M, applied and operating in combination with the shuttle frame L, substantially as and for the purposes specified.

Third. The pushers  $m m$ ,  $n n$ , and  $p p$ , applied and operating in combination with the shuttle frame and box M, substantially as and for the purpose described.

No. 23,447.—JOHN B. CHRISTIAN and ABNER BEELER, of Mount Carrol, Ill.—*Improvement in Pumps*.—Patent dated April 5, 1859.—This pump belongs to that class in which the pump proper is located at the bottom of the well, or in the water, and the power is applied from a lever E at the top of the well through connecting rods  $a a$ , and in which the pipe C conducts the water upward to the spout D.

*Claim*.—The construction, arrangement, and combination of the pumping cylinders G G, and cylinders B B and I I, substantially in the manner and for the purpose specified.

No. 23,448.—HENRY CLAYTON, of Tamaqua, Pa.—*Improvement in the Valve Arrangement of Steam Engines*.—Patent dated April 5, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the employment, in combination with a slide valve, of one or more shutters applied and secured thereto, substantially as described, to vary and regulate the area of the opening of the port or ports, as and for the purposes specified.

Second. Combining the two shutters E  $E^1$  (when two are employed) with the slide valve by means of two screws G  $G^1$ , one of whose stems passes through the other, which turns in a bearing on the back of the valve, and both of which stems pass through one end of the valve chest, the whole operating substantially as described.

Third. The valve L, with its screwed stem  $w$ , or its equivalent, and spring  $y$ , arranged and applied substantially as described for the purpose set forth.

No. 23,449.—LEVI H. COLBORN, of Baltimore, Md.—*Improvement in Polishing Rice*.—Patent dated April 5, 1859.— $a$  is a frame work consisting of four uprights, with suitable cross pieces to support the several parts of the machine;  $b$  is a horizontal shaft having its bearings upon the upper cross piece of the frame; it carries a grooved vertical disk C which, with a similar eccentric disk  $d$ , secured to the casing  $e$ , which incloses both, forms a mill with which the outer covering of the rice can be broken.

*Claim*.—The process of breaking the outer covering and moistening the inner coating of rice, and polishing the same, as set forth.

No. 23,450.—JACOB A. CONOVER, of New York, N. Y.—*Improvement in Steam Engines*.—Patent dated April 5, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—Combining with the mechanism which connects the governor with the throttle valve, to regulate the admission of steam to the engine, substantially as described, a mechanism which disconnects the throttle from the governor to permit it to be closed by an independent power, to shut off the steam from the engine, as described, and for the purpose set forth.

No. 23,451.—CALEB COOK, of Hillsborough, N. H.—*Improved Shoe Peg Machine*.—Patent dated April 5, 1859.—The nature of this invention consists in an improved mode of pointing and splitting shoe pegs at one operation, and in several arrangements calculated to facilitate this operation.

The inventor says: I *claim*, first, the disks, as described.

Second. The method of holding the peg wood together by the chain and drum and friction appliance, substantially as described.

Third. The method of holding the peg wood firmly in place by pressing it up against the guide-piece D by means of the spring S and the lever and posts, substantially as described.

Fourth. The method of relieving the upward pressure against D for the purpose of the feed motion, by means of the system of levers  $x x$ , substantially as shown and described.

No. 23,452.—JACOB CREAMER and THOMAS W. RICARDS, London, Ohio.—*Improvement in Mole Ploughs*.—Patent dated April 5, 1859.—This invention relates to the arrangement of an adjustable beam upon a sliding shoe, in such a manner that the mole connected therewith may be adjusted to the depth required.

*Claim*.—The arrangement of the beam B, screw H, wheel  $d$ , and shaft S, upon the sliding shoe A  $a a b b$ , constructed and operating substantially as described.

No. 23,453.—JAMES E. CRONK, of Poughkeepsie, N. Y.—*Improved Pump*.—Patent dated April 5, 1859.—In the operation of this machine, in ascending the lower diaphragm causes all the space between the valves J and K to be filled to its full extent. In descending the upper valve J opens, and the lower valve K being closed, both diaphragms assume an inverted position; the space between the two diaphragms is filled and the surplus discharged at E.

*Claim*.—The peculiar form and arrangement of the diaphragms H and I, with the shells B and C, as described, and the ring A forming a chamber between them, with the discharge therefrom, as before mentioned, and for the uses and purposes expressed.

No. 23,454.—EPHRAIM CUSHMAN and JOHN R. CUSHMAN, of Amherst, Mass.—*Improvement in Manufacturing Artificial Leather*.—Patent dated April 5, 1859.—The first part of this invention consists in carrying the felt a greater distance round the upper roll, so that when it leaves this roll the weight of the film shall no longer operate to cause it to adhere to the felt.

The second part consists in loosening the particles of leather from the surface of the felt by a scratcher, or card, applied to its surface before it enters the felt washer.

The inventors say: We *claim*, first, holding the felt H up to the roll F, for the purpose substantially set forth.

Second. Removing the adhering fibres from the surface of the felt H before it reaches the felt washer, by means of the scratcher  $o$ , or its equivalent.

No. 23,455.—CHARLES DICKINSON and WILLIAM BELLAMY, of Newark, N. J.—*Improved Ice Pitcher*.—Patent dated April 5, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—As an improved article of manufacture, an ice pitcher provided between its walls with a hard non-conductor, so as to prevent the walls from indentation or fracture from within or without, while it also assists refrigeration, as shown and described.

No. 23,456.—JAMES EASTERLY, of Albany, N. Y.—*Improvement in Grate Bars*.—Patent dated April 5, 1859.—The nature of this invention consists in constructing grate bars B B with corrugations.

*Claim*.—The described corrugated grate bar, constructed substantially in the manner and for the purpose specified.

No. 23,457.—WINTHROP B. FAY and RUSSELL W. COLLIER, of Upton, Mass.—*Improvement in Boot-Trees*.—Patent dated April 5, 1859.—This invention consists in having the foot piece of the tree constructed so that it may be rendered capable of being expanded laterally, and also adjusted to the instep so that the foot-piece may be adjusted to the foot of the boot, and made to conform to the same.

*Claim*.—The elastic plates B B attached to the sides of the foot-piece A, in connection with the adjustable bars C C, arranged to operate substantially as and for the purpose set forth.

No. 23,458.—FRITZ FEDDERKE, of New York, N. Y.—*Improved Billiard Table*.—Patent dated April 5, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—Constructing a billiard table which may be changed from an American into a French billiard table by effecting a perfect continuation of the cushion throughout the whole length of the same by means of cushion pieces D and E inserted between and fastened to the jaws by a handle N operating upon a fork lever L, latches or bolts R, and springs S, and reconverting the French billiard table thus formed into an American billiard table by removing the said cushion pieces by the same means, substantially as described.

No. 23,459.—JOSIAH P. FITCH, of New York, N. Y.—*Improvement in Water Wheels*.—Patent dated April 5, 1859.—This invention consists in placing the gate of the penstock or flume in a certain relative position to the wheel, whereby the wheel is rendered more efficient than usual, inasmuch as the water is permitted to pass in a direct line on the wheel, and in a column, the diameter of which will at all times equal that of the wheel irrespective of the

distance the gate may be open and of the rapidity and velocity of the discharge of the water.

*Claim.*—The combination of the wheels D, one or more, and gate F arranged relatively to each other, and placed within a proper case, which is fitted within a penstock or flume A, substantially as and for the purposes set forth.

No. 23,460.—HIRAM M. FLETCHER, of Newport, N. H.—*Improved Clothes Frame.*—Patent dated April 5, 1859.—A is a plank attached by screws or nails to the ceiling, to which another and thicker plank B, which contains the apparatus for revolving the reel, is attached by screws or other obvious means. C is the upper portion of the sectional shaft penetrating the socket E, and upon which the reel frame slides up and down when elevated or lowered. D is the lower section of the frame shaft. F F<sup>1</sup> F<sup>2</sup> F<sup>3</sup> are arms inserted into the socket E, to which are attached the outside pieces G G<sup>1</sup> G<sup>2</sup> G<sup>3</sup>, both constituting the frame of the reel upon which the clothes to be dried are placed.

The inventor says: I *claim* first, The plank A in combination with the plank B, the bearings M and N, and the sectional shafts C D, constructed and operating substantially as described.

Second. The sectional shaft C D constructed and operating substantially as described.

Third. The reel frame composed of the parts E F F<sup>1</sup> F<sup>2</sup> F<sup>3</sup>, G G<sup>1</sup> G<sup>2</sup> G<sup>3</sup>, and H H<sup>1</sup> H<sup>2</sup> H<sup>3</sup> in combination with the sectional shaft C D, the plank A, the plank B, the bearings M and N, with their corresponding mortises *m* and *n*, the spring K, the pulley O, and the cord L, constructed and operating substantially as described.

No. 23,461.—ALVIN K. GILMORE, of Bath, Maine.—*Improvement in Mechanism for Obtaining Rotary Motion from Reciprocating Rectilinear Motion.*—Patent dated April 5, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim* the combination of the bifurcated slider A, two pulley sectors C D, their double pawls G H, or mechanical equivalents therefor, and the wheel F, the whole being arranged, connected, applied to one shaft E, and made to operate substantially in the manner and for the purpose set forth.

I also claim, in combination with the pawls G H and their disk wheels I I, the disk moving mechanism consisting of the levers *m m*, bent arms *o o*, sliders *p p*, forked arms 5 3, slide rod *t*, and shifting lever *u*, combined and arranged substantially as explained.

I also claim, in combination with each double pawl G H and the shaft E, a disk or wheel I, having studs or stops *i k*, and being applied to the shaft and friction wheel *l*, substantially as and for the purpose described.

No. 23,462.—JOHN M. HANCOCK, of Lansing, Iowa.—*Improved Fire Escape.*—Patent dated April 5, 1859.—The whole of the machinery of this invention is made fast in the drawer, or attached to the top of a table "S," or its equivalent, which is attached by means of two hooks, and chained to the window-sill. There is also attached to the basket W, or its equivalent, a cone *u*, which can be used to assist the person descending to guide the basket, so as to enable him to avoid the fire which may be issuing from beneath.

The inventor says: I *claim* the flying pinions E E, in combination with the detent *x*, the driving wheel D, the spring brake M, and block brake *v*, as substantially described and for the purpose set forth.

I also claim, in combination with the described piece of mechanism, the table, or its equivalent, as substantially described and for the purpose set forth.

No. 23,463.—A. E. HARDING, of Middletown, Ohio.—*Improved Ship's Propelling Apparatus.*—Patent dated April 5, 1859.—This invention relates to the arrangement and combination of propellers, and propeller and water chambers, in boats and vessels, in such manner that the said propellers may be operated without material friction, loss of power, or the formation of a vacuum, and also discharge the water which may be admitted within the propeller chambers, without interfering with the operation of the propellers.

The inventor says: I *claim*, first, the rollers *g*<sup>1</sup>, arranged and operating substantially as described.

Second. I claim the arrangement and combination of the propeller chambers B B, air tubes *d d*, openings *c*, chambers E E, pistons *f h f h*, gates *j j*, pipe *p*, and propellers *g g*<sup>1</sup>, all arranged substantially as described, for the purposes set forth.

No. 23,464.—GORDIS D. HARRIS, of Fitchburg, Mass.—*Improved Stump Extractor.*—Patent dated April 5, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim*, as an improved article of manufacture, a stump puller having a pulley N, and two conical shafts D E; one shaft D for winding the chain with a variable speed, the other shaft E for correspondingly winding the rope M, and otherwise constructed as shown and described.

No. 23,465.—LEVY J. HENRY, of New York, N. Y., assignor to DANIEL BENRIMO, of said New York.—*Improvement in rendering Friction Matches Waterproof.*—Patent dated April 5, 1859.—The nature of this invention consists in dipping the match that has been dipped with the phosphoric compound into a melted mass of resinous matter, so that the said gum hardens immediately on cooling, and is of sufficient thickness to render the match partially or entirely water-proof.

*Claim.*—Rendering friction matches partially or entirely waterproof, by the application of the melted coating in the manner and for the purpose substantially as specified.

No. 23,466.—DANIEL HUGHES, of Rochester, N. Y.—*Improved Rotary Engine.*—Patent dated April 5, 1859.—This invention consists in the employment, in combination with oscillating abutments, of oscillating shoes, to be operated upon the pressure of the steam or other fluid which moves, or is moved by, the engine, for the purpose of preventing any leakage between such abutments and the piston hub. It further consists in a novel mode of applying metallic disks between the revolving piston hub and the cylinder heads, for the purpose of preventing any leakage between the hub and heads.

The inventor says: I *claim* the oscillating shoes G G<sup>1</sup>, applied and operating in combination with the oscillating abutments and the rotating piston hub, substantially as and for the purposes described.

And I also claim the disks N N<sup>1</sup>, having openings g g and sockets d d, applied in combination with the rotary piston hub, the cylinder heads, and the main shaft, substantially as and for the purposes described.

No. 23,467.—J. BURROWS HYDE, of Newark, N. J.—*Improvement in Treatment of Peat for Compost.*—Patent dated April 5, 1859.—The claim explains the nature of this invention.

*Claim.*—The use of peaty matter as a basis for admixture with other richer manures, when said peaty matter shall have been dried and finely powdered, previous to admixture, as set forth.

No. 23,468.—J. BURROWS HYDE, of Newark, N. J.—*Improvement in Rotating Shot and Shells.*—Patent dated April 5, 1859.—The nature of this invention consists in the employment of smooth-surfaced cylindrical bored guns and smooth-surfaced cylindrical shot or shell, which are caused to rotate by fuses placed in the solid portion of the front end of the shot, by boring tangentially from the surface into the solid metal, in advance of the bursting chamber.

The inventor says: I *claim* the use of tangential holes, bored from the outer surface into the solid portion of the front end of the shot, for receiving the rotating composition.

I also claim the use of the adjustable tubes or cases of rotating composition.

No. 23,469.—ANTHONI ISKY, of Lancaster, Pa.—*Improvement in Extension Tables.*—Patent dated April 5, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim* the arrangement of the pivoted cross slats F, fixed on each side of the central partition I, in the table frame H H<sup>1</sup>, the double wings B C, when hinged, so that the wing c may be turned upon the slats F, when extended, as also the adjustment and combination of the several parts described, and for the purpose specified.

No. 23,470.—EDMUND M. IVENS, of New Orleans, La.—*Improvement in Steam Boilers.*—Patent dated April 5, 1859.—This invention consists in substituting for that class of boilers having a series of flue tubes passing horizontally through the cylinder the ordinary single or double flue cylinder, and inserting within said flue or flues an annular or other water drum connected at or near its highest point at one end with the body of the boiler, and receiving its supply of water from the force pump at or near its lowest point at the opposite end.

*Claim.*—The arrangement of a cylindrical or annular water drum (having a forced circulation) within the flue of an ordinary flue boiler, in the manner and for the purposes set forth.

No. 23,471.—HIRAM JOHNSON, of Farmersville, N. Y.—*Improvement in Tanning.*—Patent dated April 5, 1859.—The claim explains the nature of this invention.

*Claim.*—The use of a solution of quick lime as a tanning ingredient, to be used in connection with any of the tannic acids or tanning ingredients now in general use, not confining myself, however, to the exact proportions, as specified.

No. 23,472.—WILLIAM JOHNSON, of Lambertville, N. J.—*Improved Lathe Clutch.*—Patent dated April 5, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—The combination of toothed wheels and arms, actuated by a single screw shaft, so as always to present three several points of pressure centrally upon the body to be turned or wrought, substantially as described and set forth.

No. 23,473.—**AHロン LEWENBERG**, of New York, N. Y.—*Improvement in Moulds for Forming Artificial Teeth*.—Patent dated April 5, 1859.—The nature of this invention consists in providing a divided socket, receiving the pin or pins that are inserted into the teeth, whereby the socket is removed from the mould.

*Claim*.—A divided socket or holder, receiving the pins of artificial teeth, so fitted as to be removable from said pins prior to taking the teeth out of the mould, for the purposes specified.

No. 23,474.—**RICHARD LEWIS**, of Charleston, S. C.—*Improvement in Metallic Cotton Bands*. Patent dated April 5, 1859.—To unite the clasp and band the legs *g g*, or small shoulders of *B*, are passed through the opening *f* in *A* by contracting them; they are afterwards expanded to secure the plates together. The end of the band is then secured to plate *B*, when it is ready for use.

*Claim*.—In the device, plates *A B*, with slots *c d*, projections *E E*, opening *f*, legs *g g*, and shoulders *h h*, in combination, constructed, united, and operated in the manner substantially as described and for the purpose set forth.

No. 23,475.—**RICHARD LEWIS**, of Charleston, S. C.—*Improvement in Metallic Cotton Bands*. Patent dated April 5, 1859.—To operate this band, it having encircled the bale, plate *B* is turned down, when the band is passed up through the slot in *B*. The plate is then turned up with the end of the band that was bent down upon it. By this operation, the adjustable end of the band is secured where it is caught by the expansive force of the cotton. When released from the press, the projections *ff* on plate *A* are struck down upon *B* with a hammer, for the purpose of preventing the device from unlocking by the removal of the expansive force of the cotton.

*Claim*.—The plates *A B*, opening *E*, projections *ff*, shoulders *c c* and *d d*, in combination, constructed, united, and operated in the manner substantially as described and for the purpose set forth.

No. 23,476.—**E. D. LOCKWOOD**, of Penfield, N. Y.—*Improvement in Mode of Attaching Horses to Vehicles*.—Patent dated April 5, 1859.—This invention consists in having a strap pass around the breast of the animal, its ends being attached in a novel way to the thills, and having a strap pass around the back of the animal, the ends of the latter strap being attached to the sides of the former ones. The usual breeching and holdback straps being employed and connected to the shafts in the usual way.

*Claim*.—Attaching the strap *B* to the thills *A A*, by means of the perforated plate *c*, and the pins *f*, placed in the recesses *e* of the thills, and having wide and narrow parts *1 2*, substantially as described.

No. 23,477.—**MATTHIAS SUDLUM**, of Fairhaven, Vt.—*Improved Water Tight Doors for Marine Safes, Lockers, &c.*—Patent dated April 5, 1859.—The main door *A* is hollow in its inside, and its inner portion faced with a secondary door *C*, between which and the main door is a semi-elliptic spring arranged to cross the centres of the doors and kept in place by screws *d*, which pass through slots in the ends of the spring, so as to admit of free play to the spring in its action against the inner door to press it outwards, or in the action of the inner door, when forced inwards against it.

*Claim*.—The double door *A C*, constructed and operating substantially as described, in combination with the outer or surrounding framework *B*, and independent interior frame *E*, or its equivalent, essentially as and for the purpose set forth.

No. 23,478.—**JACOB MARX**, of New York, N. Y.—*Improved Refrigerator*.—Patent dated April 5, 1859.—The nature of this invention consists in providing the refrigerator with a drawer in which the ice water collects, in constructing the ice chamber *A*, with a double front piece *a e*, and a corrugated bottom *n*, and the provision chamber *B* with internal openings for the purpose of effecting a double circulation of air or ventilation.

*Claim*.—The combination and arrangement of ice chamber *A*, the gutter *D*, pipe *E*, the water tank *C*, and provision chamber *B*, substantially as and for the purpose specified.

No. 23,479.—**CHARLES MCBURNEY**, of Roxbury, Mass.—*Improvement in India Rubber Soles for Boots and Shoes*.—Patent dated April 5, 1859.—This invention consists in a vulcanized sole of India rubber, or a compound composed of India rubber, sulphur, and scraps of cloth, having the holes for the pegs or nails formed in it at the time it is vulcanized by suitable pins in the interior of the mould.

*Claim*.—A sole made of vulcanized India rubber, and having the holes for the reception of the pegs formed in the mould in which it is vulcanized, as set forth.

No. 23,480.—**WILLIAM MCCONNELL**, of Philadelphia, Pa.—*Improvement in Sandals*.—Patent dated April 5, 1859.—The claim and engraving will explain the nature of this invention.

*Claim*.—A sandal, consisting of three blocks *B B<sup>1</sup>* and *B<sup>2</sup>* of wood or other suitable mate-

rial, attached to an elastic metal strip A, when the said blocks are so situated in respect to each other that one shall coincide with the toes, the other with the ball, and the third with the heel of the wearer's foot, as and for the purpose specified.

No. 23,481.—O. H. MELENDY, of Delhi, Iowa.—*Improvement in Seeding Machines*.—Patent dated April 5, 1859.—In this invention the operator has perfect control of the seed distributing device through the medium of the lever H. This lever can be actuated by the knee of the operator, and the dropping of the seed retarded or expedited, as may be necessary for the planting of the seed in check-rows, and both the rotary cutters J Q and the shares o R may be elevated by actuating the levers M M<sup>1</sup>.

*Claim*.—The levers F H, slides E G, and projections g on the wheel B<sup>1</sup>, in connection with the bars I K O P, connected by the links j, the whole being arranged substantially as and for the purpose set forth.

No. 23,482.—GREGOR MENZEL, of Milwaukie, Wis.—*Improvement in Steam Boilers*.—Patent dated April 5, 1859.—The nature of this invention consists in the construction of an upright steam boiler, and in the manner of conveying the heat through the ascending tubes E and descending tubes G, and then circulating around the blow pipes A, cylinder m, and steam dome L so that the heat is consumed before it enters the chimney J, and the boiler being surrounded by jacket N, is protected from the cold atmosphere.

The inventor says: I *claim* first, The arrangement in an upright cylindrical boiler of a fire box D and series of ascending tubes E, a smoke box F, a single or double circle of descending tubes G, a flue H, and flue I, in combination with jacket N, without or with horizontal steam dome L, as shown and described.

I do not claim, irrespective, a circulation pipe for an upright boiler.

But I claim the arrangement of my circulation pipes K which hang loose and inside the cylinder m, openings T, and steam dome L, in the manner shown and described.

No. 23,483.—ALBERT H. NORTH, of Hartford, Conn.—*Improvement in Lamps*.—Patent dated April 5, 1859.—The revolving plate A is made to revolve by the action of the vertical gear wheel D, actuated by the motion of the crank wheel G. As the plate A revolves, it actuates all of the gears E, the teeth of which are made of an angular or sharp form, to perforate or press into the wick, sufficient to lift or lower the same.

*Claim*.—The rotating plate A with the elongated scroll teeth, in combination with the vertical gears E and the vertical actuating gear D, in the manner and for the purpose substantially as described.

No. 23,484.—WASHINGTON OBENCHAIN, of Logansport, Ind.—*Improved Machine for making Patterns for Cog Wheels, &c.*—Patent dated April 5, 1859.—Motion is given to the cutters I, which commence below the wheel and are gradually raised by turning the feed screw M until they are elevated entirely above the wheel, cutting the full depth of the cog groove, the feed screw is then reversed and the cutters run down in the same track, cleaning and smoothing the groove as they run down to their former position.

The inventor says: I *claim*, first, The mode of adjusting the arm E vertically by means of screw M, in combination with the upright D, which is also adjustable about a vertical axis, as and for the purposes set forth.

Second. The track frame F when adjustable laterally for the purpose of giving taper to the piece cut.

Third. The arrangement and devices for adjusting the cutter I as and for the purposes set forth.

No. 23,485.—JOHN K. O'NEIL, of Kingston, N. Y.—*Improvement in Pumps*.—Patent dated April 5, 1859.

The inventor says: In the construction of the pump-body, my object is to produce a pump which can be furnished at a moderate cost, and which is, at the same time, effective and simple, not liable to get out of order, and can readily be taken apart for inspection or repair. To accomplish these objects, the pump-body is made of two castings, A and B, which are fitted together by means of bolts passing through holes a a, and held by nuts, a suitable packing b being placed between the castings, to make the joints tight.

*Claim*.—The combination and arrangement of the vibratory arm p o, rod q, stem m, guide n, and spring r, for controlling the valve I from the top of the well, substantially as described.

Also constructing the pistons o o, with raised rims w w, and guiding edges h h upon the heads thereof, in combination with the packing y, coiled springs z z, and central disk u, arranged in the manner and for the purposes set forth.

No. 23,486.—JOHN W. PEER, of Troy, N. Y.—*Improvement in Rope Machinery*.—Patent dated April 5, 1859.—This invention consists in the method of conducting the strands from the bobbins to their respective flyer-heads, whereby they are caused to draw with nearly

equal freedom, and hence to have nearly the same tension, whether supplied from the middle of, or near the ends of their bobbins.

*Claim.*—Conducting the strands from their bobbins round the exterior of one side of the flyer, and from thence over guide rods *ff*, or their equivalents, to and through a hole or guide *c*, on the opposite side of the flyer, substantially as and for the purpose set forth.

No. 23,487.—DANIEL A. PEIRCE, of East Greenwich, R. I.—*Improvement in Pencil Cases.*—Patent dated April 5, 1859.—In using this improvement, the pencil is held in the fingers of one hand by the bulb, and the handle *J* is turned by the other, until the tube *E* projects beyond the point *C*, when, by placing the end of the head in the end of the tube and turning it, it will be screwed in and may be drawn to the point by a reverse motion of the handle.

*Claim.*—Constructing the end of the tube *F* with a screw thread, and forming the row of teeth therein in the manner substantially as described and for the purposes set forth.

No. 23,488.—WILLIAM L. POTTER, of Clifton Park, N. Y.—*Improvement in the Arrangement of Machinery for Operating Corn-Shellers separately, or jointly with a Fan or Cutters.*—Patent dated April 5, 1859.—The claim and engraving will explain the nature of this invention.

The inventor says: I do not limit myself to the precise construction, arrangement, and proportion of the parts shown in the drawings. Nor do I claim, broadly, the employment of a winnowing, corn-sheller, and straw-cutter complete in one frame.

I claim the arrangement of the fan *E E*<sup>1</sup>, and the gearing *i*, in relation to the shafts *C* and *I*, so as to connect and disconnect the same, for the purpose of allowing either the fan or the cutting apparatus to be operated with the sheller, or the sheller to be worked independently of either, substantially in the manner described.

No. 23,489.—JOHN POWERS, of New York, N. Y.—*Improved Pump.*—Patent dated April 5, 1859.—The nature of this invention will be understood by reference to the claim and engraving.

The inventor says: I claim arranging two forcing valvular pistons back to back in line with each other, and combining them by means of a piston-rod, or other connection common to both, with the arm of the pump-brake, at a point between the two pistons, substantially as set forth, so that both may be operated by the same arm of the pump-brake.

I also claim combining the pump-brake with the duplex pump-barrel, by means of an air-vessel, constructed and located substantially as set forth, so that it forms a secure fulcrum for the brake and affords a passage through it, for the arm of the brake to the piston-rod, upon which it acts.

No. 23,490.—SAMUEL PIERCE, of Troy, N. Y.—*Improvement in Steam Boilers.*—Patent dated April 5, 1859.—This invention consists in the employment of perforated air tubes *I* in the fire chamber *A*, and above the fuel, which tubes receive atmospheric air from outside the fire chamber, and discharge it in numerous small jets among the gaseous products of combustion, when the said air tubes are combined with water tubes surrounding them, and connected with the water legs *b c d*, or other water spaces of the boiler, and also connected with the inside air tubes *I*<sup>1</sup> by hollow stay bolts, forming passages for the discharge of the numerous jets of atmospheric air among the gaseous products of combustion.

*Claim.*—The employment of air tubes placed within the fire chamber of a steam boiler, substantially as described, in combination with the surrounding water tubes, connected at both ends with the water spaces of the boiler, and connected with the inner air tubes by means of hollow stay bolts, when the air and water tubes so combined are arranged substantially as specified and for the purpose set forth.

No. 23,491.—GEORGE W. PITTMAN and WILLIAM C. BOONE, of Bushwick, N. Y.—*Improvement in Machinery for Laying Rope.*—Patent dated April 5, 1859.—This invention consists in the method of forwarding the twist of the strands from the flyers which are furthest from the laying point. Also, in a guide ring *i*<sup>1</sup> applied to that one of a series of flyers which is furthest from the laying block, for the purpose of carrying forwards, toward the laying block, the forehand twist which is given by the revolution of the said flyer to a strand supplied from a spool which turns on fixed bearings outside of the flyers.

The inventors say: We claim the laying and unlaying of the strands *c*<sup>1</sup> *c*<sup>2</sup>, to forward the twist, as described.

And we further claim the ring guide *i*<sup>1</sup>, applied in combination with the bobbin *C*<sup>2</sup>, to the nearest flyer, substantially as and for the purpose set forth.

No. 23,492.—THOMAS H. POLLOCK and DANIEL BLIVEN, of Greenville, Conn.—*Improved Cheese Cutter.*—Patent dated April 5, 1859.—This invention consists in arranging a lifting turntable *D* in such relation to a stationary platform *A*, that a cheese placed on the latter can be lifted clear from the same, and turned by means of the lifting table, which latter, when the cheese has been turned sufficiently, is let down again so that the cheese rests on the platform

ready for a fresh cut The knife E is attached to a rack F, which is moved up and down in a suitable guide *k*, fastened to the base or frame B on which the platform rests.

The inventors say: We *claim* the platform A provided with a rim *a* and with projection J in combination with the turn-table D, or its equivalent, to operate substantially as and for the purpose specified.

And we do also claim the arrangement of the knife E\*, the cutting edge of which makes an obtuse angle with the rack to which it is attached, and operates in combination with slots *p* and *o*, substantially in the manner specified.

No. 23,493.—RANSOM S. POTTER, of Chicago, Ill.—*Improvement in Rail Splicing Chairs*.—Patent dated April 5, 1859.—The clamp wedge is drawn down into place by means of bolts 7 7, and as it is drawn down the same bolts operate the wedge and the clamp, and a combined action is produced, which gives a pressure in *three* directions, while each end of the clamp wedge in a measure acts separately upon its own rail.

*Claim*.—A clamp wedge operated by the same bolts as a clamp and as a wedge acting upon each rail equally, in combination with the chair guard 6, substantially as shown and specified.

No. 23,494.—JESSE REED, of Marshfield, Mass.—*Improved Machine for Pointing and Splitting Shoe Pegs*.—Patent dated April 5, 1859.—The claim and engraving will explain the nature of this invention.

The inventor says: I *claim*, first, a traversing carriage M in combination with a revolving table R, so arranged that after a series of cuts has been made in one direction the table may be revolved 90 degrees preparatory to making the second series of cuts.

Second. I claim the device for traversing and returning the carriage, consisting of the following parts, or their substantial equivalents, in combination, viz: the screw shafts U and V, the block X, the lever Z, with its spring C<sup>2</sup>, and tripping arrangement *f* B<sup>2</sup> A<sup>2</sup>, the whole operating in the manner substantially as set forth.

Third. I claim the device for automatically revolving the table R, consisting of the spring *l*, and the parts *m n o p* and *k*, or their equivalents, operating in the manner substantially as described.

Fourth. I claim the grooving and splitting irons *e* and *g* traversing the block, as set forth, in combination with the holders D<sup>2</sup>, or their equivalents, operating in the manner substantially as described.

Fifth. I claim feeding the block S by means of the continuous revolution of a screw operating through a spring X, as described, so that when the block is released the feed is instantly given to it in the manner substantially as set forth.

No. 23,495.—BENJAMIN F. RICE, of Clinton, Mass.—*Improvement in Air Engines*.—Patent dated April 5, 1859.—The nature of this invention consists in giving a rotary motion to the plungers *d* or pistons in air engines, and in keeping their entire surface continually lubricated, thereby overcoming the friction, and preventing the sudden wearing out of the packing.

The inventor says: I *claim* giving to the plungers or pistons of air engines a rotary motion, for the reasons specified.

I also claim giving to the plungers or pistons of air engines a rotary motion, in combination with the means employed for keeping the entire surfaces of the plungers or pistons continually lubricated, in the manner and form and for the purposes substantially as set forth.

No. 23,496.—ANDREW RALSTON, of West Middletown, Pa.—*Improvement in Bands for Binding Grain, Hemp, &c.*—Patent dated April 5, 1859.—This invention consists in attaching to one end of a suitable cord or strap *b*, a T shaped clasp *a*, so arranged that by passing the other end around the clasp it will be locked between it and the cord.

*Claim*.—Furnishing cords or straps, used for binding grain, hemp, &c., with a T shaped clasp, as described and for the purpose set forth.

No. 23,497.—SILAS G. RANDALL, of Middlebury, Vt.—*Improvement in keeping Air Springs supplied with Air*.—Patent dated April 5, 1859.—The air enters the air pump through an opening or seat, that has a valve 2 snugly fitting it, said valve having attached to it a valve rod 3 and a spring 4 to close it after the air has opened it and rushed in to fill the vacuum created by the drawing forward of the piston *i*.

*Claim*.—Combining an air spring and an air pump, or its equivalent, with a car or carriage, or other moving conveyance, so that the motion of said car, carriage, or other conveyance, shall, through such air-supplier, keep the air springs supplied with air substantially as set forth.

No. 23,498.—J. CLINTON RANSIER, of Lyons, N. Y.—*Improvement in Car Couplings*.—Patent dated April 5, 1859.—The claim and engraving will explain the nature of this invention.

The inventor says: I *claim*, first, clevis B, in connection with fulcrum E, key bolt D, for the purpose of a connecting link between railroad cars, so constructed and arranged that said clevis or link will encircle and revolve up and down, and sway to the right and left over the

outside of bumper plate or plates I and the body of the bumper, and otherwise arranged and constructed for the purpose substantially as set forth and described.

Second. I also claim revolving arms A A, or their equivalents, in combination with dog *o*, as seen in the right hand plan, fig. 1, for the purpose of aiding in casting off the opposite clevis from hook C, in the process of disconnecting or uncoupling; also for a rest for and in aid of throwing clevis B on the same bumper forward from its upright position, in the process of effecting a coupling, substantially as set forth and described.

Third. I claim hook C or its mechanical equivalent placed on top of the upper bar H and in rear of the top shoulder of fulcrum E for the purpose of receiving the curved point of the opposite clevis B in the process of coupling. I do not intend to confine myself to rod or shaft N, for the purpose of turning dog *o* against the shoulder of arms A A, for the purpose of raising the points of said arms in the process of casting off the opposite clevis in uncoupling as described, as other well known modes of screw or lever power can be applied with equal effect.

No. 23,499.—JESSE REED, of Marshfield, Mass.—*Improved Capstan*.—Patent dated April 5, 1859.—This invention consists in placing at the base of the capstan an inclined, movable ring D or spiral, which may be readily fixed in any required position to suit the direction in which the cable is drawn towards the capstan.

The inventor says: I *claim* the adjustable detached fleeter, operating as set forth.

Second. I claim the employment of the double inclines *t*, whereby I am enabled to fleet the cable whatever may be the direction in which the capstan is turned.

No. 23,500.—THOMAS N. ROOKER, of New York, N. Y.—*Improvement in Printers' Type Cases*.—Patent dated April 5, 1859.—This invention consists in a method of so arranging the several boxes or compartments in a "type case" that a person *put at case* may learn the position of the various letters very easily, and also that the movements of the body and travel of the hand of the compositor may be greatly reduced.

*Claim*.—The described method of arranging the compartments of a type case—that is to say, placing at the side of the lower case character its corresponding upper case character, for the purposes and in the manner substantially as set forth.

No. 23,501.—JAMES SANGSTER and AMOS W. SANGSTER, of Buffalo, N. Y.—*Improvement in Pegging Machines*.—Patent dated April 5, 1859.—The nature of this invention will be understood by reference to the claim and engraving.

The inventors say: We *claim*, first, the combination of the wheels P and Q, the ratchet C, and the peg wood L, with the awl, peg driver, the knife F', and the shoulder J<sup>2</sup>, when the same are arranged substantially in the manner specified.

Second. Placing the adjustable wheel R in arrangement with those parts which form the subject of the first claim, for the purpose of regulating the distance at which the pegs are to be driven from the edge of the leather or material pegged, substantially as set forth.

No. 23,502.—HENRY SAUERBIER, of Newark, N. J.—*Improved Machine for Making Hoes*.—Patent dated April 5, 1859.—A disk is cut from the plate; the two wings *a b*, when turned down and bent over and the ends welded together, form the eye. This disk is placed in the machine between two dies *c d*, with the wings *a b* projecting above the top of the dies; a kind of a V shaped projection is formed in the front, under the eye of the hoe, tapering to a point which gives support and strength to the blade.

*Claim*.—The cam lever A and the dies *c* and *d* in combination with the lever B, the loose pin *7*, and the clamp *e*, constructed and arranged substantially in the manner and for the purpose specified.

No. 23,503.—L. K. SELDEN, of Haddam, Conn.—*Improvement in Umbrellas*.—Patent dated April 5, 1859.—The slide D is allowed to work freely on the tube B, and is fitted and works between shoulders *ff* thereon. The slide D is attached by a pin *g* to a rod F', which is fitted within the tube B, the pin *g* passing through a slot *h* in the tube B. The arms or bars *a a*<sup>1</sup> are formed of metal. The rim A, tube B, with its rod F', and the stretchers, form the frame of the device.

*Claim*.—As a new and improved article of manufacture, an umbrella or parasol, having its frame constructed of a rim A and stretcher C, formed of arms or bars *a a*<sup>1</sup> pivoted and connected together as shown, in connection with the tube E and rod F', arranged as described.

No. 23,504.—WILLIAM W. SHAW, of Troy, N. Y.—*Improved Rubber Head for Lead Pencils*.—Patent dated April 5, 1859.—The rubber A is provided with a socket B, the diameter of which corresponds to the size of ordinary pencils, and which is just large enough and deep enough to fit tightly on the top of the pencil.

*Claim*.—As an improved article of manufacture, a head A for lead pencils, made of rubber, in the manner shown and described.

NO 23,505.—THOMAS E. SHULL, of Millersburg, Pa.—*Improvement in Breech Loading Fire-Arms*.—Patent dated April 5, 1859.—The claim and engravings will explain the nature of this invention.

The inventor says: I *claim*, first, the combination with a fire-arm constructed with a stationary and closed breech or breech piece, and with an opening in the barrel, to receive the cartridge, of a hinged flap door or lid, which opens and closes the cartridge charging aperture, substantially as and for the purposes set forth.

Second. The combination with a hinged flap door or lid of a sliding collar or sleeve, so that the operation of sliding the collar back will open the flap door or lid, and the operation of moving it forward will close and lock the same, substantially as and for the purposes set forth.

NO. 23,506.—HENRY T. SISSON, of Providence, R. I.—*Improved Portfolio*.—Patent dated April 5, 1859.—This invention consists in a novel apparatus which may be applied in the back of a portfolio, or attached to a suitable handle, for the purpose of holding and securing music sheets, pamphlets, or papers of any kind.

*Claim*.—The combination of the barrel A, shaft B, hooks or teeth *b b*, a spring or springs *d d*, spring latch *f*, and stop *g*, the whole constructed and arranged substantially as and for the purposes set forth.

NO. 23,507.—ALEX. McDONALD SPRAGUE, of Mobile, Ala.—*Improvement in Side Wheel Steamers*.—Patent dated April 5, 1859.—This invention consists in dividing the after guard  $A^1 A^2$ , and elevating a section of the same next adjacent to the wheel W, so that the guard will be without the influence of the water raised and the back current produced by the motion of the wheel.

*Claim*.—Raising the after guards next adjacent to the wheel, about the deck and hull of the boat, and also above the forward guard, substantially as described, so as to leave a clear water way beneath the after guard, and immediately abaft of the wheel for the purpose set forth.

NO. 23,508.—W. S. STETSON, of Baltimore, Md.—*Improvement in Harvesters*.—Patent dated April 5, 1859.—A detailed description of this invention would require too much space to be given here.

The inventor says: I *claim* giving to the frame H a back and forth motion upon the axle-tree B, said frame supporting at its rear end the axis of the driving pinion K, all in the manner and for the purpose as set forth.

I claim the vibrating frame, connected with the rear end of frame H, and having its centre of motion coincident with the axis of pinion K, as set forth.

I claim the combination of the shoe X, with the vibrating frame R, by means of the hinge bolt *y*, arranged and attached to the rear of said frame, in the manner set forth, by which combination the knife bar is made self-adjustable.

I claim connecting the adjusting lever Z, with the platform C, and sliding frame H, as set forth.

I claim horsing the knife over the platform, or in a position at right angles, or nearly so, to the axle B, by the two movements, substantially as described.

NO. 23,509.—W. H. STIMPSON, of Boston, Mass.—*Improvement in Cooking Ranges*.—Patent dated April 5, 1859.—This improvement consists in so arranging the central or main flue *d d*, that the heat from the fire chamber *a a* shall pass out of the same some distance below the top; and in an arrangement by which the expansion of the grate is prevented from injuriously affecting the remaining portions of the range by throwing or pushing them apart. It also consists in the use of sliding covers *q q* to the boiler apertures, which are arranged so as to slide back and forth without being removed from the range.

The inventor says: I *claim* the combination of the flanges or projections, attached to the side plates of the boiler chambers with the grate constructed so as to admit air to the fuel from below, and hung so as to allow of its free play, and made narrower than the fire chamber, as described, whereby the contraction and expansion of the grate is prevented from injuriously affecting the remaining portion of the range or stove.

Second. The use of the sliding covers *q q*, in combination with the top plate arranged to operate substantially as described.

NO. 23,510.—STEPHEN STRUNZ, of Birmingham, Pa.—*Improvement in the Manufacture of Resin Soap*.—Patent dated April 5, 1859.—The inventor says: First melt 100 pounds of tallow or fat with 200 pounds of rosin, warm this mass to 70° or 80°, Reaumeur, and add 150 pounds pure, cold, caustic ley, stir the mass well during the process, and, when it is well combined, add 75 pounds of carbonated ley.

*Claim*.—The admixture, compounding, and preparing of the ingredients named, in proportions specified and for the purpose set forth.

No. 23,511.—SAMUEL TEAGUE, of Newton, Ohio.—*Improvement in Machines for Dressing Mill Stones.*—Patent dated April 5, 1859.—To operate the machine it is placed upon the stone to be wrought and motion given to the picks *a a*, by turning the cylinder B, by means of the crank L, meanwhile driving the picks forward as the work progresses by means of the screws *s s*, turned by the hand-wheel H. The arbor *r*, of cylinder B, projects through, and traverses a slot in the outer box or case.

*Claim.*—The adjustable braces *f*, when combined with the picks *a*, sliding frame A, and levers *l*, constructed and operated in the manner set forth for the purpose specified.

No. 23,512.—ALFRED THOMAS, of Howard, Pa.—*Improvement in the Manufacture of Iron.*—Patent dated April 5, 1859.—The claim will explain the nature of this improvement.

*Claim.*—The mixing of charcoal and anthracite metal and forge cinder, in the proportion substantially as stated, and working them together in the puddling or boiling process, or in a refinery fire, for the purpose of making a superior quality of iron, as stated.

No. 23,513.—PELATIAH THOMPSON, of Springfield, Ohio.—*Improved Bedstead.*—Patent dated April 5, 1859.—The claim and engraving will explain the nature of this invention.

The inventor says: I *claim* the combination of the double series of helical springs *d*, with the removable holder strips E, and series of cross slats *c*, operating with their steadying pins *e*, the whole arranged to operate as and for the purpose specified.

In combination with the series of slats *c*, operating with a series of springs, as specified, and the removable holder strip E, I claim the series of guiding blocks *b*, when two or more are extended down, to prevent the removable strips E from jumping, as described.

No. 23,514.—JONATHAN TROOP, of Sinclairville, N. Y.—*Improved Machine for Jointing Staves.*—Patent dated April 5, 1859.—This invention consists in the employment or use of a rotary adjustable cutter wheel C, and a vibrating frame F, provided with a clamp *h h*, and form bed *e*, and used in connection with a gauge *a*<sup>1</sup> and adjusting device.

The inventor says: I *claim*, first, the vibrating frame F, provided with the clamp bars *h h*, and stave-adjusting bars *m*, and used in connection with the gauge screws *a*<sup>1</sup>, arranged substantially as shown, for the purpose of properly presenting the staves to the cutters.

Second. The combination of the above named parts with the rotating cutter wheel *e*, arranged for joint operation, substantially as and for the purpose set forth.

No. 23,515.—WILLIAM C. TURNER, of St. Louis, Mo.—*Improved Syrup Charging Apparatus.*—Patent dated April 5, 1859.—The nature of this invention will be understood by reference to the claim and engraving

*Claim.*—The construction of a machine, so arranged that a uniform and definite measure of any liquid may be supplied to a bottle, or any other vessel, before, during, or after filling the same with soda, mineral, or water surcharged with carbonic acid gas or other gas, or any other liquid, by means of pump, air vessel, safety valve, charging valve or charger, constructed and applied substantially as described in specification

No. 23,516.—ALBERT WARREN, of Jefferson, Ohio.—*Improvement in Machines for Cutting Soles of Boots and Shoes.*—Patent dated April 5, 1859.—This invention consists of a long, shallow box, the bottom covered with sheet-iron, and a press working with the foot.

*Claim.*—A series of pieces covering the bottom of the box like *c c*, separated by a straight line through the centre, together with the series of pieces, like B C, with the knife J, held securely between their crooked edges, and arranged alternately, with a toe to the right and left, and covered by the forms D D D, &c., in the manner described, when these devices are combined with the slide P, arranged and operating as specified.

No. 23,517.—NATHANIEL WATERMAN, of Boston, Mass.—*Improved Egg Pan.*—Patent dated April 5, 1859.—Where the rim of each cup is nearest to that of an adjacent cup, it is joined to the same by a short connection *b*, and so as to leave open spaces *c c c* between them. These spaces are left between the cups A B C, in order to allow the currents of heat to pass upward between them, so as to equalize the heat against their surfaces.

*Claim.*—The new or improved manufacture of baking pan, or arrangement of cups, and a handle at each end of the series, all connected together and cast or founded in one solid piece of metal and with heat passages between the cups, substantially as stated.

No. 23,518.—CLINTON G. WELLS, of Galveston, Texas.—*Improvement in Fastening Iron Bands on Cotton Bales.*—Patent dated April 5, 1859.—The band to be used is to be placed around the bale with the end to which the clasp is attached standing upright; the other end of the band, upon which the washer C is placed as a slide, is then to be drawn through the clasp D, until the band is tight. The end is then to be turned up and laid flat against the band at B, and the washer slid over the end.

*Claim.*—The application of the washer C, and the mode of fastening the end of the band

with it as mentioned above, and thus expediting the operation of baling and compressing bales of cotton, or merchandise, and retaining them securely in their compressed form.

No. 23,519.—GEORGE D. WEST, of Brandywine Hundred, Delaware, assignor to P. W. NEEFUS, of New York City.—*Improvement in the Valve Motion of Oscillating Steam Engines.*—Patent dated April 5, 1859.—The nature of this invention consists in providing an arch *d*, and an intermediate lever *c*, to produce a quick and sudden motion in the valves of the oscillating engine.

*Claim.*—The combination of arch *d* and lever *c*, for the purpose and in the manner substantially as set forth.

No. 23,520.—LEROY S. WHITE, of Waterbury, Conn.—*Improved Burnishing Machine.*—Patent dated April 5, 1859.—The claim and engraving will explain the nature of this invention.

The inventor says: I *claim*, first, so applying two burnishers, in a burnishing machine, that they shall operate simultaneously, at opposite points on opposite sides of the article or piece of work to be burnished, and burnish both sides at once; and that during such operation, each shall serve to support the article or piece of work against the pressure of the other, substantially as set forth.

Second. The combination of the reciprocating and partially rotating shaft *K*, and yoke *D*, or their equivalent, and the tool stock *R*, by means of the rods *S S*, the arm *k*, rod *l*, and arm *m*, the whole operating substantially as and for the purposes specified.

Third. The sliding bars *n n<sup>1</sup> p*, applied in combination with the tool stock carriage, to operate substantially as and for the purposes specified.

No. 23,521.—D. A. WOODBURY, of Rochester, N. Y.—*Improved Variable Cut-off for Steam Engines.*—Patent dated April 5, 1859.—This invention consists in the combination of a vibrating yoke *D* attached to the stem of a cut-off valve, and a rotary cam or wiper wheel *E*, deriving a positive rotary motion from the engine, which provides for the opening of the cut-off valve always at the proper time, and the closing of the same to cut off the steam at any point in the stroke of the engine that may be desired.

*Claim.*—The combination of the vibrating yoke *D*, attached to the valve stem, and the rotary cam, or wiper wheel *E*, having arc-formed tappets, or wipers *h h*, the whole being applied and operating substantially as set forth.

No. 23,522.—WILLIAM H. YATES and GEORGE YATES, of Chittenango, N. Y.—*Improved Method of Sawing Shingles from the Bolt.*—Patent dated April 5, 1859.—This invention relates to an improvement in that class of shingle machines in which a circular saw is employed for cutting the shingles from the bolt, and the bolt fed to the saw by hand. This invention is designed to facilitate the manual operation of such machines, and enable the operator to present the bolt obliquely to the saw, so that the shingles may be sawed therefrom in taper form, and cut but and point alternately from either end of the bolt.

*Claim.*—The adjustable bar *H*, and the carriage *E*, provided with the adjustable dog *e*, connected with the hand lever *F*, the whole being arranged for joint operation as and for the purpose set forth.

No. 23,523.—ANTHONY ZINK, of Lancaster, Ohio.—*Improvement in Trace Fastenings.*—Patent dated April 5, 1859.—The nature of this invention will be understood by reference to the claim and engraving.

*Claim.*—A new article of manufacture, to wit: a trace fastening, consisting of the metal ferrule *B*, provided with a circular groove *E*, running in the path of a vertical circle, and two slots *a a*, running at right angles to the groove, and a metal cap *F*, having two lugs *c d* on its inner circumference, with a space existing between them and its head, and a plate *b*, extending from the circumference of the head some distance into the side of the trace, all as set forth.

No. 23,524.—JAMES BLACK, of Philadelphia, Pa., assignor to GEO. M. WORL and WM. S. WORL, of said Philadelphia; and the said GEO. M. WORL assigned his interest in the same to WM. S. WORL aforesaid.—*Improved Steam Engine.*—Patent dated April 5, 1859.—The nature of this invention consists in connecting one end of a piston rod to a hoop *F*, which revolves on fixed circles set eccentrically to the shaft *B*, upon which the cylinder *A* turns, in which said piston turns.

*Claim.*—The arrangement of the cylinder *A*, hoops *F F*, and the disks or wheels *G G*, when said disks are set eccentrically to an axle which pierces the cylinder transversely, and one end of the piston rod of the cylinder is connected with and operates the hoops, substantially in the manner specified.

No. 23,525.—LEVI W. BUXTON, of Nashua, N. H., assignor to JOSEPHUS BALDWIN and L. KIMBALL, of said Nashua.—*Improved Bedstead Fastening.*—Patent dated April 5, 1859.—

The end of the piece *e*, which projects into the rail, is provided with a hole corresponding to a slightly conical hole in the rail *d*, conical pin *h* is driven through these holes in the rail and piece *e*, a pin *g* is inserted through the post, and supports a small friction roller *f*, in the groove *c*. The end of the piece *e*, which projects into the post, is made into a hook *e*<sup>1</sup>, which is to be slipped over the friction roller *f*, when it is desired to fasten the rail to the post.

The inventor says: I *claim* the combination of the shoulders *J J*, on the locking or rail piece *e*, with the notched or serrated circular edges *l l* and conical pin *h*, substantially as and for the purposes set forth.

I also claim the combination of the hook *e*<sup>1</sup> with the tube or friction roller *f* and stationary pin *g*, substantially as and for the purposes described.

No. 23,526.—JACOB EDSON, of Boston, Mass., assignor to Himself and H. F. GARDNER, of said Boston.—*Improved Carpet Sweeper*.—Patent dated April 5, 1859.—The claim and engravings will explain the nature of this invention.

The inventor says: I *claim*, first, holding the rubber tire upon the driving wheel by means of the groove *c*, formed in the said wheel as described, whereby I am enabled to use a cheaper form of soft or elastic tire than would otherwise be possible, as set forth.

Second. The use of the flap or float *h*, arranged and operating as described, for preventing the escape of dust and the wear of the brooms, as set forth.

Third. Arranging two sets of brooms on their common shaft in such a manner that they shall cross each other diagonally, as described, and for the purposes set forth.

Fourth. Holding the brooms upon their shaft by sectional adjustable clamps that reach by or overlap each other, whereby, while every portion of the brooms is securely held, they can be adjusted at pleasure or new ones inserted.

Fifth. Hanging the broom shaft in such a manner by means of the hinge or pivot joint and yielding spring, that the brooms will adapt themselves to any and all inequalities of the surface to be swept, and at the same time perform their work thoroughly.

No. 23,527.—WILLIAM C. GRIMES, of Philadelphia, Pa., assignor to Himself and R. B. FITTS, of said Philadelphia.—*Improved Washing Machine*.—Patent dated April 5, 1859.—This invention consists in suspending, within a washbox *A*, two washboards or corrugated plates *B C*, and depending from its own rock shaft *e i*, so as to oscillate freely within the said box; the bottom of the latter having a double curvature in the form of two arcs of circles concentric with the centres of the rock shafts respectively.

*Claim*.—The combined arrangement of the two parallel rock shafts *c* and *i*, having the washboards *B* and *C* attached thereto respectively and connected together by the flexible apron *D*, as described, in combination with the double curved bottom *m* and *m*<sup>1</sup> of the box *A*, the same operating together in the manner and for the purpose set forth and described.

No. 23,528.—WILLIAM C. GRIMES, of Philadelphia, Pa., assignor to Himself and R. B. FITTS, of said Philadelphia.—*Improved Portable Steam Generator*.—Patent dated April 5, 1859.—The nature of this invention will be understood by reference to the claim and engraving.

The inventor says: I *claim*, first, making the three distinctively specified parts, consisting of the furnace *A*, the boiler *B*, with its external cylinder *K* and float *V* attached, as described, and the reservoir *H*, so as to be readily separated from each other and re-adjustable at any moment, as specified, in the manner and for the purpose set forth and described.

Second. Making the boiler *B* self-supplying (with water) by means of the float *V* and its containing cylinder *K*, arranged in connection with the boiler, as described, the same operating together in combination with the reservoir *H*, substantially as set forth and described.

Third. I also claim making the furnace *A*, with an annular chamber between the fire cylinder *D*, the outside shell *A*, and the rings *C* and *F*, when the same are constructed, arranged, and combined together, and with the other parts of the boiler, so as to cause the air which supports the combustion of the fuel in the said cylinder *D* to pass down through the said annular chamber *F* before it enters the said fire cylinder *D*, as and for the purpose set forth and described.

No. 23,529.—GUSTAVUS A. LILLIENDAHL, of New York, N. Y., assignor to MARTHA J. COSTON, of Washington, D. C.—*Improved Pyrotechnic Night Signals*.—Patent dated April 5, 1859.—The claim and engraving will explain the nature of this invention.

The inventor says: I *claim*, first, inclosing the necessary charges of pyrotechnic composition for producing signal fires within cases whose sides are composed of thin paper and tin-foil, substantially as set forth.

Second. Separating the respective layers of composition, in the above mentioned cases, by means of thin partitions or disks, substantially as set forth.

Third. Charging the aforesaid cases with such proportions of combustible and non-combustible materials as will allow the cases to be all made of the same length, and also enable a socket to be formed at the lower end of each of said cases, substantially as set forth.

Fourth. So proportioning the paper and tin-foil portions of the aforesaid cases that a

sufficient portion of the tin-foil will project above the stiff sides of each of said cases, to form when bent inwards, a metallic covering for the top of the same, substantially as set forth.

No. 23,530.—JAMES H. MOSHER, of New York, N. Y., assignor to Himself and ANSON P. COLT, of said New York.—*Improved Steam Pressure Gauge*.—Patent dated April 5, 1859.—This invention relates to mercurial gauges which have their index closed at the top, and it consists in certain means by which provision is made for the charging of such gauges in a proper manner by persons having no previous practice in charging gauges, and while said gauges are in their places attached to boilers; also, for renewing the air in the index leg from time to time, as may be desirable.

*Claim*.—So applying the valves *E c* in combination with each other that the gauge may be charged while both legs are open to the atmosphere, as described, and that the air above the mercury in the index tube may be caused to have an ordinary atmospheric pressure while the mercury is at zero, and there is only the pressure of the atmosphere on the back leg.

No. 23,531.—WILLIAM H. MCNIECE, of Conshohocken, Pa., assignor to WALTER CRESSON, of said Conshohocken.—*Improved Gauging Device attached to Hand-Saws*.—Patent dated April 5, 1859.—This invention consists in fitting an adjustable or folding blade or plate *B* in the metal rib or back bar *c* of the saw, whereby said blade or plate in connection with the rib or back bar of the saw produces the combination of the back saw *A*, square, and bevel.

*Claim*.—As a new and useful article of manufacture, the back saw *A*, with the folding or adjustable blade *B* fitted in its rib or back bar *c*, substantially as described.

No. 23,532.—JULIUS A. PICKERING, of Milford, Mass, assignor to WILLIAM WALKER, of said Milford.—*Improvement in the Mode of Attaching Straps to Boot Legs*.—Patent dated April 5, 1859.—The inventor says: I make a cut through the boot leg, where it is desired to place the strap, as at *C D*, cutting through both parts, and passing one part of the strap on each side at the top. I then insert the ends between the parts at the cut, and secure them below the cut in the usual way.

*Claim*.—Supporting or retaining the loop or upper part of the strap, in the manner and for the purpose substantially as set forth and described.

No. 23,533.—GEORGE W. RANDALL, of Boston, Mass., assignor to Himself and REUBEN J. TODD, of said Boston.—*Improvement in Faucets*.—Patent dated April 5, 1859.—The nature of this invention consists of a combination of two taps or valve tubes *B C* and a case or body *A*, provided with conduit pipes *D D*, the whole being arranged and applied together in such manner as to enable either of the currents of fluid conducted into the case by either of its conduits to be discharged out of the lower end of the inner tap or valve *C*, and the remainder of the currents to be shut off therefrom.

The inventor says: I *claim* the combination of the auxiliary or inner tap with the outer tap and the conduit case, provided with two or more conduits, the whole being constructed and made to operate together, substantially as described.

I also claim the arrangement of the air passage *d*, so as to discharge, with reference to the discharging end of the inner tap, substantially as described.

No. 23,534.—D. J. WILCOXSON, of Milan, Ohio, assignor to Himself and ISAAC COLLINS, of Huron, Ohio.—*Improved Ships' Steering Apparatus*.—Patent dated April 5, 1859.—These improvements in steering apparatus for vessels relate to that class in which two parallel screws are used to control and give motion to the rudder, the nuts of which act on the yoke of the rudder-post.

The inventor says: I *claim*, first, the combination of the double yoke with the traversing nuts, arranged substantially as described, and for the purposes set forth.

Second. Arranging the screws by which the rudder is turned on either side and below the top of the rudder-post, so that, in case of accident, the tiller may be used to steer the vessel without its being interfered with by the steering mechanism.

No. 23,535.—CUTTING B. WILEY, of Adrian, Mich., assignor to Himself and ALEXANDER STEBBINS, of Lenawee county, Mich.—*Improved Hub-Borer*.—Patent dated April 5, 1859.—This invention consists in the combination and arrangement of the screw *C*, having a bearing at the top and the bottom in the frame *A*, with the sliding cutter heads *G* dovetailed to the ways and attached near the top on each side to the nut *K* by connecting rods *H*, by means of which the cutter heads rise and fall with the nut.

*Claim*.—The combination of the sliding cutter head *G* with the adjustable ways or slides *E*, with the nut *K*, and screw *C*, the whole being arranged as described, and for the purpose set forth.

No. 23,536.—MARTHA J. COSTON, of Washington, D. C., administratrix of the estate of B. FRANKLIN COSTON, deceased.—*Improved Pyrotechnic Night Signals*.—Patent dated April

5, 1859.—This invention consists in a method of signaling any numerals or combination of numerals by the display of different pyrotechnic fires.

*Claim.*—The signaling of any numeral, combination of numerals, or any character, or any combination of characters, by a methodical exhibition of different pyrotechnic fires, substantially as set forth.

No. 23,537.—I. WALLACE ARNDT, of Green Bay, Wis.—*Improved Machine for Noting the Sums of Numbers added.*—Patent dated April 12, 1859.—This invention consists in arranging a swivel arm *d* with a pointer in such relation to a ratchet wheel *D*, and to a dial plate *B*, marked with units, hundreds, and thousands, that by turning the arm until the pointer points to a certain figure in the unit scale of the dial plate, the ratchet wheel is rotated, and that by this operation, and by the aid of a series of pinions *ch i* and gear wheels *F G H I*, three indexes *c m k* are rotated on the face of the dial, one of which indicates the units, another the hundreds, and the third the thousands.

*Claim.*—The arrangement of three indexes *c m* and *k* on a dial marked with units, hundreds, and thousands, in combination with the swivel arm *d*, the ratchet wheel *D*, and the pinions *c h* and *i*, and with the gear wheels *F G H* and *I*, or their equivalents, to operate substantially as and for the purpose specified.

No. 23,538.—WILLIAM H. ARNOLD, of Washington, D. C.—*Improved Projectile for Fire-Arms.*—Patent dated April 12, 1859.—In the drawings, *B* represents a conical ball of ordinary form, with a cavity in its rear portion, cast upon a metal rod *R*, whose axis is coincident with that of the projectile. The rod *R* may be either plain or its rear extremity may be split, a small ring *a* being used to hold the branches together.

*Claim.*—Combining with hollow base projectiles *B* a shaft *R*, split at its extremity, and otherwise constructed as described.

No. 23,539.—J. E. ATWOOD, of Mansfield Centre, Conn.—*Improvement in Gauging Threads.*—Patent dated April 12, 1859.—This invention consists in a series of rollers *c c c*, so arranged and applied as to constitute a number of gauges through which the thread to be sorted or measured is conveyed by suitable means, and by which its thickness is measured at several points at the same time, and a multiplied measurement is obtained.

*Claim.*—The apparatus consisting of a series of rollers, or other equivalent devices, so arranged and applied that their surfaces combine to constitute a number of gauges through which the thread is conveyed by suitable means, and by which its thickness is measured at two or more points at the same time, and a multiplied measurement is obtained, substantially as described.

No. 23,540.—SILAS D. BALDWIN, of Milwaukee, Wis.—*Improvement in Gas Regulators.*—Patent dated April 12, 1859.—This invention belongs to the class of regulators where it is designed to regulate the passage of gas from the supply to the delivery pipe, by the pressure of the gas itself, so that whenever that pressure shall become extreme the transmitting space between the valve and its seat shall be so much diminished or contracted as to keep the pressure of the gas in the delivery pipe at that degree which may be desired.

The inventor says: I *claim*, first, the annular recess or chamber *W*, for the purpose stated.

Second. And in combination with a regulator having such recess, I claim the union piece *u*, arranged and operated as set forth.

No. 23,541.—JAMES K. BARKER, of Lawrence, Mass.—*Improved Shutter Operator.*—Patent dated April 12, 1859.

The inventor says: I use a block or arc *A* for wooden buildings, and *B* for brick or stone buildings, which I fasten to any part of the blind centreing nearly with the centre of motion of the blind, or to the building directly above or below the centre of motion of the blind. These blocks or arcs are the leverage by which I control the exterior blinds from the inside of buildings. I then arrange the pipes *G*, which are made very smooth on the inside, to avoid friction and wear to the cord or chain. I then fasten one end of the cords or chains to the blinds at *H*, and pass them around the block *A* or *B*, and through the outside pipes *G*, into the pockets of the window jamb. I then, from the inside of the building and through the aperture made to receive the inside pipe *I*, pass a wire bent in the form of a hook, and draw the cords from the jamb and fasten them to the straps *C*. I then, by means of the knob *F*, which is slipped into one of the holes of the straps, make the blind fast either open or shut.

The inventor says: I *claim* the use of the block or arc *A* and *B*, of convenient size, to be fastened to the blind or building, as described in the specification, and for the purpose described.

I also claim the design of arranging the pipes and cords, and the design of opening, shutting, and fastening exterior blinds, in the inside of buildings, by means described in the specification.

No. 23,542.—FREDERICK S. BARNARD, of New York, N. Y.—*Improvement in Dovetail Joints for Wood, &c.*—Patent dated April 12, 1859.—The nature of this invention consists in tongued and grooved sectional dovetail, so constructed that the tongue can be entered into the groove for any length of material, and then the dovetail of the tongue is slipped into the dovetail of the groove by an endwise movement, which draws the joint tightly together, in a manner that is permanent, durable, easily applied, without the use of glue or cement, and will insure a perfectly tight or close joint.

*Claim.*—The tongued and grooved sectional dovetail joint, to connect wood or other material together, substantially in the manner specified.

No. 23,543.—ALEXANDER BECKERS, of New York, N. Y.—*Improved Stereoscope Case.*—Patent dated April 12, 1859.—This invention consists in confining the pictures by means of an elastic frame E, which adapts itself to different sizes of pictures, and which, by means of a hook C in the centre of its upper bar, assists in placing the picture properly in the centre; and it also consists in arranging two arms H, one on each side of the stereoscopic case, which arms form the bearings for the upper one of the two shafts on which the chain C revolves, carrying the picture frames.

The inventor says: I *claim*, first, the picture frames E, constructed of elastic wire, or of any other suitable substance, and provided with a hook C, for adjusting the pictures in the centre, substantially as described.

Second. I claim the arms H, arranged in such relation to the pictures, that by the motion of the arms each of the pictures, when brought before the eye glasses, can be moved to and from the same, until it comes into the proper focus, substantially in the manner specified.

No. 23,544.—ABNER BEELER and JOHN B. CHRISTIAN, of Mount Carroll, Ill.—*Improved Pump.*—Patent dated April 12, 1859.—This invention consists in the employment of three concentric cylinders G H I, one stationary, and the other two sliding, each provided with a valve *m h i*, and so arranged in connection with the other parts of the pump as to raise a continuous stream of water.

*Claim.*—The combination of two sliding cylinders with each other, and with a third stationary cylinder, arranged and operating substantially in the manner and for the purposes specified.

No. 23,545.—FRANCIS H. BELL, of Washington, D. C.—*Improvement in Self Priming Gunlocks.*—Patent dated April 12, 1859.—The nature of this invention will be understood by reference to the claim and engraving.

*Claim.*—The combination of mechanical devices, substantially as described, with the slide E, by means of which the latter can be either kept rigidly in position over the mouth of the magazine chamber, thus intercepting all communication with the latter, or be thrown in gear with the lock plate, so that by cocking the hammer it will be operated in such manner as to force a cap from the magazine chamber into the discharge chamber of the hammer on the descent of the latter upon the nipple, for the purposes set forth.

No. 23,546.—JACOB BENNER, of Allegheny, Pa.—*Improvement in Grain Separators.*—Patent dated April 12, 1859.—The nature of this invention consists in a mechanical arrangement of a suction fan *n* and a revolving distributing table *j*, furnished with beaters *s*, in connection with a receiving chamber D, separating chamber C, gathering chamber E, and a collecting chamber B, the whole being arranged and combined for the purpose of effectually separating all foreign matter from wheat and other grain.

The inventor says: I *claim*, first, The arrangement of the receiving chamber D, separating chamber C, collecting chamber B, and gathering chamber E, when used in connection with the suction fan *n*, as described and represented, and for the purpose set forth.

Second. The arrangement of the shutes *e*, valves *f*, when used in connection with the conical or convex bottom *h* of the chamber B, as described and for the purpose set forth.

No. 23,547.—JACOB BENNER, of Allegheny, Pa.—*Improvement in Smut Machines.*—Patent dated April 12, 1859.—The nature of this invention consists in the arrangement of a fan *m*, separating and discharging flues D F, and a revolving drum *r*, furnished with beaters *q*, in connection with receiving, distributing, gathering, and eddy chambers A B C L, the whole being arranged and combined for the purpose of separating smut and other impurities from wheat and other grain.

The inventor says: I *claim*, first, The use of plate with the cone 8, and the opening *o* between the lattice-work *v* and plate *p*, when used in connection with the suction fan *m*, the beaters *q* on drum *r*, and the flues D F and *e*, as described and for the purpose set forth.

Second. The arrangement of the chambers A B C and L, and the flues D F and *e*, when used in combination with suction fan *m*, lattice-work *v*, opening *o*, plate *p*, with cone 8, and beaters *q* on drum *r*, as described and for the purpose set forth.

Third. The use of the straight or perpendicular part X with cap 7 of the casing *y* of cham-

ber A, for the purpose of forming an eddy in chamber L, as described and for the purpose set forth.

No. 23,548.—HIRAM BERDAN, of New York, N. Y.—*Improved Bread Cutter*.—Patent dated April 12, 1859.—This invention consists in the employment of a large cylinder A placed vertically, with its upper end level with one floor of the building, so that dough can be emptied into it from above.

The inventor says: I *claim* the arrangement of certain devices, viz: the adjustable cavities, or their equivalents, in combination with the cutting off knife, or its equivalent, and the large cylinder and piston, or their equivalents, and so connecting the several parts that the amount of dough displaced by the piston shall be exactly equal to the cubic contents of the cavities presented for filling between each stroke of the cutting off knife, substantially as and for the purpose specified.

I also claim the devices for rounding up the loaves as they fall from the cavities, consisting of the grooved roller and shield, or their equivalents, the roller having a vibratory motion, in the manner and for the purpose specified in combination with the preceding arrangement of devices claimed, substantially as and for the purpose specified.

No. 23,549.—DOUGLAS BLY, of Rochester, N. Y.—*Improvement in Attaching Thills to Vehicles*.—Patent dated April 12, 1859.—The inventor says: My invention consists in an improved method of attaching the thills and pole to carriages or other vehicles, by which three important advantages are obtained. First, Seventy-five per cent. of the requisite expense is saved. Second, Increased securities against accidental disengagement. Third, Great convenience in changing the thills for a pole, and *vice versa*.

*Claim*.—The construction and arrangement of the movable piece or block E, having the notch G and screw shank in half, and slightly wedge shaped, in combination with the oblique shoulder H on the notched screw shank R, and with the hook J of the block D, substantially in the manner and for the purposes set forth.

No. 23,550.—MICHAEL BRAYER, of Rochester, N. Y.—*Improved Device for Drawing Sawdust, &c., from Stave Machines*.—Patent dated April 12, 1859.—This invention consists in the employment or use of levers *n n* fitted in the bed A of the machine, to aid in removing the waste or refuse pieces of the bolts from the machine.

*Claim*.—The employment or use of the levers *n n* in combination with the inclined bed A, arranged substantially as and for the purpose set forth.

No. 23,551.—BARNES CLAYTON, of Philadelphia, Pa.—*Improved Fastening for Shirt Studs*. Patent dated April 12, 1859.—This invention consists in making the post B, with a projecting arm D<sup>1</sup> on its upper side and the front part of the stud capable of being partially rotated in contact with one end of the post, by means of a stem C, which is fixed perpendicularly to the back of the front piece A, passes longitudinally through the post and carries a cross piece D, which is fixed at right angles upon the stem, and in contact with the opposite end of the said post.

*Claim*.—The armed post B in combination with the cross piece D, fixed to the stem C of the front piece A, the same operating together substantially in the manner and for the purpose set forth and described.

No. 23,552.—LEVI H. COLBORN, of Baltimore, Md.—*Improvement in Harvesters*.—Patent dated April 12, 1859.—The spiral cutter revolves, when in action, in the direction of the arrow, through openings in the guard *g*, which are circular, and fit close to the cylindrical cutter *f*, giving a shearing cut between the edges of the cutter and the opposing edge of the openings. The edge of the cutter also comes in shearing contact with the edge of the upper bar or plate *d*, which may be plain or serrated.

*Claim*.—The spiral revolving cutter, constructed and arranged substantially as described, with a continuous opening through its centre, for the purpose specified.

No. 23,553.—I. M. COLMAN, of Milwaukie, Wis.—*Improved Variable Cut Off for Steam Engines*.—Patent dated April 12, 1859.—This invention consists in so combining with the ordinary slide valve *c c* the double seated balanced or equilibrium valve *g g*, as to have it act as a drop valve cut off, variable in its action, and deriving its motions from the movements of the slide valve.

*Claim*.—Combining the double seated balanced or equilibrium valve with the ordinary slide valve of steam engines, as set forth.

No. 23,554.—J. P. CRUTCHER, of Silver Spring, Tenn.—*Improvement in Cotton Seed Planters*.—Patent dated April 12, 1859.—The seed is placed in the chamber C by the door *h*. The frame B being attached to the main frame, allows the chamber C to roll on the bottom of the furrow, and drill the seed from the opening *o*. The clearer *f* prevents the seed from packing in the chamber, and removes whatever soil may adhere to the edges of the discharge opening.

*Claim.*—The rotating hollow chamber C, constructed as described, in combination with the clearer and agitator *f* and swinging frame B, substantially as and for the purposes set forth.

No. 23,555.—JOSIAH DANFORTH, of Middletown, Conn.—*Improvement in Hernia Trusses.*—Patent dated April 12, 1859.—The claim and engraving will explain the nature of this invention.

*Claim.*—Uniting, by a screw or rivet, the two springs 4 4, at a given point 2, from the end of each, with pads attached, which can be adjusted to the body without any additional spring, and thereby making the arrangement and combination of the two springs 4 4, with their respective pads, a truss of itself.

No. 23,556.—EDWARD L. DORSEY, of Green Wood, Ind.—*Improved Churn.*—Patent dated April 12, 1859.—The pin *o* revolves eccentrically to the shaft I, so that when said shaft causes the wheel H to revolve the pin *o*, and pitman F communicate an up and down motion to the dashers K, while the teeth of wheel H work between the rounds *n*, of the trundle wheel C, and gives a circular motion to the dashers.

*Claim.*—The employment of the trundle wheel C, staff E, pitman F, and cog wheel H, substantially in the manner herein shown, for the purpose of giving at the same time a vertical and a circular motion to the dashers for churning butter, as is fully set forth.

No. 23,557.—NATHANIEL DRAKE, of Newton, N. J.—*Improvement in Guide Attachments for Vehicles.*—Patent dated April 12, 1859.—This invention consists in having the front end of the draft pole D connected to the strap bar F, by a catch G, which is connected by cords *c* to levers H, placed within reach of the driver's feet.

*Claim.*—The slotted pole strap bar F and catch G, placed on and connected with the draft pole D, respectively, as shown, in connection with the cords *c*, attached to the catch G, passing through the uprights E and shieves *d* of the horse collars, and attached to foot levers H, or their equivalents, substantially as and for the purpose set forth.

No. 23,558.—JOHN B. DUANE, of Schenectady, N. Y.—*Improvement in Sowing Machines.*—Patent dated April 12, 1859.—The board G is vibrated by the teeth *h*<sup>1</sup> on the pulley S, said teeth acting against a beveled projection on the board and the spring *i*, and the board through the medium of the lever H communicates a vibratory motion to the bar E. The seed in box D are kept in a loose state by the movement of the teeth *j*, and, by being agitated by the said teeth, pass down through the perforations *g e*, of the slide *f* and bottom *d*, into the grooves, the discharge passage being regulated by adjusting the slide *f* of the roller F, the roller throwing the seed on the inclined toothed board G, which distributes the seed evenly and in a broadcast manner on the ground.

The inventor says: I *claim*, first, the arrangement of the vibrating toothed board G and agitating bar E, connected by the lever H, in connection with the adjustable slide *f* and perforated bottom *d*, and grooved roller F, the whole being arranged to operate as and for the purpose set forth.

Second. The roller H<sup>1</sup>, when attached to the frame A, by the bent levers I I, and connected with the caster wheels M, through the medium of the bars J J K K L L, arranged substantially as shown and for the purpose set forth.

No. 23,559.—RICHARD H. DUTTON, of Philadelphia, Pa.—*Improvement in Artificial Limbs.*—Patent dated April 12, 1859.—The claim and engraving will explain the nature of this invention.

The inventor says: I *claim*, first, the use of the hardened cylindrical tube A, in constructing joints for artificial limbs, substantially as and for the purposes set forth and described.

Second. The use of the feather spring D, when constructed and arranged, to operate substantially as set forth.

Third. The use of the bolt E and pulley F, when constructed and arranged for the purpose described.

Fourth. The use of the spring G, when constructed and applied to act, substantially as and for the purpose set forth and described.

No. 23,560.—THOMAS FILDES, of Media, Pa.—*Improvement in Oil Cans for Lubricating.*—Patent dated April 12, 1859.—This invention consists in attaching a clamp B to a handle A, in which a lever or pressure bar C is fitted and arranged with a cord *i*, so that the can may be secured in the clamp, and the nozzle of the can directed by the attendant to the desired spot without the aid of a ladder, and the oil ejected from the can by actuating the pressure bar.

*Claim.*—Attaching the oil can D, by means of a clamp B, to a handle A, and using, in connection therewith, the lever or bar C, actuated by the cord *i* and slide *k*, or their equivalents, substantially as and for the purpose set forth

No. 23,561.—JAMES FORD, of Wabash, Ind.—*Improvement in Grain Drills*.—Patent dated April 12, 1859.—The lower part of the box E is provided with two seed slides S, which work longitudinally in grooves in the box E. The slides are perforated to permit the escape of the seed into troughs *l*. The seed, after entering the troughs *l*, fall by their own gravity through them into the tubes H, and thence into the ground. By pressing down the side T the rear side T<sup>1</sup> will be raised, and the tubes H will be lifted from the ground.

*Claim*.—The arrangement and combination of the seed box E, lever N, rod P, slide S, lever M, and tilting frame T T<sup>1</sup>, as and for the purposes shown and described.

No. 23,562.—ELBRIDGE FOSTER, of Hartford, Conn.—*Improvement in Covers for Travelling Trunks*.—Patent dated April 12, 1859.—The nature of this invention consists in the formation of covers or cases to protect travelling trunks and packages from injury while travelling, and, in case of accident, to save them from sinking in the water.

*Claim*.—The air-inflated trunk cover, in the manner substantially as set forth, and for the purposes described, as a new article of manufacture.

No. 23,563.—WASHINGTON L. GILROY, of Philadelphia, Pa.—*Improvement in Coffee Roasters*.—Patent dated April 12, 1859.—The claim and engraving will explain the nature of this invention.

*Claim*.—The arrangement of the two sets of the united staying and guiding pieces B B and B<sup>1</sup> B<sup>1</sup>, on the inner side of the said hollow sphere, each set being placed diametrically opposite to the other, and with their apexes in the direction of the rotary motion of the said sphere, that they may, in succession, operate in combination with the interior spherical curve of the latter, during its rotary motion, to remove the coffee from the middle of the bottom of the said sphere toward the end thereof, and essentially permit it to fall gradually over the edges of the said staying and guiding pieces into the middle of the bottom again, as specified, thus rendering the said spherical coffee roaster perfect in its operation, as described.

No. 23,564.—FAYETTE GOULD, of Huntington, N. Y.—*Improved Callipers*.—Patent dated April 12, 1859.—This invention consists in having an index *e* attached to the sliding jaw C, and operated by a rack *b* and pinion *c*, and the movement of the jaw, so as to give very minute fractional parts of an inch or other divisions marked on the bar A, on which the jaw works.

*Claim*.—In combination with the jaws B C and graduated bar A, the dial plate *f*, and index *e*, the latter being actuated by the pinion *c* and rack *b*, substantially as and for the purpose set forth.

No. 23,565.—HENRY H. GRAHAM, of Paterson, N. J.—*Improvement in Chairs for Railroad Bars*.—Patent dated April 12, 1859.—The binder *d* has a flat or fish shaped head on the inner side of the bar *a*, and a mortise through its body in such a position as to receive the wedge shape spike *e*, which passes down outside of and against the vertical side *c* of the chair and through a mortise in the base of the chair into the cross tie.

*Claim*.—The inventor says: I do not claim a chair taking the side of the rail and coming up to the top thereof, neither do I claim a cross key or bolts uniting the rail by the use of fish bars, or similar devices; but I do not know of any previous instance in which the horizontal binder and vertical key spike have been used to bind the ends of the rails into a chair having a vertical side and fitted to receive the rail.

Therefore I *claim* the horizontal binder *d* and vertical wedge *e*, constructed substantially as set forth, in combination with the chair that receives and sustains the ends of the rails, in substantially the manner described and shown.

No. 23,566.—MARSHALL GRANNISS, of Waterbury, Conn.—*Improved Carpet Fastener*.—Patent dated April 12, 1859.—By turning the forked pieces A A<sup>1</sup> down to a horizontal position, the carpet is stretched and the prongs take a firm hold in the same, and if the wire rods *b* or the arms *b<sup>1</sup> b<sup>1</sup>* of the forked pieces of metal wire A<sup>1</sup> are far enough depressed so that the ears *d d* catch over the same, the strain of the carpet acts to retain the forked piece of sheet metal more firmly in a horizontal position.

*Claim*.—As an improved article of manufacture, a carpet fastener, composed of a plate B, provided with ears *d d*, and a fork or plate A A<sup>1</sup>, having prongs *a a*, as shown and described.

No. 23,567.—EDWIN J. GREEN, of Valparaiso, Ind.—*Improvement in Joint Bodied Buggies*.—Patent dated April 12, 1859.—The claim and engraving will explain the nature of this invention.

The inventor says: I *claim* connecting the front axle of a carriage to the body by means of a swivel joint, composed of shaft G, king bolt E, turning plate D, and stationary plate C, when the latter is secured directly to the body of the carriage, substantially in the manner and for the purpose described.

I also claim connecting the front springs to the coupling, or reach, by means of the shaft G, which is welded or otherwise secured to said springs, as represented.

I also claim, in combination with a hinged carriage body, the braces P and Q, for the purpose of preventing the rear axle from being thrown angling when the carriage is loaded heavier on one side than on the other, substantially in the manner described.

No. 23,568.—IRA GRIGGS, of Utica, N. Y., assignor to the UTICA SCREW MANUFACTURING COMPANY.—*Improved Machine for Threading Screws*.—Patent dated April 12, 1859.—This invention consists in the manner of applying and controlling the operation of the rest, which supports the screw blanks during the threading operation, whereby better provision is made for the support of the blanks in cutting at or near their points; and in depressing the point of the cutter as it approaches the points of the blanks in such a manner as to make it cut screws with tapering points. It also consists in a certain construction of the cutter, whereby it is made to produce a cleaner cut and a truer thread than the cutter ordinarily employed.

The inventor says: I *claim*, first, so applying the rest E, and controlling it by a spring *d*, or its equivalent, as to provide for its longitudinal movement in and independently of the carriage, substantially as and for the purposes described.

Second. Fitting the cutter stock with an eccentric *m*, operated by means substantially as described, to provide for it a movement for tapering the point of the screw, independent of the vibrating movement to feed the cutter, in cutting the other portion of the screw, as set forth.

Third. And though I do not claim, broadly, a two-pointed cutter, I claim the construction of the cutter, with two points, at such a distance apart as to straddle two turns of the thread and the intervening space, substantially as and for the purpose set forth.

No. 23,569.—IRA GRIGGS, of Utica, N. Y., assignor to the UTICA SCREW MANUFACTURING COMPANY.—*Improved Machine for Nicking Heads of Screws*.—Patent dated April 12, 1859.—This invention consists in presenting the screw blanks to the notching saw, and in a novel mode of discharging the blanks from the machine after their notches have been cut.

The inventor says: I *claim* the arrangement of the holding dies and feeding slider in a carrier F, which swings upon the same shaft which carries the cams for operating the said dies and slider, and operates in combination with the notching saw, substantially as described.

And I also claim the discharging of the notched blanks from the holding dies, in a lateral direction, by the introduction of the new blanks into the said dies, as set forth.

No. 23,570.—H. S. HALL, A. D. HUNT, and C. J. WINCHESTER, of Jamestown, N. Y., assignors to H. S. HALL, A. D. HUNT, and C. E. JEFFORDS, of the same place.—*Improved Machine for Tapering Sticks*.—Patent dated April 12, 1859.—This invention consists in the employment of hollow rotating cylinder C, provided with radial sliding bearings *jj*, and one or more cutters *k*, and two feed rollers  $m^1 m^2$ , operated automatically from the driving or power shaft B, whereby the snaths, after being properly steamed and bent, may be finished, rounded, or cut in taper form.

*Claim*.—The rotating cylinder C, provided with the adjustable bearings *jj*, and cutter *k*, one or more, when said bearings and cutter are operated through the medium of the plate D, bar E, with inclined bar *q* attached, and the rack and pinion *ab*, in connection with the springs *e*, or their equivalents, substantially as described.

No. 23,571.—LOREN HALE, of Milford Mass.—*Improved Elastic Polishing Wheel*.—Patent dated April 12, 1859.—This invention consists in a hollow inflated polishing wheel A of India rubber, the surface of which is coated with sand or powdered emery, and which is employed by stretching it over a wheel or cylinder, or over an endless band carried by two drums or wheels.

*Claim*.—As an improvement in wheels for grinding or polishing, the hollow elastic ring, operating as set forth for the purpose specified.

No. 23,572.—WILLIAM J. HAMERSLY, of Hartford, Conn.—*Improvement in Stirrups*.—Patent dated April 12, 1859.—The nature of this invention consists in introducing an elastic device between the loop iron of the saddle and the stirrup, or to the stirrup itself, to relax the rigidity or stiffness of the limbs of the rider.

*Claim*.—As a new, useful, and improved article of manufacture, in a saddle stirrup, the employment of the tube C, spring E, spindle D, or their equivalents, for the purpose substantially as described.

No. 23,573.—H. P. HART, of New Woodstock, N. Y.—*Improved Bed Bottom*.—Patent dated April 12, 1859.—The nature of this invention will be understood by reference to the claim and engraving.

*Claim*.—The arrangement described of the springs *b*, hooks *a*, and rails or rods *g*, in combination with each other, by which the turns of the hooks are made to form shoulders to support the springs against the pressure of the rods *g*, when these are made to bear directly upon both ends of the springs, as described.

No. 23,574.—CHARLES T. HARVEY, of Marquette, Wis.—*Improvement in Piers or Breakwaters.*—Patent dated April 12, 1859.—The claim and engraving will explain the nature of this invention.

*Claim.*—The inventor says: I do not claim, of itself, a crib or frame of timber filled with stone or other material, and to be sunk on the bed of a river, lake, or sea, as such is well known to engineers.

But I *claim* the combination and arrangement of the adjustable bottom fender or crib H, with the pier constructed substantially in the manner as specified, the said fender being hinged or so applied to the pier as to be capable of adapting itself to the slope of the bottom in front of the vertical side of the pier, and of protecting the foundation of such pier from the corroding action of currents, the whole being substantially as specified.

No. 23,575.—THOMAS HARVEY, of Baltimore, Md.—*Improvement in Horse Collars.*—Patent dated April 12, 1859.—The nature of this invention will be understood by reference to the claim and engraving.

*Claim.*—The arrangement of the parts forming the body of a horse collar, and the construction of an underback in such form as that the outer edges of the underback, and the face of the collar, and the outer back are all made perfectly secure by an under seam, and at the same time the under seam is hid from view and wear, as also showing the stitched edge of the outer back in its proper place, all being accomplished previously to the filling of the collar instead of putting on the outer back after the collar is filled, as in the manner in putting together a case collar.

No. 23,576.—THOMAS HARVEY, of Baltimore, Md.—*Improvement in Horse Collars.*—Patent dated April 12, 1859.—The nature of this invention consists in the construction and addition of a fancy welt to a welted horse collar, and so arranged as to show a neat stitched edge, which is brought close down to the face of the collar.

*Claim.*—The construction and addition of a fancy welt to a welted horse collar, the same being perfectly adapted to its location, being alongside of the usual welt, and so formed as to bring it directly down on the face of the collar, and thus showing a stitched edge, as also being in the proper place to prevent the hame-tug from cutting into the collar, as set forth.

No. 23,577.—WILLIAM CLEVELAND HICKS, of Boston, Mass.—*Improvement in Sewing Machines.*—Patent dated April 12, 1859.—The claim and engravings will explain the nature of this invention.

The inventor says: I *claim*, first, transmitting the motion to the needle stock from that cam or crank on the main shaft which drives the said stock, by means of a pinion interposed between the connecting rod and the needle stock, and combining the two by rack-teeth cut on each, and meshing into said pinion, whereby I am enabled to impart to the needle-stock the precise motions of said cam or crank as set forth.

Second. I claim setting the feed wheel, or other feeding mechanism, and the shuttle race, in such position beneath the sewing table, that the direction in which the materials will be fed and sewed shall be in a line parallel with the bracket arm, and toward or into the bight formed by said arm and the table as set forth.

Third. I claim the herein described apparatus for giving out and taking up the slack of the thread, consisting of a partially revolving crank or arm, placed and operating substantially as set forth.

No. 23,578.—W. T. HILDRUP, of Harrisburg, Pa.—*Improvement in Rotary Harrows.*—Patent dated April 12, 1859.—D D are bars, which are pivoted to ears on the lower extremities of the sleeves B B at one end, and to cars on the rear of draft bar at the other. E E are bars which are pivoted to ears near the top of the sleeves and to a piece F which slides freely upon the draft bar C. I I are braces which are secured to the top of the sleeves at one end and to the collar H at the other.

*Claim.*—The arrangement of the bars E E, sliding-piece F and braces I I, draft bar C, substantially in the manner specified, for the purpose of giving two or more harrows a self-adjusting movement, to or from each other, as is fully set forth.

No. 23,579.—SAMUEL A. HILL and DAVID ALTER, of Freeport, Pa.—*Improvement in Lamps.*—Patent dated April 12, 1859.—This invention consists in placing a semi-cylindrical cap E over the top of the wick tube C, said cap having a plate or strip F placed concentrically within it but at a certain distance from it, to allow a suitable space between the cap and strip, both the cap and strip being slotted longitudinally and directly over the wick tube.

The inventors say: We do not claim separately the cap E, nor any portion of the choice covered by the patent granted to P. Plant, April 6, 1858, but we *claim* the arrangement and combination of the strip F within the cap E, as and for the purpose shown and described.

No. 23,580.—W. C. HOLMES, of Barnesville, Ga.—*Improvement in Ploughs.*—Patent dated April 12, 1859.—The interior limb of each beam *a a* is bent up at right angles inwardly, *b*

forming an adjustable brace by being attached; *d* is a hook to be attached when it is wished to change the double into a single stock; *f* is an attached seed dropper, of which *g* is a block through which the axle passes.

The inventor says: I *claim* the arrangement of the double beams *a a*, hook *d*, cross adjustable braces *b* and *c*, shanks *k*, and braces *m*, the whole being constructed in the manner described for the purpose specified.

I also claim, in combination with the above, the seed-dropper *f*, constructed for operation conjointly, as set forth.

No. 23,581.—WILLIAM R. JACKSON, of Baltimore, Md.—*Improved Railroad Car Seat and Couch*.—Patent dated April 12, 1859.—The nature of this invention will be understood by reference to the claim and engraving.

*Claim*.—The method described, of constructing the ordinary reversible seats of railroad cars, so that the backs can be brought down into line with the bottoms; but this I only claim when the backs, when so brought down, occupy the positions previously occupied by the bottoms, and the bottoms are used to fill the intermediate spaces between them, substantially as described and shown.

No. 23,582.—WILLIAM B. JOHNS, of the United States Army.—*Improvement in Knapsacks*.—Patent dated April 12, 1859.—The nature of this invention will be understood by reference to the claim and engraving.

*Claim*.—The construction of knapsacks, so as to be entirely separated from their slings, and with the means of uniting several of them together, and stitching them as described, so that the knapsack will perform the double function of sheltering the soldier and holding his kit, substantially as specified.

No. 23,583.—HENRY JOHNSON, of Washington, D. C.—*Improvement in Burners for Vapor Lamps*.—Patent dated April 12, 1859.—*b* is the packing box screwing upon the pipe *c*, *b*<sup>1</sup> the cotton packing passing around key *a* and held in place by screw box *b* pressing it up against pipe *c* and key *a*; *c* is the fluid pipe, and serves as case or nut to screw key *a*; *g* the burner; *h* the gas pipe leading from the generator *i* to the burner. The generator is cast solid, and then has cylinders or cavities *n o l* drilled in it.

*Claim*.—The generator *i*, burner *g*, and packing box *b*, constructed substantially as described, in combination with gas pipe *h* and fluid pipe *f*, arranged and operating substantially as described, and for the purposes set forth.

No. 23,584.—ISAAC G. JOHNSON, of Spuyten Duyvil, N. Y.—*Improvement in Stove Covers*.—Patent dated April 12, 1859.—The object of this invention is to prevent the warping and destruction of the small centre pieces between the boiler holes in the top plates of cooking stoves and ranges. It consists in constructing the centre piece, shown at *a*, of malleable cast-iron.

*Claim*.—The said centre piece, constructed of malleable cast-iron, as an article of manufacture, as specified.

No. 23,585.—WILLIAM JOHNSON, of Hampstead, N. H.—*Improvement in Machines for Chamfering Soles of Boots and Shoes*.—Patent dated April 12, 1859.—This tool is composed of a knife holder *A*, a stationary edge bearer *B*, a sole rest *C*, spring presser *D*, and a knife *E*; the said knife being provided with a handle *h*, and inserted with the knife holder and held in place therein by a screw *a*.

*Claim*.—The improved chamfering tool, or manufacture, as constructed with its sole rest and presser, arranged with respect to the carrier *f*, and the knife holder, substantially as shown in the drawings, and as specified.

No. 23,586.—WILLIAM KEGG, of Lassellville, N. Y.—*Improved Mortising Machine*.—Patent dated April 12, 1859.—The nature of this invention will be understood by reference to the claim and engravings.

The inventor says: I *claim* the method of feeding along the work, as specified, consisting, essentially, of the feeding wedge or wedges *M M*, combined with the arms or projections *N N*, sliding bolts *O O*, and adjustable cams *P P*, and arranged in connection with the feeding table *G*, frame *A*, and sliding frame *B*, substantially in the manner described.

I also claim the adjustable stops *Q Q* and notches *m m*, in the wedges *M M*, with their suspending hooks or staples *n n*, arranged as described, in combination with the feeding apparatus, for the purpose set forth.

I also claim the combination of the double scale *d*, on the face of the feeding table *G*, with the movable or adjustable pointer *f* in the bed piece *E*, arranged and operating in the manner and for the purposes specified.

I also claim the supporting index standard *F*, in combination with the scale *g* and arrangement *a a b c*, for adjusting the bed piece of the feeding table in position, and securing it in place, substantially as described.

I also claim the "keytenon," T fitting into the oblique groove *v*, in the bottom of the feeding table G, for the purpose of properly securing and tightening the said table on the bed piece E, while at the same time the desired freedom of its motion is allowed, substantially as set forth.

No. 23,587.—GILBERT J. KINGSBURY, of Rochester, N. Y.—*Improvement in Stoves*.—Patent dated April 12, 1859.—The coal is fed into the feeding cylinder D through the side door E, where it descends the inclined plane *m* and falls on the bottom grate F, on which the fire is kindled. The door E being closed, air is supplied through the opening *i* to the ash chamber H, the draft ascending through the coal and through the spaces *b* of the side grate, and thence around cylinder D to the top of the stove, where the products of combustion escape through the pipe G.

*Claim*.—Constructing the fire pot or furnace B so that a portion thereof is flaring or funnel shaped, yet having side grates or bars, with perpendicular faces *a* and flame passages *b*, with air tubes and jets *i o* and grate cap C, when combined with the interior feeding cylinder D; the whole arranged and operating substantially in the manner and for the purpose shown and described.

No. 23,588.—SAMUEL LAMON and W. S. GASKILL, of Van Wert, Ohio.—*Improved Device for Heating Feed Water of Steam Boilers*.—Patent dated April 12, 1859.—This invention consists in introducing the exhaust steam of an engine into a cylindrical vessel, provided with spiral water passages around it in a perpendicular way, and through which the water is introduced in a very circuitous manner into the boiler, and exposed to the steam during the passage through said cylinder, so as to become heated thereby.

*Claim*.—The cylinder or other suitable vessel A, provided with the induction and eduction exhaust steam pipes B C, and the spiral or helical feed water passages E, arranged substantially as and for the purpose set forth.

No. 23,589.—A. B. LATTA, of Cincinnati, Ohio.—*Improvement in Steam Generators*.—Patent dated April 12, 1859.—This invention consists of a curved cast-iron pipe A, provided in the middle with a mouth piece B for the reception of the end of the main coil or pipe, on the latter of which is cut a male screw, which enters a female screw thread *b*, cut in the end of the mouth B of the dividing piece. Through the middle of the curved pipe A, opposite the centre of the mouth piece B, and leading into it, is fitted securely a partition D, which divides the pipe into two branches.

*Claim*.—The method of regulating the circulation of water through the division coils, by means of a dividing piece A, constructed in the manner and for the purposes substantially as set forth.

No. 23,590.—RICHARD S. LAWRENCE, of Hartford, Conn.—*Improvement in Self Priming Gunlocks*.—Patent dated April 12, 1859.—This invention is an improvement in the introduction of the pellets into the tube or magazine provided for them in the lock plate, and provision is made for shutting them off to permit the use of common percussion caps in the ordinary manner when desired, and to prevent the pellets from interfering with or being interfered with by the movements of the hammer, when desired to operate the hammer, without delivering the pellets.

The inventor says: I *claim*, first, the "shut-off" *g*, constructed, applied, and operating substantially as and for the purposes specified.

Second Constructing the driver with its rear portion about double the thickness of the pellets, and with the wedge like bevel *11* and the groove *12*, substantially as and for the purpose described.

Third. The combination of the downwardly extending tooth *20* of the cover spring, and the notches *17* and *18* in the shut-off, and *k* in the lock plate, substantially as and for the purpose set forth.

No. 23,591.—HENRY LOCKWOOD, of New York, N. Y.—*Improved Alarm Lock*.—Patent dated April 12, 1859.—This invention consists in having both the latch and bolt of the lock connected with the hammer of the bell in such a manner that an alarm will be sounded by operating either the latch or the bolt.

The inventor says: I *claim*, first, the bar L, provided with the buttons *e e*, connected with the hammer rod D, and arranged with the latch E and bolt J, provided with projections *g h*, substantially as and for the purpose set forth.

Second. The movable or adjustable plate or disk M, arranged with the key-holes *j k k*, and provided with projections *j<sup>1</sup>*, to act on the button *i* of the bar L, substantially as and for the purpose set forth.

Third. The combination of the plate or desk M and bar L, when arranged with the latch E and bolt J, to operate as described.

No. 23,592.—GILDEROY LORD, of Watertown, N. Y.—*Improvement in Harvesters*—Patent dated April 12, 1859.—The nature of this invention consists in so constructing the rake head, and arranging it relatively to an endless belt O, and to a tripping foot or hand lever Q, that the rake will be when at the near side of the platform A, and in a horizontal position, out of gear with the belt, and in gear with the foot lever, and remain so until the proper quantity of grain is cut and deposited on the platform.

The inventor says: I *claim*, first, the rake head, constructed as described, in combination with the endless belt O, and tripping foot or hand lever *q m*, substantially as and for the purposes set forth.

Second. The combination of the ledge L<sup>1</sup> with the spring catch L of the rake head, arranged substantially as and for the purposes set forth.

No. 23,593.—EDWARD LYNCH, of Washington, D. C.—*Improvement in Steam Boilers*.—Patent dated April 12, 1859.—The claim and engraving will explain the nature of this invention.

*Claim*.—Circulating the water and aiding the generating of steam in the main boilers of ocean steamers, by passing the steam from the steam space of an auxiliary boiler into the water of the water space, below the ash pit of the main boilers, as set forth.

No. 23,594.—EDWARD LYNCH, of Washington, D. C.—*Improvement in Steam Engines*.—Patent dated April 12, 1859.—This improvement is upon the geared engine, and is designed to drive a propeller with high speed. The invention is one of arrangement of the various parts of an engine in relation to each other, by which a very compact and efficient engine of easy access can be placed entirely below the water line of the vessel. This improvement may be used with a jet condenser or as a non-condensing engine.

The inventor says: I *claim*, first, the arrangement of the several parts of the engine, in their relation to each other and to the propeller shaft, set forth.

Second. I claim constructing the connecting rod of one of the cranks or cross heads, in the manner described, so as to allow of its surrounding the propeller shaft, as described.

No. 23,595.—HENRY MARTIN, of Louisville, Ky.—*Improved Folding Life Boat*.—Patent dated April 12, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—The described arrangement of the ribs, one half of which fold towards one, and the other half towards the other side, in combination with the hinged bottom boards D, which, by means of slots *e*<sup>1</sup>, secure the ribs in an upright position, and which are provided with seats E, which are hinged to the bottom boards by means of rods *d*, and which are connected by the dovetailed projections *d*<sup>1</sup>, the whole being constructed and operated substantially as and for the purpose set forth.

No. 23,596.—JONATHAN M. MATTHEWS, of New York, N. Y.—*Improvement in Carpet Bags*.—Patent dated April 12, 1859.—At the centre of the upper part of one of the frames A, a lock D is placed. This lock secures the upper ends or parts of the frames A B together, and at each side of the frames there is a catch E. This catch secures the sides of the frames together, preventing them from springing out.

*Claim*.—The combination of the two frames A B, with the catches E E, substantially as and for the purpose specified.

No. 23,597.—JOSEPH W. MAUTERSTOCK, of New York, N. Y.—*Improvement in Metallic Laths*.—Patent dated April 12, 1859.—The parts *b b*<sup>1</sup> *b*<sup>1</sup>, of the plates formed between the slits *a a*<sup>1</sup> *a*<sup>1</sup>, are made into a double series of ridges and furrows, by raising one strip in an angular or curved form and depressing the next one in the same row through the series.

*Claim*.—As an improved article of manufacture a metallic lathing, composed of plates, provided with slits, ridges, and furrows, as shown and described.

No. 23,598.—JAMES MONTGOMERY, of Baltimore, Md.—*Improved Screw Propeller*.—Patent dated April 12, 1859.—A is the shaft of the propeller, B B are helical blades, act separately, and each formed with a segmental flange *b*, which flange is made to clasp the shaft and are secured firmly by bands D, so as to form the hub of the screw. C is a cylindrical casing surrounding the periphery of the blades, and firmly attached thereto by tenons *c*.

*Claim*.—A screw propeller, composed of a plurality of blades attached to their shaft, in one frame, or nearly so, when surrounded by a containing cylinder firmly attached to the peripheries of the said blades, substantially in the manner and for the purpose set forth.

No. 23,599.—RICHARD MONTGOMERY, of New York, N. Y.—*Improved Machine for Corrugating Metal Plates*.—Patent dated April 12, 1859.—The claim and engraving will explain the nature of this invention.

The inventor says: I *claim*, first, feeding the sheets, or plates of metal, at the proper time, by a feeding device, constructed and operated substantially as described.

Second. The feeding device above described, in combination with the adjusting pins, on the first set of corrugating rolls, as set forth.

Third. The combination of two sets of corrugating side guides *h h*, constructed, arranged, and operated, substantially as shown and described.

Fourth. I also claim the corrugated sweeping and forming roll *w*, constructed and used as and for the purposes described.

No. 23,600.—THOMAS W. H. MOSELY, of Cincinnati, Ohio.—*Improvement in Attaching Iron Roofing*.—Patent dated April 12, 1859.—The nature of this invention will be understood by reference to the claim and engraving.

The inventor says: I *claim*, first, securing the metallic roofing to the ribs, or purlins, so that it may slide or move freely upon and in the direction of the length of the purlins, substantially as set forth.

Second. I claim securing the purlins to the rafters of the building, so that they may have freedom of motion in the direction of their length, substantially as set forth.

Third. I claim the combination of the chairs *c*, double flanged rail *e*, anchors *n*, and metallic roofing *m*, as set forth.

No. 23,601.—E. P. NEEDHAM, of New York, N. Y.—*Improvement in Reed Musical Instruments*.—Patent dated April 12, 1859.—The nature of this invention will be understood by reference to the claim and engraving.

The inventor says: I *claim*, first, applying and arranging two or more actions, one above another, above the rear portion of the key board of a harmonium, or other reed instrument, in such a manner, substantially as described, that one or more of such actions may be removed at any time, and any one be exposed for repair or other purpose.

Second. In combination with the so arranged actions, I claim the passages *e e*, and upright passage *f*, arranged as described to combine the said actions with the bellows.

Third. Combining the several valves, or two or more of them, with the key, by a system of push pins, or other equivalent direct connection from one valve to another, substantially as described.

Fourth. The sound board *g*, applied to constitute the back of the wind passage *f*, substantially as described.

No. 23,602.—JOHN F. PAGE, of Philadelphia, Pa.—*Improvement in Spark Arresters*.—Patent dated April 12, 1859.—This invention consists in a casing *B*, having a number of openings *d* at the side, and a deflecting plate *h* attached to the upper edge of each opening, said casing being arranged in respect to the chimney *c*, the deflector *G* above the same, and the exterior casing *A* of a spark arrester, so as to afford means of readily disposing of the sparks, and allow the escape of steam and products of combustion.

*Claim*.—The intermediate casing *B*, with its openings *d*, and deflecting plates *h*, when arranged in respect to the chimney *c*, the deflector *G*, and the outer casing *A*, substantially as and for the purpose set forth.

No. 23,603.—JAMES B. PARISH, of Cleveland, Ohio.—*Improvement in Coffee Pots*.—Patent dated April 12, 1859.—The ground coffee is put into the body of the pot, and boiling water poured upon it. The condensing cup *C* is then placed upon it, and filled nearly to the top of the spiral tube *F*, with cold water, and the valve cover *E* introduced. In boiling the coffee, the aroma will be condensed in passing along the spiral tube *F*, and will flow back into the body of the coffee pot.

*Claim*.—The fluid valve cover *E*, as arranged with the cup *C*, and the helical condensing tube *F*, all operating in the manner and for the purposes set forth.

No. 23,604.—FREDERICK C. PAYNE and ALFRED REID, of New York, N. Y.—*Improved Wardrobe*.—Patent dated April 12, 1859.—The nature of this invention consists in so constructing a secretary or wardrobe as that it shall possess the combined advantages of both and a toilet accommodation; and also, by bringing one end thereof forward, either to the right or left, so that one end shall be in parallel line with the wall of the room, a bed arrangement may then be produced from the back thereof.

The inventors say: We *claim* the combined arrangement with a secretary or wardrobe, of a bed in the back thereof, substantially in the manner and for the purpose described.

Also, the arrangement of the brackets *L*, board *M*, for the twofold purpose of folding compactly, to hold the clothes in place, the folding legs *K*, the pulleys *P*, the cord *R*, weight *S*, as and for the purpose described.

No. 23,605.—AUGUSTUS H. PHELPS, of Trenton, Mich.—*Improved Water Cooler*.—Patent dated April 12, 1859.—The nature of this invention consists in having the substance to be cooled separate from the cooling compound, and protection of the faucet from the action of cold, by being surrounded by an air chamber *D*.

The inventor says: I *claim* the arrangement or combination of the tank C, the refrigerator B, and nonconducting chamber or casing.

I also claim, in combination with the preceding, the air chamber D, surrounding the faucet; all the parts arranged substantially as and for the purpose described.

No. 23,606.—LEONARD L. POLLARD, of Worcester, Mass.—*Improvement in Treeing Sticks*.—Patent dated April 12, 1859.—The handle B is made with projecting nibs or studs *o o*, and in each end of A are cavities to receive these nibs; to the handle B the rod *c* is firmly attached, and passes through A and the other handle, and has a screw on its end, on which a nut fits, which holds all together.

*Claim*.—As a new article of manufacture, the described treeing stick, when constructed and operating in the manner and for the purposes set forth.

No. 23,607.—ROBERT RAMSEY, of New Wilmington, Pa.—*Improved Clothes Frame*.—Patent dated April 12, 1859.—The nature of this invention consists in constructing an adjustable clothes horse in a single column, with arms, as shown in the drawing, which is a perspective view of the clothes horse partly closed.

*Claim*.—The combination and arrangement of the standard and the arms, with the bolts, washers, and springs, substantially as and for the purpose specified.

No. 23,608.—HENRY RIEMAN, JR., of Rogersville, Ind.—*Improvement in the Mode of Applying Power for Extracting Stumps and Raising Heavy Weights*.—Patent dated April 12, 1859.—The nature of this invention will be understood by reference to the claim and engraving.

The inventor says: I *claim*, first, the described combination with the worm shaft F and spur wheel E, the arrangement and application of the movable pillow block M, and wedge L, to hold the said spur wheel firmly in position, or admit of its being readily thrown out of gear, as set forth.

Second. I claim the adjustable supports N and Q, adapted in the manner set forth, to sustain the machine on wheels, to convey it from place to place, permitting its deposit on the ground while in operation.

No. 23,609.—D. F. ROBBINS and SIMEON MORRISON, of DeWitt, Ill.—*Improvement in Mole Ploughs*.—Patent dated April 12, 1859.—This invention relates to the manner of forming the plough beam A, and uniting thereto the sledge C, and drag bar E, by which the plough is directed and managed so as to bring the whole contrivance within the management of the operator.

The inventors say: We *claim*, first, making the beam of a mole plough in two parts, united by a horizontal joint, to give it lateral adjustment, substantially as described.

We also claim connecting the drag (which supports, and upon which the point of the beam is made adjustable, vertically,) to the rear portion of the beam, by a hinged joint or connection, so that the raising or lowering of the point of the plough beam shall not affect the drag, substantially as described.

No. 23,610.—A. J. ROBISON, of Gypsum, N. Y.—*Improvement in Dirt Scrapers*.—Patent dated April 12, 1859.—The nature of this invention consists in an improved means for emptying or unloading the scraper after it has been filled in the usual manner.

*Claim*.—The combination of the cam plate P with the spring bar A, for consecutively releasing and retaining the scraper in position, as shown, the whole being arranged in the manner and for the purpose substantially as described.

No. 23,611.—JOHN S. ROWELL, DE WITT C. FELTER, and MICHAEL LOWTH, of Beaver Dam, Wis.—*Improvement in Water Wheels*.—Patent dated April 12, 1859.—The principal feature of this invention consists in the combination of a series of curved guides G G, with the buckets D D D of a water wheel E H, whereby the guides and buckets revolve together, and the former receive the first action or direct impulse of the water, while they are serving the office of conducting the same in a collected body down upon the latter, in a manner to secure its full effect before it escapes, and by this means increase the power of the wheel.

The inventors say: We *claim*, first, the combination of a series of curved guides G G, with the buckets of a water wheel E H, in the manner specified and for the purposes set forth.

Second. Having the guides curved and fitted to a hub of a wheel, and arranged on a rising and falling governor or spring, regulated capping plate I, so as to overhang the buckets and extend down, more or less, over the discharging orifices of the same, as specified and for the purposes set forth.

No. 23,612.—MARK RUNKEL, of New York, N. Y.—*Improved Oscillating Engine*.—Patent dated April 12, 1859.—This invention consists in giving an oscillating motion to a piston, which works in a stationary shell B, on the principle of a rotary engine, the steam being admitted alternately on one side or on the other of an abutment *c*, which is rigidly attached to the shell, and which is so arranged by means of some kind of packing inserted in its lower

edge that it works steam tight against the upper surface of the piston, which, in its turn, is provided with two projections *d*, one on each side of the abutment, which work steam tight against the sides of the shell, being open at both ends.

*Claim.*—The segment *D*, with the projections *d*, in combination with the shell *B* and the abutment *c*, or its equivalent, arranged substantially as and for the purpose specified.

No. 23,613.—HIRAM H. SCOVILLE, of Syracuse, N. Y.—*Improvement in Harvesters.*—Patent dated April 12, 1859.—The nature of this invention consists in the method of operating the rake of harvesting machines by the combined action of a propelling crank *E* and stationary cam *F*, and in the method of separating the grain on the platform *B* from that which is falling by suspending an apron in front of the rake.

The inventor says: I do not claim the use of a bow or canvas attached to the back of a rake; but what I *claim* as my invention and desire to secure by letters patent is, the arrangement of the propelling crank *E* and stationary cam *F* with respect to the rake bar and universal joint, when the same are constructed and operated in the manner and for the purposes set forth.

I also claim suspending a swinging apron from a frame work over the platform and in front of the rake, the same being constructed and operating substantially in the manner and for the purpose set forth.

No. 23,614.—WINTHROP D. SHAW, of Farnworth, N. H.—*Improved Machine for Splitting Shoe Pegs from the Block.*—Patent dated April 12, 1859.—The claim and engravings will explain the nature of this invention.

*Claim.*—The feed-roller *I*, in connection with the two reciprocating or vibrating knives *G* *H*, the latter being so operated that one will move slightly in advance of the other, so that the cuts will be given to the block successively and still admit of the proper feeding of the block *M* to the knives; the feed-roller being operated by the pawl *n*, rendered adjustable by the attachment of the bent lever *O* to the adjustable bar *K*, the whole being combined and operating substantially as and for the purpose set forth.

No. 23,615.—D. H. SHIRLEY, of Boston, Mass.—*Improvement in Skates.*—Patent dated April 12, 1859.—The nature of this invention will be understood by reference to the claim and engraving.

*Claim.*—A sliding heel-piece or clamp, susceptible of being moved forward and back, and fastened at any desired point, in such a manner that, the toe of the boot or shoe being held by a suitable toe-piece or longitudinal binding, force can be brought to bear upon or relieved from the foot, as set forth.

No. 23,616.—ISAAC C. SHULER, of Amsterdam, N. Y.—*Improvement in Metallic Coffins.*—Patent dated April 12, 1859.—The claim and engraving will explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of fastening the flange or lower ends of the walls of a sheet-metal coffin in a tray or pan *c*, forming the bottom, and exceeding the circumference of the walls, by a narrow chamber *m*, which may be filled with molten metal for stiffening the base; also, the strengthening bars *l* for stiffening the bottom of this tray, substantially as described.

Second. The arrangement of scrolling or doubling over the flush lower edges of the walls of a sheet-metal coffin, soldering, consecutively, each fold of the sheet-metal, thus making a solid rim or flange of any required thickness, for the purpose of strengthening the base, substantially as described.

Third. The arrangement of placing on the outside of the walls, even with the upper edge and extending downward any required distance, according to the size of the coffin, a sheet-metal rim *f*, which may be filled with the molten metal, for the purpose of strengthening and keeping in shape the upper edges of the walls of a sheet-metal coffin, substantially as described.

Fourth. I disclaim an entire frame for covering the joint of the air-tight lid of a sheet-metal coffin with the coffin walls; I also disclaim any bisected sliding cover; these being claimed elsewhere. But I claim the hinged lids *i*, as applied to the joint in different sections, for the purpose of allowing a greater number of ornamental breaks in the coffin walls, substantially as described.

Fifth. The frame *n* for the support of the coffin handles.

No. 23,617.—HENRY SIMON, of Providence, R. I.—*Improved Fastening for Shirt Studs.*—Patent dated April 12, 1859.—This invention consists in arranging at the under side of a shirt stud four arms *b e*, which are united by pivots in such a manner that they can be compressed so as to pass readily through the button hole of a shirt, and that the same, after they have been passed through the button hole, may be brought in a position parallel with the side of the shirt, in which position the arms form a toggle joint, so that any pressure exerted on the outer ends of the arms tends to lock the same more firmly.

*Claim.*—Shirt studs A arranged with arms *b* and *c*, to operate substantially in the manner and for the purpose specified.

No. 23,618.—JOHN SMALLEY, of Bound Brook, N. J.—*Improvement in Harvesters.*—Patent dated April 12, 1859.—The nature of this invention will be understood by reference to the claim and engravings.

The inventor says: I *claim*, first, the combination of the seats Y Z, one of which is movable, as described, with the seat frame *b b*, elliptical springs X X X<sup>1</sup> X<sup>1</sup>, and main frame of the machine, the whole being arranged substantially as described and shown, and for the purposes set forth.

Second. Constructing the outer piece *c*<sup>1</sup> in the peculiar manner above described, viz: with two or more sockets *a*<sup>2</sup>, in combination with the caster supporting hub 3 and extension piece *x*<sup>2</sup>, for the purposes set forth.

Third. The neck I, in combination with collars J, groove H, standard J<sup>1</sup>, and lever *d*, arranged substantially as shown and described, for the purpose of throwing the gearing in and out of action, as set forth.

Fourth. Supporting the reel arms by means of the peculiarly constructed hub *w*, as shown and described.

No. 23,619.—HORACE W. SMITH, of Hartford, Conn.—*Improvement in Cocks for Water Basins.*—Patent dated April 12, 1859.—The nozzle A is attached to the spindle B, which passes down inside of the spindle guide C and through the stuffing box and ring D and spring E, where is formed a square terminus G, to receive the cam H, which is made to slide, when in operation, to actuate the valve I. Above the cam H is the spring E, which presses against the packing ring D and the cam H, to compensate for the wear of the cam and the compression of the packing on the valve I.

*Claim.*—The employment of the spring E and the grooved and bevel face cam H, when acting in combination as and for the purpose described.

No. 23,620.—JAMES S. SMITH, of New York, N. Y.—*Improvement in Epaulettes.*—Patent dated April 12, 1859.—To the underpart of the shell A are attached permanently by soldering two small metallic straps *a a* and a small staple or eye *b*, the former being attached at each of their extremities so as to leave room between them and the shell, to receive the ends of the adjuster B. This adjuster consists of a strip of metal of rectangular form in its transverse section, and of a form to conform longitudinally to and be received within and covered by the outer margin of the shell.

*Claim.*—The arrangement and combination of the adjuster B, fringe C, and shell A, substantially as and for the purpose shown and described.

No. 23,621.—PHILIP SMITH, of Fall River, Mass.—*Improvement in Grates.*—Patent dated April 12, 1859.—This invention consists in hanging the lower part of the front part of the grate on pivots, so far below the top that when the bottom is swung out to form an opening for the removal of unburnt coal, cinders, or stones, it will carry the top of their plate in and press the upper plate L so hard against the burning coal that it will hold it up while the cinders, &c., are removed from under it; and in arranging the upper inner front plate to vibrate so as to be pressed against the burning coal by the vibration of the lower plate, and hold up said coal while the combustible matter below it is removed. Also, in making the front frame and front plate in separate pieces, so that they may shrink and swell with freedom, without straining any of the parts which compose them.

The inventor says: I *claim* hanging the front plate G on pivots arranged so far below the top that, when the bottom is swung out, it will carry in its top, and operate the inner upper plate L, as described, for the purposes set forth.

I claim arranging the plate L to vibrate substantially as described for the purposes set forth.

I claim the plates H and H<sup>1</sup>, constructed and arranged substantially as described.

I also claim making the plate L in separate pieces, fitted together, substantially in the manner described.

No. 23,622.—PHILO P. STEWART, of Troy, N. Y.—*Improvement in Stoves.*—Patent dated April 12, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim* the method, substantially as described, of preventing the heat from striking through to the rising flue leading to the chimney by separating it from the back oven plate and from the two descending flues by non-conducting partitions, or the equivalent thereof, as described and for the purpose set forth.

I also claim, in combination with the flue above the oven, and with the rising flue leading to the chimney, the employment of a double damper filled in with cement, or other equivalent non-conducting material, substantially as described, to prevent the heat from striking through from the top flue to the rising flue, as set forth.

And I also claim separating the direct flue under the oven from the return flue below by

means of a plate lined with cement, or rendered non-conducting by equivalent means, substantially as described, to prevent the heat from striking through to the return flue, and thereby impart greater heat to the bottom of the oven, as set forth.

No. 23,623.—AMASA STONE, of Philadelphia, Pa.—*Improvement in Tools for Forming Lugs in the Mouths of Bottles and Jars.*—Patent dated April 12, 1859.—This invention consists in making a portion of the spindle C, which forms the interior or orifice K of the bottle nose to turn freely, while the other portion is held stationary; both portions being provided with corresponding scores H and L for each of the lugs to be made, the score in the rotating part of the spindle forming the lugs, and the scores in the stationary part allowing the lugs formed from the rotating part after the orifice and lugs have been formed and completed.

The inventor says: I *claim* making one part of the spindle which forms the orifice of the jug or bottle to turn freely, substantially as described, while the other part remains stationary in the nose of the bottle.

I claim making one, two, or more scores in that part of the spindle that turns freely, in combination with the corresponding score or scores in that part of the spindle which is stationary, and which aid in forming the orifice in the jug or bottle nose, substantially as described.

No. 23,624.—DAVID STUART, of Philadelphia, Pa.—*Improvement in Stoves.*—Patent dated April 12, 1859.—The claim and engraving will explain the nature of this invention.

The inventor says: I *claim* the distributing chamber or discharging pipe *r*, formed with a central projection *q*, and supplied with heated air from the grate front through pipes *h*, as set forth.

I claim the discharge pipe *z*, located under the oven, and supplied from the grate front by pipes *k*, as set forth.

I claim dividing the grate front horizontally into two series of heating chambers, as set forth.

No. 23,625.—PHILO P. STEWART, of Troy, N. Y.—*Improvement in Cover Lifters in Cooking Stoves.*—Patent dated April 12, 1859.—A hole bored through the handle *b* allows the fitting into it of the stem or prolongation *a* and the two parts are securely affixed to each other by one or two blows of a hammer upon the end of the stem.

*Claim.*—The lifter, made up of malleable cast iron and wood, as set forth.

No. 23,626.—R. H. TUCKER, Jr., of New York, N. Y.—*Improvement in the Construction of Navigable Vessels.*—Patented in England, December 10, 1857; Patent dated April 12, 1859.—C is an air chamber in the stern D D of the vessel, from which air (which constitutes the propelling medium) is forced out upon the water astern, the bottom of which chamber is flush with the bottom of the vessel; *a a* is an opening through which the air is expelled from the chamber C to drive the vessel ahead, said opening extending across the stern, from the bottom to such a height that it will always be submerged, or below the level of the water outside of the vessel.

*Claim.*—The construction of navigable vessels in the form of isosceles triangles, with vertical sides and flat bottom, the base for that side of the triangular figure which terminates in the two equal angles constitute the stern, in combination with the air chamber, constructed substantially as and for the purpose described.

No. 23,627.—S. M. WADE, of Andover, Ohio.—*Improvement in Rotary Harrows.*—Patent dated April 12, 1859.—The pin I, which forms the joint I<sup>1</sup>, is connected with the bar K. At the opposite end of the bar is another pin L, corresponding to I. From the bar K extends an arm M, at right angles thereto, and to the end of this arm is connected a fork N. This clutch grasps one of the draw bars E<sup>1</sup> when the two harrows are brought together with the teeth inward. In this position the harrows are secured together, by having the arms E<sup>1</sup> above the axle D; then the pins I L are inserted through the eyes in the ends of the arms E, at the same time the arm M depends along the side of the drawbar with the clutch or fork N.

The inventor says: I *claim* the bar K, provided with the arm M, clutch N, and pins L, in combination with the angular drawbars and double harrows, in the manner and for the purpose described.

I also claim the rod O, arms Q, and rollers P, in combination with the angular drawbars and double harrows, when arranged in the manner and for the purpose set forth.

No. 23,628.—PAUL WAGNER, of Buffalo, N. Y.—*Improvement in Water Wheels.*—Patent dated April 12, 1859.—D are the buckets of the wheel. They are arranged on the cylinder or drum E. Their lower edges are radial and their upper edges tangential to the cylinder E. G are the discharge vents, and are formed by a number of inclined planes or buckets arranged around a cylinder H, equal in size to the cylinder E.

*Claim.*—The combination of the buckets D, arranged on the cylinder E, as described, and the stationary inclined planes or buckets G, arranged with reference to the cylinder H and

buckets D, as described, the whole being inclosed by the case A, substantially as and for the purposes set forth.

No. 23,629.—ELIJAH WARE, of South Boston, Mass.—*Improvement in Valve Gear for Steam Engines.*—Patent dated April 12, 1859.—This invention consists in connecting the eccentric rod H with the valve rock shaft G, for the purpose of enabling the stroke of the valve to be varied to change the point of cutting off the steam from the cylinder of an engine; also, in a novel combination of mechanism, through whose agency the operating of the slide or valve employed in a steam engine is effected by means of a single eccentric, which is made to work the valves for running the engine, in either direction, and to vary the movement of the valve for cutting off the steam at different points in the stroke of the engine.

The inventor says: I *claim* combining the eccentric rod with the valve rock shaft G or its equivalent, by means of the lever I, with its two arc formed slots *d e* and the movable pins *f g*, the whole applied and operating substantially as and for the purpose specified.

And I also claim the combination with the double slotted lever I, and its movable pins *f g*, of the levers Q V, rods *m U*, levers M N and T, secondary lever O, pinion *u*, toothed arc S, and rods L P, the whole applied and operating substantially as and for the purpose described.

No. 23,630.—MOSES D. WELLS, of Morgantown, Va.—*Improvement in Seeding Machines.*—Patent dated April 12, 1859.—The bar B rests on a series of guides *a a*, which run on the bottom of the hopper, and, while giving ease of motion, prevent the breaking of the seed which work under the slide. The discharge perforations *b* have an upward rim *i*, the height of the guides *a*, so that when the discharge is through but a portion of them, the seed will not flow from those under the bar.

*Claim.*—The notches of the bar with the series of pins *c* therein, in combination with the guides *a a*, and upward projecting rims of the discharge openings *b*, substantially as set forth.

No. 23,631.—JOSEPH WETHERILL, of Manchester, Conn.—*Improved Quilting Frame.*—Patent dated April 12, 1859.—The upper lining I is first wound around the roll E; the lower lining J is wound around the roll D; and the two edges are brought together and secured to the roll C; the two rolls D E are then turned taught as desirable.

*Claim.*—The employment of the rolls C D E, in combination with the arms F, pawls G, notches H, so that the upper roll E may be lifted when desired, arranged in the manner and for the purpose described.

No. 23,632.—GEORGE J. WIDRIG, of Memphis, Tenn.—*Improvement in Hoop Fastening for Cotton Bales.*—Patent dated April 12, 1859.—The claim and engraving will explain the nature of this invention.

*Claim.*—The combination of the sides A having slots or grooves *e* with the bar B, for the purpose of fastening cotton bales, or other similar substances, by bringing the last end *f* over the bar B, substantially as described and for the purpose specified.

No. 23,633.—JOHN W. WILCOX, of West Roxbury, Mass.—*Improvement in Constructing Electro-plated Rollers.*—Patent dated April 12, 1859.—This invention consists in making rollers for dressing calico, printing, paper making, and other purposes, by winding a ribbon *a* of copper or other metal around a proper support or base, and then coating the surface of the roller with copper by the electro-plating process.

*Claim.*—Covering the shaft, base, or support with a fillet or ribbon of metal, soldered or otherwise secured thereto, and depositing the copper on said surface by electro-plating, substantially as described.

No. 23,634.—RUSSELL WILDMAN, of Danbury, Conn.—*Improvement in Brick Machines.*—Patent dated April 12, 1859.—The hopper *b*<sup>2</sup> is filled and brought over the mould *m*, when the attendant draws the slide cut off *e*<sup>2</sup>, which allows the material to pass into the mould *m*. The hopper *b*<sup>2</sup> vibrates from the mould *m*. With the lever D the arm B is brought forward and closes against the moulding *u* on the underside of cap *j*, thereby locking the arms B and C firmly together. While the arms are brought into line the mould *m* slides upon the head *d*, compressing the block.

The inventor says: The advantages secured by this improvement is the reducing of the friction. I am not confined to any particular form of mould; the one shown, which forms the hollow block, has been long known, and can be seen in Foster's patent, dated July 22, 1856, and also in Buck's patent, dated December 9, 1856; the toggle-power also is common in most kind of presses; also the slide cut off in the feed may be seen in Isaac Harman's patent, dated August 12, 1856. Therefore I disclaim the above described parts separately considered from their connection.

But I *claim*, first, the vibrating arm B when constructed, combined, and operated, substantially as described.

Second. I claim the vibrating feed, when constructed, arranged, and operated, in combination with the mould *m*, substantially as set forth.

No. 23,635.—C. W. WILLIAMS, of Port Jarvis, N. Y.—*Improvement in Gates for Canal Locks*.—Patent dated April 12, 1859.—This invention relates to a novel means employed for opening and closing the gates, and in the manner of hanging them, whereby the usual balance sweeps are dispensed with and the gates allowed to be operated with but little friction, and rendered capable of being closed much tighter than formerly. It also relates to an improved arrangement of means for operating the wickets, whereby both wickets may be operated singly from one and the same crank shaft.

The inventor says: I do not claim, broadly, the employment or use of the balls *g*, for they have been used for similar or analogous purposes.

But I *claim*, first, the rods C C and rack D applied to the gates B B, for the purpose set forth.

Second. Having the journals *c* of the gates fitted in oblong slots *d* of the pulleys *e*, which are placed in suitable bearings or boxes *f*, and arranged substantially as shown, to admit of the sagging of the gates, and the close fitting of the same when shut, for the purpose specified.

Third. Securing the bearings or boxes *f* to the lock A by means of the rods *h*, the boxes being attached to slides *i*, and arranged substantially as shown, so that the boxes may be adjusted as occasion may require.

Fourth. Operating the wickets H H by means of the gearing, arranged as described, whereby either wicket may be operated from one and the same crank-shaft *q*.

No. 23,636.—W. H. WILSON, of Summerfield, Ohio.—*Improvement in Ploughs*—Patent dated April 12, 1859.—This plough may be regulated by a clevis to run any depth required. The gradual rise of the wings W and shape of the mould board M lift the soil and mellow it, leaving the ground in a better condition for the growth of corn and vegetables than the ordinary plough.

*Claim*.—The arrangement of the sub-soil shovel W, the common shovel M, coulter C, and brace A, the whole being constructed as described for the purpose set forth.

No. 23,637.—C. WINTER, of Piqua, Ohio.—*Improved Adding Machine*.—Patent dated April 12, 1859.—The inventor says: In the operation of this machine we will suppose we have three columns of figures, as follows:  $\begin{array}{r} 846 \\ 573 \\ 291 \end{array}$  which figures are to be added up and their sum obtained.

We will commence adding at the right hand column. The hand *a* on dial B will stand at the 100 mark, and the hand *b* on dial C will stand at the mark *b*; now the first number in the column to be added is 1, and I place my hand on the key which is marked 1, and press it down as far as it will go in opening L; by pressing down the key 1, the lever D to which it is attached presses upon the frame E E<sup>1</sup> and bears it down. When the frame descends the ratchet *z* attached to it turns the wheel K forward just one tooth of said wheel; the movement of wheel *k* operates wheels *j* and *i*, shaft *h* and wheels *m* and *n*, the pulley P moves with shaft *h*, and the cord *o* is wound around it, and the spring in drum J is thus tightened.

The inventor says: I *claim*, first, the arrangement of the lever *c*, spring *d*, shaft *h*, wheels *m n*, and stops *e* and *f*, in the manner set forth and for the purpose specified.

Second. The arrangement of the ratchet-wheel *k*, bevel wheels *j* and *i*, pawls *s* and *z*, cord *o*, and pulley P, in the manner and for the purpose substantially as described

No. 23,638.—WILLIAM ZELLER, of Lebanon county, Pa.—*Improved Mode of Applying and Constructing Horse Power Machines*.—Patent dated April 12, 1859.—The wheel B and the truck F F<sup>1</sup> serve as trucks to the carriage when used for a reaper, but when for a horse power G<sup>2</sup> is detached and the frame turned down, the shaft C is attached to the shaft C<sup>1</sup> at B<sup>2</sup>, the arms A are attached to the outer rim of the driving wheel by the screw bolts *h*<sup>2</sup> *k*<sup>2</sup>. The stays H are also made fast to the arms A and on the rim of the driving wheel by screws D.

*Claim*.—The construction of the horse power machine described, by which it is made to drive a reaping machine or stationary power, when the whole is constructed, arranged, and operated substantially as and for the purpose described.

No. 23,639.—HENRY BELFIELD, of Philadelphia, Pa., assignor to Himself and JUSTICE COX, of the same place.—*Improvement in Hanging Bells*.—Patent dated April 12, 1859.—This invention consists in a lever G, with a spring dog *h*, in combination with a bell crank lever F and hammer H, both levers having springs *n* independent of each other. It also consists in a frame or bracket B, with a projection *b* for holding the bell, and four legs arranged in respect to the levers.

The inventor says: I *claim* the lever G, its spring dog *h*, and spring *f*, in combination with the bell crank lever F, its hammer H, and spring *n*, the whole of the parts being arranged in respect to each other and to the bell C, substantially as and for the purpose set forth.

Second. The bracket B, with its four legs and projection *b*, for holding the bell, the said bracket being arranged in respect to, and in combination with, the levers G and F and their respective springs, substantially in the manner specified.

No. 23,640.—JOHN F. BODINE, of Williamstown, N. J., assignor to Himself, WILLIAM H. BODINE, and JOEL A. BODINE, of same place.—*Improvement in Revolving Plugs for Manufacturing Bottles and Jars.*—Patent dated April 12, 1859.—D is the turning plate, arranged loosely on the central shaft B, and resting on the top of the plug *c*, and underneath a capping stop plate E, being fitted to turn between said plate and the plug on the large ring bearings *a*, which are formed on its upper and lower or outer sides, and set in ring grooves *b*, cut in the under side of the plate E and upper side of the plug.

*Claim.*—The large ring bearings *a*, formed on and near the circumference of the turning plate D, and fitting in ring grooves *b*, formed in the plug C and capping plate E, substantially as and for the purpose set forth.

No. 23,641.—HARRISON FITTS, of Somerset, Mich., assignor to Himself and NELSON TURREL, of Addison, Mich.—*Improvement in Machines for Cleaning Grain.*—Patent dated April 12, 1859.—The grain is received from the screen H and the slide I, upon the concave J, and passes down between it, and the scouring wheel F, where it is subjected to the action of the roughened surfaces of the concave J and wheel F. In the lower part of the concave J there is an adjustable elastic pad or rubber K, by the adjustment of which the discharge of grain from between the concave and rubber may be modified to correspond with the work to be done at the time.

*Claim.*—The combination of the adjustable piece K with the concave and rubber, substantially as and for the purpose set forth.

No. 23,642.—J. F. GREENE, of Brooklyn, N. Y., assignor to SAMUEL B. TOBEY, of Providence, R. I.—*Improvement in Obtaining Fibres from Waste Felted Fabrics.*—Patent dated April 12, 1859.—The claim will explain the nature of this invention.

*Claim.*—Subjecting the felts to be disintegrated to the successive and combined action of steam and picking, substantially as described, the steam having the effect either to so unfelt or loosen the hold which the fibres have on each other in felted fabrics, that they can be drawn apart of sufficient length, to be advantageously employed in the manufacture of other felts or other fabrics.

No. 23,643.—J. F. GREENE, of Brooklyn, N. Y., assignor to SAMUEL B. TOBEY, of Providence, R. I.—*Improvement in Machinery for Disintegrating Waste Felted Fabrics.*—Patent dated April 12, 1859.—The object of this invention is to disintegrate or tear apart waste and refuse felts, and consists in combining a steaming apparatus with a picker *h*, so that the felts may be thoroughly steamed before and as they are presented to the picking machine.

*Claim.*—The combination of the steaming apparatus and the picker, substantially as described, for steaming the felt, as it is passed to the picker to be disintegrated, as set forth.

No. 23,644.—HEZEKIAH JOHNSTON, of Collinsville, Ill., assignor to Himself and RICHARD WITHERS, of the same place.—*Improvement in Machines for Cutting Corn Stalks, &c., on Ground Preparatory to Ploughing.*—Patent dated April 12, 1859.—The first object of this invention is to break down the stalks upon the ground, which is effected by means of the curved frame A<sup>1</sup>. The second object is to straighten out the stalks so that knives E can operate upon them and cut them up into short ends.

*Claim.*—Arranging and combining the curved frame A<sup>1</sup>, with the knives E and the guides J, in the manner described and for the purpose specified.

No. 23,645.—CHARLES MILLER and THOMPSON W. DECKER, of New York, N. Y., assignors to THOMPSON W. DECKER, aforesaid.—*Improved Machine for Cutting Files.*—Patent dated April 12, 1859.—The inventors say: By arranging the gauge rest M to oscillate, the bed C and blank *a* are adjusted at any moment desired, without stopping the machine. The hinging of the frame E to the bed plate at *f* permits the gauge rest M to follow the curve of the face of the file, and thus cause the chisel, which is always arrested by the stop *p*, to produce a uniform depth of cut from end to end of the file, besides affording the greatest convenience for raising the chisel stock to permit the carriage to be run back and to permit the removal of the chisel.

*Claim.*—First, arranging the gauge rest M to oscillate on a fulcrum *t*, located in relation to the cutting chisel, substantially as shown, that by moving the arm of said rest, laterally, by means of the screw N, the bed C and blank *a* may be adjusted to correspond with the cutting edge of the chisel, as set forth.

Second. Hinging the frame E, which carries the chisel and its appurtenances to the frame A, by a joint at *f*, so that the rest M may readily follow the curve of the file blank, and, with the chisel, be thrown back when desired, all as shown and described.

No. 23,646.—T. H. PEAVEY, of Montville, Maine, assignor to Himself and C. G. COLLINS, of Portland, Maine.—*Improvement in Machines for Wringing Clothes.*—Patent dated April 12, 1859.—The article to be wrung being placed between rollers B B, pressure is applied at the foot-board D, which compresses the rollers; motion is then imparted to the rollers by means of crank *i*. As they revolve the clothes are drawn down between them, and pass also between the small rollers on frame F, and come out entirely free from all water and ready to be dried.

*Claim.*—The arrangement of the rollers C with the rollers B, when the same are constructed and operated in the manner and for the purpose described.

No. 23,647.—JOHN J. SIGLER, of Martin's Ferry, Ohio, assignor to Himself and W. M. GRIFFITH & Co.—*Improvement in Threshing Machines.*—Patent dated April 12, 1859.—The claim and engraving will explain the nature of this invention.

The inventor says: I *claim*, first, the series of rollers  $E^1 E^2 E^3$ , &c., provided with fingers or projections  $a a^1 a^2$ , &c., in combination with the slab device  $b b^1 b^2$ , the fingers working in the spaces between the slats, and being used for the purpose of carrying the straw from the threshing cylinder to the place of discharge, and at the same time so tossing it as to secure an effectual separation of the grain therefrom, the slab device  $b b^1$ , &c., being employed for the purpose of supporting the body of the straw between the impulses of the fingers  $a a^1$ , &c., and also for the purpose of preventing the straw from winding on the rollers E  $E^1$ , &c.

Second. I claim the application of the oscillatory motion to the fingered shaft R, by means of which I secure an agitation inwardly towards the fan G, in addition to the throw towards the place of discharge M, for the purpose of more effectually freeing the apertures near the tail of the riddle K from obstruction, the required motion being obtained by means of the pinion *h*, rack segment Q, and arm X, or their equivalents.

No. 23,648.—ORRIN D. VOSMUS, of Boston, Mass., assignor to Himself and EDWARD W. SERRELL, of Greenfield, Mass.—*Improved Method of Arranging Galvano-Electric Helices for Magnetizing the Driving Wheels of Locomotives.*—Patent dated April 12, 1859.—The nature of this invention consists in applying a helix *b* of wire around the lower part of the wheel *a*, in such a manner that the lower part of the wheel is converted into an electro-magnet, the wheel revolving within said helix. The said helix producing magnetism in that part of the periphery of the wheel that is in contact with the track, enabling the locomotive to perform much more labor, without increasing the weight of the said engine or causing so much wear or strain upon the track.

The inventor says: I do not claim, broadly, the application of electricity or magnetism, to cause adhesion of wheels of locomotives; neither do I claim a helix, applied to a locomotive wheel, as this has before been done, but, it is believed, proved nearly or entirely valueless; whereas, in my invention, I have succeeded, by the use of a curved helix, as set forth, in obtaining the point of the greatest magnetic effect at the point of contact between the wheel and the track, therefore I *claim* a curved helix applied to the wheels of a locomotive engine, in substantially the manner specified, whereby the point of greatest magnetic effect is the point of contact between the wheels and track. And, in combination with the helix aforesaid, I claim adjusting the helix in the manner and for the purposes specified.

No. 23,649.—BENJAMIN DOUGLAS, of Middletown, Conn., for Himself, and as administrator of the estate of WM. DOUGLAS, deceased, late of the same place.—*Improvement in Pumps.*—Patent dated April 12, 1859.—This invention consists in the manner of attaching the pump barrel to the base and platform on which it is designed to rest, and to the top of the water-pipe, so that the same may be attached and detached from the platform and pipe by merely turning a single screw bolt or nut A.

The inventor says: What is claimed is the combination of the lugs B and C, within the flange  $x^2$ , and the conical set nut A, substantially as described, for fastening the lower end of the pump cylinder.

No. 23,650.—JONATHAN AMORY, of West Roxbury, Mass.—*Improvement in Steam Boiler Furnaces.*—Patent dated April 19, 1859.—The invention consists in certain modifications of what is known as "Baker's Furnace," patented May 30, 1846, by means of which the combustion of fuel therein is better effected, and the invention better adapted to be used in locomotive and other boilers having internal fire places, and to other similar conditions of use.

*Claim.*—The method of increasing the combustion and protecting the combustion curves, substantially as described.

No. 23,651.—ABRAHAM BARTHOLF, of New York, N. Y.—*Improvement in a Device for Converting Alternate Circular into Direct Circular Motion.*—Patent dated April 19, 1859.—This invention consists in a certain novel mode of applying and arranging a dog and lever, and a spring in combination with a wheel, or other body, to which the direct motion is imparted,

whereby as the lever is moved in one direction the dog is caused to bite upon the surface and move the wheel or body to which it is applied, and as it is moved in the other direction the dog is caused to slip over the surface.

*Claim.*—The dog C, spring D, and lever E, combined and arranged relatively to each other and applied to the wheel A, or its equivalent, substantially as described.

No. 23,652.—A. C. BARSTOW, of Providence, R. I.—*Improvement in Burial Cases*—Patent dated April 19, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim* constructing a metallic burial case with the ogee shaped ends, as described, whereby great reduction in weight and economy in the manufacture is secured, and at the same time all the space required afforded.

I also claim forming the metallic case with the overlapping strengthening ribs, as described.

No. 23,653.—MELLEN BATEL, of Albany, N. Y.—*Improvements in Furnace for Heating Tires.* Patent dated April 19, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—As an improved article of manufacture, a furnace for heating tire, composed of an annular body A, fire space B, central tube C, with cover or damper D therein, to regulate the draft, extension E, rod F, crane G, top H, and otherwise constructed as shown and described, for the purpose specified.

No. 23,654.—T. L. BAYLIES, of Richmond, Ind.—*Improved Anchor Tripper.*—Patent dated April 19, 1859.—Within the slot *d* a tripper bar B is placed. This bar may be of rectangular form, and of such a length that when in a horizontal position it will extend the whole length of the slot *d*, and across the loop or eye. Transversely through the stock A the shaft C passes. This shaft has a lever D attached to one end of it, and on this shaft two cams, *j* and *k*, are placed. The cams *j* and *k* are so placed on the shaft C that when the lever D is drawn in the direction indicated by the arrow *l*, the cam *j* will act against the underside of the tripping bar, and, owing to the position of the slots *f h*, will raise the tripping bar B obliquely upward in a horizontal position.

*Claim.*—The arrangement and combination of the tripping bar B, shaft C, and cams *j k*, substantially as and for the purpose shown and described.

No. 23,655.—ABNER M. BEARDSLEY, of Elkhart, Ind.—*Improved Machine for Filing Saws.*—Patent dated April 19, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of the swinging frame of the file carriage upon the adjusting plate E, so that it can be turned over and supported upon the bed plate A, in the manner and for the purposes described and shown in the drawings.

Second. The arrangement of the check pieces N, upon the adjusting plate E, between the arms of the swinging frame, for the purpose of bracing the latter against the thrusts of the file carriage, while said frame is free to rise and fall, as described.

Third. The arrangement of the gauging screw M, in the cross piece H of the swinging frame, by which the teeth are filed to a uniform depth, without interfering with the rising of the file carriage, to conform to the taper of the file, as described.

Fourth. The arrangement of the seats *a a*, at each end of the bed plate A, whereby the implement may be supported directly upon the clamp of the saw, for the purposes described.

No. 23,656.—DOUGLAS BLY, of Rochester, N. Y.—*Improvement in Artificial Legs.*—Patent dated April 19, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—I am aware that straps from the shoulder have been used, both elastic and otherwise, for the purpose of retaining the artificial limb in its place, and this I do not claim.

But I *claim* the use of an elastic strap, or apparatus, from the shoulders, or upper part of the body, when attached to the artificial leg in such a manner that its contractile power is exerted in connection with the backward motion of the shoulders, to produce the forward motion of the foot, substantially as set forth.

No. 23,657.—BENJAMIN BRADBURY, of Abington, Ill.—*Improvement in Washing Machines.*—Patent dated April 19, 1859.—*a a* are the two bottom pieces, *b b* are four legs, which are let into the bottom pieces as near one end as possible; they are halved together at the top and the bottom, and fit on the sides of the box *c*; *c* is a box in which the clothes are washed, on each side of the horizontal washboard *d*, and between them and the upright boards *o*. The bottom pieces of the box are fastened to the side and end boards, across the top are nailed two boards, leaving a space to put in and take out the clothes, which space is covered by the cover *n*, leaving a space at each side of the pendulum lever *e e* to work at each end.

*Claim.* The arrangement described of the levers *h e e*, and pitman *f*, moving the dashers *d*, over the concave of the box C, the whole constructed and operating as specified.

No. 23,658.—CHARLES K. BRADFORD, of Lynn, Mass.—*Improvement in Faucets*—Patent dated April 19, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—The faucet, constructed as described, to be operated by applying pressure directly

to the head of the case, said case for this purpose being provided with an outside elastic diaphragm forming the head thereto, and combined with a valve rod, arranged in relation to the case internally, so that the ends of said rod terminate respectively at, and are secured to, the valve and diaphragm, as set forth.

No. 23,659.—WILLIAM H. BRAMBLE, of Springfield, Ohio.—*Improved Bedstead*.—Patent dated April 19, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim*, first, the combination of an under and upper section, united to each other by springs and links, so that the upper section may have a free vertical and horizontal motion, substantially as described.

Second. I claim, in combination with a bedstead made of two sections, as described, the making of the posts of the upper section shorter than the supports of the under section, so that said upper section when placed on the lower one, shall be entirely clear of the floor, as set forth.

Third. I claim the combination of the loose slats, springs, and webbing, when said webbing runs longitudinally or lengthwise of the bedstead, in the manner and for the purpose stated.

No. 23,660.—JOHN BROUGHTON, of New York, N. Y.—*Improvement in Governors for Steam Engines*.—Patent dated April 19, 1859.—This improvement relates to oil cups or lubricators for greasing the bearings of shafts and other running or working parts of machinery, in which it is desired to discharge the lubricating material from the oil cup on the part or parts to be greased at regular or irregular intervals, and in any given quantity or quantities.

The inventor says: I *claim* effecting the connection between the ball arms G G and the central rod J by means of two levers H H and two links K K, the whole being applied and operating substantially as set forth.

No. 23,661.—PETER G. BROWN, of Schenectady, N. Y.—*Improved Lubricator*.—Patent dated April 19, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim* the combination of the reservoir A, provided with a discharging aperture *c*, valve F, having a receiving aperture *d* in it, and air chamber H, or the equivalents thereof, when said air chamber is arranged to control or assist the discharge, substantially as specified.

I likewise claim giving to the valve, constructed and arranged as above described, which conveys the oil from the reservoir to the discharging aperture, an intermittent revolving motion, in one and the same direction, for and by the action of the handle I, or its equivalent, in either direction of the travel of the latter, or in reverse directions thereof, essentially as set forth.

No. 23,662.—GEORGE CLAY, of New York, N. Y.—*Improved Lock*.—Patent dated April 19, 1859.—The nature of this invention consists in the peculiar construction and arrangement of the parts for united operation in a lock.

A A represents the front and back sides of the lock, which are formed of two plates *a a*, a suitable space *b* being left between them. The front and back sides of the lock are secured a proper distance apart by transverse rods or bars. B is the bolt, placed in the case as usual, the lower edge of the bolt having a recess made in it to receive the bit of the key, so that the bolt may be operated by the turning of the key.

*Claim*.—The specified construction and arrangement of the following parts for united operation in a lock, viz: Right and left double walled case A *t t*, sliding right and left key-hole guard plates *d d e<sup>1</sup> e<sup>1</sup>*, right and left forked bars *e e s s*, main and auxiliary tumblers D D *f<sup>1</sup> f<sup>1</sup>*, and bolt D *a*, all for the purpose set forth.

No. 23,663.—WILLIAM E. COOPER, of Dunkirk, N. Y.—*Improvement in Railroad Car Brakes*.—Patent dated April 19, 1859.—In a small frame attached to the ceiling of the car are secured two pulleys *h h*. The bell cord E passes over one of these pulleys, then around the pulley in the movable block, and then over the other pulley. The bell cord passes from one car to another, but is connected in every car with the cord which leads down to the brakes. Thus the whole series of brakes are connected together from one end of the train to the other, and when the cord E is drawn at any point in the car all the brakes are acted upon simultaneously.

*Claim*.—The arrangement of the bell cord E, pulleys *h h* and *m*, and movable pulley block F, with the brake cord I, the same being connected and operated substantially in the manner set forth, for the purpose of setting all of the brakes in the entire train simultaneously and from any point within the train, as is fully described.

No. 23,664.—RIENZA DANIELS, of Almena, Mich.—*Improvement in Journal Boxes*.—Patent dated April 19, 1859.—The nature of this invention consists in constructing each of the friction rollers of a series of ring sections, and uniting said sections together, so that they lie in the same line, by means of a screw rod and nut, and, in combination with this mode of con-

structing a friction roller, it consists in constructing each of the journals of an axle of a series of similar ring sections and uniting the same together, so they lie in the same line by means of a screw tapped arm and shoulder of the axle.

*Claim.*—The axle *c d*, furnished with a screw tapped arm *c<sup>1</sup>*, and having toothed and plain sections *a a a*, *E*, *b b*, of a journal arranged and clamped upon it, in combination with the internally toothed journal box *A B B*, and with rods *m m*, toothed and plain sections of frictional rollers *D D* arranged and clamped on them, all in the manner described and for the purpose set forth.

No. 23,665.—*B. WELLS DUNKLEE*, of Boston, Mass.—*Improvement in Cooking Ranges.*—Patent dated April 19, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—The arrangement of the two induction flues *A B*, the gauge throats, their plates or bars, and the flues around and between the two ovens, a single damper, and its openings being placed over the middle flue, and with respect to the two flues, as specified.

No. 23,666.—*GEORGE ESTERLY*, of White Water, Mich.—*Improvement in Harvesting Machines.*—Patent dated April 19, 1859.—This invention consists in a novel way of operating and applying a raking attachment to a grain and grass harvester, and in a peculiar construction of the latter, whereby the two devices are adapted to each other and made to operate conjointly in a perfect manner to perform the desired work.

The inventor says: I *claim*, first, the adjusting of the rake *Q* by means of the socket *O*, suspended by journals or trunnions *s*, and secured in the desired position by set screws *v* and bars *u*, or their equivalents, in combination with the adjustable platform *L*, whereby the rake and platform may be adjusted to suit the height at which the grain is cut.

Second. The segment plate *U*, with the curved flanch *J*, for the purpose of carrying the rake backwards, as described.

Third. The use of the pendant rod or bar *f*, provided with the rollers *g h*, in combination with the flanch *j*, for the purpose specified.

I do not claim the guard finger *T*.

But I claim, fourthly, attaching the guard finger *T* to the bearing *W*, in the manner described, whereby it may be adjusted for the purpose specified.

No. 23,667.—*JOSIAH ELLIS*, of (near) Warrington, England.—*Improvement in Machines for Quarrying Stone, &c.*—Patented in England, December 6, 1855; Patent dated April 19, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—A portable apparatus, designed for cutting grooves in rocks or other mineral substances, for the purpose of quarrying the same in blocks, and consisting of supports *B B*, which are fastened to the rock and sustain an adjustable bed plate *D* and screw shaft *E*, upon which bed plate and screw shaft a tool stock and adjustable cutter is made to traverse between two previously drilled or open spaces which form the extremities of the proposed cut, substantially as described and represented.

No. 23,668.—*ROBERT G. EUNSON*, of New York, N. Y.—*Improved Water Cooler for Steam Engines.*—Patent dated April 19, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The inventor says: I *claim* the use or employment of a decalorator, such as is described, or its equivalent, when the series of very small, horizontal tubes are so arranged, in respect to the current of water outside of the tubes, that the centre of each tube, in one row, shall be opposite or nearly opposite to the centre of the space between the tubes in the next row, in combination with supporting and directing tube plates, such as are described, and for the purposes set forth.

I also claim the use or employment of tubes, arranged in rows as described, in combination with the tube plates and shell of the decalorator, when so arranged that the current of cold water is made to flow across the tubes, being directed by the tube plates from side to side or from top to bottom, and from bottom to top of the shell and around the tubes, being made to encircle them by its current, in consequence of their arrangement of rows as described, and at the same time progress lengthwise of the shell and tubes in a direction contrary to the stream of fresh water inside of the tubes, for the purposes set forth.

No. 23,669.—*DANIEL FITZGERALD*, of New York, N. Y.—*Improved Fireman's Ladder.*—Patent dated April 19, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, applying the tanks *A B*, or their equivalent, to ladders, with or without water, to elevate and hold said ladders, substantially as described.

Second. Conveying the water through a long distance by an elongated pipe *E*, or its equivalent, connected with the apparatus, substantially as described.

Third. Managing the curved or jointed pipes *Q R* by means of the lever *H*, or its equivalent, in the manner described.

No. 23,670.—PERRY G. GARDINER, of New York, N. Y.—*Improvement in Moulds for Steam Castings*.—Patent dated April 19, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim*, first, Constructing the mould with a cup or reservoir for holding all the melted metal for casting, closed and opened at the entrance of the sprue, by the movable plug or stopper as described.

Second. The spherical hollow chamber *a* and air escape passage *d*<sup>2</sup>, and self acting plug *f*, to permit the rarified air to pass from the mould, and to escape, and to shut off the external air from the mould, operating in the manner and for the object described.

Third. I claim the combination and arrangement of the two cups, the sprue, the figure O, the tool or casting, and air vents or passages, so as to form a bent tube by which the casting is filled from the bottom, and the external air excluded as described.

Fourth. I claim the use of the moulds in a state of intense heat, never less than 500° of Fahrenheit, and generally at a much higher temperature, for the purpose of producing, as nearly as practicable, a vacuum within the mould; but I do not claim the mere heating or warming of the moulds to produce a smooth casting, that having been a common practice heretofore.

No. 23,671.—P. F. GEISSE, of Wellsville, Ohio.—*Improved Oven for Cooling Castings*.—Patent dated April 19, 1859.—The nature of this invention consists in so constructing and governing the operation of a cooling oven, as that the wheels—of which as many as desirable are placed in its pit at a high temperature—may be allowed to gradually cool in such a manner that the rate of contraction in every part of each one of them may be uniform, and the act of final contraction be induced to commence at the centres of the wheels and extend gradually to their peripheries.

*Claim*.—The pipe *d* connecting the eyes or hubs of the wheels with flues E and plate *c*, for causing the current of air to pass through the eyes only of the hubs, in cooling, in combination with heating oven A and pits B, operating as described and for the purposes set forth.

No. 23,672.—ISAAC H. GIFFING, of New York, N. Y.—*Improved Mode of Attaching Casters to Trunks*.—Patent dated April 19, 1859.—The nature of this invention consists in providing a sufficient space between the plate and roller, so that a band or strap of metal may be passed freely between the plate and roller; also making a flange continuously along the whole length of both sides of the plate, in order to prevent the plate from twisting, and also for the purpose of additional strength.

*Claim*.—The method described of constructing and attaching casters to trunks.

No. 23,673.—JAMES C. GILBERT, of Leed's Junction, Me.—*Improvement in Yoke Ring Attachment for the Pole of Ox Carts*.—Patent dated April 19, 1859.—The object of this invention is to enable a person to readily attach to, or detach from, an ox cart pole the ring of a yoke; the nature of the invention consisting in a peculiar arrangement of a "backing bearer," and an engaging notch of a spring slider, with respect to, and so to operate with, a draft hook applied to the underside of such pole or tongue.

*Claim*.—The described arrangement of the backing bearer *f* and engaging notch *c* of the spring slider D, with respect to, and to operate with the draft hook C, substantially in the manner specified.

No. 23,674.—OTHNIEL GILMORE, of Raynham, Mass.—*Improved Machine for Smoothing the Soles of Boots and Shoes*.—Patent dated April 19, 1859.—The improved smoothing wheel constituting this invention is adapted to the smoothing of or reducing any boot or shoe sole having a projecting heel. It is constructed with a circular annulus or rim A A, one side of which is made convex in section as shown at *a*, and is flanked by acute angular edges *b c*, and particularly with its inner edge acute angled and having a heel recess B, or one large enough to receive the heel, while the shank of a shoe is resting on the grinding surface *a*.

*Claim*.—The improved manufacture of a sole smoothing or reducing wheel, made with the convex grinding annulus *a*, concentric heel recess B, and a cute angled edges *b c*, arranged substantially as described.

No. 23,675.—PORTER A. GLADWIN, of Bristol, Mass.—*Improvement in Attaching Cords to Window Sashes*.—Patent dated April 19, 1859.—The nature of this invention consists in attaching a spring to the edge of the sash and securing a cord thereto, so that the tension of the spring pulley will also produce the sidewise tension of the sash springs against the jamb of the window, and thereby equalize or graduate the action of the spring pulley.

*Claim*.—The employment of the slotted tension spring or plate D in combination with the cord G and pulley C, in the manner as and for the purpose described.

No. 23,676.—WILLIAM P. GOOLMAN, of Dublin, Ind.—*Improvement in Windlasses*.—Patent dated April 19, 1859.—The object of this invention is to provide means for taking up the

slack from the winding drum, so that the cable may be wound upon it with unvarying rapidity and power.

The inventor says: I *claim*, first, in the described combination with a winding drum or capstan of any suitable form, the application of a reel D, operated by the traction of the entering cable, to take up the slack from the said drum or capstan, as explained.

Second. In combination with the said reel and capstan, I claim the adjustable idle pulley G, operating as set forth, to maintain the needful traction of the cable against the reel, or vary it as may be found needful.

No. 23,677.—GEORGE P. GORDON, of New York, N. Y.—*Improvement in Printing Presses*.—Patent dated April 19, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of one or more sets of revolving grippers, with the finger stops, or their equivalents, for the purpose of piling the sheets of paper in an even and regular heap or pile, substantially as described.

Second. I claim the combination of a vibrating feed board, with the rotating or revolving platen, for the purpose of feeding the sheets of paper regularly and with precision at each rotation of the platen.

Third. I claim the combination of a rotating reciprocating bed with a revolving platen; all of which is fully described.

No. 23,678.—JACKSON GORHAM, of Bairdstown, Ga.—*Improved Bench Plane Stock*.—Patent dated April 19, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—Constructing the plane stock of a central wooden portion  $a a^1$ , secured between metal side plates  $b b$ , provided with flanges  $h h$ , the part  $a^1$  being permanently secured between the plates  $b b$  and the part  $a$ , rendered adjustable between said plates by set screws  $a a$ , substantially as and for the purpose set forth.

No. 23,679.—EDWARD GOTTHEIL, of Galveston, Texas.—*Improvement in Cotton Gins*.—Patent dated April 19, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the method of feeding the cotton bolls to the rollers  $b$ , by means of a blast issuing from a slotted or perforated tube, or its equivalent, substantially as set forth.

I do not claim creating a blast of air to issue from the periphery of the brush cylinders, by means of wings within them, by their own velocity.

But I claim, secondly, the arrangement of the two cylindrical brushes  $d$ , in combination with the rollers  $b$ , when the former are so constructed that a blast from an independent source may be forced through slots or perforations in their peripheries, substantially as and for the purposes set forth.

Third. I claim the comb  $e$ , in combination with the blast pipe  $z$ , for gathering the lint off the upper brush roller and discharging it into its receptacle, in the manner set forth.

No. 23,680.—JOSIAH M. GRUMMAN, of Brooklyn, N. Y.—*Improved Surveyor's Chain*.—Patent dated April 19, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the method of making civil engineers' and surveyors' chains of a peculiar form of link, as described and shown.

Second. The arrangement of spring balance and level in the same tube or covering, with the arrangements for adjusting, as described and shown.

Third. The method of allowing for the variation of the temperature by a scale of variation on the chain with the adjusting slide and clamp, as described and shown, so that the chain may be virtually shortened or lengthened to meet the temperature.

Fourth. The use of the spring catch, by means of which the balance and level is detached from the end link and attached to any other link in the chain at the pleasure of the operator.

Fifth. The method of attaching the thermometer to the end bar of the chain, as described and shown.

No. 23,681.—ISAAC W. HAKES, jr., and A. H. HAKES, of Norwich, Conn.—*Improvement in Bustles*.—Patent dated April 19, 1859.—The spring E helps to sustain the form of the springs D D, and by moving it higher up or lower down the springs D D serve to throw the bow lower down or higher up, to suit the taste of the wearer. The springs F G, by being shortened or lengthened, serve, by drawing the sides of the bustle more or less towards each other, to throw out the bustle more or less in a backward direction.

*Claim*.—As an improved article of manufacture a "bustle" provided with front holding straps  $a a^1$  and spring E, when otherwise constructed, as shown and described.

No. 23,682.—B. F. HARRINGTON and U. B. BURRIS, of Missouri city, Mo.—*Improvement in Cooling and Feeding Material to Mills*.—Patent dated April 19, 1859.—The nature of this invention consists in the arrangement of spiral buckets and chambers, for the purpose of conveying air and grain between the stones of a grinding mill.

The inventors say: We *claim*, first, the spiral chambers E E, for the purpose of creating currents of air for keeping the stones cool, substantially in the manner described.

Second. The combination of the spiral buckets with the spiral chambers, when both are constructed and arranged in the manner and for the purpose fully set forth.

No. 23,683.—ALEXANDER L. HOLLEY, of New York, N. Y.—*Improvement in Chairs for Railroads*.—Patent dated April 19, 1859.—The nature of this invention consists in preserving the continuity of the rail ends by means of brackets, so attached to the fish or splice pieces, and to a tension plate, that the weight of the wheels of the train on the rail keeps the said splices tightly in their places without the aid of bolts and nuts, or keys or rivets.

*Claim*.—The combination of the splice C and the bracket D, (the said splice and bracket being either the same piece or separate pieces,) with the foot of the rail *e*, acting as a tension piece, or with a separate tension piece B, in the manner and for the purpose substantially as described.

No. 23,684.—ALEXANDER L. HOLLEY, of New York, N. Y.—*Improvement in Variable Cut Off Gear for Steam Engines*.—Patent dated April 19, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—Such a combination of the motion of an eccentric, or its equivalent, with the motion of a steam piston for moving a valve as will effect a variable cut off of the induction steam without interfering with a free exhaust, substantially in the manner described.

No. 23,685.—BENNET HOTCHKISS, of New Haven, Conn.—*Improvement in Variable Cut Off for Steam Engines*.—Patent dated April 19, 1859.—This improvement consists in the method of tripping the valve stem by the use of an inclined plane on the end of a collar which is adjusted by the operation of the governor on a sliding bar, by means of a diagonal slot, in such a manner that the admission of steam into the cylinder will be cut off at any desired portion of the stroke of the piston in accordance with the velocity of the governor.

*Claim*.—The combination of the sliding bar E with the sliding collar F, when constructed, arranged, and made to control the time of the cut off by the operation of the governor or regulator only, substantially as described.

No. 23,686.—WILLIAM H. HOVEY, of Springfield, Mass.—*Improvement in Corn Shellers*.—Patent dated April 19, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim* the arrangement and combination of the endless elevator E, the spout B, the spring presser G, and the shelling cylinder F, in the manner described.

I also claim the arrangement and combination of the grated trough D, with the elevator E, and the mechanism for removing the kernels from the cobs and separating both kernels and cobs, as described, such mechanism consisting mainly of the presser G, the shelling cylinder F, and the grid or bar H, arranged and coöperating as specified.

I also claim the combination and arrangement of the guide hopper or receiver L, with the shelling mechanism, the grated trough D, and the elevator E, in the manner and for the purpose specified.

No. 23,687.—JAMES J. JOHNSTON, of Allegheny, Pa.—*Improvement in Corn Shellers*.—Patent dated April 19, 1859.—The nature of this invention consists in the combination and arrangement of shelling disks, with a guard plate, guide, and spring, or press plate, operating together.

*Claim*.—The combination and arrangement of the disks or shelling wheels *c* and *d*, with the guard *j*, guide *b*, and spring or press plate *k*, constructed and operating in the manner and for the purpose specified.

No. 23,688.—GEORGE KENNY, of Milford, N. H.—*Improvement in Combined Stump Extractor and Press*.—Patent dated April 19, 1859.—When this machine is to be used for lifting weights or extracting stumps, the wire ropes, or chains A A, are unhitched from the hooks *b b*, on shaft *a*, and the whole frame *v v v* is withdrawn, together with the pressing box *w*, and pressing box *y*, and the machine is then worked in combination with the canting frame B B.

The inventor says: I *claim*, first, the combination of the main frame *u u*, anchor frame *r r*, canting frame B B, with the shaft *a*, and the devices for working it, the whole being constructed and combined substantially as and for the purpose set forth.

I also claim the main frame and windlass device above described, in combination with the removable pressing frame and box, substantially as and for the purpose set forth.

No. 23,689.—SAMUEL KIMBALL and WILLIAM SAWYER, of Boxford, Mass.—*Improvement in Apparatus for Drying Shoe Pegs and Grain*.—Patent dated April 19, 1859.—The claim and engraving explain the nature of this invention.

The inventors say: We *claim* the arrangement of the steam pipes *fff*, &c., with the main cylinder C, covered with wire gauze or perforated sheet metal, in whatever manner the steam

may be introduced into said pipes, in combination with the floats  $K K^1 K^2 K^3$ , constructed and operating in the manner set forth.

Also the arrangement of the steam pipes  $fff$ , &c., with the main cylinder  $C$ , covered with wire gauze or perforated sheet metal, without the floats  $K K^1 K^2 K^3$ , constructed and operating substantially in the manner set forth.

No. 23,690.—A. C. LANING, of Wilkesbarre, Pa.—*Improvement in Pumps*.—Patent dated April 19, 1859.—This invention relates to an improvement in reciprocating pumps, and is designed to render the same capable of being used in an inclined or horizontal position equally as well as in a vertical one.

*Claim*.—The stationary pipe or tube  $A$ , valve chamber  $B$ , and reciprocating cylinder  $C$ , combined and arranged substantially as and for the purpose set forth.

No. 23,691.—DAVID LOCKE, of Lexington, Mo.—*Improvement in Brick Machines*.—Patent dated April 19, 1859.—This invention consists in having the tempered clay placed in suitable layers, or platforms slightly elevated above the surface of the ground, the layers being made of a thickness corresponding to the thickness of the bricks to be formed, and of any desired width or length, and using, in connection with the layers of tempered clay, a machine mounted on wheels, and so arranged that it may be moved over the layers and made to cut the layers of clay into brick.

*Claim*.—The elevated layer of tempered clay  $d$ , arranged or formed substantially as shown, in connection with the travelling plates or cutters  $p q$ , and pressure plates  $r$ , arranged to operate substantially as and for the purpose set forth.

No. 23,692.—H. H. LOW, of Galena, Ill.—*Improved Shingle Machine*.—Patent dated April 19, 1859.—This invention relates to an improvement in that class of shingle machines in which a circular saw is used to cut the shingles from the bolt, and is an improvement on a machine patented March 16, 1858.

*Claim*.—The inventor says: I do not claim a vertical reciprocating frame  $E$ , containing the bolt from which the shingles are sawed, for such device has been used, and may be seen in the machine formerly patented by me and previously alluded to.

But I *claim* operating the vertically reciprocating and balance frame  $E$ , from the saw or power shaft  $B$ , through the medium of the pulleys  $c e$ , and gearing  $g h i j$ , arranged with the slide bar  $I$ , arm  $H$ , and the springs  $n n^1$ , and spring stop  $J$ , substantially as and for the purpose set forth.

No. 23,693.—JOHN R. MARSTON, of New York, N. Y.—*Improvement in Cob and Grain Mills*.—Patent dated April 19, 1859.—This mill is made in the ordinary form of others for the same purpose. When the sliding cone  $b$  requires to be graduated, so as to grind coarser or finer, the nut on the set bolt  $j$  is slackened, the set screw  $p$  can then be tightened or loosened, as may be required; the nut on the bolt  $j$  is tightened so as to keep the cob cutter in its proper place, the stationary cutter shell  $g$  being retained in its position by means of the revolving cutter  $f$  and the collar  $i$ , both of which are firmly secured to the shaft  $e$  by a set screw or key.

*Claim*.—The set bolt  $j$ , with its nut, or its equivalent, the slot  $h$ , in the shell of the cob-cutter, and the collar  $i$ , on the shaft, for the more practicable and reliable mode of retaining the cutters of the cob-mill in their proper places, substantially as and for the purposes set forth.

No. 23,694.—JAMES F. MONROE, of Fitchburg, Mass., and E. P. MONROE, of New York, N. Y., assignors to E. P. MONROE, aforesaid.—*Improved Egg Beater*.—Patent dated April 19, 1859.—This invention consists in arranging in an adjustable frame two beaters, one inside the other, which receive motion in opposite directions by means of two pinions which gear into a large bevel wheel, and on opposite sides of the same, so that, by rotating the bevel wheel by means of a handle, the beaters receive the required motion.

*Claim*.—The two beaters  $I$  and  $J$ , constructed of wires  $i$  and  $j$ , and arranged in the adjustable frame  $A$  in such a manner that the same, by means of pinions  $F$  and  $G$ , and by the bevel wheel  $D$ , receive a rapid rotary motion in opposite directions, substantially as and for the purposes specified.

No. 23,695.—JOHN D. MURPHY, of Baltimore, Md.—*Improvement in Iron Carriage Wheels*. Patent dated April 19, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I am aware that combined cast and wrought iron wheels have been constructed before, and I therefore wish to be distinctly understood as disclaiming the invention and construction of such wheels, broadly considered.

But I *claim* a combined wrought and cast-iron wheel, when the several parts composing said wheel are constructed in the form, and arranged and combined in the order, as and for the purposes shown and described.

I also claim having the entire rim  $d$  of the tread of the wheel open at one place, as shown

at  $d^1$ , until after the hub is cast, in combination with the mode of inserting and fastening the spokes in the rim or tread of the wheel  $d$ , as and for the purposes described.

No. 23,696.—ISAAC W. NORCROSS and FREDERICK M. NORCROSS, of Lowell, Mass.—*Improvement in Skates*.—Patent dated April 19, 1859.—The nature of this invention consists in a mode of arranging and applying springs to the runner and foot stand of the skate, each spring constituting a part of and continuation of the runner, and being fastened to either the toe or the heel of the foot stand and disposed with regard to it as shown in the engraving.

*Claim*.—An improved mode of arranging and applying the springs B, each being a continuation of the runner E, and to extend laterally and longitudinally with reference to and to be fastened at the toe and heel of the foot stand, as shown in the drawings and as specified.

No. 23,697.—WILLIAM G. OLIVER, of Buffalo, N. Y.—*Improvement in Applying Electricity in Dental Purposes*.—Patent dated April 19, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—The inventor says: I am aware that electricity has been applied as an anæsthetic agent in dental operations, and do not, broadly, claim the application of such an agent.

But I claim the employment, in producing local anæsthesia in dental operations, of an apparatus in which only non-metallic conductors are brought in contact with the parts operated upon, as set forth.

No. 23,698.—GEORGE W. PARSHALL, of Middlefield, N. Y.—*Improvement in Railroad Car Couplings*.—Patent dated April 19, 1859.—The nature of this invention consists in constructing a coupling by which the cars can be all detached simultaneously, if required, and if a car runs off the track, to detach itself from all the others.

*Claim*.—The construction and combination of the head piece M, tongue R, wheel O, and pin D, arranged and operating as described and set forth, for the purpose specified.

No. 23,699.—JOSEPH R. PAYSON, of Covington, Ky.—*Improvement in Sash Cord Fasteners*. Patent dated April 19, 1859.—The nature of this invention consists in constructing a metal fixture or sash cord fastener for receiving and holding securely the knotted end of the cord, at the same time admitting of its being readily cast off in removing the sash.

*Claim*.—The cylindrical ring  $a$ , in combination with the opening  $b$ , neck  $c$ , and eye  $d$ , substantially as described, and for the uses and purposes mentioned.

No. 23,700.—SAMUEL PEIRCE, of Cambridgeport, Mass.—*Improvement in Weighing Scales*.—Patent dated April 19, 1859.—The fulcrum block C has an axis  $a$  which serves as the fulcrum of the scales, the knife edged extremities thereof resting in sockets or bearings  $b b$  in upright standards D D, secured on a suitable base E. The two slides A B are employed in such a manner that by drawing them out successively or together different degrees of weight are indicated by scales marked thereon, and by the same device, in connection with a fulcrum block C, the scales are accurately adjusted.

*Claim*.—The combination and arrangement of the two poise slides A B and the fulcrum block C, substantially in the manner and for the purposes specified.

No. 23,701.—JAMES L. PERRY, of Mansfield, and MELZER BURT, of Norton, Mass.—*Improved Fluid Measure*.—Patent dated April 19, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The fluid measure, constructed substantially in the manner and to operate with respect to a barrel or reservoir, as specified, that is to say, as made of a close vessel A, induction and eduction faucets and a tell-tale valve and valve openings, or equivalent, combined and arranged essentially as set forth, the valve serving to indicate when the case may be full of liquid, the induction faucet allowing the flow and interruption thereof of liquid into the case, and the eduction faucets determining the amount of flow out of the case, as described.

No. 23,702.—PHILANDER PERRY, of Troy, N. Y.—*Improvement in Mills for Grinding, Crushing, &c.*—Patent dated April 19, 1859.—This invention is designed to be used by farmers, and is intended to combine in a compact machine several agricultural implements in one, so that all may work efficiently, either separately or simultaneously. A description of the machine is too long for a place in this volume.

The inventor says: I do not claim, broadly, or irrespective of arrangement, the placing of two pairs of grinding stones or plates on one shaft, for that has been previously done.

But I *claim* the specified arrangement for effecting the combination, in one machine, of the described grinding mill, cob-crusher, corn-sheller, and straw-cutter, for the purpose set forth.

No. 23,703.—BRADFORD S. PIERCE, of New Bedford, and MASON R. PIERCE, of Mansfield,

Mass.—*Improvement in Machines for making Drain Pipes.*—Patent dated April 19, 1859.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim* the arrangement of the mixing apparatus, pressing and core relieving devices above the platform for conveying the moulds, in the manner and for the purpose specified.

Also the arrangement of the core socket upon the revolving disk to receive the core and the mould, with a provision for discharging the core through the platform, in the manner and for the purpose specified.

No. 23,704.—WILLIAM S. PRATT, of Brooklyn, N. Y.—*Improvement in Journal Boxes.*—Patent dated April 19, 1859.—In making this improvement the inventor says: I construct five cylinders D which I place in a recess between the cylinders C in a line between their centres; in the ends of the cylinders D, is placed a centre pin. I then construct the ring E with a recess through its centre; said ring receives the pins or centres of the cylinders D, said ring revolving around the centre B, cylinders D keeping cylinders C at an equal distance from each other, and transmitting the pressure of the centre B equally to cylinders C.

*Claim.*—The rollers D D placed between the rollers C C, in the position and for the purposes specified.

No. 23,705.—H. PURLIER, JESSE HARLAN, and E. C. CHEEK, of Cincinnati, Ohio.—*Improvement in Car Couplings.*—Patent dated April 19, 1859.—This invention relates to certain improvements in car couplings, by means of which cars may be rendered self-coupling, and at the same time be coupled while in motion.

*Claim.*—The employment of the tripping-pin *b d* in combination with the latch lever *f g*, arranged and operating substantially as described, and for the purpose set forth.

No. 23,706.—WASHBURN RACE and S. R. C. MATHEWS, of Seneca Falls, N. Y.—*Improvement in Hydrants.*—Patent dated April 19, 1859.—The claim and engravings will explain the nature of this invention.

*Claim.*—The combination and arrangement of the parts herein described, consisting of the cap K, having within its socket the spring *j*, or its equivalent, stem attachment H, interior tube D, conical valve F, and closed seat G, whereby the valve is kept in place by the force of the spring *j*, and operated free from the external pressure of the water, substantially as and for the purpose set forth.

No. 23,707.—SAMUEL RAY and MOSES R. SHALTERS, of Alliance, Ohio.—*Improvement in Harvesting Machines.*—Patent dated April 19, 1859.—This invention consists in a peculiar manner of attaching the finger bar to the main frame of the machine, whereby the bar, when not in use, is rendered capable of being adjusted or folded up by the side of the main frame in two different positions, in order to facilitate the ready transportation of the machine. It also consists in a peculiar arrangement of the driver's seat, whereby a requisite degree of elasticity is given to the same.

The inventors say: We *claim*, first, attaching the finger bar E to the machines by means of the plate G, one end of which is pivoted to the machine, as at *l*, and the other end connected with the finger bar by joints K K, the above parts being in connection with a jointed connecting rod *i* to admit of the folding and turning of the finger bar, substantially as described.

Second. Placing the driver's seat J on the springs *r*, fitted in the hollow standards *p p q*, substantially as and for the purpose set forth.

No. 23,708.—TAPPAN REEVE and M. B. SWEZEY, of Brooklyn, N. Y.—*Improved Folding Seat.*—Patent dated April 19, 1859.—This invention is designed for a supplemental seat attachment to be applied to the ends of pews or settees adjoining the aisles or passage ways in churches or public rooms, the seats be so constructed and arranged that the same may be unfolded and made to occupy a portion of the aisle or passage ways when the permanent seats are all filled or occupied.

*Claim.*—The seat B attached to the end piece A of the pew or settee by the pin *b* of the bar *c* and the slot *a* in the end piece, and provided with the hinged back F and support E, the whole being arranged substantially as and for the purpose set forth.

No. 23,709.—WILLARD RHOADS, of Baltimore, Md.—*Improvement in Snow Ploughs for Railroads.*—Patent dated April 19, 1859.—The nature of this invention consists in the construction of snow ploughs on railroad track clearers, with a flat projecting flange extending from the point along the bottom of the sides of the clearer attached, horizontally and at right angles to the sides of the clearer, and working, when in use, parallel to the rails of the track, the faces of the clearer being vertical and furnished with a series of pressing wings.

*Claim.*—The projecting flange *a* in combination with the vertical sides *b*, in the construction of the railroad track clearers.

No. 23,710.—SILAS C. SALISBURY, of New York, N. Y.—*Improvement in Machines for Tempering and Moulding Plastic Materials.*—Patent dated April 19, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—The inventor says: I *claim* the employment of a series of two or more cylinders and the intervening guard blocks, in combination with a cylinder of larger diameter provided with flanges on its ends, so that the periphery of the larger cylinder, with its flanges and the opposing surfaces of the series of cylinders and guard blocks, shall constitute the walls of a channel in which the plastic material, on its passage to the die or mould, is worked, tempered, and pressed, as set forth.

I claim giving to the surface of the cylinder *b* a greater velocity than the surface of the large cylinder *A*, for the purposes set forth.

I claim forcing the plastic material into the die between the cutting edges *s s* by the pressure of a coat or layer of plastic material, formed on and adhering to the periphery of the large cylinder, as set forth.

No. 23,711.—JACOB RUPERTUS, of Philadelphia, Pa.—*Improvement in Revolving Fire-Arms.* Patent dated April 19, 1859.—This invention consists in a safety tube, which serves to convey the fire from the priming to the several chambers, to prevent any escape of the fire in a lateral direction from the vent of one chamber to that of the next, and consequent accidental discharge of any of the chambers, and to lock the cylinder with its chambers in line with the barrel.

The inventor says: I *claim*, first, The safety tube *E*, constructed, applied, and operating substantially as and for the several purposes specified.

Second. Producing the necessary movements of the safety tube *E* by means of a forked or toothed lever *I*, spring *J*, or its equivalent, and a tooth *u* on the tumbler, the whole being applied and operating substantially as described.

No. 23,712.—CORNELIUS SCHOFIELD, of Trumbull, Conn.—*Improvement in Attaching the Rails of Carriage Seats.*—Patent dated April 19, 1859.—This invention consists in supporting the rail by which the top of a carriage is attached to the seat by means of arms, the ends of which form semi circular recesses, which fit on the rod that constitutes the rail, and only two of those arms form jaws, which extend far enough beyond the rail for a screw to pass through in front of said rail, so that the same may be removed by taking out these screws and by springing the rods constituting the rails out of the several recesses in which they rest.

*Claim.*—The arrangement of the arms *a*, the ends of which form semi circular recesses *d*, in combination with the arms *C* and thumbscrew *k*, for the purpose of supporting the rail and securing the same to the seat, in the manner substantially as set forth.

No. 23,713.—CHARLES SCHOTT and JAMES C. BALDWIN, of Nashville, Tenn.—*Improvement in Excavating Machines.*—Patent dated April 19, 1859.—This invention consists of a two wheel cart with a crooked axle *C*, with two cross bars *L L* fastened on the same, forming the shaft for the animal, also supporters for bucket *A* and shaft *H*. The bucket is made fast on the shaft, and has on one side a pinion *B*, which works the lever *D* by means of corresponding gearing with pinion *B*, so that by a pressure of the lever *D* with the foot the excavator can be loaded or unloaded by the driver without moving from his seat.

*Claim.*—The combination and arrangement of lever *D* with its connection with bucket *A*, for loading and unloading, in the manner set forth.

No. 23,714.—C. A. SCHULTZ, of New York, N. Y.—*Improvement in Steam Valves.*—Patent dated April 19, 1859.—The principle of this invention is to take off the steam pressure of slide valves for steam engines, which is done by having the described attachments made to a common slide valve.

*Claim.*—The combined arrangement of the spiral springs and their inclosing columns, with the plate *C*, as and for the purposes described.

No. 23,715.—I. W. SENER, of Fredericksburg, Va.—*Improvement in Tea and Coffee Pots.*—Patent dated April 19, 1859.—This invention consists in a modification of the Waite and Sener coffee pot, known as "The Old Dominion," for the purpose of preventing accidents from too great pressure of steam which may occur in that utensil when the siphons, from any cause, may become obstructed.

*Claim.*—The safety apparatus herein before described, the same consisting in the combination of the tube *G*, and the cap *H*, and valve *J*, constructed and operating as and for the purpose specified.

No. 23,716.—S. B. SEXTON, of Baltimore, Md.—*Improvement in Stoves.*—Patent dated April 19, 1859.—This invention consists in a certain combination of parts constituting an improvement in cylinder stoves, constructed with a covered fuel chamber reaching nearly to

the grate, so as to furnish a continued supply of fuel to support combustion in the fire chamber below and exterior to said fuel cylinder.

*Claim.*—The covered fuel cylinder H, in combination with the chambers A B B<sup>1</sup>, flues C and D, and dampers *a* and *b*, together with the rear casing R, constituting a cold air chamber, the arrangement being as set forth.

No. 23,717.—A. SHANNON, of New York, N. Y.—*Improvement in the Treatment of India Rubber.*—Patent dated April 19, 1859.—The nature of this invention consists in a peculiar process for preparing the rubber, whereby a combination takes place between the rubber and the cork, forming one homogeneous, light, elastic, waterproof, and durable article.

*Claim.*—The method herein set forth, of treating caoutchouc so as to combine therewith cork, or its equivalent, substantially as set forth.

No. 23,718.—BENJAMIN R. SMITH, of Philadelphia, Pa.—*Improved Instrument for Ascertaining the Direction of Sounds in Fogs, &c.*—Patent dated April 19, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—A reflector made of suitable material, and of such a form or shape that it will collect all the rays or waves of sound entering it, to a focus, when pointed towards the direction from whence sound comes, for the purpose of ascertaining the direction of the source of such sound, and conversely of throwing off from the reflector, in parallel lines, if need be, the sound of a bell or whistle, which may be placed at the focus of the said reflector, substantially as described.

No. 23,719.—WILLIAM SMITH, of Pittsburgh, Pa.—*Improvements in Coal Oil Retorts.*—Patent dated April 19, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I am aware that shafts exposed to heat have been made hollow, and water or air conducted through them, for keeping them cool: I, therefore, do not claim this broadly.

But I *claim* the making of the agitating arms *h*, hollow, and to communicate with the hollow shaft D, for the purpose of cooling them, by means of the current of air or water passing through the said shaft, substantially as set forth.

No. 23,720.—WILLIAM H. SMITH, of Newport, R. I.—*Improvement in Stoves.*—Patent dated April 19, 1859.—This invention consists in arranging the pipes through which the several compartments communicate with the flue, in such relation to the compartments that the hot air is forced down into the space surrounding the ash box, which space is so divided by suitable partitions that the hot air which descends on one side of the ashbox has to circulate round the same and in its front, in order to get to the tube which communicates with the flue.

*Claim.*—The arrangement of the partitions F F<sup>1</sup>, in combination with the partitions K, and the openings *a a*<sup>1</sup>, for the purpose of forcing the hot air to circulate around and in front of the ashbox, substantially as and for the purpose specified.

No. 23,721.—ERASTUS STEBBINS, of Chicopee, Mass.—*Improvement in Stop Cocks.*—Patent dated April 19, 1859.—R is a seat for the collar I; S is the valve chamber; the metallic washer G, elastic washer H, and metallic conical, or concave shaped collar I, constitute one of the peculiar features of this improvement; L is the screw nut; T is the chamber of the nut; M are openings through the shell of the nut, which is raised thereby to and from the seat P; N is an elastic substance, or washer, secured to the end of the nut L by a screw or nut O.

The inventor says: I *claim* the arrangement and combination of the collar I, flexible washer H, metallic washer G, as and for the purpose described.

Also, the chambered nut or valve L, having apertures M, as and for the purpose described.

No. 23,722.—NATHAN P. STEVENS, of Keene, N. H.—*Improvement in Brakeheads for Railroad Cars.*—Patent dated April 19, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, suspending the brakeheads D to the ends of the transverse brake bar A, by the journals and boxes, substantially in the manner and for the purpose set forth.

Second. I *claim* forming cogs or protuberances on the peripheries of the journal sleeves C, and interposing strips of rubber G between them and the ends of the grooves in the journal box cap, in which the said cogs or protuberances move, for causing a greater pressure to be extended on the lower than on the upper portions of the shoes E, as described.

No. 23,723.—GEORGE D. STILLSON, of Rochester, N. Y.—*Improvement in Excavating Machines.*—Patent dated April 19, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—In combination with an endless belt of digging hose, a presser wheel, that acts independently of the weight of the machine, for driving them into the ground, as described.

No. 23,724.—ROBERT STOTT, of Baton Rouge, La.—*Improvement in Governors for Sugar Mills.*—Patent dated April 19, 1859.—The object of this invention is to secure a uniform pressure on the cane with variable feeding, this being obtained from the action of the upper roller.

*Claim.*—In combination, the caps S S, the bolts V, the plates X and Z, when acted upon by the employment of a weight, or its equivalent, through an eccentric movement, made and arranged substantially as and for the purpose set forth.

No. 23,725.—GEORGE C. TAFT, of Worcester, Mass.—*Improved Wrench.*—Patent dated April 19, 1859.—In this invention the screw rod *b* is one piece, with the ferrule *d* extending from the projection *c* of the said ferrule, and screwing into the female screw *o* of rosette *a*, which latter is one piece with the screw rod *f*.

*Claim.*—The rosette *a*, with a female screw *o*, in combination with the stationary screw *b*, traversing male screw *f*, and sliding jaw *g h*, with its female screw *p*, substantially as and for the purposes set forth.

No. 23,726.—WILLIAM P. TROWBRIDGE, of Washington, D. C.—*Improved Apparatus for Deep Sea Sounding and Method of Conveying and Paying Out Line for Other Purposes.*—Patent dated April 19, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim* the mode of conveying and extending a line across or through a given space by means of a weight or projectile, the line being compactly coiled within a tube or case, which is attached to the weight or projectile, and moves along with it, and is discharged from the case or holder as the weight or projectile advances, while one end of the line is retained at the starting point substantially as described.

I do not limit my claim to the particular manner of coiling the line described, or to any one mode of giving motion to the same, which may be the force of gravity, the propelling power of a rocket or cannon, or other motive power.

No. 23,727.—A. P. TUTTON, of Reading, Pa.—*Improvement in Railroad Car Brakes.*—Patent dated April 19, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—Connecting the two shoes E E between the wheels B at each side of the truck by means of racks B *b* and a pinion F, whereby the shoes, when brought in contact with the treads of the wheels are made by the action of the wheels to move simultaneously in opposite directions, and bind or wedge between them the wheels, to stop the same, substantially as described.

No. 23,728.—MICHAEL VAN DEBOGERT, of Binghamton, N. Y.—*Improved Washing Machine.*—Patent dated April 19, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim*, first, subjecting the articles to be washed to the combined action of the fluted or roughened surface of the tube and cylinder, the two surfaces moving, in part in opposite and in part in the same direction with each vibration of the cylinder, as set forth.

Second. I claim the arrangement of the means for gearing and ungearing the wheels as recited, whereby I am enabled to give vibrating motion to both of the rubbing surfaces, as described.

No. 23,729.—RICHARD VAN VELTHOVEN, of Philadelphia, Pa.—*Improvement in Grates for Furnaces.*—Patent dated April 19, 1859.—This invention consists in a hinged frame with grate bars, forming the rear of a furnace grate, in combination with certain devices for raising and lowering the said hinged frame, the whole being arranged so as to enable an attendant to rapidly discharge the cinders and refuse from the back of the grate into the ash pit.

*Claim.*—The frames G and G<sup>1</sup> with the bars I, forming the hinged rear of a furnace grate, in combination with the releasing and retaining cam K, operated by the rod O, or its equivalent, and the bracket J, with its projecting chain or equivalent, the whole being arranged substantially as and for the purpose set forth.

No. 23,730.—JACOB V. A. WEMPLE, of Chicago, Ill.—*Improvement in Harvesters.*—Patent dated April 19, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The guard rod W to separate the falling grain from that which lies on the platform, while the rake is passing down, and lay hold thereof, and also to prevent the grain from falling on the rake, arranged and operated substantially in the manner described.

No. 23,731.—I. W. WETMORE, of Erie, Pa.—*Improvement in Railroad Chairs.*—Patent dated April 19, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—Notching the caps of the adjacent ends of H or T rails as at *f*, and the adaptation

of a chair A to surround the ends or joint within the shoulders of the notches, the chair forming the bearing surfaces for its length, and its leaves being bent under the base of the rail, and resting on the tie, substantially as set forth.

No. 23,732.—CULLEN WHIPPLE, of Providence, R. I.—*Improvement in Machines for Combing Fibrous Materials*.—Patent dated April 19, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, arranging the series of gill combs *a a a a* with a hot chest or its equivalent, in such a manner that said combs can be alternately sheathed and protruded from between heated plates, in the manner substantially as described, and for the purposes specified.

Second. I claim the combination of the stationary heated chest T with the movable jaw D, the two when so combined operating to hold the fibrous substance firmly while the front end is combed.

Third. I claim arranging the series of fine screen combs *b b* with the heated chest T, substantially in the manner described, and for the purposes specified.

Fourth. I claim the arrangement and combination of the revolving cylinder C for first combing the front end of the sliver, the series of fine screen combs *b b* for combing the back end of the sliver and the nippers *k* for drawing the sliver through the screen combs and delivering it upon the apron, the whole combination as arranged operating to draw and comb the wool, or other fibrous material, in a straight line, and to deliver it in a position to be formed into a continuous sliver substantially as described.

No. 23,733.—EDWARD WHITELEY, of Boston, Mass.—*Improvement in Steam Boilers*.—Patent dated April 19, 1859.—This invention consists in a peculiar construction of the boiler, in which the fire box is within the boiler, the latter surrounded by a series of vertical water tubes leading from the upper to the lower part of the water space, and so arranged within a chamber or passage around the outside of the boiler that the products of the combustion after they escape from the fire box shall circulate around and amongst the tubes.

*Claim*.—The water tubes *f* within the space E surrounding the boiler, arranged and operating in the manner substantially as set forth.

No. 23,734.—W. L. WILLIAMS, of New York, N. Y.—*Improved Machine for Splitting Fire Wood*.—Patent dated April 19, 1859.—This invention consists in certain improvements in the mode of feeding blocks of wood to the knife or knives, which are described by the claim and engravings.

The inventor says: I am aware that endless feeding chains have been previously used for feeding blocks of wood to be split to the splitting knives, and I do not claim, broadly, such device, irrespective of the lateral movement described, for chains for this purpose may be seen in my patented machine previously alluded to. The knife D has also been used and may be seen in the above-mentioned machine. I therefore do not claim the knife D; but I *claim*, first, the employment or use of the endless feeding chains I I, when arranged as shown, or in any suitable way, so as to have the usual rotating movement around their pulleys *h h<sup>1</sup>*, and also the lateral movement for the purpose specified.

Second. The endless feeding chains I I, in combination with the yielding rollers *j j*, for the purpose of permitting the lateral movement of the chains as set forth.

Third. The yielding pawls *h<sup>2</sup> h<sup>2</sup>* in connection with the yielding rods *b<sup>1</sup> b<sup>1</sup>* in shafts *e<sup>1</sup>* and spurs *f*, arranged substantially as described, to permit the yielding of the blocks of wood while split, as described.

No. 23,735.—JAMES WILSON, C. GREEN; and WILLIAM WILSON, Jr., of Wilmington, Del.—*Improved Double Seaming Machine*.—Patent dated April 19, 1859.—This invention consists of two horizontal axles A A<sup>1</sup>, upon the ends of which are placed corrugated heads B B, C C. The lower heads B B are conical, having their smallest diameter pointing inwardly; the upper heads C C are also conical; but their smallest diameter points outwardly. Behind the upper and lower heads are forming rollers H H, which are employed to keep the cylinder round.

*Claim*.—The combination of the disks E and D, and the burring pulley H, the bearing down pulleys I, the double burring pullies K, and the finishing pulley L, in the manner and for the purpose substantially as described.

No. 23,736.—JAMES WILSON, C. GREEN, and WILLIAM WILSON, Jr., of Wilmington, Del.—*Improved Machine for Corrugating Sheet Metal*.—Patent dated April 19, 1859.—The inventors say: Hitherto it has been possible to double seam one end of a metallic keg by inserting a mandrel or other instrument suitable for the purpose. The object of this invention is to enable both heads to be double seamed, which by the old process was impossible, unless a large opening was left in one head.

*Claim*.—The arrangement of the upper and lower heads, the forming rollers H H, together

with the rollers which support the cylinders to be corrugated at the requisite angle, substantially as described.

No. 23,737.—D. A. WOODBURY, of Rochester, N. Y.—*Improved Variable Cut Off Gear for Steam Engines.*—Patent dated April 19, 1859.—This invention consists in a certain arrangement of a rocker fitted with a variable slide, and of two connecting rods attached to the said slide in combination with an eccentric or its equivalent, and with arms on the shafts of two cut off valves, whereby is obtained a cut off gear which is variable either by a hand adjustment, or serves as a regulator of the speed of the engine under the control of a governor.

*Claim.*—The arrangement of the rocker J, and its variable slide I, and the inclined or toggle like connecting rods H H<sup>1</sup>, in combination with the eccentric M, or its equivalent, and the arms G G<sup>1</sup> on the valve shafts, substantially as described.

No. 23,738.—GILBERT YATES, of West Dresden, N. Y.—*Improved Mode of Opening and Closing Farm Gates by Hand.*—Patent dated April 19, 1859.—The front ends of two connecting pieces H H<sup>1</sup> are pivoted to the arms of piece I. The ends of these arms are bent down, as seen at *i i*, so as to limit the lateral play of the piece I when it is turned on its pivot *b*. The rear ends of the connecting pieces are pivoted to the front ends of the two levers or arms G G, while the rear ends of the latter turn on a stationary pivot *a* in the rear of the post B.

*Claim.*—The combination of the levers or arms G G<sup>1</sup> with the connecting arms H H<sup>1</sup>, vibrating, connecting, and unlatching piece I, and cords *c* I<sup>1</sup> I<sup>2</sup>, when arranged and combined with the gate and posts, substantially as and for the purposes set forth.

No. 23,739.—GEORGE W. ZEIGLER, of Tiffin, Ohio.—*Improved Automatic Fan.*—Patent dated April 19, 1859.—In this invention, the weight of the occupant of the bed, acting on the levers, causes the cord to unwind and turn the wheel, the flanges of which, coming in contact with the arm, cause the pendulum, with which it is connected by a rod, to vibrate, and thus the brush swings over the bed. It also has a weight attached to each end, which assists the motion.

*Claim.*—The combination of the levers B B, supporting the bedstead with the escapement wheel F, lever E, pendulum and fan, together with the parts connecting the same, for operating the fan from the weight of the occupant of the bed, as described.

No. 23,740.—FRANCIS BASCHNAGEL, of Wenham, Mass., assignor to the BEVERLY RUBBER COMPANY, of Beverly, Mass.—*Improvement in Restoring Waste Vulcanized Rubber.*—Patent dated April 19, 1859.—The claim explains the nature of this invention.

*Claim.*—The process described; that is, boiling waste vulcanized rubber in water, after it has been reduced to a finely divided state, for the purpose of restoring the same to a plastic, gummy, or elastic state, fit to be used again in the manufacture of India rubber fabrics and substances, as set forth.

No. 23,741.—THOMAS BAXTER, of Petersburg, Va., assignor to WILLIAM H. BAXTER, of the same place.—*Improvement in Hydraulic Presses.*—Patent dated April 19, 1859.—The nature of this invention consists in casting the barrel of the cylinder separate from the head, thereby allowing the thickness to be much less in consequence of all longitudinal strain being overcome, and the quality of the iron cast being more dense. Wrought iron bands are shrunk on the casting to increase its strength.

*Claim.*—Making the cylinders of hydraulic presses in a manner substantially as described.

No. 23,742.—RICHARD BENNETT, of Redditch, England, assignor to J. F. MILWARD, of New York, N. Y.—*Improvements in Needle Wrappers.*—Patent dated April 19, 1859; Patented in England, May 7, 1857.—This invention consists in the employment of an inner wrapper, having attached to it a piece of cloth, or other fabric or material, through which the needles are stuck each in a separate hole, and which is capable of holding them so as to prevent any longitudinal movement, and in providing the outer wrapper with an attached loop, through which the inner one containing the needles is passed, and by which it may be held while the wrapper is open.

The inventor says: I *claim* the employment, in combination with the outer wrapper A, of an inner wrapper *b*, with an attached piece *e*, through which the needles are stuck, in the manner described.

I also claim the employment, in combination with such inner wrapper, of a loop *a*, secured to the outer wrapper A, substantially as specified.

No. 23,743.—TRUMAN COOK, of Washington, D. C., assignor to A. THOMAS SMITH, of the same place.—*Improvement in holding Keys for Strap Connections for Engines.*—Patent dated April 19, 1859.—The nature of this invention consists in a combination of parts whereby the key is held at any place of required adjustment, as if immovably fixed to the gib, and at the same time occupies no room available for any other purpose.

*Claim.*—The notches A F in the key, as shown, the hole C in the gib, the notch D at the side of the said hole, the bolt J with its peculiarly formed head B, and the combination and arrangement of these parts, substantially upon the principle and in the manner set forth.

No. 23,744.—SHERMAN McLEAN, of Royalton, N. Y., assignor to the AMERICAN TRADES COMPANY, of New York, N. Y.—*Improved Saw Jointer.*—Patent dated April 19, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—The arrangement and adjustment of the file in the tool or file carrier, so constructed that when the flat side of the long arm of the tool is pressed against the side of the saw blade it will present the file exactly at right angles to the angular edges of the teeth, and being passed over them, will square and make uniform their edges, the saw blade being placed, when the instrument is in use, between the long and short arms of the saw jointer, as described.

No. 23,745.—H. W. ROLAND and E. FORBIS, of Newport, Ohio, assignors to Themselves and WASHINGTON WITHEROW, of the same place.—*Improvement in Mole Ploughs.*—Patent dated April 19, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—Pivoting the carriage A to the beam B, near its forward end, as represented, and in combination therewith the curved colter *i*, pivoted to the beam B, and friction rest *c*, arranged and operating in the manner set forth.

No. 23,746.—JOHN P. SCHENKL, of Worcester, Mass., assignor to Himself and E. A. DANA, of Boston, Mass.—*Improvement in the Chambers of Ordnance and other Fire-Arms.*—Patent dated April 19, 1859.—The operation of this invention is described as follows: The initial charge in space *a* being first ignited by the vent fire and exploding, imparts motion to the rod *p*, sabot *s*, and projectile S, which is instantaneously followed by the explosion of the main powder charge in space *g g*, fired by the flame following the rod *p*, by which process the *vis inertiae* of the projectile has been overcome before the explosion of the main charge takes place.

The inventor says: I *claim* the combination of an intercepting rod or leader *p* with the secondary barrel or auxiliary charge chamber, and a projectile adapted to the gun or piece of ordnance.

No. 23,747.—O. M. STILLMAN and S. WILCOX, Jr., of Westerly, R. I.—*Improved Thermostat for Steam Boilers.*—Patent dated April 19, 1859.—The patentee thus describes the operation of his invention: Upon starting the engine, the steam passes from the boiler through the separator to dome C, from which it passes through pipe G to E and circulates among the heated flues, as indicated by the arrows, and passes out at G<sup>1</sup> fully superheated.

*Claim.*—Regulating the flow or the products of combustion to the superheater by the difference in pressure between the superheated steam and that of saturated steam, substantially in the manner described, and for the purpose set forth.

No. 23,748.—R. W. BELSON, of Philadelphia, Pa.—*Improvement in Stoves.*—Patent dated April 26, 1859.—Over the top oven plate is arranged an air-heating chamber *a* of semicircular form, which chamber turns upon a hollow axis *b* and also upon the collar *c*. The air is admitted to chamber *a* through the hollow axis *b*, and as it is taken over the top of the stove it is considerably heated prior to its entrance into *b*. The straight edge *e* of chamber *a* is perforated with numerous holes for introducing the heated air among the gases arising from the fire.

The inventor says: I *claim* the semicircular heater *a*, turning upon the hollow axis *b*, near one side of the heater, arranged and combined with the stove, as set forth.

Also, combining said heater, by means of collar *e*<sup>1</sup>, with the air chamber in rear of the fire back, as set forth.

No. 23,749.—R. W. BELSON, of Philadelphia, Pa.—*Improvement in Stoves.*—Patent dated April 26, 1859.—The chamber *a* and the arms *c* are designed to receive and heat the air prior to its introduction among the gaseous products of combustion, to cause their complete consumption. The air is admitted to the chamber and thence to the arms by the pipe *b*, which extends to within a short distance of the back plate *e* of the stove. The damper *t* is made hollow, and one part *s* of its axis hollow; and the air being introduced through the hollow axis the damper becomes rarified, and rising directly into the chimney pipe increases the draft of the stove.

The inventor says: I *claim* the arrangement of the air heater *a*, sliding over the oven top and connected with the air passage *b*, in the manner and for the purposes set forth.

Also, making the damper *t* and its shaft hollow, in the manner and for the purposes set forth.

No. 23,750.—A. S. BLAKE, of Waterbury, Conn.—*Improvement in Animal Traps.*—Patent dated April 26, 1859.—To one end of the bar A the spring D is attached. One end of this spring is perforated and the jaws *e e* pass through it. The spring has a tendency to keep the jaws

in a closed state, and when the jaws are distended or opened they are retained in such position in consequence of the catch *b* fitting over one of the jaws, the trap being sprung by the animal, either treading on the plate or rubbing the bait thereon.

*Claim.*—A trap having its spring *D* attached below its jaws *ee*, and the spring brought within or nearly within the diameter of the jaws, as and for the purposes shown and described.

No. 23,751.—ALBERT D. BRIGGS, of Springfield, Mass.—*Improved Screw Wrench.*—Patent dated April 26, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—The application of the sleeve *G* to the nut *F* and the handle *D*, so as not only to be capable of turning with and rotating the nut, but of moving longitudinally on the handle and with the nut, in accordance with the movement of the movable jaw *E*, on the shank *A*.

No. 23,752.—GEORGE A. BRIGHAM, of Marlborough, Mass.—*Improvement in Dishes for Waxing Threads.*—Patent dated April 26, 1859.—*I* is a guard extending up from the upper end of *G* around the spool to catch any drops that may be carried to the spool and thrown off by its motion. In its operation the thread *C* is passed from the guide *B* under the wires *D* and *D*<sup>1</sup> to become thoroughly saturated, and then up by the rubbers in the common way to the spool *H*. Any drops carried up by the rubber are caught by the guard and returned to the dish *A*.

*Claim.*—The combination of the guard *I*, the dripper *G*, and the guides *B* with the two wires *D* and *D*<sup>1</sup>, to be placed in the dish to hold the thread in the manner and for the purposes set forth and described.

No. 23,753.—JOHN L. BROWN and A. C. GREENLEAF, of Indianapolis, Ind.—*Improvement in Sugar Mills.*—Patent dated April 26, 1859.—The following is the operation of this mill: The cane being fed into the mill through the hopper *P*, passes between the rollers *E* and *I*, the machine being operated by the lever *B*. The roller *I* is adjusted by either tightening the rods *K K*, *N N*, or operating the set screws *oo*. The eccentric levers *L L* are so constructed as to retain about the same distance between the bearings and the fulcrum of the same, when their angles are varied, thus equalizing the pressure. By adjusting the weights *M*, the required amount of pressure may be applied to the crushing roller *I*.

*Claim.*—The combination and arrangement of the rods *K K*, *N N*, levers *L L*, and bearings *J J*, with the set screws *oo*, when constructed and operated, substantially as and for the purposes set forth.

No. 23,754.—WILLIAM W. BURGOYNE, of Washington, D. C.—*Improvement in Steam Engines.*—Patent dated April 26, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim*, first, the employment of the following elements in combination for the accomplishment of the described object, to wit: A water jacket *D D*<sup>1</sup> open to the atmosphere, inclosing the fire chamber, piston chamber, and smoke stack, a steam evaporating plate *B* forming the crown plate of the fire box, a supply pump *H* for jetting in the water upon the evaporating plate, and a piston *F*, which is hung or arranged so as to reciprocate in the path of a circle or in a straight line when operated upon by the evaporating steam, and in its movement operate the driving shaft of an engine, substantially as and for the purposes set forth.

Second. The manner described of making steam between an intensely heated plate, piston, and isolated or comparatively cold sides of the piston chamber, substantially as and for the purposes set forth.

No. 23,755.—JAMES L. CATHCART, of Georgetown, D. C.—*Improved Marine Governor for Steam Engines.*—Patent dated April 26, 1859.—This invention consists in combining with the steam pipe a valve and automatic governor in such a manner that the same action which raises the propeller, or one of the side wheels out of the water, shall gradually close the valve that admits the steam to the engine, and *vice versa*.

*Claim.*—Regulating the supply of steam to marine steam engines by means of a pendulum arranged and operated in the manner substantially as described and for the purposes set forth.

No. 23,756.—GEORGE CHAMBERLIN and W. CHAMBERLIN, of Olean, N. Y.—*Improvement in Harvesting Machines.*—Patent dated April 26, 1859.—The nature of this invention relates to certain improvements in the arrangement and combination of cutters, gathering and discharging fingers, with the reel in a reaping machine having a revolving cutting apparatus.

*Claim.*—The combination and arrangement of gathering fingers *I* and knives *H* with the reel *L*, arms *M*, receiver *M*<sup>1</sup>, and discharges *N*, when the several parts are constructed and operated as specified.

No. 23,757.—DAVID CUMMING, of Sorrel Horse, Pa.—*Improvement in Devices for Starting*

*Railroad Cars.*—Patent dated April 26, 1859.—This invention consists in an improved device for starting cars.

The inventor says: I *claim*, first, In combination with the ratchet wheels D, the ratchet bars E, arranged and operating as described, for the purpose set forth.

Second. Arranging the ratchet bars E with the sliding frame to which the power is applied, so that said bars will be capable of slight play up and down when in clutch with their wheels, and will run entirely out of contact with said wheels without the aid of other mechanism as described and for the purposes set forth.

No. 23,758.—M. O. DAVIDSON, of New York, N. Y.—*Improvement in the Mode of Connecting and Supporting Railroad Rails.*—Patent dated April 26, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—The use of a rail having its lower web cut away for about fifteen inches at the ends, in combination with the use of a bridge rail splice of a form suitable to receive and support securely the stem of the rail after its lower web has been cut away, and of a length of about thirty inches, or of the distance from centre to centre of cross ties at the ends of the rails, substantially in the manner and for the purpose set forth.

No. 23,759.—THOMAS F. DEBRULER, of Rockport, Ind.—*Improvement in Cotton Presses.*—Patent dated April 26, 1859.—The inventor says: My improvements consist of a machine for compressing substances, wherein I employ two separate segments of circular rack gearing, arranged eccentrically on pivots or axles relative to each other, so that as the ends of the segments of one gear rack moving on a local pivot point, describe the arcs of parallel but different sized circles, the ends of the other gear rack, moving on a sliding pivot point, describe slightly curved lines which cut or cross each other in opposite directions.

The inventor *claims* the construction and arrangement of eccentrically operated gear racks  $h h h$  and  $h^2 h^2 h^2$ , with the connecting rod or yoke  $x x y y$ , Figs. 1 and 2, as described.

Also, the combination of the said devices with the plunger or follower  $n n n$ , substantially as set forth and described.

And also, the construction and arrangement and combination of the traversing pinion  $P^2$  with the sliding carriage  $q q r r s s$ , and driving lever or arms  $w w w w$ , substantially as set forth and described.

No. 23,760.—HENRY DUBOSQ, of Philadelphia, Pa.—*Improved Mode of Connecting Strung Pearl Jewelry.*—Patent dated April 26, 1859.—This invention consists in connecting the plates by means of metallic bars extending across the back of each mother of pearl plate, and riveted thereto on either side of the centre, and then connecting the ends of the bars with each other by an intermediate metallic link.

*Claim.*—Connecting the mother of pearl, or plates of other material used to form the foundation on which the pearls are strung, substantially as described and for the purpose set forth.

No. 23,761.—SELAH DUSTIN, of Detroit, Mich.—*Improved Low Water Alarm for Steam Boilers.*—Patent dated April 26, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—In combination with a steam cylinder located inside of a steam boiler, and having two openings in it, a float and rod carrying or operating two valves in equilibrium, and having no packed joints, substantially as described, by means of which are avoided all undue pressure and friction, and the float rendered more sensitive to any variation of the height of the water in the boiler, thus to obtain a more reliable indication, or signal, than by any of the heretofore essayed plans, as set forth.

No. 23,762.—WILLARD C. ELLIS, of Springfield, Mass.—*Improvements in Breech Loading Fire-Arms.*—Patent dated April 26, 1859.—The nature of this improvement consists in the means of providing for the removal of the cartridge shell from the barrel after the explosion and cocking, &c.

The inventor says: I *claim* the sere E, having the double action of firing the pistol and unlocking the hook F.

The lever P in this, or any other form substantially the same, in combination with the lugs on the hammer, as shown in the engravings, or with lugs on the sides of the pistol frame.

The cocking of the pistol by the act of breaking down the barrel, in the manner substantially as described.

No. 23,763.—BENJAMIN FITTS, of Worcester, Mass.—*Improved Method of Adjusting the Knives of Rotary Cutter Heads for Planing Wood.*—Patent dated April 26, 1859.—What constitutes the characteristic feature of this invention is placing the bolts F under the knife with the collar or head, as set forth, thus allowing the knife to be placed in the most favorable position for cutting, at the same time keeping the bolts within the circle K.

*Claim.*—Placing the bolt F F, fig. 2, or its equivalent, under the knife, to operate or adjust the knives as set forth and described.

No. 23,764.—TRUMAN FREEMAN, jr., of Providence, R. I.—*Improvement in Rotary Pumps.*—Patent dated April 26, 1859.—The nature of this invention consists in the method of operating the pistons of rotary pumps.

*Claim.*—The combination of the pistons H and the dogs Q, constructed as described, and arranged for conjoint operation with the cam I and pin K, substantially in the manner specified.

No. 23,765.—LOCKWOOD GAIL and JOHN H. GAIL, of West Falls, N. Y.—*Improved Washing Machine.*—Patent dated April 26, 1859.—The operation of this machine is as follows: The proper quantity of clothes are placed in the tub. The rubber is then put into the tub and rests on the clothes. A sufficient quantity of water should be put in with the clothes. By working the lever E a reciprocating motion will be given to the rubber, causing the rollers C to roll over and upon the clothes in the tub.

*Claim.*—The arrangement of the vertical post F and lever E, with the rubber, the whole being constructed, arranged, and operated in the manner substantially as described.

No. 23,766.—PERRY G. GARDINER, of New York, N. Y.—*Improvement in Springs for Railroad Cars and Carriages.*—Patent dated April 26, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—The construction of a spring, by confining the ends of the exterior blades *a a* in bearings in the ends or heads of a tension bar C, without rivets, bolts, hinges, pins, or screws, arranged and operating in the manner and for the purposes described.

No. 23,767.—J. W. GOODELL, of East Wallingford, Vt.—*Improvement in Steam Spading Machines.*—Patent dated April 26, 1859.—This is more especially designed to operate on a large scale, and to supersede steam ploughs. The desired object is attained by the employment or use of a series of wheels attached to a common shaft or axis, the wheels being provided with spades and cleavers, and in certain cases used in connection with revolving wings or blades.

The inventor says: I *claim*, first, the wheels H, provided with spades I, in connection with the cleavers J and the rotating plates *h*, arranged for joint operation, substantially as and for the purposes set forth.

Second. The attaching of the frame A, which contains the wheels H, to a traction engine by means of a universal joint B, in connection with the gearing E D and shaft C, substantially as shown, whereby the frame and wheels H are allowed to conform to the inequalities of the ground, and the working parts driven direct from the engine.

No. 23,768.—EDOUARD GUÉRIN, of Paris, France.—*Improvement in Self Acting Apparatus for Working Railway Brakes.*—Patent dated April 26, 1859.—In this invention, among other pieces of mechanism, is used for the purpose of pushing back a train, a vertical lever L, provided with a balance weight P, which actuates the rod T, the latter suspended to the frame by the piece S. The other extremity of this rod is attached to the forked piece D.

*Claim.*—The forked piece D, vertical lever L, provided with balance weight P, rod T, and collar M, when arranged substantially as and for the purpose set forth.

The inventor says: I reserve to myself the right of varying, or changing the forms, dimensions, and proportions of accessory matters employed.

No. 23,769.—STEPHEN R. HUNTER, of Cortlandt, N. Y.—*Improvement in Seeding Machines.*—Patent dated April 26, 1859.—This invention consists in combining with a broadcast seed distributing device, a rotary drag or harrow, constructed in a novel way, applied to the machine and arranged so that the drag or harrow is made to conform to the inequalities of the surface of the ground, its rotation being insured by the forward movement of the machine, and the seed covered in a proper manner directly after being dropped.

*Claim.*—The seed distributing cylinder K, with adjustable shell L, in combination with two or more seed boxes I J, and rotary harrow H, substantially as and for the purpose set forth.

No. 23,770.—DAVID KNOWLTON, of Camden, Me.—*Improved Steering Wheel.*—Patent dated April 26, 1859.—The nature of this invention consists in making a metal rim or circle and providing it with sockets for the wooden arms or spokes of the wheel, so that if one of the arms should be broken it could readily be removed without injury to the other parts, and its place supplied with a new spoke or arm without delay.

*Claim.*—The metal rim or circle, provided with sockets for the wooden arms or spokes of the wheel, substantially as described.

No. 23,771.—WILLIAM E. LOCKWOOD, of Philadelphia, Pa.—*Improvement in Ladies' Collars*

*and Cuffs*—Patent dated April 26, 1859.—This invention consists in the new manufacture of embossed cuffs, collars, and other articles of wearing apparel, made of a fabric composed of paper and thin muslin pasted together, whereby a close imitation of, and a cheap substitute for, linen cuffs, collars, &c., are obtained.

*Claim.*—As a new article of manufacture, embossed cuffs, collars, and other articles of wearing apparel, made of a fabric composed of paper and thin muslin, or its equivalent, pasted together as set forth.

No. 23,772.—NATHAN B. MARSH, of Cincinnati, Ohio.—*Improved Water Metre.*—Patent dated April 26, 1859.—The nature of this invention consists in constructing a water metre of two end measuring chambers on each side, united by a pair of stationary cylinders, and having, in connection with them, independent interior reciprocating cylinders, divided transversely by septa, and having their stroke adjustable from the exterior. It further consists in a certain construction of parts, whereby the end flanges of the stationary cylinders are made to carry the reciprocating cylinders and the one gasket or packing at each side is made to secure the reciprocating cylinders against leakage, &c.

The inventor says: I *claim*, first, the combination of the two side or end measuring chambers A A<sup>1</sup> B B<sup>1</sup>, middle piece or stationary cylinders C C<sup>1</sup>, independent reciprocating exterior cylinders F F<sup>1</sup> having septa g g, adjusting rods E E<sup>1</sup>, and valve box with its valves and passages, the former actuated by the reciprocating exterior cylinders essentially as set forth, and the latter forming inlet and outlet communications with and from the measuring chambers; all for operation together, substantially as described.

Second. Supporting the reciprocating interior cylinders F F<sup>1</sup> on projections formed by the extension inwards of the end flanges b b of the stationary cylinders C C<sup>1</sup>, and packing the said reciprocating cylinders by the gaskets ff, which make tight the joints of the stationary cylinders with the measuring chambers; said gaskets being cupped, or bent internally, as shown and described.

No. 23,773.—THOMAS J. MAYALL, of Roxbury, Mass.—*Improvement in Treatment of Vulcanized Rubber.*—Patent dated April 26, 1859.—This invention consists in the use of olive oil in compositions of soft vulcanized India rubber, and gutta percha not vulcanized.

*Claim.*—The use of olive oil in compositions of gutta percha and India rubber, substantially in the manner and for the purposes described.

No. 23,774.—RICHARD MONTGOMERY, of New York, N. Y.—*Improved Machine for Corrugating Sheet Metal.*—Patent dated April 26, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The combination of the bevel wheel h and bevel pinions i i with the sleeve n, projection k<sup>1</sup> k, m<sup>1</sup> m, and fork p, with the corrugated rolls H H<sup>1</sup>, and the device for raising and lowering the corrugated roll H, constructed and arranged in the manner described, whereby a sheet of metal once entered between the rolls can be worked back and forth and gradually and evenly corrugated at one heat and by one attendant, as set forth.

No. 23,775.—HIRAM W. MOORE, of Jersey City, N. J.—*Improved Mode of Chilling Rims for Locomotive Wheels.*—Patent dated April 26, 1859.—The claim and engravings will explain the nature of this invention.

*Claim.*—A hollow chilled rim, whose inner and outer rims are riveted at the sides or ends thereof, but also united throughout the annulus by means of braces extending from one to the other for the purpose of strengthening the tread of the wheel and preventing it from cracking or breaking in, substantially as described.

No. 23,776.—ENOCH E. MULLINER, of New York, N. Y.—*Improvement in Reefing Sails.*—Patent dated April 26, 1859.—This improvement consists in a division of the sail, whereby the surface of the canvas presented to the wind is stronger than if it were a single sheet, owing to the necessary employment of foot and top ropes of the respective parts D E where they unite.

*Claim.*—The combination of the divided sail D E or F G with reef pennants c, roller clews b, pulleys d, and yard or boom C I, as and for the purposes shown and described.

No. 23,777.—CHARLES NEAMES, of New Orleans, La.—*Improvement in Fastening Slats on Sugar Cane and Bagasse Carriers, &c.*—Patent dated April 26, 1859.—The nature of this invention consists of a hinged clasp made of malleable iron, or any other metal that will answer the purpose in a mechanical manner, whereby the same results may be obtained, one end of the clasp closing down on the wood slat, the other end taking hold of the link of the chain, by which it secures the two endless chains and wood slats, constituting the carriers or bands, and retaining them in their relative position.

*Claim.*—The arrangement and combination of the two jaws H and I, hinged together at L by means of hinge pin L<sup>1</sup>, as and for the purposes shown and described.

No. 23,778.—SAMUEL NICHOLSON, of Boston, Mass.—*Improvement in Rails for Street Railroads*.—Patent dated April 26, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* my improved rail, or combination of the flat rail or tread bar A and the continuous metal bearing or carrier B, applied together so as to be supported by a wooden sill, substantially as specified.

I claim making each bearer, not only with a grooved upper surface, but with a projection or lip at the bottom for the purpose of producing uniformity of strength in the section of the rail, and of entering a corresponding groove on the stringer C, and supporting the rail and its spikes or bolts against lateral strain.

No. 23,779.—SPENCER THOMAS PARMELEE, of Edinburgh, Scotland.—*Improvement in the Manufacture of Elastic Belting*.—Patent dated April 26, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—Submitting the belting, while within the heating or vulcanizing chamber, to pressure between the smooth surfaces of an endless metallic band and one of two revolving metallic cylinders round which the said band passes, substantially as set forth.

No. 23,780.—A. W. PAYNE, of Morris, N. Y.—*Improvement in Sharpening the Calks of Horse Shoes*.—Patent dated April 26, 1859.—This invention consists in placing within a suitable stock or frame a rotary steel burr or cutter, one or more, and a bearing plate or plates, whereby the desired work may be done with facility and in a proper manner.

*Claim*.—The rotary burrs or cutters B B<sup>1</sup>, one or more, in connection with the bearing plates C C, placed within a suitable stock or frame A, and arranged substantially as and for the purposes set forth.

No. 23,781.—JAMES RUNDERFORD, of New Haven, Conn.—*Improvement in Waterproof Leather Hose*.—Patent dated April 26, 1859.—The claim explains the nature of this invention.

*Claim*.—The new or improved manufacture of riveted leather hose, made with a waterproof lining applied to its inner surface and extending between the joint or lapping where the rivets are inserted, substantially as described.

No. 23,782.—DAVID RAMLER, of Union Deposit, Pa.—*Improvement in Machines for Raking Hay*.—Patent dated April 26, 1859.—The object of this invention is to obtain a horse implement whereby the hay can be raked direct from the spread state in which it was dried or cured into cocks, thereby avoiding the manual labor of "cocking" the hay from windrows into which the ordinary horse rakes can only gather it.

*Claim*.—The adjustable side bars A A, provided with the rake heads J J and teeth *o*, in connection with the rake head or shaft B, provided with teeth *p*, the above parts being arranged and combined substantially as shown, and used with or without the dividers *b*, to operate as and for the purposes set forth.

No. 23,783.—ISAAC REAMER and HENRY MILLER, of Conrad's Store, Va.—*Improvement in Corn Harvesters*.—Patent dated April 26, 1859.—The claim and engraving give an idea of the nature of this invention.

The inventors say: What we *claim* as our invention is, first, the combination with the vertically adjustable upper guides G G<sup>1</sup>, of the vertically adjustable reel D, for action together, as set forth.

Second. The reel D, constructed with tangentially set tie bars, or guides *k k*, as described, in combination with a platform on which the stalks fall parallel with the line of travel, substantially as and for the purpose set forth.

Third. The combination with the frame A and knife C<sup>2</sup>, of the under adjustable frame A<sup>1</sup>, substantially as and for the purpose set forth.

Fourth. The manner shown and specified of connecting the platform E with the frame of the machine, for the purpose set forth.

Fifth. Providing the platform E with a slide back extension board *n*, in the manner and for the purpose set forth.

Sixth. The arrangement with oblique, or diagonal set spring blade, or cutter, of a fixed obliquely set carrying wheel C, in the manner and for the purpose set forth.

No. 23,784.—JOHN C. REED, of Providence, R. I.—*Improved Stove Polish Mixer and Scraper*.—Patent dated April 26, 1859.—This stove polish mixer and scraper is formed of cast iron, and consists of the following parts: A, a receptacle for containing the polish; B, a scraper, or knife, formed of steel, for scraping the polish from a block of the same; C, a bowl or mixer for mixing the same after it has been so scraped.

*Claim*.—The combination of the receptacle A, scraper B, and mixer C, when arranged and operated as described.

No. 23,785.—JACOB RINEK, of Easton, Pa.—*Improvement in Machines for laying Hemp*

*around Wire and Making Rope.*—Patent dated April 26, 1859.—This invention consists in a revolving yoke, having a hollow spindle and a bobbin containing wire, in combination with certain perforated plates and a system of bobbins, some containing strands of hemp, the whole arranged so as to form an effective machine for making hemp and wire rope combined.

*Claim.*—The revolving yoke *E* with its hollow spindle *e* and one or more rollers *h*, arranged on and turning in the yoke, as set forth, when the said yoke and its appendages are combined with and arranged in respect to the two sets of bobbins *a a* containing the strands of hemp, the perforated guide plates *I* and *J* and tube *m*, substantially as set forth.

No. 23,786.—ISAAC A. SERGEANT, of Springfield, Ohio.—*Improved Spring Bed Bottom.*—Patent dated April 26, 1859.—This invention relates to the provision of a combined yielding frame, with a longitudinal arrangement of cords of simple construction, easy adjustment, and enduring elasticity; a provision, in connection with the one named, for adaptation to the purposes of a recumbent couch; also an arrangement for the temporary fixture of the yielding or upper portion of the bottom.

The inventor says: I *claim*, first, the arrangement of the stretcher frame *C C<sup>1</sup> C<sup>2</sup>* and rails *B* and *D*, secured and supported as described, for the purpose set forth.

Second. The supporting legs or stays *F* and racks *G* in the described combination with the stretcher frame *C C<sup>1</sup> C<sup>2</sup>*, for the purpose set forth.

Third. The described arrangement of straps *d* and knobs *e*, for the purpose explained.

No. 23,787.—GEORGE SCHUH, of Madison, Ind.—*Machine for Addressing Newspapers, &c.*—Patent dated April 26, 1859.—This improvement relates to that class of machines which are intended to substitute the process of printing for that of writing the addresses on papers intended to be mailed.

The inventor says: I *claim* the combination with the hopper *C*, which contains the documents to be addressed; of the sliding gate *K* provided with a heel or step, and operating to close the hopper discharge, and at intervals open the same in such manner as to permit of a single document being deposited from the pile in the hopper in front of said heel for after traverse with the gate, substantially as and for the purposes specified.

I also claim the combination of the inclined feeding channel *E<sup>1</sup>*, main type channel *E*, and raised discharge channel *g*.

I further claim, in connection with the feed bolt *E<sup>2</sup>*, the angle lever *X<sup>2</sup>*, or its equivalent, to aid the type in its course from the feed channel to the main channel of the machine.

Likewise, I claim the employment of form boxes *H*, for use as described, at either end of the machine.

Also, the combination with the traversing type, or "form," of a notice bell, or its equivalent, for operation by the type at intervals as described.

Likewise the combination with the bolster *L*, operating essentially as described, of the springs *S<sup>1</sup> S<sup>2</sup>* for relieving the type from the paper and holding it on the bolster and type shifter *G<sup>1</sup>*.

And lastly, the document discharging fly *x<sup>1</sup>*, when operated by the sliding gate *K*, essentially as described.

No. 23,788.—PATRICK SHARKEY, of Brownsville, Miss.—*Improvement in Cotton Scrapers.*—Patent dated April 26, 1859.—This invention consists in arranging the scrapers one forward of the other on guide blocks, or runners of different lengths, in such a manner that the scraper of the short runner shall always have a tendency to move with the scraper of the long runner, without offering any resistance to the movement in a right direction of the same. Also, in the arrangement of a sleigh runner shaped gauge with the short scraper.

The inventor says: I *claim*, first, arranging the scrapers *F G* one forward of the other on guide blocks or runners *D E* of different lengths, substantially as and for the purposes set forth.

Second. The arrangement of a sleigh runner shaped gauge with the short scraper *E*, substantially as and for the purposes set forth.

No. 23,789.—THOMAS SHAW, of Philadelphia, Pa.—*Improvement in Sewing Machines.*—Patent dated April 26, 1859.—This invention consists in attaching to a spring a feed box, to which a vertical reciprocating motion is imparted by revolving rods, acting in conjunction with the said spring, and to which a horizontal reciprocating motion is imparted by revolving adjustable set screws and the same spring; the horizontal motion of the feeding bar being regulated by a set screw in a bracket on the base of the machine.

*Claim.*—The feed bar *Q* attached to and carried solely by the spring *s*, operated vertically by the combined action of the rods *F F* and the aforesaid spring, and horizontally by the combined action of the independently adjustable screws *i* and the same spring *s*, and regulated by the screw *R* on the stationary bracket *g*, the whole of the above parts being arranged substantially as set forth.

No. 23,790.—THOMAS SILVER, of Philadelphia, Pa.—*Improvement in Governors for Regulating the Speed of Steam Engines.*—Patent dated April 26, 1859; patented in England, May 23, 1857.—When the instrument is in action, whilst the shaft or spindle and momentum wheel A rotate with the same velocity, the sliding sleeve H will remain distended to the collar K, but upon the shaft being impelled by the increased speed of an engine with a greater rapidity than the momentum wheel, and carrying therewith the toothed wheels or sectors, the latter, impinging upon the toothed boss or pinion, are turned, the one to the right and the other to the left, drawing the collar H toward them and compressing the spring F and closing the throttle valve.

*Claim.*—The combination of a spring with a momentum wheel, and adjustable speed limiting vanes, the whole constructed with the combination of the peculiarly adjusted sectors, pinion, and links, as fully described and set forth.

No. 23,791.—WALTER C. SMITH, of Georgetown, D. C.—*Improved Detective Register for Doors of Railroad Cars.*—Patent dated April 26, 1859.—This invention consists in the combination of devices forming a registering seal, for indicating the number of times and places where the doors of freight cars have been opened.

*Claim.*—The detection of the opening and closing of car doors by means of the latch or key *m*, in combination with the two index or registering wheels *a b*, operated substantially as herein set forth.

No. 23,792.—JOSEPH E. STANWOOD, of Malden, Mass.—*Improved Gas Pipe Cutter.*—Patent dated April 26, 1859.—In using this pipe cutter, the pipe to be cut rests on the angular recess C of the claw B, the cutter wheel E being forced against the pipe while the whole instrument is turned about the pipe, so as to cause the wheel cutter to roll transversely around the same.

The inventor says: I *claim* the improved pipe or round rod cutter as provided with a rotary cutting wheel E, to operate in conjunction with the claw or pipe rest, as specified.

I also claim the arrangement of the cutting wheel carrier in a recess C, (formed in the claw block B,) in combination with the arrangement of the adjustable screws *d e* and handle rod F, with respect to said recess and the cutter wheel carrier, the whole being as specified.

No. 23,793.—FRANK STEINHART, of Dansville, N. Y.—*Improvement in Spring Car Couplings.*—Patent dated April 26, 1859.—This improvement in car coupling relates to spring jaw and self-connecting couplings, in which the spring jaws form one part of the coupling, and a spear-headed or wedge-shaped bolt the other part.

The inventor says: I *claim*, first, the combination of the radial fenders or their equivalents, arranged as described, with the jaws of the nippers B, for the purpose set forth.

Second. Constructing the bolt head *h* with an open back, and also with a longitudinal recess *i* in its back, for the purpose described.

No. 23,794.—ENOS STEVENS, of Barnet, Vt.—*Improvement in Machinery for Accumulating and Transmitting Power.*—Patent dated April 26, 1859.—The inventor says: I place a long endless chain, band, or rope E C around any motive or propelling wheel or shaft M, and also around any working or driven wheel or shaft W, and then on the propelling or drawing side or portion of said long endless chain or belt I place a sufficiently heavy weight C W T, suspended by a traversing pulley block attached to or made part of said weight, but I put only a guide pulley G P on the slack side or portion of said long endless chain or belt.

*Claim.*—The endless chain E C, forming the pendant loops E and C, supported by the wheels N and W, in combination with the weight C W T suspended from a pulley supported by the loop E, and the weight or guide pulley G P, and cord R, the whole arranged and operated substantially as described.

No. 23,795.—FRANCIS STOCK and JOHN STOCK, of San José, Cal.—*Improvement in Pump Boxes.*—Patent dated April 26, 1859.—This invention consists in a peculiar manner of arranging and constructing the parts of the upper box in connection with its valve, and the manner of attaching said box to its rod or pole.

*Claim.*—The arrangement of the parts *j k l* of the box D in connection with the bolts or rods *p p* and valve E, substantially as herein shown and described.

No. 23,796.—THOMAS STUBBLEFIELD, of Columbus, Ga., assignor to Himself and PETER NAYLOR, of New York city.—*Improvement in Stop Cocks.*—Patent dated April 26, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—The combination of the lever D, cap l, valve stem *a*, and spring *c*, when the cap I is provided with a semi-circular opening into which fits the semi-circular end H of lever D, for the purpose of forming a tight joint without packing, substantially as herein described.

No. 23,797.—JAMES A. TAYLOR, of Cowlesville, N. Y.—*Improved Carpet Fastener.*—Patent dated April 26, 1859.—This invention consists in securing the carpet to the floor by

means of pins *b*, which pass through several folds of the carpet and the central part of which engages with hooks or eyelets *a* secured to the floor close to the base board.

*Claim.*—The hooks *a* and pins *b* arranged and operating in combination with the carpet, as described.

No. 23,798.—GEORGE C. TAFT, of Worcester, Mass.—*Improved Wrench.*—Patent dated April 26, 1859.—The guide rod *b* is one piece, with the ferrule *d*, extending from the projection *c* of the said ferrule into a corresponding hole *o* in the centre of rosette *a*, which latter is one piece, with the screw rod *f*.

*Claim.*—The screw threaded rosette *a*, with its hole *o*, in combination with the stationary guide rod *b*, rack *n*, traversing male screw *f* and sliding jaw *g h*, with its female screw *p*, substantially as and for the purposes set forth.

No. 23,799.—GEORGE TODD, of St. Louis, Mo.—*Improvement in Grinding Mills.*—Patent dated April 26, 1859.—This invention consists in placing the bearing ears which radiate from the rim of the stationary stone between double sets of springs, whose elasticity is governed and controlled by adjusting screws in such a manner that the desired position of the said stone can be readily obtained without danger of confining the stone in so rigid a position that it cannot at any time spring outwards a sufficient distance to discharge from the mill any unyielding substance that may find its way into the same.

*Claim.*—Securing the ears of the rim *f* of the stationary stone A between double series of upper and lower springs *m m* and *k k*, whose elasticity is governed and controlled by the series of adjusting screws *n n*, substantially in the manner and for the purpose herein set forth.

No. 23,800.—ALFRED R. TURNER, of Malden, Mass.—*Improvement in Pen Holders.*—Patent dated April 26, 1859.—The object of this invention is to so construct a pen holder as to allow the pen to be removed from the same without touching the fingers thereto, and at the same time insure the protection of the pen from injury when not in use, and its being firmly grasped and held in the pen holder when employed in writing.

*Claim.*—A pen holder constructed with the cover *b*, turning on a pivot or fulcrum, and acted upon by the bent spring, substantially as described.

No. 23,801.—J. B. WORTENDYKE, of Godwinsville, N. J.—*Improvement in Lamp Wicks.*—Patent dated April 26, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—A lamp wick composed of strands that have received a preparatory twist in one direction, are then spun in a contrary direction with and coiled upon a thread *c*, and are then twisted together, all as herein shown and described.

No. 23,802.—JOHN WOOD, of Brooklyn, N. Y.—*Improvement in Machines for Cutting and Folding Wadding and Paper.*—Patent dated April 26, 1859.—This invention is designed for cutting and folding wadding paper, or any textile or pliant substance which is manufactured in continuous sheets or rolls, and which require to be cut into pieces and folded for after use.

The inventor says: I *claim*, first, the receiving box V, provided with two compartments, and fly boards *a*<sup>1</sup>, connected with racks *c*<sup>1</sup>, and with ratchets *h*<sup>1</sup>, actuated by the arms *k* and cam J, in connection with the wheel X and adjustable pinion *o*<sup>\*\*</sup>, substantially as and for the purpose set forth.

Second. Operating the knife gate D and plate P, by means of the lever O, provided with sector racks *j*, which gear into the racks *k* of the gate D and bar *l*, so that the knife and plate will be actuated or made to perform their respective functions, alternately, as described.

Third. The arrangement of gearing G I K R, as shown and described, when used in connection with the lever *o*, for the purpose of operating the several parts automatically as and for the purpose set forth.

No. 23,803.—ABRAHAM YOST, of New York, N. Y.—*Improved Refrigerator.*—Patent dated April 26, 1859.—The ice holder being filled with ice and the covers closed tight, the external air rushes in through aperture *f* and around the passages *c c*, and when the dampers are all open it circulates through the compartments D D<sup>1</sup>, and out through apertures *d d*<sup>1</sup>, also through the drip pans E E<sup>1</sup>, into the compartments K K, and out through pipes L L.

*Claim.*—The combination and arrangement of compartments D K, dampers *b J*, and escape tubes L, substantially as and for the purposes set forth.

No. 23,804.—JOHN YOUNG, of West Galway, N. Y.—*Improvement in the Construction of Railroads.*—Patent dated April 26, 1859.—The nature of this invention consists in arranging and combining a rail with a supporting saddle at the ends or joints thereof, so as to prevent the spreading or swagging of the rails and ties.

The inventor says: I *claim* constructing a rail and saddle as described, whereby I am

enabled to hold securely, and render solid, the joints or ends of rails during the passage of cars, substantially as described.

I also claim combining with said rail and saddle, as described, the straining arch E, key D, and strip F, for the purpose set forth and specified.

No. 23,805.—FRANCIS BASCHNAGEL, of Wenham, Mass., assignor to the BEVERLY RUBBER COMPANY, of Beverly, Mass.—*Improvement in Restoring Waste Rubber*.—Patent dated April 26, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—Restoring waste vulcanized rubber, by reducing the same by grinding or otherwise to a finely divided state, and then submitting the same, in a suitable vessel, to the direct action of steam.

No. 23,806.—K. BORREN, of New York, N. Y., assignor to PETER SCHNEIDER, of said New York.—*Improved Sofa Bedstead*.—Patent dated April 26, 1859.—The claim and engravings will explain the nature of this invention.

The inventor says: I *claim*, first, constructing a sofa bedstead, with an interior drawer, which may be pulled out and united with the sofa seat, so as to form a bed or couch, by the application of ways or grooves *a* to the inside of the sofa frame, substantially as described.

Second. The horizontal rods F of the sofa frame, in combination with the stay F of the interior drawer, for the purpose of more securely guiding the said drawer, substantially as set forth.

Third. Providing the drawer with two back pins *o o*, in the manner and for the purpose substantially as described.

No. 23,807.—HARRY H. EVARTS, of Chicago, Ill., assignor to Himself and PHINEAS E. MERRIHEW, of said Chicago.—*Improvement in Steam Valves*.—Patent dated April 26, 1859.—The claim and engraving will explain the nature of this invention.

*Claim*.—The arrangement of the ports, cavities, and passages in the valve, substantially as herein described, in combination with a corresponding arrangement of the ports in the seat, whereby a single valve is made to perform its functions for the two cylinders of the engine, as herein set forth.

No. 23,808.—LEVI T. HOWELL, of Burlington, N. J., assignor to Himself and DE WITT C. TAYLOR, of Philadelphia, Pa.—*Improved Hinge*.—Patent dated April 26, 1859.—This invention consists in a hinge, so constructed that when applied to a window shutter or door it may serve the purpose of holding the same back against the wall, and allowing the shutter or door to be readily released when it is to be closed.

*Claim*.—The projection *i*, on one half of the hinge, said projection being inclined on one side and abrupt on the other, in combination with the spring bolt D and its notch *e*, when the said bolt is so fitted to the other half of the hinge, as to have a limited vertical but no turning movement therein, and when the whole of the parts are arranged for joint action, substantially as and for the purpose herein set forth.

No. 23,809.—CLARK LANE, of Hamilton, Ohio, assignor to OWENS, LANE, DYER & Co., of said Hamilton.—*Improvement in Horse Powers*.—Patent dated April 26, 1859.—The loops of the rods being slipped over the sweeps, and the eyes on the rear end of the rods caught in the hooks H, the loops are strained into their appropriate places on the rack by simply springing the sweep back or forward, as the case may be.

*Claim*.—The construction and adaptation of the stay rods F G, with the hooked stand plates I I and racks D E, on the sweeps C, or their equivalents, in combination as set forth.

No. 23,810.—RALPH S. MERSHON, of Philadelphia, Pa., assignor to Himself and John M. HARPER, of said Philadelphia.—*Improved Regulator for Time Keepers*.—Patent dated April 26, 1859.—The claim and engraving will explain the nature of this invention.

The inventor says: I *claim* the application to watches and such time pieces as have their vibrations governed by a balance and hair spring of a compound regulator D, composed of two or more segments C, constructed and operating substantially as described. I also claim the combination of said compound regulator with a greater and lesser scale, the former fixed and the latter movable, but having a fixed indicator, and capable of being operated either in concert with, or independently of, each other, substantially as herein described.

No. 23,811.—JAMES E. QUINN, of Chicago, Ill., assignor to JOHN M. JOHNSTON, of said Chicago.—*Improved Joint for Gas and Water Pipes*.—Patent dated April 26, 1859.—The claim and engraving will explain the nature of this invention.

*Claim*.—The arrangement of the rings *e* and *f*, on the pipe *d*, in combination with the opening *c*, in the socket *b*, forming the cement chamber *h h*, for the purpose of joining pipes so as to be air and water tight, by using cements in place of lead commonly used; the whole arranged substantially as set forth.

No. 23,812.—GEORGE W. RICHARDSON, of Grayville, Ill., assignor to Himself and JOHN P. WILLIAMS, of White county, Ill.—*Improvement in Seeding Machines*.—Patent dated April 26, 1859.—D D are stationary bars, framed to the uprights B B, with a space sufficient between them to admit of another bar E, which is caused to vibrate by means of the reciprocating lever F. The seed slide X receives its vibratory motion from the lever F.

*Claim*.—The arrangement of the cam wheel H and lever F, with the seed slide X, and vibratory bar E, of the harrow D D, when the whole is constructed for operation conjointly, in the manner and for the purpose herein set forth.

No. 23,813.—LEONARD B. TINKHAM, of Lawrence, Mass., assignor to Himself and CHARLES RYAN, of said Lawrence.—*Improved Bed Bottom*.—Patent dated April 26, 1859.—The slats are placed on the springs D by inserting the head of the rivet through the eye *c* and drawing the neck into the slot *d*. The rivet on the opposite end is inserted in a similar manner by pressing the spring and allowing it to spring back. This keeps the necks of the rivets within the slots and the slats securely fixed to the springs.

*Claim*.—The combination of S formed springs, arranged so as to receive the movable rivet and retain the slats in place, with bars B and stirrups *a b*, when the same are arranged substantially for the purposes and in the manner specified.

No. 23,814.—JOHN L. NICOLAI, of Chicago, Ill., assignor to Himself, S. E. KNOTT, and R. F. FARRELL, of said Chicago.—*Improved Egg Beater*.—Patent dated April 26, 1859.—This invention consists in arranging a series of fingered beaters in the same frame in such a manner that by revolving one wheel the whites of the eggs and the yolk and the eggs and sugar, or other mixtures contained in several different vessels, can be exposed to the action of the beaters at the same time.

The inventor says: I *claim*, first, the within described beaters C, arranged with diverging fingers F, which are attached to disks E, to operate substantially as and for the purpose set forth.

Second. The arrangement of a series of beaters C, constructed as herein described, on rotary shafts C, so that the several beaters can be operated substantially as and for the purpose specified.

No. 23,815.—FANNING ALBERT, of Brooklyn, N. Y.—*Improvement in the Manufacture of White Lead*.—Patent dated May 3, 1859.—The lines C in the engraving represent a metallic or other cylinder, designed to revolve slowly in the direction of the arrow over and within the rectangular trough, or tub B; this tub is to contain the supply of pulp, or wet white lead, of a height sufficient, or more than sufficient to touch and attach itself to the lower periphery of the cylinder, the pulp being of such consistency that the cylinder will receive a very thin coating of it. Steam being introduced within the cylinder produces the heat necessary for drying purposes. Scraper *d* takes the lead from the cylinder as it becomes dry.

*Claim*.—The application of a rotating self feeding cylinder for the drying of wet carbonate of lead, substantially in the manner described.

No. 23,816.—W. R. ANDREWS and JOHN OSWALD, of Chicago, Ill.—*Improved Alarm Water Gauge*.—Patent dated May 3, 1859.—This invention consists of a novel arrangement of steam passages, in combination with a steam whistle and valve attached to the index spindle of a float, which rests upon the surface of the water in the steam boiler for the purpose of sounding an alarm when the water in the boiler gets below or above certain levels. It also consists of a mode of applying a spring in combination with the spindle of the float and index, for the purpose of preventing any solid matter passing between the valve and seat when there is no pressure of steam in the boiler.

*Claim*.—The disk valve E, its stem B, and spring I, applied in combination with the inclosing sockets F and G, the latter of which contains an annular passage *d*, communicating with a whistle, the whole being arranged and operating as set forth.

No. 23,817.—SILAS BARKER, of Hartford, Conn.—*Improvement in Faucets*.—Patent dated May 3, 1859.—The improvements in this invention are in the direct downward formation of the discharging orifice A, of the fluid passage B, whereby the horizontal direction of the fluid striking the solid end C, is compelled to flow vertically through the orifice A, into the vessel placed to receive it.

*Claim*.—The vertical discharging orifice A, as herein described, and the concave end cut off to the face slide E, in the manner and for the purpose substantially as set forth.

No. 23,818.—ALBERT BETTELEY, of Boston, Mass.—*Improvement in Elevators*.—Patent dated May 3, 1859.—The object of this invention is to check gradually, in falling, the momentum acquired by the platform or car of an elevator, by a yielding resistance, so as to preserve the lives of persons who may be within the car or upon the platform when any accident occurs that severs the connection between it and the power that controls it.

The nature of the invention consists in the mechanical means, or their equivalent, by which the above object is accomplished, and in the new combination of the invention.

The inventor says: I *claim*, first, the combination of the air reservoir with the movable car or platform of an elevator.

Second. Constructing the base of the car *c*, in a parachute form, for the purpose set forth.

No. 23,819.—AMOS S. BLAKE, of Waterbury, Conn.—*Improved Door Spring*.—Patent dated May 3, 1859.—The bar *A* is attached at its outer end to the lintel *b* of the door frame by means of a joint *c*, so that said bar may swing out freely from said lintel, and the outer end of the bar *B* is attached by a screw pin *d* to the upper part of the door *C*. To the bar *B* a spring *D* is attached near the pin *d*; the outer end of this spring is connected by links *e e* to the bar *A* near the joint *a*.

*Claim*.—The arrangement and combination of the spring *D*, links *e*, and arms *A B*, as and for the purpose shown and described.

No. 23,820.—JAMES BOSS, of Philadelphia, Pa.—*Improvement in the Manufacture of Watch Cases*.—Patent dated May 3, 1859.—The nature of this invention consists in the application of the well known operation of spinning up sheet metal for the purpose of manufacturing watch cases by the employment of a mandrel and spinning wheels instead of the usual method of turning them out of solid material.

The inventor says: I *claim*, first, the spinning up of watch cases by the employment of a mandrel and spinning wheels, constructed to operate in the manner substantially as set forth.

Second. Spun plated sheet metal watch cases, constructed as specified.

No. 23,821.—WILLIAM Z. W. CHAPMAN, of New York, N. Y.—*Improvement in Fastenings for Curtains of Carriages, &c.*—Patent dated May 3, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—A curtain knob fastening, constructed and arranged substantially as set forth, so as to be readily opened from the base or on either side of the curtain, as described.

No. 23,822.—CHANDLER CHENEY, of Milford, Mass.—*Improved Skate Fastening*.—Patent dated May 3, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—Securing the back part of the skate to the boot or shoe by means of the spring band in connection with the screws, or their equivalents, when constructed and operating in the manner and for the purpose substantially as set forth and described.

No. 23,823.—D. W. CLARK, of Bridgeport, Conn.—*Improvement in Sewing Machines*.—Patent dated May 3, 1859.—*A* is the base of the frame, which may be made in the usual manner. *B* is the table upon which the fabric to be sewed rests. The usual aperture for the passage of the needle is made in the table; also an opening through which the teeth of the feed wheel *C* pass, so as to touch the under surface of the cloth. The latter is pressed down upon the surface of the wheel by means of the usual spring or foot pad.

The inventor says: I *claim* as my invention, and as an improvement on my patent of August 31, 1858, the combination and arrangement of mechanism, as described, for the purpose of controlling the feed wheel, in the manner set forth.

No. 23,824.—WILLIAM N. CLARK, of Chester, Conn.—*Improved Water Cask Life Boat*.—Patent dated May 3, 1859.—This invention consists of a peculiar construction of water casks and life boat, which may be used, under ordinary circumstances, as a water cask, and in emergencies as a life boat.

The inventor says: I *claim*, first, making the staves upon the lower side of the water cask more curved than those are upon the upper side, in order to give the life boat a proper bearing and greater stability in the water, substantially as described.

Second. I claim the ballast floor *G*, water tank, and hatch, when they are used in connection with the water cask and life boat, substantially as set forth.

No. 23,825.—HENRY CLAYTON, of Tamaqua, Pa.—*Improved Smoke Stack for Locomotive Engine Houses*.—Patent dated May 3, 1859.—*C* is a vertical smoke pipe or stack, the upper end of which enters the cupola *B*, and the lower end of which extends down within the building a suitable distance, and has a series of flues *D* communicating with it.

The flues *D* are so arranged that each tube *b* will be in line with the smoke pipe of a locomotive when the latter is within the house and occupies its proper place.

*Claim*.—The arrangement and combination with the smoke pipes of locomotive engines of a sliding tube *b*, flue *D*, and stack *C*, substantially as and for the purpose shown and described.

No. 23,826.—JOHN H. COE and WILLIAM B. SNIFFEN, of Stratford, Conn.—*Improved*

*Skate Fastening.*—Patent dated May 3, 1859.—The claim and engraving explain the nature of this invention.

The inventors say: We *claim*, first, the employment of the curved adjustable slotted bars E F at the front of the foot or base plate A, combined, arranged, and adjusted in relation to each other, and secured together and to the said base or foot plate A in position to correspond with the length of the foot and form of the front part of the same, substantially in the manner and for the purpose described.

Second. We claim the combination of the right and left screw K and the clamps H with the heel part of the skate frame, so that both clamps are simultaneously moved, substantially as shown and described.

Third. We claim the combination of a hinged handle L, with the screw which operates the clamps, so that after the skate is fastened to the foot the handle may be folded out of the way of the ice, as shown and described.

No. 23,827.—PASCHAL B. COMINS, of San Francisco, Cal.—*Improvement in Bomb Lances.*—Patent dated May 3, 1859.—The dart or lance is made with wings to close up, so as to be put into a gun and fired out. As soon as it is discharged from the gun the springs throw out the wings, which regulate its course and make it go straight.

*Claim.*—The employment of wings formed of a flexible material in connection with metal springs, as described, when so arranged as to be folded on the cylinder (for containing the powder) between the head and wad, in the manner and for the purposes set forth.

No. 23,828.—MATTHIAS P. COONS, of Brooklyn, N. Y.—*Improvement in Apparatus for Generating Gas.*—Patent dated May 3, 1859.—The nature of this invention consists in the construction, combination, and arrangement of an apparatus for generating gas while, at the same time, it may be used for other purposes, and by which different qualities of illuminating gas may be generated from different classes of material at the same time, the whole apparatus being made portable and of easy transportation.

The inventor says: I *claim* the form and mode of arrangement of the retorts, as specified, for the purpose of combining a series of gas generating retorts, for extending or diminishing its capacity of generating gas indefinitely, in the manner specified.

I also claim the combination of a diaphragm surrounding a condensing chamber and escape pipe, the whole arranged and operated as set forth and described.

No. 23,829.—JOSEPH COX, of Philadelphia, Pa.—*Improvement in Cooking Stoves.*—Patent dated May 3, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—I am aware that external air has been brought into the fire chamber to aid combustion, and therefore do not claim that as the scope of my invention.

But I *claim* the chamber *f* above the upper oven plate, communicating with the external air and fire chamber, substantially as described, whereby there is effected the double function of aiding combustion and equalizing the temperature of the upper portion of the oven.

No. 23,830.—ALEXANDER CRUMBIE and RUSSELL D. BRIGGS, of Brooklyn, N. Y.—*Improved Variable Cut Off for Steam Engines.*—Patent dated May 3, 1859.—In operating this invention the vibratory motion of the rockers C C<sup>1</sup> derived from the eccentric or its equivalent, causes the toes *h h*<sup>1</sup> to operate upon the lifters *a a*<sup>1</sup> and raise the rods or stems A A<sup>1</sup>, and open the valves until their respective tripping bars D D<sup>1</sup> while raised by the toes, and gradually assuming a less inclined position, have their points moved towards the rods or stems so far that they push back the sliding lifters *a a*<sup>1</sup> through the rods or stems till they push them off the toes, and thus liberate the valves and allow them to close.

*Claim.*—The arrangement and combination of the toggle rods D D<sup>1</sup>, slide E, rockers C C<sup>1</sup>, stems A, and lifters *a a*<sup>1</sup>, substantially as and for the purpose shown and described.

No. 23,831.—EDWARD CUNNINGHAM and WILLIAM B. CUNNINGHAM, of Powhatan Court House, Va.—*Improvement in Tobacco Presses.*—Patent dated May 3, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—Producing an improved hand press which is especially calculated to aid in compressing bunches of leaf tobacco into the proper shape for packing or “prizing,” the said press being composed of a narrow open box, which has a fulcrum piece and a false bottom combined therewith, and a removable lever adapted thereto, substantially as set forth.

No. 23,832.—MICHAEL A. DIETZ, of Brooklyn, N. Y.—*Improvement in Lamps.*—Patent dated May 3, 1859.—The nature and object of this invention consist in connecting, in a firm and tasteful manner, the deflector, so called, to the chimney band without the use of solder, rivets, or the like fastening, so that the connection will not be injured by the heat, or the deflector be thereby loosened, and the combustion of the lamp be rendered imperfect.

*Claim.*—Securing or connecting the deflector B to and into the chimney band A by means of a groove C, substantially as and for the uses and purposes set forth and described.

No. 23,833.—P. F. DODGE, of West Cambridge, Mass.—*Improved Lock for Piano Fortes.* Patent dated May 3, 1859.—The nature of this invention consists of a new method of moving the bolt of a lock, whereby the operating parts are simplified and rendered easy and cheap to manufacture.

*Claim.*—Actuating the bolt by means of the arm E, of the tumbler B, and the recess D, in the bolt A.

No. 23,834.—SPENCER B. DRIGGS, of New York, N. Y.—*Improvement in Piano Fortes.*—Patent dated May 3, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—So arranging and applying the sound board and strings, and so constructing and applying the bridge or bridges of a piano forte, that the depths of the bridge or bridges at the bearing points of the several strings, and the distances of the several strings from the board, are all in the same proportion, or thereabouts, to the length of string, as described.

No. 23,835.—JAMES W. ELLIOTT, of Prattville, Ala.—*Improved Machine for Filing Gin Saws.*—Patent dated May 3, 1859.—The nature of this invention consists in certain improvements for properly adjusting the files to saws of different sizes, and revolving the saws as the filing progresses.

The inventor says: I *claim*, first, making said table adjustable at both ends, substantially as set forth.

Second. I claim the standard A, with the adjustable post A<sup>1</sup>, and slotted bar B, for supporting the cylinder of saws, substantially as described.

Third. I claim making the way H adjustable, both perpendicularly and laterally, for bringing the frame I to any desired position, substantially as described.

Fourth. I claim the use of the clamp screw N, in combination with the way H, for holding the frame I in position, as set forth.

Fifth. I claim a pawl *f*, held in place by the coiled spring *g*, and operated by the connecting rod *b*, rock shaft *h*, and levers or arms *c* and *d*, for rotating the saws, substantially as set forth.

Sixth. I claim the friction plates *k*, for holding and moving the saws, said plates being arranged and operated substantially as described.

Seventh. I claim the adjustability of the guides W, for the purpose of pressing the files more or less against the saws, at pleasure, as set forth.

No. 23,836.—WILLIAM H. ELLIOT, of Plattsburgh, N. Y.—*Improved Mode of Forming Curved Electrotype Plates.*—Patent dated May 3, 1859.—The nature of this invention consists in the employment of a peculiar compound flexible impression sheet, for the purpose of making curved electrotypes, and the use of certain devices for holding impression sheets in the required form while the metal is deposited.

The inventor says: I *claim*, first, the employment of ledges *i*, in combination with the form A, for the purpose of holding a compound flexible impression sheet or type matrix in the required form, with or without screws R, as specified.

Second. The employment of curved edges B<sup>1</sup>, in combination with the form A, when said edges are so arranged in relation to said form that the edges of the compound impression sheet shall be held firmly between them, for the purpose of retaining said impression sheet or type matrix in a cylindrical form, as set forth.

Third. The employment of air escapes F, in combination with the form A, box B, and the flexible impression sheet C, so as to provide for the escape of air from between the said impression sheet and form, as and for the purpose specified.

Fourth. The combination and arrangement of the concave form A with the adjustable wires D, for the purpose of holding the impression sheet in contact with the concave side of said form, as and for the purpose set forth.

Fifth. The employment of a curved impression sheet, of sufficient elasticity that it may be straightened out while the matrix is formed by the type, and then spring up again by its own power, to the form required, in combination with the curved form A, when used for the construction of a curved type matrix, as and for the purpose specified.

No. 23,837.—JOSEPH W. GARDNER, of Shelburne Falls, Mass.—*Improved Handle for Cutlery.*—Patent dated May 3, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—Attaching the handle D to the knife or other implement or tool, by means of a tang C, provided with a cylindrical projection E, and bolsters B, the tang and projections being fitted in a longitudinal kerf or cut and hole in the handle, the bolster bearing on the end thereof, and the tang secured in the handle by a rivet *a*, substantially as described.

No. 23,838.—THOMAS C. GLEASON, of Rochester, N. Y.—*Improvement in Machines for Cleaning Grain.*—Patent dated May 3, 1859.—This invention consists in certain improvements in machinery for cleaning grain.

*Claim.*—The arrangement of the screens I and K, vibrating longitudinally with the fan G,

removable apron M. and detachable smut cleaner T; the whole made to operate in conjunction, as specified, and for the purposes set forth.

No. 23,839.—THOMAS HAWKINS, of Mobile, Ala.—*Improvement in Valve Gear of Steam Engines.*—Patent dated May 3, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The combination of the bearing and suspending plates, one on the toe and the other on the lifter, with a self-acting (or pendulum) catch for the purpose of holding open the steam valve at any desired point of the stroke, substantially as described.

No. 23,840.—THOMAS L. HAWKINS, of Sturgeon, Mo.—*Improved Wheelwrights' Machine.*—Patent dated May 3, 1859.—This machine, with its fly wheel M, gives power to the cutter head or saw L to drive through timber; the wheel K is designed to run the lathe N; this lathe is used expressly for the wagon manufacture, for turning hubs, &c. It is driven by a band running from the wheel K.

*Claim.*—The arrangement of the several parts, substantially as described and for the purpose set forth.

No. 23,841.—JOHN HOLMES, of Boston, Mass.—*Improvement in Ladies' Hoop Skirts.*—Patent dated May 3, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, constructing a skirt of “knotted” or “net work,” and this I claim whether the meshes on the front and back of the skirt are alike or not.

Second. Enlarging the rear upper portion of a skirt, formed by a series of meshes, to form the bishop shape, by increasing the relative size or number of meshes on the rear upper portion thereof, as compared with those in the same course on the front of the skirt, substantially as described.

Third. The horizontal bustle supporting spring E, in combination with the compressing tape g, and the upper part of the skirt, as shown and described, and for the purposes set forth.

Fourth. The combination of the “netted skirt” with the hoops e e e, spring E, compressing tape g, and waistband A, substantially as shown and described.

No. 23,842.—ELWOOD IVINS, of Waterbury, Conn.—*Improvement in Hair Crimpers.*—Patent dated May 3, 1859.—In using this contrivance to permit the clasp B to be put on, the prongs require to be pressed towards each other, to enable them to enter the lips a a; but the clasp C being of an elastic character, can be stretched to make the lips a a<sup>1</sup> slip over the prong.

*Claim.*—As an improved article of manufacture, a hair crimp, composed of a fork A and clasp B or C, made as shown and described.

No. 23,843.—SAMUEL F. JONES, of St. Paul, Ind.—*Improved Egg Beater.*—Patent dated May 3, 1859.—In using this machine the cap B is lifted from the vessel A, the shaft C and the bar D being connected therewith, and the eggs to be beaten are placed in the mug or vessel. The cup B is then adjusted in the top of the mug or vessel A, and the bar D moved back and forth by hand, the cords g h giving a reciprocating rotating motion to the shaft C, and the beaters f acting on the eggs properly beating them.

*Claim.*—As an improved article of manufacture, an egg-beater, having a cup B, shaft C, strap a, tube e, slotted bar D, cords g h attached to the shaft C and to adjusting screws in the bar D, and otherwise made as shown and described.

No. 23,844.—URIEL JOSEPHS, of Quincy, Mass.—*Improvement in Skates.*—Patent dated May 3, 1859.—This invention consists in the device for attaching the skate to the shoe by means of struts or arms which rise from the skate, and enter a plate or its equivalent, attached to the boot or shoe in such a manner that the weight of the person shall have a tendency to make the fastening more secure; also, in the mode of constructing the runner with a deep furrow, in combination with the adjustable spring bearer placed within the said furrow by which the penetration of the skate into the ice is regulated.

The inventor says: I *claim*, first, the combination of the braces or struts B B<sup>1</sup>, with the plates C C<sup>1</sup>, either with or without the screw D, substantially as and for the purposes set forth.

Second. The combination of the bar F, with the runner, substantially as described and for the purposes set forth.

No. 23,845.—IRA KINMAN, of Freeport, Ill.—*Improvement in Measuring Faucets.*—Patent dated May 3, 1859.—This invention relates to certain improvements in measuring faucets, by which the operator is enabled to measure the quantity of liquor as it is drawn from the barrel or reservoir containing the liquor, and to indicate the quantity drawn.

The inventor says: I *claim*, first, the employment of an endless screw or its equivalent, in

combination with the rotating slide F, eccentric chamber E, arranged and operating in the manner and for the purposes substantially as set forth.

Second. I claim the register wheel P and index hand *i*, in combination with the stop S, when the same is operated by the stem of the endless screw A, so as to indicate the quantity of liquor drawn through the faucet, substantially as described.

No. 23,846.—WILLIAM KIRKPATRICK, of Lancaster, Pa.—*Improved Shingle Machine*.—Patent dated May 3, 1859.—The nature of this invention consists in attaching to Orr's reciprocating plate an additional plate with a second roller and shaving knife, so as to have both sides of the shingle finished after the piece has been split from the bolt, and also in arranging the ends of the pieces to which the frow is fastened, so that it shall be able to accommodate itself to twisted timber without connection with the plate.

The inventor says: I *claim*, first, the added plate A<sup>2</sup>, constructed as described, and when acting in combination with the wrought-iron piece D *d* and spring S, substantially as described.

Second. I claim the guide piece *c c c c*, as arranged and for the purpose specified.

Third. I claim the combination of the rod O with the pieces *g g* and *a a*, by means of which the frow may accommodate itself to the winding grain of the timber, as already specified.

No. 23,847.—DAVID KNOWLTON, of Camden, Me.—*Improved Windlass*.—Patent dated May 3, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The winch shaft G, provided with barrels J J, and connected to the windlass by gears as described, and so arranged that the windlass may be worked by the winch shaft, or the winch shaft and barrels may be worked independent of the windlass, substantially as and for the purpose described.

No. 23,848.—L. LEFEBVRE, of Donaldsonville, La.—*Improvement in Steam Boilers*.—Patent dated May 3, 1859.—The nature of this invention consists in the construction of boilers by fluting both boilers and flue longitudinally, and strengthening the same with hoop braces placed at intervals, and in combining this construction of the boiler with a corrugated or fluted surface of the exterior flue, whereby the products of combustion are brought into intimate connection with all parts of the fire surface.

*Claim*.—The longitudinally fluted boiler, braced as described, in combination with the conformable under surface of the exterior flue B<sup>1</sup>, substantially as and for the purpose set forth.

No. 23,849.—A. W. LLOYD, of Otis, Mass.—*Improvement in Pumps*.—Patent dated May 3, 1859.—In operating the pump, the tube F, in connection with the piston G, causes a quantity of water to be raised at every descent of the piston, the labor of the piston during its upward movement is thereby lessened, as a column of water in the induction pipe D does not require to be raised directly its whole height, a portion of the column which passes the valve E having been previously elevated by the downward movement of the piston.

*Claim*.—The arrangement and combination of the side tube F, pipe D, valve E, and piston G, as and for the purpose shown and described.

No. 23,850.—JOSEPH C. LYONS, of Auburn, and H. F. PHILLIPS, of Seneca Falls, N. Y.—*Improvement in Grinding Mills*.—Patent dated May 3, 1859.—The nature of this invention consists in arranging the grinding cone and corn cracker of a grinding mill in such relation to each other that the former can be operated independent of the latter.

*Claim*.—The described arrangement and combination of the grinding cone F and the corn cracker J, when the former is arranged on a shaft C, which receives a longitudinal motion by means of a hand wheel D, and from which motion is conveyed to the corn cracker by means of wheels *k* and *l*, substantially in the manner and for the purpose specified.

No. 23,851.—HENRY MARCELLUS, of Amsterdam, N. Y.—*Improvement in Harvesting Machines*.—Patent dated May 3, 1859.—This invention consists in the employment or use of a corrugated finger bar, with cutting projections, in connection with detachable fingers.

*Claim*.—The corrugated finger bar, cast with the cutting projections *e*, in combination with the detachable fingers B, constructed and applied in the manner and for the purpose specified.

No. 23,852.—CHARLES MILLER, of Belleville, Ill.—*Improved Rotary Engine*.—Patent dated May 3, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim* a patent for all the parts specified in combination, being and constituting a rotary steam engine, as asked for in my petition herewith presented.

No. 23,853.—WARREN P. MILLER, of Marysville, Cal.—*Improvement in Locomotive Machines for Propelling Ploughs, &c.*—Patent dated May 3, 1859.—The nature of this invention

consists in providing the machine with portable tracks of a certain formation, which, going around and over the leading and driving wheels, are laid down on the ground as the machine moves forward, so as to form safe, solid, and firm tracks on soft or sandy roads, and thereby prevent the wheels of the vehicles which pass over the track from sinking into the earth.

*Claim.*—The combination of the endless chain or track, with the leading and driving wheels C C, and supporting trucks E E, the whole constructed and operated substantially as and for the purposes set forth in said specification.

No. 23,854.—AARON PARKER, of Coventry, N. Y.—*Improved mode of Attaching Harness Breeching to Wagon Thills.*—Patent dated May 3, 1859.—The nature of this invention consists in providing a safe fastening of the hold-back strap to the thills, which becomes a self unfastener when anything may break, or the tugs be unhitched.

*Claim.*—The mode of attaching the hold-back straps to thills of vehicles, by having a metal ring to slide under a spring snap, in such manner that it will unfasten of itself when the traces are unhitched, as set forth.

No. 23,855.—DUBOIS D. PARMELEE, of New York, N. Y.—*Improvement in Vulcanizing Caoutchouc.*—Patent dated May 3, 1859.—The claim explains the nature of this invention.

The inventor says: I *claim*, first, the method described of treating caoutchouc, gutta percha, and their compounds, for the purposes set forth, by employing agents, in an aeriform or gaseous state, combined with a solvent in a liquid state.

Second. In combination with a solution prepared in the manner specified to operate on caoutchouc, gutta percha, or their compounds, as set forth, I claim preparing the said caoutchouc, gutta percha, or their compounds, by blending or incorporating therewith sulphur, substantially as described.

Third. I claim dissolving sulphur in the proportions set forth, or thereabouts, in the solution prepared as specified, when the same is used in combination with rubber, gutta percha, or their compounds, previously free from sulphur.

No. 23,856.—NELSON PARMETER, of Gardner, Mass.—*Improvement in Cements.*—Patent dated May 3, 1859.—The inventor says: In making this cement, sandstone, pipe-clay, and plaster of Paris are each pulverized and sifted. Lime is slaked and sifted. These four materials, together with some salt, are then placed in a kettle over a fire and water is added to it. The mixture is to be constantly stirred and kept boiling in a state of consistency similar to common mortar when used for building purposes.

*Claim.*—An improved fire proof cement, composed of said ingredients in the proportions and in the manner substantially as set forth.

No. 23,857.—GEORGE B. PHILLIPS, of Albany, N. Y.—*Improved Wrench for Gas Fitters.*—Patent dated May 3, 1859.—This improvement consists in a wedge shaped jaw, arranged to slide so as to wedge, gripe, or tighten on the article to be turned, in order to hold it fast and firm while it is turned, and in a nut containing sections of threads of a female screw, arranged to traverse a bar containing sections of threads of a male screw, so that the nut may be turned and locked to the bar, or traverse as may be desired. Also a nut with a female screw fitted to a male screw on the before mentioned nut, so as to traverse the slide and tighten the jaw after the before mentioned nut is locked to the bar of the wrench.

The inventor says: I *claim* the jaw D, arranged to slide substantially as described, so as to wedge, gripe, or tighten, and hold the article to be turned as described.

I claim the nut K, arranged to slide freely on the bar A, so that it may be locked to the bar, when desired, in combination with the bar, when both are constructed substantially as described.

And, in combination with the nut K, I claim the tightening nut I, arranged substantially as described.

No. 23,858.—THOMAS PLACE, of Alfred Centre, N. Y.—*Improvement in Adjustable Pile Drivers.*—Patent dated May 3, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, attaching the frame A to the axles *a c*, by means of the bolt *b* and rack plate B and guides *e*, to admit the lateral adjustment of the monkey guides C C<sup>1</sup>, substantially as described.

Second. Screwing the monkey guides C C<sup>1</sup> in the frame A by means of the universal joint *h* and the sliding joint *i*, arranged with the lever D and rack catch *l*, or their equivalents, to admit of the lateral inclining of the guides, as well as the forward and backward movement of the same, for the purpose set forth.

Third. The combination of the frame A and guides C C, when constructed and arranged to operate conjointly and to admit of the adjustment, as described.

Fourth. The arrangement of the button or stop *g*<sup>1</sup>, levers J H I, and catch *j*<sup>1</sup>, substantially as shown for automatically releasing the shaft *a* from the windlass G, as and for the purpose set forth.

No. 23,859.—JOHN PLANT, of Washington, D. C.—*Improvement in Latch Hinges*.—Patent dated May 3, 1859.—The nature of this invention consists in so constructing a hinge when used with a latch for retaining it open, that great additional strength and efficiency shall be given.

*Claim*.—The hinges *a b*, when provided with projections *c c* and latch *g*, and constructed and operating in the manner and for the purposes substantially as set forth.

No. 23,860.—H. W. RANDLE, of Burnsville, Ala.—*Improvement in Cotton Presses*.—Patent dated May 3, 1859.—The nature of this invention consists in providing a vertically moving windlass between the levers for the winding of the rope drawing said levers together, so that the power exerted to operate the levers shall always act horizontally.

The inventor says: I do not claim a spirally grooved shaft, without longitudinal motion for taking up the cord; but I *claim* the vertical screw shaft *W*, as described, in combination with the levers *L L*<sup>1</sup>, cords *D D*<sup>1</sup> *D*<sup>2</sup>, and the follower, substantially as and for the purposes set forth.

No. 23,861.—JOSEPH RIDER, of Newark, Ohio.—*Improvement in Revolving Fire-Arms*.—Patent dated May 3, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the cocking dog *E*, with its notches *c d*, applied in combination with the hammer and trigger and with a stationary stop *e* to operate substantially as set forth, to effect the cocking of the hammer and firing.

Second. In combination with the above, providing the same cocking dog with a notch *f* in its extremity, to be operated upon by a tooth *g* on the trigger, substantially as described, to operate the piece entirely by the trigger for rapidly repeated firing without cocking.

Third. Combining the locking lever *G* with the cocking dog *E* by means of a tooth *i* upon the lever, and a tooth *h* upon the dog, the tooth being formed to operate substantially as specified.

Fourth. The construction and application of the trigger guard in combination with the locking levers, to serve three purposes, viz: as the guard, as the lever for operating the rammer, and as the spring for operating the locking lever or its equivalent, substantially as described.

No. 23,862.—JOSEPH ROSENKRANS, of Avoca, N. Y.—*Improvement in Cider Mills*.—Patent dated May 3, 1859.—This invention consists in a certain arrangement of means for reducing the apples into small pieces, and also in an arrangement of the pressing means in relation to the grinding means.

The inventor says: I *claim*, first, the arrangement of the cutting cylinder and the tearing cylinder within the hopper, the one acting upon a plane and the other upon a curved surface, and the tearing cylinder so geared as to have rapid rotation as regards the rotation of the cutting cylinder.

Second. I claim the arrangement of the grinding cylinders and pressing cylinders with the endless apron, chute, and hopper, when they are geared as set forth.

No. 23,863.—WASHINGTON RUDDACH, of Baltimore, Md.—*Improvement in Mail Bags*.—Patent dated May 3, 1859.—The nature of this invention consists in the manner of securing the staples by plates to the mouth of the bag, the outside plate having a joint in the centre, the fastening slide also having the central joint, of a T form at one end; and also of introducing rivets between the stitchings of the seam.

*Claim*.—The arrangement in the manner and for the purpose hereinbefore specified, of the jointed plates *B C*, staples *D*, jointed slide *F*, with projection *F*<sup>1</sup>, when applied to bags with riveted and stitched seams.

No. 23,864.—STEPHEN P. RUGGLES, of Boston, Mass.—*Improved Punching and Stamping Press*.—Patent dated May 3, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—So combining in a press for punching, stamping, &c., a coarse and fine threaded screw, with the power that drives the press, as that the coarse screw may be in action when speed or motion is required, and the fine screw when power is required; the former ceasing its action and the latter coming into action according to the resistance against the punch or die, substantially as described.

No. 23,865.—SAMUEL B. SHINN, of Philadelphia, Pa.—*Improvement in Corn and Cob Cutters*.—Patent dated May 3, 1859.—This invention consists in the peculiar construction of the cutter head *A*, with or without the knives *B* and crushers *C*.

*Claim*.—The peculiar construction of the cutter head *A*, as specified with or without the combination of the knives *B* and crushers *C*, arranged and operating in the manner and for the purpose set forth and specified.

No. 23,866.—OLLOF SHOSTROM, of Altona, Ill.—*Improved Washing Machine*.—Patent dated

May 3, 1859.—The operation of this machine is as follows: The clothes being secured under the rib 7, motion is communicated to the endless apron and washboard by means of the crank Y. It will be observed that motion is imparted to the washboard by means of a belt passing down from the larger to the smaller pulley; thus at once operating the arm lever *m*, to which is attached the washboard. By bringing the upper ends of the slat levers near each other the clothes may be rubbed as hard as may be desired.

*Claim.*—The combination and arrangement of slats *c*, levers D, serrated plates F, with rods *h*, false bottom G, endless apron 5, lever 3, and pawl 4, the several parts being constructed and operated substantially in the manner and for the purpose set forth.

No. 23,867.—JONATHAN P. SIMMONS, of Baldwinsville, N. Y.—*Improvement in Coffee Roasters.*—Patent dated May 3, 1859.—In using this machine the coffee is placed therein, and the case set over a suitable fire. The handle of the ring is slowly or occasionally turned; the effect of the revolutions of the ring is, each time, to sweep all the grains of coffee which lie in contact with the surface of the case away therefrom, raise and drop them upon the upper surface of the mass of coffee, thereby keeping it in constant motion, so that it may be uniformly roasted.

*Claim.*—The combination of the revolving ring with the spherical case, constructed, arranged, and operating substantially as specified.

No. 23,868.—D. F. SMITH, of Manchester, N. H.—*Improvement in Spinning Flyers.*—Patent dated May 3, 1859.—This invention consists in a certain construction of the compressor and method of applying its stop, by which important advantages are obtained.

*Claim.*—The construction of the arm and stem of the compressor of one piece, and the stop of a separated piece, so applied as to confine the stem in the ears on the flyer tube, as specified.

No. 23,869.—JOSEPH D. SMITH, of Lancaster, Ohio.—*Improvement in Harvesting Machines.*—Patent dated May 3, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of the mechanism for adjusting the cutting apparatus, consisting of the rack bars *a a*, hinged to the cutting apparatus shaft *e*, provided with pinions *b b*, and ratchet wheel and pawl *c d*, when employed in combination with the adjustable wheel *i*, in the manner and for the purposes specified.

Second. The employment of the ball journals *m m* of the reel shaft, in combination with the off side horizontally turning timber *n* of the reel frame, substantially as and for the purposes set forth.

Third. The combination of the secondary standard *q*, arranged on the sickle bar, with the hinged laterally adjustable brace *r*<sup>1</sup>, in the manner described and for the purpose set forth.

Fourth. The combination with the upward curved edge *f*<sup>1</sup> of the sickle bar *f*, of the overhanging upper lip *v*, and under back extension flanch *w*, of the sickle guard or tooth *u*, in the manner and for the purpose set forth.

Fifth. The spring catch *z*<sup>1</sup>, arranged on the sickle back *y*, in combination with the stop-notch *z*<sup>2</sup>, formed in the pitman *z*, for the purpose of fastening the sickle or cutter back *y* to the pitman *z*, in the manner set forth.

No. 23,870.—WILLIAM H. SMITH, of Newport, R. I.—*Improvement in Rotary Planing Machines.*—Patent dated May 3, 1859.—This invention consists in having the cutter head or disk provided with a circular concentric recess, in which a circular bearing plate is placed, said plate being attached to a shaft which is fitted loosely in the arbor of the cutter head, and having an adjusting screw attached to its outer end.

*Claim.*—The combination of the rotating cutter head C with the central adjustable bearing plate D, arranged substantially as and for the purpose set forth.

No. 23,871.—GEORGE W. SWIFT, of Oxford, Miss.—*Improvement in Portable Horse Powers.*—Patent dated May 3, 1859.—To operate this machine, the power is attached to the end L of the lever A, and moved to the left hand, where by the rotation of roller B upon the ground around the anchor G, an accelerated motion is given to band wheel F, by cord or chain H, the latter being straightened, when it becomes necessary, by driving wedges in the mortise I on the inside of the anchor next to the roller B and cord H, tightened by moving the machine to be driven from the band wheel.

*Claim.*—The arrangement of band wheel F, shafts A and C, idlers D and E, roller B, and cord or chain H; the whole constructed and operating substantially as and for the purpose set forth.

No. 23,872.—ISAAC P. TICE, of Baltimore, Md.—*Improved Machine for Cutting Wooden Curved Mouldings.*—Patent dated May 3, 1859.—This invention consists in the employment of an adjustable bed and a flexible metal guide plate, used in connection with a rotary cutter,

pressure and feed rollers, whereby work forming circles, and parts of circles, of varying diameter, may be cut and beaded for architectural and other purposes.

*Claim.*—The adjustable bed, formed of the blocks *g*, in connection with the flexible guide plate *C*, rotary cutter head *F*, and the feed and pressure rollers *D E*, or their equivalents, substantially as and for the purpose set forth.

No. 23,873.—HEZEKIAH D. TREADWELL, of Elmira, N. Y.—*Improvement in Signals for Firemen.*—Patent dated May 3, 1859.—By this invention, when it is desired to exhibit any signal, the bearer pulls the proper cord downward till its stop passes through the catch plates, and thus retains the signal in sight. In passing through its pair of holes *e* and *f*, the stop forces the vibratory plate *D* against the spring *d*, sufficiently to bring the two holes opposite to each other.

*Claim.*—The combination of the catch plates *C D* and conical stops *c c c*, or their equivalents, on the cords *b b b*, working through a series of holes in the catch plates, arranged substantially as set forth.

No. 23,874.—WILLIAM WALKER, of Pontiac, Mich.—*Improvement in Water Wheels.*—Patent dated May 3, 1859.—This invention consists in having the front, or water parts of the buckets made movable or adjustable, in such a way that in case of stones, sticks, or foreign substances of any kind entering the scroll, the buckets will be allowed to yield, or give, and be prevented from being broken. The invention consists, also, in the employment or use of a series of adjustable plates or straps, applied to the wheel in such a manner that the issues, or discharge orifices between the buckets, may be enlarged or contracted, as circumstances may require.

The inventor says: I do not claim the employment or use of curved buckets, or those having surfaces composed of two planes placed at right angles with each other; for a bucket of such form, or its equivalent, has been previously used.

But I *claim*, first, the employment or use of the adjustable plates *f* attached to the inner posts of the plates *e* of the buckets *G*, substantially as and for the purposes set forth.

Second. Providing the buckets *G* with adjustable plates *g*, arranged substantially as shown, to prevent injury to the buckets by the entrance into the scroll of hard foreign substances, as described.

No. 23,875.—CHARLES WILHELM and ANNA CATHERINE WILHELM, of Philadelphia, Pa.—*Improvement in Lamp Shades.*—Patent dated May 3, 1859.—A  $A^1 A^2$  represent a metallic frame, composed of tin or other metal; a series of openings or apertures, *C D E*, &c., are made around the circumference of the shade. The series of pictures  $C^1 D^1 E^1$  are placed between sheets of a mica of size corresponding to the picture.

*Claim.*—The combination of the metallic shade  $A A^1 A^2$  with the paper pictures  $C^1 D^1 E^1$ , between sheets of mica, as described.

No. 23,876.—STEPHEN WILCOX, jr., of Westerly, R. I.—*Improved Air Engine.*—Patent dated May 3, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the within described arrangement of the changing cylinder *B* and working cylinder *D*, and the valve or valves by which piston *b* is made both to change the air from the cold to the hot end of the cylinder, and to receive a fresh volume of air from the next stroke, with the advantages set forth.

Second. Automatically regulating the temperature of the interior of the heating furnaces by the employment of the parts *H* and *L*, arranged relatively to the heating surfaces of the cylinders *A* and *B* and to the damper *n*, or its equivalent, in the flue *O*, as described.

Third. Giving the regenerator an increasing area from the cold to the hot side, substantially as and for the purpose set forth.

Fourth. Working the single valve *M* in combination with the two pistons *a* and *b*, as described, so as to thereby accomplish the threefold purpose of induction, eduction, and equilibrium valve, substantially in the manner and with the advantages set forth.

No. 23,877.—WILLIAM E. WORTHEN, of New York, N. Y.—*Improvement in Metallic Laths.*—Patent dated May 3, 1859.—This invention consists of a sheet of corrugated metal pierced with holes, and also in combining with corrugated sheets thus pierced, tubes, or strips of metal, or rods slipped into such holes.

*Claim.*—A corrugated pierced sheet of metal, substantially such as specified, either with or without rods or tubes passed through the apertures, substantially in the manner and for the purposes specified.

No. 23,878.—W. A. WOOD, of Hoosick Falls, N. Y.—*Improvement in Harvesting Machines.*—Patent dated May 3, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—Effecting an oblique delivery of the cut grain from the platform where it falls by a series of carrying belts of different lengths, substantially as described.

No. 23,879.—AUGUST WULZE, of St. Louis, Mo.—*Improvement in Machines for Making Pearl Barley*.—Patent dated May 3, 1859.—This invention consists in a new arrangement and combination of mechanical devices for the purpose of operating a machine for pulling and scouring barley.

*Claim*.—The construction and arrangement of the described machinery, that is to say, the arrangement and combination of the frame or wheel H, pinions *t* and *u*, and wheels *l*, with each other, in the manner described, and with the pulleys,  $x^1$  *x* and  $y^1$  *y* and *a*, as set forth.

No. 23,880.—ALBERT ALBERTSON, of New York, N. Y., assignor to CURTIS C. BEAN, of said New York.—*Improved Cork Machine*.—Patent dated May 3, 1859.—This invention consists in a device for preventing corks from rotating while under the action of a rotary cylindrical cutter; also, in a plan for rotating corks by friction on their periphery while under the action of a longitudinal cutter.

The inventor says: I *claim*, first, the stationary cylinder D *d*, or any substantially equivalent device, when employed to grip a cork by its periphery, so as to effectually prevent its rotation while cut by a rotary cylindrical cutter.

Second. The feed rollers H H, with or without the band G, arranged and adapted to rotate a cork by friction upon its periphery, while under the action of a longitudinal cutter.

No. 23,881.—F. P. CAVANNAH, of Pioneer Mills, N. C., assignor to Himself and R. H. NORTHROP, of said Pioneer Mills, and W. A. McCOLLOCH and E. C. AIKEN, of Albany, N. Y.—*Improved Amalgamator*.—Patent dated May 3, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—The arrangement and combination of the elevated quicksilver channels *f g* near the rim of the oscillating amalgamating pan E, as and for the purpose shown and described.

No. 23,882.—NATHAN A. DYAR, of Medford, Mass., assignor to Himself and RUFUS KENDRICK, of Cambridge, Mass.—*Improvement in Cements for Roofing*.—Patent dated May 3, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—As a new article of manufacture, the waterproof roof covering described, the same consisting of a central layer or web of cloth, or its equivalent, covered on both sides with adhering layers of waterproofing, the outer side of one of which is covered with a layer of paper fixed thereto by contact with the waterproofing while it is in a warm and plastic state, while upon and embedded in the outer side of the other layer of waterproofing, while in the state just described, is a layer of sand, or its equivalent, forming the uppermost or weather surface of the article.

No. 23,883.—MOSES G. FARMER, of Salem, Mass., assignor to WILLIAM F. CHANNING, of Boston, Mass.—*Improved Mechanism for Operating Steam or Air Signal Whistles by Electro-Magnetism*.—Patent dated May 3, 1859.

The inventor says: The nature of my invention consists in the application of what I call an electro-magnetic escapement to a suitable mechanism operating an air pump, by which a current of condensed air is forced through an air whistle, organ tube, or other wind instrument, for the purpose of giving an alarm at a distance through the agency of the electric telegraph.

*Claim*.—The combination of an electro-magnetic escapement with the mechanism described for operating a steam or air whistle, as set forth.

No. 23,884.—THEOPHILE AUGUSTE ROUSSEAU, of Belleville, near Paris, France, assignor to EDOUARD ALEXANDER, of Paris, France.—*Improvement in Reed Organs*.—Patent dated May 3, 1859.—The nature of this invention refers to an improved construction of portable organs, in which the blast is given by means of either treadles or crank, and a key board of the desired size and stops. It also consists in the application to portable organs of certain valves worked by treadles or "knee pieces," so called from their being worked by the knee, and suitably connected to said valves.

The inventor says: I *claim*, first, the arrangement of the wind chambers *h* and registers or stops *b*, in combination with the reeds *g g*, as set forth, whereby each key  $a^1$  operates as many valves as there are stops in the instrument, but only those notes are caused to sound where the register *b* is open, as set forth, thus rendering the fingering easy, whatever may be the number of stops.

Second. I claim the arrangement of the valves *e e* and knee pieces *ff*, in the manner and for the purposes specified.

Third. I claim the manner specified of arranging the various plans or stories of the instrument, as shown in Fig. 1, and hinging the same together for affording access to the different parts, as set forth.

No. 23,885.—WILLIAM SHEPHERD, Jr., of Brooklyn, East District, N. Y., assignor to THOMAS HOLMES and VAN WYCK FOSTER, of said Brooklyn.—*Improvement in Valves for Steam Engines*.—Patent dated May 3, 1859.—This invention consists in the com-

ination of a cover attached to and operated by the valve which directly controls the admission of steam to the cylinder, with ports entering the valve cylinder in such a way as to furnish a cushion of steam to restrain the valve at the end of the stroke and prevent its slamming.

*Claim.*—The combination of the steam ports  $ff^1$  with the cover G, operated by the action of the valve C, substantially as described and for the purpose set forth.

No. 23,886.—MILTON ALDEN, of Auburn, N. Y.—*Improvement in Cultivators.*—Patent dated May 10, 1859.—This invention consists in connecting the thills, which are made of one piece with the handles, with the frame by means of braces, in such a manner that the thills pass over the growing crops, and that the same are in a horizontal position, or nearly so, when attached to a horse, and the frame is so arranged that the shares can be adjusted in the same, according to the width of the different rows, and that a larger or smaller number of shares can be secured in the same.

*Claim.*—The described arrangement and combination of the adjustable shares B, the frame A, and the raised thills C, which are made out of one piece with the handles D.

No. 23,887.—WILLIAM H. AULD, of Brighton, Iowa.—*Improved Machine for Sawing Shingles.*—Patent dated May 10, 1859.—This invention consists in the employment or use of two circular saws in connection with a reciprocating bolt carriage, arranged for joint operation.

The inventor says: I *claim* the adjustable saws C C, in connection with the reciprocating bolt carriage L.

I also claim the arrangement of the notched racks  $ll$ , gearing  $kk$ , weight  $r$ , pins  $ss$ , levers  $vv$   $a^1$ , and bars  $xb^1$ , attached to the bolt carriage, in connection with the stops  $a$ , for automatically feeding the bolt M to the saws C C.

No. 23,888.—CHARLES BAMBERG and ROMAN BLASER, of Chicago, Ill.—*Improvement in Machines for Separating Stones, &c., from Clay.*—Patent dated May 10, 1859.—This invention consists in the employment of a conical screen of knives, in connection with a separator, the above parts being placed within a suitable box, and arranged relatively to each other and without discharge spouts.

*Claim.*—The conical rotating screen C, in connection with the separator F, placed within suitable boxes A G, constructed and arranged to operate relatively to each other.

No. 23,889.—JACOB BATCHELDER, of Salem, Mass.—*Improvement in Sole Cutting Machines.*—Patent dated May 10, 1859.—The levers  $ee$  are hung to cranks  $nf$ , two of these cranks on each side of the machine, the cranks  $n$  being pivoted to the levers at  $n^1$ , and to the frame  $v$  of the machine at points  $n^2$ , the latter being the fulcra of the cranks. A screw  $r$  passes through the centre of the board  $w^1$ , and by turning the screw its end can be made to project more or less beyond the board and towards the table  $w$ .

The inventor says: I *claim*, first, the particular and relative arrangement of the levers  $ee$  and  $e^1 e^1$ , with the cranks  $np$  and  $ff^1$ , for giving the required motions to the cutting knives.

Second. The use and arrangement of the adjustable and intermediate gauge board  $w^1$ , whereby each alternate sole can be cut of equal or unequal width.

No. 23,890.—JOHN BEAN and BENJAMIN WRIGHT, of Hudson, Mich.—*Improvement in Straw Cutters.*—Patent dated May 10, 1859.—This invention consists in an arrangement of the knife worked by the forked pitman to perform two functions at the same time; namely, to cut the straw and operate the feed rollers by means of a crooked lever and rock shaft.

*Claim.*—The arrangement and combination of the knife C, lever D, and rock shaft E.

No. 23,891.—SIDNEY A. BEERS, of Brooklyn, N. Y.—*Improvement in Railroads for Streets.*—Patent dated May 10, 1859.—The nature of this invention consists in the construction of upright self sustaining rails of cast or other iron, with the head or track expanded in width, so as to form a car and carriage track, in combination of such width and form as may be desirable for such purpose when laid in public streets or highways.

*Claim.*—The construction of upright self sustaining rails of cast or other iron, with car and carriage track combined, to be laid in public streets and highways, and for no other purpose.

No. 23,892.—HAMILTON T. BEGGS, of Liberty, and JAMES ALLEN, of Lynchburg, Va.—*Improvement in Brick Machines.*—Patent dated May 10, 1859.—This invention relates to a machine for making brick out of dry or wet clay, and consists in the combination of several parts of a machine for that purpose.

*Claim.*—The combination of the bevel wheel C, cast with the cells P therein, for the reception of the moulds D, the plungers E, with the friction rollers and axles F, circular inclined plane ring  $g$ , and guard  $h$ , and top plate B, when these several parts are constructed and arranged for joint operation.

No. 23,893.—EDWARD BEHR, of New York, N. Y.—*Improved Skate Fastening*.—Patent dated May 10, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—Drawing or tightening the toe and heel straps G E, of the skate around the foot of the wearer, by means of the screw rods F I, and nuts *d i*, fitted in the stock A, one end of the straps being attached to the stock A, and the opposite end to the nuts by means of the cords *b f*, or their equivalents.

No. 23,894.—A. J. BENTLEY and WILLIAM H. ALLEN, of New York, N. Y.—*Improved Ships' Stop Block*.—Patent dated May 10, 1859.—The nature of this invention consists in constructing a block with two tapering sides and of a suitable width, and placing within the same two wedges having grooves on their inner surface, which grooves are made to clasp the rope, passing longitudinally through the block and between the grooves, and hold it firmly by means of friction rollers so situated within said block that when the wedges are relieved by a cord connected with the same two helical springs will respectively force the wedges up tight against the rope and rollers, and any further attempt to draw the rope through the block will cause the wedges to bind the same tighter.

*Claim*.—The arrangement of rollers and wedges D D.

No. 23,895.—L. F. BINGHAM and N. O. PIERCE, of Chicago, Ill.—*Improvement in Corn Planters*.—Patent dated May 10, 1859.—The inventors say: We construct a planter by placing two revolving wheels on an axle of any desired dimensions, on the front of which we place ploughs or markers, at equal and desired distances apart, seen at C, in such a manner that they may be hoisted and lowered at pleasure.

*Claim*.—The arrangement of the rotating planter A, square tube 10, beam O, lever N, "spat down" or leveller 12, and scraper.

No. 23,896.—A. W. BRINKERHOFF, of Upper Sandusky, Ohio.—*Improvement in Corn Planters*.—Patent dated May 10, 1859.—This invention consists in constructing the frame of the planter with a wheel in the centre, having pins on the side on which rests a weighted lever connected by a rod with a rock shaft extending across the frame. To each end of this is attached the roller having a cavity, into which the seed is fed from the hopper above it, so that in the revolution of the wheel the weighted lever falls on the next pin and is raised by it and falls on the next, thus moving the rock shaft and turning forward the roller, the grain is emptied into the furrow; the roller then turns up again and receives the next grain, and so on.

*Claim*.—The adjustable coverer D and opener P, in combination with lever L, the weighted lever A operating the rollers, and rod B.

No. 23,897.—JAMES BROWN, of London, England.—*Improvement in the Manufacture of Paper and Paper Pulp*.—Patent dated May 10, 1859; patented in England June 10, 1857.—This invention consists in incorporating or combining glycerine with pulp from which paper is to be made, or with paper at any stage of its manufacture, or in coating paper, after its manufacture, with glycerine.

*Claim*.—The treatment of paper and paper material with glycerine, substantially as described, to be employed for printing or other purposes.

No. 23,898.—C. M. BRYAN, of Wright City, Mo.—*Improvement in Ploughs*.—Patent dated May 10, 1859.—This invention consists in the peculiar arrangement of the parts, or the method of attaching and applying the mould board, whereby the mould board may be readily adjusted or shifted on the plough and at the same time firmly secured to it, so as to prevent the possibility of the casual movement of the mould board.

*Claim*.—Attaching the mould board D by means of the bolts *h h i i* passing through the cleets *b b*, at the inner side of the mould board, and into the landside E and handle *c*<sup>1</sup>, the bolts *g d*<sup>1</sup>, and the brace bar *d*.

No. 23,899.—ELISHA J. BURRALL, of Geneva, N. Y.—*Improvement in Machines for Sowing Fertilizers*.—Patent dated May 10, 1859.—This invention partakes of the character of a rotary sieve, out of which the lime or other material to be spread or sown broadcast is shaken by the revolutions of the receptacle holding the same, whereby the openings are kept clear and free, and any lumps too large or hard to be broken by the agitation are retained in said receptacle and emptied out when desired.

*Claim*.—The arrangement of the revolving cylinder *a*, division *k*<sup>1</sup>, and adjustable perforated slides 3 3.

No. 23,900.—DEXTER H. CHAMBERLAIN, of West Roxbury, Mass.—*Improvement in Machines for Splitting Leather*.—Patent dated May 10, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—Inclosing the cutting blade C with an external casing throughout its entire length.

No. 23,901.—ROBERT I. COLVIN, of Lancaster, Pa.—*Improvement in Convertible Carriage Shafts*.—Patent dated May 10, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the attachment of removable shafts by means of adjustable braces I I and the hinged caps Z Z of the pole crab N.

Second. The curved or segment bars A, forming a transverse horizontal slot in which the shafts are supported at their rear end, both when separated in the ordinary way and when united together as a pole.

Third. The hinged and pivoted thill attachment for accommodating the width of the same to the different positions of the clips upon the axle.

No. 23,902.—NATHAN COPE and WILLIAM HODGSON, of Cincinnati, Ohio.—*Improvement in Butterfly Valves*.—Patent dated May 10, 1859.—This invention consists in certain means of controlling the movement of the valve to prevent its opening the wrong way and further than is desired, which also provide for its opening in either direction, as may be desired.

*Claim*.—The arrangement and combination of the curved slotted plate E, valve box B, stops F F<sup>1</sup>, and slotted valve lever G.

No. 23,903.—JAMES B. CRIST, of Evansville, Ind.—*Improvement in Grain Separators*.—Patent dated May 10, 1859.—This invention consists in a peculiar arrangement of a fan, blast spout, riddle, and screen, and discharge passages, whereby the desired work, to wit: the cleaning of grain, or separating it from all foreign substances, is performed in an expeditious manner.

*Claim*.—The arrangement of the blast passage G, fan B<sup>1</sup>, screen I, and riddle K, with chute L attached, placed within the case or box A and in relation to the spouts or discharge passages *d e f* N.

No. 23,904.—EDWARD DAVIDSON, of Batesville, Ark.—*Improvement in Ploughs*.—Patent dated May 10, 1859.—F is a supplemental landside, and G a supplemental share, the front ends of which are connected and have the lower end of a coulter H attached to them. The share G is a blade of steel of proper width, and is directly in front of share E, and the landside F is directly below and in the same place with the landside C; the upper end of the coulter H passes through the bar *e* and the beam, and is secured in a proper position by a key *m*.

*Claim*.—The combination of the bar *e*, stirrup *c*, rod *f*, with the adjustable supplemental landside F, share G, and the stationary share E and landside C.

No. 23,905.—HIRAM T. DEWEY, of Sandusky, Ohio.—*Improved Fence Post*.—Patent dated May 10, 1859.—This invention consists in combining with and attaching to the lower portion of ribbed fence and other posts horizontal ribbed plates, flanges, or arms, at such a distance from the lower ends of the same as will cause them when the posts are planted to be situated about a foot below the surface of the ground, in such a manner as will enable the plates, flanges, or arms, when properly buried and packed in earth, to assist in sustaining the posts in an erect position.

*Claim*.—The combination of the ribbed post A and horizontal flange plate C, when jointed to each other.

No. 23,906.—WILLIAM C. DOSS, of Lavaca, Texas.—*Improvement in Cultivators*.—Patent dated May 10, 1859.—This invention consists of a triangular frame with five shares or ploughs and a scraper; three of said five shares have mould boards attached by means of screws, and should be used for hilling plants and keeping the ridge up as desired; the scraper is used for scraping cotton, &c.

*Claim*.—The arrangement of the triangular frame A A B, of shares J K with mould boards that may be taken off at pleasure, scraper N, and cultivators L M.

No. 23,907.—B. WELLS DUNKLEE, of Boston, Mass.—*Improvement in Furnaces for Heating Buildings*.—Patent dated May 10, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* combining with the fire pot and its dome one or more gas circulating pipes G, arranged with respect to the same, and in the hot air chamber of the case E.

I also claim the arrangement of the hot air discharge pipes *c c* and the wings *d* of the arch of the fire dome.

I also claim, in connection with the air register to the front of the ashpot, an air pipe *v* carried through the air chamber and into the rear part of the ashpit.

I also claim the combination and arrangement of the hot valve *p* and the plate or door *r* with the flue *n* and pipe H, and the opening *t*.

No. 23,908.—LEWIS EIKENBERRY, of Easton, Pa.—*Improved Method of Compensating for Expansion and Contraction of Metallic Fences*.—Patent dated May 10, 1859.—This invention

consists in making provision for expansion and contraction in an iron fence by having its palings loosely pivoted together to form lattice work, or other similar open work, and its panels with its palings arranged to turn on their points of connection throughout, and thus enable the fence to maintain its usual length while it increases in height.

*Claim.*—The method of making provision for expansion and contraction in an iron lattice or other open work fence.

No. 23,909.—STEPHEN ELLIOTT, of Richmond, Ind.—*Improvement in Straw Cutters.*—Patent dated May 10, 1859.—This invention consists in the arrangement of boards E, cross piece F, rods I and G, and lever H, with boards B and D, canvas C, rods R and S, and lever Q.

*Claim.*—The arrangement of boards E, cross piece F, rods I and G, and lever H, with boards B and D, canvas C, rods R and S, and lever Q.

No. 23,910.—ANDREW ELLISON, of Boston, Mass.—*Improved Smoothing Iron.*—Patent dated May 10, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—Attaching the handle plate A, to the separate heater or block B, by means of the guide *b*, and slot D, the angular recess E, the lips *c c*, and the latching devices *a F*.

No. 23,911.—SAMUEL V. ESSICK, of Moultrie, Ohio.—*Improvement in Machines for Loading Hay.*—Patent dated May 10, 1859.—This invention relates to certain improvements in machinery for loading hay, by means of which hay may be taken from the ground and deposited upon a cart.

*Claim.*—The adjustable frame *d*, the rake *j*, the rakers *h* and *m*, and the conveyors *g* and *l*.

No. 23,912.—JOHN L. FIELD, of Syracuse, N. Y.—*Improved Method of Strapping Wood in Bending.*—Patent dated May 10, 1859.—The nature of this invention consists in a device whereby the metallic strap after passing one curve upon a piece of timber may be connected with a strap placed upon another side of the same piece for the purpose of bending it in another direction, and thereby continuing the endwise pressure through the various curves to which the piece may be subjected.

*Claim.*—The method of connecting metallic straps for bending timber, when the parts are so arranged as to operate in connection with the forming frames.

No. 23,913.—DAVID S. FISHER, of Mauckport, Ind.—*Improvement in Seed Planters.*—Patent dated May 10, 1859.—When the machine is set in motion the band *h* on the driving wheel B communicates motion to the pulley E, and thus to the shaft D, the cams, the seed-slide, and the hoe.

*Claim.*—The combination and arrangement of the spring hoe J, the adjustable spring roller I; with the seeding and regulating apparatus.

No. 23,914.—J. H. FRENCH, of Syracuse, N. Y.—*Improvement in Harrows.*—Patent dated May 10, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim* the combination and arrangement of three triangular harrows in such a manner as to form one triple triangular harrow, by connecting the angles with flexible joints or couplings, which admit of the free vibration of the parts, and their ready adaptation to the inequalities of the ground.

Second. I also claim constructing triangular harrows of metallic bars or flat strips of metal, by folding over the same at the angles in such a manner that the draft strain of the teeth upon one side shall counteract that upon the other, and forming the couplings at the same operation by folding in links or hooks at the angles, no bolts being required to secure them, in consequence of the self bracing of the parts.

No. 23,915.—R. B. GILBERT, of Sutherland Springs, Texas.—*Improvement in Corn Planters.*—Patent dated May 10, 1859.—This invention consists in the peculiar arrangement of parts in the construction of corn planters.

*Claim.*—The arrangement of the share *a* coverers *i j*, conductor *c*, cylinder *d*, and hopper *e*, wheel *g*, and scraper *p*, for joint operation.

No. 23,916.—RICHARD GORNALL, of Baltimore, Md.—*Improvement in Mail Bags.*—Patent dated May 10, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—The employment, with a mail bag constructed with a socket G and furnished with a lock or other safe fastening, of the plates B B, which terminate in nearly complete tubes D D, and with the jointed rod or bolt H, provided with a hasp or other similar attachment.

No. 23,917.—HENRY GORTNER, of Irville, Ohio.—*Improvement in Rat Traps.*—Patent dated May 10, 1859.—This invention relates to an improved trap of that class that are self-setting,

and consists in the use of a treadle and bait platform arranged in connection with a supplemental platform and revolving disks, and a box, whereby a simple, cheap, and durable trap is obtained.

*Claim.*—The rotating disks C C, connected by the plates *b b*, in connection with the treadle platform C<sup>1</sup>, plates *c c*, and bar *d*, and the supplemental platform D, the whole being fitted to the box A.

No. 23,918.—BENJAMIN T. HARRIS, of Brooklyn, N. Y.—*Improved Mechanism by which Employés Register their Time.*—Patent dated May 10, 1859.—This invention consists of a revolving cylinder carrying a sheet of paper, on which an impression is made by the workman in such a position that the time of making such register is accurately marked, thus denoting the time of leaving, or arriving at work.

The inventor says: I *claim*, first, the manner of mounting the cylinder D on the spring barrel *f*, and with the connecting coupling 3.

Second. I claim the binding plate *d*, fitted and acting to retain the ends of the paper to the cylinder D.

Third. I claim the arrangement and manner of constructing the slides *i i*, and impression points *m m*.

Fourth. I claim the rollers *l* and their pawls *o* and *p*, in connection with the slides *i i* and openings *k* in the front plate.

No. 23,919.—SAMUEL E. HARTWELL, of New York, N. Y.—*Improvement in Corn Planters.* Patent dated May 10, 1859.—This invention consists in an arrangement of spades, planting, dropping, and covering devices, whereby the corn is dropped, planted, and covered by means that receive motion from pressing down and then lifting the apparatus.

*Claim.*—The arrangement of the slide *d*, shoe *c*, and hoe *i*, connecting and acting in the manner and for the purposes substantially as specified.

No. 23,920.—SAMUEL HENRY, of Chenoa, Ill.—*Improvement in Seeding Machines.*—Patent dated May 10, 1859.—This invention consists in the use of a reciprocating distributor in connection with an adjustable slide applied to a seed box.

*Claim.*—The slide bar or seed distributor G, with slide H, fitted therein and placed relatively with the seed box F.

No. 23,921.—MOSES G. HUBBARD, of Penn Yan, N. Y.—*Improvement in Harvesting Machines.*—Patent dated May 10, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim* the conformation of the intermediate fingers of a reaping and mowing machine, having a conical form with a straight outline from point to heel, so as to present a straight, gradual taper on the underside as well as above.

I also claim the safety flanch *s* for securing the pitman connection.

No. 23,922.—CHARLES W. KENNEDY and RICHARD T. BROWN, of Williamsburg, N. Y.—*Improvement in Machines for Breaking Coal.*—Patent dated May 10, 1859.—The plate H is armed with spikes *j*, and they are so placed or disposed in the plate as to be in line with the centres of the spaces between the spikes *a* of the drum E when the faces of the latter are directly underneath the plate H.

The plate H is perforated around near its edges, and the spikes *k* of the plate I fit therein. The plate I is directly over the plate H, and the spiral springs *l* are placed around the corner spikes to sustain the plate I.

*Claim.*—The arrangement and combination of the polygonal spiked drum E, spiked crushing plate, and spiked clearing plate I.

No. 23,923.—LEWIS KIRK, of Reading, Pa.—*Improvement in Railroad Car Brakes.*—Patent dated May 10, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of the hand-wheel J, and the rod K in combination with the pump B, so that, by depressing the rod K, the pump is placed in working order, and can be operated by means of the hand-wheel J<sup>1</sup>.

Second. The arrangement of the spring catch *k*, which is attached to the piston rod *d*<sup>3</sup>, of one of the pump cylinders, in combination with the bell crank *l*, or its equivalent, which is operated by means of an eccentric *m*<sup>1</sup>.

Third. Arranging the coupling M on a rod *p*, in such relation to the spring catch *k* and the cock E, that by exercising a pressure on the coupling, the rod *p* is turned sufficiently to open the cock E, and to depress the spring catch *k*.

No. 23,924.—THOMAS J. LAMBIN, of Baltimore, Md.—*Improvement in Mail Bags.*—Patent dated May 10, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the placing of the staples or buckles on the flap of the bag or

pouch, so that when the flap is turned down, said staples or buckles will pass through the grumnets.

I also claim the manner of forming the seams of the bag or pouch, so that they cannot be cut open and resewn from the outside of the back without instant detection on looking at the seam, as its whole character must be changed in any such attempt or effort.

\* No. 23,925.—JABEZ LEWIS, of New Orleans, La.—*Improved Apparatus for Conducting Water to Cisterns.*—Patent dated May 10, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—Making the change in openings from the box A, or its equivalent, by the employment of a weight containing water supplied from a roof, when the weight can lose the water it contained, and thus reduce its force of gravity to allow another change to be made, by which the water is conducted in separate directions from and to the cistern.

No. 23,926.—CHARLES L. LINNELL, of Truro, Mass.—*Improved Jib Boom for Vessels.*—Patent dated May 10, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The application of the after jib boom to the bowsprit by means, not only of the slide rod applied to the bowsprit, but the slider connected with the boom.

No. 23,927.—BENJAMIN TOLMAN, of Pembroke, Mass., assignor to Himself and A. T. RAMSDELL, of Pembroke, aforesaid.—*Improved Spokeshave.*—Patent dated May 10, 1859.—The claim and engravings will explain the nature of this invention.

*Claim.*—An improved spoke shave, constructed with an adjustable knife and an adjustable throat gauge, arranged and applied to the stock and so as to move with respect to one another.

No. 23,928.—WILLIAM S. LOUGHBOROUGH, of Rochester, N. Y.—*Improved Bench Plane.*—Patent dated May 10, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim*, first, the combination of the screw 2, which takes effect in the projection R, spring or yielding cap C, bit B, and screw 1, for the purpose of varying the cut of the bit, and at the same time and proportionally, the space of the throat, the base of the bit B being the fulcrum upon which it swings when said changes are made, the said combination being applicable for the adjustment of the bit in all kinds of planes.

Second. The adjustable parallel fence F, constructed with diagonal slots D, for the set screws Y, said fence being applicable to match planes, and also the stop P, with the slot running up diagonally from the face, the set screw K and the guide pin N keeping it in position, said stop being applicable to panel ploughs and dadoes.

No. 23,929.—SAMUEL D. LOUNT, of Summerville, Mich.—*Improved Rotary Engine.*—Patent dated May 10, 1859.—In this invention the steam passes into chest D, through E, and down the passage G, and through the orifice *b*, and acts against the pistons L, the saddles M of which are made to work snugly against the inner side of the case A by means of the spring *c*. The steam is exhausted through the passages F and H, and as it passes through *b* acts against two pistons passing directly between two pistons, but the principal pressure is exerted against the lower piston on account of its having a greater exposed surface.

*Claim.*—The arrangement and combination of the rotating head I, provided with sliding pistons, and placed eccentrically within the case A, the saddles M applied to the pistons and the valves N O.

No. 23,930.—ROBERT MARCHER, of New York, N. Y.—*Improved Apparatus for Laying Metal Leaf on Mouldings, &c.*—Patent dated May 10, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim* the method of laying leaf metal on mouldings and other surfaces by means of a roller.

And I also claim operating the roller in laying leaf metal on surfaces by the force of capillary attraction.

And I also claim the combination of the rails, the table for holding the book of leaf metal, and the means for holding the article to be gilded or silvered, or the equivalents of the said elements, in combination with the roller.

And, finally, I claim the combination of the roller and rails, or equivalent guide ways, with the rebate or equivalent gauge.

No. 23,931.—T. MAYHEW, of Poughkeepsie, N. Y.—*Improvement in Railroad Switches.*—Patent dated May 10, 1859.—This invention consists in the employment of an adjustable or movable platform, arranged in connection with certain gearing, a switch bar and springs, whereby the attendance of the switchman is rendered imperative at every adjustment of the switch, and while the train is passing over it, and the return of the switch to its usual position after being temporarily moved is more fully insured.

*Claim.*—The employment or use of the adjustable platform E, in connection with the switch bar B and gearing  $d h^1 h^2 h^3 h^4$ , springs  $c e$ , and stops  $i g$ .

No. 23,932.—WILLIAM McALLISTER, of South Reading, Mass.—*Improvement in Wind Mills.*—Patent dated May 10, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—The series of narrow sails 1 2 3 4, attached to vertically sliding rods  $a b c d$ , and united by means of the cords  $s s$ , and operating in combination with the adjusting ropes I.

No. 23,933.—JAMES C. MOLTRUP, of Bucyrus, Ohio.—*Improvement in Ploughs.*—Patent dated May 10, 1859.—This invention relates to certain improvements in ploughs, by means of which the same plough may be made to cut a wide or narrow, deep or shoal furrow, and without increasing the weight or cost of the plough.

*Claim.*—Giving the beam B B<sup>1</sup> longitudinal and vertical motion by means of the bearing plates  $d^2$ , slots  $c c^1$ , short rear bolt  $b$ , and long vibrating front bolt  $f$ .

No. 23,934.—JAMES MONACH, of Rahway, N. J.—*Improvement in the Manufacture of Felt Hats.*—Patent dated May 10, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The corrugation of the brims of felt or soft hats by the employment of dies on both sides of the brim, whereby the corrugation is attained without stretching the brim, both the surfaces being finished at one operation.

No. 23,935.—ELI MOSHER, of Flushing, Mich.—*Improvement in Plant Protectors.*—Patent dated May 10, 1859.—The box A is not provided with any bottom, but has a top B, of gauze or netting of any kind, that will admit the sun, air, and moisture, and exclude the insects. The gauze B is cut in rectangular form, and two of its sides are permanently attached to two of the sides  $a^1 a^2$  of the box, the fabric being tacked or otherwise secured the whole length of the sides  $a^1 a^2$ , at their upper parts.

*Claim.*—The arrangement and combination of the folding sides  $a a^1 a^2$ , cover B, and fastening cord  $b$ .

No. 23,936.—JAMES MULLIGAN, of New York, N. Y.—*Improvement in Roasters.*—Patent dated May 10, 1859.—This invention relates to a peculiar construction of a movable journal, applicable to the top plate of a stove or range, whereby the cylindrical coffee roaster is sustained while revolved over the open fire. A cover is provided which, inclosing said roaster, confines all smoke and fumes, passing the same back into the fire.

*Claim.*—The detachable journal bearings  $b b$ , constructed so as to be clamped to the edges of the openings in the stove or range and receive the spit  $c$ .

No. 23,937.—JOHN MUNSON, of San José, Cal.—*Improvement in Pump Boxes.*—Patent dated May 10, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I claim constructing the pump boxes of the rings  $a$ , bands  $e$  provided with the uprights  $g g$  and the traverse plates  $h$ , when the boxes, thus constructed, are provided with the valves  $l$  fitted thereon.

I further claim securing the lower box C in the bottom of the cylinder A by means of the traverse plate  $h$  on said box and flanch  $a$  secured to the inner side of the cylinder.

No. 23,938.—WILLIAMSON NICHOLS, of Floyd county, Ga.—*Improvement in Ploughs.*—Patent dated May 10, 1859.—By this invention a plough is so regulated that when in operation the ploughman can either plough to or from whatever is worked.

*Claim.*—The arrangement of the forked beam G, segmental head F, holes  $g$ , bolts 4 and 5, clevis  $f$ , stock H, handle L, rivet  $c$ , and holes 1 2 3.

No. 23,939.—R. B. NORVELL, of Huntsville, Ala.—*Improvement in Bridles.*—Patent dated May 10, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The cord F, attached to a bridle or halter by passing the same through the bit rings or halter rings and over the pulley  $c c^1$ , or their equivalents, and under the throat of a horse or other animal.

No. 23,940.—JAMES NUTTALL, of New Orleans, La.—*Improvement in Iron Ties for Cotton Bales.*—Patent dated May 10, 1859.—The ends of the band to be joined are marked A B, and the part where the attachment is made marked  $a b$ . The clasp  $c$  which confines the hooks in figure 3, being purposely omitted, the form of the hooks as caught in plate  $s$  can be seen, being each separately hooked in the mortise  $m$  in the plate.

*Claim.*—The combination of the plate  $s$  and movable clasp  $c$ , when made use of in confining the hooks  $a$  and  $b$ , as a fastening for iron ties for cotton bales.

No. 23,941.—HENRY A. NUTTING, of South Amherst, Mass.—*Improved Clothes Frame*.—Patent dated May 10, 1859.—The claim and engraving will explain the nature of the invention.

*Claim*.—A clothes frame composed substantially of the rod or stem *c*, the two hubs A B, and the two sets of arms D E.

No. 23,942.—ISAAC B. PALAMOUNTAIN, of Tarboro, N. C.—*Improvement in Cultivators*.—Patent dated May 10, 1859.—On each side of the centre bar, and at different heights from its base are cast boxes or projections *c* with dovetail grooves *b* therein, having a suitable rearward declination. These grooves are exactly on opposite sides of the bar, one pair of which being at the base of standard F, above the share, and the others occupying positions in rear of and below, and below the top of the share.

*Claim*.—The arrangement of the beam A, stock B, centre bar B, standard F, wings G G and J, share D, and seat H, for joint operation.

No. 23,943.—GEORGE S. REYNOLDS, of East Bethel, Vt.—*Improvement in Horse Hay Rakes*.—Patent dated May 10, 1859.—The inventor says: I construct my rake by locking on and bolting to the axle *s* several blocks of wood *a*, leaving spaces *k* between, which forms separate boxes *k* for the several arms *b b* to play in, thereby giving each a more independent position.

A frame *r* is attached to the board *f*, the top of which supports the hand, and a strap *l*, attached to the middle of the block *e* near the shoe, for the purpose of steadying the rake.

*Claim*.—The arrangement of the boxes *k*, arch arms *b*, elastic spring *g*, shoe *d*, strap *t*, frame *r*, and strap *l*.

No. 23,944.—AUGUSTUS REBETEX, of Norwich, Conn.—*Improvement in Tools for the Manufacture of Fire-Arms*.—Patent dated May 10, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The use of a crank shaft A B C to carry a cutter I, such crank shaft suspended at the centres of an engine lathe, or any similar machine, and receiving its motion from the counter shaft of such lathe, or similar machine, for the purpose of cutting an eccentric shaped slot in the barrel of a pistol or anything else.

No. 23,945.—SYLVANUS RICHARDSON, of Jericho, Vt.—*Improvement in Water Wheels*.—Patent dated May 10, 1859.—The inventor says: The nature of this invention consists in so constructing a water wheel that I am not under the necessity of placing the wheel at the bottom of the water privilege, but by placing it as low as may be convenient, and by attaching a draft tube below the wheel, and through which tube the water passes into the tail race, I receive the full benefit of the head and fall of the water.

*Claim*.—The construction and arrangement of the shutes formed by irons *g* and *i*, and the arrangement of openings in plate *f*, in fig. 3, and corresponding openings in plate *f*, in fig. 5, and the arrangement of plate *c c*, and wheel *e e e e*, and case *a a*, and draught tube *d*, and the combination of the same.

No. 23,946.—JOHN W. RINEHART, of Lexington, Mo.—*Improvement in Hemp Brakes*.—Patent dated May 10, 1859.—This invention consists in a peculiar manner of operating a swinging or oscillating beater frame, which is used in connection with stationary beaters, whereby the woody portion of the hemp may be broken and detached from the fibre in a very expeditious and perfect manner.

*Claim*.—The particular manner of operating the beater frame B, to wit: by means of the lever *j*, links *k k*, lever *l*, shaft C, arm *m*, connecting rod *n*, and crank *o*.

No. 23,947.—S. S. RITTER, of Philadelphia, Pa.—*Improvement in Hernial Trusses*.—Patent dated May 10, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the construction of a surgical truss, having a short spring, with one or more plates of metal extending in front about half round the body, and held by a strap or straps, forming the other half of the girdle, when the said spring is curved, as shown, for the purpose of making a more agreeable pressure on the hernia, and for fitting the ends of the spring better to the hips, thus rendering the truss more comfortable to the patient.

Second. I claim the described pad, having a central prominence, surrounded by a groove and ridge, when the face of said pad is made in one piece.

No. 23,948.—EDWARD A. L. ROBERTS and WILLIAM J. DEMOREST, of New York, N. Y.—*Improvement in Apparatus for Vulcanizing Rubber*.—Patent dated May 10, 1859.—The nature of this improvement is that of a portable stove, boiler, and steam chamber, for vulcanizing various articles of rubber and gutta percha.

*Claim*.—The general arrangement of the stove, boiler, and vulcanizing chamber.

No. 23,949.—DAVID B. ROGERS, of Pittsburg, Pa.—*Improvement in Grain Shovels.*—Patent dated May 10, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The so bending a plate of iron into the shape of a shovel as to form a socket for the handle out of the same piece of iron.

No. 23,950.—S. E. ROOR, of Bristol, Conn.—*Improved Clock Dial.*—Patent dated May 10, 1859.—C is a curved or ornamental frame; E is the sash, secured to the frame by a joint G, and held close by a catch H; the back A may be made entirely flat, when desirable; the dial B made the diameter of the back, and the frame made plain and turned over the edges of the frame and back, thus cramping them firmly together.

*Claim.*—The combination of a clock dial B, metallic back A, frame C, as a new manufacture, specifically, as and for the purpose described.

No. 23,951.—STEPHEN P. RUGGLES, of Boston, Mass.—*Improvement in Printing Presses.*—Patent dated May 10, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of two screws having different sized threads, and operating together substantially as described, to give a greater motion to a platen, or its equivalent, at one time, and more power at another time, as may be desired.

I also claim connecting two such screws together, and to the lever or bar that actuates them, by a strong helical spring, that, by being wound up, becomes a clamp, so as to put the two screws in action one after the other, substantially as described.

I also claim running out the bed of the press on inclined ways, for the purpose of increasing the distance between the bed and platen, which makes a better entrance for the frisket, blankets, sheet, form, &c., by affording more space when they are run under the platen, as described.

No. 23,952.—JACOB RUPERTUS, of Philadelphia, Pa.—*Improvement in Automatic Primers for Fire-Arms.*—Patent dated May 10, 1859.—The claim and engravings explain the nature of this invention.

The inventor says; I *claim*, first, the feeding slide lever B, applied in combination with the hammer, to constitute a portion of the thumb piece thereof, and with an interposed spring *l*, substantially as described.

Second. Constructing and applying the feeding piston *q* to roll within the magazine, substantially as and for the purpose set forth.

Third. Attaching the feeding piston *q*, which drives the priming forward in the magazine, to a spring or flexible driver, which winds on and off a spring barrel, substantially as and for the purpose described.

No. 23,953.—JOHN SELSER, of Williamsport, Pa.—*Improvement in Pumps.*—Patent dated May 10, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim*, first, draining the standing pipe D and relieving the air-chamber C from pressure by allowing the water to escape upward through the cylinder B whenever the plunger rod E is sufficiently depressed, thereby draining the pipe without draining the pump itself, substantially in the manner set forth.

Second. The splash plate G, with its aperture O, when used in connection with the vertical termination D<sup>1</sup> of the discharge pipe, substantially as and for the purpose set forth.

No. 23,954.—THEODORE SHARP, of Bloomington, Ill.—*Improvement in Shafting for Endless Horse Powers.*—Patent dated May 10, 1859.—The nature of this invention consists in constructing the reel, or main shaft, with long hubs, and mortises in each of a suitable length to allow the main, or driving shaft, which has pins passing through it so arranged as to correspond with said mortises or hubs of reels, to allow the shaft to slide endwise from right to left, or left to right, the shaft only projecting one side at a time a suitable length to receive the internal gear pulley, which has long hubs, with a notch or slot in their ends corresponding with the pin in the shaft, to prevent them from turning on said shaft.

*Claim.*—The sliding shaft A A, reels with slotted or mortised hubs R R, constructed and operating in the manner and for the purpose substantially as described.

No. 23,955.—DAVID M. SMITH, of Springfield, Vt.—*Improvement in Seed Planters.*—Patent dated May 10, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim* the combination of the following devices for operating the dropping slide, viz: the spring *k*, the rack C, the pinion D, the rack lifter *m*, the groove *r* of the rack, and the latch *u*, arranged substantially as specified.

I also claim the application of the rack lifter *m* to the rack, so as to be adjustable thereon, in the manner and for the purpose as set forth.

I also claim combining with the rack C, and apparatus carried by it, the latch elevator *y*, for moving the rack out of gear with the pinion and holding the rack from slipping or being thrown backward, the object being not only to prepare the rack for causing the machine to plant the first dropping of seed in the right place, but to hold the rack out of gear with the

pinion while the machine is moved over the ground and it may not be desirable to have it plant seed.

No. 23,956.—MATTHEW SMITH, of Pittsburg, Pa.—*Improvement in Rotary Steam Engines.*—Patent dated May 10, 1859.—The nature of this invention consists in an arrangement and combination of a revolving cylinder, steam chest, cam yoke, and supply and exhaust passages with a stationary cam, and supply and exhaust chambers.

*Claim.*—The combination and arrangement of a revolving cylinder, steam chest, cam yoke, supply and exhaust passages, with a stationary cam, supply and exhaust chambers, when arranged, combined, and operated as described, and for the purposes set forth.

No. 23,957.—CHARLES SPRING and ANDREW SPRING, of Boston, Mass.—*Improvement in Lathes for Turning Irregular Forms.*—Patent dated May 10, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—The combination of a gripping chuck, by which an article can be so held by one end as to present the other free to be operated upon, with a rest preceding the cutting tool, when it is combined with a guide cam, or its equivalent, which modifies the movement of the cutting tool, all operating together for the purpose set forth.

No. 23,958.—GEORGE A. STONE, of Roxbury, Mass.—*Improved Apparatus for Superheating Steam.*—Patent dated May 10, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—A steam jet, or the equivalent thereof, located substantially in the position and serving the purpose specified, in combination with a superheating apparatus, which is heated by a portion of the gaseous products of combustion, and is otherwise substantially the same as set forth.

No. 23,959.—GEORGE TATLOCK, of Salem, Ind.—*Improvement in Raking Attachments for Harvesting Machines.*—Patent dated May 10, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim* operating the rake head D, which is pivoted to the sliding bar C through the medium of the rotating shaft r, connecting rod p, rock shaft l, connected respectively with the rod p and sliding bar C by the arms k o, in connection with the arm E, attached to the rake head, the loop or guide d, attached to the arm E, and the bars or arms g i attached to the platform, the whole being arranged substantially as and for the purpose set forth.

No. 23,960.—H. L. THISTLE, of New York, N. Y.—*Improved Bureau Bedstead.*—Patent dated May 10, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim* combining the bedstead frame with the wardrobe, or other case, by means of the hinged links and movable slides, substantially as described, whereby the bed can be let down to a lower level than by any other construction before known, while at the same time it can be let down by a single movement, and within a space no longer than the bedstead, and without the necessity of first drawing out a part of the structure from the wall, or making joints in the side rails, or pieces, the hinged links and slides giving to the structure all the foregoing advantages, as set forth.

And I also claim, in combination with the bedstead frame, connected with the case by the hinged links and slides, the weighing of the head end of the frame to balance the weight of the foot end when lifting it up, and thereby facilitate the manipulation, substantially as described.

And I also claim forming the support for the foot end of the bedstead frame by a hinged panel, substantially as described, so that the said support, when the bed is thrown up, shall form part of the front of the wardrobe, or other piece of furniture, as set forth.

No. 23,961.—SAMUEL THOMAS, of Burnett, Wis.—*Improvement in Harvesting Machines.*—Patent dated May 10, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—The false pole K B, with its attached sliding gauge E C, which may be adjusted at pleasure, so as to prevent side draft and pressure upon the near horse, in the manner and for the purpose specified.

No. 23,962.—GEORGE W. TOLEMAN, of Augusta, Ky.—*Improvement in Rotary Harrows.*—Patent dated May 10, 1859.—The centre of the wood frame is made secure by means of the cast plates which are bolted to the wood frame; the arms of the frame are bolted to the iron circle 1; at each crossing of the same a cast-iron shaft 3 is elevate dabove, having a journal on the lower end, which passes through the centre of the harrow.

Rotation is produced by means of the roller or ball 2, resting on the circle iron 1, causing the teeth of the harrow on that side to sink deeper into the ground, thereby meeting with more resistance and causing it to rotate as the harrow is drawn along.

*Claim.*—The arrangement of the frame A, shaft 3, iron circle 1, roller 2, rods B B<sup>1</sup> C, and rod or hook 4, operating conjointly, as set forth, and for the purposes specified.

No. 23,963.—JOHN VAN and HENRY V. BARRINGER, of Cincinnati, Ohio.—*Improvement in Stoves*.—Patent dated May 10, 1859.—This invention relates to certain improvements in doors for cooking stoves and ranges.

*Claim*.—The swinging grated door or hearth *h*, and sliding and swinging register *g*, in combination with the supporting legs *r r* and stove *A*, arranged and operating substantially as and for the purpose set forth.

No. 23,964.—EDWARD VAN CAMP, of Readington, N. J.—*Improvement in Hillside Ploughs*.—Patent dated May 10, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—Making the share, the landside, and the landside brace of hillside ploughs, each in one piece, and uniting them together to the mould board and beam, in the manner and for the purpose set forth, thus making a cheap, strong, and efficient plough for hillside ploughing.

No. 23,965.—JAMES VAUGHN, of Magnolia, Ill.—*Improvement in Grain Separators*.—Patent dated May 10, 1859.—The operation of this machine is as follows: Power is applied to the cylinder *B*, and the ears of corn are fed in between the cylinder *B* and concave *C*. The corn is shelled from the cob as the ears pass between the cylinder and concave, and the cob and corn pass down the inclined spout *D* into the screen *E*, which is rotated from the cylinder *B* by means of the gearing *g h j k* and the belt *m*. As the screen *E* rotates the corn passes through it into the hopper *F*, while the cobs are fed along within the screen by the spiral plates *c c*, and are discharged at the outer end of the screen, the fan *J* creating a blast which passes through the screen and forces out light, foreign substances with the cobs.

*Claim*.—The arrangement and combination of the semi-cylindrical hopper *F*, having a depression *b* in its centre, with the screen *E*, buckets *d*, spout *D*, fan *J*, and spout *I*, as and for the purpose shown and described.

No. 23,966.—WILLIAM VINE, of Hartford, Conn.—*Improved Meat Slicer*.—Patent dated May 10, 1859.—The nature of this invention consists in the peculiar arrangement for feeding, or forcing the meat forward, to be cut by a rotating knife.

*Claim*.—The beveled lip *T*, and the pendant *G*, for the purpose described, in combination with the other parts of the dried meat slicer, substantially as set forth.

No. 23,967.—THOMAS K. WEBSTER, of Lawrence, Mass.—*Improved Lock*.—Patent dated May 10, 1859.—*E* is a guard or fender, and is relied on to protect the levers, the ends of the levers *c* being directly behind it, leaving no direct view of the levers from the key hole, either when locked or unlocked.

*Claim*.—The guard or fender *E*, as described in the specification, and for the purpose described.

No. 23,968.—LEONARDO WESTBROOK, of New York, N. Y.—*Improved Churn*.—Patent dated May 10, 1859.—The inventor says: To operate my churn I place the same over a tub, pail, or other suitable vessel; I then pour into the space above the disk *C* the milk or cream to be churned, simultaneously turning the crank *K*. The disk being slightly in contact with the rim *X X X* as it revolves, rubs the milk or cream as it passes through, producing in it some change mechanical, or otherwise, but not having enough friction to melt the butter contained in it. The milk or cream in this modified form then falling among the numerous dashers is thoroughly churned before it passes out into the receiving vessel at the bottom.

*Claim*.—The use of the projecting rim *X X X*, and the revolving disk *C*, working over the same, in combination with the fixed and revolving radial dashers, and with or without the regulating thumb screw *s*, all constructed and operating substantially as described, and for the purposes set forth.

No. 23,969.—MILTON WHITE, HOWARD WHITE, HENRY T. WHITE, and JOSEPH WHITE, of Philadelphia, Pa.—*Improved Ice Pick*.—Patent dated May 10, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—The combination of the ball *A* in tube *B B*, sliding upon the stem *C C*, in such a manner that the blow may be struck upon the head of the stem, substantially as described.

No. 23,970.—JOHN GEORGE WIDMANN, of New York, N. Y.—*Improvement in Stoves*.—Patent dated May 10, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—The arrangement and combination of the gas tubes *d*, with the cylinder *D*, and fire openings *b*, so that the gases which arise from the heating of the coal will be compelled to pass down into the fire, as shown and described.

No. 23,971.—HOSEA WILLARD and ROBERT ROSS, of Vergennes, Vt.—*Improvement in Harvesting Machines*.—Patent dated May 10, 1859.—In this invention the segment *e* will retain the finger bar *G* in proper position, serving as an effectual brace to both the bar *D* and

the finger bar G. By drawing the lever I backward the chain or cord *p* will, through the medium of the lever H and the projection *o*<sup>\*</sup>, raise bodily the finger bar G and cutter thereon.

The inventors say: We *claim*, first, the arrangement and combination of the hinged bar J, with the lever I, substantially as and for the purpose shown and described.

Second. The arrangement and combination of the adjustable spring *b*<sup>1</sup>, bar D, adjustable rod *i*<sup>1</sup>, spring *h*<sup>1</sup>, and finger bar G, as and for the purpose shown and described.

No. 23,972.—WILLIAM E. WILSON, of Denton, Md.—*Improvement in Harvesting Machines*.—Patent dated May 10, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim*, first, the combination of the vibrating sector A, rack *p*, lattice frame C, and carriage *j*, with the beam B, or its equivalent, and the rake D, the several parts being arranged substantially as described and for the purpose set forth.

Second. In combination with the rake D, having its centre driven backward and forward over the platform, the swiveling plate *f*, ratchets *r*, and pawl *n*<sup>1</sup>, and adjustable shifting stop *g*<sup>4</sup>, or its equivalent, whereby the rake is turned upon its centre and caused to sweep the grain off, as specified.

Thirdly. In combination with the rake D, having its centre driven back and forth over the platform, as specified, the guiding plate *w*, and rolls *p*<sup>1</sup> *p*<sup>2</sup>, or their equivalents, whereby the rake is thrown back into the proper position to sweep across the platform after having discharged a sheaf, as described.

Fourth. The combination of the rod M, with the rod *s*, arm *r*, cam *y*, and spring N, the whole arranged and operating as and for the purpose set forth.

Fifth. The stop *h*, arranged as described for the purpose set forth.

No. 23,973.—WILLIAM E. NORTHEN, of New York, N. Y.—*Improvement in Combined Metallic Street Curb and Gutter*.—Patent dated May 10, 1859.—The inventor says: The precise shape, capacity, form of curves, and size of this compound curb and gutter, are unimportant, provided all be such as to attain the ends proposed, viz: a gutter under the sidewalk curb to protect that walk, and sufficient protection from the curb portion to receive the tires of wheels whose felloes would strike and tend to upset the curb.

*Claim*.—The compound metallic curb and gutter, constructed substantially in the manner specified, whereby advantages, substantially such as are set forth, are attained.

No. 23,974.—T. J. DE YAMPERT, of Shohola, Pa.—*Improvement in Ploughs*.—Patent dated May 10, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, a revolving cone having under-cut or overhanging curved flanges or wings that extend entirely from the base to the point of the cone, so that it will revolve upon its shaft or journal by the resistance of the earth alone against it, and without being driven by other forces, as described.

I also claim, in combination with a cone furnished with spiral under-cut flanges, and revolving by the resistance of the earth against it, the mould board and landside for turning over the loosened earth and directing the plough in its path, substantially as described.

No. 23,975.—G. G. BELCHER, of Worcester, Mass., assignor to Himself and JOSEPH S. HILL, of said Worcester.—*Improved Pruning Knife*.—Patent dated May 10, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, arranging the blade of a knife in such a manner that it opens and closes by turning one or both parts of the handle, substantially as specified.

Second. The pins *i* *i*<sup>1</sup>, on the blade B, arranged in combination with the slots *h*, in the plates *a* *a*<sup>1</sup> of the handle, for the purpose of operating the blade, and keeping the same rigid when it is opened as well as when it is closed, substantially as set forth.

Third. The slide C, or its equivalent, arranged in combination with the eye *d*, for the purpose of securing the two parts of the handle together, substantially in the manner described.

No. 23,976.—JOHN B. COLLEN, of Philadelphia, Pa., assignor to Himself and PASCAL YEARSLEY, of said Philadelphia.—*Improved Horse Shoe Machine*.—Patent dated May 10, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, bending the heated bar of iron to the requisite form, by applying it to a revolving former of the shape of the inside of the shoe, when the said former is arranged to hold the bent iron while it is acted upon by the dies, as set forth.

Second. The combination of the revolving former *q* with the cutter *x*, when the latter is so arranged, in respect to the former, that the edge of the cutter shall coincide, or nearly coincide, with the circular path traversed by the outer edge of the former, and when the cutter is hung to the movable bar *y*, or its equivalent, as set forth and for the purpose specified.

Third. The die N, the spindle Q, its former *q*, and the sleeve S, in combination with the counter die T, on the spindle *u*, when the whole of the parts are arranged in respect to each other for joint action, substantially as and for the purpose specified.

No. 23,977.—JAMES D. BLACK, of Boston, Mass., assignor to Himself and EZEKIEL HALLET, Jr., of said Boston.—*Improvement in Boot Crimping Machines*.—Patent dated May 10, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* machines for crimping boot-legs, in which the "hitch-on" is raised by the hand of the operator, pivoting the device by which the "hitch-on" is raised to a spring clock, or its equivalent, for the purpose set forth.

Second. I claim the peculiar construction of "hitch-on" described, the movable jaws *p* being temporarily closed upon both sides by a spring *r*, so that they may be separately opened, as set forth, for the insertion of the leather, and may be permanently closed by a single screw, as described.

No. 23,978.—SIMEON S. DODGE, of Sunapee, N. H., assignor to Himself and EDMUND BURKE, of Newport, N. H.—*Improved Hand Plane*.—Patent dated May 10, 1859.—In order to adjust this improved plane for work, the break iron C is confined to the adjustable cap iron D by means of the two set screws G G. Thus adjusted, the break iron C and the adjustable cap iron D are inserted in the mouth F of the plane, in which they are confined in the right position by means of the bolt H passing through the groove *h*<sup>1</sup>, and confined in place by the nut *h*.

The inventor says: I *claim*, first, the curved adjustable cap iron D, constructed and operating substantially as described.

Second. The combination of the adjustable cap iron D with the bolt H, the set screws G G, the thumb screw E, and the break iron C, constructed and operating substantially as described.

No. 23,979.—WILLIAM GRIFFITHS, of Philadelphia, Pa., assignor to Himself and JOSEPH H. LAMBERT, of said Philadelphia.—*Improvement in Knapsacks*.—Patent dated May 10, 1859.—The nature of this invention consists in making the usual stationary inner frame, or case of a knapsack so that it can, at any time, be either totally and readily removed therefrom, folded down into one end of the same in a compact or solid condition, admitting of the knapsack being rolled up in the ordinary cylindrical form like a portmanteau, or placed in a flexible covering to serve as a knapsack.

*Claim*.—A military knapsack, having the usual frame or case, made and adapted thereto, so as to be convertible, substantially as and for the purposes described, as an improved article of manufacture.

No. 23,980.—WILLIAM H. KING, of Charleston, Ill., assignor to Himself and NELSON COLSON, of said Charleston.—*Improvement in Corn Planters*.—Patent dated May 10, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, in combination with the cams L and the arm M, the arrangement of the rods *e* in such relation to the seed cells *c* that they push out the corn contained in the same, substantially as described.

Second. The arrangement of the marker *g*, in combination with scraper *h*, so that the same never fails to make a clear mark in the track of the driving wheel, substantially in the manner set forth.

No. 23,981.—CHARLES LEARNED, of Indianapolis, Ind., assignor to Himself and GEORGE P. STEVENS, of said Indianapolis.—*Improvement in Seed Drills*.—Patent dated May 10, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the combination of these devices so that, by their continued action, they shall produce a steel with sharp ribs or edges, in the direction of its length, substantially as set forth.

No. 23,982.—SAMUEL LEE, of Taunton, Mass., assignor to CHARLES S. POMEROY, of said Taunton.—*Improvement in Making Steels for Sharpening Knives*.—Patent dated May 10, 1859.—The nature of this invention consists in making, upon the surface of a blank piece of steel, a series of longitudinal grooves, with sharp edges between them, formed by compression from the substance of the metal by a milling tool cut with sharp edges, thereby cutting away none of the metal, but increasing its density, and rendering it, after being hardened, very hard and serviceable when applied in sharpening knives.

*Claim*.—The guard, or series of straps K, in combination with the toothed roller G and elastic guard J, when operated in connection with the roller H and agitator I.

No. 23,983.—HENRY G. LEONARD, of Taunton, Mass., assignor to LEMUEL M. LEONARD, of said Taunton.—*Improvement in Cooking Stoves*.—Patent dated May 10, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim* so constructing and arranging one or more of the oven plates of the stove, that it or they can be removed and the flue or flues cleaned and the plates replaced, substantially as described, without loosening or separating the plates which form the outside of the stove.

I also claim making one or more of the interior flue plates so that it can be removed and

the flue cleaned, and the plate replaced, substantially as described, without loosening or separating the plates which form the outside of the stove.

No. 23,984.—JAMES S. McCURDY, of Brooklyn, N. Y., assignor to ELIAS HOWE, jr., of said Brooklyn.—*Improvement in Single Thread Stitches*.—Patent dated May 10, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: A single thread interloped stitch, in which each successive loop is encircled by a tight coil of the thread of the preceding loop, substantially as described.

No. 23,985.—DANIEL P. MEALEY, of Washington, D. C., assignor to Himself and A. E. H. JOHNSON, of said Washington.—*Improved Device for Suspending and Liberating Ships' Boats*.—Patent dated May 10, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim* the hanger, constructed with a seat or seats for the ring of the boat to rest upon, in combination with the seat formed in the tumbler, in such manner that the seat or seats of the hanger shall coincide with the seat in the tumbler, that a large portion of the weight and strain may be supported by the hanger, which increases the power of the device to resist strains, and facilitates the unlatching of the tumbler, substantially as described.

I claim, also, in combination with the arrangement of the opening E in the tumbler, in combination with the seats *c c* and that portion *m* of the hanger which rises above and overhangs them in such manner that when the seats of the hanger and tumbler coincide, the mouth of said opening will pass, and be inclosed by the hanger, in the manner and for the purposes described.

I also claim, in combination with the tumbler and hanger, arranged as described, extending the legs of the hanger below the range of the motion of the opening in the tumbler, so as to form a cut off to the passage of the ring, and thus prevent it from being carried round with the motion of the tumbler, substantially as described.

I also claim, in combination with a boat detacher, making a recess or shoulder *f* in the tumbler, in combination with a snug or projection *g* on the dead eye, whereby the connection of the ring of the boat with the tumbler, may be made with one hand, when necessary, substantially as described.

No. 23,986.—JAMES O. MERRILL, of Chichester, N. H., assignor to WILLIAM A. SWAIN, of said Chichester.—*Improved Churn*.—Patent dated May 10, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—The arrangement of the oscillating lever L and its weight W with the vibrating shaft M, the vibrating lever E, the auxiliary levers F F<sup>1</sup>, and the alternate reciprocating dasher arms G G<sup>1</sup>, with their dasher N N<sup>1</sup>, constructed and operating substantially as set forth, by which the oscillating power of the pendulum is applied to the process of churning butter.

No. 23,987.—JAMES W. MUNROE, of Fall River, Mass., assignor to JOHN SOUTHWORTH and WILLIAM R. MCKENSIE, of said Fall River.—*Improvement in Factitious Enamelled Leather*.—Patent dated May 10, 1859.—This invention consists in the employment of two thicknesses of fine cloth, united by a suitable cement, as the foundation upon which the varnish surface is laid, by which means a smooth surface is obtained, one that is not liable to crack when bent.

*Claim*.—As a new article of manufacture, the within described artificial leather, composed of two or more thicknesses of cloth, united by cement and varnish, as set forth.

No. 23,988.—JONATHAN B. PARVIN, of Hightstown, N. J., assignor to Himself and ELIAS STRATTON, of said Hightstown.—*Improvement in Machines for Digging and Gathering Potatoes*.—Patent dated May 10, 1859.—As the machine is drawn over the field the serrated cutter D cuts off the weeds, which are then pressed down by the roller C. The frame G being lowered down to the required depth by the means described, the digging plough F enters the ground, and the soil and potatoes are carried up the inclination I, and upon the endless apron K, which conveys the said soil and potatoes to a vibrating grate, where the potatoes are freed from dirt and carried by the elevator to box U, from which, when full, they are dropped on the ground in a pile.

The inventor says: I *claim* the combination of the weed cutter D and roller C, when mounted on a swivel and applied to a potato digger, substantially in the manner and for the purpose described.

I also claim hinging the frame that carries the plough, and the endless apron K, on the shaft *c*, when used in combination with the lever, links, and rods, by which the operator, from his seat can raise, lower, or hold up the plough and apron, substantially as described.

I also claim the combination of the adjustable endless apron *k*, horizontal and vertically vibrating grate O, and the elevating apparatus, substantially as described.

No. 23,989.—GEORGE W. RANDALL, of Boston, Mass., assignor to REUBEN J. TODD, of said Boston.—*Improved Basin Cock*.—Patent dated May 10, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The wash basin cock, or faucet, as made with cold and hot water inlet passages *d e*, and the column passage *h*, arranged in the socket C and column A, and with respect to the discharging spout B, substantially as described, in order to enable a person, by turning the movable part, or parts, to discharge either cold or hot water, or a mixture of the same, from the faucet, or to close off both hot and cold water induction passages, as circumstances may require.

No. 23,990.—AUGUSTUS REBETEV, of Norwich, Conn., assignor to the MANHATTAN FIRE-ARMS MANUFACTURING COMPANY, of New York City.—*Improvement in Tools for Manufacturing Pistols*.—Patent dated May 10, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The use of a frame, constructed as described, having a profile in one plate of it, to shape and finish a corresponding recess in the side plate of a pistol, by means of a revolving cutter, governed by the outlines of said profile.

No. 23,991.—FRIEDRICH SCHUTTE, of Philadelphia, Pa., assignor to Himself and PHILIP P. WEIS, of said Philadelphia.—*Improved Rotary Cutters and Mode of Operating Them for Mouldings*.—Patent dated May 10, 1859.—The object of this invention is to continue the cutting of a curved moulding throughout all changes which may occur in the direction of the grain of the wood without any interruption or alteration other than the simple reversing of the cutter; and also to insure the cut surface being clean, smooth, and uniform.

*Claim*.—A revolving cutter, with any convenient number of double cutting edges of the form of the tongue, groove, bead, or hollows to be cut; one cutting edge being the reverse of the other in each pair, so that one cutting edge only of each pair shall have a cutting effect, when the cutter revolves in one direction; the other edge to cut when the cutter revolves in a contrary direction, and so that one cutting edge of each pair shall act as a guard, to prevent the adjacent edge from penetrating too deep into the wood, when the said cutter with double cutting edges, thus constructed, is secured to a spindle capable of having the direction of its rotation readily reversed, as and for the purpose set forth.

No. 23,992.—GEORGE F. LOMBARD, of New Orleans, La.—*Improvement in Steam Engines*.—Patent dated May 10, 1859; patented in England, October 10, 1857.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the relative arrangement of two cylinders, four pistons, two rocking beams, two steam chests with valves, and the specified connections which combine and operate the same, in the manner and for the purpose set forth.

Second. The application of the exhaust steam of the engine to the crank, or eccentric shaft, through a fly wheel, constructed and combined with the engine and crank shaft, substantially as and for the purpose set forth.

No. 23,993.—JAMES A. WHIPPLE, of Boston, Mass., assignor to JAMES WHIPPLE and BENJAMIN F. COOKE, of said Boston.—*Improved Steam Engine*.—Patent dated May 10, 1859.—The following is the operation of this engine: Steam is admitted from the pipe I to the valve chest H; it passes thence through the port *o*<sup>1</sup> and channel *i* to the piston *h*<sup>1</sup>, which is driven in the direction of the arrow at the same time the steam space in front of the piston *h* communicates through the channel *i*<sup>1</sup>, port *o*, and exhaust port *r*, with the exhaust pipe G. When the pistons *h h*<sup>1</sup> and the hub *e* have revolved sufficiently far within the cylinder F to bring the pistons nearly in contact with the heads *l*, the crank *a* will be carried over its centre; the valves *k* will then be thrown into a position to admit steam on the opposite side of each piston, and drive the pistons in the contrary direction, the steam escaping through the port at which it previously entered.

*Claim*.—The described intermittent rotary engine, consisting of the cylinder F, the heads *e*, and pistons *h h*<sup>1</sup>, operating in the manner substantially as described.

No. 23,994.—CORNELIA H. WILLIAMS, of Williamsburg, N. Y., administratrix of the estate of Augustus Williams, deceased, assignor to ANTHONY POLLAK, of Washington, D. C., assignor to A. N. CLARK, of Beverly, Mass.—*Improved Steam and Water Gauge*.—Patent dated May 10, 1859.—The claim and engravings explain the nature of this invention.

The administratrix says: What is claimed as the invention of the deceased is, first, combining the vessels separate and distinct from, but connected to the boiler by means of two pipes, as described, containing a float, having an indicator or pointer attached thereto, with the transparent tube or steam chamber, when said parts are constructed and arranged in relation to each other, to operate in the manner and for the purposes substantially as set forth.

Second. The general arrangement of the instrument for forming an alarm water gauge by combining with the indicator water gauge, constructed as described, a whistle attached to a

separate chamber containing a valve arranged to be operated by the float, so as to admit steam to said whistle to give the alarm when required, substantially as set forth.

No. 23,995.—ELISHA H. ADAMS, of Taladega, Ala.—*Improvement in Cotton Presses*.—Patent dated May 17, 1859.—The nature of this invention consists in a combination of levers, connecting rod, and guide rod, for operating the follower block and guiding it while entering the bale box.

*Claim*.—The combination and arrangement of guide rod D, toggle levers E E, connecting rod H, lever G, and rack lever I, all operating substantially in the manner and for the purposes set forth.

No. 23,996.—DAVID AHL, of Newville, Pa.—*Improvement in Surgical Splints*.—Patent dated May 17, 1859.—The claim explains the nature of this invention.

The inventor says: I *claim*, as a new article of manufacture, my splint, made of the ingredients and in the manner set forth.

No. 23,997.—V. R. ALLEN, of St. Louis, Mo.—*Improved Stencil Brush*.—Patent dated May 17, 1859.—The claim and engravings explain the nature of this invention.

*Claim*.—The mode of making the handle of the brush in two parts, and fastening the two parts by means of a screw turned on the wedge, (which I term a wedge-screw,) which is driven through the bristles in the iron band, thereby wedging the bristles in the band and enabling the main handle to entirely cover the ends of the bristles and bands, which prevents the handle and bristles, when in use, from working through the iron band holding the brush together.

No. 23,998.—EDWARD R. ARNOLD, of Providence, R. I.—*Improvement in Cut Off Gear of Steam Engines*.—Patent dated May 17, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of an adjustable cam or sector  $H^1 H^2$ , fig. 4, or its equivalent, located on the rock shaft; a stop block  $J^1 J^2$ , fig. 5, or its equivalent, and an arm  $I^1 I^2$ , fig. 3, or its equivalent, attached to the devices which lift the valve, the three, so combined, operating to regulate the cut off of the steam in its passage into the engine at any desired point of the stroke, in the manner and on the principle substantially as described.

Second. I claim the same combination above specified for the purpose of working the exhaust valves of a steam engine, by means of the same rock shaft and eccentric motion with which the steam valves are operated.

No. 23,999.—WILLIAM S. G. BAKER, of Chicago, Ill.—*Improvement in Variable Exhausts of Locomotive Engines*.—Patent dated May 17, 1859.—This invention consists in arranging over the exhaust pipe a rotary cylindrical plug with different sized openings which are brought to correspond with the openings in the exhaust pipe, and with the openings of the pipes leading therefrom to the chimney, by means of gear wheels easily operated from the engineer's stand; and the whole is so arranged that the exhaust steam from the two cylinders is kept separate until it reaches the chimney, and the opening of the exhaust pipe of each cylinder is raised separately.

*Claim*.—The plug E, arranged in combination with the shell D and with the exhaust pipes A  $A^1$  of a double cylinder steam engine in such a manner that the exhaust of each cylinder can be varied while both are separate from each other, substantially as and for the purpose specified.

No. 24,000.—ABRAHAM BARTHOLF, of New York, N. Y.—*Improvement in Sewing Machines*.—Patent dated May 17, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* applying the said lever to work on a fixed fulcrum in combination with a friction clamp, which, though it permits the said lever to be moved by and with the needle arm or needle carrier during a portion of the movement of the latter in either direction, for the purpose of drawing back the thread through the cloth and completing the stitch, and letting it slack again to form the loop of a succeeding stitch, holds the said lever in a positively stationary condition during the first part of the movement of the said arm or carrier, in either direction, and so prevents the thread getting slack till the needle has entered the cloth, and prevents its being drawn up through the cloth till the heel of the shuttle has arrived at the loop, substantially as described.

And, in combination with the thread controlling lever, constructed and applied as specified, and operated as described by the needle arm or needle carrier, I claim the stationary eye  $k$ , made adjustable, relatively to the said lever, substantially as and for the purpose set forth.

No. 24,001.—E. O. BAXTER, of Foreston, Ill.—*Improvement in Sewing Machines*.—Patent dated May 17, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the clearers formed of the bars *i i*, placed on the seed tubes *F*, connected with the bar *I*, and operated through the medium of the lever *J*, or its equivalent, substantially as and for the purposes set forth.

Second. The frame *A*, fitted to the axle *B*, as shown in connection with the cams *tt*, interposed between the axle *B* and the frame *A*, substantially as shown, so as to raise the frame *A* when desired to throw the seed distributing device out of gear with the driving wheel.

Third. The arrangement of the frame *A*, lever *N* connected with frame *A* by the rod *V* and the upright *M* on draft pole *D*, substantially as shown, for the purpose of regulating the depth of the furrows as described.

No. 24,002.—DOUGLAS BLY, of Rochester, N. Y.—*Improvement in Artificial Legs*.—Patent dated May 17, 1859.—The nature of this invention consists in a certain arrangement and combination of parts, whereby a substitute is attained for the natural leg, the action of the latter, as provided for by various muscles, tendons, and joints, being simulated by simple substance.

The inventor says: I *claim*, first, curving or deflecting the jointed extremities of the bars *J*, so as to bring their axes of motion back of their line of direction, substantially as and for the purpose set forth.

Second. I claim the cord *T* and spring *X*, acting upon the parts *D* and *L*, substantially in the manner and for the purpose set forth.

Third. I am aware that metallic springs have been employed to simulate the functions of the natural muscles; but experience has proved their inadequacy, both as respects the results obtained and their durability. I am also aware that India rubber, or elastic cords, have been used for the same purpose, and with no better results; and these I do not claim; but I claim the combination of the non-elastic tendon *F* with the India rubber spring *E* in such a manner that the required effect is derived from the compression and expansion of the material, and not from its elongation and contraction, substantially as set forth.

No. 24,003.—AMOS H. BOYD, of Saco, Maine.—*Improvement in Sewing Machines*.—Patent dated May 17, 1859.—In operating this machine, the cloth is placed under the shoe, which is smooth on its under side, and is caught between the shoe and the smooth plate *e*. By turning the wheel *B*, motion is given to shaft *E* and by it to the parts which form the feeding apparatus.

*Claim*.—The employment of lever *I*, a shoe and shoe shaft, spring *j*, plate *b*, and sliding bar *h*, with an under feed plate *e*, the shoe and the feed plate having an intermittent direct horizontal reciprocating motion, and the shoe having an intermitting direct vertical reciprocating motion, the same being given substantially in the manner specified and for the purpose set forth.

No. 24,004.—JAMES BOYLE, of Roxbury, Mass.—*Improvement in Apparatus for Cooling Beer*.—Patent dated May 17, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—The combination with two or more vessels, containing a series of tubes inserted in diaphragm plates, so arranged as to allow communication from the upper part of each vessel to the lower part thereof, and *vice versa*, by means of and through the said tubes, of pipes so arranged on either side of the diaphragm as to connect the said vessels alternately at the top and bottom thereof; and of a pump or any suitable device for forcing beer or any other liquid to be cooled down through one set of tubes and up the other, while a supply of cold water surrounding said tubes is forced in a direction opposite to that of the liquid contained therein, substantially as set forth.

No. 24,005.—MERRITT S. BROOKS, of Chester, Conn.—*Improved Drill Stock*.—Patent dated May 17, 1859.—The operation is as follows: The knob *C* is placed against the breast of the operator, or the palm of the hand is pressed against it, and the bit *B* applied to its work. The operator moves the socket *E* by hand, back and forth on the shaft *A*, and the tube *D*, in consequence of the stop *e* preventing its rotation from right to left, rotates the shaft *A* and bit *B* from left to right, as the socket *E* and tube *D* are shoved outward towards the bit *B*. As the socket and tube are drawn back, the shaft and bit remain stationary, the tube *D* turning within the socket *E*.

*Claim*.—The arrangement and combination with a spiral or screw-shaped shaft *A* of a tube *D*, ratchet *a*, and stop *e* within the socket *E*, as and for the purpose shown and described.

No. 24,006.—JOHN D. BUCKLEY and S. F. MOSHER, of Schaghticoke, N. Y.—*Improvement in Plugs for Blasting Rocks*.—Patent dated May 17, 1859.—The plug consists of the combination of a tapered screw with a plug, a part of which is divided and made capable of expansion; said plug being so constructed as to be capable, when forced out against the rock, of taking a sufficient hold of it.

*Claim*.—The combination of the tapered screw with the expanding metallic plug, having

ledges, or other equivalents, to penetrate the rock, and provided with an aperture for the fuse, as set forth.

No. 24,007.—GEORGE E. COWPERTHWAIT, of Danbury, Conn.—*Improvement in Machinery for Hardening Hat Bodies*.—Patent dated May 17, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the method of hardening hat bodies by means of a cradle, sustained in an inclined position, and having a tremulous movement, substantially as set forth.

I also claim the method of subjecting hat bodies to greater or less pressure during hardening, by inclining the cradle of the hardening machine to a greater or less extent, substantially as set forth.

No. 24,008.—JESSE A. CRANDALL, of New York, N. Y.—*Improved Rocking Toy*.—Patent dated May 17, 1859.—The longitudinal bar D prevents the body A from rocking too far back, it being attached to the transverse bar E at the rear end, by means of an iron loop or band S, by which means the shaft or pole D turns, when acted upon by the body or box A. An elastic string F and thumb screw or pin *i* may be used to prevent the pole D from rising too high.

*Claim*.—The flat wound springs C C, pole or bar D, elastic string F, pin or thumb screw *i*, or their equivalent, in combination with the box A and frame B, arranged and operated in the manner and for the purpose set forth, as shown.

No. 24,009.—C. L. CROWELL and ROBERT SMITH, of Peoria, Ill.—*Improved Machine for Upsetting Tire*.—Patent dated May 17, 1859.—The inventor says: My improvements in machines for upsetting iron, or other metals, relate to that class in which the metal bar to be upset is held or grasped firmly, on either side of the point at which it is to be upset, by means of two clamps, and by the movement of these two clamps towards each other, the bar, after being heated, is pressed between the holding points and is thus upset.

*Claim*.—The combination of the lever and the intermediate slide, arranged substantially as described, for the purpose of giving movement to the sliding jaw.

No. 24,010.—JAMES E. CROWELL, of Chelsea, Mass.—*Improvement in Drawing Heads for Spinning Machines*.—Patent dated May 17, 1859.—The principal object of this invention is to draw and spin a sliver as it is delivered from the doffer of a carding machine.

*Claim*.—So constructing and gearing the two pairs of drawing rollers  $D^2 d^2$  and  $D^3 d^3$ , that each pair will draw and release the sliver or roving, and so allow the twist to pass and run back to the first rollers  $D^1 d^1$ , substantially as and for the purpose set forth.

No. 24,011.—WILLIAM DAWES, of Washington county, Tenn.—*Improvement in Soap*.—Patent dated May 17, 1859.—The following are the ingredients composing this improved article of soap: Four pounds white bar soap, three pounds brown soap, half pint alcohol, one and a half pounds sal soda, half pint table salt, to six gallons of boiling water.

*Claim*.—The use of the ingredients, when combined in the proportions set forth; the whole forming an improved soap.

No. 24,012.—GEORGE W. DEAN, of Glenn's Falls, N. Y.—*Improved Tuyere*.—Patent dated May 17, 1859.—This invention consists in the employment or use of a rotating cylinder, provided with a series of chambers having orifices of different sizes, variously arranged and placed relatively, with a blast pipe and an opening in a bed plate, whereby the desired object is obtained.

*Claim*.—The adjustable rotating chambered cylinder C, arranged substantially as shown, with the slot B in the bed plate A, and relatively with the blast pipe D, to operate as and for the purpose set forth.

No. 24,013.—OLIVER H. DENNIS, of Altona, Ill.—*Improvement in Cultivators*.—Patent dated May 17, 1859.—This improvement consists in so connecting the side beams B B with the handles C C, and arranging both the handles and side beams in connection with the central beam A, that the position of the side beams and the consequent breadth of cultivation shall be directly under the control of the holder of the implement, to be instantaneously raised by him at pleasure.

*Claim*.—The arrangement and combination of the hinged handles C C, hinged side beams B B, and connecting bars H H, in relation to the central beam A, substantially in the manner and for the purpose specified.

No. 24,014.—J. B. DRAKE, of Goshen, Ind.—*Improvement in Straw Cutters*.—Patent dated May 17, 1859.—This invention consists in the combined construction and arrangement of the toothed feeding roller and the ratchet wheel, by means of which motion is given to it, by which arrangement, while the ratchet wheel is made to operate more effectually as a band

to keep the roller from splitting, at the same time the teeth are made to keep the ratchet wheel from working out of place.

*Claim.*—The arrangement of the hinged forked feeding pawl frame Q, feeding and stop pawls P and T, centrally arranged ratchet wheel N, spiked feed roller M, and rising and falling knife frame, substantially as and for the purposes set forth.

No. 24,015.—JOHN L. DRAKE, of Cincinnati, Ohio.—*Improvement in Lamps.*—Patent dated May 17, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim*, first a wick tube for containing two or more flat wicks, one at least of which wicks is a conductor, said tube having a double chamber, brace and opening, as stated, so that the burning wick may receive the oil from the conductor, and still be free to move upon or against it, as it is raised or lowered, to regulate the burning, substantially as described.

I also claim, in combination with a slotted and perforated dome, and a flat wick for burning heavy oils, an auxiliary flat wick and wick tube, substantially as herein described and for the purpose stated.

No. 24,016.—DANIEL INGHAM DURFEY, of Croton, Ohio.—*Improvement in Apparatus for Evaporating Saccharine Juices.*—Patent dated May 17, 1859.—This invention relates to a construction and arrangement of evaporating apparatus whereby the speedy concentration of the syrup is effected without liability of burning.

The inventor says: I *claim*, first, a descending series of evaporating pans, each having a well or depression on the side next its immediate successor in the range, closable by sluices, substantially as set forth.

Second. The arrangement of the sluices B, alternately on the right and left of the range, when used in the described combination with the wells or depressions referred to, for the purpose set forth.

Third. The strainer D, in the described combination with the clarifier A, operating in the manner and for the purpose set forth.

No. 24,017.—JOHN L. FRISBIE, of Cincinnati, Ohio.—*Improved Water Indicator for Steam Boilers.*—Patent dated May 17, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim*, first, the described combination and arrangement of the box C H, adjustable pipe B I J, valve K, sleeve Q q, and sector M N, operating in the described connection with the float arm O, for the purpose of varying the point of alarm from the outside of the boiler, as set forth.

Second. The cogged sector M N, provided with a segmental slot n, in the described combination with the sliding sleeve Q q, float arms O, and bolt p, to enable the application of the alarm to any part of the boiler, as set forth.

No. 24,018.—RUSSEL FRISBIE, of Middletown, Conn.—*Improved Nut Cracker.*—Patent dated May 17, 1859.—The inventor says: I make my invention of any suitable material, having the base of suitable form, as at Figs. 1, 2, and 3, upon which I place a stationary jaw b, and bearings for joints c and d of the cam lever e and movable jaw f. By elevating the cam lever e, the jaws b and f will be opened to receive the nuts; then by depressing the cam lever the jaws will be made to compress and crack the nuts.

*Claim.*—The nut cracker, substantially as described, as a new and improved article of manufacture.

No. 24,019.—OMRI C. FORD and JARVIS O. FORD, of Collinsville, Conn.—*Improvement in Water Wheels.*—Patent dated May 17, 1859.—This invention consists in the improved construction of a reversed action turbine water wheel.

*Claim.*—The application of the reversed curved buckets, or guides, to form a reversed action centripetal and centre vent turbine water wheel, in combination with the inner and outer cut off F and K, in the manner substantially as set forth and described.

No. 24,020.—A. W. FOX, of Athens, Pa.—*Improvement in Straw Cutters.*—Patent dated May 17, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement described and shown of the wheels D and E, or their equivalent, in connection with the crank G, connecting rod H, sliding frame I, and shafts B and C, by which I obtain an accelerated upward and retarded downward motion to the knife of a straw cutter, as set forth.

Second. The combination of the sliding frame I, with the knife J, sliding in the said frame by means of the action of the angular slot and roller, or their equivalent, by which combination of parts a drawing cut is given to the knife, without interfering with the attachment and operation of the connecting rod H, communicating motion from a shaft placed crosswise to the machine, as set forth.

No. 24,021.—ALBERT GOULD and CYRUS MARSH, of Seneca Falls, N. Y.—*Improved Arrangement of Key Board for Pianos, &c.*—Patent dated May 17, 1859.—The inventors say: Instead of arranging the tones of a diatonic in one range or bank of keys, and the intermediate tones which complete the chromatic scale in another range of keys, as in the common key board, we employ different ranges of keys, so arranged that those of one range uniformly alternate in position with those of the adjacent range or ranges, and the tones of each range are, in order, all at intervals of a whole step, one above another, while those of one range are, in order, all at intervals of a half step above or below those of the next alternating keys of the adjacent range or ranges, so that by the employment of two adjacent ranges of keys all the tones of the chromatic scale are uniformly produced in succession.

*Claim.*—The arrangement of two, three, or more ranges of keys of the key board, in the manner and in relation to each other substantially as and for the purposes specified.

No. 24,022.—JOSHUA GRAY, of Medford, Mass.—*Improvement in Sewing Machines.*—Patent dated May 17, 1859.—The inventor says: My invention is upon that class of sewing machines which form a double looped stitch with two threads, and is designed to attain precision and certainty of action with the greatest simplicity of mechanism, and consists in certain details of construction for the above named purpose.

In stating his claim, the inventor says: I *claim*, first, the combination of the reciprocating bar G, with its side inclines 10 and 11, and upper incline *w*, with the bar N, stop *v*, and adjustable stop *t*, arranged and operating as described, for the purpose set forth.

Second. In combination with the slide bar G, which operates the feeder, the bent lever *f*, and universally adjustable cam I, the several parts being arranged to operate substantially as described, for the purpose set forth.

No. 24,023.—WILLIAM D. GUSEMAN, of Morgantown, Va.—*Improvement in Weighing Scales.*—Patent dated May 17, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim* in a weighing apparatus a pendulum drum or roller, which has, in addition to a rolling motion, a travelling movement, substantially as and for the purposes described.

I also claim, in combination with a rolling and travelling drum or roller, and an index, a travelling vernier or dial, substantially as described.

I also claim the combination of the horizontal levers G, of a platform scale, with the pendulum drums C and bands F, substantially in the manner and for the purpose described.

No. 24,024.—JOSIAH D. HARRINGTON, of Rochester, N. Y.—*Improved Machine for Roasting Coffee.*—Patent dated May 17, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim*, first, the construction and arrangement of the divided handle *h* whereby the crank C not only serves to hold the two halves of the ball together while rotating, but also to lift up one half of the ball when moved into the position shown.

Second. I claim my method of uniting the two halves of a coffee roaster by means of the hinge E, formed of the curved jaw attached to one half of the ball and passing into a slot in the second jaw, said slot having the pin R, beneath which the carved jaw passes.

No. 24,025.—ELIJAH HARRIS, of Princeton, Ill.—*Improvement in the Mode of Applying Lever Power.*—Patent dated May 17, 1859.—The nature of this invention consists in applying lever power by means of a weight hung from a single or double lever, which passes or is attached to an axle with pivots, so that by the suspended weight acting upon the lever and the axle, a momentum is communicated to a circular plate provided with ratchet clicks, and these acting upon a ratchet wheel, the machinery is set in motion, and power thus gained and applied.

*Claim.*—The use of a weight B, a single or double lever C, axle and pivots *D d*, acting in combination with the circular plate E, ratchet clicks G, and ratchet wheel H, in applying lever power to machinery, substantially in the manner and for the purposes specified.

No. 24,026.—JOSEPH HAWTHORN, of Thomas County, Ga.—*Improvement in Cotton Presses.*—Patent dated May 17, 1859.—Figure 2 is an end view of this invention, which consists in so combining a screw and its tap with levers and with the followers of the press as that a great amount of power can be exerted with a comparatively small amount of labor.

*Claim.*—The combination of the screw B, the tap block C, and the levers D and H, with the packing cases M, and their followers G, substantially in the manner and for the purpose described and shown.

No. 24,027.—ALBERT H. HOOK, of New York, N. Y.—*Improvement in Sewing Machines.*—Patent dated May 17, 1859.—This invention consists in furnishing the vibrating barbed needle machine with a separate and adjustable apparatus for feeding, instead of using the motion of the needle for that purpose.

*Claim.*—The combination of the cam *b*, the lever *e*, and spring *g*, arranged and combined substantially as and for the purposes set forth.

No. 24,028.—SHERMAN S. JEWETT, of Buffalo, N. Y.—*Improvement in Cooking Stoves.*—Patent dated May 17, 1859.—This invention relates to the construction of cooking stoves, partly of iron and partly of bricks, these materials being so arranged and combined as to secure the advantages of a brick oven, in connection with the ordinary purposes of a cooking stove.

*Claim.*—The bricks  $B^1 B^2 B^3$ , when constructed, arranged, and supported within the stove for the purposes of an oven, substantially as described.

No. 24,029.—WILLIAM W. JOHNSON, of Clarksburg, Va.—*Improved Machine for Manufacturing Picket Fencing.*—Patent dated May 17, 1859.—The claim and engraving will explain the nature of this invention.

The inventor says: I *claim*, first, operating a series of twisters *B*, by means of pulleys and cords, arranged as set forth, so as to give a twist and reverse twist to the wire, in combination with vibrating fingers *J*, hollow shafts *C*, and tension plates *S*, or their equivalents, substantially as and for the purposes set forth.

Second. I claim the segmental roller *N*, constructed of the pieces  $r r^1 r^2$ , for the purposes explained.

No. 24,030.—ISAAC E. JONES, of Cincinnati, Ohio.—*Improved Adjustable Canopy for Railroad Cars.*—Patent dated May 17, 1859.—This invention consists in an improved covering, or canopy, for cars, so that said cover shall adapt itself to the irregularities or curves on the road allowing a free, lateral, and, at the same time, a vertical motion to the canopy without injury to the ends of the cars, or liability to injure the covers.

*Claim.*—The combination of springs, covers, and hinges, all arranged and operating substantially in the manner and for the purposes set forth.

No. 24,031.—WILLIAM JOSLIN, of Cleveland, Ohio.—*Improvement in Centrifugal Guns.*—Patent dated May 17, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim*, first, arranging the barrel *G* upon the same shaft with cog wheel *F*, which is secured near the periphery of the plate *I*, and revolving the barrel around the wheel *K*, substantially in the manner and for the purpose set forth.

Second. The combination of the bevel and spur gear wheels with the plate *I* and barrel *G*, the same being arranged in the manner and for the purpose specified.

Third. I claim the arrangement of the slide *a*, with the barrel and bevel table *d*, for the purpose of elevating the balls to the barrel, substantially as is set forth.

Fourth. The arrangement of the revolving hopper bottom plate *J* and cylinder *e*, for the purpose of conveying the balls down to the barrel, as is fully set forth.

No. 24,032.—ALBERT B. KEELEY and JAMES S. BECK, of Philadelphia, Pa.—*Improvement in Pumps.*—Patent dated May 17, 1859.—The nature of this invention consists in the combination of a solid valveless oscillating piston, with a peculiarly shaped piston chamber, and the upper and lower valves operating in a satisfactory manner.

*Claim.*—The combination of a solid or valveless oscillating piston with the peculiar shaped piston chamber, and with the upper and lower valves, all arranged and operating substantially as and for the purpose set forth.

No. 24,033.—HENRY S. LESHER, of Brooklyn, N. Y.—*Improvement in Breast Pads and Perspiration Shields.*—Patent dated May 17, 1859.—This invention consists in producing a new article of wearing apparel for ladies, which shall prevent the arm pits of their dresses from becoming saturated and stained by perspiration, give a symmetrical rotundity to their breasts, and a more comfortable and graceful support to the skirts of their dresses than heretofore.

*Claim.*—The combination of the arm pit shields or protectors *H* and breast pads *D*, substantially as described, so as to produce a new article of female apparel of the character set forth.

No. 24,034.—DAVID D. LEWIS, of Tamaqua, Pa.—*Improvement in Railroad Frogs.*—Patent dated May 17, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The steel point *K*, dovetailed to the body of the frog, in combination with the tread plate *K* and the block *i*, when the said tread plate overlaps and is riveted to the said point, and when the block *i* is of such a tapering or wedge-shaped form that, during the process of riveting it and the tread plate to the body of the frog, the said block may serve the purpose of driving the point tight up into its socket, for the purpose specified.

No. 24,035.—ARTHUR MAGINNIS, of Philadelphia, Pa.—*Improvement in Ventilating Hats.*—Patent dated May 17, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The combination of the perforated hat body, the perforated sweat leather, and the intervening corrugated band C, when said band is provided with corrugation upon its two sides and made plain and smooth on its rear and front, the whole being constructed and arranged substantially in the manner and for the purpose specified.

No. 24,036.—ROBERT A. MAINGAY, of Pottsville, Pa.—*Improved Filter and Purifier.*—Patent dated May 17, 1859.—This invention consists in the peculiar arrangement of a series of purifying and filtering hogsheads, a large filtering tank or reservoir, a set of purifying kegs or hoppers, and a series of turbines, for the purpose of filtering and purifying the water.

The inventor says: I *claim*, first, the combination of the lime water hopper D, agitator *h*, turbine *i i i*, and hogshead A, substantially as and for the purposes set forth.

Second. The combination of the alkali keg E, hogsheads A<sup>1</sup> A<sup>2</sup>, and turbine F *o o*, substantially as and for the purposes set forth.

Third. The arrangement and combination of the purifying and filtering hogsheads A A<sup>1</sup> A<sup>2</sup> A<sup>3</sup>, filtering tank C, turbines F *o o i i i*, purifier and alkali kegs or hoppers D E, substantially as and for the purposes set forth.

No. 24,037.—ALBERT H. MANCHESTER, of Providence, R. I.—*Improved Anti-Friction Support for the backs of Rudders.*—Patent dated May 17, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The device or apparatus described, viz: supporting the rudder from behind by means of a backer or brace rising from the deck, or attached above it, having rollers in its face, constructed, arranged, and operating substantially as described.

No. 24,038.—ALFRED MARSH, of Detroit, Mich.—*Improvement in Gas Retorts.*—Patent dated May 17, 1859.—This invention consists in providing the feed pipe at or toward its lower end with a secondary and smaller cover to the retort in fusible metal in the main cover, and serving in its connection with the feed pipe many advantageous uses.

*Claim.*—The employment of the secondary lid *h* for the purposes set forth, when the same is arranged and connected with the feed pipe, substantially as shown and described.

No. 24,039.—THOMAS J. MAYALL, of Roxbury, Mass.—*Improvement in Composition for Emery Sticks and Wheels.*—Patent dated May 17, 1859.—The claim and engravings will explain the nature of this invention.

*Claim.*—The composition for the manufacture of emery wheels, sticks, and tools of more or less flexible nature, formed of gutta percha or India rubber and sulphur, emery, and olive oil, substantially in the manner and for the purposes set forth.

No. 24,040.—JOHN McDIARMID, of Brooklyn, N. Y.—*Improved Machine for Sawing Beveled Surfaces.*—Patent dated May 17, 1859.—The peculiar features of this invention are not in the use of a saw or cutters, for both or either may be used, but in the construction of an oscillating frame B B with its parts and appendages, whether the bearings or points of support are internal or external to the same, the respective parts being so arranged that any desired angle or bevel can be cut or sawn, either continuously or constantly changing.

*Claim.*—The employment of the oscillating frame B B in combination with the centre wheel O, central flange N, fig. 11, and saw T, or cutters *t*, fig. 5, when the same shall be constructed in the manner described and for the purpose specified.

No. 24,041.—CHARLES A. McEVoy, of Richmond, Va.—*Improvement in Metallic Seals.*—Patent dated May 17, 1859.—This improvement consists in constructing a metallic seal for sealing money bags, &c., of hard sheet metal, and in a manner that will admit of its being readily and securely sealed, so that it cannot be opened without defacement, and of a form that will enable it to carry, concealed from the view and protected from mutilation or removal, a label of paper, or any similar material, on which a date or address may be written.

*Claim.*—The use of a paper label, or its equivalent, in combination with a metallic seal, substantially as and for the purpose specified.

No. 24,042.—CHARLES MESSENGER, of Warren, Ohio.—*Improvement in Seeding Machines.*—Patent dated May 17, 1859.—This machine is designed for a two-fold purpose, it being a seeding machine and a ground roller, which roller also takes the place of wheels in ordinary machines for sowing grain. The roller A upon which the machine is mounted may be used as a ground roller separately without the seeding apparatus.

*Claim.*—The lever *b*, arm *c*, levers *e*, and spring *h*, when arranged substantially as described, and in combination with a combined seeding machine and ground roller.

I also claim the studs E E<sup>1</sup> and F F<sup>1</sup>, rods I I<sup>1</sup>, and shaft J, in combination with the cams D D<sup>1</sup>, substantially as set forth, and when used in connection with the seeding machine and ground roller combined.

No. 24,043.—RICHARD MONTGOMERY, of New York, N. Y.—*Improvement in Screw Excavators*.—Patent dated May 17, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim*, first, making the cylinder *a b*, which incloses the screw *a*, in a conical form, for the purpose of rendering the ascent and discharge of the earth more free and perfect, as set forth.

Second. Supporting the cylinder and screw by means of the hinged frame *u s s<sup>1</sup>*, substantially as and for the purposes set forth.

Third. Driving the cylinder *a b* and screws *a<sup>1</sup>* by means of the gearing *y x e d*, arranged and combined as described.

Fourth. Supporting and adjusting the front of the excavator by means of the friction ring *g* and chin or rope *n*, as described.

Fifth. The curved swinging standard or derrick *p*, for elevating the front end of the excavator without unfastening the chain *n*, when desired, as described.

Sixth. The combination of the cylinder *a b* and screw *a<sup>1</sup>* with the swinging frame *u s s<sup>1</sup>*, derrick *p*, and carriage *K*, substantially as set forth.

No. 24,044.—JOEL MOULTON, of Boston, Mass.—*Improved Extension Ladder*.—Patent dated May 17, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim* the improved extension ladder hose-carrier, constructed substantially in manner and with its parts arranged and applied together as described, viz: with a series of single ladder bars *A B C*, connected together, and provided with pins or handles, and having not only an extension line and sheaves connected with and arranged in them, (the said bars,) as explained, but a supporting platform and guide braces arranged at the upper part of the upper bar, as described.

I also claim the combination and arrangement of the water conduit, or hose pipe director, and its guiding lines, with the extension ladder, constructed essentially in manner and to operate substantially as described.

No. 24,045.—JACOB MURPHY, of Half Moon, Pa.—*Improvement in Metal Drills*.—Patent dated May 17, 1859.—This invention consists in so constructing the component parts of the machine that in the operation of drilling, after boring through the metal, or to the desired depth, the bit, instead of remaining fast in the metal after the weight has been withdrawn from above, is drawn entirely out and clear from the metal below.

*Claim*.—The shoulders on the drill *d*, in combination with the braces *b b* and pin *p*, upon the sliding frame *B B*, substantially as and for the purposes set forth.

No. 24,046.—THOMAS H. MURPHY, of New Orleans, La.—*Improvement in Machines for Rolling and Measuring Cotton Bagging*.—Patent dated May 17, 1859.—The claim and engraving explain the nature of this invention.

*Claim*.—The described machine or combination for simultaneously rolling and measuring bagging, consisting of an adjustable guide bar *F*, sliding shaft *D* fitting into driver *B*, the windlass and cord *E b*, adjustable pressure roller *G*, carrying cam *i*, lever *J*, indicating wheel *L*, arm *K*, pawl *l*, and spring *M*, when all said parts are arranged and combined, substantially as shown and set forth and for the purpose specified.

No. 24,047.—JACOB NAEHER, of North Orange, N. J.—*Improvement in Machines for Husking Corn*.—Patent dated May 17, 1859.—This invention consists in the employment or use of reciprocating troughs, one or more clamps or pincers, and toothed plates or stripping combs, arranged to operate so that ears of corn may be husked very expeditiously.

*Claim*.—The reciprocating troughs *c c*, one or more, provided with pincers *I*, in connection with the toothed plates or stripping combs *o o o p*, and with or without the retaining plate *q*, the whole being arranged to operate substantially as and for the purpose set forth.

No. 24,048.—CHARLES NEER, of Albany, N. Y.—*Improvement in Metallic Frames for Window Blinds*.—Patent dated May 17, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* constructing frames for blinds of sheet metal, bent in a U form, and connected together, substantially as specified.

I also claim the bent or folded strips *ff*, provided with holes receiving the ends or tenons of the slats, as set forth.

No. 24,049.—H. NORTON and J. S. B. NORTON, of Farmington, Maine.—*Improved Mop Handle*.—Patent dated May 17, 1859.—This invention consists in having one end of the mop cloth or yarn attached to the end of the handle, and the opposite end attached to a slide which is fitted on a handle, so that when the mop is used the slide may be drawn on the handle and secured in such a manner that the mop cloth, or yarn, may have a folded, or doubled position similar to the usual mop cloths, and when surcharged with water, readily distended and wrung dry.

*Claim.*—Attaching the mop cloth or yarn B to the handle A, and to a slide C, fitted on the handle, and arranged substantially as and for the purpose set forth.

No. 24,050.—NELSON PARMENTER, of Gardner, Mass.—*Improvement in the Manufacture of Bricks.*—Patent dated May 17, 1859.—The improved fire brick is composed of the following ingredients, used in the following proportions: sandstone, one part; pipe clay, one part; plaster of Paris, one part; lime, one half part; salt three eighths; coagulated part of the blood (called crassamentum), one eighth.

*Claim.*—A fire proof brick or lining, composed of the above named ingredients, in the proportions set forth, and in the manner substantially as described.

No. 24,051.—CHARLES PAGE, of West Meriden, Conn.—*Improved Signal Door Bolt.*—Patent dated May 17, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—Passing the pin which moves the bolt through the door, and permanently fixing to the projecting extremity thereof a segmental plate, so as to overlay the fixed symbol plate, and, in the manner set forth, communicate the desired intelligence.

No. 24,052.—H. D. J. PRATT, of Washington, D. C.—*Improved Machine for Planing or Shaving Ice.*—Patent dated May 17, 1859.—The claim and engravings explain the nature of this invention.

*Claim.*—The machine or implement for cutting or reducing ice to small particles, as described, the same consisting of the arrangement in a hopper of suitable size and shape of rotating cutters, with or without a presser, the whole constructed and operating substantially in the manner described and applied to the purpose specified.

No. 24,053.—ASA PRESTON, of Unionville, Ohio.—*Improvement in Cultivators.*—Patent dated May 17, 1859.—This invention consists in the peculiar construction of the plough, which can be readily changed from one form to another, by simply adding, or removing some of its parts, making it successively a subsoil plough, a right or left hand mole plough, a shovel plough, and cultivator.

*Claim.*—The construction of a combined plough cultivator, having the several parts so arranged that they can be easily attached or detached, as described, when said plough has the hinged wings W, mould board H, bars L M, and blades J K, arranged and operated substantially as set forth.

No. 24,054.—REUBEN RICH, of Albion, N. Y.—*Improvement in Water Wheels.*—Patent dated May 17, 1859.—This invention relates to improvements in the centre vent wheel plate and penstock.

*Claim.*—Constructing the penstock A, dadoed joints L, and bolts I, in combination with gates G and G<sup>2</sup>, and centre scroll plate B, and wheel C, when constructed and operated in the manner and for the purposes specified.

No. 24,055.—SYLVANUS RICHARDSON, of Jericho, Vt.—*Improved Water Wheel.*—Patent dated May 17, 1859.—This invention consists in constructing the floats of a scroll water wheel at their lower extremity, in a spiral or curved form, with a draft tube at the bottom of the case, inclosing the wheel, so that the discharge of the water through the spiral or curved parts of the floats and draft tube produces additional power to the wheel, and also in constructing the upper parts of the floats, on which the water when let in upon the wheel, within the scroll, first acts with parts or sections attached by hinges to the outer edge of the inner parts of the floats, by which the difficulties arising from small obstructions of wood or other matter clogging the floats at the termination of the scroll in the common wheel are avoided.

*Claim.*—The float with hinges, as shown at point marked *a*, and the spiral or curved form of the lower part of the float, as shown at points marked *b*, combined with the extension downwards of the case below the scroll case *e*, and with draft tube *h* as shown, substantially in the manner and for the purposes set forth.

No. 24,056.—JOHN R. ROGERS, of Sacramento, Cal.—*Improved Washing Machine.*—Patent dated May 17, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—The combination in cylinder B, of the diagonal slats *c c c C*, with the two heads of the cylinder, when said heads are provided with holes of such a shape and form that they will collect and force the water in, and empty it at alternate ends of the cylinder, as the direction of its revolutions are changed, substantially as set forth.

No. 24,057.—TIMOTHY ROSE, of Cortlandville, N. Y.—*Improved Water Wheel.*—Patent dated May 17, 1859.—This invention consists in a peculiar construction of the wheel, whereby a large per centum of the maximum power of the water is obtained.

*Claim.*—Forming the buckets B, of four parts *a b c d*, arranged or disposed relatively with

each other, the hub A, and annular plate *e*, and with a scroll C, specifically as shown and described and for the purpose set forth.

No. 24,058.—JOHN RUSSELL, of Troy, N. Y.—*Improvement in Cast-Iron Grinding Mills.*—Patent dated May 17, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim*, first, the combination of the breaker B, and internally armed hopper A, with the upper grinder I, and lower grinder H, all arranged and operating together as set forth, for the purpose of feeding into the mill and grinding large substances, such as corn on the cob.

Second. I claim making the armed portion of the hopper of separate rings N, provided with internal projections *b*, and arranged and secured together in the mill, as and for the purpose set forth.

Third. I claim making the lower grinder of separate toothed rings C, arranged and secured together upon the supporting plate E, as and for the purpose described.

Fourth. I claim making the upper grinder of separate toothed rings J, arranged and secured together in and to the supporting plate K, as and for the purpose set forth.

No. 24,059.—THOMAS SHORT, of Danville, Ill.—*Improvement in Seeding Machines.*—Patent dated May 17, 1859.—The turning of the shares I facilitates the turning of the draft. In moving or drawing the implement from place to place, the frame D is raised by the driver, who moves the lever E, and the wheel H being thereby raised from the ground, the distribution of seed is stopped.

*Claim.*—The swinging frame D, when provided with a seed distributing device, actuated by a wheel H and cutting furrow shares I, and fitted within a mounted frame A, substantially as and for the purpose set forth.

No. 24,060.—CHRISTIAN SHUNK, of Canton, Ohio.—*Improvement in Refining Iron in the Hearth of a Blast Furnace.*—Patent dated May 17, 1859.—The claim and engraving explain the nature of this invention.

*Claim.*—The employment of an auxiliary tuyere pipe within the hearth of the common blast furnace, when charged with molten iron, at such an angle as that the blast of air entering the iron may strike the circular wall of the hearth as nearly as possible at a tangent to its circumference, so as to cause the blast of air to pass round in the metal, giving the whole mass in the hearth a spiral motion immediately before the tapping of the furnace for the manufacture of pig iron from the ore.

No. 24,061.—JAMES C. SPENCER, of Phelps, N. Y.—*Improvement in Sewing Machines.*—Patent dated May 17, 1859.—The nature of this invention consists in making a needle bar and feeder combined, which will answer the purpose of moving the needle up and down, and at the same time moving the cloth or material to be sewed.

*Claim.*—The construction of a feeder and needle bar in one piece, or connected together, and the combination of the eccentric D and pin F with the needle bar by means of the slot *s*, for the purposes specified.

No. 24,062.—W. S. STETSON, of Baltimore, Md.—*Improvement in Harvesting Machines.*—Patent dated May 17, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim*, first, connecting the finger bar to the frame of the machine by means of the saddle and its support, constructed and arranged substantially as described.

Second. In combination with the saddle *d*, I claim the swiveling guide and swiveling lever *k*, as set forth.

Third. I claim throwing the cutters in and out of gear by means of the shifting bar *t*, constructed and operated substantially in the manner set forth.

No. 24,063.—W. S. STETSON and R. F. MAYNARD, of Baltimore, Md.—*Improvement in Harvesting Machines.*—Patent dated May 17, 1859.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, the double hinge joint at the end of the finger bar, consisting of the hinge *p*, shaft *r*, collar *s*, and brace *t*, arranged and operating in the manner described, for the purpose specified.

Second. We claim the compound connecting rod *m*, constructed and operated as set forth.

Third. We claim so constructing or forming the upper part of the obtuse angle iron tooth bar and the base of the finger or tooth, that said base shall bear upon two plain faces of the said angle iron, in the manner and for the purposes set forth.

No. 24,064.—FREDERICK S. STODDARD, of Litchfield, Conn.—*Improvement in Foot Power Machines.*—Patent dated May 17, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim*, first, a two throw crank, operated by one pitman, in combination with a lever and spring, or their equivalents, as described.

Second. The mode of attaching the spring to the footpiece to operate on the pitman crank, in connection with the set screws for adjusting and reversing the motion, as set forth.

No. 24,065.—J. C. STODDARD, of Worcester, Mass.—*Improvement in Potato Planters*.—Patent dated May 17, 1859.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim*, first, the combination of the compound cam K, hooked lever I, and sliding cross head *o*, with cutter *p* attached, the whole arranged and operating substantially as and for the purpose shown and described.

Second. I claim arranging the plough shares L and covering shares M, on parallel rock shafts *j k*, so that a lateral and vertical adjustment can be given to the same, substantially as set forth.
