works, which, however, was clearly inferior to that of surveyor, for in May 10 Edward III. appoints Wykeham "his faithful and prudent clerk," clerk of the works at Henley and Yeshampstead; and on Oct. 30 nominates his beloved W. de Wykeham, surveyor of all the works at Windsor Castle and park, and in his manors of Henley and Yeshampstead. The wording here is explicit. As clerk of the works he attended to the payment of wages of masons, carpenters, and workmen, and the purchase of stone and other materials, audited or witnessed by the controller of the works. As surveyor of the works, he not only exercised the oversight of the wages, the ordering of repairs, and the purchase of materials, but had the power of impressing workmen, arresting them, and committing them to prison. In 1360 workmen were forbidden to leave without Wykeham's license. On July 10, 1356, he was appointed Keeper and Surveyor of the Castles of Windsor, Dover, Ledes, and Haddleigh, and the parks and manors of Windsor, Eton, Guildford, Shene, Eltham, and others. His pay was 1s. a day at Windsor, 2s. in every other place, and 3s. a week for his clerk. In the following year, on Nov. 13, he received an additional 1s. a day. In 1353, he was acting as Grand Forester and Ranger of Windsor, and from June 1361 to 1368, as co-Warden of a name of the forest upon this side the Trent. In 1363 he was justiciary of the royal forest, with a salary of 20s. a day. Edward III. designed to make Windsor Castle the monument of his victories, where at one time he held the kings of Scotland and France his prisoners. The expenditure on these important works amounted to about 50,000l. of our present money. It would appear that the beasts of chase were sold and the trees felled to supply this vast sum. The Round Table, so called probably in allusion to the knights of King Arthur, with a subtle reference to the new order of the Garter, was completed by Wykeham as a keep, and another tower still bears the name of the Wykeham or Winchester Tower. There is a tradition extant that the evasive courtiers delated Wykeham asserting that he had engraved on an inner wall the inscription, "This made Wykeham," thus robbing the king of the honour of his works. The architect, however, silenced his enemies by the following witty explanation:—"What I intended to convey was, that these works, which have obtained for me the king's favour, may be very malicious or very ignorant of grammar." There was a very ingenious fraud practised by the architect of the Pharos: he inscribed his own name in the stone which he covered with lime and mortar, and on this again carved the king's name: the trick was not discovered in time to cause him to be exposed to punishment; but the cement gradually peeled off, and discovered in large letters the name of Sostratus of Cnidus. His repairs and alterations on the city walls of Oxford, where they partly belt in his college, betray the hand of one familiar with military engineering.

The cloister of St. George's Chapel was also the work of Wykeham at Windsor. But his services as an engineer were not limited to the inland castles of Windsor and Haddleigh. Dover and Ledes, we know positively, were under his charge; and in all probability those of Winchester, Walsey, and Porchester were indebted to him for repairs and enlargement. In the spring of 1361, being still surveyor of the works, he commenced the building of Queenborough Castle, on a swampy site in the Isle of Sheppey, and employed piers as a foundation for his walls, a method of construction which he afterwards followed in his college at Winchester. It would have been well, for the honour of England, if these fortifications had been preserved, when De Ruyter sailed up the Medway without opposition to burn the men-of-war at Chatham. This fort was completed in 1367.

Wykeham had for some time been training up in the school of statesmen: he accompanied his early patron Bishop Elyngden to Calais, and there, as one of "six masters, noble men," witnessed to the treaty of Hedigny. In 1362, Elyngden ordained him sub-deacon and priest; but he was still retained near the king, as his name appears signed to various instruments of state, as truces, ransoms, and royal marriages. In 1362 Wykeham resigned his office of surveyor of Windsor Castle; but his attachment to that early home lasted to the close of life, for we find him, on May 29, 1402, founding a chantry and chaplain in the collegiate chapel. His position was now secure and advancement rapidly followed. "There was a priest," says Froissart, "about the King of England, called Sir W. Wykeham, who was so great with the king that all things were

done by him, and without him nothing done." The sour Wylliffe sneered at his elevation: "Lords will not present a clerk able of cunning of God's law, but a kitchen clerk, or a penny clerk, or mine in building castles, or wise in worldly doing, though he could not read well his Psalter." Like most other people who are malicious and envious of others, Wylliffe sacrificed truth to a point to his sarcasm. In 1365 Wykeham was keeper of the Privy Seal, and the king allowed him 20s. a day out of the exchequer; and gave him the manor of Henley, in 1365, adding that he "was engaged in various offices touching his royal affairs, laid especially upon his conduct, and had borne excessive toil and expense in their furtherance and execution," and that this pay should last during his tenure of office, although he was "immediately attached to the royal household." On April 26, 1366, the Archbishop of Canterbury, Simon Islip, and on October 8 Elyngden, Bishop of Winchester, both died. The latter had refused the primate's rank, averring that, though Canterbury had the highest rank, Winchester had the deepest manger. Wykeham was appointed to the vacant see of Winchester. The Pope on four occasions had written letters of recommendation to Wykeham, and expressed himself in the highest terms in approval of his character and abilities. On October 13 the king issued a *congé d'élire* to the chapter, and eleven days after confirmed their election of Wykeham. On December 11 the Pope nominated him Administrator of the Spiritualities. The papal power now came into collision with the royal authority. Urban determined to appoint Wykeham by way of preservation and provision; Edward, like an English king, refused to grant the temporalities without Wykeham's renunciation of any title to them by right of a bull. Pope and king both desired Wykeham's consecration, but neither would bate his claim. The Duke de Bourbon, a hostage of the King of France, was, therefore, written to by Edward III.: he was promised that his ransom should be lessened provided that he procured the consent of the pope, then residing at Avignon, to Wykeham's immediate consecration. The duke's mission was successful. On Feb. 22, 1367, the primate admitted Wykeham administrator of spiritualities, and on July 14 the pope gave permission for his consecration.

It seems that the king, uncertain how the matter would end, took security against loss of money: from December 1, 1366, he granted the temporalities on consideration of "a great sum of money, which Wykeham paid down in hand in the king's chamber and in the royal presence, for the furtherance of weighty business." Here then is a distinct and public entry of the transaction in the Patent rolls; it denounces the infamous libel of Dr. Landon, that Wykeham owed his mire to the influence of Alice Piers whom he had married; Landon the most worthless of men, the coarse and brutal visitor of convents, the hunter of the early reformers, the instrument of the cruel Bishop Gardiner; the persecutor, the plotter against innocent persons, who was at length degraded and pilloried for perjury, and died in the Fleet Prison. Alice Piers, we shall soon find, was Wykeham's open and avowed enemy. The tale is on a par of veracity with another of the same date, that Wykeham fell under the king's displeasure because he asked the church of East Meon, of which it was said that the incumbent would succeed to the See of Winchester. In 1573 a zealous Wykehamist had to deny this silly story. On Oct. 10, 1367, Simon de Langham, the primate; Simon Sudbury, the bishop of London; and Robert Wyllyve, of Salisbury, consecrated Wykeham in St. Paul's Cathedral. On July 9, 1365, Wykeham, in the presence of the abbots of Hyde and Chertsey, knights, and divers men of gentle blood, unshod himself in the church of St. Laurence at Winchester, and walked to the cathedral. There in the porch, having offered his devotions, he put off cope, hood, birret, and gloves, which, with his boots and short cope, the archdeacon's servant promptly laid hands on, as his perquisite. Then, arrayed in pontificals, the archdeacon conducted him to the throne and said, "By the authority of Christ's Church, I induct and enthroned thee in possession of this church, with all its rights and appurtenances, elect, confirmed, and consecrated." Wykeham, like a prudent man, obtained from the king an assurance that, in all the offices which he now withdrew, he had borne an unimpeachable character. To this the king assented, and on May 22, 1368, gave him a full acquittance of all money and jewels received or delivered by him previous to his consecration, "of his own (the king's) certain and special knowledge, in consideration of his

long services, which had been both acceptable and advantageous, and of that high place, which he had held in his affairs in various capacities, and still retained, bearing much toil and expense in their discharge."

**PORTRAITS OF NATIONAL BENEFACTORS: THEIR USEFUL TEACHING TO THE MULTITUDE.**

In the National Gallery of Portraits, which is slowly increasing, it is most desirable that we should have the best delineations that can be had of those men who have been the means of introducing or establishing branches of our national industry, or of forming systems and establishments which have led to the improvement of the people. All those self-made men who have risen from the ranks to confer honour upon themselves and benefit on the community should be found there, and it is important in such an exhibition that on each painting there should be placed a brief but clear account of the circumstances of each worthy; for instance, we should have,—

William Hutton, the historian of Birmingham and author of several other important works, was born September 30th, 1723. By care and industry he acquired a considerable fortune, and became a magistrate of the above-named town. He was the son of a poor stocking-weaver, who had a large family. At seven years of age he was put to work at a silk manufactory, and was then so small that it was necessary for him to stand on a pair of wooden pattens in order to reach his work. He afterwards was apprenticed to a stocking-weaver, but, finding that trade insufficient, he taught himself book-binding, and, after various trials which gave evidence of his abstemiousness, honesty, and perseverance, succeeded in establishing himself in Birmingham, and from a small beginning formed a considerable business. He died May 2nd, 1800.

[Here the visitor might be referred to obtainable works which would afford additional particulars.]

Again: we should see,—

Peter Nicholson, who was the author of an architectural dictionary and many scientific works, which have been of great use, not only to architects, but to the practical stonemason, carpenter, and other workmen. He simplified the rules of science, and made them available for every-day use to persons of ordinary education and ability.

We should in like manner have notes of the founders of Sunday schools, mechanics' institutes, and of that humble but important benefactor who originated ragged schools.

We should have portraits of the class of men who, like Crotchet in 1702, established a silk-mill in Derby. Although unsuccessful as a speculator, this man is worthy a place in a national Walkhalla; so is John Lombe, a man of spirit, a good draughtsman, and an excellent mechanic, who travelled into Italy, and, with infinite danger and difficulty, succeeded in learning the secret of the method of silk-spinning practised in that country. He fixed upon Derby for the establishment of works in 1717. Here, on a swampy island, he erected a manufactory, which contained 468 windows, at a cost of 30,000*l.*, on huge piles of ash from 16 to 20 feet long, driven close together, and over a solid foundation of stone a building, which was then considered a marvel, was raised and fitted with machinery. With great success the works were carried forward, and they were a chief means of enabling this branch of industry to compete with the foreigner.

John Lombe did not live long to enjoy the results of his labour and ability, but died at the age of twenty-nine, it is said in consequence of poison, administered by a vindictive Italian lady, whose family had felt themselves aggrieved by the damage done to their trade. For long after, however, 300 hands were employed by Sir Thomas Lombe, a cousin of the deceased. A few years since there were sixteen silk-throwing mills in Derby, which in round numbers employed 3,000 men, women, and children, and about 3,000 more in weaving and preparing the materials.

We should also have portraits of such workers as Richard Grainger, the son of a poor widow, who was born in the most humble condition in Newcastle-upon-Tyne, who was indebted to a parish school for his education, but who lived to change the appearance and add to the beauty of his native town, to rear great markets and public institutions, and to build vast lines of streets, with palace-like structures.

There should also be a place in such a gallery for the portraits of either men or women, of

whatever station, who have performed meritorious deeds.

Such a collection, if rightly used, would be a means of affording instruction and amusement. Then, besides the labelling referred to, there should be popular lectures on the personages whose countenances are figured.

One great aim of all our national collections ought to be the instruction and advancement of the masses of the people; and we hope that the day is not far off when men of the greatest eminence in their various departments will use our treasures of art and natural history for the illustration of lectures addressed to the thousands. Soon a building will be opened, for the use of a popular preacher, which will contain a congregation of 10,000 persons. Is the day far off when in public institutions the voice of men like Faraday and Owen may be heard by audiences as numerous? Public buildings devoted to art and science should be erected with a view to such arrangements.

**THE FUNERAL OF SIR CHARLES BARRY.**

OUR list of those who were present on this occasion was necessarily imperfect, although it cost us some pains. We are able to add a few names:—Messrs. C. C. Nelson, T. Hayter Lewis, Thomson, Harris, Horace Jones, Gutch, Belcher, Gilbert, Butcher, Colling, H. Roberts, Davies, W. White, R. Bell, Moseley, David Broadbent, G. Williams, Hopkins, Frazer, James Wylde, Pearson, Atkins, Morant, Porter, Edwards, Jas. Lockyer, senior; Stride, Beck, Pyne, L. Sibley, Leekman, J. Young, St. Aubyn, F. A. Britton, Nicholls, D. E. Scott, A. Alom, Sang, Warren, Banks, Joshua Butterworth, H. H. Collins, Martineau, J. Christopher, T. C. Clarke, Pope, J. Murray, Lucas, Cnshaw, J. A. Pictou, &c.

With reference to the funeral it is stated that not fewer than eighty persons connected with the Abbey claimed and received hat-bands, &c.,—costly items in the undertaker's bill. The whole system of conducting funerals requires revision and alteration.

**FOREIGN COMPETITION.—BATHS AT SPA.**

THE Town Council of Spa desire to erect baths in the centre of the town, opposite the *Place Royale*, and invite architects, native and foreign, to submit designs by August 15th, 1860. They also desire designs for monumental buildings, to be erected at the source of the mineral spring *du Pashon*. For the best designs for baths four premiums are offered—160*l.*, 40*l.*, and two of 20*l.*; and for the buildings at the spring head, the same sum divided in the same manner. The style of architecture is left open. The cost of the baths is restricted to 20,000*l.*; for the other buildings the sum stipulated is 12,000*l.* The rewarded plans are all to become the property of the Council, who reserve to themselves the right to use such parts of any of them as they may think fit. Full conditions and information have been published, including a schedule of prices. From this we learn that the wages of stone-setters and carpenters are 2s. 3d. a day, English; stone-cutters and plumbers, 2s. 6d.; labourers, 1s. 4d.

**THE ROYAL HIBERNIAN ACADEMY.**

THE Academy's annual exhibition is now open and many works of much excellence are to be found therein, though in number not so important as on previous occasions. In the ante-room, and immediately opposite the doorway, is the "First Council" (the property of her Majesty), by the late Sir David Wilkie, and, no doubt, familiarly known to our readers; and in this apartment are numerous water-colour pictures, generally meritorious. Eugene De Block's "First Lesson," and "A Prayer at the Grave," are noteworthy, as also are Burton's "Peasants of France," Kendrick's sea pieces, and Murenuin's miniatures on ivory. In the large room, Camille Vanneman's "Laitières dans la Prairie," Jules Wagner's "Musique, Femme, et Vin," and "La Chateleine;" Otto de Thoren's "Mauving" and "The Steeple Chase;" Eugene de Block's "French taught here;" Willis's "Group of Cattle and Horses;" Friston's "Toyman;" Rothwell's "Rome, from the Esquiline-hill;" Fisher's "Weary Pilgrim;" P. V. Duffy's landscapes, and Catterson Smith's portraits, are amongst the chief attractions. Though necessarily circumscribed, we must not conclude this notice without making honourable mention of Messrs. C. Grey's, Hayes, Marquis', Craig's, Faulkner's, Bridgford's, &c., contributions. Turning to the Sculpture Gallery, where

Architecture is also supposed to hold her court, we experience much disappointment in both departments, but in the latter especially, which mainly consists of one drawing, by Mr. McCarthy, of a group of church and conventual buildings erected in Tralee. There are a couple of others intended as designs and drawings, but their pretensions are considerably below mediocrity. There would appear to be no sympathy between the architectural profession and the academy, otherwise it would surely be more creditably represented.

**IRISH NEWS.**

A MEETING was called, by requisition, of the inhabitants of St. Paul's parish, Dublin, to suppress the system of intramural interment prevalent, but had to be dissolved, being illegal. One of the parishioners said that two coffins had to be dug up to make room for a new one; that bodies were only 18 inches from the surface, and that human bones out of this churchyard had been sold in the honeycombs of Dublin. Despite this testimony, the civil was countenanced by others, that the perquisites of the rector should not be interfered with!

A new Caen stone pulpit has been recently erected in the Castle Chapel, Dublin, by Messrs. Harduan and Co.

The Galway Harbour Bill has passed the House of Commons.

A builder's action (Hugh Kelly v. Representatives of the late Sir Philip Crampton) for 662*l.*, for extra work and labour done in the construction of a house at Violet-hill, co. Fermanagh, has occupied some time in hearing at Dublin. The chief defence was, that no written orders were given, and which were necessary. The jury found for the plaintiff for 500*l.* over and above the 100*l.* lodged in court.

The tower and spire of Holy Cross, Tramore, is to be completed, Mr. J. J. McCarthy, architect.

Tenders for the plastering and stucco work of St. Mary's Church, Athlone, are being received. We believe Mr. John Bourke is the architect.

The rapid progress of Kingstown, near Dublin, is evidenced by the facts that during the last three years 370 houses had been built, and 80 more are in progress; the valuation of the electoral division has increased by 10,000*l.* since 1857; there are seven churches, yet another is wanting; one bank, and another spoken of; house rents have doubled within the last seven years, yet the building-leases are but for forty-one years.

A new Protestant cemetery is to be provided near Waterford: the Lord Bishop of Cashel has agreed to give 100*l.* subscription for purchase of a suitable plot.

A new convent, dedicated to "Our Lady of Mercy," is to be erected at Newry according to plans, &c., by Mr. John Bourke, architect.

The Armagh District Lunatic Asylum is to be improved, under the directions of Mr. J. Boyd, of Belfast, Architect.

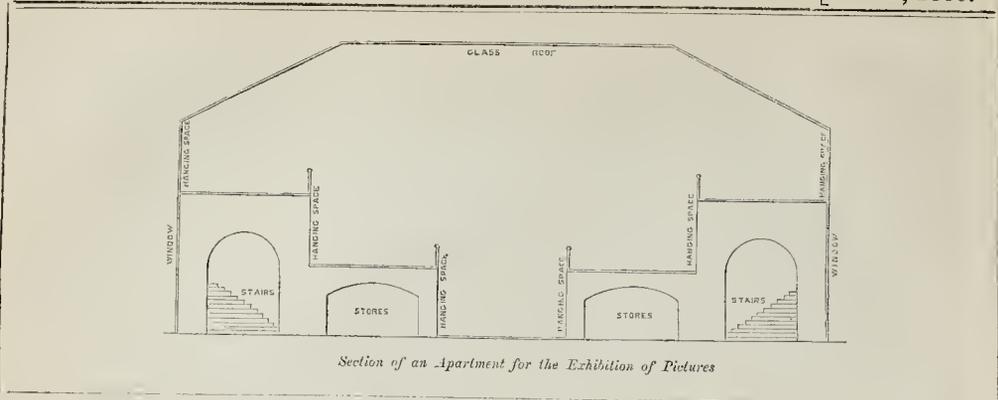

The time for receiving tenders for the erection of a beacon on the Alderman Cocks, and a Light-house on the Calf rock, co. Cork, for the Ballast Board, is extended respectively to the 30th of May and the 6th of June.

Twenty cottages are to be built at Knockmalon by the Mining Company of Ireland.

A church is to be erected at Crosspatrick, in the county of Wicklow.

The new Roman Catholic Church of the Holy Trinity at Cookstown, after being nearly five years building, is nearly completed, and comprises a nave, tower at west-end, north and south aisles, chancel, chapels of Blessed Sacrament and Blessed Virgin at ends of north and south aisles respectively, and spacious sacristy at north side of chancel. Five arches on either side of nave separate it from the aisles, and rest on slender columns, with moulded caps and bases: the arches also are moulded and have carved terminations. Above these are introduced two light traierced clerestory windows. The roof of the nave is of open timber work, and the principal corbels are carved into heads of the twelve apostles. A lofty arch separates the nave from chancel, and the corbels represent the Old and New Law. The High Altar is an elaborate work. The great window is in five compartments, filled in with stained glass by Messrs. Harduan and Co., Birmingham; the chancel railing being by Messrs. Riddell and Co., of Belfast. Material throughout fine white sandstone. Mr. McCarthy, architect.

METROPOLIS LOCAL MANAGEMENT ACT AMENDMENT BILL.—This bill has been read a second time in the Commons, and ordered to be referred to a select committee.

#### A SUGGESTION FOR A PICTURE GALLERY.

THE above sketch of a design for a picture gallery has been for some time in my desk, having been made when the idea occurred to me a few months ago, and, as the attention of the public is at the present time directed to the question of the best means of providing suitable hanging-room in our public exhibitions, I shall be obliged if you will insert this diagram in your excellent paper, as it may suggest improvements to those more competent than myself to carry them out.

HORACE DOBELL, M.D.

\*.\* The idea is not entirely novel, but may now be usefully mooted.

#### LONDON PICTURES.

IT is within the district of the metropolis that the majority of the pictures which line the walls of the Royal Academy, and other picture exhibitions, are painted, wherein the results of study in the woods, fields, and elsewhere, are put into permanent and established form. Considering the vast number of painters who live in London, and who are called, to a greater or less extent, to roam amongst the immense varieties of this dense population, it has often struck us as remarkable that so little use has been made of the decidedly picturesque and striking scenes which are presented in metropolitan every day life.

As an instance of what may be done in this line of art, it is worth while to glance at some of the finest pictures by Hogarth, which are scenes, treated in an artistic and truthful way, of matters which came, during his observant life, under his notice. In these works the painter has not deviated from the ordinary costume then in use, and the countenances and forms are such as would be met with every day.

They who examine the pictures, by Hogarth, of "Night and Morning," his remarkable views of "London Streets," that wondrous painting of "The Rake in Newgate," and the "Interior of the Mad-house," will note that the materials found in London by this famous painter are not deficient in supplying the necessary materials of a picture, so far as colour, light and shade, incident, and character, are concerned.

There is a belief that in matters which every day come before the eye there is a lack of that picturesque charm which seems to be connected with subjects having a certain degree of antiquity; consequently, many painters have, instead of attempting to delineate the remarkable incidents and peculiarities of the times in which they live, gone back to other periods for materials on which to exert their skill.

Certain pictures, which have been recently produced,—take, for instance, Mr. Frith's "Derby Day,"—and some works by other modern artists,—show that with the materials of the present time striking effects can be produced.

There is no want of gay and bright scenes in this vast city; and constantly there is going forward the display of human passions, while scenes most surprising meet the eye.

We have noted in the London streets grand effects: palaces blazing with light shining through midnight storm and rain are figures of curious contrast. In many aspects the lights and shadows of the bustling London streets are most striking—a skilful, thoughtful painter might make

a telling subject out of the West-end shops. The bustle and circumstance of a great fire have not been fairly tackled by genius. A marvellous picture could be made of such a scene, showing by the mind-light the marvellous characters which on such occasions are thrown together: in the courts and alleys, in the interiors of dwellings, even in the barracks of our soldiers, groups and incidents are to be found which not only present opportunities for great pictorial effect, but would also have great interest for the multitude, and, if rightly treated, would teach useful lessons.

Our modern English painters look at the materials of everyday life with their matter-of-fact eye: if, however, they would but glance at the peculiarities of the metropolis with artistic and philosophical feelings, many works would be produced from that source, which would amuse, instruct, and improve the present age, and have a very high value in times to come.

#### COLOGNE BRIDGE AND CATHEDRAL.

HAVING lately had occasion to visit Cologne, I have made a sketch of two bridges, one straight and the other skew, which carry the railroad over the streets that lead to the celebrated cathedral. There is good taste exhibited in the design, as well as care and neatness in the execution, without incurring any extraordinary expense: the bridges in question are of light-colored bricks, with copings, string-courses, and quoins of dressed stone.

The superstructure consists of four segmental ribs, made of wrought iron, a rib being placed exactly under the centre of each rail, of which there are also four for a double line of way. On these ribs, which are all of angle-iron, timber-joists are laid, projecting far beyond the ribs either way, so as to leave ample room for a foot-path on each side of the rail: longitudinal battens are then bolted to these, so as to form the roadway. I should state, that the ends of the joists are prettily moulded, which adds considerably to the beauty of the structure. An ornamental light iron railing is then put up on either side, so as to continue the protection afforded by the parapet walls which finish the viaducts that carry the railroad to the station on one hand, and to the Rhine-bridge on the other. Would that our engineers had erected something similar to carry the Metropolitan Railways over the streets of London, instead of darkening and destroying our suburbs in the manner I complained of when I last wrote to you.

The bridge over the Rhine, to connect Cologne with Deutz, is now nearly finished, and is open to the public.

I crossed over it, after paying the small toll of two pennings, or not quite a farthing; and, as I am writing, I send you a description of it from what I observed and learned on the spot.

There are, in fact, two bridges, side by side, built on the same piers, and only connected here and there with small stays of wrought-iron, to prevent lateral diversion. Both the bridges are on the lattice principle, but the one that carries the railway is strengthened by a double lattice-frame on each side, the distance between these frames being about two feet, while the bridge for ordinary traffic and foot-passengers has only a single frame on each side: there are in both bridges ties of angle-iron on the top to keep the frames in position, so that in reality they are girder-bridges

formed by a net-work of wrought-iron bars. The ordinary roadway is nearly 27 feet in the clear and the railway about 24 feet.

There are three piers in the water, formed by rectilinear cut-waters, both above and below, and there are four principal openings for the water-way of 333 Prussian feet, each measuring from centre to centre of each pier. As, however, the piers are each 20 feet wide, this reduces the actual water-way to 313 feet for the two central openings, while those at the side are further reduced by the quays, which project on the Cologne side 17 Prussian feet beyond the pier, making the opening on the end near the cathedral 296 Prussian feet in the clear, while that on the Deutz side is 301 Prussian feet. The height of the double bridge, above the quays, is about 27 Prussian feet, and 45 Prussian feet above the average water-level.

Each bridge consists, so to speak, of two compound girders, laid from the edge of the abutment on either side, resting on the intermediate pier, and extending to the edge of the central pier. The central pier itself forms the continuity of the roadway and railway, but the girders do not extend over it, each girder being only about 658 P. feet, while the whole extent of the girder bridge, from centre to centre of abutments, is about 1,320 P. feet.

I may mention that the beautiful cathedral here has made wonderful progress during the last ten years.

The lofty sanctuary, with its seven beautiful side chapels huddled and around the high altar, presents a surprising appearance of lightness and grandeur. The blended colours of the ever-varying forms, exquisitely represented in the stained glass, appear to assume all the combinations of a kaleidoscope; while the rich groining of the roof and the variety of the mouldings transport the beholder with delight.

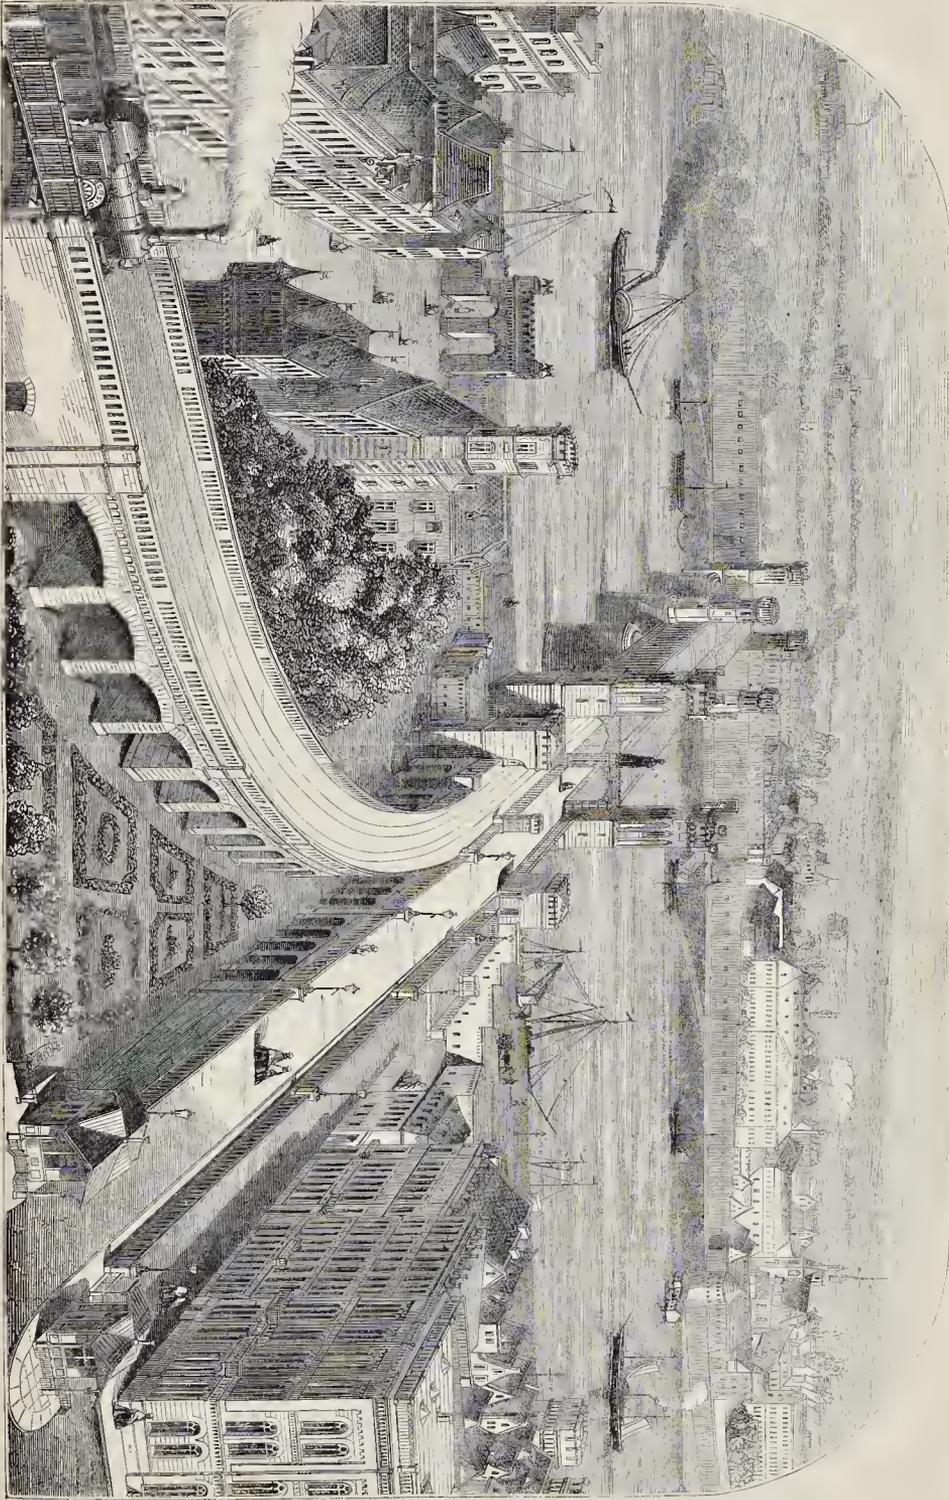

The nave and aisles are beautiful in their simplicity; and when the eye follows the clustered mouldings of the Gothic columns upwards (which have all the same general characteristics throughout the whole church, but are charmingly varied according to every changing position), a feeling of infinity pervades the mind, and gives the idea of their being prolonged indefinitely into the heaven of heavens.

However, I am sorry to see that the windows in the angles of the church are only half windows: heavy luttresses occupy the place where the remaining halves of the windows should have been. It was evidently intended to make the structure look more light inside, which no doubt it will do; but I cannot admire the arrangement, and look upon it as a blemish. The ancient part of the building has been considerably restored, but still remains in great part a splendid ruin, with the trees and wild herbs growing upon its unfinished summit; while its beautiful mouldings, carved in stone, are wasting away by the action of the elements.

The new part, which is being proceeded with actively, is carried out in strict accordance with the original, even to the statues of the saints, placed one after another among the mouldings of the doors, until they meet at the top of the Gothic arches.

Taken altogether, this cathedral will be a glorious work when it is finished, and a most masterly monument of man's manifold mental and manual munificence.

W. H. V. SANKEY.

THE BRIDGE OVER THE RHINE AT COLOGNE.

THE METROPOLITAN SQUARES.

JUST now the squares of the west end, and of some of the regions between that and the far east, present a pleasant aspect: the young buds, in all their tender shades of greenery, have suddenly burst forth, and not yet had time to be palliated with the London smoke.

In Russell-square, which, so far as the planting and arrangement of the trees and shrubs are concerned, is one of the most beautiful in its neighbourhood, the lilac and other blossoming plants make a great display; and the grass, just at the present time, looks as green as emerald; the early summer flowers give good promise. These spots are cheering to the sight of the way-farer, and a means of health to many. Although but a limited number have a right of admission into these places, they are, notwithstanding, so far as the pleasure of the general appearance is considered, and in the health-giving qualities of open and well-planted space, a kind of public property.

Many thousands of persons take a great interest in these grounds besides the dwellers around. The children of the poor, who often live in dingy places not far off, come to feast their eyes upon the fresh green foliage; and foot travellers, who pass to and from the City, look with critical comparison at the different squares. We have our flower-shows and other horticultural exhibitions; prizes are awarded to successful competitors in this department, and for the breeding of animals: societies are established for the promotion of various improvements; and it would be useful to found a society for the purpose of encouraging the improvement of the metropolitan square gardens, so that the gardeners might be tempted by suitable rewards, to be raised by general subscription, and awarded by a judicious committee, to increased exertions.

We would have a prize for the best blossom of hawthorn within a certain radius of the centre of the City, and the same for red and white roses blossoming there; others for the best keeping of the green sward, flowers, and general matters; and it is most desirable that the seasons of the year should be noticed, and the best conditions of these spaces in spring, summer, autumn, and winter considered, and the most successful in preserving their beauty at the various seasons properly rewarded.

The notice in such a way would lead to competition and great improvements, and, considering the difficulties with which the metropolitan gardeners have to contend, they are well worthy of encouragement. Besides the stimulus given to the gardeners, the publicity which would be the result of carrying out the above suggestion would cause persons to take increased interest in their own squares.

THE ARCHITECTURAL PUBLICATION SOCIETY.

THE annual general meeting of subscribers was held on Wednesday evening last, in the Gallery of the Architectural Exhibition, Conduit-street. Mr. P'Anson occupied the chair in the unavoidable absence of Mr. Whichcote.

The minutes of the last meeting having been read and confirmed, Mr. Arthur Cates (honorary secretary) read the report of the committee. It stated that the publications for the twelfth year ended the 31st December last, and received the careful attention of the committee. They comprised thirty-two pages of text, being the letter E, from Badgha to Eiland Edg, and six plates, illustrations to E F G and H; viz., Egyptian Font and Font Cover, Gable, Gargoyle, Gate House, and Half-timber House; these plates comprised twenty-seven subjects, and had been arranged and lithographed from sketches kindly contributed by Messrs. E. Ashworth, I. T. Christopher, G. R. Clarke, E. Falkener, C. Foster Hayward, E. H. Martineau, R. II. Shont, and J. J. Thomson. The remainder of the letter E was in type, and the letter F was in preparation. Six other plates of illustrations were now in the hands of the lithographer, illustrating Font and Font Cover, Gallery, Griffin, Lectern, Metal Work (knockers), and Metal Work, and comprise thirty-one subjects, which the committee had been permitted to select from the portfolios of Messrs. W. Burgess, F. P. Cockerell, G. Goldie, I. Hebb, C. H. Purdy, and G. G. Scott.

During the past year, the committee continued to receive from those gentlemen who had undertaken the duties of local honorary secretaries a continuance of that ready and zealous assistance, the rendering of which through so many years,

had placed the society under deep obligations to them. The only change which had taken place, had arisen from the resignation of Mr. W. Damant, consequent on his leaving Plymouth. The committee would be happy to fill up this vacancy by the appointment of any earnest friend of the society, who by his personal influence and exertions would feel disposed to increase the present very inadequate list of subscribers from that locality. The lamented decease of Sir Charles Barry, had deprived the committee of the assistance he had always so readily furnished, and whereby the Dictionary had been so much enriched.

The addition of the names of new subscribers to the list had been an object to which the attention of the committee had been constantly directed; but the publication of the Dictionary and the illustrations having now extended over nine years, the arrear subscriptions to be paid up by the new members had become so large that it deterred many from subscribing who would otherwise have readily done so; and it being evident that every year would increase the difficulty, the committee had arranged that, if so desired, new subscriptions might commence with the current year's publications, and that a new subscriber might pay up the subscriptions for past years at all periods, and in any manner convenient to him, receiving the publications in proportion to the amount he might pay.

An arrangement had also been made by which subscriptions would be received for the text only of the Dictionary, should any one desire to acquire it, without the illustrations, from which it was quite distinct, being in itself complete.

The committee announced with great pleasure that among the new subscribers enrolled last year have been, — the Royal Academy, the Commissioners of her Majesty's Works, the Athenæum Club, the Institute of France, &c.; and they hoped in future reports to have the satisfaction of recording the names of other institutions in whose libraries the "Dictionary of Architecture" would be an important standard work of reference.

In the report presented to the last annual general meeting, allusion was made to arrangements then pending with the Architectural Union Company, for renting from them a store-room, for the safe keeping of the stock belonging to the society. These have now been concluded, and the stock deposited in the store-room. Further arrangements have since been made, by which the Architectural Photographic Association had become joint occupiers of the room. Together with the occupancy of the store-room, the committee had been enabled to secure the use of a room for their ordinary meetings, and could thus avoid further trespassing on the hospitable kindness of the Royal Institute of British Architects, which had been for so long a period extended to them.

The final account for the eleventh year, ended April 30, 1859, showed a balance of 87. 18s. 11d. in the hands of the treasurer. The income due to the year had been 3157. and 887. 11s. 11d. had been brought forward from the previous year, making a total receipt of 4037. 11s. 11d.; while the production of the works issued for that year cost the sum of 3974. 12s. 2d.

The first account for the twelfth year ended December 31, 1859, showed receipt by subscriptions of 2427. 11s., and on account of arrears, &c., 927. 8s., which, added to the balance in hand, made together 3437. 17s. 11d.; while the expenditure already incurred for the production of the first part for the year amounted to 1914. 17s. 9d., leaving a balance of 1522. 0s. 2d. to be appropriated towards the expense of producing the second part for that year, which in the supplementary account was estimated to require 1957. The committee therefore requested all members in arrear to forward their subscriptions without further delay.

The Chairman, in moving that the report be received, printed, and circulated among the members, referred to the necessity of obtaining new subscriptions, in order that full effect might be given to the object which the society had in view.

The motion was seconded by Mr. Christopher, and carried unanimously.

On the motion of Mr. J. M. Laker, seconded by Mr. Bedells, the thanks of the meeting were given to the committee, the treasurer, and the local honorary secretaries, and they were requested to continue their services.

Mr. St. Ahyn moved, and Mr. Lockyer seconded, a vote of thanks to the honorary secretaries, Mr. Wyatt Papworth and Mr. Arthur Cates.

Mr. Wyatt Papworth moved, and Mr. Lightley seconded, a resolution awarding the thanks of the

meeting to Mr. H. R. Newton and Mr. Bright Smith, for their services as auditors, and requesting that Mr. Aitchison and Mr. J. H. Good would act as auditors for the ensuing year.

The thanks of the meeting were also voted to those gentlemen who had placed their collection of sketches at the disposal of the committee, and to Mr. Octavius Hansard for his services in the collection and arrangement of the illustrations.

Some formal business having been transacted, the usual compliment was paid to the chairman, and the proceedings terminated.

THE ARCHITECTURAL ASSOCIATION.

THE ordinary meeting of members was held on Friday evening (May 25), in the house, Conduit-street, Hanover-square; Mr. Penfold, president, in the chair.

The minutes of last meeting having been read and confirmed, the President said that the committee, in conformity with the resolution adopted at the last meeting of the Association, had drawn up a report in which they had embodied such suggestions as they considered likely to improve the working of the Society. He would call upon the secretary to read this report.

Mr. Capes, in the absence of the hon. secretary, read it.

The report set forth that the position of the Association was critical: that the interest shown by members had been gradually decreasing; that the committee, knowing that the Association had been of great advantage, and was still capable of effecting much good, were unwilling to recommend that it should be broken up until every means had been tried to restore its efficiency, and thus proceeded:—

"Most of the present members of the committee have repeatedly desired to be relieved of their duties, and nearly all of them feel that they are endeavouring to carry on this society, not so much for their own good as for that of others."

With the hope, then, of infusing new blood, and of creating a fresh interest in the society, as well as of testing the real feeling of those who should be its main support, the committee unanimously passed the following resolution:—"That it is desirable the office-bearers for the ensuing session should (with the exception of three) be selected from members who have never before held office."

Your committee, though they thought it undesirable to pass any other formal resolution, considered it would be beneficial to offer a few suggestions on the future policy of the Association. It was unanimously felt that free and unreserved discussion had been the life and soul of the meetings, and that a strong effort should be made to recover that social character which was a distinguishing feature of the early days of the Association, but which seems now in a great measure to be lost; and as one of the causes of this decline, it was suggested that the papers read at the ordinary meetings, excellent and talented as they have been, are, perhaps, too elaborate in character, and that practical and theoretical subjects, treated in a simpler and less studied manner, and more with the object of eliciting a discussion, would be better appreciated by the members. It has often been observed that the remarks or questions of the junior members, even though some of them may have seemed at the time almost absurd, have led to most interesting discussions. Your committee would, therefore, earnestly call upon your younger friends to take their proper share in the proceedings. It is feared, however, that the practice of reporting the discussions in the professional periodicals has deterred many from so doing, and your committee therefore suggest it would be well if in another year the discussions, except under peculiar circumstances, should not be reported, and that the publication of the papers read should be under the control of the committee. Lastly, it seemed the general opinion that if, instead of issuing the usual programme at the commencement of the session, a system of fortnightly announcements to each member could be adopted, as was formerly the custom, it would bring the proceedings more constantly under the notice of members, and might have a beneficial effect on the attendances.

Your committee, in conclusion, earnestly hope that the measures which the general meeting may see fit to adopt will result in advantage to this Association: they will as private members gladly contribute to its success by any means in their power, and they commend the subject very seriously to your consideration, as one which they deem to be of great importance to almost all the younger members of the profession in the metropolis."

Mr. A. Alton moved the adoption of the report, and, in doing so, said that the effort of this movement would be to stimulate the members to prevent the Association from being dissolved. He recollected a former occasion, when a similar course was undertaken with success.

Mr. W. Gritten, jun., seconded the adoption of the report.

A discussion ensued with reference to that part of the report which proposed to exclude the press from their debates, and an amendment to exclude that portion of the report was carried.

It was afterwards resolved, that a sub-committee of younger members be appointed to confer with others who are willing to serve upon the committee.

Messrs. New, Gritten, Pain, Ouph, and Keeves, were named as members of this sub-committee. They arranged to meet during the interval between the present and the ensuing meeting, which will be for the nomination of officers to serve next year.

## ECCLESIOLOGICAL SOCIETY.

A COMMITTEE meeting was held at Arklow House on Wednesday, May 2; Mr. Beresford Hope, the President, in the chair.

A discussion took place on the theory of the consecration of churches and churchyards enunciated in a speech by the Bishop of Oxford, in the House of Lords, on the Bishop of London's motion for destroying some of the City churches and selling their sites. Various architects met the committee, and submitted their designs.

A series of cartoons for stained glass, and some specimens, were forwarded for inspection by Messrs. Lavers & Barrard. Amongst them were a set of drawings by Mr. Westlake, under the supervision of Mr. Burgess, for Waltham Abbey; a five-light window for Modbury Church, Devonshire, of which the subjects were drawn by Mr. Westlake, under Mr. White's supervision; a window for Preston Church, Kent, designed by Mr. Barrard; the cartoons of a memorial window to the late Lord Lorton, for Ardean Church, Ireland, designed by Mr. Allen, and representing the four Evangelists; and the cartoons of some medallions lately placed in the chancel windows of St. Giles, Camberwell.

The committee examined a large photograph sent by one of their number, Mr. T. Gambier Parry, representing one-half of the Doom, as he is about to paint that subject, from his own designs, over the chancel-arch of his church at Highnam, Gloucestershire. The subject embraces a standing figure of Moses, six of the Apostles, seated in stalls, and an angel of the Judgment.

We understand that the annual meeting of the society is to be held this year in the gallery of the Architectural Exhibition, Conduit-street, on Monday, the 11th of June, at 8 p.m.; Mr. Beresford Hope, president, in the chair; and a debate will take place on the tendencies of pre-Raffaellism and its connection with the Gothic movement; and that persons desirous of being present will be admitted on sending in their cards to the president.

## BUILDING FOR THE SMITHFIELD CLUB CATTLE SHOW.

THE cattle show having outgrown Baker-street, a sub-committee was appointed on December 6, 1858, to inquire in what way the requirements of the club could best be supplied. A number of sites and plans of buildings have since then been offered for their approval, and the site which the committee has finally selected is that known as Dixon's Lairs, in the Liverpool-road, Islington. This piece of ground contains three acres. Under the patronage of the committee of the Smithfield Club is to be erected an agricultural hall on this site. A lease of the ground has been secured, and a large portion of the required capital of 30,000*l.* has been subscribed.

The Agricultural Hall Company will erect the necessary buildings, and pay the Smithfield Club 1,000*l.* per annum for a period of twenty-one years. The profits of the company will be derived from the admission fee to the various shows, which will probably comprise, in addition to cattle, roots, and implements, poultry, fruit, flowers, &c.

The Smithfield Cattle Show will be held in the new Agricultural Hall for the first time in December, 1862. The site is not on the right side of London for the purpose.

## COUNCILS OF CONCILIATION.

A BILL to establish equitable councils of conciliation to adjust differences between masters and operatives has just been brought into Parliament. The Bill commences by stating that it is expedient, the better to facilitate the settlement of disputes between masters and workmen, that they should be enabled to form equitable councils of conciliation or arbitration, and to amend and extend the provisions of an Act passed in the fifth year of the reign of George the Fourth, entitled "An Act to Consolidate and Amend the Laws relative to Arbitration of Disputes between Masters and Workmen." It then proceeds to provide that it shall be lawful for the masters and workmen engaged in any particular trade or trades, occupation, employment, or calling whatsoever, to form equitable councils of conciliation and arbitration, consisting of an equal number of masters and workmen, who shall have power to hear and determine all questions of disputes and differences between masters and workmen, and to have and exercise all the powers and authority granted to arbitrators, referees, justices, and others, by and under the various enactments and provision of

Acts before recited; and any award that the said equitable councils of conciliation and arbitration may make in case of dispute or difference submitted to them under the before-recited Act or Acts shall be final and conclusive between the parties to such arbitration, without being subject to review or challenge by any court or authority whatsoever. The said council further to determine any other case of dispute or difference submitted to them by the mutual consent of master and workman or masters and workmen. If any number of masters and workmen in any particular trade or trades, being inhabitant householders or part occupiers of any house, warehouse, counting-house, or other property, within any city, borough, town, or other place, at a meeting specially convened for that purpose, agree to form a council and jointly petition her Majesty to grant them a license to form such council, it shall be lawful for her Majesty, or her Majesty's principal Secretary of State for the Home Department, to grant such license, provided notice of such petition has been published one month before the granting of such license in the *London Gazette* and in one or more of the local newspapers of the place whence such petition emanates. The said council shall consist of not less than two masters and two workmen, nor more than ten masters and ten workmen, and a chairman; the number to constitute the said council to be inserted in the license; but a quorum of not less than three, including the chairman, may constitute a council for the hearing and adjudication of cases of dispute, and may make their award. For the purposes of this Act, the persons whose names, occupations, and abodes, are attached to the petition praying for a license, shall be authorized to proceed to the appointment of a council of conciliation and arbitration from among themselves within thirty days of such grant of such license; and the said council shall remain in office until the appointment of a new council in its stead.

## THE THREATENED STRIKE.

THE "Conference of the United Building Trades," through their secretary, have submitted a fresh application to the Central Association of Master Builders, dated May 25th, for a reduction of the hours of labour from ten to nine hours per day. Amongst the reasons which they give for asking this they place,—

"The determination on our part, as well as on the part of our fellow-workers throughout the country, not to cease the prosecution of our present undertaking until the boon of the 'nine hours' has been conceded. This last fact we submit to your attention, not in any boastful or defiant spirit, but lest you should be so far deceived as to imagine that the operative builders are to be diverted from the demand for the 'nine hours movement.' Rest assured that the determination to assure this amelioration of our condition is too deeply rooted in our hearts for any amount of resistance to turn us from our purpose, and that the chief object of any severities to which we may be exposed in consequence of this demand will be to deepen our attachment in the cause for which we have suffered, and strengthened our resolve to persevere in our agitation until success has crowned our endeavors."

The masters have not yet given any reply to the renewed request.

As an observer of what has been passing around us, permit me to add my mite to the much vexed question now agitating the building trades, which is simply this,—

That wages, and therefore the position of the working classes, have been improving in England for the last hundred years and more; that any attempt on the part of the men to force these things beyond their natural progress is an attempt to force nature, and must fail; but that if things had been let quietly alone the natural course of events would have given them the increased rate of wages (for the diminution of time is only a sham) they are now agitating for.

That any advance in the rate of wages must take place gradually, and not all at once, for society is always injured by sudden changes, and strikes being one of these unnatural attempts to force things beyond their natural limits, never have succeeded, and never will.

That any advance in the progress of the working classes must be with the sanction of, and not in direct opposition to, their employers, for the interests of both are the same, and if one is opposed to the other both must suffer.

That, on the other hand, it is as useless for employers to try to arrest the natural order of things as for the employed to force them; that wages have been gradually rising, are rising, and will rise, and nothing but a national calamity, such as war, can arrest their progress.

That the "document" was a failure, inasmuch as it split the working men into two classes, and

as no shop can be well filled with either, men are disputing for the merits of the "document" instead of doing their work. And, sir, how vexing it is to every lover of true progress to see the events that are passing around us, with the railway running like a fertilizing river through the land, and every village through which it passes springing into a new existence; hills, and crescents, and squares, arising where but a year or two ago were the quiet green fields; the village carpenter grown into a master builder, and the source from which the world of London was supplied with men, detaining them all at home, with increased comforts and increased pay. The easy means of emigration, waiving thousands to other shores to plant the germs of our race; with Australia, an infant Hercules; New Zealand close on its wake; India opened up; China about to be so; in Russia, a serfdom which has existed for ages abolished, and the nation arising like a giant long chained, to take its place among nations; a treaty concluded with France, which will do more to promote a good feeling towards, and prevent war between, us and our nearest neighbours, than all the guns or batteries that were ever made; London itself, the Englishman's pride, doubling and trebling itself, both in size, wealth, and population; and instead of the working men quietly abiding their time, and taking their share in the era of unexampled progress which lies before them, they are torn and distracted by internal wars, which always have impeded, and always will impede the very advancement they seek, and furnish an argument to their enemies, why they should not be intrusted with many privileges which were about to be conceded to them.

A LONDON BUILDER.

## SAINT ANDREW'S NEW CHURCH, DUBLIN.

THE amended design for this building, submitted in competition by Messrs Lanyon & Lynn, of Belfast, has been approved of by the committee, who are fortified by an estimate from a respectable Belfast builder for its execution within the stipulated amount. Amongst the other competitors were Messrs. Raffles Brown (*Templa quam delecta*); Deane & Woodward (*Dance Templa referre*); Thomas Turner, Belfast (*Excelsior*); Rawson Carroll (*In fide et in bello fortis*); J. McCurdy (*Duna spiro spero*); William Atkins (*Resurgam*); Drew (*Resurgam*); there were three of this motto); Slator (*Fides*); Bell (monogram T in a circle); Semple (*Delta*); Isaac & W. Farrell (*Finem respice*, &c.); and the first five in the order we have placed them in were, with Lanyon & Lynn's, reserved for consideration.

## PUBLIC BUILDINGS IN THE PROVINCES.

*Worcester.*—Great progress has been made, by the contractors, Messrs. Wood & Son, with the improvements and extensions at the county goal, in this city. Some time since the new east wing in the males' prison was completed, and two other wings which have been in a great measure rebuilt, says the local *Chronicle*, are now rapidly approaching completion. With the exception of some title of the chapel, the governor's old house (now partly used as the clerk's office), and a portion of the buildings near the front gates, nothing is left of the old goal. It is estimated that the prison, when completed, according to the present plans, will contain the following cells:—Male side, 13 reception and 246 ordinary; female side, 3 reception, and 62 ordinary; total, 324. In addition to these cells, the debtors' prison contains 26 for males and 2 for females. The enlargement and improvement of the goal are being carried out under the plans and superintendence of Mr. Rowe, the county surveyor. Mr. Sutton is clerk of the works.

*Wolverhampton.*—After the Town Council determined to put a roof upon the market-hall building, the contract was given to Mr. R. Stap, of London, who has now nearly completed the work, from designs furnished by Mr. Lloyd, of Bristol. By the plan adopted, the market will be divided into three compartments, averaging 100 feet in length, the central bay having a span of 33 feet, and the two sides 26 feet each. These bays are separated by four small avenues, which, like the bays themselves, run parallel with the Corn Exchange and Town Hall. The framework of the roof, which is formed of light iron spandrels, rests upon 46 iron columns, each 8 inches in diameter. The drainage from the roof will pass down these iron columns, which are hollow. The roof is composed of wood, covered externally with slates, and rests upon a framework running all round the

building and between the avenues, fitted with glass *louvre*s, composed of Hartley's patent glass. The avenues are roofed with corrugated iron.

**Birkenhead.**—A building has been erected by the county of Chester for lockups and court-house, &c. For want of funds the external part is unpretending. The cells, eight in number, are so planned as to allow of a division of the sexes. The gas is so managed as to light the whole of the interior of the cells, without any inside fixtures whatever. There are two day-rooms 29 feet 6 inches long by 9 feet 9 inches wide. The day-rooms and cells are heated by means of hot water pipes passing through them. Adjoining the lockups, and overlooking the same, is a residence for a constable. In the room built for the court, the windows are so placed, that upon opening the upper part a constant current of air is caused to pass over the ceiling; cold fresh air is admitted from below, and a hot water apparatus is introduced for warming the court in winter. The acoustic effect of the court is said to be good. The dimensions of the room are 43 feet 5 inches by 30 feet 3 inches, and 25 feet in height. The building further contains a staircase, magistrates' retiring-room, offices, &c.: there is also a stone staircase for the admission of the general public, and a separate staircase, also of stone, for the prisoners. The building was executed from the designs of Mr. William Cole, architect, Birkenhead, and carried out under his superintendence. The estimated cost for the completion of the whole, including the heating apparatus, gas, furniture, and fixtures, was about 1,800*l*.

**Hartlepool.**—The design of Mr. Matthew Thompson, of Newcastle, architect, for a new workhouse at Hartlepool, has been adopted, according to the *Gateshead Observer*.

CHURCH-BUILDING NEWS.

**Stamford.**—Tenders have been sent in for putting on a new roof and other restorations to the church of St. Mary, Stamford, and the following were the respective amounts: Bradshaw, 312*l*.; Richardson & Son, 310*l*.; Jeffs & Roberts, 300*l*.; the tender of Messrs. Richardson was accepted.

**Bacton (Staffolk).**—The chancel of Bacton Church has been reopened after restoration. The new chancel has been erected by the rector at a cost of something like 500*l*. At present it has no coloured glass. There is a five-light window at the east end. The benches are of stained oak, and the floor is chiefly composed of Minton tiles—the *reclodes* of encaustic tiles and Derbyshire alabaster, wrought up in geometrical spaces. The wooden roof is painted from designs found in other parts of the church. The painting has been executed by a village artist, under the direction of Mr. Butterfield, the architect of the new chancel.

**Lavenham (Staffolk).**—The church here has been examined by Mr. Penrose, and found to be in many points in a sad state of decay. The roof is said to be quite unsafe, as the ends of almost all the principals are decayed, and it now rests solely on the corbels. The mullions of all the windows, except ten which were restored some short time since, are said to be in a dreadful state of decay, literally falling to pieces from the action of iron bars, let into them, on the stone. The cost of the proposed repairs and restoration is estimated at 2,000*l*, of which 650*l*. are already subscribed.

**Leicester.**—The parishioners of St. Martin's have resolved to take down the very old Norman tower of the church, which is in a perilous state, and rebuild it, in the meantime without the spire. They have authorised the churchwardens to instruct Mr. R. Brandon to prepare plans for this and other requisite restorations.

**Sittingbourne.**—The foundation-stone of the new cemetery has been laid. The architect is Mr. John Wimble; builder, Mr. K. Spicer. The land on which the cemetery is being made is situated between the parishes of Sittingbourne and Tunstall. The ground is enclosed along the front boundary with a rag-stone wall with piers, and surmounted with an iron railing. Red bricks are introduced in bands. In the centre of the frontage is the entrance-lobby, which will be also of rag and Bath stone. The style of architecture is to be in keeping with the chapels. The chapels are placed in the centre of the land, and are connected by means of a covered carriage roadway; on each side of which will be a vestry and vestibule leading into the chapels. These will be in the middle style of Gothic architecture, with four-light windows in front and wheel windows at the back. Over the carriage entrance there will be a bell-turret. Inside the chapels it is intended to use coloured bricks. During the night the foundation-stone was removed, adds our authority

(the *South-Eastern Gazette*), the bottle containing the coins broken, and the coins stolen.

**Reigate.**—The opening and consecration of St. Mark's Church, Reigate, have just taken place. The foundation-stone to this building was laid on the 30th of July, 1859, by Earl Somers. Mr. W. Carrubers, of Reigate, builder, has carried out the contract. The architects were Messrs. Field & Hilton. The church is built with a local stone, and the parsonage is composed of the same material. The interior of the former affords 700 sittings; about 300 free. The estimated cost of the church and parsonage is nearly 6,000*l*, and about 4,000*l*. of that sum has already been collected.

ROMAN CATHOLIC CHURCHES AND CHAPELS.

**Brentwood.**—The first stone of a large new chapel has just been laid at Brentwood, on a site by the road-side, close to the old one, by Lord Petre. It will be more than double the size of the present edifice. Lord Petre gave the site and a liberal sum towards the work. The sum required amounts in the whole to 2,500*l*. The building was commenced some time since from the design and under the superintendence of Mr. Blount, architect, Messrs. Putman & Fotheringham, of London, being the builders, and the walls have already risen to a considerable height. The edifice is to be Gothic, of the second period of the pointed arch, with nave and chancel and two aisles, the material of the exterior being Kentish rag, with Bath stone dressings. The length is to be 90 feet 9 inches, breadth 39 feet 8 inches, height of nave to roof 33 feet, of chancel 36 feet; and at east end will be a tower and spire rising to the height of 110 feet.

**Abergavenny.**—The new church, dedicated to "Our Ladye and Saint Michael," has just been completed and consecrated. The edifice is of late Decorated Gothic, and consists of a nave, 75 feet by 24 feet; north and south aisles of the same length, and 9 feet wide, and chancel 25 feet by 18 feet. The nave is divided into six bays, supported by quarterfoil columns and high-pointed arches: it is lighted by six clerestory and six aisle windows on each side. The height to the summit is 55 feet, and it is spanned by an open timber roof with exposed rafters stained and varnished. The chancel is entered from the nave through a stone archway, 42 feet high. On the north side of the chancel are three two-light tracery-headed windows, and there is a similar window on the south side. The eastern window of six lights fills up the entire end of the chancel. The windows are glazed with cathedral glass, with the exception of the window at the eastern end of the north aisle, which is of stained glass, from the designs of Mr. Maycock, of Clifton. It is a memorial window to the late Mr. Simon Andrews, of Abergavenny. It contains the figures of "Our Ladye" and "St. Joseph." The stone employed for the building is wall stone of the immediate neighbourhood, in random courses, with Bath stone dressings. The covering is of Welsh slate, and the gables are surmounted with floriated crosses. The church is, we understand, the first public work of Mr. Benjamin Backnell, architect, Rooborough, near Stroud. The builder is Mr. Henry Williams, of Bristol.

**Wharfedale.**—A chapel has been commenced at Deepcar, a village near Wharfedale, on the line of the Manchester and Sheffield Railway. It will be built of stone, in the Early Pointed style, and attached to it will be a house for a sacristan. The architects are Messrs. Hatfield & Goldie, and the builders Messrs. Wade & Gomersall, all of Sheffield.

STAINED GLASS.

**Louth.**—The Roman Catholic chapel here has recently had its west end enriched by the addition of a stained-glass window, the cost of which has been raised entirely from penny contributions by poor Irish people, some of them in America. There are four lights in the window: in the two side ones are placed the figures of the patron saints of Ireland, St. Patrick and St. Bridget—and in the two centre ones is the representation of the widow dropping her mite into a box held by our Saviour. At the foot of the window is the following inscription:—"Given to this chapel by the poor Irish, 1860." The work has been executed by a Norwich artist.

**Southwater.**—On Ascension-day, a stained-glass window, by Messrs. Bell & Clayton, of London, was opened to view in the small church of Southwater. The window displays the character of

"*junocents*" in a fourfold view, viz.—1st. The Circumcision of Christ; 2nd. The killing of little children; 3rd. Our Saviour blessing little children; 4th. Christian baptism, above which Christ is placed as a King, sitting high over all.

"ASILE IMPERIALE DU VESINET," PARIS.

DURING a recent visit to Paris, I had the pleasure of visiting the new hospital of the government, *L'Asile Impérial du Vesinet*, which they consider one of their models for plan, economy in construction, and also on account of its sanitary regulations.

It is situated in the middle of the forest of the Vesinet, between Paris and St. Germain, on the western railroad, and designed by the government architect, Monsieur Laval.

The following diagram shows the general disposition of the building:—

It covers a superficies of about 3½ acres. The grounds surrounding it are very extensive, and well laid out for the convenience and enjoyment of the inmates.

This hospital only receives the convalescent female patients from the other Parisian hospitals, and contains accommodation for about 350 beds.

On the ground-floor are:—

In the central pavilions, two very extensive dining-rooms, both decorated with much taste. The floor is paved with a patent imitation of mosaic, which is very pretty.

The pavilions to the right contain dispensary, kitchen, *buanderie*, the directors' and house-surgeons' apartments.

The kitchen is rather small, in my opinion, for convenience; but, like most French kitchens, it is beautifully arranged, and contains every culinary improvement.

*La Buanderie*, or washhouse, has been carried out by Mous. Bouillon. Among other things in this department we find the application of centrifugal force for drying linen, and some new invention applied to the washing,—a sort of self-acting washing-machine.

Hot and cold water for baths, washing, &c., is carried over the whole hospital, on the plan of the same engineer.

The left pavilions contain wards, having in each eight beds; the average size of these wards being 26 x 18 x 12. They appeared to me rather low, and the cubical space very limited in comparison with some other hospitals; but this is sought to be counterbalanced by the system of ventilation adopted in this building, of which I will give a slight description below.

On the first floor, in the central pavilions, are two sitting-rooms, the same size as the dining-rooms. They are on Sunday utilized as a chapel, and this by a very simple arrangement. The centre of the pavilion, which is used as a chapel on week days, is surmounted by a dome, and so constructed that, by throwing open two large ornamented iron gates, which shut it out from the two rooms, a chapel is made capable of containing from 600 to 800 persons. This, erected at no additional cost, does great credit to the architectural talent of M. Laval.

The wards in the *Asile Impérial* contain, on an average, eight beds each; except in one of the right-hand pavilions, where there are two thirty-bed wards, and they have windows only on one side in all of them.

The warming and ventilation of this, as of all the hospitals lately constructed by the French Government, was confided to Dr. Van Hecke, of whose system an account has appeared in your pages.

It is carried out in the following manner. In the basement of the building, in one of the pavilions to the right, a 3½-horse power engine works a revolving fan, which draws the air from the exterior through a window, on the ground-floor, constructed for that purpose, and pumps it through long subterranean canals into four warming apparatuses. The air, after having been conveniently warmed, ascends into flues, which conduct it into all the wards through regulating air-gratings in the walls.

In each ward there are two or more escape-floes, which carry the vitiated air above the roofs. The ventilation seems to me very perfect.

OBSERVER.

LIVERPOOL DOCK MORTAR.

THE mortar used at the Liverpool Docks is made from limestone obtained from "Halkin Mountain," North Wales. One ton of this limestone is delivered on the Quay, Liverpool, at a cost of 7s. 6d. About 1½ ton of limestone makes one ton of lime as burned and drawn fresh from the kiln; which equals, by measure, 16 bushels, and, when slaked, 24 bushels.

Sea-sand is used to make mortar. By measure,—1 slaked lime; 1½ sand; ½ furnace ashes—ground during the space of half an hour.

Mortar-pans are 7 feet diameter; stones, 4 feet diameter; 14 inches on face; 5-horse power required to drive them at 2-revolutions per minute. About ½ cubic yard is ground at one time in each pan, ground half an-hour. Pans, 10 feet diameter; stones, 4 feet; 22 inches on face, and driven 16 revolutions per minute, have been used. Require 8-horse power to drive such pan and stones.

One cubic yard of mortar weighs about 30 cwt., and costs from 7s. 6d. to 10s. per cubic yard. 1 cubic yard of mortar executes 3 cubic yards of random rubble work, and about 4 cubic yards of brickwork. In grinding mortar the lime seems to be wholly lost in the sand. That is, 2 cubic yards of sand, and 1 cubic yard of slaked lime, with the necessary water: grind down to about 2 cubic yards of mortar. This mortar may be allowed to stand in heaps many days; but, before use, it must be re-ground: mere spade re-tempering is not sufficient.

Results of two experiments in preparing blue lias mortar, at Wigan Waterworks, 1857:—

First experiment, 17th December, damp and foggy evening.

Lime ground before being put into the mill, known as "Bag Lime":—

Measure.	Weight.
Lime..... 6 cubic feet ..	Cwt. qr. lbs. 2 3 18
Sand..... 12 do. ..	8 1 16
Water (21·6 gallons) .. 3·6 do. ..	1 3 20
Total bulk..... 21·6	13 0 20
Grinding occupied twenty minutes; filling, grinding, and emptying, forty-five minutes. The result was then as follows:—	

Measure.	Weight.
Mortar..... 12·5 cubic feet ..	Cwt. qr. lbs. 12 0 3
Loss in bulk 8·96 do. ..	3 0 0

Second experiment, 18th December, strong dry wind.

Measure.	Weight.
Water (25·2 gallons) .. 4·04 do. ..	Cwt. qr. lbs. 2 1 0
Lime..... 6 cubic feet ..	3 0 0
Sand..... 12 do. ..	8 1 14
Total bulk..... 22·04	13 2 14
Grinding occupied fifteen minutes; filling, grinding, and emptying, thirty minutes. The result then was as follows:—	

Measure.	Weight.
Mortar..... 12·75 cubic feet ..	Cwt. qr. lbs. 13 1 10
Loss in bulk 9·39 do. ..	0 1 4

Measure.	Weight.
First experiment.—Weight of a cubic yard of mortar.....	1 8 0 9
Second experiment.—Ditto.....	1 8 1 20

The mortar was soft enough for use when ground, but requires five or six gallons of water in an hour after grinding. R. R.

THE WAYS AND MEANS FOR METROPOLITAN IMPROVEMENTS.

EMBANKMENT OF THE THAMES.

The important question of raising the means of carrying into effect projected improvements in the capital requires the most careful consideration. From a recent report, it appears that at the present time the works actually ordered by the Metropolitan Board of Works are as under:—

The main drainage .....	£2,300,000
New street from High-street, Borough, to Stamford-street .....	429,424
New street from King-street, Covent-garden, to Cranbourne-street .....	41,820
And the Victoria-park approach .....	41,450
	£2,812,694

Other works which are described as being urgently necessary are estimated to cost 439,752l., besides Finsbury-park, which has been sanctioned by the Legislature and the Board, and will, when the money is forthcoming, cost 216,820l. There are thirty-nine improvements under notice, many of which have been already favourably reported

upon, the cost of which is estimated at 16,346,245l., and the present and prospective liability of the Board amounts to nearly 2,000,000l. These are startling figures; so much so that it is necessary to think carefully of the immense advantages which must result from so vast an outlay, provided it is expended in a right manner. Besides the above should be added the expenditure of local boards.

To meet this outlay there is an annual income of about 2,000,000l. raised by the taxation of the metropolitan district. This varies, and is very heavy in certain districts.

In raising this great sum the ratepayers of the present generation are, as we know, suffering in certain districts considerably; and it is clear that taxation in this way cannot be much increased, without causing great trouble and dissatisfaction. It is therefore most necessary to devise other means for carrying on these works, which will confer vast benefits on succeeding generations.

In a short time the coal duty, which has for long been levied for several purposes, will, unless fresh powers are granted, be discontinued. This tax, which is levied over the metropolitan district of twenty miles radius from the Post-office, does not press heavily on the poorer parts of the population.

There are three sections of this tax, viz., first, 8d. in the ton has met the cost of the London-bridge approaches, the Covent-garden approaches (now being carried out), and the new street from Coppice-row to the bottom of Ludgate-hill. The claims at present on this income will be liquidated in the course of next year. This duty yields 144,000l.

Secondly, the Id. duty yields 72,000l. This is claimed by the corporation as part of the City estates.

Thirdly, the Id. duty produces 17,000l. This fund, amongst other purposes, was applied to the re-building of the Royal Exchange.

It thus seems that the entire sum available from the sea-borne coal duties, which amount to 1s. 1d. per ton, is about 233,000l. per year.

Besides the coal duty there is a tax laid on the hackney carriages of the metropolis, which goes into the national exchequer. Considering that up to the present time the Parliament has refused to allow any grant from the national exchequer, either for the embankment of the Thames or for the vast improvements which are in progress in the capital, it is unjust that this should be applied to general purposes. The hackney-carriage tax raises a revenue of 80,368l.: not any of this tax is raised in the provinces; this, with the coal duties, would amount to 313,368l.: this, in ten years, would produce over three millions sterling; a sum sufficient to provide for the effectual embankment of the Thames throughout the metropolis. A. B.

THE PRICE OF BRICKS: SUPPLY AND DEMAND.

KNOWING your desire always to hear, and to present to your readers, both sides of a case, we take leave to offer a remark or two on the letter from "An Architect," in your last number respecting bricks. The writer complains of their present high price, and proposes that architects generally should insert a clause in their specifications, that their works are not to be proceeded with till bricks can be delivered at 35s. per thousand, and he gives it as his opinion that the present rate of prices proceeds from a spirit of speculation, analogous to that which is witnessed on the Stock Exchange.

Now, we have no quarrel with the price named, which is fair enough, but we venture to think that "An Architect," loses sight of the first principles of political economy, in trying to impose a fixed price upon brickmakers, and forgets that such matters are regulated entirely by the questions of supply and demand.

In the early part of the year 1859, when depressing influences were working to contract the demand, but when the supply was plentiful, stock bricks were sold at the unremunerative prices of 23s. and 24s. per thousand. What would "An Architect" have said to the brickmakers, if at that period they had all combined to sell no more bricks till they rose to 30s. or 35s. per thousand? We are sure he would have condemned it, and are equally sure the brickmakers would not have been so foolish as to attempt it.

At the present time, when the demand is large, and the supply is limited, bricks are dear, and so they will remain till the conditions which make them so are altered.

To attempt to impose artificial restrictions in

matters which are governed by fixed laws, which arrange themselves independently of pressure from without, savours rather of the fashion of the commissary of police at Naples, who went the other day on the Bourse, and, after commanding silence in a loud voice, and proclaiming that Garibaldi had cut his throat in consequence of the utter rout and dispersion of his followers, incontinently proceeded to fix the price of the funds at 112½. W. W. W.

SCHOOL-BUILDING NEWS.

Colchester.—A school for children of both sexes is in course of erection at Great Clacton, near Colchester. The building is of red brick with Caen dressings, in the style of the sixteenth century. It has a large four-light window at each end, and four three-light windows and a double porch at one side, with lateral entrances, surmounted by a bell-gable. The architect is Mr. H. W. Hayward, of Colchester; and the contractor, Mr. Hawkins, of Monks Eleigh, in Suffolk.

Thrapston.—On May 3rd, the new National School at Ratnuds was opened. It has been built by Mr. Parker, of Thrapston, from designs by Mr. G. E. Street. The building is in the Gothic style, and consists of a school-room, approached by a flight of stone steps in a porch, through which access is also had to a class-room. The sloping ground necessitated this arrangement. To the school building is attached a master's house.

Liverpool.—The foundation-stone of National Schools, to be erected in connection with Holy Trinity Church, Toxteth-park, has been laid. The schools will consist of three rooms, each about 45 feet by 18 feet, lighted on both sides, the lower one 15 feet, and the upper ones 14 feet high. A class-room communicates with each school, and all are approached by a fireproof stone staircase from the ground. The teachers' dwellings are attached. The architect is Mr. George Williams; contractors, J. and R. Duckworth, T. Williams, W. Goodall, Knowles, and Eriam. Cost of site, 1,700l.; cost of erection, 1,649l.—The roofs are put on the Friends' Free Schools and Literary Institute, at Islington. The architects of the new building are Messrs. W. and R. Duckworth, and the style is a modification of the Italian. The architects were rigidly restricted from any attempt at the ornamental. A design of a Gothic building first submitted by the architects was at once rejected. The building shows a frontage towards Islington of 66 feet, and runs back along King-street-lane, Soho, to a depth of about 70 feet. It is two stories in height, exclusive of the basement, and (speaking of the front) rests to a height of about 4 feet above the surface on red rock-work of roughly-quarried stone. The first story is of white stone, from Stourton; the upper story of red brickwork, stone-dressed, with the windows marked by a large anticlerical cornice and ornamental consoles. The doorway is placed in the centre of the front, and serves to divide the schools, on the left, from the various departments of the Institute, which are grouped on the other side. There are six windows on each story, filled with plate-glass. The schools are calculated to accommodate about 750 children,—500 boys and girls, and 250 infants. The different school-rooms measure 50 feet by 30 feet, and, contrary to the usual order, the boys will occupy the lower story and the girls the upper, the infants' school and various class-rooms being situated behind. The reading-room is 40 feet by 24 feet. The kitchen is on the basement, and suitable apartments have been provided for the keeper, and for the convenience of visitors or temporary guests. Mr. Tomkinson is the sole contractor, and the estimated cost of the building is 2,200l. The land on which it stands cost 1,500l., making the total amount 3,700l.; and a subscription of from 600l. to 700l. has been raised in addition for the purpose of furnishing the library.

Sheffield.—The corner-stone of the Oughtibridge National and infant schools has been laid by Lord Wharfedale. The building will be a stone edifice, in the Tudor style of architecture; the estimated cost of which is 600l. The stone used in the construction is quarried in the neighbourhood, and the facings are of freestone. There will be three school-rooms and two class-rooms, furnishing accommodation for 500 scholars, and residences for master and mistress. The site closely adjoins the church and parsonage, which stand on the side of the hill, about 200 yards from the turnpike-road. The architect is Mr. R. G. Smith, of Hull, and the contractors are Messrs. Ash and Clayton, of Sheffield.

**NATURAL MINERAL ASPHALTE SEYSSEL.**

SIR.—Our attention having been directed to the case of F. Seyssel, Architect, before the Vice-Chancellor Kindersley on the 22nd inst., wherein the important works executed at the Waterloo Station are alluded to, we feel it our duty to explain that the works in question were divided into three distinct contracts for their execution, one moiety by ourselves and the other by Mr. Henry Broughton, the material specially stipulated to be used in both cases being the "Genuine Seyssel Asphaltite."

Mr. Broughton, Mr. Strauss, sitting reasons to believe that the material used by Mr. Broughton was not the "Genuine Natural Asphaltite," stayed all further progress with his work until he should be satisfied on that point, which Mr. Broughton having failed to do, the completion of his portion of the work was entrusted to us, in addition to our own contract, and finished by us to the satisfaction of Mr. Strapp.

As we frequently remark that architects, fully satisfied of the goodness of the true Seyssel Asphaltite, simply specify that their works shall be done with "Seyssel Asphaltite," without any other distinguishing name, the following explanation may possibly not be unacceptable to your readers:—

The town of "Seyssel" (from which this natural bituminous lime-stone called "Seyssel Asphaltite," so largely used in this country takes its name) is situated in France, and the mines which produce it are on both sides of the river Rhone, where it separates France from Savoy.

This mineral rock-stone is a natural production, and can only be obtained from three distinct mines, viz.,—Seyssel Eyremont, Seyssel Perrette, and Seyssel Franzy. Of these mines the company represented by Mr. Farrell import the produce of the first, whilst we are the importers of the mine "Seyssel Perrette," and proprietors for half the production of the mine of "Seyssel Franzy."

Except, therefore, from one of these three sources, it is impossible that "Genuine Seyssel Asphaltite" can be obtained.

With the knowledge of these facts, it will be very easy for architects (if they wish to have their work carried out with the "natural" mineral production of Seyssel) to obtain it by simply adding the name of the mine the production of which they desire to use, and by satisfying themselves that the contractors of the works import them direct from the respective mines. ARMANI & CO.

**LEEDS CORN EXCHANGE COMPETITION.**

SIR.—Allow me to say a few words with reference to the competition to which architects are invited, for a design for a new Corn Exchange, at Leeds. In entering into competitions of this sort, architects have been induced to give their time and abilities in honourable rivalry, not so much for the paltry premium offered, as in the hope, if successful, of being allowed to carry out their design in the usual way; and, in cases where such honest intentions are ruling, it is surely enough to enable committees to fulfil them, if they require the design to comprise plans, elevation of principal front, and one or two sections, together with a general description as to the way in which the several works are to be done, and an approximate estimate of the cost. But what do we find in the instructions to architects in this case? Why? The architects are to state in detail the cost of completing the works according to their several plans. The architects are to supply a complete set of working plans, sections, and elevations, all drawn to a scale of one eighth of an inch to the foot, with all requisite details, and a minute specification, sufficient to enable contractors to tender from."

Now, it appears, the Leeds corporation have secured the services of a gentleman, who signs himself "C. E.," as their thorough surveyor, no doubt a very proper person, and we may take it for granted not overpaid. This fact, coupled with the craving for "a complete set of working plans, sections, and elevations, and a minute specification, sufficient to enable contractors to tender from," raises in the mind a very strong suspicion that these "complete sets" are, when obtained, to be handed in to "C. E.," to be carried out under his direction; and it would have been only honest to have said so.

The lucky author of the first prize will then have his name and address handed over, and "no further questions asked," as the custom is with fortunate finders of gentlemen's pocket-books, or ladies' pet dogs. But stop, there is yet another difficulty to be encountered; for, says the instructions, "should the actual cost of the selected plan, when contracted for, exceed the architect's estimate, he will be held to have forfeited his claim to the Premium." &c.

Now, the plain English of the matter is this,—the architect who employs himself in such a competition gives his time and talent to it, with a very remote chance of obtaining the money prize, and without the slightest chance of any further advantage. It is, supposing the works to amount to 12,000*l.*, about one-third of the fair charge upon similar works, carried out in the usual way, viz., at 24 per cent., and he is deprived of a further 24 per cent. for carrying out the works. Sicut.

**Books Received.**

*An Inquiry into the Law of "Strikes."* By FRANCIS D. LONGE, of the Inner Temple, Barrister-at-Law. Cambridge and London: Macmillan & Co.

Is this pamphlet, which comes at what we very much fear will be an opportune moment, the author has brought together with care the various authorities bearing on the subject. A simple exposition of the law is out of the question, so conflicting are the precedents; but, by a careful perusal of this pamphlet, those desiring to strike or coerce may at any rate see what they must do if they wish to keep within the law. We have, to speak candidly, no desire to aid in such investigation; our earnest hope being that, by the exercise of common sense and honesty of purpose, the necessity for looking into the law of strikes may be altogether avoided.

*Peaks, Passes, and Glaciers. A Series of Excursions by Members of the Alpine Club.* Edited by JOHN BALL, M.R.C.S., &c., President of the Club. Fifth edition. London: Longmans and Co. 1860.

The voluntary facing of out-of-the-way dangers and difficulties, and the persistent contention with and overcoming of them, are characteristics of the Anglo-Saxon race acknowledged even by their most inveterate foes. The ascent of the ice-bound peaks and passes of the high Alps of Switzerland affords a good field for the exercise of this commendable spirit. The Alpine Club now numbers at least 100 members, every one of whom doubtless has his own story to tell of dangers faced and difficulties vanquished. The present volume contains interesting narratives of a few of these, together with the scientific and other information picked up by the way. In a scientific point of view, indeed, the glacial districts of the Alps are of especial interest now even to archaeologists, as they afford some idea of that strange state of the world in which the glacial remnant of the modern Arctic regions had spread over nearly all the globe—at least over nearly all our own northern hemisphere,—at a time when unknown tribes of men traversed its ice-bound surface in pursuit of monsters now extinct, which they attacked with those implements of flint so recently discovered in the glacial drift and gravel of our own and other countries,—then partly covered by icy oceans, and partly, like the high Alps, frozen up under everlasting glaciers.

Even apart from all geological or other scientific associations, however, the sublimity of the scenery of the snow-clad peak and glacier, associated as these are with the softer beauty of lake and valley, constitute of themselves a rich and all-sufficient recompense for the healthful labour and enticing peril of the ascent; and crowds of Anglo-Saxon tourists, many of them doubtless excited to the task by the graphic narratives of recent writers, such as those of the Alpine Club, and of that incomparable popular yarn-spinner poor Albert Smith, are now scrambling up the "peaks, passes, and glaciers" of Switzerland.

**Miscellaneous.**

**DECAY OF BUILDING MATERIALS.**—At the Royal Institution last week Professor Aunsted delivered a lecture on "The Decay and Preservation of Building Materials."

**PILGRIMAGE TO NEWSTEAD ABBEY.**—Under this title the *Nottinghamshire Guardian* contains a pleasantly-written account of Newstead Abbey and the associations it awakens. The estate is to be sold on the 13th of this month.

**CRYSTAL PALACE.**—The annual meeting of the children of the charity schools of the metropolis, which has so long been annually held in St. Paul's Cathedral, will this year be discontinued; but it is announced that a more than ordinarily great gathering of the children will take place in the Crystal Palace on Wednesday next, June 6, preparations for which have been in active progress for some time past.

**THE SOCIETY OF ARTS.**—The second convocation of the Society of Arts took place on Saturday evening last at the Brompton Museum. The company was received at the entrance to the Educational Department of the Museum by Sir Thomas Phillips, chairman, and the various members of the council of the society. All the departments of the museum were open on the occasion. The band of the Coldstream Guards performed a selection of music. There were 2,500 persons present, and the arrangements seemed to give satisfaction to all.

**CAMBRIDGE ARCHITECTURAL CONGRESS.**—The arrangements for the week, under the presidency of Mr. Beresford Hope, were promising. On Monday, Mr. E. A. Freeman was to meet a party at Waltham Abbey, *en route* to Cambridge, and to explain to them the various points of interest connected with the recent restoration. In the evening, at Cambridge, the president was to deliver an opening address; and a lecture was to be given by the Rev. Professor Willis, on "The Architectural History of the University." On Tuesday, an excursion to Ely, with a lecture on the Cathedral, and a *conversazione* in the Town Hall, Cambridge, when Mr. Le Strange was to read a paper on "The Application of Colour to Architecture." Wednesday was appropriated to the various objects of interest in the town. In the evening there was to be a lecture, by the president, on "The English Cathedral of the Nineteenth Century;" and Thursday was set apart for Bury Saint Edmund's.

**RENAISSANCE ART IN "SOUTH KENSINGTON MUSEUM."**—Some interesting works of the period of the revival of art have been opened to view, we can scarcely say set up, in the Museum, and an account of them, by Mr. C. J. Robinson, has been printed. We are forced by the pressure on our columns to postpone notice of them.

**THE GALLERY OF ILLUSTRATIONS, REGENT STREET.**—Mr. and Mrs. Germain Reed have made some agreeable additions to their excellent entertainment. Both highly accomplished in their arts, and refined in their own tastes and feelings, the most fastidious may go to them with the certainty of being pleased. They stand quite alone, and thoroughly deserve what they are obtaining, the warm support of the public.

**SOCIETY FOR THE ENCOURAGEMENT OF THE FINE ARTS.**—The fourth *conversazione* of the season was held (by permission of the Earl of Ellesmere) in the Bridgewater Gallery, on Friday evening, the 25th of May, and was very fully attended. Mr. H. Ottley read a paper on the Italian and Dutch Schools, with reference to the Bridgewater Collection; and there was afterwards a concert of vocal and instrumental music, under the direction of M. Benedict. Madame Cillag, Madame Jenny Meyer, and Herr Steger were amongst the executants. The gallery is scarcely sufficiently lighted for such meetings.

**THE 1862 EXHIBITION.**—The guarantee fund now amounts to 291,900*l.*, and a committee has been formed to increase it still further. The 1851 Commissioners have not yet replied to the application of the Council of the Society of Arts for a portion of the land at Kensington, purchased out of the surplus fund of the last Exhibition, in order that it may be secured for the next and future International Exhibitions. The Council will deem it necessary to apply for a Royal Commission, so that the managers may be in a proper position to correspond direct with foreign countries.

**ROME IN LEICESTER-SQUARE.**—The View of Rome, at the Panorama in Leicester-square, painted by Mr. Burford and Mr. Henry C. Selous, from sketches made by the former, is one of the best we have seen for some time. Apart from the undying interest belonging to the subject, it is beautifully painted, and gives a very truthful and striking picture of the lone mother of many nations. The effect of distance looking towards the Lago di Albano, and Monte Saveli, is charmingly conveyed. The panorama is taken from the Campidoglio, or tower of the capital, and embraces all the prominent objects in both the ancient and the modern portions.

**ROYAL ITALIAN OPERA, COVENT-GARDEN.**—"*Il Barbiere di Siviglia*" never went more charmingly than it did on Monday night last. Madame Carvalho is an admirable *Rosina*, while Mario's *Almaviva* and Ronconi's *Figaro* are unapproachable. Who shall estimate the amount of gratitude due to a composer who gives the world a set of heart-filling melodies such as are here, for its delight and elevation? Mr. Gye is redeeming his promises one by one. On Wednesday the first of the morning concerts was given in the New Floral Hall, nearly the whole of the chief artists assisting. The duet from "Semiramide" by Grisi and Didée, and the serenata from "Don Pasquale" by Mario, were encored. Amongst the other successes, we should name Madame Carvalho's "Carnivale di Venezia," and Grisi's aria from "Puritani," "Qui la voce." "The Huguenots" is announced for Tuesday next, with Grisi, Carvalho, Didée, Faure, and Mario in the principal parts; and it may be anticipated, with such a *Fides* in the house as Madame Cillag, that the "Propheète" will follow before long.

**TO ASCERTAIN WEIGHT OF LEAD.**—SIR: Can one of your correspondents inform me whether there is any kind of instrument for the purpose of ascertaining the weight of lead, glass, and other similar articles used in the building trades, without putting them to the test of scales and weights, when a doubt may arise as to the accuracy of the weight, size, or thickness of such articles when being used. Such an instrument would be exceedingly useful to the profession and their representatives, when inspecting works, especially in the country, where the means are not always at hand for putting such materials to the ordinary test when required. Such an instrument, if made sufficiently portable to be carried in the pocket, would be a ready means of settling disputes of this kind, which are not unfrequent.

**ONE OF THE PROFESSION.**  
\* \* \* We do not know of such an instrument. The weight of lead may be ascertained nearly from its thickness.

THE GUESTEN HALL, WORCESTER.—Edeu- vours are being made to ensure the preservation of this ancient hall, with its interesting wooden roof. It is to be hoped they will be successful.

STRIKE OF THE RAINFORD PIPEMAKERS.—This body of men have struck for an advance of wages in consequence of the briskness of their trade. Hitherto, they have been paid at the rate of 8d. per gross, and they now ask 9d.

LUBRICATING COMPOUND.—Mr. C. Collins, Lower-road, Islington, provisionally specified an invention for a lubricating compound made of tallow, vegetable wax, soap, lead, and bone-black or animal charcoal.

PRESERVATION OF STONE.—When the Caen stone statue of Captain Coram was put up in front of the Foundling Hospital, we mentioned that a stone-preserving process had been tried upon it (known as Daines's, if we remember rightly), and said it should be watched as an experiment. We owe it to our readers to say that it failed entirely: parts of the figure, indeed, dropped off. Afterwards another process was tried, without effect, and more recently the statue has been repaired and thoroughly painted.

DONCASTER RAGGED SCHOOLS.—A design for the new school building proposed to be erected in Factory-lane has been prepared by Messrs. Blundell & Arnold, of this town, architects and engineers. The entire cost of site and buildings may be estimated, says the Doncaster Chronicle, at least at 700. Messrs. Blundell & Arnold have placed these plans at the disposal of the committee without charge, and offered to undertake the superintendence on the same terms. An appeal will be made to the Town Council for assistance.

TIMBER LANDS OF VICTORIA.—The timber lands of Victoria lie in the valley of the Gull River. The timber hitherto cut upon this stream has been wholly in the section below the Fenelon Falls. Some of this has been manufactured into square timber, and in that shape has reached the Quebec and other markets. A portion also was put into saw logs, and converted into boards. Twenty per cent. more can be made of the raw material in board timber than in square, which, added to 20 per cent. made out of square timber curls, give 40 per cent. in favour of board timber over square timber. It has remained, however, for this past winter to see the lumbermen above the falls, and we now learn that by the end of the present season not less than from 1,000,000 to 1,200,000 cubic feet of square and board timber will be sent to market from this new and prolific region.—Quebec Chronicle.

RIDGE TREESTLE.—Among patents recently specified by Mr. Henry, patent agent, Fleet-street, is one taken by Mr. Wilkins, builder, Banbury, for a "ridge trestle," or apparatus to be employed on ridges of buildings for supporting persons and planking. This ingenious apparatus consists of a pair of wood bars hinged together at top, and having hinged to them at their junction a pair of beams, and at their lower ends a pair of supporting bars. The apparatus is set up by opening out the first-named bars at an angle corresponding to the pitch of the ridge, extending the beams horizontally, and resting their outer ends on the supporting bars, which are provided with a step arrangement to adjust the level of the horizontal beams to the pitch of the ridge, and are kept in position by stays and recesses on the ends of the beams. When so set up, a person may stand thereon, or two such trestles may be set on the ridge and putlogs for scaffold planking laid across. When not in use the whole folds up into a portable shape, to be carried about from place to place.

FEMALE SCHOOL OF ART AND DESIGN.—The movement for raising a fund to build premises for this school is making progress, aided as it is by all the old supporters of the school, and by other friends of art education. The pupils themselves, the teachers, and the ladies visitors, are using their most active exertions to carry out, not only as an attractive *flou*, but as a means of accomplishing their object, the *conversations* which is to be held on the 21st inst. at the South Kensington Museum. The collection of ancient and modern jewellery, to be contributed by the Council of the Fine Arts Club, will be believed to be exceedingly interesting; and, to say nothing of other treasures which will be collected for the occasion, the "Mountain of Light,"—the world-famed "Koh-i-noor," will, by the gracious permission of her Majesty, dazzle the eyes of her subjects there assembled with the increased brilliancy which it has acquired since it has been recut. We find, by a paper lately issued, that up to the 17th inst. the subscriptions had amounted to 493. 12s.; but as an expenditure of at least 2,000. is contemplated, there is yet much to be done.

PAINTERS' HALL, QUEENHITHE.—The exhibition of works of decorative art arranged by the Painters' Company is open. We shall have something to say of it next week.

BLENHEIM PALACE.—This structure has lately been undergoing considerable alteration, with various additions, to bring it more in accordance with modern notions of domestic comfort. The noble owner has just employed Messrs. Price & Co., of Westminster, to warm the halls, corridors, and passages by hot water pipes, which are distributed in a series of coils, and made to assume certain forms suitable to the building, and intended to harmonize with the general character of the interior. Some of these coils of pipes are in the shape of ornamental columns: others are placed in recesses concealed by ornamental tables.

DECAY OF THE OAK.—We had occasion lately to draw attention to the decay of the lurch in this country. It now appears that the oak itself is in danger, and it is said that unless Government immediately issues a commission for investigating the cause of the decay of oak trees by the nut-gall insects, and suggesting a remedy, there will not, in the course of a few years, be a single oak left. The same state of things exists in America, and as yet without a remedy.

FATAL ACCIDENT AT THE NEW SEWER, DEVONSHIRE-STREET, BISHOPSGATE.—A few days since, workmen in the employ of Messrs. Ashby & Sons, builders, Bishopsgate-street, were ordered to commence the preliminary business of shoring up the properties in the neighbourhood, and, whilst engaged in this duty, two of the men were fixing shores at a considerable height, when the ladder broke with one of them, and precipitated him to the pavement, and the other man, as if shocked by the fall of his mate, instantly fell from the beam on which he was standing on to the pavement also. Both were removed to St. Bartholomew's Hospital, in an insensible state: one of them shortly after expired, and but slight hopes were entertained of the recovery of the other.

METAL TRADES' PENSION SOCIETY.—The seventeenth anniversary of this Society was celebrated at the London Tavern, on Tuesday week, when about 100 of the most influential persons connected with the metal trades were present. The chair was occupied by Mr. Alderman Mechi, the vice-chair by Mr. Lloyd, mayor of Birmingham. The chairman, in proposing the toast of the evening, said he was glad to see that the society had 67 pensioners,—27 men, and 40 women, and that the contributions last year amounted to 1,352. That was very creditable as a beginning; but seeing that coal and iron were, so to speak, the backbone of the nation, he did not think that 1,352. per annum represented, in its full power, the metal trades of the country. The total amount subscribed during the evening was 671s., the Birmingham deputation having subscribed 80s.

METROPOLITAN BOARD OF WORKS.—At the usual ordinary weekly meeting last week, the Board proceeded to receive tenders for the construction of the Ranelagh overflow sewer Hyde-park. The following tenders were received:—Hemming, 35,800s.; Newton, 29,690s.; Moxon, 27,600s.; Dethick, 23,800s.; R. Robinson, 24,963s.; W. Hill, 25,926s.; Battersby, 26,500s.; Thirst, 24,927s.; Lavis, 26,317s.; Rowe, 29,689s.; Bird, 26,779s.; Hare, 30,765s.; Tredwell, 35,435s. The tender of Mr. Dethick, as an old contractor to the Board, was unanimously accepted, subject to the usual inquiries as to securities. A report was received from the Street Improvement Committee submitting a specification for the formation of a subway along the Covent-garden approach, by the construction of arches and vaults, for the laying down of pipes for gas, water, &c., to render unnecessary the frequent breaking up of the streets for these purposes. This proposition led to a long discussion, but ultimately the report of the committee was adopted by a majority of 20 to 6.

TENDERS

For improvements to remainder of Newgate; Mr. J. B. Bunning, architect to the corporation:—  
Jury (eight months) ..... £10,720 0 0  
Myers ..... 10,120 0 0  
Walker & Neave (nine months) 10,094 0 0  
Perry & Co. .... 9,793 0 0  
Mansfield & Son ..... 9,775 0 0  
Holland & Hannen ..... 9,614 0 0  
Little (eight months) ..... 9,524 0 0  
Piper & Sons (ten months).... 9,497 0 0  
Axford & Co. (ten months).... 9,482 0 0  
Gammon & Co. .... 9,465 0 0  
Ashby & Horner ..... 9,357 0 0  
Brown & Robinson (nine months) 9,230 0 0  
Haydon, for heating, ..... 532 10 0

For the erection of an Hotel, in the Victoria-road, Aldershot, for Rhomas Tautou; Mr. Frederick Eggar, architect:—  
Smith ..... £1,470 0 0

For the erection of Residence, Offices, and Farm Buildings, at Moulton-park, Northampton, for Mr. G. M. W. Peacock, M.P. Mr. Frederick Eggar, architect, Farmstead and Albany:—  
Ireson, Northampton ..... £1,613 0 0  
Watkin, Northampton ..... 4,350 0 0  
Boddington, Wellingborough ..... 4,137 0 0

For alterations at the National Scotch Church, Regent-square; Mr. J. Gibson, architect:—  
Church. Lecture Hall.  
Wardle & Baker ..... £4,100 ..... £1,150  
Holland & Hannan ..... 3,840 ..... 1,010  
Piper ..... 3,755 ..... 1,180  
Clarke ..... 3,750 ..... 1,225  
Jackson & Shaw ..... 3,665 ..... 1,165  
Patman & Co. .... 3,653 ..... 1,140  
J. & W. Sanders ..... 3,590 ..... 1,090  
Lucas, Brothers ..... 3,440 ..... 1,033  
Mansfield & Son, ..... 3,340 ..... 1,033  
Lawrence ..... 3,290 ..... 900

For works to be done in pulling down and rebuilding Premises, No. 9 and 10, Adde-street, City, for Mr. A. Shore; Messrs. Tiltott & Chamberlain, architects. Quantities supplied:—  
Fish ..... £1,613 0 0  
Rider ..... 1,502 0 0  
Browne & Robinson ..... 1,458 0 0  
W. Hill ..... 1,373 0 0  
Pritchard & Son ..... 1,266 0 0  
Cannon (accepted) ..... 1,150 0 0

For alterations at 87, Hatton-garden, for C. Meeking & Co. Architects; Mr. C. Shopper, architect. Quantities supplied by Mr. Williams:—  
Battam & Craske ..... £1,569 0 0  
Searave & Blonfield ..... 1,425 0 0  
G. Mansfield & Son ..... 1,410 0 0  
Wagstaff & Son ..... 1,390 0 0  
Clarke & Co. .... 1,333 0 0

For Villa Residence, for Mr. Thomas Ford, Hailes; Mr. Robert Schriener, architect:—  
Mathews ..... £665 10 8  
Hammerley ..... 615 0 0  
Jones ..... 629 0 0  
Staford (accepted) ..... 600 0 0

For alterations to the premises, No. 108, Prand-street, Paddington, for Mr. J. C. Wood; Mr. Ridley, architect:—  
Wardle & Baker ..... £700 0 0  
King & Son ..... 595 0 0  
Jackson & Shaw ..... 575 0 0  
Bowley, Brothers ..... 525 0 0  
Greig, Brothers ..... 522 10 0

For the erection of a Detached Villa, for Mr. T. Confield, Buckhurst hill, Essex; Mr. J. H. Rowley, architect:—  
Rivet ..... £1,033 0 0  
Cordery ..... 670 0 0  
Goodman ..... 619 0 0  
Humphreys ..... 620 0 0  
Sewell ..... 604 0 0

For new Rail Fence, at the Marine Parade, Dover. The contractor to take the old fence; supposed to be about two tons:—  
Allowed for Old Nails, s. d.  
Ismay & Co. .... £246 0 0 ..... 6 per cwt.  
Probble ..... 169 0 0 ..... 5 0  
J. & J. Joyce ..... 151 10 0 ..... 5 6  
Wright & Thomas ..... 119 0 0 ..... 4 0  
Reed ..... 118 14 0 ..... 2 0  
\* Accepted.

For new North Aisle, &c., to the Parish Church of Weston-on-Trent, near Stafford; Mr. G. G. Scott, architect:—  
Espley ..... £467 0 0  
Ratcliffe ..... 415 0 0  
Espley ..... 413 0 0  
Emery ..... 398 17 0  
Lilly ..... 383 10 0

For the Croydon Cemetery Works; Mr. E. C. Robins, architect:—

	Chapels.	Lodge.	Drain.	Total.
	£.	£.	£.	£.
Downes	2,433	511	1,253	4,197
Batterbury	2,191	489	1,319	4,199
Kent	2,350	489	1,314	4,153
Jackson & Shaw	2,180	523	1,330	4,033
Ebbutt	2,200	460	1,327	3,987
Beavers	2,195	523	1,262	3,980
King, Barton, & Hipwell	2,460	470	1,180	3,970
McLellan & Birt	1,940	439	1,223	3,583
Pickard	1,777	425	784	2,987
Boss	2,150	460	...	...

\* Accepted.

For the Ironwork in Gates and Railings, for the Croydon Cemetery:—  
Hill & Smith ..... £865 10 0  
Randall ..... 800 0 0  
White ..... 740 10 0  
Ford & Son ..... 615 0 0  
Hood & Son ..... 598 0 0  
Jordan ..... 573 0 0  
Lainworthy & Reed (accepted).... 540 0 0

ST. MATTHEW, BETHNAL GREEN.  
Sir,—For the restoration of this church, tenders were invited, but as those tenders were not approved, certain changes were directed, and the committee determined to advertise. The existing cause of this communication is to assure intending competitors that the list of tenders forwarded to you, evidently with a purpose, has been without my sanction.—I am, Sir, &c.  
THOMAS EDWARD KNIGHTLEY.

# The Builder.

VOL. XVIII.—No. 903.

The Exhibition in Painters' Hall, and the Painters' Company.

THE Exhibition of the Specimens of "Decorative Works of Art," at Painters' Hall, Little Trinity-lane, Queenhithe, briefly mentioned in our last, and which will remain open till the 21st inst. deserves a recognition as an effort by one of the City Companies,—one

that has other claims, than those which are obvious, on the attention of our readers,—to confer advantage on a calling with which the name of the company is associated. Whilst we have no desire, were it possible, to see revived many of the ancient privileges, it is obvious that some of the Companies might effect much more than they at present attempt for the improvement of the crafts with which they are supposed identified, as well as for the advancement of art,—if not also for the cultivation of an understanding between master and workmen, based on the ground of common interest. Of the companies concerning which we might be particularly interested, there are of "the twelve," the Goldsmiths' and the Ironmongers'; and of the others, taking them in order of precedence, the Armourers' and Braziers', the Carpenters', the Painters', the Masons', the Plumbers', the Founders', the Bricklayers', the Blacksmiths', the Joiners', the Plasterers', the Stationers', the Broderers' or Embroiderers', the Upholders' or Upholders', the Turners', the Glaziers', the Paviers', the Shipwrights', the Clockmakers', the Gardeners', the Tinplate Workers', the Glass-sellers', and the Wire-Drawers',—the Painters' at present ranking twenty-eighth of the Companies. Some of the Companies retain important privileges, like the Goldsmiths'; but, generally they, or their ruling bodies, are little more than trustees for charities or chartered festivals; and the liverymen and commonalty being persons entitled to participate in these charities, and to partake of the dinners, and who are qualified for office, or to vote. In this light only, says the report of one of the commissions on affairs of the City and the Corporation, are the different Companies to be viewed.

The position and power of the Companies during the Middle Ages, was very different, as may be seen on reference to "Herbert's History of the Twelve Great Companies," and to Jupp's work on the history of the Carpenters' Company, noticed in our pages at the time of its publication. The evidence of a certain influence which they had in art, remains in descriptions of the City pageants, in some of the paintings out of a number little known which there are in the halls, in their furniture and plate, and in the embroidered funeral palls of several of them. Some of these art-works, like the picture by Holbein, at Barber Surgeons' Hall, are well known; but there are many others, and amongst the latter may be named the works belonging to the Painters' Company, amongst which are the silver cup, shown at the Manchester Exhibition, which was presented

to the Company by Camden, and a portion of a collection of paintings, extending to about fifty altogether, of various orders of merit.

Though the Painters' Company now represents, chiefly or nominally, the trade of house-painting or "decorator's" work, its origin appears to have been in a somewhat higher calling. As late as the seventeenth century, Verrio and Sir Godfrey Kneller belonged to it; and later, the company had the accession of the great name of Sir Joshua Reynolds. In the present livery, with many names unconnected with building, are included those in some way connected with decorative art, of Sir S. M. Peto, Bart., and Messrs. G. J. Morant, G. F. Trollope, J. D. Crace, and others. Like many of the other Companies we have named, that of the painters, however, is very deficient in funds, whether for entertainments, or for any object such as that at present more immediately coming under our notice.

Some particulars of the history of the association here may not be uninteresting or out of place. The "Painters', otherwise Painter-stainers' Company," had its origin in a fraternity of artists formed in the reign of Edward III., and styled a company, though not then incorporated. They called themselves Painter-stainers, from their chief employment, which, in the words of Pennant, was "the staining or painting of glass, illuminating missals, or painting of portatif or other altars, and now and then a portrait; witness that of Richard II., and the portraits of the great John Talbot and his wife, preserved at Castle Ashby." In the year 1575, continues Pennant, "they found that plasterers, and all sorts of unskilful persons, intermeddled in their business, and brought their art into disrepute by the hadness and slightness of their work." They, therefore, determined "to keep their mystery pure from all pretenders," and were incorporated in 1576. The date of incorporation is given 1582 by others, as Maitland, though 1580 by Strype. The company was called that "of the Art and Mystery of Painting called Painter-Stainers within the City of London." The author of "A New View of London" (1708), who gives the date of incorporation 1580, speaks of the company as "composed of Face Painters, History Painters, Arms Painters, and House Painters;" and of the panels of the wainscot and ceiling of their hall, as "inbelleished with great variety of History and other Painture exquisitely performed," &c.

John Stow, writing before the Great Fire of London, identifies them on their present site of habitation, or in 1598, saying,—“In Trinity-lane, on the west side thereof, is the Painter-stainers' Hall, for so, of old time, were they called, but now that workmanship of staining is departed out of use in England.”\*

In Strype's edition of Stow, there is an interesting account of the circumstances of the incorporation. The story runs:—

“But now, about the time before said [that of Queen Elizabeth], their Trade began to go to decay, by reason of other Persons that had not been apprentices to it, who undertook Painting; as Plasterers and others, intermeddling in the same Science; And the Painters, having no Power to restrain them by virtue of any Corporation, to the great Slander of the Art and Science, and the utter Decay and Ruine of all such as would endeavour themselves to be good Workmen in the same. Much slight work went off; as Pictures of the Queen and other Noblemen and others; and all other manner of Works, which showed fair to sight: And the people bought the same, being much deceived; for that such Pictures and Works were not substantially wrought: A Slander to the whole Company of Painters, and a great decay of Workmanship in the said Science; and also a great Discouragement to divers forward Young Men, very desirous to travel for knowledge in the same.”

Of this state of things, not much unlike what exists now, the painters, according to Strype, made complaint from time to time to the Lord Mayor, but could never get redress, the reason given to them, on the part of the City authority, being the want of "judgment or skill in that science," to distinguish the

bad from the good. Therefore it was that the painters addressed the Queen, desiring to be incorporated, and have privileges, amongst which were "to restrain, that none be suffered to use that Trade but such as have been, or shall be, Apprentices to some of that Mystery seven years; to have Authority to enter into any Shops, Warehouses, or Workhouses of Men exercising that Mystery, and to search, examine, and survey their Works, Paintings, Colours, or other Stuff," &c. This was granted. One George Gower was the Queen's Serjeant Painter; and he had authority "to take up and provide for the Queen," "for the only provision of ber service, all Colour, Oil, Varnish, Workmen, and Labourers, as well Free as Foreign," and barges, carriages, and other things necessary for conveyance, at reasonable payments. The oath taken by freemen still enjoins the keeping "well and faithfully," "the secrets of the same Mystery and Science," and that these shall not be taught except to an apprentice, or one who has been an apprentice for seven years. In the first year of the reign of James I. it was, with other stipulations, again enacted that,—

“\* \* \* no Plasterer shall exercise the art of a Painter in the City or suburbs of London, or lay any colour, or painting whatsoever, unless he be a servant or apprentice to a painter, or have served seven years' apprenticeship to that trade, under the penalty of five Pounds.”

Yet "plasterers" might use whitening, "blackening," red ochre, &c. mingled with size only, and not with oil, without any fine. Eventually many painters settled in Westminster, and these had little intercourse with one another. We find, however, that the Painters are specially referred to in an Act of the Common Council (15th November, 1667) after the Great Fire, which, as we learn from Mr. Jupp, besides regulations applicable to the City and to the Twelve Companies, required the Carpenters, Bricklayers, Plasterers, Painters, Masons, Smiths, Plumbers, and Paviers, each to elect yearly two master workmen, four journeymen, eight apprentices, and sixteen labourers, to be ready on all occasions of fire to attend the Lord Mayor and Sheriffs. We have not been able to obtain any account of the original building which was destroyed in the Fire; and, perhaps, there is none, beyond the slight reference of Stow.

The persons relieved by the Company in 1859 were 221 in number, and amongst the charities is Mr. John Stock's "Charity for Poor Lame Painters, more or less incapacitated from illness arising from the injurious effects of Painters' colours, who receive pensions of 10l. per annum." May we suggest to the Company that as in other cases, which are analogous, much more may be done by the principle of prevention than that of cure? The "illness" of working painters (some who are members of the Company will, perhaps, bear us out) is greatly caused by the want of cleanly habits; and, considering there are even grounds for an opinion which has been entertained, that all charities, so called, do harm, it might be a good expenditure of the funds to appropriate something to the publication and diffusion of information on means of prevention, amongst the class in question; in short, this is one of those lines of action which we should be glad to see pursued by the Companies generally. The other charities of the Painters are chiefly to the blind.

Besides the work in connection with the charities and the duties which they are just now, so very creditably, imposing upon themselves, the Worshipful Company of Painters issue a list of prices which their practical men consider a standard for work of the most durable nature, and executed in the best style. It was last established by the Master, Wardens, and Court of Assistants, at a Court held in May, 1851. It includes fifteen to twenty per cent. profit, and is considered to be still applicable. The rates in it are high, as compared with those of other lists, or very high as compared with what work is done for, especially the prices for work in common colours. There is no sort of work in which there is greater difference of price and greater deception, than painter's work. If the Company could manage to alter

\* Edit. Thoms, 1842.

the practices in the trade, so far as to insure more generally the acquirement of the article paid for,—which they will perhaps tell us, they can hardly do, until they are able to raise the standard of *morality* in the one trade, or generally,—great good would be effected; and their prices would be low in comparison with others which are the half of theirs,—for, positively, such prices, the half, are somewhere about what is occasionally charged and paid for.

There is little in the building internally, any more than externally, that should detain us from the works which it now contains—those belonging to the Company, or those just now more prominently exhibited. The Hall, Court Room, Clerk's Office, Painted Chamber, and staircase, are pretty thickly furnished with the permanently-disposed works—nearly all works of painting. These pictures are mostly let into panels, as mentioned by the writer already quoted, who also speaks of a “handsome screen, arches, pillars, and pilasters of the Corinthian order, painted in imitation of porphyry, with gilded capitals:” these, however, did not make any great impression upon us. Most of the pictures are temporarily concealed by the specimens which are exhibited; but amongst those which can be examined, in the Hall, is a small picture, of great merit, painted on copper, “A Magdalen,” by Sebastian Franks: there is also in this Hall, the picture of the Fire of London, by Waggoner, engraved in Pennant's History of London and elsewhere; and also in the collection there are, by Catton, R.A., “Reason governing Strength,” painted in 1761, and presented by the artist, who was a member of the Company; architectural compositions by Trivett, or Trevit, who was Master in 1713; and some works of Hondius, Hogarth (figures in a landscape, by Lambert), Baptist, Sebastian Ricci, Smirke, R.A., Houseman, Sir Godfrey Kneller, Huis, and others: but of scarcely any of these should we be able to give particulars. Some works named by the old writers are now not to be found. There is a portrait of Camden in the Hall, from which an enamel was copied by the late H. Bone, R.A., for his Elizabeth Gallery. A card of invitation to “accompany the Society of Painters, at St. Luke's Feast, kept on Thursday, ye 24th November, 1687, at 12 of the clock, in Paynter Stayners' Hall, where you shall be entertained by us,” and signed “Anthony Verrio, Nicholas Shepherd, Godfrey Kneller,” and “Ed. Polehampton, Stewards,” was designed by Sir Godfrey Kneller; and of this, an engraving is in the hall—presented by the Clerk of the Company, Mr. P. N. Tomlins, to whom much is due of the success so far, of the movement in the present exhibition. Mr. John Sewell is the Master of the Company, this year. There are no corporate funds applicable to festivals; but the members of the court club together for a dinner on such an anniversary as that of the patron Saint, or St. Luke's day. The old master then drinks to the one newly elected, out of the Camden Cup. This cup was originally valued at 16*l.*; and it is inscribed,—“Guil. Camdenus Clarenieux, Filius Saupsonis Pictoris Londinensis dono dedit.”

The exhibition now open, comprises about 180 specimens, by 35 bards; and it includes some works of arabesque and Medieval ecclesiastical decoration, many imitations of marble and inlaid work, of graining, and writing, and also specimens of “enamelling,” as on deal. The work is executed on different materials, as wood, canvas, paper, slate, and glass. Four prizes were awarded by the judges, who were five in number—three belonging to the company, and two to the general trade. The prizes consist each of a certificate of merit and the freedom of the Company; but the chief advantage derived by producers of the works, will be one in which all the exhibitors are allowed to participate, namely, that from the publication of the names and addresses in the catalogue. The judges in awarding the prizes, we believe, felt that more than four could have been claimed on the score of merit; and their awards do not represent the entire merit belonging to the same name, in such cases as where one person had

contributed work both of graining and marbling. It had been decided that only one first-class certificate could be awarded to an “artist.” The classification was made into decoration, marbling, writing, and graining; and the awards were in favour of Mr. J. Simkin for a specimen of decoration in arabesque, to Mr. J. McDouall for inlaid marbling, to Mr. J. Edmett for writing on plate-glass, and to Mr. T. Kershaw for ornamental inlaid graining, as given,—though there were works amongst the thirteen produced by this last-named bard as remarkable, as imitations of marbling, and others, such as flower-paintings, as works of decoration. The works of the first-named class, or *decoration* so called, are mostly very inferior to what can be produced, or for instance to much of what was shown at the Exhibition at the St. James's Bazaar in 1844, preliminary to the decoration of the Westminster Palace. The deficiency observable is in the element of invention, as well as that of drawing.

It will be seen that for a matured judgment on the exhibition generally, as well as the direction taken in the movement, we should have to discuss the whole of the question heretofore so much debated, of the propriety of using painted imitations of wood and marble. But such imitations,—whether or not they are to be tabooed and interdicted as “slams”—that is, whether they are to be condemned the more, as according to one person, the more they are successful as imitations; or whether, as according to other persons, they are to be condemned only when placed in situations where we should not expect to find the original materials,—are clearly not works entitling the producer to the designation *artist* in the sense which may be understood by the use of the term in some parts of the printed list of specimens, or the notices to the exhibitors. We have, ere this, taken great pains to inculcate right views of what is, and what is not, *art*. There is considerable difficulty in finding an appropriate term; but that difficulty will not excuse the misuse of one, and use which, as in this case, perpetrates the misconception and deficiency of that which is most desired,—*art* real, or the thing itself.

Supposing that a need of some variation of effect in surface be held to justify the imitations, graining and marbling, as according to one argument that has been put forth,—that would not therefore justify the substitution of an imitation for *inlaid* work. But in all these cases, the imitation, as shown by specimens at Painters' Hall, is perfect: there is much reason, however, before deciding in favour of any imitation, to take into consideration the appearance after wear. Should other than painted imitations be more advantageous in this latter point of view, it would be decidedly well, on all grounds, to divert the attention of house-painters from the branch of their pursuit which has been most followed by the “practical artists” of the “decorative works of art” as they are called, to be found at Painters' Hall, and to direct them to true art-work and to the perfection of the ordinary manipulation of painting. It deserves consideration and experiment whether the whole aesthetic result supposed to accrue from marbling and graining might not be produced by diaper, and other surface ornament “on the flat,” which could be executed by stencilling. In more important works, the panels, of course, would be treated pictorially. At the Architectural Exhibition, last year, there were two doors which showed what might be done. The prejudice on the part of the public in favour of graining is probably due chiefly to there not having been of late years anything better—designed by artists, or executed by practical painters.

We do not here attempt to decide the question; the “art,” however, as it is called, of graining and marbling requires no encouragement,—works, such as there are at Painters' Hall, being perfect in their way; but there are other departments of the painter's craft which require considerable improvement. We have already spoken of the difficulty that there is about the execution of durable work and about price. There is, we say, much greater difficulty in getting well executed, other descriptions of

decorative work than marbling and graining. Such other work may be divided into two kinds,—that which like arabesque decoration may require that the workman should be indeed an artist to some extent, and that which like diaper and stencilled work, is more distinctively the enlargement of another person's—an artist's—design, and which, as requiring only a steady hand, and a knowledge of pigments and the mixing of colours, should be within the scope of ability of every workman. There is, however, almost as much difficulty in procuring a workman who can draw an even line with the fitch, as there is in getting a good artist-decorator.

Therefore, whilst the Painters' Company are paying attention to the improvement of work generally, they will do well not to confine themselves to awarding prizes to the best imitations, or to works of arabesque decoration; but will seek both to elevate the trade, and to improve the manipulatory skill of ordinary workmen, whereby they will, besides other results, conduce to the result from the introduction of true art, decorative, into all kinds of buildings.

Leaving the questions which are here involved, for the consideration of the Painters' Company, between this year and next,—expressing, however, our conviction that they can do much good,—we may specify as amongst the best of the works not already named, those of inlaid graining, by Mr. C. Smith and Mr. W. Glover; of enamelling on deal, by Mr. E. G. Sinton; of marbling on slate, by Mr. C. Dainton, and marbling on glass, by Mr. B. W. Maughan; of inlaid marbling and gilding on glass (with a photograph in the centre of each specimen), by Mr. J. H. Dearsley; and of graining and marbling, by Mr. T. Newby; and those of church decoration (with a good lettering in several cases), as by Messrs. A. O. P. Harrison, W. Pitman, and T. L. Coulton,—the last of whom, however, has failed in the drawing of the figure. An ornamental glass door is exhibited by Mr. J. Price: it is not altogether satisfactory in design, but is suggestive; and the latter observation may be applied to some specimens which there are in the exhibition, of natural leaves placed under glass.

There is reason to believe that several of the producers of the works have toiled hard to be successful; and it will be doubtless satisfactory to the Company and to the more energetic promoters of the exhibition, should, in those cases, as in the general furtherance of the craft, and the improvement of the “art and mystery of painting,” the efforts on both sides attain the results desired. We have witnessed the inauguration of the movement with much pleasure, and we look forward to the continuance of it which is proposed for subsequent years, and to the consummation or extension of it which we have suggested, hopefully as well as expectingly. Could not other companies whose names we have identified as connected in some manner with architecture or building, take similar steps? We are certain that benefit might be found in “arts and mysteries” the chief of those referred to, which some old builders (claiming to understand their business, rather than to be only capitalists and contractors) say are not the crafts they were, and which certainly do not progress as they might; whilst the relations of masters and workmen, now imperilled, would probably be drawn closer by the same means.

#### CAMBRIDGE ARCHITECTURAL CONGRESS.

The programme we gave was followed out, and some interesting papers were read, which, but for the number of such papers at this moment, we should willingly print. We must content ourselves with two or three references, referring those who wish a fuller account to the local *Press* and *Chronicle*.

At Waltham, Mr. Edward Freeman, in his discourse, said, he found historical evidence that the nave was consecrated in 1060: from that he was of opinion, judging from the details of the architecture, that it was the work of the Saxon King Harold: it was right, however, to say that Professor Willis thinks it is later work. In “De Inventione,” which was written before 1175, there

Priapus. In Seneca, ep. 57, and in a passage in Suetonius (Caligula, 57), the word "crypta" clearly means a subterranean tunnel or passage. Vitruvius uses the word but once (lib. vi. 8), and that in the list of offices necessary to a country-house, viz.—"Stables and sheds in the vestibules (or outer courts), and crypts, 'cryptæ,' granaries (horrea), and apothecæ (storage places, particularly for wines—see Julius Pollux, vi. 11), and other places for preserving fruit, which should be in the houses."

An attempt has been made to show, as Varro de R. R., lib. 1, tells us the corn was often kept in pits under ground, that the "cryptæ" must necessarily be subterraneous; but, as "horrea" clearly are the granaries, the proof is defective. In fact, all we can gather from the passage in Vitruvius is that "cryptæ" were used, among other places, "ad fructus servandos."

It is therefore doubtful whether the word in classic times ever had the signification which we now give to it; still less should we confuse it with the word "crypto-porticus," a construction which resembled rather the walks of one of our cloisters than what we call a crypt, although we gather from the description of Pliny, ep. ii. 17, and from Sidonius Apollinarius, ii. 2, that these walks were sometimes partly sunk in the ground to keep them cool. The best example extant is perhaps that round the garden in the villa of Dionces, at Pompeii.

But before going directly into the history of the crypts in Christian churches, it will be well to advert to some of the Etruscan sepulchral chambers, which resemble very closely the early crypts, and by which they probably may have been suggested. Like the tombs of the Greeks, they were always below ground; in fact, where this was difficult to accomplish, from the flatness of the country, a circular apartment was built, and the earth piled over it so as to completely cover it. The Greek tomb was generally a sort of chamber to enclose the body; sometimes a mere stone coffin; sometimes very much like our own family vaults, but without the arch. The Etruscan tomb, on the contrary, was the banqueting-hall of the departed spirits. Hewn out of the solid rock, the ceiling was, nevertheless, curved to resemble the timber rafters of a chamber, the walls panelled like wainscot,—benches, arm-chairs, footstools, tables,—all hewn from the solid rock, fill the chambers; while the walls are hung with weapons and tripods; lamps and other utensils lie about; and the panels are filled with pictorial representations and stucco figures. There is, in fact, little doubt that the Etruscan subterranean chamber was a complete copy, in design, decoration, and arrangement, of an Etruscan dwelling-house. A plan and interior view of the famous tomb at Tarquinii, commonly called that of the Cardinal, is given by Canina, "Etruria Mar." pl. 81. Attention is particularly called to the plan, which, it will be seen, strongly resembles that of some of the early crypts.

It would now be a very curious and interesting inquiry as to the customs of sepulture among the ancients by burning or by burial; but it would, though bearing directly on the subject, be too wide and extensive an inquiry for the present occasion. Suffice it to say, that the customs of burning, and sometimes burying the dead, were practised by all the three nations—the Greeks, Romans, and Etruscans. A very high authority, the Canon di Iorio, who had excavated as largely as any one, says ("Sepul." p. 28) that, among the Greeks, not more than one body out of ten was burned; while, among the Romans, not more than one out of ten was buried. In fact, it appears from a passage in Homer ("Iliad," vii. 334), that burning was practised among the Greeks as a matter of convenience, for Nestor recommends that the bodies which had fallen in battle should be sought out and burned, that the remains might be more easily carried to their children when the heroes returned to Greece. Among the Romans we have the direct testimony of Pliny ("Hist. Nat.," vii. 55) that in ancient times their practice was to bury the dead, and this prevailed among the old families even till a late period, Sylla being, as he informs us, the first of the gens Cornelia whose body was burned.

At the time of the Christian era, as we shall see, the practice became almost universal; but, as Christianity became more diffused, it gradually fell into disuse, till Macrobius (Saturn. vii. cap. 7), who is supposed to have written his work about A.D. 420, tells us, in his days the practice of cremation was quite left off, and it was known to him only from reading.

But whether the one or the other of the modes were preferred by the Romans, one rule was

strictly observed. It was a law of the Twelve Tables neither to burn or bury a dead body within the city walls, a space which of course included also the "Pomerium." The words are given by Cicero in his treatise (De Legibus, l. 2), thus, "Hominem mortuum in urbe sepelire neve urito;" and this law prevailed for many centuries after the Christian era.

One great barrier which the early Christians invariably opposed to the persecutions of their heathen rulers was this,—that they scrupulously obeyed the laws of the country wherein they may have sojourned, or of the superior who governed; provided that these laws did not positively command them to do anything absolutely contrary to their faith,—the most prominent of which was the sacrificing to idols. In other respects they declared themselves the most faithful of citizens. Accordingly, we find there were no burials within the bounds of any cities, either Christian or Pagan, for several centuries after the Christian era.

The Roman antiquary will remember how he must have been struck to see the huge vestiges of tombs and monuments stretching away across the Campagna down the Flaminian, Salarian, Praenestine, and above all, the Latin and Appian Ways. For miles the memorials extend along both sides of the road leading to the city; for miles, tombs—some of gigantic, some of moderate, and some of very small proportions—line the roads leading to the refined city that once governed the whole world, and must have given a strangely impressive effect to its entrance, viz., that the introduction to the presence of the greatest among the living should have been through the silent ranks of the remains of the dead.

But the Christian feeling revolted from the practice of burning the dead; and this variation from the conventionalities of society (as it is the fashion to express ourselves in this day) gave rise to great prejudice on the part of the Pagans against the Christians at that time. Many of my hearers must have read the delightful apology of Minucius Felix, for the Christian religion. This beautiful little treatise, in manner, language, and to elegance, worthy to be compared to some of the best philosophical essays of Cicero, introduces the Christian Octavius, walking with his heathen friend, Cæcilius, at Ostia. The mighty ocean, the everlasting hills are before them, exhibiting the unlimited power of the Deity, while the occupation of a few boys, who are amusing themselves with pitching smooth pebbles into the sea, and watching them spring from wave to wave, is a fine illustration of the vanity, the nothingness of human pursuits. The friends begin to moralize, and the Pagan, after remarking with his Christian companion as to some gross charges brought against them—such as worshipping an ass's head,—an accusation, by the way, which it appears from some coins may not have been unfounded as against that strange sect, the Gnostics, who represented their deity, Abraxas, with an ass's head. After this has been refuted, Cæcilius begins to blame the Christians for some peculiarities he deems absurd. He objects that they are not content, like other people, that their dead bodies should be burnt; because they fancy, if they should be deposited in the earth instead, they are to arise again to the skies at some future time. But the Christian apologist answers him, "What care we if our bodies are dried up in the sands, or perish in the waters, or are consumed into cinders, or are dissolved into vapour—the Almighty receives the elements. Nor do we, as you believe, fear any damage to the soul from any manner of sepulture, but we follow that which we consider the older and better method, of burial in the earth." I will not pursue the eloquent and touching explanation of the Christian; it is too long for our purpose. I only quote a short part, to show how the customs of the heathens and Christians differed at that time, and how the latter adhered to the practice of inhumation.

But this was written scarcely a century after the apostolical period, and before the more organized persecutions which followed; the history of which, though deformed by ridiculous legends and exaggerations, is still a very great and affecting part of the annals of our religion.

To go into this history would be not only beside the purpose, but far too extended an inquiry for the space we have. Suffice it to say, from the exigencies of the persecution of the Christians arose two most important circumstances—the use of the basilica as a place of worship, which afterwards became the settled form of the Christian church; and the use of the catacombs, the cubicles or crypts, in which were the principal cause of the use of crypts in churches. It appears that at first the Christians interred the dead in open

fields, which were called "arenæ," and we have the testimony of Tertullian (ad Scapulam, 3), that when Hilarion was prefect, the use of these "arenæ sepulchrorum" was denied to the Christians. "Let there be no arena," was the decree. A similar expression is found in the Acts of St. Cyprian. Eusebius (vii. 10; ix. 2; vii. 12) tells us, too, that their cemeteries were taken away from the early Christians, and not restored to them till the time of Gallienus, A.D. 262.

In fact, one part of the policy of the persecutor was to deny the rites of sepulture to his victims. According to Prudentius, the body of Hippolytus was cut into little pieces, and scattered abroad. Many bodies were burnt, and the ashes given to the winds; many thrown into wells, and others into the sea. One of the most curious instances is cited by Baronius, in the Acts of the Martyr Tharacus, or Taracus. The Præses Maximus, who seems to have resembled Judge Jefferys in his violence of temper and language, burst out at the martyr—"Won't I destroy you? Yes! and, as I said before, even your remains. The little woman (mulierculus) shall not roll up your carcass in fine linen, and cover it with ointments and odours. No! I'll command you to be burnt, you scoundrel (seleste), and your ashes to be scattered to the winds."

Under these trying circumstances, one tradition tells us the Christians were compelled to flee to the crypts, or catacombs, both for the exercise of their worship and for the burial of the dead.

Another tradition, recorded by Baronius, states that the Christians, being condemned by their persecutors to labour in the mines like slaves, some of them were sent to these sand excavations, and took the opportunity to use them for the purposes before named.

Through the greater part of Italy, particularly round Rome and Naples, as most of us are aware, there are vast beds of an arenaceous substance called pozzolano. It is a very close and compact body of sand, mixed with a sort of burnt argillaceous matter in granules, very much resembling pounded brick, and is evidently of volcanic origin. It being the best possible material for making hydraulic mortar, it has been dug out in a countless number of excavations for ages; in fact, the excavations are going on now.

The material is very easily moved, and yet stands with extraordinary firmness; in fact, unless water has got amongst it, there is scarcely an instance of the roof or walls (so to speak) of an excavation falling in. It, however, varies much in hardness and quality, which probably accounts for the irregularity of the passages. The workman turning to the right or left, or ascending or descending, as the material was more or less easily worked, or more or less valuable. It also contains frequent masses of tufa, in which the cubicles, or crypts proper, are generally excavated.

The Romans called the pozzolano "arena," or sand, and the excavations "arenarie," or sand-holes. Many of the Roman burial-places, for depositing the "ollæ" or urns, which contain the ashes of the dead, are excavated in this soil. But the most remarkable of all are these celebrated "crypts" in the Catacombs near Rome.

These last are innumerable narrow passages tunneled out in the solid earth, not more than 4 or 5 feet in width, and about 7 to 10 feet in height. Having been excavated without plan or settled purpose, they run in every conceivable direction—some side by side, some over each other, forming a most intricate labyrinth—and that of such dimensions as to astound and bewilder the visitor. Aringhi has given several plans of parts of these passages, one of which is before us. It will be seen they form mazes of passages, like the adits in a mine. The principal plans given by this writer are those called the Catacombs of St. Callistus, St. Agnes, and St. Marcellinus. In the plan before us, that of a small part of the former, it has been estimated there are full 5 miles in length of those passages. In the time of Baronius, forty-three of these cemeteries were known: at present it is probable twice the number have been found. Taken together, it is estimated that there is a sort of net-work of these passages under Rome, which must measure at least 100 miles.

In the sides or walls of these are a countless multitude of excavations, mostly about half a yard deep, and about 6 feet in length; in fact, square horizontal niches, to hold the body—not of the pigeon-hole fashion of the Egyptians, but like hodies, laid lengthwise, on a sort of shelves.

Sometimes there is but one body in the height; sometimes two, three, and four, and in the catacombs of S. Saturninus are many places, where no less than five bodies are deposited, one above the other, in the height of the passage.

The front is covered by a slab of stone, or very commonly of marble, and sometimes of terra-cotta, on which is usually carved the name and age, and any other particulars, of the deceased, and generally some Christian emblems.

Some, however, are constructed by cutting a semi-circular arch into the natural wall, and then sinking beneath it an excavation to receive the body, which is afterwards covered with a stone slab, and forms a tomb much like the monuments recessed into the walls of our cathedrals. These tomb tops have been used as altars.

To give some idea of the vast numbers deposited in this city of the dead, it has been reckoned that there are upwards of 170,000 bodies in the crypts of St. Sebastian only.

I know nothing more extraordinary than visiting these solemn places, which, on the first occasion, I did alone. It was at St. Sebastian. I had seen the noble church, and was then directed to a small door which opened, and there was a descent to the catacombs,—a narrow passage scarcely higher than one's head. At the entrance I was met by a single bare-footed monk, in the coarse brown robe of his Order, the cowl of which he drew over his head, to ward off the cold, for it was winter, and the air was chilly to him, for below, in the excavations, it is warm and close.

He lighted a large torch, and we descended, proceeding by one winding turn after another, sometimes ascending and sometimes descending for a very long time. To me it seemed marvellous that he did not lose his way, but he evidently knew every step and almost every tomb, pausing to point out, as we passed, those of the greatest interest.

The atmosphere, as I said before, is close, and stifling, and smelling of earth. Not a living thing, not an insect, not even a spider, is found there. It is, in every sense, the abode of death.

Many stories have been related, and I can readily believe them, of persons who have ventured into these passages without proper guides, and who have been hopelessly lost. In fact, it is said, that as late as the year 1837, the teacher of a school, accompanied by thirty pupils, went into an excavation that happened to be open, stating that among so many it was impossible to lose their way, and that not one of the party was ever seen or heard of from the time of their entering, though every possible search was made by proper persons as soon as the fact was known.

Other tales are related of those who have been so affected by the "gelidus horror" of their situation, the deep burial beneath the earth, in an inextricable labyrinth, and in close contact with a vast multitude of the dead, as to become mad with terror. Nothing can describe these awful solitudes better than the words of St. Jerome, in his commentary on Ezekiel (cap. 40), who says,—“When I was a boy at Rome (A.D. 350), and studied the liberal sciences, I was accustomed, with others of the same age and disposition, to go round on Sundays, and visit the sepulchres of the apostles and martyrs, and frequently to enter into the crypts, which are dug deep in the earth, and on each side of them, to those who enter, they have the bones of the dead for walls, and are so dark as almost to fulfil the saying of the prophet, ‘Let them go down alive into hell.’”

SUGGESTIONS ON ARCHITECTURAL COMPOSITION.†

Gothic architecture is a combination of small parts, in general forms and constructive features: the lines have a vertical tendency, but more especially as applied to cathedrals or other public buildings. In the early art the openings of windows and doors had high pointed arches, but in the later periods the arches were generally depressed, and the windows square-headed. It is not my present business to inquire how Gothic architecture arose: it is sufficient to know that it employed the materials of the district; or, when necessary to be obtained from a distance, they were of such dimensions as made them easy of transit: that they did use small stones in the construction of their buildings, and that these stones harmonized with the small divisions of their composition, are sufficient now for our purpose; but such fact is certain evidence of their artistic skill, and that they considered and applied the materials of a locality in a natural manner.

The forms of Gothic architecture were always united: they grew out of each other, and blended with the construction: they were usually continuous and rarely abrupt, except in such positions

where contrast was required. This system was the very reverse in the Classic style, where the blocks were placed abruptly upon each other with few connecting links to unite the whole mass, and the contrasts consisted in any continuous lines that were found necessary in the composition. One style may be considered as the union of curved and pliable lines, and inseparably linked together; the other a union of massive forms, square arrangement, and abrupt lines, requiring little but the positive indication of ponderous strength to satisfy our scrutiny as to its perfect combination of harmonious parts. I have taken this wide parallel as most suitable to my illustration of the incompatibility of the two styles existing in the same group or arrangement of buildings without positive detriment to either the one or the other: together it would be difficult to dispose a composition that could be pleasing in an artistic point of view, but, separately, the same principles of esthetics would establish a perfect work of art. Various columns in the same portico, a mixture of various sizes of various forms, a composition of various dates, windows of various widths and forms would not be more offensive to the laws of harmony in one building than the arrangement of the different styles of architecture in juxtaposition in a number. How, then, can we reconcile the practice so generally adopted and constantly advocated as the application or reproduction of the two styles of art so diametrically opposed to each other—one for ecclesiastical, and the other for domestic purposes? In the Gothic art the windows are large, but subdivided by mullions, and, when any increased size is required in the windows, an increased number of mullions is introduced, so that very little difference is made in the sizes of the general forms, and thus harmony of form is preserved. In a composition where numerous windows are required of nearly the same form, the division of the parts of construction should be similar; and, if larger windows were required, as in a tower or other parts of the structure, the increased size should be obtained by increasing the number of divisions, and not by merely magnifying the general forms; for, in the latter case, the effect would be to decrease the apparent size of the tower.

The general effect of any composition will depend upon its unity of form or outline. Outline gives our first impression: whatever this may be, it should be studied first, independently of any arrangement of light and shade and colour contained within it. Outline applies as much to the composition of many other subjects as well as to architecture, and should be amenable to the same principles. The beauty of an outline may not entirely depend upon flowing and graceful lines: it may consist of straight and short lines, and abrupt angles: the harmonious arrangement of the lines would, of themselves, constitute a beauty, although in one case of a yielding and flowing character, which might indicate elegance and delicacy; in another, short, crisp, and angular, imparting to the design an appearance of firmness, weight, solidity, strength, and durability: still they would be equally beautiful if harmoniously arranged. It is the combination of like parts which produce a harmonious whole, whether those parts be curved or square in their general forms. I have before shown that compositions of perfectly opposite character may be harmonious in themselves: it is not the materials, but the proper arrangement of materials which constitutes a beautiful picture.

It would be well to turn our attention more frequently to the value and importance of outline, when scrutinizing any works of art: it is impressed upon us in a greater or less degree according to the variety of its arrangement, and it should always retain that position even when in connection with the forms it surrounds; and in order that these forms should harmonize with it, they should indicate its presence in a minor degree, and be the index, as it were, of the other features.

It may be almost said that outline embodies imagination, for the mind conceives an occupancy, and gives solidity to a mere outline drawn upon any surface: the limited space is immediately filled up by the mind, and connected with whatever prescribed form the outline partakes: in this disposition of the imagination the conceived composition is pleasing or disagreeable according to the quality of the outline, its leading principle.

Outline and harmony of form will naturally lead to the consideration of what is termed "proportion." Proportion is too frequently considered a fixed standard, or type of art: it should rather be considered a relative quality, by which we regulate the numerous details of a composition.

Proportion is a term in such general use, when

applied to architecture, that I feel a degree of diffidence in attempting to explain what proportion is, and not what it is generally understood to be. Proportion *must* be a relative quality, as it must have a direct reference to some other thing; yet we constantly hear of a column being in good proportion: true, it may be in good proportion in reference to another of the same kind, or when applied to the object it supports: still, if this were the case, a column supporting a statue could hardly be in good proportion as compared with a similar column supporting an entablature: there can be no comparison between the weights supported—then what becomes of the standard proportion? A column by association as well as fact, is only part of a composition—a limb of a perfect body, and it is inconsistent to apply it to a use for which it was never intended. A column is an established part of Classic architecture, and applied in every age for a specific purpose; it therefore offends our associations by placing it out of its position, and shows by this misapplication a lack of thought and invention, and how little study is given to the contrivance of characteristic composition. It is quite true that numerous precedents can be cited for such misapplication, in Rome and elsewhere, but I cannot help doubting the good taste of those authorities: it was a custom rarely if ever practised by the Greeks or the Mediaevalists, but if it had been so practised, I still think it a custom more honoured in the breach than the observance.

Proportion we have been taught to believe to be also a fixed standard for the dimensions of rooms, and that when the measure is many breadths in length and height, that such proportions are essential to beauty in architecture. But are these the only proportions that we must look to for a satisfactory and esthetic composition? If so, I fear there is little of our art that can claim any beauty; nay, more, that there is little chance in these degenerate days of utilitarianism of adopting the elevated proportions laid down by the Italian masters. Yet I do not despair that at the present time many works will stand the test of criticism for ages to come, although they may be composed upon rules quite contrary to those I have alluded to. Rules, I have before stated, must give place to principles, and a clear conception of harmonious arrangement. And when the relative proportion of the parts to the whole is fully carried out, at least, an agreeable composition may be attained. I would lay a great stress upon *this* system of proportion—this equipose in the composition, as it must be evident that such a system would engender fresh thoughts and new ideas, which when thoroughly analysed, and found perfectly connected, must yield a satisfactory composition. Upon these principles I would recommend all works to be tested: such investigation would be severe, but instructive, and would soon lead to a wholesome state of critical inquiry and study: we should hear less of dogmatical ridicule, and receive more instructive information in architecture.

I cannot refrain here from remarking upon the various ingenious modes of ascertaining the system of composition which produced those marvellous works the ecclesiastical edifices of the Middle Ages. Much labour and thought have been bestowed upon the supposed origin of the composition of these edifices. One theory is based upon a combination and intersection of a series of triangles, and might apply to two or three structures, but it rarely fits more than that number; and, even then, some portions of the design do not exactly coincide; yet we are told that this fact is not to be taken as a defect in the theory, but as a defect in the execution of the work. It is not my intention or wish to depreciate such labours: any one who will take the trouble to propound a theory renders a great service to art, and, although we may differ in opinion, at least he has called attention to the subject in a way that may lead to further investigation, by which we may elicit much valuable information. I do not feel at present convinced upon this subject any more than that of the theory of proportion laid down by the Italian architects. I consider that the great works of the Middle Ages are the result of an intuitive and artistic inspiration,—in the first instance roughly sketched out, then reduced to the principles of harmony in form, colour, material, and construction. I would rather take this system of composition with strict analysis, than all the piling of triangles one above another according to the theories just alluded to.

It would be a useful study for the young architect to test his compositions by the principle I am advocating. I feel assured that although all I say may not be correct, at least he would acquire a power

\* To be continued.

† By Mr. E. B. Lamb. See p. 324, ante.

of analysis very useful to him in describing his own works or those of antiquity that he may have seen. In the numerous excellent illustrated works published the descriptions are in such general terms that little information is obtained from them that can be useful to the student; but by acquiring a power of just criticism the architect would not only be storing much information for his own benefit, but he would be in the way of imparting knowledge to others—that knowledge, in short, that would round again to his benefit—for the more the public obtain knowledge of our art the more they appreciate it; they then feel greater diffidence in attempting to carry out works in architecture without a previous amount of arduous study—such study as can be rarely acquired by an amateur.

I will not now speak of the system of composition founded upon squares, as my objections, however ill-founded, apply equally to that system; these theories, in short, are but expedients—helps to composition, and lame helps too,—they fetter the mind and cramp the energies, for “although art has its boundaries, imagination has none.”

Proportion is too frequently associated with our knowledge of existing works of art as standards of excellence from which no deviation can be allowed; yet by such works we are apt to judge all others instead of judging by the abstract laws of harmony; convenience, scientific construction, durable materials, locality, and other requirements incidental to circumstances, must always be considered before any attempt is made to use any particular style of architecture in a composition. This should invariably be the case, as the requirements of circumstances and the materials to be used would most likely lead to the application of such forms only as would be fresh. The materials of the locality would have considerable influence upon the general character of the composition. Presuming that nothing remained to be done but to arrange the artistic composition, this must necessarily arise out of the wants previously considered; and in all districts opportunities occur for considerable variety in embellishment without launching into profuse display.

It can scarcely have escaped the observation of persons acquainted little with art that, if an artist desires to produce a good effect in a building, although only part of his picture, he does this in many instances by a crispness of touch and subdivision of parts, which gives decision to the jointing of his masonry, and breaks up his surface: it produces different dispositions of light and shade, and keeps the eye employed and prepared to receive the other and more important divisions of his composition without violent contrast; broken surface, too, gives greater apparent size. In stone districts, the common walling is frequently extremely picturesque, and when soundly built becomes an important surface decoration. The introduction of brick with stone, where the latter material is rare, gives an excellent opportunity for contrast; brick and flint, in alternate courses, form a chequer, and various other modes, form great variety and pictorial effect. In all this description of surface decoration, great attention is required to the jointing,—not merely the practical masonry, but the artistic jointing; no line of joint should appear to be continuous, or merely wavy, or with such regular undulations that produce smoothness; the joints should be crisp, the angles of the stones sparkling, not neat, the termination of the lines abrupt,—such, in short, as Prout used to delight in, leaving on the mind an impression of brilliancy: flint walling produces a similar effect; then, too, the bond stones of window and door jambs should bear the same character of work; they should not be square, regular in the tail of the bond, or of equal heights; they should be varied, just as the man who worked the stone had found it when fresh from the quarry. This is almost imperative, as the rough tail of the stone, when united with the rough wall, harmonizes with it, and prepares the mind by easy stages to the more finished portion of the work, in the moulded jamb. Again, it gives greater value to the decoration in the window, or other feature, by the gradual union of the strong or rugged with the more finished and delicate portions; and at the same time, by concentrating the objects, draws the eye to the most observable forms in an unobtrusive and yet pleasing manner. In commenting to this kind of rough building, it is not my intention to disparage squared masonry. I am now merely pointing out the simplest means of legitimate surface decoration—a subject full of suggestion, and worthy of the greatest attention;—but, although full of interest and value as an artistic

study, it has its limits: roughness should not merge into unsmoothness or sloveliness, and an affectation of roughness; nor should the distortion of natural smoothness, by giving the appearance of roughness, at an amount of additional labour and cost, be allowed; such labour would always prove abortive. Roughness of surface must arise from evident consistency of construction, and when thus tinted with it, shows a certainty of strength and durability, and another charm is then added to the composition. In some districts the native material is of such a description that there can be no roughness without bad masonry, except, indeed, where the stone is chopped into shape—a very useful mode of surface work. In smooth-surface masonry it is much more difficult to produce an effect at a moderate cost, as the regular, close, horizontal, and vertical joints produce little or no variety in the wall, and in many instances look like a wall of one stone perforated with openings; and, if without string courses, or other apparent ties, the decorations of windows and doors appear unconnected with the wall. We need not look far from this metropolis to see ample illustrations of this fact: in such work the object of the mason is to make his work look “all of a piece,” and the union of the parts become abrupt. We do not see where the jamb unites, or bonds into the wall. Frequently pilasters or columns are in larger blocks than the wall masonry, and are practically and positively defective in construction. In positions where bricks are used for the surface of walls and jambs of windows and doors of stone, it is a common practice to carry the stone jambs the whole height without any apparent union: this is not only defective in composition but also in construction, and the loss of the uniting tie of the jambs is a loss in pictorial effect of the wall decoration.

I speak of these matters irrespective of style, as the picturesque and pleasing in all architecture would be in like manner produced in either or any style.

Hitherto I have spoken of walling, or surface, in the first or simplest mode of artistic decoration—an incrustation, in short, upon the surface; but the similar principles of arrangement will apply to the most elaborate ornament. On the surface, as a whole, it forms but an incrustation, a roughness acted upon by the sun's rays, and thus producing lights and shades. The size and distribution of those parts also tend to produce a relative magnitude in the grouping. For we only observe the magnitude of buildings by their relative proportions. Take for instance a mere plain wall, the size and extent of that wall would appear greater or less if a door or opening of large or small dimensions were placed in it. The plain squared stone, with little appearance of joints, would also reduce the apparent size; but a few breaks, either in a difference of construction or panels, a small bracket or corbel, a baso-relievo, on the surface, would add to the appearance of extent, and at the same time produce a pictorial and pleasing variety. But suppose the doorway and panel to be nearly of the same size, and divide the attention; whereas a decided difference in dimension would give value to the larger feature, and leave the smaller one, being less, in consequence, to carry the eye by degrees to the plain surfaces or repose in the wall. Too great a similarity of surface decoration, whether of simple or ornate character, would be as defective as too little, and become monotonous in the extreme. In architectural composition there are many things which would give us the power of breaking up the surface of a wall without resorting to the commonplace expedient of liank windows, useless doors, or tenanted niches. Whatever is used for purposes of this kind should be perfect in itself, not left to the imagination of the observer to complete, or, in the country, to be filled up by the growing plants of the gardener.

You will at once see how a multitude of useful forms of every description may be legitimately used in the decoration of walls: a rough wall becomes decorated by the mode of arrangement and construction of its materials; any wall, however elaborately wrought or panelled, would, at a certain distance—that distance from which we view an outline properly—produce no more pictorial effect than its rough relation, and, upon a nearer approach, it should be evidently constructed upon the same consistent principles, so that the several parts should be undoubtedly united, and that one part could not be removed without the destruction, not only constructively, but artistically, of the whole composition. The Egyptians decorated their walls most profusely with sculpture and hieroglyphics; in the Grecian

temples the walls were almost invariably plain. The Romans introduced panels and ornamental sculpture on their walls; the moderns carried to a greater extent this system. The Early Medieval artists decorated their walls with panelling, which, at a later date became profuse, extravagant, and frequently monotonous. All these methods of ornamenting surface walling may be artistically called, a production of incrusting to create variety of light and shade; and in an artistic point of view, when considered in a general composition, they must be taken in that sense. It is in a particular inspection that these matters must derive a further individual interest, and so aid in producing a fine work of art.

If it were easy to remove any part of a composition without detriment to the general effect, it must be evident that such part of the design would not only be unnecessary, but would amount to an intrusion and a deformity. One of the great leading principles of all composition is, that every single part should have a positive relation to the whole constructively and esthetically. If the whole outline of a composition is pleasing, and the balance of parts is in perfect relation to each other, the minor accessories should hold a similar relationship; the contrasts, the light and shade, the *incrusting* and repose, require a like balance and relative proportion. The important feature should not only be sufficient to demand the first consideration, but the repetition of some connecting link should be carried throughout the whole work, leaving a greater influence in the parts most required to be brought into secondary consideration. As in the composition of a picture the painter draws your attention to the main subject by slow gradations; his high lights, his colour, his forms, are carried in lesser degrees throughout his canvas, so contriving his composition that his satellites shall reflect, though in diminished lustre, the rays of the parent planet.

In speaking of surface decoration, I am naturally led to the consideration of those features which individually may come under the denomination of distinct designs; but, as I have before mentioned, when connected with the walling, must be inseparable from it, and should, therefore, next claim our attention.

The early writers on classic architecture have laid down rules for the *proportion*, as they call them, of windows and other openings, the breadth of spaces or piers between, and the size of their decorations. In most of the erections which come under the hands of architects of the present day, such rules may have formed the study of previous years; but although known, how are they to be now applied? for every new building requires a new treatment, as it is most likely for a new purpose. How, then, are we to reconcile those dogmas with the necessities of the case? Certainly not by such rules.

I have before stated how necessary it is for the student in architecture to store his mind with the knowledge of every style of architecture, and to study each style so as to ascertain in what way the great effects have been arrived at in those works that have received universal commendation. No doubt it will be found that this arises from the principles of harmony being carried out to the fullest extent, and that every single design is governed by the principles of harmony, which principles are universal.

But the rules for one subject can only be derived from the principles of that subject. Perhaps I may be more clearly understood by stating that the principles of harmony are universal, without regard to style or particular subject; but the rules derivable from the harmonious composition of one design may be perfectly different to any other; for instance, the massive, simple, plain, and sturdily appearance of the temples at Paestum, require that the details should partake of the same massive character and size. The relative proportions of the parts of this design would be unsuited to that of a temple or other building of a lighter, more ornate, or simple structure; hence it is that no rules can be universal, but principles must be so. Taking this broad basis, I again reiterate that the rules laid down by old writers must be regarded with care and jealousy, as they may lead to error, and, by a too zealous attention to precedent, the principles of harmony be destroyed.

I feel that I have exhausted my time and your patience in the subject I have so feebly discussed. I feel, too, that I have touched but lightly upon the subject of architectural composition—a subject of unbounded interest;—and the unconnected way in which I have treated these suggestions, will, I fear, contribute little to the general stock of usefulness. The matter still wants to be treated by abler hands; yet I feel a certain conviction that

the close of these remarks, that it is still necessary to speak out, and, unequivocally,—“Man builds houses to live in.” It is a stubborn, cold fact, entirely divested of all antiquarian or architectural enthusiasm, that millions will still be knocked out of Gothic windows, because they are useless; that the Gothic style will be still difficult of application in its full truthfulness; Classic art will be mangled into utility; and Act of Parliament houses still are, and will be continued to be built; for, as we are taught, that in “a multiplicity of opinions there is wisdom,” I think there can be no doubt that in a multiplicity of modern houses, there is the wisdom of convenience.

Out of these facts we shall, no doubt, find a new style, or progressive change in art, suitable to our purposes. I feel that that change has already commenced; but the ultimate result is a problem I must leave for others to solve.

It may appear in these suggestions that I desire to set at naught all established rules and authority. This I trust you will not place to my charge. A knowledge of architecture is not to be derived without a close study of every connecting link in the art: this connection can only be firmly held by grasping all information, whether from buildings or books, yet there must be a time after long and arduous striving, that buildings and books should be considered only as the foundations of new theories and fresh ideas. In the heyday of life we are, perhaps, too apt to give our imaginations full scope, before we have sufficiently digested the ideas of others. In more mature age we may endeavour to enlarge upon those principles which we have received as a bountiful legacy from our forefathers. We should, however, bend our energies to the task with unflinching zeal: we should follow the art for the art alone, for he who merely looks to the amount of his commission for the repayment of his labours, will not only lose the pleasure derivable from the study of a noble art, but will do little worthy of regard; nor can he hardly be considered to have added his quota for the benefit of his species, for no pursuit tends so much to the profit of the mind as the development of the arts of the beautiful.

SUGGESTIONS

ON THE EARLY EDUCATION OF THE ARTISTICALLY ENDOWED.

MANY pens are already at work in the endeavour to conduce to the enrichment and elucidation of art and science; and, in venturing myself to add a few words on this subject, I do so solely from a desire to aid the removal and suppression of some peculiarities, but too prevalent, in the present mode of writing on art. My chief object at the present time, is to direct attention to early artistic education; and, by unfolding my views and mode of conception, to suggest that help which seems most needful. Every true artist will agree with me, that the fundamental, and consequently most important, step in artistic education is the training of the eye into harmony with the development of the mind. It is an old story, yet always new, that the labour of thinking is indispensable in the life of all classes of men; and with regard to artistic studies, which are intimately related to observation and reflection, it is surely of the utmost indispensability, that, from the commencement, mind and eye should be educated together. Indeed, it is this precise education which so completely distinguishes and elevates every genuine artist. This every-day world he regards from an entirely different point of view, recognizing in nature a multitude of charms, and discovering in her inexhaustible treasures of a purer knowledge, which from others are far ever hidden. It is his constant habit of uniting seeing with thinking, which endows him with the power of understanding aright, where an undisciplined eye perceives nothing save hieroglyphics.

Now, in suggesting the means of procuring such an education, first I would state, that I entirely agree with those of my fellow-artists, who condemn the practice of constant mechanical copying, and endeavour rather to lead the students entrusted to their care, as early as possible, to the only original source and productive fountain—Nature.

Drawing from the object itself, instead of from copies, necessarily compels the student to think, and in a short time imparts to him a power of perception utterly unattainable by any other method. The student's attention should also at once be directed to the fact that, prior to any attempt to delineate, and in order to give anything like an adequate representation of the object placed before him, it is absolutely imperative,

closely to observe and to examine every object as a whole, that is, in its general appearance, and therefore necessarily, at the same time, to observe also all those parts of which this appearance is composed. This examination must be sufficiently prolonged, so as to allow the mind a fair opportunity to seize and retain accurate impressions of both form and colour. By a discipline, as here described, every line, every touch, becomes replete with character, and tells its own story, whereas every other method is not only inferior, but, in point of fact, pernicious in influence, and conduces to a style of drawing which, being altogether deficient in character, is therefore utterly worthless. However, in this drawing from nature, clearly, some preparatory study is needful, which should advance and keep pace along with it; for when the seed, which the teacher sows, does not fall into well prepared soil, and is not quickened by the aid of rain and sunshine, the prospect of an abundant harvest is more than doubtful.

Now this preparatory study—the science of seeing—commonly called perspective, is the only true guide that will ensure real competency to represent faithfully the varieties of appearances, presented by natural objects, in accordance with their retrogression from the eye. The image of every object in nature upon which the eye can rest is exquisitely, in form and colour, impressed upon that most delicate membrane (which lines the interior of our chamber of vision), according to the unchangeable laws of the perspective of nature. In truth, this latter is the magic key that opens to the student the entrance to the mysteries of his art, and the supposition that any artist can dispense with it, will prove itself, without doubt, a fatal error. The student who attempts to draw from nature without being guided by perspective will often find himself in fault, and much retarded by the expenditure of precious time: dreading ever of falling into fresh error, he will not so expeditiously and certainly attain the faculty of reproducing nature on the canvas, with truth and feeling, as he might have done, had he only had the right guidance from the beginning.

Perspective—the science of seeing—must, as already told, be taught in progressive connection with the close observation of nature; and, in that case, I have no hesitation in saying, that the acquiring of its knowledge will be found in no wise a difficult matter. The instructor should also possess a taste and knowledge, sufficient to enable him to avoid everything strictly mathematical, and to reduce the whole to simple principles, in which case the student cannot fail, at length, to arrive at the conclusion, that what is current under the name “Perspective” is, in fact, nothing but a most requisite accessory in art,—namely, the power of seeing accurately.

Nevertheless, no one can be more fully aware than I, of the number of scruples and difficulties to be overcome, ere pupils can be incited to the study of perspective, especially when taught in that irrational manner so generally adopted. Too many mathematical subtleties are apt to alarm beginners, and fill them with a natural aversion, which deters them from penetrating through the shell to the sound and healthy kernel.

With the avowed object of naturalizing perspective, numbers of books have been written, and are continually appearing, though the result, I feel sure, is entirely different from that intended. For example, how repelling to the beginner, and perfectly ridiculous to the artist, if he sees that simply to draw a chair, box, &c. &c., he has to penetrate such an alarmingly intricate web of lines, before he can, and then only with difficulty, observe the required object itself. Moreover, some of the laws of the so-called perspective, given in the majority of books, are entirely opposed to those laws, which the only true perspective of nature dictates. But more of this in its proper place. No critique, I feel sure, can be too plain-blank, in order to combat effectively, this thoughtless fashion of needlessly perplexing the learner. Another impediment, and increasing the difficulties of inciting some pupils to study perspective, is the damaging circumstance, that even leading writers on art have treated it with such comparative indifference; although, of course, they are themselves fully aware of its true import, in a fundamental point of view, and only solicitous that learners should avoid giving it undue weight, in a way that would be derogatory to other studies. It is this comparative indifference on the subject, indulged in by some writers, which has given rise to the absurd—and for the idle, welcome—notion, that perspective is without any substantial value whatever. No real artist will be at all likely to misapprehend

the true significance of this apparent slight cast upon perspective by some writers, or be in the smallest degree disconcerted thereby; but, unfortunately, the multitude, amongst whom might be named, especially, those who possess a singular dexterity in devouring voluptuously the contents of a multiplicity of books, but, strange to say, familiarizing themselves only with the crust, while incapable of piercing to the innermost substratum;—this multitude, I say, is only too apt to follow, blindly, the writers of the most notoriety; and no sooner is anything asserted by them, than the former, parrot-like, chatters it glibly forth, all the while lacking the requisite powers of scrutiny, yet possessing a singular proneness for talking, plausibly and speciously, of subjects they do not understand.

Lastly, in concluding these remarks, I take it for granted no real artist will accuse me of depreciating other studies out of regard for perspective. Knowing well that undue prominence given to one branch of study would most surely prove obstructive to the student, and fully convinced of the truth,—

“Where fashion throws her chain,  
True art can ne'er remain;”

nevertheless, I recommend the study of perspective, founded on the intimate observation of Nature, from the first, as an absolutely necessary, sure, and faithful guide for every student of art. It must be taught and practised early, otherwise the eye falls into a loose and imperfect habit of study. In such a case it is then only with the greatest difficulty—if at all—that the student can rectify such unprofitable and pernicious groundwork. But even to—so-called—artists, who have neglected perspective in former years, I would earnestly recommend the culture of perspective simultaneously with their other studies. I admonish them to reflect that, seeing the last step has been only a retreat, the return to a former position will become a real advance. The foundation of all real improvement, is the recognition of an evil.

A. LE VENGEUR.

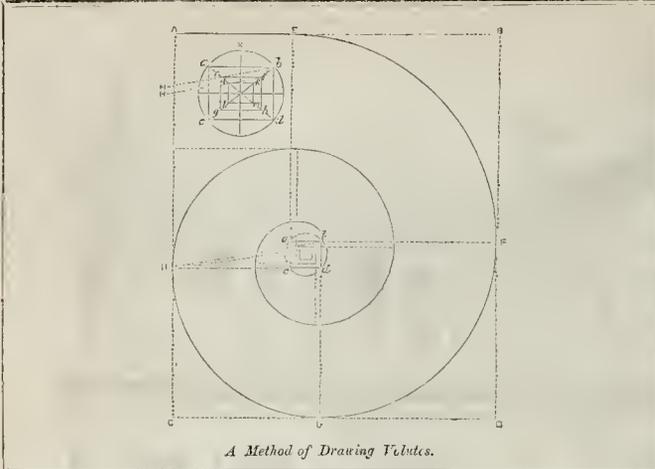

THE PROPOSED DRAMATIC COLLEGE AT MAYBURY.

THE foundation of this institution must be considered an important event in the history of the English drama. An endeavour to provide a shelter for their brethren who, in their old age, may be reduced to need, or to young children, who have been deprived of their natural support, the means of preventing them from falling into the way of temptation and providing them with good education and so preparing the way for future careers of usefulness and respectability, calls for general aid.

A museum and library, of a class character, will be the means of gathering together many curious and valuable matters which, except for such a central place for their reception, would be scattered about, and be comparatively of little value. By persons connected with the theatrical profession, aided by others eminent in literature, arrangements have been made for the completion of part of this work. The special train took a large number of the leading actors and actresses, together with a gathering of friends, on June 1st, to the site of the College, which has been presented by the Woking Cemetery Company. On the ground flags and other decorations were raised, and in the large tent the foundation-stone was suspended in its proposed position. There were flags of all nations and mottoes in honour of the Prince Consort; but, singularly enough, there was nothing which would bring to mind the immortal Shakespeare and other worthies of the British drama. It was observed that such an occasion would be differently treated in Germany; but perhaps the committee considered that the circumstances were sufficient to rouse a host of associations without resorting to other than the ordinary manner of decoration.

From the site of the College extensive views are to be had which to the artist's eyes are not without beauty; but many are inclined to think the wide waste of heath rather a melancholy and bleak prospect. However, by the exertions of skillful men, the grounds surrounding the College will soon become a pleasant garden in the desert; and in all the land around improvement is going forward which will change the appearance of the scene, and in time plantations and fields will be where the heath now is.

It seems to us too far away from London. We have already given some account of the intended structure in our notice of The Royal Academy Exhibition. Mr. Webb is the architect; Mr. Perry the contractor.

A METHOD OF DRAWING VOLUTES.

I SEND you a diagram and description of a method of drawing spirals or volutes, which I have reason to believe is original, as I have searched in vain to see if I have been anticipated in arriving at a means which has cost me no inconsiderable trouble. If I am mistaken in my claim to the originality, many of your readers will doubtless soon be down on me, and I shall with becoming submission withdraw the claim, *after proof*. Peter Nicholson, in his "Principles of Architecture," gives instructions for drawing the various spirals or volutes, such as the archimedean, the logarithmic, &c.; but they are all dependent on one dimension, viz, the height, without any regard to the breadth. But my proposition is:—

A general method of inscribing a spiral in rectangular quadrilateral figure, ABCD.

Multiply the given height by the given breadth, and divide the product by the sum of the height and breadth; subtract that quotient from the height, and the remainder is the radius of the first quarter revolution of the spiral. The formula is

$$h - \frac{h \times b}{h + b} = r$$

Subtract the radius so found from the height, BD, and the remainder, FD, will be the radius of the second quarter of the revolution, and is to be set from F to b. The difference, ab, between aF and bF, will form one side of the quadrilateral abcd. Subtract the radius Fb or bG from the width, CD, and the remainder, bd, will be the other side of the quadrilateral, abcd, and it will be a figure similar to or of the same proportions as the given quadrilateral, ABCD. Then dG will be the radius of the third quarter of the revolution, and He the radius of the fourth quarter.

In the quadrilateral, or parallelogram, abcd, draw the diagonals ad, bc, and draw dh, cutting the diagonals ad in e; then will e be a point for the formation on the diagonals of another parallelogram, efgb, whose angles (aa in that first made) will be the centres for the radii of the second revolution.

By again drawing fH to cut the diagonal ad, another parallelogram, iklm, may be formed, and so on to finish the spiral.

From the nature of the formula it is evident that when h (=1) exceeds by a trifle more than  $\frac{1}{2}$  or 0.236 of the width, the first radius will be greater than the breadth of the quadrilateral, and the spiral cannot be described within the figure. Also that when h and b are equal, the spiral vanishes, for the formula becomes  $h - \frac{h}{2h}$

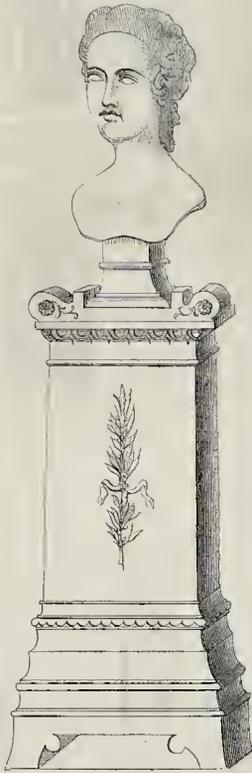

and the first radius is equal to half the circumscribing square. Hence a circle is inscribed. Also, that as the height and breadth approach equality the number of revolutions increases.

In the diagram the height is taken at twenty-seven equal parts, and the breadth, twenty-three parts.

X is the centre part to a larger scale.

JOSEPH GWILT.

SOUTH KENSINGTON MUSEUM.—During the week ending 2nd June, the visitors were within a hundred of 20,000.

A BUST-PEDESTAL.

SOME time ago we gave illustrations of the Pompeian House erected in the Avenue Montaigne, Paris, for Prince Napoleon.\* The accompanying sketch represents one of the pedestals in the atrium.

THE ST. MARTIN'S SCHOOL OF ART.

THE students of this school held their fourth annual *conversations* on Thursday last week, when a considerable number of students received medals and books as prizes. The drawings on the walls included some from the Female School in Gower-street, and others lent for the evening by Mr. Hogarth and Mr. J. C. Robison (early works by Turner being of the number); and amongst the other articles exhibited were some of Messrs. Hart's productions and two or three meritorious

\* See vol. xvii. p. 618.

works in *mezzo-relievo* by Mr. S. Ruddock, sculptor. After the distribution of the prizes, glees were sung. There was a large attendance of members of the volunteer corps of the South Kensington Museum. The works of the students were hung in a very bad light: from the number of prizes distributed, however, we expected that the general display, both as to number of drawings and merit, would have come out better than it did.

One or two of the premiated works, and some by "pupil-teachers," were highly creditable to the school or schools; but it was sufficiently clear that the complaint of the masters is well founded, that pupils too generally remain only long enough to acquire the first lessons, and not the power of drawing elaborate forms. Also, considering the importance of a knowledge of the method of representation by plans, elevations, and sections, to all persons, and specially to workmen, the evidence of attention paid to architectural drawing at the St. Martin's School is not satisfactory—however creditable may be a specimen which we found, by a student who had been a very short time under instruction.

The Department of Art, and the schools in connection with it, under difficulties, are effecting an amount of good that is already manifest, and may eventually place the arts in this country in a high position; but it is clear that the difficulty of the early withdrawal of children and pupils from their opportunities of instruction, which has been so much spoken of generally, extends far out of the agricultural districts, under pressure of the demand of entrance into active life; and that the system of instruction of the Department will need continual revision, to permit it to secure rapidly the ends hoped for from it.

PARIS ARCHITECTURE: THE HOUSE OF AN ARCHITECT.

AT different times we have given numerous examples of buildings erected in Paris, including houses built by sculptors and architects for themselves. We add to the list illustrations of one of the latter class, which we have engraved from views given in the *Revue Générale de l'Architecture*. It is situated at a corner of a street in what is known as the *Cité Malesherbes*, Paris, which takes the character of a London square; the police, the maintenance of the place, the keeper, and the lighting, being paid by a rate of 8*l.* per annum on each house. The residence we are illustrating stands on 230 square *mètres* of ground, 100 of these being arranged as a garden. In making the design it was determined that it should not be expensive, that the ground-floor should be appropriated to the business requirements of the culinary department; and that the first-floor should contain the living and reception-rooms. The top floor, in the roof, provides a spare bed-room, and four servants' sleeping rooms; and the basement contains wine-cellar, pantry, gas, water, a warming apparatus, and fuel-cellar.

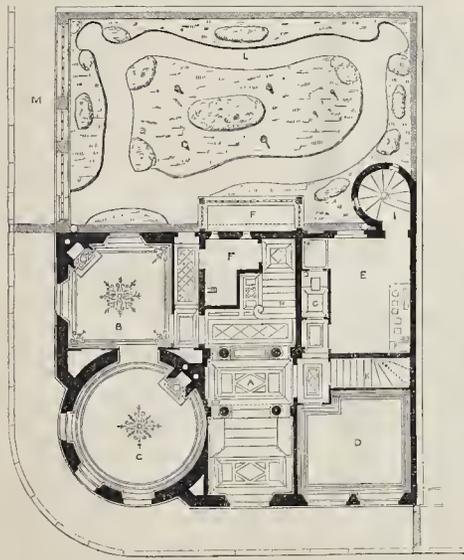

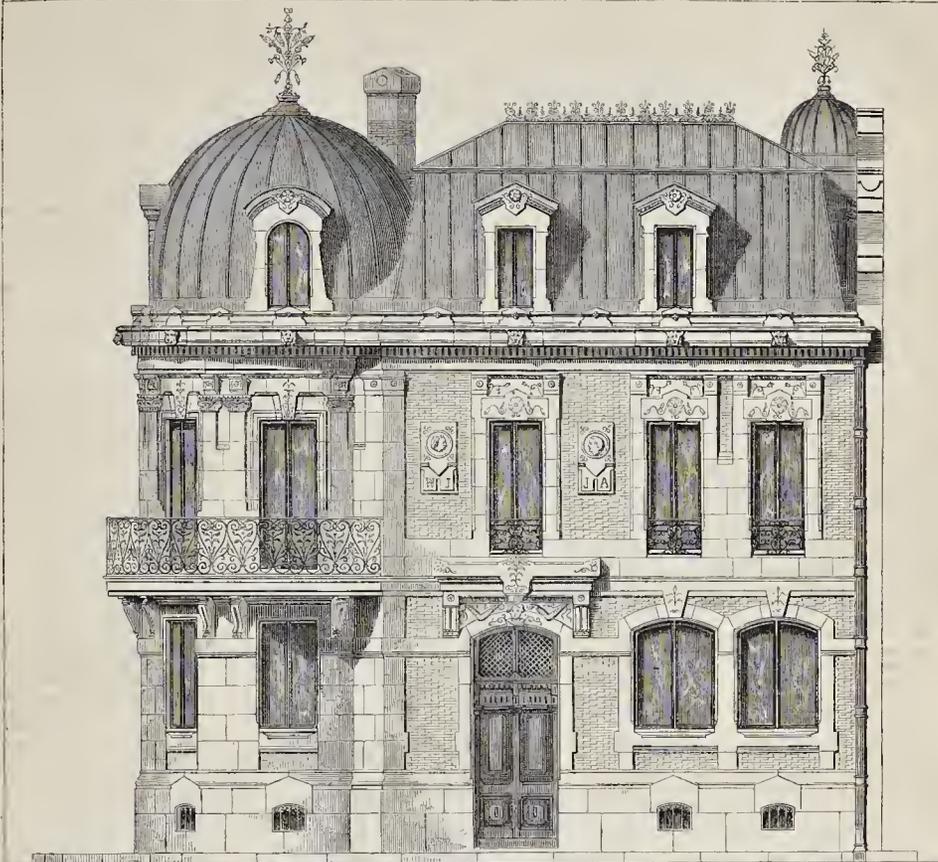

The vestibule on the ground-floor is formed in stone, paved with marble. The four columns which decorate the hall are of stone, as are the stairs. On the left there are a study and library, with a way out to the garden; to the right is an office for assistants, also the kitchen, with water-closet in too close proximity. In the roof there is a reservoir of water, to supply a little fountain in the garden. The kitchen is fitted up very completely, and water is laid on to the bath-room. The bath is of cast iron, lined with earthenware. The lining of the flues is of pottery. The ribs of the cupola are of iron. The interior appears to be fitted up with great elegance and luxury, including tapestry, pictures, and other works of art, and M. Daly makes us understand that it is not all French architects who can permit themselves such indulgences. Nevertheless, says he, it is right to state that, though ordinarily the architect retires from an arduous career with but a modest independence, happily there are some in France who have made or inherited fine fortunes, and can afford to indulge their fancies.

The extreme width of the house is 44 feet; the depth, exclusive of aviary, 32 feet.

THE HOUSE OF AN ARCHITECT: CITE MALESHERBES, PARIS.—M. AMODRU, ARCHITECT.

Ground floor Plan.

First floor Plan.

### PROPOSED MEMORIAL OF THE LATE SIR CHARLES BARRY.

SEVERAL suggestions under this head have reached us, including one for a stained glass window in Westminster Abbey, next to one which is to be filled with glass in memory of the late Robert Stephenson. It is understood, however, that Sir Charles Barry himself always desired the memorial should take the shape of a statue in some convenient niche in his own Parliament Houses, and this wish should be carried out. We believe that one or two of his friends are quite ready to provide the requisite funds if the arrangement could be satisfactorily made. It would be but a graceful act, however, if the Government were to undertake the duty of erecting the statue.

### ROYAL INSTITUTE OF BRITISH ARCHITECTS.

The ordinary meeting of members was held on Monday evening last, at the house in Conduit-street. Mr. G. Godwin, V.P., occupied the chair. The minutes of the last special meeting, and of the ordinary general meeting, were read and confirmed.

Mr. T. H. Lewis (honorary secretary) read the following letter, which had been received from the family of the late Sir Charles Barry, conveying their thanks for the warm and cordial sympathy of the Institute:—

"Lady Barry and the family of the late Sir Charles Barry beg to acknowledge, with the most sincere thanks, the resolution of the Royal Institute of British Architects. They are deeply sensible of the honour conferred by such a testimony from that noble profession to which it was his greatest pride to belong. They rejoice to feel that his memory is held in affectionate and respectful remembrance by those friends whose opinions he so highly valued; and for themselves they acknowledge, with gratitude proportionate to the greatness of their loss, the expression of such warm and cordial sympathy.

No man can they ever forget, while they look back with inexpressible emotion to the memories of this day, that to the Institute is due the conception and the conduct of that movement which has laid him in honour among the great men who are departed, and so given a public testimony to the value of his labour in the cause of art, and his services to his native country.

*Clapham, May 22, 1856."*

The chairman said he thought it right to inform the meeting that the council of the Institute had passed a vote of thanks to those members, fellows and associates, who had assisted in the ceremony at Westminster Abbey. They had also passed a vote expressing, through Mr. Quarm, the gratification with which they had witnessed the cordial sympathy of the workmen who had attended the obsequies.

Mr. James Bell (honorary secretary) read a list of donations to the library, which included a copy (large paper) of the "Archives de la Commission des Monuments Historiques," presented by the Imperial Government of France.

Professor Donaldson, in moving that a vote of thanks be presented to the several donors, congratulated the Institute upon possessing so many valuable records of the progress of art. He was glad to perceive by the designs for the new cemetery at Croydon that the distinctions which had been too long kept up between the chapels in places of sepulture of Protestants, Roman Catholics, and Dissenters, were, in the case of the Croydon cemetery, about to be eliminated. He also ventured to express a hope that their excellent secretary for correspondence (Mr. Penrose) might be able to find time to look through the donations which they had received from countries, with the view of bringing them, on a future occasion, more directly under the notice of the members. The speaker also commented at some length on the "Baueitung."

Mr. Penrose seconded the vote of thanks, and called attention to some specimens of coloured marbles which were about to be used by M. Matas in the new façade of the church of Santa Croce at Florence. The marbles consisted of dark green, dusky red, and the ordinary white from the Carrara quarries. The same distinguished architect was about to huddle the façade of the cathedral of similar materials, and it was to be hoped it would prove in every way worthy of the magnificent building of which it was to form a part. Mr. Penrose also spoke in eulogistic terms of the magnificent national work received from the French Government.

The chairman having put the vote, which he declared to be carried, referred to the "Monuments Historiques," and observed that our own Government might take a lesson from the example set them by that of France. It had often been urged, and he thought with great propriety, that some central body having authority should be established

in this country, to which should be delegated the charge of our ancient historical and architectural monuments. In France this national duty had never been lost sight of; and, in spite of revolutions, republics, and empires, the Government of the day had steadily continued the record of those magnificent monuments of antiquity, the continued existence of which it was impossible to guarantee.

Mr. Penrose announced that he had received letters of apology and condolence from several foreign corresponding members who had been invited to attend the funeral of Sir Charles Barry.

Mr. Ashpitel then read his paper on "The Origin and Development of the Use of Crypts in Christian Churches from the Earliest Period," the commencement of which we give elsewhere.

At the conclusion, Mr. Ashpitel remarked upon the fact, that there appeared to have been no examples of the construction of a crypt after "the Decorated period." Just about the origin of that period, and when there were no religious dissensions in the church, the practice of building the crypt suddenly ceased. At all events neither he nor the friends whom he had consulted could remember any case of a regular crypt under a large Perpendicular church or cathedral. Crypts, it was true, had been discovered under Gerrard's Hall and under the Guildhall, but as far as churches were concerned they appeared (for no reason that he could tell) to have fallen into sudden and utter desuetude. He hoped, should his health permit, to be able, early in the ensuing session, to give some account of the crypts in English churches, from the earliest period down to their disuse. He begged to thank those gentlemen who had favoured him with drawings of ancient crypts, and especially a gentleman (a stranger to him), who kindly sent him particulars of a curious building of the kind in the Isle of Man. Any further particulars on the same subject would be gratefully received, not only by himself personally, but by the Institute.

Mr. Bialloblotzky observed that the very interesting paper which they had just heard read brought to his recollection the crypts at Naples and Alexandria. In the latter it was possible to trace the period at which the Christians introduced into these tombs some pleasing ornaments. There was found the introduction of Bacchus worship, with close imitations of the Christian cross. It was to be regretted that the Turks had blown up the Catacombs at Alexandria, for the purpose of converting the marble into lime, a piece of vandalism which it might be useful to protest against. The Catacombs of Paris were somewhat similar to those which had been described by Mr. Ashpitel; but it was extremely difficult to obtain permission to view them. The tombs of the kings at Jerusalem also corresponded with some of the descriptions they had heard.

Mr. Papworth proposed a vote of thanks to Mr. Ashpitel for his interesting paper, and observed that he was sure they had all heard with surprise and satisfaction the clear and lucid manner in which he had worked his way through what some people might term a mass of "antiquarian rubbish," and established the point which he had in view. With regard to the paper which Mr. Ashpitel had promised for next session, it occurred to him (Mr. Papworth) that there were some crypts, lighted from the outside, which might be worthy of special notice.

No member having risen to continue the discussion,

The Chairman said, there could be no diversity of opinion as to the desirability of giving their warm thanks to Mr. Ashpitel for his deeply interesting communication. The paper was one of extraordinary merit, and its fulness and comprehensiveness constituted perhaps the reason why silence had fallen upon what might be termed a usually discussion-loving Society. He was sure they would all agree with him that the paper showed much thought and research, and that their best thanks were due to the author.

Mr. Kerr said that the impression left on his mind by the paper was that the early Christians repudiated art and destroyed it whenever they could find it. The crypts in the Roman catacombs were Christian tombs, and, for his own part, he could see no art about them. It seemed to him that something might be deduced of the progress of the Christian mind in art from the character of these tombs.

The vote having been passed by acclamation, The Chairman announced that on the 18th instant, a paper would be read by Mr. Digby Wyatt "On Illuminated Manuscripts," as illustrative of the history of arts of design; and that on the 25th of June, a special general meeting

would be held to consider the suggestions of the Council as to architectural examinations.

The following gentlemen were elected Fellows of the Institute:—Mr. Harry Robert Newton, Associate, of 6, Argyle-street, Regent-street; and Mr. Henry Dangerfield, of Cheltenham. Mr. Robert Knott Blesley, of 8, Farnival's-inn, Holborn, was elected an Associate.

### ROYAL EXCHANGE.

At length further endeavours are being made to have a glazed roof placed over the quadrangle, as recommended in the *Builder* many years back.

In this cold and variable climate, any space open to the access of rain or unmitigated winds can be but ill adapted for the transactions of the great money market of the greatest of cities; it may be that the remarkable chill of speculation during the last winter and spring has accelerated the desire for standings and niches somewhat more comfortable; or that the improved taste of the time has impressed the frequenters of Change with the desire to protect those frescoes which adorn the walls of the now open corridors. The wonder is, that the protection of a roof, so much needed by wealthy negotiators whose custom is to stand from one to two hours daily, all the while on a paved floor, and plunged in meditative calculations, was not given before.

It is clear that the thing can be done, and for a sum so insignificant, that a small subscription from each person using the Exchange might defray the expense; that it can be accomplished without damaging the aspect of the building; that it may afford protection from the alterations of the weather, as well as from the sun's rays; and, that perfect ventilation may, at the same time, be preserved. Let it be done, not as a railway station, nor yet as a conservatory, but in good taste.

### THE HOLIDAYS AT THE BRITISH MUSEUM.

It is satisfactory to saunter into the national collection on a holiday, when the rooms are crowded with visitors; when the humming of voices and the tramping of feet re-echo in the presence of the gods of antiquity and the effigies of those who have been chief movers in the world's affairs in ages long gone by, and a present living multitude wanders amongst those relics of Egyptian and Greek kings and queens, the choicest works of art which the world has yet produced, and the fragments of cities which have long ceased to exist.

Glancing at the crowd who on these occasions throng the various galleries, it will be seen that nineteen out of twenty consist of working men and their families: excursion trains have brought visitors from many a distant province; the observer will hear the broad dialect of the Scotch, who make an intelligent observation; the guttural and somewhat croaking tongues from the banks of the Tyne; and the characteristic dialects of "canny" Yorkshire and Lancashire.

It is instructive to remark what portions of the Museum seem to be most popular; for it shows us in some degree the intellectual and artistic position of a great mass of the industrious classes of this country.

The mummies and other curiosities in the Egyptian room attract great notice: so do the collection of stuffed birds and beasts, portions of the ethnological gallery, and the letters of eminent personages. The Nineveh marbles are appreciated to a great extent, and the important fragments of Greek art seem to impress the general mass of the visitors in a manner which many would not anticipate.

The galleries containing Etruscan vases and curiosities of Roman and British antiquity are rapidly passed through. When the writer was examining the very interesting group of Mediaeval remains which are here preserved, a man, who with his wife and children had been attracted there, asked, "Are these the things, sir, we brought from the Chinese?" On explaining to him that they were articles of British workmanship made in different reigns, the visitors became deeply interested, and, after some little general information, they went from place to place reading the tickets with great care.

Generally speaking, the keepers with the white wands who move about the rooms keep themselves too much aloof, and do not seem to care to give information when it is asked for: indeed, replies have been made by one or two of these officials which, as regards intelligence, might be compared with the question above noted. Great good and

much pleasure would be the result, if intelligent attendants—and most of them are so—were ready to give useful information.

The rising generation will be able to read for themselves the marvellous lesson of the British Museum; but in the meanwhile no means should be left untried to make it so, and so to advance taste and general information. We want whole-sale teaching in our national collections. Museums should be established, too, in the eastern and southern districts of the metropolis, and in the large provincial towns, to increase the means of instruction and amusement.

#### STAINED GLASS IN LUDLOW CHURCH.

THIS magnificent parish church, dedicated to St. Lawrence, has for many months past been undergoing extensive repairs under the superintendence of Mr. Scott. Among the donors the borough members have each given a window. Of these the great west window is the gift of Mr. Botfield. The window is full of tracery, the top compartment having the emblem of the Trinity, and the seven compartments immediately below it having the Majesty surrounded by the emblems of the four Evangelists, the Lamb, and Pelican; below them the royal arms, and on either side St. George and St. Lawrence, and beneath them the arms of the borough and of the donor of the window. On either side of the above are the arms of the see of Canterbury and Hereford, and various badges of the royal house of York. The subject of the window is principally historical, relating to the castle and town. The seven long openings below the tracery contain full-length figures of "R. De Montgomery," "Josec De Duan;" "Fulke Fitzwinc;" "Peur De Ghien;" "Rog. E. of March;" "Edm. E. of March;" "Rich. E. of Cambridge." Most of them are in armour, and all surrounded by rich canopies, with their names and armorial bearings beneath them. The following inscription runs across the bottom of the openings:—"Humbly offered to God and to this church of S. Lawrence by Beriah and Isabella Botfield. An. Dni. MDCCCLX."

Below the transom of the window the west doorway cuts away the three centre openings, leaving two on each side of the door, which are filled with kneeling figures of "Richard Duke of York;" "King Edward the fourth;" "Edward Pr. of Wales;" "Arthur Pr. of Wales."

The window was designed and executed by Mr. Willement.

There are several old windows in the church, some of which are now being repaired; some new ones by Evans, of Shrewsbury; and one by Messrs. Clayton & Heaton.

#### CHURCH-BUILDING NEWS.

**Sittingbourne.**—Mr. H. M. Molyneux wishes it stated that the works here are being carried out under the joint superintendence of himself and Mr. Winble.

**Market Deeping.**—Thurby Church has been internally restored. Amongst the recent embellishments is a new reredos, executed by Mr. Tinkler, jun., of Stamford. It is of Stamford limestone, and extends the whole width of the chancel. The design is perpendicular, and accords with the window above.

**Oxford.**—Woolvecot Church, which is in the Early Decorated style, has been entirely rebuilt, except the tower, from the designs of Mr. C. Buckridge, of Oxford; the builder being Mr. Thomas, of Abingdon. The total cost of the church, including the faculty and fees, will be about 1,800*l.*, of which 150*l.* have yet to be raised.

**Witley.**—The first stone of the intended chapel for the Union House has been laid. The chapel will be of an Early English character (and, if funds can be obtained), with an apsidal chancel. It will be built for upwards of 200 persons. 200*l.* have been voted by the board of guardians for its erection, and about 250*l.* more will be required, 200*l.* of which have already been subscribed. The architect is Mr. Wilkinson, of Oxford.

**Whippingham.**—Her Majesty has laid the first stone of the new church at Whippingham.

**Devizes.**—The little church of Figheldean, after repair and restoration, has been re-opened. The architect employed was Mr. Huggall; and the builders were Messrs. Rundell, of Devizes. The estimated cost of the restoration, according to the *Dorset Chronicle*, was 1,100*l.*, of which a debt of about 200*l.* still remains to be defrayed.

**Hanley.**—We have obtained the following further particulars as to the new cemetery at Hanley:—Having secured a site, the council offered pre-

lims for the two best designs for chapels, and for laying out the grounds. Sixty-five architects, residing in various parts of the county, competed, and several designs for the arrangement of the grounds were also sent in. The designs were publicly exhibited, and ultimately that of Messrs. Ward & Son, of Hunsley, architects for the chapels and lodges, and that of Messrs. Bellamy & Hardy, of Lincoln, for laying out the grounds, were accepted. For the construction of the chapels and lodges a contract was entered into with Mr. J. Clewes, of Hanley, at a cost of 2,598*l.*; the tender of Mr. Nunn, of Leek, for arranging the grounds, at a cost of 825*l.* was accepted; Mr. J. Hill, of Hilderstone, was employed to plant the grounds, at an expense of 105*l.*; and Mr. T. Durbar contracted for 1,800*l.* to make the road, the deep drainage, and the boundary walls, and also to erect the rails and gates. This contract was carried out under the superintendence of Mr. James Forbes. The burial ground, throughout its entire extent, is drained 12 feet deep by main brick sewers, with auxiliary 6-inch pipe drains at regular distances, and at a depth of 12 feet. The plans of Messrs. Bellamy & Hardy for laying out the grounds have been executed under the supervision of Mr. J. S. Forbes, who also, as borough surveyor, exercised a general oversight of the works. The principal entrance to the cemetery is on the Stoke-road, where two lodges have been erected. Iron gates and railings (supplied by the Coalbrookdale Iron Company) have been erected. The chapels are each about 40 feet long and 21 feet wide. Each chapel has a vestry, and the two buildings are connected by three open archways, the centre of which is groined, and is intended for a carriage-way, while the two side archways are intended for foot passengers. The chapels are built in a uniform manner, and the tower, surmounted by a spirelet, springs from the centre of the group. They are constructed of Werrington stone, with dressings of Hollington stone. The style of the chapels is transitional from the Early English to the Decorated Gothic.

**Down Hatherley (Gloucestershire).**—The parish church of St. Mary, rebuilt by the family of the late Sir Matthew Wood, Bart., M.P., has been opened for public worship. The church is in the Decorated style, and consists of a tower, nave, north aisle, and north porch, a chancel, with vestry and organ-chamber attached. The edifice is entirely new. The stone carving throughout the church is the work of Mr. Purdey, of London. The chancel windows are all filled with stained glass. The subject of the east window is the Crucifixion, in the centre light of which is the Saviour on the cross, with Mary Magdalene at His feet; in the north light, the Virgin and the other Marys; and in the south light, St. John the Centurion and other figures. Over these figures and in the wheel tracery of the window are choirs of angels. The north chancel window, which is small, has for its subject the Nativity. The window on the south side nearest to the east end of the chancel represents the Annunciation. Westward of this is another window representing the Resurrection and the Ascension. These windows are all of them the work of Mr. O'Connor, and are memorial windows. The architects were Messrs. Fulljames & Waller, and the builder was Mr. Oliver Estcourt.

**Moretton-in-Marsh (Gloucestershire).**—The work of removing the old tower of the parish church here has been commenced, for the substitution of a new tower and spire, in architectural character with the new portion of the church. The contractor for the work is Mr. Joseph Gill, of Bourton, and the architects are Messrs. Poulton & Woodman, of Reading. The amount of subscriptions already promised, including 350*l.* from Lord Redesdale, is 665*l.* 10*s.* 6*d.* The subscriptions, however, fall short of the estimated cost by at least 100*l.*

**Curry Rivel (Somerset).**—A contract having been entered into by Messrs. Hartnell & Staples, builders, for the pulling down of the old, and rebuilding of a new tower to Curry Rivel Church (we here nothing of any architect having been employed), accordingly the old tower has been entirely removed, and the foundation-stone of the new one laid by Miss Frances Coker, for Miss Pinney, who used a silver trowel, the handle of which was made from a piece of the famed Glastonbury chert, and curved. The projected tower is to be built in the same style as the old, which was square, differing only in having pinnacles placed at the top of each corner of the tower, and panel tracery round the centre. There will be a carved window in the bell-tower loft, which will contain five bells. The lower level is to be built of the Pilsbury and Ham-hill

stone, and will stand on the same site as before. Its height will be 95 feet 10 inches. Amongst the ruins of the old tower was discovered the tomb of a monk of the days of Richard I.

**Cardiff.**—St. Nicolas Church, near Cardiff, has been opened, after restoration mainly by Mr. J. Bruce Pryce, of Duffryn. The works have been carried out by Mr. Parry, of Llandaff, builder, from the designs and under the superintendence of Messrs. Pritchard & Seddon, the diocesan architects.

#### COMPETITIONS.

**Heyham.**—The Committee for building a New Church at Heyham, Kent, invited several architects to offer designs for the proposed church. From the drawings submitted the Committee have selected the design by Messrs. Peck & Stephens, and it is proposed to proceed with the works forthwith.

**Bristol General Cemetery.**—For designs as to the enlargement of the Cemetery at Arno's Vale, the first premium of fifty guineas was allotted to Mr. Hans P. Price, of Weston-super-Mare; and the second, of thirty guineas, to Messrs. Poole & Newman, of Sherborne. The designs were referred to Mr. Underwood, architect, Bristol, for his decision.

#### IRELAND.

The Augustinian church at Dublin, alluded to in our Royal Academy notice, page 328, has not yet been commenced. There seems to have been an understanding that this building was to have been competed for.

A new Roman Catholic church is to be built at Crosspatrick, county Mayo; also another at Colton, county Louth.

Mr. Gillespie (late district inspector), and Mr. William Welland (assistant, and son of the late Mr. Joseph Welland, architect), have been conjointly appointed architects to the Ecclesiastical Commissioners in Ireland. The professional candidates complain of trouble incurred owing to the result not being arrived at without advertising the vacant appointment, thereby raising expectations.

The chapel school, at Newbridge, county Kildare, relative to which there is an action pending is again advertised for tenders.

The memorabilia case of Kempston v. Butter, relative to fall of house in Graston-street, Dublin, will come on immediately, for the third time.

In the case of Hugh Kelly (a builder) v. Representatives of Craunton, the plaintiff gained a verdict for 400*l.* A contra-action for breach of contract has yet to be tried.

#### THE NINE HOURS MOVEMENT.

SCARCELY has work been resumed before a fresh rupture is threatened, which, it is to be feared, if arrangements cannot be made, will end in the same disastrous results as the last struggle, which brought harm to all concerned in it—good to none.

The considerations which arise are various and important. One of the first is the right of the workmen to combine for the purpose of protecting the price of their labour and themselves from oppression and injustice. Such a right can scarcely be doubted. To the workman his labour is his sole dependence; and, in these days of cutting contracts and the most remarkable competition, it is especially necessary that the men should be able to defend themselves from the injury to which they would be exposed if left without the strength of a rightly-established combination. Care should, however, be taken, not to make this a means of oppression either with the employers or those men who have an objection or a disinclination to join the trade societies.

The next phase of this important subject which suggests itself is the question of the reduction of the hours of labour. In the long run this will more concern the public than the masters.

We have met with few workmen who say that ten hours' honest labour are more than they would willingly undertake; but they urge that in order to find anything like proper accommodation for their families, they are obliged to live at a distance from their work, and that this often forces them to walk several miles before commencing and after they have finished labour, and that this actually makes the hours of labour from twelve to thirteen a day, and many say that on reaching home they are so tired that they cannot raise their heads. This might to some extent be prevented when men are regularly established in one manufactory; but in the building trades a man

may, for a few weeks, be engaged in the direction of Fulham, and the next in the far east, or in the northern parts of Islington or Kentish-town, and then, perhaps, is sent away to Kennington or Clapham. A married man with a family of children to support cannot be constantly changing his residence, nor can he afford to pay for a separate lodging. It has been suggested that the distance at which a job is from the establishment of the master should be thought of, and a fair amount of time allowed the workmen to reach the spot where their operations are required. It is certain that if the physical condition of men is overtaxed their labour becomes of less than its right value: this not only causes the sacrifice of life and health to the men, but is also a loss to the employer.

It is said that the masons, carpenters, and bricklayers should feel especially thankful when their state is compared with the Spitalfields weavers, slop-tailors, shoemakers, and several other workers. This, however, is not the right way of putting the matter before the public, for no greater calamity could befall this great country than that the great industrious masses of the population should fall into such a state of suffering as is above alluded to.

No one who has carefully considered the additional expenses of the metropolis above the country will say that a clear income from 30s. to 35s. a week is too much to ensure the comfort and respectability of a good workman.

It is the duty and the interest of the employers not to stand aloof from the men; and it is equally clear that, while the workmen assume a sufficiently independent condition, they should not exhibit a spirit of antagonism towards those who supply that capital which gives impulse to human industry.

Let us hope that, before the building trades are drifted into another strike, mutual interests may be considered, evils complained of redressed; and, if it can be shown that the present condition of the trades and the demand for workmen will allow it, that a further amount of remuneration should be allowed. The call for a restriction of the day's work to nine hours is simply an absurdity which will not bear arguing.

We have received letters from several working men, deprecating, in the strongest possible manner, as well they may, being forced into a strike by their own leaders. One writes thus:—

"Would the 'nine hours' benefit the unemployed? Would it not increase the cost of building? And has the effect of any article nothing to do with the demand for it? A man with 400l. spare cash buys an eight-roomed house, because it lets for a certain rent, and yields a fair interest; but, if it costs 40l. more, it must let at a higher rent to pay him; and the same consequence would be that three families would occupy the house instead of two; thus six families would do with two houses instead of three, and thousands who now occupy two rooms, at 6s. per week, would make shift with one at 4s., did the two cost 7s. Again, is there any mechanic in the building trade so ignorant as not to know that repairs, alterations, decorations, &c., mostly depend on whether they can be done for a certain sum? A job that is done for 1,000l. would not be done at all were its cost 1,100l.; and to argue otherwise is only asserting that there is no limit to the price the public will pay for building.

Is ten hours' moderate exertion, in a trade where the lifting and carrying are done by labourers, too much for a healthy man? I can truly say I do not find it so. My employer has been a journeyman, knows what a day's work is, and every man in his service must do his 'bit,' or go; and yet I walk three miles to work in the morning, and back again in the evening, without impairing either health or strength.

In conclusion, I must say that if the agitators would let this question rest at its present settlement, I should think far higher of them; that they re-ignite it is as much owing to spleen at the last disappointment to their vanity as leaders as anything else; for, if they had only the good of their fellow workmen at heart, they would not attempt again to plunge them into the want and distress they brought them to last winter, and all for a measure of doubtful good. JOHN OWEN, *Bermingham-street.*"

No sensible person disputes the existence of a growing fluctuation on the part of the toiling masses to elevate themselves in the social scale; but, however much such a result is to be desired, it will never be secured by the agitation of such schemes as that of the nine hours—a plan for it varies at all times, repeatedly proved, with the principles which regulate the relative agencies and action of capital and labour. To aid in securing the results described in the "memorial," I would not hesitate to give my hand, heart, and soul; but I feel strongly convinced that the mere reduction of one hour per day in the hours of labour will not suffice, nor even compensate, for the assertion of a false principle; and if so, it would be most impolitic, unjust, and ruinous in the extreme, to attempt the enforcement of a measure which its most sanguine supporters can never expect to be permanently successful, even though it may be temporarily so. JOHN PLUMMER.

Sir—At this time, any suggestion that will tend to make men pause before they again rush into the fearful horrors and privations attendant upon a strike, is useful. Being an employer of a large number of men, and having conversed with society as well as non-society men

on the subject, it is my sincere conviction that by far the majority of the workmen in the London building trades are desirous that the strike should not take place, as they feel convinced that it would not succeed in its object.

I would suggest to the committee of the Trades' Union to let the men decide the matter for themselves, by either appointing a place to receive votes for and against the strike from all the workmen employed in the building trades, or if that arrangement would cause confusion, to select fifty of the leading building firms in this metropolis, and take their votes by ballot, in order to allow them the free expression of their opinions. If such a course were adopted, I feel sure that the men would give their vote against the strike. And let those persons who from interested motives are urging on the men beware how they again drive strong men, as well as the helpless women and children dependant on them, to starvation, despair, and crime; for few persons are at all aware of the awful amount of misery which follows on a strike. E. Y. C.

Labour is everywhere in a very unsettled state, and it is of the utmost importance that some earnest efforts should be made to bring about a better understanding.

In *Cork*, the masons are out, and according to local papers are beginning to suffer greatly.

In *Glasgow* the painters are out of work, but endeavours are being made to effect an arrangement.

At *Bradford*, in Yorkshire, 300 masons have been parading the streets. The *Manchester Examiner* says:—"The men petitioned for a reduction of six hours' labour per week, that is 57½ to 51½ hours; but to this the masters are opposed, and show that this would be only eight hours and thirty-five minutes per day; and yet it is demanded that this be conceded without any corresponding reduction of wage, the men declaring, at the same time, that, in order to meet this reduction in point of time, they are sacrificing 2s. per week wages as agreed upon seven years ago, but which agreement was violated by the masters when it suited their convenience to do so. It is only proper to state, however, that the employers offered the men an advance of wages at present, rather than allow their contracts to stand; but this the men refused; and, as the two months' notice which they gave their employers expired yesterday, they have remained idle, with the exception of a few indentured apprentices." The masters state that they are open to give or accept any reasonable terms.

At *Blackburn* differences have been arranged. In *Hull* most of the joiners are on strike. The men seek an advance of 6d. per day in their wages, raising their weekly wages from 24s. to 27s. Several of the masters have assented, but others say they are determined to withstand the efforts of the men to gain their object.

There has been a riot amongst the nailmakers of parts of *Staffordshire*, who have been on strike several months.

MEETING IN FURTHERANCE OF THE NINE-HOURS MOVEMENT.

A MEETING of working men, called by advertisement, was held in St. Martin's Hall, to further this movement, on Friday evening, the 1st inst. It was very numerously attended.

Mr. Wheeler, a plasterer, having been called to the chair, opened the proceedings. He denied that the movement was set on foot by paid professional agitators, for it had emanated entirely from the men themselves, who were desirous of ameliorating their own condition both morally and physically.

Mr. G. Potter, secretary of the Conference, then moved, in a speech of some length, the following resolution:—"That the object of this movement is not to injure the master builders, but to benefit the men. That the desired reduction in the hours of labour, whilst it will materially contribute to the physical wealth, the social improvement, the mental development, and the moral elevation of the operative builders, is not calculated to inflict the slightest loss either social or financial on their employers, and that the concession of this boon is certain to beget a better understanding between them and their workmen than that which unhappily prevails at present." The present movement was, he said, one which the workmen were justified in making by the improved state of trade. They all knew the depression of the physical system caused by long hours of labour, and he contended that if one hour were taken away the aggregate amount of work done by the individual workman would be quite as much as they performed by their overtasked energies at present. They had met to-night in the furtherance of a purely legitimate movement, and they had just as much right to demand the shortening of the hours of labour, as they had to demand a rise in wages. So far as combination was concerned it had been shown over and over again that masters com-

lined more against the workmen than the workmen did against the masters. The over-working of labourers, whether engaged in any one branch of the trade, only led to physical infirmity; and if a man through over-working was laid up at home for a month, he lost more than any amount he could gain in the year by the additional work he did. No one could deny that the working men were the producers of wealth in a nation. Yet it was proverbially the case that they obtained less of it than any other class. What the employers said was, that although the workmen might legitimately ask for an advance of wages, they could not ask for a diminution of labour from the present state of trade. He had no hesitation in saying that the men were under, rather than over paid. If the masters would concede the benefit which the workmen sought at their hands, it would be of immense importance to them, particularly in the summer months. The men had now asked the masters in respectful though in firm terms to concede the requests they now made, but they very well knew that they were in a position to demand instead of request the concession.

Mr. Perry seconded the resolution, which was carried unanimously.

Mr. Faery, painter, then moved—"That this meeting is fully convinced that the desired reduction is no more than is justly due to the manifold requirements of the operative builders, and therefore pledges itself, by the use of all the just and lawful means at its disposal, to persevere in the present agitation until the demand for the nine hours has been granted."

Mr. Howe, bricklayer, seconded the motion, and it was agreed to.

A vote of thanks to the chairman terminated the proceedings.

We are requested by "The Conference" to publish the following correspondence:—

"To Mr. Wales, Secretary to Central Association.  
Sir,—At a special meeting of the Conference convened last evening, for the purpose of receiving a suggestion from yourself, to the effect that you thought the employers would receive a deputation if the Conference asked for one. Resolved—  
'That the Conference are willing to send a deputation if the employers wish to receive one, that the question may be fully discussed between the two parties.'  
I am, sir, on behalf of the Conference,  
Yours respectfully,  
GEO. POTTER, Secretary."

In answer to the above, the following resolution was received from Mr. Wales on the 6th inst.—"That Mr. Potter be informed by the Secretary that the Committee of the Central Association decline to renew any discussion on the Nine Hours question."

MASTERS AND OPERATIVES.

The select committee appointed in March to consider what would be the best means of settling disputes between masters and workmen have sent in a concise report, which was issued yesterday. The Masters and Operatives Bill was referred to this committee, and the proposed measure is alluded to in the report, which says:—

"From the evidence taken before them, in which both masters and operatives were examined, and also after referring to the evidence taken before the committee appointed in 1856, your committee have come to the unanimous opinion that the voluntary formation of equitable councils of conciliation would tend to promote a more friendly understanding between the employers and employed, to soften any irritation that might arise, and in most cases to prevent the growth of such a spirit of antagonism as too often leads to a strike."

THE CONDITION OF TRADE.

The following is a portion only of a letter received:—

It strikes me that as long as the Legislature or those connected with the Government hoards give away the contracts of eight or ten different tradesmen's work to one single monopolising contractor, and that society generally adopts the system (which it has), you need never expect contentment amongst the tradesmen; nor will you have good workmen in all or any of the different trades it takes from the commencement to the end to finish a building; and, if this be continued, in a very few years you will have no one to educate apprentices.

It is within the last half century that this wholesale system has been generally adopted in all the Government public boards and with private parties, as previously the bricklayer, stone-cutter, plasterer, carpenter, painter, slater, plumber, sculptor, and many other trades had the benefit of their separate contracts. Then we had respect-

able employers in each and all of these trades, which can be seen by a reference to the different directories of the time, and even since, and who are all but gone, only in name. All these separate trades are monopolised and engrossed by one capital and grinding monopolist contractor, who too often sub-contracts each department of these works to the cheapest journeyman in trade, even should he want knowledge, capital, or character.

Now, what I would suggest as a remedy is, to license all the tradesmen throughout the Queen's territories, of every class and trade; and that, by a test of servitude, skill, and ability, if passed into a law, this would have the effect of doing away with those local trades' societies which every tradesman, as a stranger, has to join in every city he goes into before he will be permitted to work in the majority of employments. Let each working tradesman pay into the Exchequer 1*l.* per year as a license, and each employer, say 3*l.*, which could go, as the Government might choose, either to support the old and infirm of each trade, or to educate their orphan children, or to relieve the general taxation; and by this means the Government would make at least ten millions per year in favour of the Exchequer, and could keep a registry of their names and residences, which could be constituted into a standing army of irresistible power and magnitude, and that, too, without any extra expense to the State.

Also, I would press on the Privy Council or Board of Trade to have all the public works subdivided, so as each separate trade could have the benefit of their own servitude, skill, and ability. This alteration would require new Act of Parliament. By subdividing all those contracts under the Board of Works, Ecclesiastical Board, Board of Ordnance, Woods and Forests, and the army and navy departments, so as each trade would be brought into competition, you would have less jobbing between either architects, engineers, or clerks of works, and monopolising contractors, and do away for ever with sub-letting of every kind, as it is easier to job with one than with many.

THOMAS MANASSEPE.

ARCHITECTURE AND THE ROYAL ACADEMY.

SIR.—As the profession are very likely to overlook the fact in the channels which the council of the Royal Academy select for their advertisement of it, will you generously give them the advantage of your circulation, and state that Mr. Sydney Smirke has been elected Professor of Architecture there? I looked in vain last year for advertisements in your pages of the architectural lectures, and was not surprised to hear afterwards (when the lectures were over, and I could not go) of the comparatively small attendance on these occasions. This is amongst the hundred small foolishnesses by which the Academy show their disregard or want of knowledge of what is going on around them, and annoy their best friends.

AN OLD STUDENT OF THE R. A.

"BLIND BUILDERS."

SIR.—May I call your attention to the two following lists of tenders, again making public that "blind builders" still exist. The first is for an alteration to Clermont Chapel, Pentonville hill, Clerkenwell, and the second for repairs, partly re-building, and alterations to a house, No. 11, Tavistock-row, Covent-garden.

Clermont Chapel—Mr. Tarry, Architect.

Brass	.....	£ 454	0
Madgin	.....	241	0
Roberts	.....	289	0
Powell	.....	266	0
Richards	.....	224	0

No. 11, Tavistock-row, Covent-garden.

Keys & Head	.....	£ 730	0
Scott	.....	536	0
Fowler	.....	432	0
Thompson	.....	429	0
Williams, Brothers	.....	293	0

Comment upon this is unnecessary, but whence arises the discrepancy? In my opinion it arises from the fact that many men who call themselves builders have no right whatever to do so. I can name numbers (many of large firms) who now are professing to understand all the minutie of building (and many of them act as surveyors also), who have been working jewellers, brokers, dealers in old building materials, barbers, &c. &c., and who have amassed fortunes by others' experience and mind. In days gone by, when every part of a building was entrusted to each department, when bricklayers executed brick-work (which now will bear the severest criticism), the mason mason's work, the carpenter and joiner his work—and so on through all the different trades, then a lad was obliged to serve a seven years' apprenticeship to be an accomplished tradesman of his department; but now seven little months are all that is needed for a man (however humble his mind) to understand fully and undertake the whole of the trades combined under the head of a builder. Hence arise those vast differences in estimating, and very naturally persons say, if one man can do a job for 360*l.*, and get a profit therefrom—for it he does not, how can he find food, raiment, and lodging?—what a pro-

digious profit must the other builders require, when another estimate is nearly 50*l.* You have written pretty openly and freely upon the subject, and I will leave in your hands the consideration of those two estimates. I am one who looks with a serious eye at every one who calls himself a builder, and asks the questions where such a man served his time? with whom? and what distinct part of the trade he was taught, worked at, and learned?—and if these three simple questions were asked by every professional man before he invited (self-styled) builders to offer tenders, the remedy would be accomplished to a very great extent.

C. F.

GAUGE FOR LEAD AND GLASS.

SIR.—An architectural friend of mine having been imposed upon by a builder in reference to lead, had a gauge very carefully and accurately made in a thin piece of brass, with the respective weights of from 4*lb.* to 9*lb.* lead, marked on the sides of each slit, and by that means was enabled to test all weights of that article,—thereby preventing 5*½* and 5*¼* *lbs.* being substituted for 6*lbs.*, and other similar "mistakes;" and I believe it answers very well.

Such a one could, with care, be made for glass, &c., to carry in the pocket.

S. Y.

In reply to "One of the Profession," inquiring about an instrument for ascertaining the weight of lead without weighing, I think the following would answer for milled lead.

The weight per foot, according to the several thicknesses, is as follows:—

$\frac{1}{2}$ of an inch thick	... 3 $\frac{3}{4}$ lbs.
$\frac{3}{4}$ .....	5 "
1 .....	6 "
1 $\frac{1}{4}$ .....	7 $\frac{1}{2}$ "
1 $\frac{1}{2}$ .....	10 "
1 $\frac{3}{4}$ .....	12 "
2 .....	14 $\frac{1}{2}$ "
2 $\frac{1}{4}$ .....	17 $\frac{1}{2}$ "
2 $\frac{1}{2}$ .....	20 $\frac{1}{2}$ "
2 $\frac{3}{4}$ .....	24 $\frac{1}{2}$ "
3 .....	30 "
Inch .....	50 "

Take a piece of stout copper, or zinc, and notch out these several thicknesses, and it will form a gauge to ascertain the weight. I apprehend the notches need not go further than  $\frac{1}{4}$  of an inch 14  $\frac{1}{2}$  *lb.*

JAMES EDMONSTON, Salvador House, Bishopsgate.

SIR.—In reply to "One of the Profession," at page 355, allow me to mention that I have seen an instrument for the purpose alluded to. It was of circular form three or four inches diameter, with concentric scales, indices, and a means of taking the thickness with great exactitude; the results being obtained by a process similar to that employed with the slide rule.

With regard to the weight of lead, there can be no difficulty in works of magnitude, as every sheet is stamped in the way noted in the margin; 10 3 1 the first line showing the total in cwt., lbs., ounces, and lbs.; the second the length of the sheet in feet; and the third, the weight per foot. The sheets are all rolled at a 7 feet gauge, and the accuracy of the mark is therefore easily tested. There is usually a side number for reference in the merchants' books.

Sheet glass of thirteen ounces to the foot, is one-sixteenth of an inch thick; and twenty-four ounce glass, one-ninth of an inch. But the young architect should accustom his eye to these points, as instruments are not always at hand when wanted; and to those unaccustomed to their use, are often as mischievous as the cabinman's "distance indicator!"

Far.—What have I to pay?  
Cobby.—Five shillings, sir.  
Far.—Why, I have not ridden two miles!  
Cobby.—Can't help it, sir; we always goes by the index.  
T. M.

LEEDS CORN-EXCHANGE COMPETITION.

SIR.—I observe in your last number a letter upon this subject, signed "Scru," reflecting upon the supposed intentions both of the Leeds Markets Committee (who have the management of the corn-exchange competition) and of myself.

As some of your readers are probably interested in this competition, and as they may fairly presume that such supposititious statements would not have been permitted to appear in so carefully-conducted a journal as the *Builder* without some foundation in fact, I may, perhaps, be allowed to assure them and yourself, sir, that not one of the suspicious so freely indulged in by your correspondent has any such foundation whatever.

The committee have had no intention of placing the works in my hands, nor have I any intention of undertaking them. On the contrary, it is in accordance with my recommendation to them from the first, that they have determined to entrust this building to an architect. They decided to throw the design open to competition, because they believed it to be the most satisfactory course of proceeding.

The stipulations in the conditions for sufficiently detailed plans and minute estimates, which I am desirous to tender from, are intended not only to secure accurate estimates from competing architects, and to enable the committee to have these estimates tested, if necessary, but to prevent "approximate" estimating upon insufficient data. The other stipulations which your correspondent appears to dislike have a similar end in view.

On the other hand, if the best designs submitted are not of too costly a character, and if no other unforeseen objection arise, the committee do not intend, nor do they in their instructions express, otherwise than that a successful architect should carry out his designs, as well as receive the premium.

I would a copy of the instructions for your own information, and shall be happy to give any explanation that

may be in my power to any competing architect who will address a line to me.

I trust, sir, that you and your readers will be satisfied with my assurances that the Markets Committee has had no intention of acting in the discredit manner suggested by your anonymous correspondent, and I only regret that he should have been permitted to occupy your valuable columns with groundless suspicions of a public body, and with uncalculated personal remarks upon a professional man.

EDWARD FILLITER, Civil Engineer, Borough Surveyor, Leeds.

"HERTFORD BUILDING COMPANY'S COTTAGE COMPETITION."

SIR.—I have anxiously watched your two last impressions, expecting to have seen something relative to the above competition.

Designs from about twenty-eight architects were received; and, after exhibiting them to the public two or three days, eight gentlemen were written to, requesting their attendance; and upon the day named eight gentlemen made their appearance, each surprised at seeing so many others. One by one they had an audience, and were told by the directors that it was not possible to decide on that day. After a lapse of some days letters were received stating that the premium of 20*l.* had been awarded to Mr. D'ball, of Cheswick. Now, sir, Mr. D'ball was not one of the eight who were brought from Norfolk, Nottinghamshire, Somersetshire, Kent, Hampshire, and London.

I am also informed, on the authority of persons living at Hertford, and who inspected the designs, that Mr. D.'s plans were sent in two or three days after the other designs were exhibited to the public.

Can we not claim our time and expenses?  
ONE OF THE EIGHT.

STAINED GLASS.

Southwater.—One of the windows of the church of this place has been recently enlarged, and filled with stained glass, to the memory of Sir Henry Fletcher. The glass is by Messrs. Bell & Clayton. The subjects illustrated in it are,—1. The Massacre of the Innocents. 2. The Circumcision of Christ. 3. Christ Receiving and Blessing Little Children. 4. Infant Baptism. In the upper compartment of the window is the figure of our Saviour, seated on his mediatorial throne, in the attitude of imparting benediction.

Taunton.—A stained glass window, says the *Taunton Courier*, has just been placed in the south wall of the church of Taunton, St. Mary Magdalene, to the memory of the late Lord Hinton, Colonel of the 1st Somerset Militia, and his brother officers. It is a three-light, and has full-length effigies of three of the warriors of the Old Testament—Joshua, David, and Gideon, under light canopies. Beneath are panels illustrative of Joshua's vision of the captain of the host, David slaying Goliath, and Gideon breaking down the idol. In the tracery are angels holding Christian armour.

Launceston.—A stained window, value 200*l.*, has been placed in the centre aisle of the east end of the church here. It represents a scene at Bethany after the Ascension. Above are the two angels. The window is the gift of the late Mr. Edmund Spettigue, of Launceston.

Warrington.—A stained glass window is about to be erected in St. Paul's Church, Warrington, in memory of the late Mrs. Beaumont. The subject is "Dorcas distributing Alms to the Poor." The cost will be about 130*l.* It is to be executed by Messrs. Clayton & Bell.

Books Received.

An Analysis of Ancient Domestic Architecture in Great Britain. By F. T. DOLLMAN and J. R. JOBBINS. No. 7. London: Masters.

The current number of this well-executed work contains four plates illustrative of the Guesten Hall, Worcester, of the efforts to preserve which we have lately spoken. The illustrations comprise an interior and exterior elevation, and full details of the elegant timber roof which distinguishes it. The Guesten Hall appears to have been commenced about the year 1320, in connection with the monastic establishment of Worcester, as a place for the entertainment of visitors.

Speaking of Worcester, we may mention that the further restoration of the cathedral, under the direction of Mr. Perkins, has been commenced. Messrs. Bennett & Sons, of Birmingham, are the contractors.

VARIORUM.

The state of progress made with the additions to the American Houses of Parliament,—the United States Capitol,—is recorded in the printed "Reports of Captain M. C. Meigs, accompanying the annual Report of the Secretary of War, for the year 1859" (G. Bowman, Washington, printer). From these reports it appears that the interior of the Capitol extension is now nearly completed; and the re-

building of the dome is so far on the way, that the iron framework is put up, and a part of the iron covering laid on; and that the subject of ventilation turns out to have been nearly as great a problem in the United States Capitol as in the British Houses of Parliament. — In a tract on the Thames Navigation, titled "Reduction of the flow of the tide, with the beneficial results thereof" (Blackwood, Paternoster-row), Mr. George Wyson, C.E., suggests the formation of breakwaters, to limit the width of the river, at Southend, by which means, he maintains, a proportionate reduction of the high tides will take place, the beneficial effects of which he sums up as comprehending the drainage of London and its suburbs; the reclaiming of land from the influence of the high tide; the offering facilities for the safe, speedy, and economical erection of river-walls; the further deepening of the bed of the river; increased and ready dock-accommodation; shelter for vessels from storms at the mouth of the Thames; and the extension of railways in conjunction with the breakwaters.

### Miscellaneous.

**TO ASCERTAIN WHETHER A ROOM IS DAMP OR NOT.**—Place a weighed quantity of fresh lime in an open vessel in the room, and leave it there for twenty-four hours, carefully closing the windows and doors. At the end of the twenty-four hours re-weigh the lime, and if the increase exceeds one per cent. of the original weight, it is not safe to live in the room. — *Cosmos.*

**ABERYSKIR, NEAR BRECON.**—A vestry meeting took place on Friday, the 1st of June, for the purpose of receiving tenders for the restoration of the church. The designs are by Mr. Charles Buckridge, Oxford. The following tenders were opened in the presence of the contractors by the rector, the Rev. Mr. Morgan.—Williams & Sons, Brecon, 622l.; R. Price, Brecon, 542l.; Griffiths & Son, Brecon (accepted), 510l.; E. Winstone, Brecon, 441l. The works are to commence immediately.

**BIKENHEAD.**—On Monday, 4th June, it was stated at the meeting of the Birkenhead commissioners, that the net profits upon the supply of gas and water to the township, during the past year, amounted to 2,800l., and that in time the local rates would be very materially reduced from these sources. — During some remarks at the meeting of the Birkenhead commissioners recently, the chairman, Mr. John Laird, stated that the new landing stage for Woodside would be ready in twelve months, and that the contract had just been given to Messrs. Vernon & Son, the builders of the present great landing stage at Liverpool.

**RAILWAY MATTERS.**—It is decided to erect a new railway station at Kendal. The designs have been furnished by Mr. Worthington, of Manchester, and the cost is estimated to be between 7,000l. and 8,000l. — The new station at the Leamington avenue terminus of the London and North-Western railway is approaching completion. The building is composed of white brick and stone. The platform is 250 feet long by 12 feet, with entrance-hall, first and second-class waiting-rooms, and various offices. The building has been designed by Mr. W. Baker, the engineer of the company, and erected by Mr. Purnell, of Rugby, at a cost of about 4,500l. — A company is being formed for piercing a tunnel through the Simplon, in connection with a railway line which is to start from Geneva, touch at Thonon, Martigny, Sion, and Brig, and end at Arosa on the Italian side.

**PROPOSED CASCADES AND FOUNTAINS FOR THE VICTORIA-PARK, BATH.**—It is proposed, says the *Bath Chronicle*, to construct near the level of the river a filtering apparatus, and from thence to force the water up to a tank or pond (to be made in centre of paddock at the corner of Park-lane) by means of "Fryer's Water-Raising Apparatus." From the tank or pond it would flow on to Cascade No. 1, in upper dell, and winding round the dell flowing on to Cascade No. 2, in lower dell, and passing on, underneath the proposed ornamental bridge, down through pipes to the pond, and rising there as a fountain should, viz., a graceful display of water, unincumbered by inexpensive river gods and nymphs, or vomiting gurgoyles. From thence, if desirable and the funds will admit, Cascade No. 4 may be formed in the valley below the pond: the water would then return to its original source through the drains, unless the inhabitants of Norfolk-crescent desired to make use of it first to adorn the centre of their lawn. In raising the funds for the first cost no difficulty is apprehended, liberal offers of assistance having been already promised.

**IRON AND THE IRON TRADE.**—The London Association of Foremen Engineers (St. Swithin's-lane) have printed for distribution a paper read by Mr. James Robertson, at one of their meetings, on the "History of Iron and the Iron Trade." It is a sensible sketch of the subject.

**GAS AT EARLSTOWN.**—Since the introduction of gas into Earlstown (upwards of twenty years ago) the price of this useful article has never been below 15s. per 1,000 cubic feet. No wonder the consumption of gas is very small with a price so primitively and extravagantly high. A reduction of 1s. 3d. per 1,000 cubic feet, according to the *Kelso Chronicle*, has just been announced, making the present price 13s. 9d.; but the reduction is far too small to do any good either to the consumer or the manufacturer: it is still, in fact, all but prohibitive.

**PREVENTION OF BANKRUPTCY.**—Mr. David Smith, an extensive wholesale merchant, of Glasgow, and a county magistrate, has submitted a proposal to the Attorney-General of England for the prevention of bankruptcy. A study of the systems of bankruptcy in other countries, especially those of France, Belgium, and Hamburg, has suggested to him the expediency of enacting stringent rules, under severe penalties, for compelling every man who trades on credit to balance his books at least once a year, and providing that where a trader, at the end of any year, finds that he has lost all his own capital and is below par, it shall be imperative on him, under the penalty of imprisonment, to call a meeting of his creditors, and lay before them a statement of his affairs.

**MONUMENTAL.**—The committee, at Southampton, for the erection of a memorial to the late Alderman Richard Andrews, have resolved—That Mr. Brannon's design be adopted, provided Mr. Bryer and Mr. Brain will agree to enter into a joint contract to carry the same into effect, in accordance with the plans and specifications submitted for the same, for 320l.; and provided they do obtain two surveys, to be approved of by the committee, and that no Bath stone be used externally. — A monument, at the expense of the members of the Waterford Hunt Club, has been erected to the memory of the late Marquis of Waterford. It consists of a plain ancient Irish cross and pedestal, of Wicklow granite, placed upon a cubic base, constructed of stone, and 7 feet in dimension. The cross is raised upon the spot where the marquis was killed. The monument, including cross, pedestal, and base, presents an elevation of more than 20 feet.

**IMPORTANT TO WELL-SINKERS AND OTHERS.**—It is well known, remarks a contemporary, "that carbonic acid often accumulates in large quantities at the bottom of wells, and that its presence may be ascertained by letting down a lighted candle, which will go out as soon as the flame comes into contact with the gas. Many men have lost their lives from descending into wells in this state. M. Sylvestre has discovered an easy way of absorbing this fatal gas. He pours lime-water (water in which lime has been slaked) gradually into the well, allowing it to trickle down the sides; and then throws down some five or six pounds of quicklime in lumps. By the next day the carbonic acid gas is all absorbed, and the well is safe." Who M. Sylvestre may be we know not, but it is many years since this mode of absorbing the carbonic acid of wells was pointed out in our columns. We only mention what is now said as to it, because we still occasionally see recorded cases in which persons lose their lives from not adopting some such precautionary measure.

**CONDITION OF OUR MONUMENTS.**—Remarks have been justly made on the delays which take place in the completion and erection of our public monuments; but the utter neglect of these monuments after they have been erected is perhaps still more unaccountable. We pay extravagant prices for our statuary; yet, when a statue is once placed on its pedestal, paid for, and consigned to the blackening and corroding influence of the London atmosphere, no one seems to care any more for it. A few weeks ago the Prince Consort was invited to view the decorations of the arcades of the Royal Exchange; and it is to be hoped that some means were taken on that occasion to conceal from sight the statue of her Majesty, by Lough, which occupies the centre of the quadrangle, and which is now so begrimed and disfigured by soot that the features are scarcely discernible, and if seen by his Royal Highness, must have been a positive eyecore. A trifling outlay would suffice for cleansing and keeping clean all the public statues of London; but it is begrudged, and we act in respect of the smoke nuisance as if it were irremediable. — A. F. H.

**EFFECT OF THE REMOVAL OF DUTIES.**—A correspondent of the *Morning Star* gives statistics showing that between 1841 and 1851, when the excise duties on bricks and glass were abolished, the population of Great Britain increased not quite thirteen per cent.—the number of people employed in making glass rather more than fifty per cent.; the number of bricklayers, brickmakers, and dealers, rather more than seventy per cent.; and the number of other persons employed in the building trade, rather more than forty per cent.

**FRESCOES AT NETLEY ABBEY.**—Mr. J. Smith, of the Ordnance Office, Southampton, in the *Hampshire Advertiser*, announces the discovery of fresco paintings on the walls of Netley Abbey. Pieces of coloured ornament, he says, are still adhering to the walls, although to decipher them requires a considerable amount of patience, owing to successive coats of whitewash having been passed over their surface, which holds so firmly on to the original ground that it is almost, in many instances, impossible to remove it, whilst damp and mildew have been doing their subtle work, rendering what remains quite brittle or rotten.

**ARTISANS AND THE VOLUNTEER MOVEMENT.**—Through the zeal of the Rev. Harry Jones, incumbent of St. Luke's, Berwick-street, the Lord Lieutenant of the county has rescinded the rule which obliged all members of the Working Men's College Corps to be members of the College. A company is being formed at St. Luke's, subscription small and uniform inexpensive, to enable artisans to join the Volunteers without special pecuniary help from others. The "St. Luke's Rifles" will form a company of the "19th Middlesex," which was the "Working Men's College Corps," and now a Working Men's Corps, and have battalion drill with them: their company drill, however, will be held in the school-room, under St. Luke's Church, Berwick-street, on Mondays, Wednesdays, and Saturdays, from 8 till 10 p.m. We want to see working men in general, and operative builders in particular, taking a more active share in the movement.

**PREVENTION OF BOILER EXPLOSIONS.**—Recent explosions of boilers have induced the *Wolverhampton Advertiser* to call attention to an invention patented by Mr. Thomas York, of this town, in 1856. It is designated a "Patent Safety Valve and Low and High Water Indicator." Its peculiarity consists chiefly in blowing off the steam from the boiler when the water rises too high, or sinks too low, and when the steam exceeds the pressure applied by a spring, it escapes as in an ordinary safety-valve. The apparatus consists of a lever, from each end of which descends a rod, bearing a float. The lever is suspended within the boiler by a fulcrum, upon the centre of which it moves freely in a vertical direction. An iron box containing the valve and the spring (which is spiral) presses upon the valve.

**THE METROPOLITAN DRINKING-FOUNTAINS ASSOCIATION.**—The first annual meeting of this association was held on the 31st of May, at Willis's Rooms, Mr. Samuel Gurney, M.P., in the chair. From the report we learn that the plan of attaching money-boxes to the fountains for the donations of friends has been adopted, and the first money-box has been placed at the first erected fountain on Snow-hill. So far as the experience of four weeks justifies an opinion, it is very encouraging, and a sum of 8d. a day has been deposited in small coins varying from farthings to two-shilling pieces. The experiment is to be extended to five other fountains, when, if successful, it is proposed to supply every fountain with a money-box, when the erection will be more than self-supporting. Among the fountains in preparation may be instanced, besides that for the Royal Exchange,—the donation of Mr. Samuel Gurney,—a costly fountain, of Gothic design, intended for Palace-yard, or some other site contiguous to Westminster Abbey, the gift of Mr. Charles Buxton, M.P.; a fountain, of classic design, to be placed in the Strand, presented by Mr. Robert Hanbury, M.P.; and a fountain for which Mr. Theed, the sculptor, is preparing statues. Another fountain has just been erected in front of St. George's Hospital, Hyde-park-corner, the design by Mr. Westmacott, I.R.A. Mr. John Bell has also prepared some designs of both standard and mural fountains, and other designs are in preparation by Messrs. Wills. A turncock has been appointed, whose exclusive duty it is to visit the fountains at regular intervals, for the purpose of keeping them clean and in good order. A daily return is made by him to the central office. The past receipts of the association during the past year have amounted to 2,609l., and the expenditure to 2,346l., leaving a balance of 263l.

SASHES AND CASEMENTS.—Mr. John Brown, of Norwich, has patented an arrangement to render window-sashes and French casements dust and water tight when closed. The method of effecting this appears to be inexpensive and easy of application. Cloth padding, of a simple description, and a screw sash-fastener, being all that is required for sashes, and for casements, a small apparatus with padding. It is worth looking into.

THE BUSINESS OF THE LATE MR. THOMAS CUBITT.—We go a little out of our usual course to mention that the executors of the late Mr. Cubitt have relinquished that portion of the building business which up to the present time has been carried on at the premises in Grosvenor-road, Thames Bank, in favour of Mr. George Dines, to whom they have granted a lease of the workshops and premises. Mr. Dines has been with the late Mr. Cubitt and his executors for upwards of twenty-six years, and, during that period, has taken a leading part in the management of nearly all his larger works. We were indebted to Mr. Dines, on more than one occasion, during Mr. Cubitt's lifetime, for careful experiments as to certain desirable facts.

ACCIDENT AND LOSS OF LIFE, GUERNSEY.—On the 25th ult., a workman employed at the Methodist New Connection Chapel, in course of erection at Guernsey, was killed. This chapel is to be built on the site of a house that once belonged to the late Lord Saumarez. To accomplish this the old mansion has to be demolished. A great part had been taken down, when, in the act of bringing a vault to the ground, a quantity of brickwork fell upon one of the workmen: the others escaped. The accident happened through neglect on the workmen's part. The builder had given the necessary orders the day before, but, unfortunately, they had been disregarded. Instead of demolishing gradually, they took down some stones at the springing of the arch. This straining the arch caused it to fall, and before the deceased had time to escape the ruins had covered him.

THE COPPER TRADE.—By a special return, ordered by the House of Commons, of the exports and imports of copper and copper ore for the twelve months ending Dec. 31, 1859, we find that the total amount of copper ore imported into the United Kingdom was 71,277 tons, and copper wrought and unwrought, 25,105 tons. The total declared quantity of the copper ore exported was 987 tons, of which 921 tons were foreign, and 66 tons British. The copper, wrought and unwrought, exported amounted to 25,382 tons, being 22,788 tons of British, and 2,594 tons of foreign copper. The imports were received chiefly from Chili, Cuba, and Australia, while British India and France were the largest recipients of our exports; the former took 7,123 tons, and the latter 5,270 tons of copper.

A NEW MODE OF CONVEYANCE.—A prospectus has been issued of the Pneumatic Despatch Company, to be established for the construction of pneumatic tubes for the conveyance of despatches and parcels between various stations in the metropolis. The system has for several years been privately in operation, the Electric and International Telegraph Company having employed it between their central station in Lothbury and the subsidiary stations in Cornhill and the Stock-Exchange. It is now proposed to lay down a complete and extended series of public lines in London, on a scale which will receive not merely papers and packets, but parcels of considerable bulk, including the mail-bags of the Post-office, between railways and the district offices. It is considered, also, that it will be found desirable to connect the various Government establishments. The capital is to be 250,000*l.* in 10*l.* shares. The Marquis of Chandos is the chairman.

DISCOVERY OF ASSYRIAN ANTIQUITIES IN ARMENIA.—The discovery of "a perfect mine of antique art treasures," in some mounds outside the old Armeno-Assyrian city of Van, is spoken of by a correspondent of the *Levant Herald*. A couple of peasants were engaged in digging out some loose stones from the mounds in question, when they came upon, first one, and then a second bronze plate, thickly embossed with cuneiform inscriptions, interspersed with rude angular figures of men and animals. The pasha then despatched a party of explorers to the mounds, and the result of a few days' search was the discovery of a splendid bronze human-headed bull, about three-quarters life-size, a large winged eagle, and two elaborately carved serpents, all of seemingly the purest bronze. The exploration has not been carried further, and the pasha has hauled over all to the *Karabash* of the Armenians, who is about to melt them down for the sake of the copper! Won't he sell?

COLLECTION OF ENGLISH AND FOREIGN MSS. FROM FIFTEENTH CENTURY.—We see from a catalogue of sale issued by Messrs. Chinnock & Galsworthy, that 1,175 lots, forming only a small portion of the collection, will be dispersed under the hammer during the present month. The historical value of many of the documents referred to is very great, particularly those relating to the Stuart family and the time of the Commonwealth; those also of the reigns of Henry I, II, III, and IV, of France, are very interesting. The great aim, however, of the collector, seems to have been the full and almost perfect illustration of the History of the first Republic, and the Consulate and Empire of the first Napoleon.

THE METROPOLITAN RAILWAY.—On Tuesday Mr. Burchell, the solicitor to the company, appeared before a bench of county magistrates, at the Freemasons' Tavern, and applied to them, under the 85th section of the Lands Clauses Consolidation Act, 1815, to appoint a surveyor to value certain property in the neighbourhood of Gray's-inn-lane, which the company desired at once to take possession of. A good deal of discussion took place, and ultimately it was held that there was no proper proof that this property was a portion of that which was authorized to be taken under the Company's Act; and it was arranged that the application should be repeated.

GAS ACCOUNTS.—A report by Mr. J. McClelland, a Glasgow accountant, has been printed, in which the results of an investigation of the books of the City and Suburban Gas Company of Glasgow are given by order of a court of law, in connection with a case in progress at the instance of certain gas consumers, to ascertain, among other points, whether the profits of the company have exceeded 10 per cent. on paid-up capital. The accountant reported that the paid-up capital was 185,740*l.*; expenditure on works and buildings, 156,228*l.*; average gross income, 33,433*l.*; average working expenses, 20,983*l.*; average of gas made, 159,737,748 cubic feet; of gas sold, 130,498,300 cubic feet; of loss, 29,239,445 cubic feet (per annum, of course, or 18,300 per cent. on the make); average cost of manufacture, 3s. 2d. 590 per 1,000 cubic feet; average price to public, 5s. 1d., '486; average apparent profit, 1s. 10d., '896 per 1,000 cubic feet; average net income, 10,570*l.*; average dividend thence payable, 7,787 per cent.; average dividend from 1845 to 1858 paid, 8,200 per cent. (surplus from premiums on shares sold). Of late years the company had paid the maximum dividend of 10 per cent., free of income-tax. In 1853, about the period when this maximum dividend first began to be paid, the price had been reduced from 5s. to 4s. 7d., and this reduction, says the accountant, "formed, with the augmented consumption of gas, the chief operative cause of the increased surplus revenue of the company," and one of the elements of its "prosperous" state of progress. Since then, however, the price to its 25,000 consumers had been raised again to 5s., on the ground of a rise in the price of coal.

TENDERS
For building St. Luke's Church, Heywood, Lancashire; Mr. Joseph Clarke, F.S.A., architect.
Hay, Cochran, & Co. £11,652 0 0
J. Bramall 11,431 0 0
William Buxton 11,303 0 0
Bowden, Edwards, & Co. 10,291 0 0
Thomas Penk 10,060 0 0
High Yates 9,990 0 0
Mark Foggett 9,952 0 0
Edward Hughes (accepted) 9,589 0 0

For the erection of Three Houses on the New-road, Rochester, for Mr. J. L. Levy Messrs. Andrews & Son, architects:—
Kemp, Chatham £3,475 0 0
Spicer, Strood 3,218 0 0
Jennings, Rochester 3,598 0 0
Lilley, Strood (accepted) 2,555 0 0

For the erection of Seven Houses, Earl-street, Kensington; Mr. W. Sim, architect:—
For 4 Houses. For 5 Houses. For 7 Houses.
Cowland £2,914 0 0 £3,635 0 0 £3,167 0 0
Bird... No price given. 3,130 0 0 No price given.
Fish... 3,479 0 0 3,835 0 0 4,267 0 0
Mr. Fish's tender for the four Houses accepted.

For erecting Corn and Flour Store, Horsfall Basin, Regent's Canal, for Messrs. Waters & Steel; Mr. G. A. Burn, architect:—
Bird £2,986 0 0
Downs (accepted) 2,438 0 0
2,835 0 0

For works in erecting Offices, Warehouses, and Workshops for Messrs. Parkhoun, Gas Meter Manufacturers, College-lane, City-road; Mr. T. Taring, architect:—
Higgs, Lambeth £2,300 0 0
Patman & Potheringham 2,224 0 0
Brass 2,100 0 0
Myers 2,114 0 0
Roberts, Islington 2,130 0 0
Poster, Whitefriars 2,090 0 0
Batterbury (accepted) 1,989 0 0

For the erection of New Farmhouse, Offices, and Home-street, (with Cowshed, Cambridge-shire); Mr. Robert Hutchinson, of Huntingdon, architect. Quantities supplied:—
Stairs & Bridge £2,600 0 0
Frensh & Leach 1,114 12 0
French 1,750 0 0
Mason 1,741 0 0
Saint 1,739 10 0
Allison & Smith 1,720 0 0
Jobbott & King 1,726 13 0
Allen & Smith 1,690 0 0
Bunting & Son 1,650 0 0

For additions to the Plumbago Crucible Works, Bat-tersea; Mr. G. O. Leicester, architect:—
Fowler £1,117 0 0
Newman & Mann 1,075 0 0
Coleman 1,029 0 0
Wilson 990 0 0
McLennan & Bird 967 0 0
Downs (accepted) 954 0 0

For Roads and Drains on the Suburban Land Society's Estate at Bromley, Middlesex:—
Rivett £960 0 0
Ley 589 0 0
Leyton 479 0 0
Pound 452 15 0

For draining and forming Roads to the Building ground adjoining the Hartford-road, in Huntingdon; Mr. Robert Hutchinson, surveyor:—
William Mosher £637 15 0
Zachariah Hobbs 670 0 0
Samuel Mason 617 8 0
John Saint 506 0 0
Richard Brown 450 0 0

NOTICE.—All Communications respecting Advertisements, Subscriptions, &c., should be addressed to "The Publisher of the Builder," No. 1, York-street, Covent-garden. All other Communications should be addressed to the "Editor," and not to the "Publisher." Post-office Orders and Remittances should be made payable to Mr. Morris R. Coleman.

ADVERTISEMENTS.

Just published, price 6*l.* or 1*l.* in boards, MEMORIALS OF WORKERS: the Past and the Future. By GEORGE COPPIN. Author of "The Social Struggle," &c. "This printed lecture should be read and thought over in the home of every peasant and artisan in Great Britain."—Art-Journal. London: GOSWOLD, Tremlett, and at the Office of "The Builder," 1, York-street.

DE GEORGE SMITH, DECEASED.—In Pursuance to the Act of Parliament, the 22nd and 23rd of Victoria, chap. 55, relating to an Act to further amend the Law of Property, and to relieve Trustees, notice is hereby given that all creditors and persons claiming under or against the Estate of GEORGE SMITH, late of No. 18, Blandford-road, Stockwell, in the County of Surrey, Timber Merchant, deceased, who died on the 26th day of May, 1859, or on or before the 24th day of July, 1859, to send to the undersigned, at our Chambers, No. 6, Baring-lane, Lothbury, in the City of London, a list of the names of the Administratrix of the deceased, particulars of their debts or claims, or in default thereof the Administratrix will, at the expiration of the above period, proceed to distribute the assets of the estate amongst the parties entitled thereto, having regard to the debts and claims of which she shall then have notice; and notice is hereby given, that all persons owing any debt or debts, or sums of money to the said late estate or to his estate, are requested to pay the same to us on behalf of the said Administratrix, on or before the said 24th day of July, 1859. Dated this 5th day of June, 1860. SIDNEY SMITH & SON, 6, BARNARD'S-INN, C. F. HOLLORN, London, Solicitors to the Administratrix.

MR. T. Y. KIMPTON, ARCHITECT and SURVEYOR, 2, ADAM'S-COURT, OLD BROAD-STREET, LONDON, E.C. Detailed accounts precisely adjusted. Architects' works measured and valued. Estates surveyed and mapped. Designs, working and detail drawings, maps, plans, tracings, perspectives, and architectural generally. Laboratory, artistic and executed with despatch.

MR. WILLIAM ELLISON, CONSULTING SURVEYOR, late of BILDING ROAD, has taken office at 15, FENCHURCH-BUILDINGS, FENCHURCH-SQUARE, E.C. ON BEHALF OF CONTRACT DISPUTED ACCOUNTS, &c.

RICHARD ROBERTS, C.E. (formerly of R. SHARP, ROBERTS, & CO. Manchester) begs to inform his friends and the public, that he has entered into arrangements for carrying on the business of CONSULTING ENGINEER, under the Firm of RICHARD ROBERTS, KILD, & CO. at 10, ADAM-STREET, ANGLIA, LONDON.

MR. THOMAS WYATT, SURVEYOR, 15, MADDOX-STREET, REGENT-STREET, may be consulted on BUILDING CONTRACTS and on the adjustment of DISPUTED ACCOUNTS, ADVANCES ON BUILDING SPECULATIONS, &c.

PARTNERSHIP.—A London Architect is well situated for PURCHASING a SHARE of not less than 200*l.* in any well-established London practice.—Address, in confidence, to ARCHITECT, care of G. G. 4, Kilburn Priory, Edgware road, W.

A PARTNER WANTED, in the PLUMBING, PAINTING, and BUILDING LINE, Capital required, 700*l.*—Address, A. M. S. Office of "The Builder."

VOL. XVIII.—No. 906.

Condition of London—Italians—Children.

**B**ETHNAL-GREEN was startled two or three weeks ago by an inquiry before the coroner touching the death of a woman which had occurred in St. Bartholomew's street. The evidence showed that deceased, her husband, and seven children, the eldest eighteen years of age, slept huddled together in one small wretched apartment, and the jury returned a verdict "That the deceased died from asphyxia, produced by the overcrowded and unwholesome state of the room where she had resided."

This overcrowding and other evils in a sanitary point of view, are still permitted to a lamentable extent. It may be noticed as satisfactory, however, that in many districts to which we have directed

attention, improvements have been effected. For instance, in the Soho district, where one of the earliest of our sanitary sketches was made, model lodging-houses have been raised; and close to Charlotte's-buildings, in Gray's Inn-lane, schools have been opened, improved dwellings have been erected, and a church is now rapidly rising. Nevertheless, the buildings described seven or eight years ago in Soho, and those in Charlotte's-buildings, still remain unchanged, in spite of the appointment of district boards, inspectors of nuisances, and the usefulness of the sanitary department of the police.

From time to time since the publication of our first statement respecting Charlotte's-buildings, we have inspected its condition, considering that this may be considered as a type of many other places which are thickly inhabited, and where, through ill arrangements, health and life are constantly sacrificed. At times when the public attention has been directed to this dismal spot, the dilapidations have been, to some extent, repaired, the dingy walls whitewashed, and some attention has been paid to the cleanliness of the back part of the premises. This partial benefit is, however, but temporary, for the north side of the place is as filthy and dangerous as it was nine or ten years ago. When we last saw it the pavement was broken, and the earth saturated with every kind of refuse. The closets were stopped and overflowing into the yards, and the atmosphere was so heavy that the people declared that they were not able to have the windows open. The condition of the interiors was equally bad, and no words can give an idea of the pictures of neglect which were there presented, close though it be to the life and wealth of a great London thoroughfare.

To one circumstance we would particularly direct attention. The time of our visit was about three o'clock on a Saturday afternoon. At that hour the butts were empty, and not a drop of water was to be had on that side of the court, nor would they have any fresh supply until the following Monday. It seems terrible that for forty-eight hours these poor people should be left without this important necessary of life. How can cleanliness or decency be expected under the circumstances? It should be borne in mind, moreover, that each of

these houses produces an annual rent of from 45*l.* to 50*l.* Surely for this there should be water and other means of comfort provided. The buildings on the other side of the court are in the charge of another person, and are in a better condition, while tanks have been placed for the reception of water, which prevent such frequent scarcity. Between this court and Tyndale's-buildings the contrast is remarkable. In the latter place there is plenty of water, with good ventilation, and order and cleanliness. We well recollect the condition of the rooms there before they were taken possession of by the Association, which has conferred so much benefit on the neighbourhood. A lodging-house, similar to that in Charles-street, Drury-lane, has been opened, and is well occupied. In parts adjoining, and towards Hockley-in-the-Hole,—the Italian quarters,—the neglect of sufficient water supply was much complained of when we last inquired, and this, undoubtedly, is one of the sanitary evils to which thousands of the poorer dwellers in the metropolis are subjected, particularly between Saturday and Monday.

In the winding courts and alleys which stretch from the Sessions-house, Clerkenwell-green, towards Smithfield, hundreds of people had no water. This neighbourhood certainly needs sanitary inspection.

In the course of our wanderings we glanced at several dwellings which have been licensed under the Common Lodging-house Act, and are overlooked by the police. Water is well supplied, and the houses are kept in repair; the closets are in order, and other necessities of health are attended to.

Remembering the beneficial effect which has been produced by the systematic exertions of the sixteen or eighteen sergeants who form the sanitary staff of the metropolitan police, and knowing the fever dens over which they have no authority, we feel the desirability of extending this power to houses which are let in tenements to numerous families of old and young. The law at present has no power in such cases, although the dwellings may be altogether unfit for human habitation, and be crowded from the basement to the roof. Thus human life is wilfully sacrificed, and sickness, immorality, and crime are surely generated.

No one who has thought carefully on this important subject, who has viewed the monster evil which exists, will deny that the better regulation of houses in large towns, crowded with tenants, is absolutely necessary. In many situations the amount of ignorance is startling. To persons thus situated the enforcement of sanitary improvements is necessary for the protection of themselves and children,—while to those of intelligence who may have been driven to seek shelter in such places the benefit of proper inspection will be readily acknowledged.

We have watched with attention the efforts of the sanitary staff to which reference has been made, and have noted their general civility and intelligence. In very few instances are their operations found fault with. Indeed, generally speaking, the poor people are glad of their care,—and sadly, indeed, is care needed. We earnestly hope that, before this session of Parliament is finished, another attempt will be made to obtain increased powers of inspection, which will force those who let buildings to the struggling classes to make them wholesome and fit for human occupation, and to ensure everywhere a sufficient water-supply and proper drainage. Enough, however, for the present on this head.

We mentioned just now the "Italian Quarter."

Amongst those who throng the dwellings in the back parts of Drury-lane and Gray's Inn-lane, Saffron-hill, the neighbourhood of Hockley-in-the-Hole, and some other localities in the metropolis, the wandering Italians, familiar to all who live in London, call for notice. The Italians, who come in great numbers to London, are of different classes, and have strayed from various parts of their beautiful and picturesque country. Some of them are casters and vendors of plaster images,—others manufacture and sell barometers, or cheap picture-frames,—others travel with "shows," organs

and animals of various descriptions; while a considerable number become waiters and servants at inns. Far away from their mountain homes and their friends, these strangers, in their different ways, make exertions in order to save a sum of money with which to return, and purchase some little property, that will enable them to supply their simple wants in inexpensive neighbourhoods.

In England, Germany, through the wild wastes of Russia, and other countries, the Italians, real missionaries of art, spread both instruction and amusement. Before menageries were regularly established, they roamed about with dancing bears, camels, and other animals. A considerable number of these visitors come from the north of Italy; these are generally more intelligent, and are better off than the poor peasants, who are natives of the Apennine region. The former of these come principally from the lakes of Upper Italy, and the valleys and declivities of the Alps. In these parts it has been the custom for many generations for the inhabitants of each district to follow some distinct branch of industry: for instance, one place sends forth vendors of barometers and mathematical and philosophical instruments; another place, stone-cutters; a third, house painters and whitewashers; another, masons; while the manufacturers of plaster figures come chiefly from Lucca.

In some instances these workmen only go to such a distance that they are able to return in winter, after they have completed a summer's labour. Others during the winter manufacture toys and other saleable matter, and they travel in the summer and dispose of them in the adjoining states. To such an extent is the roving disposition of the portion of the Italians above referred to carried, that it is seldom one-tenth of the male population is at home. The cultivation of the soil, which in many cases is but ill adapted to the purposes of husbandry, is generally managed by the women. At a very early age many of the boys are engaged to persons who have acquired a certain amount of capital and experience. Some of them learn the art of figure casting and painting, and others are entrusted with white mice or an organ.

A stated sum is agreed to be paid for their services, the employer providing them with food, lodging, and clothing, and depending for his remuneration upon the amount of the earnings of the lads. In London and other places, where the distance will permit it, the boys return with the result of each day's work to one of the lodgings just mentioned, and there receive their humble fare. If, however, they take a wider range, they may be absent for several days, under which circumstances they would purchase their own cheap food and shelter, and would hand over the money remaining on their return.

It may be, by this arrangement, that one Italian has more than a dozen lads of different ages in his employ, some of whom, in addition to their musical instruments, have monkeys, white mice, dogs, and other animals. This arrangement leads to much mischief; for the master, anxious to gain as much as he can, and, perhaps, not being aware of the dangers, in a sanitary point of view, crowds the sleepers into an insufficient space, and thus causes injury to health. In some of the inconvenient houses in the neighbourhoods alluded to, several bands of Italians may be found lodged in the different apartments. Of late, the sanitary police has effected much good; for although the overcrowding is still great, some attention has been shown to cleanliness. With the exceptions alluded to, it does not seem that the adventurous strangers are ill used. In the night we have seen picturesque and cheerful groups of them resting after their day's labour, some of them, perhaps, contrasting the fresh mountain air and the clear sky with the dusky and loaded atmosphere of Saffron-hill, but comforting themselves with the recollection of the object in view.

Some of the Italians, who originally came to England in the poorest condition, have accumulated considerable sums of money. Formerly, when bears, camels, hyenas, were a fashionable exhibition, successful Italians speculated in

these creatures to a considerable extent. It was not always that one poor man could afford the cost of the hire of the whole creature; so it was customary for two travellers to agree to take two quarters, the proprietor retaining two, and all the profits of the wandering were divided in the due proportions.

Hand-organs are lent to those who can be trusted at a certain rent: these instruments have been greatly improved; and, notwithstanding that a difference of opinion exists, it is clear that much pleasure is afforded by them in places where better music cannot be heard.

In various ways the operations of the wandering Italians are of much benefit. The savings they make during a course of years are invested in the improvement of the places of their nativity, and usually on their return they carry for sale a quantity of goods of English manufacture.

Generally speaking, the wandering Italians are a well-conducted body: they are seldom brought to the police-courts on charges of dishonesty, or seen intoxicated. At times brawls take place chiefly between them and the Irish, which give trouble, but in other ways these foreigners set an example worthy of the imitation of many of those among whom they reside.

So far as we have seen, both those who have charge of the young Italians and those who have the management of the lodging-houses provided for their reception are willing to attend to suggestions for improvement. It would be beneficial to institute a more rigorous examination, particularly at night time, and for the sake of these poor strangers to enforce the regulations made for the metropolitan lodging-houses.

Dr. Croly asserts, on good authority, that there are in the metropolis 16,000 children trained to crime, 15,000 men living by low gambling, 50,000 by constant thieving, 5,000 receivers of stolen goods, and 150,000 men and women subsisting by other disgraceful means. There are not fewer than 25,000 beggars. So that there are more than 250,000 persons in the London district, of all ages and sexes, who prey upon the honest and industrious part of the community.

The above are terrible figures. It is right to say that there is a difference of opinion as to the amount of the evil, but none deny that it is enormous.

This is a matter, however, on which there should be no doubt. We ought to know clearly and distinctly the extent of the evil which exists, in order to be able, with proper strength, to face the danger. A searching inquiry into the condition of the metropolis is one of the necessities of the age. We want some distinct data by which to judge of the increase or decrease of evil conditions: we should know to what extent the police and prisons have had the effect of checking crime: we should have evidence respecting the working of the detective body of the police force; and know if it would be advisable to increase this power or give greater strength to the visible part of the police.

The mode of improving reformatories and ragged schools—the treatment of the pauper population, both “in-door” and “out-door”—the medical relief of the poor—the working of societies for ameliorating particular conditions—the effects produced by the City Missionaries,—these and fifty other considerations suggest themselves to those who have thought carefully on the matter, and call for settlement.

For the purpose of solving these questions—to enable us to get at something like the true state of affairs—a careful and well-managed commission to probe the condition of the metropolis, to penetrate its shadows, would be the means of consolidating and making useful a large amount of knowledge, which is now of but little avail in consequence of its being dispersed. Especially should we seek to rescue the rising generation from the misery which threatens them.

Children have been called the poetry of the earth, beams of light, and “living jewels dropp’d unstained from heaven.” As Longfellow writes, beautifully:—

“Childhood is the bough where slumber’d  
Birds and blossoms many number’d.”

If society get but a gnarled, deformed, and hurtful stump instead of a flowering, gladdening, good-giving tree, the blame and crime are society's own. Every child is a white page on which may be written good things; an impressible mass which waits to receive beautiful forms. The blame be on those who permit the page to be blurred, and the forms to be made repulsive. Children are the sacred trust of the State. The neglect of this trust—a great sin—brings its own great punishment.

#### ON THE ORIGIN OF OUR EMOTIONS OF THE BEAUTIFUL.

AMONG the many subjects which have engaged the attention of metaphysicians not the least interesting or instructive is the inquiry into the cause of the pleasurable emotions which the presence of beauty excites in our minds. Numerous, diverse, and opposite have been the theories propounded, all of them unsatisfactory as a whole, yet most containing the germs of truth, though seemingly so contradictory. Some consider that it is a simple emotion due to our perception of design; and that is truly a noble theory, for without this ultimate decision of our intellect we feel not half the ennobling sentiments which inspire those who can “look from nature unto nature's God,”—who, feeling themselves in the presence of the Deity, hasten to offer the ovations of a full, hearty confidence in the overflowing bounty and benevolence of the Almighty, trustful in the wisdom of His laws and certain of His omniscience.

There are others who reduce our perception of the beautiful to an *original faculty* implanted in our nature for the sole purpose of admiring and being delighted with external nature. Again, there are a more limited circle who think it due to the *perception of relation and proportion*; while others, such as Alison, will admit of no inherent beauty in external form, and attribute all our pleasure to the *imagination*, being strangely obtuse to the self-evident contradictions contained in almost every page and sentence. Mr. Ruskin has given it as his opinion that it is neither sensual nor intellectual, but moral; a most difficult position to defend, though no doubt true to a certain extent. Among those who have penetrated deeply into the nature of things to discover the original cause of the beautiful, Oersted stands pre-eminent; yet his profundities tend more to obscure than to enlighten, and we rise from his book with an amazing impression of the greatness of his intellect, but hopelessly bewildered in our ideas respecting beauty. Burke's essay is clever, curious, and surprisingly pleasing, considering the dry, philosophical manner in which the afterwards great orator has chosen to write it. Hogarth's analysis contains an *artist's* notion of the beautiful, and is perhaps one of the most complete expositions of the practical knowledge required in the production and composition of works of beauty. It does not pretend to metaphysical investigation, but analyses the qualities, curves, and modes of composition governing the beautiful in art, on the simple supposition that we have faculties planted in our minds purposely for the appreciation of the beautiful.

Where, then, have arisen these opposite and contradictory theories? If we closely examine them, we shall find that, though each is at first extremely plausible, before many pages are turned over, both the reader and the author get hopelessly confused;—that in attempting to bend nature to their theories, they resort to the most contradictory statements, seemingly in quite an unsuspecting manner. We may be sure that where a writer has entangled himself in the web of his own ideas, he has commenced with but a limited view of the subject he treats of, and cannot take that comprehensive grasp so necessary for useful investigation. Many of the theories respecting beauty can be likened to nothing but a card-house, which juveniles build up with great assiduity and perseverance, until, overloaded, they tumble down, from their own inherent defects.

Such unsatisfactory theories respecting beauty must result from very imperfect and crude ideas, and we consequently find that it is usually assumed that the emotion excited is simple and definite—not complex, but of one kind. A very slight investigation will, however, serve to show us that the term beautiful is applied by mankind to objects totally dissimilar in their effects, yet it is in a most unaccountable manner assumed that the origin of all beauty is the same. This is the great fallacy which, if I succeed in overthrowing, I think will be a great step in advance towards a solution of the difficulty.

If we take a glance at the varied objects, emotions, and sensations to which we apply the term beautiful, it will be seen that it is invariably associated with a feeling that the object in which we discover beauty is possessed of a certain degree of goodness and perfectibility. It does not arise from a mere pleasure of the mind or body, for all pleasures are not beautiful: it would seem that it is a comparative term, used to distinguish the *highest* pleasures.

Thus an object which we may at one time have considered the very perfection of beauty, as our knowledge increases and our notation of the sensations affecting us becomes more exact, frequently ceases to be considered beautiful. Consequently, the term beauty is used in the sense of goodness and perfectness; and as our observation of external things, and our penetration into their inner nature, and our perceptions of the spiritual workings of the mind are enlarged, our opinions respecting the order in which we should place them must be constantly changing. Our ideas of beauty are dependant upon our judgment—and that which it pronounces to be good, the same we call beautiful.

As the pleasures of the human kind are both spiritual and material, it will follow that beauty is both spiritual and material; or, in simple words, dependant either upon mind or sensation, or both combined. Consequently, there will be sensational beauty as well as spiritual or mind beauty, and subdivisions too numerous to mention.

It will be well at this point of our problem to examine some of the things which we are in the habit of calling beautiful, which we shall find perfectly corresponds with this view of the question; and, indeed, the position here advanced is so self-evident, after a little thought, that it is extremely strange none of the writers I have named should have thought of noting this fact. Their minds seem to have been so bent upon proving the *common* origin of beauty, that they have neglected to examine even the meaning of the term, which, had they done, the whole would have unfolded itself as easily as the leaves of a book. Alison almost stumbles upon the truth when he proves that the emotion of beauty is usually complex; yet so perverse is the human mind, that when on the very point of discovering the great highway, it suddenly turns, and strikes off into a by-path. After pointing out the complex nature of the emotion, he suddenly refers the whole to the *imagination* or association of ideas, in doing which he gets so bewildered in the labyrinth of contradictions resulting, that it is almost hopeless for those who follow him to extricate themselves. The first species of beauty of which the mind becomes conscious is sensational: it arises from the mind concentrating its attention on the quality of certain sensations, and may be considered the lowest in the scale, though often the strongest in effect.

When a child is shown a brilliant bit of colour, say scarlet or blue, it will, by way of expressing its delight, frequently throw up its hands and look pleased. This it evidently does from a consciousness of a pleasing sensation conveyed to the brain through the nerves of sight. It instantly distinguishes the new impression from its activity being greater than that produced by the dull tones around. Now, if the child had happened to be in a room covered all over with a colour of the same depth and brilliancy, it would have evinced no pleasure at the sight of the scarlet or blue; hence it follows that the sensation is only pleasing during the transition, as the nervous energy is only active then.

This effect of colours we see takes place at first, and pleases us without any association of ideas intervening. As well might we say that the taste of the palate is due to the association of ideas, and that there is no inherent quality to produce the effect of taste in food, as to say that there is no inherent beauty; or that because when we shut our eyes we see nothing, declare that there is no such thing as material existence. As our knowledge and experience of effects increase, we associate ideas and sensations, both consciously and unconsciously, and then the beauty, though the basis is the original sensation, becomes of a mixed character,—complex, as I will explain as I unfold my theory.

If we examine how we become possessed of accurate ideas respecting the taste of various kinds of food, we shall find that we go through exactly the same process as we do when forming our ideas of the comparative beauty or purity of colours. We direct our attention to the sensations, note their various difference, and compare their effects. It will be seen that to do this requires an effort of memory, for we must have a distinct recollection of the former impressions before we can pro-

nounce authoritatively respecting their beauty. In this process of comparison, the mind takes a positive pleasure, and we unconsciously connect the amount of the difficulty overcome with the original sensations, and so enhance its beauty. Thus though a child is pleased with a bit of brilliant colour, it cannot by any means appreciate the full beauty of it. This brings us back to my first position, that beauty is a comparative term, used to denote the goodness or perfectness of any work. Hence, we call a neat mitre beautiful; an accurately built wall is said to be beautifully built; a well-made door is beautifully made. If any one could make a neat mitre, a good door, or build a firm wall, we should cease to use the term beautiful in connection with them.

Though beauty always implies the presence of a certain amount of goodness and perfectibility in an object, it is not on that account quite synonymous with either, for it implies often something more, and frequently the words cannot be used interchangeably. A fine, clear blue sky is softly and brightly beautiful; it is also good and perfect. Yet a rainy day, though in common parlance not a beautiful one, must be considered good, if we look beyond our own present and individual wishes.

It would seem that the beautiful cannot co-exist except with pleasurable emotions, and that the word is applied by mankind to those things which in their nature, when uninterfered with by any disturbing force or emotion, are capable of affecting the human mind with pleasure. Thus though a rainy day may be beautiful to a farmer, a strong wind to a mariner, or a suit of mourning to an undertaker, by the general consent of mankind it is determined that the nature of each generally tends to feelings otherwise than pleasurable; therefore they are not beautiful to the generality of mankind.

In the formation of a good taste it frequently happens that our former decisions affect present emotions—what the judgment has once acknowledged the eye afterwards recognizes as beauty. If the proportions of a column are those which we have found by constant observation to be just sufficiently strong to carry the superimposed weight without much effort, we say that the proportions are elegant. If, on the contrary, the columns are very stout and closely set, we say they possess massy dignity. Now, in this there must be some unconscious reference to former impressions, for were the material of the latter of such a loose nature as to render the whole insecure, no dignity would result. The same with costly materials—the main beauty of these consists in their durability, polish, texture, colour, and costliness. However good any imitations are, the moment it is discovered that they are neither so durable nor so costly, dissatisfaction is sure to ensue. Of the value of costliness we have a striking illustration in the comparative effect over the mind of marble and plastic figures. In a large hall I have seen both in proximity, of which, what with dust and distance, the difference of material could hardly be detected. As the eye ranged over the whole, without special thought as to whether they were all of marble, the effect was almost equally good, the plaster figures scarcely suffering in an æsthetic point of view. When, however, the eye discovered the difference in value, they lost incomparably. Marble, we know, is a much finer material, and the recollection of this, together with its great value, influences our judgments. Even if it were possible to manufacture a marble in every respect equal to the natural stone, and at one fourth the cost, though æsthetically the effect would be exactly the same, we should not be half as well satisfied with the result. The Greeks had the finest marble in the world, but as it was easily obtained and in large quantities, they scrupled not to cover the surface with a thin coat of fine stucco, to receive paint. Horrible barbarism! it is said. Human nature, replies our judgment.

The theory of unconscious association accounts in a much more satisfactory manner for the disgust which many people feel towards imitations of costly woods, stones, and other valuable materials, than the common one of untruthfulness and effort at deception; and, indeed, it also accounts for the effect of all those theories which have been imbibed from a one-sided and partial view of a question. For instance, we establish as an axiom that untruth is immoral, and to be despised in every shape. So far so good; but we must estimate truth by intention, otherwise it is but verbal. The intention of *graining* I take to be, not for the purpose of deceiving us respecting the nature of the material beneath, but to give a fine glossy, varied, and lasting surface to the wood. There-

fore, on principle I do not object to it; while others, who hold different sentiments respecting its intention, think the contrary. That graining will, when well executed, be often more durable and more brilliant than the natural wood, admits of no dispute. The colours are likewise more under our control and the effects within our reach greater. The propriety of an imitation must be judged of by the success of the effect as a decorative feature; independently of this there is a real pleasure in seeing a good imitation,—as when the great Turner, attracted by a bit of oak graining next to one of his pictures, exclaimed, "The fellow that did that knew how to paint."

When the intention of an imitation is to deceive, and it fails, we pity the meanness of the device. When one material is imitated in another, to which its statistical principles are altogether opposed, we are disgusted.

But all imitation is not a gross attempt at deception. We have only to go a step further than those who pride themselves so much upon the honesty of their materials, and prohibit imitation altogether, to condemn festoons, wreathed capitals, and all naturalistic foliage. Some do even go as far as to condemn decorative ornament painted in natural colours, but here an insuperable difficulty in the practice of the old Italian Masters presents itself,—a difficulty that all the distinctions in the world will not help them over.

Many have been the devices concocted for reconciling the difference of opinion respecting honesty of purpose, in which the article *common sense* has been strangely neglected. The whole matter lies in a nut-shell. Imitation, which has for its object mere ostentation, disgusts us. A gilt chain is a moral swindle, and excites either our anger, pity, or laughter, for it professes to be solid gold. On the contrary, a gilt moulding does not, for we know that it is gilt solely for effect, the size preventing even the most ignorant from being deceived.

Unconscious and imperfect association of ideas is one great cause of the difference of taste exhibited by various people, and nothing is so likely to lead us from the truth. All association, to be true, must have its foundation in nature. Expressional beauty is the result of associations of this sort: it arises from the discovery of analogous impressions. Thus, in saying that a precipitous cliff possesses *stern grandeur*, we mean that it impresses us in a manner analogous to the effect produced on the mind by a firm and severe aspect. In this we may distinguish the difference which lies between *expressional* and *sensational* beauty. Sensational beauty chooses words for its expression drawn from the sensational vocabulary, such as sweetness, harshness, softness, hardness, &c., clearly showing that the effect of the picture on the mind or senses is analogous to that sensation which originally suggested the term. One relates to an *impression of the mind and imagination*, producing an emotion of awe; the other relates to the direct physical effect on the nerves.

Unless the association which moves us is founded in natural laws, it is accidental, and as such should have no influence on our taste; it is here where the judgment comes into play to form the correct taste. God gave us passions, emotions, desires; but He also gave us reason to direct and control them: passion is the motive power,—reason, the guide. Unless we have intellect, it is impossible that we should select the good from the bad, the beautiful from the vicious. It is folly, then, to let our likings blindly lead captive the imagination and intellect, and shows how cautious we should be in approval or condemnation. Never like a thing until you find a reason for it, or *vice versa*, would be a good axiom for the formation of a correct taste. Naturally, however strong a man's tastes may be, they are constantly changing and advancing (or ought to be), as he penetrates more deeply into the nature of the beautiful.

Strong contrasts give power in expression, as in the angularity of the oak; easy curves and cadences, sweetness. The sublime is but a series of magnificent contrasts, which amaze the mind by their vastness. Fear heightens the effect, as when on the edge of a precipice, wondering at the depth below, we suddenly and involuntarily slither and step back. The awful possibility of falling where sure destruction awaits us,—the terrific crash, the maimed limbs, and lifeless trunk are instantaneously pictured by the imagination. The sublime, therefore, results from the association of ideas, as does, also, every case where the *emotions of the mind* are called forth.

The sympathetic chords of the human soul vibrate in unison with the inner meaning of nature. The imagination penetrates the superficial coat enveloping her works, and sees, as

through a glass, the inward workings and soul of matter. It needs more than the artistic eye, the keen sense, or the contemplative mind, to discover her hidden meaning, and feel, when communing with her, as if constituting a part of the scene before us, or as if the unthinking and lifeless matter were endowed with sentient faculties and sympathetic feelings.

The associations connected with certain forms may be said to constitute part of their inherent beauties when the impression made upon the mind is constant and unchangeable. Expressional beauties are dependant upon association, and give character to every scene. They are the main test of originality in art, and show the comprehensiveness of mind possessed by the designer, for expression is unity—the idea of the whole impressed upon the mind in its oneness. The false architect joins a number of forms possessing no common coherence—a confused mass of meaningless ideas,—a second Babel of tongues, all speaking, and no one comprehending. On the contrary, unity may be compared to a thousand men at work upon different parts of an edifice, yet having one common object, and directed by a single mind. That expressional beauties are also inherent beauties, I think no one, unless hopelessly confused by a perusal of Alison, would attempt to dispute. I take an inherent beauty to be a beauty that is not dependant upon accidental association, for if the form of an object constantly impresses us with the same ideas, it must do so by virtue of the nature of the form itself. As well might we say that the taste of sugar is due to association, as to attempt to prove that because we do not always feel the same emotions, therefore the beauty is in the mind, not in the object. Sugar itself has not the same taste at all times. Sometimes it sickens us; and in like manner the disturbing effect of accidental associations sometimes destroys the proper emotion due to the form. When the mind is pre-occupied, an object may pass before the eye without our perceiving it; yet, without doubt, it must, at the same time, have been mirrored upon the retina. Though we may shut our eyes to external things, we cannot doubt of a material existence. We do not at the time see them, but that does not prove their non-existence. So it is with beauty; the mind is not always attuned to receive pleasing impressions, and what will at one time delight us, we view at another time with perfect indifference, or perhaps disgust. The eye may perceive and acknowledge the beauty, yet the mind may not receive the slightest satisfaction from viewing it.

The imagination is dependant upon the conscious association of ideas. The poet gives expression to the mute feelings of mankind. We are enraptured with a bright sun, with green fields, and the full foliage of summer. We are pleased, but we know not why; for, if asked to give a reason for our delight, we are usually unable to get beyond a few unsatisfactory common places or imane repetitions. The poet's imagination penetrates the inward springs of thought, and vividly pictures in its bright, shining images, the common connection and relation between matter and ideas, the object and the conception. Imagination brings together the points in which things agree. The analytical faculty separates and arranges. To form a correct taste, there must be a balance of the two faculties; the latter must control the former, and bring its life-images to the test of reason.

In the exercise of our imagination lies the consciousness of the similarity of ideas. Most people are unconsciously poets; they receive the same impressions, feel the same emotions, experience the same delight, yet, from their incapacity to create tangible images illustrating their feelings and ideas, their impressions die with them. The act of discovering our ideas by clothing them in the garb of imagery, is a pleasure entirely distinct from art beauty; for the painter, though he may penetrate beyond mere surface form, cannot give tangible expression to associations. He presents to us the picture, and each must read the interpretation in the way his own tastes lead him. The poet, on the contrary, gives direct expression to thought, and reads you his interpretation of nature in a manner that cannot be mistaken.

The crowning charm of all art, architecture included, draws its force from the imagination of the observer. Æsthetic beauty is nature itself; poetry is its interpretation. What is more common than to observe, in reference to some matter-of-fact individual, who persistently and dogmatically refuses to see any utility in a thing which does not minister directly to material or bodily comfort, that he has no *imagination*? This is certainly a tacit admission, that the main delight

of the human mind in beauty is due to the imagination: we are pleased with colours, satisfied with form; but the imagination holds us enthralled, enraptured, and enthusiastic. The vivid pictures of beauty floating before the artist's mind, entice him onward to the goal of perfection. As we walk through the streets of a large town, and view its beautiful buildings, dreams of prosperity, wealth, refinement, learning, science, and art, are indulged in, till wrought up to a key of intense sensibility, the mind is ready to receive deep impressions and lasting emotions. A person of unimaginative mind feels no such pleasures; he dwells, perhaps, on the number of inhabitants, the height of the buildings, the extent in square miles of the city; or, if of a modern turn, the sanitary condition of the houses or streets, the mode of sewerage, or the supply and quality of the water,—all very important objects in their way. He attaches no ideas to, or has no conception of these matter-of-fact ones; his mind is eternally upon the comfort of the body, and never rises into the region of poetic fancy. To illustrate my meaning, we will suppose a stranger in London for the first time,—a man of imagination. He will, perhaps, compare her with ancient Rome, and from the accounts transmitted to us through nineteen centuries, attempt to picture Rome in all the pride of glory and conquest. From that he will proceed to develop the difference of the two civilizations,—the grandeur yet debasement of the one, and the political privileges of the other. Gratified with the superiority of modern civilization in reference to the mass of mankind, he will thank God that His laws are those of humanity and progress. St. Paul's Cathedral, Westminster Abbey, and the Parliament Houses will by turns excite his attention and admiration; the colossal grandeur of the one, and the beauty and age of the other, enshrining as it does the chiefest of those whom England has delighted to honour, and will hold famous so long as genius, virtue, and manly devotion are prized; the splendour of the modern palace where the representatives of the people meet to protect the country's honour and pass laws for her well-being, present such a mass of association to every patriotic Englishman, that he must be cold-blooded indeed who does not feel his heart warmed and his conceptions exalted.

Is it not apparent from this that the imagination of all our faculties yields us the most delight, and constitutes through its images the greater part of the pleasure we receive from the perception of beauty? As to the imagination is due the first conception of a beautiful design, therefore the imagination takes most pleasure in afterwards interpreting it. Our pleasures would be small indeed were we left only to sensual beauty; our feelings would be dulled and our senses blunted could we see only the intellectuality. The sensual, the intellectual, and the imaginative must unite in one harmonious whole before we can rejoice in the fulness of gratification. It is indeed, so difficult to find each kind of beauty distinct and separate, that most of the treatises on the subject end in confusion. The first impressions of colour may be considered to be entirely sensual in the pleasure which they give. A problem in "Euclid" contains intellectual beauty, abstract, pure, and unalloyed; but the third it is impossible to find except in conjunction with one or both of the other two. In poetry, being prohibited by the mode of expression from the exactness and precision of painting, and intellectual beauty, being by itself in a poem a pure impossibility, imagination constitutes its chief charm.

The three kinds of beauty are so mixed up and complicated in their effects, that it is all but an impossibility to tell with certainty to which class we must attribute certain emotions. For instance, on examining a noble classic portico in the full blaze of a mid-day sun, the unprejudiced mind feels fully and deeply impressed by the glowing grandeur of the sight. Then whence our pleasure? We know that to design well we must enter into the soul of the dull stones, even as the orator enters into and forms a portion of the soul of his audience. We must vivify our materials, or we cannot have any hold on the human heart. Dull conceptions and rapid thought never conceived anything worth preserving. The lifeless stones must receive their impress from *mind*, and then they will speak to others intelligibly, eloquently, and well. Still we cannot point out or analyze the separate springs of our emotions, and if we are asked to give an explanation of the causes of our pleasure, we shall probably attribute it to graceful proportion, harmonious combination, variety, play of light and shade, or strength of expression, recognizing the original cause to be an æsthetic impression. The

æsthetic sense must be satisfied before the imagination can delight us with its images, for observe, that the imagination in architecture can scarcely be said to discover inherent beauties, but rather to heighten them. Beauty of imagery is a beauty independent of the object which excites it; it is a mental beauty,—a discovery of relation, similarity, and connection. Æsthetic beauty is an impression of beauty associated with sensational effects. Sensational beauty may also be modified in its effects by association; red may be associated with warmth, blue with cold,—one is called a refining colour, the other a prominent one. Thus, then, our simplest ideas of beauty may be both sensational and associative, and the delight we take in a certain thing may be owing to our generally finding it associated with something which naturally provokes pleasing sensations. Sunlight derives part of its beauty from association, for it presents to our minds a picture of activity, vitality, and happiness. The beauty of many natural things is owing greatly to their brightness: the mirrored surface of water, the clear brightness of the sky, and the shining coat of gum laid over the upper surface of most foliage, are in themselves great attractions. Who can doubt that it is due in part to association as well as to sensation? Artistically speaking, it is æsthetic and mind beauty, but in its great power over the generality of mankind we must look to pleasing association as the cause.

Again, the pleasure which we feel in objects of beauty is due in a measure to the direct evidence of mind. The mind reads mind even as the imagination interprets works of the imagination. In the case of a good design we attribute part of our satisfaction to originality, confirming at once the origin of the pleasure. Many of our pleasurable emotions are also to be ascribed to the indirect association with mind. The pleasure which we feel in the noble outlines of St. Paul's is indirectly associated with admiration for Wren. He is the good genius of the place: though his spirit be passed away, he and his work are inseparable.\*

T. MELLIARD READE.

#### ON THE ORIGIN AND DEVELOPMENT OF THE USE OF CRYPTS IN CHRISTIAN CHURCHES FROM THE EARLIEST PERIODS.†

HERE and there, however, are small chambers, commonly called "cubicula" or crypts proper, of the greatest interest. In them the Primitive Christians are said to have assembled for a species of service, called by Tertullian (*ad Uxor. i.*) and by St. Cyprian (*de Lapsis*) *συναγωγὴ*, or gathering together; but this is simply impossible, as out of some fifty or sixty described by Aringhi, and which he gives the dimensions, the largest is only 15 feet by 7 feet 6 inches: the greater part being only nine or ten palms (about 7 feet 6 inches) square, while those lately discovered by Perret, and published by the French Government, seldom exceed ½ metres each way. As has been said before, they are generally cut out of the solid tuff rock. The probability is, they were oratories, or perhaps mortuary chapels. That of St. Hermes, who is said to have been a prefect at Rome, who suffered martyrdom in the time of Hadrian, contains a tomb, which is to this day occasionally used as an altar. It may be convenient to describe this crypt as a type of very many others. It is about 13 English feet in length, by about 6 feet 6 inches in width and about 8 feet in height, and arched like a barrel vault. It is approached by some steps leading out of one of the mazes of passages before described; it is plastered with a fine intonaco, and filled with paintings, as, in fact, a large majority are. The tomb at the end is, in fact, a sarcophagus; the top of which is plain, and the front is sculptured in three compartments. It is supposed there were two bodies buried at the end (besides that of the saint), four on the right side, and four on the left, besides three smaller spaces which probably held the bodies of children. In the centre a lamp has been suspended. This crypt of St. Hermes must not, however, be confounded with the church dedicated to that saint, which is of considerable size; and though now entirely covered over, apparently was originally only partly sunk in the earth, as there are a sort of clerestory windows, which gave light apparently through openings resembling the walls round the area window of our houses.

The illustration (Baldetti, pl. 2) shows another crypt, which is in the catacombs of St. Agnes. It is groined, and on three sides has tombs, which have been used as altars. On one side is a large chair cut in the solid rock, said by him to have

been an episcopal seat; by others the seat of a priest, while giving instruction to catechumens. Such chairs, however, are not uncommon in these crypts. In one given in Aringhi, vol. ii. p. 81, there are two similar chairs cut out of the solid tuff, and a bench of the same kind which goes round the other three sides of the room. It is said, but on what authority I do not know, that the second seat was for the deaconess, and used by her at the catechising or instructing the female converts. The crypt is, however, but 8 feet long, 7 feet 6 inches wide and 8 feet high, and has contained eight bodies, besides one (probably) over the door. In addition to those with arched or groined roofs, there are some of which the ceilings are quite flat. The crypt, called the oratory of St. Helena, is of this class; it is supported by four columns each, at a little distance from the wall. Sometimes the tombs were covered by a sort of grating carved in marble, through which visitors might look, and probably view the coffin of the martyr. A very curious one is found in the crypt of St. Calixtus. The grating is of peculiar form, and much like that under the altar at St. Nereo and Achilleo.

It is the opinion of Seroux D'Agincourt, and seems a very probable conjecture, that the idea of these crypts was taken from a species of construction common among the Romans, where a "sacellum" containing an "ædiculum," or shrine, to the tutelary god of the family, was erected over the "columbarium," or place of depositing the urns which contained the ashes of the different members of it. The illustration shows one not far from the church of St. Agnes. It is wholly of brick, even the capitals of the columns being cut out of that material, and is supposed to be of the time of the early emperors. The shrine of the genius of the family is above, and below is an arched chamber, which was the sepulchre. On each of the four sides of this lower part is a niche, probably intended for the statues or "imagines" of the principal members, and eight other very small niches, each of which contained two urns full of the ashes of the dead. There can indeed be but little doubt, that these Roman structures (which were a combination of the tomb and the oratory) gave the origin not only to the crypts of the ancient and medieval church, but also to those picturesque tombs now so common in the cemeteries of Italy and France, where the family vault is below, and above is a little chapel, whose grated door displays an altar and crucifix, where the relatives repair at certain times to pray and to suspend crowns of "immortelles" in memory of the dead.

It will not be within my limits to describe the various objects found in these crypts. The greater part, as I have said, contain paintings, some of very great merit: the subjects are mostly from Scripture history. There are also, as might be expected, many rings, coins, lamps, &c. found plain chalices of mixed metal have also been discovered, probably eucharistic; strange and horrible instruments supposed to have been used for the purposes of torture; phials of glass, in which, it may be now to some to hear, are paintings. M. Perret is said to have made no less than eighty-six copies of paintings on, or rather <sup>in</sup> glass in the various catacombs. To describe the symbols found on the tombs and the inscriptions would fill many volumes. They comprehend not only sepulchral inscriptions, the history and memory of the dead, pious ejaculations, religious emblems, but in many cases delineations of the instruments of the worldly calling or profession of the departed.

There is one, however, of great interest to the architect, as probably forming the tomb of a mason or sculptor. There are represented the ordinary compasses, callipers, a rule, square, level, mallet, and chisels, and what is more curious, an instrument much resembling a trowel, and which has been surmised to be intended for the delineation of ellipses.

A few words, however, may be said as to the style and date of these crypts. In the admirable work of Seroux d'Agincourt a very curious parallel is given between the pictures found in the Pagan tombs and those in the Christian crypts. The author is inclined to think they range in point of style and date from the second century to the eighth, and in instances at Naples even later. He gives as a parallel the paintings in a tomb discovered by Bartoli near Rome, which is clearly of the time of the Antonines and those discovered in the crypt of Saint Priscilla, which may be said to be identical in point of style.

That many of the paintings in the Christian crypts must be of very early date is also indicated by their still preserving some traces of Pagan

\* To be continued.

† See p. 324, ante.

emblems. Thus the Muses still exemplify harmony; and for some time Orpheus, with his lyre, attracting the beasts around him, was given as an emblem of our Saviour: and this is of frequent occurrence, and being surrounded by Scriptural subjects, as Daniel in the Lions' Den, Moses striking the Rock, the Raising of Lazarus, all prove them not to be the tombs of Pagans, but of Christians; and they also show how the memory of Orpheus was associated in their minds with the idea of the law-giver, the leader of civilization; and, which is perhaps still stranger, to typify the inventor of fine art; for it has been too much the case to represent the early Christians as stern ascetics, for whom poetry, music, art, and architecture had no charms.

Again, the whale swallowing Jonah is exactly like the dragons on the walls at Pompeii; Elijah departs for heaven in a regular classic quadriga; and the three kings seek the Saviour, each having on the Phrygian cap. On some are representations of persons dining together at a table, not reclining like Romans upon the lectum or bed around the triclinium, but seated in chairs. These we know, from the inscription *αγαπη*, written on them, must be representations of the "love feasts" of the early Christians. Another curious subject would lead us to believe that the Christians often employed heathen artists, for on one of the tombs the sculptor has probably forgotten and cut the usual Pagan D.M., or Dis Manibus, but has recollected himself, and struck his chisel across the letters, and placed the well-known Christian monogram by its side. These last-cited circumstances, however, prove but little, as the *αγαπη* are continued in churches as late as the sixth Council of Constantinople, commonly called the Council in Trullo, which was at the end of the seventh century, and if the tradition as regards the celebrated monogram be correct, the inscription alluded to must at least be as late as the time of Constantine. Of course without direct evidence, it is difficult absolutely to pronounce on such a point; if, however, we may be allowed to reason from similarity in art, we may believe some of these crypts to be as old as the third if not the second century. The art, however, gives an idea of wealth and refinement among the early Christians, which we are usually taught not to expect at that period. It seems still more extraordinary that they should be permitted so to adorn their tombs. It must have been not only an expensive work, but one which must have taken up a great deal of time, and therefore could hardly have been done, at any rate, to such an extent, without the knowledge of the authorities. It must, however, be borne in mind, that the persecutions broke out at intervals, and then ceased; and, according to the worst accounts, the Christians had peace for more than 140 years out of the three first centuries.

If the internal evidences as to art give us no certain data, those as to architecture give us less. There are no distinctive marks about the construction of the passages, or the arching, or groining the crypts, that differ from what we know decidedly to be Pagan work. It is true that the details of the capitals in the crypt at S. Agnese, mentioned before, seem to be Classic, but those in another of the same crypts, given by Perret in his magnificent book, seem very late indeed, and can hardly be called Classic work. Still more unlike are the caps of the crypt of S. Pretextatus, given in the same book; they certainly must be referred to a late period; while a corbel in the same crypt, discovered in 1846, is quite unlike anything Classic, but rather resembles Byzantine work.

I fear this long account of the subterraneous world must have weary'd my hearers. I must now crave of them,—

"Though long detain'd,  
In that obscure sojourn, while in my flight,  
Through utter and through middle darkness borne,"  
to return to the upper world, and see what effect the objects below had on those above.

My hearers will remember the law of the Romans, quoted some time back, on extramarital interments. It appears that frequent attempts were made from time to time on the one hand to evade and on the other to enforce it. Adrian passed a law, fining any person 40 aurei (about 30*l.*) who buried any person in cities. Short as was the time between his reign and that of Antoninus Pius, we find (from Julius Capitolinus) that the latter was obliged to re-enact the same law, and that a few years after Domitian was obliged to do the same. The consequence was, all the Christians, whether martyrs or not, were buried, not only without the city, but also without the pomerium, or suburbs, as Sidonius Apollin-

naris (i. 5) tells us. Constantine seems to have been the first buried in a city. Eusebius (Vit. Constan. iv. cap. 71) says he was buried at Constantinople, in the Church of the Apostles; but St. Chrysostom (Quod Christus sit Deus) says "in the porch without the church, so they who were diadems think it a favour to be buried so that kings are the fisherman's doorkeepers." It will be unnecessary to go through the history in all its points; it will suffice that the Council of Braga (A.D. 563) gave permission for men to be buried in the churchyard in cases of necessity (*si necesse est*), but on no account within the "walls of the church." The claim, however, to lay their bones under a holy roof grew so on men that we find a council at Mayence deciding that "no one should be buried in the church but bishops, abbots, or worthy priests, or faithful laymen;" and at last we find the Council of Meaux (Meldense) leaves it to the bishop and presbyter to settle who should be buried in churches and who should not. The result from that time to the present is well known.

But to return to the other branch of our subject. When the persecution had ceased we naturally find the remains of those who had testified their faith with their blood held in greater reverence day by day. These tombs were first visited by those who dwelt near, and then became an object of pilgrimage to those who lived afar off. Pride of such a situation as the proximity of a holy grave in some, and the love of luxury in others, caused all sort of pretences to be set up to the possession of a martyr's tomb, or relics, and these like all other possessions, soon became objects of barter or sale. In the "Codex" of Theodosius (lib. ix. tit. 7, de Sepul. Violat.) we find this law:—"Let no one move a corpse once buried to another place; let no one take away or make merchandise of the body of a martyr; but, nevertheless, if any of the saints is buried in any place for the sake of venerating him, let them add [or construct] any fabric which they please as a martyrrium." That this trafficking in relics of saints and bodies of martyrs had become scandalous, we learn from St. Augustin, who wrote about this time. He says ("De Vita Monach." c. 28), "The most cunning enemy of souls has sent forth everywhere so many hypocrites in the habit of monks, going about the provinces, without any mission, never fixed, never settled, some selling the members of martyrs, if, indeed, they are members of martyrs; others make broad their phylacteries," &c., &c. This state of things may also be still better illustrated by a solemn canon of the fifth council of Carthage (A.D. 437). It is the 14th chapter, and the title is "Concerning churches [hasilicis] which are dedicated without the relics of martyrs." The canon runs thus:—"Whereas, altars, everywhere, through fields, or by roads, are set up to the memory of martyrs, in which no bodies or relics of martyrs can be proved to be buried. Let them be pulled down by the bishops who preside over such places, if it can be done. But if it cannot be done on account of popular tumults, let the common people be admonished that they should not frequent such places, so that those who think rightly should not be caught and bound by any superstition." Then certain principles are laid down for ascertaining the truth in such cases, and the canon concludes,— "As to those who, through dreams, and certain vain quasi-revelations, put up everywhere the altars of men, let them, in every manner, meet reprobation."

It is not my intention, nor would it be in place, to go into the history of the increasing reverence paid to the relics of martyrs. It will be necessary, however, to mention that people were not content that the bodies of holy men should be venerated at their tombs, but a system of removing the relics into different churches now prevailed, which system was called "translation." The earliest mention I have found of this, in the works of the ecclesiastical historians, is in Socrates Scholasticus (lib. vii. cap. 25). He mentions a sect of Novatians, who dug up the body of Sabbatius from the Isle of Rhodes, and conveyed it to Constantinople, and prayed on his tomb. Atticus, the bishop, however, caused the body to be removed (this must have been about A.D. 425). The same author (vii. 44) says that Proclus, about fifteen years later, removed the body of St. Chrysostom, who had been buried at Comana, to Constantinople, and laid it on the left side of the Church of the Apostles. But before this we have long accounts by St. Jerome of the deposition of the bones of SS. Peter and Paul under the altars at Rome; of SS. Andrew, Luke, and Timothy, and Sannol, the Judge of Israel, at Constantinople. But we have no time to enter into

details, which may be found in Baronius, and in the letters of the curious controversy between St. Jerome and Vigilantius. Suffice it to say that in almost every church relics of martyrs were deposited under the altars.

This, at first, was done by simply making an opening under the altar, in which the bones or other relics were deposited, the front of which was closed by a sort of grating carved out of marble. It must be remembered that in the early Basilican church the altar did not stand against the wall, but at the chord of the arc of the bema, or tribunal, on the edge of the raised platform itself, behind which, in the middle of the apsis and against the wall, was the *θρονος*, or seat of the bishop, and on each side of which were the seats of the presbyters, ranged in the form of a semi-circle. To this day it is so in all churches which claim either to have been erected by the early Christians or re-erected on their foundations; and, to this day, in all such churches, the priest says mass at the back of the altar, with his face towards the people, instead of the opposite method which is usual in other churches.

This place for depositing the relics was called the "confessionne," or place where the relics of those who had confessed the faith are deposited, and this name is retained to the present day. The simplest and no doubt oldest form is that which was at the church of the Quattro Incoronati, before the alterations, and which was a simple aperture under the altar, about 2 feet wide. Very much like this was that at S. Nereo and Achilleo, which is closed by a curious grating, resembling in design very much that in the crypt of S. Calixtus, mentioned above. At S. Maria in Trastevere, the "confessionne" is a sort of small chamber, about 5 feet square, also under the altar. As time went on, the confessionne becomes larger, and more and more resembling the crypts in the Catacombs. At S. Maria, in Domnica, it is in reality a small crypt, about 13 feet by 10 feet, and is partly below the floor, and approached by a descent of five steps. In this is a sarcophagus, containing, it is said, the body of St. Ciriacus. At S. Prisca the crypt is still larger. It is a vaulted chamber, about 10 feet by 22 feet: the arch supported on two masses of masonry, strongly reminding us of the Etruscan tombs, behind which are two flights of stairs, of about thirty steps in each. I must now call your attention to two confessionnes which partake more of the character of the passages of the Catacombs than of the crypts therein; one is that of St. Marco, (A.D. 336 the Pope, not the Evangelist); this is a sort of passage way, of semicircular form, the extreme diameter of which is about 24 feet: the passage itself is about 4 feet wide. It receives light from the grating under the altar. The other is at S. Prassede. Here the entrance is immediately under the altar, by a descent of eight or ten steps: this leads to a passage about 40 feet long, which branches off into two semicircular passages, much like that at St. Marco. This must have been in existence in A.D. 493, in which year it was restored, we are told, by Pope Adrian, in a life of him, written by Anastasius. A still larger crypt is at S. Martino; this was originally partly supported by a block of masonry, and partly on square pillars, like the Etruscan tombs, and forms in fact a small church, about 45 feet each way. In fact, this is the form the crypt now began to assume. At S. Maria in Cosmedin, it has a nave and side aisles, formed partly by six columns, three on each side, and partly by two solid blocks of masonry, and is about 22 feet by 13 feet. At San Lorenzo it is still larger, about 30 feet by 16 feet, and has four columns on each side, and also a tomb in the centre.

I have thus shown that, as time progressed, the small aperture called the confessionne had increased till it became larger and larger, till at S. Minato, near Florence, and S. Michele, at Pavia, it had lengthened to 60 feet and upwards, and become a second church.

THE STORY OF A GREAT AND GOOD MAN,—WILLIAM OF WYKEHAM.\*

WYKEHAM made no change in his coat-of-arms: he still kept his carpenter's couple, the symbol not only of his architectural knowledge, but also of his accomplishment of difficult works. His administration of his diocese was vigorous and firm. His oversight was most exact. The value of the bishopric in 1345 was 2,977*l.* 15*s.* 10*d.*: the dilapidations actually paid to Wykeham were 700 marks, corn, &c., in kind, worth 1,660*l.*, and stock equal in value to 20,000*l.* sterling; and nobly he spent his revenues. From an account-roll it appears that

\* By the Rev. Mackenzie Walcott. See page 345, ante.

on his journeys alms to the poor were freely dispensed in every village through which he passed. In the last year of his life there is an entry on the back of a roll, mentioning that a person wrote to ask him for money, and the note is added, "An answer received, and they are sped." In 1377 he paid all the debts of the Austin Canons of Selborne, and gave the house a second large grant, while in 1387 he rebuked them for their neglect and evil conduct. In his hall twenty-four bedesmen daily dined. On taking possession of his see he forgave the customs due from poor tenants; he presented a magnificent sum to the infirm and aged servants, gave lands to the chapter, and paid 3,000 marks to liberate poor debtors from prison. The University of Cambridge commemorated him as a benefactor; his arms are seen carved on the walls of Beaulieu, Luton, and Etchingham; the church of Adderbury and the palaces of Wolvesey, Farnham, Southwark, and Waltham were almost reconstructed by him at a cost of about 160,000*l.* sterling. On repairs upon the estates he expended about 13,000*l.* Mr. Cockerell estimates the sum devoted to architectural works alone at 500,000*l.* exclusive of his foundations. The restoration of the revenues of the Hospital of St. Cross, near Winchester, in opposition to a fraudulent master, cost him six years of dreary litigation. His visitations of the diocese were searching and vigilant: those of 1386-7 are still preserved. Two of his rebukes of careless clergy are remembered; the one,—"If I pleased men, I should not be the minister of Christ;" and the other,—"It is sin to praise that which God abhorreth." However, he would not allow old customs to fall into desuetude, but in the presence of the primate obtained the restoration of the old practice of the chapter to send daily to him, when resident in Winchester, eight loaves of wassail bread and four bottles of good wine, by the hands of the junior canon, who presented them, saying in French:—"Sir, SS. Peter and Paul send you these."

William of Wykeham, before he received the mitre, was nominated Lord High Chancellor, in September, 1367. On August 24th, 1368, he signed the treaty of peace with Scotland. On May 27th, 1369, the Parliament met to consider the state of affairs, for a war with France was imminent. Wykeham made the opening speech, and, like a sensible man, did not, as his predecessors were wont, preface it with a text, or dilute it with wordiness. He spoke out bravely that "the king of England had not slacked his duty; yet his enemy, the king of France, had done contrariwise, for neither had he delivered up the countries and lands agreed upon by the treaty, nor had he made full and due payment of the monies, but had sent armed men to wage war, and to lay hands upon the lieges of the king, and had surprised divers of the king's garrisons and towns." Charles summoned the Black Prince to appear before him at Paris to answer for his rule in Gascony, and Edward replied he would come with a helmet on his head and 60,000 men behind him. Wykeham spoke, also, on the rising of Parliament. Charles V. threatened that he would hang a challenge on the gates of London. On February 21st, 1370, Wykeham again addressed both houses. "Sirs," he said, "the king has received by his friends and allies that his enemy, the king of France, is making himself stronger than ever he was before, and hath levied such a number of forces as seemeth to him sufficient this year to dispossess the king of all the lands and possessions which he hath beyond the seas. He has, moreover, gotten ready so many galleys and other ships of war as seem to him sufficient to destroy the whole navy of England, and useth, also, his utmost efforts to send a vast force of armed men into this country, to destroy it, and subject it to his own power. Therefore the king requireth and chargeth his Lords and Commons here assembled to consult upon these points and to give him their advice, how his kingdom may be well guarded and the navy defended and maintained against the malice of his enemies, and for the safeguard of the king's countries beyond the seas." In consequence of this appeal the laity and clergy made an offering of 100,000*l.* towards the defence of the realm. A panic seems to have seized the Parliament, and they entreated the king to appoint a layman and chancellor in place of an ecclesiastic. Wykeham at once resigned the Great Seal, and was succeeded by Sir Robert Thorp, March 14th, 1371. But it was not long before he was again recalled to office, for he was one of the three bishops who were summoned to the great council which met at Winchester in the following April to decide on the means of raising 50,000*l.* voted by Parliament. In 1373

John, duke of Lancaster, named him as one of the committee of seven to confer with the Commons on the subject of supplies, and held him in such high esteem that both in 1369 and in 1373 he appointed him the trustee of his affairs and the keeper of his castles and estates. In 1373 Pope Gregory XI. importuned him to use his influence and to forward the treaty of peace between England and France. The king's indolence and declining health resigned the administration of affairs into the hands of the designing and ambitious Duke of Lancaster, who aimed at such changes in the law of succession as would give him hopes of attaining the crown, as his elder brother, the Black Prince, was dying, and his nephew, Richard, was a minor. After a recess of two years the Parliament met on April 23th, 1376, and recommended a council to the king to be retained about his person for the government of affairs. The king assented, and William of Wykeham was one of the nine. In 1377 he is styled Chief of the Privy Council and Governor of the Great Council. The Parliament which the nation named "the good," renewed their subsidies for three years, but complained that the grant would not have been required but owing to the incompetency and fraud of ministers. William, Lord Latimer, the Lord Chamberlain, was fined 20,000 marks, and imprisoned in the Marshalsea, and Alice Piers was banished from the court: these were the Duke of Lancaster's confederates, and the blow fell heavily upon him. He waited to have revenge. On June 8 the Black Prince died, having appointed Wykeham his executor, an office he afterwards held by desire of the Princess of Wales as "her very dear friend." The Parliament desired the king to name Richard, then a boy of ten years old, heir apparent to the crown; and on November 20 the king formally declared him Prince of Wales. At the close of the session Alice Piers and the duke prevailed on the king to dismiss his council, to imprison Sir Peter de la Mare, who had impeached Lord Latimer in the Commons, and to undo all reforms. On the information of nameless sources, the vindictive duke had eight articles, which were fabrications without proof or evidence, advanced against Wykeham before the Privy Council. On one charge only they gave judgment, a matter of 40*l.* which the bishop had ordered to be refunded to the defendant in the case of a fine of 80*l.* to the Hanaper: for the informality of the procedure, done in open court, the creatures of Lancaster banished Wykeham from court, and seized upon his temporalities. There is a similar instance of Wykeham's lenity. When Devereux, a tailor, who had brought an action against him for a portion of the site of Winchester, was cast in 200*l.*, Wykeham paid the fine, and afterwards gave him a pension.

In 1376, on the occasion of a general pardon at the king's jubilee, Wykeham only was excepted, while, significantly enough, Lord Latimer and Alice Piers were restored to favour. In the Convocation of February, 1377, Courtenay, Bishop of London, vindicated Wykeham, and the synd addressed the Crown, stating that they would vote no subsidy until redress was made. Before the close of the month Wykeham was restored to his see, but the revenues were granted to the Prince of Wales. The violence of the Duke of Lancaster in St. Paul's Cathedral, his vulgar insolence and threatenings against the bishops in favour of Wycliffe, coupled with his proposal in Parliament to deprive the city of London of its privileges, roused the indignation of the people, and they compelled the duke to fly for his life, and required that the king should restore Sir Peter de la Mare and Wykeham to their rights. On June 18, 1377, Wykeham recovered his temporalities, and on July 15 took part in the consecration of Richard II. The young king, on July 31, 1377, issued a pardon to Wykeham, and in it mentions "his acceptable, advantageous, and praiseworthy services rendered in very many ways, at great charge and with great trouble, to his grandfather, the high place he held in their affairs of various kinds, and the peculiar affection and true love borne to him by his late father." The Commons chose Sir Peter de la Mare their speaker; confiscated the lands of Alice Piers; demanded the confirmation of Wykeham's pardon, and the appointment of a Supreme Council of nine; and on May 2, 1380, the king appointed sixteen commissioners, of whom Wykeham was one, to examine into the state of the finances; and on August 7 annulled all grants of Wykeham's possessions made to others. On August 9, 1381, Wykeham witnessed the treaty of marriage between the king and Anne of Bohemia, the famous queen who introduced the lady's side-saddle. They expressly named Wykeham as one of the commissioners with

whom they desired to confer on the low state of the exchequer, for the protection of English commerce, and touching a treaty with France. In 1385 he assisted in calling in all debts due to the Crown, amounting to 120,000*l.* Within five years Wykeham himself lent 500*l.* to the king. In 1386 the Commons demanded a commission to redress grievances, to curtail the Royal expenditure, and to provide for a just administration of the laws. Wykeham was one of the fourteen members appointed to examine into the expenses of the king's household. Richard soon after declared the commission illegal, and the authors traitors; and the Duke of Gloucester marched upon London with 40,000 men; then halting at the gates, they permitted Wykeham, the Duke of York, and five other commissioners, to wait upon the king at once, to mediate and reconstitute. Wykeham bore himself with such moderation, that, on May 4, 1389, the king appointed him Lord Chancellor. His administration was brilliant and conciliatory. Within a few days two royal proclamations were issued, promising a better rule for the honour, peace, and welfare of the kingdom, and the suspension of the payment of certain taxes until they were indispensably required.

On January 17, 1390, Wykeham, in his opening speech, declared that the king would rule with justice, and maintain the liberties of his people; that it was necessary to provide for the safety of the frontier and coast of the realm, but that the taxes raised for the purpose should be levied in a manner the least burdensome. He invited all persons who had petitions or grievances to submit them to a royal commission, and desired the Commons to ensure the observance of the laws and maintenance of peace. He then laid down his office, submitting his conduct to the judgment of Parliament, who returned to him the thanks of the House. At the close of the year he again opened Parliament, with a speech requiring money to pay the expenses of a treaty with France, and to secure the frontiers against the Scots, and both Houses thanked the king for his professions of attachment. Wykeham, who had re-established the good understanding between the Crown, the Parliament, and nation, finally laid down his office on September 27, 1391. In 1394, the king and queen were his guests for several days at Wolvesey and Farnham. The expense of entertaining their majesties and 210 guests, on September 16 and 17, was 385*l.* sterling. He was now reconciled to the Duke of Lancaster. The infuriated king, deprived of advice, proceeded to deny the Commons their right of free speech, or control of the public expenditure. On September 17, 1397, he intimidated them by the presence of an armed force into submission; they annulled the proceedings of the commission of 1386, and the session of the following year. From Wykeham the tyrant extorted 1,000*l.* as the price of a royal acquittal of any evil design in its intent and execution. Wykeham, on September 26, swore with the Lords to observe the statutes made in that session, in St. Edward's Chapel, in Westminster Abbey. In the following year he successfully pleaded his age and infirmity as an excuse for his absence from the Parliament of Shrewsbury. On September 30, 1399, he witnessed the abdication of the king in Westminster Hall, but he stayed away on October 23, although residing at Winchester House, Southwark, when Richard was sentenced to perpetual banishment. However, at the coronation feast of Henry IV. he was present, believing that he had been invited to redress the grievances of an oppressed people, and knowing that he had received the welcome of the chief persons in the realm. The last public act of Wykeham was to give his vote in a great assembly of lords and bishops, February, 1400, at Westminster, when they charged themselves only with a considerable sum of money to be raised for the defence of the realm against France and Scotland. He received the crown jewels in pledge for a loan of 400*l.* to Henry IV.

No one will be prepared to deny to Wykeham great statesmanship, political sagacity, high moral and intellectual command, and peculiar tact in dealing with princes, people, and diplomatists. His principles were the truest loyalty to the crown; silent under his own wrongs, earnest for the redress of injuries to others. When stripped of wealth he went uncomplaining to the calm retreat of Merton and Waverley, until the Parliament and his own order demanded his restoration. As a financier he advocated economy in the administration, the removal of burdensome imposts, and the levy of taxes in ways most easy to the payer. In foreign policy he recommended

the formation of definite treaties, and peace wherever possible, whilst at the same time he distinctly urged forward the necessity of a Channel fleet, and of the maintenance of the British navy for the safety of these shores, when there was an apprehension of a French invasion. He gave not only words but money to that great cause, and I am proud to say that the first public school which gave a company to the corps of volunteers was Wykeham's own, at Winchester. No doubt the aged bishop gladly retired from public life: he had seen two kings uncrowned, and done to death: he saw the follies, fail, and calamities of the ancestor reproduced in his great grandson. Before the close of life he witnessed the usurpation of Bolingbroke, the germ of the civil distractions which opposed the fœdral to the courtier noble, extinguished the pomp and power of the former from the Exe to the Tweed, and changed the entire social aspect of the kingdom. On January 27, 1403, Henry IV. was married to Queen Joan, in Winchester Cathedral.

"In 1378 the population amounted to 2,300,000. 'So greatly had it been impoverished,' said Parliament in its address in 1376, 'by war, pestilence, famine, and murder, that there was but one-third of the people left,' owing to the French wars of Edward, and those of the Duke of Lancaster to secure the crown of Castile, and five fearful plagues between 1349—1382. The great political movements of the period emanated from the faction and intrigue of the nobles, the divisions and feuds of ecclesiastics, and popular risings under leaders to resent the oppression of Government. The franklin stood but one step beneath a noble: the power of the burghers began to be felt in parliament; and free intercourse to prevail among all classes. The discipline of religious bodies had grievously degenerated: the clergy were few, and for the most part illiterate: the University of Oxford was the arena of furious disputes and quarrels, which too often terminated in actual blows: the course of study had fallen low: degrees were offered for sale, and poor scholars were the ridicule of the day; wandering students in the vacation begging alms for their maintenance, and living in hostels, and inns, and licensed private houses, or as menials in the colleges. Oxford was then not the grand city it is now: it had but six colleges in 1340; narrow streets overhung by wooden-fronted buildings without chimneys, and thatched on their high-pitched roofs; a highway with footpath and wheel-track in one; and gowmsnuckstering at a stall or beside the packhorse on fair days, chaffering with the itinerant pedlar. Four of the little halls occupied by the students of the monasteries may still be seen at Worcester College. Colleges were first founded by the general name for all incorporated houses deemed religious—the word *domus*—as we use head of a house to this day, afterwards by the local appellation of hall, and lastly by the corporate and expressive term *collegium*, the first so called being Wykeham's College, the collection of persons into a unanimous body living together. He tells us that he had observed with a troubled heart the neglect of the statutes of founders; that he implored the guidance of God's spirit, and determined in his own life-time to provide a liberal education, far above the common standard of teaching; a grand design of leading the scholar from the first elements to the highest acquirements of knowledge. He resolved to provide this bounty for "poor scholars, men of letters, and acquainted with various sciences, who would have God before their eyes, and do His will in all things." It is quite certain that in the Black Friars, London, Wykeham signed his name in 1382, in condemnation of Wickliffe's opinions, and, with the primate, expelled him from the University of Oxford. Wickliffe was a reckless assailant of all opinions which he disliked, and fell into grievous errors. Wykeham was calm and temperate in his reform, and foresaw danger in the heat of the intemperate favourite of the Duke of Lancaster. When he was reproached that there were Lollards in his college, he said there was a Judas among apostles, a had man in the ark, a Nicholas among deacons. He interposed, however, in favour of the Chancellor of Oxford, when he was exposed to severe punishment for his countenance of a Lollard preacher. His religious views were most decided: he distinctly says that in founding his College of Winchester his ultimate design was that his scholars should have "a true knowledge of the mystery of Holy Scripture." His colleges are dedicated in honour of the Annunciation of the Saviour, as is evident from the sculptures still remaining; and it is remarkable that in his will there is not a word relating to any doctrine or tradition which was

renounced at the Reformation: "I recommend my soul to Almighty God, my Creator and Saviour, who made me from nothing, with most humble heart, praying for His mercy, and asking, that of His great pity, He would vouchsafe to set it in the company of His elect." His statutes adjure every member of his foundation "by the mercies of Jesus Christ, by the hope of happiness both in this life and in the world to come, and by the expectation of divine judgment, above every thing, and in all things to maintain unity, mutual charity, peace, concord, and brotherly love; to desire and be zealous for those bonds of kindness; to avoid every word of envy, contempt, and braggartry, quarrel, jarring, hurt, foul speech, contention, whispering, scoff, injurious scandal, or wicked imputation, or any comparison of birth, or of nobility with nobility or low estate." This was surely the rule of bringing up the boy as a Christian and an English gentleman.

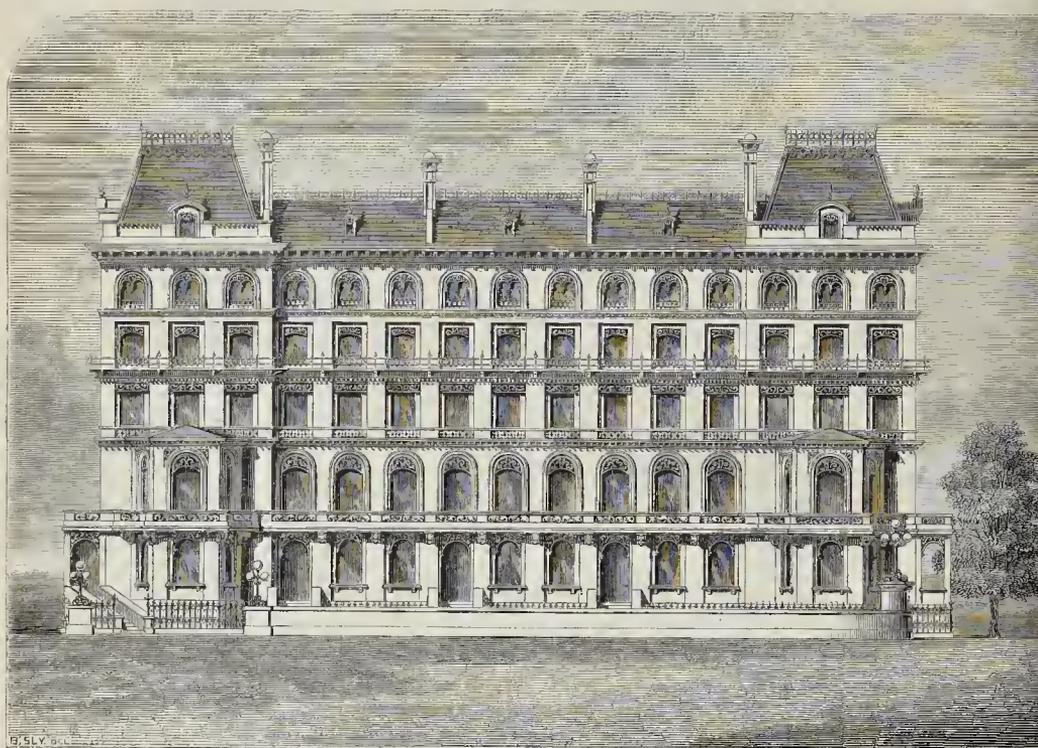

The arrangement of his buildings at Winchester and Oxford remains: change has little affected them; and the happy, graceful, and convenient design, peculiar and original, furnished the model for similar foundations. The hall and chapel, the munition-room and library, the chambers of fellows, chaplains, and scholars, and cloisters, the earliest instance in a college, were seen for the first time gathered into one group. Wykeham here first lowered the pitch of roofs, and employed lead as a covering in place of shingle; and in the wooden vaulting at Winchester, may be seen the germ of fan tracery. The library was richly supplied by him with MSS. at Winchester: at New College it included in theology, sixty-two vols., valued at more than 82*l.*; in medicine, fifty-two vols.; and in Canon Law, fifty-three vols., valued at 33*l.*; in decretals and treatises, thirty-seven, worth 17*l.*, exclusive of gifts. The buildings show the artist and man of taste in their solidity, proportion, picturesqueness, and harmony of ornament. The Society of New College, on April 11, 1386; that of Winchester, on March 28, 1393, took possession of the new buildings. The course of study at New College was thus prescribed:—"Holy Scripture, the mother and sovereign of all other sciences; philosophy; canon and civil law." He desires that *especially Christ may be preached more often and more fervently, and the faith and worship of God, read, and more strongly upheld; and all sciences and virtues more richly abound and strengthened, and that every member may be always a learner, and endeavour to become a better man, and assist his fellows, that all tending to one end might have one heart and one mind.* Out of seventy fellows, ten were to be civilians, ten canonists; the remaining fifty to be students in arts, philosophy, and divinity; two being students of medicine, and two of astronomy. The entire system, we must remember, included geometry, mathematics, grammar, logic, rhetoric, music, arithmetic, astronomy, and physics. His sumptuary laws were most excellent; but he encouraged a cheerful gathering round the fire on every holiday, to sing ballads, to enjoy all honest merriment, and read poems, chronicles, and marvels of the world. Latin was to be the ordinary language; but Wykeham, like a courteous gentleman, forbade its use in the presence of strangers. And what did Wykeham for architecture? He gave the sound preliminary education. He reared Fox, the founder of Corpus Christi College; Chicheley, of all Souls' College, Wuyufete of Magdalen, at Oxford; and Field, one of the architects of King's College, Cambridge. Henry VI., a frequent guest at Winchester, there was induced to found Eton and King's College, adopting his statutes almost literally: Wolsley, at Ipswich and Christchurch; Sir T. White, at Merchant Taylors' and St. John's; and Queen Elizabeth, at Westminster and Christchurch, adopted the form which he had originated. And the impulse he gave is not dead at Winchester; for we can still point out with pleasure, as one of Wykeham's sons, the name of Mr. Penrose. And more, Wykeham was no destructive of earlier works: when he created his colleges he did not, like Beckington, or Wolsley, or Alocck, found them out of the funds or on the ruins of earlier buildings. When the king gave him the lands of certain French monks, he never rested till he found them a house and ample revenues at Paris. And what did he do for education and literature? In his school he reared four archbishops of Canterbury, numbering the gentle Warham, Bilson, Burgess, Lowth, and Ken; Grocyin, the reviver of the Greek language; philosophic Shaftesbury, Norris, Sir H. Wotton, and profound Harris; Sir T. Browne, the moralist; of poets, Otway, Young, Collins, Somerville, Phillips, Crowe, and Bowles; Sir R. Maclure, Professors Empson and Daubeay,

Dr. Arnold, and Dean Buckland. Four speakers of the House of Commons, one of whom is the respected Lord Eversley. Among seamen, Keats and Warren; and among soldiers, Guildford, Dalbair, Myers, and F. M. Lord Sauton. It is right to add that he educated two grandsons of his early patron, Sir N. Uvedale, at Winchester.

His work on earth was nearly completed. He carefully repaired the priory church of St. Mary, Southwick, where his father and mother, and sister, were buried. It is related that he could never sing the Requiem without tears, for their sweet memory. He framed a will remarkable for display of a religious mind, good heart, gratitude, benevolence, singular exactitude, and tender consideration for all with whom he had been connected. It contains 230 bequests to the value of 7,000*l.*; 1,000*l.* devised in a codicil he had paid in his lifetime. But his great bequest was in the service of architecture, in which he established and introduced a new style. When Edingwood commenced his episcopate, Wykeham was twenty-three years of age; and, probably, as he had then been recommended by Uvedale to the bishop, and received by him as one competent in architecture, designed the alterations made in the cathedral. That building forms an epoch in the art, an innovation founded upon the remodelling of an ancient structure, where prominence was first given to a new and animating feature, the development of an idea to which a tendency had already been made. No one has ever denied the grandeur of the nave of Winchester, the only one of such enormous size that has been carried out in a consistent style, and still standing in the highest rank. Wykeham neither wholly destroyed nor merely overlaid—he retained the proportions of the old Norman fabric, while he exhibited the richness and fertility of his own mind. Every word of this straightforward and honest-hearted man carries a special weight. He distinctly claims the merit of design and construction in his will, where a man must speak the truth. He directs that the windows shall be glazed, beginning at the "west end of the church in the new work made by me, in the windows, both upper and lower, on the south side of the church repaired by me." He desires his "executors to cause to be repaired the body or middle of the church between the N. and S. aisles, from the west door of the choir down to the west door of the church, in the walls, in the windows, and vaulting, honestly and honourably, conformably and orderly, according to the exigency, form, and mode, of the new work of the aisles now begun, and the aisles also for the same length, for the completion and consummation of the work, according to the mode and form limited above." He deposes the disposal and ordering of the new work to the men he had employed in his college, Wm. Wynter, the stone mason; the paymastership and surveyorship of the works to Simon Membury, treasurer of Wolsley; and the comptrollership, to J. Wayte, monk of Winchester, who acted on the part of the dean and chapter. He bequeathes 2,500 marks to these works, and 500 marks to the glazing of the windows. He died Sept. 27, 1404, having transacted business within four days of his decease, and was buried at Winchester.

The splendid testimony borne to Wykeham's reputation as an architect by the venerated president of the Royal Institute of Architects is singularly in harmony with the character of the man in his public and private life—"simplicity and sincerity of purpose; wisdom, forecast, and economy; enlightened principles of taste;" the admission of "no ornament but what is appropriate; variety of resource and mastery of design; his consideration of wants and requirements." Vitruvius sums up every accomplishment in his ideal of an architect. Wykeham reached that standard. His golden sentence was, "There can be no true dignity where there is no real high principle." His motto is a scrmou in itself, full of lofty meaning. Manners maketh man,—manners which affect more than laws: on them, in a degree, laws depend, and touch us but partially. Manners exalt or debase, civilize or corrupt us, by their steady, continuous, insensible operation: life takes its form and colour from them: they form or destroy morals. Not on wealth, not on rank, not on birth, accidental advantages, but on his own conduct and worth, depends a man's whole estimation in life.

Such was Wykeham. He rose by natural genius, knowledge of mankind, and talent for business, by honesty of purpose, and reliance on God. He was humble, and, therefore, became great. He devoted his whole heart to every labour which he undertook. The highest witness has been borne to his patriotism and integrity by his own sovereign, his order, and by parliament, in whose

THORNTON TERRACE, CLAPHAM COMMON, NEAR LONDON,

confidence be always stood high. He first instituted the system of a public school, "the best adapted," said Gibbon, "to the genius and constitution of the English people." "In my conscience," said Mr. Canning, "I believe that without it England would not be what she is." There in his own school,—I trust many here will visit it one day in their lives,—you will find his statues observed in the memorable words with which he closed them, commending all his sons to observe God's will as the servants of Christ, and maintain the bond of perfect charity.

And when I look round this room and see the beautiful works of art which adorn its walls, I recognize those who labour in the same school that Wykeham toiled in. I cannot but see the promise of a still wider dissemination of the growing appreciation by the public of "the queen of arts," in proportion as the triumphs of peace are preferred to the excitement of war; and the opening of galleries and museums and exhibitions such as this elevate and instruct the taste of the people. Nor can I doubt that higher honours await the professors of this art, or that, as buildings, religious and civil, of the merit which they now possess, are multiplied throughout the land as its chiefest ornament, the country will fail to bestow on them adequate recognition of their services, and take for a precedent the glorious name of Wykeham, the crined architect.

**THE FREE PUBLIC LIBRARY AT LIVERPOOL.**—At a meeting of the Liverpool town council, a resolution (rescinding a former one refusing an allowance of money from the corporation funds towards the opening of the Free Public Library, the gift of Wm. Brown, esq.), was passed unanimously, granting a sum not exceeding 10,000*l.*, for the purpose of opening the Brown Library and Museum in October next. It is stated that the Queen will be invited to attend on the occasion.

#### NEW TERRACES ON CLAPHAM COMMON.

THESE terraces form part of a large building operation now being carried out upon an estate formerly called "The Cedars," connecting Battersea-park with Clapham-common, and about twenty acres in extent.

A broad road will be cut through the centre of the ground, planted boulevard fashion, with a double row of limes, and having a fountain in the middle of its length. On each side of the road detached houses, at rentals of about 120*l.* or 130*l.* will be built, and at each end of it, coupled terraces,—those we illustrate facing the western end of Clapham-common,—and corresponding, but smaller blocks, at the other end of the road, overlooking Battersea-park, the Thames, and Chelsea.

The terraces represented above are now in course of rapid erection. They will each consist of five residences, the corner houses having twelve, and the intermediate houses nine bed-rooms and dressing-rooms, besides bath-rooms and closets. The drawing-rooms will be 50 or 40 feet long, with houndoirs overlooking the common attached to them, and the dining-rooms 27 feet by 17 feet.

The stabling is arranged as a mews at the extremity of the gardens behind. The rentals in the terraces will be from 200*l.* to 250*l.* per annum. The material employed in the architecture is almost entirely white brick, the window hoods, strings, and pierced balcony panels being in Portland cement. The iron work to ridge crests, upper balconies, and front railings, will be painted chocolate and gold, after the manner of the Tuileries. The dwarf walls in front, separating the carriage-drive from the common, will be of white brick and stone, with clustered lamps upon the terminating pedestals, gilded and painted to match the other metal work.

The whole scheme is the property and speculation of Mr. Harris, of West-road, Clapham-park, who has already done much towards transforming the "sanctified ville" of the past into the great suburb of to-day.

The designs are by Mr. Knowles, jun., of Gray's-inn, and will be of similar character and style throughout the whole estate, to that shown in the elevation of the front terraces.

These have been named "Thornton-terrace," from the fact of the estate upon which they stand having been once the property of the Thornton family, so intimately connected with the establishment and influence of the famous "Clapham Sect."

The new road itself is named the "Prince's-road," and will probably become at no distant date the channel of direct communication, by means of Chelsea Suspension-bridge, between Pimlico, Belgravia, and Kensington, on the one side, and Battersea-park, Clapham, Wandsworth, Tooting, and Brixton, on the other side of the Thames.

#### WORKS OF RENAISSANCE, ARCHITECTURE, AND SCULPTURE ACQUIRED FOR THE SOUTH KENSINGTON MUSEUM.

AMONGST the works obtained for the Government Museum during the early part of last year, and now, as we mentioned some time ago, to be seen there, the most striking is the "Cantoria," or singing gallery of the Conventual Church of Santa Maria Novella, Florence, concerning which a good deal has been said in the newspapers. It is the work of the sculptor Baccio d'Agnolo, dating about the year 1500, and is executed in Carrara marble. The length is 16 feet, height 7 feet 6 inches, and projection from the wall 5 feet.

The wealthy confraternity of Santa Maria Novella having determined to renovate their celebrated church, amongst other judicious proceedings, decided to do away with the ancient "Cantoria," and to erect another in its stead, designed in the style of the edifice itself, which is of the thirteenth or early part of the fourteenth century. Accordingly, in the beginning of the year 1859, this noble monument was taken down, and sold to Signor Freppa, an eminent dealer of Florence; and immediately afterwards, whilst still lying in disjointed pieces on the pavement of the church, it was repurchased for the Kensington Museum.

Rev. Dr. Croly,—so that several hours may be spent with advantage in examination of the topographical and architectural points of the subject. We should expect to find, notwithstanding the "authorities," differences of opinion in many cases on the identity of a site; and there may be similar differences on the correctness of some of the details of the architecture, as those of the "Holy Place" of the Temple; nevertheless, one of the pictures especially is a work of extraordinary interest, and both of them are works of great power and beauty. Both views are taken from the same point, or looking across the valley of Jehoshaphat, to the area of the Temple, where now the Mosque of Omar is the prominent object, and so as to include almost every feature of interest in the ancient city or the modern. In place of the procession of upwards of 150 figures in the foreground of the one picture, we see in the other modern Arabs and a party of English travellers. The pictures were painted for Mr. G. L. Beaufort, of Scarborough, who commissioned the artist by the advice of Mr. David Roberts, to whom the subjects were first named. The principal subject will require even greater care in the engraving, in details of the architecture, than was thought necessary in the picture, and much greater than is shown in the painting on the photograph taken preparatory to engraving.

#### PRE-RAFFAELITISM AND ARCHITECTURE.

##### THE ECCLIOLOGICAL SOCIETY.

THE annual meeting of this Society was held on Monday evening last in the Gallery of the Architectural Exhibition, Conduit-street, Hanover-square.

The chair was taken by Mr. Bressford Hope, president of the Society.

The President, in opening the proceedings, said that the Society, having come of age that evening, met for the first time in the Gallery of the Exhibition; but he trusted they met with the same heart and the same spirit as ever. The progress which their views had made during the last twenty-one years was apparent from the drawings on the walls. Every church or cathedral represented there embodied the principles which they were accounted fanatics for enunciating in 1839. The success of the movement had been exhibited in every town in England; churches were being built and cathedrals restored in a spirit unknown a short time ago. Sculpture and painting, as applicable to church ornamentation, were rapidly showing the greatest improvements, and the vandalism which had hitherto destroyed old buildings was fast expiring. Yet, when they heard of such destruction as had recently occurred at the Guestern Hall, Worcester, they felt that much remained to be done. This building, though capable of restoration, was allowed to meet its fate because the body of local authorities knew not what to do with it. The committee had selected for discussion this evening "The Tendencies of Pre-Raffaellism, and its Connection with the Gothic Movement." He knew no subject so likely to elicit difference of opinion, and he hoped that every one had come determined to put forward his own views.

The Rev. Mr. Webb, secretary, then read the annual report.

The report said, *inter alia*—

"Your committee has to thank the following architects, who have favoured us with drawings of their various works during the past year.—Messrs. Buckridge, Burgess, Bodley, R. Brandon, Clarke, Douglas, Fowcett, Hopkins, Hills, Hugall, Jones, Lee, Norton, Pearson, Pullan, Robson, Scott, Seddon, Slater, St. Aubyn, Street, S. S. Teulon, W. M. Teulon, Truett, Turner, White, and Withers. To this list must be added Her estate, of Cologne, and Messrs. F. C. Withers and C. M. Buris, of the United States. In stained glass must be noticed Messrs. Clayton & Bell, and Messrs. Lavers & Barnard; and in metal work Mr. Skidmore and Mr. Keith, who has worked some excellent church plate from the designs of Mr. Butterfield and Mr. Street.

The principal new church of the year is undoubtedly Mr. Scott's noble building of All Souls', Haley-hill, Halifax, which was consecrated last November. This fine work has been noticed at large in the *Eccliologicalist*, and it was pointed out how important an example it is of the introduction of sculpture into church decoration. The same architect's chapel for Exeter College, Oxford, has also been consecrated. Mr. Butterfield's church of St. John Evangelist, Hammer-smith, has been finished; his St. Alban's, Baldwin's-gardens, is in progress. Mr. Street's church of St. James the Less, Garden street, Westminster, is rising; and another, by the same architect, in the parish of St. Giles, Oxford, has been begun. The committee observe with satisfaction that in the chancels of these two churches, and in Exeter College Chapel, vaulting has been adopted. Mr. Brandon's church in Great Windmill-street will be commenced in the course of the summer. Mr. Slater's cathedral at Kilmore is almost ready for consecration; and he is about to build a mortuary chapel of unusual scale and dignity at Sherrborne, as well as a satisfactory church at Bray, near Dublin. Another work of peculiar interest is the trans-

mutation, by Mr. Butterfield, of the parish church of St. Columb, Cornwall, in hope of its becoming the cathedral of the future diocese of Cornwall. The plans include the addition of a chancel to the nave, and the substitution of a more dignified choir for the existing chancel. Mr. Burgess's memorial church at Constantinople is at last ready in hand.

We are able to mention this year with great approbation several colonial churches. Foremost of these is a very original design by Mr. Burgess for a cathedral at Brisbane, Australia. Mr. Slater has completed the very successful church of St. George, Basseeterre, St. Kitts; and Mr. Bodley has designed a peculiarly good parish church for the diocese of Graham's Town. Montreal Cathedral was opened for service on Advent Sunday, and the cathedral for Sydney is approaching completion. The high roof recently added to Calcutta Cathedral is an improvement to that unsatisfactory structure.

Of foreign churches we may mention St. Lawrence, Alkmaar, by M. Cuyvers; the votive church at Aix-la-Chapelle, and the cathedral at Litz, by M. Stutz; and the Lutheran churches of St. Bartholomew, Berlin, and St. Ansharum, Hamburg. A volume of designs for churches, built or projected by Herr Stutz, testifies to great ecclesiastical activity in Germany. Mr. Scott's church at Hamburg is nearly completed.

The new Park Church at Glasgow, by Mr. Roebuck, may be referred to as a conspicuous example of the now common use of the Pointed style among the Presbyterians of Scotland."

The Venerable Archdeacon Thorpe, of Bristol, moved the adoption of the report, and, in doing so, pointed out a mistake into which the committee had fallen in complaining that the present architectural movement had not produced a new church completely groined throughout. They had forgotten Mr. Scott's church at Leeds.

A gentleman, in the body of the hall,—“Yes, and Chalcot.” A second gentleman,—“And Exeter College, Oxford.”

Mr. Street, in seconding the report, asked whether the committee had come to any decision upon the admission of chairs into churches. The subject was brought before the last annual meeting, and he expected that some allusion would have been made to it in the report. He felt that an opinion from this Society would have some influence upon the Incorporated Society for Building Churches, who had adopted a rule not to make grants in the erection of a church where moveable seats were used.

The President thanked Archdeacon Thorpe for correcting the mistake into which the committee had fallen in overlooking the groined church at Leeds. The Cathedral Church at Exeter College, Oxford, did not apply to the observations in the report, as it only spoke of parochial churches. In reply to Mr. Street, he had to say that the committee had slumbered on their seats, but that the change from the benches at New Brompton, to the chairs in Conduit-street, might awaken them next year to pay attention to the subject.

Mr. Street thought that the matter should be taken up seriously. A memorial from an independent society might have some effect upon the Church Building Society. He felt, as a church restorer, very strongly upon the matter.

The President suggested that the question was one of policy rather than of ecclesiology, and that any active steps taken by them might give an air of party to it in the eyes of narrow-minded people. The *English Churchman*, a journal which still lingered on in undisturbed obscurity, objected to their introduction, on the ground that chairs were a badge of party. He was anxious that no steps taken by them should countenance the idea. Perhaps Mr. Street would be good enough to move a resolution calling the attention of the Society to the subject, and full justice would be done to it in the report for next year.

After some discussion, the following resolution was adopted, “That it is the opinion of this meeting that the question of seating churches is one well worthy of the attention of the committee, and that it be requested to take steps in the matter, with reference to the existing rules of Church Building Societies in regard to the use of chairs, and the terms of their grants.”

The Rev. S. S. Greathead, treasurer, then read the financial statements, which showed that the Society, starting with a balance from last year of 61*l.* 9*s.*, had received 128*l.* 13*s.*, and expended 43*l.* 5*s.* 11*d.*, thus leaving a balance in his hands of 85*l.* 4*s.* 11*d.*, but that some printing expenses were still due.

The business of the annual meeting having been disposed of,

The President opened the subject of debate by remarking that the committee having made ecclesiastical art the subject of study, had observed that along with the Gothic or Pointed movement there had sprung up another, which had attracted much attention, and which had been described in the public press as identical with it. He believed that the Pre-Raffaellite movement had excited as much attention as any matter outside the field of politics. In proposing a discussion on the subject

the committee did not ask the meeting to give any opinion, as the question could not be decided in a promiscuous one like the present. Accordingly, all the remarks he might make on the Pre-Raffaellite movement, from a Gothic point of view, were made in his personal character, as a member of the Association, and not as its president. Some of his views had never been announced before, and were now thrown out to provoke friendly discussion. He had been first attracted to the views of this school by a series of papers which appeared in 1849 and 1850, and which, under the title of the “Germ,” announced strange opinions. The school had, from their first starting, laid down two distinct principles. One was a phase of mysticism, the other a phase of strong and determined realism,—to paint nature more naturally than nature itself. Nature, as seen by man, was a compromise; for nature must be ever viewed by different eyes. The effects produced by nature on one sight would be lost on another; and the various atmospheric effects of the same scenes were seen by different persons in different aspects. No representation could be representative of nature which did not deal with that *chiaro-oscuro* which was a principal element in all nature. The Pre-Raffaellites were determined to sum up every detail, and from these details to form a natural result. Holman Hunt's last painting, “Our Lord discussing with the Doctors,” must be looked upon by the Pre-Raffaellites as the triumph of their art. All who had seen it had been struck with the perfection with which the details were worked up. It was wonderful for its minuteness; but then it was so grouped that the Saviour of the World was made the centre figure? Was it not a conglomeration of wonderfully studied models? Where was there in it the glorification of one figure? The intense realism was gradually overcoming the mysticism with which Pre-Raffaellism had started. However, the question before them was whether this peculiar style was the correlative of Gothic art. He declared it was not. At the same time he was ready to acknowledge the good it had done. Painting had fallen into blotched habits that required correction; but since the appearance of Pre-Raffaellism the Academy had paid more attention to details, and so proved that this movement had done good. Gothic architecture aimed at an imaginative scale, the Grecian temple did not: the spiritualism embodied in the Gothic design was never absent, but in Pre-Raffaellism could not be discovered. He always admired the facial line of the Greeks, and could not approve of the Pre-Raffaellite abandoning the Greek model for the English face of everyday life. He did not look for the spiritualism of Gothic art amongst this school. He had thrown out these cursory remarks to provoke discussion on the subject.

Mr. Burgess observed that the Pre-Raffaellites had tried to do with painting what the Camden Society had done with architecture: the latter had gone back to first principles, to correct the irregularities which were springing up: the former had faithfully adhered to nature. Rosetti, Hunt, and Millais still adhered to nature, and were improving; he expected that the world would be delivered by their labours of the conventionalism under which it had been bound. He hoped that the Pre-Raffaellites would break the facial line of Greek face which the president so much admired, and thought that if Venus were turned into flesh and blood, she would not be such a creature as any one here would admire.

Mr. Seddon remarked, that the Pre-Raffaellites had worked under great difficulties, but were gradually getting rid of early faults. The last production of Holman Hunt's, was a vast improvement on any of his previous works.

Mr. Gaubier Parry thought that Pre-Raffaellism should be called Pre-Reynoldism, because it was a return to the pure system of colouring.

Mr. Street felt strongly in favour of the school. The main object it proposed was to do everything in the most natural manner. Pre-Raffaellites had a most enthusiastic love of Gothic art, and had been the only body who forwarded a memorial in favour of Mr. Scott's design for the Houses of Parliament. They were desirous for minute details; but if the walls of cathedrals and public buildings were given up to them, they would soon lay aside this fault. Instead of paying two guineas a foot for painted windows, patrons of art should encourage the Pre-Raffaellite by commissioning him to paint his walls. The enthusiasts of the school had shown the determination to succeed in their art, by painting, gratuitously, the walls of the Oxford Union. The Eccliological Society would be devoting itself to the principles with which it had started, if it secured for the

schools the balls of some churches, on which to develop their art.

The Rev. W. Scott observed that he had been struck with the fidelity of Pre-Raphaelite painting, when he went to southern latitudes. Mr. Holman Hunt's last painting was an exact representation of the atmospheric perspective, as he had seen it in the latitude of Jerusalem; for he might remind the meeting that chiaro-oscuro did not exist in tropical climates. In consequence objects appeared much flatter than in this country; at the same time it was a great mistake to introduce flat treatment in northern latitudes. There was a great deal of cant amongst Pre-Raphaelites as to the study of the nude figure; if the school applied itself to the greatest work of God, that which He pronounced very good when He had created it, they would do more good than by their present outcry, and deserve more of it.

The Rev. George Williams confirmed Mr. Scott's observation as to the fidelity with which the Pre-Raphaelites painted Eastern scenes. Mr. Seddon's picture of Jerusalem, now the nation's property, forcibly reminded him of the very scenes among which he had moved for eighteen months. The devotion to their art which prompted members of the school to undertake journeys to the East and sacrifice valuable time was beyond all praise.

Several specimens of art in connection with eccelesiology were exhibited at the conclusion of the discussion, and the society adjourned its meeting.

THE BRITISH INSTITUTION.

The collection of works by deceased foreign and English masters, now exhibiting in Pall Mall, is one of the most interesting we have seen there; for some years, including, in the first room, some noble Vandyses,—“St. John” (25), and “St. Matthew” (31), by Carlo Dolce; Rembrandt's marvellous “Standard Bearer” (27), and some exquisite Ruysdaels. If the “Giulio de Medici” (21) be not by Raffiello, it is nevertheless a work of wonderful power and beauty. The Countess of Jersey's version of Vaudyke's “Charles I. on Horseback” (1) is greatly inferior to that in Warwick Castle; in fact, if genuine, it has evidently been painted over by another hand.

In the middle room are several early works, notably (102) “Virgin and Child, with Angels,” by S. Botticelli, and (114) “Virgin and Child,” by D. Ghirlandajo. “Christ at the Pillar,” by Velasquez (81), a remarkable work, is injured by its position. Sir Joshua Reynolds (Burke, Dr. Hawkesworth, and others), Gainsborough, Calcott (in force), Smirke (especially his designs from “The Rambler,” 130), and Leslie, of whose works here we have spoken on another page, maintain with honour the position of the British school.

ART AND PHOTOGRAPHY.

In the hands of a good artist there are few materials, either in animate or inanimate nature, which cannot be so arranged as to be made to tell as pleasantly on the sight as sweet music does upon the ear. A crumbling moss-grown wall, a piece of brickwork with fresh creeping plants, or a flower or two close by, a little cluster of wild flowers, the bleak and monotonous henth, the clustering of branches against the sky of varying shade, groups of simple objects in farm-yards or at cottage-doors, and a thousand other matters can be made into things of beauty which have an effect upon the senses. It is remarkable, however, how differently each artist sees and translates nature.

Not long since we saw some out-door studies of a cottage, with a simple background, sketched by seven artists, each, in his way, distinguished; and it was surprising to note how different was the feeling displayed, and yet each view would have been pronounced by a close observer to be a good transcript of nature. It is the same with the human countenance. Take, for instance, half a dozen portraits of an eminent man, executed by different hands, and although all good likenesses, how different are the expression and treatment in each!

If we could get a drawing from a similar point of view of the same subject by Roberts, Cattermole, Prout, Nash, and Mackenzie, each would have an impress of fidelity; and yet how varied would be each picture! Painting is in its way similar to poetry, and each artist in his peculiar manner appeals to the senses of others. Some delight in the lofty strata of Milton, others in the pleasing but more simple images of Cowper or Crabbe. So it is with pictures: each in its way, if true to the principles of harmony and art, finds its class of admirers.

The trained artist, who is gifted with a natural

faculty for art, sees the wonderful combinations preserved by nature,—the glowing reflections, the mingling and falling of tints, all in tune. He seizes and makes the most of points of interest, and what is faulty throws “discreetly into shade;” and it is this mental quality in art which will always render photography its useful handmaid, and not a rival.

THE LATE MR. JOHN WHICHCOKD, SEN., ARCHITECT.

We regret to have to record the death of this much-respected architect, which took place at his house, in Maidstone, on Sunday last. He was born at Devides, in Wiltshire, in 1790, where his father practised as a surveyor, but died while quite in his youth. He was articled in 1806, in the usual way, to Mr. C. Harcourt Masters, architect, of Bath, at the expiration of which he entered the drawing-office of the celebrated D. Alexander, by whom he was afterwards engaged on the great works at the London Docks, and subsequently at that large and original hudding,—the goal at Maidstone. On Mr. Alexander's retirement he succeeded him in all the county business, and not only so, but to a very large practice, both public and private. His principal works were the large county lunatic asylum, the churches of the Holy Trinity and St. Philip at Maidstone, the corn exchange, the Kent Fire-office, and many other works at the same place. He also built no fewer than fifteen union poor-houses through various parts of the county.

His cool judgment, talent, and integrity, gave him a very large share of reference business, and secured him the confidence of the clergy: indeed, he is said to have built more parsonage houses, or transacted other business in relation to them, than almost any man in England.

His late preceptor, Alexander, being equally well known as an engineer and as an architect, Mr. Whichcokd was appointed the surveyor (as it is called) to the Medway Navigation Company, and executed on that river several extensive hydraulic works, particularly some difficult tidal locks, besides erecting a great number of bridges through the county. As a professional man, as an active magistrate, and as a private friend, few have had more respect, or in the language of our great poet—(lines which he often repeated to younger men)—have had a greater share of

“That which should accompany old age,—  
As honour, love, obedience, troops of friends.”

Few men indeed have left this life with greater respect from all classes, from the highest to the lowest, than he who is the subject of our present notice.

FRENCH INTELLIGENCE.

The town of Melan, on the 27th ult., inaugurated the statue of Jacques Amyot, the celebrated translator of Plutarch, bishop of Auxerre, and founder of the college of that town. Among the personages present were the Comte de Nieuwerkerke, director of the Imperial museums; M. Maury, and M. Longprer, of the Institute of France; and the ancient minister, M. Drouyn de Lhuys. Much interest was excited by the presence of the last descendants of Jacques Amyot, viz. Nicholas Amyot, his brother, viz. Amyot de Fontainebleau, and Vicomte de Kerkiguen, deputy at the Chambers of France. The usual discourses were pronounced by the Prefect of the Seine-et-Marne, M. Nieuwerkerke, and M. Maury. The statue is due to the chisel of one of his townsmen, M. Godiu, and bears the following inscription:—

“Enfant d'une famille humble et pauvre,  
Il va chercher la science à Paris  
Soul et sans appui.  
Sert des écoliers pour vivre et s'instruire.  
Maître des Arts à XIX ans,  
Professeur de Grec et de Latin à l'Université de Bourges,  
Honoré pour ses écrits,  
De l'abbaye de Beilozanne par François I<sup>er</sup>  
Précepteur de deux fils de Henri II.  
Grand amonier de France, Evêque d'Auxerre,  
Commandeur de l'Ordre du Saint Esprit,  
Toujours modeste, retiré, laborieux,  
Bienfaisant et tolérant pour tous.”

He died in 1593.

A silver medal was awarded at the last agricultural meeting in Bordeaux, on the 13th ult., to the inventor of a new tipping cart or tumbrel, which he calls *tomereau remblayeur*. In the culture of the vine up to the present time an inconvenience has always occurred which was not easily remedied. The furrows left by the plough

have to be filled up by the hand carefully, as any water lodging in them would materially affect the safety of the plants. This machine, perched on an axle-tree sufficiently long to have each wheel in a furrow and the horse and man in the centre one, tips the earth where required: the axles are placed at such a height as to leave the vines untouched, and, in consequence, the diameter of the wheels is enormous. Its use has been appreciated by those best acquainted with vine-growing and vineyards, viz. the Bordeaux farmers. The inventor is M. Sansot, of the Gironde.

The French Government has ordered the immediate execution of the works for deepening the canal of the Haute Deule, between the Fort de Scarpe and the Lock of La Barre, above the town of Lillo, at an expense of 290,000 francs (11,600*l.*).

The adjudication of the fortification works, near the Kehl bridge, on the Baden side of the Rhine, took place these last few days. The estimate of masonry, ironwork, and carpentry work, amounted to 332,000 florins. The tenders were numerous, and the greatest portion of the works was awarded to foreign contractors, says the *Gazette*, of Fribourg, who took them at 2½ per cent. below the estimated cost. By this diminution the State gains 20,000 florins. At Kehl there is a veritable mania of house building and decorating, especially in large shops, cafés, and beer-shops; and the inhabitants look forward to an influx of visitors from Strashourg and Alsatia, when the railway junction is completed.

Mons. Auguste Mariette, the celebrated archaeologist writes from Egypt, says the *Payis*, that he has just discovered the whole of an immense palace, in granite, a few paces from the great Sphinx. He believes it to be the palace of the famous Chephrem, who lived about 3,600 years B.C., and who constructed the Great Pyramid. Seven superb statues of this prince were found in the structure, imbedded in sand.

At Havre an enormous buoy, of riveted iron, has excited some interest. This buoy, measuring at least 8 mètres from the base to the summit, has the form of an inverted balloon. On the round or upper portion, an open-work map of the world is displayed: beneath it is suspended a bell, of pretty large dimensions, with seven banners ranged around it, and disposed so that the slightest oscillation is sufficient to render sound. The lower portion submerged is hollow and watertight. On the outside are four ladders, uniformly spaced, for ascending to the top of the buoy from the water.

THE ARCHITECTURAL MUSEUM.

The following letter was read at the meeting of the Architectural Museum Committee, on Monday last:—

The family of a late Sir Charles Barry beg to tender their hearty thanks for the resolution of the committee of the Architectural Museum. Living, as he did, almost wholly for art, it would have been deeply gratifying to him, and it is therefore in the highest degree consoling to them, to receive so emphatic and so general a recognition of the value of his public services. It is scarcely less gratifying to find that in those institutions, in the work of which he had some practical part, and took at all times a strong personal interest, his loss is so truly felt, and his memory so kindly regarded. And for themselves they must ever retain a deep sense of the warm and kindly sympathy which has been given to them in their trouble, and been valued by them in a degree proportionate to the greatness of their loss. Nor can they fail, at the same time, to return their sincere thanks to the committee for the part taken by them in the ceremonial of this day, and in that general and spontaneous tribute of respect which would have been highly appreciated by its object, and will ever live in the recollection of those whom he has left behind.

Clapham, May 29<sup>th</sup>, 1860.

BATH AND WEST OF ENGLAND SOCIETY FOR THE ENCOURAGEMENT OF AGRICULTURE, ARTS, MANUFACTURES, AND COMMERCE.

On the 4th instant the annual exhibition of this society was opened at Dorchester. The exhibition appears to have been a very extensive one, and not the least interesting feature in it was the fine-art and manufacturing department, more particularly the “special protection” shed, a building of wood, 100 feet by 40 feet, covered with corrugated iron, and lighted by a skylight at the junction of the roof from end to end. Here the choicest and most valuable contributions were arranged. It contained upwards of 270 artistic specimens. The collection of works of art from the Kensington Museum and the Science and Art Department alone was estimated at 30,000*l.* value. The art branch of the exhibition also included a gallery of pictures and a collection of antiquities, specimens of carving, &c. The west end of the

"special protection" shed was fitted up with a stained-glass window. The department of machinery (in motion), implements, &c., was crowded with objects of agricultural interest. The town was gay with decorations—public and private,—ringing of bells, and a numerous accession of visitors.\*

#### SHREWSBURY CONGRESS OF THE BRITISH ARCHEOLOGICAL ASSOCIATION.

The proposed congress, to be held in Shrewsbury, August 6th to 11th inclusive, promises to be more than usually successful. Berial Botfield, esq., M.P., is the president. The following is an outline of the intended proceedings:—

Monday, August 6.—General meeting, three p.m. precisely; the president's address; visit to the Abbey Church; St. Mary's; the School and Library; remains of castle; old Loues; table d'hôte; evening meeting at the Towmill for papers.

Tuesday.—Visit to Buildwas Abbey; Messrs. Maw's encaustic tile manufactory; luncheon given by Messrs. Maw at Benthall Hall; Wenlock and Priory; Acton Burnell; Pitchford Hall; evening meeting, half-past eight.

Wednesday.—Visit to Shifnal Church; Tong Church; White Ladies; Boschell; Royal Oak; luncheon given by the president at Decker-hill; Lilleshall Abbey; evening meeting.

Thursday.—Visit to the Roman lead mines at Shelve; luncheon given by Rev. T. F. More, at Linley Hall; Roman villa at Linley; More Church; evening meeting.

Friday.—Visit to Ludlow Castle, church, &c.; luncheon given by Sir Charles Boughton, bart., at Ludlow; Stokesay Castle; evening meeting.

Saturday.—Visit to Battlefield and church; Haughmond Abbey and hill; camp on Ebury-hill; Wroxeter, the excavations on the site of Uriconium; Wroxeter Church; Ateam Church; table d'hôte; evening meeting; conclusion.

#### THE DRINKING-FOUNTAIN MOVEMENT.

**Brighton.**—The want of taste displayed in most of the drinking-fountains here is protested against by the *Brighton Times*, which especially alludes to the conventional absurdity of lions' mouths spouting water, the faces, so far from being like those of lions, being neither the likeness of least nor man, but something between the two. What we said in the first instance, as to London, is being repeated elsewhere.

**Poole.**—The drinking-fountain presented to the town by Mr. G. W. Franklyn, one of the borough members, says the *Shear and Journal*, has been erected in the square, in front of the National Provincial Bank. The base is a column, the four sides of which represent different figures. This is surmounted by a kind of cupola, supported upon four light columns, resting upon swans. Within this cupola the water descends from the roof in a slight stream. From the top of the cupola an iron pillar springs, which supports a lamp. The material is iron bronzed.

**Hanley.**—The drinking-fountain presented to the borough of Hanley by Mr. Brownfield during his mayoralty has been formally dedicated to the public service. It has been erected in the Lower Market-square, and is a *fac simile* of that at the Royal Exchange, and the only copy which the owners of the design have allowed to be erected in the provinces. A stone platform composed of three broad steps supports a pedestal, the base and cap of which are of Aberdeen granite, and the shaft of "Lizard" marble. The pedestal is surmounted by a female figure in bronze. The figure is draped, and holds in its hands a cover or vase, from which the water flows. A small trough at the base of the platform is intended for the refreshment of members of the canine fraternity. The entire cost of the fountain and of its erection will be about 200l. The figure, which is 4 feet 6 inches in height, was cast by the Coalbrookdale Company, from the design of Messrs. Wills, Brothers, of London, and was erected under the superintendence of Mr. Scrivener, of Hanley, architect.

**Glasgow.**—A drinking-fountain has been placed in the centre of St. Enoch's-square, to commemorate the inauguration, by her Majesty, of the City of Glasgow Corporation Waterworks. It is composed of cast-iron, and occupies an area of 3 feet square, by 9 feet 6 inches in height. The structure consists of a square basement (which also supplies water to dogs), surmounted at each angle

by columns composed of reeds and clustering water leaves. Surmounting this is an open and enriched dome, the apex being occupied by a crown, to which, if necessary, may also be added a lamp. Under the canopy stands the font. Messrs. Walter M'Farlane & Co. are the manufacturers and patentees.

#### THE IRON AND MACHINE TRADES.

The immense expansion of the iron trade of late years, remarks the *Mining Review*, is rendered obvious by recent official returns. The value of the exports last year and in 1854, 1849, and 1844, was as follows:—

	1859.	1854.	1849.	1844.
Pig iron.....	901,929	1,244,853	417,457	316,400
Bar, bolt, and rod.....	2,373,910	3,731,071	2,655,247	1,498,141
Railroad.....	4,125,088			
Cast.....	795,819	737,428	174,452	188,972
Other kinds.....	275,919	158,400	82,091	46,831
Wrought iron..	3,129,381	3,129,381	1,386,867	949,515
Unwrought steel	805,832	681,852	319,881	192,392

The demand for British machinery exhibits a similar progress. The value of the steam engines exported in 1844 was 317,092l.; 152,519l. in 1849; 566,768l. in 1854; and 973,340l. in 1859. Other machinery was exported of 459,923l. in 1844; 548,112l. in 1849; 1,364,092l. in 1854; and 2,757,941l. in 1859.

#### COMPETITIONS.

**Public Rooms, Kirkcubright.**—The premium of 20l. for the best design for public rooms has been adjudged to Messrs. Haig & Low, of West George-street, Glasgow. There were eighteen competitors from various parts of the country—London, Southampton, Leeds, South Shields, Newcastle, Kilmarnock, Glasgow, Edinburgh, &c.

**Aldershot Cemetery.**—The Burial Board for the parish of Aldershot have decided in favour of the design submitted by Mr. T. Goodchild, F.S.A., architect, Guildford, and these are to be carried into execution forthwith.

**Scarborough.**—Mr. W. B. Stewart, architect, is the successful competitor for the building of the New Primitive Methodist Chapel in this place. Six plans were sent in. Mr. Stewart was the architect of the Royal Northern Sea Bathing Infirmary, at Scarborough.

**Wolfe Cemetery.**—In answer to this advertisement, which appeared in our columns, numerous designs were received, of which, after consideration, those bearing the motto, "I take aim for the mark," were selected, and, upon opening the letter accompanying them, were found to be from Mr. C. H. Edwards, of London, architect.

#### CHURCH-BUILDING NEWS.

**Tickwell (Leicestershire).**—The church of All Saints, which is in a very dilapidated state, is about to undergo a restoration, consisting of new roofs on nave and aisles, rebuilding the south aisle and porch, entirely resetting, with new pulpit and reading-desk, and sundry door and window restorations. The chancel was restored some years since by the patron of the living, the Earl of Gainsborough. The chief features in the church are the Norman arcade, on north side of nave, and the tower. The works are going to be carried out under the superintendence of Mr. R. W. Johnson, of Melton Mowbray, architect.

**Northampton.**—The restoration of the decorated church at Fincon, according to the *Northampton Herald*, is now completed. A reredos, after a design by Mr. Slater, the architect of the restored church, has been erected against the east wall behind the altar. It is of the same style as the rest of the church. It consists of five highly-pointed canopies of Caen stone, supported by red marble pilasters. The restored chancel screen is of Caen stone, excepting the portion behind the pulpit, where the only perfect piece of the original is inserted.

**Colchester.**—Wivenhoe Church has been restored and reopened. The first stone of the nearly new structure was laid about the middle of June of last year, by Lady Georgiana Gordon Rebow, and the restorations have now been completed at a sum amounting to nearly 3,000l. The building operations have been carried out under the superintendence of Mr. E. C. Hukewill, architect, London, and Messrs. White, of Vauxhall-road, and Eade of Wivenhoe. Oak doors, covered with iron work, open into the north and south aisles of the nave, the two first arches of which were original, and, with some dilapidated windows of

the north aisle which have been replaced with new, have given a key to the architectural period of the whole work—namely, the Decorated of the fourteenth century. Except the south aisle, which has been added, all the walls are on the old foundations. There are now no galleries to be seen, and the tower arch, which is therefore open, shows the west window above the organ with the old instrument in a renovated case. The whole of the pewing is of oak. The east window to chancel, and the west window of north chancel aisle, are filled with stained glass, and are both memorial windows, as are also the tower window and the west window of south aisle of nave. Open timber roofs of high pitch cover the building. In the east chancel, over the altar, is a memorial stained-glass window. The subjects comprise, the Annunciation, Baptism, Crucifixion, and Entombment. In the east of the north chancel aisle is also a stained-glass memorial window. The two side-lights represent our Saviour bearing the Cross, and His appearance to Mary Magdalene in the garden; and the central light depicts Christ's Ascension. The upper tracery contains symbolic representations of the Trinity and the Four Evangelists. These windows were executed by Mr. Warrington, of London. There are memorial windows at the west-end of the church, representing "Christ walking upon the Sea and stilling the Tempest;" and in the church tower, behind the organ, depicting two full-sized figures of angels, expressive of praise. The two latter windows were executed by Cassell, of London.

**Maldstone.**—The Baptist chapel in King-street, having become very much dilapidated, is now being pulled down, preparatory to the erection of a more commodious building. The new chapel will be a Gothic structure, the front towards King-street, presenting two tiers of windows, the upper windows being placed in small gables rising from the parapet of the chapel roof. The entrance will be under a tower at the N.W. angle. The upper portion of the tower is finished by angle pinnacles, from which a spire rises to the height of 100 feet. The west end is lighted by a five-light window, the staircases to galleries and approaches to school-rooms being arranged under. The south side is similar in elevation to the front facing King-street. The east end is a polygonal apse: in each face is a single-light window, and it is proposed to fill these windows with stained glass. The internal arrangement is a combination of the early Gothic styles with the requirements of the present age. Messrs. Peck and Stephens are the architects, and the contract of Messrs. Sutton, Walker, and Goodwin has been accepted for the erection of the building.

**St. Helier's.**—The foundation-stone of the new Congregational chapel, Victoria street, St. Helier, according to the *Jersey Times*, has just been laid. The edifice will be in the early English style, and built of blue and grey native granite with Caen stone dressings. There is a tower at the south-east angle, surmounted with a corresponding spire, at a height of 100 feet, the lower stages of which consist of eight arcades of the pointed trefoil arch, sharply moulded, and finished with carved canopies and finials. The front elevation exhibits a central doorway, and over it a three-light window, after the example of the great western window of Salisbury Cathedral. There are also two-light windows on each side of the door to give light to the lobbies, windows of similar construction in the tower, and a small sharply-moulded quatrefoil window in the centre of the gable. The interior of the church has an open-arched ceiling, wrought in plaster of Paris, in imitation of groined stone roof, with ribs moulded rising from ornamental bosses, and ornamented with bosses at their intersections. In the rear of the church is a school-room. Mr. Philip Brée is the architect, and Mr. James E. Hoday the builder.

**Chen-Magna (Somerset).**—The parish church here has been re-opened, after having been closed since September last, for the purpose of repair and restoration. The nave, north and south aisles, and Strachey and Baber chapels, have been furnished with open seats. The tower arch, at the west end, has been opened to view by the removal of the organ, which blocked up the west entrance. The organ has been placed on the north side of the sanctuary, forming an ornamental screen in front of the vestry. The screen, which divides the chancel from the nave and aisles, has now been divided into three parts, all the old bays restored, and put between the columns of the centre arch of the chancel leading into the nave, and the arches leading into the Strachey and Baber chapels. When the funds will permit, it is intended to complete the restoration of this screen

\* An elaborate and extended account of the whole of the exhibition and proceedings, prizes, &c., appears in the *Dorset Chronicle* of 7th instant.

by the addition of a carved cornice of vine foliage and crocketing. In restoring the screen, the ancient polychrome decorations were brought to light, on the removal of the modern coats of paint, and it is proposed to restore the gildings and colourings of the fifteenth century. One of the bays has been rigidised and coloured. The chancel has been repaved with Peumant stone, inlaid with tiles, the gift of Mr. Rose. During the progress of this part of the work the old altar slab was discovered buried under the chancel. This slab has been restored as far as possible, and now forms a dais or platform for the present altar-table. New roofs have been added to the north and south aisles, the tower chamber, and the Strachey and Baber chapels. The additional restorations in the side chapels are of minor character, but the stone work throughout all the columns and arches has been restored. By the new arrangement of the seats, accommodation is provided for about 460 persons. The works have been carried out under the superintendence of Mr. Norton, of London, architect. The general contractor was Mr. Kingham, of Ipswich, but the mason's, plasterer's, and carved stone work, were entrusted to Mr. J. King, of Bristol. The foundation stone of a new vicarage-house has been laid. The site adjoins the old parsonage-house, which is to be pulled down, and as much of the old material used as possible. The style of the new building will be Gothic. The architect is Mr. Norton.

**Dunham (Cheshire).**—The foundation-stone of a new church has been laid at Dunham by Miss Park, of Ince Hall, the first sod having been cut by Mrs. Barker on the 6th of April. Dunham Church is to be a chapel of ease in the parish of Thornton. The edifice is to be erected of stone, in the Decorated style. It will have a chancel, nave, vestry, south porch, and a bell-cot on the west gable. Accommodation will be provided for 110 persons, in open seats, all free. The building is estimated to cost 800*l*. Mr. Joseph Barton, of Dunham, is the contractor; and Mr. James Harrison, of Chester, the architect.

**Heywood (Lancashire).**—Two of the foundation-stones of the new church of St. Luke were laid on Thursday, May 31st; one stone, in the north-west angle, being laid by the clergy; and one, in the north-east corner, by the Masonic brethren. The day was observed as a general holiday. The members of nearly all the "orders" or "clubs" in the town and neighbourhood assembled, and walked in procession to the churchyard, where immense platforms had been erected. Some 18,000 to 20,000 persons were astir about the ceremonial. The church comprises a parallelogram of 131 feet by 67 feet, divided into a chancel, 42 feet by 22 feet; a nave of 80 feet by 24 feet wide; and aisles, 16 feet 6 inches wide, extending the whole length of the nave and chancel, excepting where meeting the vestry, with the heating-chamber under, on the south side of the chancel. On the north side, next to York-street, and approached by a wide flight of steps, is a detached tower, 23 feet square, exclusive of the buttresses, and a spire of the total height of 188 feet, forming the principal entrance into the church; whilst on the south side, next to Church-street, is a porch entrance. Attached to the north side of the chancel aisle is to be a chapel belonging to Mr. Joseph Fenton, J.P., of Banford Hall. The church is designed in the character of ecclesiastical architecture which flourished during the period of Edward III. It will be built with Yorkshire freestone and Staffordshire ashlar stone externally, and Bath stone ashlar work internally. The roofs will be open, of pitch pine, springing from a lofty clerestory, with the lights carried on slender shafts of coloured stone. The east window is of seven lights, and it is expected, will be filled with stained glass. The west window is also large, and of six lights. The clustered columns in the chancel, with the shaft of the chancel arch, as well as the shafts of corbel supporting the roofs, will be of local-coloured stones, mixed with marbles and serpentine, as the funds will allow. The seats will be of pitch pine, varnished. A great amount of carving is intended. A sum of more than 10,000*l*. has been raised to rebuild the church. The edifice is being erected from plans furnished by Mr. Joseph Clarke; and the contractor is Mr. E. Hughes, of Liverpool. Mr. Radcliffe is clerk of the works. The church will accommodate 1,000 sitting, without galleries.

**Grimston.**—We understand, says the *York Herald*, that the parish church of Grimston, or Kirkby Wharfe, near Tadcaster, is at present being restored, enlarged, and beautified by the family of the late Lord Londesborough, in the memory of his lordship. It is intended to preserve all the interesting old architectural features of

the church, including the Norman doorway, the early English lancet windows in the tower, and the transition pillars and arches of the nave. Considerable accommodation will be gained by the addition of a north aisle, which will at the same time afford a west window towards the park. The east window, which will be entirely new, and in the Decorated style, is to be filled with stained glass by Capronnier, of Brussels. The furniture for the chancel will be worked by Lady Londesborough and the Hon. Miss Denison.

SCHOOL-BUILDING NEWS.

**Caversham.**—The foundation stone has been laid of "Amersham Hall School," Caversham, near Reading. The building, which is in the Tudor style, is from the design of Messrs. Haslam & Buckland, of Reading and London, and the contractors are Messrs. Orton & Child, of Reading, who have undertaken the work at something over 4,000*l*. It forms three sides of a quadrangle; the centre occupied by the dwelling-house; the western wing, intended for the class-rooms and dormitories, affording accommodation for nearly 100 pupils, and externally approached from the quadrangle by cloisters; the eastern wing includes all the domestic offices, and the dining-hall, and will communicate with the centre school wing by a corridor. The site is upon an elevated piece of land on the road leading from Caversham to Henley, about one mile from Reading.

**York.**—The foundation stone of a new Wesleyan Sabbath School has been laid adjoining the Centenary Chapel, in St. Saviour-gate. The cost will be about 1,600*l*. There will be two rooms, the larger one 54 by 36 feet, and the smaller one about 30 feet square. They will communicate with each other, and there will be connected with them six class-rooms, including a large room for a library. The architect is Mr. Edward Taylor, of York, and the following are the contractors:—Young & Biscorn, builders; Shaw & Young, joiners; Close, Ayre, & Nicholson, the iron work and hot-water apparatus; Wm. Hartley, plumber; H. Rayson, painter; and Francis Rawling, plasterer. The school will be capable of accommodating about 400 children.

**Sheffield.**—The local Poor-law Guardians have received the following tenders for the alterations at the Pitsmoor schools:—B. Carr, 825*l*.; Wm. Turtle, 775*l*.; Wm. Reynolds, 818*l*.; G. Smith, 790*l*.; B. Marshall, 650*l*.; J. Hickson (the contractor for the mason work in the Workhouse alterations), original tender, 742*l*.; amended tender, 796*l*. The tender of Mr. Turtle has been accepted, being the lowest. Mr. Stafford tendered for the painting, and Messrs. W. T. Larder & C. W. Black, sent in a joint tender, one to do the joiners' work, and the other the masons' and other work. These tenders were laid aside as informal, the guardians requiring to have one contractor for the whole work. The tender of Messrs. Larder & Black was over 900*l*. Mr. Cashin, who made the design, has been appointed architect, at the usual per centage.

**Thurso.**—The foundation-stone of the Miller Educational Institution has been laid, according to the *John O'Groat Journal*. Sir George Sinclair took the principal part in the ceremonial. The builder is Mr. Smith, who has erected various buildings in Thurso, including the new church, with spire, which has just been built for the Free West congregation. The site of Miller's Institution is to the south of Sinclair-street, a short distance from the Free West Church. This is in what is called the New Town of Thurso, which is extending rapidly. The academy is intended to occupy the centre of what will be a square. The front, built of polished ashlar, will be to Sinclair-street. The style of architecture will be the Roman Doric. The building will be cruciform, consisting of a centre-piece with four wings, the frontal one consisting of a portico, faced by four columns. The shape will not be unlike that of Pulteney-town Academy, and, as in it, there will be but one floor, the height of the side walls, above the platform, being 14 feet. The whole will be surrounded by a wall, which will enclose the play-ground. Mr. Miller is to give the sum of 1,500*l*. for the building, should that sum be necessary for its completion, besides sinking a considerable sum for a permanent endowment.

A SHEET OF PAPER FOUR MILES LONG.—A sheet of tissue paper has been exhibiting at Colyton, Devonshire. It measures in length four miles, being 21,000 feet long, and is in breadth 6 feet 3 inches. The weight of it is but 196 lbs. It was manufactured in twelve hours.

STAINED GLASS.

**Harrow.**—A stained glass window by Clayton & Bell has recently been erected in Harrow School Chapel. Subject, St. Paul's Farewell to the Ephesians. We may here note that a window in Ludlow Church, lately alluded to in our columns, was by the same artists.

**Newport (Isle of Wight).**—Another window of stained glass has been added to St. Thomas's Church, according to the *Hampshire Advertiser*. It is placed immediately over the monument erected by her Majesty to the memory of Elizabeth, daughter of Charles I. The window was designed by Mr. R. J. Withers, architect, London. In the centre the subject is, Our Lord, with Mary and Martha. The sides represent the parable of the Ten Virgins. The work was done by Messrs. Lavers & Barraud, of Bloomsbury, and was erected by Messrs. Stannard, of Newport. The funds for the same were collected and subscribed by young ladies. It is therefore called the "Maiden Window." It is intended as a tribute of dutiful respect and gratitude to the Queen.

THE GREAT MALTA HOSPITAL.—WHERE IS IT?

In an article on the "Site and Construction of Hospitals," in the current number of the *British and Foreign Medico-Chirurgical Review*, and at page 310, there occurs the following passage:—"In the very elegant new garrison hospital in course of erection at Malta, from designs by the Sanitary Commission on Barracks and Hospitals, the distance between the pavilions is about a third less, and the walls most exposed to the sun are double, to subdue the effects of the sun's rays on the interior of the wards, while the windows are provided with *jalousies*."

I have put questions about this hospital to several officers of more than usual intelligence and of more than usual observation, who have lately returned from Malta, and one and all declare that there is no such building in course of erection, or indeed thought of; that one of the old *ambryes* is being converted into an hospital, but that no new hospital building is known in the island.

Now the "little military hot-house" is not the sort of place at which a pavilioned hospital for eight battalions is likely to be long kept out of view; and besides that, on looking through the army estimates for the last four years, one finds that not a farthing has been voted for such a purpose.

Can any of your readers give any information on this subject? Perhaps the reviewer himself, who seems, by his context, to have the good taste to be a reader of *The Builder*, will be so good as to answer the question. Cwm.

A SOCIAL WANT.

I KNOW from observation that your remarks some time ago on the small, unclean, and unventilated eating-houses in the City have led, by gradual changes, to the opening of new, or altering old, places for this purpose, which are much more comfortable than the "horse-boxes" in which we had hitherto been compelled to dine. Having thus been benefited by your suggestions, it is now my object to draw your attention to the number of men, a great portion of them bachelors, who labour in town, but sleep in the suburbs. If you notice the "bus" loads from either Camberwell, Euston, and Clapham, on the south, or from Islington, Highbury, and Kingsland, on the north of the Thames, which pour into London every morning, it will, I think, at once strike you as an important question,—how do these people spend their evenings? I have a tolerable acquaintance amongst them, and know for a certainty that, if a true answer could be obtained to this question, it would show that, in the absence of better places of resort, they were in the habit of frequenting the bar-parlours of the public-houses in the neighbourhood of their lodgings. Several instances have come under my eye, where in the pernicious influences of such a habit have had a most injurious effect upon the future of those who have formed it. Therefore, I beg to suggest, through your columns, that as there are places in the centre of London where the wealthy man can spend his evening at his club, in various kinds of enjoyment, including eating, drinking, smoking, billiards, &c., whilst the middle classes have reading-rooms, with town and country papers, magazines, and reviews,—may smoke, play chess, or take part in a public debate if disposed, or can join "The Whittington Club," which offers similar advantages; and, in addition, receive social

refinement and conversational benefit from "the drawing-room," and "evening *soirée*,"—features of that institution;—I suggest, that if some such means of spending an evening as these were at the hands of young men, who, living at the suburbs, are too distant to be benefited by those now existing in our cities, it would be found productive of a vast change to the moral and physical benefit of this portion of the community. I believe such establishments would be well supported if some speculator thought it worth his investment to erect here and there round London large buildings, similar in advantages and objects to the above stated, with from 100 to 200 bed-rooms, plainly but comfortably furnished: baths, both hot and cold, and as well as landriads, also should be a branch of each establishment. There should be no more restriction upon the habits of each inmate than is necessary to the quiet, health, and comfort of others. Such a plan, if carried out, would benefit the investor, and confer a great social benefit upon thousands of men engaged in business during the day, and who now spend their evenings in a miserable and unhappy manner. A man may take lodgings which are good in many respects, but he may be a smoker, and his landlady object to smoking; he may be quiet and fond of reading, yet living in a house where there are noisy children; he may wish for society, and yet not find the company of those he is lodging with at all general. I have had a tolerable experience of these things, and have also heard the same complaints from myriads of others, who desiderate the opening of places here hinted at, where they could associate with men of their own age and class—where the literary and social resources would be an attraction stronger than late hours at a tavern. I am afraid that this subject, important as it is, will occupy too much of your valuable space; but whoever takes it up will, in my opinion, find a good return for his money, and confer a benefit upon men who are, like me, A CITY CLERK.

THE ARCHITECTURAL ASSOCIATION.

A MEETING of this Society was held in the Rooms, Conduit street, on Friday evening, June 8, for the nomination of candidates for the several offices of the ensuing year, and the transaction of general business: Mr. J. W. Penfold, in the chair.

Mr. H. A. Reeves brought before the Society a report of the sub-committee appointed the last night of meeting, to select among the younger members such as would be willing to serve on the committee of next year.

The report recommended that voting by proxy should be done away with in the election of officers, and nominated the following gentlemen as candidates:—Mr. T. Roger Smith, to fill the office of president; Mr. B. A. C. Ferring, the vice-president; Mr. B. A. Herring and Mr. Arthur Smith, for the honorary treasurer; Mr. Francis Trenchard, for the honorary solicitorship; Mr. Arthur Smith and Mr. E. Winbridge, for the honorary secretaryship; Mr. S. C. Capes, to fill the office of registrar; Mr. C. H. Lewis and Mr. B. O. Harris, as curators. The report submitted as willing to serve upon the committee, Mr. B. Bewell, Mr. R. Billins, Mr. Banker, Mr. W. Griffen, Mr. R. O. Harris, Mr. C. H. F. Lewis, Mr. New, Mr. Pain, Mr. H. A. Reeves, Mr. T. M. Rice, Mr. W. Winbridge, and Mr. A. Walters. Mr. W. T. Sams and Mr. S. C. Rogers were named as auditors.

The President said that the recommendation in the report to abolish voting by proxy could not be effected, without the repeal of one of the general laws of the Society, and must fall to the ground for the present.

The receipt of the report was duly mentioned and accepted.

Mr. Roger Smith proposed Mr. Bashill, to fill the office of president.

Mr. Rickman seconded the nomination.

Mr. Alfou was proposed and seconded, to fill the office of vice-president.

Mr. Parare hoped the meeting would allow him to make a few observations. He was not a member, but as he had heard of the present position of the Society, he determined to attend and lay before it a few practical suggestions, the carrying out of which might impart new life into the Association. When he was a member ten years ago, he found the papers read of such a stamp as did not seem to meet with the difficulties which a young man had to encounter in entering upon the drudgery of the profession, and this led him to take little interest in what was going on. He feared that the society at the present day was confining itself to the same beaten track, and that the papers submitted were beyond the grasp of most apprentices. He thought if the subjects were of a practical rather than artistic nature, and if half-a-dozen members were invited to bring each a paper on a particular evening, a discussion would be got up on the several points in which each presented peculiar views. This would interest all who attended. Thereby the points which were never explained in his office would be brought before an apprentice. He thought, also, that some test of a practical nature should be submitted to every person applying for admission into the society, in order to induce only those who could understand professional matters to attend. Mr. Parare having made some observations on the tendencies of the present day to break up the profession of the architect, and to allow the legitimate fees of the profession to fall into the hands of surveyors and auctioneers, concluded by expressing his anxious desire to contribute in every way to the welfare of the Association.

After some further conversation, Mr. Reeves proposed, and Mr. Pain seconded, Mr. A. Alfou, Mr. J. W. Penfold, and Mr. T. Roger Smith, as judges of essays and sketches made by the members of the Class of Design.

The President announced the 1st of September as the last day for the receipt of essays. The successful members will be declared the first meeting of next session.

COUNCILS OF CONCILIATION.

THE Bill, intitled "Masters and Operatives," introduced by Mr. Mackinnon in the month of February, and subsequently referred to a Select-Committee (who unanimously reported in its favour), finally passed the House of Commons on Tuesday, the 11th instant, and is now before the House of Lords.

I hope those who feel desirous that the Bill should pass will not delay in forwarding petitions to the House of Lords in favour of the same. Any information respecting the measure, will be cheerfully given upon application to the promoters.

I enclose form of petition: if you can find space for insertion, with this note, you will oblige,

THOMAS WINTERS, Secretary.

269, Strand, London.

To the Right Honourable the Lords Spiritual and Temporal of Great Britain and Ireland in Parliament assembled.

The humble petition of (here insert the name of the trade) (here insert the name of the town or place), humbly sheweth, that your petitioners beg to represent to your Right Honourable House, that the statute of George 4, cap 96, intitled, "An Act to Consolidate and Amend the Laws relative to the Arbitration of Disputes between Masters and Workmen" is inoperative.

That there exists a great unwillingness to go before a magistrate under this Act, as having some appearance of a criminal proceeding.

Your petitioners further submit to your Right Honourable House, that many of them are liable to heavy losses under various pretexts, which they are compelled to submit to, or summon their employers before a magistrate, the consequences of which would be, first, a long delay in the settlement of the dispute; second, a discharge from their employment. Either of these alternatives is sufficient to induce them to submit to a wrong. They feel, therefore, a necessity for some tribunal of ready access, capable of securing the respect and confidence of master and workman in cases of dispute, and of exercising salutary influence with regard to matters affecting the trade in general.

Your petitioners therefore pray, that your Right Honourable House will be pleased to pass the bill now before your Right Honourable House to enable masters and workmen to form equitable councils of conciliation and arbitration. And your petitioners, as in duty bound, will ever pray, &c., &c.

THE BUILDERS' THREATENED STRIKE.

RESPECTED Sir,—It afforded me great satisfaction, in perusing the article in last week's *Builder*, to find the practical common-sense view in which you put it; for, most certainly, it is not a diminution of the hours of actual labour that the majority of operative builders seek (though unfortunately it has been brought as such before the public), but it is unjust to judge the many for the few. I am practically acquainted with the position of the London operative, and the disadvantage he labours under, as compared with those of us in the country. I have walked five and six miles to my work when in London, and, in the contrary, had to be there six o'clock in the morning, and, after working ten hours, have had the same distance to walk home again. I ask, what opportunity has such a man to superintend and regulate his own business, and to be a limited partner in a concern? Is he to be a domestic, that must not be thought of by the working-man in London. It is true, we are told, by the Peace-at-any-Price Society, we must not toil on, but in our country, we are not so well off. But I am one of those who would like to make the best of both worlds, and I think there is many more like me.

A LUCKLESS J. NER.

P.S.—It is a rule here, when the distance to the work exceeds one mile, to walk it in the employer's time, and home again in our own.

COMMITTAL OF WORKMEN FOR THREATS.

At Clerkenwell Police-court, on 11th inst., three carpenters and joiners, lately in the employment of Mr. Philip Anley, builder, of Whitecross-street, St. Luke's, were charged, before Mr. Corrie, with endeavouring to compel their employer, by threats, to dismiss two other workmen who had signed the well-known "declaration." There was a unanimous assent to a fourth for a similar offence, but he had got out of the way.

Evidence having been given by the magistrate considered sufficient to prove the case against two of the defendants, William Walsby and John Griffin, and in course of which it appeared that Mr. Anley had proceeded against the defendants with the approval and support of the Masters' Association, Mr. Corrie proceeded at some length to express his opinion and decision on the case before him. The defendants, he said, were charged with a serious offence. They had attempted by threats and strike to stop the business of their employers, and to throw their fellow workmen or themselves, and their wives and children, out of the means of living, and probably to burden the public with their support. The question was, had the defendants made use of a threat punishable under Sec. 3 of 6th Geo. IV., cap. 129. He had no doubt, and was of opinion, that there was a very case in which the Act was passed to meet. It was clearly, in the words of the Act, an endeavour "to force the master to limit the description of his workmen." He must keep in mind the "declaration" which was made under the Act, and "clarification" referred to, that it was the master who had himself required the labourer to work under this "declaration." Mr. Anley said he had no workmen who had not made the "declaration" in the last year, and therefore, wherever might have been its terms, it would have been cowardly and mean on the part of the master had he consented to sacrifice the poor non-militant workman to the demands of the militant workmen, and that the man who had "declared" was, that they would not be guilty of a crime. Now, continued the magistrate, sitting here to administer the law indifferently between the masters and the men, and between one class of workmen and another—the "unionists" and the "declarations,"—

then I say that "societies with such objects are," adopting the words of the prosecuting counsel, "tyrannies." I say that nothing can be more monstrous or illegal than the conduct of the defendants, who have combined together and threatened the prosecution, that they would strike, and who have in fact struck work, with a view to prevent him from carrying on his business unless he will discharge men whose only offence, as far as I can see, is that, at the request of their employer, they have promised not to break the law. I have said that nothing can be more monstrous and illegal, and I add that few crimes can be named which are more wicked than the object which the defendants have in view is to deprive innocent men of the means of getting their living, and thus to drive their wives and families into the workhouse, unless these poor men will also offend against the law by joining these illegal societies. Having authority to administer the law, I tell the defendants and their associates that the law of England will not tolerate such tyranny, and that all such combinations and conspiracies will be put down by the strong arm of the law. I gave distinct notice in Perham's case that if illegal threats of this kind were again brought before me I would inflict upon the offenders the most severe punishment in my power. The threats used by these defendants are far worse than in Perham's case. The objects of these defendants are more wicked than his were. The threats are used with a view of ruining innocent men who have a right to the protection of the law in the disposal of their skill and labour.

Mr. Corrie then sentenced the defendants to be imprisoned for three months, with hard labour, with the exception of Trimlett, who was discharged for want of evidence.

Notice of appeal was given in both cases, and the defendants were liberated on bail.

BUILDERS' ACTIONS.

Williamson v. Lovelace.—This was a special case in the Court of Exchequer, June 6, stated for the opinion of the court by an arbitrator. The action was commenced by the plaintiff, a builder, against the Local Board of Health in respect of the work performed by him. Such a notice entered into a contract under seal to effect the necessary repairs, one of the covenants stipulating that if the Board should direct that the repairs should be made by the Board in the performance of the work they might remove him from the continuance of it, and all the moneys received by him up to that time should be deemed to be in full satisfaction of the work performed by him. Such a notice was given, and the plaintiff's removal was consequent upon it, and he sought to recover a sum of money which he alleged to be due to him from the Board, who pleaded that stipulations contained in the covenants.

Mr. Welsby (with whom was Mr. Horace Lloyd), argued for the plaintiff; Mr. Lush, Q.C. (with whom was Mr. M'Mahon) for the defendant.

Their Lordships held that the covenant in the contract prevented the plaintiff from recovering anything beyond the amount which he had received prior to his dismissal.—Judgment for the defendant.

LIGHT AND AIR.

FIMLICO HOTEL, BUCKINGHAM PALACE.

Baker v. Breach.—The defendant erected a wall, depriving the plaintiff of light and air, whereby his premises were rendered less commodious and valuable. On an injunction being moved for, the case was agreed to be deferred under the Lands Clauses Consolidation Act, as for compulsory sale.

Mr. G. Dent, Mr. R. L. Sibley, and Mr. E. Roberts deposed to the plaintiff having a beneficial lease and interest in the premises to the extent of about 1,000 ft.

On the part of defendant, it was contended that there was no value in the lease, and very little in business, and goodwill. He valued the whole at less than a third of that amount.—300l.

Mr. Oakley, to whom the matter was eventually referred, awarded 562l.: the expenses to be borne by defendant.

"SEYSELL ASPHALTE."

Sir,—I cannot but regret the use sought to be made of your columns, under the guise of imparting information to the public, by those whose real object is to narrow in their own favour the already exclusive limits of the Asphalt Trade.

In reply to Messrs. Armani's letter I beg to say—The bituminous limestone known in the trade as "Seyssel Asphalt." Messrs. Armani constantly attempted to prejudice Mr. Strapp, the engineer, to whom I furnished under the most exclusive evidence of the genuineness of my material, which evidence is at the service of any of your readers who care to see it. Mr. Strapp, however, on the solicitation of these gentlemen, granted, as understood, on their having a superfluity of material on the spot, allowed them to do a small portion of the work I had contracted for, the wisdom of which course I, am informed, been proved by the work being attacked under reply. My asphalt has been tested by an eminent analytical chemist, and pronounced superior to any other in use. Mr. Strapp has expressed himself as dissatisfied with my work, for which I have made and under certificate.

2. I do not enter upon the topography of the bituminous mines of France, because I should be sorry to occupy your space by exposing the contradictory statements made by competing firms, as to the source whence the supplies come. Of the genuineness of my own I have the fullest warrant; but, unless directly attacked, as in this instance, I would prefer to leave my work to abide the test of time and wear, to parading its merits at the expense of others engaged in the same trade.

June 6th. H. SEYSSSEL.

P.S.—With this the correspondence must cease. The public have before them the evidence given at the trial.

THE FRENCH VISIT TO THE CRYSTAL PALACE.

THE visit, in a week or two, of 3,000 intelligent Frenchmen, from all parts of France, as representatives of 30,000 of their fellow-countrymen, who constitute the members of the Amateur Choral Association or Orpheon of France, is an event of international importance. These gentlemen must nearly all be utter strangers here, and will form their impressions of England and Englishmen for the first time from personal observation. Let us fervently hope that any prejudice which may exist in their minds against us will be utterly effaced by the cordial reception they are destined to meet with from us. Their influence, in course of time, upon their fellow-countrymen in the heart of France, will be considerable, for good or for evil. Let us make sure it is for good. Much depends upon ourselves. The French press have already expressed unqualified satisfaction with the projected visit, and we doubt not the press of this country will do all honour to our friendly visitors. Public buildings should be opened free to them, and it is a pity something of the same kind could not be said of public places of amusement, such as operas and theatres. The secretary to the Crystal Palace Company makes some useful suggestions in a communication we, as well as other members of the press, have received. Among these he hints at the advisability of the Metropolitan Rifle Corps adopting some means of manifesting a fraternal spirit towards our visitors. On the whole it is to be hoped, as Mr. Grove remarks, "that the reception given to them, during their brief glimpse of this country, shall be such as to send them back to their homes full of the pleasures and advantages which will result from a visit to England."

The music for the first day includes the choruses of the Enfants de Paris, by Adolphe Adam; the Veni Creator of Besozzi; the Requite of Laurent de Rille; the Depart du Chasseur of Mendelssohn, &c. &c. (Hunter's Farewell); concluding with the Septuor in the duel scene of Meyerbeer's Huguenots, which, sung by thousands of voices and accompanied by military music, produced the most marked enthusiasm when performed in Paris at the Palais de l'Industrie in March of last year.

PUBLIC HALLS IN THE PROVINCES.

**Ashbourn.**—The proprietary of the market hall undertaking, says the *Derbyshire Advertiser*, have appointed Mr. B. Wilson, of Derby, their architect, and given instructions on their requirements, which comprise, first, a market hall, from 70 to 80 feet long, furnished with forms, stalls, pump, and other requisites; an assembly-room, with ante-rooms; and other apartments, which may be available for either a public news-room, with accommodation for librarian, or for accountants' and attorneys' offices.

**Wokingham.**—The new town-hall here has been opened. The building is in the centre of the market-place, and embraces a town-hall and county police-station, with a residence for a superintendent and four constables. The town-hall is to be used for a court, and there are witnesses' and consulting rooms, in connection with it. Attached to the hall are rooms for savings' bank and a reading-room, in connection with the Mechanics' Institution. Beneath there is a covered market. The shape of the building is peculiar, apparently caused by the irregular outline of the market-place. It is mainly constructed with bricks of various colours, red predominating. The roofs are covered with green slates. The clock tower is placed over the roof of the hall, and rises to an altitude of nearly 80 feet. Over the entrances to the hall, on the north and south sides, there are slated turrets. The interior of the hall has an open timbered roof, the framing of which is of ornamental character. The pictures belonging to the corporation have been restored by Mr. Butler, of Reading, framed in accordance with the style of the building, and suspended from the walls. The hall is lighted at night by eight star-light gaseliers, in blue and gold. The design was selected in the autumn of 1855, in a limited competition. The cost of the building is about 3,500*l.*, and it has been executed by Messrs. Wheeler & Woodroffe, of Reading, under the direction of the architects, Messrs. Poulton & Woodman.

**LIVERPOOL BOROUGH CEMETERY.**—On Monday last Mr. Gay, of the Undercliffe Cemetery, was elected by the Liverpool Burial Board their surveyor and manager for the formation of the intended new cemetery at Walton-on-the-Hill, the extent of which will be upwards of 100 acres, and the probable cost 100,000*l.*

Books Received.

*Autobiographical Recollections of the late Charles Robert Leslie, R.A.* Edited, with a Prefatory Essay, by TOM TAYLOR, Esq. 2 vols. London: John Murray, 1860.

MR. TOM TAYLOR, in the prefatory essay of these interesting volumes, places the works of Leslie high in the list of artistic productions, on the ground of their "inborn refinement, their liberal element of loveliness, their sweet sentiment of nature, their literary associations, and their genial humour;" and, again, as "pictures which it makes us happier, gentler, and better to look upon,—pictures which help us to love hooks more and to regard our fellow-creatures with kinder eyes." In this we go wholly with him; and they who may remember best some of Leslie's latest productions and speak of chalkiness and opacity, should see the two fine works now in the British Institution Exhibition, "The Reading of the Will," from "Roderick Random," and "Don Quixote Reproving the Canon," to say nothing of the charming specimens of his skill in the national collection at Brompton. Still he cannot be placed in the first rank of artists. He seldom did more than set forth admirably the conceptions of others. In this respect he was inferior to Hogarth. Hogarth was a creator; Leslie an illustrator. His illustrations, however, are full of beauty, good taste, and, where needed, fine humour, and will always be highly prized. He lived to get a notion of the sums his pictures will hereafter command. The version of "Sancho and the Duchess," painted for Mr. Rogers, brought 1,150 guineas at the sale of the poet's collection. "Mr. Leslie was present. A country dealer, seated beside him, who had been absent from the room when the picture was knocked down, seeing that his neighbour had noted the prices in his catalogue, asked to look at it. 'Good gracious me! 1,150 guineas for Leslie's picture!' Did you ever hear of such a price, sir?" "Monstrous, is it not?" said Leslie, who told the story to his family with great glee on his return home.

The first volume includes an autobiography prepared by himself for posthumous publication, and the second volume consists of selections from his correspondence. Leslie appears to have been fortunate in his friendships; and what better fortune can befall a man? "I often look back with fondness and regret," writes Washington Irving to him, in one of the many letters from that genial sketcher given in the second volume, "on the times we lived together in London, in a delightful community of thought and feeling; struggling our way onward in the world, but cheering and encouraging each other. I find nothing to supply the place of that heartfelt fellowship."

The memoir is full of anecdotes of others rather than notices of Leslie himself, but his knowledge of art, and his wide wisdom, make themselves evident throughout. We quote an anecdote he gives of Lord Melbourne, though it involves an injurious opinion of architects more common than true. "He asked me how it was that Raffaele was employed by the Pope to paint the walls of the Vatican.—I said, 'Because of his great excellence.'—'But was not his uncle, Bramante, architect to the Pope?'—I replied, 'I believe Bramante was his uncle.'—Then it was a joke, you may be sure," he said, with his hearty laugh.

With the following few will agree—  
"Turner often expressed himself happily. I remember that when it was proposed that the new Houses of Parliament were to be decorated with pictures, he said, 'Painting can never show her nose in company with architecture, but to have it snubbed.' How true this is! No architect ever seems capable of understanding in what light, and at what distance painting can be seen; and it is a great pity that first-rate art, either sculpture or painting, should ever be employed in the decoration of architecture. The Egin marbles were never seen till now, when they are in ruins. The concert art world have as well ornamented the Parthenon, and Lucca Giordano might have been better employed in decorating the Sistine Chapel and the chambers of the Vatican, than Michelangelo and Raffaele."

No argument against these assertions can be necessary to our readers.  
Mr. Tom Taylor has executed his share of the work with ability, knowledge, and good taste, and the result is a very good and charming book.

*Astro-theology.* By HENRY MOSLEY, F.R.S., &c. Third edition. Longman & Co. 1860.

THE object of this well-written treatise is to point attention, with an educational view, to those evidences of the wisdom and goodness of God which may be seen in the daily changes of the heavens. The papers were first published in the *Church of England Magazine* in 1838, and were republished

in the hope that they might promote the cause of popular instruction,—a hope which the demand for a third edition has fully justified. The style of the work is simple, clear, and well adapted to the purpose in view; and it is gratifying to find a new work of the class to which Paley and Derham contributed, meeting with a favourable reception and demand among the young of the present generation.

*Lyrics and Legends of Rome; with a Prologue and Epilogue.* By IDEA. London: Chapman & Hall. 1860.

THE subject of these poems gives them a claim to our attention, and entitles them to a word of comment. Rome,—

"Where we steer  
Stumbling o'er recollections,"  
must always retain, spite of changing factions and opinions, a power of attraction over the student of every fine art which no other city exercises, and it is there he may best hope to perfect his taste and enlarge his views of art.

The writer of these poems has sought to make them serve to recall agreeable recollections in those who know the glories of the "fallen mistress of the world," and to induce those who have not to take the *strada di ferro* forthwith, and get some fresh emotions. We take a verse or two at random:—

"Now mount the 'Campidoglio's' square tower,  
A startling vision will the senses greet,  
The 'Roman Forum'—all her vanished power  
In crumbling relics lying at your feet:  
Oh! wondrous spectacle! the 'Ancient World'  
Lies wreck'd and cast in ruins o'er the plain,  
Crush'd and o'erthrown, as if by tempests hurld,  
The 'Lambstones of 'Departed Rome' remain.  
From hence we count the 'seven proud hills' of yore,  
Nature's own landmarks of old Roman clay,  
This throne remains,—the kingdom is no more,—  
Her countless Legions long have pass'd away;  
Her hurruish'd Temples, too, where shouts would thrill,  
And Songs of Triumph, no reflected beam  
Illumes the Forum, all is hush'd and still—  
Her greatness like the 'Story of a Dream!'"

'Campo Vaccino,' by a lofty flight  
Of steps we reach thy atmosphere sublime,  
The shafts of 'Janitor Tommas' on the right,  
And on the left the prison 'Mamertine,'  
Where 'Paul and Peter' lay in prayer prostrate,  
Where 'Aurigha's' gave his dying groan,  
The 'Castine Conspirators' here met their fate,  
Sejanus too—in 'Flavim Tiber' throw'd!  
In front, the Arch of 'Severus' must command  
Our admiration, from the earth exhumed,  
It rises now majestically grand.—  
Fresh as the day its beauties were entomb'd,  
This 'Arch of Triumph' tells a truthful tale  
Of brilliant victories, o'er which the gloom  
Of savage cruelty must draw a veil—  
Rome has her Temple! Britain has her Tomb!"

In "The Clock of St. Cosmo," and other poems in the latter half of the book, the author takes a higher flight, and he shows the variety of his talent by prefixing a photograph from a drawing by himself of the statue of St. Peter, in the Church of St. Peter, at Rome.

Miscellanea.

**STATUE OF HAYLOCK FOR SUNDERLAND.**—Mr. Belmes has finished the model, in clay, of a colossal statue of General Haylock, to be erected at Sunderland.

**LINCOLN DIOCESAN ARCHITECTURAL SOCIETY.**—The annual meeting of this society was held last week in Workshop. The Rev. Edward Trollope was the chief guide and lecturer. Mr. Heming and Mr. F. Bury have acted as local secretaries.

**FLORAL HALL.**—Very charming indeed was the aspect of the Hall, made literally floral, on Wednesday and Thursday last, and to remain so till the close of this week. The flowers with which it is filled are disposed with great taste, and, with the decoration of the building, show the hand of Mr. Gye, whose skill in such matters is well known. When the building is brought to its intended use—a flower-market,—it can scarcely fail to become a general resort and cheap gladdener of the metropolitan eyesight.

"AUTUMN ON THE HUDSON."—Messrs. Thompson & Co., known to some of our readers as architectural publishers, have inaugurated a new gallery, 45, Pall-mall, for the sale of works of art, with the exhibition of Mr. Gossey's very charming picture of an American autumn, which we had the satisfaction of first making known to the public. It is proposed to engrave it in the mixed style, when a sufficient number of subscribers has been found; and Mr. T. O. Barlow has been selected for the work, and will, doubtless, produce a worthy engraving. The opinion we expressed of this excellent picture has been confirmed emphatically in many quarters.

BRIGHTON MUSEUM.—We have great pleasure in announcing the fact that the town-council have, at length, been able to take decisive steps towards the formation of a public museum worthy of this important town; several gentlemen of eminence having liberally responded to their request for aid in the prosecution of so noble a purpose.

A HEAD OF THE "CENTURY OF INVENTIONS." It is stated that the grave of the Earl of Worcester, who was buried in the time of Henry VIII, is to be opened for the purpose of ascertaining whether it contains a model of a steam-engine invented by him, and, as asserted, buried with him.

GAS AT RUGBY.—The low rate of gas per 1,000 feet in Rugby, as compared with neighbouring towns, is thus alluded to by the Rugby Gazette:—"At Davenport the price of gas is 8s. 4d. per 1,000 feet; at Lutterworth, 7s.; at Warwick, 6s.; at Leamington, 5s.; while at Rugby the charge is but 4s. 6d. for the same quantity, a reduction of 6d. per 1,000 having just been made by the company. We also find that five per cent. is allowed upon all accounts paid within twenty-eight days after each quarter-day.

ENGLISH SHIPWRIGHTS AND THE FRENCH DOCKYARDS.—In reply to a question put in Parliament it was stated, on the part of the Government, that, on inquiry, it was found that the report that English shipwrights were being employed in the French dockyards was without foundation. On the contrary, not only had 400 men been dismissed from these dockyards, but the wages given were only four francs a day, while in England shipwrights could obtain 6s. a day.

MR. BIDDER'S CONVERSATIONS AND THE FRENCH ENGINEERS.—The annual conversation of the president of Civil Engineers, which was held last week, was, as usual, well attended and well managed. If the "hat and cloak" question could be more satisfactorily resolved, there would be nothing to desire on these occasions. Wedged in with a score of people under the stairs, the expectant may console himself with the recollection that,—"He also works who stands and waits," but there are certainly pleasanter ways of doing one's duty. The rooms were filled with interesting inventions and works of art.

THE VICTORIA STATION AND PIMLICO RAILWAY.—This line, which forms a connection between all the railways south of the Thames and the Victoria station, now in course of erection at Pimlico, was opened on Saturday. The line of railway so opened forms an important feature in the metropolitan communications, as affording access from all the railways south of the Thames to the western and central districts of London. The chief work on the line is the bridge over the Thames, which consists of four openings of 175 feet each, and is entirely composed of wrought iron, with stone piers and abutments.

THE STOCKPORT BOROUGH SURVEYORSHIP.—At the last monthly meeting of the town council of Stockport, the minutes of the special committee appointed to define the duties of a borough surveyor were brought up. Mr. Alderman Williamson said the committee did not believe the council were justified in giving the salary of 500*l.* in order to secure the whole of his time to the office, because it would be unnecessary. They, however, agreed to give a salary of 100*l.*, and allow the surveyor to follow his own profession, subject to the duties so defined. A resolution to this effect was carried. It was also arranged that candidates be advertised for, their testimonials to be sent in at the next monthly meeting of the council, and the appointment to be made at that meeting.

PRESERVATION OF WOOD FROM DECAY.—A correspondent, in "J. B. N.," suggests the following composition, in preference to tar or ochre, as a preservative of wood from decay, the purpose especially in view being the painting of our decaying gun-boats with it:—"Take," he says, "three parts of air-slacked lime, two of wood ashes, and one of fine sand: pass them through a fine sieve, and add as much linseed oil as will bring it to a proper consistence for working with a painter's brush. As particular care must be taken to mix it perfectly smooth, it should be ground on a stone slab with a proper muller, in the same manner as painters grind their white lead, &c. Two coats of this composition being necessary, the first may be rather thin, but the second should be as thick as it can be conveniently worked." This preparation, chemically speaking, appears to be no other than the silicate of lime prepared with potash, or wood ashes, and mixed with oil, and it is identical in effect with Hanson's patent for the preservation of stone, only the composition is made up with linseed oil as a paint, to be coated over the surface to be preserved.

FALL OF A HOUSE IN THE CITY.—On Saturday afternoon, the inhabitants of Water-lane, Blackfriars, were alarmed by the fall of a lofty building, five stories high, which was in course of being pulled down, in Pilgrim-street. The premises belonged to Messrs. Spicer & Co., paper manufacturers, and new premises were to be erected on the site. The men had an intimation from the police that the building did not look safe, and the last man had just descended the ladder, when it fell.

NEW ORGAN FOR GODMANCHESTER CHURCH.—A large and powerful instrument, containing thirty-two stops, distributed on two manuals, and an independent pedal organ, was publicly opened on Monday and Tuesday last, at the factory of the builder, Messrs. Bryceson & Fucham, Brook-street, Easton-road. Mr. Archer (late organist of the Royal Pauopticon) and Mr. W. H. Strickland, were the performers. Although the church for which the organ is constructed is large and spacious, great difficulty has been experienced in finding a position for an organ. A chamber has now been built, with arches opening into the chancel and north aisle, in which the organ will be placed, thus obviating any removal of the oak seats and stalls, with which the church has lately been restored.

ORNAMENTAL BUILDINGS AT GLASGOW.—The rapid increase of such buildings in Glasgow within the last few years, especially in the west end streets, terraces, and crescents, is alluded to by the local Gazette, with incidental reference to an erection nearly finished, on the Dumbarton road, opposite the west end of St. Vincent-street, and forming the front and show room of the Glasgow Marble Works, belonging to Mr. Keenan, marble cutter, formerly of Beilwell-street. The facade is built of white Sicilian marble, while the pilasters on each side of the two windows, the arch over the tops of these, and the border of the circular window above the door are of a darker streaked marble, known as "rouge royal." The marble front, it adds, is an idea scarcely to be found in this part of the country.

THE GREAT OIL WELLS IN PENNSYLVANIA.—Western Pennsylvania and a portion of Ohio are rife with excitement. The grand discovery of the age there is oil springs. The earth is bored and burrowed into in every direction to pump out the subterranean fluid. The price of land has gone up, and the price of oil has not yet come down. Vanago county, Pennsylvania, boasts of nearly 100 "wells" of oil already, and wherever it is found or guessed to exist, the soil instantly trebles or quadruples in value. One well yields eighteen barrels of oil per day, another twenty-five, and the great well at Crosby, which has been sunk to the depth of 181 feet, yields ninety barrels per day. This last, it is shrewdly supposed, must have struck the jugular vein of the oil region, and is drawing on its richest fountains. One man, a blacksmith, in Frankland, Pennsylvania, who bored his own well, has been offered 100,000 dollars for it. The boring machines used are very simple, and are driven by steam power. There are no less than 200 wells now in progress in Pennsylvania, and in a few weeks it was estimated there would be 1,000. The oil found is the species variously known as naphtha, coal oil, petroleum, Seneca oil, and rock oil. The principal market for it is New York, where it is shipped, to be distilled and purified.

ELECTRO-TELEGRAPHIC PROGRESS.—When the Atlantic submarine telegraph failed, it appeared very desirable that a thorough experimental investigation into the subject of submarine telegraphs should be instituted before any other deep-sea cable was formed. This, in the cause of electro-telegraphic progress itself, we frequently urged; and, indeed, a commission was thereupon appointed on the part of the Government in order to carry out such an investigation. The late Mr. R. Stephenson was one of the commission, but whether his death interfered with its purpose we do not know: we have heard nothing of it for some time. Our fear that the extension of submarine telegraphs would be checked by repeated failures, were more put in operation before some further light was shed on their best possible form and mode of laying down and lifting up, has been justified already to a certain extent by repeated failures which have since taken place, and which are still, we regret to say, occurring; and the Chancellor of the Exchequer pointed to these failures the other day as a reason why the Government hesitated to proceed with the Gibraltar line. It is really a pity that such a thorough experimental investigation as we have referred to should not at once be proceeded with, and the result made public as soon as possible, for the guidance of future projects.

FALLING IN OF A SEWER.—The shaft of the main sewer in Oxford-road, Manchester, opposite Chester-street, has fallen in to the depth of about 4 feet, and 9 feet in diameter.

FALL OF TWO HOUSES.—About four o'clock on Saturday afternoon, two houses, long unoccupied, in the Waterloo-road, fell out on the pavement. No person received any injury.

STRADES OF THE COMPETITION SYSTEM.—A new church, to cost 4,300*l.*, is to be built to relieve the old parish church of Tor, near Torquay. A select number of architects seem to be invited to give plans, and it appears that the designs are to be contrived with and without a tower, as circumstances may admit. Drawings of details are to be included. It is to be clearly understood that no premium or payment is offered for the competition, and something is said about a reserved right of not adopting any of the designs. So we go on and on.—A NON-COMPETITOR.

TENDERS

For Cuxwold Hall, near Great Grimsby, Lincolnshire. Mr. James G. Colling, architect. Quantities supplied by Messrs. Lander & Bedells:—

Table with 2 columns: Name and Amount. Includes Dove, Brothers, Brown, Holborn & Taylor, Hollingsworth, Myers, Walls & Son, R. Young (accepted).

For a set of farm buildings and bailiff's house, at Harbour, near Tenterden, Kent, for Mr. Henry Lutter. Mr. James G. Smither, architect. Quantities supplied:—

Table with 2 columns: Name and Amount. Includes Donnelly, McLean & Bird, Porter, Ellis, Simthorpe & Co., Greenwood & Co., Humphris & Luxford, Fisher.

For building schools, out-buildings, &c., at Bronyard Herefordshire. Mr. F. R. Kempton, architect:—

Table with 2 columns: Name and Amount. Includes Nott, Tenhill.

For pulling down and rebuilding No. 9, Lower Thames-street, for Mr. Palmer. Messrs. Young & Son, architects:—

Table with 2 columns: Name and Amount. Includes Piper & Son, Browne & Robinson, Verry & Turner, Down, Hardman & Sandon.

For the erection of a new Warehouse, Meeting-house-square, City, for Mr. Joseph Myers, Messrs. John Young & Son, architects:—

Table with 2 columns: Name and Amount. Includes Hall & Son, Raby, Henshaw, Larke & Son, Chessum.

For building St. Dunstan's Schools, Canterbury; Mr. Joseph Clarke, architect:—

Table with 2 columns: Name and Amount. Includes Gozens, Gaskin & Godden.

For a house at Dalston, for Mr. J. Harman. Mr. J. Clever, architect:—

Table with 2 columns: Name and Amount. Includes Bishop, Jarvis, East, Raby, Rowland (accepted).

For alterations and additions to the Old Brewery, Harwich. Mr. Horace Darken, architect:—

Table with 2 columns: Name and Amount. Includes Henry Lamb, J. Corder, Spooner & Co., S. J. Newton, Worswick & Co., Wilding (accepted).

For Drainage Work for the Poplar Board of Works:—

Table with 2 columns: Name and Amount. Includes Toole, Hartland, Salt.

For additions to Trinity Asylum, Acre-lane, Frixton. Mr. Samuel Field, architect. Quantities supplied:—

Table with 2 columns: Name and Amount. Includes R. Roberts, J. Wilson, Skinner.

For building a presbytery and Catholic school at Atherton. Mr. R. Jennings, architect:—

Table with 2 columns: Name and Amount. Includes Fox & Brother, Potter, Spencer.

TO CORRESPONDENTS.

S. C.—A Workman (well intentioned, but not fit for printing).—L. H.—Jack Plane.—J. G.—J. H. B.—J. E. G.—W. H. (will come).—J. D. W.—M. J. L.—Con. Sub. (at the house of members).—S. F.—(Miss) Mungton (must look to his "Bonyestie").—C. R.—M. C.—B. G. S.

ERRATA.—In Mr. Gull's paper on "Drawing Values," a break of type, after going to press, changed the formula, on 17th line from bottom. Instead of a — it should be a —.

Post-office Orders and Remittances should be made payable to Mr. Morris R. Coleman.

# The Builder.

VOL. XVIII.—No. 907.

*Progress of the Metropolitan Main-Drainage.*

SINCE we last reported progress of the great work of the sewerage of London, the main lines then begun, namely, the Northern and the Southern High-level Sewers, have been proceeded with; the Middle-level Sewer, north side of the Thames, has been commenced at Old Ford, and other parts of its course; and the Southern Outfall Sewer also has been commenced, and is being carried forward with energy. A commencement likewise has been made with the Low-level Sewer, south side, at Deptford. The line generally for the low-level is not yet tendered for. Since our last report also, much has been determined upon, or spoken of, which may need explanation to justify a claim for the accuracy of our original account of the whole scheme for the metropolis, and that of our subsequent particulars.

We allude in the last sentence, to the plans for the diversion of sewage from the Serpentine, and to the announcement that the low-level line, north side, would be taken along the Strand. The supposition here referred to, as to the Strand, is important so far as it has proceeded from a statement in the House of Commons, and been fortified by a report of Mr. Thwaites's evidence before the committee on the Thames embankment, and is apparently corroborated by the operations which have been commenced in various parts of the line, or at the ends of streets joining the Strand. Nevertheless, our original particulars in all points were correct; and they are so to this moment. Although a public meeting of the ratepayers of St. Martin's parish has been thought necessary on the subject, we have the best reason for stating that no decision has been arrived at subservive of the conclusions of the report by Messrs. Bidder, Hawksley, and Bazalgette, wherein the Strand line, which had been first proposed by the engineer to the Board, was abandoned in favour of a line on the margin of the river, to be in conjunction with an embankment. Besides the more obvious argument for the embankment line, one of the reasons was that by taking the Strand line, all the sewers between the Strand and the Thames would require to be reversed. Mr. Bazalgette himself is paying attention to the subject of the embankment, and has given evidence before the committee; so that the statements and apprehensions are at least premature.

It is necessary, indeed, for the engineer of the Board to anticipate so far, the rejection of an embankment scheme, as to take means to ascertain the nature of the strata in the Strand; and these investigations, desirable for many objects besides any of a particular sewer, are what are now in progress, and are the most that is at present contemplated. It occurred to some of the officers of the Board, from observation of the strata in Long-acre, that the London clay would be found within the space which the sewer would occupy, should the Strand line have to be chosen; and to certify this, borings were in the first instance made in a few places, from the position of inverts of existing sewers. It is now, we believe, quite ascertained that the clay exists as anticipated; so that the sewer, if in the Strand, would be tunnelled; and at least there would be comparatively little obstruction to

the traffic,—since even the shafts for the execution of the work would be arranged in the manner of side-entrances, placed at the ends of the streets of junction, and might not differ very considerably from the present hoarded spaces where the borings are in progress. We trust, however, that the intention of the embankment line will be steadily pursued, and that the alternative will not for the present be further thought of.

Referring to the diversion of sewage from the Serpentine, which, it has been announced, requires the construction of a sewer from the head of the Serpentine, or from the Bayswater-road, to a junction with the Ranelagh Sewer, at Albert-gate,—that is to say, diverting, but conducting the contents of the sewer towards an outfall into the Thames; our original account and later particulars of the Middle-level Sewer remain correct. The Middle-level Sewer, to pass along the Bayswater-road, is to divert the sewage proper and the ordinary rainfall (as, indeed the existing sewer diverts these from the Serpentine); and these ordinary contents of the sewer will run on to the junction with the High-level Sewer at Old Ford, and further, or to the general outfall of the northern sewage, at Barking Creek. But as throughout the sewerage system which is in process of construction, means of escape for excessive rainfall are provided or left,—the existing sewers falling into the Thames (such as the Fleet, so far as its length where along Farringdon-street and Bridge-street), being made use of to a large extent,—means of relief would be required for the waters which at present on certain occasions flow over into the Serpentine, or required in substitution for that outlet. With such object, the sewer through the north-eastern portion of Kensington-gardens, and along the north of the Serpentine, is to be constructed, and tenders for it have recently been received. The line was not shown in the drawings of the Middle-level Sewerage, and was not decided upon at the time those drawings came before us.

The total length of the sewer in question, called the Ranelagh Storm-overflow, starting from the weir in the Middle-level Sewer, which is opposite the junction of the Ranelagh Main-sewer, or near the Crown Inn, and ending in a junction with the Ranelagh sewer just north of Albert-gate, will be 1 mile 420 feet. The greater part of the length, or 4,700 feet, will be 8 feet 6 inches barrel sewer; but the first or upper portion of the whole length, 520 feet, will be equal in area to 9 feet barrel; and the lower portion, 480 feet, to the same diameter. The inclination will be 1 in 421.5, or 12.5 feet per mile. Borings appear to have been taken in the line at six places. The sewer is intended not only to provide the overflow for the storm-waters from the upland districts, and intercept any sewage matter from the Serpentine, but also to provide means for drainage of the barracks and other Government property in the park. Her Majesty's Commissioners of Works contribute 2,000*l.* The engineer's original estimate was about 23,000*l.*; but this was afterwards somewhat increased. Tenders, however, were received at the end of last month, which were all, except one out of twelve, in excess of the estimate; several of them considerably so. The excess is ascribed to the rise in the price of materials and the complicated state of the labour market. The accepted tender, by Mr. Treadwell, amounted to 35,455*l.* Operations will be commenced in a day or two.

The work commenced towards the formation of the Low-level Sewer, south side, is near to the railway and bridge over Deptford Creek; and is not far from the site of the intended pumping station (which we have already described), but on the opposite, or western, side of the creek. The portion of the sewer is commenced now, in consequence of the intended construction of a new gas-holder at the works adjoining. The work of this sewerage is in the hands of the contractor for the ordinary jobbing of the sewers in the district. The ground is in great part loose sand copiously charged with water; whilst the excavation—at present about 130 feet long by 23 feet broad, and 46 feet deep—reaches to the edge of the creek, or very nearly, and goes down to 22 feet below the bed of it; so that, altogether, the work is of a peculiarly

difficult nature. Four pumps are constantly going by steam,—having to raise upwards of 3,000 gallons of water a minute, constantly impregnated with sand, and often so to an extent which would stop the action of ordinary pumps. Our readers will not have forgotten our interrogatory to the engineer of the Board of Works, relative to the intention to use valved pumps at the Deptford Pumping station. The pumps now in use at Deptford, working day and night, are chain-pumps. There is frequent trouble with them, owing to an accumulation of sand or earth; and valved pumps would be useless. Centrifugal pumps which served at Old Ford, it is thought would equally become choked in the present case. It is doubtful, however, whether the chains would wear sufficiently well to admit the use of pumps on the principle, for the constant service.

Besides the difficulty in the watery state of the soil, there is that of the looseness of the sides of the excavation. The wet sand begins at about 20 feet from the surface. Here sheet-piling or pile-planking, with the edges of the planks grooved and iron-tongued, is used; and the whole of the excavation presents a network of cross-strutting of timber, of which material alone the value may be upwards of 1,500*l.* Probably it may be necessary, besides the provision here referred to, to execute the whole of the work in portions,—in a considerable number of small coffer-dams. At the Broadway, Deptford, in the construction of the High-level Sewer so far as completed, or in difficult ground, iron sheet-piling was used where not required to be left in; and the same kind of piling will be adopted in the present case wherever the circumstances are similar.

Difficulty has arisen both in this portion of the southern drainage-works, and in those of the Middle-level Sewer, north side, from the present scarcity of bricks. The price of bricks has risen, perhaps chiefly in consequence of the demand for the sewerage works, higher than we have known it since the duty was taken off. The first bricks brought to the works of the Middle-level Sewer had to be condemned; and the same thing occurred in the works we are noticing as regards bricks of average quality, though not equal to the requirements, where the price given, we were told, had been as much as 4*s.* a thousand. The price now being paid is said to be 45*s.* a thousand.

The Southern High-level Sewer is complete so far as the length of the Broadway, and some distance along the road westward towards the North Kent Railway,—whilst each of its branches traced upwards, is in progress at several points; but it has yet to be carried along Church-street to the storm-water outfall. We must notice any points of interest in the work here, or in different parts of the same division of the sewerage, as in the case of the tunnel at Dulwich, and also any points in the work of the Outfall Sewer towards Woolwich, and in the marshes, on some future occasion. Mr. John Grant, the engineer for the southern district, is the resident engineer under whose immediate direction the works we have last noticed are being carried into effect. These operations, and the bulk of those yet uncommenced, will task all the skill of the officers of the Board of Works, and all the resources of contractors.

## ON THE ORIGIN OF OUR EMOTIONS OF THE BEAUTIFUL.\*

THESE are pleasures that have nothing in common with æsthetic beauty, and ought not to be considered when forming a correct estimate of a design. To do that we must disconnect our ideas from any biasing or accidental associations, and judge of it as a whole in relation only to itself and the mind contained in it. Afterwards, when our judgment has given its consent—for the activity of the critical faculty cannot co-exist with ar-t pleasure, the imagination may revel in intoxicating delight, and serve to heighten the inherent charms of the work.

The beauty of a problem in Euclid to which geometric beauty has much in common may be considered to be inherent as well as associative; for truly the mind recognizes it as such in its first impressions. It is a sort of acknowledgment of

\* See p. 374, ante.

the harmony of its properties and the fulness and completeness of thought contained in it. It is a discovery of the relation existing between its own members, and exemplifies the unity of universality—an idea complete in itself. All works of art must have this inward relation and coherence, otherwise they remain unfinished ideas. This unity of purpose and object gives in art that high quality termed repose. For a work cannot have repose unless it is at rest within itself, and the object is represented as well as the action. The Fighting Gladiator is the representation of action with its object beyond its own circumference. While the Laocoon, as a complete work, contains all within its own circle, a complete incident, and notwithstanding the convulsions of the figures, possesses repose, considered in the group,—the Fighting Gladiator is an anomaly seldom found in art. Gibson's Hunter, than which there never was a more perfectly knit and gracefully-turned figure—strong, yet elegant—the very perfection of mainly *physique*, is slightly liable to the same objection. That most beautiful figure of the mad Opella, by Calder Marshall, which was exhibited at the Manchester Art Treasures Exhibition, and is as exquisite a production as was ever turned out of an artist's studio, possesses also the merit of being a self-contained work. How miserably poor are Canova's Venuses, compared with the sublime sentiment of melancholy, womanly madness conveyed by this artistically complete statue, the very impersonation of Shakespeare's creation. With her hand clutching the rock, and her sweet, mad face turned up to Heaven, a more affecting sight it were impossible to conceive. This is the true modern sculpture—beautiful, expressive, yet classically true, individual in character, and as far superior in healthy sentiment to the god generalities of the Greeks as Shakespeare is wiser than Homer.

Of the value of this completeness and relation of parts we may judge by comparing Bulwer's "Caxtons" with "My Novel." The first is as complete a work of art in every respect, and as interesting, instructive, and learned a novel as ever was written. The latter bids fair at first, even to outdo its predecessor, for in it there is the most exquisite description of a quiet country life among characters so diverse, original, quaint, and clever, combined with such repose, completeness, and finish, artistically considered, up to the end of the first volume, that the hustling activity and hurrying incident of the second reminds our more of Reynolds than Bulwer.

Æsthetic beauty is mind as well as sensational beauty. It is the mind that estimates proportions and judges of the harmony of relations, but by intuitive perceptions rather than reasoning power. The thickness of a beam or column, or any structural support required to carry a certain weight, may be calculated to a nicety if the length be given, provided we have made ourselves acquainted with the comparative strength of the material. But it would be impossible to calculate ratios of proportions except in time-music; for the formula would be so involved as to be inextricable: consequently we must rest satisfied with the natural capacities of judging by sensational effect: our process must be inductive, not deductive. Æsthetic effects may be sensorially pleasing, from the varied play of light and shade, independently of any associations, and, I think, may also be perceived without much exercise of mind. Sensations are the foundation of beauty; the mind judges, arranges, compares, and thus leads to a correct knowledge of effects, and to intellectual satisfaction. With the ordinary observer the intellectual pleasure is much smaller: he judges through naturally acute perceptions and correct associations, but receives most pleasure through the indulgence of the imagination.

The question naturally presents itself to the mind,—Does associative beauty please through the discovery of similarity, or would the impression which provokes it equally please us, were it not associated with some property or quality? I think it would not, for expressional beauty pleases us through the beauty of the sentiment conveyed, and that is a beauty which we could not see except in connection with something else. Admiration is excited by elevation of character, loftiness of purpose, and decision of will,—these beauties belonging rightfully to the human mind; yet the imagination connects these qualities with material and lifeless objects through similarity in the ideas present. A great rock is said to be *grand* and *noble*. In that expression we at once detect the connection between the original idea of nobility and the object which, from its *expression*, excites the associative power of the imagination. Unconscious association has nothing in common with

the imagination; but expressional beauty is due to the images excited in the mind by the impression. The one is passive assent; the other active energy of the mind and soul.

The theory that association of ideas is the sole cause of our emotions of the beautiful, is one which, at first sight, seems likely to be true. Many have taken this view as well as Alison; but any one willing to take the pains to test it, will find how incapable it is of accounting for all beauty. The theory has arisen from confusion of terms and want of clearness in distinguishing the several functions of the mind and sensations. For my own part I consider that the associated faculty has beauties peculiarly its own, and that it is, also, in itself, the means of *intensifying* our emotions and sensations. It causes a re-action of the mind upon the body, or sensations exalting our faculties and rendering them keen and acute. Its principal use, then, is in brightening our pleasure in the beautiful from passive satisfaction to active delight. The sight of a fine building, a beautiful vase, a charming picture, may not at all times raise in us any pleasure which approaches delight from the inactivity of the associative faculty; while at others they may hold us in wrapt admiration. If we see a beautiful picture when the mind is either inactive, or engaged with some other object, the beautiful is acknowledged, but the pleasure is but transitory. Reasoning from this, Alison has supposed that the pleasure is owing entirely to the association. I think, however, if we will take the trouble to examine and note the mental process involved, that we experience satisfaction before any active association can possibly be formed, and often unknowingly exclaim,—“How beautiful! how splendid! what a charming landscape! what a delightful prospect!”

It is quite true that a magnificent view, suddenly hursting upon you while perhaps traversing the gorge of a mountain, creates a quick sense of delight and expansiveness of mind, which may partly result from association, unconsciously rapid, undeveloped, and mysterious; but can we possibly argue from this, that inherent beauty does not exist. Absurd! to suppose that the association of one thing which gives no inherent pleasure with another thing, equally dull, can ever excite such intense satisfaction. Such would actually be the creation of something out of nothing. No; there are certain things which in their nature are necessary to our being in which we move and breathe, and have our existence; and it is one of the bounteous gifts of God to man, that the knowledge of this should be unconsciously associated with their effect, and prove an added gratification. “And God said, Let there be light, and there was light; and God saw that it was good.” There is the soul of light—speaking in every respect—so that it was good—good in every respect—consequently, *beautiful*. We cannot separate the sight-beauty from the knowledge of its innate goodness, its necessity to our health and vitality, its all-renewing powers from its radiant splendour. The soft, diffusive, all-pervading quality of daylight has been felt and admired by generations of authors. Addison, in the *Spectator*, speaking of mirth compared to cheerfulness, treats us to a beautiful simile. “Mirth,” says he, “is like a flash of lightning that breaks through a gloom of clouds and glitters for a moment; cheerfulness keeps up a kind of daylight in the mind, and fills it with a steady perpetual serenity.”

In these and such like figures and similes, which we think beautiful, the authors display a hidden sympathy with the objects,—an entering into their very nature. If they describe rocks, it is as if the immovable matter were endowed with reason and feelings, for they speak and think. What is it that gives such a quiet, humorous charm to Sterne's description of the famous Lyons donkey unless it be that we are brought into communion with the donkey's ideas, real or supposed? Sterne's imagination endowed the creature with thought and feeling, and in this imaginary conversation with a dumb animal we trace through an exquisite humour the exact truth of the description, for not only is its outward mien correctly represented, but its donkey feelings are photographed to a nicety. It is the kind spirit of the writer that irresistibly engages our sympathies with the poor oppressed brute. Had the same donkey been described by a man of malicious feelings, either our hearts would not have warmed towards the donkey, or our indignation would have risen against the man, or we should merely have looked on and laughed heartlessly.

After reading any of the poets, how absurd it seems to attribute all beauty to the discovery of the relation of parts or the hidden harmonies of

nature, for the harmonies of nature I take to be dependent upon proportion or relation of parts,—a natural sequence by which three proportions being given, the fourth can be evolved. Harmony is the result of proper arrangement of effects regarding the strength of each, and must be found in everything beautiful; for, without this natural sequence, whether it be of form, or tone, or time, or colour, or ideas, the object or work must be incomplete and incoherent. It does not follow, though, because harmony is one of the necessities of beauty, that to it must be referred the origin of all beauty.

Mr. Ruskin has well said, that it is neither accuracy of description nor attendance to the invariable that constitutes what is called poetry, for there may exist both without approaching in the slightest degree to poetic feeling. The words we use are sufficient to show us this; for we say emphatically, poetic *feeling*, not truth, nor accuracy, nor knowledge of the principles of nature, but something that excites our joy or grief, our admiration or awe, our compassion or indignation. Yet, still admitting this, accuracy *is* a beauty, and the invariable, or what is founded on general nature, has charms peculiarly its own. To distinguish between the effects of the various arts which address themselves to the mind and the imagination, to trace their course upwards from whence they sprang, to discriminate between the true and the false, and to study their common connection, is worthy of the highest intellect. Yet the greatest may feel humbled when, after laborious investigation, they find their range of thought so circumscribed that the subject of their study can only be comprehended piecemeal and in detail.

In a subject such as the one I have in hand, the additional difficulty of mental introspection presents itself. Should I, however, be instrumental at all in extending our knowledge of the beautiful, I will leave it to other and greater minds to form a more systematic philosophy.

The emotions of the beautiful, as I have said at the outset, may be classed under four heads, viz.: the sensational, the emotional or imaginative, the purely mental, and the moral. Frequently the sensational induces the other three, either separately or combined. It is, however, only with the first three classes that we have to do with, and any one of these may superinduce the other two. Thus, if it is a statue to which our eye is directed—say the Apollo Belvidere,—the first thing that strikes us is its artistic merit, the graceful pose, the elegantly inclined head, the attentive yet slightly scornful expression of the face, the quivering expectation of the lip, and the god-like air of the figure, too womanly to express great, rough strength, and too innately great to be human. We next, perhaps, turn our attention to the *drapings*, and the proportions of the limbs, and we here discover that the sculptor has produced these effects from a profound knowledge of nature and comparative anatomy; that the lower limbs have been lengthened, to indicate swiftness, and a female softness diffused over the frame, more in consonance with the radiant daylight beams he is the impersonation of. The countenance has been cleared of all gross animalism, and bears a lofty, elevated look, suited to the “Lord of the unerring bow.”

On attentively noting down our impressions, it will be seen that the *graceful* sway of the figure is due to the expressional association by which curves express elegance; that the scornful throwing back of the head, and the slightly-parted and disdainful curve of the lips, express scorn and disdain, because we know from experience that the human countenance is affected so when under the influence of those passions. Elevation of character we admire, because we also admire the conscious knowledge and power which it represents. Now, the composition of the figure, its artistic pose, and the anatomical skill displayed in its design, are emanations of mind, and therefore are interpreted by mind: the pleasure we receive from them is mental. The former beauties, combined with these, produce an associated mental pleasure, from the knowledge of the amount of skill and the warmth of imagination possessed by the creator of the work.

And the mental attribute of the statue may possibly excite the imagination to activity from the superiority to most other performances possessed by it. The sensational beauty which it possesses is a yielding fleshy softness of appearance, due both to association and actual sensational feeling, for the effect of softness is perceived by the senses before the imagination discovers the connection between the sensation and actual touch. The softness of the effect may be divided into

what appertains to two classes of sensation,—the actual softness of the shades, though the substance may be as hard as marble, and the pulpy softness which we know by unconscious association of effect with cause belongs to some substances. Thus the human face may be drawn and shaded in the smoothest shades, yet appear like a hard substance. On the other hand, it may be painted in with a thick impasto, and appear yielding as living flesh.

The grace of curve and flow of line must also, I think, be attributed in part to sensational effect, for the curves lead the eye a sort of dance, as Hogarth has it; and though the expression of the lines is due to the exercise of the associative faculty, for those who have never paid any attention to nature, or who have never taken the trouble to detect the difference of effect in lines, their faculties being naturally wanting in acuteness, or have been unaccustomed to exercise their imaginations by calling up images to represent those effects more clearly to the mental eye, cannot by any means sympathise with the movement, or feel its grace, yet the original sensation must bear an analogy in its effect to the other qualities with which the imagination associates it.

It is only when the cause of an association is incidental that we can properly say that the beauty is not inherent, for if it is the nature of the line to produce a certain effect,—the cause of the beauty must be in itself, and the sensational. Some will perhaps be inclined to think that it is not in the nature of any forms to affect the senses in the manner we ascribe to them, but that the form being invariably found associated with some other quality, that it insensibly raises the idea of that quality in our minds. This may be the case sometimes, but softness of shade, purity of tint, clearness of outline, brilliancy of colour, depth of tone, richness of effect, are surely actualities which we express by means of words borrowed from analogous sensations. Also, in the case of expressional beauties, which, without doubt, depend more upon the imagination than any other; the effects are founded in Nature, and it is through our correct interpretation of her that we perceive them. Then why not consider that to be inherent which inevitably produces the same emotion in every healthy mind. We can no more dissociate power from craggy rock,—for we perceive the mass—the intensity of the forces which have caused its upheaval,—than we can dissociate this universe from the evidence of creative mind. If it is the nature of mass to possess power, then is it not an inherent property which it possesses, and which the associative faculty only discovers?

No mental perception of beauty can be received excepting through the exercise of the associative faculty; for mental perception is mental action, and mind, energy, or thought consists of trains of associated ideas. It is in this limited sense only that association can be said to be the cause of beauty, for without mental perception our pleasures would not be far removed from mere animal enjoyment,—such as a dog may feel when let loose into a green sunny field. Our sensations, notwithstanding, form the substratum or foundation upon which the spiritual emotions are built, and animal enjoyment excites the latent mental energies to vigorous action.

Presuming that I have established the position that the beautiful is the generic term we give to those qualities or combination of qualities which delight the mind, through the medium of the senses, the intellect, the imagination, or the moral feelings, either separately or combined,—it will be seen that the perception of beauty lies in the very nature of the faculties themselves, requiring no distinct single faculty for its due appreciation, and depending upon no one quality, such as truth, harmony, relation of parts, proportion, &c.; nor does it necessarily require the perception of design, but rather in its fullest and highest development requiring them all combined.

It has evidently been ordained that man shall discover the principles of nature, and in the perception of those principles shall feel delight. There have been implanted in man certain innate convictions and feelings in accordance with nature, or rather he has been so organized in harmony with outward things, that nature shall be to him a never-failing mine of instruction and delight. He is the chord that vibrates sympathetically with the mood of outward things. It has been decreed that while certain combinations please, through the very nature of the mind itself, and in the different balance of organism in different minds, we see the reason of the diversity of tastes. It is the province of practical art to point out the laws that govern these combinations, and the principles they must possess to please the human mind.

On that subject this essay does not profess to treat, leaving it, perhaps, for some future occasion on which the practical application of the principles expounded, may be discussed more at length.

T. MELLARD READE.

#### ILLUMINATED MANUSCRIPT AS ILLUSTRATIVE OF THE HISTORY OF THE ARTS OF DESIGN.\*

FROM the invention or introduction of writing in every country of the world to the present date, it has been customary, more or less frequently, as the current of civilization advanced or receded, to embellish manuscript with polychromatic decoration. Of a practice so steadily maintained in spite of ages of indifference and Vandalism, thousands and, indeed, I might say millions of specimens actually exist. Fortunately, the intrinsic value of the materials of which such volumes were made, offered no great temptation to barbarian capidity, and many a precious codex still remains, which, stripped ruthlessly of the costly binding which once encased it, has been thrown aside as worthless by the very hand which despoiled it of the covers, or precious capsule, under which it was once exhibited to the admiration of the faithful, on the altars or lectisteria of the great cathedrals and churches.

Such memorials of the zeal, industry, piety, and taste, of our forefathers lay claim to our attention on two grounds, apparently different, but in reality one and the same, viz. their value as illustrations of the history of the arts of design, and the importance of those lessons of experience, which every artist may unquestionably derive from the study of the beautiful types both of form and colour which they present to his notice.

It is the former of these two divisions of the subject which it constitutes the leading theme of the present paper, but as it would be comparatively deficient in usefulness, if I failed to establish the ultimate identity between that which may be regarded as historical, and that which may be looked upon as more strictly practical, I propose to do so very briefly in drawing this paper to a close.

To commence, therefore, with the historical portion of my theme, I need scarcely recall the facts, that not only was that which we know as the earliest type of writing the most pictorial, but it was also embellished with colour from the most remote ages. A glance at the pages of Rossini or Lepsius, will suffice to convince us that the monumental hieroglyphics of the Egyptians were almost invariably painted with the liveliest tints; and when similar hieroglyphics were executed on a reduced scale, and in a more cursive form upon papyri, or scrolls made from the leaves of the papyrus, the common flowering rush of the Nile, illumination was also employed to make the leading pages more attractive to the eye. Nor was such illumination peculiar to hieroglyphic characters; it prevailed also, but not to the same extent, in the hieratic and demotic modes of writing. Of such papyri, notable specimens may be seen in the British Museum; the most wonderful in existence, however, is the remarkably interesting and graphic illustration of the funeral of a Pharaoh, preserved in the Royal Museum at Turin.

Extraordinary dexterity was acquired in a conventional mode of expressing complicated forms by a few rapid touches, and the life and spirit with which familiar scenes are represented, and ornaments executed, in both the early and late papyri, are truly remarkable. The precise extent, to which the Greeks and Romans were indebted to the Egyptians, for the origination and use of alphabetic symbols, the learned have not yet agreed upon. They have, however, concurred in recognizing the fact that Egypt certainly supplied the principal materials, by means of which writing was ordinarily practised. The primitive books of the ancients were no other than rolls formed of papyri prepared in the following manner:—Two leaves of the rush were plastered together, usually with the mud of the Nile, in such a fashion that the fibres of one leaf should cross the fibres of the other at right angles; the ends of each being then cut off, a square leaf was obtained, equally capable of resisting fracture when pulled or taken hold of in any direction. In this form the papyri were exported in great quantities. In order to form these single leaves into the "scaps," or rolls of the ancients (the prototypes of the rotuli of the middle ages), about twenty were glued together end to end. The writing was then executed in parallel columns a few

inches wide, running transversely to the breadth of the scroll. To each end of the scrolls were attached rounded staves similar to those we use for maps. To these staves, strings, known as "umbilici," were attached, to the ends of which bulse or weights were fixed. The books, when rolled up, were bound round with these umbilici, and were generally kept in cylindrical boxes or capsas, a term from which the Medieval "capsula," or book-cover, was derived. The mode in which the students held the rolls in order to read from them is well shown in a painting in the house of the surgeon at Pompeii. One of the staves, with the papyrus rolled round it was held in each hand, at a distance apart equal to the width of one or more of the transverse columns of writing. As soon as the eye was carried down one of the staves, when, of course, the student had arrived at the end of his book.

Of such papyri I need scarcely remind you that no less than nearly 2,000 were found at Herculaneum, the whole so shrivelled and burnt up as to be susceptible of being opened only at the greatest possible risk of total destruction. By careful steaming, and a variety of ingenious processes, many have been unrolled and displayed. They proved, however, to possess little literary, and no artistic merit.

The first great improvement in book-making, was the substitution of sheets of parchment for the leaves of the papyrus. Necessity was in this case the mother of invention, for Pliny tells us, that owing to the illiberality and jealousy of one of the Ptolemies, Eumenes, king of Pergamus, being unable to procure the Egyptian papyrus, introduced the use of parchment prepared for taking ink and pigments.

The second, and even more important change was introduced, according to Suetonius, by Julius Cæsar, who first divided books into pages. His letters to the Senate were so made up, and subsequently all documents either emanating from, or addressed to that body or the emperors, were arranged much as our modern paper-books are. The volumes so formed were known as *codices*, a term which has been retained to express similar objects during the whole reign of Medieval Latinity.

Although the rolls to which I have alluded, as having been discovered at Herculaneum, were devoid of embellishment, there is sufficient evidence that many of the classical manuscripts were elaborately decorated. Thus Martial alludes to a bookseller's shop opposite the Julian Forum, in which his works may be obtained, "smoothed with pumice-stone, and decorated with purple." Pliny tells us, that Varro illustrated his works by portraits of no less than 700 illustrious persons, and he assures us that writers, on medicine gave representations in their treatises of the plants which they described. Seneca also alludes to books decorated "cum imaginibus." Such were the original classical illuminated manuscripts of the Augustan age.

A distinct class may, however, be recognized of somewhat later introduction into Europe than those in this simple style, founded, no doubt, upon Oriental models. The combination of brilliant colours, with gold upon purple, and other stained vellums, appears to have been derived by the Greeks from India and Persia, and continued to be preferred to the more sober style particularly affected by the Romans during the first three centuries, at least, of the Christian era. The earliest instance of Roman adoption of gold lettering on purple or rose-stained vellum is given by Julius Capitolinus in his life of the Emperor Maximinus the younger. It is therein related that the mother of the emperor presented to him, early in the third century, a copy of the works of Homer written in gold upon purple vellum.

Although evidence is wanting that both styles prevailed among the Romans, the simpler one may be assumed as having been most popular in Italy; as, after the transfer of the seat of empire to Byzantium, scarcely any of the more brilliant class can be traced as emanating from the Roman schools of calligraphy. On the other hand, the simpler style appears to have found but few admirers in Byzantium, since almost all the earliest examples which can be met with of the skill of the artists employed in the capital of the eastern empire are based upon the capital of the eastern illumination in which golden grounds and conventional ornaments, executed in brilliant colours, form the leading features of decoration. The Roman style may be considered as closely allied in its pictorial elements, originally, to the art of

\* Read by Mr. Digby Wyatt, at the Institute, as elsewhere mentioned.

Pompeii and Herculaneum, and, subsequently, to that of the Catacombs; while the Greek style presented, originally, a close relation to Oriental prototypes, and, ultimately, to the popular art of the mosaic worker.

I shall briefly allude to a few of the principal existing specimens of each style, since they must ever be regarded as furnishing the best and indeed the only reliable illustrations of the painter's art during those ages in which classical tradition became all but extinguished.

The most important Latin illuminated manuscript known to the student of palaeography is unquestionably the square Virgil of the Vatican. This originally contained fifty paintings, five of which are now almost entirely effaced. The text is written throughout with considerable regularity, in capital letters, in black ink, and its only ornaments are paintings of subjects derived from the Æneid.

They are executed in body colour, with great spirit, and in a very free hand, but are wanting in finish, and in any considerable attention to gracefulness of composition. The whole of the accessories, architectural and picturesque, are purely classical, and the costume, arms, and technical execution are perfectly characteristic of the fourth century. They are not accompanied by any purely ornamental frame-work, but are separated from the text only by plain, narrow, red bands. It is right to notice this, as in almost all manuscripts of Latin origin a similar mode of simple framing of painted subjects may be observed. The two subjects of this series most interesting to architects are unquestionably those which represent Achates and Æneas inspecting the works undertaken by Dido for the beautifying of Carthage, and King Latinus receiving the ambassadors of Æneas. In the former, masons and other artificers are represented at work, and a curious illustration is given of the primitive crane, worked by a large wheel. In the latter the Trojans approach Latinus, who is seated before a temple with an octastyle portico, the pediment of which is filled with sculpture, and the general architectural character of which is exceedingly clearly defined.

A much ruder series of illustrations of leading incidents in the Æneid is also preserved in the Vatican, in a Virgil, probably, of the fifth century, formerly in the Parisian monastery of St. Denis. The celebrated Terence of the Vatican is a classical MS., of little less interest and importance than the square Virgil, being similarly illustrated with miniatures, but of a much ruder description.

So far as ancient texts are concerned, irrespective of illuminated decoration, some of the most valuable now extant are those which belong to the peculiar class of books known as *palimpsests*, that is, books which have been twice written over, the original writing having been, as far as possible, expunged, in order to provide a fresh surface of vellum for receiving later transcripts. The most important of this class was unquestionably the treatise of Cicero *De Republica*, discovered under a copy of St. Augustine's Commentary on the Psalms, by Cardinal Angelo Mai, the celebrated librarian of the Vatican.

The Imperial Library at Vienna is rich in Roman MSS., of scarcely inferior interest to those contained in the Vatican. The most elegant is a calendar, decorated with eight allegorical figures of the months. Although of about the same period as the square Vatican Virgil, it differs from it in containing, in addition to pictorial representations, numerous elegant ornaments of a conventional description. At Vienna is also the exceedingly curious MS. "*Dioscorides*," a work of peculiar interest in the history of painting, since not only does it contain in its text the earliest allusion to that property of drying which renders oil an eligible material for the painter's use, but in one of its miniatures, illustrative of invention, it shows a scribe writing, and an artist engaged in painting a picture placed upon an easel differing but little from those in use at the present date. In one hand the artist holds his palette, and with the other he is applying the colour to the surface of his picture. At his feet is a slah upon which his pigments are disposed for transfer to his palette. The date of this interesting MS. is satisfactorily fixed by the fact of its containing an elegant portrait of the Empress Juliana Anicia, for whom it is known to have been written at the commencement of the sixth century.

The Ambrosian Library at Milan contains a Homer with fifty-eight pictures, corresponding with those of the Vatican square Virgil. The Laurentian Library at Florence possesses the celebrated Medicean copy of the latter author, a codex much esteemed for the purity of its text, although devoid of illumination. The Paris

Prudentius may be said to correspond (with the exception of a difference in the form of the capital letters in which it is written) with the Medicean Virgil.

The purest of the classical MSS. were written in regularly-formed capitals. The next and less regular class is that in which the characters consist of what are known as rustic capitals, or those in which the writing is slightly inclined, in a manner corresponding with many of the inscriptions which have been found rudely scratched upon the walls of the houses at Pompeii, and in the chapels and other apartments of the catacombs.

Another variety of writing in capital letters was that known as the *uncial* style, which was the first approximation to a cursive or running hand. These letters generally resemble capitals, but instead of being angular are to a great extent composed of rounded forms. Specimens of this uncial character may be traced in the fourth century, and it appears to have changed little until the seventh. It is in this character that the *Dioscorides* of Vienna is written, while the later of the two Vatican Virgils already mentioned, and the Paris Prudentius, are in the rustic.

The uncial character, or rounded capital, was a transition to the *minuscule*, or "lower-case" letter, which at length became an entirely distinct character from the alphabet of capitals, the latter being generally known in contradistinction to the *minuscule* as *magnolet*; but whilst a knowledge of the exact sequence of the varieties of character in which illuminated MSS. have been written, is essential to enable us to arrive at any approximation to a correct determination of the age of any such work, I do not propose to dwell upon this branch of the subject here, but rather to confine myself to the illuminations, which have more direct interest for us as artists.

Having adverted to a few of the most important of the simpler class of classical MSS., I will now proceed to allude to the principal specimens of the more gorgeous kind, including those known to have been executed in the Eastern Empire, at the same time that those already described were completed in the Western.

St. Jerome, writing in the fourth century, exclaims in a well-known passage,—"Let those who will have old books written in gold and silver on purple parchments, or, as they are commonly called, in uncial letters,—rather ponderous loads than books,—so long as they permit me and mine to have poor copies, and rather correct than beautiful books." The principal volumes still existing corresponding with the description given by this great father of the Church, are the celebrated "*Codex Argenteus*," of Upphals, written in gold and silver letters upon a purple ground, A.D. 360; the *Psalter* of St. Germain de Pres; a fragment of the New Testament in the Cottonian Library (Titm. c. 15); and a copy of the Book of Genesis in the Imperial Library at Vienna; the three latter of which are believed to have been executed during the fifth and sixth centuries.

All of these, it may be observed, are in the Greek character, and, with the exception of the *Codex* of Upphals, may be considered as the production of Greek scribes. The only one which contains miniatures is the copy of Genesis, at Vienna, which is illustrated by no less than eighty-eight. These correspond very closely with the paintings which once enriched another celebrated Book of Genesis, which belonged to Sir Robert Cotton, and was almost entirely destroyed in the fire at Ashburnham House, in 1731, which consumed so many irreplaceable relics of past ages. The Cottonian Genesis, as far as can be ascertained from collections made previous to the fire, and from the charred and shrunken fragments which are all that now remain of this precious volume, contained no less than 250 miniatures, each about 4 inches square. These two remarkable versions of the Book of Genesis are supposed to be of nearly equal date, a slight precedence in point of antiquity being conceded to the English specimen. The Vienna text is written, as we have remarked, in letters of gold and silver, while that of the English version is throughout in black. Gold in the English volume is but sparingly introduced in the miniatures; and Dr. Waagen remarks that only the hatched gold upon the borders, the glories, and the lights upon the crimson mantle, indicate the commencement of Byzantine art.

That which is supposed to be the most ancient of all the texts of the Holy Scriptures, the *Codex Alexandrinus* of the British Museum, is written throughout (with the exception of the first three or four lines in each book which are in red) in black letters; a slightly ornamented pen-and-ink line

drawn at the end of each book being the only decorative feature contained in it.

The Libraries of the Vatican, as well as those of Paris, Oxford, and London, contain other specimens of brilliant ancient MSS., written in gold and silver letters, for the most part, no doubt, at Byzantine previous and immediately subsequent to the age of Justinian. There can be very little question that an important modification in the character of illumination took place during the impulse given to the arts by the important works carried on by command of this emperor during the middle of the sixth century. The relations which existed between the empire over which he reigned, and the ruling powers of Persia, were exceedingly intimate, and there can be little doubt that the fruits of the "eternal peace," which he concluded with Chosroes Nushirvan, in the very year in which the great church of St. Sophia was commenced, A.D. 532, may be traced in the golden grounds, the jewelled ornaments, and brilliantly coloured conventional foliage, which speedily and almost completely superseded the traditions of Roman art, which had greatly declined during the interval which occurred between the removal of the seat of empire from Rome to Constantinople by Constantine, in the year 329, and the accession of Justinian, in the year 527.

The most interesting illustration of the participation of the art of illumination in this change we may be proud to possess in this country in the celebrated and unique Eusebian canon, executed on an entirely gold ground, two leaves of which, painted on both sides, are preserved in the British Museum (Addit. MS. No. 5111). Their beauty of coloring is very great, and both in that respect and in the peculiar forms of the ornament by which they are decorated, their divergence from classical tradition, and their affinity to Oriental art, will be at once perceptible. In the more pictorial features, such as the small portraits introduced in circular compartments, they exhibit a mode of painting strictly in consonance with antique precedents, and still retained in tolerable perfection.

To whatever degree this pictorial power might have degenerated from the comparative excellence of Classical ages, it is to be remembered that it was far in advance of any other school at that time existing. The social and political convulsions which prostrated the Latin empire before the Goths, the Vandals, and the Lombards, reduced the traditions of Roman art to an utterly effete condition in the land in which they had once reigned paramount; and it was in the Eastern empire alone that art found that protection and comparative tranquillity under which it can alone flourish.

While all was dark in Europe, with the exception of the flickering light still casting an occasional ray from Constantinople over countries far remote, a new light and a new school were springing up in the islands of the extreme west. The learned have differed in their recognition of the immediate means by which Ireland first became Christianized. It is, however, generally admitted that that providential change from utter darkness to true light took place at a very early period. That the Irish were in possession of some of the most ancient versions of the Gospels is quite clear from the texts of their earliest MSS., which differ essentially from the version introduced by St. Jerome towards the close of the fourth century. The oldest of these works date from the sixth century, and exhibit a series of entirely original features in the extraordinary illuminations by which they are decorated. Many of their saints were distinguished scribes, while their schools became so generalised throughout Europe as to be resorted to by students from many distant lands. In the school of Finian, which is said to have included no less than 3,000 scholars, the great St. Columba, or Columbkille, who was born A.D. 521, was instructed in many arts; and in that of illumination he became especially and justly famous. He it was who about the middle of the sixth century, established that celebrated monastery in the island of Iona, or Icolmkill, which was subsequently transferred under the Irish monk, St. Aidan (635, 651), to Lindisfarne, and from whence St. Cuthbert and his learned associates, spread true religion and sound knowledge far and wide in the north of England. In the library of Trinity College, Dublin, is preserved a precious volume containing an entry of extreme antiquity, relating that it was written by St. Columbkille himself, in the space of twelve days. It is copiously decorated with what Mr. Westwood (who has done more than any other student to spread a knowledge

and illustration of this interesting school of calligraphy) has designated as "fossilated interlaced ornament." Nor is this by any means a singular specimen of Celtic art of the sixth century, since many other volumes of even greater intricacy and elaboration are extant in Ireland, England, France, Germany, and Italy.

The remarkable diffusion of MSS. executed by Irish scribes is accounted for by the exemplary efforts and untiring peregrinations of the Irish and early Anglo-Saxon missionaries. Thus St. Boniface, the apostle of Germany, carried with him to that country his precious book of the Gospels, still preserved as a relic, and a highly-prized one; at Fulda. St. Kilian took with him Franconia books, still preserved at Würzburg. In the public library of St. Gall, in the canton of Switzerland which still bears his name, records of the labours of the saint still exist; and not only did these curious volumes help to form the schools of calligraphy which afterwards became celebrated in Germany and elsewhere, but, in the monasteries which they founded, the saints themselves educated scribes to imitate the writings originally brought from Ireland. Thus, as M. Libri, the great bibliographer, has justly observed, "One cannot help remarking that the most celebrated of these pious missionaries, St. Columbanus, laid the foundations at Luxeuil, in France; at St. Gall, in Switzerland; and at Bobbio, in Italy, of three monasteries which afterwards became famous for their admirable MSS., in many of which, the influence of the Irish and Anglo-Saxon schools can be recognized at a glance. The Bobbio MSS. are known everywhere by the discoveries which have been made in the palimpsests, which once belonged to that collection. As for the MSS. of Luxeuil they have been dispersed; but the specimens of them which are to be found in the Libri collection, joined to what has been published on the subject by Mabillon, O'Connor, and others, prove unambiguously that in this abbey, as well as in that of Stavelot in Belgium, and other ancient monasteries on the Continent, a school of writing and miniature had sprung up, as remarkable for the beauty of its calligraphy as for the care applied to reproduce the forms of the Anglo-Irish schools."

I have never seen any MSS. demanding for their execution greater truth and delicacy of hand than some of these Irish productions, and more particularly the "Book of Kells," a treasure preserved in the library of Trinity College, Dublin, which tradition asserts to have belonged to St. Columba himself. The volume consists of 339 leaves, each 13 inches by 9½ inches. The text is that of the Gospels, and is considered by Biblical students to be a version antecedent to that of Jerome sanctioned by Pope Damasus. In this, like other contemporary books of Gospels, the Eusebian canons precede the sacred texts, and these are written, as is also usual, in arcades. In this respect, and in the conventional attitudes of some of the figures, can be traced the analogy they present to ancient Byzantine or Latin MSS., from which they totally differ in every ornamental detail. With the exception of certain flat tints, forming the fillings in, the whole of the work appears to have been executed with an extraordinarily fine pen; there is no attempt whatever at any expression of light and shade; the whole is perfectly flat, and no graduated tints are introduced. Gold I have never yet seen in a genuine Irish MSS., and, although it is to be found in some of the books executed in a similar style in England, I do not think that it was ever used in Ireland itself. The power of depicting the human figure was almost entirely wanting, but the occasionally some of the animals occurring in the lacertine combinations of ornament were drawn with an approximation to correct form. The colouring, however, is invariably most conventional in its arrangement. The leading elements of ornament are interlaced bands, terminating in spirals, coiled most eccentrically one within another, and interwreathed birds and animals struggling as if in interminable contest. The surfaces inclosed by lines or by ornaments such as those described, are frequently covered over with geometrical patterns of extreme minuteness, executed by repeated symmetrical touches of a finely-pointed pen, and corresponding occasionally both with the class of ornament exhibited on Chinese and Japanese work, and with that found on the carved woodwork of aboriginal races. The most agreeable contrasts of colour in these manuscripts are those of purple with yellow. Considerable life and distinctness was given to combinations of ornament by enclosing the bounding lines with closely-serried minute red dots. Although small, one of the most elegant of all the Irish volumes is that known as the Gospels of

McDurnan, preserved in the library of the Archbishop of Canterbury at Lambeth.

It is exceedingly difficult to predicate with any certainty as to the relative ages of the various specimens of Irish illuminated MSS. which still exist; as, although some are ruder than others, there is scarcely any alteration in the system of ornament, or the representation of animated objects, to be recognized in the whole series. How profoundly they were admired in the Middle Ages is testified by several citations given by Mr. Westwood; the most interesting perhaps being that of Giraldus, written in the twelfth century. That author describes a book which he saw at Kildare, said to have been written by St. Bridget, who died A.D. 525, and concludes what Mr. Westwood calls his "flaming account" of it by stating that "scarcely could Apelles himself execute similar works, which appeared to have been formed and painted by some scarcely mortal hand."

From the monastery of Lindisfarne, to which I have already alluded, the arts taught in the schools of Ireland were communicated to various English monastic institutions, and more particularly to that at Glastonbury. How completely identical the practice of the scribes, both Irish and Anglo-Saxon, who exercised their art at Lindisfarne was with those of Ireland itself, may be clearly traced by a comparison of books known to have been illuminated in Ireland, with such works as the Durham Book, or Gospels of St. Cathbert, and others which we cannot doubt were executed in this country.

The last-named volume, which is probably the most remarkable MS. in the British Museum, is of world-wide celebrity. St. Cuthbert died in the year 685, and by way of a memorial to him, his successor, Bishop Eadfrith, caused this noble volume to be written. It was greatly enriched by Ethelwald, Bishop of Lindisfarne, who succeeded Eadfrith in 721. This prelate caused the book to be richly illuminated by the hermit Bilfrith, who prefixed an elaborate painting of an evangelist to each of the four Gospels, and also illuminated the capital letters at the commencement of each book. The bishop caused the whole to be encased in a splendid binding of gold, set with precious stones; and in the year 959 a priest named Aldred rendered the book still more valuable, by interlining it with a Saxon version of the original, which (unlike the more ancient Irish MSS.) was in the Latin text of St. Jerome. In the diagrams on the wall I exhibit to your notice various ornamental features from this extraordinary book, some drawn to the exact size of the original, and others magnified so as to enable you to perceive the general characteristics of the style from a distance.

The preservation of this most elaborate volume is of the highest importance, as showing that, for at least 100 years after the advent of St. Augustine in this country, the Irish style of illumination was adhered to in the north of England by Anglo-Saxon students; and that very few traces were manifested of those changes in style which were unquestionably introduced through the admiration excited by the comparative pictorial excellence of the illuminated books known to have been brought by the envoy of Pope Gregory the Great into this country in the year 597.

These books are known to have consisted of a Bible in two volumes; two Psalters; two Books of the Gospels; a Book of Martyrology; Apocryphal Lives of the Apostles; and Expositions of certain Epistles and Gospels. The Bible, which was beautifully written on purple and rose-coloured leaves, with rubricated capitals, with portions in gold and silver, was certainly in existence in the reign of James I. Some of the learned think that this original Gregorian Bible may be traced in the magnificent purple Latin Gospels of the British Museum (Royal Library, I. E. 6); but a careful examination will, I think, suffice to establish the presence in that volume of features so decidedly characteristic of Anglo-Saxon work, as to render it exceedingly unlikely that the volume could have been written anywhere but in this country. There can be little doubt, however, that if not the identical volume, it was one of the earliest transcripts made from it; and probably under the superintendence of St. Augustine himself. In this book of the Gospels the execution of the figures is entirely different from that commonly practised by the Irish scribes. There is an attempt at shading, and there is a sketchiness of touch which appears to me to clearly indicate the attempts of an artist, accustomed only to the use of the pen, to copy the touches and effects produced by means of the brush.\*

\* To be continued.

#### ON THE DISCOVERIES OF THE BUDRUM EXPEDITION.

The concluding lecture at the Architectural Exhibition, delivered by Mr. R. P. Pullan, on the 5th inst., was on the "Discoveries of the Budrum Expedition." The subject has been treated of on various occasions in our pages, but the following portions of the paper will be found to convey additional information.

It was reserved for the Budrum expedition, under Mr. Newton, to be the means of adding to our national collection the finest sculpture it possesses, after the Elgin marbles. This gentleman united to the necessary qualification of being a scholar, that of being imbued with an enthusiastic love of Greek art, and what is of more consequence to the leader of an expedition, he possessed a thoroughly practical turn of mind and great administrative talent, for it is not only the acquisition of antiquities he has to consider, but the daily requirements of those united under his charge.

Mr. Newton had been appointed vice-consul of Mitylene, by Lord Granville, in order that he might have the opportunity of exploring the neighbouring coast, and that he might turn to the national advantage any discoveries that might there be made. After a residence of a few years, which enabled him to master the language and become acquainted with the customs of the people amongst whom he dwelt, he turned his attention to an object that had always been the nearest to his heart, viz. the discovery of the sepulchre of Mausolus, king of Caria—one of the seven wonders of the ancient world, the exact site of which had never been determined, though several had visited Budrum for the purpose of ascertaining its exact position.

The expedition reached Budrum on the 22nd November, 1857, and here, perhaps, it would be as well for me to describe the beautiful spot at which they arrived, which was to be for a year the scene of their labours.

The city of Halicarnassus, now Budrum, was situated on the shores of a bay curved in the form of a horseshoe, on ground gradually sloping up to rocky mountains, which lay about a mile from the shore, and the lower parts of which were included in the circuit of the walls. The city was built on terraces, formed by low walls, which prevented the alluvial soil washed from the hills from being carried away. The hills encircling the bay gave the ancient city the form of a theatre, and in this respect it resembled Rhodes; possibly it was laid out by the same architect, Hippodamus, who is known as an architect of cities. The bay was divided into two equal parts by a rocky promontory, upon which stood the palace of Mausolus, where now the castle is situated.

Of the several travellers who visited Rhodes, two only have indicated the precise spot upon which they surmised the Mausoleum to have been built,—Captain Spratt, who made a plan of the town when surveying the coast for the Admiralty; and Ross, a German architect.

According to the description of Vitruvius, it stood in a broad way at the centre of the town. Both these sites have a central situation; and, from these being the only large level platforms perceptible in the centre of the town, they seemed likely to afford ground for the hypothesis. Mr. Newton explored Spratt's platform first, and found nothing but Byzantine walls, probably those of a monastery. Ross's platform was afterwards excavated: it turned out to be the site of the Temple of Mars. Mr. Newton then began to dig in a field belonging to Hadji Captain, where a fine statue of a female had been found. In this field were found the foundations of a Roman villa, and several mosaic pavements of rather coarse workmanship. These were carefully raised, packed, and put on board ship, preservation having been first taken to photograph them all while *in situ*—a most difficult operation, as you may imagine, as a scaffold had to be erected, and the camera arranged with the lens downward. This operation was, however, successfully concluded by the two photographers of the expedition, Corporals Spackman and Macarty.

During the excavations of the villa Mr. Newton, in exploring the neighbourhood, discovered some remains of columns and other fragments of a fine Ionic building, built into the walls of houses and vineyards, on a spot mentioned many years ago by Professor Donaldson as the probable site of the Mausoleum. Excavations were commenced here on January 1st, 1859, and in the course of a few days Mr. Newton had the satisfaction of ascertaining that he had attained the object of his search—the site of the Mausoleum,—for fragments of

friezes were soon brought to light, corresponding in style and in dimensions with those which had been removed from the castle of Budrüm, which was known from records to have been built out of the ruins of the Mausoleum; and shortly afterwards parts of two colossal heads were discovered, and then numerous pyramid steps, which proved without doubt that these were the ruins of the building described by Pliny as having been surmounted by a pyramid of twenty-four steps, crowned by a quadriga.

There were several obstacles to the rapid progress of the works. One of these was the difficulty of purchasing the houses and gardens that covered the site. These had to be purchased one by one, and were only parted with by their proprietors on condition that the excavation should be filled up, so that they could build anew on the same sites. The natural cupidity of the Turks was excited; they imagine all Englishmen to be mad; but they considered it an incredible degree of insanity for men to spend thousands of piastres and so much time and labour simply for the sake of a few *eski tashler* (old stones), even though they might be *yazli tashler* (inscribed stones), or *marrowfat tashler* (wonderful sculptured stones). No! we must know of some concealed treasure; and had not they or their friends discovered coins in ancient tombs before now? Were not they themselves in the habit of hurrying their treasure in times of tumult, not knowing what else to do with it?—and as we had not yet discovered this buried treasure, was it not likely that it might be under their own houses? So they asked fabulous prices for their miserable little tenements, hardly better than cowsheds; and it was only by a series of clever negotiations that Mr. Newton was enabled to secure them. Even to the last there were two houses left unthought within the peribolus on the south side; but they were tunnelled under in every direction, without any trace of sculpture being discovered.

At length a sufficient space of ground was excavated to show a quadrangular cutting in the rock, 126 feet by 110, which would give ample space for a building the circumference of which was 431, according to Pliny, to stand within it. This area was partly filled with blocks of green rag, laid in regular courses of a foot in depth. This formed the core of the stylobate, which must have been of great height and solidity, for a great part of the ancient castle of Budrüm is built with these courses of green rag, of uniform height, taken from the Mausoleum. Pliny's description of the monument is, no doubt, familiar to you: he gives the total height of the structure, including the quadriga, as 140 feet. He mentions that the *pteron*, or colonnade, was raised to the height of 25 cubits (37½ feet), and that the pyramid was of the same height; so that the stylobate would have been 65 feet in height. I may mention that this high base is not unusual; it occurs at the Ionic monument of Xanthus, and in other tombs of this class.

We found the order to be fine Ionic, resembling in proportions the temple of Minerva at Priene, and that its height came out about the same as that given by Pliny—viz., 37½ feet. The pyramid steps formed on the north side and near the peribolus wall (which they had struck in falling, and made to bulge outwards), were of two dimensions, as to the treads, viz., 1 foot 9 inches, and 1 foot 5 inches, the riser being uniformly 11½ inches. One step was found with a 9-inch tread.

The chariot was by Pythis, the frieze by Scopas, Timotheus, Lechares, and Bryaxis, the first sculptors of their day. In addition to these fine sculptures were found some magnificent lions, an equestrian figure, two seated figures, and heads and pieces of several others, all in good style.

I will not now go into the question of the restoration. This, as you know, has been a *questio vexata* for a long period. It would be unfair to criticise the various restorations that were put forth (before we had any data to go upon) based upon Pliny's description, which it is so difficult to reconcile. I may mention that the whole question mainly depends upon whether the 63 feet given by Pliny as the length of the sides, in contradistinction to the fronts, refers to the cella, or to the *pteron* or colonnade. Connt Caylus was one of the first to make a restoration, and his conception of it was unlike anything that has subsequently appeared. This was followed by those of Texier, who supposed it to have been circular, those of Bosse, Professor Cockerell, and Mr. Watkins Lloyd. In Mr. Falkener's "Museum of Classical Antiquities" will be found a complete report of these various restorations which are all to a certain extent to be reconciled with Pliny.

I may mention that the mode of restoration proposed by Mr. Fergusson (in the *Builder*),

explains a passage in Pliny before lost sight of, in which he says that the pyramid contracts in the form of a goal, which would give it a curvilinear form. In Mr. Newton's hook on the "Expedition," I hope to be able to put forth a restoration in which most of the points are met: at present I am waiting to hear the result of the collation of the various manuscripts of Pliny which is being done by Mr. Newton's direction.

Besides the Doric colonnade, which stood in front of the temple of Mars, there is nothing of the ancient city remaining above ground but the theatre and the city walls. The theatre is situated, as is almost universally the case, on the side of a hill, so placed that the spectators might, between the performances, gaze upon nature's own scenery, painted in her most brilliant colours. Opposite them, at a distance of twenty miles, could faintly be distinguished the promontory of Cnidus; a little nearer, the jagged peaks of the Cos mountain called Prion, from its saw-like appearance; while the magnificent panorama of the city lay immediately beneath them, the palace of Mausolus and the temple of Venus occupying the two horns on each side of the bay, and the magnificent sepulchre of Mausolus rising in the centre to the height of 140 feet, of Parian marble, brilliant with gold and colours, and surmounted by the four-horse chariot containing the colossal statue of the departed monarch.

In October, 1857, as the excavations did not require his immediate presence, Mr. Newton took advantage of the return of the *Supply* to Malta to visit the temple of Apollo at Branchida, the modern Greek name of which is Gerouta, near the ancient city of Miletus. He was induced to make this excursion for the purpose of endeavouring to find certain statues that lined the sacred way approaching this celebrated temple, which was the seat of one of the greatest oracles of antiquity. There is a vignette in the "Ionian Antiquities" showing a group of these figures, and from this it was evident that they were of an archaic style, of Egyptian character, and therefore valuable to the historian of art as the connecting link between Egyptian and Greek art. He found eight seated statues of regal personsages in their original positions, but hurried up to the neck: most of the heads had been knocked off. Upon digging round the figures, inscriptions of an interesting sort were found, some of them in the boustrophedon or earliest character known—that is to say, running from right to left and then from left to right, as an ox ploughs; hence the name; in addition to which he discovered a lion and a sphinx, and on the former the name of Thales, the Greek philosopher, who flourished in the year 560 B.C., in the neighbouring city of Miletus. The temple had been so thoroughly illustrated by the Dilettanti Society that it offered nothing new. Upon it being represented to the Government that these eight figures were worthy of transportation to England, money was liberally granted for the purpose, and some months afterwards the *Supply* again touched at Branchida, and by the efforts of the crew these large sculptured blocks were dragged down to the shore, and safely shipped. They are now in the Cnidus gallery of the Museum.

In the summer of 1857 Lieutenant Smith, taking with him a photographer and some Turks, made an excursion to the ruins of a temple at Lagina, which was not known to any former traveller, a city a little north of Stratonicæ, and was known to Pococke under the name of Chitua. We found amidst the thick underwood several fine friezes of Roman temples, of which photographs were taken: the peribolus gateway was standing, but the rest of the structure, which was of the Corinthian order, was in ruins. The friezes were unfortunately too far from the coast for removal, being four or five days' journey by an impracticable road—that is to say, impracticable for sledges.

Lieutenant Smith also explored the shores of the Gulf of Keramo, and visited the city of that name, which had been identified by the surveyor of the Admiralty. He found there a city of the first class, that is, one that had not been built upon after Roman times.

In November, 1857, I started for the purpose of exploring the island of Cos, taking with me a photographer (Corporal Spackman) and two Turks. The island had been visited by Colonel Leake and by Rosse; but it was thought that there might be sculpture or architectural remains that had escaped their notice.

In the well of Hippocrates, about four miles from the city of Cos, is an example of horizontal arched vaulting, the only one I know of besides that of the treasury of Athens. This well is in the

side of a hill, about 20 feet beneath the ground, and is approached by a subterranean passage: it is about 10 feet in diameter, and 18 feet high: the vault is of beehive form.

At Pylia we found the Charmyleion, a monument of the kind called Heroön, consisting of an oblong chamber, with an arched roof, niches for the dead being at the sides. The Ionic ornaments of the façade were found in the façade of a neighbouring church. We visited the site of Astypalœa and Halasarna, which possess but few fragments of buildings. We brought back copies of many inscriptions inedited.

In December Mr. Newton and myself, accompanied by a body of marines, were landed on the barren peninsula, at the extremity of which is situated the city of Cnidus: this peninsula, 120 miles long, by from 3 to 4 miles broad, is bounded on the sides by the Gulf of Doris and Keramo. A high mountainous ridge, with one or two breaks in it, runs the whole length of the peninsula. At the extreme point are the ruins of a city built on the side of a mountain. The forms of the temple, theatre, and other public buildings, can be accurately distinguished, and are shown with great exactness in the map published in the second volume of the "Ionian Antiquities," and in the excellent survey by Captain Graves.

The Triopian promontory, about a mile long by a quarter of a mile broad, is joined to the main land, near the middle of its length, by a narrow sandy isthmus. Its natural harbours were formed in this manner: massive walls and piers were erected round them, which still remain. As there were no houses, however, within six miles of the city, the marines were employed for some time after our landing, in erecting the Crimean huts, for the accommodation of the expedition, which had been sent out from Malta on board the *Supply*.

In a short time a little settlement arose, formed of huts arranged in a quadrangle: a pier was constructed for the embarkation of antiquities; a tank was sunk for the preservation of water, which was scarce; and by Christmas-day everything was ready for the commencement of excavations. Our first trial was at the celebrated temple of Venus. The architecture of the temple (which is thoroughly illustrated in the "Ionian Antiquities") was found to be, though elaborate, late and of Roman character. Beneath the foundations we found fragments of cornices, which induced us to suppose that there had been an earlier temple in a purer style; but we found neither inscriptions nor sculpture.

The vestibule of the theatre next engaged our attention. Here we found Corinthian capitals, bases, and several fragments of thin marble, showing that the interior had been veneered after the manner of the Palace of Mausolus, as mentioned by Vitruvius.

The first important discovery was the tomb of Lykæthius on the Triopian promontory. This had been a Roman tomb, also Corinthian, with two columns in *antis*. The vault had been circular. Three sarcophagi of late workmanship were found *in situ*, and a statue of Demeter that had been in a niche at the side. Some valuable inscriptions were found that had lined the walls.

The finding of a statue figure on a terrace near the city walls induced Mr. Newton to dig in the vicinity, and he found that on this terrace had been a *temenos*, or sacred inclosure for internets, dedicated to Demeter. Here was brought to light a fine head of Proserpine, a small Venus, hundreds of lamps of terra-cotta, and also fragments of fine sculpture.

Before coming to Cnidus Mr. Newton had heard of a lion upon some promontory near. I had also received information from a shepherd that upon the top of a hill was a figure like a demon. When the weather became favourable for exploring, I went in search of this demon, taking with me two sappers. On the second day of our search, upon the top of a promontory not easy of access, I had the good fortune to come upon a magnificent lion, lying on his side in hollow ground. He measured 10 feet long and 6 feet to the top of his head, being represented in a recumbent posture. As soon as this discovery was made known to Mr. Newton, he directed an encampment to be formed on the spot. Lieut. Smith set the sappers to work to construct a zigzag road (for the cliff upon which the lion stood was some 200 feet above the level of the sea) for the purpose of embarking it; and in a few weeks' time the monster was hauled up by means of shears and powerful wind, put into a strong oak case, dragged down the ramp by 120 Turks, at the rate of about 100 yards a day, and at last shipped by the sailors amidst the united rejoicing of Turks and Englishmen.

While this was being done the tomb upon which the lion formerly rested was carefully removed. That portion which remained standing was a core of petrified beech, a stone common to that country—circular in the interior, of the diameter of 17 feet 6 inches, and externally forming a square of 40 feet. In the thickness of the walls were eleven recesses for the reception of bodies, and a low entrance.

The casing, which was of a local marble, had been detached and overthrown, and the stones separated for the sake of the metal crumps. The tomb had been surrounded by engaged columns of the Doric order, resting upon a stylobate. Above this had been a pyramid of steps, and, to crown all, a high plinth, surmounted by the lion. The whole must have formed a conspicuous landmark for mariners, and probably was the original Cnidian lion which we find on the coins of the city, and was, no doubt, one of the most imposing monuments of the country. The work had never been quite completed, as the lions' heads on the cornice were left in block, and the columns unfinished, as at Rhamnis and Delos. There was, however, sufficient *matériel* to enable me to make a restoration of the tomb. Other discoveries of sculptures were subsequently made.

In conclusion, I may say to the student of art, who to an appreciation of antiquities unites a love of exploration and something of the spirit of adventure, that there is no country that will so well repay the toil of travel as Asia Minor: there he will find that which will compensate for the dangers of an excursion amongst lawless people—and these are not few—and for the inconveniences of a hot climate, and these are many. In the course of every day's journey he will meet with, perhaps an inscription, perhaps a ruined temple, or perhaps a decayed city, abounding with ruins of theatres, temples, palaces. Here he may pitch his tent in the centre of some vast theatre, and for days find interest in exploring and measuring the ruins; or he may be still more fortunate and discover among the brushwood, or half buried in the ground, some wonderful work of art, a frieze, or a statue of Praxiteles, or some of his pupils. This may be the case even in a place so much exposed and so frequently visited as Cnidus. One day Mr. Newton and myself were walking in the outskirts of the city, and near the outer wall we observed a piece of white marble protruding. The surface had been broken off, but on removing a little of the earth we discovered folds of drapery: the Turks were summoned to dig, and in a short time a fine colossal seated figure was disinterred, which is now in the British Museum. Should the traveller not be so fortunate as to bring to light any fine sculpture, he may still be lucky enough to discover some city site, which was unknown before, from inscriptions or coins to identify it; thus adding considerably to our historical knowledge. He may bring home drawings of ancient remains that have never been represented by the architectural draftsman.

Not one of the ancient cities of Asia has yet been properly explored, and those that have been visited have, with few exceptions, not been illustrated; so that the field of labour is vast, the difficulties not great to an enthusiastic man, and the reward and satisfaction so great as only to be appreciated by those who have experienced it.

#### ROYAL INSTITUTE OF BRITISH ARCHITECTS.

The closing ordinary general meeting of the Royal Institute of British Architects was held on Monday evening last, at the house in Conduit-street; the President, C. R. Cockerell, Esq., in the chair.

Mr. Lewis (honorary secretary) read a letter from Mr. Quarm, clerk of the works at the new palace of Westminster, acknowledging the vote of thanks which had been passed to the men who had assisted at the funeral in Westminster Abbey of the late Sir Charles Barry.

Mr. Lewis also read the draft of a memorial from the council and members of the Institute to the dean and chapter of Worcester Cathedral, praying them not to demolish the famous Guesten Hall; which is one of the finest examples remaining of the building of the Decorated period.

Mr. James Bell (honorary secretary) having read a list of donations,

The President, in moving that the thanks of the Institute be awarded to the donors, announced that a special general meeting would be held on Monday next, to consider the proposal of the council as to architectural examinations. He was sure that all present would agree with him that this was a subject of great importance to the profession; for if there was anything which could add

more to its respectability and status, it would be the institution of the proposed examinations. He hoped, therefore, that there would be a full attendance of members, so that the subject might be fully discussed.

Mr. Bell next read a paper forwarded by Sir Gardner Wilkinson "On the use of Granite." This will be found on the present page.

Thanks having been voted to Sir Gardner Wilkinson for the paper,

Mr. Digby Wyatt read a paper on "Illuminated Manuscripts as Illustrative of the History of the Arts of Design," the commencement of which we print elsewhere.

At the conclusion,—  
Mr. Burgess observed that some time since he had met in Theophilus a recipe for dyeing the ivory knobs of bishops' croziers, and he had made an experiment in order to see whether the materials would do for colouring vellum. The principal substance was rose madder; and he found on steeping the vellum in it for about a week that it produced a most beautiful and brilliant colour. He saw no reason why the service books in our abbey churches should not be illuminated. It seemed to him that if a memorial of a good and distinguished person were required, it would be far better to produce a magnificent illuminated volume than an ugly bronze statue, which in a few years would become as black as a sweep. Just fancy what a magnificent Book of Common Prayer might be produced for Westminster Abbey if Mr. Dyce and Mr. Herbert were commissioned to illustrate it.

Mr. Wyatt observed that the gorgeous purple colour found in ancient manuscripts was produced from madder. The Greeks had a plant which grew near Athens, which they called *fulvum*, and which they used for illuminating purposes. This plant was mentioned by Theophilus.

Mr. Burgess said Theophilus called the substance madder.

Mr. Wyatt observed that the ancient scribes covered the surface of their paintings with albumen, or the white of eggs, to preserve them from the action of the atmosphere.

Mr. Lewis said he had followed the recipes left by Theophilus for producing the gold effects, but that he had not succeeded to his satisfaction. He would be glad to know whether Mr. Wyatt had, in the course of his research, been able to throw any light upon this portion of the subject.

Mr. Wyatt replied that there were many treatises on the art of illuminating, which contained particulars about the preparation of the gold process, but he was free to confess that he had not been able to make any of them work. He believed that white of egg mixed with plaster of Paris, as used by the ancient Italian illuminators, was the best groundwork for gold.

Mr. Burgess said he had no doubt but that the problem could be solved, if the demand for illuminated books were revived. He believed the ancients had two ways of laying the foundation for thin gold—a gesso ground and an opaque ground. In the gilding of picture-frames, a ground of whitening and size was used, then burnishing gold size mixed with common size, and then a wash of water. The best success which he had met with was to take common burnishing gold and apply until a raised surface was obtained; then rub down with a brush, and afterwards apply shell gold or gold powder. Some years ago a man named Hewitt, who worked at the British Museum, was enabled to produce a very fine gold burnish, which he made a great mystery of. He said it consisted of three vegetable extracts, but the mark being rather wide, he contrived to keep the secret to himself.

Mr. Reynolds Rowe (Cambridge) said that perhaps a clue might be afforded to the wonderful excellence of the ancient illuminated manuscripts, by the fact that they were not executed by contract.

Mr. Wyatt said that, unfortunately for the force of Mr. Rowe's argument, there was abundant evidence to prove that many of the manuscripts were executed by contract. In the rolls of York Minster there were several entries showing how a certain accomplished scribe had contracted to execute illuminations for all the Psalms, with azure and vermilion, at 5s. 6d. each.

On the motion of Mr. Kerr, a vote of thanks was unanimously awarded to Mr. Wyatt for his paper.

The President expressed a hope that the paper would be published, in order that it might become of practical service to the members of the Institute as architects, and assist them to get rid of the white and grey surfaces so apparent in the interior and exterior of modern buildings. He

had himself seen that day a beautiful work which wanted nothing but the pencil of the artist to make it perfect. Strangers conversant with Continental buildings were surprised that we had not made more way in this peculiar style of decorative art.

The Right Hon. the Earl de Grey and Ripon was, on ballot, elected an honorary fellow. The following gentlemen were elected Fellows: Mr. Edward Middleton Barry, Associate, of 1, Old Palace-yard; Mr. George Low, Associate, of 10, Basinghall-street, City; Mr. Thomas E. Knightley, Associate, of 25, Cannon-street, City; Mr. Octavius Hansard, Associate, of 11, Argyll-place, Regent-street; Mr. Frederick H. Pownall, Associate, of 15, Gower-street, Bedford-square; and Mr. C. F. Reeks, Associate, of 12, Middle Scotland-yard. Mr. Louis De Ville, of 36, Great Ormond-street, and Mr. Thomas Tod Mardon, of 6, Great James-street, Bedford-row, were elected Associates.

#### ON THE USE OF GRANITE.

As the question of using granite for building and monumental purposes has been much discussed, I beg to offer a few remarks connected with it, and to notice a fact which shows at bow early a period the ancient Egyptians had watched the effect of atmospheric and other influences on stone, and how wisely they profited by the lessons taught them by experience. They had learnt that earth, abounding with nitre, from its attracting moisture, had the effect of decomposing granite, but that in the dry climate of Upper Egypt the stone remained for ages unaltered when raised above all contact with the ground. When, therefore, there was a possibility of its being exposed to damp, they based an obelisk, or other granite monument, on limestone substrations; and these last are found to the present day perfectly preserved, while the granite above them gives signs of decay in proportion to its contact with the earth subsequently accumulated about it. I am speaking of Upper Egypt, visited only four or five times in a year by a shower of rain; for in the Delta granite remains have been affected in a far greater degree than in the Thebaid. Nitre abounds there, and it is remarkable that the obelisks at Alexandria have suffered least on the sides next the sea.

The Egyptians seldom used granite as a building stone, except for a small sanctuary in some sandstone temple; and in the later times of the Ptolemies one or two temples were built entirely of granite. But in the pure Egyptian period that stone was chiefly confined to the external and internal casing of walls, to obelisks, doorways, monolithic shrines, sarcophagi, statues, small columns, and monuments of limited size, and was sometimes employed for roofing a chamber in a tomb.

The durability of granite varies according to its quality. The felspar is the first of its component parts which decompose, and its greater or less aptitude for decay depends on the nature of the base of which the felspar consists. Egypt produces a great variety of granite, and the primitive ranges in the desert, east of the Nile, about 35 miles from the Red Sea, supplied the Romans with numerous hitherto unknown kinds, as well as with porphyry, which they quarried so extensively in that district; but the granite of the ancient Egyptians came from the quarries of Syene, in the valley of the Nile, and from these they obtained what was used for their monuments. It is from this locality that the name of "Syenite" has been applied to a certain kind of granite; it is, however, far from being all of the same nature, and a small portion of the stone found there is really what we now call "Syenite."

Already, at the early period of the third and fourth dynasties, between twelve and thirteen centuries before the Christian era, the Egyptians extensively employed granite for various purposes. They had learnt to cut it with such skill, that the joints of the blocks were fitted with the utmost precision. Deep grooves were formed in the hard stone with evident facility; and it must have been known to them for a long period before the erection of the oldest monuments that remain—the Pyramids of Memphis, where granite was introduced in a manner which could only result from long experience. Again, in the time of the first Osirtasen, about 2050 B.C., granite obelisks were erected at Heliopolis, and in the Fyöom, and other granite monuments were raised in the same reign at Thebes; from which we find that even then the Egyptians had learnt how the damp earth acted on granite when buried beneath it; and this interesting question subsequently sug-

gests itself—how long before that time must the stone have been used, to enable them to obtain from experience that important hint which led them to place granite on limestone substractions?

I have already had occasion to offer some remarks on the mode of treating granite surfaces, which has been so ably detailed by Mr. Bell, at the meeting of the Society of Arts (March 14); and I have stated that the Egyptians adopted the broad character of ornamentation in sculpturing granite very judiciously advocated by him. I will, therefore, only add, that other good examples of such treatment may be found in early crosses of Cornwall, Devonshire, and other localities in this country; where what was design (rather hastily called the Bunie knot,—a design of entwined basket-work, common also in Italy, and in other countries,—the large scroll pattern also frequently met with on the same monuments, and numerous massive ornaments in relieved intaglio, cut in the thickness of the stone, are instances of a style of decorative sculpture admirably suited to granite.

GARDNER WILKINSON.

#### CONSTRUCTION OF BREAKWATERS.

INSTITUTION OF CIVIL ENGINEERS.

ON May 22nd the paper read was, "On Breakwaters," by Mr. Michael Scott.

This communication was in continuation of a former paper, read in December, 1858. It consisted of two parts,—the first being an account of the completion of the Blyth breakwater; the second, a description of a new kind of breakwater.

It was stated that, since the date of the former paper, the breakwater at Blyth had been completed with entire success, notwithstanding a cross current of 3½ miles an hour. Having been exposed to the violent storm of October last, without sustaining the least injury, it was claimed that experience had afforded a complete answer to the objections made, during the previous discussion, to this kind of breakwater, which consisted of timber-frames, deposited in deep water, planked and filled with stone.

The cost of the breakwater, including the round end and the light-house, was stated to have been 117. per lineal foot. Four years' experience had shown that properly cross-tied timber was not touched by the worm.

The new kind of breakwater was a modification of the wave screen described in the former paper. Although similar in principle, it differed in the materials of which it was constructed, and it was applicable to deep water. It was proposed to deposit a bank of rubble stone, up to the depth, below low water, at which stones began to be disturbed by the action of the waves. Upon this bank would be built a face wall, up to the low water mark, and behind this wall long counterforts, the upper surface of which would rise from low water at an inclination of say 2 to 1, and extending back for a distance dependent upon the extent of the slope rendered necessary by the magnitude of the waves. These counterforts would be so far apart from one another as could be conveniently spanned by iron girders, suppose 20 feet; and the whole of the sloping surface would be converted into a sort of gridiron by girders laid from counterfort to counterfort at distances of about 18 inches apart. Supposing such a breakwater to be exposed to a heavy sea, whether the waves were breaking or not, the water would be projected up the slope, and would gradually drop through on its passage.

The paper "On the Method of Computing the Strains and Deflections of Continuous Beams, under various Conditions of Load," &c., by Mr. J. M. Heppel, was stated to be of so purely mathematical a character as to be unsuited for reading. It would be published in the Minutes of the Proceedings.

#### OUR ARCHITECTURAL ANTIQUITIES.

THE GUESTEN HALL, WORCESTER.

It is to be hoped that the stir that has been made may serve to save this valuable relic of the Middle Ages from the destruction threatened by the Dean and Chapter of Worcester, or the Ecclesiastical Commissioners. We early protested against the threatened vandalism, and since then other metropolitan papers have taken up the matter. The Society of Antiquaries have sent a memorial to the Dean and Chapter, showing reasons for its preservation. The Institute of Architects (as elsewhere mentioned) have also sent one, signed by the president, vice-presidents, council, and many of the members; and the same course has been pursued by several other bodies. It is perfectly preposterous that any such inter-

position should be necessary. The last statement, which we owe to Mr. A. B. Hope, is to the effect that the contemplated proceedings, which have so justly caused apprehension, are to be limited to clearing out the modern partitions and fittings which now clog the building; and that no order has been given to destroy the old work.

That gentleman adds,—"The satisfaction which this assurance would have created is, however, greatly mitigated by one of my informants having added the expression of his fears that the building, thus relieved of the cross walls which now keep it up, may come down with a run."

Let us hope soon to hear that proper professional advice has been taken, and that this interesting structure will be put into a state to withstand the operations of time for many years to come, and be appropriated to some fitting and useful purpose.

We have received several letters on the subject, and give part of one which refers to the general question of the preservation of our architectural antiquities.

It seems to me very desirable that some measure of a permanent character should be taken, in order to save buildings of architectural and archeological interest from the hands of such ruthless spoilers. This might be effected by a joint action of all the British societies. I would, in the first place, propose a central committee in London, at whose office the name of every society throughout the country should be registered. Each society thus registered should either elect a special sub-committee attached to its own body, for the preservation of objects of interest, or should act as a body in this capacity. When any such object is threatened with destruction, decay, or dilapidation, it should be the province of the local sub-committee to report the facts concisely to the central committee, with the best means that appear evident to the sub-committee for its preservation. The central committee should then print a short statement of the facts, and send it to every local society registered on its books, with a request that the members would take such measures, and hand in such subscriptions, as they might be able to obtain. By this means, I am convinced, money might be raised, and antiquities, otherwise doomed for want of sufficient local funds to purchase or repair them, might be saved. It would also be a means of spreading widely a knowledge of such remains that otherwise would have only a local fame. Such an organization would have saved the noble gateway recently destroyed in York; it might now be in operation to save the Guesten Hall, and it would in all such cases give unity and force to protests against vandalism, that are now weak and ineffectual by their want of a common centre. E. W. C.

#### THAMES EMBANKMENT COMMITTEE.

The committee continues its sittings. On the 15th, Sir Joseph Paxton in the chair,—

Mr. G. P. Bidder said that he was President of the Institution of Civil Engineers, and had turned his attention to the question of the embankment of the river Thames, and to the subject of the construction of a low-level sewer running in the direction of the Strand and Fleet-street. The plan now before the committee contemplated to obviate the difficulties of such a construction, and at the same time by an embankment of the river to improve the access from the West-end to the City. The proposed embankment would leave New Westminster-bridge on the level, and proceed to Whitehall place on a low level, so as not to interfere with the mansion residences on Richmond-terrace and Privy-gardens. It would so proceed until it approached Hungerford-bridge, which was about to be converted into a railway bridge, which it would pass under, and then rise at an easy gradient with an embankment 5 feet above Trinity high-water mark to the level of Waterloo-bridge. Thence it would proceed to Blackfriars on a level, and on to Southwark-bridge, where it would end. At Hungerford it was proposed to construct a dock of five acres for the accommodation of the existing traffic there in the hay and straw trade, and along the line of route the plan was so designed as not to interfere with the premises and wharfs on the northern bank of the river. On the embankment, besides the roadway and foot-pavement, it was proposed to construct a double tramway for omnibuses drawn by horses to run between Westminster and Southwark bridges. The time that would be required for the construction of the works would be between three and four years. He considered that the Metropolitan Board of Works might fairly contribute towards the work 250,000*l.* on behalf of the metropolis, for the accommodation it would give to the con-

struction of the low-level sewer and a roadway 100 feet in width. If the low level is carried out the estimate was 50,000*l.*, but there would be loss occasioned by persons being obliged to close their shops for months together. It was believed the total liabilities for the construction of this sewer would not be far short of 240,000*l.* The circumstances on the south side of the Thames were entirely different, as they would not require a roadway there. He estimated the cost of the works contemplated on the north bank between Westminster and Southwark bridges, including the construction of the embankment-wall, the dock, and roadway on arches, as shown in the plan exhibited, but irrespective of compensation, at 1,500,000*l.*

On the 19th instant, Mr. Gisborne, civil engineer, was examined. He stated that he had executed works on the River Shannon to the extent of 800,000*l.*, and had conducted other extensive works in connection with embankments and other works in which the foundations had to be made under water. He had also paid considerable attention to the subject of the embankment of the Thames, and had submitted plans to the Government. He proposed to create a quay-wall from Westminster-bridge to St. Paul's-wharf. Under the quay-wall there would be tidal basins with numerous entrances, having headways varying from 13 feet to 18 feet. There would be then a roadway of 70 feet, and an esplanade of 20 feet wide, raised on iron columns and supported upon an iron viaduct. The roadway would be narrowed from Hungerford to Paul's-wharf, along which, except in front of Somerset House and the Temple Gardens, houses, shops, and warehouses, would be built, and would increase remuneration, as he would subsequently show. He had intended also to construct a railway from Hungerford to London-bridge, but he confessed he had been obliged to abandon it in consequence of the amount of compensation that would be required. The roadway would be carried on from Paul's-wharf to Fishmongers' hall. The estimates for the works on the north side was 953,869*l.*, to this he added 100,000*l.* for compensation to persons for temporary losses during the progress of the works, and adding to this 10 per cent. for contingencies, raised the total estimate for the north side works to 1,281,000*l.* On the south side he proposed to carry out works on the same principle, by the construction of a quay wall, with tidal basins inside. The total estimate for both sides of the river was 1,900,000*l.* By this plan, and by railway foundations above the high-water mark, there would be obtained 315,000 superficial feet which could be sold or let out for building purposes; on the south side there would be obtained 499,500 superficial feet, making 814,500 superficial feet. He had valued that land at 1*l.* per foot, representing 814,500*l.* In addition to this, he should have 400 cedar wharfs on the Middlesex side, for stowing coals, straw, and other commodities, and 300 similar cedar wharfs on the Surrey side; and these he calculated would be worth 750,500*l.*, so that the total calculated remuneration was 1,564,000*l.*, leaving about 336,000*l.* to be provided.

Captain Morgau was next called, and informed the committee that he had formerly been superintendent of the London Docks, and gave evidence with respect to his experience of the effect of narrowing the river with regard to the tidal supply of water to those docks. He considered that an embankment was prejudicial to the navigation of the river.

#### UNHEALTHY HOUSES.

Sir.—Perceiving a paragraph in the *Builder* of last week, cautioning the public as to the ill drainage of dwelling-houses in the event of a sudden change of the weather, will you permit me to ask what steps it is advisable for me to take under the following circumstances:—

I have hired a cottage for a term; have a family of six children (delicate). I find, now that I have got in, the drains are in a horrid condition; the stench is intolerable; the rats running about like bees; not a drop of water, except rain-water; my liberal landlord refuses to lay out a fraction, or to release me from the house, adding, that if I (as I have threatened) refuse to pay the rent, he will immediately distrain. I am a working man with a large family, and limited income, and took the cottage for the benefit of country air for my children, at serious inconvenience to myself. If your correspondents can throw out any suggestion how to act, I shall feel extremely obliged. Are there no sanitary inspectors?

Ealing.

T. P. M.

THE MARBLES OF TUSCANY AND MODENA, AND THOSE OF THE BRITISH ISLES.

A PAPER was read, on 23rd May, at the Society of Arts, by Mr. W. P. Jervis, F.G.S., "On the History, Geological and Geographical Distribution, and Commercial Bearings of the Marbles of Tuscany and Modena, and of the Boracic Acid Lagoons of the Maremme."

The salient points treated of in reference to marble related to a proposition for tramroads connected with the quarries at Carrara, Serravezza, and Massa,—the quarrying by cave workings, instead of allowing the stone to be continually exposed to the atmosphere,—the absurd practice of the late Medesene Government of taxing the marbles,—and the small quantity of marble which we consume in England, where it could be so advantageously employed for domestic architectural purposes, especially for internal decoration.

Besides the geological, topographical, historical, mineralogical, and other varied and interesting information afforded in the paper, it contained statistical and other practical and useful details, some of which we may here quote.

I have been unable (said Mr. Jervis) to find the statistics of the production of the late Duchesse of Modena in any publication issued in that state. The *Annuario Economico Statistico dell' Italia*, Torino, 1853, gives little more satisfactory information. It is there stated that the exports of marble from Carrara, from 1837 to 1846, were valued at 370,341*l.* The total produce in 1847, including that for home consumption, was estimated as worth 66,139*l.* At the same period, 2,258 persons were employed directly or indirectly in the marble trade. Through the kindness of Sig. Fabriciotti, a gentleman who owns extensive quarries, I am enabled to publish more particulars than have probably been yet set before the English public. That gentleman has made out a table, which, though not official, may be considered as pretty accurate.

The paper gave rise to a practical and interesting discussion, of which we must endeavour to give an abstract.

Mr. John Bell said there could hardly be a more interesting subject for discussion than that of the marbles used in art, amongst which, perhaps, the white marbles would be the most interesting, because the statues of old and of the present day were usually made from them. Marbles were, however, found with great variety of colour, and in that way, no doubt, they would be extremely interesting as regarded their use in the decoration of public buildings, &c., which opened a field that perhaps had not been of late sufficiently worked. He believed it was contemplated that a great deal of the interior decoration of St. Paul's should be executed, if the funds admitted of it, in various-coloured marbles, some of the best specimens of which were now to be seen in the apartments of the surveyor, Mr. Penrose, in the Chapter-house. The observations of Mr. Jervis, with respect to these marbles, were very valuable. There were, however, numerous descriptions of marbles, both from Scotland and Ireland, which were of very beautiful colour, which had been worked for a short time, and then, for some reason, laid aside. There were also some fine white marbles obtained in this country, but whether they were sufficiently white throughout for statuary purposes he did not know. The white marbles of Scotland and Donegal were very beautiful. No description of white marble, however, equalled the Parian, which had been principally found in the island of Paros; but he believed that the whole yield of it had been completely exhausted. A similar description of marble had been found in the neighbouring island of Naxos. The beauty of Parian marble consisted in this—that it had exactly the same amount of transparency that there was in the human flesh, which made it so suitable for statuary. The Carrara marble was of a different character—it was not nearly so beautiful as the Parian for the purposes of sculpture. It was called lunar marble, from its moonlight colour. Mr. Jervis had alluded to the manner in which the blocks of marble were sent rolling down the sides of the hills at Carrara and Serravezza. It was no doubt highly desirable that a better mode of bringing down the marble should be adopted. He believed the blocks were, in the first instance, blasted with gunpowder, which shook the marble very much, and then the rolling down the steep declivities of the mountains tended to increase the "shakes" throughout the block, and deteriorated the quality of the marble for the purposes of art.

Professor Tennant said he had brought with him an old diagram of brecciated marbles, com-

posed of broken fragments, of which chimney-pieces were often made. Another form was that of the conglomerated marbles, which were extensively used some years ago for decorative purposes. Many specimens of them were to be found at Hampton Court, and other of the older palaces in this country. He was sorry Mr. Jervis had not given them a little more information with regard to other materials which were found in the country of which he had principally treated. Amongst other substances might be mentioned alabaster and serpentine. The serpentine was the "green marble" of Italy, and was at the present time used there to an enormous extent. These compact marbles were useful for many purposes, although they were not adapted for external work in this country, owing to the influence of our climate. He would particularly refer those interested in this subject to the house No. 76, Strand, the interior of which was some few years ago fitted up at great expense in various marbles. It was now occupied as a penny newsroom, and it would well repay a visit to inspect the beautiful marbles which were let in to the walls, although at the same time they would have presented to them the fact of the perishable nature of those Continental marbles under the influence of the London atmosphere. Professor Tennant proceeded to call attention to a serpentine material, which was to be obtained by thousands of tons in Galway—a fact he believed not generally known. In the model-room of the Society's house there was to be found, in a window-seat, a remarkably fine collection of British marbles. They had been roughly used, but if they were polished they would form one of the oldest and best collections of British marbles that could be met with. Few countries afforded better specimens of marble than the British Islands. They might be placed as "No. 2" in the series of countries which afforded marbles. In Tuscany, however, these materials might be obtained at comparatively small cost if proper machinery were introduced for the working of the quarries on a large scale.

Mr. Jervis remarked that the marbles of this country generally partook of the character of limestones. All British marbles might be called either marbles or limestones. With regard to the marbles of Italy it was different. All the specimens on the table from Carrara had a more or less crystalline structure, and had lost their original texture. In illustration of this he might state that in the marble districts of England the *debris* produced by the action of the weather was in the form of a kind of mud. Near Bristol the roads in rainy weather were covered with a close, compact mud, which adhered very tightly to the clothes. On the other hand, in going through Carrara, he had noticed that the *debris* was of a different character. The crystalline particles were separated from each other by the weather, and the result was calcareous sand, in particles of considerable size.

Mr. C. H. Smith said he would offer a few remarks of a practical nature. Many years ago he read a paper before this society, "On Marbles, and their adaptation to ornamental purposes." At that time he had endeavoured to discover some record amongst ancient authorities which would satisfy him that Carrara marble was to be found amongst some of our antiquities. He had, however, hitherto failed to satisfy himself that there were any antiquities now remaining of Carrara marble. In this country no building of Carrara marble had stood even a couple of centuries. The cornices and capitals of the Pantheon at Rome were of white marble, but he very much doubted whether they were from Carrara, and a great portion of St. Peter's was built of Travertine, which remained very white up to the present day. They knew very well that in this country Carrara marble would not last for any great length of time, and it was scarcely possible to find a specimen 150 years old, unless it had been preserved by repeated painting. The statue of Queen Anne, in St. Paul's Churchyard, had suffered from the weather, and it had been necessary to replace some portions. Since that it had been frequently painted, and might possibly last for many years longer. He admitted, however, that in warmer climates the Carrara marble might be more durable. There was a specimen which was within reach of the inspection of all—the statue of Her Majesty in the Royal Exchange. That was going very fast, and the angular portions might be easily broken off with the thumb and finger. The same might be said of the statue of Charles II., which was placed in a niche in the ambulatory of the same building. Another important material was the dove marble, which contained one or two per cent. of carbonaceous matter. In his opinion this colouring matter

diffused through the mass made it more durable. A specimen of that marble was afforded by the tomb erected about thirty years ago by Sir Francis Chantrey to the memory of David Watts, in St. John's-wood burying-ground. That, even, was already in a state of decay. Another specimen of perishing marble was to be found in the Marble Arch, at the end of Oxford-street. With regard to the marble of Porto Venere, mentioned in the paper, it had this disadvantage, that it was apt to split under the action of the hammer. With reference to the sawing of the marble abroad, the material was of that extremely brittle nature that it should be transported in larger blocks to its destination, as, when sawn into slabs, it was extremely liable to split. It could be sawn in this country so cheaply, that it could never in the long run answer the purpose of the merchant to import it already sawn. He had no hesitation in saying that Parian marble was infinitely superior to the Carrara in standing the weather in this country. The only specimens which had been exposed were fragments at the British Museum, which had stood out of doors. Carrara marble became disintegrated all through the mass, but the action of the atmosphere upon Parian marble only decomposed the surface, as was shown by the Elgin marbles. In cases where the object was durability, as in the instance of monuments and tombs in cemeteries, he should prefer many descriptions of stone to marble.

The Chairman congratulated the Society upon the interesting paper which had been presented to them that evening, and also upon the practical character of the discussion which had arisen upon it. He was persuaded, from conversations he had had with Mr. Jervis, that he had not communicated one tenth part of the information he possessed on this subject. He would advert for a moment to the disintegration of the stones alluded to, which was so important in an economic point of view. In connection with all these facts, observations were easily made in the laboratory upon the comparative durability of stones. Those who had burnt various descriptions of limestones knew the different way in which the fire acted upon them. Carrara marble, if heated in a fire, crumbled to pieces; that disintegration took place to which Mr. Smith had alluded. The particles of Carrara marble were held together by so slight a tie that the heat of the fire destroyed their cohesion. In other kinds of marble the cohesive power, about which we knew so little, was infinitely greater. The Chairman concluded by proposing a vote of thanks to Mr. Jervis for his excellent paper. The vote of thanks was then passed.

The *Journal of the Society of Arts*, of the 1st of June, we may here add, contains a supplementary letter answering objections raised by Mr. C. H. Smith, and corroborating Mr. Bell's remark regarding the use of Carrara marble, as proved by the name of the port whence it was shipped, viz. Luna. The letter alluded to also contains the prices of marbles at Serravezza.

THE "BUILDER'S" LAW NOTES.

*Alteration of Footway.*—There was a footway across a brook, by means of fourteen stepping-stones. The surveyors of the highways of the parish reduced the number of the stepping-stones to eight, increased their height, and placed flagstones on the top of them, forming a kind of bridge for the public convenience, whereby the traffic on the footway was increased to the annoyance of the owner of the adjoining land. He caused the flagstones to be removed, and was convicted before the magistrates on an information by the surveyors under the Highway Act. Having appealed to the Court of Queen's Bench, that court set aside the conviction, on the ground that the surveyor was guilty of a trespass in putting down the flags. It was an unauthorized enlargement of the public right by making the way a species of bridge.—*Sutcliffe v. The Surveyors of Sowerby.*

*Pawnbrokers.—Loss of Pledge by Neglect.*—A pawnbroker placed a gold watch (a pledge) with other valuable property in a strong room which was left at night without any guard. No person slept on the premises. The house was entered at night, the room broken open, and the watch with other property stolen. In an action against the pawnbroker he was adjudged by the magistrate to pay the pawner the full value of the watch, and this decision was confirmed by the Court of Queen's Bench on appeal; it being held that to leave unguarded premises containing so much valuable property was a "neglect" within the meaning of the Pawnbrokers' Act.—*Healing (appellant) v. Cathrell (respondent).*

#### THE OXFORD UNIVERSITY MUSEUM.

OXFORD is celebrating its great Commemoration Festival, and is running over with life. There have been concerts, and speeches, and exercises: all the buildings have been examined, and the adjoining localities visited. That we may be *appropos*, we give some additional illustrations of the University Museum, namely, a view in the court, showing chiefly the ironwork of the roof and its supports, and one of the windows. In previous volumes will be found a plan of the whole, external views, and examples of the carved capitals and corbels, together with descriptive particulars.\* The museum was built, as our readers know, under the superintendence of Messrs. Deane & Woodward.

The ornamental portion of the roof is of wrought-iron, and was executed by Mr. Skidmore. In the spandrels it takes the shape of interwoven branches, with leaf and flower, of chestnut, sycamore, palm, oak, and other trees, while in the capitals of the columns and elsewhere are seen the passion-flower, water-lily, ivy, holly, and other plants, effectively wrought. The amount of the contract for the ironwork of the roof, including the cast-iron pillars, was 5,000*l*.

Mr. Munro has completed six of the statues, to be placed on corbels against the piers of the cloister around the court, namely Galileo, Leibnitz, and Newton, commissioned for presentation by her Majesty the Queen; Sir Humphrey Davy, by the Marquis of Lothian; James Watt, by Mr. Boulton; and Hippocrates, by Mr. Ruskin.

**LORD BACON RIGHTED.**—We are glad to hear that Mr. Murray will shortly publish "Francis Bacon, Lord Chancellor of England," by Mr. Hepworth Dixon, being an inquiry into his life and character based on letters and documents hitherto unpublished. This work, though new in form and in material, will contain the substance of the very remarkable and interesting articles on the subject which appeared in the *Athenæum* in January last.

\* See Vol. XIII. pp. 294, 318, 319. Vol. XVII. pp. 252, 253, 401, 408.

#### THE VOICE OF A TOWN.

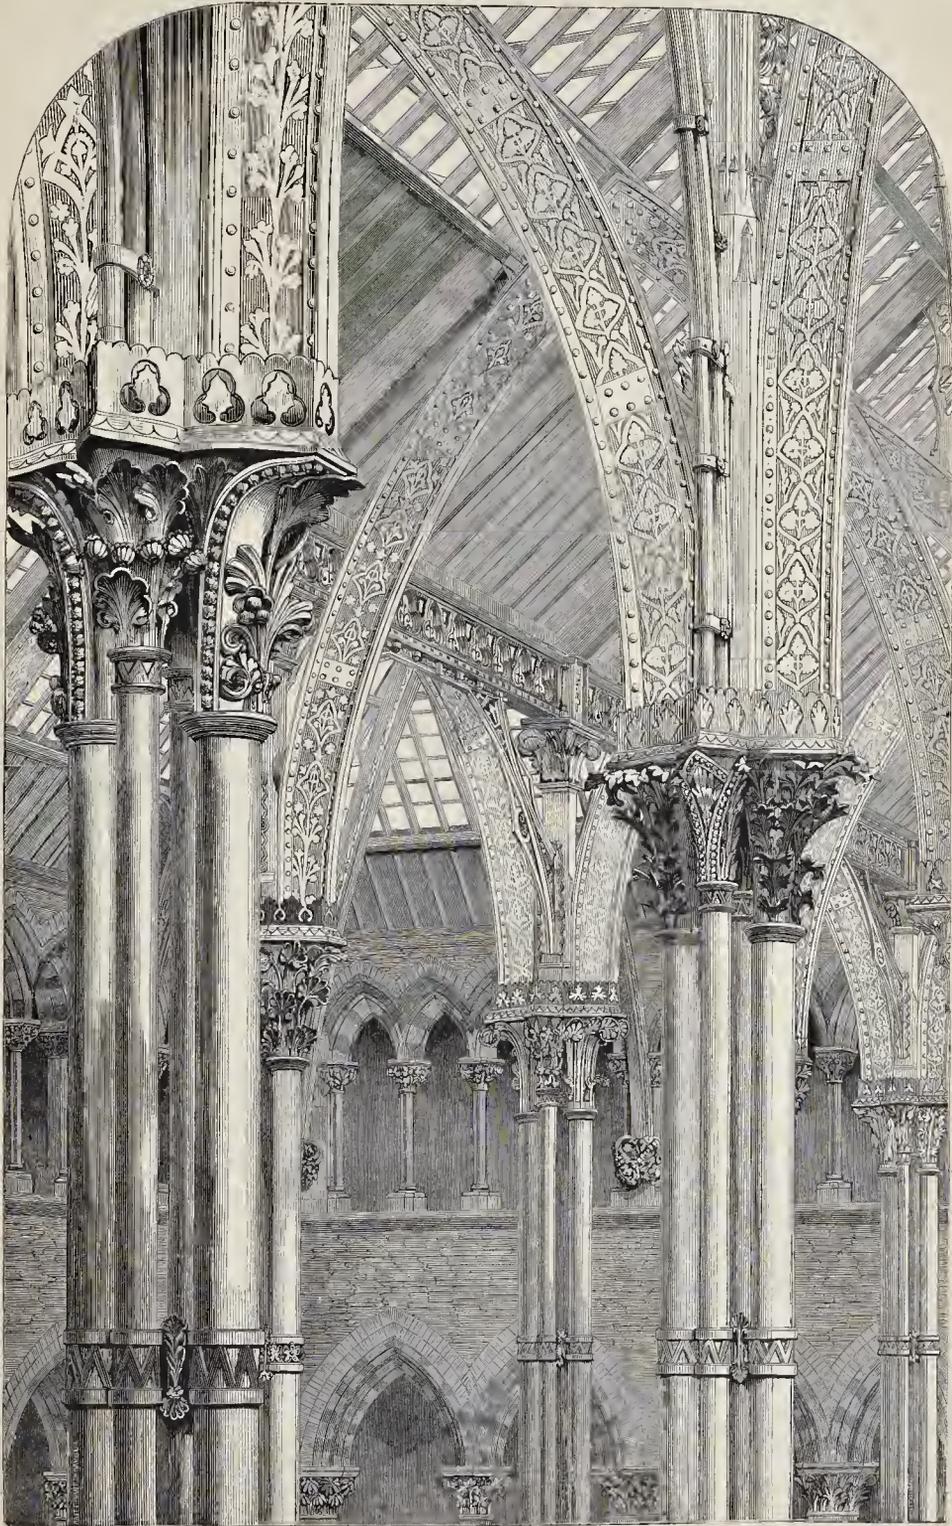

WE once spoke of the voices of old buildings. The thoughtful wayfarer in this great city cannot fail to be impressed with the varied and peculiar sounds which form one of the peculiarities of this teeming city, and which mingle together and produce a voice singularly impressive. It may be heard with solemn effect sounding in the dome of St. Paul's, and less loudly, though distinct, in still weather, in quiet nooks in the suburbs. When the varied materials which compose this mighty voice are considered, the mind becomes bewildered in the contemplation of what for more than 2,000 years has been constantly increasing, and now includes the mingled tones of nearly 3,000,000 of people. What rolling of carriages, what clattering of heavily-harnessed horses, aid in the huzzah! The measured tread of a detachment of police, the marching and counter-marching of soldiers, the footsteps of thousands, the hum of schools, the unceasing rattle of steam-engines, and the roar of furnaces, are amongst the details! Many evil voices are raised, but there is also a corrective agency at work, for preachers in churches and chapels, professors, and lecturers, are busy; and missionaries, who in certain districts are as greatly needed as they are in the Sandwich Islands, zealously labour, while lawgivers, judges, and magistrates, who dispense laws, and the crowd of council exercise their important functions.

The mallet of the sculptor: the more homely but useful working of the stonemason; the hammering of the carpenter, and the chipping of the bricklayer; even the quick tapping of the coffin-maker, all play their part in the city voices. Music and minstrelsy; the hoarse voice of street traders are there; in banks and counting-houses the chinking of gold adds a low but important sound. Go where you may, additions are made to the voice. Ten or twelve thousand machines of the half-starved Spitalfields silk weavers give a peculiar note. Bells toll, others ring joyful peals, and some send forth old-fashioned tunes; so great, however, is the roar of the city, that these cannot be heard when more than a few yards distant.

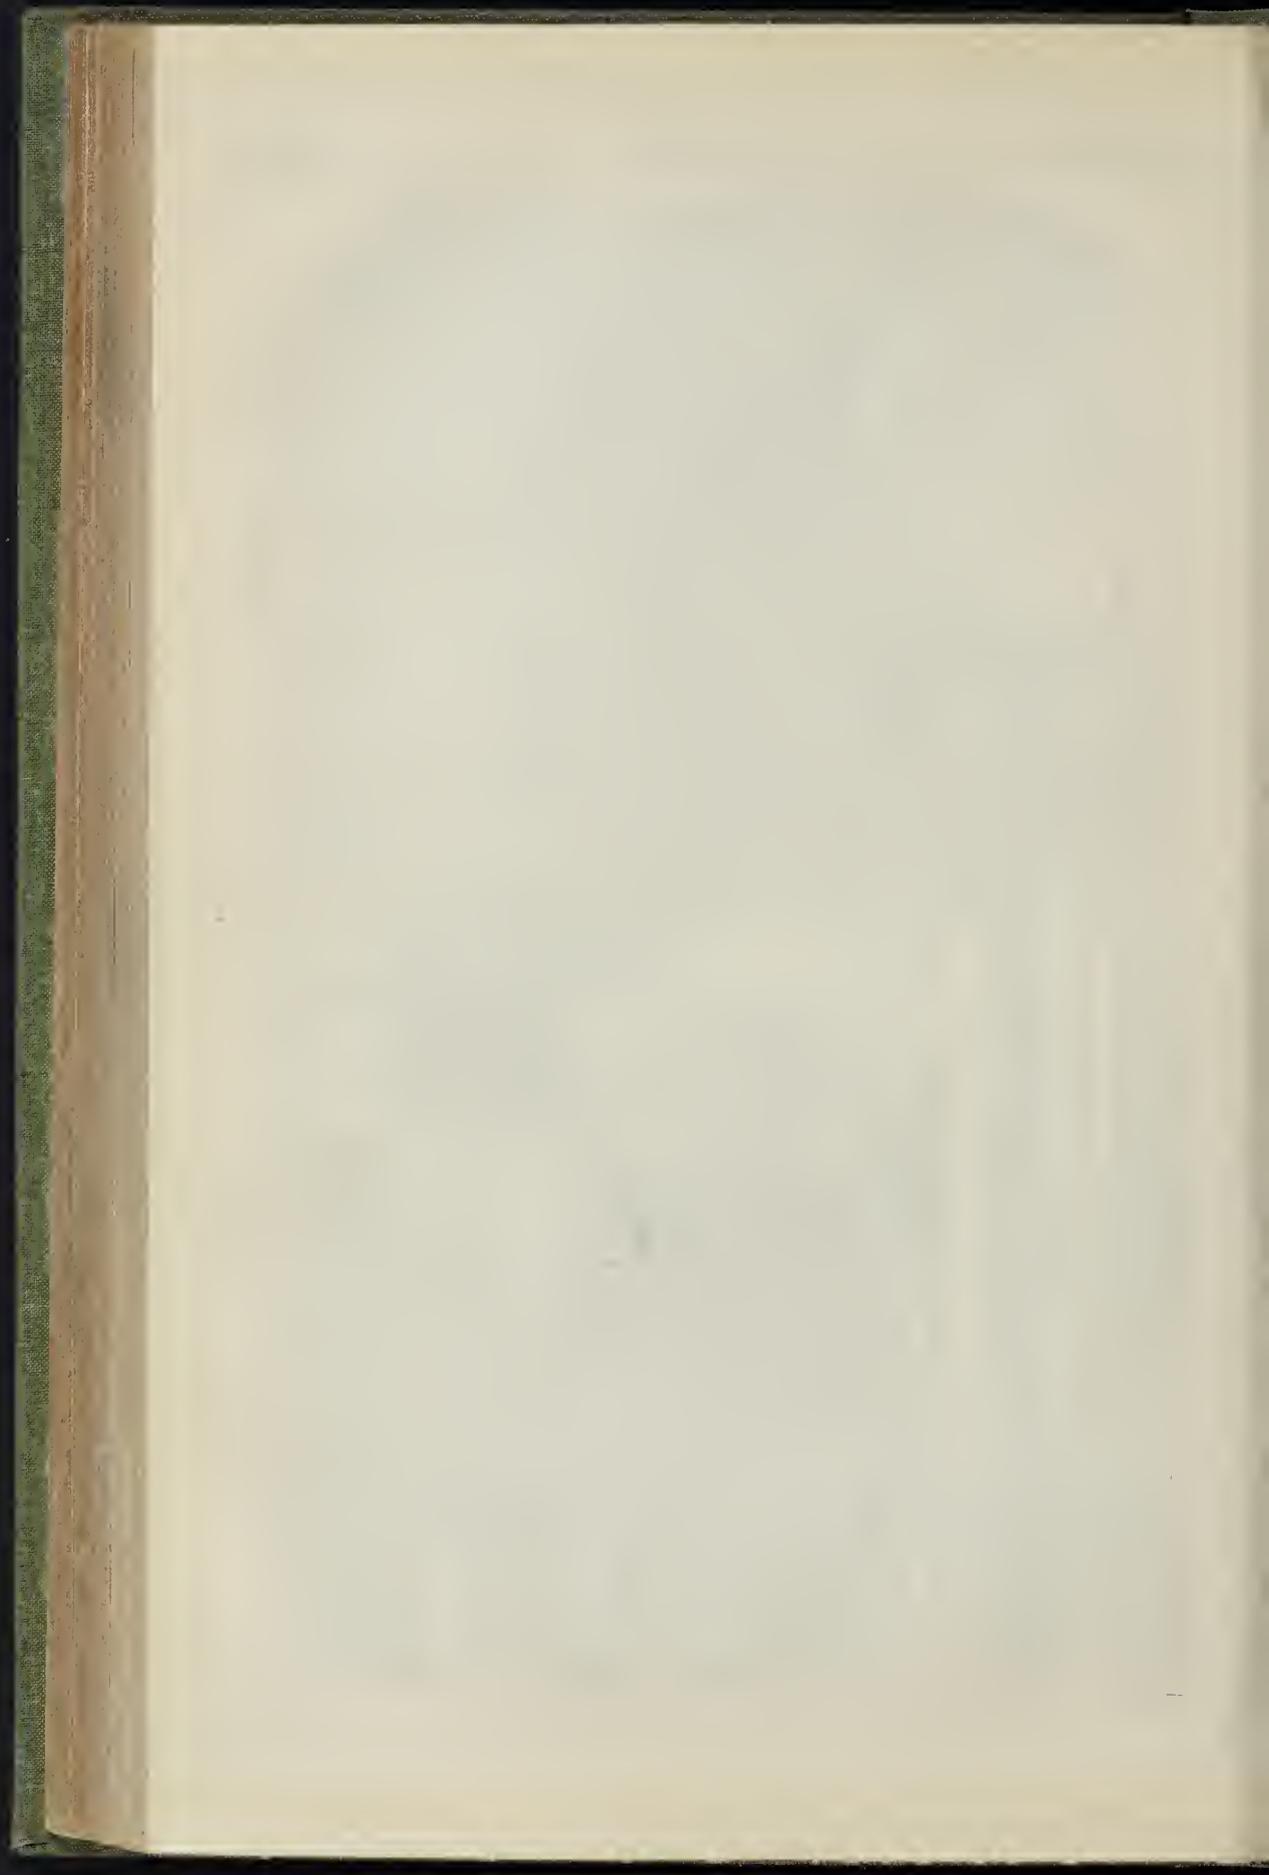

Memory goes back to many city sounds which contribute towards the general whole: the peculiar and rambling voice of madness; the compressed moan of suffering in hospitals; the lamentations for those who every hour die in this vast hive. There are, however, more pleasant suggestions in it. The language of most civilized nations and the music of sunny lands may be detected. In a street in Bloomsbury, a few hours ago, we heard the peculiar note of the Italian bag-pipe. Soon a group of shepherds of the Abruzzi came in sight, performing the dance of their native district. Singular was the contrast with all around: dusky black hats, trimmed with scarlet ribbons, glittering silver crosses and other ornaments; closely-fitting coats of sheepskin, with the hair turned outwards; knee breeches of bright glossy green, like the breast of the peacock; goatskin wallets and water-bottles; the legs covered with leathern sandals; the primitive bag-pipe, formed of goatskin, together with swarthy countenances and coal-black hair, presented a curious picture, the more remarkable from the circumstance that the costume has remained unchanged for more than a thousand years. The old Romans, whose effigies are in the Museum hard by, have listened to the same piping; and so the past is wedded to the present; and a note of sound, one component of the mighty voice of London, suggests a long train of thought, and makes the world populous with the dead.

#### THE PUBLIC PARKS, NEW YORK, U. S.

MR. CALVERT VAUX, formerly of London, now architect to the public parks at New York, in a private letter says that "the park is quite a popular affair already, 40,000 or 50,000 people visiting it every fine Sunday, even in cool weather. We have fortunately secured another half-million pounds for it this last winter. It has already cost one half million; but this has resulted to a considerable extent from the streets all round being at inconvenient levels, and from the great quantity of rock everywhere. The park is 2½ miles long, and half a mile wide."

THE OXFORD UNIVERSITY MUSEUM; VIEW IN THE COURT.

CHURCH-BUILDING NEWS.

**Ipswich.**—The foundation-stone of Burlington Chapel has just been laid. The new chapel, according to our authority, the *Suffolk Chronicle*, will be identified with no particular sect. It is to be called Burlington Chapel, simply because it will stand in Burlington-road. A few years ago, this part of the town was the domain of market-gardeners. Now it is studded with houses and villas, and the builder is still superseding the gardener. The new edifice will be Italian in character, and built with red brick, with stone and white brick dressings. The external dimensions are 76 feet by 45 feet, and it is estimated to seat 360 persons, exclusive of galleries, which will not be erected at present. The plans also include school-rooms and vestries. The architect is Mr. Ribbans, the builder, Mr. Hunt, of Freston, whose tender was 1,059*l.*, and who has engaged to complete his contract by October next.

**Wivenhoe (Colchester).**—The wood-carving of the restored church, described on 16th June, was executed by Mr. Polley, of Wivenhoe, and Mr. Radburn, of William-street, Regent's-park.

**Loughton (Essex).**—The first stone of the new Baptist chapel was laid on Thursday, 7th instant, by Sir S. M. Peto, Bart., M.P. It is intended to accommodate about 350 persons. There are no galleries at present, but provision is made for them, should the increasing population require their introduction. The plan is a parallelogram, with curved approaches by twenty-one steps at the sides, which take you to the floor of the chapel, beneath which are school-rooms. The style is Roman Doric, on a rusticated base. The total cost of erection is to be 1,950*l.* The architect is Mr. William D'Oyley; the builder, Mr. Martin Page.

**Wallingford (Berks).**—The foundation stones of the Episcopal and Nonconformist chapels, in connection with the new cemetery, at Wallingford, have been laid by the mayor. The plans and designs, selected by the Board in competition, were prepared by Messrs. Woodman & Poulton, architects, Reading. The style adopted by them is the Early Decorated Gothic. Messrs. Orton & Child, of Reading, are the builders, and the estimated cost of the works, which they have undertaken to complete in six months, is a little under 2,000*l.*

**Bristol.**—The foundation stone of a new Congregational church has been laid at Redland-park. The edifice will be erected on the north side of the nursery-ground which lies to the right of White Ladies'-road. The architecture will be in the Early English style, and will be simple in design. The material used is to be blue lias, with freestone dressings; and, by way of variety, a deep red sandstone will be introduced. The church will consist of a nave, and north and south aisles, with a transeptal recess in the north aisle, in which will be placed a Scandinavian organ. The length of the nave will be 73 feet, and the width, with the aisles, 48 feet, besides small transeptal projections to the aisle. The nave is to be 26 feet 8 inches wide, and 50 feet in height. The edifice will be lighted by a clerestory round the aisles. Sitting accommodation will be provided for 520, and it is intended at some future time to add an end gallery. The pillars in the nave will be octagonal in form, and of blue Pennant stone, with carved freestone capitals. The tower, which will be 16 feet square, and which, with the spire (of slate), is to be 141 feet in height, is intended to be placed at the west end of the south aisle. The estimated cost of the whole, including the purchase of ground and all extras, is 4,200*l.* The architects are Messrs. Fripp & Ponton, of Bristol; mason, R. Wilkens; carpenter, D. Jones; plasterer, C. Hill; plumber, H. B. Osborne.

**Barbourne (Worcester).**—A new church is to be erected at Barbourne, near the Crown Inn, on the Droitwich road. The edifice is to be in the Early English style, and will accommodate about 500 persons. It will have a chancel, nave, aisles, vestry, entrance-porch, and tower. The entire length is 125 feet; and from the ground to the top of the pinnacle on tower, 120 feet. The east and west windows will be of three and four-light trifoliated lancets, with quatrefoils and tracery, the masonry of grey Aylevie stone, and the windows in the side walls will be combed lancets: there is to be also a range of clerestory lights, deeply recessed. Four pointed arches divide the aisles from the nave. The porch is on the southern side, opening into the aisle. Minton's tiles will be used in the chancel. The walls are to be constructed of Hadley stone, presented, according to the *Worcester Herald*, by Mr. T. G. Curtler. The church is to be covered in by the 1st of next May,

and the whole work completed by the 1st of August, 1861.

**Holmer (Hereford).**—The ancient church of Holmer, one mile and a half north of the city of Hereford, on the Leominster road, has been restored. The work of restoration has been executed from the designs and under the superintendance of Mr. J. H. Evans, of Hereford, architect. The chancel not being under the control of the parish, that part has not been touched. The expense of the improvements has been almost wholly met by voluntary contributions. The school cost 480*l.*, of which 208*l.* was a grant; and the cost of the restoration of the church is about 330*l.*, of which only 50*l.* has been supplied by a church-rate. Exclusive of the chancel, accommodation has been thus provided for 223 persons in the nave, and 50 in the gallery; total, 273. The woodwork has been executed by Mr. Mason; the stonework by Messrs. David & Philip Pritchard; the stone carrying by Mr. P. Pritchard; and the colouring by Messrs. Savory & Son.

STAINED GLASS.

**Chester.**—A stained-glass window has been lately fixed in St. Peter's Church, Chester. It is the gift of the Rev. John Watson, the rector. The window is divided into four compartments, each containing a group illustrating the following subjects:—The Miracle of our Saviour at the Marriage Feast; Feeding the Multitude; the Woman taken in Adultery; Martha and Mary. They are fixed in a geometric form, surrounded with ornamental scroll work, of the Early English period. The rector, according to the *Chester Chronicle*, has fixed upon subjects for the same side of the church, illustrating the entire life of our Saviour. The window just fixed has been executed by Messrs. J. A. Forrest & Co., of Liverpool, the same firm who executed the window in the church at Chester Castle.

**Ripon.**—There has been inserted in the third large Perpendicular window, on the south aisle of the nave of Ripon Cathedral, a window of stained glass, "to the memory of the Hon. Caroline, wife of Charles Thomas Longley, successively Bishop of Ripon and Durham, who died in 1858." The window was purchased by subscription. There are three large figures, representing Faith, Hope, and Charity—the last of which occupies the centre light. Messrs. Hardman, of Birmingham, were the artists.

CURIOSITIES OF LEARNED SOCIETIES.

In the rooms of the different societies in the metropolis there are matters of curious interest, which, although well known to members and their friends, are not visible to the masses of the community. For instance, in the apartments of the Royal Academy, there are the diploma pictures of the Academicians since the foundation of that institution. Some of these are certainly not worthy of the masters, but, taking them as a whole, they present many characteristics which repay study. In the rooms of the Society of Antiquaries there are many rare objects, which are seen but by few. At the Royal Society, in Burlington House, there are some choice matters, which have a world-wide interest. There are, for instance, the sun-dial cut in stone by Sir Isaac Newton's own hands, and the first reflecting telescope, which was also fashioned by the skilful hands of the great philosopher. The electrical machine of Dr. Priestley, of Birmingham, has been recently added. The mace presented to the Society by King Charles I. was long supposed to be the mace of the House of Commons ("the bauble"), which Oliver Cromwell ordered to be taken away. There is a fine collection of portraits.

THE PRESENT HIGH PRICE OF PROVISIONS.

THE present prices press very heavily on the workman. Great meetings on the subject have been held at Bristol and elsewhere. Many have blamed the dealers, both wholesale and retail, for causing the present extraordinary increase in the price of butcher's meat, and recommended that we should go back to plans which were once resorted to for the purpose of preventing "forestalling" or the trimming of the markets. It is clear, however, that in these days of competition, provisions will find their true market value, and that such proceedings would be of no avail. The lambs have perished this season in consequence of the inclemency of the weather, and cattle have died in vast numbers for want of fodder and from disease caused by the flooding of the land. In short,

the demand for butcher's meat is greater than the supply. For some time past, even in good seasons, this evil has been apparently on the increase. The subject, therefore, requires careful consideration how to obtain increased supplies from abroad, and also how best to increase and economize the quantity produced at home. The population is constantly increasing, and in times of prosperity great quantities of animal food are consumed. It is reported, too, that from one cause and another the English stock is falling short. Amongst the reasons given for this is the practice of killing animals at an early age for the market, and so preventing the proper extent of breeding. This is worthy of thought. An endeavour should be made to save as much as possible. At present, one-third of the nutritious portions of animal food used by the families of the working classes is wasted; while, in the kitchens of the rich, a great saving might be made, which would be of the greatest advantage to the poor, if rightly applied.

TO ASCERTAIN WEIGHT OF LEAD, &c.

"ONE of the Profession" asks (p. 355) for a means of ascertaining the weight of lead, glass, &c., without weighing them in scales. The following tables will assist him in doing so, the only instrument required being a pair of callipers.

As the same method can be applied to materials of all kinds, I will give the formula for logarithm calculation.

Taking the specific gravity of lead = 11.35, Weight of cubic foot of water = 62.5 lbs., Weight of cubic foot of lead = 709.4 lbs. =  $w$ ,  $t$  = thickness of lead in parts of an inch,  $n$  = number of lbs. in a square foot of lead of thickness  $t$ .

Then,  $w : n :: 12 : t$ ;

or,  $t = \frac{12 \times n}{w}$ , taking the logarithm of both sides,

we have  $\log. t = \log. 12 - \log. w + \log. n$ , which gives the value of  $t$  for every value of  $n$ .

No. of lbs. in square foot of lead,	Thickness of lead, parts of 1 in.
4 lbs. ....	.008, rather more than $\frac{1}{16}$ in.
5 lbs. ....	.065, " " $\frac{1}{16}$ in.
6 lbs. ....	.10, " " $\frac{1}{16}$ in.

E. WYNDHAM TARN.

M. T. Gerard, of Paris, has sent us a sketch of a small instrument in use there, to ascertain the weight of lead, which indicates the half-tenth of a millimetre.

THE LABOUR MARKET IN THE PROVINCES.

MARRIAGE still continues in a very unsettled state. The *Chester* joiners have struck for an advance of 2*s.* a week, except those of late receiving 1*l.* 5*s.*, who demand 1*s.* advance.

The *Gloucester* horse-nail makers are on strike for an advance of 3*d.* per 1,000. An advance had been already made a few months since. The wages of good and steady workmen, it appears, were 2*s.* throughout the year.

At *Hereford* there is a partial strike amongst the masons and bricklayers, for a reduction of hours from 10 to 10, and from five o'clock to four on Saturdays.

At *Leeds*, a strike of Joiners for an advance of 2*s.* a week has just terminated, by the masters agreeing to the demand. The stonemasons, however, have given notice that they will strike work on 2d July, unless certain concessions are made to them. They want the hour for commencing work on Monday mornings to be altered from six o'clock to seven. They also object to sub-contracts, and make certain propositions in reference to the erection of sheds and piece-work.

The *Bradford* dispute remains somewhat in the same position as when last alluded to. The largest employers are without workmen, 250 masons having now left their employ. The operative masons' committee allege that nearly all the men who turned out have got work either in town or elsewhere; but the local *Observer* states that the largest and most important works there are still deserted. The associated employers have resolved to offer the men an advance of 1*s.* per week on the present wages of 2*s.* and 3*s.* per week, and a reduction of two hours' labour on Saturday, in place of the terms sought, viz., a reduction in the time from 57 to 54 hours per week. The operatives' committee, however, reply that they will be content with nothing less than a reduction of one hour per day and the same wages. At the

Books Received.

*Things not generally known familiarly Explained. Curiosities of Science. Second Series. A Book for Old and Young.* By JOHN TIMBS, F.S.A. London: Kent & Co. Paternoster-row. 1860.

THIS is certainly one of the most curious and interesting of all the many curious and interesting books of that great book-producer, Mr. Timbs. Moreover, there is less of mere extract, and more of judicious and skilful compilation in it than in some of those which have preceded it from the same indefatigable source. We shall avail ourselves of its curiosities (chiefly chemical) on this occasion to an extent rather unusual with us in dealing with mere curiosities in our crowded and professional pages; but the interest of such a subject as the curiosities of science will, we hope, excuse us with those of our readers who grudge the space thus filched from subjects more immediately practical or professional.

Floating bricks must have been a curiosity of science not by any means out of our way.

"Bricks which floated on water are mentioned by Posidonius, Strabo, and Vitruvius Pollio, as having been made of an aluminous earth found in Spain, for building, on account of their lightness. Pliny also mentions a pumice-like earth possessing these properties. In 1791, Giovanni Fabroni formed floating bricks from a silicious earth, found at Santafiora, in Tuscany; they were also such bad conductors of heat that they might be held by one end in the hand while the other end was red hot; and similar bricks have been made from the silicious earth dug on the borders of the Spree, at Berlin; whereas floating bricks were hitherto thought to be 'wonders of the ancients.'"

Malleable glass is another curiosity of science quite in our way; although, doubtless, the glaziers would demur to its introduction into practical existence and utility, at least for window-panes:—

"Malleable glass was made in old Rome; and in the reign of Theodosius a Roman artist had, according to Pliny, his house demolished,—according to other writers he was beheaded,—for making glass malleable. The idea of discovering the secret was only ranked second to that of the philosopher's stone among alchemists; but in 1845, there is stated to have been discovered at St. Etienne, in France, the means of rendering glass as malleable when cold as when first drawn from the pot. The substance, silicon, is combined with various other substances, and can be obtained opaque or transparent as crystal; it is described as very ductile and malleable, neither air nor acids acting on it."

Mr. Timbs should have mentioned here, while speaking of the alchemists, that the agent wherewith they professed to transmute metals into silver was the very same substance wherewith they professed to transmute glass into malleable glass. It would have also been worth while to say, for behoof of those who do not know the fact, and as another curiosity of science, that silicon, wherewith the modern malleable glass is alleged to be made, constitutes the very basis and essential element of all ordinary glass itself, only stripped of its oxydous or vitrifying nature. It is very much to be doubted, however, whether malleable glass has as yet been made in recent times,—if indeed it was ever made at all.

While on this subject, and especially considering the contention of the alchemists with malleable glass, the formation of which involves the very principle of transmutation, although glass is known to be compound, while metals are as yet by chemists treated as (though not believed to be) elementary,—we may here remark that one of the most curious and interesting portions of Mr. Timbs's new hook is that which treats of alchemy, with which (historically speaking) he displays no inconsiderable acquaintance. He also quotes Faraday, Liebig, Draper, and other modern chemists, in favour of the principle of transmutation, and would have materially enhanced this curiosity of science, had he also quoted Davy on the subject. There is one little inconsistency, however, which we cannot help here drawing his attention to. On page 8 he says,—"Yet, although the existence of the Stone was regarded for centuries as an established truth, no one possessed it; each adept only maintaining that it was in the possession of another." This, we are quite aware, is the usual hackneyed modern opinion on this curious subject, like that other totally mistaken idea as to the much misrepresented alchemists, that they were all visionaries in search of a transmuting agent, whereas, unless they were the most unaccountable and extraordinary liars in existence, many of them—indeed, all of them entitled to be called alchemists—already possessed it. However that may be,—that each adept did not merely maintain that it was in possession of another, as Mr. Timbs remarks, he himself affords more than sufficient evidence within the next few pages. Thus, on page 10, we are told that Pope John XXII. "professed and described the art of transmuting metals, and boasted that he had made two hundred

ingots of gold, each weighing a hundred pounds;" and on page 11 we are informed that Sir George Ripley "pretended to have discovered the secret." The question here, of course, is not whether these and other alchemists alluded to really did transmute the metals,—a question we do not mean to take the trouble to enter into,—it is merely a question of whether alchemists really never alleged that they themselves had transmuted metals. It is curious, in the midst of all the historical knowledge on this subject displayed in the volume before us, that the evidence of Helvetius in favour of transmutation—evidence which those inclined to disbelieve in its possibility rightly regard as the toughest of all to tear up—does not appear to have come under the author's notice. Moreover, Helvetius was also one of those who expressly declared that he had himself transmuted metal into gold. But enough of this very equivocal and (at least at present) by no means practical subject.

There is another stock curiosity of modern science, however, having reference to the old chemists, and to very erroneous modern ideas as to their ignorance, which our eye has just caught sight of in the vicinity of Mr. Timbs's alchemical region, and to which it may be worth while for a moment to advert.

On the subject of "The Great Discoveries of [modern] Chemistry," it is stated, on the authority of Dr. Neil, that—

"A century ago no person on earth knew that there existed in nature the substance which, since Dr. Priestley's discovery of it in 1774, has been named oxygen."

Now, before showing the error of this, we would wish to make one or two preliminary remarks. The substance which has been named oxygen is that appreciable, and even weighable, though invisible agent which, for example, combines with metals in the fire, and reduces them to oxides, calces, or glasses. It is, by the way too, another and cognate error, in modern scientific conceit, that "a century ago" no one knew that the calces of metals were anything but the elementary and indecomposable bases of metallic substances themselves. All old chemists, it is alleged, supposed the metals to be composed elementarily of such calces, and of another substance which gave them metallic lustre, and which the fire only drove off in calcining the metal.

How nicely, then, does the following little quotation, which we take from Van Helmont's work "Concerning the Macrocosm, or Great World," dispose of both of these vain-boasting and most erroneous "curiosities" of modern science:—

"When we turn 100lbs. of lead into minium, or red lead, we find that the said 100lbs. are augmented 10lbs. viz. when the calx of lead is ground to powder, and afterwards exposed to a small fire, the lead borrows part of its weight from the fire in which it was calcined, and part from the water in which it was ground; and each of these two severally, and both of them jointly, do help to turn the case melting lead to glass; because THE FIRE is naturally and easily reduced to a body in lead, by which means it also turns all other things into glass. But, when the lead is exposed to a greater heat in a strong fire, it is forced to leave it, vitrifying part behind, viz. the aforementioned 10lbs., which from the fire and water were separated to it, and, consequently, turns to a metal as it was before."—P. 109 of English translation, of 1661, from the High Dutch, by "A Hollander."

The ignorance of our forefathers constitutes a stereotyped and very generally credited curiosity of science in our own conceited and fast generation; but there are still more recondite curiosities of science, as we thus see, into which a little deeper investigation and insight into its actual truths, ancient and modern, could speedily initiate us, would we only take the trouble.

We had marked for extract or comment various other of the many interesting and suggestive *bon-hous* presented to us by Mr. Timbs in the present curious little volume; but our space is exhausted, and all we can further do is strongly to recommend the work itself to the leisure moments of our professional and other readers, as one sure to repay tenfold both the cost and the trouble.

VARIORUM.

"Notes on North Italy and the Seat of War, in 1859," by the Rev. G. T. Hoare is the title of a brochure published by Aylott & Son, containing the substance of letters written last year in the vicinity of the scenes they describe.—"Shall Gothic Architecture be denied fair play?" heralds in some thoughts suggested by reading a pamphlet entitled, "Remarks on a National Style, in reference to the proposed Foreign Office." Like that to which it replies, it is issued by Messrs. Bell & Daldy. It is coolly and clearly written, but we do not find that it brings much that is new into the discussion. The writer quotes mainly from Mr. Scott's Academy lectures.

Miscellanea.

FEMALE SCHOOL OF ART.—The distribution prizes and rewards to the students of the Female School of Art and Design took place at the South Kensington Museum, on the 14th instant, under the presidency of Mr. Radgrave, R.A. (in the absence of Earl Granville, the Lord President of the Council). A large number of visitors were present, the majority being ladies. The chairman, in addressing the company, remarked that the school might be considered a great success; and the mode in which the prizes were awarded contributed in some respect to promote that success. A new phase, however, was now arriving in its career. The Government had hitherto provided a home and residence for the institution, and it was now thought advisable to place it on the same footing as other schools, and make it self-supporting. Subscriptions were, therefore, being raised to build a school for the purpose, and a committee were making the most active exertions to accomplish that object. The Royal Academy had responded by a gift of 50*l.*, and he believed there was every desire to support the institution, if its objects were only properly brought under the notice of the public. The largest number of medals awarded by the committee of this school was thirty, and there were now to be twenty-six recipients, whilst in the preceding year there were twenty-five. The winners of national medallions were not quite so numerous as last year. They were then four: they are now only two. The present was the last occasion on which they would assemble under the auspices of the Government; and on Thursday, the 21st of June, a *conversazione* would be held in the Museum for the purpose of raising a fund for erecting the building for the Female School of Art. The prizes were then awarded.

THE DRINKING FOUNTAIN MOVEMENT.—A drinking-fountain has been presented by Mr. Alderman Fisher, of Sheffield, to the Free Library there. It consists of a polished white marble basin, with mouldings, and with rim enriched with wreaths of flowers deeply incised. The back also is of white marble, the design being a carved shell surmounted by an arch of raised conventional flowers. The water spouts from the rolled head of a young fern leaf, also somewhat conventionally treated, and the whole is set in a frame of polished Aberdeen granite. The design was furnished by Mr. Godfrey Sykes, once a pupil of the local school of art, and it has been carved by Mr. T. Fidler, at present a pupil in the same school.

DRINKING FOUNTAIN, HYDE-PARK CORNER.—The drinking-fountain in front of St. George's Hospital, already alluded to, is completed, and has been in use during the last week. It is of stone, and has an Italian *Lavabo* character. The top is of pedimental form, surmounted by three small vases. There is a flat semi-circular-headed sinking in the face of the erection, and within this, against the back, is a group of burlesques, in bronze, proceeding out of a mass of rock-work. From the leaves of the rushes, in two places, the water runs, and is received in a large marble shell. Below there is a dog-trough. The design is ascribed to Mr. Westmacott, R.A.

MONUMENTAL.—The municipal council of Brest voted the erection of an equestrian statue of the Emperor Napoleon III., in the public square of that town, but in reply to an announcement of that intention the Minister of the Interior received a letter from the Emperor, to be transmitted to the mayor of Brest, in which his majesty points attention to the fact that in general equestrian statues are only erected to sovereigns after their death, and that it was, in fact, proper that such popular homage should not have the appearance of a transitory flattery, but be a permanent impression of gratitude. "If the erection of an equestrian statue at Bordeaux, two years ago, was permitted," adds the Emperor, "it was because I was ignorant of the design, and it was done without my sanction or authorization."—At Novogorod, in Russia, a monument is about to be erected to commemorate the thousandth anniversary of the existence of Russia as a state. The construction of the pedestal at an expense of 75,000 roubles has already been contracted for, and the monument, in cast-iron, and which had been designed by M. Mitjeshine, is to cost 230,000 roubles. In addition to that sum the government is to supply the metal, of which 4,000 poods (the pood is nearly 3*½*lb.) will be required.

SOUTH KENSINGTON MUSEUM.—On Tuesday last, on the motion of Mr. Lowe, a select committee of the House of Commons was appointed "to inquire and report concerning the South Kensington Museum."

VALUABLE

WORK OF REFERENCE

CONDUCTED BY

CHARLES KNIGHT.

This day is published, price 12s.

THE FOURTH VOLUME OF THE

CYCLOPEDIA OF ARTS AND SCIENCES.

This Volume extends from the beginning of the letter "F" to "Ji" and contains, among numerous other Articles:—

FALLOW; HOMESTEAD. By C. J. MORRIS.

FORTIFICATION AND GUNNERY. By the late JOHN NARRIEB, of Sandhurst College, and Captain DONNELLY, R.E.

FRESCO PAINTING; GLASS PAINTING; GOTIC, GRECIAN, INDIAN, and ITALIAN ARCHITECTURE. By JAMES THORNE.

GALVANISM; HYDROSTATICS. By C. TOMLINSON, Lecturer on Natural Science to King's College School; and HEAT, by the late R. MURPHY and C. TOMLINSON.

GAS; GAS LIGHTING; GASOMETRIC ANALYSIS. By E. FRANKLAND, Ph.D., Lecturer on Chemistry at St. Bartholomew's Hospital.

GAS MANUFACTURE. By G. R. BURNELL, C.E.

GEODESY. By the late Rev. R. MURPHY; T. GALLOWAY, Actuary of the Amicable Insurance Society; and R. GRANT, Professor of Astronomy in Glasgow University.

GLASS MANUFACTURE. IRON MANUFACTURE and TRADE. By GEORGE DODD.

GRAVITATION. By G. B. AIRY, A.M. Astronomer Royal.

GREAT CIRCLE SAILING GROUND TACKLE; GUN BOATS. By S. M. SAKBY, of the Devonshire Instruction Ship, Sheerness.

GYMNASTICS. By ROBERT DIXON, M.D.

GYROSCOPE. By the Rev. CHARLES H. TOMLINSON, Worcester College, Oxford.

HAIL and HAILSTORMS. By E. W. BRAXLEY, F.R.S.

HERALDRY. By J. R. PLANCHE, Ronge Croix Pursuivant, Herald's College.

HEROGLYPHICS. By SAMUEL BIRCH, British Museum.

HOROLOGY. By JAMES BREESE and GEORGE DODD.

INVENTION AND DISCOVERY; FLUXIONS; INVOLUTION AND EVOLUTION. By A. De MORGAN.

INTERFERENCE (IN OPTICS). By G. G. STOKES, A.M., Lucasian Professor, Cambridge.

\* \* \* This, the 4th, Division of the ENGLISH CYCLOPEDIA finishes the Work, and is published in Monthly Parts, price 2s. 6d.; and in Volumes, price 12s. each. It will be completed in Eight Volumes.

London: BRADBURY & EVANS, 11, Boulevard-street, E.C.

MR. T. Y. KIMPTON, ARCHITECT and SURVEYOR.

2, ADAM'S-COURT, OLD BROAD-STREET, LONDON, E.C. Disputed accounts speedily adjusted. Architects' works measured and valued. Estates surveyed and mapped. Designs, working and detail drawings, maps, plans, tracings, perspectives, and professional assistance generally. Lithography, artistic and commercial, with despatch.

MR. WILLIAM ELLISON, CONSULTING SURVEYOR, late of STAINSBY ROAD.

Has taken Office at 13, FENCHURCH-BUILDINGS, FENCHURCH STREET, E.C. Where he continues to advise BUILDERS ON BRANCHES OF CONTRACT DISPUTED ACCOUNTS, &c.

MR. BITTLESTON, ARCHITECT and SURVEYOR.

37, Wakefield-street, Row's-square, W.C. Designs, Plans, Perspectives, and Competition Drawings, prepared on moderate terms: Surveys, Estimates, and Builders' Accounts arranged, Tracings, Mapings, and professional assistance generally. Office hours Ten till Four.

WRITINGS COPIED.—ENGINEERS', ARCHITECTS', and BUILDERS' SPECIFICATIONS, and every description of Technical and Scientific Writings, neatly and accurately COPIED, at 1d. per folio of twenty-two lines. Twenty per Cent. Discount for Cash.—WILLIAM LONG, Law Stationer, &c., 58, Carey-street, W.C.

TO JOINERS, BENCHMEN and FIXERS and BRICKLAYERS. A DOZEN MEN in either of the above Branches may obtain IMMEDIATE and CONSTANT EMPLOYMENT by applying to W. WILLICOMBE, Builder, Tumbidge Vale, at advanced country rates.

AN Architect and Surveyor, in the City (a member of the Royal Institute), has a VACANCY for a Pupil. Amount of premium a secondary consideration.—Apply, A. Z. Mt. Stanton's, No. 91, Old Broad-street, City.

CLERK of WORKS.—The Bazaar Bazaar Board will, on the 23rd inst., proceed to the ELECTION of a CLERK of WORKS, at a salary of £7. 2s. per week.—All persons intending to apply for the appointment, are requested to send their applications, with testimonials to the effect intended. By order, SAMUEL HALL, Clerk to the Board. Bazaar, near Manchester, June 14 1860.

TO BUILDERS' FOREMEN. MESSRS. SHOPEE & SON, Builders, 10, Upper-street, near the Royal Exchange, London, E.C., have pleasure in stating that they are desirous of employing FOREMEN, to superintend their Carpenters and Joiners' Work. No one need apply who has not acted in a similar situation, and satisfactory testimonials and references will be required.—Address, by letter, stating age, terms, and references, to Messrs SHOPEE & SON, Builders, Upper-street, Middlesex.

THE TOWN of BURTON-UPON-TRENT ACT, 1853.—WANTED A MANAGER of GAS-WORKS.—In consequence of the death of the late Manager, the Commissioners under the above Act are in want of a duly-qualified person to undertake the SOLE MANAGEMENT of their GAS-WORKS at Burton-upon-Trent. The party must be fully conversant in superintending the manufacture of gas, the laying of sewers and drains, the erection of retorts, the arrangement of fittings, the correction and repair of pipes, and all other necessary works and repairs in a gas-work establishment; and also to keep all necessary accounts of the receipt of gas, and to keep all other articles required for the use of the works, and the use of coke, tar, and every other material, together with all accounts at the Works. The register of the meters will be taken by the Collector; but the Manager will be required to give all necessary assistance and instructions to the Collector. Salary £200 per annum, with a comfortable house and garden adjoining the Works. Rent, rates, and taxes free, together with all reasonable expenses of coal and gas. Applications, in the handwriting of the candidate, together with testimonials of moral character as a manager, civility, and competency for the office, endorsed "Candidate for Office of Gas Manager," to be forwarded to me on or before THURSDAY, the 23rd day of JULY next, at 12 O'clock in the forenoon. Such parties as are deemed most eligible for the office will be informed of the time and place of election, and no person will be expected to attend unless requested by letter. The person appointed will be expected to commence his duties as soon as possible after the election.—By order of the Commissioners, WILLIAM COXON, Clerk. Commissioners' Offices, Burton-on-Trent, June 16, 1860.

WANTED, A PLUMBER. One who has the knowledge of gas-fittings preferred.—Apply to Mr. THOS. MOLLEY, Blomfield-st.

WANTED, by a Builder in the country, a Man capable of taking CHARGE of a small SAW-MILL, sharpening saws, &c.—Address, stating age, salary required, and to whom to apply, to "The Builder."

TO CARPENTERS and JOINERS. WANTED, in the Country, a WORKING FOREMAN in the above Trade. Also TWO or THREE experienced WORKMEN.—Apply to Mr. J. SANDER, Stationer, Walling-borough.

WANTED, a thoroughly experienced CONTRACTOR'S CLERK of WORKS, to manage a large Government contract in the West of England. None need apply unless fully conversant with plans and measuring, and can give satisfactory references.—Apply, stating age, salary expected, and where last employed, to G. R. C. Coling-place, Plymouth.

WANTED, as BRICKLAYER, PAINTER, &c. a Young Man with some knowledge as above, and to make himself generally useful.—Apply by letter, or otherwise, to the Wellington Nursery, St. John's Wood, N.W.

WANTED, immediately, THIRTY FREE-STONE MASONS.—Apply to Mr. J. GRIFFITHS, Builder, Newport, Monmouthshire.

WANTED, in an old-established BUILDERS' OFFICE, in Town, for a permanent, a YOUNG MAN who is thoroughly versed in accounts, book-keeping, time, and with a knowledge of estimating measuring up works, and the usual office duties. A liberal salary will be paid, and professional assistance given, to one who has filled a similar situation in a London firm. All communications to state age, salary required, and where last employed, addressed to "The Builder."

WANTED, in an Architect's Office (in the City, a clever and experienced DRAUGHTSMAN (in the perspective, and colouring indispensable). Salary, 100l. per annum.—Apply by letter, to Mr. R. Cotton, Paper Warehouse, in Wallbrook, City, E.C.

WANTED, a RE-ENGAGEMENT, as HOUSE or ESTATE AGENT, to collect rents and attend to repairs, by an experienced Joiner. First-class references, and security found, to any amount.—Address, G. E. O. 7, Hope Cottage, Cottage-grove, Bedford-road, Clapham, S.

TO CARPENTERS, ESTATE AGENTS, &c. WANTED, a RE-ENGAGEMENT, as GENERAL WORKING FOREMAN, or to have the entire management of a good Jobbing business. By trade a Joiner.—Address, G. L. 2, Terlington-place, Edgware-road, N.

TO ENGINEERS and IRONFOUNDERS. WANTED, by a respectable Young Married Man, a SITUATION as DELIVERY CLERK, TIMES PEPPER, or FURNACE-KEEPER, or both if convenient. Five years' experience, and good character.—Address, N. M. 1, Bloomfield-street, South Middlesborough, Kingsland, S.E.

TO DECORATORS, &c. WANTED, an ENGAGEMENT, by a Young Man of first-class experience in the various styles of decoration, to make designs, working drawings, and to execute the same, or to manage a business.—Address, N. B. Office of "The Builder."

TO BUILDERS and BUILDERS. WANTED, a SITUATION as FOREMAN or Three-brick Hand, in a good London Office. No objection to the country.—Address, A. B. 114, Hall-park, Paddington.

TO BUILDERS and CONTRACTORS. WANTED, by an experienced FOREMAN, with good references, an ENGAGEMENT as SHOP FOREMAN or otherwise, in a respectable London firm.—Address, A. B. 11, Union-terrace, Bagnigge Wells-road, W.C.

WANTED, a SITUATION, as JUNIOR CLERK, or IMPROVER, in an Architect and Surveyor's Office. The Advertiser has been three years in the profession, can copy and trace drawings, plans, &c. from sketches; colour copy age elevations, and has a little knowledge of land surveying and levelling.—Address, C. B. 2, care of Messrs. Vining & Son, 69, Barbican, London, E.C.

WANTED, a RE-ENGAGEMENT in the Office of a Builder, to keep men's time, book materials for extra and other works, measure joiners' work, keep the day and other books, &c.—Address, G. E. 10, 11, care of Messrs. Lucas, 10, Ryder-road, Lambeth.

TO ARCHITECTS and BUILDERS. WANTED, a RE-ENGAGEMENT, as CLERK of WORKS or GENERAL FOREMAN, by one who has superintended extensive works, in town or country. Good references given.—Address, R. W. 6185, Foreman of Works, Battle Abbey, Sussex.

TO PLUMBERS and BUILDERS. WANTED, a SITUATION as PLUMBER and GLAZIER. No objection to jobbing work, and to make himself generally useful.—Address, B. H. No. 33, Bressford-street, Waltham.

WANTED, by a respectable Young Man, a SITUATION in a Joiner's or Cabinet-maker's Shop. One who has served his time as a cabinet-maker, and wishes to engage himself for twelve months.—Address, G. L. 55, Harker-street, Chelsea.

TO BUILDERS. WANTED, a RE-ENGAGEMENT, as SHOP FOREMAN of JOINERS and CARPENTERS, by a thoroughly practical man, who has had experience in the first London Office, and is quite efficient in making joiners' working drawings. The country preferred.—Address, T. S. Mr. Collett's, Sunbury, S.W.

WANTED, by a Young Man, EMPLOYMENT as CLERK, in an architect, surveyor, house, or land agent, in a country town. Moderate salary.—Address, E. Z. Mr. Sibley's, News Agent, Union-street, East.

TO PLUMBERS, &c. WANTED, a SITUATION, by a first-rate PLUMBER, or as working foreman.—Address, B. F. No. 11, Ann-street, York-road, Lambeth.

WANTED, by a practical and confidential MILLWRIGHT, a SITUATION, in a millinery, mill work, stone, and foundry, and will be found useful to any employer.—Address, T. D. No. 7, Coburn-road, Colindale-square, Clerkenwell, London.

TO BUILDERS, ESTATE AGENTS, and CONTRACTORS. WANTED, EMPLOYMENT, by a steady, active Man, aged 25, a Joiner and Carpenter. Is a good fixer and an excellent scholar. Would be very useful on a building estate, or to an employer. Wages not so much an object as permanent engagement. Must be in town. Good references.—Address, E. D. 51, Charlotte-street, Whitechapel.

TO PLUMBERS and BUILDERS. WANTED, EMPLOYMENT, by a Plumber, Glazier, and Gas-fitter. No objection to fill up time in painting. Good wages wanted.—Address, "For a Plumber," 69, Henry-street, St. John's-wood.

WANTED, by a respectable Young Man, aged 20, an ENGAGEMENT, in a Builders' or other Office. Has been engaged for four years and is in the building line. Can give unimpeachable references to his former employers. Is an excellent bookkeeper and accountant. &c.—Address, A. M. E. 41, Saint Paul-street, Abington-square, N.

TO ARCHITECTS and SURVEYORS. WANTED, by an ASSISTANT, aged 27, articled at 15, who has been in several London offices, an immediate ENGAGEMENT. Has a knowledge of perspective, and drawing on quantities, &c. Terms for London, 25s. per week.—Address, R. H. D. 94, Dunsford-street, Notting-ham.

WANTED, by a middle-aged Man, a SITUATION as WORKING FOREMAN to a BUILDER, or in a hand jobbing shop. Can write a fair hand and keep books, or assist in the Office if required.—Address, W. G. Office of "The Builder."

WANTED, a RE-ENGAGEMENT, by a DEAGHERMAN (Gothic) just returned to town, in London, a twelve months' advance to Alfred Waterhouse, Manchester; and others to several London architects.—Address, M. M. M. Office of "The Builder."

WANTED, by a Young Man, who has received a good education, and has been engaged during the last six years in an ironmongery, a SITUATION as a BUILDERS' Office, or any other employment in which he might be useful. A very moderate salary required.—Address, H. D. care of Mr. Francis Cross, Architect and Surveyor, 21, Moorgate-street, E.C.

TO OWNERS OF STEAM-POWER. WANTED, by a steady, sober Young Man, a SITUATION to TAKE CHARGE of an ENGINE, &c. and to do general repairs. Good character.—Address, R. E. 7, Mount-place, Waltham-street, near the gate.

WANTED, by a House Decorator, a thoroughly efficient CLERK. He must be capable of measuring and taking out quantities. Unimpeachable references will be required.—Apply to M. & V. COOPER, Waltham.

WANTED, by a Young Man, an ENGAGEMENT in a Carpenter and Joiner's shop, as an IMPROVER. Has been four years in the trade.—Address, H. O. Post-office, Mulden-road, Camden-town, N.W.

TO ARCHITECTS. THE Advertiser, a Practical Designer, in business for himself, is willing to DEVOTE THREE DAYS IN THE WEEK in the Office of an Architect. Competition and other designs, working drawings, details, and perspectives prepared at his own office.—Address, S. Z. No. 5, Cellar-park, Gray's Inn-road.

TO ARCHITECTS and SURVEYORS. THE Advertiser, who has just completed his studies with a London estimating and measuring surveyor, is desirous of an ENGAGEMENT in either of the above Offices. Salary not so much an object.—Address, H. V. Mr. Reed's, 5, Great Portland-street, W.

TO BUILDERS.—FRENCH POLISHING done on the most reasonable terms, in town or country. Men employed by the day or job. All orders immediately attended to. W. REMAN, No. 24, St. Pauline-place, St. Pancras-road.

CHURCH FITTINGS FOR SALE.—The whole of the Pews and Seats in a modern Church to be SOLD. They are in most excellent condition, and suitable for Church or Chapel. For a very moderate sum a congregation may supply themselves with Seats and Pews of the best description.—Apply to Mr. MEAD, at the Mills, Wakefield-street, Regent-square, Glyn's-lane-road, Prince of Wales-road, Kenton-town.

TO BUILDERS, PUBLICANS, and OTHERS.—TO BE SOLD, a quantity of 4-inch MOLDED MACHOGANY SHAPES, with Double Elliptic Heads, glazed with Plate-glass, 6 feet by 4 feet 6 inches, and 6 feet by 3 feet 3 inches; 1 1/2-inch MOLDED LETTING SHUTTERS, with Lanes and Weights complete, Slided Linings and Moulded Racks. Also, two pairs of DOORS, of Mahogany and Plate-glass, 7 feet 6 inches by 4 feet, and 6 feet 6 inches by 4 feet 10 inches, and Panights 18 feet high; all in excellent condition, and suitable for a first-class public-house.—Apply at No. 7, Abchurch-lane, Prince of Wales-road, Kenton-town.

NO SHUTTER BARS.

JENNINGS'S SHOP SHUTTER-SHOE. SHOP SHUTTERS are SHOD and SECURED by the above, at HALF THE COST OF THE USUALLY AND DESTRUCTIVE SHUTTED PARTS. In every public-house in London. When ordered the above, send FINISHED THICKNESS OF Shutters, and the way they go up. Sold at all Sawyers and the Inventor. GEORGE JENNINGS, Sanitary and Engineering Dept., Holborn-street, Blackfriars-road.

SOLID PARQUET FLOORS. ARBORN SMITH'S PATENT. From 1s. per foot, in various woods. 1-inch thick, grooved, tongued, and k-yed together, not separated. For Halls, Staircases, Corridors, Reception-rooms, Libraries, Billiard and Billiard-rooms, Picture Galleries, Parlours, Dining-rooms, Bay Windows, Chancels of Churches, &c. SROW ROOMS, 30, New-street, W.

NOTICE OF REMOVAL.—ROBERT WARD & SON, Timber Merchants, beg to announce that their business at 5, CORNHILL, IS REMOVED to their YARD, 101, BERMONDSEY NEW ROAD, near Bricklayers' Arms, S.E. where will be found a large assortment of mahogany, timber, and deals, English timbers, &c.

WILLIAM GORTON, PATENT STEAM SAWING, PLANING, and VENEERING MILLS LETTS' WARE, COMMERCIAL-KNOX, LAMBETH. The proprietor is prepared to enter into arrangements for sawing, planing, and veneering timber, every description. Extensive yards for stacking and drying goods. No charge for rent, except by special arrangement. Veneers cut 24, 32, or 42 to the inch. Specimens and priced lists forwarded on application. GREATER REDUCTIONS.—Mahogany, 34, 24 Yellow Battens, 11s. 10s.; 1-inch White Flooring, from 14s. 9d.; 1-inch Yellow, from 15s. 3d.; 4 White, from 11s. 8d. Carriage free to any part of the Kingdom. T. FORMAN, 1, Walnut-tree-walk, and Valence-place, Lambeth.

BUILDERS and CARPENTERS, and OTHERS have submitted to their notice these very reduced prices, the lowest consistent with really useful quality. All sawn goods carriage free within three miles. 4-inch Flooring (well prepared), 11s. 6d.; 1-inch do. 12s. per square. Yellow Deals, sound and good, 18s. 10s. per 100, or 34d. per foot. Spruce Deals, 15s. 10s. do. do. Yellow Battens, excellent quality, 11s. 10s. do. do. Pine Planks, 47, 120, 20 by 11s. 21s. do. do. Seasoned Mahogany, plank and board, 6d. per foot. A very large stock, ready sawn and seasoned. ALFRED CARTER, Old Bethnal-green-road, N.E.

SEASONED WAINSCOT OAK. 30,000 in plank and board, sawn three years. E. BUTTERWORTH, ALUM-STREET, TIMBER-YARD, MANCHESTER.

ALFRED ROSLING & SONS, beg to inform their Customers and the Building Trade generally, that they are enabled to allow a discount of 15 per cent upon their Last Prices for Woodings. A large stock of Dry Flooring at low Prices. Southwark-bridge Wharf, Bankside, S.E.

TO ARCHITECTS, ENGINEERS, AND SHIPBUILDERS. PATENT WOOD, or FIBROUS SLAB. DAMP PREVENTED, FIRE RESISTED. DECORATIVE PROTECTED, AND RESISTIVE HEAT SUBMITTED. All the COMFORT, ECONOMY, and SECURITY incident to these considerations are to be obtained by the use of the PATENT FIBROUS SLAB, in the lining, flooring, ceiling, and decoration of public buildings and dwellings of every class, however newly erected; as well as in the entire construction of all kinds of both permanent and temporary buildings; also to the lining of IRON SHIPS, so that the usual effect of sea damp which in all cases arises from the iron skin, may be prevented; and the excessive heat from engine room bulkheads "subdued." For samples, circulars, and all other particulars, apply at the Office, 133, Finchurch-street, London, E.C.

FOR SALE.—SIX WAINSCOT CASES. (old English design).—The Cases are 3 feet high, by 2 feet 8 inches wide, fitted with 4 drawers, from 24 to 5 inches deep, enclosed in doors, having sliding drawers on top, glazed with plate glass. Each case is complete in itself, nearly new, in first-rate repair, constructed to stand against a wall, and well adapted for showing fancy goods, mineral specimens, or such like. 4 cases, each 18 feet long, with 40 drawers in each. 1 do. 10 do. 25 do. Apply to JOHN WATKINSON & SONS, 8, Charlotte-place, Pall-mall.

NOTICE TO BUILDERS and PAINTERS.—Genuine White Lead, 31s. per cwt.; Linseed Oil, 2s. 2d. per gallon; Boiled Oil, 2s. 6d. per gallon; Turpentine, 3s. per gallon; Fine Pale Oak Varnish, 7s. 6d. per gallon; Dry and Ground Colour, Prussian, &c. at wholesale price. For cash, at G. COUPLER'S, Colour and Varnish Works, 37, Crosby-row, Walworth-road, S. Established fifty years.

TO RAILWAY COMPANIES, COLLEGE and IRON SHIPOWNERS, CONTRACTORS, &c. By H.M. ROYAL LETTERS PATENT—GREY MINUM PAINT, a new, economical, and permanent coating, to preserve iron from oxidation, and render it more durable than when galvanized. It is unaffected by climate, acids, salt water, &c. It does not run, filter, crack, or peel off; it is efficacious as an inner coating, for protecting iron in a core-iron. It will cover a larger surface than double its weight of pure red lead colour, and is found to be more permanent in its effects than any yet known anti-corrosion paint. Minimum Cement for steam joints, bolt heads, &c., more adhesive and durable than any hitherto invented. Sole London Agent, ANDREW J. MAUGHAN, Saltmaker and Ship Chandler, 21, Lower Shadwell, E. Office, 35, Broad Church, Newcastle.

IMPORTANT TO BUILDERS and PAINTERS.—Genuine White Lead, 31s. per cwt.; Linseed Oil, 2s. 2d. per gallon; Boiled Oil, 2s. 6d. per gallon; Turpentine, 3s. per gallon; Fine Pale Oak Varnish, 7s. 6d. per gallon; Dry and Ground Colour, Prussian, &c. at wholesale price. For cash, at EDWARD HIGGINS' Colour and Varnish Warehouse, 45, Colwell-street, Finsbury. Every article for the Trade at the lowest price.

BLUNDELL'S STUCCO PAINT. This Paint gives to stuccoed surfaces a stone-like appearance, it remains for a considerable time after the weather and is not more expensive than well-executed distemper colouring. It answers equally well on brick walls, and is adapted for the interior of churches, chapels, kitchens, basements, passages, &c.—Particulars apply to the Inventor. MESSRS. BLUNDELL, SPENSE, & CO. Colour, Paint, and Varnish Warehouse, 5, Upper Thomas-street, London; and at their Manufactory, Hull.

TO PAINTERS. GREENSLADE'S PATENT GROUND-PAINTE, DUSTING, and VARNISH BRUSHES, are highly recommended, containing many important improvements, both in construction and durability. GREENSLADE'S Painters' Brushes and descriptions are made in two qualities—good, and superlatively good. The latter are of the very best materials, and worthy of the attention of those who desire a really good Brush.—Manufacturers, S. & A. W. GREENSLADE, Thomas-street, Bristol.

TO PAINTERS, BUILDERS, and SIMPSON & CO. COLOURMEN, WHITE-LEAD and OIL MERCHANTS, VARNISH MANUFACTURERS, 33 and 35, LONDON ROAD, SOUTH-WARK. Price List sent on application.

WORKS, MERTON, SURREY.—Buy of the Manufacturer and save the Retailer's Profit.—Colours and Varnishes at reduced prices. Greenish White Lead, 31s. per cwt.; Pale Oak Varnish, 7s. 6d. per gallon; Pale Carriage Varnish, 10s. per gallon. A large assortment of dry and ground colours. Painters and plumbers' brushes at list prices.—Orders sent to all parts of London and to any railway station carriage free for cash, by G. A. LITTLEWOOD, Colour and Varnish Manufacturer, 29, Drury-lane, and 14, Carey-street.

KENT'S PAINTING-BRUSHES are of the very best quality, and may be obtained at all the first houses in the trade, and of the manufacturers. G. B. KENT and CO. 11, Great Marlborough-street, London, W. N.B. Kent's Painting Brushes are all stamped "G. B. Kent and Co." Price list forwarded by post.

CROWDEN and GARROD (successors to THOS. KENT & CO.), the celebrated PAINTING and GENERAL BRUSH MANUFACTURERS, FALCON-SQUARE, LONDON, E.C. \*A. Also Manufacturers of the best India-Rubber Knife-boards, Cocoa-nut Fibre Door Mats, Mattings, &c. T. KENT, and CROWDEN & GARROD, are stamped on the Brushes. Established 1777.

T. KENT'S PAINTING-BRUSH MANUFACTORY. Continued by his Successors, CROWDEN & GARROD, Falcon-square, London, E.C. Where the TRADE is supplied with the same superior quality that made the name celebrated. N.B. The names of T. KENT and CROWDEN & GARROD, are stamped on the brushes. Also Manufacturers of the Patent India-Rubber Knife-boards, Cocoa-nut Mattings, Mats, &c.—See catalogue.

TRADE MARK. CROWN TUBE WORKS, WENDENSHURP, STAFFORDSHIRE. Warehouse, 31, Upper Grosvenor-street, London, S. JAMES RUSSELL & SONS, The Patentees and first Makers of Wrought-Iron Tubes.

RAILINGS, PATENT WROUGHT-IRON TUBULAR, CHEAPER THAN CAST. Wrought-Iron Girders, and every kind of Ornamental or Constructive Iron-Work, Designed, Estimated, and Executed. H. G. COOMBS, IRONFOUNDER, at 17, UNION-STREET, BOROUGH, LONDON. Eight doors from Borough.

STUART & SMITH respectfully refer to ST. GEORGE'S CHURCH, DONCASTER, as an illustration of their SYSTEM OF WARMING, which secures an agreeable temperature at a very small consumption of fuel. Other references, and every information given, on application at their Manufactory, ROSCOE PLACE, SHEFFIELD; or to their London Agent, Mr. D. BARBER, No. 59, John-street, Adelphi.

GALVANIZED WROUGHT IRON CISTERNS.

From 4 s. per gal. MADE TO ANY SHAPE OR SIZE REQUIRED. MANUFACTURED BY TUPPER & COMPANY, 61A, MOORGATE STREET, LONDON, E.C. Galvanized or Lead service Pipe, Brass Bell Valves, Rivet Cocks, &c. Price on delivery in London. N.B. A Discount to the Trade, Builders, &c.

CORMELL'S WROUGHT IRON TANKS, CISTERNS, TROUGHES, &c. from 2WOPENCE PER GALLON.

Improved in strength and finish. COATED INSIDE WITH ENAMEL-LIKE NON-POISONOUS COMPOSITION (without extra charge), making them very durable and suitable for any purpose. LEAINGTON, KENTHURST, from 6s. per foot. JOHN CORMELL, Lansdowne Iron Works, Cheltenham.

WROUGHT-IRON TANKS, CISTERNS, TROUGHES, FUNNELS, &c. plain or galvanized, CATTLE TROUGHES, IRON CARBIDE, &c.

No. 2 Made any shape or size. Wrought Iron Cistern, for Water or Oil. 24, to 50, per gallon. BURENY & BELLAMY, Mill-wall, London, E.

ROBERT MACLAREN & CO. EGLINTON FOUNDRY, GLASGOW. Manufacturers of all sizes of CAST IRON MAIN PIPES, for Gas or Water, by an IMPROVED PATENT. GENERAL IRON FOUNDRIES, GAS WORKMENS, and WROUGHT IRON TUBE MAKERS.

TO IRONWORKERS and the TRADE GENERALLY. HULETT & CO. Manufacturers of GAS CHANDELLERS, HALL LANTERNS, GLASS LUSTRES, &c. &c.—A large assortment of the latest designs always on hand, every article marked in plain figures. Patentees and Manufacturers of the Mercurial Gas Regulator. Complete Pattern-book and Price-lists, 12s. Nos. 55 and 56, High Holborn.

SAVING IN GAS. S. D. HULETT, INVENTOR and PATENTE. The Mercurial Gas Regulator is the only efficient instrument for insuring wholesome and uniform lighting, combining the greatest and preventing any irregularity in the weight of the flame. S. D. HULETT & CO. 55, High Holborn, London. Manufacturers of Gas Chandlers, Glass Lustres, &c. &c.

LOSH, WILSON, & BELL, NEWCASTLE-ON-TYNE. Manufacturers of Bar Iron, Railway Bars, Forges and Engine Works, Cast-iron Goods, and PATENT CAST-IRON GAS and WATER PIPES. Office, No. 7, Saxe-lane, London.

HEATING BY HOT WATER. JOHN WEEKS & CO. KING'S ROAD, Chelsea, HOT-WATER APPARATUS MANUFACTURERS.

IRON ROOFING OF CORRUGATED IRON. Wrought-Iron, principal Roof covered with Slates, Iron Bridges, Girders, and Railings; also Portable Buildings for Dwelling, Farm, Shop, Churches, Chapels, Schools, Concert or Dancing Rooms, Theatres, &c. suitable to all climates, fixed complete, in town or country, or packed for exportation. For Designs and Estimates apply to RANBALSTAP, CONTRACTOR, 23, King William-street, E.C. where numerous drawings and photographs may be seen. N.B. The Iron Building, &c. manufactured by R. STAP are not fixtures on leasehold property.

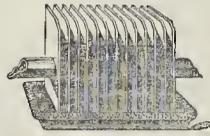

JOHN PARKIN (late Blake & Parkin), STEEL WORKS, HARVEST LANE, SHEFFIELD. Manufacturer of Circular Saws, machine-cut, Mill-Saws, endless Bands, or Ribbon Saws, of tough temper, without joints. Machine Tools, Grooving, Milling, and Mortise Joints, Saw Cuts, Railway and Common Road Springs, &c. Agent for London; Mr. CHAS. BADGER, 1, Stagshead, Westminster-road.

**THE LONDON WARMING AND VENTILATING COMPANY, LIMITED,**  
26, GREAT GEORGE-STREET, Westminster, S.W.  
MANAGER, MR. WOODCOCK.

Churches, Greenhouses, Offices, and Buildings of every description warmed by means of a modification of the plans successfully used during the last five years by Mr. Goldsworthy Gurney in both Houses of Parliament.

Steam, Hot Water, Gas, and in open or enclosed fire-places, Coal and Coke, are equally available for the process.  
The cost is less and the effect greater than that of any other known means.  
The Horticulturist will find herein an instrument of new and important powers.  
The Apparatus may be seen in operation in ST. PAUL'S CATHEDRAL, the various offices of the "Department of Science and Art," and at the Architectural Societies' House, 9, Conduit Street, Regent Street.

JAMES BARTON, Iron Works, 37a, Oxford-street, London, W.

**NAILS and IRONMONGERY,**  
from BIRMINGHAM direct.  
Builders, Contractors, and Others, supplied with Nails, Iron, and Ironmongery, of every description, at the LOWEST BIRMINGHAM PRICES.  
A complete list of which will be forwarded upon application to  
**FRANCIS BIANCHI (late Blyth & Bianchi),**  
Nail Manufacturer and General Factor, BIRMINGHAM; and 19, Gresham-street, London, E.C.

**PATENT WROUGHT-IRON WINDOWS,**  
manufactured by the GENERAL IRON FOUNDRY COMPANY (Limited), HENRY ROGERS, Manager, Lion's Wharf, and No. 43, Upper Thames-street, London. These windows combine the advantages of great strength with lightness and cheapness, and they have been very highly approved by many of the most eminent architects of the day. They are peculiarly well adapted for factories, railway stations, jet-ways, and lighthouse systems, and also for exportation, as it is impossible to break them by fair means. Lists of prices can be had on application.

**W. CALLEN'S PATENT SMOKE CONSUMING APPARATUS AND REGULATING VALVE.**—This valve is the simplest and cheapest of all the inventions yet introduced, for the purpose of effecting more perfect combustion of fuel, in all kinds of furnaces. Testimonials of the highest possible character, are readily given by the parties who have them in operation.—Price, No. 1, 3s. 3d.; No. 2, 5s. 10s. for furnace-door complete with the Patent Valve.

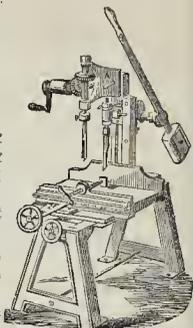

**H. ROGERS'S REGISTERED SEWER, STABLE, AND DRAIN TRAP.**—The cheapest and most effective trap yet introduced. A great number of these traps are fixed in various Government and private establishments, and having had a full trial have met with unqualified approval. These articles may be had of Ironmongers, and of the General Iron Foundry Company (Limited), 43, Upper Thames-street, Makers of Gas and Water Pipes, High-water Pipes and Connections, Chemical and Soap-pans, Furnace-bars and all other kinds of Castings, for manufacturing and building purposes.

**IRON ROOFING, FLOORING, AND BRIDGE WORKS.**  
GAS STREET, BIRMINGHAM.—LONDON OFFICE, 33, NICOLAS LANE, E.C. where Plans, Estimates, and Printed Lists may be obtained, and where PHOTOGRAPHS of Roads and Bridges, of various dimensions, may be seen.  
FIRE-PROOF FLOORS, on the French system, as recently carried out on a large scale by  
**JOHN HENDERSON PORTER, Engineer and Contractor.**

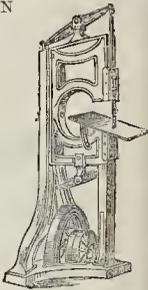

**BATHS and HOT-WATER APPARATUS.**  
J. TYLOR & SONS  
ILLUSTRATED CATALOGUE OF BATH WORK, &c. to be had on application.  
Estimates may be sent.  
J. TYLOR & SONS, Manufacturers, Warwick-lane, Newgate-street, London.

**WILLIAM BISSELL, Wholesale Iron-Manager,** Cannon-street, Whitechapel. Proprietor of the Patent EQUIVALENT MORTISE LOCKS, and Sole Agent for HAYES'S PATENT MORTISING, BORING, and DRILLING MACHINES.

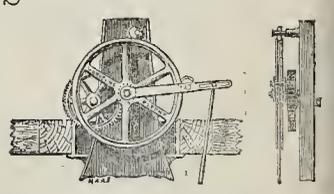

The most POWERFUL, SIMPLE, EASY, and DURABLE in the market, combining the best mechanical principles of RACK-TRUD and LEVER MOTIONS.  
Testimonials of the highest class can be shown from Builders in almost every part of the United Kingdom.  
A The Boring and Drilling Apparatus, which can be removed at pleasure.  
Price 1s. 6d. complete, with set of eight bits, core-driver, and Boring Apparatus.  
B, ditto, ditto, without the Boring Apparatus.

**THOMAS ROBINSON and SON,** ROCHDALE, near MANCHESTER. PATENTEES, AND Makers of Sawing, Planing, Moulding, and other Woodcutting Machinery.  
**IMPROVED VERTICAL SAW,** For Cutting out Sweeps and Circles.  
Price 20s.  
Drawing sent on application.  
MACHINERY TO BE SEEN AT WORK IN ROCHDALE. Agent for London.—Mr. W. SIMMONS, 24, Austin Friars, London, E.C.

**SAMUEL WORSSAM and CO'S**

**PATENT SILENT FEED.**  
S. WORSSAM and CO. beg to call the attention of Builders and others to their new Patent Silent Feed for Timber and Deal Frames, &c. which possesses very great and obvious advantages over the old ratchet feed, and also over any other silent feed. S. W. and Co. will undertake to alter any frames to work with their Patent Silent Feed at a trifling cost.  
For Illustrated Circulars apply to S. WORSSAM & CO. Saw-mill, London, or to Messrs. CHAS. & ALFRED ROBERTS, 10, Abchurch-lane, London, E.C.

**MOREWOOD & CO.** (late Morewood & Rogers), Dowgate Dock, Upper Thames-street, London; and Eastville Works, Birmingham.  
**PATENT GALVANIZED TINNED IRON AND TILES,** GALVANIZED IRON, PLAIN or CORRUGATED, and CURVED, of all Gauges. Also, BLACK or PAINTED CORRUGATED IRON, GALVANIZED or BLACK CAST GUTTERS, PIPES, &c. STOCKS KEPT IN LONDON AND BIRMINGHAM.  
Works—LIMEHOUSE and BIRMINGHAM.  
Offices—61 A, MOORGATE STREET, E.C.

**SKAIFE & COMPANY,** Manufacturers of PATENT GALVANIZED IRON. Sheets, Corrugated and Plain, and Telegraph Wire; Bars, Rods, Hoops, Nails, Screws, and Manufactured Articles, supplied to the Trade. Galvanized Tinned Sheet and Tiles for export. IRONWORK GALVANIZED. Roofing orders promptly and carefully attended to. Office—Commercial road, Limehouse, London. Works—Copenhagen Wharf, Limehouse.

**W. TEMPLE & CO.** Manufacturers of PATENT GALVANIZED IRON. Corrugated Sheet, Galvanized or Black, Wire, Wire work, and Castings, &c. of every description. Iron work of all kinds is promptly galvanized. By their new arrangements they can galvanize heavier castings and larger tanks than any house in the trade.  
PATENT GALVANIZING and CORRUGATING WORKS, GLASSHOUSE YARD, E.C. Opposite the principal Entrance to the London Docks.

# The Builder.

VOL. XVIII.—No. 908.

*Society for Improving  
the Condition of the  
Labouring Classes.*

HERE was a review, the other day, as important in its way as that which took place in the Park on Saturday last,—a review of some of the means which are being used to fight the demons of dirt, and disease, and crime. Lord Shaftesbury and a number of gentlemen interested in improving the dwellings of the industrious classes, assembled in the model houses in Streatham-street, Bloomsbury, for the purpose of inspecting these and some of the other buildings which have been provided by the Society for Improving the Condition of the Labouring

Classes, and which buildings have shown one way in which health and life can be preserved. These houses, which are good in their structure and arrangement, have been already noticed in our pages. It is satisfactory to find that the rooms are fully occupied, and that the general health of the forty-eight families who live there is excellent. In the number of years during which this establishment has been open, terrible fevers, that from time to time rage around, have been unknown. The very small number of deaths, of even young children, is remarkable, and shows, in comparison with other places, the extent to which human life might be saved, not only in the metropolis, but also in most of the large towns in the provinces.

One advantage of such gatherings is, that men of influence have the opportunity of seeing the working of useful experiments; and many persons interested in these undertakings hear suggestions which are likely to be useful as the result of practical experience. Finding all well in Streatham-street, and that notwithstanding the great cost of the site and building, the structure returns a moderate profit, the party went to the lodging-house for single men in George-street, close by. Some had curious recollections of the state of the place, eighteen or twenty years ago, when all around was bad. When we look at the churches, schools, and other institutions, which have been reared on the site of buildings disgraceful to a civilized country, it is encouraging. Others glanced at the little specimen of the Rookery which still remains; but even that is wholesome in comparison with its former condition.

In this lodging-house there is room for 104 single men. It has separate sleeping-places; a large reading-room, and provision for cooking. The rent here is 2s. 6d. a week. Although the general plan of this place is sufficiently satisfactory, and since a former visit much improvement has been made by painting and plastering, still it seems to us that the management might, in some respects, be mended. It is well, as far as possible, for those who have the conduct of such establishments to show kindly dispositions towards the lodgers. We heard complaints of the want of attention to the cleanliness of the kitchen. One of the tenants, indeed, asserts that it has not been washed since he first became an occupant, two years

and a half ago, and says in the course of his letter,—“I hope that you will endeavour to get this state of things remedied. It is of no use to speak to parties in authority here. In fact, I can compare the management of this place to nothing better than what would result if you were to put one of the old style of waggons to drive and look after a locomotive engine.” Let us hope that he overstates the case.

From George-street they went to Charles-street, Drury-lane, a locality which has a vicious population. Here the Society have a house similar in construction to those round about it, which has been altered, drained, and ventilated, for the purpose of providing a lodging for eighty-two single men. From time to time, during some years past, we have taken opportunities of looking in here, and have always noticed the apparent excellence of the management, and the prosperity of the house. In a money point of view, it now clears about 10 per cent. per annum on all charges. There is a library here from which any lodger can borrow books. There is also a club formed for the supply of newspapers and other periodicals.\* The rent here is 4d. a night, and those who occupy their place for a week have the Sunday night's occupancy without charge; so that the cost of this home, in which no pestilential illness has occurred, and where men can preserve their self-respect, is only 2s. a week. The condition of some of the houses near is abominable; and, when we hear that the police have the power of removing obnoxious matters from the immediate neighbourhood of all common lodging-houses, at the cost of the proprietor or tenant of the premises, it seems strange that more has not been done in that direction.

Omitting for the time to look in at Wylde-court, and another lodging-house in Drury-lane, we proceeded to Gray's-inn-lane. Some of the party glanced first at the dismal dens in Charlotte's-buildings; sad was their state, and marvellous the contrast between them and the places which had been previously visited. *Between four and five o'clock in the afternoon in many of the houses there was not a drop of water.* No wonder that the public-houses flourish, and that filth, dirt, and disease are joint inhabitants.

With sorrow for such a state of things, the visitors gladly moved to Tyndall's-buildings, where the houses have been put in order by the Society. Our readers will recollect the state of this court some years ago. It was as bad, if not worse, than Charlotte's-buildings, close by: it was more dangerous for a stranger to enter within the precincts than to traverse Africa: policemen went in bodies of five or six, and were even then exposed to brickbats and other missiles: in some instances a *single room* was occupied by between thirty and forty men, women, and children; and in every hole and corner festered a mass of neglected and troublesome human life.

Many of the underground apartments were below the level of the sewer which ran near. We have no statistics that afford the means of calculating the extent of slaughter which by this means alone has been brought about, or the result would startle. Wisely was an enactment of Parliament made to prevent the occupation of underground places which were unprovided with a certain amount of open area and other requirements. It was so contrived as to be nearly inoperative; but a clause in the Bill now before Parliament for amending the Metropolis Local Management Act will, it may be hoped, put it on a different footing, and lead to good results. In Tyndall's-buildings the cellars became the receptacles for vast masses of refuse; and, when the Society came into possession of this property, the quantity of filth found which had been left to poison the crowds living above was astonishing. We illustrated

\* The library of this and other of the Society's houses might, with great advantage, be added to by presents of books. In some of the lodging places which have been opened by private enterprise, the proprietors, with a view towards encouraging a taste for reading, agree that, provided a certain amount is subscribed by a company of the lodgers, they will double that amount, and at the end of each year bind the serials into volumes, and place them in the library for general use.

the then condition of this place, and are glad to notice that the general improvement has verified our predictions. In many of the houses the diseases arising from sanitary neglect have disappeared; and those advantages and means of decency to which we have before referred have led to a marked change in the manners and appearance of the people.

Having recently mentioned this place, it is only necessary to say that in Baldwin's-gardens, not far off, there is an excellent school on the National principle, where children may be educated at 2d. per week, and that the Ragged School in Fox-court is doing its work. Both these, in such a neighbourhood, deserve, indeed demand, assistance.

There is a lodging-house for forty single men, and it is worth while to mention that although the lodgers are migratory, seldom remaining more than a week, still the apartments are usually occupied.

At the Thanksgiving-buildings, in Portpool-lane, the washhouses are constantly used, and afford a good profit on the money expended. Could not the ventilation of these washhouses be improved? Apartments are here provided for single females. This arrangement, as regards profit, has not been successful: it seems, however, to be becoming better appreciated than it was formerly. The houses for families here, which let at 5s. 6d., 4s. 6d., and 3s. 6d. a-week, are nearly all occupied.

The Society of which we are speaking have done good service by testing schemes which have from time to time been suggested for rearing and adapting various kinds of dwellings for the use of the large classes of the community who are now so ill provided for in this respect. There are nine establishments belonging to them in various parts of the metropolis, which are in this way adapted to the purposes mentioned, and which are most valuable in showing the working of these matters, and suggesting in what manner and to what extent they may be successfully imitated either by public bodies or private individuals. Besides those already mentioned, we must speak of the chambers, No. 76, Hatton-garden, which have been provided for men. Some time since this large dwelling was set apart for the reception of females who were obliged to wait in London on their way to the emigrant ships. The plan, however, did not succeed, and then the place was opened as a lodging-house for single men.

Hatton-garden, once almost as famous as the gardens of the Bishop of Ely close by, was, two centuries or so ago, occupied by wealthy people, whose dwellings still remain in excellent condition. The tide of fashion has moved westward, and now the houses are mainly occupied by jewellers, goldsmiths, and extensive dealers in different kinds of merchandise.

The entrance to the chambers is kept clean and covered with drugging. At the side is the superintendent's apartment, well furnished: the walls are decorated with prints, and there are also books and other matters which give to this part of the premises an air of comfort and elevation. Beyond, on the ground-floor, there is a large reading-room, looking to a garden, which is, under the circumstances, well cared for by Mr. Mitchell, the superintendent. One cannot but note the advantages, in some respects, which old houses of this description have over certain others of recent construction. They have an appearance which is generally preferred to that produced by whitewash and bare walls, which, wholesome as they are, are associated by many with the idea of barracks or workhouses. Below are kitchens, where the lodgers have convenience for cooking their food. In one part are cupboards, each numbered in correspondence with the apartment occupied by the lodger. By this arrangement each man, or company of men, may prepare food at a moderate cost, and save any portion which remains. The upper floors of the house have been fitted up for sleeping. Each room, both at back and front, is divided into a certain number of spaces, which are partitioned off at the height of about 7 or 8 feet, leaving a passage along the centre. These apartments let at 3s. 6d., 3s., and 2s. 6d. a week each, according to position. The bed-rooms near the windows, and

which are in some little points better furnished than the others, are at the first price, and the bed-places which are at 2s. 6d. a week are smaller in space, and situated at the top of the house.

The door of each of the little apartments referred to is numbered, and is quite private. An arrangement has been made for ventilation,—that important provision to ensure health and the proper duration of life. The bedrooms are to the right and the left hand of the staircase. Conveniently placed on each landing there are wash-hand basins supplied with water. Some will note with satisfaction the care which has been taken to place geraniums, mignonette, and other flowering plants, in the windows; these little matters cause no great expense, and are a source of much pleasure.

The accommodation provided here is for fifty-four lodgers; and it is satisfactory to learn that, notwithstanding many and rapid changes, the average number of lodgers is about fifty. About two years ago the average number of lodgers was not more than twenty-eight, but under the present management the demand for these chambers has been constantly increasing: one person recommends another, and so, notwithstanding that this establishment is not very generally known, the number of lodgers is kept up. Men have applied here directly on their arrival from Australia and America, recommended by friends. Amongst the lodgers there are several persons of education and most likely slender means, who are regular in their visits. Night after night and month after month they come to Hatton-garden, probably from long distances. These persons pay their rent, and, excepting a civil greeting in passing, form no particular acquaintance with their neighbours. They may be engaged in some important but ill-paid branches of scientific or literary inquiry: no one asks; obscurity, if desired, is one of the advantages of the metropolis.

This establishment only needs to be better known in order to insure increased demand for its accommodation, and to encourage the opening of others in proper situations, not only in London but also in the larger provincial towns.

There is a scarcity of water here on the Sunday and Monday, a very general complaint elsewhere. Notwithstanding all that has been said on this point, the want of water is still an evil to which large numbers of the poor in various districts of the metropolis are exposed, particularly on Sundays, when they need rather an extra supply of this necessary of life, for the purposes of personal cleanliness, and for cooking what in many instances is the only meal which the workman has the opportunity of sharing comfortably with his family. On the Saturday afternoon and evening, in these homes where notions of decency are preserved, the floors are scrubbed, the stairs washed, and frequently articles of clothing have to be prepared for Sunday use: this, when several families occupy one house, causes on the Saturday an extraordinary demand for water.

In some courts, which team with life, and where upon the whole a considerable amount of rental is collected, no butts or other reservoirs are provided for the reception of the water. A small pipe may be seen, and to this old and young rush, at the hours at which the water is expected to be turned on, for a supply: here the water runs for perhaps twenty minutes, or may be less. It is clear that this is quite insufficient, even if the water were turned on both morning and evening. There are closets to be flushed, or drains to be kept clean. Under such circumstances, if water be taken into the dwelling by those who are fortunate enough to obtain sufficient, it is spoiled in the polluted atmosphere.

On this point a question naturally arises, if it be legal for landlords who let premises to great masses of the poor, to do so without providing proper means for a plentiful supply of water and receptacles for its proper storage. If the law be clear on this point, whose duty is it to see that it is properly carried out? If it be the duty of the parish authorities to do this,

it matters not to whom such property belongs; but, without favour to persons, the regulations which exist, and on which life and health depend, should be strictly carried out. If the authority of the parish is not sufficient, does the matter come within the province of the police? If so, let them be instructed to carry what is so necessary into effect. It should be at once set at rest; and, if necessary, fresh powers be obtained from Parliament.

We are no advocates for labour on Sunday; but, as thousands of the poor are at present situated, a Sunday supply of water is an absolute necessity. At present, in many instances, as our readers know, the water is turned on during the Saturday afternoon, and not again until late on the following Monday: for forty-eight hours, in conditions such as we have described, are the people, whose shortcomings in points of order and cleanliness are with justice complained of, left without a fresh supply of water.

We learn that in spite of all the care of the Society for Improving the Dwellings of the Industrious Classes, there have been complaints as to water in Strentham-street, Tyndall-buildings, Hatton-garden, and elsewhere. It may, therefore, be readily understood, if in places like these, where neither pains nor expense has been spared to make good provision, there is a deficiency, how great it must be in places where little attention is paid to the tenants beyond getting the rent.

The Metropolitan Association for Improving the Dwellings of the Industrious Classes have built eight houses for families and dwellings for single men in Mile-end and Soho. From the report delivered at a recent meeting, we learn that the whole population of this property of the Society amounts to 2,186; and in this number forty-five deaths have occurred during the year. This is at the rate of about 20½ in each 1,000,—rather in excess of what might have been expected, but still a great improvement on the result in all London.

In some of these houses persons with large families of young children, and some in indifferent circumstances, have been glad to find a shelter; and it is amongst these that a large per centage of deaths takes place. There are, moreover, unsatisfactory circumstances to which attention might be directed. The construction of some of the staircases of those buildings to which we refer is not good, and they should be carefully ventilated. Too many sets of apartments open into one staircase; and that peculiar unwholesome taint which is to be found in the barracks of the soldiers in the Tower of London and elsewhere may be noticed. Dr. Southwood Smith remarked that in the buildings for families in Nelson-square, Bermondsey, the deaths had been so excessive that inquiry should be made into the causes. Not only should the condition of this and other houses, upon the working of which the more general advancement of sanitary science so much depends, be ascertained, but the state of the surrounding neighbourhood, should be carefully examined. Are there cow-houses or other damaging agencies which pollute the air? The schools to which the children go should also be examined. The comparative death-rates of the several houses should be taken in proportion to the population, and causes arrived at as clearly as possible, accounting for the difference. This cannot be too carefully done for the public satisfaction by societies who have not only large interests at stake on their own account, but also on that of the community at large.

The amount of profit realized on the whole of the buildings is not quite satisfactory. On this point it would be well to make very distinct accounts; for in connection with some of these structures accidental expenses have been incurred which prevent the possibility of a fair return, and thus others who would invest in this way are discouraged without cause.

The Society for Improving the Condition of the Labouring Classes, who led us to take this walk and make these observations, have shown that decent and healthful accommodation may be provided for the labouring and poorer classes, and a fair return ensured for the money expended.

#### THE DAY INDUSTRIAL SCHOOL, TICHBOURNE COURT, HOLBORN.

The following speaks for itself:—

"About a year ago you were good enough to allow us a space in your paper to make known the plan of the Day Industrial School we then expected in a short time to be able to form. As you yourself are aware, such a plan has to some extent been realized, and we are now engaged in the very arduous work of endeavouring, by every means in our power to develop and fully to carry out that plan. We have begun with about a dozen boys, to whom we give food and industrial and intellectual occupation. The principal work in which they are engaged is fancy box and paper bag making; but in order that our institution may flourish, we must have a ready sale for our stock. Will you allow me, therefore, to appeal to your readers to give us encouragement in that way? If they will only visit our school, and let us have the benefit of their kindly suggestions and criticisms we shall be obliged; but if to this they add their influence to obtain a sale for our work, we shall be extremely grateful. As regards the paper bags, some grocers in the neighbourhood have kindly promised occasional orders; but what we want is a permanent demand for supply, and this can be obtained if only some energetic friends will interest themselves in the matter. I add no more.—B. A. HESWOOD."

We do sincerely hope that some of our readers will go to Tichbourne-court (it is near Great Turret-street) and judge for themselves. Those who want paper bags, for example, may as well order them there, and will thus do good without any extra expenditure of money. It is surely a wise thing to save boys from the temptation of the streets, to give them good training, and so, it may be hoped, manufacture honest, happy fellow-citizens out of what might have been transformed into thievish, miserable creatures,—a pest to society. We take low ground, and say nothing of a higher question.

#### ILLUMINATED MANUSCRIPTS AS ILLUSTRATIVE OF THE HISTORY OF THE ARTS OF DESIGN.\*

Mr. Westwood, in articles recently published in the *Archæological Journal*, has avowed himself as clearly of opinion that a scriptorium, or school for the production and multiplication of illuminated books, was established by St. Augustine at Canterbury, almost immediately subsequent to his arrival in this country; and he cites various MSS. in which the combination of the Irish or earliest Anglo-Saxon style with features evidently derived from classical antiquity, through both Greek and Latin MSS., is plainly to be recognized. In these, the writing, the initial letters, and the interlaced ornaments—lacertine and simply decorative—are altogether Anglo-Irish, or, in other words Early Anglo-Saxon, while the figures and pictorial features are evidently copied from classical models; from their imitation of which there is little doubt the Saxon scribes ultimately acquired that free manner of sketching to which we shall presently have occasion to allude, as distinguishing the second class of Anglo-Saxon illumination.

The most notable illustration which I am acquainted with of this combination occurs in the Cottonian Psalter, known as *Vespasian, A. 1*, the principal illustration in which consists of an arcade, formed of an arch and pilasters, entirely ornamented with the tessellation, the spirals, and the red dots of the Illyrian scribes, and within which King David is represented as seated and playing on the lyre, surrounded by attendants rejoicing and blowing horns and trumpets. The framework is outlined in the hard, sharp-peg style of a scribe, while the subject is executed in body colours with a free brush, with considerable attention to light, shade, and effect, and a total absence of the hard outline which bounds all the figures in such volumes as the Book of Kells and the Gospels of St. Chad.

Of all the series of MSS. known to have been brought to England by St. Augustine, the books of the Gospels are the only ones the existence of which at the present time may be considered as probable. Fragments of a set of the Gospels are preserved in the Library of Corpus Christi College, at Cambridge, the illuminations in which are of the highest possible interest. The most important of them represents St. Luke, in perfectly classical costume, seated under a triumphal arch, supported by four marbled columns, and ornamented just as we might suppose a similar architectural monu-

\* By Mr. M. Digby Wyatt. See page 391, ante.

ment would be, by a mosaic worker of the time of Gregory the Great, hung to, or placed against, the two outside columns supporting this arch, are two square pictures, enclosed with the plain Roman red frame which I have described as a common feature in the more simple style of classical illumination. No ornament recalls the Celtic style in any degree; and there is every reason to believe, from the internal evidence afforded by the MSS. itself, that it may have been executed at Rome and brought to this country by St. Augustine.

In this case tradition coincides admirably with artistic probability. The above, and another fragment preserved among the Hatton MSS. in the Bodleian Library, at Oxford, embellished with no other illumination than the contrast of red and black ink, and a few ornaments about some of the initial letters, contain entries in Saxon, written certainly not less than 1,000 years ago, connecting them with the library of the Abbey of St. Augustine, at Canterbury; and, furthermore, they correspond with a description given by a monk of that monastery, who, writing in the reign of Henry V., dwells upon the "primitie librorum totius Anglie Anglicane," preserved in that library, as the very Book of Gospels, in the version of St. Jerome, brought to England by St. Augustine.

Considerable interest is attached to the question of the probable nature of the illustrations to the Book of Psalms, brought hither by the Roman missionary, in consequence of the existence of a set of illuminations, such as we may conceive to have been copied from a classical original, not altogether unlike certain well-known Latin MSS., constituting one of the earliest and most ably designed series of illustrations, carried out unquestionably by Saxon scribes, and executed in that which I have alluded to as the second Anglo-Saxon manner. It was the manner, in fact, of scribes giving up purely conventional ornament, and taking to imitative art.

The finest specimen of this transition style is exhibited in the Psalter one belonging to Sir Robert Cotton, and now preserved in the public library at Utrecht. In this volume the text is written in Roman rustic capitals, and in narrow columns, three in a page, both evidences of considerable antiquity; such, in fact, as would certainly place the MS. amongst those of the sixth or seventh century. At the same time it contains several features common to Anglo-Saxon scribes during the seventh and eighth centuries. The principal illuminations are executed in pen and ink, without the application of colour at all. The architectural forms, the costume in style, the details, are completely Roman. The figures are drawn with great spirit and expression, but with rather a weak and fluttering outline. Mr. Westwood, who has examined this Utrecht Psalter more carefully than any other Englishman, observes that the subjects are treated identically in this and no less than four well-known Saxon MSS. The classical nature of all the details, and the great popularity of this set of illustrations, justify the belief that they must have been copied from some classical specimen held in high estimation,—from just such a MS., in short, as would have been one of the Psalters brought to this country by St. Augustine.

There can be little doubt that several other Anglo-Saxon MSS., which have much puzzled students, owing their apparent anomaly to the fact of their having been frequently copied by scribes, at various periods, from early classical originals. Such, for example, as the celebrated MS. of Cicero's translation of the astronomical poem of Aratus (Harl. MS. No. 617), the miniatures in which Mr. Otley considered so thoroughly ancient in every respect, that he was induced to ascribe the origin of the MS. to the second or third century. More recent students are, however, clearly of opinion that in this case the MS. was executed at no earlier date than the ninth century, and that it is a copy from some classical model of the age to which Mr. Otley desired to ascribe the transcript.

There can be very little doubt that to this habit of copying works of classical antiquity, introduced probably into this country mainly through the foreign monks, who rapidly followed in the wake of St. Augustine, must be ascribed much of that graphic dexterity which characterizes the Saxon MSS. from the commencement of the ninth century to the Norman Conquest.

The third style of Anglo-Saxon illumination is that in which the interlacings, and some of the ornaments of the Hispano-British school of scribes, are retained, and combined with original illustrations of current contemporary scenes, such as sports, pastimes, incidents of the chase, and agricultural pursuits. Among these, one of the most

interesting is the Saxon calendar, preserved in the Cottonian Library (Tiberius, B. 5); and even in this many classical features are to be recognized.

The fourth and final style is that which we may believe to have been founded, or, at any rate, greatly encouraged, under St. Ethelwold, at the monastery of Mew Minster, or Hyde Abbey, near Winchester. In this style gold was very freely introduced; and, indeed, the charter of King Edgar to the same monastery, granted in the year 969, is written entirely in gold.

The most magnificent specimen of this school is unquestionably the celebrated benedictional of St. Ethelwold, in the library of the Duke of Devonshire, engraved *in extenso* in the twenty-fourth volume of the *Archæologia*. In the figure subjects, as well as in the ornamental portions of this volume, great and striking originality is to be recognized, and it is especially distinguished by a delicate harmony of colour, and tenderness of shading, superior to that of any other production of Anglo-Saxon art with which I am acquainted. In this MS., and in others,—such as the Gospels of King Canute, the two Gospels preserved at Rouen, the Cottonian Psalter (Tiberius, C. 6), the Hyde Abbey Book, late in the Stowe Library, and the Gospels at Trinity College, Cambridge,—the text is generally enclosed within a rich framework, formed by wide and solid bars of gold, about and over which twine and break elegantly-shaded masses of conventional foliage.

I have dwelt in some detail upon these British manuscripts, because they are unquestionably of the highest national interest. To the architect they are of very great importance, since they afford him almost the only completion of the picture, of which some faint traces are presented to him in the scanty existing remains of Anglo-Saxon structures.

Mr. Thomas Wright, in a most interesting article in the first volume of the "Archæological Journal," has dwelt upon the valuable illustrations of the details of Anglo-Saxon architecture which are contained in illuminated manuscripts; more especially in those of the end of the tenth and the beginning of the eleventh century. In one of these especially (Cotton MS., Claudius, B. 4), a fine copy of Ælfric's translation of the "Pentateuch," he has carefully examined the various pictures, which contain a great mass of architectural detail. Among the most frequently recurring features are arcades, carried upon columns, and the arches occasionally surmounted by pinnacles. The triangular-headed doorways, and halber-shaped columns, are frequently represented. The doors are shown with iron-work of an ornamental description, and the capitals of the columns are not infrequently covered with foliage of graceful forms. "Polychromy," says Mr. Wright, "is observable in all the architectural subjects throughout the manuscript. The arches, and even the moldings and different parts of the columns, are painted of various hues. The colours most frequent are yellow and blue. It may, perhaps, be doubted how far we may depend on the strict truth of the colours employed by the early artists, for in some instances they seem to be extremely fanciful. I have met with pictures in which men's hair was painted of a bright blue, but it is not impossible that at some period it may have been the custom to stain the hair of that colour. However, be the colours true or not, these drawings appear to establish the fact that the Anglo-Saxon buildings were painted in this variegated manner." As the general result of his comparison, Mr. Wright finds that almost all those structural features which ecclesiologists have recognized as Anglo-Saxon, in contradistinction to Norman, are represented, rudely perhaps, but not inaccurately, in the manuscript in question.

In respect to the point so much mooted of late,—the date of Waltham Abbey,—Mr. Wright observed, in another Anglo-Saxon MS.—the Prudentius of the British Museum (Cotton MS., Titus, D. 4), written apparently about the middle of the eleventh century,—two rows of columns, of which the shafts are ornamented in precisely the same style as some of those which still remain in Waltham Abbey. On this and on other grounds he is inclined to recognize in the existing remains the real church of Harold, or, at any rate, a considerable portion of it. He thus sums up the nature of the evidence as to Saxon architecture to be derived from Saxon MSS.: "We have, then, in the MS. under consideration a series of architectural drawings, which are pure Saxon, and of the date of which there can be no doubt. They present a number of characteristics which are probably to distinguish a peculiar style, which sufficiently was the general style of Anglo-Saxon

buildings. It is certain that the old artists produced nothing on parchment which was not modelled on what really existed before their eyes. I would add that, although illuminated MSS. became more numerous after the Conquest, I never met with one of later date exhibiting any of the peculiar characters mentioned above. We find a similar style on parts of existing buildings, which are evidently of a very early date, and which, therefore, as it appears to me, we are justified in attributing to the same age as the MS.; in the same way that we should ascribe an unknown effigy to the age in which its costume is found to prevail in similar illuminations."

If the character of Anglo-Saxon architecture and sculpture agreed with the representations of both given in the benedictional of Ethelwold,—as I have every reason to believe it did,—it must have been both massive and elaborate in the highest degree; and there is no reason to suppose that a people who were capable of drawing so well as they assuredly could, should have limited their productions in the sister arts to the rude and clumsy, long and short, and other similar work, which we are in the habit of supposing characterized all their principal productions.

While the progress in the art of illumination to which I have thus called your attention was made in the extreme west of Europe, but little novelty was introduced in the studios of Byzantium. The brilliancy and harmony of colour which were first developed in the age of Justinian, were never subsequently surpassed. That agreeable composition in figure subjects, which remained as the last relic of antique art, became gradually lost sight of, and in weak action and attenuated forms the saintly personages of the principal Byzantine MSS. degenerated at last into complete mannerism. In technical excellence, however, Greece long retained its superiority, and that which had been at first an art of uncertain result, finally became a well-regulated process of manufacture. Occasionally, and more particularly about the era of the Norman Conquest, figure subjects of great excellence were executed at Byzantium, both in marble, in metal, in ivory, and in painting on wooden tablets, and illuminated MSS.

The advance towards excellence which should have followed after the introduction of so many original Oriental features into Greek illumination of the age of Justinian, was cruelly interrupted by the iconoclastic troubles. Under Leo the Isaurian, A.D. 726, multitudes of skillful workmen and artists were forced to take refuge in the monastic establishments of all Europe. Their settlement in the convent of Sta. Maria in Cosmedino, at Rome, led to the foundation in that capital of the famous *Scuola Greeca*, and gave a vast impetus to the execution of mosaic work and the production of pictorial embellishments, both on walls, on panels, and in books. On the cessation of those persecutions in the middle of the ninth century a revival appears to have taken place in Greek art, no doubt coincident with the return to their native country of many of the descendants of those who had been exiled in the early stages of the persecution. Under Basil the Macedonian, A.D. 975, and indeed until about the year 1200, many beautiful ornaments were painted upon gold grounds, and lessons of no mean degree of beauty in ornament were set to the Russian, Syrian, and Armenian illuminators, who always closely followed the precedents communicated to them from Byzantium.

Contemporary with the development of the Irish school of illumination there prevailed in Central Europe a style of considerable rudeness, compounded of the ornamental features affected by the Irish and Anglo-Saxon scribes, the traditions of ancient art still prevailing in some of the principal ancient Roman settlements, and an odd sort of originality which may be perhaps best designated as *Frankish*. In this concrete style the comparatively few books illuminated for the magnates of the Merovingian dynasty were executed, and it was to convert that comparatively barbaric style into something better corresponding with his accumulated dignities that Charlemagne enlisted in his services the best artists that he could procure in Italy and elsewhere, and engaged our own much-honoured Alcuin to take charge of a scriptorium which he founded at Aix-la-Chapelle, and more especially that in the Abbey of St. Martin, at Tours. It was in that "Paradise," as the Saxon sage describes it in one of his letters, that all the latter years of his life were dedicated to the superintendence of correct and beautiful transcripts of the Holy Scriptures, and other precious books for the honour and satisfaction of his friend and affectionate patron; and certain it is that the

books produced under his auspices are among the most precious monuments of calligraphy still existing.

Among the most important of these are the Gospels of St. Medard de Soissons,—so called because believed to have been presented by Charlemagne to that abbey, and now probably the greatest lion of the Bibliothèque Impériale at Paris. This magnificent volume exhibits just what might have been expected from the condition of the art of illumination at the period; that is, a style of grand initial letters and complicated ornaments of an interlacing kind peculiarly Saxon, combined with a series of figure-subjects painted with a free brush in body colour, and completely in the antique style. One can, therefore, readily believe that in the execution of the *ornament* and *calligraphy* generally, the most skilful Anglo-Saxon artists were employed, while for the execution of the *figure-subjects* the talents of painters learned in all the arts of Byzantium and the traditions of ancient Rome were enlisted.

In addition to the Gospels of St. Medard, among the magnificent volumes produced for Charlemagne may be enumerated an Evangelarium, long preserved in the Abbey of St. Servin, in Toulouse, and ultimately presented to Napoleon I. on the baptism of the King of Rome. From contemporary entries this appears to have been completed after eight years' labour in the year 781, by the scribe Godescalc. In the same list we must include the Vienna Psalter, written for Pope Adrian, and the Gospels of the Library of the Arsenal at Paris, formerly belonging to the Abbey of St. Martin des Champs, the forms of which are principally Saxon, although the colouring, which is mainly restricted to gold, purple, white, and a little very brilliant vermilion, are on a purer and more elegant scale than is usual in contemporaneous productions. That which is known as the Codex Aureus we preserve in England in the Harleian collection. A somewhat similar volume was found upon the knees of the emperor on opening his tomb at Aix-la-Chapelle; and last, not least, as the production of his era, if not completed in his life-time, we may reckon the celebrated Bible known as that of San Calisto, preserved in the Benedictine monastery of that Saint at Rome. This is by far the most magnificent illuminated volume I have ever seen. It contains no less than 339 pages, and is one blaze of gold and colour from the first page to the last. It is no less in size than 16 inches high by 13 inches wide. The large initial letters are quite Saxon in form; the borders, of which there are endless and beautiful varieties, are more strictly classical in character than is usual in Caroline MSS., and the pictures are in an indeterminate style between Greek, Latin, and original Frankish; in that style which, under the descendants of Charlemagne, grew into the peculiar type of twelfth-century work—the progenitor of the pure Gothic of the thirteenth.

Time will not permit my dwelling upon the chief monuments of this transition. I cannot, however, pass over the Bible of Louis le Debonnaire, his Gospels, and the Sacramentaire de Metz, which differ in some degree, although they correspond in general magnificence, with those executed for Charlemagne. The Bible of Louis le Debonnaire is, however, in that Frankish and semi-barbaric style on which Alcuin and others improved.

The MSS. written for the grandsons of Charlemagne are very remarkable for their splendour and curiosity. Thus the Gospels of Lothaire were written and decorated at the Abbey of St. Martin, at Tours, as were also the two celebrated Bibles executed for his brother Charles the Bald,—the one known as the Bible of St. Denis, and the other as that presented to the monarch by Count Vivien, abbot of St. Martin. In these, as in the MSS. executed during the lifetime of Charlemagne, the ornament is unquestionably characteristic of the Hispano-Saxon school, intermixed with both painting and ornament derived from classical models.

The scriptorium founded under Alcuin at the Abbey of St. Martin, at Tours, was speedily rivalled by corresponding establishments in other localities; and thus from the Abbeys of St. Martial, at Limoges; from Metz, Mans, St. Majour in Provence; Rennes, St. Germain, and St. Denis, at Paris, issued, from the age of Charlemagne to the thirteenth century, an uninterrupted series of highly illuminated volumes, a sufficient number of which remain to enable us to trace the progressive development of that expressive and original style which attained its greatest power in the early part of the thirteenth century.

Many Byzantine features were brought into

French illumination through the schools of St. Martial and other abbeys of Limoges, and all illumination produced in the south of France shared in the impulse which French architecture received from its adoption of many of the peculiarities of Eastern origination. It was at Paris, however, as we might readily suppose, that the most rapid change from mannerism to originality was effected. Thus, at St. Germain and St. Denis were produced, during the first half and middle of the eleventh century, two volumes, still existing in the Imperial Library of France, which distinctly show the germination of Gothic. The St. Germain "Mysteries of the Life of Christ" are illustrated by many original and very spirited outline compositions, some of which are slightly coloured; while the missal of St. Denis displays that peculiar grace and *noblesse* in the action and expression of the figures, together with that soft elegance in foliated ornament which for several centuries remained dominant excellencies in the best French illuminations.

It is but just to mention the reaction which took place upon Anglo-Saxon and English illumination through the improvements imported into the art under Charlemagne and his successors, and more especially through the original vigour displayed in these already most characteristic Gothic compositions. In fact, we have every reason to believe that, distracted by the invasion and final ascendancy of the Danes, and ultimately by the descent of the Normans, Saxon illumination almost entirely died out in the country in which it had been propagated. So shortly after the Norman Conquest as the year 1091, Ingulphus, in alluding to the fire which destroyed the noble library of his abbey at Croyland, states that the juniors in his monastery were unable to decipher the Saxon character, that letter having been, as he says, "for a long while despised and neglected by reason of the Normans, and now known only to a few of the more aged."

The accession of the French nation which acquired power in England afforded by no means good specimens of the lettered Frank; and under its auspices the development of a new style, to take the place of the extinguished Saxon, was undoubtedly but tardy. With the accession of the Plantagenets, however, in 1154, and especially through the marriage of Henry II. with Eleanor of Guienne, the best French influence was allowed to acquire a marked predominance in English illumination: and for nearly 100 years from that date the progress of style in England and France was parallel and almost identical. And here it is but fair to the Dominicans and Franciscans to recognize the extent of the influence exercised by those monastic orders in consolidating the Gothic elements which took the place of the gradually disappearing Romanesque features.

As the styles of architecture varied in England and France,—agreeing in leading particulars, but each acquiring for itself a set of distinctive characteristics,—so did the art of illumination. In the purely Gothic work, such as prevailed from 1250 to 1400, extreme *finesse* in execution, tenderness of colour, gentleness of expression, piquancy of ornament, and elegance of composition, may be regarded as almost invariable attributes of French productions. In England, on the other hand, the style was not so harmonious but more vigorous, the colouring was fuller and deeper, the action of the figures more intense, the power of expression more concentrated, and reaching occasionally in its energy almost to caricature, the sense of humour always freely developed, and a more generally active sentiment of life impressed upon design, not only in figure subjects, but in ornament. In the latter, monkeys and other animals, dragons, and comic incidents, are very frequently intermingled with graceful foliage and heraldic embellishments. In fact it is to the credit of both countries that, with so much that is excellent in common, they should still have displayed such free and distinctive features as marked the works of each respectively. About the year 1400, in both countries the mechanical reproduction of the accredited types and leading incidents of Scripture and of Catholic faith began to be abandoned; and, mainly from the necessity of giving to the historical personages introduced in secular romances and chronicles individual force and vigour, an attention to portraiture and a transcription of characteristic traits of active life are freely developed.

Considering how few traces of the art of painting, as exhibited either in panel pictures or in mural embellishments, remain to attest the condition of the arts in England and France in the thirteenth, fourteenth, and fifteenth centuries, it is impossible for the student of Gothic art to over-

estimate the extreme interest which attaches to the chronological series of specimens of the painter's art which may be examined in the great metropolitan libraries of either country. It is very fortunate for our reputation that we are enabled through so large a series of volumes as still exist, to trace such distinctive and national characteristics as enable us to assert without fear of error that so far as graphic dexterity is concerned, the English artificers were fully competent to execute all the artistic productions which have as yet been found upon our soil. That foreigners were freely employed there can be no doubt, but that the works which were executed by them could not have been executed by Englishmen, no one can with safety assert, who has traced with any considerable care the gradual development of English art through a series of English illuminated MSS.

The most perfect production of the English school in all respects is, so far as I have been able to discover, the celebrated book known as Queen Mary's Psalter. It appears to have been executed about the year 1320, for a member of the Willoughby family. It contains 320 leaves, and is filled throughout with illuminations, which Professor Waagen deliberately regards as the refection of a larger school of painting. "Upon the whole," he states, "I am acquainted with no miniatures, either Netherlandish, German, or French, of this time,—by no means so favourable to art as the thirteenth century,—which can compare in artistic value with the pictures executed by the best hand in this MS. The artist here displays equally in subjects which require a strict architectonic disposition as in those admitting a freer arrangement, a most correct feeling for the disposition of subjects in a given space. The motives are not only true and animated, but very free, and frequently uncommonly graceful, and in the heads the moral expression is very rightly indicated. The proportions are slender, the drawing of the nude (the period considered) unusually good, and the hands especially of excellent action. In the draperies, it is true, the Gothic, somewhat conventional manner predominates, though treated with refinement and excellent taste." The docteur recognizes what must, I think, strike any unprejudiced observer, the coincidence of the lightness and freedom with which these designs are expressed with that which may be remarked in both the second and fourth style of Anglo-Saxon miniatures.

The impulse given by the Emperor Charlemagne to French illumination, found a rival at a later date in the school instituted in Germany, under the auspices of the Emperor Henry II. (1092—1026), of which many interesting examples are to be met with in the libraries of Bamberg and Munich. Shortly previous to the accession of that monarch, St. Ulrich, Bishop of Augsburg, who died in the year 973, had paved the way for this improvement, by himself decorating several copies of the Gospels with miniatures, in which Byzantine influence is apparent, and with ornaments already exhibiting a very good taste. One of these is preserved at Munich, and another in the Harleian Collection, No. 2970. It is, in fact, in the full development of that ornament which we generally know as Romanesque, and which was of a nature far more complicated than that commonly recognized in this country as Norman, that the greatest amount of originality, and the highest perfection was attained in German illumination. The artists of Germany early converted these Romanesque forms, at first highly conventional, into a quaint reproduction of the more natural features of growing and convoluted foliage, and introduced those crinkled ornaments the mannerism of which subsequently, in their more completely Mediaeval specimens, proved a considerable stumbling-block to their arriving at the graceful elegance attained in the best specimens of French and English illumination. Their miniatures, in later examples, reflect the peculiar angularities of the Early German school of painting, and through the influence which they exerted upon the Flemish masters, they tended in no small degree to popularize that greatly increasing spirit of naturalism in art which, during the fifteenth century, displaced the pure Gothic, and more ideal elements of the preceding century.

The improvements in pictorial art introduced by the school of Van Eyck proved a fruitful source of excellencies for Flemish illumination, which, under the patronage of Philip the Bold, Duke of Burgundy, arrived at the highest pitch of perfection, and exerted no slight influence upon the miniature painters and illuminists of England and France. In those countries Jean, Duc

de Berri, brother of Charles V., and the Duke of Bedford entered into a keen competition with the great Burgundian. Of the library of the former his Psalter, his two Prayer-books, and his copy of the "*Merveilles du Monde*," in the Imperial Library at Paris, and of the latter the celebrated Bedford Missal, in the British Museum (mainly, no doubt, the production of Flemish artists), still exist to attest the perfection attained at this period.

Whether the increasing popularity of the art of illumination in Western Europe induced all those artists who had preserved any of the traditions of ancient art to quit Italy and to take service under more liberal patrons than they could find in that country, or whether the frightful internal convulsions which distracted that soil gave the death-blow to the art in the capital of Christendom, certain it is that little or nothing remains to testify the proficiency of the Italian scribes in this branch of art from the ninth to the end of the twelfth century.

At the commencement of the thirteenth century, however, some few Italian specimens are to be found, and by the beginning of the fourteenth we meet in the writings of Dante with a commemoration of the talents of Oderigi, the contemporary of Cimabue, and of those of his pupil and successor, Franco of Bologna, who was contemporaneous with Giotto. Vasari bears testimony to the talent of Franco, with whose works he appears to have been well acquainted.

I might of course multiply the names of the successors of these distinguished artists to a great extent, and, if time permitted, dwell on the skill of those distinguished masters by whom the splendid series of choral books were executed which still remain at Sienna, Ferrara, Perugia, and elsewhere, to attest the rare merits of these brilliant illuminators. But from the revival of painting in Italy pictures, both on *tavola* and in fresco, so greatly abound, and are so well known, that I cannot but feel that, however interesting a specification of their peculiarities and merits might be, enough exists in more important monuments than illuminated books to illustrate the history of Italian art.

The same remark applies with equal cogency to those exceptional artists who in the various countries of Europe continued to practise, and some of them with extraordinary success, the art of illumination as a luxury, long after the invention of printing and the popularization of painting had ceased to render their works labours of necessity. There are, however, among these Italian masters, three whose merits were so transcendent, that no sketch, however slight, of the history of illumination, could approach completeness without a passing allusion to their exquisite productions.

For the great families of Italy,—the truly princely patrons,—such as the Sforzas, the D'Estes, the Medici, the Gonzagas, the Strozzi, and the Visconti,—the best artists were constantly employed in decorating both written and printed volumes, in which portraiture is freely introduced, and picturesque and historical subjects are represented with great vivacity, and attention to costume and local truth.

Among these artists, at the end of the fifteenth and during the first half of the sixteenth century, no one was more celebrated and excellent than Girolamo dai Libri. Vasari's description of the talents of this celebrated Veronese gives so lively a picture of the then popular style, that I am tempted to translate it:—

"Girolamo executed flowers so naturally and beautifully, and with so much care, as to appear real to the beholder. In like manner he imitated little canoes and other precious stones and jewels, cut in intaglio, so that nothing like them, or so minute, was ever seen. Among his smallest figures, such as he represented on gems or canoes, some might be observed no larger than little ants, and yet in all of them might be made out every limb and muscle, in a manner which to be believed must needs be seen."

This extreme delicacy of individual imitation was not confined to Italy, but found most zealous votaries in France, Spain, England, and Flanders. In France especially, the artists employed upon the celebrated "*Hours of Anne of Brittany*," carried to extreme perfection this almost microscopic style of miniature painting.

Among the principal claims of Girolamo to our respect must ever be regarded the fact of his having been the instructor of the still more celebrated Julio Clovio, who was born in 1498 and is believed to have died in 1578. Adopting in his ornaments the general characteristics of Girolamo's compositions, which he worked out in tenderer colour, and in his figure-subjects with a

miniature Michelangelesque pose and drawing, Julio Clovio excelled for Clement VII., and his successor Paul III., a series of masterpieces, such as it would be impossible to even indicate in such a paper as the present. Fortunately we possess in this metropolis two fine specimens of his skill, one in the Soane and the other in the British Museum,—both tolerably accessible. Others are, I believe, in various private hands, but I am happy in being able to produce for your inspection this evening two copies made from the miniatures in the Soane Museum of the greatest possible accuracy and beauty. They were prepared under the superintendence of Mr. Owen Jones, and have been reproduced in chromo-lithography with the utmost perfection that process is capable of attaining in his and Mr. Noel Humphreys's splendid work on illuminated books.

Julio's successor in the office of illuminator to the Papal chamber was an artist of not quite as great strength and brilliancy as his predecessor, but one who was endowed with a keener sense of elegance and harmony. Apollonius de Bonfratellis de Capranica surrounded subjects usually taken from the incidents recorded in the Holy Scriptures, with borders of the most glowing colours, in which are introduced compartments, with small figures touched with extraordinary delicacy and skill. I have never seen any more glowing and brilliant specimens of late Italian decoration, such as might be most fittingly introduced in combination with good Italian architecture, than are exhibited in the elegant compositions of this master. Many beautiful specimens of his works were brought to this country in the year 1825, by the Abbate Celotti, from whom they passed into the collection of the late Mr. Rogers. Apollonius does not appear to have worked later than 1572. After the cessation of his labours, however, the Apostolic Chamber appears by no means to have relinquished the employment of an official illuminator, as elegant illuminations continued to be produced down to certainly within a few years of the commencement of the eighteenth century.

I have now run over, at what you will, I fear, some too great a length, although at the same time far too rapidly for the interest of the subject, the principal historical characteristics of the art of illumination; enlarging upon its features at those epochs upon which additional light is most needed for the illustration of the history of art, and condensing my theme into extreme tenuity at those periods in which more important monuments are sufficiently abundant to require but little collateral illustration from subsidiary arts. It remains, therefore, for me only now to touch upon the practical lessons which must, I believe, follow as inevitable sequences from the historical incidents I have endeavoured to indicate.

The most obvious of these is the coincidence with, and proper subjection to, the major arts, of those which must always be regarded as minor. The miniature ornament of every period reflects on a diminished scale, and frequently in a highly concentrated form, the leading spirit which pervades the greater revolutions of monumental art. Owing to the licence which the diminished scale afforded, the imagination of the artist in these works was restricted by none of those material impediments which, in the execution of the major monuments of art, protracted the realization of the changing fashions of the day, frequently until long after the period when the original impulse may have been communicated to the art in which those variations were possibly but transient fluctuations.

Thus it is that in these relics of the past may frequently be traced artistic impulses destined to find no other embodiment than the form in which they are presented to us in the pages of a MS. The copiousness, then, of such documentary illustrations of the invention of remote periods is one of the most valuable features of the teaching they should convey to us. No revival now-a-days of any historical style by the architect can be satisfactory which is not based upon a knowledge, not of the purely architectural features of the period alone, but of the condition and characteristics of all those decorative details which distinguished it as a living reality from the effete and denuded relic which may now only present itself for our information. Thus even the Saxon and Romanesque styles of architecture may, through the architect's careful attention to the decorative features exhibited to us in the pages of ancient illuminated books, be revived, not in their rude and structural nudity, but as glowing with those colours, and decorated with those forms, which we may observe as peculiarly affected in the ornamental and pictorial embellishments of the best artists of the days when those styles were

the only ones popularly adopted. And not only are the beautiful ornaments and decorative features of illuminated MSS. valuable as supplying us with correct information as to the system of embellishment regarded by the best artists of each period as harmonizing most perfectly with the structural styles prevalent in their days; but in the measure of their permanent beauty they are no less valuable to us as indications of what is excellent for all time.

Thus, then, they may be used, either as enabling us to restore the most brilliant features of the historic styles with an accuracy to be acquired from no other sources of information, or they may be regarded as providing us with materials for that more extended system of eclectic selection which must afford the only basis of perfection and originality in any styles which we may desire now or hereafter to originate; and the origination and perfection of which we may desire to bequeath to succeeding generations, as testimonies that, in the nineteenth century, there lived men as capable of the creation of beauty as any whose happiest inventions are to be found in the pages of these ancient and most precious volumes.

Throughout the delivery of his paper Mr. Digby Wyatt made frequent reference to a large collection of drawings and engravings which had been arranged on the walls of the meeting-room, as far as possible, chronologically. Among them we observed, in addition to Mr. Wyatt's own diagrams, specially prepared, many exquisite illustrations produced by Mr. Owen Jones and Mr. Noel Humphreys, and a series of no less than 100, lately drawn and lithographed in fac-simile of the originals, by Mr. W. R. Tymms, for a work on the eve of completion by Messrs. Day & Son.]

ARCHITECTURAL EXAMINATIONS.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A SPECIAL meeting of the Institute was held on Monday evening last, to consider certain propositions on this subject which had been submitted by the council. The meeting was confined to members of the Institute, and we content ourselves with giving an outline only of the proceedings. The first proposition, being as follows, was moved and seconded:—

"Proposition 1.—That it is desirable to afford an opportunity for a voluntary professional examination to the present Associates, and to the future Fellows and Associates of the Royal Institute of British Architects. That an elementary examination be therefore established for the Students and Associates of this Institute under the age of twenty-five years; and a higher examination in the theory and practice of the profession for Associates above that age, and for future Fellows."

An amendment, to omit all after the word "examination" (making the resolution simply:—"That it is desirable to afford an opportunity for a voluntary professional examination"), was carried.

It was further resolved that the discussion should be resumed on Monday evening next. Thanks were voted to the council for bringing the question forward, and to the president, Mr. Cockerell, R.A., for his conduct in the chair.

LAMBETH SCHOOL OF ART, VAUXHALL.

EXTENSIVE schools are about to be built for the populous district of St. Mary-the-Less, Lambeth, on a site formerly part of Vauxhall Gardens, and in connection with these a building is to be erected exclusively devoted to art education. On Wednesday last, H.R.H. the Prince of Wales worthily commenced his public career, so to speak, by laying the first stone of it, amidst the loud plaudits of a large and distinguished assemblage. The committee, in their address, which was read by the Rev. Robert Gregory, said:—

"The special avocations of multitudes in this part of the metropolis render a knowledge of design of great importance for the efficient discharge of their callings in life. Engineers, painters, joiners, and other mechanics, by learning to draw, achieve a success in their several employments which would otherwise be denied them, and thus their zeal for the cultivation of their natural talent is artfully increased by a conscious accession of power, and by a sensible addition to those material comforts which they win for themselves. And thus self-interest has urged them to study, while the self-discipline thus acquired, it may fairly be hoped, adds stability to their general character, and so becomes a valuable element in their moral education. The success which has attended the efforts of the committee furnishes evidence of the truth of the principles upon which they have acted. Each year that their school has existed it has grown in number and efficiency. Commencing with a few pupils, who found ample accommodation in a corner of a room lent for their use, they now find themselves unable suitably to provide for all to enjoy the advantages they offer; while they have refrained from publishing more widely the existence of their school, lest more students presented themselves than could be received. They now muster 120 pupils in their classes, and the fees paid by those students, with the usual help afforded by the Department of Science and Art, suffice for the maintenance of the school, so that no subscriptions have been

received during the last few years for defraying its current expenses. Nor have the results been less marked and satisfactory in other respects. Students of great natural ability have been found who, but for the assistance afforded by this school, would never have had the opportunity of cultivating the special talent which they had been endowed. A potter, for example, who had no instruction in drawing till he entered the school, last year gained a national medal for designing and executing a most beautiful piece of pottery ware, and by general competition this year the school has obtained twelve medals and twenty-nine prizes—strong evidence that its success is not confined to the number of students it collects within its walls.

His Royal Highness made a reply in a frank, manly way, and indeed comported himself throughout in a manner to win golden opinions from all. Mr. Pearson is the architect: the buildings will be erected in the style of the thirteenth century.

Funds are still needed: the Rev. G. W. Herbert is acting as honorary secretary.

#### THE ARCHITECTURAL ASSOCIATION.

The closing meeting of the session 1859-60 was held in the Rooms, Conduit-street, Hanover-square, on Friday evening, June 22; the president, Mr. J. W. Peaufold, in the chair.

The Society proceeded to elect by ballot the officers and committee for next year. At the conclusion, Mr. Capes (secretary) announced that the following gentlemen had been elected to fill the respective offices:—President—Mr. Thomas Roger Smith; vice-president—Mr. A. W. Blomfield, M.A.; honorary treasurer—Mr. Arthur Smith; honorary solicitor—Mr. Francis Truett; auditors—Messrs. W. C. Sams, S. C. Rogers; registrar—Mr. S. C. Capes; censors—Messrs. C. H. F. Lewis, R. O. Harris; honorary secretaries—Messrs. Arthur Smith, E. Winbridge; committee—Messrs. B. A. C. Herring; J. A. Bunker; T. Blashill; C. H. F. Lewis; W. Gritten, jun.; H. A. Reeves; G. B. New; W. Tain; A. Walters; R. O. Harris.

The president declared these gentlemen duly elected, and assured the Society that, in resigning office, he was not resigning therewith the interest which he had ever taken in the society.

Mr. Billings moved a vote of thanks to the president for the hearty aid he had given to the Association during his year of office. Though the scanty attendance sometimes rendered his position rather discouraging, he was ever at his post.

Mr. S. C. Capes seconded the motion, and the vote of thanks was carried.

Mr. H. A. Reeves proposed, and Mr. S. C. Capes seconded, a vote of thanks to the honorary secretaries, for the faithful manner in which they had discharged the responsible duties of their office.

Mr. Herring returned thanks on the part of the secretaries, and the Society separated for the session.

#### THE ARCHITECTURAL MUSEUM.

The committee of the Architectural Museum have determined not to hold a *conversazione* this year. In this decision they have been chiefly influenced by the results of former meetings, which, whilst most successful in point of numbers, have partly, from this circumstance, entailed upon the institution very heavy expenses without realizing any adequate increase in the means of providing for them.

The offers of prizes to artist-workmen have, however, been extended; and, we understand, meetings of a less costly nature will take the place of *conversazioni* during the ensuing lecture season. It is much to be desired that practical use should be made of the collection to a greater extent than is at present the case, and we are anxiously looking to see it take a more complete shape, and approximate to our much-desired National Gallery of Architecture.

#### LONDON FORTIFIED.

In the king's collection in the British Museum there is a series of very curious maps and plans; and, as they show us the progress of London and the growth of the suburbs, they are of considerable value. Amongst these is a plan of the City and suburbs of London, as fortified by order of Parliament in the years 1642 and 1643. This is copied from Hollar's Map of England, in six sheets, and traced from the remains of all steps of the works, by Cromwell Mortimer, M.D., Secretary of the Royal Society. This work seems to have been undertaken in 1746, and at that time considerable traces of these fortifications were visible.

With care, the line of the great ditch and embankment referred to may be distinctly traced, and it is worth while to compare the extent of the

line with the more ancient defences of the City. A reference to the map shows that there was:—

1. A bulwark and a half on the hill at the north end of Gravel-lane.
2. A hornwork near the windmill in the Whitechapel-road.
3. A redoubt, with two flanks, near Brick-lane.
4. A redoubt, with four flanks, in Haekney-road, Shoreditch.
5. A redoubt, with four flanks, in Kingsland-road, Shoreditch.

Islington seems to have been very strongly defended; at

6. A battery and breastwork, at Mountmill.
7. A battery and breastwork at St. John's-street end.

8. A small redoubt near Islington Pound.
9. A very large fort, with four half bulwarks, at the New River Upper Pond. (This seems to have stood not far from the White Conduit, and was still in existence in Dr. Mortimer's time.)

10. A battery and breastwork at the hill east of Black Mary's Hole.

11. Two batteries and a breastwork at South Hampton, now Bedford House. This, says Dr. Mortimer, is complete to this day in the Duke of Bedford's gardens. Here were mounted fifteen pieces of cannon. This would be on the site of Southampton-street, Bloomsbury-square.

12. A redoubt, with two flanks, near St. Giles's pound.
13. A small fort at the east end of the Tyburn-road.

14. A large fort, with four half bulwarks, across the road at Wardour-street.
15. A small bulwark at a place called Oliver's Mount.

16. A large fort, with four bulwarks, Hyde-park-corner.
17. A small redoubt and battery on Constitution-hill.

18. A court of guard at Chelsea turnpike.
19. A battery and breastwork in Tothill-fields. On the other side of the Thames, was

20. A quadrat fort, with four bulwarks, at Vauxhall. This was still in being in 1746.

21. A fort, with four bulwarks, at the "Dog and Duck," in St. George's-fields. This was also in existence.

22. A large fort, with four bulwarks, near the end of Blackman-street.
23. A redoubt, with four flanks, near the Lock Hospital, in Kent street. From this the line took a direction towards the north-east, and formed a correspondence with the line leading from Gravel-lane to the Thames.

We believe that all traces of this fortification have now disappeared.

Glance at the present map of London and consider, if a similar defence should be needed now, how gigantic must be the work.

#### SEWAGE APPLICATION EXPERIMENT AT CARLISLE.

THE application of town sewage to agricultural land is a question of the utmost importance. Many attempts have been made to use sewage as manure; and, unfortunately, there have been failures, as at Croydon, at Rugby, at Leicester, and at some other places. Some of the attempts seem to show that sewage refuse cannot be solidified by any known chemical or other process, so as to make a profitably saleable manure. The Leicester case has proved a costly failure. An expensive plant of steam-engines and cast-iron pipes, to raise sewage for the purpose of showering it over land, will not pay. Land naturally fitted to receive sewage, or properly drained, will use up large volumes; and, therefore, the apparatus and means of application must be cheap and simple to work; the mode of application must be surface and contour irrigation. The crops should be grass, and, as much as possible, this should be cut for stall feeding. The sewage should be strained or filtered by the cheapest possible process, to prevent seeds of weeds being carried over the land. Artificial grasses (Italian rye grass) thrive well, and use up vast volumes of sewage. The objects to be attained are to get rid of a nuisance from towns (sewage), and to prevent it becoming a nuisance to the country by fouling streams and rivers. Extravagant expectations as to profits may be discarded. Town populations may reasonably, in many cases, be expected to pay farmers at first for taking the sewage, and then, if it uses justify any charge, such value may be settled subsequently.

At Carlisle Mr. McDougall has rented about 100 statute acres of meadow land, having a gravelly or sandy subsoil. The main outlet-sewer of Carlisle

bounds this land, and the corporation allow sewage to be pumped without charge. The fluid sewage is disinfected by McDougall's powder or fluid, and is raised about 17 feet by a nominally four-horse steam-engine and Gwynne's pump. The engine is high-pressure, and can be worked higher power. This small engine lifts not less than 500,000 gallons of sewage in twelve hours. About fifty acres of land are laid out at present for irrigation, and readily absorb this volume of fluid without, as we are told, causing any perceptible nuisance. The ordinary grasses have, in this case, been irrigated, and the crops have proved exceedingly heavy. No one who has seen them doubts as to the pecuniary benefits being ample. The land, with rent and rates, costs about 47. per statute acre, and the annual working expenses are expected not to exceed 350*l*. The capital involved is not, so far, large, and any attempt to make town sewage agriculturally useful must be economical. Something may be learned at Carlisle which will be socially and agriculturally useful for other towns. The city of Carlisle, as our readers are aware, was sewered by Mr. Robert Rawlinson, and provision was made at the time the sewers were constructed to enable the sewage to be taken for agricultural use so soon as any one would come forward and apply it. If the works had not been designed and executed in such manner the present works of irrigation would not have been undertaken. All town sewers should be laid out and executed with a view to the ultimate application of the sewage. The right man and the right mode will come presently.

#### NEW PUBLIC BATHS IN HULME, MANCHESTER.

THE baths for the Manchester and Salford Baths and Laundries Company, in the township of Hulme, are so far completed, that the chief portion was opened to the public on the 20th of June. The building fronts into Leaf-street, the frontage to this street being 114 feet, and the depth of the plot 117 feet 6 inches. The whole has been constructed from designs by Mr. Worthington, architect, John Dalton-street, the style being described as after the Venetian school of Lombard architecture, combining the local material of brick and Yorkshire stone, as the marble and Lombard brick were commonly united. The erection comprises two large swimming-baths, a great number of private baths, for men and women; Turkish baths; and a public washhouse, in which the washing can be performed either by hand or by machines. Each swimming-bath is 75 feet long and 25 feet wide; the dimensions of each room to the walls being 82 feet 5 inches by 41 feet. The depth of water will be 3 feet at one end, and 6 feet at the other, and from the floor of the lowest part to the apex of the roof is 35 feet. Around the first-class bath there are forty dressing closets, with suitable requisites; and round the second-class, sixty stalls, all numbered. A gallery above each swimming-bath is supported on either side by nine iron columns, and in the gallery of each bath there are twenty-two private baths for hot, cold, or tepid water. The charges are the same as for the swimming-baths, 6*d*. and 2*d*., the difference being for the superiority of the accommodation and fittings. The roofs over the swimming-baths, &c., are divided, lengthwise, into ten bays, formed with semicircular ribs, and a continuous line of glass along the sides. At each end there is a group of three semicircular-headed windows, which, along with sashes at the sides, subserve the purpose of ventilation. There is also a ventilating trunk formed along the summit of the roof, through which the heated air is drawn by four archimedean ventilators.

The washers, when within their entrance, pass through a folding and ironing room 13 feet 6 inches by 13 feet, then reach the washhouse, which is 60 feet long and 23 feet wide. It is loftier than either of the other establishments of the company, and much more complete in its fittings and appointments. There are twenty tubs for washers, divided into four groups of five each; in addition, there are twelve tubs in connection with the machine washing department. This includes four of the patent machines by Stott, Bellwood, and Findlow, with two bydros, which answer the purpose of wringing by rapid centrifugal motion. These are all worked by steam power. The drying-chamber is divided into two compartments, and fitted up with thirty-two clothes-horses: each has upon it a number corresponding with a particular washing-frame. The horses are moveable upon wheels into the heated chamber, and are then under the control of the matron, and opened at stated times—perhaps at every half-

hour. The vapour expelled from the clothing is carried upward through funnels, and is effectually prevented from becoming diffused in the wash-house. Over every washtub there is also an arrangement for taking off the vapour by a down-draught; but, to clear the room of what may arise in it, there are on the roof four of Mr. Muir's four-point ventilators. The vapour collected from this department of the building is passed off up the tall shaft or chimney in connection with the boiler furnace. This shaft, which is 7 feet square, rises 112 feet from the ground level. There is a smoke flue up the centre, formed of boiler plate, gradually diminishing in thickness from 3-8ths to 3-16ths of an inch. Surrounding this, and between it and the outer brickwork, is the vapour shaft. The boilers, tanks, engine, and ramification of pipes, have been furnished by Messrs. W. & J. Galloway, of Knott Mill; and the plain and ornamental iron work connected with the building was executed by Messrs. Edward T. Bellhouse & Co., of Eagle Foundry, for the general contractor, Mr. Niell, Strangeways. Mr. Thomas Drinkwater was clerk of the works. The cost of the Baths will be nearly 12,000*l.*

There is now nearly completed, near the baths at Mayfield, for the company, from Mr. Worthington's plans, a building for a penny bath, specially intended for boys and lads, the depth of the water being nowhere more than 4 feet.

THAMES EMBANKMENT.

At a meeting of the committee on Tuesday, Sir Joseph Paxton in the chair,—

Mr. Henry Addington Bird was called, and, in answer to questions put by the chairman, thus described his plan: He proposed a commencement at Westminster-bridge, on the north side of the river, which would terminate very near Southwark-bridge, at Queenhithe docks, and would leave the average width of the river about 700 feet. A portion of the embankment would be solid, and a portion would contain floating docks. From Whitehall-place to Chatham-place, Blackfriars, he proposed to carry, on the embankment, a carriage road 50 feet in width, supported on iron columns, and the roadway would have direct connections with Surrey-street, Norfolk-street, and Arundel-street, Strand. He further proposed to construct a railway from the Victoria Station, Piccadilly, which, coming under a tunnel, would join the road near to Manchester-buildings, Westminster, and would proceed inside the embankment to Queenhithe. The length of the railway would be about two and a half miles. To carry out his plan for the embankment of the river, he did not contemplate any application whatever to the Government for pecuniary contributions, as he believed that ample funds would arise from the sale and leasing of land which would be reclaimed by the embankment, and by eminent capitalists, who had expressed their readiness to contribute if the plan was adopted and sanctioned by the committee. The wharfingers on the banks of the river had approved of his plan. The estimate for the construction of the railway was 221,000*l.*, and for the embankment, roads, and other works, 512,000*l.*, making a total of 733,000*l.*

Mr. Page was next called, and stated that, formerly, he had been the resident engineer of the Thames Tunnel, and was now the engineer and designer of the New Westminster-bridge, and also of the Victoria-bridge. He had considered the subject of the embankment of the Thames, and had prepared plans with that object. His plan was to commence with an embankment beginning half-way between Southwark and Blackfriars on the Middlesex side of the river, and terminating opposite Lambeth Palace, at the end of Millbank-street. On the south side of the river he proposed to commence an embankment opposite Queenhithe Dock, and terminate it between Lambeth Palace and Vauxhall-bridge. From Blackfriars-bridge to Waterloo-bridge there would be a carriage-way 50 feet wide, but the rest of the embankment would be devoted to a promenade for foot-passengers only. On the south side the embankment in front of Lambeth Palace would also be applied only to a promenade. His object had been to encroach as little as possible upon the river, and to adopt an economical mode of construction. His estimate of the entire works from Westminster to Blackfriars-bridge was 360,000*l.* This included the construction of the roadway and the docks behind the embankment. His plan could be made self-supporting by appropriating part of the embanked land between the embankment and the present shore, and by giving additional wharfs next to the embankment itself. Another source of rendering the plan self-sustain-

ing would be by constructing an omnibus tramway on the embankment, like those in Liverpool and on the Champs Elysées, at Paris, and letting the privilege of using the tramway at a rent, from which a large annual revenue would undoubtedly arise, though the fare might be fixed as low as one penny each passenger.

PUBLIC BUILDINGS IN THE PROVINCES.

**Croydon.**—The new public hall, Croydon, has been inaugurated. The building is situated on the north side of George-street, on a site at the angle of the Wellesley-road. There are five or six class and other rooms for the use of the members of the local literary and scientific institution. The chief feature in the structure, however, is the assembly or lecture room. The original estimate for the building was 3,000*l.*, independent of the ground (which is let on ground-rent), the directors having liberty to purchase the same at a future time. The builder's contract amounted to 2,655*l.*, and the expenses of the building will exceed by about 300*l.* the amount of the subscribed capital. The number of 1*l.* shares already taken by the Literary and Scientific Institution is 900, 100 of which were presented by Dr. Westall. The institution anticipate increasing their shares to 1,000. The hall was built by Messrs. Jackson & Shaw, builders, Westminster; and the designs, plans, &c., were furnished by Mr. Belcher.

**Aylesbury.**—An appeal, emanating from a meeting of the governors of the county infirmary, held lately, has been put forth, explaining the necessity of a new infirmary, the present one being quite inadequate. It is proposed to erect one near the same site, capable of accommodating fifty in-patients, for which the sum of at least 8,000*l.* will be required; 3,500*l.* (including 1,311*l.* specially set apart for building purposes) will be appropriated out of the capital of the infirmary. It is proposed to raise subscriptions to make up the total required for the commencement of the new building by the 1st of March 1861.

**Stockport.**—At a recent meeting of the Town Council, the Manorial Tolls Committee recommended, for covering the market hall, the plan of Mr. Henry Lloyd, of Bristol, which, exclusive of the cost of paving, levelling, and fitting up the stalls, &c., would involve an outlay of about 5,000*l.* Mr. Alderman Williamson proposed that the subject be referred to the next meeting. There were seven plans or designs sent in, but that recommended by the committee was the most expensive. The estimates for one of them, where the pillars are left open, were 3,310*l.*, but if enclosed in glass would be 600*l.* more. Another was 3,190*l.*; but with the tower, which was intended for floral exhibitions, the figure would be increased by 550*l.*, making the gross estimate about 5,000*l.*, independent of the fitting up and paving. Then there were others more moderate in the cost, namely, 2,500*l.*, 2,805*l.*, 2,500*l.*, 2,520*l.*, and 2,800*l.*, of course all differing essentially in their plans. The elevation of the plans varied from 16 to 20 feet. Roofs of corrugated iron or zinc had already been condemned in the market hall. Mr. Lloyd's plan was a roof of wood, covered with slate; and the others were iron and glass. A month, at least, ought to be allowed for the consideration of these particular designs, before calling upon the members of the council to vote upon which ought to be adopted. The motion was agreed to, and it was understood that all the plans and specifications would be exhibited in the committee-room, for the general inspection of the public.

SCOTLAND.

**Jedburgh.**—The foundation stone of the new corn exchange has been laid at Jedburgh. The site, says the *Border Advertiser*, is close upon the spot where one of the principal gates of the town was hung in the days when the burghers had so often to defend it with their formidable "staves" against the assaults of the English invaders. The company is incorporated under the Joint Stock Companies Act, with limited liability. The capital subscribed is 2,500*l.* The building, which was designed by Mr. Bell, architect, Glasgow, is in the old Scotch style of architecture, with cross-stepped gable and corbelled parapet. The Exchange Hall is placed behind the front building, and, when completed, will measure 70 feet by 36 feet within the walls. The contractors are Messrs. R. Turnbull, Nisbet, for the mason work; J. Thomson, Jedburgh, for joiner work; G. Charters, Kalemouth, plumber and slater work; and A. Smith, Jedburgh, plasterer.

**Glasgow.**—The estimates for the Town-hall buildings have been taken by Messrs. A. Hbertson

& Son, and their estimate, which includes plastering and plumbing work, is 2,368*l.* The plans have been designed by Mr. Lessells, architect, Edinburgh, and show a very plain front elevation of two stories, which is to be built of freestone. The estimate for the Corn Exchange has been given to Messrs. Stirling, at 786*l.* The latter building, which is expected to be finished by the 1st October, will also have a plain front. The length of the Exchange hall is 59 feet by 30 feet, and it is 22 feet in height to the tie-joints. It is to be lighted entirely from the roof.

**Alloa.**—At a recent meeting of the trustees of Alloa Harbour, the tenders for executing the excavations, masonry, and iron floating gate, of a wet dock for Alloa were examined. There were, it is said, seven estimates, all approximating within 200*l.* of each other, the probable cost being altogether somewhere about 7,000*l.* The trustees are said to be so satisfied with the estimates they have of the cost, and the practicability of the scheme, that there is almost a certainty that the undertaking will be immediately proceeded with.

PORTUGUESE RAILWAYS.

The group conceded to the Royal Portuguese Railway Company is composed of two lines, leading from Lisbon, on one side, to Badajos, and on the other to Coimbra and Oporto the second city in Portugal. These two lines have been carefully surveyed under the immediate direction of Mr. Wattier, engineer of the French corps of ponts and chaussées, and their total length is 480 kilometres; viz., in common to both lines, 110 kil.; from the junction to the frontiers of Spain, 153 kil.; the Oporto line, 217 kil. The concession is made for ninety-nine years, according to a public adjudication, which took place September 14, 1859, between the Government and D. Jose de Salamanca, and was ratified by a law on the 6th of May. Land is to be purchased, and works of art constructed, for a double line; but the earthworks are to be made for single line only at present.

By the sixth article of the statutes, the cost of construction, &c., of the railway, over and above the subvention granted by the Portuguese railways, is fixed at a lumped sum of 122,500*l.* per kilometre; wherein are comprised fixed and rolling stock, stations, workshops, tools, purchase of land, electric-telegraphs, and other accessories, all to be handed over in working order.

As to the state of the works, surveys have been completed for continuing the line from Ponte d'Assoca to Santarem, and the works commenced on many points: the foundations of the bridge over the Assoca are terminated, and the piers, constructed in England, are to arrive this month. The gauge of the line has been altered from 1.47 m. to 1.67 m., which is adapted on all Spanish railways. At Lisbon the quay is being prolonged to enable vessels to tie closer, and discharge or take in heavy cargoes with greater facility. From Santarem to the Spanish frontier the detailed surveys have been completed, and most of them approved of by Government. The large bridge over the Tagus has been wholly contracted for by an English firm, and 3,500 men are now employed on earthworks. The Lisbon and Oporto line (217 kil. total) joins with the above line at or near Ponte da Vedra. Between Oporto and Coimbra (110 kil.) the earthworks are contracted for to a considerable extent.

ONE OF MR. GYE'S FEATHERS.

In our number for December 15, 1855,\* we gave some particulars of a scheme proposed by Mr. Frederiek Gye, in 1842, for connecting different parts of the metropolis by means of a gigantic glass and iron arcade. It foreshadowed to some extent "Crystal Palaces," and included "an extensive flower market, constructed entirely of glass," such as the projector has since carried out, though not in connection with his proposed aid to metropolitan communication. Amongst other matters in that proposal, Mr. Gye put forth a plan for conveying letters and parcels inside tubes, by atmospheric propulsion, in the same manner as Mr. Vallance had proposed to propel passengers some years before at Brighton,—with this difference, that one suggestion was feasible, the other not. In one of our recent numbers, it will have been seen that a company has been formed for the construction of pneumatic tubes for the conveyance of despatches and parcels, including the mail bags of the Post-office; and it is but fair to give Mr. Gye the credit of this application of the exhausting idea.

\* Vol. xiii. p. 693.

## REST FOR THE WEARY.

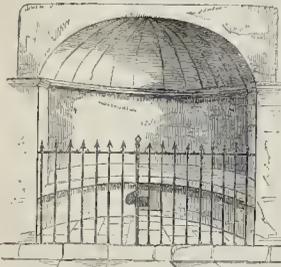

In these days there are few chances of rest in this great city: hurry, hustle, and drive, are the order of the day. Mourning coaches and hearses go at the rate of old stage coaches: goods waggons thunder along at the rate of seven or eight miles an hour: the man who walks, however swift and strong of limb, cannot keep pace with the times: old-fashioned persons who, like slow coaches, are pushed to one side, gravely shake their heads and wonder what will come of it. Once upon a time, city men, at about meridian, would take an hour or so for rest, and then the stuffy chop-houses and other places of substantial refreshment were thronged. Now, the same class of men rush into places gay, truly, with many decorations, but without sitting accommodation: here relay after relay of hungry men are supplied with various viands with a rapidity which is bewildering—no time for speech; and scarcely has the busy citizen passed in at one door than he rushes out *refreshed* at the other. In every street, in every office and place of business, the cry seems to be, move on.

Marvellous is the high pressure which is put on in this metropolis, while the size of the mighty engine is hourly increasing: the general machinery is becoming more rapid in its evolutions: steam and electricity are busy; and the fuel, in the shape of growing millions of people is working with a power which should tell upon the world. The operation is very consuming; men grow old before their time, and many become faint at the beginning of the race.

In summer's heat and winter's cold, the whirl still goes on; and it is to be feared that in the tumult we are liable to overlook many things which are duties. True, in these railway days we have new drinking-fountains from which threads of water dribble, but in the olden times there were also fountains erected at the cost of noble-minded individuals, from which copious streams rushed for the benefit of man and beast.

Provision was also made for the resting of the weary, and here and there, in places which did not interfere with the traffic, seats were provided and stands on which those with heavy loads might place their burden while they breathed. Some of these seats are in alcoves formed in the walls of churches, and in central places near thronged markets.

These are now locked up. Even the posts are spiked, and railed ways, which might afford the chance of a seat, bristle like the battlements of a prison. This is one of the oversights of the time. On many sites seats might be placed at little cost, and with great convenience. And might not the basements of street statues be fashioned without destroying the beauty and harmony of form, so that tired women and children might rest? We like to see living figures grouped closely with monumental sculpture. We made this suggestion long ago; and in Edinburgh, as we are told, it is about to be acted on. It is to be hoped that the want may be supplied elsewhere; and that even in the midst of the life-flood of London

we may see little harbours of refuge, similar to those of slower days, above which might be inscribed

## PHOTOGRAPHY AT THE BRITISH AND SOUTH KENSINGTON MUSEUMS.

It ought to be generally known that, at the last-named place, photographs of most of the objects there exhibited can be purchased at a small cost. This is a great advantage: many visitors, particularly those from the country, like, for educational and other purposes, to have representations of particular objects. Few have time to make careful sketches, and the photographs answer a most useful purpose. A similar plan might be adopted, with great advantage, at the British Museum.

We are told that, at the British Museum, there is an admirable photographic room and apparatus, and that formerly photographs were made of the various antiquities, which could be purchased at a moderate rate. It seems that the "negatives" have been sent to Brompton; and, on inquiry, persons will find a list of such objects in the British Museum as can be there had in photography. It would be an advantage, however, if persons who visit the British Museum could be supplied on the spot at a moderate rate with photographs of the examples of antiquity and art which crowd those galleries. Such an arrangement would be often the means of saving the time of artists; and, if they were well known that the public could be supplied with these, a very large demand would follow.

## FAVERSHAM ALMSHOUSES.

The trustees of the Faversham Public Charities are empowered by the Court of Chancery to expend a sum not exceeding 11,000*l.* from Henry Wright's Charity in erecting, on some eligible site within the town of Faversham, thirty suitable almshouses, containing accommodation for thirty poor persons, with a chapel adjoining.

There are twenty-five almshouses of the respective foundations of Wright, Napleton, and Mendild, scattered in various parts of the town, many of which are inconveniently situated and in a dilapidated state. These are to be sold as soon as the new ones shall be erected and fit for habitation, and the inmates will be removed to the new houses. The trustees have chosen part of Napleton's Orchard, containing 2 a. 0 r. 19 p., as the site, and they lately issued a general invitation to architects to submit for their approval designs for the new buildings. Accordingly, on the 31st of May last forty-five sets of designs were sent to the trustees, the greater number of which were of considerable merit. The trustees, after giving them consideration, and feeling their inability to come to a satisfactory conclusion without the assistance of an architect, called to their assistance Mr. Benjamin Ferrey, to examine the various plans.

The names of the competitors were concealed from the referee, and he was requested to point out which six designs he considered the most suitable for the trustees to make their selection from; but, after a conference with him, it was arranged that he should only explain which four he considered best. This he had no difficulty in doing. The trustees met him on the 21st instant, and heard his explanation of the merits of each of the four designs which he had selected, namely, a design marked "W. H.," which proved to be by Messrs. Hooker & Wheeler, of Brentley, Kent; a design marked "Invicta A.," by Mr. R. P. Pope, of Bedford-row, Gray's-inn-road; a design marked "B.," by Mr. William Webbe, of Victoria-street, Pimlico; and a design marked "N. S. A.," by Messrs. Newman & Billing, of Tooley-street, Southwark. After some discussion the trustees resolved to confine their selection to one of two out of the

four designs recommended by Mr. Ferrey, and they ultimately chose that submitted by Messrs. Hooker & Wheeler, and were then informed by Mr. Ferrey that he entirely concurred in their choice. Mr. Hooker designed the gardener's lodge in the recreation ground at Faversham, which has recently been completed under his superintendance. The whole of the designs were on the 21st, 22nd, and 23rd June thrown open to general inspection in the public rooms, an admission fee of sixpence being charged, to defray the expenses attending the exhibition.

## THE ISLINGTON REFORMATORY AND RAGGED SCHOOL.

DURING several years past this establishment, in Bryan-street, Caledonian-road, with very humble means and appearance, has been productive of much good. Within the last three years ninety-six boys have been admitted, thirty of whom have been placed in respectable situations, and are now honestly endeavouring to earn their own living.

The readers of the *Builder* need not be at this time told of the great necessity which exists for reformatories and ragged schools, and the advantages which result from them when properly managed. In Bryan-street the accommodation is not sufficient for the demand which there is in this district for the shelter of young boys, who are in the way of becoming hardened criminals. The building at present in use is a rough shed-like erection, which has an uncomfortable and somewhat dilapidated appearance, and it is not large enough for the proper accommodation of the 33 boys who are inmates of the Reformatory, and the 200 children who regularly attend the Ragged School, who are receiving useful and religious instruction.

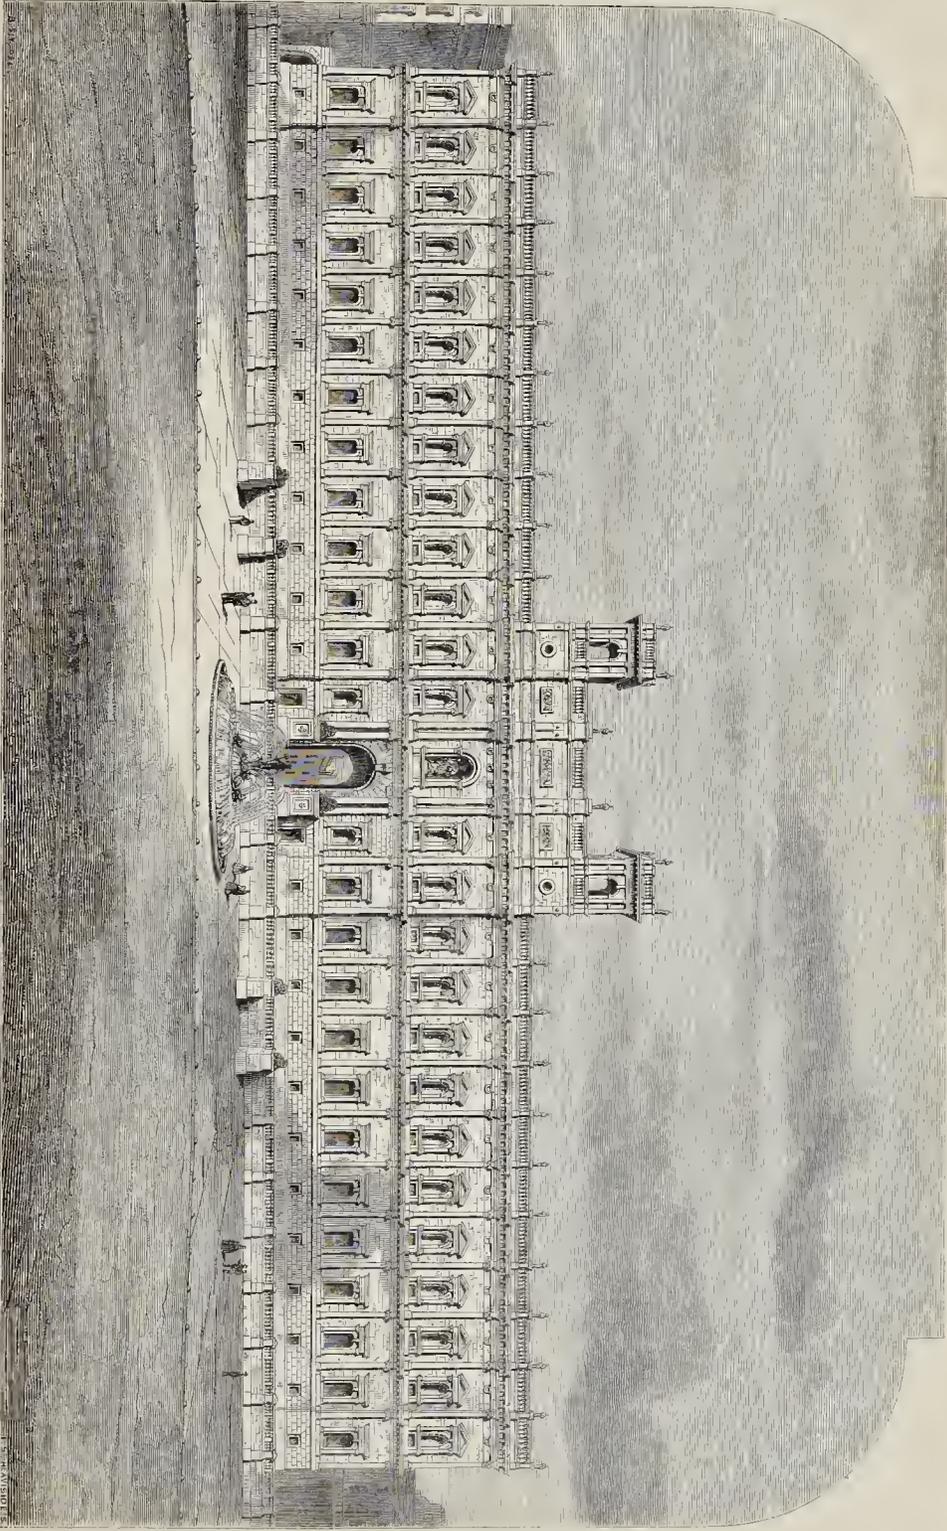

It is proposed by the committee to make a very urgent appeal to the inhabitants of the Islington district, and other friends of these valuable institutions, for the purpose of raising means to erect a plain but suitable structure, of such dimensions, that room may be found for 100 inmates in the Reformatory, and for 400 children in the Ragged School. Already 200*l.* have been collected for this purpose, but much more is needed before they can venture to commence operations. Here is a good work in which aid is needed.

## DESIGN FOR NATIONAL GALLERY AND ROYAL ACADEMY BY THE LATE SIR CHARLES BARRY.

In the notices we have given of our lamented countryman, mention is made of a design for the National Gallery, prepared by Sir Charles Barry, at the desire of Sir Edward Cust, to show the effect of a loftier building than that which was proposed, being of the same cubical capacity and expense. An etching was made of this design for private circulation, and from that we have made the accompanying engraving. A similar etching was made of the building proposed, and afterwards carried out, by Mr. Wilkins, and the two were privately circulated, in order, as it appears from a MS. note on the copy which has come into our hands, "that a feeling might be thereby created in the public mind sufficiently decisive and unanimous to induce the Government to require of Mr. Wilkins another design for a loftier structure than that which he at present proposes, and on such a plan as would ensure an uninterrupted view of St. Martin's Church from Pall-mall East, and, further, a direct communication with Castle-street." In Barry's plan the building was set back to show the whole of St. Martin's portico, and the central opening in the façade led to Castle-street.

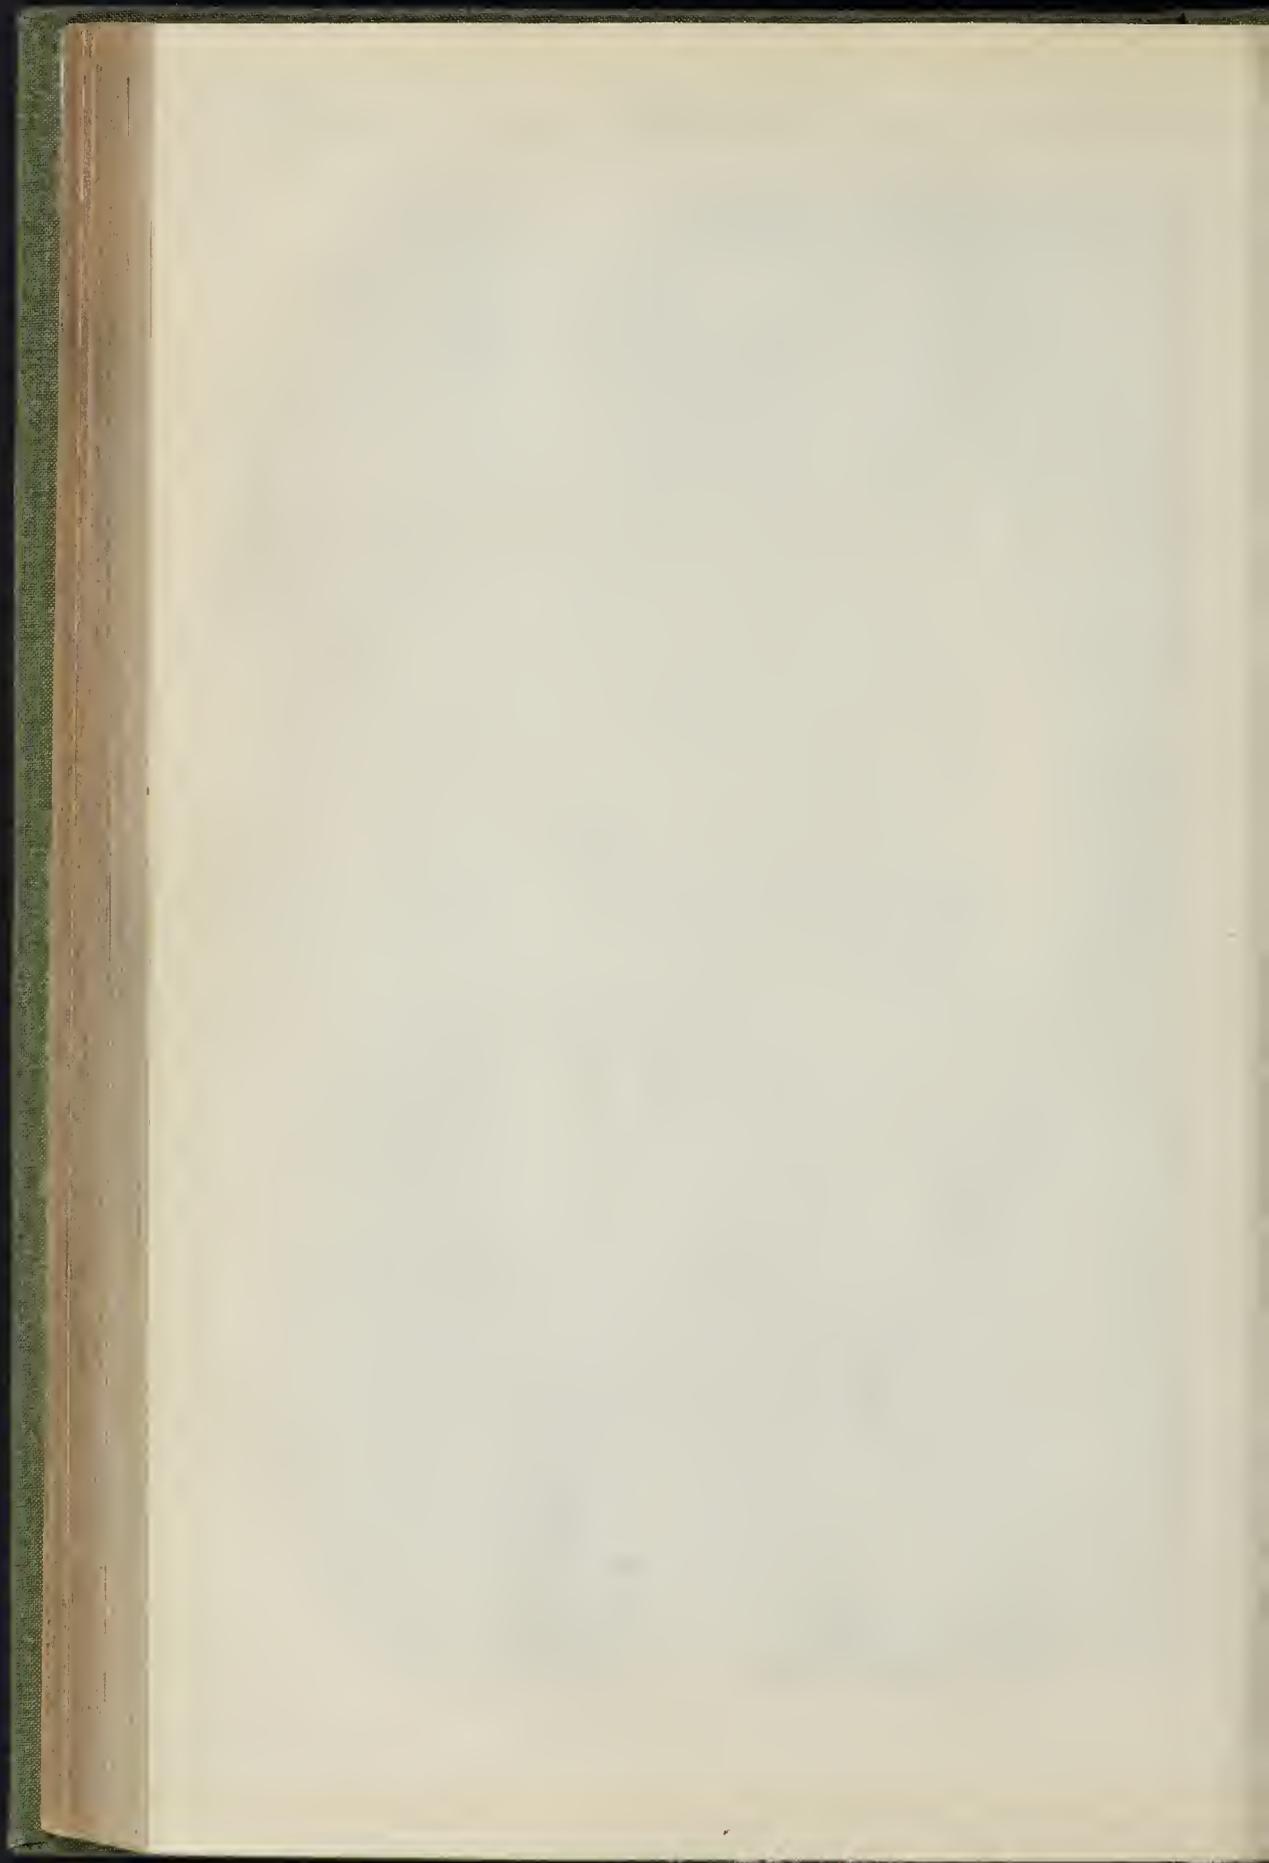

We may add that Sir Charles was engaged on the subject of our National Gallery up to the day of his death, and his matured ideas (which differed considerably from those previously entertained by him) are only expressed by some small sketches. The improvement of the existing structure was an ever-present idea with him, and he was very anxious to see something in Trafalgar-square worthy of its fine position.

THE LEAD TRADE.—From the annual statistics of imports and exports of metals it appears that in 1859 we imported 23,620 tons of pig and sheet lead; 2,100 tons of lead ore; 1 ton red lead; and 162 tons of white lead. During the same period we exported, of British lead ore, 197 tons; pig and rolled lead, 18,414 tons; shot, 2,157 tons; red lead, 2,641 tons; white lead, 3,624 tons; and of foreign lead ore, 1094 tons; pig and sheet lead, 403 tons; and white lead, 52 tons.

DESIGN FOR THE NATIONAL GALLERY: BY THE LATE SIR CHARLES LANE.

W. & A. KILGOUR, LONDON.

THE ORPHEONISTES IN THE CRISTAL PALACE.

The Orpheonistes, between two and three thousand in number, duly arrived, as was anticipated, and in their performances have given extreme pleasure to all who heard them without extravagant anticipations. Anything more charming of their kind than *Les Enfants de Paris*, *La Re traite*, or the *Chant du Bivouac*, we never listened to. These singers possess a rare appreciation of the value of light and shade,—of piano and forte, and produce some marvellous effects in consequence. We are glad to hear that an additional performance will be given on, this, Saturday, and we advise such of our readers as love singing not to lose the opportunity of hearing the orpheonistes. Considering the large body of Frenchmen whom they represent, as many as 200,000, it is stated, spread all over France, we should be glad to hear of some compliment to them on the part of the Court. Is there any reason why the Queen should not honour them with her presence on Saturday? The courtesy would not be lost on our impulsive neighbours. At present little, if anything, has been done for them, notwithstanding the advertisement of an imposing committee, but it is to be hoped their visit may yet be made agreeable to them.

We may mention that the great orchestra has received some fresh decorations. In panels running round the back of it is fixed the name of each department of France in which the members of the musical societies are resident. Between each name is a large gilt eagle, surmounted with tricoloured flags, the intermediate spaces being filled in with tricoloured escutcheons or shields. Wreaths of evergreens and flowers, and groups of palm trees and exotic shrubs occupy the lower portion of the back of the orchestra, interspersed with which are busts of celebrated men of France.

In front of the organ some slight emblematic devices are placed: and the banners of the various societies help to produce an effect of a pleasing character.

SCHOOL-BUILDING NEWS.

*Sherborne.*—The first stone of the new building for King's School, according to the *Sherborne Journal*, was advertised to take place on June 26th. The new building, now commenced, is to stand at the east side of the quadrangle, of which the church forms the south, and the school-room, chapel, &c., the west. It is to provide a school-house, and accommodation for the boys who are boarded therein, and will be connected with the opposite side of the court by a covered cloister. The Earl of Shaftesbury was to lay the stone. The architect is Mr. Wm. Slater.

*Worcester.*—A new school has been erected at Whitlington, near this city, by Messrs. Hemming & Son, from the design and under the superintendence of Mr. Perkins, the architect to the Dean and Chapter of Worcester. The site is nearly opposite the Swan Inn. The style is Early Pointed. The walls are of parti-coloured brick, with Bath stone dressings, and the roof is covered with different coloured tiles in pattern. The plan contains a school-room to accommodate sixty children, a class-room, and a porch. The school-room has an internal area of 36 feet 6 inches by 17 feet, and the roof is open-timbered. Externally the height to the top of the wall is 11 feet 6 inches, and about 40 feet to the top of the ridge. The room is lighted by a large three-light window at each end, and by a two-light window in the wall beneath the turret. The class-room has an internal area of 12 feet by 10 feet, and the porch 7 feet by 7 feet. Mr. G. Rogers, of College-yard, has presented the committee with a window in stained glass for the east end; Mr. Doe, of High-street, giving the central subject, which is Christ blessing little Children.

*Wednesbury.*—The foundation-stone of St. James's Schools, Wednesbury, has been laid on a plot of ground contiguous to the present building. The present schools, which have been erected about fifteen years, were constructed to accommodate 250 scholars, but are now crowded with about 400 children. The estimated cost of the new building is 1,400*l.*, of which 1,200*l.*, including the Government grant of about 600*l.*, have already been collected. In the erection of a portion of the present school will be added to the new building, and the existing Infant Schools will be converted into a dwelling for the master and mistress. The architect is Mr. J. H. Palmer, and the builder Mr. B. Stevenson, both of Wednesbury.

*Oughtibridge (Sheffield).*—The total cost of the schools here, lately noticed, will be 1,400*l.*

*Kirkburn.*—A school for 130 children is about to be erected at Kirkburn, near Driffield. The building, comprising a school-room, master's residence, class-room, &c., will be of red brick, with Mexbro' stone dressings in the Tudor style, with bell-tower. Mr. R. G. Smith, of Hull, is the architect. The cost of the building will be 750*l.*; and Messrs. Simpson & Malone, of Hull, are the contractors.

*Scarborough.*—National schools have just been completed at Scarborough. They are of Gothic design, built with white bricks of a mellow tone, relieved with stone dressings to the windows, &c., and with red, brown, and white bricks disposed in bands around the building, and in relieving arches over the stone heads to the windows. The boys' school-room has an open timbered roof, with arched ribs. The schools are provided with desk and form accommodation for about 600 children, with separate class-rooms for each school. There is a large infants' school on the ground floor, over which is a residence for the master and mistress. Stone staircases lead to the upper floor. Between the boarding of the upper floor and the ceiling below it, the space is sound-boarded and plugged with mortar, to prevent the transmission of sound. The boys' and girls' schools are each upwards of 62 feet long, with a transept; and the infants' school about 50 feet by 45 feet. Mr. Kirby, of Scarborough, is the chief contractor for the works. The architect is Mr. Ewan Christian, who in 1849 restored the old parish church of St. Mary, Scarborough. Mr. W. H. Espenpet, one of his clerks of works, has had the direction of the building operations.

HOUSE BUILDING OPERATIONS IN THE NORTH OF ENGLAND ABOUT FORTY YEARS AGO.

EVEN to a casual observer it is obvious how much the neatness of the manner of executing this important branch of industry has increased during the last forty years. At the time stated, even in large towns, the erection of houses in the district mentioned was of somewhat rare occurrence, and the work was executed in a leisurely way, which contrasts in a remarkable manner with the rapidity with which it is now done. Doubtless, however, the work was more substantial, and both bricks and mortar were of a better description than are now generally used. On the laying of the first rafter of the roof it was celebrated by flying colours from the chimneys, and a supper, generally supplied by the proprietor, called "The raising supper."

Then works were but seldom carried out on such an extensive scale as at present, and there were a greater number of masters, who were men in comfortable but unassuming circumstances, who followed the trades of stonemason, bricklayer, carpenter, joiner, plasterer, slater, painter, &c. All were kept remarkably distinct, particularly in the towns. It was the almost universal custom for the masters to meet the men at some public-house, for settlement on the pay-night,—a practice which led to much evil and irregularity.

Then but few Irish labourers had begun to fill the office of hodman, and several women were engaged in filling the duties which are now performed by so many thousands of workers from the sister country. Singular to relate, the employment of women, in such masculine and to them degrading work, did not seem to attract much general notice or objection. But then, in other ways, females were engaged in other unlit labour, such as the grinding with large boulder stones, sand, and carrying it for sale on their backs for long distances. Women were also to be seen regularly carrying the sheep and quarters of oxen from the shambles to the market-place. To the rising generation in England this will rightly be considered brutal and degrading toil.

When observing the manner in which old buildings are removed in the metropolis, it seems strange to look back to the manner in which this operation was performed formerly: now that every brick of a worn-out dwelling is numbered and valued; doors, windows, staircases, flooring, and, in fact, every part, is appointed to fresh uses, showing the truth of the adage, that "In old things there are new." The waste which formerly took place seems surprising. Great walls were demolished with hattering-rams, and by gangs of men tagging with ropes; the scene more resembling the demolition of a city by hostile invaders, than the orderly proceedings which are now observed on these occasions.

Fresh inventions are constantly coming into use. In great works, steam and hydraulic cranes and

railroads, at a great height, are prepared for raising materials, and it may be noted that contrivances are being brought into operation for lifting bricks, &c., which would seem to render the uncomfortable-looking operation of ladder climbing, with heavy loads, unnecessary; and it may be before long that the Irish labourers, incessantly climbing and descending with the load, may, like the female labourers above referred to, be requiescences of the past: they will, however, find employment for their energies in more useful ways, both to themselves and the community.

VIATOR.

CIVIL AND MILITARY BARRACK BUILDERS.

SIR,—Permit me to offer a few remarks on Mr. Sidney Herbert's statement in the House of Commons a week ago, to the effect that the barracks constructed by the Royal Engineers were much cheaper than those designed by civilians, giving as examples the barracks at Devonport, built by the Engineers for 70*l.* per man; at Preston, 80*l.*; Gloucester, 91*l.*; Aldershot, 51*l.*; and Berwick, 61*l.*; whereas the civil designs would have cost 141*l.*, 200*l.*, and 212*l.* per man.

Now, I presume that Mr. Herbert alluded to the designs called for at the recommendation of the Barrack Committee of 1855, when civil architects were invited to compete.

The instructions issued on that occasion, it was easy to perceive, were got up at the suggestion of parties who did not want the civilians to meddle in the construction of barracks; and, consequently, the profession were led into the belief that the Government required something after the manner of a palace, instead of the barn-looking buildings called barracks, for they were to have enclosed passages, and parades, and goodness knows what, all covered with glass, which, of course could not be constructed for anything like the cost of a simple barrack.

Therefore they were never executed, and the public have been persuaded how much cheaper than the civilians the Engineers can do the work.

I venture to state, however, that these civilian designs which were to cost 141*l.*, 200*l.*, and 212*l.* per man, would not have been carried out by the Engineers for twice these sums.

The facts quoted by Mr. Herbert are sufficient to condemn the whole system; for, leaving Aldershot out of the question, which are wooden huts of the most miserable description, and more like sieves than barracks, the lowest cost per man for which the Engineers execute barracks is 61*l.*; and as there are usually ten or twelve men in a room, each room costs the country at least from 600*l.* to 700*l.*

I question if a royal palace could not be built at this rate; and yet these buildings are of the plainest and meanest description, badly constructed, and in defiance of all architectural rules. The whole thing is monstrous. CIVILIS.

THE LINCOLN DIOCESAN ARCHITECTURAL SOCIETY.

THE visit of the Lincoln Diocesan Architectural Society to Workop has taken place, and is said to have been a very successful one.

The dinner took place in the Corn Exchange. The Rev. H. Gray read a paper on "Bolsover Castle," and Mr. Trollope followed with one on "Monastic Walls and Gate-houses."

The proceedings of the next day commenced with a public breakfast at the Lion Hotel, the headquarters of the society, to which many gentlemen sat down; and the excursionists left shortly after ten o'clock, occupying twelve carriages, which were speedily joined by many others. On leaving the town, in a westerly direction, the party entered Derbysire, and in the course of two or three minutes passed into Yorkshire, to the west of Shireoaks. The first stoppage was at Thorpe Salvin, a village about six miles from Workop, where half an hour was spent in inspecting the Norman church. Near this place is the Anston stone quarry, which furnished the materials for the Houses of Parliament. The visitors then proceeded to Loughton-en-le-Morthen, where they partook of luncheon at the inn, and then walked as far as the village church. A visit was next paid to the cartwork at Loughton, where the Rev. E. Trollope read a short paper on this remarkable work. The journey was shortly afterwards resumed, and the pleasant grounds of Roche Abbey were reached, where a paper was read respecting its interesting ruins, in which about an hour was spent, when the party proceeded to Carlton, in Lindrick, where half a dozen

Thames had manors and halls during the Saxon period. After visiting the church and other points of interest, they proceeded to Workshop, where dinner was held in the Corn Exchange. About 150 members and friends were present. Afterwards the company adjourned to the Museum, on which the Rev. E. Trollope lectured.

From the paper on Roche Abbey, as reported at length in the *Dorchester Gazette* (though without the name of the author), we take the following extract:—

"If you examine carefully the surface of the walls, you will notice three things. 1. That they have everywhere been plastered over, that false joints have been painted in black, and that the mouldings have been painted of an orange colour. This may be best seen in the south transept. 2. You will notice that upon the face of each stone the mark of the mason who cut it may still be discovered. These marks to me seem to possess more than an ordinary interest. Each stone, with its monogram, is a memorial tablet to an individual, who assisted in the building of the abbey, in the latter part of the twelfth century. More than thirty different masons' marks have been found on these stones. Yet seven hundred years ago this band of masons cut the stones, and the mason's monuments more durable than painted glass or polished marble! Where are the richly sculptured and painted epithets of the founders of the abbey?—Maud, Countess of Cambridge, and others? Broken, lost, and nameless! The poor mason's tablet has outlived them all! But there is, I am sorry to say, still one more thing noticeable on these elegantly carved stones, and I do not bring this subject before the present company, thinking it applies in any way to them, but in hopes, should any reporter be present, that he will give publicity to what I am about to say. I allude to the vice and vulgar practice of cutting names. What pleasure can there be in hacking the fair surface of these walls, and obtruding upon the eye of the stranger names as unknown as they are uncareful for? What gratification can be derived from 'Jinks, Leicester'—whose name and address are carved in full, younger—what satisfaction can it be to him to write his name there, when every intelligent person who sees it comes to the conclusion that he must be a vulgar and silly snob, with taste as execrable as his carving?"

COMPETITION.

*York and Ripon Diocesan Schools.*—Various designs were submitted in competition for the York and Ripon Diocesan Female Training Schools. From these the building committee have selected one by Messrs. J. B. & W. Atkinson, of York, architects, for adoption.

THE NINE HOURS' MOVEMENT.

Sir,—Considering the very able manner in which this subject was treated (during the great struggle of last year) in your valuable Journal, and by several very eminent writers in the daily press, it is doubtful whether any thing new remains to be said or written: the momentous interests at stake, however, induce me to offer one or two suggestions which you may possibly consider worthy a place in your next issue.

It is admitted on all hands that the value of labour, like other marketable commodities, is regulated by the law of supply and demand. If the latter exceeds the former, labour will be dear; if the former exceed the latter it will be cheap. It is clear, therefore, that, unless the promoters of this movement are in a position to prove that at the present time the building operatives are fully employed, their proposal is at least ill-timed, and cannot be looked upon with favour.

It is true that the leaders say their demand is for a shortening of the hours of labour, or more strictly shortening the length of the working day by reducing the number of hours from ten to nine; and this boon they ask at the hands of the master-builders, not because ten hours' manual labour is too severe a tax on their physical powers, but because they have now no opportunity for mental improvement.

If this were the sum total of their demand, there would, I apprehend, be no practical difficulty in the case; and if it be proved that the number of unemployed artisans form ordinarily a fifth of the whole, as is probably the case, their proposal would be a reasonable one,—perhaps, indeed, none better could be made.

When, however, the workmen say to their employers, shorten our day by one hour, but give us the same wage as at present, it is peculiarly characteristic the movement otherwise than as one for an increase of wages.

My object in writing, however, is not to discuss the propriety of the movement, but, assuming for the nonce that it is rational, to suggest a compromise. London mechanics command usually 5s. 6d. per day of ten hours, or a trifle more than 54d. per hour; they ask 5s. 6d. for nine hours, or a trifle more than 74d. per hour. Let the master-builders agree on and after, say Midsummer day, or any other early date that may be agreed on, to cease paying workmen by the day, and thereafter to pay mechanics 7d. and labourers 6d. per hour during the working day to be ten hours during the summer months, and eight during the winter.

I have long been of opinion, however, that the present system of payment to artisans, especially as opposed to equity, expediency, and sound policy; inasmuch as he who is lazy and incompetent obtains the same wage per day as he who is industrious, ingenious, and skilled. The obvious remedy for this state of things would be to employ workmen by the job or piece in lieu of by the day in all cases where it is practicable; and it would be so as to nearly the whole of the work prepared at the bench, as well as the greater portion of the fixing of new work, alterations, repairs, and exceptional new work, most of course be paid for according to the time occupied, and, as I would suggest, by the length.

The advantages of this reform would be manifold and obvious: the employer would have ample opportunity of classifying his workmen, and thus every man would be paid according to his merit. Such a time would be more satisfactory than the present system, both to the employer and employed: none, indeed, could complain except it be the first class of workmen referred to, viz. the idle and incompetent; but in the interest of these I do not write,

except to advise them henceforth to emulate their competitors, whose condition would doubtless be benefited by the change. WILLIAM EDWARDS.

BUILDERS' ACTIONS.

PENALTIES FOR TIME.

*Thornhill & Son v. Neale.*—*Count of Common Pleas, Westminster.*—This was an action by a builder (Acted June 22nd) to recover 1,173*l.* The plaintiff pleaded that the buildings were to be completed by contract within a given time, and that the plaintiff had not finished them in that time, and had incurred 7*l.* as penalties by way of liquidated damages, which he claimed to set off. The plaintiff replied that the defendant had, after the contract, required certain alterations and additions to be made in the buildings, and that by reason thereof it was impossible, as the defendant knew, to finish the buildings in the stipulated time. There was a demurrer to this replication.

Mr. James Grant appeared for the plaintiff, and Sergeant Kinglake for the defendant.

The Court held that the replication was good, and that the plaintiff was entitled to recover; and that there had, by the subsequent agreement as to the alterations in the buildings, been a waiver of the original contract as to the time when the buildings were to be completed.

Judgment for the plaintiff.

"LIGHT AND AIR."

*Court of Common Pleas, Westminster.*—On the 21st day of the court was occupied during a great portion of the day in trying the question whether the new building in the course of erection for a hotel at the corner of Berkeley-street and Piccadilly materially obstructed the light and air to which the plaintiff, the occupier of a neighbouring house, was entitled by a lease.

The table of the court was covered with models and plans of the most elaborate and expensive description, and the trial seemed likely to last for a considerable time.

Mr. Bovill, who acted as the advocate for a series of witnesses, who proved distinctly that his property was greatly deteriorated in value.

At the close of his case, however, the jury said that they had no objection to the new buildings (having a view of the premises) that the new buildings were not detrimental to his light or air.

Mr. Chambers, Q.C., was therefore not called on to give evidence, and a verdict was entered for the defendant.

The learned judge observed that one view was better than fifty witnesses, who, having given their opinion in favour of the plaintiff, would be met by fifty other witnesses who would give theirs for the defendant.—Verdict for the defendant.

DECISIONS UNDER METROPOLITAN BUILDINGS ACT.

*Woods Buildings.*—At the Westminster Police-court Mr. P. B. Simpson, of Cremorne Gardens, appeared before Mr. Arnold to a summons taken out by Mr. Samuel Beachcroft, surveyor of the district of Chelsea, for that he being the builder engaged in erecting buildings situate in Cremorne Gardens, neglected to give him, the said surveyor, two days' notice before such building was commenced, contrary to the statute, by which neglect he had rendered himself liable to a penalty of 20*l.*

Mr. Alfred Williams, clerk to Mr. Beachcroft, proved that the building was a polygon, about 108 feet in diameter, and at each angle nooks were let into the ground 4 feet, varying from 34 to 26 feet in height. At the top of the building there was to be a cupola, and the roof was to be covered with asphalted felt. In the centre of the structure was a railway, the form, about 6 feet from the ground, and the public were admitted to it by an inclined ascent.

Mr. Rawle, on the part of the owner, said he was prepared to show that the structure in question did not come within the interpretation of the word "building," as contemplated by the Act, as this, after being erected, could speedily be removed, and be placed in another position. It was a structure that was easily removable, and, he considered, not such a one as was contemplated by the Act as a building, any more than could a dancing booth, or any large tent for the exhibition of shows at a fair. After a long argument,

Mr. Arnold observed that it was a case of some importance, and that before he gave his decision he should take an opportunity of going to the Gardens, and seeing the "building" in question.

On the 26th inst. Mr. Arnold gave his judgment. He said he was of opinion that this case must be decided upon the same principles as had influenced his decision in the case of the Marionette Theatre at Cremorne in 1857, as it fell within the rule then laid down that the word "building" meant something of a permanent structure, permanent, at least, as regarded its component parts. In some respects, however, this case differed from that of the Marionette Theatre, inasmuch as this structure was somewhat of a more permanent character, as it was supported on piles or uprights fixed in the ground, all the other parts being screwed or fastened in by plates. The piles, however, remained as scaffolding poles by aid of chains of iron, it was not necessary to dig away the soil. He had been at great pains to examine the building at Cremorne Gardens, which was called the Stereorama, and the conclusion he had come to most certainly was that the theatre had the most great appearance of solidity and permanency, and much more resembled a building, than the present structure, and consequently came much more within the Act, for it had pits and galleries, and was capable of holding several hundred persons at once, while the Stereorama had no seats, and, although a large structure, would only accommodate a few spectators at once. He, then, his decision as to the Marionette Theatre, was correct—and he must say he entertained some doubt as to whether it was—that decision must govern the present case. The same difficulty presented itself as in the case of the theatre, viz. a structure made of wood and canvas was a building, it must, to comply with the Act, be pulled down and rebuilt with brick, or, to put the matter strictly, a building of wood and canvas must be made of brick. It was not necessary to repeat that the Act was most explicit: it was quite as intelligible to lawyers as it was to laymen, and of all laymen he certainly believed it was least intelligible to builders themselves. The decision, however, he had come to was, that

this was not a building, and the summons must, therefore, be dismissed. Mr. Arnold amongst them, seem bent on increasing the difficulties to which he alludes. It a building in which the public are to assemble be built with brick walls and proper arrangements, it comes within the control of the district surveyor and the Building Act: if it be put together of wood, and be, possibly, in every respect of the most dangerous character, the provisions of the Act are not to apply, and the lives of the public must be left to chance.

THE "BUILDERS'" LAW NOTES.

*Bill of Exchange.*—An action was brought on a bill of exchange drawn by the plaintiff and accepted by the defendant, payable to "the treasurer for the time being of the Commercial Travellers' Benevolent Institution." It was held by the Court of Common Pleas, on argument, that the bill was bad for uncertainty, for that it must be at the time of drawing clearly ascertainable who is the payee under the instrument.—*Tates v. Nash.*

*Misrepresentation.*—A house-agent induced a person to buy the goodwill of a certain public house on a misrepresentation of the "takings" of the house. The purchaser, finding himself deceived, sued the vendor, without notice to the agent, for the deceit; but failed, as he could not show that the mis-statements of the agent had been authorized. He then sued the house-agent, and obtained a verdict for the loss sustained by the re-sale of the goodwill, and a sum for personal loss and inconvenience, and also the costs of the unsuccessful action. The last part was struck out on argument before the full court, as the action was not directly caused by the house-agent, but might have been avoided if he had got notice.—*Richardson v. Dunn.*

*Lands' Clauses Act.*—A railway company sought to take a house to which were attached a shrubbery and several gardens, separated by walls, but having a connecting path through them. It was held that the term "house" meant all that would pass under the ordinary conveyance of a house, and that the company were bound to take with the house the shrubbery and gardens.—*Hewson v. The Great Western Railway Company.*

*Building Society.*—A dispute between a member who denied his liability under the covenants in his mortgage deed to pay subscriptions and fines was held not to be a matter in dispute within the meaning of the rule of the society that required all disputes between the members and the society to be referred to arbitration.—*Farmer v. Giles.*

*Half-Notes.*—A person sent half-notes to pay an account for a third party, but before sending the second halves he found, by altered circumstances, that he was not the party who ought to pay the account. It was held, in an action by him for the first halves, that he was entitled to them; for that, until payment was complete, property in the note remained with the sender.—*Smith v. Munday.*

CHURCH-BUILDING NEWS.

*Lincoln.*—The work of restoring and renovating the west front of Lincoln Cathedral, according to the local *Chronicle*, proceeds satisfactorily. The Early English porch has been recently opened out. The columns, which are of Purbeck marble, in places where they have not been exposed, are in a good state of preservation, and to the touch are smooth and polished.

*Long Sutton.*—Sutton Church has been restored. The restoration is of a plain character, with little ornament. The clustered pillars built in moulded brick, owing to the damaged state in which they were discovered when stripped of stucco, have been again covered with a coat of cement. The chief work has been expended on the chancel, which has been restored entirely by the Vicar and Lay Improvers of Long Sutton. Here the architect, finding no structural character worth preservation, has given the building the architectural character of the tower. A lofty roof has been erected, and three decorated windows have been inserted. The interior has been furnished with plain oak stalls, and the eastern end raised and paved with Milton's encaustic tiles, relieved by white marble slabs. A large gallery which obscured the lofty arch has been swept south aisle, previously boarded off as a vestry, has been thrown open to the church. Five new windows, designed to correspond with the few remaining old windows, have been inserted. The entire area of the church has been resented in stained pine. The gable of the porch has been rebuilt, and a small vestry has been erected on

the north side of the chancel. The restoration of the chancel is from the design of Mr. Wm. Smith, of London. The woodwork has been principally executed by Mr. B. Ballerban, of Wisbech, who has presented the carved oak lectern; and the stowwork of the chancel, including the credence table, is by Mr. Lawrie, of Downham. The remainder of the work has been executed by Messrs. Warwick, mason, and R. Carbut, builder, Long Sutton; and by Messrs. Cunningham & Harrison, carpenters, Luton. The total expense will not exceed 750l.

**Little Cawthorpe (Louth).**—A new church has been erected and opened here. It is built entirely of brick of light colour, striped horizontally, with black externally and with red in the interior. Its roof and spire are covered with slate. The east window is of stained glass, the centre light of which contains a medallion representing the Crucifixion, and another smaller one at the apex of the window gives an emblematic representation of the Trinity. Mr. J. R. Withers, of London, has been the architect, and his designs have been carried out by Mr. C. Clark, builder, of Louth.

**Ipswich.**—The foundation stone of a new Wesleyan chapel has been laid in Museum-street. Mr. William Pretty headed the subscription list with 1,000l. The new chapel will seat about 1,050 persons, the inside dimensions being 76 feet by 46 feet. The width is divided into three spans by timber arches carried upon iron columns, the centre arch being 40 feet high from the floor, and the side arches over the galleries 25 feet in height. The front towards Museum-street will be faced with Kentish rag-stone and Caen stone dressings, the details of the windows and other decorative portions being of the early Geometric style of English Gothic. The centre entrance will be through an open arcade of three arches, 15 feet high, and on each side are stone staircases, which lead to the galleries. In the rear of the chapel will be six class-rooms and a school-room above (level with and communicating with the galleries) capable of seating 300 adults. Mr. John Wright has undertaken the contract for the whole work, at 2,000l., from designs prepared by Mr. Frederick Barnes, architect. The other tenders received were from Mr. Luff, 2,200l.; Messrs. Warswick & Morphey, 2,240l.; and Mr. Gibbons, 2,549l. 10s.

**Colchester.**—The north aisle of All Saints' Church is to undergo a complete restoration internally. The façade consists of six bays, five of which contain large three-light perpendicular windows. The whole is crowned with an embossed battlement, in which red brick is to give way to flint panelling. There are three enemies to contend with here,—the decay of nature, Puritan zeal, and the "taste" of the "good old times." The nave and chancel were restored in 1854. The architect is Mr. Henry W. Hayward, and the contractor Mr. W. Bremer.

**Uppingham (Rutland).**—The estimated cost of restoring and re-opening the church of St. Peter and St. Paul, Uppingham, is about 4,000l., of which upwards of 3,000l. have been promised. It is proposed to remove all the ill-arranged galleries and pews, widen the north aisle, lengthen the nave one arch, provide new roofs and seats for the whole building, and thoroughly repair the tower and spire. The architect is Mr. Henry Parsons, of London, who restored Riddington church.

**Banbury (Oxon).**—The buildings in connection with the Banbury cemetery are now completed. The grounds in which they are erected are in extent about five acres. The chapels are detached, and are in every respect peculiarly similar, containing a *porte cochère*, or covered way, a nave, and a chancel. The elevations assume the style of the twelfth century. The sides of the nave are gabled, having triplet windows, by which means the effect of transepts is gained. The carving is a copy of the natural foliage and flowers found in the cemetery grounds. The interior is paved with ornamental tiles. A bell turret is provided to each chapel upon the west gable. The lodge for the sexton is built upon a raised and sloped terrace. This building is of the same style as the chapels, but built entirely of brick. The contractors are Messrs. Orchard, of Banbury; and the architect is Mr. C. H. Edwards, London.

**Preston (Ladbury).**—The ancient fabric of the church in this small place being in a dilapidated condition, its restoration and enlargement were resolved on. The chancel has accordingly been restored, and fitted for the occasion with stalls. An aisle has been added to the church on the south side of the nave with a lean-to roof, the arches and columns belonging to the Early English period. The whole has been re-seated with

oak open benches. The font, of Early English character, is the gift of the labourers and children of the parish. Mr. Huggall was the architect employed.

**Newport.**—We are asked to mention that the Maiden's window, at Newport, was both designed and executed by Messrs. Lavers & Barrard.

**Devizes.**—The parish church of Beechingstoke, in Devizes, which is in a dilapidated state, is about to undergo restoration, consisting of new open roofs to nave and chancel, entire reseating, new pulpit, font, and screen to chancel, new bell turret, and sundry door and window restorations. The chancel will be restored by the rector. The works are to be carried out under the superintendence of Mr. S. B. Gabriel, architect, of Bristol.

**Cheltenham.**—The tender of Mr. J. Acock, of Cheltenham, for the erection of St. Mark's Church, in this town, for 2,880l., has been accepted. Mr. Acock's tender was about 20l. under one sent in by Mr. Darby. The contract binds Mr. Acock to complete the erection within twelve months, and he has commenced operations.

**Cardiff.**—The foundation-stone of St. Andrew's Church, Cardiff, has been laid. This is the sixth new church for Cardiff and its suburbs. The new site is in Windsor-street, Crockerbottom. The architects selected to prepare the plans, &c. are Messrs. Pritchard and Seddon, of Llandaff. Mr. T. Williams, of Canton, is the builder. The church will consist of a nave 80 feet by 32 feet, with narrow aisles on either side, a west porch, and a chancel, with vestry and heating chambers on either side. The chancel will be 36 feet by 18 feet. The height of the edifice to the ridge of the roof will be 63 feet. The east window will be the largest in the town: it will be lighted with five lights with tracery on the head, and will be 53 feet high. The church will accommodate 583 persons in all, and a large portion of the sittings will be free. It has been so arranged that the whole of the congregation will be accommodated in the area of the nave, the aisles being merely passages to the pews. By this means the seats will occupy all the best parts of the church, and their occupants will not be incommoded by pillars, as is usually the case. The church will be lighted by clerestory windows above the aisle roofs. The building will be so arranged as to permit of a tower and spire being added. The architecture will be of a simple type, of geometrical decorative Gothic. The walls will be built of Newbridge sandstone in courses, relieved by pebbles and bands of other stones.

**Birmingham.**—A new congregational chapel is about to be erected at the junction of John-street with the Moseley-road, Balsall-heatb. The plan of the edifice is in the form of a parallelogram, being 42 feet 6 inches wide and 77 feet long on the ground-floor. A gallery is placed over the principal entrance: there are also side galleries, containing three tiers of seats, extending the whole length of the building. The accommodation provided is for 870 adults and 150 children. Two vestries, with offices, are arranged at the rear of the chapel. The principal feature in the front elevation is a double central entrance, the arches being supported by circular Bath-stone columns, with carved and foliated caps, over which is a range of double lancet windows, extending the whole length of the principal front: there is also, at either angle, a turret, 70 feet high, which contains a staircase leading to the gallery. The style adopted is Early Pointed in character; the materials for the facings being red bricks, with Bath-stone dressings, and blue and white bricks and tiles worked in bands, patterns, and arches. The roof will be covered with slates. The whole of the seats are to be open, of deal, stained and varnished. The work is about to be carried out under the superintendence of Mr. Edward Holmes, of this town, architect, by Mr. Charles Jones, whose estimate has been accepted for the work. The entire expense to be incurred will amount to upwards of 3,000l. (including a sum of about 560l. for the land).

**Wigan.**—For the restoration of the Parish Church tower, the amount of subscriptions already promised is upwards of 700l. The plan proposed to be carried out has been prepared by Mr. Paley, of Lancaster, architect.

"CLASSIC OR GOTHIC?"—Mr. F. R. Wilson has published photographs of his drawings under this title, which are exhibited in Conduit-street, and were described by us at some length in our notice of the Architectural Exhibition. The photographer is Mr. F. Ordish, of Brompton.

RECENT PATENTS CONNECTED WITH BUILDING.\*

**MATERIALS FOR BRICKS, &c.**—*W. Blinkhorn*, Sutton, near St. Helen's, Lancashire. Dated 19th November, 1859.—According to this invention, which is entitled "The novel application of certain materials to the manufacture of bricks, quarries, or tiles, to be employed principally in the construction of furnaces as 'fire-bricks,'" the material to be employed chiefly is the waste sand from grinding plate-glass, either alone or in combination with clay, lime, or oxide of iron, or mixed with a small quantity of pulverized quartz. The material for tiles is chiefly "spent gypsum," from the polishing of plate-glass, either alone or in combination with the above-named materials.

**MOULDING AND PRESSING BRICKS.**—*W. E. Neoston*, Chancery-lane, London. A Communication. Dated 21st November, 1859.—This invention consists chiefly of a mode of moulding and pressing bricks, whereby a concave form or surface is given to one of their sides for the reception of cement or mortar. In carrying out this invention an annular rim or concave moulding surface is employed in such a way that the bricks are moulded by the pressure of a rotating wheel or roller mounted inside the concave moulding surface, and made to press the bricks towards the circumference, the finished bricks being pressed out of the moulds and discharged in a direction towards the axis of the said concave moulding surface, that is, towards the inside or concave part of the moulding wheel.

**MOULDING HOLLOW BRICKS, &c.**—*J. Howard*, Fenchurch-street, London. Dated 3rd November, 1859.—The object of this invention is to mould hollow bricks and other hollow articles with a closed end by pressing them through a die by means of a moving plunger. It is proposed to admit air to the interior of the moulded hollow article, or to the inner face of the closed end thereof, just prior to its starting from the die.

**PLASTIC COMPOSITIONS TO BE EMPLOYED FOR BUILDING AND DECORATING PURPOSES, AND IN LIEU OF MARBLE, &c.**—*R. A. Brooman*, Fleet-street, London. A Communication. Dated 31st October, 1859.—From the similarity of these compositions to marble the inventors style them "similimable." To manufacture similimable intended to remain white, take sulphate of potash about 14 oz.; river water, 16 quarts; gum arabic, 2 lb.; purified cement, 20 lb.; marble or alabaster powder or dust, 20 lb.; and treat as follows:—First mixture: Dissolve over a slow fire, stirring all the time, 14 oz. of sulphate of potash in 16 quarts of water: after fusion dissolve 2 lb. of gum arabic. Second mixture: Stir together 20 lb. of purified cement, 20 lb. of marble or alabaster dust, and 5 lb. of lime, slacked sufficiently to cause it to crumble into powder. Pour into a mortar of marble, porcelain, or other suitable material, a part of the first and a part of the second mixture, and stir with a wooden or bone spatula until the ingredient assumes the state of thick paste; then beat with a pestle until the mass becomes elastic, which will be ascertained by the composition not adhering to the pestle. To make mouldings or castings, grease the mould, and apply a first layer of about one-third of an inch in thickness of the composition produced as aforesaid; this first layer is backed by another formed by boiling, for about three or four hours over a brisk fire, hemp, tow, or other filamentous substances, cut small in the "first mixture" of gum and sulphate of potash. The product is mixed with the "second mixture" in a mortar and well beaten with a pestle until the filamentous parts are divided through the mass, and the whole reduced to a paste. Thus, it is said, a composition of great solidity and impermeability is produced, lighter than, and taking an equal polish to, marble, and resisting the action of frost better than marble.

**"VENTILATORS."**—*G. Wemyss*, Springwood Park, Roxburgh, N.B.—A Communication. Dated 3rd November, 1859.—There is fitted up in the wall of the room to be ventilated, and by preference near the ceiling, an adjustable "gridiron" valve or slide, the face of which is flush with the inner face of the wall. This valve governs a passage into a metal chamber, which is fitted into a hole in the thickness of the wall directly behind the valve. This metal chamber is double the external section or division, being solid and close, excepting where the adjustable door or valve opens into it from the apartment, and where a tubular thoroughfare opens from it on the opposite side to connect the apartment with the external atmosphere. The inner section of the chamber has a solid end next to the valvular pas-

\* From the Engineer.

sage, but it is perforated or slotted all round, so that the vitiated air, as it enters from the room, first of all strikes against the solid end, and is then diffused along and over it, passing in between the two sections or divisions of the chambers. From this space the vitiated air passes into the interior of the inner section of the chamber through the openings in the sides, and it flows off therefrom through the end opposite to the solid end, and the valvular entrance of the external section or chamber, thus escaping into the tube before mentioned, and passing off into the atmosphere. The air does not, however, pass at once into the atmosphere, but it flows into a second duplex chamber built in the external face of the wall. It is the same as the duplex chamber in the apartment, except that its outer end or face is covered by a shield-piece open all round for the passage outwards of the vitiated air.

IMPROVEMENTS IN MACHINERY FOR GRINDING AND POLISHING SHEETS OF PLATE AND OTHER GLASS.—*G. T. Bousfield*. A Communication. Dated 5th November, 1859.—To grind plates of glass to an even thickness, the plates are placed on a carriage which slides on an inclined frame, and above the centre of the frame a grinding cylinder is supported, so that it can be brought nearer to or farther from the frame, to regulate the thickness to which the glass shall be ground. The grinding cylinder is caused to revolve rapidly by a pulley on its axis being driven by a driving band, and the cylinder is so supported that, in addition to its being caused to revolve, an endway motion may be imparted to it by a disc on the axis of the cylinder working in a grooved can on an axis to which motion is given from the axis of the grinding cylinder. A hopper, containing sand and water, or other grinding material, is placed above the grinding cylinder, to supply grinding material.

### Books Received.

*Ancient Armour and Weapons in Europe from the Iron Period of the Northern Nations to the end of the Seventeenth Century.* By JOHN HEWITT, Member of the Archaeological Institute of Great Britain. Three Vols. Oxford and London: John H. & James Parker.

The first volume of this work, bringing the subject down to the end of the thirteenth century, was published in 1855. The second and third volumes, continuing it to the end of the seventeenth century, are just now issued. To describe them more closely, however, it must be mentioned that the second volume deals with the fourteenth century alone, and the third, called a supplement, gives a series of examples of armour and weapons belonging to the fifteenth, sixteenth, and seventeenth centuries, with which latter armour-bearing terminated. These are three very handsome volumes, profusely illustrated from contemporary monuments, and will be found very useful by painters, sculptors, stage-artists, and others. To the advanced student of ancient armour, to those seeking to clear up doubtful or disputed points, we are disposed to think the book will be less satisfactory. We should say, at starting, that we have a quarrel with Mr. Hewitt, as author, on two grounds,—his treatment of the late Sir Samuel Meyrick, and his defence, on a previous occasion, of forgeries purchased for the Tower. A great debt is owing to Meyrick, who was the pioneer in the elucidation of ancient armour and weapons. All that has been done since has been founded on his previous labours, and but for these the book now before us would not have been written. Of this debt, however, there is not the smallest acknowledgment; in fact, we do not observe that the name of Meyrick is in the book. There is a living English writer, too, on the subject, whose researches deserved acknowledgment, but have not found it.

In some cases, where Mr. Hewitt differs from his predecessors, it is done without conclusive argument. For example, the term *palet* or *ronnel* has been applied, on the suggestion of Meyrick, to the junction of the cuirass and the armpit armour. Mr. Hewitt views the *palet* only as a helmet, and says "the *palet* (*pelliers*) appears from its name to have been originally of leather; but the word, like the cuirass, became extended to the analogous defence of iron." There is no doubt that *palet* was a cant name for a man's skull. See *Minor's Poems* (fourteenth century).—"I'll knock thy *palet*." Much later, indeed, the crown of the head was called the *palet*, though the term is now obsolete. Nevertheless, the plates in question used for the armpits may have

been called *palets*, for *paleta* and *palettus*, in Du Cange, mean everything in the world, and something besides;—a measure for corn, a pell or hammer, a staff shod with iron, a lever to raise machines, a ring, a round (orbicular) object (why not a plate?), &c. It would seem moreover, quite as a natural assumption on our author's part to call them *gouchelets* or *gussets*, unless he has better authority from it than the one quotation he gives, an extract from the "History of Charles VII." by Malchou de Coucy, who says, speaking of a contest in 1416: "L'Anglais frappa de sa lance le dit Louis tout dedans et au travers, scavoir, adoussons du bras et au vis de son harnois, par faults et manque d'y avoir un crescent ou *gouchelet*,"—through not having a crescent or *gusset*,—but this is by no means conclusive. The writer may mean to say, because he had neither a crescent (of plate), nor *gusset* (of chainmail). *Gusset* is certainly not a good word to apply to the circular or oval-shaped plates of metal of which we are speaking.

In the use of the word "halberet," again, it is quite clear that it simply means "light-body armour—the corslet?" However, not to pursue a disagreeable path, and to let Mr. Hewitt speak for himself, and give a sample of his style, we will extract part of what he says of *cannon*:—

"The date of the first appearance of cannon in the field has long been a subject of dispute, and probably will long remain so. The plain of Cressy still continues a scene of contest between opposing archeologists. The chief arguments brought forward by those who maintain that the English employed cannon at this place in 1346, are, the passage in the 'Chroniques de St. Denis,' that of Villain, the 'Froissart,' and the statement already noticed of this chronicler, that the English were 'used to carry cannon with their armies.' On the other side it is objected that in the numerous manuscripts of Froissart, where he has treated with such particularity and at such length, and from the testimony of those who took part in the fight, the various incidents of the day (and of the previous march, also), not a word appears about guns or gunners; but the word *cannon* is distinctly attributed to the English archers. The passage in the 'Grandes Chroniques' runs thus:—'L'Esqueuils Anglois getterent trois canons dont il advint que le sieur Genevois archibailleur, qui estoit en premier front, tourment le dos et laissèrent le traire, al ne seot on si ce fait treason non.' Villain writes:—'E ordna il re d'inghilterra i sus arcei, che n'avea grande quantite au per le carra, e tali di sotto con bombardie che acetano pallotte di ferro con fuoco, per imparare e disorsari i cavalli de Franceschi.' The transcript of Froissart's 'Chronicles' preserved in the Library of Amiens contains this passage:—'Et li Angles desputerent aucuns canons qui's avoient en la bataille pour esbaluz li Genevois.'"

The anonymous compilation of this portion of the 'Grandes Chroniques,' and the distance of Villain from the scene of action, are not circumstances to add weight to the evidence of the volumes in question; and both writers may be pardoned for seeking to refer the disaster that befel their countrymen to the employment of some new and terrible instrument of destruction. The unique copy of Froissart at Amiens does not seem entitled to much attention. It can scarcely be an early manuscript, or we should have had transcripts containing the same words; and, if late, its authority vanishes altogether.

In 1382, however, we obtain more reliable evidence of the employment of field guns. The men of Ghent, marching to the attack of their adversaries of Bruges, 'chargèrent environ deux cents chars de canon et d'artillerie: ils leur leur port on a hill, suffered the troops of the count to begin the attack, and the Ghenters to get the advantage of the sun, and plied the Bruggens with their guns: 'Sitôt que ceux de Bruges outrent la voix de ceux de Gand et les canons desloperent, et que ils les virent venir de front pour eux assaillir, ayement, ils jetèrent leurs batons jus et tourment le dos.'"

At the combat of the Pont-de-Comines in the same year, 'y avoit aucuns qui jetoient de *bombardes portatives*, et qui traioient grands quartiaux ennemis de fer, et les faisoient voler outre le pont jusques à la ville de Comines.'"

Philip von Arteveld directs his men assembled on the Mont d'Or, when the attack shall begin, to ply their bombards, cannon, and crossbows, in order to intimidate the enemy. And we further learn that these cannons and bombards cast forth "gros carreaux empennés d'alraïn."

That hand-guns were invented, though but rarely appearing, in this century seems very probable from several contemporary evidences."

The "gonne" of that day was a very different thing from the Whitworth of ours, which does its dreadful work at five miles' distance.

*Observations to accompany the Map of the Shadow Path thrown by the total Eclipse of the Sun, on the 15th July, 1860, across the North-eastern part of Spain.* By CHARLES VIGNOLES, F.R.S., M.R.I.A., and C.E. &c. London: Longman & Co., 1860.

This elaborate work is dedicated to the Astronomer Royal by the author, who, well known as an engineer, is himself a fellow of the Astronomical Society. The map was prepared, in the first instance, solely for private circulation among scientific men; but Mr. Vignoles was led by the very great number of inquiries made to it to think that a more extended circulation might be acceptable.

The accompanying "Observations" though confined to what is relevant to the subject, contain much useful and interesting general information as to Spain, the state of its roads, railways, and

general means of conveyance and accommodation as well as its physical aspect and peculiarities. The roads on the map have been laid down from the official map of the carriage roads of Spain, published by the Board of Public Roads at Madrid, and from the best local maps, especially those of Navarre and the Basque Provinces. As for the railways, which are numerous, but mostly only in course of construction, Mr. Vignoles must be in a position to give the best information to the Spanish Government and its national maps in place of receiving any from them, inasmuch as he is the engineer of many of them himself. The prospect of conveyance through the country to an Englishman, however, is by no means enticing, according to the author, and seems to require the actuating spirit of the enthusiastic astronomer to enhance its somewhat negative attractions. He must also be prepared to pay well for ill accommodation, especially if he show that he is in a hurry, and must secure his retreat before-hand, as the *malles postes* and diligences to the coast are sure to be all engaged, sometimes for weeks, previously to starting: so are the post-horses in summer, and very few relays are kept. It is not in every town, either, that a wheeled carriage can be hired: these vehicles are generally like a small omnibus, and ought not to have less than three horses or mules. As for riding horses these can more readily be had; but the traveller must beware of riding mules. Not a very brilliant picture this, however picturesque and primitive. There are spirited and enterprising Englishmen, nevertheless, whom such minor difficulties will perhaps only stimulate the more to take the trip on this interesting occasion.

Astronomical instruments will be admitted free of duty, as liberally intimated by the Spanish Government.

One of the chief objects of attention at the eclipse, as remarked by Mr. Vignoles, will be those roseate and cloud-like protuberances which surround the disc of the moon at the moment of total solar eclipse. In an appendix, some interesting remarks, by various astronomers, are given, on these as well as other points.

Opinions differ as to whether these rose or flame-coloured and fantastically-shaped masses are connected with the moon or with the sun. "To admit the possibility of their being solar mountains," says Dr. Lardner, "we must suppose their height to amount to nearly a twentieth part of the sun's diameter, that is, to 44,000 miles." But a more feasible idea seems to be that they are clouds in a solar atmosphere. "There appear to us, however, to be well-grounded objections even to this hypothesis. Thus the Rev. W. R. Dawes remarks, in reference to one mass, of a rich carmine hue except where partially hidden by a flocculent intervening substance, that, to his astonishment, "this marvellous object continued visible [round the moon's disc, that is] for about five seconds after the sun began to appear; and Mr. R. Stephenson observed that "the largest of the three prominences presented the appearance, at one moment, of an irregular solid mass standing out from the moon, and visible only on one side; that is, one side was in shadow, and the illuminated side resembled a rose-coloured sickle."

Were these extraordinary Auroras of the nature of clouds in a solar atmosphere, how could one side of any of them be in shadow? Their deep and vivid colours, too, would rather seem to militate in favour of the idea that they did not exist in the midst of, or within or beyond, the pure white light of the sun, but nearer to the eye, and were more analogous to our own clouds, tinted by the solar light transmitted first from the sun to them, as intervening surfaces, and next from them to us. It comes, therefore, to be a question, whether it be possible that they can be clouds in a lunar atmosphere. Mr. Dunkin, in his observations, seemed to have the idea that, at all events, they were connected with the moon. But then the moon is believed to have little or no atmosphere: here is the difficulty, which doubtless goes further than anything else towards preventing astronomers from conceiving this curious auroral display to be a lunar one.

As an endeavour was made on a previous occasion in our columns (by J. E. Dove), to obviate this great difficulty; and as the subject unquestionably involves one of the most interesting and curious of all the phenomena witnessed or to be witnessed in every total solar eclipse, and ought, as Mr. Vignoles remarks, to have particular attention given to it on the forthcoming occasion, perhaps we may be excused for reproducing a portion of what was said in the *Builder*, in 1856, on this very singular question, in a paragraph on a "Centrifugal Theory of the Moon," originating in a

previous one on "The [negative] State of Architecture on the Lunar Surface."—

"If the moon really have an atmosphere with vaporous clouds and other aqueous forms, all centrifugized to its exterior hemisphere under the influence of the revolving or centrifugal force, as it must act on, and *oblongate*, a sphere such as it is, always presenting, as it does, one and the same face or hemisphere away from the centre of its revolution,—can it be that the earth is never so situated in relation to that hemisphere, that atmosphere, and these clouds,—thus for ever, doubtless, placed beyond the straight line of our visible presence, that, at all events, by some refraction or refraction of light from the latter, as they float in the lunar atmosphere, these lunar clouds may, at least for a moment or so, become distinctly and actually visible to the earth's inhabitants? In such a case as that of a total eclipse of the sun, for example, by the intervention of the moon between it and the earth, ought not some of the lunar clouds to appear by refraction, as coloured streaks, above and around the black disc of the moon, and amid the ring of solar light thus left? Now, what else can those auroral or flame-hued, roseate, fantastic, and heretofore unaccountable streaks be, which, in fact, do appear, above and around the black lunar disc, in the midst of the solar total eclipse, and which have hitherto excited so much astonishment and unrewarded curiosity amongst astronomers of all nations? Can these ruddy streaks be anything else than auroral cloud-refractions from the lunar atmosphere, seen above and around the horizon of the higher side of the lunar ball, in a way similar to those false (yet true) appearances or simulacra of ships and towns, above the earth's own horizon, by refraction, while yet in reality completely beyond or below that horizon above which they thus appear?"

In concluding our notice of Mr. Vignoles's handsome volume and elaborate map, we may remark that it is an interesting sign of the times that so many of our people are likely to go abroad, on this strictly scientific occasion, as to warrant the publication of an expensive work such as this is.

BOOKS OF TABLES.

*The Universal Table Book.* By M. D. KAVANAH. Cornish, 297, Holborn, W.C.  
*Cottman's Builder's Tables.* Cottman, Fording-bridge, 1860.

THESE are both useful little books of their kind. The Universal Table Book is prepared and intended for the use of colleges and public schools, engineers, and mechanics, counting-houses, and tradesmen, and indeed for everybody. It contains a variety of tables, besides those of multiplication, weights and measures of many kinds, interest tables, foreign money tables, &c. Of Cottman's Builder's Tables, we need not restate the contents: they are well known among our readers, and it is not the first time we have had occasion to refer to them.

LEGAL HANDY-BOOKS.

SEVERAL of the shilling Handy-books, by Dr. J. W. Smith, Barrister-at-Law, published by E. Wilson, of the Royal Exchange, have been before noticed in our columns; but they now form a series applicable to many phases of life, social and commercial, and appear to be exceedingly useful and clear of perplexing terms. In the series are Handy-Books of the law of master and servant, husband and wife, partnerships, bills, and all sorts of notes and I. O. U.'s; banking, and commercial and social affairs generally.

VARIORUM.

"ENGLISH HISTORY. By Henry Tuce, M.A., and James Gilbert" (Kent & Co., Paternoster-row), is an extension of a little book titled "Outlines of English History," which was favourably noticed by us at the time of its appearance, and of which, it now appears, no less than 170,000 copies were sold. The more extended volume contains very copious notices of the customs, manners, dress, arts, commerce, &c., of the different periods, and is altogether a very able condensation of the history of England. True it has been accused of a Roman Catholic leaning; but, so far as we have been able to discover,—and we cannot pretend to have perused the whole,—there is little which would seem to justify such a charge. The Reformation we notice, is once referred to under inverted commas as the "Reformation," but this is in close connection with the personal doings of Henry VIII. The title "Defender of the Faith," too, which her Majesty and her Protestant predecessors have maintained, and which Mr. Shell, of the Mint, a Roman Catholic, tried to blot out of our coin, is spoken of as having been conferred by Pope Leo X., and this, though briefly done, may be supposed, by suspicious and straitened people, to be done in such a way as to imply or show a Popish leaning. But the statement is simply a fact, both as regards Henry and as regards Queen Victoria, although the title has been continued by the Protestant sovereigns in a sense different from that intended by Pope Leo. The extended work seems so far as we have seen of it, to be a worthy and judicious successor to the

smaller one.—"An Account of the Chorleywood Association for the Improvement of the Labouring Classes," has been published by Messrs. Longman & Co. We are glad to observe, from this little pamphlet, that so useful and commendable an Association is making progress in its chief objects, which are, as our readers may remember, the encouragement of habits of order and of self-management, of economy and saving, of education or the use of the mind, of healthy recreation, and of mutual goodwill and respect between all classes. It affords an example to the gentlemen and residents generally of our rural districts, showing what they may do in one special way for the good of their kind.

Miscellaneous.

"THE CLUB."—In these days the term club usually implies a magnificent stone building in Pall-mall or St. James'-street, by Smirke or Barry. But there still remain one or two of the old houseless clubs with which our grandfathers were familiar. Amongst others, there is one which so far transcends all others, both in antiquity and in old associations, that it has all along maintained the name of "The Club" *par excellence*. To it Dr. Johnson, Boswell, and the other wits and literati of his day belonged, and it has retained an apostolical succession of great names down to the present day. It is very small and select, and a single black ball excludes. A year or two since it numbered amongst its members Hallam and Macaulay, and they were among the constant attendants at its dinners, which take place twice a month during the Parliamentary season. "The Club," however, though unknown to fame, still holds its assemblies, and embraces most of the representative men of the age, such as Mr. Stirling, Professor Owen, Dean Milman, &c. The custody of the books and archives of the club rests with the secretary, Dr. Milman, the venerable Dean of St. Paul's, who takes great pride and pleasure in showing to literary friends the valuable collection of autographs which these books contain. Some of the signatures bear evident token of having been written after dinner, and there is a tremulousness about Boszy's signature which is most characteristic of the man.—*Court News.*

MONUMENTAL.—The memorial, subscribed for, of the late Mr. Richard Sandford, surgeon, has just been erected in the grounds of the Wolverhampton cemetery. It consists of an obelisk of white veined Sicilian marble, upon a pedestal of the same material, the whole resting upon granite steps. The only ornament is a chaplet on one side of the obelisk. Mr. Bidlake furnished the design, which has been executed by Mr. Horsman, of Wolverhampton, at a cost of 100*l.*—An address of the acting committee of the Wallace monument, adopted at a meeting held in Glasgow in May last, has been published. Its principal reference is to the state of the funds; and while it appears that a sum of 4,168*l.* has already been collected, it seems that 7,000*l.* will be required to carry out the design of Mr. J. T. Rothead.—Garibaldi, says the Sicilian correspondent of the *Morning Post*, has received from the municipal authorities of Partinico the votation of a statue in marble. With characteristic plainness he replied, "Remember that I am in Sicily to wage war: every expenditure which has not this object is indifferent to me. Give up the statue, and with the money buy arms and ammunition."

DESTRUCTION OF THE BRITANNIA MILL, MOSSEY.—A fire, of a most serious description, has occurred at Mossley, resulting in the total destruction of the very extensive mill belonging to Mr. John Mayall, cotton manufacturer, and involving the loss of about 40,000*l.* Nearly 1,000 people were employed in this mill. In about four hours the whole building was in ruins. The gable end stood within 4 yards of the mill of Mr. George Mayall, and it fell, in its fall carrying away from ten to twenty windows, and strewn the floors with stones. Two portions of the mill which remain standing are fire-proof. One is a piece two stories in height, and contains in its length thirteen windows: the other portion is one story in height, and thirty windows in length. Another portion, which was fireproof, was crushed in by other walls falling, part inward and part outward, upon it. The mill has been erected about ten or twelve years. The fire originated, there is no doubt, in the ground-floor of the loading-room, but whether from a railway truck loaded with cotton, or the sweepings of the mill, is not known. The mill is insured to the extent of about three-fourths of the value, in the West of England, Phoenix, Sun, and Globe offices.

PROPOSED MEMORIAL OF THE LATE AUGUSTUS WELBY PUGIN.—A committee is being formed to do honour to the memory of the late Augustus Welby Pugin, for his services in the promotion of true principles of Mediaeval architecture. In furtherance of this object it is proposed to raise subscriptions, and devote them to the endowment of a fund, to be entitled the "Pugin Travelling Fund," to be awarded to an architectural student, in such manner and at such periods as may hereafter be decided, and to be expended by the recipient, within one year of the time of its allotment, in travelling in the United Kingdom, and in examining and illustrating its Mediaeval architecture, sculpture, and painting.

ART ABROAD.—The *Athenaeum* has several items of information which would come under this head. M. De Keyser, Director of the Academy at Antwerp, is busy with the sketches for the monumental frescoes which are to ornament the walls of the Academy. The principal events of the art-history of Flanders are the subjects for these compositions.—News comes from St. Petersburg that the works for the foundation and the pedestal of the monument for the celebration of Russia's Millennium have been begun at Novgorod. The pedestal will be erected at an expense of 75,000 silver roubles: the artist, M. Mikeschin, receives 120,000 silver roubles. The galvanoplastic cast, in the manufactory of Messrs. Nikols & Plinke, will amount to the further cost of 110,000 silver roubles. Government furnishes the bronze. M. Mikeschin's design, which was favoured with the prize, makes in its total the effect of a bell. It consists of a cylinder-like foundation, which stands on several steps, and the lower part of which is surrounded by six flat gable-shaped stones, each of them cut out at the bottom in two semi-circles. Every stone rests on two short columns, and in the middle, on a console. Between these stones, low, square, long-drawn panels are formed for the basso-reliefs. On this foundation lies a colossal globe, almost of the same diameter as that of the cylinder on which it rests. On this globe rises the cross—an allegorical figure, representing Russia, kneeling before it: an angel hands the chalice to this figure. On the edge of the cylinder, with their back to the globe, in lively attitudes, stand the figures of Peter the Great, Rurik, &c. These figures reach up to half the height of the globe. At their feet, partly kneeling, partly lying, we see different figures, mythological and allegorical, representing subjected nations, and so on.—One of the oldest and most remarkable architectural monuments of all Suabia is now offered for sale: we mean the old Castle of Meersburg, on the Lake of Constance, "the origin of which, together with its 'Belvédère,' or Donjon, the so-called Dagobert's tower, reaches up to the seventh century, for the King of the Franks, Dagobert the First, is said to have erected the lower out of large boulders in 630-638, as a protection for the haven—an early lighthouse."

THE FEMALE SCHOOL OF ART, GOWER-STREET. A conversation was held on Thursday last, at the South Kensington Museum, the object being to raise funds for erecting a Female School of Art, and securing the permanency of that excellent institution, which for some years has been established in Gower-street. There was an assemblage of ladies and gentlemen to the number of at least 1,500. The picture galleries, brilliantly lighted, were thrown open to the visitors, and several magnificent works of art were lent to the management. The Queen lent the Koh-i-noor diamond, which has been recut since 1851, and now sparkles with fifty-fold brilliancy; the members of the Fine Arts Club, ancient and modern jewellery; Mr. Hope, his blue diamond; the Duke of Devonshire, a group of cameos; Mr. Dresden, a large diamond and other gems; Mr. Waterton, ancient rings. Mr. Hancock, Messrs. Hunt & Roskell, and others, were also contributors. There was music at intervals by the band of the Hertfordshire Militia. The Earl of Shaftesbury presided in the lecture theatre of the museum, and Mr. Westmacott, Mr. Redgrave, Mr. Donaldson, the Rev. Mr. Bailey, and other gentlemen delivered addresses explanatory of the position of the school, and illustrative of the large amount of good which it has already effected by educating young ladies in works of art, and enabling those on whom the hand of affliction has fallen to find self-sustaining employment. The lease of the present school is nearly expired, and there will be required, to secure another site and building, about 2,000*l.* About 600*l.* have been already subscribed, the pupils contributing a fair proportion,—over 70*l.*; and to the public the committee look with confidence for the remainder.

**EFFECT OF SEA-WATER ON TIMBER.**—Sir,—Perhaps some of your correspondents will be good enough to say what effect is produced on timber by sea-water (portions totally immersed, and portions exposed to the frequent washings and spray, wet and dry), used in staging and scaffolding for marine works temporarily, timber so exposed to salt water being afterwards used for building purposes. Persons living on the coast who buy timber at sales of wrecked vessels, and cut it up for farm and building uses, assert that it is as good as new fir (?), and a farmer told me that the oak "lasted till he was tired of it."—BANGOR.

**RAILWAY ROUTE FROM MANCHESTER TO MILFORD.**—A prospectus has been issued, under, it is said, influential Manchester and other auspices, of a "Manchester and Milford Railway Company," with a capital of 555,000*l.*, in 55,000 shares of 10*l.* each (deposit 1*l.* per share), and limited responsibility. In reference to one important recommendation, namely, coast defence, the prospectus says "the proposed railway completes the western coast line from Glasgow to the extreme point of Pembrokeshire, making all the great garrisons of the manufacturing districts of the kingdom available for concentration on any point of the undefended parts of the coast of Wales."

**MUSIC FOR THE MILLION.**—"The Music Publishing Company (Limited)" is being established, with a capital of 25,000*l.*, in 1*l.* shares, and a ready-made business in the City, for the sale of music of all kinds at very low prices. They have already issued a catalogue of many items, in which 3d. a sheet is the general price, although, it is said, "printed on better paper than the best of the dear music, by the improved process which won the large medal at the Great Exhibition." The whole of the musical works published by the company are said to be suitable for school use, and for school prizes, as well as for family practice. The offices of the company are at 19, St. Peter's-hill, St. Paul's, E.C.

**NEW BRONZE COINAGE.**—The first contract for the execution of a portion of the new bronze coinage has just been taken by James Watt & Co., of Sobo, near Birmingham, and it is said that the quantity contracted for amounts to between 1,700 and 1,800 tons, or something like 250 or 300 millions of pence, halfpence, and farthings.

**ANOTHER PARK PROPOSED FOR HALIFAX.**—Shrogs-wood estate, near Lee-bridge, is proposed as a second park for Halifax, and a design, the execution of which will cost 2,000*l.*, has been prepared by Mr. Gay, of the Underlife Cemetery, for laying it out into carriage drives and walks, with cricket-grounds, bowling-green, and archery-stands.

**FREE READING-ROOM AND LIBRARY.**—The foundation-stone of a free reading-room, lecture-room, and library, for Garston (Liverpool), has been laid. It is intended to erect a building in the mixed style of architecture. The site was given by Mr. George Heald, and it will be constructed so as to accommodate from 400 to 500 persons. The building will contain a reading-room, a lecture-room, and a library; and a cottage for the keeper of the place will be erected in close contiguity. The cost is estimated at about 1,000*l.* Messrs. Hay, of Liverpool, are the architects; and Mr. John Jones, of Aigburth, is the builder.

**O'CONNELL AND ARCHITECTURE.**—The *Times* says,—Mr. Daniel O'Connell, of Derrynane Abbey, grandson of "The Liberator," after having completed his course of study under Mr. Hanson, the architect, and improved his observation by inspecting the best specimens of church architecture in classic lands, has determined to commence his profession in Dublin as an architect.

**NEW GARDENS** now afford a pleasant ramble. The large masses of rhododendrons, and other American plants, on each side of the grand promenade, are in perfection, being in full flower. The conservatory, or Australian house, too, is very attractive.

**THE DATES OF STREETS AND BUILDINGS.**—Many houses of various dates—some of them in no way remarkable for external appearance,—the time, and some short circumstances connected with their erection, attract a certain amount of attention from the wayfarer; and, as time rolls on, the value of those dates becomes the greater. Why, therefore, should this good old-fashioned custom be so little thought of in these modern days? It should be considered that, in due course, the present reign, and all connected with it, will become antiquities, when the marks which record the structures of Queen Victoria's times will be looked upon with as much interest as those of Queen Elizabeth's now are by us.

**UNSAFE BOG ON SOUTH COAST RAILWAY.**—A correspondent, "G. R. L.," states that he lately drew the attention of the chairman of the South Coast line of railway to a boggy piece of ground on the line between Steyning and Henfield, which has given much trouble, and is considered to be still unsafe. Piles for the line were driven 60 or 70 feet down, it is said, without finding a firm bottom, and "G. R. L." has suggested that some such tubes as those of the Menai-bridge, or pontoons, should be laid, on which to run the line; and a lining of prepared planks laid to float the line. In various instances, in the intersection of the country by railways, bogs were safely crossed, after much trouble and many failures, by means of floats of brushwood, peat or turf, and timber, on which the ground-soil of the line was laid, after immense quantities of earth and stones had been swallowed up without filling the bog, and even, in some cases, after the line itself had been repeatedly absorbed. Chat Moss, the great morass on the Liverpool and Manchester line is a case in point.

**PROPOSED SICILIAN MOSAICS FOR ST. PAUL'S.**—It is suggested by Mr. Penrose that many may be glad of a way being pointed out of doing something by which we may benefit the citizens of Palermo at a time when, by their noble conduct, they have won all our sympathy, and when, owing to the cruel destruction of so much of their property by the Neapolitans, any encouragement to their arts and manufactures will be peculiarly valuable. He says,—"The Dean and Chapter of St. Paul's, it is well known, are earnestly engaged in making the cathedral as useful and as perfect as they can, and would be willing, if funds were available, to decorate its walls, &c., with the rich and durable ornament of mosaic work. A fair commencement could be made with about 500*l.* in hand. The cost of the material would be about half the whole expense of the finished work. There is a manufactory of the material at Palermo, where it has been largely used in the restoration of the Dnomo of Monreale after a destructive fire some years ago. As there can be but few of your readers who do not sympathize with the Sicilians, who have such peculiar claims upon us and are now dreadfully impoverished by oppression, should any be disposed to encourage the beautiful art for which I am pleading, and will intrust me with subscriptions for that purpose, I will undertake that the requisite proportion of such money shall be immediately laid out at Palermo in the purchase of the material, and the work here forwarded as rapidly as it will admit of."

TENDERS

For the London-bridge Railway Terminus Hotel. Mr. Henry Currey, architect. Quantities supplied by Mr. J. H. Stroudwick:—

Myers	.....	£139,159 17 0
Moxon	.....	127,500 0 0
Holland & Hemman	.....	122,829 0 0

# The Builder.

VOL. XVIII.—No. 909.

*The British Association, at Oxford.—Efforts to Raise the Condition of the Working Classes.*

THE meeting of the British Association for the Advancement of Science, just ended, has been productive of the usual amount of matter professionally important to us, and of much that would be interesting to all our readers. To some of the questions we can do little more than refer,—as those of the Antiquity of the Human Race, which could not have found a more appropriate place for discussion, than the university where science seems to have at length succeeded in obtaining *status* as a pursuit

side by side with theology and classical learning. We shall give notes of some of the papers on the subjects that more immediately concern us, and reference to others which may perhaps be published in the Transactions of the Association.

The selection of Oxford this year, as the meeting place, was altogether a happy one; and will do much to confirm the tendency observable in the University, of late years, towards several objects. The Museum is now so far progressed to completion that it was opened for the *conversations*; and it is one of the most considerable efforts the University has made in a similar number of years by building,—though collections and libraries, even such as are devoted specially to science, the University possessed (as well as works of art), no less than institutions of a different character. Architectural art is forcing its way through the antiquarianism or reproduction still somewhat prevalent in new buildings of the colleges; and the commencement of an effort to promote the work of education amongst classes beyond the precincts of the University, has been made. Persons qualified to judge, say that opposition to what is called the spirit of the age does not exist, unless with undergraduates. Whatever the branch of pursuit, Oxford now offers educational advantages, the amount of which must surprise one who visits the libraries and collections for the first time; and though the nature of the stone has prevented the preservation of much that would have been now interesting in the details of architecture, abundance of this is left, as well as a beauty of "old patrician trees," of shaded walks by water-side, and of lawns and gardens, which no other place in the world possesses combined with and enhancing so large an amount of architectural beauty, and enhanced by so much as there is of antiquarian interest, or associations with the place. To the true architect, the relics of work of his art in Oxford are by no means confined to the buildings of Medieval origin. Inigo Jones is represented there, as by manuscript notes to books preserved in the library of Worcester College, and by gateways (though not the best of his works, but amongst the most interesting) in the Botanic Garden; Wren is identified with the University, almost as much as with London; and, besides his buildings, five volumes of his drawings are preserved; whilst the Radcliffe Library, by

Gibbs, is a fine work, decoratively considered, as well as structurally,—the vestibule forming the lower story is one of the best pieces of domical vaulting in existence. Much has been said, both of the distant effect of Oxford, and of the principal street as a lesson of street-architecture. In both cases, the reference is justified, and might still afford hints,—in the former case, towards elucidation of the question of effect from forms of two very different styles, occurring in the same field of view; and in the latter, in many ways, towards the production of what is wanted in London. The present entrance to Oxford from the railway, however, is disappointing; and only on entering from the opposite side, or over the bridge by Magdalen College, does the stranger realize the beauty of the combined architecture and foliage, of the curving street, and of the groups and succession of buildings. The important part in this effect, played by Queen's College, a building good in masses, but somewhat plain in details, is worthy of attention; as also is the value of the clear atmosphere generally, and of the not smoke-enslaved stone of a considerable number of the buildings. It is not difficult to understand why, in attention paid to architecture, the art alone, or what is most valuable, is not now appreciated as deserved. Though this art-subject is enticing; and though there is much in Museum building structurally, and in the other new buildings decoratively, that might at another time be spoken of with advantage, it was the object with which we commenced, to chronicle some of the proceedings of the Association. To that subject, therefore, we return.

The chair was taken, in the Sheldonian Theatre, by the Prince Consort, on Wednesday in last week, when he briefly addressed the meeting, and resigned the presidency to Lord Wrottesley. The address of the new president related chiefly to the science in which he has become eminent; but noticed the progress made in some other branches of inquiry. In 1814, when Lord Wrottesley's residence in the University commenced, science was represented by the geologists chiefly, as Buckland, Broderip, the two Conybeares, and Kidd; though there were chemical lectures by the last of those named, and some on experimental philosophy by Rigaud. The Radcliffe Observatory was inactive. After 1818, the mathematical branches of study improved, and others were not neglected; and in 1839 a good appointment was made to the office of Radcliffe Observer. The progress continued till at length a sum approaching to 100,000*l.* had been expended on the New Museum. The president then adverted to the repeal of the statute which enforced attendance on two courses of lectures, and to the rejection of a proposal that the undergraduate, after passing his first two classical examinations, should be permitted to select his own line of study, both which decisions he did not approve of. After alluding to the Middle Class Examinations, he passed to the subject of astronomy. Treating of this, he showed the respective advantages of the labour undertaken in observatories, public and private, and noticed the speculations on the nature of comets and of the sun, and the existence of an interplanetary ether. He also spoke of the management of the Parliamentary grant to the Royal Society, as an example, and of the importance of such aid to investigation. He then passed to a notice of the principal results of research in the science of chemistry, especially regarding the processes of substitution, or displacement of one element or organic group by another more or less analogous; and he mentioned some practical applications, as those in the dyes extracted from aniline for the colour known as mauve and others. These processes, we may mention, were subsequently referred to in the chemical section, as well as investigations also referred to by the president, on the nature of ozone. Respecting the antiquity of man, the opinion originally published by M. Boucher de Perthes in 1847, relative to the remains in the valley of the Somme, had been confirmed since last year. Flint implements found were as ancient as a mass of gravel which filled the lower parts of

the valley between Abbeville and Amiens. The gravel is an ancient fluvial alluvium, by no means confined to the lowest depressions; and changes in the physical geography, comprising both the filling up with sediment and drift, and the partial re-excavation of the valley, must have followed since old river beds were at some former periods the receptacles of the worked flints. The old alluvium, whether at higher or lower levels, consists not only of the gravel with the worked flints, but also of superimposed beds of sand and loam, in which are many fresh-water and land shells of species now existing; but with the shells, are found bones of extinct animals. The same bones are found sometimes in the gravel. After some further statements, respecting discovery of bones elsewhere, elucidatory of the same subject, and a reference to the progress of physiology, the address concluded with an eloquent peroration.

The most interesting subject in the address just mentioned, was referred to in papers in the geological, the zoological and botanical, and the geographical and ethnological sections. One of these papers, by Dr. James Hunt, in the section last-named, led to a most animated discussion. So far as we have been able to ascertain, none of the proceedings in the sections are properly reported. The loss through the omission is very great; as the discussions often supply matter as valuable as that of the paper, and sometimes what is necessary to correction of statements contained in it. As it is impossible to be in two places at once, or even to ascertain exactly when papers are to be read, we have ourselves to regret the loss of much that we should have been disposed to publish.

In the Mathematical and Physical Section, amongst the papers read were the following:—"On the Trisection of an Angle by Plane Geometry," by Mr. Patrick Cody; "On the Principles of the Solar Camera," and "On the Means of Increasing the Angle of Binoocular Instruments, in order to obtain a Stereoscopic Effect in proportion to their Magnifying Power," by Mr. Claudet; "On some Optical Illusions connected with the Inversion of Perspective," by Sir David Brewster; "On his own Perception of Colours," by Dr. Gladstone; "On an Instrument for exhibiting any Mixture of the Spectrum," and "On the Results of Bernoulli's Theory of Gases, as applied to their internal Friction, their Diffusion, and their conductivity for Heat," by Professor Maxwell; "Experiments and Conclusions on Binoocular Vision," &c., by Professor W. B. Rogers; "On a new Geometrical Method for establishing the Theory of Conic Sections," and "On an Improved Instrument for describing Spirals, invented by Henry Johnson," by the Rev. Dr. Booth; "On a new Analyzing Prism," by Professor Jellett; "Further Researches regarding the Laws of Chromatic Dispersion," by Mr. Mungo Ponton; "On the Chromoscope," by Mr. John Smith, of Perth; "Description of a New Reflecting Instrument for Angular Measurements; and of another for Measuring Actual Distances," by Mr. Patrick Adie; and "On the Tripletty of Sound," by the Rev. S. Earnshaw.

In the Chemical Section, amongst the papers read were the following:—"On the Deodorization of Sewage," by Dr. Bird,—which did not place the subject in a more advanced position, whilst the discussion showed a concurrence of unfavourable views of the immediate prospects; "On Ozone," as before referred to, by Dr. Andrews; and "On the Causes of Fire in Turkey-red Stoves," by Dr. W. Wallace.

In the Geological Section, the vicinity of Oxford was described by Professor Phillips; the Blenheim iron ore, and the formations below the Great Oolite at Stonesfield, were treated of by Mr. Hull; and a new map of the neighbourhood was exhibited by Sir R. I. Murchison. The geology of Cambridge was explained by Professor Sedgwick. We cannot, however, find space even for the names of the majority of the interesting papers in this section. We may mention that there was one "On the Course of the Thames from Lechlade to Windsor, as ruled by the geological formations over which it passes," by the Rev. J. C. Clutterbuck.

In the Zoological and Botanical Section, we may refer to several papers on the Teredo, and the mischief caused by it to timber in water; and a vote of money was announced at the concluding meeting of the Association, for the prosecution of research on this important subject. In this section there were several papers on the views of Mr. Darwin and others, that the progression of organisms is determined by law of which we may mention one by Professor Draper, which treated of the intellectual development of Europe.

In the Geographical Section, Mr. John Crawford read a paper disputing the Aryan, or Indo-Germanic Theory of Races; and there were other papers on analogous subjects,—as one by Dr. Robert Knox, "On the Origin of the Arts, and the Influence of Race in their Development." A paper was read before the conclusion of the meeting, by the Rev. Professor Graves, "On the Arrangement of the Forts and Dwelling-places of the Ancient Irish;" and an account of the progress of the works of the Isthmus of Suez Canal, by Mr. Daniel A. Lange. In the same section, Mr. Thomas Wright had given an account of the Excavations at Wroxeter, bringing up the particulars to the latest discoveries.

The papers in the two remaining sections,—those of "Economic Science and Statistics," and "Mechanical Science,"—were some of them of great value or interest; and these we shall notice more minutely. Passing over a paper by Mr. Edwin Chadwick, C.B., "On the Physiological as well as Psychological Limit to Mental Labour,"—a subject, however, of great moment,—we come to one by Mr. Henry Roberts, F.S.A., "Notes on various Efforts to improve the Domiciliary condition of the Labouring Classes." It had for its object to remove the impression operating against the erection in larger number, of buildings of the improved character,—namely, one to the effect that they cannot be pecuniarily remunerative. Reasons were adduced for the failure which had occurred in some places; and facts were given tending to show there had been a considerable number of cases of success. It appeared that the Metropolitan Association for Improving the Dwellings of the Industrious Classes, from six buildings in different parts of the metropolis, accommodating 395 families, had received, after deducting all current expenses and repairs, a net return of 3½ per cent. on the outlay. On two lodging-houses, one of them new, the return had involved a considerable loss, either because the buildings were too large, or in some other way not adapted to the class of men frequenting the neighbourhood. A similar result had been experienced at Marselles, through choice of a site outside the town—too far from the men's daily occupation; whilst, at Leeds and Liverpool, buildings on a smaller scale, better placed, had required to be extended. Passing to a consideration of the undertakings of the Society for Improving the Condition of the Labouring Classes, although the accounts did not afford the same facility as in the other case for ascertaining the pecuniary return on the investment, the author showed that from the Dagnigge Wells, Streatan-street, and George-street buildings, the return collectively, after deduction of ½ per cent. for repairs, was 4½ per cent. net. The return for the Streatan-street building, it should be stated, was higher than for the other two; that is, it amounted to 5 per cent. net. The rents were fixed below those usually paid for similar accommodation. The new buildings in Portpool-lane were considered to be of so experimental a character, that their results formed no criterion, "excepting as a caution against providing largely in one building for single women." The rooms so provided at Portpool-lane had not been fully occupied; and "more stringent regulations with regard to the hours of closing, and more constant supervision than in the men's lodging-houses, proved to be indispensable." We trust this comparative ill-success will not induce the society to lose sight of the fact that residences for single women are really more required in London than for single men.

In his calculation of the return on the first-named piles, Mr. Roberts explained, 4 per

cent. interest was taken on the cost of the land. In the case of the two lodging-houses, old buildings and leasehold, one in Charles-street and the other in King-street, the return left, after deducting per centage on repairs, was 15 per cent. Repairs in the above calculations are taken as averaging ½ per cent. only on new buildings; 2 per cent. is required on old buildings.

In the case of three old courts put into a good sanitary state with suitable fittings, the lodging-houses included, the return had been much less satisfactory. In 1855, it was, after deducting 1½ per cent., about 1¼ per cent. only; whilst in the past year, the receipts had diminished considerably; and even the actual benefit resulting otherwise, was not that supposed,—as a considerable portion of the previous tenants had been ejected, not only to reduce the number to a due limit, but to secure a more eligible class. However, from the figures, it would appear that whilst old buildings may be dealt with, for men's lodging-houses, with a fair prospect (though results will depend on the manner in which the work is done), courts and old buildings for families in the metropolis will not yield a satisfactory return after provision made for repairs, and for a sinking-fund to pay off the capital—which there should be, especially in the case of leasehold property. It was, however, stated that the Hastings Cottage Improvement Society during the past three years, had succeeded in getting a return of 6 per cent. It forms the main part of that Society's principle, to disturb existing occupants as little as possible. There is a reserve fund of 1 per cent. per annum.

The sanitary and moral results of the operations of the two London societies, need not be here recapitulated. The point required to be got at, is the reason for any ill success which there has been in the financial returns, and in the extent to which the example has been followed by speculators, or by philanthropists who would gladly select the form of investment in buildings of the kind referred, were they assured of a moderate return. The sanitary and moral effects, taking them as a mere drop in the ocean of the extent and vast population of London, the author did not consider were unimportant, or when compared with those in Paris, obtained by a Government subvention of 10,000,000 francs. For description of what had been done in the British metropolis, the author referred to his paper "On the Improvement of the Dwellings of the Labouring Classes," given in the "Transactions of the National Association for the Promotion of Social Science," for 1858.

Still, facts remained to be stated regarding financial success in London. At Shadwell, close to the line of the Blackwall Railway, some miserable dwellings came into the possession of a gentleman, Mr. W. E. Hilliard, of Gray's-inn, who thereupon decided to endeavour to improve his own property, and also by example the immediate neighbourhood. The old dwellings were replaced by a street, with dwellings on Mr. Roberts's plan, as exhibited in 1851 in the Prince Consort's Model Houses. There are twenty-eight blocks, each of four residences—112 families in all being provided for. The cost of each block was 487*l.*; and, after allowing for ground-rent and all charges, the authority of the owner was given that they continued to "pay upwards of 6 per cent. and, in fact, nearly 7 per cent., as a net return on the investment;" whilst the same competent judge spoke of the facts as of "perhaps more consequence," that the houses were "almost constantly let," and were "appreciated by the tenants"—who, "as a rule," were "pretty stationary, and not migratory, as that class frequently are."

Thus, as in the last-named case, we have an outlay (of 14,000*l.*) on new buildings, containing 448 rooms, kitchens included, yielding 6 to 7 per cent.; whilst the cost of putting into sanitary condition the three old courts before alluded to, which contain 275 rooms and a lodging house with forty beds, had been upwards of 7,000*l.*; and, in that instance, the return on outlay has been 1½ per cent., after deducting 1½ per cent. for repairs, but making no allowance for sinking fund.

The Windsor Royal Society, with 9,000*l.* invested, now pays 4 per cent.: at Liverpool the Frederick-street dwellings, for twenty-three families, pay 4½ per cent.; and the Association at Brighton gets a fair return. Not fewer than twenty societies have been established in provincial towns, the results to occupants being in every case beneficial; and, whilst the financial results have varied so far as to show the necessity of competent skill in planning, and watchful supervision, they are yet valuable. One instance from Scotland,—that of the Pilgrim Model Buildings, near Leith-walk, Edinburgh,—was added by Mr. Roberts. There are forty-four dwellings in three blocks, with access on both sides, the upper floor tenements approached from one side, and the ground-floor from the other. By economy the cost was only 4,052*l.* 15*s.* 9*d.*, or about 92*l.* per house. The rent of the whole is 303*l.* 19*s.*, or varying from 6*l.* 5*s.* to 9*l.* 15*s.*, per house, one-half of them not exceeding 6*l.* 6*s.* per house. The rents were purposely made low. After deduction of all expenses, namely, fee duty, 22*l.* 14*s.* 10*d.*; insurance, 5*l.* 12*s.* 6*d.*; rates and taxes, 13*l.* 11*s.* 2*d.*; repairs, 13*l.* 4*s.* 7*d.*; management, 21*l.* 6*s.* 3*d.*; and paying a dividend of 5 per cent. (less income-tax), a balance of 30*l.* 13*s.* 1*d.* was last year added to the sinking fund, from which sundry expenses, as painting and papering, are defrayed, this fund now amounting to nearly 200*l.* The demand for the tenements is generally six times the supply. Besides these instances, allusion was made to what had been done through enlarged views of self-interest by many large proprietors and companies, and to the possible development of the machinery of Building Societies. Improvement in the metropolis, the author urged, as we have often should be consequent upon demolition for new streets, and should be enforced. A standing order of the House of Lords for the investigation of such cases, he said, had become a dead letter. The Legislature should interfere in the case of all tenements let at low rents, as in the lodging-houses; though such a power exists in the City.

In the discussion which followed the reading, Mr. Edwin Chadwick contended that results of improvement were even more favourable to the object of the author of the paper than would be supposed from what had been stated. He did not, however, we thought, add much to the argument to be addressed to capitalists, and in favour of good planning and internal arrangement of tenements; though he adduced the facts of the gain by sanitary measures in towns. Reference being made to the branch of the subject connected with cottages in agricultural districts, Mr. C. H. Bracebridge described some cottages which he had built at Atherstone, Warwickshire, each containing equal to three bed-rooms, and which had cost, exclusive of closets at the back, but inclusive of a common wash-house and dust-bin to a group of five houses, as well as pathway, 81*l.* 6*s.* a cottage. The object of low cost, and the provision of the third bed-room, were attained by placing the bed-room in the roof—together, or nearly so. The roof being constructed with queen-posts, the room was got in the space between the "queens." The area in the clear, covered by each house, was 21 feet by 13 feet; the room on the ground floor was 13 feet square; and the space for stairs and other features of the plan, 13 feet by 8 feet, including the partition. The room in the roof, which ran from end to end, was of adequate height; and it cost about 6*l.* of the amount named as that for the whole cottage. This room was not, it was true, a very good one; and it had to be reached by some kind of ladder: nevertheless, it served the purpose, and it had an advantage over a better room—as it could not so well be let. Water supply, except that from the roof, is not included in the amount named.

Subsequently in the same section, a paper, by Mr. H. J. Ker Porter, M.R.I.A., was read, entitled "Hints on the best Plan of Cottage for Agricultural Labourers." It was useful as showing the disposition on the part of tenants in certain districts, to pay a moderately increased rent for dwellings, better built, and provided with means of ventilation. Having remarked that in the cottages of farm labourers, besides the defective drainage and ventilation,

the evil of cold air was felt,—as from construction of the walls, in some cases, of "wattle and dah," or wickerwork, covered with untempered mortar,—the framework of which was always giving way, so that doors and windows could not be kept water-tight,—the author said he had had thatched roofs of such buildings underpinned, with brick walls, in which new doors and windows were added, at a cost of from 10*l.* to 12*l.* a cottage, for which alteration the occupiers were willing to have 5 per cent. on the outlay added to their rent. In some new cottages, of which Mr. Porter showed drawings, ventilation was secured, he said, by a 4-inch square opening, near the ceiling of each apartment, connected with a flue of the same size, carried to the gable of the house for egress; or several of such flues might be connected together. On an estate in Ireland, where this arrangement was adopted, immunity from fever had been shown in contrast with the cases which had occurred in neighbouring dwellings. In the new dwellings, for defective lead-lights, or iron casements, sashes, swivel-hung, were substituted, formed,—the outer part of the sash of wood, and the inner divisions of 3/4-inch hoop iron, cut half through at the intersections. Thus, with strength, there was the advantage of being able to add to, or take from, the outer sides of the sash, to make them fit tightly. After the erection of one cottage, on an estate in the county of Huntingdon, so many tenants were desirous of the benefit of like improvements, that several more cottages on the same plan were to be built; and the five per cent. on the outlay, additional rent, would be paid by the labourers,—who were only glad to settle where they could find constant employment and comfortable and healthy dwellings. The money in this case was advanced by the Land Improvement Society, the repayment being spread over twenty-one years; so that the proprietor of the estate, who was only tenant for life, had not to debar himself from making other improvements for benefit of his tenants. We must leave the completion of our notice till next week.

THE PARIS ART EXHIBITION OF 1861.

The following is the official programme of the Paris Art Exhibition of 1861, announced on the 23rd instant, by the Count de Nieuwerkerke, Inspector-General of the Imperial Museums:—

REGULATIONS.  
CHAPTER I.

Deposit of Works of Art.

Art. 1.—The exhibition of the works of living artists, to be held from the 1st May to the 1st July, 1861, will be open to the productions of French and foreign artists.

Art. 2.—The following works are to be admitted:—

1. Paintings, comprising also drawings, water-colours, pastels, miniatures, enamels, or on porcelain.
2. Sculpture and medallions.
3. Engravings.
4. Lithographs.
5. Architecture.

Each artist is only permitted to exhibit four works in each of the above classes.

Art. 3.—The works not to be admitted are:—Copies, excepting those reproducing a work in a different style, on enamel, in porcelain, or by the altered design. Works already having been exhibited at preceding exhibitions in Paris. Pictures or other objects without frames. Productions of a deceased artist, unless the demise took place since the opening of the last *salon*. Anonymous works. Sculptures in unshaped clay. Painted windows (stained glass).

Art. 4.—Each frame is not allowed to contain more than one subject for the jury to decide upon unless there are several pieces which form an *ensemble*. Miniature painters can alone group their objects in the same frame.

Art. 5.—Works in round, oval, or polygonal frames, must be adjusted into gilt ones of a square form.

Art. 6.—If several works be sent by the same artist they must be all presented at the same time.

Art. 7.—All works to be delivered at the Exhibition building at the expense of the artist.

Art. 8.—Each artist, in delivering, or causing

to be delivered any work of art, must, at the same time remit, or cause to be remitted a notice, signed by him, containing his name, Christian name, place of nativity, the names of his masters, and the enumeration of rewards already obtained. Those who cannot accompany their works must send some person authorized under their handwriting.

Art. 9.—Each of the five classes of works mentioned in Art. 2 must be specified in a separate notice.

Art. 10.—An appendix to the catalogue will be devoted to works of painting and sculpture executed, since the last Exhibition, in public monuments, and which, by their fixed position in the decoration of these monuments, cannot figure in the gallery of 1861. Artists, on depositing at the bureau of the catalogue the indications of these works, should accompany their declarations by official vouchers attesting the order given for the works, and the date of delivery.

Art. 11.—No work having been registered for exhibition is allowed to be retouched.

Art. 12.—No work is allowed to be reproduced without special permission of the artist.

Art. 13.—No work can be removed before the closing of the exhibition without special permission.

Art. 14.—All works must be deposited from the 20th of March to the 1st of April, at six o'clock in the evening. Beyond this time no work will be received. No indulgence of time will be allowed by the administration.

CHAPTER II.

The Jury of Admission.

Art. 1.—The jury will be composed of the four first sections of the Academy of Fine Arts, to whom will be joined the free members of the Academy.

Art. 2.—Each work, whatever be its nature, will be judged by the whole of the jury.

Art. 3.—The director-general of the Imperial Museum will be president of the jury.

Art. 4.—The decisions will be according to the absolute majority of the votes of the members present. In case of equal votes the work is decided to be admitted.

Art. 5.—The works received without examination will be those of artists decorated for their works, or having obtained a 1st class medal in the annual exhibition, or a 2nd class medal at the Universal exhibition.

CHAPTER III.

The Jury of Rewards.

Art. 1.—The same jury which pronounces the admission of the several works is to decide upon the merits of those worthy to receive the medals or honourable mention.

Art. 2.—The medals are of three classes: 1st value, 1,500 fr.; 2nd value, 500 fr.; 3rd value, 250 fr.

Art. 3.—The awards of the jury cannot be over-ruled.

For Painting.

Three medals of first class; six medals of second class; and twelve medals of third class.

For Sculpture.

Two medals of first class; four medals of second class; and six medals of third class.

For Engraving and Lithography.

One medal of the first class; two medals of the second class; and four medals of the third class.

For Architecture.

One medal of the first class; two medals of the second class; and three medals of the third class.

Art. 4.—A medal of honour, value 4,000 francs, can be awarded to the artist who distinguishes himself pre-eminently by a brilliant work of merit.

Art. 5.—The rewards will be distributed with all due solemnity at a meeting held for the occasion.

The sums received for admission and other purposes will be devoted to the purchase of some of the exhibited works.

Admission on week days one franc. On Sundays the public are admitted free.

COMPETITION: PUBLIC ROOMS, KIRK-CUBRIGN.—The committee appointed to carry into execution the erection of public rooms in this town, in connection with the Institute, have awarded their premium of 20*l.* for the best plan of a building suitable for such a purpose to Messrs. Haig & Son, of Glasgow.

AN ARTIST'S IMPRESSIONS OF THE ESCORIAL.

RICH as Spain is in architectural monuments, in the Alhambra of Granada; the Mesquita of Cordova; the cathedrals of Seville, Burgos, and Cuena; the noble Roman remains, as the aqueducts of Segovia and Merida; there is none that in magnitude and importance exceeds the Escorial; and it is wanting only in that romance with which a more remote antiquity invests great works, to render it of equal interest.

That the intention of erecting it in the form of a gridiron, in honour to its titular saint, Lawrence, controlled or influenced its plan, I believe to be an idle remark, devoid of foundation, which has gained credence by being frequently repeated, especially by the writers of published travels and guide-books, from Swinbourne to Ford. The latter, enlarging upon it, says:—"Bigoted indeed was Philip when he could sacrifice the opportunity of building a perfect palace to the idle legend of a gridiron; and poor Herrera, forced to lower his genius to a plan worthy of the breakfast club or Cobbett's Register, was indeed the real unartyr."

The plan of the building bears no resemblance to the symbolical gridiron with which the saint is represented in the statues and pictures which form the architectural decorations, and which were placed under the inspection of the architect himself. The general plan and arrangement bear unmistakable evidence of the influence of the Moorish taste in architecture, however different or even opposed in its development and detail, like the Alhambra in its arrangement of *patios*, as well as in the absence of architectural features, and almost baldness of the exterior. The quadrilateral intersections of the building forming the *patios* have given rise to the surmise that it was erected in the form of a gridiron; but I believe that the present form would have been adopted had it been dedicated to any other saint than St. Lawrence; nor can I imagine one more appropriate to the climate and to the object for which it was erected—that of a convent palace.

The north facade, in which is the principal entrance, presents more architectural features than the others, which are indeed almost devoid of them; but it is in the interior that the artist has lavished his genius, not in ornament or richness, for its style is of the utmost severity (the order Doric), but in giving that impression of dignity and grandeur which is derived from beauty of proportion allied with majestic simplicity.

Upon entering the principal porch we pass an open vestibule supported by Doric columns, and are immediately in the fine court, the *Patio de los Reyes*, the side of which in front is elevated by a few steps, for it forms the facade to the church—one of the noblest monuments of architecture of the modern world. Upon entering the vestibule we have a view of the church in its full extent, it being separated by an open archway and massive grating only. The vestibule, which is somewhat low, is remarkable for its flat roof, which is constructed, not by means of beams, but with solid blocks of granite, upon the principle of an arch reduced to its minimum of curvature. For the lateral pressure, which must be enormous, I am not aware of the provision, which is of course concealed in the walls.

The view of the interior of the church, from the vestibule, moved to enthusiasm even the cynical genius of Ford, who exclaims that,—“as seen from under this sombre grotto-like arch, it is the triumph of architecture, it takes away the breath of the beholder from its majestic simplicity.”

The situation and arrangement of the *coro* I consider a masterpiece of art: it is placed above the vestibule, thus not enumbering the principal nave, as in the cathedrals of Seville and Toledo, and indeed in most cathedrals; impeding the view of the high altar and impairing the impression of their vastness. The effect of its arrangement in respect to acoustics is admirable, the intonation of the service being perceived from whence it comes, its elevation being sufficient to hide from view the stalls. The *coro* above the vestibule forms part of the body of the church, and parallel with it are galleries running round the church, and widening in the opposite side to the *coro* (by the high altar) into the *ante-coro*, from which the views of the church are remarkable for their grandeur and varied architectural effects, which recall strongly the impression of the upper galleries of the Coliseum at Rome. From these galleries open several noble rooms, as the *sacristia*, &c. The cloisters are in accordance in style with the church: the arched doorways communicating between them enforce attention, notwithstanding their freedom from all

ornament and their severe simplicity, from the beauty of their lines.

In the works of no architect is the impress of the genius of the individual more apparent than in those of Herrera, not only in the whole—in which he has known how to impart to the Roman architecture, in his sacred buildings, that solemnity which is considered as exclusively belonging to the Gothic (as may also be seen in the portion of the cathedral of Valladolid executed by him) and which is not apparent in the same degree in St. Peter's, Sta. Maria Maggiore, and other churches of Roman architecture,—but the portions of his work bear his distinctive mark. It is, therefore, to be regretted, as he completed the Escorial, that any subsequent additions to or alterations in it were made. Some of these, as the grand staircase and the Pantheon, or burial vault of the sovereigns, although fine in themselves, are not in harmony of style with the original building. The former was by Castello, though Herrera has shown his power in designing a staircase in the beautiful though smaller one of the Lonja, at Seville. The creation of the Pantheon, or the burial-vault of the sovereigns, is more objectionable, as more florid in its style, and replacing the appropriate one designed by Herrera. I consider, also, the effect of the church inspired by the frescoes, subsequently added, of Luca Giordano, who has painted the vaulted roofs of the *ante-coros*, which are conspicuous from the church. His style was peculiarly that of the decline of art, with its rapid redundancy and all its vices, and is especially out of place here, which is not the case with those decorative portions, the frescoes of Romulo Cincinato and L. Cangiari, in the *Coro Allo*, and the pictures at the altars by El Mudo, which were placed under the architect's inspection, who, having completed his work, superintended its appropriate decoration, and even himself designed the bronze tabernacle of the high altar,—“a glorious work of art”—now no longer existing.

When we consider how many of the greatest works of modern times, as the Palace of Whitehall, the Cathedral of Cologne, the Duomo of Florence, have never been carried to completion,—that St. Peter's occupied for more than a century a succession of Popes,—it is worthy of admiration that this—one of the most vast of architectural works—was commenced and finished in twenty-one years by a prince who at the same time was enriching Spain, in various parts, with noble structures. Its magnitude is such that it does not appear dwarfed by the Sierra, in the midst of whose wilds it is placed, and with whose sombre aspect it is in perfect harmony. Its gloomy and austere character, which has been objected to as a fault, is surely its crowning merit. It was a *covered* palace, and even the parts for royal residence were subordinated to the predominant and religious feeling. Its almost Cyclopean simplicity is certainly more in unison with its object than in the Pitt Palace at Florence, which included no sacred element in the object of its erection. That it embodies most vividly in outward and visible forms the austere and ascetic feeling of religion which circumstances long continued to produce, though now passed away, with which the sovereign, and, indeed, his subjects, were equally imbued, is a triumph of art; for surely architecture assumes its highest rank as a fine art in attaining the power of embodying a feeling and expressing powerfully a sentiment, in which respect the Escorial may with justice be termed “a romance in stone and mortar.”

Madrid.

F. Y. HERLSTOSE.

#### CONDITION OF LONDON HOUSES.

CAREFUL personal inquiry shows, not only in the metropolis but throughout the provinces, that the enactments which have been made during recent years in connection with common lodging-houses have worked well. These places, in days not far back, were in many instances “rude-montions” of the most terrible description, in which vice was encouraged, and pestilential diseases which destroyed a large amount of life were generated. The profits of some of them were enormous, and it is a fact, that certain persons let houses of a description which were not fit for human occupation,—where drainage or ventilation, or cleanliness or decency was uncareful for,—where both sexes were huddled together, and immorality prevailed.

In years to come, inquirers into sanitary conditions will look with wonder at some of the pictures of such houses which have been preserved. Sometimes a single room was made to contain a larger population than a house of the ordinary

size built for the use of the middle-classes should contain.

The Earl of Shaftesbury, who has seen the ill condition of London with his own eyes, not long since introduced a bill into the House of Lords, for the purpose of extending the provisions of the enactments in connection with the common lodging-houses. This, however, was not carried, amid the expression, “that an Englishman's house was his castle.”

Amongst the relics of the feudal times, we have seen English castles, moated and otherwise, which must have been most pestilential; but these scarcely bear comparison with some of the modern castles of the poor in this country in these intelligent days, which are beyond the reach of the law, but where absolute need exists for attention and change. We have lately made inquiry in connection with some of those castles in which the poor dwellers would be glad of assistance, for the salvation of their own and children's health.

In a street to the west of the Caledonian-road, Islington, there has been a considerable amount of death and ill health. The houses, although they have been erected since the laws in connection with metropolitan dwellings should have made imperfect drainage impossible, have been poisoned by stoppages, and this in cases where they are let in tenements and the population is dense. Take a sample of some of them in this respect. Each contains two kitchens below the surface, and six rooms above. In one of those places the population is as follows.—Three in the kitchens; nine in the parlours; four in the first-floor front; four in the back; five in the second-floor front; three in the back. Total, twenty-eight.

In the dwelling adjoining there are thirty persons.

In three houses we have a population of *seventy-six men, women, and children*; and many dwellings in which respectable working-men who have families of children are obliged to dwell, will be found to contain a far larger population in proportion than this.

While considering this important question, it is worth while to glance at the amount of rent which is paid by lodgers in those situations.

The rent of these houses we would put at an average of 25*l.* a year, and about 6*l.* taxes (31*l.*):—The kitchens let for 4*s.* 6*d.* a week; the parlours for 5*s.*; front room, first-floor, 3*s.*; back room, 2*s.*; front room, second floor, 3*s.*; back room, 1*s.* 6*d.*; total, 19*s.* This makes 49*l.* 8*s.* a year, and leaves a profit on such a house, beyond the actual rent, taxes, and rates, of 18*l.* 8*s.*

In such places the struggling classes pay, as is shown by the above statement, a sum which should be sufficient for decent and wholesome accommodation. The rent of tenements of this kind is generally safe; in fact, the risk is more frequently to those who occupy the premises, owing to neglect of the sub-landlord to pay the rent and taxes, the amount of which they have actually received. This, however, is not a part of the subject to which we would particularly refer: we are speaking of the danger of overcrowding houses which are at present not adapted to such purposes.

We have lately looked at premises in several other parts of the metropolis, and find the overcrowding even worse than in the cases alluded to. In one house, where every room is let to separate families, we found, by the statement of the landlord, that forty-five persons lodged there, and it is probable that the fair average is upwards of fifty, who sleep nightly in spaces altogether insufficient for the preservation of health. It will be said by some who have thought on this matter, that it is only by letting, in the manner in which the dwellings in the metropolitan district are now let that the rent can be kept within the means of thousands of families, and that to interfere with the overcrowding would have the effect of raising the prices of the homes of those who, having large families, have the greater need of cheapness. There is truth in this; but for the protection of young life—for the sake of enabling workers to preserve that stamina and degree of health which would allow them, by means of increased earnings, to pay a little extra rent, and for other important considerations, such a state of things should not exist. In the houses which have been mentioned in Islington, and it is the same in many other instances, the drains were partially choked; children became sickly; measles and whooping-cough visited in their most dangerous forms. In such cases the doctor and undertaker are often knocking at the doors. Nor is this to be wondered at. The rooms occupied as shown, are not provided with the necessary means of ventilation; the staircases are in the same way

neglected, and the atmosphere when the windows are closed at night, is very bad. In such houses some are aware of the danger of this, but being on friendly terms with the landlord, do not like to complain; others may be a little in arrear; but the chief part are careless. It is therefore a necessity for the wellbeing of all, that facilities should be given for the sanitary inspection of all houses which are let into more than a certain number of tenements. This duty need not be made unpleasant to persons dwelling in such situations; in fact, we feel assured that supervision in this way would be agreeable to a large majority.

All houses let in tenements should be in the first instance inspected by competent men, who should give a certificate that the drainage is sufficient,—that provision is made for a proper water-supply,—that closets and drains are trapped,—the rooms, staircases, &c., ventilated; and from time to time with great regularity the premises should be examined, and any derangement reported upon and remedied.

Having seen the condition of vast masses in the metropolis, and in some large towns, we are convinced that the greatest benefit would be conferred on thousands by such a provision as that alluded to,—that hundreds of lives might be in each year saved, and that the condition of a large body of our working population would be materially improved.

#### THE FIRST MAKER OF EARTHENWARE SEWER AND DRAIN PIPES.

ORIGINALITY is very difficult to establish in this our day; and it will be still more difficult to be original in succeeding ages. Printing, libraries, and the Patent Office will show that the human mind reasons in a circle; that “necessity” is truly “the mother of invention;” and that many inventions have been many times invented. A thing may, however, be as old as the hills, and yet to an inventor it may be new; but this cannot make it original to the world. The inventor can only complain that “the ancients had stolen his ideas.” Certain persons claim to have invented (about 1814) earthenware pipes for town sewerage and house drainage purposes, when on inquiry it appears that earthenware socket-pipes have been made in Lambeth at a much earlier date.

The sanitary inquiries and reports up to “The General Report on the Sanitary Condition of the Labouring Population of Great Britain, 1842,” in which Mr. Edwin Chadwick performed so important a part, had laid bare the terrible neglect under which the mass of our people existed; and whoever will read these reports carefully will find that most of the sanitary improvements which have since taken place had been indicated. John Roe, engineer to the Finsbury district, had demonstrated that sewers should have circular inverts and regular forms; and about this time ordered earthenware socket-pipes, for the purpose of using them as sewers and drains. Pipes were ordered from two makers simultaneously, “without letting either know that the other was employed;” so that it is quite clear neither of these gentlemen can claim priority of invention; especially as we find, by the previous testimony, that earthenware socket-pipes had been made in Lambeth for fifty years, within personal knowledge, and probably for upwards of a century. Mr. Rawlinson, in several of his sanitary reports, gives instances of the use of earthenware pipes in towns for the conveyance of water. At Longton, near Stoke-upon-Trent, earthenware pipes were made of hinc marl, others of brown earthenware, and some of China clay. They were termed “pitcher-pipes,” and were made by hand, 2 inches in diameter, and in 2-foot lengths. They

\* “My father from his own observation, knows that socketed pipes have been made at Lambeth for the last fifty years. He has no doubt they have been made here for a century past. Will within the last fourteen years they were chiefly used for the conveyance of rain-water. They were considered a good substitute for leaden pipes till iron were made so cheap.—HENRY DOUGLASS.”

Mr. Roe (Mr. 17, 1860) thus writes to Mr. Chadwick: “At the time alluded to in your letter (1842, I directed one of my clerks of works (Mr. Needworth) to ask two of the stoneware manufacturers each to make me a 2-foot length of 9-inch socket-pipe of stoneware, without letting either know that the other was employed, as I wished to see how their prices would agree over this new adaptation of stoneware. One of these manufacturers was Mr. Northern; the other was Mr. Davy. The two specimens arrived at the Holborn and Finsbury Sewers Office, in Hutton-gard (I believe) on the same day, and remained there until after the amalgamation of the Commission of Sewers.—JOHN ROE.”

The Etrurians used brick sewers with circular inverts; and John Howard, the prison philanthropist, in his great work, recommends egg-shaped sewers as better than those square on section. Pipes of glass have been made and tried, both in France and in England, but failed.

broke and burst in use, although they had been proved capable of resisting a much higher pressure singly. At Sunderland earthenware-pipes were made from  $\frac{1}{2}$  up to 5 inches internal diameter, and 54 inches in length, each pipe.

These pipes were squeezed through what is called in the potteries a *dad*, an inverted cast-iron cone, with a bore in the centre. This *dad* was fixed at the bottom of a cylinder; and, when filled with tempered clay, a piston was screwed down, and forced the clay through in the shape of a pipe. A man below received it on a wooden mauldril, and a boy cut it off with a wire to the fixed length. These pipes bore an internal pressure up to 350 lbs. on the square inch, but although they would bear a constant heavy pressure, in use they burst by the shutting of a cock, splitting longitudinally. The joints were made with cast-iron faucets. Roman cement, sulphur, and flannel soaked in tallow; as also oakum soaked in white-lead and tallow, were used for jointing. The pipes did not give way at the joints. Such earthenware pipes were used at Lyme Regis Waterworks, in 1821, and at Bishop Wearmouth, 1824-25. The early water companies used wood, stone, and earthenware, but cast-iron superseded every other material at present for waterworks mains.

The Assyrians used earthenware pipes for drains. Mr. Layard has found them in the foundations of ancient Babylon. They were used by the Egyptians and by the Hindus; and no doubt by the Chinese in the remotest periods. Etruscans, Greeks, and Romans also used them; and Vitruvius describes them fully. The Easterns make and use earthenware pipes to this day. Mr. Rawlinson saw some British workmen laying a line of earthenware aqueduct pipes to the hospital at Kulali, on the Bosphorus, the joints made with a cement composed principally of lime. These pipes were of modern make, and about the same form, dimensions, and general appearance as hand-made English earthenware pipes.

The annual make and use of earthenware pipes in England at present is enormous—upwards of 12 miles per week, or more than 600 miles per annum; the least diameter 4 inches, and up to 36 inches; but, as a rule, 15 and 18 inches are about the largest diameters used to any great extent.

Several towns in England have been entirely sewered with earthenware pipes, and in most towns they are used as tributaries from branch streets where brick sewers are used as mains. Many thousands of houses are drained with earthenware pipes, from such houses as Alnwick Castle down to the single labourer's cottage.

If no modern can claim to have invented earthenware pipes, many can now claim to be users of them. Mr. Edwin Chadwick was one of the earliest to enforce a their use, as better and more economical than brick drains.

"Pitcher-pipes," "pot-pipes," "earthenware-pipes," are used, and will be used, for draining purposes, to an extent not before seen in the world. Macaulay's New Zealander will be able to stock the museums of the new world with dug-up specimens of earthenware pipes from our ruined towns and from our fields long after every surface vestige of our civilization has perished and passed away.

#### ARCHITECTURAL EXAMINATIONS PROPOSED BY THE INSTITUTE.

AN adjourned meeting of members of the Institute, on the subject of Architectural Examinations, was held on Monday evening last, the president, Mr. Cockerell, R.A., in the chair. A resolution to establish two examinations, open to members of the Institute, was moved by Mr. George Morgan, and seconded by Mr. Ferrey. Upon this an amendment to the effect, that the examinations should be open to all British subjects, was moved by Mr. J. W. Papworth, and seconded by Mr. Hansard. A second amendment, to appoint a sub-committee to inquire and report, was moved by Mr. Wigginton, and seconded by Mr. Hanson. Ultimately, however, it was resolved to adjourn the consideration of the question until the second Monday in November next, the Council, meanwhile, to ascertain the opinion of provincial Architectural Societies.

Readers of the *Builder* do not require to be told our views on "the diploma question." The difficulties in the way of properly carrying out examinations in respect of art are very great, and the advantages that would result in this particular case very doubtful. In Prussia, as our readers have been told, the system has made red-tapists instead of architects, and men are crammed with a variety of useless knowledge to the extinction of vigorous thought and active art-exercise. The

course of study at any particular period, the fashion of the day, the opinions held, may be wrong ones. Make the adoption of these a necessity on the part of all who would obtain the right to practise, and you lengthen the existence of error and greatly obstruct the advance of improvement. The longer we think on the subject, the less inclined we are to agree with those who insist that no one should be allowed to practise as an architect who had not passed a prescribed scholastic examination and obtained a diploma.

What is now proposed by the council of the Institute of British Architects, however, is another thing. The rising members of the profession ask for an opportunity to show that they have properly studied their profession and may be safely trusted by the public, and the Institute, we are disposed to think, will do right if they afford them the desired opportunity. A more complete and thorough education for the architect is needed, and the institution of these examinations will tend materially to bring this about. We shall have plenty of time to go more fully into the matter.

#### DEPUTATION ON CITY OF LONDON CHURCHES.

A DEPUTATION of the Council of the Royal Institute of British Architects, consisting of the President, Mr. C. R. Cockerell, R.A., Mr. J. Bell, Hon. Sec., Mr. Penrose, Hon. Sec. for Foreign Correspondence, and Mr. Roumieu, waited by appointment on the 3rd inst. on the Bishop of London, to confer with his lordship on the best means of securing the finest of the City churches, especially those built by Sir Christopher Wren, from danger of demolition under the proposed Union of Benefices Bill. The deputation pointed out the objects which they had chiefly in view, namely, the preservation of all the towers which form so remarkable an ornament to the City; and also that a list of churches should be appended to the Bill, and which should be specially protected by some additional safeguard, the list to be settled after due reflection and advice; but the following would be among the most conspicuous:—St. Stephen's, Walbrook; St. Clement's Danes; St. Bride's; St. Lawrence, Jewry; Christchurch, Newgate-street; St. Andrew's, Holborn; St. Martin's, Ludgate-hill; St. Switbin's, Cannon-street; St. Anthony's, Watling-street; St. Mary's Abchurch; St. Antholin's; St. Michael's, Cornhill; St. Mildred's, &c.

The deputation was very courteously received by his lordship, who pointed out the way most likely to conduce to the objects contemplated by the council.

#### ON SCULPTURE.\*

It is not my intention to give you anything like a history of the art of Sculpture, nor to enter upon the controversy that has lately raged between those who have advanced diverse views upon the subject of our sister art. My engagements have allowed me but few hours to prepare this paper: the treatment I can give to the subject must, therefore, be more suggestive than complete. My attempt will be to put before you the subject in something like chronological order, bringing forward, in illustration of each epoch, certain examples which will afford the students of the Association an opportunity of obtaining a good general idea of the subject, by comparing one example with another; and for this purpose I propose bringing before you a valuable series of copies of Ancient Sculpture in Ivory, published by the Arundel Society. It will thus be seen at the onset, that I shall contribute nothing to the sculpture controversy; but though I advance nothing original, I trust the subject may be clothed with somewhat of new interest, owing to the instructive series of illustrations to which I shall have to call your attention, for in them we may examine, somewhat in detail, the peculiar style of each period, from the earliest ages of Christianity, enabling us to arrive at general criteria, by which the works of various centuries may be assigned, both as to date and country, in the same manner as a piece of moulded stone will generally give us, within a few years, the date at which it was wrought.

I will not waste the short time allotted to my subject by any attempt to elucidate the much controverted questions referring to the origin, and the exact date of the origin, of Sculpture as a fine art; but, I think, the more we inquire, the more fully satisfied shall we be, that its origin

dates beyond all written records, and that the Greeks were quite moderns in the art, compared with those nations who practised it in the ages which preceded them. Instead of Daxalus introducing the art into Greece, it is pretty clear he was simply an improver on what had gone before; no doubt, by adding life to the expression of the features, and animation to the limbs of his statues, he made a great advance on his predecessors; but, although the ancient writers speak of his works as possessed of divine expression, we may rest satisfied that, though good for some fourteen centuries before our era, they could not compare with the works of later schools. His was, no doubt, a great epoch in the history of ancient sculpture; but, as all the examples of that and other contemporary Schools have perished, we have, unfortunately, no means of comparing the relative excellence of each, in their varied phases. Rome became the great art-treasure house of the civilized world, from the spoils of Greece and Etruria, but she was robbed of her accumulated spoils by Byzantium, who, in turn, was despoiled of her treasures, which were irrevocably lost, in the various sacks and conflagrations to which she was subjected; aided, too, by the zeal of Constantine, in destroying all traces of the ancient worship; not, however, in either case, before accomplishing their mission by perpetuating the art, and founding separate schools, the influence of which was felt throughout the Middle Ages.

It will be instructive at the outset to advert to the various materials and modes of working adopted at each period by the ancients. In the most ancient times it is probable that the impressions of form were presented to the eye by the softer and more plastic materials, and that the modeller in *clay*—at first a potter, modelling objects for his art,—at length became so adept, that he ventured upon reliefs, and, eventually, figures. We see in the Greek and later Etruscan pottery what exquisite forms of art the material was susceptible of, and it seems very natural that a high development of this art should lead to subsequent excellence in works in various stages of relief. Numerous proofs of the excellence of the potter's art are to be seen in the terra-cottas in our own and foreign museums: at Rome, statues of the gods larger than life, and at Naples, life-size figures recumbent on Etruscan sarcophagi, show how nearly the art approached that of sculpture. Alabaster or gypsum was much used by nations even more ancient than the Greeks. The art of forming reliefs in *stucco* was also practised by the Romans.

It may incidentally be noted that the ancient terra-cottas and figures in pottery are for the most part highly coloured, from which was probably derived the custom, which at all events was partially practised by the ancients, of colouring statues worked in marble and other hard materials. Great dexterity was shown in the formation of figures in *bronze* and *brass*, sometimes by casting and soldering on the locks of hair and other projecting details; at other times, by hammering and embossing for works in gold and silver.\* Brass figures were frequently covered with gilding, remains of which can now be seen on the celebrated horses at Venice. The ancients do not seem to have understood the tempering of *iron*, so as to use it for art purposes. Carved figures in *wood* were used both in the temples and for private objects, the favourite wood being cedar, which had the reputation of being incorruptible. Ebony, citron, cypress, vine, olive, and other woods were also used. But the substance most prized by the ancients was undoubtedly the *marble* or marble, from its shining and polished surface. The marble from Paros was the favourite among the Greeks, but in later times coloured marbles were much used. Other kinds of marble in great repute were Carrara, which resembled fine sugar; Pentelic, which was veined and streaky; and Hymettian, the Nero-Antico, a favourite marble for statues of Isis, Rosso-Antico, and Porphyry. Calcareous tufa was also used, especially for Etruscan sarcophagi.

The Egyptians showed marvellous dexterity in working the harder materials, such as porphyry, granite, basalt, and syenite.

The Romans worked occasionally in these harder materials, frequently inlaying portions with various coloured marbles, and even with metals: busts and figures executed in this manner do not accord with our modern notions of refinement, and have a disagreeable harsh appearance, but the practice among the ancients seems to prove their love of colour, and it is natural to suppose that this *polylitic* process of sculpture originated from the

\* From a paper by Mr. Norton, mentioned previously; see p. 295.

\* This process was termed Torcetic art, and was employed for shields and armour.

use in the antique examples of actual painting and gilding, originally with vivid colours, and afterwards with softer tones: this is called *polychrome sculpture*. I think, on comparison of the two processes, the latter would unquestionably be more in accordance with refined taste. Another favourite practice was coating the surface of the marble with wax, which gave the surface a soft and slightly coloured gloss. The draperies, the hair, and portions of ornament were also painted, but apparently only for the purpose of relief, for I do not consider the practice of entirely covering the surface of sculpture with bright positive colours as anything short of a libel on the taste of the ancients. In modern times Canova and our own Gibson have adopted the same method of rubbing the surfaces of marble with wax and of partial polychrome, as far as I have had opportunities of judging, with perfect success.

The last process to which I shall refer is that of carving in ivory; and, as my examples are all in that material, I will devote a little closer attention to it. When the art of the Torians, or metal-workers, was combined in ancient times with carving in ivory, we come to a process which is called *chryselephantine sculpture*, which was much practised in antiquity, and is undoubtedly the most important development of carving in ivory. The ancients procured elephants' teeth from India and Africa of great size, and by a process of splitting and hewing we are assured that they could obtain plates of ivory from 12 inches to 20 inches in breadth. The colossal figures executed in this manner appear to have been covered with these plates of ivory, joined with isinglass, over a rough internal model made of wood, and iron bars for support. Pausanias mentions that the teeth of the hippopotamus were also used for ivory; and the northern nations of Europe are known to have used the tusk of the walrus, from which drinking horns of immense size were made, the surfaces being sculptured with hunting and other scenes. The most celebrated example of the "chryselephantine" method was the colossal statue of Minerva, in the Parthenon, by Phidias, which was about 39 feet in height, and an equally celebrated statue of Jupiter, in his temple at Olympia. The cost of such works is described to have been fabulous, and it is clear that the labour and expense of execution must have precluded their frequent repetition. We thus find that ivory came at length to be used solely for objects of cabinet size, such as diptychs, triptychs, situlas, devotional tablets, statuettes, and generally to mobiliary works.\* It is supposed that the ancients

\* As these diptychs form our principal illustrations, it will be well to understand correctly their object and uses. The word diptych is derived from two Greek words signifying "I fold twice;" when, therefore, more than two leaves are employed for these tablets, they become either "tritychs" or "polytychs," as we now say. They were formed sometimes in wood, but more frequently in ivory; the leaves hinged together in the manner of doors, so as to expose the sculptured sides, and to protect the interior of the tablets, which were prepared with a surface of wax, on which memoranda were written. They were also called "pugillares" from their extreme portability; they were strapped round and sealed with wax, and this appeared to be the most mode of conveying the most secret despatches. The diptychs form a most interesting series in the study of ancient art, and many elaborate treatises have illustrated them. They were divided into two grand classes, secular and ecclesiastical; the former were called "diptycha consularia," and the latter "diptycha ecclesiastica." The consuls in the time of the Roman emperors were in the habit of presenting to their friends and acquaintances, as a memento of their appointments to office, and it is even said as presents to the principal voters who were instrumental in their elevation—a practice differing somewhat from our modern notions of electoral matters. The exterior faces of these tablets were elaborately carved in low relief, usually with a figure of the consul in his robes of office, and illustrations of the Ctesian games to which he had probably contributed to pay the expense. Besides proving to us that high dignities were anciently not to be enjoyed without expense, these diptychs afford valuable records of costume and customs, and are the more so, as the inscribed name of the consul frequently furnishes the exact date of the carving. The second class, or ecclesiastical diptychs, were universally introduced in the Church, from the period when the Roman empire became Christian; they were used for various purposes, and were first presented by the consuls to the Church as votive offerings to the altar, and subsequently were used for inscribing the names of converts, great benefactors, the saints canonized by the Church, and of the faithful generally. The subjects of the carving were generally scriptural; but instances occur in which ancient consular diptychs were converted into ecclesiastical ones, by slightly altering the figures and inscriptions. It is worthy of remark that the carved side is the reverse of the consular diptych, the carving being on the inside, and the letters as folding over for protection. In later periods these diptychs were multiplied to such an extent that both clergy and laity seem to have been universally possessed of them. They were made smaller in size for portability and economy of cost. Their introduction on the altars of churches probably gave rise to the "retable" and "reered," or ornamental back to the altar, in the first instance portable, and afterwards in the fourteenth and fifteenth centuries developed into the magnificent specimens we see in foreign churches, in which the "plaques" of ivory form panels inclosed within borders, surrounded by elaborate canopies.

had a method of softening the ivory, which would render the process of elaborate carving and occasional undercutting less remarkable, but this has been doubted by some authors.

Having thus briefly described the materials used in sculpture at various epochs of the art, I will commence my series of illustrations, and describe to you various examples from the Greek period through the Roman, Byzantine, and Medieval, down to the time of the Renaissance. The Arruel cast will furnish examples of almost every century from the second to the sixteenth, whilst the photographs taken from original works at Rome, Florence, and elsewhere, will illustrate the works of Greece and Rome. The work of d'Agincourt will be of great assistance in filling up gaps and affording additional illustrations.

*Jewish.*—Of the ancient nations whose art had a separate existence to that of Greece and Rome I have no illustrations to offer, but we need go no further than the Bible to prove that the art of sculpture had reached great perfection amongst the Phœnicians, Tyrians, and Sidonians. We read, too, of gilded images of gods existing at Babylon, carved in gold, in silver, and in wood, and the ample description of the building of the Temple of Solomon by the Jews, containing incidental art references, seems to show that at that period (1,000 years before the Christian era) the sculptor's art was not then in its infancy.

*Egyptian.*—Of Egyptian sculpture we have numerous and fine examples in our own museum; and in these we trace an intimate connection between architectural and sculptural arts, and even with the literature of the nation, in the symbolic forms, images of men and beasts, but more especially in the hieroglyphic enrichments with which the surfaces of the architectural members are elaborately covered. In their sculptured figures, besides the colossal grandeur of their size, there is a dignified composure which seems never broken, and it is impossible for us to contemplate them without a feeling of awe, ignorant though we be of their symbolic and mystic meaning. This applies even more remarkably to the animal than to the human forms, for we know that particular animals were held in the highest esteem by the Egyptians. There is, however, great conventionalism and want of variety, as well as an absence of life, tending to prove that their artists were compelled to obey rigidly certain types and established proportions which precluded originality, and that the study of anatomy was restricted by law. This is especially observable in their temple sculptures, but when warlike and domestic scenes are attempted there is an air of greater originality. Their reliefs generally rise very slightly from a sunk or depressed surface.

The marvellous head of the so-called young Memnon is, perhaps, the finest example we have; and although it has the usual characteristic, thick lips, projecting eyes, and rounded nose, it still possesses great dignity and beauty.

*Etruscan.*—The art of Etruria is preserved to us more particularly in the cinerary urns or the tombs: both these and their sculptures have a close resemblance to the early and stiff character of the Greek school, particularly that of Egina. Their sculptures were usually in terracotta, sometimes of stone and bronze, and show signs of having been painted; remains are also found in the tombs, proving their excellence in working the more valuable metals. The heads frequently possess great beauty, but the draperies and actions of the figures are far inferior to the best works of Greece, the attitudes being exaggerated, and the drawing generally affected and unnatural, but possessing at the same time masculine power, and, though stiff, still showing a bold independent treatment, which distinguishes the school of Etruria from that of Greece: in lieu of the grace of the latter, we find violent muscular, almost contorted action, combined with much delicacy of execution.

*Greek.*—Greek sculpture may be divided into numerous periods; but, as it is my object to describe more in detail the works of the less known ages after the Christian era, I shall say but little on this head. The archaic was the most ancient period of Greek sculpture, and I will illustrate it with the example of the temple of Jupiter Olympius, at Agrigento, which has been so well described by Professor Cockerell. The giants, or "Atlantes" which support the cutabular, and attached to the walls of the cella of this temple, form an interesting example of the archaic manner of the Greeks, and are not unlike the works of Etruscan sculpture. The manner in which they subserve the architectural forms is very interesting, and their hold angular and energetic treatment seems to suit them ad-

mirationly for the object in view, which was to support a superincumbent weight. Their height was 25 feet, and they were constructed with stones having parallel courses with the walls of the cella, and the joints of the alternate courses show vertical joints, and thus form a part of the construction of the cella. You will notice the peculiar character of the heads, with the half-closed eyes, long and prominent nose, and hair arranged in uniform curls. Although these sculptures are supposed to be only about four centuries B.C., consequently not anterior to the Parthenon sculptures, still we see in them a much earlier treatment, proving that the ancient manner was practised later in Sicily than in Greece. The next great period was that of Phidias, when the art made a wonderful advance, and during which the grandest works the world ever saw were executed. The early stiff forms were rejected, and the rigid and inelegant actions of the archaic period became refined; and, instead of the dryness and hardness of their treatment, we find in the works of Phidias the most perfect expression of the human form—graceful and flowing lines taking the place of severe and architectural forms of the early period. The casts exhibited of the Theseus and Iliuss from the Parthenon afford, perhaps, the most perfect example of this style, the originals of which are to be seen in our own Museum. The first has lost portions of the legs, arms, and nose: the size of the original is 5 feet 8 inches by 4 feet in height, and has been called by other authors Hercules: the figure is half reclined upon a rock, covered with drapery and the lion's skin. The wonderful development of the anatomy is to be remarked, and thus is combined the most perfect scientific knowledge and truthfulness of nature, with the highest ideal of beauty. The Iliuss is a figure equally beautiful, from the opposite or western pediment of the Parthenon: it is half-reclined like the Theseus, to suit the raking lines of the pediment: the figure possesses great truthfulness and animation.

The next great period or development was during the age of Praxiteles, who introduced a more sensuous style, and Greek sculpture lost much of its sublime character, but exhibited the utmost technical skill in drawing, especially of figures in the nude. The photographs give illustrations of some of the finest works of this period. 1. The Pythian Apollo, which was found in the fifteenth century, near the ruins of the villa of Nero, at Antium. 2. The Venus of the Capitol, found in the eleventh century, and the exquisitely refined statue of the same goddess, in the Tribune at Florence, which is, probably, of the age last mentioned, and is an instance of the departure from the rigid grandeur of the earlier forms, and displaying the most fascinating and graceful harmony of lines and purity of expression. The Dancing Faun is another marvellous specimen of Greek art at its perfection, differing from the last instance in its muscular development and elasticity of movement: the entire figure seems in action; but there is nothing unnatural or distorted, and the physical quality seems subordinated to that of ideal refinement. 4. A beautiful example of the best period, illustrating the peculiar mode of draping the female figure, is shown in the statue of Pudicitia, or "Modesty," from the Vatican: this figure possesses wonderful grace and dignity, and the folds of the drapery are arranged in broad masses, and have the appearance of being modelled from drapery wetted and applied closely to the body, showing the form beneath. Another photograph shows that marvellous example of refinement and dexterity of execution the group of "Laocoon," found in the ruins of the Baths of Titus. Technical difficulties of execution have evidently been sought for, and it is impossible to imagine anything more perfect than the drawing and anatomical perfections of this work: at the same time the sentiment of the subject is so well preserved that the spectator is agonized at the sufferings of the father and his sons. This perfect work of ancient art throws into the shade the performances of Michelangelo, which appear stiff and cold in comparison.

*Roman.*—From the decline of Greece, Rome became the great cultivator of the art; and, as the Grecian sculptors found an asylum at Rome, and as the chief works were transferred from Greece as the spoils of war, it is natural that the early works of the Roman school partake of a Grecian character, and supplanted the earlier style which was founded upon the Etruscan. Sculpture now became much more generalized in its adaptations: equestrian statues and public works of every kind gratified their taste for splendour. The base of the column of Antonine, representing the Apotheosis of Antoninus and Faustina, is an illustration of their

sculpture, in which we trace much of the Greek feeling, whilst the marvellous sculptures in the column of Trajan show an entirely new application of the art, and illustrate the fertility of their invention; but the art became gradually debased, and degenerated into luxurious and capricious forms. The busts and portrait statues of the emperors form an important class at this time, and we find numerous illustrations of historical events.

Many works were executed in the time of the Antonines, but after that became gradually debased, an illustration of which may be seen in the sculptures on the arch of Constantine, which are executed in a rude and clumsy style, and we finally lose all traces of distinctive Roman art in the works of the Byzantine sculptors. In many of the earlier Christian monuments, traces are to be found of the Roman manner, in the catacombs and sarcophagi of the first ages of Christianity.

I draw your attention especially to the sarcophagi of Bassus and of Probus, both executed in the fourth century, and in which the reliefs containing Old Testament subjects might be taken for debased Roman works.

The Ivories will now come to our aid in illustrating the subsequent development of sculpture throughout the early periods of the Christian era, illustrations of which are scarcely to be found in any other material, they thus become doubly valuable.

THE GREY SANDSTONE OF THE FOREST OF DEAN.

The Forest of Dean stone is less known, perhaps, than it deserves to be. A report on the quarries has been recently made by two gentlemen of Coleford,—Mr. Atkinson, engineer, and Mr. Terrett, builder,—from which we take the following particulars:—

The stone is generally grey or blue in colour, and lies in three series, each of a different degree of hardness, and each applied to peculiar and distinct purposes; but the quality of the stone differs in the various localities from which it is derived. The upper series is generally from 20 to 30 feet thick, the second 40 to 70, then a thin vein of clay from 3 to 7 feet intervenes between. The third series is proved to 130 feet, but how much deeper it may be is unknown; hence, where the three series are found, as in the centre of Birch-hill, the supply of stone seems inexhaustible.

The upper series consists of a soft, easily-worked stone, of various degrees of hardness, suited for the manufacture of gravestones, sinks, troughs, gravestones, flagging, sills, and wall coping; all of which can, in the best quarries, be got any size possible of carriage through the arches of the Severn and Wye tramways.

The prices of gravestones at the quarries are about 2d. per inch diameter up to 3 feet high, and up to 7 feet from 10s. to 5l. each; flagging, 2d. to 2½d. per foot super.; sinks, 1s. 3d. per foot super.; troughs, 6d. per gallon of 231 cubic inches to the gallon; gravestones, 6d. per foot super.

The second series consists of a grey stone, of harder character than the first, and the third than the second; and the third species of stone is of a blue colour, and a closer, finer grit, and both series run in blocks, of any size possible to be removed. The stone is admirably adapted for dock and railway purposes, and, being easily worked, and capable of being sawed and planed by machinery, to builders and statuarists. It has been used in the construction of Cardiff, Newport, Gloucester, and Swansea Docks; South Wales and Western Valleys Railway; Gloucester and Berkeley Canal; Polly Bridge, Oxford; Cardiff Castle; and National and Provincial Bank, Marlborough; and part of Llandaff colleges; assize courts; interior of St. John's and Exeter Colleges; and Taylor and Randolph's Buildings, Oxford; Easton Castle and Whitley Court, Worcester; Langton House, &c. &c.

As regards its quality for building, if placed on its proper bed, it does not scale, is not affected by the weather, and instances of its durability may be seen at Newland, Staunton, and Mitcheldean Churches, in which the outlines and carving of the oldest pinnacles, and the letters cut on the oldest gravestones, are as sharp and defined as when first worked, some 400 years ago; but it must be observed that only the stone raised in certain localities and from the best quarries is likely to possess these qualities, generally so unusual in sandstone.

The price of blocks at the quarry is 7d. or 8d. per cubic foot, if scappled or picked; and about 7s. per ton if rough. The texture under which quarries are held is peculiar.

By ancient custom, any person born within the hundred of St. Brivels, and who has worked a year and a day under ground, or in quarrying, is called a free miner, and each free miner has a right to make application to the Crown to grant him a gale of land for a quarry in perpetuity, which, when awarded, becomes his freehold, subject to an acknowledgment to the Crown of 3s. 4d. per annum each grant.

In 1 & 2 Victoria, as the Forest of Dean became more accessible, and facilities of traffic increased, rendering the property more valuable, an Act was passed for regulating the opening and working of these quarries, and a commission was issued to ascertain and confirm the title of those claiming quarries. The quarries granted since the award are leasehold, and subject to a rent.

Each gale or grant is twenty yards in length, and of course quarries increase in value according to the number of lengths lying together. Five and a half lengths (Messrs. Grindell & Co.'s, at Lydbrook) is the largest grant ever made together and at the same time; but at Birch-hill they have, in addition to their own grants, acquired by purchase several lengths lying together, which, together with the superior quality of the stone, renders these quarries undoubtedly the finest in the Forest of Dean.

The principal localities whence the best stone is raised, but yet differing very much in value and quality, are:—1. Birch Hill. 2. Bislade and Bishcald. 3. Dark Hill. 4. Lydbrook (Barnedgre). 5. Knockley Lumpy. 6. Gosty Kuall. 7. Morgan's Cote. 8. Merry Hole. And the principal quarry proprietors are Messrs. Grindell & Co., Messrs. Trotter & Thomas, and Mr. Townsend.

SURVEYOR OF BRIDGES FOR THE COUNTY OF SURREY.

The election of the surveyor of bridges and public works for the county of Surrey took place at the general quarter session, on Tuesday last, and resulted in the appointment of Mr. C. H. Howell, of Guildford, and of the Norwich Union Insurance Office, London. Upon the death of Mr. Lapidge, the late surveyor to the county, Messrs. Charles Barry, Currey, Hesketh, Jarvis, Howell, Field, Ashdown, P'Anson, Lett, and other members of the profession announced themselves as candidates for the office. The contest finally lay between Messrs. Hesketh, Howell, and P'Anson, and upon the votes being taken, the numbers were found to be,—for Mr. Howell, 43; for Mr. Hesketh, 19; for Mr. P'Anson, 16.

THE WORKING OF NEW SEWERS.

ANY information as to the working of new sewers in our towns must be useful. We may, therefore, note from the *Nottingham Journal*, that during a recent severe thunder-storm, in Worksop, by the new arrangements, flooding in the streets, which has hitherto been common there, was prevented. "The sewers were for the first time brought fairly into action, and performed their work in such a manner as to reflect credit on all concerned. Mr. Rawlinson is the engineer of these sewerage works, which have been carried out under the superintendence of Mr. Landsborough, surveyor to the local board."

The outlet sewer is an earthenware pipe, 15 inches in diameter, and about three-quarters of a mile in length, having flood-water overflows in the low ground. Earthenware-pipes have been used, for the most part, throughout the town. The estimated cost was 6,000l., and the whole of the works, we are told, will be completed within this sum.

There are manholes at numerous points, to enable the sewers to be examined and permanent means for ventilation, with charcoal disinfecting screens. The sewers can be flushed at several points.

DESIGNS FOR LABOURERS' COTTAGES.

At the beginning of the present year, as well as often previously, we inserted letters and observations touching the want of properly arranged cottages for the labouring classes, with especial reference to cost, and the necessity for three bedrooms, and on the last occasion said that we proposed engraving some plans and particulars. We partly carry out this intention in our present number, giving—

Plans and elevation of double cottages, erected at Parndon, near Harlow, Essex, under the superintendence of Mr. C. H. Cooke, for Captain Slark;

Plans, section, and elevation of double cottages,

with flat roof, designed by Mr. N. E. Stevens, in connection with the Society for Improving the Condition of the Labouring Classes;

Plans for double cottages, by Mr. C. W. Strickland, in connection with the Yorkshire Agricultural Society; and

Plans, elevation, and section of cheap double cottage, by Mr. H. Barnes, referred to in a letter in our journal for March 17th of this year.\*

All the drawings are made to the same scale, so that the accommodation afforded may be readily compared.

The cottages at Parndon (three pairs of them, fronting to the railway), are built of white Cambridge bricks (brought thirty miles), with red brick dressings and quoins, doors and windows, overhanging roof, stained timber where visible, and red brick chimney-stacks. The cost of the six cottages, inclusive of gates, was 507l. 10s., or 84l. 11s. 6d. per cottage,—certainly a small cost considering the appearance presented. The necessary is at the end of garden, one to each cottage. We append the architect's specification in full. The plan has many good points. An objection may be justly raised to the position of the fire-places, in the outer walls, by which heat is wasted.

A specification and bill of quantities of Mr. Stevens's design, are printed, and may be obtained at the offices of the Society for Improving the Condition of the Labouring Classes in Exeter Hall. We do not understand that any cottages exactly in accordance with these plans have been constructed, but Messrs. Dove, Brothers, of Islington say,—

"We shall be happy to erect cottages in the county of Herts, agreeably to these plans (with flat roof) for the sum of 170l. per pair, if built within a quarter of a mile of a railway station (with a siding), provided that not less than six pairs be erected in one locality. If only one pair be erected, 5 per cent. should be added, and if two pairs, about 3 per cent. This estimate does not include any local carriage."

The following is the mode given for forming the roofs:—

"Cover the roofs with plain tiles in cement, laid in the following manner:—Baltic fir laths, to be nailed to the joist; the first course of tiles to be bedded in cement on the laths, the other two courses to be then laid each in such a quantity of cement only as shall ensure their firm bed; care to be taken to fill up all interstices with the cement, which can be effected by rubbing the tile well on the cement; the last course of tiles to be left as smooth as practicable, but not to be coated over with cement. The outer edge of the flat roof to project over the face of brickwork 2½ inches all round, and a plain tile to be bedded on the edge so as to form a rim, and stand up above the upper surface not less than 1½ inch, and the tile to be rendered all round with cement, and also the under portion of the flat roof which projects. The flat to be laid with a fall from front and back sufficient to carry off the water, and a space to be left in the rim as an outlet, connected with the iron rain-water pipe by a lip formed with cement.

The cement for the work to be tested, so as to ascertain its qualities, and a greater or less proportion of sand to be mixed with it as shall render it most available for the purposes for which it is to be used."

Careful workmanship, and attention to the foundation, would be requisite, or a roof so constructed would be a constant source of annoyance.

Mr. Strickland's plan is an exceedingly good one, but provides for a larger and more costly building than would be in all cases desirable. They were made with reference to the requirements of a particular competition; and Mr. Strickland himself says, in reply to an inquiry with which we troubled him:—"I think them larger than is either requisite or desirable for the generality of labourers' cottages, especially in parts of England where fuel is dear. But it cannot be too much insisted on, that there is no absolutely best form of cottage or anything else. A great variety is wanted to suit families very variously circumstanced. I hope before long to see another display of plans of other forms, at some meeting of the Yorkshire Agricultural Society, and that it may be as interesting and instructive as the last one was."

In brick-built cottages, hollow walls, with a view to warmth, and dryness, are much to be desired. The walls should be plastered inside. Good drainage and the means of ventilation are of course absolutely necessary.

Of Mr. Barnes's design, the author says,— "I wish to observe that my plan offers no attraction as an ornamental or picturesque object in the landscape; its advantages are simply giving a large available area for a small outlay: as I said before, it must be adapted to local circumstances. In my sketch I have presumed mud walls on stone or brick footings and plinth. These kinds of walls (particularly in clay districts) form warm, dry

\* P. 174.

THE FINLAY ASYLUM, QUEBEC, CANADA, EAST.—MESSRS. STENT & LAVERS, ARCHITECTS.

and durable dwellings. It should be properly worked or finished off with an outside coat of rough-cast. Thatch, in this case, should be the covering material. This, especially in rural districts, will enable timbers of home growth to be employed." The cost of such cottages he places at 70*l*. each.

If the wretched hovels in which thousands of our labourers spend their lives were brought prominently into view, new cottages would be built for very shame.

#### SPECIFICATION.

Of the several artificers' work required to be done, and of the materials to be used in the erection of double cottages for Captain Clark, at Parndon, in the county of Essex, according to the designs and under the superintendence of Mr. Charles H. Cooke, architect.

#### Excavators' Work.

Dig out ground, the necessary depth and width for foundations of the several walls: fill in and well ram round brickwork when built.

Ground beneath sitting-rooms to be levelled 9 inches below floor joists.

Excavate for all drains, &c.

Ground to be properly levelled at completion of works.

#### Bricklayers' Work.

The brickwork to the several walls to be commenced on proper and sufficient footings, and carried up the requisite heights and widths, according to the true and evident intent of the drawings.

All the brickwork throughout to be of the best sound and hard clamp bricks, the external facing to be of picked white bricks, and the dressings to windows, angles, &c., to be of the best burnt blue bricks; every course to be well flushed with mortar, neatly pointed, and the joints struck. Chimney flues to be well pargetted and cored, the chimney stacks to be carried up above roof in good sound red brickwork.

Proper discharging arches to be turned over all door and window openings.

Iron bars, 2½ inches by ½ inch, to be laid over all chimney openings, turned up and down at ends.

Provide and fix two cast iron gratings under the floor of each sitting-room.

Proper trimmer arches to be turned to all fire places.

The scullery, closet, and closet beneath stairs, to be parged with brick, on concrete 4 inches thick.

A cooper to be built up in brickwork, and set therein a good 20-inch galvanized iron copper and furnace complete.

The walls, where described, to be lime-whitened internally, to be worked fair with a neat joint.

Provide 50 feet of stoneware drain pipe to each cottage.

#### Masons' Work.

The steps to entrance and back doors to be hard toolled York stone.

The paving to lobbies to be of brick, on edge, laid in mortar.

Provide and fix plain slate chimney-pieces for sitting and bedrooms, with 1-inch shelf, &c. complete.

Provide a small sink in scullery, 2 feet by 1 foot 9 inches, and 4 inches deep.

Provide front and back hearths of rubbed York.

#### Carpenters' and Joiners' Work.

All the timbers used in these works, not otherwise specified, to be of the best Christiana deal.

The roof to be framed as shown on drawing, with the several scantlings set forth in the following schedule:—hips and ridges, 7 inches by 14 inch; rafters, 4 inches by 2 inches; valley rafters, 8 inches by 14 inch; collars, well spiked to rafters, 4 inches by 2 inches; wall plates, dovetailed at angles and pinned, 4½ inches by 3 inches; battens for slates, 2½ inch by 3 inch; ½-inch eaves boards, 7 inches wide; 1-inch valley boards, 9 inches wide. Provide fitting fillet round the several eaves.

The rafter shown as barge board to be of deal stained, 7 inches deep by 2½ inches; the wall-plates and ridge-pieces are also to be placed on with a larger scantling, 6 inches by 4 inches where showing on the front gable.

The roof over the entrance doorway to be formed with a plate 4 inches by 3 inches, supported by wrought deal brackets let into wall, and rafters 3 inches by 2 inches.

Floors for living rooms, on sleepers 4 inches by 2 inches; bedroom joists 7 inches by 2½ inches; wall-plates 4 inches by 3 inches; and 1 inch floor boards.

All the partitions to be properly framed together, with heads, sills, and uprights, 3 inches by 3 inches; quartering, 3 inches by 2 inches; braces, 3 inches by 3 inches.

The windows in front and back of cottages to have solid and beaded deal frames 4 inches by 3 inches; oak sunk and weathered sills, with 1½-inch casements, to open inwards (one casement to each window), hung to frames with 2½-inch butts, and with a suitable fastening and set-screw bar, the bottom rail to be framed weather-dight.

Provide to same 2-inch beaded lining and moulded top to plastering, and 1-inch wrought and rounded window boards.

The external doors to be of 1-inch deal, ledged and cross braced, with 2-inch wrought, rebated, and chamfered framing, hung to solid rebated, and chamfered, frames, with stock, lock, and fastenings complete.

The internal doors throughout to be of 1-inch deal, ledged and braced, and covered with 2-inch wrought, rebated, and chamfered boarding, hung to wrought, rebated, and beaded linings, with 3-inch butts.

Provide and fix a staircase, having 3-inch yellow deal risers and 1-inch treads, rounded nosings, glued and blocked, and all requisite strings, carriages, &c. complete. Trim out and form bulkhead, to give sufficient headroom to staircase.

Provide and fix in pantry two tiers of 1-inch wrought deal shelves, 12 inches wide, on proper bearers.

#### Smith and Ironmonger.

Provide all necessary air gratings and other ironwork that may be required.

Provide a good 20-inch galvanized-iron copper, with furnace, doors, dampers, complete, as specified.

Provide and fix all round the building 4-inch cast-iron half-round eaves gutter, with stacks of 3-inch cast-iron rain-water piping, with all necessary head-shoes, &c., and properly trapped to drains.

Provide for fixing to stoves only.

#### Slater and Plasterer's Work.

The roofs to be covered with Bangor countess slating, 2½ inches lap, patent-slate ridge; double course of slates round eaves, pointed inside with hair mortar.

Lime to be of the best quality. Sharp, clean, and well-washed sand.

Lath, plaster, float and set the ceilings throughout.

Render, set, and twice colour walls, &c.

Lath, plaster, set partitions.

Skirting to sitting-room and lobby 4½ inches high.

#### Plumber, Painter, and Glazier.

Line the valleys with 5 lb. mill lead, and same for flashings round chimney stacks.

Glaze all windows with seconds crown glass.

The whole of ironwork usually painted to the external doors, frames, and brackets, to be stained and varnished.

#### THE FINLAY ASYLUM, QUEBEC, CANADA, EAST.

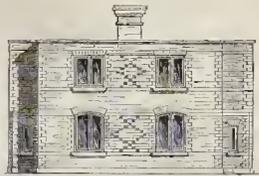

The first stone of the Finlay Asylum, on the Foy Road, Quebec, was laid on the 10th of May. The building, of which we have engraved a view, is about 110 feet in length, by 55 feet in width, and is to be erected in the Gothic style of architecture. It is two stories in height, with basement and sick wards at the rear. It is contemplated, also, to carry up a Chapel at some future period, attached to the edifice.

The building will be constructed in the granite of the district, having cut stone dressings and plinths, with variegated arches over each aperture.

The foundation stone was laid by Mrs. Hamilton, one of the chief supporters of the institution. Messrs. Stent & Lavers are the architects of the building.

Canada is expecting with impatience the promised visit of the Prince of Wales.

THE FRENCH VISIT TO ENGLAND.

The Orphéonistes have performed their pleasing and useful mission, and the army of 3,000, who invaded England with such wondrous harmony, will, by this time, be scattered throughout various districts of France, and many an account of the wonders of London and its Crystal Palace will be reported to old and young in the great neighbouring capital, in the manufacturing towns and cities, and in rural places where the sight of an Englishman is uncommon, and where his peculiarities, till now, were only known by old and unfavourable traditions and by garbled and unjust modern accounts.

We hope that the visit which has just been made will help to remove, to a certain extent, unfavourable and wrong impressions, although nothing could have been worse than the arrangements made for the first reception of the strangers. It was painful to note the preparations made for some of the party in the occupied taverns of the cattle-market: their comfort might have been as great in some of the lairs for sheep and oxen, so appropriately adjacent. And some who sought for lodgings elsewhere, and were willing to pay, fared worse. We have reason to believe, however, that the blame, at all events, did not rest with the Crystal Palace management. The agents were, we understand, French, and were appointed by the Orphéoniste authorities themselves, their society being on this, as on other occasions, bound to make all arrangements, while the members give their own personal exertions as amateur musicians, gratis. So far from the Crystal Palace management being in any way to blame,—unless, indeed, they should have assisted the French agents with their advice and knowledge of London in the outset,—when it was found that the agents, being strangers and without means sufficient at the moment, could not get arrangements made for the accommodation of their constituents as they arrived, the directors of the Crystal Palace, as we are told, at once advanced them a sum of 1,000*l.* to facilitate matters.

The Orphéonistes appeared to be of all grades, from the prosperous country gentleman and the well-to-do manufacturer to the respectable mechanic and art-workman. Some had brought their families, and it was curious to note the physiological peculiarities of those coming from the different parts of the extensive empire of France: in some might be observed the marked features and complexion of the Normans, and in others the more florid and massive forms and fair hair of the German races.

Our great buildings, and, as far as possible, their contents, were critically examined. Gog and Magog held a numerous levy of the guests: the courts of justice were visited; and, according to taste, some wandered into St. Paul's, Westminster Abbey, and the vast new palace for our Parliament. Their criticisms in certain instances might be useful to us.

Trusting that this is but the forerunner of other and even more extensive visits of this kind, to be returned, as this should be, in some well-organized and judicious manner; it would be worth while to consider how the greatest amount of good could be done, and how we could best manage during such friendly invasions to gain the greatest amount of useful information, and promote to the largest extent that mutual acquaintance, and those kindly feelings, which are so likely to obviate the stern and terrible advent of war. It seems to us that, provided proper means were used for the reception of such visitors, who may be considered as ambassadors of peace, harmony, and good fellowship, between one nation and another, it would be an advantage if, on such occasions, a certain number of persons who are skilled in both languages, and well informed on particular points, should volunteer to form committees, and agree to take charge of such of the guests as might wish to visit such institutions as our British Museum, for example, or the Tower, and act according to their discretion in any other way in which they might be best informed. Though as a general rule we are kept hard at work in our busy country, still there are many to whom this task would be a pleasure, while it would be a benefit to others.

We know that on many points our visitors have returned home with improved feelings respecting us; and this advantage has been mutual; for thousands in London have been struck by the kindly spirit and polite and gentlemanly bearing of the amateur musicians; and those who had the opportunity of conversing with some of them will remember with pleasure the enlarged views, in connection with commerce and art, which were ex-

pressed, and the anxiety that only in this way should a struggle take place between us. Unfortunately there are less agreeable feelings amongst classes over the water, and uncertainty in another way; but undoubtedly such a gathering as that which has recently taken place will strengthen the peaceful efforts of the best disposed section of the French nation.

All this good is rendered possible by the modern improvements made in the methods of transit: but for steam-packets and locomotives, so large a body could not have been gathered from the various and distant provinces of France, and brought so readily to our shores.

That a decidedly favourable impression has been produced upon our recent visitors by their reception was very clearly manifested by them on every occasion in which they appeared before the English public, especially on Saturday, when their hearts were opened, and their real feelings betrayed by the genial influence of an English "collation," even though "cold," accompanied as it abundantly was, by the best "palate," of which many of them will doubtless long retain a pleasant remembrance. Indeed, their friendly demonstrations, not only on this, but on all the previous occasions, were certainly far more cordial and unreserved than those of our less demonstrative (but not less warmhearted and friendly) fellow-countrymen: we hope they appreciate the difference of national temperament, and do not ascribe the difference to coldness of feeling on our part, but to its true and only cause—coldness of manner. One of their directors, it is satisfactory to know, has, on their part, thanked "a thousand times" the English nation for the manner in which they have been received; and the response of the whole body, through their chief leader, M. Delaporte, to the address of "the friends of peace" was all that could be desired.

THE LIBRARY OF TRINITY COLLEGE, DUBLIN.

THE old roof of the library, Trinity College, Dublin, was found some time since to be in a state of hopeless decay; and, after receiving various plans for its reconstruction, the result has been the adoption of a design by Messrs. Deane & Woodward, which will give much greater height and importance to the apartment. It had formerly a flat plaster ceiling: it will now be vaulted in the centre. The book accommodation of the library being very limited, and the fact that in forty years the number of books would double, induced the Board to adopt a plan, not only for renewing the roof, but also for increasing the book accommodation. These two points are accomplished very cleverly in the plan decided on. The room is 240 feet long, and the span 44 feet.

The architects have put up a temporary V roof, which enables persons to use the library while the work proceeds. The cost will be about 7,500*l.* Messrs. Cockburn are the contractors.

WORKS IN PARIS.

THE transformation of the flower plantations of the grand avenue of the Champs-Élysées proceeds rapidly. For some days past a considerable number of workmen have been in possession of the square plot of the *Cirque*, where masses of shrubs and flowers are to be placed, as on other portions of this delightful promenade. Meanwhile, the elegant fountain called *Les Quatre Saisons*, having been coppered over, is being put in its place again. The flowers to be planted in the *Carré du Cirque* were recently purchased, by the Municipal Council of Paris, in Holland, and most of them are in full bloom. The rhododendrons, the kalmias, the azalias, and the canus are said to be very fine specimens.

The environs of Paris, as well as the capital, receive fresh improvements. In the park of Vesinet, spontaneously fixed upon by the Parisians as a site for country seats, a second and vast lake has been formed; and the situation, naturally picturesque, has been rendered more so by the earthworks thrown up, to render the grounds more undulating. Water in abundance is to be supplied by powerful steam machinery, which the engineers are putting in place in the buildings near the reservoir. Moreover, the two bridges over the railway, uniting both sides of the park, are finished; so that, henceforward, Vesinet will rank among the most delightful summer residences about Paris.

A new loan is to be raised by the Municipal Council, amounting to 150,000,000 francs, for the further embellishment of Paris, sanitary works, and the construction of new boulevards.

EXHIBITION OF STEAM PLOUGHS IN THE NETHERLANDS.

AN exhibition, open to all the world, of steam ploughs and reaping-machines, is to be held in the Netherlands, from the 5th to the 13th August next, at a place called *Wilhelminapolder*, near Goes, province of Zealand. Prizes will be awarded for the best steam-engines for labouring and turning the ground, so as to replace advantageously horse work and human labour. First prize, 1,200 florins; second prize, a gold medal. For reaping-machines,—First prize, 500 florins; second prize, a gold medal. Competitors should address, for information, to the secretary of the Royal and General Agricultural Society of the Netherlands, at La Haye, stating the nature of the machine and its price. They are to be on the spot (*Wilhelminapolder*) before the 3rd of August. The council of the society furnish at their own cost the necessary men and horses for the experiments, but each exhibitor must have at least one competent person to mind the machine: the council also furnish the use of a building for storing the above in safety. The Government have consented to allow the free importation of the implements, insisting, however, on the provisional payment of the duty as a guarantee of good faith, which will be reimbursed on their return to the original country. Arrangements are to be entered into with the different railway and steamboat companies to have these machines transported at reduced prices, and further particulars will be announced as to this step.

TAUNTON.

THIS ancient and loyal town is not behind its contemporaries in "the march of improvement." Many of the public buildings have been considerably beautified, or re-erected, within a few years. The well-known St. Mary's Tower is rapidly rising under the care of a townsman. St. John's Church, under Mr. Scott, is nearly ready for the roof, and promises well. The Roman Catholics are now in possession of their new church, lately opened. Of civil buildings, there is a new shire-hall recently erected, besides a large hospital, institution, archaeological museum, and many others. The private houses are all full, as well as the mansions in the neighbourhood; and the town, since the introduction of the Public Health Act, has attained a high character for health.

THE HANOIS LIGHTHOUSE, GUERNSEY.

THE *Hanois* are rocks on the west coast of Guernsey. On the *Biscan*, one of these rocks, a lighthouse is about to be erected. The base of tower is 23 feet 7 inches; the height of stonework 90 feet; and the least diameter is 17 feet. There are to be six rooms in it. The works are not to be done by contract. They are to be executed under the guidance of the engineers of the Trinity Corporation, Messrs. Walker, Burgess, and Cooper. The resident engineer is Mr. W. Douglas.

This lighthouse, when erected, will supply a desideratum.

PROPOSED GAS-WORKS FOR BAHIA.—BRAZIL.

WE have before us the prospectus of the Bahia Gas Company (limited), with a capital of 100,000*l.*, in 5,000 shares of 20*l.* each. The following information is gleaned from the prospectus, which may be interesting to our readers:—

"Bahia is a seaport city, the second in size and importance in the empire of Brazil. The population of the city is 180,000. The following statistics are from an official return:—palaces, 4; public establishments, 28; fiscal ditto, 7; hospitals, 9; churches, 58; public institutions for education, 75; manufactories, 74; printing establishments, 13; workshops, 676; alimentary stores and shops, 678; other stores and shops, 660; wharfs, 76; exchange rooms; railway station, 1; private houses paying the government tax, 5,910. The Bahia and San Francisco railway, now in course of formation, will tend greatly to increase the commerce of this city. The first section, viz. that starting from Bahia, will shortly be opened for traffic."

The prospectus gives the following cheering account of the state of the gas-works at Rio de Janeiro:—

"The shares of this company are at a considerable premium, having advanced in value nearly 50 per cent. The profits realized have each year increased, the dividend in 1855 being at the rate of 8*l.* 10s. per cent. on the capital, while the pro-

fits of last year, 1859, allowed of a dividend equal to 16 per cent. In addition to this, 10 per cent. of net profits is carried annually to the reserve fund."

We have in our pages frequently alluded to the progress of the Pernambuco Gas Works, which were completed by Messrs. E. T. Bellhouse & Co., of Manchester, last year. This undertaking is thus alluded to in the prospectus:—

"The Pernambuco Gas concession, with terms nearly similar to those of Bahia, was considered to be so profitable that it was purchased from a company in course of formation in London, and carried out by private enterprise. The demand made for gas by private consumers has been so large, that additional hands and fittings have been written for, to meet the requirements."

The document before us further states, that Messrs. Law & Bount, of London, are the engineers for the company; that the direction of the undertaking will be in London; that the necessary arrangements have been made with the concessionaire, whereby the privilege is secured to the company; that it is probable that a net income of 16 per cent. will be realized on the capital expended; and that the prospects of the undertaking are most favourable.

#### ANNUAL MEETING OF THE SURREY ARCHÆOLOGICAL SOCIETY.

The seventh annual general meeting of this flourishing society took place at Reigate on the 27th ult.; under the presidency of the Hon. W. J. Monson, M.P.

The members of the society assembled in large numbers from different parts of the county at the Merstham railway station, at eleven o'clock in the morning, from whence they proceeded to the parish church, where Mr. Alfred Heales, F.S.A. attended, and gave a sketch of its history, calling the attention of the company to objects of interest.

The company then left for Chipstead Church, where the Rev. P. Aubertin, the rector, described the edifice at great length.

Gatton Church was next visited, and was described by the Rev. J. C. Wynter.

The party then proceeded to Gaston Hall, the seat of Sir Hugh Cairns, which was thrown open to their inspection, and in the new marble hall of which the business of the meeting was transacted. Here the chairman congratulated the meeting upon the fact that the funds of the society were in a very prosperous state, and that the number of members was 606, being an increase of 32 during the last year.

The company afterwards proceeded to Reigate, and visited the parish church, a description of which was given by Mr. W. Hart, F.S.A.

The Priory, the seat of Earl Somers, was the next point of attraction, and the Baron's Cave was visited by a large number of people, both before and after dinner, the passages having been lighted up for the occasion. When the company assembled in the principal passage, Mr. John Lees, of Reigate, made some general remarks upon the caves.

The annual dinner took place at the White Hart Hotel, when about 120 persons sat down, including ladies of the party. A conversation was afterwards held at the Town Hall; and, during the evening, lectures were delivered by the Rev. Mr. Mayhew, of Newdegate, Mr. W. J. Hart, and Mr. Richardson.

#### NEW BUILDINGS FOR THE ROYAL BANK, POSTER PLACE, DUBLIN.

The directors of the Royal Bank have been erecting a cash-office of large dimensions. The new hall measures 84 feet by 56 feet, and 35 feet to the centre of the circular roof. The walls and ceilings are elaborately panelled. The light is admitted through the circular part of the roof, in plate-glass panels surrounded by enriched moldings. The effect is increased by means of corresponding mirrors in similar panels, at each side of the centre between the ornamental ribs spanning the vault. The flooring is of tessellated tiles, extending round each side of the semicircular counters, within which are the departments of the principal officials and their assistants. The peculiarity about the erection is the suspension on iron beams and columns, unusual in size and weight, of the eave of the old buildings facing Poster-place, measuring 56 feet by 10 feet, by 25 feet in height. The architect (Mr. Charles Geoghegan) has had numerous difficulties to surmount, and has been

obliged to resort to a novel method of shoring the superstructure, to which we have before referred. The works have been executed by Messrs. Crowe. Messrs. Courtney & Stephens have supplied the iron beams and columns, under the special direction of Mr. Anderson. The entire counteracting and the desks are from the establishment of Mr. Beakey, and the marble mantel-pieces were furnished by Mr. Manderson. The *Evening Mail* says,—"The building in every part proclaims the hand of an accomplished architect, who has encountered and overcome enormous difficulties, and produced a hall the singular beauty and the admirable arrangements of which cannot fail to arrest the attention of the public on the day of opening."

#### CHURCH-BUILDING NEWS.

**Stamford-hill, Middlesex.**—The foundation-stone of the new district church of St. Ann's, Hanger-lane, Stamford-hill, was laid on Tuesday last, the 3rd instant, in the presence of a large assemblage of the founder's friends and the residents of the district, by Mrs. Newsum, the wife of Fowler Newsum, Esq., of Stamford-hill, at whose sole expense the same, together with a spacious parsonage-house adjoining, are to be built. The design is by Mr. Talbot Bury, architect: it has an apse and transepts, and will seat 600 persons; it will be highly finished, and when completed will cost about 8,000*l.*, and the parsonage 2,000*l.* The contract for both has been taken by Mr. Myers. Two years back, the munificent founder of this church erected in the immediate vicinity a spacious school and some model cottages.

**Wolverhampton.**—The foundation-stone of a new church, dedicated to St. Luke, has been laid at Blakenhall, in the parish of St. John, in this town. This is another of the memorial churches to the late Archbishop Hodson. The site is easy of approach. The style of architecture will be Early English, and the exterior walls will be of dressed bricks, ornamented with coloured brick-work, and stonework. At the south-west corner will be a tower, upon which it is proposed ultimately to place a spire. There will be at the western entrance an arcade, decorated with iron shafts. The interior of the church will consist of nave, aisles, and large chancel, which will also contain aisles. There will be no galleries. The roof will be open-timbered. The extreme length of the edifice within the walls will be 130 feet, and the width 52 feet, but arrangements have been made for future extension, if needful, by means of transepts. The shafts of the pillars on either side of the nave will be of cast-iron, with ornamental wrought-iron capitals. The ends of the pews will also be of decorated iron, while the bodies will consist of stained deal. The church will be capable of accommodating 700 adults and 200 children, mostly free. Mr. G. T. Robinson, of Leamington, is the architect; and Messrs. Lilley, builders, of Measham, have undertaken to complete the church for 2,800*l.* This sum, however, does not include land, fences, architect's commission, &c., which are computed at 1,500*l.*

**Nantwich.**—Nantwich Church restoration approaches completion; the only unfinished part, the chancel, now being restored at the sole expense of the patron of the living, Lord Crew. The work is being carried out under the direction of Mr. Scott. It is satisfactory to find, according to the *Macclesfield Courier*, that, with trifling exceptions, the stone vaulting, with its carved bosses, so long disfigured by thick coatings of plaster, is as perfect as when first chiselled. The canopied stalls of oak, with their quaint carvings, had in many parts been barbarously mutilated, but will be restored. The east window consists of a repetition of small windows of bowing tracery, so combined as to give the whole the appearance of perpendicular work. The large window in the south transept has come out with effect since the stained glass, by Mr. Wailes, has been placed there by Mr. G. F. Wilbraham, in memory of his ancestors.

**Brecon.**—The following tenders for the restoration of Trallong Church have been considered at a vestry meeting:—

Griffiths & Son.....	£ 330	0	0
Hargest & Price.....	510	0	0
Williams & Son.....	450	0	0
Williams (accepted).....	462	0	0

The plans, &c. were prepared by Mr. C. Buckridge, of Oxford, architect. The work is now in progress, and is to be completed by the 1st of December next.

**Manchester.**—The corner-stone of a Methodist free church has been laid at Openshaw, near Manchester. The intended edifice will comprise a

chapel to seat 310 adults, and a school to accommodate from 500 to 400 children. The building will be of brick, with white bands and stone dressings. The architect is Mr. R. M. Smith, of Manchester, and the contractors are Messrs. B. & W. Hoyland, of the adjoining township of Bradford. The cost will exceed 1,000*l.*; towards which amount 550*l.* have been already raised.

**Leeds.**—The foundation-stone of a new Jewish synagogue has been laid in Belgrave-street, Leeds, by Mr. M. Gluckstein, president of the committee of the congregation. The building is to be erected from a design by Messrs. Perkin & Backhouse, of this town, architects; and the contracts for its erection are let as follows:—Bricklayers' work, Messrs. W. Simpson & Son, Leeds; joiners' work, Messrs. Terry & Hill, Leeds; slaters' work, Mr. W. Pycock, Leeds; plumbers' work, Mr. T. Bedford; painters' work, Mr. E. Fearnside. The new synagogue is to be in the Byzantine style of architecture, and will cost, it is estimated, 1,200*l.* It will contain accommodation for 300 persons.

**Preston.**—The architects of the church at Preston, noticed in our last, are Messrs. Huggall and Mark.

**Dunsforth.**—The first stone of St. Mary's Church, Dunsforth, has been laid by Mr. W. F. Schofield. The contractors are Messrs. Freeman, Kettlewell, and Bramley; and the architects are Messrs. Mallinson & Healey.

#### PUBLIC BUILDINGS IN THE PROVINCES.

**Bagshot-heath.**—The State Asylum for Criminal Lunatics, at Broadmoor, on Bagshot-heath, now approaches completion. The site comprises 220 acres, and the land, which is of an undulating character, falls towards the south, and is sheltered from the north and east winds by a belt of wood. There is a stream yielding from 50,000 to 100,000 gallons daily, of soft water. The buildings are erected upon the northern part, from which extensive views are commanded. The Commissioners in Lunacy state that it has been deemed sufficient at present to provide accommodation for 400 males and 100 females.

**Malvern.**—A new Petty Sessions-room and Police-station have just been completed. The building stands on the road entering Malvern from the Liuk. The materials are red brick, with Bath stone dressings. In consequence of the rapid slant of the ground at the site, the building is only one lofty story in height towards the road, but is three stories at the back. The upper story is occupied by the large room in which the magistrates meet, with a retiring-room for the magistrates at one end, and a waiting-room for witnesses at the other. On the east side is the principal entrance, with a charge-room on one side, and police-room on the other. The justice-room on the south is 35 feet long, 19 feet wide, and 15 feet high. The architect was Mr. Rowe, the county surveyor, and the contractor Mr. Perkins, of Malvern.

**Birmingham.**—The foundation stone of the new Magdalen Asylum, or refuge for penitent females, has been laid by the Earl of Dartmouth. The site is at the farther end of one of the new streets opened on the Rotton Park estate, Hagley-road. The elevation of the building is in the Italian style, of an inexpensive character. The architect is Mr. Thomas Naden.

**Manchester.**—Contracts have now been accepted for nearly all the work connected with the new Manchester Assize Courts in course of erection in Bury New-road, Strangeways. The first contract, for the excavating, was that of Messrs. Gilbert & Sharp, and the cost was about 1,200*l.* They followed the contract for the brickwork and flag foundations, stone footings, &c., for which the tender of Mr. Robert Neill, of Strangeways, was accepted, and the cost has been about 1,700*l.* The work is now to the level of the ground floor. The original estimate was that the builder's work proper should not exceed a cost of 70,000*l.*; but the committee have since that time arranged with Mr. Alfred Waterhouse, the architect, for somewhat extending the plans, so as to give rather more space for the court rooms and the surrounding corridors, and for the addition of a projecting entrance from South-hall street. In addition to this a rise has taken place in the value of building materials and of labour; but the contract of Mr. Samuel Bramall, of Hulme, is understood to be 69,977*l.* Mr. Bramall has undertaken to complete his work by the 1st of May, 1863. The building is to be warmed and ventilated by water apparatus, for the supply of which the tender of Messrs. Hayden, of Trowbridge, has been accepted; amount, 2,600*l.*

STAINED GLASS.

*Doncaster.*—Arrangements are being made for the completion of a stained-glass window at the east end of St. James's Church. The work has been entrusted to Messrs. Clayton & Bell, of London. This window was a spontaneous offering of the officers and workmen engaged in the Great Northern Railway Plant, as a mark of personal regard to Mr. Denton, the chairman.

*St. Peter's Church, Oldham.*—Messrs. Edmundson & Son, of Manchester, have just placed in this church four stained glass windows, three in the chancel and one in the west end. The subject in the centre window in the chancel represents the Last Supper—Jesus seated with the Twelve Apostles—John sorrowfully resting his head on the breast of the Saviour. The window on the left is the Crucifixion, and on the right the Resurrection. The old windows are left in their places, and the new ones of stained glass are placed in the inside, leaving a space of 15 inches between the old and the new windows. These spaces are filled with gas burners, which are at night lighted up, so that the subjects in stained glass are seen almost as effectively as in the day time.

THE GOLD EFFECTS IN MEDIEVAL MANUSCRIPTS.

My notice has just been called to an article in the *Builder*, of June 23rd, wherein a discussion on the gold effects obtained in Medieval manuscripts is reported as having occurred at the last meeting of the Royal Institute of British Architects. The discussion appears to me so meagre and unsatisfactory, that I venture to add some remarks on it, and to give the results of my experiments on the subject. Just now so much attention is being deservedly paid to the exquisite models bequeathed to us by our forefathers, that I hardly think it necessary to apologize for occupying your valuable space.

As regards the discussion, it is quite true that the processes mentioned by old writers, such as Theophilus, will not work. The white of egg and plaster of Paris, from a very coarse groundwork, and would, I imagine, be best laid on with a trowel, an instrument not in request for delicate illuminated work; besides, the gypsum is much too gritty to take a burnish, and the composition would be certain to crack off. I cannot agree with Mr. Burgess that the foundation is prepared in gesso, having (as I understand his remarks), a superposed opaque burnishing layer. I have carefully examined, both with the naked eye and with lenses, the damaged surfaces of raised gilded manuscript ornaments; and I am satisfied that the ground is homogeneous, and that the gold used is extra thick leaf gold, all but free from alloy, if not chemically pure. That the gold is extra thick I am certain, not only from its solid plate-of-metal-like appearance, but also from the fact that it is only within the last few years that the trade has succeeded in beating gold so thin as the three hundred thousandth of an inch: that it is leaf gold I am confident, from examining with powerful lenses, under which it is easy to detect the grain of the gold, and the places where different leaves join. The purity of the gold is proved thus—Use common yellow gold: gold and burnish a surface with it: repeat the experiment with fine gold in leaf. Hold the two side by side in different lights, and it will be seen that in some the common gold shows black, but that the pure gold shows uniformly a soft yellow tone, such as is always seen in old illuminated manuscripts. I speak more confidently with reference to twelfth, thirteenth, and fourteenth century manuscripts, as that is the period to which I have mostly directed my attention.

After numerous experiments, I believe I have succeeded in solving the groundwork problem. I have made a composition which reproduces the gold effects, both flat and raised, mat and burnished, of the Middle Ages. I regret that I do not feel at liberty to make public the nature of the "medieval gold-body," as it is called; for I have disposed of the receipt to Messrs. Barnard, of Oxford-street, and I can, therefore, no longer consider it as my property. I may state, however, that the manufacture is excessively complicated and difficult, and that, even were the ingredients known, amateurs would most likely fail to produce the proper result. Messrs. Barnard have handsomely offered to supply the medieval gold-body gratuitously, to any of the gentlemen who took part in the discussion, and who are desirous of experimenting. Let me caution those who are not in the habit of handling leaf gold (and especially the leaf-gold mentioned above—beaten out of fine gold), not to expect complete success at first.

Some specimens of the effect produced by the medieval gold-body have been shown to several first rate judges, among whom are mentioned several gentlemen connected with the manuscript department of the British Museum, Mr. Warren, instructor to the royal family, and Mr. Noell Humphreys. They are unanimous that the effect is the most perfect they have ever seen. I may mention that the gold-body can be used easily and freely in both large and small spaces, with an ordinary camel-hair pencil; and, if it is laid on in thin coats, it will bear a great deal of rough handling.

HENRY JONES, Jun.

VENTILATION OF SCHOOLS.

SIR,—My attention has been directed to a paragraph in your No. for June 23rd, headed as above. J. B. has described wrongly my plan of ventilation, which does not consist in boring the frames of windows and doors, neither in several 6-inch pipes in the ceiling. If this plan was used 20 years ago, it may boast of its antiquity, but I do not think it can boast of anything else.

My plan which, from personal experience of its advantages, Lord Ducie so highly recommends, is as follows; the description being taken from the *Builder*, vol. xiii. p. 414:—

"It is described as consisting essentially of two tubes, the one placed within the other, with an annular space between them, and both opening freely to the external air. The internal tube, destined to carry off the vitiated air, is placed in the chamber to be ventilated, with its downward opening near the ceiling, towards which the air, from its superior lightness, naturally rises. The annular space is intended to supply the waste, by permitting the external atmosphere to pass into the chamber. A flange checking the entering air in its downward course is introduced, to cause it to spread equally over the whole area, without producing sudden fluctuations of temperature."

I trust you will do me the favour to insert this in order to remove the impression that the plan described by "J. B." at all resembles mine.

J. McKINSELL.

THE "ONE HOUR SYSTEM."

SIR,—With "William Ellison" I fully agree, respecting paying men by the hour, and beg to state that I have paid the men under my charge by the hour for the last twelve months, and I sincerely wish that others would adopt the same system; for I assure you it is no easy matter to bring about such a change alone, and no one in my neighbourhood has as yet adopted the one hour system except myself. I have been both insulted and assaulted for making the change, but now my men are as great advocates for the one hour's pay, as they were at one time averse to it; and I feel certain that were the one hour's pay to become more general, the nine-hours movement would soon become a thing that was.

A BUILDER'S FOREMAN.

CARRARA MARBLE.

MOONSHINE!

In your number of June 23rd, I find the following assertion on the part of Mr. J. Bell, in a discussion on the marbles of Tuscany:—"It [the Carrara marble] was called lunar marble from its moonlight colour."

Now, I want to know if Mr. Bell has a shadow of authority for this remark, which appears to me to be pure moonshine and nothing else! In ancient times, and down to about A.D. 1300, Carrara marble was styled "*Marmor lunense*;" not from anything to do with the moon, but from the matter-of-fact reason that the port of shipment was the famous Etrurian city of *Luni, Luna, or Lane*, which flourished down to 1020 in a sort of way, decayed gradually between that and 1500, and was quite deserted in 1600.

Some imaginative classic, more up in his translated Vitruvius than in the pages of Facioliati or Ducauge, may have taken "lunense" for "lunare," and so hindered into "lunar marble."

In Italy, from traditional habits, Carrara marble was long called "*Marmo di Luna*," but solely from the port which gave its name to that entire district—the Lunigiana.

And as to the "moonlight colour," so far from the even paleness that such an epithet would seem to indicate, no marble that I have ever seen has such a sugary, dazzling surface, as fresh Carrara. F. E. S.

OBVESTRY CEMETERY COMPETITION.—We have received some letters of warning on this matter, but have not had time to inquire into it. Complaints are made of the course pursued by some of the competitors.

THE MAIN DRAINAGE CONTRACTS.

METROPOLITAN BOARD OF WORKS.

At a meeting of the Board, held last week, a report from the Main Drainage Committee, containing the following, was adopted:—

"That the committee, considering the nature of the sewer works being now carried on by the contractors for the main drainage, is of opinion that it would be sufficient for the Board to retain 10 per cent. on the value of the works executed, as certified by the engineer, such certificate to be final and binding."

And recommending—  
"That all the contractors in future be paid 90 per cent. on such value, and the balance of the amount hitherto retained be paid them, the consent of the sureties being first obtained."

That as regards Mr. Helling, who has stopped the works of the outfall sewer on the plea of his not receiving moneys due to him according to contract, he do only receive such payment on his finding a responsible and approved party to join in his contract, on the works being immediately proceeded with, and on the understanding that the certificate of the engineer shall be final and binding as to the value of the amount of work executed—the consent of his sureties being first obtained.

That it be referred to the solicitors to prepare all necessary agreements and securities to make the Board safe."

GAS.

The directors of the Faversham Gas Works having determined upon building new offices, extending the retort house and other buildings, the following tenders have been shewn: Mr. Lewis Shrubsole, 415s.; Mr. S. M. Shrubsole, 435s. The lowest tender was accepted.

—At a public meeting at Buckingham to consider as to the price of gas, it was stated, on the part of the directors, that some time ago they had resolved that, from September next, the price of their gas should be reduced from 7s. 6d. to 6s., and that the charge for metres should be abolished, which would leave about 5s. 6d. per 1,000 feet for the consumer to pay. It appeared that the shareholders, on an average, received about 4½ per cent. This statement seemed to give satisfaction.—The Plymouth Gas Company, who have for some years acted steadily on the principle, recommended in the *Builder*, of reducing the price of gas in order to increase their profits, have, we understand, once more reduced their price, after, as usual, dividing 10 per cent. on their capital, the maximum dividend allowed by law. The price is now reduced to 8s. 6d. per 1,000 cubic feet.—The Bradford Gas Company were to reduce the price of their gas from 4s. to 3s. 4d. per 1,000 feet on and after the 1st July.—At a recent meeting of the Kelson Gas Company a dividend of 10 per cent. on the paid-up capital was declared.

THE PROPOSED GARRISON HOSPITAL AT WOOLWICH.

When the remaining items of the Army estimates for the current year were disposed of in the House of Commons on the 18th ult., the Secretary for War took occasion to advance the somewhat startling assertion that "the Government is now building barracks that would make incomparably better hospitals than the generality of the metropolitan ones," and then, in reply to Mr. Monell, and with reference to one very heavy item in the estimates, Mr. Herbert asserted something like the converse of the first proposition, and gave it a special application by saying that a bad hospital, the very worst perhaps in all England, one which has been conducted for years, would make a good barrack. His words were,—"The present hospital at Woolwich is well fitted for barracks." He added, "It is proposed to build a new hospital on a more eligible site for the purpose."

One must be permitted to doubt how far it is at all possible to adopt an involved series of exceedingly small rooms to the requirements, disciplinary and sanitary, of a barrack. What was meant by a "more eligible site" than the present one at Woolwich we are now enabled to understand, as the War Department has concluded, or is about immediately to conclude, the purchase of Kidbrooke-common, with a view to the new hospital being built on it.

This common is a piece of stillye land, below Shooter's-hill, and just over against the new vast Greenwich cemetery. It is so far removed from the barrack from which patients will be supplied to it, that much delay and great inconvenience must of necessity occur when the hospital is moved to this site; and the distance between the two points will also render necessary a supplementary hospital at Woolwich and a double set of officials,—an arrangement which will cause expense, embarrassment, and circumlocution.

It cannot be necessary to say one word more in condemnation of a scheme for the carrying out of which the House of Commons has, with but the faintest breath of inquiry, without a whisper of objection, with no more explanation than the very superficial one quoted, sanctioned an expenditure of 120,000l. of the public money.

What renders this act of supreme folly all the more deplorable is the fact, which is patent to every one who knows anything of the district, that Government already possesses, in the immediate neighbourhood of the barracks, more than one site,—two are at present unoccupied,—which, in their soil and surroundings, comply with several of the most imperative sanitary necessities, while they are free from the objections which ought to condemn the proposal to build on Kidbrooke common.

There can be little doubt that as soon as many thousand pounds have been expended on this scheme, it will be discovered that a great mistake has been committed, and that there will be much controversy, and the seemingly inevitable array of commissioners and committees.

In view of that contingency, the courteous reader is requested to take note that a public and detailed protest, in behalf of common sense and sound sanitation, has been four several times made in these columns.

It cannot be too well remembered that this work will, in magnitude and expense, be second only to the huge blunder at Netley. There is this difference, however, that, in the course of the last five years, since it was determined to build at Netley, the sound principles of hospital construction, and the principles which ought to influence the selection of hospital sites, have obtained far greater currency in the public mind. It is understood that one site at Woolwich, in many respects suitable, has been abandoned, because a medical practitioner of great respectability has stated that, in the course of a long practice, he had met with a few cases of ague in the neighbourhood. This is an objection to which it is right to attach a certain degree of importance, but it cannot justify the preference of a site, which all the medical practitioners in the world, which any corps of sappers, will tell you is one on which an hospital should never be built. Oddly enough, it would appear that the rejected site has been fixed on for the supplementary hospital, which will be rendered necessary by the great distance of the new large one. If one could suppose that Mr. Herbert is cognizant of all the bearings of the question, it would seem strange that he should so run counter to all that he has so ably said and done, that he should so "turn his back upon himself." If one could suppose that Mr. Herbert is in office to Mr. Herbert out of office, and if the question were to be settled by the judgment, there cannot be a doubt that the sounder principles would prevail. There may yet be time to retrace an unfortunate and indelible step. C.W.R.

#### COMPENSATION TO YEARLY TENANTS.

*The Metropolitan Railway.*—Some interest has been excited by the settlement of several disputed compensations to yearly tenants, by reason of the practice hitherto of coupling the 22nd and 121st sections of the Lands Clauses Consolidation Act, the one section authorising two justices of the peace to settle all cases under 50*l.*, and the other all cases of yearly tenancy. On Thursday, the 25th ult., several parties were summoned by the Metropolitan Railway Company, before Mr. Samuel Gregson and Mr. William Griffiths, two justices for Middlesex. Mr. E. Roberts appeared for the claimants, and conducted the cases. Messrs. Burchell and Mr. F. Fuller represented the company. The first case was,—

*Oborn v. The Company.* for premises, 33, Upper Lisson-street. The sum claimed was 37*8*l.** 10*s.* The company offered 8*8*l.** and a further sum of 17*l.* to save litigation. The justices awarded 13*5*l.**, which carried costs.

*Williams v. The Company.*—This claim was 1*8*l.** for loss on fixtures and an improved rent of 3*l.* a year on a cow-shed in Middlesex West. The company had refused to make any offer, as the claimant was under notice to quit, according to their arrangement with the landlord. The justices advised the company to settle, which resulted in an offer of 10*l.* This was declined, and the justices awarded 13*l.*

*Sharpe v. The Company.*—The claimant is a working lrazier and founder, also under notice to quit, expiring at Christmas. The company made no offer, but upon presence in court proposed 30*l.* The arguments mainly turned upon the damage to the trade for the remainder of the term. Mr. Roberts urged that the notice to quit was caused by the railway works. The justices awarded 85*l.*, which carried costs.

#### ARCHITECTS' CASES.

*Manton v. Farmer.*—In this case, tried in the Wolverhampton County Court, June 23, Mr. Charles Manton, architect, of that town, sued the defendant, Mr. Joseph Farmer, butcher, Tettenhall, to recover 3*6*8*l.** 6*d.* for preparing plans and specifications of some new building which the defendant intended to erect at Tettenhall. Mr. Claydon appeared for the plaintiff, and Mr. Underhill for the defendant. Plaintiff's case was that, in May last year, he was engaged by the defendant to prepare plans and specifications for the erection of some new buildings to be used as a butcher's shop. He did so, and submitted the plans to Mr. Farmer, who thereupon raised a question as to the cost, saying it would make a hole in 200*l.* This was the first intimation Mr. Manton had of any limit as to price. On looking over the plans, Mr. Farmer suggested certain alterations, which Mr. Manton told him would further increase the expense; but defendant ordered them to be done. Mr. Farmer approved of the plans with these alterations, and tenders having been solicited, the lowest was from Mr. Jones, for 32*0*l.** Mr. Farmer cavilled at the expense, and plaintiff suggested a certain curtailment in the plans, but the defendant would not assent to this. While the plaintiff had the plans in hand to reduce them, defendant came to him and told him he should not require them. Plaintiff, being a relation of the defendant, had charged him at the rate of 2*1* per cent. on the 32*0*l.** with the items of 16*8*l.** 6*d.* for preparing a ground plan of the property, and 1*5*l.** for an estimate. Mr. Underhill admitted the plaintiff had performed the work specified, and if he was entitled to an architect's fee in respect of the work done, the charge made was reasonable and reasonable. The whole question was whether an architect was entitled to any remuneration if he had a specific arrangement with his principal as to the amount to be spent, and afterwards exceeded that estimate in his plans. In cross-examination by Mr. Underhill, Mr. Manton said the first interview between him and Mr. Farmer took place at Mr. Farmer's house. Miss Moore, defendant's housekeeper, was present. Plaintiff positively denied that Mr. Farmer then told him he would not go beyond 200*l.* Mr. Farmer swore that, at the interview referred to, he*

told the plaintiff he did not propose to go further than 200*l.* His Honour said this question has narrowed itself into a flat contradiction between the parties. Miss Moore, defendant's housekeeper, was called, and confirmed Mr. Farmer's statement as to the mention of the 200*l.* on the occasion of the first interview. Mr. Banks spoke to the custom amongst architects, in accordance with Mr. Underhill's views. The judge, Mr. Skinner, accepted the defendant's version of the transaction, and gave judgment in his favour.

*Sprague v. Tomkins.*—Mr. Serjeant Parry and Mr. Digby Seymour were counsel for the plaintiff; Mr. Macnamara for the defendant.

This was an action by an architect, tried in the Court of Common Pleas July 3rd, to recover the value of certain plans made for the defendant, and relating to certain proposed alterations at St. George's Wharf at Wapping.

The defendant paid 5*l.* into court, and the plaintiff had a verdict for 10*l.*, being the remainder of his claim.

#### ACTION FOR DILAPIDATIONS.

RUCK V. HALL.

In this action, tried in the Court of Exchequer, June 29th, Mr. Montague Smith, Q.C., and Mr. Field were counsel for the plaintiff; Mr. Henry James and Mr. Griffiths appeared for the defendant. It was upon a branch of covenant to build and maintain a house in a proper state of repair.

The question was one involving all matters connected with the construction of the house, and during the opening of the plaintiff's case, his Lordship said that it was impossible for the jury to try the case, and the matter had better be determined by a surveyor, to whom it ought to be referred. The plaintiff not acquiescing in the suggestion of the learned Baron, the case was proceeded with, getting into a perfect maze of facts and figures, but eventually it was consigned to the fate that had been originally proposed for it, his Lordship remarking that the fault of such cases coming into court lay with the judges, who had not the courage to insist upon referring them. In the present instance an expense of at least 100*l.* might have been avoided if the case had been referred to chambers.

#### THE LABOUR MARKET.

AN advance of wages seems to have been very generally agreed to.

At *Polechampton* an advance of 4*d.* a day has been conceded by the employers to the bricklayers; and the carpenters and joiners have resolved to apply for the same increase. The painters are about to make a similar application.

At *Liverpool* a good many of the master joiners and carpenters are said to have agreed to allow the required half-hour each evening, and others have promised to be nice by the majority.

The *York* joiners have gained an advance of 2*s.* a week, and a diminution of one hour and a half in the time of labour from the masters.

The *Dorsetshire* masons remain much as it was: one master, however, has been obliged to give an advance of new hands of 2*s.* a week in wages, and a few others have got some men on like terms; but the diminution of time has not yet been conceded, and the new works are mostly at a standstill.

At *Dorsetshire* the employers have agreed to give their masons an advance of 4*d.* a day, and labourers 2*d.*, which has been accepted, although the requirement was 6*d.* to masons and 4*d.* to labourers. Wages will now be 26*s.* for masons, and 17*s.* to 19*s.* for labourers.

The *Jedburgh* masons have struck for a rise of 2*s.* 6*d.* a week, which the masters as yet refuse to give. The builder of the Exchange is said to give only 26*s.* 14*d.* in *Jedburgh*, although he gave 2*s.* at Melrose just before he started at *Jedburgh*.

At *Hawick* the masons' wages are rising.

#### "ANCIENT ARMOUR" AND THE TOWER.

SIR.—You have been pleased to notice in your last number, the volumes lately published, "Ancient Armour and Weapons in Europe." Your remarks on the work itself would not have led me to trouble you with a single word; but you accuse me of the "defence, on a previous occasion, of forgeries purchased for the Tower." This is a grave charge, and I claim the right of being heard in denial. Even if I had been guilty of so foolish a thing, I am at a loss to see how a transaction of purchasing armour by the Tower storekeeper, in 1853, bears upon the publication of two volumes on military topics, by an amateur, in 1850. But so far from defending the nefarious practices of vendors of spurious antiquities, if your readers will turn to your No. 522, in 1855, p. 85, they will find that I wrote a long letter in your own columns, exposing, as far as in me lay, the frauds of these dishonest traders.

On the particular object there in question (a so-called "helmet from Florence") I did not indeed express any opinion, either *pro* or *con*, for the simple reason that I had nothing to do with the matter. But I may be allowed to add, that the very first moment an opportunity presented itself for my recording an opinion on the subject, I took care to do so. At page 31 of the Tower Armoury Catalogue, you will find the *Florentine helmet* thus described:—

"Mask burget, the visor in the form of a monster's head, with an ornament of wings at the sides. This helmet, though not genuine, is curious as an ingenious example of metal-work after the manner of the old armour-smiths."

J. HEWITT.

\* \* \* Receiving this at the moment of going to press we are unable to add anything to what we

have already said, but we may find another opportunity.

#### Books Received.

*Transactions of the Glasgow Archaeological Society.* Part I. Macnab, Printer, Glasgow, 1859.

The first part of the Transactions of the Glasgow Archaeological Society has just now been printed. Articles requiring illustration have been reserved, but will probably also be published. The first paper in the present part consists of some interesting reminiscences of James Watt, by Mr. Robert Inart. While speaking of Newcomen's engine (on what authority, by the way, is Newcomen's engine so spelt "Newcomen," as it here repeatedly is?), the author alludes to the Marquis of Worcester's inventions, and particularly to that "engine" in respect to which the marquis says "I do intend that a model thereof be buried with me"; and as it so happens that we recently made mention of a proposal to open the tomb of the marquis in order to look for this model, let us see what an engineer of some skill and experience has said, speaking in 1857, on this subject. But first, we may remark, it is in allusion to the ninety-eighth of his "century of inventions" that the marquis hints his intention to have a model of the engine he is then briefly and obscurely treating of buried with him. That engine appears to have had the atmosphere as its first mover or primum mobile. Of the ninety-ninth he says that by it a weight of 1 lb. can raise 100 lbs. as high as 1 lb. felleth. Now, in respect to these two inventions, Mr. Hart says, "the ninety-eighth means that he has discovered a way to use the pressure of the atmosphere as a first mover: in the ninety-ninth he applies it to act on a piston whose area is equal to lift 100 lbs. by the pressure of the atmosphere. He would have a model of the air buried with him." The 100th (a waterwork engine for raising "an incredible quantity of water") Mr. Hart considers to be "composed of the other two," and to be, in fact, no other than Newcomen's engine. Into this latter question we need not here enter; but of the former we must say we think Mr. Hart's conclusion to be by no means borne out by the marquis's words. It is not a "model" of the "primum mobile" that he "would" have buried with him, but a model of "an engine so contrived" that "the working" of it is by means of a "primum mobile," or first mover, which, in fact, can be no other than the air; and this model "engine" he says he intends to have buried with him—not merely that he will have it buried with him. Moreover, if, as Mr. Hart concludes, the 100th and last invention was based upon the ninety-eighth and ninety-ninth, then, since the marquis says, "I deem this invention [the 100th and last] to crown my labours;" in all probability it was in the form of this crowning invention that he intended the ninety-eighth or "semi-omnipotent engine" to be buried with him, even if that ninety-eighth be supposed merely to denote a discovery of atmospheric pressure as a primum mobile, and not any special application of that power in form of an actual "engine," such as the 100th and crowning invention assuredly was; for the Grand Duke of Tuscany saw it at work in 1665.

*Shall the New Foreign Office be Gothic or Classic? A Plea for the former.* By Sir FRANCIS E. SCOTT, Bart., Chairman of the Government School of Art, Birmingham. London: Bell & Daldy, 1860.

In this addition to the crop of pamphlets grown on the battle-field of styles, Sir Francis Scott, repeating all the arguments which have been used in favour of the adoption of Gothic as the style of the New Foreign Office, writing with considerable vigour and spirit, and putting into it the result of much reading and travel, has made an interesting and agreeable contribution on his side of the question. With all his love for Gothic architecture, he views the Greek ruins as "the relics of an architecture so true, so perfect, and so lovely, that the world can never look upon the like again!"

Against "decorators" the author is wrathful:—"The 'decorator' [he says] is of *Clayton* origin, and was first spawned, in North Italy, about 1870, in an unhealthy state of society, in an utter stagnation of popular life, at a time when architecture was corrupt in taste and deceptive in practice."

The earliest and finest known specimen is Alessandro Victoria, of Trent.

The modern variety in this country is a compound of inferior and superior, of preserving habits and insulating address, with a keen eye to colour, and a keener to profit. Their name is Legion and although perhaps a

dozen of their leading men have very great knowledge and ability, yet their existence as a profession is, and will always be, a token of the incompleteness of architects, and still more of the public, and of the education of the public.

Incomplete in technical skill, their application of it is disgraceful—yet not so much to them as to their patrons; for the gifts that make the artist are prostituted to lies, and the marble, and the plaster, and the semblance of marble, and stuccoed walls into that of porphyry and granite.

These men believe in Louis XV.: "Le style Pompadour est le haven of their choice: they swim the deep waters of Gothic meaning, and swarm in the shallows of pseudo-classic art, as tadpoles in a pond."

Putting aside the debatable points (again and again discussed), here is a paragraph with which the majority of our readers will agree:—

"While upon the subject of architectural criticism, I cannot help regretting that the study of architecture and its history should be so neglected as it is among all classes of the general public except the clergy,—when it is evident that the question must affect us all.

The most direct and obvious method of remedying this defect, and at the same time of imparting a knowledge and love of art in general, would be, I am inclined to think, by the same sort of education in form and colour as is now given in Government Schools of Art being made a necessary part of the curriculum at all private and public schools throughout the country; which system is now pursued with most encouraging results in several large grammar schools in the provincial districts."

Again, to let Sir Francis speak for himself:—

"In ancient Greece the 'Fight for the Championship' would have inspired a Pindaric ode, instead of columns of twaddle from a *Daily Telegraph* and a *Morning Star!* And on the other hand, I am perfectly certain that there are not half-a-dozen connoisseurs and professional architects among us, who could feel the need of, and worthily appreciate the exquisite—and almost indescribable—optical effects of the temple of Minerva, which taste and education made indispensable to the fastidious eyes, not of few critics, but of entire communities of the Grecian race for century after century. And these optical corrections in columns, sphinxes, and ensablures,—these upward deviations, from a horizontal level, of a quarter of an inch in a hundred feet, only to be detected by our grosser sight after the nearest measurement—these we find, not only in the temple of Minerva at Athens, in her Parthenon by Ictinus, in her Propylæa by Mnesicles; but at Eleusis, in *Agina*, and, far away in the west of Magna Græcia, in the temple of Neptune—among the marshes of Posidonia—in the work of colonists from material and lazy Sybaris a century before."

"That such delicacies of architectural design (Independent of material, for we find them with the coarsest breccia and the finest marble), were considered necessary to satisfy the æsthetic requirements of the public, among a practical people like the Greeks, is enough to fill a modern observer with positive amazement! Wonderful that such citizens of Athens! shrewd men and practical—who went down every day to Piræus on their business, as we go to the City; who knew to a fraction the price of tin from Cornwall, of ivory from Egypt, and of grain from Thrace; who made time-bargains in colonial stock, and who were well up to the last new dodge in jarticks, and gave long prices for Thessalian hawks; who had time for arts and arms, for politics and sport; and whose whole soul into each and all with true Athenian intensity of feeling and appreciation!"

VARIORUM.

"THE HABITS OF GOOD SOCIETY," published by James Hogg & Sons, Fleet-street, is a new book of etiquette addressed to both sexes. Although a *Gentleman* is not to be made by hooks of etiquette, this little volume exhibits a great deal of good sense and much knowledge of human nature. There are few who may not gain something from it.—The June number of the *Gentleman's Magazine* commences a volume. It contains, amongst other valuable antiquarian matter, a tolerably full report of the late Architectural Congress at Cambridge.—The *New York Architects' and Mechanics' Journal* is pursuing its course usefully. The editor appears to find it necessary to be more elementary in its teaching than we should have thought desirable. The journal is rightly resisting the stipulation which is being made by some competition committees, that all the designs submitted shall be their property. An organization amongst architects is spoken of "to impose a wholesome restraint on the widening presumption of building committees."—The second part of "The Warwickshire Antiquarian Magazine" (Cook, Warwick) has been published. It contains several interesting papers, among which is a document respecting Kenilworth in the fourteenth, fifteenth, and sixteenth centuries, and notes and extracts from *The Black Book of Warwick*. Amongst the illustrations are representations of several vessels, such as flags, used by Lady Dudley and the Earl of Leicester.—"The Streets of London, and how to make them Passable," is a pamphlet lately printed, the object of which is to urge the throwing open at once to the public of the toll bridges within the metropolitan bounds, and especially Southwark Bridge, in order to relieve the traffic along Cheap-side and London Bridge, an immediate relief and advantage which we ourselves have frequently urged, and which is now absolutely and immediately necessary, even though new bridges

were about to be built, which they are not.—Mr. Newlands, C.E., the borough engineer of Liverpool, has made a "Report on Horse Railways" to the chairman of the special joint local sub-committee on tramways, according to their instruction, in which an impartial review of their advantages and disadvantages is given, and the conclusions from all which are, that, so far as the traffic is concerned, the reporter sees no difficulty in the way of introducing horse railways into Liverpool; that their advantages are proved to have been great, and the evils attending them few, even under systems of monopoly and mismanagement; and that such evils he believes to have arisen simply to malconstruction, and easily to be avoided. The sub-committee alluded to, we may here note, have been examining models and plans in reference to the proposed introduction of such railways in Liverpool, and the general committee are about to report to the council on the subject.

Miscellaneous.

ART-UNION OF LONDON COMPETITION.—In reply to the offer of a premium of 100 guineas by the council of the Art-Union of London for the best series of designs illustrative of "the Idylls of the King," forty-two sets, we understand, have been sent in. The whole will be exhibited to the public, with the works of art selected by the prize-holders, at the close of the various current exhibitions.

PORTRAIT OF THE PRINCE OF WALES.—Mr. John Watkins, the artist and photographer, of Parliament-street, had the honour of attending at Buckingham Palace on Wednesday last, and taking sittings of H.R.H. the Prince of Wales, prior to his departure for Canada. Major-General the Hon. R. Bruce, governor, and Captain Grey, equerry to the Prince of Wales, also sat to Mr. Watkins on Wednesday. The Earl of St. Germans and Major Teesdale having previously given sittings to the same artist, a series of photographs has been completed by him of the gentlemen who will officially accompany the Prince of Wales to the United States.

THE CARLSLE SURVEYORSHIP.—The Town Council of Carlisle have appointed a new surveyor in the place of Mr. McKie, who has resigned. There were in all forty-five applicants for the vacant office, from whom the committee had selected the following:—Jos. Brierley, Jos. Gordon, John Lamb, Wm. Marquis, G. F. Parfit, W. S. Rampling, and Joseph Fox Sharp. The decision eventually rested between Mr. Lamb and Mr. Gordon, who had a personal knowledge of the Carlisle sewerage and drainage, and had been incidentally recommended by the engineer who planned the town sewerage, as a very fit person for the office. Mr. Gordon was finally appointed by a majority of eighteen to twelve. The salary was afterwards fixed at 240*l.*, with an office fund; 160*l.* to be paid by the local board of health, and 80*l.* by the corporation; the object of this arrangement being to ensure the surveyor resigning "the other appointment" if dismissed by either.

MEMORIAL TO THE LATE HON. MRS. LONGLEY.—The subscription window erected in the cathedral, Ripon (see p. 401), is quite honorary in its origin, and constitutes a graceful tribute to a name justly prized in that city. Dr. Longley was its first bishop, and held the see from its foundation, in 1836, till his translation to Durham, in 1856. The episcopal palace was built for Bishop Longley, who, while in occupation of the see, and a suffragan of York, rendered essential services to his aged primate, Archbishop Harcourt. The family memorial to Mrs. Longley is a mural brass, designed by Mr. Morris, and erected in the chapel at Auckland Castle, the palace of the bishops of Durham. It consists of a doubly-foliated ogee arch, of Perpendicular character, within which and the supporting shafts the inscription is displayed, and the ground not so employed is charged with arabesques. The tracery panels over the arch are enriched by seraphim, and the cornice carries bosses, on which are repeated the initials of the deceased. The side piers have, on pedestals within niches (the ground of which consists of stars relieved by azure enamel), figures of the Virgin Mary and St. John, while other compartments bear shields, executed on separate plates of gilded metal, inserted in sunk matrices, and the charges are of various enamel. The two principal figures, named above, are also on separate plates, gilt, as is the one which surmounts the design, namely, our Saviour in an attitude of exhortation.

ELECTION OF ORGANIST AT THE LEEDS TOWN HALL.—After a contest for this post, before Messrs. John Goss, George Cooper (London), and W. T. Best (Liverpool), these judges have recommended Mr. Wm. Spark, of Leeds, as the person best qualified for the situation.

NEW CHURCHES AT ISLINGTON.—The foundation stone of a new church at Hornsey-rs, dedicated to St. Mary, has been laid by Mr. R. C. L. Bevan, the banker. A new church, dedicated to St. Thomas, in Heningford-road, in the same parish, has just been completed at a cost of 4,200*l.*

A RAILWAY ACROSS THE CHANNEL.—Some new scheme, or modification of old schemes, rather, is ever turning up for a junction between England and France. It has been chiefly Frenelmen, too, who have started the idea anew. A pamphlet has been recently published, according to *Galligani*, by M. Gustave Robert, advocating the construction of a jetty across the Channel. The jetty is to rest on a colossal foundation, 10 metres below the level of the sea, having a breadth of 15½ metres at its base, and of 88 metres at its upper service, and on an average altitude of 22 metres. On this foundation rests the jetty, its crest above water measuring 28 metres across, and its base 76 metres, with an altitude of 16 metres from the foundation, so that it stands 6 metres out of the water. Four double lines of rail are laid down along the crest. Two passages are to be left for ships, with ports of refuge on each side. These passages and ports of refuge are to be declared neutral, so as to secure the navigation of the Channel at any time to all nations. The materials for the construction of the jetty are to be had in abundance and cheap from the adjoining cliffs. The cost is calculated at 4,900 millions of francs.

THE MIDLAND COUNTIES ARCHEOLOGICAL ASSOCIATION.—An excursion has been made by this Association, chiefly to view the Abbey Church of Tewkesbury, and Worcester Cathedral. A considerable party of archeologists, accompanied by lady friends, left Birmingham by a train in the morning, and were joined at the Shrub-hill Station, Worcester, by a few members of the Worcester Diocesan Architectural Society. On arriving at Tewkesbury they repaired to the Abbey Church, where the history of that fine structure, as far as it is known, was related by the Rev. C. G. Davies, vicar of the parish. After lunch the party returned to Worcester, and assembled at the College-hall, where Mr. J. Severn Walker gave an historical and architectural account of the building. He next conducted the party through the cloisters, the crypt (which was lighted up for the occasion), the Cathedral, and the Chapter-house, pointing out the principal objects of interest, and speaking approvingly of the restoration works, under the direction of Mr. Perkins, architect to the Dean and Chapter. In the evening the party dined together at the Crown Hotel, after which, Mr. Tymms proposed a resolution to the effect that the meeting, looking on the Guesten-hall as a most valuable record of ancient architecture, and believing that the interests of art and the honour of the city of Worcester alike require its preservation, resolve to memorialise the Dean and Chapter on the subject. The motion was seconded by Mr. Bunce, editor of *Ari's Gazette*, and carried unanimously.

CONTRACTS FOR LENDAL BRIDGE, YORK.—Tenders for the iron-work were received from the following persons:—M. Samuelson, Hull, 12,360*l.*; Bray and Waddington, Leeds, 12,000*l.*; S. and R. Carter & Shaw, London, 11,489*l.* 10*s.*; Cochrane, Dudley, 11,042*l.* 6*s.* 3*d.*; J. Cliff, Bradford, 10,721*l.* 1*s.* 10*d.*; J. Wilson & Bell, Newcastle, 10,700*l.*; Renard, Brothers, London, 9,988*l.*; J. Butler & Co., Stanningley, 9,312*l.*; R. Crossland, Bradford, 8,850*l.*; W. Williams, London, 8,669*l.* 4*s.*; C. D. Berge, Manchester, 8,500*l.*; Head & Co., Stockton, 8,500*l.*; Close, Ayre, and Nicholson, York, 7,632*l.*; and G. J. Calvert & Locking, York, 7,298*l.* 8*s.* 6*d.* There were only three contractors for stone and brick-work, and scaffolding, viz. J. Taylor, Exeter; Bray & Waddington, Leeds; and J. Shaftoe, York, whose contract amounted to 9,390*l.* Messrs. Calvert & Locking's, and Mr. Shaftoe's, being the lowest tenders, were accepted by the committee. It will be observed, remarks the *York Herald*, that the difference between the highest and lowest tenders for the iron work amounted to 5,062*l.*, Messrs. Calvert's and Mr. Shaftoe's tender together being 16,688*l.* 8*s.* 6*d.*, whereas the two highest tenders amounted to 25,560*l.* The difference between Messrs. Calvert's and the next lowest tender (Messrs. Close's) is 338*l.* 11*s.* 6*d.* We understand that Mr. Pickersgill, the city surveyor, estimated the cost at above 17,000*l.*

**WATER LEAKAGE AT GLASGOW.**—The Glasgow water commissioners are compelled to resort to the most stringent measures to prevent the waste of water. Mr. James Gale, the resident engineer, has made a brief preliminary examination, and the result is that in only 300 houses which he has examined there is a leakage or loss of 37,800 gallons per day, being 120 gallons per house, or 24 gallons per individual.

**THE NEW CHURCH IN ST. JAMES'S.**—The foundation-stone of St. Peter's, the new church about to be erected in Windmill-street, Haymarket, was laid on 25th ult., by the Earl of Derby, who stated that great difficulty had been experienced in finding a convenient site, and still greater difficulty in raising the necessary funds. He was, however, happy to say that the deficiency, which six weeks ago had amounted to 2,600*l.*, had since been reduced by 1,200*l.*

**THE NEW POOR-HOUSE FOR HUDDERSFIELD.**—A special meeting of the local Board of Guardians has been held to consider the tenders for the several works connected with the erection of the new workhouse at Dean House. The following tenders were accepted, subject to the sanction of the Poor-law Board:—Mason's work, Abraham Grabau, 2,290*l.*; carpenter and joiner's work, Kaye & Oldroyd, 949*l.*; plumber's work, Lidster & Armitage, 490*l.*; ironmongery, Messrs. Hays, 217*l.* 10*s.*; plastering, Thomas Longbottom, 288*l.*; slating, W. Goodwin & Sons, 210*l.*; painting, Carter & Studdard, 45*l.*

**INTIMIDATION OF WORKMEN AT INVERARY.**—Walter M'Naughton, stone dresser at Mr. Hume's quarry, near Craze, who, owing to a misnomer, was dismissed on a previous complaint, charging him and others with using threats to intimidate the stone-dressers whom Mr. Sim had brought from England and Wales, to replace those who had struck work on the question of wages, and left his employment, was again placed at the bar on a similar charge, under fresh proceedings, as being guilty of contravening the Act of 6th Geo. IV., cap. 129, entitled "An Act to repeal the Laws relating to the Combination of Workmen, and to make other provision in lieu thereof." The Sheriff-Substitute (Graham) found the complaint clearly proven, and, after adverting to the ruinous consequences that might have followed to many of those concerned by the panel's conduct, sentenced him to ten days' imprisonment, remarking that he made the period so short in consideration of his threats not having been followed up by personal violence. A party of those on strike at Craze intimidated Mr. Sim himself, so as to induce him to allow them to go through his quarry, where they first attempted to prejudice Mr. Sim against his new workmen, and afterwards to induce the men to desert their work, offering them a bribe of 20*l.* for the purpose. It was on the new men declining to do so, on being assured of protection by Mr. Sim, that the acts of intimidation took place for which M'Naughton, the spokesman, has been punished.

**THE WORCESTER DIOCESAN ARCHITECTURAL SOCIETY.**—The first general meeting and excursion of this society for the present year has just taken place. The route chosen for the day's journey lay amongst the churches situated to the east of this city, commencing with Spetchley and ending with Abbot's Morton. Admission to Spetchley Church was refused by the rector on account of the "ungenerous remarks in the report of the Architectural Society on their last visit." An external examination of the church was made by some of the party, and a general opinion was expressed that the criticism was fully justified. The party next drove to White Ladies Aston, where they were received by the Rev. H. M. Sherwood and conducted to the church, and afterwards had refreshment in the vicarage. The next church inspected was that of Churchill. The Rev. George Jenkin, the curate, received the excursionists at the gate of the churchyard. Broughton Hacket, Upton Snodsbury, Grafton Plyford, North Riddle, Plyford Flavell, Abberton, and Abbots' Morton churches were afterwards visited in succession. The party had a refectory at Abberton, and lunch and tea at Abbots' Morton. The altar-rails and communion-tables in all the churches visited appeared to be nearly of one common date, between the Restoration and the end of the seventeenth century. The monument-chests appeared to be as old as the churches. The fonts were nearly all octagonal, and plain. That at White Ladies Aston was believed to be the oldest, Mr. Bloxham thinking it to belong to the thirteenth century. The font-covers appeared to be of the same date as the altar-rails.

**HER MAJESTY'S THEATRE.**—Mr. E. T. Smith has produced, with great splendour and completeness, Webber's Fairy Opera, *Oberon*. Mr. Pianchi, by whom the piece was written, has superintended the production of it; and Titiens, Albion, Montgini, Belart, and Everardi, sing the music admirably. We may speak of it more at length next week.

**FABRISHAM ALMSHOUSES.**—Sir: Will you do us the favour to state in your next number that ours was one of the two designs selected out of the four chosen by Mr. Perrey, and that that finally decided on was carried by one vote?—**NEWMAN & BILLING.**

**BROMLEY, MIDDLESEX.**—It is proposed to erect a church, parsonage, and schools in this densely-populated district, on a site liberally given by Mr. David McIntosh. The church will accommodate about 800, the sittings to be free. Messrs. Morris & Son, architects, London, are appointed to carry out the works. The style of the church will be Gothic, of the Decorated period, and it will be built of Kentish rag and Bath stone. There will also be a tower and spire, about 120 feet high.

**THE DRINKING-FOUNTAIN MOVEMENT.**—A drinking-fountain has been erected in front of the Bloomsbury Mission Hall, Moor-street, Seven Dials. The design is the same as that in the Regent-circus, except being surmounted by a lamp. In the place of this is an urn. At the foot of this fountain there is a dog-trough bewn out from the stone. The expense has been about 80*l.*, nearly all subscribed by poor people near the quarter.—Another fountain is being erected in the Strand, opposite Somerset House.—At Portsea, a fountain, the gift of Mr. J. Faulkner, has been opened. It comprises a bronze column, based on a block of granite. At the base of the granite a trough is cut for animals. Above the granite base is a square piece of iron lrouzed, at each face of which is a design in relief, representing "Moses in the hidrushes," above which the water pours down. Four small columns also support the lamp-pedestal, at the base of which are griffins' heads. Mr. Hood, of London, cast and erected the fountain, and Mr. Absalom fixed the granite. The work cost 150*l.*

**THE RESTORATIONS AT LICHFIELD CATHEDRAL.**—The extensive restorations now being carried on at Lichfield Cathedral, under the superintendance of Mr. Scott, are exciting attention, says the *Midland Herald*, not only on account of their magnitude and the prestige attaching to the name of the architect, but also because of the successful manner in which the work is being executed. The magnitude of the works may be judged of by the fact that more than 11,000*l.* will be expended to complete those portions now in hand, exclusive of gifts, and leaving a considerable amount of ornamentation in abeyance. Towards this sum the ordinary fabric fund has supplied 5,000*l.*, of which 3,000*l.* have been absorbed in the restoration of the mutilated stonework in arches, vaulting, and columns, scraping of whitewash, scaffolding, stone, and materials, &c.; and the remainder in warming apparatus, double glazing the choir windows, and the expense of fitting up the nave for service. The heaviest item in the work now being carried on is that for the oak carving, which has been entrusted to Mr. Evans, of Ellastone, Staffordshire. The contract taken by this gentleman includes the bishop's throne (400*l.*), forty-two stalls, substalls, fronts to choristers' seats, &c., at a total sum of 2,030*l.* The choir screen has been confided to Mr. Skidmore, of Coventry: the expense will be 800*l.* The four side screens east of the stalls (including metal work) will cost 600*l.*; and the two pairs of gates to the north and south aisles, 100*l.* The money value of the whole floor pavement will be about 450*l.* The expenses connected with the lighting (gas-fittings by Skidmore) will probably amount to 600*l.* The organ loft having been removed, a new organ (by Houlditch, of London), value 1,000*l.*, will be placed at the angle where the choir joins the north transept. The entire expense of the works now in hand, so far as an approximate estimate can be made, and exclusive of the gifts presented, is about 6,300*l.*, to which must be added 5,000*l.*, the amount already expended by the dean and chapter, making a total of 11,300*l.* Of what is further proposed to be accomplished,—the rest-dos, carved and inlaid with marble, will cost 1,800*l.*; the pulpit, 250*l.*; the fald stool, 100*l.*; the sedilia, 500*l.*; grills opposite sedilia, 350*l.*; grills behind stalls, 800*l.*; canopy over dean and precentor, 150*l.* The total expense (including seats for the nave) will be nearly 5,000*l.* Nor will this sum complete the scheme: the lady chapel, the chapter-house, and the nave will still remain undone.

**LAYING ELECTRIC TELEGRAPHS.**—Sir: I am not a mechanician; I am merely a tradesman; and this will account for the following proposition. Supposing we had a cable to lay across a stream,—say a few miles long,—would it not do to roll that cable round an axle on shore which would revolve easily, and attach one end of it to a ship that would carry it over, and so lay our electric wires, supposing such to be the cable abovementioned? Now if that would do, why would not the same thing apply to the *Atlantic Telegraph*? Two great advantages would follow from the experiment: first, you would be in constant communication—the shore with the ship; and, second, supposing the rope broke, why then each side would hold its own; the vessel would return with hers, and the other part could be wound home again.—P. L.

**TENDERS**

For Merchant Seamen's Orphan Asylum, Spareshook, Mr. G. Somers Clarke, architect. Quantities supplied by Messrs. Batstone and Hunt:—

Design A.	Design B.
Moxon .....	21,820 0 0
Mansfield .....	21,720 0 0
Holland & Co. ....	21,740 0 0
Lucas, Brus. ....	20,455 0 0
Higgs .....	20,300 0 0
Parker .....	20,450 0 0
Meyers .....	19,685 0 0
Kirk & Parry .....	18,925 0 0

For New Dilap Asylum, Brighton, Mr. G. Somers Clarke, architect. Quantities supplied by Messrs. Batstone and Hunt:—

Lynn & Co. ....	23,368 0 0
Widder & Ancombe ..	5,315 0 0
Fabian .....	4,480 0 0
Patching .....	4,300 0 0
Cheesman & Co. ....	4,200 0 0

For building a detached house on Sydenham-hill, Messrs. Banks & Barry, architects. Quantities supplied:—

Wolchman & Gale .....	23,970 0 0
Papps .....	3,755 0 0
Dover .....	3,700 0 0
Richards .....	3,665 0 0
Becton .....	3,673 0 0
Adams .....	3,570 0 0
Wilson .....	3,487 0 0
Jackson & Shaw .....	3,475 0 0
Patrick .....	3,423 0 0
Hill .....	3,428 0 0
Wardle & Baker .....	3,120 0 0
Wade .....	3,357 0 0
Glen .....	3,390 0 0
Adamson & Son .....	3,292 0 0
Stevenson .....	3,275 0 0
Hickard & Co. ....	3,073 0 0
Amos (accepted) .....	2,988 0 0

For Stapleford Abbott Church, near Romford, Essex, Mr. T. Jechell, architect, Norwich:—

Brown & Robison .....	2,730 0 0
Savill .....	2,324 0 0
Spence .....	2,362 0 0
Hammond .....	2,210 0 0
Beever .....	2,201 0 0
Dove, Brothers .....	2,075 0 0

For two dwelling-houses, stables, and coach house, for Mr. A. M. Bles, Woolwich. Mr. James Harrison, architect. Quantities supplied by Mr. Arthur W. G. Nicoll:—

	Stable Fittings.	
	Wood.	Iron, Varnells.
Robertson ..	2,995 17 0	283 11 3
Laurence ..	1,968 0 0	81 0 0
Brake .....	1,894 0 0	75 0 0
Johnson ..	1,776 0 0	271 0 0
Bozique ..	1,645 0 0	56 10 0
Smith .....	1,729 0 0	77 10 0
Little .....	1,593 0 0	145 0 0

For repairs and alterations at St. James's Church, Holworth:—

	Comb. Painting walls.		Four oils.
	graining.	£	
Carter .....	275 0 0	295 0 0	20 0 0
Hardman & Sandon .....	593 0 0	85 0 0	47 0 0
Brown & Robinson ..	468 0 0	120 0 0	50 0 0

For finishing a house, corner of St. James's-road and Rensay-road, Holloway, for Mr. Goldsworthy, Westminster-road, Lambeth. Quantities not supplied:—

Corbet .....	2461 0 0
Senogoff .....	449 0 0
Wishard .....	417 10 0
Starkey .....	359 10 0

For building six small cottages in North-street, Wandsworth:—

Noley .....	2,790 0 0
Thornton .....	630 0 0
Benjamin .....	480 0 0
Stevens & Co. ....	450 0 0
Brazier .....	418 0 0

For sundry repairs, alterations, and additions to a house and premises, for Mr. R. Mathew, Mr. Poagter, architect:—

Little .....	2,437 0 0
Benjamin .....	398 0 0
Harding .....	381 0 0
Thorpe .....	389 7 0
Dovnis .....	380 0 0

For repairs to No. 7, Mead-place, and No. 2, Mead-row, Westminster-road, for Mr. Joseph Stearns, Mr. William Hey, architect:—

Beauchamp .....	2,375 0 0
Knight .....	338 0 0

# The Builder.

VOL. XVIII.—No. 910.

Lambeth.—Maudslay & Field's Manufactory.

WHEN we stood on part of old Vauxhall-gardens the other day, to see the Prince of Wales lay the first stone of a new building for a School of Art there, the changes which have taken place in Lambeth since the days when Queen Elizabeth was in the habit, after taking an airing in the St. George's-fields, of looking in on the Archbishop at the palace, made themselves strongly felt. At the commencement of the present century, according to some authorities, the number of houses in Lambeth parish was only 1,400, while in 1851, when the last census was taken, there were 20,520. In former days two important roadways seem to have passed through this neighbourhood,—one, the Broad Wall, and the other, the Narrow Wall; and the line of the latter is now

the Belvidere-road. Two centuries or so ago, there were several noted wells in this district: that at the Dog and Duck, in St. George's-fields, contained portions of Epsom and sea salts. On the ground lying near the Marsh were scattered residences of greater or less importance. In one of these resided Thomas Bushel, a man of great scientific attainments, who was a friend of Lord Chancellor Bacon. He obtained from Charles I. a grant to coin silver money for the purposes of the king, when the use of his Mint at the Tower was denied to the king. When Oliver Cromwell assumed the protectorate, Thomas Bushel hid himself in this house, which it seems had a turret upon it. A large garret extended the length of the premises. In this the philosopher lay hid for upwards of a year. This apartment he had hung with black. At one end was a skeleton, extended on a mattress: at the other was a low bed, on which he slept; and on the dismal hangings of the wall were depicted several emblems of mortality. At the restoration, Charles II. supported Bushel in some of his speculations. He died in 1674, eighty years of age, and was buried in the little cloisters of Westminster Abbey. In South Lambeth, resided John Tradescant, who left his collection of curiosities to Elias Ashmole. Both are commemorated in St. Mary's Church and churchyard. Lambeth was strong in astrologers. Besides Ashmole, Simon Forman, Capt. Babb, and Francis Moore were its inhabitants. In what was once the marsh stood, until 1523, an old house, called Bonner's house, which was traditionally known as the residence of Bishop Bonner. Reventon, the famous engraver, for some time resided in a house in Lambeth Marsh, but removed in 1774 to a more healthy residence, "opposite the Mother Red Cap, in Tottenham Court-road," where he died. He was buried in old St. Pancras. William Curtis, the celebrated botanist, had a large piece of ground in Lambeth Marsh, where he cultivated an excellent collection of British plants. The small cost of the land, and the advantages of water conveyance have caused the establishment along the river's margin of important manufactories. In Pedlar's Acre, to which the Charing-Cross Railway Bridge across the Thames will stretch, were established, in 1769, by Mrs. Coade, works for the making of artificial stone. The works were afterwards carried on by Messrs. Croggon

& Co., who ultimately removed to the New-road. Amongst the works executed in this material are the screen for St. George's Chapel, Windsor, supporting the organ; also the statues of King Edward, Madonna and Child, and St. George and the Dragon, in the west front of the Chapel; the arms at the Trinity-house and elsewhere, and statues and ornaments for Carlton-house. We have before now spoken of the stone-ware potteries in this district. Here, too, were the celebrated Vauxhall Plate-glass works. As early as the thirteenth century, as all know, the Venetians had attained peculiar eminence in glass-making. For a long time the mirrors of Venice were held in great esteem. About the year 1670, a number of Venetian artists arrived in England, the principal of whom was named Rosetti. Under the patronage of the Duke of Buckingham, a manufactory was established by them, and carried on with great success and much profit. As has been the case with other manufactories which have been introduced into England by foreigners, improvements were made, and the firm of Dawson, Bowles, & Co. soon excelled the Venetians and other nations in blowing plate-glass. The famous Vauxhall Glass-works stood on the site of Vauxhall-square. In 1780 a difference appears to have arisen between the employers and workmen, which led to a total stoppage of the works at Vauxhall; and a descendant of Rosetti died in extreme poverty. The pursuit of this manufactory is one of the many beneficial results from the encouragement of foreign talent by the English. It would be instructive to collect the particulars of the introduction of the numerous great branches of industry, now our own, which have sprung from this source. At Chelsea, for example,—to run across the water for a few minutes,—there was a manufactory of "Chelsea porcelain," carried on by a foreigner. Under fashionable patronage the establishment prospered, and a number of hands were employed. The original proprietor acquired a large fortune and retired from the concern; his successor, wanting his spirit and, probably, his skill, did not succeed so well, and in a few years the concern was abandoned. But on a far more extensive scale the manufactory was carried on at Derby and elsewhere. During the difficulties of the Chelsea works, the proprietors, acting on the now exploded principle that Government protection is of service, addressed the following memorial to the State authorities:—"This manufactory in England has been carried on by great labour, and at great expense. It is, in many points, to the full as good as Dresden, and the late Duke of Orleans told Colonel York that the 'metal,' or earth, made at Chelsea, had been tried in his furnace, and found to be the best made in Europe. It is now daily improving, and already are employed at least 100 hands, of which is a nursery of 100 lads taken from the parishes and charity schools, and bred to designing and painting—arts very much wanted here, and which are of the greatest use in our silk and printed manufactures." Specimens of the Chelsea porcelain have been much esteemed. At the sale of Queen Charlotte's effects, the examples of this china, which were very numerous, brought high prices. In the first instance, the Chelsea china seems to have been patronized by the Duke of Cumberland, and afterwards by Sir R. Faulkner. So great was its repute, that for long it was sold by auction. As soon as a set or hatch left the kiln it was disposed of in this manner, dealers and gentlemen surrounding the doors for the purpose of bidding. Faulkner, in his "History of Chelsea," gives the following curious note:—"Mr. A. Stephens was told by the foreman of the Chelsea china manufactory (then in the workhouse of St. Luke's, Middlesex) that Dr. Johnson had conceived a notion that he was capable of improving on the manufacture of china. He even applied to the directors of the Chelsea China Works, and was allowed to bake his compositions in an oven in Laurence-street, Chelsea. He was accordingly accustomed to go down with his housekeeper about twice a week, and stayed the whole day, she carrying a basket of provisions with her. The

doctor, who was not allowed to enter the mixing-room, had access to every other part of the house, and formed his compositions in a peculiar apartment, without being overlooked by any one. He had also free access to the oven, and superintended the whole process; but completely failed, both as to composition and baking, for his materials gave way to the intensity of the heat, while those of the company came out of the furnace perfect and complete. The doctor retired in disgust, but not in despair, for he afterwards gave a dissertation upon it in his works; but the overseer assured Mr. Stephens, in the spring of 1814, that he was still ignorant of the method of the operation." To return, however, to Lambeth. With the exception of the Archbishop's palace and portions of the old church, but little that is ancient remains to reward the search of the antiquary. Thousands of ill-conditioned houses have been planted on the marsh and adjoining parts, but we may now expect better doings, particularly in that large portion of the parish which forms part of the royalty of the Duchy of Cornwall, which is a portion of the patrimony of the Prince of Wales. Various improvements are already going on: a new railway-bridge will soon pass across the Thames to Pedlar's-acre: schools and churches are rising up; in parts the drainage has been improved, and the manufactories have increased in importance. Let us look more minutely into one,—the establishment of Messrs. Maudslay & Field, marine engine-makers. Little more than a century ago the site of it and miles around were little better than a swamp, the best of its productions being a few bulrushes, while on the edge of certain high lands appeared some vegetation of the willow kind. The hand and the intelligence of man have produced wonders in the comparatively useless waste. In old times, the only living persons who would choose to resort to this district, would be some fishermen eel-catching, or at low water, in the winter time, a few Cockney sportsmen hoping perhaps to shoot some snipe, in hard weather. Sea-gulls and other scarce birds would make the only sounds which, with the exception of the distant note of the bells of the London and Westminster churches, were heard in Lambeth Marsh. At Maudslay's, when, some little time ago, we visited it, there were, independently of clerks, between 1,300 and 1,400 workmen employed from early morning until the hours of evening. Consider that each man here engaged has on the average (as there are here few, if any, apprentices) four persons depending on him for support, there are, say 5,000 men, women, and children who are supplied with the necessities of life as a return for their useful labours on the morsel of marsh where this manufactory is established. This firm was, in the first instance, made by the exertions of a man who was not only the founder of his own fortune, but also that of others; one who, like the Stephensons, rose to eminence from a humble beginning. Entering what seems an ordinary dwelling-house in the Westminster-road, Lambeth, we will not stop to speak of the models of the most important of the marine steam-engines, which have been either improved or invented and patented by those engaged in the direction of this place, though they are most exquisitely formed: they move in the turning of a steam tap, and, in their miniature way, are as perfect as those ponderous works to which, from this place, we are presently guided. In the various workshops, each superintended by a foreman of intelligence and ability, steam marine-engines are in the course of progress for various nations. At the same time that engine work on a certain scale is being executed for foreign governments, it will be seen that commissions for our own government are not wanting. Among other works we saw screws for the British ship *Victoria*: two of those screws were fashioned like the double tail of a whale, or the largest monsters of the deep in times long passed: huge masses of metal were being coated with brass or copper work by processes which require extraordinary management. These screws will be

moved by a power of 1,000 horses. We pass through workshops of great space, lofty as many churches, fitted with cranes which will lift huge weights, and convey them in a slow, but sure manner to parts of the establishment where the rough work may be fashioned and fitted with the most perfect nicety. In all directions swarms of workmen are engaged in fabricating parts of engines, which, in spite of wind and waves, enable large ships to plough the ocean. In another, by means of the cranes already mentioned and by the skill of the workmen, parts of the work, some of several tons weight, are adjusted and joined together; and in another shop of great length, the men are working at lathes, fitting and finishing the more minute portions. In other directions, immense cylinders are being polished and cut round, after they have been removed by powerful means which are completely made available for the uses of man. One machine, the invention, we are told, of Mr. Maudslay, the founder of the firm, is boring and polishing the inside of a cylinder, of such diameter that a man might almost walk upright through it. There are other engines cutting and shaving hard iron, as if it were as soft as wax. One of these, with the greatest ease and exactness, can pare away from 7 to 8 cwt. of metal in an hour. Another of these planing machines has a circular and complex movement. There are all sorts of iron planes and cutting apparatus. Iron of an inch in thickness can be cut cleanly through with great rapidity. The instrument with which it is done has a force of thirty tons. In one place three steam-hammers, of 10, 20, and 30 cwt., perform the part of the sledge hammer, which of old was the only means of executing the heaviest work. There are also rolling mills and machinery by which plates of metal of considerable thickness can be pierced for riveting. An invention for fastening the red-hot rivets is very simple and effective.

In shops provided for the purpose are copper-smiths making steam-funnels of different sizes and shapes. Some men are beating the metal into the necessary form; others are attending the blast furnaces which heat and partly weld the copper together; others are guiding the steam-hammers; cauldrons of hoiling lead are at hand, and the stranger, as he wanders through those numerous places of industry becomes bewildered with the vast extent of iron-girded roofs, the seeming complication of endless masses of machinery, the lifting and moving of immense pieces of metal, the blazing of furnaces, and the clang and clatter of the different parts of the works. All the sounds of this great manufactory are, however, as nothing in comparison with that in the immense space in which the boilers are made. There is something indescribably grand in "the voices" of this place, which, at the hiding of a single man, can be raised or stilled. It was said that when steam-machinery was introduced into manufactories like this, the work of the smith would be useless: there are now, however, perhaps ten times as many smiths, who work with hammer and anvil, employed, and at better wages, as there were formerly.

The smiths' shop here is, like the other portions of the establishment, of great extent, and many sturdy arms are actively engaged. Through vaults lighted by gas, in which numbers are arranging fuel and moulding materials, is the casting-room. These arches support the first part of the building which was reared, and were necessary in consequence of the damp marshy nature of the site. Drainage has, however, of late years, dried and improved this part of Lambeth. Before entering the casting-room, it is worth while to ascend to the pattern-shop, which is on an upper story. Piles of wood are stored in places for use; and, in the long perspective of the pattern-shop, skilled workers are fashioning the models from drawings which have been prepared by the engineers. Here we noticed that the glue is melted by steam, which lessens the risk of fire; and that, throughout the whole place, pipes are laid in all directions, so that, in case of fire, water could be thrown in vast quantities. A fire

brigade has been organized amongst the workmen; and, in parts, iron doors and partitions are in use, to separate portions of the works.

In the casting-room, in deep pits, the metal-founders are preparing the moulds for cylinders and other parts of the engine. Five cupolas will soon send their blazing contents into the hollow shapes provided; and the results, in due time, will be hoisted and borne away to the places through which we have passed, and finished for use. The groups of workmen, the peculiar masses of light and shadow, the mounds of black earth, and the machinery here form a most picturesque scene. Near is the boiler which works ten steam-engines of considerable power, blows the furnaces, and moves the immense machinery, that adds so much in this place to the strength of men's hands.

The firm has provided a large room, heated by gas and well lighted, in which about 200 of the men who live at a distance may eat their meals which they have brought with them, and thus save the expense of the publichouses; they have also provided an excellent reading-room, to which is attached a library, now containing nearly 900 volumes. The books in the library can either be read in the room or taken home. The papers are supplied by a very small payment from those who choose to avail themselves of this advantage.

However, we must get out into the road again, where Astley's amphitheatre takes us back slightly into the past. Nearly a century ago, one Astley, who had been brought up as a mechanic, but who had entered a cavalry regiment and much distinguished himself abroad, erected a temporary shed on this spot for the exhibition of his skill in horsemanship. His wife and he were the only performers. The idea was, however, approved of; and with great energy Astley extended his establishment, until it became one of the most popular places of amusement in the metropolis. He was a man of handsome personal appearance and great strength. Undaunted by two fires which destroyed his premises and caused him great loss, the building was each time reconstructed in a better manner than formerly. Astley is worthy of a place amongst those who by talent and some peculiar ability have raised themselves to repute. This theatre continued to flourish; but the once famous Vauxhall Gardens are now amongst the things that were. The glory of its coloured lamps, its green avenues and sham temples; the arbours where Evelyn and Pepys gossiped, where Goldsmith and Reynolds samtered; the decorations which Hogarth designed, have passed away; and soon the site will be covered with useful buildings, destined, it may be hoped, to improve the rising generation, and aid the general advancement.

#### CO-OPERATIVE SOCIETIES: IRON.

THE BRITISH ASSOCIATION IN OXFORD.

THE relation between the subject of Mr. Robert's paper mentioned in our previous notice of the proceedings of the British Association, and one which we are about to notice,—“Co-operative Societies; their Social and Politico-Economic Aspects,”—did not seem to occur to recollection at the meeting; but it will be obvious to our readers.

We have already given some attention to this subject, last referred to,—that is when discussing the question of means other than strikes, to be taken by workmen in the building trades towards improvement of their position. The paper, which was by Mr. Henry Fawcett, M.A., Fellow of Trinity Hall, Cambridge, and the author's reply to various doubters and objectors, were remarkable efforts—considered as those of one man from the results of a melancholy accident, to read or to take notes. On a previous day, the same author had given an able paper entitled “Dr. Whewell on the Method of Political Economy,” which called forth a defence from the Master of Trinity, and produced like the subsequent paper, a most interesting debate. The object of the paper on Co-operative Societies, was to bring prominently into notice the facts of the success at Leeds and Rochdale; and was similar to our own when we drew attention to one of the very societies instanced,—namely, to show there were means, one of which might be the co-operative principle, by which workmen could possibly benefit their position,—or which at least deserved the attempt, as promising

success if undertaken with the same elements of management as existed in the society called the Rochdale Pioneers. It was, perhaps, unfortunate that the author of the paper appeared to base his argument upon assertions of Mr. Froude, that the condition of agricultural labourers had not advanced, since the time of the Tudors, with all the increase in the national wealth. This of course called up Mr. Edwin Chadwick, and produced an indignant denial from others. The facts adduced on one side, however, did not controvert those on the other, that there was a great contrast between the wealth of one class and the misery of another. The author would seek for a remedy, from the lessons which political economy taught, and take away the dependence of labourers or workmen upon the capital secured by others. Wages being determined by the relative rapidity of advancement of population, and of the accumulation of capital; and it being impossible to permanently raise wages by the mere desires of humane sympathy, he remarked on the widely-spread opinion amongst workmen that wages were reduced by the tyranny of the capitalist. But he said, when labourers expressed unity towards capitalists, they should remember that so long as the labourers as a class did not save, they rendered capitalists who did not work with their hands absolutely necessary. He well said:—

“Capital is that portion of past produce which has been saved to aid future production; capital, in fact, sustains the labourer until the results of his labour become available for consumption; if the labourer will not save, he must look for others to sustain him; and a large portion of the produce of his labour must be devoted to compensate the capitalist for his accumulation, for his risk, and for the labour of superintendence; and the greatest advance which could be made, not only in the social, but in the material condition of the labourers, is, if they would become a saving class,—in fact, that they might obtain from their own savings, all those services for which they now have to pay the capitalist so heavy a price.”

It might be said, however, he continued, that the difficulty was to induce the saving. All saving involved a present sacrifice for future advantage. A sure sign of inferior education, was the absence of foresight. The poor would be naturally not provident; and, of course, saving was peculiarly difficult, where it had to be made by deprivation of some necessities. Recognizing the obstacles, he said, we should be better able to discern the manner in which the saving could be encouraged. The first thing was to bring distinctly before the labourer the advantage of the saving. It was not surprising there should be an absence of the saving; few could accumulate 100l.; and those who did, could only get 50s. a year from a savings-bank, as reward for their prudence. If, however, these individuals could use the capital to support their own labour, they might be able to cease paying the capitalist the heavy price they now have to pay him. The results could not be over-estimated. The labourer would be advanced to a different social grade; the whole produce of his labour would be his own; if this could be made the reward of his prudence, the prudence would not be so rare. The tendency at present, however, was against this desired state; every year small capitalists found it harder to contend against those of larger means. It was hopeless to expect that production would again be carried on by uncombined labourers. But by combination, the labourers would take to themselves the whole of the profits now falling to the capitalists. Savings would have their mode of investment, and accumulation would be stimulated; and the same prudential habits would distinguish the working as the middle classes.

To show there was good prospect of success in this direction, the societies above mentioned were then noticed, and their operations described. Through those societies, articles were obtained free from adulteration; and by the competition, other dealers had been obliged to reduce their prices. The success was ensured by selling for ready money, and by keeping the arrangements in the hands of the workmen themselves, as opposed to the system adopted in some undertakings which had not been so successful. The Rochdale Co-operative Store, and the Leeds Co-operative Flour Mill, together, had effected transactions to the extent of more than 1,000,000l., without having had to set off 10l. of bad debts. If the results were surprising, it was the more reason why we should seek to understand the cause of them.

In explanation of the cause, Mr. Fawcett expressed the opinion that the doctrine of the interests of the employer being identical with those of the employed, was not strictly correct. They were identical only so far as those are of buyers and sellers in other cases. The

produce of labour being divided into two shares, whereof one fell to the employer and the other to the employed, it was obvious that each party must be interested in securing to himself as large a share as possible. The conclusion that the interests were opposed as those of buyer and seller, was confirmed by the fact that every employer felt that no one of his labourers would spontaneously put forth his full energies. Labourers had to be kept to their work; and employers throughout the country, now complained that men were more careless of their masters' interests than formerly. The existence of the trades' unions was evidence that such dissatisfaction existed; and every thoughtful mind must be impressed with the opposition growing up between the classes. Many wished to revive the condition of days gone by, when the master and his servants were as one family. But you could not have an effect when its cause was gone. The attachment had its source in the protection from danger which the labourer needed, and the master never failed to extend; but the relations now were commercial; the attachment could no longer exist; and the utmost efficiency of the labour was rarely secured. And so long as the labour was forced, so to speak, from the workman, so long must the employer pay a heavy charge for the necessary watching. But in co-operation each labourer had the direct interest, both to work himself, and to see that each other did the same. Efficient inspection was thus created without expense, and there grew up a certain *esprit de corps* which never existed amongst mere hired labourers. The mental powers were called forth, whereas in the present system it would be difficult to estimate the pecuniary loss from the apathy and mental inactivity that exist. Looking at the subject thus, it was not difficult to understand the success which had attended co-operative efforts when the labourers had selected proper managers from their own body. Even in France, the societies started in 1848, had when their career was cut short, succeeded so far that they had paid off all their borrowed capital, and had funds in hand. The failures which there had been in London, only showed what would be the elements of success. An erroneous view taken in one of those cases, was that competition was to be displaced, and motives which were inapplicable, substituted. It had been for a long time supposed there was something essentially democratic in these societies; but the truth was, if any political party ought to rejoice in the establishment of such societies, it would be the Conservative party. "The real revolutionary element of a nation," it was very fairly said, "is a class without accumulative property, and so impoverished, that national disturbances may possibly improve their lot, but cannot leave them worse off than they were before." Mr. Fawcett concluded by reminding the section that he had carefully avoided saying anything antagonistic to capitalists. He had sought to explain a mode by which labourers might make themselves independent of others' savings,—becoming their own capitalists; whereby the class might be enriched, not at the expense of other portions of the community, but through developing habits of prudence, and by increasing the efficiency of their labour. And thus would co-operation become a great instrument, not only of social amelioration, but of national wealth: for, the facts quoted proved, that with co-operation, capital and labour both worked with maximum efficiency.

In the discussion, as we have remarked, the position that the working classes were worse off than formerly, was disputed; at least, it was said, the fact was otherwise in the manufacturing districts of the north. No one could be in a more fortunate position than a workman who earned good wages, considering the lessened prices of capitalists, and who had no anxieties like those of the capitalist. Mr. Chadwick went so far as to add that as the small farmers were extinguished, wages of labourers were improved. An evil was that money was spent in beer that would be better devoted to the purchase of meat. Mr. Newmarch considered the *mill* at Leeds, and not the *store* at Rochdale, the fair experiment. The commission principle, which gave each workman an interest, was already in use, and the law was now favourable to everything desired. Mr. Alderman Nield and others dwelt upon the necessity of management, and on the difficulty, especially in undertakings of varied details,—of finding the manager who was not, at the same time, virtually the proprietor. The Rev. J. E. T. Rogers argued that workmen under the Tudors were worse off than now, both from the devastation of epidemics, discomfort, and the price of food. Mr. Senior, in the chair, held that

the interests of employer and employed were, in the most important sense, identical.

Mr. Fawcett in reply, reiterated that they were no more identical than those of buyer and seller. Buyer and seller were both benefited by general prosperity of the country; and so were the employer and the employed by the general prosperity of trade; but in each separate bargain, the buyer tried to buy as cheaply, and the seller to sell as dearly as possible; and just in the same way, employers baving work to be done, would try to get labourers to do it as cheaply as possible. The railway contractor would be as eager to secure cheap labour, as to buy cheap materials. The labourers felt there was not an identity of interest: the feeling was proved by the facts of trades' unions and strikes. Trades' unions had not been mentioned with the view of defending them, but only to show the feeling existent. As to the comparison between one age and the other, Mr. Fawcett had not said that the lowest class of labourers had been in every respect better off under the Tudors. There were epidemics then; and comforts were in cottages now that were unknown in the earlier time. All that he had affirmed was, that the wages then paid, gave the labourers more of the prime necessities of life. This was shown by Froude; as well as, in his later editions, by Hallam. Of course, management was all important; and, truly before the societies had been tried, it might have been supposed that would have offered an insuperable difficulty. But results proved it could be got over. All joint-stock concerns were under a relative disadvantage compared with ordinary concerns; because as a general rule, energy of the manager was not so great as that of the individual owner. In co-operation there was a compensating advantage, namely, that the labourers put forth the full energies of their body and mind, having direct pecuniary interest in their work. The figures proved that the advantage more than compensated for the disadvantage. But the secret of success, indeed, in co-operation, was the good management.

We will not extend a *résumé* already too long, of these proceedings in only one of the sections, by adding our reasons for considering that these co-operative societies, and the controversial points which we have set forth, deserve impartial consideration. The arguments which were brought against the matter of the paper are quite beside the question raised, which may be said to be simply whether it is necessary to pay a large sum for management, and whether the workman is better circumstanced through not having any anxiety attendant upon that. Mr. Fawcett tries to show that, on the one hand, the difficulty has been got over; and, on the other, that the workman is elevated by being induced to take interest in the undertaking. It is singular that many large concerns in Lancashire, such as were adverted to, are carried on, and return large fortunes, without that close supervision of the actual proprietor which some of the speakers supposed; and the knowledge of this circumstance amongst the labouring classes is producing a feeling of dissatisfaction,—call it unreasonable,—or admit exceptions, and the performance of Christian duties by some masters,—which is admitted to exist, and is causing many of those masters who had formerly very liberal views, to become conservative. We do not expect that capital identified with management will be displaced; but a case is certainly made out for the extension of co-operative associations, whether that they be looked to as a resource for the workman, or that further experiment of them be viewed as means of coming sooner to a settlement of the general question—what is the value of capital and management?—which is ever and anon raised.

In the same section, a paper by Mr. John Hitchman, "On Sanitary Drainage of Towns," was announced in the journal of proceedings, but was only partly read. The object of the author, a medical man, was to show the advantage of separation of the sewage and the rainfall, respecting which he quoted a statement that the principle had never received attention. Our readers know that such an assertion is incorrect, and also, fully perceiving that the principle is one to be kept in view, as well as to be applied wherever circumstances immediately permit, as in many small towns, cases similar to those in which indeed it has been applied already,—they know that when the question as regards London came before the Government referees, difficulty was felt in determining what was not sewage. The author began his paper by an attempt to justify *his* having taken up the question—he not being an engineer; and in the course of this, he gave his

account of the manner of selection of the design of the Exhibition building of 1851, and of an invention of the "ridge-and-furrow system" of roofing,—being wrong on every point that he advanced as fact,—inclusive of a statement that the system of roofing was applied in the New Museum. We do not assert that engineering questions may not receive elucidation from medical men: there are instances enough to show in architecture and engineering, that good may accrue from extra-professional suggestions; but there is a growing tendency to expression of opinions on these questions, without the knowledge of facts; and the committee erred in affording opportunity for the statements, in the Statistical Section, which time and place did not allow to be refuted as deserved. In the same section several other papers were read on subjects connected with the objects of our journal,—one of them a paper "On Local Taxation for Local Purposes," by Mr. R. Dowden, which led to discussion.

In the Section for Mechanical Science, the proceedings were of considerable importance. Mr. P. W. Barlow read a paper "On the Mechanical Effects of combining Suspension Chains and Girders, and the Value of the practical Application of this System," the discussion on which was pursued on the following day. Suspension bridges being economic of construction and suited to wide spans, the aim of the author, as in papers on the same subject at previous meetings of the Association, was to show that such bridges could be adapted for railway traffic, contrarily to the opinion of the late Robert Stephenson, Mr. Fairbairn, and most others in this country.

In the discussion, which was very interesting, Mr. Barlow's views as to the sufficiency of a form of girder, to impart stiffness to the roadway, were much contested; but were to a considerable extent supported by the president, Professor Rankine. It appeared that very little was known to the speakers, of the success (whatever that may be) of the application of the principle in the chief example referred to, namely, the Niagara-bridge, whether regarding the manner of passing trains across it and the effects of strain, or the construction of the bridge and dimensions; though we believe the most important particulars are published, and are to be had readily in this country. What was known and was put forward in the discussion, touched rather a question of strength of the several members of the construction, than that of the suspension principle as applied in the bridge. Mr. Fairbairn especially dwelt upon the fact that when in the north of England, experiment had been made on the effect of a railway train on a suspension-bridge, it had been found that the roadway rose in the form of a wave in front of the advancing engine. Mr. Edward Hall observed that there were provisions in the Niagara-bridge to prevent the effects instanced by Mr. Fairbairn. The underside of the roadway was held down by inclined tension-rods anchored to the piers, similarly to the arrangement in the Brighton Chain-Pier, adopted after the storm some years back. It appeared to him, therefore, that the effects were not inevitable. Also, he believed, that the Niagara-bridge was so far a successful work, that its engineer, Mr. Roebling, was proceeding, or had proceeded, to the application of the principle to other bridges. In the course of the discussion, Mr. E. Cowper, who agreed with Mr. Barlow on the applicability of the suspension principle, but differed with him on the method of overcoming disadvantages of the present suspension bridges, brought forward his own proposal for the construction of a rigid suspension bridge. He believed that the passage of rolling weights would rapidly destroy the bolts and rivets of the links of a chain; and we would, therefore, substitute for the catenary of many links, a rigid piece of construction of riveted boiler-plate, of the same catenary figure, and of the usual form of section for girders, but so deep in the web or connection of top and bottom flanges, that the tensile-strain, the only one to which it would be subjected, would follow a curve within the depth of the construction, or, in either case, whether of the bridge being loaded or not loaded. By this principle, rigidity in the roadway would be combined with the advantages of the suspension principle, more effectually than by addition of a girder. We may explain here that it did not appear to be contemplated by Mr. Barlow, that his added girder should bear any portion of the ordinary weight; but that such weight, as well as the girder itself, should be borne by the chains. Respecting the modification of the principle by the late Mr. Brunel in the Saltash and Chepstow bridges, where, instead of anchorage of the ends of the chain in the usual manner, there is a great cross-

head, or girder, in a state of compression between the towers, Mr. Barlow did not seem to consider that the method secured the economic advantages of the suspension principle.

A subject equally important at the present time, was that of Mr. Fairbairn's paper, entitled "Experiments to determine the effects of vibratory action, and long continued changes of load upon wrought-iron girders." The subject has engaged the attention of Mr. Fairbairn, as will be known to most of our readers, since the date of the experiments by himself and Mr. Hodgkinson, which have done so much for our knowledge of the best form for cast-iron girders; and the investigation into the effect of time in contributing to destruction, is still in progress under the author of the present paper. Mr. Fairbairn observed that opinions were still much divided upon the question, namely, whether the continuous changes of load which many wrought-iron constructions undergo, have any permanent effect upon their ultimate powers of resistance,—that is, whether a beam or other construction, subjected to a perpetual change of load, would suffer such a change in structure of the iron, or tenacity of the joints, that it would in time break with a much less force than its original breaking weight. Few facts were known bearing on the solution. We knew that in some cases, wrought-iron subjected to continuous vibration assumed a crystalline structure, and was deteriorated in cohesive properties; but we were ignorant of the causes of this change, and of the precise conditions under which it occurred. The commissioners appointed to inquire into the application of iron to railway structures, found that in cast-iron, no bars would stand 4,000 impacts, bending them through one half their ultimate deflection, but "that sound bars would sustain at least 4,000 impacts bending them through one-third of their ultimate statical deflection." They ascertained, also, that when the load was placed without impact, the bar was not weakened, provided the deflection did not exceed one-third of the ultimate deflection; but that if the deflection were one-half the ultimate deflection, the bar was broken with not more than 900 changes of load. With wrought-iron bars they found no perceptible effect from 10,000 changes of load when the deflections were produced by a weight equal to half the statical breaking weight. Interesting as these experiments were, they were incomplete as regards wrought iron. For bars, they were not continued long enough; and they do not apply to a construction of riveted plates. The question for solution was, whether girders of the kind now so much used became weakened from the continual passage of trains, and whether it is requisite to give increased strength accordingly, or for deterioration beyond that from the influence of the atmosphere. A contrivance was devised for the experiments, imitative of the gradual manner in which the load is brought upon bridges, and of a succession of impacts. First, a girder formed of plate and angle iron, having been loaded with one-fourth of its ultimate breaking weight, the experiment commenced by causing the beam to undergo impacts, or changes, amounting to about eight a minute, or half a million in the two months for which the experiment lasted; the result being that there was no visible alteration. The load was then increased from one-fourth, to one-third of the statical breaking weight; and the experiment proceeded till the total number of changes amounted to one million. It sustained these changes with only a slight increase of permanent set in the latter experiment; but the experiment being continued with a load from one-third to one-half that which would ordinarily break the beam, it broke after 5,175 more changes. The beam, of course, had been submitted to severe tests; and the molecular construction had, no doubt, suffered considerably ere it gave way. The fracture occurred across the bottom plate and angle iron, and part way up through the side plate, and at two rivet-holes immediately under the shackle from which, in the centre of the beam, the load was suspended. These facts (submitted to the Association, by permission of the Board of Trade) were rightly regarded as of immense importance, and it was desirable they should be continued. A recommendation was subsequently made by the Association to this effect. Mr. Fairbairn considered these experiments tended to show that there was a limit of time, however remote, to the endurance of such pieces of construction as those of iron bridges of railways, calculated on the hitherto recognized data; and that this required the provision of additional strength. In the discussion, it was remarked, that experiments tried with weight in one place, were not the test for rolling weight; but the necessity for special pro-

vision against the percussive action of a railway train, was adverted to by Colonel James; and facts of the destruction of fibrous character of axles, and of similar parts of steam-engines, were mentioned by several speakers. Mr. Fairbairn said the lifetime of axles on railways, could not be computed at more than four to five years; and that, in short, no material could be depended upon permanently, subjected to variable strain. In consequence of what had been ascertained, the Railway Board had largely increased their requirements for the strength of bridges in proportion to the load.

In the same section a paper was read by Mr. Calcott Reilly, "On the Longitudinal Stress of the Plate Girder;" and there were also a paper "On a new Mode of obtaining Blast of very high Temperature in the Manufacture of Iron," by Mr. Cowper; one "On a Cylindrical Strip Boiler," by Mr. J. Elder; one "On the Density of Saturated Steam;" and on the Law of Expansion for superheated Steam," by Mr. Fairbairn; one "On Giffard's Steam-jet Feed Apparatus," by Mr. W. Froude; and one "On an Atmospheric Washing Machine," by Mr. John Fisher. In the washing-machine, air was forced in at the bottom of the vessel, by means of hollows worked by turning a handle; and the results were said to be quite successful. Also, in this section, Admiral Taylor described and illustrated by models, "A novel means to lessen the frightful loss of life round our exposed coasts, by rendering the element itself an inert barrier against the power of the sea; also a permanent deep-water harbour of refuge by artificial bars." The subject is one to which the author has long given attention. He considers that stone breakwaters are always of short duration. In the case of those of rough stone, he says disruption of the masses must occur from the compressed air in vacuities, when the waves are dashed against the breakwater. He therefore advocates the adoption of timber framework. One of his models showed a structure of open timbers, somewhat in the form of a prism laid horizontally, with one of the edges downwards, which would be placed at anchor, and would be furnished with gangways at the top, and otherwise designed to afford place for shelter. A paper was read in this section by Mr. David Chadwick, "On Water Meters," in which a meter was described which it was considered would prevent waste, as well as, on the other hand, restrictions of a non-sanitary character. The determination of the best form of meter, he remarked, was of importance both to the companies, sellers, and the public who were buyers of water; and there was no reason, if a suitable apparatus existed, why water should not be sold by measure, like gas. No one entertained the idea of buying or selling gas otherwise than by meter, although frequent complaints were made of defective registration by the contrivances in use.

Until about seven years ago, no high-pressure water-meter had been constructed on which reliance could be placed. There were now about 10,000 high-pressure water-meters in use in Europe, of which about one-half were of the kind known as "Inferential Meters," under the names of different inventors, and the remainder as "Positive Meters," working on the principle of the piston and cylinder. From 1824 to 1858, 84 patents had been taken out for meters; and it might be affirmed that not more than six or seven of these are in practical use, and only two were in extensive use. The principle of increasing by inference, from the revolution of a wheel, spiral fan, or turbine, did not seem likely to give exact results; and with the best workmanship there was leakage, varying according to size of the meter, when used under circumstances in which the velocity of the current was insufficient to overcome the friction of the working parts of the machine. The new high-pressure piston water-meter of Chadwick and Frost, the author of the paper considered overcame the difficulties and objections. The contrivance would not be intelligible from mere verbal description; but, as experience of the use of nearly one hundred of these meters has appeared to confirm anticipations of their efficacy and durability, we may be considered to have rightly called attention to them.

Mr. Kell, taking up the subject of the paper, said he was connected with a company in the north of England where they had used a meter on the principle of the vortex wheel. This had been discontinued in consequence of small shells becoming fixed in it, and interfering with the workings. They now used Kennedy's meter (which Mr. Chadwick had named as one of those on the piston and cylinder principle), and they had no reason to doubt its accuracy. Consumption of water for

domestic purposes, they found to be 25 to 35 gallons per day. Waste of a portion of this quantity could not be prevented; the small houses not having meters. The chairman stated with regard to waste, that the inhabitants of Glasgow, since the supply from Loch Katrine, drew about 50 gallons per head per day. One family had drawn 2,500 gallons daily; and many families drew two-thirds more than they used. Mr. Chadwick said that for the last seven years, he had measured the water used in his house. His family consisted of nine persons; the water was carried into the cellar, ground-floor, bed-rooms, two closets, and bath; and as he was a sanitary man, they used water to excess. Finding the quantity was 180 gallons, he thought 20 gallons per head must be the maximum daily consumption for all domestic purposes: all above that was waste.

The last paper in this section which we are able to notice, was "On Street Railways as used in the United States," by Mr. G. F. Train, who is about commencing the formation of the railway at Birkenhead. The paper was illustrated by a model of a car on the rails. The rails were broad tracks well suited for the wheels of waggons, and were furnished with strong flanges rising very slightly above the general level to receive the flanged wheels of the cars. We have so recently and so fully treated the subject in connection with that of improved metropolitan communications, and the saving of time and avoidance of confusion in the existing streets, that we need not quote the points of argument in favour of the system, as they were stated by Mr. Train. The truth is, as was shown at the section, there is perfect unanimity of opinion as to the saving of time, and the lessened confusion and wear and tear, which would follow from the introduction of horse-railways or tramways into the London streets viewed as they are. New main routes and greater width of the present thoroughfares, are required; but the tramway, at least one line along the centre of the street, would be a considerable gain in almost any of the routes. Narrowness of streets is not found to be an objection in America. The non-introduction of these tramways into the streets of English towns was imputed by the author of the paper to Sir Benjamin Hall, who had thrown cold water upon one project "partly to please his constituency; but mainly, because an accident happened to his carriage in passing some coal tramway in Wales." Mr. Train referred to tramways of this kind, to those in Paris and St. Petersburg, the tramway from Carnarvon to Nantle, and the omnibus railway along the docks at Liverpool, as giving no idea of what he contemplated. The advantages of the amended system for omnibus traffic, he said, were that "you ride in less time, with less confusion, less noise, less fear of accident, less mud and dust; and with the additional luxury of more regularity, more attention, more comfort, more regularity, better light, better ventilation, and with a greater facility of ingress and egress." The carriages, or cars, for the Birkenhead traffic, are commenced. The reports of proceedings of the section in the local papers, print a great deal of irrelevant matter which we did not hear read, and which if furnished to them by Mr. Train, he would do well to omit on subsequent occasions. But he has evidently the energy to carry forward the undertaking upon which he has embarked. He has already placed himself in communication with the authorities of several large towns. In reply to questions, Mr. Train explained that his car would accommodate sixty passengers in all, and that gradients of one in thirty would be surmounted easily by two horses. For steep gradients an additional horse might be required. On the tramway, two horses would draw five times as much as they would on the common road. Dr. Carpenter, who had lately returned from America, spoke forcibly on the advantages of the principle in every respect. In Boston, which was like an English town, in its crooked streets, the system worked well, and caused a reduction in the number of vehicles and in the confusion of traffic. Mr. P. Le Neve Foster spoke to a similar effect, as did also Mr. Smith, of "The Artizan." The latter, alluding to remarks on the possibility of inconsequence through stoppages and different speed of traffic returned to one of the inventions for shifting the flange of the wheel, whereby the carriage could readily be turned on or off the line or the common road. The Chairman said there was no doubt, the advantages of the street-railway had owing to a concentration of attention upon the system required for long distances in the country, been too little attended to. Referring to objections which had been raised, he said that

he had been engaged in the construction of a horse-railway; and he had found that one horse could draw forty passengers up ascents of 1 in 66, to 1 in 40, at the rate of five miles an hour, the average speed on a level being ten or twelve miles an hour. They had on his line level crossings, but met with no accident; though there were trains of coal-waggons, there was no difficulty in passing them; and there was this convenience in the system that the train could be stopped anywhere, to set a passenger down near his home, instead of at a distance from it. He saw no difficulty in carrying out the same system in our streets, but rather every advantage. The rails as proposed by Mr. Train would not interfere with the ordinary use of the road; they would, on the contrary, serve for the ordinary vehicles. His experience showed there was no difficulty in getting round curves of great sharpness. For very steep ascents, it was only necessary to have an additional horse, although for Hothorn-hill and Ludgate-hill, the proper corrective was a windcut.

In the Mechanical Section, also, a paper was read by the Earl of Caithness, "On Road Locomotives," in illustration of which a carriage was shown working along the streets of the city.

Had our space permitted, we could have wished to note particulars of some of the papers of which only titles were given in our last. Dr. Gladstone's paper, "On his own Perception of Colours," was exceedingly important, as showing that there is an intermediate condition between absolute colour-blindness and the accurate perception, not hitherto recognized by those who have paid most attention to the subject, but adverted to as possible when the attention of the Department of Art, and of decorative artists, was called to the subject by a correspondent in our journal. This condition, it appears, is capable of improvement. The instrument described by Dr. Maxwell, for exhibiting any mixture of colours of the spectrum, would have been equally worthy of notice.

The proceedings in the Mechanical Section included the reading of several important papers. The business at Oxford was wound up under the general impression that the meeting had been one of the most successful since the Association was established. This opinion we willingly endorse, saving only as to the charges by the townspeople, and the difficulty of getting anything whatever to compensate for them. Also, we may add, that the map of the town, and arrangements in some other points, might have been improved. The inconveniences to those not housed in colleges, sent many of the visitors away at the end of the first week. Next year the meeting will be held in Manchester, under the presidency of Mr. William Fairbairn.

The condition of the low land about Oxford, charged with moisture from the overflow of the numerous branches of the streams, which almost encircle the town, or intersect many parts of it,—and exhaling perceptible miasma under the action of the sun,—gives reason for apprehension as to the proximate sanitary state of the town. A very difficult engineering question is involved, which is receiving some attention from correspondents of the local journals. We gave in our last, the title of a paper, by the Rev. J. C. Clutterback, which ought to afford some hints to those competent to suggest improvements.

#### VISITS TO MANUFACTORIES. THE PREPARATION OF BOX-WOOD.

AMONGST the manufactures of the metropolis there is one which, although it is not of any great extent, yet is connected in such an important manner with literature and art, that it deserves notice; for, without the process of which we are about to speak, the illustrations which in our day are made to advance the teaching of science and other descriptions of knowledge could not be given. Some of our professional readers may think that the method of preparing box-wood blocks for the use of engravers is so well known as not here to require note. In truth, however, more than ninety in each hundred persons, even of some education, know little of either the nature of the material or the manner in which the box-wood is prepared for use.

Box-wood is about as heavy and durable as ebony, and cuts better than any other description of wood. So close and even is its surface that, by the means of sharp graters, it can be cut with the greatest delicacy in all directions on the cross grain of the wood. In England a dwarf description of box is used for the flower borders of gardens. There is, however, a larger species, which grows at times to 15 feet in height. The diameter of

the trunk at the widest part is not more than 6 inches. The great demand for wood of this size, and the large value of it, have caused the finest of this description of trees to be cut down at Box-hill and other parts of this country. The wood is further valuable for the making of the handles of some kinds of tools, delicate parts of surgical instruments, children's toys, such as peg-tops; and, by a steam process, this close-grained wood can for a time be made soft as wax, on which by means of pressure medallions and other ornamentation can be stamped by engraved dies. Snuff-boxes and parts of cabinets have been beautifully decorated in this manner.

The introduction of wood-engraving by the Bewicks soon led to a considerable demand for box-wood suitable for the practice of that art, and it was worth the while of speculative merchants to import box-wood from Turkey and some other districts in the East. From them a larger description of wood was obtained than any that had been grown in England, yet the large box-wood of a useful description from even foreign parts, seldom exceeded 12 inches in diameter. From this a square of a considerable size might be cut. The nature of box-wood is, however, to retain the sap and moisture for a long period; and, until these have been carefully removed by time and keeping in a dry and tolerably warm atmosphere, the wood, when cut into slices of the proper width, is liable to warp and split in various directions from the outer bark towards the pith or centre of the tree. The undried wood, and even that properly seasoned, without great care, is liable to warp; and if in that state, after the block has been drawn and engraved on, it he exposed to the pressure of the printing-press, it will be likely to split into many pieces, and thus destroy the valuable work of both the draughtsman and engraver. Besides this loss is the more serious inconvenience of these accidents happening at the time when a periodical publication is ready for printing.

It may be worth while to mention that the form of the type used for books, newspapers, and all other printed matter, is of a uniform height,—about  $\frac{1}{2}$  of an inch,—and to this thickness the box-wood for the use of the engravers must be reduced. In addition to the trouble caused by the splitting above referred to, few blocks of large size can be found without specks of soft rotten parts, which would crumble under the action of the graver. If one of these happened in a dark part of the design, or a tint of clarity, this imperfection in the printing would prove a sad blot,—a flaw destroying the general effect of a wood engraving in a most unpleasant manner. For some time these difficulties restricted the size of wood engraving; but Thomas Bewick, ambitious to excel on a larger scale, produced some works on wood which, although not so large as the page-blocks of the *Builder*, were nevertheless looked upon with wonder. This was effected by selecting pieces with great care and at much cost, and joining them together with metal clasps. This did not, however, prevent the destruction of the wood: one piece more porous than another was affected to a greater extent by the changes of temperature, and pined and shrunk away from its neighbour in spite of the iron binding; another piece would crack or warp; and all was trouble and uncertainty; when Mr. William Hervey, who was a pupil of both Thomas Bewick and the clever but improvident Hayden, made a worthy attempt to produce the picture, by his latter master, of the "Assassination of Dentatus," on what was then thought a large scale, on wood. The greatest difficulty was experienced by the artist to provide a sufficient block, although that beautiful and artistic work is not much, if any, larger than a page of the *Illustrated London News*. This block\* was, like the castle-gate described by the poet, "clamped with iron within and without." This, however, did not prevent the warping of this fine work.

When the *Penny Magazine* was established, the difficulty of procuring proper blocks for the largest cuts was great, and the artists who worked upon them will remember the anxiety they experienced when the studio got too hot, and caused preliminary cracks, similar to those heard amongst the wood fittings of old churches and houses on a change of weather. Another drawback was, that in a large block (as then called) only one engraver could work at the same time. It is evident that without improvements it would have been quite impossible, even within any reasonable time, to

\* It would form a feature of very great interest, and even instruction, if some of the engraved blocks by Bewick and some others of the early engravers on wood could be gathered together and placed in the Brompton Museum.

have produced the cuts in our own journal, much less those, of immense size, which have appeared at such times as the Duke of Wellington's funeral in the *Illustrated London News*, and some other illustrated newspapers. In order to show how this difficulty has been overcome, we will step into the workshop of a preparer of box-wood, who has for several years been engaged in making this material ready for the engravers. Here are stacked large quantities of box-wood cut into slices of a little over the required thickness, brought from the places abroad already mentioned. These slices of box-wood are in few instances perfect, but are split from the centre, or else imperfect in other respects. A small steam-engine is at work, and we cannot but think of the wonder which would have been felt by Thomas Bewick if any one had hinted that such a powerful means would have been needed to fashion the wood required for the engraver.

Here we learn that this manufacture is confined to only two or three firms, and that there are some secrets in the trade which it is not considered desirable by the box-wood preparers to reveal. Having been accustomed to look for some time past at many works, some of immense extent, when we have been shown with great readiness the various operations, and anxiety expressed to explain the various processes to the public, it reminded us of old days to be told that there are mysteries in this trade into which it is not convenient to inquire. Without being too curious in this instance, we will look at the process of selecting from the circular slices of wood the perfect parts, and cutting them, with a circular saw driven by steam power, into square, oblong, and other shaped pieces. These, by a process of which we are not informed, are planed with the greatest nicety, and joined together with glue, or some species of cement; sutures of cedar or some other wood are passed from one small block to another; and when a portion of what may be a large block has in this way been joined together and allowed a sufficient time for drying, it is a matter of rare occurrence that any portion of this skilfully-arranged mass will separate or crack. The whole of the joined block can be separated, so that when an engraving is needed in haste, one of these blocks can be divided into six portions, so that instead of one engraver, six might be engaged at the same time. Care is, of course, to be taken that the work on each part of the block should correspond; but this is, in a measure, partly effected by the touches of the draughtsman, and the cutting of the proper lines at the joinings by a skilled engraver gives a key to the whole work, which produces uniformity.

At the back of the block oblong holes are pierced, about half way through the block: these are for the purpose of inserting brass screws of about  $2\frac{1}{2}$  inches long. Before passing the screw, by means of a properly-drilled hole, a nut is dropped into each of the orifices above mentioned, and attached to the screw, which is octagonal; these can be turned by a key made of the proper form, which draws the parts of the block tightly together; and so nice is the fitting of the joints, that if the block is properly managed there should in printing be no evidence of any of the divisions of the block.

Sometimes, in the hurry of going to press, this is not sufficiently attended to, and the consequence is those white straight lines, which mar the beauty of many wood engravings. In this manufacture much depends on the quality of the wood and on the great nicety with which the various small pieces of box-wood are squared and joined together; and it would be worth while for any ingenious mechanic, who might be anxious to understand the nature of this construction more clearly than we have at present the means of showing, to examine one of these prepared blocks, and particularly notice the manner of joining and inserting the hands of softer wood into the permanently-joined parts of the blocks.

It seems to be a matter of dispute who was the person to whom credit is due for bringing this work to its present state of perfection. It is, however, certain, that Mr. Brunton, to whom the art of wood-engraving is in other ways indebted, long made expensive experiments in order to prepare blocks of this description. In this he was in a great measure assisted by Mr. Williamson, of Pickett-place, Strand, who, in the forty-third volume of the "Transactions of the Society of Arts and Manufactures," page 58, describes a plan, worked by a peculiar action, which prepares a surface of wood so smooth and generally even, that it requires little, if any, further polishing for the uses of the engraver. Mr. Wells, of Bonvicar-street, also lays claim to have brought this invention to perfection.

The cost of boxwood thus prepared is from 1½d. to 2d. per square inch. A page block of the *Builder* costs from 10s. to 12s. This shows that a very large sum must be expended on this article in England alone; and in consequence of the facilities which we have for the importation of boxwood, and our skill in its preparation, it is likely that both the Parisian and German wood-engravers would be glad to come to this market but for a duty of say 30 or 35 per cent., and the great cost of insurance and carriage, which would probably amount to more than 50 per cent.

Having thus glanced at the manner of this manufacture, it may be worth while to mention the method of preparing the surface of blocks for the use of draughtsmen.

When the block is completed it has a smooth and somewhat greasy surface, on which neither black-lead pencil would mark nor could Indian ink be properly laid: it is therefore necessary to give it a sort of tooth; and, while this is done, the preparation must neither be so thick nor so gritty as to interfere with or damage the engraver's tools. The best preparation is a quantity, according to the size of the block needed for use, of the best finely-powdered flake white,\* diluted with a very weak mixture of gum arabic and water. When sufficiently mixed, it must be spread evenly over the block, from side to side and from end to end, until the whole is covered with a very thin even stratum.

To those, however, who have not the opportunity of seeing this simple operation performed by one used to it, it is perhaps better to ask the wood-preparer to make ready the block. By means of tracing on black-lead paper, the design can be easily transferred, and then both pencil and Indian ink can be worked, the same as on paper.

#### THE ARRANGEMENTS IN THE BRITISH MUSEUM.

It ought to be generally known to artists and other students who visit the Reading-room of the British Museum, that right of admission to that department is not sufficient, without further express permission, to allow persons to visit or sketch in other parts of the Museum collections on the closed days.

There are, for instance, the Manuscript-room, the Print-room, the Egyptian, Ornithological, Geological, Botanical, and several other departments, which have each a head; and according to the present regulations it is necessary, before free access can be had to the different galleries of the Museum, to obtain about a dozen permissions. This arrangement is unpleasant to some of those who have charge of departments, and the cause of inconvenience and loss of time to those who are engaged in collecting varied information.

A chief reason for continuing the galleries of natural history and antiquities in immediate connection with the Reading-room is the advantage which readers have in the ready means of examination and contrast of objects. But, if a person engaged in some historical inquiry wished to examine and sketch a medal or other object, in order to be certain that the description in books is correct, he would be told that according to the regulations it is necessary that application should be made to the head of the department. This might cause a delay of several days. It would be the same in connection with the Print-room, and elsewhere. The writer, on one occasion being suddenly called upon to make a tracing in the Manuscript-room of a matter required for immediate publication, found that, although as a reader he might be permitted to look at the MS., he could not trace it without an introduction from one personally known to the keeper of the manuscripts. It may be that a young man who is commencing his career, although able to obtain sufficient introduction to the Reading-room, has not any friend who can give him a recommendation to the heads of departments. Or it may be that such friends are out of town, so that a delay may take place in getting the means of obtaining matters which may be of the greatest use for some purpose of the press, or other illustration. Several persons will remember the inconvenience of this, and that in the old times Sir Henry Ellis stepped out of the routine of his office, and gave facilities which persons might otherwise have had some difficulty in obtaining.

Once the writer, in explanation of some

\* Some skilled chemist might suggest another material for the flake white, which is a form of lead, and, if not speedily used, is liable to turn black, and thus effect is in a measure lost.

printed matter, suddenly needed to leave the reading-room for the purpose of examining and drawing several natural history objects, and, on reaching the place, an attendant said,—“Have you an order to sketch here? If not, it is necessary to have an express permission.” The head of the department did not at the time happen to be in, but on his arrival said,—“I do not wish to ask about orders, and, so long as no damage is done, it pleases me to see any one come to sketch.” But an order is needed, and, in this case, if it had been officially applied for, such a delay would have taken place as would for the purpose have rendered the matter useless. In some other departments the chief officer might be more strict or less courteous. But, even under the best circumstances, few wish to obtain a matter of this kind on surference. It would be well for the trustees of the British Museum to consider if a beneficial change might not be made in rendering the admission to the reading-room, art, and other collections more general, and that, as the right of admission to the library is obtained only by persons of respectability and position, the same should carry the right to the use of all the galleries.

The Print-room, notwithstanding its accumulation of not only art treasures, but illustrations of great historical importance, is, so far as visitors are concerned, a comparative desert, and a large proportion of those who call there are persons of rank and position, and not those engaged practically in the arts. If access could be obtained to the prints in the manner suggested, the number of those who resort to this fine collection would be increased five-fold. On the closed days the long galleries are desert places, and certainly it would be an advantage, if the public are to be excluded on certain days in each week, that every means should be used to render the marvellous collections which are here gathered together useful by affording every facility to those engaged in art and literature.

#### PLATE OF THE CITY COMPANIES.

At an extra meeting held by the Society of Antiquaries last month, Lord Stanhope in the chair, a very interesting exhibition was made of ancient plate belonging to the City companies.

Down the centre table were disposed numerous cups and other articles, together with some of the rarer documents from the companies, flanked by the maces of the whole of the City Wardens, and interspersed with the ancient garlands or crowns used by the livery companies on the election of their master and wardens. Amongst those present were the master, wardens, and clerk of each of the following companies, who had contributed, the Ironmongers, the Carpenters, the Waxchaulders, the Armourers, the Plasterers; Mr. John Nicholl, F.S.A., the historian of the Ironmongers; Mr. E. B. Jupp, the historian of the Carpenters; and Mr. Thomas Brewer, the writer of the memoir of John Carpenter, Town Clerk of London.

Mr. Octavius Morgan, M.P., discoursed at some length on the various articles before him. He assigned the first place to the oldest piece of plate exhibited, the Richmond Cup, from the Armourers' Company, of the date 1460.

The quaint salt-cellars of the Ironmongers' Company, 1520; the more modern shaped and larger cups of the Carpenters' Company, of the seventeenth century; and the Carpenters' posset, or candle cup, were specially noticed: the exact use of the latter was not clear, unless it was used in the families of the masters of the company on interesting occasions. The mayoralty mace of the City of London, of the time of George II., was referred to as perhaps the finest example of that description of article that existed either in ancient or modern plate at the present day.

Amongst the articles exhibited were, from the Ironmongers' Company,—Grant of Arms by Lancaster, King of Arms, to the Company, dated 24 Henry VI.; Grant from the Prior of Rochester to Mathew de la Wyke, of the Manor of Norwood, in Middlesex, dated A.D. 1241; Two Volumes of the manuscript collections for a History of the Ironmongers' Company, compiled by the present master, Mr. John Nicholl, F.S.A. From the Carpenters' Company,—Grant of Arms to the Company, by William Hawkeslowe, Clarenceux, dated Nov. 24, 6 Edward IV. The Crowns of the Master and three Wardens (date 1561). The master's cap is of crimson silk, embroidered with gold and silver lace. On it are represented, in silver shields, the arms of the City of London (with date 1561) and the Carpenters' Company, enamelled in proper colours. The Merchants' mark, and initials of John Tryll, Master in 1561, are also on the cap. The Masters' Cup (date 1611). This cup, which

is silver gilt, and of elegant workmanship and design, bears the following inscription:—“John Reeve, being Mr. ye second tyme, made me for ye use of the Mr., Wardens, and Countye of ye Mystery of Freeman of ye Carpenry of ye Citty of London for ever, without charging ye Countye then being.” From the Plasterers' Company,—Grant of Arms to the Company, by Thomas Hawley, Clarenceux, dated 15 January, 37 Henry VIII.; the Book of Ordinances; and from the Armourers' Company,—Grant from John le Despenser, of Cockeham, to William Stote, citizen and fishmonger, dated 27 Edward III. A MS. Volume, containing “the marks allowed to the workmen armourers' freemen of the same company,” dated 1619.

#### CHANGES AT KING'S-CROSS.

ALTERATIONS at King's-cross, or Battle-bridge we would rather call it, are going rapidly forward, and so altered will the spot soon be that those who knew it twelve or fifteen years ago, and have not seen it in the meanwhile, will fail shortly to recognize this important point of the metropolitan thoroughfares. At about the time mentioned a dingy-looking piece of green sward, enclosed by an iron railing, led to the Small-pox Hospital, a plain brick building, with a dome surmounted by a weathercock over the central entrance, which is, probably, the only fragment of this edifice remaining. It is now above a shop nearly opposite the railway hotel. The site of the hospital and grounds is covered by a portion of the Great Northern station and the hotel. The statue of King George IV., to which we have before referred, stood near the large lamp, surmounted by a dual crown, which, though not so conspicuous as the “cross,” as it was called, is not designed in much better taste.

There are few efforts which have had the least pretension to art of which we have such an unpleasing memory as of the clumsy stuccoed figure of royalty which once stood here. The changes on the north side prevent one from being reminded of it; but often the peculiar corner, which will be soon amongst the matters of the past, would bring unpleasantly to mind the architectural pedestal the superstructure of stiff line which were supposed to represent the drapery of royal robes, and that singular countenance, monoidly looking, weather-beaten, and falling like “shreds of sentheons” (but more prematurely) into decay.

#### DESIGNS FOR THE FOREIGN OFFICE.

MR. D. FORTESCUE, in the House of Commons, asked the First Commissioner of Works whether it was his intention in the course of the present session to submit Mr. Scott's amended designs for the Foreign Office to the inspection of members of this House, and if so, when?—Mr. Cowper said Mr. Scott had prepared designs for an elevation in the Italian style. That design was still under consideration, and therefore at the present moment he was not able to answer the question, but he hoped in a few days to be in a condition to do so.

#### THE RAGGED REGIMENT IN WESTMINSTER ABBEY.

In former days, when people were less cultivated than at present, there were exhibited at the same time with the tombs and effigies of the kings, queens, and the noble in intellect and rank, in a portion of the interior of the Abbey, a singular collection of figures, which were known as the Ragged Regiment. Many persons who visited this ancient building took more interest in these figures than in matters really worthy of notice.

Amongst the most conspicuous of them was an effigy of Queen Elizabeth, wearing, it was said, her coronation robes. There were, besides, the Earl of Chatham, Lord Nelson, and other worthies of more modern date. Some of the figures are of ancient date. The garments had, however, become dilapidated (whence the name); in some cases, were entirely removed. Some had been carried in the funeral processions of several monarchs, upon the hearse. This fashion went out of use, and we believe that the last of these effigies brought to Westminster Abbey was that of the first earl of Chatham. In those days it appears that the attendants at the Abbey were without any regular salary, and they were allowed, as a perquisite, to exhibit the Ragged Regiment at a stated sum to the curious. In order to increase the attraction they renovated and made gay some of the most popular of the ancient characters, and added the waxwork effigies of persons of note, who, although not hurried in the Abbey, were much

under the notice of the public. The regiment, in this way, became, in such a place, offensive to right taste and feeling, and arrangements were made to pay the attendants in a more proper manner, and close this exhibition.

For many years now the Ragged Regiment has been hidden from the public view. The modern part is worthless, and might well be disposed of. Some of the old figures are, however, curiously cut, and worthy of preservation as remnants of the past. A sight of this regiment of wooden and wax figures, once an exhibition in such a place, shows that in matters of taste and propriety the present generation has made an advance upon the last.

ARCHITECTURE AT UNIVERSITY COLLEGE, LONDON.

A DISTRIBUTION of prizes in classes of architecture and construction took place on Tuesday, the 3rd inst., when the following were adjudicated as the result of the examination, by Professor Donaldson, for the session 1859-60:—

*The Art.*—1st year, prize and 1st certificate, Edward Mawley; 2nd year, prize and 1st certificate, Ernest Beck; and 2nd and 3rd certificates to J. H. Tarring and Francis Nibbs.

*Construction.*—1st year's prize, and 1st certificate, Edward Mawley; 2nd certificate, C. H. Bright; 2nd year's prize, and first certificate, Francis Nibbs; and 2nd certificate, J. H. Tarring.

FRANCE.

At Saint Malo, the new works ordered by the Emperor in his decree of the 24th March, 1860, for finishing the floating-basin, consist of the following:—

1. The Napoleon Quay, valued at 1,820,000 francs.
2. Interior Dyke, 640,000 francs.
3. Sluices for letting in water, 540,000 francs; moles to protect the locks, 250,000 francs; swing bridges, 87,000 francs; culvert sluices, 54,000 francs; lock-gates, 620,000 francs; basin-gates, 480,000 francs; breakwater against the northeast currents, 50,000 francs; contingencies, 459,000 francs. Total, 5,000,000 francs. These works will yield to the state revenues of the floating-basin; also tolls for graving dock, and the use of the gridiron for ships, besides the road revenues on the highway between Saint Malo and Saint Servan.

The racecourse of Craon (Mayenne), recently established, is likely, from the beauty of its scenery, to take a prominent position in the ranks of French hippodromes. The next meeting will take place on the 16th September next, and Horace Vernet, who holds property in that department, is painting a work for the Society. It is to be presented by him as a gift to the winner of the handicap reserved for French horses.

NOTES IN IRELAND.

THE War Department are about having a Royal Engineer office built in connection with the Royal Barracks, Dublin, as also certain drainage works executed at the Curragh camp.

A new iron bridge, with masonry abutments, is to be built in the county Cavan, on the post road from Cavan to Arva, according to plans by the county surveyor. Tenders to the 17th July.

The church at Drumcliffe, Ennis, is to be rebuilt, according to plans by the architects to the Ecclesiastical Commissioners.

Messrs. Gillespie and William Welland are the newly appointed architects to the Ecclesiastical Commissioners of Ireland, in lieu of the late Mr. Joseph Welland.

The Royal Hibernian Academy have opened their exhibition of pictures to the working classes in the evenings, at a charge of one penny, and the attendances are very numerous. We learn that this body will shortly have an accession of six architectural members to its ranks, and which, we trust, will ensure a more creditable display in the department of architecture at the annual exhibition.

Extensive works are to be erected at the churches of Rathclarin, county Cork, and Killflyn, county Kerry, by the Ecclesiastical Commissioners.

The additions and alterations to Sandford Church, near Dublin, are progressing towards completion, under the direction of Messrs. Lanyon, Lynn, and Lanyon, of Dublin and Belfast, architects, who are also about having built a mansion house and offices at Earlsfort-terrace, in the same city.

A new mart is to be erected in Drogheda, according to plans and under the direction of Mr. Lyons, of Dublin, architect. The town needs much improvement, and business premises generally have a neglected appearance. We understand that the internal arrangements of the Tholsel are to be remodelled, and it is desirable that they should be, for the hall or court is one of the most ill-arranged in the kingdom. A vast amount of discussion has taken place relative to the proposed new bridge over the Boyne, leading from the railway to the town, and various plans have been suggested; but lacking an indispensable requisite, we presume that they must remain for some time in abeyance, though the present structure is in a dilapidated and dangerous condition.

The subsidence in one of the piers of the viaduct, which caused much alarm, and gave rise to a lengthened discussion between certain professionals, is not of sufficient importance to impede the traffic, and has been pronounced by Mr. Hawkshaw, C.E., as not to afford grounds for immediate apprehension. House rents in the town have dwindled to such insignificance that commodious dwelling-houses may be had from 10l. to 12l. per annum, exclusive of taxes, which are heavy; yet trade is increasing, and excellent fairs and markets are periodically held.

The services of gentlemen of the long robe were more than usually called into requisition last term; and at the after sittings, in actions relative to disputed accounts with architects and builders, dilapidations, injuries to premises, &c., &c. In the case of "Cunningham v. Knox," for the latter cause, Mr. Whiteside, Q.C., M.P., thus humorously described plaintiff's case, his client being a hotel and dining-room keeper, and the defendant the proprietor of the *Irish Times*:—

"The result of the working of the defendant's printing machine was that, when the visitors to the Ship Hotel sat down to dinner, the plates danced before them, and the knives and forks indulged in the same amusement." Cheapness might be a very desirable object; but counsel doubted very much "if a man would not be sulky if he was to read a newspaper while bungry and deprived of his dinner." The action was arranged by defendant paying 5l., and naming an architect to see the requisite building operations made.

The new Roman Catholic Church recently erected at Cookestown, co. Tyrone, has been consecrated. The plan comprises nave, 80 feet by 25 feet; aisles 14 feet wide, chancel 32 feet deep, side-chapels, tower, sacristy, and vestry; style, Gothic. A five-light window, filled with stained glass, by Messrs. Hardman, of Birmingham and Dublin, lights the chancel; and the aisles and clerestory have also traceried windows. The roofs are of open timber-work; the high altar of Caen stone, by Mr. Lane, of Dublin; and the interior fitted carvings by Messrs. Purdy and Outwaite. The tower (with spire 175 feet high) is placed central on west elevation, and has a deeply-recessed doorway, with three-light traceried windows, and canopied niche above in the first stage, and a two-light belfry, open, in the second. Mr. McCarthy, architect; Dr. Johnson and Mr. Charles the contractors.

Two memorial windows—one to Knox, the reformer, the other to Mrs. Hemans, the poetess—have been erected in St. Anne's Church, Dublin. The former is centrally placed in the chancel, and is 21 feet in height by 11 feet 6 inches wide; the latter at one side, 16 feet high, and 7 feet 6 inches wide, both Byzantine in character. They are to be filled with stained glass by Mr. Warrington, of London, and the stonework is by Messrs. Purdy and Outwaite, of Dublin, supplied from the quarries of Messrs. Pictor & Son, of Clippenham, Wilts.

A new bridge is to be erected over the Lagan at Ormeau, near Belfast, by the Board of Public Works.

Two new Gothic churches are to be erected respectively at Dingle and Fierces, county Kerry. Messrs. McCarthy & O'Connell, architects.

Extensive alterations are being made to the marine residence of the Marquis of Downshire, at Dumdrum.

A small church in the Gothic style is to be built at Dollymount, near Dublin, after the plans by Mr. Rawson Carroll, architect. It will accommodate 300 persons.

A new railway hotel is in progress of erection at Kinsale. It has an Italian facade, with oriels, carried up two stories, an ornamented cornice, and balustraded parapet; spacious terrace in front, with steps descending to the river. Mr. Conybear, architect; Mr. Barnard, contractor.

Alterations and additions are to be made to the Court House, Armagh.

A church in Early English style, with nave and chancel 100 feet by 26 feet, vestry, tower, spire, &c., is being erected at Taghadee, county Kerry. Mr. McCarthy, architect.

HER MAJESTY'S THEATRE: "OBERON."

It is to be regretted that this fine work was not produced earlier in the season. Wanting in melody though it may be, it displays so many beauties, so much genius, that its popularity has increased each night. We may expect, however, that it will be given by Mr. Smith's English company, and with Madame Titiens and Mr. Sims Reeves, we shall be surprised if it do not even more completely lay hold of the sympathies than it has done with Signor Mongini. Signor Mongini is so robust a tenor that we find little sentiment or feeling in his singing. In "Oberon," the process with which we are most familiar was reversed. It was written for Weber by Mr. Planché, in English, and has been translated into various languages. Much of it is charmingly written, and has long been well known; for example, Hnon's song, "Oh! 'tis a glorious sight to see," and Reiza's great scene,—

"Ocean! thou mighty monster that liest e'er'd,  
Like a green serpent, round about the world."

The scenery is very agreeably painted; "Oberon's hower," for example, with which the first act opens, and the banks of the Tigris, showing the City of Bagdad. For the eighth and ninth-century buildings in Bagdad the artist has adopted the Alhambra as his type,—a building of the fourteenth century,—and thus gives an aspect less archaic than might in strictness be desired. In Bagdad, during the reign of Haroun el Rasheed, the greatest magnificence prevailed; but of the buildings of that period not a vestige remains. There is nothing earlier than the thirteenth century. The artist would assert, and it would not be easy conclusively to disprove it, that Mahometan architecture had taken in Bagdad as magnificent a form in the eighth century, as we find it presenting in Spain in the fourteenth. Madame Alhoni sings exquisitely the music entrusted to her, and Mr. Benedict has discharged the duty that devolved on him of fitting the opera to the present position of musical taste and knowledge, in a manner that has gained the approbation of Weber's warmest admirers.

ECCLESIOLOGICAL SOCIETY.

At a committee meeting, held on Monday, June 11, the president, Mr. Beresford Hope, in the chair, Mr. Slater exhibited a design for a large mosaic pavement, to be executed in the *opis Alexandrinum* method, for the sanctuary of Chichester Cathedral.

Other architects exhibited designs. Mr. E. R. Robson presented to the Society three photographs, representing portions of Durham Cathedral which no longer exist, taken from water-colour drawings by Carter, made in 1795. The following extract is from Mr. Robson's letter:—

"No. 1 shows the Galilee, in which nothing has been disturbed except the fifteenth century altar, replaced by enormous oak doors and cast-iron hinges.

No. 2 represents that end of the Chapter-house, four years after the execution of Mr. Carter's drawing, was entirely swept away.

No. 3 gives the opposite end of the Chapter-house, which is not 'destroyed' (as Mr. Carter mentions), but only defaced. No vestige of the groining, or of the small side door, remains. The floor is of wood, about the same distance above the cloister pavement which is formerly measured in the opposite direction. The two-light windows have the window-order vaulted up.

The originals belonged to the late venerable antiquary, Dr. Raine, whose son has allowed the photographs to be taken for the Dean and Chapter of Durham.

"Thanks to the faithful work of Carter, the Chapter-house can be restored to its pristine glory, but, as Dr. Raine forcibly asks, 'Who can restore its pavement, studded with the gravestones of the first three centuries after the conquest?'"

At a committee meeting held immediately after the annual meeting, the president undertook to frame a memorial to the Incorporated Church Building Society, on the subject of chairs in churches.

The document was subsequently forwarded to the Incorporated Society; and the secretary, in reply, says:—"There was subsequently much discussion on the subject of chairs for churches, and a sub-committee has been appointed 'to consider the expediency of making grants' where they are introduced 'in lieu of fixed seats,' and the regulations under which such grants shall be made."

MEDIÆVAL GROTESQUES.

## GROTESQUES.

## RESEARCHES IN LIBRARIES.\*

THE accompanying fantastic designs are from a MS. of the fourteenth century, in the Royal Public Library of Stuttgart, in the kingdom of Wurtemberg, Germany. (Bibl., fol. 3, vol. iii.) The building is in Neckar-street. I copied them because they show such an exquisite healthy sense of humour, and, though grotesque, they are not obscene. They are, in the original, executed with a spirit and life remarkable for the age, especially in the expression of the faces.

A. B. LE V.

## THAMES EMBANKMENT COMMITTEE.

AMONGST the schemes for Thames embankment laid before the committee now sitting, we must give an outline of that proposed by Mr. James Edmeston.

The road would run from Westminster-bridge to London-bridge upon a river wall as far as Southwark-bridge, and thence to London-bridge upon iron piles, so as to allow craft to pass under the wharfs: from Westminster to Southwark it would be constructed so as to allow access to landing places beneath, for the use of the owners of river-side property.

The road would pass under all the bridges, including Blackfriars, in which bridge an alteration in the first arch might be effected without stopping the traffic. The river wall would be recessed beneath Blackfriars bridge and Southwark-bridge, to allow barges to lie near to the present frontages. The landing-places would be 4 feet above Trinity high-water mark, and the roadway over these recesses would be carried on iron girders, leaving large open spaces for landing purposes. The railway would run from Westminster-bridge to Queenhithe inside the river wall, just low enough to pass beneath the landing-stages or platforms, and thence would be continued in a tunnel to the Fenchurch-street station, and might be extended in a tunnel from Westminster to the new Pimlico station, communicating with the Metropolitan and Hungerford-market stations, and thus connecting all the railways north and south of the river. The entire proposed constructions, except where the river is very wide, would run as close to the side as possible, in order that owners of wharf frontages might receive the least possible injury, and also that the work might be done tide-work, and at as little cost as possible. But little water would be abstracted from the river. Opposite the Temple-gardens, and where desirable, an open arcade would be formed, which would in no way obstruct the view.

The railway behind the river wall would be at a level of about 8 feet above low water.

The intercepting sewer, which is proposed by the Metropolitan Board to pass through the Strand and Fleet-street, would pass beneath the railway, or in the river wall, as found most convenient.

The estimated cost of the entire construction, except the railway, is 450,000*l.*, and some capitalists have had the matter under their consideration, with a view to undertake the whole, in-

cluding arrangements with the wharfingers, if the public bodies interested would pay a sufficient sum, the road being dedicated to the public use.

## MODERN LONDON AND ARCHITECTURAL SCULPTORS.

DURING the growth of London we have had several "ages" marked by the use of peculiar materials.

Two thousand years or so ago, we had an age of mud-work and wattle. Then the Romans came, and we may believe that we had for four centuries an age of brickwork. During the Saxon times there was an age of wood, superseded by the use of stone in the Norman days. Then came again the use of wood, which was continued, to a very great extent, until the Great Fire of 1666. Afterwards we had another age of brick, which lasted for nearly two hundred years. Then, for a short time, stucco was the rage; now, however, an age of substantial stonework is beginning, which promises to give us a lasting city.

From time to time we wander abroad, and look with wonder at the vast masses of buildings which are at present in the course of removal for alteration and improvement. This is the case, not only within the corporate limits, but throughout most other neighbourhoods which are about a hundred or a hundred and fifty years old.

The premises of the City warehousemen, the offices of the great bankers, and of insurance and other companies, now contrast curiously with the recollection of the dingy and inconvenient buildings which stood in many instances not twelve years ago.

The old-fashioned hostelry, the "Swan-with-two-Necks (Nicks)," its gabled roof and quaint-looking frontage, have disappeared, and instead a front of massive architecture is appearing. Here the railway carrier, notwithstanding the alterations, is busily pursuing his work. Shops, and places of less pretension, are also undergoing a great change. Note, for instance, the shop of a well-known butcher, not far from the Guildhall: the front, of stone, is composed of a large circular-headed window and entrance. At the centering of the former is a colossal lion's head: the head of the ox is equally classical, it would have harmonized as well with the general design, and have been more appropriate. It is surprising to look in all directions at the works of magnitude which are going forward above the surface; and now the curb below is being troubled, and soon in all directions thousands of passengers will be rolled along beneath the crowded footpaths and roadways.

Most wonderful are the phases of London: no man can fathom its varied depths, its glories, and its shame.

It would be interesting if we could get an account of the sums which have been spent even within the last ten years on the building of new houses, churches, prisons, and other institutions, within the metropolitan district; the cost of the alteration of shops and public-houses: the latter alone would amount to an extraordinary sum. Some rough estimate might be formed of the amount of capital expended within the metro-

politan district in the way above mentioned, and in the construction of sewers and roads: the total would be startling.

Seeing the massive and solid manner in which the bulk of the buildings within the City are being raised, and that they may be expected to remain for a long time to come as examples of the skill and taste of the present age, it is important that these should be satisfactory. The general appearance which the streets are putting on is more harmonious and picturesque than might have been expected. The broad design of many of the buildings is good, and some will bear examination in the decorative details. In many instances, however, as we have before said, the sculptors, instead of being ornamental, are actually blemishes, and these on buildings which have cost thousands of pounds.

That the necessary ability is to be had is certain. How is it, then, when imposing buildings have been planned evidently without consideration of expense, that those details on which so much depends should be slighted and made unpleasant to the sight? We could point out more than one building on which groups of allegorical figures have been placed, which are so distasteful in design and so bad in execution, that it must be absolutely an infliction for a person of only ordinary feeling for art to live opposite to them. Several circumstances concur to produce this. In some instances, perhaps, the architects do not sufficiently appreciate the value of excellence in the sculptural decoration of modern buildings. In others, so great is the hurry, that it is impossible to give proper effect and finish. But chiefly those who are putting up an important building are indisposed to a sufficient expenditure on what seems to them to be extra and unnecessary works. The details of the buildings of Greece and Rome have now a priceless value. The sculptures by Flaxman, introduced into his house by the late Samuel Rogers, brought more than their original cost; and, if proper ability were used, it would be the same in time with the decorations of the buildings of modern London.

Up to the present time it is to be regretted that sufficient attention has not been given to architectural sculpture. The sculptors have not taken their right position. They have an important mission to fulfil in the progress of English taste; and it is to be hoped that before long they will be enabled to take their proper place amongst the artists of the land.

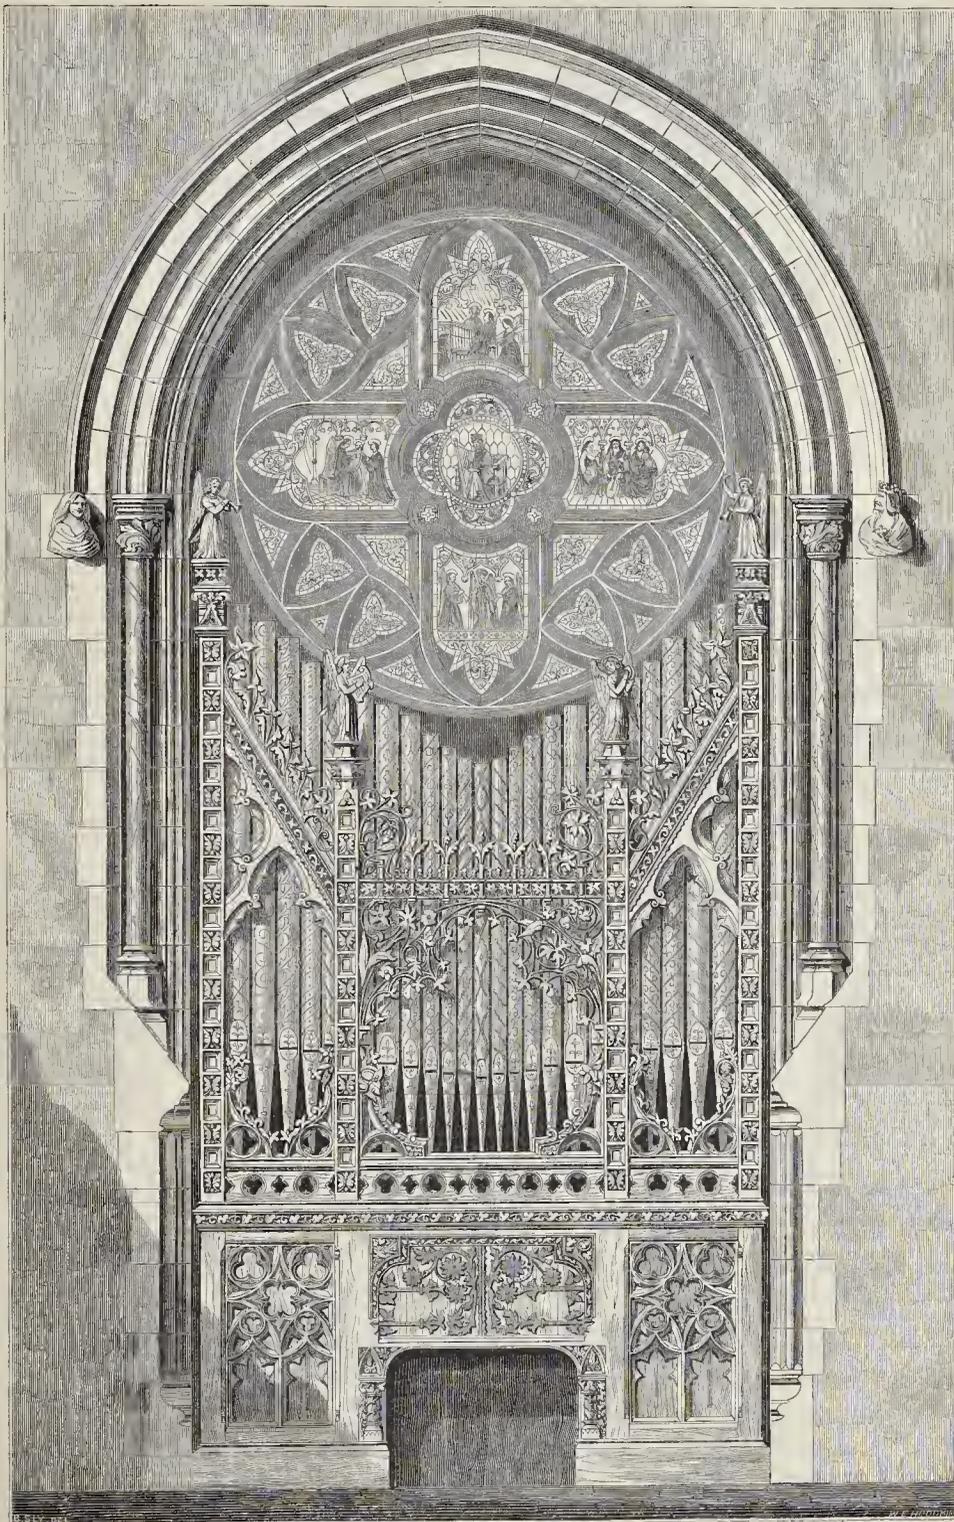

## ORGAN, SHADWELL COURT, NORFOLK.

THE accompanying engraving represents the organ which has just now been set up in the great hall at Shadwell Court, Norfolk, the seat of Sir R. J. Buxton, under the direction of Mr. S. S. Teulon, architect. On a previous occasion we gave a view of the exterior of the building.

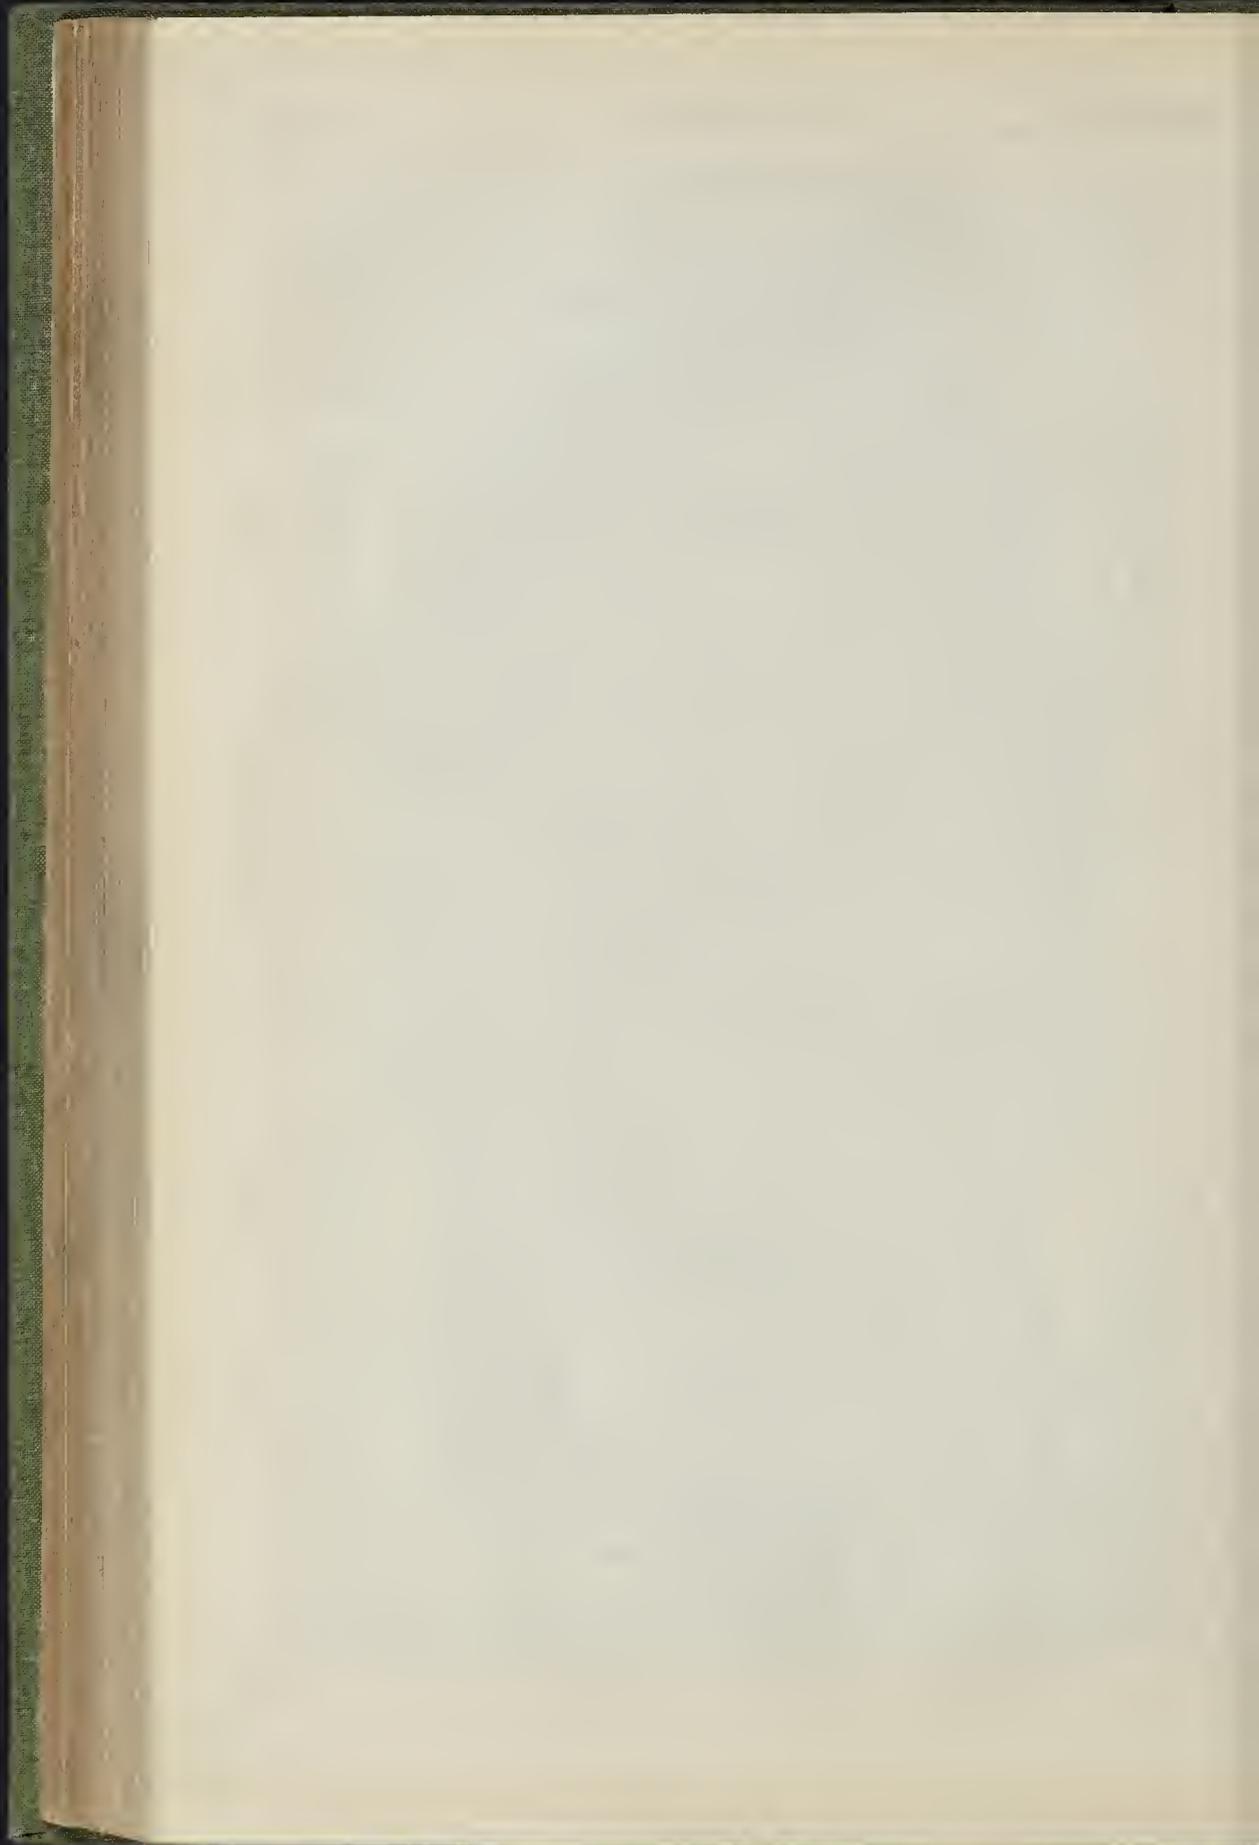

The woodwork of the organ-case is of oak. The metal work was executed by Skidmore, of Coventry; the coloured decoration by Fisher. The organ was built by Messrs. Gray & Davison.

The window at the end of the hall, seen above the organ, contains medallions of great composers, not exactly represented in the engraving.

\* See p. 849, vol. xvii.

THE ORGAN, SHADWELL COURT, NORFOLK.

LOCAL PORTRAIT GALLERIES.

A MEMORIAL, the only one yet raised to Admiral Blake, has been erected within these few days in the Courts of Assize at Taunton. It consists of a portrait bust of Blake, designed by Baily, and executed in the studio of Mr. Papworth, his son-in-law, with a pedestal, and an inscription from the pen of Mr. Hepworth Dixon. The design of the memorial is said to be well adapted to the place which it occupies, though it suggests the want of a companion bust, which might be fitly supplied by the other great Somersetshire worthy, John Locke.

A contemporary in alluding to the Blake memorial very justly observes that, "The erection of such monuments, while it illustrates our history *in situ*, has a tendency to promote provincial spirit in its worthiest form of emulation; and for its promotion of patriotic influences or its expression of the gratitude of posterity it deserves equally to be noted and encouraged."

We have before this suggested the usefulness of forming galleries of portraits of eminent townsmen in the halls, or some other proper place, in the provincial towns of the kingdom,—so that the inhabitants of such places might take visitors and their children, and say, pointing to such a collection,—“These are the men who have been born or reared amongst us.” And if this be advisable in the provinces, it is no less so in the great metropolitan districts, which have grown into such vast proportions, and which are connected in various ways with men famous for their abilities. In the great districts of St. Pancras, Marylebone, Islington, Clerkenwell, and others, vestry-rooms, which, in a measure, answer the purpose of the guild-halls of the country, have been reared. Many of these are large in size, but by no means creditable either in their interior or exterior forms to modern architectural taste. In these places, however, thousands of persons assemble for various purposes, and there the effigies of men who had been an honour to the neighbourhood could not fail to have an inspiring and beneficial effect. In the chief portions of these vestry halls, however, there are no portraits or other artistic matters to break the flat uniformity of the walls; and yet what interesting collections might be formed at comparatively small cost; for, if an appreciation of such works were shown, many pictures of great value and interest in a general collection would not doubt be freely offered.

In the Clerkenwell session-house there are some very good pictures, but they chiefly consist of royal personages or distinguished statesmen who are not particularly connected with that locality,—and yet what a gallery of Clerkenwell worthies might be gathered together. There is not one of these metropolitan parish halls which could not be usefully ornamented in this way.

Take any of the parish histories and glance at the names of resident inhabitants whose career would be worthy of imitation. Let us look at the first of these which comes to hand, Robinson's "History of Stoke Newington,"—a place which is still suburban, but which is rapidly increasing its population. Here lived, about the year 1710, Daniel Defoe: how profitable it would be if a portrait of this man—one of the most popular British authors—could be pointed to in the national schoolroom, or vestry hall. Would it not be instructive to mention that the far-famed author of "Robinson Crusoe" was the son of a London butcher; and so on, giving a sketch of his history, and what he did to make himself so celebrated?

Another distinguished resident of the same parish, though born at Hackney, was John Howard, the great pioneer of sanitary and social improvement, whose devoted life is worthy of the study of both old and young. The father of this public benefactor was also a London tradesman, who died when he was an infant, but left him in charge of guardians, who apprenticed him to a grocer. Howard came to Stoke-Newington rather before 1750, and lodged in the next house to Mrs. Wollaston: from thence he removed to the eighth house from the Church, which was kept as a lodging-house by Mrs. Sarah Lardcan—the lady to whom he was afterwards married. What a fine subject for expatiation, *apropos* of his portrait on the wall, would Howard be!

The memory of another choice spirit is connected with Stoke-Newington. Here Isaac Watts wrote a large portion of his beautiful works; and here he died on November 25th, 1748, in the 75th year of his age. He was buried with great solemnity in the dissenting burial-ground of Bunhill-fields. Since then a small monument has been erected to his memory in Westminster Abbey. But how strange it is that in a position where a monument might

be so well placed, close to the resting-place of John Bunyan and Daniel De Foe, one to Isaac Watts should not have been raised long since.

We have before referred to this neglect, which is not creditable to us. But our present object was merely to point out a few examples showing the interest which such local portrait-galleries, both in London and the provinces, could not but excite in connection with the histories of the local worthies, so brought face to face again, as it were, with young and old, in the present and coming generations.

BUILDERS' CUSTOMS.

SHORING ADJOINING PREMISES.

A PROBLEM, of considerable importance to all connected with the building profession throughout the United Kingdom, has been for a lengthened period in process of legal solution before the Court of Common Pleas and a special jury at Dublin. In the abstract it is simply this,—is a builder who contracts for the taking down and the rebuilding of a house or premises, with one on either side thereof, bound to protect by all necessary shoring, bracing, strutting, &c., the adjoining houses?—and does he, by reason of neglect, or insufficiency of skill in so doing, incur a responsibility?

Another question, bearing materially on this, suggests itself as regards the practice of architects in inserting a clause in their specifications, that the contractor is to provide for such precautions; and again, assuming that there is no special agreement between the client and the contractor, is it the custom of the trade to adopt the necessary measures, in its absence; and must the latter be responsible for the consequences? The case to which we refer is that of "Kempton v. Butler," before mentioned in our pages, the plaintiff being the proprietor of a house of business, in Grafton-street, Dublin, and the defendant the contractor for the taking down and rebuilding of the adjoining premises, during which plaintiff's house fell, destroying all his goods, furniture, &c. The defendant acted in the double capacity of architect and builder: there was no specific agreement as to the protection of the adjoining houses, and therefore the chief question devolved on "the custom." At the first hearing of the case last November, the plaintiff was non-suited on a technicality; at the second, after evidence on both sides had been fully entered into, and counsel on both sides had advocated their respective client's cases, during five days, the jury disagreed, *six to six*, and were discharged without a verdict; and at the third—last term—with substantially similar evidence as before, they found a verdict for 750*l.* with costs, damages being laid at 7,500*l.*

Does such a custom universally exist? If so, is it one of obligation or of courtesy? And if not an obligation, why should not the trade unanimously disavow it?

Assuming that to a certain extent it does exist where precaution is practicable, should it apply to all cases, however great the difficulty, and however dilapidated the premises, when all prudential measures would be unavailing? and, apprehensive of a consequent responsibility, should a builder decline all interference with premises so circumstanced, and should a proprietor be precluded from rebuilding? These general questions involve serious considerations worthy of attention and a definite understanding; for though "the law" may be with the builder—as impressed by Sergeant Fitzgibbon, Q.C., in the case alluded to,—"the custom" will, to a great extent, influence the jury in a verdict.

THE LIVERPOOL ARCHITECTURAL SOCIETY.

THE annual excursion of the members of the Liverpool Architectural Society and their friends took place on Mouday, 2nd instant, on which occasion the ruins of Furness Abbey were visited. The aid of Mr. Paley, of Lancaster, architect, was of great value to the excursionists.

After the inspection of the abbey, the excursionists assembled in the Furness Abbey Hotel, where dinner was provided. The chair, in the unavoidable absence of Mr. James Hay, the president, was occupied by Mr. W. H. Weightman; and the vice-chair was filled by Mr. Wm. Stubbs, one of the vice-presidents.

In giving the toast of "The Army, Navy, and Volunteers," the Chairman remarked that the volunteers had added another safeguard to the kingdom, and that he was glad to know the society numbered many volunteers amongst its members.

Mr. C. O. Ellison, in responding, gave "The Profession," coupling with it the name of Mr. Paley.

The Chairman proposed the toast of "The Visitors," coupled with the name of Mr. Golding, from whom it elicited an appropriate response. He proposed the toast of "The Liverpool Architectural and Archaeological Society," coupled with the name of Mr. J. A. Picton. Mr. Picton, after replying, proposed "The health of Mr. James Hay, the president," who was unavoidably absent. Mr. John Hay acknowledged the toast, and afterwards proposed "The Associate Members," responded to by Mr. Frodsham.

The health of the chairman was next drunk; and Mr. Sherlock gave "the Secretary, Mr. W. H. Picton," which was suitably acknowledged by that gentleman.

STATUES AND MONUMENTS.

A COMMISSION having been given by the present Earl of Ellesmere to Mr. Noble, the sculptor, for a tribute to the late earl, the artist has completed a recumbent statue, at full length, with the arms placed crosswise on the breast, the body being folded in the robes of a knight of the garter. The figure is rather over life-size, and is cut from a solid block of the finest Carrara marble. The statue will be conveyed to Worsley, the family seat, near Manchester.

The committee for raising a memorial to the late Henry Hallam, have resolved to erect a full-length statue of him in St. Paul's, an eligible site having been offered by the Dean and Chapter.

For some time past several influential gentlemen connected with the parish of Islington, have been desirous of erecting a monument to the memory of Sir Hugh Myddelton, who brought the New River through the parish to the metropolis, and in the prosecution of which gigantic work it is well known he embarked all his vast fortune. It has been resolved to erect a drinking-fountain in some conspicuous part of the parish, and on it to place a statue of Sir Hugh. The most appropriate site for the monument, it is considered, would be on Islington-green, on the spot on which the old watch-house stands. Sir S. M. Peto has promised to present the statue to the parish. A full committee has been appointed to assist in carrying out the object in view.

A tablet has just been erected in St. John's Church, Moulsham, to the memory of the late Mr. Henry Guy. The design is by Mr. James Lockyer, architect. The white marble slab terminates at the top in a pinnace, ornamented, and around the whole runs a mosaic border formed by inlayings of black marble. The centre is occupied by a long inscription to the deceased.

The *Darke* monument in the Penzance Cemetery is to be in the form of a Gothic spire, carved and crocketed, and surrounded by an iron railing. It will stand upon a base 9 feet square, and will be of Lamorna granite. Plans have been prepared by Mr. Matthews, the borough surveyor, and much of the material and work will be furnished gratuitously or at a low price.

A statue to James Hogg, the Scottish poet, popularly known as the Ettrick Shepherd, has been publicly inaugurated on the banks of St. Mary's Lake, at the head of the vale of the Yarrow, one of the finest and most picturesque streams on the Scottish border. There was a large assemblage at the inauguration, at which three daughters of the poet were present. Mr. Glassford Bell, one of the Sheriff-Substitutes of Lanarkshire, delivered the inaugural address. The statue of the poet is rather above the life-size, and represents him seated on some "grassy knoe," with his shepherd's staff in hand, and his grey bill plaid thrown carelessly over his shoulder. In his left hand is a scroll bearing an inscription,—“He taught the wandering winds to sing.” On the panels are inscriptions from his own works. At his feet lies his dog "Factor." The block from which the figure has been chiselled out is of fine grained white sandstone, and was procured *gratis* from the Duke of Buccleuch's quarry at Whita-bill, near Langholm. Mr. Currie was the artist.

At a meeting of subscribers to the fund raised to erect a memorial to the late Rev. Principal Macfarlan, of Glasgow, held in the Council Chambers of that city,—the Lord Provost in the chair,—it was reported that a site had been obtained for the monument in the Necropolis, and that Mr. J. A. Bell, of Edinburgh, architect, had prepared a design, not to exceed 700*l.* in erection. It is in the form of an ancient cross, ornamental in details. It will rise 50 feet from the surface, is to be 11 feet square, and built of

Binny stone. The site is on the crest of the Necropolis-hill, a little to the south-west of John Knox's monument.

#### CHURCH-BUILDING NEWS.

**Southport.**—Christchurch has just been reopened after extensive alterations: the walls have been taken down, the roof supported on iron columns, and side aisles added. The galleries have also been thrown back and widened. Additional sittings have thus been provided for about 400. The work has been executed by Messrs. Richard Wright & Son. A stained-glass window has been presented to the church by Mrs. Edward Rimmer, in memory of her father, Mr. Wright, builder. The subject chosen is, "Job in the days of his prosperity," as described in Job, xxx. 11, 12, 13.—Messrs. Wright have also obtained, by competition, the contract for pulling down and enlarging St. Cuthbert's Church, the parish church of Southport. All that now remains of the original structure is the spire and eastern wall. A new roof and new galleries are to be added, and additional sittings, to the number of 500, obtained. A subscription has been raised for the purpose of placing in the eastern window a testimonial stained-glass window, to the Rev. Charles Henkeht, the rector of the parish.—The enlargement of Trinity Church has also been entrusted to the same builders. The plans prepared by Mr. W. Culshaw, of Liverpool, contemplate widening the church nearly 90 feet, and lengthening it 36 feet, adding a new tower and spire 120 feet high. The new seats will hold about 720 people. In this rapidly-increasing town and favourite watering-place, the demands for extra church accommodation have necessitated these enlargements, and it is now contemplated to build another church in the town.

**Louth.**—At the first meeting of the committee for the restoration or rebuilding of the parish church of Rotherby, a proposal was made "That Mr. James Fowler, of Louth, be the architect to the committee." To this an amendment was submitted "That Mr. James Fowler and Mr. Charles Ainslie, of London, be joint architects to conduct the restoration of the church." The amendment having been negatived, the original resolution was carried. It was also resolved that Mr. Fowler be instructed to prepare plans for the restoration and rebuilding of the nave and tower, and reseating the interior, with an estimate of each; also to prepare a plan and estimate of a vestry, about 10 feet 3 inches square, to be placed on the north side of the chancel, or elsewhere adjoining the church.

**Ridlington (Rutland).**—Ridlington church has been re-opened, after having undergone a restoration. The church was in a very dilapidated and unsafe condition, when the Rev. C. A. Hay, having entered upon the living, set about the work of restoration. Mr. Henry Parsons, of London, architect, received instructions to examine the fabric, which was found in a very unsatisfactory condition, and Mr. Halliday, of Greetbam, was asked to do the work without any competition, at the estimate of 800*l.* The architect has preserved ancient relics. The nave is of three bays. The pillars on the south side are circular, with moulded caps and bases,—on the north side, octagonal. The carving was executed by Mr. Matthew Irving, of Leicester.

**Boyton (Wills).**—The parish church of Boyton has been restored and re-opened. In the old church, at the west end, now rebuilt, says the *Wills Mirror*, there were two flat Norman buttresses, showing the antiquity of the church. Beneath the pavement of the tower a low black sepulchral slab was discovered, the style of carving upon which is remarkable, and would indicate an antiquity prior to the Conquest. The ancient font of the church, placed in front of the Manor House, discovered under the floor of an old cottage, partakes of the same very rude antiquity. The steeple of the chancel, the oldest part of the existing building, was lamentable. The walls were above a foot out of perpendicular, broken bricks, rotting pews of gigantic height, windows broken and grieved with damp, a hideous plaster roof falling upon the worshippers, such was the aspect of this part of the building, the date of which might be fixed at about 1240. This part of the building has been restored: the roof is similar in formation to that of Ely Cathedral. The north wall is wholly new. The eastern window is in keeping with the rest of the chancel. The east window, by Mr. A. Gibbs, represents our Lord's Crucifixion, with the types of resignation—the Virgin on one side,—and of Love and St. John on the other. The east lancets are memorials to the Rev. S. Routh, rector

of Boyton, presented by his family. The north-west lancet contains an ancient piece of glass, with the arms of Sir Alexander Giffard, the Crusader, whose tomb is in the church. The pulpit is of stone. The arch separating the chancel from the nave was cut off at the top for about 8 inches by a flat plaster nave roof, which exceeded even the chancel roof in deformity. The gable has been raised about 16 feet, and is now as nearly as possible at its original height. The old roof has been gradually let down, as the ends of the beams decayed, until it became nearly flat, with just enough pitch to cause the rain to run off.—The Warminster Chapel, containing the tomb of the Giffards, has been restored. Under the slab at the entrance, a headless skeleton, probably that of the last of the Giffards in Edward II.'s reign, was found. The west and east windows have been restored, the rose windows with glass, by Messrs. Horwood, of Mells. The top circles contain the arms of the sees of York, Worcester, and the family coat of Giffard, the Crusader. The next triplet contains the *vespas* or symbol of each brother, the crozier with W. G. for Walter Giffard; G. G. for Godfrey Giffard; and the mitre to mark the Bishopric of Worcester, the Red Cross of St. George, the Standard of the Crusader. The other triplet contains the later descent of the Manor—the Lambert, Bonett, and Fane coats. The centres of the large quatrifolios contain emblems of the Knights of the Temple, the Holy Lamb, the Angels at the open tomb, and St. George of England. The east window in the chapel, like the west or rose, partakes of a mixture of English and Decorated architecture. The glass (by Mr. A. Gibbs, of London) is a memorial of the ministerial connection between Mr. Fane and the parishioners of Warminster. The chapel has been mainly restored by their liberality. The centre light contains the Charge to St. Peter,—the other two, St. John Baptist, the Preacher of Repentance, and St. Paul, the Preacher of Faith: above are the four Evangelists and the symbols of the Passion. The south windows are all memorial,—the centre one presented by Mr. T. H. Wyatt, the diocesan architect. The nave is the latest part of the building. The east window has been moved from the chancel and placed on the western gable. The roof replaced a flat plaster roof about a foot below the point of the arch. The south window, which replaces a ruinous doorway, has baptismal references. The west window, of Mells manufacture, contains the arms of her Majesty, of the Lord Bishop, and of Magdalen College, the patron of the living. The architect of the restorations was Mr. T. H. Wyatt; the builder, Mr. W. Barnden; mason, Mr. Trap; plasterer, Mr. Duteber; painter, Mr. T. Harris; master masons, John Turner and William Handcock; master carpenter, John Grist; clerk of the works, Mr. John Harding. The church has been restored at a cost of about 2,000*l.*

**Belgrave (Leicester).**—The Chancel of Belgrave Church is about to be restored, from plans prepared by Mr. Evans Christian, of London. The tender of Mr. B. Broadbent, according to the *Leicester Advertiser*, has been accepted by the Ecclesiastical Commissioners for the carrying out of the work.

**Moorhouse (Notts).**—A new Church is to be built for the small parish of Moorhouse, at the cost of the Speaker of the Commons. Mr. B. Broadbent, of Leicester, is to carry out the works. Mr. Henry Clutton, of London, is the architect; and the style adopted is Continental Gothic.

**Rochdale.**—The chief stone of St. Martin's Church, Castleton Moor, has been laid on Brunt Hill. The cost of the church is estimated at 3,000*l.* Mr. Ernest Bates, of Manchester, is the architect; and the contractor for the stonework, for 1,760*l.*, is Mr. Edmund Taylor, of Rochdale; and Mr. John Mills has undertaken to do the woodwork for 650*l.* The Early Decorated is the style chosen for the church, which consists of a nave, aisles, north and south transept, and chancel. In the north-west aisle a tower will be erected, which will be surmounted by a spire, rising to a height of 140 feet from the ground. The stone used for dressings will be from Summit, and the tracery will be from Halifax. The interior of the church will be fitted up with red deal, the seats open and stained, and the roof of the same material. There are to be no galleries, and the church is to accommodate 600 people, 250 free. The building was commenced in October, 1859, and it is expected, will be finished by November next.

**Bradford.**—The work of altering and restoring the parish church will shortly be begun, Mr. Thomas Hill, joiner and builder, having received the contract. The "faculty," authorising the

removal of the west gallery and the altering and removing some of the pews in the body of the church has been received. There is a fair prospect, says the local *Observer*, of such an arrangement being made with few owners in the east gallery as will result in the removal of that ugly and unsightly object. It is intended to re-hang and elevate the bells in the old tower.

**Montrose.**—A new Free Church has been opened in Castle-street, Montrose. It is capable of accommodating 550 sitters. Mr. Henderson, of Edinburgh, was the architect. The cost, including the price of the site, was 1,400*l.*

#### PROVINCIAL NEWS.

**Rushall (Staffordshire).**—The tender of Mr. E. Spencer for the erection, at a cost of 1,429*l.*, of a police station at Rushall, has been accepted.

**Trysull (Staffordshire).**—The new workhouse for the Grisdou Union has recently been finished. It was built to accommodate 120 inmates. The site is an elevated one, near to the village of Trysull, and the buildings form a conspicuous object. They are of red brick, banded with blue, and roofed with tiles. In plan they comprise three distinct groups. The front is appropriated to the board-room, clerk's office, vagrant and receiving wards, &c. The main or central group, with a frontage of 155 feet, accommodates the various classes of healthy and more permanent inmates, the females being on the left, and the males on the right of the master and matron's residence, which forms the centre of the range, while the third group is formed by the infirmary, and each group is divided by the yards of the respective wards. The water supply, contracted for by Mr. Deeley, of Dudley, is obtained from a well sunk on the premises, and pumped up to a wrought-iron tank, on the top story of the main buildings, whence it is laid on to the lavatories, waterclosets, &c. The works, including fittings, have been carried out by Mr. Hlevningham, at a cost of 2,595*l.*, from the design, and under the superintendence of Mr. George Bidlake, of Wolverhampton, architect.

**Leicester.**—The following tenders for the various works required in rebuilding the Infirmary were accepted:—Stonemason's work, Mr. Firn; carpenter and joiner's, Mr. Clifton; bricklayer's, slater's, &c., Mr. Collins; plumbing and glazing, Mr. Pazzard; ironfounder, Mr. Richards; painter, Mr. Haynes.

**Doncaster.**—The tenders for the erection of six almshouses, four of which are under Stock's trust, in the Holmes, having been opened, Mr. Taylor, who is at present engaged in extensive alterations at the Turf tavern, was declared the successful competitor, at the sum of 600 guineas. Mr. Butterfield is the architect.

#### DRINKING-FOUNTAINS ASSOCIATION.

A CONVERSATION in furtherance of the objects of the Free Drinking-Fountains Association was held in St. James's Hall, on Thursday, July 5. The Earl of Shaftesbury took the chair. Dr. Lankester made an address on the qualities of the water of the metropolis, and Mr. John Bell read a paper on "Art," connected with the drinking-fountains. It is to be hoped that better council on art-questions will now prevail in the Association.\* Various specimens of fountains were exhibited, as was also a very remarkable drawing by Mr. George Cruikshank, illustrating "The social drinking customs of society." A committee has been appointed to obtain subscribers to an engraving of this work and assist in the production of a large picture of it to be painted by the artist.

#### SCHOOL-BUILDING NEWS.

**Southampton.**—The foundation stone of Holyrood National Schools has been laid. The site of the building is in the Warden's garden, "God's House," and has been granted by the Provost and Fellows of Queen's College, Oxford. The contract for these schools, says the *Hampshire Advertiser*, has been taken by Mr. John Gumbling for 600*l.* The girl's school, which is on the ground-floor, is 40 feet by 16 feet, and together with an adjoining classroom contains space for about 100 girls and infants. The boys' school, together with a class-room at the end, is 40 feet by 16 feet, and is intended to hold about forty scholars.

**Wombourne (Staffordshire).**—The parochial schools at Wombourne have been completed.

\* A correspondent objects that the water supplied to the fountains in London is not cool and pleasant tasted, and thinks the Society should set itself to obtain spring water. We have not heard the objection before.

They are built from the design of Mr. George Bidlake, of Wolverhampton, architect, by Messrs. Hartland and Addenbrooke, and consist of girls' school-room, 39 feet 6 inches by 18 feet; boys' school-room, 39 feet 6 inches by 18 feet; with class-room, 14 feet by 12 feet, to each, and infant school, 30 feet by 18 feet. A teacher's residence, with additional accommodation for an infant mistress, is built on the south-east side of the schools. They are of red brick, with bandings of blue brick, and Bath stone dressings. The rooms are ceiled to the back of the rafters, which are stained and varnished, and the roofs are covered with tiles and plain cresting. The cost of the buildings, including boundary and fence walls, and forming play-grounds, has been £1,275l.

**Birstall (Leicester).**—The building of Birstall schools, upon plans prepared by Messrs. Millean & Smith, has been commenced. Mr. Firm, of Leicester, is contractor for the stone work, &c., and the carpenter is Mr. Robinson, of Dorking.

**COUNCILS OF CONCILIATION BILL.**

The Bill, entitled "Masters and Operatives," is now before a select committee of the House of Lords.

The committee is composed of the following peers—Lord Chancery, Lord Cranworth, Earl Granville, Lord St. Leonards, Earl Derby, Lord Brougham, Lord Overstone, Lord Ravensworth, Lord Kingsdown, Lord Belper, and Lord Wensleydale.

The report from the select committee of the House of Commons on "Masters and Operatives," together with the proceedings of the committee, minutes of evidence, appendix, and index, have been communicated to the House of Lords, pursuant to a message of Tuesday last, and ordered to be printed.

The select committee held its first sitting on Monday, the 9th, and will meet again on Friday.

Lord St. Leonards, in moving the second reading of this Bill, in the House of Lords, last week, said it was not anticipated that it would directly operate against such a strike as had lately taken place in London; but it was hoped that it would prevent strikes taking place at all. It was impossible to overrate the enormity of the evil of strikes, or the urgent necessity for a remedy. If the relation between masters and operatives was fairly looked at, it would be seen that the operative was really a limited partner in the concern, drawing his share of the profits in the shape of wages, although not responsible for the liabilities of the firm. It was obvious, therefore, that he had a direct interest in the continuance of the business, and that mutual confidence and regard between the employer and the employed were essential to the interests of both. Lord Ravensworth moved that the Bill be read that day six months. He believed that a court of petty sessions would give more satisfactory judgment than a court of conciliation under this Bill, which was hastily prepared and ill digested, and would probably be attended by disastrous circumstances. The Earl of Derby supported the motion for a second reading, but believed the Bill would require serious examination. Lord Granville recommended a select committee, in which recommendation the Lord Chancellor and Lord St. Leonards concurred, and the amendment was withdrawn, and the Bill read a second time.

**THE NINE-HOURS MOVEMENT.**

A MEETING of the building trades was held in St. Martin's Hall, Long-acre, on Wednesday evening, the 11th instant, in furtherance of this object. The chair was taken by Lord Robert Montague, M.P. There was a very numerous attendance.

The Chairman, in the course of his address, said,—He felt sure that no acrimonious language would mark what had hitherto been conducted with great temper and discretion. There were two questions before them, but they had been mixed up and confused by those interested, who had raised the cry that they required ten hours' wages for nine hours' labour. There were, however, two questions for consideration. The first was the fair and proper duration of daily labour, and the second was the amount of wages they were to receive. Now, the question of labour was one thing and that of wages was another. The first question was, what was a fair day's wages? Lord Cranworth had thought to settle the question by laying it down that wages should be the subject of a free bargain between the employers and the employed. But how could there be any free bargain when the capitalist could close his works and still reveal in luxury and magnificence, while the workmen must submit to any terms, or pine away of starvation and die, both themselves and their families? Then they were told that wages must be regulated by the principles of political economy. The pet mission of political economy was to buy in the cheapest market and sell in the dearest market. But should the labour of man be subject to the higgling and bargaining of the market? Was labour to

be dealt with like cotton? As to the second part of his subject—the quantum of daily work which a man ought to perform. Many of them had an hour's walk to work, and the same to return home, and they often could not sleep that, because they could not always change their residences from time to time so as to be near their work. Then they often had to have their meals away from home, and it was only fair to say that nine hours' work represented twelve hours' labour.

Mr. Cremer (a carpenter), moved the first resolution,— "That we believe our request for a reduction of the hours of labour, justified by the first principles of political economy, and that the increased skill and rapidity of manipulation acquired by the workmen the necessity for the ten-hours system has passed away, the building operatives, in conjunction with machinery, being enabled to produce sufficient for the requirements of society by labouring nine hours per day."

The speaker adduced extracts from the works of Adam Smith to refute the statement of Lord St. Leonards' recently made in the House of Lords that the demand for the reduction of the hours of labour was not in accordance with the principles of political economy. He further asserted that labour was not a marketable commodity, and ought not to be treated as such. Mr. Pitt, painter, seconded the resolution, and recommended organization, after which the resolution was carried unanimously.

Mr. Howard, bricklayer, moved the second resolution.— "That the meeting regretted the late refusal of the master builders to discuss the nine-hours question with a deputation from the men, believing such refusal to be inimical to the interests and position of the employers, and calculated to engender embittered feelings between themselves and their workmen at a time when every effort should be made to render the interests, welfare, and progress of both identical. Being convinced that the concession we seek is for the preservation of the physical and the expansion of our intellectual and moral powers, we pledge ourselves to press our claim until it has been conceded."

Mr. Major, a plasterer, seconded the resolution. The resolution was then agreed to. Mr. Potter then moved a vote of thanks to the chairman, which was carried amidst loud applause.

**THE "BUILDERS'" LAW NOTES.**

**Partnership.—Breach of Trust.**—Where one partner committed a breach of trust, it has been decided by the Master of the Rolls that the other partner has a right to dissolve the partnership; such dissolution to take effect from the date of the notice of the dissolution.—*Essell v. Hayward.*

**Metropolis Local Management Act.**—A District Board, under the above-mentioned Act, may assess a parish to an amount greater than is required for the outlay within its own limits, if such assessment be by a general rate throughout the district to meet the expenses of the district at large. It is, however, competent for the Board, in the exercise of its discretion, in cases where the outlay is for the exclusive benefit of a part of a district, to exempt from the rates that part which enjoys no benefit; and the Court of Queen's Bench, in a recent case, refused to interfere with such discretion.—*Parish of St. Botolph v. The Whitechapel District Board.*

**Wills.—Shakespeare's House.**—Mr. John Shakespeare, by will in 1556, bequeathed to his executors 2,500l. out of his personal estate, "to be laid out by them as they shall think fit, with the concurrence of the trustees of Shakespeare's house, in forming a museum at Shakespeare's house, in Stratford, and for such other purposes as they shall think fit for giving effect to my wishes." This bequest was held by Vice-Chancellor Wood to be void for uncertainty, and the same opinion was held by the Lord Chancellor and Lords Justices on appeal.—*Thompson v. Shakespeare.*

**Shareholder.**—If the entry of a person's name upon the register of a company be sufficient to identify him, a mis-spelling of the name will not release him from liability as a shareholder. An acceptance of shares by a person in writing, in the manner prescribed by the company's deed, must be proved in order to fix him as a contributory, and the fact of his name being on the registry is not of itself sufficient.—*Re Otterenshete.*

**STATE OF BATTERSEA-PARK.**

SIR,—A few days ago I strolled through Battersea-park, and saw the beauties of nature and art lately introduced there. The swampy fields of days babbly gone by, where the lower class of Londoners were wont to spend the Sabbath in frivolity and crime, now converted into a splendid garden, looked truly beautiful: the once silvery Thames flowed by in its sombre blackness, yet a shade brighter than it did last year.

In my ramble from enchantment to enchantment in this lovely garden, I was forcibly reminded of a picture which was in your journal a few weeks back (an east-end tea-garden, with a black ditch skirting the edge); for here is a ditch black and stagnant, running, or I should say standing, in the gardens, surrounded by flowers, shrubs, and in many places hidden from view by long grass. Little children played and gambolled, attended by their parents or nurses, out for the good of their health, each enjoying the most blissful ignorance.

But, although the cesspool (for such it is) was almost covered up, its disagreeable odour rose most painful to my sensitive nasal organ.

Should the ranger or commissioners fail to profit by the remarks of your correspondent C. S., many fond mothers may regret taking their children to this spot. A KNIGHTSBRIDGETTE.

**CLUB CHAMBERS FOR CLERKS.**

SIR,—With reference to a "City Clerk's" social want, I would repeat the following suggestion, offered some fifteen years since:—

Say 100 bachelor clerks (no great number out of upwards of 7,000) subscribe each their 50l.

This amount will purchase the land, create a club-house, provided with spacious coffee-room, library, smoking-room, lavatories, bath-room, water-closet and cloak-room, separate sleeping rooms, kitchen offices, with wash-house, laundry, &c., &c.\* Rent to each, say from 3s. per week; washing, from 1s. food, from 3s. 6d. per week, provided they dine out.

The advantages are such, that it has been a matter of great surprise that there should not have been some ten or twenty established; but the fact is, our young men, with some of the middle-aged, are so fast, that the accumulation of 50l. is difficult to attain. F.

**RECENT PATENTS CONNECTED WITH BUILDING.**

**MACHINERY FOR CUTTING AND DRESSING STONE.**—A. F. Newton, Chancery-lane, London. A Communication. Dated 21st December, 1859. The blades, whatever may be the form of their teeth, are made thicker in cross section at their cutting edges than at the back. The teeth may be chisel-shaped, or the saw edges may consist of chisels carried between metal bands or plates. The kind of blade preferred is made with long, vertical, chisel-shaped teeth, the uppermost being set the most forward, and the others receding, so that when the saw commences to operate the teeth will come into action in succession, instead of simultaneously. The invention also includes several arrangements of mechanism, in which these blades are employed for cutting and dressing stone. The invention cannot be described in detail without reference to the drawings.

**A KILN OR OVEN FOR BURNING BRICKS, TILES, &c.**—A. F. Newton, Chancery-lane, London. A Communication. Dated 22nd December, 1859. The kiln or oven is built of an annular form, and, by preference, sunk in the ground, so as to leave the roof only exposed. This inclosed annular space is divided radially into compartments by sliding doors, and each compartment is connected by a radial flue with a concentric annular smoke-chamber which surrounds the central chimney-shaft, and is connected therewith by short lateral flues. Dampers are provided for shutting off communication between the radial flues and the smoke-chamber, and the compartments into which the kiln or oven is divided are closed at top, and fitted with openings which may be shut when required.

**REMAINDER OF WORKS SELECTED BY ART-UNION OF LONDON PRIZEHOLDERS.**

From the Royal Academy; 201. and upwards.—An English Pastoral, by H. B. Willis, 210l.; The Nile Raft, F. Dillon, 120l.; Chastity (marble statue), J. Durham, 103l.; The First Step in Life, Mrs. E. M. Ward, 75l.; Volunteer Movement in the Studio, J. Balaizant, 65l.; The Sexton's Sermon, H. S. Marks, 63l.; Fisherman's Cottage, J. Cassie, 50l.; Loch Fied Bute, J. F. Buchanan, 31l. 10s.; The Sister's Prayer, J. A. Fitzgerald, 20l.; A Cottager, Waistcoat, J. W. Hayes, 23l.; A Fisherman's Hut, W. Hensley, 17l. 5s.; Going a Milking, W. Lucas, jun. 20l.

From the Society of British Artists.—Summer on the Thames, W. W. Gossling, 100l.; River View, J. C. Ward, 62l.; A Sea Breeze, J. Henzell, 35l.; Fishing-boats off Lunby Island, W. West, 35l.; A Scene in Brittany, E. J. Cobbett, 30l.; A Shepherd's Home, E. A. Pettit, 30l.; Mounts Bay, G. Wolfe, 45l.; A Lane Scene, J. C. Ward, 25l.; Girl with Blackberries, J. T. Pease, 30l.; On the River Loos, W. Pitt, 27l.; at Montreux, J. F. Pettit, 25l.; St. Michael's Mount, G. Wolfe, 23l.; Pont Aber, Cornwall, J. Steele, 21l.; On the Tavey, W. Williams, 20l.; At Wiltshire Lees, J. J. Wilson, 20l.; The Daughter of Jerusalem, J. Bouvier, sen., 23l.; The Warrenter's Boy, J. Davall, 15l. 15s.

From the Water-colour Society.—Venice from the Rialto, by W. Callow, 70l.; Meel Shabod, S. P. Jackson, 42l.; Auld Robin Grey, Mrs. Criddle, 30l.; Clovelly, S. P. Jackson, 30l.; The Fountain and Red House Hotel, Treves, J. Cowess, junior, 15l.

From the New Water-colour Society.—Interior of the Cathedral of Cefalu, Carl Werner, 75l. 15s.; Port Madoc, H. C. Pidgeon, 40l.; A Salmon Leap, D. H. McKewan, 32l. 10s.; Flute Pucelle, G. Howe, 40l.; White-bridge on the Dudden, D. H. McKewan, 31l. 10s.; Sea, Coast of Nice, T. L. Rowbotham, 30l.; Toll demanded, H. Warren, 21l.; A Weir Gifford, P. Mitchell, 25l.; An Old Mill, Estabate, D. H. McKewan, 17l. 14s.; Springing Eggs Shells, Emily Farmer, 15l.; View on the Swale, W. Tebbin, 36l. 15s.

\* Scarcely.

From the *Institution of Fine Arts*.—The Close of a Summer Day, G. A. Williams, 261.; Head of Loch Lomond, J. T. Walton, 261.; The Haunt of the Kingfisher, J. Adams, 261.; Carrickfergus Castle, J. Godet, 261.; An Interesting Topie, H. King, 261.; Ferring, E. Tolley, 181.; The Lake of Geneva, R. E. Tindall, 261.

#### THE LABOUR-MARKET IN THE PROVINCES.

At *Liverpool*, the change of hours conceded by some has been introduced more generally. The reduction, however, has not been granted by one extensive firm, that of Messrs. Holme & Nicol, who are said to object more to the mode of application than the principle. They have the Free Library at Shaw's Row in hand, but have been allowed time, under the circumstances, by the Library Committee.

The *Leeds* masons, as intimated, have followed the joiners by striking for objects similar to those just attained by the latter. The employers refuse to accept and sign a code of rules adopted by the men. The master builders have conceded to their bricklayers an advance in their wages of from 26s. to 27s. per week; and the strike which was apprehended in this department of the building trade is thus avoided. The men have also given twelve months' notice of their intention to ask to be paid by hour instead of by week.

The *Bradford* stonemasons' strike may be said to be at an end.

The *York* joiners are settling into good understanding with their employers, who have agreed to the advance in wages and reduction in Saturday time asked for.

At *Castletford*, says the *Newcastle Courant*, the workmen employed in its staple trade, that of glass bottles, have given notice to strike for an advance of wages, and the movement is general all over the district.

#### THE STATE OF THE RIVER THAMES.

On this important subject Dr. Lethaby, in a report to the City Sewers Commissioners, says:—

In the spring quarters of the last two years I have had to report to you of the putrid condition of the river, and to discuss the circumstances which have attended it; but this year I am relieved from that necessity, for up to the present time the river has not been offensive. In point of fact it would appear from the analyses which I lately made of the water, and a comparison of them with the results obtained by Dr. Lamb and Dr. Bostock in 1828, that the river is now in its normal condition. At that time the water of the Thames at high tide at Lambeth and Blackfriars contained only about 27 grains of dissolved matter in the gallon, which is not much above the natural proportion of its constituents at from Teddington-lock to Wandsworth; and during the whole of the present year this has been nearly the proportion found in the water at high tide at London-bridge. Last month the highest proportion was 32 grains in the gallon, but at all other times of this year it has ranged from 24 grains to 27 grains in the gallon; and of these from two to four grains were organic. Last year, however, at this time the water contained 94 grains of soluble matter in the gallon, and the year before it contained nearly 144 grains, of which from 11 to 12 were organic. Little by little it went on increasing until it amounted in August and September to from 300 to 400 grains in the gallon, and during the whole of that time the river was most offensive. The source of these impurities I have already described—they were derived from the sea water and the stagnant sewers. A long continuance of dry and warm weather had so diminished the supply of water from the tributaries of the river, that the oceanic wave was not kept back to its usual confine, but advanced far upwards into the bed of the stream, and brought with it its organic and saline impurities. Then came the heavy showers which flooded the sewers and washed out the stagnant matters that the torpid stream had been unable to discharge. In this way a large quantity of impurity was discharged into the river, for the proportion of solid matter in the storm sewage is often as much again as that in the sewage of dry weather. When these storms occurred at the flow of the tide, the foul matters were carried upwards by the stream, and were thus a cause of serious annoyance; while at other times they seemed to act in a beneficial manner upon the river by diluting and carrying the impurities seaward. The present state of the river has evidently been secured by the continuance of wet weather. In the month of May last year, the total rainfall in London was but 2 inches—whereas in the corresponding month of this year it has amounted to 3.7 inches. In June of last year, it was barely 2 inches, and of the year before, only 1.2, but in the three weeks of the present month it has been 4.6 inches. The wet days have also been more numerous, and therefore the supply of fresh water to the Thames more continuous. This is the principal circumstance which has characterized the present season, and it has manifested been the principal agent in securing the normal condition of the river; for as regards

the effects of temperature on the water, the differences up to the present time have not been so marked as to have exerted any important influence. At this time last year, and the year before, the Thames was very offensive, notwithstanding that the mean temperature of the water during the month of May was nearly a degree lower than it has been during the present year. The conclusions, therefore, to be deduced from these facts are, that the main causes of the putridity of the river are a great excess of sea water far up in the stream, and a large amount of organic matter from the stagnant sewers, both of which are due to a continued absence of rain, and to the sudden flushing of the sewers during the upper flow of the tide. A certain temperature is, of course, necessary to the putrefactive changes, for they do not progress with any remarkable activity below the temperature of sixty degrees; but when the heat of the water rises, as it did in June, July, and August of last year, to a mean temperature of seventy-two degrees, the changes are exceedingly rapid. There is an additional mischief at such a time from the decomposing mud upon the exposed banks of the river. Dr. M-William, of her Majesty's Customs, has so recently inquired into the effects of the river miasms, and has so clearly shown that they have not yet produced the mischief which was anticipated of them, that I need not here discuss this subject. Happily for us, there is evidently some condition wanted to make "this filthy river capable of generating cholera, or of forming a soil fit for the germination of the seeds of that disorder when introduced into it." But this is no argument for the neglect of sanitary precautions, or for disregarding every means for abating the noisome condition of the river. Nor is it a reason for temporising with the mischief, by resorting to any doubtful expedient that may merely serve as a disguise for the nuisance. Already I have reported on this matter, and have directed your attention to the uncertainty of the proposed plan for deodorizing the river by means of perchloride of iron. But since then I have ascertained that the perchloride is highly charged with a compound of arsenic, which is exceedingly poisonous. A sample of the liquid, furnished to me by the patentee, Mr. Dales, and described by him as the same as that used in the experimental inquiries for the Board of Works, has yielded from 296 to 297 grains of chloride of arsenic per gallon. If, therefore, the sewage of London were deodorized in the way proposed, there would be discharged daily into the Thames as much as 227 pounds of chloride of arsenic. I cannot tell you what would be the consequence of this, but it would be equivalent to casting into the river about one hundred weight and a half of powdered arsenic daily. It is true that the poison would be diluted with a large quantity of water, and with many millions of gallons of sewage, but a knowledge of this fact would afford no relief to our apprehension of danger, or to the anxiety that must be felt lest the accumulated effects of the poison might in the course of a very short time be dangerous to the extreme.

The report was ordered to be printed, and a copy sent to every member of the Corporation, as well as to the members of the Metropolitan Board of Works.

#### Books Received.

*Handbook of the Mechanical Arts concerned in the Construction and Arrangement of Dwelling-houses and other Buildings.* By ROBERT SCOTT BERN. 2nd edition. Blackwood & Sons, Edinburgh and London. 1860.

WHEN first published, this work was intended exclusively for the use of colonists and emigrants. Very considerable additions have been made in the present issue, to a great extent in the shape of extracts from "The Book of the Farm," so that, although still chiefly of value to settlers and others thrown on their own resources, it will be found useful as a skeleton text-book for the student at home. It is illustrated with 504 engravings, is clearly written, and is altogether a valuable little book.

*Address to Trades' Unionists on the Question of Strikes.* By MALCOLM ROSS, Bradford. London: W. Tweedie.

UNIONS amongst workmen are a fact of our times that must be acknowledged and received as a fact, however unwelcome to masters under its present aspects; but much can be done both by men and masters towards directing them into channels really useful to the working classes, without being

so obnoxious and injurious to employers, to trade, and, though last, not least, to workmen themselves, as they have been. It is most unfortunate that unions should have sought to obtain unreasonable objects in objectionable ways, but we must not overlook the fact, that in the eye of some masters requests ("demands") they have too often assumed the shape of) neither unreasonable nor objectionable, in themselves, have been looked upon as both, and hence to be resisted.

That some of the procedure of trades' unions has been both objectionable and unreasonable as well as extremely injurious, not only to the masters, but to the men themselves, it has not been left exclusively to the press to point out; for not a few of the most intelligent of the workmen also have done so with ability and cogency of argument and demonstration. In the three-penny tract under notice, Mr. Ross, who is himself a workman, severely reproaches one too frequent resource of a desperate kind by trades' unions in the attempt to benefit their members,—namely, strikes, with which, indeed, such unions have come to be regarded as almost synonymous in meaning, although there is really no necessary or essential connection between them, since it would, on the contrary, be much more consistent with the main purposes of these unions, that is, with the joint interests of the unionists, that resort should be very rarely, if ever, had to strikes, however beneficial it may be considered to hold them in *terrorem* over refractory or unreasonable masters.

Trades' union strikes, says Ross, are, in their nature and action, the most unjustifiable means which can be resorted to for the purpose of keeping the rate of wages at a high, or, if you like to prefer, an equitable standard, and for the following reasons:—

1. An account of their coercive character.
2. Because they inflict an irreparable injury on the morals and habits of workpeople.
3. Because of the injury they do to the general trade of the country.
4. On account of their natural and logical impotence, as manifested by their repeated failures.
5. Because they prevent better means being employed to elevate the people, for whose pretended benefit they are brought about.

As an example of those better means to which he alludes, and which he would like to see adopted by trades' unions, he adduces trades' union co-operative workshops and factories:—

"When trades' union co-operative workshops and factories," he remarks, "are in regular working order, the wages given there will, most probably, become a standard in each separate branch of trade. When working men capitalists have to compete with the goods in the general markets of the country, they will get to thoroughly understand what the wages fund will allow to each workman, skilled and unskilled. They will be able practically to solve many problems as regards remuneration for labour and the requisite number of hours for work, which one-sided committees are scarcely qualified to do. They will then be in a condition to offer employment to those workmen who are disliked by masters, and to whose dismissal are owing many causes of contention, where they do not lead to combined strikes. Above all, they will be the most likely men to suggest wise remedies for grievances, whether they originate with the masters or the workpeople, since they will perceive that their own interests will be best served by the trade which they follow being least disturbed. Once let working men share in the profits of their own capital,—let them realize the idea of success being achieved by incessant application,—let them begin to practically understand the operation of the law of supply and demand, as it affects both the produce and the labour markets,—and it is more than probable that the evil day of strikes will have passed away, with all its attendant miseries and workhouse associations.

What say you, shall you carry these suggestions out to their legitimate end? Then first of all use your great influence in staying the threatened renewal of the London strike in the building trades. Let the object for which that strike is again to be renewed, be worked out by the means, and in the manner, I have advised. In such a way, if you can prove that even eight hours' work per day is sufficient (and I do not see but what it yet might be) to serve for all your personal and domestic requirements, let the change be so brought about that it will produce no suffering to yourselves or your fellow-creatures, and no injury to the trade and commerce of the country."

Nor are such means of turning trades' unions to really useful and beneficial purposes the only ones that suggest themselves: there are others, such as a system of emigration for behoof of the unemployed, by which means the employed unionists would not only benefit their fellow-workmen, whether unionist or non-unionist, but also themselves, by the removal of such surplus labourhands from the field of competition with them for a share of the profits of the capital of the country. By a strange perversity, however, it so happens that because this was suggested by those opposed to strikes, an obnoxious face was put upon it by the unionists, who resisted the idea as derogatory to their class, instead of taking advantage of it as a benefit; and we should not wonder but that a similar fate awaits even the suggestion of co-operative work-shops and factories, as well as stores, which latter are being successfully carried out in the North of England, much to the advantage and comfort of the working classes there. In fact,

anything, however good and however beneficial to the workmen, is likely to be resisted that will interfere with the prospects of those who live upon their fellow workmen by the pernicious system of strike organizations.

It is most earnestly to be hoped, however, that dear-bought experience will now speedily open the eyes of the working classes to their true interests in such matters; and the little tract under notice is just an evidence of the working out of so desirable an end.

VARIORUM.

The ninth part of "Ure's Dictionary of Arts, Manufactures, and Mines, new edition (Longman & Co.), chiefly rewritten and greatly enlarged, and edited by R. Hunt, F.R.S.," has been issued. It concludes the elaborate article on "Iron," and proceeds to the end of letter L, and of the second volume. The more important articles contained in this part are on Lead (an extended one, but not containing much practical information for our professional readers), and on Lamps, Light-houses, Leather, &c. We need not repeat the favourable opinion already expressed, by us as well as others, in reference to this standard work: Ure's Dictionary is a well-known book, more than ever useful and valuable to all classes.—The Board of Works for Hackney district have issued, in a printed form, "A General Report on the Works executed by the Board." By James Lovegrove, Assoc. Inst., C.E., Surveyor to the Board." From this document it appears that, since 1856, 14,596½ have been expended upon sewers for the district, calculated to benefit 3,418 houses, and an area of 588 acres. Ten miles and a half of sewers of various sizes have been executed. The average cost has been 5s. 3½d. per foot. Of new houses, 337 have been erected, and 815 drained, at a private cost of 5,155. Gravel-paths about Hackney are being paved, and several drinking-fountains have been erected. Many other useful works have been, and are being, carried out.—A little twopenny treatise on "The Art of Swimming, for Beginners, by James Bennett, M.D., LL.D." (Lea, Warwick-lane), contains some useful and curious information, thus given almost gratis, by an experienced swimmer. In a nation who "go down to the sea in ships," as we do, swimming ought to be as universal an accomplishment as it is in the Sandwich Islands, where the human species seems to be amphibious, or semi-fish semileg in its nature. The little treatise under notice will, as far as possible, we dare say, obviate the objection of the cautious gentleman who would not trust his precious corporation in the water till he learnt to swim; but learners are to be advised to take their lessons with, rather than without, "the fluid element."

Miscellaneous.

PAINTERS' COMPANY.—EXHIBITION OF SPECIMENS OF DECORATIVE ART.—The successful competitors—viz., Messrs. Kershaw, Sinkin, Edmott, and McDonald—were, at a full court on Wednesday, the 4th inst., presented with the freedom of the company and certificates of merit for specimens of decorations in Arabesque, marbling, graining, and writing. 876 persons of all classes have visited this exhibition during the month it has been open.

REMUNERATION OF THE ESSEX COUNTY SURVEYOR.—The committee appointed, at the Essex quarter sessions, to consider the principle upon which the county surveyor should be remunerated in future for works exceeding 1,500*l.*, reported that, having referred to the order of court containing the appointment of the county surveyor, and the terms of his remuneration, they are of opinion that the exception extends to all new works, alterations, additions, or improvements exceeding in amount the sum of 1,500*l.* for any one such, and not merely to any excess of expenditure in such cases over that sum. The committee recommended that such remuneration should be according to the usual rate of professional charges, but that no extra charge should be made for travelling or other incidental expenses. Capt. Dudworth said, in the committee they moved the usual sum of 5 per cent., but it was thought there might be larger works in which the 5 per cent. would be more than adequate, or there might be matters on the other side with which the Court would no doubt deal liberally, but judiciously. Mr. J. O. Parker said they did not think of anything over 5 per cent. It was stated that anything over that would not be professional. The report was agreed to.

THE PROPOSED LEEDS CORN EXCHANGE.—Fifteen sets of plans for the proposed new Corn Exchange have been sent in. They were opened by the committee, and ordered to be placed in the Civil Court.

FALL OF A CEILING.—Mr. John Cail, optician, Grey-street, Newcastle, was exposed to a considerable loss on Saturday last, by the fall of his shop ceiling. About one-half of the entire ceiling fell down, destroying plate-glass cases and their contents to the value of not far from 100*l.* In this building age, one would have expected the art of ceiling-making to have arrived at such perfection as to have prevented an accident like this.—*Gateshead Observer.*

INAUGURATION OF BANBURY (NEW) CROSS.—The Foresters' Court of the district have inaugurated the new cross at Banbury. The foresters rode to the cross, in grand parade, preceded by a lady, but not on "cock-horse," nor probably had the lady "hells on her toes," though she may have had "rings on her fingers." An address suitable to the occasion was duly delivered by one of the white lady's attendant foresters. The cavalcade included Robin Hood, Friar Tuck, and other characters with which modern poetry still keeps alive the memory of the olden times of merrie Sherwood. Old English sports in the field closed the festival.

ANTIQUITY OF THE CHURCH AT DITTON.—Extensive repairs have lately been going on in this venerable church. In cutting away some portion of the old building for the formation of a new vestry-room, an arch was discovered constructed of the Tufus or Tufia stone—the same as that of which a considerable portion of the ancient Pharos at Dover Castle was built. The *Maidstone Journal* says,—Mr. Knocher, in a lecture on the antiquities of Dover, alludes to this stone as one which he thinks "is found nowhere in this part of Europe, save on the banks of the Rhine and the Tiber;" though it is said to have been used by the Greeks, Romans, and Egyptians as a stational concretion.

LEICESTER ARCHITECTURAL AND ARCHEOLOGICAL SOCIETY.—At the last meeting of this society various objects of archaeological interest were exhibited, and Mr. Gresley read a paper upon "Newstead." The secretary distributed to the members present copies of a paper upon armorial windows erected in the reign of Henry VI., in Woodhouse Chapel, Charnwood Forest, read last year by Mr. J. G. Nichols, F.S.A., at the annual meeting of the society at Loughborough. It was resolved that a special meeting should be called to make arrangements for an evening *soiree* of the society to be held shortly in Leicester, and that the annual meeting of the society for the transaction of business should be held at the close of the year; these arrangements to be independent of the contemplated excursion and meeting at Rugby.

PUBLIC WORKS AT ADELAIDE.—The *South Australian Register*, in its last summary for England, says,—"With respect to the Colonial Architect's department, in which extensive changes have recently been made, it appears that a sum of 25,290*l.* was laid out under the control of that officer during the last half-year. The staff of that office has been subject to considerable reductions of late, the post of Assistant Colonial Architect having been left vacant from the 15th of November last. It is now understood that the office is to be annihilated. A statement indicating the details of the expenditure on various public works during the half-year last past shows that among the principal works in progress or completed are the South Australian Institute, Dry Creek Labour Prison, New Registry Offices, New Treasury Offices, Observatory and Observer's house, Additions to Lunatic Asylum, Casualty Hospital, Gaol at Robe Town, New Adelaide Hospital, New Custom-house, Police-station, and Court-house, Port Adelaide; Custom-house, Court-house, and Post-Office, Port Augusta; and various other court-houses and police-stations. The total amount expended in public works during the half-year under notice was 234,754*l.*, viz.:

By Colonial Architect . . . . .	£23,290
By Superintendent of Telegraphs, in constructing new lines . . . . .	7,474
By Railway Engineer, for construction and extension . . . . .	125,653
Waterworks expenditure . . . . .	26,811
By Central Board of Main Roads, inclusive of surplus labour expenditure . . . . .	45,416
By Harbour Trust . . . . .	3,309
Clearing channel of River Murray (say cost relating to half-year) . . . . .	750
	£234,754

In addition to this expenditure for the half-year, the sum expended on public works by Municipal Corporations and District Councils during the whole of 1859 was 43,637*l.* 1*s.* 1*d.*

THE PROJECTED PUBLIC ROAD THROUGH HYDE-PARK.—We regret to learn that the Chief Commissioner of Works has no intention at present of doing anything towards opening the much-required direct communication between the districts north and south of Hyde-park.

THE STOCKPORT SURVEYORSHIP.—Mr. John Whittaker, Jun., of Alton Norris, has been appointed to the office of surveyor to the Stockport town council, by a majority of twenty-six to ten votes. There were nine candidates.

A STEAM ELEPHANT.—One of Taylor's patent traction engines called "steam elephants" built at the Britannia Works, Birkenhead, for the Dutch Government, for use in the docks at Flushing, when tested, it is said, drew a load of 14 tons 13 cwt., going up and down hill, turning corners, &c., with ease.

THE GREAT EASTERN.—Intelligence from New York announces the arrival in that city of the *Great Eastern* on June 23; that is, eleven days after her departure from Southampton. A great crowd had, of course, assembled, to give her an enthusiastic reception. Her average rate of speed was something less than 300 miles a day; the greatest speed she attained was 1½ knots an hour—considerably short of what was anticipated.

ELECTRO-PHOTO-TELEGRAPHY.—A Florentine abbé now in Paris has, it is reported, made a wonderful discovery in connection with photography and electricity. He is able, in sending a telegraphic message, to produce, at the opposite end of the wire, a *fac-simile* of the writing that the message has been sent in. The idea of an autographic telegraph, however, is not new, although the connection of photography (if it really be such as alleged) with electric telegraphy does seem to be a novelty.

GAS.—The Sunderland Gas Company have resolved to extend their works, and a piece of ground, ten acres in extent, has been purchased near the "Blue House," Hendon, whereon a new gas-work is shortly to be erected, having a gasometer 123 feet in diameter, and 28 feet in depth.—At the annual meeting of the Brechin Gas-Light Company it was resolved that the rent of consumers' meters (1,900) be lowered from 2*s.* 6*d.* to 2*s.* per annum, and a dividend, at the rate of 9½ per cent., was declared, free of income-tax, being a rise of a half per cent. on the previous dividend.—The Alyth Gas Company, says the *Montrose Review*, have resolved to divide 6 per cent., and carry to the sinking fund 15*l.* out of their total income of 400*l.* Great disappointment is felt by the community that no reduction in the price of gas is to take place. Here it is 10*s.* per thousand feet, being the highest price paid in any town in Scotland.

LENDING MONEY TO WORKMEN.—IMPORTANT TO MASTERS.—At the Wolverhampton petty session, a journeyman locksmith, late in the employ of Mr. Benjamin Walters, master locksmith, was summoned by Mr. Walters for leaving his employment without having completed his agreement, by which he bound himself to serve for two years, the complainant at the same time lending him 4*l.* 17*s.*, to be repaid in 1*s.* instalments weekly; and the agreement stating that, "in case the whole of the said sum of 4*l.* 17*s.* shall not be repaid by me, or I shall be indebted to the said Benjamin Walters in any further sum of money, at the expiration of the within-mentioned term, then I do hereby agree not to quit his service until I have fully paid all such sum or sums of money, and give to the said Benjamin Walters fourteen days' notice in writing, before leaving his service." Complainant deposed that the defendant had given the required notice to leave, but inasmuch as he was indebted to him (complainant), in the sum of 5*l.* 4*s.* 6*d.*, he could not legally leave his work. The magistrates declined to convict, as the man had served the specific time for which he had agreed with the complainant, who wanted the magistrates to do that which a small debts court would not do, viz., order imprisonment in the event of non-payment. The complainant would then have lent money with an advantage on his side that no insurer in the kingdom could secure. Having lent the man the money, the complainant could have stopped it from his wages without consulting him. With such an agreement in his possession, it would be quite possible for an employer to lend a workman money, and keep him in perpetual bondage. Mr. Walters said that every lockmaker in Wolverhampton made such agreements, that convicts were constantly taking place upon them, and that he had himself taken proceedings successfully against twenty-five of his men at different times, under similar circumstances. The magistrates said complainant might appeal, but the case must be dismissed.

BUILDERS' DINNERS.—Sir: The workmen in the employ of Mr. John Jay had their annual excursion, on Saturday last, to Rosherville Gardens, and about 220 sat down to a substantial and satisfactory dinner. Mr. Jay contributed 35*l.*, and several of the architects and merchants subscribed handsomely. Surely if this were more generally adopted in the building firms, it would tend to create a better feeling between employer and employed.—ONE OF THE COMMITTEE.

KNIGHTHOOD OF AN ENGLISH ENGINEER.—The Manchester Advertiser announces that a former fellow citizen, Mr. W. G. Giuty, has had conferred upon him, by the Emperor of the Brazils, the rank of a Knight or Chevalier of the Imperial Order of the Rose. Mr. Giuty is engineer-in-chief of the City Canal and other important public works of Rio de Janeiro.

THE TRAFFIC RETURNS OF RAILWAYS, in the United Kingdom, for the week ending June 23, amounted to 539,230*l.*; and for the corresponding week of last year to 502,440*l.*; showing an increase of 36,790*l.* The gross receipts of the eight railways having their termini in the metropolis amounted to 237,220*l.*; and for the corresponding period of 1859 to 224,821*l.*; showing an increase of 12,399*l.*

SMALL-POX AND VACCINATION HOSPITAL.—It has been resolved that in consequence of the frequent return of epidemics of small-pox, and of the crowded state of the hospital, steps should be forthwith taken to provide a separate building or wards to receive the more urgent cases, and thus afford additional accommodation to the public and security to the patients. In accordance with this resolution applications for plans and estimates were made, and eventually a tender accepted from Mr. John Perry, for building two additional wards to the hospital for the sum of 3,858*l.*, and these wards are to be proceeded with at once.

THE CONSERVATIVE LAND SOCIETY.—At the thirty-first quarterly general meeting of the members, held on Tuesday, the 3rd inst., Sir Lawrence Palko, bart., in the chair, it appeared that the society has acquired its forty-first estate by a second purchase in Hert, close to the Hertford Terminus, which estate, in twenty-six lots, will be offered to the members on the 15th inst. On the same day will likewise be allotted twenty-six plots, being the first portion of the Roehampton Park estate. The sites selected are in the south-west part of the estate, partaking of both the Richmond Park and Putney Heath boundaries, and the finely-wooded scenery, and the immunity of being built against, which the Royal Park and Putney Heath both secure. The plots range in price from 102*l.* 7*d.* to 696*l.* 13*s.* 6*d.* each; the quantities varying from 36½ perches to 1a. 1r. 3p.

A NEW STONE-CUTTING MACHINE.—We were not a little surprised the other night at seeing a small machine planned by Mr. D. Ross, foreman, to Mr. Craig, constructed and erected upon the green island along the side of the river for the purpose of cutting pavement, and by which Mr. Ross says a man and boy will accomplish the labour of four men who cut by the ordinary method, at the same time saving a great deal of unnecessary labour. The machine is set in motion by means of a large fly-wheel which is driven about by manual labour. A piston is attached to a crank fixed to the wheel, and extends to an upright bar in the frame which gives it motion, in this way bringing the whole lever power to bear on the movements. The affair is only in a temporary condition merely to try its practical utility, and if successful will be adopted. We observe that "D. Ross, Patentee," was printed upon the machine.—John O'Grady's Journal.

REFORMATORY SCHOOLS.—The annual report of Mr. Sydney Turner, inspector of reformatories in Great Britain, states that the number of boys in these institutions at the end of 1859 was 2,636, and of girls 640; but another school for girls is urgently required. During the year 108 of the inmates emigrated, 57 were sent to sea, 143 were apprenticed or placed in service by the managers, 212 were allowed to return to their friends, and were placed in service by them, 102 absconded, and were not recovered. Of those who enlist or go to sea, a large proportion turn out well. Of the whole number (637) of boys and girls discharged from English reformatories up to the end of 1858, above half (333) are known to be living honestly, and maintaining a good character. The total expenditure for the year was 72,893*l.*, of which the Government paid for maintenance 51,681*l.*, the parents 1,804*l.*, and 16,169*l.* was raised by voluntary contributions. Mr. Turner speaks very favourably of the condition of the reformatories.

ASSOCIATION OF FOREMEN ENGINEERS.—The usual monthly meeting of the above society took place at their rooms, St. Swithin's-lane, City, on the 7th instant; Mr. J. Newton, of the Mint, in the chair. After the transaction of the routine business, Mr. James Robertson, iron merchant, of Barkside, read a paper on the Development of the Iron Trade.

FRIEND'S PANORAMA OF CANADA, ST. JAMES'S HALL.—The variety of talent exhibited by Mr. Washington Friend in his entertainment, "Two Hours in Canada and the United States," enforces recognition. The art may not be very high, the acquirements not altogether complete; but when a gentleman paints you a panorama, describes it very forcibly, sings you some songs, plays the pianoforte, the violin, the banjo, and the harp, and, moreover, opens your eyes to the extent and importance of one of our most important dependencies—just now, too, invested with an extra interest,—you must be very unreasonable if you are not amused and gratified. Speaking for ourselves, we certainly were both, and were glad to see the room well filled, as a reward for the skill, tact, and energy displayed.

TENDERS

For Wottonhampton Church, Berks. Mr. J. Jansom, architect:—  
Weller ..... 2,500 0 0  
Dove, Brothers ..... 1,785 0 0  
Hollis ..... 1,930 0 0

For new roof and restorations to Brandon Parva Church, Norfolk. Mr. John Daymond Ellis, architect, Norwich:—  
Bartell ..... 2,470 0 0  
Woodbine ..... 450 0 0  
Skipper ..... 424 8 0  
Miller ..... 412 0 0  
Bardman (accepted) ..... 385 11 6

For new schools and class-rooms, Princess-street, Norwich, for the Rev. John Alexander. Mr. John Daymond Ellis, architect, Norwich:—  
Lacey ..... 2,682 10 0  
Brooks (accepted) ..... 619 0 0

For additions and alterations to the Small Pox and Vaccination Hospital, Upper Holloway. Messrs. Williams & Smith, architects. Quantities supplied by Mr. James Dudley:—  
Patman & Potheringham ..... 2,343 0 0  
Koyner ..... 3,079 0 0  
Turner & Sons ..... 3,430 0 0  
Ashby & Homer ..... 3,400 0 0  
Perry (accepted) ..... 3,358 0 0

For alterations and additions to St. Andrew's Schools, Lambeth:—  
Sawkins & Vokhis ..... 2,365 10 0  
Chatter ..... 103 0 0  
Jeffs, Brothers (accepted) ..... 183 0 0

For Congregational Chapel, Morcton-in-Marsh, Gloucestershire. Messrs. Poulton & Woodman, Reading, architects:—  
Wood & Son ..... 2,128 0 0  
Young & Co. ..... 1,050 0 0  
Turner ..... 930 5 11  
Sharpe ..... 590 0 0  
Gore (accepted) ..... 3,400 0 0

N.B. All the above tenders include, in addition, the old materials of the present chapel.

For building ten houses for Mr. Martlett, Carshalton, Surrey. Mr. E. C. Wade, architect:—  
Wilson ..... 2,246 0 0  
Downs ..... 2,120 0 0  
Fowler ..... 1,934 0 0  
Smith ..... 1,493 0 0

For fittings and finishings to 77, Aldgate-street, for the Worshipful Company of Tallowchandlers. Mr. William Snook, architect:—  
Rider ..... 2,494 0 0  
Piper ..... 453 0 0  
Mare ..... 387 0 0  
Collis ..... 475 0 0  
Ashby & Homer ..... 470 0 0  
Wells ..... 452 0 0  
Coleman ..... 419 0 0

For storage reservoir for the Torquay Water-works:—  
Wilecocks ..... 2,050 0 0  
Royds & Wittie ..... 3,490 15 0

Stepneyford Abbots Church.—We are asked to insert the following detailed and corrected list of Tenders:—

	For rebuilding the old complete.	For Hot Water Apparatus.	Reduction for repairing and putting in new fittings and materials.	Reduction for putting in new fittings and materials instead of Wain scot.
Brown & Robinson	2,390	148	139	200
Beever	2,490	199	229	274
Savill	2,471	143	217	74
Dove, Brothers	2,297	105	130	195
Spence	2,282	157	147	30
Hammond	2,275	148	237	60

For Shoreham and Mid-Sussex Line Stations. Mr. R. Jacob Hood, engineer. Quantities supplied by Messrs. Pearson & Doughtney, and Mr. William Trego:—  
Fabian ..... 21,640 0 0  
Hack & Son ..... 10,620 0 0  
Dowson ..... 16,544 0 0  
Longmire & Bruce ..... 10,341 0 0  
Busby ..... 10,183 0 0  
McLennan & Bird ..... 9,660 0 0  
Todd ..... 9,300 0 0  
Rudkin, junior ..... 9,002 0 0  
Reynolds ..... 8,853 0 0  
Barclay & Co. ..... 8,770 0 0  
Evans, Brothers ..... 8,743 0 0  
Dales (accepted) ..... 8,493 0 0

For house at Whitbourne, Herefordshire, for Mr. E. Bickerton Evans. Mr. E. W. Elmelic, architect. Quantities supplied by Messrs. Batstone & Hunt:—  
Mansfield & Sons ..... 25,745 0 0  
Gascoyne ..... 23,227 0 0  
Lucas, Brothers ..... 24,063 0 0  
Myers ..... 24,738 0 0  
McClain & Everal ..... 23,750 0 0  
Barclay & Co. ..... 23,480 0 0  
Wood & Son ..... 22,740 0 0  
Broadbent (accepted) ..... 21,500 0 0

For house at Wanstead, Essex, for Mr. L. Hart. G. R. Noble, architect:—  
Pritchard ..... 23,000 0 0  
Ferry ..... 2,995 0 0  
Dove, Brothers ..... 2,965 0 0  
Hill & Son ..... 2,947 10 0  
Hill, W. ..... 2,906 0 0  
Conder ..... 2,899 0 0  
Hedges ..... 2,880 0 0

For additions and alterations to a house near Chertsey. Mr. W. Walker, architect. Quantities by Messrs. Lausfloren, Bloomsbury:—  
Including Lodge.  
Onles ..... 28,680 0 0  
Hickey ..... 7,990 0 0  
Macey ..... 7,737 0 0  
Mansford ..... 7,778 0 0  
Wilson ..... 7,380 0 0  
Williams, Brothers ..... 7,880 0 0  
Nicholson ..... 7,438 0 0

For repairs and alterations to the Bedford Arms public-house, Commercial-road, for Mr. Masters:—  
Libbeter ..... 2,499 0 0  
Brake ..... 359 0 0  
Fox ..... 315 0 0  
Williams, Brothers ..... 305 0 0  
Hodges ..... 227 0 0

For new galleries, &c., to the Congregational Church, Kentish-town. Mr. E. M. Habershon, architect:—  
Batterbury ..... 2,813 0 0  
Patman & Potheringham ..... 720 0 0  
Williams, Brothers ..... 684 0 0  
Lambell ..... 665 0 0  
McLennan & Bird ..... 614 0 0  
Porter ..... 637 0 0  
Hull ..... 615 0 0

Trailing Church.—Sir: Observing in your last impression the list of Tenders for "Trailing Church Restoration" from a local paper, and finding them not exactly correct, we have to state there were only the following three Tenders given in, and not four, as represented:—  
Williams, Brothers, without hauling ..... 2,050 0 0  
Griffiths & Son ..... 2,180 0 0  
Williams & Son 450 0 0 ..... 400 0 0  
W. Williams (acc.) 402 14 6 ..... 322 14 6

We had in our estimate (as stated distinctly in writing) included the whole of the chancel and vestry roofs, of new framed oak. The other contractors did not, and this, of course, made a great difference in the estimates. Mr. William Williams (the accepted tender) subsequently was requested by the committee to furnish an estimate for the work above stated, and which said tender now amounts to 475*l.* without hauling, and being within 5*l.* of our original tender, which included the whole. Mr. Williams has just told us that the committee has also given him the hauling in addition to the above (last week), as at this time of the year it is very inconvenient for the farmers to spare their teams for that purpose.

GRIFFITHS & SON.

TO CORRESPONDENTS.

Portea Fountain.—Sir: As there are five or more "Mr. Hoole, London," will you oblige me by stating in your next that the drinking fountain, given by Mr. Faulkner, Portea, was erected by "William Hoole, Upper Thames-street, London."—W. H. M. (better entered by list to some person used to moulding. A genuine mould would, probably, be the best).—E. M. G.—H. W.—Another of the Transients (we know nothing of the decision by the Board of Oak Benefit Society. We have received several complimentary letters).—H. T. R. (we do not know. One architect of that name, Mr. John Blake, of Quareway, died, we regret to say, a few months ago).—M. B. R. A.—R. R. (no).—O. J. London (no; my thanks).—J. H. R.—A Competitor.—J. N. P.—W.—A Practical Man.—T. D.—F. W. H.—G. B. A.—J. S.—G. S. R. (Transactions of Yorkshire Agricultural Society).—K. P.—H. L.—F.—N.—E.—W. (it could not be legally removed).—J. N.—G.—S.—Poor Man (it depends on local circumstances. Inquire on the spot).—H. R.—J. R.—G.—Subscriber (we are unable to assist).

NOTICE.—All Communications respecting Advertisements, Subscriptions, &c., should be addressed to "The Publisher of the Builder," No. 1, York-street, Covent-garden. All other Communications should be addressed to the "Editor," and NOT to the "Publisher."

Post-office Orders and Remittances should be made payable to Mr. Morris R. Coleman.

# The Builder.

VOL. XVIII.—No. 911.

The International Statistical Congress.

READERS of the *Builder* do not require to be informed how much they are concerned with the science of political arithmetic. The judicial, the sanitary, the industrial, and the commercial divisions of statistics are necessary to the attainment of the objects of our publication. It is obvious that not a step could be taken towards the structural formation and sanitary arrangement and regulation of towns,—towards the provision and planning of churches, schools, hospitals and asylums, workhouses, prisons, or public buildings of whatever other class, without *data*, such as it is the aim of the congress, now sitting at Somerset House and King's College, to devise improved means for elucidating and supplying. The longer our journal runs on, however, the more we are astonished at a necessity for showing what is the range and character of the architect's study and pursuit. In the present case, we are surprised that no intimation to us of the congress, should have been deemed necessary; and that needless trouble should have been given, even in our procuring the report of the proceedings which is supplied to the daily journals. It has happened occasionally that our profession has been accused by such as those who are the promoters of statistical congresses, of not co-operating sufficiently in one department of the objects above referred to. It is clear, however, that, considering the *Builder* has done as much as most journals to disseminate information in some of the branches of statistics, omission, or a neglect of duty, is not always on the professional side.

Our readers are more likely to be aware of the importance to them of statistics, than of the special objects and of the nature of proceedings of the congress now sitting. The object of the present congress, as that of the sessions at Brussels in 1853, Paris in 1855, and Vienna in 1857, is to secure, as nearly as possible, uniformity as well as completeness in the tabulation of facts, so that these may admit of comparison. The idea of a congress originated at the time of the Exhibition of 1851. The chief proceedings in this week, commenced with the excellent address of the Prince Consort, have been divided in six sections; besides which there have been general meetings to receive reports of delegates from the several countries, and from the sections; whilst the mode of conducting the Ordnance Survey of the United Kingdom has been explained by Colonel Sir Henry James, R.E., Director of the Survey. These arrangements were decided upon by an organization commission, at a meeting prior to the opening of the congress, when an elaborate report on the programme of this, the fourth, session was submitted by Dr. Farr.

The programme, of which copies are printed in French as well as English, comprises papers with forms, and heads of inquiry, in the several branches of the subject. The first section, presided over by Lord Brougham, attends to the department of Judicial Statistics. The programme for this section has been written by Professor Leone Levi and Mr. J. Hill Williams,—the former attending to civil and criminal statistics, and the

latter to that subject so nearly concerning all who are interested in building property and investment, statistics of the subdivisions, transfers, and burthens of real property or land.

At a preliminary meeting Mr. Williams read his note upon the second subject. He explained that at former meetings, the Congress had expressed itself strongly in favour of the registration of landed property and the systematic collection of facts connected with it, and regretted that, from the absence of a general national map and book of reference, England was not in a position to contribute the materials necessary for a general scheme of statistical inquiries applicable to this question, as specially recommended by the Vienna Congress. He stated the objects of registration to be to increase the security of titles and the value of real property by facilitating its transfer and encouraging its improvement, and proposed the following general propositions as worthy of support, viz.:

1. That the establishment of a general land register in every State is highly expedient.
2. That it should be based upon a general survey and map, accompanied by a book of reference, giving for each parcel or close of land the names of owner and occupier, the state of cultivation, and contents.
3. That the map and reference should be revised periodically, so as to represent, as nearly as possible, the actual state of the land itself.

These three propositions met with approval. Other propositions, recommending the registration of all transfers of land and mortgages, were postponed.

In the second section, Sanitary Statistics, of which Lord Shaftesbury is chairman, Dr. Farr has submitted an elaborate scheme for determining the sanitary condition as effected by circumstances of the population of different states: Dr. Sutherland similarly has put forth "Proposals for a Uniform Scheme of Sanitary Statistics," which we give in a note\*; and Miss Nightingale has treated the Statistics of Hospitals.

In the third section, Industrial Statistics, as those of Manufactures, Mining, and Agriculture, of which Lord Stanley was named as president, the programme includes papers by Dr. Farr on the general subject (manufactures having been dealt with at Vienna); on Agricultural Statistics, by Mr. James Caird and the Registrar-General of Ireland; and by Mr. Robert Hunt, on Statistics of Mineral Produce, and of Mining and Metallurgical Industry. The last-named paper contains suggested points for returns respecting stone and brick.

In the Fourth Section, Commercial Statistics, presided over by Mr. Nassau W. Senior, the

\* *Proposals for a Uniform Scheme of Sanitary Statistics.*

1. Statistics of mortality, and causes of mortality, arranged according to age, sex, and occupation. To include not only entire towns, but districts of towns, such as wards, arrondissement, and also *culs de sac*, courts, &c.
2. The same as regards local charitable institutions, hospitals, poorhouses, schools, &c.
3. The local climate to be tabulated.
4. The geological formation, soil, and facility or otherwise of drainage.
5. The area covered by the town.
6. The length of a line enclosing this area.
7. The amount of space occupied by buildings, and the vacant area, such as squares, streets, places, &c.
8. The length of streets:—  
(a.) Drained; (b.) undrained.  
(c.) Paved; (d.) unpaved.
9. The breadth of streets, with the height of the houses to the top of the front walls.
10. Number of houses.  
" of flats per house.  
" of rooms "  
" of families "  
" of windows "
11. Character of houses as to—  
(a.) Repair.  
(b.) Cleanliness.  
(c.) Ventilation and light.  
(d.) Healthiness.
12. Supply of water per head of the population; and its source from:—  
(a.) Rivers.  
(b.) Lake.  
(c.) Shallow wells.  
(d.) Springs.  
(e.) Waterworks.
13. Consumption of—  
(a.) Food.  
(b.) Drinks, with their kinds.
14. Classification of Trades:—  
" Manufactures.  
" Workshops.
15. Internments, their cost, and costs of sickness.

programme includes Statistics of Prices, and of Wages in the principal Trades, the heads of inquiry being set forth at considerable length, with suggested basis tables, by Mr. W. Newmarch; whilst Mr. J. Crawford shows what details will be necessary in the Statistics of Banks.

The fifth section, of which Lord Stanhope is president, includes two subdivisions,—“Census” and “Military and Naval Statistics.” These heads as stated, do not show the whole importance of the subjects comprised under the section. In the programme, Enumeration of Population, and Existing Methods in connection with the Recommendations of the Congress, are treated by Mr. Hammack, and “Occupations of the People,” by Dr. Farr. In the second subdivision of the programme, towards the subject of the general Statistics of the Army there is a paper by Mr. W. B. Hodge; and there are papers on the Vital Statistics of the Army, and Statistics relating to Horses, by Dr. Balfour. Let us take the last suggested head of inquiry in illustration of the importance of statistics to ourselves. Dr. Balfour remarks that a heavy item in military expenditure is that for keeping effective the horses of the cavalry and artillery. He finds the mortality, and horses “cast,” making a loss in one case, in the English army, of 11.2 per cent. of the annual strength, and in the French army of 14.7 per cent. He therefore asks for a series of returns of the causes of mortality and “casting,” and the ages at which these have occurred, analogous to the returns now in use for the *personnel* of the British army. The points to be comprised would be the number and ages of the horses borne on the establishment, numbers dying and “cast” in each year, and at each age; the diseases; the relative mortality of horses, geldings, and mares; the amount of sickness, with the diseases; and the annual cost. He says,—“The results would probably give rise to modifications in the stable arrangements and general management of the horses, by which these diseases might be considerably diminished in amount.” Were this the place to discuss the particular subject, we could show we have some grounds for believing from observation of places in which horses of the cavalry are kept, that the modifications, as they are mildly called, are required; and that some recent questions in Parliament were not asked without reason. To continue; in the Sanitary Statistics of the Army, there is a paper by Dr. Sutherland, embodying the procedure and forms recently introduced into the British army medical department, but suggesting the tabulation of all the essential conditions to which each man is exposed during the period of his service,—as regarding the country served in, its climate, its diseases, and the habits of its inhabitants; the soldier's duty, diet, and clothing; his barrack, its position and neighbourhood; the harrack-room, the superficial area and cubic space for each soldier; the window-space and means of ventilation and warming. Dr. Sutherland proceeds:—

“We must take account of the water supply, its quantity and quality; the cleansing, drainage, and paving; the latrines, urinals, and means of ablution and bathing; the means of cooking; the expenditure of fuel; the amusements and occupations provided for the soldier, such as libraries, reading-rooms, schools, soldiers' clubs, gymnastics, work-shops, &c. We must follow the soldier into his guard-room, and examine its cubic contents, ventilation, and warming. We must go to the canteen, where he spends his spare time, and to the cell where he has to undergo confinement. We must also know the man's habits when left to himself, and his general character.

But further, the sanitary state of the hospital which the soldier enters during illness has a most important bearing on his health, and on the results of sickness. It must be submitted to an examination similar to his barrack. Its position, neighbourhood, construction, and dimensions must be examined; the dimensions of its wards, the superficial area and cubic contents for each bed, must be carefully noted; the extent of window space and its position, the means of ventilating and warming in use; the hospital appliances, water-closets, baths, ablution-rooms, kitchen, must be noted; the water supply, drainage, paving, cleansing, must all be examined, as well as any

special peculiarities, changes, or additions which disease is apt to undergo in different hospitals; the nature and causes of hospital diseases, such as pyæmia, gangrene, fevers, &c.

These subjects of inquiry, so far as their results admit of the application of statistical methods, show the extent of the question of sanitary statistics as regards armies, and the importance of the results which may be expected to follow from carefully investigating them.

A separate division of the inquiry would refer to the occurrences of active field service, in which corresponding data would have to be examined.

The whole would be incomplete without taking account of the circumstances under which troops and sick are moved from place to place, marches, and their results to health, including distances and times of march. Troop transports and hospital ships, with their arrangements as to cubic space, ventilation, &c., would pass under review in this inquiry. But at this point the inquiry would merge into another most important branch, namely, Naval Sanitary Statistics.

The division of the programme, just mentioned, "Statistics of the Navy," is treated by Sir R. M. Froomley.

It is one object of statistics to collect facts and figures, after devising the means conducive to accuracy; but they would often be of comparatively little use, unless presented to the eye as by picture. Hence the value of all such aids as statistical maps. The sixth section, presided over by M. Quételet, takes cognizance of this branch of the subject, or "Statistical Methods." The importance of notation in a science, as observed by Dr. Farr, may be understood from the obvious results of the introduction of the Arabic numerals into arithmetic, and of the use of signs and letters in algebra and chemistry. Dr. Guy has contributed a paper on Statistical Methods and Signs, in the course of which, following upon the indicated "tabula invenendi" of Lord Bacon, and the method in the Book of Analysis of Dr. T. J. Todd, he endeavours to show how such tables, recording, displaying, and analysing all the constituents of the compound fact, may be made the instruments of discovery. Dr. Guy, to whom many of the best arrangements for the congress are owing, also has arranged in the meeting-room of the sixth section, a considerable number of illustrations of methods of representing statistical facts. Tables in ordinary use are divided by Dr. Guy into—1. Tables of Record and Reference. 2. Tables of Illustration and Exposition; and 3. Tables of Analysis and Discovery. Dr. Guy further proposes to call certain forms "Tables of Elimination," "Tables of Identification," "Tentative Tables," and "Tables of Coincidence." The exhibition includes a number of ruled forms for the delineation of statistical facts through the medium of lines, curves, columns, squares, and other mathematical figures, or circles with radii, as well as maps. Thus there are diagrams representing the density and the proximity of the population of England and Wales in the years 1570, 1700, 1801, and 1851, by means of hexagonal divisions for the amount of ground to each person. By the addition of points in the centres of the hexagons, and lines connecting, we are able at a glance to see facts of density and proximity of houses and persons at contrasted dates. In the use of circles and radii, the latter may mark months, the circles as distant from the centre, numbers of deaths, and colours the class of diseases. Amongst the maps, the Austrian ethnographical maps; and a Swedish map, showing, besides rail-road statistics, the produce of corn, whether above the necessary want, or equal to it, or below it; the wood equal to consumption; the iron ore extracted, and the works; and density of the population, are the most conspicuous. But the application of the method of representation is seen in maps (several of them English), showing the statistics of idleness and lunacy, population, cholera, traffic along roads, and distribution of occupations in the several parts of Great Britain.

The metrical system of weights and measures is explained by a sheet of diagrams published in France, and by specimens of weights and measures themselves; and the decimal system of coinage is illustrated by specimens of the currency of certain states. There is also a

large collection of publications on statistics. It is to be regretted there is no catalogue of these, and of the other portions of the exhibition.

In the programme of this sixth section, Mr. Valpy writes a paper of suggestions for an "Abstract of Principal Statistical Results for one year, to be prepared in each country, as a basis for comparative statistics;" Mr. S. Brown, one on "Units of Money, Weights and Measures;" and Mr. J. Winter Jones, one on "Statistics of Literature." In an appendix, Admiral Fitzroy gives "Suggestions intended to promote Correspondence between Meteorological Observers."

It is difficult to give by heads of subjects (which are only a selection of those which have occupied the attention of the Congresses), or by quotation from any of the papers, an idea of the course of investigation upon which every state of the civilized world will be, it is to be hoped, now actively engaged for the advancement of its people, and of other nations. The object of statistics, it is well said by Dr. Farr, is "by investigating the things of the greatest interest to nations, to promote their prosperity, and to benefit mankind. It is the study of enlightened princes, ministers, legislators, and political students; but its principles are the appanage of the people of every rank who exercise any influence in the conduct of public affairs. They should all be, in Milton's words,—

\* \* \* \* \*  
"And lovers of their country;"

We could have desired to ask one or two questions respecting the compilation, in the programme of the fifth section, of the list of corresponding terms for occupations, in three languages. May we say that "éditeur" is not French for "editor, writer," &c.; that "architecte" cannot represent "builder," since it is given for "architect" in another place; and that if "maçon" be the word for "bricklayer," "paveur" fails to identify "mason, pavior," as intended, or to be distinguished from the other trade? Good nomenclature will be found essential, even should it involve some correction of terms in use.

#### THOUGHTS IN THE STREETS.

##### PATER-NOSTER-ROW.

EVERY one takes his own particular view of the metropolis. The antiquary, besides stately Westminster Abbey, the massive tower, and other old buildings, notes in nooks and corners things of great value which many would overlook. The man of commerce lingers amongst the vessels in the river—a fleet,—the warehouses to which the products of the world, of costly kind, have been brought, and takes an interest in buildings which may possess no great external attractions, but where operations are carried forward which have influence in shaking or establishing thrones and kingdoms. The military man, comparatively heedless of other matters, wanders to the neighbouring arsenals, inspecting the vast stores of arms, the preparation of the munitions of war, and the making of those "arms of precision" which will pave the way, although by present deadly effects, to a more intelligent manner of contest between nations. The medical professor, the lawyer, and the man of letters, have each their peculiar views. The mechanist finds pleasure and instruction in spots which others would pass over without note. The artist has his views. He sees the phases of this great life-mass according to the guidance of his fancy; and the tasteful architect, in his way, looks with feelings of mingled satisfaction and regret at the marvellous extent of the work of human hands which covers so many miles of space. Fewer look at it as a whole—as the home of nearly 3,000,000 of inhabitants, and as the great centre of the world's civilization.

Viewed from the highest point of sight, from Highgate or Hampstead, the Monument, or the upper gallery of St. Paul's Cathedral, even when the atmosphere is clear, the extent of London is such that great districts teeming with life vanish into a hazy distance, which prevents any complete picture. Seen from over the dome of St. Paul's the appearance is singular. The men and women, the horses and carriages, appear like mere specks. The houses and buildings are dwarfed to the size of children's toys. That moving figure which looks like a pigmy in contrast with the great

statues on Wren's church, may be a lord mayor of London, a capitalist whose means are boundless, a chief minister of State, or one of those lions of literature who have a world-wide fame. How small is the figure in comparison with the extent and movement around! How great is the praise due to those who, amongst such a multitude, rise to distinction! Many thoughts are caused by the sights presented from this spot, and the mind forms pictures of times gone by, running over 2,000 years, during which the capital has been growing to its present size.

There are some sights in London which are familiar to most visitors. The venerable Abbey, the palace of the Parliament, the galleries of pictures, sculptures and antiquities, the parks, St. Paul's, Gog and Magog, the Thames Tunnel, Greenwich Hospital, and the public offices, are looked at by most strangers, be they hurried as they may, and who generally leave in a bewildered state in consequence. Nor is this surprising when those who have made the various parts of the metropolis a study for a life, each day wonder afresh at its marvels. By constantly looking at it, the huge whole seems to expand, and important interests, powerful operations, which were at first invisible, become evident.

Like the ebb and flow of the tide, streams of men and women, of various grades, move in all directions at all hours of the day (unhappy is the wanderer in this flood of human life who has no object in view), and this to our fancy is one of the most remarkable sights of London. What variety of condition, how strange the difference amongst so many countenances. Here the prosperous gentleman or gentlewoman elbows the struggling and needy passenger, doubtfully endeavouring to obtain the commonest necessities of life. Isolated as each seems, many are more dependent on, and connected with, the other than may be thought. Most have their cares, and there are few even amongst the most humble but have a circle of greater or less size and influence, to whom even in the hustle of business, the thoughts revert, and to whom they look for sympathy and pleasure.

The great thoroughfares are crowded: statisticians would be puzzled to estimate the value of what is borne along in the roadways. A single van may contain from 10,000l. to 15,000l. worth of silk, or other costly wares; and that meek-looking, ill-clad individual, whom you jostled just now on the pavement, may be revolving an idea which, when it becomes a fact, may give employment and bread to thousands, and advance the interests of the whole human family. There is raw material yet in London for a great poet to work into a great poem, developing the lights and shades of this mighty metropolis.

While sitting out of the stream, accident has led us into Paternoster-row. World-wide as is the fame of this locality in connection with the publishing trade, it has not long been such an important mart as it now is for the sale of literary productions. Stow says that in 1549, when the chapel had been pulled down which had been built on the site of the old charnel house, several dwelling-houses and warehouses were built in its stead, and sheds before them for stationers. On this occasion Wolfe paid for removing 1,000 loads of bones to Finsbury-field. But few names of publishers are met with as carrying on business in Paternoster-row before the fire of 1666: one of these is "R. Harford, in Queen's-head-alley, Paternoster-row, 1642," and another, "Christopher Meredith, Crane-alley, Paternoster-row." Ivy-lane, Cheap-side, Ave Maria-lane, were much occupied by booksellers and printers. Caxton (citizen and mercer) had a shop for the sale of books, &c., in Fleet-street. He was succeeded by Wynkin de Worde, who, in his last will, 1545, calls himself "citizen and stationer." The following were also contemporary printers in Fleet-street, viz., Robert Copland, stationer, printer, bookseller, author, and translator; his sign in 1515 was the rose garland; he died about 1547. John Butler lived at the sign of St. John the Evangelist, in Fleet-street, in 1529: Thomas Bertholt, king's printer, dwelt at the Lucretia Romana, in Fleet-street; he retired from business about 1541. John Bedel, stationer and printer, lived in 1531 at the sign of Our Lady of Pity, in Fleet-street; John Wayland, citizen and stationer, lived at the Blue Garland, in Fleet-street, 1541: Lawrence Andrew, a native of Calais, was a printer at the Golden Press, by Fleet-bridge.

From Fleet-street several of the succeeding printers removed to St. Paul's-churchyard, and some were settled there at an almost equally early date. Julien Notary, in 1512, lived in St. Paul's-churchyard, near the west door, by my lord of London's palace, at the sign of the Three Kings.

Books printed by him occur from the year 1527 to 1544. Robert Foy lived at the Bell, in St. Paul's-churchyard, he died in 1566. Thomas Petit lived at the sign of the Madman's Head, in St. Paul's-churchyard, about 1538; Thomas Ragland lived in St. Andrew's, in the Wardrobe, and kept a shop in St. Paul's-churchyard from 1544 to 1548. Reginald Wolfe, a native of Switzerland, was a man of learning, and brought up to the profession of a printer. This was the printer who removed the bones alluded to; he was Archbishop Cramer's publisher, and publisher of other books appointed for the use of the Church; he was also a great collector of English history, which was afterwards digested and printed by Hollingshed. Most of the printers who published theological books had religious signs. Henry Petwell's sign was the Trinity, in St. Paul's-churchyard; he was buried in St. Faith's Church, under St. Paul's. John Juy had the sign of St. Nicholas, in St. Paul's-churchyard; and John Caward, who published some of Bishop Bonner's works, had the sign of the Holy Ghost, in St. Paul's-churchyard. Rivington's house, which ever since the Fire of London has been noticed for the publication of works on divinity, still retains the sign of the Bible and Crown.

Thomas Godfrey, the printer of Chancer's works, lived near the Temple-bar; and Robert Wyer, an early printer, lived at the sign of St. John the Evangelist, in the Bishop of Norwich's rents, beside Charing-cross.

THE WANTS OF THE ARTISAN IN LONDON.

THE circumstance, that in this huge population of London, education, both artistic and otherwise, is not sufficient for the need, must be evident to all who have carefully considered this most important subject.

In a former article in the *Builder* we have shown how an immense number of the youth of modern London are springing up to a certain extent a deteriorated class, and we wish most earnestly now to hint how matters may be improved.

Let us once more mention that the present population of London is about *two millions and a half*, and that if the same increase of population go on, in A.D. 1900 we shall have five millions of people in this metropolis; and the question is, whether a large portion of this multitude shall grow up as little profitable as the weeds of the fields, or be manufactured into a useful and profitable material.

No words that we can use can sufficiently express our appreciation of the value of that education which is gathered after leaving the ordinary schools, and yet how few have been the efforts made to form institutions in this great place to meet the urgent demand.

We hear constantly in the provinces (in small towns even) of buildings called *Lycæums*, and what not, having sprung up for the avowed purpose of providing the industrious classes with the means of intellectual improvement; and yet, notwithstanding this example, and the evident good which has resulted from such steps, little of the same kind is done in London.

In the days of Queen Elizabeth, when this country took a step onward, many schools were established which, according to the population at that time, were sufficient for the purpose of supplying useful knowledge to those who required help. Some of those schools then endowed have now risen to such prosperity that they are no longer available to the poorer part of the population.

In Elizabeth's reign, London grew so much that the greatest alarm was felt in consequence, and vigorous means were adopted to improve the knowledge of the citizens. Since that time never has the necessity for the most strenuous exertions been so apparent as at the present day.

In Islington, Somers-town, Camden-town, and other districts, there are no institutions which are available to the humbler classes, and the consequence is, that many a promising youth is lost for the want of opportunities. The only way to tackle with this evil is to take London into pieces, and look upon each portion as a distinct town or city which needs its Athenæum, Lycæum, or Mechanics' Institute, where young men may obtain useful books, and at the same time have an opportunity of joining classes composed of men of similar taste and pursuits, and in some cases obtaining the encouragement which is derived from the praise he would have from his fellows.

At the present time in London, throughout miles of streets, there are no places in which the

young workmen can, at a moderate cost, obtain the culture which would be valuable to him in life. Lord Stanley some time ago, at the opening of the new Institution at Oldham, remarked, with great truth, "that the establishment of an Athenæum, an Institute, a Lycæum, in every large town in England, call it what you will, is no longer a mere luxury which may be enjoyed or dispensed with at pleasure, but has become an essential part of our social organization." He also said, "that a man may leave either of the great Universities, after a school and college, which together have extended over ten years, an accomplished classic, an able mathematician, yet be wholly unacquainted with external nature, ignorant of the principle on which a common steam-engine is constructed, ignorant even of the mechanism which he carries with him in his own body, and utterly unversed in that law of the land under which he lives."

This acknowledgment that after a course of our highest system of education, it is necessary to go to school again, and learn the useful knowledge of every-day life, shows the need which must exist for the improvement of a large number of our artisans, who have had only the most imperfect training.

PROPOSED MEMORIAL OF THE LATE SIR CHARLES BARRY.

WE are glad to find that our views on this subject are likely to be carried out. A deputation from a committee of the Institute of Architects had an interview a few days ago with Lord Palmerston, to urge the propriety of erecting a statue of the late Sir Charles Barry in some convenient part of his great work at Westminster. The premier, we understand, acquiesced fully, and, moreover, when it was suggested that the Government should undertake the duty, expressed his personal willingness that it should be so. The site spoken of is the top of the flight of steps at the end of Westminster Hall, under the large window put in by Barry, and where, indeed, his work, it may be said, commences.

The Art Union of London, being about to commission the execution of a medal commemorative of an architect for their medallie series, have determined on appropriating it to Sir Charles Barry, who was for many years one of the council of the society.

PROPOSED MEMORIAL OF THE LATE A. W. PUGIN.

WE mentioned last month that a committee had been formed to raise a travelling fund as a memorial of the late Mr. A. W. Pugin. It has since appeared that some of his friends were contemplating a more personal memorial. On the 14th inst., in consequence, a conference was held for the purpose of receiving mutual explanations, when the following resolution was agreed upon:—

"That as the utmost unanimity is essential to ensure the successful carrying out of the above object, on which two bodies of gentlemen are from accidental circumstances engaged, it is expedient that immediate measures be taken to promote the amalgamation of the two, any decision as to the appropriation of the funds to be raised being left to the united body, or to a committee to be appointed by them."

On Thursday last a meeting was held in the rooms of the Royal Institute of Architects, to take the matter into consideration.

INLAID SLAB-TOMBS.

THE brief mention in our last of the incised tablet erected under the direction of Mr. James M. Lockyer, in the church at Moulsham, does not give a correct idea of it. The slab is of Sicilian marble, 7 feet 6 inches by 4 feet 4 inches, incised to an average depth of one-sixteenth of an inch, deeper in the large surfaces, less in the fine lines, and slightly undercut, to afford a better hold for the inlay, which is a fine scagliola. It was found necessary to polish the marble before the scagliola was introduced. The former being so much harder, required an amount of friction and force in the polishing which would have destroyed and hollowed out the softer surface of the inlay. Two shafts of columns (which support a foliated arch), the narrow hands round the border, the fields of the quatrefoils (in the spandrels), and the cross, are inlaid with a green serpentine, the remainder with a black, and the whole, being highly polished, presents exactly the appearance of being entirely of marble.

The perspective effect given to the border at the bottom should have been continued round, if introduced at all. It is, nevertheless, a very in-

teresting work. The architect says on the subject:—"Slab-tombs and pavements inlaid in this manner are of common occurrence in Italy and France; but generally, if not invariably, in the latter country, are of a dull, unpolished stone and cement. In Italy, I have, however, found examples in marble, the whole polished, and have no doubt that the material used was a scagliola, and not a mastic, as Viollet le Duc supposes. Some of the slab tombs in Florence are very elegant, and as most of these works date from not later than the fifteenth century, it is evident that the inlay (which in many places is exposed to the action of the atmosphere, and in others to the wear of foot passengers) is sufficiently indestructible and imperishable to entitle it to more frequent use; nor is it so expensive as one would imagine; the total cost of this slab, including the cost of carriage thirty miles from London, and fixing, being only 587."

THE ARRANGEMENT OF MODEL WAREHOUSES.

I REMEMBER once hearing an eminent divine\* express himself as follows:—"When I hear any one allege that he has discovered in the Scriptures a new article of faith, I set him down for a fool, because the field of doctrines has long since been thoroughly explored and exhausted; but did he profess to have discovered some new application of Christianity to the improvement of society, I would listen; for the time will never arrive when the Christian religion, in reference to what it suggests and inculcates for the social happiness of man, is not in advance of every specimen of human society found in the world."

It is some such feeling as is here expressed that leads me to give an account of what I call 'A Model Warehouse,' that is, a warehouse the management of which has been devised and is carried on in a spirit of benevolence; and yet the description I shall give will, I doubt not, be only a remote approximation to the standard that may in time be attained.

Happening to be in Nottingham last summer, I paid a visit to the new lace warehouse, Stoney-street, occupied by Messrs. Thos. Adams and Co. Here may be seen at work some hundreds of women; and I could not help being struck with many things in this establishment as presenting a very favourable contrast to what I had heard of women's work-rooms in London and elsewhere. The building faces the east, presents a handsome façade about 120 feet in length, consists of cellar and five stories, including the attic, and has, projecting from the centre behind, a narrow wing of the same number of stories. A visitor, on entering from the street, finds himself in a well-lighted, spacious room, whose area is 10,200 feet, and the cubic air space 132,500 feet; the area of the next story is 9,100 feet, the cubic air space 117,155 feet.

The windows are numerous, and face each other in the opposed (external walls); the frames are of iron, and reach in height to within a few inches of the ceiling, and a portion of the upper part in each window being hung upon hinges, it is readily pushed out at the bottom, by which arrangement the casement, when thought proper, can remain open in rainy weather as well as fine.

The building, in winter, is warmed by a system of vertical flues in the outer walls, through which a continuous current of air, heated by contact with water-pipes underneath the ground story, is discharged.

There is gas in all the rooms, and when it is lighted, ventilation, in addition to what the windows afford, is sought by openings near the ceiling leading into flues in the walls. In the top rooms the ceiling is perforated by large zinc pipes, which run out some feet above the roof, and are found to improve the ventilation. When I again refer to gas-lighting, I shall have occasion to point out the insufficiency of these and all other modes hitherto adopted for carrying off the polluted atmosphere generated in the combustion of gas in offices and warehouses.

In addition to three stone staircases, each running the whole height of the building, the several stories are communicated with by a powerful hydraulic hoist, by which the heavy goods, and occasionally the workpeople, are carried up and down.

The *Lathings* are well placed. In a small room entered from each landing of the outside stair, marked A, are a closet, urinal, and lavatory; and behind the same staircase, I may just observe

\* The late Dr. McCall.  
+ Illustrations of this warehouse, Mr. Hine, architect, will be found in a previous volume of the *Builder*.

(though not marked in the plan), there are various rooms used as library, class-room, &c.

The women occupy portions of every flat, excepting that on which is the sale-room. The room which, in proportion to its area, contains the greatest number, is 69 feet long, 31 wide, and 12 high. Here forty-four girls work; yet in this, the most crowded apartment in the warehouse, the cubic air space for each girl is 581 feet, an allowance, though not more than sufficient for health, vastly greater, we shall find, than exists in most of our warehouse work-rooms. The happy, comfortable look of the women impressed me much. The weather at my visit was warm, but the rooms were all well ventilated by open windows. I remember remarking to an attendant, after walking amongst the girls from room to room,—“Why these women look almost as fresh and healthy as if they were hay-making!”

When I had completed my survey, Mr. Adams said to me that perhaps I would like to meet the hands at prayer next morning. To this I assented, and accordingly was with them at the door of the little chapel, which is behind the warehouse, as the clock struck eight. On entering, I walked to the further extremity, and sat down near the chaplain's desk. In about a minute the master, Mr. Adams, entered and took his seat, which is by the door, and a multitude of the people, the majority females, locked in. A hymn commenced, accompanied by the sound of a neat organ, purchased for the chapel by the contributions of the hands; and at five minutes past eight the door was shut, so that none after that came in. The service consists of a portion of Scripture, the reading and exposition of a portion of Scripture, the time occupied altogether being limited to twenty minutes, a portion of the day not deducted from the time of the hands, but given them by their employer. The scene was very impressive, and the service so wisely conducted as to be without weariness even to the youngest present; and when I saw Mr. Adams seat himself with a look of paternal benignity, and unite with his workpeople in seeking a blessing ere commencing the labours of the day, I felt that here was the recognition of a bond of brotherhood which as yet is too little regarded in the world.

By the kindness of the Rev. Edward Davies, chaplain to the warehouse, I was furnished last December with information in answer to queries respecting a number of points, and this I give chiefly in his own words. It will show how valuable are the services of this devoted gentleman, who, in the best sense of the word, may be pronounced the workpeople's FRIEND.

“1. The number of hands in the warehouse is about 410; of these about 330 are females, sixty of whom are under the age of fifteen. We have no definite age at which young persons are admitted. We should not scruple to receive them at any age, provided they were able to do the work, which is always light, and not infrequently pleasing to a child. Our reason for this is, that we do not take them, they are thrust into ‘dame houses,’ that is, into the little and not unusually dirty houses of the ‘middle’ women, who do lace-work in their homes, where they are at times exposed to harsh treatment, and are commonly kept at work at unreasonable hours. I have seen little ones at work in these places when not more than eight years old. They cannot do our work until they are about eleven, so that it is a rare thing to see one among us younger; and then all our children under fifteen years are required to attend the night-school, where they are taught to read and write. Out of the sixty young ones there is not one who does not attend a Sunday School, and that without any direct pressure on my part. They are most of them under the influence of kind, motherly overlookers, which is a matter of great importance.

2. Our daily service in the chapel lasts twenty minutes, and the average attendance is 365. In the winter time we commence half an hour later than in summer, so that the people in the former season get to work by about five minutes to nine.

3. The hands go to dinner at one o'clock, and return at two. Seven o'clock is the common hour for leaving. In busy times they work until eight, when the warehouse is closed. We are gradually shortening the hours of labour. I speak of the females now, for all the males, with very few exceptions, leave at six o'clock every evening.

4. There is a tea-room, but for the males only. Tea is provided for them at the expense of the firm,—the hour five o'clock,—and twenty minutes is the time usually taken. We have not, at present, a ‘girls’ tea-room, but hope to have in a little time. They take tea in their own work-rooms,—the hour, five to half-past.

5. There is ready access to pure drinking-water in every story. Two years ago the public company's water was used; but not liking it, we sank a shaft within our yard, and obtain excellent drinking water, which is constantly distributed over the warehouse by means of the engine.

6. The school-room is open every evening in the week. On Monday is the meeting of the ‘Mutual Improvement Society,’ attended by the youths, nineteen members, who read papers of their own preparing, chiefly on moral or religious subjects. On Tuesday evening we have a reading and writing class for grown females, numbering about fifty. On Wednesday and Friday are reading and writing classes for children, all females; we have no young boys in the warehouse. Thursday we have a meeting of the Choral Union: this is a most promising society, composed entirely of our own people. On Saturday the warehouse closes at five, and on that evening I have a Bible class for the youths at my house, attended by about ten of them. We receive the girls into the children's school until they are about fifteen, after which they have the privilege of attending the young women's class.

7. The sick are always visited by me at their homes, whether male or female. Last week I had four on my list, one of whom, a female, died. My visits are gratefully received. The girls of the room to which the sick person belongs show the most tender feeling: the woman who died on Saturday last was supported by two of her fellow-workers when she expired.

8. Our Savings Bank is not just now in a flourishing state, which, I must confess, is not the fault of the people, but of the Chaplain. It occupies so much of my time that I find it difficult to attend to it. I am, however, to have a helper, and hope to begin again in good earnest next year. I may mention that at the time of the panic, when trade received such a serious check, there were females among us, some of whom had not a creature they could look to for help, who had sufficient money in the bank to carry them right through the winter. I see, from the book of the woman who died on Saturday last, that she has 9*l.* 5*s.* 8*d.* saved. She has no friends excepting a kind, noble-hearted widow, with whom she lived: the money is to be given to her.\* In a subsequent communication the Chaplain says:—“We are just about to start, under improved regulations, our bank, which we intend to call a *Penny Bank*. It will be for the use of our own people only, and they will be allowed to deposit as little as a penny and as much as a pound. Two persons—probably myself and an overlooker—will go over the warehouse shortly after the workpeople shall have been paid, to receive their deposits or to make payments.”

9. We have a sick club that has been in operation about a year, and there are at present on the books 204 members. This is the only one of our schemes which is not self-supporting. Indeed, this society might have been so, but that Mr. Adams does not like the common club system, where the medical attendant is paid a fixed amount yearly, and that frequently a very small one. He resolved, therefore, that the people should pay a penny a week,—I mean those who might wish to do so,—and that the medical gentleman should keep a separate account for each patient, and send in his bill for attendance and medicine to the counting-house as soon as the case was done with. During the first ten months of the society's existence the sum received from the hands was 37*l.* 4*s.* 11*d.*, whilst the amount paid for medical attendance by the firm was 63*l.* 3*s.* 6*d.*

10. As we all enjoy many privileges owing to our connection with the warehouse, we think it only right that we should try and do a little good to others; accordingly we have, for the last two years or more, been supporting a missionary school on the Red River. This money comes chiefly from the working males and females. But it may be asked—Is there no undue influence exerted to get this money from the people? None whatever. To prevent this, the people collect it among themselves, and a person is deputed to hand over their little sums every fortnight. It is not known to me who give and who do not. They take great interest in this little matter. In the past year the

aggregate sum handed to me for the above object was 25*l.* 3*s.* 5*d.*

11. We circulate periodicals among those who like to have them. Last year we received 18*l.* in payments for these. The works are—Leisure Hour, ‘The Sunday at Home,’ ‘British Workman,’ ‘Teacher's Friend,’ ‘Family Economist,’ &c. The people also purchase Bibles and other books from me, paying for them by instalments.\* On Wednesday evening I am at my own home after warehouse hours, and the people know I am to be found there if wanted, and they come to see me, perhaps to ask for religious counsel, or for advice on domestic subjects. On Wednesday night last I had a larger number than usual—eleven came.

My time is occupied in a variety of other ways than those I have named; but these are the chief matters which take up my attention from week to week. Since I last wrote you, Mr. Adams has engaged the services of a person to act in the capacity of a general superintendent of the warehouse. He is a man of good education and gentlemanly mien, and will not fail, I think, to secure the respect of the people. His duties will be to traverse the warehouse from top to bottom, and be as nearly ubiquitous as possible,—to see that every one employed is in his or her right place,—to correct irregularities if only trivial, and to report them if serious. I cannot but think that this arrangement will be attended with very happy results.

You are of course aware that, where large numbers of young people of both sexes are brought into daily contact, there must be at least a great deal to excite one's fears. Wherever such arrangements prevail there is immorality, and our warehouse is no exception to the rule; but there certainly is far less among us than there used to be. The daily service has been very beneficial in this respect,—it has been the means of many of our young people becoming entirely changed characters, and I do trust that there will yet be many more.†

#### THE GENIUS OF VANBRUGH: BLENNIEM.‡

THE grand master-fault of Vanbrugh, according to his detractors (who, be it remembered, are all of one school,—scholars of one belief, and men of corresponding train of thought), is the neglect of rule which characterises so strikingly his productions; the very slight and partial reverence which, seemingly, he paid to modes of composition taught and practised by his predecessors; and that strong self-assurance and independent feeling which led him to place such confidence in himself and in his own genius.

His detractors are the *ultra* advocates of adherence to precedent,—men who denounce departure therefrom as the greatest error, and any originality of invention in architectural composition with feelings somewhat analogous to those of the theologian who sees the feeble thoughts of the human mind attached to the sacred Scriptures as improvements. The one, in their notion, is as great a heretic in architectural composition as the other is in religious belief; and, as a consequence, in the opinion of these men, our architect's views were more heterodox, and his conduct more lame-worship and injurious to the profession than that of almost any man who has practised considerably as a member of its ranks.

Surely it must be acknowledged that the slavish trusting to precedent is most unhealthy in its nature, and must be very injurious in its consequences, if it attain an *ascendant* authority over the minds of architectural students. I know of no influence more powerful to turn the mind in favour of Vanbrugh, and to induce the student to seek a more reasonable and just standard to apply his works to, than such an indiscriminate censure as Vanbrugh has suffered from the hands of these men; because his works were not able to stand the comparison with precedent. Allan Cunningham says, most justly,—“Vanbrugh was an inventor: he has been criticised by a race of classic copyists who think it a merit of the highest kind to build according to the expressed dimensions and form of some famous temple of old. They cannot perceive that he has dealt in

\* We can hardly overrate the importance of encouraging the labouring classes to lay up against the evil day, especially when we consider how great is the number of destitute widows and orphans. From the last report of the Poor-law Board we learn that the number of widows, July 1st, 1858, in receipt of out-door relief, in 679 Unions in England, amounts to 59,468; yet these figures do not reveal the number of orphan children belonging to the widows, no more than they do the number of widows and orphans who are all but on the Union, and the number of widows struggling in poverty whose husbands are disabled through infirmity or long sickness.

† Last year I sold of Otter's beautiful edition of the ‘Pilgrim's Progress’ sixty-eight copies at 2*s.* 6*d.* each. I also sold 152 copies of Miss Marsh's ‘Light for the Lion’ at 6*d.* each, and eighteen Bibles, chiefly family Bibles, quarto.

‡ This paper, by Mr. John Robertson, was read before the Manchester Statistical Society. To be continued.

§ The following observations form part of ‘A Critical Essay on the Architectural Genius of Sir John Vanbrugh,’ signed *Hope*, and submitted to the Royal Institute of Architects, last session in competition for their medal.

the original elements of art; and, disdaining to copy where he could invent, has created an original style" (or, rather, originality of treatment) "of his own." "The scholars of his day were against him, but he obtained the wider applause of those who were not learned enough to try merit by other standards than their own feelings."

Without yet offering one opinion of the train of thought from which Vanbrugh's works sprang as the fruit from the tree, I think that this authority and absoluteness of styles should be combated by arguments which have occurred to my mind, and, in spite of efforts to shake them off, demand to be heard.

These men advocate the absoluteness of style, and the authority of precedent; by which they mean, that since Gothic architecture is chiefly associated in our minds with the Christian Church, and since its most successful and beautiful examples are ecclesiastical edifices, therefore Gothic architecture furnishes to us unquestioned precedents for all future edifices of that class. Upon its beauties we may be allowed to improve, if we can, but from its distinct and settled characteristic principles and features no man must depart.

Some even say that not only all other styles of architecture which have had their birth and development are to be ignored as styles; but even any of their features or elements, however beautiful, are not to be valued and esteemed by us, because they may not harmoniously blend with their favourite style, which is to displace every other style, at all times, and for whatever purpose the structure may be intended, to which they apply it.

There are other men who have broader views, who see beauties in more styles than one, and who are ever willing that these styles may be severally adopted by our architects, and, in their fuller development, made increasingly beautiful; but, whilst agreeing with the other class that Gothic is the style *par excellence* for ecclesiastical edifices, since the Christian Church conceived it, and developed it as its own—they deny its applicability, or even the appropriateness of its architectural expression, for other and secular purposes. Their theory is, that municipal and secular public buildings should be faithful and scrupulously correct imitations of some classic (Grecian or Roman) edifice, with such deviation from precedent as the peculiarities of modern wants absolutely necessitate; whilst the requirements of a palace, a villa, and all domestic structures, call for as faithful an adoption of the Italian style, preserving as closely as circumstances will permit the characteristics which belonged to it as a style in its palmy days, and in its early freshness and vigour.

Yet, it must be acknowledged that precedent alone is a most inadequate and unsatisfactory authority for our present architectural practice. The fact that most artistic and exquisitely beautiful and harmonious creations were conceived and produced by the Middle Age architects—edifices which were not only in harmony with the ritual ceremonies and the religious feelings of the age, but which were actually the architectural expression of those feelings—is certainly not sufficient authority to bind us to a servile copyism of them in our present ecclesiastical edifices, whose ceremonies are so unlike, and whose feelings are so changed.

Nor do these men tell us why our intellectual and creative faculties are to be cramped and restrained more considerably than those of any preceding age by such adherence to precedent.

I think that in a future day our art shall be unique; that every development of it, for every purpose, shall spring from common principles; and, amidst large diversity and variety of architectural expression, our architecture, as a noble art, shall be perfectly harmonious at all times with itself. I conceive that the several styles shall not proceed as at present—everlastingly upon the same beaten track, even to the perfection of each; but the judicious efforts of a band of geniuses shall bring about the convergence of these styles into a phase of architecture as unique as any preceding style, and yet which shall be calculated more fully to express the feelings and the thoughts of our advanced civilization.

Though Vanbrugh was the author of several architectural works (some of which do not now exist), among them being a facade to Grimsthorpe, in Lincolnshire, and King's Weston, near Bristol, erected for the Hon. Edward Southwell, yet his fame must ever rest on his two masterpiece of composition—I mean the palatial edifices of Blenheim and Castle Howard, which infinitely more fittingly attest the native grandeur and majesty

of our nobility than the baronial castles and fortified strongholds of their ancestors.

There are strong and marked points of divergence in these compositions, but it requires little closeness of attention to trace the defined and characteristic workings of the same master-mind in them both.

What I consider to be the first and most indispensable law of architectural composition, that the work should have its due measure of praise, or even be styled a work of art at all, demands that it should be a perfect conception, elaborated and worked out, free from all fragmentariness or sketchiness, and should be complete in itself, as needless of addition, or as liable to suffer from excision as the human frame. Blenheim and Castle Howard illustrate this principle most strikingly.

Secondly, in this advanced and progressive stage of architectural practice, each work of art should be distinguished by variety in plan, and in perspectives. I must qualify my assertion, and remark that this law is almost inflexible where our structure is surrounded by landscape, of which it is to form a component part.

Sir Joshua Reynolds, in one of his discourses, suggests this thought, and adduces Vanbrugh as an illustration of the happy effect of its free recognition. He says, "Variety and intricacy is a beauty and excellence in every other of the arts which address the imagination, and why not in architecture?"

I have been much impressed with the power to delight, which the various perspectives of Blenheim can impart. As you walk round it, at a suitable distance to take the whole structure within the range of your vision, fresh beauties and fresh combinations of forms strike upon your eye. Sir Uvedale Price says, "No mansion has, from such a number of different points, so grand an appearance as Blenheim."

A higher expression of beauty than this, which I have denominated a *passive* one, is inadmissible in the palatial residences of our cities, where the line of plan is determined by the formal regularity of its streets and its squares—the cities of Rome and Florence, presenting to us some of the most illustrious examples of this style of treatment. But, surely, was not Vanbrugh justified in striving to emulate in his beautiful art-creations, by the free use of this element, the piquant life of the varied landscape scenery in which his work was embosomed, and of which it formed one of the most essential parts?

Speaking of Vanbrugh's proportions—though they often are as singular as his genius—yet the pavilions at the four angles of Blenheim are in excellent proportion; and have, by the way, been introduced wisely and with discrimination, for they are surmounted by belvederes for the better appreciation of the beauties of the landscape.

The south facade of Blenheim, in my estimation, is treated with the most artistic feeling. The scenery is full of grace, and the spirit of beauty: some would say it was tame—there is nothing striking, obtruding, nor severe. And so Vanbrugh has designed in its spirit: he has shunned those bold and violent projections which he has so freely courted at other times; yet this facade is as free from tameness or insipidity as possible. This elevation is replete with a quiet, subdued vigour and energy. Due emphasis and increased expression are given to the colonnade or portico, as a central feature, and to the pavilions forming the angles.

In summing up these observations, and arriving at a just estimate, I beg leave to say that I do not believe in any remarkable *universality* in Vanbrugh's genius. I do not think he is destined, after the most perfect justice has been done him, to rise to the distinguished platform upon which our world's greatest men will stand.

In my opinion, Blenheim possesses many qualifications to be called a work of high art; and, as an architectural edifice, not the least of its peculiarities, and its greatest merit, is, that the whole of its wondrous beauty and grandeur are the effects of what should always be the predominant quality of our art—I mean, *form*. Simple lines and curves, varied in their contour, and diversified in their arrangement, are—to the exclusion of ornament and colour—the source of these results.

I know that some tell us that ornament or sculpture is the chief part of architecture; and, if they be consistent, they must hand this edifice as a huge pile of construction only, which the sentiments and pleasurable emotions of every student of these buildings flatly deny the truth of.

But, after all, the qualities which have been the chief attraction and source of wonder to all are

those which are expressive purely of his individuality—his idiosyncrasy. A certain degree of universality I have already given Vanbrugh the credit of; but I must reiterate that there never has practised a man in our art who left the marks and impress of his idiosyncrasy upon everything which he touched so much as Vanbrugh.

Other men have designed singularities; but they have been whims, freaks; but we are not justified in stating that, as a rule, Vanbrugh's peculiarities were whims, but they were rather the creations simply of his own mind, distinct from anything which other men had produced, and harmonious with themselves. Seeing that Vanbrugh discarded all formulas or rules to guide him in his designs, I confess that I can discover no explanation whatever for the peculiarities of his proportions, the heavy forms (when not required for certain architectural expression) so very much complained of by his detractors, the singular and original disposition, use, and arrangement of those architectural elements which preceding styles furnished him with, the quaint and peculiar contours of his features, whose outline was not determined by the best principles of construction, other than that they were emphatically his own.

The student of Vanbrugh will find numerous instances of the outpouring of the soul into his works. His comedy has found vent in a myriad forms, in the decoration of the keystones of Castle Howard. The exuberance of his imagination, and the fertility of his invention, are alike displayed in the prodigal use of ornament, in both the interior and exterior of that palace.

But perhaps the student will never understand the existence of an individuality in the treatment of Vanbrugh's productions so forcibly as if he visited Blenheim, and viewed it by the light of the moon, when he will find an undue prominence given to the forms upon the summit of the structure, exhibiting their contour and outline to great advantage against the illumined sky, whilst the more impressive qualities, those more purely architectural and grand, dwindle, on such an occasion, into comparative unimportance.

So I am convinced that when Vanbrugh is studied through the medium of prints, views, or displayed elevations, similar injustice is done him, in consequence of a like preponderance being given to these peculiarities.

I would here quote the remarkable words of Mr. Gwilt upon this very subject—"Vanbrugh's buildings are the result of a combination of forms and anticipation of effects, originating solely from himself; effects which none before had seen or contemplated."

HINTS ON THE BUILDING OF SCHOOLS.

SOME time since Mr. Harry Chester delivered a lecture on the subject of Building a School. It was afterwards published,\* and it may not be useless to reproduce some portion of it in our pages.

I do not say never accept, but I advise you never to seek, the gratuitous services of a solicitor or architect. The true professional responsibility is scarcely consistent with gratuitous performance. You must not look a gift horse in the mouth; and you can scarcely haul over the coals a gratuitous attorney. Engage professional services on the usual professional terms; and when these services have been rendered and remunerated, then and not sooner, is the proper season for professional donations, if any, to be made.

When your memorial, and the plan of your proposed site, have been approved by 'My Lords,' they will send to you two distinct sets of instructions, which you may find more or less easy to understand;—first, with reference to the plans, specifications, estimates, and available funds for the building; and second, with reference to the title to the site, and to its conveyance in trust.

The documents which relate to the plans, specifications, and estimates should form a part of the general instructions which you should now give to the best architect that you know of, or to a few of the best architects in competition, to prepare the plans and specifications.

When the Committee of Council on Education was first created, in 1839, so little attention had been given to the planning of schools, that they were very commonly erected by the village bricklayer and carpenter, by rule of thumb, without any plans at all. The National Society, not so wise then as now, had unfortunately proclaimed that 'any shape' would do for a school, and that there was no better model than a 'common barn.' The organization of schools had been little studied.

\* Chapman & Hall, Piccadilly.

The buildings were low, thin, dingy, ill-drained, often without means of warming, often without proper conveniences; with no furniture but a teacher's desk, a few rickety forms, a rod, a cane, and a fool's-cap: the floors were almost invariably of brick—the worst kind of floor, as it is tenacious of moisture, cold to the feet, easily abraded into red dust, and soon worn into holes. There were rarely any porches or lobbies for the caps and cloaks of the children. If there were a house for the teacher, it was seldom such a house as a teacher of the present day would like to inhabit.

Under these circumstances, when the Committee of Council on Education requested the applicants for grants to exhibit plans and specifications of their proposed buildings, the request was often regarded as an insult. 'Plans and specifications! why put me to the expense of plans? do My Lords suppose that I cannot build a school without plans?' Others were milder or more honest, and sent plans about the size of the palm of my hand, with a few indistinct scratches upon it. Now, however, all this is improved. The National Society has long been wiser than it was in 1839. It has set a splendid example to the other educational societies: they all vie with each other in architectural exploits; and the hand is adorned with schools. The most celebrated architects undertake to design these buildings; and give their minds to the designs. No one now thinks that a school can be built anyhow, without any reference to the uses to which the building is to be applied.

Of course, a school may be held in almost any building; and a clever teacher may teach cleverly almost anywhere; but the shape of a school-room is nevertheless important as regards (1st) the cost of the building; (2nd) the convenience of organization and supervision; and (3rd) the strength of the teacher. Persons used to go, and some persons still go, to an architect, and say, 'Let me have a plan of a school for (say) 100 children, allowing six square feet to each child.' Now, what could an architect do, thus instructed? In the first place, no school can be so organized that six square feet per child will afford a sufficient area; and, in the second place, you can no more determine how many square feet per scholar will suffice in a particular school, without reference to the peculiar organization of that school, than you can determine how many guests can sit down to dinner in a dining-room without knowing the shape of the room, and whether the table is round or oblong. The capacity of a school-room depends on the organization of the school, on the length and breadth of the room, and on the positions of the doors and fire-places.

Before you instruct an architect to prepare plans, determine how many scholars you will provide for, and on what system you will organize the school. How many boys, how many girls, and how many infants? Shall the boys and girls be instructed in one room as a 'mixed' school, or in two separate rooms? If you wish to have a perfectly convenient building, you must determine these questions before you instruct your architect. In your mind's eye you must see the several departments and classes of the school at work; and then, the area necessary for each portion of the work of each class being calculated, you may surround the scholars (as it were) with the proper walls, and you may give such instructions to your architect as will enable him to prepare a convenient and economical plan.

It is possible to organize a school in a great variety of ways; but, given the case that we have to deal with in educating the poor, i.e. given one principal teacher, assisted only by pupil-teachers, to instruct the greatest possible number of children, I am satisfied that the organization, recommended by the Committee of Council on Education, and commonly used in the best national and many other schools, is on the whole by far the best; and therefore to this system of organization alone I shall at present refer. It is not my business to give a series of plans for schools. That is the proper work of architects.

In extreme cases it may be necessary to have groups of benches and desks on two opposite sides of a room: it should then be not less than 30 feet wide; but this arrangement has many inconveniences, and I recommend you to avoid it if possible. The fireplaces are at the two ends of the room, in the corners, where the fires, though out of the way of the children and of the teachers, can be seen from all parts of the room. The fires may be 'gathered over' and carried up in the gables. The walls all round are free for maps, diagrams, and pictures.

Windows should be high up. Get your light as high as possible, plenty of it, and from all quarters if possible, by slanted windows in the long walls, by great windows in the gables, by dormer windows, and (best of all, in my opinion) by vertical skylights. No wretched little diamond quarries, but big panes of white glass. Let all windows be made to open. Have blinds to the east, south, and west. Never let the children or the teachers sit or stand in front of an unblinded window on a bright day. If you do this, you may do more than you intend towards blinding the children and teachers. When I go into a school-room and see the poor things blinking in the face of a streaming sun, I cannot help thinking that the managers should be indicted for cruelty. Never introduce a window in such a position that a child standing in its place at its desk or on the gallery will be projected in front of the light. As far as may be, let your light from different quarters be equalized, so that strong shadows may not be cast. If the faces of the children are in a full light, an equal light should be cast on the teacher's face and board, otherwise they will be in shadow. Do not place a gallery in a school-room at right angles, or opposite, to the benches and desks: if the gallery be in the same plane as the benches and desks, the teacher, instructing a class on the gallery, retains a command of the rest of the room. The seats of a gallery (not intended for infants) should be fitted with backs, which are not needed in the desks groups, as the children receive support from the desks. The height of a seat should be such that the knees of a child seated thereon shall be bent at a right angle: the desks for the girls should be made with flaps to let down for needlework, leaving only a ledge horizontal to hold cottons and scissors, and allowing space for the girls to place their work on their knees.

Be very particular in your specification for the floor of the school-room. Oak being too expensive, the planks should be of the best deal, perfectly seasoned, and well laid down. If they are cut into short lengths, they will be the less noisy.

Make your school-rooms as comfortable and as pleasing to the eye as possible. What can be more depressing than the appearance of many school-rooms, which exhibit either extreme, of bare walls or of superabundant hangings of untidy maps, ugly pictures, threatening texts? The latter extreme is the worse of the two. I have seen school-rooms whose walls have been so huddled all over with such things as to make one imagine oneself in an ill-arranged religious toyshop. I advise you to batter your walls, which will add a little to the cost, and a great deal to the comfort. If you will paper your battered walls with a few good bright maps, a few good diagrams, a few good prints, and a very few well-chosen texts; and if, round each of them, arranged with good taste, you will paste a little border of coloured paper to set it off as by a frame, the cost will be trifling, and the educating effect will be very great; and if you will have the whole surface well sized and well varnished, the walls may be occasionally washed, and will not require to be repapered for many years. The ground colour of the walls should be light and warm: avoid yellow, which I believe to have an injurious effect on health. Instead of smothering the walls with prints, have as good and as large a collection of prints as possible in strong books, with leaves of brown holland: you will find them repay you for the trouble and expense. Let such texts as you select be rather soothing and elevating, than grim and depressing.

The woodwork, especially in the higher portions of a school-room, is very commonly too much darkened.

Benches and desks of birch, varnished, will cost little more than deal, and be better appreciated and taken care of; but they may warp if not made of wood particularly well seasoned. Do not screw the fittings to the floor, but either have them heavy and firm enough in their own weight to be not easily capable of accidental displacement, and yet such as may be lifted from one part of the room to another; or screw them to sleepers, and lay the sleepers loose on the floor. The benches at least should be so constructed as to stand each by itself when wanted, apart from the sleepers. The hindmost bench and desk should be somewhat taller than those of the middle row, and the latter should be somewhat taller than the front row. In opposition to the ordinary opinion and practice, I advise you to provide a larder and pantry—small ones will suffice—in the teacher's house, and to let there be plenty of cupboards and presses in the school and in the house, and coal-cellar capable of containing a year's supply. It is also

as well not to forget to lay on water, or to provide a well and pumps.

Have the ground so made up to the entrances of the schools that there may be no need of high flights of steps. There should not be more than a single step, if any, at the entrance of an infant school. There should be a provision for washing hands, but not on a large scale: the children should come to school with clean hands. Never provide a separate entrance for visitors, but keep the children's lobbies in a state fit for the passing of visitors; and if the children's doors are large enough to admit criminal of reasonable size, unreasonable crinoline need not be admitted.

Allow no inferior nor unduly perishable materials to be used in the building: let everything be of the most durable character. In regard to the architectural style, I say only let it be pure and simple. (Face Lord Palmerston and Mr. Tite.) I have seen many excellent Gothic designs, some good Elizabethan designs, and some few very bad Italian designs for schools. Whatever you do, do not allow of any false architecture: let the beauty of the building depend on its good proportions, its good materials and workmanship, its correct details, and on its exterior's truthfully representing the facts of the interior. For example, do not turn the master's kitchen into a Crystal Palace on a small scale, under the notion that, where you want a window of moderate dimensions, you may have a great big one to balance another big one, very properly placed in one of the end walls of a school-room. Do not allow breaks and projections for mere effect, where uses point to unbroken lines: forbid all construction of ornament as ornament, and let the real structure of the building be ornamental. Let the ground plan be first settled as convenience may point out, and let the elevations absolutely follow the carefully-arranged ground plan. Never let the ground plan be tampered with under the idea of improving the elevation: for effect and utility combined, let the chimneys be lofty and massive. About open roofs, where all the timbers are shown, I confess myself somewhat heretical. *Non equidem insideo, miror magis!* hot in summer, cold in winter, they are more handsome than comfortable. For comfort, give me a ceiled room, having a good air-chamber between the ceiling and the roof: if you object to a ceiling, even at the collar-beam, you must at least ceil to the rafters, and insert a layer of felt; and you should board to the under side of the rafters.

Never let any one persuade you that the site does not require draining.—

Let sites be drain'd that ne'er were drain'd before,  
and those that have been drain'd, be now drain'd more.'

#### ROMAN MOSAICS.

At the last meeting of the Northern Architecture Association, Mr. F. R. Wilson, as elsewhere mentioned, read the following observations on the manufacture of mosaics:—

At a former meeting I took occasion to suggest the use of mosaics as a decoration for buildings in this country. My suggestion referred then most especially to the Royal Exchange, London, where the distemper decorations had perished, or been obliterated by smoke, only a very few years after they were perfected. I have seen since, in the *Builder*, that there is a proposal to apply mosaics to the embellishment of the interior of St. Paul's Cathedral, London, after the manner of those in St. Peter's in Rome; and deeming that such a proposition is likely to call forth a more general desire to know more of the particular decoration in question, I venture to introduce to the present meeting the specimens I brought home from the Eternal City.

The small pieces of enamel, about the size of a pin's head, are those employed in the manufacture of the smallest objects,—ornaments, trinkets, &c. The larger sizes are used for larger surfaces, such as pictures, or buildings; and when required for situations very removed from the eye, as in the dome of St. Peter's, the cubes are nearly an inch square. You will note that the edges of the blocks are not geometrically perfect—a circumstance which takes away all appearance of stiffness, and admits of more accommodation, in some cases, to the exigencies of outline.

The studio in which the government manufactory is carried on—a room nearly a quarter of a mile long—is in the Vatican itself, and is a sight most artist-visitors take care to see. Some idea may be formed of the nicety and skill required in the manufacture of these stone pictures, when we consider that there are upwards of ten thousand tints in the enamels, and that an artist will sometimes spend from twelve to twenty years in the

delicate though durable construction of a large work. Great knowledge of art, and a full appreciation of the difference of schools, are requisite to do justice to subjects thus invested with immortality. The prices of the same design vary, according to the character of the work, from one to five-fold.

The method employed in forming a picture is not intricate. A ground-work of a certain clay is first formed, into which the slender shafts of enamel (all ready to the hand) are inserted in the order and colour required. When this stage of the operation is completed, the surface is reduced to a level by means of grinding with a lathe. When unequal heights are thus removed, there remains but the application of a fine polish to finish the process. Pictures are thus produced which rival those of the enamel in the subtlety of their colouring, and in the grace of their flowing lines; and outshine them all in the imperishable nature of their tints, and in the almost everlasting qualities of the materials used in their construction. Mosaics more than two thousand years old attest these facts.

It remains only to inquire whether the conditions of our very humid climate be likely to affect mosaic work injuriously. The tessellated pavements of both ancients and moderns appear to have suffered no ill from them. At all events, it is very clear that decorations in distemper are not for us; and that it is highly desirable to find an efficient substitute for their light and colour in a superior vehicle as regards durability; for, with the increasing appreciation of the beautiful so strongly manifested around us, we may be assured that the public will not be content much longer with white-wash for the decoration of the national buildings.

**NORTHERN ARCHITECTURAL ASSOCIATION.**

The committee of the Northern Architectural Association, in pursuance of one of the objects of the Society, forwarded the following protest to the advertisement lately issued by the committee of the Hartlepool Mechanics' Institute.

**ADVERTISEMENT.**

"The committee of the Hartlepool Mechanics' Institute are desirous of receiving plans and drawings for a proposed new institute, to be erected at the head of Medley-street. The site is 100 feet by 50 feet, and the building is to include library, news-room, class-rooms, large lecture-hall, and keeper's rooms. A premium of 10*l.* will be given for the plans approved of and accepted. Plans, accompanied with estimates of the cost, to be sent to the secretary, Mr. J. Hindmarsh, on or before the 2nd day of July, next."

The following condition was also appended:—  
"That the committee do not bind themselves to employ, in any way, the drawer of the successful plan, or to pay any other remuneration than the 10*l.* for the plan accepted."

**RESOLUTION.**

"The Committee of the Northern Architectural Association, having had their attention drawn to the advertisement issued by the Committee of the Hartlepool Mechanics' Institute, offering a premium of 10*l.* for the best plan for a proposed new building, beg respectfully to call the attention of the committee to the utter inadequacy of the payment as a remuneration to the successful competitor, especially as the committee do not bind themselves to pay any other remuneration, or to employ in any way the drawer of the accepted plan; and the committee would also respectfully suggest that the terms of the competition be revised, and beg to offer their services to assist in preparing such terms as may be equally advantageous and honourable to the committee and to the competitors."

The committee of the Mechanics' Institute have not responded to the offer and suggestion of the committee of the Association, but have awarded the premium to their vice-president, Mr. J. W. Gaffray, manager at Messrs. Richardson's engine factory. There were six competitors.

The ordinary quarterly meeting of this Association was held on Saturday, the 15th inst., in the Old Castle, Newcastle-on-Tyne, Mr. Dobson, president, in the chair. After transacting the preliminary business, and electing Mr. Green a vice-president, in place of the late Mr. Wardle, Mr. Pritchett, of Darlington, re-read a paper entitled "The Evils of our present Practice, and the best Way of remedying them," and concluded by proposing the following resolutions, which, after some discussion, were carried unanimously:—1st. That the committee, with power to add to their number, be requested to correspond with other associations, to ascertain the possibility of establishing an Architectural Alliance, and report to next meeting. 2nd. That the committee, with power to add to their number, be requested to

prepare a code of professional charges, for the use of this Association, to be laid before the next meeting. 3rd. That the committee, with power to add to their number, be requested to prepare a circular to be sent to the promoters of all competitions advertised, the conditions of which are not satisfactory, and present it to the next meeting. Mr. F. R. Wilson afterwards read a paper on Roman Mosaics, which we print elsewhere. After remarks from the president and other members, it was agreed that the annual excursion be to Hexham and neighbourhood, on the 1st of August next.

The Secretary, Mr. Oliver, called the attention of the members to the decision of the Royal Institute of British Architects to adjourn the consideration of the diploma question till November next, in order to ascertain the opinion of Provincial Architectural Societies, and urged the consideration of it in connection with the present resolutions.

**ABINGDON RECREATION GROUND COMPETITION.**

IN reply to the offer of a premium for the best design for laying out the Recreation Ground at Abingdon, Berks, several were submitted. From these, we understand, the Governors of Christ's Hospital have selected the design of Mr. J. W. Chapman, landscape gardener, of Dulwich.

**GENEALOGICAL AND HISTORICAL SOCIETY.**

THE annual general meeting of this society was held on Tuesday night last in the mansion of the president, the Earl of Ellesmere. Lord Ebury, one of the vice-presidents, took the chair, and the vice-chair was filled by Sir Thomas Maryon Wilson, Bart.

In opening the business of the evening Lord Ebury stated that the objects of the Genealogical and Historical Society deserved to be more widely known than they were. They are the collection, recording, and preserving facts connected with the descent and history of families: these facts are in danger of passing into utter oblivion, though they often throw unexpected light on many events in the history of the nation, and therefore possess a general as well as particular interest. The report of the past year was then read and adopted. It stated that the society is receiving a steady, increasing support; but the funds at its command do not yet allow it to make such an extensive examination of the public records and the private sources of information at its disposal as the Council would desire. Nevertheless the materials it has gathered already fill several folio volumes. In the last year the society has examined the registers of wills in thirteen diocesan courts, commencing with the will of the earliest date in each, and has had extracts made from them relating to names of military, political, or literary celebrity.

After other formal business, the Rev. Thomas Hugo read a paper on the Domesday Survey, showing the importance of the information which Domesday Book affords with reference to the ancient tenure of land, and the names of those who held land at the time of the survey.

Mr. Hamilton followed with a paper "On the Anglo-Saxon Chronicles, and the History and Heraldry of the Saxon Kings;" and Professor Christmas delivered a discourse on "Half a Crown, Historically and Archeologically considered."

**THE PRESENT STATE OF CHURCH-BUILDING.**

So much has been said and written on the best form and arrangement of large churches, that some apology might seem to be needed in offering the following remarks on so trite a subject: I can only plead as an excuse a very strong conviction that in the struggle to escape from so-called Classicism, and to return to the healthy and vigorous guidance of our Mediaeval masters, we have, in church-building, lost sight of some of the first principles which governed them, as they ought to govern us now. It was only natural that in the early days of the revival the merits of a new church should be judged according as it approached more or less nearly to an exact copy of some Mediaeval favourite; but now that architects are supposed to have risen above copyism, and to be able to originate churches rivaling our ancient models in beauty, it is time to take a common-sense view of the question, and to ask ourselves whether our present system is really founded on true principles.

Let us start with these two axioms:—First, that

a building should be in every respect adapted as completely as our resources will allow to the purposes for which it is erected; and, secondly, that in its architecture—i.e., not only in the furniture and arrangements, but in the bare walls—the very skeleton, in fact, of the complete edifice, it should bear the lasting marks and evidence of its original purpose.

Now, we invariably see these principles carried out in our old churches. They presented the most convenient form for the existing services, and to this day we find the piscina marking the position of altars; we find the sedilia, the ambry, the credence-table, the low side-windows, the priest's door, and the entrance to the rood-loft, even where rood and loft have long since been destroyed: all these we find as parts of the building, each speaking for itself, and bearing evidence while the church stands of some rite or custom in use when it was built. Go, on the other hand, into almost any one of the best of our modern churches, and examine it with reference to these principles. Beautiful and correct in detail as it is, you find, in the first place, a building unadapted in many respects to our present requirements—still, in fact, a mere dead copy of the Mediaeval type, if not of any particular example. You find that it wants all the interest imparted by the above-named characteristic features; or, if it has any of them, they are either useless, and consequently meaningless, or else trivial and unnecessary, and apt to give offence to many minds. Turn to the body of the church, and you find a roof containing a forest of timber, high pitched and open to the ridge, thus giving a form of ceiling destructive to all acoustic qualities, so that you will generally find the officiating minister nearly inaudible at the west end of the church.

Turning to the aisles, you find that the view of a considerable number of the congregation is obstructed by the columns of the nave arches. You find the font placed canonically near the western entrance, but its position unmarked save by a gap in the sittings. The altar, pulpit, and reading-desk were probably provided for by a sum named in the specification, and the very positions of the two latter not finally settled, perhaps, until near the completion of the building; so that they are necessarily mere pieces of furniture, which might be removed in an hour, and leave not a trace behind. The church, in fact, carries in itself no inherent evidence of what our ritual uses.

Again, we can adapt our existing Mediaeval church more or less completely to our present wants; but we cannot, without violent destruction, get rid of the means and appliances of forms of worship now passed away. But in a modern church how different is it! What a want of interest in the building itself, apart from decoration! It is generally ill adapted for seeing and hearing, and, while thus sacrificing utility to what is considered church-like appearance, it might, without injury to the fabric, be stripped in a few hours of all evidence of any particular kind of ritual observance whatsoever. This cannot be right, and yet the principles with which we started will probably be readily admitted by all those who habitually infringe them in the case of churches.

What have we to do, then, in designing a large church? We have to contrive accommodation for a great congregation, in a building the most fitting and convenient we can devise for seeing and hearing the officiating minister; and for joining, decorously, and with undistracted attention, in common prayer and praise; and we have to take care that our building shall show distinctly, in its architectural features, that in it are to be celebrated the two sacraments and daily services, consisting of public prayer and praise, the reading of God's word, and preaching.

The question of plan is one that must, of course, be settled in a great measure by peculiarities of site; but, wherever a church is built, we must not forget that there are many other considerations to be kept in view along with the mere requirements of seeing and hearing. And if these points can be satisfactorily attended to (putting it on no higher grounds than association and traditional custom), who would not see with regret the abandonment of the auditorium, half lecture-room, half theatre, which some persons wish for. The truth is, that it is possible, beyond doubt, to retain the traditional divisions, and yet to produce buildings fitted in every way to our present wants, and an architect should not content himself with less than this. To attempt to point out any of the methods that might suggest themselves would occupy too much space; but what we have to avoid may be summed up in a few words, namely, wide aisles and heavy piers,

deep chancels, excessive height, and high-pitched roofs open to the ridge.

Next let us take care to make the positions of altar, font, reading-desk, pulpit, and organ as distinctly marked as possible in the architecture of the building; to make them, in fact, as much as possible part and parcel of it, and to let none of them remain to be added as an after-thought or piece of furniture.

A clergyman, who has thought much on this subject, and could speak with authority on it, once said to me,—“Give me a handsome communion-table, a good and well-placed font, an unmistakable reading-desk, and a large pulpit, not too low, and I do not care what the rest of your church is like.” This is, of course, pushed to an extreme, but in it is involved the principle which I hold to be so sound, and so generally neglected in our modern system of church building.

M. A., Cambridge.

#### RAILWAY MATTERS.

THE directors of the Midland Railway have decided upon covering with a glass roof the down platform of the Chesterfield station from the collector's gate (the usual place of exit for passengers) to the semaphore signal. The work of roofing has been commenced.

On the 1st inst. the Great Indian Peninsula Railway to Sholapore was inspected by the Government consulting engineer and other railway officials, and the line from Mohol to Sholapore has been opened to the public. This section of twenty miles makes the entire length of the railway now opened 315 miles. Sholapore is the place that was chosen for a temporary station till the through line from Bombay to Madras was completed.

On the subject of preventable risk in fast railway travelling, Colonel Yolland, in a report to the Board of Trade (just published) on the accident at Hatfield in April, states that a train at Hatfield, travelling down an incline of 1 in 200 at the rate of sixty miles an hour (a frequent rate of that train at that point), could not have been stopped by the breaks in less than three-quarters of a mile. This, as he remarks, is a very unsatisfactory condition attending fast railway travelling, and such quick trains ought to be furnished with an amount of break power which will enable them to be stopped in a third of that distance: this can be done by means of continuous breaks, which augment the retarding power three or four fold. Two years ago the Board of Trade sent to all railway companies a report of the successful working of such breaks on the East Lancashire Railway, where a train of 90 tons, supplied with 80 per cent. of break power, travelling at the rate of 53 miles an hour down an incline of 1 in 120, was stopped after running 235 yards.

#### DOINGS IN CORK.

THE all-absorbing topic in the capital of Munster is the approaching national cattle show, which is to be honoured by the vice-regal presence; and judging from the enterprising characteristic spirit of the Corkonians, and the preparations made so far, we may fairly anticipate a creditable display.

The exhibition will be held in the corn exchange building, a portion of which, many of our readers will remember, was adapted for the industrial exposition of 1852, after designs by Sir John (then Mr.) Benson. A number of sheds have been erected, with promenades between of 20 feet in width, and with ranges of stalls on either side. These will be decorated with striped calico in various colours, and flags of all nations interspersed throughout the yards. Externally there will be a gay dressing of the main building likewise. Two drinking-fountains will be placed in the implement yard, also two ornamental *jets d'eau*, with catter-troughs at base, in the promenades; and a fountain jet supplied with five gallons of *eau de Cologne* before the table allotted for his Excellency in the dining-hall, which will accommodate 350 persons. The ceiling of this apartment will be decorated also with striped calicoes, and the columns with festoons of evergreens and banners. A new supper-room of permanent character, 90 feet by 30 feet, and 18 feet to the eaves, and to accommodate 250 persons, is being built. The statue of William Pitt will form a conspicuous feature in this apartment.

Numerous English, Scotch, and Irish manufacturers of eminence have secured space in the implement department, which will embrace many other classes of goods besides those of a purely agricultural character.

We have little else to chronicle in the way of building improvements here; indeed, save the new St. Patrick's-bridge and the R. C. Church of SS. Peter and Paul, both in progress of construction,—matters are somewhat at a stand-still, and the builder's mission seems to have dwindled into a state of nothingness. The new bridge, which, between the abutments, will be 185 feet, and consist of three elliptical stone arches surmounted by balustraded parapets, and having a breadth of 60 feet at roadway level,—will supply a desideratum and verify the proverb, that “out of evil cometh good.” It is being built under the direction of Sir John Benson by Mr. Hargreave, contractor; Mr. Barnard, clerk of works; and will cost some 15,000*l.* We must remark, *en passant*, that the architects (Messrs. Pegin & Ashlin) of the new church above alluded to, can hardly congratulate themselves on the site of the structure, completely hemmed in as it is by the backs of houses on all sides.

#### THE WESTMINSTER PALACE HOTEL COMPANY.

MR. S. C. HALL, a member of the Board, has printed a letter to his brother shareholders “concerning the position, past and present, and the future prospects, of the Westminster Palace Hotel Company,” which, whatever reply the other directors may have to portions of the charge, shows proceedings on their part, unusual, illegal, and little calculated to inspire confidence, or lead to a satisfactory result. We must set Mr. Hall right, however, on one point—

“The dismissal of Mr. Burchell was, he says, but the beginning of the end; the surveyor and the clerk of works were to be ‘got rid of’ also; and some time before the extraordinary meeting of the shareholders, a written question was put to the architect as to whether he could dispense with the services of the surveyor and the clerk of works. It was akin to asking the wolf if dogs were needed for the protection of the flock; inasmuch as both these officers were guardians of the company, as against the architect and the builder. The clerk of works was expressly appointed by the board with that view: he was appointed in direct opposition to the wish of the architect, who claimed and contended for the right to such appointment. The answer of the architect was of course pre-arranged: it was simply the one word ‘Yes.’ The dismissal of these gentlemen did not, however, then take place, although they have since been so dismissed—an event in all respects deplorable, and to which I shall presently advert.”

Without knowing whether the dismissal was judicious or right, it is necessary we should say that the duties of the measuring surveyor and the clerk of works are to carry out the views of the architect and to assist him,—not to protect the employer against him. The moment a committee, or board, or individual employers, cease to have confidence in their architect,—begin to believe that he has any object in view above the protection of their interests, the sooner they separate the better for them, the better for him, the better for all.

However, this is in no degree a reply to Mr. Hall's pamphlet. He has been from the first an indefatigable member of the Board, and led his friends to take shares representing a tenth of the whole capital required. He objects altogether to the arrangement which has been made with the India Board, and the way in which it has been made. He denounces the proceedings of the Board as showing “a thorough incapacity for business,” and concludes by calling on the shareholders to attend the half-yearly meeting on August the 6th, and add to the Direction three or four members. I trust, he says,—

“That they will be themselves large shareholders, gentlemen of position and high character, and men of business; who will, by their ability, assiduity, and business habits, not only relieve you from danger, but soon and greatly improve your circumstances, and conduct this hotel for the advantage of the company, which the present board, so little aided by the business element, cannot do.”

#### THE NEW BANK AND EXCHANGE BUILDING, VIENNA.

CONFINED space in the old building of the National Bank, in Vienna, and the want of a proper exchange for merchants in that city, induced the directors to undertake the new building, for which purpose they purchased the houses belonging to Count Traun, situated between the Herren Gasse, opposite their present place of business and the Freyung, and had them pulled down to afford a site for the new building.

Several architects of the city were invited to send in designs in accordance with a programme, drawn up by the bank directors—among them, in August, 1855, Ferstel, who was then at Florence, but forthwith returned to Vienna, passing through Venice, and who endeavoured to embody in his design the artistic impressions he had received

in these two Italian cities. He had the honour of having his design selected, and the superintendence of the building was entrusted to him in the beginning of the year 1856.

Unavoidable circumstances required modification in the plan, by which the area of the Exchange Hall was increased from 140 to 160 square fathoms, and the other rooms and passages became necessarily contracted. Necessity, however, demanded these alterations.

In addition to the great irregularity of the ground plot, the difficulty had to be encountered of partially using the old locality, and of not interfering with the neighbouring houses; so that while the building next the Freyung was roofed in in 1856, the last pulling down and getting in the foundations, towards Count Harrack's Palace, were warily taken in hand, in the winter of 1857-58, and great difference was found in the depth to which the foundations had to be carried. The whole was roofed in in 1858, and the interior finished in 1859. The bazaar was opened October 3rd, and by the end of the same year the bank buildings could be brought into use. This summer the decoration of the Exchange Hall and of the coffee-room will be complete, and the whole building in use.

The arrangement of the whole building, and the purposes to which it is appropriated, are shown in the *Bauzeitung* (1 Heft, 1860), from which admirable periodical we have engraved the view in our present number, and have gathered these particulars.

The governor of the bank, Herr Ritter von Pipitz, desired that with strict economy, and avoiding useless luxury, the building should be carried out with solidity, and artistic as well as technical completeness, corresponding to the object of its erection, and to the dignity of so rich a national institution.

With the view of employing *genuine materials*, it was intended to use brick, with glazed coloured, and unglazed courses, &c. for the fronts, but the result of the trials not being satisfactory, free stone was chosen for all the fronts, as well as for the internal works. All carved ornament is wrought in stone. The stone was taken from different quarries, and varies in hardness according to the position in which it is used in the building. The balusters of the principal stairs are of marble. Polished stone is used for columns, pilnths, and walls, in the Exchange Hall. In the coffee-rooms the columns are of polished stone, the walls in stucco to represent grey marble. *Natural* and real woods are used; oak for the windows and doors. The bank directors' room has a ceiling of carved oak, gilt and coloured; the wainscoting is of the same. The ante-hall of the Exchange, and the ante-hall of the bank directors' room, have ceilings of soft wood.

The floors are most substantially constructed of wood and iron. Hollow bricks, on rolled iron bearers, 3 to 4 feet apart, form the arched ceilings of the bank offices. These arches are plastered underneath to form a flat ceiling. The bearers are 9 inches deep, 53 lines thick. The top and bottom flanges are 2 inches 9 lines wide, and 5 lines thick. Such a bearer, 22 feet long, weighs about 395 pounds, and costs about thirteen florins, say a guinea English the hundred pounds. The glass roofs have wrought-iron bars.

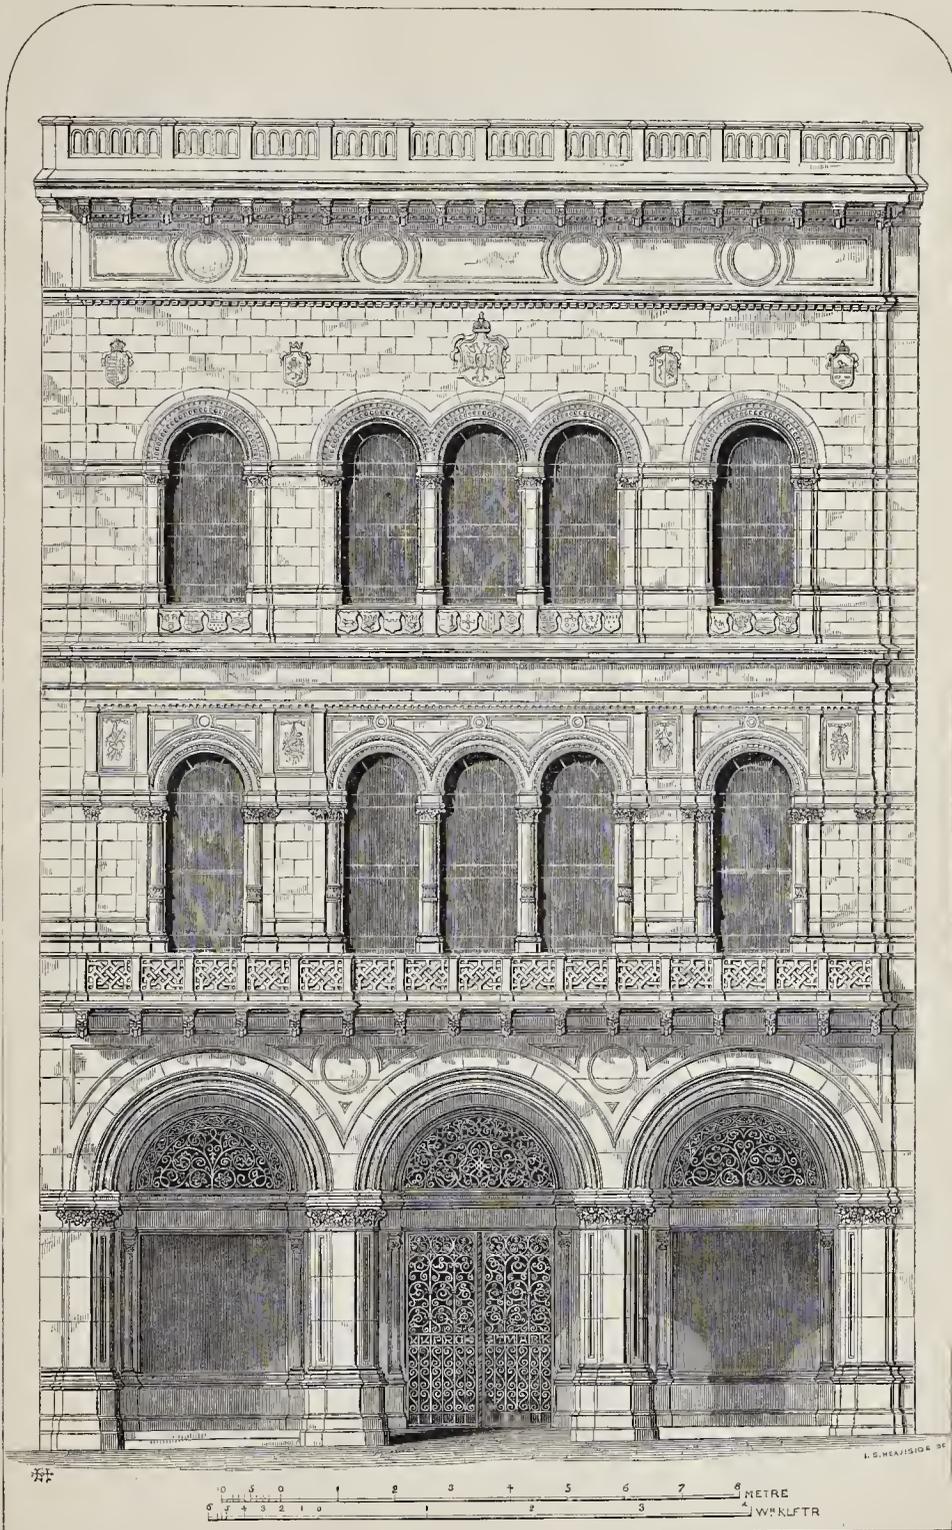

The walls of the passages and staircases are covered with solid, smooth cement work; those of the Exchange Hall in its lower portion, and of the coffee-room, with stucco-marble. The vaults of the vestibules, staircases, and halls, have ornamental fresco painting. The ceiling of the great Exchange Hall is of wood, and appears a piece of solid joinery, carried by strong beams. Bronze and brazier work are introduced in the doors of the hall, and in other places *red bronze*. The fittings and furniture correspond. There are leather hangings in the bank directors' room, after designs by the architect.

In the same room there is a chimney-piece of Porto Venero marble, with bas-reliefs of Carrara marble, with oil paintings, and bas-reliefs in pear-tree wood.

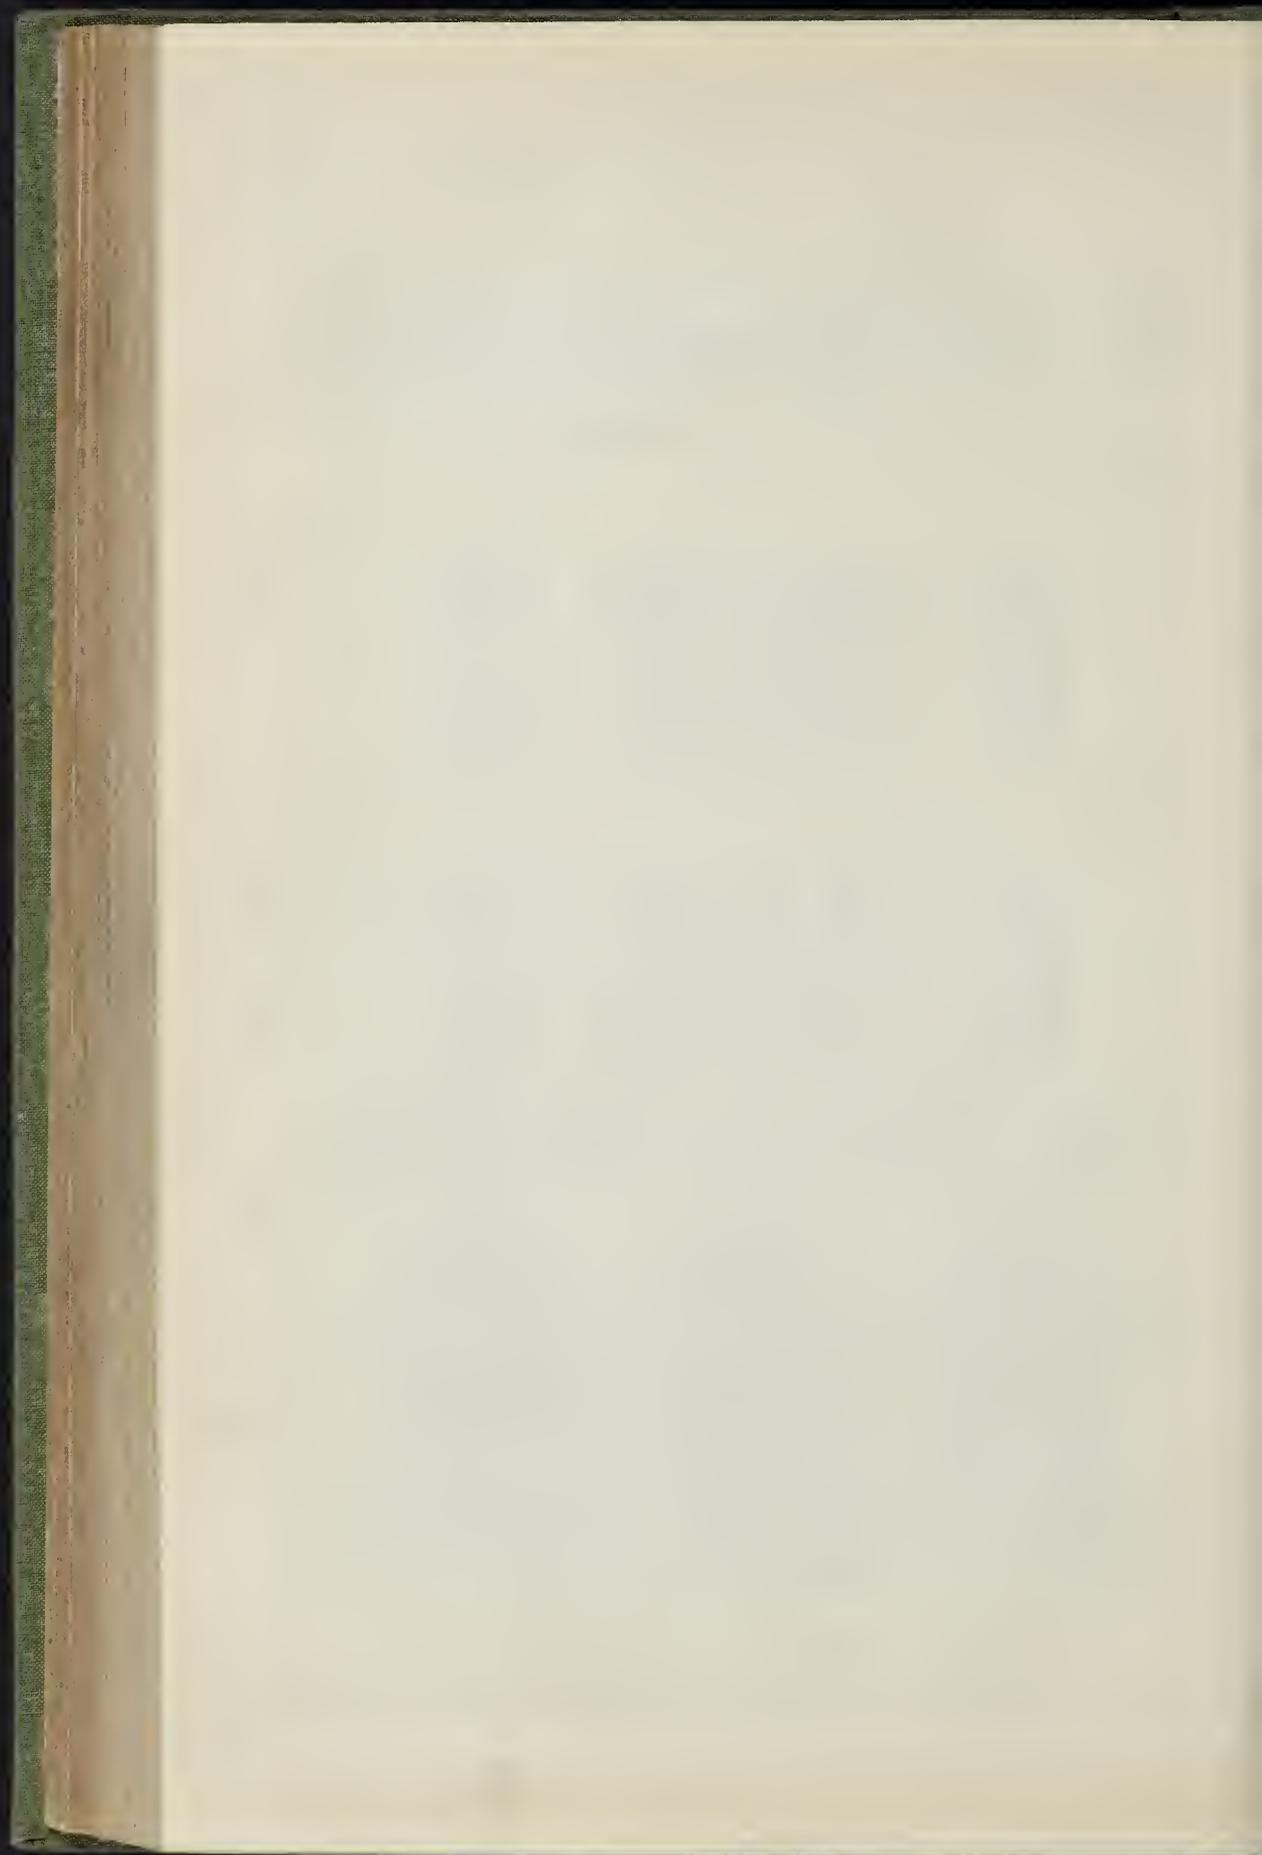

In the bazaar staircase fresco painting is introduced, and in the Goods Exchange Hall there are bas-reliefs in stucco. Further works in stone and bronze have been agreed upon.

The cost of the whole building, together with internal fitting and embellishments, will amount to 1,400,000 florins, or, at twelve florins to the *l.* English, 116,667*l.* The plan is curious and suggestive.

Herr Ferstel is the architect of the Gothic *Gotiv Kirche*, at Vienna, praised by Mr. Tite in his address to the Royal Institute of British Architects, of November 7, 1859.

THE NEW BANK AND EXCHANGE BUILDING, VIENNA.—HERR HENRY FERSTEL, ARCHITECT.

**OSWESTRY CEMETERY COMPETITION.**

The competitors are about twenty in number. Nearly a dozen have written to members of the Burial Board, so that the adoption of mottoes is a joke. One correspondent says,—"The following is the closing paragraph of a signed circular forwarded to members of the Board. Do not architects, so writing, place themselves in the position of common shopkeepers?"

"We shall be happy to modify our plans, or prepare other designs more in accordance with the wishes of the Burial Board; or should our designs be generally approved, and other competitors' drawings exhibit points liked by the Board, we would not object working in conjunction with such competitor, if required."

**SCARBOROUGH WESLEYAN CHAPEL COMPETITION.**

In answer to advertisement the committee received upwards of thirty designs, and, after consideration, those bearing the motto "Truth prevails" were selected, and were found to be from Mr. W. B. Stewart, architect, of that town, who has since received instructions from the committee to prepare the specifications. The design is Italian, with Corinthian portico, pediment, and four staircase towers, the two in front carried up considerably above the roof; the whole to be faced with Whitley stone. (The original design, to cost 3,000*l.*, did not include columns and towers.) The whole congregation in the body of the chapel sit facing the minister direct. The body of the chapel is to be lighted by three sun-lights in the ceiling. The ventilation of the edifice is to be assisted by the windows: a piece of finely-perforated zinc is to be attached to the upper sash, so that, when the same is lowered, the zinc is drawn down with it from above the window head, filling up the aperture. The ventilation of the lecture-room it is proposed to assist by means of a revolving fan, placed in the roof, and worked by a descending weight, all the ventilating flues from the lecture-room being drawn together and connected with a case in which the fan works. The chapel is to accommodate 1,200 persons, allowing 1 foot 9 inches for each sitting, and 2 feet 9 inches for the width of the pews. The second premium was awarded to Messrs. J. & D. Petch.

**PROPOSED LONDON, CHATHAM, AND DOVER RAILWAY.**

The fight which has been going on, first before a committee of the Commons, and now before a committee of the Lords, has cost thousands of pounds. We take from the evidence given by Mr. Joseph Cubitt, engineer of the railway, before the Lords, the following particulars, showing the direction of the line.

The line, he said, was considered by Mr. Turner and himself with a view of giving relief to the streets, and proving an independent access to the city of London, the terminus being in Farringdon-street. There was one portion of the line called the Beckenham Station, with which they proposed to make a junction, and so pass on under the Brighton railway to the Sydenham station by means of a girder bridge. There would be no difficulty in doing that, and it was constantly done by other companies. They then proceeded to Dulwich, near the Alleyne's Head, over the property of Dulwich College, and so on to Herne-hill. The carrying of this line through that property would greatly increase the value of it; and, as it would increase the value of the property, it would increase the benefits of the clarity. The City section commenced at Herne-hill, passing over Cold Harbour-lane by a bridge, and from thence on a viaduct all the way to Farringdon-street. It would pass through Camberwell, Walworth, and Newington, with a station near the Elephant and Castle. From there the line passed over the New Kent-road, Newington-causeway, the Borough-road, and Friar-street, crossing the new street proposed to be made by the Metropolitan Board of Works from London-bridge to Stamford-street. From Green-street the line would go on by Holland-street, crossing the Thames by a bridge about 40 feet to the east of Blackfriars-bridge, the bridge to be 945 feet in length, including the abutments. He proposed a plan for making the bridge of nine arches, but that had not been determined. The line then skirted the houses on the east side of Bridge-street, crossing Ludgate-hill by a bridge 18 feet high, and from thence to the site of the old Fleet Prison. The bridge over Ludgate-hill was to be subject to the approval of the City authorities. The bridge over the Thames will be wide enough to take three lines of railway,

The three lines will extend to Charlotte-street, Blackfriars-road. The total length of that line will be 4 miles, 3 furlongs, and 2 chains. The line from Farringdon-street would proceed to Skinner-street, and there form a junction by a gradient of 1 in 40, with the Metropolitan Railway. That railway is an underground railway, and to get at it they were compelled to adopt that gradient. There would be no difficulty in working that railway with a junction of 1 in 40, as it would never be worked at a high speed. Whatever gradient it was, as the bridge over Ludgate-hill was fixed by the City authorities, they had no alternative to get a junction with the Metropolitan Railway but by the plan proposed. There would also be a short branch to the proposed dead-end market under Smith-field-market, the length of this branch being one furlong and fifty chains. Another branch line commences at Herne-hill, and runs by Manor-road, at Brixton, where there would be a station for the benefit of the inhabitants of Brixton and Stockwell. It would then go on to Clapham, over the Wandsworth-road, and under the South-Western line at Stewart's-lane. It then went on to the West-end and Crystal Palace Railway at Pimlico. There will be a permissive communication at Stewart's-lane with the South-Western Railway. This junction is approved by the South-Western Railway Company. The worst gradient on the line would be 1 in 200. The length of the viaduct on one branch, No. 3, was 1,300 yards. He had great experience in making viaducts, and by means of those proposed it would afford almost an omnibus route from all parts to the City. There would be six stations on the line. The estimate for the whole of the works of the line was 1,650,000*l.*, 930,000*l.* for land, and 720,000*l.* for works and stations. There was a proposition for a branch to the Crystal Palace, but that was violently opposed by the Brighton Company, who have a monopoly of the traffic to it, and it was cut off by the committee of the House of Commons. His estimate of the cost of that branch was 12,510*l.* As to the Farringdon-street station, that was now clear, but they proposed to take additional property.

**THREATENED DESTRUCTION OF THE HEREFORD TOWN HALL.**

In a few numbers back we lamented the rapid destruction of our national antiquities, and the want of taste and spirit which dictated such removals. We have now to record that it is in the contemplation of the Hereford city authorities to remove the remains of the interesting old wooden Townhall, standing in the centre of High-square, in that city.

This building is one of the largest of the kind erected in the kingdom. It measures 80 feet by 34 feet, and is supported on twenty-seven oak columns, having bandsomely-enriched spandrels and pendants, which, together with the interior of the hall above, remain in a perfect state at the present time. It is to be hoped that the authorities will pause before they consign to destruction so curious an edifice.\*

**THE STRIKE IN COVENTRY.**

GREAT distress, we regret to hear, prevails amongst the ribbon weavers of Coventry. More than 10,000 hands have turned out from their employment, and are wandering in the streets. This has been brought about by the change in our tariff with France, which in other ways will cause temporary trouble to various departments of trade. In the case of the Coventry ribbon weavers, it seems that the reduction of the duty on ribbons has led to the introduction of a quantity of French goods, of such quality, and at such prices, that those heretofore obtained for the English manufacture cannot be had, and the masters assert that they are obliged to abandon the prices which for some years past have been given to the men. The masters have also determined to pay weekly instead of by piece-work. The men have in consequence struck, and every loom is silent.

This dispute at the present time is most unfortunate, and if not settled will lead to disastrous results. Misfortunes which fall upon an individual induce feelings of commiseration, and these are naturally increased in proportion to the extent of the evil. A strike, it is to be feared, will not mend matters, at a time when both masters and men should be using every exertion to compete with the foreign maker; and if intelligence and right feeling on all sides are not used, the ribbon

weaving trade will be lost to us. The new trade treaty is formed with a view towards the general benefit of both nations. In all such changes a certain amount of suffering must unfortunately be the result. In the matter of ribbons, the price of that commodity has been much reduced to the whole of the millions who form the population of this empire.

This saving it will be said is dearly earned at the sacrifice of so many persons—the impoverishment and ruin of so many homes. It does not seem to us, however, that this need be the case, provided that proper means are used to place the trade in a right position. Examining samples of ribbons for which there is the chief demand, it is seen that in the French patterns the colours are more harmonious and the patterns more tasteful than in our own. Nor is this to be wondered at when we consider the artistic education which has long been general in France. The change which has taken place should cause every exertion to be made to improve the defects of the artistic part of the English work, and the ribbon weavers must take advantage of the facilities which are to be had in England for manufacturing purposes, and of the powers which can be obtained through the advanced condition of science. If that be not done, the ribbon weavers will fall into the same condition as the silk weavers of Spitalfields. On the contrary, if proper endeavours and improvements are made, there seems to be no reason why we should not be able successfully to compete with the French, not only in our own country, but in the other markets of the world. In order, however, to ensure success, both masters and men must get rid of old-fashioned ideas, and work with that determination to succeed which has, in so many other instances, raised up struggling branches of industry into prosperous conditions, which have given employment to increased thousands, and added largely to the national wealth.

The spring reports of the factory inspectors show that wages for sixty hours a week are now higher than they were twenty years ago for sixty-nine hours in the week: new mills have sprung up, and hands have become so scarce that machinery has stood still from the want of them. It was not long since thought that the introduction of machinery would prove the ruin of the cotton-spinners: how different, however, have been the results—how vast has been the increase of cotton-spinning, and how improved is the condition of the work-people.

There is much intelligence in Coventry: the application of steam machinery has increased; but great work has yet to be done there; which, if properly carried forward, will do for ribbon weaving what has been so successfully carried out in other large branches of English manufacture. A strike, however, under the present circumstances, seems little better than madness.

**THE DRINKING-FOUNTAIN MOVEMENT.**

London.—In the Green-park, nearly opposite Coventry House, a series of three drinking-fountains has been completed. It is the gift to the public from a benevolent lady of rank, and was designed by Mr. Sydney Smirke, R.A., who likewise superintended its modelling and subsequent execution. In the centre of the composition is a die or pedestal, upon which rests a vase having carved enrichments of fruits and flowers. Below and around the pedestal are three capacious basins, into each of which a stream of water of uniform volume is poured through a lion's mouth. The structure is made of Roach Abbey stone, and was erected by Messrs. Edwardes & Co., of Newman-street, Oxford-street.—In Fleet-street, near St. Dunstan's church, a drinking-fountain has been opened, thus inscribed:—"The gift of Sir James Duke, Bart., M.P., Alderman of this Ward, elected Lord Mayor, 1848," and "Elected Member for London, 1848."

Newbury.—A sum of 40*l.* having been obtained, the work of erecting a fountain here has been commenced. The site chosen is in the centre arch of the Mansion House, facing the church. The basin is of marble, and the water will issue from a tap above it.

Bristol.—Another public fountain is being erected in front of the Counterslip schools, at the top of Temple-street. It is of carved freestone, with a metal basin.

Leek.—Three fountains have been lately erected in Leek. One erected in Buxton-road is the gift of Mr. J. Brough. It is supplied from a pure spring upon the spot, called Duxton Spout. The other two fountains were given by Mr. C. Pliat. They are situate in the

\* A view of the hall in its original state will be found in Clayton's work on "Ancient Timber Edifices."

centre of the town, one being in the Market-place and the other at the end of Church-street. To this fountain is added the necessary apparatus for watering cattle and dogs.

**Edinburgh.**—A sum of 90*l.* has been forwarded to the magistrates by Mr. Dunlop, of Brockloch, for the erection of three granite fountains in this city; and the fountain committee have fixed on the sites,—one on the road leading from Princes-street to the Mound, between the East Princes-street-gardens and the Royal Institution; the second at the foot of the Calton-hill stairs at the end of Waterloo-bridge; and the third at the north end of St. Patrick-square. These fountains were all ordered from Aberdeen.

#### PROVINCIAL NEWS.

**Worcester.**—At the last monthly meeting of the committee of Lunatic Asylum visitors five tenders were received for the building of the infirmary ward; that of Mr. S. Jones, Lewesmoor, for 2,338*l.* being accepted. There were several other tenders, the highest of which was 3,521*l.*, showing a difference of nearly 1,200*l.* The work was ordered to be proceeded with as soon as practicable. Mr. Warrington is proceeding with the water-tower contract.

**Crickhowell.**—The opening of the new bridge which has been erected over the river Usk, at Llangrwyney, near Crickhowell, was celebrated by a public dinner, held at Llangrwyney. The bridge has been erected by a proprietor, under the Limited Liability Act, at a cost of 2,378*l.* The principle of the bridge is that of the lattice-girder, the river being crossed by a main span of 145 feet, in addition to which there are two flood arches of 50 feet span each. The whole of the materials used are iron, with the exception of the roadway, which is timber. The contractor was Mr. John Hughes, of Newport; the work has been mostly carried out under the superintendence of his assistant, Mr. John Morgan, who is at present engaged on the Merthyr and Abergavenny railway.

**Darlington.**—A covered market having been considered necessary for the increasing wants of this town, the Local Board of Health, some few months ago, offered 100*l.* for the five best designs for a covered market, in sums of 50*l.*, 30*l.*, and 20*l.* The result was that there were thirteen competitors, some of whom sent two designs each, and the designs have been exhibited in the Mechanics' Hall, for the inspection of the public.

**New Byth (Bauflshire).**—Contracts have recently been entered into for the erection of a new school-house and schoolmaster's house at New Byth. The buildings are to be erected after a design furnished by Messrs. Reid, Elgin, and the cost of the buildings will be about 600*l.* The contractors are, for the mason's work, T. Whyte, Pligair; carpenter's work, J. McAndrew, Turrie; slater's work, A. Walker, Band; plasterer's work, R. McKenna; plumber's work, W. Duthie, Band. The school is to be in connection with the Church of Scotland, and the Privy Council give a considerable portion of the funds necessary for the erection.

#### CHURCH-BUILDING NEWS.

**Islington.**—St. Thomas's Church, Islington, was consecrated last week. The church is situate in Hemingford-terrace, a little to the east of the Caledonia-road. The edifice is in the Decorated Gothic style, and consists of a nave and chancel 87 feet long and 27 feet wide, with north and south aisles of about the same length and 12 feet wide. The aisles and west end of the church have galleries, which are approached by stone staircases at the ends of the aisles. The principal entrance to the church is through a deeply moulded and recessed double doorway on the north side. The nave is divided into five bays, supported by columns alternately circular and octagonal, with high pointed arches. The chancel arch, 45 feet in height, is carried one day westward into the nave, at the steps of which stand the stone pulpit, of an hexagonal shape, with carved panels and columns at the angles, with sculptured angels and foliage introduced. At the east end of the chancel, and occupying nearly the whole of the wall, is a large five-light window. At the west end of the church is a large circular window of the same diameter, and filled with tracery. The whole of the windows are filled with green cathedral glass, with white glass borders, except the large circular portion in the east window, which has been filled with stained glass containing the subject of our Saviour's resurrection, by Mr. Warrington, the gift of the architect, being one of a series of subjects intended to

illustrate the life of our Saviour. The whole of the roofs are of stained lead open framing, and the height of the nave is 57 feet. The church is built of Kentish rag-stone, from the design of Mr. Arthur Billing, at a cost of 3,375*l.*

**Rochester.**—The ratepayers of the parish of St. Nicholas, have resolved to have the church of St. Nicholas altered according to plans by Mr. Gough, architect. The contemplated alterations include the erection of a gallery and re-arrangement of the seats in the body and chancel of the church, by which a number of additional sittings will be obtained. The sum required to make the whole of the alterations will be about 1,400*l.*, to be raised by voluntary contributions. About 500*l.* have been already subscribed.

**Elm (Cambridgeshire).**—Elm Church, after having been closed some time, was reopened on the 3rd July, by the Dean of Ely. The fittings are in English oak. Mr. S. S. Teulon was the architect, and Mr. Brown, of Lynn, the builder.

**Pontardawe.**—The Church of Pontardawe, South Wales, according to the *Cambrian*, is now completed. The architect is Mr. Baylis, of Swansea. The style is Decorated Gothic. The pulpit is carved, and embellished with figures of several of the Apostles. The steeple and tower, 200 feet high, are seen from Swansea, a distance of eight miles.

**Birmingham.**—The want of a commodious place of worship in the rapidly-increasing suburb of Selly Oak is about being supplied by the erection of a church, from designs by Mr. Holmes, of Birmingham, architect. The foundation stone of the edifice has just been laid. The church, according to *Aris's Gazette*, will be cruciform in plan, having a nave 70 feet 6 inches long, and 21 feet 6 inches wide, with north and south aisles, 11 feet 6 inches wide; north and south transepts, 20 feet 3 inches wide, and 21 feet deep; and a chancel, 32 feet long and 20 feet wide; with a vestry and organ chamber on the north side, and an aisle for children on the north. A tower, with a spire, is to be placed at the west end of the north aisle: the height to the top will be 145 feet 6 inches. The extreme height of the nave roof will be 46 feet. Sittings will be provided for 617 persons, viz.—263 free, 172 for adults, and 182 for children.

The style adopted is the Early Decorated, and the materials for the walls are to be bricks, faced with Promogrove stone, and Bath stone for the tracery, the dressings, and the spire. The nave, chancel, and aisle arches and columns are to be of Bath stone, with Wooley Castle stone introduced in the arches.

To improve the effect, marble shafts are to be used under the chancel arch, and in the sedilia. Bands of Wooley Castle stone are also to be introduced at intervals on the inside of the walls, thus forming a contrast to their plastered surface. The roofs will be open timbered, stained, and varnished, and plastered between the rafters, and will be covered with tiles laid in patterns. The seats will be open, no distinction being made in appearance between free and appropriated. It is proposed to fill the principal windows with stained glass: several have been already promised. The work is being carried out by Mr. S. Briggs, of Birmingham.

**Letchford (near Warrington).**—On Tuesday, the 10th, the foundation stone of the New Baptist Chapel, at Letchford, about to be erected to supply the place of the old "Barn Chapel," at Stockton Heath, was laid by Mr. Aaron Brown, of Liverpool. It is situated in Aekers-lane, near the Warrington and Stockport railway, on a plot of ground purchased from Mr. Barber. It is intended to be of the Italian style, 58 feet by 35½ feet, and will seat, in the body of the chapel, about 240 people. There is to be a gallery for the Sunday School children, and vestries. The cost of erection will be about 600*l.*, towards which 400*l.* have been subscribed by the congregation and friends in the immediate neighbourhood, leaving 200*l.* yet to be raised. Mr. T. Mollard Reade, of Liverpool, is the architect of the building.

**Stockport.**—The Roman Catholics of Stockport are about to build a new church, near the schools lately erected by Messrs. Hadfield and Goldie, who are also the architects for the proposed church.

**Manchester.**—The foundation-stone of a new Independent church and schools has been laid, on a plot of ground fronting Chorlton-road, Moss Side, and near to the toll-bar. The total cost, including the site, will be about 6,000*l.* The general plan of the chapel is a parallelogram, 85 feet 6 inches by 40 feet in the clear, with semi-octagonal transepts, 23 feet 6 inches wide by 15 feet 9 inches, and an apsidal recess, 22 feet wide by 19 feet deep at the west end. Behind the church, and at the

sides of the apse, are the minister's and deacons' vestries, cloak-room, stairs, corridor, and school-entrances; infants' class-rooms, room for prayer-meetings; and two class-rooms. The school is rectangular in plan, 57 feet by 26 feet, and is on a story above the class-rooms, approached by staircases. The building will be erected in the Decorated Gothic style. The walls are of Yorkshire parpout, with Hollintun stone dressings. The east front is divided by buttresses into three portions, the outer compartments being slightly recessed, and having a single-light window in each. The centre division has a large five-light window, the upper part being filled with tracery. Over the large window is a quatrefoil opening, serving as one of the ventilators to the upper part of the roof, and surmounting the whole is a stone cross. The south buttress is made to project, and is pierced with a window, so as to form the side of a porch which gives one access to the church. At the north-east angle of the building is the main entrance, formed in the base of a tower standing out from the main building, measuring, in the interior, 10 feet by 10 feet. The tower has buttresses at the angles, the space left by their intersection being filled by stone spilays. The internal entrance to the tower is designed to be exactly central, with a corridor that runs across the church from north to south to the porch entrance before referred to, which corridor gives access to the aisles of the church. The tower is pierced in its upper stages with small rose windows and two-light windows, as well as lucerne lights in the base of the spire, which rises over the whole to the height of 116 feet from the road level. The sides of the church are divided into bays by buttresses, covered with water-tables, and between the buttresses are two-light windows. The visible access to the school is covered with a turret, 60 feet high, which gives character to that portion of the building. There will be red and black paving to the passages. The roof will resemble that of a vaulted building, with groined arches, these terminating on carved stone corbels. The sides of the apse are pierced with windows, intended to be filled with stained glass. The church will have accommodation for about 700 persons. The contract has been taken by Messrs. Young & Co., of Oxford, at the sum of 4,377*l.* 10s. Messrs. Poulton & Woodman, of Reading, are the architects who designed and are superintending the erection, their design having been selected by the committee in competition.

**Barnworth (Manchester).**—The corner-stone of Barnworth New Wesleyan Chapel has been laid. The cost of the building is estimated at 6,000*l.*, the accommodation being to seat 1,200 persons. Mr. Coope, of Leeds, is the architect.

**York.**—A new Roman Catholic Church is about to be erected in Blake-street, York, on the line of the intended street from the railway station to the Minster. Messrs. Hadfield and Goldie have been appointed the architects.

**Glasgow.**—The foundation-stone of the Seamen's Chapel, to be erected in Brown-street, by the Glasgow Seamen's Friend Society, has been laid by the Lord Provost. It is estimated that the building will cost somewhere about 1,500*l.*, and it has been designed to accommodate between 400 and 500 persons.

#### STAINED GLASS.

**Gloucester Cathedral.**—Messrs. Clayton & Bell, of London, are erecting the glass of the memorial window, in Gloucester Cathedral, to the memory of the late Sir B. W. Guise, bart. The subject is the Coronation of Henry III, which took place in the Cathedral in 1216. The state of England at that time was distracted by the wars of the barons, and it was the interest of one faction to get the king, who was then only ten years of age, crowned as early as possible after the interment of King John at Worcester; and as, in their hurry, they could not send to London for the crown, the youthful king was crowned with a golden bracket taken from his mother's arm. This will be represented. The window has also the armorial bearings of the Guise family, who claim to be descended from one of the barons who were present at the coronation.

**St. Paul's Church, Warwick.**—Two memorial lancet windows have just been fixed in this church. They have been executed by Mr. Holland, of Warwick. One light contains a female figure in the act of devotion. The other light represents figures of six children, deceased, supported by angels ascending to Heaven.

**Aleston Church, Stratford-upon-Avon.**—Two lancet windows have been fixed in this church, by Mr. Holland, of Warwick. The first light con-

tains a female figure as "Resignation," and the other a subject representing "Our Saviour's Ascension."

A VOLUNTEER RESERVE.

SIR,—I beg to send you a proposal for a volunteer "reserve," designed to meet the views of the unostentatious, and men of moderate means throughout the country.

1. That a volunteer reserve be instituted.

2. That this reserve shall require a special call for service in the field.

3. That the annual subscription shall accumulate, and be devoted, in case of danger, to the equipment of those of the reserve desiring to join the regular corps, and also contribute to the support of the National Rifle Association.

4. That the accumulating funds of the reserve be under the management of the National Rifle Association, provided the committee of that institution could in some measure be made representative of the reserve.

5. That the companies of the reserve be attached to the local corps, in the councils of which the senior captain of the reserve companies only shall have a voice, and that only when attached.

6. That the annual subscription shall be one guinea; the uniform a cap, blouse, and belt.

W. CAVE THOMAS.

THE CATHEDRAL OF ST. PATRICK, DUBLIN.

SIR,—It has been frequently stated, and as often denied, that the extensive works here are being proceeded with without efficient professional superintendence, if any. Can any one throw any light on the subject? Or, if the Dean and Chapter and Mr. Guinness have been unjustly accused, can any one name the gentleman or gentlemen to whom has been entrusted the delicate task of renovating and restoring the most perfect remnant of Medieval glory in this country.

DEILA.

\*.\* We have every reason to believe that there is not any architect superintending the works at St. Patrick's Cathedral, although the donation of Mr. Benjamin Lee Guinness for its restoration is £20,000; and it is understood that if that amount be insufficient, more funds will be forthcoming from the same quarter. The builder (Mr. Timothy Murphy) appears to be proceeding partly on plans made some time ago. The sooner a proper architect he appointed, the better, or Mr. Guinness, instead of doing the good he desires, and gaining the credit his liberality deserves, may find himself justly reprobated or ridiculed for his share in an injurious vandalism.

THE AUTHOR OF "ANCIENT ARMOUR," AND THE TOWER.

SIR,—You may think it unnecessary to reply to Mr. Hewitt's letter in your number of the 7th instant, denying your assertion that he had defended the purchase of forgeries for the Tower. I hope, however, you will not object to receive a few words, in the interest of truth and our national collection, from an outsider. The hardihood displayed by Mr. Hewitt in this letter is nothing less than remarkable. You referred, of course, to the famous winged hurgonet, which he now admits not to be genuine. When did he make that discovery? Certainly not till after it had been exposed in the *Builder*, when he had exhibited it as *genuine* at a meeting of the Archaeological Institute, and furnished the council with a paper on it, which is printed in their journal (with a plate of the helmet). Upon the notice of it in the *Builder* as a modern fabrication, he wrote a furious letter in its defence, wherein he says, "If there is any point of suspicious work about it, let your correspondent point it out." Was he not aware of the doubt thrown upon it when he so ostentatiously exhibited it? and is not his letter to the *Builder* a defence of it after positive exposure? It is true he abuses the dealers; but as Mr. Falck told him, in his letter to the *Builder*, it is the people at the Tower who ought to know what is *genuine*, and therefore not to be taken in by dealers, as they were upon that occasion, and have been, too often; while their constant rejection of valuable and unique articles has shown the utter want of knowledge and discretion in them and their advisers, amongst whom Mr. Hewitt is avowedly the most important, attending sales for them, making journeys for them (*vide* his letter), and now drawing up their "official catalogue," in which, by the by, his determination to ignore Meyrick is curiously illustrated. He is compelled

in his preface to mention the re-arrangement of the armoury by Dr. Meyrick, by whom "many improvements were effected;" but at page 6, where he describes the fine suit of Henry VIII. (No. 8), he speaks of the engravings by the late G. Lovell, Esq., published in the "Archæologia," with great praise, but says no word of Meyrick's work, elaborate, and valuable paper upon it, which they were engraved to illustrate! Dr. M. having been the first person who called the attention of the public to this magnificent suit, and the interesting circumstance of its being a presentation one on Henry's marriage with Katharine of Aragon, a suggestion which Mr. Hewitt complacently adopts, without the least reference to the original promulgator.

I repeat that the hardihood shown by Mr. Hewitt in his last letter to you is nothing less than remarkable.

A LONDONER.

LE PROPHETE AT COVENT GARDEN.

The production of Meyerbeer's "Prophète" by Mr. Gye is an event. It is so large and remarkable a work, that all who are interested in good music, good singing, good acting, and good scenery, should see it. Mademoiselle Gilling, although somewhat inferior to her predecessor, Madame Viardot, is an admirable *Fidès*; and Tamherlik, in his singing of *Jean de Leyden*, leaves nothing to be desired. The action of the drama passes, as most of our readers remember, first in Dordrecht and Leyden, in Holland, and afterwards in Munster, about the year 1536. Mr. Beverley has put forth all his strength, and has produced some exquisite pictures; including a scene near Dordrecht, with castle and mill; the frozen lake, with Munster in the distance; and a square in Munster, with well in foreground; and the interior of the Cathedral, with preparations for the coronation of the prophet. The excellence of the painting, the number and grouping of the persons engaged, and the dramatic situation, render this latter one of the most remarkable scenes that has ever been witnessed.

The Floral Hall has been again put to use for a flower show. Seen lighted after the opera, the effect is very charming.

PAWNBROKERS AND THE POORER CLASSES.

SIR,—A recent enactment is at the present time causing much angry feeling in some of those districts of the metropolis which are inhabited by the poorer classes. Believing, however, that this measure is likely in some respects to add to the comforts of the poorest class, it may be useful to state the facts. Before the new Act was passed pawnbrokers would receive articles and lend upon them so small a sum as 3d., 4d., or 6d.: in some instances downright poverty compelled persons to take the last remaining article of clothing belonging to themselves or children, and pledge it for the purpose of providing bread or firing; but in the great number of instances these articles of the last necessity were parted with to procure drink, and thus little children were stripped of their last portion of covering of any value; but for this facility many things of the greatest use would have remained in the possession of families. The interest paid upon these trifling loans was in proportion enormous: for all sums under 1s. a halfpenny a month was charged; if the article remained a day or only a portion of a day, the cost was just the same; and in thousands of instances the same article was in this way disposed of and redeemed four or five times in the week. Supposing that 4d. was lent on some article, and pledged and redeemed four times in the week, 2d. would be paid: how much, in the year, would amount to 9s. 6d.! How much is this per cent. per annum? Parliament has determined, and as we think wisely, that it shall be no longer legal for pawnbrokers to receive pledges on which they may lend a smaller sum than 1s.; and for this they are entitled, in order to make up for the loss of the profits on the smaller loans, to a charge of one halfpenny on the delivery of each duplicate for goods up to a certain value, and the usual interest of a halfpenny in the 1s. in the month besides. I have made some inquiry about this matter, and believe that, although the profit of the pawnbroker is large, the change will be the means of sparing to many a poor little child articles of clothing, on which the sum of 1s. would not be advanced, but which are of very great use.

In the course of your wanderings in the poorer neighbourhoods you may have met with places called "dolly shops," or "leaving shops," where articles of small value are taken in by unlicensed

persons, something in the same manner as they are by the pawnbrokers. The charge for this accommodation is still more enormous than that above mentioned; moreover, these, kept by the worst characters, are places to which young boys and girls are encouraged to take articles which they have come dishonestly by; and it is well known that these shomahable places, and also many of the marine storerooms, are a great means, by affording ready facilities for parting with goods, of encouraging crime in the poorer districts.

Now that this change has been made, the police should leave no means at their disposal untried to root out the "dolly shops," and keep up a very close surveillance on certain of the rag-shops. Measures such as these, although they may seem trifling, are all leading to a good end.

A STRUGGLER.

Books Received.

*Companion to Hoopss: Hand-Book of Tables for the Use of Timber Merchants, Builders, Ship-owners, and Others.* By JOSEPH SMITH, of Bristol. Houlston & Wright, Paternoster-row, London.

THESE tables, which occupy ninety-five pages, purport to show the number of Petersburg standard deals, "and the fractional part of a deal, contained in any number of deals, any length, any width, or any thickness." Also the number of Petersburg standard deals, &c., contained in any number of superficial feet of  $\frac{1}{2}$ ,  $\frac{2}{3}$ ,  $1$ ,  $1\frac{1}{2}$ , and up to  $7\frac{1}{2}$  inches thick. We have tested a few of the calculations, and found them quite correct. This said Petersburg standard gives a deal of trouble.

*Country Cottages: a Series of Designs for an Improved Class of Dwellings for Agricultural Labourers.* By JOHN VINCENT, Architect. London: E. & F. N. Spon, Bickersbury, 1860.

MR. VINCENT gives plans for single cottages, with two bedrooms, and three bedrooms for double cottages; a group of three cottages, a group of four cottages, sections, plates of details, and six perspective views of the designs. The cottages are mostly a little too expensive, the cheapest pair, with only two bedrooms, costing 250*l.*; but the designs are tasteful, and the work is so nicely got up, that our impulse was to give our commendation without qualification. Looking a little closer, however, an unlucky blot becomes observable, which may not be passed by. So little attention has been given to the staircases, that in several of the designs they would be useless. In plate 7, for example, there would be 4 feet 6 inches headway, the result of which is, that the bedrooms could not be formed as shown. The author says of sections,—"These constructional drawings, though necessary to the builder, are very uninteresting even to professional persons." If he had taken a little more interest in the section he has himself given on plate 9, he would have seen at a glance the error he has unfortunately fallen into.

Mr. Vincent has prefixed some observations on the earnings and condition of agricultural labourers, and gives a table of their wages in twenty-nine English counties. The pith of his remarks is contained in this extract:—

"The interest of the resident population, no less than that of the proprietor, dictates that no cottages should be added to those already built in a parish, in which the numbers are in excess of profitable employment, as any surplus, however small, must inevitably depress the whole community, and reduce them to a low level of wages. It not unfrequently happens that in one county there is ample and remunerative employment for the whole class of labourers, while in an adjoining county (and even sometimes in a neighbouring parish) the lowest rate of wages is paid. And this state of things continues, when a free circulation of labour would benefit all parties. Every independent labourer moved away would make room for a pauper: the hands that are wanted for the extension of commerce and manufactures would be supplied; the ratepayers relieved; and pauperism restricted to the tender in years, the enticed by age, and those incapacitated by mental or bodily infirmity."

While, in Wiltshire, say, a man could with difficulty get 8s. a week, he might be able, in the West Riding of Yorkshire, to obtain with ease 15s. or 16s.

*The Edinburgh Review*, July, 1860. Longman & Co.

In this No. of the *Edinburgh* there are several very interesting articles, especially a review of Chevalier On the Probable Fall in the value of Gold, and one on Mrs. Grote's "Memoir of the Life of Ary Scheffer."

The reviewer of Chevalier's work differs from the author on some essential points, and discusses

questions which the author leaves untouched. The gold movement, he conceives, whatever may be its effect in particular cases, will, on the whole, operate favourably for the industrial classes of society, by throwing into their hands an increased share of the purchasing power of the world. But during the transition how will it operate—how is it operating?—these are the more pressing questions of the moment. Is it not already raising prices faster than wages? May not the recent advance in prices be at least to some extent attributable to this cause? The reviewer differs from Chevalier on this point, but here we cannot help differing somewhat, not only from the author but also from the reviewer, who says:—

"If the prices of the labourer's provisions and clothing rise, this result can only happen (assuming that the rise proceeds from an abundance of money) because more money is spent on these commodities; and, inasmuch as the labouring classes themselves immensely outnumber all classes who consume the same commodities, it is plain that it is their expenditure, and consequently their wages, which must substantially regulate the rise. The rise in wages, in short, is (where it proceeds from an abundance of money) the cause of the rise in the price of commodities, and consequently cannot be preceded by its own effect."

No doubt this must be true, strictly speaking, so far as it goes; but when did ever wages rise as fast as prices? Does not experience show that when provisions rise, from whatever cause, wages are not necessarily raised in the same proportion?—not that an upward movement of wages, as Chevalier remarks, does not follow a continued dearth of provisions, but in the majority of employments it follows slowly and far behind. The reviewer, as we see, considers that the rise in prices always follows on the rise of wages—not that the rise in wages is what follows on the rise of prices, in the case of an abundance of money. But is it not more probable that the sequence will be twofold and reactive? That not only will the rise in wages cause a rise in prices, but this consequent rise in prices eventually cause a further rise in wages? All such questions, however, are really of less pressing moment to the working-man than the one great question,—how often and how long will the rise in wages lag behind the rise in prices? Doubtless there will be occasional or partial falls in prices too; but for the next twenty or thirty years,—for the life of the coming generation, in short,—it is Chevalier's opinion that there will be a *tendency* at least to depression of the state of the necessitous working classes, in accordance with the depreciation in the value of gold, which both author and reviewer think will probably be all that time in progress. Nor is his prospect even then, according to Chevalier, by any means so bright as the abundance of gold would induce the belief of; for his opinion is that then,—at the close of this era of anxieties and trials,—he will only be placed substantially in the same position as at present.

But it is not the operative class alone who are expected to suffer at least temporary inconvenience from the depreciation in the value of gold from its increasing abundance: many others will also suffer, and especially those whose incomes consist in fixed sums of money, or whose property depends on fixed contracts expressed in the current gold coin of the realm. Thus, if the fall in the value of gold go on till it be 50 per cent., that would indicate a loss to such persons of one half their incomes, unless, as is likely, compensatory modifications take place in the mean time.

The impending changes, as the reviewer remarks,—

"Will in many instances increase, instead of mitigating, existing inequalities of condition. They will enrich the cosmopolitan merchant at the expense of the petty trader. They will enrich the commercial classes, as a whole, at the expense of possessors of fixed incomes, the professional classes, and of salaried employes. Landlords will probably, on the whole, be gainers: they will lose temporarily where the outstanding leases are long, but they will gain permanently through the lightening of their fixed incumbrances; the balance of gain being obtained by encroaching on the incomes of their mortgagages. The tendency of the movement, amongst the middle and higher portions of society, will thus be to aggrandize the wealthy at the expense of the indigent; to tax the more liberal and enlightened, for the benefit of the more narrow minded and selfish, by enriching those whose command of wealth is, perhaps, already somewhat in advance of their sense of its responsibilities, from the means of classes at once more necessitous and more cultivated. These are the evils of the change; and against these we have to set the benefit to the working classes, and the ultimate gain to the world, from the opening of new and fertile regions to man's industry, and the extension of his dominion over the earth."

That the influx of gold is neither an unmixed good nor an unmitigated evil, in short, there can be little doubt. Even to those who reap of and enjoy the abundant harvest the advantage is in itself by no means an undoubted one; and, should the working classes fail to derive all the benefit

promised by the reviewer, he himself gives them this consolation, that,—

"It cannot be denied that the sudden introduction of higher rates of wages and more ample means amongst the working classes often tends to their own destruction. The temptation of money inflames the worst passions of their nature for drunkenness and debauchery in men, for dress and frivolity in women. It militates against those homely virtues of thrift and self-restraint which most effectually elevate the condition of mankind as intelligent and moral beings. Experience proves that it is not amongst those who have the most money at their disposal that the best examples of manly independence are to be found. The highly-paid pitmen and navvies of this country are the most brutal, portion of the community; the gold of the Australian diggers is too often fettered away in reckless sensual indulgence; and, although the wages of labour are far higher in the United States than they are in Europe, we question whether the moral standard of the population can sustain an equally favourable comparison. It may, therefore, be doubted whether the physical improvement resulting from the greater diffusion of gold will be sufficient to outweigh the concomitant evils, and we are far from regarding these evils as either few or trifling."

Meantime, however, there are not yet many unequivocal signs of the pending depreciation in the value of gold. For eight years the golden stream has been flowing, and not less than 200,000,000 sterling of metal have already been added to the common stock. The annual supply is now 38,000,000 sterling, or one-tenth of all the gold obtained in the principal field of supply throughout the whole period from the discovery of America down to the year 1818, when the annual supply had increased from 2,500,000, at the beginning of the present century, to 8,000,000,—itself a very moderate sum compared with the 38,000,000 of annual increase which now takes place, and which is expected to continue for at least twenty years to come.

#### VARIORUM.

Part I. of vol. iii. of the new series of the "Proceedings and Papers of the Kilkenny and South-east of Ireland Archaeological Society for the year 1860, Twelfth Session," has been issued. Besides the general proceedings of the Society, it contains portions of papers on Money in the time of Charles I., with illustrative engravings, and on the Barony of Idrone, in co. Calow.—Some account of the works contemplated by "The Bombay Elphinstone Dock Company (Limited)" has been printed, in the shape of a pamphlet, at the Education Society's Press, Byulla, at Bombay. A "Plan for Improving the Shipping Accommodation of Bombay, and the Reclamation of Back-bay Shore, by Robert Fairbairn, C.E.," accompanies the letterpress.—We are glad to observe that "The Law Amendment Journal," being the proceedings of the Society for Promoting the Amendment of the Law—so much needed on many points,—is progressing. The number for the 12th July, which happens to be before us, contains a report of the annual dinner, at which the veteran law reformer, Lord Brougham, presided.

#### Miscellaneous.

THE AREA OF THE BANK OF ENGLAND.—We have been asked to settle a dispute by stating the quantity of land covered by the Bank of England. It is not our province to settle such disputes, but as a misconception prevails on the point in question, we will not refuse reply. We learn from the best authority that the building covers three acres of land, within nine or ten yards.

DOCKS NOT RATEABLE.—MERSEY DOCKS AND HARBOUR ROAD v. JONES AND OTHERS.—In this case the Court of Common Pleas, by a unanimous judgment, has reaffirmed the principle laid down in the "King v. The Inhabitants of Liverpool," to the effect that the Birkenhead Docks are not subject to be rated, on the ground that the property is held and applied for the public interest.

THE SUMMER DRESS OF THE POLICE.—Many have been the complaints which have reached us of the discomfort, in the hot weather, of the leather stock, the closely-buttoned coat, and unwholesome hats, of the guardians of public peace. Remonstrances have been made, but closed are the ears of metropolitan authorities. We are glad, however, to learn, that the magistrates of the county of Kent have adopted a reasonable dress for their section of the police in the summer heat. The dress now in use there consists of a loose tunic of blue serge, with trousers to match, and light straw hat: the suffocating stock too has been done away with. This intelligent change, which has been carried out on the recommendation of Captain Ruxton, the superintendent of the Kentish force, is worthy of imitation elsewhere.

JAPANESE KNOWLEDGE OF MAGNETISM.—The Japanese have discovered that a few seconds previous to an earthquake the magnet temporarily loses its power, and they have ingeniously constructed a light frame supporting a horse-shoe magnet, beneath which is a cup of bell metal. The armature is attached to a weight, so that, upon the magnet becoming paralyzed, the weight drops, and, striking the cup, gives the alarm. Every one in the house then seeks the open air for safety.

THE NORTH-WEST LONDON PREVENTIVE AND REFORMATORY INSTITUTION.—The annual meeting of this institution was held on Friday, the 6th instant, in the hall of the Reformatory, Euston-road; the Earl of Shaftesbury in the chair. The report states that the number of inmates in the institution is now 110, and that inducements are held out either in diet or accommodation for them to prefer the reformatory to the gaol. The course of training to which they are subjected is calculated to encourage self-respect and self-control, and continues about twelve months, when they are either sent out to Canada or assisted to provide for themselves in this country. The committee rejoice to state that the general working of the institution is most satisfactory. In addition to the asylum for voluntary adult inmates is a juvenile industrial school, certified under Mr. Adley's Act, for fifty lads, and provided with masters skilled in various useful trades, which are taught.

THE TIMBER TRADE OF BRISTOL.—Messrs. Barnes and Sons, in their monthly circular for July, say: "We have to report an unprecedentedly small importation for the month of June. The consumption has been fairly maintained, and the stocks are now lighter than they have been in this market for a considerable period, all which tends to an active and profitable season for the importers. The arrivals for the past month have been 5 vessels, 1,633 tons register (against 16 vessels, 8,830 tons for the corresponding month last year), and consist of 2 from Danzig, 894 tons; 1 from Memel, 437 tons; and 1 from Wyborg, 175 tons; and 1 from Dramen, 177 tons; showing a decrease of 11 vessels, 7,147 tons register, compared with the corresponding month last year. For the season commencing February 1st, 1860, to the present time, there have been 23 vessels, 8,457 tons register, arrived, against 39 vessels, 18,411, for the same period last year, showing a decrease of 16 vessels, 9,954 tons register."

SOCKET JOINT PIPES.—Sir: I perceive it is discussed in your pages as to how long socket-joint pipes have been made in this country. I cannot assist in clearing this question, but I can prove them to have been made long before the modern application or invention of the socket-joint. In under-pinning some cottages in this town two or three years ago, I came upon an old drain of red socket-joint pipes, one foot long and full two inches in the bore. They were as perfect as when laid down, and bear strong and evident marks of having been made on the potter's wheel. The tiles were four or five feet from the surface, and far below the foundations of the cottages. I should have concluded they were for conveying brine or water, but no cementitious matter was in the joints. I shall be happy to forward one or two to the Kensington Museum, if the curator thinks them worth accepting. The date of the tiles I cannot guess at, but they are very perfectly made.—J. SMITH, Droitwich.

NEW ACT FOR PUBLIC IMPROVEMENTS.—The new Act which has just received the Royal assent and is now in force provides for local improvements beneficial to the health and comfort of the people. The ratepayers of any parish maintaining their own poor, the population of which, according to the last account, exceeds 500 persons, may purchase or lease lands and levy rates for maintaining the same, and for the removal of any nuisances or obstructions to the free use and enjoyment thereof, and for improving any open walk or footpath, or placing convenient seats or shelters from rain, and for other purposes of a similar nature. The Act may be adopted in boroughs. After the adoption of the Act a meeting of the ratepayers is to take place, to make a separate rate, and such rate is to be agreed to by a majority of at least two-thirds in value of the ratepayers assembled. Previous to any such rate being imposed a sum in amount not less than at least one-half of the estimated cost of such proposed improvement shall have been raised, given, or collected by private subscription or donation. The rate is not to exceed 6d. in the pound.

**ELECTRO-TELEGRAPHIC PROGRESS.**—Mr. W. P. Piggott, says the *Photographic News*, has laid and satisfactorily worked an experimental cable between Ryde, in the Isle of Wight, and Alverstoke, on the main land, which cable has the remarkable peculiarity of being uncoated, and of having neither india rubber nor gutta percha in its composition.

**THE TOWN DRAINAGE OF MONTROSE.**—It has been resolved by a joint committee, named by the police board and by the inhabitants, to consult Mr. Leslie, C.E., as to the most eligible mode of draining the town, and to put into Mr. Leslie's hands the plans of Mr. Thomson, and other information already obtained. Mr. Burnes, says the local *Review*, proposed to apply for a copy of the Government survey of the town, which, he said, would be useful in furnishing or verifying the levels of the ground. Mr. Millar thought there could be no doubt about the levels; and, after consideration, Mr. Burnes agreed not to press his proposal.

**THE NEW TINTS.**—The attention of dyers is just now directed to some new tints which have been brought into the market. The colouring matter for these fine shades is extracted from gas tar, and several analytical chemists are busily engaged in prosecuting an investigation into the qualities of the new agent. A considerable amount of business is doing in the new shades by dyeing houses in France, also in Leeds, Bradford, and Halifax. The French call the colouring matter by the terms Magenta, or Magent. Mr. Coleman's, which is somewhat different, is called Dianthine. The colouring matter, which is a liquid, is applicable in dyeing worsted, silk, and cotton. In the finer shades, as crimson and rose, cochineal, it is said, cannot approach it in brilliancy; and even saffron yields a tint flat and thin compared with the new element. The shades range from a deep purple to a brilliant rose. The great object the dyers have now in view is to discover some mordant that shall perfect the process.

**MAUSOLEUM FOR THE GORDONS OF CLUNY.**—A mausoleum which has been erected near the Episcopal chapel of St. John, at Edinburgh, for the Gordons of Cluny, is described in the *Scottsman*. It is in the Early English style, and is some 26 feet in height, 24 feet in length, and 12 feet in breadth. The front elevation shows three pointed arches, with mouldings, springing from pillars with small shafts of polished red granite, and decorated with floral capitals, the arches terminating in pointed gables, decorated on each side with crockets, and finished with finials. The mausoleum has a ribbed stone groined ceiling, the ribs being supported on both sides by ornamental corbels. Entrance to the vaults is obtained by the arch openings. The interior wall has three polished tablets of grey granite, with gold letters recording the names of the Gordons interred below. The "skevyns" (at the angles of the building) are ornamented with masks, male and female alternated. Three grotesque masks in front form gurgoyles. The mausoleum is of Binny stone, and was designed by Mr. David Bryce, R.S.A. The sculpture work was executed by Mr. P. B. Smith, of Dean Park.

**INTERESTING ARCHEOLOGICAL DISCOVERIES AT ELEUSIS.**—The famous temple of Ceres has been unearthed, according to the newspapers. "The excavations of Eleusis," says a letter from Athens, "have just been for the present terminated. The temple of Ceres is completely disinterred, and a number of articles connected historically with it and with the *rites* of Eleusis have been brought to light. Among others are the propylea of which Cicero makes mention in his letters, and a magnificent marble statue, to which only a left arm is wanting, and which represents Antinous, the favourite of the Emperor Adrian. This statue is the size of life, and is considered a likeness from nature." A vast court, paved with marble flags, lies in front of the temple. A large cubic altar has been brought to light, standing in its original place, and adorned in front with the *torches* of Ceres and Proserpina *crossed*, and surmounting the inscription, AXAIOI. The famous sacred well, Kalichoros, mentioned in the thirty-eighth chapter of the first book of Pausanias, has also been found, at least M. Lenormand, the excavator, thinks so, since he has discovered, in a grotto, situated between the first and second of the sacred enclosures, a well, partly cut in the rock, and partly built of large hewn stones, bordered with sculptured marble at the top. A kind of crypt or sepulchral hall has also been discovered, coated with green stucco, and filled with the bones of the animals sacrificed to Ceres. The excavations are said to have been carried out at the cost of the French Government.

**INSTITUTION OF MECHANICAL ENGINEERS: ANNUAL PROVINCIAL MEETING.**—The annual provincial meeting of this institution will be held in Birmingham on the 8th, 9th, and 10th of August next, when many engineers are expected to attend from different parts of the kingdom. Papers on engineering subjects will be read and discussed, and a conversation held. A local committee, of which Mr. William Matthews is the chairman, has been appointed.

**CAIRNCROSSAN EXCAVATIONS.**—Excavations, says an Arbroath paper, have been going on at these interesting objects of antiquity, and in addition to curious works previously discovered, an entrance has been found on the north, which connects the round or beehive-shaped house with two other passages. One of these passages stretches towards the north-east, and the other towards the north-west. Both are upwards of 6 feet deep, and, so far as traced, the former is about 16 feet long, and the latter about 48 feet. It is to be feared that some time may elapse before the work is resumed, in consequence of a want of funds.

**DISCOVERY OF ROMAN REMAINS AT ROCHESTER.** In recently excavating the foundations for a new inn at Cuxton, on the site of the White Hart, the workmen dug up a quantity of Roman pottery, probably the remains of a sepulchral interment. It consisted of five or six patens and cups of the red glazed ware, commonly called "Samian," an urn (which probably contained the burnt bones), and a smaller urn-shaped vessel in dark-coloured clay. Two of the red dishes bore the potters' names, one of which was imperfectly stamped and illegible. The other is Maternus, a name which occurs in the list of Roman potters' names found in the late excavations made in the city of London, and published by Mr. Roach Smith in his "Collocanea Antiqua." The vessels discovered are now in the possession of the Earl of Darley.

**MR. TRAIN'S HORSE RAILWAY AT BIRKENHEAD.**—The operations in connection with the construction of the horse railway from Woodside Ferry to the Birkenhead Park were commenced on Tuesday in last week, at the Park entrance. The Ebbw Vale Company, says Mr. Train, have agreed to deliver the iron in July: Messrs. Crowe & Williams are preparing the timber: Mr. R. Main is at work on the carriages, to be ready in August: Mr. Chas. Burn is the contractor, under the engineering of Mr. Samuel, of London, and Mr. Palleo, of Philadelphia, the resident engineer. In September, the Birkenhead Street Railway Company, Limited, will issue excursion tickets from Liverpool to Birkenhead Park and back for 6d.

**GAS.**—By the Bill before Parliament it is proposed that inspectors shall be appointed with very extensive powers of supervision over the gas companies. Should the Bill become law these officers will hear all complaints made against the companies, for which purpose they are to hold a meeting at least once every month. They will also be empowered, without giving notice to any one, to test at any time both the quality and the quantity of the gas supplied by any company, and to enter upon their premises and examine their works. If in any case the gas is found to be deficient in illuminating power, of which a fixed test is prescribed by the Bill, the company which supplies it shall be liable to a penalty of 50*l.*, to be recovered by summary conviction before a police magistrate, with a further penalty of 10*l.* a day so long as the offence continues. It is also proposed, or provided, in the Bill, that "The metropolitan gas inspectors shall inspect and audit the accounts of each of the gas companies to which this Act applies, at least once in every year; and the companies shall lay before the inspectors at every such audit their accounts for the year preceding, accompanied by proper vouchers, and submit to their inspection all books, papers, instruments, and writings belonging to the companies relating to their accounts; and the inspectors of the directors or officers of the company whom they shall think fit; and they may summon before him or them any such director or officer for the purpose of the examination, and may take the examination upon oath, and administer an oath, to the person summoned." A subsequent clause in the Bill—the forty-eighth—empowers the inspectors, whenever they find that any company has earned 8 per cent. upon their paid-up capital, to oblige them to reduce the price of the gas supplied by them to the amount of sixpence for every thousand cubic feet.—At Wigan the gas company have resolved on a reduction in the price of gas of 3*d.* per thousand cubic feet, thus lowering the net price to large consumers to 3*s.* 4*d.*, and to all other consumers to 3*s.* 9*d.*

**THE GUESTEN HALL, WORCESTER.**—We understand that Mr. Christian, architect to the Ecclesiastical Commissioners, has made a survey of the Guesten Hall, in this city, in order to report to the commissioners upon its actual condition, and the outlay which its restoration would require. It is stated that the expense of making the roof good, tying it with iron rods, patching the walls, and restoring the windows (without, however, restoring the west end or the porch), would be about 1,700*l.* or 1,800*l.*: if the west end be restored with the porch and turret, the cost would reach nearly 3,000*l.*

**FLOATING HARBOURS AND BATTERIES.**—A cheap mode of constructing wooden floating breakwaters, &c., is now under the consideration of Lord Clanricarde's committee of the House of Lords. From printed particulars it appears that the design is that of Captain Adderley Sleigh. The system proposed consists of the use of floating structures, built according to the method adopted in the construction of slips, hollow, water-tight, drawing about 3 feet of water, their bottom broad and flat, and the seaward side of them presenting to the sea a decked plane inclined inwards at an angle of from 12 to 15 degrees from the sea level, and rising upwards from the line of floatation at the same angle to the height of about 12 feet; and the decked plane descending in like manner at the same angle below the water to a depth of about 10 feet, the whole being moored from that extremity. It is in principle a *wedge*, of which the point is moored seaward, and it resembles an artificial beach. The cost, it is said, would only be 60*l.* per yard, instead of 1,000*l.*, as the cost of stonework. As outer defences, such wedge-shaped floats, it is conceived, would be useful, as shot would glance off them as they do off the surface of the ocean itself. Coir cables are recommended for anchoring the structures. Wind, it is urged, would be deflected as well as waves by the inclined planes presented to seaward, thus securing quiet harbours to the landward by means of such breakwaters. No difficulty as to security in mooring is anticipated.

**UNPICKABLE AND GUNPOWDER-PROOF LOCKS.**—An invention, patented by Mr. Price, of Wolverhampton, which we have lately seen, seems to be an effective one, and well adapted to the purpose in view. It is called the double patent *unpickable* lock, and is warranted unpickable against every mode of picking, and also proof against repeated charges of gunpowder, as two *drifts* are said to be the most that can be hammered into it. "The hardened steel nozzle," says Mr. Price, "prevents the keyhole being enlarged, and the spindle of the knob being case-hardened, and working in a rebate with a shoulder inside, prevents gunpowder being got into the lock-chamber by breaking the spindle." These and other important improvements in locks and safes are secured by his patents of 1855, 1859, and 1860. Mr. Price has published a document with numerous names of military men, engineers, and others, who witnessed the experiments with gunpowder at Burnley in April last, from which it appears that it was not this lock at all into which gunpowder was introduced so as to explode it on that occasion, the safe produced by his opponent, after every attempt on the right one had failed, being an old one, though of Price's make; and that Mr. Price and his agent and friends repeatedly protested against its introduction, or any operation on it, as a test of the properties of Price's gunpowder-proof locks and safes.

**BUILDERS' DINNERS.**—Sir: Seeing a notice in your last of the annual dinner of Mr. Jay's men, and entirely concurring with your correspondent in respect to the advantageous results of the annual festivities where, by the aid of (I suppose I must call them) the good things of life, masters and men get into such good humour with each other, as, at least for the time, to forget there is any distinction between them, I wish to record the fact that on Saturday last the men in the employ of Messrs. Evans, Brothers, builders, had their annual dinner (at the Rye House), when this happy state of things was fully realized. This desirable result, however, was not entirely due to the consumption of "creature comforts," but was rather the effect of the expression of kindly feelings. One of those present, had their toast, "The Gentlemen Visitors," indignantly repudiated the invidious distinction, and showed that employers, particularly those of small capital, who took an active part in their business, were clearly entitled to call themselves working men, as they generally worked, if not harder, at least more hours than the majority of their assistants.

ONE OF THE COMMITTEES.

**THE BRONZE COINAGE.**—Mr. Hopwood has asked in the House of Commons, when the bronze coinage would be issued. The Chancellor of the Exchequer said he was informed the Master of the Mint was prepared to proceed with the striking of the coin almost immediately; but some time would necessarily elapse, after the striking of the coin, before the issue could be commenced. It was necessary that about two months should elapse to have a sufficient accumulation before they commenced the issue; and therefore the issue would probably take place about the end of September.

**DEATH FROM THE FALL OF A GALLERY.**—An inquest has been held at the Clerkenwell Workhouse on the body of William Mavity, aged 27, who died from the effects of injuries received by the falling of a gallery in the St. George's Hall, St. George's-road, Southwark, on the 17th of April last. The evidence showed that at a pugilistic exhibition a number of people crowded into the music-gallery, a place constructed only to hold about twelve, and the gallery broke down, and Mavity, among others, fell and was crushed by a beam. He was at Guy's Hospital for nine weeks, and was afterwards removed to his own house, where he died. The jury returned a verdict of "Accidental death."

**ACCIDENT AT THE RATCLIFF GASWORKS, SHADWELL.**—A sad accident has just occurred at these works, whereby one person lost his life, and several others were severely injured. For some time past workmen have been engaged in the erection of a new gasholder, capable of containing 80,000 cubic feet of gas, and which was so far completed as that the boiler, being finished, was suspended by chains attached to the pillars which were to be its permanent support, and which were some 60 feet in height. It was raised by means of these chains to the height it will attain when full of gas, in order that the workmen might finish off some of the points which could best be done with the holder in that position. There were a number of workmen employed about it; some of them at the top of it, some of them on the pillars to which the chains were attached, and a considerable number were employed in various ways on the ground outside the tank; when, with a crash which resounded throughout and alarmed the surrounding neighbourhood, the holder frame became detached from the chains suspending it, and snapped into a hundred pieces, and fell a distance of 12 feet into the bottom of the tank, while the pillars, some of them smashed into half a dozen pieces, swayed outwards and inwards, crushing and scattering the workmen in all directions.

**EXTRA PAYMENT TO PUSH ON A CONTRACT.**—*Swansea County Court.* Joseph Downing, contractor, v. Robert Morris, contractor.—The action was for the recovery of 37l. 6s. for work executed. 19l. 6s. had been paid into court. The dispute was a difference of 3d. per yard. Mr. Joseph Downing deposed: I have been doing mason's work in the half-tide basin for defendant, and continued the work until the contract was taken by the Harbour Trustees. The price for the masonry was 2s. per cubic yard, with the rubble backing. The materials were to be delivered to me, but some were obliged to wheel about 300 yards, and Mr. Morris agreed to give me 2s. 3d. per yard.—Cross-examined: Mr. Morris told me the price was too high. I reduced my men one half after it had been agreed to give me 2s. 3d.—Re-examined: When I gave in my tender to Mr. Robert Morris it was on the understanding that I should do all the masonry: what I have done is the most expensive work.—Mr. R. Morris, the defendant, said that the first agreement was for 2s. per yard, and he made no other agreement whatever. Plaintiff told me the materials were not delivered on the spot as required, and I told him that as the trustees were to take possession of the work at the end of the month, I would give him 3d. extra per yard if he would push on the work as much as he possibly could. No sooner, however, had I agreed to this than Mr. Downing reduced his men one half. The advantage which I should have received had the work been pushed on was, that I should have used all the materials on the ground. I should have gained about 4s. for every yard executed by Mr. Downing. He having failed to push the work on, he is not entitled to the extra 3d. per yard. It was not necessary to pause occasionally to allow the wall to "set." The judge remarked that some of the work had evidently been executed before the new agreement to give 3d. extra per yard had been entered into, and under these circumstances the plaintiff could not sustain the action for the full amount claimed. He gave a verdict for plaintiff of 9l., in addition to the sum of 19l. 6s. paid into court.

**CATTLE SHOW DECORATIONS AT CANTERBURY.**—The Royal Agricultural Society have just held their usual meeting and exhibition, this year at Canterbury; and the city appears, from the local papers, to have been effectively decorated for the occasion. Mr. Clarke, of Gloucester, architect, who has superintended extensive decorations in other places, was engaged by the committee, having been recommended for that purpose by Mr. H. Maubing, the contractor for the erection of the sheds and other works in the show-yard. The intentions of the committee only comprised the erection of three triumphal arches—one at the top of North-lane, another in High-street, in front of the Guildhall, and the third on the site of the old city gate at St. George's, together with the decoration of the public buildings. In addition to those named, however, four other arches were put up by private subscription among the inhabitants of different parts of the city—one in High-street, near the Corn Exchange, one in Northgate, one at the end of St. Margaret's, spanning both at St. Margaret's and Walling-street, and one near the toll-gate at St. Dunstan's.

**BATHS AND WASH-HOUSES.**—The report of the Commissioners for Public Baths and Wash-houses in the parish of St. James's, to the Vestry, states that the additions rendered necessary by the increase of business at the establishment in Marshall-street have been for some years under consideration, and it was felt that a decision upon the subject should be no longer delayed. It was necessary to raise an additional sum of 6,000l. under the provisions of Sir H. Dufkinfield's Act, and to appropriate two houses belonging to the parish to carry out the proposed improvements. At a meeting of the Vestry, held on the 28th ult., Mr. Geesin stated, with respect to the financial position of the undertaking, that it was in a perfectly solvent state, and that this was entirely owing to proper management. The Rev. J. E. Kempe, the rector, remarked that it was not a financial question alone; for it had been shown that great moral and social improvements would follow. After some further discussion on the subject, the motion for the adoption of the report was carried. In 1859, 100,133 baths were taken, and women availed themselves of the wash-house on 40,900 different occasions at the Marshall-street establishment. The gross receipts amounted to 2,292l. 10s. 8d., and the working expenses to 1,772l. 10s. 7d. In 1818, two establishments were open in the metropolis, and the receipts for bathing and washing then amounted to only 2,806l. 5s. 1d.; in 1855, at thirteen establishments, to 24,526l. 7s. 2d. We may add that, from 1818 to 1855, the very considerable sum of 113,541l. 1s. 5d. was received at the public baths and wash-houses in London alone.

**HOLYHEAD HARBOUR OF REFUGE.**—On the 16th the Earl of Mayo moved, in the House of Lords, for a select committee to inquire into the state and efficiency or otherwise of the new refuge harbour at Holyhead, and the cause or causes of the number of wrecks that occurred therein during last year;—also to inquire into the plan as now sanctioned by the Admiralty for the construction of a packet harbour for the accommodation of the large class of steamers about to be employed for the Irish mail service.—The Duke of Somerset said he believed that the first outline of the plan proposed by the late Mr. Rendle, if carried out, would have given a much better harbour than the present one, at a much smaller cost, but the question was the actual state of the harbour at present: Was this harbour a bad one as a harbour of refuge? Now, according to the report of the officer in charge of the harbour as to the effects of the gales on the 25th and 26th of October last, it appeared that none of the fifty-six vessels which at that time were riding with the harbour sustained any material damage, except four or five which had been fouled by a vessel that had lost her anchor off Liverpool, and had run into Holyhead harbour for security. Under these circumstances he did not think there was any foundation for the assertion that Holyhead was not a harbour of refuge, and the Admiralty were disinclined to assent to any further expenditure.—The Marquis of Clanricarde observed, that what was required was a vigorous exertion to overthrow an expenditure of millions of money. The Government justification for that expenditure was, that it was incurred under the direction of the most eminent men; but he believed it would be found to be a total waste of public money.—Earl Granville said it was impossible for any one who was acquainted with Mr. Rendle, not to be aware of his singular clear-headedness with regard to any sort of business.—The Earl of Mayo, after a brief reply, withdrew his motion.

**PREPARATION OF BOXWOOD.**—Those of your readers who may be desirous of extending their knowledge, afforded by your article "On the Preparation of Boxwood," would do well to visit the South Kensington Museum, where, in a glass case in the Educational Department, they will find a good illustrative series of boxwood blocks exhibited by Mr. Scott, of Whitefriars-street, Fleet-street, practitioner of this said-to-be mysterious art, VERITAS.

**TENDERS**

For house at Wimbledon, for Mr. John Reeve. Mr. John Giles, architect. Quantities supplied by Mr. James Barnett:—

Macey	£6,297 0 0
Lucas	6,257 0 0
Jackson & Shaw	6,025 0 0
Higgs	5,987 0 0
Baberbury	5,969 0 0
Piper & Sons	5,900 0 0
McClyment	5,873 0 0
Patman & Co.	5,796 0 0
Hardman & Co.	5,750 0 0
Asby & Sons	5,680 0 0
Manfield & Sons	5,676 0 0
Brown & Robinson	5,614 0 0
Down	5,498 0 0
Hill	5,470 0 0
Adams & Sons	5,400 0 0
Down	5,340 0 0
Nyers	5,268 0 0
Wilson	5,237 0 0
Welshman & Gale	5,195 0 0
Avis & Sons	5,184 0 0

For the new passenger station at Redcar, for the Stockton and Darlington Railway Company. Mr. Wm. Peachey, architect; by whom, also, the quantities were supplied:—

Bolmer	£6,000 0 0
Marree	4,179 9 3½
Reedy	3,871 0 0
Armitage	3,850 0 0
Chapman	3,824 0 0
Wainman	3,729 0 0
Pearson (accepted)	3,716 11 11

For restoring the clerestory and internal stonework and for re-erecting St. John's Church, Chester. Mr. R. C. Rickman, architect. Quantities supplied by Mr. T. M. Rickman:—

Add for		Materials exclusive of local.
Tracery in Roof.	of local.	
Haswell	£5,798 0 0	£88 0 0
Stone	5,480 12 9	33 2 8
Hitchen	5,469 0 0	45 7 110
Roberts	5,188 0 0	80 0 0
Lockwood & Co.	5,100 0 0	50 0 0
Owens	4,579 0 0	68 10 0
	4,938 0 0	29 0 0

For residence and warehouse at Leytonstone, for Mr. R. Payne, architect. Quantities supplied by Mr. T. M. Rickman:—

Saville	£2,413 0 0
Dove (Brothers)	3,103 0 0
Coxter & Son	2,554 0 0
Reed & Son	2,730 0 0
Asby & Horner	2,735 0 0
Newman & Co.	2,723 0 0
Rivet	2,709 0 0
Hedges	2,673 0 0
Hill	2,649 0 0

For villa at Moseley, near Birmingham, for Mr. Isaac Ford. Mr. Edward Holmes, architect. Quantities supplied:—

Hardwick	£2,684 0 0
Briggs	2,590 0 0
Barneley	2,530 0 0
Matthews	2,457 0 0
Jones (accepted)	2,288 0 0

For restoring damage by fire, Castle Tavern, Longley. Same architect:—

Dearsley	£1,026 0 0
Wills	963 0 0
Gadsby	880 0 0
Papps	890 0 0
Day	650 0 0

For the chapels and lodge for the Battersea Burial Board, minus the inclosure fence, the board not being in a position to carry out the former contract:—

McLennan & Bird	£1,173 0 0
Bov's	1,119 0 0
Adams & Sons	1,025 0 0
Bass.	1,020 0 0

For erecting a villa at Buckhurst hill, near Langton. Mr. J. Tanner, architect. Quantities supplied:—

Taylor	£616 18 0
Axford	520 0 0
Turner & Son	475 0 0
Roper	450 0 0

For additions to the Maid and Magpie, Stepney. Mr. W. E. Williams, architect:—

Seck	£123 0 0
Brake	121 10 0

For addition and alterations to house at Thames Ditton, Surrey. Mr. Thomas Milbourn, architect:—

Atkinson	£295 0 0
Matthews & Son	230 0 0
Newland	192 10 0
Cannon	145 0 0

For building new luncheon-bar, The Dolphin, Coleman-street. Mr. William Nunn, architect:—

Day	£250 0 0
Buffam	225 0 0
Anley	221 0 0
Elphinstone	210 0 0
Gadsby	210 0 0
Papps (accepted)	180 0 0

# The Builder.

VOL. XVIII.—No. 912

Architectural Publication Society.—The "Dictionary."

THE satisfactory progress of the "Dictionary of Architecture," commenced by the Architectural Publication Society, is a matter in which we are much interested, as indeed all our readers should be. We desire, in the most emphatic manner, again to draw attention to it.

Since the beginning of last year, when we noticed the progress of the Society, further progress has been made in the "Dictionary." The letter D has been commenced and issued; one half of the letter E has also been issued; the remainder we have completed, and the letter F is taken in hand.

The Part before us, containing the first mentioned letter, we observe whilst turning over the pages, *Dagoba; Dairy; Damp; the Dances*, father and son, which articles appear to have been drawn up with some care; *Deal; Decay; Decomposition; the Decorated Period of Gothic Architecture in England with its contemporary examples abroad; Dentil; Desk; Desk*, with some capital Medieval illustrations supplied by Mr. Salter; *Diaper*, which, whilst clearly defining the difference between it and *Chequer*, throws doubts upon the generally received origin of the word from the town of Ypres; *Dog-tooth ornament; Dome*, under which head is given a tabular statement of 150 of the most celebrated examples produced in the ancient and modern worlds, with the sizes and dates of construction; *Door*, presenting carefully drawn up lists of those mentioned by various authors as being of stone, and early dated examples of wood, and the more remarkable ones of metal, still existing in Italy, Turkey, Palestine, Egypt, Germany, Russia, and Spain, with their dates, artist's name, general style of ornamentation, and description, if any, forming a most valuable contribution, whether considered in an historical, archeological, or artistic point of view; *Doric Order; Doubling Stone; Drawing*, which article details the existence of such of the few mediæval productions as have come down to our time, not forgetting reference to the interesting album of Villard de Honnecourt, which has excited so great an interest during the early part of last year, and it may surprise some of our readers to hear that there are but four existing, it is supposed, in England, three of which are in the British Museum and of late date; *Dresden; Dry Rot; Dublin; Durham*; including with a concise account of *Dutch Architecture* and the present state of the art in the Netherlands.

We reprint the article, *Drawing*, to serve as a specimen.

### Drawing.

This word in the singular means the developed plan of the designer expressed in lines: in the plural it signifies all the plans, sections, elevations, and working details necessary to carry out such a design. It is usually stated that, under ordinary circumstances, the drawings belong solely to the architect: he is employed to design and to erect the structure, whatever it may be, with due regard to expenditure, and for that he is paid: the drawings are simply his means of proceeding. As a general rule an architect, in charging for his plans and specifications for a work which has not been executed, is not bound to give them up to

his employer; but something would depend on the circumstances of the case. Builders will sometimes refuse to give up the drawings during or after the execution of the work, but a summons before a magistrate has been considered sufficient to meet the case. This appears to be founded upon the acknowledged principle that letters belong to the writer and not to the receiver of them.

It appears difficult to understand how a foundation could be put in of proper proportions, before the nature of the superstructure had been determined. Yet Raine, "Catterick Church," 4to, London, 1834, says, "No reference is made in the contract to anything resembling the working drawing of modern times; nor has the greatest pains, taken for this purpose, been able to discover any such record relative to any other early fabric. The archives of Durham Cathedral have been carefully searched for architectural plans, but without success. A manuscript commentary upon the prophet Ezekiel, belonging to the Dean and Chapter of Durham, written apparently in the eleventh century, contains some curious pen-and-ink delineations in the Norman style, of Ezekiel's temple, such as ground plans, elevations, &c., which prove the architectural skill of the commentator, and the fact that it was no unusual thing to commit to parchment illustrations of this nature. 'Patternes in paper,' 'portraictures,' 'patternes in timber,' are referred to in the contract for the Beuchamp chapel at Warwick, in 1439; but, during the earlier centuries of our national architecture, we suspect that models in wood, or drawings upon wooden tablets, were in general adopted as specifications by the contracting parties, and referred to during the progress of the work." The value of parchment seems to have been sufficient to cause the erasure of designs upon that material, so that it is hardly reasonable to expect the discovery of any drawings made before the general use of paper, unless the original owners and their heirs had considered that the preservation of such documents would be useful. Such a feeling does not appear to have existed in England. Britton, "Dict.," s. v. Cathedral, also observes, "it is a remarkable circumstance that amongst the numerous records preserved in muniment rooms respecting cathedrals, there have not been found any ancient drawings of the ground plans and architectural designs for these splendid national buildings."

If exception be made in favour of the valuable section of the mouldings to a door of the church of St. Stephen at Bristol, engraved in *fac-simile* by Willis, "Arch. Nomens," 4to, Cambridge, 1846, from the original in William of Worcester's (or Botoner's) "Itinerary," preserved in the library of Corpus Christi College, at Cambridge, there does not seem to be as yet any knowledge of architectural drawings in England older than those in the British Museum, Cottonian MSS., Augustus I, II, and III. Among these is "the monument intended for King Henry the Sixth," beautifully (for the time) drawn and slightly shaded in ink, on parchment 2½ inches by 15 inches, which has been inadequately engraved on a reduced scale in Gough, "Sepulchral Monuments," fol., London, 1796, pt. 231. Another is entitled "Capella bte. Marie in collegio regali Cantabrigie," and is a slightly-tinted view of the exterior of King's College chapel while the interior was being finished. It is on paper, and is 48 inches long by 26 inches wide. This is accompanied by a less excellent drawing, 52 inches long by 15 inches wide, being the design for a "campanile regalis, Collegii Cantabrigie," which has been engraved on a reduced scale, with many alterations in the drawing, in Lysous's (Magna Britannia), "Cambridgeshire," 4to., London, 1808, p. 116. A tinted drawing of a gallery intended to be built for Henry VIII. may be passed over; but three large drawings, highly coloured, with the decorations in gold, of magnificent pavilions made of tents, deserve much attention. The Society of Antiquaries, "Vet. Mon.," fol., London, 1808, iv. pl. 16-20, has published the pictures of the death (1522), &c., of John Islip, abbot of Westminster, which contain his hearse, chapel, and other details. Many of the contracts which have been recovered refer to then-existing works as models for imitation. A few notices are appended hereto of mention of drawings of late date.

In the will of Henry VII., 1509, it is declared, "we wol that our towmbe bee in the myddes of the same chapel, before the high autlier, and in such distance from the same as it is ordered in the plat made for the same chapel, and signed with our hande;" "also that the said chapel be desked \* \* \* as is by us redily devised, and in picture delivered to the priour of Saunt Bartilmew's

beside Smythfeld, maistre of the workes of our said chapel." In 1516 was made an agreement with Peter Torrysan for the monument of Henry VII., "according as appereth by the patren"—"all the aforesaid worke shall be graived, and workmanly wrought according to the said patren;" Ackerman, "Westminster Abbey," ii. 136-137, 141-2; and "a plat" signed by the executors of King Henry VII., is referred to in the agreement dated 1513, for building King's College Chapel at Cambridge. Considerable difficulty may be expected to arise from the various constructions which may be given to the words "carve" and "pattern" in the following extract relating to the building of Roslyn Chapel, 1446, wherein it is stated that "to the end the work might be more rare, first he caused the draughts to be drawn upon Eastland boards, and made the carpenters to carve them according to the draughts thereon, and then gave them for patterns to the masons, that they might thereby cut the like in stone;" MS. memoir, Hay's collection in the Advocates' Library, Edinburgh; printed in Britton, "Arch. Antiq.," 4to. London, 1812, iii. 51.

The following list comprises drawings mentioned as still existing on the Continent, and proves them to have been abundant and of large scale.

A copy, four-fifths of the size of the original, supposed to date 820-30, that is preserved in the library of S. Gall, of a design for the monastery there, was published by Keller, Zurich, 1844, and has been repeated, to half the scale of that publication, in the *Archæological Journal*, Svo. London, 1848, v. 85.

A design on parchment about 11½ feet long, dating about 1450, for the still unfinished tower to the church of Ste. Waudru, at Mons, was published in *fac-simile* by Chalou, "La Tour," &c. Brussels, 1844, who notices that at Ghent a drawing of the Hôtel de Ville is preserved; and that in the Town-hall at Louvain there is a drawing containing almost every detail of the towers and principal portall of the Church of S. Pierre.

The Comité Historique, &c. "Bulletin Archéologique," Svo., Paris, 1843, mention, i. 311, a *projet* in west door for the Cathedral at Clermont Ferrand; ii. 460, the full-size outlines worked on the granite paving covering the vaults of the aisles to the choir of the Cathedral at Limoges; ii. 513, 542, the (fifteen or) twenty-two drawings in the Frauenbaus at Strasburg; the magnificent *portall* of the fifteenth century for a cathedral (? at Barcelona), which was traced by M. Tastu; and ii. 726, five drawings for the church of S. Pierre, at Tonnerre, three of which are dated 4th January, 1567. The interesting album of Wilas de Houceurt (1230-60?), including sketches of the tower at Laon, of a window at Rheims, and plans of the choirs of the church at Vaucelles, of S. Etienne at Meaux, and of Notre Dame at Cambrai, as well as of the apsidal chapel at Rheims, was edited in *fac-simile* by Lessus, 4to. Paris, 1858; the *Builder*, 1858; paper read by H. B. Garling, at the Royal Institute of British Architects, 10th November, 1858. Didron, "Anuales Arch.," 4to., Paris, 1846, v. 37, gives, at two-thirds of the size of the originals, two out of three palimpsest drawings discovered 1838 at Rheims, under a necrology reaching down to 1270, of the principal church in that city. Those that were published exhibit a design for the west front of a cathedral having three large porches, a smaller design of the same character, and some foliage: the restoration shows the careful use of central lines, and complete regularity in the arrangements. Didron, who attributes these drawings to the first half of the thirteenth century, also mentions more of the others, herein described, which, as he observes, are nearly all of the fifteenth and two succeeding centuries; and adds intimations of the existence of others at Auxerre, Bourges, Montpellier, and in the hands of private persons at Paris and at Treves. The drawings of the tower, of Beauvais Cathedral, which fell 30th April, 1573, were lately or are still in the possession of M. Dorgedray, of S. Lucien, near that city, and were engraved by Gilbert, "Notice Hist. de l'Eglise," Svo., Beauvais, 1830.

Didron also notices the existence of a plan on the walls of the cathedral at Freiburg, in Breisgau; and states that the sacristy at Ulm possessed an interior elevation of the cathedral, with the name of the architect Ensiger written upon it. A drawing of the tower and spire of the same cathedral belonged to Canon Schmidt. This is partly engraved *fac-simile*, pl. 58 of Moller, Denkmaler. Fifteen old drawings have been found at Frankfurt, and others at Munich. The *Acquis* Au

Ratisbon Cathedral was published in a new very scarce plate, entitled "Idea cathedralis ecclesie S. Petri in civitate Ratisbouensi juxta verum originale delineata par Melchior Küssel, fol. Aug. Vind., 1655." The mode of setting out a pinnacled in 1386, by Mathias Rorizer of Ratisbon, was published by Reichensperger, Treves, 1845, and is translated in the "Detached Essays," 1848-9. An engraving about 2 feet 9 inches long from an old drawing of the celebrated fountain at Nuremberg, was published 1822-4 by Lotzbeck, of that city.

An elevation of a tower for the cathedral of St. Stephen at Vienna, 15 feet long (not the tower that was finished and afterwards destroyed, but the approved design of a second tower which it was proposed to erect), is engraved in *fac-simile* in the "Bauezeitung," seven sheets, 1841, pl. 528. At Vienna are also six large plans and elevations of both the towers of St. Stephen's church, by the Kirchen-hausmeister Gregor Hauser, which were probably made at the time of the repairs in 1819; and also the elevation of a Sakramentshaus, by Michael Fröschel, hausmeister of St. Stephen's, 1524. The north-west tower and half of the facade of Cologne Cathedral, on a parchment roll 3 feet wide and 9 or 10 feet long, found in 1814, was published 1818 by Moller, in *fac-simile*, in seven plates. The south-west tower and the whole of the facade are engraved in Willemin, "Mon. Fran. Inedit." One of the upper windows of the choir, and a small plan of the south tower; both of these, with an elevation of the second story and a section of the portal to the nave, were apparently drawn by one hand. The plan of the south tower was published in *fac-simile* by Moller: detailed descriptions of these drawings are given in Boisseree, "Cologne," 4to., Munich, 1843, p. 116-7. Moller, "Denkmaler," pl. 47, gives a *fac-simile* of a plan (at Strasbourg), which he dates thirteenth century, of a tower resembling that of Freiburg Cathedral; pl. 48, an elevation (at Strasbourg), which he dates thirteenth or fourteenth century, supposed to have been for the tower of the church at Thann, near Colmar, built 1450-1500; pl. 53, a church tower at Carlsruhe, after a drawing of fourteenth century; pl. 60-1, *fac-similes* of a plan and elevation for a tabernacle, with plan of another, both at Strasbourg, without dates, but late; and pl. 66-70, the plan and elevation of another tabernacle, dated 1462.

It is scarcely necessary to refer to the numberless architectural drawings still existing in Italy, made by the eminent followers of the Renaissance style: almost every city, and large collection, contain a number, more or less, of specimens of their talents. In England, Wren's drawings are preserved in the library of All Souls' College, at Oxford: many by the still later practitioners will be found in the library of the Royal Institute of British Architects; in Worcester College, Oxford; in the Radcliffe library at Oxford; and in Sir John Soane's Museum: the latter also contains the unique collection of drawings by John Thorpe, of the time of Queen Elizabeth.

Although not immediately connected with the precise subject of this article, it may be mentioned that not only does the Museum at Cologne possess a collection of drawings bequeathed by M. de Noel, of buildings now destroyed; that in the Town-hall of Briinn, in Moravia, drawings are collected of any old building, or of any edifice otherwise characteristic, which is about to be destroyed; that a valuable collection of plans of the churches at Vienna, made by the han-inspektor, Belsch, at the beginning of the present century, is also deposited in the magistratsgebäude; but that the French Government has published under Lenox, "Statistique Monumentale," fol., Paris, 1835, &c., details of the old structures that are from time to time disappearing in that city. Contract, Design, Example, Model, Mould, Patron, Pattern, Picture, Plan, Plat, Template.

In the portion of E which has been issued, we observe *Early English Period of Gothic architecture in England with its contemporary examples abroad; Earthenwork; Eastland Boards*, asserting that it is not clearly ascertained whether they were of fir or of oak; *Ecdiciam*, which is an interesting notice of the metal vases used for the conduction of sound in the ancient theatres; *Edinburgh; Efflorescence; Egyptian Architecture*, explained in an able manner by a concise and chronological arrangement, from the best authorities, of the works of art, wherein the student will at once see the probable position of every structure of any import-

ance in the ancient history of that people; *Elasticity; Elephant; Elizabethan and Jacobean or Revival Architecture*, which is treated generally in a different manner to that hitherto usual: thus, a table is given of the publications upon architecture during the epoch, "as a means of examining one of the sources from which those artists who had not travelled obtained their notions of the theory and details of the newly-fashionable style;" another paragraph gives the names of the surveyors and architects employed; whilst a third portion gives, in chronological order, the most noted buildings erected during the period in question. We must refer our readers and those interested in this phase of our art to the dictionary itself for further details, merely observing that the references extend from the year 1512 (the date of the erection of the palace, now the Palazzo Giurati, at Rome, presented in 1517 to the Crown of England, and which has lately been referred to in the discussions on styles) to the buildings in Edinburgh erected as late as 1632-40. Reference is made to an article in our fourth volume, and the writer concludes, "There is no work which can be said to give a satisfactory history or practical synopsis of it [the style]; the following publications consist chiefly of pictorial views, and the more architectural works are only miscellaneous collections of parts or details, without any arrangement whatsoever." The last article in this part is a good account of the *Bland Edge stone*, a very useful material, obtained from near Halifax, in Yorkshire.

We have necessarily merely pointed out the more interesting articles in these two parts of the work. Most of them are worthy of perusal for their own interest, being subjects which, as we have already stated of one of them, are treated generally in a different manner to that hitherto usual. They show the writers were aware that their space was very limited; that fresh useful matter, united with a *raisonné* of the points usually put forward under such heads, were chiefly requisite; and that references to previous authors were necessary to be added, instead of copying, or as is too often the case, misquoting by garbled quotations. They will suffice to indicate the large amount of information brought together; and it may be presumed from the forethought displayed at the commencement of the work, and the care which appears to be still afforded to it, that few terms are omitted, at all useful, in any of the divisions into which the art and science resolve themselves.

Whilst the printer has been busy, the lithographer has not been less so. There is yet a word or two to be given to the plates of illustrations accompanying the text. As far as the lettering is concerned, they have gone far ahead of the text; and we presume, until the binding up is commenced, the back letters are always open for plates to be inserted. We observe that two goodly useful volumes are already prepared, comprising the letters A and B, and C and D, a third being in course of completion. In the Parts under inspection are supplied examples of *Chimney-piece; Cinque-Cento; Door* (bronze), illustrating the article in the text, above mentioned; and *Doorway*, which were in time for the second volume; while for the next and succeeding ones are now prepared *Entrance Gate; Fountain* (two plates), a subject always acceptable; *Furniture*, which brings in three chests, the extent of ornamentation on which we can scarcely hope to see reproduced in these days; *Gate-house; Grille*, two plates, giving about twenty examples of wrought iron work, mostly from Venice and Nuremberg; *Egyptian*, some dozen capitals with remains of colour; *Font and Font cover*, the latter showing a peculiar example of a crane for lifting up the cover and swinging it aside; *Gable; Gargyle; Gathouse*; and *Half-timber House*. The subjects, generally, speak for themselves. We have only to add that they are of all styles of design, and that the lithography by Mr. Bedford is satisfactory. Besides Mr. Hussey, who kindly supplied the drawings for the three chests, other friends who have assisted this part of the undertaking are Messrs. F. P. Cockerell; W. E. Nesfield; H. R. Newton; E. H. Mar-

tain; A. McDunn; C. H. Purday; G. R. Clarke; A. Salvin, jun.; J. M. Lockyer; R. R. Rowe; Lewis Vulliamy; Octavius Hansard, the able examiner of the illustrations; F. W. Porter; T. H. Lewis; E. Falkener; J. J. Thomson, jun.; C. F. Hayward; J. T. Christopher; R. H. Shout; and E. Ashworth.

With reference to the Dictionary and to the Society, we have lately seen two letters from one of its ablest contributors, addressed to the honorary secretary for the Dictionary. Considering that they were written while suffering under a severe illness, they afford so happy a specimen of the thorough good-feeling which exists in the management, and of the active spirit still uppermost and available to render the Dictionary worthy of the profession under whose auspices it is produced, that we are tempted to place them before our readers, trusting at the same time that they may tend to draw the attention of some to the undertaking, who might otherwise overlook it.

The first communication is prefaced as follows:—"While confined to my bed, I was amusing myself with reading about the Civil Service, and the difficulty they have to conquer the spelling-book. Then I fell thinking of you, and of course my head got full of nonsense directly; so, to give it a vent, I compiled an alphabet for the expression of the A. P. S. Dictionary, and all concerned therein, yourself in particular. When we next meet you shall sing it in character:—"

A is an *Architect*, driving his pen:  
B our *Boys*, some of very small men:  
C are the *Critics*, who look rather shy:  
D is the *Dictionary*, never say die!  
E is the *Editor*, surly and grim:  
F is the *Firm*, which we oft poke at him:  
G are the *Geors*, long, tedious, and dull:  
H *Half-and-Half*, how I long for a pull!  
I 'Illustrations,' they're famous, no doubt:  
K is the *Kind Keepers*, who forge them out:  
L the *Lithographers*, always behind:  
M are 'Materials,' those we don't mind:  
N 'Nomenclature,' what work for the pen:  
O are the *Opticks*, we ordered at ten:  
P are the 'Palings,' oh! what a lot!  
Q is a *Letter*, the shortest we've got:  
R are the *Reviews*, they're always full work:  
S is our *Secretary*, out-and-out Turk!  
T are the *Tables*, our columns that swell:  
V are the *Volumes*, they're certain to sell:  
W the *Writers*, poor buffers! who plie  
On X, the 'Xpenses,' a furthing a line!  
Y is *Yoursself*, we're delighted to tease:  
Z is *Zo-o-pluruz*, alias a Frizee.  
But here come the oysters, and here comes the beer—  
Success to the A. P. S. Number! 'Hear! hear!  
Three rattling buzzas, and a finishing cheer!"

The following was shortly after forwarded, as a foot-note to the above:—

"Yes; I call him a Turk,  
For he drives us to work,  
And blows up like bricks if we venture to shirk:  
He bores for 'MS.'  
For 'Procs,' and for 'Press'  
And scolds for 'Reviews' till we're quite in distress:  
And worse than all else, (believe my narration)  
Compels us to verify 'y' quotation!  
Diodorus or Cato,  
Vitruvius or Plato,  
He'll have every word, and he won't be said nay to:  
The Latin Apicius,  
The Dutch Burgersdicius,  
Theocrisus, Pilius, Severus, Sidius,  
Pausanias or Pindar, Solinus or Varro,  
Terullian, Augustine, or Bingham, or Barrow;  
And he makes you transcribe him, line, chapter, and  
verse, or he  
Writes you to say 'your citation's too cursory,'  
And should a poor scribbler but venture to nab as his  
Own, a sang bit from the 'clouds,' or 'Ambasis';  
Or make any blunder in metre or grammar,  
By Jove! sir, he's on you, as down as a hammer;  
Nor spares you one morsel, or bit—no! nor half a bit—  
So now I'll go on with my A. P. S. Alphabet."

I have thus particularly exposed the cruelty of making the unappy writers verify their quotations, robbing them of the pleasure of quoting books they never opened.—harbarous!"

#### ON HEALTHY DWELLINGS, AND PRE- VENTING SANITARY DEFECTS IN THE HOMES OF THE WORKING CLASSES. LADIES' SANITARY ASSOCIATION.

AMONGST the various circumstances of which man is the creature, none have a more powerful influence on his physical condition than those connected with his dwelling; and in respect to the poorer classes, this influence affects him also very seriously as a moral and accountable being.

In viewing the question of "healthy dwellings" under this twofold aspect, as presenting a remedy for much wide-spread physical evil, and as pointing to the means of removing very formidable obstacles to the moral and the religious improvement of a numerous class of the community,

+ Read by Mr. Henry Roberts, F.S.A., at the South Kensington Museum, 18th July, 1860.

its double claim on the attention of the Christian philanthropist, and on the earnest efforts of all who have its advancement in any way within their power, is clearly manifest.

Believing that the influence of the Ladies' Sanitary Association cannot be directed to an object of greater importance, I felt bound to comply with the request made, that I would present, in a condensed form, the experience of more than fifteen years, during which the study of this question, with its practical application at home and abroad, has occupied much of my time. And before doing so, as a proof of cordial sympathy with the objects of the Association I have now the honour to address, it may not be out of place to quote a resolution which was proposed by me at the Congress International de Bienfaisance, held in Brussels, in 1859, and was unanimously adopted by the representatives of about twenty different countries there convened under royal authority:—

"The Congress declares that it is of public utility that the working classes be enlightened by all possible means in regard to the improvement and the keeping of their houses in good order. It declares that the instruction of the young in the labouring classes ought to comprise all which relates to the cleanliness of their persons and of their dwellings, to the benefits resulting from good ventilation, and the evils arising from humidity. Lastly, it thinks that the study of the science of preserving health is one which ought to be rendered accessible to all."

The condition of "healthy," in regard to dwellings arises out of that which is either local or structural, and may be said, in the majority of instances, to be not under the control of the occupants; or else it results from circumstances which they ordinarily have the means of changing.

Amongst the class of persons whose advantageous position usually gives them the power of choosing a residence, there are, however, not a few who, either through ignorance, or from want of consideration, are manifestly insensible to the evils they expose themselves to, in a dwelling which is unhealthy as to its locality, or deficient as to its sanitary arrangements; until the serious, if not fatal consequences, are painfully manifest in the state of their own health, or that of their family. A single illustration of this fact may be drawn from the last annual report of the Registrar-General, where, amongst other analogous cases referred to, is that of three young ladies, nineteen, eighteen, and fifteen years of age, the daughters of a lieutenant-colonel, who died in the past year at Lymcomb, near Bath, from the effects of imperfect drainage.

Such cases show that the importance of this inquiry is not limited to one class of the community,\* but that all have a personal interest in knowing what are the conditions essential to a "healthy dwelling." In endeavouring to point them out with precision and brevity, my aim will be to avoid the use of technical terms, as much as possible; and with a view to simplify the treatment of the subject, it will be considered under the three heads already indicated. 1st, as to that which is local. 2nd, as to that which is structural; and, 3rd, as to that which may be distinguished as being mainly, though not wholly dependent on the occupants of the dwelling.

**In regard to Locality.**—High and dry situations, with a free circulation of air, whether in towns or in the country, are proverbially healthy, whilst those which are low and damp, or surrounded by confined air, are the opposite. Experience affords by the state of troops when encamped, or when in permanent barracks, or in hospitals, is conclusive on this point. It is on record that the mortality of troops in Jamaica has been diminished from 120 to 20 per thousand, by their removal from the plains to the hills. And it is well known that ague, dysentery, and fever prevail in localities where the surface of the ground is naturally wet, and insufficiently drained; or where there exists an accumulation of decaying matter, of which one sure indication is the presence of an abundance of flies. Dampness of situation is also productive of mental depression, bodily feebleness, and a disposition towards intoxicating drink.

Wherever, therefore, dwellings are built on naturally wet ground, it is essential to their being

healthy, that ample provision be made for draining the soil, as well as for ordinary surface drainage, and the carrying off of surplus fluid from the house itself. This necessity is more manifest in the country than it is usually in towns, as their gradual formation and progressive increase, has generally been accompanied with surface drainage, under some form or other. Good surface drainage is, however, peculiarly necessary in towns built on an uneven surface, as is the case with the Metropolis, which has been built on low hills, in the midst of an imperfectly reclaimed swamp, and is partially underlaid by a stratum of peat. The lower levels on either side of the Thames, where the drainage has been most inefficient, are well known to have been much more severely visited with cholera than the higher parts of the metropolis. Dr. Farr tells us that, taking the mean of the cholera epidemic of 1818 and 1854, in London, nearly 15 per 1,000 of those living under 10 feet of elevation, died to 1 per 1,000 of those at the highest elevation, and that if London be divided into terraces of different degrees of elevation, the mortality from an epidemic of cholera is, in round numbers, inversely as the elevation.

The providing efficient means for house drainage as well as a good surface drainage, is a duty which in the case of towns, obviously devolves on the public authorities. The consequences of a past neglect of this duty have been recently manifested at Windsor, where the prevalence of fevers and choleraic complaints having led to an investigation, the drainage of the town was found to be very defective; whilst, on the contrary, at the castle, a separate and perfect system of drainage having been provided, no disease existed there.

In house drainage, one valuable modern improvement is the use of glazed earthenware tubes, which should invariably be kept as much as possible without the building; and especial care ought to be taken that the pipes which discharge into them are properly trapped, in order that they may not become a medium for the escape of foul air into the dwelling. Cesspools under basement floors have been the cause of sickness and deaths innumerable. During the cholera in 1849, to my knowledge, several cases, wholly traceable to this cause, occurred in one house. Whenever these latent sources of mischief are discovered they should be removed as quickly as possible. The experience of an eminent sanitary engineer leads me to believe that in many houses of the first magnitude, both in the metropolis and in the country, which are not of recent construction, this evil exists, as well as that of defective drains, causing the ground under the house to become sodden with fetid matter. The gases which originate from these sources and diffuse themselves over the dwelling, constitute one of those conditions of local impurity which exercise a powerful influence, when the state of the atmosphere is favourable to an outbreak or spread of cholera, fever, or other kindred complaints.

For an ample supply of pure water, one of the most important accessories to a healthy dwelling, the public authorities should, in the case of towns, be held responsible. The contamination of our rivers, by their being unscrupulously and at the same time most wastefully made the receptacles of sewage, has rendered them very generally incapable of supplying the neighbouring population with wholesome water. That drawn from wells is not unfrequently impure, though its sparkling appearance and freshness to the taste might lead to the contrary supposition; in towns this is generally caused by an infiltration from some neighbouring drain, cesspool, or other deposit of untrifling matter. Many such instances in the metropolis might be referred to; one was recently mentioned to me by the medical officer to the General Post Office, as having been the cause of much internal derangement to several of the employes in that establishment, and which had led to his recommending the use of Harrison's moulded carbon filter. In the last report of the Registrar-general, reference is made to a well at Sandgate, as containing 40.96 grains of impurity per gallon.

Measurements recently taken in many places have effected much good in respect both to drainage and to the supply of water. The noble example set by Glasgow, especially deserves the highest praise. The purity of the water now abundantly drawn for the supply of that city from Loch Katrine, a distance of 34 miles, and which has involved an outlay of about 1,500,000, may be judged of by the following figures, which represent the total amount of impurity in grains per gallon. In the water supplied to Glasgow from Loch Katrine, 3.16. In the water supplied to London, according to the returns for May last, by the

leading companies,—Chelsea, 17.84; Grand Junction, 17.95; New River, 18.52; West Middlesex, 20.08; Lambeth, 20.80; Kent, 21.68.

For dwellings in the country good drainage and ready access to pure water are not less essential than they are in towns, and they ought, therefore, to be made the subject of deliberate investigation before the locality of a dwelling is fixed on.

Gravelly soil is unquestionably the most healthy, and next to it one of sand. The embossing in trees should be avoided; loose soil close to the house is frequently a cause of damp, which might be remedied by a flagging of stone, covering a dry drain formed round the building. Care should, therefore, be bestowed in regard to the surface of the ground round a dwelling, as well as in the selection of a site.

The influence of aspect on the salubrity of a dwelling is too often overlooked: in preference to all others, the south should be chosen. In towns the difficulty of obtaining a sunny frontage may frequently be great, if not insurmountable; but the value of having the sun's rays for some portion of the day within the dwelling, especially in the rooms occupied by children or by invalids, should never be forgotten. I could point to a large convalescent asylum in the country, so arranged that the spacious gallery used by the patients for exercise, and where much of their time is passed, is for the greater part of the day, without the cheering and warming rays of the sun. I know not whether in this instance it was the case, but such mistakes are very likely to arise out of the prevailing mania for the choice of plans in competition, which are often made by novices and selected by incompetent judges, instead of experienced professional advice being taken.

In particular localities diseases which formerly prevailed have, under the influence of sanitary improvements, such, especially, as a free circulation of fresh air, efficient drainage, and cleanliness in the houses and the persons of their occupants, greatly diminished, and in many instances entirely ceased. This has been the case to a remarkable degree in some of the valleys of Switzerland, where the painful disease in the neck called "goltre," and the species of idiocy called "cretinism," formerly prevailed much more extensively than they do now. Remarkable instances have been mentioned to me in that country of the sad consequences to children born and reared in a low and damp ground story, whilst those in the floor above were perfectly healthy.

The beneficial results of sanitary improvements effected in several of our large towns within the past ten years are very manifest. I select three, out of nineteen returns which have been obtained. In the metropolis, the death-rate has been reduced from 25 in 1,000 to about 23; at Croydon, the reduction has been from 28 in 1,000 to 22.9; and at Liverpool, from 39 in 1,000 to 27. Knowing, however, as we do, that the normal standard is certainly not above 17 in 1,000, these results should only be regarded as a proof of our responsibility, and an encouragement to perseverance in the discharge of duty.

How greatly sanitary science has in past days been neglected, even in cases where, of all things, health ought to be considered of primary importance, may be judged of from an observation made very recently by the Dean of Christchurch, in reference to the removal of Westminster School—"Eton," he said, "is notoriously unhealthy; Winchester is in a swamp; Harrow and Rugby without water."

Before passing on to the next head, I observe, in reference to the local position of buildings in towns, that, if the streets around them are of sufficient width, and there is no obstruction to the current of air, dwellings in towns may be better ventilated when they are moderately high, than when they are low and surrounded by higher buildings which exclude a free circulation of air. Nothing can be worse in this respect than the narrow courts terminating in a *cul-de-sac*, which are so numerous in London and in many other towns, small as well as large.

The vast extent of ground in London covered by low buildings, tenanted by the poorer classes, will account for the much larger area occupied by houses in proportion to the number of inhabitants, than there is in Paris. A fact, which may suggest the practicability of increasing the provision of dwellings for working people, near their occupations, and at the same time improving their healthiness. As a practical illustration of the advantages which might be derived from the destruction of existing streets of low and miserable tenements, and the replacing them with lofty and suitably arranged dwellings for the working classes, I may refer to two streets, both of them

\* That such studies might be useful to public men is evident from a statement very recently made in Parliament, with reference to Netley Hospital, which was denounced, as the most mismanaged public affair in this country, and its site declared to be, in a sanitary point of view, most improper for a hospital. Mr. Sydney Herbert said, "that it had not been spoken of a bit too severely in the discussion, and that when the plan was first proposed, he himself protested against it, but the House did not support him;" and he added, "I adapted as our military hospitals no doubt are for their purpose, civil hospitals are as good as better. Many of the London hospitals quite escaped anything to be found in the worst military establishments of that kind."

close to New Oxford-street; one on the south side, which leads out of George-street, is the notorious Church-lane. The other is Streatham-street, which lies to the north of New Oxford-street, leading out of a continuation of George-street. Let any one take the trouble of standing at the end of Church-lane, I do not ask him to go down it, but merely to look, and then turn his steps to the neighbouring building in Streatham-street, "The Model Houses for Families," where, if he enter the quadrangle, and pass along the galleries which give access to the distinct dwellings for fifty-four families, arranged in five fireproof stories, he will have ocular demonstration of the benefits which may, without pecuniary sacrifice, be placed within reach of the working classes; and he may also, by visiting at the same time the "Model Lodging-house" for 104 single men, in George-street, learn the amount of accommodation and comfort which can be given on the self-supporting principle, for the payment of 4d. per night.

Having already noticed under the head of "Locality" that a free circulation of pure air, an efficient drainage, and an ample supply of good water are indispensable requisites to a healthy dwelling, we come now to inquire secondly, *what is essential in the structure of a dwelling to its being healthy?* 1. It must be dry. 2. Warm. 3. The number and area of its apartments must be in proportion to the number of the occupants, and a due provision be made for a well-ordered family life. 4. It must be well lighted. 5. It must be properly ventilated, and entirely free from noxious vapours of every kind.

1. In order to a house being dry, it must stand on a dry foundation; and where this is not otherwise obtainable, artificial means should be adopted, either by forming a stratum of concrete, varying in depth according to circumstances, but never less than 12 inches, or by bedding slate in cement, or laying asphaltic through the whole thickness of the wall, under the floor level. The ground floor should be raised not less than about 8 inches above the external surface, and where there is no basement story, and the floors are of wood, they should be ventilated by means of air-bricks built in the external walls, the ground being excavated to the depth of not less than 12 inches.

The walls must be weather-proof, of sufficient thickness to secure dryness and warmth. On the facilities for obtaining the material may depend whether brick, stone, or flint be used; whichever it be, good mortar is essential to dryness. In some places concrete, Pisé, or cob, with an external facing of plaster, may be employed with advantage, provided the foundation be dry. Hollow walls conduce greatly to dryness and warmth; and with stone or flint externally, a lining of brick or tile, with a small hollow space left between, is an effectual means of securing both these benefits. A glazing on the external surface of brickwork is an effectual preventive of damp, and it is to be regretted that suitably glazed bricks are not easily to be obtained at a moderate price.

Whenever, for the sake of economy, a ground-floor is laid with brick or tile, it is essential that there should be a dry bed beneath it. Hollow bricks, if well made, may, with advantage, be used for this purpose, and will prove warm and durable. In some parts of the country lime and sand floors are pretty generally used for cottages, and when properly made are said to last upwards of forty years. Stone or slate is, of course, preferable to either, in places where there is much wear. Bed-rooms ought, in our climate, to have boarded floors.

It is a false economy to use inferior or unseasoned wood in any part of a dwelling, whilst the cracks and shrinkages caused thereby are often prejudicial to health.

For the covering of roofs, tiles are generally found to be warmer in the winter and cooler in the summer than slate, and, requiring less lead, are more economical. In some situations, however, slate more effectually excludes the weather, and is, on that account, preferable. Projecting eaves should invariably have gutters, to prevent the drip, which renders the walls and foundation damp.

How greatly dryness on ship-board, which is the sailor's dwelling, is conducive to health, may be learnt from a fact stated by Captain Murray, R.N. After being for two years in H.M.'s ship *Falorous*, amongst the icebergs of Labrador, he proceeded thence to the Caracass and the West India Islands on a long cruise, and returned to England "without one casualty, or, indeed, having a single man on the sick list." After describing the special care taken to secure perfect dryness in every part of the vessel, Captain

Murray says, "I am satisfied that a dry ship will always be a healthy one in any climate."

2. The warmth of a dwelling depends not only on its aspect, its dryness, the materials used, their proper application and substance, as I have already noticed, but also on the structural plan, and particularly on the relative position of the doors and fire-places, as well as of the windows and spaces for beds; which should be so contrived as that the occupants are not exposed to draughts.

It is surprising that, with all our regard for comfort, we should not more frequently, by the use of double sashes, which are so commonly used in many parts of the Continent, endeavour to modify the effects of our variable climate, and retain more of the small portion of genial warmth which passes into the room from our wastefully constructed open fire-places. The artificial warming of buildings will be referred to hereafter in connection with ventilation.

3. It is essential to a healthy dwelling, that the number and area of the apartments be in proportion to the number of the occupants, and that suitable provision be made for all that appertains to a well-ordered domestic life. The question of the amount of space required for health being greatly dependent on efficient ventilation, will be considered hereafter under that head. Suffice it at present to say, that the scale of accommodation in most dwellings, depends in a great measure on the means and circumstances of the occupants; as these vary so much, all that I can attempt is to point out the minimum provision which should be made in the country for a labourer's family, consisting of parents and children of both sexes. There should be a small entrance-lobby, a living-room not less than 150 feet in area, a scullery, of from 60 feet to 80 feet area, in which there should be a stove or fire-place for use in summer, as well as a copper and sink; there should be also a small pantry. Above should be a parents' bed room of not less than 100 feet superficial, and two sleeping-rooms for the children, averaging from 70 feet to 80 feet superficial each, with a distinct and independent access. Two of the sleeping-rooms, at least, should have fire-places. There should also be a ventilated and well-drained closet, and suitable receptacles for fuel and for dust. The height of the rooms, in order to their being healthy, should be scarcely less than 8 feet, and even 9 feet would be desirable, but for the extra expense. With a view to ventilation, the windows should reach nearly to the ceiling, and the upper part be invariably made to open. For examples of such dwellings, I may refer to the model cottages for twenty families, built in 1852 and 1853, by the Windsor Royal Society, from plans I had the pleasure of giving to the Society: they have continued to be let at rents which, with careful management, have returned from 4 to 5 per cent. net on their cost, clear of all expenses.

To revert again to the essentials in the construction of a healthy dwelling, I add, that the smoking of chimneys, if not caused, as it often is, by the want of sufficient air in the apartment, or by bad management in the first lighting, or in the putting on of fuel, generally arises from some defect in the construction of the flue, and not infrequently from its being too large for insuring a continuous upward current. Nine inches square, or, which is preferable, 11 inches diameter, is a size sufficient for all ordinary chimneys. Especial pains ought to be taken to avoid smoke, an evil which so greatly contaminates the air, and proverbially has but one parallel in the category of domestic grievances. Of Dr. Arnott's smokeless fire-place I shall have occasion to speak hereafter in connection with ventilation.

The use of lead for water-pipes, and especially for cisterns which are to hold drinking water, ought to be dispensed with as much as possible, on account of the injurious effects produced by the chemical action which frequently takes place when the water is soft. Iron, properly varnished, may be substituted for both purposes; and for cisterns, slate is a very suitable material. The offensive smell which often proceeds from sinks of ordinary stone or of lead, renders the substitution either of slate, of glazed stone ware, or of enamelled iron, very desirable, wherever it be practicable.

4. A dwelling, to be healthy, must be well lighted—a dark house is not only gloomy and dispiriting, but always unhealthy. We know on high medical authority, that "the amount of disease in light rooms as compared with dark ones is vastly less." Light ought to be diffused over the whole dwelling, so that no dark corners be left to invite a deposit of that which is untidy or offensive.

Happy the motive which in time past led so

much to an exclusion of the light of heaven no longer exists; and though ages may pass ere the evils resulting from a vicious legislation are entirely swept away, yet the removal of the tax on windows, and of that on glass, must, amidst much to discourage those who have long and zealously laboured in the cause of sanitary amelioration, be regarded as most valuable concessions in its favour.

5. Proper ventilation, efficient warming, and entire freedom from noxious odours, constitute, with the four points already noticed, the sum total of those essentials to a healthy dwelling which are dependent on locality and structure.

The question of ventilation is of the first importance, though, judging from the neglectful indifference of multitudes, its value is far from being duly appreciated by the educated, and even by some in the scientific classes of the community. Were it otherwise, the classiness perceptible on entering many of their dwellings, the oppressive heat of the rooms, the sickening fustiness in the apartments occupied by the servants, and too frequently in those of the children, would certainly not exist. In halls and lecture-rooms, as well as in schools and other places of public resort, how often does the atmosphere become unbearable through the neglect of an efficient application of known laws. I name but one instance—that of the large room of the Society of Arts on a crowded night. Many others might be added.

In hospitals\* the want of due attention to this important branch of hygienic science has too often led to the aggravation of disease and the destruction of human life. It is recorded of one hospital that the deaths, which before the ventilation were one in six, were after ventilation reduced to one in twenty.

Mr. Rawlinson, the sanitary commissioner, when testifying to the marvellous results of the introduction of sanitary measures in the Crimea, says, "The first requisite in all cases was improved ventilation." The opinion of Miss Nightingale on this, as well as on other points which come within the scope of our inquiry, are so well known that a frequent reference to them might be deemed superfluous; I cannot, however, withhold a quotation from such eminent authority, which strengthens my general argument. Alluding to the enormous mortality of children, Miss Nightingale says, "The causes are perfectly well known: they are chiefly want of cleanliness, want of ventilation, want of whitewashing,—in one word, defective household hygiene."

It is with ordinary dwellings that our observations have chiefly to do, and when we remember the number of hours passed within doors by every human being in a civilized state, it will be manifest that the breathing of vitiated air for so large a portion of the twenty-four hours, must be as injurious as living on unwholesome food.

A remarkable proof of the influence which ventilation has on health was given some years since at Glasgow. In a block of buildings known as the barracks, which contained a population of 500 persons, 57 cases of typhus fever occurred in two months, and within the year there were about 100 cases. A medical gentleman had them ventilated by carrying a pipe from the upper part of each room into the shaft of a neighbouring factory chimney; the result was, that in eight years only four cases of typhus occurred.

The cubical space required to keep a healthy man in full vigour is a question of much importance, and one on which very different opinions have been expressed. Experience gained in poor-house dormitories, prisons, &c., has led to the conclusion that from 450 to 500 cubic feet are requisite, and that the ventilation should be such as will cause an entire renewal of the air about once in the hour. Observations made at the model lodging-house in George-street, St. Giles', which is a confined situation, satisfy me that the cubical space of 535, which is provided in the dormitories of that building for each inmate, is, with proper ventilation, abundantly sufficient to render them healthy; such was proved to be the case even when the cholera raged in the

\* "Infection acts through the air. Poison the air breathed by individuals, and there is infection. Sick people are more susceptible than healthy people, and if they be shut up without sufficient space, and sufficient fresh air, there will be produced not only fever, but erysipelas, pneumonia, and the usual tribe of hospital diseases." "In every such example the 'infection' is not inevitable, but simply the result of carelessness and ignorance."

"In solid built hospitals the progress of the cases will be very curtailed, if the space much below 1,500 cubic feet. In Paris 1,700, and in London 2,000, and even 2,500 cubic feet are now thought advisable."—Miss Nightingale's *Nurses on the Sanitary Condition of Hospitals.*

"The space allowed in the cells of prisons should not be regarded as an absolute criterion. At the Model Prison, Pentonville, there are about 800 cubic feet.

neighbourhood, and had not a single victim out of the 104 men who lodged within its walls. From this fact it is reasonable to infer that the cause of unhealthiness in the Wellington Barracks where the cubical space per man allowed in the dormitories is stated to be 500 feet, must be caused, not by want of space, but by some other existing evils, particularly defective ventilation, pointed out in the Report made to the General Board of Health by the commission on warming and ventilation.

As mistakes with regard to space may create imaginary difficulties, and either impede sanitary reform, or cause a serious unnecessary expenditure,\* I think it of use to notice an error on this point, made in a recent article on "Labourers' Homes," in the *Quarterly Review*, where it is stated that the Lodging-house Act requires an allowance of 700 cubic feet per person. On inquiring of the Assistant Commissioner of Police as to the fact, I learned "that 30 feet superficial is the space allowed to each lodger, in the metropolitan common lodging-houses, the rooms averaging 8 feet high [which is equal to 240 feet cube], and that 50 feet superficial is equal to each police constable lodged in a station or section house, the rooms on an average being 9 feet high" (which is equal to 450 cubic feet).

All dwellings should be so constructed as that they may be everywhere accessible to pure air, and free from stagnation in any part.

The state of the surrounding air has necessarily much influence on that within the dwelling, and the renewal of the latter should always be sought from the purest source, instead of the supply being drawn, as it often is, from a low, damp situation, or a confined internal court.

It is unnecessary for me to describe on this occasion, as I have done elsewhere,† the component parts of the air, or the process of its deterioration in passing through the lungs, or the other sources of impurity, and the many accessory influences in and about a dwelling which tend to vitiate the air within: some of these have been already noticed, and others will be referred to hereafter, in their proper place. The main practical question is, in what way the air which has become vitiated can be renewed with a supply of pure fresh air, without the creation of a draught injurious to the health? To do this the air must enter copiously, but almost imperceptibly, and when used, its exit should be both complete and continuous.

Ventilation is of two kinds, *natural* and *artificial*; the former being effected by means of windows and doors, with the crevices round them, as well as by chimneys and fireplaces, which are important agents in natural ventilation, and may also, by scientific arrangements, be made conducive to an efficient system of artificial ventilation, peculiarly applicable to dwelling-houses.

It must be obvious that improvements easily adopted in new are not always applicable to old buildings, but as far as circumstances allow they should be carried out from a conviction that pure air is indispensable to a healthy state of body and mind.

Windows, properly constructed, made to open at the top as well as below, and suitably placed, afford the most ready means for the natural ventilation of dwellings, besides which are the contrivances of louvers, of perforated glass, zinc, tin, &c.

Whenever a fire is lighted in a room the lower stratum of air is immediately set in movement; a current of air is established from the crevices round the doors and the windows, or from any

other openings, towards the chimney, whereby much of the vitiated air is carried off. This process of ventilation takes place in a slight degree when there is no fire in the chimney, and therefore bed-rooms are much more healthy with a chimney than without.

An independent supply of fresh air may be introduced into most rooms which have a fire, place by conveying it through a pipe or channel formed under the floor or in the wall to an air chamber constructed at the back or sides of the stove, in order that it should be there warmed before entering the room. The same, or a separate pipe or channel, may also be used for feeding the fire with air, independent of that in the room, for which purpose it should pass out at the cheeks of the stove, rather than beneath the grate, which is liable to cause a diffusion of dust in the room. Such an independent supply is calculated to prevent the chimney from smoking, as well as cold draughts passing from the windows and doors to the fire. It also renders chimney ventilating valves more certain in their action than they often are, owing generally to an insufficient draught in the chimney, which causes an emission of smoke into the room. These valves would be invaluable for the discharge of vitiated air, which is their intended purpose, were it not for this occasional ingress of smoke. The most effective means of avoiding that evil is the carrying up an independent flue in close contact with the smoke flue constantly in use: the air within it is by that means rarified, and the action of the valve rendered more efficient. Tubular flues, made double for this express purpose, are found to answer well, and have the advantage of occupying but little space.

The best remedy for an ingress of smoke, in cases where the valve is fixed in the chimney flue, is Dr. Arnott's smokeless grate, with the draught duly regulated by a contraction of the vacant space over the fire. These grates have also the advantage of economizing fuel considerably.

With regard to the ordinary grates in use, I may here remark that they are alike wasteful of heat and fuel, both of which would be much economized by the substitution of a stove projecting slightly into the room, and combining the chief advantages of Dr. Arnott's ventilating stove\* with the cheerful open fire-place.† I have seen some such stoves in use on the Continent, and believe that the only valid reason against their adoption in England, beyond the force of custom, is the difficulty—not, however, an insurmountable one—of applying them to our fire-places with their ornamental chimney-pieces, &c.

In reference to fire-grates generally I would recommend, as one of the most useful modern improvements, the forming the back and the linings with fire-brick instead of iron.

The intimate connection between warming and ventilation has led to a digression, in returning from which I would remark that the greatest difficulty to be overcome in all arrangements for natural ventilation, which provide an exit for the vitiated air, separate from that by which fresh air is introduced, is the securing that it should always thus act, and not become the medium of ingress for cold air, as is often the case, on a change of temperature in the apartment, when no artificial means to prevent it are provided.

Gas is sometimes used for this purpose, in order to rarefy the air. I have successfully applied it within a shaft or tube of wood, placed behind a square of glass.‡ The air enters through perforated zinc, having a fall-down hopper before it. The apartment, or rather series of dormitories, one above the other, thus receive from the same quarter the combined benefit of light and ventilation.

Tubes of wood, perforated with holes, or having chinks at the angles, may with advantage be fixed for ventilation in the angles of the ceilings to common rooms, or be carried across the ceilings, in which latter case, they have occasionally been used for admitting fresh air, as well as for the exit of vitiated air.§ These tubes distribute the air

\* It is to be regretted that the public should suffer from the disinterestedness of the scientific inventor of this and other valuable appliances for warming and ventilating our dwellings, in consequence of their proper manufacture and application not being secured by a patent right.

† Professor Hosking, in a lecture at the Royal Institution, suggested the rudiments of construction for a stove of this description. In his work, entitled "Healthy Homes," many valuable practical suggestions are made on warming and ventilation generally.

‡ This application was made in 1817, at the dormitories of the George-street Model Lodging-house.

§ In the appendix to Dr. Arnott's work on the smokeless fire-place, a description of the latter application of these tubes at the dormitory of the Field-lane Ragged School will be found; and in the Rev. Henry Stuart's work on the "Social Condition of Agricultural Labourers in Scotland," at folio 56, is described the mode of applying the tubes 2 inches clear, which are used in small bed-rooms with great success.

more generally, and are not liable to be closed, as is the case with Sheringham's, or the cottage ventilator made by Hart. Where, however, tubes are not used, the most simple way of introducing fresh air, apart from a window ventilator,\* is by fixing one of the ventilators just named in an external wall near the ceiling, with an air-brick outside. In small rooms with a fireplace, this addition to the usual means of changing the air, generally suffices to keep them in a healthy state. At the same time, it is desirable that there should be an opening for the escape of vitiated air near the ceiling. This is most indispensable in small bed-rooms without a fireplace. In some instances it may be effectively done by means of a pipe carried through the roof and bent at the top; in other cases, an opening may be made over the door, with perforated zinc fitted in. Perforated or ventilating glass may, in some situations, be used, and it should be remembered that where openings can be formed on the opposite sides of the room, the air will be most speedily and effectually changed.

Amongst various devices for effecting ventilation without artificial aid, is that of Mr. McKinnell, which has been much used in Glasgow, and lately in England. It combines the admission of fresh air by an outer tube, surrounding an inner tube, through which the vitiated air should constantly ascend and make its escape. The tubes are fixed in the centre of the ceiling or roof, and by a broad flange or fan, extending from the inner tube, below the level of the ceiling, and reaching beyond the outer tube, the pure air is diffused as it enters.† The certainty of a uniform action is required to render this ventilator perfect; but that is probably unobtainable without some such artificial appliances as I have now to speak of.

Artificial ventilation is ordinarily effected by the action of valves, fans, pumps, serews furnaces, stoves, or other artificial heat, including gas, and a variety of contrivances, whereby air is either drawn out or forced into the apartment. In the one case the space occupied by the vitiated air which is withdrawn, is replaced by an admission of pure fresh air; and in the other the pure air forced into the apartment causes a displacement of the vitiated air, for the escape of which due provision must be made. In both cases a just proportion between the volume of air which ought to enter, and that which should be expelled, is necessary; and in order that the fresh air may be adapted for use at all seasons of the year, means must be provided for warming it, prior to its distribution in the apartment. The best means for effecting this, is by bringing it in contact with heated firebrick, suitably arranged in stoves or furnaces. When heated iron is used for this purpose, the air is liable to be deteriorated, or, as is commonly said, burnt. Hot water, which is similarly employed, has not this injurious effect.

Nothing can be more inconsistent with a healthy system of warming than those arrangements which provide only for raising the temperature of the air already in the apartment, vitiated as it may be. Such is mostly the case when the German hot-air stove is used, and also when hot-water is circulated in pipes through the apartments. But either may be employed with impunity as an auxiliary to an open fire.

The question has been much discussed here as well as in Paris and Brussels, whether suction or propulsion be preferable as a motive power for effecting the change of air in ventilation, and after examining both systems in their practical application, the latter appears to me decidedly preferable, excepting in peculiar cases, where the power of suction may be more readily applied.

When fresh air is forced into an apartment, through suitably placed openings, it becomes more generally diffused than it does when its entrance is dependant on the withdrawal of the vitiated air by means of suction, the tendency of which is to draw the fresh air towards the point of exit, instead of leaving it to disperse and circulate freely. Suction involves the further disadvantage of settling in movement whatever noxious vapours may be within its reach.

My object in giving these latter details, which are mainly applicable to artificial ventilation, will be misunderstood if it were inferred that I would,

\* A good and clean cottage ventilator may be made with a triangular piece of zinc fixed in an upper angle of a window, and perforated in the centre, a rim being formed round it to receive a moveable cover, which may be hinged.

† Properly conducted experiments can only decide the practical value of the objection to the admission of fresh air in the upper part of the room; on the ground that the air vitiated by breathing, which ascends in consequence of its relative lightness, is in that case only diluted, and not entirely replaced by pure air. A simple test whereby the deterioration of the air could be readily ascertained is a great desideratum.

\* The Report of the Government Commissioners above referred to says, at folio 89:—"Under all the circumstances, it would be directed the attention of the Minister at War and the Horse Guards to the absolute necessity of providing more room and accommodation for the soldier in barracks; and, instead of 500 cubic feet of space, that 700 to 800 cubic feet should be allowed per man, or, as in the case of the Wellington Barracks, that only ten persons should occupy the space allotted to sixteen; and that these regulations should be enforced as soon as extra spaces can be provided throughout the whole of the United Kingdom." In a previous part of the report, at folio 92, are found the following apposite remarks, which scarcely appear to have emanated from the same mind:—"The continuous removal of impure air, as it arises, is of very much greater importance than the cubical contents of air in a room." "In the soldiers' rooms, which are constantly occupied, the amount of cubical space can be of very little importance, for how lofty soever the rooms may be, unless the heated and impure air can pass away, the space will soon be occupied by air unfit for respiration, and the greater or less size of the room will only resolve itself into a little more or a little less time before the air is brought into an impure condition." "The soldiers' rooms are about 12 feet in height, with good ventilation this might be reduced to 11 feet or even to 10 feet without disadvantage."

† In a lecture, entitled, "Home Reform," an address to working people on the improvement of their own dwellings. Published by the Labourers' Friend Society, 21, Exeter Hall.

under any circumstances, dispense with an ample provision for natural ventilation in dwellings,—at all events, until the science be more thoroughly mastered, and its practical application more simplified than the Report of the Government Commissioners on Warming and Ventilation,\* before referred to, would prove it to be.†

#### ARCHITECTS' COPYRIGHT.

THE session is now so far advanced that it is to be feared nothing will be done at present as to artistic copyright. It is desirable, nevertheless, to keep the question open, and to lead the public mind to correct views on the various points of the subject. The draft Bill for the amendment of the law of artistic copyright, prepared by a committee appointed by the Society of Arts, does not go far enough in respect of architecture, as we have already pointed out. Under the head, "Interpretation of Terms," an *architectural work* is described as

"The representation of a design for any edifice or building or any part thereof, by any plan, section, elevation, or model made by any process or processes, manual, chemical, or mechanical, either separate or combined."

And the Bill then goes on to say, in Clause III.,

"The copyright in every architectural work which shall have been executed or made by any person who shall also have been the author of the design thereof, shall mean and include the exclusive right of copying, reproducing, or multiplying the same, or the design thereof, or any part of such work, or of the design thereof, by any means, of any size, or for any purpose whatsoever; but when any building shall have been constructed, nothing herein contained shall preclude any person from making any plans, sections, elevations, or models of the same, or any part thereof, and constructing any building therefrom, provided such plans, sections, elevations or models, be made and executed, not from those of the author of the design thereof, but only from the said building."

This would positively make legal the piracy of architects' designs. Mr. Cockerell, in the evidence he furnished to the committee, dwelt, it is true, only on the injustice often done by the piracy of ideas from rejected designs in competitions. He said:—

"The copyright of design and invention in the Fine Art of architecture is especially claimed by its professors on the present occasion, their works being more exposed to piracy in the case of public competition than any other of the fine arts.

The fact that the piracy of ideas and inventions from rejected designs is often permitted to the successful competitor is notorious, and the work executed is constantly the composition of the ideas and inventions of the several competitors, without scruple, reward, or acknowledgment of any kind. To guard myself against this crying injustice, on the occasion of a great public competition, I applied to the late Mr. Long, chief of the office of the Registry of Designs under the Board of Trade, but the opinion of Mr. Long was, that the law was not sufficient to protect architectural design.

The direct consequence of this failure of protection was, in that instance, that the most important feature of my design, and of other designs in this public competition, were pirated, and put into execution in a great or public work.

It is obvious that for the removal of this scandalous injustice, for the honour and credit of this fine art, and for the due advantage of the professors, some legal protection for copyright is just and expedient; and I trust that the copyright of architectural design and invention may be fully represented on the present occasion."

Protection as to drawings, however, would not suffice either for architects or the public. Executed works should also be protected, as was set forth in the memorial presented by the Royal Institute of British Architects to the House of Lords in 1858, through Lord Lyndhurst. This memorial urged

"That architects are liable to considerable injury in the piracy of their designs and inventions, and that other parties can and do copy and appropriate to themselves such original ideas, without any benefit or remuneration to the authors.

That it is therefore desirable to afford protection to architects for the copyright of their works.

That such copyright should extend to their executed works, as well as to their publications.

That the copyright of an architect in any work executed, or in a work proposed to be executed, should not pass to the employer, except under special agreement, but remain with the architect; and that the design in the drawings and specifications prepared for the purpose should still remain so for the property of the architect.

That the execution of a building should be equivalent to registration as a work of art and science.

That no other person be justified in pirating or reproducing the same in such points as are peculiar to the author of the design, without the permission of the author.

That copyright of architects' productions should extend to the same period as is given to authors of literary productions.

Your petitioners, therefore, most humbly pray your Lordships that, in any bill introduced in your Lordships' House for the better protection of design and invention in the fine arts, provision to the above effect be made for the protection of architects, in a manner similar to that for authors and inventors."

\* It is to be regretted that this Report, with its mass of information, fails to place the subject in that clear light which was contemplated in the suggestions made by Dr. Arnett in 1849, for an investigation by a committee of eminent scientific men, comprising chemists, engineers, and physicians.

† To be continued.

The committee admit that this should be done when they say, in the "Reasons in favour of a Bill to establish Artistic Copyright," prefixed to it,— "The justice of securing copyright to all works of art, especially to those which possess design and invention, will not be disputed;" and consideration will show that the public would be benefited by letting justice be done. The brain's creation is as much a man's property as the hand's creation, and his right to the possession of it should be fully assured. What is much to be desired is, that the value of *design* should be understood, and that the right to the protection of it should be fully admitted. The means of giving this protection would speedily follow.

#### THE GLOUCESTER CONGRESS OF THE ARCHÆOLOGICAL INSTITUTE.

A GEMSE of the past has necessarily a charm for antiquaries. The announcement that Professor Willis would be at Gloucester, after so long an absence from the meetings of the Institute, was a source of considerable congratulation among the members, more especially as they could not fail to recollect that so many genial ones have left the study of the past to learn the future. The announcement seemed also to have an inspiring effect upon those who contributed papers, for they were all far above the average, and what was very important, they all possessed local interest, a point which has not always been sufficiently considered at our annual gatherings.

On Tuesday morning the Congress was inaugurated by the usual cordial expressions of welcome and the reciprocal congratulations. Afterwards the members took a survey of the city, inspecting many architectural remains, assisted by Mr. Parker, who made some explanatory remarks on the various objects. In the evening there were several papers read: one from the Rev. S. Lysons, "On Richard Whittington," a Gloucestershire man, caused some remarks. Mr. Lysons, notwithstanding Mr. Riley's notes to the *Liber Albus* of the City of London, maintains the tradition, *pure et simple*, of the great mayor and his wonderful cat. A paper from Mr. Powell, "On the Early Commerce of Gloucester," appeared more suitable to the Statistical Society.

On Wednesday the Rev. C. S. Petit read a paper "On Tewkesbury Abbey." This was illustrated by a variety of sketches, done in that gentleman's usual artistic style, of churches in Normandy and elsewhere, possessing apsidal characteristics of the period of the building of Tewkesbury. He said that he had found the greatest difficulty in sketching the tower on account "of its height and massiveness." Now, may not the converse of this have something to do with modern designers? They can sketch with the greatest ease and facility; but do they produce height, massiveness or effectiveness?

In speaking of the glass he was content with quoting from Winston, from whom the following, in these ages of rabid destruction, is worth consideration:—

"Identity of design does not always produce identity of effect, in consequence of different material being used." It would be as absurd to restore ancient glass, as to attempt to restore an ancient manuscript.

Mr. Petit was followed by Mr. Parker, who read a paper "On the Domestic Architecture of Gloucestershire."

In the Historical Section, the Rev. C. H. Hartsborne read an interesting and eloquent paper on "the Parliaments of Gloucester," in which he traced the growth of our representative system, and the development of our constitutional liberties. He paid a glowing tribute to "Domesday Book," and claimed the gratitude of students of the present time for the benefits derived from that work. He said,— "A recent report on privileges has, after a lapse of four centuries and a half, invested the last Parliament that sat for six weeks at Gloucester with fresh value. It has been appealed to as the chief authority for passing bills of supply, and upon its practice have been founded a series of resolutions marked equally by their dignity and independence, which have asserted the authority of the House of Commons to impose and remit taxation."

Alas! alas! that this should be read in a city that has been deprived for a time by the present Parliament of its political privileges, because its citizens have basely bartered their suffrages for a mess of pottage.

At the same sitting, the Earl Ducie gave an account of the discovery of a Roman villa at Tortworth.

Dr. Guest then gave a learned and ingenious

paper on "the English Conquest of the Severn Valley."

In the afternoon, there was an agreeable excursion to Tewkesbury, where Mr. Petit pointed out the peculiarities and illustrations to which the attention of the members had been called by his paper in the morning.

The usual annual dinner, for some reason, was omitted, but the president and about sixty others dined at the ordinary at the "Bell." It is difficult to say why the good old custom of the public dinner is given up. Surely the formality acts as a stimulus to those who take part in it. Why a few tokens should be proposed without any remarks, and considered sufficient substitute for the usual routine, remains to be discovered. The mayor must, however, be honoured with an exceptional notice, he having made an earnest and appropriate reply.

In the evening the members visited Highnam Court, the seat of Mr. T. Gambier Parry. This was a source of great gratification to the members, who were charmed with the works of art that Mr. Parry possesses. There was some discussion among the members as each one selected his object of admiration in accordance with his individual taste; but there was perfect unanimity on these points—the liberality of the host, and the graceful reception of our fair hostess.

On Thursday we went to Cirencester, where we were met by the Rev. Wm. Powell, who kindly undertook to give an account of the abbey and the church. As may so often be observed, those who are the best masters of a subject are generally the most cheerful and pleasant illustrators, and our worthy friend, by his humour, not only established this principle, but left upon us a lasting impression of his consideration and kindness of heart. "Long live William of Cirencester" is the wish of all who heard him.

Some of us then proceeded to Fairford Church, containing, or rather filled with, painted glass, every window being nearly complete. The conclusion arrived at was that the glass was English glass of a late period, manufactured by foreign workmen; but there was a general expression of regret at the absence of Mr. Scharf.

In the evening the sections met, and there were several papers read. One by the Rev. John Earle, on "Some Fragments of Anglo-Saxon Manuscripts discovered in the Chapter Library." That which called forth most remark was a homily upon the saint said to have most influence just now,—St. Withlin. Mr. Earle, who was formerly professor of Anglo-Saxon at Oxford, gave a clear and succinct account of the saint, and elucidated his history. But how many saints would there be in the Calendar if they were submitted to the same analytical process by a gentleman so learned as Mr. Earle?

Friday was the great day of papers. Mr. Earle was first in again devoting his knowledge to the illustration of "Some Historical Associations connected with the county of Gloucester."

Then came Mr. Richard Westmacott's paper on the Mediaeval Sculpture, illustrated by examples in Gloucester Cathedral, which perhaps caused more enthusiasm and more opposition than any other paper read at this meeting. The subject was treated with pure art-feeling and with strong love for the truth, which he maintained should be the only source of art. He stated, and brought strong evidence to bear upon the argument, that it is not right to attribute to the Reformation the decay of art in England. It was delightful to hear the response with which this statement was received, and equally delightful to find that the members have not by their fondness for the memorials of the past become converts with many young men in long black coats and no shirt-fronts who twaddle upon this theme. The professor having ended, Mr. Parker rose to enter a protest against what he considered an attack on Gothicism. He remarked that domestic architecture of the Middle Ages was of the same style as that left by the ecclesiastics, and instanced as a proof the Refectory of the Blackfriars as a sample of secular building. But in saying this without qualification, he must have spoken "in his haste," as he did upon a previous occasion during the meeting, when he was corrected by the sexton. Mr. Parker, however, can afford to make a slip: all of us cannot. The president made some remarks, but he failed to turn the stream of popular opinion away from the professor, who was again greeted with cheers. This manifestation, and the applause Mr. Hartsborne received when he delivered his truly constitutional and liberal paper, are gratifying indications that intolerance is not the necessary adjunct of antiquarian studies.

The discussion gave way to Professor Willis. Those who expected much were not disappointed: those who had never heard him before were astonished; and those who had been charmed at his undiminished power. He constructed the cathedral from its foundation with a clearness and simplicity that left an impression on his hearers that, had they to "go in" for a competitive examination, they would be able to tell stone by stone as the mighty edifice rose in their imaginations. The professor stated that he believed this cathedral and this district to have been the school of the Perpendicular style, as it was here shown of a more early date, from authentic records, than in any other spot. He had, therefore, little doubt that this style originated in Gloucester.

This day's pleasure terminated with a conversation, given by the Mayor, Mr. Nix, at the Corn Exchange, where he provided most liberally for the entertainment of his guests, and superintended the arrangements with great *bonhomie*. It was a most agreeable *omnium gatherum*. The choir from the cathedral sang glee. Dr. Bruce read a paper "On the Roman Remains of the South as contrasted with those of the North;" and one gentleman of the choir sang a Gloucestershire comic song, which provoked a unanimous encore.

On Saturday, nothing daunted with a steady downy rain, which caused the streets to be covered with one vast eruption of bubbles, we started for Berkeley. Fortunately for us, by the time we quitted the train the weather improved, and umbrellas were not necessary as we mounted those curious hybrid vehicles that are now found in the country when excursions are extemporized. What their use is at other times it is puzzling to say. The "Berkeley Vale lad" who drove ours said it was a dray, but it seemed something between a market cart and, but for the colour, a hearse with the top taken off. Our first object to visit was Wanswell,—a house built in the middle of the fifteenth century, and indicating the domestic habits of that period. From this we journeyed to the stronghold of the Berkeleys. We were allowed by the kindness of Sir Maurice Berkeley to visit the interior, which was scanned by the visitors with much critical attention. Mr. Parker explained many points of interest, and ruthlessly destroyed one tradition by saying that the architecture of the room in which Edward II. is said to have been murdered was of a later period than his reign.

We then proceeded to Thornbury, where we visited the church, that has been restored under the direction of Mr. Townsend, whose kindness and attention will be remembered as a parallel to that of Mr. Powell, of Cirencester. We then visited Thornbury castle, the most beautiful feature of which is the chimney shafts: in no engraving published has justice been done to them.

Even archaeologists require a commissariat, and this had been amply provided by mine host, of the "Swan." After doing full justice to the good things provided, we returned home, enduring a most pitiful storm with a cheerfulness that proves that antiquity and the study thereof are not "harsh and crabbed," as some suppose.

Rain again on the Monday, but off we started for Ross, whence we proceeded down the Wye in boats to Goodrich Court, where we inspected the beautiful collection of armour belonging to Colonel Meyrick. We then went to the ruins of the old castle. The sun now shone forth as if to reward our perseverance and the cheerful endurance of the ladies. The charming landscape came forth from its cloudy mantle in great magnificence. When proprietors thus allow such delightful spots to be visited, how much envy is prevented. Nature's beauties are for all, and sometimes, fortunately, the best points of view are held by individuals who do not turn the key upon you, but share their possessions with you or hold them in trust, as it were, for the good of their fellow-creatures. But, on the other hand, the liberality of a proprietor is too frequently abused. One in Sussex informed me, that a few weeks ago a party visited his place, accompanied by a black dog, who performed a cheerful interlude with the proprietor's sitting game. Let us hope that time will teach their duty to those who receive benefits in return for the kindness of those who dispense them.

We then returned to Ross, still delighted with the lovely prospect that surrounded us. We were informed that a great portion of the property around here belongs to Guy's Hospital. Thus, while the spot affords such delight to health and pleasure seekers, it is at the same time administering to the wants and relieving the afflictions of a large portion of the poor and distressed in the great metropolis.

On Tuesday the annual general meeting took place, when the report was read, and other business transacted. We then started on another excursion to Bishop's Cleeve Church, containing some very interesting specimens of Transition and Decorated Norman work; and to Winchcombe, where there is a poor Late Perpendicular church, the clergyman of which was much grieved when informed by Mr. Parker that it was built in the reign of Henry VIII. He maintained that it was built many years before, and Mr. Parker as strongly insisted upon the correctness of his statement. Local guides are not always the surest informants; for instance, an old man that we saw at Goodrich informed us that the castle was built by Oliver Cromwell.

We then proceeded to Sudley Castle, where we were received by Mr. J. C. Dent. This castle has been restored with considerable taste and propriety, and the furniture and appointments carry you back to the period of Catherine Parr, who lies buried under the chapel, which is being restored under the direction of Mr. Gilbert Scott. A niche in the wall is to contain a tomb, under which are to be placed the remains of the last Catherine of him who, according to a modern historian, so generously sacrificed himself and his feelings for the policy of the state!

After viewing all the objects of taste, and partaking of a liberal collation, we returned to Gloucester. This was the last regular day of the meeting, but a great number of members remained to accept the invitation of the Cotswold Club to visit Chepstow, Tintern, and the ancient Roman remains at Coed Itel, on Wednesday; and on Thursday to proceed to Wroxeter, under the guidance of the Rev. H. M. Search, who has taken, himself, and fostered in others, a deep interest in the excavations.

The excursions were a great success, and too much praise cannot be given to the Rev. Edward Hill, the director, for the zeal and tact displayed by him in contributing to the comfort and enjoyment of the members. One gentleman, more distinguished for his antagonism than for his authority, got up an opposition excursion, but there was not the response of a single name to the notice he appended in the reception-room.

The Museum was very good. The chief attraction certainly was the collection of rings exhibited by Mr. Edmund Watkinson, who furnished a very interesting paper on this subject.

At the general meeting, it was resolved to accept the invitation from Peterborough for the ensuing year.

This closed a pleasant and successful, and, let me hope, useful gathering. F. S. A.

STATUES AND MONUMENTS.

SOME months ago a number of gentlemen held a meeting in London, under the presidency of the Master of the Mint, to devise steps for erecting a statue of the philosopher Priestley in the Oxford Museum. The statue has now been erected on one of the corbels projecting from the pier at the south-west corner of the grand central court of the Museum, in immediate proximity to the statue of Sir Humphrey Davy, which has been presented to the University by the Marquis of Louthian. The figure of Priestley is about 6 feet high, worked in Caen stone. The sculptor was Mr. E. B. Stephens.

A monument has just been erected at Derby, in the old cemetery at Uttoxeter-road, to the memory of the late Rev. J. G. Pike, for many years pastor of the Baptist Chapel, St. Mary's-gate. The execution of the monument was entrusted to Mr. J. B. Robinson, of Derby, sculptor. The monument was raised by public subscription. It is large, and carved in the Decorated Gothic style, 24 feet in height, of octagonal form, with eight recessed and carved panels for inscription, surmounted by a carved cornice and spire with gables at the base. The stone, of which twenty tons were required in its erection, was procured from the Darley Dale quarries, and is of uniform colour.

The ceremony of laying the lower course of the obelisk to be erected, at Manchester, to the memory of the late Mr. J. A. Nicholls, F.R.A.S., has just taken place. There was present a large concourse of working men, by whom the monument is being erected. The site is in the middle of Great Ancoats-street, between the openings of Lever-street and George Leigh-street; so that the obelisk will stand most prominently in the district in which the deceased gentleman was best known as an employer of factory labour, and in which he first laboured for popular education, in connection with Sunday schools, and then as a foremost supporter of the Ancoats Lyceum. The obelisk is to be of polished grey granite, 19 feet high, with a

base 6 feet 6 inches square. The obelisk has been executed by Messrs. Pateson, of Manchester.

It is proposed to lay the foundation-stone of the Wallace Monument on the 11th September next, being the anniversary of the battle of Stirling Bridge.

WEDGWOOD INSTITUTE COMPETITION DESIGNS, BURSLEM.

TWENTY-NINE designs were received in competition for the memorial building which it is proposed to erect in his native town in honour of Josiah Wedgwood, pre-eminently "The father of the pottery." The committee, in order to ensure justice to the competing architects, requested Mr. G. T. Robinson and Mr. J. A. Hamersley to assist them in making a selection of a design in conformity with the specified requirements, and one most likely to answer the purposes desired. Invitations for a private view of these designs were issued to the subscribers, and free admission given to the general public for Friday. The designs are arranged in the large room of the Town-hall. Some of the works exhibit considerable ability, and an intelligent appreciation of the objects indicated by this competition.

The following are the mottoes of the designs: "Bise quam videri," "Think well out," "Esperiar," "Eyes right," "Wait patiently," "Volunteer," "Regardez bien," "Convenience and Economy," "Loyola non hontia," "Utilis," "Convenience," "Virtute et industria," "Esto perpetua," "In memoriam," "Maintien le droit," a device, a trefoil in a circle, "Jus supra vim," "May the arts flourish," "In memoriam," "Per ardua," a pencil sketch of an Associate of the Royal Institute of British Architects, "Wedg in wood," "Dum spiro spero," "Study," "Quidnunc," "Pro bono publico," "Hath not the potter power over the clay?" "Mens conscia recti."

NORTH RIDING INFIRMARY COMPETITION.

TWENTY-EIGHT designs for the proposed North Riding Infirmary were sent in. The first premium of 50*l.* has been awarded to Messrs. Oliver & Lamb, of Newcastle-upon-Tyne; and the second, of 25*l.*, to Mr. Hope, of Manchester.

OSWESTRY CEMETERY COMPETITION.

WE understand that Mr. Kirke Penson, of South Wales, and Mr. Smith, of Shrewsbury, have been called in to inspect the drawings. The Board properly considered they were not competent to decide. Some of the drawings have been returned to the competitors. Six are to be retained for further selection.

WORCESTER: THE OLD BANK.

THE building known as the "Old Bank" has been recently altered and renovated: it is, externally, a large example of brick and stone construction, and of Palladian character throughout, but the interior arrangements as to the plan were too restricted for the extensive business carried on in these premises by Berwick, Lechmere, & Co. Several apartments have been therefore thrown together, to form a spacious banking-room 93 feet square and 24 feet high; and other rooms have been altered and refitted, new staircases constructed, the windows enlarged and fitted with plate-glass, and Bunnett & Co.'s revolving shutters. The interior has been finished with oiled and enriched ceilings, panelled walls and parquetry floors. The mahogany counter-fronts and doors, metal desk rails, marble chimney-pieces, fenders, clock stands, &c., are highly enriched with electro-copper work.

These decorations are one of the earliest adaptations of electro-depositing to architectural embellishment. The staple products of Worcestershire—the pear and the hop—are intermingled with agricultural and other types deposited from the natural forms, and afford a pleasing variety of permanent ornamentation. The work was executed by Messrs. Wood & Son, of Worcester, from the designs and under the superintendence of Mr. John Billing, of Westminster.

METROPOLIS LOCAL MANAGEMENT ACT AMENDMENT (No. 2) BILL.—On the motion for the resumption of the adjourned debate on the third reading of this bill (Tuesday last), on the question that the bill be "now read," the house divided,—For the third reading, 23; against it, 93. The bill was consequently lost.

## ROMANESQUE DOORWAY, PALAISEAU, FRANCE.

Capitals.

## ROMANESQUE DOORWAY, PALAISEAU, FRANCE.

I SEND you sketches of the remarkable Romanesque doorway of Palaiseau, in the department of the Seine and Oise, France. It bears the date 1172, in figures of more modern date. The capitals are exceedingly well carved. Palaiseau, it may be added, is about eleven miles from Paris. The drawing was made a few years ago. M.

## THE TRAFFIC OF LONDON.

SOME noticeable statistics respecting the great traffic of the metropolis may be gathered from the evidence given before the Parliamentary Committee on the London, Chatham, and Dover Railway; the Extension to Plumco, Newington, &c.

Mr. Church, the secretary of the London General Omnibus Company, stated that the company had 640 omnibuses, and 6,600 horses in daily work, and that they employed about 3,000 men. These took sixty different routes, and the traffic receipts for the last week amounted to upwards of 13,300l. The average fare was 3½d. each passenger in twenty millions of passengers. Considering that this is but one of several omnibus companies whose carriages ply in the streets of the metropolis, it seems remarkable when we contemplate how comparatively few years have passed since these public carriages were introduced, and how rapid has been their increase.

In some parts, about thirty or forty years ago, Shillibeer's first omnibus—a singularly shapeless box-like vehicle, with very small windows, for at that time plate-glass was expensive,—might have been seen on its way from the Bank to Paddington,

the charge then being 1s. 6d. for each passenger. The first promoter must have been very sanguine if he imagined that the revenue of a single omnibus company would amount to over half a million sterling in the year.

Both Mr. Church and Mr. Hubble, the chairman of the Camberwell, Peckham, and Dulwich Omnibus Association, were of opinion that the formation of the line mentioned, or the Farringdon line, would but little affect the omnibus traffic: if anything, it would increase it.

Considering the present blocked up condition of Newgate-street, Cheap-side, Fleet-street, and some other thoroughfares, it would seem that any further increase of traffic would cause a complete stoppage, and this shows the necessity of pushing forward fresh arrangements.

## AS TO THE CENSUS.

In a recent report by the Registrar General on the health of the metropolis, with reference to the death of a child, aged nine months, at 12, Brick-street, Mayfair, from "teething," and foul drains in the kitchen (six weeks), with hydrocephalus, Dr. Drutt writes as follows:—"It may be well put on record that, although houses may be well drained, as regards the removal of refuse and water therefrom, yet the house in which they stand may be utterly undrained, and nothing more than a marsh. This is the case with the house in question, No. 12, Brick-street, and its neighbours. Underneath the kitchen-floor there are pools of water which are kept down by being every day. The site is at the bottom of a hill, and on a bed of clay; and, as I am advised, the nearest sewer is too too high a level to carry away the water which

comes to the surface." Undoubtedly this is the cause of much sickness in other quarters, and should be a warning to persons not to choose a house in a valley, or at the bottom of a hill, where the dwellings are built upon clay foundations, without the greatest care be taken at the different gradients to drain the surface.

It would be useful if, in the next return by the Registrar General, a geological map of the metropolitan district were given, showing the different soils, the gradients and elevations, number of persons, their general conditions on a particular space, and the proportionate deaths from various causes.

We see the difficulties which exist in the taking of the census. It is necessary for the comprehension of a large number of persons to render the papers as concise and simple as possible; much good might be done by the employment of an additional staff of intelligent enumerators particularly in crowded and poor neighbourhoods. From observation made in some such localities in 1851, it seemed that there was too much hurry; men unaccustomed to the particular duty were required to do too much in a limited time, and, doubtless, errors were in consequence committed.

In some places not one person in a house occupied by a number of families could either read or write, and it was a labour of time for the enumerator, often struggling against prejudice, to get at the right facts for filling in the papers; and it should be borne in mind that, in such neighbourhoods, to get correct statements is of the greatest importance.

It has been suggested that it would be of great use, particularly in large towns, to obtain the amount of the various kinds of sickness at the time the census is taken, not only in the hospitals, but also in other places. This could be easily managed in hospitals, asylums, and prisons; but, at a first glance, it seems to us that generally there would be a difficulty in getting a true statement of the diseases where the people are not well informed, and where frequently supposed infectious disorders are concealed; and in even serious cases no medical advice is called in. No doubt, however, if this return should be determined upon, the able heads who direct the registration department will find some means of carrying the matter into effect. Even if the return in this instance should not be perfect, it might be suggestive of such improvements as would produce better results on a future occasion.

## R. C. CATHEDRAL OF ST. THOMAS THE APOSTLE, NORTHAMPTON.

THE engraving represents the north-east view of the edifice about to be erected for the Right Rev. Bishop Amherst, as the cathedral church for the diocese of Northampton. It will measure 160 feet in length by 60 feet in width, and 70 feet to the apex of the roof. The material will be the yellow stone of the neighbourhood, with Portland slabs, and the remainder of the dressings in Bath. Mr. Welby Pugin is the architect.

## ARTIST VOLUNTEERS.

THE "38th Middlesex Volunteer Rifle Corps" is formed principally of artists (painters, sculptors, engravers, architects, musicians, literary men, actors, amateurs, and gentlemen in any way interested in or connected with the arts), and thus has an extra claim on us for notice. Other gentlemen are also invited to join its ranks.

The uniform is light grey with silver. The corps drills in Burlington House Gardens, and has the use of the ranges at Plumstead for rifle practice.

The following gentlemen at present hold commissions in the corps:—H. W. Phillips, captain; A. J. Lewis and J. E. Millais, A.R.A., lieutenants; F. Leighton and A. Nicholson, ensigns. The committee consists of Messrs. H. W. Phillips, John Leeb, J. E. Millais, Sims Reeves, Frederick Leighton, F. P. Cockerell, Lewis Dickinson, Alfred Wigan, A. J. Lewis, Field Talford, Alfred Nicholson, W. Richmond, J. Thomas, Thomas Woolner, W. R. Cusins.

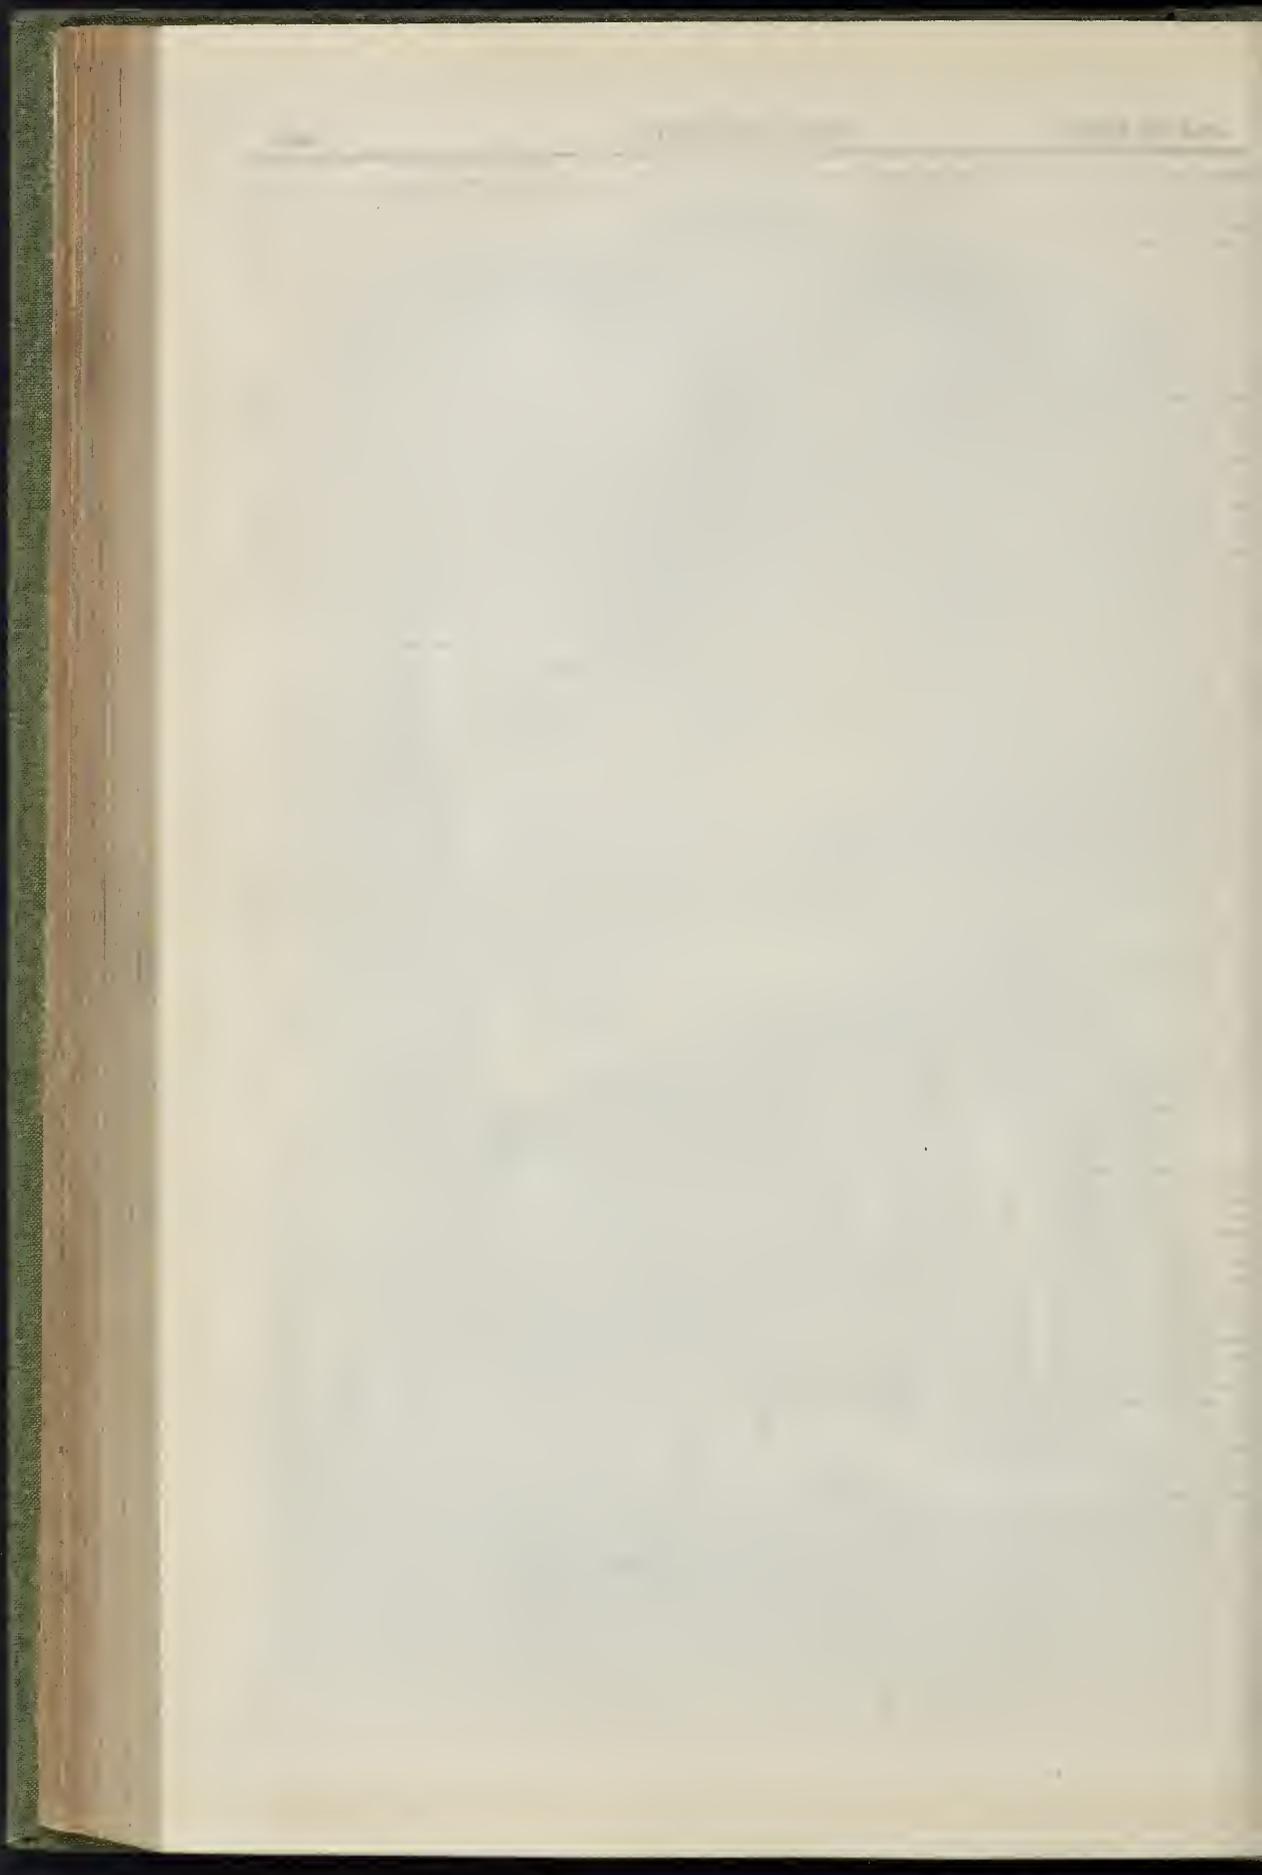

Of architects in the ranks we find Messrs. Devey, Wyatt Papworth, Horace Jones, Bright Smith, &c.

The review in Hyde Park showed how well the corps can do their duty.

ELECTRO-TELEGRAPHIC PROGRESS.—The *Exp.* of Arctic celebrity, has been despatched to the north, on a survey of the route of the proposed North Atlantic Telegraph.

R. C. CATHEDRAL OF ST. THOMAS THE APOSTLE, NORTHAMPTON.—MR. WELBY PUGIN, ARCHITECT.

IMPORTANCE OF SANITARY STATISTICS.

At the closing meeting of the International Statistical Congress, Lord Shaftesbury read the following letter from Miss Nightingale:—

"My Lord,—Pardon me for suggesting to you, first, that there must be a large amount of statistical information, bearing on the prevention of disease, in possession of the Governments of different countries; and second, that it would be of great importance, at the next meeting of this Congress, if each delegate would include, in any report to be presented, any marked examples of diminution of mortality and disease, together with the saving of cost consequent on the carrying of sanitary improvements in towns, in dwellings of the labouring classes, in schools, in hospitals, and in armies.

As, for example, it is stated to be a fact, demonstrated by statistics, that in improved dwellings the mortality has fallen, in certain cases, from 25 and 24 to 14 per 1,000; and that in common lodging-houses, which have been hotbeds of epidemics, such diseases have almost disappeared as heads of statistics, through the adoption of sanitary measures. As no one has been more instrumental than your lordship in bringing about these happy results, so no one is better acquainted than yourself with these facts.

It is also stated that in the British army large bodies of men, living under certain improved sanitary conditions, have proved a test-rate, one-third only of what the army has suffered in past years.

Would not your lordship consider it of great importance that the statistics of these and similar cases should be carefully collected and presented for comparison with the statistics of ordinary mortality?

Again, it is stated that in our colonial schools for aborigines we have, in many instances, exposed the children to the same diseases, such as while Christianizing and civilizing them. Might not this be avoided by sanitary arrangements?

Again, to take a different case, from the experience of schools, it is stated as a statistically true of some industrial and half-time schools for orphans and destitute children, that whereas formerly two-thirds of the pupils became sacrifices to vice and crime (as, indeed, is stated to be the case in some instances), the failures on account of misconduct among the pupils have been reduced to less than two per cent.

Might it not be well to consider whether these statistical results do not exemplify what may be done by application of like means?

I am encouraged to make these suggestions by the following words from the statesman Guizot:—

"Valuable reports, full of facts and sound views, drawn up by committees, inspectors, rectors and prefects, remain unknown to the public. The Government ought to draw itself with the knowledge and the expansion of all good systems, with the encouragement of all favouring efforts, and with attempts to improve them, according to our present habits and institutions. One channel alone embraces sufficient action and power to secure this salutary influence: that channel is the Press."

If facts already existing regarding the points I have mentioned above were carefully abstracted and made accessible to the public through the medium of the Congress, there cannot be a doubt of the great benefits which would accrue to science and humanity.

And if, as it is the cost which frightens communities from executing the works necessary to carry out sanitary improvements, it could be shown that the cost of crime, disease, and excess of mortality is actually greater, it would remove one of the most legitimate objections in the minds of Governments and nations against such measures."

We endorse all that is said as to the importance of statistical information bearing on the prevention of disease, and trust that the Congress will aid in making it accessible to the public.

RIDE OF THE HYDE.

It seldom happens that an extension of public privilege causes discontent such as has been manifested on the opening of the crooked horseway staked out through Kensington Gardens. The equestrian order has had ample scope hitherto in the mile-and-half course from Aspel's House to Kensington-gate; in addition to which the whole area between Rotten-row and the Knightsbridge barracks, the site of the Exhibition Palace, has been thrown open to them. Here any one might suppose that there was space enough for coursing, curvetting, carioling, and such other gambols as liberated doctors or lawyers might desire for an hour's vacation. This liberty interfered with no pedestrians, as they had the wide range of the park and gardens, and the delectable resource of miles of borders, adorned in all the luxuriance of blooming plants and flowers, besides the more sequestered, but not less valued, retirement of Kensington's lofty timber groves.

The care bestowed on perfect cultivation of the borders, as well as in the complete adaptation of the rides for the equestrians of both sexes and of all conditions, left nothing to be faulted or desired; when lo! of a sudden the crotchet of a commissioner violates the general peace, and sets all classes again by the ears! The uproaring and havoc perpetrated in the borders by a late authority ought to have admonished the present "Arbiter Sylvorum" that violent interference with popular rights is an unwise experiment; and, above all, he ought to avoid the baneful issue involved in the war of classes; for such is the result of his extended liberty to the equestrian at the expense of the pedestrian order.

By the intrusion of a tortuous ride through the very centre of the gardens, one half of these 300

acres of woodland is cut off from the other, and, moreover, a muddy or dusty arena is carried through the most sequestered parts. All this is done on the humanitarian principle of easing off the professional cares of lawyers and doctors, and perhaps for relieving the "ennui" of the noble sojourners for three months in town; but it is all set down to the laudable incentive of extending the public privilege, and of affording a thoroughfare for general convenience from Bayswater to South Kensington.

Were this the motive in reality, it would be both laudable and popular; but no, the indulgence as well as the short cut is really designed only for the upper twenty thousand—ten of the nobles and ten of the millionaires.

For the accommodation of the public, what is really required is a road cut slick across the park, or gardens and park, to pass by the already built bridge, from near the Victoria-gate, Bayswater, to the city of palaces, South Kensington; whereas the extension of the now existing spacious rides, whilst it could bring but little increased accommodation to the rolling aristocracy, must become a real nuisance to the rambling and health-seeking public at large.

The *Builder* has for many years sought to impress upon the Commissioners of Works the expediency of granting a public traverse way between the populous districts of Paddington and Tyburnin, on the north; and Knightsbridge and Kensington on the south. Here is a city in itself, for over two miles, from Park-lane to Kensington, has no line of intercommunication, except during the sun-lit hours, and then not for business, but only for aristocratic convenience!

Perhaps in a city like ours, where on either side of the river millions of the trading community are diserved, and have access only by toll-bridges, we have no right to question or inquire into matters of expediency or of public utility; or to suggest innovations which might be more conformable to the altered circumstances of the age. Yet still we are at liberty to censure any violence done to public rights for the benefit of only a very small number. It is a duty to guard the rights of the public when invaded, as also to unveil the real motive of the innovator, who would mask his proceedings under a false showing.

To give a plausible pretence for the extension of the ride, it has been alleged that the pedestrians all flock to the exhibition *au grand galop*; that they seat themselves, or lean over the bars, in admiration of the beauty or fashion, the fine horses, the feats of daring, or of graceful equitation. Good luck! what a spectacle is exhibited there on a favourable day, and in a full park! Clustered groups of parties, sometimes all of a ruck, soberly babbling, on thoroughbreds, hacks, Punches, ponies, switebails, hobtails; then in twos or threes, ambling, trotting, racing; anon a grocer, or a tailor, or a clerk (in orders or otherwise), let loose on his bled or unbarnished steed, scudding and threading the maze of quadrupeds: on such occasions, to cross is doubly hazardous for those who go afoot or astride.

But we must not omit the fair actors on the scene,—the ladies,—all habited alike in flowing broadcloth; here, indeed, the true enchantment lies. Many are handsome, or graceful, or beautiful; but they differ in array only in the colour of a feather, or the peak of a Jersey, or Gibus riding-hat. The spectators who love exhibitions of the cirque or amphitheatre have little to interest them in the display or costume, and no one will assert that Rotten-row is the arena for graceful horsemanship; in truth, the scene can have attractions only for the lover, the stranger, or the quizzier: those who walk seek the green sward, the flowers, or the shade; and, where health or recreation is the object, they avoid the motley ride.

All who remember the Parks twenty years back are conscious of the wondrous advance of beautiful grounds, as well as seats and studied improvements: they know that Sir B. Hall originated the fairy creation; but they also know who caused the last year's devastation, and they watch the suspended progress of the filtering beds and Dutch garden. Let the present authorities imitate so good an example: let them consult the wants and wishes of a swollen and increasing population; not by shamming, but by realizing useful changes and improvements; and they, too, may win and merit applause—not censure.

The universal volunteer movement has amalgamated all classes, who are progressing fast to only one simple distinction; not of equestrian and plebeian, but of cavalry and of infantry volunteers.

So slight a matter as a muddy or dusty gallop through the pleasure-grounds of William III. ought not at this crisis to be made a cause of dissension, since the peer and the squireman march together shoulder to shoulder. British liberties are typified in minute evidences, and the smallest right should be carefully guarded and held sacred, since the best security for national independence is the community of all in true conservatism.

QUONDAM.

FIELD LANE RAGGED SCHOOL.

REMEMBERING with interest, as we do, the early beginning of this establishment, it is gratifying to notice its greatly advanced and more prosperous condition. The attendance at the school is now very large, and many a destitute boy, without parents or friends, has been saved from ruin by its means. Lately several lads from this school were received into the Royal Navy in the *Fishguard* at Woolwich; they had previously attended the day and evening classes under the care of Mr. Fraser, who is to be praised for the ability and zeal he shows in carrying out an important duty. In great measure through Mr. Fraser's instrumentality, during the last fifteen months as many as 120 lads belonging to these schools have been admitted into the navy, and good accounts are given of their conduct.

TESTIMONIAL TO THE LATE HONORARY SECRETARY OF THE INSTITUTE.

THE testimonial proposed to be given to Mr. C. Charnock Nelson, in recognition of his valuable services as honorary secretary of the Royal Institute of British Architects during a number of years, took the shape of a silver vase and a drinking-cup, manufactured by Messrs. Hunt and Roskill, and was presented to Mr. Nelson in the rooms of the Institute, Conduit-street, on Thursday last, the 26th inst.

The president of the Institute, C. R. Cockerell, Esq., R.A., took the chair, and there was a good attendance of members. Mr. Sydney Smirke, R.A.; Professor Donaldson; Mr. Titic, M.P.; Mr. Wyatt; Mr. T. H. Lewis; Mr. H. Roberts; Mr. Jennings, and others, stated the various ways in which the Institute had been advantaged by the continuous services of Mr. Nelson during ten years. The chairman then in some well-chosen and feeling sentences presented to him, in the name of the subscribers, the vase and cup, which he begged him to receive as "full of his own merits."

Mr. Nelson thanked the meeting briefly but happily:—*Facta non verba* had been his motto during his period of office: *Facta non verba* let it be to the end of the chapter.

A vote of thanks to the chairman terminated the proceedings; and afterwards a number of the members went off to Greenwich, where they dined together very pleasantly.

STAINED GLASS.

*Lynn*.—The east window of St. Nicolas's Chapel has been filled in with painted glass. The artist employed was Mr. H. Hughes, of the firm of Ward & Hughes, Fifth-street, Soho, London. The window comprises medallions and rich mosaic. The lower portion of the window contains thirty-four subjects, chiefly illustrating events from the life of our Lord, which were selected by the Rev. C. N. Wodhouse. There are eighteen lower lights (in two rows of nine divided by a heavy transom), each containing two medallions, except the two centre lights, each of which contains one of larger dimensions and scale. These central and principal subjects are the Crucifixion and the Ascension; and about them are grouped others. In the tracery above are figures of the twelve apostles, a choir of angels, the celestial dove, Alpha and Omega, and the emblem of the Trinity. These are designed with reference to a cruciform plan of the window, which is a particular feature in its stonework. The ground work of the lower lights is composed of a flowing vine alternated on blue and ruby grounds.

*Congleton*.—Messrs. Edmundson & Son, of Manchester, have just completed three windows of stained glass for the chancel of the new church of St. Stephen, Congleton. The subjects are, Jacob blessing the two sons of Joseph, Joshua addressing the tribes, Job and his friends, Daniel in the den of lions, Simeon and the infant Jesus, and the stoning of Stephen.

*Doncaster*.—The testimonial window which has been put in the great east window of St. James's church, in this town, has been formally presented

to Mr. Edmund Denison, chairman of the Great Northern Railway Company, by the subscribers, to mark their sense and appreciation of his efforts to provide the company's employé's with spiritual instruction. Mr. Archibald Sturrock, the company's engineer, made the presentation, and the heads of the respective departments of the company's works at Doncaster were present. Mr. Denison suitably acknowledged the gift; and it is expected that he will assign it over to the incumbent. Mr. Denison's exertions have resulted in the establishment of schools for the children of the company's servants, and subsequently in the erection of the present edifice, St. James's church, from designs by Mr. O. G. Scott. In the design of the window there are twelve representations, embracing several incidents in the life of the Saviour and his Apostles, and some of the leading events in the history of St. James the Less, or as he is designated also St. James the Just. The first illustration is that in the principal cinquefoil on the left hand of the tracery, the incident being "St. James addressing the Council." The next is the main subject of the window, "Jesus presiding over the Council, St. Paul and Barnabas being present." In the third compartment are "St. Peter and St. James." The fourth shows "St. James praying in the Temple." Fifth, "St. James reading his epistle." Sixth, "His arraignment before the Council." Seventh, "His being led to the top of the Temple," and the remainder his death and burial; "The Adoration of the Lamb," angels, &c. Underneath the window is a brass plate, upon which is the following inscription:—"This window was done at the cost of persons employed by the G. N. R. Company, in grateful acknowledgement to Edmund Denison, the promoter of the building of this church."

#### COMPETITIONS FOR SCHOOLS IN THORNE.

THE late Richard Ellison, esq., of Sudbrooke Holme (who was one of the old trustees of Brooke's Charity), in bequeathing the sum of 1,000*l.* in augmentation of the funds of the charity, enabled the new trustees to take steps for commencing the erection of new school buildings near the site of the school at present occupied by the trustees of Travis's Charity, which, however, belongs to Brooke's Charity, and is intended to be pulled down to make way for the new erection. Architects were invited to send in designs, and the sum of 20*l.* was guaranteed for the design that should be selected. There were thirty-four competitors from all parts of the kingdom, and the total number of designs sent by them amounts to about forty. A meeting of the trustees was held on the 12th inst. to receive a report of the building committee. Four designs were selected by the committee, viz., from Messrs. T. Shaw & Son, Leeds; A. Wilson, Nottingham; Brundell & Arnold, Doncaster; and Hooker & Wheeler, Brencley. The trustees selected the design of Messrs. Shaw & Son, as the one for adoption, subject to the sanction of the Court of Chancery.

#### SCHOOL-BUILDING NEWS.

**Leeds.**—A new school for boys, in connection with the Church of St. Matthew, Leeds, has just been opened. It has been erected under the superintendence of Messrs. Dohson & Chorley, architects, Leeds, and has cost about 1,000*l.*, nearly one-half of which has been received from the Committee of Council on Education. The building stands on the north side of the church. The room is 62 feet long, by 30 feet wide, and will accommodate 230 children, exclusive of the class-room. The roof is of high pitch, and the timbers, which are exposed to view, are stained and varnished. The height, from the floor to the wall-plate, is 16 feet 6 inches, and to the ceiling, 30 feet. The new class-room is 22 feet by 21 feet, 11 feet 6 inches high to the wall-plate, and 14 feet to the ceiling. The walls are lined with dressed boarding, 4 feet above the floors. The north and south ends of the school have each two large triple light windows, with ogee heads and circular tracery windows in the apex of the gables. The west elevation towards Meanwood-street has a series of three large triple light-gabled windows, with two smaller windows on either side, and a projecting entrance porch. The old boys' school, which adjoins and communicates with the new school, through double doors, will in future be used as the girls' school, and has had a new entrance porch erected. A strip of land on the north side of the school has been procured for the boys' play-ground. The schools are in the

Decorated style, and built of Potternewton wall-stones, with sandstone dressings, and have cost, with the improvements to the girls' school, upwards of 1,000*l.* The whole of the woodwork is stained and varnished. The contractors for the erection of the new school were—Masons' work, C. Jackman; joiners' work, T. Hill; plumber and glaziers' work, J. Standish; plasterers' work, R. Branton & Son; slaters' work, W. Watson; painters' work, W. Walsh; ironfounders' work, Singleton & Tennant.

#### PROVINCIAL NEWS.

**Bilston.**—Some town improvements are in progress here. The Great Western Railway Company, who have a station in the town, are about to make a convenient approach to it through New-street, which runs into Oxford-street, and thence to the most densely populated part of the township. They are also about to give to the Town Commissioners 51 yards in front of Pipe Hall to enable them to widen and improve the street in that part of the town. On a previous occasion 15s. a yard was asked for the necessary land, but it has now been given up free of expense. The company are also about to carry a road through the orchard, near Foster's hank. They further offer to the commissioners a small piece of land and other advantages in Stafford-street, to improve the street.

**Ashbourn.**—The architect's plans, &c., for the proposed new Market Hall, have been given in for the approval of the proprietary. Two plans, each of a distinctive style and arrangement, are furnished. Included in the draft is a provision for the accommodation of the Ashbourn Literary Institution.

**Dewsbury.**—It is in contemplation to raise a Peoples' Park for Dewsbury. A sum of 1,000*l.* is offered by Mr. John Hague, of Crow Nest; and 500*l.* by Mr. Joseph Chadwick, of Northfield House.

**Hull.**—Sites have been obtained for model houses at Hull, in accordance with the desire of Miss Emma Sperling, who has given 5,000*l.* for the purpose.

**Wills.**—The mansion of Grithleton is now receiving its complement of painting and decoration, under the superintendence of Mr. Jas. Thomson, architect, for Sir John Neeld, its present possessor. This house is likely to become, from its valuable collection of paintings, sculpture, books, and minerals, one of the most attractive houses in the county.

**Sunbury.**—The chapel in this village is being restored, repewed, and fitted throughout with new windows and arches. The design is Lombardic Gothic, and includes the erection of a porch, and entire remodelling of the building. The work is being executed by Mr. Dove, of Sunbury, builder. Mr. Stapleton is the architect, who also erected chapels at Cobham and Hershaw, in the vicinity.

**Ayr.**—It is proposed to build a new Town-hall for Ayr.

#### NEW DOCKS OPENED.

**Sunderland.**—On Thursday, says last week's *Gatehead Observer*, an extensive graving-dock, which has been constructed by James Laing, Esq., J.P., Deptford, Sunderland, in his large ship-building yard, fronting the river Wear, was opened in the presence of a number of people. The dimensions of the dock are as follows:—Length, 320 feet; width at the top, 62 feet; breadth at the bottom, 44 feet; depth of water on the sill at ordinary spring tides, 13 feet; at Equinoctial spring tides, 16 feet 4 inches. The entrance is built of solid masonry, in the form of an inverted ellipsis. The other portion of the interior of the dock is formed of timber, fastened with iron bolts and straps. Instead of a gate, the dock is opened and closed by means of an iron caisson. There are three pumps, each being 10 inches in diameter, for the purpose of clearing the dock, constructed on an improved plan by Mr. George Clark, engineer, of Monkwearmouth. The dock has been constructed under the superintendence of Mr. J. G. Brown, and Mr. John Ness, manager of Mr. Laing's works. The opening was celebrated by a dinner, given to upwards of 600 of the workmen.

**Runcorn.**—The new Bridgewater dock at Runcorn has been opened. The dock is 600 feet long, by 136 feet wide, and contains an area of water space of 6,000 square yards. The entrance gateway is 50 feet wide. The dock sill is only 6 inches below the depth of water shown in Holden's tide table, as taken from the old dock sill at Liverpool. The bottom of the dock is 2 feet below the sill, thus enabling a much larger class of vessels to enter the dock than heretofore. A greater facility

will also be given in the discharging and transhipping of cargoes by the use of Sir William Armstrong's patent hydraulic weighing cranes, which are being erected on each side of the dock. A few months since the large tidal basin was completed, and the canal dock, with two locks on the canal passing into the Weaver navigation, opened, thus giving a direct communication with the salt district. This dock has been completed under the superintendence of Mr. George Forrester, the resident engineer.

#### CHURCH-BUILDING NEWS.

**Bradfield (North Walsham).**—The church here has been reopened after having undergone considerable repair and restoration. The fabric has been repaired, and the fittings renewed, nearly entirely with solid oak. The pews with which the church was formerly encumbered are replaced with open benches, and a pulpit, prayer-desk, and altar-rails have been fixed. The work was executed under the direction of Mr. R. Kitton, architect, by Mr. R. Cornish, of North Walsham. The cost of these improvements amounts to about 500*l.*

**Bridport (Dorset).**—St. Mary's Church, Bridport, has been restored and reopened. The church, says the *Sherborne Journal*, is now computed to hold between 900 and 1,000 persons; about 400 free. The roof of the new chancel (or at least the new part of it) is of stained oak, and the dressings are of the same material, supported on corbels of Caen stone, with carved angles. The walls exhibited a specimen of fresco paintings, consisting of lilies, passion flowers, &c., on a drab ground, with a border of blue and gilt. The same stained window has been used, and twining around it was also a fresco painting of the emblem of the Lord's Supper—in the form of ears of wheat around which the vine was twining, laden with bunches of its fruit. The removal of the stained glass had been entrusted to Messrs. Lavers & Barrard, of London. The organ has been removed from the west end of the church (the window of which it formerly blocked up), to the north side of the chancel, and the choir has also been removed thither. At the west end of the church, two additional arches have been raised on either side, and the nave has consequently been lengthened above 30 feet. The whole of the masonry consists of local stone, with Hamhill dressings. The cost of renovation is over 3,000*l.*, the greater part of which has been realized by subscriptions; but there is yet a deficiency of some four or five hundred pounds.

**Ashbrittle (Wellington).**—A chapel and school have been opened at the tything of Greenham, parish of Ashbrittle, between four and five miles from Wellington. Mr. H. Davis, builder, Taunton, has carried out the contract. The chapel, which is capable of accommodating from 150 to 200 individuals, is in the Early English style, with apsidal chancel; the walls of the rubble-stone of the neighbourhood, and Han stone dressings. A tower of Bath stone decorates the north-west angle; with spirelet surmounted in finial; a gilded metal cross, and a helvy. The interior of the building is lofty, compared with its size. The apsidal chancel at the east end is laid with encaustic tiles, and is separated from the aisle by a communion screen executed by Mr. Alfred Stansell, of Taunton. Over the altar are three lancet windows of stained glass, presented by the Rev. Mr. Robinson, formerly curate of Ashbrittle. They have been executed by Messrs. Lavers & Barrard, of London, and are representations of the command of our Saviour to His disciples,—"Feed my lambs." The whole of the windows, with the exception of the triplet at the west end, are of stained glass, and at the expense of the Rev. Mr. Robinson.

#### THE THREATENED DESTRUCTION OF THE HEREFORD TOWN HALL.

The western midland district seems just now particularly rampant in its destructive propensities. It is only three or four years since the beautiful Town Hall at Leominster—one of a series of beautiful and most interesting timber structures for which that district is so famous—was rubbly removed by the authorities of that town. Its actual existence has happily been prolonged, owing, I believe, to its having been purchased by a private individual, and re-erected in the outskirts of the town. A month since the archaeological public were dismayed by the report that the Dean and Chapter of Worcester,—the natural guardians of the ecclesiastical antiquities of their city, but doubly so of those of their own precincts—were about to decree the demolition

of the "Guesen Hall" of the ancient monastery, one of the finest specimens existing of the halls and timber roofs of the fourteenth century. This seems, happily, to be a premature alarm, and it is earnestly to be hoped that this noble monument is preserved *sine die*. We are, however, denied the satisfaction of thinking that this district is settling down into a state of conservatism of its antiquities. A third hall is, we find, now endangered. The very curious and (so far as it is preserved) beautiful Town Hall of Hereford is now threatened, if not actually condemned. I know this building well, and can speak most strongly of its value and interest, and can assure the inhabitants of Hereford that if they carry out what they threaten, they will deprive their city of an object of interest second only to their cathedral. I most earnestly wish that this act of deliberate vandalism may be averted through some timely influence, and that the notice of these repeated proofs of the want of appreciation of our national antiquities on the part of those who ought to view themselves as their guardians will influence others who have not yet ventured to hint at the destruction of their venerable but helpless wards.

GEO. GILBERT SCOTT.

\* We drew attention to this regrettable proposition last week, and protested against it. It is to be hoped that the authorities may yet be induced to abstain from inflicting the contemplated injury. The council of the Institute of Architects, we believe, have taken some steps in the matter.—Ed.

NUISANCES IN MARYLEBONE.

NOT only are the seasons this year out of place, but the municipal sanitary regulations of this extensive parish (Marylebone) set up defiance as regards the supposed imperative removal of the manure and other refuse in the various mews, twice a week, as posted up at the entrance of each and every yard. Overlooking one of these yards, I have noticed from week to week an increasing accumulation until the stench has (even with this autumnal weather) become quite offensive. On remonstrating with the offenders, they simply tell you they *cannot get it taken away* by offer of payment, the carts being so occupied. This I believe is all moonshine, as the market gardeners, who now daily run their carts to town with fruit, must have empty carts on return, and for their produce are indebted to these very nuisance-heaps. The parish authorities, I contend, ought to see their orders enforced, and I trust they will do so, but there is nothing like the press. The dust carts seem also to be very scarce: for some days past I have in vain endeavoured to find one passing; so what with dust and dung we are thoroughly stench'd up.

PUBLICO.

FLAT-ROOFED COTTAGES.

SIR,—In a recent number you mentioned that the plans of the cottage designed by Mr. Stevens were issued by the Society for Improving the Condition of the Labouring Classes. As I presume that its arrangements must be therefore considered excellent, I venture to ask what may be the advantages of the flat roof (its most striking peculiarity). Such a departure from the ordinary course of construction would hardly be ventured on without it presented some important advantages.

The following points strike the mind as likely to be those in which such a roof would be decidedly inferior to a sloping one:—

First. Since the protection from wet depends entirely on the water-tight character of the materials, it will always be liable to leak from any defect in the joints.

Secondly. If the roof be quite sound still the least stoppage in the gutters will make the roof a pool, which must render the walls very damp.

Thirdly. The roof, being flat, will always be liable to injury from persons walking on it, the accumulation of snow, &c.

Fourthly. If the bricks are of at all a porous character, the walls, not being protected by the roof, will be much damper than when screened by eaves, and would, under any circumstances, require a good coping; and,

Lastly. Flat roofs are intensely ugly. If, however, a roof of tiles laid in cement can be rendered quite watertight, such a roof might often be advantageously substituted for lead in those positions of the better class of houses in which a flat roof may for various reasons be desirable. Perhaps some correspondent will state the result of experience on this point.

C. D. S.

THE TEMPERATURE OF THE WATER IN STREET FOUNTAINS.

A CORRESPONDENT of the *Builder* remarks that the water of the fountains is often unpleasantly warm at this season of the year. This may be accounted for by the circumstance that in many instances the filter for the water is placed in situations where the sun shines on it. The filters are generally of small size, and in consequence the water gets unpleasantly warm. Some of the fountains which are placed in the thoroughfares are designed in the form of an urn, from which the water slowly trickles: in other instances the filter, of small size, is placed in a wall on which the sun's rays rest for several hours of the day. This seems to show that change is needed: the situation chosen for a fountain should be considered, and means used to place the filters in well-shaded situations. The water, however, which is delivered from the companies' mains should not require filtration when it is delivered either into dwellings or to the street fountains.

In addition to the falling above referred to, the artistic designs of the greater number of those useful features of our streets are in most instances unpleasant to the sight,—a matter to be regretted. A. B.

BUILDERS' TENDERS AND ARCHITECTS.

SIR,—Some months ago, the architect of one of the incorporated societies wrote to myself and three other builders requesting tenders for a parsonage house. Tenders were accordingly sent in to the clerkman of the parish, who forwarded them to the architect; and I understand that, when they were opened, mine was found to be the lowest, but not commensurate with the price made to me. On the contrary, the architect subsequently applied to two other builders, and one of them whose tender was as I have heard 100*l.* below mine is, I find, now engaged in doing the work. I shall be glad of an opinion as to whether it was competent for the architect to reject my tender, and to act as I have described. A BUILDER.

\* What the legal position of the parties in this case may be, we cannot pretend to say on such slight *ex parte* information. In justice, if a builder be invited to tender without any proviso, and his tender be the lowest, he ought to be employed to do the work, or be otherwise remunerated.

TOUTING SURVEYORS.

MR. EDITOR,—Can you find a corner in your valuable journal to expose the disreputable practice now in vogue with advertisements for contracts, by a class of men calling themselves surveyors, who are nothing more, in most instances, than bankrupt builders, bankrupt builders' clerks, or their foremen, who have during their reckless career with their former employers picked up a little from attending on legitimate men of business in their vocation as surveyors. I am induced to allude to the present system adopted by this class from the circumstance that occurred at the Vestry office of St. — the week before last.

Two parties presented themselves to take out quantities for some schools. The first party had canvassed, and obtained about, I suppose, twenty or thirty names attached to a list (of course all sorts and grades, from Jay down to packing-case makers, &c.): the other superseded this list by a great number, which, on inspection, appeared almost all in one handwriting. The builders (1 for one) objected to the papers, and proposed for the lists to be set aside, and to be put in the hands of a surveyor, which was acted on. The one selected went to work, it appears, in spite of the other having the majority in names; but the best of the joke is, that these touting gentlemen had to dab down deposits of a couple of guineas for each name they introduced, which sum was to be returned on the receipt of a *bona fide* tender being sent in, but if not it would be lost. I think—say out of forty names—that scarcely a dozen will be given in, which will serve these impostors of the profession perfectly right; for no respectable, responsible surveyor has the least chance against this host of touters if he wait at home for business as it was formerly carried on; *i.e.*, by the builders all meeting together and voting by ballot, thereby employing a proper, competent, and responsible party.

Cannot you further aid the profession by advocating a Surveyors' Institute, and thereby block out these broken-down builders, bankrupt builders' clerks, and I know of some who were plumbers and glaziers, and others, I suppose, jawbrokers? A BUILDER.

BUILDERS' BENEVOLENT INSTITUTION.

The thirteenth annual meeting of the subscribers and friends of the above charity was held on Thursday, at the Loudon Tavern, Bishopsgate-street, for the purpose of receiving the report for the past year; for the election of president, treasurer, directors, and auditors for the year ensuing; and for other matters connected with the welfare of the institution. Mr. George Bird (treasurer), in the unavoidable absence of Mr. George Spencer Smith (president), occupied the chair.

Mr. A. G. Harris (secretary) read the following report:—

Although the past twelve months, from various causes, has not been a flourishing period for the building trade, the directors have the satisfaction of informing their friends and supporters that the cause of benevolence has not suffered in consequence: on the contrary, there is an increase both in subscriptions and donations; and they do hope that this gratifying increase, under such circumstances, will stimulate them to still greater exertions, so that the funds of this deserving charity may be yearly augmented, as they ought to be, considering the numbers

representing the interest connected with the trade, and the great necessity for its existence too painfully evinced in the large number of applicants who were unsuccessful at the last election in May, 1859, and who were now anxiously looking forward to be elected at subsequent periods, whenever the funds of the institution will permit such an augmentation.

The directors take the opportunity presented by this being the last half-year of the subscription, to offer their grateful thanks to Mr. Charles Lucas, the proposer of the scheme, and those gentlemen who so generously responded to it at the dinner in 1855, in guaranteeing for five years an annual subscription of 10*l.* 10*s.* each; by so doing, the satisfaction remains with those gentlemen of having made happy and comfortable a number of their distressed brethren who otherwise would have lingered on in disappointment and expectation.

The subscriptions and donations for the past year amount to 1,817*l.* 6*s.* 6*d.*. Annual subscriptions, 858*l.*; donations, 574*l.* 6*s.* 6*d.*; and 429*l.* 0*s.* 7*d.* stock has been purchased in the per cent. Consols—369*l.* 10*s.* 7*d.* for the relief fund, and 387*l.* 4*s.* stock for the building fund. The total amount of stock now standing in the names of the trustees is 7,111*l.* 7*s.* 9*d.*, being 4,947*l.* 15*s.* 8*d.* for the relief fund, and 2,164*l.* 12*s.* 1*d.* for the building fund, with a balance at the bankers' of 419*l.* 2*s.* 5*d.*

An election of three pensioners, two males and one female, was held at the Loudon Tavern, on Thursday, 24th May last, when Mr. Goodfellow of Plymouth, James Oliver, and Katherine Edmunds, were the successful candidates.

Three pensioners have died since the last report—Robert Manning, elected February, 1853, died August, 1859; J. St. George, elected May, 1857, died October, 1859; Harry Chalmide, elected November, 1855, died January, 1860.

The amount paid in to the bankers by Mr. Joseph Bird, the honorary secretary of the ball held at Willis's Rooms, St. James's, in February last, was 124*l.* 1*s.*, being an increase of profit of 25*l.* 6*s.* 6*d.* over the preceding year.

The annual dinner, which took place at the Loudon Tavern, on the 27th October, 1859, gave an addition to the funds of the institution, in the shape of subscriptions and donations, of 375*l.* 16*s.* 6*d.*

In the appeals which have at former periods been made to the profession, trades, and the public, by whom this charity is supported, the directors imagine that almost every topic of explanation as to its object, or inducement towards its support, has been urged or explained; they therefore, in this report, have confined themselves to the statement of accounts, and progress of the institution; and simply stating that, at the election in May last, there were thirteen unsuccessful candidates (and several applications since), all urgent and distressing cases, many of whom were formerly in possession of ample means, and are now, through misfortune, obliged, in the decline of life, to seek charitable aid of their more fortunate brethren; and the directors hope that such aid and assistance will be given, as to enable them to have another election in November next, and place some of the number out of the reach of poverty and distress.

In conclusion, the directors are convinced that the success of this charity will stimulate to further exertion, and that the public patronage so liberally bestowed will be heartily responded to by those more immediately interested in the welfare of the Builders' Benevolent Institution.

The directors have the satisfaction of announcing that Mr. George Pucknett has kindly consented to become the president of the institution for the ensuing year.

Mr. T. Cozens (the founder of the institution) moved the reception and adoption of the above report, with the recommendation that it be printed.

Mr. E. Richardson seconded the motion.

The report was then unanimously received, and the terms of the motion agreed to.

The balance-sheet was next read, showing—balance of cash in hand from last year, 218*l.* 4*s.* 6*d.*; ditto in the hands of the secretary of the Brighton branch, 47*l.* 12*s.* 8*d.*; which, together with the subscriptions and donations, amounting to 1,688*l.* 0*s.* 11*d.*, made a total of 1,914*l.* 8*s.* 1*d.* On the other side it was shown that after all the incidental expenses were defrayed, a balance was left at the bankers' of 419*l.* 2*s.* 5*d.*

The above having been unanimously accepted, The Chairman, in referring to the report, regretted the loss which the institution would sustain by the ceasing of the annual subscription of ten guineas each from the gentlemen who guaranteed that amount for five years, at their dinner in 1855. He, however, had some pleasure in finding that the annual subscriptions and donations had increased, and which he hoped would continue to increase to such a degree that they might be enabled to have two elections a year instead of one: he considered that they ought to have two elections, for he was sure it was painful to see so many of their poorer brethren who, having become applicants for the benefit of their institution, were obliged to retire through non-success in May last, to await the result of the next opportunity. In conclusion, he would call upon the builders generally to come forward and assist in obtaining a second election, in each November, as it was originally intended; and as now the strike was over, and confidence restored among them, he requested them to come forward and assist in advancing the charitable undertaking.

Mr. T. Cozens could not help feeling that the lapse of the five years' guarantee by Mr. Lucas and the gentlemen who had kindly taken up the offer, was a serious loss; but he hoped at their next dinner some other well-disposed person would make a similar offer.

Acknowledgments were then made to the various officers for their services for the past year, and a general expression that they would continue to perform those duties, which had given the highest satisfaction. Mr. George Plucknett was elected president for the ensuing year.

The other business having been disposed of, a vote of thanks to the chairman for his general interest in the welfare of the institution concluded the proceedings.

### Books Received.

*Specimens of Medieval Architecture, from Sketches made in France and Italy.* By Wm. DEXES NESFIELD, Architect. Nos. 1, 2, and 3. Day & Son, Gate-street, Lincoln's-inn-fields.

It will be sufficient praise with those who know Mr. Norman Shaw's excellent "Architectural Sketches from the Continent," to say that this work which has been commenced by Mr. W. E. Nesfield, promises to form a worthy companion, and valuable continuation of it. Mr. Nesfield is a very good draughtsman, and in the buildings of the thirteenth and fourteenth century, in France and Italy, he has excellent subjects. The numbers now before us include drawings from Ardennes Abbey, near Caen; Cigny Abbey; the Church at Bernieres; the charming arcade above porches, west front, of Amiens Cathedral; Leon Cathedral; Coutances Cathedral; Mont St. Michel; Chartres Cathedral; and others.

It would be a pleasant task, hereafter, to write a book to accompany them.

Mr. Nesfield's work is being produced at the establishment of Messrs. Day & Son, and will consist of twenty monthly parts, each containing five plates. We can fairly recommend it.

### Miscellaneous.

**A STRIKE IN LOMBARDY.**—A communication in the *Messenger du Midi* states that the operatives in Lombardy are striking for an advance of wages. The printers began, and their example was soon followed by the masons and smiths, who have compelled employers to accede to their demands. Domestic servants afterwards turned out, and demanded to be paid in francs instead of Milan lire of 70c. each. At Modena and Bologna the market people tried to raise their prices, and the consequence was that a number of disorderly boys joined the servants in an attack on the provision stalls, and the pavement was soon covered with broken eggs, fruit, and vegetables. At Como there are nearly 4,000 persons usually engaged in the silk manufacture, who have all struck for higher wages, and, as they have nothing to live on, the town is obliged to feed them.

**THE REAPING MACHINE KNOWN TO OUR CELTIC FOREFATHERS!**—Truly, there is "nothing new under the sun." A correspondent of the *Gloucester Chronicle* thus writes as to reaping machines:—It may perhaps be interesting to you and to your readers to learn that those "utter barbarians," as our British ancestors have been wont to be called, were before us in many of those inventions which are supposed to be the result of modern ingenuity. I am not prepared to say that they had the steam plough, but that they had reaping machines there can be no doubt in the minds of those who read the following much-overlooked passage of Pliny, who wrote between the years 60 and 70 of the Christian era:—

De Messis et Tridico.  
"Messis spicis ratio varia, Galliarum latifundis, valli pregrandes dentibus in margine infensa duabus rotis per segetem impelluntur, juncuntur in contrarium juncto, ita direxerit in vallum eadent specie."

"Of reaping itself there are various methods: in the broad plains of the Gauls, enormous machines with teeth set in a row, placed on two wheels, are driven through the standing corn, a horse being attached to it in a contrary way to the usual mode of attacking horses. Thus the corn, being cut off, falls into the furrow."—*Pliny's Natural History, Book 18, chap. 30.*

Some question may arise whether or we should translate *vallum* as it occurs in the latter part of this sentence differently from the sense given that word at the beginning, *vallus* being a van or machine (see Ainsworth's Dictionary), and *vallum* being a trench or furrow. If we adopt the latter translation, then it follows that our ancestors had which was with such difficulty effected in those of modern construction. If, on the other hand, we translate it as the machine itself, then they had accomplished that which our modern inventors have not yet succeeded in, for they must have made the machine not only to reap, but to carry away the corn.

**PROPOSED STURGE MEMORIAL, BIRMINGHAM.**—It has been decided that a limited competition shall be invited for designs for the Sturge memorial. Three sculptors will be requested to send in models or designs for a statue and fountain. The funds at the disposal of the committee fall short of the amount required.

**VOTE FOR PUBLIC BUILDINGS.**—In the House of Commons, the other night, the sum of £119,523/10 was asked for, for public buildings. Mr. Midway moved that the vote should be reduced by the sum of £1200.—an item stated to be for the expense of a house to contain the Wellington funeral car, which he thought was unworthy of having money expended upon it. By whom such a thing was designed he knew not. Lord John Manners always objected to questions of taste being submitted to that House. The car was used upon a memorable and national occasion, and it would be desirable, when it became necessary to remove it, there should be a proper place provided for its reception. Mr. Joseph Locke regarded the proposed institution as a folly. They would have to provide for the keeping, warming, and cleansing of this new building, and, as a body of practical men, he called upon the house to reject the vote. Mr. Cowper said he quite felt the difficulty of the occasion. Here was a car used on a memorable occasion, and it was owing to its associations with the remains of that great hero, who was held in honour in this country. There was nothing more visited in London, or in which greater interest was manifested by the people generally, and he did not think that either the people or the House would like it to be broken up. Lord Claude Hamilton suggested that the car might be taken to the Tower. Mr. Cowper would be very sorry if the car was not placed in a proper situation, but as the opinion of the House was against the vote, he would withdraw it. The item was then withdrawn.

**WALLASEY LOCAL BOARD OF HEALTH.**—The address of the chairman, Mr. H. Pooley, of Home Croft, Birkenhead, at the first meeting after the election, 1860, has been reprinted from the *Liverpool Mercury* of July 6. We extract a few particulars from it:—The footways leading to and from the Egremont and Seacombe ferries have been laid with flags, to the great comfort of pedestrians. During the past year 9,600 yards of road have been formed by the Board in the owners' default, and 214 yards by the owners voluntarily. The sanitary provisions of the district have received continued attention. Main and branch sewers have been considerably extended during the year: the respective systems of sewerage which have their outfalls at Seacombe and New Brighton approach their completion so far as present dwellings require. The main drain, recently completed, passing through the village of Liscard to Seacombe has effectually delivered Liscard itself from the dangerous and long-standing nuisance of having its entire sewerage carried into tidal ditches which were the only recipients of the house-drainage of the neighbourhood. House-drainage is keeping pace with main-drainage: 120 private drains have been admitted into the sewerage during the year. The principal sanitary undertaking is the procuring of an abundant supply of wholesome water, and its economical distribution to every house. In this they have made considerable progress. The sinking of the well at the Hooks has proceeded satisfactorily so far as regards the main object. The water, as had been prognosticated by the engineer, is found to be vast in its abundance and excellent in quality: in fact, so large is the supply that the men have been "drowned out" and difficulty and delay have been occasioned solely by that result. The present yield is 30,000 gallons per hour, which is equal to the supply of 30,000 persons at the largest standard rate, or 20 gallons per day for each—that is to say, equal to the wants of very nearly thrice the present population. The water possesses all the brilliancy and purity of the ancient supply of Liverpool, with considerably greater softness. The water-tower at Liscard is raised to nearly the height required to receive the iron tank—that is, 91 feet from the ground, and the tank itself is ready for erection. The workmanship, it is said, is sound, and the building will not only be complete for its destined purpose, but will, it is hoped, furnish, in its many stories, accommodation for a public library, reading-room, and the nucleus of a museum. The water-mains are being actively laid down along the principal thoroughfares. The gasworks were completed in November last; and gas mains are now laid down along the chief roads and streets. It was considered good policy to fix the price of gas low, and therefore it was struck in the outset at 5s. per 1,000 feet.

**RESTS FOR THE WEARY.**—The introduction of these useful accommodations in England and Scotland has led to their introduction into Ireland. The *Belfast Newsletter* states that one has been erected near Carrickfergus, another near the village of Eden, and two more are to be placed between the latter and Larne. "The one near Carrickfergus, adds the *Newsletter*, is 12 feet long, and we lately saw seven persons seated on it at once."

**LONDON SHOP ARCHITECTURE.**—The new premises constructed for Mr. Emanuel, the jewel merchant, in Brook-street, Hanover-square, are handsome, lofty, and well appointed. The cases and other woodwork are of mahogany chromised, tastefully ornamented. A large glass roof at the back gives light in the day, and gas in "sun-burners" illuminates at night. Externally the building is of brick and stone, displaying the features of the style called Jacobean. Mr. Parnell (one of the architects of the Army and Navy Club) was the architect at Mr. Emanuel's, and the work was done by Messrs. Jackson & Shaw.

**BUILDERS' DINNER.**—Sir: The annual dinner of the firm of Mr. John Kelk took place on Saturday last, at Rosherville-gardens, Gravesend; and, notwithstanding the difference of opinion that last year existed amongst the men, all estrangement was entirely obliterated to give way for a thorough unanimity of feeling. A slight disappointment was manifested, that neither Mr. J. Kelk nor Mr. Taylor was present, but that was, in a measure, obviated by the presence of Mr. Wm. Hearn, and other officials of the firm. The chairman announced that Mr. Kelk had given the handsome sum of 30*l.* for the men to enjoy themselves with, which they undoubtedly did. I hope, sir, you will kindly give this a corner in your valuable journal.—BEN JACKPLANE.

**THE KENT COUNTY SURVEYORSHIP.**—At the adjourned annual session for the county held on the 17th inst., the appointment of a county surveyor in the place of Mr. Whichecord, deceased, was proceeded with. It had been resolved that the order of General Session made in October, 1859, should be adhered to. This order, after defining the duties of the county surveyor, increasing the salary from 200*l.* to 250*l.* per annum, and including travelling expenses, and provided the following allowances, namely, 3*l.* per cent. upon all works sanctioned by the Court, such as lock-up houses, alterations or additions to county prisons, repairs to county bridges, in cases where the amount expended was 200*l.* and upwards. Where the amount laid out was less than 200*l.* then the usual architect's commission of 5*l.* per cent. would be allowed. Upon all plans and specifications drawn or made out, where the works were not carried on, there would be an allowance of 1*l.* per cent. upon the estimated amount of outlay required. The gentlemen proposed as candidates were Mr. Martin Bulmer, of Maidstone; Mr. Blandford, also of Maidstone, partner of the late Mr. Whichecord; Mr. John Hooker, of Brenchley; Mr. Messinger; and Mr. F. Fick. The result of the voting was that Mr. Bulmer was appointed, by a majority of thirty, to twenty-one for three of the other candidates.

**FOOTPATHS: BLUE BRICKS, RAGSTONE, BOLLERS, SHINGLE.**—The question of footpath manufacture is in agitation at Birmingham,—the worst paved town in England," as the local *Journal* calls it. First, says this paper, "we have the controversy of blue bricks *versus* Rowley rag, and then comes a denunciation of the pathways in Edgbaston. As to the bricks, we cannot profess greatly to admire them, whether red or blue, since their use must necessarily exhibit this town as one unshod or unwilling to afford the expense of lagging. But they are vastly superior to the horrid bollers which now render our footpaths impassable, and are, in respect to the important quality of smoothness, at least as good as fragments of rag stone. An abominable nuisance is the shingle with which our suburban footways are covered. In summer it renders them useless, from the pebbles becoming loose and excruciating to the feet, while in winter it is converted into a superficies that can only be compared to turtle soup. Should any reader be sceptical on this subject, he has but to visit one of the main routes in Edgbaston, where he will find the wayfarers universally making for the horse-road, as the only portion of the thoroughfare that can be traversed with comfort." It is not in Birmingham alone where the nuisance of shingle footpaths is to be met with. They still exist about the suburban streets and paths of the metropolis, as at Battersea, Hackney, &c.; and the assertion that they cause foot passengers to turn out to the horse-roads is strictly true here as at Birmingham. The subject, however, as we lately noted, is receiving attention at Hackney.

**STREET RAILWAYS FOR GLASGOW.**—At a recent meeting of the City Council, a formal application from Mr. Train for permission to lay down rails for his patent cars in some of the principal thoroughfares of Glasgow was read. The application was at once agreed to, and Mr. Lang instructed to communicate with Mr. Train to that effect.

**BRISTOL FINE ARTS' ACADEMY.**—The sixteenth annual meeting of the subscribers and friends of this Academy has just been held at the Exhibition Hall of the institution, White Ladies-road. The attendance was far from numerous. The report stated that the committee of management continued to give their sedulous attention to the development of the objects contemplated by the Academy, with (as they believed) a fair prospect of success, and they considered its prosperity to be now established on a firm and secure basis. The Life Academy had continued to offer to the artist members and students great opportunities of advancement in art, during its usual sessions, which had been conducted by the artists according to the rules laid down by the committee, and had been regularly attended during the winter months. The Antique School and Model room had also been much frequented, proving that the students duly appreciated the advantages thus offered. The committee regretted that a heavy debt still remained to be settled on account of the building, amounting to about 1,300*l.* The report was adopted.

**DOCK WORKS AT LIVERPOOL AND BIRKENHEAD.**—At the last meeting of the Mersey Docks and Harbours Board, Mr. Hartley, engineer to the Board, laid his annual report before the meeting. From this document it appeared that with regard to Liverpool works the expenditure from the 25th of June, 1859, to the 25th of June this year, had amounted to 122,257*l.* 8*s.* 7*d.*; general repairs had been effected at a cost 90,422*l.* 8*s.* 7*d.*; and this was inclusive of stock, 16,495*l.* 1*s.* 3*d.* The inland-carriers and half-tide docks were in rapid progress, and the gates and machinery in preparation. The excavations of the steam-dock to the east of Huskisson Dock were proceeding, and the foundations of the south wall had been commenced. At Birkenhead the great float was rapidly approaching completion, and the whole of the north wall (2,366 lineal yards) was now finished except the coping, 1,059 yards having been built within the last twelve months. Great anxiety and annoyance had been experienced by the constant giving way of the walls on the south side of the float, and, to a great extent, these walls had been either strengthened or rebuilt. This, together with the difficulty of procuring good and efficient masons, had considerably interfered with the general progress of the works. The expenditure at Birkenhead had been 334,401*l.* 16*s.* 11*d.*; the restoration of the walls had cost 37,014*l.*; repairs, 4,402*l.*; and inclusive of stock, 13,370*l.* The report was adopted.

**THE DRINKING-FOUNTAIN MOVEMENT.**—At Devonport, Mr. Gill, plumber, has had entrusted to him the work of erecting the drinking-fountains presented to the town by Mr. J. R. Jeffery, of Liverpool. The Devonport Water Company are about to erect two fountains, one at the head of Fore-street, and the other at Newpassage-hill.—At Sheffield, the Red Hill drinking-fountain has been opened. It is located in the middle of the broad part of Broad-lane. The structure is in the Italian style, and is the joint gratuitous production of two young townsmen, Messrs. R. G. Smith and Thomas Bradley. The lower portion is of Brincliffe edge stone, and the upper from the Darley Dale quarries. On the principal front to the west, is the fountain, which is ascended by two steps. From this level the fountain is erected upon a square base. From the base rises a pedestal, in the front of which is a niche containing a bronze ornamental shell, out of which the water flows in two streams into a white marble basin. Round the corvo is the inscription, "Whosoever drinketh of this water shall thirst again." On the east front are corresponding steps, and in the pedestal are fixed a barometer and thermometer, manufactured by Messrs. Cutts & Co. On the north side is a semicircular seat, with the inscription, "Rest for the weary;" and on the pedestal is a medallion of James Montgomery, the gift of the council of the School of Art. On the south side is a cattle trough. The whole is surmounted by an ornamental pillar and lamp: the casting of the pillar and shell ornament are the gift of the Mayor, the lamp being the present of the Police Commissioners. The contractor for the whole is Mr. Alderman Mycock. The entire cost of the erection is 85*l.* 9*s.* 3*d.*, of which sum 65*l.* has been subscribed.

**ANOTHER CHANNEL-CROSSING SCHEME.**—Dr. W. H. Brown (formerly one of the lecturers at the Napoionic and Polytechnic) is said to have devised a method of transmitting parcels under water across the Channel with great celerity; so that deliveries of goods and letters can be effected on both sides several times in the twenty-four hours. A company is being formed, it is said, to carry it into effect.

**NEWS FROM CANADA.**—The Crystal Palace at Montreal will soon be completed: it is considered by the Canadians to be quite an imposing building, which will admit of a good display of Canadian industry and her agricultural and mineral productions. At Toronto the arrangements made for the royal visit are on an extensive scale. The Hamiltonians have erected their Crystal Palace, where the Upper Canada Annual Provincial Exhibition is to take place. The Commissioner of Public Works has visited the Exhibition grounds, and expressed himself highly gratified with the magnitude of the arrangements which are being made. The commissioner, afterwards visited London, that rapidly growing city in the western peninsula of Upper Canada. Everything indicates the great anxiety of both Government and people to give a worthy reception to the Prince of Wales. Montreal has subscribed between 30,000 and 40,000 dollars to provide for the reception of the royal guest. The Grand Trunk Railway Company will put forth great exertions on the occasion. The street decorations at Montreal are to be on a grand scale. The artist employed is Mr. Spence, brother to the English sculptor of that name, now at Rome, and also to Mr. James Spence, C.E., for some time in the service of the Grand Trunk Railway Company's contractors.

**THE ENLARGEMENT AND REDUCTION OF ENGRAVINGS, MAPS, &c., BY A CHEAP PROCESS FOR PRINTING.**—A very simple and ingenious process was shown to us the other day, at the "Electro-printing-block" Company's premises, in Burleigh-street, Strand. What we saw was but a portion of various processes, we believe; but we shall speak chiefly of what took place under our own eye. A sheet of vulcanized rubber, prepared in some special way it was said, and coated with an elastic composition on which had been printed a copy of an engraving, was fixed to an iron framework with hooks and rings attached to small iron bars, crossing so as to form a square, and by means of screws the rubber sheet was stretched, according to a graduated scale, until the inked impression had attained certain increased dimensions. The whole being fixed, was then taken to a lithographic press, and the rubber laid with the inked side on a clean lithographic stone, and passed repeatedly through the press. The inked impression was thus completely transferred to the stone, and from that in a few minutes an impression of the enlarged engraving was worked off. This impression we examined with a magnifying-glass, comparing it also with an unenlarged copy, and certainly it displayed not the least rotteness or comparative imperfection, but was, on the contrary, quite as good as the unenlarged one in every way: nor did it seem to be in anywise distorted, although it does seem clear that minute differences in the amount of the stretching, from the central point of rest outwards towards the squared circumference, must exist, and must hence produce minute though it would appear inappreciable distortion in the enlarged impressions taken by such means. However this may be, a pair of compasses seemed to show that round the circumference at least of the rubber, which was marked with equidistant lines, the enlargement was equable in all its parts. Moreover, the sheet of rubber was thin, and very elastic, and easily stretched, and seemed to be of uniform thickness. Another process exhibited was the converse of the first, namely, reduction: but in this case it happened to be the reduction of a portion of a page of the *Times* of that day. The rubber sheet in this case had to be stretched beforehand, and relaxed after the impression was stamped on its elastic coating. The diminished copy was quite as vivid as the original. In this case another process, which we did not witness, was said to have been used in obtaining the first impression: of course it was not from the *Times* types. A piece of a copy of the *Times* had been cut out and submitted to a simple process of maceration in a bath, and an impression was then taken off it on a lithographic stone, and thence it was impressed upon the stretched rubber sheet for the reduction. This process is not quite new. Engravings can be so transferred, it seems, and the original copy be none the worse. The economy and other advantages of such processes as those described are obvious.

**ST. STEPHEN'S, VIENNA.**—To judge from the preparations in progress, the demolition of the steeple of St. Stephen's, in Vienna, will be finished by the end of the year 1861, when the building of a new one up to the height of 56 yards, after the design of the artist Ernst, will be commenced.

**INLAID SLAB-TOMBS.**—To the notice you gave in your last of the inlaid tablet of Mr. J. M. Lockyer, in the church at Moulsham, I beg to add that there is no doubt as to the extensive use of scagliola for pavements, slab-tombs, the ornamentation of marble columns, &c., in Italy, especially in Florence, the cradle of scagliola work; where, till lately, there was in the academy a government school for teaching the art. But the only point I particularly want to rectify in your notice is the belief that marble is so much harder than scagliola. I have continually worked scagliola, from an inlaid flower to a pavement, and can assure you that it is as hard as the hardest marble. —GUSTAVO GEORGI.

**PROPOSED CONCENTRATION OF THE LAW COUETS.**—The report of the Royal Commission is unanimously in favour of the Attorney-General's scheme for appropriating the entire space between Carey-street and the Strand. In spite of this the Board of Works is laying out some 30,000*l.* in acquiring and repairing some very old and dilapidated property in Doctors'-commons for the use of the Probate Court; and, further, it has given notice to purchase the freehold of a property let on lease, of which about eighteen years are unexpired. The report states that the unclaimed suitors' fund, with the exception of 16,000*l.* to be provided for out of the consolidated fund, will be quite sufficient to cover every expense.

**THE LION AND THE UNICORN.**—James I. was the first who united the lion and the unicorn heraldically, adopting the latter beast from the supporters of the Scottish sovereigns. The conjunction of these animals on an ecclesiastical vestment of the period of the Reformation must be attributed to religious symbolism rather than to any heraldic arrangement; the lion typifying fortitude and strength, while the unicorn is emblematical of fortitude and chastity. As such the former may have reference to our Lord "the Lion of Judah," and the latter may be an emblem of the Hessed Virgin Mary. The tradition with regard to the unicorn, that it would never be caught, except by a virgin, and that if its skin was at all defiled it pined away and died, is well known. Its captive was a favourite subject with the Medieval artist. I have before met with these animals as a powdering for a vestment. I think among the inventories in Sir William Dugdale's "History of St. Paul's,"—G. W. W. MINNS.—From "Notes and Queries."

**UNDERGROUND RAILWAY.**—Sir: I think the following scheme, if it could be carried out, would be of great utility. My idea is for a company to be formed to construct a railway from London-bridge to Bayswater and Kensington, by the following means: the company to undertake to embank the Thames from London-bridge to Westminster-bridge, the embankment to include, besides a railway, the low-level sewer for that distance, and a promenade for pedestrians. In return for this undertaking, I would allow the company to construct an underground railway along Birdcage-walk to Buckingham-gate, where a station might be made; from thence to carry the line in front of Buckingham Palace, up Constitution-hill to Hyde-park-corner (another station), across Hyde-park to Gloucester-gate, where a very few hundred yards under streets would join it to the Great Western Railway. From Hyde-park-corner a branch might be made, also along the road running parallel with Rotten-row to Kensington, where, again, a very short distance under a newly-formed road would connect it with the Brompton Museum. I would grant the underground privilege at a peppercorn rent for a certain term of years, and on condition that the surface should be left exactly as found. These lines would connect very populous districts with the centre and many other parts of London along the line. The parks would be made more accessible to people living in the City, many of whom, I believe, know very little of the beauties of Kensington-gardens. I hope you will excuse me, sir, if I have trespasses unnecessarily on your time.—A WORKING MAN.

**THE LLANGWENNY BRIDGE.**—I observe in the last number of the *Builder* a notice of this bridge, in which the names of the contractor and clerk of works are mentioned, but not a word about the engineer. I think it an act of justice to state that the bridge was designed, and the whole of the calculations made, by Mr. T. Dyne Steel, civil engineer, of Newport and Abercromby.

SHARPEHOLDER.

**OPENING OF A PRESBYTERIAN CHURCH AT WHAU, NEW ZEALAND.**—This place of public worship has been formally opened by the Rev. John Macky, of Otahuhu. The site, which comprises about three acres of land, is the gift of Mr. John S. Adams, of Sydney, and his sister, who resides at Edinburgh. There is ample room for a manse and school-room in addition to the church, and, if the district advances as rapidly as it has done within the last few months, these additional buildings will be soon required: meantime, the church is to be used for the purpose of a school.

**THE WELL AT CLERKENWELL-GREEN.**—At a recent meeting of the Vestry Board of Clerkenwell, it was reported that the capacity of the pump on Clerkenwell-green was tried on the 2nd of the present month: it yielded only three loads; on the following Tuesday, to two p.m., three loads, after which there was abundance; on Friday, the 5th instant, fifteen loads; on Monday, two and three-quarters; Saturday, 7th, only fifty gallons; on Tuesday, the 10th, there were eight loads. This water supply seems to be connected with that of Messrs. Nicholson's distillery. Mr. Foster, in seconding a resolution in connection with this matter, much regretted that the Board had ever depended for any part of its supply on a private firm: considerable expense had been incurred to run drains into the well: at the same time there were complaints in some places of too much water. Although useful for the purposes of street-watering, wells into which drains are cut through crowded neighbourhoods should be avoided for domestic use.

**SAN FRANCISCO.**—A Californian paper says:—The congregation of the Church of the Advent (Protestant Episcopal), propose to build a church that will be an ornament to the city of San Francisco. The congregation has a lot, 70 feet by 165 feet in size, on the south side of Howard-street, extending back to Tehama, and bordered on one side by Bachman and on the other by Jane-street. It is probably the only lot in the city which is bounded by a street on every side. Mr. Wm. Patton, architect, designed a building, and we understand that his design is accepted. The style of architecture is the Early English, and the plan of the building is an exact copy of the church in the town where Sir Isaac Newton was born. The size of the church on the ground is to be 70 feet by 94 feet. On the left side will be a steeple 150 feet high. The body of the church will contain 616 seats, and the gallery 324. The material is to be a gray stone, probably from Angel Island, the stones along the corners having a reddish tinge. The cost will be about 20,000 dollars.

**THE WORCESTER MODEL DWELLINGS ASSOCIATION.**—The annual meeting of this association has just been held. The association was established six years ago, to provide healthy and well-arranged dwellings for the labouring classes, and a large quadrangular block of houses was accordingly erected in Cooken-street. The report sets forth that, in consequence of necessary repairs and the increased rates paid upon houses, there was still a small balance against the institution, nor was any dividend likely to accrue for some time to come. So far as a return for capital was concerned, the experiment had failed; but the results, in a moral and sanitary point of view, had been most satisfactory. All the houses had been full during the year, and the conduct of the tenants good, the arrears of rent not being more than two guineas. Only three deaths, in a population of 131, had taken place during the year, of which two were from decline, and one from extreme old age.

**PUBLIC PARKS AND PLAYGROUNDS.**—The new act, now in force, provides for local improvements beneficial to the health and comfort of the people. The ratepayers of any parish maintaining its own poor, the population of which, according to the last account, exceeds 500 persons, may purchase or lease lands, and accept gifts or grants of land, for the purposes of forming any public walk, exercise, or play ground, and to levy rates for maintaining the same, and for the removal of any nuisance or obstruction to the free use or enjoyment thereof, and for improving any open walk or footpath, or placing convenient seats or shelter from rain, and for other purposes of a similar nature. The act may be adopted in boroughs. After the adoption of the act a meeting of the ratepayers is to take place to make a separate rate, and such rate is to be agreed to by a majority of at least two-thirds in value of the ratepayers assembled. Previous to any such rate being imposed a sum in amount not less than one-half of the estimated cost of such proposed improvements shall have been raised by private subscription or donation. The rate is not to exceed sixpence in the pound.

**BUCKS ARCHITECTURAL AND ARCHAEOLOGICAL SOCIETY.**—The annual meeting of this society was held at Newport Pagnell on the 17th instant. There was a crowded meeting, and sixty new members were admitted. The chair was occupied by Mr. C. G. Du Pré, M.P. The business of the day having been disposed of, a paper, "On a Double-faced Brass in Stowe Church, with a few general Remarks on the Desecration of Churches," by Vice-Admiral Smyth, was read by the Rev. C. Lowndes. A variety of interesting information was given in the paper with regard to brasses and monumental tablets, the writer justly remarking that every one should be interested in the preservation of such memorials. The importance of the careful preservation of monuments was illustrated by the well-known instance of the value of them which occurred in the recent trials concerning the Shrewsbury peage. Much might be done by the churchwardens, under the direction of the clergy; and, with an eye to their preservation, it was advisable that all monuments, records, &c., should be regularly taken in stock. Good rubbings should be taken of brasses and inscriptions, as much greater accuracy was by that means ensured. Two papers were then read by the local secretary,—"On Lavendon Priory," and the other "On Tickford Abbey." The museum, which was open from Tuesday till Thursday inclusive, contained many objects of interest, and was largely contributed to for the occasion.

**SANITARY STATE OF ST. HELENA.**—Few towns in Lancashire have progressed with greater rapidity within the last dozen years than St. Helens. It is the seat of numerous chemical works, copper works, foundries, plate glass, sheet and crown glass, and a number of bottle works. The immense quantities of coal found in the district, and the subsoil so prolific of good clay and sand, have, no doubt, contributed to encourage the growth of the town, and the numerous works around it. Mr. M'Nanus, the town surveyor, by order of the commissioners, has just completed a report on the sanitary state of the town, and on the water-works, from which it appears that the area within the limits of the town proper is about 630 statute acres; the population about 23,000 inhabitants; but the whole neighbourhood on the south and east of the town is densely inhabited, and studded with numerous works of various descriptions. Notwithstanding the rapid growth of the town, sanitary works have not been neglected by the inhabitants, there being at present upwards of eleven miles of public sewers. Various modes for deodorizing sewage are pointed out in the report. It does not recommend the covering of the brook which runs through the town and at present receives the drainage of the town and surrounding district, comprising an area of several thousand acres. Within the town limits there are seven miles of adopted streets, and seven miles unadopted. The report enters at some length into the mode of cleansing streets, backyards, courts, and passages, with examples of the methods of street-cleansing resorted to at various other towns. The water-works report states that to meet the requirements consequent on the rapid growth of the place, more reservoir space should be secured; that twelve times the area of the present reservoirs would be wanted to secure the rainfall due to the watershed of the district. There is a total of upwards of twenty miles of water-pipes.

For the erection of a parochial infant school, at St. Barnabas, Homerton. Mr. Edineston, architect. Quantities not supplied:—

Asby & Sons	£786 0 0
Perry	665 0 0
Lawrence	575 0 0
Norris, Brothers	487 0 0

For repairs to the exterior of the church of St. Augustine, London. Messrs. Tress & Chambers, architects:—

Axford & Co.	£540 0 0
Hutchinson	540 0 0
Wills	484 9 6
Fenris	457 0 0
Holmes	435 0 0
Brown & Co.	359 0 0

For new schools, Ewell. Messrs. Ailen, Snooke, & Stock, architects:—

Tolland	£3,500 0 0
Myers	3,300 0 0
Hall	3,301 0 0
Robinson	2,099 0 0
Rider	2,789 0 0

For new houses, stables, &c., Weybridge:—

Seagrave	£3,669 0 0
Macey	2,970 0 0
Myers	2,859 0 0
Patman	2,666 0 0
Scott	2,493 0 0

For new offices, Wellington-street, Strand. Mr. Withers, architect:—

Holland	£3,237 0 0
Myers	2,824 0 0
Rowland	2,760 0 0

For alterations and additions to Buscot Park, Oxon. Mr. Coudy, architect:—

Glasscock	£12,350 0 0
Mansfield	14,200 0 0
Panison	15,739 0 0
Holland	15,555 0 0
Myers	11,667 0 0
Troopole	11,018 0 0

For the restoration of Newton Church, Glamorgan. Messrs. Pritchard & Seddon, architects:—

Rees & Roderick	£995 0 0
Jarvis	654 13 0
James	610 0 0

For alterations and new shop-front, King's Head, Newington. Mr. Wm. Nunn, architect:—

Gallienne	£374 0 0
Wills	233 0 0
Day	225 0 0
Bennett (accepted)	220 0 0

For farmhouse and outbuilding, at Stoke Lacy, Herefordshire. Mr. Kempsom, architect:—

Leighton	£2,342 0 0
Howers	1,651 0 0
Nottingham	1,300 0 0

For building two houses, at South Norwood. Mr. J. C. Paines, architect. Quantities supplied:—

Fenny	£1,560 0 0
Henshaw	1,448 0 0
Thompson	1,424 0 0
Harding	1,300 0 0

For building warehouse, for Mr. Sheppard, Borough. Mr. Waite, architect:—

Downs	£1,433 0 0
Fowler	1,417 0 0
Carter	1,395 0 0
Coleman	1,395 0 0

For building eight cottages, at Hereford. Mr. J. H. Ewins, architect:—

Morgan	£670 0 0
Mason	650 0 0
Lec (accepted)	640 0 0

For Gelly Gaer Parsonage, Glamorgan. Messrs. Pritchard & Seddon, diocesan architects. Quantities by Mr. Charles Poland:—

Griffiths, Newport	£1,190 0 0
Moore	1,129 0 0
Griffiths, Cardiff	1,100 0 0
Parry	962 0 0
Bolt (accepted)	959 0 0

For painting, &c., Hanover Chapel, Peckham. Mr. J. G. Stapleton, jun., architect:—

Fennell	£178 0 0
Brighton	179 0 0
Chamberlain	146 0 0
Smith	137 0 0
Gates	120 0 0

For Barnsley sewerage works, Contract No. 2. Mr. John Richardson, engineer:—

Buxton	£1,650 0 0
Moxon	1,585 0 0
Robinson	1,530 0 0
Royds & Whittle (accepted)	1,215 0 0
Barker	625 0 0

For sundry alterations at the Grand Junction Arms, Præd street, Paddington, for Messrs. Truman, Hanbury, & Buxton; quantities supplied:—

Scott	£713 0 0
Brake	693 0 0
Stoner	642 0 0
Marr (accepted)	621 17 0

**TENDERS**

For new chapel, Wokingham, Berks. Messrs. Poulton & Woodman, architects, Reading:—

Lecture room.	
Lewis	£2,069 19 6
Martin	1,976 13 9
Gray	1,895 3 6
Cooper	1,770 0 0
Sheppard	1,698 0 0
Orton & Child	1,649 0 0
Matthews	1,517 0 0
Wells (acc'd.)	1,470 0 0

[Materials from the present chapel, in addition to the above.]

For a cottage, at Crowtham-common, Hants. Messrs. Tress & Chambers, architects:—

Stevens & Co.	£1,369 10 0
Charlton	994 10 0
Martin, including plate glass (accepted)	993 10 0

For alterations and additions to premises, Robert's-mews, Hampstead-road. Mr. J. Tanner, architect. Quantities supplied:—

Axford & Co.	£913 0 0
Mann	899 0 0
Elston	499 14 0
Turner & Sons	499 0 0
Patman	458 0 0
Afry & Bellingham	459 0 0
Taylor	415 0 0
Sweet	405 0 0

# The Builder.

VOL. XVIII.—No. 913.

Rambling: Broadhurst, Sussex.

**B**ROADHURST (we were told) "was the residence of the excellent Archbishop Leighton: it was a good house once, but there is nothing left now worth seeing." "Don't take their word for it," said an enthusiastic friend, who knows that things are sometimes visible long after they have disappeared, if looked for with the mind and the heart as well as the eyes. "Let us see for ourselves." And so being hard-by, and the sun at last smiling, an event in England, we went. It certainly is agreeable to be able to say with something like truth,—

"'Tis summer, joyous summer time,  
In noisy towns no more abide;  
The earth is full of radiant things,  
Of gleaming flowers and glancing wings,  
Beauty and joy on every side."

We have not yet full summer, but it promises to come; and when it does come we shall enjoy it the more for its coyness.

Reaching Broadhurst, we found it quite true that comparatively little is to be seen there; but it has many points of interest, and is full of suggestiveness. A poet asks,—

"Hast thou not oft, in unrequited ground,  
A region full of wild enchantment found,  
Which stays your steps; and e'en when left behind,  
With its sweet memories cheers the pensive mind?"

Now Broadhurst is not a region of "wild enchantment;" nevertheless it "stays your steps," for it speaks of man's labour and care which have been useless; of hopes, and fears, and affections that have passed away; and of the ever-enduring hountfulness of Nature, ever fresh, ever varying. Nature, it may truly be said, is preserved by her elements in a perpetual youth; and so this earth will never want her worshippers. Again, although not ancient, Broadhurst is old; and antiquity gives a charm to the commonest things. Objects seen through the haze of centuries are increased in importance, refined, and made picturesque. Time the healer, Time the avenger, may also be called Time the consecrator.

The name itself is suggestive. Hurst, or hirst, as our dictionary shows, signified amongst our Saxon progenitors a forest or grove, and when we hear of this Broadhurst, and of Hawkhurst, and Wakehurst (quaint old house), and Buckhurst, and Ashurst and Crowhurst, and Penshurst and Goudhurst, and Ticehurst and Hurst Monceaux, and Hurst Pierpoint, the leafy, and, moreover, stumpy condition of this part of pleasant Sussex county is pretty plainly indicated.

Broadhurst (or more properly Bradhurst, but we retain its now usual title), was built by Richard Michelborne, in the early part of Elizabeth's reign. The family resided here till his grandson, Sir Richard Michelborne, having married a Campion, of Combwell, removed to Stanmer, about the year 1610. Broadhurst was then let to the Lightmakers, and Edward of that name married Archbishop Leighton's only sister, Saphira, which led to Leighton's residence there.

Robert Leighton, in troublous times, gained a reputation for piety, ability, and moderation. Amongst other anecdotes of him one is recorded which is characteristic. The Scottish clergy, it

appears, were occasionally asked in their assemblies, "Whether they preached to the times?" When the inquiry was put to Leighton, he said, "While all my brethren preach to the times, suffer me to preach about eternity." When toleration was better endorsed than it had been, he accepted the archbishopric of Glasgow. Contention, however, still prevailed, so he resigned his office, and retired to Broadhurst, where he died in 1684. Bishop Burnet bears testimony to his power as a preacher. During Leighton's sermons, he writes, "I never once saw a wandering eye." Of how many divines can this be said now-a-days. Leighton was buried in the Church of Horsted Keynes, close by, where until lately his name was recorded by a slab only. Now, however, there is an altar-tomb to his fragrant memory, outside the church, on the south side of the chancel. In this church, it will be remembered by our readers, there is a miniature, cross-legged effigy of a knight in mail, concerning which something has been written. It is a cross-church, and the body of it is Early English, but the tower at the junction of the nave and chancel is that of the Norman church which preceded this, and retains the small semi-circular arches below that opened into the nave and transept. The transept of the later church is built to the west of the old one.

When Leighton lived at Broadhurst it was a good house;—one of those of which Mrs. Hemans sings,—

"The stately homes of England,  
How beautiful they stand!  
Amidst their tall ancestral trees,  
O'er all the pleasant land."

But it fell into decay, and being too large for a farm-house, was partially taken down in the middle of the last century. A portion, however, still remains; and the foundations of the centre and destroyed wing, as well as the stately terraces, can still be seen. The part left, which shows some bold chimney shafts,—stone below and brick above,—includes the kitchen with its yawning fireplace and crane-suspended cauldron. One hettemost room is panelled, and there are some plain stone chimney-pieces of the original period. The stairs of this portion are of whole-timber squared, and the necessity of self-protection (in the absence of the rural police) is shown by the occurrence on the staircase at different heights of weighty wooden flaps which close the whole opening, can be secured by bars when down, and would resist a powerful attack. The chief charm of the place, however, is certainly outside.

"In every garden," says Sir W. Temple, "four things are necessary to be provided,—flowers, fruit, shade, and water; and whoever lays out a garden without all these, must not pretend to it in any perfection."

These, it is evident, were all provided at Broadhurst. The general aspect of the terraced ground recalls strikingly Bacon, and his essay "Of Gardens." "The garden is best to be square," saith he, "encompassed on all the four sides with a stately arched hedge," the hedge raised up on a bank, "not steep, but gently slope, of some 6 foot, set all with flowers." What we have before us could not be described more correctly than with these words. And then at the side there are "some fair alleys" to give a full shade, and at the end there is what he further asks for,— "a mount of some pretty height, leaving the wall of the enclosure breast high, to look abroad into the fields." At the opposite corner to the mount, and on the terrace, we find what was once and might easily be made again a delicious summer house, formed with yew trees, tall and graceful, and admitting a beautifully attenuated light. It is sadly desecrated just now, and needs the care of some lover of the beautiful.

Beyond are the fish-ponds. The strict observance of Lent and other fasts in early times, induced a great consumption of fish. In ancient accounts remaining, enormous quantities are entered as having been bought for use in English houses. Even after the Reformation fish was greatly eaten. Necessarily, therefore, in the days before railways and mangel-wurzel were, fish-ponds, the nests especially of carp and tench, were indispensable adjuncts of a good residence, and

these are not wanting at Broadhurst. There would seem to have been several, with one pool, perhaps, for lathing. Just such a cool retreat as Thomson's Musidora sought, when,

"Warm in her cheek the sultry season glow'd,  
And, robed in loose array, she came to bathe  
Her fervent limbs in the refreshing stream."

Our ramble of pen, however, has lasted long enough; but before we stop we will venture on the suggestion, that Broadhurst should again be made into a tasteful residence.

Englishmen seem to have a natural love for trees, fields, and flowers, and catch at the first opportunity to possess a greenery of their own, whether it be the overlooked and wall-bounded parallelogram of the suburban "semi-detached," or, happier fate, a thousand acres in a ring-fence. It would be easy at Broadhurst to get the agreeabilities of antiquity without long waiting.

Old growing trees in a desired spot are amongst the few things that money cannot produce. Castles may be raised, ruins may be run up, hills will arise, and rivers may be led to follow fresh courses and flow to the newly-built walls at the drawing of a cheque; but the leafy monarchs of the wood are not to be had in that wise; all the wealth of Threadneedle-street cannot conjure up a grove of oaks; it must be waited for or gone to.

Sussex is very different now from what it was. Dr. John Burton, in his Latin and Greek *Iter Susseciense*,\* gives a lively idea of the inaccessibility of Sussex a hundred years ago. He cannot speak often enough of Sussex mud, and suggests as a reason why "the women and all other animals [polite pundit] are so long-legged in Sussex," that pulling the feet out of so much mud by the strength of the ancle stretches the muscles and lengthens the bones! Sussex indeed, he says, in another part, being so hard to ride or drive through, has earned a bad name in this respect, and passed into a proverb, so that any difficulty hard to get through may be called "the Sussex bit of the road." It is clear, in fact, that Sussex, until recently, was an unapproachable and uncivilized place. Thanks to the locomotive, however, *non avens changed tout cela*, and many of its nooks and corners and beautiful elevations are becoming occupied. Nevertheless, as everything depends on the frame of mind in which a place is viewed, and what may be called the motive-power in the viewer, it is quite possible that all would not be so much interested with Broadhurst as we have been.

## ON HEALTHY DWELLINGS, AND PRE- VALING SANITARY DEFECTS IN THE HOMES OF THE WORKING CLASSES.†

LADIES' SANITARY ASSOCIATION.

Having considered that which is local and that which is structural, I come now to notice that which is in the main, though not wholly, dependent on the occupants themselves, to constitute a healthy dwelling, external and internal cleanliness, and a proper use of structural arrangements.

External cleanliness, which includes the cleaning away of all dirt and refuse, as well as the scavenging the streets, must in towns be provided by the local authorities, and every clearance ought to be with sufficient frequency to prevent any accumulation in the dwellings.

The most suitable provision for rendering a dwelling dry, or for its efficient ventilation, will not secure the health of the occupants, if there be, either around or within the abode, an accumulation of dirt, whether in a solid or liquid state. Houses may, to all appearance, be very desirable dwellings, but if there be defective drainage, or cesspools within their precincts, or untrapped and foul sinks, there is no safety for the inmates. Nor can the close proximity of stables, and of dung-heaps, their indispensable adjuncts, be a matter of such indifference as might be supposed from the practice so prevalent in the most wealthy parts of the metropolis, one inevitable effect of which is, that in the summer many windows which should be opened for ventilation, remain closed, in order to exclude the noxious fumes of the stables.

Neglect of sanitary laws is as much manifested

\* Learnedly set forth by Mr. Blaauw in "Sussex Archaeological Collections," vol. viii.

† See p. 474. By Mr. H. Roberts, F.S.A.

in the country as it is in towns and on the Continent, not less than it is in England. It would be easy to point to spots where the air is unrivalled for purity, and the scenery around of surpassing beauty; and yet such are the accumulations about the dwellings that it is often difficult to enter the doors without wading through a stream of filth, alike offensive to the sight and to the smell. Can it be matter of surprise if such violations of the known laws by which God regulates the health of his creatures, be visited with sickness and premature death? With equal certainty as to the issue, we may predict that those who live in close proximity to black and stagnant pools, to foul ditches, or to sluggish open drains, will periodically suffer from fever or dysentery, as we do that the house in flames will be consumed, if the destructive element be not extinguished, or that the neglected garden will be overrun with weeds and become a wilderness.

In the houses of the wealthy, all that, as matter of daily routine, concerns their cleanliness, and their ventilation, is in the main, left to the care of servants; and often through their ignorance, rather than their culpable neglect, the health of the family, and especially that of the younger children, is very seriously injured, without the slightest apprehension as to the cause.

Were it necessary, numerous instances might be cited in proof of a fact which is calculated to arouse even the most self-indulgent, and to induce them to co-operate in the diffusion of sanitary knowledge for their own sake, as well as that of their neighbours and dependants. To such persons the study of much that is contained in Miss Nightingale's instructive notes on nursing, might be of great advantage; and I could earnestly desire that in a suitably abridged form, the valuable practical directions with which it abounds, were widely-circulated amongst female servants, who would, doubtless, receive with merited attention, the instruction of a lady whose name is so universally known and respected.

Amongst the middle classes, many would contribute less grudgingly than they now do to the cost of public sanitary improvements, and even urge their extension, if they were better acquainted with the laws of health; whilst they could not fail of deriving especial benefit themselves from a practical knowledge of such of them as relate to in-door life, whether it be that of the dwelling-house, the manufactory, or the workshop; in all of these the advantages of cleanliness and good ventilation, are of paramount importance, whilst in each case the same general rules are applicable. There are, indeed, but few places where proper ventilation is more needed than it is in those hives of human industry, where large numbers of working people congregate for many successive hours, partly by gas-light, which in itself greatly vitiates the air.

Descending to the lower stratum of the social edifice, we cannot doubt, that a knowledge of the intimate connection which exists between physical suffering and the want of cleanliness in the house, or in the person, would be instrumental in restraining many who gradually yield themselves up to habits which end in a reckless fatuity, and lead them to the beer or the spirit shop, for the means of stimulating their enfeebled energies, or of satisfying the craving produced by the want of pure air. The first step in the downward course usually begins with want of cleanliness; disease and vice follow in succession.

The difficulties with which working people have to contend in regard to their dwellings, in most thickly populated towns, are very great. Indeed, there is no social or political grievance in the removal of which they are more deeply interested than they are in being freed from the hardship of having to live in the midst of filth, foul air, and pestilential exhalations. The organization of such an agitation amongst them as would lead to their feeling how much they are concerned in all the essentials of a healthy existence, is heartily to be desired. To such an agitation, as was said by the Right Hon. Wm. Cowper, at the late meeting on social science held in Bradford, "a cry for a new charter might succeed, and certainly would not be treated with disdain, if the five points of that new charter were to be pure air, pure water, good drainage, unadulterated food, and open spaces for exercise." To which I should desire that "healthy dwellings" were added, as a right which those who cannot protect themselves, are entitled to claim at the hands of the Government, on precisely the same ground as the community at large seek protection from fraudulent weights and adulterated food. "As yet the necessity of protecting life from the influence of poisonous dwellings has not practically been ac-

nowledged, though the principle is in the statute book."

The striking contrast which the homes of large masses of our working population present to all that is essential in a healthy dwelling, renders them not only a painful study, but also a just cause for national humiliation.\* I have felt it to be such when endeavouring on the Continent to press attention to those sanitary ameliorations which are in all countries so greatly needed. It is true that England has taken the lead in associated practical efforts for the improvement of the dwellings of the labouring classes,† and that, for several years past, individual efforts have been made by some of the most exalted in station and social position. Legislative measures have also been adopted with the same end in view; but these being chiefly of a permissive character, but little, comparatively, has been effected in producing any marked improvement in the domiciliary state of the masses of our working population in towns; if we except the state of the common lodging houses, which, under the operation of a compulsory Act, have been very greatly improved.

No words of mine can so vividly present a true picture of the scenes which may be witnessed within a short distance of our own doors, as those of the Earl of Shaftesbury, in a preface to the published report of a very remarkable address lately delivered by his lordship in the House of Lords. "The domiciliary state of whole legions of our fellow citizens has been with me, for some time, a subject of observation and inquiry; and I do not hesitate to assert that it lies at the root of nineteen-twentieths of the mischiefs that we seek to redress. Not only the actual dwelling, but the situation of it, the character physical and structural of the locality, whether it be street, or court, or alley, or some deep, dark, and poisonous recess, never penetrated, except by its own wild and unknown inhabitants, must be included within the term 'domiciliary state;' and in those places,—low, narrow, with a death-like darkness, impervious to light or air (the work of greedy speculators uncontrolled by law)—are aggregated all the fearful influences that breed evil, and neutralize good wherever it seeks to establish a footing among those neglected classes. Fever and disease of every kind prevail: a poor standard of physical strength, the result of the fetid atmosphere they inhale by day and by night, deprives them of power to do able-bodied work; while loss of energy and depression of spirits drive them to seek life and support in vice and intoxication."

"Their modes of existence are sometimes diametrically opposite. A large mass is found in the perpetual din and whirl of close-packed multitudes. A smaller, in the remote and silent retreats of filth and pestilence (through which no thoroughfare passes), dwells in a kind of savage solitude, seldom emerging by day from their bidding-places, and rarely visited. But whether in great or small numbers, whether in the most active or the most tranquil quarters, all are equally shut out from the possibility of domestic life. A dozen families in a single house, though barely sufficient for two; as many individuals of both sexes and of all ages in a single room, the common and only place for cooking, washing, and sleeping; the want of fresh air, the defect of water, of every decency, and of every comfort, give proof enough. We need not wonder why the gin-shop and the tap-room are frequented; why the crime of incest is so rife; why children are ragged and ignorant, and the honest dignity of the working man's home degraded or forgotten. These poor people, by no fault of their own—for they did not create the evil, nor can they remedy it—are plunged into a social state which is alike dishonourable and unsafe to our common country."

† It should be supposed that the evils which, thus photographed by a master hand, present

\* A well-known American writer says of England,— "The pauper lives better than the free labourer, the thief better than the pauper, and the transported felon better than the one under imprisonment."—a contrast which could not have been drawn until, through the philanthropic labours of Howard, "the gaol fever" had been banished from the precincts of our prisons. We learn now, from the annual report of the Brixton Prison, that, in 1857, whilst the needlewomen of London died at the annual rate of 34 in 1,000, the death rate of female prisoners, who were healthy on their admission into that prison, was for the same period, only 13·6 per thousand;—a rate singularly coincident with that in the model lodging-houses of London to which I have referred.

† In a paper on the "Improvement of the Dwellings of the Labouring Classes," which is published in the transactions of the National Association for the Promotion of Social Science, at the meeting held in Liverpool, 1845, I have dwelt at some length on the efforts made in England, as well as on those in other countries.

dark a picture\* of human wretchedness, only exist in the metropolis,† I will give two or three examples of the state of things in our provincial towns, after first quoting from a recently-published work by a lady whose Christian efforts have brought her much into personal contact with a western suburb of the metropolis. My own observations lead me to know that her experience is but an illustration of what may be met with in many other spots round London.

Mrs. Bayly, in "Ragged Homes, and How to Mend Them," justly says,— "One of the greatest obstacles which meet those who are striving to improve the homes of the poor is the construction of dwellings. There are whole streets of houses in this neighbourhood whose appearance gives you the idea that they were originally designed for a higher class of people; and yet the builder must have known that the supply of such houses was already much beyond the demand, and that if let at all, the inmates must be poor. Nothing, however, adapts them for this class of inhabitants. Five or six families may occasionally be found in one such house, with no more provision for health, comfort, and decency, than ought to be made for each one. The houses professedly erected for the poor are still more deficient. They are sometimes built below the level of the road, so that the drainage is to them, instead of from them. The basements are consequently fearfully damp, and the whole atmosphere in every part of the house is impregnated with the effluvia from the stagnant sewage."

"The materials used in buildings are so bad, and the workmanship so inferior, that the floors are always loose, and every thing seems constantly getting out of order. We have whole streets of small six-roomed houses, let out entirely to the poor; so that three families frequently live in one house. There is no outlet to the air at the back of these dwellings, either by door or by window. One long blank wall is all that is to be seen. Frequent illness prevails among the inhabitants of these streets, and I can never forget the scenes presented there during the visitation of the cholera."

After mentioning a case of horror, alas! too much like others frequently occurring in these inhuman abodes, and which, if they were only represented in wax, as the ravages of the plague are in the museum at Florence, we should turn away from them with a shudder, and never forget them; the writer depicts with so much feeling and clearness the necessary results of a state of things which, those who have long thought on the subject are increasingly convinced can be remedied by no other means than such Government interference as would effectually counteract the reckless ignorance and the heartless cupidity of the owners of such property, that I cannot abstain from quoting another passage. "I sat down, as soon as I reached home, and wrote a letter to the editor of the *Times*, describing the scenes I had witnessed that morning, calling his attention particularly to the construction of those houses; and then asked, in the bitterness of my heart, if, with all our extensive and costly paraphernalia of government, nothing could be done to stop this awful waste of comfort, health, and life. The importance of the subject at once commended itself. The narrative not only appeared, but was backed by every argument and appeal that the talented pen of the editor could bring to bear upon it. But there it ended: no steps have been taken to make the construction of such dwellings contrary to the law of the land. Many fathers, mothers, and children, too, have since died in those streets; only in these cases by lingering fever, instead of by sudden cholera. Surely the cries of distress must have ascended again and again, and have entered into the ears of the Lord of Sabaoth!"

"But there is a still darker side to this grievance. The death of a few is less calculated to excite our compassion, than the miserable, lingering existence of the many. When I see the little boys and girls playing before the doors, often with crooked backs, or crooked limbs, with emaciated forms and faces, if not with still more unmistakable marks of disease, I cannot help thinking—Are these boys to be our future working-men, upon whose sinew and muscle we are to depend for cultivating our soil, constructing our railways, sinking our mines,

\* Must not the mere remembrance of such a picture as this restrain us from yielding an unqualified assent to the words lately uttered by one of our most eminent statesmen—"This country is making most wonderful progress in everything that constitutes national greatness and prosperity?"

† The illustrated and very graphic descriptions given by Mr. Godwin in a recent work, entitled "Town Swamps and Social Brides," may mislead those who are at all sceptical on this subject.—H. R.

and defending our country; and are these girls to be the mothers of the next generation?"

On the state of the lower class of dwellings in our provincial towns we have the evidence of innumerable official reports. In one of them we learn that "at Leicester the worst houses are to be found in the old quarters of the town; they are the habitations of the working classes, and the poor, and are family both in arrangement and structure. For instance, there are eleven houses of one room each, at first used as pigsties, but the speculation failing, they were converted into dwellings, each 14 feet by 10 feet, and 6 feet 6 inches high, with an average of five persons in each room.

Of Swansea we know, on the authority of the mayor, that in a sanitary survey of the epidemic districts there were found in five consecutive cottages in one street, seventeen, thirteen, eight, ten, and twelve inhabitants; each house had two sleeping apartments, the largest, 10 feet by 8 feet, the other only 8 feet by 6 feet, giving a total of sixty inhabitants shut up in ten rooms, not too large for the requirements of ten persons; and, as a necessary consequence, some form of disease was always present.

In the town of Hertford, out of 294 court-yards or alleys close and confined, without entry from the main street, and mostly terminated by a *cul-de-sac*, only thirty-two have any outlets at the back made for ventilation. Referring to such places, it has been remarked by Mr. Rawlinson, that "in the towns formerly occupied by an agricultural population, and afterwards adapted to receive an increase of artisans and manufacturers, it is universally the custom to convert old and decayed manor-houses or other buildings of any extent into a number of dwellings; but the requisite attention to sewage, ventilation, and other accommodation demanded by the increased number of inmates seems quite forgotten, and they are left to make the best arrangement they can for themselves, when, in fact, the most careful supervision should be exercised by the proprietors. In another report, the same gentleman, after naming ten northern towns, says, "There are blocks of houses and tenements which no remedial measures can ever make healthy dwellings, because the construction prevents free ventilation, and the sun can never shine within the crowded area, or even the light of day break the crowded night in which many of the poor at present exist."

The physical result of such a state of things, wherever found, has been already spoken of, and may be illustrated by a single example, taken from the Report of the Assistant Commissioner to the Metropolitan Police made in March, 1859: "The occupant of one room said, 'I was a strong healthy man when I came into this court four years ago; now I am fast sinking into the grave. I have scarcely had a day's health since I have been here.' Viewing the results in their moral and religious aspect, the present Bishop of Ripon, when rector of the parish of St. Giles's-in-the-Fields, thus wrote: 'The physical circumstances of the poor paralyze all the efforts of the clergyman, the schoolmaster, the Scripture reader, or the City missionary, for their spiritual or their moral welfare. \* \* \* Every effort to create a spiritual tone of feeling is counteracted by a set of physical circumstances which are incompatible with the exercise of common morality. Talk of morality amongst people who herd men, women, and children together, with no regard of age or sex, in one narrow confined apartment! You might as well talk of cleanliness in a sty, or of blimp purity in the contents of a cesspool!'"

A scene in Lisson-grove, the north-western St. Giles's of the metropolis, is thus described by a lady, the well-known author of "The Missing Link."—"The heart sickens at the sight of degraded lads and girls, lost to every sense of decency; and one can only ask, Where were these brought up, and whence do they swarm forth, to mock the God of Heaven, and defile the air they breathe? Whence? Let those who know them lead you to their homes, or truly their 'dens'—back kitchens, 8 feet square, with broken floor and window—where the mother, drunk, sits on an old tin kettle in the midst; she has on one garment and a tattered shawl, but her baby has nothing; and a three-year old child, crippled by a fall from a chair, and with one eye cut out, has nothing; or to rooms where each corner has its family, and where one lies dying of starvation and another of small-pox. Such is the close of life to thousands in London. City missionaries and Scripture readers know it; medical men know it; the clergy know it; but the gulf of misery is immeasurable, and it is given up in despair. These

homes make these people, generation after generation. Would it have been thus if the Christian women of London had long ere this found their true mission, and fulfilled it? Mothers make homes, and mothers make 'dens.'"

I offer no apology, in addressing a ladies' association, for having quoted at such length the writings of two ladies, who devote both time and talent with so much Christian zeal to the carrying into effect their well-devised plans for promoting the temporal as well as the spiritual benefit of their suffering fellow-creatures. In regard to such efforts, I most cordially agree with an eminent clergyman in the north, Dr. Guthrie, when he says,—"The grand and only sovereign remedy for the evils of this world is the gospel of our Lord Jesus Christ. But he rather binds than helps the cause of religion who shuts his eyes to the fact, that in curing souls, as in curing bodies, many things may be important as auxiliaries to the remedy, which cannot properly be considered as remedies. In the day of his resurrection, Lazarus owed his life to Christ; but they, that day, did good service, who rolled away the stone. They were allies and auxiliaries."

The prevailing sanitary defects in the homes of our rural labouring population have yet to be noticed. Although much has lately been done by many land-owners to improve the cottages on their estates, and instances might be named in which a sense of duty, in this respect, has been manifested by a princely and, at the same time, judicious expenditure; it is a lamentable fact, that there are but few counties where there are not a great many cottages around which the external air may be good and circulate freely, but their aspect is such, that the sun's rays never enter the dwelling, or the site is remote from good water, or the drainage defective. The walls, the roof, or the floor, perhaps all of them, admit the external humidity. The windows are badly constructed for the purposes of light and ventilation. The rooms are very low, and too few in number, for a family; indeed, it is rare to find more than one or two bed-rooms in an old cottage, although three are evidently indispensable to the health and moral habits of a family with children of both sexes.

In some instances which have fallen under my own observation, I regret to say that the want of judgment in the selection of plans has led to the building of cottages, more particularly in the neighbourhood of manufacturing towns, which by no means combine all the requisites of a healthy dwelling. In other cases an unnecessarily heavy expenditure has been incurred, whereby an imprudence is created that even under favourable circumstances, the moderate return of 3½ to 4 per cent. clear, cannot be obtained from well-built cottage property.\*

This is not a suitable occasion for entering at length on the important question of pecuniary return for capital invested in the improvements of the dwellings of the labouring classes; were it so, I might quote the words of the Duke of Bedford, and other distinguished landowners, who have placed its hearings, with regard to the proprietors of land, in their true aspect; and I could show, that from 4 to 5 per cent. clear of expenses, and in some instances a higher rate, has been realized in towns, from newly built improved dwellings, in a sufficient number of instances, to prove that, with the exercise of a sound discretion and careful management, a return may be obtained which is about equal in per-centage to the average profits of the nine great railways diverging from the metropolis.

It would, however, be unreasonable to expect that those who, whatever may be their zeal in the cause, have not the requisite knowledge, can themselves conduct with pecuniary success undertakings which are so practical in their character. With great justice and feeling does Miss Nightingale say, "What cruel mistakes are sometimes made by benevolent men and women in matters of business, about which they can know nothing, and think they know a great deal."

As bearing on the question of pecuniary return, I may add, that one important result which would inevitably follow the legal enforcement of a good sanitary state in all dwellings let in apartments to pay a low weekly rent, must be that

\* Benefit Building Societies present an important machinery for providing improved dwellings for the working classes, and any judicious advice given to the members, in the selection of their plans, may essentially contribute to the acquisition of a "healthy home." In many places on the Continent, societies have been formed by philanthropic persons to build suitable houses, and to afford facilities which enable the working classes to become the owners of their own dwellings; the parties advancing the money being satisfied with four per cent. interest, and the security of a sinking fund to pay off the capital.

those who now obtain a large profit out of the necessities of the poor, would be forced either to effect the much needed improvement of the dwellings themselves, or to part with them on equitable terms to those who might be willing to make the necessary outlay, in anticipation of a reasonable, but not extravagant return. At present such property, if sought after, can only very occasionally be obtained at a price which, with the heavy expenses of repairs, and the maintenance of old buildings, will yield a fair rate of interest.

It is gratifying to know that the results of all the efforts made to improve the homes of the working classes have, in regard to the occupiers, been most encouraging. In order to show how greatly employers of labour may in this respect promote the welfare of their dependants and their families, I instance two cases which, though they differ greatly in many respects, are both calculated to stimulate and encourage to similar efforts for the relief of those who, through the wretchedness of their homes, are sunk into a reckless state.

Lord Palmerston, in addressing a meeting lately held at Romsey, said, "When a cottage is in such a ramsackle state, that it is impossible for the wife to keep it clean, she becomes a slattern, everything goes to ruin, the man is disgusted, and flies to the beer-shop. If, on the contrary, the wife feels that she can, by a little exertion, make the cottage decent and respectable, she does so, and then the man enjoys the comfort and happiness of his home, stays away from the beer-shop, and the sum of money he would spend in liquor goes to the benefit of his wife and children. I had an example of that in a double cottage of my own. It was in a dreadful state; the walls were not airtight, it had a brick floor, a bad roof, and everything uncomfortable. The people who occupied it were slovens and slatterns, and quarrelsome ill neighbours. At a small expense it was made tidy; boarded floors were put down; a little porch erected, with a wood-house and other conveniences, and from that moment these people altered entirely their character, altered entirely their conduct, became well-conducted people and good neighbours, which they had never been before. \* \* \* Depend upon it, a very great deal can be done at a moderate expense towards making old cottages decent and comfortable."

The other case was mentioned to me in Paris, when inquiring as to the disposal of a legacy of 50,000 dollars left by the late American ambassador, Mr. Abbott Lawrence, for building model houses in Boston. My informant, Professor Beck, of Harvard College, U.S., as a practical illustration of the benefits resulting from individual efforts, said, that "shortly after engaging an out-door servant, who was a native of Ireland, I had much reason to complain of neglect of duty, and learnt indirectly that the man was intending to abandon his wife and children. A serious conversation with him, and a representation of the cruelty and wickedness of his conduct, led him, without attempting a justification, to acknowledge, after some hesitation, that he felt discouraged; he was desirous of keeping his family in a respectable condition, and educating his children, but he was obliged to keep them in a miserable neighbourhood, occupied by people of the lowest character, who, old and young, gave themselves up to intemperance and other vices; he found it impossible to prevent the evil effects of such a neighbourhood upon his family, especially his children; he had not the means of procuring a better habitation, and did not know what to do. This conversation having directed my attention to the importance of proper dwellings for this class of people, and entertaining in other respects a favourable opinion of the man, who had received a good common school education, after some reflection I proposed to him, that if he could find a small piece of land in a respectable neighbourhood, I would advance the money for its purchase and for the building of a suitable house. He seized the proposition with great eagerness; he found a piece of land, and a house was built. This change from a bad to a good dwelling was the saving of the man and his family. The house is so large that he lets a portion of it to one or two other families. The rent thus received is more than sufficient to pay the interest of the debt, and the surplus of his wages has gone to paying off the principal. The man remained in my service eight years, until I left to make a tour of two years in Europe. The prosperity of the man continues. His habits of industry and thrift are confirmed."

After instancing these two cases of a successful application of remedial measures, it may be useful, in closing, to recapitulate briefly the various

means, through the use of which, the dwellings of our working population can be rendered "Healthy Homes."

They may be ranged under the three heads of—Government measures; the action of public bodies, of the employers of labour, as well as of voluntary associations; and personal influence.

In England, where every man's house is said to be his castle, legislative interference can only be anticipated to a very limited extent, beyond the enactment of general sanitary laws, and those which are strictly of a permissive character, or calculated to favour the action of individuals and of associations, in providing improved dwellings. A step further in advance, one which has proved most successful, has been taken in the regulation of common lodging-houses, and not until the same principle is applied to the enforcing of a good sanitary condition, with suitable arrangements in all tenements in towns and cities, can it be anticipated that the miserable dens,\* in which large masses of our population at present herd, will be cleared of their filth, and rendered fit for the occupation of human beings. Within the jurisdiction of the corporation authorities in the City of London such a power was conferred in 1851, and is discreetly exercised under the supervision of the Medical Officer of Health, to the great benefit of the poor, and a marked diminution in the returns of mortality, which have fallen since that date from 25 to 23 in 1,000.

By a standing order of the House of Lords, provision has been made for ascertaining the necessity of enforcing the construction of suitable dwellings for the working classes, in lieu of such as may be demolished, under powers granted by Parliament for the carrying out of public improvements, or the works of large companies, such as docks, railways, &c. The non-enforcement of such an obligation, has led to incalculable misery and evils in our own metropolis, as well as in that of a neighbouring country.

Legislative interference is also much needed to provide a remedy for the evils arising out of the selfish system pursued in some "close parishes" of pulling down cottages, in order to obtain relief from a burden, which is thereby thrown on a neighbouring parish.

The building of small houses on undrained ground, and without proper sanitary arrangements, should, as a fruitful source of sickness, and consequent expense to the public, be entirely interdicted.

Public bodies, including many departments of Government, railway, and other commercial companies, as well as the regular employers of working people generally, whether they be agriculturists, manufacturers, owners of mines or quarries, have it in their power greatly to promote the well-being of those whom they employ, by caring for their domiciliary condition, and by either providing suitable dwellings for them; which may generally be done, with ample security as to the cost, or by aiding them to form amongst themselves well-constituted associations for the carrying out of that object. In other instances existing dwellings may, as we have shown, be greatly improved at a moderate cost.

The construction of model dwellings, by associations formed for that purpose, as well as the renovation of old houses, have proved in some places of great value as an experimental and pioneering movement, irrespective of the immediate benefit conferred on their occupants, and their immediate neighbourhood. The pecuniary return, of necessity greatly depends on the judgment and care exercised in the selection of sites, and in the arrangement of the plans, as well as on watchful and economical management.

The practical results of the personal interest taken in this object by His Royal Highness the Prince Consort, in connection with the Great Exhibition of 1851, have been manifested in several instances by the providing accommodation for married soldiers; a want which led the late Duke of Wellington to object to the placing the model houses in the barrack-yard, lest they should cause dissatis-

\* I well remember seeing repeatedly in the metropolis a room about 22 feet by 16 feet, the ceiling of which could be easily touched with the hand, without any ventilation excepting through some half-patched broken squares of glass, and in it were constantly lodged from forty to sixty human beings, men, women, and children, besides dogs and cats. The lodging-house Act has in this case operated a great reformation, but the want of power to extend its regulations further leaves a mass of untouchable filth and misery; for, as is said in the last Report of the Assistant Commissioner of Police, 1859, "All the evils which that Act was intended to remedy still exist, almost without abatement, in single rooms occupied by families, single rooms so occupied being exempt from the operation of the Act."

faction in the army. During the present session of Parliament 30,000, have been voted for this object. Amongst many examples of houses built after the general plan of those in the Exhibition, is an entire street, near the Shadwell station, on the Blackwall Railway, built by W. E. Hilliard, Esq., of Gray's Inn, who has the satisfaction of having replaced a miserable range of dwellings with "Healthy Homes" for 112 families, which return him between 6 and 7 per cent. clear, on the outlay of about 14,000.

With regard to personal influence, if ladies throughout the length and breadth of the land, would individually make themselves acquainted with the domiciliary condition of the working people in their own neighbourhoods, and would sympathize with them in their difficulties in this respect, a task vastly more easy than that to which ladies have devoted their time and talents with so much zeal and wisdom, in visiting our prisons and hospitals; the sights they would witness, and the reflections which must arise therefrom, would compel them to exert all their influence in promoting the greatly-needed reform.

Although the power of aiding directly in the removal of existing structural defects in the dwellings of the poor, is not very generally possessed by ladies, their influence may be exerted with the greatest benefit in pointing out to the necessity for, and in persuading them to carry into operation, those remedial measures which have already been referred to. There is, moreover, a field for the exercise of influence in which ladies may labour, and have done so most efficiently. They can impart instruction, can exhort, encourage, stimulate, and, above all, can manifest that sympathy which shines with such attractive lustre in the crowning grace of Christian charity.

Amongst those practical duties, of which the necessity and advantages may be pointed out to the wives of working men, one of the first in importance is, that she should be "a keeper at home," and attend to her household duties as well as to her children; for without this, a dwelling may possess all the conditions essential to health and morality, and yet the occupants be comparatively little benefited by its advantages.

Ladies can exercise a personal influence, by either teaching, or causing to be taught, the benefits resulting from a free admission of pure air, of personal and household cleanliness; and they can facilitate the obtaining of such articles as whitewash, brushes, and ventilators, as well as the mending of broken windows; they may also enforce, more especially on wives and mothers, a careful attention to the many details which conduce so much to health and domestic comfort, and render home attractive, rather than repulsive, to husbands and sons. They can likewise be instrumental in promoting those habits of temperance which enable husbands to expend on home comforts "the fool's pence" whereby the publican is so greatly enriched, to the impoverishment and incalculable injury of the labouring classes.

Ladies have, by the bestowment of premiums and rewards for the best-kept cottages, in many places conducted to the health and the comfort of their occupants. They have also exercised a most beneficial influence, through personal intercourse, and what has been aptly called, "Mothers' meetings," conducted in a spirit of Christian kindness, with the aim of teaching the poor to help themselves.

The obligations of the Divine command, "Thou shalt love thy neighbour as thyself," have been further recognized by ladies in the organization and in the personal superintendence of a female agency, which combines a social, or domestic mission with the carrying to the dwellings of the masses of our town population that hook, in regard to which, experience proves that the heartfelt reception of its sacred truths, is the best security for a lasting abandonment of those evil ways which deprive so many the enjoyment of a "Healthy Home."

With such numerous examples of effort in various directions, it can scarcely be necessary to add, that but few who, actuated either by a sense of Christian duty, or by the lower motives of self-interest, or of patriotism, sincerely desire to improve the homes of the working classes, can fail of finding some suitable channel through which to promote this important and much-needed object. If any remarks or suggestions I have made should contribute thereto, my aim in offering them for consideration will be answered.

HUNGERFORD BRIDGE FOR CLIFTON.—Of the 35,000, required for the completion of the suspension bridge at Clifton, Bristol, nearly 30,000, have already been subscribed.

#### THE STUDY OF CLASSICAL ARCHEOLOGY.

"ANNALS" OF THE FRENCH INSTITUTE.\*

The other day we fell upon an article in a number of the *Journal des Débats*,† which contains some observations on the study of classical archaeology, not without value in these times, and can scarcely fail to interest many readers. It is a memoir written by M. Ernest Vinet, a distinguished French savant and archaeologist, on the *Istituto di Corrispondenza Archeologica di Roma*. It is interesting as showing the state of archaeology throughout Europe, for the members of the Institute are not confined to Rome, but are selected from every country of the civilized world. M. Vinet gives a *résumé* of the labours of the Institute and its members, and although he has doubts of England generally, he mentions individual investigators in complimentary terms. It must be remembered that he is speaking only of classical archaeology, a subject about which our Medieval antiquaries care little. In Germany and France, Medieval antiquities are studied by a certain number with as great zest as here in England; but in those countries classical archaeology is still considered as the great occupation of men of learning. Gerhard and Pausanias, Bunsen and Lepsius, Ritter and Kiepert, Müller and Wüchelmann, of the one country with Quatremère de Quincy, Raoul-Rochette, Hittorf, Letronne, Lenormant, Laborde, Texier, and many more in the other, are names which are familiar to us all, and will remain so in future generations. In Italy, archaeology is confined to classic times, in consequence of the wealth of material which lies at their disposition. Vases, bronzes, marbles, turn up on every side. To cite names would be useless, for each antiquary is a lover of the *bell' antico*. It would be worth while for our county archaeological associations to consider whether it would not be well for them to devote some small portion of their journals to this noble study; for while it is the province of inspiration only to look into the future, it is in the power of every man to gather experience and lessons from the past. However we may sympathize with Medieval antiquities, let us beware lest we forget or despise those "*Ingeniorum monumenta quæ seculis probantur*."

The work in question, written partly in French and partly in Italian, holds a marked position among the most useful and most beautiful books in the library of the artist and of the man of letters. Commenced thirty years ago, the publication now consists of thirty volumes. An extensive atlas forms part of it, and under the title, "*Monumenti Inediti*," includes numerous plates, which reproduce with fidelity the greater portion of the most remarkable monuments which have been recovered during a quarter of a century by excavations in all classical countries, but especially in Italy. The text is a mine of research. Without this collection it would be impossible to grasp the entirety of archaeological studies and to follow their progress. Strange to say, however, the notice to which we are referring is the first given to it in a French journal. Let us follow M. Vinet. Speculation did not create these Annals; book-making had no part in them. The idea, so happily realized in them, descended from a higher source. Some fervent worshippers of antiquity, some great personages from the two aristocracies of birth and intelligence, the heir-presumptive to a crown, these were their founders. Nor must we forget the ardent initiative taken by M. Gerhard, member of the Academy of Berlin, and one of the most worthy representatives of German science.

The idea of a publication to unite in itself all contemporary archaeological researches, is not a new one. Three archaeologists of renown, Boettiger, Schorn, and M. Welcker, and the celebrated antiquary Ghattani, some time since, and separately, entertained the notion. But ever a too exclusive policy, too limited means of information, or, more than all, the extreme difficulty for learning and talent by themselves to support such an enterprise, placed an obstacle in the way of the complete success of these publications. And yet, when one contemplates the condition of archaeological studies, the necessity for a creation of this kind is very evident.

Since the day when a charming enthusiast, within the walls of that Rome which he adored, produced the "*Histoire de l'Art*" and the "*Monumenti Inediti*," foundations of two recent studies, æsthetics and the interpretation of monuments

\* Benjamin Duprat, Paris, Rue Cloître St. Benoît No. 7.  
† January 22nd, 1860.

*Figurés*.—since that epoch, memorable for ever in literary history, materials for archaeology have increased tenfold; the treasures, heretofore concealed by the ashes of Vesuvius, have not ceased to accumulate within the walls of the Neapolitan Museum; the exquisite principles of Classic architecture have been displayed in all their beauty. To artistic and free Europe, England has revealed Phidias; skilful antiquaries have visited every spot of Greece, marking with pious care upon that land thickly strewn with ruins, the site of many a once famous, but now obliterated city; others have travelled through Asia Minor, recognising everywhere the Hellenic taste, though under unexpected aspects: in giving to us the key to Egyptian hieroglyphics, in raising to the veil which envelops a civilization which seems to have had no infancy, a philologist of genius has conquered the kingdom of the Pharoas in the name of French science.

Assyria, that other enigma, has permitted us to look upon palaces as ancient as the Bible, and whose walls are covered with a writing which still awaits its Champollion; and, lastly, pagan Italy has yielded to us her soul in delivering up to us the secret of her tombs.

It was at the critical moment when this grand scientific movement, inaugurated by Winckelmann, was in all its force in Rome, between the years 1825 and 1828, that the creation of the "Annales" was projected by M. Gerhard and his friends. Thanks to them, light for the first time was shed over all portions of monumental antiquity; thanks to them publicity, so difficult and so confined in this branch of study, has become extended and easy. Scarcely was their project known, than immediately all the high celebrities of learning grouped themselves around this pleiad of antiquaries; and the formation of the Institute of Rome was the speedy result of this noble eagerness.

"Annales et Bulletin de Correspondence Archéologique," such was the title of this new collection, henceforth directed and supplied by a whole academy, or rather by the entire learning of Europe, whence it daily demanded and received some fresh fact, text, or idea. To register the results of excavations was the primary object; the secondary was to discuss those ancient monuments already discovered, but wrongly or inadequately interpreted, and still more to describe briefly all those which classic soil delivered up, day by day, to antiquarian criticism, preparatory to their being studied more minutely at leisure. One branch of this study, till then much neglected, archaeological topography, and another study equally interesting, to which M. Bockh had just given a brilliant start, epigraphy,—in a word, numismatics and glyptics, that is to say, a whole host of details and small problems, these found a place in the "Annales." The lively impulse they received has not been forgotten. Each month the "Bulletin" comes to inform the reader of the daily movements of the science, and on each anniversary of the birth of Winckelmann, marks the progress that has been made. Each year, the "Annales" discuss before the learned public, some delicate point, with all that majestic solicitude so perfectly rendered by Gerard Dow, in his "Gold-Weigher."

I lately read the first list of the members of the Institute of Correspondence,—the list of our former colleagues. At the head appears the name of Frederick William, then Prince of Prussia, and protector of the Institute. How forcibly this name speaks of the elevated and liberal taste of the reigning families of Germany! K. Othfried Müller and Letronne, Boettiger, Hirt and Millingen, Sir William Gell, Raoul-Rochette, Ehlersch and Quatremère de Quincy, Dodwell and Brönsted, Nibby, Schorn and Panofka, and, finally, Messieurs Bockh, Welcker and Guignaut, appear as members of this ultramontane academy. Two artists, large appreciators of the ancients,—Thorwaldsen and M. Hittorff,—also placed their names upon this list, where I regret to miss those of so many of their fellows. Amongst the honorary members three names have filled me with esteem,—those of William Humboldt, William Schlegel, and Chateaubriand.

Rome, where the breath of antiquity so forcibly stirs our souls, has become the definite abode of the new academy. On the Tarpeian Rock the Archaeological Institute has established its penates, and there have they been saluted by all the lovers of science during thirty years.

The same year in which this Society entered upon a path which it has traversed so honourably, and at such enormous sacrifices, fortune accorded it a marvellous discovery, which has been compared to the excavations of Herculaneum and Pompeii. Not far from Cornetto, in a pestiferous

plain traversed by a torrent which flies with rapidity towards the Thyrrian Sea, near to a venerable bridge shown between two wild banks, Ponte della Badia, six thousand Etruscan tombs have been opened from the year 1825 to 1829. To tell all the wonders that have been found in the necropolis of Vulci would be impossible. Bronzes and jewels, of exquisite workmanship, were scattered about in the midst of homes in these funeral retreats, which had been spared as by a miracle. Four thousand vases which attest the ardent desire of the ancients to decorate the dwellings of the dead; yes, four thousand vases! as beautiful for the most part as the graceful amphora of Nola, have been restored to the light of day. Fine clay, delicate varnish, elegant and varied form,—nothing was wanting to these fragile *chefs-d'œuvre*, which are alive with multitudes of figures. These compositions bear the reflex of different epochs and of divers styles; but in them the gods and heroes of antiquity play an important and undisputed part.

The fine memoir of M. Gerhard upon the Vulcian vases, "Rapporto intorno i Vasi Volcenti" ("Annales," 1831), produced a profound sensation in the scientific world. By what miracle, it was asked, were 4,000 vases, covered with Greek inscriptions, buried in the cemetery of an Etruscan village whose very name was scarcely known to history? With the exception of some Italian antiquaries, for whom these treasures of Greek ceramic art represented "the most ancient monuments of Etrusco-Pelagic worship,"—for it is thus the Prince of Canino expresses himself,—all the masters of science verified the Hellenic character of the vases of Vulci. Still, upon the question of origin, they were far from being of one mind. The presence of these vases,—did it prove the establishment of a Greek population living an Athenian life within the walls of Vulci? or even the existence in this town of a colony of Athenian potters? Or, again, was it an indication of a very lively taste for painted vases amongst the Etruscan aristocracy, causing them to send for them from Greece and Southern Italy, thus, as it were, forestalling in the paths of luxury and love of foreign productions our modern manners of Chinese and Japanese porcelain?

K. O. Müller, Raoul-Rochette, Millingen, M. Gerhard, Bockh, Welcker, and others, shared in this discussion, which was hotly contested in the "Annales et le Bulletin." Such questions may appear futile to the gay world—to drawing-room loungers, particularly in France, and more especially at the present time; but the learned perceived in them something more instructive than secondary details. They saw therein curious revelations concerning the economic and social state of the old world,—incomplete divergent revelations, but precious withal, touching as they do upon questions respecting which the most absolute silence reigns; but when the science of illustrated monuments shall have made still further progress, who can say that these revelations may not become transfused with light? Truth is willing to be a long time looked for, and criticism has penetrated many other mysteries.

By this wonderful discovery at Vulci, the imagination of all was excited; and therefore the attention of the editors of "Les Annales" was directed, through several years, upon painted vases. What an extended field of study is that of ceramic art! How it has enlarged under the double influence of scientific research and commercial avidity! Their efforts have combined to excavate all the burial-places of Etruria, of Southern Italy, of Sicily, and of the Greek continent. "Henceforth," wrote M. Bunsen, Prussian ambassador to the Papal seat, and at the same time the learned secretary of the Institute of Rome, and worthy successor of M. Gerhard, "henceforth, no one may hope to study with profit this class of monuments, and to speak of them authoritatively, without first consulting our collection." How few people imagine that upon the 50,000 vases found during the last century, and incorrectly called Etruscan; that upon these water-pots, these cups, these amphora, whitened with dust in the cabinets of the curious; that upon this pottery of such monotonous aspect, the heroic and religious myths of Greece unfold themselves to an inconceivable extent! Frequently these lines, so pure, this ease, full of grace, this ravishing caprice, all this flow of youth and beauty, screen from uninitiated eyes the free creations of pantheism, and the ideas of the ancients upon the forces of nature, and on death.

In these simple sketches, which a mercantile pen has let fall, the symbolic school, and the learned and gentle Creuzer, its illustrious chief, have more than once sought the light trace of pagan spiritualism. The enigmatic figures which

group themselves around the large vases of La Pouille, those grand and confused representations of the gods of Erebus and of the Furies, may well have seemed to them the mysterious formulae by which the ancients revealed their thoughts upon man's destiny after death. We admit that some tendencies, impressed with a certain mysticism, have glided into the excess of those monuments of serene antiquity. But, on the other hand, they have been pointed to with vivacity by a rival school, of which Voss and M. Lobeck arduous representatives. But have not the critics gone too far? If, as some philologists think, the treasures of Greek art, that art so clamring and so pure, merely express puerile ideas; if those divine marbles only portray gross appetites, the complete want of sympathy between the form and the idea, this eternal contradiction is most intensely to be deplored; it were indeed a veritable dishonour to the human mind.

Towards 1835, antique topography took the first place in the "Annales et le Bulletin." The Pontifical Government had been eight years previously to clear out the mass of ruins which separates the Capitol from the Coliseum. These excavations brought valuable results. Thus the discovery of the pavement of the Via Sacra led to the recognition of the ancient limits of the Forum. The study of this celebrated spot is full of difficulties. To mark upon the sward which springs up between the ruins the spot where the kingly people crowded together to listen to its tribunes, and to call by their real name all the illustrious remains that ages have accumulated in the Campo Vaccino, may be regarded as one of those labours that the most courageous sagacity and the soundest erudition alone may dare to undertake. Many antiquaries have exercised their powers upon this delicate subject. We will cite Nardini, Féa, Gial, Nibby, Canina, and more recently, M. Becker and Henzen. In a previous volume of the *Builder* our readers have had particulars of their various theories.

To the efforts of the antiquaries must be joined those of artists: fine restorations, admirably conceived, have been proposed by the architects. While with so brave a hand Niebuhr rebuilt Roman history, this great critic dreamed over a restoration of the Forum. But the earth still hid in part the monuments which could have guided him. Admirer and friend of Niebuhr, and prompt to profit by a fortuitous circumstance, M. Bunsen has wished to conclude the sketch commenced by a bright intelligence. This remarkable attempt, the work of a mind at once large and enthusiastic, is summed up and made clear in carefully studied plans. Not only does it embrace the Forum of the republic, but also includes all those constructed by the emperors. Doubtless it is hypothetic on several points; but, as it is an authority on others, as it occupies an elevated rank in the "Annales," we ought to pause before it.

The Forum of the republic (*Forum vetus*), covered originally with trees and shops, developed itself in a valley closed by three hills, the Capitoline to the west, the Palatine in the south, and the Velia to the east. All the space comprised between the arch of Septimius Severus, placed at the foot of the Capitol and the temple of Faustina, situated at the base of the Velia, now crowned by the triumphal arch of Titus,—all this space, we repeat, was occupied by the Forum. Spacious enough at the west end, it narrows considerably in the east. The figure it takes on paper is that of a truncated pyramid, of which the base lies at the foot of the Capitol, and the summit at the foot of the Velia. This form was given to it by the divergence of two streets, which descended from the Velia, in the direction of the Capitol. They founded it on the north and south throughout its entire length. These two streets isolated the Roman square from the temples, the Basilica, and the Senate-hall, which surrounded it, and ranged themselves along their façade. The northern street was called the Via Sacra—*summa via Sacra*; it was by this street that the triumphant warriors entered the Capitol; the southern, *summa Velia*, which passed at the foot of the Palatine. Two transverse streets crossed the former, the one to the east marked the limits of the Forum, as high up as the temple of Faustina; the other to the west, and nearer to the Capitol, divided the Forum; this was the *Clivus Sacrus*. In the portion comprised between this street and the temple of Faustina, the Forum changed its name; it was called Comitium. There, in fact, were held the *comitia*.

This Comitium, which a great epigraphist, M. Henzen, places at the foot of the Capitol ("Annales," 1844),—why, we will not say here—this Comi-

tium constituted the most important part of the Republican Forum; or, to speak more correctly, it was a second Forum,—whereas the former, the Forum of the plebeians, was merely a market. The Comitium belonged to the patricians. It was for ages the political and religious sanctuary of the Roman people. The Forum of the plebeians had, doubtless, also its days of glory. The vine, the olive, and the fig-tree, which the Roman labourers had formerly planted—those happy symbols of Italian culture—in later times threw their broad shade over many a stormy discussion.

The Comitium, open on all sides, was raised upon a flight of steps, and was protected by an immense *valerium* from the effects of sun and rain. The tribunal of the pretor and the tribune of harangues characterized the Comitium. They here called to mind that justice and eloquence were the two grand supports of the Republic. A semicircular alcove, with the judge's seat at the far end, such was the tribunal. As to the tribune, its form recalled the ambo—[rather, suggested]—that peaceful pulpit whence, in Christian Basilicae, the Epistle and the Gospel were read to the people during the celebration of mass. The tribune, according to M. Bunsen, presented the appearance of a little temple, the façade of which should be ornamented with six rostra, or prows of vessels. It was surmounted by a platform, which was sufficiently capacious to allow the orator to walk a few steps either way upon it. It is at the extremity of the Comitium, on the border of the *Clivus Sacrus*, facing the Capitol, that the tribunal of harangues must be placed. The reason is obvious; from this spot the voice of the orator could be heard by the plebeians who were listening to him in the Forum.

One day, in the most flourishing epoch of its aristocracy, Rome saw a novel spectacle in this tribune. Instead of addressing himself to the senators, who from the neighbouring balcony of the *curia* joined in the debates, an orator, Licinius Crassus, wishing to carry a project of democratic law, turned towards the people assembled in the Forum, as if they alone had a right to pronounce an opinion on such a subject. This light cloud in the clear horizon presaged the coming storm, and ushered in those fearful convulsions which were ultimately to crush the Republic. Twenty years later, a man superior by his talent, but whom impetuosity carried beyond all limits, was debating in the tribune of the Comitium, holding a shuddering people in thrall beneath his words of fire. This was Caius Gracchus! In the later times of the civil wars, at the moment when the horror of this struggle between colossal factions was at its height, Anthony ordered the head and hands of Cicero to be fastened to the *rostra* of the tribune. Fortunately for the Comitium, the tribune had changed its position; in his attempts to annihilate republican forms, Cæsar, three months before his death, had caused it to be transported to the Forum, which he wished to restore.

On such questions as these, and a hundred other subjects, the publications of the Archaeological Institute shed a light: witty discussions by Letronne; polemics from Raoul-Rochette, fertile in suggestions; remarkable works by Messieurs Borghesi and Cavodon, Philippe Lebas and Rathgeber, Canina and Lepsius; continual investigations by the indefatigable Emile Braun,—who, wonderfully learned in comparative archaeology, was prematurely taken from the study he loved—are all recorded in the collection which we are recommending to the attention of all men of study.

They will also find therein the philosophic researches of a great philologist, M. Welcker, and those of Panofka brimful of Pausanias; daring but ingenious observations of a scholar not long since suddenly raised to archaeology; more than one proof of the happy perspicacity of Messrs. De Sazley and De Longperrier; and, lastly, the conscientious descriptions of M. de Witte. It is a matter of astonishment that this deep philology, this notable movement in these novel paths of criticism should not have penetrated more intimately into the enlightened portion of the French public. Those whom their vocation leads to æsthetics and archaeology could not possibly have more profitably reading. What sources of preparation for studies whose beauty and usefulness have been so often denied! Assuredly if ever ancient genius makes its extraordinary power apparent, it is in its art-ornaments; there, above all, shines forth its incomparable spontaneity; if it ever attains to a sublime perfection which has never been equalled, much less excelled, it is still in these we find it. There are faults in the Iliad; the Parthenon is exempt.

Which of the twain, Livy or the Coliseum, speaks to us the more eloquently of Roman greatness?

M. Vinet goes on to discourse briefly of the present situation of the sciences in question. Archaeology flourishes still in Italy. Long time past Messrs. Borghesi and Cavodon, and more recently M. Minervini, acquired for themselves well deserved celebrity in this class of study. As of old, it is still towards antiquity that the intellectual activity of Germany is turned. At the present time, professors and students, all or nearly all contributors to the "Annales," follow in the steps of Messrs. Welcker and Gerhard, whom thirty years of scientific research have failed to weary. To unite, as closely as may be done, philology and archaeology, such is their aim, and they are right, for if it be true that the complete spirit of antiquity can only be obtained by the study of its monuments, so in many instances these only tell their secrets to philologists. Of what has been done by ourselves the reviewer speaks thus:—

Can archaeology acclimatise itself in England? ( ) Up to the present time it reminds us of those exotic plants whose somewhat sickly branches can only expand themselves under the greatest care and trouble. Nevertheless I have confidence in the veteran ardour of Mr. Cockerell, in the profound knowledge of Mr. Birch, in the delicate tact of Mr. Newton, and in that swarm of accomplished travellers at the head of whom march Messrs. Leake, C. Fellows, Hamilton, and Falkener; and I have faith in the influence of a museum without a parallel.

Of some here mentioned by M. Vinet, Leake and Hamilton, we must now unfortunately speak in the past tense. Others might worthily be named in addition.

In France the actual state of archaeology is alarming. Far be from me the thought of daring to condemn the study of Romanesque and Gothic art; this study is too grand. It has given us, among many valuable treasures, the precious monographs of M. Vitet. But this very legitimate passion, this love for our national ruins, as was proved by the recent discussion on Alesia, these varied researches to which the Antiquarian Society of France gave so happy an impulse, have given birth to an error sufficiently grave, to make it necessary to endeavour to remove it. Misled by the rapid progress of Medieval archaeology, and by the numerous well-informed persons who conscientiously study the cathedrals and castles of their particular province, the general public, who concern themselves but little about these matters, have imagined that this scientific avocation has been made everywhere alike. Thus, according to them, the great field of archaeology employs an army of labourers. Alas! this is far from the truth! With the exception of one small group composed of members of the Institute, to whose worth in particular foreigners pay just homage; with the exception of some first-rate explorers, a few artists of a great school, and two or three unknown men of science, no one in the country of Montauban, even among literary men, seems to feel the least interest in figurative antiquity.

This is a remarkable fact, but its explanation is found in our modern styles of literature; that feverish activity, that desire for incessant production and appearance before the public, cannot brook long and often sterile studies of antiquity, and forced application to difficult research. Men fear this patient and painful labour, this alchemist-like working, unsupported by the encouragements of the outer world, which is removed thousands of leagues from such trains of thought. What an amount of reading before being able to write a single line! What immense preparatory study! Buildings, statues, vases, medals, inscriptions, the antiquary must see all, study all. In a science where so much is left to hypothesis, where induction plays so important a part, it is only by the careful comparison of monuments one with another, that their true significance can be divined. Now that their number has so wonderfully increased, the effort should indeed be proportionately great.

An eminent writer, M. Ernest Renan, a short time since mentioned the following portrait, drawn by M. le Maître; it is that of *Moderne Science*, whom the author of the "Soirées de Saint-Petersbourg" represents, "with his arms loaded with books and instruments of all sorts, pale with work and night-watches, dragging himself, panting, and stained with ink, along the path of truth, as he droops towards the earth his forehead furrowed with algebra." Archaeology I should have to personify with a magnifying-glass in her hand, gazing around on the sublime relics which are her delight. I would especially take care to seat her beneath a gilded canopy, and for this reason:—

In spite of the strictest union with the scholar, she always keeps a pleasant smile for the rich and well-read amateur. The sacrifices this science exacts are sometimes too costly to allow her always to content herself with the somewhat ragged mantle of philosophy. This, to my thinking, her weak point, has in many instances drawn her towards intelligent luxury, that of an enlightened aristocracy. To speak more correctly, the taste for art, the elegant culture of the mind, has attracted to her persons of high condition. One of the privileges of archaeology is to please great personages: the Count de Caylus, the Earl of Arundel, Lord Pembroke and Sir William Hamilton, M. de Choiseul, Gouffier, and Cardinal Albani, Baron de Stosch and the Duke de Blacas, Count Alexander de Laborde, whose scientific ardour lives again in his son, the Count de Clarac, who has given his fortune in exchange for the gratification of publishing a great work, and a hundred others, bear brilliant testimony in favour of the liberal inclinations of the higher classes. The Duke de Luynes, whose generous hand has so nobly supported the "Annales,"\* is the latest shoot of this noble race of connoisseurs, a race which dates from the Medicis. No one is ignorant of this fact: their palace at Florence was the cradle of archaeology.

An optimism, very honourable in its principles, will perhaps raise a doubt as to the justice of these observations, and will deny the decadence of a study which is much more important than is commonly believed,—a decadence only too real in our own country. If so, the reply is easy: in a town containing a million souls, commands M. Vitet, in the midst of that intellectual sun whose rays spread throughout the entire world, a collection considered by the whole of Europe as the most learned organ of archaeology, has not twenty subscribers.

#### ACCIDENTS IN MINES AND SEA-BOUND VESSELS.

DURING the last half-century many remarkable changes have been made. While science has wonderfully advanced, and steam and mechanical aids have been used to give increased power, safety, and facility to the manufacture and transit of various goods and products, it is a lamentable consideration that during this period wholesale loss of life has been constantly taking place. In considering this important subject, it should not be forgotten that not only in coal mines, but in our great emigrant and other ships, and also in our manufactories, the number of persons engaged has vastly increased, so that large numbers are exposed to the risk of a single calamity.

Notwithstanding, as regards our shipping, that lighthouses have been raised in places of danger, charts and other matters of this description have been improved and corrected, while the intelligence of the commanders, officers, and crews of both steam and sailing vessels has been much improved, yet from time to time we read of the tragedy of several hundreds of our fellow-creatures being suddenly buried in the sea, and but few left to give even an imperfect account of the catastrophe.

While admitting the sudden and terrible dangers of the sea, it is certain that a great deal might be done to lessen danger in this direction. In formidable parts of our coast the harbours of refuge now in progress will save life. More, however, will be wanted. Hundreds of lives are lost by the imperfect machinery by which boats in the time of danger are lowered from ships. Iron ships need consideration as regards their arrangement and strength for the support of machinery. The formation of an institute of ship-builders may be the means of causing good; and, moreover, there is still a rare field open for the advancement of the education of them "that go down to the sea in ships, and occupy their business in great waters;" and also in the nice adjustment and more general use of those instruments on which the safety of crews, passengers, and valuable merchandise depends.

In coal mines, as it seems to us—and we say so both from personal observation and after hearing the opinions of both managers of mines and workmen in them—with far greater certainty could even a large per-centage of the lives of

\* In 1856, to make up for the delay in the continued publication of the Roman direction, the members of the French section updated themselves provisionally to publish new "Annales" until the Institute at Rome should be in a position to continue its work. Two volumes only were produced—1856 and 1857. The editing was confided to a committee composed of Messrs. de Quincey, president; the Duke de Luynes, vice president; F. Lajard, Ch. Lenormant, Letronne, Raoul Rochette, and J. de Witte.

those engaged he saved than of those employed at sea. In considering these matters, it is worth while to look back. In former times, in the best coal districts, scarcely any care was taken touching ventilation. About the year 1816 (forty-four years ago) a writer of good authority says, the miners were afflicted with various disorders, owing to their breathing the heavy, unwholesome air which lodged in some parts of the pits; and it was a common occurrence to find numbers of workmen in a sitting posture, their heads resting on their knees, seemingly asleep. On attempting to rouse those seemingly sleeping ones, they were generally found fixed in that position in the rigid stiffness of death. This did not always occur in the mines, but the poison there inhaled into the lungs acted frequently on their arrival at the bank. In the Forest of Dean, not fifteen years ago, the surgeon of a large district, whose duty it was to attend to the health of miners, told the writer (and this was confirmed by many of the men) that the most common illness was caused by inhaling this description of gas—the pitmen called it the "blind,"—which lodged in the stomach, causing the most violent pain, that could with difficulty be removed by strong purgatives and other means. In that part there are many small collieries carried forward by means of a small association of miners, with but little capital, who, by being horn within the margin of the forest, have a right to commence works of this description. In many of these instances the arrangements are of the most primitive description; the machinery is imperfect and dangerous, and the ventilation still more so.

Formerly, even in the large collieries of Northumberland and Durham, there was no registration of the extent of the coal which had been excavated, and it was by no means rare to have lawsuits and other disputes, arising from coalmen interfering, sometimes from ignorance, with the royalty of others. In this careless manner of working, many lives were lost by cutting into some exhausted pit filled with water, which rushed forth, causing death and destruction with it. On one occasion the water, owing to some such cause, came suddenly into the working of a pit near Newcastle-upon-Tyne. There were upwards of one hundred men and many horses employed at the time. Machinery was erected for the purpose of clearing the pit of water; but the process was so slow, that all chance of saving life was given up. It was, however, suggested by many that, by the opening of a shaft which had been closed, but which communicated with a higher portion of the coal seam, the men might be reached, and perhaps fortunately saved. When the pit was cleared, it was found that, if what was suggested had been carried into effect, lives might have been saved. The men and boys had fled to the high parts just mentioned,—there they had subsisted by various means, huddling them carefully, and keeping a record of the time of their terrible imprisonment; and it is supposed that some of those poor fellows had existed for three weeks. Not one, however, was found alive to report the sad tale.

Formerly baskets formed of very strong twigs were used for the purposes both of raising the coal and lifting and lowering the men and boys: hundreds of accidents have happened by the upsetting of these baskets called "corves;" now, however, strong square boxes are passed in grooves from top to bottom with much greater safety.

Steam-engines of vast power are employed, which in a measure prevent danger from water, and the system of mine-registration will prevent many of the former accidents. As is the case at sea, both the managers of mines and those who work in them have advanced in intelligence. The "Davy lamp" has been introduced with good effect, notwithstanding that sudden and lamentable accidents are of frequent occurrence. We believe that the safe and proper ventilation of a coal mine, in nine cases out of ten, is quite a matter of skill and cost, and fear it must be admitted that when the last fatal accident occurred, which struck with sudden death eighty human beings,—changing them in a few instants into charred and shapeless masses, so that some could only be recognized by the buttons on some little article of clothing which might be left upon them—it had been distinct warning for some time before: even on the very morning of the explosion, several men refused to go to work, and by that means saved their lives. In the case of railway accidents the companies are made to pay large sums for neglect, or deficiency of machinery which may be the cause of damage; and if the same arrangements were made in the case of accidents such as that we have alluded to, that

lives and limbs should be paid for so as to afford the means of subsistence to the widows and orphans, such appalling accidents would be of very rare occurrence; improved methods of ventilation would be introduced, and care taken not to neglect the warnings which are generally given of such calamities; in some cases they are caused by the carelessness, ignorance, or foolhardiness of the men. One such act endangers many lives, and such heedlessness should be punished as a crime. As matters now stand those belonging to the miners who are left behind, are objects of public sympathy—and which it is hoped will be shown in a substantial shape, for it should be remembered that while we are enjoying our cheerful fires at home, industrious workers are delving in darkness and danger. Moreover, when such accidents occur, no Deal boatmen more bravely venture on the stormy sea for the purpose of saving life, than do the pitmen enter the burning shaft and stifling working, to endeavour to save their fellows.

**BRUSSELS PALACE OF JUSTICE COMPETITION.**

We hear from the Legation that the Belgian Government has postponed till the 1st of October next the day for the reception of the designs for a new Palace of Justice at Brussels.

**OSWESTRY CEMETERY COMPETITION.**

We are informed that the first premium has been awarded to Mr. Hans F. Price, architect, of Weston-super-Mare.

**HEREFORD IMPROVEMENTS COMPETITION.**

We understand that the Town Council Improvement Committee have received about a hundred designs from architects in various parts of the country, for a clock tower in the High-square, and a clock turret over the market entrance in the High-town. The Committee have made arrangements for the public exhibition of the designs, in the Assembly-room of the Shire-hall.

**THE ART-UNION OF LONDON COMPETITIONS.**

The exhibition by the Art-Union of London, which will open on Monday, will be more than usually interesting, inasmuch as it will include, besides the works of art selected by the prizeholders, the outlines illustrative of "The Idylls of the King," sent in reply to the offered premiums of the association, and the statuettes illustrative of English history, submitted under the same circumstances. The council have not made a decision in either case, preferring to submit the designs first to public criticism. Of the outlines there are forty-two or forty-three sets, each consisting of about a dozen drawings,—nearly 500 therefore in all.

The statuettes are fewer in number, only eleven having been sent in. These represent "Alfred in the Danish Camp" (a group of three figures); "Edward and Eleanor," "The First Prince of Wales" (King, Queen, and Prince); a second "Alfred and the Danes" (two figures); "Queen Eleanor and Fair Rosamond;" Lord Macaulay (a seated figure); British Children ("Non Angli sed Angeli"); "Martyrdom of Margaret Wilson;" "Lady Godiva," and two statuettes of Oliver Cromwell. The choice will lie amongst the three or four first-named.

We have already given a list of the pictures and sculpture purchased by the prizeholders.

**BUILDERS' AND CONTRACTORS' HOISTS.**

A GREAT saving of human labour is effected by a new form of hoist introduced for the use of builders in this metropolis. Hod-carrying up long ladders is a depressing occupation, though an elevating movement. The mechanical hoist should, therefore, be encouraged throughout the metropolis, and in many provincial towns we think that even the human labour of the mechanical hoist may be lessened by the use of water as a balance-weight, making the huge steam-engines of our water-works lift bricks, mortar, stone, cement, iron, timber, slates, or any other material up to the full elevation of the effective head. The working cost of pumping each 800,000 lbs. of water 100 feet high is only 1s. (as see Mr. Quick's published returns). If we consider that a brick weighs 8 lbs., this is equal to 100,000 bricks,

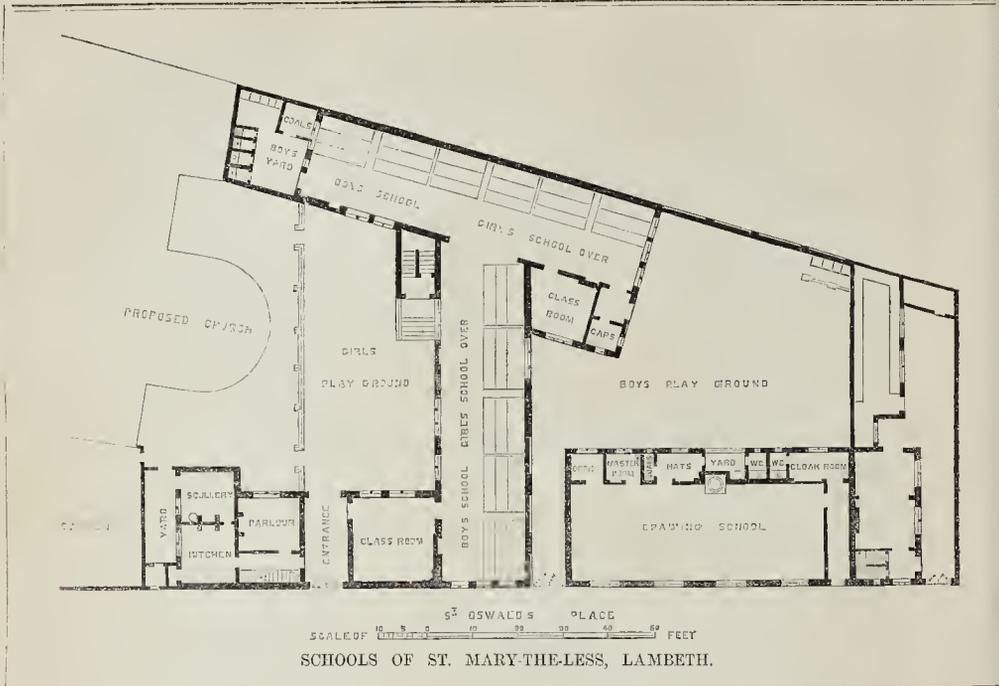

lifted 100 feet. The companies cannot sell water at the price indicated; but supposing we say 6d. per 1,000 gallons (water, in bulk, is sold at 3d. per 1,000 gallons to railway companies, &c.), then 8,000 gallons of water, charged 6d. per 1,000 gallons, will, at a cost of 4s, lift 1,000 bricks 100 feet high, by means of a water-balance hoist: at 3d. per 1,000 gallons, the cost will only be 2s. Some of the water may be used for lime mortar, and for other purposes. We give the idea, and leave the application to the users of power.

**THAMES EMBANKMENT COMMITTEE.**

THE Thames Embankment Committee have presented their report, and it has been printed. The *Observer* says of it:—"There is some reason to hope that, after all, something will be done towards effecting that most desirable object, the best means of providing for the increasing traffic of the metropolis, by the embankment of the Thames. The committee have carefully considered the several plans which have been brought before them with a view to the embankment of the Thames, and they have received much valuable evidence on the subject. In connection with the matters referred to them they have considered it necessary to inquire into the mode proposed for constructing the low-level sewer about to be made by the Metropolitan Board of Works, and they found that if that sewer were carried under the Strand and Fleet-street it would cause a vast amount of injury to the trade and traffic of the district, which it is scarcely possible to estimate. The importance of providing for the construction of the low-level sewer in connection with the embankment has been recognised by the various engineers whose plans have been submitted to them; and provision is made in all these plans for constructing the low-level sewer along the foreshore of the river and within the embankment. The committee have had many plans before them, out of which they have agreed to select the three presented by Messrs. Bazalgette, Bidder, and Fowler, civil engineers. All of these comprise the plan of including in the embankment the low-level sewer on the north side of the Thames, the embankment to extend from Westminster to Queenhithe—that is, from Westminster-bridge to London-bridge. All the plans comprise a railway and a roadway—in two of them on the same level, and in the third on different levels. The wharfs are not to be interfered with, but, on the contrary, to be improved by the construction of docks and other facilities within the embankment. The committee has rejected the proposition to attempt to make it a public company, and recommended that, as the Legislature have already intrusted the main drainage of the metropolis to the Metropolitan Board of Works, by the 21st & 22nd Victoria, cap. 104, sec. 11, and armed them with powers to deal with the foreshore of the river in connection therewith, the construction of the embankment should also be intrusted to them. They recommend that, in aid of the funds already voted for the sewer, the coal and wine duties, which are to expire in 1861, should be renewed for a limited time, and the proceeds be applied to the expenses of the embankment. The whole expenses of the embankment, including sewers, &c., are estimated at 1,000,000. One-fourth of this at least would be the cost of the length of sewer to be made. Indeed, it would be much more if it ran under Fleet-street and the Strand. The rest is to be raised by the renewal of the 8d. and the 1d. coal-tax, and the wine duty of 4d., from which an annual sum of 100,000, may be expected, and the committee recommend that the cost of the embankment should be a first charge upon these duties.

From the simplicity of the proposition, and the manifest—indeed, the pressing—necessity of the scheme, we are glad to see a prospect of its being carried out at length. The money can be easily raised in the manner and in the proportions proposed."

**BUILDERS' DINNERS.**—Sir: The workmen in the employ of Mr. George Smith, of Gillingham-street, Finsbury, held their seventh annual dinner on Saturday last, July 28, at the Crystal Palace. The men, 220 in number, sat down in the south wing dining room; Mr. Spencer Smith presided, supported on the right by his father, Mr. George Smith, and on the left by Mr. Whices, the shop-foreman. The usual loyal and other toasts were drunk, and the greatest conviviality and good feeling prevailed. Several tradesmen connected with the firm attended. Your notice of the above will oblige,—J. C.

## SCHOOLS IN VAUXHALL.

DISTRICT OF ST. MARY-THE-LESS, LAMBETH.

THESE schools (which we here illustrate) are being created for the benefit of a large poor district parish in Lambeth, lying east of Vauxhall Bridge, and bordering on the river: it forms part of the Manor of Kennington, and belongs to the Duchy of Cornwall. Nine years since the two existing church school-rooms were closed from want of funds to keep them open, and their broken windows and desolate appearance presented a complete picture of poverty and decay. The late incumbent re-opened these schools, and they were speedily filled with children. Since he left the parish, three rooms (one of them had been previously used as a Mormonite meeting-house), have been hired or borrowed, and all are now so crammed with children, as to be unhealthy in hot weather. It is to remedy this evil that the new schools are being created. The district is one of the very poorest in the metropolis. Its present population is 15,000, of whom the collector says not ninety are assessed for income-tax, and of this small number more than a fourth are publicans. Vauxhall Gardens, which are within the limits of the district, are now being built over, so that in a short time the population will be most materially increased.

The drawing-school was opened nearly six years since by the present incumbent, shortly after his appointment to the parish. It was designed for the benefit of the many artisans engaged in the building trades, and as engineers or potters, by whom the neighbourhood is peopled. It has been pre-eminently successful in accomplishing its design, and is probably the only Art-School in the metropolis which draws the great majority of its pupils from the ranks of the artisans. This school has more than 150 students on its books, and an average attendance of considerably more than 100. For the last three years it has been quite self-supporting. The students assemble in the parochial school-rooms, both of which have now been opened for them, but the inconvenience and many practical evils which arise from having to use rooms that have been crowded all day with children are so great, that it has been felt for some time that the school cannot continue in its present high state of efficiency, or retain the more advanced pupils which itself has trained, unless a separate building can be provided for its accommodation. The Prince of Wales laid the first stone of such a building on the 27th of June, as we stated at the time, but several hundred pounds are still needed for its completion. It will be scarcely creditable to the many wealthy employers

of labour in Lambeth and Southwark, where men enjoy the benefits of this school, and whose labour is rendered more valuable by the instruction they receive in it, if such a work is permitted to languish for want of the funds which are necessary for its speedy completion. The incumbent of the district, the Rev. R. Gregory, St. Mary's Parsonage, Lambeth, is the treasurer of the fund.

The schools are being built of stock bricks, both inside and out, relieved by red brick bands and arches over windows and doors. Bath-stone bands are also introduced, and all window-heads are in Bath stone. The columns, forming mullions to most of the windows, stand clear of the sashes. There are four large school-rooms; two for the boys, on the upper floor; and two for the girls, on the ground-floor; and there are also four class-rooms. The whole affords accommodation for full 700 children. A playground is provided, as shown on the plan, for the boys, and one also for the girls.

The contract for the parochial schools amounts to 3,265*l*. The builder is Messrs. B. Colls. The tender for the drawing school is 500*l*.

The whole is being erected from the designs and under the superintendence of Mr. John L. Pearson, architect.

## ANCIENT AND MODERN PENMANSHIP.

GREAT is the difference between the clerly penmanship in the body of ancient deeds and the rough, rude, and often illegible signs of those famous men of the sword whose functions in the Middle Ages were so much in demand; and it may be remarked that in those days when the circumstance of having a pen in hand must have been a remarkable event in the lives of the great men of the community, the penmanship of the few learned clerks was noticeable for its beauty, and also for its correspondence, to some extent, with the contemporary style of architecture.

The effect of the introduction of Italian architecture may be traced both in manuscripts and books. Many of the specimens of the handwriting of Queen Elizabeth are singularly beautiful, and show much variety. There is the small Italian hand, which was used when writing, as princess, to her dear cousin and king, Edward VI., and on other complimentary occasions; a more vigorous style for state purposes; and a very large hand, which combined the Gothic with the Italian, which "Good Queen Bess" used when she threatened to unroof a bishop.

Looking at ancient documents of a time when being obliged to resort to the use of a cross for a

signature was not considered disgraceful, even to the nobility, it is curious to notice the great variety of the crosses, and the different degrees of artistic skill which are shown in them. As the practice of writing became more general, the use of the cross became less so; and, although many could not write their entire name, they managed to sign with a letter, or a peculiar form or flourish which had some resemblance to one.

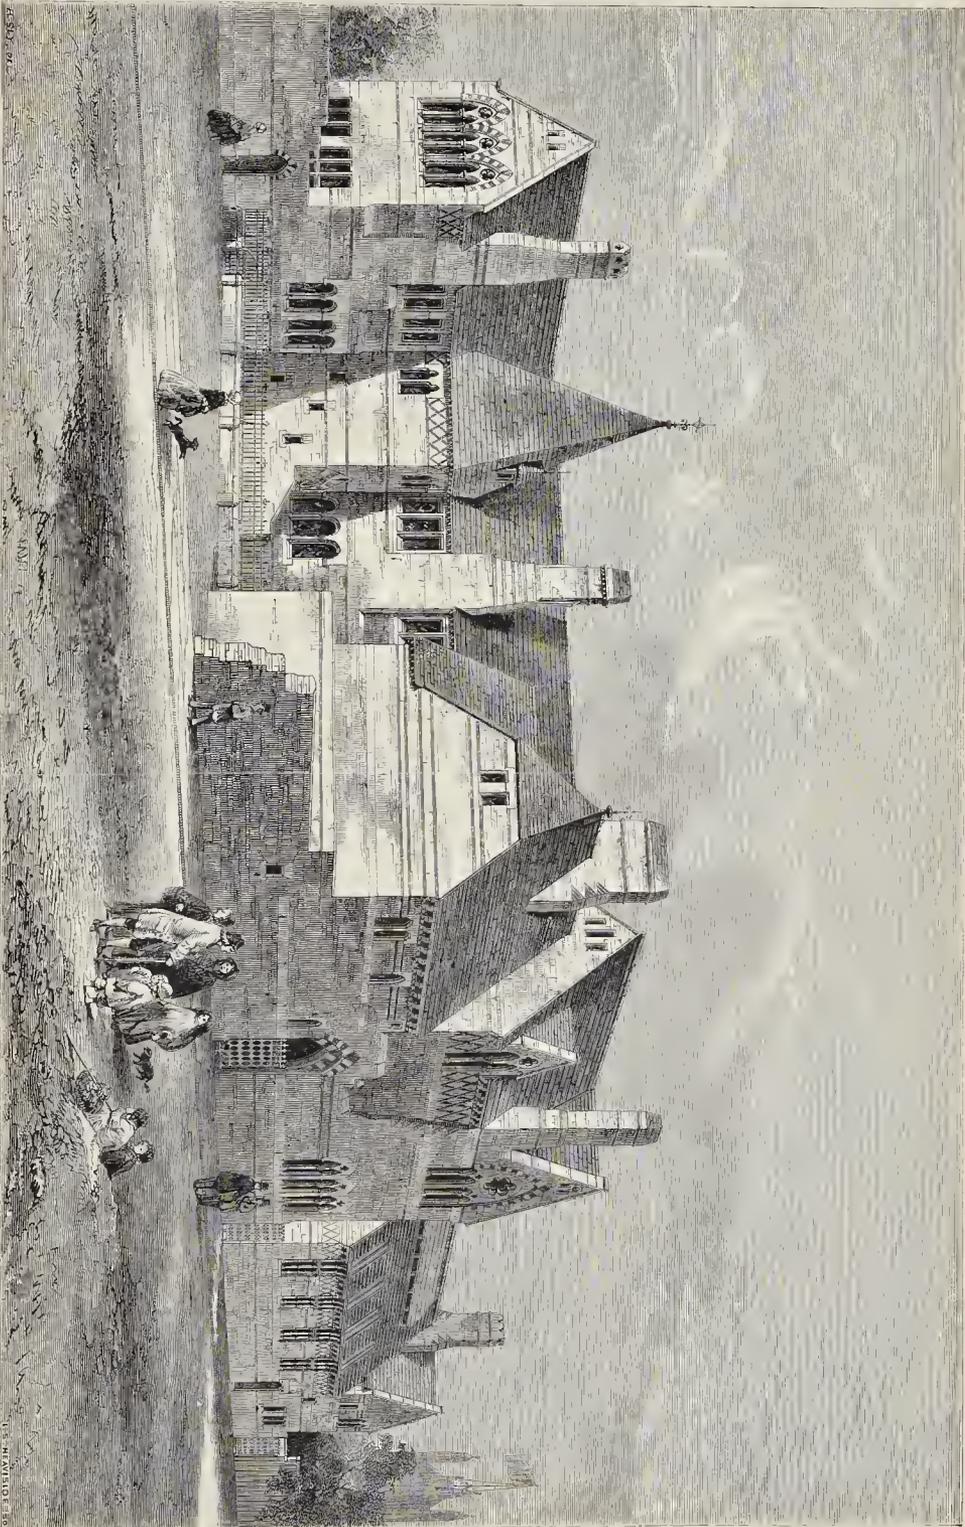

In a collection of autographs of the relatives of Shakspeare, published by Mr. Halliwell, a great variety is shown. Agnes Arden's signature resembles the letter U, such as would be made by a schoolboy who had just got out of his "pot-hooks." John Shakspeare signs with sword-like crosses, so firmly and vigorously marked, that one can fancy, if opportunities had offered, that this hand might have been cultivated into that of the skilled draughtsman. Others of these signs are crosses surmounted by circles, and some show imperfect attempts at regular signatures.

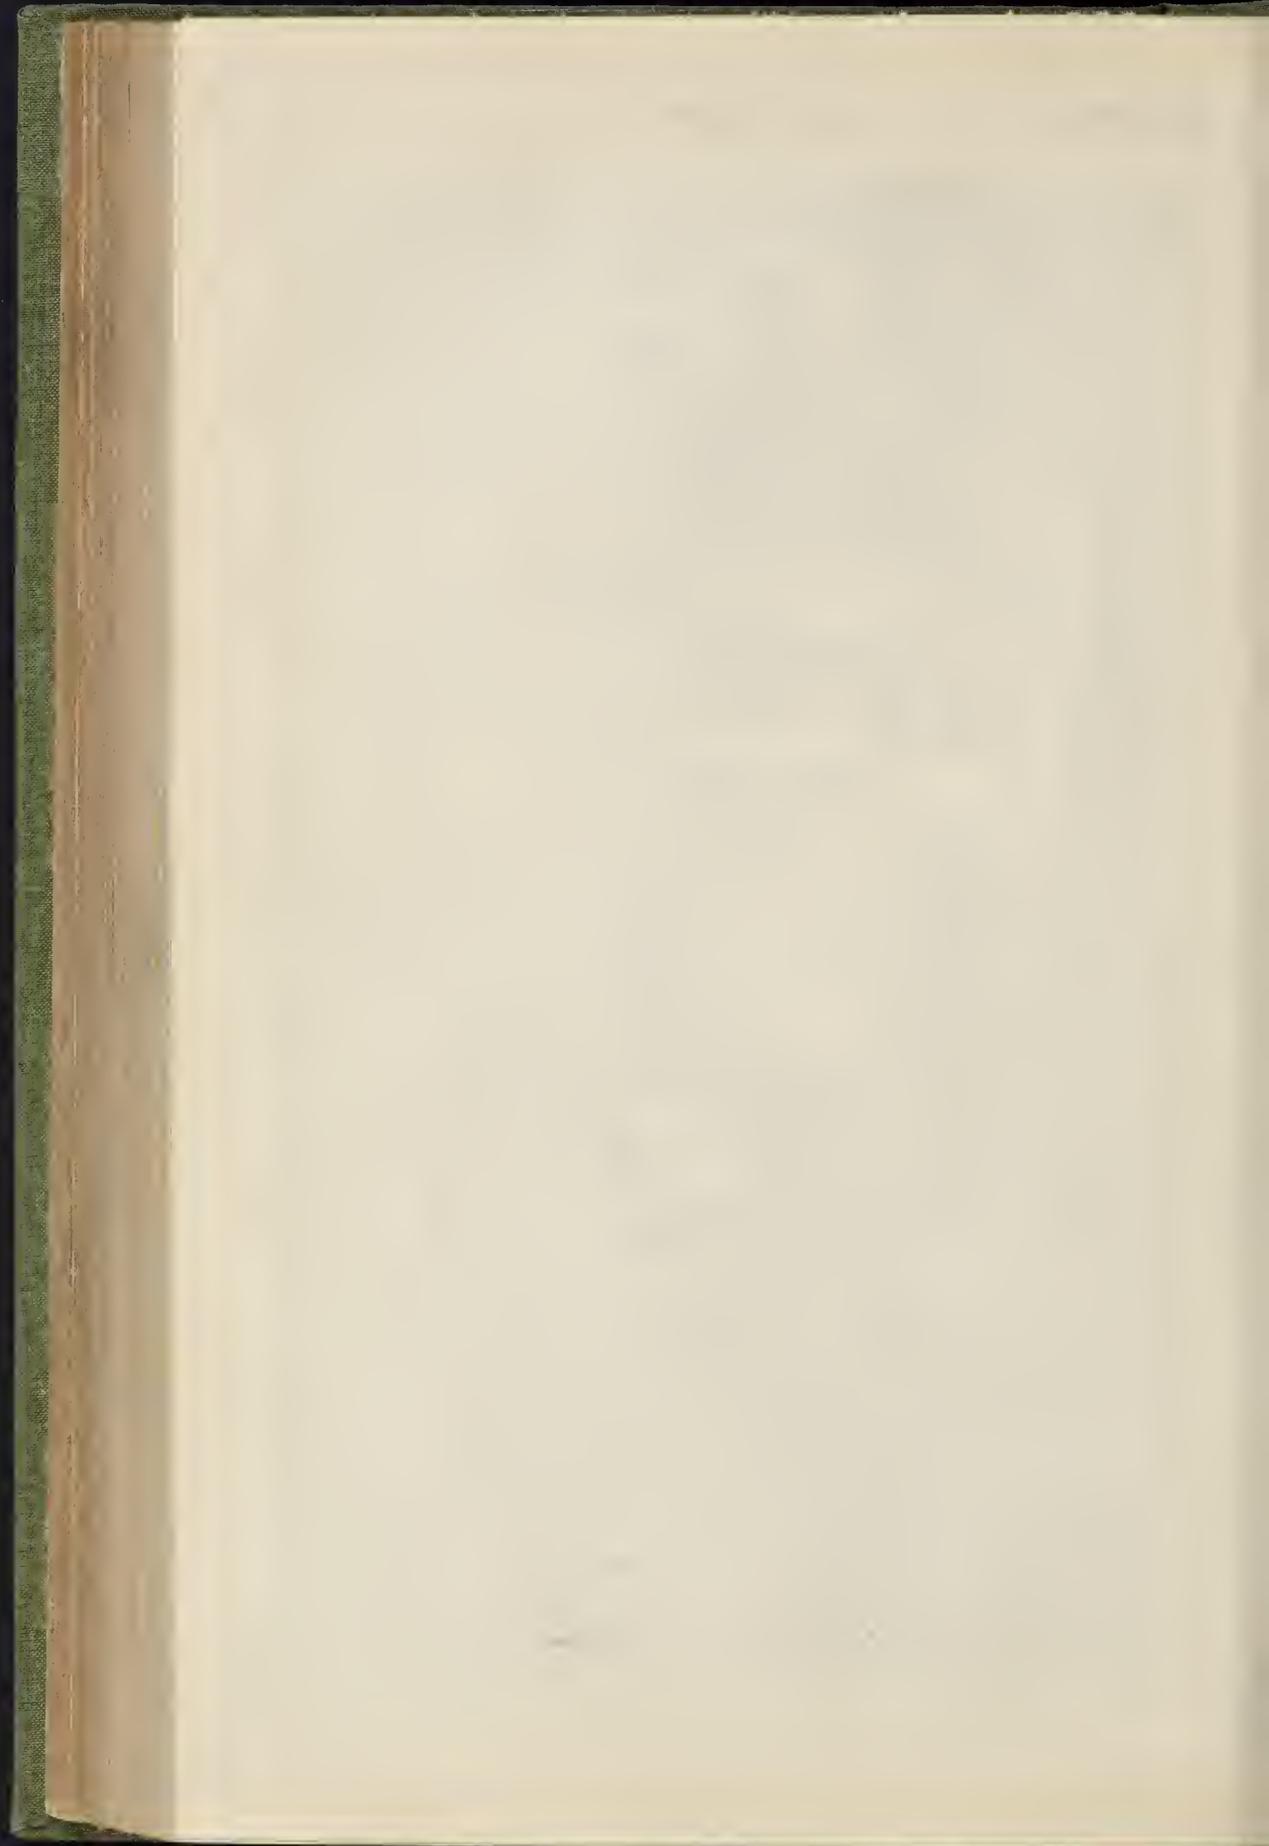

Remembering the systems of book-keeping and accounts which are now required for successful trade, it is difficult to understand how business, to any extent, could then have been carried on. Tallies kept by notched sticks, with certain hieroglyphics for the different goods, were much used instead of books; and no doubt those instruments were produced by many of the traders of London and elsewhere, with as much gravity as a regular bill at the present day.\*

In the reign of George III., when education had become more general, the crosses of those who could not write, lost the distinction and artistic character of older times, and the large bold round hand corresponds in style with the buildings and furniture then in use. This writing, although without much beauty, has, notwithstanding, the merit of distinctness. In these railway times, with the exception of book-keepers in banks, and clerks in merchants' offices, few seem to have time to trim their letters. Few artists write a good hand. Physicians' prescriptions are often as difficult to decipher as ancient hieroglyphics; and it must be confessed that writers for the press are not generally remarkable for either the distinctness or beauty of their manuscript. As regards artists, the practice of handling the brush and pencil is not favourable to graceful penmanship; and in respect of the literary profession, it is generally difficult for the pen to keep pace with the thoughts, to say nothing of the fact, that time often presses.

\* At the beginning of the present century, in the case of a disputed account, in a town in the north of England, the door on which the account had been kept with chalk, was produced in court.

SCHOOLS OF ST. MARY-THE-LESS, LAMBETH.—MR JOHN L. PEARSON, ARCHITECT.

**THE GOLDEN LANE BURIAL GROUND.**

We have before now referred to this place since the closing of the ground by the Parliamentary enactment, remarking upon the removal of the grave-stones and other memorials of the dead: by chance we recently paid another visit, and strange was the scene of dilapidation and neglect which was witnessed. The stuccoed chapel, of Strawberry-hill Gothic design, has fallen into outward decay. A large sign-board announces that part of the interior has been converted into a manufactory. A large part of this building seems to have been a casing of plastered brick-work, raised for show. This is now plainly visible. Above the porch is a board, similar to those which announce that "building sites are for sale." The trees are in ill condition, and serve in many instances as posts for clothes-lines: the "washing" flutters in the air: the ground is broken, and covered with various matters: squalid-looking children, who have by some means obtained admission, are playing at various games: some little gambling goes on,—and part of the ground seems to be a depository or standing-place for carts; near which, is a large boiler of a steam-engine. A suspicious-looking hoarding of wood has been drawn across part of the ground, which contains a large portion from the general view. Words would, however, fail to convey an idea of the unpleasant appearance of the place. All signs of human burial have vanished, and yet how large a number of bodies have been here deposited. Extraordinary sums have been paid for the use of this land in trust, for a purpose which has not been fairly carried out. On one side of the entrance-gate is a painted board, which is so much defaced with handbills of a miscellaneous description, that it is with difficulty that the following words can be deciphered: "Two tiers of large dry vaults are to be let." Have there once been human remains lodged here? and if so, where are they now?

Seeing a stranger noticing the place, several persons who were accidentally passing,—some of whom had relations buried here,—remarked upon the shameful desecration. One woman said that her husband, son, and other relations lie there, or rather perhaps did, all traces of those marks by which the site of the interments could be identified having been removed. Another complained of the hardship, and said that the poor had natural feelings as well as others.

Can it be intended to build upon this spot, which is so thickly crowded with the dead? As we have before said, such a transaction would be a gross act of injustice. Many graves have been paid for, and should be held as sacred, as any lauded or household property. Many hundreds of persons have also paid sums of money for the consideration that the remains of their relations should be allowed to rest in decency.

In a crowded neighbourhood like this, where other evil conditions exist, this burial-ground should be carefully looked after by both the Government and parish authorities; for, as has been shown in some other instances, the law in its present state is sufficient to prevent, to a great extent, the dismantling of graveyards,—at any rate, the wholesale opening of graves for building purposes, even if they are the property of trustees or private companies.

**THE BELL FOUNDRY OF GLOUCESTER.**

In the course of a paper on this subject, read at the Congress of the Archaeological Institute, the Rev. W. C. Lukis said, the Gloucester bell-foundry had not been surpassed by any others even if it were not unrivalled in England. It ranks at least in the first-class with that of Salisbury, which was established as early as the reign of Henry III., about the year 1260, while a foundry existed at Gloucester in the reign of Edward II., and was conducted by a master founder, whose reputation spread far and wide. "Master John of Gloucester" was so renowned a founder that the monks of Ely sent for him during the reign of Edward III., in the year 1346, and he cast four bells for them, the largest weighing 7,000 lbs., bringing copper, tin, clay, and all other necessary materials for the work. "How vast the undertaking must have been," said the lecturer, "when some eight or nine tons of metal, at least, were conveyed a long distance, over bad roads, to that isle, which at that time must have been very difficult of access! Must we not feel and own that even with all our grand ideas about Big-Bens, and all the appliances of modern days, we have to sit at the feet of such a skilled master as John of Gloucester?"

Master John's successor in the foundry is supposed, from a seal found in the Thames some years since, to have been "Sandre of Gloucester," and Mr. Lukis says that if Master John and Sandre of Gloucester were not one and the same person, then he has no doubt that the second bell in the peal now in the cathedral tower was cast by him. The next bell-founder known was one William Henshaw, about whom Mr. Lukis was jocose. "The bell-founder has made his exit, and left two wives behind him to represent him. If one wife is 'a better half' two wives must make more than one husband, and consequently in Alys and Agnes, wives of William Henshaw, whose portraits in brass may be seen in St. Michael's Church, we have rather more than campanologists looked for—but not more than their gallantry and good taste would find fault with or despise. If they have missed the founders, at all events they may see his *Belles*." Mr. Lukis thinks the fifth and sixth bells in the cathedral, and also the small curfew bell at St. Nicholas Church, were probably cast by Henshaw, who lived in the house now occupied by Mr. Ferry, Eastgate-street, and his arms still remain in painted glass. The next bell-founder known was Abraham Rudhall, whose family carried on the bell-foundry from 1626 to 1828, when the foundry ceased, and Mr. Mears took up the Gloucester business.

**DESTRUCTION OF HOUSES BY LIGHTNING IN PIMLICO.**

In Sutherland-street, Pimlico, near the Wooden Bridge, two houses—four stories high—were struck by lightning on Saturday night, about six o'clock, and although at the time it was not anticipated any serious damage had resulted, subsequent events established the fact that the electric force had shaken the houses to the foundation. About eleven o'clock the two houses had fallen into a heap of ruins. The front walls had fallen inwards, dragging with them the back walls, and the whole presented a complete mass of ruins. A third house adjoining is left standing, but is injured.

Hoop iron bond was used throughout. Could this have had anything to do with the disaster?

**PROVINCIAL NEWS.**

**Bishop Storrford.**—The first stone of the intended new residence for the head master of the High School here has been laid by Mrs. Archer Houlton, the wife of the president. The estimated cost of the ground, which contains upwards of five acres, and of the house and offices necessary for the accommodation of sixty boys as boarders, is about 3,500*l*. As large a part of the sum as possible must be raised by subscription, and the remainder will be provided by gentlemen who have consented to become personally responsible for the whole amount required. The head master will pay, as rent, interest for the amount not raised by subscription, also an annual sum, to be agreed upon, to form a sinking fund. The subscription list appears to have approached 1,000*l*. Mr. Murray is the architect.

**Ashtown.**—On the 19th ult., the designs for the Market Hall and Assembly Rooms were laid before the shareholders. After inspecting them, a design in the Italian style was selected. The ground plan, says the *Derbyshire Advertiser*, will form accommodation for butter dealers, greengrocers, and other parties frequenting the market, with a small corn exchange. The second-floor contains a concert-room, 65 feet by 27 feet, with platform, and cloak and ante rooms. The front view of the building, which is of stone, presents a centre door, and five windows with balcony. The architect is Mr. Wilson. The tenders have been advertised for.

**Bristol.**—The foundation-stone of a new work-house for the Bristol Union was laid at Stapleton on 26th ult. The arrangements of the new buildings have, in a great measure, been regulated, as far as their position is concerned, by the existing buildings, which are to remain and be incorporated with the new. The present range of kitchen buildings, for instance, is converted in the new plan into apartments for the master and matron, store-rooms, officers' kitchens, bread-rooms, &c. The general plan of the structure may be thus described:—"We have first what are termed the 'entrance buildings,' which stand close to the road, and contain the entrance gateway, with the turret above, the porters' rooms, store-rooms, female receiving and probationary wards, bath-rooms, and vagrants' wards on one side; and on the other a committee and ante room, and the various receiving and probationary wards, &c., for

the men. Passing from this building, along a railed-off road, which divides the old men's and women's airing-yards, we reach the "main building, in which the greater portion of the inmates are lodged, and which contains the officers' as well as the culinary apartments, and store-rooms. On entering this building, we have a passage running directly through it, branching off right and left, and dividing the men's from the women's portion of the house. The day-rooms and dormitories of the aged and infirm of both sexes are placed facing the south; the floors of their rooms are boarded; they have separate staircases, lavatories, and comfortable and well warmed and ventilated apartments. The able-bodied paupers are placed on the north, east, and west sides of the house—every class being separate, and the wards, as well as the airing-yards, being inclosed, those of either sex of bad character by walls 10 feet high. Their wash-houses and workrooms are also separate. A large room is provided on the side of the women's wards for the nursery and attendants. The female infirmaries are also located on this side. At the end of the central passage before alluded to is the dining-hall, about 41 feet by 75 feet. Adjoining this are the kitchen and scullery, and other offices, and immediately behind it the engineer's room, heating apparatus, boiler-room, coals, &c. The workshops and washing and drying rooms are placed at the northern extremity of the yards, of which they form the boundary. The infirmary stands at the north-west corner of the ground, and is approached by a road of its own, after leaving the common entrance. This building is divided, as are all the others, into two distinct portions, appropriated for male and female patients; the surgical cases being placed on the ground floor, and the medical and sick on the upper floor. Baths, lavatories, water-closets, rooms for surgeons, nurses, &c., are included in this building, and care has been taken to insure good ventilation. In the whole of the buildings, accommodation is afforded for over a thousand inmates, exclusive of the present children's wing. The general plan of this workhouse bears some resemblance to similar buildings, erected by the same architects at Norwich and Lynn, in Norfolk. The elevations are designed in a plain and simple style. The upper floors of the house are almost wholly appropriated for dormitories. It is intended to warm the building by the same apparatus which will perform the cooking. The contract was taken by Mr. Thomas Brooks, of Bristol, for a trifling under 16,000*l*; and the architects are Messrs. Medland and Maberly, of London and Gloucester.

**Manchester.**—Mr. A. Waterhouse, architect, has prepared plans for various alterations and improvements at the Concert Hall. A new entrance, says the *Courier*, will be made in Lower Mosley-street, which will obviate the crushing that takes place at the Peter-street entrance. There will be a new entrance for performers in Concert-buildings. An extension of 3 yards will be made to the hall near the Casino, to furnish a library, a new staircase for the performers, and a committee-room, in place of the present one, which will be taken to make the new entrance for subscribers. The orchestra is to be remodelled, and extended to nearly the width of the hall. The performers will have a central entrance to the platform and orchestra, but there will still be a door at the back, to facilitate leaving. The panelled ceiling will be continued over the orchestra, with an additional sunlight. The interior will be redecorated. There was a proposal made to rebuild the front.—The city magistrates have notice to quit their present court-house in Brown-street, on the 29th September next, the whole of the building being required for the post-office. As a temporary court-house, a large building, belonging to Mr. Falkner, in Bridge-street, formerly a draper's shop, has been leased, and, under the direction of Mr. Lynde, the city surveyor, Messrs. Travis & Manganal, the architects, will draw plans to turn it into a court-house with all possible speed. The building comprises an area of 750 square yards, with three stories and a basement. The facade of the building will be plain Italian in style, the shop-fronts being removed, and the upper part remaining as at present. It is expected that a court-house and a town or city hall will be built at a future time.

**Arundel.**—The school now being erected by the Duke of Norfolk at Arundel, from the design of the architects of his grace, Messrs. Hadfield & Goldie, is rapidly progressing, and will be roofed shortly. It is of brick, with facings of Yorkshire stone, and forms part of a pile of building intended hereafter to supply fully the religious requirements of the Roman Catholics of the town and

neighbourhood. Mr. Bishby, of Littlehampton, is the contractor.—The extensive and important works at the castle are beginning to develop their grand proportions. We hope to give a more detailed account hereafter of the chapel, gateway, and staircase, which form the principal features of Messrs. Hasleld & Galdie's design. Mr. A. Pearson is the clerk of the works.

**Kilno.**—The new building for the Bank of Scotland is now all but completed, and the new bank office has been opened for business. The building stands on the site occupied by the old bank, and is in the Italian style of architecture. The front to the Wood Market is occupied by the bank itself, and the agent's house enters from Abbey-row. There is little ornamentation on the exterior of the building. It is plain, and substantial; but forms a prominent feature in the street in which it is situated. The bank is entered through a large porch, and the main building is thrown back a few feet from the line of the street. A railing traverses the entire length of the building, and at the entrance to the porch are placed two large lamps. The architect was Mr. John Burnet, of Glasgow; and Mr. Robertson the builder.

**Dundee.**—There is a local rumour that 15,000*l.* have been put down by one of the merchants, for the purchase of a people's park in Dundee.

**Coleraine.**—The newly-erected building for the Coleraine Academical Institution has just been inaugurated, as appears from a report of the proceedings given, together with an engraving of the building, in the *Coleraine Chronicle*. The Institution is intended to accommodate about 40 boarders, and as many as 150 day pupils. The principal of the Institution has apartments in the southern wing of the building, which also contains the kitchen, pantries, &c., required for the boarders. The middle and northern portions are devoted to the educational uses of the Institution. This is surrounded with five acres of land—the gift of the Worshipful Company of Clothworkers—which it is intended to lay out in ornamental patches of shrubs, &c. The building is a plain structure, designed by Mr. Farrell, of Dublin. The gross contract was divided into two portions 1,708*l.* 1*s.* 10*d.* and 943*l.* 18*s.* 8*d.*; the first sum for the covering in of the building, the second for its complete finishing.

#### STAINED GLASS.

**Gloucester Cathedral.**—Messrs. Clayton & Bell have now completed the erection of the Gniez window in this cathedral, according to the local *Chronicle*. In the centre light is depicted the coronation of Henry III. in Gloucester cathedral, the western department representing the Bishop of Bath and Wells, surrounded by the barons, officiating at the coronation. Exception has been taken to the drawing of the features of the youthful king, as being deficient in expression. In the eastern division of the window the principal figure is that of Hubert de Burgh, from whom the Gniez family derive the name of Elmore.

**St. Mary's, Walspool.**—It is in contemplation to place a stained-glass window in the chancel of St. Mary's Church, a design for which has been submitted for approval by Mr. Wailes, of Newcastle. The estimated cost is 200*l.*, towards which a considerable amount has been already subscribed. The restoration of the chancel of this church has lately been effected.

#### CHURCH BUILDING NEWS.

**Brigg.**—St. Helen's, Kirmington, was re-opened on the 17th ultimo. The church, which is of the thirteenth century, has undergone a restoration. The chancel window (east) was hoeked up by the Commandments, the Commandments by an ugly organ, and the platform on which the instrument rested, and on which the singers were seated, reached seven or eight feet beyond the communion-rail. The north and south aisles have been entirely rebuilt at the sole cost of two parishioners, Messrs. Frankish and Hudson—the north aisle with four new windows by the former. One of these windows is an ornamental window, by Wilmhurst, of London, the gift of Mr. William C. Brackenbury, her Majesty's Consul at Vigo, in the province of Galicia. The designs are, the conversion of St. Paul, and Paul preaching at Athens—the heading being ornamented with the figure of the dove bearing the olive branch. This window is near the pulpit. The south aisle has three new windows, given by Messrs. Frankish and Hudson. A memorial window has been placed in the south aisle by the vicar. The subjects are the following:—1st light.

The Raising of the Widow's Son; 2nd. The Resurrection of Lazarus; 3rd. Raising Jairus's Daughter. The heading is a representation of the Ascension. Mrs. Hudson, the widow of the late Francis Hudson, of Kirmington Vale, has also put in a memorial window to her late husband. The following are the subjects:—1st light. The Disciples on the Road to Emmaus; 2nd. The Three Marys at the Tomb; 3rd. The Incredulity of St. Thomas. The heading is descriptive of the Resurrection. Both are the work of Messrs. Lavers and Barraud, of Bloomsbury. There is also a figure of St. Helen (to whom the church is dedicated) in the west (lanet) window of the tower, by Mr. Wilmhurst, of London. This was presented by the vicar, as was also the font, the work of Mr. Keyworth, of Hull. It was designed by the architect, Mr. Teulon, under whose superintendence the whole of the restoration has been carried out. Mr. Stiles, Navenby, was the contractor and builder.

**Braintree.**—The sum of 1,663*l.* has already been expended in the restoration and enlargement of the church, and about 270*l.* only remain in hand towards the sum of 2,000*l.* which will be required to complete the works.

**Bolnisi.**—Recently the church of this place, according to the *Bedford Times*, has undergone an almost complete restoration. The chancel has been fresh roofed, the inner side being stencilled. A memorial window, the gift of the rector, occupies the eastern end. The window is of stained glass, and contains twenty-six figures. There are several other windows of stained glass in this church. On the walls are painted several scriptural texts. A fresco-painting of St. Christopher was discovered on the northern wall some time ago. Several of the lines are visible.

**Chesham (Herts).**—The foundation stone of St. James's Church has just been laid here. The style of architecture is the Early Pointed. The church will consist of nave, an apsidal chancel, transepts, and south chapel, with a tower. The contract for erecting the edifice is 2,271*l.*, and the subscriptions already received exceed that sum. But it is proposed also to erect a parsonage house. The church will contain 256 free sittings, 85 appropriated, and 50 for children; in all 421 sittings.

**Newbury.**—The new church and schools here have been opened. The church is built in the Perpendicular style, and is intended to accommodate rather more than 500 persons. There are four windows on the south side, and six in the north aisle. Four arches extend the length of the nave, the roof of the nave and chancel have small arches of wood. An organ chamber on the south side of the chancel is lighted by a wheel window, filled in with quatrefoil tracery. On either side of the chancel are oak seats for chorists. The nave and aisles are stenciled with lead; the pulpit oak, with open traced panels, and on a Portland stone base. At the east end of the church is a Perpendicular stained-glass window, representing the Saviour and the Evangelists; the seven candlesticks underneath; and in the centre above a representation of the Lamb. At the west end is a stained-glass window, representing the Twelve Apostles and the Descending Dove. The font is of Caen stone, with Portland stone base, and oak cover, surmounted by a cross. The flooring is composed of Minton's tiles, except that portion covered by the seats, which is of deal. The church will be heated with hot-water pipes, laid down by Messrs. Plenty & Pain, of Newbury. At the west end of the south side of the building there is a porch, having a moulded stone arch, supported by pillars. The church is covered with green and red slates. The building is of brick, with Bath stone dressings. At the west end is a turret, 75 feet high, which contains two bells. Mr. Butterfield, of London, was the architect, and his design was carried out by Messrs. Myers, of London. The architect of the schools is Mr. G. Woodley, of Grafton, near Guildford. Mr. T. Bicknall, of Steventon, Berks, is the builder; and Mr. J. Walker was the clerk of the works.

**Ransay.**—The new church at Olliam, a hamlet of Ransay parish, has been consecrated by the Bishop of Chester. The old church is situated at a very inconvenient distance from that part of the parish in which the people reside; and, after a period of some 500 years, age is beginning to tell upon the structure. The tower will, however, be maintained, as a chapel to the cemetery around it, whilst the walls of the body of the church will be allowed to fall into decay. The Shiffner family have contributed 1,700*l.* towards the erection of the new edifice, as well as the site on which it is built. The architect is Mr. Christian. The church, which is 21 feet square inside, consists of a nave and south aisle, with a spire tower above

the nave and chancel. The nave and aisle of the church together form a square of 40 feet besides a transept of 18 feet; the chancel 20 feet. The style of the building is Geometric Decorated, of simple character. The walls are built of flint work, with dressings of Sussex stone from Seaynes hill quarry. It has a multangular apse, with five windows, single tracery lights, the arches of the windows being supported by pillars of polished serpentine. The windows which are filled with stained glass by Lavers and Barraud, were given by five of the late baronet's friends. The large west window of the church is to be shortly filled with painted glass by the Shiffner family, as a memorial to the late Sir Henry. The roofs of the nave and aisle are plastered white between ribs of timber. The ceiling of the apse is decorated in colour. The tower is surmounted by a single-covered spire of the short proportion common in Sussex. Within the church the tower is groined with ribs of stone and chalk fluting. The nave is divided from the aisle by an arcade of three arches supported on stone pillars. The side windows of the nave and aisle are glazed with rough glass, decorated in patterns by Mr. Wilmhurst, of London. The fittings are in deal, stained. The walls of the church are decorated with texts, written by Mr. West, of London. The flooring is of Staffordshire tiles; those of the chancel from Milton's factory, at Stoke-on-Trent, the space within the communion railing being paved with encaustic tiles. The pulpit is of oak, carved and paneled, supported on a stone base. The work was executed by Mr. Ayres, the contractor for the Sussex County Lunatic Asylum.

**Saunage (Dorset).**—The church of St. Mary, Swanage, has been restored, nearly the whole except the tower having been rebuilt. According to our authority, the *Dorset Chronicle*, the building is cruciform, with the addition of a north aisle separated from the nave by two arches, and the prevailing characteristic of the chancel is early English, and of the nave and transepts Perpendicular, though there are features of the Decorated style here and there throughout the building, more particularly in the east end, which has a five-light window of this description. The roof is open-timbered. Accommodation is given to a congregation of about 700, by a series of open seats of stained deal, while the chancel stalls have bench ends, with carved finials. There are likewise galleries for children in the transepts. The communion steps are of Purbeck marble, and the space within is laid with Minton's encaustic tiles, while the chancel is paved with productions from the Poole Architectural Pottery Company. In the south wall of the chancel there is a two-light hooded window, supported in the centre by a Purbeck marble column, and filled in with stained glass. On the opposite side there is an arched organ recess, which is the earliest part of the church now extant, and which is lit by two squints filled by Mr. Wyatt, the architect. The whole of the works have been carried out by Mr. Monday, builder, Dorchester, according to the plans of Mr. T. W. Wyatt, the diocesan architect. The total sum now received for the restorations is about 2,700*l.*, but about 300*l.* more are still required.

#### GAS.

THE Metropolitan Gas Bill has passed through the committee, who, amongst other points adverse to the promoters and favourable to the gas companies, have decided that the price per 1,000 cubic feet of common gas should be any sum the company think fit not exceeding 5*s.* 6*d.*, and that the price of canal gas should be any sum not exceeding 7*s.* 6*d.*, per 1,000 feet. The chairman finally said, that the committee had agreed to make a special report to the House, stating that it is their opinion, in case no legislation shall take place during the present session on the subject of the metropolitan gas supply, it is highly desirable that the whole subject should be brought under the consideration of the Government, and that the Government ought to be prepared to introduce a measure for the settlement of the question at the commencement of the ensuing session of Parliament, with a view to regulate the conditions under which the gas companies shall supply gas in their several districts, with a due regard to the interests of the public.

Preparations are being made for lighting the town of Cuckfield with gas. The building was commenced last month. It is expected to be finished by the 1st of September, and the pipes and apparatus are already manufactured in Brighton.

The question of reducing the price of the Devonport gas is being mooted. The Devonport

*Independent*, in an able article, urges the reduction as a measure likely to be beneficial to the company no less than to the public. The present price is 4s. 6d. while in the adjoining town of Plymouth it is 3s. 4d. The dividend on the 4s. 6d. is 8 per cent, while that on the 3s. 4d. is 10 per cent; and although the Devonport Company has had the advantage of witnessing the steady and continued benefit derived by the Plymouth Company, as well as the Plymouth consumers from the adoption of a liberal and enlightened policy, some of the Devonport shareholders seem to be far too stupid and far too greedy to follow up so excellent and profitable an example.

The Glasgow Gas-light Company have declared their usual dividends of 10 per cent, deducting Income-tax, to be paid on 1st August and 2nd February next. The chairman at the annual meeting explained that the balance of profit for last year amounted to 16,997.0s. 10d., and that, after paying the dividend, there remained a sum of 2,567. 10s. 10d. to be carried to the credit of the reserve fund account, which would then amount to 26,491. 16s. 11d., and which, in terms of the Act, might be raised to 29,101. 13s. 5d., out of which to secure the shareholders in the payment of a dividend should the revenue of the company, from any unforeseen cause, fall off, which placed the company in a very advantageous position. He also spoke of a further reduction in price to be hereafter considered with reference to the price of coal, "assured that, by following such a course, they would not only benefit the public, but insure the prosperity of the company by largely increasing the consumption of gas."

Gas has just been introduced into Launceston, Tasmania. The cost is 20s. for cash, and 25s. for credit, per 1,000 cubic feet.

THE PRESENT STATE OF CHURCH BUILDING.

The elegantly penned letter of "M. A., Cambridge" (p. 463), deserves attention, from its being a sensible exposition of certain asserted shortcomings in Church Building, and from its enunciation of a somewhat correct though incomplete theory; but, from his having left the practical conclusion almost untouched, it will be asked, What does it mean? What sort of church does the writer require?

In the first place, admitting his principles to be such as should prevail in erecting buildings for the Church of England, it must at the same time be seen that these principles are not completely given, and in the next that, without a full statement of them, no church can be satisfactorily designed; for, if a theory be not fully understood, the correct practical result cannot be attained. And here is the difficulty; for, while the acceptance of the theory is easy when it does not go beyond general ideas, yet, when others are introduced, there may arise a conflict of opinion that will render it impossible to establish in men's minds the desired rule.

The scope of "M. A.'s" remarks may be considered to set up a complaint that churches are not built as they should be, and an hypothesis that, if proper thoughts were introduced, there might be combined in them the fullest expression of ritual observance, with the highest development of æsthetic qualities.

I assent to his hypothesis, but am not much inclined to join in his complaint, for I am at a loss to perceive that the numerous admirable buildings that have been erected are so deficient as he intimates: granted that his requirements are for desirable points, I maintain that many of the best modern churches fulfil his wishes, and that others could be readily made to do so. The auditorium is effected, whatever be its shape, if every worshipper can hear, as is the case in numerous instances, whether there be columns or not; and, as to the less essential requisite of seeing, columns, when used, do not obstruct the view to anything like the extent that is commonly imagined. The emphatic structural declaration of preaching is secured when the pulpit is solidly built of stone, and adjoining or issuing out of a wall, as it often is. The desk, though frequently a removable fitting, is often properly placed and well marked. The table of the Holy Communion has received good attention of late years; and, by its being placed on a stone dais, its site becomes a portion of the structure. The font is sometimes emphatically and structurally fixed; and the organ has been gradually getting into suitable position.

Now, with such results, there is some danger of falling into a wrong mode of design, if we become discontented with what we have done. Let us

advance by all means, but let us take care that in altering our mode we do not go back. I am not objecting to what "M. A." has put forth; but, on the contrary, I approve and would enforce his valuable remarks. But I cannot fathom his views; and this engenders a fear that he may unwittingly entertain ideas inimical to true excellence in church architecture, which is a peculiar art requiring a structural expression of religious sentiment, and for this there are numerous indispensable particulars in which some minds, and possibly that of "M. A.," may not agree: for instance, one is, that the worshippers should all kneel in one direction as much as possible; yet some persons would place them in a circle, or, so long as they could see and hear. Another maxim should be, that no worshippers should be placed over the heads of others, as in galleries—this being an incongruous and irrelevant mode of placing a congregation; though, in a west end tower, or in some receding western portion, an exception to the rule might apply, but never at the sides. Strike out some such subordinate essentials as the two I have named, and the whole mode of design becomes a random thing,—an incoherent system,—with free license to make a church like a theatre, a circus, or an exchange, inasmuch as in none of these would the essentials named by "M. A." be necessarily cast aside. "M. A." may be aware of this danger; and, if he be so, then there is less need of observations on his ecclesiastical hammer.

EDWIN NASIR.

ON CERTAIN INTERMITTENT FOUNTAINS.

I PASS through Endell-street, Long-acre, occasionally, and have observed that the drinking-fountain there, though sometimes flowing, is also frequently dry. I have not had time to make the observations necessary for ascertaining the exact law by which it is governed, but I conjecture that it has stated seasons and hours.

This fountain, like many others, bears inscriptions to the effect that it is the gift of So-and-so, Esq., and is under the auspices of the Metropolitan Drinking-Fountains Association; and I should be glad if you would give me the opportunity of suggesting to these gentlemen that the first condition towards making a fountain attractive is, that it be perennial; and that if they wish to persuade the thirsty labourer to go past the public-house and wait till he gets to the fountain, they must make him feel perfectly assured that he will find a draught when he gets there: a single haulk will furnish him with an excuse to his own conscience for stopping at the Red Lion for the next twelve months.

The good people who have interested themselves in procuring the erection of these fountains have no doubt done a useful work: they do not, it is true, seem to belong to the class who "do good by stealth," nor to be likely to blush at any fame that may befall them; but I only touch on this for the purpose of urging on them that those who record themselves so confidently as great public benefactors ought to be actuated by a feeling akin to what is expressed in the French saying—"Noblesse oblige!" It does seem a little inconsistent that the leaders of a grand movement (everything is called a movement now), with office and secretaries, long subscription list, dinners, speeches, and what not, not to mention the special donor, should not be able to keep a poor little stream, no thicker than this pen, going all the twenty-four hours, and all the 365 days except when there is a frost; and, on the whole, one cannot help feeling that it would be better to have rather less self-glorification and rather more water. AQUARIUS.

THE NEW PARISH SCHOOL OF CLYST ST. GEORGE.

THE little village of Clyst St. George, near Exeter, on the 19th ult, was the scene of much rejoicing on the occasion of the opening of the school-rooms lately erected, with a teacher's residence, for the accommodation of the school endowed there many years ago by Dame Hannah Seaward. The bells pealed from the old tower at intervals, and flags waved both from the tower and the school buildings. The school-room was decorated with flowers by the children, about seventy of whom were assembled, and many villagers came to witness the ceremony. The mayor, the Rev. H. T. Ellacombe, delivered a short address, and the party afterwards partook of a goodly supply of old English fare, and spent the remainder of the day in the playground attached to the school, and on the rectory lawn, which was thrown open to all who chose to participate in the merry-making.

The school buildings are of substantial limestone masonry, laid in irregular courses. The windows are square-headed, with millions of Combe Down Stone, as are the quoins and dressings. The roofs are high pitched, with gables and dormers; the whole being covered with Bridgewater tiles, set in patterns, surmounted with a cresting. Octagonal stone chimneys, plainly ornamented, with a bell-turret of stone on one of the gables, give character to the whole.

Within, the walls are wholly of bricks, with black headers intermixed with white; and appropriate texts of Scripture, formed with letters from Minton's patent tile works. The roof, of oak and deal, is open to the ridge, affording ample ventilation; and the floors are laid with wood. A classroom adjoins.

On the outside a cloister of open-timber work (set on a dwarf wall), paved with common Staffordshire tiles, affords a useful covered space, where the children can play in wet weather.

The master's residence, which is unsexed, though of the smallest authorized dimensions, is conveniently arranged, having a porch and entrance, a small parlour, kitchen, and washhouse, with other offices, and three bed-rooms. The staircase is of stone, and the walls within are of brick, white-washed; indeed, there is neither paint nor plastering, except in the parlour, throughout the premises.

We understand that the cost has been defrayed by divers benefactions, added to from time to time and nursed in the Savings Bank. The site was given, and the whole work has been done under the superintendence of the Rev. H. T. Ellacombe, the rector, who is spoken of as architect, clerk of works, &c.

FLOATING BREAKWATERS.

In an article in your paper of July 21, upon floating breakwaters, it is stated that a plan is under consideration of the Ports Committee, by Captain Ardlerley Sleight; and, judging from the details given in your article, and without wishing to cast any disparagement upon Captain Sleight's plan, it must be evident to any one experienced in nautical affairs that such floating structures as are here proposed are erroneous in construction, and equally so to the purposes for which they are intended. Firstly, because of their great buoyancy from being water-tight; secondly, their utter destruction, if perforated by ball or shell. The former defect would be painfully manifest in a storm, where these structures were moored in line as a breakwater. The rise and fall by the action of the wave would tear asunder the strongest couplings, and the enormous strain upon the moorings would very soon displace them. The broad inclined plane to seaward would offer facilities for easy destruction; for, if a well-directed shell were planted right upon the plane, nothing would save it from going down.

These wedge-shaped timber structures might be found to answer the purpose of breakwaters at a cheap cost, but certainly not if made water-tight. Some years ago a similar invention to Captain Sleight's was moored off Brighton to protect the coast, but there were open structures of timber in shape resembling a prism, floating 10 or 12 feet below the water, and rising 7 or 8 feet above the line of flotation. This plan was found to answer, and the principle upon which it succeeded was the rendering the element itself the resisting barrier to the force of the wave. The inventor of this recommended breakwater was Admiral Taylor.

Shoreham. K. C. B.

BURSLER WEDGWOOD MEMORIAL COMPETITION.

The following is the report of the Referees on the designs submitted:—

"We have carefully examined the whole of the twenty-nine plans submitted in competition for the Wedgwood Institute, and with much regret have to find in them so great a lack of the requirements of a building of this import and character. The following requirements are essential.—Elementary class room, library, modelling room, master's room, store room, keeper's official room, and living room, must be on the ground floor. Museum, ladies' class room, advanced class room (this room is not inserted in any of the plans; it should be of moderate size, say 30 feet by 20), should be on the upper floor, and lighted from the roof. To avoid the imposition of local taxes, the keeper's house should have its entrance in the open air, and quite independent of any of the entrances of the institution. Provision should be made for lifting heavy casts, &c., with facility and safety. The style of architecture should be strictly memorial and suggestive; that is, should imply, as it were, an appreciation of Wedgwood's character and labours. This is not a question of cost, but one of taste—its absence contradicting the primary motive and feeling of those who are promoting the erection of the institution. Scarcely any of these elements of the question are found in the plans submitted; some of them are set verily at defiance. Their presence is compatible with the proposed expenditure; and it is for the committee to consider the propriety of another competition. Out of the twenty-

nine designs submitted, we have selected four, which, in point of arrangement and artistic treatment, elevate themselves far beyond any of the remainder, and upon which we offer the following comments:—Design No. 2, with the motto, "Think well out," presents a better recognition of the requirements of the building; its style is more consistent with its intended use, and some of its accessories were revised—would be more expressive of a memorial building to Josiah Wedgwood than any of the other designs, though still wanting in monumental character. To carry the building into execution in an honest and trustworthy manner would, however, considerably exceed the sum at the committee's disposal, and the plan fails to comply with the above conditions. Design No. 18, "Jussumus Veritas," is a high artistic merit, and offers many points of commendation in the arrangement of the plan; but it is quite inappropriate to the locality, and still further beyond the amount stipulated, and likewise, but to a greater extent, fails in its requirements. Design No. 19, "May the Arts flourish," presents a better lighting arrangement than many of the others, but is in other respects equally deficient and dissimilar in style. Design No. 27, "Pro Bono Publico," has by far the best arrangement of plan, but is wanting in truthfulness and monumental character. The remainder of the designs do not call for any comment. (Signed) George T. Robinson, F.G.S., architect; J. A. Hammerley, F.S.A., artist.

The premium of 20l. was awarded to the designs bearing the motto, "Think well out." On the letter accompanying them being opened, they were found to be from Messrs. Ford and Meyer, architects, Burslem. The second premium of 10l. has been awarded to Mr. James Murray, of Coventry, being No. 27 named in the above report, and bearing the motto, "Pro Bono Publico."

A second competition, limited to a few of the competitors, is now talked of.

#### EMPLOYERS AND WORKMEN.

Str.—At the request of my fellow-clerks and others, in the employ of Mr. George Jennings, of Bloomsbury, I write to inform you that on Saturday last we all met at Godstone, to celebrate our annual dinner. As the circumstances attending this particular meeting are calculated to produce a better understanding between the employer and employed, as well as to materially promote the interests of the latter, we consider it a duty to inform you of the circumstances to which we refer, leaving you to estimate their value. After various toasts, our chief clerk, who filled the chair, proposed the health of our employer: Mr. Jennings, in responding, said it should not be forgotten that masters had certain responsibilities as well as the men, and that, commercially speaking, a master was as much entitled to full service from the men in his employ as the men were to full weight in the purchase of domestic necessaries. He said he was glad to find that, after the payment of all expenses, each man would receive 5s. 3d. As there could be no ending without a beginning, he proposed that every man should put aside half a crown, and that if these willing to do so would give in their names, addresses, and the savings' bank most convenient to them, he would make the half-crown five shillings, invest it in the bank they named, obtain a book for them, in which all the money they could save would be entered, and at the end of every year he would add a shilling to each pound thus accumulated, when the men would be free to purchase those comforts so necessary to the season, and commence the year afresh.

As the hands employed in our London and Poole works amount to upwards of 250, I think I need scarcely apologize to you for relating this act of liberality.

Geo. G. MACVILLIAM.

#### ACTION FOR DILAPIDATIONS.

*Gibson v. Charter*.—This was an action tried at Newcastle, before Baron Martin, on a covenant to uphold and keep in repair certain buildings comprised in two leases, of which the plaintiff had purchased the reversion, to recover for their dilapidation on the termination of the leases.

Mr. Manisty, Q.C., and Mr. T. Jones appeared for the plaintiff; and Mr. Temple, Q.C., Mr. Monk, Q.C., and Mr. Udall for the defendant.

It appeared that the plaintiff, Mr. George Tallantire Gibson, an attorney of Newcastle, had purchased the reversion of a large quantity of leasehold property in Newcastle, the purchase-money being 10,000l., from Sir Matthew White Ridley, the leases on which were about to expire. The property in question formed a very small portion of that purchase, and consisted of certain sheds used for timber, a pawnbroker's shop, and the ruins of some wooden buildings erected in 1798, and used then and which, from age and decay, had tumbled down some twelve or fourteen years ago. The leases affecting this property were dated respectively in 1836 and in 1844, and the term of each had just expired. The property had been used and occupied by Mr. Cowan, who was dead, and the defendant was his executor. On the part of the plaintiff a surveyor was put into the box, who proved that the pawnshop and sheds would require various sums, amounting to nearly 200l., to put them in tenable repair, and that the granaries which had tumbled down would require from 200l. to 300l. to rebuild them. Altogether the plaintiff made a claim of 487l. for dilapidations.

The case for the defendant was that the granaries were merely temporary structures, built of wood, which, from wear and tear and natural decay, had tumbled down years ago, and which Sir Matthew Ridley had never called upon or expected the tenant to rebuild; and that, as to the other buildings, just before the lease terminated, one of the most respectable architects and surveyors in Newcastle had been called in to examine them, and put them in tenable repair, consideration being had for reasonable wear and tear; and that without stint on the part of the defendant this had been done before the premises had been delivered up, and evidence was given that they were in as good condition now as twenty-five years ago. The learned counsel for the defendant stated that the plaintiff had purchased this old tumble-down property as a speculation, with the object of compelling the holders of the leases to restore it, or pay an amount of compensation which would go far to reimburse him the whole purchase-money. The learned counsel for the plaintiff, in

reply, contended that whatever rights Sir Matthew White Ridley had the plaintiff now had, and that it was not to be contended that Sir Matthew White Ridley could not recover on the covenants in his lease entered into by the defendant's testator to maintain and uphold those premises, and that a Northumbrian jury would not give a verdict in regard to his client different from what they would give in regard to Sir Matthew Ridley, simply because he was Mr. George Tallantire Gibson.

His Lordship, in summing up, told the jury that they must take the evidence on both sides, and, as well as they could, determine in what condition the premises were at the periods of the respective leases, and they must take it into consideration whether or not, regard being had to their condition at the time of these leases, the defendant had surrendered them in a reasonable state of repair. The defendant was not bound to leave new buildings in the place of old, but only to keep in repair the existing buildings, regard being had to reasonable wear and tear. If premises got so old and decayed that they could not be kept up, the defendant was not bound to rebuild them.

The jury retired, and on their return found a verdict for the defendant.

#### Books Received.

*A Rudimentary Treatise on Clocks and Watches, and on Bells; with a Full Account of the Westminster Clock and Bells.* By E. B. DENTON, M.A., Q.C. Fourth edition, rewritten and enlarged. London: Weale, 59, High Holborn. 1860.

It does not necessarily follow, certainly, that an author who can write fairly and fully on a scientific subject, and even meet with no unfavourable criticism on it, must therefore be practically and intimately versant with that subject, as the writer of the present notice is quite ready to confess that he very well knows, from personal experience in a small way; having himself, in his younger days, prepared one of the very few treatises on Time and Timekeepers to be found in the English language; although, when he began to study the subject with the special view of preparing the little treatise referred to (for "Chambers's Information for the People," he may add), he had not the least practical acquaintance with it, and only learnt his task while teaching it to others, as not a few authors and compilers are very well known to do: nevertheless, so far as he is aware, his little compilation met with no unfavourable criticism.

Mr. Denison's work, however, is one of a totally different stamp, and undoubtedly displays great practical knowledge of timekeeping structures, whether in the shape of clocks or watches. So far as we know, indeed, it is the only reliable and practical modern English work on the subject. The only other work which we recollect of (besides Reid's old works, which has been long out of date), is the treatise in the "Encyclopaedia Britannica," which, in fact, is Mr. Denison's own, and the basis of this fourth edition of essentially the same work.

Mr. Denison's connection with the Westminster bell business (another branch) has been an unfortunate one, somehow, for his scientific reputation thus far; and, however groundlessly or unjustly, even his sixteen years' connection with the Dent clock for Westminster Palace (which, by the way, "has already seen the deaths of the three clockmakers, the architect, and the commissioners of works, whose names are involved in it") has not proved much less unfortunate for Mr. Denison. Nor does this close the debit account of fatalities, though not precisely in connection with the clock affair. Mr. Denison, it appears, is (or was to have been) the executor of the late Mr. Dent (whose real name, he intimates, was Rippon, and not Dent at all); but, by an unfortunate mischance, if not by design, the will of Mr. Dent, or Rippon, was burnt, shortly before his death, and not by his own hand; and this circumstance, Mr. Denison remarks, seems "likely to form the subject of a very remarkable 'will case.'"

In respect to that other law action with which Mr. Denison was, no less unfortunately for himself, connected lately, namely, the case of Nears versus Denison, the defendant in that action is still far from considering himself to have been worsted, and seems "determined," in this as in all other instances, to "die game."

"When I first announced to the public," he says, "that holes had been discovered in the bell, filled up with artificial cement, and that the referers had no idea of the existence of such holes when they passed the bell, Mr. Nears replied in the *Times* with *his most unqualified condemnation*," and enforced it with the statement that he was going to refute the calumny, and vindicate the soundness of the bell, by an action. I have no hesitation in saying now, what I suspected before the bell was cut into,—that if the Board of Works had done their duty, and had a complete examination of the bell made at once (which, according to Mr. Cowper's own account, they have not done even yet), no such action would have been necessary, and the tables would have been turned upon Mr. Nears. As it was, he was persuaded by his advisers, after he knew I had got the analysis, to retire without a verdict, and without getting, but on the contrary, being distinctly referred, the retraction of that statement which both he and his

counsel declared to be 'the sting of the liebel,' viz. that the bell got passed by the holes being concealed. But his persistence up to that point did something more. His counsel had to expand his 'unqualified condemnation' of my published statement about the half county of Middlesex, of Mr. Nears's theory and practice of bell-founding and bell-trimming."

Mr. Denison gives a very full account of all his various differences with many of those connected officially and otherwise with the Westminster clock and bells, the last upon whom he pours the bitter contents of the vials of his wrath being Chief Cowper, the last, or rather the present, Chief Commissioner of Works, and "his master," the premier. Speaking of Mr. Cowper and the delay as to the dissection or final disposal of the doleful Big Ben the second, he says,—

"At last, however, he has let out the real reason of all this delay and pretence of investigation, which, indeed, it was not very difficult to divine before; remembering that a certain prime minister, with whom he is a good deal more than officially connected, last year pronounced the striking of the clock a nuisance; and that Fitzroy was desired to ask me if it could not be stopped every evening while the House was sitting. And so Mr. Cowper now says, 'I rather had that a great deal more than I should be informed of the hours at the cost of the serious inconvenience of that House.' I do not venture to express an opinion whether those who have paid 5,000l. for these bells may not reasonably expect to hear them. But I am convinced, from experience in other places, and, indeed, from some experience in the committee rooms of the very place in question, that, although the striking of a clock may be felt as an interruption for a few weeks while it is novelty, the loss of the striking is often thought a greater nuisance afterwards. It should be remembered that the House of Commons and the clock were only speaking together in this about a month last year. But I suppose we must wait till Mr. Cowper rises into a Secretary of State, or otherwise leaves Her Majesty's public works to be managed by somebody else. Then perhaps at last we may get a great deal more soundly, after the same number of trials as they had in Paris 180 years ago, and the Westminster clock may at last be allowed to be completed, if it has not been spilt in the mean time."

It is far from supposing, however, that this discovery, or any other, will make the least impression on the present Chief Commissioner of Works, any more than the recent success of his determination to have the fourth pair of hands fixed by the engineer who made the condemned minute-hands, instead of by the clockmakers. I shall not be at all surprised to find him telling the House of Commons again, that, notwithstanding the cracks nearly had to be brought, and the holes all over and the brittleness of the outside, and the miscarriage of the composition, "it does not appear to be necessary to abandon the use of the bell, or to pay the smallest attention to any advice or opinion he may have received from me about either the bell or the clock."

*The Elements of Mechanism; designed for students of applied mechanics.* By T. M. GODFREY, M.A. London: Longman & Co. 1860.

THIS treatise has been written by the author—who is the Professor of Natural Philosophy in King's College, London—with the view of providing an elementary text-book upon the principles of mechanism for the students in the applied science department of King's College.

The work seems to be clearly and carefully written; but the method of classification is not very satisfactory; the author, however, remarks, apologetically on this point, that the book is simply designed to serve as an introduction to the elaborate and highly philosophical work of Professor Willis, and is not intended to stand alone, as in itself sufficient.

*The Oxenbridges of Brede Place, Sussex, and Boston, Massachusetts.* By WILLIAM DURRANT COOPER, F.S.A. J. Russell Smith, London.

SUSSEX is fortunate in having a little knot of accomplished and energetic antiquaries, who spare no pains to investigate customs, to trace families, and to illustrate the monumental and other antiquities to be found there. Foremost amongst them is Mr. W. Durrant Cooper, a large contributor to the Sussex Archaeological Collections, in the new volume of which the *brochure* named above appears.

It includes an elevation and a picturesque view of Brede Place, a house built in the latter part of the reign of Henry VII., or the early part of that of Henry VIII. "The old part is of stone, with good foliated windows, and two fine chimneys." The essay itself displays Mr. Cooper's usual acuteness.

Miscellaneous.

**TESTIMONIAL TO SIR MORTON PETO, BART., M.P.**—A testimonial, in the shape of a china dessert-service, together with a platoon epergne candelabrum and other plate, has been presented to Sir Morton Peto, at Lowestoft, as an acknowledgment of his successful efforts in establishing a complete railway system in the county of Suffolk. The cost of the articles presented was about 2,000l.

**AN EARLY JEWISH TEMPLE IN CHINA.**—At the late meeting (Oxford) of the British Association, Dr. Macgowan read a paper, before the geographical section, "On an *Ante Christian Colony in China*." The most interesting fact brought forward in Dr. Macgowan's communication related to a magnificent Jewish temple, which was destroyed by fire, in the city of Chingtu, about a century before Christ.

**PLYMOUTH.**—West Hoe is about to be set in active operation; Mr. James Thomson, architect. Situated at the bottom of Plymouth Sound, of a semicircular form, with its convex towards the sea, it presents three fronts, east, south, and west, commanding delightful marine views. The railway station is within half a mile of the property, the approaches to which are already formed, and lighted with gas. Public baths and reading-rooms have recently been erected. The drive encircling the property is completed, and connects immediately with the public promenades, the railway station, and the town.

**SOUTH KENSINGTON MUSEUM.**—It is understood that Mr. Lowe's committee on the South Kensington Museum will propose an additional grant for public buildings there of 27,000l. a year, to be applied to the construction of a building of a more beautiful and permanent nature, and erected so as to be part of any future plan for a uniform collection. It is proposed to remove from the British Museum only the Mediaeval part of the collection, and such duplicates and superfluities as cannot find room in Bloomsbury.

**DOINGS AT ST. LUKE'S, LIVERPOOL.**—Sir: Will you call the attention of the architects and builders of this town (Liverpool) to the wholesale desecration that is about to be perpetrated by injuring the most beautiful of our churches (St. Luke's) in pulling down and breaking up the gates and rails of the said church, which cost thousands of pounds, thereby spoiling what has always been considered as a great ornament,—and all for the sake of fixing a big lamp, to improve an adjacent cab-stand? As you always uphold all that is fine and beautiful, pray give this a place, in the hope that the profession may consider of the matter, and so in time prevent spoliation, by raising their voices against it. I am sure that it will meet the views of every lover of architecture to find that the intended job is stopped.—A READER.

**THE FRESCOS IN THE HOUSES OF PARLIAMENT.**—It is now three years since we pointed attention to the dissolution of the frescoes in the so-called Poets' Hall; and since then we have from time to time noted their progressive decay. Some of the artists by whom these works were executed have been unwilling to admit that their works were destructible by damp; they cannot, however, now but confess that not only are some entirely destroyed, but that all are partially injured, and their total destruction is only a question of time. The progress of the decay is more rapid and patent after the dreary winter and the hibernic wet summer from which we have been suffering; and if there is any who yet doubt that damp is the cause of the ruin, they have but to examine for themselves and be convinced.—*Art Journal*.

**PROPOSED MEMORIAL TO THE LATE A. W. PUGIN.** We are glad to find that a fusion has taken place between the parties who had this object in view, and that one committee will now prosecute it. The following words of Pugin himself, at page 20 of his "Apology for the Revival of Christian Architecture in England," seem to confirm in a peculiar manner the original opinion of the committee that the form of memorial proposed is the most appropriate:—"God grant me the means and I would soon place architectural studies on such a footing that the glory of these latter days should be even greater than that of the former. I would also have travelling students, but I would circumscribe their limits;—Durham the destination of some; Lincolnshire's steeped fens for others; Northampton spires, and Yorkshire's venerable piles, Suffolk and Norfolk's coasts, Oxford, Devonshire, and Warwick,—each county should be indeed a school—for each is a school—where those who run may read, and where volumes of ancient art lie open for all inquirers."

**PROVINCIAL ARCHITECTURAL CONGRESS.**—An advertisement announces the postponement of the Rugby Architectural Congress, and the members of the Worcester Diocesan Architectural Society will join the meetings of the Midland Counties' Association on the 7th and 8th of August.

**A TESTIMONIAL.**—The committee of the new school buildings for the parish of St. John the Evangelist, Tottenham-court-road and John-street, met together last Monday evening to celebrate the completion of their work. Upon the removal of the cloth, the incumbent presented to a fellow-committee a silver inkstand, hearing the following inscription:—"Presented to James Schofield, esq., by the other members of the committee of the new school building of St. John the Evangelist, St. Pancras, in token of their grateful appreciation of his valuable services in superintending the erection of the building, and designing important improvements in the work. July 30th, 1860."

**ISLINGTON VESTRY-HALL.**—At a recent meeting of the vestry of this parish the cost of the new hall was reported as follows:—Cash paid for land, 1,550l.; law charges, 91l. 2s. 6d.; clerk of works, 223l.; erection of building as per contract, 4,987l.; extra works, 696l. 2s. 9d.; architect's commission on buildings, 301l.; extra drawings, 20l.; incidental, 5l.; sewer works, 5l.; furniture, 314l. 5s. 3d.; gas-fittings, 230l. 17s. 8d.; warming apparatus, 195l. 7s.; total, 9,201l. 3s. 9d. At the same meeting, on the motion of a gentleman who was not present, "To consider the propriety of taking the opinion of three scientific men as to the possibility of remedying the acoustic defects of the vestry-hall," a vestryman, amid some laughter, suggested that if a few maps or the portraits of vestrymen were placed upon the walls, the defects spoken of might be remedied. It is by no means certain that he is wrong.

**WORKMEN'S INSTITUTE AND BENEFIT CLUB.**—An entertainment has been given to the members of this Institution by Mr. H. E. Gurney, M.P., who is one of the vice-presidents. The members assembled at the Institute in Euston-road, and were conveyed in eight four-horse omnibuses to Hampton Court, where they spent the day. In the evening they returned to the Institute, where dinner had been prepared, to which about 200 members sat down, the chair being taken by Mr. Gurney, and afterwards by Mr. J. Tidd Pratt, who said he knew of no such association with rules so admirably constructed as those of the Workmen's Benefit Club, which entirely excluded the possibility of fraud or error. The sick fund was kept entirely apart from the fund for superannuation, and for payment of a sum to relatives on the death of a member. A member might, by periodical payments, according to his age at the time of joining, assure an annuity commencing at any period of life he might choose to appoint. If he should die before that period, every halfpenny of his payments would be returned to his friends, or, if he chose to withdraw, to himself. The money was invested in Government securities, the Society only acting as agents. The Association have now, besides the large reading and lecture room in the Euston-road, branch establishments at Lambeth and Kensington.

**THE PROPOSED WATERWORKS FOR SPALDING.** At a meeting of directors and shareholders of the Spalding Waterworks Company, plans, diagrams, &c., relating to the proposed works, were introduced to the meeting by Messrs. Esom & Co., of Southwark. Mr. Brydone, the engineer, was also in attendance. The capital of the company is 8,000l. in 5l. shares, of which 6,000l. have already been taken by shareholders. It is anticipated that Messrs. Esom & Co. will be the contractors, and Mr. Brydone the engineer, and the works will be commenced within a month and completed during the year 1861. The proposed waterworks will be situated in a field close to the railway, by the side of the Finchbeck-road, and nearly opposite to the entrance to the cemetery. A tower of brickwork will be here erected, upon the top of which, at an elevation of several feet above the highest house, there will be a cast-iron tank capable of containing 30,000 gallons of water. Upon the ground-floor of this building, the boilers, steam-engines, and pumps will be placed, and above these, and underneath the tank, living rooms will be provided for the engineer and his family. Two filters will be constructed, and capable of filtering the required quantity. The filters will be provided with layers of shingle, sand, and a thickness of Spencer's magnetic carbide of iron, which is said to possess the remarkable property of removing all traces of organic matter, and materially improving the water for domestic purposes.

**THE PERNAMBUCO RAILWAY.**—The matters in dispute between Mr. Furness, the contractor, and the Pernambuco Railway Company, involving, as stated in the recent proceedings in the Court of Exchequer, nearly half a million of money, have been referred to arbitration. The arbitrator, Mr. Joseph Phillips, barrister-at-law, will leave for Brazil by the *Oceida* on the 9th instant, accompanied by Mr. Baylis, C.E., and Mr. Basse (instructed by Messrs. Rixon, Son, & Anton), as the representatives of the contractor. Mr. Lempriere (instructed by Messrs. Swift, Wagstaff, & Blenkinsop), left for Brazil by the mail on the 9th ultimo, and will represent the Company.

**LIQUIFYING QUARTZ ROCK: ARTIFICIAL STONY SILICATES.**—An idea, started some years since, is said to have been worked out in America by a certain Dr. Benjamin Hardinge, who, the *New Orleans Picayune* says, has spent the last fifteen years in his laboratory in liquidating quartz rock, and combining it again in new and varied forms. "By chemical combinations," says the *Picayune*, "Dr. Hardinge makes an article of plastic marble purer than the purest Parian. It can be made of any colour by mixtures with various metallic oxides. Every article of marble work may thus be cast as perfectly as castings of metal now are, and copies of Corinthian pillars, statues, mantels, &c., can be furnished at an expense of probably 1 per cent. their present cost. By a proper combination with ordinary sand or marble, a stone is made harder than the hardest flint, and at a price far less than the cheapest brick. Your parlours may be frescoed in marble, and time will never injure the colours. This is, undoubtedly, the same process used in the catacombs of Egypt, the colours of which are as fresh as when they were first put on, 3,000 years ago. This liquid quartz is also made into paint, incombustible and insoluble. This seems almost like a story of the Arabian Nights; yet it cannot be otherwise than true. For dissolving gold-bearing quartz, this invention's value is without limit. Every atom of gold may be precipitated and saved, and then the liquid is of far more value than the whole thing has cost." It remains to be seen whether Dr. Hardinge has really advanced practically beyond the hopes of past years with this invention. Messrs. Ransome, of Ipswich, we should think, have some title to a share in the practical invention of artificial stony silicates, though they may neither be properly called "marble," nor be "purer than the purest Parian."

**LONDON, BRIGHTON, AND SOUTH COAST RAILWAY.**—The half-yearly report of the directors of this company states that the amount of capital raised to the 30th of June last was 9,596,396l. The amount of capital expended had been 279,924l., of which 150,000l. was for the purchase of the Mid-Sussex Railway, 28,920l. for the Shoreham, Henfield, and Horsham line, the southern portion of which was on the eve of completion, 5,000l. on account of the company's contributions to the West London Extension line, 12,362l. in respect of the construction of the Victoria station, and the remainder for other works and purposes. The works at the Victoria station and Pimlico Railway were now nearly completed, and the company's station there was expected to be ready for public traffic in a few days. The total traffic receipts for the half-year ending the 30th of June last amounted to 385,714l., against 357,713l. of the corresponding half of 1859, showing an increase of 27,997l. The total working expenses and renewals amounted to 184,057l., against 170,365l. at the corresponding period, showing an increase of 13,692l. The net amount at the credit of the revenue account was 116,907l., out of which the directors recommend the payment of a dividend of 2½ per cent. for the half-year, amounting to 115,464l. Differences had arisen between the Board and the auditors by reason of the directors having declined to continue the issue to them of permanent free passes over the company's lines of railway. The auditors (Messrs. Reeves and Pilcher), in their report, call the attention of the proprietors to the great increase in the capital account of the company during the past eighteen months. The purchase of the West-end and Crystal Palace line had increased it by 640,508l., the Victoria Railway by 450,000l., and the Mid-Sussex by 150,000l.; together, 1,240,508l. In the past half-year was also added 94,497l. for the Shoreham and Henfield and other additional works. In consequence of the dividend being at the rate of 6 per cent. last year, the sum of 4,283l. had been divided in per-centages and paid this half-year to the secretary, officers, and oldest clerks, but which sum was charged in last half-year's accounts.

**KEEPING TIME BY ELECTRICITY.**—*Apr*opos of the doings of electricity, at Clatham they have now decided upon firing a cannon at twelve o'clock every day, by a wire from Greenwich Observatory, so as to inform the skippers of the hour for regulating their chronometers.—*Leeds Mercury.*

**FALL OF A SUSPENSION BRIDGE.**—The *Courrier de Saumur* states that at the suspension bridge of St. Florent (Main-et-Loire), as a man was driving a dray, loaded with twenty-one casks of wine, he became alarmed by hearing a loud crack, and flogged his horses to make them go faster; but, when they reached the middle, the bridge gave way, and the horses with the load fell from a height of 8 or 9 metres into the river Thionet. The driver escaped.

**DISEASE IN THE FRENCH OAK.**—It is not our own English oak only that is suffering from disease. The oak trees in the French forests have been attacked this year by a strange disease. They are covered from the top branches to the roots with a species of caterpillar, which forms a coating some inches thick, and in some localities the municipal authorities have published a notice forbidding children to enter the woods, as these insects, at the approach of a human being, cover the face, neck, and body, and their bite, it is said, has in many instances produced fever.

**BUILDING ACCIDENT AT DUBLIN.**—In Lower Bagot street, Dublin, whilst four workmen were on a scaffold 38 feet from the ground, in front of a new house, plastering a heavy brick cornice, the entire cornice fell over and carried the men and scaffolding into the street. Three of them were killed, and two others received serious injuries. At the inquest the jury could not come to any satisfactory conclusion as to whether the cornice was properly erected, the evidence being contradictory.

**OPENING OF A NEW DRINKING-FOUNTAIN AT READING.**—A second drinking-fountain has been opened here. It is the gift of Mr. Thos. Rogers, clerk to the Board of Health, &c. The fountain stands in a recess formed by the junction of St. Lawrence's Church and the adjoining building in Friar-street. The work is of an Early Gothic character. It has been executed in Mansfield stone by Messrs. Wheeler. The principal basin, which is semi-octagonal in outline, projects from the face of the stone a considerable distance, and is supported by a marble column. On each side of the column there is an arched recess, with small basins for animals, supplied with water from the overflow of the large basin. In the recess above the upper basin there is a carving in imitation of the water lily. From the point of a central leaf there issues a small jet of water which descends to the middle of the basin; and above there is a double arched canopy, supported on marble columns with carved capitals. The extreme height is about 11 feet. Messrs. Boulton & Woodman superintended the erection.

**THE NEW RIDE IN KENSINGTON-GARDENS.**—The determination of the Hon. Mr. Cowper, the Chief Commissioner of Public Works, to persist in the maintenance of the new equestrian ride, in continuation of that of Rotten-row, through Kensington-gardens, has been met by a corresponding spirit of opposition and resistance on the part of the inhabitants of Kensington, Chelsea, Paddington, and Marylebone, and the immediate districts abutting upon the scene of the alleged encroachment. During the past week various meetings have been held in Paddington, while in Kensington Mr. Russell Gurney, the Recorder of London, and the higher class residents, have taken part, and even the clergy, headed by Archdeacon Sinclair, the incumbent of Kensington, have been making common cause with those who look upon the new horse ride as an invasion of the quiet of Kensington-gardens. There appears to be a general opinion that the right hon. gentleman who now fills the office of Chief Commissioner of Public Works has committed a mistake, neither the requirements of the public nor the wants of the aristocracy tending to justify the proceeding. The opposition entertain a belief that the Chief Commissioner has, in making this new ride, acted not only without the sanction of the Queen, but in opposition to her Majesty's wishes, and this has determined them to make an appeal to her Majesty direct. A joint committee therefore met by arrangement at the Marylebone Court-house on Friday morning, which was completely filled, and it was then unanimously resolved to memorialize her Majesty upon the subject. A form was adopted; and it was further resolved that copies of the petition should be laid at the Marylebone Court-house, and at the vestry-halls of Paddington, Kensington, and Chelsea, for the signature of the inhabitants.

**MANUFACTURE OF BRICKS.**—Mr. W. Blynkhorn, Sutton, St. Helen's, has patented the application of the waste sand, spent gypsum, or other available residues arising from the grinding and polishing of plate-glass to the manufacture of bricks for the purpose of increasing their durability and fire-resisting properties, whether employed separately or in combination with other carthy matter or material.

**THE NEW PIER AT SOUTHPORT.**—The new pier is about to be publicly opened. The company was formed under the Limited Liability Act, with a capital of 10,000*l.* The designs were by Mr. Brunles, engineer, London, and the builders have been Messrs. W. & J. Halloway, of the Knott Mill Ironworks, Manchester. The pier extends from the promenade at Neville-street into the sea, to a distance of 1,200 yards, or nearly three-quarters of a mile. The height of the flooring from the sands varies from 16 feet to 25 feet, and the extreme width of the pier is 15 feet. At the further end there is a large platform for promenade, 120 feet long and 20 feet wide, which runs parallel with the sea at low water, and consequently transversely to the pier itself. From this promenade two flights of stairs descend to the sands, whence visitors can reach the boats which lie in the channel a little beyond the extremity of the pier.

**THE SCOTTISH ROYAL ASSOCIATION FOR THE PROMOTION OF THE FINE ARTS.**—The annual general meeting of this association was held in Queen-street Hall, Edinburgh, on the 23rd ult. The works of art to be distributed by ballot among the subscribers were exhibited on the wall behind the platform, with the exception of the first prize, Mr. Noel Paton's series of paintings illustrative of "The Dowie Dens of Yarrow," which was hung conspicuously in front of the platform, immediately beneath the chairman. There was an unusually large attendance, both the area and the galleries of the hall being filled. The report, among other things, stated that the funds of the association had materially increased, as last year they amounted to 4,263 guineas; whilst this year they amount to 5,616 guineas, that there had been commissioned, at the cost of 600*l.* sterling, from Mr. J. Noel Paton, R.S.A., six oil paintings in illustration of the Border ballad, the "Dowie Dens of Yarrow," and "considering," continues the report, "that these beautiful pictures derive at least a portion of their value and interest from being a connected series of illustrations, the committee have determined that they shall form one prize, the most valuable, even at the price paid for them, 600*l.* (which is far below their market value), that has ever been distributed by any art association in this or any other country. They will be delivered to the prizelord after the engravers, in whose hands they now are, have completed their respective plates; and that they had purchased, at a cost of 1,628*l.* sterling, forty-seven works of art recently exhibited at the Royal Scottish Academy, consisting of forty-six paintings and one piece of sculpture. The list of artists from whom these works of art had been acquired included the names of Douglas, Archer, Drummond, Hill, Crawford, Macculloch, Steell, Giles, and Houston, academicians; of Wintour, Hough, Fraser, Christie, Waller Paton, associates; and of Johnson, Hutchison, Pettie, Boddum, Milne, Donald, Hargitt, Mitchell, Graham, Halswelle, Clark, Munro, Greig, Michie, Stewart, Vallance, Stoddart, Fairbairn, Taylor, Bell, Finlay, Mackinlay, Prondfoot, Mackie, and Ritchie, artists.

**TENDERS**

For a new vestry-hall and offices, parish of Mile-End. Mr. Knight, surveyor:—  
Stewart ..... £4,695 0 0  
J. & C. Todd ..... 3,995 0 0  
Wood ..... 3,650 0 0  
Brown ..... 3,595 0 0  
T. Rudkin, jun. .... 3,595 0 0  
W. Hill ..... 3,513 0 0  
Blackburne ..... 3,449 0 0  
Porter ..... 3,375 0 0

For six houses at Kensington. Mr. C. Sewell, architect:—  
S. S. Wilson ..... £3,300 0 0  
Bird ..... 4,973 0 0  
Adamson ..... 4,907 0 0  
Godbolt ..... 4,824 0 0  
Fish ..... 4,300 0 0  
J. & C. Todd ..... 4,075 0 0  
T. Rudkin, jun. .... 3,909 0 0  
Walbutton ..... 3,679 0 0

For New National Provident Institution. Mr. R. Kerr, architect:—  
Piper ..... £13,284 0 0  
Holland ..... 13,959 0 0  
Jay ..... 13,566 0 0  
Lucas ..... 13,390 0 0  
Ashby ..... 12,880 0 0  
Myers ..... 12,997 0 0

For schools to be erected in Houghton-street, Claremarket, for the St. Clement's Danes Holborn Estate Charities. Mr. R. Hesketh, architect:—  
Hawson ..... £11,500 0 0  
l'Anson ..... 10,994 0 0  
Lucas ..... 10,503 0 0  
Trotlope ..... 10,473 0 0  
Byler ..... 10,409 0 0  
Foster ..... 10,021 0 0  
Nixon ..... 9,997 0 0  
Ashby & Sons ..... 9,984 0 0  
Macey & Horner ..... 9,950 0 0  
Piper ..... 9,740 0 0

For a new infirmary at Kensington Workhouse. Mr. Blore, architect:—  
Cowland ..... £1,931 0 0  
Foster ..... 1,931 0 0  
J. & C. Todd ..... 1,899 0 0  
G. Todd, jun. .... 1,739 0 0  
Hurst ..... 1,720 0 0  
Stimpson ..... 1,719 0 0  
McLennan & Co. .... 1,672 0 0  
T. Rudkin, jun. .... 1,625 0 0  
Pickard & Co. .... 1,557 0 0

For building new stables, living-rooms, repairs, &c., at No. 293, Oxford street. Mr. Searle, architect:—  
Williams, Brothers ..... £2,149 0 0  
Robinson ..... 1,844 0 0  
Davies ..... 1,716 0 0  
George ..... 1,264 0 0

For works to be done in erecting the Jews' Hospital, at Lower Norwood. Messrs. Tillot & Chamberlain, architects:—  
Lucas, Brothers ..... £20,387 0 0  
Ashby & Son ..... 19,640 0 0  
Hill ..... 19,460 0 0  
Piper & Son ..... 19,457 0 0  
Lawrence & Sons ..... 18,530 0 0  
Macey ..... 19,160 0 0  
Myers ..... 15,600 0 0  
Cabitt & Co. .... 18,470 0 0  
Jay ..... 18,207 0 0  
Wilson (accepted) ..... 17,759 0 0

For alterations and additions, Shiffield Paragon, Haats. Mr. Withers, architect. Quantities not supplied:—  
Prentis ..... £450 0 0  
George & Gover ..... 430 0 0  
Booker & Knight (accepted) ..... 368 10 0

For the formation of a sub-way, &c., Covent garden approach:—  
Evans, Brothers ..... £4,950 0 0  
G. Todd, jun. .... 4,925 0 0  
T. Rudkin, jun. .... 4,800 0 0  
Dethick ..... 4,157 0 0  
Deane ..... 4,115 0 0  
Thirst ..... 4,391 0 0

For a pair of semi-detached villas, at Sydenham. Mr. G. Low, architect:—  
Porter ..... £2,990 0 0  
Wood & Son ..... 2,768 0 0  
George ..... 2,550 0 0  
McLennan & Co. .... 2,633 0 0  
Adams & Co. .... 2,591 0 0  
Riley ..... 2,579 0 0  
Allen & Co. .... 2,501 0 0  
Todd, jun. .... 2,500 0 0  
Rudkin, jun. .... 2,495 0 0  
Amos ..... 2,379 0 0  
Deane ..... 2,290 0 0  
Humphreys & Co. .... 2,293 0 0

For an addition and alterations to a house at Hampstead, for Charles Eley, Esq. Messrs. Judge and Winstanley, architects. Quantities supplied:—  
Shaw ..... £845  
Mason ..... 839  
Patterson & Enderby ..... 745

For Finchley Industrial Schools:—

	Main Building.	Infirmary.	Total.
	£.	£.	£.
Cushing .....	19,900	2,760	22,660
Welchman .....	16,250	4,160	20,410
Ploemann .....	17,753	2,510	20,263
Foster .....	17,422	2,579	20,002
Nixon .....	15,997	3,757	19,754
Knaapp .....	15,820	3,552	19,372
Glenn .....	15,988	3,728	19,716

# The Builder.

VOL. XVIII.—No. 914.

Drawings by Sir Christopher Wren.

**SIR CHRISTOPHER WREN'S** drawings, preserved in the library of All Souls' College, Oxford, are known to all interested in the biography of the great English architect, though known only by hearsay: few of our readers are likely to have seen them; and better knowledge of them is much to be desired. Such particulars as we are able to give from a recent examination, therefore, may be welcome. Mr. Elmes, indeed, refers to the drawings in his well-known volume on the life of Wren, and gives some extracts from the manuscript matter in the same collection, including reports and estimates; but

he gives no list of them in that volume, or sufficient account of their general character. He refers,

however, to a list which he had contributed some years earlier, or in 1812, to the "General Chronicle"; and which was the result of an examination in the year 1807, occupying three or four days. That list, and the comments and particulars interspersed, should be looked at by any future biographer. Although the services of Mr. Elmes are not to be lightly spoken of, there is still need of the adequate memoir of one respecting whose life, and whose influence on our art, much has been left unsaid in print. The "General Chronicle" was a periodical of short existence, and is not likely to be found in many architects' libraries; and the volumes of that work in the library of the British Museum, are imperfect, or do not include the portion of the publication wherein the list appeared. Those, however, who may be able to procure access to the drawings at Oxford, will find the printed list cut from a number of the "General Chronicle," bound in the copy of Mr. Elmes's memoir which there is in the same library of All Souls'; and they will also find manuscript catalogues, old and new, more or less imperfect and at variance. The drawings themselves, in several cases, bear memoranda, chiefly in pencil, which appear to have been made, at the time of the inspection, by the Rev. Mr. Gutch, late librarian of the college, and editor of the "Oxford Annals" of Anthony à Wood, and should have been erased,—or rather not made at all; for, we can speak to the difficulty which results from them. The printed list, however, we take as representing the best information to be derived from the combined labours of Mr. Elmes and Mr. Gutch; and though we have notes of many features of interest in the drawings, which are not mentioned in it, we found its general accuracy, as well as grounds for opinions which Mr. Elmes expresses on the authorship of a considerable portion of the collection,—established wherever time permitted us comparison and minute inspection.

Subsequent to the preparation of the matter of this article, we called to mind that some notice of drawings by Wren had been given many years ago at the Institute of British Architects. All efforts, however, to refresh recollection from printed records of proceedings of the Institute were unavailing. We were about to conclude that no paper had been read—at least, on the drawings at Oxford, when we came to a rough list of some of the early papers, and, after a long search, discovered the title of a MS. which was subsequently found. The paper, which is by Mr. Gutch, the architect, son of the late librarian of All Souls', is dated

Feb. 16, 1836, and is entitled "Some Account of the original Drawings and Designs by Inigo Jones, Sir C. Wren, and James Gibbs, preserved at Oxford; with two Catalogues and Remarks thereon by James Elmes, Esq., architect." The list of Wren's drawings appears to be the same (copied in MS.) as that in the "General Chronicle." The paper includes some extracts from the "Athenæ Oxoniensis" relating to the biography of the three eminent architects, besides the particulars of the drawings by Jones and Gibbs. There ought to be a perfect catalogue in print of all papers that have been contributed to the Institute.

The drawings altogether, at All Souls', attributed to Wren, must amount to more than 300 in number, and are now contained in five folio volumes. They were formerly in portfolios, as presented by Sir William Blackstone, to the college; but they were mounted on drawing paper, and bound, in 1800, having been previously much injured through frequent inspection. There are, however, in two of the volumes, still some loose drawings. The contents of these two volumes, the fourth and fifth, are, we should say, hardly any of them Wren's; and many of this number are landscape sketches. Mr. Elmes makes mention of no more than the three first volumes. The new arrangement in 1800, is spoken of by Mr. Elmes as having been "according to the catalogue in the middle of the first volume." A large number even of the drawings in the three volumes, are regarded by the same authority as not genuine: the remainder of the collection, however, includes matter of great interest and unquestionable value and authenticity: though, under any aspect, the collection can include a very small proportion of the drawings that must have been made by Wren or his pupils. Some of the drawings we saw may be by Hawksmoor, who designed a considerable portion of the new buildings at All Souls'. We should not be surprised to find many drawings by Wren in other libraries at Oxford, or at Cambridge. As numbered, there are 270 drawings and MSS. together, in the three volumes, viz. 110 in the first volume, 109 in the second, and 51 in the third. Those of which the authorship may be considered pretty certain, are, we should say, about half the number in the first volume, nearly all those in the second, and perhaps half those in the third. The most interesting part of the collection, which is in the second volume, relates to St. Paul's Cathedral, to several of the City churches, to the mausoleum intended to have been erected at Windsor, to Charles I. and a proposed statue, and to a design for Winchester Castle, for Charles II.; whilst elsewhere may be found drawings and a report referring to the library of Trinity College, Cambridge, the plan for the rebuilding of London after the Great Fire, and designs for the Monument. In the second volume, also, under No. 9, is the original warrant under the sign manual of Charles II., dated 14th May, 1675, for rebuilding St. Paul's according to designs which follow in the volume. The warrant is given in the "Parentalia," as well as in the memoir by Mr. Elmes, where, also, there is a slight account of these particular designs, with some reference to the progressive changes and great discrepancies which they exhibit, and the growth of the present grand result. Though obviously wanting many stages of that growth, which further research probably would supply, they deserve some attention, and a more particular account than has been given of them.

Great and very proper care is taken of the whole collection by the present authorities of the college. Every facility consistent with preservation of the drawings, we are assured would be afforded on proper application, to those having time to spare. The present notice is given merely to direct the researches of others, and to add information to that which is accessible, or has appeared in print. We have not space for a list.

In the first volume we find plans of the campanile of Christ Church College, Oxford, and of several private residences and suites of rooms, including apartments at Windsor, Kensington, St. James's, Whitehall, and the House of Lords, and houses for the Duchess of Mon-

mouth, Lord Allston, Lord Sunderland, and Lord Newcastle. Some of these are distinctly attributed to Wren's own hand by Mr. Elmes, whilst questioning the authenticity of many of the other drawings.

Looking at the execution of the drawings in the collection generally, most of them are in ink outlined, and sometimes slightly washed; but some are in pencil. Several are coloured. Amongst those which are most likely to be Wren's, are some with writing upon them, which should be examined by those practised in the identification of hands. In No. 32, the council-chamber, audience-room, and drawing-room, at St. James's Palace, of which Mr. Elmes, has said "drawn by Sir Christopher," the walls are outlined and hatched in brown ink, and the writing is in a flourishing hand. Many of the drawings, though made obviously without some of the tools and appliances which are now used, are well executed; and many of them remind us of the French manner of minute and carefully stippled drawing, rather than of the present manner of English architects.

The plan (No. 7, in the volume) for rebuilding London after the fire of 1666, showing also the connection of the new streets and the old, we suppose can be regarded as the original of the engraving which was published by the House of Commons (28th July, 1800), in a report on Improvement of the Port of London, and of the subsequent publication by Mr. Elmes. It would, however, be desirable that the original plan, whether at Oxford or elsewhere, should be certified as authentic. There are several copies varying from one another, in the library of the British Museum. The discrepancy is generally as to the position for the City Halls; that is to say whether they should be on the river-side, or grouped about the Exchange. No. 8 in the same volume, is a rough plan of the streets after the fire; and No. 101 is a copy of the first-named plan, cut out, to show only the new buildings.

The drawings are of every kind,—general drawings, and details both of ornament and fittings. A design for a drawing-room at Whitehall (85), has appended to it a letter as follows, but not addressed:—

"May it please your lordship to consider of the memorandum mentioned in the enclosed paper (most of which being pressing), and be pleased to recommend the same to the rest of your lordships."

The drawings and MS. matter, relating to the library of Trinity College, Cambridge, form the most interesting feature in the first volume. There is also exhibited in several drawings, a design for a senate-house and library for the University. The drawings for the Trinity College library include a design—not executed,—which, on a circular plan, is not very different in character from the present reading-room of the British Museum. The numbers following (44 to 51), with the plan of the site (43), seem to correspond with what is now built. No. 44 is the explanation of the drawings; but it is not signed. The sheet No. 45, shows half the back-front next the river, and half the longitudinal section: No. 46 shows 1st, a plan of the substructure and cloister; 2nd, the plan of the library and arrangement of the shelves; and 3rd, the front next the court with the pavilions for the stairs; No. 47 is the transverse section; No. 48, a perspective view of a stool and table; and No. 49, a sketch of the classes of the library; whilst Nos. 50 and 51 show other parts at large. Most of these are well drawn. The explanation has been given by Mr. Elmes, but with the spelling modernized; and as the document is interesting, and we have copied some parts of it from the original, our readers may be glad to have these as they were written.

We have printed words erased in the MS. in smaller type, and the corrections over them.

"If a building of that consideration you go about deserves good care in the designe, and able workmen to performe it, and that he who takes the generall management upon him may have a prospect of the whole & make all parts, correspond well together, to this end I have comprissed the whole designe in 6 figures.

Fig. I.

Shewes half the groundplot of the Substruction, Cloister, & first flights of the Stairescases. I have chosen middle pillars & a double porticoe & lightes outward rather than a middle wall, as being the same expence, more gracefull, & according to the manner of the ancients who made double walkes (with three rows of pillars or two rows & a wall) about the forum.

Fig. II.

Shewes half the groundplot of the upper floor, the entrances from the stairescases & the disposition of the shelves both along the walls & breaking out from the walls, w<sup>ch</sup> must needs prove very convenient & gracefull, & the best way for the Students will be to have a little square table in each Celle with 2 chaires. The necessity of bringing windowes & doores to answer to the old building leaves two square places at the endes & 4 lesser Celles not to study in but to he shut up w<sup>th</sup> some neat Lattice doores for archives.

Fig. III.

Shewes the face of the building next the court with the pavillions for the stairescases & the they

sections of the old buildings where a joyne to the new. I chose a double order rather than a single, because a single order must either have been mutilated in its members or have been very expensive, & if performed would not have agreed with the lownesse of the porches w<sup>ch</sup> would have been too darke & the solids too grosse for the openings. I have given the appearance of arches as the order required fair and lofty: but I have

of the Library  
laid the floor, upon the impostes, w<sup>ch</sup> answer to the pillars in the cloister & the levels of the old floors, & have filled the Arches with relieves of stone, where if you please you may w<sup>ch</sup> I have seen the effect abroad in good building, & I assure you where porches are lowe with flat ceilings is w<sup>ould</sup> be infinitely more gracefull than lowe arches, and is much more eye open & pleasant, nor need the mason feare [sic] the performance because the Arch discharges the weight, & I shall direct him in a firme manner of executing the designe. By this contrivance the windowes of the Library

rise high & give room for the desks against the wall, and being high may be afforded to be large & being wide may have stone mullions & the glasse pointed w<sup>ch</sup> after all inventions is the only durable way in our climate for a publique building, where care must be had that suow drive not

in. I have given noe other ornament to the middle than statues, because in this case I find anything else impertinent, the entrances being endwaies & the roofe not suiting it. This may be don if you please, you may make the three

middle Arches with columns & the rest with pilasters of a third or 4<sup>th</sup> of their module diameter, w<sup>ch</sup> will save some charge in stone, but it is best as it is designed."

After describing Fig. IV., the document referring to Fig. V., and speaking of the library, says:—

"if the middle ally were paved of the Library were paved with small marbles you would much for consult, the quiet of the place, & for the cleanness of the books from dust, the Celles may be floored with wainscote,"

and further,—  
"the cornices divide the ceiling into three large rows of square pannells answering the pilasters w<sup>ch</sup> will proove the best fret because in a long room it gives the most agreeable perspective."

And as to Fig. VI., transverse section, it says as to the king-post roof,—

"I have given the ancient forme of roofe w<sup>ch</sup> the experience of all ages hath found the safest, noe other is to be trusted without doubling the thicknesses of the walles. The Statues will be a noble ornament, they are supposed of plaister, there are Flemish artists that doe them cheape.

I suppose you have good masons, how ever I would willingly take a farther paine to give all the mouldings in great, we are scrupulous in small matters & you must pardon us, the Architects are as great pedants as Critics or Herald's. And therefore if you approve the designes let the mason take his measures

copies be taken of them as much as is necessary for

the present getting out the worke & he pleased to transmit them to me again & I shall copy out partes of them at large more proper for the use of the workmen and give you a careful estimate of the charge, & returne you again the original designes, for in the hands of the Workemen they will soon be soe defaced that they will not be able from them to pursue the worke to a conclusion. I have made a cursory estimate & it is not that at w<sup>ch</sup> you will grumble as not exceeding the charge proposed."

The date of this library has been variously given, as before and after the date of the Fire of London: but a quotation from the chronology of Wren's life and works derived from the Lansdowne MSS. would seem to settle the point. It is:—

"1677—1680, 'Bibliotheca magnifica collegii inceptit, S.S. Trinitatis Cantobrigie, et exerit.'"

In the second volume, there are about forty of the drawings connected with the building of St. Paul's Cathedral, or the reparation of the old fabric. There is a ground-plan of the cathedral "before Inigo Jones's portico," as says the MS. catalogue, and carefully drawn on vellum. There are also, a "Sketch of a doorn for St. Paul's before 1666" in pencil, and resembling the dome of Sta. Maria at Florence; a plan of one of the old Gothic piers of St. Paul's, signed "C. Wren;" a "Plan of the intersection of the cross of the Church and the proposed doorn in the middle," also signed,—the angles being solid, with large niches, or four instead of eight arches; a "Plan of the proposed doorn," and "Orthography of the doorn and part of the old Church according to the same design." Like the section which follows it in the catalogue, the "Orthography" has a signature, "C. Wren, 1666," in small characters, amongst the timbers of the roof. The design has, carried up to a great height, a gilt pine-apple hollow termination, which is very ugly. In the section, the choir remains Gothic, whilst the nave is Corinthian.

The appointment of architect to the new building, was made at the date named in the following, as we find it in Mr. Elmes's recent work "Sir Christopher Wren and his Times" (Svo., London, 1852).

"1673 [Nov. 12] Architectus et commissioner ad edificandum novam basilicam Dvi Pauli Lond. per mandatum regis sub magno sigillo, ex mandato, R."

After which there is:—

"1675. Nova basilica Dvi Pauli: Lon. primum posuit Lapidem."

But at what date he entirely condemned the great tower of the old building is not clear, at least from the documents and authorities immediately before us. It appears, however, that he had, anterior to the occurrence of the Fire, proposed the removal, and that of the parts of the old building adjacent to the tower, saying that the whole were "such a heap of deformities, that no judicious architect will think it corrigible by any expence that can be laid out upon the dressing it, but that it will still remain unworthy the rest of the work, infirm & tottering." He proposed "by cutting off the inner corners of the cross, to render the middle part into a spacious rotunda, with a cupola or hemispherical roof; and upon this cupola a spiring top to rise proportionably, but not to that unnecessary height of the former spire."

This proposal does not seem to have been approved of by Wren's employers, at the period preceding the Fire. What has been quoted, however, will serve to show how he arrived at one of the designs which we are about to mention, and how different the present dome is from designs which preceded it.

No. 10 in the volume of drawings, is an "Enographical Plan of the church." It resembles the present plan; but the western portico is decastyle, has internal columns like those of the Pantheon, and projects three columns from the face of the wall; whilst the north and south entrances have recessed porticos. In the "Orthography of the west end, with a doorn & spire," there is only one order of columns—to a portico resembling that by

Inigo Jones; and there is a lofty spire on a dome: there are also sections of this; and another drawing shows the same idea—the spire much resembling that of St. Bride's Church. Amongst the other drawings, is a plan (16) slightly different from the approved plan; a sketch in pencil (18) for a screen and organ; some sketches of the interior; and what are called in the MS. catalogue, designs "for the centering of the present cupola," but are ordinary plans of the octagon and cupola. No. 21 is called "Sir Christopher Wren's favourite design for St. Paul's, 1673," on what authority it does not appear. It "resembles the model," as Mr. Elmes says, "but it is a perfect square, with quarter-circle angles." In four or five drawings following No. 21, the dome is represented as in the model. In another design which we should hardly think belongs to St. Paul's, there is a termination somewhat similar to that of the tower of St. George's, Bloomsbury. In some of the other drawings, the variations from the present design are chiefly in points of detail, as by the arrangement of the northern entrance with steps as those of the south, the omission of rusticated work, or (if the MS. catalogue have not misled us) the insertion of lucarne windows in the dome.

The drawings of other churches, or designs, relate to Bow Church, St. Bride's, St. Anthonin's; St. Clement's, Bastechap; Christchurch, Newgate-street; St. Clement's Dances, St. Bennet Finch; St. James's, Piccadilly; and to the fittings of chapels, probably those of All Souls, Oxford; and Emanuel College, Cambridge. Some of the drawings are signed or marked "Chr. Wren," or "C. Wren." The designs for the Monument, with flames represented on the shaft somewhat after the manner of the Roman rostral columns, will be known to most architects. There is also a section of a design for a theatre; but the authorship is doubtful.

Nos. 91 to 93 are drawings preceded by an estimate, which has been published, of the design for the mausoleum already spoken of, and Nos. 94, 95, are the two designs for a statue. The whole appear to have been originally stitched together as a book, and on the cover is written:—

"MAUSOLEUM DIVI CAROLI REGII MARYRIE. Excogitatum anno Salutis 1673, de Mandato Serenissimi Regis Caroli Secundi, Consentaneo cum Votivis Inferioris Domus Parliamentarii suffragis; at (eheu conditionem temporum!) nondum extractum."

The estimate is precise and minute; but it is now well known. Mr. Elmes, in the "General Chronicle," says of the original:—

"It is not inserted with the fair copies of the rest, as by his desire, but is a rough private copy, much scratched, interlined, and doubled; and is a very interesting document, in his own hand-writing, as it develops his mind, divested of the formality of a document for public inspection."

The mausoleum was to have been erected (according to a further endorsement in Wren's hand), "at the east end of St. George's Chapel, on the place where stands the little chapel (commonly called the Tomb House), in the middle of which was begun by Cardinal Wolsey a most magnificent tomb of copper-gilt, for King Henry the Eighth, but never finished." The design resembles that of the Radcliffe Library so much as to lead to the impression that Gibbs must have taken his idea from it. One of the designs for the monument within the Mausoleum is tinted as if for gilt copper, and the other with Indian ink. In one, Charles is represented in armour, borne upon a shield carried by figures, as of Hercules and Minerva, which stand upon a base, or block of stone, under which last are crushed four figures representing vices, and Murder, and Hypocrisy. It was subsequent to the proceedings for the Mausoleum, that Wren superintended the re-erection of Le Scur's statue, at Charing-cross, of which he designed the pedestal carved by Gibbons. There are also in the same volume, plans for extensive stabling and barracks. One (101), a plan "of barracks in Hyde-park, for 1,000 horse," shows what might be called the pavilion principle applied to stabling.

The third volume contains plans of apartments in St. James's Palace; of the Earl of Oxford's house, St. James's; and the Duchess of Buckingham's; of the old record-rooms at Westminster; and others, including sketches and plans of the House of Lords and buildings at Westminster, which are probably Hawksmoor's. Amongst many drawings which there are of the Westminster School, there is a sketch of a new dormitory, like the building existing, which is marked, "Examined July 14, 1718-19, C. W." There are also drawings showing the relative situations of Old St. Paul's, with Jones's portico, and the present church, which latter is shorter, inclines more to the south-west, and has the intersection of the cross more to the east.

There are, doubtless, amongst the treasures of the Bodleian, and besides All Souls', in libraries of the colleges, whether at Oxford or Cambridge, great stores of material for the history of architecture, that have never been fairly examined. We are not referring only to what may be found, in Oxford, at Worcester College, relating to Inigo Jones; and in the Radcliffe Library, to Gibbs. Whether in the old loft at Merton, with its picturesque Elizabethan furniture, or in the later built and fitted library of Queen's, to which additions have been made under the direction of Mr. Cockerell, it is impossible for one having any mind for study and research, to help sighing that in place of months, only hours can be spent over what must be in each case so rich a mine, as in the midst of associations the most conducive to study.

#### BRITISH ARCHÆOLOGICAL ASSOCIATION AT SHREWSBURY.

The seventeenth annual Congress of the Association was opened on Monday, the 6th instant, at Shrewsbury, under the presidency of Beriah Bosfield, esq., M.P., and with the support of most of the nobility and influential gentry of the county. The Town-hall was placed at the disposal of the Congress, and the members assembled in the *Nisi Prius* Court, at three o'clock, to the number of about a hundred, when Mr. W. Bury, the mayor, inducted the president; and the Corporation presented an address of welcome, to which the president replied in the name of the Association.

The president's address occupied upwards of an hour and a half, and consisted of a eulogium on archaeology, and an erudite and able dissertation on its usefulness; followed by a condensed history of Shropshire, with some account of its language, agriculture, industry, and arts. He concluded by paying a tribute to the Rev. R. W. Eytton, for his recently completed "Antiquities of Shropshire," and to the memory of Blakeway, the historian of Shrewsbury; also to Mr. Thomas Wright, for his several works, and the explorations at Wroxeter.

The members then examined the abbey church very hastily, under the guidance of Mr. C. E. Davis, F.S.A. He said it was but a fragment of the original church, consisting of the western portion of the nave from the central tower. The nave was originally of one style, but now consists of three Norman bays on each side, with two others at the west end of subsequent date. There never was a western tower. The central tower was low, with probably a lantern, as was usual in Norman buildings. The east end had most likely an apse. The chapter-house no longer exists, but the door from the south of the church to the cloister is still visible. He doubted if there had ever been a lady chapel.

The style of building was Early Norman, and characterized by extreme simplicity. There had been a triforium, or blind story, and a story over that. He complained of the hideous modern gallery at the west end, and hoped the corporation would have it removed.

Subsequently, the company examined the decorated pulpit in the garden, supposed to have formed part of the refectory.

Mr. J. R. Planché, *Rouge Croix*, commented on some of the monuments. Whatever he says is always listened to with the greatest attention, and deserves some notice here. The first in order was one at the old south doorway, and was stated in the guide-books to have been dug up, prior to 1623, where Roger de Montgomery, the first Earl of Shrewsbury had been buried, and the author and the heralds then visiting the abbey imagined it would represent that warrior. This figure, and

another in the same church, supposed to be Earl Hugh's, were both said to be cross-legged; but this one never was so. Both the legs were broken off, but enough remained to show that they were perfectly straight. If these effigies were ever intended for Roger and Hugh, they were made long after their death. This one was of the date of King John, and very interesting,—somewhat similar to those in the Temple Church in London, which were of that date.

The next effigy was supposed to be that of Walter de Dunstanville, of Shiffnal, who died in the reign of Richard I. If this were so, it must have been made long after, as the cross-legged effigies, of which this was one, were not made until 1230, or later, and this would be, then, another instance of monuments being erected to individuals long after their decease.

Another recumbent figure is in the north aisle, but Mr. Planché had nothing to add to what had already been written about it: he attributed it to the time of Edward II. It represents a judge, but it is not known whom.

Another in the north porch was described in the guide-books to be in plate armour, which was a great error. It was a fine old figure of the time of Edward III. in civil attire of state. It had the mantle of state similar to those in all civil effigies of that period. This was removed from St. Alkmund when that church fell down. Another adjoining, also from St. Alkmund, was of the same period or slightly older—probably a merchant or official.

Mr. T. J. Pettigrew, F.R.S., treasurer, read a brief paper on a unique monumental effigy of a sub-deacon in the south aisle—a stone slab of the thirteenth century was sculptured with a small figure below a floriated cross. The figure was clothed in a clerical dress with an alb, and the emblems in the hands and about the figure, were a bell, a book, a lighted taper, and what was said to be a chalice, but this was an error, as it was quite clear that the person represented was a sub-deacon, or some one even inferior, who would not be allowed to carry the chalice—he therefore concluded it was a holy-water vat.

Mr. Pidgeon (the author of the "Guide") said he had considered it to be a holy water. This, however, was generally disputed. Mr. C. E. Davis thought it was a representation of the pyx.

The day had now nearly closed, and, together with a steady rain, prevented much further research amongst the antiquities of the city. The president, however, and a score of others, were zealous enough to make their way to the fine old church of Saint Mary's, which was described by Mr. Edward Roberts, whose account differed considerably in respect of dates from the Guide-book. Mr. Roberts made a difference of 70 or 80 years in the dates of some of the parts described in the "Guide."

He said,—it is generally considered to have been founded about 980, by King Edgar; but the earliest portion visible in the present building is of about the end of the eleventh century, and from that time up to the last period of Lancastrian and Tudor specimens are to be seen here, a great part of it of excellent character, but some very debased and inferior, probably due to repairs and restorations. It consists of a nave and chancel (24 feet wide, and about 136 feet, or, including the tower, 160 feet long); north and south aisles; transepts, with large chapels, north and south porches, and solar or library over one. The tower is Norman in the lower part, but seems to have been considerably altered or repaired internally. The nave has probably been reworked after the piers and arches were built, or it was the earliest indication of the pointed arch, scarcely differing from the circular. The piers were of clustered shafts of Early English spirit, and perhaps the earliest indication. The clerestory is early Tudor. The chapels are very lofty, but much altered from the original character. In the arch between the south chapel and the nave is a table-tomb with an effigy of a cross-legged knight of the fourteenth century, very similar to the one in the abbey. The tomb is beautifully arcaded in the canopy-work of that period.

The north porch caused much discussion; Mr. Pidgeon insisting that it had been built by the same workmen who had built the abbey, after that was completed: Mr. Davis and Mr. E. Roberts asserted that from its style that was impossible. It is groined and has two windows, with a central pillar and plate-tracery over it, with a quatrefoil.

There is an immense quantity of very fine glass, brought from several places; but it has been much and well repaired.

At the evening meeting, which, notwithstanding the rain, was attended by nearly a hundred members, Mr. Botfield presided.

Mr. Planché read a paper on the Earls of Shrewsbury. He said that Owen and Blakeway confounded Roger de Montgomery, the first earl, with his brothers and uncles, and he cleared up the genealogical difficulties. Robert de Belesmo was the last earl, and it might be this one whom the cross-legged effigy in the abbey represented.

The Rev. Mr. Bridgeman read the Rev. C. H. Hartshorne's paper on Powis Land and the Earls of Powis: it seemed to lead to nothing very conclusive.

Mr. Gordon Hills read a paper on "Buildwas Abbey," giving a full description of the remains of that once important edifice, with conjectures of what it was in its original state. He said, this building is a fine example of the smaller class of Cistercian Abbey Churches. Every part of its arrangement is preserved or distinctly traceable. The width of the aisle on each side of the nave is marked, though the enclosing walls are gone. The convent brothers and lay dependents of the monastery were placed during divine service at the west end of the church. Their entrance from the great cloister, I think, must have been close to the west end of the north aisle. This position is not quite usual for a door, nor is it usual for a church to be without an entrance at the west end of the nave, which clearly was the case here. My reason for believing the door to have been close to the end of the aisle is, that the western of the nave arches is some inches wider than the others. The massive proportions of these arcades, and the scalloped capitals of their columns, indicate the prevalence of the Norman style of architecture; while the pointed arches show an approach towards the style which early in the thirteenth century superseded the Norman, the union forming the transition style which began about 1150. The clerestory remains entire on both sides, and has round-arched windows throughout. Advancing to the east we find between the columns indications of a stone screen, which shuts off the aisles, leaving them as mere passages; and at the end of the fifth arch from the west, we ascertain that the choir, or portion devoted to the monks themselves, commenced. The bases of the columns here and eastward are raised, so that the choir must have been entered by an ascent of four steps, in which proportion also the marks on the columns show that the side screens were raised, forming the back of the stalls. The stalls extended up to the first great transverse arch, and would seat about thirty-four monks. The number originally on the foundation is not known: at the time of the suppression it is reported to have been only twelve. I may here remark that from the number recorded to have inhabited other monasteries, we may conclude the whole of the lay inmates to have amounted to about five persons for each monk. Mr. Hills exhibited a ground plan and other drawings, which proved useful to the audience, in assisting to a proper understanding of the subject.

*Tuesday, Aug. 7,* was a beautiful day, and permitted the Association to make an early start; and this appeared to be necessary, for, even with incessant exertion, the earliest return was not effected until nine o'clock—a twelve hours' journey with the same horses. The roads, too, are neither good nor easily hit, and our reporter was unfortunate enough to be on the coach, which, in addition to those misfortunes, lost its way, and did not return until after the close of the evening meeting.

The first object of interest was Buildwas Abbey, over which they were conducted by Mr. Gordon Hills, who described carefully its various details. Thence they went, through a hilly country, to Messrs. Maw's tile manufactory, which, not being an archaeological subject, we may here omit to describe. In another number we will give an account of this manufactory. A handsome lunch at Mr. George Maw's residence ended this part of the programme.

More hills and dales, and then the magnificent ruin of Wenlock Abbey was examined under the guidance of Mr. Edward Roberts, whose observations we append.

*Wenlock Priory.*—All authorities seem to agree in accepting the account of the original foundation of this abbey given by William of Malmesbury, and in fixing the date of it as 680. It is needless to say, that nothing whatever of that building is in existence, probably it was of timber, as was almost universal prior to this time, and by no means unusual both here and on the Continent, for centuries after; and it is not surprising that they have in consequence been frequently destroyed. This abbey, then, was founded by Milburga, daughter of Merewald, a Prince of Mercia and niece to Wulphere, the King of Mercia.

Milburga's sister dedicated herself to celibacy, as we gather, on account of the death of her bro-

thers, who were murdered by, or at least the murder was permitted by her uncle. Her mother founded a monastery at Mûster, in Kent, on land given as compensation for those murders; and it is possible that the immediate cause of this foundation of Wenlock was the same tragic event.

Milburg became abbess, and in process of time a saint, and on her death was buried near the altar.

The abbey does not seem to have escaped from repeated calamities, although they mostly arose from warfare, of which, from its great richness of soil and general wealth, as well as its population, this part of England was the constant theatre. It was twice destroyed by the Danes, and after the second destruction it was deserted. Some accounts state that it became decayed, and was deserted in consequence. It was not, however, until twelve years after the Conquest, that it began to appear in somewhat of the form in which we now see it. Mr. Eytton says it is the oldest, and was the most privileged, and perhaps the wealthiest and most magnificent of the religious houses of Shropshire.

The three abbeys which I have undertaken to describe to you all partake largely of the Norman and immediately subsequent eras.

After the loss of the arts by the overrunning of the Roman provinces by the Goths, there arose, in the course of time, an architecture more or less beautiful according to the greater or less rudeness of the country, and which may be considered as one great school which prevailed for six or seven centuries, the longest period of existence in any style without material alteration in so many countries not under the same rule. Originating either in the indiscriminate application of materials taken from Roman temples and houses, or in a rude imitation of them, we obtain various specimens of one universal type. Familiar as the English must have been with pure Roman works, and a high state of civilization in common with all countries where Romans went, it is remarkable that, so far as we are able to judge from Saxon remains, the worst type appeared here,—not very different from the Norman in its elements, but differing most materially in the magnitude and the taste of the works. There was besides, on the part of the Normans, an unaccountable jealousy of or dislike towards the Saxon buildings; and, although we can point to a score or two of works either in part or wholly ante-Norman, yet they are very few as compared with the vast number of remains comparatively perfect to this day of what was confessedly only a century or so of later date. Except of the sacred edifices of the thirteenth or fourteenth centuries, the majority are of Saxon origin. This we have seen was the case with Wenlock Priory. Its refounding was by Leofric, Earl of Mercia, and Godiva, his wife, shortly after 1017; but it was soon again deserted, and eventually forfeited by their grandson in 1071.

There are several slightly varying accounts of its subsequent rebuilding; but judging from the remains, there is nothing which indicates the truth of either one of them beyond the fact of the buildings being of different dates. The oldest portions are of the date of the Norman period. Domesday Book states that Earl Roger had made the church of St. Milburg an abbey, and I consider that little besides the guest-hall (near the present gate) remains of that building, if it ever was completed. William of Malmesbury, writing about A.D. 1130, says that "lately, however, a convent of Clugniac monks was established there while a new church was erecting." Of course St. Milburg's body was miraculously discovered, and was not only found not corrupt, but emitted the sweetest odours. Of the period referred to the chapter-house is part. All the church is of the massive Early English of the beginning of the thirteenth century.

It was an alien priory, and in common with others of that class was treated with much severity, and suffered exactions and confiscations repeatedly, until it was naturalized in the time of Richard II.

*Description of Buildings.*—The church is cruciform, with nave and aisles, two transepts, chancel, without aisles, and lady chapel. This I attribute to the time of Joybertus, who first appears as abbot in 1198, and died 1216; or of Humbert who succeeded him, at which time the abbey became of greater importance, and the parent of other abbeys. The south greater transept has one aisle, and an arcade or cloister. In the aisle is a coeval piscina, and probably the base of an altar: the niches for the parolæ are in the shafts;—a chapel also in adjoining part.

On the west side of this transept are remains of an altar, with part of the stone in the arching over it cut away apparently for the head of a

crucifix or statue. There are two corbels or brackets for relics, or for saints' statues. There is a drain from the centre archway.

The south transept is remarkable for the evident arrangement made with the view of preserving the chapter-house beyond,—the transept required a stronger wall than its aisle, and the main wall has either been added to or cut away so as not to interfere with the other side, and the arrangement of the arches and angle is peculiar and unique.

The chapter-house is the only remaining portion of the structures commenced, as I conclude, by Roger de Montgomery. But, whatever the foundation may have been, it was, as now existing, never designed by the same architect. It is a very beautiful specimen of the semi-Norman or Transitional period, which prevailed generally from 1151 to 1187. There is no record whatever as yet discovered by which we can ascertain the benefactor or designer of this part of the abbey. It must have been in the abbacy of Humbald or Peter de Leja. The latter was promoted from St. David's in 1176.

The walling is very elaborately ornamented with the interlaced arcading which has by some been supposed to have caused the invention of the pointed arch. He called attention to the building of the Early English church over these ornamented walls, in order to retain and preserve them.

A fireplace has been inserted in the south wall at a much later date. The whole of these buildings have been vaulted.

The ruins have been very badly used at different times. A Mr. Moore, writing in 1787, says that many years ago great part of the abbey was pulled down to rebuild some houses, and only four years since one of the clustered pillars of the church was nearly levelled, and a cart was waiting to take it away. To the credit of the late Sir Watkin Williams Wynne he it said, that he, as well as the present Sir Watkin, put a stop to these depredations.

A seal of the abbey was said to have been found at the church of Clun in 1760. Several views have been published in Grose, Beauties of England and Wales, Phillips, and Eytton.

There is a popular belief of a subterranean passage to Buildwas, of course without foundation, as was the case at Upton Court and other places seen at the last congress. In the garden at the east of the church is a heap of stones: amongst them is a very beautiful incised tracing of Early English underent mouldings, on a capital of a shaft, illustrating the subject of architectural drawings which has been occupying considerable attention lately.

Acton Burnett was reached at dark, and nothing was said about it. In the evening, on return to Shrewsbury, several papers were read, but we must leave further notice till next week.

#### SCIENTIFIC CONGRESSES AND WORKMEN'S ASSOCIATIONS.

The formation of societies of persons who are pursuing the various walks of science and art, and the congresses of others who are interested in various pursuits, are amongst the noticeable facts connected with the history of the past century. Previously to the reign of Charles II., when the Royal Society was founded, there were a few earnest men "knocking at the door" of science; but in consequence of the want of concentration much labour and valuable information were wasted, owing to the want of a knowledge of what had been previously done. The value of union, which has had such an important power in advancing particular studies, was then unknown.

The Royal Academy, the Colleges of Physicians and Surgeons, and the Antiquarian Society, were, after that just named, amongst the first class societies which were instituted in London: now we have the Society of Arts, the Institutes of Architects and Civil Engineers, Agricultural, Botanical, Archaeological, Geological, Zoological, and other societies connected with the various departments of natural history. Besides, there are the Ethnological, Statistical, Genealogical, and other institutions which are earnestly engaged in the worthy work of gaining, arranging, and distributing knowledge.

It is worthy of note, that from many of the original stems we have new branches which are extending in various directions. From the example of the Antiquarian Society have sprung the Royal Scottish Society of Antiquaries and that at Newcastle-on-Tyne, the British Archaeological Association, the Archaeological Institute; and throughout the provinces there have risen up

numerous architectural, antiquarian, and archaeological societies, which are engaged in accumulating materials for a complete record of the antiquities of the nation.

In connection with the fine arts, there are now also several societies of the greatest value.

Notwithstanding these numerous offshoots, it is satisfactory to find that in nearly every case the original institutions have increased in prosperity; and constantly we have fresh clubs and societies springing up, which, each in its sphere, serve, by the combination of those having certain degrees of knowledge, to pave the way to the general establishment of those truths which severally lead to the improvement of the condition of mankind.\*

Besides the societies above mentioned, which have frequent periodical meetings, the important congresses which take place annually of those engaged in various walks of art and science, are causing most important results. To these gatherings professors and men of eminence not only come from all parts of the kingdom, but from abroad, with their stores of information, which they exchange with others, all getting richer by the transaction. The British Association may be considered the first of those assemblages in England; and lately have sprung up the Social Science and Statistical Congresses, which are destined to throw so much light on peculiar conditions, that matters at length in doubt will be reduced to certainty, and legislators be enabled to provide remedies for those evils which have caused such great destruction of life and health, and been the cause of so much vice and mischief.

The skilful physician or surgeon, when considering the case of a patient, proceeds as soon as possible to inform himself of the extent and peculiarities of the disease: the wounds are probed, and the nature of the constitution is taken into account. Then medicine can be made of more sure effect than if the professor was left in uncertainty. In like manner, social and statistical congresses will enable us to obtain knowledge of the exact position of affairs, and to go more readily to effect a cure.

But while the great workers in science and art are found banded together for the advancement of each body, and for the purposes of mutual improvement and instruction, little has been done amongst the various classes of our skilled artisans to form, on a somewhat similar plan, institutions, by whatever name they might be called, which would have for their object the elevation of their crafts, and mutual advancement.

In connection with the Architects' and Civil Engineers' Institutes, useful books and other means of study are gathered together. At the meetings members exhibit drawings or models of their works: the youthful practitioner finds an opportunity of getting his ability made known; and is also, by the acknowledged position of others, stirred to energetic exertions.

The Painters' Company of London bare, to a certain extent, set a worthy example; and the chromometer and watch makers of Clerkenwell have founded an institution which bids fair to flourish, and increase the skill of those engaged in this important manufacture.

When thinking of this important subject, the following question suggests itself.

Why should not the stone and wood carver, cabinet-makers, the various metal-workers, decorative painters, and the numerous classes of skilled workmen, each have a club or society on a somewhat similar plan to those above mentioned, into which men might be admitted in consideration of their ability and respectability?

These should be independent of the trade associations. Recently we had an exhibition of pugilistic ability and the contention of brute force, which excited general attention. Far more worthy are those contests which take place in the ploughing and harvest field, and equally useful in developing muscular power. We have lately heard accounts of trials of skill which do not tend to the disfigurement of the human countenance, and the encouragement of a degraded taste. In one instance two farmers fought a severe battle in making within a given time the largest number of horse-shoes, of the best description. The sturdy smiths were enclosed within a certain space, and a large crowd watched the operations with the most intense interest. Formerly, within the recollection of many, there was a good deal of this kind of competition amongst masons, bricklayers, and others, not without benefit.

With the advance of the intelligence of the

\* The philosophical institutes and mechanics' institutes throughout the country should not be omitted from the above list.

upper and professional classes, the British workman should also improve, and to do so, should use means similar to those which have been so evidently the cause of progress with other portions of society.

KENT ARCHEOLOGICAL SOCIETY.

The third anniversary of this society was held at Dover, on the 1st and 2nd of August, under the presidency of the Marquess of Camden, K.G., and was very successful.

The report stated that 138 members had been elected since the Rochester meeting, and 23 more were elected on the 1st August, so that the total number of admittances to the society have been 821. Some members, however, have died, and others are in arrear of their subscriptions, and the exact number of present members was not given. The second volume of the Transactions for the year 1859 was promised in a month.

The principal feature of the meeting was a most extensive collection of rubbings from Kentish brasses, from the commencement of the fourteenth to the middle of the seventeenth century, with an interesting museum of antiquities. No paper was read on either collection, nor description given. The brasses of the fourteenth century were of excellent workmanship: two or three were Flemish, and of much beauty in design and execution. In the collection were illustrations of the armour and dress of knights and their ladies, of priests in their canonicals, of citizens and burghers in civic costume, with their wives; one remarkable feature being the large proportion who had been married twice. Kent is rich in brasses; and, large as the present collection was, there are many existing specimens, at Cobham Collegiate Church and elsewhere, which were not exhibited. The museum had Mr. Wm. Gibbs's collection, from Anglo-Saxon graves at Faversham; Sir P. H. Dykes's Celto-Romanic howl, with Christian emblems, found near Lullingstone, the ornaments on which have been recently replaced by Mr. A. W. Franks, the zealous director of the Society of Antiquaries, at whose meeting it was exhibited; an illuminated MS. representing the Court of Common Pleas in the reign of Henry VI., from the papers of Recorder Fleetwood, exhibited by Mr. G. R. Corner; a Roman urn found in Castle-street; Roman pottery found at Alkham; a dolium and other remains, found at the Buckland schools in 1859, sent by the Rev. S. T. Moss; and Samian and other Roman pottery found at Caxton last month, exhibited by the Earl of Darnley; charters of the Mission Dieu, from the Surrenden collection; a snuff-box given by Charles I. to Judge Twisden; and a gold case and tooth-pick presented by that monarch to Col. Tomlinson; the horn and remains of the corporation, including the space of Charles II.'s time, when the art of working in silver was fine, and part of the gold and silver cloth which formed part of the canopy at the coronation of George IV., of the same texture as that in the time of Queen Anne, preserved at Rye.

The buildings visited during the day were the Pharos and Church in the Castle, and St. Martin's Priory.

The excavations at the church had laid open the Saxon church to its foundation, and opened out a southern and a northern door, hitherto covered up, and gave the church a more imposing appearance than heretofore; and besides this, the fragments of Norman work have served as patterns for the restoration or re-edifying, which is under the care of Mr. Gilbert Scott. An interment in a chalk cist in the nave, and a leaden coffin in the north aisle, have been brought to light. The cist was lucidly explained by the Rev. J. Puckle, who had caused a ground-plan to be lithographed, which marked distinctly the Saxon portion of the fortress, and all the additional towers and works in the Norman and Medieval times; with the names of the persons for whom the several works were executed. The account is to be printed entire; and, by adding dates to the map at the different parts of the works, a valuable guide will be furnished for future visitors. Of the church itself, the rev. gentleman said, he had always supposed that the ancient edifice had been constructed of much larger dimensions, and of somewhat different materials than the Pharos itself, and at a later date. There were no traces of Roman tiles, very few of which had been found during the excavations and repairs now going on. Although our Saxon forefathers endeavoured closely to imitate the Roman style of masonry, still the difference between bricks or tiles baked and burnt was too apparent not to be observed; the Roman tiles being grooved somewhat after the fashion of waves upon paper; and thus they would

sink into the concrete and consolidate the whole fabric.\* In digging beneath, they came upon the foundations of what there was every reason to believe was the ancient Anglo-Saxon church of Egald the Saxon. If this were true, the date of St. Augustine's death being 605, it was at once clearly determined that this ancient British church was before his day. Mr. Puckle directed attention to the peculiar features of the edifice, the "long" and "short" work so distinctive of Saxon origin, and the "double-splay" windows, and various other indications, as corroborative of this idea; there were similarities to the Norman form that might be seen at Canterbury; but, then in this Norman style, they never found the "double-splay" upon the windows. He was disposed to date the foundation of this ancient church in the year 518. Beneath the western window, overlooking the Pharos, there was a smaller opening, which was exactly the height of a man's eye. It had been recorded that the Pharos was used as a guard-room, and mention was also made of two sergeants being appointed to keep lights continually burning in the chancel; and it would not be an extreme idea to imagine that this small window enabled the soldiers in the guard-room to see that their charge was properly attended to.

The architecture of the priory of St. Martin's was explained by the Rev. Dr. Plumtree, Master of University College, Oxford, who, with the aid of Mr. Ayres, the builder, had been able to trace the foundation, and to form a good approximate opinion as to the conventual church, and the parts now destroyed.

The walls were constructed of rubble and Kentish rag, together with finely-wrought Caen stone. The edifice itself consisted of a nave and two side aisles, and was 285 feet long; a chancel and a transept crossing the nave and aisles at about 145 feet from the western entrance. There were also two small chapels, with apsidal terminations similar to these at Romsey, at the sides of the chancel. At the north extremity of the transept there had been a chapter-house, 54 feet long by 20 feet wide. There were also discovered the bases of nine arches on pillars, each 15 feet wide, which had divided the aisles from the nave (33 feet wide). The bases of these pillars were about 5 feet square; the chancel or choir 40 feet long and about 29 feet wide. By the measurements, he had arrived at the conclusion that this monastic establishment must have covered about 20,928 feet, exclusive of the chapter-house. The refectory was one of the largest and most perfect in England. It was 100 feet long; in its walls the Caen stone was used in common with the other materials he had mentioned. It was of the Anglo-Norman period. Archbishop Corhoil, in 1132, obtained a grant from Henry I. of the revenues of the monastery of Martin's-le-Grand, at Dover, and erected the monastery or priory; and, as it was taken possession of in 1139, it was pretty evident that it must have taken seven or eight years to construct; and the stone showed in places marks of fire: similar traces existed in the Canterbury Cathedral and Gloucester Cathedral. There was an entry in the "Monasticon" which proved that these ravages were the work of an incendiary. Traces of paintings had been discovered on the walls, and beneath the windows might be distinguished the outlines of thirteen heads, the centre figure being taller than the others.

A well-served dinner was provided at the Wellington Rooms, and 180 ladies and gentlemen sat down. In the evening a *conversazione* was announced, and many attended. There was, however, little done. The Rev. J. Edge read a paper from Mr. Elphée, "On the Danish Vessel found in the River Rother, in 1822," which attracted much attention at the time, and was removed to London for exhibition. The vessel and its contents are figured in plate 30 of Rouse's "Beauties of Sussex;" and the paper added nothing to the particulars there printed; but it led to a subscription to raise another vessel supposed to be still in the sand. The evening closed with a few extracts from the public records relating to the Kent volunteers in the olden time, made by the energetic and popular secretary, the Rev. Lamherst B. Larking; to be printed at length in a future volume.

On Thursday excursions were made to St. Radigund's Abbey and the church of Alkham, to St. Margaret's-at-Cliffe, and to Barfrestone Church and the Roman camp at Coldred.

\* This was for the bond course in the Roman work at Dover, but flat and perfectly smooth Roman tiles are found in Richborough, Pevensey, and elsewhere.  
† The refectory at Battle Abbey is 106 feet long by 35 feet wide.

Of the building of St. Radigund, or Bradsole (founded in 1191), little remains, and little more is known. The gateway is of the time of Edward III., and on entering the square the arches of the huttery hatches leading to the refectory are found to be the only original parts left. The refectory itself has been shortened, and Leland tells us that the buildings had been larger than in his time. On the opposite side of the refectory, on the north of the square, are two rooms with a gable end and Perpendicular windows of the period of Henry VI., which might have been an oratory and ante-chapel; but all is in doubt, and must remain so till the foundations have been traced. A. Poyning and other men of note directed their bodies to be buried in this abbey, and hence a church is supposed to have existed; but the burial-place of the monks themselves was in a mortuary chapel on the north side of Alkham Church, a chapel distinguished for its elegant two-light Early English window, with shafts between the lights and at the sides, and an oriel window above, and for its Geometric (trefoil-headed) arcade of Caen stone, with Purbeck pillars. The original abbey barn is standing, and still used. It is large, but not too large for the grange of 450 acres. Mr. Poynter described the few remains; and a good paper might have been easily prepared for the occasion. The abbey was much used by the pilgrims going to the shrine of St. James of Compostella, and to the Holy Land. Aldrington Church, in Sussex, which had passed to Hubert de Burgh, on his marriage with Beatrix de Warren, temp. Henry III., together with the church of Portslade, was given to the canons of this church for the sustenance of themselves and the pilgrims journeying that way: \* and though the revenues were small, and the number of canons was only nine, the buildings indicate a sufficient provision for the pilgrims. The well still supplies the farmhouse, built by a grantee of the site in the days of Elizabeth, on the side where the abbot's apartments stood. This well is sunk for 300 feet till it reaches the water below the chalk, and has been known to be dry only once. The large pond or "sole" (Sax.), from which the place was named, and the fishing-ponds, are still to be traced, but are now dry.

The visit of the society has saved the facing with white brick of a flint buttress to the tower of Alkham Church. W. D. C.

THE ART-UNION OF LONDON COMPETITION.

THE Council of the Art-Union have reason to be satisfied with the response made to their offered premium of 100*l.*, for a series of drawings illustrative of "The Idylls of the King;" as, by the way, Mr. Tennyson and his publisher have with the Art-Union, considering the enormous advertisement and notoriety they have given, and will give, to the poem. Such a piece of good fortune has occurred to few authors. The forty-three sets of designs, consisting of 510 drawings, show a very large amount of talent. Some of the competitors have sent as many as nineteen drawings, others fourteen, the required number being twelve. The stake is a large one, amounting in fact to little less than a reputation, as the selected series will be engraved and distributed all over the world, and the name of the artist will be further set forth in the reports of the Society for years. The costume question has evidently plagued some of the competitors; indeed, if we admit that chain-mail did not come into use in Britain until the thirteenth century, and entire plate armour until the fourteenth century, it will be thought that very few of them have preserved correctness in this respect; a circumstance the less to be wondered at, since the poet himself has not greatly troubled himself to do so. The period of Arthur must be regarded as the eighth or ninth century. Some of the competitors state that they have advisedly adopted the costume of the Romancers, and not of the King. What view the Council will take in making their selection, remains to be seen.

Amongst the most excellent of the designs we should place, on cursory inspection, in the order in which they hang, so as not to convey a precise opinion on the subject, No. 18 (Constancy); 22 (Consuelo); 24 (A. C. N.); and 25, marked with a Crowned Skull. The merits and demerits of these must be carefully discriminated and balanced in coming to a decision. Amongst those less equally clever, but deserving attention, we should place No. 1 (Dion); 4 (Koppa); 5 (a Crown); parts very clever; 6, elegantly drawn, but mis-

\* Sussex Archaeological Collections, vol. XII., p. 121

taken in type, with a large number of added designs in circles around the main drawings; 14 (red cross); 17 (double triangle); and 43; while less emphatically we might mention 31, 42, and some others. No. 2 and No. 36 have considerable pretensions, but the authors have not submitted the required number of drawings.

Amongst the works of art purchased by prize-holders are some very excellent landscapes, and M. Durham's admirable statuette "Chastity," selected by Miss Ross Allason. The collection is further enriched by the competition statuettes and groups, of which we have already spoken, and a reduced copy of Mr. Foley's fine statue of "Caractacus," made for the Art-Union by the sculptor preparatory to its production in bronze.

#### SOUTH KENSINGTON MUSEUM.

THE Report of the select committee, occupying 63 folio pages, has been issued. An early class says,—

"The collections illustrating Architecture are partly the property of the public and partly belong to the Architectural Museum Committee. The collections of that Committee are valued at 2,500*l.*, and were brought from some lots in Cannon-row to commence a National Gallery of Architecture. These collections, for want of room, are at present ill arranged and crowded. They are much consulted by artisans employed in architecture. The same want of room prevented the Department from taking possession of the architectural casts obtained as models for the Houses of Parliament, purchased by the public at 7,000*l.*, and now resting the Office of Works 49*l.* a year for horse-room at Thames-bank."

Having arrived at the opinion, that the Museum in respect of its action as well throughout the United Kingdom as in the metropolis is exercising a beneficial influence, and that it is fully deserving of continued parliamentary support, the committee turn their attention to the state of the buildings at South Kensington, and arrive at the conclusion that additional space for the accommodation and exhibition of the art collections should be provided at once. Capt. Fowke states that the cheapest mode of obtaining this space would be to complete the quadrangle of brick buildings which was commenced by the Sheepshanks, Vernon, and Turner Galleries, and to glaze it over. He estimates that this might be done for 17,000*l.*, and by doing so the art collections now in the Iron Museum would be placed in safety, others not properly shown would be efficiently exhibited, whilst space would be provided in the Iron Museum to receive and exhibit the architectural casts. The report thus concludes—

"The danger arising from the use of the wooden schools and dilapidated houses renders it equally necessary to remove these buildings, and instead of them to provide as nice safe buildings for official residences and the art training schools. The cost has been approximately estimated by Captain Fowke at 27,000*l.* The committee recommend these works as matters of extreme urgency, the completion and covering in of the quadrangle court as a means of securing much valuable public and private property from a respectable quietude for it, the removal of the wooden schools and the dilapidated houses from considerations of safety, and, therefore, of real economy. The Iron building and the temporary brick buildings your committee see no occasion to disturb at present. They can be usefully employed, and may well be allowed to stand for some years to come. Your committee are by no means anxious to involve the revenue in large expenses for mere ornament. The museum is yet in course of formation, and they think it unwise to commit the country to a heavy expense in anticipation of its wants. The committee recommend that any plan which may be adopted for the buildings to be erected should be capable of being worked into a general plan which would at once fully occupy the ground, and be susceptible of a proper amount of decoration. Such a plan has been laid before the committee by Captain Fowke."

#### HISTORY OF GLOUCESTER CATHEDRAL.

WE avail ourselves of a report in the *Gloucester Chronicle*, of Professor Willis's "Sketch of the History of Gloucester Cathedral," given to the Archaeological Institute.

The general character which Gloucester Cathedral presents is that of a Norman cathedral completed nearly from one end to the other, but subjected to various alterations in consequence of repairs and faults of construction. Most of the writers on the cathedral describe the south aisle, and the choir, or presbytery as it was called by Abbot Frocester, as Decorated, but its features are only plastered on the Norman wall. The whole transept and choir present one of the most glorious examples of architecture he had ever seen. Bearing in mind that beneath the edifice there is a beautiful crypt, he would give passages from Frocester's Chronicle, which fixes the dates to the particular parts. The Chronicle said, in 1058 Aldred the Norman bishop built the church from the foundation (this was in the time of Edward the Confessor), and dedicated it to St. Peter. It was, then, either a Saxon or Early

Norman Church in the style prevalent at the time of Edward the Confessor. Now archaeologists have ascertained that the Norman style was brought in during the reign of Edward the Confessor, and the work was very rudely executed, judging from the examples of it in Westminster Abbey. In 1087, said the Chronicle, the cathedral was burnt down, and in 1087, that is, after the Norman Conquest, on the Feast of the Apostles St. Peter and St. Paul, the foundation of the church was laid by Robert, Bishop of Hereford, at the request of Serlo, the abbot. The first stone of the foundation was then laid in the time of Abbot Serlo in 1089. It was completed for consecration in 1100; it was certainly completed sufficiently for the performance of service, and probably the nave was also finished. In 1163, or between 1163 and 1180, the Chronicle states, the north-west tower fell, owing to a bad foundation; this fact shows that the building was a Norman church, and that there was a north-west tower. In 1222 the north-west tower was rebuilt by Hilarius, the sacrist, but that tower has now disappeared, and he need not treat of it, nor of the chapel of the Blessed Virgin, because that also did not now exist. In 1242 the Chronicle said the vault of the nave was completed by the monks themselves; they did not employ common workmen, and therefore he might suppose that the monks considered they would do the work better than common workmen. It is an Early English vault. The Chronicle next brought him to Tokay, a very important person in the building. Tokay gave Edward II. honourable burial in the church, and that attracted to the church a multitude of visitors; all classes began to regard the murdered king as a martyr and saint; and the offerings on his tomb amounted to such a prodigious sum, that the monastery was supplied with the means of building the church. That was, in fact, the great era of the church. Now Tokay, before that period, says the Chronicle, had constructed the south aisle of the nave at great expense; and we now see that this aisle has received an outer case; whereas before it was a Norman nave with a Norman vault, it now presents a Decorated vault with Decorated ribs, and the outside also appears to be Decorated. It is one of the most beautiful examples of the style; and it has this great advantage which other altered buildings do not possess: in other buildings the proportions very often constrain the designs in the new work, and give it a mixed character, spoiling both; giving, for example, heaviness to the Norman and flimsiness to the Decorated. But this is not the case at Gloucester; the south aisle is a good example of the Decorated. The windows resemble some in Merton College, Oxford. There is a variety of windows there, but the pattern occurs twice. The connection between Gloucester and Oxford was very curious. The college was founded in 1280, and the windows were of that period. Merton College was one of the first established in England, and the monks of Gloucester established a college for their student monks at Oxford, which afterwards became Gloucester College. Merton College was founded in 1280, Gloucester in 1288; Tokay began the south aisle in 1307, so that it is probable that he derived the pattern of the window from Gloucester College, Oxford. He (Professor Willis) knew no other example of it. This shows that windows were continually copied; indeed there are contracts still in existence, stipulating that windows and other features shall be copied from those in other buildings. In 1329, Tokay was succeeded by Wigmore, who seems to have made a table for the prior's altar, and he was well skilled, for the images were worked with his own hands. In Wigmore's time began the offerings on Edward's tomb, which enabled him to construct the aisle of St. Andrew as it now appears. The next person was Staunton. In his time it was that the prior of the monastery was made an abbot, and also was constructed the great vault of the choir and the stalls of the choir on the prior's side; and these were built with the oblations of the faithful. Indeed, the monks, it is said, grumbled about the expense; because it was so high up, he supposed; they declared more money was spent in ornament than would have rebuilt the whole church if it had been properly employed. The next person concerned was Thomas de Horton, the second abbot; and in his time the Chronicle states the high altar, with the choir and the new stalls on the abbot's side, were begun and finished, and also the aisle of St. Paul. The work was commenced in 1367, and completed in 1373. Nothing more was told of the history of the church till they came to the time of Walter Frocester, who wrote the Chronicle

which supplies the facts which he (Professor Willis) had stated. A commentator on the Chronicle after his death tells us that amongst other things which Frocester built was the cloister of the monastery, which had been begun in the time of Horton, and completed to the door of the chapter-house, and remained imperfect. Frocester was a great builder, and he took up this great work and completed it. For the rest of the history of the cathedral, strange to say, there is nothing else to depend upon but a passage in Leland's "Itinerary," containing, as he said, "notable things following I learned of an old man, lately a monk at Gloucester." Leland gives the facts all of a jumble, without any regard to chronology; but, by comparing his statement with the Chronicle, it appears that the north aisle and St. Paul's aisle are the same. He should assume this as a fact. Leland's old man said the south aisle was made with the oblations; the Chronicle says that Wigmore, who received them, made St. Andrew's aisle; so that here was the identity of the south aisle and St. Andrew's aisle established. He should, therefore, assume this as a fact also. Leland also said that Abbot Scarbroke built a great part of the tower, which was "a pharos to all parts of the hills." It is so still, at least by daylight, for a light is not put up at night. Then Leland says that Morwent erected the stately porch and two pillars at the west end of the nave, being minded to make the whole alike. We must be glad that he did not live to spoil the Norman by his paltry Early English. Now, it is remarkable that the only history of a late period resting on mere gossip; they found all later historians referring to each other, and when they got back as far as Willis, they found him referring to the old gossip on whom Leland relied. He had now done with history, and he would show what use could be made of it in fixing the dates of the different parts of the cathedral. First we have got the date of the crypt. The mention in the chronicle of a Saxon foundation has led many antiquaries to believe that the Saxons commenced the church, and the Normans completed it. But there are alterations in the crypt of a very curious character, and this is a very important point for consideration. One curious point—he had only discovered it the day before—is that the chapels which radiate from the choir instead of being circular or polygonal, and on examining some of the stones lying on the grass, he found that they were arcs of circles. It was now clear to him that when the foundations of the cathedral were laid the crypt was planned to receive the existing superstructure and no other. Indeed, in its design it is far too complicated for a Saxon church. He rested his opinion on the great complexity of the plan. The building is in conception a Norman church from bottom to top; with this difference, the bases which were forced on the architect for reasons of construction compelled him to make the east end of the crypt polygonal. It is a very early instance of polygonal chapels; and, indeed, every example of other styles is early at Gloucester. We find the arches of the crypt ribbed rudely, but in parts of the superstructure they are not ribbed but groined. Now all the buildings before the Conquest had not groined but ribbed vaults; and he thought some of the first of that construction might be claimed for Gloucester. It is allowed that this building had then very early, and they were of such rude form that we might think the builders of the cathedral struck out the idea for themselves. A slight examination showed that the arches of the crypt are greatly distorted. The statement of the chronicle that the tower fell down is confirmed by the state of the walls, which shows that the foundation of the building was faulty. It appears to have settled and become in a dangerous state, and an examination of the ribbed vault shows another curious fact. It is found that originally they were groined, so that the vault is not a real ribbed vault. These ribs have, indeed, been inserted under a previous vault, to prop it up. The builders saw the building settling in a dangerous way, and the Norman rib vault being understood, they applied it in this ingenious way. When this took place, there was no transept or choir, which clearly were in the Perpendicular style. The character of the Perpendicular is that the lines run right up to meet the arch-heads; but in the tracery of the cathedral you get flowing lines, which plainly indicate Decorated. The south transept, for instance, does not contain work such as the Perpendicular defines; but in the north aisle there is a great branch which runs up to the arch-heads, so that we have here the Perpendicular style. There is also some hexagonal tracery, similar in general character. Now, as regards the way in which this

is done,—all this beautiful tracery is laid on the Norman wall below. Parts of the choir are nothing but the ancient Norman work cut down and shaped; this shows the skill and economy of the builders. It may be supposed that this was done by Wigmore. He was inclined to think the Perpendicular style commenced in this district; it must have begun somewhere; in some places the mullion must have been carried up for the first time; and he knew no place so likely as Gloucester to have produced the change of style. There are no dates so early. The earliest is the great west window of Winchester, built in 1350 or 1360. You see here a nascent Perpendicular design gradually changed. The definition of Perpendicular is that a generally unbroken line rises from the ground to the top of the arch; this showed itself here in 1338; where, then, was it more likely to have originated than here? The lines of the vault are peculiar to England, the ribs run like a spider's web, and are most difficult to work out. There are earlier examples, earlier than the vault of the aisle of St. Andrews, which is the earliest in this Cathedral; but very few buildings have such magnificent examples as the vault of Gloucester. But there is this peculiarity in this vault, that it demands great skill in the art of stone-cutting, so that the joints may lie truly together, without which all would fall to the ground. That shows that the builders of the Cathedral were most skillful masons. This led to fan vaulting; a noble example of which is seen in the Cloisters; it springs from one central point. The fan is not much like a lady's fan, but more like an umbrella turned inside out, because the curvature of the ribs is all the same. This, of course, led to stone-cutting at the same curvature. This style of vaulting is entirely peculiar to England; there is no specimen of it on the Continent that he had ever seen, and all foreigners he had consulted say they have nothing like it; besides, they don't like it; it is ungenial to their eyes, and they say it looks like a thing turned inside out. But it demands the greatest skill in stone cutting. This vaulting at Gloucester is clearly dated 1360, and there is nothing like it till long after the reign of Henry VIII.; therefore we must assume that this school of masons produced fan vaulting, the glory of our own country. He was not saying this to pay a compliment to Gloucester; to justify this he might add he had put it in print many years ago; there it is in print, and it has become an established fact. The whole building, indeed, is full of peculiar fancies. What is more peculiar than the slender arch spanning the great arch of the tower, looking like a piece of carpentry in stone, and apparently holding up the vault? It is a deception, because it rests securely on the wall beyond. But the object is not to deceive, it is built for a good æsthetic reason. Unless something or other was provided the builders must have allowed the capital to hang down to a level with the others without anything to support it, or altered the arch above, and thus have disturbed the curvature of the vault. He believed that the arch was contrived to get rid of these defects. All this appears to be characteristic of a school of masons who were extremely skilful and glad of an opportunity of showing their skill, just as a modern engineer likes to carry his railway through a chain of mountains when he has a plain valley before him, to show his skill. The original south aisle ran completely round the east end of the choir. Abbot Staunton was determined to extend it, and in so doing contrived to solve the problem of getting a window wider than the side walls which contained it. Professor Willis then described, by reference to the plans, how the builders extended the side walls to relieve the new walls of the weight of the superstructure. He admired the ingenuity of the middle ages, but whatever may be said of their skill and science shown in their masonry, he believed they had none. They were perfectly practical and most ingenious men; they worked experimentally; if their buildings were strong enough, there they stood; if they were too strong, they also stood; but if they were too weak they gave way, and they put props and built the next stronger. That was their science, and very good practical science it was; but in many cases they imperilled their work, and gave trouble to future restorers.

Afterwards Professor Willis went through the building, and commented on its various peculiarities and beauties.

THAMES TUNNEL.—During the week ending 4th August, 18,033 passengers passed through, and paid 75l. 2s. 9d.

THE SHILLING TELEGRAPHAGE.

AN improvement in the telegraph system, which we have long wished for and advocated, is now likely to be realized by means of various and ingenious inventions, constituting an almost entirely new mechanism for the facilitation of telegraphic operations, and which is already in the hands of a new company, "The United Kingdom Electric Telegraph Company (Limited)," to be forthwith carried into practice.

The company will have a capital of 150,000l. It has been brought forward under favourable auspices, for the purpose, as the prospectus states, of establishing "a system of electrical communication, based on the principle of the penny postage, to convey messages throughout the United Kingdom at a low and uniform rate—a shilling for a short message, or some equivalent charge—irrespective of distance." It is Mr. Allan's system of electric telegraphy which is to be adopted, and it is believed that this system will, from its great rapidity and other advantages, effect an important saving in primary cost and working expenses. The arrangement is to place London in direct circuit correspondence with all the principal towns of the United Kingdom; and the promoters base their estimates of success upon the results achieved on the Continent, especially in Switzerland, where a low tariff, similar to that which it is now sought to introduce here, has realized high dividends, which have rendered telegraphic stock a favourite among the investing public of that country.

The improvements and inventions of Mr. Allan are too elaborate to be here described, and especially without the aid of diagrams; but we may state that they include a complete system of message printing, sending, and recording, by means of mechanisms which, it is believed, will ensure a rapidity of operation much more in accordance with the capabilities of the electric force than anything hitherto realized in practice. The messages, in the first place, instead of being sent "by hand," as it were, are put into the telegraphic apparatus ready printed in the form of punched paper cut out beforehand by alphabetical punching and composing machines, or keyed instruments, which rapidly prepare them for the telegraph; and the messages, in transmission, record themselves by special apparatus at the other extremity of the line. Resource is had to alternate negative and positive currents also, and to new pole changes or relays, for the obviation of delays and the general improvement of the telegraphic system; so that, on the whole, as we have said, an almost entirely new mode of telegraphing will be adopted, which, if it succeed, will completely supersede the old system, and compel all telegraph companies to adopt it (if allowed so to do) in self-defence, no less than for the public behoof.

The cheapening of telegraphic communication is also now being mooted in France. A Paris letter in the *Nord* says:—"The idea has been entertained of reducing the charge for telegraphic communication. That course would be a happy complement of the free-trade measures. The telegraphic despatches transmitted from offices in France do not yet amount to more than 500,000 f. per annum, each costing on an average 5 f. 6 c. That number is small in comparison with the 250,000,000 of letters sent through the Post-office. The reduction in the telegraph charges would therefore be at the same time a benefit for the public, and a good measure for the administration."

THE CANYNGES SOCIETY: ST. MARY REDCLIFF, BRISTOL.

THE thirteenth anniversary of the Canynges Society, established to raise funds for the restoration of the church of St. Mary Redcliff, was held on the 2nd inst. Divine service was, as usual, first performed in the church, the Bishop of Llandaff preaching the sermon. At the meeting subsequently, the president, J. Battersby Harford, esq., occupied the chair. The report read showed that the amount of contributions last year was about 500l. The report proceeded:—

"Your committee are able to announce the complete restoration of the stonework of the south porch, by means of contributions supplied by the efforts of the Commercial Auxiliary Association, in whose report this restoration will more particularly be noticed. The stonework of the east window of the Lady Chapel has been completed, and the stained glass, to be executed by Mr. Wailes, is in a forward state. The stonework of the north window of the Lady Chapel is also ready to be put up, and means are provided for stained glass, for which drawings have been ordered. A window has been completed in the north transept by the surviving members of the family of the late Mr. William Hopton Wylde, to the memory of that deceased gentleman, who was a respected

parishioner, and who assisted the restoration by his contributions and exertions. The doors of the north porch have been completed by the continued liberality of *Mrs. Desperdenem*, at a cost of 66l.; the elaborate tracery is well worthy of examination. A donor, whose name has not been allowed to transpire, has, through Mr. Churchwarden Powell, offered to contribute another stained-glass window, and that at the east end of the south chancel aisle has been selected. The buttresses on the south side of the church are now completed. The internal reparation of the church has also proceeded. The restoration of the pillars, mentioned in the last year's report of the Commercial Auxiliary Association, was completed, together with two other pillars by Mr. Alderman Barnes, and another by the treasurer, Mr. Edwards; and three anonymous benefactors have intimated their readiness to undertake the restoration of four out of the remaining five pillars, provided any one can be found to undertake the fifth. The Society of Freemasons have undertaken the restoration of the north east corner of the Lady Chapel. The work is proceeding satisfactorily, and it is the intention of that body to lay the chief corner-stone at an early period with Masonic honours."

The report then went on to state that Mr. Lucas's munificent proposal to give 1,000l. on condition that the sum of 800l. a-year, for five years, was secured, had proved successful, and that the sum of 5,000l. was thus secured.

A report from the Commercial Auxiliary Association was read, which announced, amongst other things, that the "Hall window," in the south side of the Lady Chapel (by Messrs. O'Connor), was finished and set up.

Dr. Symonds proposed, in an eloquent address, a resolution of thanks to the president. He said, as to the restoration he was glad that the movement had taken place in this age, for it was a practical refutation of the abominable calumny against the age, which had been called a mere mechanical, utilitarian age. Thank God it was a mechanical age: all sorts of improvements were being effected for the benefit of the population, for spreading comfort, and for extending advantages through the land, many of which would not have reached the lower classes, but for mechanical contrivances. It was also a utilitarian age, for sanitary improvements were being effected, and great reforms were being carried out in the criminal and other institutions that might be enumerated; but still it was not a mere mechanical and utilitarian age, for it was more of an æsthetic age than any that had preceded it. He would like to know at what period in the history of the nation there was so true and readily defined a love of art as in the present age—at what time more art, or a greater love of the beautiful, was cultivated than in the present day?

Thanks were voted to Mr. Alderman Proctor, to the Commercial Auxiliary Association, and Mr. Hatberly, their honorary secretary, to the treasurer the honorary secretary, the architect, and others.

Lord Stratford de Redcliffe was unanimously elected president of the society for the year 1861.

EXHIBITION OF 1861 AT DUBLIN.

THE Irish metropolitans seem determined to anticipate the Londoners—in the matter of time, at least—as regards an art and manufacture display; for an ærgetic movement is now on foot to secure that object for May of next year, in connection with the Royal Dublin Society. Triennial exhibitions were formerly held by that body, prior to the Great Industrial Exhibition of 1853, but since that period have ceased. The society, however, is far more favourably circumstanced as to accommodation than heretofore, owing to the recent erection of the Museum and the Agricultural Hall, in which latter the proposed exhibition will chiefly be held. It is required that a sum of 5,000l. should be guaranteed by the public, and at the preliminary meeting about twenty individuals subscribed in all 1,000l.

EXTRAMURAL INTERMENT IN RELATION TO THE POOR.

DURING some recent wanderings amongst the poorer neighbourhoods of the metropolis, we have heard repeated complaints of the additional cost of interment in the suburban districts caused by the distance to which it is now necessary to remove the bodies of the dead. Having formerly used some exertions to put a stop to the abominable practice of intramural interment, we have felt it a duty to watch the working of the new method, and we may state some facts in the hope of obtaining remedies for any evil which may exist.

In the metropolis, at the present time, on an average, 61,360 die in each year. If we take the moderate average of 4s. each for the interment of this vast multitude of the dead, the annual cost would be 245,440l. In ten years 613,600 people die in the London district, and at the above rate

the cost of interments would amount to 2,454,400L. We believe that in the time just mentioned this sum was below the cost of the interments of this vast city; and it must always be borne in mind that these figures are constantly increasing.

The competition of undertakers is as great as that amongst advertising tailors and dealers in health specifics. This competition, though liable to unseemliness on a subject so solemn, will in the end be productive of good, and cause the introduction of some plan which will in time tend to the further cheapening and increased decency of funerals.

Before entering into further particulars, it may be worth while to mention the cost of interments at the several suburban cemeteries:—

	Private Graves.		Common Graves, Parish-tioners.		Common Graves, non-Parish-tioners.	
	Adult.	Child.	Adult	Child	Adult.	Child.
Saint Pancras, Finchley....	£ s. d.	£ s. d.	£ s. d.	£ s. d.	£ s. d.	£ s. d.
Islington, Finsbury....	1 4 0	10 0	11 0	7 8	0 14	0 9 8
Marylebone, Finsbury....	3 15	0 3	10 0	9 0	6 8	15 0 10 6
Paddington, Willesden....	5 7	6 4	10 0	6 8	5 8	1 5 0 18 0
Saint George's, Hanwell....	3 11	6 3	4 3	15 0	10 0	1 10 0 1 0
Kennington, Hatwell....	4 12	0 3	7 0	18 0	14 0	1 0 1 0 6
Lambeth, Totham....	4 12	0 3	7 0	16 0	12 0	1 8 6 0 6
Saint Giles's, Camberwell, Forest-hill....	3 7	6 1	13 6	13 0	10 0	1 6 0 1 0 0
	5 7	6 4	13 6	13 0	8 8	1 4 0 10 16 0

It will be here seen that for a common grave in any of the above cemeteries the charge for an adult ranges from 8s. 8d. to 2l. 2s. and for a child, from 6s. 8d. to 1l. 12s.

We have just now before us several charges for funerals. For 80l. we can have such costly trappings of woe as imbes on horseback, hearse with six horses, pages, mourning-coaches with four horses, coachmen and footmen, a lead coffin, with inside case lined with silk, &c., and outside coffin covered with velvet; achievements, apartments hung with black cloth, &c. For smaller sums less pomp is offered; but for 2l. 11s. an adult can be decently conveyed, together with mourners, to one of the cemeteries,—for 2s. 6d. less, if the minister is not required; an extra horse to the carriage would be 6s. more. A young child can be hurried for 18s., with the exception of the ground.

These figures show that if certain cemeteries are selected, the charge for burial, even when a separate grave is provided for the poor, is not greater than under the former ill-conditioned system; and if we could but get rid of prejudice, and induce the introduction of different arrangements, the cost of interments, and conveyance of mourners to and from the distant suburban cemeteries, might be very much further decreased.

	For Private Graves.		Common Interments.	
	Adults.	Child.	Adults.	Child.

Tower Hamlets, Victoria-park....	4 17	0 1	6 0	0 10 0*

At the Victoria-park Cemetery, and we believe in most of the above-named places, the practice of interring several bodies in one grave is continued. In the Victoria-park Cemetery a space is devoted to the funerals of children; deep pits are dug, and the coffins closely packed. We were told that in some of these graves there are as many as twenty children buried in each. Many persons complain that by this arrangement it is impossible for parents and children to rest together. So great is the number of funerals in those cemeteries in which the charge for common interments is suitable to the means of the poor, that care should be taken, and frequent inspection made, in order to preserve the regulated covering of earth (3-feet 6 inches) over the vast number of

\* This has been raised to 12s. for a child's funeral on a Sunday.

dead bodies, and that a sufficient space be left between each grave.

In the following cemetery there is a separate grave for each common interment.

WORKS IN IRELAND.

THE Amalgamated Waterford County and City Prisons are to be rebuilt according to plans by Mr. Tarrant, county surveyor. Tenders will be received till the 10th September.

The War Department are about executing the following works, viz:—An engineer's office at the Royal Barracks, Dublin; sundry slating and plumbing work at the Royal Infirmary, Phoenix-park, Dublin; a similar class of work at Fermoy barracks; the renewal of embrasures at Charles Fort, in the Cork district; and a new magazine, shafting-room, &c., at Sandy-cove battery, Dublin Bay; and altering the construction of redoubts at Tarbert and Kilkerrin, Limerick district.

The building season is unusually brisk in Dublin and vicinity. Various works, of a commercial character chiefly, are in progress in the City and the suburbs: the southern, especially, are rapidly extending, and dwelling-houses are springing up in all directions.

The stone-roofed church of St. Douglagh's, near Dublin—the most perfect pre-Norman relic in Ireland—is now in a forward state of preservation, under the directions of Mr. Sloane, who has caused the roof and outer walls to be repaired in Roman cement, the western corner shored up and partly rebuilt, the west window restored to correspond with the east, the vaulted ceiling of the oratory repaired, the floor relaid with fire-clay tiles bedded in cement, and the stairs and several other portions throughout repaired. It is said that the square tower of this edifice commands a view of the Welsh mountains, and those of Mourne (county Down), Wicklow, and Wexford.

The Court-house at Castlebar has been lately enlarged and improved after plans by Mr. Wilkinson, of Dublin, architect. It now contains two courts, viz. a crown and a record, separated by a central hall, with ascending flight to upper floors, which contain grand and petty jury rooms, &c. &c. The wings have been elevated a story, and are finished with pediments and connected by a central hexastyle Grecian Doric portico of cast-iron, according to the design of the original architect to the building, the late Mr. George Papworth. We learn that Mr. Wilkinson has also received instructions to prepare plans for a county lunatic asylum to accommodate about 150 inmates. In other respects the town is palpably "slow."

The summary dismissal of Mr. Deane, county surveyor, by the Grand Jury of Tipperary, is a subject for much gossip; but, as it is to be investigated before a court, public judgment ought to be suspended. The right of the appointment and dismissal of county surveyors rests (it seems) exclusively with the Grand Juries; but in this case, on application to Mr. Justice O'Brien for a public investigation, his lordship's suggestion that it should be accorded where a professional man's character was at stake has been acted upon.

A new Roman Catholic church is being erected at Crossmolina, after plans by Mr. Canning; Mr. McGurran, builder. The dimensions are 115 feet by 90 feet; nave, transepts, chancel, and intended tower and spire; style, Gothic. Differences having arisen between the architect and the builder relative to constructional questions, they were referred to the final arbitration of Mr. J. Lyons, architect.

The cathedral of St. Niel's, at Longford, now being completed under the direction of Mr. John Bourke, architect, is an important classic edifice. It was originally designed by Mr. Keane, architect, and is a cruciform structure, 240 feet in length, and 87 feet in clear breadth of nave and aisles, with breadth across transepts of 130 feet. The nave has a semicircular ceiling, divided into double recessed coffers, springing from a continuous entablature immediately over arched arcades, with Ionic columns at either side. A great portico, 96 feet in length, and a campanile, are yet to be erected. Mr. Bourke is also architect to the diocesan seminary of Holy Cross, near Dublin, and the building just commenced will be 260 feet in length, and 5 stories in height, the principal being approached by a spacious flight of steps through a stone portico, supported by rectangular pillars, and containing entrance-hall, 23 feet by 15 feet; reception-rooms of same dimensions; study, 41 feet by 30 feet; library, 23 feet by 30 feet; chapel, 23 feet by 40 feet; and class-

rooms of various sizes. The stories above comprise professors' and sitting rooms, together with seventy bedrooms; and in the basement will be refectory, culinary offices, bath-rooms, &c. &c. The exterior will display chiselled granite cornices and stringed courses, a central projection with wings dividing the facade into three portions, the groins and dressings of the central windows being granite likewise, the remainder throughout of the plainest character.

A parish church has been recently erected at Upper Cumber, Derry, according to plans furnished by the late Mr. Welland, architect to the Ecclesiastical Commissioners. It comprises nave, aisles, and porch, with sittings for 400 persons; is open-timber roofed, has spire and heltry, and is in the Gothic style. Messrs. McElwee, contractors. Cost, 3,000l.

A memorial schoolhouse is proposed, at Dublin, to the late wife of the Archbishop Whately.

Large additions are about being made at the Dominican Convent, Lion Hill, Dublin, chiefly comprising a new wing, with refectory and kitchen offices on ground floor; on first floor, an infirmary, noviciate, pharmacy, &c.; on other stories dormitories, dressing-rooms, &c. A transept will be added to chancel, and have a school underneath. Mr. Bourke, architect.

The foundation-stone of the new Presbyterian church at Rathgar, Dublin, has been laid by the Rev. Dr. Cooke, of Belfast.

A new church is to be built at Kilmachadar, county Kerry, for which the foundation stone has been laid. Mr. McDonnell, builder.

The Glasnevin (Dublin) Cemetery Committee are about having building improvements effected: Mr. Patrick Byrne, architect.

VALUE OF LAND IN THE CITY OF LONDON.

FROM a recent report of the Metropolitan Railway Company, we learn that, in anticipation of the extended traffic of this line and the need of space near the goods' depot at Smithfield, the directors have determined to purchase the whole of the vacant land belonging to the Corporation of London, on the eastern side of Victoria-street and north of West-street. For this, in quantity 5 acres 19 perches, the purchase-money has been agreed on at 179,157l., of which 60,000l. will be paid in money during the next twelve months, and the remainder by a rent-charge at the rate of 4½ per cent. per annum, redeemable in forty years. This is about 35,000l. per acre, so that each yard of vacant ground in this locality seems at the present time to be worth about 7l. 5s.

This large value, which is moreover small in comparison with that of land in other parts of the City, shows the difficulty of providing, on the ordinary plan, within these limits, dwellings for large numbers of workmen, and of a moderate income, who are engaged in the City.

MEMORIAL OF THE GUARDS; WATERLOO PLACE, LONDON.

EVERY one knows that a Memorial in honour of the Guards who fell in the Crimea is being erected in Waterloo-place, Pall-Mall, opposite to the Duke of York's Column, under the direction of Mr. John Bell, the sculptor. The pedestal, of granite, from the Cheesewring Company's quarries, has been ready for some time, and lately the bronze group in front has been set up. Of this we give an engraving in our present number. It represents a man of each of the three regiments, viz. the Coldstream, Grenadier, and Fusilier Guards. Each figure is attired in full marching costume, as they fought at Inkerman. These figures are between 8 and 9 feet in height, in bronze, by Messrs. Elkington, from their works in Birmingham. A figure of Honour, also in bronze, is to surmount the whole. The total height of the Memorial will be about 36 feet. The motto, which appears in our illustration, will not be placed so near the feet of the soldiers as it is here shown, but on the pedestal below.

There will be a trophy at the back, to be of real guns taken from Sebastopol, several mortars, and shot and shell being to be added to those already there. The devices and mottoes are only temporarily painted on at present, so as to be criticized and modified, if required, before incision. All must approve of the *principle*, even should they object to the details as they at present stand, of decorating pedestals, and not allowing them to remain the bald bare posts that they usually are in our British monuments.

THE GUARDS' MEMORIAL, WATERLOO PLACE, LONDON: LOWER GROUP.—MR. JOHN BELL, SCULPTOR.

THE PROPOSED FOREIGN OFFICE.

RECENTLY in the House of Commons, Mr. C. Bentinck asked the first Commissioner of Works whether there was any objection to exhibit photographs of the Ca' Vendramin Calergi, the Scuola St. Marco, and the church of St. Zaccaria at Venice, in order to show good examples of the style of architecture which Mr. Scott now proposed to adopt for the New Foreign Office.

Mr. Cowper believed that the photographs which the hon. member wanted to exhibit would be instructive, and that the sketches at present in the committee-room gave but a very imperfect and faint idea of the building which Mr. Scott would erect. But if he were to exhibit photographs of these three buildings, he could hardly stop there; and, to give the House an adequate notion of the subject, it would be necessary to convert the committee-room into an architectural exhibition. The House would do well to attach due weight to the opinions of the eminent architects who had acted as referees—Mr. Cockrell, Mr. Fergusson, and Mr. Burn,—who had stated that the sketch now in the committee-room was one worthy of approval for the purposes of the Foreign Office.

The new design as originally made was, we believe, Byzantine-Italian. Some who are in authority afterwards treated it, if we are rightly informed, somewhat after the fashion of the two wives of a certain individual famous in story, one of whom picked out all the gray hairs, while the other removed all the black. What is left the public have to see. No vote will be taken till next year.

LEEDS CORN EXCHANGE COMPETITION.

We understand that the Markets Committee of the Leeds Town Council, having made a final examination of the designs sent in for the intended new Corn Exchange, have decided to recommend that the first prize shall be awarded to Mr. C. Brodrick, of Leeds; the second to Mr. W. Hill, of Leeds; and the third to Messrs. Lockwood & Mawson, of Bradford.

SOUTHERN HIGH LEVEL SEWER.

METROPOLITAN BOARD OF WORKS.

At a meeting of the Board of Works, on the 3rd inst., Messrs. Lee and Bowles were accepted as contractors for the southern high level sewer, in the place of Messrs. Helling, on their signing a proper deed, to be prepared by the solicitors of the board.

A meeting of the creditors of Messrs. Helling, contractors for the sewer, was held a few days ago. The accounts, prepared by Mr. F. Kemp, showed liabilities to the extent of 15,132l. 17s., and assets, principally consisting of plant, of 13,357l. 17s. irrespective of what may be recovered from the Board of Works from moneys retained. An offer was made and accepted of 15s. in the pound, secured by the gentlemen who were sureties for the completion of the contract, which they have taken (as above shown) into their own hands.

ST. HELEN'S CHURCH, BISHOPSGATE STREET, LONDON.

It is at all times interesting to note the changes and record the alterations which, from day to day, steadily proceed in our ancient metropolis. New buildings rising up startle the inhabitants in their immediate neighbourhood with their conspicuous novelty, while the traveller almost doubts the identity of this or that locality, from the strange metamorphosis which greets his view.

Other buildings there are, nestled in quiet nooks, or embowed in ramparts of brickwork, which, when exposed, bring long-lost features to light, venerable from their antiquity, and pregnant with historical recollections. These last are precious to the antiquary, who does not pass unheedingly, but notes the changes, and finds some fact revealed, some beauty disclosed; and thus he forms a useful link between the past and the future.

It is in this spirit that we would call attention to the Priory Church of St. Helen, which, by the removal of some adjoining buildings, has exhibited portions long hidden. The nunnery was founded about the year 1210, and suppressed at the time of the Reformation.

The interior of the church is chiefly remarkable as containing several fine monuments and being the last resting-place of Sir John and Lady Crosby, Sir Thomas Gresham, Sir William Pickering, Sir Andrew Judd, and Francis Bancroft. Externally

it is of an unpretending character, with windows of late Tudor period; recently, however, some houses adjoining on the south side of the transept have been removed, in doing which a three-light and other windows of an earlier date have been revealed.

The parish finding this to be the case resolved to open one in the transept, as an ancient light; which right was disputed by the Merchant Tailors' Company, who contended that they were entitled to rebuild; after some litigation the matter was compromised. The Merchant Tailors allow a somewhat scanty light to enter the sacred edifice, slant in by new and handsome offices in the course of erection, under the superintendence of Mr. Corbet.

The parish have carefully repaired the window, which, by the liberality of Mr. Wm. Jones, deputy of the ward, has been filled with stained glass, with devices and descriptions.

The glass was supplied by Messrs. Claudet & Houghton, from a design by Messrs. Wadmore & Baker.

MASTERS AND MEN.

THE necessity which the masters have been under, in many instances, from the obvious state of the labour market, to grant reasonable advances to the men, has, as was to be anticipated, encouraged others to agitate for similar advantages, so that matters are still in a very unsettled state.

The movement in the building trade is, it is said, extending to Worcester. The carpenters and joiners in the employ of the various building firms in this city have sent letters to the masters, requesting an advance of 2s. per week in their wages. It is thought probable that the masters will consent to meet their men half-way, by allowing an increase of 1s. per week.

In consequence of a strike amongst the masons engaged in building the new church at Over, the further progress of the building is for the present prevented; but time has been allowed for completion.—The ship joiners employed by Messrs. Laird & Co., of Birkenhead, demand an increase of 3s. per week in their wages. In the event of this being conceded, it is said that the men in other departments will make somewhat similar demands.—Messrs. Dennis, Lee, & Welsh write to the *Leeds Intelligencer*, complaining that the Unionists insist upon their workmen quitting their employment, although "they already had all and more than their brethren in the trade were apt for," and that the Unionist masons have adopted as a model the "odious document" for the coercion of the masters. The Leeds master masons and bricklayers have followed the example of the men by combining for their mutual benefit. Indeed, the combination extends to the whole of the West Riding of Yorkshire. The fundamental principle of the association is that all the members pledge themselves (and are bound under a penalty) not knowingly to employ any of each other's workmen if they are on strike "on unreasonable grounds," and if any question as to the reasonableness or unreasonableness of a strike arises, it will be left to the branch association in the locality in which the strike exists to decide. The promoters strongly disclaim any wish to oppose "reasonable" requests on the part of the workmen. The application for an advance of wages by the masons in Leeds "had been willingly acceded to, but other demands which the men had made were such that it was impossible the masters could accede to them."—The *Leeds Intelligencer* states that the whole of the men employed at the various glass works at Castleford (fifteen in number) have given a week's notice to leave, in consequence of the refusal of the masters to raise the rate of wages. This is said to be a general movement throughout the district.—The operative masons of Halifax are demanding a reduction of the hours of labour from 57½ to 51½ hours a week, without a proportionate reduction of wages. A three months' notice was given to the masters of their intention to strike, if what was asked was not acceded to, and the notice has just expired. The masters not having as yet granted the demand, the workmen have, accordingly, struck work.—The joiners of Hull have been agitating for an advance of 6d. per day upon their present wages, and they have at length issued an appeal to the public for support. A great number of the men are at present on strike, but about thirty of the seventy-two master joiners have yielded the advance.—The opening of the Liverpool Free Public Library, which was fixed for the 18th of October next, is likely to be postponed in consequence of the strike of the joiners. The employers are willing to give the half-hour on the first five

days of the week, but they object to the loss of an hour on the Monday morning, and hence the strike.—The masons of Austerlarder have had a strike against their employers as to a rise of wages. They wished that 1s. 4d. per day might be added to the present rate, and the masters were unwilling to comply with the request. All work in this branch was thrown aside; but the masters have since, we hear, come to a good understanding with their men.

The insane strike at Coventry still continues; and although a highly popular local friend of the poor weavers, the Rev. Sidney J. Widdington, Vicar of St. Michael's, called a meeting of them, at which "he was greeted with deafening shouts of applause," nearly every idle hand was held up against him when he urged them to relax the stringency of the strike, and allow each to do his best for his starving family. Under the peculiar circumstances this is a dreadful infatuation. We observe, too, that most erroneous ideas prevail amongst them as to the prevalence of taste for French ribbons in this country, and even in Coventry itself. Even were it so, the reasons given for preferring the latter are onerous. But the flourishing state of the French ribbon manufacture is as gross a delusion as the idea of deriving benefit from a strike under present circumstances assuredly is. The French ribbon weavers are in a state of actual distress no less than the Coventry ones, and from sheer want of work, too, and not from a voluntary strike. Most of the looms at St. Etienne, where the ribbons are made, are idle, as we happen to know, and the weavers have either become colliers in the vicinity, or have left it altogether. And the reason we have but too well ascertained. In France, we learn, as well as in this country, the fashion has veered, for the moment, from ribbons altogether, whether for bonnets or dresses, to partridge wings, cocks' tails, and other feathers with wide-awake and other hats, and artificial fruit and flowers for bonnets, net quillings instead of ribbon bows and long ends for full dress, &c. The taste for ribbons may revive shortly, but such is the state of matters in the meantime, and strikes can only aggravate the evil.

In justice to the Coventry operatives (though it really affords them no justification for striking), we may here mention that the *Coventry Free Press*, which advocates their interests, states that "day after day appeals have been made, in courteous language, to the manufacturers, to reconsider the list, and offers even to submit to a reduction of prices have been made by the workmen, if the employers will but condescend to prove the necessity for it."

THE DRINKING-FOUNTAIN MOVEMENT.

A FREE drinking-fountain has been erected and opened at London-bridge. It has been put up at the cost of the United Kingdom Temperance General Provident Institution, and is situated directly opposite the society's offices, Adclaide-street. Mr. J. Taylor, at the opening in presence of a numerous assemblage, remarked that we had in the metropolis 10,000 places for the sale of intoxicating liquor, and it was proposed to counterbalance this, in some degree, by the erection of 400 drinking-fountains. The great object of this movement was not merely to supply water to the people freely in the streets, but to supply it of a pure and excellent quality. The supply of water to this fountain was furnished by the New River Company, and was filtered immediately on being brought to the fountain. The fountain was executed by Messrs. Wills, sculptors.—The Earl of Dudley having offered to erect at his own cost an ornamental fountain, in the Market-place, Dudley, on condition that the inhabitants put up one of an ornamental character, a committee has been formed for the carrying out of the latter object. A design has been obtained from London artists, consisting of six columns standing upon a pedestal, supporting an ornamental canopy. A site has been granted by his lordship at the top of the Birmingham-road. The estimated cost of the erection—all stone—will be 200l. The design is after the Temple of Vesta, at Athens.

*Birkenhead.*—SIR.—Amongst the drinking-fountain news I have never seen our rising town of Birkenhead mentioned. We have a gentleman who has done good by stealth: Mr. Joseph Craven put up drinking-fountains nearly two years ago. They are plain in design, and manufactured by Messrs. Leslie & McDonald, out of Peterhead granite. There are no ornaments about them that the street iconoclasts can injure. I fear the beautifully executed Middle Age designs so accurately illustrated in your journal will suffer from the hands of these despoilers. There should be a special enactment to punish them with great severity, even to the extent of penal servitude. R. H.

## PROVINCIAL NEWS.

**Newbury.**—It is proposed to consider, at a public meeting, the propriety of erecting a coin exchange in Newbury.

**Worcester.**—Mr. E. B. Evans, of this city, has recently purchased an estate at Whitbourne, and a mansion is about to be erected thereon. Mr. Elmslie, of Malvern, is the architect, and eight tenders for the building were sent in by contractors. Of these the highest was 25,745*l.* by Messrs. Mansfield & Son, and the lowest 21,500*l.* by Mr. Broadbent. The latter was accepted.

**Abergavenny.**—The local commissioners have nearly completed their arrangements for commencing the new water-works. The contract for the whole of the required new iron pipes, about 210 tons in weight, has been taken by Mr. Spittle, iron founder, Newport.

**Cardiff.**—New wards have been erected at the Cardiff Union Workhouse from designs by Mr. G. E. Chittenden, the architect of the new gaol. Mr. Webb, of Birmingham, was the contractor. The walls of the new wards—the floors of which were merely paved with tiles, and in some cases below the level of the ground outside—are raised upon the walls of the old ones, which stood in the rear of the workhouse premises: the washhouse and laundry adjoin the new wards. The men's sick ward, approached from the north, is 32 feet 6 inches by 1½ feet, and 12 feet high; it has a boarded floor raised above the level of the ground outside, bath-room, lavatory, with hot and cold water laid on to both, and the old lying-in ward is altered both in size and appearance. It is now warmed, ventilated, and lighted the same as the new wards, and has also hot and cold water laid on.

**Derby.**—The tenders for the erection of Derby Corn Exchange, according to the designs of Mr. Benjamin Wilson, have been examined, and that of Mr. Henry Bingham, for 2,985*l.*, accepted.

**Manchester.**—A large building for the A Division of the Manchester police has been erected on the site of the gas station, Albert-street, and is nearly ready for occupation. The building has a frontage of 200 feet, and extends back into Lower King-street. It is in the Italian style, from plans by Mr. Lynde, the city surveyor, and is built of stock bricks with stone dressings. There is a parade-room 58 feet by 42 feet and 28 feet high. It is lighted with sun-burners in the ceiling as well as gas-brackets on the walls, and there are seats round and an extensive fireplace and oven, at which the men on duty may warm themselves and their food. Stone staircases lead to the upper stories, which contain a great number of rooms, including seventeen bedrooms, kitchen, fitted with cooking range, larder, scullery, clothes-room, baths supplied with hot and cold water, a mess-room fitted with tables, and a lavatory large enough for a dozen men to perform simultaneous ablutions. Telegraphic communication has been formed with the new station. The building has cost about 4,000*l.* Mr. W. Buxton, of Manchester, was the contractor; and the sub-contracts were let to Mr. John Bramall, for the woodwork; Mr. Higgins, bricklaying; Mr. Kirkley, slating; and Mr. George, plastering and painting.

## CHURCH-BUILDING NEWS.

**Aunby.**—The church here, a time-worn edifice, is now undergoing a thorough restoration, after designs by Mr. W. Thompson, architect, Grant-ham. The works comprise the taking down and re-erection of the tower and spire, new roofs, seats, and floors to the nave and aisles; and a restoration of the pillars, arches, and windows. The chancel will also be restored by the rector. The tower, spire, and south aisle, are specimens of Early English architecture: the north aisle and chancel are of an earlier date. Mr. John Rudd, of Grant-ham, has obtained the contract, and is now engaged in taking down the spire. We understand the funds are raised partly by a rate on the parish, and partly by subscription.

**Church-Stowe.**—The church of Church-Stowe with Stowe-nine-Churches has been reopened for Divine service, after having been closed for restoration purposes for the last twelve months. Under the direction of Mr. Hardwick, the side arch, north of the chancel, has been again opened, says the *Northampton Herald*, the figure of the knight replaced in its original position under it, and the monument to Bishop Turner placed against the north wall beyond it. The large old pulpit, reading-desk, and screens have been removed, a more appropriate pulpit, prayer-desk, and reading-stand being substituted, the lesson-stand, an eagle, being supplied by Potter, of London, who also furnished the one for the church of All Saints,

Margaret street, London. On the principle that no portion of the old building that it was possible to retain should be done away with, the wood-work of the old screen now forms a wainscot for the walls of the baptistry, which is at the south side of the tower porch, and immediately at the left on entering the church. The pews are done away with, and open seats substituted, each seat being furnished with a complete set of kneeling hassocks. A new vestry has been built on the north side, the style being in accordance with the other portions of the building, the walls being wainscoted with some carved wood-work, removed from behind the altar. The chancel is stone. Outside the chancel arches are decorated with fruits and flowers, cut from the stone, and inside the arches are several figures of angels carved from the corbels. The chancel is paved with Maw's encaustic tiles. The church throughout is paved with Maw's dark blue and red small tiles. Adjoining the chancel, on the north side, are stalls for the clergy and the choir. The stalls are of plain unvarnished oak, on each stall being carved an angel with a trumpet, harp, or other musical instrument in its hand. The entire interior of the church is new, all of it being decorated. The east windows, indeed all the windows in the church, even to the belfry, are filled with stained glass, from Messrs. Powell & Son's, of London. The church is warmed with hot air pipes, the iron work and gratings, with all the other iron work in the church, being executed by Mr. Collins, a resident of the village.

**Market Harborough.**—Some restorations and improvements, such as replastering the walls, have been carried out at the parish church here. A new window has been placed in the west end of the belfry (which is open to the church) of Powell's patent plates, with a ruby band. Over the arch dividing the chancel from the church is a stencil border of the vine, which helps to relieve the dullness of the walls. At the bottom of the east window has been placed a brass plate, engraved by Mr. Hardiman, of Birmingham, and bearing the following Latin inscription:—"Ad Majorem D.E.L. Gloriam hanc Pictam Fenestram, d.d., F. P. J., J. H. II., A. M. V., H. A., anno Salutis mdcclxx." The whole of the work has been executed by Mr. Lee, of Lutterworth.

**Braintree and Bocking.**—The restoration and enlargement of Braintree Church, as at present carried out, in the Early Decorated style, comprise the erection of a new and enlarged north aisle, with external walls of flint and stone dressings, interspersed with red brickwork. The north aisle is lighted by four large windows, with stone mullions of geometrical tracery, and glazed in ornamental patterns. It will provide additional sitting accommodation for 100 persons. The tower has been denuded of its old coat of plaster, and now displays its original stone materials, while the spire is new shingled. The exterior of the chancel is also composed of new stone and brickwork, and has an east window. The open roof of the nave and north aisle is supported by stone corbels, carved. The clerestory windows of the nave are all new. The chancel roof is composed of old English oak. The gallery on the north side has been removed, as has also the gallery in front of the west end of the nave, which has thrown open to view a stone arch and small window in the tower. It is intended to remove all the galleries, which will expose to view the arches. All the big pews are to be removed and substituted by low benches. The interior of the tower will be refitted with seats, and the organ removed to the north chancel aisle. The whole of the south side of the church, which is in a very dilapidated state, requires to be restored. The south-west end, for many years used as a school-room, and now in a very ruinous condition, is to be restored, and will afford increased sitting accommodation to the congregation. The present alterations in the nave of the church have been completed by voluntary contributions, under the directions of Mr. J. L. Pearson, architect, London. The chancel has been erected at the cost of 400*l.*, by order of the trustees of the Felsted Charity. The contractors are Messrs. Parmenter & Sons, builders, Bocking. The whole of the work connected with the church restoration is progressing, and it is hoped will soon be completed, but much will depend upon the pecuniary contributions. The old bells have been recast.

**Corfe Castle.**—The Church of St. Edward the Martyr, which, with the exception of the tower, has been entirely rebuilt and enlarged, has been re-opened, and consecrated. The old church, which for centuries had occupied the site of the present erection, remarks the *Dorset Chronicle*, is a blending of various styles of architecture in

a somewhat confused mass, the predominating one being Early English; and to this latter style the architect, Mr. T. H. Wyatt, has principally adhered in the restoration. The chancel arches, separating the chancel from the aisles, are supported by clustered columns of Purbeck marble, eight smaller circular shafts surrounding a larger central column, and surmounted by plain mouldings, from which the arches spring. The arch between the nave and chancel is of the same character, and springs also from Purbeck marble shafts. The roof of the chancel is an open one of stained wood. The corbels supporting the vaulting shafts are carved. The chancel, which is approached from the nave by four steps, has been extended towards the east, and considerably enlarged; and the east end of the chancel has a three-light lancet window. The rails before the communion-table are of oak, and the space within them is laid with Minton's encaustic tiles. A small space in the north aisle is screened off, and appropriated as a robing-room for the minister. In the north aisle is a memorial window, lancet-shaped, erected by the Rev. J. C. Bradley; subject—The Crucifixion. On the opposite or south aisle are two small lancet windows—"Christ blessing little Children," and "Our Saviour presented to His Parents;" these were the gift of the architect, Mr. Wyatt. On the various arches of the chancel different texts of Scripture are inscribed; these have been prepared by Lady Charlotte Banks. The columns of the nave of the church are said to be types of the Saxon age, from which spring pointed arches of a later period, and these are surmounted by clerestory windows. The roof is open and lofty, and also of stained wood. The chancel aisles are continued throughout, each side of the nave. The capitals of the columns appear somewhat heavy, and are carved variously with fruit, flowers, and other designs, some of which are yet unfinished. The church is seated throughout with low open seats—those of the chancel with finials at the ends, and open backs. The pulpit is low, carved, and panelled. The tower has not been touched. The arch leading from the nave is lofty, and the belfry which it used to contain has been carried to a floor above the crown of the arch. The space within has been screened off, and in it the old font, which is of Purbeck marble, has been placed. The west window of the tower is in the Perpendicular style. In the north porch the two original Saxon shafts have been restored and built in with the new work. Mr. T. Farwell, of Swanage, and Mr. Meadus, of Poole, were the builders.

**Hagley.**—The new chapel of ease at Blakedown has been consecrated. It is located within a short distance of the Churchill Station on the West Midland Railway, four miles from the parish church of Hagley. It was built by Mr. Griffiths, of Eldersfield, after the design of Mr. Street, architect. The cost of the building was about 600*l.* The style of the edifice is Early English. The number of sittings (all free) is ninety for adults, and thirty for children. Provision has been made for warming the building after a plan by Mr. Mitchell, of Leamington. The church is dedicated to St. James.

**Worcestershire Churches.**—The building and restoration of churches is going on with great vigour in the Worcester diocese. The church at Barbourne, near Worcester, to be founded by Miss Lavender, is to be built by Messrs. Hartland & Aldenbrooke, of Sedgley, whose tenders have just been accepted. The long-desecrated church of Cow Honeybourne, near Evesham, is at length undergoing restoration, a public subscription having been raised for that purpose. Sir Thomas Wymington, bart., M.P., patron of Upper Sapay, is now restoring the church of that parish, at a cost of 1,000*l.*, one-half of which will be given by the hon. baronet, and the rest raised by subscription and a rate. Mr. Hopkins, of Worcester, is the architect, and the edifice will be re-opened in about a month. It has been nearly rebuilt. White Ladies' Ashton Church, near Worcester, is also being restored by the same architect, and will be furnished with a new aisle and vestry. There will be a general refitting of the interior and removal of the old galleries. The estimates for this work varied from 99*l.* to 380*l.*

**Falfield.**—The new church of Falfield, according to the *Gloucester Chronicle*, is erected on land presented by Sir John Jenkinson, bart., opposite the entrance to his park at Eastwood, in the parish of Falfield. It was originally a small hamlet in connection with Thornbury; and the church was designed with a simple bell turret at the west end; but as it was subsequently made into a district church, a small tower, surmounted

by an open belvedere, was substituted, presenting the appearance of a suitable village church. The style of architecture is Early Decorated. The arrangement of plan is that of a nave, with central aisle, chancel, and a small sacristy on the north side of chancel. The entire length internally is 62 feet, the width of nave 24 feet, the height 40 feet to ridge of roof. The exterior is of native stone with freestone dressings, and divided into four bays, having a two-light window in each: the large east and west windows are filled in with simple tracery. Over the nave and chancel are open, stained timber roofs, with carved principals of simple construction. Open seats of uniform size are provided throughout, which, with the pulpit and reading-desk, are of stained deal. The accommodation is for 206 persons, 150 free. An open archway is left between the chancel and sacristy, in which a small organ will be placed. The whole of the work has been executed by Mr. W. B. Burchell, builder, Thornbury, from the designs of Mr. S. W. Daukes, of London.

**Oystermouth, Somerset.**—The Swansen *Cambrian* states that the Oystermouth Church, having been almost entirely rebuilt, has been reopened for Divine worship. The architecture is principally Gothic, with, however, variations of the Early Perpendicular and Norman. In the restorations and additions care has been taken, where the ravages of time would admit it, to make use of the old materials, such as doors, windows, &c., whilst, in those places where rebuilding was absolutely necessary, the old style was imitated. Some of the old eucastic tiles which were found amongst the rubbish have been placed in conspicuous parts of the new walls: some tessellated pavement has also been preserved. In order to carry out the restorations and additions, upwards of 2,000l. were required; and the larger portion of this amount has already been realised: only about 200l. are now wanted to pay for the work completed. The restoration and renovation of the old tower are said to be seen to. The whole of the work has been carried out by Mr. Joseph Holtham, of Bath. Mr. J. Kyrke Penson, architect.

**Caythorpe.**—The church here is undergoing considerable alteration under Mr. G. G. Scott, architect. Mr. Scott's clerk of the works was at Caythorpe on the 16th ult., and made a special examination of the spire, the result of which is to be that the upper part is to be taken down to the extent of 40 feet and rebuilt. It seems that the bulge in the spire for the first 50 feet was straight, but from that point it had been carried up straight, instead of to the line directed.

THE ATLANTIC TELEGRAPH CABLE.

THE erroneous construction of the great Atlantic telegraphic cable is now made but too manifest by the recent attempts to lift it on the American side. It has been found to be quite rotten, so far as regards what was meant to constitute the chief stay of its strength, the heavy iron wire covering twisted round the central core. In some instances, on the other hand, the cable was actually lifted solely by the strength of the copper wires and gutta percha of the core, surrounded by the ponderous, rotten, and useless iron covering. Generally, however, the cable parted at length in all the continued attempts to lift it, doubtless not from rottenness of the core, but from the undue weight of the rotten covering. Where this covering had itself been protected by tarred yarn it was sound, as was the yarn. The cable has been abandoned, but we think prematurely, since the core was sound, and might, though not continuously liftable, be perfectly workable, for all that appears, across the entire Atlantic. Of course, the covering will be equally rotten, but it was towards either shore where any actual breakage, by the mechanical action of the sea, was most likely to occur; and were new extremities of better construction joined on to the main portion, we do not see why the whole might not yet be made workable, if, as is said, the gutta percha and copper core be entire so far as has been seen. Could not the main portion be tested, at least after a similar riddance of shore lengths on this side of the Atlantic? Meantime, however, the American end has been lost, but the spot is buoyed. On the whole, nothing could have been in more complete accordance with all we have remarked and suggested as to this cable than the result as now published. It would have been infinitely better, and far cheaper, to have simply laid the uncovered core; but that, farther protected merely by tarred yarn, would have constituted a far more reliable cable for the purpose than the stupidly ponderous and costly iron one actually laid.

SCOTLAND.

**Dundee.**—The Misses Baxter, of Balgavies, and David Baxter, Esq., of Kilmarnou, are named as those to whom Dundee will be indebted for a beautifully situated park of thirty acres. The piece of land marked out for purchase lies on the east side of the town, on the high ground immediately to the north of Springbill, between the Arbroath and Forfar roads: it commands, from its elevated position, a fine view of the Tay, the sea, and the magnificent ranges of hills which stand piled up like banks of summer clouds to the north.

**St. Andrew's.**—The new town-hall, commenced two years ago, now approaches completion. It is placed exactly opposite the Town Church in South-street, and extends about 120 feet down Queen-street, also running southwards. The design is by Mr. Henderson Hamilton, architect, Edinburgh.

**Bo'ness.**—The clock and bell-tower, designed by Messrs. Brown & Waidrop, Edinburgh, is at length all but completed. It is a square Gothic edifice of four stories, rising to the height of 75 feet, and is in keeping with the architectural character of the town-house. The lower portion forms a vestibule to the town-hall, through a large archway with heavy hotted mouldings—a flight of steps leading from the lower court. On each side of these steps are heavy ornamental stone pillars and stone balustrade. The pillars will be surmounted with metal lamp-posts. The second and third stories form the bell-room, and externally are buttressed to the third string course, which marks the commencement of the clock-room. The roof, of zinc, is flat, and hidden by the parapets. The bell weighs 950 lbs.: John C. Wilson, founder, Glasgow.

STAINED GLASS.

**Christchurch Cathedral.**—This edifice stands upon the site of an ancient nunnery, founded in the eighth century by a Prince of Oxford, father of the Saxon saint Frideswide. The *Times* says,—According to the legend, the beauty of Frideswide, who presided over the nunnery, attracted the attention of the Mercian prince Algar, who determined to carry her off by force. To evade his pursuit the pious virgin concealed herself for a long time in a pigsty, and when this unsavoury place of seclusion no longer availed, the daring lover was visited with blindness until he repented of his evil designs, through the intercession of the saint. This story, which is like a thousand others, will be told in ample detail by a window which is to be placed in the cathedral, and is now about half completed by Messrs. Powell & Sons, of Whitefriars. The saint is first shown in her childhood, trained by pious preceptors. Then she wanders a little into the pleasures of the world, typified by a sort of flower-garden; but she soon cuts off her hair, that she may live in holy retirement. Next comes the astonishment of the presumptuous Algar, at his want of success in his attentions to the virgin. Then the Mercian army, misled by an artful peasant, fairly marches round St. Frideswide, who is hidden in a kind of ditch. With the concealment of the fair saint in the sty, where she fervently prays, surrounded by a literally "swinish multitude," the completed portion of the window, consisting of two lights, terminates; but the cartoon for the fourth light is already painted, embodying the incident of the prince's miraculous blindness, and the death of the sinner. The work is executed on the old mosaic principle, each separate colour being represented by a separate piece. Mr. E. B. Jones, the artist who has designed the composition, has treated the subject in a thoroughly Medieval spirit, pursuing the tale with an almost childlike love of minuteness. The peasant-boy who misleads the Mercian army, by pointing over the wrong shoulder, is clearly the originator of the phrase, "over the left," now frequently used by modern Anglo-Saxons, with less pious intentions.

**Tarring Church.**—The stonework window of the early Perpendicular period, consisting of five lower compartments with a full tracery bead, at the east end of the chancel of the church at West Tarring, has just been filled in with painted glass. The design of the upper portion of the three centre lights, says the *Brighton Gazette*, is the Ascension, with the eleven apostles grouped around. The north opening contains St. John the Evangelist; and the south, St. Andrew (the patron saint of the church), with their respective emblems. The compartments are connected by the ornamentation of passion-flowers on a ruby ground. The lower portion of the compartment contains—1st. The Nativity; 2nd. The Baptism by St. John; 3rd. The Crucifixion; 4th. The Entombment; 5th. The Transfiguration. In the

tracery of the upper portion of the window arc represented Angels, the Holy Trinity, St. Andrew's Cross, with foliations of roses, figs, &c. Beneath runs the memorial inscription, in memory of John Thomas Longman, of Waterloo Place, London. There now only remains to complete the restoration of this old church, on which upwards of 3,000l. have been expended, an entire renovation of the chancel, a duty which belongs to the Ecclesiastical Commissioners, as appropriators of the rectorial tithes.

**Christchurch, Hants.**—A large memorial window has been erected at the east end of the north choir aisle, in the Priory Church of Christchurch, Hants, by Admiral Walcott, M.P., to the memory of his parents, Col. Walcott, commandant of the Christchurch Volunteer Artillery, in the French war, and his wife Catherine, aunt of Admiral Lord Lyons. The four lower lights are filled with designs representing the Nativity, Crucifixion, Resurrection, and Ascension of Our Lord, executed by Messrs. Lavers & Barrard. The only remaining east window in the church is that of the Lady Chapel. The window was erected under the directions of Mr. Benjamin Ferrey, the architect employed in the restoration of the church.

**Miscellaneous.**—A stained glass window has been put up in Glasgow, to the memory of Mrs. Hemans, the poetess. The architectural features of the window comprehend two principal lights, with a bold circle, and two curved spandrels above them. In each light, two groups of figures in panels appear between as many smaller medallions. The subjects of the four groups (selected by the committee of the subscribers) are Miriam singing—her Song of Triumph, the Presentation of the Youthful Samuel by his Mother, Deborah judging Israel seated beneath her Palmtree, and the Salutation of the Virgin Mary by Elizabeth. The upper circle contains a fifth group, representing another Mary seated at the Saviour's feet, and receiving from his lips the happy assurance that she had chosen the good part which should not be taken away from her. The architectural accessories are of the Renaissance period, and not very elegant. This window constitutes one of three in the apse. The centre one is of three lights, and will be in its glass of like character, to the memory of Alexander Knox, whose writings on the parables contained in Matthew xiii. are so well known, and from which the subjects will be chosen. The other will be a *fac simile* of the Hemans one, differing only in the subjects. All the side windows, too, are to be filled with memorials, some of which Mr. Warrington (the artist of the preceding) is already making designs for.—The same artist has in hand some works, 18 feet high, and 8 feet 6 inches wide, in one expense, for the apse of Whitechurch, Salop. Two of them are erected: the third, now in hand, represents the Ascension, the figures of which are fully life size. He has also recently erected the five-light window at the west end of the north chancel of the parish church of Hullix; and has now nearly finished two others for the north side of the same anto-chapel. The subjects of these are,—1. Moses receiving the People's Gifts; Moses lifting the Serpent; Moses anointing Eleazar. 2. Rebecca at the Well; Abraham offering his son Isaac; Melchisedec blessing Abraham. All these are memorials of the Waterhouse family. Mr. Warrington has also erected a memorial to Mr. E. D. Brockman, late M.P. for Hythe, in Newtonington church, Kent, the subject, the Good Samaritan. And he has recently put in six in Cheriton church, near the above-named.

FLAT-ROOFED COTTAGES.

I AM much obliged to your correspondent "C. D. S.," for his inquiries relative to the roofing of the cottages referred to in his letter, as it affords me an opportunity of giving additional information to that which has already appeared in the pages of the *Builder*; and, if I enter at length into the subject, it is simply for the purpose of bringing into notice a description of roofing which I consider a cheap, efficient, and water-tight covering, and one, as "C. D. S." observes, that might be advantageously substituted for lead, or other material, under a variety of circumstances.

I will first remark that "tiles and cement" have been used for some time in the suburbs of London as a covering for small buildings, and frequently also, I believe, in lieu of the ordinary roofing for houses. It commended itself to my notice for the following reasons.

If it is required that a tank, or reservoir, be perfectly water-tight, cement is adopted. If we wish to make a soft, porous brick, used in an external

wall, impervious to moisture, we cover it with cement. In fact, its frequent use for hydraulic purposes at once stamps cement as a material especially adapted for all purposes where it is desirable to exclude the penetrative action of water.

It is, without doubt, highly important that the materials used in a flat roof of this construction should be the best of their kind. The tiles ought to be hard-burnt, and true on the surface. Portland cement is the best for bedding the tiles, and should be tested, as sometimes, if confined, it will "Mon." The sand should be sharp, and washed, and mixed with the cement in equal proportions; and it is not necessary that the layer between each course of tiles be more than sufficient to thoroughly flush the work, so as not to leave any interstices.

Where small surfaces only have to be covered, it is best to avoid timber, and to lay the tiles with a slight curve on rough centering; but, where a large building is roofed in this manner, timber is necessary. In such cases the scantlings should be as slight as possible, care being taken to support the same until the work has set, when, if properly done, there is no fear of deflection. It is desirable, in laying the tiles on the timber, that the laths, or reeds, on which they are placed, should not be secured to the joists, so that, if the timbers shrink, the tiles would not then be disturbed. An arrangement of slight wire-work would, perhaps, be a good substitute for laths or other material. I do not recommend that the last course of tiles be rendered with cement; but, if they are of a porous quality, a coating of tar and oil will fill the pores, and tend to resist the action of the frost. A thoroughly hard-burnt tile will render this precaution unnecessary.

I will now reply to the several points raised by your correspondent.

First.—"C. D. S." can scarcely have understood the construction of these roofs, or he would not have alluded to a "leak in the joints." In the three or four courses of tiles used each joint of the underlying tile is covered by that immediately over it; and, the whole being thoroughly flushed with cement, a leak could only arise from a crack through the entire thickness. A crack in any material, whether lead or slate, will let the water through; and I do not claim exemption for this mode of covering under such circumstances.

Second.—One outlet being, in most instances, sufficient, as the flat can be laid with a fall to any given point, and one large stack pipe only being, therefore, requisite, there is much less chance of stoppage than with ordinary roofs, where several are necessary. My plan is to have a slightly raised parapet all round, and a cement lip at the outlet to the head of the stack pipe; and, as the tiles are laid over the walls before the parapet is fixed, it tends to keep the walls dry instead of damp.

Third.—I am not aware that in this country roofs are used as a promenade; but of this I am satisfied,—that a roof such as I have described will bear a test of this kind equally with any other material; and as for snow or other accumulation, the evenness of its surface would facilitate the removal of such with far greater ease than is usual.

Fourth.—There is no reason whatever why a roof of this kind should not project beyond the face of the external walls: the joists can be continued over 2 or 3 feet, if necessary, and corbels of wood, brick, or stone, to suit such projections, be introduced with effect: in fact, the covering forms a most efficient coping.

Lastly.—Whether flat roofs are "intensely ugly" or not is a matter of taste. I admit that the elevation shown in a previous number of the *Builder* was a very plain affair; but, as the object sought was economy, simplicity was necessary. If, however, "C. D. S." will call at 21, Exeter Hall, he can see some other drawings, which will satisfy him that, by an inexpensive arrangement of brickwork for parapet and cornice, a very fair effect can be produced; and that flat roofs are incapable of being treated with a variety of pleasing forms and arrangement is a fact I have yet to learn.

A good foundation for any building is of course most desirable; and, with such, I am convinced that, if tiles equal to those made in Staffordshire are used, and good cement, a roof of such materials would constitute a substantial, durable, and perfectly watertight covering.

I have adopted it in several instances, with a most satisfactory result, and shall be happy to afford any additional information, if required.

N. E. STEVENS.

#### MANAGEMENT OF THE SOCIETY FOR IMPROVING THE CONDITION OF THE LABOURING CLASSES.

SIR:—Various references have been made in the *Builder* to the low rate of mortality in model lodging-houses. Allow me to say it would be very surprising if it were not low, for the fact is, that we are not allowed to die upon the premises. As soon as a lodger is afflicted with mortal illness, he is removed to die either in the workhouse or the hospital. In the report lately published by the Press of lodging-houses belonging to the society of which the Earl of Shaftesbury is the head, this house (George street) was set down as having no deaths during the previous year. Sir, the truth is that three men were taken out during that year whom it had pleased God to afflict with sickness unto death; two of them to St. Giles's workhouse; one lingered a few weeks, the other a few days: the third was taken to the hospital and died the same day. Another reason I think is the migratory manner in which the lodgers come and go: it would (I think) very much surprise you to know the many changes there are in the course of a few months. Statistics are powerful for good or evil: every fact should be known; so that, when the figures are published, the public might be confident they were the very truth: if they are not true the calculations made from them must be deceitful also. It is not an untruth to say that these men did not die in the house; but, if not an untruth, it is a suppression of facts, and Jesuitical in the extreme.

I myself, and I am sure my class, appreciate the efforts made by influential persons to better our condition; but, if they want the work well done, they must keep a strict watch over their servants; as, if they are not looked after, the management of these houses becomes very lax, and the comforts and health of the inmates are injured in consequence.

#### A LODGER OF SOME STANDING.

George-st. Lodging-house, Aug. 6th, 1860.

\* \* \* We print this letter with no desire to throw discredit on the efforts of the Society for Improving the Condition of the Labouring Classes, but simply that truth may be elicited. We take the opportunity, moreover, to make an observation in connection with the society. We are informed that some of its officials have desired to make it known that they did not approve of an account which was given in our pages recently of a visit to the houses belonging to the society, and were surprised that we should have permitted the appearance of a letter from one of the tenants who was dissatisfied. For many years, with pains and much personal exertion, we have advocated and advanced the objects which the society are supposed to have in view, and have uniformly supported and applauded the doings of the society itself. On the occasion in question we sent a trustworthy person to report to us, and have no reason to doubt his good faith. We must here, however, at once say that we care nothing whatever for the society: whether or not its officials are pleased with the course we adopt gives us no concern. It is the cause we have at heart, not the society; and it is quite possible that we have been too easily satisfied with their doings. That there have been tergiversation and misappropriations on the part of officials is notorious; and it is quite possible that, if we should be led to inquire fully into the management, and to state the precise results, they might have less reason to be satisfied than they now are.

#### THE WEDGWOOD MEMORIAL COMPETITION, BURSLEM.

SIR,—By the award of the committee for the above building we and the second premium is given to a design, "*Pro bono Publico*," placed No. 4 in the report by the architects selected to assist the committee in their decision, while ours, "*Jesuyra Vira*," returned as No. 2 in the same report, is placed as No. 3 by the same committee. We contend, in face of the report, that the second premium is honestly due to us, and, as we only know the result by a communication in your columns, we ask of the committee, through you, why it was that the selection of "*Pro bono Publico*" for this premium was made?

Without further calling into question the decision of the committee, we may be permitted to remark that it is singular the best design should, in the majority of instances, as in this one, emanate from a "lecal" man.

WIGGINGTON, BENNETT, & MORRIS.

APPOINTMENT OF ASSISTANT SURVEYOR, WOLVERHAMPTON.—The General Purposes Committee have appointed Mr. John Wakeford, of Brighton, as assistant surveyor, and to assist the borough surveyor in examining and making plans of the existing sewerage. There were thirty-three candidates for the office.

#### THE "BUILDER'S" LAW NOTES.

*Payment of Bills, &c.*—By an Act passed this session, whenever any bill of exchange, draft, or order, having thereon an adhesive stamp, shall be presented for payment, the person to whom the same shall be presented shall, upon paying the same, write, or impress on the stamp the word "paid." In default there is a penalty of 20l.—*The Stamp Act of 1860.*

*Penalty on late Stamping.*—By the same Act the penalty on stamping after the proper time, an agreement subject to a sixpenny stamp duty, is to be only 1l, if the subject matter be under the value of 20l.

*Minerals.*—The owner of the surface of land is *prima facie* entitled to all below it, and those who claim property in the minerals, must show some grant or conveyance by the owner of the land, or by his ancestors, or by the Crown. The rights of the grantee depend on the terms of the deed, but *prima facie*, if the minerals are to be enjoyed, it will be presumed that a power to get at them has also been granted as a necessary incident.—*Rowbotham v. Wilson.*

*Policy of Assurance.*—An ironmonger insured his life as "J. P. esq. of S. Hall" (giving full name and residence), omitting to state that he was an ironmonger. It has been held not to be such a misrepresentation or concealment as would render the policy void.—*Perrins v. Marine and General Travellers' Insurance Company.*

*Dividends.—Stamp Duty.*—A correspondence has lately taken place between the Board of Inland Revenue and the London and Westminster Bank, by which a point is settled respecting which some doubt existed in the mercantile world. The question was whether a person authorized by a shareholder to receive his dividends at the bank, should be the bulder of a power of attorney, and it has been decided that such a document is not necessary, but that a draft on demand, with a penny stamp, is sufficient.

*Railway Company.—Coals.*—It has lately been decided by Vice-Chancellor Kindersley, that trading in coal is not within the powers of a railway company, and an injunction was issued to restrain a company from such trading as being illegal in itself, and also contrary to public policy.—*Attorney-General v. The Great Northern Railway Company.*

*Waterworks.—Rating.*—A waterworks company obtained water in a certain parish, and conveyed it by mains and aqueducts through several parishes, but sold it only in the last of these parishes. It has been held that it is not a correct principle of rating to ascertain the value of the apparatus, and to divide it between the several parishes through which the water is carried, because the value of the occupied land may differ very much. The point was not decided as to which parish should make the rate.—*Petney Parish v. The Chelsea Waterworks Company.*

#### RECENT PATENTS.\*

SCREW WRENCHES.—*J. Ferrabee*, Stroud, Gloucestershire. Dated 20th December, 1859. The moveable jaw is made to slide freely on the bar or stem of the handle, and it is fixed or retained in any part thereof by means of a sliding wedge, which is introduced between the back of the bar or stem and the sliding-jaw. The wedge is carried by a strap from a sliding-piece, which slides readily on the bar or stem, and the sliding-piece can be moved to and fro thereon by means of a worm or screw carried by the sliding-piece, taking into a toothed rack formed on the bar or stem. The screw or worm may be so mounted on the sliding-piece that it may be readily thrown in and out of gear with the worm, so as to be able to adjust the screw-wrench or spanner with greater rapidity.

WATER-TRAPS, AND THE APPARATUS EMPLOYED IN THE MANUFACTURE OF THEM.—*J. H. Johnson*, Lincoln's Inn-fields, London. A Communication. Dated 20th December, 1859. According to the ordinary mode of making water-traps, two bent pipes are soldered together, and are consequently found to be very liable to break at the seam by reason of the tin being eaten out of the solder by the action of acid, and also by reason of the straining of the traps from the settling of buildings, such traps being found to be generally thinnest at the heads, where, in reality, the most strength is required. In constructing water-traps according to this invention, these objections are completely obviated, as the entire trap or head is cast in one piece; but, as a difficulty would occur in withdrawing the core, it is pro-

\* From the Engineer.

posed to employ a core of a peculiar construction, which constitutes one of the main features of this invention. This improved core is made of metal, and consists of segments of the bend put together separately upon a series of square blocks joined together by links, the segments fitting into dovetails on the actual surfaces of the blocks, in such a manner that they will form a curved metal core of a round section, the end and lateral joints of the component parts being sufficiently close to ensure a smooth surface in the pipe or trap. A hollow cylinder is screwed on to the end of the bend, on which cylinder is shrunk a ring, which fits a shoulder in the end of the core, and presses them against the screwed cylinder, which thus holds the core firmly. The cylinder, with the bent core screwed on, is placed in the mould, and by drawing the other half of the core (for the reverse bend) tightly against it all the end joints will be closed, whilst the dovetails, if properly fitted, will hold the longitudinal joints tight. The metal is now poured in so as to completely enclose the core, and when sufficiently cool the core is withdrawn by first unscrewing the cylinders and removing them, then inserting a sheet-metal pipe in the trap to hold the segments of the core in their places, whilst the plugs are withdrawn by means of a hook, leaving the segments inside, which latter are easily removed individually, leaving the cast metal trap clear.

**SCREW-CUTTING MACHINES.**—*H. B. Barlow, Manchester.* A Communication. Dated 24th December, 1859.—This invention consists, first, in an improved combination and arrangement of levers, rods, stops, and springs with the holding head of a screw-cutting machine, for the purposes of opening and closing the cutting dies; secondly, in an improved chuck for screw cutting machines, the improvements consisting in furnishing the inside of a ring with a recess and cam, and the outside with a spring-catch, lever-cam, and locking-stud, the said ring being used in combination with a die, box, cap, movable stud, and an eccentric lever, which is placed on the face-plate of the running head of the screw-cutting machine.

**CUSHIONING RAILWAY CHAIRS, PILLARS, PIPES, GIRDS, &c.**—*T. Truss, Darlington, Durham.* Dated 27th December, 1859.—The patentee claims the filling or otherwise coating of animal or vegetable fibres with alkalines, cold and hot grease, pitch, tar, or other greasy substances, and the application of the same for packing or cushioning for railway chairs, pillars, girders, engines, and other machines and pipe-joints. He also claims the application of animal or vegetable fibres not coated or otherwise filled with alkalines for packing or cushioning for railway chairs, pillars, girders, engines, and other machines.

**PREPARING YARN FOR SUBMARINE TELEGRAPH CABLES.**—*L. S. Magnus, Adelaide-place, London-bridge, and W. Sinnock, Brompton, Kent.* Dated 28th December, 1859.—This invention consists in saturating yarn, twine, cords, and strands of hemp or other fibrous material, with a composition consisting of India-rubber, gutta-percha, vegetable or other wax, resin, pitch, with or without other matters.

**Books Received.**

*Catalogue of the Works of Art forming the Collection of Matthew Uzielli, Esq., Hanover Lodge, Regent-park.* By J. C. Robinson, F.S.A., Member of the Academy of Fine Arts, Florence. Privately printed.

If all the treasures of art and vertu to be found in the United Kingdom were gathered together, they would form a whole that would astonish the world. When a portion only was sent to Manchester the eyes of cultivated men from abroad, who knew something of their own and our public collections but nothing of the interiors of our houses, were opened; but even this gathering gave no idea of the multitude of scattered valuables that exist in Great Britain in small collections and our old country residences. Wonderful men were those artists and art-workmen of old,—workers with the pencil, the chisel, and the burin; enamellers, potters, chasers, jewellers, die-sinkers, and inlaid, still putting to shame the art-workmen of these nevertheless great days,—these days of general knowledge and scientific discovery,—these days of steam, electricity, and photography!

Mr. Uzielli's collection, of which Mr. J. C. Robinson has prepared an elegant catalogue, appears to be one of great excellence. Some of the gems of it are known to the public through the

liberality of the owner, who has at different times sent them to the Brompton Museum, as, for example—not to mention smaller and more ancient works—Henri Ley's remarkable picture, "Mary of Burgundy giving Alms to the Poor," and Gibson's "Venus," both commissioned by the owner from the artists.

By the way, if we are not misinformed, the same sculptor's more elaborately coloured "Venus," concerning which so much has been said, is now in the English Custom-house, and will shortly be visible in this country.

In the catalogue before us Mr. Robinson describes 1,026 specimens, including a large number of engraved stones. The bendings comprise, besides, glass ware, Venetian and antique; Majolica, pottery, enamels, antique and cinque-cento jewellery, vases, bronzes, pictures, &c. &c.; and to each are prefixed introductory observations. As an example, we take some of his remarks on

*Majolica Wares.*

"With respect to the composition and methods of fabrication of the Majolica Wares, the *paste*, or body, is a mere common clay or terra cotta, usually of a brownish or yellowish hue. When the pieces are finished on the wheel, and have taken their appointed shape, they are first thoroughly dried, and then fired or burnt in the furnace: in this state, the ware is technically called *biscuit* (*biscotto*). The glaze is applied generally by immersion, i.e., the substances composing it being reduced to a fine powder, and mixed with water to the consistence of cream, the piece to be covered is dipped into this liquid contained in a large vessel. The porous nature of the biscuit ware speedily causes the moisture to be absorbed, and the gazing material then simply adheres to the piece as a soft coating liable to be removed by the slightest touch; on this surface the painter executes, with his enamel colour simply ground up or diluted with water. It is here that the wonderful executive facility of the Majolica painter is displayed, as the nature of the ground requires the work to be done at once; the artist, for instance, must be drawn at a single stroke, and no touch can be erased. The surface is so absorbent that, if the point of the brush charged with colour be allowed to rest on it, for even the briefest instant, an unsightly blot ensues. After the execution of the painting, the piece is fired a second time, being on this occasion enclosed in a case or "engobe" of terra cotta, to protect it from the direct action of the flames. In the furnace, the crude pulverulent covering fuses into a glossy enamel; whilst the painting, executed on its surface, sinking in and becoming judiciously incorporated with it, assumes at once a degree of power and brilliancy of tint very different to its previous crude, raw aspect.

The most remarkable variety of Majolica is the iridescent lustre ware, which reflects metallic lustrous tints, of various colours, according to the angle at which the light strikes its surface. The secret of the iridescent lustre, which appears to have been used principally at Gubbio, was lost even in the sixteenth century. Giorgio Andreoli, known as "Maestro Giorgio," was the first and most successful artistic manufacturer of the lustred wares; he lived between 1470 (?) and 1552 (?). The oldest date as yet noticed on any piece of Majolica is 1475."

In his notice of Gems the author alludes to the great caution now required in judging of the authenticity of such works, and gives these general rules, which may assist in judging of

*The Genuineness (i. e., the Antiquity) of an Engraved Gem.*

"First, the ancient gem engraver seldom bestowed his time and talent on an inferior stone; so that, although coarse and inferior engraving are sometimes found on stones of fine quality, the reverse is almost invariably true; engraving is rarely, if ever, seen on a bad stone; the work and the stone, in short, were generally of corresponding quality. Secondly, as (in Italy) the ancients were accustomed to examine their work by transmitted light, homogeneous and semi-transparent stones were, as a rule, preferred to cloudy and mottled ones, especially for delicate works. The back of the stone was, in all cases, carefully levelled and highly polished; and, as a rule, the engraving itself is nearly always highly polished—a degree of finish, which, on account of the great extra labour it involves, is seldom bestowed on modern works. Any supposed antique intaglio of highly finished work, if not polished in the "incavo," or hollows, of the design, should be looked on with great suspicion, and is, most probably, a forgery.

In cameos, the field, or ground, of the work is generally highly polished, whilst the flesh, or nude figure, is often left *mat*: the drapery and accessories are often, however, polished. The field, or ground, seldom shows much margin beyond the surface of the design, which is small in proportion to the extent of polished background. It is, as a general rule, an indication of recent origin. If there is any signature or inscription on the stone, it should be in relief or cameo, like the rest of the design; inscribed characters are scarcely ever incised, or cut in, on ancient cameos. It is important to observe the material, or peculiar stone, employed in cameos, certain varieties of stones being almost invariably preferred. The antiquity of a work, whilst others are as equally indicative of a modern origin: experience only can, however, inform the observer on this point; but, after all, the study and observance of the art displayed in the work itself is the surest guide. The connoisseur, imbued with a true feeling for art, will speedily be able to distinguish, as by a kind of intuition, the true from the false; whilst many material indications in the style and method of the work, if a work, to be acquired only by minute observation, come in aid of his judgment."

The examination of a collection such as is here catalogued is not very flattering to our art-progress. Reflected on rightly, indeed, and compared fairly, the position of several art-industries amongst us is little other than disgraceful.

**Miscellaneous.**

**MEDALLION PORTRAITS.**—We have lately examined with much pleasure a number of medallion portraits, in low relief, executed by Mr. Kuntze, of Newmarket-street, Oxford-street, a young German sculptor, lately resident in America. The medallions include portraits of Mr. Hawthorne, the author of "The Scarlet Letter"; Mr. Motley; Mr. Crosey, the American painter; Mr. Bennett, the author of "Baby May"; and several others. Some groups in bas-relief, lately produced by him, suggest to us that Mr. Kuntze's skill might be turned to advantage in architectural works.

**MUSICAL TASTE.**—Amongst the signs of advancement which may be noticed is the development of a musical taste amongst the working classes throughout the country. In Northumberland and Durham bands for the practice of instrumental music have been formed by the colliers in connection with numerous large works, and instead of cockfighting and other brutal sports, contests of musical skill, or meetings on a large scale for harmonious purposes, are common on holidays. In other districts, in the Potteries and several great manufactories in the metropolis, bands have been formed. This leads to good results, and affords a degree of intellectual amusement which has a humanizing effect. At the Caledonian Institution, the Foundling Hospital, and elsewhere, are trained companies of juvenile musicians, from which have been picked many able performers. The gathering lately at the Crystal Palace give some idea of the extent of this movement amongst the intelligent working classes. In public gardens, in the suburbs of London, music is made a chief source of attraction, and the best music is brought within the reach of all.—A. B.

**BUILDERS' HOISTS.**—Sir, If I may presume to claim the remarks on "Builders' and Contractors' Hoists," which I find at page 495 of the *Builder*, as intended for my new hoist-lifts, &c., I can but feel greatly obliged by your kind recognition. The application of water-pressure (suggested by you) might, I think, be carried out with advantage in some large contracts, but in the generality of small contracts perhaps it would not be quite so applicable. There is a quarter-size model in the Museum of Construction, South Kensington, and I am invited to exhibit a model of our "waved wheel," 12 feet diameter. I beg to call your attention to this novel form of wheel, and its general applicability for hoisting-machinery, for mining, and especially for paying out long lines of electric cables, as a single wheel could be made to pay out a cable with the least possible strain, and at any speed.—GEO. JOHNSON.
